Such, then, was the plan recommended and adopted. Originally I did not arrange for valves to close the primary inlet openings, but I was afterwards driven to their adoption, because when the wind came against the front of the house it rushed up the lobbies and through the rooms at a most uncomfortable rate. The air is warmed as it comes into the ground-floor lobby by five coils, in two layers of Perkins's inch bore hot-water pipes. These pipes are heated by a stove in the basement of the stairs lobby. By this means the air in this lobby can be kept permanently at 65°. Instead of confining all the hot-water pipes to the entrance, it would have been better to have taken them up from the stove directly to the attic floor, and carried a coil along each floor also, and ending with a few coils at the entrance. This I have since had done. I would here bear testimony to the perfection of Perkins's apparatus, as supplied by Mr. Gibbs: it is safe, efficient, economical, and almost all that could be desired. The greatest objection to it I have observed is that it has happened that in really cold weather it has required water, and, in this case, it has had to be let out to have some supplied.

Now, as to the central reservoir, corridor, or lobby, it appears to occupy much space, and may be thought by some to be a waste of space. What I have to say, after paying for the land and building and living in the house for four years, is that I am very thankful indeed that I appropriated the space for it; it is one of the greatest comforts and best provisions of the house; and I am sure that, after experiencing the comfort, no proprietor of a good house would regret such appropriation of space by his architect.

This lobby is lighted at night by Rickett's globes—these globes do not foul the air, and I wish I had adopted them throughout the house: this would have prevented all blackening of the ceilings. By having the central reservoir also as lobbies to the different floors, the heated air is checked on each floor, and prevented from rising at once to the attics, as it does when this heating takes place in the stairs lobby. By having the entrance of the air into the rooms independent of the door, it is continual, even when the door is shut; and by having it by numerous openings along the longest side of the room, it is nicely distributed, and perceptible current is prevented. And I still prefer that it should be through the cornice. There are advantages in having the inlet through the skirting, and there are advantages in having it through the cornice; but I am sure through the cornice has a preponderance of advantages. Though the skirting has the advantage of less easy travel of sound from the rooms, when the air in the lobby is warmer than the air of the room the ventilation is more perfect. But what does travel of sound matter when it is into a private lobby? So that this is really no advantage after all. And when is the air of the lobby warmer than the air of the rooms? Scarcely ever,—indeed, only when the heating apparatus is fully on, and the rooms are without fires; so that neither is this any real advantage. Nearly all the year round the air is colder in the lobby than in the rooms, and that also after having been artificially warmed; and there are about two autumn months and two spring months when, though it is scarcely necessary to have the heating apparatus at work, the air is too cold to be admitted directly into

the rooms, or, at least, through the skirting directly to the feet of the occupants; but it is not then too cold to be admitted through the cornice, because by slowly falling through the warmer air of the room it becomes tempered before reaching the occupants; practically, I have found this to be so. And, besides, there are now and then days, even in winter, when it is not necessary to have the heating apparatus working; and, now again, the advantage of the entrance through the cornice comes in. So, taking all points into consideration, the cornice is decidedly preferable to the skirting for the inlet.

Having control over the exit-flues with valves enables one to economise heat, and to direct the current of fresh or of heated air through any particular room at pleasure; for instance, on a very cold winter night by closing the valves of the ground-floor and first-floor rooms, where the heated air is not wanted during the night, we have the full benefit of the whole of the heated air through the bedrooms.

The question may be asked: Why have a foul-air chamber at all? Why not carry the outlets from the rooms directly into the upcast, and thus save both foul-air chambers and downcast? Because, in that case, some of the flues would have suction and others none. Having a foul-air chamber secures the suction from all the rooms equally. The other plan has been adopted by Mr. King, in the new gas offices,—all the offices having a flue into the shaft surrounding the furnace flue, which is of iron. I shall watch the working of this plan when in operation.

The fresh air being drawn through dry cool cellars, it settles the dust and blacks, and, in the summer, becomes cooled; and, in dusty weather, it can be passed through canvas screens. That the ventilating-lobby should be separate from the stairs-lobby is absolutely necessary in every good house; for in no other way can steady, sensible warmth and ventilation, combined with privacy, be secured. And this, of course, necessitates that the front door, or entrance into the house, shall be at one end of the house, and not in the centre of the front elevation. I grieve, whenever I see a good house built or being built with the entrance in the centre of the front; for I know that this is or will be necessarily a badly-warmed and ventilated house. By admitting the air specially into the central lobby, the quantity admitted can be regulated according to the number of persons in the house, and the way of the wind,—conditions absolutely necessary to the complete comfort of the house.

There are a few other innovations I wish to notice. For instance, the windows do not open,—they are fixed like church windows; four of the bedrooms have only two chimney-fues amongst them: the breakfast-room chimney-fue runs into the kitchen-fue; the principal chimney-breasts are in the outer wall of the front and back elevation, and the bells are electric.

Most persons object to the idea of windows not opening. My wife, in particular, protested that she should imagine herself in a prison, and go mad. I have, however, to say of the practical experience that I am confirmed in my own opinion of the wisdom of this arrangement in the town, when the house is properly ventilated; and my wife is not only reconciled to the idea, but says she is delighted that they do not open. It is a wonderful protection from dust and blacks, and from the necessity of dusting. The cleaning is done as in most good houses, by men,—and costs me 20s. to 30s. a year. This *fixed* condition of the windows is not at all essential to either the ventilation or warming,—it is not at all involved in the principles, and it was adopted merely to assist to obviate the ordinary draughty nature of window-places, and to keep out the dirt. I have been disappointed to find that it has, with some, been thought essentially involved in the principles followed out. An open window would, of course, increase the inlet, which might be an advantage on a very hot summer evening. It is generally thought that one flue will not answer for two fireplaces: practically, however, it does, and, indeed, these fires burn as well as any other when only one of them is lighted, and much better when both are burning. This, I think, results from the flues meeting at equal heights, and the common fue being equal to the two. The breakfast-room fue was, at first, a failure; as originally designed it was shown, the entrance flush with the inside of the kitchen fue; but it was found that when the common fue was occupied by the smoke from the kitchen fire the breakfast-room fue

* From a paper by Dr. John W. Hayward, read at a meeting of the Liverpool Architectural Society.

would not draw, so I got a shoulder put at the lower edge of the entrance into the kitchen fire. This remedied the difficulty at once, and now this is one of the best drawing-flues in the house. This making one smoke-flue serve two fireplaces is quite independent of the principles followed, and was adopted merely for economy's sake. As to the chimneys in the outer walls, here is still a difficulty, and the only difficulty that now requires remedying. These chimneys are subject to gushing down-draughts, when the wind blows in gusts against the walls in which the chimneys are; for instance, the west or front chimneys smoke in puffs in strong west winds, and the back or east chimneys smoke in puffs in strong east winds. This is contrary, I believe, to the general opinion, as it is usually thought that the wind comes over the roof and curls down the chimney. I have tried several kinds of chimney-tops, amongst them the swivel cowl and archimedean screw, a horseshoe cowl towards the roof, and the introduction lower down in the warm part of the chimney of an opening slanting upwards into the smoke-flue, but without success. I have now a straight long top, simply doubled at the termination; this has not yet met with the adverse wind. Of course it is not an essential part of the principles of warming and ventilating that the chimney-breasts shall be in the outer walls, and it was adopted merely to utilise the fire-draught to assist the ventilation. The electric bells also are a mistake; I do not recommend them for private houses. They are about the same cost originally; but they are a continual trouble and expense afterwards: mine have already cost me more in the absolute cost of sulphate of copper than the bells of my previous house cost me in repairs the six years I lived in the house, besides the annoyance of their not acting. Notwithstanding these imperfections, the working of the general arrangement fully answers the expectations originally formed: there are perfect ventilation and complete warmth throughout the house, so that persons may sit in any part of the room, and do not require to crouch over the fire; the smell of dinner is gone directly, and so is that of smoking in any room; the bedrooms in the morning do not smell like bedrooms; there is no offensive smell from the water-closets; and both the ventilation and warmth are easily regulatable, according to the requirements of the occupants, and the season of the year. Each room receives an ample supply of fresh air, so distributed that there is no perceptible current, and which in summer is cooled from 5° to 10°, and in winter is warmed from 10° to 30°; so that all the year round the atmosphere of the whole house can be kept from varying more than 8° to 10°; and in the coldest winter it can be kept up to or above 65°, and in the hottest summer it can be prevented from rising above 72°. Of the comfort and advantage of these conditions I have had practical experience, not only in health, but also in disease. For some weeks of the winter '69 and '70 I had staying with me a young lady in the early stage of consumption, and I had my wife laid up with bronchitis; both patients felt the advantage of being able to range through the lobbies and whole house at any time with a full supply of fresh air, and without fear of the irritating effects of cold air. Also in the spring of '70 and '71, I had two of my children down with putrid scarlet fever: and I then felt the immense advantage of plenty of fresh warmed air going from the lobbies into the bed-rooms, and thence out of doors without returning into the lobbies, and with the ability to load the incoming air with disinfectants. By using disinfectants in the first floor lobby, the air entering the house became impregnated, and then passing through the lobbies into the rooms to out of doors without returning into the house, left my professional part on the ground floor free from any risk of infection, much to my own and my patients' satisfaction. Finally, I am very well pleased with my bargain; and were I about to build another house, I would build it on the same principles, and in the same way, only that I would have a metal (cast iron) instead of an earthenware kitchen smoke-flue, in order to utilise more of the waste heat of the kitchen fire; it was a mistake to have an earthenware smoke-flue. It is, I am sure, the warmest house in winter, and the coolest in summer; and altogether the most comfortable and healthy house in this town. I speak now, not only from theory, but also from experience; and had I time to superintend the erection, I would have some houses built in the

same way as a speculation, for I am sure they would be sought after, and would pay a good percentage on the outlay. . . . The primary inlet has an area of 5 square feet, the total area of the flue running into the four-air chamber is 4 square feet, the area of the downcast shaft is 5½ square feet, and the area of the upcast, at the place of the anemometer, is 4 square feet; and the canvas across the primary inlet is 171 square feet. The air first passes through this canvas; this causes a loss of about 55 ft. per minute, i.e., 55 cubic feet more of air would pass through the house per minute (were the canvas removed); there is a further loss of about 8 ft. per minute when the doors of the rooms are shut over when they are open. The air passes up the upcast shaft at the rate of 220 ft. per minute. The area of the upcast is 4 square feet; 480 cubic feet, therefore, passed through the house every minute, independent of the suction of the fires,—enough to supply the standard quantity of 15 cubic feet of fresh air per minute to fifty-eight persons in the house at one time. But, supposing the ordinarily used fires were lighted, about 4,500 cubic feet of fresh air would pass through the house every minute, thus allowing each of the fifty-eight persons 77 cubic feet of fresh air per minute, or enough to supply 300 persons with the standard quantity of 15 cubic feet per minute; for, of course, the occupants would have the use of it as it passed to the fires. I have also ascertained that when the fires are burning there is no diminution of the quantity going up the upcast.

SHAM JEWELRY AND MORALS.

At the Society of Arts, on the 28th of February, Mr. W. G. Larkins (editor of the Society's *Journal*), read a paper "On Trinkets and their Manufacture." In concluding, Mr. Larkins said,—Let me give utterance to an idea that has come into my head with regard to the matter of personal adornment. I am not going to say that makers and sellers of sham jewelry are lowering the morals of the country. I will not say they aid and abet the actual lie of those who would have us believe their brass is gold; and I will not go so far as my friend, Dr. Dresser, who, in a paper read before us last year, asked if the destruction of Pompeii and the woes that have lately fallen upon our neighbours across the Channel, were not due to their false quantities in decorative art. But I do mind me of a sentence of that quaint divine, Dr. Andrew Fuller, who said that, in the time of Elizabeth, a "lady would as soon have patiently digested a lie as have worn a false pearl." I am afraid this high regard for truth is not characteristic of the present generation. There is, on the contrary, a good deal of show and lumbricity about even ladies and gentlemen, and "all is not gold that glitters;" and it is possible that mock jewelry, false hair, pretended jewels, and other shams may blurt that keen sense of truth and right which distinguished our Saxon progenitors. At the same time, I am bound to admit that, by the rapidity and cheapness of manufacture now-a-days, things of beauty are placed before those who would never otherwise enjoy them; and perhaps, after all, as Mr. Wright says, "There is no valid reason why the factory-girl should not display her gilt buckle and brooch of the same design as the golden one worn by the lady of the villa." Art may thus serve the community by cheapening the cost of the beautiful, and afford gratification to the humblest members of society, by superior designs reproduced in the cheapest possible form, and attainable by all.

Mr. George Wallis, opening the discussion, said,—They had all frequently heard it asserted that anything which came from Birmingham must be an imitation; but he would say, if it were made as an imitation, it was sold as an imitation; and, whatever might be done by the retailers afterwards, it went out of the hands of the manufacturers honestly for what it was. He had had the pleasure of living in Birmingham for seven years, as Head Master of the Birmingham School of Design, now called the School of Art. He had known Birmingham from his boyhood, and had kept up his connexion with it ever since he left, in 1858, and during the time he was there or since, he had never read in any police report in the newspapers of any workman purloining the goods of his master, although they were in the habit of dealing with precious materials amounting to the value of a million

and a quarter in the year. In 1855 he had the pleasure of reading a paper in that room, upon the "Recent Progress in Design," and he brought up from Birmingham a considerable display of the products of the town. Many of the objects were mounted upon cards, which were marked London so-and-so, and people thought they were made in London, but that was a mere myth; it answered the purpose of the manufacturers to cater for the whim of the retailer, and he mounted his goods accordingly. He should like to see this kind of thing done away with, as it would be more honourable and honest. In the Exhibition of 1851, Birmingham did not exhibit a single article of jewelry, but in 1862 they made a very excellent display, chiefly through representations made by him. Previously, the manufacturers said they did not care what the public thought about Birmingham jewelry; they sold it honestly for what it was, and did not care to betray the secrets of their customers. He was sorry to say that many persons, who ought to have known better, said they did not care to look at the Birmingham cases, because they did not consider there was anything worth looking at. There had been a deal of talk about French design, but he was satisfied that the French designers had led the English into some of the most outrageous absurdities, and it arose out of the incessant following of the mere whims and caprices of the French.

Sir Walter Stirling said he was much pleased at finding that Birmingham was in reality the temple of truth, for the general impression was quite the contrary. It was evident, however, from what Mr. Wallis said, that what was fictitious jewelry was honestly sold as such, and therefore there was no deception. He considered it a great public benefit that articles could be produced of the highest finish and beauty, without having intrinsically such a high value as to tempt housebreakers and thieves; and he hoped it would be more generally recognised that the beauty of trinkets should depend on the excellence and taste of their manufacture. The same principle applied in the highest circles of society, for he believed there was no such thing in use now, even at royal tables, as gold plate, except in rare instances. On one occasion, when dining with the Goldsmiths' Company, he inquired for the gold plate, but the only specimen shown him was a cup, which had been set before Queen Elizabeth. Even silver plate was now so closely imitated by electro-plate, that it was almost entirely superseded by it, and people might now sleep in safety, either in their town or country houses, without the fear of burglars breaking into their plate-closets and carrying off that which was not only precious as having been in the family, perhaps, for several generations, but also from its intrinsic value. It was very creditable to the artists to see such beautiful imitation jewelry, but, after all, there was nothing which could equal the beautiful appearance of pure gold. Indeed, having witnessed the Royal procession of the previous day, he was of opinion that even Temple-bar was vastly improved in appearance by the gilding bestowed upon it.

MASTER AND SERVANT BILL.

This Bill was issued to Members of Parliament and the public on Tuesday last. It provides that the Act shall come into operation on the 1st of January, 1873, and shall not extend to Ireland. Under the Act the whole of the wages of workmen shall be paid in coin of the realm, without any deduction, and without any condition as to the spending any part thereof. Every contract in contravention of the Act shall be illegal and void, and the workman may recover his wages as if the contract had been made in conformity with the Act, and as if any deduction had not been made, or as if such payment, so far as it is illegal, had not been made. Masters and masters' agents who make contracts imposing conditions, or using compulsion, as to the place or manner in which, or the person with whom any money paid on account of wages is to be expended, shall be guilty of an offence against the Act, as shall be also the person with whom such money is expended, unless he shall satisfy the court that he was in ignorance of such illegal contract. The Bill provides for the weekly payment of wages, or by special contract, and that a part only of wages may be paid, but such part to amount to not less than 90 per cent. No wages shall be paid on any premises licensed for the sale of intoxicating liquors, or at or within any office, yard, or place contiguous

to, or occupied with, such premises, or on any premises on which goods are ordinarily sold to such workman. Where any goods have been sold or supplied to a workman by his master or master's agent, as or on account of wages, at a shop or place kept by or belonging to such master or master's agent, or in the profits of which they may have an interest, an action shall not lie against the workman, and the master shall not be entitled to any set-off for such goods. The Act is not to refer to deductions for school fees for short-timers, or for contracts for the school fees of other children, or for board and lodging when the workman lives with his employer, or for fines mutually agreed to between master and workmen; nor shall the Act deprive a master of the right of distraining for rent. The Bill provides for an audit of deductions, for education, &c., by auditors appointed by the workmen, and for appeals to the Quarter Sessions. Offences against the Act will expose to a penalty of 10*l.* for the first and of 20*l.* for subsequent offences. If passed, it may not be doubted that this Bill will prove the death-blow of the Truck system.

THE WALWORTH COMMON ESTATE.

The sixtieth letting of the land on the Walworth Common Estate, which is vested in the Governors and Guardians of St. Mary Newington, and which has, during the last few years, been let on lease for building purposes, took place on Monday last, at the Elephant and Castle Inn, where there was a large attendance of builders and others interested in property. There were sixty-three lots offered, fifty-seven being sites for private houses, and six for shops. With the exception of sixteen lots, the whole of the sites offered are situated in a new street, called Faraday-street, which has been so designated in honour of the Professor whose name it bears, and who was born in the parish of St. Mary Newington. This new street, which is 15 yards in width, and about 400 yards in length, is now in course of formation. Messrs. Stuart & Son, who officiated as auctioneers, stated, in opening the proceedings, that the bulk of the estate had now been disposed of for building upon, and there was little more left to purchase. All the lots offered were readily sold, there being an active competition amongst builders present for the several sites. The sites for the private houses, which contain an average area of 17 ft. frontage by 60 ft. in depth, and which are all intended for a superior class of houses, realised an annual ground-rent of 4*l.* 15*s.* per annum, on a lease for the term of eighty years, whilst the sites for two shops, opposite each other, at the corner of Faraday-street and Thurlow-street, containing, respectively an area of 24 ft. and 23 ft. frontage and 60 ft. deep, realised 10*l.* 15*s.* and 9*l.* 10*s.* annual ground-rent. The lettings of the day realised, in the aggregate, an annual ground-rent of 331*l.* This estate, upon which several hundreds of houses and other premises have been built within the last few years, whilst whole streets of others are still in course of erection, is now yielding a large annual revenue in ground-rents to the Newington governors, the average amount paid for the leases representing about 3,000*l.* per acre, as freehold.

SHEPTON MALLET.

SINCE our reference to this town, the inhabitants have held a public meeting regarding the matter. It considered there was a necessity for reform in the existing sanitary arrangements, and a committee was formed to consult as to the best means of procedure. Immediate action was deprecated, in view of sanitary legislation this session, yet it was thought that the committee might pick up many good hints in the meanwhile in the towns in which sanitary knowledge and action were more advanced than in Shepton Mallet. We were not surprised to learn, that at this public meeting there were some who believed the sanitary arrangements of the town were well-nigh perfection, and who were prepared at all points, to prove Shepton Mallet "the healthiest town in England." There are now such a very large number of "healthiest towns in England," that we commend with delight to all Improvement Commissioners, and other opponents of sanitary measures, the phrase recently introduced by an Improvement Commissioner,—"the healthiest town in Great Britain." It is a decided pull upon phrases.

The Duchy of Cornwall possessing a large

amount of property in Shepton Mallet, the stream that runs through the town being part of it, it was asked to help in the work of purification; but for the second time the application has been refused, and with that peculiar air of grandiose snobishness that we hope and believe only Duchy of Cornwall officials exhibit in such perfection.

They would offer no impediment to the improvement of the Duchy property, but they had given an answer in the year 1868 (or thereabout), to which you are referred. On the Duchy stream from Kilver-street to the Factory at Draycott, there are forty-three privies emptying more or less directly into it, and forty-two sewers, nine of which are public, draining between them the whole of this town of 3,500 inhabitants; and on this stream, just before it reaches the town, there is a brewery, and then a large factory; some portions of the stream are arched over, of course making the uncovered portions all the more noxious and nauseating. Mr. Rawlinson, in his "Practical Suggestions," issued by the Commissioners in Lunacy, says,— "Natural streams should not be arched over to form main sewers;" to which one might add in this case,—so much ignorance, so much mischief; for ignorance is not idle any more than knowledge.

In an uncovered portion of the stream about twenty yards in length, close to Leg-square, at least three sewers and three privies empty; yet in this place we saw a man doing his weekly washing of entrails for sausage manufacturers in the town, whose names were given us. 10 ft. or 12 ft. back from the banks of this same part of the stream, and in such a position that God's sun can rarely if ever reach them,—cold, dank, dismal,—there are two houses; in one of them there has been a fatal case of typhoid fever, and the people who live there are constantly ill. An agent of the Local Government Board should see the convenience on these premises,—not the outside only, but the inside as well,—and then he should go across to another outside the flour-mills opposite: he would eat no dinner that day. Now, that the Prince has had such an awful experience of the very disease that may at any time visit some of the tenants of the Duchy of Cornwall property in Shepton Mallet, we believe that, if a proper representation were made to him, more directly than has hitherto been done, he would at once cause inquiries to be made as to the existence of these nuisances.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a Special General Meeting of the Institute held on Monday, the 4th inst., the royal gold medal, annually bestowed (subject to Her Majesty's sanction) on some distinguished architect or archaeologist, was awarded to Professor Friedrich Schmidt, of Vienna, President of the Austrian Institute of Engineers and Architects, and holding the Government office of "Ober-Baurath," a title nearly equivalent to that of our First Commissioner of Works. Professor Schmidt designed the new Roman Catholic church at Vienna, the gymnasium in the same city, the Dominican church at Bisseldorf, and many other buildings of importance. He is also an honorary and corresponding member of the Institute. The meeting having next proceeded to consider the recommendation of the Council respecting the award of the Soane medallion and other Institute medals and prizes offered for designs, measured drawings of ancient buildings, &c., the following adjudication was made.

The Soane Medallion and 50*l.* (subject to the usual conditions as to Continental study), to Mr. Alfred Reading, of Hall-road, Handsworth, Birmingham, for his design of a town-hall.

The Institute Silver Medal and five guineas, to Mr. Fred. H. Reed, of London, for a series of elaborate and carefully measured drawings, illustrating Tattersall Castle, Lincolnshire.

A Medal of Merit, to Mr. Fred. C. Deason, of London, for a similar series of drawings, illustrating All Saints' Church, Edington, Wiltshire.

In the same competition, the drawings submitted by Mr. John Langham, of Leicester, and Mr. C. Bryan Oliver, of Bath, were "Honourably Mentioned."

The student's prize in books was given to Mr. William Scott, of London, for his design for a staircase in a domestic building.

The Council then announced their decision respecting the award of certain money prizes offered by Mr. H. W. Peck, M.P., for the

best series of drawings, illustrating the restoration of Eastbury Manor House, and the Convent Gateway, Barking, viz.:—the sum of 42*l.* to Mr. T. E. C. Strachan, for the best set of drawings of Eastbury Manor House; the sum of 20*l.* to Mr. Philip J. Marvin, for the second best set of drawings of the same subject; and the further sum of 10*l.* to Mr. Philip J. Marvin, for the best drawings of the old Convent Gateway, Barking.

It is understood that these prizes were offered by Mr. Peck with the sole object of encouraging architectural study, and with no view to the restoration of the building, which does not belong to him.

It is proposed that the formal presentation of the Royal Gold Medal and the Institute Prizes shall take place during the General Conference of Architects, which will be held later in the season at the Institute.

The next ordinary general meeting will take place on Monday, the 18th inst., when a paper will be read, by Mr. Wyatt Papworth, "On the Fall of a Church Dome, with Suggestions for its Construction on better Principles."

THE HOME AND THE MAN.

"As the home, so are the people."

WHAT is progress? Let us reason.

It is conquests great and great;

Honours, such as we enbazon

With the emblems of the State?

Is it arms bravely quelling

Civil strife, that drest ban;

Or the building of a dwelling

Where to mould the future man?

What is progress, Lords and Commons,

Ye who gnido the nation's will;

Can it be that man and women's

Nature courts but human ill?

Is it schools for prayer and spelling,

For the Arab class and clan;

Or a healthy human dwelling

For the family of man?

Progress, human, is the solemn

Home foundation undefiled,

Man the grand Corinthian column,

And the ornament the child:

This is progress, onward swelling,

In proportion and in plan.

As we make the human dwelling,

So we shape the future man.

Pro.

Let us build for health and morals;

Let us raise, in Heaven's name!

Homes to win us lasting laurels,

And to wipe away our shame.

Earthly triumphs these exelling

Are not in creation's span;

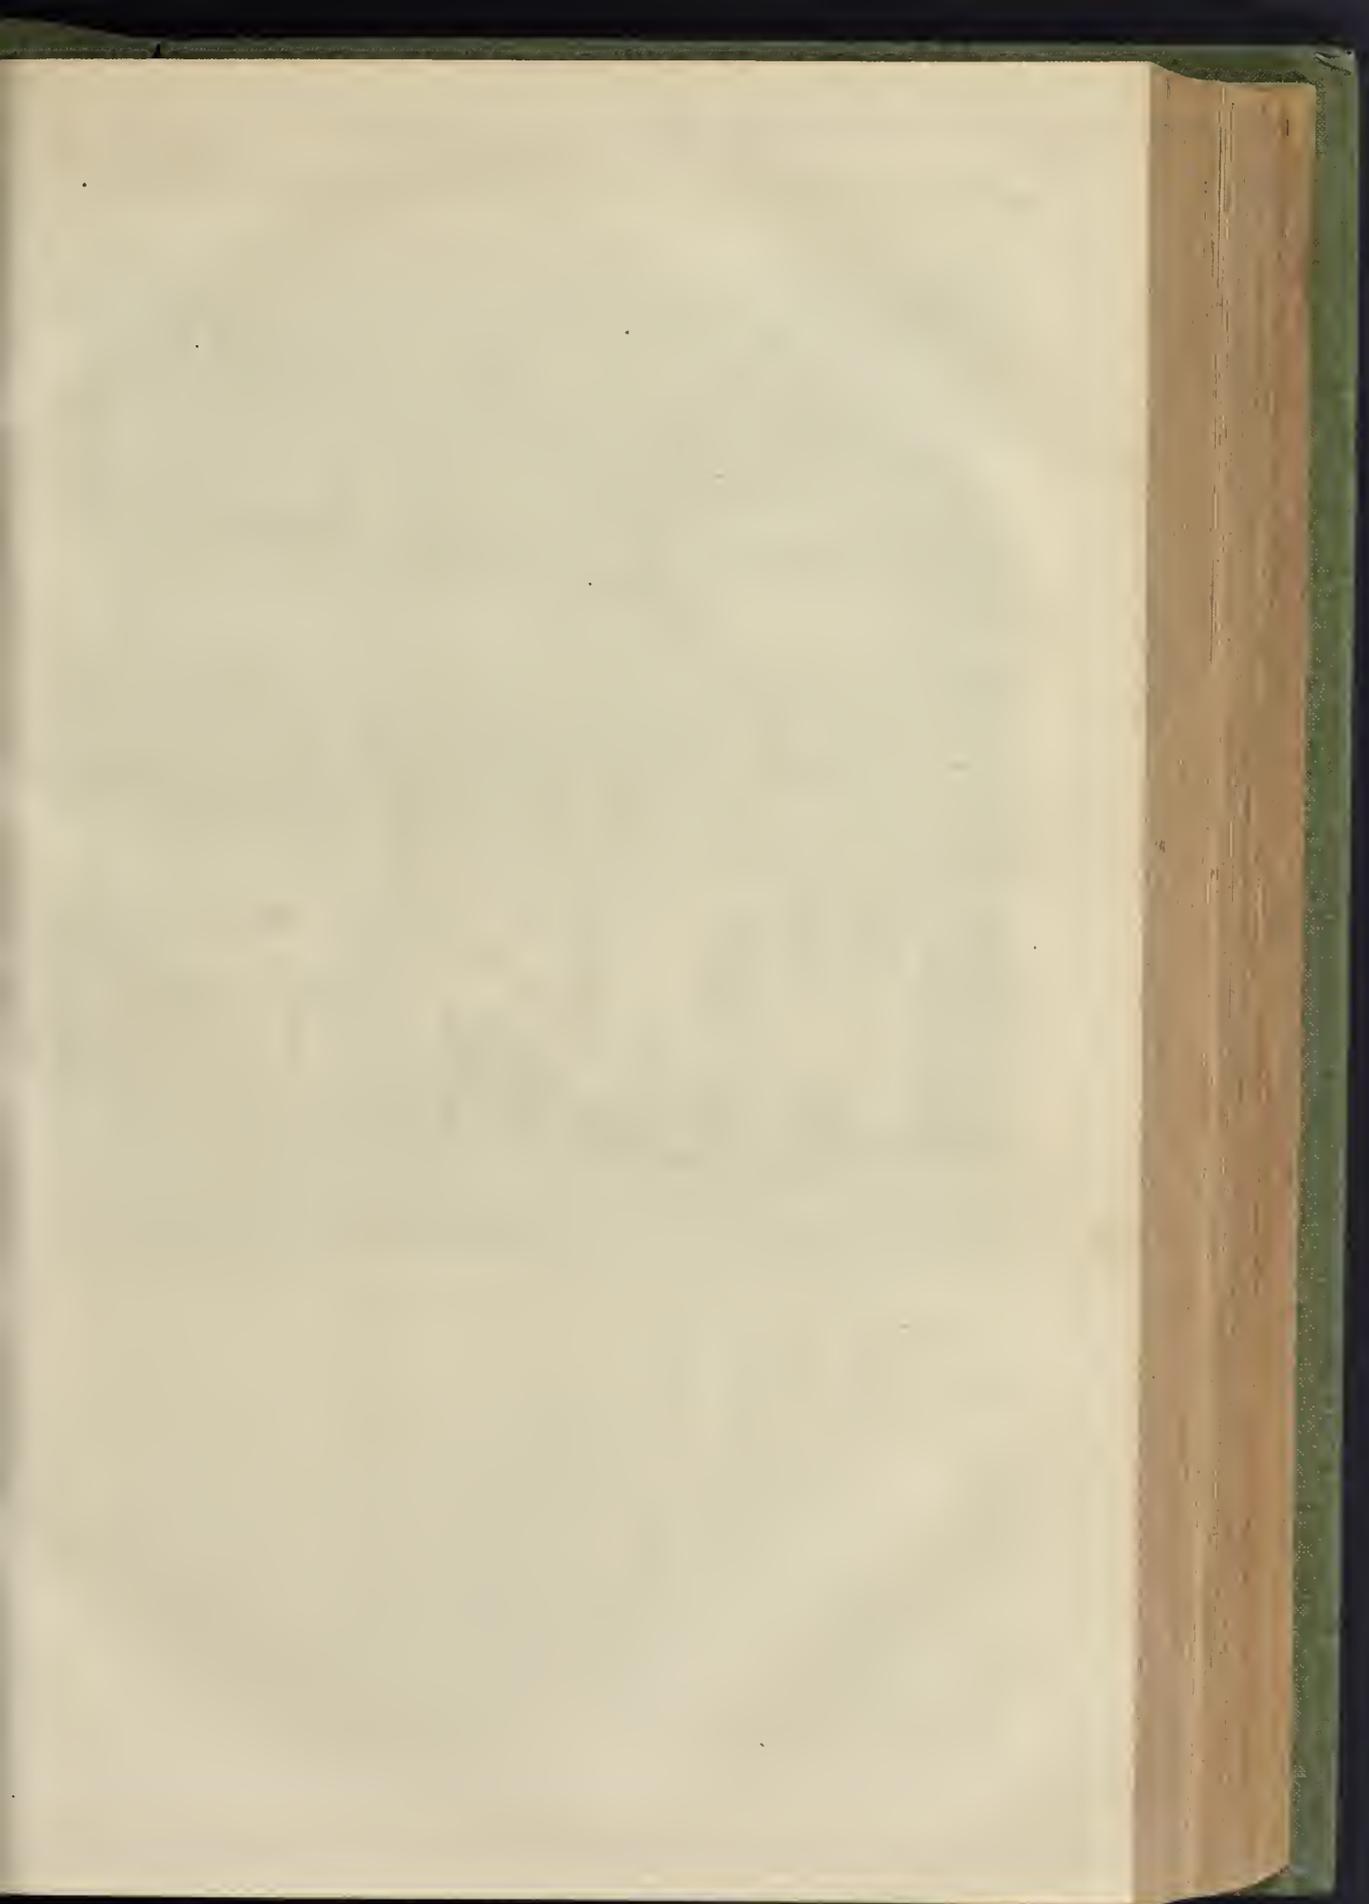

For improvement in the dwelling

Means improvement of the man.

C. C. H.

EARLY REMAINS NEAR GRACECHURCH-STREET.

IN Corbet-court, a turning out of the west side of Gracechurch-street not far down from Cornhill, a pile of offices with large cellars is about to be built, under the direction of Mr. Crockett. Considerable excavations and clearances of old works are being made in consequence, and in the course of these, at a depth of from 16 ft. to 18 ft. from the present street level, remains of a small Norman arcade and other early work have been exposed. One of the stone columns, with its capital, is pretty perfect. On other parts of the site there are vaultings of rubble and concrete. The bearing-wall of one of these is seen to have been underpinned with good masonry, probably soon after the Great Fire. St. Peter's, Cornhill, close by, is of very ancient foundation. Even if the tradition which makes it the first Christian church in London, and takes it back to the year of our Lord 179, be put aside, there is evidence to show there was a church here in the year 1230. It seems just possible that the remains now discovered formed part of some of the buildings connected with this or the neighbouring church of St. Michael. Chroniclers mention a subterranean passage-way from St. Peter's, the "London Tavern Apprentices," it is said, penetrated it to a considerable distance about sixty years ago, soon after which occurrence it was broken up.

ANCIENT TIMBER BUILDING AT LIMBURG.

ANCIENT TIMBER BUILDING AT
LIMBURG.

We add one more to our examples of ancient timber buildings. It is to be found in Limburg-on-the-Lahn, to the east of the cathedral, and forms the interior of the courtyard of an ancient building, which was originally the dwelling-place of the canons attached to that church. This is an early example of timber construction, and may date from the fourteenth century. As will be seen from our engraving, the beams are chamfered in a very elaborate manner, as are likewise the uprights and the ends of the joists, giving a contradiction to the assertion of some members of the profession, who are wont to persuade themselves, and try to persuade others, that chamfers are a "modern invention."

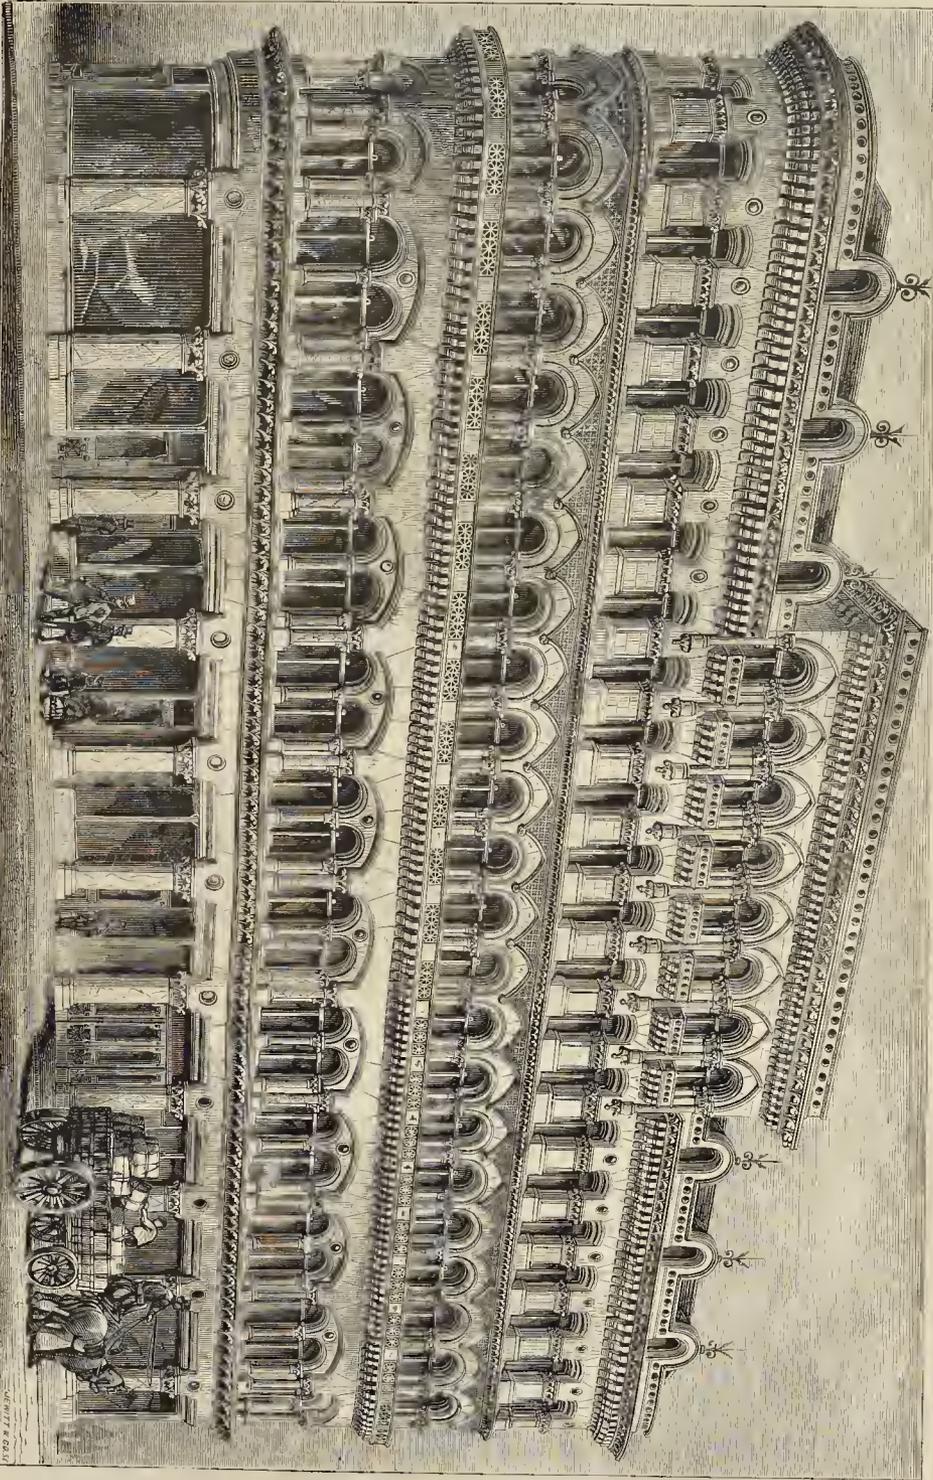

CHEAP GAS FOR RAILWAY COMPANIES.

It may be readily believed and easily understood that the expenditure for gas in lighting stations and booking offices constitutes a heavy

item in the accounts of the railway companies that have stations in, or near, London. The London and North Western Company paid, if we mistake not, over 40,000*l.* for gas consumed last year in London and the suburbs, at its stations, warehouses, and booking-offices. Reference was made to this subject at the last meeting of the Metropolitan Company, and to the hope that could now be entertained of an important reduction in this item of expenditure, through an arrangement with a new gas company, that was ready to engage to supply gas of sixteen-candle illuminating power, at 2*s.* 3*d.* per 1,000 cubic feet. It is understood that the company referred to has already arranged to supply the Metropolitan, the Metropolitan District, and the London Chatham and Dover Companies, with gas of the quality referred to, at the price stated. A condition of the supply will be that the gas company shall be allowed to lay pipes along the railway companies' lines, from the gasworks to the stations or places where the gas is to be consumed. This arrangement will obviate the necessity, and, of course, the heavy cost, of an

Act of Parliament, and will deprive the gas companies,—which are, as is well known, a rich and powerful confederation,—of a *locus standi* as opponents of the new company. Land for the new works has been taken at West Brompton and at Battersea, from which there is communication with all the railways having termini in London, north and south of the Thames, and all the stations in the extensive metropolitan railway district. It is stated that the gas rentals paid by the London railway companies amount to 175,000*l.* per annum, and that fully a third of that sum will be saved by their contracting with the new company. It will, of course, be seen that the arrangement between the railway companies and the gas company can be carried out without any interference with or breaking up of the roads or streets. It may be expected that other companies will speedily follow the example of those that have contracted for the supply of better light, at a rate so much lower than that they are now paying.

Mr. George Flintoff is the engineer of the new company.

LONDON STREET ARCHITECTURE: ALBERT BUILDINGS, QUEEN VICTORIA STREET.—MR. FREDERIC J. WARD, ARCHITECT.

—GUTHRIE & CO. L.

SECURITY AND SASH FASTENINGS.

SOMETHING has been lately said as to obtaining a safer method than the one in use for securing sash windows and reforming their fastenings.

Before making some suggestions to that end, I would point to the communications which appeared in the *Builder* on a cognate subject, from different correspondents, in the volume for 1870, "On Sashes and Sash Hangings." Most of our present sash-fasteners are useless for purposes of security, not alone from the fact that in the majority of instances they are "cheap and nasty," and of bad material, bad design, and worse workmanship, but because the sashes to which they are attached are not constructed in the right manner at the point where all the danger lies. The meeting-rails of the top and bottom sashes are seldom or never made of sufficient thickness or breadth. To allow for the thickness of the parting slip that separates both sashes, it is, of course, requisite to add to the breadth of the meeting-rails. Some sash-makers allow for the additional breadth on one rail alone; others equally divide it between the two. The first method is the worst, and the second method not much better, if what is technically called "hooking" or "spraying" both edges of the meeting-rails is not done. By this method both edges of top and bottom meeting-rails lap diagonally against each other. This meeting-rail is not so secure than a square meeting-rail, is still not proof against a thin blade of steel or a knife being inserted between; but it is far preferable to the square section, as the blade or instrument used will have to pass in at a great inclination. The fastener can be put on in this instance in such a manner as almost to counteract any successful insertion of a blade unless considerable force be employed.

Here is, however, in our opinion a much better method. Let the edges of the two meeting-rails of both sashes be rebated, the meeting-rail of the lower or inside sash to overlap the outer, so that their rising and lowering will not be interfered with. To go to the rudiments, let us suppose that the thickness of the sash-stiles is $2\frac{1}{2}$ in., and the parting-slip or bead in the sash-frame $\frac{1}{2}$ in. thick. Let us allow, then, in the breadth of the meeting-rails for what will give a $\frac{1}{2}$ in. or $\frac{3}{4}$ in. rebate: the last will be found sufficient if the sashes are closely fitted. No knife or thin blade of steel can be inserted in this instance, as the projecting section of the rebato of the meeting-rail of the inside sash stops it.

In making sashes, it is always aimed at to give the meeting-rails as light an appearance as possible, from the belief that they ought, if possible, to correspond with the bars,—a very erroneous notion.

There is no valid reason why the thickness of the meeting-rail of an ordinary sash should be reduced to $1\frac{1}{2}$ in. or $1\frac{1}{4}$ in., which is foolishly considered by many very gross for an ordinary sash meeting-rail. In fact, they should not be under 2 in. in thickness; but if men will aim at airy lightness, they must not anticipate security. In future, with a view of increasing the strength and security, and maintaining the lightness of appearance in the meeting-rails of ordinary sashes, I would recommend that the meeting-rails in every instance should be composed of either oak or ash. The rebato then would be more strong and durable, and would resist a much greater degree of real violence and open force. In respect to the suggestion of having the meeting-rails of sashes rebated, there will be some people who will pretend to see objections and eyesores at once; but before these are made we will anticipate them. As to a rebato being unsightly on a meeting-rail of a sash, it is no more unsightly than a rebato on a folding-door or a French casement window, which has to be so treated. One rebato only can be seen from the outside, and this only when the lower window is raised; and even in the window of the ground-story of a dwelling, no person, except those possibly bent on looking out for the sight, would take notice of the difference. As for the additional trouble in the preparation and fitting of the sashes, we see very little indeed. All sashes should be fitted to their frames before leaving the workshop or builder's yard and glazed. Fitting sashes after being glazed is an unworkmanlike fashion and leads to much loss of time and also loss of glass, as a great quantity of it is often broken when this slovenly method is adopted. The rebating of the meeting-rails will not interfere in the least with the space occupied by the sash-fastener, as there will be sufficient room for the screws and placement.

A word about sash-fastenings in general. They are, as a rule, flashy and bad, and instead of improving in quality they are growing worse, so far as good design and artistic design they have little claims to "honourable mention." The old screw and spring sash-fasteners of thirty or forty years since were far preferable and more secure than any of our present descriptions. The screw and spring were protected in the barrel or tube; and when the screw entered its corresponding socket, at each revolution both sashes were drawn tighter and tighter together. The opening and closing of sashes when required was a little more troublesome, or, rather, was not so expeditious as now, but increased security was obtained. The more we consider the adoption of the rebating process the more we are convinced of its security, and are prepared to meet the objection which may be urged against it.

If the meeting-rails are closely fitted they will keep close for years, and sand-bags may be dispensed with. Any objection that may be urged in the matter of paint clogging up the rebate in course of time may be urged against a rebate in other instances, but no such thicknesses of coats of paint may be anticipated, as they can always be avoided and prevented at each repainting.

After all, it may be said that the publication of each new improvement or invention connected with the security of house property is but giving so many useful hints to burglars. Swift, by his humorous "Advice to Servants" how to cheat their masters, opened the eyes of masters and mistresses a little also, and led them to be more particular in their manner of leading people into temptation.

If burglars as well as builders are assisted by our advice we cannot help it, but for the further information of the latter, who may be the owners of house property, we would advise them to provide shutters for all windows, and also we would advise the Commissioners of Police to give instructions to every policeman on his beat to insist that all shutters to windows, particularly those belonging to the two lower stories, should be closed to before midnight. Porches or porticos to dwellings offer great facilities to confederated burglars or housebreakers, who can make ladders of their backs in the interest and pursuance of their profession.

Finally, forcible entry can only be resisted by force, or counteracted by precautions,—household precautions, and those belonging to the public and local authorities,—or, otherwise translated, the due vigilance of "the man on the beat."

A clever burglar is not stopped or awed by trifles; give him but the coveted opportunity and his drills, jemmies, and centre-bits, and even with the shutters fastened he will make a stealthy and almost noiseless entry. A diamond and a leather sucker will lift a pane of glass, or a piece of it, with a refreshing smoothness into the tail of his coat or working apron, and after that *open sesame* we will let the imagination of our readers supply the rest.

A CRAFTSMAN.

CO-OPERATIVE BUILDING INVESTMENTS.

At a local conference of representatives from Lancashire Co-operative Societies recently held at Eccles, near Manchester, the employment of capital in buildings was very fully discussed. We condense a short notice of the conference from the *Co-operative News*:—The subject first considered was, "The Best Means for the Employment of Surplus Capital," and among many suggestions, that of cottage building seemed to find most general acceptance. If the buildings were adapted to the wants of the members, and suitably located, the investment yielded a good and safe return, and was advantageous to the members generally. It also conferred a political power which could be used in defence of industrial interests, when, as at the present time, an attack upon co-operative societies was expected on the part of the trading and mercantile classes.

In most cases the houses were built by the society, and either leased or purchased by its members. The Rochdale code of rules was commended, and their practice was to lend money for building purposes at 5 per cent. The working classes ought now to require good houses, and the co-operative societies might very profitably provide them. They frequently found private individuals do so to very good advantage. At Radcliffe they had built thirty-one cottages of a good class, most of which were let to their

members, and they had now formed a building committee, to whom they had granted 4,000l. for building purposes. Each member paid a tenth of the cost to start with, and the rest quarterly. Cottages were generally preferred as an investment to cotton. But it was urged that there should be somebody on each building committee who knew the trade, and they should carefully watch the extras.

The Baccup Society was referred to as a surprising instance of the supply and employment of capital. They had already more manufacturing companies than any other town in England. They had been building cottages very extensively, having just completed sixty-five, and having passed the plans for twenty-two more. They would probably keep on building for some time, as they could dispose of the cottages as rapidly as they were erected. Their society had 12,000l. or 13,000l. invested in different companies. They had found building a most practicable method for the employment of their capital, and distributed the repayment from purchasers over thirteen years.

Over Darwen was another instance given worth example. They had found the capital for a paper-mill which was nearly ready for work. They had about 8,000l. invested in cottages, of which they had built about as many as they required. They had next agreed to go into coal-mining, and were then in treaty for the purchase of an estate. Having provided for their colliery they were thinking of a spinning-mill.

A FATAL MISTAKE.

SIR,—I am much disappointed, in common with many of your readers who interest themselves in the great question of public health, to find that Mr. Stansfeld in his new Bill permits the appointment of inspectors and medical officers of health still to be left in the hands of the local authority. Unless this important provision be altered, I venture to predict that the Bill will never work. The reason is short and clear: the "local authority" themselves are for the most part the great perpetrators of sanitary sins; and how can I report against the interests of my employers? AN INSPECTOR.

ALBERT BUILDINGS, QUEEN VICTORIA STREET, CITY.

"ALBERT-BUILDINGS," now nearly completed have a frontage of 120 ft. to the new thoroughfare, Queen Victoria-street, with returns on Queen-street and Cannon-street of about 60 ft. each. The total height of the pile in the centre is 80 ft. The traffic to the upper portions of the premises is intended to be carried on by means of a hydraulic lift, in addition to the ordinary staircase. The material employed in the elevation is Portland stone, and very little ironwork is used in the construction. Mr. Frederic J. Ward, of Cannon-street, is the architect; the contractors are Messrs. Trosse & Co.; and Mr. Frampton is the carver.

THE PROPORTIONS OF CORNICES.

SIR,—I have always found great difficulty in designing cornices to rooms so that they be neither too large nor too small. After many failures, I have adopted the following rule, which will, I think, be found to give satisfactory results:—

Take half the width of the ceiling and the height of the wall from the top of the skirting to the ceiling, and, whatever they measure in feet, set out in inches for the cornice. Let as many inches as half of what the ceiling measures in feet be set off for the members on the ceiling, and as many inches as the wall measures in feet be for the members on the wall. Thus the cornice will measure on the flat (not girth) a twelfth of the height and of half the width of the room, which for public rooms might be increased perhaps to a tenth part if they were low in pitch. Of course, the space thus set out is to be filled in with members and ornaments designed in due proportion with each other,—a matter with which I have no immediate business.

It will be seen that by this rule, if the room is narrow in proportion to its height, we obtain more members on the wall than on the ceiling; and, on the other hand, if it is wide, we have more members (in proportion) on the ceiling

than on the wall; thus obtaining a flexible rule, which the necessarily infinite proportions of rooms require, and which will, I think, be found convenient, and at the same time satisfactory in its results, and as such will, I hope, be useful to some of your readers, from any of whom, however, I should be glad to hear of a better rule, if such exists.

E. F. HUTCHINS, Architect.

THE NEW PUBLIC OFFICES.

In reply to Lord Redesdale, the Marquis of Lansdowne said, in the House of Commons, that it was probable the public offices now building in Downing-street would be completed about the spring of the year after next. As to the second question, he could not say precisely when the houses between the new offices and Parliament-street would be pulled down. Rents were being got out of some of these houses, and the Government thought that it would be as well to have the advantage of those rents as long as possible. Besides, these had from view the work now going on at the back of the side of Parliament-street in question. With regard to the noble lord's third question, the Government had no intention of widening the side of Parliament-street near to the new public offices. He agreed with the noble lord that there would be a certain amount of unsightliness if the whole of Parliament-street was not opened up; but it would not do to throw the cost of such an improvement on the whole country. If the widening of the street was found to be necessary on account of an increase of traffic, it would be different. In that case, however, the proper body to deal with it would be the Metropolitan Board of Works.

THE PROPOSED METROPOLITAN AND ST. JOHN'S WOOD RAILWAY.

ALLEGED SERIOUS INJURY TO HOUSES AND OTHER PROPERTY.

It is stated that the proposed Metropolitan and St. John's Wood Railway, for which application is about to be made to Parliament, will very seriously interfere with the safety and value of property along the district which it intersects, and the consequence is that a determined opposition to it has for some time been resolved upon by the Marylebone Board of Works, which it appears is now to be followed up by the Metropolitan Board. It is alleged in opposition to the project that the company by their Bill are seeking for powers to interfere with houses and other buildings, without granting compensation, in a manner which has not hitherto been attempted by any public company. It is urged as one reason why the Bill should be resisted that it proposes to establish coal depots in some of the best parts of the metropolis, which it is contended will materially depreciate the value of property in the vicinity; also that the time for the completion of the line was three years, so that the West-end streets might be blocked up for that period.

SCHOOL BUILDING AND OTHER WORKS AT GREAT YARMOUTH.

The new Grammar School, in the Trafalgar-road, is now approaching completion. The buildings comprise master's house and offices, dormitories, dining-hall, and other accommodation for about forty boarders. School-room, 65 ft. by 26 ft., with class-rooms adjoining. Entrance porch, with bell-turret over, spacious lobbies, and the necessary offices. The buildings are of Gothic character; the walling material is red brick, with stone dressings. The expenditure has been about 4,500l.

St. Peter's National Schools.—These schools have recently been enlarged, additional accommodation having been provided for about 100 children.

St. James's National Schools.—The designs for these schools were prepared about four years since, at which time the Infant School was built. Contracts have now been entered into for the completion of the group by the addition of boys' and girls' school, with the necessary offices. Accommodation will be provided for about 500 children. The buildings are of Gothic character, walls of red brick, roof open timbered. The cost will be about 1,500l.

St. Nicholas (Priory) National Schools.—Considerable additions are about to be made to

these schools, by which accommodation will be provided for about 180 additional children.

St. Mary's Roman Catholic Schools.—New rooms have just been completed in connexion with these schools. Accommodation is provided for about 100 additional children.

St. George's Dens.—New school-rooms, class-rooms, and lecture-room have been erected, adjoining to, and in the area of the Baptist Chapel. The lecture-room is over the school and class-rooms, and is about 50 ft. by 30 ft., with open-timbered roof. Convenient and direct access is obtained from the lecture-room to the galleries, and from the school-rooms to the ground-floor of the chapel.

Dwellings for the Working Classes.—The Great Yarmouth charity trustees have instructed their architect to prepare plans for laying out a portion of their estate, near the Caistor road, for building purposes. The site contains about 7½ acres, and it is proposed to erect thereon about 200 small houses suitable for the various grades of the operative and working classes. The general plan and scheme for laying out the ground have been approved by the Charity Commissioners of England and Wales, and designs have now been prepared by the architect for the whole of the dwellings.

Mission Church.—It is proposed to erect a new Mission Church (Convent of Huntingdon) here, in a rapidly increasing part of the town. The building will be Gothic in style, with flint walling and stone dressings.

The architect in all these cases is Mr. J. L. Bottle, of London and Yarmouth.

THE CURACY HOUSE, PEWSEY, WILTS.

The Curacy House in the High-street has been pulled down. The new building recently finished is of a Domestic Gothic character, constructed of red bricks obtained from Devizes, relieved with hands and arches of coloured bricks, and having dressings of Bath stone. The roofs are covered with Staffordshire blue and brindle tiling, laid to patterns. The entrance porch forms a feature in the front elevation, having a bold open-timber roof, supported on brackets and stone corbels, rising between the two front gables. All the windows have been filled in with quarry lights and tinted cathedral glass, supplied by Messrs. Watson, of London. The ornamental ironwork was supplied by Mr. Shrivell, of Long-acre. The works have been carried out by Mr. Thomas Edwards, builder, from the designs and under the supervision of Mr. John Birch, architect.

OLD ST. PAUL'S CATHEDRAL.

Sir,—In the *Builder* for February 24th, I notice an article on Old St. Paul's Cathedral, by Mr. E. B. Ferrey, reference being made to an earlier church, which might have been afterwards "cased." Perhaps Mr. Ferrey may not have seen the following extract from Peppy's *Diary*, September, 1668:—

"It is pretty here to see how the late church was but a case wrought over the old church. You may see the very old pillars standing whole within the walls of this."

The above appears to have been entered by Peppy in his *Diary*, after paying a visit to Old St. Paul's Cathedral, then being pulled down.

J. HORDERN.

SCHOOL BOARDS.

Bradford.—At a meeting last week, Mr. Neill moved the adoption of the plans, specifications, and estimates submitted by Messrs. Lockwood & Mason for schools in Feversham-street. The cost of the schools, he said, would be 9,237l. of which 7,000l. were for the buildings, 1,300l. for the playgrounds, 250l. for fittings, 532l. 10s. for architect's commission and clerk of works, and 50l. for contingencies. A sum of 630l. for paving and draining of streets and 132l. for expenses of conveyance had been included in the former vote of 8,750l. for the land. He did not think they could ask the ratepayers to sanction the erection of a school that could be much plainer from an architectural point of view than the one shown in the plans. In Bradford hitherto, whenever a public building had been erected, the general feeling was, after a few years, that it ought to have been better done. In the matter of the street improvements, the men who had advocated the more ambitious plans had incurred a good deal of unpopularity at the time, but public opinion was year by year coming round

to their view. If they looked at schools built twenty years ago, the general feeling now-a-days was, that they were out of date, and that it was about time to rebuild them. He urged that if 50,000l. or even 100,000l. were spent on schools for Bradford, it would not be a great tax on the people. Mr. Coates said he was acquainted with the case of a school nearly as large as the one under consideration, the cost of which, including the land, would be about 6,000l. He might add that the cost of these proposed schools would be 23l. per head of the accommodation, against an average cost of school construction of 7l. per head. Mr. Neill said the actual cost of the schools would be 22l. 10s. per head. He did not know what school Mr. Coates was referring to, but he supposed it would be Bishop Ryan's school in Captain-street; he should be sorry to see those of the Board built in the same way. The resolution was carried by six to four.—Mr. Neill next moved that the Board adopt the plans, specifications, and estimates produced by Messrs. Milnes & France for schools in Bowling Back-lane. The estimates of this school by the architects amounted to 7,000l. The buildings were set down for 5,000l., the playground 1,071l., fittings 185s., architects' commission and clerk of works 482l., and contingencies 268s. The whole cost of the school, when complete, including land, would be 9,250l. The playgrounds would be laid with stone to a depth of 12 in., with asphalt over. The motion was carried, all except two voting in its favour.—Mr. Neill then moved the adoption of the plans, specifications, and estimates submitted by Messrs. Simpson & Langley for schools in Ryan-street. These schools would cost about 14l. 2s. 6d. per head of the accommodation, including the price of the land. The estimate for the buildings was 3,600l.; for the playgrounds, 1,500l.—a recreation park for Little Horton almost; 500l. for architects' commission and clerk of works. The total cost, including that of the land, would be 11,300l. The resolution was carried. Mr. Neill then moved that the clerk be instructed to write asking the Education Department to recommend the Public Loan Commissioners to advance 25,682l. for the erection of the schools of which the plans had been approved. The motion was carried, one only voting against it.

The Dimensions of Class-rooms.—At the last meeting of the London School Board a long discussion took place as to what the dimensions of the new class-rooms should be. It was agreed that nine square feet should be allowed to each child, and that no class-room should be of less than 360 superficial feet. It was understood that this decision referred only to the three or four schools about to be constructed, and that the general question will be discussed at some future period.

ARCHITECTS' ACTIONS.

THOMPSON v. ALLISON. ALLEGED BREACH OF CONTRACT.

This was an action (tried in Nisi Prius Court, Newcastle) brought by Mr. Matthew Thompson, of Newcastle, architect, to recover compensation for an alleged breach of contract entered into with Mr. W. H. Allison, a brewer, residing at Undercliffe, near Sunderland. Mr. Holker, Q.C. and Mr. Hugh Shield appeared on behalf of the plaintiff; while defendant was represented by Mr. Aspinwall, Q.C. and Mr. Crompton. According to the opening statement of Mr. Holker, it appeared that the plaintiff sought to recover damages from Mr. Allison for having failed to carry out an agreement concerning the erection of an hotel, and, as a consequence, for preventing him earning a considerable amount of remuneration. In the month of August, 1869, both parties to the suit met at the house of Mr. Charles Mark Palmer, Grinkle Hall, Yorkshire, and there got into conversation with respect to the erection of a large hotel on the Duke of Northumberland's property at Tynemouth. Mr. Allison said, "By the bye, have you not to do with the Duke of Tynemouth belonging to the Duke of Northumberland? I suppose there will in time be large building operations going on there?" Plaintiff replied that he was connected with the property, and expressed his belief that in a short time there would be a very considerable number of houses built. Mr. Allison next asked if there was a hotel site to be obtained on the estate, and, on being told that there was, said, "Well, you know if you could use your influence, and get me this site, of course I should employ you as architect." After plaintiff had promised to use his influence, and there had been something said as to the kind of building required, the conversation turned on the desirability of adding a ball room to the defendant's residence at Undercliffe, and Mr. Thompson was asked to go over, view the premises, and then tell him what it would cost. This was all that occurred at Mr. Palmer's residence; but when Mr. Thompson returned to Newcastle, he saw Mr. Snowball, the solicitor of Northumberland's commissioner, and obtained from that gentleman a site for the proposed hotel. The defendant was then communicated with, and, after several discussions, he was asked to be ordered to be prepared for a second-class hotel, and Mr. Thompson was asked to solicit tenders for the building from several of the local contractors. The residence was also examined at Undercliffe, and plans proposed for the ball-room; but as the work

of Osnaburgh-street, Regent's Park, and St. Paul's Churchyard, having waited upon the firm requesting them to give them the benefit of the nine-hours system, they have readily granted the same, viz., that for the future the working week shall consist of 54 hours, the wages to remain as before.

Northampton.—A meeting of carpenters and joiners has been held in this town for the purpose of taking steps to ask the masters to concede the nine-hours movement and to adopt a new code of rules for the governance of those trades. The meeting was well attended, and was presided over by Mr. Pickering. There were also present Mr. E. Brimley and Mr. C. Poll, delegates from the amalgamated carpenters and joiners' society, and Mr. Thompson and Mr. Green, delegates from the local society; the four forming delegates from the trades' council. The chairman denounced strikes as injurious to both employer and employed, and referred to the general concession of the nine-hours movement in all parts of the country. He advocated the principle of uniformity of labour, especially in the building trade, and requested the meeting to pass the rules which would be submitted to them. The rules were passed, and the 1st of April was fixed upon as the day on which it should be suggested that these rules come into operation.

York.—There has been a general strike made by the masons, joiners, and bricklayers connected with the York building trade, and as a consequence several hundreds of them are out of employment, besides a large number of labourers, who have nothing to do with the strike. The bricklayers have hitherto worked fifty-six hours per week for 29s. 2d. wages. They ask a reduction of hours to 50, and the same wages as before. The masters offer to reduce the hours to fifty-three, or one hour less than nine hours a day. The joiners gave notice of their present action three months since. From fifty-six hours they demand a reduction to fifty hours, and an increase of wages at the rate of 6d. per hour instead of 6d. The masters offer to reduce to fifty-three hours, and to give 6d. per hour. The masons have in the summer months worked fifty-six hours, at the rate of 6d. per hour. They seek for a reduction of time to fifty hours and a half, and an increase of pay to the rate of 7d. per hour. The employers here also offer to reduce the hours to fifty-three. In the latter branch one or two of the smaller masters have given way to the men. The labourers, who have been thrown out of employment, have also met. They have been paid at the rate of 19s. 3d. a week, and they have resolved to demand a guinea, but not to go out upon it until May next. The masters in the mean time offer 19s. 10d. per week, or an increase of 7d., and a decrease of the hours of labour to fifty-three.

Cockermouth.—The masons and wallers of Cockermouth have made application to their masters to adopt the nine-hours system, and have threatened to turn out if the application be refused.

Bishop Auckland.—A meeting of joiners and carpenters now on strike has been held at Bishop Auckland, to bring the strike there, if possible, to a final settlement. Five out of seven of the masters have acceded to the fifty-three hours and 1s. more wages for the present, and 1s. more advance within two months from this date. The men agreed to adopt the present settlement, and to appoint four men to meet four of the masters within the time stated to settle the fifty-hours question; and if they cannot agree, each party to appoint an independent arbitrator, and accept his decision. Two shops remained out.

PUNISHMENT OF ADULTERATORS.

A PROPOSAL of a remark made in our last number, as to Mr. Muntz's new Bill and the analysts under a past Act, a Dublin correspondent calls our attention to what can be done under the Act of 1860. The Dublin corporation have summoned three milk-vendors before the police magistrates, and had them fined, merely for adulterating their milk with water, on the evidence of the city analysts, in the respective sums of 5s., 3s., and 2s., besides being ordered to pay for public advertisements of their own names, addresses, and offences. Now if this can be done in Dublin, why can it not be done in London and elsewhere? Is not Dr. Letheby the City analyst for London? But was it not he who lately himself defended the adulteration of butter? In any new Act

there must be clauses compelling the proper authorities to act, and not merely wait for complaints; and analysts ought to be obliged to do something in return for holding such an office. Perhaps they want sufficient motive power under the Act. They ought to be active and detective officers, doing nothing else than perpetually testing food and drink, unawares to tradesmen and merchants, and holding over the whole class therefore the salutary terrors of the risk of exposure, fine, and imprisonment, as a preventive of the unmeasured rascality which now prevails amongst them.

AN AMBITIOUS RAILWAY COMPANY.

AMONGST the several projects for railway extensions which will come before Parliament in the course of the present session, one is a Bill promoted by the Mersey Railway Company at Liverpool. Last year this company obtained powers for the construction of a submarine railway under the Mersey between the Liverpool and Birkenhead shores, and they are now applying for additional powers, which include the extension of their line from the Mersey, underground, into the centre of Liverpool. In their Bill they seek Parliamentary sanction for the purchase of several properties in the neighbourhood of the Exchange, and amongst other buildings which they have scheduled with the intention of absorbing for the purposes of their undertaking is the town-hall, situated immediately adjacent to the new exchange, of which it is one side of a quadrangle and square formed by the two buildings. The corporation are unwilling that their municipal temple, under the roof of which royalty, ministers of state, and other distinguished magnates have been entertained, should be demolished, or converted into railway booking offices, and they have just decided to oppose the railway company's Bill before Parliament in consequence of the introduction of the obnoxious clause.

DRAINAGE OF WINDSOR.

THE Windsor Board of Health are still in difficulty in respect to the drainage question. A few years ago it was proposed to establish a sewage farm at Horton, but after some discussion the plan was considered too expensive, and it was not carried out. Then Mr. Dover's process was adopted, and negotiations were carried on between the Board and that gentleman for a considerable time, but to no purpose; and now the Board have turned their attention to the A B C scheme, but we understand it is not likely to meet with favour, and the site for the proposed works is not happily placed. It appears by a letter published in the *Windsor and Eton Express*, of the 17th ult., from Mr. Harkness, C.E., of Victoria-street, Westminster, that six years ago he proposed a plan for collecting all the drainage of Windsor, Eton, Slough, and Windsor Castle to a central point on the banks of the river Thames by gravitation and pumping it to Chobham, Finchley, or Bagshot, where suitable land could be purchased at a moderate price for a sewage farm. The cost of carrying out this plan amounted to 60,000l., to be apportioned among the three towns and the Castle.

THE SEWAGE QUESTION AT LEEDS.

At a recent meeting of the Leeds Town Council, the town clerk read a report on the utilization of sewage, which had been presented by a sub-committee of the Streets and Sewerage Committee. This document stated that the "A B C" system of works had been in operation since January 9th. The sub-committee had had the effluent water analysed, and, on the assumption that the "A B C" process would render the effluent water so pure that it might "flow into the river Aire without causing a nuisance, or becoming injurious to public health," called the attention of the committee to the immediate necessity of at once asking the Council for the requisite authority to proceed to the full completion of the scheme. 30,000l. had been expended on the land and in the erection of works for the purpose of experimenting on 2,000,000 gallons of sewage per day. Alderman Tatham proposed a resolution to that effect, and said he "hoped the Council would not go into the question as to what might be a better system of dealing with the sewage than that which they had taken up, because, if there were superior modes, they would not avail them now in meeting the

difficulty in which the riparian owners had placed them."

Mr. Mosley moved as an amendment,—

"That the Government Medical Board be requested to send an agent to Leeds, to test our sewage water after leaving the tank of the A B C system, in order to ascertain if it is so far purified as to be admissible into the river before the Council grants any sums of money to extend the sewage utilisation scheme."

Alderman Joy estimated that it would take 50,000l. per year to work the "A B C" system so as to deal with the whole of the sewage of Leeds, and said they were not justified in committing themselves to such an enormous expenditure on so doubtful a scheme. After some discussion, however, the amendments were defeated, and the original resolution was adopted.

It has been arranged before Vice-Chancellor Bacon that there shall be an extension of time for one year under the injunction against the Corporation of Leeds, restraining them from discharging the sewage of the borough into the river Aire, the Corporation undertaking to purchase fifteen acres of land, or obtain compulsory powers to purchase the same next session, for the erection of works for the disposal of the sewage.

EDINBURGH ARCHITECTURAL ASSOCIATION.

The usual fortnightly meeting of this Association was held on February 27th, in the hall, 5, St. Andrew's-square; Mr. Hippolyte J. Blanc, president, in the chair.

The second part of a paper on "House-drains and Plumber Work" was read by Mr. John Paterson, architect. To secure a perfect system of drains and appliances, Mr. Paterson urged it was necessary to trap all rain-water pipes, and have an air-vent in all house-drains. He pointed out where flaws in the arrangement were most likely to occur in consequence of defective construction or decay of the soil and waste pipes by corrosion. Although the necessity for air-pipes was well known, it was astonishing how seldom they were found where they ought to be. He recommended an independent stalk of air-pipes, to which a branch from every trap should be joined. This would not only prevent the trap being emptied by suction, but would ventilate the whole of the soil and waste pipes, and thereby render them less liable to be destroyed by the noxious air. He condemned the practice of fitting up cisterns beside water-closets, as was commonly done in flatted houses. Where this could not be avoided, water-tight covers should be provided for the cisterns.

OUR ENGINEER OFFICERS.

Str.—An extract from *Allen's Indian Mail*, quoted in the *Times* of the 29th ult., clearly shows that the recent surprising failures which have taken place in the Government buildings in India are really due "less to native rascality than to our own officers' ignorance." This is a notable discovery, after the great amount of "bouncing" we are accustomed to hear when allusion is made to the scientific education of engineer officers.

Some forty years ago Colonel Pasley made great and praiseworthy efforts to improve the education of our engineering cadets, especially as regards the arts of construction, with what results we now see.

Might I be permitted humbly to suggest to our young prince (whose restoration to health is causing delight from the palace to the cottage), that he might, with great advantage to the country, engage the first fruits of his convalescence in prosecuting a few stern, searching inquiries into the causes which are diverting the attention, and undermining the efficiency of our Engineers, both officers and men.

We know not how soon the enemy may be at our gates; let us not be, like Nero, caught fiddling. S. M. C. QUATE.

THE PROPOSED CHANNEL TUNNEL.

Strong endeavours are being made to raise subscriptions to the 30,000l. fund for cutting a drift-way under the Channel. We hear that about 16,000l. have already been subscribed; and amongst the most prominent contributors are the Duke of Sutherland, 200l.; Mr. Thomas Brassey, M.P., 1,000l.; Lord Richard Grosvenor M.P., 500l.; Marquis of Westminster, 200l.; Lord Delmeire, 200l.; Mr. E. Blount, C.B.

200l.; Mr. Albert Grant, 300l.; Mr. A. Joy, 400l.; Mr. Pender, 200l.; Sir R. Wallace, 200l.; Sir W. Jackson, 200l.; Sir Watkin Wynn, bart., M.P., 200l.; and Sir E. Buckley, bart.; Admiral George Elliot; Captain Beaumont, R.E., M.P.; Sir R. A. Cunliffe, bart.; &c.—A correspondent, commenting on Mr. Morant's letter, in our pages, urges that the tunnel may be made in the "Gault." The writer ridicules the notion of attempting it in the lower chalk.—Another correspondent insists upon Dungeness and Audrepelles being the proper termini for the tunnel. "For the furtherance of the tunnel scheme, I boldly say that at Dungeness may be found the following advantages over any other locality which has been suggested,—viz., a soil of clay, a splendid level approach to the shore, a beach superbly adapted for the construction of the necessary air-shaft, lighthouse, &c., called 'Le Colhart,' exactly half-way across, where at low spring tides there are only about two fathoms of water, and, what is, I believe, one of the greatest desiderata, a very excellent material on the spot for building of all kinds."

Sir.—A letter appeared in your journal recently signed by A. W. Morant, in which that gentleman gave as his opinion, that the construction of the above great scheme was next to an impossibility; and to bear out this assertion he mentioned some of the difficulties he encountered as engineer to the Norwich intercepting sewers. Now, sir, being not only a firm believer in the possibility, but likewise in the practicability, of the grand submarine work, I should, with your permission, like to ask Mr. Morant the following questions.

Did he employ sufficient power for pumping out the large bodies of water met with? Did he have duplicate engines and pumps in cases of breakdowns, which do and will occur where machinery is worked day and night without intermission? And, lastly, did he keep the brickwork well up to the face of the mining?

Unless these precautions were taken (from his own statement I imagine they were not), it must have proved fatal to the works. How is it possible, then, for Mr. Morant to argue from analogy on such a gigantic undertaking as the proposed tunnel at Dover from his experience at Norwich?

A PRACTICAL ENGINEER.

Sir.—Mr. Alfred W. Morant states in a letter in the *Builder* of the 24th ult., that the proposed tunnel is to be made "in the upper chalk," notwithstanding that I assured you, in reply to the article in the *Builder* of January 27th, printed in your issue of the 10th ult., that the proposed tunnel would be made in the lower chalk, and that it was because it could be made there in the lower chalk the proposed site for it had been selected. Will you allow me to reiterate this?

Permit me to add, that there are already some hundreds of miles of "tunnels" (colliery and lead-mine workings) under the sea, and that therefore the proposed tunnel is neither so novel nor so extraordinary or hazardous an undertaking as some would make the world believe. If there were coal or lead to be sought for in mid-channel, it would have been driven to long ago, without fuss or wonder.

THE SECRETARY OF THE COMPANY.

Miscellaneous.

The Artizans, Labourers', and General Dwellings Company, Limited.—The fifth annual meeting of the shareholders of this company was held on Saturday, at 1, Great College-street, Westminster, Mr. J. Baxter Langley, chairman of the company, presiding. There was a good attendance. This company possesses in various towns houses which are rented, and ultimately to be owned, by the working-class tenants. The report stated that the amount of share capital is now 18,580l., showing an increment during the year of 12,580l. The uncalled capital is 22,000l. The directors proposed a dividend of 6 per cent. on share capital, and 5 per cent. on deposits, leaving a balance of 281l. 8s. 11d. to be carried forward to the reserve fund. The shareholders who have recently joined include peers, members of Parliament, merchants, and others of the higher and middle classes of society, as well as many working men. One of the objects of the company is to direct operations more particularly to some of those large centres of populations where overcrowding is notorious, and where the laws of sanitary science, so far as they relate to the construction, ventilation, and improvement of workmen's dwellings, appear to be altogether ignored. The report was adopted, and the dividend declared.

The Polytechnic.—The directors of the Royal Polytechnic have purchased Messrs. Bryceson's Electric Organ, which has been for some considerable time on view in their theatre. Duplicate key-boards are to be placed in the Great Hall, with a cable connecting the organ in its original position, and in no way interfering with the key-boards in front of the stage in the theatre.

* Mr. Morant's letter was written before the appearance of the communication referred to.—Ed.

The Hallington Reservoir of the Newcastle Waterworks.—The directors of the Newcastle and Gateshead Water Company state in their twenty-seventh annual report, that the new reservoir at Hallington, which has been in progress since August, 1869, is now practically completed. The reservoir is estimated to contain about 600 millions of gallons; the contents, however, are found to exceed this by 85 millions, the true quantity being 685 millions. At the present moment there are in store 540 millions, and this quantity is daily increasing. The water at present in store, taking old and new reservoirs together, is 1,070 millions of gallons, which, when Hallington is full, will be further augmented to 1,200 millions. The directors express their satisfaction with the skill and attention displayed by Mr. Bateman, their engineer, and his staff. Credit is also due to Mr. J. B. McGuire, the contractor, for the manner in which he is said to have carried out the works, and managed the men employed thereon for the last three years. There has not been a single case of misconduct with the workmen; no strikes, riots, nor even a case of poaching. The workmen lived in huts or temporary dwellings.

Oxford Architectural and Historical Society.—On Tuesday evening before last, this Society held a meeting in the large room of the Ashmolean Museum, which was fairly attended. The Rev. the President of Trinity occupied the chair. The chairman called on Mr. J. P. Earwaker, of Merton, to speak on "the most important archaeological discoveries during the past year in the neighbourhood." After which Mr. James Parker gave an account of the Garford Barrow, near Abingdon, which had lately been opened under his supervision, illustrated with maps, plans, views, &c. Nothing was found in the barrow which did not appear anterior to the Roman occupation, but in a field near, a vast amount of Roman pottery was found, which all pointed to the third century. Professor Rolleston did not quite agree with Mr. Parker. The urn found in the barrow appeared to him clearly of the Saxon type, as whenever an urn of that shape had been found containing burnt bones it was always Saxon.

The Electric Light.—Writing to the *Standard*, Mrs. Mary Staitie, in reference to the inauguration of the electric light at the South Foreland Lighthouse recently, says that her husband, the late William Edward Staitie, was the originator and patentee of the application of electricity to lighting purposes, and that at the time of his death, in 1854, he had so improved upon it as to produce a powerful light, which was pronounced by scientific men perfect for all practical purposes. He held patents for this country, America, and several places on the Continent. Exhibitions were given from time to time in several of the chief towns of England, including London, Manchester, and Liverpool. Mr. Staitie also had the honour of exhibiting his light twice by command to her Majesty the Queen and the late Prince Consort. A tower was erected by the Liverpool Dock committee, where the light was tested for a considerable time, and there was reason to believe it would have been permanently adopted in Liverpool had not Mr. Staitie's death put a stop to all further proceedings at that time.

Not to Every One his Own.—Mr. W. Cave Thomas has before now seen his proposals taken up and carried out by others. It is happening to him now in respect of army organisation. Mr. Thomas's proposal, first roughly sketched in the *Pall Mall Gazette* of 1867, and further developed in a lecture at the Royal United Service Institution, before Sir William Codrington, March 12th, 1869, was to divide the country into military districts, and localise recruiting; also to establish the head-quarters of the depot battalion, military schools, exercising grounds and military workshops in one spot, and that a strategic one if possible. It was a scheme, in fact, as stated by its author, calculated to remedy the want of unity, to give more stability to our whole military system, and more organically to unite the army, militia, and volunteers. His lecture also detailed the organisation of his proposed district military schools, which, as he thought, would perfect the voluntary system of enlistment.

Architects' Benevolent Society.—The annual meeting of this excellent society will be held in the Rooms of the Royal Institute of Architects, 9, Conduit-street, on Wednesday next.

The Palestine Exploration Fund.—The annual meeting of the Dover Branch of this Society has been held in the hall of the Dover College, recently inaugurated by Earl Granville, which was filled with a company including the *élite* of the town and neighbourhood. Prince Arthur presided, and with several brief but appropriate and graceful speeches introduced Captain Wilson, Captain Warren, and Mr. Morison, one after another to the meeting. His Royal Highness also said:—"My duty is to draw your attention to the object of the meeting, and to ask you kindly to assist the funds for the exploration of Palestine. I believe that not more than 10,000l. are required adequately to complete this praiseworthy and admirable work; but surely such a sum ought easily to be collected in a wealthy country like our own—a country which ought to, and always does, take the lead in all matters connected with the Bible."

Cost of the Lambeth New Workhouse.—The new workhouse for the Lambeth Union, in Kennington-lane, which has now been some time in course of erection, has already cost a very large amount, although not yet finished, and the ratepayers have evinced much dissatisfaction at the expenditure which has up to the present time been incurred. In addition, however, to the sum already expended, a further contract, amounting to over 3,200l., has just been entered into, and the works commenced. These works are the erection of a laundry, kitchen, and bake-house machinery and fittings, in still further extension of the building. The contract includes all incidental builders' work which may be required in the additional premises. The contractors for the work are Messrs. Benham.

The Reclaimed Land on the Victoria Embankment.—A special meeting of the Metropolitan Board of Works has been held, to consider a letter from the Office of Woods and Forests as to the land reclaimed in connexion with the Victoria Embankment, and submitting the following proposition:—

"The Crown to sell the two acres of land to the Board for such a sum as shall represent the estimated loss which will be sustained by the Crown and the public at large if the proposition in the report of the Select Committee as to the dedication of the land in question as a public garden is adopted, in lieu of the proposed appropriation. The amount to be paid to be settled by arbitration."

Mr. Newton said the Board could not agree to this proposition; they were willing to negotiate on the basis of the report of the Select Committee (which proposed that the Board should rent the ground, 2½ acres, for a garden). After some discussion, it was decided that the proposal of Mr. Gore be not entertained.

Metropolitan Improvements and Houses for the Working Classes.—It is tolerably well understood that the constant improvements in the metropolis necessarily involve the destruction of large numbers of houses occupied by the working classes, and the Hampstead vestry appears to be of opinion that the Metropolitan Board, in carrying them out, should obtain Parliamentary powers for providing house accommodation for the working classes dispossessed by such improvements. A communication from the vestry to this effect was last week forwarded to the Metropolitan Board.

The Roads round St. Paul's.—A discussion took place at the meeting of the City Commissioners of Sewers, on Wednesday, as to the desirability of widening the western portion of St. Paul's Churchyard, by setting back the railings. A sum of 15,000l. had been offered for the land required, but no definite answer has been received. It was said that the Cathedral authorities positively decline to allow of the widening of the roadway on the north side; and ultimately the Improvement Committee were instructed to bring up a report detailing all the proceedings in the matter which have lately been taken.

Movement among Farm Labourers.—A class of very hard-worked, ill-paid, and ill-fed labourers,—the agricultural,—are now fairly on the move in the north of England, in an endeavour to obtain increased wages and shorter hours. Numerous meetings are being held at Morpeth, Newcastle, Prudhoe, Walton, Driffield, &c.

Institution of Surveyors.—The next meeting will be held on Monday evening, March 11th, when the discussion on Mr. Smith's paper, entitled "Land," will be resumed.

The late Frauds on the Birmingham Gas Company.—At an extraordinary meeting of the Birmingham Gas Company, held to receive the report of the Investigation Committee to inquire into the defalcations of the late secretary, the report disclosed an incredible amount of neglect on the part of the directors, by which the company had been exposed for years past to heavy losses, arising from want of management. The total amount of the defalcations of the officials is estimated at 40,000l.; the late secretary, Joseph Harrison, who has absconded, being responsible for nearly the whole of this amount.

Addition to Leith Hospital.—The directors of the Leith Hospital having just received 20,000l., as part of a legacy bequeathed to them by the late Mr. T. W. Ramsay, of London, lately a merchant in Leith, they have resolved to apply the funds in carrying out an important addition to the institution. A new hospital is to be wholly set apart for the administrative department and for casual cases of illness; and when it shall have been completed, the present building will be used exclusively for infectious diseases.

Metropolitan Street Improvements Bill. On the order for the second reading of this Bill, Mr. Pell moved (in the House of Commons) the postponement of the second reading for six months. The amendment, however, was withdrawn, and the Bill was read a second time. Mr. J. H. Palmer then moved that it should be referred to a Select Committee of ten members, of whom five should be nominated by the House, and five by the Committee of Selection; but the House decided by a majority of 170 against 122 against this motion.

The Metropolitan Water-Supply.—It has been resolved by the St. James's Vestry to instruct their medical officer of health (Dr. Lancaster) to call the attention of the different waterworks companies to the impure state of the water supplied by them. It has also been decided to petition the House of Commons to give the Metropolitan Board of Works powers to enforce on the various waterworks companies a pure and ample supply of water.

Architecture and the International Exhibition.—We would remind intending exhibitors that the date on which architectural drawings, designs, and models will be received at the International Exhibition (east goods entrance), is fixed for March 11th. Architectural drawings will be exhibited in the east quadrant, now in course of preparation; in order to obtain a favourable light they will be hung on screens, placed at right angles to the windows.

Vienna Palace of Industry.—Messrs. Clark & Co. have signed a contract at Vienna with the Imperial Commissioners to fix their patent steel shutters to all the entrances, &c., of the Palace of Industry, now rapidly approaching completion, in the ground of the Prater, in that city. There are upwards of 300 entrances and windows, measuring over 30,000 superficial feet.

New Town-hall, Sherborne.—We understand the committee recently appointed at a meeting of the inhabitants of Sherborne have seen Mr. Digby, who has expressed himself favourable to the movement, and plans in accordance with the object in view will shortly be laid before him by Mr. T. Farrall, architect.

Catholic Schools, Hatton Wall.—On Tuesday, the memorial stone of St. Peter's Schools, attached to the Italian Church, Hatton-wall, was laid by the Countess Tasker, who subscribed 500l. towards their construction. The cost of the structure is estimated at 1,250l. The architect is Mr. J. N. Tasker, and the builder is Mr. G. Leggett.

The Treatment of Stone.—Under this head a patent has been taken out by C. Douglas, Glasgow, and D. M. Watson, Dundee. The invention consists in first applying to the surface of the material as a wash a solution containing resin or colophony and an alkali, and then, before this first wash dries, applying a solution of alum.

"The Railway Interest."—The statistics we gave under this heading (p. 153) are from a lecture "On Railways," delivered by Mr. Crosbie Dawson, C.E., at the Nonceaton Institute.

New Railway Station, York.—We understand that the works in connexion with the formation of the new railway station at York will shortly be commenced.

The Thames Sewerage Commission.—The promoters have determined to withdraw the Bill for this session; but with the intention of making a renewed application to Parliament next session, by which time the views and wishes of each parish, and other interests affected, may be ascertained and provided for.

Buildings for Sound.—We understand that Messrs. Weigand & Co., of La Hogue, propose to show in the approaching International Exhibition a kiosk, described as "the music temple in its full power of propagating the undulation of sound," and which appears to possess many peculiar properties.

The Roadway in Cornhill.—The paved roadway in Cornhill, partly of stone, and more easterly, of wood, is miserably out of repair, and makes a journey along that important thoroughfare a dislocating misery. The whole is so singularly bad that we should like to know when it was done, and who did it.

TENDERS

For additions and alterations to Watford Union Workhouse, Herts. Mr. Arthur Allom, architect. Quantities by Mr. Bagg:—

Allen	£10,600 0 0
Wright, Brothers & Goodchild	9,375 0 0
Sharrington & Cole	8,225 0 0
Bentley	9,175 0 0
Jarrett	9,960 0 0
Coles	8,570 0 0
Brown	8,500 0 0
Sant	8,488 0 0
Blackmore & Morley	8,500 0 0
Holland	8,100 0 0
G. & J. Waterman	7,918 0 0
Chadwick*	6,638 0 0

* Error of 1,000; withdrawn.

For erecting eight villa residences in Leamington-road and Horn-lane, East Acton. Mr. John B. Badock, architect. Quantities applied:—

Tyler	£6,731 8 0
Cook	6,700 0 0
Gough	6,450 0 0
Sawyer	6,335 0 0
Stephens & Co.	6,225 0 0
Blackmore & Morley	6,222 0 0
Crook & Wall	5,500 0 0
Rankin	5,500 0 0
King & Co.	5,340 0 0
Johnson	5,279 0 0
Stegg & Long	4,850 0 0
Blick	4,850 0 0
Freedy & Son (accepted)	4,800 0 0

For erecting four villa residences in Leamington-road, East Acton. Mr. John B. Badock, architect. Quantities supplied:—

Sawyer	£3,353 0 0
Tyler	2,977 18 0
Stephens & Co.	2,803 0 0
Blackmore & Morley	2,800 0 0
Gough	2,840 0 0
Johnson	2,779 0 0
Rankin	2,750 0 0
Crook & Wall	2,750 0 0
Freedy & Son	2,750 0 0
Stegg & Long	2,600 0 0
Cook	2,500 0 0
Blick	2,325 0 0
King & Co.	2,217 0 0

For additions to the Hayes, near Stone, Stafford, for Mr. George Meakin. Messrs. R. Scrivenor & Son, architects:—

Turner	£2,850 0 0
Sutton & Meadon	2,701 0 0
Barlow	2,680 0 0
Ratcliffe	2,530 0 0
Whitome	2,527 0 0
Cook	2,516 0 0
Matthews	2,475 0 0
Bridley & Critchlow	2,400 0 0
Freakley	2,200 0 0
Inskip, Brothers (accepted)	2,156 0 0

For six cottages, in Crown-street, Brighton. Mr. W. Edridge, architect:—

Barnes	£1,470 0 0
Blackmore & Howard	1,350 0 0
Holloway & Son	1,240 0 0
Lockyer	1,100 0 0
Reynolds (accepted)	610 0 0

For the erection of a warehouse on Curtain-road, Shore-ditch, for Messrs. S. Moss & Sons. Mr. Lewis H. Isaacs, architect. Quantities by Mr. L. C. Riddett:—

Patman & Fotheringham	£1,260 0 0
Cheoman	1,200 0 0
King & Son	1,232 0 0
Ellington	1,205 0 0
Kilby (accepted)	1,150 0 0

For the laying of 5,588 feet run of stoneware pipe sewers, and other works, in the town of Uppingham, for the Uppingham sewer authority. Messrs. Whitaker & Ferret, engineers:—

Stevens	£1,105 0 0
East	1,030 0 0
Lee	900 0 0
Ridley	887 0 0
Streeton	828 0 0
Acok	809 0 0
Morris	777 0 0
Deane	756 0 0
Donahy	735 0 0
Chibb	706 0 0
Freeman	650 0 0
Walker (accepted)	556 0 0

For building a pianoforte manufactory, King-street, Camden-town, for Messrs. Monaghan & Weston. Mr. J. Pennington, architect. Quantities supplied:—

Walton	£1,050 0 0
Nutt & Co.	1,023 0 0
Kelly, Brothers	1,023 0 0
Mann	1,013 0 0
Scrivenor & White	997 0 0
Mildwater (accepted)	975 0 0

For curate's house, at Kenley. Mr. R. Martin, architect:—

Taylor & Son	£998 10 3
Simons	887 0 0
864 0 0	
836 0 0	
836 0 0	
785 0 0	
775 0 0	
748 0 0	

* Quantities supplied by Mr. F. Sparrow.

For alterations and additions to "Bedford Arms," Clapham, for Messrs. Whitbread & Co. Quantities not supplied:—

House and Fittings	£3,130 0 0
Stables	£230 0 0
Henshaw	£986 0 0
Axford	868 0 0
810 0 0	
519 0 0	
665 0 0	
603 0 0	
455 0 0	

For building vicarage-house for St. Michael's, Chesters-square, E. W. Mr. E. J. Withers, architect. Quantities by Mr. Poland:—

Rider & Son	£3,120 0 0
Brass	2,965 0 0
Higgs	2,943 0 0
Robinson & Cole	2,797 0 0
Perry & Co.	2,750 0 0
Henshaw & Co.	2,740 0 0
Adamson & Sons (accepted)	2,600 0 0

For the erection of new school at Stepley; and alterations to existing house, for the trustees of the Stepley Jewish School. Messrs. Davis & Emanuel, architects. Quantities supplied by Mr. Henry P. Foster:—

Myers & Son	£1,600 0 0
Williams & Son	1,635 0 0
Temple & Forsker	1,535 0 0
Lemon	1,520 0 0
Ennor	1,468 0 0
King & Son	1,440 0 0

For the erection of a warehouse in Victoria-street, Bristol, for Mr. Joseph Brivell, iron merchant and founder. Mr. H. Masters, architect:—

Kingstons	£1,590 0 0
Wilkins & Sons	1,375 6 0
Church & Phillips	1,350 0 0
Escott	1,325 9 8
Norris	1,248 0 0
Diment	1,225 0 0
Robertson	1,220 0 0
Ford & Summers (accepted)	1,031 16 6

For rebuilding drug-mill and stabling, at Redington-cum, recently destroyed by fire. Mrs. Mrs. Aiken. Mr. R. W. Price, architect. Quantities by Mr. W. H. Barber:—

Smith	£387 0 0
Black	355 0 0
Patman & Fotheringham	795 0 0
Jarratt	768 0 0
Tyerman	725 0 0
Coleman (accepted)	740 0 0

For additions to Crescent House, Brompton, for Col. Aikman. Messrs. Landsdown & Pollard, architects:—

Hird	£248 0 0
Howarth	218 0 0
Patman & Fotheringham	445 0 0
Stimpson & Co. (accepted)	404 0 0

For alterations and additions to Edmondton Union. Mr. T. E. Knightley, architect. Quantities by Messrs. Arding & Bond:—

Field & Sons	£3,450 0 0
Hivert	3,333 0 0
Callum	3,300 0 0
Easton & Chapman	3,287 0 0
Patman, Brothers	3,285 0 0
Robertson	3,160 0 0
Rose & Brown	3,047 0 0
Letherdale	2,983 0 0
Ponock	2,975 0 0
Callum	2,897 0 0

Has been engaged on a large estate for many years, superintending all building, drainage, and the house, jointly of the mansion; the management of gas and water works, with hydraulic mining, and the working of all kinds of machinery. Good references and testimonials.—Address, R. 51, Canal-street, Chelsea, S.W.

TO ARCHITECTS, &c.— WANTED, by a Young Man, of respectable ability, a SITUATION, as a CLERK OF WORKS, or CLERK and DRAUGHTSMAN combined. Mason by trade. For many years past he has had the management of the constructive portions of building, public, domestic, and ecclesiastical. Has thorough knowledge of masonry, brickwork, and sanitary matters, and a good knowledge of the general duties of a clerk of works in a Government School of Art, in drawing, geometry, and modelling.—Address, in own handwriting, to Mr. DILSTON, Office of 'The Builder.'

TO AUCTIONEERS and LAND AGENTS.— WANTED, by a Young Man (aged 20), who is a good draughtsman, and has had practical experience, a SITUATION, as a GENERAL FOREMAN, or to Take Charge of Work, or to be a draughtsman.—Address, 40, Office of 'The Builder.'

TO MASTER PLUMBERS, BUILDERS, and OTHERS.— WANTED, by a Young Man, a SITUATION as IMPROVER, who has had three years' experience in the Plumbing and Hot-water Work.—Address, Mr. THOMAS, 28, Bridle-street, Harrow-road, Waddington, W.

TO BUILDERS.— WANTED, a RE-ENGAGEMENT as GENERAL FOREMAN. Good references.—Address, A. B. 301, High-street, Southwark, S.E.

TO BUILDERS.— WANTED, a RE-ENGAGEMENT, as FOREMAN of MASONS, or to Take Charge of a Job, principally the erection of a new building.—Address, 438, Office of 'The Builder.'

WANTED, a RE-ENGAGEMENT, as SHOP or GENERAL FOREMAN, by a thoroughly practical Man (Joiner). First-class knowledge of machinery, plasterwork, prices, and management of workmen.—Address, 438, Office of 'The Builder.'

WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, by a thoroughly practical Man (Joiner). First-class knowledge of machinery, plasterwork, prices, and management of workmen.—Address, 438, Office of 'The Builder.'

TO BUILDERS and CONTRACTORS.— WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, by a thoroughly practical Man (Carpenter and Joiner by trade). First-class knowledge of machinery, plasterwork, prices, and management of workmen.—Address, A. B. 26, Bennet-street, York-road, E.C.

TO BUILDERS and CONTRACTORS.— WANTED, a RE-ENGAGEMENT, by a CONTRACTOR'S ASSISTANT. Qualifications, drawing, estimating, and general practical experience.—Address, T. B. care of Mr. G. Street, 30, Cornhill, E.C.

TO BUILDERS and CONTRACTORS.— WANTED, a RE-ENGAGEMENT, by a thoroughly practical Man (Carpenter and Joiner by trade). First-class knowledge of machinery, plasterwork, prices, and management of workmen.—Address, A. B. 26, Bennet-street, York-road, E.C.

TO BUILDERS and CONTRACTORS.— WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN OF JOB, Thoroughly experienced. Carpenter, Joiner, and general practical experience.—Address, F. H. 21, Westbourne-road, Barnsbury.

WANTED, a RE-ENGAGEMENT, as CLERK and SURVEYOR to a BUILDER and CONTRACTOR, or as a RE-ENGAGEMENT, as a GENERAL FOREMAN, by a thoroughly practical Man (Carpenter and Joiner by trade). First-class knowledge of machinery, plasterwork, prices, and management of workmen.—Address, A. B. 26, Bennet-street, York-road, E.C.

TO ARCHITECTS and BUILDERS.— WANTED, a RE-ENGAGEMENT, as CLERK OF WORKS, or GENERAL FOREMAN (Joiner by trade). With the last London job for seven years as above. Age 35. Good references.—Address, G. M. 29, Abchurch-lane, Hammer-smith, W.

WANTED, a RE-ENGAGEMENT, as GENERAL BUILDERS FOREMAN, Out-door or on an estate, by a thoroughly practical Man (Carpenter, Joiner, and Stone-work by trade). Age 36. Just now completed a five years' job. First-class testimonials from last employer.—Address, D. H. U. 2, Middle-street, Richmond-road, Kingston, London, S.W.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, OUT-DOOR FOREMAN, or CLERK OF WORKS, by a thoroughly practical Man (Carpenter, Joiner, and Stone-work by trade). Age 34. Good draughtsman, and well up in plasterwork and machinery.—Address, in own handwriting, to fill up the blank in the office. First-class testimonials from London Architects and Builders.—Address, A. B. FRANKLIN, 5, Catherine-street, Kensington, London, W.

TO BUILDERS and CONTRACTORS.— WANTED, immediately, a RE-ENGAGEMENT, by a Young Man, with one to three years' experience. Well up in all office work. Twelve years' first-class testimonials. Good references.—Address, R. C. H. 6, Bow-street, Commercial-road, E.

TO ARCHITECTS and CIVIL ENGINEERS.— WANTED, of practical experience, a RE-ENGAGEMENT.—Address, W. L. 30, Abchurch-lane, Kingston, W.

WANTED, by the Advertiser, an experienced GENERAL FOREMAN CARPENTER by trade. Good references.—Address, G. T. E. 1, Eaton-place, White-street, South Hackney, N.E.

TO ARCHITECTS, &c.— WANTED, by the Advertiser, aged 17, a SITUATION, in an ARCHITECT'S OFFICE, as IMPROVER, is a fair draughtsman, and very industrious. Unexceptionable references.—Address, E. C. 304, High-street, Strand, E.C.

TO MASTER PLUMBERS, BUILDERS, and OTHERS.— WANTED, by the Advertiser, a CONWY STANBY or JOB as PLUMBER or THREE BRANCH HAND. Can do plain sink-work, Town, country, or abroad.—Address, W. D. 4, Liverpool-road, Holloway, London, N.

TO BUILDERS, &c.— WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK. Is a competent book-keeper and accountant, and is well up in prices and the usual routine. Six years' experience. Town or country.—Address, ALPHA, 64, Great Percy-street, Finsbury, W.C.

TO BUILDERS.— WANTED, by the Advertiser, a JOINER by trade, a RE-ENGAGEMENT as SHOP FOREMAN. Accustomed to all office work in the building trade. Thoroughly competent in making out working drawings, &c.—Address, A. B. 176, Warwick-street, Finsbury, S.W.

TO BUILDERS, CONTRACTORS, and OTHERS.— WANTED, by the Advertiser, a BRICKWORKER, or Charge of a Job. Thoroughly acquainted with drawings and setting out work.—Address, E. H. No. 24, Norfolk-street, Strand, London, W.

TO ARCHITECTS and SURVEYORS.— WANTED, by a very good DRAUGHTSMAN, EMPLOYMENT in an Architect's Office. Accustomed to prepare designs from rough sketches. Well up in perspective and general routine of the office. Good personal and professional references. Unexceptionable references.—Address, ALPHA, 2, Lovelace-terrace, Knightsbridge, S.W.

The Builder.

VOL. XXX.—No. 1519.

Megaliths and Tumuli: their probable Eras, "Architects," and Purposes.

N this subject archaeologists are more or less divided into two classes,—the low-age and the high-age, according to their belief in the less or greater antiquity of the monuments in question. Mr. Fergusson is what we must really call a special pleader for their low-age; and he appears to regard a supposed proof that one or two, or a few, monuments of any one class must have been constructed since the Christian era commenced, to be sufficient to show the probability that all, or almost all, of that class belonged to much the same era. His work is a laborious and valuable one, as a collection of facts and illustrations, but it is on this ac-

count, and not on account of its theoretical or explanative value, we should think, that it will become, as it doubtless will, a standard authority. Historical proof of the extreme antiquity of pre-historical structures is, of course, an inconsistency and an impossibility; but it is incumbent on those who maintain the age of such structures as those we speak of to be within historical limits, to prove their case by historical evidence, and this we think no low-age advocate has yet done. On the supposition, however, that they really are, as a class, pre-historical, and of great antiquity, how are we to show the probability, at least, that they are so? Here is a difficulty not easily surmountable. Still we conceive that there is a way,—a new way; and we shall now proceed to indicate slightly rather than fully to show that way. Meantime we may remark that the fact that a few of the monuments in question,—if it be a fact,—have been proved to have been constructed since the beginning of the Christian era, is precisely what was to be expected by the high-age archaeologists. These monuments are admittedly Pagan in their origin. The Pagan era preceded the Christian, from pre-historic times; but overlapped it, and continued, even in partially Christianised countries, to exist down to comparatively recent ages. The Pagan era itself was undoubtedly and admittedly of pre-historical and extreme antiquity; and so, in all probability, are most of its more lasting monuments; but as Paganism continued to exist, and indeed still continues to exist, in the Christian era, there must be Pagan monuments erected during the Christian era; and that may be provable: it is what cannot but be. Some low-age advocates, however, would really almost seem to desire to establish the anachronism that the Pagan era and its monuments were not pre-Christian at all, as a rule. Such a line of argument may well suit the advocates of the literal interpretation of Scripture as to the age of the earth and of man, and the necessity or special advantage of crowding down as much of the Pagan era and its megalithic and other works into recent ages as possible. But since it has been proved, by the implements of the glacial drift, that man must have existed on the verge

of the glacial era at least, if not actually during or throughout that era; and since many thousands of years must have passed since that time,—however possible it may be, as we think it is, greatly to shorten the time of the glacial era itself, by showing reasons for vastly more rapid grinding action of the rocks, by ice and flood than than now, by the alternation of hot or tropical summers with Arctic winters, just as even now summers alternate, though in a minor and not tropical degree, with the winters, in the present restricted Arctic regions;—we have plenty of time, during all of which the Pagan era must have continued, for its monuments to last, if capable of outlasting severe and trying alternations such as even the immediately post-glacial era must have brought to bear upon them in now temperate latitudes like that of Britain. And were they not capable? What works of man were ever more fit for war with the elements than those tremendous rocks and artificial hills which Pagans reared? what works of ancient man were ever so suited for such an era?

The outlined history of man having been extended by the drift implements back to the glacial era, which materially affected the contours and the limits and sea levels of the habitable land in all countries,—the British Isles, at that time, for example, being a series of highland "isles," with tenfold significance; since the low-lying land in the glacial era lay hundreds of feet below the level of the ocean;—this state of matters, throughout, a great part of the hemisphere, but not the whole, necessarily affected, very materially, the distribution of mankind from their chief centre or centres, further south, or wherever those may have then existed.* The geological question, therefore, involves and rules the ethnological, as the ethnological does the "architectural" and mythological. Even on ethnological and architectural grounds, therefore, we must first of all say a few words on the geological phase of the questions at issue, which phase cannot now be any longer ignored in an inquiry such as this.

In a few words, the glacial era was simply an intensification and extension of the still existent and operative causes, productive, even now, of the present state of things in the Arctic circle and region, spreading it farther south into now temperate latitudes, though not over the whole of the hemisphere.† The winter cold was more extreme than now; and (as the existence of tropical and other animals in the glacial region indicates) so was the summer heat; and during this era of ice and flood the land, or rather the surface of the earth's crust, had already assumed the general outlines which

* Professor Phillips, in his "Treatise on Geology" (p. 78), thus describes the general features and the probable time of the glacial era in Britain and Ireland:—"There is reason to think that, during very late geological,—PROBABLY PERMISSIOVAL,—periods, the same northern zones of the earth which, in earlier times, had nourished plants and animals resembling those within the tropics [the summers being even then still tropical?], were chilled by a general reduction of temperature [in the winter, then Arctic], so that the mountainous [and at that time inland] regions of Great Britain and Ireland, were covered with perennial snow; their rugged valleys filled with gliding glaciers; the seas at their feet filled with Arctic life, and covered by floating icebergs, loaded with rocks."

† The land, as he remarks, was then, or during part of the glacial era, covered by the ocean to a depth of 1,500 ft. to 2,000 ft. more than now; but it appeared by degrees during that era, and continued to do so, till the close of the glacial and the opening of the "post-glacial and lacustrine" or lake era, after which "much the same general conditions of land and sea as those which now prevail" came at length to exist.

‡ We have on several occasions treated of this subject, both in its geological and its astronomical aspects, in the *Builder*.—*q. v.* on 10th of August, 1861; 4th of October, 1862; and 8th of September, 1866; if not previously also, and since that time; and we must refer to these occasions for a more particular account of this simple view of the ancient glacial era, and of the present Arctic region, as its residue or remnant and restricted glacial era of the present time; the key to which is, popularly speaking, the movement of the sun in the ecliptic, which is the cause of the alternation of winter and summer, according to the increase or diminution of the obliquity of the angle between the equator and the ecliptic, which angle, from time immemorial, has admittedly been on the decrease, as the extremes of winter and summer must therefore have also been, according to geological evidence, by which the astronomical, admittedly extremely defective, must now be instructed.

it still possesses, but was sunk in sea level, and existed partly beneath the ocean, so that what are now low level plains and countries had no existence then, as such, at all; and the British Isles, as we have said, were "islands" in tenfold intensity of meaning to what they now are. In fact, it was mainly the backbone, as it were, of the country, or the high lands, including Cornwall, most of Wales, Cumberland and Northumberland, and some other districts, with the highlands of Scotland, that were above water and constituted a collection of islands. So with Ireland, which was nearly a great ring of high land enclosing the sea; and so with other countries: the great plain of Europe was under water; but Scandinavia, like Britain and Ireland, was a series of islands. So was the high land of Europe, including parts of France and Spain, and so was the Caucasus. The nearest great continent, however, was the heart of Africa, including Upper Egypt, Abyssinia, and parts of Algeria and Morocco. The great desert of North Africa, though a vast level plain, was sooner uncovered than the great plain of Europe and Asia. A great part of the vast continent of Africa, moreover, like great districts of Asia, never came under actually glacial influences at all; or was not, even then, within the extended Arctic circle; but was tropical or temperate, and high and habitable land, while the glacial era in the isles of the great ocean lasted; as well as before and afterwards.

The continent next nearest, after Africa, to the European isles, was Upper Asia, including Thibet as the central land, the Himalayan and sub-Himalayan regions, Persia, and the higher districts of China adjoining Thibet. The great desert of Gobi, like the Sahara of Africa, was above water before the great plain of Europe. So was it with the Doocan aboriginal plateau of India, and with Asia Minor and Arabia; but Thibet and the Himalayas were the grand centre of the Asiatic continent, as they still are. Except through Persia and Asia Minor, Asia was then divided from Europe by a vast sea, which covered the low lands of Asia, and the great plain of Europe, as its remnants, the Caspian and Black Sea still do. The American continent was then also materially different from what it now is, but we need not here enter further into that subject; except to note that, as man existed in the glacial era, the frozen North Atlantic in the winters would form a way of communication for tribes, such as the Esquimaux, or the Laps and Fins, to traverse with freedom east and west as well as north and south. But although the men of the glacial drift itself were probably as little advanced as the men of the Arctic drift are at the present day, there is no reason, in the physical state of the earth at that time, why men of a far more advanced state—nay, as civilised at least as the Moors or Abyssinians of North Africa, or the Thibetans or Chinese of Upper Asia,—may not also, and simultaneously, have existed as comfortably as now, in the south; while the extended Arctic region of the glacial era covered the more northern, and now temperate, latitudes of the globe. Such is the case, both in Africa and Asia, as well as Europe, now, by comparison with the present glacial region, and such may have been the case then, as regards parts of Asia and Africa. And even had the more northern (but now temperate) latitudes not been at all habitable by man during the full extension of the Arctic circle to these latitudes, as the more restricted Arctic or glacial region and era now are; no sooner would the extended Arctic circle dwindle into less extended dimensions, so that the latitudes of Europe and the British Isles became less severe in climate, or more temperate, than migratory races from the more southern and gonal countries,—that is, from the north-west of Africa and the south-west of Asia,—would penetrate into these "Isles of the sea," and first of all from Africa, as the nearest continent, into Spain, France, and England; that is, from

Morocco and Algeria into the high land of Spain, into Aquitaine and Brittany, and thence into Cornwall, Wales, the Isle of Man, the high land encircling the sea in Ireland, and also, in fewer numbers, into Cumberland and Northumberland, as well as, in still fewer numbers, into the high lands of Scotland; and thence (let us say, in place of the contrary route) into Scandinavia.

In other words, these migrants from North Africa would necessarily and unavoidably take almost the exact route indicated by Mr. Ferguson's own most suggestive and valuable "Map, designed to illustrate the distribution of dolmens and probable lines of the migrations of the dolmen-builders;" avoiding, as they need must, the eastern and more lowland districts of England, the central lowlands of Ireland, and the eastern lowlands of Scotland, since these must have been beneath sea level when this great migration from Africa must have taken place, at the close of the glacial era, and before the land came to the level of less ancient ages. It might have been expected that in subsequent ages the dolmen-builders, if they then existed, might have erected them at lower levels; but they appear to have never been built, as a rule, in the lower districts of Britain, where tumuli and other forms took their place; and it was not till they had reached Scandinavia that the first great evidence of a descent to somewhat lower levels appears on the dolmen map in the region of Denmark and the northern corner of Germany adjoining it.

In long after times, when the great plain of Europe became dry land, other migrants would spread themselves westwards, across the Steppes of Asia and the low-levelled middle region of Europe to the Belgian district, and thence to England. And this route across Europe is precisely that which is strewn with *barrows or tumuli* in innumerable thousands.

Meantime, however, and long before these barrow men could have crossed Europe, the African aboriginal possessors of the isles of the great sea must have been already intruded on, south-westward, from Asia, through Asia Minor, along which route also so many tumuli are scattered; but by this route far higher and more civilising influences, architectural as well as others, were thrust upon the Western peoples than any they probably ever derived either from Africa or through the great plain of Europe: not that we necessarily entertain the idea that because the megaliths of the Africans were rough and rude, and mere glacial boulders (lifted, it may be, by great tides, into their high places in the then semi-insular or "sacred enclosures" or islands, spoken of, in far later times, by the bards or Taliesins; therefore these rough rocks were an undoubted proof and token of North African barbarism: on the contrary, it may only have been because the dolmens were unworked rocks, or stones, that they were devoted and used, untouched, unaltered, for sacred purposes. "If thou wilt make me an altar of stone, thou shalt not build it of hewn stone; for if thou lift up thy foot upon it, thou hast polluted it," said the Lord [in Exodus xx. 25] to Moses, the African, who was "learned in all the wisdom of the Magi," of the Africans, or at least of the Egyptians; and again [Deut. xxvii. 5],—"Thou shalt build the altar of the Lord thy God of whole stones;"—of boulders, in fact, whether great or small. And it is not curious, in this connexion, that as the sacred stones even of these early Jews of the later ages were probably glacial boulders, so their sacred or sacrificial knives were always flint implements, even while iron was used for other purposes? These ideas themselves look almost like vestigia of an extreme antiquity, far back beyond merely Jewish times; and, at all events, they go to show that the dolmens were sacred structures,—not that the Africans were then mere savages.

Now, the conclusions that have been or are being arrived at by ethnologists as to the aboriginal races who must have peopled this country in remotely ancient times are in singular accordance, as some of Mr. Ferguson's are, with these ethnological ideas. The apparently most ancient race, it is concluded by ethnologists, were a dark-haired, long-skulled, short, dark-eyed people, who have been traced to Spain and called Iberians and Milesians. These, we conceive, must have been of African blood, like the Moors in Spain. Another and less ancient race were light-haired, round-skulled, tall, and light-eyed. These must have been of Asiatic or Mongolian blood, whether by the southern or first route, including the Caucasus, or by the second or more northern and Scythian

route, across the Steppes of Tartary and the great plain of Europe. From the conjunction, probably, of these two,—the aboriginal dark race with the intrusive light race,—and chiefly, we should think, with the light race as warrior, and intrusive fathers, and the dark as aboriginal and receptive mothers,—another race, with dark hair and light eyes, as described by Professor Huxley, whom we are here following from memory, are recognisable. These we suppose to be the Celtic race. But the Teutonic element indicated here in the light-haired, round-skulled, tall, and light-eyed race must be distinguished, as Huxley remarked, from the Saxons and Danes of far less ancient times, though originally, doubtless, the same, essentially, in blood. There have been successive intrusions, but it is the more primitive intrusion of which we here speak.

Now it is remarkable that the flint arrow-heads, axe and chisel beads, and other implements of the men of the glacial drift of the British Isles, to use the words of Professor Ansted, in his lectures on Geology at the Royal Institution, in 1860, are "exactly like the flint celts and arrow-heads of the Ancient Britons." And we may here incidentally remark that these implements of the glacial or Arctic era men, as is well known, have been found in connexion with the bones of the elephant, hippopotamus, and other animals of warm climates, a fact which goes far to prove the truth of our simple view of the nature and cause of the glacial era, and to show that it was not an era of eternal and unmitigated fixed ice and snow, but of Arctic winters alternating with hot and something like tropical summers, clearly indicating, on the one hand, the departure of the sun further to the south than now in the winters, and, on the other, its removal farther to the north than now in the summers; so that Arctic life and tropical life co-existed, as a fact, side by side; only the tropical or sub-tropical animals were covered with hair, at least in the winters, if we may judge from the remains of a long extinct elephant actually found imbedded and preserved, it must have been for thousands of years, in the northern ice, and eaten by Siberian dogs, not many years ago.

Since the flint or stone implements of the men of the glacial era are exactly like those of the Britons of Druidical and historical times, it is probable that in their changeless barbarism (to use a phrase of Mr. Ferguson's), they were the same people essentially in the glacial and pre-historical era as in the time of the Romans; and that if they were dolmen-builders and tumuli-rearers in the Christian era, so were they for thousands of years before that era began; just as they were not only flint-implement makers during all that time; but, with the traditional fidelity of beavers to their dam-building, or birds to their nests, were makers, for all these thousands of years, of even the exact same patterns of such implements; and, while their flint implements of the glacial era still exist, side by side, and identical, with those of the Christian era, and undistinguishable from them, except by the localities in which they were found,—it is highly improbable that their supposed or admitted monuments of the Christian era, or end of the Pagan era, have no predecessors of far more ancient ages, during that same Pagan lasting nature of such rude monuments will fit them to endure for many thousands of years.

Since the people whose priesthood, in Roman and Christian ages, were Druids probably were one and the same people with that of glacial, or at least, post-glacial and lacustrine times, one would expect that, in the records of the later descendants of that pre-historical and pre-Christian priesthood, few as these records are, some traces may be found of the leading special physical features of the country in these more ancient times; and, above all, we would expect to find something notable about seas, and islands, and lakes, and boats. Now, this is precisely the case. The "bards" of Wales, who were one of three orders of the ancient British priesthood,—ovates, bards, and Druids,—in the Taliesin records, while speaking of "Deon or Hu," the great Druidical god,—round whose "narrow cell, beneath the tumulus," the priesthood, and it may be the people, danced in circles, "with frantic mirth,"—called this, their chief god, "the Emperor of the Seas," according to Davies's "Druids" (1809); and "the Ruler of the Deep." So numerous, indeed, are the allusions to seas, consecrated or holy islands, and sacred lakes, that one class of writers is well known to have held that it all related to rites connected with the Scriptural deluge and its retirement; and if that deluge could be sup-

posed to have referred, in some allegorical or figurative way, to the covering of the land by the ocean, during the whole of the glacial era, they might, in a certain sense, be right; but we have no intention to identify our own ideas with theirs. Still, we may make a few quotations from the passages collected by Davies, Brynau, and others, from the Taliesin records. Thus:—

"Existing of yore in the great sea, from the time when the shout was heard [whatever that cataclysmic noise may have been] we were put forth; whilst, smiling at the side of the rock, Ner remained in calm tranquility."

Ner, says Davies, was "the great Alysas, now retiring."

Taliesin (or one of the Taliesins; for Taliesin seems to have been an official title, and indicated the initiated) wrote a poem called "The Spoils of the Deep;" and in another poem, called "The Bardic Sanctuary," is the following:—

"O! thou proprietor of heaven and earth: [Hu, pronounced 'He' to whom great wisdom is attributed, a holy sanctuary there is on the surface of the ocean. May its chief be joyful in the splendid festivity, at the time when the sea rises, with expanding energy. Frequently does the surge assail the bards over their vessels of mead. And on the day when the billows are excited may this enclosure [this sacred list?] skim away through the billows. Come beyond the green spot from the region of the Fets . . . a holy sanctuary there is on the wide lake: a city not protected with walls: the sea surrounds it."

The precise meaning of all this, and of much more like it, matters little here: all we have to do is to show how much the minds of the Druids or bards were engaged with seas, islands, and lakes.

As to islands, we have such passages as these. The Taliesin says, in respect to his initiation:—

"I went the circuit. I slept in a hundred islands; through a hundred caers [chairs, kivaens, or dolmens?] in sacred enclosures. I tolled . . . a second time was I formed . . . I have died: I have revived: . . . I am now Taliesin."

"What are the names of the three insular sanctuaries [or caers] between the flowing and the ebbing tide." "In the quadrangular enclosure, in the island with the closed door, the twilight and the pitchy darkness [as of the Arctic winter and the early summer?] were mingled together."

It was not in Britain alone that islands were revered in this peculiar way. Bailly, the French astronomer, wonders "why islands have had so distinguished a hold of the superstitious feeling of the continentals." Now, we can better understand this than in Bailly's time.

And as to lakes, the Druidical allusions to these are no less frequent. Taliesin speaks of the "songs that were chanted by the Gwyllion, the children of the craving, in the bosoms of lakes." Gwyllion means fairy, night-wanderer, or witch. Gwyllion meant propheticesses who sang nightly songs, or songs in the night, as Hu, or Apollo, is said to have done, probably when "the God" was manifested in the entranced, who had "slept in the caers," or islands, and so became Gwyllion, or "became the God,"* as, in the kindred rites of Isis, Ceres, or Ceredwyn, the last being the Druidical name of the goddess Ceres, round whose central childron the Druids and Druidesses danced and circled till they were "inspired."

The supposed connexion of the Irish lakes with fairies (like that of the Irish tumuli with witches) has evident allusion to Druidical times and rites. The Welsh have a tradition very like that of Buddha stealing a flower from the Garden of Paradise. On a rock, near a lake, a door opened, every May morning, leading to an island, in the centre of the lake, where was an enchanted garden, inhabited by the Tylwyth Teg, or Fair family, a kind of fairies, who gave spirit-flowers and fruits to those whom they favoured. A sacrilegious wretch, however, once plucked a flower with his own hand, and lost his senses, in consequence, and the flower vanished as soon as he touched unhallowed ground. Thenceforth the door of the rock never opened more. The story reminds us a little of the golden branch which Æneas got from the Sibyl who lay (entranced) upon a rock, in her cell, which was the way to the Elysian Fields, or to the Shades.

Coracles or other boats, as well as lakes, islands, and seas, had much to do also with Druidical rites; and here we may incidentally remark that it is a curious and very interesting circumstance now explicable, that in the heart of Continental Asia, on the borders of Upper Asia, and very far now from any sea, a tribe of natives exists in whose language there are various words etymologically connected with the sea and seaports. A kindred fact of a different description may be here briefly adverted to. In the Asiatic

* See letters of J. E. Dore on Symbols, in the Builder of 16th October, 1853, &c.

Journal of Bengal for 1853, p. 2, Mr. Hodgson, while speaking of the vast influence of the Himalayans in the distribution of mankind, states the remarkable fact that between certain tribes of the Sub-Himalayas and the inhabitants of the Caucasus mountains, which are separated by low countries, there is a strong affinity in language. To many such facts, we have not the least doubt, the geological evidence of the gradual development of the land above sea-level, from the glacial era downwards, will now be found to constitute a key, which will open its relative dates, or epochs, in etiological time, that will shed a brilliant light upon the pre-historical era of man.

The route of the dolmen-builders into Britain, according to Mr. Fergusson's important map, as we have said, is really the route of the races who first, after the glacial era, probably migrated into Britain, when it must have first become habitable by a settled population; and this was especially the case with the southern districts of Cornwall and Wales, and the higher lands of Ireland, as the spread of the Silures and other dark races has shown; nevertheless, Mr. Fergusson urges, apropos of nothing but his undue desire to bring down the pre-historical and Pagan era of rude monuments within the limits of historical or quasi-historical record, that dolmen building was introduced into Britain, if not entirely originated, in comparatively recent ages. Whereas, since he himself has traced them from North Africa, through Spain and Franco to Cornwall and Wales, and to Ireland and Scotland, by the very route which must have been taken by the first settlers in Britain and Ireland after the glacial deluge, and before the lower lands appeared above sea level, it is much more probable that these first settlers brought their African dolmen-buildings, with their propensities with them, whatever were its purposes; than that, in long subsequent ages, of comparatively recent times, both Britons and Africans should have taken it into their heads, either simultaneously or in succession, either one way or the other, to commence the Pagan practice of dolmen-building at the fag-end of the Pagan era.

Mr. Fergusson thinks that "the key to most of our mysteries is hidden in the African deserts," and he is not far wrong; but that key he has just missed finding; and it is no other than it that we now produce. Africa is clearly a great centre whence not only dolmens but other monumental forms, and especially concentric circled ones, emanated; although, probably, it had many of them in common with those of the aboriginal Asiatic continent, before the lower countries came above sea level.

In North Africa, as instanced by Mr. Fergusson, dolmens and other stone monuments, occur in tens of thousands, many of them of prodigious dimensions; and not only dolmens simply, but dolmens centred in concentric stone circles, one, two, three, and fourfold; concentric stone circled tumuli crowned with dolmens; round towers in concentric circled series of walled masonry; cairns in "quadrangular enclosures" (to use words in the Druidical records); single stone circles; menhirs or single standing stones; even trilithons, exactly like those of Stonehenge; and various others. Mr. Fergusson may well say, therefore, that probably the key to many of our mysteries lies in the African deserts; and he himself points the way to the discovery of the extreme antiquity of these mysteries and these monuments, as a class, however many may have since come scattering down to less ancient times, and to lower levels of country.

In tracing so many of our crude Pagan monuments to the nearest continent, however, and to the earliest times, we must not overlook the fact

that there were those other great sources already referred to,—of equal antiquity in themselves, probably,—in the continental high lands of Asia and Asia Minor; but these were certainly not the source, or at least the chief source, of the dolmens, though they, perhaps, were of the chambered tumuli. But the chief source of the simpler harrows was more probably that which flowed from Upper Asia by the Scythian and Tentic route, through the great plain of Europe, where earth was more plentiful, and rocks were less so, than in the higher, earlier, and more mountains and rocky routes. These tumuli of the Steppes of Asia were usually surmounted by a human figure called a *baba*, one of which is represented in Mr. Fergusson's book, with carvings behind of something like the *V* and *A* symbols crossing each other; one, *V*, the masculine symbol above, and the other, *A*, the feminine below. A Russian barrow, on being levelled, was found to have, on the natural surface, a series of four concentric circles in stones (the genesis of our great circles, Mr. Fergusson thinks), with a central chair or kistvaen enclosed. There are stone circles at Caboul. Little seems to be known of the great Thibetan plateau, however, or even of the Himalayan and other mountain borders, especially the western, whence the barrow-rearers must have descended; but India is a great field for rude stone monuments, such as menhirs, trilithons, and dolmens, as in the hills inhabited by the Khassia tribes, and in the west of India, where there are also a variety of cairns, stone circles, and holo dolmens. Chambered tumuli and other forms of the Black Sea district, Lydia, &c., which probably emanated, originally, from Upper Asia, independently altogether, or nearly so, of glacial restrictions, through the plateaus of Persia and Asia Minor, came chiefly, it may be, by the southern or Aryan route, between the first or African descent and the third or North Asian ones; unless, indeed, they were a cross between the African dolmen and the Asiatic barrow, both in Britain and in Western Asia.

The fact (if it be a fact) that certain tumuli, kisteds or not kisteds or dolmened, stone circles, dolmens, or any other forms of gigantic Pagan monument were erected in the Christian era, or at the close of the Pagan era, either in Britain, or in Asia or Africa, and even were the proof clear and unquestionable in all such cases, is no evidence whatever that other monuments of a like order, or the main mass of such monuments, were not erected throughout the whole of the pre-historical and Pagan era, which is now clearly extended back to the glacial epoch,—probably 50,000 years ago. As regards one of the most ancient forms probably of all those introduced into the British Isles,—the dolmens,—these were too hard a nut to crack; and really Mr. Fergusson has scarcely attempted it, but has swallowed the nut whole without cracking it at all. He has not even tried to show when any British dolmen ever was erected, unless in a failure to identify one of them,—"Arthur's Quoit,"—with King Arthur as an historical personage. There is truly nothing for us to disprove in this respect therefore, because there is nothing but mere assertion to meet. As regards the chambered tumuli, stone circles, &c., we shall have some remarks to make, as well as in connexion with the dolmens and kistvaens, when we speak of the probable purposes of such monuments. Mr. Fergusson considers these rude structures in general, with certain exceptions, as being sepulchral and also simulative of sepulchral rites, and as works of ancestor-reverencing or departed-spirit-worshipping peoples. Our remarks, affirmative and otherwise, we must make in another article.

THE LATE MR. EDWARD WALTERS, ARCHITECT.

On the 22nd of January, 1872, there died at No. 11, Oriental-terrace, Brighton, of pleurisy, in the 64th year of his age, Mr. Edward Walters, an architect who during a professional practice of about thirty years in the city of Manchester and its neighbourhood produced a series of important and most original works, which have imparted a marked character of dignity and picturesque effect to what was before an uninteresting, although an important, provincial city, and have achieved a lasting reputation for the accomplished man who produced them.

Edward Walters was born in December, 1808, at No. 11, Fenchurch-buildings, in the City of London. His father, Mr. John Walters, was a

fellow pupil with James Savage, Joseph Woods (author of "Letters of an Architect from Italy," and the architect of the Commercial Sale Rooms, Mincing-lane), Whichcord the elder, J. Anson the elder, Ashpittel the elder (?), and Suter, in the office of Daniel Alexander. Mr. John Walters resided and carried on business at No. 11, Fenchurch-buildings, as was usual at that time. His principal work was the old Auction Mart, London, at the corner of Bartholomew-lane and Throgmorton-street, which was lately pulled down by the Estates Company, and the site is now occupied by the northern portion of the Alliance Bank. The Auction Mart was an imposing structure, but was very much disfigured by the subsequent addition of skylights in the roof. He also designed Shadwell Church, the tower of which is well proportioned, and St. Philip's Church, Stepney, built upon ground belonging to the London Hospital, of which institution he was surveyor. This latter building was one of the earliest attempts at the revival of Gothic architecture, and is a very creditable, although, of course, a very imperfect work viewed by the light of our present knowledge of Gothic art. Mr. John Walters died at a comparatively early age, leaving a widow, sister of Mr. J. Anson, senior, who survived him many years; a son, the subject of this notice; and a daughter, still living.

Edward Walters was educated chiefly at Brighton, and was a youth at school at the time of his father's death. He shortly afterwards came to London, and entered the office of Mr. Isaac Clarke, now of Lime-street-square, who had been a pupil of his father, and had then recently commenced business. He was not articled to Mr. Clarke, but remained with him for two or three years, and obtained the rudiments of an architectural education. His first professional employment after leaving Mr. Clarke was in the office of the late Mr. Thomas Cubitt, from whence he entered that of Mr. Lewis Vulliamy, where he was the contemporary of Mr. Owen Jones. He also for some time assisted the late Mr. John Wallen, and afterwards became assistant to Sir John Rennie, by whom he was sent to Constantinople in March, 1832, to superintend the building of a Small Arms Factory and some additions to the Arsenal for the Turkish Government.*

Mr. Walters remained at Constantinople until the completion of the works in 1837, when he returned to England, in company with his friend Mr. W. H. Barlow, the engineer to the Midland Railway Company, who had been sent out to superintend some works at the same place for Messrs. Maudslay. They left Constantinople in the month of August, 1837, visiting Smyrna, Malta, Sicily, and travelling through Calabria to Naples. Thence they went to Rome, Florence, and Pisa, and by Leghorn and Marseilles to Paris, arriving at Dover on the last day of January, 1838. The friendship which was thus early established between Mr. Walters and Mr. W. H. Barlow was continued with the greatest possible satisfaction to both, until Mr. Walters's decease. They frequently consulted each other upon points relating to their respective professional practice, and worked together with the most cordial feelings of amity. In 1860 they were associated in the laying out of a portion of the Midland Railway, between Ambergate and Manchester, of which Mr. W. H. Barlow was the engineer; and several of the stations on this line were built from Mr. Walters's designs.

It is evident, from a consideration of his works, that he must at some time have studied the proportions of some of the Italian palaces, particularly those of Genoa and Venice; but he does not seem to have made any measurements, the drawings which are preserved being coloured sketches, executed with considerable force, and the point of view selected with a just eye for effect. It is possible that if he ever made any drawings they may have been destroyed, as he was extremely jealous of his early drawings being made public, and frequently tore up his youthful designs when he came across them.

Whilst at Constantinople he made the acquaintance of the late Mr. Cobden, who, being at that time in ill-health, had undertaken a journey in the East for the purpose of recruiting his health, and at the same time to endeavour to obtain the secret of the method of producing the beautiful colour called Turkey Red, which is largely used in

* He made an elaborate design for a palace for the Sultan during his residence at Constantinople, a perspective of which was exhibited at the Institute. This design was never carried out, and this circumstance has, in all probability, led to the statement in a Manchester paper that he was appointed architect to the Sultan.

* It is an interesting circumstance that among a set of photographs from Abyssinia in the Kensington Museum (but removed to make way for the Duke of Edinburgh's collection) there was one, which we have seen, including a series of concentric circles amongst other symbols; and that an Abyssinian church was described in the *Builder* during the war, which was built or arranged in concentric circles, the most holy place being in the centre, with an altar or ark there placed. It is notable, in reference to the concentric circles carved on rocks in Northumberland too, was found in Wales a few years ago. Doubtless, however, they were, in subsequent ages, carved on rocks at lower levels, though their chief localities thus appear to have been on high land; and so long as that is the case, a few exceptions are of little or no force against the general principle, either as regards carvings or as regards megalithic references to African circles, with an slab from Carthage, with the circle and centre symbol on it, brought to the notice of the Society of Antiquaries by a member,—Mr. George Godwin,—and published in the "Archæologia," many years ago, is now more interesting and important than ever.

certain textile fabrics. With Mr. Cobden Edward Walters formed a warm friendship, and at that gentleman's suggestion he resolved to establish himself at Manchester, although at that time he had no friends in that city, but, on the contrary, all his relations and connexions were in the metropolis. He accordingly established himself, in 1839, on the ground-floor of No. 20 (now No. 24), Cooper-street, in which house he carried on business until his retirement, migrating only from the ground-floor to the first floor, and there his business is continued by his successors, Messrs. Barker & Ellis. His energy of character, his strict uprightness, and genial manners procured him friends, and he eventually acquired a considerable practice, after passing through an interval of doubt and difficulty.

At that period most works of any importance in Manchester were entrusted to Mr. Richard Lane, whose designs were in the prevailing style of the early part of this century, strictly Classic, and founded on Greek models, — a style which Sir Robert Smirke made popular. Lane's most successful work is the Manchester and Salford Savings Bank, at the corner of King-street and Pall Mall. He also built the Town-hall, Salford; St. John's Church, Higher Broughton; and several churches and chapels, one of which, the Pendleton Independent Chapel (built in 1849), has a front designed "after the manner of Whitby Abbey, delineated in Sharpe's Abbeys of Yorkshire," and a cast-iron roof. Sir Charles Barry, who designed the Royal Institution in Mosley-street, erected in 1823, had just completed the Atherton, Cheadam-hill Church was built by Mr. T. W. Atkinson, of London, in 1836-9, and the same architect designed the Manchester and Liverpool Bank, Spring-gardens.

The whole field of employment seemed barred to Mr. Walters; and, being a perfect stranger, his early life in Manchester was one of struggle and anxiety.

One of Mr. Walters's earliest commissions was a warehouse for Mr. Cobden at No. 16, Mosley-street. This is a plain, unpretending building, the ground-floor of stone, and the upper part of red brick, but although there is a certain refinement in the details which distinguishes it, it does not materially differ from other Manchester warehouses erected about the same time.

In the early part of his career he was chiefly employed in designing chapels and schools and residences in the suburbs of the ordinary villa type. In 1844, however, he built Oakwood Hall, a mansion of some extent of a Tudor character, upon the drawings of which he bestowed great care and study, most of them being drawn by himself.

It has been attributed to him by a contemporary that he designed some of the churches forming part of the scheme for building "ten churches" in Manchester proposed by the late Canon Stowell, but this does not appear to have been the case. Mr. Walters held aloof from the established clergy, but built several buildings for dissenting denominations, and had at one time a son of Dr. Halley's predecessor, Dr. McAll, for whom he built Cavendish-street Chapel, as a pupil. He did not ally himself, however, with any sect.

The same journal falls into the mistake of attributing the church in Grosvenor-square to Mr. Walters, which is not by him. He designed, however, the Free Church in Oxford-street, at the corner of Grosvenor-square, and this may have led to the error alluded to.

The first work that brought him into prominent notice, and developed his special talent, was a warehouse built, in 1851, for Messrs. Brown & Co., at the corner of Aytoun-street and Portland-street, and this was so pleasing in design, and so original in treatment, that the old-fashioned Manchester warehouse style was discarded, and Italian Renaissance buildings became the fashion. This warehouse was quickly followed by others in Portland-street, and may be named that for Messrs. Kershaw, Loose, Sidebottom, & Co., Messrs. Jackson's, one at the corner of Lower Mosley-street (Mr. C. P. Henderson's), and others in the central part of the city.

By reference to the list of Mr. Walters's works given at the end it will be seen that his progress in his profession was at first slow. In 1847 John Dalton and Corporation streets were opened, and considerable improvement became manifest in the architectural character of Manchester. The Branch Bank of England, designed by Mr. Cockerell, was opened in 1847. The Royal Exchange was enlarged by Alexander

Mills in the same year. In 1849 Sir Benjamin Heywood's Bank, at the corner of St. Ann's-square, by J. E. Gregan, was built, and other important buildings erected in the city. Mr. Walters soon obtained a considerable share of practice, and from about the year 1848 to 1860 was the leading architect in Manchester. He designed in succession a number of handsome warehouses, each in extent exceeding the majority of palaces, as well as numerous houses in the suburbs. In 1853 he obtained the Free Trade Hall in a limited competition. In 1860 he designed the Manchester and Salford Bank, in Mosley-street, a very charming composition, by some considered his *chef d'œuvre*, and in the same year the picturesque stations on the Midland Railway, among which may be specially mentioned those at Bakewell, and Miller's Dale, near Matlock, Bath. After 1860 his popularity to some extent declined in the face of the energy and determination of some of the younger members of the profession, and as he was of too proud and sensitive a nature to enter into what he considered a derogatory conflict with his brethren, he gradually withdrew from active practice.

With very few exceptions, the whole of Mr. Walters's works are founded on the style of the Italian Renaissance treated in the fullest, freest, and most intelligent manner. His earlier Gothic designs are poor and meagre, but the church in Cavendish-street is finely proportioned, and although the detail may not bear critical examination, it is a noble building, and will not suffer by comparison with any of the Gothic buildings of the same period. In all his compositions there is great breadth of design, a fine eye for proportion, a decided originality in combination, and a very careful study of detail. His work is throughout of the most conscientious character; it is the product of his own mind, and was carried out by his own hand. Of two years he was, however, greatly assisted by two gentlemen who became his partners, and ultimately succeeded him in his business on his retirement, whom he entirely reared and educated, sending them to study in Italy in order to qualify them for the position they were to occupy.

One of his last serious efforts in competition was a noble Classic design for the Manchester Assize Courts. This was not successful; and his want of success had a very painful effect upon his sensitive nature. He shortly afterwards retired from the active practice of his profession, resigning the business into the hands of his former pupils, Messrs. Barker and Ellis. He still, however, continued to take some interest in the practice of his successors, and only finally withdrew from a profession to which he was much attached, and in which he had so well and so intelligently practised in the year 1865. After this time he resided a good deal abroad, passing the winter generally in Italy, but making frequent visits to London.

Mr. Walters was singularly modest and unobtrusive in character, but his social qualities were of the highest order, and endeared him greatly to the many friends he found in Manchester, with whom he was on terms of the most cordial kind, as well as those who had known him in his youth. He was never married, and, although most courteous in his demeanour to women, he was not fond of female society.

He was most conscientious and laborious in his professional work, making a large number of his drawings himself, and altering and retouching frequently until the last moment. He was very particular as to the profile of his mouldings, upon which he bestowed great attention. Most of the warehouses in Manchester face to the northward, for the sake of the light, and on this account there is very little opportunity for obtaining any effects of light and shade upon those portions. For this reason the mouldings were, to some extent, exaggerated, and their proportions are slightly increased as they recede from the eye, in order to emphasise them, or, as Mr. Walters expressed it, to "make them read." This will account for, what may appear to those who are accustomed to the delicacy and refinement of the Italian prototypes of these buildings, an apparent coarseness of detail which is observable in his works. This peculiarity is more apparent than real, and is due to a careful study of the conditions under which the buildings were to be seen, and the dulness and opacity of the atmosphere at Manchester. There is in Mr. Walters's works in the city no attempt to obtain effect from the sky-line; the roofs of his city buildings are almost universally hidden, and

they derive all their value from the judicious proportions of their masses.

Mr. Walters's integrity and sense of honour were of the highest order, and it is to the credit of the people of Manchester that these qualities were appreciated by them as they deserved to be appreciated. To Mr. Walters is due the credit of having introduced into Manchester the system of taking out quantities as practised in London, and the abolition of the equivocal relation that formerly existed between architects and builders in the matter of quantities. Formerly it was the custom for the bills of quantities to be prepared in the architect's office, and the charges were paid by the whole of the builders tendering. If the quantities were prepared by a surveyor, the architect received a commission upon the amount charged for them. Mr. Walters, by the force of his example, did away with this unsatisfactory state of things, and promoted a more honourable, and at the same time a more cordial, relationship between architect and contractor. A contemporary organ of the building interest (the *Builders' Trade Circular*), in commenting on Mr. Walters's death, remarks on this subject:

"Mr. Walters was not popular among his brother architects and seldom associated with them; but he had the respect and confidence of the builders in a very marked degree. He was a strict man in having his work well done, but his criticism and his remarks were faithfully carried out, but a man of rare integrity. If a contractor gained his confidence it was not easily shaken. Sometimes a greedy client would try to get more work than was ordered. With weaker men this sort of thing too often succeeds; but in the hands of Mr. Walters the builder was safe. No fear of giving offence in any quarter prevented him doing justice to his tradesmen. He had a generous, warm heart, and his sympathies were strongly in favour of those who assisted him in carrying out his designs. He never failed to give his workmen with a word of consideration, and the builders of Manchester entertain a profound respect for his memory."

The *Manchester Critic* of the 16th of last December, in a series of papers on Manchester Architecture, past, present, and to come, reviewed Mr. Walters's works, and dwelt justly on the influence of his taste and common sense upon the buildings erected in Manchester during the last thirty years. We reprint a small portion of it, though our earlier volumes contain full reviews of his various works:—

"There can be no doubt that Manchester architecture may be criticised, and its quality estimated through the medium of its warehouses; those huge receptacles of manufactured goods, the buying and selling of which constitute what is commonly called the Manchester trade. In fact, Manchester is unmistakably a city of warehouses; the architectural character of the town is mainly derived from these buildings, inasmuch as the effect of whole streets depending upon their architectural treatment. The rebuilding of the old square-block warehouses inaugurated a new era in the history of architectural art, and opened out a wide field for the display of artistic powers, and an expenditure of money, the result of increased commerce and a livelier appreciation of the beautiful and of the refining influences of art.

The idea of inaugurating this new era in art devolved upon an architect whose name will always be held in esteem by his professional brethren, and whose genius will, we think, be acknowledged by succeeding generations as his fellow-countryman. Mr. Walters, indeed, Manchester owes a debt of gratitude for the wonderful change which he wrought in the appearance of the town, and for the respect which he won for the enterprise and spirit of Manchester merchant princes. The time was ripe for such a revolution in artistic thought, and Mr. Walters came upon the scene with an educated mind and a refined intellect, and the results soon became apparent as one after another, with astonishing rapidity, his stately piles reared themselves in our midst.

We well remember the surprise and wonder excited by, we think, his first great warehouse, the one built for Messrs. Brown & Co., at the corner of Aytoun-street and Portland-street; the style was new, there was a freshness and purity about it which quickly took hold of men's minds, and the building of Italian warehouses became almost a rage. This warehouse was quickly followed by others in Portland-street, including the one for Kershaw, Loose, & Sidebottom, one at the corner of Lower Mosley-street and Oxford-street; then followed the Free Trade Hall, the Manchester and Salford Bank, and many other buildings."

This article was written during Mr. Walters's lifetime, and the same paper, referring a few weeks afterwards to his demise, spoke in feeling terms of Mr. Walters's ability, and concluded with the observation:—

"It always engaged a cause for regret that Mr. Walters, when engaged in active practice, did not mingle more intimately with his professional brethren; but no doubt on account of the unfortunate relations and petty jealousies existing among members of the profession in this city this retirement is to be respected for. Mr. Walters has passed from among us respected by all, and with whom he came in contact, and leaving the mark of his genius in lasting monuments in the streets of Manchester."

The work upon which Mr. Walters's fame will chiefly rest is, the Free-trade Hall in Peter-street, the scene of the "Pterloo massacre" in 1819, and then called St. Peter's Fields, which was inaugurated on October 9th, 1856. It was built on the site of a hall of the same name, in which the Anti-Corn Law Meetings were held. It was erected by subscription among a very

limited number of residents in Manchester, and cost 25,000*l.* without fittings. The hall is 135 ft. long, and 78 ft. wide, and only 52 ft. in height. It was originally intended to be 61 ft. high, but acoustic considerations induced a curtailment of its proportions. In addition to the hall proper there is an assembly-room, 76 ft. by 37 ft., and 28 ft. high, approached by a separate staircase, with a summer-room over, a drawing-room, 40 ft. 6 in. by 24 ft., and other apartments. The principal front measures 153 ft. and the total height is 75 ft. The entire building covers an area of 2,300 square yards. The galleries will accommodate 754, and the floor of the hall will seat 3,156 persons, making a total of 3,910 persons, allowing 18 in. of seat to each individual.

There is a view of the principal front of this building in the *Builder* for 1856, vol. xiv., p. 526, and another view in the *Illustrated London News* for October 11th, 1856, which was taken from the drawing exhibited at the Architectural Exhibition in 1856 (No. 14).

Mr. T. Roger Smith, in his useful essay on the "Acoustics of Public Buildings," in "Weale's Series," founded on a paper read at the Institute of Architects, in 1860, refers to the Free Trade Hall as "one of the best examples that can be presented of a successful public room of the largest size." He proceeds to describe the means that have been taken to prevent echo at the end of the hall, and remarks:—

"This room, when empty, possesses a good deal of sonority, but when full is excellent in the extreme, either for music or public speaking. The amount of resonant material employed is not great, although there is a good deal about the orchestra, the part of the building where it will be of most service. The resonance is, however, produced by the large space above the ceiling, and by the fact that there is a hollow space under the floor. The included mass of air is probably also nearly as large as could be safely set in motion; so that, in all probability, the architect of this hall may be considered to have approached as closely as was either salutary or safe that limit of capacity or sonority, to have exceeded which would have spoiled the success of his undertaking."

The dimensions of the Free Trade Hall are, length, 135 ft.; width, 78 ft.; height, 52 ft. (originally intended to be 64 ft.); so that, as Mr. Smith observes, the height bears exactly to the width and approximately to the length the simple numerical relation of 2 to 3 and 2 to 5, the unit being 26 ft. The total cubic content may be roughly stated as about 500,000 ft.

The published illustrations of Mr. Walters's works are not numerous. Amongst them are illustrations of the Chapel in Cavendish-street, built for Dr. Halley, an Independent minister of some reputation in Manchester, given in the *Illustrated News* for 1849, vol. x., p. 181, and in a periodical which had but a brief existence, the *Architect*, 1849, vol. 1, p. 339. The Cavendish-street Schools are illustrated in the *Builder*, vol. vii., page 103.

In the notice accompanying the engraving in the *Illustrated London News* no mention is made of the architect, although it is evident from the accuracy of the description that the particulars must have been supplied by him.

There is a view of the Free Trade Hall in the *Illustrated London News*, October 11th, 1856, but it does not do justice to the building; the vigour and solidity of the original being quite lost.

There is no good view of the interior of the hall published. An attempt has been made to photograph it, but it has not been successful. There are a plan and section of the hall engraved in Mr. T. R. Smith's "Acoustics of Public Buildings."

An illustration of Messrs. Kershaw's Warehouse, Portland-street, is given in Knight's "Companion to the Almanack," 1854, p. 258.

Mr. Walters was a frequent contributor to the Architectural Exhibition. The first exhibition was held in 1849, but his name does not appear as an exhibitor. In 1850, when the exhibition was held at the Suffolk-street Gallery, he exhibited a garden elevation of a Mansion proposed to be built near Manchester (52); Oldham-road Chapel, Manchester, described as then building at Manchester (25); Entrance-gate and Lodge to Beechwood Hall, Cheshire (131).

In 1852 he exhibited a House for Mr. J. McLaren, at Manchester (28); a Warehouse erected at Manchester for Messrs. Callender, Sons, & Dodgson (72); a House at Rivington Pike, near Bolton, for Peter Martin, esq. (82); Messrs. Brown & Co.'s Warehouse, then building (153). In 1851-5 he did not exhibit. In 1855-6 he exhibited a group of Commercial Buildings lately erected in Manchester. In 1856-7 he exhibited a composition of buildings, lately erected at Manchester (1); the Free Trade Hall, Manchester (14); and Warehouses, Marsden-

street, Manchester (105). In 1857-8 and 1859, his name does not appear in the catalogue. In 1860 the Manchester Assize Court competition took place.

Mr. Walters does not appear to have contributed to the Architectural Exhibition after the year 1856-7. He had a strong dislike to exhibiting designs, and when urged to do so, generally refused, alleging that designs gave no idea of the appearance of a building when finished, and that when completed he would have the building photographed.

Mr. Walters was a Liberal in politics, and an ardent Free-trader. He was one of the promoters of the *Morning Star*, the organ of the Manchester School, which, although it did good service in familiarising the country with the doctrines of its party, was unsuccessful as a newspaper. Mr. Walters lost what money he had invested in the undertaking, but was proud of the sacrifice he had made for the sake of his principles. He was, however, as a rule, extremely reticent with regard to himself, and was averse to expressing his opinions openly, although he felt deeply upon public questions. Almost his only London work, which he obtained through this connexion, was the offices of the *Morning Star*, in Dorset-street, Fleet-street, erected about 1856, the date of the establishment of that paper.

The following is a list of Mr. Walters's principal works, for which we are indebted to Messrs. Barker & Ellis. The list is, however, incomplete, and does not include some of his early designs and alterations, nor buildings not strictly of an architectural character:—

- 1830.—Residence for Mr. E. Lloyd.
- 1841.—Union Chapel; Scotch Kirk, Manchester.
- 1842.—Grand-royal-starch; Queen's Hotel; Broughton-road Chapel and Schools.
- 1844.—Oakwood Hall, for Mr. Ormrod Heyworth; St. Andrew's Free Church, Oxford-street, corner of Grosvenor square.
- 1845.—Warehouse for Mr. S. Schwabe; Residence for Mr. T. Critchley; Darwen Chapel and Schools; Scotch Kirk, Bolton.
- 1846.—Residence for Mr. Whitlow.
- 1848.—Warehouse for Mr. Thos. Cooke; Residence for Mr. Thos. Ridgway; Residence for Mr. W. Morris; Blackpool Chapel.
- 1849.—Oldham-road Chapel; Stockport Chapel; Middleton Schools.
- 1850.—Residence for Mr. J. Leigh; Residence for Mr. J. McLaren, Whalley Range; Residence for Mr. Peter Martin, Rivington-Pike; Residence for Mr. W. Hadfield.
- 1851.—Warehouse, Portland-street, for Mr. Jas. Brown; Warehouse, Charlotte-street, for Messrs. W. R. Callender; Residence for Mr. Wm. Bellhouse; Residence for Sir Joseph Whitworth.
- 1852.—Warehouse, Portland-street, for Messrs. Kershaw, Leese, & Co.; Residence for Mr. Henry Hart; Residence for Mr. J. Leese; Residence for Mr. E. F. Langworthy; Billiard-room for Mr. T. B. Potter; Residence for Mr. W. J. Tate; Knott-mill Chapel.
- 1853.—Free Trade Hall (opened in 1856); Warehouse for Messrs. Gruner, Schmidt, & Co.; Residence for Mr. Jas. Brown.
- 1854.—Warehouse for Mr. C. P. Henderson.
- 1855.—Warehouse for Mr. Wm. Atkinson; Warehouse for Mr. J. C. Harter; Warehouse for Messrs. Jones, Brothers.
- 1856.—Warehouse for Messrs. Beaver, Higson, & Co.; Warehouse for Messrs. Williams, Scott, & Co.; Residence for Mr. Peter McLaren, Isalm.
- 1857.—Manchester and Salford District Bank, Warrington; Residence for Mr. J. Williams.
- 1858.—Warehouse, Portland-street, for Messrs. E. & J. Jackson.
- 1859.—St. Helen's Bank; Ashbury Carriage Company's Works; Residence for Mr. T. Ashton, Didsbury.
- 1860.—Liverpool, London, and Globe Insurance Office, King-street; Manchester and Salford Bank, Mosley-street; Residence for Mr. T. Wrigley; Burton Station, Bakewell Station, Longstone Station, Miller's Dale Station, Rowsley Station, and Hasop Station, on the Midland Railway; Manchester and Liverpool District Bank; Warehouse for Mr. E. R. Langworthy; Warehouse for Mr. Leo Schuster; Residence for Mr. B. Boden; Residence for Mr. G. Crossfield; Lynn Chapel.
- 1861.—Warrington Public Hall; Southport Chapel.
- 1865.—Warehouse for Mr. Dewhirst.

ARCHITECTURAL DRAWINGS, ROYAL SCOTTISH ACADEMY.

ARCHITECTS, here as elsewhere, meet with but scant justice at the hands of their fellow artists, the painters. If a small space at either side of the entrance to the galleries is allotted to architectural drawings, it is talked of as a good-natured concession to a kind of thing which is only by courtesy called art. The architect has more intractable materials to work with than the painter, but form and composition, light and shade, are as essential requisites to the successful performance of the one kind of work as the other. That a moderate degree of success is more easy of attainment with the brush and palette than with the square and compass, is shown by the fact that several exhibitors of paintings in these galleries began their career as architects, but we cannot point to a single example of the converse. The painter, too, is

indebted for much of his material to the architect, as is shown by the considerable number of views of purely architectural subjects exhibited; and although it may be pleaded that these are, in great measure, indebted to the mellowing hand of time for their artistic value, and that the new works lack that interest, it may also be safely predicted that the new work will, in the course of time, be as suitable and as eagerly appreciated by a new race of artists.

The sister arts should go hand in hand, each lending grace to the other, and then we shall find, as in the palmy days of old, the walls of our public halls covered with works of high art. Mr. Dick Peddie is the first architect in Scotland who has taken a step in this direction. "The Telling Room of the Royal Bank of Scotland," of one side of which we are presented with an elevation (768), is an elegant apartment, square on plan, and lighted by a dome supported upon four strongly pronounced arches. The details are simple, and effect is sought for by covering the broad wall surfaces with coloured decoration, and introducing four large paintings in the upper section of each arch, a much more artistic proceeding than loading the surface with plaster casts, as has been the practice hitherto in similar works. No. 779, "Interior of Inverness Cathedral, Alexander Ross." This edifice consists of a nave, with aisles, clearstory, transepts, and apsidal choir, covered by a wagon-roof. The pillars are of red granite, and the roof richly decorated in colour. The effect is pleasing, but exhibits no particular marks of originality. No. 812 is a view of the exterior, showing two spires at the west end, a flèche at the intersection of the cross, and an octagonal chapter-house. Nos. 781 and 822 are drawings of the exterior and interior of a new church, Woodgreen, Staffordshire, by Edward Francis Clark, who seems to have a thorough knowledge of Gothic details, and, by a skilful combination of such, produces a happy result.

No. 780, "Design for a proposed Free Church," John Honeyman. Why a Free Church should be made to appear outwardly as if it had a chancel is to us a mystery. We know of one example where such an anamorphosis has been perpetrated, and it produces no small shock to one's preconceived ideas, when, upon entering the building, the pulpit is seen at the opposite end to what appeared a chancel, and that that portion of the interior is fitted up with pews in the ordinary manner. An architectural work may be either the visible expression of the ideas of the designer, or it may be a composition produced by grouping together old forms. Mr. Honeyman seems an adept at the latter and more easy mode of procedure; for both as to detail and general effect the design is far from being unpleasing, like the poetry of those who,—

"Haunt Parnassus but to please the ear."

No two buildings could be more unlike than this and No. 787, "St. John's Free Church, Leith." There is no mistaking it for anything else than a Dissenting chapel. The fact that the interior is fitted up with galleries is apparent by a double tier of windows, and is emphasised by the stair leading thereto being indicated by a glazed arcade which follows its slope. A tower at the south-west angle is terminated by an open crown formed by eight flying buttresses meeting in a point; this feature has a poverty-stricken wooden character about it, the lower tier of windows are unpleasantly near to the ground, and the upper tier terminate in gables which are overwhelmed by an unnecessary parapet. The building is altogether too pretentious. No. 824, "St. Luke's, Dumfries," Robert Anderson, is quite another affair; it is an Episcopal church, and looks like one. Nothing is overdone, and a satisfactory feeling of appropriateness and repose pervades the interior. The only peculiarity about it is that the side aisles are without lights, and are kept narrower and lower than is usually the case, and a greater height is consequently given to the clearstory. This, we think, a satisfactory arrangement, the light coming from above producing a fine effect. Mr. Anderson has restored the parish church of St. Vigeans in a satisfactory manner; it is a Mediaeval church appropriated to Presbyterian worship; but instead of fitting up the chancel with pews, Mr. Anderson has set aside that space for the choir, and has placed the pulpit at one side, and not in the middle, as is usually done in similar circumstances.

No. 808 is a very grand "Design for a Scott Memorial Hall for the University of Edinburgh," by Adolph Emil Melander. It is after (a long

way after) the Ducal Palace at Venice, is spanned by a vast roof, out of which crop towers and pinnacles, turrets and canopies, producing a wonderful sky-line. How these features are to be supported is a mystery which a view of the interior could hardly solve. We doubt if the designer has made the attempt. No. 783, "Design for a Town-hall," William Nicholson, and No. 796, "Design for a Club-house," by the same, are common-places in the extreme, without a new feature in combination. No. 793, "Roschaugh House, Ross-shire," as designed by Mr. Alexander Ross, is a Renaissance mansion, with a large display of plate-glass, and would be as inappropriate in the North as No. 814, by Messrs. McGibbon & Ross, a turreted Scottish baronial mansion, would be out of place in the New Forest, Hants, where it is proposed to erect it. The Renaissance mansion has a tower with a heavy-looking roof, which crushes it into an appearance of humility towards the mountains of the north; but the Scottish intruder asserts his nationality by thrusting aloft a series of lanky turrets. "*Honi soit qui mal y pense.*" Cortachy Castle, Forfarshire, which is now in course of being restored by Mr. David Bryce, and of which a south-west view is given (831), is a very fine example of a Scottish baronial mansion. The main portion of the building is symmetrical, and not broken up into numerous small features, as is too often done in modern instances, such as No. 813, "Threave House, Kirkcudbrightshire," by Mr. C. G. H. Kinear. An outside stair, supported upon a semicircular arcade, is a happy feature, and so is the clock tower in the angle; but the sky-line to the right of the tower is hard and unsatisfactory, and appears to have been done at a later period than the rest of the buildings.

Mr. William Leiper has in "Colcarr, Perthshire" (825), given a new and appropriate expression to this style. It is difficult to point out wherein this design differs from many others lately produced; we can only say that it possesses a distinct individuality, and has that something about it which characterises the works of the new school of Gothicists. It is homely and comfortable-looking, and elegant without being pretentious.

No. 794, "Villa for Alex. McLaurin Monteith, esq., South-side, Edinburgh," Fred. Thos. Pilkington. This is the first instance we know of where Mr. Pilkington has stooped to use the vernacular villa architecture. Of its kind it is good, but that kind is very stale and uninteresting.

No. 821, "New Asylum, Lenzie," being erected for the Barony parish, Glasgow, by Messrs. Salmon, Som, & Ritchie, architects, is one of those widely scattered groups of buildings to which it is very difficult to impart artistic effect. No. 833, "Memorial Cross" to be erected by friends and pupils of the late Mr. John Charteris, Wamphray, is an appropriate Christian memorial. The sculpture represents the "Tree of Life and the Dragon bound," treated after the manner of the decoration on Runie crosses. Mr. J. B. Fife is a clever draughtsman, and presents us with "An Architectural Idea" (828), a church with deeply-recessed windows, and much carving, to produce which would necessitate a larger outlay than can usually be commanded. The composition around the base of the tower is too crowded for good effect.

ON JAPANESE ART.

The Japanese have, for thousands of years, worshipped at Nature's shrine, watching her every movement, and noting every change of mood and costume with a loving eye, until each detail of her marvellous handiwork and each expression of her changeable face are imprinted on their minds, to be transferred to every work they set their hands to do. These words may strike you as being too strong, but I can assure you that a careful study of Japanese art will convince you that the Japanese artist is, perhaps more than any other, a devoted worshipper of Nature, and delights in nothing so much as in depicting her works.

In the animal and vegetable worlds he is ever seeking for expressive action or lovely forms and combinations of colour; and when satisfied with his research, how boldly and truthfully he depicts what has pleased his fancy,—sometimes with his thumb and finger dipped in ink, sometimes with double brushes held in one hand, and used together with marvellous dexterity; or, sometimes, with a laboured delicacy which makes us attempt to calculate the time expended,

and, as is most frequently the case, break down in the calculation.

Another remarkable trait in the character of the Japanese artist is his keen appreciation, and indeed intense love, for the humorous and grotesque. This is evidenced in his drawings, and more particularly in his ivory carvings. This fancy leads him very often into broad caricature, and into the representation of positively indecent subjects.

Of all the objects adopted by the Japanese artist for ornamentation, the most beautiful are birds and flowers; and those over which he is least artistic are human figures. It appears that in depicting the human form the artist acknowledges some rules which restrict his fancy and neutralise his accurate observation. He submits to a conventionalised type, and goes on in one groove all his days. Notwithstanding this fact, great power and breadth of treatment are observable in his drawing of drapery; and in many instances one observes that action and *pose* have been well considered and carefully rendered.

In coloring, the Japanese are, generally speaking, very skilful, adopting a quiet and refined style, and using full low-toned colours in preference to excessively brilliant ones. In this they differ from their neighbours, the Chinese. Of course I do not wish you to understand that the Japanese artists do not use bright colours, for few men know their value better; but what I desire to convey is that they use them judiciously, and in comparatively small proportions, cleverly supporting and contrasting them with the secondaries and other compound colours they use in grounds in large masses generally.

Much as we may admire the marvellous skill and delicacy of manipulation the art-works of Japan display, as artists ourselves, we must feel that we are constrained to more fully admire the exquisite feeling set forth in the designs of their ornamentation; and it is rarely that one can detect any hardness imparted to the designs through their laboured execution. This clearly proves that the workman is in all senses the artist, and that he is not merely reproducing in his peculiar material the designs created by the fancy of others. In Japan, therefore, we find in every branch of art-manufacture what we so much want in our own land,—the artist workman. Combined with his artistic feeling, the artisan of Japan shows the greatest skill in manipulating the almost countless materials he presses into his service. We are informed that his tools are few, and of the simplest description; and personal inspection of the collection of native implements in Siebold's Museum, at Leyden, certainly corroborates this statement. It is a matter, therefore, of no small wonder how the Japanese workman can produce such absolute perfection of finish. The greatest possible dexterity of hand must be cultivated, along with accuracy of eye; and time, that bugbear of the West, must be held in small account in the production of his art-works.

The power of delineation displayed by Japanese artists is unquestionably great, and although they sometimes resort to careless and off-hand methods, they can display the greatest delicacy of touch, combined with the most perfect freedom. I have one example of this, a bird resting on a spray with leaves and flowers, executed in Indian ink. There is not a particle of outlining in this sketch, each feather, branch, leaf, and flower-petal being executed with a single application of the brush, a few dark lines on the bird and leaves, and a few dots completing the drawing. Notwithstanding this simple means and hasty manner adopted, the result is truly beautiful, and so expressive that nothing seems wanting to the eye.

It seems strange that so much could be told by half a dozen up and down brush-strokes as is plainly told in the simplest Japanese sketch; but let the artist have a clear idea to set forth, and he will never fail to do so, even in so humble a material as a grass blade. Nothing can exceed the grace infused into their representations of grasses, wild flowers, and creeping plants. Let any one who questions this, examine their ordinary illustrated books or the paintings often found on their beautiful *Satsuma Ware*.

With such materials as grasses and creepers they seek to display the graceful negligence of Nature. When they desire to show her strength and vigour they depict the stately iris with its erect sword-blades and curling plumes; when they wish to show her lavish richness they throw down showers of long drooping purple racemes,

or cover the picture with a profusion of giant *chrysanthemums*, or the beautiful *rose-like* flowers so much prized by the Japanese.

In addition to the flowers mentioned, the lily, the lotus, the carnation, the convolvulus, and numerous other creeping plants are very commonly represented.

Trees are also favourite subjects with Japanese artists, and those most frequently observed are the palm, the fir, a tree bearing dense masses of white flowers, and another of spiky character, bearing white flowers and pink buds. The native name for the last tree, I am told by a Japanese gentleman, is *Oumai*: it bears fruit somewhat similar to our greenage, but is evidently not prized on that account, the fruit never being depicted.

Perhaps of all the trees the fir is most often used, and the reason for this may be that it is held in considerable esteem on account of its constant verdure and the great age which it is supposed to attain before it dies. The superstitions amongst the Japanese believe that the fir-tree exercises some influence over the happy events of human life.

Equally with the fir, the bamboo is much used for decorative purposes, and indeed it appears to be held by the superstitious in similar veneration, and for similar reasons. The straight ascending habit of the bamboo, rendered unmonotonous by its frequent jointings, and its effective crown of foliage, have no doubt been the principal inducements for the artists to adopt it, and they certainly make good use of it, depicting its jointed stem, with an occasional leaf, on narrow upright spaces or such like, and its spreading foliage and graceful leaves on panels or other broad fields.

By all accounts the Japanese are passionately fond of dwarfed trees and shrubs, and their gardeners are remarkably skilful in the art of dwarfing. Such things as perfect trees, full of foliage and blossom, only a few inches high, are not uncommon. *Meylin* is stated to have seen in Japan, in the year 1826, a box 4 in. long, 1½ in. wide, and about 6 in. high, in which were growing and in healthy condition, a fir, a bamboo, and a plum-tree in full blossom.

In the miniature gardens which are commonly attached to the better-class houses in the towns, dwarf trees, a few feet high, are usual objects. This taste for dwarfing has led to the diametrically opposite taste for unnaturally increasing the size of trees and flowers. Firs are reported to be seen in the country, of gigantic proportions, and some fruit-bearing trees with blossoms as large as good-sized cabbages. Vegetables are likewise cultivated until they attain enormous size.

The Japanese also delight in bouquets of flowers and branches, with which they ornament the interior of their simply-ordered apartments on all festive occasions. I said bouquets of flowers and branches; but the latter ought to have been placed first; for branches, and wild-looking, distorted ones, too, figure largely in their composition. The Japanese construct their bouquets decidedly in a more artistic manner than does any other nation under the sun.

They frequently represent bouquets on works of porcelain and lacquer,—and what charming objects they always are! Dwarf trees and clusters of giant flowers are associated together without the least attempt at symmetrical arrangement; indeed, anything like uniformity or balance is studiously avoided in these groupings. A piece of bamboo sometimes rises vertically from amidst the flowers, with a stray leaf or two of its own, a delicate creeper trailing round it, or a slender branch of some choice plant, stuck through a hole in its side, and deriving moisture from water contained within; or, when the bamboo is of considerable size, with a perfect miniature fir or oak tree planted in soil contained in the top joint, and flourishing as luxuriantly in its way, as its friends of the mountain. So far, we have a picture of the mild type of Japanese bouquets; but there is another, which may be termed the wild type, and, to me, the most interesting and artistic. This consists of dwarf trees, gigantic flowers, bamboo, &c., as before, with the startling addition of the most outcorted and gnarled branches which badly brought-up trees might be expected to supply. These branches are sometimes devoid of foliage, or, at others, carry quaint tufts at their extremities, and, being so fantastically twisted, they wander about the bouquet in the most erratic manner; or, when of an independent turn, strike off, tufts and all, yards from the vase in which they are planted.

Before leaving the subject of vegetation and its use in ornament, I may mention that the Japanese adopt a great variety of conventionalised floral forms in the construction of vases, powderings, and such-like enrichments, where they cleverly combine them with purely geometrical patterns.

Next to vegetation, the artists of Japan are most skilled in the representation of birds; and they appear to have an equal love for depicting them. Here, again, we detect their painstaking and enthusiastic course of study, by the care and accuracy with which every action and favourite position of their birds is rendered.

It is principally in their porcelain, lacquer, illustrated books, and original drawings that we find the best specimens of their skill in this department; but I have frequently seen rare examples in their metal-work. Let the material, however, be what it may, wherever there is a bird there is food for our study and cause for our admiration.

A law existed in Japan, and, no doubt, does now, that no firearms should be used within a radius of thirty miles from the Imperial Palace; and this encouraged, to a great extent, the sport of falconry, and consequently the taste for depicting scenes from it. The screens which the Japanese use so commonly in their dwellings as temporary partitions, are very frequently painted with such sporting scenes; and many books are published entirely devoted to falconry. Both in these paintings and in illustrated books we find countless evidences of their skill in bird-drawing, and every conceivable position of the falcon and its quarry delineated. I possess two books on falconry, containing many woodcuts of great interest.

The birds most frequently represented by the Japanese artists are storks, tame and wild ducks, wild geese, pheasants, ravens, hawks, falcons, and cocks and hens.

The stork is held in a sort of semi-veneration by the Japanese, and adopted by them as the emblem of longevity. For these reasons, it is one of their most favourite objects, and is used as an ornament throughout the entire range of their arts. It is impossible to imagine any position which storks can assume that is not depicted by the Japanese artists, and it is likewise impossible to realise anything more artistic than their manner of treating them.

There are two birds, one a variety of the pheasant, and the other a species of tame duck, called *Kimodori*, which, from their extreme beauty, form favourite studies for Japanese artists.

The Japanese appear to have only one mythical bird, which, they believe, dwells in the high regions of the air, and descends, to bless the earth with its presence, only on the birth of a great emperor or some such extraordinary occasion. The name of this bird is *Foo*, and it is represented in art like a bird of paradise, with excessively rich plumage. This bird is not so generally introduced in art as the natural birds; and it appears to me that it is always in some way connected with royalty, and alludes to some remarkable event when it is introduced. Representations of this bird occur on several pieces of enamel in the possession of my friend Mr. James Lord Bows, and are almost in every case associated with insignia of royalty, the most usual being that of Taikosama, the first secular monarch of Japan, A.D. 1585-91. I have seen the *Foo* several times on porcelain, and in a few instances in lacquer-work,—one is on the top of a superb cabinet, also in the possession of Mr. Bows, and another on a cabinet in my brother's collection.

Kempfer remarks:—"Considering the largeness and extent of the Japanese empire, it is but sparingly supplied with four-footed beasts, wild or tame. The former find but few desert-places, where they could increase and multiply, and follow their usual shy way of life. The latter are bred up only for carriage and agriculture. Pythagoras's doctrine of the transmigration of the soul being received almost universally, the natives eat no flesh meat; and living, as they do, chiefly upon vegetables, they know how to improve the ground to much better advantage than by turning it into meadows and pastures for breeding of cattle." Such being the case, we cannot be surprised that natural animals are comparatively seldom depicted in their art-works. The horse is certainly often met with, sometimes alone, but more frequently with its rider, and always treated skilfully.

The elephant is represented in the Buddhist temples, no doubt in allusion to India, the birth-

place of that faith; and when it is used in other works of art, it is no doubt with some kindred idea.

I do not remember ever having met with a single representation of a natural lion in Japanese art, but have seen a few tigers, although indifferently well done. The Japanese frequently represent a mythical animal somewhat resembling a lion, commonly called by us the *Kylin*; but what their ideas are in connexion with this animal I have been unable to clearly ascertain.

The most important of the fabulous animals of Japan, and the one most frequently represented in art, is the dragon. Kempfer says:—"The chronicles and histories of their gods and heroes are full of fabulous stories of this animal. They believe that it dwells at the bottom of the sea, as in its proper element. They represent it in their books as a huge, long, four-footed snake, scaly all over the body, like a crocodile, with sharp prickles along the back, but the head is, beyond the rest, monstrous and terrible. Some of the Japanese emperor's cloth, his arms, scimitars, knives, and the like, as also the furniture and hangings of the Imperial Palace, are adorned with figures of this dragon, holding a round jewel or pearl in the right fore-claw. The Japanese dragon hath but three claws on each foot, whereby it is distinguished from the Chinese Imperial dragon, which is represented with five."

Foxes, monkeys, bears, dogs, cats, rats, rabbits, and frogs are amongst the animals most commonly met with in works of Japanese art; and although generally cleverly rendered, deserve no special remark.

A great variety of fishes are favourites with Japanese artists, and are invariably well drawn. Fish is one of the staple articles of food in Japan, and the fisherman's trade is held in considerable esteem by the people. Both these facts have operated largely in making representations of fish, and indeed all marine productions, very popular objects of art.

The different ways in which fish are introduced by the Japanese artists are positively countless, but there are four ways which are more common than others, namely:—As dead and lying singly, or in twos or threes, across each other; as alive and swimming amidst curling waves; as in the act of being caught by the expert fisherman by rod or net; and as in the act of ascending a waterfall.

The sea-tortoise or turtle in its natural form is occasionally depicted, but in art we more frequently meet with a fanciful modification of it. This consists of a tortoise, with a long and broad tail of hair issuing from the hinder half of its body. In this form it is called *Mooko* or *Mingano*, and is looked upon with considerable veneration as the emblem of long life and happiness. It is introduced in the ornamentation of screens and walls of the temples and palaces of the Japanese, and represented by their artists in every branch of their work.

Catfish and shell-fish of all sorts are adopted by the Japanese, and executed with great skill in metal-work, ivory carving, lacquer-work, and painting.

Insects are frequently represented, but generally in connexion with other and more important objects. Fruit and leaves, for instance, are sometimes shown partially eaten by insects; and we generally find a specimen of the deprecators, in the act of eating, shown along with them. It is also common to find insects and birds together; and a spider with its web stretched between the branches of a shrub, is also a favourite ornament; and should we find a fallen leaf supported by the web, we need not ask why the artist put it there,—it is only a way he has of telling us what a strong thing a spider's web is.

I have said as much as I dare say at the present time with regard to objects of animated nature. I shall therefore add a few words upon the most characteristic inanimate objects, utilised for art purposes by the Japanese, and pass on to the consideration of the several departments of art manufacture and their peculiarities.

The chief of all the inanimate objects utilised for art purposes by the Japanese, is the beautiful mountain, *Fusiyama*. This mountain is one of the most common illustrations in books, on porcelain, and on lacquer articles. It is nearly always represented as it appears from the suburbs of Yeddo, with its sharply-defined sloping sides and crown of snow. *Fusiyama* is an extinct volcano. The latest eruption on record was in 1767. It is considered sacred by the natives, and religious pilgrimages are made to it.

Rocks, with waterfalls, or waves of the sea breaking over them, are often represented by the Japanese in the charming little pictures they paint on their porcelain and lacquer-work. And driving rain, softly-falling snow, or a hoisterous gale, appear to give great scope for the graphic delineation of these cunning craftsmen. Their way of representing a mist at sea is very amusing, positively nothing being shown but a few straight and curved lines, shaping upper portions of masts and sails. Imagination supplies the mist which obscures all the rest of the vessel.

Sunset and moonlight are also very favourite representations, and are always cleverly rendered.

Clouds are almost invariably present in landscapes, or, indeed, almost every open-air scene, but are never well drawn. The attempt to flatten them to meet the requirements of decorative art is almost a universal failure.

There are countless other objects which are pressed into the service of the decorative artists of Japan, and I shall allude to many in the remaining portion of my paper: it is, however, impossible for me to describe them all, and, as I have mentioned the most prominent, it is not at all necessary.

G. A. AUDSLEY.

THE ENSUING IRISH EXHIBITION AND ITS PROSPECTS.

The first general Irish Exhibition, it may be remembered, was in the year 1853, following close upon the great English or polynational one of 1851. The one in the sister kingdom had its impulse and certainty in the princely liberality of one man, Mr. William Dargan, a well-known railway contractor, since deceased, who on the 24th of June, 1852, placed at the disposal of the Royal Dublin Society 20,000*l.*, which he subsequently increased by an additional 6,000*l.* towards defraying the expenses. It was opened in May by the Lord Lieutenant, and in the following August her Majesty, Prince Alhert, and the Prince of Wales visited it. During its continuance, which lasted within a few days of six months, it was fairly patronised; and, on the whole, considering that it was the first of its kind and defective in many of its arrangements, the receipts were large, but not large enough to make up losses through evident mismanagement and lack of proper organisation.

The second Exhibition, which was more of the nature of a local one, took place in 1865, a glass and iron structure having been designed for the purpose. It is in this building that the forthcoming Exhibition is about to take place. Though there was a considerable influx of English and foreign visitors on the occasion of the second Exhibition in Dublin, still it was financially a failure; and a good deal may be attributed in this case also to bad management, lack of foresight, and want of business scrutiny in several of the departments, and also as to the funds.

Both Exhibitions, however, had their useful ends, and gave an impulse to many dormant industries, which have since been successfully, in some instances, developed.

The Exhibition for this year begins under more favourable auspices, and it is hoped will be more successful than the preceding ones. The Messrs. Guinness, of the well-known Dublin brewery firm, are acting as the guarantee, on the condition that the business, control, and management will be left to their direction,—a condition that has been acceded to by the committee of noblemen and gentlemen formed, and others interested in seeing it properly carried out.

Already considerable progress is made in the arrangements, and a large quantity of goods of various kinds has arrived. The building, as we write, is undergoing re-decoration and painting, and the garden attached is being looked to with a view to have it as attractive as possible when the building opens, which it is thought will take place early in June, or perhaps sooner. The Exhibition will be of a permanent character, similar in conduct to that of South Kensington. Loans of articles of an art description have been freely granted by many Irish and English noblemen and gentlemen, as also by public bodies. The several corporations, having been applied to for loans of paintings and other historical works in connexion with their town-halls, have responded to some extent, and others are also willing to comply with guarantees as to the safety of the articles which they severally intrust.

Although the Irish Exhibition will be general

in its features, it will, at the same time, be more especially devoted to the illustrations of the arts, manufactures, and industries of Ireland; and for that end a separate portion of the building, called the Leinster Hall, will be allotted for the national department. To the latter will be annexed the "Loan Collection," comprising the whole circle as far as possible of objects historic, artistic, and *adscripti glæbe*, interesting in various ways to the Celt. A short enumeration will not be amiss of what the sections and classes embrace.

Section A.—Natural products, including minerals and animal products, chemical products, food, raw materials, and the immediate product of their manufacture.

Section B.—Works of art, including (Class 1), sculpture, plastic art, oil and water-colour paintings, &c., pencil, chalk, and crayon drawings, engravings ancient and modern, lithography, and chromo-lithography. Class 2.—Architectural and decorative designs, photography, models, porcelain painting, enamels, stained glass, and mosaics, and miscellaneous works of art.

Section C.—Class 1. Marble, porcelain, and pottery of all kinds. Class 2. Textile fabrics, lace and fancy work. Class 3. Printing, book-binding, leather work, wood carving, metal work and furniture. Class 4. Scientific inventions, musical and optical instruments, jewelry, carriage work, and manufactures not otherwise specified.

In looking over the several conditions and regulations laid down by the directorate, we might feel disposed to object in some instances if fault-finding were our only desire in recording them. As every possible care is promised to be taken of the exhibits, the promise must be relied upon. No insurance will be effected unless under special arrangements, and in the matter of providing stalls or fittings, glass cases for shows, show-boards, and other appurtenances, their security or appropriateness must be looked to by the exhibitors themselves, the committee reserving the power of objecting, in cases, we suppose, that may seem to outrage natural fitness.

In the matter of "sales," it is questionable whether the committee or directorate are on the right track. An agency office is to be established in the building to provide means for transmitting orders or negotiating sales, and for other cognate purposes, for which a nominal charge of 5 per cent. will be made on the amount realised by such sales. This is certainly the bazaar principle, and we shall be surprised if the committee will succeed in otherwise procuring open or covert sales, in view of their loose "regulations and restrictions as to exhibits," which say, "No exhibits can be received for a period less than six months, unless by special arrangements to the contrary, and goods will not be allowed to be removed or substituted except by a special permit from the superintendent."

Notwithstanding that two months' notice is to be given by an exhibitor before the removal of any of his goods, the above regulation is a very plastic one, and the special permit may be managed or relaxed, perhaps to cover a multitude of venial sins. The prohibitions as to admission of inflammable goods are unobjectionable. In the former Exhibitions in Dublin, a description of sales was allowed, and "touting," which we trust will not be witnessed in the present. We bear in mind of course that the ensuing Exhibition is intended to be a permanent one, yet we can hardly see that this alters the fact that it ought not to do anything that would detract from its merit, as a *bona fide* exposition of art, industries, and manufactures intended to elevate public taste, and encourage native talent to compete worthily with other talent outside the limit of the island.

We may expect to see a good many evidences of ancient skill; museum and cabinet articles; heirlooms in gold, silver, and other material belonging to Ireland of the past; but what we really desire to see is modern and present day evidence of the country's advancement in arts and manufactures. Appealing to the past, as in condemnation for the neglect of the present, will not do in these days of sober improvement. If Dublin, Cork, Limerick, Waterford, and Galway cannot show as fair an example in natural products and manufactures as the commercial town of Belfast, they will not deserve a very high commendation.

Belfast took several gold and silver medals at the late distribution of prizes belonging to the Workmen's International Exhibition,—first-class prizes; but we have failed to see that Dublin carried off any. In strict justice, however, to

her, it may be said that Dublin sent very few exhibits to London on the occasion.

As architecture has been lately looking up in Ireland, can we hope for anything in the way of a good show of architectural drawings, designs, models, and building appliances? Can the Institute of Irish Architects redeem the credit of their profession in Ireland, singly or conjointly? They ought to be able by this time to have gathered together the nucleus of a creditable museum. Of Irish works in marble, pottery, and porcelain we shall be anxious to see the results. In that ware known as Beleck pottery we are aware that some creditable progress has taken place of late years, as also in domestic marble ornamentation. We are unaware of whether anything has been done in the sister island in the projecting of native terra-cotta, glazed earthenware of an improved description, or encaustic tile manufacture. In the manufacture of the common building brick in Ireland there is vast room for improvement, and with every facility in many districts for brickmaking, the greater part of that article is rotten rubbish. The country has good brick-clay in many localities, and splendid marble-beds; and the county of Dublin alone is a perfect mine of building materials, from the hardest granite to the softest chalk, casting-sand, moulding-sand, building-sand, painting earths, minerals of various kinds, and a variety of other substances used in the arts, industries, and manufactures of other nations; and yet, with all these, the capital of Ireland is half a century behind the age in many ways.

We are scarcely called on to go into detail; yet we feel it is not out of place, in sight almost of these matters, with a view of leading men who ought to feel interested to consider the strange oversight that has characterised their action for a number of years.

Energy and enterprise are wanted in Ireland, more dependence on self, and less dependence upon others. A permanent Exhibition will or ought to do good, if it is kept from degenerating into a mere show-shop or building for effecting sales. To be successful, it must have the power to promote, foster, and elicit the true artistic and skilled spirit and embodiment of the country. This it can do only by keeping before the eyes of the people the best examples in everything, and, as far as lies in the power of its directorate, urging and encouraging to still further improvements.

ST. PAUL'S THANKSGIVING FUND.

A NUMEROUSLY-ATTENDED public meeting has been held in the Mansion House for the purpose of establishing the fund already on foot for the completion of St. Paul's as a thank-offering for the recovery of the Prince of Wales. The Lord Mayor occupied the chair, and was supported by the Earl of Feversham, the Bishop of London, Mr. Beresford Hope, M.P., Mr. Thomas Brassey, M.P., Canon Gregory, Lord R. Cavendish, Lord George Hamilton, M.P., Mr. W. H. Smith, M.P., Mr. Longman, Mr. Talbot, M.P., Mr. Wren Hoskyn, M.P., Archdeacon Bickersteth, the Dean of Westminster, Canon Liddon, and others.

The following resolutions were unanimously passed:—

"That the national thanksgiving for the happy recovery of His Royal Highness the Prince of Wales would be incomplete without some national thank-offering to mark the people's gratitude; and that, in the opinion of this meeting, the most suitable form which such thank-offering could take would be the completion of the cathedral in which that national thanksgiving was offered up to Almighty God."

"That inasmuch as Her Majesty the Queen and His Royal Highness the Prince of Wales have, after the example of their predecessors, affixed their signatures to the new subscription-book, with a memorandum of their offerings, those present be invited to follow the Royal example by now signing the subscription-book; and that the book be presented for subscription to other distinguished persons who may not be present on this occasion."

"That inasmuch as the greater part of the original revenues of the dean and chapter of St. Paul's Cathedral have been diverted from their original purpose and applied to the spiritual and ecclesiastical interests of the whole country, and the funds now remaining to St. Paul's suffice only for the maintenance of its fabric and services, the co-operation of the nation be invited to this essentially national work, and that the resolutions passed this day be communicated to the lords lieutenant and chief magistrates of the counties and boroughs of England and Wales, with the view of obtaining the requisite contributions for this object."

A letter from Mr. Wm. Gibbs, of Hyde Park-gardens, was read, promising, if nine others would subscribe a like amount, to give 1,000*l.*, and if 10,000*l.* were so raised, to give another 1,000*l.* upon the same terms.

The Bishop of London, in moving a vote of thanks to the Lord Mayor, said that no one could enter the cathedral without thinking that something should be done to make it more fit for such occasions as that of the Thanksgiving. The architect of St. Paul's had achieved a building in which the human voice could be heard by a larger number of people there assembled than in any other building in the world devoted to ecclesiastical purposes; and now, Sunday after Sunday, were assembled there between 6,000 and 7,000 worshippers, and he believed that the work which was done there was telling most powerfully upon the lower middle classes of London. On that ground alone he urged the importance of carrying on the work they had in hand.

DEAN STANLEY was not quite correct when, speaking of the propriety of commemorating the thanksgiving by the restoration of St. Paul's, he said,—"St. Paul's had this advantage, that there was not the slightest doubt whatever as to what should be done for it." Ten thousand schemes might be started in reference to other churches, such as that of Westminster Abbey; but what we had to do with St. Paul's was to make it more bright, more splendid, more gorgeous; to put it in the same category as the great basilica of St. Peter."

The fact is, there is the greatest doubt as to what should be done for it, and it is mainly because the public is by no means satisfied that the committee themselves know what should be done with it, that the matter has been allowed to drag on as it has done. Mr. Street's Papistical proposition to set up a high altar with a baldachino under the centre of the dome, has much damaged the scheme.

It is an unsatisfactory circumstance that not a single artist took part in the meeting in the Mansion House. Art is not to be had without artists.

ROUND CHURCHES IN EUROPE.

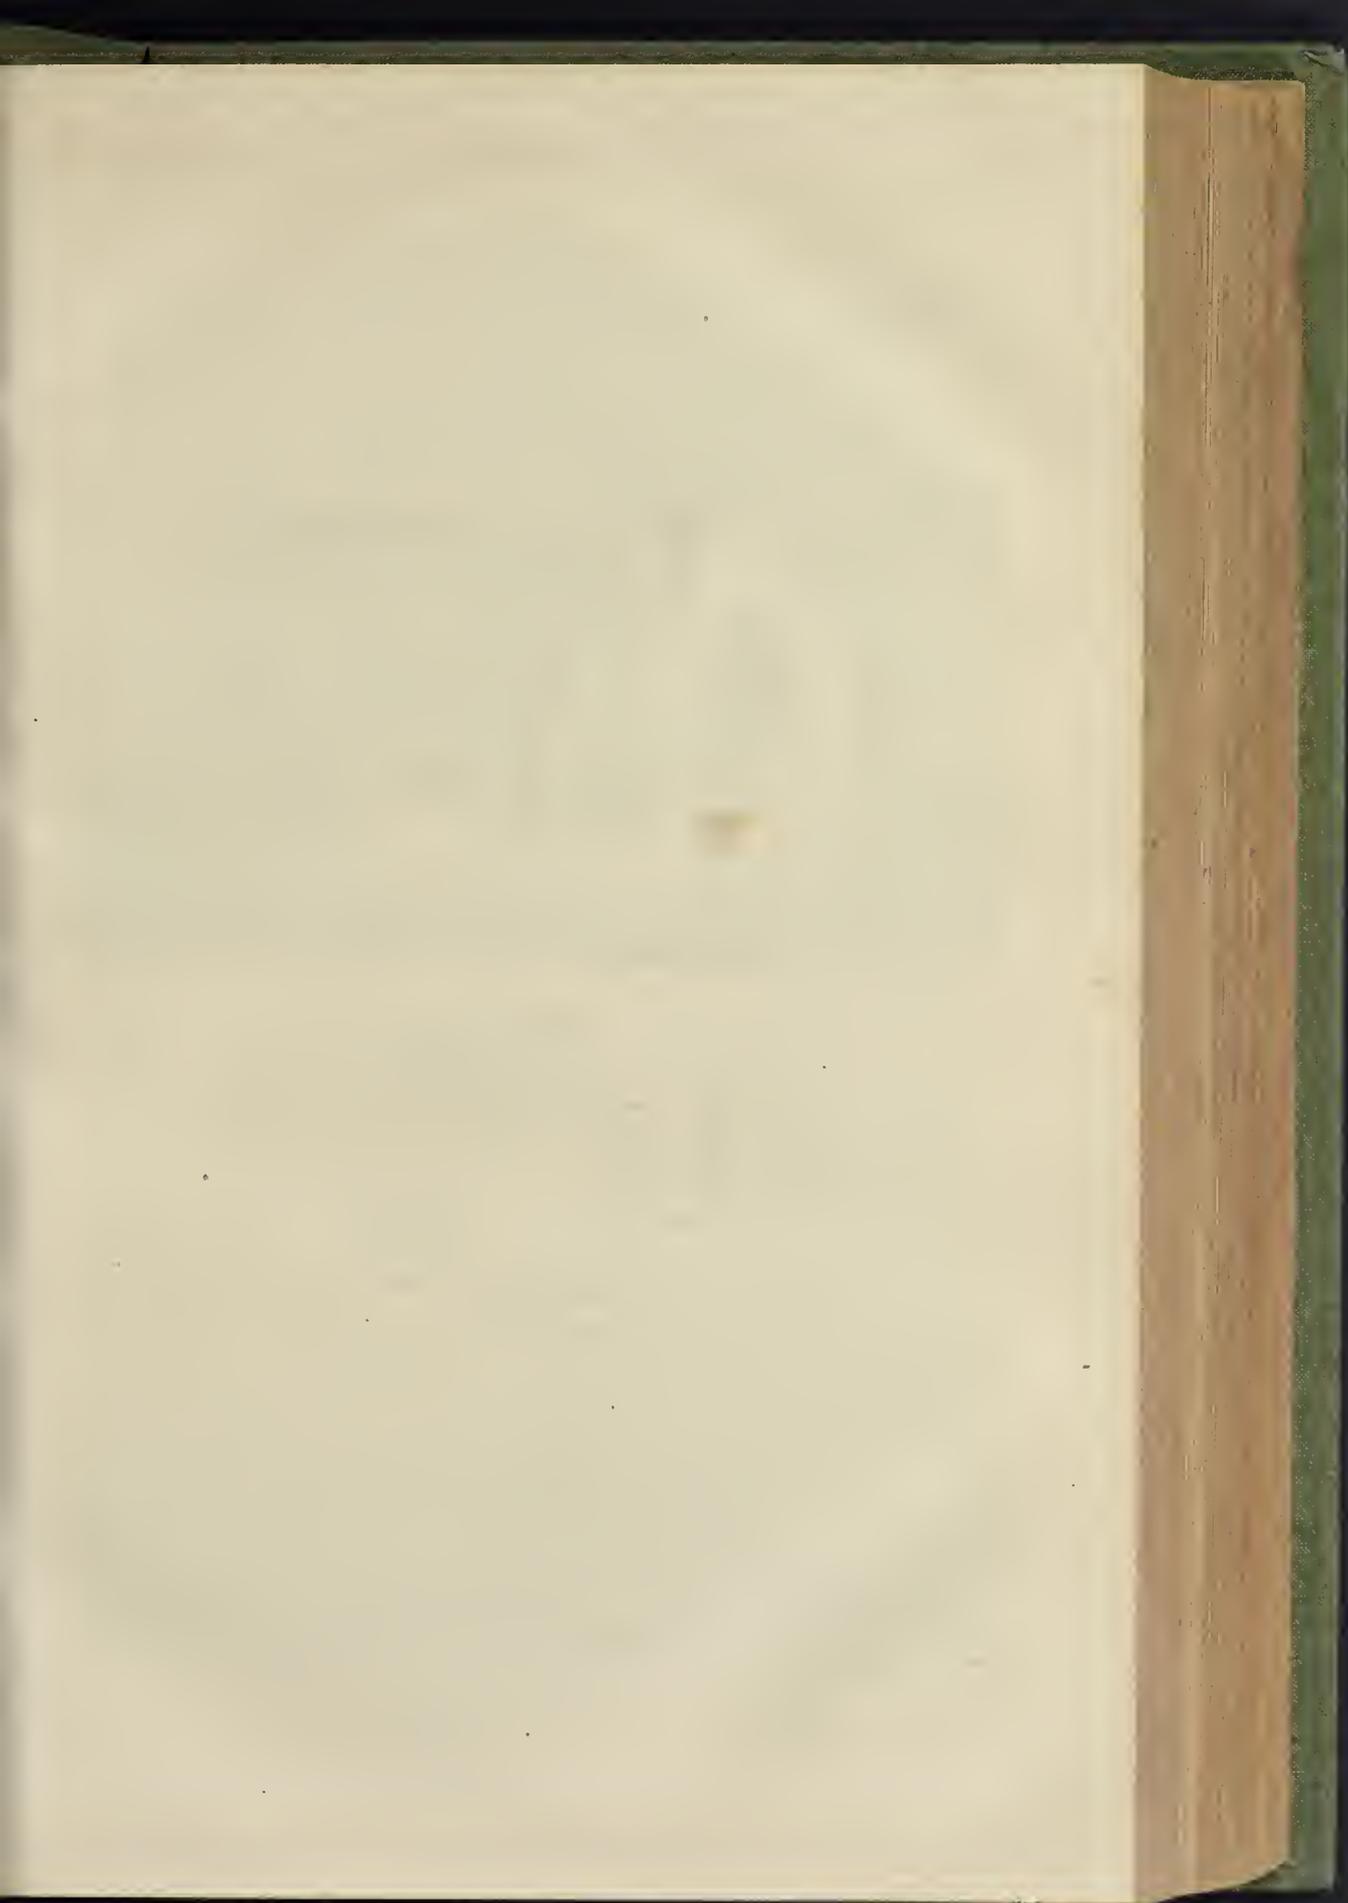

SIR,—M. Lucas, in the essay reviewed in your last number, conveys the inference that the Cathedral of Paderborn is a round church, and was founded by Charlemagne. Allow me to say Paderborn Cathedral is not round, and was not founded by Charlemagne. Possibly the writer has confused Paderborn and Aix La Chapelle.

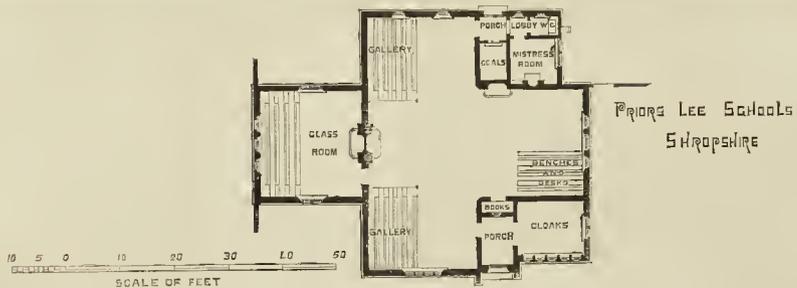

The following are the most remarkable round or polygonal churches in Germany:—Aix La Chapelle (octagon); Fulda; Wurzburg Castle Church; two small round churches at Prague (very early); church in the Wischerad (Prague, fourteenth century); Oberwittigshausen (octagon); Grunfeldshausen, nave and choir both octagon (thirteenth century, Romanesque); Weilburg; St. Geron, Cologne (twelve-sided); Koblenz (hexagon); and Standorf.

H. W. BREWER.

MARBLE STAIRCASE: GOLDSMITHS' HALL.

THE fine hall of the Goldsmiths' Company, close behind the General Post-office,—too, close behind it,—has recently received a further adornment: the stairs, staircase, and approaches have been re-formed in marble of various kinds, at the cost of something over 8,000*l.*, under the direction of Mr. Robert Hesketh, architect, by Messrs. Burke & Co., of Regent-street, who have done the work well. The steps and landings are of Sicilian marble, one of the landings remarkable for its size; the balusters are of Staffordshire alabaster; the columns which carry the dome are fine monoliths of Griotte de Plancres, each about 16*ft.* in height; and the walls are lined with Italian, Belgian, and Devonshire marbles of different hues, elegantly moulded and ably harmonised, including some remarkably beautiful panels of Pavanazzi from the Apennines. A niche on the first landing, whence the stairs go up right and left, and which contains Chantrey's bust of William IV., is cut from a single block of Devonshire marble, weighing originally, we are told, nearly 50 tons. We were surprised to hear that the whole of this successful work had been done in seven months. The Goldsmiths' Company need no longer dream that they dwell in marble halls,—it is with them a broad-day reality. By the way, the domical covering is now scarcely good enough for the substructure: it needs mosaic work, and a little high-class painting.

THE GRANVILLE SCHOOLS, PRIOR'S LEE, SHROPSHIRE.—MR. JOSEPH FOGERTY, ARCHITECT.

THE GRANVILLE SCHOOLS, PRIOR'S LEE, SHROPSHIRE.

The schools we illustrate have been recently erected from the designs of Mr. Joseph Fogerty, near Shiffnal, in Shropshire.

The external faces are of red brick, with white stone dressings to windows, tower, and doors. The roof is covered with brown and blue Broseley tiles, in bands. The internal faces of walls are of white glazed brick, with wood skirtings.

The internal woodwork throughout is of selected pitch pine, varnished. The ceiling is plastered, and divided into panels by wood ribs. The porches are tiled, and all the remaining floors are of wood.

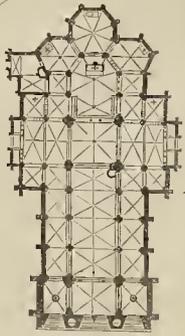

The room is heated by large open fireplaces, as shown on the plan. The requisite closets, &c., are erected in the playground for the children.

Accommodation is provided for 250 infants; and in the arrangement of the galleries and desks care has been taken to avoid, as far as possible, any confusion when more than one teacher is speaking. The cost was 1,296*l*. The builder is Mr. J. Cobb, of Newport.

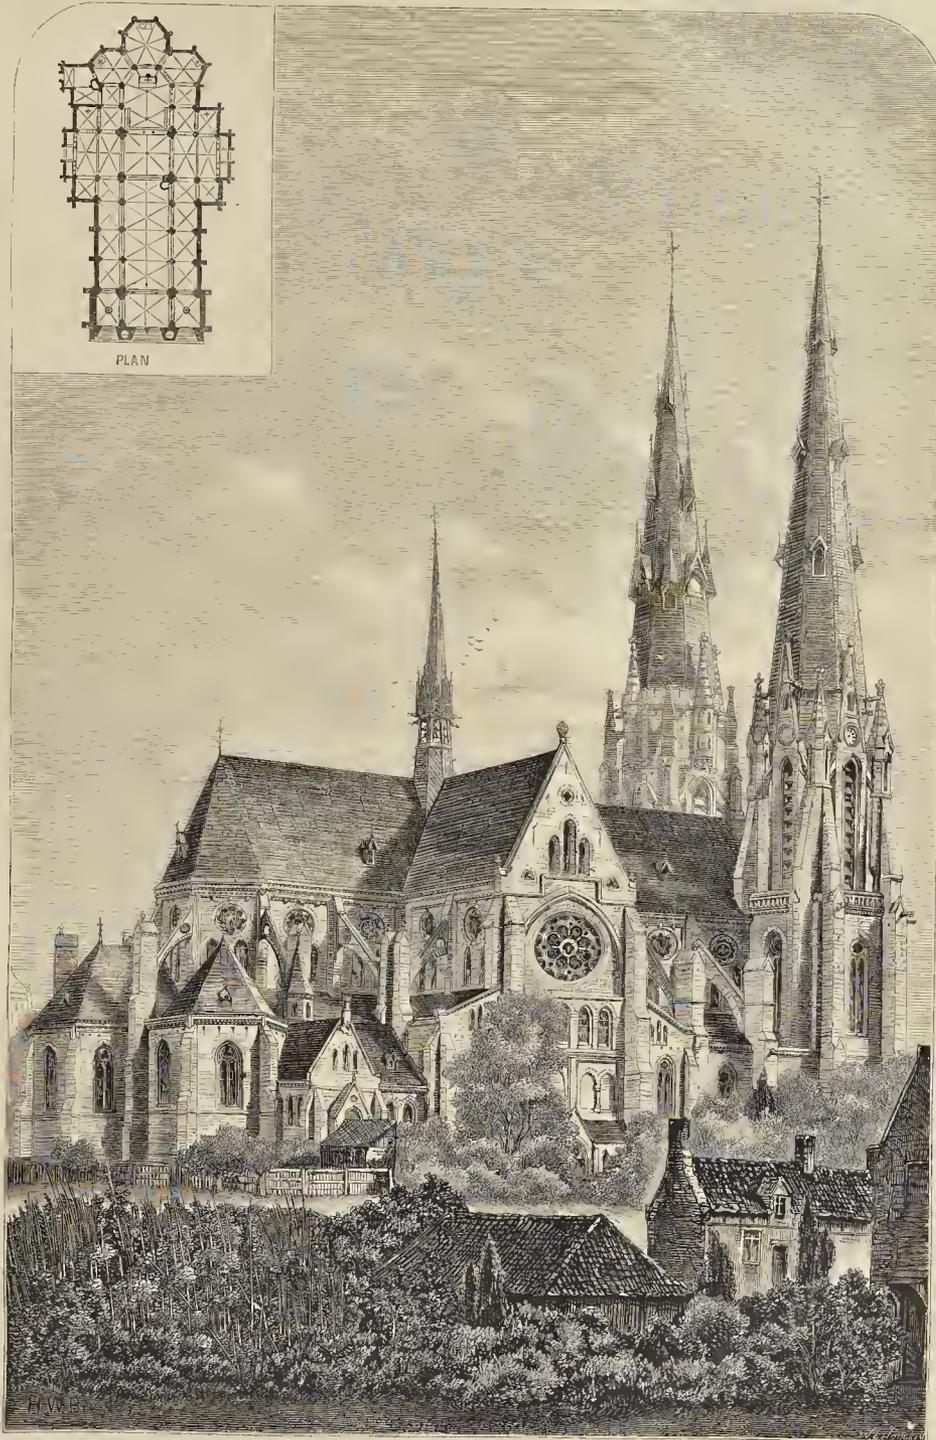

THE PUBLIC HEALTH BILL AND WATER SUPPLY.

In introducing his Public Health Bill, Mr. Stansfeld expressed his conviction that the existing enactments furnished sufficient powers for enabling local health authorities to provide sewerage and water supply for their districts; but with regard to the powers of local authorities to compel the use of wholesome water, the honourable gentleman is certainly in error. The Public Health Act of 1848 enables Local

Boards to compel any occupier to lay water on to his house, provided he can do so at a cost not exceeding 2*l*. per week; but practically this clause has been found to be inoperative, and a further provision appears in the Local Government Act of 1858, enabling Local Boards to enforce the use of wholesome water when the cost of doing so does not exceed the rates authorised by any *Local Act* in the district. Now the term *Local Act* is so ambiguous as to render the contemplated extension of power almost nugatory; and in districts where water is furnished by a private company, Local Boards have more than once been advised that the Public Health Acts do not confer the powers that they require to secure a supply of pure water for domestic purposes. Will it not be well to have so important a power conveyed in terms that admit of no ambiguity? A. J.

PLAN

ST. CATHERINE'S CHURCH, EINDHOVEN, HOLLAND.—Mr. CUYPERS, ARCHITECT.

ST. CATHERINE'S CHURCH, EINDHOVEN.
ARCHITECTURE IN HOLLAND.

WE have frequently had occasion in this journal to notice the remarkable "revival" of Gothic architecture which has taken place in the little kingdom of Holland during the last fifteen years, and we have more than once pointed out the fact that it is almost entirely due to one gentleman, Mr. P. J. Cuypers, of Amsterdam and Roommond. We have published illustrations of some of this gentleman's works, including St. Barbara's Church, Breda, and his design for a new museum at Amsterdam. We now give an additional example of his work in our illustration of his Church of St. Catherine at Eindhoven.

The new Church of St. Catherine in Eindhoven is certainly the best example of modern Gothic architecture which we have seen in Holland; it is also one of the most complete and perfect modern churches in that country. In addition to these advantages, it possesses another, that of being erected on a most excellent site.

The pretty little town of Eindhoven consists principally of one long wide street, with high brick gabled houses on either side. At each end of this street is a large square or "place" planted with trees, and paths bisect these at right angles to the principal or High street. Now the Church of St. Catherine is situated at the extreme end of the town, with its west end opening upon one of these large squares. It has a wide street on its southern side, while the east end and north side are surrounded by market-gardens and hop-grounds; and, as the church is upon the only rising ground in the whole town, it is seen to great advantage from all points of view.

It will be seen from our "sketch plan" that the church consists of a choir and aisles, a chevet, with three radiating apsidal chapels to the east, and a sacristy to the north; transepts, with eastern and western aisles; a nave and aisles, and two western towers. The dimensions of the building are as follows:—Total length, 237 ft.; width across transepts, 114 ft.; width of nave and aisles internally, 71 ft.; width of nave in the clear, 33 ft.; height of nave to the brick vaulting, 71 ft.; height of spire, 214 ft.

The most striking portion of the exterior of this fine church is perhaps the west front. It consists of three deeply-recessed doorways, the centre one of which is double, and has a noble statue of the Madonna and Child, considerably larger than life, upon its centre column, and a tympanum filled with sculpture, representing scenes from the life of St. Catherine. Above this is a large wheel-window, and over this, again, a gable pierced with long lancets, in front of which is an arcaded parapet, with angels standing upon it in front of the gable. The towers which flank this gable are similar as high as the parapet of the clear-story-walls, which is carried round them and returned across the west front. Above this line, however, they are wholly dissimilar. The northern one consists of an elongated lantern, pierced with lancet windows on its four cardinal sides; while long, sloping buttresses and octagonal pinnacles fill in the spaces between the square of the tower and its four oblique sides. The whole is crowned with a lofty spire of slate, pierced by three rows of louvre windows. The southern tower also becomes octagonal above the line of the clear-story parapet, but is quite differently treated from the one we have described; for, instead of having its cardinal sides gabled above the windows, four circular turrets are bracketed out from that front, and are united by an embattled parapet, from within which the spire commences. The spire also differs from its companion inasmuch as four large dormers are inserted into it for the clock-faces. We need scarcely observe that, in ancient churches it is much more common to find the western towers dissimilar than exactly alike, and this is even the case when both were erected at the same time. The rest of the exterior of this church can be better understood from our illustration than any description. We should mention that the whole building is in brick, with the exception of the doorways, window tracery, and strings. The brick is of a dark brown colour, and is laid in "English bond."

The interior of this church is far richer and more elaborate than the exterior. The whole building is vaulted in brick, with stone ribs and richly-carved bosses. The clear-story windows are shafted and moulded in stone, and below them is a very originally-treated triforium, consisting of three arches in each bay, the upper portions of which are filled with tracery, and the

lower portions, as high up as the springing of the arches, are filled in with a conventional representation of curtains similar to those on the west end of Rheims Cathedral. The arches of the main arcade are of brick in bands of colour, but with stone labels; all the capitals are carved in simple and conventional foliage of admirable design. The altars and screen-work, most of which is complete, are of stone, elaborately carved, especially the parcloches of the choir and the high altar, which are excellent examples of church furniture. The metal throne candlesticks and candelabra are all from the designs of Mr. Cuypers, and show that gentleman's thorough knowledge of that branch of his art. The arrangement of the altars in the transepts is one of the most pleasing features of the whole design. The only articles of church furniture which are not from the architect's designs are the pulpit, the font, the confessionals, the altars: these are all Italian, and were the only things saved from the church which stood where the present one now stands. It was a poor barn-like edifice, about 200 years old, and everything that was good for anything about it has been carefully preserved in the new building. The pulpit is a good example of Late Renaissance carving, as are also the confessionals: they are of oak. The font and altars, though bad in design, are of pure white statuary marble. Some people have found fault with Mr. Cuypers for keeping these features in his new church, but we think that he has acted wisely in preserving memorials which were in themselves good of the old building, however out of character they may be with the new one, and really the effect of these is anything but bad. They seem to give an interest to the church.

Before concluding this notice of this remarkable church, we must say a few words of the system of decoration which has here been carried out. The brickwork of the interior is in bands of buff and red, with a few lines of black; the buff, however, is in every case separated from the red by a broad band of whitewash, over which the markings of the brick are all picked out, and arabesques in blue and green painted over the whole. The stonework is also decorated in lines and spots of colour, and a considerable amount of gilding is introduced into the decoration of the roof. Below the aisle windows runs a series of wall pictures, painted in very flat colour, with strongly defined outlines. They are chiefly on a white ground. The records of the altars, and the altars themselves, are also decorated in colour; and every window is filled with stained glass, or patterns in "grisaille." Certainly a church with as much colour as is here described would, without great care was taken, appear gaudy; this has, however, been entirely avoided by the introduction of a quantity of pure white, which has a most brilliant effect, and yet seems to bring the whole into harmony and good keeping.

An altar carpet of most elaborate design, consisting of a mystical representation of the Garden of Eden, has been worked for this church. It is from the designs of the architect, and is, with the exception of the altar carpet for the Cathedral of Aix-la-Chapelle, the finest example of modern work of this description that we have seen, on such a large scale.

NEWS FROM ROME AND FLORENCE.

A HURRIED visit to Rome during the last weeks of the Carnival enabled me to take a cursory view of the state of the new capital under its Italian régime.

To the lovers of art, and the lovers of Rome as it was in the old Papal days, the change will not be altogether satisfactory. The welcome tranquillity, after visits to the bustling cities of the north of Italy, and the noisy Neapolitan capital, no longer exists. True, the crowd—the mob, I may say—of people this winter in Rome prefer the Corso and the Pincio; the places where, seeing, they can be seen, mostly attract them; luckily for the would-be student and lover of antiquity's remains, who are thus able to see some of Rome's treasures unmolested. But to our minds, in the words of the poetess (whose son, so deeply read in Rome's archaeological lore, is now delighting his hearers with his interesting *stances* in Rome), we may sing appropriately, "Rome! Rome! thou art no more, as thou hast been!" On the other hand, to the lover of progress the movement literally speaks volumes. The freedom of speech and

action, before so circumscribed, is now unchecked, but sudden and great changes like those in Rome must bring mixed consequences. In time, there is no doubt, the good will predominate. Education and enlightenment are the two great objects now prominently being battled for; but the reformer has to fight his way into Rome with hard, struggling steps. Old institutions,—the profitable begging trade, formerly sanctioned by the municipality,—have to be eradicated, and that at a time when rent and provisions have been raised and taxed to an unwanted degree. Begging produces a tangible supply, while education seems to the poor but the engrossing of the machinery for begging without producing visible returns; but work will soon be supplied in abundance, and the Roman workman should, if able to put forth sufficient energy, profit by it. The unemployed from the late capital are flocking down to be ready to work in the new buildings about to be erected. Count Beretta, the director of public constructions in Italy, has now the plans ready, and the approval of the Government for the commencement of the new grand quarter to be built on the site of the Pretorian Camp, near the Railway Station. Three streets of good large and imposing-looking houses are already planned, one leading from the railway station to the Corso already begun, and nearly a dozen houses being completed.

A handsome railway station is in course of erection, to replace the wooden sheds of many years' standing; the hitherto receptacles of all the accumulative confusion and ill-management to be found wherever railway termini exist.

To reach Rome is one thing,—to leave the station in possession of your luggage is a much more distant accomplishment. The coming of the Italians has produced the yellow washing of the exteriors of the houses in the principal streets of Rome, but the parts not in that category appear to be, perhaps from contrast, much more filthy than ever. The streets were indescribably filthy during the Carnival; the rain, mixing with the lime *confetti*, made matters still worse. An attempt at paving the Via Condotti, the street in which the most attractive shops exist,—where copies of the antique and the Roman jewelry are mostly displayed,—signally failed, the pavement being *lower* than the road, and, therefore, the receptacle of all the rain and mud from the latter, and the coachmen, unused to the modern innovation, drive over it indiscriminately. But the municipality promises, when the crowd of visitors has passed away, to pave Rome in an efficient manner.

All buildings to be erected are to be within the walls; large parcels of ground are to be found on which to raise the necessary buildings.

The *on dit* that the Campagna is to be drained by an English company requires confirmation. For agricultural supplies to the growing capital, it would prove of immense advantage.

Depending from without for all necessary supplies, provisions for the poor and the ill-paid employes who have flocked down to the capital have become exorbitant in price; increased by the enormous consumption by the unusual number of visitors to see Rome under its new auspices.

Taxes, increased twenty-fold, are groaned over by artists and artisans there; but after the first *furor* affairs will brighten for them. Enterprising North Italians have taken down their wares, and duplicate shops to those opened when Florence became the capital, and vying with those of Paris, may now be seen in the Corso.

The excavations of the Roman Forum are progressing most satisfactorily. A question might be mooted as to the legitimacy of Signor Rosa's supplying by brick erections the bases of the pillars in the Forum; the spots where they originally stood cannot be mistaken.

The hours and days of admission to the Vatican are limited, but to the real wisher to see its treasures, the ways and means are easily obtainable.

The prevalence of small-pox continues,—deaths therefrom range from 35 to 55 a week, but are almost entirely confined to the Italians; the visitors are not sufferers from it.

We must not omit to mention, among the projected improvements, the erection of two churches,—one for the English Episcopal congregation, one for the American: Mr. Street is the architect of both. Nothing is to be spared to produce a handsome and appropriate building for the English church. The site is within the walls, and nearly facing the Pincio.

The admission of all sects into Rome, now the capital of a free State, having a free Church,

causes a great demand for places of worship. Perhaps the chapels of the appropriate religious houses may be ceded, as has been done in Florence to the Waldensians.

The one great theme of conversation has been the discussion, permitted by the Pope and in Rome, on the subject whether St. Peter ever visited Rome. The arguments were carried on with great patience on both sides, three learned Roman Catholic divines being heard with three Italian "Evangelists," or Protestants, in opposition. Deodati's translation of the Bible being used by all by common consent. Learning only on tradition, and the assertion that the name "Babylon," used by St. Peter, whence, in his Epistles, he sent salutations, meant Rome,—as said an Italian discussionist, "We might have used the expression in reference to Paris during the reign of the Communists."—on these two arguments the Roman Catholic disputants founded all their answers to the addresses on the opposite side. The weak assumption of the chief of the orators that if St. Peter were but an hour in Rome it was sufficient to constitute him the head of the Roman Church, failed to give any weight to the question. The tale has been taken up, and discussions on the subject are being held all over Italy. The mode of crucifixion, which tradition and history attach to St. Peter's death, was found by Mr. Hemans to be Parthian, not Roman.

Many celebrities of the Roman Catholic Church of the anti-infallibility party are now in Rome. Père Hyacinthe, the famous ex-Germolite French declaimer against innovations, is there; the great friend of Dollinger, the *head*, as Père Hyacinthe is the *heart* of their cause.

Meanwhile Florence, the ex-capital, has suddenly resumed its provincial character. The old Italian families, whose huge palaces have been dim and closed for years, have opened their gates and let in floods of light and gaiety. Florence's attractions will be always the same,—the art treasures are its great stay,—the Pitti pictures are the city's property.

The natural surroundings are always beautiful; and it will not be the fault of its spirited sindaco, Signor Peruzzi, if Florence do not increase in beauty and attractiveness. The already-commenced improvements are to be terminated, those of which the plans are made, but not commenced, are to be ended; but there is a clause allowing a tetter of twenty-five years. But plenty of space has been left void by the removal to Rome for any new comers, and it is to be hoped that the willingness with which, for Italy's welfare, the ex-capital ceded its rights, may meet with the reward of greater prosperity in future years.

THE ROYAL SURREY GARDENS, WALWORTH.

THESE gardens and grounds are now undergoing extensive alterations and improvements, with the view of being shortly opened to the public, with a varied combination of attractions. The large building, which was formerly used as a music-hall, and which was also for some time the scene of Mr. Spurgeon's preaching previously to the erection of the edifice in Newington, is being converted into a spacious theatre, which is intended to be fitted up and decorated in a remarkable manner. The building will be devoted to dramatic entertainments of a good class, and also to concerts and general musical entertainments, which will be one of the principal attractions of the restored establishment. In addition to the theatrical and musical entertainments, the gardens will include the zoological element, and buildings for an extensive menagerie are now in progress simultaneously with the construction of the theatre. With the view of making this department of the establishment partake as much as possible of an educational and instructive character, the services of an experienced zoologist have been engaged, who is now collecting specimens for the menagerie, and several valuable and rare animals have already been purchased. Another feature of the design is the laying out a portion of the grounds as botanical gardens, which is now going forward under the superintendence of a landscape gardener. The gardens are to be rigidly closed not later than eleven o'clock at night, and on day in each week will be set apart as a reserved day for that class of visitors who may have objections to mixing with a miscellaneous crowd. Messrs. Jarvis & Son are the architects for the new buildings and alterations,

Mr. Shepherd being the contractor; and the estimated cost of this portion of the works is 3,400*l*. We understand that the buildings and laying out of the grounds are to be completed so as to admit of the establishment being opened in May. Mr. Strange is the new lessee and proprietor.

COMPETITION DODGES.

WE have received several letters, commenting indignantly on some invitations to compete now before the profession, such as the request, in our issue of February 24th, to send designs for two semi-detached villas, to cost 750*l*, and that for designs for the Western Counties Idiot Asylum. The terms are very objectionable in both cases. If architects choose to respond, they deserve what they will get.

ARCHITECTURAL ASSOCIATION.

WE reproduce elsewhere some portions of the paper read by Mr. G. A. Audley, of Liverpool, at the meeting on Friday evening last, the 8th instant, entitled "Notes on Japanese Art." The Saturday afternoon visit on the 2nd, was paid by a body of the members to the church of St. Augustine, Kilburn, the choir and transepts of which are nearly covered in. The nave is to be completed while the portion now in hand is in use, the western arch of the crossing being temporarily walled up. As a large church of somewhat unusual plan, with passage aisles in two stories, vaulted with stone ribs and brick filling in throughout, of red brick externally, with a very sparing use of stone, the building proved in many ways interesting to the students present, and thanks were very heartily voted to Mr. J. L. Pearson, the architect, for the permission and facilities afforded.

CHEAP BUILDING AT PORTSMOUTH.

IN the case, Alexander Dickson v. William Amlet Whillier (in Portsmouth County Court), claim for 49*l*. 10*s*., Mr. Burbidge appeared for the plaintiff, and Mr. G. H. King represented the defendant. Both parties are builders, and an agreement was entered into between them for the plaintiff to build three pairs of villas, at the rate of 36*l*. each, the plaintiff to find the labour, and the defendant the materials. After two villas and three-fourths of another pair had been erected by the plaintiff, a dispute occurred between them, the defendant alleging that the houses were not being built in a proper manner. After hearing part of the evidence in the action, the Judge remarked that it was impossible to do absolute justice in these cases. There were no specifications, and having entered into a blind agreement, out of which a dispute necessarily arose, the parties came to the court expecting him to settle it. His Honor also called attention to several receipts given by the defendant, some of which bore no receipt stamp, remarking such conduct was scandalous. The defendant said he should know better in future. After some fighting on both sides, the Judge finally gave judgment for 15*l*. and costs.

What about the happy tenants of such abodes?

SCHOOL BOARDS.

Derby.—At last meeting the minutes of the Building Committee were read, intimating that the plans and specifications for the new schools in Gerard-street had been laid before the committee by Mr. Coulthurst, the architect, and, having been sanctioned by them, had been forwarded to the Education Department for their approval. The minutes were confirmed.

Bolton.—At a meeting of this Board the tender of Mr. G. Martin for adapting the British School (which had been recently transferred) to the requirements of the Board, at an expense of upwards of 500*l*., was accepted. It was resolved to make application to the corporation for offices in the new Town-hall.

Southampton.—At the last meeting Mr. W. C. Westlake said, before the Board proceeded to the election of an architect and surveyor, as there was no fixed salary connected with the office, it struck him it would be better to propose that the appointment be made subject to such terms as may from time to time be made by the Board. The resolution was carried. The clerk then read applications for the office from Messrs. E. T. Howell, A. Burt, W. & J. Jurd, and J. G. Poole.

Mr. Westlake proposed the election of Mr. Howell, a gentleman who had acted for the Board upon several occasions already, both satisfactorily and reasonably. He was also connected with the town in various ways. The Rev. R. Mount alluded to Mr. Critchlow, who, he believed, had designed many edifices in the town, and amongst others his schools; but that gentleman's name not being sent in for the appointment, he supported the surveyor proposed by Mr. Westlake. He believed he was well versed in the duties of an architect and surveyor. Mr. W. Hickman said the name of the gentleman whom he intended to nominate was already before the meeting, and Mr. E. T. Howell was then unanimously elected.

THE ROYAL DUBLIN SOCIETY.

THIS body are making some commendable efforts to change their sphere of action in connexion with their schools of art and science. New buildings, and enlargements of existing ones, are projected. The Lord Lieutenant is interesting himself in the affair, and promises whatever assistance is compatible with his office in the country. The co-operation of other institutions in the carrying out of their views is sought under conditions, and more direct Government aid is required to place the schools of the Royal Dublin Society on a larger and more useful basis.

THE GALLERY OF ILLUSTRATION.

MRS. GERMAN REED and her little company achieved a genuine success on Wednesday evening last, in the production of an entertainment called "My Aunt's Secret," written by Mr. F. C. Burnand, with very agreeable music by Mr. Jas. L. Molloy. When we say that we regard it as the most complete little piece that has been done in the Gallery of Illustration, our readers will not need much more recommendation. The piece is exceedingly well written and admirably acted by Mrs. Reed, Miss Holland, Mr. Corney Grain, and Mr. Arthur Cecil. The latter gentleman, Mr. Cecil, had already established a reputation as a most accomplished comedian, but in the new piece he shows a power of pathos which could scarcely have been anticipated. His three personations,—the courtly valetudinarian, Sir Marmaduke Pender, Thomas Egerton, and the organ-grinder, Arniard,—viewed together and contrasted, demand for him the highest praise.

THE JEWS' HOUSE, LINCOLN.

WE hear with regret that the interesting Norman House at the foot of Steep Hill, Lincoln, is in so bad a state of repair that unless wise measures be adopted to restore the front to the perpendicular, and otherwise strengthen and maintain the fabric, one of the very few examples we have of a street house of the Norman period will become a ruin. This building dates from the beginning of the twelfth century. It appears to have gained its popular name, the Jews' House, from an incident in the reign of Edward I., when a Jewess residing near it was executed for clipping the coin of the realm. The city of Lincoln, for its own sake, should see that this interesting and valuable relic of past time, and tangible evidence in connexion with its early history, is safely preserved.

CONVENTIONALISM.

SIR,—I have been much interested with the articles which recently appeared in your journal on "Conventionalism in Art." May I be allowed to add an illustration not made use of in them, bearing on the subject, and showing how fine the line is which divides the ideal and conventional in artistic treatment from the actual and the vulgar? I refer to the introduction of the representation of the iris and pupil of the eye, in sculpture, which is sometimes tried, always, however, resulting in a parallel degradation of the ideal of the work which the introduction of colour occasions, as noticed in your articles. The more ideal the subject and treatment the greater the degradation by these means; and even in portrait sculpture a refined taste will not think that anything is gained, but the reverse. How correct and exquisite the instinct of the ancient Greeks in art matters was is seen in nothing more than in the absence of colour (though this is considered dubious by some), but

certainly in the uniform blankness of the eye, which to a lower taste is deemed a defect. It bears, however, I think a very interesting relation to the subject of "conventionalism," as treated in your pages. NEMO.

PETITIONS TO THE HOUSE OF COMMONS.

SIR,—Would some of your correspondents on the spot kindly enlighten a poor bewildered country coterie of your readers by giving us the following information?—

1. Where do all the petitions go to ultimately which are presented to the House of Commons?
2. Are they pigeon-holed (if so, where?) or stored (if so, how?) or thrown into a cellar under the House? (state whether it be fire-proof?) or are they preserved at all? (if so, in what building?)
3. How many cubic feet of space do they occupy per annum.
4. Are they considered as "national records"?
5. Finally, kindly inform us whether they do not constitute a waste-paper perpetuity of the Chancellor of the Exchequer, as some of us think? X. Y. Z.

WHAT MIGHT BE EXPECTED.

AMONG the replies transmitted, through their town clerk, to the council of the borough of Reigate, upon their inviting by advertisement applications for the appointment of an assistant surveyor, to give his whole time at a salary of 50*l.* per annum, was the following:—

"6, Hodge-alley, New-cut, 24 March, 1872.

Mister, I as fur this many yers carid a odd has a bricklayers laborer for a good master Bildee has wud I nose give me a cartiber.

My wages time about eums by working overtime and such like to a bit more in the yere nor you hoffers for silent surveyor, but I be gotten in yeres and fanas the work wud be easier in yure place, so if I sutes wud be glad to take it, remaining your servant mister,

SAMUEL SMITH.

I rites this has specimen, but my son has us ad sculing rites the dressin fur me."

Samuel's enliphraph partook rather more of a *fast than a hand*, but he enclosed a testimonial as to his fitness for the post from his employer, Mr. E. Eakins, of Eden-gardens, East Lambeth-road. P.

THE NEW PUBLIC OFFICES AND THE WIDENING OF PARLIAMENT-STREET.

In the *Builder* of last week is a report of the reply of the Government to Lord Redesdale on the subject of the widening of Parliament-street, the reply being that if such was found to be necessary, the proper persons to pay the expense would be the metropolitan ratepayers. Now, sir, the present Government have of late expressed most extraordinary opinions on such matters (notably in respect to the Thames Embankment), but I think this proposition beats all. You are aware that parallel to Parliament-street formerly ran King-street, one of the oldest streets in the metropolis, and (as its name implies) the king's highway to Westminster. The Government have stopped up this street and taken possession of the soil thereof, whereon they are building the New Public Offices. Having thus thrown the traffic of King-street into Parliament-street, and made the latter dangerous, the Government has the conscience to say that the ratepayers of the metropolis must pay the cost of remedying the inconvenience. I do not believe the Metropolitan Board are quite so soft as the Chancellor of the Exchequer seems to think them. T.

THE TRADES MOVEMENT IN LONDON.

THE Master Builders' Society met last week to consider, in a memorial from the carpenters and joiners, in support of one previously received from the operative masons, requesting an advance of one penny per hour on wages, and a reduction of the hours of labour to fifty-one per week. After considerable deliberation, the master builders unanimously came to the resolution that the present rate of wages,—viz., 8*d.* per hour,—was a fair and liberal rate, having regard to other like trades, both in the metropolis and in the country. As regards the hours of labour, they had reports from different quarters that in some places the men wished to work fifty-four hours, the same as the engineers have settled to work. In other places even longer hours are general; and so the society eventually

came to the conclusion that the present hours, as proposed by the operatives themselves last October,—viz., fifty-six hours and a half in summer, and fifty hours and a half in winter,—was a fair and not excessive rule. Although some little difference of opinion existed as to the exact number of hours desirable; on the main point,—viz., 8*d.* per hour,—it was unanimously agreed not to increase the rate; and if the men should strike against any employer for a rise, other employers would close their works.

THE EXHIBITION OAK.

SIR,—Walking in Hyde Park on Saturday, I was sorry to see that the old elm tree, which was so conspicuous in the north transept of the Exhibition of 1851, was prostrate on the green sward, hewn ready for the saw-pit, and marked or lotted as if for sale, or sold. I should have thought that South Kensington would have gladly claimed it as a relic, or at any rate it might have been converted into seats for the children of those who sat twenty years ago under its branches, and refreshed themselves. A JUNIOR of 1851.

THE SEWAGE QUESTION.

The Birmingham Bill.—In the course of the discussion on the Birmingham Sewage Bill in the House of Commons, Mr. Samuelson said that he could speak from personal experience as to the application of sewage to land, for that of Banbury passed within a quarter of a mile of his house, and was no nuisance. Lord Warwick, moreover, was having the sewage of Leamington brought into his park, being convinced that it was no nuisance if properly utilised. The opposition to the Bill was analogous to that offered to railways by landowners, to whom they subsequently proved a great benefit. There was a strong fight over the Bill, the second reading of which was, however, agreed to.

The Fleet.—A suggestion for relieving the Fleet Sewer, which has proved too small in wet weather to carry away the drainage of the district through which it passes, has been made by Mr. Scott, the surveyor of the St. Pancras vestry. He proposes that advantage be taken of the construction of the Euston, St. Pancras, and Charing-cross Railway, for making another sewer to carry off the storm-waters which now periodically overflow into the kitchens of the houses at King's-cross and its vicinity. Mr. Scott's proposition was warmly approved by the vestry, and recommended to the consideration of the Metropolitan Board of Works.

Ventilation of Drains.—A system of ventilating drains is now in operation at Victoria Mills, West Vale, Mr. Scott having patented the system, through Messrs. Tasker & Brierley, Halifax. The plan is simply that of connecting a pipe between the drain and the ashes place of the boiler furnace. The heat of the fire draws the bad air from the pipe, and it is thus consumed, no smell escaping from the pipe, and the drain for a considerable distance is in this way kept free from foul gases.

ACCIDENTS.

Fall of a Corn Mill at Manchester.—The front of a corn-mill, in Back-street, John-street, Manchester, has fallen to the ground. Happily no one was injured, the workmen on the premises having left for dinner shortly before the accident took place.

Fall of a Building at Stockport.—As some workmen were engaged clearing away old store-houses and offices, three stories high, and 60 ft. long by 30 ft. wide, in the Park Mill-yard, Stockport, previously to the erection of some new premises, about one-half of the length suddenly fell outwards, owing to some of the beams becoming rotted. Several persons were more or less hurt, and others had narrow escapes. Two of the labourers are not expected to recover.

Fatal Fall of a Scaffold at Strettonbury.—A shocking accident has occurred to Mr. Deaves, and to two other men who were with him on some scaffolding, at the bottom of Wylcop. Mr. Deaves, it appears, purchased, some months ago, a house in the locality named, and the building has since been pulled down and rebuilt. A man named George Heath, who had a youth working with him, was engaged in putting up some troughing at the back of the house, and Mr. Deaves ascended the ladder to see how the

work was progressing. While the three were standing on a plank, the "putlog" on which it was standing gave way, and they were precipitated a distance of from 35 ft. to 40 ft. Mr. Deaves, in falling, is supposed to have caught his foot in the ladder, but he came to the ground with a terrible crash, the young man falling upon him, while Heath fell upon his feet. Mr. Deaves has since died, and the others are seriously injured.

CONCRETE HOUSES.

SIR,—The conduct of your correspondent, Mr. G. P. Edwards, cannot be too highly praised in so kindly allowing your readers to inspect the house now building at Addlestone. It has three reception-rooms, kitchen, offices, &c., on ground-floor, about six bedrooms on the first-floor, with an attic story in the roof. There is also a cellar.

The walls, of concrete, have hoop-iron bond at intervals, and are covered with rough cast, with cement dressings to the angles, windows, copings, chimneys, &c. I was much disappointed to find a quantity of brickwork in various parts of the house, and on the question of cost, if 2,000*l.* be correct, and the price or hire of apparatus added, he might just as well have used bricks and mortar, unless the joiner's work and fittings are to be very costly. A concrete house costing from 600*l.* to 800*l.*, and letting for about 50*l.* per annum, would not only pay well, but be a great acquisition to middle-class dwellings, from the accommodation being greater than is now obtained at the same price in bricks and mortar. It would be interesting to hear of any now erecting.

BUSY BEZ.

VARNISH.

SIR,—Will one of your readers oblige with a recipe for varnishing a small article, made of beech? When varnished, I wish it to have a glossy and shining appearance. R. M.

THE ROYAL ENGINEERS.

SIR,—Your correspondent, "Summ Cutigue," makes the assertion that there are "causes which are diverting the attention and undermining the efficiency of our engineers—both officers and men."

As neither officers nor men can defend themselves from this attack in your columns, permit me to assure your numerous readers, as the result of some five weeks' close observation of both officers and men, during the last summer at Chatham, that the Royal Engineers are in no sense of the word "inefficient."

I am not acquainted with the state of efficiency of the other branches of her Majesty's service; but, if those branches are in the same state of discipline, training, and efficiency as the Royal Engineers, the country is in possession of an army that is fit for any duty to which it may be called, though the enemy stood at our gates to-morrow. FRANKLIN.

PROVINCIAL.

Workington.—The Carlisle City and Branch Bank is just about completed at Workington. An effect is produced in the north-east front by simply setting back the wall on the one-pair floor, thus forming a natural balcony, which forms a little tile-paved conservatory, outside the manager's drawing-room, should he see fit to utilise it in this manner. There is a limited amount of enrichment. The principal office walls will be lined to a height of 4 ft. with moulded panelling. The manager's house is amalgamated with and forms part of the bank building. The architect is Mr. John Hodgson, of Carlisle; and the contractors are, Messrs. James Wilkinson, builder and slater; Robert Harrison, carpenter and joiner; J. Ashbridge, plumber; Lea & Graham, iron-founders; Robert Ormerod, cementer and plasterer; and David Canning, painter and glazier.

Bradford.—A new infirmary for the accommodation of male patients of the Bradford Work-house, has been erected, at a total cost of about 4,000*l.* (exclusive of furnishings), and formally opened.

Books Received.

Laxton's Builder's Price-Book for 1872. Kelly & Co. London.
Atchley's Civil Engineer's and Contractor's Estimate and Price-Book. Lockwood & Co. London.

LAXTON'S new old-established Price-Book increases in bulk, and we may add in usefulness. Like all similar works, it requires to be used with intelligence, but evident pains have been taken to make it accord with recent changes in the labour market. The present edition includes the Building Act, the Bye-laws of the Board of Works, a list of distinguishing Brands on deals and boards, and much other information.

The Civil Engineer's and Contractor's Price-Book is edited by Mr. W. D. Haskell, and includes some forms of specifications, and a priced list of plant and tools. The editor properly remarks, that the varying cost of labour under

different circumstances, and in different places, "becomes of primary importance, and requires to be very closely examined into before it is possible to shape a reliable estimate."

Estimates and Diagrams of Railway Bridges.
By J. W. GROVER, C.E. Second Edition, enlarged. London: Spon.

THESE estimates and diagrams include railway bridges for turpiko, public, and occupation roads in the embankments of double and single lines and cuttings of double lines, with form for calculating quantities in skew structures, &c.; also culverts of various dimensions. The author, in this edition of a strictly professional and reliable work, has added some good examples of station works, as actually executed, with their costs, which will be found useful.

VARIORUM.

"EXAMPLES of Architectural Ornaments of Papier Mâché manufactured by the Papier Mâché Company." Part III., shows very attractively the ceiling-flowers and ventilators which they have on sale. The representations are got up in somewhat novel style.

The *Illustrated Book of Poultry* gives a hint as to economy in poultry-houses—"In erecting any range of buildings for poultry, it will save much, both in time and money, if all the details are so planned as to cut up the standard lengths of timber without waste. The most usual length is 12 ft., but 16 ft. is not uncommon, and occasionally 24 ft. may be had in quartering (2 in. by 3 in.) or scantling (4 in. by 3 in.). The latter will be the proper size for the main uprights, while quartering will do well for door-posts, and to support the partitions. But as short wood is generally cheaper than full lengths, if the width of a shed be 6 ft. for instance, it will save both money and the labour of sawing if all the boards for the cross partitions be ordered from the yard in 6 ft. lengths, when they are ready for nailing on without any preparation or loss of time. If the width of shed be 8 ft., a board will still cut out without waste, as the tongue will keep two 4 ft. lengths in place before the long ones. Much money is often literally thrown away for want of considering these simple matters."—The *Quiter* has a chapter on underground work. The writer says—"The work going on day and night in our 3,000 British coal-mines is difficult to realise. We hear not the sound of the 10,000 picks, borers, and sledges; we see not the subterranean towns where the grimy pitmen are manufacturing wealth and power for the British empire. But we may note some of the results directly following from the labours of these coal-black workers. The myriad spindles of our cotton-factories, the blazing furnaces of the iron districts, the ceaseless work of steam-engines, in towns, villages, and homesteads, and the fleets of steamships crowding the ocean highways, are all dependent on the mines, from which are drawn, day and night, the elements of an empire's strength. Such considerations may tend to quicken our sympathies for every class of these underground workers."

The *Art Journal*, treating of "Art-work for Women," says—"Hitherto, the most favourite branches of design for ladies have been lace, fans, and jewelry. If they could not decorate their dwellings, they might, at least, ornament themselves. But the same kind of talent might find a yet wider scope in the recent revival of the ancient homage to St. Valentine, and in the interchange of the Christmas and New Year's cards, which now make the postman's Christmas-hox a double pleasure as well as duty. The coloured lithographic 'scraps,' birds, fruit, and flowers, pretty heads, &c.,—used in the ornamentation of screens and fancy boxes, are also in the same class. The original design is bought by the lithographer, who then reproduces it by the thousand. But such designs are usually made by men: we hear of women employed in the manufacture of these things, but not in originating them. In the manufactory of Mr. Robert Canton, Aldersgate-street, for instance, a very pleasant sight may be seen of rooms filled with happy-looking young women, chatting and singing over their work, as with skilful fingers they put together the delicate flowers, and pretty or quaint devices, which are to bring delight to expectant eyes on February 14th. Mr. Canton is not only willing, but even desirous to give the preference to designs sent by women. But as yet he finds few applicants who can meet his wish."—Dr. Braithwaite, in *Hardwicke's Science Gossip*, affords some interest-

ing particulars of "Manna of the Desert," *Lichen esculentus*. It occurs thickly among stones in the very driest limestone hills of the Tartarian desert, and is scarcely distinguishable from small stones, except by the expert. Mr. Berkeley tells us that Dr. Arthand published a pamphlet to prove that this must have been the manna with which the Israelites were fed. Mr. Munby, who resided many years in Algeria, says that it covers the sand in some parts, and grows during the night like mushrooms, and also that the French soldiers during an expedition south of Constantine, subsisted on it for some days, cooking it in various ways, and making it into bread. "Presuming that the lichen is the same as that on which the children of Israel were fed, there is really little inconsistent with the Scriptural account; allowing that the manna was miraculously supplied, it might still be brought about by natural agency, for Mr. Berkeley further mentions that, lying loose on the ground, without any attachment, it is easily rolled along by the wind, and sometimes piled together in strata several inches in thickness. Nay, more, it is still, occasionally, rained from heaven, being carried up by whirlwinds, and after traversing the air for many miles, falls precisely as the showers of fish, frogs, and grubs' larvæ, which afford sensational paragraphs for our own newspapers. Such a shower of these lichens fell about twenty years ago at Zerzour, during a time of great scarcity: this bread from heaven affording opportune relief to the inhabitants."

—The March number of the *People's Magazine* furnishes, with several interesting papers, some account of the Granite Works of the Ancients. The writer, speaking of Indian work, says,—

"Compared with the monolith temples of granite at Mahabalipuram, which is likewise situated on the promontory coast, those in Egypt sink into insignificance. The rocks thereabout are composed of a hard grey granite, containing quartz, mica, and felspar, with a few crystals of hornblende interspersed. Many have been hollowed out by art, and sculptured into temples with spirited bas-reliefs,—representing episodes in Hindu history and mythology,—and supported by graceful columns; all carved from the solid rock. Detached masses have been cut into shapes of elephants, tigers, lions, bulls, cats, monkeys, and various nondescript monsters, and colossal statues of gods, one of which, namely that of Ganesh, being 30 ft. high. The southernmost of the temples is about 40 ft. in height, 27 ft. in breadth, and nearly the same in length; the exterior being covered with elaborate sculptures. The adjoining edifice is about 49 ft. in length, and in breadth, 25 ft. It is rent by natural causes from summit to base. According to the local Brahminical tradition, these wonderful sculptures were executed by 4,000 workmen, who had come from the north, and returned before their completion. From a careful examination, it is evident that almost all the enormous mass of sculpture and carving that adorns this city of monolith temples and colossi, must have been performed without the aid of fire,—with the hammer, chisel, lever, and wedge alone, and this is one of the hardest rocks in the world." Mention is made of festoons of granite chains in the interior of one of the principal structures, and in length about 518 ft. Each garland, consisting of twenty links, is made of one piece of granite, 60 ft. long. The links themselves are monstrous rings, 32 in. in circumference, and polished as smooth as glass.—The *Gardener's Magazine*, reviewing the City churchyards, speaks thus of that of the Metropolitan Cathedral:—

"The next open space I meet with is the churchyard of St. Paul's, and it pains me to say it is one of the very worst in the city. A more disgraceful scene I cannot imagine than that presented by what is called 'God's Acre' attached to the metropolitan cathedral. Some three or four years ago an avenue of poplars was planted on the northern side of the cathedral. The trees were set 5 ft. apart, so that if they should thrive, they would soon form a thick, but happily they did not thrive: some have lost their leaders and have been cut back, others are complete and are consumptive. I leave it to the architect to say what would be the effect of a nice thriving avenue of Lombardy poplars on the north side of the cathedral, and conjecture in advance their dictum, 'hideous.' As for the rest of the gardening here, it is too bad for respectable criticism, and I must say nothing because I dare not speak my whole mind plainly. I will simply ask every good citizen to pause for one moment at the point where the cabs congregate opposite the Cathedral Coffee-house, and therefrom survey the scene. Here there are a few good trees on the ground to save it from complete disgrace, but the 'gardening' that has been attempted is not only a disgrace to the ecclesiastical authorities, but to the City of London."

Miscellaneous.

Protection of the City from Fire.—A proposal, having for its object the better protection of the City from fire, was discussed at the last meeting of the Court of Common Council. It was brought forward by Mr. Isaacs, whose idea is to erect large reservoirs, to be supplied with water from the Thames, at such an elevation that it may be available by means of hydrants, without waiting for the arrival of the fire-engines. The cost, according to Mr. Isaacs, would be 100,000*l.*, and the proposal was negative.

The Infringement of a Registered Design.—An inquiry has taken place before the Stipendiary, at the Wolverhampton Police Court, into a charge against Messrs. Stokes & Hackett, ironfounders, Hall Green, near Bilston, of infringing a design for stove-grates of Mr. William Rice, iron merchant, of Birmingham. The complainant, Mr. Rice, being under an apprehension that the defendants were applying his identical pattern of stove-grates for their manufactures, for the purposes of sale, Mr. Rice had instigated the firm of Rigby & Co., of Birmingham, to purchase half a dozen grates from the defendants. For the prosecution, it was maintained that the grates thus supplied were *fac similes* of the ornamental design in question. For the defence, a moulder, who for twenty years had been employed by the defendants, testified that neither the grates nor the registered ornamental portion of them had been made at the works of Messrs. Stokes & Hackett during the time he had been in their employ. The firm only manufactured plain grates, and purchased all the ornamental ones that they sold. Corroborative evidence was given. Mr. Mallard Ingram, ironmonger, of Wolverhampton, swore that about twelve months ago he sold to the defendants the four ornamental grates, which he had purchased from Messrs. Barwell. A correspondence between the defendants and Messrs. Rigby, relating to the order for the grates, was then handed in. In one of these communications the defendants wrote that, in consequence of a breakage in their machinery they were not able to complete the order in the specified time. The Stipendiary decided that this was an admission of machinery being applied in the manufacture of these grates, and thereupon found the defendants guilty of the infringement: mitigated penalty, 5*l.*, and costs in one case: other charges were withdrawn.

Funeral of Mrs. Gilbert Scott.—Mrs. Scott, the wife of Mr. George Gilbert Scott, R.A., died (as we heard with great regret) at Mr. Scott's country seat, Rook's nest, Godstone Tandridge, Surrey, on the 24th ult., after a short illness, but after suffering from an affection of the heart for several years. The funeral took place at Tandridge (within which parish Rook's-nest House stands) on Thursday, the 29th ult. The procession consisted of a hearse drawn by four horses; three mourning-coaches, each drawn by two horses; and several private carriages. The mourners were Mr. George Gilbert Scott and Rev. John Oldrid, Mr. Gilbert Scott and Mr. Alwyn Scott, Mr. and Mrs. John Scott, Mr. Dufkinfield Scott, Rev. T. Scott, Rev. Canon Scott, Rev. William Scott, Rev. T. Scott, jun., Mr. Henry Scott, Rev. — Stevens, Rev. G. T. Hoare; the servants of the household, gardeners, ten clerks, &c., from Mr. Scott's office. The service was performed by the vicar, the Rev. R. H. Borradaile. The outer coffin was covered with violet velvet, and had gilt furniture. The handles were crosses, with circles; on the top was an illuminated brass plate. The brick grave was lined with enamelled encaustic tiles. At the bottom of the grave was a Latin cross of coloured tiles, with black border on red ground. The sides and ends were covered with tiles of various patterns. The deceased lady was the youngest daughter of the late Mr. John Oldrid, of Boston, Lincolnshire.

Buildings in St. James's Park.—Mr. W. H. Smith having asked the First Commissioner of Works if it was the intention of her Majesty's Government to proceed with a Bill for which plans had been deposited, under which it was proposed to obtain powers to take a plot of ground in St. James's Park upwards of 350 ft. in length and from 50 ft. to 70 ft. in depth, for the erection of additional offices for the Admiralty, Mr. Ayrton replied that the Bill was in course of preparation, and he hoped it would be introduced before Easter. It ought, he said, to be remembered that the land belonged to the Crown, and the Crown had the undoubted right to build upon it, if such buildings were for improving the carrying on of the business of the country. The real object of the Bill, however, was to acquire some land that belonged to private persons.

West Somerset, Norfolk.—Plans and estimates for the complete restoration of St. Mary's Church have been prepared. Some fine wall paintings have been discovered on the walls of this church, which should be carefully preserved. There is also a Perpendicular screen.

Society for the Encouragement of Fine Arts.—A lecture on "The Drama" has been delivered by Sir Charles H. Young, at the rooms of this Society, in Conduit-street, before a numerous audience, the chair being occupied by Mr. W. Bodham Donne, the examiner of Stage Plays. After referring to the magnitude of the subject he had undertaken, Sir Charles said that he must not be considered as coming before the audience as a theatrical critic, his experience of the stage being chiefly derived from a spectator's point of view. He considered that of all diversions that of the theatre was the most entertaining, and that in the drama we see the high art of the poet concentrating the various incidents of human life into a narrow space, and thus affording to observers a kind of retrospective view of life. But the drama should afford something more than a mere pastime to thinking men. The lecturer was in favour of a subsidy from Government in aid of the true interests of the drama, and he was confident that if a sum of money voted by Parliament were properly expended, the beneficial effect would be felt far and wide. Mr. Donne expressed his opinion that, until the stage was put upon its proper level as one of the great and fine arts, no real improvement could be expected in the drama.

The Proposed Metropolitan Improvements.—At the last meeting of the Metropolitan Board, a report was presented by the engineer (Mr. Bazalgette) in answer to the report of Mr. Haywood, on this subject. As to the new line from Oxford-street through Old-street to Shore-ditch and Bethnal-green, Mr. Bazalgette says:—"Opponents have sought to separate and review them as distinct local improvements, treating each portion upon its own local merits only in order to lower their value and importance, to divert attention from their real object, and reduce the whole from one large metropolitan to several small detached local improvements." The Board, he remarks, in this chief improvement has used up several existing lines of wide streets to complete the intended lines of communication, and so at a small expenditure convert them from their present undeveloped condition into arterial lines of thoroughfare. The report then goes ably into the subject *seriatim*. A copy of the report was ordered to be sent to the City Commissioners of Sewers, and other Boards and Vestries represented at the Metropolitan Board.

Bagshaw Hall, Tideswell, Sheffield.—The chief stone of this hall has been laid. The edifice, now in course of erection, is the gift of one of the oldest inhabitants, Mr. John Bagshaw, from whom it takes its name, to Tideswell Old Sick Club. It is intended to be used by this society, of which Mr. Bagshaw has for many years been a member, for the transaction of their business; it will also be let for public meetings. The site is in the Market-square, opposite to Mr. Bagshaw's house, and is the gift of the Duke of Devonshire. The building, which is to be of white stone, will be of the Elizabethan style of architecture, and will measure 78 ft. by 31 ft., with an elevation of 32 ft. This space will be divided into three rooms adapted for the purposes of committee or other small meetings, and a good-sized hall in which magisterial or other public meetings may be held. At the rear of these a small cottage is to be provided for the hall-keeper. The architect is Mr. Samuel Howard, jun., of Stockport, and Mr. Bullock, of Tideswell, is the clerk of the works. The total cost of the building is estimated at 2,000l.

Jersey Harbour Extension Works.—It was proposed, at the sitting of the Jersey States, to set aside its Act of March 31, 1871, ordering the construction of a landing-stage and break-water, at a cost of 250,000l., on the ground that the island's exchequer could not afford the outlay; and a motion, embodying those facts, was submitted, providing for the erection of three landing-stages, one in each of the three principal ports of Jersey. After a long debate, the motion was rejected by an overwhelming majority. Later in the sitting, it was unanimously decided to vote 3,000l., in addition to a grant of 1,000l. already made, for the construction of a break-water, 350 ft. in length, at Bonne Nuit Bay, in the northern coasts.

Freethorpe, Norfolk.—A number of almshouses in the Tudor style have recently been erected here for Mr. R. H. V. Walpole, lord of the manor of Freethorpe; Mr. J. T. Botle, architect. The cost has been about 1,000l.

Health of Liverpool.—The official report by Dr. Trench for last year has been circulated in a printed form. The death rate of the parish was equal to 39.0, and that of the out-townships to 31.4 per 1,000 of the population. The average age at death of the inhabitants of the borough was 22 years; in the parish, 24 years; and in the out-township, 20 years. The average age was lowest, in July, August, and September, when infantile diarrhoea was rife. The deaths of infants below five years old for the year, was 8,348, or 48.0 of the whole deaths. The death rates in the districts and wards, ranged from 23.4 in Everton and Kirkdale, and 27.2 in West Derby, to 44.0 in St. Paul's and Exchange, and 43.2 in Vauxhall. The mortuary chapel for Roman Catholics in Collingwood-street has at length been completed, and that curious remnant of a superstitious custom, the "waking" of the dead, it is to be hoped, will soon be put an end to.

The Marylebone Water Supply.—A report by the local medical officer of health on the quality of the water supplied to the parish by the West Middlesex Water Company, has been circulated in a printed form, in order to allay the uneasiness excited by what has been recently stated as to the water supply of Lambeth. Dr. Whitmore has examined the source of supply to Marylebone, the three reservoirs at Barnes, the process of filtration, and the water itself; and he says,—"I can have no hesitation in expressing my opinion that the directors of this company have availed themselves of the best practical means known to science, for delivering their water to the consumer in the best possible condition; that such water is excellent in quality and perfectly wholesome; and that so long as its present state of purity is maintained, it may be drunk, even during the prevalence of an epidemic of cholera, with the most perfect safety."

Black Beetles.—A correspondent complains of that never-ending pest the black beetles; that they exist in a new house of his in battalions, or rather in legions, invade his sitting-room, and attack his book-bindings. He has tried all sorts of traps and baits in vain. We cannot recollect all the "cures" suggested in the *Builder*, but of one or two, of which we have had a little personal experience, we have a grateful remembrance. Phosphoric paste, if spread upon very thin slices of bread, and carefully overtopped and covered by dripping or butter, will kill hosts of them; and many traps, made with bowls or jelly-dishes and sloping pieces of firewood, upon which they follow their noses to get at a mixture of treacle and beer, for they seem not only to be sweet-toothed but tippers, will do for them by hosts at a time. The phosphoric paste should be kept or put out of the way of children, cats, and dogs: mice or rats may share it with the beetles.

American Institute of Architects.—The first course of lectures for the winter of 1871-2, given under the auspices of the New York Chapter of the American Institute of Architects has closed, and the second course commenced on the first Monday in February. The course so far has comprised weekly lectures by Mr. E. G. Hatfield on "Constructive Architecture," and by Mr. Russell Sturgis, jun., on its "Aesthetics." Also a series on "Hospitals," by Mr. Carl Pfeiffer, and another series by the secretary, Mr. A. J. Bloor, on "Landscape Architecture." Mr. Bloor has also lectured on "Common Sense in Future American Architecture." Mr. L. W. Robinson has held, during the week, for the benefit of the junior members, a weekly class in mathematics, as preparatory to the lecture on "Construction."

Public Offices, Reading.—The town council have finally resolved to adopt Mr. Waterhouse's revised plans in pencil of the proposed buildings for public offices, comprising a new council chamber and other improvements of the town-hall buildings, which he estimated could be carried out at a cost not exceeding 7,000l.; that Mr. Waterhouse be requested to finish the plans submitted, and to prepare a perspective view of the exterior, with an explanatory report and estimate, in order that the same may be submitted to the council for consideration. Mr. Parry, the borough surveyor, has also been instructed to prepare a ground-plan of the vacant site adjoining the town-hall buildings, and to show thereon the line of the proposed new street, as delineated in the plan attached to the agreement between the Board and Mr. John Henry Blagrove.

Sanitary Legislation in Ireland.—Mr. Nelson Hancock, in his returns, just issued, with reference to local taxation in Ireland, says,—"In sanitary legislation, Ireland had been allowed to fall behind the favourable position of almost complete assimilation, secured by fourteen clauses of the Sanitary Act, 1866, extending nearly the whole sanitary law of England to Ireland. The defect noticed in the last introductory report of the statutes since 1866 not having been extended to Ireland has been remedied by the Local Government (Ireland) Act, 1871, and assimilation has again been secured. The risk, however, of Ireland being again left behind in sanitary legislation is shown by the entire omission of Ireland from the Bill introduced by Sir Charles Adderley, to carry out the codification of sanitary law recommended by the Sanitary Commission."

Chicago Post Office and Custom House.—The *Chicago Builders' Journal* says,—"The plans for our new Government buildings are nearly completed. The edifice will have a frontage on both Clark and Dearborn streets of 336 ft. On Adams as well as Jackson street the frontage will be 210 ft. The style of architecture will be of the Romanesque-Inglo-Jonesian order, which is peculiarly Mullettonian. The adoption of this order of architecture by the treasury architect, Mr. Mullett, will give to Chicago an architectural display rarely seen except in London, where Inigo Jones was regarded in his time, which was in the sixteenth century, as the greatest architect of his day."

An Historical Building.—The *Edinburgh Courant* states that a considerable part of the more ancient portion of Invercauld House is at present in course of being pulled down in order to make room for the erection of a new wing. The plan of the projected extension is intended to be in better harmony with the other architectural features of the mansion than the old portions in course of demolition. Among these are the apartments which were occupied by the Earl of Mar, and from which he issued his famous letters in 1715, relative to the Jacobite rebellion, a few days prior to the unflinching of the royal standard at Culloden or Bannanur.

Application to Build between the Victoria Embankment and Cannon-row.—At a recent meeting of the Metropolitan Board of Works, a report was presented from the Works and General Purposes Committee, stating, with reference to the letter from the Statistical Society of London, inquiring whether the Board will lease to them the plot of ground lying between the Victoria Embankment and Cannon-row for the erection of a building thereon, for the purposes of the society, that, in the opinion of the committee, it is not desirable to let the ground in question at the present time, and recommending that the society be so informed. The report was unanimously adopted.

The Proposed Wet Dock at Whitehaven.—At a meeting of the Whitehaven town and harbour trustees, the secretary read a letter from Mr. Phillips, who submitted a revised tender at 76,997l. 16s. 9d., in the place of his original one at 75,869l. Mr. Brunles, C.E., the consulting engineer to the Board, wrote an explanatory letter that Mr. Phillips had added about 2l. a ton to the price of ironwork, seeing that the price has risen considerably since the tenders were sent in. After some discussion the secretary was instructed to write to Mr. Phillips and inform him that his amended tender could not be entertained.

Re-building of Warwick Castle.—The rebuilding of that portion of the castle which was destroyed by fire in December last is about to be commenced. Within the past few days workmen have been engaged in erecting scaffolding around the walls at the east wing. As a consequence the public are no longer admitted by order to see the ruins. The work has been undertaken by Mr. Bromage, builder, of Rugby, under the supervision of Mr. Salvin, Lord Warwick's London architect.

Collective Assurance against Injury from Personal Accidents.—A novel feature in assurance is presented by the "Royale Belge" Life and Accident Assurance Company, who have established an English branch for the assurance *en masse* of the employes of railway companies and other large industrial establishments against accident to life and limb, as practised in Belgium. The terms seem worth looking into.

Remains of Lake Dwellings.—On the borders of Lake Leman, almost opposite Nyon, there has recently been discovered a lacustrine station, which appears to be very rich in curiosities of the pre-historic times. This station is situated in the gulf of Condre, near Thonon; the piles cover a considerable space, and the importance of this lake settlement seems to have equalled that of Morges, which faces it on the Vaudois shore. In the course of one morning's investigation there have been collected seven hatchets, two knives, two sickles, one lance, five bracelets, and a large number of pins, all in bronze.

Model Lodging-house, Bradford.—A new model lodging-house has been erected near St. Thomas's Church, Bradford. It is for the accommodation of male lodgers only, and will provide 184 beds, 110 of which are for lodgers paying 4d. per night, and the remainder for those who pay 6d. Reading and sitting rooms are provided, and there will be a small library of standard works. At each end of the building are lavatories and bath-rooms, where hot and cold water can be obtained.

Royal Albert Hall, Kensington Gore.—A series of People's Subscription Concerts is to be given, in order to enable all classes to enjoy music in the Royal Albert Hall. There will be twelve concerts on Tuesday evenings, beginning on the 12th, just past. The prices are, to the picture-gallery, for twelve concerts, 1s., or to a single concert, 3d.; to the orchestra, 2s. for twelve, or 6d. for one; to the balcony seats, 3s. for twelve, or 9d. for one; and so on.

St. Andries.—On Saturday, the 24th ult., the workmen employed at St. Andries in enlarging the mansion for Sir A. Acland Rind, bart., sat down to a supper at Mossman's West Somerset Hotel, in Watchet, provided for them at the expense of Mr. Davis, of Taunton, the contractor for the works. Many pleasant things were said with reference to master and men.

An Engineer Knight.—Her Majesty has been pleased to signify her intention of conferring the honour of knighthood upon Mr. John Condie, C.E., in recognition of his professional services rendered to the Government, and extending over a period of about twenty-five years, during the construction of the national harbour at Portland, which has recently been completed.

Framlingham.—A new bank is about to be erected at Framlingham, Suffolk, for Messrs. Curmey & Co. The architect is Mr. Bottle.

TENDERS

For alterations and additions to factory, Southwark-bridge-road, for Messrs. Welch, Margeson, & Co. Mr. R. M. Shaw, architect.—

Patrick	21,369 0 0
Avis & Co.	1,274 0 0

JOHN MURRAY, Albemarle-street.

NEW LIFE OF LORD BYRON. With an Original Portrait and Facsimile of Byron's First Letter. LORD BYRON: a Biography; with Critical Essay on his Place in Literature. BY KATE ELIZA. Translated and Edited with Notes.

Kate Eliza has used wisely and judiciously the materials illustrative of Byron; and the most exact care which she has made them give a charm to the narrative, which is clear, compact, and well arranged. Not the least interesting part of the book are the two chapters, in which she traces of Byron's character and his place in literature. The book is one which all the admirers of Byron must read.—Athenaeum.

Professor Eliza has been presented in a manner worthy of her deserts, and the English public will have before it a work on the correctness of which it can rely, while the style is flowing and readable. Besides the usual care which the translator has exercised with regard to the text, he has done some service by collecting in an appendix several interesting contributions to our knowledge of Byron.—Advertiser.

LORD BYRON'S WORKS. Complete in a case, price One Guinea. THE POCKET EDITION OF THE POETICAL WORKS OF LORD BYRON. Beautifully printed in clear type and good paper. Complete in Eight Pocket Volumes, bound and in a case. Unquestionably the most compact, portable, and handy edition of Lord Byron's Works. Here we have in volumes of most convenient size, the best fully revised, carefully edited, and bound in a style elegant and serviceable, the complete works of the noble poet. It will be a happy thought to bring out Lord Byron's works in this form. Some volumes, when printed with fine steel type sufficiently large, are an unpleasantly bulky in the hand and read too heavy ones.—The Spectator.

THE PEARL EDITION OF THE POETICAL WORKS OF LORD BYRON. Beautifully printed in clear type, as complete as on volume. The Pearl edition of Lord Byron's works is certainly a most remarkable reprint. For half-a-century now has had a complete and faithful collection of the poet's works. The type is beautifully clear. Cheap as this edition is, it has by no means a cheap look. It is bound in green morocco, is a substantial and is reasonable. The paper has that equal finish which makes all work pleasant to the eye. The best edition of Byron is now brought within the means of the poorest student of the English classics.—Pall Mall Gazette.

Variation Editions.—BYRON'S POETICAL WORKS. Library Edition. Portrait of the Poet. 8vo. 5s. 6d. BYRON'S POETICAL WORKS. Cabinet Edition. 12 vols. Fcap. 8vo. 30s. BYRON'S POETICAL WORKS. ACTUARY AND SECRETARY. GEORGE CUTCLIFFE, Esq.

ASSISTANT ACTUARY. BENJAMIN NEWBATT, Esq.

NINTH BONUS MEETING, January 4th, 1872.

The following are Extracts from the Reports of the Directors:—

1.—Progress of the Society in the Bonus Period.

"AS TO INCOME: THE NEW ASSURANCES were 2150 in number, for an aggregate sum of £38,000, at premiums amounting to 54,654 per annum, —results which, viewed in relation to the depressed condition of Life Assurance during much of the period, cannot be regarded as other than satisfactory. THE YEARLY REVENUE was increased by over £2,000 per annum, and reached 226,508 on the 30th June, 1871. THE INTEREST yielded by the whole of the Funds, whether invested or uninvested, was 41.66 per cent. on the average of the entire period, being fully 38 per cent. more than that realized in the previous period. This increase was obtained not only without loss, but without the smallest impairment of security.

"AS TO OUTGOINGS: 877 Policies, amounting to 648,811. The claims which accrued by the death of 786 persons, assured by the Society, amounted to 648,811. The mortality was very favourable to the Society, the payments having been below those estimated by fully 80,000, and the interest which occurred then fewer by 92 than the number expected. THE EXPENSES incurred in conducting the business, always moderate and well within the provision made for them in the Premiums, were fractionally less than in the previous period, and fell below 71 per cent. on the Revenue. It is thus seen that side by side with uniform success in the transactions of the Quinquennium, there was continuous growth in the resources and assets of the Society, which consequently stood, at the closing of the books, on a broader basis than at any former time."

2.—Financial Position of the Society on June 30th, 1871.

"The subsisting Assurances on the 30th June were 8,670 in number, assuring, with their Bonus additions, the sum of 3,445,028. The Assurances Fund at the date of Valuation was £1,826,458 10 9 and the total calculated Liability £1,477,179 17 3 Leaving a Surplus of £349,278 13 6

This Surplus is matter for hearty and unmitigated congratulation, and justifies the preference shown by the Board for a well-selected business tending to profit. It must, however, be remembered that although owing in the main to ordinary recurring causes, and to sources of profit having every prospect of permanence, it is, nevertheless certain that its unprecedented enlargement is due to a condition of mortality favourable beyond previous experience, to be probably ascribed under the law of averages by an increase of deaths hereafter, beyond those allowed for in the calculations. The Cash Bonus, which is the present value of the Reversionary Bonus, and therefore the true measure of the allowance, will average 29 per cent. on the like payments as against 20 per cent. at the last Division, and 28 per cent. in 1866, which was the highest previous percentage. No comment can illustrate better than this comparison the merits of the present Division."

3.—Results of the Division.

"Of the sum now to be divided, five-sixths, or 225,000, will fall to the Assured, and will produce a reversionary addition to the Policies. This Reversionary Bonus will average 49 per cent. or vary according to age from 34 to 82 per cent. on the Premiums received in the Quinquennium, all at the Policee amongst which it will be distributed.

Dealing it prudent to provide for each a contingency, the Directors have, under the advice of their Actuary, set aside the sum of 20,000 for this purpose. Of the remaining 274,278 13s. 6d. they now recommend the division of 270,000, a sum greater by 30,000 than any previously divided, and sufficient to give to the Shareholders 2s. a share, and to the assured the largest bonus ever allotted to them."

The next DIVISION OF PROFITS will take place in JANUARY, 1872, and Persons who effect New Policies before the end of June next will be entitled at that Division to one year's additional share of Profits over later Entrants.

The Report above mentioned, a detailed account of the proceedings of the Bonus Meeting, the returns made to the Board of Trade, and every information may be obtained of GEORGE CUTCLIFFE, Actuary and Secretary, No. 13, 81, James's-square, London, S.W.

DARWIN'S ORIGIN OF SPECIES: A NEW, REVISED, AND POPULAR EDITION.

Now Ready, 6th and thoroughly Revised Edition (11th Thousand), with Glossary of Terms, Post 8vo. 7s. 6d. THE ORIGIN OF SPECIES BY MEANS OF NATURAL SELECTION; OR, THE PRESERVATION OF FAVOURED RACES IN THE STRUGGLE FOR LIFE. By CHARLES DARWIN, M.A. F.R.S. Author of "The Naturalist's Voyage Round the World," &c. &c. JOHN MURRAY, Albemarle-street.

LYELL'S PRINCIPLES OF GEOLOGY.

Now Ready, 11th Edition, with numerous Illustrations, 2 vols. 8vo. 16s. each. THE PRINCIPLES OF GEOLOGY; OR, THE MODERN CHANGES OF THE EARTH AND ITS INHABITANTS, CONSIDERED AS ILLUSTRATIVE OF GEOLOGY. By SIR CHARLES LYELL, Bart. F.R.S. Also, by the Same,

THE STUDENT'S ELEMENTS OF GEOLOGY.

With 600 Illustrations. Post 8vo. 9s. "Sir Charles Lyell has here done for the geological student what Sir John Herschel did for the student of astronomy in his treatise on "Outlines." Young beginners in natural science had long wanted a short manual of geology at a reasonable price, which should yet contain a full explanation of the leading facts and principles of the science. Now they have it."—Examiner. JOHN MURRAY, Albemarle-street.

MONUMENTS WITHOUT MEMORIALS.

Now Ready, with 230 Illustrations, Medium 8vo. 24s. RUDE STONE MONUMENTS IN ALL COUNTRIES; THEIR AGE AND USES.

By JAMES FERGUSON, F.R.S. Author of the "History of Architecture," &c. &c. "Hitherto antiquaries have looked upon unadorned monuments as mainly pre-architectural and possibly pre-historic. But Mr. Ferguson now has published an idea fully outlined by him about ten years ago, and in this copiously illustrated work endeavours to prove these stones are comparatively modern, and that those of the East especially are very ancient and have been erected by the nations to whose lands and intricate accounts especially attributed to them. Those who have investigated the subject for themselves, some will receive and some will resent his interpretations, but all who look into his book and examine his 234 illustrations will be gratified."—Builder. JOHN MURRAY, Albemarle-street.

WANTED, AN ASSISTANT, who can ABSTRACT and BILL, and do the usual work of a Quantity Surveyor's Office.—Address, stating age, salary required, and references, to 87, Office of "The Builder."

WANTED, A JUNIOR CLERK, to assist with the prime cost, and to the general routine of the office.—Address, stating age, salary required, where last engaged, to 99, Office of "The Builder."

WANTED, A first-class GOTHIC ASSISTANT, experienced in competition (tender) engagements. Apply, by letter, to J. C. of Housekeeper, 35, Essex-street, Strand.

WANTED, A first-class DRAUGHTSMAN, well versed in Italian design and detail, construction, and specifications.—Apply by letter, stating age and terms, with all necessary particulars, 631, Office of "The Builder."

WANTED, immediately, in a Surveyor's Office, a competent ASSISTANT. Must be quick at figures, and able to abstract, bill, and trace.—Terms, qualifications, and references, by letter only, to SURVEYOR, care of Mr. South, New-agent, Duke-street, Adelphi, W. C.

WANTED, A good MECHANICAL DRAUGHTSMAN. Must have been in a draughtsman's office. Preference given to one who has a knowledge of heating hot water.—Apply by letter, stating former situations and wages required, to DRAUGHTSMAN, 79, Cornhill, E. C.

MR. EDWARDS ON THE DOMESTIC USE OF FUEL. Sixth Edition, revised, with Forty Illustrations, price 3s. 6d. SMOKY CHIMNEYS: their CURE and PREVENTION. By FREDERICK EDWARDS, Jun. OUR DOMESTIC FIREPLACES, new Edition with Illustrations, price 3s.

THE EXTRA-VAGANT USE OF FUEL IN THE COOKING OPERATIONS, with Illustrations, price 1s. London: LONGMANS, GREEN, & CO. Paternoster-row.

IN ONE VOLUME, crown 8vo. price 6s. cloth. PEWTERERS' COMPREHENSIVE RECIPE-BOOK: a Guide to the Practical Specification of every kind of Building, Artisan, Work: with Forms of Building Contracts and Agreements, an Appendix, Foot-Notes, and Copious Index, compiled by WILLIAM YOUNG, Architect. London: LONGMANS, GREEN, & CO. Paternoster-row.

Is a good and steady workman, and is well up in saw mills and works for preparing timber. Unexceptionable testimonials. State Wages—Address, E. D. Post-office, Worcester.

The Builder.

VOL. XXX.—No. 1520.

Megaliths and Tumuli: their probable Eras, "Architects," and Purposes.

We have traced the outline, and shown the probability, we conceive, of a very high antiquity, as a class, for the main mass of the rude but gigantic and lasting monuments of our Pagan ancestors of the hitherto prehistoric past; and have pointed

to the probable "architects" of these monuments; whatever evidence there may be in favour of a slight sprinkling of a few special examples, reared by their successive descendants, down into ages more or less approximating towards the historic close of the long existing prehistoric Pagan era; which is now fully proved and recognised as having extended back at least to the drift-impliment men of glacial times,—probably 50,000 years ago.* And, above all, the dolmens appear to have preceded most of the other forms; although, among their African precursors, there would seem to have not only been dolmens, but stone circles single and concentric, trilithons, tumuli, and many other forms of such monuments, in vast, central, and, as it were, metropolitan and dispersive abundance. Even Mr. Fergusson cannot help inadvertently indicating the probably extreme antiquity of the dolmens, as a class,—or, at least, of the dolmen builders,—notwithstanding his sweeping general conclusion, without any legitimate or adequate premises, that we can see, to the contrary. At page 329 he says:—"In the present state of our knowledge, the cave men [of the glacial or Arctic era] and the dolmens seem not only contemporaneous, but their frequency seems generally to be coincident." And as to the era of the cave-men themselves and their stone implements (p. 509), he speaks of "the question of the antiquity of the cave men, or the palæolithic stone implements, the age of which we must, for the present at least, leave wrapped in the mists of the long prehistoric past"; these men, as he fully admits, having existed under Arctic or glacial influences, in their caves, contemporaneous with dolmen localities, in "a climate nearly similar to that of Arctic North America," and "the inhabitants of these caves had all the habits of people now dwelling in the Arctic regions." Yet in Mr. Fergusson's arguments for the comparatively recent origin of the dolmens themselves all this appears to be forgotten. Into the apparent inconsistency, however, we have no space here to enter. Still, we may remark that his idea that the dark-hued (ex-African) dolmen-builders of this country originally inhabited the low-lands, and built there no dolmens; but were at last driven, by Bryts (or other comparatively recent races), up into

the mountainous fastnesses of Wales and Cumberland; and only there and then began to build their dolmens, appears to us to be just as clear a perversion and reversal of the probabilities of the case as that the rude stone monument builders of Europe got their ideas from the Romans; or that the Greeks,—those mere children of antiquity, as Herodotus tells us the Egyptian priests regarded them, by comparison with the hoar antiquity of the Thebans of Upper Egypt,—instructed the Indian, Aryan, or other ancients of the East;—opinions which Mr. Fergusson almost seems himself to entertain. That the ex-African and Arctic dolmen builders of the high lands of this country, in Wales, Cumberland,* Northumberland, &c., the Isle of Man, and the high lands of Scotland and Ireland were aboriginally residents of these high lands, though of African descent; that their Arctic caves and dolmens were contemporaneous; and that they erected these dolmens there, as they did in Africa, Spain, and France, even before the low level lands of Britain had reached up to sea level after the drift impliment era, we think, is much more probable than Mr. Fergusson's hypothesis. That they afterwards spread downwards from higher to lower lands is more likely.

But the chief object which we have now in view is to consider, as far as our limited space will allow, the probable purposes of the rude monuments of the Pagan era. And as we desire to agree with Mr. Fergusson, as far as we possibly and reasonably can, we shall first of all note what he says of these, or of certain of these, probable purposes; with which, to some extent, we agree, so far as they go.

The summary and result of the whole of his elaborate and interesting inquiry is, "that honour to the dead, and propitiation of the spirits of the departed, seem to have been the two leading ideas that, both in the East and West gave rise to the erection of these hitherto mysterious structures, which are found so numerously scattered over the face of the Old World." Again he says (on same page): "With the fewest possible exceptions, and these of the most insignificant character, their connexion with the relics of the dead can be proved, from all having become places for ancestral worship; and having, under various forms, been used for commemorating or honouring departed spirits." They were reared, he conceives, "by dead-reverencing, ancestor-worshipping people" (379), who made "offerings to the dead," and were "kindred races of mankind, with whom respect for the spirits of deceased ancestors was a leading characteristic." Stone circles of theirs, in North Africa (311), were "evidently connected with the religious rites of the ancient inhabitants of these regions." The great stone circle of Drumbo, in Ireland,—580 ft. in diameter, and second only to Avebury itself, with "one of the most interesting of the Irish dolmens" in the centre, called the Giant's Grave,—or "bedd,"—and probably "the grave of a chief,"—Mr. Fergusson suggests (p. 229), may have been used "for celebrating funereal games or ceremonies round the tomb."

Well, surely all this goes to show that these circles, tumuli, and other earthworks and ramparts, dolmens, kists, chambers, and so-called altar-stones were something more than mere places of burial, even according to Mr. Fergusson's own ideas, since they were "places of worship," where "religious rites" and "ceremonies" of the dead, in "departed spirit worship" were conducted? And a very curious sort of hero-worship is that of the "dear spirits." How is it, too, then, that only Christians are said by Mr. Fergusson to have associated "their places of worship"

* It is a curious fact that the supposed great range of high mountain land in the heart of Africa is called by natives "Jebel el Kimmzi." It is so named in Hughes's Physical Map of Africa. The word, however, seems still more closely akin to "Cymry" than to "Cumberland."

with their burial-places; and that it is "applying a Christian precedent to a Pagan people" to say that the barrows of Stonehenge were "gathered round the sacred precincts" of that assuredly "sacred enclosure" (Druidically speaking) as a place of worship;—we shall not call it a "temple"? we hear little, if anything, from the Welsh hards themselves, as to "temples," but much about "sacred enclosures," "circles," "fenced enclosures," "ramparts," "sanctuaries," "dales where the courses surround the circles," the "sacred corso," where—

"rapidly moving, in the course of the sky, in circles, and uneven numbers, druids and bards unite to celebrate the [central] Leader,"

"round the sanctuary of the uneven number."

"Whilst the circular revolution was performed . . . the assembled train were dancing . . . and singing in cadence, with garlands on their brows, loud was the clattering of shields round the ancient cauldron [or cup, of inspiration from Ceredwyn] in frantic mirth."

For jovial cantrips such as these why might not the area of the great circle enclosing the two inner and lesser circles of Avebury (or the circuit of Stonehenge either) be five times that of St. Peter's at Rome? We need not imagine that such places were ever intended for congregations either sitting or standing in, as Mr. Fergusson supposes; for either witnessing spectacles or hearing harangues or sermons. But what arena could be better fitted for assemblies of people, singing, dancing, and circling round "the sacred course in a serene morning," in frantic mirth, with inspiration (of a kind) in their hearts, and garlands on their brows; till, like dancing whirling dervishes at their devotions, some one or other fell out of his ranks, "stirred up" or "awakened," in this "revival," into a fit of entrancement, sacred ecstacy, or God-possession, and was "chained" as an Oracle, or as Deon,—thus to "celebrate the Leader"?

But what of the oaks and groves of the Druids? In hunting out these and other passages and expressions quoted from the Welsh hards, we did not happen to come upon even one about either trees or oaks any more than temples, far less serpents, sun-worship, or astrology. Yet no doubt such were just the sort of people against whom the early Christian priesthood fulminated mandates against "the worshippers of trees and stones." Must not both stones and trees, then, have been venerated, and used, in their "sacred enclosures"? In the Sub-Himalayas there are Druids who chant or sing and dance in circles of trees, with a stone at each tree.

But all this has nothing obviously to do with "departed spirits," after all. The one central druidical "Leader" was their God, Deon, or Hu, Apollo, or whatever we may call him, as manifesting Himself in a taliesin, or initiated and inspired bard or druid, in the car, or chair or figurative womb, kist vaen, dolmen, or "simulative tomb" of "the Goddess of Death," Ceredwyn. "I have died: I have revived: I am now Taliesin," said the bard. His death was the simulativo death of entranced inspiration, in the simulativo tomb, kist, sarcophagus, or coffin, whence he was "born again," into the new and divine awakened life of trance,—"the life of the Gods." "I require men to be born again," said Deon, as the true purpose of the druidical religion; and the Taliesin or God-possessed says, "twice have I been born," and "complete is my chair in Caer Sidi: neither disorder nor old age will oppress him who is within it": he was now one of "the deathless brotherhood," of "the twice-born,"—"first, born in the egg [an ovate]: next, born out of the egg [a hard]."

Far other than mere "departed spirit worship," as this was, the druidical like other doctrines may have been apt to degenerate into it, with its trance and other mediums and spirit-circles; and, in a sort of saint worship, the sacred enclosures may have become surrounded and embued with the dead, just as every second or third Christian

* See p. 197, ante.

Church is by its churchyard and its tombs,—its God's Acre, and its Paradise, or city of the dead; but so far from this implying that "application of a Christian precedent to the Pagan people," it is the Christians who must have adopted the Pagan practice of associating their places of burial with their places of worship, even on Mr. Ferguson's own principles. There are churches in the Scottish Highlands which to this day are called "The Stanes," or Stones, as if even the name of some Pagan Stonechairs had been adopted by the Christians, as well as the Pagan sites and practices too.

The fact that the Romans made no allusion to Stonehenge, we may here note, is of little force, considering that the French occupied Algeria for many years without taking the slightest notice of all the tens of thousands of dolmens, stone circles, &c., there and elsewhere in North Africa.

While pointing out the general association of the actual tombs of the dead with simulative tombs, devoted to religious rites, it must be noted that according to Mr. Ferguson himself a host of instances occur in which dolmens or kistvans have all the appearance of being nothing more than what he calls "simulated tombs." But of the precise uses or purposes of these simulated tombs he hardly gives any definite idea. He thus speaks of these "Bedds," as the Irish call them, in connexion with the real and generally underground tombs, kist-vans, or dolmens, with special reference to a singularly typical tumulus, with three concentric circles of stones, rising circle above as well as within circle, round and up to a central dolmen at the top, in Aveyron, and called "the dolmen de Bousquet."

"So far as I know, none of these dolmen-crowned tumuli have been dug into, which is to be regretted, as it would be curious to know whether the external dolmen is the real or only a simulated tomb. My own impression would be in favour of the latter hypothesis, inasmuch as a *trou-à-fauteuil* are characteristic of all similar monuments. In the Pyramids of Egypt they consisted, in every Buddhist tomb, without exception, there is a tee, A still more apposite illustration, however, is found in the tombs around Agra and Delhi. In all those of any pretension the body is buried in the earth, in a vault below the floor of the tomb, and a gravestone laid over it; but on the floor of the chamber, under the dome, there is always a simulated *trou-à-fauteuil*, which is the only one seen by visitors. This is carried even farther in the tomb of the great Akbar (1556, 1605). Over the vault is raised a pyramid, surrounded, not like this tumulus, by three rows of stones, but by three rows of pavilions; and on the top, exposed to the air, is a simulated tomb (or kist), placed exactly as this dolmen is. No two buildings could well seem more different, at first; but their common parentage and purpose (?) can hardly be mistaken; and it must be curious to know whether the likeness extends to the double tomb also."

Of course, Mr. Ferguson means it to be inferred that the encircled or enclosed and dolmened tumulus, being so like in principle and arrangement to Akbar's monument, must be of much the same age, although the evidence for that is just about as slender as it would be to urge that the stone implements of Britons (if we may so call them) of the glacial drift must be of much the same age as the stone implements of Britons of the Roman era (near 50,000 years, at least, later, probably), because the one sort is "exactly like" the other.

The chief races who honoured their dead by the peculiarity of tomb-rearing are thus specified, although the great North African dolmen and circle builders, and High Asiatic tumulus rearers, are not so explicitly named as they might be.

"The peculiarity is most characteristic of the EARLIER CIVILIZED RACES, whom we have generally been in the habit of designating as the Pagan races of mankind. But if that term is objected to, the tomb-building races may be specified,—from the East,—as the Chinese; the Mongols in Tartary, or Mogols, as they were called, in India; the Persians, in their own country, or in Persia; the Ancient Pelasgi, in Greece; the Etruscans, in Italy; and the races (North African and Upper Asian, we shall call them), wherever they were, who preceded (and probably preceded) the Celts in Europe. But the tomb-building people, *par excellence*, in the old world, were the Egyptians (African, of course). Not only were the funeral rites the most important element in the religious life of the people; but they began at an age earlier than the history or tradition of any other nation carries us back to. The great pyramid of Gizeh was erected certainly as early as 3,000 years before Christ; yet it must be the *actual* descent of a *radi-chambered tumulus* or cairn, with external access to the chambers [just such a one as that of New Grange,

or the 'Sorcery Hall' (or simulative tomb?) at Maeshowe], and it is almost difficult to calculate how many thousands of years it must have required before such rude sepulchres as those our ancestors, erected,—may (?) probably after the Christian era,—could have elaborated into the most perfect and most gigantic specimens of masonry which the world has yet seen."

If we rightly understand this, surely it means that the chambered tumuli, such as those of our ancestors, are of a much more ancient type, at least, than that of the Pyramid of some 5,000 years of age, and just such as the North African predecessors of the Pyramid builders, must have given origin to, both in Africa and Ireland. Nevertheless, the tumuli builders of the East may have combined with the chamber or dolmen builders of the South in the enterable chambered or kistled tumuli, which are said to be more peculiar to the West than either to the South or to the East, alone.

Anyhow, *simulative tombs* are regarded by Mr. Ferguson as a very general feature connected with megaliths and tumuli. But not only so; the dolmens, as a class, are simulative tombs, the connexion of which with actual tombs at all has not been established, even when associated with tumuli, as we have just seen. And the *simulative tomb*, whether with or without a real one, is a mystery which requires a different line of research altogether than a merely archaeological or antiquarian one, to enable us to divine or reach its purpose. The author of "The Buddhist Emblem of Architecture,"* we do believe, was not far off that purpose in the brief generalisation, from various ancient sources, here quoted; and which, we may at once say, manifestly relates, whether he knew it or not, to the *simulative death* of entrenchment, often in *simulative tombs*, and kists, dolmens, or hedds, coffins, "elegant couches," as in Egypt and at Babylon, or on altars of self-sacrifice," divine self-annihilation, or God-possession, as in modern Tibet, which simulative death has been already shown, in the *Duiller*, to be a key to ancient religious mysteries,† both magical, as were the Pagan religions in general, and especially those of a higher order, as were the Buddhist and Brahmical, the Egyptian and the Druidical; no less than the Jewish and the Christian, or the Free-Masonic mysteries.

"In all those mysteries which were held in such high veneration by the ancients, and the types of which have descended as a chain of unbroken succession even to our own days, the attainment of the crowning point of the craft was typical of death. It was alone by passing through the vale of its shadow that perfect light [the well-known 'lucidity' of entrenchment] could be obtained. Apuleius, in the eleventh book of his 'Metamorphosis,' or 'Fable of the Golden Ass,' describes minutely this completion of initiation: 'the night-like darkness; the approach to the confines of death; and then, in the very midst of this darkness, the Light revealed to him (and in him). In some of the various versions of these mysteries it is said that the candidate was shrouded in the shroud of death; was placed in that narrow lane to which we all must go, was buried again, and went forth the new-born and perfect craftsman.' Others it was represented by the candidate passing through an oval, symbolising that as he entered this scene of woe so must he go forth again. Thus was it that we find that styled, in ancient writ, the *portal of life*."

There is an allusion here to "the narrow home" which reminds us of this passage in the Taliesin records of the Druids:—

"In the dale, where the courses surround the circle (or cairn) Ho [Ho] arouses who is partly covered and partly bright. [He is now, says Davies, in the mystic coil (or kist or chamber), giving direction to his attendants.] . . . Let the renowned, the enterprising (Eidol) or Ambrosius, whose actions are recorded in the Gododin] be lulled to sleep. But let Hu mildly warm him with his divine presence. The man who rushes forth, when the fies lies in ambush, is the *red-fellow* of him who rests in the narrow house beneath the tumulus."

The allusion to a chambered tumulus like those encircled "sorcery-halls" at Maeshowe in Orkney, and New Grange in Ireland, seems here to be evident; but we need not wait to consider the special meaning of the context, which relates to Him—Hm,—of whom it is said that he "lived and died alternately." We merely wished to show that the *simulative tombs* were associated with *simulative death*, as indeed has already been done, in the *Duiller*, while treating of the Great Pyramid of Egypt and elsewhere. The Druidical and various other Pagan doctrines have also been treated of on this principle in our journal, in a series of Letters, to which we may here refer.‡

* Captain T. Latter, B.N.T., Assistant Commissioner, Agra.

† See Letters referred to below.

‡ See articles on the Great Pyramid, in *Builder* of 24th September, 1864, and 19th September, 1868. See also letters in *Builder*, by J. E. Dove, on "Wing and other Symbols," October 16th, 1858, and January 15th, 1859; on "Geometrical and other Symbols," April 4th and 18th, June 6th, and July 11th, 1859; on "Wing and other Symbols," July 2nd, October 22nd, and December 17th, 1864; and various others.

But merely to indicate all that this subject involves would require an inquiry and a volume at least as extensive as Mr. Ferguson's; and all we can do here is merely to offer a few disjointed remarks on so vast a subject.

That the *worship* of "departed spirits," real or imaginary, has been one form of error in religion which was very prevalent in ancient times appears to be undoubted; and we may just hint that this Pagan form of error, as a *positive and intentional "religion,"* seems to be on the high way to a full-fledged revival in modern times.

There are two great divisions into which all so-called religion may be said to have ranged itself in practice, both in old and in recent times,—Monothemism and Polytheism. That the veneration of the dead, or the worship of "departed spirits," belongs to the order of polytheism there really cannot be a rational doubt. The object of worship becomes "a God," whatever it be; and even were it an image or idol,—a God of silver and gold,—or even a stone, far less a real or supposed human being, "departed or not departed." "These be thy Gods!" a phrase applied to those who "served" the "golden calf," may quite as legitimately be addressed to "the servants of the spirits," as one class of modern Spiritists actually call themselves. The witch of Endor called her own "familiar spirits" Gods; and Samuel the Seer was venerated by her as one of those Gods. Of such as she, no doubt [in Isaiah lxx. 3], was that "people who . . . sacrifice in gardens and burneth incense [for enchantments] upon altars of brick; which remain (and sleep, as Herodotus says) among the graves, and lodge in the monuments," kist-vans, dolmens, chambers, tumuli, or other "simulative tombs."

The monothemistic principle has also been, to a certain extent, mixed up with the polytheistic; but in many cases the priesthood upheld the polytheistic for exotic purposes, while they were well enough acquainted, covertly, with the monothemistic; and, indeed, the multitude of Gods in Pagan mythology, apart from "departed spirits," was little else than a multitude of names given to one ruling principle, "one and the selfsame Spirit" of Nature, God, or Goddess, in whom all live, move, and have their being, or by whom all subsist. Thus Ceres was called the "many-named God," and according to Lucius, at his initiation, Isis declared herself to be Nature, and "the uniform manifestation of Gods and Goddesses." After this multitude of Gods had consecrated a variety of her names, such as Juno, Venus, Proserpine, Ceres, and Minerva, she said, "Under all those names, and with many different ceremonies, I am the only Deity whom the universe invokes!" And whatever Isis was, as an oracle manifested in her "servants," she was no more "departed spirit," far less any endless variety of departed spirits, such as the 333 millions of Hindu Gods may have been to those who were instructed to dwell in the tombs (like Chaldeans in cities of the dead), and wear grave-clothes, even though Brahma was always one God, or Brahma, Vishnu, and Shiva, three in one. It is very curious, however, that Isis did call herself "The Queen of departed spirits," and an unruly set of subjects to Queen Isis, or Cereswynn, they occasionally seem to be in their modern manifestations; and much they stand in need of a ruler and a pater-down. It is no less curious, too, that this self-announced title is not quite unprecedented, as a title, even in sacred writ. In Numbers xvi. 22, God himself is called "the God of the spirits of all flesh." Either of these, if they be not "one and the selfsame Spirit" of the Universe, is a God of Gods, and not such a mere rabble of minor Gods, unruly and unrulied, as are those who actually rule or govern "the servants of the spirits."

The Universal Spirit, as the oracular monothemistic principle, whether as God or Goddess, has a close relationship to "the flesh." The body of man is the temple of God,—the temple of the Holy Spirit, or Holy Ghost; "the body is for the Lord, and the Lord for the body." And in truth *God-possession*, which means to be "not in the flesh but in the Spirit" of ecstatic and sacred entrenchment, is, as has been heretofore remarked, the leading idea of all monothemistic religion; as *departed-spirit-possession* is the leading idea of all really polytheistic religion. It is to "one and the self same (divine) Spirit" that monothemism exhorts

* See in *Builder* of 17th December, 1864, on "Rock and Sorcery-hall Symbols."

man kind to present and give up possession of their bodies, as temples, and as living sacrifices, at sitting and appointed times, in which to manifest "the Spirit of Truth," or to constitute "the Oracles of God." It is to an endless succession of different and merely human spirits, illusory or real, that polytheism calls upon them to give up possession of their bodies as "servants of the spirits,"—not as "servants of God,"—and to constitute questionable oracles of these their "Gods," with their seers and prophets, or trances and other "mediums," and their tables or altars, spirit circles, "services," prayers, hymns, and other mockeries of "religion." A few of the "trance mediums," moreover, among the modern veneration of departed spirits, do devote themselves mainly to the "service" of some few, or one even, among the hosts of "spirits"; and the proper place for such a "medium," who gives up the possession of his body to another, who has lost his own, to be talked through, or written through, or oracled through, while "in the trance," or simulative death, should be in a Pagan dolmen, or other "simulative tomb," on the top of the grave of the defunct interlocutor, to those quasi-oracular utterances he is so devoted, as "a servant of the spirits," in these their second-hand inspirations. Where else so appropriately as among the tombs, and the dead, or in church-yards, could "departed spirit-worshippers" practice their "religion," as in ancient Pagan times.

These remarks, however, only apply to a certain fanatical class of the modern spiritists, and not to those who are scientifically engaged, or merely as a pastime, in "trying the spirits";—the "psychic forces," magical forces, or whatever they be,—an inquiry of a very curious and interesting order; and it would be well the chaff were winnowed from the wheat as soon as possible, in this more than threatened modern revival of hero-worship and polytheistic Paganism.

The ancient Pagan worship of departed spirits must thus be distinctly contradistinguished from any one of the various more or less pure or impure forms of ancient monotheism, although they were, doubtless, more or less mixed up with it as they sank into more and more degraded and superstitious forms of "worship." These more or less pure monotheistic forms of religion included the Buddhist and Brahminical, the hierophantino of Egypt, and even the Druidical, no less than the Judaic and the Christian; as cannot be appear from evidence already given in the *Builder*. Here, however, we cannot dwell on this subject. There is even a lower depth into which the ancient religions probably sank than into the worship of "departed spirits," whether with mediums entranced or not entranced, and that is into the region of mere dreaming and unentranced sleep, as their only source of inspiration, or dictation; and Sir John Lubbock was probably not very far wrong when he said, in a lecture at Liverpool on the social and religious condition of the lower races of men, that—

"The ideas of religion among the lower races were intimately associated with, if indeed they had not originated from, the condition of man during sleep, and especially from dreams. Sleep and death [he continued, though this is much more the case with *france and death*] had always been regarded as nearly related to one another. The savage would naturally look on death as a kind of sleep. . . . the events in his dreams as real as those which happened when he was awake," &c.

We can now, from all that has been said, see pretty clearly the meaning of the passage from Herodotus, as to a North African people, the Nasamonites, thus referred to by Mr. Fergusson (p. 407):—

"From Herodotus we learn that this people buried their dead sitting, with their knees doubled up to their chins [which is the sleeping posture of the Tibetan peasantry, we may here remark; and a posture of the ancient dead which has been noticed in this country as well as in America], and were so particular about this that when a man was dying, they propped him up that he might die in that attitude (iv. 190). We also learn from him that they had such reverence for the tombs of their ancestors that it was their practice, in their solemn form of oath, to lay their hands on these tombs, and so invoke their sanction; and, in their mode of DIVINATION, they used to SLEEP in or on these sepulchres (iv. 172)." That is, probably, he remembered, "in or on" the dolmens, which Mr. Fergusson thinks the Nasamonites may probably claim, as one form of [simulative] tomb in ancient use by them and their forefathers, although he cannot think that all the thousands of North African dolmens, even

in Algeria alone, were theirs. Were not these Pagans also like those in Judea already alluded to, of whom Isaiah spoke (lxv. 3-4), as those who "remain among the graves, and lodge in the monuments,"—that is, probably, sleep in them, too, by night? "I slept in 100 caers," kist-vacns, or dolmens, or at least sacred enclosures, islands, or whatever they were, said the Taliesin, and "have died and revived," or been "horn again." And as such people also "sacrificed in gardens, and burned incense upon altars of brick"; so the Druids sacrificed in groves, although much less is said as to that, as we have remarked, in the Taliesin records, than about caers, and narrow houses, sanctuaries, sacred islands, lakes, circles, revolutions, inclosures, and boundaries.

The sleep alluded to by Herodotus may have been, even in his time, the same as the "sacred sleep" or "temple sleep" of the Egyptians, which, in truth, was entrancement, high or low, and regeneration into a new life, in theoretical principle at least, and however degraded or false,—however dissimulative no less than simulative of death, it may then have become in practice. It was the same state that Herodotus indicated, in his account of the concentric circle, or rather voluted, pyramidal tumulus, or tower, of Belus, at Babylon, with a shrine, or actual tomb below, and a chapel, or simulative tomb, at the top, in which a "chosen priestess" lay, on "an elegant bed" at a golden table, and was nightly visited by Belus, or entranced by the God; when, probably, the oracles uttered were written down at the table. Here is a type of the probable uses of the ruder kist-vacns, dolmens, beds, cells, chapels or oratories, caves, and crypts of various ages.*

Such then appears to us to have been the chief purposes of simulative tombs, such as dolmens, kists, beds, chairs, chambers of tumuli, and also many altars. They were probably used, whether by "departed spirit worshippers" or not, in the production of simulative death, or entrancement, real or false,—or in "waking" the mystically "dead"; and whether among the actual tombs or tumuli of the really dead or not; and Mr. Fergusson's discovery of so extensive an association of "simulative tombs" with real ones, and also apart from them, is a most significant and important one; and whether the object of worship, or service, by human beings in "God-possession," were the one divine monotheistic Spirit of the Universe; an endless polytheistic host of "departed spirits"; or a mere dreaming delusion of the insane, "possessed, by devils, coming out of the tombs."†

In concluding this very imperfect outline of a new argument in favour of the probably great antiquity in general of the mass of gigantic monuments throughout the old world, we must acknowledge how materially indebted we have been to Mr. Fergusson's own labours and suggestive pages, and map, for being able at all, now for the first time, to put into something like definite form, this outline of an idea which we have long entertained, as to the probable uses, architects, and purposes, of these rude megaliths and tumuli; and, without the aid of this very interesting and important volume itself, in which confusion is reduced to something like order, we do not see how this could have been done with the least chance of a favourable reception by archaeologists.

THE PUBLIC HEALTH BILL.

A BILL to amend the law relating to public health, prepared and brought in to the House of Commons by Mr. Stansfeld, Mr. Secretary Bruce, and Mr. Hibbert, and ordered by the House of Commons, on 10th February, 1872, to be printed, has just been issued.

The Bill has no preamble. Those who are attached to time-honoured associations may be shocked. For our own parts we are disposed heartily to welcome any well-considered attempt to escape from that barbarous verbiage of legal meshwork with which our statute-book afflicts and disgraces the age and the country. An approach to either the incisive lucidity of the French publicists, or the elegant perspicuity of the Italian legists, would be hailed by all plain-dealing, honest men. That the case which exists for legislation, in any instance, should be explained and admitted, before a Bill is pro-

* In the Kensington Museum, amongst the interesting and curious photographs of Indian temples and tombs, one, called "the Muddan Mahal," at Jubulpore, appears to be in the form of a chapel, erected on the top of a dolmen, with access to it by outside stairs.

† Matt. viii. 28.

ceeded with, is, of course, proper. But it is not necessary to commence with WHEREAS in large letters. Not only are we struck with this novelty in the mode of commencement, but still more with the care and skill that have been evidently devoted to mastering and explaining the subjects dealt with by the Bill. Its draughting forms an exception to the cumbersome and slovenly dictation which we have learned to expect, as matter of course, in any new Act of Parliament.

The Public Health Bill contains ninety clauses, and occupies forty pages of letter-press. Commencing with the usual preliminaries, defining the title, the application, and the date of the commencement of the proposed operation, of the Act, it devotes the seventeen following clauses to the establishment of sanitary authorities. It goes on to deal with the alteration of areas, the union of districts, and the repeal of local Acts; which subjects occupy, altogether, eleven clauses. Clauses 32 to 50 deal with the subject of nuisances; 51 to 53 with that of water supply; and 54 with gas supply. Seven clauses follow, treating of hospitals and provisions for the sick; three deal with the subject of analysing water; and the remainder of the Bill consists of miscellaneous, and saving clauses, directions as to legal proceedings, and definitions. Under the miscellaneous clauses is to be found an important power granted to any "sanitary authority to buy up any water-mill, dam, or weir which interferes with the proper drainage of the district," which we regret to see nullified by the condition that Parliamentary sanction must still be sought, in order to give compulsory power of purchase to the Local Government Board.

England is divided by the Act into sanitary districts of three descriptions, namely, urban, rural, and port (including riparian) sanitary districts. Urban sanitary districts are either boroughs, in which the sanitary authority is the council; Elective Improvement Act districts, under the direction of the Improvement Commissioners; or Local Government districts, in which the authority is that of the Local Board. A rural sanitary district is commensurate with the area of a rural union; and the guardians of the union are to form, with certain exceptions, the rural sanitary authority.

From the first meeting of the sanitary authorities constituted by this Act all other sanitary authority shall devolve on the newly-constituted Boards. No less than six sets of Acts of Parliament, in addition to the Local Government Acts, are mentioned as forming the basis of the powers of the new authorities. These are the Sewage Utilisation Acts, the Nuisances Removal Acts, the Common Lodging-house Acts, the Diseases Prevention Acts, the Artizans and Labourers' Dwellings Act, and the Bakersons Regulation Act. It would be desirable, if it be felt unadvisable to attempt during the present session a consolidation of all the legislation, the enforcement of which is thus committed to the new authorities, that a schedule should be attached to the new Act containing the enacting clauses of the earlier laws, so that the new authorities should not be compelled to provide themselves with an extensive legal library.

A medical officer of health is to be appointed by every urban sanitary authority from and after the expiration of three months from the commencement of this Act, in the manner provided by the 40th section of the Public Health Act of 1848. Here, again, we ask to have the section in question appended to the new Bill. Clerks and treasurers, inspectors of nuisances, and any other necessary officers and servants may be appointed by the new authorities.

Inspectors of the Local Government Board are to have, for the purpose of the Sanitary Acts, similar powers to those which the Poor-law inspectors have under the Acts relating to the Poor Law, for the purposes of those Acts. Here, again, a clear and compendious summary of actual legislative enactments is absolutely necessary for the guidance of the inspectors as much as for that of the Board.

All expenses incurred by urban sanitary authorities are to be defrayed as provided for by the Local Government Act, if in force in their district. If the Act is not in force at the commencement of the new law, the council of a borough are to have recourse to the borough rates, and the Improvement Commissioners, to any rate leviable on their district.

The expenses incurred by any rural sanitary authority will be either general or special; the former including the expenses of the establish-

ment and officers, the expenses in regard to disinfection, the providing conveyance for infected persons, the providing of hospitals, and all other expenses not defined as special. The latter comprise the expense of construction of sewers within the district, the providing of water supply, and any other expenses legally incurred, and determined by the Local Board to be special. The general expenses are to be defrayed out of a common fund, to be raised out of the poor-rates of the parishes forming the district. Special expenses are to be separately charged on each contributory place; the sanitary authority issuing its precept to the overseers of each such contributory place for the payment of the same.

Power is given to Local Government Boards to make over their authority to the conservators or commissioners of any port of England for the jurisdiction over such port and its waters; and riparian sanitary authorities may be empowered to act in like manner; the expenses being regulated on the same principle as in the case of the contributory districts.

Consolidation of areas, and of local authorities at present constituted, is facilitated by the new Act. In the case of a borough comprising, with its area, the whole of an Improvement Act District, the authority may be transferred to the borough council. Where a special drainage district has been formed, but no works, involving the raising of a loan, have been commenced, the district is to be dissolved, and will merge in the parishes. When works have been executed, in such circumstances, the confirmation of Parliament to the provisional order of the Local Government Board is necessary. No simple mode of obtaining such Parliamentary assent is, however, contemplated by this clause of the Bill; which, to this extent, must be regarded as a convenient seed-bed for numerous future Acts of Parliament. The assent of some central authority might, with extreme advantage, be substituted for this cumbersome process, or the provision, which occurs later in the Bill, of allowing a regulation that, after being laid on the table of the House of Commons for forty days, has met no opposition, to be taken as definitive, might apply to the whole measure.

Where it appears to the Local Government Board, on the application of the sanitary authorities of any sanitary districts, to be desirable to form the same into a united district, power is given to do so by what is rather enigmatically termed a "provisional order." The term is explained by reference to the Local Government Act of 1858. The objects of such unions are stated to be the prevention of the pollution, or of the obstruction, of streams; the procuring a common supply of water; or the making of a main sewer, or combination of a system of sewerage, for the districts to be united. It is, however, added, "or for any other purpose of the Sanitary Acts." The mode of forming such united districts, the description of the governing body, the regulations as to constitution of joint boards, and the mode of charging expenses and of raising funds, are then severally detailed; and power is given to the Local Government Board to repeal, alter, or amend any local Acts which are inconsistent with or relate to the same subject matters as the Sanitary Acts.

We now come to the very important part of the Bill that stands under the simple title of "Nuisances."

Every person who throws into any stream rubbish, cinders, refuse of manufacturers, or other solid matter, in such quantities as to interfere with the due flow of, or to pollute, the water is to incur the penalty of 5*l.* for the first offence, 10*l.* for the second, and from 1*l.* to 2*l.* for every day during which the offence is continued. On a third or subsequent conviction, the penalty is increased to 20*l.*, with a daily fine of from 2*l.* to 5*l.* Every person who turns into any stream any sewage matter, solid or liquid, or any other polluting liquid, is to incur similar penalties. Two years' grace is allowed for the continuance of any existing nuisance, so far as the operation of this Act is concerned. The question of the liquids which shall be considered as polluting is removed from the ground of conflicting opinion, and placed upon that of scientific analysis,—a bold and wise step. The tests specified are these:—

The presence, in 100,000 units of water, taken by weight, of either three units of dry mineral matter; one unit of dry organic matter; two units of organic carbon; '03 of organic nitrogen; two units of any metal except potassium, sodium,

calcium, or magnesium; '05 of metallic arsenic; one unit of free chlorine; or one unit of sulphur, in the condition either of sulphuretted hydrogen or of a soluble sulphuret; shall be held to constitute a polluting liquid. Further, any liquid of an acidity greater than that which is produced by adding two parts by weight of real muriatic acid to 1,000 parts of distilled water; any liquid of an alkalinity greater than that produced by adding one part of dry caustic soda to 1,000 parts of distilled water; and any liquid which exhibits by daylight a distinct colour, when a stratum of it 1 in. deep is placed in a white earthenware vessel; is to be held polluting. There should, we think, be some explanatory clause added to prevent any drainage or irrigation works in mountain districts from being hereafter impeded by the foregoing provisions. A spate in the Highlands, for instance, would bring down a peat-coloured torrent that would, no doubt, show a golden stain in the test-tube of white porcelain. The intention of the provisions is clear; but a word of explanation would not be here out of place.

The Local Government Board may alter the foregoing conditions by order. In case of rendering the stringency less, they may do so absolutely. In case of increasing the stringency, the alterations are only to come into force when they have lain for forty days before Parliament. This mode of counting Parliamentary challenge appears to avoid the objection which we mentioned as lying against clause 65. The mode of obtaining Parliamentary sanction to the acts of the sanitary authorities ought, however, to be the same in all cases. A special enactment, applying to the whole Bill, would simplify and improve this part of the arrangement. The sanitary authorities are empowered, by clause 34, to take any proceeding they may think fit, at law or in Chancery, for the protection of streams; and no plea that other nuisances exist is to be available in extenuation of any individual nuisance.

A penalty not exceeding forty shillings is imposed on any person having charge of a fire, the smoke of which is found to be a nuisance. The Nuisances Removal Acts and the 19th section of the Sanitary Act of 1866 are referred to in this clause, and should be appended to the Bill.

The 37th clause is so important as to require citation in full. All sewers and drains, whether public or private, shall be constructed, provided with means of ventilation, and kept so as to effectually prevent such sewers and drains from being dangerous to health, and any sewer or drain not so constructed, ventilated, or kept, shall be deemed a nuisance under the Nuisances Removal Acts, and, whether it be on public or private premises, may be dealt with under the said Nuisances Removal Acts as if it were on private premises. This very comprehensive clause will, no doubt, provoke full discussion. The force of the word "kept" is absolute.

A long-voiced controversy is to be closed, and a long-standing scandal to our civilisation removed, by the six lines which form clause 38, making it the duty of the urban sanitary authorities to provide for the proper cleansing of streets (pavements ought to be distinctly specified), as well as for the removal of all refuse or unclean matter from all closets and cesspools. Here, too, is a clear proof of the earnest determination of the framers of the Bill that it shall not remain a dead letter. If the sanitary authorities, after due notice, omit for two days any such cleansing they shall pay to the owner of the house so neglected a penalty not exceeding ten shillings a day. We take it that this provision is not only novel, but likely to be extremely effective. The only weak point that strikes us is, that it is not stated from which funds the penalty is to be defrayed. If it comes out of the rates, it only brings a moral pressure to bear on the neglectful authorities. But even that is much. Power is given to the officer of the sanitary authority to inspect premises; and a penalty not exceeding forty shillings is imposed for throwing rubbish into any sewer or drain.

The 49th section of the Public Health Act of 1848, providing that houses are to be drained into any sewer that runs within 100 ft. of their site, is so far modified as to allow of the construction of a new sewer, instead of making communications with an old one, where desirable.

Clauses 44-46 relate undoubtedly to the protection of the public health; but, although admirable in their enactments, would hardly have

been looked for under the head of nuisances. They provide that the milk of any animal suffering from any tubercular, contagious, or infectious disease shall be deemed unfit for human food; and that milk and tea shall come under the provisions of the Nuisances Removal Act of 1863. A penalty not exceeding twenty pounds is attached to the sale of any unwholesome food, and a warrant may be granted by a justice, on application from a sanitary authority, to search for unsound food. These are admirable clauses.

Foul pumps or wells are to be closed, by the order of two justices, on the application of any sanitary authority; and the inhalation of any building unfit for human abode may be prohibited in the same manner.

Power is given to sanitary authorities to carry water mains, when requisite, without their own district, as well as to purchase water rights. All water supplied either by the sanitary authority itself, or by any waterworks company or person, shall be filtered when necessary, and shall be free from all impurities; and a penalty not exceeding 50*l.* is imposed for the supply of impure water; without relieving the offenders from liability to any further proceedings, and without removing the obligation resting on the sanitary authorities to enforce the provisions of the section. This is root and branch work, and, if carried out, will be a most important safeguard to human life.

Power is given to any urban sanitary authority to light their district with gas, or to buy up, with the assent of three-fifths of the shareholders, the property of any gas company.

Clauses 55 to 61 lay on the sanitary authorities the duty of establishing hospitals and dispensaries, of supplying medicines during epidemics, of providing a mortuary, and of obtaining returns of sickness. The water supplied for domestic purposes is to be analysed from time to time, as well as all matters polluting streams. To the power to buy up water-mills, given by clause 65, we have referred. The Local Government Board have further powers entrusted to them with reference to section 35 of the Sanitary Act of 1866, and further explanation is given as to section 69 of the Public Health Act of 1848, and section 28 of the Local Government Act of 1858. These sections ought to be appended to the present Bill.

Clause 69 imposes a penalty not exceeding 20*l.*, or one month's imprisonment, on persons making false representations with respect to infectious disease, which may have existed, within three months, in any house or rooms let for hire. A great howl will probably ascend from many a watering-place at this most righteous and enlightened check on our favourite "Eherty of the subject." The liberty of any one to spread disease is thus boldly denied by the Bill.

The remaining clauses give directions of detail, which those whom they concern will best study in the Bill; a set of definitions, or sort of glossary of some of the legal terms employed, occupying the two pages which constitute the 90th clause.

The Public Health Bill may be, and has been, criticised on two grounds. First, that it does not consolidate the existing legislation; secondly, that it is permissive, and not compulsive. It may be fairly urged, however, that, important as consolidation is, the Government are in a better position to know whether the time has arrived for effecting it, than any one else can be,—not, as Prince Bismarck pithily remarked, because they are more clever than any one else, but because they must know more on the subject than any one else. An attempt to do more at this moment might, in case of opposition, have resulted in the embarrassment of the whole question. We suggest that the several clauses of other Acts which are specially referred to in the present measure, should be printed as an appendix to the same. As to the second point, we can only say that, although we believe more is needed, the bill has been taken by the horns; and an amount of compulsory cleanliness must result from the passing of this Bill in its integrity, that will greatly astonish and confound the friends and patrons of filth.

The Bill is, for the most part, clearly and well arrayed. Further progress in that direction we hold to be both possible and desirable. By the insertion of one or two preliminary clauses, as in French legislative and legal documents, a large amount of repetition may be avoided, and an Act of Parliament much reduced in length and equally increased in perspicuity. By comparing the two or three lines in which we have above described the liquids that shall be held

to be polluting, with the page devoted to the same object in the Bill, it will become clear that verbiage may be yet diminished. We shall return to some objections to the Bill as it stands, but meanwhile we thank the framers of the measure, Mr. Stansfeld, Mr. Secretary Bruce, and Mr. Hibbert, for the stride which they have made towards a legislation that shall be intelligible to plain men, without the interpretations of a lawyer.

The provisions of the Bill have been taken, almost entirely, from the Second Report of the Royal Sanitary Commission appointed in 1869. It will be seen that the Public Health Bill is, in the main, a great engineering measure. While the medical element must always retain great importance, the works of all kinds that will be necessitated by the provisions of the Bill can only be successful if carried out by competent engineering skill, and if duly designed as a portion of that great reform in the water supply, irrigation, drainage, and agricultural engineering of the kingdom which, as we have often pointed out, might in so short a time trouble the products of the soil, and occupy all available labour.

ON JAPANESE ART.*

Enamels.

Of all the arts of the Japanese the one which is to my mind the most interesting is that of enamelling. In this they excel beyond any other nation with whose works we are acquainted.

It is only within the last few years that examples of Japanese enamelling have reached this country, and I am led to believe that it is only very recently that they have been allowed to be exported from Japan. Neither the large collection of Japanese curiosities preserved at the Hague, nor Siebold's Museum at Leyden, contains a single specimen of this art.

The few statements I have been able to obtain from those who have resided in the country, or who are living there at the present time, as well as from Japanese gentlemen themselves, are so vague and conflicting that, put together, the result is nil. My own idea is that none are now made, and that the art has always been dedicated to the production of articles of use and ornament for the palaces of the Mikado and the princes of the land.

The recent alterations in connexion with the Government of Japan, and the breaking up of a large proportion of the Daimios' establishments, consequent upon the decrease of their power and revenues, may account for the sudden exportation of so many valuable works of art from this country. Be this as it may, we have become the lucky possessors of works of great beauty and value, as well as of lasting interest to all true art-lovers.

A careful examination of the Japanese enamels almost bewilders the mind, and confuses the eye; on the one hand by the almost superhuman skill displayed in their manipulation, and on the other by the marvellous diversity, intricacy, and beauty of their designs.

The ancient examples of the art of Cloisonné which have come down to our time from the Middle Ages are almost entirely in the form of small plaques, which were used for the ornamentation of ecclesiastical vessels, book-covers, altar-frontals, and the like. In the interesting work by the monk Theophilus, on the "Arts of the Middle Ages," we find an elaborate description of the manner of constructing small plaques of this enamel for the enrichment of church vessels; but no hint is given as to its adoption for the complete surfaces of the vessels themselves. Theophilus appears only to have been acquainted with pieces which could be held between the thumb and finger, and polished like the natural gems with which they were usually associated on the golden vessels. What would he have said if he had seen the works of the Japanese in vases nearly 3 ft. high, and dishes 2 ft. in diameter, entirely enamelled (on both sides in the case of the dishes), with designs more minute and accurate than any he ever saw in the church plate of his day,—the culminating epoch of the arts of the Middle Ages?

Japanese enamels are characterised by great sobriety of colouring, bright colours being sparingly used. In this respect they differ from the Chinese, in which the brightest possible colours are introduced throughout. The principal colour in Japanese enamels is a dark green,

and is adopted generally as the ground tint. Other colours, such as lilac, drab, and dark blue, are frequently employed for the grounds of the variously-shaped medallions introduced in the designs.

In almost all instances which have come under my notice, the green ground is ornamented with a delicate spray and leaf work, with small flowers studded throughout it; the leaves are in various colours, including drab, light green, and white. Medallions of different sizes, formed when small of various geometrical designs, and when large of devices derived from animal and vegetable life, occur at intervals, sometimes symmetrically placed and sometimes erratically disposed. Along with these medallions, pieces of diaper work, of both regular and irregular shapes, are introduced with the most happy result. Sometimes a wonderful degree of care and skill is observable in their manipulation, especially when the design is of a small repeating geometrical figure; for instance, in a diaper most difficult to put together, I counted no less than 103 separate squares of wire in the quarter of a medallion of only $\frac{1}{4}$ in. radius. You must remember that each of these squares had to be shaped out of the fine ribbon-wire, and soldered one by one to the ground of the article.

Of the designs of the conventional flowers, rosettes, and scroll-work, found on every piece of enamel, it is impossible to speak too highly, and their colouring is invariably harmonious and effective.

On large specimens of the art, the dragon is perhaps more frequently depicted than any other object, and it is invariably handled in a most masterly manner. The Foo is another favourite representation, and is commonly shown in the act of descending from its lofty home towards earth, with its numerous long and richly-coloured tail feathers floating around it in graceful curves. In this shape, the sacred bird is certainly one of the most artistic conceptions of the Japanese artist.

The material, which for its proper display requires to be cut up by the metal files into minute divisions and distinct forms, is highly favourable for depicting birds, fish, foliage, flowers, and all descriptions of purely ornamental figures; but is, on the other hand, incapable of rendering landscapes or any scenes requiring perspective. It is simply impossible to convey any idea of distance in the material. I have seen a landscape attempted on a Japanese dish, but the result was of the most archaic character, and a total failure.

Lacquer Work.

I am truly at a loss where to begin my remarks on the lacquer-work of the Japanese, and I am afraid I shall experience considerable difficulty in knowing where to end.

The styles and modes of manufacturing and ornamenting it are apparently countless. I have endeavoured to classify the several descriptions which show some signs of resemblance, but have been compelled to give up the task as hopeless. There is no art-manufacture, I believe, which displays such a diversity of treatment as this.

In a single cabinet, which formed one of the gems of the Japanese Court in the Paris Exhibition of 1867, and which now ornaments the collection of Mr. James L. Bowes, there are no less than nine distinct species of lacquer, and twenty-four different modes of artistic treatment represented on the main divisions, such as drawers, doors, and the like. On a more minute inspection, we find on one drawer sixteen different modes of applying and decorating gold-work, and on another seven ways of treating various metals; all the remaining drawers, along with the doors, present numerous interesting methods of handling the coloured and aventurine lacs, and the metal, shell, and other inlays. This work, taken altogether, is certainly an extreme illustration; it was made, I understand, for the purpose of showing, in a single article, the most important modes of lacquer-working followed by the Japanese of the present day; and, notwithstanding the great variety it displays, its general effect is superb. It is richly mounted with silver; and the key-drawer is faced with an engraved plate of that metal, edged with gold, and barred with a broad line of some black metal.

It is rarely that one meets with more than two kinds of lacquer on one article, but the artistic treatment of any one kind may vary considerably.

It is a well-known fact that Japanese artists

avoid, if not positively dislike, diametrical division. This you will see most satisfactorily illustrated on the sides, ends, and top of a cabinet before you. On all these surfaces a piece of fret diaper is introduced, but nowhere dividing them diametrically or into regular forms. The diaper is not constructed, as we should certainly do it, at the angle of 45° ; and, what may strike us as more peculiar, its margin lines are not at the same angles as the pattern, or even similar to each other, one being straight and the other zig-zag. Here, then, we have all our ideas of propriety in ornamentation broken through, yet who can deny that the result is satisfactory?

The Japanese frequently use diapers to cover surfaces entirely, in the manner common with us, but they never consider it necessary to border them round, but let them crop out just as they may.

So much for ornamentation by means of diapering; I shall now draw your attention to the Japanese method of introducing medallions in their art-works. When two or more medallions are introduced, containing any kind of enrichment, they are almost always of different outlines, the love for variety preventing the artist repeating his forms. Referring to the cabinet, we find twelve medallions and six different outlines used; and out of the total number eight are complete, and four are broken medallions, the latter being cut into by the panels of the doors and main drawer.

The back ends, and top have two medallions each, of different forms, one being placed on the black ground, and the other breaking into the fret diaper-work, in the most free-and-easy manner imaginable. The artist bore contrived, by comping differently-shaped medallions, by disposing them in different positions, and by cutting the ground in a different way with the fret diaper, to make every surface of the cabinet a distinct and independent design; yet combined they produce a most consistent whole.

I have been led to enlarge on this subject because it involves art-principles which we should do well to carefully consider; and, because, on the other hand, it supplies a key to much that may appear strange to the observer who examines works of Japanese art for the first time.

Nothing can surpass the delicacy and beauty of finish observable in the old lacquer-work, now unfortunately rarely to be met with, and one cannot but wonder at the loving care and marvellous skill displayed in it. Some of the small articles, such as medicine-boxes, come as near perfection, to my mind, as anything done by the hand of man; and larger works, though not demanding so much delicacy, are still remarkable for their manipulation.

Of the mode of manufacturing lacquer-work very little appears to be known in this part of the world, but what little is known I shall briefly detail to you.

The lacquer or varnish in its original state is the produce of a shrub called by the natives *oerosino-ki*, that is, varnish-plant. The product of the shrub requires to be prepared with great care, and the colouring materials have to be incorporated with it by a tedious process of grinding. The colours most commonly used are black, scarlet, dark green, crimson-red, and brown. Black is more generally adopted for the ground-work of lacquered articles than any other colour; scarlet is principally used for the interior of boxes, and sometimes as the ground-work of trays and similar things. Perhaps the most beautiful of all the lacquers used for grounds are those called by us aventurine, from their likeness to aventurine glass made in Venice; there are several kinds of this, some closely resembling the glass, and others of a more dispersed nature, with flakes more like coloured mother-of-pearl than metal.

In laying on the varnish, five or six coats are applied, one after another, each coat having been allowed to dry before the next is laid on. When a sufficient time has passed to secure the perfect drying of the whole, the surface is ground down and polished. In many instances squares of gold and silver, pieces of pearl, ivory, coral, and such like are inlaid, as it were, into the lac surface; this is done by fixing them with the first coat of varnish, and then filling up to their thickness with many successive layers, and ultimately grinding the whole to an even surface.

The process, so far as I have described it, is used in the preparation of grounds only; when the beautiful relief ornamentation is to be applied, much more complicated and tedious

* By Mr. George A. Audsley. See p. 202, ante.

manipulation has to be gone through. I have been told, by those who have resided in Japan, that many months, and even years, are required to produce a highly-raised piece of lac. Lacquer-work is prized, in the first place, in proportion to its delicate finish, and in the second, in proportion to the degree of relief given to its ornamentation. In the writing-case before you, which was exhibited at Paris in 1867, you will observe how very beautifully the designs, both outside and inside, are rendered in relief, with the lights put in with squares of polished metal, and the red berries, growing on the rock plants, represented by raised beads of coral.

There can be no question that the process of raised lac working is one of the most tedious nature, and it is evident that careful cutting and grinding are required, to bring the rough masses of varnish into their proper forms before the final gilding is attempted. As regards the gilding, I know nothing, and can get no correct information. It is on the surface of the lac; but whether it is laid on in leaf, or powder dusted on a wet coat of varnish, I am unable to decide. When of good quality, it stands rough usage, washing, and polishing.

The practice of enriching lacquer by applying other materials, such as the various coloured metals, tortoise-shell, mother-of-pearl, coral, and precious stones, is very usually followed in good work. The small vase brought for your inspection is a most characteristic example of this practice. The general body is raised gold lac; the flowers of the iris are in white and purple pearl; the chrysanthemum flowers are in white pearl, with yellow centres and green calyxes; and the *Oumai* blossoms and buds are in white and red coral. All these flowers and buds are exquisitely carved and engraved.

As another instance of this class of work, I may describe a picture on the top of a modern Japanese box, which I had the pleasure of examining the other day. It comprised two figures of men, one of which was on horseback. The faces and hands of both were in ivory, carved in high relief; their sword-handles and guards were in ivory and purple pearl; and the silk tassels of the horse's trappings were in white pearl. The remainder of the picture was in various-coloured lacquer, and the whole beautifully rendered.

Porcelain.

To my mind, the most beautiful and artistic of all the fictile wares of Japan is the Satsuma; and I consider it superior, in an art point of view, to anything produced by other countries. This is made in the province of Satsuma, situated in the south-west of the island of Kiusiu. The body of the ware is of a delicate cream or vellum tint, and is covered with a thick transparent glaze, which is in nearly all cases cracked. On this softly-toned ground, figures, birds, flowers, and conventional designs are painted in the most exquisite manner imaginable. The freedom and grace infused into every line of the flower and bird subjects are astonishing; while the colouring is soft and refined to a degree.

In my remarks on lacquer-work I drew your attention to the fact that the Japanese artists dislike diametrical division. I have here a piece of Satsuma ware which is a still better illustration. It is a small basin, on which are painted two medallions, one filled with flowers, and the other with ornamental patterns. Looking at the basin, on the outside, neither of the medallions is seen to be complete: the one with flowers, placed on the lower part, is almost, one-third cut away by the stand of the bottom; and the other, placed on the upper part, is cut in half by the rim. On the outside of the basin, therefore, we find no trace of the symmetrical arrangement or balance of any sort; and on the inside we find the same love for irregularity displayed, for all we discover there is the remaining portion of the upper medallion cleverly doubled over the rim. How quaint all this is; and, on careful examination, how lovely,—as free as Nature herself, yet satisfying all the requirements of decorative art.

Another beautiful ware, richly ornamented with red and gold, is made in Japan, I am informed, in the district belonging to the Prince of Kanga; but of this I am not at all certain. The ornamentation of this ware is infinitely more minute and laboured than that of Satsuma, but is far inferior to it in artistic excellence. Kanga ware appears to be held in great estimation in Japan, no doubt on account of its fine colour and intricate ornamentation.

The Japanese frequently lacquer articles of porcelain, sometimes entirely and sometimes

partially. When entirely covered, they are treated, as regards their decoration, in a similar manner to ordinary lacquer-work; when only partially covered, two methods are adopted. The first method consists in grounding in with lac all portions of the object excepting those which have been already decorated, and intended to remain in their original state; and the second method consists in taking the porcelain itself as the ground, and ornamenting it with raised designs in gold and coloured lacs.

Metal Work.

The Japanese are very skilful in all that relates to the artistic treatment of the metals, and produce works in this branch of art as commendable as they are varied. They are expert in casting, carving, damascening, engraving, inlaying, weaving, and tempering; and in many of these departments, produce specimens comparable to anything done in Europe.

Perhaps the most characteristic of all their metallurgic works is that called by them *syakifo*. In this, numerous metals and alloys are associated, the designs being produced in colours, through the agency of the various coloured metals,—white being represented by silver, yellow by gold, black by platinum, all shades of dull red by copper and its alloys, brown by bronze, and blue by steel. Gold, silver, and polished steel, of course, represent themselves in designs as well as abstract colours. A red garment, embroidered with gold, and clasped with silver, would be executed in red-coloured copper, inlaid with gold, and furnished with a silver brooch. The sword in the hand of a warrior would be in polished steel, and, if bloody, would have red copper inlaid on it. These instances will suffice to illustrate the general mode of producing coloured designs by the exclusive use of metals. I have seen many beautiful specimens of *syakifo*, and can bear witness to their faultless execution.

The Japanese have brought bronze-casting to great perfection, as is proved by the superb incense-burner which was presented to his Royal Highness the Duke of Edinburgh by the Mikado, and is now exhibited in the South Kensington Museum. They also produce a highly-finished and polished bronze-work, on which the relief ornamentation is produced by cutting the surrounding metal away. The relieved objects are then engraved, and richly damascened with gold and silver. Bell-founding is carried on to a considerable extent, and art is never neglected in the designs.

Reposist-work is well known to the Japanese metallurgists, but is not so largely adopted by them as it is by Western artists.

Flat silver wire, woven into diaper patterns, is a favourite material for covering uniform surfaces, and is frequently applied by the Japanese artists in an effective manner.

Lastly, I desire to draw your attention to a group of stones, executed in gold, silver, bronze, and other metals. You will agree with me, that the Japanese have been more successful than our silversmiths in appreciating the nature of their materials, and realising the correct modes of working them. Compare this group,—where every feather is a thin plate of metal, carefully engraved; where the legs, tails, necks, and heads of the birds are in their natural colours; where the rock they stand upon is modelled with accuracy, and its stunted vegetation truthfully rendered,—with the best efforts of our silversmiths, as displayed in presentation plate, of which the best that can be said is that they contain many pounds of "solid silver." Compare them, and I am satisfied that you will give the award in favour of the Japanese.

* * * * *

Carved Works.

It is a somewhat remarkable fact that in all the varieties of ornamentation applied to such materials as porcelain, textile fabrics, paper, and in pictorial illustrations generally, the Japanese never resort to shadows for the purpose of giving the effect of relief. It is a remarkable fact, because, as a race, their artists are passionately fond of relief in everything, and adopt it everywhere it can be properly used. My last words explain all, they acknowledge the great law in decorative art that flat surfaces should not appear to be relieved, but be treated as flat surfaces, and admit relief only where it can be properly used.

When relief is wanted, the Japanese artist has countless expedients for securing it: in porcelain, he moulds it from the clay, or applies it by lac; in metal-work, he casts it, sculps it, or

bents it up; in ivory and wood, he carves it; in lacquer-work, he brings it up by coat after coat of varnish; and in embroidery, he plies thread over thread with patient care until the relief is gained.

Of all the carved work of the Japanese, the most wonderful and interesting are their ivories, called *netskes*. These consist of groups of figures and animals, grotesque figures, and representations; in short, of nearly every natural object in Japan, most truthfully rendered. It is quite impossible to give any idea in words of the quaint humour, the broad caricature, the intense power of expression, and the general artistic excellence, which stamps every *netske*, in which the human form appears with an individuality distinct from all kinds of a kindred nature produced in other lands. A first-rate Japanese *netske* has positively no rival. The carving of these ivories is carried to the highest degree of perfection; and its effect is frequently enhanced by the partial application of colour and gilding.

The Japanese are likewise skilful in wood-carving, and they frequently substitute it for ivory in their small works.

Of the larger and most important labours of the wood-carvers,—such as those applied in the temple and domestic architecture of the country,—I am at present unable to speak. My visit to Japan will, no doubt, put me in a position to tell you something about the native architecture, and the modes adopted for its decoration; and on a future occasion I shall be pleased to give you the result of my observations.

THE BOARD OF PUBLIC WORKS IN IRELAND.

An alteration in the constitution of this Board, which is in contemplation, if not already actually decided on, is exciting a strong feeling of dissatisfaction in the sister kingdom, and involves questions equally important in England as there. For the proper understanding of the matter, some little information is necessary.

The range of business coming within the Architect's Department in Ireland is enormous. The department is presided over by three commissioners, the chairman being an officer of Engineers, Colonel McKerlie, whose interference in the details of the architect's administration leads at times, it is asserted, to some miscarriage of business.

The architectural department consists of:—architect (800*l.* per annum), assistant ditto (450*l.*), with a moderate staff of draughtsmen, clerks, three surveyors (at about 300*l.* per annum), one clerk specially attached to the architect and surveyor (120*l.*).

The department has to administer in all matters of building, maintaining, furnishing all buildings of a public nature (except the military ones) in Ireland, and to transact the business appertaining to Government loans under existing Acts of Parliament for farm buildings, labourers' cottages, globe-houses, &c. The Board of Works is now identical with, or has absorbed into itself, the functions of the Board of Control of *Lunatic Asylums*; also the architect's department of the *Board of National Education*. Under this head, the department has the entire work of negotiating for sites, building, maintaining, inspecting, and keeping in repair all model schools, model farms, and national school-houses over the whole country. So with regard to the *Constabulary Department*: it has a like duty with regard to the constabulary barracks, which are spread throughout Ireland; *coast-guard stations*, officers' and "coast-guard's" houses, the same; a vast number of miscellaneous public buildings, their maintenance and furnishing, to the minutest details,—the Castle of Dublin; the Vice-regal, Chief Secretary's and Under Secretary's lodges, Phoenix Park, with all the lodges and rangers' and keepers' houses, &c. (the park is under the control of the Board of Works); the Law Courts, comprising some eight or nine courts, record buildings, solicitors' buildings, &c.; the Queen's Colleges, at Galway, Belfast, and Cork, and College of Maynooth; the post-offices, Custom-houses, stamp-offices, Income-tax offices in the larger towns, and a host of public departments,—the Dublin Metropolitan Police-offices, and other buildings which we cannot at present call to mind. The above will be sufficient to show the extent of the work ent on for the architect's department, and the nature of it being such that even a pair of bellows or a poker is not applied to the Lord Lieutenant's kitchen without the matter passes under the architect's hand, it

may be fairly conceded the staff is not an immoderately extensive one.

As respects the present head of the department, Mr. Jas. H. Owen, the president of the Irish Institute of Architects, we believe we are correct in saying that he bears a high reputation for administrative ability, and is popular in the greatest degree with both the public and his subordinates.

Touching the surveyors, who divide Ireland into three districts among them, the peculiar character of their duties should be remembered when estimating the proposed Government scheme. In inspections of the many buildings under their charge, the limited amount of railway communication in Ireland is to be borne in mind. It is still possible, in going from Dublin to inspect some remote coastguard station, to expend *six days* of hard travelling in going and returning. There is no parallel in any English architect's practice for the extraordinary conditions of laborious posting over long distances of fifty, sixty, and seventy miles per day, which fall to the lot of an Irish architect in wide practice.

And now let us see what is proposed. A commission was sent over on the part of the Treasury last autumn, consisting of the Marquis of Lansdowne, Mr. Herbert Murray, and Captain Crossman, of the Royal Engineers; three gentlemen at that time admittedly, we believe, unacquainted with Ireland or Irish affairs.

It is stated that the first and most essential provision laid down for them,—no matter what they should ascertain the work of the department to be,—was that on no account was the annual cost of the department to be increased. A confidential report has been made by these gentlemen, but the nature of the recommendations have leaked out, and are well known. First, they propose to appoint an assistant-commissioner, or director of works, whose sole duty shall be to direct and control the architect's department, and that this functionary shall be a *captain of Royal Engineers*, at a salary of 1,000*l.* per annum! To provide the means and ways for this 1,000*l.*, the lower officials are to be doctored off. The entire of the surveyors' work is to be done by two persons, one of whom shall have the city of Dublin; the other, the whole of Ireland; (the assistant architect, we presume, is to be abolished altogether). These two surveyors are to do all inspecting, negotiating as to sites and buildings, write specifications for new works, and are to have one clerk allotted to them at home, to copy their said specifications and documents. As neither of these gentlemen in the discharge of his duties would often find time to enter his office, and as the surveyor in charge of all Ireland would be obliged to live, eat, drink, and sleep in railway-carriages and jaunting cars, the nature and description of his office-work, and how it is to be done, are puzzling. It is unnecessary to go into further details as to the injustice to the subordinate employes. The object would really seem to be to provide a berth for a captain of Royal Engineers, and at the expense of the salaries of the working officials doctored off. We look in vain for a reason for humiliating the able architect who is at the head of the department, and knows his business, and does it thoroughly, by placing an officer of Engineers as his superior; and it seems to us that we are justified, as well on the part of the public as of the profession, in asking to be furnished with a statement of the grounds on which this determination has been arrived at. The question might very properly be asked in the House of Commons, and we trust this will be done.

THE METROPOLITAN EXTENSION OF THE GREAT EASTERN RAILWAY.

On Saturday last the members of the Civil and Mechanical Engineers' Society visited the works of the Metropolitan Extension of the Great Eastern Railway, by permission of Mr. Edward Wilson, the engineer to the company.

The object of these extensions is to shorten the route from the main line at the outskirts of London into the City, by cutting across, under Hackney Downs, and near London-fields into Broad-street, instead of going round as at present; and also at the same time open up a district at present unserved by any line, running from North to South. The members first met at the site of the new station in Liverpool-street, adjoining the existing Broad-street Station of the North London Railway.

The new station will be below the level of the ground, and large quantities of earth have been removed by the contractors, Messrs. Lucas & Co. These excavations show a great depth of made soil, the accumulations of centuries, cesspools and sewers being in great abundance. On the west side of the site a heavy retaining wall, somewhat after the style of those at the metropolitan stations, but more ornate, is being erected. In the foundation and backing of this wall such of the old bricks as are sound and whole, from the houses that were taken down, are being re-used, and for hardness they compare favourably with new bricks. The North London Railway being on a viaduct immediately alongside, and, as before mentioned, the new work being below the level of the ground, it has been necessary to underpin the piers of the viaduct, as well as the neighbouring houses, on the east side of the course of the line.

This work, although not presenting a great show, takes a good deal of time and requires great care on the part of the contractors. The heavy traffic running on the viaduct, and the tenderness of some of the concrete underneath the piers, increasing the care necessary in securing a proper foundation. Between Sun-street and Brick-lane, the various bridges and other works were carefully examined. At this point, near Brick-lane, the extension line crosses under the main line of the Great Eastern Railway at an angle of about 30°. The old line is carried on a viaduct, the arches of which are elliptical; these had to be cut away and replaced by girders carried on three massive walls: this work created a good deal of interest amongst the members of the society, the mode in which it was carried out being described by a representative of the contractors, who conducted the members over the works. After passing under the Great Eastern main line, the extension rises by a stiff gradient from under the surface of the ground to Winchester-street, which it crosses over, and the line continues on a viaduct to Hackney Downs, where it runs into a cutting. Beyond the Mile-end Station the works are in a forward condition, and will shortly be opened for traffic.

MANAGEMENT OF THE NEWSPAPER PRESS FUND.

A WRITER in the *Pall Mall Gazette*, signing himself "A Humiliated Journalist," has given so erroneous and injurious an account of the operations of the Newspaper Press Fund, that any one who feels interested, as we do, in the maintenance of an important charity, will desire to aid in setting the matter right. He professes to speak in no spirit of hostility; but the public have not now to be told that mischief is done by want of head as well as want of heart. The writer in this case has either wilfully mis-stated the case or is altogether ignorant of its real facts. Referring to the balance-sheet for the year 1870, he says,—

"I learnt that the total amount in the way of grants was only 152*l.* Yet, on reference to the other side of the sheet, it appears that the donations and subscriptions alone amounted in the twelve months to 81*l.* 1*s.* 9*d.*, while the interest from investments is set down at 17*s.* 12*s.* 8*d.* Of these sums, however, the association has, I see, invested 421*l.* 7*s.* in Eastern Bengal Railway Stock. But there remains the striking fact that the committee in this one year consumed 551*l.* 6*s.* 2*d.*, and that out of this expenditure only the above-mentioned sum of 152*l.* reached the unfortunate persons whose distress this society was intended to alleviate. Nor does the balance-sheet leave us in any doubt as to the causes of this extraordinary state of things. It appears that the annual dinner of the association cost 17*s.* 18*s.* 6*d.*, although the tickets only brought in 96*l.* 1*s.* Thus the philanthropic diners were apparently provided with a banquet at very little more than one-third of cost price."

Now, what is the truth? In the first place, the committee "consumed" *nothing*, being an unpaid body; but if by this expression the "Humiliated Journalist" means to refer to the amount they allowed to be expended in the management of the Society, the sum should be not 551*l.* 6*s.* 2*d.*, but 291*l.*, including the secretary's salary and a gratuity, 112*l.*, rent of office 42*l.*, stationary, postage, and so on. He shows that only 152*l.* were given away, and goes on to explain the cause of "this extraordinary state of things" by pointing out that, while the dinner cost 17*s.*, "the tickets only brought in 66*l.*" Objectors of this class, even when honest, forget the fact that in the infancy of a society the chief aim and cause of expense are the collection of money and the establishment of a fund to assure the permanence of the Institution. A dinner is in our days, whether rightly or wrongly, the means adopted: men of eminence are invited,

and they, in lieu of paying for it, ordinarily present donations far exceeding the cost of the dinner. The correct statement as to the precise dinner in question would stand thus:—

By cost of annual dinner, and postages in relation thereto	417 <i>l.</i> 0	0
Received—Donations at the dinner 4217	0	0
" For dinner-tickets	66	0
Gain by the dinner	683	0
	2509	0

Of this and other receipts 400*l.* were invested, 152*l.* were voted to distressed members, and 100*l.* remained at the banker's. The assertion of the writer that the philanthropic diners were provided with a banquet at little more than one-third of the cost price shows entire ignorance, or something much worse.

The sum voted to applicants seems small; but it may have been all that was necessary during that year, at which time only members of the fund could obtain relief. Since then, the Society, recognising the great assistance they were receiving from the outside public, have altered the rule, so as to allow the committee to relieve extreme cases of destitution on the part of deserving members of the press not contributors to the fund, their widows and orphans. The grants last year, partly in consequence of that change, amounted to 403*l.*

We repeat that the expenditure in the office of such a society must be viewed, not alone with reference to the sum distributed, but the sum collected; and in the case of the Newspaper Press Fund, it must not be forgotten that a permanent fund, amounting to 6,200*l.*, has been created available for the purposes of the charity. We shall by and by be glad to see its doors opened still wider, and have little doubt that this will gradually take place. We will only add that, after a careful examination, we feel tolerably well assured that, so far as the Newspaper Press Fund is concerned, the "journalist" who wrote in the *Pall Mall Gazette* has no occasion to feel "humiliated," except on the reflection that he has done very great injustice to what promises to be a valuable and important institution.

SCHOOL BOARDS.

Liverpool.—At a recent meeting of the Liverpool School Board, Mr. Stitt said that the school organisation and management committee had given serious consideration to the question as to the kind of schools to be erected by the Board. The same matter had occupied the attention of the London School Board, who had issued an elaborate report pointing out what they thought should be the character of the buildings. Mr. Robinson, the architect of the London School Board, had had the report under consideration, and was preparing instructions upon it to architects. The organisation and management committee had asked for a copy of those instructions, and it had arrived that morning, so that no time would be lost in the matter.

Covestry.—The first premiums for school plans having been awarded to Messrs. Parsons & Ellwood (motto, "Modus Operandi"); and the second to Messrs. C. Henman & W. Harrison, of Newcastle-upon-Tyne (motto, "System"), Messrs. Parsons & Ellwood wrote to the clerk stating that with reference to the terms upon which they should be disposed to carry out their design, they would be prepared to make the necessary working drawings, draw out the specifications, and procure the estimate, at a commission of 1½ per cent., and to superintend the erection of the buildings at a like percentage, making in all 3 per cent. upon the accepted tender. Messrs. Henman & Harrison said:—

"We hope that, should you decide to build schools from our designs, we may be entrusted with the preparation of the necessary working drawings and specifications for carrying the same into execution. We beg to point out (and we feel sure that you will agree with us) that the premium will not adequately remunerate us for preparing the drawings which you have chosen. It was in the hope of getting the superintendence of the buildings which induced us to prepare and submit them."

It was resolved, after some consideration, that Messrs. Parsons & Ellwood's offer be accepted, and that one of those gentlemen be requested to call upon the Board.

Ipswich.—At a recent meeting of this Board, some conversation took place on the subject of inviting competition for plans, and the chairman drew up an advertisement, which it was agreed should be inserted in the *Suffolk Chronicle* and *Ipswich Journal*, and that a copy of the advertisement should be sent to all the architects resident in the town within the knowledge of the Board. The Sites Committee for St. Margaret's

and St. Helen's District reported that, acting under the instructions of the Board, they had agreed to purchase nine allotments in the Argyll Estate, Woodbridge-road, covering an area of 49 rods 85 ft., for 425l. It was then mentioned that it was proposed that the schools built here should accommodate 250 boys, 200 girls, and 200 infants. It was agreed that the report should be received and adopted, and referred to the committee to complete the purchase. Some conversation took place as to whether the Board should wait till they had received plans for the Stoko Schools before they invited plans for these, but it was decided to advertise at once for plans. Mr. Fraser raised the point, as he had done with reference to the Stoko schools, of lighting the school buildings from the north; and after some conversation, in which Dr. Chevallier and Mr. Grimwade expressed their disapproval of a room which the sunshine never entered, it was decided that a suggestion should be made in the advertisement that architects should give their attention to the expediency of lighting from the roof facing the north.

Bridgewater.—The School Board have received tenders for the proposed new schools at East-over from builders who had been invited to furnish them. The highest estimate amounted to 2,500l., the next figure was 1,700l., and the other estimates amounted to 1,580l., 1,350l., 1,320l., and 1,290l. respectively. The plans were examined in detail, but the consideration of them was adjourned.

THE CONSTRUCTION OF BANKS FOR CANALS OR TANKS.

THE INSTITUTION OF CIVIL ENGINEERS.

ON March 12th, the paper read was "On the Sookkasa Canal of the Madras Irrigation and Canal Company," by Mr. J. H. Latham.

The object of this communication was to give a general description of the canal between Sookkasa and Cuddapah, recently constructed for irrigation and navigation by the Madras Irrigation and Canal Company; and to direct particular attention to the mode of safely constructing high banks for canals or tanks, illustrated by that work.

It was remarked that the countries possessing the greatest powers of production were those in which the yearly rainfall was concentrated into a few months. Settled warm weather was the safest for crops at every stage of their sprouting growth, and ripening; and, not only in England but in India, it was found that crops grown during uncertain weather, as all unripened crops must be, were nearly as often and as severely injured by rain or floods as by drought. To fully develop the productive powers of land three things were needed.—1st, settled weather, which art could not give nor control; 2nd, irrigation, which must be controlled by art; and, lastly, manure.

Of the native engineering works in the Madras Presidency those for the application of water to irrigate fields and gardens ranked the first, both in magnitude and importance. Of these there were three kinds, viz.—wells, tanks or reservoirs, and river channels. Of the latter full details were given, and it was remarked that, while the rebuilding of the Nellore anicut, since it was last carried away, was making progress, the Toombudra project, of which the Sookkasa canal was a portion, was adopted by the Government. This was designed to serve two purposes; first, the continuous irrigation throughout the year of three large areas, of which the principal lay in the Bellary district, the next in the Kooder Valley, and the other in the Nellore district. The second purpose, apparently necessary to the success of the first, was a means of communication by canals, by which the produce of those areas could be sent to a market more cheaply than by cart or railway, more expeditiously than by cart, and more securely than by railway.

The canal began at Sookkasa, with a weir across the river Toombudra, 1,500 yards in total length of clear overfall, which was broken into two lengths by an intervening island. The weir stood upon the rocky river-bed, and was formed of three patterns, viz.—(1st) of solid rubble masonry of gneiss, trap, and quartzite boulders; (2nd) of gravel concrete, with gneiss rubble facing in front and rear; (3rd) all recent portions were of solid gneiss rubble masonry, with a facing on the lower side of Kurnool limestone ashlar, which averaged ½ yard thick

where exposed to concussion. Patterns Nos. 1 and 2 had a front and rear batter of 1 in 8; while No. 3 had an upper batter of 1 in 4, and rear face vertical. All were 8 ft. broad at the top, and coped with dressed limestones 1 ft. thick. The mortar throughout was of Kurnool kunkur, except the joints of the coping, which were of Portland cement. The coping was joggled wherever the anicut (which was not straight, but followed the line of highest solid rock) was concave in plan on the upstream side. No part of the anicut formed on any of the above patterns, either with or without the coping, had ever failed. The height varied from 6 ft. to 26 ft., and averaged about 15 ft.; and the highest registered flood rose 7½ ft. over the crest.

Though the masonry works, and especially the weirs, contained a great variety of work, the chief interest and novelty in the construction of the canal was undoubtedly the mode of forming the banks. These ranged up to a height of 50 ft. from the ground surface of their site to the water-line. In all cases single banks were revetted or shingled on the inner slopes. The formation of the banks was various, comprising lengths of simple filling, of masonry wall, of masonry face-wall, of masonry revetment, of puddled bank, and of puddle-core bank, in different sections of the canal. The masonry wall, masonry revetment, and puddle-core bank came into the author's hands in 1865, as finished works; but had since been strengthened or raised. The strongest and best sections were the masonry face wall and the puddled bank, adopted after the experience of two seasons in the working of all kinds. The author estimated the efficiency of these as equal, that the choice between them might be a question of cost. The only objection to the face-wall was, that it could not be easily raised when once built. No portion of this face-wall had cracked, or shown any signs of weakness; nor, though unprotected in front by either plaster or puddle, was the leakage more than just sensible. The puddled slopes were even tighter than the face-wall, and had proved efficient even when the bank was of the worst kind of white and grey clay, mixed with salts of lime and soda, and such as to absorb water readily.

Some remarks were then offered as to the probable stability of a bank, composed of any soil thrown up without either selection or puddling, when first exposed to water; and the mode of meeting the two dangers, of slips and leaks, to which a bank was exposed, was described. The consideration of the problem, how to construct earthen dams, of a great height, which could neither slip nor be cut up by leaks, was discussed at some length; and it was remarked that, in practice, the best position for the puddle was on the flattest slope in front of the bank, where it should be protected by rubble, the larger and smoother the better, laid on sharp loose gravel impervious to vermin. The thickness of this protection must be so great, that it could not be wholly removed as the bank settled. Rubble packed, or very rough stone, as kunkur, was best avoided, as it would not follow the bank during settlement. The puddle would be the most dense part of the banks. Where used by the author, the surface of puddle under construction was always kept flooded, like a rice-field; and gangs of men, with their arms linked together, walked backwards and forwards on short lengths of it all day, treading it stiff, as layer after layer was added by the contractor's workmen. In order to insure the puddle remaining water-tight under all circumstances of original settlement, and of alternate wet and drought, it was desirable that it should rest on a substance rather more compressible than itself. To lay it to an ordinary rammed filling would be too violent a change, and it had always been laid by the author on a cushion of earth, moistened and rammed; each layer, of 6 in. or so, being well wetted, and then sprinkled with enough dry earth to prevent it sticking to the rammer, when punned with a rammer of 40 lb. weight. The rest of the front slope, if not already existing, had been made of earth rammed dry in the usual way; since it was found safest, indeed almost necessary, to establish the broad rule, that nothing but earth should be brought to the front of the centre line of the bank. The bank was then completed of any gravel or hard soil available, the gravel being kept at the bottom as much as possible, and the finest soil to the centre. Though such banks were not theoretically perfect, they had never failed, nor given trouble upon letting the water against

them. The lengths entirely constructed on these rules were insignificant, but about five miles of old bank had been faced with puddle laid on earth rammed moist.

HIGHBURY STATION.

A CONSIDERABLE amount of terra-cotta has been used at the new station of the North London Railway Co. at Highbury, now nearly completed from the designs of Mr. Horne. It was supplied by the Watcombe Terra Cotta Co., and is in the shape of medallions, small columns, and an elaborate frieze round the whole of the building, very well executed. The colour, red, contrasts at present somewhat strongly with the stonework of the rest of the façades, but a short time will bring these more into accord. The building includes the well-known "Cock" tavern, and will cost, we learn, about 17,000l. The looking-office, which is of considerable size, has a panelled wood ceiling. Messrs. Wicks, Bangs, & Co. are the contractors, and the stone carving has been well executed by Messrs. Farmer & Brindley.

CANDELABRA FOR KING'S COLLEGE CHAPEL, CAMBRIDGE.

UNDER the direction of Mr. G. G. Scott, jun., M.A., architect, Mr. Barkentin, goldsmith, has just now completed two brass candelabra for King's College Chapel, of unusual size. They are 13 ft. in height, are supported on lions and stand upon plinths of black marble. Each standard carries in the centre one great taper, 3 ft. in height, and six smaller ones round, on (vine) branches. A small shield on each standard admits some work in enamel. The style adopted is that of the period of the chapel, but it is, to a certain extent, German in feeling rather than English. The work has been executed, with praiseworthy care, at the cost of 550l.

ST. HELEN'S TOWN HALL COMPETITION.

SIX competitors have sent in seven designs, respectively marked "Truth 1," "Truth 2," "Respice Finem," "Justice," "Tenuanda Via Est," "Utility," and with a device of three circles. A local correspondent points to the last-named as much superior in internal arrangement to the others. The majority have ill-lighted corridors, and are deficient in the means of entrance and departure.

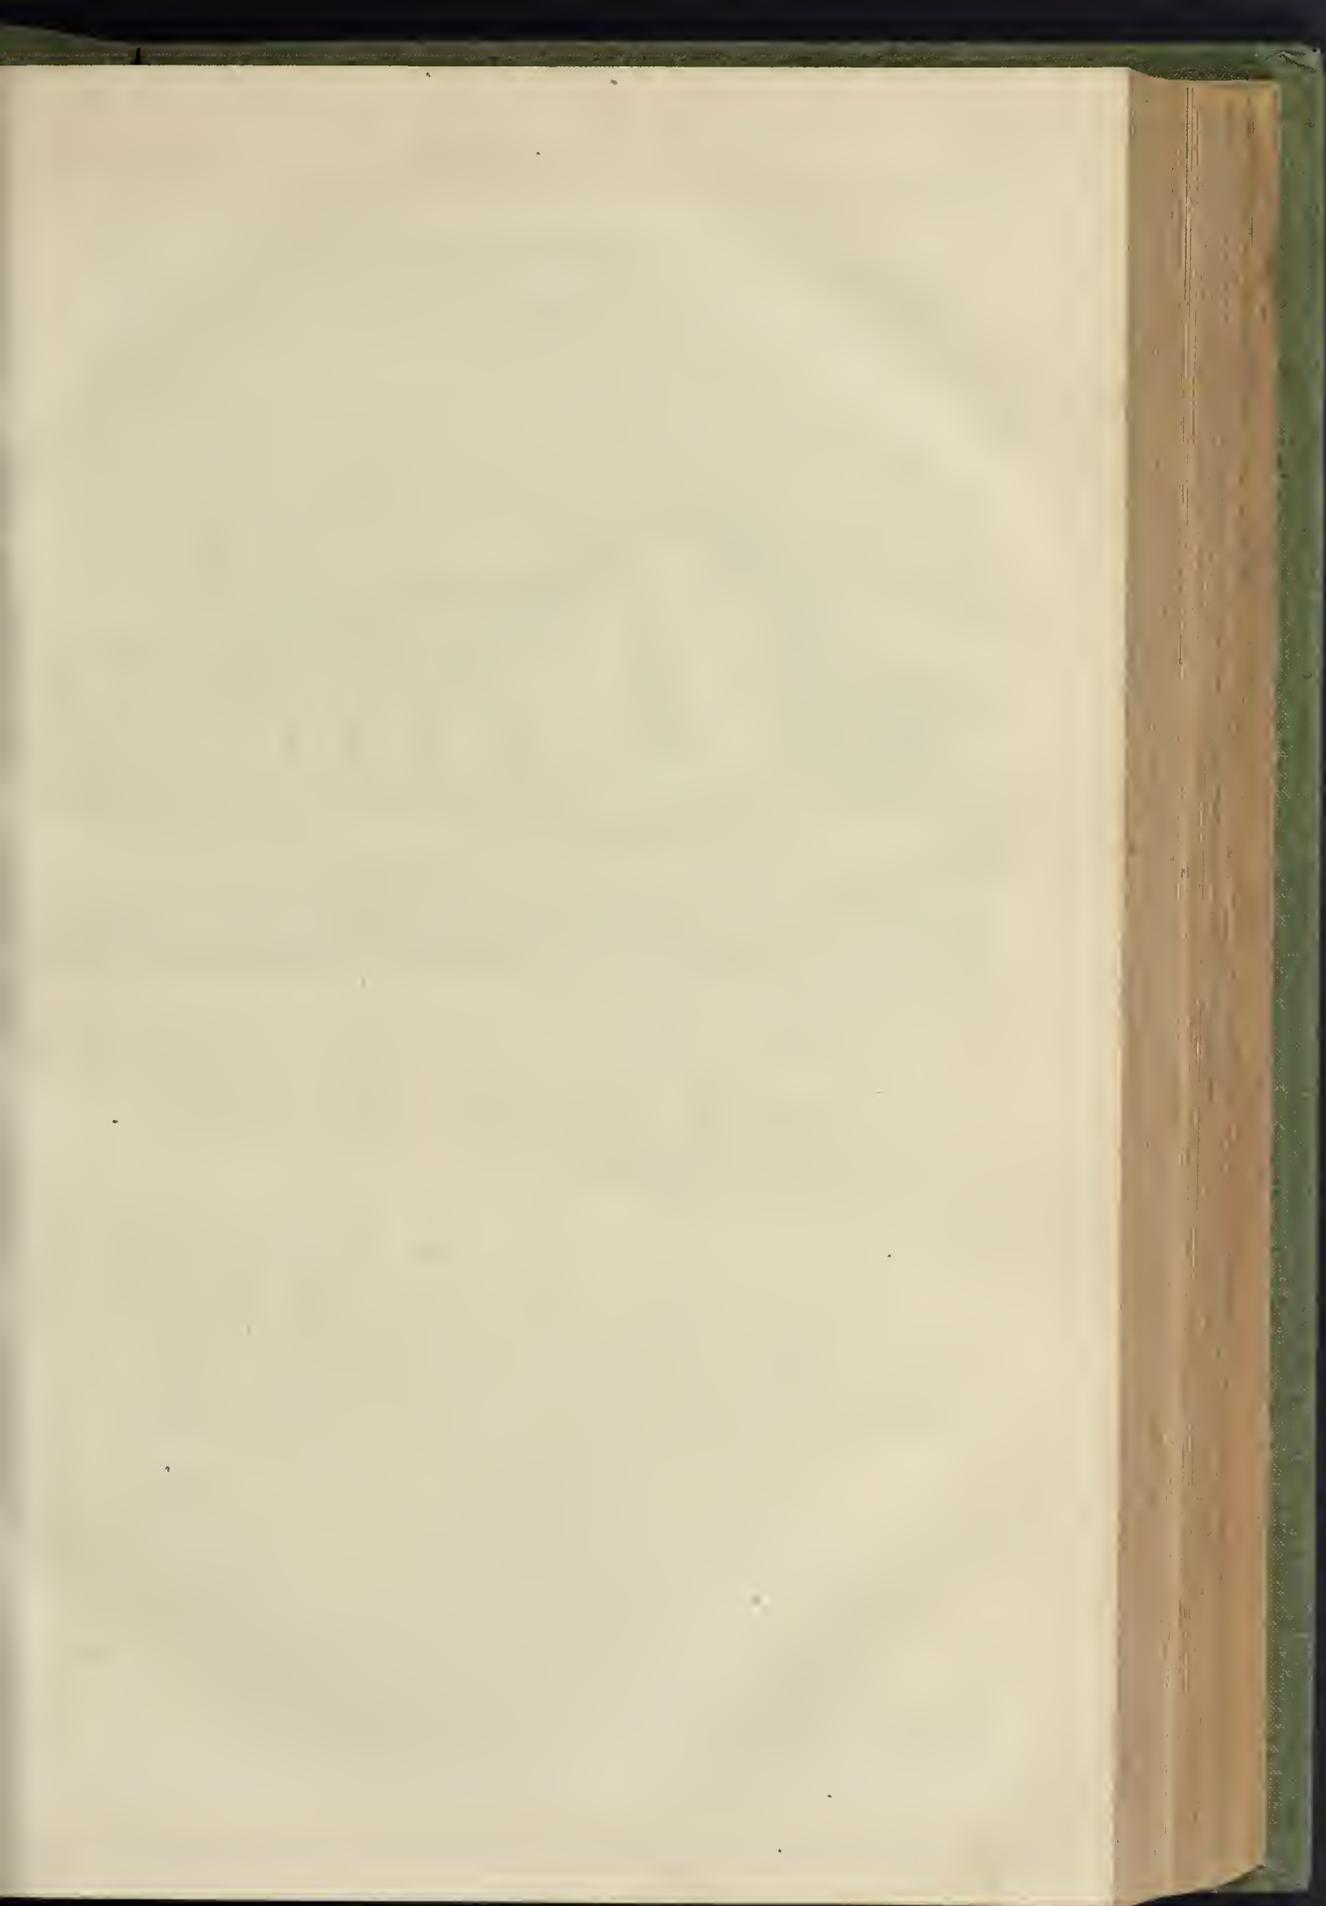

PAINT IN LONDON.

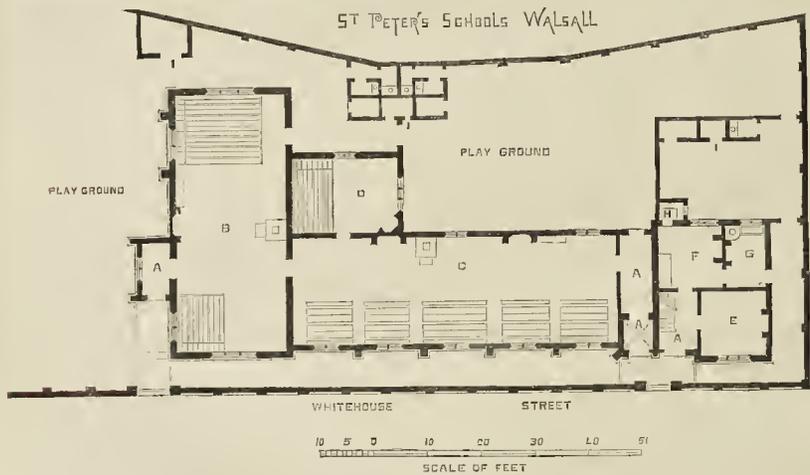

Sir,—Will some of your correspondents explain the cause of the light-coloured paint work in London during the past few years after two years' wear, turning in places dark grey, with a metallic appearance? My own opinion favours the belief that it arises from inferior white lead.

GASSETTER.

THE WORKS AT PUTNEY-BRIDGE.

THE Thames Conservancy Commissioners having called the attention of the proprietors to the obstruction caused to the navigation of the river by this bridge, it was arranged that application should be made to Parliament for powers to alter and amend the structure so as to afford increased width and height to the waterway. These powers were obtained in 1870, and designs were at once prepared; the work has since been carried out, and is now, with unimportant exceptions, completed. The alteration comprises the removal of several of the old piers, and sinking in lieu of them two pairs of cast-iron cylinders, 5 ft. 6 in. diameter, with granite caps supporting wrought-iron truss girders, with a clear span of 70 ft., and two side openings, giving a total waterway in the middle of 138 ft., and an additional height in the centre of 3 ft. 6 in. The roadway is formed with a concrete of broken granite bedded in asphalt, supported on buckled plates riveted to the cross girders. The traffic over the bridge was never suspended, a temporary roadway having been formed while the cross girders were being fixed. This has now been removed, and the permanent roadway is open for carriages and foot passengers. The works have been ably carried out by Mr. Walter Scott, of Newcastle, aided by Mr. John Nichol, under the superintendence of Messrs. Wadmore & Baker, of Great St. Helen's in conjunction with Mr. John Mair, C.E., of Newcastle.

 I. Out-offices.

ST. PETER'S NEW SCHOOLS, WALSALL.—MR. R. CHAMBERLAIN, ARCHITECT.

THESE schools, recently erected, occupy a commanding position, and have a pleasing appearance. They will accommodate 270 girls and infants; they are built of red bricks, with blue brick bands, and Hollington stone dressings. The roofs are open-timbered and covered with slates, and provision is made for ventilation. The total cost exceeded 1,300l. Mr. Adkins was the builder; the stonemason's work was done by Mr. Hanks; Mr. Kendrick was manager in charge; and the architect was Mr. R. Chamberlain,—all of Walsall.

NEW ESTATE OFFICE BUILDINGS, HUDDERSFIELD.—MR. W. H. ROSSLAND, ARCHT.

NEW ESTATE OFFICE BUILDINGS,
HUDDERSFIELD.

Our engraving represents a new block of buildings just completed for Sir John W. Ramsden, bart. In the central portion towards Railway-street are placed the Ramsden Estate Offices. The Westgate front over shops is wholly occupied by the Huddersfield Club, which, together with the central shop (converted into the Club vestibule and entrance-hall), is fitted up in an elaborate manner.

The remainder of the building is used as offices and warehouses, and the cost of the whole is about 35,000*l*. The work has been executed principally by local contractors, from the designs of Mr. W. H. Crossland, of London, who is also the architect for another large block of buildings adjoining, and now in course of erection.

A WORKMAN'S COGITATIONS ON
DOMES.

This is a vexed subject, I must admit, and I have often kept myself awake half the night in striving to think out some new and practical plan of dome construction.

The result, I am sorry to say, has not been a success. I have seen in my experience some very fine domes in appearance, constructed with great ingenuity, but every one of them looked better at a distance than near. Some were of timber and brick, some were partly of stone, and others of the three combined. I have long since got into my head that a cupola is not a *bona fide* dome, no matter what the Italian may be for it,* and I also believe that a man may construct a very good cupola and a very bad dome.

Some considerable analytical formulae have been given from time to time in the *Builder*, by architects and mathematical scholars, rather than by those whose interest I speak; but, sufficient for me to understand what the writers aimed at.

After all, I must say that true dome construction is hardly universal yet in this country, and true domes are not constructed from the mechanical and other difficulties attendant. Some of these difficulties arise from lack of technical education, others from the material, and not the least is in matter of experience, and the fear that if the big baby were left alone, its "understandings" would not be able to support its weighty body. There are but few of us who have not in the course of our lives witnessed unwieldy little children with howlers: well, like these poor little ones, so are most of our domes, for both have generally the "rickets." None but those architecturally informed, or belonging to the building profession, are aware of the many expedients that have been adopted in former days, and in recent times, to keep domes from collapsing; in fact, dropping in, or dropping down, like a house of cards. As the bow-legged child is hound, braced, and bandaged with "splints," so are many of our domes by a variety of contrivances not necessary to mention in a particular manner.

This is not at all clearing at this age of the world. I hope some members of the Institute of Architects will give us proper "lines," that our craftsmen may be able to put the "baby" firmly on its feet, and so that it may stand alone a thing of strength and proportion, and a thing of beauty.

Without running too cursorily over the subject, I take note that the theory of the equilibrium of domes has been said to be somewhat similar to that of the equilibrium of arches; but I have never sufficiently mastered the whole of the laws of the divergence; nor has it been made manifest to me where this divergence begins and ends. I have been told to consider this, and also about planes passing perpendicularly through an axis at a small angle to each other,—say, for shortness, a series of balanced arches,—connected at the crown, each of which would preserve its equilibrium if standing alone (but, in sooth, would not as at present constructed). Is the equilibrium in the dome really maintained by having the weight of each upper part of each series of companion arches or supported arches greater than what would be required to preserve the equilibrium of a balanced arch standing by itself? Viewing the circular courses of the stone, and taking them as voussoirs, do

the whole series exert a uniform lateral pressure on those on either side of it, and is their tendency to fall inwards, exactly of the same nature as the tendency of the stones of the regular arch which are locked tighter by the action of the same laws? From my deductions I think the principles that govern dome and arch construction differ much; but I am, I must confess, unable to explain them technically. The equilibrium of the common arch is insured by a different method. Putting aside the question of friction, the weight of the voussoirs composing the crown is brought up to a defined limit, neither greater nor less; but I believe it is admitted as a principle or theory that the equilibrium of the dome to be maintained must lie in the difference alluded to,—viz., when the upper portion of each circle or series of arches exceeds this limit, presupposing that the dome is composed of the series of arches already mentioned. I must say I would rather be quit of all these suppositions. They are extremely interesting, I have no doubt, as a theory, but in practice there is a mortal terror to be endured by both architect, builder, and workmen, and certain contingencies have to be provided for.

Now I have other notions in my head about domes,—I mean perfect domes;—and they are these:—Domes proper ought, in my opinion, to swell out at a certain defined height considerably beyond the circle of their base; in fact, like columns, they should have an unmistakable entasis, regulated according to the height they are from the ground, and proportionate with their dimensions. I would say that this entasis is necessary for the purpose of preserving their true and well-defined donical profile from being absorbed by the distance they are, or may be, from the eye. If we admit this entasis as a necessity in a very large and very high dome, then as a constructional idea we must imagine two series of converging concentric courses or circles of stone, descending and ascending from the mid point of the entasis on the dome.

In cutting the stone for such courses, there would need to be beforehand a very correct plan, and setting out; but I will not touch the subject of equilibrium in relation, as it is beyond my analytical powers. My readers must bear in mind that I am speaking now of solid and geometrical planning and stone-cutting in view of a solid dome of masonry, with no advantageous backing, bracing, or hidden expedient, to keep body and soul together from parting in this life.

As I am allowed, like others, to suppose a good deal about the theory of dome construction, that may not be absolutely capable of a practical working in all details, I will ask my readers to suppose something with me. Well, then, let us imagine the existence of an enormous block of stone a perfect cone in shape, and that out of this geometrically shaped boulder, it is desired to evolve a dome. To give room for the full play of intellect, let us say the cone is sufficient to allow for the cutting of a dome of the size of that of St. Paul's.

Here now we have a perfectly geometrical figure and basis for our starting-point, and what can geometers do for us in sweeping a number of curvilinear or spiral lines, so to speak, from the base of the cone to the required height of the dome within the cone? I apprehend there would be something useful evolved in the theory or practice of stone-cutting in working out this problem. There are many other questions which suggest themselves here on this head, but they are too minute. My reason for taking up the figure of a cone as a basis to work out some ideas about dome-construction, is simply to find room at once for the whole application of the conic sections for those who are capable of applying them for the production of a dome.

Now I will once more suppose that the dome is evolved from the huge cone, and the latter stands alone perfect in its outline, forming one of sufficient thickness to be utilised as a body,—say for a spire. Within the figure of the cone we have now a beautiful donical vault, or, perhaps, properly speaking of it as a concavity, a cupola. What then? The core of the dome proper has yet to be cut out, to give us the inside contour; and were it possible to place the huge body of stone, or imagine it placed, in a lathe, the turner could give half a dozen smaller domes, without all bothering his brain about the intersecting of lines and curves in the art of stone-cutting. As stones, however, have to be worked in series, and not as one body, we are perforce necessitated to consider them as atoms of defined shapes, and

deal with them in construction as best we may. So I will leave the further cogitation upon this part of the subject to others more competent than I am to deduce something now which I think is quite probable or possible. Only I fear lengthening out my notions beyond discreet limits, I would ask the reader to suppose other stand-points for building up some more ideas on dome construction. Here is one. Suppose we cut off the crown of a dome—mentally will do for the moment,—and imagine its inside space a well-hole, what is to prevent us in constructing all its courses of stone on the spiral or geometrical stair principle,—one winding on the back of another to the topmost ring, platform, or table? or could we not run the courses similar to the winding courses of an oblique arch, as it would appear if thrown up on its haunches? If possible or practical in stone, of course this would be a very expensive method; but it is the possibility of new constructions, not the expense, we are now considering. Would not each winding course, from top to bottom of this donical heft, taken as a whole, be a sort of elongated key-stone voussoir reversed? yet still developing as a natural law of its donical shape, an inward curve and splay locking the whole fabric together beyond a fear of collapse. Of course, the joggle or rebating, or other method of keying stone to stone, might be adopted for the greater security in connexion, to counteract a tendency to expansion or settlement in any shape.

In relation to the winding in the courses of masonry, each course might be made to wind only once, or make one complete revolution spirally, or as many as were desired. I believe it is admitted that a geometrical or spiral stair starting on a proper basis can be carried to any height, and still preserve its equilibrium. Is it, then, impossible to adapt the principle to the construction of a dome with complete safety? If it were required to run a stair spirally within or without any of our present domes, there is no difficulty in the way of its execution. Why should there be any in relation to the similar construction of the dome?

Without diagrams it would be impossible to convince many what might or might not be done, so I pass to another part of the subject.

Messieurs Engineers and others, a word with you. As a body you have given us a number of hideously ugly iron constructions, but a few of your profession have redeemed their order by giving us some noble iron bridges, which stand forth here and there in the island like beacon lights of hope. Can you, messieurs, do anything for us in the way of dome construction in iron? I do not mean in architectural composition, but in constructional exactitude. Do you think that a dome that can stand on its own legs, a thing of strength, not outraging Euclid or causing Archimedes to jump from his grave, is a work within your mental and constructional grasp? It ought to be, judging you by your own standards.

Presupposing that an anti-oxidative for iron were discovered at last capable of meeting all requirements, I believe that a good iron dome, cast-iron if you will, or "half-and-half," is quite possible, even of the dimensions of St. Paul's. It would be, perhaps, presumption on my part to point out the way it might be constructed; for, indeed, admitting the possibility of construction, the proper method would be a matter of professional opinion. Well, as a first instance, imagine a series of concentric circles of framed iron panelling, converging upwards every circle of bays in the entire circumference of the dome, distinct in itself, yet detachable one bay from another,—one series of bays placed on another, the top bolted to the under one, and so on. Two forms of construction could be adopted in the putting of the work together. A complete circle of bays could go together, and be lifted into its place; or the curvilinear upright sweep of converging bays or panels forming one complete piece of ribbed panelling from base to apex. This is the faint outline: the details could be worked in a variety of ways. The interior edges of the ribs could be cast or worked plain if it was thought advisable, in the first instance, and bronzed or gilt facings screwed on afterwards, worked to any form of tracery or finish. The ornamentation is a matter that has nothing to do with the safety of the construction, which I am speaking about. I have been supposing that a dome could be safely constructed of iron, and I believe one could be constructed, light and graceful in appearance, geometrically exact, architecturally beautiful, and successful as an engineering performance.

* The term "cupola" (from *cupa*, hollow) strictly speaking, applies only to the inside or ceiling part of a dome.—Ed.

In the matter of a large lantern, with hall, and cross at the top, like St. Paul's, this requirement would, in my opinion, if it had to be provided, only give the greater chance of successful construction. The ribbed, or perhaps the flying buttress principle under cover could be adopted here. The engineer would not care much for outraging style or pressing Gothic and Classic, Oriental and outlandish together so as it suited his ends, but the architect would pause and hesitate.

A few words more about dome construction. In these days of cheapness and innovation, did any one, I wonder, ever hethink himself of constructing a dome of concrete? Within certain limits it is of course possible; exceeding these limits the construction would require to be of a composite character.

A composite dome, I believe, could be constructed by casting hollow hoops of metal of sufficient thickness, representing the size of the different stones, and, as the work was put together, filling the inside with concrete, not singly, but filling several courses at the one time, so that the continuous bond might be preserved, and the whole body of work rendered more compact. A timber dome, well planned and well fitted together, inclusive of its covering, though a clever piece of handicraft, is not any extraordinary feat in constructive carpentry. Yet we have not many of them that are framed or covered well. Generally a great loss of time and a great destruction of material result from an imperfect knowledge of setting out the work and cutting the timber.

Such are my cogitations, Mr. *Builder*, and if you can detect any grains of reproductive seed in what may be designated by some much "claff," for sake of the principles involved and my love of the profession, let the matter see the light. Ere now a grain of productive corn has been extracted from within the swathing of an Egyptian mummy, more than 2,000 years in darkness. Domes are as old, and yet we are in some darkness concerning them. Let us think inwards and look onwards, and grope less among dead men's bones upon the Appian Way.

A CRAFTSMAN.

THE ANTIQUITIES OF BEWCASTLE, IN CUMBERLAND.*

In his introductory remarks the lecturer expressed a hope that he might be bringing under their notice a place which, while it really had a long and considerable history, was very little known and hardly ever visited. If, however, Bewcastle was known to any among his hearers, it would probably be because of the Runic monument in the churchyard, which was of course by far the most wonderful thing there, and was famous among those who had made Runes their study; but it was not the only interesting thing there. Although the inscription had been read, he had not seen much attention called to the historical value of the writing. He should pay most regard to that point, and should use it as a sort of text for a brief discourse upon the early history of the county of Cumberland. Tracing the present boundary between England and Scotland eastwards from the head of the Solway Firth, it ran first along the little river Sark, and then was continued along the river Liddle, one of the tributaries of the Esk, to the western end of the Cheviot hills, which it followed until it reached the coast. The line of division between Northumberland and Cumberland met that division about half-way, and made with it two angles; on the Northumberland side an obtuse angle, and on the Cumberland side an acute angle, in the point of which Bewcastle stood, so that it had been a border place throughout its history. The scenery of the surrounding country was not without beauty, but it was the beauty of solitude and desolation, the land being now so silent that it was hard to believe it was once busy with active life, and that the loneliness of its hills was disturbed by the tramp of marching armies and the wild scenes of border warfare, at a time when venerable Oxford was but a watery waste.

At Bewcastle, unlike most ruins, things had been left to themselves since the castle was more or less destroyed by the Parliamentary troops. What was once a strong Roman station, one of the outposts of the empire, is now marked by a grass-grown rampart and a few mounds; what

was probably a royal city has now shrunk to less than half a dozen houses; the castle is now only four mighty walls, without a trace of moulding or ornament, built evidently for strength alone, and built so well that one huge fragment which had fallen down, lay in the most entire piece of masonry. The churchyard is full of graves, almost every one having a headstone enriched with the armorial bearings of forgotten families; and there, too, is the famous Runic monument, standing as a solitary witness of departed civilisation. The Roman station had been placed on a low and irregularly-shaped eminence, and occupied an extremely strong position. The sides were steep all round, especially on the south, which arose abruptly from the little river called the Kirk-heck, i.e., the Church-brook, which ran into the Lyne—a tributary of the Esk. The station was four-sided in shape, and covered an area of six acres. On the north side there were traces of ramparts, which formed probably an outpost. Upon the eastern half of the station stood the church and parsonage, the castle, and a farm called the Manor House; on the south-east the land was washed away by the Kirk-heck. It was quite easy to trace the Via Principalis running across from east to west, and on both sides a break in the Vallum, with two round mounds on each side, probably guard-houses for the defence of the gates. The Porta Decumana on the north, and the Porta Hadriana on the south, were not apparent; the Manor House seemed to be built over the Pretorian Gate. At the north-west corner of the churchyard the foundations of a considerable building were visible, which might be those of the Pretorium or general's head-quarters. The clergyman at the parsonage had a small collection of coins and other things which had been turned up there; one piece of ware had stamped upon it, "Martini M.," i.e., that it was made by the hand "Mann," i.e., of the potter Martinus. Several altars had also been found. The relics which struck him most were the querns, which at Bewcastle seemed quite plentiful.

The Romans must first have visited Bewcastle under Agricola, who commanded here from 78 to 84. Under him they conquered the Isle of Anglesey a second time, pushed on northwards through Lancashire, Westmoreland, Cumberland, and the Lowlands of Scotland, and reached the isthmus between the firths of Forth and Clyde, where Agricola built a line of forts designed as a protection from the savage tribes beyond. Though Agricola gained a great victory over the Caledonians at the Grampian mountains, it had no lasting result, and the Romans never made any permanent conquests beyond the line of forts. Before 79 or 80, when the Romans visited Bewcastle, it might have been one of the strongholds of the Britons, and would therefore be fortified by the Romans to secure it. On the withdrawal of Agricola the Northern barbarians became so troubled as to bring about a less than thirty years such a state of anarchy as required the presence of the Emperor Hadrian, who drove back the Britons, and drew a vallum, i.e., a dyke and rampart across the island, from the mouth of the Tyne to the Solway Firth, to protect the country south of it. Bewcastle, however, lay north of Hadrian's dyke, and did not partake of its protection. The submission of the tribes to Hadrian was only transitory, for in the reign of his successor, Antoninus Pius, the northern district was again a prey to their incursions. To guard against this a rampart of turf was constructed along the line of Agricola's forts, now known as Graham's dyke. From the time of Severus until the victories of Theodosius the elder, the country between the two dykes was entirely abandoned to the natives for upwards of 150 years. Theodosius once again subdued it and gave it the name of Valentia, in honour of the Emperor Valentinian, in honour of whom he was withdrawn in 383, and never returned, and the province of Valentia, the land between the walls of Antoninus and Severus, were finally lost to the Romans. In 410, Honorius, the Emperor of the West, wrote to the State of Britain "to provide for their own defence," which brought them to the end of the first period of the history.

The Runic monument was the memorial of the next age. Mr. Nanson said he was not going to enter into the Pictish question, but would be content to suppose the people who occupied Bewcastle after its evacuation by the Romans were the same who were known later as the Picts. The question seemed a sort of ethnological hodgepodge, which most antiquaries and historians, unless they were fired with the zeal of Mr. Jonathan Oldback and his knightly antagonist, were con-

tent to leave alone. By these non-Romanised Britons was founded the kingdom of Strathclyde or Cumbria. It was an independent Celtic kingdom, and for some time sustained the honour of the British name in the North of England. The Cumbrian Britons were not an unmixed people, for there must have been amongst them a considerable number of Picts and Scots. The kingdom included three great principalities, named by Sir Francis Palgrave as follows:—1, Reged may perhaps be placed in the forests of the south of Scotland; 2, Strathclyde may be traced in Clydesdale, and the local name ought to have been confined to that region, but being the seat of the "Toyrn," to whom the other British kingdoms of the north were subject, the same appellation was easily extended beyond its proper boundary; 3, the Terra Cumbrorum, which included the modern country of Cumberland, together with its appendages, or dismembersments of Lancashire and Westmoreland, the principalities of which may be traced as the principality or kingdom of Westmore. Bewcastle would belong to the last division.

Speaking of the Runic monument, Mr. Nanson said he should follow Mr. Maughan's translation of the Runes. It was fixed upright in a stone pedestal, above which it rose to the height of 1½ feet, though it must once have been higher, there evidently having been a cross at the top. It was covered all over with sculpture in low relief, exceedingly well done. The ornament consisted of a vine twining up one entire side in exquisite curves, and on the branches were perched birds and squirrels eating the fruit. Two of the sides were sculptured with vines, and the wonderful and beautiful knots which were so favourite an ornament at that early period; there was also a large space filled like a chess-board with chequered diaper. The remaining side contained three figures and the principal parts of the inscription. The top figure was that of a man holding what appeared to be a lamb in his arms, which has been supposed to be St. John the Baptist carrying in his arms the Agnus Dei. Below were the words "Jesus Christus," and under them a figure in priestly robes, with a glory encircling the head, and the hand raised in the act of blessing. Below the figure of our Saviour was most of the writing, and at the bottom of the pillar a man standing sideways with a hawk on his wrist, supposed to be King Alfrith. The inscription was translated as follows:—"Hwætset, Wæthgar, and Alfrith set up this thin beacon in memory of Alfrith, a King, and son of Oswin; pray for them," or either "for them, their sons, their sons," or as some say, "for his soul's great sin." So that if the translation be right, it must be to mark the burial-place of Alfrith or Alfrid, king of Northumbria. Returning to the history of Northumberland, Mr. Nanson related the circumstances under which Penda, the son of Penda, was converted to Christianity by Alfrith, leading to the Christianising of Mercia; so that the hero of the Runic cross at Bewcastle might have been the means of sending Christianity into parts of England not far from Oxford.

SUB-MARINE TUNNELS.

Sir,—When I sent the few particulars relating to the Norwich works to the *Builder*, I had not any idea of entering into a controversy on the subject of the Channel tunnel; but, as "A Practical Engineer" puts certain questions, it is only not to employ to them. Duplicate engines were right to employ, because the sumps were placed at tolerably short distances apart, so that if any one engine or pump failed, it was assisted by those right and left of it; and, from the streets of the old city being very narrow, it was quite difficult enough to find space to place even one engine. At one important point we had three engines and pump together. Of course, where the pumping machinery, as in the Channel tunnel, would be about eleven miles apart, it would be absolutely necessary to have at least duplicate machinery.

With regard to the other question, "Did he keep the brickwork well up to the face of the mining?" the rule was, that when the miners had completed a 10 ft. or 12 ft. length, the bricklayers went in and put in their work; and were again succeeded by the miners. This was done unless any special circumstances prevented its being followed.

"The Secretary of the Company" states "that there are already some hundreds of miles of tunnels (colliery and lead-mine workings) under

* From a paper read at a meeting of the Oxford Architectural and Historical Society, on March 6th, by Mr. W. Nanson, Trinity College.

the sea." I much doubt this, and shall be obliged if he will name a few of the details, as I am much interested in the subject, and believe it will puzzle him to specify even ten miles. Moreover, the strata in which minerals are found consist of rocks and shales, either upper or lower; in fact, the metalliferous rocks have even allowed workings to be carried up to within a few feet of the bed of the sea; and in one place, in the Botalick mine, the miners actually broke through the roof of the heading into the sea, and the opening is now only stopped with oakum and a wooden wedge. Imagine this in lower chalk!

ALFRED W. MORANT.

COLOUR ON THE EYES OF GREEK SCULPTURE.

SIR,—May I be allowed to make a remark on your correspondent "Nemo's" letter of last week? While I am thoroughly desirous to agree that the "exquisite instinct of the Greeks" did eventually lead them to discard colour in sculpture, yet the "uniform blankness of the eye," which your correspondent claims for that taste, is not borne out by facts. In the Scleritine marbles at Palermo, black is distinctly traceable on the pupil of the eyes of the Medusa in the group of "Perseus and Medusa." A second instance is found in the Æginetan marbles in the Glyptothek in Munich, which bear traces of colour on the eyes, but *none on the flesh*. And, thirdly, in that splendid portrait relief from Marathon, of "Aristion," now in the Temple of Theseus at Athens, there is, if I remember rightly, distinct colour on the eyes, as well as in most parts of the dress and armour. I omit other more questionable instances. The three which I have quoted are enough to show that the instinct of the Greek did not uniformly restrain him from colouring the eyes of his statue.

G. S. DAVIES.

BELLS.

THE "Bell Catalogue," a trade-book just now issued by Messrs. Warner & Sons, of Cripplegate, contains information as to the cost of bells of various sizes and descriptions, which many will be glad to have. It includes also a long list of inscriptions for bells. It may be worth noting that the approximate cost of a peal of five bells and fixing, complete, is 290*l.*; of six bells, 500*l.*; and a peal of eight bells, 700*l.*

PROJECTIONS BEFORE THE GENERAL LINE OF BUILDINGS.

At the Westminster Police-court, before Mr. E. H. Woohy, an adjourned summons was heard upon a question of considerable importance affecting buildings in the metropolis as controlled by the certificate of the superintending architect of the Metropolitan Board of Works.

The complaint was preferred by the Vestry of Chelsea against Mr. Aldridge, the owner of the house, No. 27, Smith-street, in that parish, for having erected a lavatory which, it was alleged, formed a projection beyond the general line of buildings of Smith's-terrace.

Mr. Reeves, of the firm of Messrs. Pemberton & Reeves, appeared for the Vestry; and Mr. Brewer, from Messrs. Baxter, Rose, Norton, & Co., the solicitors for the Governors of the Hospital for Consumption, Brompton (who occupied the house as a home for patients), for the defendant.

Considerable legal discussion took place, particularly as there appeared to be a conflict of decisions in the Courts of Queen's Bench and Common Pleas, as to whether the magistrate was bound by the certificate of the superintending architect without the power of exercising any discretion on his own part.

His Worship decided in favour of the defendant, and dismissed the summons on the ground,—

1. That he considered he had a discretion, and was not conclusively bound by the architect's certificate.
2. That it would operate most injuriously if parties, who might innocently erect expensive buildings, were afterwards met by a certificate of a line of building of which they previously knew nothing, and were obliged to demolish their buildings.
3. That in the present case the architect's line was irrelevant to the question, it being a line for the houses in Smith-terrace, which were a considerable distance in the rear of the house in Smith-street, and which line, if projected to Smith-street, would cut off not only the entirety of No. 27, but one-half of the house next door. It appeared that the offending building did

not project so far as an existing ancient part of the house, in that it had been erected with the knowledge of the local surveyor, who at last simply complained of its height.

The magistrate expressed a strong view that it would be a very harsh application of the Act to authorise the demolition of the erection complained of. But on the application of Mr. Reeves, for the Vestry, he consented to grant a case, if it were desired to take the opinion of one of the superior courts.

In the Equity Courts, before Vice-Chancellor Sir R. Malins, an injunction has been granted in the case of Lord Auckland v. The Westminster District Board of Works. This was on a motion to restrain the defendants from taking any proceedings for the purpose of compelling the plaintiff, his builder, or any person employed by him, to abstain from erecting buildings upon so much of the site of Nos. 1, 2, and 3, Buckingham-row, Westminster, as was outside the line decided by Mr. Vallentyne, the superintending architect of the Board, to be the general line of buildings in York-place. In November, 1870, the Metropolitan Railway offered for sale, by auction, a part of their surplus lands in Westminster, and Lord Auckland, who had a house in Queen's-square, purchased, for the erection of stables, a lot on the south side of Buckingham-row, containing 2,560 superficial square feet. When taken by the railway, the plot formed the site of three houses with front gardens at the corner of York-place, but the houses had been pulled down, and the site was sold to the plaintiff for 880*l.* as building ground. The plans for the stables were submitted to the District Board; and, after considerable delay, they, having communicated with the Metropolitan Board on the subject, informed Lord Auckland that he could not be allowed to build beyond the general line of buildings in York-place; a decision which, according to the plaintiff's statement, rendered the land worthless for the purpose for which he had purchased it.

The Vice-Chancellor said he could not allow the Board to deprive the plaintiff of the benefit of his purchase without giving him compensation, and therefore granted the injunction.

CATHEDRAL OF PADERBORN.

MONSIEUR TRÈS-HONORÉ CONFRÈRE,—Veuillez vous m'ouvrir les colonnes de votre estimable *Bailler*, pour une petite rectification au sujet de la Cathédrale de Paderborn que Mr. H. W. Brewer m'accuse, dans votre numéro du 16 Mars, de classer dans les églises rondes et de confondre avec le dôme d'Aix-la-Chapelle.

Voici ce que je dis de la Cathédrale de Paderborn, dont je n'indique nullement la forme, mais que j'achasse seulement, sur l'autorité de Wiebeking (Architecture théorique, au Munich, t. v., in-4°, 1829), dans la partie de mon travail consacré aux Églises, dans la construction desquelles le souvenir du Saint-Sépulchre de Jérusalem exerça une certaine influence:—

"La Dom ou Cathédrale de Paderborn (Prusse) dut sa première fondation à Charlemagne, qui la fit ériger d'après des sources de la Pader, après le fameux diète tenu en cette endroit vers 777, et où ce prince reçut le serment de fidélité des Saxons; mais, suivant Wiebeking, l'évêque Mainwerk le fit reconstruire, au commencement du XI^e siècle, sur le modèle de l'église de Saint-Sépulchre de Jérusalem. Cette cathédrale, plusieurs fois incendiée de 1057 à 1138, fut réparée et agrandie de 1134 à 1243, grâce surtout aux soins des évêques Berard et (Elsin), et conserve encore des parties de l'église d'antique de l'évêque Mainwerk."

Voilà, je vous prie, tenir l'exemplaire qui accompagne cette lettre à la disposition de Mr. Brewer, en remerciement de la liste des principales églises rondes ou polygonales d'Allemagne qu'il indique, et dont je ferai mon profit pour le compliment de mon travail.

En vous présentant, Monsieur et très-honoré Confrère, tous les affectueux respects de votre tout dévoué,

CH. LUCAS.

A TECHNICAL COLLEGE FOR GLASGOW.

The proposal to found a Technical College in Glasgow has originated in the belief that no city in the empire stands more in need of such an institution, or will derive from it greater and more immediate benefits.

The object of the promoters is to provide such a system of technical education as shall embrace scientific instruction in the theory, and as far as possible in the practice, of the various great industries of the city, so that the manufacturers, managers, and overlookers by whom such industries are conducted may be thoroughly acquainted with the principles of science upon which they are based.

It is proposed that the Technical College of Glasgow shall be in unison with Anderson's University, the Mechanics Institution, and the School of Art, and Italian Academy,—institutions which already embrace instruction in branches hearing upon technical education.

The promoters of the college aim at ultimately raising a sum of at least 50,000*l.* to carry into effect the proposed object. This fund to be applied as follows:—

1. In providing lecture-rooms, class-rooms,

and suitable accommodation for apparatus and illustrative material.

2. In payment of lecturers and teachers.

3. In purchasing mechanical and chemical apparatus, models, drawings, specimens of industrial art, and natural products applicable to manufactures.

4. In meeting the general expense of maintenance and management.

We observe the names of three architects amongst the committee of promoters,—Mr. John Honeyman, Mr. Alex. Thomson, and Baillie Salmon. The Lord Provost and several members of Parliament are among the number. In short, those who have taken the subject up are men of the highest standing in Glasgow in connexion with the various industries to be benefited, and the scheme, we are glad to understand, has every prospect of being successfully carried out.

THE NINE-HOURS MOVEMENT IN LONDON.

SIR,—I trust you will not think it out of place to review in a brief manner the agitation of the nine-hours question between the masons and the master builders of London, which up to the present time has been conducted very quietly and almost privately.

In the first place, it will be as well to state that at the request of the employers we commenced working the nine hours for the three winter months, commencing on the 9th of November and ending on the 14th of February, in the winter of 1866 and 1867, being a reduction in wages of 8*d.* per week. That system has been continued, with great advantage to both parties, up to the present time. When the masons thought that the system might safely and advantageously be adopted throughout the year, they made it becoming a general thing in all branches of industry. They met together last November, and agreed to present a memorial to the employers on the 1st of January, 1872, giving them notice that we wished to continue the nine hours from the 14th of February of the present year; also asking for an advance of one penny per hour, to commence on the 1st of July, 1872, being six months' notice for the advance of wages, if it might be so called, but in reality it would be the same total (as our conge will admit of) for the 51 hours as it is now for the 56.

Well, sir, after the notice was sent in, correspondence and interviews took place between the masons' committee and Mr. Piper, the secretary of the Master Builders' Association; and ultimately the employers issued a statement to the masons, declining to concede the terms of our Memorial, stating for their reasons that it would cause public dissatisfaction and great inconvenience. On the receipt of that we held another meeting; and, to avoid a strike, the committee were instructed to write to the Builders' Association, respectfully requesting them to receive a deputation from our body, believing it would lead to an amicable settlement of the question in dispute. The request was granted, and the 18th of February appointed for the meeting; when, to our great disappointment, the employers' committee was not in authority to dispose of the question, but only to hear what we had to say for our cause, which they listened to with great respect and courtesy, and advised us to ask their Association to appoint a committee with power to make arrangements for finally settling the question; and from the general expressions and tone of their remarks, we had reason to hope that we were near a peaceful solution of our difficulty; but we were mistaken, for after we had sent in the request for them to appoint an authoritative committee, and waiting a fortnight for an answer, they wrote, saying they saw no reason to depart from the terms of their Circular, referred to above. So, after leading us to believe they were pacifically inclined, they turn round with a blank refusal for further negotiations. Whether they have acted wisely or unwisely remains to be seen. When our time comes we shall be prepared to set upon experience. My object in writing this letter is to clear ourselves from the charges so frequently and so freely made against us of being hasty and dictatorial. Let the readers of this draw their own moral from the above facts.

R. SCOTT, Stonemason.

THE TRADES MOVEMENT.

Oxford.—A meeting of masters and a deputation from the men engaged in the building trade, now on strike at Oxford, has led to a satisfactory arrangement, to the effect that 56½ hours shall constitute a week's work, to commence on the 1st of April, and that on and after the 1st of November 54 hours shall be sufficient.

Keswick.—The masons and wallors in Keswick are still out on strike. The terms they demand are 3*s.* per week advance during the summer months, which would raise their present rate of wages from 2*4s.* to 27*s.* per week. The labourers employed in the building trade also demand that their wages be advanced from 18*s.* to 20*s.* per week during the same period, the old rate to be paid in winter as hitherto.

Penzance.—A large meeting of masons has been held to consider the best means of adopting the nine-hours movement without injury to the masters. The chairman invited the opinions of the audience (numbering over seventy), when the following resolutions were adopted, viz.:—
1st. That 5½ hours constitute the week's work, the men working 9½ hours each day (except Saturdays), and on Saturdays working 6½ hours, leaving work at one o'clock. 2nd. To be paid by

the hour. 3rd. To receive 4jd. per hour for eight months in the year, and to receive 6d. per hour during the remaining four months, which consist of short days, being only eight hours' daylight. 4th. A deputation be selected, and requested to wait on the masters, to invite their consideration and approval of the same." The chairman said he sincerely hoped that the present harmony existing between masters and men would still continue; and he felt assured the masters (as on former occasions) would openly and fairly meet the deputation, and finally decide in favour of the men.

Abergavenny.—At a meeting of the employes in the building trade it was stated that the masters were agreeable to give the men 55 hours per week, but would not advance the wages. The men determined to strike. Six men were deputed to see the masters, with full authority to settle the question on the best possible terms. The whole body of masons, however, seceded, and said they would not again solicit the employers for another interview upon the matter. The same evening the carpenters, joiners, plasterers, &c., met together, when the deputation stated the masters would give the 54 hours and no more. It was then resolved that no work be commenced until the employers make a concession with respect to the wages, and the meeting separated with that understanding. Some of the master plasterers afterwards agreed to give their men 2s. advance, and the hours, which was accepted, and the men went to work. The body of carpenters from one firm went in by having the 54 hours only. Another body of carpenters commenced work on having 2s. advance and the hours asked for. It was afterwards understood that the remainder of the carpenters and joiners, who stood out, were to be paid 5jd. per hour and receive the reduction of hours. They agreed to commence work on the following day. A meeting of the masons was held. A statement was made that some employers were agreeable to give the hours, and an advance of 3d. per day. One master was agreeable to give time and money to those men who were worth it. A proposition was put to the meeting that the masons accept 3d. per day advance and go on to work. As an amendment, a speaker proposed that no work be commenced until they get the time and money asked for. Upon being put to the meeting, the amendment was carried unanimously. The masons plumed the town, warning those masons who might come to seek work not to accept it, as the men were on strike.

ST. STEPHEN'S CHURCH, HAGGERSTON.

On Tuesday, the 5th inst., the new church of St. Stephen, Goldsmiths-row, Haggerston, a densely-populated neighbourhood, where the want of adequate church accommodation, has been long felt, was consecrated by the Lord Bishop of London. In plan, the church consists of a nave of four bays, with north and south aisles, and apsidal chancel with aisles, that on the south side being used as a vestry, with an organ-chamber over. At the west end are two large two-light windows, surmounted by a circular window, and over the nave arcade on the north and south sides is a clearstory with two-light windows. At the east end of the chancel is a three-light trefoil-headed window in the centre bay, and single-light windows, also trefoil-headed, in the sides of the apse, all of which will hereafter be filled with stained glass. The ceiling of the nave is boarded under the rafters, that of the chancel being divided into rectangular panels filled with gilt stars on a blue ground. In the ceiling of the sanctuary, the martyr's crown and palm, in honour of the patron saint, are introduced; over the junction of the nave and chancel is an octagonal bell-cot of oak. At the west end of the nave stands the font, of sufficient size to admit of immersion, the octagonal bowl of which is of Caen stone, and is supported by a red Mansfield centre shaft, and four smaller angle shafts with moulded capitals and bases. In the panels on the "cardinal" faces of the bowl are introduced the sacred monogram, twice repeated, the Cross, and the Holy Dove.

The seats in the nave are of deal, stained and varnished, with open backs and solid ends. The chancel is elevated six steps above the floor of the nave, the table being raised on two additional steps. On the north side of the chancel is an open parclose of oak, separating the chancel from the aisle, and in the corresponding arch on the south side will be the organ. On the north side of the sanctuary is a credence-table, opposite to which is the usual arrangement of sedilia

and piscina. Above the altar is a re-table, over which is the reredos, in three compartments, the centre containing a large cross in statuary marble, on a diapered and gilt background.

The church is constructed of brick throughout, with coloured bands. It has been erected from the designs, and under the superintendence, of Mr. Francis T. Dolman; Messrs. Dove, Brothers, being the contractors.

The building will accommodate 600 worshippers, and the cost will amount to about 5,000l., a great part of which has been bestowed by one or two munificent contributors.

ACCIDENTS.

Fall of Building in Stockport.—An inquest has been held on the body of one of four men injured by the fall of an old building in the mill-yard of Mr. Dickie. A bricklayer, living in Heaton Norris, said deceased and others had been pulling down the walls of an old mill, under the direction of Glas. Hadfield, plumber and glazier. He was a practical man for that purpose. They had the roof off, and had got down a part of two of the upper stories. Witness was bricklaying at the boiler-house underneath. The wall which they pushed over was 10 ft. high by 13 ft. long, and built against the principal building that fell. There were two iron beams running over the round columns, but were without a tie, and when the wall was knocked down it so shook the building that it drew out the untied beams; the wall gave way, and the bricks fell upon the deceased, who was dressing the old bricks below. There was no contract work; all was day-work, both with bricklayers and labourers. Samuel Gaskill, manager, attributed the accident to the absence of any ties to the ends of the beams. The moment the old wall was removed, the building to which it was attached of course fell. Every precaution was used on the occasion. The jury decided that the cause of death was purely an accident.

Fall of a House in Dublin.—A house situated in Werburgh-street, Dublin, has fallen, the entire back part of the building coming down with a crash, leaving only the front wall standing. The police immediately took precautions to stop the traffic in the street, which is in a dilapidated state. Efforts were also made to get out the inmates, and, with the aid of the fire brigade, this was accomplished. One woman was insensible, and had to be sent to the hospital. Another was severely hurt, and a third only saved herself by clinging to the rafters until help arrived.

DISASTROUS FALL OF HOUSES IN CHELSEA.

On Tuesday last, Dr. Diplock, the coroner for West Middlesex, resumed, at the Chelsea Workhouse, an investigation respecting the death of Charles Free, aged sixteen years, who lost his life through the fall of two houses, 163 and 165, Marlborough-road, Chelsea.

Mr. G. Lewis, solicitor, appeared for Mr. Hill, contractor, who at the time of the fatal occurrence was engaged in making the two houses into one by removing the party-wall and putting up a new breastsummer; Mr. Roberts, of Gray's Inn, represented Mr. Watts, the landlord; and Mr. Newman watched the proceedings for Mr. Jones, a linendraper, who was the tenant of the fallen houses.

Mr. Walter J. Hill deposed that he was the son of Mr. Hill, the contractor. The fronts of both houses were taken out, and a new breastsummer had been put in, in order to support the upper part of the houses. The breastsummer was 30 ft. in length. In the front of the house and underneath the party wall there was an iron column, 4 in. in diameter. Witness did not know when the shoring of the houses had been taken down. The column rested on a wall, and neither the column nor the wall beneath had been erected by Mr. Hill. When the houses fell men and breastsummer came down; the men went through the flooring, and witness and the column had just time to run out into the street before both houses fell. He would swear that he did not remove the struts supporting the houses before they fell.

Mr. Sancton Wood, the district surveyor, said that on the 10th of February he received notice in accordance with the Building Act, that it was the intention of Mr. Jones to alter his shop-front. The notice did not state that the party-wall was to be removed. He then visited the premises, and he found that nothing had been done. He afterwards went to the houses several times, until at last he saw that a scaffolding had been erected in front of the shops, and they were covered with blankets, table-cloths, advertising placards, and, in fact, the greater part of the stock-in-trade of Mr. Jones. Witness then said to Mr. Jones, "When are you really going to build?" and Mr. Jones replied, "This is rather a good arrangement at present." It was then agreed that Mr. Jones should send a witness to tell him when the building commenced, but

he never did so, and witness there only saw the houses after they had fallen, and he then examined the basement walls of the houses. They were the worst walls that witness had ever seen in his life. He was aware that such walls were bad, and the mortar was merely road-scrapings. The houses fell through the giving way of the column.

Mr. T. Spradbury, builder, said that he had examined the fallen houses, and he believed that the catastrophe had been caused by the rottenness of the walls.

Other similar evidence having been given, the inquiry was adjourned till, this, Friday, 22nd.

We must compliment the coroner on the care and acuteness shown by him in the inquiry, and would suggest that he should obtain the opinion of a professional man unconnected with the work.

UNSAFE LANDINGS.

At a meeting of the St. George's, Hanover-square, Vestry, a letter was read from Mr. Goldsmith, of Font-street, on behalf of Col. Hamilton, of 118, Eaton-square, complaining of the unsafe condition of his landing, and announcing that he will not hold himself liable for any accident that may occur. A proposal was made to have the case settled by the magistrate, but Col. Scott said he hoped this course would not be adopted. A legal opinion—that of Mr. Thrupp—had recently been taken, which was against the Vestry. He understood that other parishes had been advised to repair such landings. Mr. Nicholl said the parish of St. Margaret, Westminster, repaired the landings on Cadogan-street, near the Catholic cemetery. If a poor parish like Chelsea could repair landings, surely a rich parish like St. George's might do it. He would suggest that the letter be referred to the Vestry, which course was adopted.

CHORLEY TOWNIAL COMPETITION.

Sir,—I would like to kind if you can learn for me the decision arrived at in this competition. The drawings were sent in on the 1st February, and no notice has been taken of them further than that they were to be exhibited to the public some three weeks ago. If any of your correspondents can inform me, through your columns, of the results of the committee's deliberations, it would interest not a few who competed.

A CORRESPONDENT.

MARBLES FOR THE NATIONAL GALLERY.

Sir,—I wish to call your attention to a large contract for marble-work about being put up in the Nations Gallery. The specification names Belgian marbles. I seen estimates to some London marble masons, who are my customers; but it appears Irish black marble will not be accepted (though equally good). Green marble is also required. There is no green marble in Belgium; the very finest is raised in Ireland. Is it not worth considering whether foreign marble should be used for a national building when better marble of the colours required can be had at home, and cheaper?

Edinburgh.

"LEAKY SEWERS."

The vagueness of "O. E. D.'s" answer to my letter on this subject in the *Builder* of Feb. 24th, being probably produced by a false misapprehension in not supplying sufficient data, I wish it possible to afford same.

The bricks used were "hard brimstone lumps," laid in Portland cement, one to one, the sewer being on an quarter of its diameter. There are only four junctions prepared for future connections, being say one every ten chains, which, practically, would be wasteful.

If any of your readers have tested the average leakage in a 2 ft. sewer of 4 1/2 in. brickwork due to percolation in different descriptions of soil, and will give me the benefit of their experience, I shall be much obliged, as a local question of some importance has arisen on this subject.

B. A.

ARCHITECTS' BENEVOLENT SOCIETY.

The annual general meeting of this Society was held on Wednesday, the 13th inst., at the rooms of the Royal Institute of British Architects; the chair being occupied by Mr. George Mair, F.S.A., in the unavoidable absence of the president, Mr. Sydney Smirke, R.A.

Amongst the members present were Messrs. C. C. Nelson, D. Mocatta, F.S.A., William Mosley, Thomas Cuny, Wyatt Papworth, J. Goldicutt Turner.

The Report laid before the meeting, and which the chairman read, showed that,—

"The net increase in the number of subscribers to the funds of the Society, after deducting the death and retirements, is twelve; the donations have exceeded the amount of the preceding year by 38l. 3s.; and the balance now in hand has increased by 22l. 11s. 8d. During the past year seventeen cases have been received of that number which were very widows."

The report drew attention to the circumstance that out of over 500 members of the Institute, only about 160 have as yet enrolled their names on the list of this Society.

The chairman having moved the adoption of the report,

Mr. D. Mocatta, in seconding it, said he wished to bring the fact before the meeting, the Royal Institute, and the profession, that during the past year the council had felt themselves only justifying in making grants to applicants for relief of a sum in total upon the year as would barely

give 10*l.* average to each, a gift, he considered, too paltry and insignificant, when it was borne in mind the class of persons who sought aid. He hoped the appeals of the Society would not be in vain.

Mr. C. C. Nelson said, speaking as a member of the council, he could assure the profession that if they knew the number of men deserving and distressing cases that came up for relief, he was certain more funds would be forthcoming.

Mr. William Mosley wished it known that neither was the amount of subscriptions fixed at 1 guinea nor was it only members of the profession who were eligible to become subscribers; and that all subscribers of 1 guinea could recommend applicants.

Mr. John Turner, the honorary secretary, called attention to the fact that whilst many members of the profession subscribed to the Builders' Benevolent Society, but few of that calling were subscribers to this.

The report was then adopted *nem. con.*

The treasurer, Sir William Pitt's, account, as audited by Messrs. Charles Fowler and Henry Jarvis, was then discussed, from which it appeared that the gross receipts for the year amounted to 28*l.* 8*s.* 4*d.*, gross payments, 317*l.* 10*s.* 4*d.*; balance carried to next account, 70*l.* 1*s.* 3*d.* of the payments, 62*l.* 1*s.* 6*d.* had been invested, and that the gifts to applicants were 136*l.*; the stock now standing in the Society's name amounts to 1,664*l.* 1*s.* 4*d.*

Mr. John Turner then announced some donations just received, which were—Sir M. D. Wyatt, 5*l.*; Mr. R. L. Roumie, 5*l.*; J. L. Phené, 5*l.*; George J. Mair, 5*l.*; John Turner, 5*l.* He also read a letter from Mr. J. H. Jackson, in which he expressed the intention of himself and his brother hereafter to double their subscriptions.

After the formal business had been transacted, the meeting was closed by a well-deserved vote of thanks to the chairman.

CONDITION OF NEWLYN, NEAR PENZANCE.

In September, 1870, we directed attention to the sanitary condition of this place. The authorities did make a feeble effort, and as ineffectual as feeble, to reform matters. It will be remembered that, for one thing, the local county magistrates tried to make a scapegoat of the county surveyor, and failed contemptibly.

And now the condition of the place may be gathered from the following, taken from the *Cornish Telegraph* :—

"WHEN WILL SUCH A STATE OF THINGS BE REMEDIED? In the course of an inquiry, at the late Penzance County Court, on the liability of parties to keep a drain repaired at Newlyn, it came out that the drainage of seven or eight houses in Factory-row emptied into a main sewer, which runs through the garden of the Navy Inn. This sewer is open in the garden, and passes by the mouth of a well, from which it is only divided by a kerystone! Then it passes under the Navy Inn. The present owner of the drain, who has his predecessors, has had to keep it in repair for the houses in the rear of his premises, said there had been two cases of fever in the house and two deaths. In the winter, with plenty of water, the drain under the house was tolerably clear, but in the summer it was foul and most offensive. The Judge ascertained from one witness that there are only five privies in all Newlyn, and from another there are certainly not ten! The Judge: 'And this is the state of Newlyn in 1872, a state of things which might have been expected 400 years ago, but is almost incredible now, except for the evidence of one's own senses, if he happens to visit Newlyn and—comes out of it again alive!'"

It will thus be seen that our report on the place, shocking as it was, was far within the real facts. At the time we were of opinion that the report of the Government inspector was far too complaisant to be of any use; we are sorry our opinion receives such powerful confirmation.

Pro.

METROPOLITAN TRAMWAYS JOINT COMMITTEE.

A COMMITTEE of Lords and Commons has been appointed to inquire whether it is desirable or not that any additional tramways should be laid within the metropolitan area; what should be the limits of the metropolitan area in respect to tramways; under what authority the construction and working of metropolitan tramways should be placed; and along what lines of streets, if any, the tramways shall be allowed to be constructed, and under what restrictions.

The Committee will meet to hear evidence on the 15th of April, after the Easter holidays.

Miscellaneous.

The Snow.—The metropolis was visited on Thursday with a heavy fall of snow, commencing about twelve o'clock and continuing for some hours. About two o'clock the scene was most picturesque. Scarcely a breath of wind disturbed the steady, graceful dance of the white aerial deposits. The trees in the parks and squares were lovely to behold. The mantle scenery and vista were most extraordinary. No artist on his travels could have failed to observe the beautiful subjects which Nature sends such a short time had presented, and which, even to the least-tutored mind, had a most delightful aspect.

The Tramways in South London.—The London Tramways Company are endeavoring to extend their system in South London. At the present time their trams run over 16½ miles. They run from Westminster Bridge to Brixton and Camberwell; also from Westminster Bridge, through Camberwell and New Cross to East Greenwich. They run also from Blackfriars Bridge to Brixton, and from the same terminus to Greenwich. The Company are about to apply to Parliament for leave to open some additional lines, including lines from the Horns, Kennington, to St. George's Church, Borough; from Westminster Bridge to Whitehall-place; from the Obelisk, St. George's-circus, over Waterloo Bridge, to the Strand; and Victoria-street, Westminster, to the Abbey. The company appear to be doing a considerable amount of business on their existing lines in South London, their receipts during the last four months of 1871 amounting to 24,709*l.* 2*s.* 5*d.*

The Health of London.—The periodical titled "Labour and Unity" thus urges a point before now pressed by us:—"We contend, the health of London can only be known, and thereby only attainable, by returns of sickness instead of the mortality it now gives us; because the only value to be relied on must be by the medical staff themselves. To the Ancient Order of Foresters and the Society of Odd-Fellows we can only look for information in this particular. These useful institutions record their rate of sickness per day per member, and from such information is compiled that valuable detail which may be called the true record of health. The readiness with which this information is obtained is as simple as it is effective, and if it can be so successful on the 700,000 to 800,000 members of these institutions it can be made also as available for the community."

Society of Arts Window for St. Paul's.—It has been suggested that the Society of Arts should provide a memorial of Thanksgiving Day in the form of a painted window, to be set up in the cathedral, thus helping at the same time to complete the decoration of the interior of that edifice. A fund for this purpose is being raised among the members by subscription, each member of the Society being at liberty to subscribe 5*s.* for himself, and the like sum for each member of his family. It is to be hoped that British glass-painters will be employed.

Discovery of Roman Remains in Gloucester.—Some interesting Roman remains have been brought to light on the premises of Mr. Rumsey, of Southgate-street. An excavation had to be made in the cellar, and at a depth of about 10 ft. from the surface of the footway, the workmen came upon the border of a tessellated pavement. The tesserae are of white and black, first in bands, and next worked in a design like that of a carpenter's square. The floor is in excellent preservation. The pavement is laid parallel to the street as it now exists.

Asphalte Pavements.—A new experiment, writes the *Mining and Commercial Times*, is about to be tried in the method of asphaltizing roads. The Patent British Asphalte Company have contracted with the streets Commissioners to lay its asphalte over the existing granite curbs in King William-street, City, so as to save the expense of removing the existing road-pavements, and insure a firm foundation for the asphalte covering.

Art-Union of London.—An advertisement in our present issue announces the approach of the last day for subscribing. It will be noticed that the first prize in the distribution will be a life-size marble statue, "The Wood Nymph," for which the sculptor, Mr. Birch, was awarded a premium of 600*l.* by this society, the result of a competition, when fifteen artists exhibited. The set of prints relating to the sea and coast scenery, from the works of David Cox, Copley Fielding, and Samuel Prout, given to each subscriber, are worth more than the guinea subscribed. Such is the result of co-operation.

State of Hammersmith Bridge.—In view of the approaching University Boat Race, attention is again drawn to the condition of Hammersmith Bridge, and the proprietors of that structure are entreated to employ an engineer, in order to report whether it can safely carry the weight which will be imposed upon it.

Mr. Henry Ashton, Architect.—The death of this gentleman, in his 71st year, is announced.

The Art Schools at University College, London.—The following is an extract from a private letter written by a lady now studying in the Art Schools of University College, which have recently been opened to students of both sexes:—"Since Christmas I have been working hard every day in the Art Schools, which have lately been opened under E. J. Poynter, A.R.A. I think male art students must be more amiable than medical students, for the utmost harmony prevails in our classes. We work together in the antique room, and three days a week from a half-draped live model; the other three days the male students have a nude model in one room, and the ladies a draped one in another. The mixed classes are by far the most orderly and hard-working. A few outsiders have made a feeble protest on the score of propriety, but I do not think they will be attended to, while the present arrangement answers so well. There are about eighty students, rather more than half women. The schools are open every day from half-past nine to five. Mr. Poynter visits each class about three times a week, and there is also an assistant master, who looks round now and then, and gives advice to the less advanced pupils. The rest of the time we are left to ourselves. A few of the students complain, but by far the greater part see that it is only by their own hard work that they can expect to improve, and that if their studies are rightly directed, it is all they need."

The Thames Embankment Question.—At the last meeting of the Board of Works the Parliamentary Committee submitted a report setting forth that they had considered the Bill introduced into the House of Commons by the Chancellor of the Exchequer, empowering the Board to purchase the land on the Thames Embankment for the sum of 40,000*l.*, or a sum to be ascertained by arbitration, and they had come to the conclusion that the Board would not be justified in paying 40,000*l.* for the land in question. With regard to the offer of arbitration, the committee thought the Board ought not to accept it, believing that the course recommended by the select committee of the House of Commons presented an equitable basis for an arrangement. The committee were of opinion that the Board might either pay an annual rental for the ground calculated on the basis suggested by the select committee; or, if it were preferred, pay the capitalised value of the rental, and thus become absolute owners of the ground. After some discussion the report was adopted.

The Society of Accountants in England. This Association has grown, and now numbers more than a hundred members of the profession, established in every part of the kingdom. Since the inaugural meeting, held at the Cannon-street Hotel, on the 11th of January, the council have framed a series of rules and regulations. The aim of the society is to promote the complete acquisition of those branches of knowledge which are essential to the practice of an accountant, to decide upon questions of professional usage or courtesy, to advance generally the efficiency and character of members of the profession, and so to guard those public interests which are now annually committed to the skill and honour of the accountant.

The Westminster Testimonial at Chester. At the Town-hall, Chester, on Saturday, a full-length life-size portrait of the Marquis of Westminster was presented by the citizens to the Marchioness on the occasion of his lordship succeeding to the estate and title, and in recognition of the connexion which, for upwards of twenty years, has subsisted between the city and his lordship, as its representative in Parliament. The work is by Mr. J. E. Millais, R.A., who has painted his lordship in hunting costume, and about to leave Eaton-hall and mount for the chase.

State of St. Silas's Church, Bristol.—The Church of St. Silas, Bristol, has been gradually sinking ever since its erection, four years ago, at a cost of between 5,000*l.* and 6,000*l.* The building is now broken right across, and rendered quite dangerous. Practical engineers recommend that the church be pulled down, and rebuilt on a better foundation, at a cost of from 1,500*l.* to 2,000*l.*; and this will probably have to be done.—*Wills Standard.*

Portland Drainage Competition.—We have received a letter on this subject, from Messrs. Glennie & Coke (authors of the plans marked, "Thorough"), but too late for our present issue.

The Purchase of Railways by the State. At the Inventors' Institute, St. Martin's-place, Trafalgar-square, on Tuesday night last, Mr. Raphael Brandon read a paper in which he advocated the Government management of railways. Glancing first at the difficulty of enlisting the public ear in favour of any new project, of which he adduced a succession of illustrations drawn from the history of inventions, of legislation, and of great undertakings within the past half-century, he argued that railways having become in the present day the great highways of the country, ought, as the king's highway was in the past, to be under the control and management of the State. It was indispensible detrimental to the interests of the nation that they should remain subject to the caprice of the different localities which they traverse, or to the tender mercies of companies formed purely for purposes of speculation. The transfer, he endeavoured to show, would involve no money payment, but simply a guarantee (which would not be difficult with the Government) with regard to punctual payment of dividend upon shares. In fact, it would give rise to a new Government stock much more saleable than railway shares as now constituted and dealt with. After discharging dividends, any surplus profit he proposed to apply to the general improvement of the railway system by providing sleeping and refreshment carriages, and other through traffic comforts and conveniences, and especially to providing separate sets of rails for goods traffic as distinct from passenger traffic.

Society for the Encouragement of the Fine Arts.—On Thursday evening, the 14th inst., a lecture was delivered before the members of this society, "On the Literature of Letter-writing," by Mr. T. R. S. Temple, M.A., Cantab. The chair was occupied by Dr. Doran. After giving the early history of letter-writing, the lecturer traced its gradual development from the first faint glimmerings of a good epistolary style in England down to the times of Pope, Lady Mary Wortley Montagu, Swift, Steele, Lord Lyttelton, Walpole, and Dr. Johnson. Among later writers, Sir William Jones, Burke, and Cowper, were to be commended. Owing to the cautious and practical business-like habits of our countrymen there do not exist an over and above number of love-letters. Modern authors were careless in the matter, in consequence of which their letters generally sank below, rather than rose above, the level of the best colloquial discourse. Scott, Burns, Campbell, Lord Byron, and Southey often were quoted as examples to the contrary, perhaps without much ground, although they possessed some qualities necessary to a good epistolary style. A discussion, opened by Dr. Doran, who made, as usual, some very interesting remarks, followed, in which also Dr. Altschul, Mrs. Lucy Newbery, Messrs. Gilks, Passmore Edwards, and others took part.

Ventilation and Purification in Factories.—M. Charles de Frécinet, mining engineer, was charged by the late Imperial French Government with a commission to visit the most important factories and workshops in England, France, Germany, and Belgium, and to report on the means adopted to prevent the ill effects of the various deleterious agencies on the health of the operatives. The results of this investigation were printed in four large volumes, and the *Journal of the Society of Arts* for the 15th inst. notes a few of the observations of M. de Frécinet, and especially of those which refer to foreign countries. In respect to our own country, we regret to observe, M. de Frécinet says:—"In England, the manufacturers, forming a part of the Government, and not fearing any censure, neglect to apply in their works the preventive systems adopted elsewhere." Were this true, it would be one of the most serious statements that were ever made against a nation or a Government; but M. de Frécinet is able to find "some exceptions." The value of M. de Frécinet's work lies, however, in his accounts of what has been done on the Continent, and these deserve serious study.

Bankruptcy of a Clerical Builder.—In the London Court of Bankruptcy, on Tuesday, the case of the Rev. Henry Marchmont came on for hearing. This was an adjourned sitting for public examination. The bankrupt, a clerk in holy orders, was described as of 29, Colville-square, Notting-hill, builder. It appeared that he had engaged in extensive building speculations in the neighbourhood of Kensington Park, besides officiating as a clergyman. The judge adjourned the sitting until the 12th of June.

The East Window in Windermere Parish Church.—A paper, by Mr. Frederick Clowes, on the characteristics of this well-known window, has been read by the Rev. Canon Stock, at the Bowness Pearly Readings. Mr. Clowes explained that being neither an artist nor an antiquary, he had collected together some of the views of the best artists and antiquaries who had studied the window, and gave the result. Before the old window was taken down, he stated, the responsibility of the treatment of it was felt by the church restoration committee to be a very serious one, and he was able to consult on their behalf Mr. C. Knight Watson, secretary of the Antiquarian Society. It was a fortunate circumstance that this gentleman, being the grandson of the late Bishop Watson (who was buried at the east end of the church), and feeling strongly the association of his family with the old edifice, felt a great interest in the subject of the window. He at once took it up, and by his advice the work was intrusted to Mr. Henry Hughes, who has done, under the auspices of the Antiquarian Society, some important restorations of old windows.

Kimberley v. Dick.—In the Rolls Court, Chancery-lane, on the 7th inst., this case, which was partially decided in November last, again turns up. It was directed, amongst other things, that the plaintiff should make out his claims for extra work, and accordingly he, with two surveyors from London and his foreman, went to Ireland about a fortnight ago for that purpose, but Mr. Fenton, Mr. Dick's agent, refused them access to the premises, and locked up the rooms. Accordingly an application was made to the Master of the Rolls for an order to enter the premises for the above purpose, and some discussion has just taken place on the subject, in the course of which the Master of the Rolls has expressed his opinion that access must be had, with as little inconvenience to Mr. Dick as can be, but that it does not seem to be possible to do it by sections as suggested. The case, however, was adjourned without any explicit order having been given. The judge signified that the costs of the futile visit to Ireland should be paid by Mr. Dick.

Edinburgh Architectural Association.—The usual fortnightly meeting of this Association was held on the 13th inst., in the hall, No. 5, St. Andrew-square, Mr. Hippolyte J. Blanc, president, in the chair. The minutes of last meeting were read and approved, after which a paper was read by Mr. J. D. Marshall, jeweller, entitled "The Origin of the Forms of Classic Ornamentation." He traced the forms used in Greek architectural ornamentation to an Assyrian and Egyptian origin. In their first use it is probable they had a symbolic and religious meaning, but when adopted by the Greeks they became mere instruments of decoration, and in their hands assumed a peculiar elegance and beauty. The paper elicited considerable discussion, and at the close a vote of thanks was awarded to Mr. Marshall.

Proposed Brighton New Parochial Church.—A proposal for building a new church on Albion-hill is before the town. The edifice is to be known as the Church of St. Barnabas, and will be adjacent to the Home for Female Penitents. The site of the church is described as suited for the purpose. The committee are desirous that provision should be made at once for all the machinery which will be required for the proper and efficient working of an independent parish. Contributions are therefore being requested for the following objects:—1. The site, which can be purchased from the trustees of the Home for the sum of 950*l.*, which has been certified by a competent surveyor to be a fair and reasonable price. 2. The church. 3. The parsonage. 4. An endowment. It is thought that these objects cannot be accomplished for less than 10,000*l.*

Durham Courts of Justice.—Judge Mellor, in charging the jury at Durham Spring Assizes the other day, said,—"Let me congratulate you on the reconstruction of your Courts of Justice. This is the first time I have had the honour of presiding in this court since it has been reconstructed, and, as far as I can observe, it is highly creditable not only to the county, as a temple of justice, but to the architect and those persons who superintended the arrangement. Of course there are minor details on which it is impossible to pronounce an opinion until the business of the court has proceeded. You have now one of the best-arranged courts which it has been my lot to witness."

TENDERS

For completing two houses at Silverdale, Sydenham, for Mr. J. A. Bartrum:—
Bysh 2900 0 0
Rickett 880 0 0
Slaford 870 0 0
Wilson 750 0 0

For building new chapel, at Barnet. Mr. T. W. Horne, architect:—
Bracher & Son 23,220 0 0
Wicks, Bangs, & Co. 3,550 0 0
Conder 3,525 0 0
Wood 3,500 0 0
Dove, Brothers 3,475 0 0
Scribner & White 3,433 0 0
Adamson & Son 3,379 0 0
Higgs 3,333 0 0
High 3,100 0 0

For repairs and alterations to the Regent's Canal Iron works, Eagle Wharf-road, New North-road, Hoxton, for the Henri Ribbed Barrel Company, Limited. Mr. H. A. Alexander, architect. Quantities by Mr. Henry Laxton:—
General House and Works. Offices. Total.
Browne & Robinson 2739 2315 5054
Potter & Ferrige 1,060
W. H. & J. Mansbridge 761 290 1,051
Sawyer 650 802
Baxter 577 245 822

For the completion of six houses at Berrigee-road, Gipsy-hill. Mr. H. A. Alexander, architect:—
Baxter 2870 0 0
Farket 800 0 0
Jelly 632 10 0
Mundy 627 10 0
Lovejoy 623 0 0
Swain 623 0 0

For house on the Magdalen Charity Estate, Hastings. Messrs. J. Jeffery & Skiller, architects:—
Bridgland (accepted) 21,300 0 0

TO CORRESPONDENTS.

H. F. K. J. P. E. R. J. F. E. R. W. & Sons—A. A. W. C. R. H. C. F. R. T. R. E. S. J. L. A. H. H. E. H. J. B. J. H. O. W. H. C. J. D. H. M. C. O. R. (the statement as to the moving of houses is quite correct).—"Mistress and Servant" (in type). "Barrow" (last week).—

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

NOTICE TO ADVERTISERS.

GOOD FRIDAY.

"THE BUILDER," for the week ending MARCH 30th, will be published at ELEVEN a.m. on THURSDAY, 28th. Advertisements for insertion in that Number must therefore reach the Office before THREE p.m. on WEDNESDAY, the 27th.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit in any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slate and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITLAND ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 and 15, Bury-street, St. Mary Axe, London, E.C.—[ADVT.]

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret clocks [with gravity or dead-beat escapement for Churches and Public Buildings. Estimate and plans on application. Price:—Village clocks, from 15*l.*; church clocks, from 40*l.*;—Village wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Whole sale Entrance—Burlington Steam Works.—[ADVT.]

Architects, before committing themselves to any system of warming, should send to TRUSWELL, BROTHERS, & HOLDEN, 10, Nottingham-street, Sheffield, for a prospectus of their Improved Patent Hot-Air Apparatus.—[ADVT.]

THE SUBSCRIPTION LIST WILL CLOSE 30th MARCH, INSTANT.

Every Subscriber of One Guinea will receive, besides a Chance of a Prize
 at the Annual Distribution in April,

A SET OF IMPRESSIONS OF
EIGHT PLATES OF COAST SCENERY,

Engraved in the Line manner by E. P. BRANDARD, C. COUSEN, T. A. PRIOR, and
 A. WILLMORE, after Drawings by COX, FIELDING, and PROUT.

THE PRIZES INCLUDE

A MARBLE GROUP, THE WOOD-NYMPH,

By C. B. BIRCH, for which he received a Premium or £600 from this Society;

THE RIGHT TO SELECT A VALUABLE WORK OF ART FROM ONE OF THE
 PUBLIC EXHIBITIONS;

BUSTS IN PORCELAIN OF H.R.H. THE PRINCESS LOUISE;

BRONZE VASES AND TAZZAS,

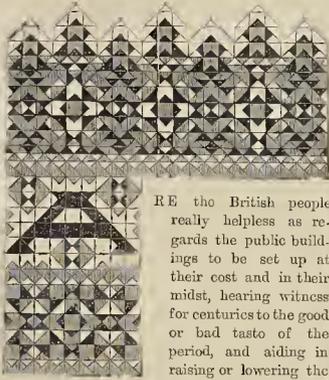

And other Works, all produced exclusively for the Society.

ARTISTS' PROOF COPIES OF THE PLATES, WITH FIVE CHANCES IN THE DISTRIBUTION, MAY BE HAD FOR FIVE GUINEAS.
 INDIA PAPER LETTERED PROOFS, WITH TWO CHANCES, FOR TWO GUINEAS.

The Builder.

VOL. XXX.—No. 1521.

The Designs for the Law Courts.

RE the British people really helpless as regards the public buildings to be set up at their cost and in their midst, hearing witness for centuries to the good or bad taste of the period, and aiding in raising or lowering the national taste, as the

case may be? Is the selection of designs for such buildings ever to remain a matter of chance, or worse? It would seem that the reply in both cases must be in the affirmative.

In the House of Commons, last week, Mr. Cavendish Bentinck asked the Chancellor of the Exchequer whether the finally settled designs for the new Courts of Justice were identical in all material particulars with those exhibited in the library of the House in the month of July last, and moved that, in the opinion of the House, the designs prepared by Mr. Street for the new building of the Courts of Justice were unsatisfactory, and ought not to be executed. For many years it had been considered that, inasmuch as the House of Commons voted money for the erection of large public buildings, they should have some voice as to the selection of the plans. He did not hesitate to affirm that when the eye of the House had been removed from those plans, they invariably met with disaster; and such had certainly been the case in this instance. For a year or two the matter had slept, and it was not till the session before last that his right hon. friend the member for East Sussex called attention to the plans, when the First Commissioner stated that the foundations were being proceeded with, but gave no hint as to what architectural form the building should take. He showed that no opportunity had been afforded to the House to form a real opinion on the plans, and referred to the objections which had been widely raised to them out of doors. He agreed with those who considered the design was not what we were ambitious enough to require for Courts of Justice; and what we did require was a building, the façade of which would proclaim as intelligibly as words could, "These are the Courts of Justice."

Mr. Bressford Hope was brave enough to say that the sum total of the charges brought against the architect was, that he had first arranged his plan, and then made his Strand elevation accord with it; Sir Roundell Palmer thought it sufficient reply to objectors to say that it was quite clear no architect would ever please his brother architect,—an incorrect assertion; Lord Elcho tried to induce the erroneous impression that it was simply a struggle between the partisans of the Classical and the Gothic styles; and Mr. Ayrton, without the acuteness which usually distinguishes his observations, said Mr. Bentinck's motion was four years too late! The corollary from this

last assertion is, that, to be effectual, the objection to the present unsatisfactory design should have been raised at least two years before it was produced; and that, no matter how monstrous the design might have been, the country could not now be saved from it. Mr. Bentinck's motion was ultimately withdrawn, and it was stated that contracts would be entered into some two months hence on the basis of the present design.

We reiterate, and will continue to do so, that the design for the Strand front is unsatisfactory in the highest degree, and that, if it be carried out, the result will prove a discredit and an eyesore. We will not withdraw a line of the expressions we used when the design was first made public at the end of last year:—"The overhanging turrets at the two extremities (the details of which, moreover, are so poorly designed that they would not pass muster in a suburban villa); the overhanging pinnacles of the staircase turrets; the meanness and insufficiency of the main entrance; the ugliness of the great window; and the feeble treatment of the gable of the central hall, are amongst the weaknesses which will strike most critical observers. The great objection to the design, however, is utter want of unity, and of anything like the dignity and grandeur which should mark an important public building. The more the central portion of the design, especially, is studied, the less satisfactory it appears; and if a model of it were made, the objections would be even more strongly seen. If the end of the great hall, brought forward, were seen from bottom to top, we should have, at any rate, a central feature; but as it is, with the end of the hall some 70 ft. behind, there is here nothing but a hole, the common gabled buildings seen on each side increasing the meanness of the effect."

We have no desire to bring about an interference with Mr. Street's appointment as architect of the Law Courts. The chances of war and one or two good friends hoisted him over the decision of the judges; and although we fully agree with Mr. Low when he said,—“The effect of what has occurred will not only tend to throw discredit on the Government, but to put an end to the system of competitions altogether;” we have no wish to interfere in this direction. What we earnestly seek to do is to obtain such a revision of at any rate the Strand front, as may give us a dignified, noble, and monumental structure, in lieu of the present conglomeration of inharmonious morsels. In Mr. Street's published account of his first design, he himself claimed that he had made all his “façades tolerably regular in their arrangement,” and that he had given “a distinct centre to the south front.” Where is the regularity now, and what has become of the distinct centre to the south front? They have vanished, leaving nothing but anarchy and a huge gap. As has been said before in this journal, treating of the same subject, buildings have special purposes, which, according to their dignity, require, and in unsophisticated ages seem naturally to generate, expression of like grade of dignity. A purpose so defined has its own coherency; it is itself a combination of primary and subsidiary purposes; and a balance and unity are thus its very essence. It is on this account that a structure that is apt to accommodate such a complex but still congruous purpose, will itself bear the visible impress of congruousness and subordination. In this our day at last the confused disorder of English law is being reduced to the happy regularity of a digest,—shall we choose this very day to house it in a structure only fitted to symbolise that very wilderness of obsolete craze out of which at last is proceeding our hopeful exodus?

We will not believe that this matter is settled.

ON THE ORIGIN OF THE ELEMENT OF GRANDEUR IN THE ANTIQUE.

ALL persons possessing even the slightest claim to a cultured taste are aware of the unrivalled beauty of that which is called, *par excellence*, the antique. The charm is said to be unrivalled, indescribable, inexplicable. It attaches to certain relics of Grecian sculpture and architecture, as a perfume lingers in the petals of a rose, even after they have fallen from the plant. A great English poet, who felt this glamour, as poets instinctively appreciate the charms of Nature herself, while conscious of his own want of artistic training to analyse its elements, has well expressed a very general sentiment:—

“I leave to learned fingers and wise hands,
The artist, and his ape, to teach and tell
How well his composureship understands
The graceful bend, and the voluptuous swell:
Let these describe the indescribable!”

The idea that there is something in the beauty of Grecian art that defies analysis, is to be traced in the expressions of almost all writers on the subject. That language must fail to convey to the mind even a shadowy idea of the Athenian sculpture and architecture, may be freely admitted. But it does not follow that a systematic attempt to arrive at the elements of the grandeur and beauty that, after the lapse of two thousand years, speak in such vivid poetry to the human heart, need altogether fail of success.

There is a characteristic in human art which may be regarded as universal. It is one to which attention has been rarely, if ever, duly directed. It is independent, almost entirely, of the stage of excellence, or the degree of perfection, at which that art has arrived. As connected with the natural history of nations, and with the philosophy of human progress, it is a feature of the utmost importance. It is this,—the art of any nation, age, or separate epoch, reflects the features of that age. From the rudest caricature to the most finished portrait this similarity can be traced. In comparing the art of different eras, the phenomenon becomes strikingly manifest. It is not a mere question of fashion, of choice, or of imitation. If there be any truth in physiognomy, which is almost the same thing as saying if there be any reality in art, the reason lies far deeper. When we observe in the portraits of any of the great courtiers of the Tudor reigns a resemblance to the peculiar air and pose of King Henry VIII., we may suppose that the delicate flattery, or at all events the flattery of imitation, may account for the fact. But when a little later, as in the case of the beautiful portrait by Vandyck of the Countess de Brignole and her son, we find the gait and attitude of bluff King Hal reproduced in the bearing of the child, we cannot thus account for the fact. If we consider that the social habits, the moral sentiments, the intellectual requirements,—all that goes to make up the national life of any given era,—find expression not only in dress and in mode, but in the very cast of countenance and characteristic attitude of the actors in the historic drama, we can understand these marked resemblances. The reigning sovereign, it may often happen, has been the very embodiment of the genius of his age,—the foam on the crest of the wave. On the other hand, at times his character has been inharmonious with that of his era, as in the case of Louis XIII., and we then fail to group the portraiture of the reign around a central royal figure. But that portraiture is none the less peculiar and expressive. If it were possible to review a series of scenes representing with photographic accuracy the history of mankind, we should not be liable to make any very material error as to date. At times we can trace the effect of some great personal impulse; at other times the movement is more that of the general mass; but at all times, and under all circumstances, among European nations, the dress, the manners, and the general appearance of society has borne an impress characteristic of the period.

A remarkable example may be taken from the long reign of Louis XIV. No monarch, since the time of Charlemagne, has been so absolutely the central figure of European civilisation. With his beautiful and impetuous youth coincided the culture of graceful and flowing locks in all polite society. As he advanced in life, and as the years of his declining age were overshadowed by the up-growth of that giant crop of evils of which he had so unsparringly sown the seeds, he failed to accept the evidences and the dignity of

* See *Builder*, vol. xxix., p. 949.

age. His locks were not allowed to fade into that silver grey which is a crown of honour, but were replaced by a prodigious wig. So sacred was this adornment, that it was the only article of attire in which the king arrayed himself. It was handed into his bed, when he awoke in the morning, on the cad of a stick, so that not even the eyes of the most familiar attendant should light upon the features of the poor bald old man. This wig became the characteristic of the time. Europe grew old with Louis XIV. Western civilisation became aged under his decrepit influence. The painful superstructure of Court etiquette erected by his hands, the careful systematising of personal favour, the erection of servility into a title of honour, the *petites entées*, the *justes aux corps aux brèves*, the emasculation of France by the crushing of that great aristocracy with which Louis XI. first commenced an interminable war,—all these matters, or rather the spirit that underlay them, all had a mighty influence which was felt throughout the whole of Europe. In England the reflection of the French glitter was most conspicuous. In the graceful demi-toilettes of Lely we trace one symptom of this influence. In the stilted, histrionic, bewigged figures, such as those which now crown Temple Bar, as if with an impenitent contempt of truth, and even in the imperial Roman attire in which the solid Dutch form of William III. is arrayed in his marble statue in the Bank of England, may be traced symptoms of the decadence of the Grand Monarque.

The reflection of the spirit of an age by contemporary art is less dependent than might be anticipated upon the genius of the artists of the period. That great artistic genius may affect the age is, indeed, undeniable. A great sculptor, painter, or architect may, for a time, exercise more influence on the aspect of surrounding society than even a royal or military celebrity. The taste of such an artist, when himself a highly-cultured man, will be one of the main influences felt in the formation of the general taste of his time. Pageants, dresses, equipages, and arms have been arranged, designed, and ornamented by some of the most illustrious artists; ever since the time when Valen wrought the shield of Achilles. The pseudo Classic taste that deformed the age of Louis Quatorze had no doubt been highly fostered by the mythological predilections of Rubens. That great portrait-painter, the equal, in his purest productions, of Vandyk, sank into a mere decorator in such work as his series of pictures for the New Palace of the Luxembourg, in which he commemorated the marriage of Henry IV. Fat nymphs, and outrageous Tritons, form part of the *cortège* of the most Christian king. In the picture representing the disembarkation of the new queen, the sea-gods come to the front of the scene. The brilliant charms of the young Florentine princess, half astonished at her own elevation, half uncertain as to the stability of the gangway over which she is conducted; the stately submission of her attendant ladies; the eager tendance of the squires; the stern air of authority of the Grand Prior of France, Reigner de Guercy, who leans on his *bizet* at the poop of the galley, are contrasted with an exuberance of physical development in the Nereids who aid to moor the vessel, that, to the taste of our time, is destructive of the pictorial truth, no less than of the historic value of the picture. But even in the works of this very artist, who exercised, no doubt, an abiding influence on courtly attire and habit, is to be traced the stern operation of the law to which we have referred. The king, queen, and courtiers of Rubens are the living flamed by his hand. Here still upon the canvas. Habit, air, dress, all are truthful to nature, no less than features and expression. And not only so, but even in scenes illustrating Classic history, as, for instance, in the Rape of the Sabinæ, instead of the half savage, wholly Italian, girls, upon whom the eager youths of Romulus rushed like wolves upon their prey, we have substantial Flemish matrons or maidens, clad in silk and velvet, and calling, not too loud, on the Madonna in their exigency.

If we compare, in like manner, the works of any artist since Giöto, with what we know of the tone and habit of his day, the same truth becomes apparent. For the artist, it must be remembered, is a man subject to like passions with those by whom he is surrounded. The spirit and genius of his age speak within him, as well as seek expression at his hands. His models, the range of his experience, and thus the range of his ideas, are all circumscribed

within certain limits. If he strives to ennoble his genius by the patient study of the antique, he must also dip his pencil into the fresh colours of contemporary life. If he fails to do this, he fails to be an artist of his own time. He may attempt to recall the past, and will then become simply an anachronism. This is well illustrated by the works of two artists who did study, and deeply and lovingly study, the antique. But they could not reproduce it. Andrea Mantegna, adding to study of the past, observation of the present, gave to his Roman processional triumphs a character of their own. To much of that yet lingers in Italy, be added a picturesque richness and harmony unknown to the sterner sculpture of the triumphal monuments of Hadrian, or of Antoninus. He gives us a translation of Latin chronicles into the sonorous and dignified Italian of his own day. Flaxman, on the contrary, whose sketch-book, as he wandered through Italy, is not enriched by one portraiture of the ardent, graceful, enthusiastic life of the Peninsula, but who accurately copied every scrap and shred of the past, in attempting to become wholly classical, failed either to reflect the spirit of his age, or to inscribe a permanent chapter of his own in the history of art.

If the art of a period be so certainly the reflection of the contemporary life which surrounds it, the artist, the antique art of Greece must be the reflection of the antique life of Greece. This is the first premise in any attempt to arrive at the elements of that grandeur which, more than any other quality, characterises the art, especially the sculpture, of the purest ages of Grecian history. The reflection is one that opens the way to clear elucidation. For we have much to enable us to contemplate, and even ideally to realise, the antique life of Greece. We have far more than *torii* and mutilated fragments in Greek literature. The bombs that wrecked the Parthenon could not destroy the verses of Homer; Temple and tower have gone down, but *Alexis* lives, almost as she did in the age of Euripides himself. It is true that of the nine great branches of the fictile, plastic, and pictorial art of the golden age of Athens, we have but few and mutilated specimens. Of the architecture, while we can restore much on paper—the sublime and overpowering effect upon the mind produced by the perfect and glittering structures, fresh from the chisel of the mason, shining in the clear atmosphere of the Mediterranean shores, and thronged by graceful youths and beautiful women, clad in garments appropriate at once to the climate and the form, can never again be experienced. Still, we can tell very much of what the genius of the architect laboured, and that successfully, to express. In painting, but one sole relic is known to exist of the golden age of Athens, the pictures of Cortona painted in a wax medium upon stone. To that solitary testimony may be added such argument as we can draw from the beautiful painted vases of the best age; remembering, however, that in Greece, of all places in the world, we can least judge of the perfection of high, from the condition of merely decorative, art. But it would be absurd to doubt that the works of Apelles, in their own province, were inferior to those of the other two artists distinguished by the Macedonian Conqueror as the portrayners of his own features. We know something of what was the workmanship of Lysippus; we know more of that of Pyrgoteles. For Apelles to have received the testimonies which were paid to his genius, he must have been no unworthy fellow artist of these great men.

The first characteristic, then, of the sculpture of the Greeks, is, that it reflects the life of Greece, as seen, felt, and represented, by the Greeks themselves. A second, but still important question is, what rules did the great sculptors prescribe to themselves for effecting that representation. By what law did they so regulate their labour, that they should attain the highest range of the ideal, while at the same time they steered as wide as can be possibly conceived of that capricious irregularity which lesser artists have learned to term original.

Since the pre-historic time, when man first raised his face towards heaven, no period of which we have any account, and no race of which we have any record, was distinguished by the golden age of Greece. The physical beauty of a beautiful Aryan race was cultivated with a care that was at once religious and political. The beautiful was the great object of conten-

plation and of desire—the *kalon*, the noble, and the grand, whether in moral stature, in intellectual culture, or in the physical expression of the vigour and beauty of the mind. The climate was such as to encourage the development of a beautiful race, by turns to stimulate and to soothe the natural and noble passions, and to the youth of the world, and to allow of just so much or so little clothing as consisted with the occasion of the hour, and with the most graceful draping of the form. Manly vigour was not only necessary, in a time when to every man's hand was entrusted the defence of his life and his honour, but was systematically cultivated, to a pitch of which modern training can give but a feeble idea, for the occasions of the great Hellenic games. We can see from the various types of manly beauty, preserved in the sculptures of Greece, that the physical education of the people was thoroughly understood, and religiously prosecuted. For each class of manly excellence there was an appropriate crown. For the slight and agile youth, the foot-race afforded at once a stimulus and a delight. For the man of more massive proportion, and more matured strength, there were the *costus*, the *discus*, and the wrestling matches. For the cultivation of accuracy of the eye, and steadiness of nerve, as distinguished from the fury of attack, there were the chariot races. The one element of physical education which has lately received attention at our national universities, the boat-race, was not wanting. The horse-race had not then sunk into a mere means of accumulating money. The sanction of religion was appended to the celebration of the great international games; and the periods at which they recurred were so regulated as to insure a steady and deliberate training of the flower of the Grecian youth, and of all who might hope to attain Olympic or Isthmian crowns.

With all this powerful influence on the development of a manly race were blended domestic habits of like tendency. Personal purity was exalted. The bath was the first rite of hospitality offered to a guest. The temples of the gods were not to be approached by the unwashed. The monastic superstition that connects sanctity with filth would have been regarded by the Greek youth as simply blasphemous. Nor was the care of the women less enlightened. A grand majestic figure was regarded as the first, not only of feminine charms, but of feminine virtues. Aristotle quietly hints how the exercise so necessary to female health was to be insured, during periods of natural weakness, by directing the matrons to pay daily visits to the temples. The thoroughly domestic life of the Greek women, the presence and direction of queens and great ladies in all the labour of domestic service,—in baking, weaving, spinning, in training the maidens for their future position as mothers and mistresses of families,—all this tended, with irresistible force, in the same right and wise direction. Again, the rites and order of sacrifice, as among the Hebrew people, involved the use of a nutritious diet, and the attention, as a sacred duty, to the purity and excellence of both vegetable and animal food. The golden fruit of the Hesperides—the greatest boon to the health of the Mediterranean people—was then probably only known as an exotic rarity. But scarcely less precious to human health and welfare than the olive itself, was the nutritious luxury of the fig.

This wise and unrivalled course of physical training, an object not of fancy or of chance, but of the profoundest philosophical speculation, coincided with an intellectual education of little inferior excellence. All that was then thought to be within the compass of the human mind was mapped out by wise men, and taught in famous schools. The boundaries of scientific knowledge have been enormously extended since that time, but the powers of the human mind have never been so brilliantly displayed. It is true that the culminating point of the intellectual excellence of Greece dates somewhat later than what we regard as its artistic zenith; but it is not to be expected that the highest point of excellence in all branches of culture should be simultaneously attained. Looking, not at any particular decade, but at Greece, we find the noblest and grandest productions of the Aryan mind to have then and there originated. Poetry was there native,—the epic, the tragedy, the comedy, and the ode. What has any other age added? History was there born, and was characterised, in one instance, by a

Religions and careful adherence to truth, and in another by a philosophical and calm treatment, that excels modern historic work as the day does the night. Eloquence then rose to a pitch never excelled, and only once rivalled. Politics, the most thorny of subjects, because in their pursuit most men seek, not what is true, but what is consonant to their tastes and passions, was reduced to something like an exact science by Aristotle, — so much so, that the surest test of accurate science, the power to predict, was exerted by that great moralist in the case of the Persian conquests of Alexander. Amid this systematic and complete intellectual training must be included those geometric rules for architecture, and for sculpture both in relief and in the round, which, being committed only to the faithful but perishable safeguard of oral tradition, are now not only lost, but not even imagined to have existed.

Nor must we allow the more clear enlightenment, or more narrow prejudice, of our own religion and morality to refuse that meed of admiration which, under widely differing circumstances, is due to the religion and morality of Greece. That the peasantry were not much more enlightened than those of Italy, of France, or of Ireland, at the present day, is extremely probable. That they regarded the exterior allegoric and poetic forms of their mythologic legends as historic narrations, is as likely as that Europe in mass still attaches a literary historic interpretation to those things as to which, in the opinion of Josephus, Moses spoke "philosophically." That they were anywhere sunk in such extreme degradation as is evinced in modern, and even in present, times, by a belief in the magic power exerted by the priesthood, there is no reason to suppose. The religion of Greece, like all early religions, shared with that of Palestine the character of being a figure for the time then present, in which were offered both gifts and sacrifices, that could not make him that did the service perfect as pertaining to the conscience. That ritual had a shadow of good things to come, and not the very image of the things. There was an esoteric as well as an exoteric doctrine. The mysteries communicated, to those only who were carefully prepared to receive them, the inner meaning of the external rite. Regarding the philosophy of the religion of Greece, and separating, as far as may be, those historic traditions of early kings, queens, and demi-gods, which became confused with the original impersonations of a magnificent celestial hierarchy (as is the case in the Romish calendar), we cannot but regard with wonder and with admiration the mode in which the noblest faculties of the heart and mind were clothed in poetic beauty, and held up as objects of imitation.

The Greek poet who spoke of the birth of Wisdom, perfect and armed, from the brain of Jove, might have used the words of the writers of the Book of Wisdom, — "*Condor est animi spiritus Dei, in interitu habitus ejus.*" "His word runneth very swiftly," is almost a Homeric phrase as applied to the Messenger of Heaven. Whenever the Hebrew poets and prophets speak of what we call the attributes of the Divinity, they draw their language from a source that seems common also to the Greek poets. The impersonation of Iris, as the herald of a Divine mission, — the one mythologic form which it passed the power of sculpture at all worthily to represent, — may bear comparison, for its beauty, with any other legend attached to the rainbow. These physical, as well as moral, truths were enwrapped in the shadows of Olympus. The far-acting wrath of Apollo is yet to be dreaded in the sunstroke. In spite of scepticism, we are slowly rediscovering the danger of keeping exposed to the rays of the full moon. The well-enclosed quivers of the brother and sister luminaries are yet to be feared. Time would fail to enter into the minor beauties of a religious and allegoric system, which, never reduced to writing, — because it was too sacred to run the risk of divulgement, — is now regarded with the same stolid ignorance which causes a horse-laugh at the calumnious terms of those great precursors of modern science, the alchemists. Belief in the inferiority of our ancestors is perhaps the most fatal sign of national decay, and of the degradation of race. Such, at all events, is the witness of the Hebrew faith.

It thus occurred that the artists of Greece had their imagination fired by grand and noble subjects, while they had around them objects of beauty which offered apt models for their illustration. Nor must we omit the fact that, whatever the amount of light that they possessed,

the antique people were a reverent, earnest, God-fearing race. Their moral code might not be like our own; but that code had a sanction which was believed to be divine, and, in the main, that code was obeyed. We do not find men going to war on lying pretences, and daring to invoke Divinities, every one of whose acknowledged laws they passed their lives in openly violating. No atrocities, such as render infamous the name of Philip II. can be charged against any Grecian form of faith. A tyrant who persecuted the noblest of his people, as did the fourteenth Louis, would have been held up to secular execration. A man who had plunged a people into a mad, unprepared, unprovoked war, such as that of 1870, would have been considered as pursued by avenging furies, and blinded by divine wrath. A sense of earnestness, of the divine reality of life, of duty, enforced by divine vengeance in the infringers, and of the religious, acceptable, worthy character of the exercise of every human faculty; the gratification, within due limits, of every natural human passion; and the belief that our enjoyment of life is in itself pleasing to the Giver and Ruler of life, tended to invest the whole Greek nature with an unspeakable grandeur. Nothing would have been held more impious, in the better times of Greece, than the ascetic spirit which prescribes and cultivates the virtues of sloth, celibacy, and filth.

SANITARY LEGISLATION.

IMPORTANT and well-attended meetings have been held, on the initiation of the British Medical Association, and of the Social Science Association, on the subject of the Public Health Bill, described in our last number. It was resolved to seek for an interview with Mr. Stanfeld, in order to urge upon the Government the addition to the measure before the House of eight specified items, which may be summed up in the words, — Consolidation of Sanitary Law, Unity of Sanitary Code, and Hierarchical Medical Inspection. There will be but little difference of opinion among sanitary reformers as to the importance of the objects contemplated by the resolutions. As to consolidation of law, we propose to aid its advocates by a sketch of the history and actual condition of our sanitary jurisprudence. But there is a consideration of importance no less urgent than any which they have discussed that has not yet received sufficient attention, either from the Commission, the Government, or the gentlemen who desire to amend the Bill. We refer to the engineering nature of the operations required. The medical side of the case has been well discussed; inspection, registration, and powers of entry and of removal of nuisances are essential, and are admitted so to be; but the importance of systematic organisation in the physical part of the matter is at least equal. The expenditure here to be incurred will be the heaviest part of the matter, as well as the most irreparable loss if botched and tinkered. If we have on the one hand the medical inspector, insisting on the drainage and purification of dwellings, and on the other hand some other officer, insisting on the non-pollution of streams, we shall be at a dead-lock unless we find the proper link between these two very different requisites to be duly and providently supplied by the services of the engineer.

We shall return to the subject next week.

LEAD SOIL-PIPES AND SEWER GAS.

THE effect of sewer gases on lead pipes has been alluded to before now in our pages. On this subject Dr. Andrew Ferguson has submitted some statements to the Social Science Association, the pith of which we may usefully circulate:—

About fifteen years ago I first detected perforated soil-pipes. At first I merely looked upon them as a nuisance, because offensive, and did not connect them with disease; neither did I then know how these perforations were produced.

In the first pipes I inspected, as the perforations were on the upper side, I imagined that pieces of lime might have dropped down on the pipes and eaten their way through. This opinion I abandoned, as I found the perforations were from within. I also found that they were generally on the upper surface of the pipe, and that, therefore, the destruction could not be caused by fluid conveyed through it. I also observed that the pipe usually affected in this manner was the cross one, leading from the

closet to the main descending soil-pipe; and that if there was a bend or arch in the pipe, the upper surface of the bend or arch would become perforated. Another element to be taken into consideration is, that these perforations are most frequently found in the upper floors of houses, and, occasionally, in the sides of the descending soil-pipes.

The question now arises, how is this destruction of good well-made lead pipes effected?

If we remember the position of this destructive action in the pipes, and take into consideration the results of chemical analysis, as well as the increased rapidity with which this action takes place in pipes that are not ventilated, I think we are justified in coming to the conclusion that these results are owing to the action of sewer-gas. Specimens show that the destructive action is from within, and that in some places the pipes are more or less corroded even where the action has not gone the length of complete perforation.

Of course, my own discovery of such pipes in houses has only been where I have been attending professionally, and where the diseases were of such a type as are known to be produced by breathing the results of the decomposition of excreta. The diseases I have observed as resulting from this state of pipes are typhoid fever, diphtheria, scarlet fever, diarrhoea, &c.; and in one or two cases I have had to order the removal of families who were suffering from ill-health from this poison, without exhibiting symptoms of any well-defined disease.

About three years ago I was asked to visit the child of the superintendent of a large public institution. I at once suspected typhoid fever, which proved to be the case. I was, moreover, told that it had twice already been in this gentleman's family; and that the year before the whole family had suffered from diphtheria. On making inquiry as to the state of the drainage, water-supply, &c., I was told that the water was Loch Katrine, and so beyond suspicion. The master of works for the institution was a most intelligent man, who had paid special attention to the drainage. He had soil-pipes with extra depth of traps, indeed the deepest I have seen, and it was difficult to account for the manner of infection, the pipes being pronounced free from any defect; but, in a short time, another child was seized, as well as several of the officials of the institution. In passing a particular spot in the superintendent's house, however, I perceived a faint odour of sewer-gas; and on mentioning this to him, he most promptly had the pipes uncovered, and perforations were at once discovered in the vertical soil-pipe.* This led to a complete overhaul of all the pipes in the house, and the removal of those that were defective; and since then I have not heard of a single case of typhoid or diphtheria in the establishment. Plumbers do not readily detect this defective state of pipes, as they look for a liquid leakage. Some time ago, in visiting a case of typhoid, I asked the mother of my patient as to the state of the closet and pipes. She replied, "Oh, Doctor, you are wrong this time; all these things were renewed only two months ago." Of course, I was extinguished; but still ventured to inquire what might be the cause of a very perceptible, and by no means agreeable, odour. A dead rat was suggested as its possible origin. However, as it was no matter to trifle with, I requested that the plumber might be sent for, and also that he should be told that the soil-pipe close to the cross-pipe was eaten away.

At my next visit, the lady told me that the plumber had been very much astonished to find the pipe exactly in the state I had predicted. Lead has generally been used as the material for soil-pipes, and as we have seen how capable it is of corrosion, it becomes a very important sanitary question, to inquire how long a good lead soil-pipe will hold out. I have been studying this question for several years, and it is now about five since I first exhibited decayed pipes in public; yet I would not wish to dogmatise on the subject, but rather give approximations, and would remark that the time will vary under the various circumstances according to the strength and rapidity of flow of the sewage, as well as the original thickness of the pipe. But after allowing for this, we must broadly distinguish between soil-pipes which are ventilated and those which are not. By the former, I mean when the pipe is carried up to the roof of the house, and open to the external air; by the latter, I

* I would by no means be understood to say that smell merely as such, produces disease; it is simply a quality of what in this case does so.

mean when the pipes are closed up. Of these last-mentioned, the duration may be stated to be about twelve years, the extremes of variation being from a minimum of eight to a maximum of twenty years.

In ventilated pipes, the duration may be stated to be nearly double, running from twenty-one to twenty-three years, the extremes of variation being from eighteen to thirty, or even more years. The practical sanitary conclusion which it concerns us all to keep in mind is, that any house, no matter how carefully or well built, may become unhealthily from this source; and that when cases of typhoid fever, diphtheria, &c., occur, the pipes should be thoroughly inspected—especially their upper surface,—and the whole of the soil-pipe uncovered.

I must strongly insist on this, as in many cases the plumbers have declared the pipes to be all right, which turned out to be very defective when uncovered. For some years back, I have insisted on a careful examination of the soil-pipes wherever I have cases of typhoid or diphtheria, and in every case where I could get this carefully carried out, I have detected these perforated pipes.

Another way in which sewer-gas may act injuriously is by its passing up the waste-pipe of the cistern, and becoming absorbed by the water. In houses that have been shut up for a few months, this should be guarded against by running off all the water, and clearing out the mud at the bottom of the cistern, before the houses are re-inhabited. I also propose to insert into the waste-pipe a long wire cage with a circular head, and to keep this filled with seaweed or other charcoal, which should be replenished from time to time. Of course, it would be much better if all water used for cooking or drinking were drawn direct from the main.

It would prolong the duration of the pipe, and be an important sanitary improvement, if the soil-pipes were in every case carried up to the roof, and left quite open to the air. The expense of this would be more than compensated to the landlords by the greatly-increased duration of the lead pipes.*

THE NEW TOWN AND PORT OF BARROW-IN-FURNESS.

NEW WORKS AND BUILDINGS.

A FEW weeks ago we gave, in the columns of the *Builder*, a short descriptive notice of the cemetery now in course of construction at the new and rapidly rising town of Barrow-in-Furness, situated at the north-west corner of Lancashire, and immediately open to the sea. The rise and extraordinary expansion of Barrow is something almost fabulous, and is, perhaps, without a parallel in the history of any locality in the United Kingdom, if not, indeed, in the world. Before briefly glancing at the immense piles of buildings for manufacturing purposes, docks, shipbuilding-yards, hotels, churches, and other public and private buildings, which have already been erected, and are now in course of construction, it will give the reader some conception of the increase and expansion of this remarkable young town when we state that whereas within twenty years ago the population of the place was under 200, the inhabitants residing in a few straggling cottages, it now contains, according to the census returns of last year, a population of 76,000 souls, engaged in almost every branch of commercial and manufacturing enterprise, and with its immense docks and shipping, presents all the appearance of one of the leading seaports in England. Barrow may with truth be said to have risen, in an incredibly short space of time, from an isolated waste to a town of vast importance and wealth, where miles of new docks have been formed for the trade of a shore which only a few short years ago was washed by the tide, and there is, perhaps, no town in Britain that affords such a striking example of enterprise and engineering skill. Barrow is situated within a very few miles of old Furness Abbey, one of the finest ruins of its class in the country; and a recent writer on the wonderful rise and growth of Barrow, appropriately remarks, "Could some of the monks who were located in Furness when the Abbey was in its zenith rise, Rip Van Winkle like, to-day, they would find extensive workshops and warehouses

where there were rocks and sands; docks and lines of railway where were witnessed the water's ebb and flow; steamships and crafts of all dimensions tacking to, and bringing from distant lands the produce and material which is the very existence of mankind; and the locomotive puffing along like a fiery serpent over the very ground which in their day, might have been the scene for the hunt of a wild boar or the deer, a sport much enjoyed by the denizens in Furness about the fourteenth century."

The great secret of the rise of Barrow is that it contains a magnificent bed of iron ore, and it is, doubtless, owing to this fact, in conjunction with its immediate proximity to the sea, that the town has already attained such a position and eminence as a great commercial and shipping centre. In the year 1816 a railway was opened from a place called Broughton to Dalton, and in the following year, 1817, it was extended to Barrow, to facilitate the export of the iron ore, which had hitherto been put into small crafts from a wooden pier. For many years after the formation of the railway there were very few passengers. In the year the line was commenced, the traffic was 103,768 tons, whilst in the year 1863, it amounted to 621,525 tons, of which 408,612 tons were sent to Barrow for shipment and consumption, the remainder being sent inland by rail. At this time the whole of the inhabitants of Barrow were engaged in agricultural work or in the export of the iron ore. It was in the year 1859, that Messrs. Schneider & Co. commenced the erection of blast furnaces on a site which now forms the north-western extremity of this large and enterprising town. Additional furnaces continued to be built in succession, and kept in full operation, until in 1867 there were in all eleven furnaces, which gave employment to a large number of workmen, and from this source alone the inhabitants were more than trebled. Thus it was that these iron works inaugurated, so to speak, the birth of the town, and gave the first great impetus to building operations and manufactures in the locality, leading at the same time to the formation of the magnificent docks now filled with shipping. About this time a pressing demand for pure iron throughout the country raised the price of the material to a high rate, and the result was that large steel works were erected by a company in close proximity to the iron works of Messrs. Schneider & Co., who subsequently transferred their iron works to the Steel Works Company.* The company's works which were commenced in 1865, have been considerably enlarged since they were first opened, and now cover an area of 25 acres, upon which stand large blocks of buildings for the company's purposes. Amongst the articles manufactured are steel rails, weldless tyres, steel plates for shipbuilding, boilers, girders, iron roofs, bars, angles, guns, and forging of every description in steel; and in addition to this branch of their business, the company also supply from their own mines, the hæmatite ore and pig iron from which the steel is exclusively made. These Bessemer steel works, at Barrow, are said to be amongst the largest and most complete in the country, and their immense size and capacity may be conceived, when it is stated that they at the present moment give employment to about 3,000 workmen.

The rise and development of Barrow thus date from the great works just described; and their establishment has been followed by the laying out of long and wide streets and other thoroughfares, and the erection of numbers of manufactories of a varied character, each of which has swelled the population, and been followed by the erection of entire streets of houses, which are every day receiving additions; but notwithstanding that building is proceeding at an active rate, in order to meet the requirements of the constantly-increasing inhabitants, there is a great difficulty in procuring houses for the population, the demand being much greater than the supply; and a co-operative building society has just been formed. The town, which runs from south-east to north-west, may be said to be angular in form, and covers altogether an area of more than 2,000 acres, its greatest length, from east to west, which is at the extreme north side, being between two and three miles. The streets are well laid out, and chiefly at right angles, several of them being wide and spacious,—more especially Hindpool-road, which is one of the principal business thoroughfares in the town, and almost one mile in length. Amongst the

several establishments in the town which employ a large number of hands are extensive brick-making works, extending over an area of five acres; a large ship-building yard at the west of the town, belonging to a private firm, together with another similar establishment, the property of the Furness Shipbuilding Company; whilst a third company, called the Barrow Shipbuilding Company, has just been formed. This company has purchased a large area of land at the north-west angle of the town, having a long frontage to the Walney Channel; and they are now constructing a ship-building yard and engineering works, together with a graving dock capable of accommodating the largest vessels.

The company have already entered into a contract for the building of six steam-ships, of 5,000 tons burthen each, for a local steam-ship company, who are about to establish a line between Barrow and Canada. The several other premises are timber yards and steam saw-mills; then come several engine and boiler works, steam rope works, very extensive steam corn-mills, the Furness Railway Company's works, wagon works, steel-wire drawing works, and the Barrow Rolling Mills, all of which give employment to several thousands of artisans. In addition to these, what are called the Barrow Flax and Jute Works, situate at the north-west end of Hindpool-road, not far from the Hæmatite Steel Works, are just on the eve of completion. These extensive works, which occupy an area of between five and six acres in extent, will, when finished, give employment to between 2,500 and 3,000 artisans. The exterior of the building, the designs for which have been furnished by Messrs. Paley & Austin, of Lancaster, architects, presents a prominent and attractive appearance. The main front elevation is 612 ft. in length, and three stories in height, with two side elevations of the same height, and 350 ft. in length or depth. The materials used are vari-colored bricks, and the French style of ornamental architecture has been adopted, the building resembling more that of a Government office than a factory for the spinning and weaving of jute. The machinery, engines, and boilers are on the most extensive scale, and very costly; and the entire outlay incurred in the erection of these important works, which will give employment to large numbers of women and young persons of both sexes, is estimated at upwards of 200,000.

The public buildings in the town are numerous, and many of them handsome and ornamental architectural structures. The town-hall, market-place, and municipal offices are situated in a square in the centre of the town. The town-hall is not yet completed, a clock-tower requiring to be added in order to finish its architectural exterior. The interior, which is most elaborately fitted up, contains a public room, 90 ft. by 45 ft., which will hold upwards of 1,000 persons. There are also several reading and other rooms. The municipal offices, which contain, amongst other apartments, the council chamber, is situated on one side of the square, not far from the town-hall, whilst the market-place, which is now being enlarged, is on the other side. The town can also boast of a commodious theatre, which is now being enlarged. Baths and wash-houses have also recently been erected by Mr. James Ramsden, the mayor, who has held that office for some years, and is closely identified with the growth of the borough; whilst a large and commodious working men's club has been erected by Mr. W. H. Schneider. There are several handsome churches, St. George's Church, which is a fine architectural structure in the Gothic style, having been built at the joint expense of the Dukes of Devonshire and Buccleuch, whilst another church has been erected by Mr. Schneider. There are also a large Roman Catholic church, and several Congregational churches. The hotels are very numerous, and many of them large and elegantly fitted up. Amongst the leading establishments of this character are the Burlington, the Royal, the Imperial, the Hartington, and the Devonshire, besides many others.

The spacious and magnificent docks are amongst the chief attractions which Barrow possesses, and their enormous area will be understood when it is stated that it exceeds that of the whole line of docks on the Lancashire side of the Mersey, the former being between 350 and 400 acres in extent, whilst the water area of the Liverpool docks is not more than 250 acres. The Devonshire and Buccleuch docks, which were opened in 1867, are of great size, containing respectively a water area of 30

* In some examples that we have seen we found the soldered seam along the pipe perfect, while the lead on each side of the seam had perished.—Ed.

* The title of which is the "Barrow Hæmatite Steel Company."

and 33 acres. The Devonshire Dock is 2,500 ft. long, and the Buccleuch Dock 3,000 ft., and the width of each is 750 ft.; the entrances are 60 ft. In addition to the two docks just named there are also two timber-ponds containing a water area of 105 acres; whilst the Ramsden Dock, now in course of construction, is of immense dimensions, containing a water area of 200 acres. Its extreme length is upwards of 6,000 ft., or nearly one mile and a quarter, whilst its extreme width, at the point where it is connected with the Buccleuch Dock, is 2,500 ft. The entrance from the river to this dock is 100 ft. in width, being more than sufficient to admit through its gates the largest ship of any class or character ever yet built. When this dock is completed, the entire water-area of the Barrow docks will be 360 acres, whilst the wharfs adjoining them are 200 acres in extent; and extensive blocks of warehouses, four stories high, with a floor area of 17,000 square yards, abut upon them. Some thousands of workmen are engaged at the present time upon the Ramsden Dock and the timber-ponds, and the works are thus being pushed forward with great rapidity. It should be stated that at the entrance from the channel to the Devonshire and Buccleuch docks there is 25 ft. of water on the dock sill at ordinary spring-tides, and 18 ft. at neaps; whilst at the entrance to the Ramsden Dock, now in course of construction, the depth of water at ordinary spring is 31 ft., and at neaps 2½ ft. The depth of water maintained in the docks is 24 ft.

Such is the present of this remarkable modern town and seaport. What will be its future it would be difficult to foretell.

THE CITY CORPORATION VACANT LANDS.

It may seem almost incredible that the unproductive vacant lands in the metropolis belonging to the Corporation represent a million and a half of money in value. It appears that in consequence of the defects in the system in use for the letting of these vacant lands by tender, and the City architect not being able to attend to them owing to his being already overworked by his general duties, a special committee of the council was appointed some time ago to consider that system and report whether any change was desirable. After investigation, the committee reported that the course pursued with regard to the letting of the lands by tender was inefficient in its working and unsatisfactory in its results, and they recommended that the several committees having charge of vacant lands should have the power of offering a commission to any person introducing a tenant, and that an officer should be appointed whose duty it would be to take charge of all vacant land belonging to the Corporation, to attend daily at the Corporation City offices, and answer any inquiries in respect of such lands, and to state the rent or price at which any site would be let. The report was adopted by the Court of Common Council, and the salary of the officer was fixed at £300. per annum, and a commission of 5 per cent. on the first year's rental of all lands he might dispose of. On these conditions Mr. C. W. Thompson was appointed to the office in October last, and had since that time performed its duties; but it appears from the proceedings of the Court last week that the Improvement Committee declined to place any vacant land in Mr. Thompson's hands, notwithstanding the resolution of the Council instructing them to do so. The result was that at last week's meeting the special committee recommended to the Council that it be an instruction to the several committees to place in Mr. Thompson's hands all such vacant lands as they desired to lease. The discussion on this recommendation brought out some curious revelations as to the manner in which these vacant lands have been leased during several years past, and the loss which the Corporation have sustained under the operation of the system hitherto adopted. Mr. Isaacs, in endeavouring to show that since Mr. Thompson's appointment several sites of vacant land had been let which for years had been idle, said that amongst other cases a piece of land in Oxford-street had been placed by the City Lands Committee in Mr. Thompson's hands, and there was now a formal offer in writing for the larger half of that land of greater amount than any offer for it since 1867; and there was also an offer for the remaining half. From this fact Mr. Isaacs contended that as that land was disposable in 1867 five years had been lost in

respect of it, and he urged that if it had been earlier in the hands of an officer who had an interest in its disposal by the payment of a commission, the probability was that it would have been let five years ago, and 22 per cent. of the value saved. As another instance, he stated that the Bridge House Estates Committee had placed some land in Bevis Marks in Mr. Thompson's hands, and plans were now being prepared, and an offer for it would soon be received from a large capitalist. Mr. Isaacs added that under the old system the Improvement Committee had done nothing with the Clerkenwell Improvement property, which they had had in their hands since 1868, and some of it since 1854; and that property represented in the accounts of the corporation nearly a quarter of a million of money. He strongly urged that as the value of the unproductive land belonging to the Corporation amounted to a million and a half of money, they would perceive the need for utilizing it by a different process than had hitherto been pursued. Mr. Shaw, the chairman of the Improvement Committee, on the other hand, defended the old system, and was in favour of the lands being let through the architect's office, rather than through Mr. Thompson; whilst, as regarded the Clerkenwell property, it was owing to its having been in the hands of the railway, and only recently come back to the Corporation, that it had not been let. He stated incidentally that, as regarded the Holborn Improvement property, the viaduct was not opened until 1869; and that since then ground had been let producing a yearly rental of 11,000l. Mr. Alderman Sydney said it was most unfortunate that so large a portion of the City should be lying waste, and expressed himself in favour of offering a commission to any architect or agent whatever who brought them customers. Mr. Fowler, in supporting the recommendation of the special committee, said it was not right or proper for any committee to say they would have nothing to do with Mr. Thompson as a duly appointed officer. As an instance of what had taken place under the old system, he stated that the site of Whitecross-street Prison had been let to a gentleman who had since re-let it to a railway company, at an annual profit of 1,000l.; and the company stated that they had known nothing about the property, or they would have had it before. The report of the special committee was adopted, the several Committees who may have vacant lands to let being instructed to place them in Mr. Thompson's hands.

IMPROVEMENTS IN NORTHAMPTON.

THE new Post-office, which has been erected in Abington-street, is about to be opened, though not quite finished. It is of the Doric order of architecture, from designs supplied from her Majesty's Office of Works. The lower part of the front elevation is of Bath stone, and the upper part of red brick, with the exception of the windows; the jambs, &c., of which are also of Bath stone, surmounted with entablatures. The building is of four stories, including the basement, which has five rooms for letter-carriers, sorters, store-room, battery-room, with coal-cellar, &c. The first floor comprises the public office, the sorting office, the telegraph office, and the postmaster's room. The public office is 38 ft. long by 18 ft. wide, and will amply provide for the requirements of the town when it becomes much larger than it is. Behind the public office, but in full view of it, is the sorting office, which is 56 ft. long by 28 ft. wide, and is fitted up with a large number of sorting places, with mahogany divisions. The telegraph office, which is to the left of the public office when entering, is 38 ft. long by 11 ft. wide, and to the right of the same office is the postmaster's room. The first and second floors contain four rooms, each with lavatories, &c., and these were originally intended for Inland Revenue offices. These offices will not, however—at present at least—be transferred to the new post-office. The ground floor is so constructed that all the operations in the office will be under the eye of the postmaster. The building has been erected by Mr. Dunkley, of Blisworth, under his own superintendence, and the constant presence of his manager, Mr. Brown. The cost, exclusive of the purchase of the premises, is about 4,000l.

In few towns of late years, says the local *Herald*, have greater improvements been made in the buildings and general appearance than in Northampton. Not only have villas been erected at the outskirts of the town, but large factories

have been built on spots which, a few years since—in some cases only a few months since—were devoted to agricultural and horticultural purposes. Nor have the shops been behind hand, for within the last few years, not to speak of other parts of the town, where great improvements also have been going on, the appearance of "The Drapery" and Gold-street have been completely altered by the erection of shops which would be an ornament to any town. Abington-street, which has hitherto been completely stationary, has now entered upon an active career of improvement; and in addition to "The Nunnery," at the top of the street, and the new Post-office, there are signs of great progress in the shops also. Of this, the "Repository of Fine Arts," just opened by Mr. H. J. Atkins, who has removed from Gold-street, may be mentioned as an instance. It would be an oversight not to mention the new railway station in St. John's-lane. As an evidence of the progress made during the last few years, the breweries erected in Bridge-street and Commercial-street might be mentioned; but on this subject a difference of opinion to some extent prevails; as, in the estimation of some, breweries are a sign, not of progress, but of the contrary. They are considered, however, to be an addition to the architectural appearance of the town.

THE FALL OF HOUSES IN CHELSEA.

THE adjourned inquest was resumed before Dr. Diplock, the coroner, on Friday the 22nd inst., at the Chelsea Workhouse. Mr. Geo. Lewis appeared for the contractor, Mr. Hill, and Mr. Newman for the tenant, Mr. Jones, as before.

Mr. Jones, in reply to the coroner, stated he never saw the contractor's foreman examine the wall in the basement. He believed there was a support under the bressummer at twelve o'clock on Thursday morning, when he left home, the day of the accident. A witness was called, who said he saw the houses fall, having previously seen all the supports knocked away. The evidence of this witness, however, could not be depended upon, as in his answers to Mr. Lewis there was a confusion in his mind between the raking shores, the dead shores under the bressummer, and those under the trimmer which was suspended to the bressummer by irons, to support the joists. This uncertainty appeared to exist in the minds of two other witnesses who were called at the previous examination to prove that all the shores were removed from under the bressummer. Three of Mr. Hill's workmen were recalled, and again swore that the centre support to the bressummer was not removed. One man said, shortly before the houses fell he remembered distinctly placing his hand on the shore to steady himself as he was looking up to speak to a fellow workman; and in reply to Mr. Lewis, one of the witnesses said "it would have been an act of madness to have removed that shore and imperilled our lives." The iron column to be placed under the centre of the bressummer was on the premises, and the men were only stopping for orders to fix it.

Mr. R. Bell was called, and said, I am the district surveyor of St. George's, Hanover-square. I have examined the house, and believe it was the giving way of the basement wall under the column in the centre of the premises, that supported the party-wall above (the portion of wall in the shop having been at an earlier time removed) that caused the accident. The doorways cut in this wall would have a tendency to weaken it. If the wall had been sound, the house would have been standing now. It was a wretchedly-built wall, and the bricks which I looked at were as clean as if no mortar had ever touched them. The bressummer put up by Mr. Hill I consider was strong enough to carry four times the load which it had to bear.

By Mr. Newman: Even if the basement-wall had been a good one, cutting the doorways would have weakened it, as it only left 9 in. of brickwork; but in a wretched wall like this, built with mortar similar to garden-mould, it was fatal. As a proof that the one column was sufficient, it is now in a perfectly sound state, and rings clear as a bell.

By the Coroner: Was it possible that the front of the house gave way, and dragged the column from its place, and so caused it to slide off the basement-wall?—Mr. Bell: No.

This concluded the evidence, and the coroner then summed up, remarking that the first point upon which there was any discrepancy was as to the notice to the district surveyor, the statements

of Mr. Jones and Mr. Wood being contradictory, and he queried whether the notice given was sufficient under the Act. Having quoted from the Act those clauses relating to the point alluded to, he said it appeared that full particulars had not been given as required. It was also a question for the jury to consider whether the bressummer put in was of sufficient strength. According to Mr. Bell, it was strong enough to carry four times the weight which was upon it. He also commented upon the discrepancies in the evidence of the two costermongers and the butcher on the one side, and Mr. Hill's workmen on the other, and also between that given by Mr. Salter and Mr. Jouses. A great weight appeared to have been thrown upon the pier of the basement wall which had given way. Mr. Bell had stated that the horse had yielded in the centre, and had drawn the rest in like a vortex. If they thought there had been culpable negligence on the part of those who had been engaged in altering the premises, it would amount to manslaughter; but if they considered that ordinary care had been taken, it would merely be the result of accident. If more than ordinary care had been exercised, no doubt the horse would have been standing at this time.

The jury deliberated for half an hour, when their verdict was,—

"That the deceased, Chas. Freed, had been killed by accident; and they considered that Mr. Hill was deserving of censure for carrying on the work without having it examined by a competent surveyor; and that the foremen, Salter and Bradon, were also deserving of censure for undertaking duties which they were too inexperienced to discharge."

To this verdict we take one very important exception. Mr. Jones, the tenant for whom the alterations were being made, was the person who should have called in an architect to advise him as to the proposed works, and to have superintended them during their execution. When will the public see the folly of dispensing with the services of a professional man? The prevailing idea is to save his fee; but of the short-sightedness of this view there can but be one opinion, for not only does the employer have the work properly done by calling in an architect, but it is a check upon charges made by the builder. Had a competent professional man been employed in the case before us, there doubtless would have been no necessity for the inquest.

There appeared to be a wish on the part of some few of the jury to prove that all the supports were removed from under the bressummer, and that it broke, bringing down the houses with it. However, there was not the slightest reliable evidence of this: all went to show that the failure of the column in the centre of the premises was the cause of the disaster.

Mr. Hill wishes us to make it clear that he had nothing whatever to do with the party-wall, either in shop or basement, and we willingly do so.

THE LONDON CHARTERHOUSE SCHOOLS. AT GODALMING.

These schools are now nearly completed, so far as the contract is concerned. In our volume for 1870, p. 567, we gave an illustration of the design, and some particulars. The architect is Mr. P. C. Hardwick, and the contractors are Messrs. Lucas, Brothers. The style is Gothic, and the stone is native largetate, with Bath stone dressings. It is intended to occupy the building in June. The school is to accommodate 160 boys. At present it consists of a series of blocks of buildings, placed at angles, and forming in their position the letter Z. The chief approach is from the Peper Harrow-road on the west, facing Hartmore, a broad drive having been constructed there. The head master's residence and school for his pupils form the north-west block; the gown or foundation boys occupy the middle of the Z, so to speak; the matron's apartments and the south-east block contain the second master's apartments and offices for other boys in the school. Thus the matron's and gown-boys' apartments are to the south-west of it.

The ground-floor contains the usual living-rooms and reception-rooms of the masters, the boys' dining-rooms, for the pupils, and other offices. The dining-room at the head-master's will accommodate sixty boys, and is 39 ft. by 21 ft. On the first and second floors are the dormitories. These are fitted up to accommodate fifty boys each. The rooms are 21 ft. wide, and each sleeping compartment is 7 ft. long, and divided from the other by a wooden partition,

8 ft. high, thus leaving a passage of 4 ft. through the apartment. The room is heated with hot water, and attention has been paid to ventilation. Adjoining the dormitories are eight studies on each floor, 6 ft. by 7 ft., which are also warmed with hot water. The floors throughout the establishment are fire-proof. The plastering is the "sclenic," of General Scott, R.E., prepared entirely by machinery; it sets firmly in about 48 or 50 hours at the most. The mortar also has been made in the same way. The bath-rooms, lavatories, kitchens, and other domestic offices are as perfect almost as it is possible for science and ingenuity to make them. Throughout the building provision has been made for Monie's patent earth-closets to be fixed. All along the rear of the building are cloisters, with columns and arches of Bath stone, so that access can be gained from one part of the building to another without any exposure to the weather. The ceiling of the cloisters is composed of yellow deal, stained, and furnished with Gothic ribs. There will be no paint used about the woodwork in any of the compartments; all of it will be stained in this manner.

The schoolroom itself is a capacious and lofty detached edifice, being only connected by the cloisters to the main building. It is 82 ft. by 32 ft., and on either side there are three commodious class-rooms. It has an open stained timber roof, with cross-beams, key-posts, and circular ribs; and at the east and west ends there are two fine lancet-headed windows, with quatrefoils above in Bath stone.

The church is not yet commenced. It will be in the Gothic style, with traceried and stained-glass windows, and a spire about 125 ft. high. One of the chief objects in the front of the western elevation of the main building is the central tower. This is 160 ft. high. Over the entrance are oval windows in carved Bath stone, and above these are lancet-headed windows, with jamba and mullions richly carved. The whole of the tower is profuse in carved stonework, and above the lancet window is a niche, in which it is intended to put a statue of Sir Thomas Sutton, the founder of the school. The whole is surmounted by a spire, which has an ornamental finish of iron. This tower is not only ornamental, but useful, as within, it contains a tank capable of holding 7,000 gallons of water, and into which the water supply of the house will be pumped.

Ample provision has been made for an efficient water supply. A well, 175 ft. deep, has been sunk, and there is never less than 25 ft. of water in it. From the bottom of the well to the height of 40 ft., there are iron cylinders, and above that the well is bricked to the top. The water is to be pumped up by steam power, which is also available for the laundry. This latter has not yet been erected.

The whole of this work has been carried out by the contractors, who have had all the joinery work sent up from their manufactory at Lowestoft. At one time there were 420 men employed on the building. The general work is under the superintendence of Mr. Carpenter, the clerk of the works, and of Mr. Huntley, the foreman.

The grounds around the building are of great beauty, and about seventy acres in extent, from which some of the finest scenery in Surrey can be viewed. A piece of ten acres has been appropriated for a cricket-ground.

THE ROYAL HIBERNIAN ACADEMY.

The annual distribution of prizes to the successful students connected with this Academy has taken place. On this occasion there is some reason for congratulation, as commendable effort has resulted in lifting the essays on the part of the students out of the chronic rut of mediocrity, which was the distinguishing feature of the majority of former sessions.

The Government Commissioner who was sent over to assist in the awarding of the prizes has reported favourably of the progress evidenced on the last examination.

The President (Mr. Thomas A. Jones, M.R.I.A.), delivered a lecture "On the Life and Works of Raffaele," referring to his early career, his works in the Vatican, and his early death, saying that in invention, composition, and expression, the world has unfortunately none like him, and that his works were, in fact, transcripts of his imagination; also that the technical example of

his life was that in order to be successful they must begin with careful elaboration.

The bye-laws of the school need remodelling, and the hints thrown out by the Government Commissioner are to receive a careful consideration. It may not be amiss to state here that the Royal Hibernian Academy owes its foundation to the noble gift of an able architect, and the subsequent generosity of his wife, who completed her husband's intentions by an additional grant. Upwards of forty years have now passed over since its establishment and the death of its founder; yet the city he heartified and the arts he has benefited have scarcely done ought to prove their appreciation of his merits or his memory.

DANGEROUS CONDITION OF ADELPHI TERRACE.

At Bow-street, on Monday, Mr. Napier, on behalf of the Metropolitan Board of Works, applied to Mr. Vaughan for an order of removal, under the Building Act. He stated that five houses in Adelphi-terrace were in a very dangerous condition, owing to the sinking of the vaults underneath. A notice to that effect had been served upon the inhabitants, but they had not quitted their residences.

Mr. G. F. Hayward, the district surveyor, deposed to the dangerous state of the various houses, and alleged that at one of them,—No. 2,—the staircase would have fallen down, but for the shores which he had ordered to be put up.

Mr. Vaughan at once granted the order for the removal of the inhabitants.

We have had occasion to examine the houses and vaults, and fully endorse the opinion expressed by the district surveyor. Under the direction of Messrs. Scully & Wright, for the owner, Mr. Drummond, the buildings are being secured by means of strong shores; but in the vaults that were occupied difficulties were thrown in the way by the tenants, and thence the above application. Not a moment should be lost in getting the whole shored up.

We were, in the first instance, inclined to view the railway and drainage works in the Embankment as partly the cause of this disaster; but this is not altogether borne out by appearances in some of the vaults, where the failure seems rather above than below the foundation.

SCHOOL BOARDS.

Barnsley.—At an adjourned meeting of the Barnsley School Board, called partly for the purpose of selecting plans for the new schools, the members having inspected the twenty-eight sets of designs and plans sent in for the erection of a school in Park-road, among which were designs marked "Knowledge is Power," 2,060l.; "Alpha in the Circle," at 2,000l.; and "No Name," 2,100l., after some discussion the design "Alpha in the Circle" was accepted. It was stated that the authors of the design were Messrs. Wade & Turner, architects, Barnsley.

Dronfield.—The Uxstun School Board have appointed Mr. Rollinson, Chesterfield, architect to the Board. A requisition had been sent to Mr. Lambert, asking that the site selected by a set of schools at Nether Green, should be changed for one preferred by the Board opposite the railway-station at Uxstun. No reply has yet been received.

Drighlington.—At a meeting of this Board the clerk read a letter from the Education Department, in reply to his communication of the 10th ult., explaining that the inspector had reported that there were no efficient schools within the school district, and that the deficiency of 800, or, according to the statements of the Board, 900, should be supplied by a central school, to be erected at or near the spot suggested by the Board. The letter concluded by stating that, before the Education Department could recommend the Public Works Loan Commissioners to grant a loan for the purpose of erecting the proposed elementary school, the Department must be satisfied with (1) the plan and cost of the site; (2) the plan, specifications, and cost of the buildings. It was proposed, "That the advisability of advertising for plans for a new central Board school be considered at the next monthly meeting." This was carried unanimously.

Ordsall (Retford).—At a special meeting of this Board, it has been resolved that a school

shall be built to provide accommodation for 300 children, and that the building committee appointed last January be requested to obtain plans for the erection of a new school and school-house from not less than six nor more than nine architects, on such terms and conditions as the committee may think fit. The clerk read letters from the Education Department, giving instructions as to the building of schools and the transfer of existing public schools to school boards.

Southampton.—At a recent meeting, the architect was instructed to prepare plans and estimates for the proposed schools in Bevois Town.

CHESTER CATHEDRAL RESTORATION.

A MEETING has been held in the Birkenhead Music-hall, for the purpose of assisting to raise funds towards the complete restoration of Chester Cathedral. The chair was occupied by Mr. J. Laird, M.P.

The very Rev. Dean Howson gave an account of the restoration. The tower had been completed and paid for; the cost, including the restoration of the turrets and pinnacles being 6,000*l.* Having entered into details of the work in the chapter-house, cloisters, nave, transepts, and other parts of the cathedral, he said the original estimate for the complete restoration was 55,500*l.*, and he did not believe it would have been exceeded but for certain things which could not possibly have been predicted. They found, when they came to restore the eastern parts of the cathedral, that they had been absolutely built on no foundation at all, but on the green grass. The walls, being built of a frail stone, and being pressed upon by the roof, had been mouldering away, until there was imminent danger of the collapse of a portion of the structure. They had been in time to save the building from such a catastrophe, but the putting in of the foundations cost 2,400*l.* The restoration of the Lady Chapel was estimated to cost 1,700*l.*, but it had cost 3,000*l.*, the walls being so dilapidated. The tower, which was estimated to cost 3,000*l.*, had cost more than 4,000*l.*, leaving out the cost of the exterior decorations at the summit, which were not included in the estimate. The sum expended up to the present moment amounted to 40,000*l.*, towards which the Ecclesiastical Commissioners had given 10,000*l.*, while the subscriptions had realised the remaining 30,000*l.* At the end of last year the subscription list was rather more than 40,000*l.*, nearly all of which had been paid. In consequence of the impulse given at the beginning of the year, there was now enough money in the bank to carry on the work for several months. He estimated that about 30,000*l.* would be still required to complete the restoration. His present wish was to obtain 10,000*l.*, of which already 4,000*l.* had been contributed during the present year. He thought it would not be unreasonable if he were to expect from the Hundred of Wirral 1,000*l.* of new money.

A resolution was passed, "That this meeting highly approves of the restorations at Chester Cathedral, which it considers have been carried out with great architectural ability."

It was also agreed that subscriptions be solicited from the inhabitants of the Hundred of Wirral.

Subscriptions amounting to about 450*l.* had been received since the issue of the circular calling the meeting.

ANGLO-SAXON REMAINS NEAR WITNEY.

SEVERAL ancient interments have been discovered in removing soil between Witney and Burford, in Oxfordshire, where there are ancient fire-clay barrows. In one case the skeleton was that of a young woman. An earthenware urn stood at the head, and there were a necklace of glass beads, from the size of a pea to that of a crab-apple, and a bronze tooth-pick and ear-cleaner, on a bronze ring. "The figures," says a correspondent of the *Church Times*, "lay on her left side, with her face towards the west, and bent down upon the bosom; the knees bowed as one lies in bed when one's feet are cold. Her arms were folded across her breast, and on the third finger of the left hand was a ring of twisted bronze wire. Was this a marriage ring? If so, it indicates the use of the ring for this purpose as prior to Christianity amongst the Teutonic nations. On her breast were two flat silver brooches, each brooch the size of a five-shilling piece, each brooch

ornamented with a pattern of six small incised circles round the centre of the field. A small diamond-shaped bronze pendant was found near them; at her wrist a silver buckle, about 3 in. long, with slight and rude pattern. A knife lay close by, evidently having hung at her girdle. Beside his mistress (indeed his bones mingled with hers), lay a little lap-dog. The bones of a child of about two years of age, lay a few paces off northwards, and between them two skulls (which had been cooked) of the '*Bos longifrons*,'—a very rare find in a Saxon burial-place. Some paces away from the grave the spade disclosed the former existence of a circular excavation, the made soil descending about 4 ft. down through the natural stone trash. This was almost certainly the remains of one of their dwellings."

MISTRESS AND MAID.

WHILE we admire the munificence of the Baroness Burdett-Coutts,—her good sense and good works,—are there not humble and not far-off means within the reach of others of her sex to do good, though in a more limited degree, which in the aggregate would tell favourably towards easing a grievance that is more or less felt in middle-class society,—a class that represents perhaps the largest portion of all civilised communities?

It is not necessary to be rich to do good, though riches go far, if well dispensed, towards accomplishing good upon an extensive scale, as we have of late years been fortunate enough to witness. Great and grand effects occur in nature, which produce sudden and vast changes in the physical condition of the globe; so likewise do important results arise, though more slowly, from long-continued insignificant causes, each in its way equally desirable for the provision and well-being of the human race, one of the noblest of whose characteristics is to take into consideration the welfare and prosperity of succeeding generations.

The Legislature has now taken up the subject of education, and of improving the social and industrial condition of the working classes. The "street Arabs" and "gutter children" even will probably not be long without their guides and instructors; but there is a class afloat that seems to be *let alone*, to steer its course in the best way it can without such advantages, and this class is represented by the ordinary domestic servant, such as fills that capacity in families where only one or two are kept,—and a very large number of young women and girls are thus employed. Taken as a whole, what a disturbing cause they are permitted to be; and whose fault is it? Not entirely their own, most certainly, for some blame at least is attached to those who employ them, and who are supposed to possess better balanced minds, resulting from the advantage of a better training and education, and who could, if they would take the trouble, really do much towards improving their habits and character. As, however, there are some we cannot improve, so also are there mistresses who can do no good to their servants; but these are few compared with those who can, in some degree, benefit and instruct.

Ordinary schools cannot, of course, be used by those engaged in domestic service, nor are they necessary; for each household is, or ought to be, in itself a school, with all needful appliances at hand, and the mistress the proper guide and instructor. A well-regulated household is the right sphere for carrying on this good work, and the head of it is in no way doing her duty unless she exerts herself to correct and improve those beneath her who are thus brought into daily, almost hourly, contact with her. Subdivision of labour in all cases facilitates and perfects the work in hand, whatever it may be; so would the subdivision of instruction under these circumstances,—one teacher, one guide, daily teaching common things, and fostering a higher tone of mind; nor would it be found irksome were the importance of it once conscientiously acknowledged. Many ladies, however, may shrink from the idea of doing this, if they fancy they are being called upon to exert themselves on behalf of the low, vulgar type of domestic servant.

That need not necessarily be the case. Let her first select one suited to her own position in life, leaving the rougher sort for rougher situations; then follow the course recommended. There will always be something to regulate and influence for good with the best of them, and the

work will be equally useful to the community at large. Glancing at schools generally, they are found of all grades,—the village, ragged, national, cheap day and boarding, and, lastly, those of a higher and finishing character. Each of these may be represented by a single family, since there are certainly households of as many degrees: thus may the upper class be absolved from interfering with the lowest, and so be released from what may at first appear a too trying duty.

There are plenty of benevolent persons ready to be the friends and advisers of the poor; numbers visit them in the hope of rendering some service to both body and soul; in this way a sort of intimacy is established which aids them in their work: it is just this personal knowledge of each other that is required between mistress and maid; for it is chiefly through the heart that the best feelings are reached, and it is quite possible to cultivate this intimacy without encouraging an improper freedom. No one who speaks in unison with common sense and kind feeling need fear a loss of dignity or respect; it is only the ignorant, the vulgar and coarse in expression, who are likely to draw forth impertinence and contempt. Each class can show its high as well as its low type of human nature, and natural good sense is as likely to be found in the lower as in the upper orders: wherever found it will not be appealed to in vain. No one need suppose it is making any great sacrifice to do these things. Life ought not to be spent selfishly: a helping hand ought ever to be extended towards our fellow creatures; and this is one way, and a very important way, of assisting them. While doing it we improve ourselves, inasmuch as the mind is led into a train of thought that strengthens and tempers the whole character, and at the same time keeps up a habit of self-restraint and consideration for others; likewise, as we are the better for frequent and free intercourse with our superiors, so do we benefit by occasional conversation with those beneath us. Be it also remembered that, as we come into the world and share, at once, the benefit arising from the mental energy of our predecessors, the least we can do is to add our mite to the general advancement of our species; a brick or a stone added by each passing individual has been known to accomplish such results. Once more then be it urged upon every mistress: "kindly instruct and discipline your servants," so that they at length become sensible of a progress, of a step onwards in civilisation; though they may not know it by those "fine words," they are sure to feel it; and how much better for us all than discharging them and letting them again loose to disturb other households.

THE TRADES MOVEMENT.

Cambridge.—At a crowded meeting of the Building Operatives of Cambridge held at the Guildhall, it was resolved "that a deputation of six from the united body be appointed, asking for a conference with an equal number of the Master Builders' Association, to confer upon the basis of our circulars; and that the following be the deputation:—Messrs. J. H. Cooke and F. Burwick (carpenters), F. Lowings and R. Ison (bricklayers), and W. Scott and W. Cook (labourers)."

Middlesbrough.—An adjourned meeting of operative house-painters has been held to consider the reply of the masters to their demands for 6*d.* per hour and nine hours per day, overtime to be paid 7*d.* per hour. Of fourteen masters eleven concurred all these demands, one merely objecting to payment of overtime till after 8 p.m., and another declining to pay any overtime at all. A vote of thanks was passed to the masters who had made unqualified concession, and a hope expressed that the others would follow their example, the men pledging themselves to work no overtime for those who did not.

Shrewsbury.—A considerable number of men connected with different branches of the building trade have turned out, in compliance with a resolution passed at a meeting held during the earlier part of the week. Another meeting of the men was held; and they seemed unanimous in their determination not to resume work until the nine-hours system has been adopted. A committee was appointed to meet the masters should they express a wish to communicate with the men.

Chicago.—Mr. John D. Prior, General Secretary to the Amalgamated Society of Carpenters and Joiners, Manchester, thus writes:—"I find

that large numbers of building operatives are at the present time leaving this country for Chicago under the impression that there is a great demand for labour in that city, and that skilled artisans are receiving from five to seven dollars per day. It may, perhaps, be interesting to some of your readers to know that I have just received a letter from the secretary of our Chicago Branch, who informs me that trade in that city is very dull, that the supply of carpenters and joiners is more than equal to the demand, and that the rate of wages at present is from two to three dollars per day.

Workmen's Revolt.—The men employed in Messrs. Rothschild's mines at Witkowitz, in Moravia, broke out recently in revolt, and did various acts of plunder and destruction, owing, it is reported, to a delay in the payment of wages. The disturbance was quelled by military, after four of the rioters had been killed, 50 wounded, and about 100 taken prisoners. Workmen's strikes with us are tame affairs compared with this; and think of Rothschild not paying up his workmen's wages!

THE NEW ESTATE OFFICES, HUDDERSFIELD.

IN connexion with the view and particulars of these new buildings, in Huddersfield, given in our last issue, we are asked to add the names of the various contractors and others engaged in the execution of the works, and willingly comply. They included Messrs. Ben Graham, mason; James Christie, carpenter and joiner; James Walsh & Son, of Halifax, plumbers and glaziers; E. J. Goodwin, Brothers, slaters; D. Sumner-cliffe & Sons, plasterers; Knight & Jackson, painters; Minton, Hollins, & Co., Stoke-on-Trent, tilers, encaustic; Hodgkinson & Co., of Coventry, Medival iron-work and gasfittings; Longdon & Co., of Sheffield, grates; Fisher & Dyson, of Huddersfield, marble chimney-pieces; T. Outhwaite, of London, marble chimney-pieces for club and estate offices; Geo. Jennings, the closet and lavatory fittings; R. Dennett, fireproof floors; H. Brook, ironfounder; and Farmer & Brindley, carvers. Mr. Rd. Phillips was clerk of works.

CONCRETE AND BREAKWATERS.

WE have frequently had to comment on the great difficulty and expense of building and keeping in repair the breakwaters on our fishery harbours on the northern coasts. It is not long ago since nearly 40,000l. were actually flung into the sea at the harbour of Anstruther, a town on the Fife-shire coast, of a small and insignificant fishing population, in trying to provide a safe harbour. The harbour at Wick has also been another rock of offence in this light. But it seems at length that the northern engineers have adopted a material capable of resisting the tidal action and the ravages of storms. Glancing at the report of the British Fisheries Society regarding the Wick Breakwater, we find that it states that the breakwater has been exposed recently to two very severe south-easterly gales, and has sustained some damage; but the concrete blocks at the extreme end of the works have not been injured, and this appears to show that *solid cemented masses will resist the force of the waves better than the best masonry, however large the stones, and however strongly they may be bound together.* The directors propose to repair and strengthen the erection up to the point it has already reached. Before proceeding further seawards, it will be necessary to obtain additional funds, and they think it is advisable to suspend operations for a year in order that the stability of the work may be thoroughly tested.

The reports of Messrs. Stevenson, the engineers, are appended to that of the directors, and one states, *inter alia* (the last, dated 5th March, 1872), that the breakwater has sustained damage during the last gales, when, for a period of about twenty days, with little intermission, the work was exposed to the impact of waves about 30 ft. high, and which, on striking the work, projected the spray to the height of about 200 ft. The damage is confined to the portion of the work built without the parapet. The number of stones fractured is not great, but it shows the excessively intense force of the sea on this part of the work, which struck the breakwater with such force as to fracture blocks of the same density as granite, and having a strength three times greater than that of Craig-leith stone,—a fact unparalleled in the history

of sea works. They are of opinion that, if left exposed, the sea will ultimately make a breach in the wall by shattering the stones, and think the directors should, if possible, arrange, in preference to extending the work next season, to deposit blocks of cement rubble of 80 to 100 tons weight outside of the wall, which would not only protect the wall itself, but tend to tranquillise the water inside of the harbour. They estimate the cost of depositing concrete blocks in front of the outer portion of the breakwater, which is most exposed, at about 5,000l.

THE METROPOLITAN WATER SUPPLY.

IN a summary of Dr. Frankland's analytical examinations of the waters supplied by the eight metropolitan companies, he contributes to the annual report of the Registrar-General some valuable remarks upon the London water supply in 1871. The daily supply to London is now about 107 millions of gallons. Of this 20 millions are "good wholesome water from wells and springs in the chalk," and 87 millions are "more or less impure water derived from polluted rivers." The Chelsea and Lambeth companies draw their supplies from the Thames after it has received the polluted Mole and the sewage of 600,000 people, including the filth of Oxford, Reading, and Windsor. The West Middlesex, Southwark, and Grand Junction companies draw their water from the Thames above the junction with the Mole, but after it has received the sewage of the three above-mentioned towns, as well as of smaller places. The East London Company takes its supply of water from the Lea, below the sewer outfalls of Luton, Hertford, and Ware. The Lea, however, is less polluted than the Thames, and Dr. Frankland remarks that it is to be "regretted that the East London Company have just spent about 500,000l. in conveying water from the Thames to their works in the Lea Valley." This new source of supply will probably come into use in the current year, when "a considerable deterioration in the quality of the water supplied by the company may be looked for." The New River Company draws rather more than half its supply from chalk wells, and the rest from the River Lea above the sewer outfalls of Hertford and Ware, but below those of Luton, Whitwell, and Welwyn. The Kent Company is the only one of the metropolitan companies which draws its entire supply from chalk wells, and does not distribute any water from polluted rivers; "this water is uniformly excellent for drinking and all domestic purposes, but is too hard for washing." As the Kent water is drawn entirely from deep chalk wells, it is not filtered before delivery, and the natural filtration it receives through the chalk is so superior to the best artificial filtration, that this company's water has never for several years past shown any signs of turbidity. The Chelsea and Lambeth companies, however, "periodically deliver water so muddy as to be entirely unfit, on this account alone, for domestic use." Living organisms were found during 1871 in most of the turbid samples delivered by each of the companies drawing their supplies from the Thames, excepting only the West Middlesex, which "on all occasions sent out well-filtered water."

SCHOOLS OF ART AND SCIENCE.

The Lambeth School of Art.—The distribution of prizes to this successful institution has been made by Canon Gregory, at the school, Miller's-lane, Upper Kennington-lane. Miss Agnes Schenk was awarded the gold medal for design for lace, and also received the Prince of Wales's scholarship of 25l. The silver medallists were Miss Alice Parkess, for a head from life; Mr. Arthur Barlow, for a model from the antique; and Mr. Tom Hunt, for a life study. There were seven bronze medals, and numerous other prizes, including books, money, and several useful articles. Canon Gregory sketched the eighteen years' history of the academy, from its modest origin, with which he was personally connected, to its present useful and large proportions. The aim of its founders and existing managers was to render the teaching a practical adjunct to the iron and pottery industries of the district. This was the first occasion of the pupils being able to display beautiful objects of pottery art of their own conception and workmanship, a result due in great measure to the liberality of Mr. Henry Donlon, and the taste, and ability of Mr. Sparks, the head master,

Owing to the rebuilding and enlargement of the premises, he appealed to the overflowing audience to contribute something towards wiping off a debt of 300l. This extension had left unpaid. Mr. Tom Taylor, after the distribution, recited an address upon Art, taking for his leading theme the street-decorations of the recent Thanksgiving Day. Speculating upon the unfavourable impression they must have produced upon the minds of the youthful Japanese sent over to study our habits, tastes, and institutions, and who were in St. Paul's on the day, he thought they must have said to themselves this could not be the England of 500 years ago, of which they had read, or the country that set so high a value upon the beautiful productions of their own Japan. In this strain he reasoned, contending that the art taste of the nation had degenerated, but argued that institutions of this kind were destined to restore correct notions, amongst the people, of the picturesque.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

MR. T. GILKS delivered a lecture before this Society on Thursday evening in last week upon "Thomas Bewick, and the Revival of Wood Engraving in England;" Mr. J. A. Henson, R.S.A., in the chair. There was an exhibition of chiaroscuro by Baptiste Jackson and Goldins, some large Dürer cuts, some choice large cuts by Bewick, five different portraits of him, and most of his works. Mr. Gilks began by a retrospective glance at the low state of the art in England anterior to Bewick. The lecturer then spoke of his birth, education, love of art, and apprenticeship, and alluded to his first cuts, his visit to London in 1776, and the few persons he found then practising the art. Mr. Gilks laid great stress upon Bewick's intense love of nature. He also drew an analogy between Michelangelo, who was called "the master of live stone," and Bewick, who certainly was a "master of live wood;" and he urged that not even Dürer or Holbein had so faithfully interpreted nature as Bewick. Mr. Gilks referred to Landseer's "Life and Letters of W. Bewick," and the light it shed upon the engraver's estimation by the literary world. The lecturer critically examined Bewick's *modus operandi*, and showed how he attained superior results to the modern mode. A discussion ensued, in which Messrs. J. G. Waller, T. Reed, Palmer, Sadder, Captain Britton, the Chairman, and the Hon. Secretary, took part.

THE ROYAL ALBERT HALL.

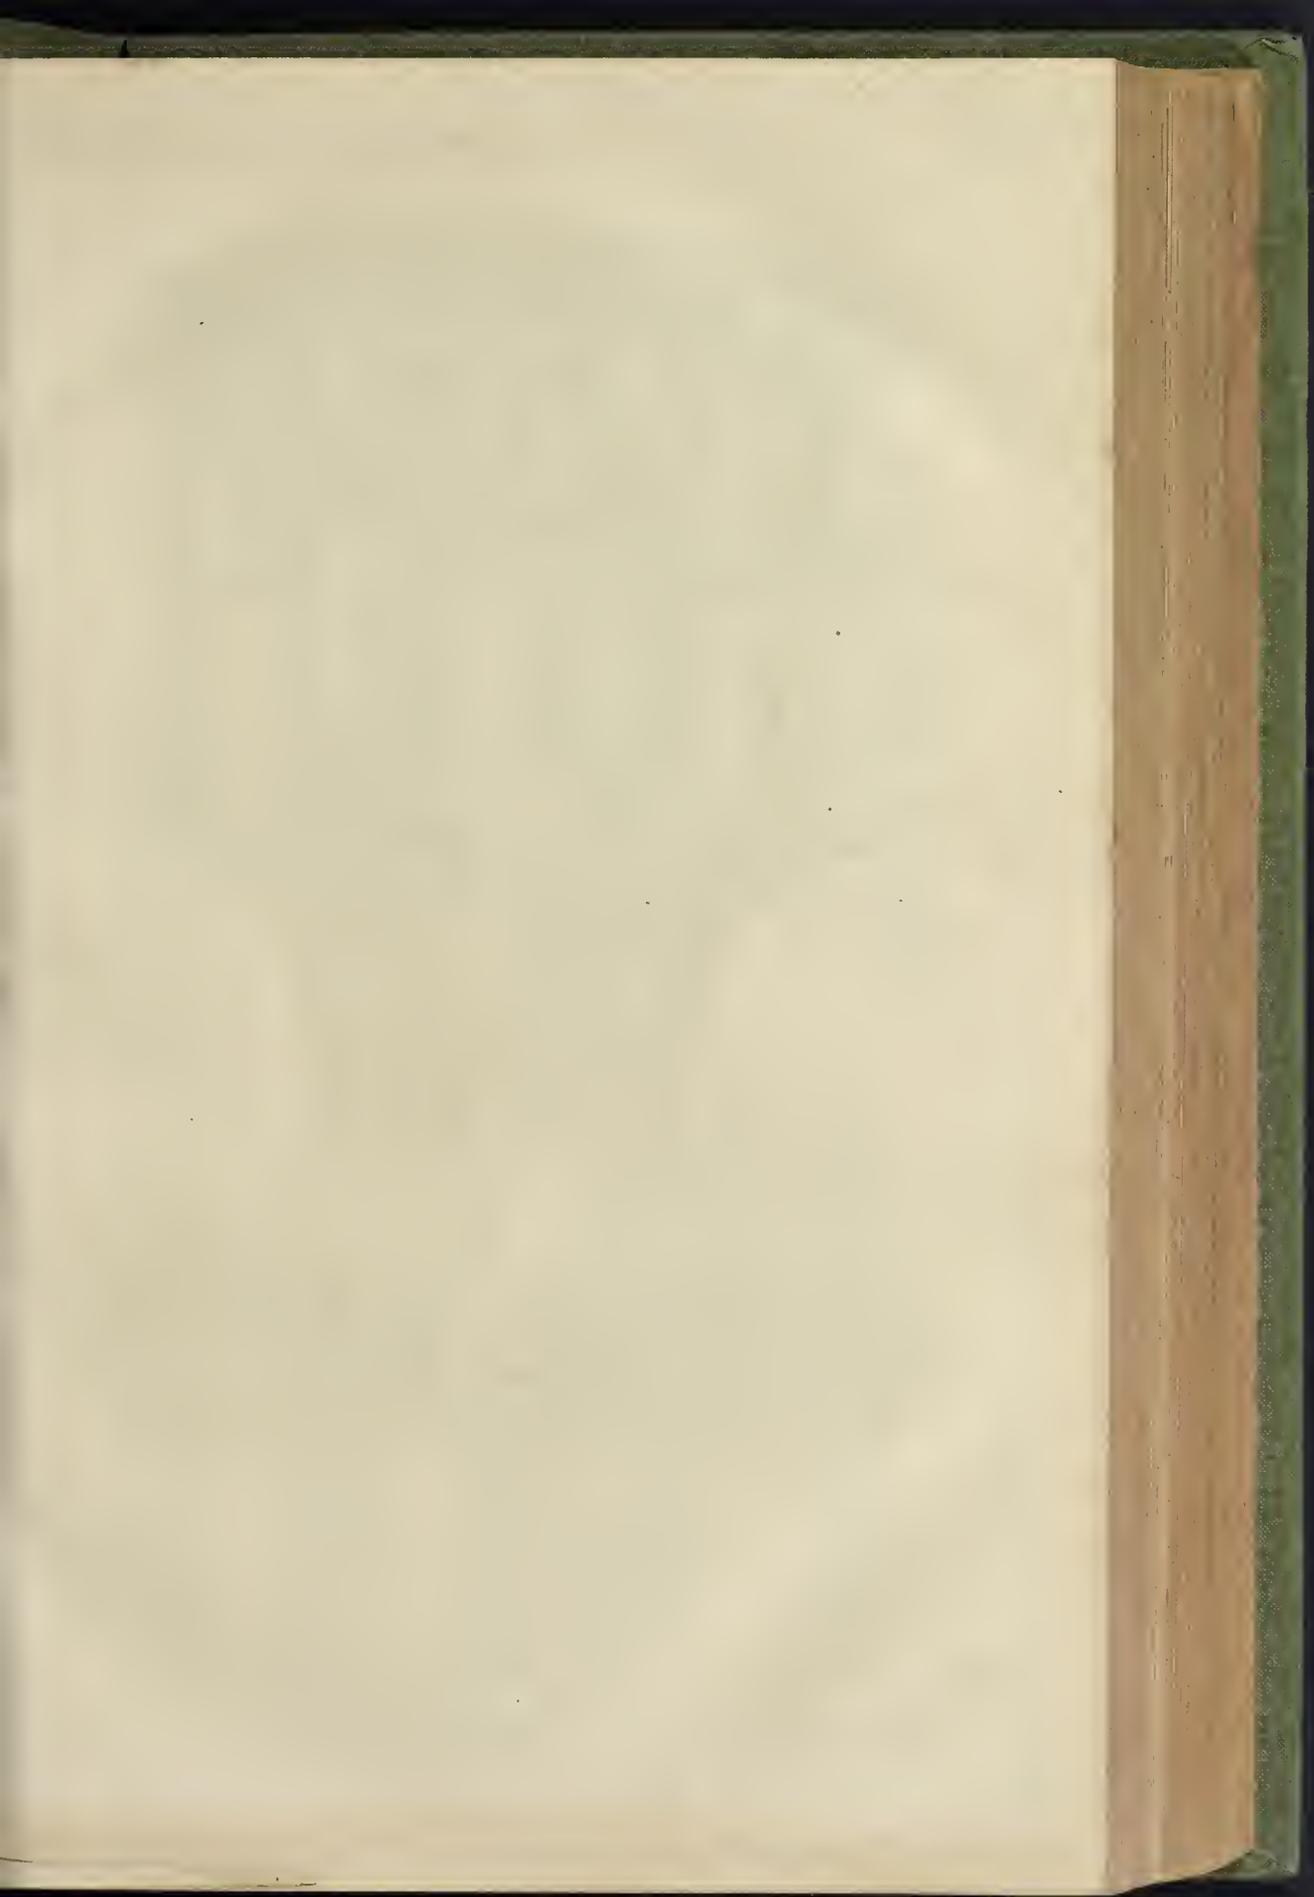

HIS Royal Highness the Duke of Edinburgh presided at the first meeting of the Corporation, on Monday last, in the East Lecture Theatre of the establishment, when the draft constitution was submitted, and, after a few alterations, adopted. The Duke made an excellent address, giving the history of the undertaking, and an account of its present position. General Scott read a report from the Provisional Committee, which was also adopted: all the proceedings were characterised by great unanimity. About a hundred members of the corporation were present.

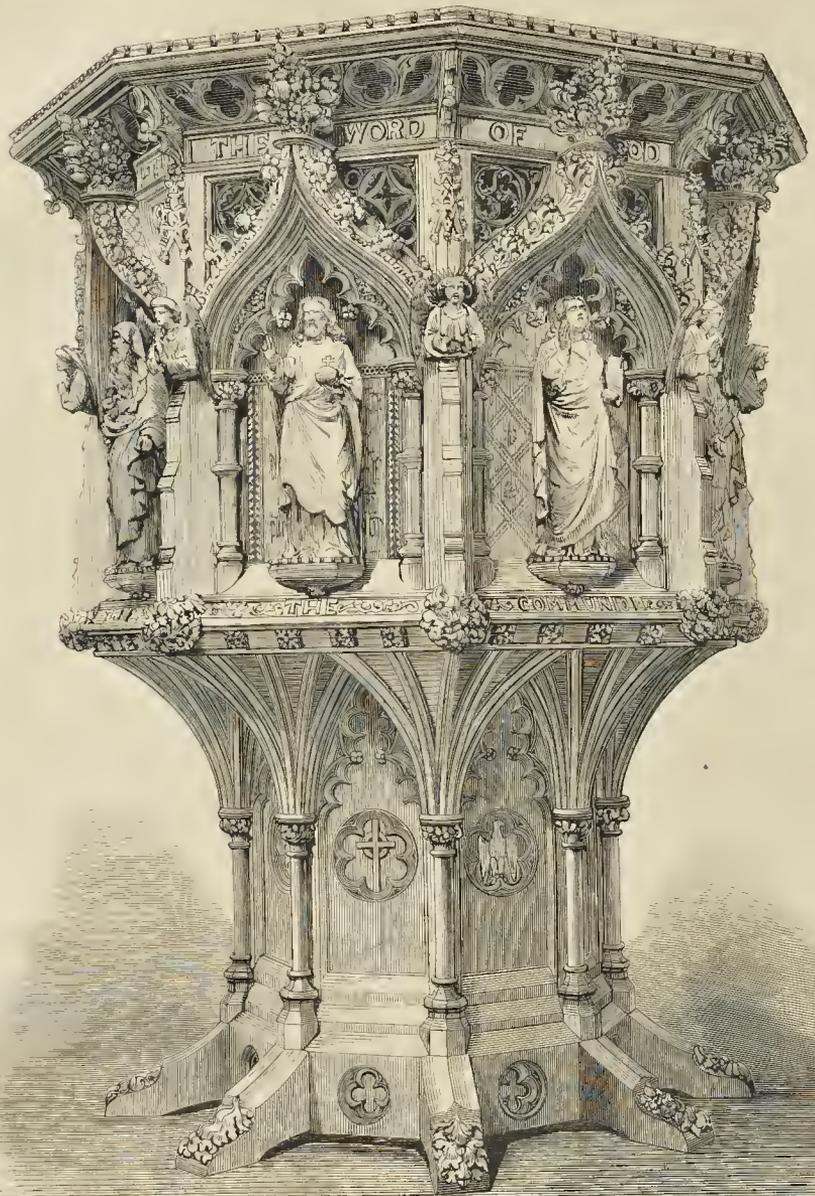

JEBEL EL KUMRI.

SIR,—May I be permitted to say that this word Kumri, which you seek to ally with our aboriginal Welshmen, is only a form of the common Arabic word for moon; thus, Jebel el Kamar is the moon-mountain, called luns, in the plural, the mountains of the moon; the well-known backbone of Central Africa.

The Welsh word for "moon" is *Henad*, cf. Latin *luna*. Had our Cymreig really retained so important a word from a supposed Semitic ancestry, we should find a more striking similarity between Welsh and Arabic than is now apparent.

A. HALL.
* Mr. A. Hall is no doubt quite correct in his Arabic, but we made no attempt whatever to show, or even to hint at, anything like either an Arabic or an Arabian origin of the people of Cumberland, of which district we were speaking; or of those of Wales either. Our argument pointed to Africa; and the only question here would be, whether the word Kumri, applied by natives to African mountains, may not be connected with some ancient African language, as well as have, in another form, a meaning in Arabic. "Kumri" and "Cynury" are "closely akin."

PULPIT. HOLBEACH CHURCH.

Designed by Mr. Christian, Architect; executed by Mr. J. Forsyth.

HOLBEACH PULPIT.

THIS pulpit, recently placed in Holbeach Church, as a memorial, is executed principally in oak; but its architectural effect is heightened by a mixture of teak and other woods. The height of the pulpit is 6 ft. 6 in., and it is octagon in form. Each segment of the octagon (excepting the one for the entrance) contains canopied panels, which form the setting for the figures.

those being seven in number. The figures represent, in the order of their position, Moses, Abraham, Elijah, our Lord, St. John, St. Paul, and St. Simon, and are all carved in oak from models made expressly for this work. On the base, under each figure, appear their appropriate emblems. These figures, together with much richness in ornamental and moulded detail, produce an imposing effect. The cost was nearly 300l.

Mr. E. Christian was the architect (under whose superintendence the church has been restored), and Mr. J. Forsyth the sculptor.

Honour to Literature.—The Metropolitan Board of Works have decided to rename Oakley-square, Chelsea, and to call it henceforward "Carlyle-square."

FLECHES : GERMANY.

FLÊCHES.

The "Flèche," for which we have no English name, unless "spirelet" may be used, forms a most graceful and interesting feature in Continental Gothic architecture, and it is a singular circumstance that the ancient architects of this country should never have introduced it. In their smaller churches they seem always to have preferred using the bell-gable, and in their larger cruciform churches the central tower is almost universally to be found. Probably, however, Westminster Abbey had a Flèche before Sir C. Wren added the present stamp of a central tower which disfigures that building; and it is known that there was one at Beverley Minster before the existing abomination was erected over the "crossing" of that beautiful church.

A flèche of large dimensions exists at South-void Church, in Suffolk, and the "louvres" over our dining-halls partake of the character of this feature, but all the ancient English examples, and they are very few, seem to be clumsy and ungraceful in their outline, and quite wanting in the elegance and grace of the Continental ones.

Flèches appear to have first come into use in the thirteenth century, and a few examples of that date are to be met with in France. In the fourteenth century they were of such frequent use that nearly every church in Germany of that date seems to have possessed one. The examples we give, from the Minorite Church at Cologne (fig. 1), from St. Michael's Church, Bamberg (fig. 2), the Kloster-Kirchoth Cassel (fig. 3), and the Chapel of the Town-hall at Cologne (fig. 4), are all of this date, as are also those of the cathedrals at Münster and Halberstadt, and the churches of St. Andrew at Hildesheim and of the Franciscans at Limburg-on-the-Lahn. In fact, most of the churches erected by the mendicant orders of this date possess this feature, as their rules did not permit them to erect towers. During the fifteenth and sixteenth centuries flèches continued to be used, and examples of the fifteenth century are often exceedingly elegant and beautiful. Those of St. Maria in Capitol at Cologne (fig. 5), and St. Mary in Thal at Rothenburg (fig. 6) are of this date. The latter is of stone, and bracketed out from the western gable. The flèche of the interesting and beautiful convent of Himmelsport, near Würzburg, is a charming example of the latter part of the sixteenth century (fig. 7).

The spiral portion of this example is of wood covered with slate, but the rest of it is of red stone, and it is carried down through the church to the ground. The arrangement internally is singular, but very picturesque. It occurs just over the centre of the nave of the church, and not between the nave and the chancel, which is the usual position for a flèche. The portion of the nave to the west of this flèche is raised upon a crypt, that between the flèche and chancel is consequently 12 ft. or 14 ft. lower than the western portion. The part of the nave which is raised is used as a choir for the "religious," and the basement of the flèche combines with a kind of roof-structure, separating this from the eastern portion of the nave, which is used by the secular inhabitants of the convent, who are thus stationed between the choir and the chancel of the church. The lower portion of the flèche, i.e., that part of it which rises from the floor of the church, contains a staircase communicating with the choir of the "Religious" and the crypt below. This singular and interesting church is of various dates. The crypt under the nave (we call it a crypt, although it is entirely above ground) and the south doorway are "First Pointed" work. The chancel, which is small and square-ended, is "Second Pointed"; and the nave is "Third Pointed." The flèche and gables are of the latter part of the sixteenth century. There is another flèche of the same date, and equally picturesque, though smaller than the one we have described, over the refectory of this interesting convent.

The little flèche or bell-cot represented in fig. 8 is from the chapel of a small convent at Bamberg, in Bavaria; it is probably a work of the sixteenth century; and that represented in fig. 9 is from the western end of the Cathedral of Limburg-on-the-Lahn, and dates from the seventeenth century.

All these examples, except figs. 6 and 7, are constructed of wood. The example from the Minorite Church at Cologne (fig. 1) is entirely covered with lead, and the crockets are beaten out in that metal. The basement is adorned in a peculiar manner with a number of small shields.

The example from St. Michael's, at Bamberg,

is also entirely covered with lead. The example from Cassel (fig. 3) has its spire and base covered with small slates, whereas the wood is left exposed in the open portion of the flèche. Fig. 4, from the town-hall at Cologne, is entirely covered with lead, and is exceedingly elaborate. Fig. 5, from St. Maria zu Capitol, Cologne, has the upper portion of its spire covered with lead, the lower portion of the spire with slate, the open portion covered with lead, and the base, which is in the form of a spire, covered with slate. Below this flèche is a pretty little stone oriel window, forming internally the receptacle for a small altar. The whole of this flèche has been recently restored, and apparently with considerable care.

In figs. 8 and 9 the roofs alone are covered with slate, the timber being left exposed in their lower portions.

THE DARLINGTON FEVER HOSPITAL COMPETITION.

SIR.—As you are always ready to expose injustice, I will, in as few words as possible, recount the *grossest* case that I have ever met with in the course of my professional career.

The Town Council of Darlington invited the local architects to compete for two premiums for an infectious hospital. Five of them complied. Four of the designs being (as you and most of your readers will, of course, expect *all* would be) on the "Pavilion plan," but varying, no doubt, in merit as to carrying it out; the fifth is, however, on the old long-abandoned "ward plan," with windows only at one side and one end, and a window about 3 ft. square, into a narrow passage. And will you believe me, sir, when I assure you it is a positive fact that although you, as well as Miss Nightingale and others, have explained and advocated the pavilion principle for years, so that a complete revolution has been effected in hospital construction, the Hospital Committee actually selected this "ward" plan as "*the best*," and although asked by the other competitors to call in you, or some other "expert" on the subject, before making their report to the council, refused to do so, but sent in their report, which was almost as a matter of form adopted, only one voice being lifted up in favour of a skilled and impartial adjudicator, and in vain?

The most painful part of the affair is, that at the meeting of the committee who practically selected the design, of the three members besides the mayor present, two of them are the partners in business, and one of them a "client," and considered to be a decided partisan, of the architect whose design they selected as the best.

It is perfectly certain that the Government officer who has to approve the plans of hospitals built with public money will not approve the design, but the committee of partners took good care not to make any stipulation as to that in awarding the premiums: only get their friend appointed architect, and he can, with the aid of the other designs, probably make a fresh design to pass.

Can you conceive a more cruel case of injustice to the other competitors? And can you, with your great experience, suggest a remedy, or must they "grin and bear it?"

"ONE WHO LIKES FAIR PLAY."

ARCHITECTURAL ASSOCIATION.

THE visit of the members, on Saturday afternoon, the 16th inst., was paid to the new buildings for the learned societies, now in course of erection on the old courtyard of Burlington House, at the present time roofed in, the scaffolding removed from it, and the masonry of the upper stories cleaned down, and preparations are being made for beginning the internal plastering.

At the ordinary fortnightly meeting, held on Friday evening, the 22nd, thanks were voted to Messrs. Banks & Barry, the architects, for the opportunity of visiting their building. A paper was then read, by Mr. G. H. Birch, "On Christian Iconography," which he defined, for the purpose of his paper, as the regulation of the representation of holy things by paintings, statues, glass and wall decorations in Christian churches, and their appendages; advocating, 1. The employment of the arts to teach the people as well as to decorate sacred buildings,—a principle largely acted on of old, though in more modern times fallen into some disuse. Also, 2. The application to the different divisions

of churches of a set system of decoration, the reference in paintings, sculpture, &c., only to subjects having a special and peculiar suitability to the parts and their ordinary uses. Basing his remarks on the information conveyed in a single view in M. Didron's well-known "Manuel d'Iconographie Chrétienne, Grecque et Latine;" and instancing examples from England and the Continent of the traditional treatment of the various walls, windows, and fittings; Mr. Birch proceeded to indicate what seemed to him the method of applying the same to modern needs. Recommending most strongly the devotion of the north sides of all churches uniformly to the history of the elder world, and of the southern sides to history since the appearance of the founder of the Christian faith; also, among other matters, censuring the use of holy symbols in floors, and the introduction of memorial windows filled with delineation of modern buildings or of portraits and personal traits. He also pointed out what seemed to him the unlimited field for able work if thorough schemes of church completion became the rule instead of the exception; though all the work should be sober and dignified, he did not consider there was any need to resort to archaic drawing to obtain that repose and character. Treated at first hand with all the freshness of true talent, the old subjects of Christian art may take a continual newness from the artist's hand, even though he works within the trammels of traditional iconography. In the discussion which followed, some stress was laid on the necessity for real interest in the subjects depicted, in order that they may be permanently of value; and doubts were expressed as to the possibility of direct didactic result from any art, or of the real usefulness and high character of art produced under more prompting. Notice was also taken of the avoidance of modern subjects in churches, an undesirable exclusion, as the speaker seemed to think, of a portion of the world's history that ought to be interesting above all others to moderns; and the possibility of attaining completeness and interest with but little reference to tradition was hinted at.

EXCAVATIONS IN ROME.

WILL you permit me to take advantage of the wide circulation of your paper to make known to my numerous friends in England and the subscribers to the Roman Exploration Fund, that I have this day been through the subterranean passage from the vestibule of the great ancient Maestri Prison (commonly called the Prison of St. Peter), under the Church of the Crucifixion, near the Arch of Septimius Severus, and the principal chambers of that prison called the Lautumiao, now cellars under the houses in the Via di Marforio and the Vicolo del Ghiattello? This passage is 80 yards long, nearly 2 high, and 1 wide, and the construction as well as that of the prison is of the large blocks of tuff, usually called in Rome the walls of the kings, the same as that of the earliest part of the Cloaca Maxima. The excavation of this passage has been a tedious, difficult, and expensive work, and I hope it will be duly appreciated by the subscribers. It clearly settles another long disputed question among scholars, and demonstrates that this is the prison in the middle of the City, mentioned by Livy as made in the time of Anens Martius (A. U. C. 121; B. C. 632. Livy Hist. lib. 1, c. 33). All the disputed points in the historical topography of Rome might be settled and demonstrated in the same manner, if the necessary funds were forthcoming. I have had plans and sections made of this, and shall have them published as soon as possible and sent to the subscribers.

JOHN HENRY PARKER, C.B.

DOMESTIC ARCHITECTURE AND THE ART SCHOOLS.

AT a meeting of the South Kensington District Schools last week, Sir Coutts Lindsay, who distributed the prizes gained by the students, said he had been asked by Mr. Cole to suggest anything he thought needful with regard to the schools, and he had mentioned the subject of domestic architecture. He proposed to offer a prize of 5l. to the student who should produce the best design for a dwelling-house to be erected on a given plot of ground in town or country. He also proposed to give a prize of 5l. for the best study, executed in marble, from a design from the antique. It might be but a part of a

figure," for probably a whole figure would be found to be too costly as regarded the material. He would also give a prize of 5l. for the best understood and most gracefully arranged drapery copied from life, not to be elaborately finished, but to be sketched so as to serve, if needful, for elaboration afterwards; we had many such sketches by Raffaele, from which one who understood drapery could readily see how that master had intended that the details should be filed in. He thought that a number of draperies should be provided for the school, and that the students should study them placed upon one another, and variously arranged.

NEW RAILWAY STATION AND RE-ARRANGEMENTS, LOUGHBOROUGH-ROAD.

The works now going forward in connexion with the loop line of railway from the main line of the London, Chatham, and Dover Company to the Crystal Palace High-level line, involve a very important reconstruction of the Loughborough-road station arrangements. The present booking-offices and station at Loughborough-road are very inconvenient and altogether inadequate to the traffic, the only accommodation for passengers being under two of the company's arches, whilst the approaches to the railway platforms are still more unsatisfactory. On the completion and opening of the Crystal Palace Junction, a great improvement will take place in this respect. The directors have resolved altogether to close the present booking-offices and approaches, and to erect a large and commodious new station on the street level, on a plot of ground fronting Coldharbour-lane. The exact site of the new station will be in the fork between the main line and the new junction line to the Crystal Palace, now in course of construction.

ST. MARY WOOLNOUTH.

SIR,—There are rumours afloat that the existence of Hawkmoor's noble church, St. Mary Woolnoth (admirably situated at the corner of Lombard-street), is included under the Loudon Churches Act.

I am sure it is only necessary to state this fact to secure the co-operation of all who care for the old architecture of England, in a rally for its preservation. The works of Hawkmoor are not so many that we can afford to lose so excellent a specimen of an artist in whose hands the modified Italian of Wren assumed a peculiar character of dignified prettiness. VIGIL.

* * * We fully agree with the expression of our correspondent, and hope to be speedily assured that no such disaster as the destruction of this building will be allowed to occur.

METROPOLITAN BOARD OF WORKS AND DISTRICT SURVEYORS.

At the usual weekly meeting of the Board of Works on the 22nd, Mr. H. L. Taylor wished to ask the Superintending Architect whether Mr. Power, the district surveyor of the southern district, was entitled to charge 10s. 6d. each for inspecting the parapets and roofs of their buildings in Ludgate-hill before Thanksgiving Day. He wanted to know if the district surveyor was entitled to make this charge for buildings not inspected.

The Superintending Architect said that the district surveyors were directed by order of the Board to make an inspection of roofs and parapet walls, and he believed that was on the motion of Mr. Fowler.

Mr. Eli said he seconded the motion, and that all that was required was that notices should be served upon the householders, drawing their attention to means being taken for their security. The subject then dropped.

GLASS AND GLASS PAINTING, SOCIETY OF ARTS.

THE next course of Cantor Lectures to be delivered on Monday evenings, commencing on the 8th of April, will treat of Glass and Glass Painting, as the following letters show:—

Lecture I.—On Silica, Silica, and compound of these with other substances—Fluorine, &c. Lecture II.—Solutions of Silicic Acid—Silicates—Glass (composition of)—Different Kinds of

Glass—Methods of Making Glass. Lecture III.—Manufacture of Glass (continued)—Coloured Glasses—Glass Staining—Glass as a Decorative Material—Glass Painting. Lecture IV.—Glass Painting (continued)—Mosaics—Enamels. Lecture V.—Styles of Glass Painting—Illustrations with the Electric Light, illustrative of the Nature of Colour. Lecture VI.—Silicates as Painting Vehicles, and some other of their Useful Applications in the Arts.

Every member has the privilege of introducing two friends to each lecture.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the Ordinary Meeting, held on the 18th of March, the paper read was,—"On the Fall of the Brick Dome of the Koltovskote Church, at St. Petersburg; with an Account of its Construction, and the Theory proposed for the Safe Erection of such Structures: being a Communication from M. Bernhard, Architect, of St. Petersburg," by Mr. Wyatt Papworth.

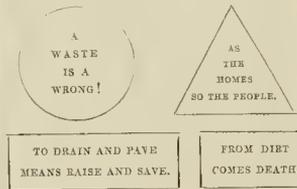

The following have been elected as honorary and corresponding members:—Mons. Espérandien, of Marseilles; II. Cavaliere Giuseppe Fiorelli, of Naples; II. Cavaliere Antonio Cipolla, of Rome; II. Cavaliere Enrico Alvino, of Naples; II. Cavaliere Pietro Rosa, of Rome.

On the recommendation of the council with regard to the nomination of new members, it has been resolved that,—

"The Nomination Paper must be accompanied by a separate written statement by the applicant as to his professional education in the case of Associates, and as to his professional education and works in the case of Fellows; and by another written statement by one of the three Fellows who have signed the Nomination Paper, giving particulars of his acquaintance with the candidate in the case of Associates, and of his acquaintance with the candidate and his works in the case of Fellows."

HEALTH APHORISMS.

SIR,—I in common with some other "women workers" in a densely-populated neighbourhood, take charge of a class in the Sunday School; and it has occurred to me to suggest through your columns that, as well as the present beautiful Scripture mottoes which we distribute to the children on cards and other pictorial illustrations, we could at the same time do much good by a similar dispersion of some of your sanitary maxims or Health Aphorisms, such as,—

A suggestion from your able pen might so influence the administrative department of the Religious Tract Societies that they would be induced to print these.

PRISCILLA.

EXPENDITURE ON THE NATIONAL GALLERIES AND MUSEUMS.

A RETURN has been furnished to the House of Lords, on the motion of Lord Overstone, as to the sums expended on the following public galleries and museums:—

National Gallery.—1. Total amount expended on account of purchases from the date of its commencement to the present time, 337,196l. 9s. 10d.; 2. Total amount expended during the same period on account of annual cost of the establishment and other outgoings, 133,384l. 11s.; 3. Total amount expended on building account, 102,406l. 1s. 8d. Note.—The amount of 7014l. 6s. 9d. was received by sale of catalogues to March 31st, 1871, and paid over to her Majesty's Exchequer.

South Kensington Museum.—1. Total amount expended on account of purchases, from the date of its commencement, in 1853, to the present time (March 31st, 1871), 308,677l. 2s. 7d.; 2. Total amount expended during the same period on account of annual cost of the establishment and other outgoings (including schools of science and art), 1,133,617l. 19s. 2d.; 3. Total amount expended on building account, 231,740l. 5s. 8d.

National Portrait Gallery.—1. Total amount expended on account of purchases, from the date of its commencement to the present time (March 31st, 1871), 14,832l. 7s. 3d.; 2. Total amount expended during the same period on account of annual cost of the establishment and other outgoings, 11,997l. 4s. 9d.; 3. Total amount expended on building account (including rent), 4,320l. 4s. 2d.

British Museum.—1. Total amount expended on account of purchases and acquisitions (including the amount ex-

pendent in excavations) from the commencement of the year 1824 to the present time (March 31st, 1871), 778,347l. 13s. 6d.; 2. Total amount expended during the same period on account of annual cost of the establishment and other outgoings, 1,637,786l. 12s. 4d.; 3. Total amount expended on building account, including acquisitions, during the same period, on commission, from Michaelmas, 1823 (when new buildings were commenced), to the 31st March, 1871, 1,239,087l. 5s. 1d.

MARBLÉS FOR TILE NATIONAL GALLERIES.

SIR,—Having given estimates to several builders for the marble work to be put up at the National Gallery, our prices being for Belgian Black and Genoa green, may be permitted to remark, on behalf of ourselves and others who have estimated, for the same, that we think that it would be unfair to us were any estimate for Irish marbles accepted, the difference in price being so considerable as to make our prices appear extremely high to those who do not understand the difference between the marbles; and we are also doubtful if Irish green could be obtained the size required, viz., 13 ft. 9 in. long, 20 in. diameter each, in one stone, and certainly in colour it would be greatly inferior to the Genoa green.

As other marble merchants may have given estimates for Irish green and black, on behalf of themselves and others to whom we have given our estimates according to the specification, it is likely to add to our prejudice and do us injury, unless it is shown that there is a great difference in the price of the different marbles.

J. W. BIRD & CO.

* * * We have received three other letters on this subject, but must refer the writers to the architect.

TUNNEL UNDER THE CHANNEL.

SIR,—As the subject of effecting an improved communication between England and the Continent by means of a tunnel is occupying considerable attention just now, I think it would be well that the most practicable site should be selected. To my mind the line proposed by Mr. G. Remington from Dungeness to Cape Griznez is the best, for by it the chalk formation which is so porous would be entirely avoided, and the work would be carried through the strata containing beds of strong clay and other impervious strata.

This line has the advantage of starting from a low level, and therefore the level required under the Channel would be more readily attained, the approaches could be in open cutting, and the tunnel would not exceed twenty-six miles in length. Following this route, the shaft in mid-channel affords great facilities for sinking an intermediate shaft, so that only half the time would be required than if driven from shore to shore.

The Dungeness line would shorten the distance between London and Paris, and would afford greater facilities for uniting with all the existing railways, and would therefore give the public greater accommodation. It is to be regretted that to insist upon the idea of tunnelling through the chalk, when such strata as the wealden are so near at hand, appears to me to be a great engineering mistake, and in such a case the cost of the tunnel would be increased by any other amount for proposed works could be laid out to better advantage if employed on works at Dungeness.

I think that the secretary of the company has, in his letter published in your paper of the 9th March, come to erroneous conclusions when he refers to colleries and lead mines under the sea, as the shaft in mid-channel which these works are carried out not chalk, but generally compact and impervious.

It seems to me, therefore, that the Dungeness line is the proper one to follow, and that the works may be carried out with the certainty of success. J. H.

THE INNS OF COURT HOTEL.

THE Inns of Court Hotel in Holborn, which, since its erection, has been extensively used by members of the legal profession, is, nevertheless, now in liquidation, and has just been disposed of by public auction, at the Mart, Tokenhouse-yard, by Messrs. Norton, Twist, & Watney, the sole including the unfinished building in Lincoln's-inn-fields, and the whole covering half an acre of freehold land. The upset price of the property was 48,550l. There was a very numerous attendance, and a spirited competition for the property took place. It was ultimately knocked down at 52,700l. to Mr. Henry Albutt, who, it is understood, has purchased it on behalf of the Midland Land Corporation of Birmingham.

The previous bidder was Mr. Tewson, of the firm of Debenham, Tewson, & Farnes, who offered 52,600l. on behalf of a client. It is a matter of surprise that the property did not realize a higher sum when, according to the statement of the auctioneer, the amount at which it was knocked down is only slightly in excess of the cost of the site.

PORTLAND DRAINAGE COMPETITION.

SIR,—In your impression of the 9th inst. "An Engineer" inquires what has become of the above competition, and complains that he has been unable to get any information about it since the plans were sent in.

We imagine that he is not singular in this respect, and that it will be found that the competitors have been left almost entirely to gather their information as best they could from the local newspapers or from private sources.

In this manner we are enabled to give him and others whom it may concern, the following history of the case. Six sets of plans were sent in, and a notice of them with the various estimates appeared in the local papers, and also in the *Builder*—the estimates, however, being somewhat increased in price. The plans were subsequently on view at the Royal Hotel, Fortuna's Well, for a week.

The Local Board being unable to decide for themselves as to the merits of the different schemes, determined to call in professional assistance, and ultimately appointed an architect of Weymouth to report on them.

This report was received at a meeting of the Local Board on 16th November, the local papers giving a full account of the meeting and its summary of the report, in which the competitors were placed in the following order:—"Thorough," "Sero ac Spero," "Paire mon devoir," "Sanitas No. 1," "Experience," "Sanitas No. 2," and the Board proceeded to award the first premium of £60, to "Thorough," and the second, of £20, to "Experience." The envelopes containing the names of the competitors were, however, left unopened.

At a meeting of the Board on 18th December, during a discussion as to carrying out part of the drainage of Fortane's Well, it was proposed that they should have a proper surveyor to superintend the works. This seems to have been decided on at a subsequent meeting, for in the local papers of 6th January an advertisement appeared for a "Drainage Surveyor," to superintend the carrying out of certain drainage works, "and to perform all the duties connected with and pertaining to the office of surveyor to the Portland district under the Local Government Act 1858." "Salary about 100*l.* a year."

We immediately wrote to the clerk to the Board asking if the Board intended ignoring the competitors, and carrying out the works themselves, and received answer that either of the above courses was what was intended to be carried out, and that their present surveyor being incapable of drawing a plan, they felt they required a superior person where there was so much to do.

As this was not very explicit, we sent a letter to the Board (timed so as to arrive with the applications for office of surveyor) putting forward our claim to carry out the works, on the ground of our plans having been awarded the first premium, and the objections issued to competitors stating that the claims of those gentlemen whose plans, &c. were chosen should have "the Board's favourable consideration." We also offered to send the Board to explain the details of our plans and to give any other information that might be required.

No notice was taken of this letter; but in the local papers of 27th January appeared an account of a meeting of the Local Board (probably 17th January), at which several applications for the office of surveyor were received. One letter is not mentioned, but a letter from "Experience," in his own name, is given in full, offering to carry out his own plan at a salary of 150*l.* for twelve months, and, after a discussion, he was appointed surveyor to the Board, and the duties assigned to him, the duties set out in the advertisement, and to his plans being approved by the Local Government Board.

We at once protested against the course adopted by the Board in appointing the second premium competitor to carry out the drainage works at a higher salary than that named in the advertisement, without giving us the opportunity of submitting our terms.

Our letter was countersigned at a Board meeting on 8th February, and on the 18th we received answer that the Board had decided not to carry out either of the plans sent in by competitors; that the plans by "Experience" were most in accordance with the recommendations of Mr. Harrison, who conducted the inquiry instituted by the Local Government Board, but that our plans as a whole were considered the most complete and correct.

The newspaper report of the meeting, however, states that a letter from "Experience," accepting the offer of the Board, was approved of, and, with regard to sending his plans to the Local Government Board, the meeting was adjourned to give an opportunity of communicating with him as to various alterations required. At the adjourned meeting on 12th February a resolution was passed that no alterations should be made in the plans until the next general meeting.

We have since written to ask whether the letter we received from the Board or the newspaper report is to be taken as correct, as we considered them at variance, but we have as yet received no answer.

The above we believe is a correct outline of the history of the case down to the present time,—any comment upon it we think would be superfluous.

WALTER H. GLENNIE,
W. LANGTON COKE,
Authors of the Plans, &c. marked "Thorough."

FROM SCOTLAND.

Edinburgh.—The subscription towards the restoration of St. Giles's Church, though as yet only promoted in a private way, has reached the sum of 1,900*l.*, being nearly two-thirds of the amount required for the first stage of the undertaking,—that is to say, the renovation of the High Church. The committee are having specifications prepared, with a view to obtain estimates for the work, which is intended to be commenced immediately after the General Assembly's meeting in May. When the choir of the old cathedral shall have thus been restored to a proper condition, says the *Scotsman*, the committee will direct their attention to other parts of the building. The portion occupied by Trinity College congregation will probably be vacated at no distant date, on the completion of the new church in Jeffrey's-street. This portion, accordingly, will next fall to be dealt with in accordance with a general plan for opening up the entire building, of which the restoration of the choir, now arranged for, is to be regarded the first instalment. In course of time, we may hope to see the Metropolitan Cathedral cleared of its present disfigurements.

Wick.—One of the recent additions made to the architecture of Pulteney-town is a new shop, says the *John O'Grady's Journal*, which has just been opened by Messrs. Gow & Sons, merchants, at the junction of Dempster-street and the South-road, and opposite Thurst-street. The building is of dressed freestone, and has four

front windows of plate glass, 9 ft. by 6 ft. The interior accommodation and fittings are complete. The building plans were furnished by Mr. J. Ross, Inverness, and Mr. J. J. Harper of this town. The mason work was done by Messrs. Gow & Sinclair, builders; and the joiner work by Mr. John Bain, jun.,—the whole having been done under the immediate direction of Messrs. Gow & Sons, for whom the work was performed. The walls are lined with wood, varnished, thus giving a clean and airy appearance to the interior. A villa which is being erected in the new street which has been opened off the South-road, opposite the Episcopal Chapel, is nearly finished; and the new Pulteney-town Free Church Manse will be forthwith commenced in the same street.

Desford.—A new church, according to the *Elgin Courier*, has been opened for divine service at Desford. The old church overlooks the Desford Burn; the new one is built about a quarter of a mile farther west, and close to the turnpike road between Cullen and Keith. The Earl of Seafield is the only proprietor in the parish, and has built the new church at a cost of about 1,000*l.* There is accommodation for 500 persons. The style of the building is Pointed Gothic. It is surrounded with a walled-in shrubbery, and stands east and west. The façade is to the west. Over the entrance-door, of Mediaeval form, there is a two-light window, with tracery above it. On each side of this window is a lancet one, and the façade is surmounted with a belfry and bell, the first in keeping with the architecture beneath it. In what may be called the imitation traipse on each side of the church there are three-light windows, with different tracery above them from that in the one over the door. The other side windows are single lancet ones, all in diamond panes. The vestry stands at the east end of the church. The gallery in the west end is high above the ground-floor, supported on ornamental pillars. The architect was Mr. John Miller, Cullen House, the architect on the estate; the mason, Mr. Wm. Bennett, Cullen; the carpenters were Messrs. J. & W. Duffus; and the slater was Mr. Alex. Desson.

SCHOOL-BUILDING NEWS.

Hull.—The foundation-stone of a boys' school in connexion with St. Paul's Church has been laid. The site is on the north side of the vicarage, and has been presented by Mr. Liddell. The edifice will consist of two main schools and two class-rooms, and are capable of accommodating 390 boys. The main front is to be towards St. Paul's-street, and immediately adjoining the vicarage. The building is designed after an early type of Mediaeval architecture to harmonise with the church, school, and vicarage already erected, and is to be executed in red brickwork, with Yorkshire stone dressings. It will have an open-timbered roof, and be plastered internally. The work has been let by competition to Mr. Barrett, of Hull; the architect being Mr. Samuel Musgrave.

Reigate.—The new boys' school at St. Matthew's, Redhill, has been opened by the Bishop of Winchester. The new building has been erected, under contract, by Mr. Carruthers, from designs gratuitously furnished by Mr. Heeketh, of the Mount, Redhill. The new building, standing as it does behind the girls' school, and consequently almost hidden from view, can scarcely be said to be an additional architectural ornament to the town. The site was gratuitously presented by the Rev. H. Brass, and the situation is convenient. The school itself has cost 1,000*l.*, but another 150*l.* have been expended in putting the girls' school in thorough repair, whilst other necessary expenses for drainage, fencing, warming apparatus, &c., have brought the total expenditure up to 1,400*l.*, of which sum about 100*l.* have yet to be raised.

Shaftesbury.—Schools in connexion with the Church of England are about to be built in the parish of St. James, Shaftesbury, to afford accommodation for ninety boys and girls (mixed) and eighty-five infants respectively. The architect is Mr. James Soppit, of Shaftesbury.

Tisbury.—A school is about to be built in this parish, to accommodate ninety-two infants. The architect is Mr. James Soppit, of Shaftesbury.

Llanfist.—The foundation-stone of new schools about to be erected at Llanfist, near Abergavenny, has been laid. At the foot of the gigantic Blomange Mountain stands the little

village, and within a few hundred yards of the parish church, now crumbling in decay, it is proposed to erect the new school buildings, which will consequently stand on a considerable eminence, overlooking the town of Abergavenny, and in full view of the Holy Mountain, the Little Skirrid, the Sugar Loaf, and many other peaks of the Black Mountain range. The new schools are being erected to supply a want long felt, and, as the inhabitants of the district have not deemed it advisable to place themselves under the governance of the School Board, private subscription was the only means by which the scheme could be carried out, and it is chiefly, if not entirely, due to the late Mr. Crawslay Bailey that the erection of new school buildings has become practicable. The school is being built upon a portion of the globe land, from the designs of Mr. J. Neville, architect, Abergavenny, and Mr. Foster, of Abergavenny, has undertaken the contract for the sum of 315*l.* The building will be of native stone, which is very durable, and the main school-room will be 30 ft. in length, by 17 ft. in width, whilst the adjoining class-room will measure 14 ft. by 12 ft. Accommodation will be afforded for 84 children, allowing 8 ft. space for each child. Registers of a new kind, invented by the architect a short time ago, and adapted to unions and sick-wards, will be introduced. Provision has been made in the plans for the addition of a master's house at some future time.

Books Received.

Practical Geometry for the Architect, Engineer, Surveyor, and Mechanic. By E. WYNDHAM TARN, M.A., Architect. London: Lockwood & Co. 1871.

This is a work of remarkable merit in its class, and will be found of real use by those to whom it is addressed. The rules laid down are simplified, and they are fully illustrated by 164 wood engravings. We should have been glad to find a separate chapter on the theory of domes, concerning which Mr. Tarn has elsewhere shown himself well informed.

The Monumental Inscriptions of Middlesex. With Biographical Notices and Descriptions of Armorial Bearings. Vol. II. By FREDERICK TEAGUE CANSICK. London: J. R. Smith, Soho-square. 1872.

It is this second volume of a work, the first volume of which has already been favourably noticed in the *Builder*, the collection of epitaphs, copied from the existing monuments of distinguished and noted characters in the cemeteries and churches of Saint Pancras, Middlesex, is completed; and although not so curious and interesting as a whole, probably, as the first volume, the record of them will become more valuable as time runs on. Mr. Cansick, we believe, contemplates the publication of other volumes of a similar kind as to city churches and churchyards.

VARIORUM.

IN English Exhibitions sufficient attention has not been paid to mining and metallurgy, their processes and products. The *Mining Magazine* has the following remarks on the subject:—"What is wanted is a more correct classification, coupled with a more complete organisation. When it comes to the turn of mining and metallurgy in the Annual Exhibitions at South Kensington, it is to be hoped the classification of 1862, the best we have yet had, will be followed, with the improvements that experience cannot fail to have suggested to those intrusted with the arrangements of the class or classes. We should like to see, in order of their localities, and in connexion with similar products of other countries, a complete assortment,—first, of the various ores precisely in the state in which they are found; secondly, of the ores in the various stages of dressing; next, as they assume a defined shape as metals; and fourthly, as they are applied in the primary stages of manufacture. We would suggest as a model of what we mean the arrangement of woods shown in the Colonial Department in 1862, than which nothing could well have been more perfect.—Speaking of glass for horticultural purposes, the *Gardener's Magazine* remarks,—

"The selection of glass for horticultural purposes receives far less attention than the case demands, especially in gardens where glass is largely employed. It is not an uncommon thing to see the leaves of plants blotched and spotted, sometimes pierced with holes, in consequence

of inequalities in the texture of the glass, and the consequent focusing of the sun's rays upon it, the specks and bubbles in the glass constituting so many little "burning glasses." In other cases we see plains drawn and of a sickly colour through deficiency of light, and when this occurs the production of flowers and fruit is reduced considerably below the degree of possibility, for light is the grand agent in the promotion of a healthy development of every vegetable and secretion. There is much bad glass in the market, and it meets with ardent sale because of its apparent cheapness; but in no department of horticulture is it of more importance to secure a good article, and that which commands a comparatively high price is usually the cheapest in the end. . . . The best glass for ordinary purposes is 21-ounce sheet. It is usually of good quality; but, as above remarked, there are bad samples in the market. In making a purchase of glass, the buyer should see that it is free from specks and bubbles, and the examination of a few sheets will suffice to determine the character of the whole. To be lured by mere cheapness is to jeopardise the prospects of the gardener, and low-priced Belgian glass should always be purchased with caution. An even texture is of the utmost importance, and fortunately a person who has had but little experience in the purchase of glass may very quickly determine if a sample is faulty; for, in truth, the fault cannot be hidden, and, to quote the older Mothers, when he looked through a hole in the frying-pan on the stage, we may, if we buy rubbish, easily "see through our folly."

Miscellaneous.

Dover.—Building operations at Dover Castle have been enlivened by the frequent discovery of human skeletons. Recently a skeleton was found by the workmen in the course of their excavations for the battery in front of the military hospital; and another has been dug up at the south side of the Pharos. It was lying in a horizontal position, with the fleshless hands crossed over the bony framework of the breast. The arches in the Pharos, blocked up in the time of the Duke of Wellington, are now being again exposed to the light of day. Lieutenant Peck, R.E., has charge of the restoration, in the course of which it was seen that the Pharos goes down into the earth about 6 ft., and is built on a bed of clay, free from grit or foreign matter of any kind. During the excavations a stone was found bearing the inscription, "St. Adigmund's." Public attention at Deal is engrossed with the subject of the proposed tramway from Ramsgate, through Deal, to Dover, all the towns giving their approval, the opposition that has been encountered being from the country gentlemen and farmers. Irritation is felt that, as upwards of 70,000 persons have signified their desire for this method of communication (notably between Deal and Dover), there should be any difficulty placed in the way by those to whom a tramway is no desideratum.

Processes for Ornamenting Glass are given in the *Zeitschrift für Farberlei*, No. 20, 1871, by F. Springmühl. Bleached shellac is coloured by alcoholic solutions of any of the aniline colours; this is spread upon glass or mica after they have been warmed. Gun-cotton, dissolved in ether, when coloured with any of the aniline dyes, forms beautifully-tinted films. This coloured solution can be cut into any pattern, and the film attached to any transparent surface. These processes remind us of those suggested in the *Builder* many years ago. One of these was the conversion of glass itself into iridescent films by blowing, and then laying them on the back of thin sheets of heated copper or other metal previously gilt, and ornamentally perforated (or it might be by laying the films on heated ground glass itself, of gold or other colour, after being perforated); so that the iridescent films should shine through the perforations if the whole could be annealed or gradually cooled, so as to retain the film entire. Such experiments, as we stated, had been suggested by partially successful ones with perforated cards and shellac varnish films cast upon water, and lifted upon the backs of the perforated cards. Perhaps the gun-cotton or collodion might be of use in thus imitating gems in cheap ornamentation, by causing films to shine through perforated cards or thin metallic plates.

A New Public Hall for Peuge.—A substantial public hall has just been erected and opened at Peuge: it is intended to be used for meetings, lectures, concerts, and other entertainments. The building was opened last week, when the Crystal Palace Lodge of the Improved order of modern Templars held a tea meeting, at which a company of 240 were present. Afterwards a public meeting, presided over by Mr. J. Broomhall, of Peuge, was held in the hall.

Bromley Local Board.—Mr. Hugh S. Cregeen has been appointed surveyor to the Bromley Local Board.

The Artesian Well in Boston, U.S.—The work of boring this well was begun in the latter part of the month of March, 1871, and has been going steadily forward up to the present time, the progress made being from 1 ft. to 15 ft. each day, at a cost of 15 dollars per foot. The well had reached a depth of 1,000 ft. when we last heard of it. When the work was first commenced, a drill would last thirty-six hours without sharpening; now the same kind of drill will only last one hour. The diameter of the bore is 5 in.; the drill is 4 in. across. The drill and iron shafting which connects it weigh now 1,200 lb., and the rope by which it is lowered weighs 900 lb. The power is furnished by a 16-in. horse-power engine, with a walking-beam of 36-in. stroke, at the rate of about thirty strokes per minute. It is said to be the intention of the company to keep the drill at work until they obtain a sufficient volume of water for their use, unless their money gives out, or the drill goes through on the other side.

Midland Steam Boiler Inspection and Insurance Company.—The chief engineer's report for 1871, to the twentieth half-yearly meeting has been printed. The explosion of 1871, it states, do not point to any particular form of boiler as being especially dangerous, as nearly all those commonly in use can be made equally safe with proper care, and most of those often denuded of weak shape had worked safely twenty or thirty years, and had exploded from evils to which all are liable. The experience of the year shows the need of greater care in construction, to provide proper stays to ends, the want of stronger girders to manholes to prevent the edge of the plate cracking with the extra strain upon it, and the necessity of hoops or other means of strengthening weak internally fired tubes, and the greater care in executing repairs, so as to restore the strength, and with sound work to prevent the leakage from corrosion so often found in boilers repaired with rough screw-patches. There has been a considerable increase in the examinations of boilers and flues by this company's officers.

Boiler Explosions.—The report of the chief engineer of the National Boiler Insurance Company for the past year has been issued in a printed form at Manchester. It states that, although the explosions reported in 1871 were numerous, their total was below the average of recent years. The reporter had information of 43 serious explosions, which caused the deaths of 49 persons and serious injury to 103 others; total, 152 persons killed or injured. Since the commencement of the Company's operations in July, 1864, no less than 149 serious explosions of steam-boilers had occurred in the United Kingdom, causing 512 deaths, and, in addition, 860 persons were seriously injured. None of the boilers which exploded during the past year were under the inspection of the Company. The number of boilers under their care, and insured with them, has greatly increased; the accidents to them had not been many; and none of them were accompanied by serious results. The report is instructive as regards the kinds of boilers liable to explosion, and the more immediate causes of accident and means of prevention.

Iron and Steel Institute.—The third and final meeting of this society for the present season has been held at Willis's Rooms, St. James's, Mr. Bessemer in the chair. There was a large attendance of gentlemen interested in the iron trade, and several machines for improving the manufacture of iron were exhibited. The Chairman opened the proceedings by inviting a discussion on the papers which were read at Wednesday's meeting. A discussion then ensued of a technical character, and a variety of opinions were given as to the value of silicon and phosphorus in the manufacture of iron. Mr. Bessemer at the close said he believed they had inaugurated an institution which would, from year to year, be making its way before the world; and that it would cull from various sources an amount of information on specific subjects which would be interesting to them.

The Destruction of the Academy at Dusseldorf.—The *Cologne Gazette* gives particulars relative to the burning of the Academy of Dusseldorf.—Several studios of living painters were wholly destroyed, with all their contents; one large painting being an altar-piece by Andre-Müller, on which he had been at work for four years, and which was nearly finished. All the archives, records, engravings, plates, pictures, &c., of the Westphalian-Rheinish Club are lost.

Copying Drawings by Electricity.—A method of rapidly copying drawings or engravings is suggested by M. Chandery, who uses the induction coil for this purpose. The method adopted by draughtsmen consists in puncturing holes through the design, and thus obtaining an outline, which is subsequently transferred by sifting plumbago or other powder through the holes,—a very laborious task where the drawing is large or has much detail. In the plan proposed, a table covered with tin foil is connected with the negative pole of the inductorium, and on it are placed as many sheets of paper as the spark will penetrate. A metal bar, insulated with gutta-serena, serves as the positive pole, and as a pencil for copying the tracings. This point is moved about on the outline of the engraving, and sparks pass through the paper to the tin sheet underlying it every time connexion is made, puncturing four holes through the tissue at each passage. It is said that but little skill is required to guide the pencil, as the ink tracings, being good conductors, carry the pencil easily along.

The Polytechnic Exhibition at Moscow. The Vienna correspondent of the *Eastern Budget*, says:—"A Vienna paper warns the manufacturers of the empire against taking part in the Polytechnic Exhibition which is to be opened at Moscow in May, on the ground that the chief object of this Exhibition will probably be political, not industrial. There is reason to believe that this will only be a second edition of the famous ethnographical congress. It appears from the private accounts which arrive here from Moscow, that neither the space which is to be allotted to foreign exhibitors, nor the arrangement of subjects, can give the proposed Exhibition any claims to the appellation of 'international.' Industrial interests, it is said, are only so far considered as they may affect Russian manufacturers, and even the Government attaches but little value to the Exhibition as such. The committee has announced to the promoters of the Exhibition, that deputations would come to Moscow from all the Slavonic nations.

The Judge and the Carpenter.—The *Dorset Chronicle* reports that during the progress of the assize business in Dorchester, Mr. Baron Bramwell was repeatedly interrupted by the noise of a chisel and hammer. The judge despatched a request that the work should be put off, but he had again and again to inquire, "Who's that knocking?" which was loud and incessant. The answer to the third inquiry was that the industrious carpenter did not see the force of obeying the judge, and had put the query, "Who's to pay me my day's wages, I should like to know?" The learned baron, vexed apparently at the man's persistent knocking, but amused at his impudence, said, "Go and tell him to come and show cause why he shall not be fined 50l. for contempt of court!" No longer were law and justice impeded, or the dignity of "my lord judge" slighted by "that knocking" within the precincts of the court. Nevertheless it was hard upon the poor carpenter.

Telegraphic Progress.—A novel and successful experiment in telegraphic reporting was made in connexion with the Oxford and Cambridge Boat-race. In order to transmit a description of the race, as it was rowed, arrangements were made by the proprietors of the *Central News* to pay out a cable from one of the steamers which follows the racing-boats. There is no novelty in telegraphing through cables as they are being payed out, but there is no precedent for performing such a work at the pace of racing-boats. The leading facts connected with the race, including the varying positions of crews, and the times at which they reached well-known points, were telegraphed before the race was concluded. By this means the *Central News* was enabled to transmit throughout the kingdom, and to place before readers hundreds of miles distant, more information respecting the race than was known to the spectators on the banks of the Thames.

Fish Torpedoes.—A number of workmen in Woolwich laboratory, it is whispered, are specially employed in the manufacture of "fish torpedoes," machines of iron, in shapes somewhat like a fish, about 5 ft. long and 1 ft. in thickness, each containing a little engine worked by compressed air, capable of propelling the torpedo a considerable distance under water with wonderful accuracy. When it strikes the hull of a hostile ship it explodes with fearful force.

Model Dwellings for Boston, U.S.—The first annual report of the Boston Co-operative Building Company has been printed (Deland, printer, Boston). The directors have purchased ground, and are now erecting ten small houses in a block. The general plan is, that each floor should be so arranged as to accommodate one family only; and thus, though the entrance and the stairway will be in common, there being only one set of occupants on each floor, a tolerable degree of privacy will be secured. Each apartment will be furnished with water and gas, and will be thoroughly airy and comfortable. There being, however, great need of dwellings for single persons, or for families of two members only, it has been arranged that some floors shall be subdivided, giving the front to one person or family; the back to another. Meantime, buildings already in existence are being remodelled, and the Company are proceeding hopefully with their good work. They desire to extend the capital already in hand.

Preservation of the Hackney Commons.—The Metropolitan Board of Works have determined to take under their control, for the preservation and recreation of the public, the collection of open spaces known as the Hackney Commons. Under this general name are included London Fields, Hackney Downs, Hackney Common, North Mill Field, South Mill Field, Stoke Newington Common, and Clapton Common, with pieces of waste land, near Dalston-lane, and Grove-street, all situated to the north of Victoria Park. A scheme for the local management of these places, and their preservation, in the interests of the public, has been prepared by the Board of Works, and certified by the Enclosure Commissioners, under the provisions of the Metropolitan Commons Act. This step on the part of the Board of Works will effectually prevent all future attempts to build on the Commons.

Chicago requires Self-help.—A Chicago paper has let the world into the secret that, although contributions in aid of the ruined and destitute people of that city were sought all over the world, the part of the city which remained burnt has done literally nothing for the relief of its starving neighbours. In the same way, from a Chicago letter in the *New York Times*, we learn that the luxury and extravagance of the place are greater and more ostentatious than ever. There are, it seems, 2,000 saloons,—1,987 being known to the police,—where drinking and gambling on an extensive scale are carried on. There are five theatres; and a new Opera-house, cost 400,000 dollars, is projected. The writer of the letter goes on to say,—“The support of 1,000 saloons at 5,000 dollars only, costs 5,000,000 dollars a year, and this is a mere sagatello oven for burned-out Chicago.”

Poplar New Town Hall.—At the last meeting of the trustees of the parish of Poplar, a report from the Committee of Accounts on the completion of the new town-hall and parochial offices, as read and unanimously adopted. The committee said in conclusion,—“Your committee do feel much indebted to Messrs. Harston, the architects, for the attentive manner in which they have watched over the interests of the trustees, and recommend that a letter be written to Messrs. Harston, expressing the thanks of the trustees for the careful consideration which they have given to the directions of the committee, and for having designed a building so reliable to the parish. Your committee further recommend that a letter be written to Mr. din Sheffeld, testifying your appreciation of the manner in which he had carried out his contracts.”

Kimberley v. Dick.—The Master of the Chancery has made the following order:—

“The plaintiff to give to the person in charge of the house two clear days' notice of an intention to visit the house. The visit to be from 10 a.m. to 4 p.m. in each day. No locking of doors; free access to every room to be given to the plaintiff, his surveyors, and workmen. The plaintiff undertaking on behalf of himself, his surveyors, and workmen, to do all in their power to avoid giving any inconvenience or annoyance to any person residing in the house at the time and to be answerable for all damage done to the house or to any of the furniture or ornaments therein, and the defendant to pay the costs incurred by an ineffectual visit to Humewood, and also the costs incurred of the last motion and of this motion.”

Private Views.—The private view of the exhibition of pictures by artists of the Continental School, will take place at the French Gallery, on Saturday, the 30th of March; that the Institute of Painters in Water-Colours on Tuesday, April 20th.

Further Addition to St. Luke's Workhouse.—Although recently enlarged, St. Luke's Workhouse has been found too small for the requirements of the Union. No estimate, says the *Clerkenwell News*, has yet been furnished of the cost of the proposed enlargement, but the contemplated outlay so alarmed Mr. Eastace, that he expressed his belief that before long the burdens of taxation would bring down many ratepayers to the position of paupers. In view of such a contingency, Mr. Mathews thought it would be desirable to make the workhouse as comfortable as possible, and the Board generally appeared to agree with him, for they adopted the report of the committee, recommending the erection of new buildings.

Consecration of Corbridge Cemetery.—Two acres of ground, situated on the south side of the River Tyne, on the road between Corbridge and Dilston, were purchased by the Local Board, who borrowed 1,500*l.* to meet the cost of purchasing the ground, and erecting two chapels, a cottage for the keeper, and walling in the ground. Mr. J. J. Lish, of Newcastle, was appointed architect, and he designed the two chapels, one for members of the Church of England, and the other for Nonconformists. The style of architecture is Gothic of the Early English period. The cemetery is divided into two equal portions, one-half for members of the Church of England, and the other half for Nonconformists. The Church of England portion has been consecrated by the Bishop of Durham.

Sea Water Utilised.—Something novel in the way of sanitary improvement has been undertaken by the Borough of Tynemouth Corporation. Mr. Adams, contractor, Darlington, is making a reservoir in a field in Hawkey's-lane, near the former town, 49 ft. square, 6 ft. deep, and to hold 52,000 gallons of sea water, which the corporation intend to supply from a pumping station on the Low Light Shore. There will be two services of pipes, and it is anticipated that Turkish and public baths will be supplied with salt water. The water, however, will be principally used for flushing the sewers, watering the streets, extinguishing fires, and general sanitary purposes. Private houses and hotels, no doubt, in the line with the pipes, will be able to contract for a supply of salt water for baths.

Curious Facts in the Wood Trade.—Among other trade circulars to hand is “Edward Chaloner's Wood Circular.” From it we learn that Mr. Chaloner, whose name and character are well known, has been a broker for fifty years. Also, that in the last week of February last, 1,890 tons weight of mahogany, cedar, lancewood, lignum vitæ, and teak, were sold by auction in Liverpool among 90 actual buyers, of whom 68 were non-residents, and who in the aggregate travelled 13,600 miles journeying to and from the auction. Further on, Mr. Chaloner says, “The highest price ever paid for mahogany was paid at this sale by Messrs. T. Mills & Co., cabinet-makers, of Bradford—viz., 29*s.* 4*d.* a foot, a London buyer being the previous bidder.”

Surveyor's Services in Islington New Workhouse Arbitration.—At a recent meeting of the Islington Board of Guardians, the clerk read a letter from Mr. Sparling, the solicitor to the Board, certifying that the claim of Mr. Gritton, surveyor, for 498*l.* 16*s.* 3*d.*, for services rendered in connexion with the recent arbitration in the matter of the guardians and the contractors for the new workhouse, was correct. Mr. Hillman said the guardians had lost nearly 2,000*l.* by accepting the contract of Messrs. Nutt. Mr. King said he was of a contrary opinion. He believed Messrs. Nutt had lost largely by the contract, and the Board had enjoyed the full benefit. The account was ordered to be paid.

An Amphibious Circus.—There is at Rulroort, in Prussia, a circus of remarkable construction, although the kind appears to be not uncommon in the United States. It is an immense float, or boat, 300 ft. long, and nearly 80 ft. broad, built in sections, and made to contain 2,500 spectators, when put together. It has on board lodgings for the company, stables for twenty-five horses, a restaurant, gasometer, printing-office, and two steam fire-engines. It is now going down the Rhine, giving performances at the towns on the banks.

London Institution, Finsbury-circus.—Interesting lectures are given here on Thursday evenings. On the 21st, the subject was “How Plants are fertilised,” by Mr. A. W. Bennett.

The Tunbridge Wells Cottage Improvement Company.—The report of the last year states that by a liberal and judicious expenditure on their old cottages, they have now been made into decent and respectable residences, which are let at moderate rents paid regularly. This is the work which the directors desire to proceed with as opportunities occur for making fresh purchases; but, without increased capital, it must soon come to a stand-still. Purchases have been made during the past year. Notwithstanding drawbacks, they recommend a dividend of 4 per cent. on the paid-up capital of 2,640*l.*, and leave 32*l.* to be carried to next year's accounts.

The Sewage Question at Ware.—The Ware Board of Health having petitioned the Local Government Board for an extension of time to provide means for preventing the flow of sewage or other offensive matter from their district into the River Lea (further time having been refused by the Lea Conservancy Board), in pursuance of this petition Mr. Robert Morgan, the inspector appointed for the purpose, has held an inquiry as to the subject-matter of the petition at the offices of the Ware Local Board of Health. The evidence taken by the inspector will be laid before the Local Government Board, after which the Board of Health will be informed whether their petition for an extension of time is granted or not.

The Fires Bill.—Colonel Hogg, M.P., intends to move in committee on the Fire Bill the insertion of the following clause:—“Inquiries respecting fires under this Act shall be held by the police magistrates within the metropolis, and by such one of those magistrates as acts within that part of the metropolis to which the inquiry relates, and elsewhere by the justices or the stipendiary magistrate acting within the division or place where a fire has occurred, and an inquiry under this Act is to be held.”

Street Improvements in Blackfriars.—Amongst the improvements noticeable in the vicinity of the new railway station which is now being proceeded with at Blackfriars, at the west end of Southwark-street, is the opening out of a broad thoroughfare leading from Southwark-street to Bankside. The demolition of a number of small and dilapidated-looking property has been a decided gain in appearance. A broad street has been made, which is laid in asphalt by the Limmer Company.

St. Paul's Cathedral.—The choir of St. Lawrence, Jewry, and other friends have subscribed to present to St. Paul's two handsome caskets for the wine and water, which will, we believe, be used for the first time on Easter-day. They stand 9½ in. high. The bowl is of crystal, and the mounts are gilt silver. The foot, neck, and cover are chased in relief, and they correspond with the alms-dish lately presented. They have been designed and executed by Messrs. Lias & Son, of Salisbury-court.

Cost of Illuminating a Church Clock.—A committee appointed to inquire as to the cost of illuminating the dials of Limehouse Parish Church have reported that the entire cost of illuminating the dials, gasfittings, and other works to complete the same, will not exceed 400*l.*, and that the cost of lighting and annual maintenance of the same will not exceed 60*l.* The dial is 188 ft. from the ground, and 12 ft. in diameter: it is visible on the Thames. The work is to be done.

Theatres.—It is proposed to erect a new theatre in Edinburgh, on the south side of the town. The project is to be on the joint-stock company principle, and is being got up by the friends of the lessee of the Royal Princess Theatre, Mr. McNeil. One of the sites that has been mentioned is Nicholson-square Gardens, nearly opposite the Princess Theatre, for which the owner asks 6,000*l.*

The Wellington Monument.—In reply to a question from Mr. Goldsmid, the Chancellor of the Exchequer said he had every reason to believe that this monument would be completed within the contract time, although at present the sculptor was ill. The progress made thus far was rather architectural than sculptural.

Plans for the Portsmouth School Board. Designs, prepared by Messrs. Alexander & Henman, of Stockton and Middlesbrough, architects, have been selected, second in order of merit, from among forty sets submitted in competition for schools for the Portsmouth School Board.

The City Sewers.—The reports, as to the interception of the sewage of the City from the Thames, by Mr. Bazalgette and Mr. Hayward, and report, with return from the City Sewers Commission to the Court of Common Council on the main drainage rate paid, and the other charges of the Metropolitan Board, have been issued by the City Sewers Commission in a printed form.

Asphalte Paving in the City.—It has been further resolved that the footways in King William-street be paved with asphalte, and that that portion of the footway of King William-street between Lombard-street and Cannon-street be paved with Barnett's asphalte, at 4s. 6d. per square yard, he undertaking to keep it in repair for ten years without further charge.

Varnish.—To Varnish Beech.—It is a poor-looking wood, with little curl or figure: therefore stain with the following:—Burnt umber and soap lees, and if any knots, give an extra touch or brush; let it stand to dry; the next day following size it over twice; and the next day, varnish it: use the best varnish.—G. Y.

Land in London.—Mr. Richard Tress, architect, has taken a lease for eighty years of all that angle at the north-east end of the Holborn Viaduct having a frontage to the Viaduct itself, a rounded frontage towards St. Sepulchre's Church, and about 200 ft. frontage on Snow-hill, for which he is to pay 1,725*l.* per annum. The quantity is said to be about a quarter of an acre.

The Literary Fund Dinner.—The dinner of this corporation, to be held in St. James's Hall on the 8th of May, under the chairmanship of H.M. the King of the Belgians, promises to be a brilliant affair. The list of stewards, not yet published, but already numbering 201 names, is a remarkable document.

Holbein Pictures.—The Burlington Club intend to hold an exhibition of pictures and drawings by Holbein in the house of the Club, and to open the same at the end of April next. This exhibition will include pictures and drawings from Windsor Castle and other Royal palaces.

The Agricultural Labourers' Strike.—The agitation amongst agricultural labourers has extended to the counties of Buckingham and Northampton. Meetings have been held at various places to consider the question, and it has been agreed to ask an advance of wages.

Visitors at South Kensington.—The number during the week ending March 16th was 33,019, against an average of corresponding week in former years of 12,742. This serves to show the interest excited by the Duke of Edinburgh's collection.

Tunstall.—The memorial-stones of a new Wesleyan chapel and schools, in Cardridge-street, Sandford, have been laid. The cost of the edifice will be nearly 700*l.* It will be a plain brick building, 36 ft. by 45 ft., and will accommodate about 250 persons. One portion will be partitioned for school purposes, and the partition will be capable of being withdrawn, so that the old building can be used when required for divine service. The architect is Mr. R. Dain, of Burslem; and the builder, Mr. Joseph Lunt, of Tunstall.

TENDERS

For Messrs. Cook's new premises, Ludgate-circus, Fleet-street, Mr. H. Gundry, architect. Quantities supplied:—

TO BUILDERS, &c.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, Out-door. Ten year character from one employer. References undesirable.—Address, J. C. Cousins-terrace, High-street, Kensington.

WANTED, a RE-ENGAGEMENT, as OUT-DOOR FOREMAN, Carpenter and Joiner by trade, &c. &c. No objection to the country.—Address, E. M. G. 5, Clifton-villas, Upper Lambeth-road North, S.W.

TO BUILDERS.
WANTED, a RE-ENGAGEMENT, by a competent FOREMAN, of twelve years' experience. Is experienced in all branches of the trade, and is well up in figures and drawing. No objection to the country.—Address, T. J. 8, Office of "The Builder."

TO BUILDERS and CONTRACTORS.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN or FOREMAN of BRICKLAYERS, and Stone-work, by trade. Well up in setting out work and superintending men. No objection to the country. Seven years' testimonials from last employer and good references.—Address, H. H. Post-office, High-street, Croydon.

WANTED, a RE-ENGAGEMENT, as SHOP FOREMAN, OUT-DOOR FOREMAN, or CLERK of WORKS, by a thoroughly practical London Builder of the Firm, Joiner and Stone-work by trade. Age 24. Good character, and well up in piecework and machinery of all kinds. No objection to fill up time in the office. First-class testimonials from last employer and Builders.—Address, H. K. 44, Matilda-street, Coleman-road, N.

WANTED, by a Young Man (aged 26), a SITUATION in a Builder's or Contractor's Office. Ten years experience. Good references. Well up in quantities, estimates, &c.—Address, H. C. 38, Fresh-street, Northampton.

TO SIGN WRITERS and DECORATORS.
WANTED, by a Young Man, just out of his time, a SITUATION as IMPROVER in SIGN-WRITING, GRATING, &c. Is a good writer on glass and wood. References of the highest character.—Apply, by letter, to C. STAMP, High-street, Merton, Surrey.

WANTED, by a Young Gentleman, who has had four years' experience in an Architect's Office, a TEMPORARY ENGAGEMENT from April inclusive. Good draughtsman.—Address, 201, Office of "The Builder."

TO AUCTIONEERS and LAND AGENTS.
WANTED, by a Young Man (aged 20), who is a good draughtsman, and has had practical experience, a SITUATION in an Office where he can IMPROVE himself. Salary not a consideration.—Address, 41, Office of "The Builder."

WANTED, by a Young Man, a SITUATION. Call do the jobbing work of houses, plumbing, whitewashing, range and copper setting. Would fill up time in setting.—Good references can be had.—Address, S. M. No. 1, Clyde-terrace, Harrogate, East-riding, S.E.

TO BUILDERS and OTHERS.
WANTED, by a Young Man, aged 23, a SITUATION as CLERK, TIME and STORE KEEPER. Joiner by trade, and could fill up time at the bench. Good personal character.—Address, F. C. & John's terrace, East John-street, Exeter.

TO ARCHITECTS, &c.
WANTED, by a YOUNG MAN, of respectability, an ENGAGEMENT as CLERK of WORKS, if required would execute supplementary drawings in connection therewith. Mason by trade. For many years past has had the management of the constructive portions of buildings (chiefly in Yorkshire), public, domestic, and ecclesiastical, and is now finishing a large church. Has a thorough knowledge of masonry, brickwork, and sanitary matters, and a good knowledge of the other building trades. Has been practising in the office of an architect, and has acquired architectural draughtsman and designer, specimens of which can be forwarded. Unexceptionable references for integrity and capabilities.—Address, F. W. Southampton Court, Northampton.

The Builder.

VOL. XXX.—No. 1522.

The Japanese Craze.

HERE have been during a comparatively short period, as all our readers who take note of such things are aware, several successive tendencies among English architects and decorators towards the imitation and adoption of first one and then another fashion in the treatment of ornament, borrowed from people separated from us by

either time or space, or both. These changes in decorative taste have taken place much more rapidly than those in architectural style in the wider sense; two or three at least having already supervened upon the increased use of the forms of Gothic architecture. With that we had, of course, at first the imitation of the ordinary forms of detail and decoration common in our own country in the Middle Ages; commencing with the later, and going back by degrees to the earlier forms. Then followed, after some coquetting with Egyptian work, the neo-Greek school, with which some Egyptian "dodges" in colour and design were incorporated, with their barbaric character in some cases (not in all) more or less refined out of them. Now we are entering on a similar predilection for Japanese work, and Japanese colour and ornamental design.

All these different succeeding tastes have one thing in common in their development. They have all commenced by a sincere appreciation and admiration of the real merits of some one class of ornament on the part of a few persons; they have then been taken up and carried out in modern English work to supply the demand for novelty in ornament, and have finally lapsed into a mere foolish fashion, a dilettantism for fashion's sake, and only to be rightly described by the word we have used above, as a popular "craze." With a certain clique of amateurs, the taste, or appetite, or whatever we may call it, for Japanese work has for some little time past reached the "crazy" state; and a paper read the other day at the Architectural Association, the greater part of which appeared in our columns, appears to sound the note for a further development of this fancy among the rising generation of the architectural profession.

Our object in reverting to the subject is not by any means to attack either Japanese art in general, or Mr. Audsley (who seems to have become practically a Japanese) in particular. In regard to the general subject, we believe we were the first to call attention, a good many years ago, to the peculiar freedom of hand and felicity of design betrayed by the Japanese in their conventionalised treatment of foliage ornament, of which we gave illustrations from time to time; to have reproduced these with the colour which is perhaps their chief excellence, would have been travelling beyond the limits necessarily set to illustrative additions in a journal of this nature. And we willingly gave further currency to a paper on the subject by an

architect who seems to have paid a good deal of attention to it, and who had something to tell his audience about it. It is in order to draw attention to the defects as well as the merits of Japanese art, and (which is still more important) to recommend a discriminating and critical study of the subject, instead of a blind and exaggerated admiration, that we feel impelled to say a word in the way of criticism on Japanese ornament and its prophets.

For it cannot be too often repeated that there are two ways of studying and adapting from any ancient or foreign school of design. One way is to get up an over-wrought enthusiasm about it, to believe or affect to believe everything about it to be marvellous and perfect, and to endeavour to reproduce it wholesale, "with all its imperfections on its head;" the other is to study it critically and carefully, arrive at a settled conclusion as to what in it is really admirable in principle and what is not, and then draw from its best points suggestions and lessons for the amelioration of our own art or manufacture. The former is by far the easiest and most popular method, requiring only the expenditure of some time and patience in examining and copying specimens; the latter, which requires an admixture of intelligence and critical insight, is the only method of studying which it is worth while for any educated man to give his time to. If our readers think this a truism, we can only reply that it is one which we mean to reiterate until we see it a little more carried out in practice than it is at present. Now, it is not difficult for any unprejudiced person to see to which method of study the present increasing fever of admiration for Japanese work belongs. To judge from the expressions used by Mr. Audsley and others of the Japanese *dilettanti*, it would seem that the Greeks themselves must have been mere barbarians by the side of these artists of the Eastern Seas. It is claimed for them that they have been "for centuries the great students of Nature;" that in colour, in form, in variety of design, they are completely fitted to be the masters and teachers of the West. "Marvelous," "wonderful," "almost superhuman" (!), are the epithets which seem to be considered quite within the mark in speaking of them. Now, what is the truth of all this?

There appear to us to be two points in the art of the Japanese, in regard to which it would be scarcely possible to speak with too much admiration. The patience and manual dexterity shown in the minute finish and elaboration of much of their ornamental work, notably in the cabinets and the *cloisonné* enamelled ware, are really something wonderful; and such works, like the enormous granite temples of Egypt (the architectural antipodes of Japan), speak of a country and society where time was "no object;" secondly, their natural feeling for harmonious combinations of colour, rich without garishness or over-brilliance, is remarkable, and renders their enamelled ware in particular as delightful to the eye as it is suggestive and instructive to the student of colour. It is noticeable that in these works pure primary colours are little used, and only in very small detached portions, warmed secondary tints being, however, very largely introduced. This taste in colour distinguishes the Japanese from some other Eastern nations which have shown great aptitude in decoration. In the mere manipulative dexterity mentioned above, the Chinese are their rivals; but in regard to colour, though the Chinese show that a natural ability to deal with it which belongs more or less to all Eastern nations, civilised and uncivilised, the bright, strong, and comparatively raw tones of their work seem coarse and commonplace by the side of the Japanese work. There is accordingly much in the colour designs of the Japanese which affords the most valuable hints to the Western decorative artist and student of colour, and from their enamelled ware might

be taken many motives and ideas for the treatment both of stained glass and of mural and ceiling decoration,—not in the way of direct imitation, of course, but by working out in our own fashion and in our own materials the hints given by the Eastern workmen. The free, and yet perfectly suitable and characteristic manner, too, in which the forms of flowers and leaves are conventionalised to adapt them to their situation in the ornamental design, a manner in which much of the freedom and grace of nature is retained along with the degree of symmetry and regularity required by artistic design, cannot but strike every critical observer of these works: (as to the delineation of animal life we have a word to say just now). All this would certainly strike any one on examining for the first time one or two of the best specimens of the Japanese *cloisonné* ware; indeed, we believe the first impression generally is, what we remember ourselves to have experienced, a feeling of astonishment that things so elaborate and characteristic in their treatment should have remained so long practically unknown to Western artists.

An inspection on a larger scale by degrees modifies to some extent this first admiration. It becomes evident that whatever the minute variations of detail, the character of treatment and the idea on which the ornamentation is based vary very little in objects of the same class; and that in many cases there seems indeed to be no "idea" at all but bow to cover a given space in the richest and most varied manner with elaborate ornament. The colours, the general effect, the character of detail, will scarcely vary appreciably in a dozen specimens taken at random; and it is as possible to get tired of *toujours perdrix* in this as in many inferior works of art-handicraft. In regard to what may be called intellectual interest, indeed, the Japanese ornament cannot be compared either with the Greek in the purity of line and of general form or details (the outline of their vases in particular being often very ugly and clumsy), or with the Saracenic in the dexterity with which these are incorporated into one design. On this latter point the Japanese artist is utterly careless, not only disregarding symmetry in the relation of the various parts, but quite careless even as to fitting the design to the size or shape of the object to be decorated.

With the bappy consistency of blind admiration, this irregularity is pointed out to us as one of the things to be specially admired. That professed artists can be found deliberately to say this, is a significant fact; as significant as the theory we saw put forward in a contemporary not long since, also by a professed artist (a painter), that all ornament ought to be irregular because there was no regularity in the disposition of the starry heavens! Such ideas serve to indicate the sad nonsense that people will talk when they follow a fashion in art, or commence theorizing without any definite basis. We have no hesitation in asserting, and we feel sure that every really thoughtful critic will bear us out in a view illustrated by all the greatest styles of ornamental art, that the relation of a design to the space and figure it has to occupy is just one of the things which most gives intellectual interest to it, and which requires often more thought on the part of the designer than any other part of his work; and that the ignoring of this, and the overlaying an object with ornamental design at random, is simply an avoidance of one of the most difficult and interesting problems in design, and is more than anything characteristic of the "childishness," as we may call it, which always belongs to the work of a semi-civilised people. It is true there is something very interesting in this childish *naïveté*, when it is genuine, just as there is in the simplicity and efforts of childhood in general; but it would be no less absurd for men to imitate deliberately

the manners and voice of children, than for the artists of an intellectual and educated society to deliberately imitate the unstudied irregularity and purposeless character of much of the Japanese ornament. Whatever charm might belong to the original will be found to have completely evaporated in the copy; and we hope the young architects of our day will not be persuaded to try any such foolish tricks in design.

We referred just now to the claims for admiration put forward for the Japanese as delineators of animal life. Within certain limits these claims are justifiable enough. In the representation of birds in particular, which are their favourite objects, we find, notwithstanding a certain stiffness, that close imitation of minutiae of outline and action frequently found in the drawings of half-civilised nations, depicting with care and exactitude exactly what they see before them. In the treatment of quadrupeds they are, as far as we have observed, less successful, the difficulties of drawing and foreshortening being greater here. But one point which is conceded even by their most enthusiastic admirers is, that the Japanese never have shown the ability to introduce the human figure with success, or with artistic power in their works.

This was admitted at the lecture at the Architectural Association before referred to; but the real significance and importance of this deficiency does not seem to have occurred either to the lecturer or his audience. The fact is, that the human figure is the one object in nature in regard to which mechanical copying will effect little or nothing for art, in which we demand not merely a correct representation of the physical characteristics of the species, but the representation of thought and feeling, and mental character through the medium of form; and this is just what a half-educated and infantile people never have arrived at, and never can. In every marked period of art, the degree of power shown in the representation of the human figure and of human character as exhibited through its medium, is almost the exact measure of the intellectual power of the artists and of the intellectual value of their productions; and the want of this power is always the mark of a barbaric, or semi-barbaric, art. Without this, a national art may exhibit ingenuity, patience, dexterity of hand, and correctness of eye, and even a very refined feeling for colour; but it will never answer fully the demands of educated minds, nor bestow the highest class of enjoyment which such minds are capable of deriving from art. We have been for some time confined in our convictions as to this distinction by the observation that among those amateurs and collectors who make the greatest display of this exaggerated fancy for some particular branch of ornamental art, the majority appear to have no faculty for comprehending the works of the greatest masters of art, and trouble themselves very little about them. We remember hearing of one of these ornament-fanciers one day observing condescendingly, in response to some observation as to the beauty of Flaxman's designs—"Yes, I believe he was very clever." Any comment would spoil this; but we could multiply instances of similar Boettianism.

On the whole, then, we conclude that while there is in Japanese art a feeling for colour, a delicacy of manipulation and finish, and a peculiar naive charm and freedom in ornamental design, rendering its productions objects of great beauty and interest, and in some respects highly suggestive and instructive; on the other hand, it exhibits, though in a more refined form than usual, all the characteristics of what may be rightly termed a semi-barbaric art, and possesses little or nothing of what can be called, in the highest sense, intellectual interest. The now celebrated miniature cabinets, with their odd and interesting variety of ornament increasing the whole without any apparent rule, except that of elaborating every part of the surface available for ornament as highly as possible, show, with all their delicacy and minuteness, little thought on the part of the designer in proportion to the amount of work displayed; for real thought, in ornamental design, is evinced not in crowding every part of an object indiscriminately with ornament, but in the faculty of judging where to ornament and where to stop; what part to emphasise, and what to leave as a foil to the rest. And this want of intellectual interest is rendered more marked by the absence or total failure of delineations of the human figure, without which the highest and most intellectual feelings cannot find voice

in art. The Japanese art, in short, is one in which ingenuity, patience, and (in general) good taste take the place of that great power in art which we call *genius*. It is an art for the pleasure of the eye, and not of the mind; and, whatever, its real beauties, such an art ought never to be slavishly worshipped by those whose higher education and civilisation should fit them to appreciate higher things.* In regard to those articles which are becoming the staple object with "collectors," it may be said "they that buy them are like unto them;" for nothing has a greater tendency to weaken and deaden the appreciation of the more intellectual productions of art than the indulgence of this kind of forced taste for an imperfect or restricted form of art. In this view, the whole philosophy of the subject might be summed up in the words from one of the finest sonnets of Drummond:—

"Of this fair volume which we World do name,
If we the sheets and leaves could turn with care
Of him who it corrects, and did it frame,
We clear might read the art and wisdom rare.

But silly we, like foolish children, rest
Well pleased with colour'd vellum, leaves of gold,
Fair dangling ribbands, leaving what is best;
On the great writer's sense nor taking hold.

Or if by chance we stay our minds on aught,
It is some picture on the margin wrought."
Which thing is an allegory.

THE PROGRESS OF SANITARY LEGISLATION.

THE Public Health Bill, of which we recently gave an analysis,† is founded on the second Report of the Sanitary Commissioners presented to both Houses of Parliament by command of her Majesty. This document was printed in 1871, and bears the mark C. 281; but, extraordinary as it may seem, is not dated. We propose to give some further attention to this Report; to inquire how far the Bill now before Parliament does, or does not, carry out its recommendations; and, in so doing, to take a general survey of the present state of this most important subject.

It is now, perhaps, for the first time in the history of this country, that it has been proposed to introduce into our law an entirely new branch, the necessity for which has been ascertained, and the object of which has been formulated, on scientific grounds. While an attempt of this nature is, in itself, a great stride in the progress of civilisation, it is the more necessary to guard against any avoidable complication, and to take care that, in the inception of a new code, no false steps are made. Pressing, as the subject is, it is one in which haste is not necessarily coincident with good speed. It is the more useful to examine where the bounds of the new laws should be drawn, because in this, as in all comprehensive questions, there is a wide margin of debatable ground. It does not follow, because certain points bear more or less directly on public health, that they are, for that reason, to be removed from the province of police or of criminal law, and handed over to the operation of a new machinery, destined, in its original organisation, for the discharge of another class of duties.

Legislative protection against dangerous nuisances is not, however, altogether new in this country, although the general review of matters affecting the public health cannot yet be said to be at all complete. So early as the twelfth year of Richard II., A.D. 1388, an Act was passed, imposing the heavy penalty of 20*l.* on persons who cast animal filth or refuse into rivers and ditches. In 1489 an Act was passed prohibiting the slaughtering of cattle within cities and boroughs. The common law, and the Sheriffs' Court and Courts Leet, took cognizance of unhealthy nuisances; and in 1552, and again in 1558, the father of William Shakespeare was fined for depositing filth in the public street of Stratford-on-Avon, and for not keeping his gutter clean.

In the reign of Henry VIII., the Statute of

* It is amusing enough to hear, as we did the other day, from a correspondent in Japan, that the people there are taking just now to imitating our costumes, the ladies in particular procuring all the adornments of chignons, &c., while we in England are manufacturing imitations of their ware. We are afraid it can hardly be said that they are the gainers in this exchange; but if the Japanese in this country go on as they seem inclined to do, crying up every branch of Japanese art-manufacture as something wonderful, and giving fabulous prices for any small ugly-shaped pot with an enamel pattern over it, it may be hard to say which will prove in the long run the more absurd "craze" of the two.

† See p. 218, ante.

Sewers was passed, authorising the issue of commissions to superintend the cleansing of rivers and streams, and the maintenance of dykes and sea walls in specified districts. From the reign of George II., the more populous and wealthy towns have applied to Parliament for special local Acts for paving, lighting, cleansing, and improving their districts. But it was the alarm caused by the ravages of the Asiatic cholera, in 1831, that led to the first move in sanitary reform. In 1832, the powers already exercised by the Privy Council under the Quarantine Act of 1825 were extended. In 1833 a new Lighting and Watching Act imposed penalties for the contaminations of streams by gas. In 1835 the Municipal Corporations Act was passed, the importance of water supply, the want of open spaces in crowded cities, the necessity of superintendence being exercised over common lodging-houses, and the need of public baths. The appointment of Local Boards of Health and of inspectors was also recommended by the committee.

In 1836 a most important step was taken by the appointment of a Registrar-General of Births, Deaths, and Marriages. Sanitary information was now, for the first time, officially collected and abstracted, and the basis for enlightened legislation was thus prepared.

In 1839, attention was called, in consequence of the report of the Registrar-General, to the excessive mortality of towns. A select committee of the House of Commons reported, in 1840, as to the evil of interments in towns, the importance of water supply, the want of open spaces in crowded cities, the necessity of superintendence being exercised over common lodging-houses, and the need of public baths. The appointment of Local Boards of Health and of inspectors was also recommended by the committee.

In 1840 inoculation for small-pox was prohibited; and in 1841 the expenses of vaccination were charged upon the poor-rates. In 1843 a royal commission was appointed to inquire into the causes of prevalent disease, and the best means of improving the public health under the then-existing laws. The evidence before the committee traced, in the cases of fifty towns, the origin of excessive mortality to defective drainage and similar causes. In 1845 the commissioners made a second report, recommending that the Crown should inspect and supervise the sanitary improvement of towns and populous districts, and that the powers and areas of operation of local authorities should be enlarged. After two failures the legislation required for accomplishing these purposes was effectually commenced in 1846.

In that year was passed the first of a series of Acts of Parliament for the removal of nuisances, Summary jurisdiction was given to justices in petty sessions, acting on the information of town councils, commissioners under local Acts, or Boards of Guardians. Nuisances were defined to comprehend filthy and unwholesome dwellings, accumulations of offensive matter, and the existence of foul drains or pools. The powers of the Privy Council to make regulations for the prevention of formidable contagion was also extended by this Act, which, however was only to remain in force until the session of 1848.

In 1847 the Towns Improvement Clauses Act, and the Towns Police Clauses Act, were passed, for the purpose of consolidating the provisions usually inserted in local Acts for public purposes of a sanitary kind. Nine "Clauses Acts" were passed in the year 1845-7. In 1848 was passed the first Public Health Act, which may be regarded as the groundwork of all our sanitary legislation. This measure was designed to affect towns and populous places in England and Wales, not including the metropolis. It was not to come into force in any locality unless on the petition of the ratepayers, or on the initiation of the Board of Health, on the ground of excessive mortality. A General Board of Health, consisting of a president and two members, one of whom was paid, appointed by the Crown, was established. A second paid member was added in 1850 by the Metropolitan Interment Act; which imposed additional duties on the Board. This body was to be continued during five years, and was empowered to appoint inspectors. In 1849 was passed, and in the following year was amended, the Nuisances Removal and Diseases Prevention Act, in substitution for the Act of 1846, which was then about to expire. It was on this occasion, for the first time, that legislation of a permanent character was attempted.

In 1849 came the second outbreak of cholera, and the pernicious effects of impure air and

water were very fully illustrated by the medical reports of the time. In 1854 occurred a third visitation of the same pestilence; with the result of stimulating the Legislature to unprecedented activity. A comprehensive Act was passed, in 1855, to consolidate the law relating to the removal of nuisances; and a separate Act for the prevention of diseases,—the Legislature not yet having attained sufficient intelligence to regard these two details of supervision as parts of one sanitary code.

In 1854 the Board of Health was reconstituted; and from that date its powers were annually renewed, until 1858, when the Board was allowed to expire, and certain of its powers were vested in the Privy Council. The Local Government Act was passed in the same year. It is to be construed together with the Public Health Act of 1854 as one measure; and this combined law forms the principal sanitary legislation now in force. The Local Government Act was amended in 1861 and in 1863; and further powers were given to local boards by the Sanitary Acts of 1866 and following years. The Act of 1863 restricted the operation of the original measure, declaring it to be inoperative in places having less than 3,000 inhabitants, unless with the approval of the Secretary of State.

In 1860 a Nuisances Removal Amendment Act reconstituted the Guardians as the local authorities, and enabled them to appoint committees for the execution of the Act. A new Amendment to this Act, in 1863, gave powers for the seizure of unwholesome articles of food.

In 1865 the Sewage Utilisation Act, applicable to the whole of the United Kingdom, enabled local councils, improvement commissioners, and vestries, to deal with sewage for economical purposes. It conferred certain specified powers on their bodies, under the title of sewer authorities, and for the first time introduced sanitary measures into rural districts. This Act was amended in 1867.

Sanitary Acts, under that title, were passed in 1868, 1868, 1869, and 1870, which gradually extended the powers of taking precautionary steps with regard to the public health. There are thus now on the Statute-Book no less than fifteen Acts in concurrent and confused operation.

Some of them apply to Scotland, to Ireland, and to London; which have also their peculiar Acts. In upwards of seven hundred districts, councils, commissions, or elected boards, now exercise the powers of the Public Health and Local Government Acts. A comparatively small number of towns are still governed by Local Improvement Acts alone. But there are still many places with very defective sanitary government; and still more with practically none at all, owing to the defective exercise of the powers which the law confers.

The Commission of 1860 have given a summary of the beads under which they consider that legislative protection of public health should range. But their point of view has rather been that of the lawyer than that of the engineer. They have regarded rather the method in which the principles of local government may be developed with reference to sanitary measures, than the absolute physical conditions of the problem set before them. We think that this has led to a less simple and comprehensive result than that at which the civil engineer would naturally arrive. Thus the Commission state that the subjects of local government generally may be separated into two main classes,—those of police, and those of the supply of public requisites, which latter class subdivides itself into ordinary requirements for the general community, and the public provision for those who depend on the support of others. Without stopping to criticise this statement as being in itself erroneous, on the ground that there is a confusion between restrictive measures and measures of supply, and that the latter can only to a very limited extent be matters of local government at all, we cannot but remark that we fail to perceive the natural connexion between police and local government. Police, or the machinery for the prevention of crime, and for the detection of crime when committed, is a highly important branch of criminal law. Where a special ministry of police does not exist, the regular state of this service naturally falls within the province of the executive, and within the department of the Ministry of Justice. The displacement of the old parish constables by an organised force of police, is a consequence of this view of the case; and any attempt to localise the authorities that

exercise police functions, and thus to impair the simultaneous action of the detective and protective force throughout the country, would be a great comfort and encouragement to the criminal members of society. For this reason we hold that those measures which, although no doubt affecting the public health indirectly, are not properly matters of sanitary regulation, but of criminal repression, should be as little as possible referred to the action of local authorities. It is hardly possible that any statesman should have contemplated this method of interference, except from the anomalous position of this country in the want of a public prosecutor. Such matters as the adulteration of food, and the supply of unwholesome articles of consumption, are criminal offences. They resemble, in their nature and effect, such offences as the use of false measures and scales, more closely than any other. It is not proposed to remit to the new sanitary authorities the supervision of the weights and measures used by retail tradesmen. No doubt the poor are as much ground by means of short weight and measure as they are by actual adulteration. Between the sale of under-weight loaves of beer made from improper ingredients, and of meat, fish, and vegetables that have been too long exposed for sale, it is impossible to draw any philosophical distinction. We would facilitate the punishment of all dealing of this kind. We would give every facility to complaints, whether from individual sufferers, or from those who, by their position, as medical men, as guardians, counsellors, vestrymen, or sanitary authorities, or otherwise, become acquainted with any instances of such unprincipled roguery. But we would not complicate the working of the new law, and throw upon those who ought to be its efficient administrators at once the onus and the unpopularity of exercising a supervision over retail trade, which is properly a matter of police.

Removing, then, from the direct charge of the sanitary authorities the responsibility for the inspection of food, which, if exercised by them, would at all events demand a special staff, and a direct association with the machinery of the law, the whole of the sanitary government of the country will classify itself under two heads. These may be called either the duties of inspection, and those of provision, or the medical and the engineering functions of the administrative authority. One item included in the list of subjects drawn up by the Commissioners should be settled once for all,—if, indeed, it be not now so settled. We refer to the provision for the burial of the dead without injury to the living. This is no question of local government, but is a matter of national prosperity, to be determined on broad and simple rules, and requiring none of that constant vigilance as to the removal of the active nuisances chiefly dealt with by sanitary authorities that must be given to sanitary works proper. Again, the registration of death and of sickness is a national necessity, no more devolving on the irregular action of various local authorities than the registration of births and of marriages. Let us see the subject discommodated of those matters, which, though connected with the health and welfare of the people, are not, properly speaking, sanitary measures. The field left for our exertions will still be ample. It may not, even then, be perfectly homogeneous. But, if restricted to its medical and its engineering features, and freed from any irregular police action, it will be both intelligible and practical.

Sanitary provision, thus restricted, comprehends the following subjects. First, the supply of wholesome and sufficient water for drinking and domestic purposes. This is a large and a purely engineering question. It contemplates not only the wants of the population of to-day, but those of the continually increasing numbers of the people. It cannot, therefore, be dealt with on merely local, or hand-to-mouth, considerations. The division of the whole island into watersheds, and the application of the rain falling within their limits to the supply of the district population, must be primarily borne in mind. Intimately connected with this question of the supply of water, are those of prevention of the pollution of streams and rivers, and of the method of dealing with sewage. These two items are, naturally, referred to by the Commission, but we do not find in the Report any indication that the essential connexion between these different branches of the hydraulic survey and distribution of the country has been grasped by the Commissioners. Two other questions, intimately connected with the above, are left un-

noticed in the Report. These are, the arrangement of a sound system of irrigation, instead of the wasteful and clumsy mode practised in many of our valleys; and the provision of urban water conduits, that shall be quite unconnected with the sewers. Confining our attention at the moment to the one great engineering question of the water supply, we require means to prevent waste, to look to due and proper fields of collection, to see how the requisite quantity is to be supplied to great towns, how it is then to serve as a carrier of refuse from the houses, and how, while the water follows the great river courses to the sea, we can make the most of it in its passage, and avoid contamination of its channel. The subject is immense. It is not to be dealt with by the simple plan of rendering the pollution of rivers penal two years hence. To attempt to secure sanitary propriety by simply prohibiting the discharge of sewers into rivers, is like attempting to secure the cleanliness of a dwelling-house by stopping up the drains. The matter must be looked in the face, and dealt with on sound engineering principles. It is perilous to throw the onus upon comparatively uninformed and unintelligent local authorities. In every large town, or class of large towns, different conditions exist; affecting, and indeed indicating, the course to be taken as to the proper method of dealing with the sewage. But, so far from this being a reason for leaving every town to settle its own plan, often on its own unassisted notions, it renders it indispensable that a general system should be created, applicable to all different conditions; and that each special system of works should form a harmonious portion of this grand well-considered plan. If this be lost sight of, our efforts at sanitary legislation will only result in sowing pestilence broadcast through the country.

Let any one compare, for instance, the position of such a town as Oldham, the local legislation for which has recently been referred to as exemplary, with that of such a town as Reading; the former lying on the steep and rocky hills, the latter situated on an alluvial basin, hemmed in by the courses of two navigable rivers. The provisions proper in these two cases will be entirely different. Certain dangers will have to be guarded against in one case that are not very pressing in the other. On the other hand, considerable expense will have to be incurred in the lowering town in lifting the whole quantity of liquid sewage to a considerable height before it can be allowed to filter by gravitation. The prevention of the irregular dilution of sewage by rain-storm will be much more important in one case than in the other. Again, the course taken by the effluent water, when it escapes from the confines of the sanitary arrangements of the district, will require more careful watching in the case of the more inland town. This is only one illustration, out of hundreds that might be taken, of the supreme importance of a well-ordered engineering plan of dealing with the watershed of the country, under its three great divisions of supply of human need, supply of vegetable nourishment, and use as a carrier in the removal of *excreta*, with the necessary provision that it shall not serve as a conveyor of poison to more seaward places. This is what may be done, if properly taken in hand. It is what must be done, if we would not sow the seeds of a plague more fatal than cholera, or any visitation of modern times. It will involve, necessarily, a large outlay. This outlay will be either a mere frittering away of money in costly failures, which will be the case if the carrying out of the prohibitory provisions of the Bill is merely left to the unskilled parsimony of the local authorities, or it will be the most beneficial expenditure ever yet made in any country,—a public investment than which the value of our railway capital itself will be less important and less productive,—an expenditure that will not only replace itself within a decade, but more than treble the agricultural produce of the country. The future of the country is, in this respect, in the charge of the civil engineer. Let him be consulted at once.

Worthing College.—The boys of this college, through the consideration of the principal for their sports, have been enjoying themselves this winter by skating upon asphalt, he having in the vacation of 1870 put an iron roof over a large area of ground and paved it with Claridge's patent asphalt, which, we are told, answers the purpose admirably, and is in no way injured by the rollers of the skates.

THE ORGANISATION OF EDUCATION,
CIVIL, MILITARY, AND NAVAL.

With the exception of the imperfect provision for the education of the masses, which, wo trust, will now soon be remedied, there is, perhaps, no other country in the world which possesses such a wealth of scholastic institutions as Great Britain; but these are so disconnected and deficient in any concerted plan of action, that their power is in a great measure frittered away, and thus they fail to exercise that larger and healthier influence which would inevitably be consequent on united action.

Being painfully impressed, several years ago, with this terrible absence of organisation in the educational forces already at our disposal, I ventured to address the following letters to the editors of the *Daily News* and of the *Builder*. These are given in the order in which they appeared. That to yourself, October 31st, 1868, was headed,—

"THE ARTIST 'MASTER OF ARTS.'—Felix Summery' did good service the other day by directing attention, through the medium of the columns of the *Builder*, to the greater consideration and larger share of time devoted to the study of art in the continental colleges and schools than in England. This opens a question of great moment, a subject requiring thorough ventilation. Is not the sabbat 'Master of Arts' a mischievous sign of a complete education, when it may be, and is commonly, earned by men that ritically and practically unacquainted with the two great arts of painting and music? The classics, it is true, were for many centuries the only studies in the liberal spirit of art, and therefore gradually assumed a prescriptive and undue importance in the college curriculum, which, in due time, strengthened into an overbearing prejudice in their favour difficult to combat. There are, however, signs at the ancient seats of learning of a better temper, and a more gracious bending to the times. The more modern collegiate institutions have adopted every thing, not only for the classics and the mathematics, but science, chemistry, and medicine,—but even in these there is still much to be desired. The study of art, and of music, civilisation,—painting and music. This is strange when it has been so long admitted that an improved taste is daily becoming a more crying national need, for the present and future craft of our manufactures; nevertheless, though such an educational reform promises greater mercantile prosperity, a plethora of wealth, the country remains unmoved, to any sensible extent, even by the prospect of the promised golden reward. This immobility after the importance of a change has been long demonstrated is truly English.

When the Schools Commission was pursuing its useful work in 1868, I took advantage of a professional position, to call the attention of one of its body to the disadvantages under which the study of art in our colleges and schools commonly labours, and, whilst urging the importance of the study, and the immediate necessity for some reform in this direction, stated that the study of art was not merely important as the proper means of education, but to appreciate the beautiful, but in a direct utilitarian point of view,—for that, when drawing is properly taught, it is a most potent means for perfecting the faculty of observing correctly, of looking at things rightly,—of enabling people, in fact, to see properly. How inaccurately people do generally observe what is before, or going on around them, is only fully known to art-teachers and the quinquers of the Courts of Justice; and this will continue till the importance of training the two leading senses of sight and hearing be as thoroughly recognised and important object of education. It is not, therefore, a matter of indifference, I urged, "how drawing is taught in public and private schools; whether the students be condemned to *make-shift* in respect to time and place of study; whether the time set apart for it be pinched in between the more favoured claims of Greek and Latin, or carried on in the class-room, the worst lighted and adapted for the purpose. Moreover, the slight consideration it receives is too frequently aggravated by the so-called 'practice of drawing' being nothing more than mere crude water-colour blots being drawn, and more than half performed by the teacher. For the study of art to fulfill its true educational function, it should beget a habit of exact comparison, and this is only to be induced by experienced teachers conversant with that thorough discipline and training of the eye which is acquired in the art-school proper,—the student commencing his studies from the simpler forms of leaves, fruit, and flowers, and gradually rising, step by step, to grapple with the subtleties of the human form. One great hindrance to the introduction of a better system of studying drawing in schools is doubtless the ignorant satisfaction which parents evince at those wonderful landscape performances, enlivened with impossible rustic figures and dwellings, surrounded with a blaze of impossible foliage. Such performances are unfortunately too often preferred to the dry and less showy but more useful work under a good teacher.

In returning to the subject of the 'footing' on which art ought to stand in our great seminaries of learning, I would ask why it should not be the same as that of the more favoured subjects? Has there not been already sufficient reasons adduced why it should be so placed? An art student, too, ought to have it in his power to pursue his general, simultaneously with his special study, and to take the degrees of B.A. and M.A. The question of which naturally suggests itself to me is this,—whether, as the reorganisation of our educational system must soon become an important consideration, it would not be better that every college should adopt a leading speciality. Thus we should have a College of the Fine Arts, of Medicine, of Engineering, &c. in which the degrees of B.A. and M.A. could be gradations for as well as the specialties of R.A., M.D., or C.E. The plan would have this advantage, that the greatest talent in each speciality could be concentrated. This would appear to me to be the best mode of combining special with general studies, and one which would not materially disturb our present educational prejudices. Oxford might retain the classics as its speciality, Cambridge the mathematics. The Royal Academy or South Kensington might be transformed into a College of the Fine Arts, the College of Physicians into a great Medical College, and so on.

We will now turn to the letter addressed to

the editor of the *Daily News*, December 28th, 1868. This had more immediate reference to the Slade Professorship; but it incidentally touches upon the more general question of the organisation of education:—

"Although I have from time to time advocated the establishment of a Faculty of Fine Arts in each of our principal universities, I have only recently become aware of the existence of the Slade bequest for that purpose, and I think you will agree with me that for the interests of art it would be well if the chief features of this bequest were made more widely known. There is no less a sum than 45,000*l.* bequeathed, free from legacy-duty, by the late Felix Slade, of Woburn-place, Lambeth, to endow, within two years after his decease, three or more professorships in the universities of Oxford and Cambridge, and also in University College, London; moreover, to endow art exhibitions or scholarships for proficiency in the fine arts, for students under nineteen years of age. And if, after providing for these several trusts and purposes, there shall be any surplus, it shall be applied for the encouragement, benefit, and advancement of the fine arts in England, and every part of such surplus which shall not be so applied within five years is to fall to the residuary personal estate. I have recently proposed that every college should have a leading speciality, so that a student in any of the liberal arts would be able to matriculate at the same time, and pursue a course of general and special degrees. There would be, according to this proposal, the College of Fine Arts, the College of Medicine, the College of Engineering, &c. A student would receive a general education, and then, after having obtained an education under difficulties. This proposal, however, is but a compromise, or rather one collateral to that for a Grand Central College, submitted to the Royal Commission in 1851, and which provided that all the means for a general and special education should be concentrated in one locality. A proposal to convert the Royal Academy into a College of Art, and to have the Royal Academy as an impracticable one, and indeed may be so now; but had the Slade bequest been available before the new building, the Royal Academy might have been justified in considering whether it should not separate its schools from its exhibitions, and carry them on under the roof of a University College, whether it could combine its own with the courses of the bequest. At the College there would be every facility for studying anatomy, chemistry, &c. on the spot. As this conjuncture has never occurred, University College cannot hope to make art its dominant speciality; it would be useless to attempt a 'little rivalry with the Royal Academy and Heriot's' which would occur. University, then, which appears to be left open to the council of the college, is to proportion its intended art department to its place in a comprehensive scheme of general education; and a very important position, I conceive, that should be. So far back as 1865, whilst the Schools Commission was pursuing its useful course, I took occasion to direct the Commission's attention to the fact that the study of art was not only important to educate men to appreciate the beautiful, but to train them to observe, to see correctly what is passing before them. How imperfectly,—inaccurately,—people do observe, is only fully known to art-teachers and queen's counsel. Some painters may think that the establishment of the faculty proposed would only tend to swell the number of those who pursue art for art's sake; but it should be borne in mind that the college art-classes would at the same time cultivate a taste for and an appreciation of art in students never intending to follow art as a profession. We must look to the art-teachers in countries where art is more widely cultivated than in our own, when the fact must be recognised that all who study art cannot be painters, sculptors, and architects, but that some students must direct their talents to the manufactures. The whole question, however, requires careful consideration before it is held to be now important. The benefits to be derived from a more extended study of art."

But long before writing these letters, and so far back as 1850, I had projected the foundation of a Grand Central College of Art, Literature, and Science, at South Kensington or elsewhere, already referred to, and that the surplus fund of the first International Exhibition should be devoted to the realisation of the project. In projecting this central college, the ruling idea which possessed my mind was this,—that the central college should be the institution to which all other educational establishments in the Kingdom should converge, and that every means should be used to enlist the best representatives of every department of inquiry, in either hemisphere, as its professors; and thus to make London the great educational centre of the world. All other scholastic institutions were, according to my conception, to graduate up to this. The pamphlet which contained this first suggestion for a Central Polytechnic College was in the hands of the Royal Commissioners of the Exhibition of 1851.

We are all, I believe, now coming to understand the first and foremost condition of a true system of education, viz., the importance of including those subjects which are essential to the development of the mind,—that knowledge and training which give a man the power of turning himself to good account in whatever speciality he may select, which completes him mentally and physically as a man. These subjects are very many fewer than most people are apt to suppose,—and should form the real nucleus of every educational course in the Kingdom. There is no practice which requires more repeated consideration than that of "cramping"; too many subjects into the curriculum of general education. I believe that both mental and physical power are weakened by an ignorant persistence in this course; that practical capacity

is lowered rather than raised by this too-prevalent educational fashion.

National education, then, may be broadly divided into two important and distinct sections: first, that central or general education which should be accorded to all; and, secondly, that special or professional education which should be provided for some; and as most men in England are destined for some special work, the organisation of the special or professional section of education becomes a very important subject for consideration.

The nation has of late years got a notion that special or technical education is a very important thing, and has some hearing upon national interests. The country has tortured itself into the utmost confusion on the subject, and is now intent on providing and applying remedies precisely where they are not wanted. Let us consider for a moment that there are two estates of the realm which require this professional, special, or technical education,—viz., the middle and the working classes. Now, for the technical education of the latter, or the working class, there is no country on the whole earth in which this kind of education is so well provided for. The college in which the English workman obtains his special education is, as Charles Burton well observes, "the workshop,"* and the workshops of England are unsurpassed. Yet it is precisely in this direction that the public is clamouring for technical education. "It is not here," as the writer just named rightly observes, "that technical education is required," and with the caution, "beware how you interfere with the workshop!" It is the special or professional education of the middle and wealthier classes which urgently needs improvement. The office cannot do for the art-learned pupil what the shop can do for the apprentice. The professional pupil requires, before or after passing through the office, a wider range of study touching upon his speciality than could by any possibility be acquired there. All the professions, therefore, require their own special colleges, as I have previously suggested. This need has recently been felt by some of the professions, and the system has received further extension in proposals for two more special colleges, "the Legal" and "the Naval." The mention of the latter leads me to note that the military and naval education of the country ought to be a part of a comprehensive educational scheme. The following list of special colleges exhibits the extension of the principle in conformity with my own views:—

Theological, Civil Service (Diplomatic, Social Science, &c.); Fine Arts, Music, Mathematical (Astronomy, Physics, &c.); Legal, Military, Naval, Medical, Engineering, Chemical, Mineralogical, Zoological (Veterinary, &c.); Agricultural, Preceptors, Ancient Literature, Modern ditto, Pharmaceutical, Mercantile (Colonial, &c.), Oriental.

The centre of this system of special colleges would be the Grand Central Polytechnic College already referred to; this, if carried out on the scale proposed by me in 1851, would bring all the special colleges under one roof; in that case the special education of London professionals, would be provided for in one locality. Such an institution, however, might prove too colossal for convenient management, so that I think the central institution should represent the head of the system of special colleges, and that the highest representative of each of the specialties tabulated should occupy a chair in the Central Institution, from which he would have to lecture on his particular subject, at stated times, to any students of the special colleges then assembled. This Central Institution should also have libraries and museums on an extensive scale, and be the centre from which all London Diplomas should be dated. Under this arrangement the special colleges for London would exist as separate institutions, conveniently located, and ranged at moderate distances around the central college.

The several kinds of institution necessary for the educational welfare of the country appear to me to be the following:—

The Central College, Special Colleges, Public Schools for the youth of both sexes (established for several degrees of citizens, and to meet difference of means); Private Schools, District Military Schools, ditto Naval ditto, Volunteer Officers' ditto, Working Men's Colleges, School Board Schools.

* Art, Pietorial and Industrial."
† Special Colleges already existing, or about to be established.

A more equable distribution of collegiate institutions could, as the Ormond-street College, be needed. It is a very great inconvenience and expense to provincials to have to send up and support young men at any one of our few educational centres, and a practice which is not unfrequently fraught with mischief. Every county town of importance ought to have its properly-constituted medical college, where young men intended for that profession might matriculate *pari passu* for their special and general degrees. I very much doubt whether medical schools ought to be attached to hospitals; it would, it appears to me, be a better plan to have properly-located medical colleges, the students being permitted to "walk the hospitals" lying in their own particular district.

The Royal Academy should either be a college of art, or simply a syndicate to confer degrees and appoint the most able masters of the theories of painting, sculpture, and architecture to the art-professorships at the central college. The special college of the fine arts, the schools, and annual exhibitions could then be transferred to other management.

All colleges but the central, let me repeat, should have but one leading subject,—one speciality. The misfortune at present appears to me to be this, that every college is trying to make itself as comprehensive as we propose the central institution should be, without having the means, the money, or the room, to carry out the ambition of its directory; and, therefore, the attempt only complicates, encumbers, and involves the management.

With respect to the establishment of public schools, I would merely suggest that such should be insisted on a similar plan to those of which the middle class can avail itself, but on a reduced scale of fees, in order to meet the more limited means of the lower middle and upper working classes.

There are two other institutions on my list about which I have something to say, viz.—District Military Schools and Working Men's Colleges. And, first, of the Military Schools,—which I proposed as the basis of the localisation of our military forces in a letter to the editor of the *Pall Mall Gazette*, March, 1867. This was, of course, before those events which have proved "localisation" of such potent advantage. The outline of the scheme which I sent to the *Pall Mall* was afterwards more fully developed in a lecture delivered at the Royal United Service Institution, March 12, 1869, and published in its Transactions for that year.

The chief features of my proposal were, that the country should be divided into military districts. That every district should have its military school graduated to the requirements of youths training for commissioned officers, non-commissioned officers, and privates. That the recruiting depot for the district should be in proximity. That there should be drill-grounds and workshops for instructing the boys, destined for private soldiers, in employments which would render the army, as much as possible, independent of any non-military artificers. These Military Schools would be special, professional, or technical schools—the workshop in which the soldier would be made. And I believe the establishment of these schools, and the localisation proposed would render our voluntary military system adequate to all our requirements. It was also suggested that Naval Schools on a similar plan should be established on the seaboard.

And now, touching the institution called the Working Men's College. I have no doubt in my own mind that that in Great Ormond-street is destined to be the precursor,—has been, indeed, already,—of many similar institutions throughout the kingdom. Colleges of this kind would fulfil several important and useful functions. They would afford opportunities to workmen and others, having but limited means, to improve and extend their information in their leisure hours. In Ormond-street there are classes for the study of Greek, Latin, history, art, mathematics, physiology, &c., at a very small term-fee. The programme is as extensive as that of the great universities; but it can seldom fall to the lot of working men to be able to take advantage of the entire course: yet it always affords men the opportunity of taking one or two subjects in which they may be specially interested. And now and then, when a man is conscious of possessing superior ability, to educate himself up to the higher mark he has proposed. But that this kind of institution may be of an extended national advantage, I think they must become a part of the Government scheme of education.

It can scarcely be expected that many institutions could, as the Ormond-street College, be taught on the voluntary principle, by unremunerated teachers. We have there been bound together by enthusiasm in the cause, and a sincere respect and regard for the Rev. the Principal. It requires great determination, and a rigorously-ordered working life, to be able to give, through the years, regular attendance to duties of this kind. I am therefore inclined to believe that when the merits of this institution, the useful functions which such colleges are calculated to fulfil, come to be better understood, and the establishment of working men's colleges throughout the great towns be contemplated, the voluntary system of teaching will have, if not entirely, to be partially abandoned. The Rev. the Principal was, however, sanguine that it would not. My own notion is that the most feasible and practicable plan for their extension would be by widening the local and provincial art schools of the Science and Art Department to the functions of working men's colleges.

Finally, I should desire to direct attention to the importance of drawing and music in general education,—in that education which is to form the manhood; they are essentially human and humane studies. The study of the arts would cover those dry bones of physical science, to which modern notions in their cold mechanical pride would confine education. The arts are the golden links in education; they are, too, as utilitarian as those studies to which this virtue is most attributed. I have repeatedly touched upon this subject, and will only now recapitulate the strong arguments in favour of their becoming an essential part of general education, of all college and school courses. Drawing and music are the proper exercises of the two most important of our senses, the eye and the ear. We should bear in mind that it is through the senses of seeing and hearing that we chiefly bear witness to what is passing in the world, and those who have the training of these senses only fully know what false witnesses the senses generally are, before they are properly educated. Neither let it be forgotten that it is upon these generally untrained and neglected senses, that character and life are frequently at stake. The desire to obey the command, "Thou shalt not bear false witness," may sometimes be strengthened by being put upon oath, but the truth of evidence cannot be guaranteed by that course. If a witness be an imperfect observer, as the majority of witnesses of course are, in default of proper training, he may, and often does, conscientiously swear to the absolute truth of his erroneous impressions, and he cannot conscientiously do otherwise. In teaching drawing, this moral may be inculcated: "If you misapprehend the truth with regard to the fact, the model immediately before you, and bidding your time for deliberate inspection, how can you expect to correctly observe and accurately record the fleeting facts and occurrences of every-day life?" It is not, however, in the witness-box only that trained senses are required, but to appreciate harmony and beauty in nature, to preside watchfully over all kinds of work, and to endow a nation's manufactures with that taste and permanent excellence which will insure their appreciation throughout the civilised world. I am now speaking more immediately of the education of the eye, and I will venture to say that you would find that painters and sculptors could more readily be inducted to any kind of handicraft,—could more readily turn their hands to any kind of work,—than any other class of the community; and why? Not only because these arts require the greatest dexterity of hand, but because painters and sculptors see better. I know that there is as much to be said in behalf of music as an essential study, and has been said by musicians who are more competent than I to speak upon that subject.

The thorough organisation of education should be the question of paramount importance with a nation's rulers. It is education which moulds a people for good or evil. Take care of that, and England may rest hopeful and confident in her future. No difficulties should be permitted to stand in the way, nor expense be spared in order to have it the most complete in the world. W. CAVE THOMAS.

The Alexandra Palace.—The Alexandra Palace and Park, at Muswell Hill, will shortly be opened to the public. Mr. Gilbert R. Redgrave has been appointed to be the manager, and the building is close upon completion.

EXHIBITION OF DOMESTIC ECONOMY IN PARIS.

An International Exhibition of Domestic Economy will be opened at the Palace of Industry, in the Champs Elysées, Paris, on the 15th of July next, under the auspices of the National Society for the Encouragement of Industrial Workers (*Travailleurs Industriels*). This society has for its object, in its own terms, the honour of labour, by protecting, encouraging, and rewarding it, the raising of the intellectual and moral level of the workman, the facilitating of his independence by means of the Savings Bank, and providing for him in his old age, by other methods than the assistance given by the State.

The exhibition is divided into forty-six classes, composing ten groups, comprising every object that can contribute to the material as well as the moral welfare of the artisan.

We draw the attention of our readers to Groups 3 and 10. Group 3 is devoted to buildings, and contains five classes, which are thus described:—

Class 18. Models and plans of married or single working men, characterised by cheapness, combined with comfort and healthfulness; models of furnished rooms.

Class 19. Models and plans of public buildings, for the use of artisans, schools, lecture-rooms, hospitals, almshouse, baths, wash-houses, &c.

Class 20. Building materials. Wall papers.

Class 21. Examples of barrack buildings, and sailors' lodgings on shipboard; camp furniture.

Class 22. Municipal and domestic hygiene, ventilation, water supply, and drainage.

Group 10 contains but one class; but its scope is sufficiently comprehensive. It consists of historical documents of every kind relating to the moral condition of the artisan, from the earliest period to the present. Books, pictures, engravings, examples of clothing, tools, &c.

It would be in every way desirable if English architects would give their neighbours the benefit of their studies for the improvement of the dwellings of the working classes. The conditions under which the French and English workmen live are radically dissimilar, it is true; but if no other purpose were served than the opportunity of comparing two entirely different systems, it would be worth the experiment. There are but few architects who have not at some time of their lives exercised their ingenuity upon the production of a cheap and good labourer's cottage, and it would be interesting to see these designs placed side by side with designs for similar objects from other countries.

The numerous inventors of cheap building appliances, improved sanitary arrangements, labour-saving machines, &c., in this country, should also be represented, and we invite attention to the opportunity thus presented, because, from some cause or other, the exhibition does not appear to have been properly advertised in England.

The prizes, which will consist of gold, silver, and bronze medals, and honourable mentions, will be awarded by an International jury to the exhibitors. Certificates will also be presented to workmen who have invented or produced articles exhibited. The Exhibition will be open from the 15th of July to the 15th of October next. Applications for space must be made before the 15th of June, 1872, specifying the name and address of the exhibitor, the nature of the object he desires to exhibit, and the space required. All communications should be addressed to the Direction of the Universal and International Exhibition of Domestic Economy, 23, Rue de la Chaussée d'Antin, Paris; or to the Vicomte de Vallat, French Consulate, No. 38, Finsbury-circus, London.

ARCHITECTURE IN EDINBURGH.

As the season advances architectural projects are developed and the prospects of the profession brighter; for although at first there seemed a probability of a falling off, building operations appear to be going on as briskly as last year.

Several new churches are projected. The congregation of the Holy Apostolic Church, which meets in a very modest building in Barony-street, have resolved upon erecting a handsome new edifice upon a site at the north-west angle of East London-street, and Broughton-street. Four architects have been invited to send in designs, the successful competitor to be employed in carrying out his design, and the

other three to receive a fee of 35*l.* each. The style prescribed is Norman. Provision is to be made for a large double channel and other features of a ritualistic character. The construction is to be of stone, within and without, and the cost to be between 7,000*l.* and 8,000*l.*, exclusive of fittings, tower, &c., which last-mentioned feature is not to be proceeded with in the mean time, but is to be embodied in the design.

The Rose-street United Presbyterian congregation intend to abandon their present church, and have secured a site at the angle of Palmerston-place and West Maidland-street, whereon it is intended to erect a new church, at a cost of about 8,000*l.*, from the designs of Mr. Dick Peddie.

A limited competition has been invited for a new Free church at Morningside, to supersede the present building,—a specimen of the "Batty Langley" style; and an additional United Presbyterian church is projected in London-road, to the eastward of Brunton-place.

A movement is on foot to establish a new club, upon a site in one of the streets leading off Princes-street; but we learn that it has as yet received only a limited amount of support.

In domestic street architecture nothing remarkable is on foot in the new town, except the opening up of new ground upon the Drumsheugh estate, where first-class mansions, after the designs of Mr. Dick Peddie, are to be erected. In the old town the practice of keeping up the ancient style is pretty generally adopted. A very picturesque group has been erected at the angle of High-street and Blackfriars-street, one feature of which, a piazza, has been objected to as forming a refuge for idle loungers. As an architectural feature, however, it is quaint and pleasing.

The old Bavian House in Bristol-street has been erased, and an imposing and characteristic block of shops and dwellings has been erected on its site. The architect, Mr. R. Thornton Shiells, has caused a panel to be inserted, giving the date of the erection and destruction of the old house; and in another part of the same block a similar panel commemorates the fact that here stood a bastion of the ancient city wall. Mr. Shiells has also prepared designs in the old Scottish style for another block in course of erection in Forrest-road, upon the site of the old city Poor-house; and opposite this another block is being proceeded with from the designs of Mr. J. C. Hay, in rear of which an Odd Fellows' Hall is to be built.

The new street from the Lawn Market to the Bank of Scotland, to be called St. Giles-street, is being pushed forward, and several blocks are being roofed in. Mr. Bryce, who is architect, has been saving in ornamental detail in this instance, and has sought for effect by bold and telling outline.

The two southernmost blocks are five stories in height, gabled and finished at the angles by high pointed towers. Those towards Princes-street have large turrets corbelled out from the angles, which are conspicuous from the distance.

Adjoining this, in Market-street, a new hotel has been erected from the designs of Messrs. Beattie & Son, who have adopted a Flemish type. In outline it harmonises well with the surroundings; but we would have preferred it without the blank windows in the west elevation, which are neither beautiful nor useful, and are quite out of place in a building of this kind.

DRINKING FOUNTAIN, CLIFTON DOWNS.

THE Society of Merchant Venturers having munificently granted the enjoyment of the Clifton Downs to the citizens of Bristol for ever, a liberal and much-esteemed citizen, Mr. Alderman Proctor, at his own cost, has erected a drinking fountain to commemorate the event.

The fountain stands on the site of the old turnpike, a most admirable position, as it is approached by four roads, leading respectively from the Hotwells, Durham Downs, Kellands, and the city, as well as by a pathway from the new zig-zag walk up the cliff. The structure has the novelty of being triangular on plan; thus, effect is obtained for a certain expenditure without making it so massive as would have been the case had it been square. The stone used is the Box ground, with alternate voussoirs to the arches of red Mansfield; the three arches spring from columns the shafts of which are of Rouge Roule marble polished: the

basin is red Mansfield with a polished, veined marble curb. Inside the basin stands what may be termed the fountain proper, from which the taps project; this takes the form of the structure, and there is a tap in front of each arch. The under side of the superstructure is groined. Over the arches are gables, with coping and carving under it, and they have each a central finial. At the three angles there are buttresses, terminating with gables detached from the pyramidal roof which rises from the centre, and is topped by a handsome finial. In the gables over the three arched openings are circular sunk panels containing the arms of the Merchant Venturers, the arms of the city of Bristol, and those of the donor, Mr. Alderman Proctor, carved in red Mansfield stone, with their several mottoes. Cut in a panel in the base of the fountain is the following inscription:—

"Erected by a citizen of Bristol to record the liberal gift of certain rights over Clifton Down made to the citizens by the Society of Merchant Venturers, under the provisions of the Clifton and Durham Downs Acts of Parliament, 1861, whereby the enjoyment of these Downs is preserved to the citizens of Bristol for ever."

The fountain stands on three Pennant stone steps; on one side a fourth is added, for the accommodation of children. The steps take a hexagonal form, the lowest being 12 ft. 9 in. through. The whole structure is 25 ft. 6 in. high, to the top of the curved finial. It is surrounded by a plain but substantial iron railing, forming a circle, which is to be laid out with flower beds and gravel paths. In connexion with the fountain there is a cattle-trough not far off, which will be continually supplied with water.

The work has been carried out from the designs of Messrs. G. & Henry Godwin, of London, architects, by Messrs. Broad & Tucker, of Bristol.

The scene on Easter Monday, when the fountain was first made available for the public, was a remarkable one, and showed that the donor has supplied a want. Numbers were waiting their turn all the afternoon, and it was found necessary to obtain half a dozen loose caps, so that the children amongst the excursionists clustered round it might be quickly supplied.

The citizens of Bristol are to be congratulated upon obtaining such a valuable concession on the part of the Society of Merchant Venturers; but they certainly are to be congratulated equally upon having amongst them so generous a fellow-citizen as Mr. Alderman Proctor.

PRIZES FOR STUDENTS.

"A DISGUSTED PUPIL" writes us a letter of two parts, blowing hot and cold. He inquires if certain premiums offered to members of the Architectural Association for designs for the iron roof of a Corn Exchange, have been awarded, and complains, justly, that the very people who call out for inducements to work when such inducements are offered do not take advantage of them. He then goes on to complain of architects that they do not offer a sufficient number of prizes of good amount to induce members of the Association to come forward, and says pupils and assistants are as little cared for as day-labourers. There is more truth in the first part of his letter than the second. There are plenty of medals and premiums offered every year in various quarters to architectural students, but these scarcely call forth so many competitors as might be expected. It is much easier to say, "I wish I could distinguish myself," than to exert the amount of energy and application necessary to effect this. Men must work if they would win, and not be depressed by a failure or two at starting.

TURNER'S "LIBER STUDIORUM."

AN important collection of proofs and prints illustrative of Turner's "Liber Studiorum" has been made by the Burlington Fine Arts Club, and is now on view at their house in Savile-row. It includes choice impressions of first states, touched proofs, and unpublished plates, and for the first time shows in its full strength this remarkable work of our remarkable countryman. As all students know, there was no copy of the "Liber" issued containing only early impressions; to obtain such a one several had to be sacrificed. An interesting catalogue has been published for the assistance of visitors. As the writer of it points out, the issue of "Liber Studiorum" began in the year 1807. Its publication was fitful and unbusiness-like. Turner employed no publisher to put forth the work for him; and, so far as we have

been able to ascertain, there is no trace of any prospectus or advertisement intended to recommend the work to the public. Five plates were issued together in a part, and it is supposed that the work, according to the original plan, should have extended to twenty such parts,—that is, one hundred plates. The first four were issued under an arrangement with Mr. Charles Turner, the engraver, according to which he was to engrave all the plates. On all but a few of the earliest of these his name appears as publisher, as well as engraver, and it has been suggested that the original design of the work was partly due to him. Rather a hard bargain is said to have been struck by the painter with his namesake for the performance of these twofold duties. However that may be, the engagement between them terminated not very amicably after the appearance of twenty plates, and thenceforward Turner, the painter, became his own publisher, arranged the work himself, and sold the copies at his own house. Each part contained five plates. They were stitched together in a blue-grey cover, with a badly-printed title. The price asked for the first numbers was, prints, 15*s.*; proofs, 1*l.* 5*s.*; "to be paid for on delivery;" but it was afterwards raised to, prints, 1*l.* 1*s.*; proofs, 2*l.* 2*s.*

We can remember a visit to the artist's house, backed with a letter of introduction, for the purpose of purchasing a copy. "Have you got the money with you?" The money was produced. "Go up and get a copy" (addressing his dirty old servant), "and mind, take the top one: I'll have no picking." However, let this pass: the recollection is not an agreeable one. The subjects treated in the "Liber Studiorum" are very varied, and show the range of the artist's power. For the full appreciation of the work an education is necessary, and this exhibition will afford it.

SCHOOL-BOARDS.

Chesterfield.—The report of Messrs. Smith & Haslehurst having been given to the Board, it was resolved that the plans for the new schools in Hepper-street and St. Helen's-street, which bore the motto of "Simplex Munditiis," be adopted. Upon looking at the letter accompanying the plans, the architect was found to be Mr. S. Rollinson, of Chesterfield. It was then resolved that the clerk apply to Mr. Rollinson for all information in respect of the building, to be placed before the Education Department, previously to the amount required being borrowed for the building of the schools.

Eckington.—It has been resolved "That Mr. Robson, consulting architect of the London School Board, be appointed architect to the Board."

Bradford.—At the last meeting of the Board two letters were read from the Educational Department, enclosing one from Alderman Shepherd, who had called the attention of the department to what he considered the extravagant expenditure of the Board. The letters also gave the substance of the report of their local architect upon the proposed schools at Fersham-street, Bowling Back-lane, and Ryansham-street, which he regarded as too expensive in character. It was further pointed out that these schools would almost cover the entire deficiency which the inspector had reported to exist in the borough, so that the accommodation in them would appear to be excessive, especially as the Board contemplated the erection of four additional schools in other districts. These communications were referred to the committees of the Board. The Mayor, as chairman of the Board, then made a statement showing that the expenditure in providing schools for 5,000 children at a total cost of 100,000*l.*, would, if the money were borrowed from the Public Works Loan Commissioners at 3½ per cent, be simply covered by a rate of 3*d.* in the pound. Alderman Mitchell afterwards brought on his motion for appointing a committee to inquire into the cost of the proposed schools and sites for schools, with a view to the diminution of the expenditure on each or all of them. He estimated that if the Board carried out their present scheme in regard to these schools, the total cost would be at the rate of 1*l.* 6*s.* 10*d.* for every child accommodated, and quoted figures to show that in other towns School Board schools were being erected at a much less cost. The motion gave rise to a debate, and was ultimately defeated by nine votes against five.

Ipswich.—In consequence of the advertisements which appeared for plans of school buildings, several architects in the town pointed out

that sufficient time had not been allowed to get out the plans, and that there was an apparent want of harmony between the ground plan referred to in the advertisement and the rules and regulations defined by the Committee of Council on Education. As to the first point, the clerk to the Board stated at their last meeting that, under the direction of the vice-chairman, he wrote to the architects informing them that they might calculate upon having an extension of time; and as to the second matter it was pointed out to him that the scale for the breadth of the rooms was fixed at 20 ft. in the rules and regulations for building schools, and that this scale was binding. He had an interview with Mr. Westhorp, and with the inspector, Mr. Alington, and, as a result, he wrote to the Department asking if, in building the schools required, the Board were necessarily limited to the breadth of 20 ft. He received the following reply:—"The breadth of the schoolrooms need not be strictly confined to 20 ft., but all experience shows that narrow rooms fitted with groups of desks and benches along only one side of the room are far more convenient for school purposes than the wider rooms fitted with groups against the opposite sides. Moreover, the narrow rooms are readily partitioned off into class-rooms if necessary, which cannot be done in the case of the wider rooms without considerable expense. In the opinion of their Lordships, the Board would do well to re-consider the arrangement of the plan herewith returned." A long discussion ensued as to what should be the action of the Board in reference to the matter. An opinion was expressed that it would be a great mistake for the Board to confine their large rooms to 20 ft., seeing there could be no possible objection to the room of the size fixed upon in the ground plan, which had been approved of by this Board. But it was pointed out that the breadth of 20 ft. was a general instruction, and that if the Board departed from the instructions which had been laid down, they might afterwards get found fault with by the Government authorities. It was also remarked that this Board could hardly set itself against the experience and strong representation of the Government. Mr. W. Fraser pointed out the advantages which resulted from the school-room being of the size laid down by the Government, and urged the desirability of the Board altering their ground plan. A letter was read from Mr. S. Westhorp (who was unable to be present), expressing his opinion that it would not be wise for the Board to adhere to the plans they had prepared, but to advertise for plans generally, and have the schools only 20 feet wide, as it appeared to him that the department would eventually approve of none other. Eventually a proposition by Mr. Fraser, to the effect that the ground plan approved of at the last meeting, should be withdrawn, and that the architects should be apprised thereof, was carried unanimously on the understanding that the clerk should procure information as to whether the school-room, divisible into class-rooms, was of itself sufficient without class-rooms. It was also resolved that the plans should be sent in on the 1st of May.

SOCIETY OF BIBLICAL ARCHÆOLOGY.

At the meeting on Tuesday, April 2nd, a notice of a "Curious Myth respecting the Birth of Sargina, from the Assyrian Talhots, containing an Account of his Life," by Mr. Henry Fox Talbot, was read. Mr. Talbot showed that Sargina the First was a very ancient king of Bablyonia. The date of his reign is uncertain, but it may be roughly estimated at fourteen or fifteen centuries before the Christian era. He was a legislator and a conqueror; and his arms appear to have reached the distant Mediterranean. He fixed his capital at Agani, in Bablyonia, a city whose site has not yet been discovered. His history, like that of other ancient conquerors and legislators, has become partially involved in fable. An account of his birth and infancy, preserved on a tablet in the British Museum, offers a great similarity to that of the infancy of Moses, as related in the second chapter of Exodus. For, we read that the mother of Moses "took for him an ark of bulrushes, and daubed it with slime and with pitch, and put the child therein: and she laid it in the flags by the river's brink. And Pharaoh's daughter saw the ark among the flags, and she sent her maid to fetch it. And when she had opened it she saw the child." All this agrees

very closely with the conduct of Sargina's mother as described on the Assyrian tablet. "In a secret place my mother had brought me forth. She placed me in an ark of bulrushes: with bitumen she closed up the door. She threw me into the river, which did not enter into the ark. The river bore me up, and brought me to the dwelling of a kind-hearted fisherman. He saved my life, and brought me up as his own son," &c. The inscription appears to have been a long one, but only a small portion of the beginning has been well preserved.

SINKING SHAFTS THROUGH WATER-BEARING STRATA.

THE INSTITUTION OF CIVIL ENGINEERS.

At a recent meeting, Mr. Hawksley, president, in the chair, the paper read was "On the Kind-Chaudron System of Sinking Shafts through Water-bearing Strata, without the Use of Pumping Machinery," by Mr. Emerson Bainbridge. Of the total expenditure necessary to open out a coal-field, one of the chief items of cost was caused by the heavy expenses incurred in sinking the shafts, and when such sinking happened to pass through water-bearing strata, the proportion due to this head, of the total cost, was much increased. When a shaft exceeded 200 or 300 yards in depth, and when the water occurred near the surface, it was usual to keep the water back by the insertion of cylindrical metal "tubbing," placed upon a hard bed of rock at a point immediately below the lowest feeder. Where pits were less than 100 or 200 yards in depth, the application of tubbing was not of much service, as the movement and dislocation of the strata, consequent upon the removal of the coal, generally caused the water to find its way into the underground workings. The sinkings in which there was the largest quantity of water had been carried in Belgium through the chalk, and in England through the Permian series; these rocks usually being sufficiently porous to contain large volumes of water. Without exception, in England, all such sinkings had been made by the use of pumping machinery of sufficient power to keep the pit, during the process of sinking, comparatively dry.

It was stated that the question of dealing with wet sinkings in the most economical manner would, before long, become of much greater importance than heretofore. In the report of the Royal Coal Commission an estimate was given of the coal remaining in the British Islands, as follows:—

	Million Tons.
Coal yet remaining which is or will have to be reached by sinkings through the coal measures	99,527
Coal yet remaining which is or will have to be got by sinkings through the Permian and other formations overlying the coal measure	104,419
Total	194,946

The plan of sinking pits hitherto practised in this country consisted in dealing with the water by means of large pumping-engines, in leaving the bottoms of the pits dry enough to allow the sinkers to block the well, and in keeping back the water in the upper strata by metal rings, cast in segments about 4 ft. long, and connected by wooden joints, which were wedged tight, when all the tubbing was fixed. The evils of this system were:—1. The heavy first cost of the plant, when special pumping machinery was used. 2. The expense of the wedging tuis, and the cost of fixing them. 3. The delay caused by the sinkers being compelled to work always in water. 4. The high first cost of the tubbing and of fixing it in the shaft, and the liability of the tubbing leaking in consequence of the numerous joints.

In the application of the Kind-Chaudron system these evils were to a great extent avoided. This system consisted of a combination of Mr. Kind's well-known apparatus for boring wells, with an ingenious device, invented by M. Chaudron, for fixing cylindrical tubbing under water in such a manner as to make it quite secure and watertight. In the latter part of 1871, the author, accompanied by Mr. W. Cochrane, visited the Mourage pits, near Mons, where two shafts were being sunk by this process. These shafts, though having a depth respectively of 373 ft. and 593 ft. at the date of that visit, had been bored that depth under water with a diameter of 13 ft. 6 in., the water having been constantly standing at a depth of 37 ft. from the surface. The Chaudron system consisted of the following distinct processes:—1. The erection of the

machinery on the surface. 2. The boring of the pits to the lowest part of the water-bearing strata. 3. The placing of the tubbing. 4. The introduction of cement behind the tubbing to complete its solidity. 5. The extraction of the water from the pits, and the erection of wedged cribs to secure the moss-box. The machinery on the surface consisted of a capstan engine, which raised the debris from the pits, and a vertical engine, by means of which the boring tools were lifted at each stroke; the speed of the latter engine varying from fifteen to eighteen strokes per minute. The first tool applied was the small trepan, which weighed 8 tons and bored a hole 4 ft. 8½ in. in diameter, the depth of the boring being increased at the rate of from 6 ft. to 10 ft. per day. The pit was enlarged by a trepan weighing 16½ tons, which increased the size to 13 ft. 6 in., and was kept from 10 to 30 yards behind the pit made by the smaller trepan. The larger boring-tool had twenty-eight teeth, and the smaller tool fourteen teeth, each tooth weighing 72 lb. The boring by the larger trepan did not progress faster than about 3 ft. per day of twenty-four hours. The boring was generally carried on in the day, the remaining twelve hours being employed in raising the debris from the pits. When the bottom of the water-bearing strata was reached, the tubbing, which consisted of metal cylinders cast in complete rings of an internal diameter of 12 ft. and a length of 4 ft. 9 in., was placed in the shaft, the rings of tubbing being connected by bolts. The tubbing was tested by hydraulic apparatus to one-half more pressure than it was expected to be subjected to. The rings of tubbing were let down into the shafts by means of the capstan; the moss-box at the bottom of the tubbing being placed in the pit first. The moss-box consisted of two cylinders, one sliding inside the other, and each having a flange broad enough to form a chamber to hold a quantity of ordinary moss. When the moss-box reached the bed which was prepared for it at the bottom of the pit, the weight of the superincumbent tubbing pressed upon the moss, and formed a water-tight barrier. The tubbing being thus fixed, the annular space between it and the sides of the shaft was filled with cement, thus ensuring the solidity of the tubbing; after this was finished, the standing water in the shaft was drawn out, and the joint below the moss-box was permanently safe, by the fixing of several rings of tubbing resting on two strong wedging cribs.

The comparative cost of sinking by the processes referred to was shown by two tables, one of which exhibited the complete cost of sinking, and the time occupied by the ordinary system, at eighteen different collieries, whilst the other gave the same information for ten collieries put down by M. Chaudron's process. The results showed that, whilst with the system of sinking by the aid of pumping machinery, the average cost per foot had amounted to 114-7L., and the rate of sinking to 8-9 ft. per month, with the Chaudron process the average cost of all the pits was equal to 22-9L. per foot, and the speed of sinking to 15-8 ft. per month.

WORKS AT THE EXHIBITION PALACE, DUBLIN.

We recently gave particulars of progress here. Since then various new works have been determined on. A grotto fountain, consisting of a large central stalactite cavern, and two smaller caverns at the sides, is being constructed at the southern end of the nave. In front of the smaller caverns at the sides will be figures of the Spirits of the Land, standing in ornamental basins carried on light curved and foliated ribs springing from a larger basin of rock-work; into which, after passing through the basins before described, water cast from ornamental jets rising above the figures will be discharged, and will flow through the rock-work of the rim, and over concealed coloured lights. Within the large central cavern there will be Naiads.

The summit of the grotto will be crowned with a figure of Erin, seated on a bank of shamrocks, and a cataract will rush over, and cover the entire of the mouth of the central cavern, and be acted upon by lime-lights and coloured reflectors. The interstices of the rock-work will be filled with ferns, mosses, and drooping foliage, and a flower-slope will be brought down from the rim of the main basin to meet the floor.

Another fountain is in course of erection in the part of the nave opposite the Colonnade,

with reclining figures bearing ornamental lamps. Outside the rim will be a border of ornamental tiles, manufactured by Messrs. Kerr, of the Belleek Pottery Works. Within the rim there will be, at either side of the centre of the basin, a group of four storks. In the centre of the fountain there will be a group rising to a height of about 20 ft. above the floor; and around the base there will be four figures (emblematical of the four provinces of Ireland), each seated on a nautilus, with sails set and extended ears. The group is crowned by a figure of St. Patrick trampling underfoot a toad-stool, and banishing the serpents from the soil. The right hand is extended, the left grasps a staff, above which is a cluster of shamrock-leaves, containing large ornamental water-jets.

Two colossal figures of St. Michael are being carved in Portland stone,—one for each of the garden fountains,—and a spacious orchestra is being erected at the north end of the nave.

The Naisies between the central cavern of the grotto fountain will be in Portland stone; the groups in front of the side caverns, and also the colossal figure of Erin, in Sicilian marble. The rim of the fountain front of the colonnade will be in violet vein marble, the stork groups in majolica, the basins in light Bardiglio, the base and serpents in Egyptian green, and the nautilus shells, figures, and foliage generally in natural colours.

The entire of the works are being executed from the designs and under the superintendence of Mr. Walker Emden, architect. The carved work of the grotto fountain and of the garden fountains has been entrusted to Mr. Edward Mitchell, of Crowndale-road, Camden-town. The whole of the ornamental work of the central fountain is being carried out by the Marezzo Marble Company, of Oxford-street, for whom the modelling has been done by Mr. Broomfield, of Kennington-road. The grottoes and rustic work generally are being constructed by Mr. Nadal, a French artist; and the artistic lighting will be by Defries & Sons. The constructive works of foundations and basins have been executed by Mr. Thomas Henley, of Holloway; and the hydraulic engineering by Messrs. Edmondson, of Capel-street, Dublin. Mr. Beer, of Tennis-street, London, who is well known in connexion with many of the London theatres, is engaged in decorating the concert-hall and dining-room.

CONDITION OF THE HOUSES IN ADELPHI-TERRACE.

At Bow-street, on Tuesday last, Mr. Biron, instructed by Mr. Napier, attended the court with Mr. Hayward, the district surveyor to the Metropolitan Board of Works, by the request of Mr. Vaughan, with reference to an application for an order for ejection under the Building Act, which he made on Monday, the 25th of March.

The application was made respecting the dangerous state of five or six houses in Adelphi-terrace, and the result was that Mr. Vaughan granted an order for the removal of the inhabitants, one of the houses being the Junior Garrick Club. Afterwards several of the inhabitants, accompanied by Mr. Fladgate, solicitor, waited upon Mr. Vaughan, and in consequence of their assertions that the houses were perfectly safe, Mr. Vaughan suspended the order, and requested Mr. Fladgate to attend on Tuesday, when notice would also be given to the Metropolitan Board of Works.

Mr. Vaughan said there was no case before him upon which he could decide. He suggested that Mr. Fladgate should take out a summons against the Board of Works to show cause why the order should not be cancelled. After some little discussion, this course was adopted, and the summons made returnable at once.

Mr. Fladgate then stated that the houses had been built about a hundred years, and had been somewhat neglected. There were cracks in the walls and basements, but they had not increased during the last ten years. They were sufficient perhaps to frighten the district surveyor, who had only recently seen them, but their true nature did not justify the steps which he had taken to eject at once the inhabitants.

Mr. Robert Driver, of Whitehall, said that he had been surveyor of the Adelphi estate for twenty years. He had recently examined the houses in Adelphi-terrace, and was satisfied of their stability. No. 14, the Junior Garrick Club, was in the same condition as it had been for the past ten years. There were large cracks, but they had not increased during the past ten or twelve years. There was certainly no danger of the house falling. The same re-

mark applied also to Nos. 1 and 2, except that the latter was the worst. No. 3 was in very good order. No. 4 was not so good, but it was in no danger. Some of the cracks might have got a little larger, but there was no fear for people sleeping there.

Mr. Wm. Scurry, architect and surveyor, deposed that he had received notice to shure up the foundation, and the work was in progress. He had made a careful survey of Adelphi-terrace, and he considered the houses quite secure. The Club was perfectly safe. On being cross-examined, the witness said that one of the piers or supports of the arches under one of the houses needed rebuilding, and he was appointed to see to the repairs. He had shored the place in such a manner that there was no immediate danger of the house above falling.

Mr. Vaughan said the question he had to decide was whether the shoring was sufficient.

The witness replied that he should consider so himself.

Mr. Fladgate said that he had other witnesses, but their evidence was only in corroboration of what had already been said.

Mr. Hayward stated that he considered the houses were in a very dangerous condition, and that the reconstruction of the piers was a very delicate operation. It was exceedingly unsafe for people to remain in the house while the reconstruction was being carried on. He had advised 100 men to work at it on Sunday, on account of the immediate danger.

Mr. George Vulliamy, the superintending architect to the Board, made similar statements.

Mr. Vaughan said he was quite prepared to express his opinion that the order must not be cancelled.

The order for the ejection was therefore held good.

THE PROPOSED WIDENING OF THE POULTRY AND CHEAPSIDE.

The Works and General Purposes Committee of the Metropolitan Board of Works have reported to the Board that they have inspected the locality, and also received a report from their architect, from which it appeared that the width of the Poultry was about 39 ft., and that it was proposed to throw 13 ft. 6 in. in depth by a length of 50 ft. into the street, increasing the width for the said 50 ft. from 39 ft. to 51 ft. 9 in. at Old Jowry, and 53 ft. 3 in. at the eastern end of the improvement, being a continuation of the line of the setting back of the site of St. Mildred's Church and of the Union Bank of London. The gross cost of this, the architect was informed, was 44,400. 17s. 9d., and the ground at the rear of the improvement left for recoupment had been let at a rental of 1,200. per annum, which at twenty-five years' purchase was 30,000., and, deducted from the gross cost, gave 14,400. 17s. 9d. net, as against 15,810. 17s. 9d., the estimated cost. The committee believed this to be a very valuable improvement, in which the Board might properly assist. They thereupon recommended the Board to contribute one-half of the cost, such contribution not to exceed 7,220.

The report of the committee was adopted by the Board unanimously.

THE SAFETY OF SASH-FASTENERS.

Sir,—While agreeing with "A Craftsman" in his statement that the desire for cheapness, and the great competition amongst manufacturers, have resulted in producing at the present time goods which, as a rule, are "flashy and bad," I think his letter in some respects is likely to mislead.

To understand the difficulties to be overcome, I would put shortly before you the present position of the fastenings of our windows.

1st. The police authorities find, from the daily reports furnished them throughout London and other large towns, that a very large proportion of the robberies committed in houses are effected by the thieves obtaining entrance thereto through the windows, and that, naturally enough, they wish to render this easy ingress more difficult. The entrance is easy sometimes, because, through the carelessness of the servants, the sashes are not fastened.

2nd. When they are fastened, the fasteners can be quickly and easily opened from the outside by the use of a common knife. I am here alluding to the ordinary sash-fastener which is in such general use.

It will, then, be seen that this is not a question of good or bad workmanship, but a question of design. What is wanted is a sash-fastener which shall satisfy those requirements, and it should therefore be:—

1st. Of that configuration that it may easily be seen whether it is shut, while a person is standing in almost any part of the room.

2nd. It must not be possible for thieves to open it from the outside by the use of a knife or thin steel blade.

Therefore, the old spring screw sash-fastener, which your correspondent much praises, will not satisfy the requirement. The servant may not

have screwed it, and as it is a little trouble, most probably has omitted to do so. Yet the eye of a master or mistress will scarcely detect it, without trying the fastening. Herein is the old sash-fastener inferior to the one in general use, which can at a glance be seen whether it is fastened. The further objection to the spring screw sash-fastener, is fairly stated by "A Craftsman." This fastener, then, is not likely to be again brought into general use.

Next, let me examine "A Craftsman's" own idea; namely, the rebating of the meeting bars themselves, of which he says, the more he considers that process the more he is convinced of its security, and that he is prepared to meet the objection that may be urged against it.

The objections I would advance are, that in any sashes constructed in the usual way, and having cross-bars, there is no security because the rebate cannot be made sufficient. This will be apparent if a section be drawn; or a model, still more so if the sashes be made, or a model, it is not novel, being but a repetition in wood of the rebated sash-fastener, which has just been found a failure. Even if it could be made to answer, it would not meet the difficulty, for it is not to be supposed that all houses could have new sashes; and therefore its application would be almost limited to new houses. This I need not speak about, however, until I am shown to be wrong in respect to its uselessness. Practically the only remedy is a sash-fastener giving security without much (if any) increased expense.

It is foreign to the question to say, as your correspondent does, that if the thief cannot open the sash-fastener, he will resort to other modes; because all that is desired is that he shall not enter by reason of the defectiveness of this one article. Every additional impediment in the burglar's way means increased security to the householder. Further, it must be remembered that many a thief would be afraid to carry with him the articles "A Craftsman" names,—drills, jemmies, and centre-bits, a diamond, and a leather sucker; and it is certain that if caught with any such things about him, they would ensure his conviction; while if he only had a pocket-knife, he might escape.

The necessity, then, exists of selecting from the very many sash-fasteners (the number of different kinds of which I may mention has greatly increased of late) some few of which while they have the requisite security, have also cheapness to insure their general adoption.

The reason I say some few is because I consider it an advantage that a variety should be used, so that the burglar may have some little uncertainty as to the particular kind which is on the windows of the house he proposes to attack.

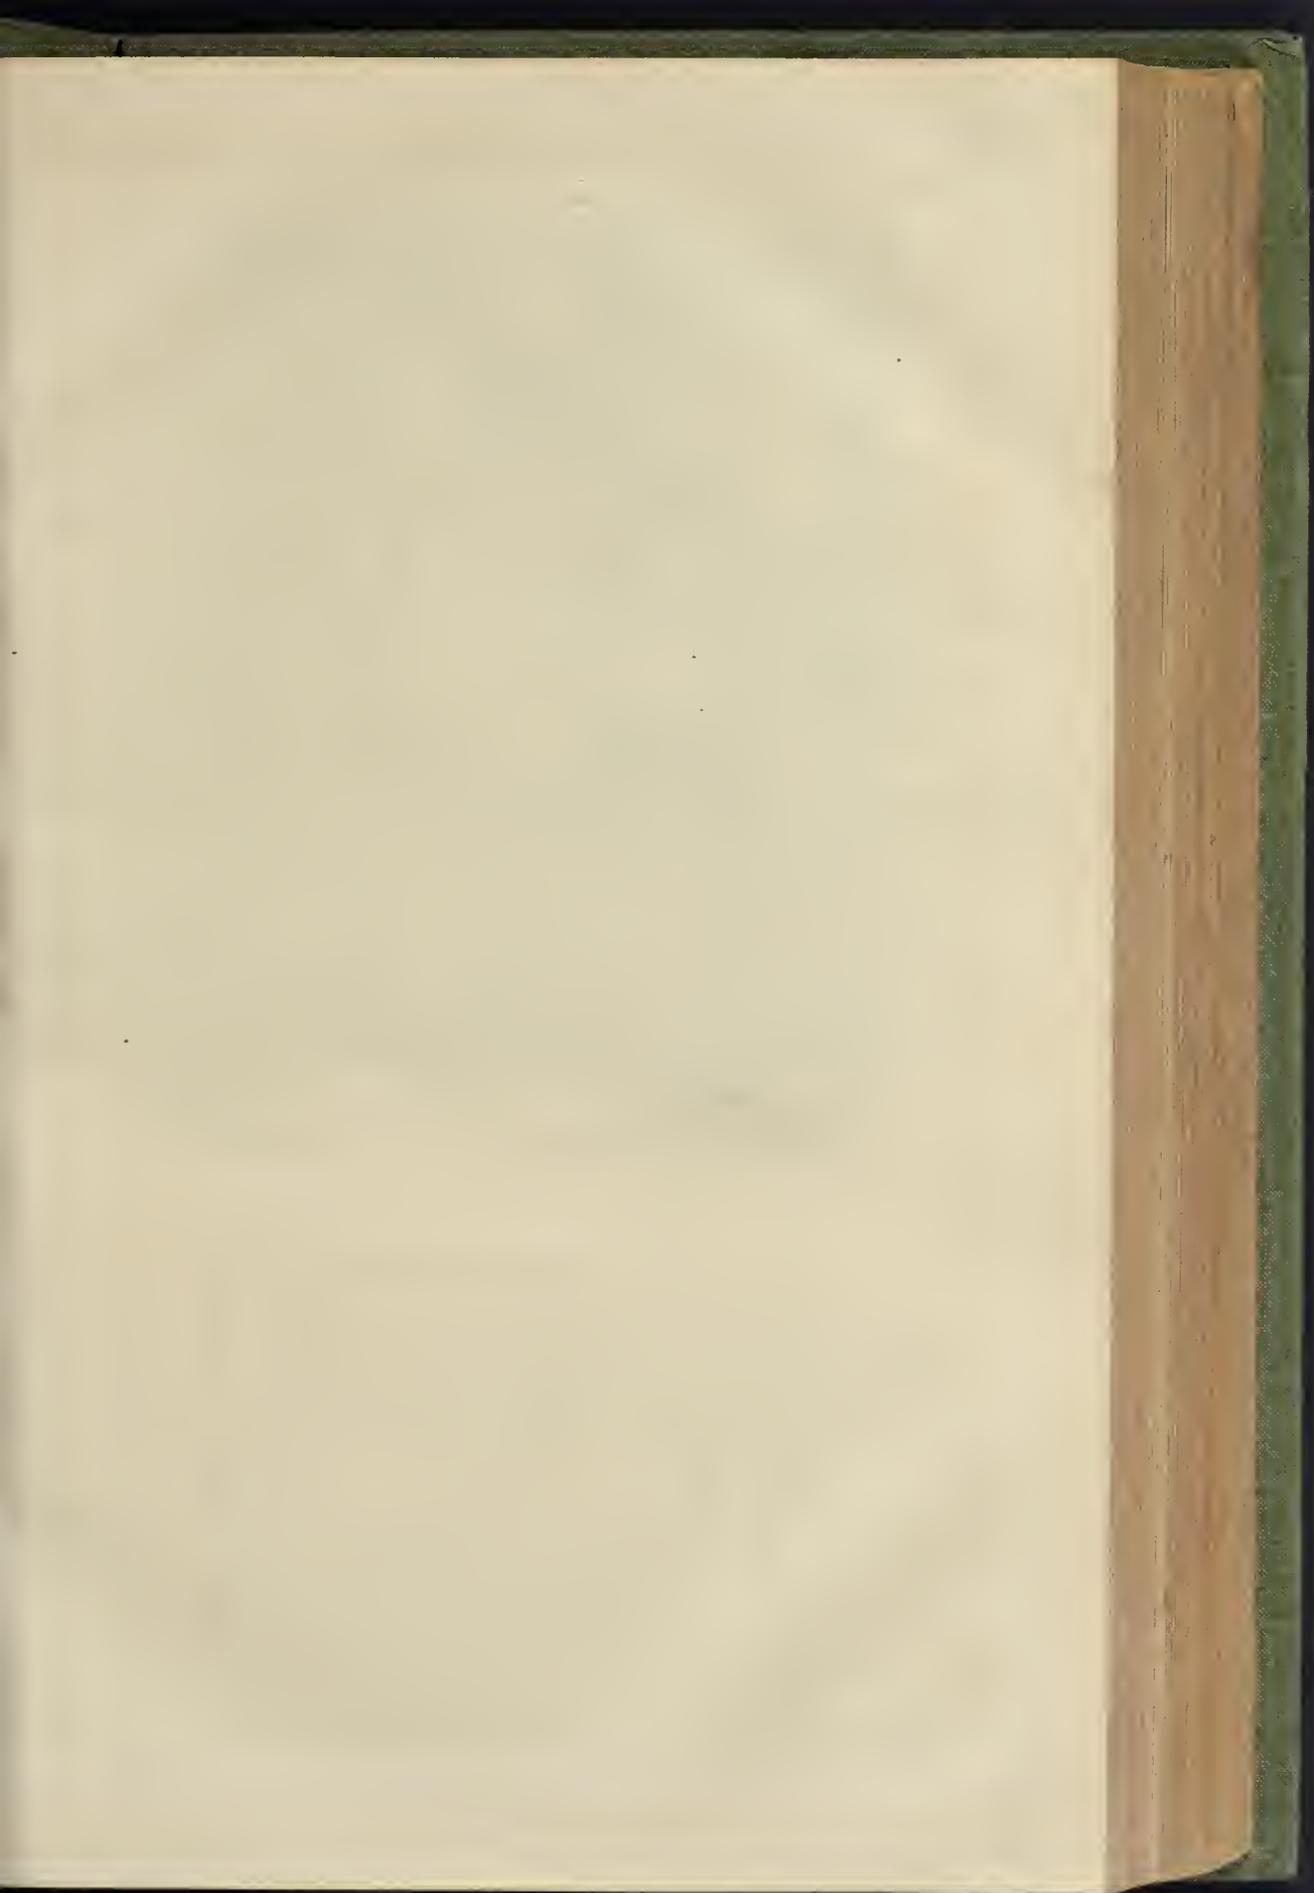

I trust shortly to have arrived at a decision on the merits of the great number of sash-fasteners I have had submitted to me, which result I hope to be able to present to your readers.

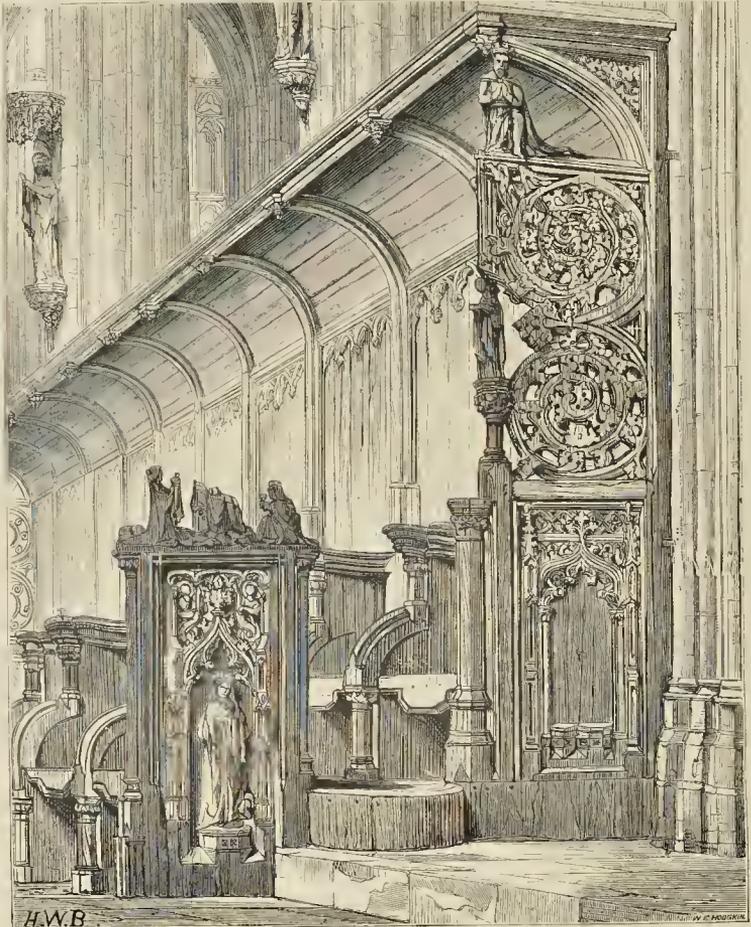

B. FLETCHER.

THE NEW PUBLIC OFFICES.

ABOUT a month since, a question was put by Lord Rodesdale in the House of Lords as to the block of houses in Parliament-street in front of the new Home and Colonial Offices, and Lord Lansdowne replied on behalf of the Government, that this block would remain for the present, as a matter of economy, inasmuch as the houses were producing rent. Of course, Lord Lansdowne replied according to his instructions, but the answer is so palpably absurd on the face of it, that it is marvellous how the officials of her Majesty's Office of Works could have ventured to put such words into his Lordship's mouth. Some of the houses are empty, or let to book-stall keepers and such like; so that the income must be very little. *Par contra*, the extra cost to the contractors must be enormous; for any passer-by can see that, on account of the confined space, there is the greatest difficulty in getting in the materials. Not only is a large unnecessary cost thus put on the contractors, but they must be inevitably delayed to a serious extent; and as the Government are put to cost and inconvenience for the want of these offices, it is plain that the interest on the outlay which is lost by delay in completing them must be tenfold the trifling rents which the Government are receiving from weekly or monthly tenants. It seems the fate of her Majesty's Works to be continually governed with the mixture of reckless extravagance and miserable parsimony so well described by Mr. Gladstone some two years since.

A LOOKER-ON.

STALLS IN THE CATHEDRAL OF BOIS-LE-DUC.

STALLS IN THE CATHEDRAL OF BOIS-LE-DUC, HOLLAND.

THE Cathedral of Bois-le-Duc, to which we have already frequently referred, offers us yet another illustration. The stalls here represented are of a type far from uncommon in Holland and Northern Germany, but not frequently to be met with in England. The continuous "coved" canopy does not seem to have found much favour with the English Medieval architects, who seem always to have preferred placing a separate canopy over every stall; and where the coved canopy is to be met with in the stalls of English churches, it will generally be found that they are of foreign workmanship and design.

Another foreign peculiarity is to be noticed in the stalls at Bois-le-Duc, and that is the singular pierced scrollwork filling up the end of the stalls.

We believe that a somewhat similar treatment was to be seen in the old stalls at Wells Cathedral before they were removed to make way for stone niches, which now occupy their place; but we do not know of any other English example. On the Continent, however, the examples are numerous and very varied. Sometimes the scroll is simply foliage, as in the case before us;

at other times, figures are introduced, as at Hildesheim. At Breda, the mysteries of the rosary are introduced into the scrollwork; and at Moosburg, grotesque animals. The most interesting examples of this kind of stall-end which we have met with are to be seen at Hildesheim, Erfurth, Halberstadt, Moosburg in Bavaria, Breda and Bois-le-Duc in Holland, and the Cathedral of Palermo.

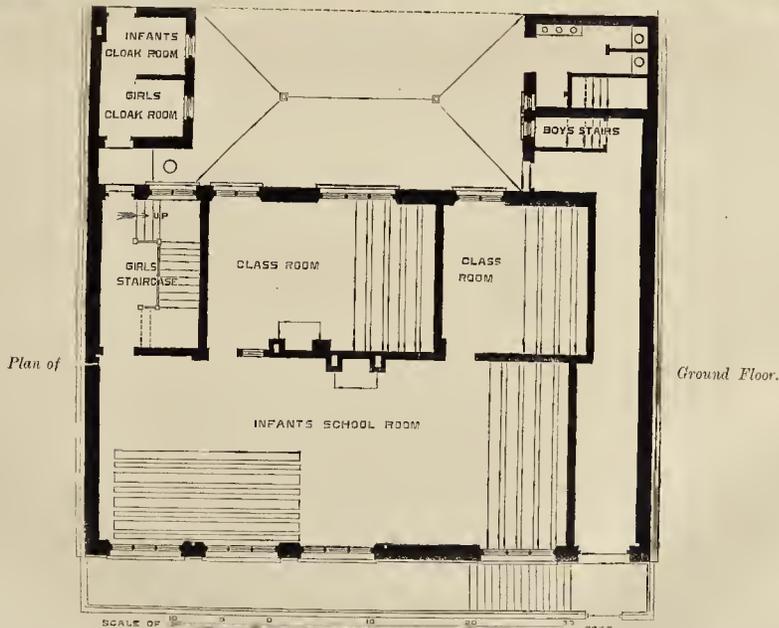

THANET STREET NEW SCHOOLS, ST. PANCRAS, MIDDLESEX.

THESE new schools are built on three floors, and include three large schoolrooms, with four class-rooms, and accommodation for 552 children. In the basement there is provision for a soup-kitchen and coal-store; also for an industrial kitchen, if hereafter required. In the rear of the building is a small playground. The site runs through from Thanet-street to Sandwich-street; and at the Sandwich-street end it is intended immediately to erect a two-storied building, consisting of a mission chapel above, to hold about 200 people, with a mission-house below for the various benevolent agencies of the extensive parochial machinery. The cost of the

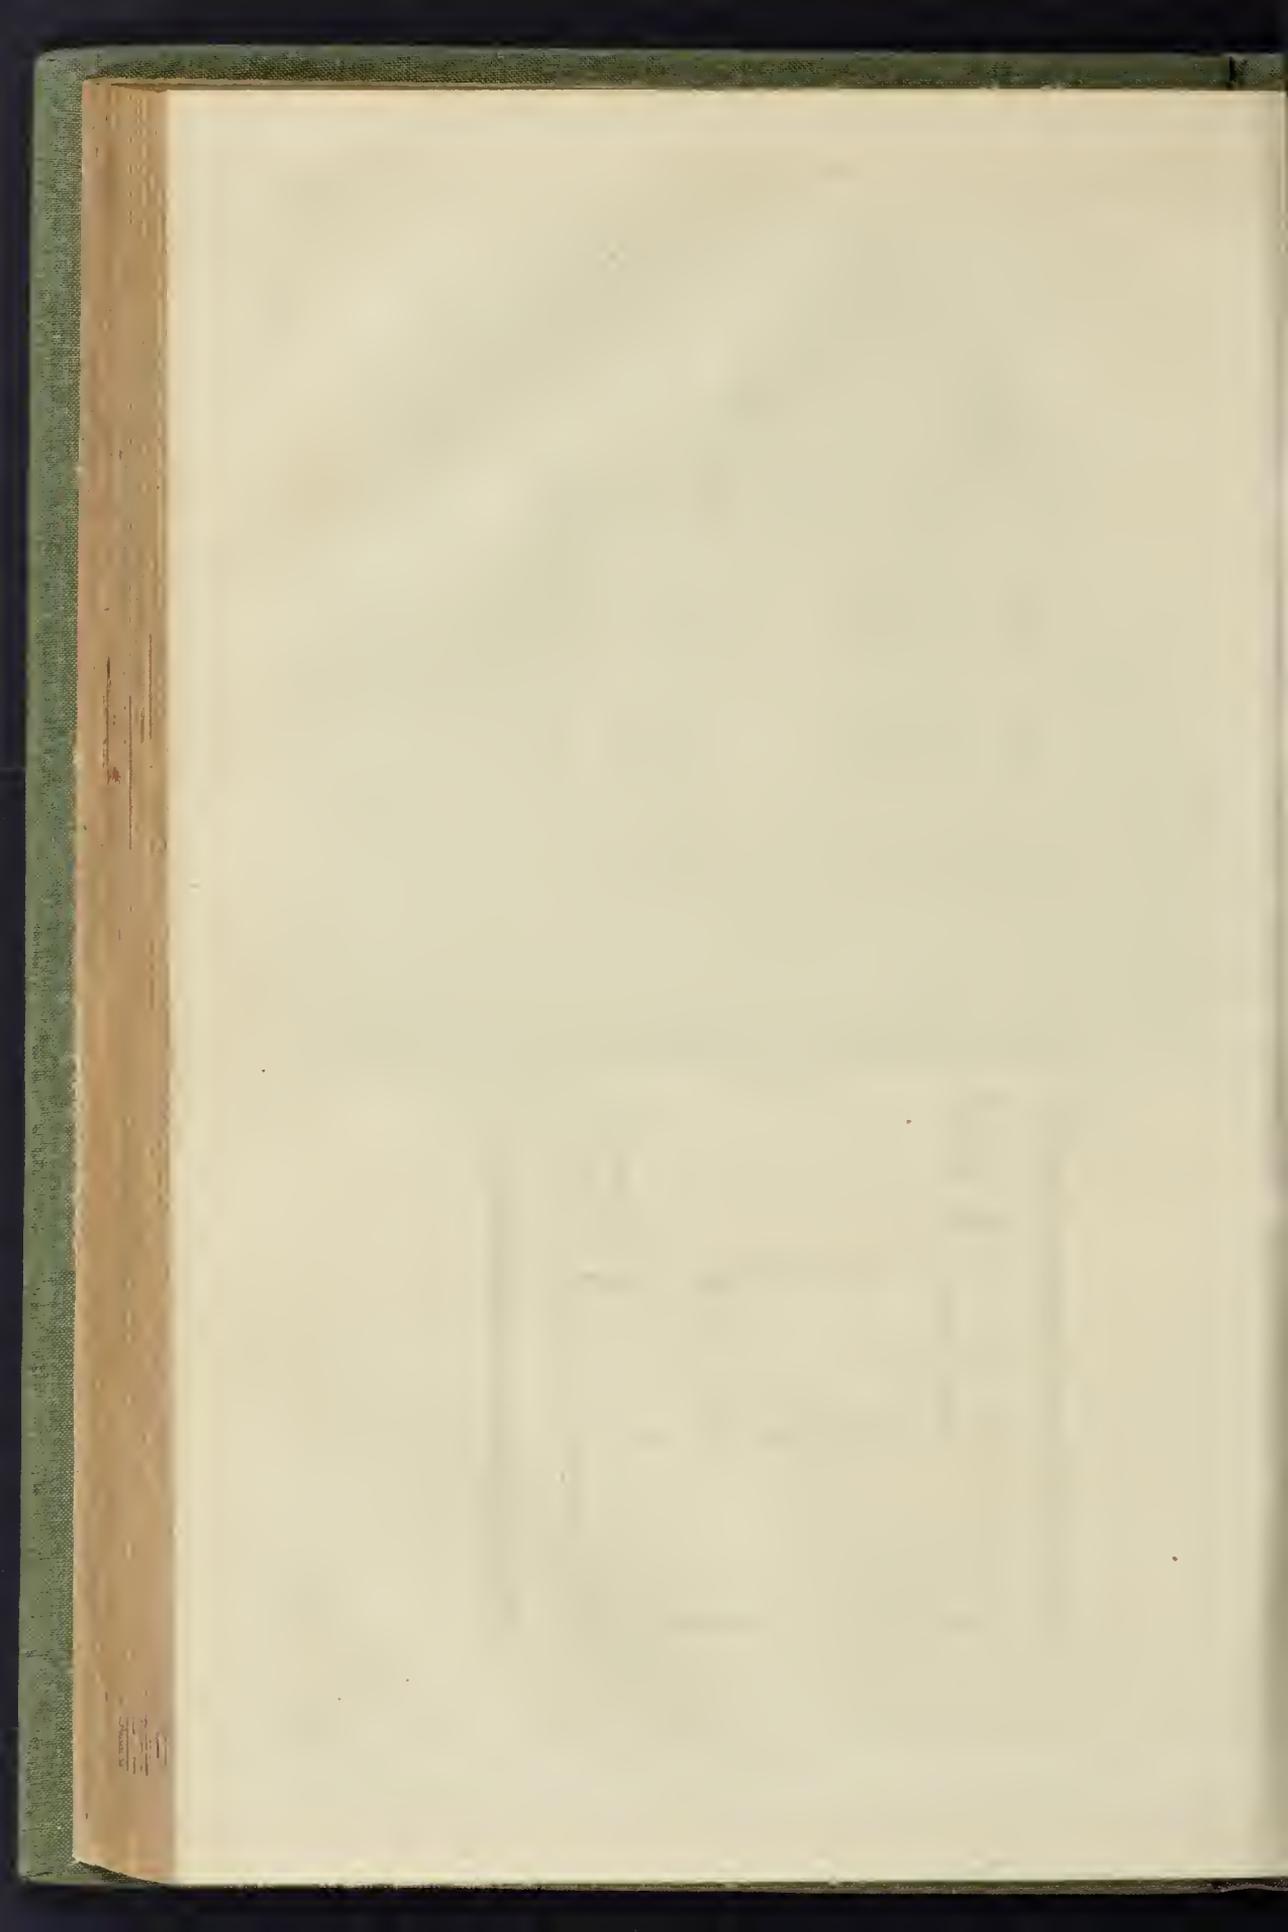

entire site, including the freehold, has been 2,510*l.*, and the total cost of the school-buildings, 3,996*l.* 3*s.* 1*d.*, making a total of 6,536*l.* 3*s.* 1*d.*

The Bishop of London's Fund has contributed 500*l.*, and 500*l.* more have been produced by the sale of stock, to which must be added 5,216*l.* 11*s.* 10*d.*, contributed almost entirely by the residents in the neighbourhood and friends of the ragged schools formerly held here. The schools have been planned and the money raised by the persevering efforts of an influential local committee, of which the Rev. Prebendary Thorold, M.A., Vicar of St. Pancras, and a member of the School Board for London, is chairman. The schools have been built without a building grant from Government, and they amply supply the neighbourhood with efficient school accommodation, without any burden on the ratepayers. Messrs. Wm. Milford Teulon & Cronk, of Wimpole-street, are the architects; and Messrs. Sewell & Sons the builders.

The building is constructed of brick; washed stock facings, here and there relieved by red kiln-brick bands and moulded red brick cornices. The windows to the front are of Bath stone, with moulded kiln-brick arches and moulded brick label mould. The roofs are covered with slate with red tile ridge.

THANET STREET NEW SCHOOLS, ST. PANCRAS, MIDDLESEX.—MESSRS. W. MILFORD TEULON & CRONK, Architects.

THE TREATMENT OF THE EYE IN GREEK SCULPTURE.

SIR,—May I be allowed a word in reply to your correspondent, Mr. Davies, on the above subject. The illustration I suggested, in connexion with your article "On Conventionalism in Art," had reference solely to the absence of any sculptured representation of the iris and pupil of the eye, exclusive of colour. Unless it can be shown that it was thus left for the very purpose of being coloured, and was thus invariably coloured, though trace of this has since disappeared, it would, I presume, remain an illustration of that for which it was added—the conventional treatment. I was quite aware of the researches which have been made, hinging upon the use of colour in Greek architecture and sculpture, and presumption is much in its favour as to its decorative employment; but the evidence seems too indeterminate, both from existing remains and contemporary literature, to lead to any safe conclusion as to its general or precise employment, or that their statues were parti-coloured in an ultra-imitative manner. If, as Mr. Davies suggests, colouring was abandoned at the dictate of a purer taste, that they did not then resort to any sculptured equivalent in treating the eye, affords, if anything, a more remarkable instance of an adherence to the conventional principle. It would be an interesting experiment if some of our sculptors and painters would combine in giving the fullest use to colour in statuary, to decide what is gained or lost thereby. The late Mr. Gibson's attempt was not regarded, I believe, as a favourable one.

NEMO.

CHRIST CHURCH CATHEDRAL RESTORATION, DUBLIN.

DURING the works proceeding at this cathedral, some notices of which we have already given, several interesting features have been brought to light concerning the original structure and subsequent additions. Not the least of these are the "finds," which will possess much interest for archaeologists and antiquaries. Among these are carvers' tools, huttons, keys, a flagon of glazed earthenware (slightly artistic), a stone cannon-hall (supposed, but may in reality be a rolling hall used in some games or pastimes common to the people), some pieces of different coloured glass, a large collection of tiles of various patterns, various encaustic tiles, among them one of Moorish pattern, bearing impressed figures of different animals, and other sundry tiles, in which the designs were burned in. A great number of these patterns of pipes known as "Danos' pipes" in the sister kingdom, has also been unearthed; some with long shanks, and exhibiting the distinctive characteristic of thickness and obliqueness in the shape and form of the bowl. Among the coins there are several Danish, Elizabethan, and some of other reigns less decipherable.

In respect to the restoration, the old north wall of the nave is completely taken away, and is being rebuilt up to the sills, which are nearly 8 ft. above the old floor level, or about 20 ft. above the adjacent street. Under the nave and supposed original choir, the old crypt that was unharmed showed evidence of very early construction in mixed, round, and pointed arches, some good carved caps and stopped chamfers at the angles of the square piers which supported the vaulting. These features are also to be found to some extent in the transept of the church, and are accounted thirteenth-century work. The eastern portion of the crypt is planned with an apse, with aisle around, and three square-ended chapels on the east of this aisle. The peculiarity is that the side chapels open into the aisle without intervening arches; the aisle around the apse in consequence presents no marked expression. When the choir is restored, its piers and walls will apparently stand upon the existing walls below in the crypt. This will lead to the peculiarity being followed or preserved in the finished design.

The groining of the centre chapel will be divided from that in the aisle by an arch corresponding to that in the crypt, but the groining of the aisle and side-chapels will be continuous, without intervening arches. A flight of steps was come upon during the excavations on the southern side, from the crypt to the cells or under-chamber of the old courts of law once existing in the vicinity. When the old wall was being removed of the north aisle, a spiral or winding stair was discovered leading to the

door. The workmen also came upon the remains of an old chapter-house projecting from the main structure. The details connected with the latter have been deemed sufficient by the architect to lead him to design a new building upon the old plan. It was originally intended to utilise all the columns of the northern arcade of the nave, but on subsequent examination they were said to be too much decayed to be depended on, so they will be replaced. This is rather a sweeping elimination of old work. The southern wall of the nave will come down, and will be rebuilt to match the northern side, and the southern aisle wall is already down to the ground level. Below the aisle an accumulation of several feet of rubbish had to be removed, and during the removal two doorways were brought to light in good preservation, one leading from the south aisle into a building in an angle between the transept and aisle, and thence to the crypt. This is a well-defined doorway, with detached shafts and jambs, handed at short intervals, and presenting features, it is said, similar to those of the doorway of St. Canice's, Kilkenny.

The building of the western wall will shortly be commenced; the gable and arch of the western window have been taken away, the arch is brought out from the angles, window-lights are put in, and the early jambs restored.

THE SEWAGE QUESTION AT HERTFORD.

THE Town Council of Hertford having obtained permission to borrow 3,000*l.*, have at length determined to carry out in their integrity the plans of their engineer, for the enlargement and improvement of their deodorizing works. "While hoping for the best, we cannot but fear," says the local *Mercury*, "that the Council have committed a grave error in committing themselves to Mr. Grindle's scheme, on the authority of Dr. Letheby alone, and without submitting it to the opinion of some eminent civil engineer. We have no adequate guarantee that when the 3,000*l.* are expended it will not be found to have been money thrown away. Nearly every town which has adopted the deodorizing process has been forced to give it up, and resort to irrigation. Why should we expect Hertford to prove an exception to the rule?" The Council appears to have finally decided upon Mr. Grindle's plan because the primary outlay is small, and because the promised results will enable them to attain the standard of purity inserted in Mr. Stansfeld's Bill, which is not yet law.

THE TRADES MOVEMENT.

Leicester.—The workmen engaged in the numerous brickfields around Leicester have come out on strike. They demand an increase of wages, at the rate of 4*d.* per thousand for making, 3*d.* per thousand for grinding, 2*d.* for carrying, and other branches of the trade in proportion.

Hartlepool.—The operative joiners of the Hartlepoons have turned out for a concession of 2*s.* per week on their present wages of 28*s.* per week.

The Potteries.—The bricklayers of the Staffordshire Potteries and Newcastle-under-Lyme district have gained the concessions recently demanded of their employers. The builders at once acceded to the application for a reduction of working hours and an increase of wages, and this week the new arrangement has been formally ratified. Working hours have been reduced from 58 to 55½ per week, and wages have been raised from 6½*d.* to 6¼*d.* per hour.

Bromsgrove.—Up to this time the masters engaged in the building trades have taken no notice of the request of the men for an alteration in the mode of work, a slight increase in pay, and a limitation of the hours of labour. The committee have issued circulars to the masters, giving them notice that on and after the 1st of May next they will demand to work by the hour system only, and to finish work on Saturdays at one o'clock; and that they will claim wages on and after that date at the rate of 6*d.* per hour for all skilled labour, and for unskilled labour in fair proportion. They also gave notice that unless the masters gave a satisfactory intimation in writing of their intention to accede to the demands on or before Friday, the 29th ult., the men would not resume work after the 30th until such concession had been made.

Edinburgh.—A meeting of the joiners of Edinburgh has been held, Mr. George Rintoul in

the chair, to consider the answers received to the men's demand. It was stated that the following employers had either signed or agreed to the code of bye-laws.—Messrs. Macgibbon, Crow, Duncan, John Smith & Son, Black, A. Wilson, Ponton, Robertson, Leith-walk; Lamb, Bellevue; Grievie, Hutton, McKellar & Swan, Shclair & Fortune, McNaughton, Cowie, Hunter, Lothian, Edinburgh Co-operative Building Co. It was reported that many more of the employers would sign the bye-laws whenever they were presented for signature, as they only objected to some of the travelling points and other minor details. The workmen in those shops where the demand was not conceded, with very few exceptions, gave notice to leave work. As near as can be estimated, upwards of 300 joiners gave in their warnings to leave. It was stated at the meeting by the secretary that he had jobs for sixty men in shops where the employers had signed the bye-laws, and that these shops would be the first supplied with men. A conference between representatives of the employers and workmen, however, afterwards took place, Mr. James Waterston in the chair. The working regulations, as proposed by the operatives, were gone through in detail. Several alterations were proposed by the employers, and a number of mutual concessions were made. The conference separated with the understanding that the rules as amended would be submitted to their respective constituents, with the recommendation that the bye-laws would now be adopted by the whole trade, and that the threatened strike should not take place.

UNVEILING OF THE QUEEN'S CANOPIED STATUE AT BOMBAY.

THE Queen's statue is about to be unveiled at Bombay by the Guicowar of Baroda. The design was submitted to and approved by her Majesty. A view of it appears in the *Builder* for 1869, page 567. The cost has been 15,500*l.* It is a colossal sitting statue of her Majesty, in the best Carrara marble, with an elaborate canopy, nearly 50 ft. high, also executed in marble of various colours. The Royal coat of arms is placed on the front of the pedestal, and the Star of India in the centre of the canopy, while, on the enriched part, immediately above the statue of her Majesty, the rose of England and the lotus of India, accompanied by the mottoes, "God and my Right," and "The Light of Heaven our Guide," are introduced. Besides these accessories, others also are introduced in the design. Four panels between the columns have been provided as spaces for the inscriptions in four languages. The effect of the whole is good.

PROPOSED STATUE OF THE LATE PRINCE CONSORT AT HOLBORN CIRCUS.

At the last meeting of the Court of Common Council, the Improvements Committee submitted a report, accompanied with a design for the pedestal of the equestrian statue of the Prince Consort, at a cost fixed by the Court, viz., 2,000*l.*; and the committee recommended that the sides of the pedestal be filled with bass relief, at an additional cost not exceeding 600*l.*

Mr. Saunders strongly objected to the design of the pedestal submitted, as out of accord with all canons of art.

Some discussion ensued, and Mr. Isaacs moved, by way of amendment to a motion adopting the report, that the matter as to the design be referred back to the Improvement Committee, and that they be instructed to invite designs, the carrying out of which would not involve an expenditure of 3,500*l.*

The debate was adjourned.

MISUSE OF CEMENT IN IRON SHIPS.

At a meeting of the Institute of Naval Architects, a paper "On the misuse of Cement on Iron Transport Ships, with Suggestions for making half-worn-out Iron Ships perfectly Sea-worthy, at a small Cost," was read by Mr. William Poole King. He said, in reference to cement,—There can be no doubt that the half-worn-out plates of iron ships may be much strengthened by the application of the cements in ordinary use, composed of silicate of lime and alumina. The plates are found covered with scales of oxide of iron; and, when the cement is applied in a wet state, an imperfect chemical

union is formed, consisting of silicate of iron, lime, and alumina, which hardens into an artificial stone of some strength; the plates are firmly backed up, and the ship is much strengthened throughout her structure. As long as there is little cargo in the ship, she makes but little water, and seemingly is in perfect order for the longest sea-voyages; this, however, is delusive, for when the ship is loaded, say 20 ft. deep, and her plates are a little strained by the motion of the ship, she begins to leak.

By affixing cement upon the inside plates of an iron ship, a most deceptive trap is laid. In dock, under survey, the ship appears abundantly strong, and resists the strenuous and honest strokes of a wood mallet. Borings may be taken which seem compact: the ship may not even leak till a small hole occurs deep in the outward surface from working in rough water: when the ship labours, the trap falls, and lucky are the sailors if they escape.

In cementing vessels, it would be well to fill in solid between the frames, and flush with the lining or ceiling about the bottoms of coal bunkers, leaving a course for water in the centre of each bay by inserting a piece of iron piping; the bottom parts of the vessel, forward and aft, should be filled in to nearly the top of the floor-plates, and such other parts as it is difficult to gain access to.

MOVING A CHIMNEY.

We learn from an American newspaper that the great chimney of the Cabot mill at Brunswick, Me., has been moved 20 ft., to allow of the enlargement of the mill. The work was done by a process similar to that by which ships are launched, the chimney being slid along on greased planks. The chimney is 70 ft. high, and nearly 8 ft. square at the base, and it was moved, the flues connected, and the fires started, in eight hours and a half.

WHAT MIGHT BE DONE.

THE LAW-COURTS.

Sir,—Having read your remarks in the last *Builder* relative to the New Law-Courts, I am induced to write the present letter.

You ask whether the people of England have no means of making their sentiments known and felt on the question of the Law-Courts. The answer must be, Yes; and it only requires a little organisation to effect it. The legal profession are chiefly concerned in obtaining convenient courts, as it is in these courts most of their lives will be spent. The next in order is the general public. Well, this being so, all that is required is, that a few men taking an interest in the matter hold a preliminary meeting at some friend's chambers, appoint a committee, elect a chairman and secretary, adjourn to a public room, invite the gentlemen of the press to be present, and enter into the discussion, examining the plans, sections, elevations, and drawings, so that the whole business could be brought before the country, and a fair and impartial judgment be arrived at. The legal profession is a powerful body, and possess great political influence, so that the metropolitan members of Parliament and many representatives of the provinces would certainly attend.

ABOVS.

THE NEW "OLD BANK," MALVERN.

The new premises now occupied by the Old Bank are not quite new, as premises, for the original building was before occupied by Messrs. Salmon & Co. The entire shop-front has been taken out, and new fenestration substituted, of Cradley stone supports, oak bronzed frames filled with extra thick plate-glass, protected with Clarke's patent revolving shutters. The entrance-door, a double-margin one, constructed to match, opens into a lobby 7 ft. square, common to the bank and the manager's residence. The doors leading to the banking department, also of oak, and glazed, are hung folding, and flanked with bronze columns of Ionic character, surmounted with elliptical entablature, also bronze. Entering through these doors is the public business portion of the establishment, which is about 30 ft. by 20 ft., filled with counters and desks of mahogany. The doors and finishings are of oak, relieved with bronze mouldings and ornaments, all the wood being French polished. Godwin's encaustic tiles, specially designed for these pre-

mises, form the floor of the bank and the lobby. The books are kept, when out of use, in "the strong room," underneath the floor. To convey them to this place a hydraulic lift, with a capacity of 4 cwt., has been constructed, by means of which the books are lowered at night and lifted in the morning by the expenditure of only 184 gallons of water for the double journey. This room is approached in the ordinary way, and for ordinary purposes, by an iron staircase, which, as well as the lift, is guarded by thief and fire proof iron doors, and with all modern improvements for the purpose of keeping out thieves, fire, or damp. Inside it is finished off with Parian cement, having a polished face. It is fitted up with iron shelves for boxes, &c. An additional security is afforded by a Cubb's patent door, gate, bolts, bars, and locks.

The manager's room is situated at the west end of the bank, separated by an oak glazed screen, in keeping with the other doors. The whole of this department is heated with hot water, circulating in iron pipes, on the low-pressure system, the pipes being enclosed by specially designed ornamental bronze cases. The walls are of Parian cement, painted and decorated.

The doors are protected by electrical appliances, and on being tampered with, alarms are rung in various parts of the premises.

The general contractor for the work was Mr. John Everal, of Malvern, whose foreman was Mr. Thomas McCann. The heating apparatus gasfitting, bellhanging, &c., were supplied by the trustees of Messrs. Guy & Son, Malvern; the hydraulic lift, stairs, folding-doors, &c., by Whitmore & Binyon, London; the electric bells, by A. Boyd & Son, London; the iron fittings in the safe, by Hansher, Malvern; the plumbing and glazing, by Davis & Son, Malvern; and painting, paper hanging, decorations, &c., by Mrs. Adams, Malvern. The entire arrangement of the work was carried out under the superintendence of Mr. H. Haddon, architect, Malvern; clerk of the works, Mr. J. S. Alder.

PRESTON COVERED MARKET.

THE people of Preston have been unlucky as to their proposed market. If we remember rightly, after its erection, in January, 1870, at a cost of 6,000*l.*, it fell down in May of the same year. Recently a contract for its re-erection was entered into by Messrs. P. D. Bennett & Co. These gentlemen have now stopped the work, and have written:—

"We unhesitatingly say that a roof constructed in accordance with the plans and drawings furnished to us cannot stand, and this must be strictly true to any engineer accustomed to work of this description."

The committee have since instructed the engineers to call on the contractors to complete the work in accordance with their contract.

SHAKESPEARE'S LAND.

MR. HALLIWELL-PHILLIPS, whose recent accession to a new name and fresh fortune has already been marked by some munificent acts, has just purchased the theatre at Stratford-on-Avon, a very ugly modern brick building provokingly standing in the centre of Shakespeare's New Place Gardens, and intends to pull it down, and give the site to the public. We have no doubt whatever that Mr. Halliwell-Phillips is well advised, and that his liberal act will be to the general advantage, but we, nevertheless, should be sorry to think that Stratford-on-Avon is to be left without a theatre.

DORKING PUBLIC HALL.

THE progress of the works in connexion with the New Public Hall at Dorking, has, during the past few months, been rapid. The walls of the front building, containing the assembly-room or concert-hall, are up to their full height; all the roof principals are in position; and everything is nearly ready for the commencement of the slating. It is not at present intended to carry out the full designs and wishes of the architects as regards the internal decorations of the walls and ceilings. The block of old buildings formerly the model lodging-house, has, under the hands of the architects, been transformed into extensive suites of rooms available for various purposes, either by themselves or in conjunction with the large hall. On the same floor with the assembly-room, and

connected with it by a short corridor, is a room suitable for magistrates' meetings, lectures or supper room, &c., with retiring-rooms, offices, and other necessary conveniences. At one end of the assembly-room is a retiring-room for performers, having also direct communication with the street by means of a separate staircase. On the floor above and opening into the large room, is a gallery that may be used either for an orchestra or a ladies' gallery, with retiring and cloak rooms attached. On the ground floor, in addition to the covered space under the assembly-room is a smaller ball suitable for small public meetings, lectures, &c., and to which separate access can be obtained when desirable by means of the entrance-door at the side of the old building; and under the principal staircase are arranged gentlemen's lavatories, &c. The architects are Messrs. Driver & Row, and the contractor is Mr. Shearburn, of Dorking.

COMPETITIONS.

Sandgate Church, Kent.—Designs for a new memorial tower (to commemorate the recovery of the Prince of Wales) have been submitted in competition by Mr. Morley, architect; Mr. J. Gardner and Mr. S. S. Stallwood, architects, of Folkestone, and the committee have decided to accept the design submitted by Mr. Stallwood, which will be carried out as soon as the necessary funds are raised.

School-Board for London.—The following six gentlemen have been invited to compete for the schools at Hatcham (Greenwich district):—Messrs. Joseph Gale, John Giles, Charles F. Hayward, G. Gilbert Scott, jun., John P. Seddon, and E. Wyndham Tarn.

New Presbyterian Church, Liverpool.—The committee of this church have selected, in limited competition, the design bearing the motto, "We Fight to Win," the authors being Messrs. J. E. Murray & G. H. Thomas, architects, Liverpool. The second premium is not yet awarded.

FOREIGN CONGRESSES.

At the Institute of Architects, March 18th, Mr. F. P. Cockerell, hon. secretary for foreign correspondence, announced that the thirty-eighth session of the Scientific Congress of France would open at Saint Briou, on Monday, the 1st of July next. All persons interested in the progress of science, literature, and the arts are invited to co-operate.

The proceedings of the session will be divided into five sections:—

1. Natural Science, Physics, and Mathematics.
2. Agriculture, Industry, and Commerce.
3. Anthropological and Medical Science.
4. History and Archaeology.
5. Philosophy, Social Economy, Jurisprudence, Literature, and the Fine Arts.

It was also stated that the Royal Academy of Belgium proposed to celebrate their hundredth anniversary by a festival, to be held on the 28th and 29th of May next. The Institute had been invited to send a representative, and Professor Donaldson, past-president, at the request of the council, had kindly consented to attend on the occasion, in conjunction with Mr. E. Anson, vice-president.

BOARD OF PUBLIC WORKS IN IRELAND.

Sir,—The article in a recent number of the *Builder*, relating to the proposed changes in the Board of Public Works in Ireland is a proof of the catholic interest you take in whatever concerns the architectural profession in all its branches. Of this, indeed, there are numerous instances in the goodly row of volumes of the *Builder* that I possess now, dating back a quarter of a century, from 1846 to 1871. I therefore trust that you will afford me space to supply an omission in the article referred to, and for a few general remarks on the subject of it.

A reference to Thom's Official Directory will show that in addition to the officers mentioned as constituting the architectural staff, there are six district clerks of works located in the principal cities and towns of Ireland, whose duties are to survey sites for new buildings, to inspect works in progress, and measure them up when completed, to check and certify contractors' accounts, and to prepare specifications, &c., for alterations and repairs of existing buildings in their respective districts; so that it is they who

have to take the long drives and perform the other services attributed to the surveyors, who only leave Dublin a few times at most in the summer; indeed, one of them, although otherwise no doubt very hard-worked, has not I believe left home even once a year for some time past.

The duties of the surveyors are chiefly confined to the buildings in Dublin, and revising the specifications and submitting reports and accounts forwarded by the district clerks of works under the general direction of the architect.

Having set this matter of fact right, permit me to refer to the changes indicated; and as it appears that not only the chairman of the Board, as at present, but a third Commissioner, as director of works, is to be a Royal Engineer, it may be well to glance at the working of the now defunct Board of Ordnance under those officers. The *Builder* having taken a leading part in the discussion of the subject at the time, you will probably remember that the late Lord Herbert of Lea (when at the War Office) contemplated severing the connexion between the military and civil branches of that Board, as it was found that they worked badly together. You then advocated transferring the works at barracks and other buildings to properly qualified civilians, and leaving fortification entirely to the military corps, and it was generally supposed that, had Lord Herbert lived, some such arrangement would have been carried out; however, the decision was subsequently reversed, and the civil branch is now in course of being broken up, and it is thought that some of the civilians up may also be provided for at the Irish Board of Works by the changes now under consideration. If those changes are correctly shadowed forth, they would convert the Board of Works almost into a revived Board of Ordnance, where the military heads would have power and the civilians practical knowledge, which would in course of time produce the same results as caused the breaking up of the Board of Ordnance.

As you intimate the probable disappointment of the present staff of the Board of Works in their long-deferred hope of receiving better pay, may I in conclusion add a few remarks on that subject. Some years ago the surveyors were placed on the same footing as first-class clerks in the secretary's and accountant's departments, and the district clerks of works got the same maximum salary as the second-class clerks, their minimum salary remaining as it had been for many years before, when the architect and the surveyors were clerks of works; but since then the clerks in each class received an advance which neither the surveyors nor the district clerks of works shared with them. Surely the surveyors should possess qualifications at least equal to the higher clerks in addition to their professional knowledge; and the district clerks of works certainly must be fit to discharge the duties of second-class clerks to properly fulfil their own, which require special training and long practical experience, and involve the endurance of much hardship and privations when travelling to remote and almost inaccessible places in all seasons; yet it is a fact that they are, and probably may continue to be, worse paid than the ordinary clerk, with whom they were classed some years ago, although the clerks in the Board of Works and other public offices in Ireland justly complain that their pay is much less than in the corresponding departments in England.

AN OFFICIAL.

THE CHELSEA EMBANKMENT.

THE contract to embark the northern shore of the river Thames, between Chelsea Hospital and Battersea Bridge, was let to Mr. Webster for £33,950, including a portion of the sewer corresponding in length with the Embankment, and the foundation-stone was laid by Colonel Hogg, the chairman of the Metropolitan Board of Works, in August last year.

The works, which are now in active progress, consist of an embankment wall three-quarters of a mile in length, by means of which, when completed, 9½ acres will be reclaimed from the foreshore of the river. The area behind the wall will be occupied by a roadway, 70 ft. wide, and by ornamental grounds; while at a depth of more than 30 ft. below the roadway-level will run the sewer. The wall is formed of Portland cement concrete, faced with granite, being similar in this respect to that of the rest of the Victoria Embankments. The face of granite, however,

instead of being dressed smooth is simply hammer-dressed, the style of masonry being that which is technically known as drafted and scabbled-faced. The parapet and pedestals for the lamp-standards will be of solid granite, and will be fine dressed work, although the contour will be bolder and less refined than in the other embankments. The concrete backing of the wall is 12 ft. thick at the base, 7 ft. 9 in. midway of its height, and 4 ft. 6 in. at the top, immediately under the footing of the Embankment. The concrete is tipped into its trench behind the granite, and when the tide has nearly risen to the top of the trench a sluice is opened, by which means the water is admitted and covers the concrete work. When the tide has fallen below the level of the trenches the water is rapidly pumped out, and the work again proceeded with. This arrangement is necessary, as the work is being executed without the aid of whole-tide cofferdams, the comparatively shallow depth to which the foundations of the wall extend entailing those expensive items of construction to be dispensed with.

WASTE-PIPES AND DRAINS.

Sir,—Allow me to make a suggestion in your columns on one point to which I attach considerable importance. It has often been pointed out (see *Builder*, March 30, page 240) that the water of our cisterns is liable to contamination from the effluvia arising from the waste-pipe, which I believe, as commonly constructed, delivers immediately into the house-drain.

The remedy is simple and easy. Let the waste-pipe be made to deliver into the supply-pipe, between the cistern and the closet-pan. By this arrangement, if there is any overflow it will pass off through the pan without any direct communication with the drains, and thus all access of foul air will be cut off.

I have myself adopted this plan to my own closets without difficulty.

EXPERTUS.

*. The remedy proposed is by no means complete. The waste-pipe should discharge into an open sink, whence the water should flow off to the drains.

CHANGE IN PAINT.

Sir,—A reader of your paper, who signs himself "Gas-fitter," asks, in last Saturday's number, why his light-coloured paints, in London, tarnish and turn grey and black, assuming a metallic lustre after a short wear; and gives his opinion that it is owing to inferior white-lead. But the very best white-lead will turn black, and will assume that peculiar mother-of-pearl appearance, rather than metallic, when exposed to an atmosphere containing sulphuretted hydrogen gas, such as would be the case in London.

There is a paint manufactured in Liverpool, by the "Salem Paint Company," that has no white-lead in it, and therefore would probably not tarnish.

THE GASFITTER'S FRIEND.

PRESERVATION OF IRON.

Sir,—I shall feel obliged if any of your readers can inform me where I can procure a preparation for dressing iron shafting, metal castings, &c., so as to prevent them from rusting through coming in contact with water, and at the same time leave the water quite free from stain of any kind. If any preparation of a liquid nature is in existence with which the iron or metal could be dressed, and afterwards be free from liability to rust, and from which water could carry no stain, perhaps some of your readers may be able to inform me, through the medium of your paper, where such may be obtained. The medium dressed would require to be in contact with water several weeks between each dressing.

R. P.

RIGHT TO PAINT WALLS.

At Nisi Prius in Ipswich, before Mr. Justice Blackburn, in the case of Fox v. Clarke, this was an action for trespass and painting part of the walls of the plaintiff's house. The defendant pleaded not guilty; that the house wall was not plaintiff's, that it was defendant's; that plaintiff gave defendant leave and licence to paint it; that the plaintiff granted the right to do so to Mr. Phipson, Mr. Clarke's predecessor, and Mr. Phipson had granted it to Mr. Clarke. Defendant paid 1s. into court.

Mr. O'Malley put a photograph of the *locus in quo*, which was two houses in Museum-street, Ipswich, one of which belonged to Mr. Fox and the other to Mr. Clarke. These two houses were built upon one architectural design, which included a pediment in the centre block, which was over the door of Mr. Clarke's house, but the tenement did not square with the outer architectural design, the party-wall running some distance from the end of the pediment. Another architectural feature was a portico over the defendant's door, but the internal party-wall ran between the column of the portico next Mr. Fox's house and Mr. Clarke's door, so that the column of the portico of Mr. Clarke's entrance was really part of Mr. Fox's house. Mr. Fox had hitherto painted the piece of pediment which was upon his house, and the trespass complained of was that Mr. Clarke had painted the piece of the pediment, the string-course, and the column of the portico which were in front of Mr. Fox's house.

A good deal of discussion took place, in the course of which Mr. O'Malley said there would be no difficulty in arranging for the whole portico and pediment to be painted alike, Mr. Fox having not the slightest wish to disfigure the houses by doing otherwise. His only object was to decide the question of right to the wall, which might be of importance in case of alteration to the property. The case for the defendant was that the whole portico was his property, and the wall of Mr. Fox's house behind it was a party-wall "returned," used in the architectural sense.

Mr. Justice Blackburn said his opinion was against the contention of the defendant. He thought the party-wall should be drawn straight out to the street, and entered a verdict for the plaintiff on the issues which raised the question of right, giving the defendant leave to move the Court of Queen's Bench, the Court to have power to draw all inferences of fact, and say whether he was right to admit the evidence of Mr. Luff, damages 1s., with certificate for costs. He expressed there would be no necessity for an undertaking as to the painting in future.

Mr. O'Malley said certainly not. His client would be willing to permit the defendant to do it on payment of a nominal rent.

DARLINGTON FEVER HOSPITAL.

Sir,—Please correct a misprint in my letter, p. 240, ante. In 3rd paragraph, 4th line, the last word "the," should be *his*, making it read the mayor's, not the architect's partners.

ONE WHO TAKES FAIR PLAY.

Sir,—That "One who likes Fair Play" has not had it, is very evident; and my advice, gained from painful experience, is "Get in and cadure it."

He asks, "Can you conceive a more cruel case of injustice to the other competitors?" And since it is, so it is said, some satisfaction to know that some one is worse off than yourself, I would console him by saying that as he does not mention that the committee actually instructed architects to send in designs upon the Pavilion plan, and were consequently free to select what they pleased, and of course they chose the worst.

What, now, will "One who likes Fair Play" say to a case where positive instructions were issued that certain schools should be planned in accordance with the "rules of the Committee of Council on Education," and then selected a plan totally in opposition to those rules, and yet were so polite to the competitors as to say they had chosen the one most to accordance with them?

I do really hope that something will be done some day to make committees responsible at law for such palpable breaches of faith.

ONE WHO BOUGHT HIS EXPERIENCE AT WORCESTER.

ON OUR ROYAL ACADEMY.

Sir,—It is now above a hundred years since the Royal Academy was first established. As an artist who, having his three elder brothers students of the Academy, naturally expected to be permitted to enter also as a student when his father had selected him from feeling as an artist, while those brothers were permitted to be there rather than be idle at home, judge his astonishment when his father, a Royal Academician himself, declared he would not allow him to enter there as a student until he had been under him some years; for, said he, "I shall ground you more thoroughly in art than you can become grounded there." His mother, overhearing the observation, said, "The Royal Academy will then say your son is not qualified."

Time reveals most things, and the recent advertisement in the *Times*, for "Ridicemental and Technical Instructors," for the Royal Academy, explains upon the reason why that Royal Academician refused to allow his youngest son to enter so soon as a student. In this case, it appears that there is a sad deficiency in that royal institution, not only in admitting members excellent only in auxiliary art, and omitting to set objective art in the human figure as first and foremost to all others.

The Royal Academy is sufficiently rich to have a branch academy at Rome, where a Royal Academician might, if adequately supported as president, and where the student, having received his travelling medal, would derive advantage from his teaching, and be fostered with every aid.

ART.

THE EAST LONDON MUSEUM AT BETHNAL-GREEN.

It is at last authoritatively announced that an endeavour is to be made now to open this museum to the public. We gave a view and plan of it in our volume for last year, pp. 46-47. With the exception of some slight details at the main entrance the building is now completed, and the internal decoration is also finished. Great numbers of objects of art and science are daily being removed from South Kensington to Bethnal-green, under the superintendence of Mr. Henry Cole, C.B. The museum will be partly stocked with collections lent for the purpose by her Majesty, the Royal Princes, the Marquis of Westminster, the Duke of Abercorn, Lord Elcho, Sir Coutts Lindsay, and others. At the request of Mr. Cole, Sir Richard Wallace has promised to lend the magnificent gallery of pictures known as the Hertford collection. Those collections which are sent from the South Kensington Museum will be changed from time to time, but the food collection will hereafter be permanently located at Bethnal-green. The hours during which the East London Museum is to be opened will be the same as at South Kensington, viz., on Mondays, Tuesdays, and Saturdays, free days, from 10 a.m. to 10 p.m.; and on Wednesdays, Thursdays, and Fridays, from 10 a.m. until sunset, on which days a charge of 6d. for admission will be made.

THE PRIZES OFFERED BY THE
TURNERS' COMPANY.

SIR,—According to a prospectus issued by the Worshipful Company of Turners last year, it is proposed to give each year the silver medal and the freedom of the Company to any one workman or apprentice in the trade who may send in the best specimens of hand-turning for the year.

As there will no doubt be prospectuses issued shortly, will you allow me to point out to you some of the conditions of last year's prospectus which I consider act unfairly towards the majority of the competitors, and I hope will be altered in this year's conditions? In the first place, I do not think that a master turner ought to be allowed to compete against a journeyman, as was the case in last year's competition, for the successful competitor was (and is) a master employing several journeymen. Had it been understood that the term "workman" included masters and journeymen several masters would have sent in specimens. Few journeymen turners have lathes and tools of their own, and those who have would have to work after they have already done a day's work to make their specimens, whereas a master can easily afford to lose time to make such things, as well as having a better chance to buy materials, &c., when he has the profits of several journeymen to depend upon. And I am certain that many masters will compete this year unless this condition is altered, and therefore the chances of a journeyman getting the prize will be very small indeed. In another paragraph it is stated that a certificate of good conduct must be sent in by each competitor. I cannot understand how a master could send in a certificate, because he might be a perfect reprobate, and yet, by employing steady and good workmen, give satisfaction to all his customers.

Paragraphs 2 and 3 are as follow:—
"The materials to be used will be varied in different years, so as to include Wood, Ivory, Metals, Stones, Spar, &c."
"The competition for this year (1871) will be Turning in Wood."

The prize specimen was in wood and ivory. I think the prospectus ought to state whether a combination of materials will be allowed, as I cannot reconcile the award with these two conditions.

There were six qualities mentioned which would be considered in awarding the prize, but I shall only comment upon three of them.

Quality 1.—"Working to exact dimensions, illustrated by a cylinder, 6 in. long and 2 in. in diameter, or any other object which shall measure exact inches without fractions."

To my mind it would have been better to have fixed dimensions, because a competitor making a cylinder, 6 in. by 2 in., would have a chance, according to the conditions, of getting the prize; whereas, another one making one 18 in. long by 1 in. diameter, would stand no better chance, when [there is obviously] no comparison in the amount of skill necessary to make the two articles.

Quality 2.—"Exact copying, so that two objects produced, such as two cups, vases, boxes, or chessmen, may be fac-similes in every part."

It ought to be clearly defined how those fac-similes in every part are to be produced; for, if one competitor turned, say a set of chessmen, in pine, with ordinary gouges and chisels, and the other turned a set in ebony, with tools made to the pattern like a moulding-plane iron, the latter would not have done such a skillful piece of work as the former, and yet possibly he might get the prize.

Quality 3.—"Neatness of design, symmetry of shape, and good form of mouldings."

The company should state whether the competitors are to design their specimens, for one might procure a first-rate design from a designer (as was the case last year), and another attempt to design his own, and however faulty it might be, the latter would deserve more credit than the former. It ought also to be stated by the competitor whether the specimens were designed by himself or not.

The conditions should also state if the specimens are to be glass-papered and polished, as those two processes often put a good finish to bad work.

And, to make these competitions of any practical use, the specimens ought to be exhibited to the trade, with their good, and, if any, bad qualities pointed out by the judges, so that the unsuccessful competitors may see their failings, and benefit thereby, and the trade in general derive a great deal of valuable information.

I must concede, sir, that the honourable company have a perfect right to give away their prizes under any conditions they may think fit; but I feel sure that unless the conditions are altered in something like the direction I have suggested, the company will not have the confidence of the great majority of wood-turners.

I think if a few turners would take up this subject, it would benefit the trade very much.

W. A. BARBER.

Books Received.

Technical Manuals: Gothic Stonework. By ELLIS A. DAVIDSON. London: Cassell & Co. We have spoken with commendation of several of the manuals prepared for this series, by Mr. Davidson, and should be glad to know that they were largely circulated. We must speak in more measured terms of the little volume before us, well intentioned as it is. The illustrations are so spiritless, so entirely devoid of anything like the Gothic feeling, that they are calculated to do more harm than good. Gothic details and ornaments can be drawn properly only by those who have well studied the style, and not always by them. There are some persons who think they can do everything: this is usually a mistake.

The glossary of terms, too, is unsatisfactory. It is an error, for example, to state under the head "Bay Window," that if carried on projecting corbels, such windows "are called Oriol windows." Oriol windows are not necessarily carried on corbels.

Tegg's Readiest Wages Reckoner; calculated on the Basis of Nine Hours per Day. By WILLIAM A. STONE. London: Tegg.

This timely Reckoner of Wages will have to be substituted for the previous reckoners in establishments where the nine-hours movement has been successful. The author is one of the firm of James, Edwards, Cash, & Stone, well known and experienced London accountants. The work cannot but be useful to all engaged in skilled labour. The calculations being extended to 108 hours, adapts it for use when the wages are paid fortnightly, as well as weekly. The tables enable the wages due for any given number of hours, or the fractions of any hour, to be read off speedily, and without complication. A table at 45s. has been added by special request of an experienced wages clerk, with relation to halving the amounts, as well as taking them of a whole.

VARIORUM.

"A HANDBOOK OF Sewage Utilisation" (Spon, Charing-cross) gives, in a very condensed shape, reference to the principal systems that have been tried in England, and appears to be exempt from bias. The author is Mr. Ulrick Ralph Burke, Barrister-at-Law.—"Cassell's Illustrated History of the War between France and Germany," which has now reached its fifteenth part, gives a remarkably clear and interesting account of this momentous enterprise. The engravings with which it is filled are really illustrations, and serve to convey to the reader a vivid idea of the persons and places mentioned.—"The new story in Cassell's Magazine, titled "The Doctor's Dilemma," by Hiesba Stretton, promises well. The first five chapters in the April number make us long for May.—The principal paper in *Temple Bar*, "Good-bye, Sweetheart," also by a lady, is coming to an end, to the sorrow of the readers of that periodical.—*The Argosy* gives us more woman's work, and very agreeable work. The story "Within the Maze," by Mrs. Henry Wood, who edits the periodical, will interest a large circle of readers.—The sketch of the Boat Race by George Cruikshank, Jun., in *London Society*, is remarkably funny and clever; it needs a glass for its due appreciation.—"Little Polly Piker-ton" is also a very good illustration of its class.—*The Art Journal*, offering a plea for practical female education, says,—"If it were not a fact of daily occurrence, it would seem absurd to state that we have no right to expect women to do by instinct that for which men give years of patient toil. But until we secure for girls the same kind of apprenticeship given to boys, we have surely no cause for wonder that similar work should not be done as well by women as by men. If we allow that women may undertake certain branches of work, it must follow that we grant also a system of regular training or apprenticeship for girls. For boys this is a matter

of course. Society practically endorses for them the old Hebrew proverb, "He who brings his son up without a trade brings him up to steal," and no toleration would be given to the man who brought up a family of sons without giving them either fortune, profession, or trade. There are hundreds of girls with a pure passion for knowledge and a love of study, as intense as any other power of love with which women are universally credited, who have yet to stand aside, watching an education of which no share comes to them; and, later in life, to sit idle at home, envying the activity which is denied to them, until, under some sudden pressure of necessity, they find themselves rudely jostled out of their quiet corners, and breathless in the midst of a crowd of eager bread-seekers."—*The People's Magazine*, speaking of the enormous view taken by some people of the work of others, says,—"In a trades' procession a few years ago, a wonderful piece of glass-blowing, the result of much time and labour,—a ship in full sail, made entirely of glass,—was carried in triumph as the masterpiece of the craft. 'Ah,' said one of the exultant glass-blowers, 'it would be a long time before Derby or Dizzy could do a real piece of work like that.' The thing was utterly useless: it was in the worst possible taste (for glass is not suitable for such work); and therefore it must have been irredeemably ugly; and yet, because it had cost much time and labour,—hard labour,—therefore it was to be preferred to all the brain-work and moral and physical labours of the then leaders of the respective Houses of Parliament. This notion is an old as well as a widespread one; it is embedded in the word 'school,' where we flatter ourselves that a good deal of work is done, and which yet is nothing but 'schol'd,' the old Greek for 'leisure.' So that school hours are, according to the original sense of the term, leisure hours; and, contradictory as it may appear, this sense is fully recognised at the present day; for how many hundreds of boys are every day, for a time, or for ever, taken away from school in order that they may go to work."—"Concerning Sewage and its Economical Disposal. By Frederick Hahn Danchell. C.E. London: Simpkin, Marshall, & Co. 1872." The purpose of this pamphlet is to advocate the cause of charcoal,—in particular peat charcoal,—as the great panacea and solution of the sewage question. Peat charcoal is, no doubt, a very good thing in some cases,—especially for those interested in peat charcoal; but for the practical, efficient, and economical settlement of the great question of the best possible disposal of the sewage of towns, and the cleansing of rivers, we have very little faith in its prospects or its practical efficacy. The author very truly says, in the preface, that, "to attend a meeting of sewage doctors, and hear them wrangle and explode each other's doctrines, is enough to bewilder any unscientific auditor. In the matter of sewage there is really little help to be had from authority; and a plain man must be content to trust his own judgment." Now, although the author is a C.E., he is here also an S.D., or sewage doctor, and wonder whether he is likely to "bewilder the unscientific auditor" when he says in the summary of his case, with reference to the alleged result of the charcoal process,— "The advocates of sewage irrigation profess to accomplish the same result, but with what success let the evidence of numerous commissions of inquiry testify!" This is highly significant, no doubt, but it is more like a pleading for the plaintiff,—in re Peat Charcoal versus Sewage Farm,—than anything else. Still, we watch the progress of the experiments in peat charcoal with interest; and we think that, in special cases, and for special utility, though not for general use, it may be recommended.—"On the Cleansing of Rivers. By C. E. Austin, C.E. London: Mitchell, Parliament-street." On this question Mr. Austin says,—"It is evident that the process which extracts in the most economical manner the largest proportion of the organic matter of sulliage must be found the most efficacious; and that will be sometimes filtration, often irrigation, and most often both filtration and irrigation combined. Irrigation appears to be a very effective process for the purification of sulliage water and for the utilisation of the contents of the sewers; but it is a very inconvenient one to depend on solely; because, when the population of a town increases, the means of procuring additional land for irrigation diminish. The improvement can only be made by the introduction of filtration, if not already practised."

Miscellaneous.

The Artizans', Labourers', and General Dwellings Company (Limited).—The fifth annual social gathering or *soirée* of the shareholders and friends of this undertaking has been held in the Westminster Palace Hotel. After the very large party of ladies and gentlemen who met on the occasion had partaken of a substantial and varied repast, the chair was taken by the Earl of Shaftesbury, who was supported by Archbishop Manning, Sir Curtis Lampson, Dr. Baxter Langley, and others. Mr. William Swindlehurst, the secretary, read an elaborate report of the past year's operations, showing that the company have estates in Liverpool, Birmingham, Bradford, Salford, and other large towns, besides one in the neighbourhood of the metropolis, atrixton, New-cross, and Hornsey. The houses at up are let at 5s. 6d., 4s. 6d., and 4s. 3d. per week. The share capital now amounts to £12,580., presenting an increase of 12,580. over that it was in 1870. The uncalled capital is £1,000. For the past year the directors were enabled to declare a dividend of 6 per cent. on the share capital, and to pay 5 per cent. on deposits. Mr. Swindlehurst spoke of the great advantages the company were conferring upon the industrial population, by inculcating habits of thrift, temperance, and economy. All those happy results were brought about through the principle of making capital constantly reproductive. There were 1,600 working men holding shares in the undertaking, varying from 50l. to 1l., and the list also included the names of the highest nobles of the land, dignitaries of the Church, lawyers, artists, and scientific men, who sympathized with a movement the direct effect of which was to make people more conservative in their love of country. Several addresses were given, one being specially devoted to the advocacy of the co-operative principle generally, and at intervals the proceedings were pleasantly diversified with music and song.

Exeter Cathedral.—The Lady Chapel has been issued out of the hands of the decorators (Messrs. Clayton & Bell), and nothing remains to be done except the revedos and the rearing down the eucastus tiles and marbles of which the floor will be composed. Some difficulty has been experienced with regard to the revedos. It has at length been decided to fill the central panel with a piece of alto-relievo stonework, illustrating the following scripture, "The seed of the woman shall bruise the serpent's head." The side-panels will be filled in with appropriate work. The massive rheck pillars in the choir are being thoroughly repaired, all the defective parts being removed, and replaced by freshly-quarried marble. In a work 100 tons of marble have already been used, and it is calculated that 60 tons more will be required. The carving of the woodwork for choir-stalls, &c., which has been entrusted to eminent London firm, is in an advanced state, and will be finished by October. A marble pit, the gift of the chapter-clerk, will replace the old wooden structure.

Music for the Blind.—The normal college and Academy of Music for the Blind, at the Crystal Palace, is a most remarkable venture, says the *Echo*, in reference to a subject for behoof of the blind, promoted by Mr. Armitage and Mr. Campbell, and referred in our columns some time ago. "The blind are taught by blind teachers under a blind principal and general director—an American gentleman, Mr. F. J. Campbell. Mr. Campbell has secured himself that in America he has frequently made from 800l. to 900l. per annum by exercise of his musical powers as pianist and instructor. The success of his system has prompted him to transplant a branch to England, and he has already sent a number of blind teachers from America. The education is a thorough sound general course of instruction, with the special addition of music—in art in which the blind peculiarly excel. Among the presidents we notice the names of Lord Chelmsford and the Marquis of Westmorland, and among the musical committee those of Sir Sterndale Bennett and Mr. Henry Leslie."

Her Majesty's Opera.—Messrs. Bracher & Under the superintendence of Messrs. Nelson Harvey, the architects to the theatre, are again converting old Drury into an opera-house, for Mapleson. The works have to be finished by the opening night, April 6th.

Improvements in Bedford-street, Plymouth.—Two houses, with shops, just erected for Mr. Matthews, are considered an acquisition to the street architecture of Plymouth. The style is a somewhat freely-treated description of French Classic. The material is Southampton bricks of a warm red colour, relieved sparingly by hands of the same material of a lighter tone. The dressings—which are of an ornate description—are of Portland stone. The shops are divided, and supported on either side by massive pilasters of polished granite, from Messrs. Freeman's works at Penryn. The building is from the designs of Mr. J. H. Keats, of Plymouth, who has personally superintended its construction; and Mr. Finch is the builder. Mr. Harry Hems, who for the last twelve months has had the carving of the new Guildhall in hand, has executed, with his assistants, the whole of the stone carving.

New Theatre for Darlington.—Plans for a new theatre which Mr. Scouson intends to build in Northgate, Darlington, on the site of the present building, are described by the local *Times*. It is proposed to considerably widen the theatre, to add several feet to its length, and to raise it by two stories. A new stone front is to be built into the edifice, uniform with the Bridge Inn, which will also be altered; and the whole façade, it is proposed, shall be relieved by a handsome portico, forming an arcade extending the whole length of the united buildings. The plans of the internal arrangements of the theatre provide for every accommodation in the way of cloak-rooms and lobbies. The dress-circle will be constructed on the horse-shoe principle, and there will be separate entrances for the dress-circle and the pit and gallery. The architect is Mr. Wm. Hodgson, of Darlington.

Steel Tools.—Mr. La Breche-Viger, of Montreal, has obtained a patent for a method of manufacturing axes, hammers, and other implements, by first making them of wrought iron and then converting them into steel. The nature of the invention consists in manufacturing the articles to be treated under the process of and with wrought iron first, and immersing them in a bath of molten cast-iron free from sulphur and phosphorus, and carburized to its utmost capacity. The best for that purpose is spiegelstein, but in default thereof such cast-iron may be made by melting good malleable iron or blister steel in a cupola furnace with charcoal, or the best anthracite coal, or bituminous coal, or coke, as fuel. The articles are left in this bath a space of time which must vary with the degree of hardness desired to be imparted to the metal and with the size of the articles.

Excavations in Cornwall.—Mr. W. C. Burchas, of Castle Horneck, Ponzance, is making excavations near St. Colomb, Cornwall. He has uncovered a sunken kist-van, consisting of a vault sunk in the slate-rock surface, lined with slabs, which support a fine cap-stone of an apparently foreign origin. This cap-stone is 10 ft. 6 in. long, 5 ft. 6 in. broad, and nearly 2 ft. thick. The kist, which contained a human skull and other osseous matter, was covered with a pile of stones, blackened apparently by the action of fire, and near the outer edge of a huge mound of burnt earth, the whole forming a barrow, the outer edge of which had evidently been once enclosed within a revêtement of disintegrated slate fragments. This barrow forms one of twin barrows some 30 yards apart, between which is the remnant of a bank, which, it is suggested, may have formed either a rampart or enclosure around the two barrows.

Sheep in Boots: a Sheepshank Legacy?—R. T. writes,—"The foot-and-mouth disease, so disastrous to sheep and cattle, is said to arise through standing in wet pastures and muck. Is this so? (for I am no sheep or cow-herd). Let us seek a remedy, and bestow a comforting gutta-percha boot (it would be no novelty, for puss of yore was thus equipped), and gutta-percha ribbon wound round; a few turns extra at foot; flame it, and squeeze gently to unite and shape. It would last their lifetime, and protect their trotters when travelling to that hour when no sheep return!"

The Cotswold Hunt Kennels.—At a recent meeting of subscribers to the Cotswold Hunt at Cheltenham, to consider a scheme for removing the kennels from their present site to a more central point, at Andversford, it was stated that the cost of erecting new kennels would be about 2,500l. The proposal was to establish a limited liability company.

The Proposed Tunnel under the Mersey.—The Mersey Railway Company, who have obtained powers to make a railway tunnel under the Mersey, have commenced the preliminary operation of sinking a shaft on a piece of land in Shore-road, near Woodside Ferry. The ground has been enclosed, and the intention is to sink to a depth of 70 ft. below the bed of the river, at which point the cutting of the tunnel will begin. The tunnelling will be performed with two machines, each of which will make a cutting 15 ft. in diameter, under a pressure of 30 horse-power engines. Two other shafts will be sunk at Birkenhead, one of which will be near the gas-works. In the tunnel there will be space for a double line of rails, and it is expected that the work will be completed in two years. The contractor is Mr. John Dickson, of Whitby, Yorkshire.

The Antiquity of Mankind further extended.—An important discovery bearing on the antiquity of man has just occurred, Mr. Edward Charlesworth, F.G.S., having discovered in the Suffolk craze, or old Pliocene beds, in the very heart of the tertiary era and long before the close of the glacial in the post-tertiary, teeth of the extinct shark (*Carcharodon*), apparently perforated by human agency, as well as many concretionary nodules with longitudinal perforations unlike those produced by the action of boring mollusca. The specimens will be exhibited and described at the meeting of the Anthropological Institute on the 8th of April: so says the *Pall Mall Gazette*. If this discovery be verified, it will carry back the existence of man in England to a period coeval with the Mastodon arvernensis, and far more ancient than the "mammoth age."

The Salt Library.—The obstacle which has so long stood in the way of the acquisition of this collection by the county of Stafford has, at last, been removed. Including the donation of 3,000l. from Mr. T. Salt, M.P. for Stafford, the 6,000l. required by Mrs. William Salt, of London, has been subscribed, and the collection, together with a building in the Market-square, Stafford, for its reception, will be handed over to the county. Mrs. W. Salt has given 3,000l. for the building, and the remaining 3,000l. will constitute a fund for providing the requisite fittings and endowing a librarian. The estimated value of the collection is 30,000l., but many of the books and manuscripts it contains are regarded as literary and historic treasures almost priceless. Among other rarities are the autographs of almost every English monarch.

The Space in Front of St. Paul's.—We may now expect that steps will at once be taken to throw open to the public the area at the west end of the cathedral. The Dean and Chapter are to receive from the Metropolitan Board of Works 15,000l. as compensation; 5,000l. of this, it is stated, will be spent by the Chapter to the arrangement of the paving and other works, and the rest will go towards the decoration of the cathedral inside. It may be hoped that some space will be given up to the roads and pathways on the north and south sides of the building. In connexion with this improvement, the City Lands Committee has agreed to purchase, for the sum of 10,500l., the freehold interest of Messrs. Newbery in the premises No. 44, St. Paul's Churchyard.

Value of Land at South Kensington.—We understand that a plot of building land a short distance from the Horticultural Grounds has lately been sold by private contract to an eminent London builder, through Messrs. Powell, estate agents, of Bayswater-terrace. The extent is five acres in one block, and the price 60,000l., or 12,000l. an acre. This affords a wonderful contrast to the value of such a property in the early days of many persons still only middle-aged, had since the first Exhibition of 1851 so great an area of South Kensington has been covered with ranges of private mansions that any remaining land is now sought after with eagerness, and obtains terms which would have appeared fabulous to our fathers.

Utilisation of Waste Sailing Force.—A screw-propeller fitted to a sailing-ship would turn round whenever the vessel moved forward. It has been suggested that the power thus gained might be used to give motion to an electro-magnetic apparatus which would produce an electric light of great brilliancy, far more serviceable for signalling and other purposes than oil-lamps.

Flexible Marble.—Mr. A. J. Holliday, of Wheeling, describes a flexible marble slab, which is procured from the Portland Quarries, Vermont. Professor Hay, of the Western University, of Pennsylvania, describes its constitution as:—carbonate of lime, 97.50; magnesia, a trace; silica, 2.05; water, .45; = 100. The above composition and its crystalline character together proclaim it to be a true marble, and, at the same time, a pretty pure specimen of that mineral. The indubitable flexibility of the slab is its most remarkable feature. Dana states that "some of the West Stockbridge marble is flexible in thin pieces when first taken out." The slab in the possession of Mr. Holliday is about 2 in. thick, and is nearly as flexible as an equal thickness of vulcanised india-rubber.

The Colony of Victoria.—The rapidity with which settlement is proceeding is shown by reference to a decennial return of the land occupied and cultivated. In 1862, the number of holders was 14,960; the extent of land occupied, 4,090,781 acres, and the extent of land cultivated, 439,895 acres. In the year ending the 31st of March, 1871, the number of holders was 31,812; the extent of land occupied, 9,530,638 acres; and the quantity of land cultivated, 900,015 acres. Machinery upon farms during the year ending the 31st of March, 1871, is put down at 1,102,863l., and the approximate value of the improvements effected, which include buildings of all descriptions, fencing, dikes, wells, dams, &c., but not the cost of clearing, 8,777,548l.

Trapping and Ventilating Soil-pipes and Water-closets.—The Birkenhead Improvement Commissioners have issued a printed circular as to trapping and ventilating private sewers, drains, soil-pipes, and water-closets, in new buildings, or in connexion with the alterations of houses where water-closets are introduced. The observations point out the more general defects of the present arrangements. Drawings, showing the existing and proposed mode of the connexion of water-closets, &c., with soil-pipes and drains, and for the ventilation of the same, are appended to the circular.

Roman Remains.—An interesting discovery of Roman remains has been made at Milton-next-Sittingbourne, Kent. *Urnæ*, in which the Romans were accustomed to place the ashes of the dead, were turned up. Large masses of concrete, evidently the bed of a furnace; masonry, which bore evidences of exposure to intense heat; lumps of "clinker," and iron nails were found, as well as fragments of funeral urns and calcined bones.

The Railway Bridge in Ludgate-hill.—Sir: What do you say to covering this ugly bridge, all over its entire height and length on both sides, with rich mirrors? The *coup d'œil* would be magnificent and grand in the extreme. These sheets of glass could be easily cleaned, and could be insured against accidental and wilful damage.—J. B.

Chelsea Old Church.—The incumbent of this quaint old structure is seeking aid to enable him to put it into a decent condition. It has many interesting associations, and with its two side chapels, built by Sir Thomas More and Sir Thomas Lawrence, and monuments to the ancestors of the Duke of Northumberland, Lord Derby, Lord Dacre, Lady Chyney, and others, makes a strong claim for proper sustentation.

Sewers in Kensington.—The Kensington vestry have considered the following tenders for the construction of 260 ft. of 3 ft. 9 in. by 2 ft. 6 in. sewer, air-shaft, &c., in Pembroke-gardens, Kensington. Messrs. Thirst & Co., Norman-street, Chelsea (accepted), 199l.; Mr. Geo. George, Cambridge-road, Kilburn, 210l. 10s.; Mr. Wigmore, Wallham-green, 199l. 10s.; Messrs. J. & S. Williams, Shepherd's-bush, 210l.

Proposed Monument for India.—A monument to the late Lord Mayo is to be erected in Calcutta, and 20,000l. have already been subscribed for the purpose. It is to be hoped proper care and knowledge will be brought to bear on the selection of the artist and the design. We spend large sums on monuments; on how many of them will posterity concern itself.

Architectural and Antiquarian Books.—The library of the Rev. Robert Willis, F.R.S., is to be sold by Messrs. Hodgson, commencing on Monday, the 8th instant. It includes books interesting to the majority of our readers.

Cost of Steam Rollers.—Messrs. Aveling & Porter, of Rochester, in answer to an inquiry from the Kensington vestry, whether they allowed discount for ready cash for the steam-roller lately supplied by them, state their inability to do so, adding that the rise in iron had necessitated an increase of 10 per cent. They added, further, that they were now quoting 605l. for the rollers sold at 530l., and observed that this increase in price did not cover the increase of cost to them. The vestry referred the question to the Finance Committee.

TENDERS

For the erection of warehouse, &c., in Charterhouse-street, for Messrs. Reynolds & Son. Mr. L. H. Isaacs, architect. Quantities by Mr. Riddett:—
 Patman & Fotheringham.....£11,995 0 0

The Builder.

VOL. XXX.—No. 1523.

Pressure on Foundations.

EFFICIENCY of foundations, it is almost needless to say, is ever the first source of anxiety to the architect and builder. Nor is that anxiety unjustifiable. When it is required, as so often happens at the present day, to erect gigantic edifices on weak and treacherous soils, it may well tax the highest constructive skill to supplement the weakness of the natural foundation by such artificial preparations as shall enable it to sustain its massive and costly burden with safety.

Even in constructions of an ordinary character, the same remarks apply, though in less degree. The safety of a structure may be imperilled, or its cost unduly increased, according as its foundations are laid with insufficient stability, or with provision for security in excess of its requirements. When it is considered, therefore, that the precise conditions of safety are generally capable of being calculated with as much practical accuracy in this as in any other part of a construction, it is unpardonable that any liability to danger or loss should exist from the imperfect comprehension of a subject of such vital importance.

Yet it cannot be denied that there appears in many instances, much deficiency in the knowledge of the first principles which regulate this branch of the constructive art. The practice, not only of the workman, but of the otherwise educated architect, is often based upon empirical, rather than upon exact and scientific principles, so far as the laying of foundations is concerned. It may therefore be advisable to attempt to classify these principles in a somewhat systematic manner, so as to be available for convenient reference in the majority of cases occurring in practice.

The nature of the soil to be built upon is evidently the first object for consideration; and it is scarcely necessary to say, that soils vary in their strength or bearing-power as much as in their geological formation. They range from a soft or semi-fluid condition,—such as that of marsh, mud, or silt,—through all intermediate stages, to the condition of the hardest rock. The inherent strength of the soil itself, and the load to be sustained upon a given unit of its surface (which is usually taken in practice as a square foot), has accordingly in the first place to be considered.

Where the soil is incapable, from its inherent capacity of resistance to pressure, of sustaining the incumbent load of the structure to be placed directly above it, it is then the duty of the constructor either to increase its bearing power by artificial applications, which shall augment the strength of the bearing surface immediately under the superstructure to the required extent; or else, by widening the area of the foundations, to extend and enlarge the bearing surface to such a degree, that that surface shall contain within it the necessary resistance to pressure which the circumstances of the case require. The means by which these results are arrived at will form the second branch of the inquiry.

The materials commonly used for these purposes and the amount of bearing-power obtained by their use, will also require to be described.

Soils of a soft and even semi-fluid character are capable of being treated with great success, as regards the improvement of their capacity for sustaining structural weights. The well-known instance of carrying the original Liverpool and Manchester Railway over the Chat Moss is one of the most remarkable cases of this nature. The fluid moss along the intended line of railway was first thickened by throwing into it a quantity of earth, just as water is thickened into paste by the addition of flour. When the soil was thus improved, though still in a partial state of fluidity, it was covered by a broad and thick layer of fascines, which floated on the viscous soil like a raft upon water. Upon this the railway was formed; and the result amply justified the marvellous foresight of the great engineer who introduced the railway system into England.

On reviewing this operation, it will be seen that a double process contributed to the successful result. As the original soil nearly approached to the fluidity of water, it might be assumed to be incapable (or nearly so) of carrying any superstructural weight. The first operation, therefore, was to increase the solidity of the soil by the addition of a more solid material, which, commingled with it, should impart to it a certain amount of sustaining power. This having been effected, the next operation was to cover the improved soil with layers of fascines of such a breadth that the surface which they covered should contain an inherent bearing-power sufficient to sustain the weight of the railway and the trains. It then became a safe operation to lay the railway on the fascines.

This leads us to the principle on which the bearing-power of all soils should be calculated. Every soil is capable, as above mentioned, of sustaining a certain weight upon each unit of its surface, which varies in a scale proportionate to the solidity of the soil. The bearing-power of a soil approaching in fluidity to water itself may be assumed, as above mentioned, at zero, or the lowest point in the scale; and the bearing-power of the hard rocks may be assumed as the highest; and if these bearing-powers be taken at from 0 to 30 tons per square foot, it will be sufficiently accurate for practical purposes. Between these extremes lie all the intermediate soils of weak rocks, shale, gravel, sand, clay, loam, silt, &c.; with the varying degrees of bearing-power inherent in each. Supposing, therefore, that the soil is capable of bearing a pressure of three tons per square foot with security, it follows, of course, that either one square foot of foundation must be provided for each three tons weight in the entire structure; or, if this be impracticable, that the bearing-power of the soil must be increased by such means (piling, for instance), as will bring it to the requisite standard of sustaining force.

The first operation, therefore, is to ascertain the weight of the structure. This is done, it is hardly needed to say, by calculating the cubical quantities of the whole of the various materials in the structure, and ascertaining from thence the exact weights which will come upon the foundation. If these weights be not equally distributed, care must, of course, be taken to ascertain the proportion that weight carried on each part of the foundations, and of proportioning the area of that part accordingly. Suppose, for instance, that in a warehouse the floor-joists run from back to front; it is then evident that the back and front walls only will carry the weight of the floors and of the goods placed upon them, which will render it necessary to strengthen correspondingly the foundations of the front and back walls above those of the sides. Again, suppose a shop-front to be carried on an arch, or a girder having its bearings on piers at each

end of the building, it is manifest that the weight of the whole superincumbent structure, instead of being distributed equally along the front wall, will be carried on the end piers only, the foundations of which should be made of a suitable capacity.

The weight on the foundations, so calculated, should also include all extraneous loading which may be incidental to the structure. Thus, in a bridge, the foundations of the piers should include, not only the weight of the materials of the pier itself, but that of the girder or arch, with all the supplemental parts which compose the superstructure of the bridge; and also the extraneous loading which comes upon the bridge; the whole being, of course, ultimately supported on the pier foundations. This extraneous loading varies in amount according to the nature of the structure, and can generally be ascertained beforehand with tolerable accuracy. Thus in a railway-bridge it is usual to calculate the weight of the trains at from 1 ton to 1½ ton per foot run, for each single line of railway. On a road bridge, the usual load assumed is from one half cwt. to one cwt. per superficial foot; the load of a crowd of persons standing as close together as practicable having been ascertained by many experiments to be a little more than three-quarters of a hundred weight per square foot. In a warehouse the weight on the floors should be ascertained in each case, as it varies according to the nature and quantity of the goods which it is required to store; about four or five cwt. per square foot, being, perhaps, an average amount. In ordinary floors, the weight may be safely assumed as similar to that on a road bridge; it being understood in both these cases, that the effect of a crowd of persons in motion considerably increases the strain on the structure, for which reason a load of 1 cwt. per square foot is more frequently assumed in practice as a safe amount.

The weights on the foundations having been thus ascertained, and proportioned to each part of the structure, it is then necessary for the constructor to determine the number of tons pressure per square foot, which he will put upon the soil on which the building is erected. In this respect it is curious to observe what great variety appears to exist in the practice of the most eminent engineers. Take, for instance, the pressure of foundations in solid London clay, which possesses, perhaps, a greater amount of uniformity of bearing-power than any other soil ordinarily met with; and it is on record that the greatest engineers of the present day have varied no less than from 1 to 8 tons per square foot in the pressure which they allowed to be placed on the foundations of structures of the highest importance on London clay. In general, however, it may be stated that this soil will compress to a considerable extent, though with tolerable uniformity, under greater pressures than 6 tons, and about 4 tons per square foot is recommended in practice as a safe pressure upon stiff clay; the foundations being presumed to be laid at such a depth as to be unaffected by the weather, or by any external cause, such as that of water settling in them which will soften the soil on which they rest; or of deep excavations being made in their immediate vicinity, which will allow the clay under pressure to escape or ooze away from beneath the building.

The weaker descriptions of clay soils, such as loam, for instance, and also the stronger description, such as indurated clay or shale, as well as soils of similar strength, such as chalk, &c., vary in bearing-power in degrees which it is impossible here to indicate, and the practical judgment of the constructor will determine in each case the amount of pressure they can be trusted to sustain.

The beds of solid gravel which overlie the London clay in many places, and are of common occurrence elsewhere, form, when of sufficient

thickness and uniformity, one of the firmest and most unyielding of the ordinary soils. They may safely, under these circumstances, be loaded with double the pressure which can be put upon London clay with safety. Where they occur but casually, however, or in thin and partial beds, it is preferable to carry the foundations through them till a uniform soil is reached; as otherwise they may give rise to unequal settlement and to damage to the structure in consequence. The soils of sand will be next considered. They vary from a compact close sand with a clayey hind perfectly impervious to water (which is found in the bed of the Thames and else where), through all conceivable varieties of coarseness, looseness, and porosity. Porous sand soils, as a rule, are unaffected by stagnant water, but easily capable of removal by water in motion, and they require extreme care at the constructor's hands where there is any probability of the latter occurring. In this case, the only course is to lay the foundations so deep that there shall be no probability of their being laid bare by the scouring power of the current. Perhaps the most difficult of all engineering work is the foundation of bridge piers in a deep soil of this nature which is subject to the action of running water in a river; and the contrivances adopted in such cases for securing the foundations present the most interesting examples known to us of modern engineering resources.

Up to a comparatively recent date, the means adopted in cases of this kind have been usually the erection of coffer-dams round the space to be occupied by the foundation of the pier; and if a solid soil could thus be reached within a moderate depth, the operation, though costly, became one of tolerable certainty. The piles forming the coffer-dam being driven into the solid soil, the inside was pumped dry and the loose material within the dam was removed, when the foundations were laid as on dry land. Where, however, from the porosity of the subsoil it was impracticable to remove all water from the interior of the dam, concrete made with hydraulic lime or cement was deposited in the bottom and raised till it reached the level of the lowest water-surface, when the building of the pier was continued upwards in masonry or brickwork till the level of the bearing of the superstructure was attained. It sometimes happened, however, that a solid bottom was unattainable by any of these means; in which case the usual course was to drive long piles all over the foundation surface, over which the concrete or masonry foundations (as the case might be) were laid; this process increasing to a large extent the bearing powers of the soil, even in cases where the piling failed to reach more solid strata. The piles forming the coffer-dam were cut off below the lowest water-level, instead of being wholly removed; the underground portion of them thus forming an additional protection to the pier foundations against the effects of the current.

It is evident that in this case the natural sustaining force of the lowest soil reached must be the measure of the pressure to be allowed on the foundation area of the structure; except in the case of piling as above mentioned, where the friction on the sides of the piles, as well as the resistance of their points or lower ends to sinking under the superincumbent weight, increased the sustaining power of the soil. We will carry on the subject in our next.

THE WARWICKSHIRE MOVEMENT.

A NOVEL feature has recently appeared in the developments of our social progress. For good or for evil, a certain disintegration of classes, or rather of class organisations, has for some time attracted the attention of thoughtful men, as one of the most significant characteristics of the day. The number of trade-unions, strictly so called, has within the past few weeks been augmented by a union of agricultural laborers. The fact is one of no ordinary importance. We do not propose to follow the lead of some of our contemporaries, and read to the rural labourer a homily on the blessedness of his lot, and the crying sin of ingratitude. Still less do we mean to excite the working population by expectations that can never be fulfilled. We wish to look at a great national phenomenon in the clear light of historic impartiality. A great evil in all political discussions is the absence of dispassionate investigation. Public speakers and public writers are but too apt to treat imperial questions from the very narrowest standpoint of class or of party views. A certain balance may result from

the pitting of advocate against advocate. But that result rather resembles the oscillations of the pendulum than the stability of a well-poised structure. When all are more or less advocates, the tenure of the scales of justice is committed to blind chance, or to the no-less blind decision of an ephemeral majority of voices. Unless more of the judicial spirit, and less of that of the special pleader become developed among our public men, we cannot but anticipate bad consequences.

Great organic changes in national condition may be effected in two very different ways. They are either the natural consequences of growth, whether in number, extent of territory, or the physical or intellectual improvement of a people, or they are the result of legislation; or it may be said, they are either the causes or the consequences of a change of laws. In the former case, this change is gradual, often almost imperceptible,—always irresistible. Such, for instance, was the gradual change with regard to the right to dispose of property by will that developed itself in the history of Rome. Very often, in such cases, the letter of the ancient law if indeed it be written, remains intact, while the spirit of the innovation has deprived that venerable form of its original efficacy. At other times, a law, admitted to be *efete*, is by common consent removed from the statute-book. This silent and necessary change in the laws of a people, a phenomenon resembling the organic growth and change of a living being, is that which accompanies the vigorous growth and full maturity of races. It is uninitiated by party or personal selfishness; and as it is the result of actual change, and not the effect of a mere vague wish to better matters, it is unattended by convulsion or misfortune. In the ancient world, and to this hour, among Semitic and Turanian races, the hatred of innovation is the strongest bond of the social system.

On the other hand, we see, especially among the Aryan nations, and most notably in France during the past century, the rapid and gigantic development of the opposite method,—a development that has had a prodigious influence on our own national condition. This method may be called the attempted application of the logical principle to politics. But, unfortunately, it is applied after the fashion of the scholastics and commentators of the Middle Ages, rather than after that of the earlier inductive philosophers.

It has been impossible for any writer whose thoughts are occupied with the political future of this country (using the word in its high and proper sense), to doubt that the time must come when the agricultural labourer would experience the influences of that great revolution which is stirring the very framework of society. It was a point on which, however, wisdom and patriotism prescribed a watchful silence. It is easy to fire a rick; it is very hard to put out the flame. The rural population has been almost left out of all calculation by party legislators. The rustic was thought to be *adscriptus globo*.

The old-fashioned farmhouse, where the hinds congregated at night-fall in the capacious kitchen, where the farmer headed the board and his wife regulated the sufficient food, drink, and lodging of the humbler members of one great family, is no more. The labourer is driven to his cot, and told to live on his wages. Hence, as a natural consequence, he marries before he is well out of his teens. Poverty comes on him armed, with his rapidly increasing family. Boys and girls are over-weighted with more boys and girls not a score years their junior. Nor is poverty the worst of it. All the genetic influences of unconscious education, whether of the ploughboy by the farmer's children, of the men by their masters, of the women and girls by their mistresses, of the youth or maiden of gentle blood by the nobleman's castle, are passed, gone out of date. Hence the yearly increasing savageness that marks the manners of many. Hence, in some measure, the want of earnestness and of realism often evinced by the higher classes. Hence the spread, to our remotest villages, of the pestilential fashions set by the *demi-monde* of Paris; and the disappearance from our island of our once unrivalled domestic servants.

The question now arising in Warwickshire is but one of the natural results of this state of things. Society has left each class to take care of itself. Volunteer teachers have loudly insisted on the inauguration of the reign of what the Americans call the almighty dollar. The farmer, the tradesman, the artisan, is each a different man from his grandfather. Luxury of living, of

which the latter would have been ashamed, is now an every-day thing. The bond with the labourer is loosed; and the labourer is looking at the matter, at last, from his own point of view. He may not exactly appreciate the position, but who is to blame for forcing him into it? The state of the matter is this. That which the opponents of all education, all culture, all change, predicted, is coming to pass. It was inevitable that such should be the case unless due precaution were taken. The hands of the clock cannot be stopped without stopping the entire mechanism. That a rural labourer, if educated, will not be content to remain in the position of an uneducated rural labourer, is obvious to the sleepiest capacity. The natural remedy suggested by the blind—"Don't educate," is out of the question. We need not discuss its absurdity, because it is one of the things that are at an end. We have to see how the new state of things must be dealt with. The social movement, by virtue of which each class or craft of Englishmen is now seeking how to benefit itself, as a class, has at last reached the agricultural labourer. Rightly or wrongly (we are forced to say rightly), they are discontented with their condition. They have heard what is going on elsewhere, and they are attempting a movement of their own. It will be remarked that this movement originates, not among the most helpless and abject, but among the best paid and most comfortable of this class of peasantry. It must further be remarked, that the movement originates—not in consequence of, but at the same time with, the introduction of a great revolution in our entire agricultural system. The ploughman now may be regarded as in a position similar to that held by the scribe, or copyist, at the date of the invention of printing; to that of the weaver at the time of the invention of the power-loom; to that of the stage-coach proprietor at the time of the invention of the railways.

This coincidence has a double effect. On the one hand, the substitution of steam power for manual labour may be looked on as a means of making the farmer, to a certain extent, independent of the labourer. On the other hand, all experience leads us to anticipate that the performance of a large quantity of heavy work by steam power, will not only set free a certain amount of rude labour, but will further cause a demand for a much larger amount of labour of a more skilled kind. For one man who is no longer required to thrash, to winnow, or to pitch trusses of hay or straw, three men will be required for the performance of those duties which no machine can discharge. Brute power is no longer looked for from the labourer. Three times as much of skilled labour will be asked at his hands.

Such, then, we take to be the actual state of things, regarded from that point of view which will, hereafter, be taken by the historian. What is the practical outcome? A word of counsel to both farmer and labourer.

We would ask the farmer to put a home question or two to himself. Does he remember his grandfather's time? How is he, himself, now dressed, and mounted, and fed, and amused, in comparison with his father in his boyish days? How do the occupations of his wife and daughters compare with those of his mother and aunts? And, at the same time, what is the change in the condition of his labourer? Let those to whom such a comparison suggests disagreeable ideas remember how far they are accountable, in the court of conscience, for dealing between man and man. Any progress that is marked by an increasing divergence in the comfort and welfare of classes that are really interdependent, is, disguise it as we may, only progress to destruction.

Again, from a low, but yet solid, point of view, let the money question be regarded. Science now offers to the agriculturist the means of increasing his returns to an extent altogether disproportionate to that increase of outlay which she counsels him to incur. We stated some time ago,* that the average return of the cultivated land in the kingdom is taken at 75s. per acre. From poor land at Thytres, Mr. Mechi has raised crops, in animal and vegetable produce, to the value of 250s. per acre. The average amount spent in labour throughout the country is stated at 15s. per acre. Mr. Mechi's outlay is, including interest on money sunk in improvements, 56s. per acre. If we take the total acreage under all kinds of crops in Great Britain (which have increased by half a million of acres in the past

* See *Builder*, No. 1499, p. 837, and No. 1490, p. 460.

year), we then find the actual outlay on agricultural labour to amount to about 35,000,000 sterling, while there is room for an application of labour to the amount of 130,000,000 sterling, with the result of trebling, not the outlay, but the income! This is what lies before the farmer; but it is to be attained, not by killing the goose—not by compelling labour to emigrate—but by such an intelligent and kindly combination of machinery and labour—of steam power and human agency—as is impossible in the absence of a well-housed, well-fed, thriving, happy peasantry.

To the farmer, then, we say,—As a man of sense, meet the wants of your labourers as far as you can; and, whatever else you do, meet them at all events as a Man. Let the kindly feeling that should exist between the elder and the younger sons of the same soil not be allowed to disappear.

To the labourer, on the other hand, we have a word of advice. All good men, all wise men, all your true friends, wish to see your position improved,—nay, more, they will most rejoice if this improvement is your own work. But do not be misled by extravagant statements. You can only live and thrive, in England, as part of one great agricultural family. You cannot extort, at the point of the pitchfork, more than the farmer can actually afford to pay. Discuss the matter fairly and moderately. Wages are not matters of taste or of fancy; they are elements of the cost of production. It is only by making it worth the while of the farmer to throw capital, energy, and whole-hearted industry into his pursuit, that either you or he can thrive. True, there are backwoods enough to which you may emigrate,—broad forests, damp swamps, rocky mountains, and the like, which, some time or other, by the intelligent application of immense labour, will be laughing fields of plenty. But hard labour is necessary there, as well as here. There is great question how far any of you can better yourselves by trying an unknown country, soil, and climate. One thing is pretty sure, you will get on nowhere without industry, good conduct, and intelligence. Let these be your characteristics at home. Let whatever the schoolmaster brings be added to the sterling qualities in her sons that have made Old England what she is; and your new country will be found at home,—found in such a paradise as earth would never excel, if the agriculturists of England would only do justice to her soil.

LEASES v. YEARLY AGREEMENTS.*

It may seem, at first sight, that I am to some extent retreading the ground already traversed by Mr. Squarey, in his paper read before this institution two years ago, entitled "Farming Covenants." Mr. Squarey limited his remarks on that occasion to "the consideration (to quote his own words) of the principles which should govern farming covenants;" and although, in the resulting discussion, I am aware that reference was made incidentally to the relative advantages of leases and yearly agreements, the question which I venture to bring under your notice to-night was not touched upon in the paper itself.

My attention has, for some years past, been more or less directed, in its own practice, to the question of leases and agreements, but especially so in connexion with an essay written by me for the Royal Agricultural Society, and to which I need not more particularly refer.

I may candidly admit, in starting, that I am a convert to the opinion that an annual tenancy, regulated by a wise and liberal agreement, unembarrassed by numerous or vexatious conditions, is to be preferred to a lease, whether regard be had to the interest of the landlord or of the tenant. This conviction, however, will not influence me, I trust, in my endeavour to set forth with fairness the advantages and disadvantages, as I conceive them, of both leases and yearly agreements; nor lead me into any of those involuntary misrepresentations of fact into which the most impartial person may fall, when under the influence of strong convictions either in one direction or the other.

I may premise that I shall not venture in this paper—neither do I think it possible to do so—to lay down any fixed rule for the determination of the kind of tenancy which shall be the best in all cases. Peculiarities of soil, the different cir-

cumstances under which farms are let, the personal habits and dispositions of both owners and occupiers, are so various that no general principle can be asserted as the best in all cases. It will be sufficient for my purpose if I can pave the way, by a careful setting forth of *pro and con*, for the determination by others more able than myself of some rule which will serve to regulate a *majority* of cases.

It may assist us in arriving at a just conclusion if we consider for a moment the true position of landlord and tenant, as such.

The landlord has land which he cannot or does not wish to farm himself; the tenant, on the other hand, has no land, but is endowed with certain capital and skill which he is ready to employ in its cultivation. The requirements of both parties, therefore, induce to an arrangement of the basis of mutual benefit. So far the matter is clear; but in proceeding to make an arrangement of the kind, we are at once confronted by the fact that the interests of the two are not on all points identical, and hence arises the necessity for an agreement.

Abstractedly considered, the tenant is, in the very outset, in a position of some disadvantage, being in many cases compelled, by the competition for holdings, to accept conditions from the landlord under his agreement which, were the position of the two parties to the transaction absolutely similar, he might decline. The landlord practically dictates his own terms, which the tenant accepts or not, as he chooses,—the only restriction upon the landlord, in this respect, being the necessity for letting his land and living by his rents, a restriction which, under a system of excessive competition for holdings, is nearly inoperative.

This inequality of conditions may, in years gone by, when the processes of agriculture were very much less complex, have operated without any particular detriment to the interests of either party.

In those days the system of farming was very different. There were no artificial manures, cake, and corn used,—or, at all events, very little,—and the landlord had to stipulate that his land should not be injured by the unnecessary removal of its mineral or staple constituents,—the guiding principle of farming being, not the improvement, but the maintenance of the land in its then present condition.

Under the modern system of agriculture, all this is changed. The tenant, no longer a maintainer but an improver,—and having, since the restrictions on the import trade were abolished, to compete with the world,—is compelled to leave the beaten track, and avail himself of all the aids to increased production which modern science has placed at his command. It is natural, under these circumstances, that he should seek some form of arrangement less hazardous to his interests than was formerly sufficient.

The landlord, moreover, perceiving the probable benefit to his land, may be conceived as being, on his part, desirous of meeting with an improving tenant; and thus the inequality of the conditions under which the parties treat, and to which I have before alluded, may be to some extent redressed. The landlord, however, is anxious to decide to what extent he can, in justice to his own interest, meet the tenant's wishes. In endeavouring to decide this question, it is necessary to look at both interests, and determine, if we can, the exact relation in which they stand to each other.

Before I proceed to do so, I may premise that, in modern farming, the land may be considered a mere manufactory for the conversion of the water and the gases of the atmosphere into corn and meat; and it is to these sources that the farmer must look mainly for his profit,—having to return to the land more mineral constituents than he takes from it, and often, in the case of corn, at a higher price than he sells it at.

The land, according to this view, is a machine which it is necessary to keep oiled and in the best possible state by draining, manuring, and—a fact of primary importance—in such a mechanical condition as to admit of the free penetration of the air, without which both water and manure will fall to act.

This being so, we, as land agents, are looked to by landlords to protect their interests, and shall do so most effectively by giving the tenants every facility for managing the land according to the principles of husbandry which modern science has proved to be the best.

While on this branch of my subject, I may venture to observe that the difference between a good and a bad farmer is rarely, if ever, fully

appreciated. Regard is seldom had to the fact that, in the case of a good farmer, who uses a great deal of corn and manure every year, the producing power of the land increases annually at something like the rate of compound interest.

Suppose, for instance, that the good tenant in question grows the first year, by the use of manure, an extra 10 cwt. of straw, or 10 tons of roots; the next year he has the manure made up from these extra crops (provided, of course, that they are not sold off the farm) in addition to the manure he may purchase. He has thus the means of obtaining a still larger crop the next year, without an increased rate of outlay.

This rate of increase is maintained year by year, to the manifest advantage, not only of the tenant, but ultimately of the landlord also.

The bad tenant, on the contrary, who farms from hand to mouth, as it were, does nothing more than maintain his land in its then condition, whatever that may happen to be, and not infrequently fails in doing even that.

I will now proceed to lay before you, as concisely as I can, what I conceive to be the advantages and disadvantages of a lease to the landlord and the tenant, adding thereto such remarks as may occur to me under each head.

The following order of consideration will be most convenient:—

- 1st. A lease: its advantages to the landlord.
- 2nd. " its advantages to the tenant.
- 3rd. " its disadvantages to the landlord.
- 4th. " its disadvantages to the tenant.

The Advantages of a Lease to the Landlord.

1. It secures a good tenant for a term of years. Every one will agree that this is a most desirable object, and that no trifles should be suffered to stand in the way of its attainment.

2. It generally insures an increased rental at the commencement of a term. This fact has sometimes been overlooked in the discussions of this question which have taken place here and elsewhere. My experience seems to show me that leases, whether for short or long periods, are upon renewal accompanied by an increased rental,—a circumstance explained by the fact that the tenant is in the position of an applicant for a continuance of the occupation.

3. It saves the investment of the landlord's capital in improvements; while it often happens that he resumes possession, from some cause or other, before the end of the lease, and reaps the benefit of the tenant's improvements. Many estates are so embarrassed that leases are granted for the express purpose of inducing tenants with capital at their command to improve the land. This case is met, no doubt, to some extent, by the Land Improvement Act, as well as by several private Acts of Parliament in the hands of companies, but it is not of infrequent occurrence.

4. It is a means of inducing tenants with capital to invest their money freely. Very few men of capital care to take a farm out of condition without security of some kind to enable them to recover their outlay upon improvements.

5. It saves the landlord, who does not employ an agent, the trouble of repairs and other matters incidental to yearly tenancies. I have met with many instances where leases of detached farms were granted with this object.

These are, as far as I am aware, the leading features of advantage attaching to a lease, as regards the landlord.

I will now advert to

The Advantages of a Lease to the Tenant.

1. It is a security that he will have an opportunity of getting back the money he may invest in improving the land.

2. It secures him a farm for a fixed number of years,—a great consideration, if the farm be a good one and the rent moderate.

3. It enables him to do anything he may require in the way of improvements,—a fact of great importance to a tenant with capital which he is willing to expend in that way, and under a non-improving landlord.

4. It secures him in his farming operations from undue interference on the part of the landlord, and affords him more general independence.

In many cases owners, having let their farms on lease, trouble themselves no more about them until the expiration of the term (a circumstance of some importance to a tenant who is disposed to try improved methods of cultivation, which might otherwise be resisted by the landlord).

Now let us turn to the reverse of the question, and summarise, as briefly as possible, the leading

* By Mr. Clement Cadie, Read at the Ordinary General Meeting of the Society of Surveyors, April 8th, 1872, Mr. Richard Hall, President, in the chair.

objections to a lease, as far as the landlord's interest is concerned.

The Disadvantages of a Lease to the Landlord.

1. *It alienates the land from his possession for a number of years.* With many landlords this is an important consideration, especially in cases where they reside on the estate.

2. *It hampers him if he wishes to sell, effect an exchange, or carry out improvements.* This is often an inconvenience of a serious kind to the landlord, who not infrequently, having once experienced a difficulty of the kind, becomes unreasonably adverse to all leases.

3. *It prevents him from getting rid of a bad or unprofitable tenant.* This is probably the most serious of all the drawbacks to a lease. Of course, in the great majority of cases the force of the objection lies in the incompetence or the poverty of the tenant; but instances are not rare in which tenants have been known to take farms for the express purpose of rendering themselves so obnoxious to the landlord as to induce him to buy them out on their own terms. Others, from some disagreement with the landlord or his agent, deliberately set themselves to oppose his wishes and interests in every possible way.

4. *It lessens to a certain extent the general or local importance which land confirms upon its possessor, by diminishing his power and influence over his tenancy.* The social value of this influence is very fairly measured by the low rate of interest which many persons who purchase land are willing to make out of their money.

I will now set forth

The Disadvantages of a Lease to the Tenant.

1. *It invariably results in an increased rent when the time comes for its renewal.* This rule is almost without exception; and it will be found, I believe, that in districts where leases are customary, the rental of the land ranges higher than where annual tenancies prevail.

2. *It precludes him from getting rid of a farm which he may find too dear, or which may prove to be unprofitable.* I have known instances in which tenants have actually sought a declaration of bankruptcy, and have gone to prison, in order to get rid of a lease.

3. *It often involves, in case of death, the loss to his family of the money expended in improvements, from the inability of the survivors to carry on the lease.* Many leases contain, as you are aware, a provision that a tenant is not to part with possession, or that in case of death the lease is void. In such a case a lease, so far from being an advantage to the tenant and his family, is often a downright misfortune.

4. *It often induces a tenant to spend money upon improvements which should more properly fall upon the landlord.* Instances are numerous where tenants, with a very imperfect knowledge of the capabilities of their farms, commence at once to spend money on improvements which, with a few years' experience of their holdings, they would leave to the landlord, as requiring a longer period than that included in the lease to give an adequate return for the outlay.

Thus far I have summarised the advantages and disadvantages to both landlord and tenant arising from ordinary leases and agreements.

I will now venture to place before you, for the purpose of discussion, the question of compensation, or, as it is ordinarily called (I think erroneously) "tenant-right," submitting it to your judgment to decide what amount of advantage, or the contrary, to both parties, the adoption of the principle would entail.

I take exception to the term "tenant-right," on the ground that it is not clear whether such compensation is not really more in favour of the landlord than the tenant. The tenant who feels that, whenever he leaves his farm, he will be fully compensated for the unexhausted improvements, has no hesitation in continuing to spend his money in effecting them.

We have to bear in mind that while a tenant continues in a farm he is every year (in effect) an outgoing and incoming tenant, and that whatever improvements he makes he does so in the expectation of reaping benefit in the future. His position in this respect is the same if at the end of any particular year another man is incomer instead of himself, and hence it is far better (in the interest of all parties) for the new tenant to pay in money for the unexhausted improvements of his predecessor than for the outgoing to have the trouble of exhausting the land, while his successor, in the end, probably expends a much larger sum in bringing the land back into condition than would represent a fair compensation to the outgoing in the first instance.

I have seen many instances in point, and it is difficult for any one, without experience of the kind, to realise the trouble and expense of restoring to a proper state a farm which has been left in a foul and bad condition, to say nothing of the loss in rent and profit in the meantime. My experience teaches me that it is far better for a tenant to take a farm in good condition, no matter what (in reason) may be the cost of doing so, in the shape of compensation to his predecessor.

Let us look at it from a landlord's point of view. Under present circumstances the landlord, with a farm to let, finds it (even at the end of a lease), in its worst possible appearance, and sends his valuer to look at it when it is in that state. Now, it is patent to every gentleman present, who is a valuer, that it requires considerable knowledge and experience to determine whether a farm is naturally poor, or has been made so by over-cropping. We know that it is not every one who values a farm who is possessed of that nice tact and discrimination necessary for the estimation within 1s. per acre of what a tenant should pay. It is manifest, therefore, that the better the condition of the land at the expiration of the tenancy the better will it be for the landlord.

For this reason (and owing to the periodical running down of the land before alluded to), I have no hesitation in saying that the landlord is more interested in a good system of compensation than the tenant. The latter does, no doubt, in some cases, obtain his farm cheaper under such circumstances, and manage to get what is commonly called "his pull" out of the land before he leaves. Nevertheless, I maintain, as I have before shown, that a system of compensation for improvements would, in its results, have better answered the purpose of the tenant also.

A system of farming which had regard simply to the present crop, would neither be practicable nor remunerative. No one would think of putting on his land the manure necessary for one crop only; his husbandry of that kind would be in direct defiance of every rule of modern agriculture. Thus the benefit of "bonns" applied to the land is not fully exhausted for eight or ten years; farmyard manure for three or four years; consumption of corn and oil cake for two or three years (and often much more, especially on the pasture lands), and other things in proportion.

Is it likely, then, that the tenant will leave years of this unexhausted benefit to his successor without an effort to recover it in some way or other in defiance of agreements?

Agreements, no doubt, have their uses; but it is undeniable that an instance of perfect compliance with every clause, which an agreement may contain, might be looked for in vain. Personally, I have never met with an instance. Restriction clauses are made for bad tenants not for good ones, and are useful, in as far as they enable the landlords to restrain tenants who are disposed to use the land improperly. I am convinced that the adoption of a well-considered system of compensating agreements would operate more beneficially in all directions than the most elaborate network of covenants and restriction clauses.

Under such a system the yearly tenant would enjoy much of the security of a lease, and expend his money freely in the improvement of the land; the property of the landlord would be maintained in continuously good condition; much of the spirit of scheming and evasion which is provoked under the present system, by a not unnatural desire on the part of the tenant to reap the fruit of his own enterprise, would be obliterated, and a general feeling of confidence and mutual interest would be established.

I have endeavoured to show that a system of compensation is beneficial to both landlord and tenant, as applied to yearly tenancies; but I feel that it might also be introduced into leases; for the same arguments apply to the end of a lease as to the determination of a yearly tenancy; and, my opinion is, that this compensation should extend not merely to barely recouping the tenant his outlay, but to making it his interest to farm the land best at the end of the lease.

Before leaving this part of the subject, I will allude, for the sake of discussion, to the system (advocated by many) of giving two years' notice to quit. The only advantage of that system appears to be that, in the absence of a desire to run the farm out, the tenant thus secures a longer time in which to look out for another farm.

A NEW THEATRE IN SOUTH LONDON.

A new theatre, of large dimensions, to be called the "Imperial," is about to be erected on the Surrey side of the river, the locality being Newington Causeway, about midway between the Elephant and Castle and the Borough-road Stations of the London, Chatham, and Dover Railway. The principal entrance to the building, which has been designed by Mr. Albert Bridge-man, will adjoin the large wheelworks of Mr. E. H. Bayley. Architecturally, the new structure will be an ornamental feature amongst the surrounding buildings. The style of architecture adopted is an admixture of the French and Italian, the principal façade being about 40 ft. in width and 70 ft. in height, the elevation consisting of six stories. The materials used in the construction of the lower portion of the building will be polished granite, a colonnade extending across the entire width of the structure. The upper portions of the elevation will be of stone, with polished granite facings, surmounted by an ornamental pediment. The structure, from front to back, will be of great depth, extending to a distance of 300 ft. from the front to the rear, which will be in the Borough-road, where the stage will be approached. The interior of the building will mainly be appropriated to the auditorium and stage; but a considerable portion will be set apart for saloons and restaurants. These saloons will be in the front part of the building, each saloon being about 30 ft. by 50 ft., and connected with the pit and the several tiers of boxes, four in number. The auditorium sweep,—horse-shoe in form,—will be 75 ft. in length from the extreme back to the proscenium, and 66 ft. in width. A special feature in the auditorium arrangements is that the pit, as well as the boxes and gallery, will have an unusual fall in the direction of the stage, thus enabling the whole of the audience, in every part of the house, to have an easy and commanding view of the performances. The stage will be of large dimensions, occupying an area of 84 ft. in depth, by 30 ft. in width, and being 40 ft. in height. The stage and business arrangements will be on a comprehensive scale, if, as we learn, there are to be thirty dressing-rooms, in addition to a spacious green-room, manager's room, property room, painting-room, and scene-dock. In his plans for the construction of the building, the architect has produced a novel design for the roof. It will be formed of zinc, and is so arranged that for the purposes of renovating or redecoration it can be taken down without the necessity of scaffolding. It is stated that nothing but performances of a high class and sterling character will take place at the "Imperial," and it is confidently expected that the extensive facilities which now exist for reaching the theatre from every part of the largely-populated suburban portions of South London, will secure for the new establishment an ample amount of support. The ground is now being cleared, and in the course of a week or two the contractors, Messrs. W. & B. Lacey, of Clapham, will commence the building.

SOCIETY OF BRITISH ARTISTS,
SUFFOLK STREET.

If the quality of pictures now on exhibition, or preparing for exhibition, in London were at all commensurate with the quantity, we should have great occasion for jubilation. Twelve exhibitions, we think, are now open; many more will be inviting visitors in another week or two. Were all as good as we could wish, it is evident that we could devote but small space to each. Nor do we hold that the absence of goodness, unless in the case of any flagrant outrage on taste, is a justification for departing from a scanty measure of space. As far as the paintings are concerned, it would often be more easy for the critic, as well as more amusing for his readers, to point out faults, than to praise non-evident merit. But the thought of the artist who may have done his best,—poor though the best may be,—often checks the bitter word on the very nib of the pen.

The forty-ninth Exhibition of the Society of British Artists opened on the 8th of April, with the respectable number of 529 oil-paintings, 316 water-colour drawings, and thirteen specimens described as "Sculpture, &c." Of the members and associates of the Royal Academy, the president contributes one production; Mr. Leighton, two studies; Mr. Marks, two pictures; and Mr. Redgrave and Mr. Watts, each one. Of these, the portrait of an anonymous subject, by

Mr. Watts, is perhaps the most striking thing on the walls. The most original productions, we take to be two water-colour landscape drawings, Nos. 825 and 836, by E. A. Pettit. They represent scenes in Cumberland, "Honeister Crag," and "Sly Head Pass,"—striking little bits of our wilder lake scenery; but the remarkable part of them is the manner in which some blue body-colour,—cobalt, we take it to be,—boldly, not to say coarsely, thrown on, produces a very happy effect. Still, no such drawing would have attracted more admiration than two. A new effect may be either a stroke of genius or a happy accident. In the former case it is dangerous to repeat it; in the latter, fatal. "Evening" (79), by A. Cluitt, is a bright, clear bit of landscape, although it wants atmosphere. "Dolly Varden" (86), by W. H. Weatherhead, is a subject very pleasing in its motive. The sprightly maiden is attired in a charming yellow brocade, and leans against a style. Mr. F. T. Lott gives the "Pandvortje, Bruges," a peep at this semi-deserted capital of old Flemish industry that is bright with a light we never saw gild the brickwork of its towers. This is a picture that will mellow by time. There is a want of scale, not to say of perspective, in the home-scene by Mr. J. Tennant (143); but the ray of light that bursts on the rocks to the left has been caught from nature. So has the colour of the angry waves, but not the apparent texture. A pretty little domestic scene is "Not Sleepy," by G. F. Hicks (spelt G. E. Hicks in the catalogue), a sturdy little fellow being washed by a bixom nunsmaid as a preliminary for being put to bed. He throws back his head as he utters the remonstrance, of which his face bears witness to the truth. A bright gleam of light falls on the rocks in No. 161, by E. Hayes, "Fishing-boats off Staithes, near Whitby." This is a picture that could be very well copied by photography,—an element of excellence which painters would do well specially to study. There is much that is pleasing in "Expectation" (168), by J. J. Hill: a pretty girl with a pitcher, waiting for her lover by the spring. But the mouth has been idealised, or conventionalised,—whichever may be the best term,—out of the rough truth of nature.

"Love leads the Way," by E. S. Kennedy, is the highest compliment we have yet seen paid to Mr. Calderon; for it announces him to be the head of a school,—the picture being evidently inspired by admiration of his style. We cannot say much as to execution; but the helpless wrath of the old gentleman, who is left perched on a stone in the middle of a water-course, while a gallant aids his daughter, or young wife, farther down the ravine, is very droll. "Morwell Rocks, on the Tamar, Devon" (216), by G. Cole, is another picture in which we have noted a happy effect of light. The most finished portrait, a little paughty, perhaps, but giving a good idea of a man of no little note, is that of His Imperial Highness the Prince Imperial of Japan, by J. Edgar Williams (265). The name of the prince is spelt "Hiigashi Fushimi, No Miya." On his head he wears a nondescript ornament, only awarded to high dignitaries as a part of their court dress, which somewhat resembles a lantern. His face might be taken for that of a European, and evinces no ordinary intelligence. We note No. 275, "A Happy Mood," by E. G. Girardot; "A Waterfall, Pont-y-Monach" (323), by J. B. Smith, in which the foam and spray are rendered with rare fidelity to nature; "An Evening Landscape on a Sussex Heath," with sheep and figures (324), by Mr. G. Cole; "Solitude by the Sea: a Dead Calm in Early Morning" (451), by J. Tennant; and "Quimper, Brittany" (508), by L. J. Wood. Mr. H. H. Coudery's "Nursery" (377) is extremely ill attended to; for the pet-dogs of the family have got into the cradle, and are making mince-meat of the dolls. But they are two beautiful little dogs, notwithstanding. Why Mr. Wyke Bayliss calls La Sainte Chapelle, of which he gives a very highly-coloured interior, "The Lily of France" we should be glad to know. In the "Sculpture, &c.," Mr. A. Chesnoa's "Street Arab" is a little terra-cotta sketch of much merit.

St. Luke's Chapel, Norwich.—Messrs. Arrowsmith & Co. have manufactured a carved oak communion-table and a handsome chair for the Dean of Norwich, Norman in style. The table would be all the better if the jointings in the spandrels of the arches introduced to make it an imitation of a stone arcade, were removed forthwith.

ARCHITECTURAL WRITING.

ARCHITECTURAL ASSOCIATION.

The usual meeting was held on Friday, the 5th inst. A gift of about a dozen valuable books to the lending library, by Mr. Wyatt Papworth, was announced;—a piece of judicious liberality worthy of imitation.

A paper was read by Mr. T. Roger Smith, entitled "Architectural Writing," being instructions to students of architecture as to their use of the pen:—

1. In writing for themselves,—in digests of studies, notes, and other processes for amassing valuable information.

2. In writing done in the course of business, addressed to clients, tradesmen, other professional men, &c.; such as correspondence, documents of various kinds, specifications, reports.

3. In writing for the public.

For all a single maxim would be found of much value, if well apprehended, and always instinctively attended to, lodged in the simple phrase,—“Remember the reader.”

The following is a condensed statement of Mr. Smith's recommendations, under the several divisions of his subject:—

I. For students' notes, &c., the requisites,—accurate information noted as completely as possible when first obtained, and means of ready reference; a commonplace book for extracts or condensed results (always append edition, volume, and page of any book); a journal for regular or occasional travels: of course, in addition to the usual sketch-books, and so on. A chronological order uniformly adhered to will bring everything into sequence; mere paging and a slight index of principal subjects should be ordinarily sufficient: too elaborate a system will mostly be abandoned, and never renewed. The journal would contain a general plan, &c., with the principal dimensions of any building studied, notes as to materials, and the effect,—the impression made on the student by the whole or parts: whether quiet, grand, overdone, or apparently perfect; particulars as to such matters as the height above the eye of any details observed or measured; the surface of lighting area, its relation to the whole area, and the result. To describe a building well and briefly requires much practice, and, above all, a power of seizing at once the main distinctive features. Mr. Smith pointed out as models, in his opinion,—the late Mr. Pettit's books; the descriptive articles in M. Viollet-le-Duc's Dictionary; Mr. G. E. Street's books on Italy, Spain, and paper R.L.B.A. on "Lo Puy" (January, 1861). Failures, how manifested,—their causes, remedies if any; success, and analysis of real or apparent causes; miscellanea, as sizes of objects, carriages, animals, machinery, musical instruments,—all the details, in fact, that may at leisure be easily got together, but perhaps with difficulty when suddenly wanted, would thus find their proper places for use hereafter, if need be. Collections of cubical contents of buildings, costs, and the circumstances influencing the same, are very useful; in all these, and similar things, however, it cannot be often enough said that the training in terse, direct statement, made at the same time as full as necessary, was perhaps really, after all, the most valuable thing obtained.

II. Of business writing: the object is to convey information in such a way as to render mistake impossible. The requisites for letters,—legible handwriting, date, address, and a very readable signature (printed name at head, if the usual signing is likely to be beyond the ordinary record), press copy, posting entered in a book. The memorandum now in some use among tradesmen does not seem properly professional (and must not be accepted in any case in lieu of a letter, as it is not usually signed, and therefore might possibly be repudiated in some instances). The official method of recapitulating all the contents of the letter answered may be useful at times, and prevent mistakes by correspondents who do not keep copies of their letters; for ordinary use it will, however, be found practically sufficient to refer to the letter answered. Letters received should be acknowledged usually by return of post, even if the expected answer cannot be sent; but letters that stir the temper should always be passed by for a day at least, and may be, would often be better treated of at an interview (*littera scripta manet*). In case of instructions from clients, mutual good understanding will be often promoted by a copy of the architect's memorandum being sent to him; a dissent or a fresh direction by letter may in such

case prevent difficulty thereafter. Notes agreed to by both parties on the spot, very full and explicit, should always be made after a long interview involving a distinct arrangement; as in the case of a reduction of builder's tender by agreement before commencing pressing work, where, perhaps, many items have been subject to revision, &c. Specifications should have a uniform character throughout,—either full and even minute from beginning to end; or general—touching only on the important points, and leaving the drawings and dimensions, scantlings, &c., thereon to explain the rest: either (supposing the drawings prepared accordingly) will be found efficient. For reports state your results; omit your reasons: give the facts, the advice, and an estimate. Models may be found in Sir C. Wren's reports in the "Parentalia;" or Sir G. Barry's, given in his *Life* by his son.

III. Of architectural literature,—as other special class literature now a matter of necessity, owing in part to the small leisure, in part to the few intimacies,—the press takes to many the place of society. There are some who ought to engage in this, and some who ought to leave it alone. Long and well-directed study of some sort for the acquisition of a distinct, or, at any rate, a serviceable style, composition being an acquired art, like penmanship only occasionally well acquired; something of importance to say, either as the outcome of special gifts or of special education. These may warrant the attempt, either sustained or occasional, to mould or to influence public thought, or to supply the materials of knowledge. Sketching at some length the influence of writers on art matters in recent times, commencing with Sir Walter Scott, especially with reference to the Gothic Renaissance, instancing Mr. Rickman and M. Viollet-le-Duc as influencing architecture through architects, and other writers as acting at first hand on their employers,—Mr. Smith stated that there seemed to him many divisions of architectural literature as yet only partially treated. While it might safely be said that the writing of distinct treatises for the stimulation of art-feeling had best be left (like poetry) to those who are unable to refrain; and while we are almost overdone with hospitals and houses, good and thorough books, with full illustrations on theatres, railway stations, markets, warehouses, factories of various kinds, &c., would advance the standpoint from which such works in the future should start. Some buildings also deserve a monograph after the manner of Captain D. Galton's "Herbert Hospital." In conclusion, the paper dealt with the advantage to architects themselves, and to their profession, as well as to the public, of papers carefully written at intervals on matters that have been well studied. By such exertions some useful faculties are kept in activity, and as becomes the members of a liberal profession, the information that education, opportunity, or fortune may have placed in the way of one man is shared generously with others. In all cases he would reiterate his text,—advise the writer to be sure that he is well in advance, but not out of sight,—to "remember the reader."

IMPROVEMENTS FOR KENSINGTON.

CHANGED from the appearance it bore some thirty years back, of a quiet suburban village, Kensington has become the most important district of outlying London, being the main western arterial line to and through the metropolis. Bordering Hyde Park, and enjoying the singular advantage of another park and baronial hall, together with the Royal Palace at a short distance, and the unrivalled Kensington woods and gardens, its position and south aspect must always give it a preference before any other suburban quarter.

On approaching, the Albert Hall and Monument give dignity to the roadway, which has been to some extent enlarged and divested of old unsightly brick walls; and just on entering the town, the winding of Gloucester-road has been rectified and opened by Messrs. Cubitt, who have erected several important mansions just opposite to Kensington Gardens. On the north side, the gardens have been tastefully planted and decorated, where some fifteen years back stood a hideous old cowley stable, which, on the repeated instances of the writer, through the *Builder*, was removed.

Within two years immense improvement has been effected through the local authorities, in widening the thoroughfare opposite the church,

and by the erection of a commanding structure upon the site of the old sacred pile; but still there remains to be done a work that most of all would tend to the easement, the appearance, and the prosperity of this royal town.

We all know that there are two great leading routes,—one leading west from Piccadilly, and another, the Bayswater line, from Oxford-street, in a parallel direction for several miles; but few, excepting those who feel the want, notice the fact that there is no direct traverse road or street between Park-lane and Addison-road, a distance of over two miles.

On the south side there are numerous roads and streets of respectable width; but these lead to Chelsea, Fulham, or nowhere.

On the north side there is a winding narrow way, not inappropriately called Church-lane: this meanders through antiquated tenements, built without order or regard to the causeway, up to the elevation of Campden-hill, where the character of road, as well as the structures, is of a more modern type, but descending again to Notting-hill, by Silver-street, the line is little better.

On turning northwards by the church the road-caravets round the churchyard railings, which obtrude some 30 ft., and here the causeway varies in width from 13 ft. to 17 ft. Now in order to give effect to Mr. Gilbert Scott's fine architectural achievement, the churchyard railing should be drawn inwards to alignments, or nearly so, with the continuation up hill; and between Holland-street and Dako's-lane, a range of ten paltry one-story shops advances in a curve from 10 ft. to 25 ft. on the line of causeway. Then, again, an old, dreary-looking house, now used as a monastery, advances about one-third of its frontage upon the line of any proposed modernised way.

In making a new street, the purchase of such valueless property as this ought to offer no barrier to improvement, for the wayside building plots would probably indemnify any such purchases, to be made of course by valuation jury. The Campden Grove Cathedral impinges a little on the line, but the withdrawal of the railing at the upper end, similar to its construction at the lower, might perhaps suffice, seeing that no portion of the structure could be removed without prejudice to its integrity.

The parochial authorities have work enough on their hands in relation to the police-station, just now under consideration; that subject I avoid, as it is under discussion, only expressing the wish of many residents "that no niggardly dealing may prevent the erection of a building that may be a lasting credit to the town."

As to the opening of Church-lane, that is also under consideration. The traffic-way of that line is wholly inadequate to its growing requirements; in fact, St. Martin's or Chancery lane is not more used by carriages, carts, and vans; and, if taken up with spirit and purpose, it would not only repay the outlay, but embellish the neighbourhood, adding at the same time to general prosperity and comfort. T. H. H.

CONDITION OF AN IRISH COURT-HOUSE.

At the Queen's County Spring Assizes, after the judge took his seat, he said that he hoped some improvements had been made in the Court. One of the counsel replied to his lordship that matters remained *in statu quo*, and that nothing had been done either for the bar or the jury, with the exception of the dock having been removed. The foreman of the grand jury came before his lordship, accompanied by the county surveyor, and both gentlemen said that the matter was brought by them before the road sessions, but the presentment that resulted from the previous advice of his lordship had been thrown out. Hereupon his lordship soundly rated all concerned in the neglect in the following fashion:—

"The presentment sessions have nothing whatever to do with the Court-house. There was a small thing I requested to be done in the King's County Court-house, and it was done by the grand jury, at an expense of about 20*l*. The gentleman who has been addressing the jury here before you came in had to sit upon a bench there, and I am put here in a pit I will not continue to sit in. The jury have no cushions on their seats. I would not think of asking the jurors in the Court of Queen's Bench to sit on such seats. It would be most disrespectful to gentlemen to compel them for

hours to sit on such seats. This building is an antediluvian one, and it could not be arranged as a court of justice ought to be, but the work should be altered. *The room is a filthy one.*" Here the foreman interposed by saying the grand jury were under the impression that the matter should come before the road sessions. Instantly his lordship, with increased warmth, continued:—"Ask the Chief Justice of the Common Pleas, who is the county judge here, and if he says the grand jury have not the power to improve the court-house, of course it need not be done. I was in a third-rate court-house in Scotland, and the arrangements were most perfect and beautiful, because the people of Scotland have a regard for the proper administration of the law. This court-house is like an old barn, and a very bad barn. It is a shabby court-house, as shabby as any court you could find in the whole of the three kingdoms. A court of conscience,—a forty-shilling court in England,—would not be so shabby."

SOME ROUGH-HEWN SANITARY MAXIMS FOR THE PEOPLE.

The bath is a blessing.
A lover of flowers,
A hater of filth.
A stagnant drain
Bodes death and pain.
In labour there's health.
Badly-built dwellings are often hospitals, but seldom houses of recovery.
Care for the infant.
Training for the boy.
Occupation for the man.
Rest for old age.
Neither overcome sleep,
Nor be overcome by it.
A cultivated garden is a floral Eden,
A happy and healthy home a moral one.
Preserve thy health in early youth,
Or physic in old age will avail thee little.
Good draught, no choke;
Better fire, no smoke.
A thorough drainage and pure water-supply are the prime essentials of public health.
Extremes, though distant,
Will join issue still;
And heat or cold
Can cure or kill.
In choosing a house for health,
Look below the foundation.
In choosing a house for strength,
Look to the workmanship and materials.
In choosing a house for beauty and utility,
Please yourself, and strive to please those who know better.
Draughts bring doctors
(And doctors send them).
When gas is escaping find the leak with an extinguished candle.
Sloth and dirt grow apace,—with long nails.
Foul smells have fouler causes.
With rats comes rot.
With mice comes mischief.
The mother is the fittest nurse.
The parent should be the first educator.

RABBIT, RABBIT, OR REBATE?

I HAVE been often disposed to put some queries to my brethren in the building crafts respecting the correctness of the terms used by them as to methods common to their workmanship. Among building operatives the word I have selected as a first example is generally used, spoken, sounded, and written in the two first forms, and the second form appears to be greatly in the ascendant.

Having had an intimate acquaintance with building matters and building operatives in many parts of the British Islands, I have noticed the variations that occur in the technical terms used by workmen to distinguish the same or similar methods of work.

The same operation by a mason or stone-cutter, bricklayer, cabinet-maker, or iron-worker as that performed by the carpenter or joiner, is often called by another name; the sole difference being very often only the material on which the operation is performed. Many terms used among building operatives in the North of

England are quite unknown in the South; and the same holds true in relation to Glasgow, Edinburgh, and Dublin, in all which places the English language has been common for centuries, and intercourse with the workmen of other parts of the kingdom frequent.

Yet workmen are often puzzled and confused when they are strangers when they get a job in any of these places, when directions are given by the foremen or masters to do so and so, the words employed being quite new to them, and which, if expressed in their proper building or architectural form, would be thoroughly understood.

To return. The words under notice are, however, easily understood, no matter in what way they may be pronounced or written. My purpose is to arrive at the correct reading. I believe, myself, that the proper form of the word is "rebate," and so I find it in all old building treatises. Its derivation is obvious to my mind, as I deduce it from the primal word, "bate," or "abate," to lessen or reduce; hence "re-bate," to reduce still lower.

A piece of wood or stone when "squared,"—that is, reduced or planed down to its required form,—is lessened in size; so when a rabbit, or rebate, is sunk in any part of its surface, it is, consequently abated lower, or, in other words, re-bated. This, I submit, is clear enough.

I find the French word for the process is *rebattre*, which is identical with the old English term in derivation. From the same root we have several words,—bate, bated, abate, abatement, rebate, rebated, &c.

With masons, the term for rebated is "joggled," whether the stones are fitted into others externally or internally, as in architraves or lintels, voussoirs, &c. The word "joggle" is also used by carpenters, joiners, and cabinet-makers, but not in the same sense. It is used to denote those over-lengths of wood left on the sides of pieces of framing, for security's sake, before the process of mortising, tenoning, or halving takes place, and are afterwards cut off when the work is finished.

A rebate, we see, then, is a joggle in one form, and a joggle a rebate, but not in all forms. I venture to say that in architectural and building matters we need badly a revised dictionary of technical building terms. I will show on another occasion many words most wrongly used, and repeated again and again by our *semi-distant* technical guides and educators, who are misleading our workmen in many ways, instead of instructing them. Technical knowledge can only be taught by practical professional men; and many of those who assume the office of teachers ought as a preliminary to "read up" for their own information.

In speaking of the word "rebate" above, the carpenter's or joiner's "rabbit-plane" might have been instanced, and the query may be put, Why is a sash-rebating plane termed a "filister"? Again, is a rebate a groove, or a groove a rebate, or to constitute a groove in joinery, must the channel or sinking have two sides in contradistinction to the common rebate on the angle? Again, why is another joiner's tool used for making grooves called a "plough"? Is it from any similarity to the agricultural implement? A CRAFTSMAN.

* * * There is more to be said in favour of "rabbit" than some think. The French word from which we are said to derive it is *rabotter* (to put down, to abate), not "*rebattre*" (which has an entirely different meaning), though our correspondent is not alone in using the latter; see, for example, the glossary in Gwillt's "Encyclopaedia." Again, it need not be forgotten that *raboter* in French is the verb "to plane"; and *raboteur* is a planer. Moreover, *rabotter* is "to join by the ends."

THE TRADES MOVEMENT.

Ipswich.—At a meeting of twenty master builders several resolutions were agreed to. The first is rather indefinite, as it begins by disclaiming the existence of a league, and ends by establishing one. It runs thus:—

"That we do not acknowledge the existence of any league; but whatever alteration is made in the rate of wages the same shall be communicated by the masters to their men, and that each shall be at liberty to make any arrangement he chooses, provided only that this meeting shall fix the maximum rate of wages to be given to skilled workmen, which rate shall be acted upon by us all."

The next is:—

"That for the future the men be paid by the hour, and that the maximum rate of wages for skilled carpenters,

joiners, and bricklayers shall be 5d. per hour; and for good labourers 3d. per hour; and that ten hours is to constitute a day's work."

Leicester.—The strike of joiners and carpenters at Leicester continues. The master builders adhere to their resolution to grant an advance of three-eighths of a penny per hour only, and not to employ any men on strike.

Bedlitch.—The agitation which has been going on for some time among the carpenters, bricklayers, and painters, came to a termination on Monday. The demands of the men were an increase of wages, and a reduction in the hours of labour by leaving off work on Saturdays at one o'clock. The carpenters and bricklayers demanded a rise of 1s. per week, and the painters 2s. a week, with the diminished hours on Saturday. On Wednesday the men resumed work, the rise in wages and reduction in the hours of labour having been conceded by the masters. Instead of the masters, however, paying by the week, as has hitherto been the custom, it is arranged between the masters and men that the latter shall be paid by the hour, at the rate of 5d.

Bewdley.—A meeting of the employers in the building trade at Bewdley has been held, to consider what steps should be taken as regards adopting less hours of labour, and asking for a higher rate of wages. There was a good attendance, and after some discussion it was resolved that the time of labour for bricklayers, carpenters, and painters, for the first five days of the week, should be from six o'clock in the morning till 5.30 in the evening, deducting one hour and a half for meals; and for Saturday, from six in the morning till two in the afternoon, allowing half an hour for breakfast; that the wages for the above time for bricklayers and carpenters be 27s. per week, and that an advance of 3s. per week on their present rate of wages be paid to painters. A copy of this resolution has been sent to all the masters of the town, asking them to call a meeting at their earliest convenience to take the matter into their consideration. The men propose that the above concessions be made to them in the week ending 4th May next.

Coventry.—Some time since the masters were served with a notice demanding a rise of wages from 5d. to 6d. per hour for carpenters and joiners; for the bricklayers, from 6d. to 6½d.; labourers, 3½d. to 4d. This advance, with the restrictions demanded for overtime, the masters felt they could not accede to. Various meetings were held without any practical result, and at last it was resolved to submit the whole affair to arbitration. The carpenters and joiners asked the mayor, Mr. W. H. Hill, to act for them, and the bricklayers and labourers, Mr. J. Gulson. These gentlemen have now given in their award, which is as follows:—The carpenters and joiners to have 6½d. per hour, being a rise of 2s. 11d. per week of 56½ hours; that is, from 27s. 1d. to 30s. The bricklayers, 6½d. per hour, being a rise of 1s. 9d. per week, from 28s. 3d. to 30s.; and the labourers, 4d. per hour, being a rise of 1s. 2d. per week, from 17s. 8d. to 18s. 10d.; and all overtime made at the request of the master between eight o'clock in the evening and six o'clock in the morning to be paid for at the rate of time and a half, and on Sundays at double the ordinary rate. Overtime for labourers to commence at four o'clock on Saturdays as before. This new arrangement has just come into operation. The labourers, however, have declined to recognise the decision of the arbiter (Mr. Gulson), and such of them as are unionists are now out on strike.

Cockermouth.—The master joiners have held a meeting for the purpose of considering the propositions of their workmen, which were submitted to them a short time ago, for a reduction in the hours of labour, and an advance of wages. Mr. Joseph Boll presided. It was decided by the meeting to concede the demand of the men for the adoption of the nine-hours system, but no action was taken with regard to the other proposals.

Edinburgh.—At a general meeting of the joiners it was agreed that copies of the by-laws as adopted should be sent out to all the employers in the city for their signature, and that a cessation of work should take place on Monday in those shops and among those squads where the by-laws are not signed. At another meeting the secretary read a list containing the names of seventy-eight employers who had signed the by-laws. The names of some small employers who had not signed them were then read, and the list was remitted to the joint com-

mittee, with powers to take steps to obtain the signatures of all the employers.

Glasgow.—A section of the Glasgow brick-makers have struck work for an increase of wages.

THE PUBLIC HEALTH BILL.

A DEPUTATION from the Social Science and British Medical Associations have waited upon the president of the local Government Board, relative to this Bill, to ask for amendments to it. The deputation was introduced by Mr. Corrance, M.P., who mentioned that three associations were represented, namely, the Social Science, British Medical, and Medical Officers' Associations. The main points were the question of arrears; of local authorities; and of suitable and proper authorities. They thought that the success of the Bill must be of greater importance than its passing; but they could scarcely look with satisfaction on it without some alteration. A memorial was then read, which set forth at great length the various points which needed alteration, and concluded by requesting an assurance from the president that the sanitary work of other departments of central administration might be consolidated in the local Government Board; that the constitution of the Board for sanitary purposes might be revised and strengthened, and that a measure might be introduced by her Majesty's Government in next session for the consolidation of the existing sanitary laws; and also that he would consent to introduce several amendments in the Bill now before Parliament, the chief points being that there should be one authority instead of a division of authority, in whom should be vested the power of directing the administration of medical relief, who should appoint officers of health, &c., and that a moiety of the expense of medical and scientific officers, and of sickness returns, should be borne by the national exchequer. Several members of the deputation having spoken, Mr. Stansfeld, in reply, said he could not affect to agree with the views which had been propounded, because he adopted the views of the Sanitary Commission. He did not think the time had come for consolidation. After several points were discussed, Mr. Stansfeld said, with regard to the power he proposed to take, if they read the clause they would find it was unlimited, for he did not mean to tie his hands in that respect, but to proceed tentatively, and he really thought as practical men that ought to be some satisfaction to them. As to the medical officers of health, the Bill had been misunderstood. They only said that they might be medical officers. When the Bill came into operation the whole of England and Wales would be mapped out into districts. The points in dispute were so complicated that, as Mr. Stansfeld said, it was very easy to misunderstand them.

COLOURING VENEERS.

SOME manufacturers of Germany, who had been supplied from Paris with veneers coloured throughout their mass, were necessitated by the late war to produce them themselves. Experiments in this direction gave in the beginning colours fixed only on the outside, while the inside was untouched, until the veneers were soaked for twenty-four hours in a solution of caustic soda, containing 10 per cent. of soda, and boiled therein for half an hour. After washing them with sufficient water to remove the alkali, they may be dyed throughout their mass. This treatment with soda effects a general disintegration of the wood, whereby it becomes in the moist state elastic and leather-like, and ready to absorb the colour. It must then, after dyeing, be dried between sheets of paper, and subjected to pressure, to retain its shape. According to the *Society of Arts Journal*, veneers treated in this way, and left for twenty-four hours in a hot decoction of log-wood (one part of log-wood to three of decoction), removing them after the lapse of that time, and, after drying them superficially, putting them into a hot solution of coppers (one part of coppers to thirty of water), will, after twenty-four hours, become beautifully and completely dyed black.

A solution of one part of picric acid in sixty of water, with the addition of so much ammonia as to become perceptible to the nose, dyes the veneers yellow, which colour is not in the least affected by subsequent varnishing.

Coralline dissolved in hot water, to which a little caustic soda and one-fifth of its volume of

soluble glass has been added, produces rose colours of different shades, dependent on the amount of coralline taken.

IN PARLIAMENT.

The Thames Embankment Bill.—Colonel Wilson-Patten brought up a report from the Standing Orders Committee, stating that in the case of the Thames Embankment Bill those orders which had not been complied with might be dispensed with, but that the Bill should not be read a second time before the 7th of May, and that fresh notices should be given in the *London Gazette*.

Dwellings for the Poor.—Lord J. Manners asked the hon. member for Truro whether the Metropolitan Board of Works had directed his attention to providing dwellings for the poorer classes, in place of those cleared away to effect metropolitan improvements. Colonel Hogg replied that the Board were considering this question. It had been referred to the Parliamentary Committee, and the solicitor had been instructed to draft a clause which he trusted would meet the requirements.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE fifth annual meeting of this Institution was held on the 27th ult., at 165, Aldersgate-street, Mr. George Plucknett (Messrs. Gubbitt & Co.), president for the ensuing year, in the chair.

The balance-sheet showed an increase in the amount of annual subscriptions for the past year of 137. 13s., and in the interest received on invested funds of 47. 7s., but a decrease in the amount of donations of 24. 18s. The whole income was 273. 15s. 3d., the amount granted in relief 93. 6s. 8d., and the cost of management 61. 1s. 3d. An addition of 200l. to the invested funds during the year had brought them up to 1,000l., of which 600l. belong to the relief fund, and 400l. to the orphan fund. Two widows and one incapacitated clerk had been added to the list of pensioners, but the latter had died shortly after his election; the committee, acting under rule 5, allowing his widow one-half her husband's pension until her election for the full amount.

Mr. Plucknett, in moving that the report and balance-sheet be received and adopted, said he wished to congratulate the Institution on the progress made during the last four years. He trusted this might become a much larger institution, and be able to relieve all the applications made to it, and mentioned the fact that in looking over some very early papers connected with the Builders' Benevolent Institution, he observed that their expectations were very small, being at first confined to the hope of relieving three applicants, then six,—now they annually assisted forty or fifty, and possessed large invested funds. It required men earnest in the work to carry on such an institution, and such men they had in the present officers, who he thought deserved much praise for the economical way in which the society was worked, and for the zeal and perseverance shown in an unselfish cause, the Institution being not for subscribers only, but for all builders' clerks. Being a class matter the area in which to look for support was limited; but although the same persons were applied to over and over again, yet the large builders of London could be fairly appealed to, as the employers depended upon the clerks and *vice versa*. He should be glad to see more of the clerks become subscribers, as it would show their appreciation of a cause for the benefit of their class, and a constancy of income from annual subscriptions was the best.

Mr. Benjamin Hanneu (of Messrs. Holland & Hannen) followed with an expression of the pleasure and satisfaction it had given him to have been connected with this young institution as president during last year. Having been a builder's clerk himself, he sympathised with those who had established and worked it so successfully. It had derived great advantage from the previous presidencies of Messrs. Heusshaw and Strling. He knew no one who had such a thorough knowledge of the working of such institutions as Mr. Plucknett, and he heartily congratulated the committee upon the prospect of being under such good direction for the ensuing year.

Mr. G. S. Fritchard proposed a vote of thanks to the retiring officers, which was seconded by Mr. Matthew Hall.

The election of fresh officers for the current year and other formal business occupied the remainder of the meeting, which concluded with a cordial vote of thanks to Mr. Plucknett.

BILSTON TOWN HALL AND FREE LIBRARY.

THE foundation stones of the new town-hall and free library for Bilston, now in progress, have been laid. The site is that of the old post-office, and once adjacent buildings, at the junction of Church-street and Wolverhampton new road. The new building will have a frontage to the Wolverhampton-road of 95 ft., and on the return front of 74 ft. They will be erected with brick, stone-faced. The town-hall will afford accommodation on the ground-floor for the Town Com-

missions, committee-rooms, with waiting-room, town-clerk's, surveyor's, and collector's offices. On the first-floor will be a large room, 70 ft. by 43 ft., for public meetings, with orchestra-gallery in the west end, and several retiring-rooms. The public entrance to the town-hall will be carried up as a tower, forming a prominent feature on approaching the buildings from Oxford-street. The free library buildings, although uniform in frontage with the town-hall, will be distinct therefrom. The entrance will be from the Wolverhampton-road, and the accommodation on the ground-floor will be—reading-room, 36 ft. by 20 ft. 10 in., and library, 20 ft. by 17 ft. 6 in.; and on the first and second floors will be class-rooms. There will also be in the town-hall a porter's residence. The total cost of the buildings is 5,000*l.*, of which 1,300*l.* is the portion of the free library. Mr. Bidlake, of Wolverhampton, is the architect; and Mr. Nelson, of Dudley, the builder.

SILVER WORK.

Messrs. ELKINGTON & Co. have recently produced a remarkable work, in *repoussé* silver, relieved by steel damascened with gold, allegorical of Music and Poetry. It is of large size, and includes a vase in the Renaissance style, upon a long plateau: upon one side of the vase, are four of the Muses, and upon the obverse the other five. The summit of this vase bears two Genii. At the sides of the vase, seated in recumbent attitudes, are placed draped female figures, who represent Music and Poetry. Bas-reliefs,—Pegasus occupying one; the other, a winged Griffin, carrying the Genius of Imagination; masks, and other fanciful emblems and trophies, complete the work. When we say that it has occupied the artist, M. Morel Ladeuil, for several years, and is valued at 6,000*l.*, our readers will have some idea of its importance, especially if they remember the Milton shield, the work of the same artist. We must go further, however, and point to it as the most important work of its kind produced in this country, exhibiting artistic genius as well as skill of the highest order.

THE WORKS OF HERR GULDENPFENNIG.

At a meeting of the Royal Institute of British Architects, held on Monday, April 8th, Herr Guldenpfennig, diocesan architect to the Bishop of Paderborn, was elected an honorary corresponding member of that body. Attention has been previously called to the works of Herr Guldenpfennig in this journal, as well as in a paper read last November, before the Institute, by Mr. H. W. Brewer. In a future number we shall give illustrations of buildings carried out from this gentleman's designs. Mr. Guldenpfennig's works are in the Gothic style; and the principal buildings upon which he has been, or is now engaged, are the following:—The restoration of Paderborn Cathedral; new seminary at Paderborn; house for Herr Mallinkrodt; grange and chapel for the Baron von Brenkin; dwelling-houses at Paderborn, Dortmund, &c.; churches at Paderborn, Ruthen, Ochsersleben, Buderich, Hoerde, Wattenschied, and Warbourg. The churches at Paderborn, Hoerde, Buderich, and Wattenschied, are important cruciform buildings.

GAS FROM WOOD.

Sir,—Will any of the readers of the *Builder* give me any information, through the medium of your journal, on the subject of making gas from wood? I believe it is manufactured thus in some parts of Germany, and am desirous of gaining all the knowledge in the matter I can obtain.

ALBERT MORSE.

FALLS OF STANDS.

At the Bridgenorth Steeplechases the grand stand suddenly gave way, and about 150 of its occupants were more or less hurt.

At the Lurgan steeplechases, which took place close to Belfast, in the presence of from 15,000 to 20,000 people, a stand had been erected by the council of the races, and a second by a private speculation, to which admission was at the cheapest rate. At the most interesting part of the day's proceedings, the start for the Brownlow Cup, the latter stand gave way, and all the people upon it were pitched among the *d'bris*. Between twenty-five and thirty persons are known to be injured, eight or nine seriously,

and in two cases, at least, it is believed the result will be fatal.

As mentioned by us last week, a stand erected to witness the laying of the chief stone of a Wesleyan Chapel in Kenilworth Town gave way under the weight of the crowd upon it, and several of those precipitated sustained serious injuries.

SCHOOL BOARDS.

London.—The following architects have been invited to compete for the schools at Old Castle-street, Whitechapel, for the London School Board:—Messrs. T. W. Aldwinckle, Edward Biron, Francis Chambers, Habershon & Brock, Edward C. Robins, and John Turring & Son.

Conisborough, Yorkshire.—Mr. William Watson, of Wakefield and Doncaster, has been appointed architect; and schools for 600 children, with master's house, are to be built.

CAUTION TO BUILDERS.

An adjourned case, at Worship-street, under the Buildings Act, came on for hearing before Mr. Hannay, on Wednesday, the 27th ult., in which the District Surveyor for West Hackney summoned Mr. Wm. Townshend, of Greenwood-road, for the penalty, for neglect in giving notice before the commencement of works.

The magistrate, after hearing the evidence, fined the defendant in the penalty of 5*l.*, and costs.

THE NEW BUILDINGS FOR THE CITY OF LONDON UNION.

THE new offices and premises in Bartholomew-close, which have for some time been in course of erection, for the City of London Union, are now almost finished. The building, which is in the Elizabethan style of architecture, is in three blocks, namely, the office block, the Board-room block, and the recess or centre block. The first two stories of the office block are of Portland stone, the remainder being of brick, with Portland stone dressings; and the recess block is similarly constructed, but finished with a pavement, upon which appears the City arms. The Board-room is gained from the central hall by a moulded spirally staircase of stone, and there is a similar staircase from the Board-room to the committee-rooms. Mr. W. Hudson is the architect; the builders being Messrs. Hill & Sons.

THE KEEP OF MIDDLEHAM CASTLE.

ALTHOUGH the size and extent of Middleham Castle are but moderate for the figure it has made in local story, and the rank and power of the succession of great barons who built, augmented, and have inhabited it, it is in itself a remarkable building, and presents much of antiquarian interest. It is placed on the southern edge of the town of Middleham, and a little above it. Its immediate position presents no great natural advantages, but for the general defence of Wensley Dale it is not ill chosen, standing between the Yore and the Cover, about a mile and a half above the junction of the two streams.

In plan Middleham is rectangular, composed of a keep about 100 ft. north and south, by 80 ft. east and west, and to the base of its parapet about 55 ft. high, which is placed in the centre of an *encinte*, also rectangular, 240 ft. north and south by 190 ft. east and west, so that the area of its only ward is but limited. The *encinte* is a curtain wall, about 30 ft. high. At its north-west and south-east angles it has rectangular towers of slight external projection, which rise above the curtain. Its south-west angle is capped by a drum tower of three stages, and on the north face, but at its north-east angle, is the gatehouse, rectangular, of slight projection, but four stages high, basement included. The east curtain has been destroyed. Upon the south and west curtains are many exterior projections, battresses, and near the centre of each a rectangular tower. The domestic buildings were chiefly placed against the curtains on the north, west, and south sides, and thus the ward is reduced to a mere passage between these buildings and the keep.

The gatehouse is about 25 ft. deep by 50 ft. broad. It has in its exterior front a central portal, round-headed, beneath a pointed arch of relief. This is flanked by buttresses, 2 ft. high by 1 ft. deep, and the adjacent angles of the

building are supported by similar buttresses, two being set on each. At the first story these pass into a single buttress, which caps the angle,—a pleasing arrangement, giving variety to the outline. The entrance vault, like the gateway, is round-headed, with ribs for doors, and it has a single porteuilis groove at its inner end. It is all of one date, and in the Decorated style. This gatehouse, and the buildings of the ward generally, are Decorated, and require far more examination than the writer has been able to bestow upon them.

The Keep is reinforced at the four angles by broad, flat capping buttresses, of variable breadth and projection, and which, no doubt, rose above the battlement into rectangular turrets. The buttress on the north-east angle has a breadth of 26 ft. on the north and a projection of 7 ft., and to the east a breadth of 16 ft., and a projection of 1 ft. It contains the chamber communicating with the battlement of the outer gate of the barbican, and below is solid. The buttress on the north-west angle has to the north a breadth of 22 ft. and a projection of 3 ft., and to the west a breadth of 12 ft. and depth of 1 ft. On the south-west angle the breadth of the west face is 14 ft., and of the south 11 ft., and the depth of each is 1 ft.

The south-east angle, as at Rochester, contains the staircase. It has no projection on the east face, being covered by the barbican. On the south its breadth is 20 ft., and its depth 6 ft. This alone preserves the remains of a turret above the battlements. Excepting the stair-turret, the angles of the keep seem solid below, though worked into chambers on the first floor.

There are also projections on the west and south wall. That on the west has a depth of 12 ft., and a breadth of 18 ft. The lower story is broken away; it was hollow, and looks as though meant for a gigantic cespit. The upper part hangs unsupported save by the cohesion of its cement, and greatly needs conservation. This turret is about 51 ft. from the north end, and 31 ft. from the south. The projection on the south wall is 12 ft. broad, and 8 ft. deep. It is placed 24 ft. from the west, and 44 ft. from the east angle, coinciding with the partition-wall within. This turret is hollow, and forms a great shaft for garbierobes in the upper stories. In its face, at the ground level is a round-headed arch, of 3 ft. opening, and 4 ft. high, the outlet of the sewer, but above ground. These two turrets at present cease at the level of the parapet, but probably rose sufficiently above it to cover a garbierob. The keep has a plinth on the north, west, and south sides. The east face is covered by the barbican. The walls are about 9 ft. thick.

The keep has a basement floor at the ground level, and a first or state floor, and on the east side an upper floor. It is divided by a wall 9 ft. thick into two unequal parts, that to the east being 29 ft., and that to the west 24 ft. broad, each being about 84 ft. long. A well stair 12 ft. diameter, ascended in the south-east angle from the basement to the battlements. Lighted by loops, and with doors to each floor.

The east chamber into which this stair opens by a large and apparently round-headed door, now broken, was vaulted in two lines, resting upon five cylindrical piers, about 3 ft. 6 in. each in diameter, and averaging 14 ft. from centre to centre. The vault seems to have been a barrel, groined. At each end were two square-headed loops, high above the floor with stepped recesses. The east wall contains only three square lockers, and the door of the staircase. The west or partition-wall side is pierced by five openings, about 4 ft. broad, and round-headed, three to the north, and two to the south of the thick solid central part. Probably these were introduced to lighten the work, and all but one or two thinly walled up. One must have been a doorway, as from the eastern bay the only communication with the western chamber.

The western chamber seems to have been spanned by a single vault, apparently slightly pointed and groined in six bays. In each end is a single square-headed loop. On the west side are seven loops, the central part being occupied by the unpierced rear wall of the turret already described.

First floor, east side. This was evidently the hall. It is very lofty, and in its north end is a round-headed window of 2 ft. opening, and 7 ft. high to the springing. In the south end are two similar windows, but about 14 ft. long, and a curious water-drain between them and the door. This, the door from the stair, is plain round-headed, and of 6 ft. opening. Close north of it is a similar door, of 7 ft. opening, quite plain, and

without a portcullis. This is the main entrance, and opens from the barbican tower. Beyond this is a short window, and then three long ones, like those at the north end, so arranged as to open clear of the exterior barbican stair. The west wall has an opening at each end, the bulk of the wall being solid. The northern of the two openings was probably the great door of passage between the rooms; the southern communicated with the garderobe in the south wall. In the north-east angle is a very curious mural chamber, 12 ft. cast and west, by 9 ft. north and south, vaulted in a single groined bay, round-headed, and springing from half-octagonal brackets in the angles, each the cap of a detached shaft, now removed. In the north wall are two, and in the east one loop. A door in the south wall opens into the north end of the hall, and one in the east wall passes obliquely through the wall, and evidently led to the battlements of the outer gate of the barbican, over the foot of its staircase. This room is much broken, but its fittings are original, and late Norman. If the hall had a fireplace in masonry, it was in the west wall, at a part recently repaired. It is not clear how the hall was roofed; possibly the original covering was a high-pitched roof, with the battlements above, but at present the side walls carry a table, with corbels of a plain billet moulding, on which an upper wall, about 12 ft. high, is advanced 6 in. In these walls are large window openings, with segmental arches, three on each side, which must have opened clear of the roof of the west chamber, and upon the battlements on the east side. In the south end, above the two narrow windows mentioned, is a third smaller one, as though to light a roof of high pitch. There are no corbels for principals, and no holes for main beams, but above the corbel table on each side is a range of holes, about 9 in. square, and as much apart, neatly stopped with ashlar, as though an original flat roof had been removed, and a roof of high pitch introduced. However this may have been, the windows of the side walls are clearly additional, and belonged to a second floor. Altogether the history of this roof is very obscure, and demands a close local investigation. The upper door in the west stair is not at a level to suit a second floor, nor consistent with a high-pitched roof.

First floor, west side. In the north end is a round-headed window, 2 ft. opening, by 7 ft. high, and a door into a now inaccessible mural chamber in the north-west angle. At the south end are two similar windows, and a door into a chamber in the south-west angle. In the east wall are the two broken doorways already mentioned, and the broken shafts of which, much broken, still rise clear of the roof. The fire-places are gone, and the wall has been much patched recently to give it support. There are two rather curious lockets in this wall. In the west wall there seem to have been four round-headed windows of 2 ft. opening, and 7 ft. high, and near the middle is a door opening into the middle buttress tower, which contains two chambers of unequal size. These are not accessible, but one was probably a large garderobe, and the other may have been the way to a small drawbridge, opening from the keep upon a rectangular tower in the ward, not 12 ft. distant, so as to give direct passage from the keep to the outer walls. In the keep wall, north of this tower, is a large segmental-arched window, evidently an insertion, probably the work of Rich. III. In the north-west and south-west angles, as already mentioned, are mural chambers, not accessible. There do not appear to be any galleries in the wall.

This west chamber was probably divided by a battice, and the north part used as a withdrawing-room from the hall. There does not appear to have been a second floor on this side. It is, however, curious that there should be no corbels, nor any of the usual indications of the principals of an ordinary open roof. In each side wall, high up, is a row of holes, about 9 in. square and 18 in. from centre to centre, so that probably the roof was flat, or, at any rate, was composed of heavy rafters, without principals.

The east face of the keep was occupied by the barbican or tower of entrance, and which, as was not uncommon, contained the chapel.

The approach seems to have been, as at Rochester, Scarborough, and elsewhere, by a flight of stone steps built against the wall, commencing, in this case, about 10 ft. from its northern end, and rising about 20 ft. to a vestibule, upon which opened, right and left, the great door of the keep, and that of the

chapel. The staircase was about 9 ft. broad, and 45 ft. or 50 ft. long to the vestibule. It seems to have been protected by a side wall, reducing the actual stair-breadth to (say) 5 ft. or 6 ft., and to have been either vaulted or roofed with timber. Its lower gate must have opened beneath a small tower, the battlements of which were reached from the chamber in the north-east angle of the keep. About half-way up the wall, seems to have been the appearance of the staircase, past what, from the appearance of the wall, seems to have been a second gate, in the keep wall is a large cavity capable of holding comfortably twenty men, evidently as a guard in case the entrance should be forced. Higher up, where the staircase landed on the vestibule, there seems to have been a third door.

The vestibule is part of the second floor of the usual rectangular barbican tower built against the keep, about 12 ft. from the south end of the east face. This tower measures about 33 ft. north and south, and about 48 ft. east and west. It rose about two-thirds of the height of the keep, and is divided into a basement or sub-crypt, an upper crypt, and a chapel and vestibule floor.

The basement is at the ground level. Next the keep, or, rather, next the solid mass of masonry which supports the stairs and vestibule, is the sub-crypt, 20 ft. north and south, by 24 ft. east and west. Beyond that is east of it, a passage runs right through the building, 5 ft. broad, with a door at each end; and beyond this are the ruins of a small chamber, which probably reached to the outer curtain wall. The passage gave a communication between the north and south parts of the ward, otherwise divided, on this side, by the barbican tower, and from this passage a door led into the sub-crypt. This room was vaulted in two bays in eight bays, springing from a central line of three columns now gone. The arch gables show that the vault was round-headed. In the south wall at the west end is a well-stair leading to the upper crypt, and the only way to it. The sub-crypt is lighted by two small round-headed Norman windows in each of the two open faces, one on each side of an exterior plain pilaster buttress, 3 ft. broad by 3 ft. deep.

The first floor, or upper crypt, extended eastward over the passage the whole length of the barbican, and was 20 ft. broad, and probably 40 ft. long inside. This also was vaulted, but the vault spanned the whole breadth, and formed two bays only. The ribs of the groining sprang from half-round mural pilasters. In the north wall, near the east end, is a fireplace. This floor had no communication with that above it. It was not uncommon for the basement of the barbican to be quite independent of the keep, and to be entered, as here, by an outer door of its own.

The second floor of the barbican contained the chapel and the vestibule, this floor being on the level of the great entrance to the keep. Whether the vestibule was vaulted is uncertain, probably it was. It is about 20 ft. north and south, by 9 ft. east and west, the entrance stair arriving at the north end, the keep door being on the west, and the chapel door on the east side. The chapel was loftier and vaulted in a lighter style than the crypts below. Its walls were 7 ft. thick, and its area about 20 ft. by 40 ft. It was vaulted in two bays in a light style, probably Early English. The great door of the keep was plain Norman, but chamfered round the head and jambs. There are traces of caps, and probably there were two flanking shafts, but no mouldings or drip-stone. The walls of the barbican are, no doubt, mainly original, though the vaulting of the sub-crypt and crypt may have been renewed. The chapel probably replaces an earlier building.

Middleham seems never to have had any works beyond the *enceinte* wall, save a slight ditch, of which traces remain on the south side only. On the east, a field road has superseded the ditch, as have some modern buildings on the west side. There is no present trace of either ditch or drawbridge on the north or town front.

The keep is built of coursed rubble, with ashlar groins and dressings. The discoloured and later work is mostly of excellent ashlar.

As regards the age of the several parts of the castle, the keep is plainly late Norman, and, likely enough, the work of Robert Fitz-Ranulph, Lord of Middleham, in 1190; and to his immediate descendants are certainly due the earlier alterations, especially the chapel, before the extinction of the family, in 1251.

No doubt the exterior ward is built on the side of a Norman *enceinte*, and some of the original

work may remain; but this part of the fortress was completely recast by the Nevilles, who married the Fitz-Ranulph heiress, and, no doubt, either by Robert, called the Peacock of the North, who had Middleham, &c., from his grandmother, and who died before 5 Ed. II., 1331, or by Ralph, Lord Neville of Raby, his brother and successor, who died 41 Ed. III., 1367.

Of the later residence of Richard, Duke of York (Rich. III.) the traces are the large window opening on the west face of the keep, and perhaps the upper story on the east side of the same building, and certain details added to the ward.

Middleham was a part of the broad territory granted by the Conqueror to Alan Fitz-Gaunt, the founder of Richmond Castle, and lord of that extensive honour, stepping thus into the seat of the English Earl Edwin, which he stultified from the adjacent Gilling. His younger son, Ribald, had Middleham for his especial lordship, by the gift of the second Alan, his brother. Ribald was followed by Ralph, his son, and he by Robert Fitz-Ralph, or Ranulph, who married Berta, niece of Ranulph de Glouville, and is the reputed builder of Middleham keep in 1191, 2 and 3 Rich. I.

Ranulph Fitz-Robert was the founder of Coverham Abbey, "Near his manor-house of Middleham," and was there buried in 1251 (31 Hen. III.), leaving Ralph Fitz-Ranulph, his son, who appears to have been lord of Middleham Manor in an inquisition for the partition of his lands (55 Hen. III.), the year of his death. He left three daughters co-heirs, of whom, Mary, the eldest, married Robert de Neville, and had Middleham. Ralph died (55 Hen. III.) 1271. It appears, by an inquisition under the name of Peter of Savoy, that Middleham was a fee owing suit of court to the honour of Richmond. 18 Ed. I., Maria de Nevile is styled Domina de Middleham, and 13 Ed. II. she had the manor. She lived till 14 Ed. II. (1320), having held Middleham for life.

Their son was Ralph Neville, who died 5 Ed. III. (1331), and who appears in an inquisition (1 Ed. III.) as holding Middleham Manor and Castle. His son, Robert Neville, the Peacock of the North, had from his grandfather the castle and manor of Middleham. He died, without issue, before his father, leaving Ralph his brother and heir, who died 41 Ed. III. This Ralph, Lord Neville of Raby, took a very active part in all the public transactions of his time, both in war and peace. He died seized of the castle and manor of Middleham, and was the first layman buried in the Cathedral of Durham.

The next lord was John, his son, also a great soldier and diplomatist. He died 12 Rich. II., 1388, leaving Ralph, his son and heir, who added to the wealth and power of the family, and also held the castle, manor, and lordship of Middleham at his death in 4 Hen. VI., 1425. John, son of Ralph, died before his father, 1123, who was succeeded by his grandson, Ralph, Earl of Westmoreland, who died 2 Rich. III. Middleham, however, had passed to Richard Neville, Earl of Salisbury, son of Earl Ralph, who died 4 Hen. VI., by his second wife, a daughter of John of Gaunt. The Earl of Salisbury, by an inquisition of 12 Rich. II., had then Middleham. This is the earl who, in 37 Hen. VI., marched with 4,000 men from Middleham into Lancashire on his way to London, to obtain redress from the King and Queen for injuries done to his son. On this earl's forfeiture, before 38 Hen. VI., his Lancastrian kinsman, Sir John Neville, was made constable of Middleham Castle, then in the Crown. Sir John fell at Towton, 1 Ed. IV., and his son Ralph became Earl of Westmoreland. But Middleham remained in the Crown.

At Middleham, then in charge of Neville, Archbishop of York, Edward IV. was confined by Richard, Earl of Warwick, the prelate's brother. Edward escaped when hunting in the park. After Barnet the castle was granted to Richard Duke of Gloucester, to the exclusion of the male heirs of the Marquis Montagu, Warwick's brother. Richard was much here; raised the rectory to a deanery, with a view to the foundation of a college; and here his son Edward, Prince of Wales, was born. After Richard's death, Middleham fell to the Crown, and was leased to various persons. Finally it was sold to Mr. Wood, of Littleton, ancestor of the present owner, General Wood. Recently the keep has been partially cleared of rubbish, and some of the most dangerous portions have been underpinned; but a little more assistance of the same character is much needed, to save some of the most prominent features of the ruin from destruction. G. T. C.

CONGREGATIONAL CHAPEL AND SCHOOL, THAME.

This building was opened for public worship at the end of last year. It is in the Geometric style, and the materials of construction are local stone, with Bath stone supplied by Messrs. Randall & Saunders for the dressings.

The internal dimensions of the chapel are 32 ft. 10 in. by 62 ft. 9 in., in addition to the organ recess at the back.

The accommodation, inclusive of an end gallery, is for 450 adults. The minister's desk is on a raised semicircular platform in front of the organ. The two seats immediately near the platform follow its curve. The ceiling line is about one-third down the roof. In the centre the height is 34 ft. 9 in., and at the sides 22 ft. The roof principals are visible below the ceiling line, and they, as well as all other visible woodwork, are stained and varnished. Simple dis-temper enrichments are introduced round the window-heads, organ recess, and ceiling panels. The lighting is by ten gas pendants.

The space under the chapel is appropriated to a school, 32 ft. 10 in. by 51 ft. 6 in.; a class-room, 13 ft. 4 in. by 17 ft.; a minister's vestry, 9 ft. 4 in. by 11 ft. 9 in.; and the vault for heating apparatus. The chapel floor being 6 ft. above the ground level, every part of the basement is light and well ventilated.

The heating is effected by Haden's warm-air system.

The total cost of chapel and school, exclusive of site, but including heating, lighting, and fencing, will be about 1,500l.

The architect is Mr. W. F. Poulton.

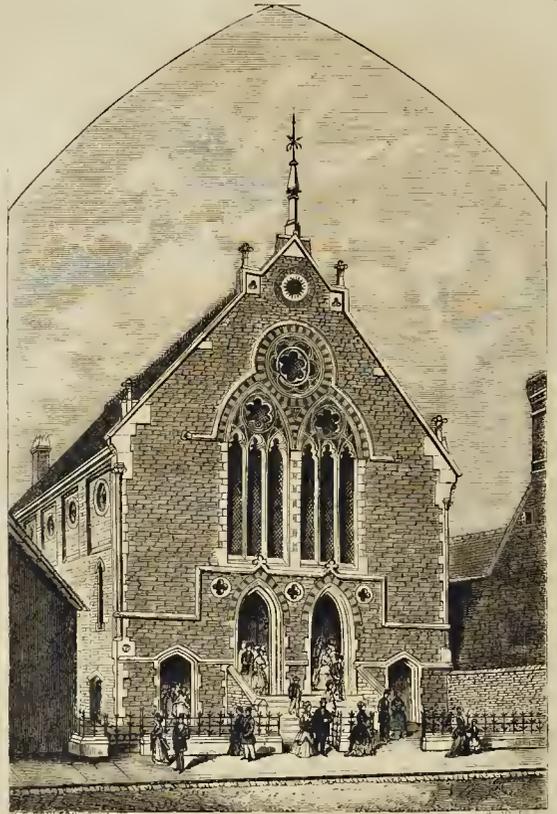

CAMBERWELL NEW VESTRY HALL.

We publish in our present number a view and plan of the ground-floor of proposed Vestry Hall for Camberwell. This design was selected in open competition. The style is French Italian, and the principal front facing the Peckham High-road will be executed in stone. The building throughout will be of fireproof construction. On the first floor are arranged two committee-rooms in the front. The Vestry Hall, 47 ft. by 12 ft., is placed at the rear, and lighted by means of a skylight and side windows.

The awkward nature of the site, and the specific requirements of the Vestry, are urged as reasons for the shape of some of the rooms: we seriously recommend a revision notwithstanding.

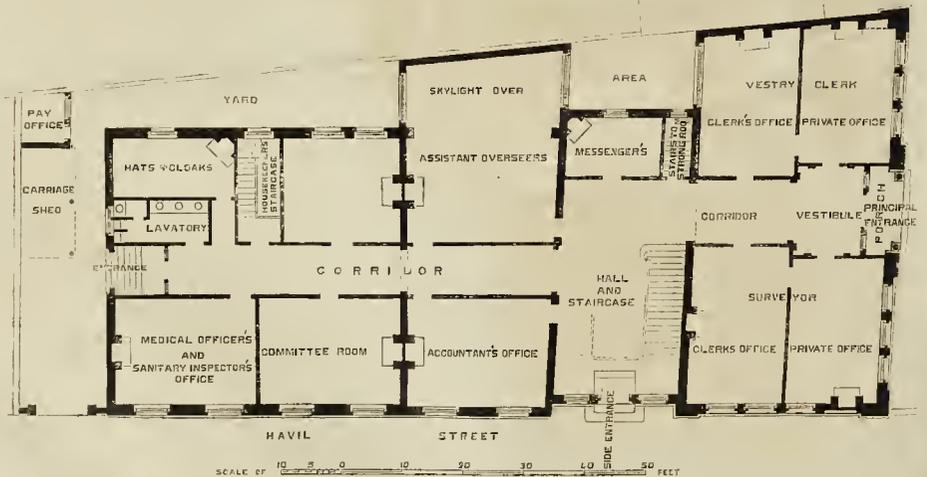

The estimated cost is 8,000l.; tenders for the works are about to be sent in.

The architect is Mr. Edward Power.

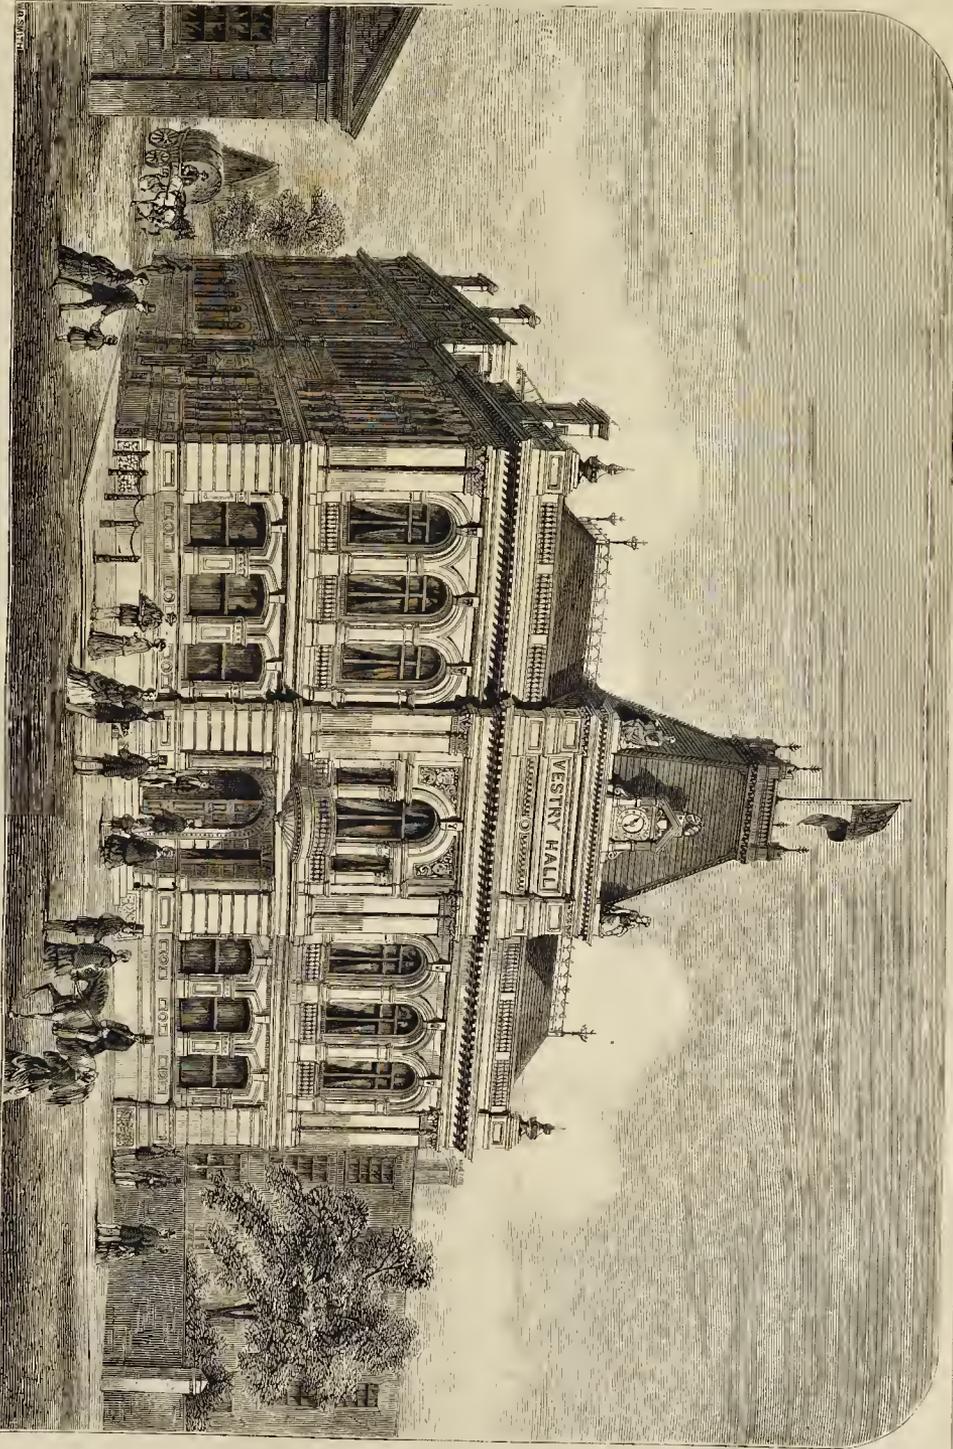

CONGREGATIONAL CHURCH AND SCHOOLS, THAME.

MR. POULTON, ARCHITECT.

CAMBERWELL NEW VESTRY HALL.—Plan of Ground Floor.

CAMBERWELL VESTRY HALL.—MR. EDWARD POWER, ARCHITECT.

REDEDOS IN PIEDMONT CHURCH, NEAR STOURBRIDGE.

This church, which has recently been rebuilt, has just now received a reredos, after a design by Mr. F. Preedy, of London, architect. The principal part of the reredos is of a light-coloured alabaster, which material forms the background above the level of the table, and in which is worked a series of canopies, supported by coloured Irish marble shafts, and containing sculptured figures of the four Evangelists, the latter being of a whiter tint than the ground-work. The central and most conspicuous object is the *Agnus Dei* standing on the Mount of Paradise, and from beneath his feet issue the four mystic streams; this panel, and one on either side of it, containing the Alpha and Omega, and other symbolic ornaments, are worked in Venetian mosaic, on gold grounds of the same material; as are also other smaller panels in the sides of the reredos, representing the sacred monograms, and other emblems, on blue and red grounds. The lower part at the sides of the table is hewn in bands of Caen stone and alabaster, the stone inlaid in ornamental patterns, with coloured marbles and cements.

The carving, inlay, stone, and alabaster work has been successfully executed by Mr. Boulton, of Cheltenham, carver. The mosaic work is from the architect's studio. The reredos (as explained on a brass plate placed in the side wall of the chancel) has been erected by Miss Hunt, a former parishioner, but now of Brookfield, Bellbroughton.

THE THEORY OF THE BEAUTIFUL.

A LECTURE was lately delivered in the lecture hall of Trinity College on the above subject, during which the lecturer, Professor Todhunter gave expression to the following, seeming to prove that the Beautiful was merely a theory, without any defined or known laws to govern its action,—a theory very disputable:—

"To some extent" (said the Professor) "each man has his own ideas of beauty, and there is no recognised authority to which we can refer for guidance. We find, however, an approach to unanimity in all ethical judgments, and in aesthetic judgment there is still a greater approach to it. The aesthetic conscience may be awakened and convicted of sin, just as the ethical conscience is; and the more aesthetic men are, the more unanimous in their judgment will they become. It would appear that there is a certain catholicity in ideas of beauty, and that an unsophisticated mind may appreciate the beautiful when fairly confronted with it. Two categories might be made of the beautiful,—first that of form and colour; second, that of rhythm and sound. The phenomena produced in us by a beautiful object might be summed up in one word,—Joy. The emotion of the beautiful has something of a sympathetic character. It is contemplative instead of worshipful, and underlying the delight an element of melancholy. We yearn to absorb things useful into our personality; we yearn to be absorbed into the beautiful in what way?"

The beautiful is the revelation of the divine purpose of creation; the ugly, the revelation of the chaotic disorder of things, the disorder which tends to the decay of all loveliness, the production of lower and lower types of life, a revelation of the Kingdom of darkness of Satan. The beautiful and the sublime express different ideas in the comital order of things,—the beautiful may be regarded as the resolution of discord; the sublime, as discord unresolved, but suggesting its resolution. The pretty and the grotesque are derived respectively from the beautiful and the sublime."

The Professor reminded his hearers in the beginning that the subject was one of the deepest questions in metaphysics, and at the conclusion he gave his audience an instance of the difference between the sublime and the grotesque by painting to a portion from the Book of Job, and comparing it with a passage from Goethe's "Faust." As an abstract theory or series of ideas about the beautiful in nature, the passage we quote, of the lecturer may be good enough, accepting the old and common belief that "every eye forms its own beauty," but in the matter of art the theory of the Professor would be an unsafe theory. And in answer to him, we submit that there is a recognised authority or authorities for guidance in the matter of the beautiful in relation to art. For instance, without proportion in architecture there can be no true harmony, and without harmony there is very little real beauty. A very intelligent and even learned man in many ways may have a joy excited within him at beholding a supposed work of art: it may be a painting or it may be an actual building. In common parlance, his joy may only be another name for the emotion the supposed grandeur of the edifice awakens to his senses. Yet the building or the painting may

have little or nothing of art in its composition. The same object or objects to a professional eye instead of creating joy, might produce disgust. Joy is not the consequence of beholding the beautiful, except in a conditional or limited sense. If joy is experienced by the true artistic and professional eye, the work may be assumed to be a work of merit or art, but if otherwise the emotion is felt, it cannot be said to be due to the phenomenon that is said to arise on beholding the object of one's admiration or joyousness. A knowledge of the laws, the proportions, the harmony, and the composition, is necessary before we can pronounce an object artistically beautiful at least.

CHORLEY NEW TOWN HALL COMPETITION.

NOTHING has yet been decided about these plans. The Improvement Commissioners have devoted some time in the examination of the drawings, and have held several meetings respecting them; but they have been unable to come to a decision upon the merits of the plans, and have at length determined upon calling in the assistance of an architect, so that it is expected an award will very shortly be made.

COMPETITIONS.

Trent Bridge Cricket Ground.—In the competition for the new Cricket Pavilion for the Trent Bridge Cricket Ground (the famous Nottingham Cricket Club's home), the design submitted by Mr. S. Dutton Walker has been selected.

Tiverton Land Company.—The Directors of the Tiverton Land and Building Company having advertised for plans for laying out their estate, at an adjourned meeting held on Tuesday, at the Town-hall, under the chairmanship of Mr. J. H. Amory, M.P., awarded the first premium of 20*l.* to Mr. C. J. Phipps, of Mecklenburgh-square, London; and the second, of 5*l.*, to Mr. J. Chudleigh, jun., of Newton Albot. They have also appointed Mr. Phipps architect to the company, and instructed him to proceed with the erection of four pairs of semi-detached villas.

The Kereham Villas Competition.—The competition for villas at Fardham, Hants, has been decided by the selection of a design prepared by Mr. D. J. Brooks, of Kennington-road.

LEEDS UNION INFIRMARY.

THE foundation-stone of a new infirmary for the accommodation of the sick inmates of the Leeds Union Workhouse has been laid by Mrs. Middleton, the wife of the chairman of the Board of Guardians. The erection of this building has become necessary owing to the existing infirmary having, by reason of the increase of population, and the formation of the Leeds Union, ceased to be adequate to the necessities of the union.

About two years ago the guardians issued a general invitation to architects, by advertisement, to compete for the erection of a new Union Hospital, the conditions being that the structure should be designed upon the Pavilion principle, and with an allowance of not less than 1,200 cubic feet of space per bed. Twenty-seven sets of designs were sent in, and that of Mr. Henry Walker, of East Parade, Leeds, was chosen from amongst them for execution. The selected design, however, met with disapproval on being submitted to Dr. Smith, the medical officer of the Poor-Law Board, who saw no necessity for isolation in a workhouse hospital, or for an allowance of more than 800 cubic feet of space per bed; and after several interviews and much correspondence and delay, the guardians have been obliged, though very reluctantly, to abandon the Pavilion principle (upon what grounds we should like to know), and to submit to a modification of the design in other respects, in order to obtain the sanction of the Poor-Law Board. The design now being carried out, prepared by Mr. Walker, in accordance with the requirements of the Poor-Law Board, is based on the block system, and the main building comprises separate suites of wards for male and female patients, with administrative departments between. The hospital is three stories in height, and has a frontage of 342 ft. It is arranged for 216 beds, exclusive of attendants. The central portion contains accommodation for nurses, chaplain, and dispenser, and also includes ward sculleries, hoists, and separate staircases and conveniences

to the wards. The kitchens, &c., are built at the rear, and connected on the ground-floor to the main building by corridors. The wards for each sex are alike, those on either side consisting of nine compartments, arranged in suites of three on each floor, and the compartments of each suite communicating with each other, as well as with a day-room at the end, by means of large doors. Each compartment will have a double stove, with descending flue in the centre; and Pettit's system of ventilation is to be adopted. Each day-room has separate conveniences immediately attached. The beds are ranged on each side, in pairs, between the windows. The design is of a Gothic character, in agreement with the architecture of the surrounding buildings, and will be executed in brick, with sandstone dressings; and the contractors are—Messrs. Thos. Whiteley, mason and bricklayer; Thos. Hall & Co., joiners and carpenters; Thos. Storey, plumber; Hoops & Robinson, ironfounders; Wm. Pycock & Son, slaters; H. Orange, plasterer. The contracts amount altogether to about 14,000*l.*, not including furnishings, &c. The Poor-law Board have sanctioned the expenditure on the new edifice of the sum of 17,000*l.*

OUR NEW ORGANS.

Sir,—Can you do anything towards improving modern organs? What are they made of? Not the sonorous Baltic timber, but spruce and American pine, full of knots and shakes, glued inside to fill the cracks; mouths, one-fourth, and some one-third, of the width; so that nothing short of a pair of bellows such as are fit for a blacksmith, could fetch a groan out of them. And the public think this music. Why? Because they know not the rich and beautiful tones that are only to be heard in the very few existing instruments worthy of the name of an organ. What about the modern metal pipes? This, I am sorry to say, is (next to the tuning) the most abominable part of these instruments,—organs I cannot call them. Instead of tin and lead with the silver, it is lead without the silver, with little or no tin, and—listen—antimony, to make the metal hard. There is still the execrable system of equal temperament to be spoken about, and the erroneously formed bellows.

AN ORGANIST.

THE SURREY GARDENS RE-CONSTRUCTION AND THE MAGISTRATES.

WE have already noticed in the *Builder* the extensive alterations and new buildings now in progress at the Surrey Gardens with the view of their shortly being opened to the public. These new works include, amongst others, the conversion of the large music-hall into a spacious theatre, the erection of a menagerie, and other buildings. Mr. Strange, the new proprietor, has just applied to the magistrates for a licence, and they last week refused it, on the opposition of Mr. Spurgeon (who formerly preached there before the erection of his Tabernacle) and a number of the inhabitants of the neighbourhood. Within the last few days the decision of the magistrates appears to have created a considerable amount of dissatisfaction amongst a portion of the residents in the district, who complain that it is somewhat harsh, considering the large amount of money which Mr. Strange is expending in the new buildings.

RE-OPENING OF ST. GILES'S CHURCH, SHREWSBURY.

THIS church, which has been closed for some time past, in consequence of the carrying out of extensive alterations and additions, which have become necessary from the increasing population of the district, has been reopened for divine service. The chancel being old and in a dilapidated state, it has been taken down and rebuilt at the cost of a resident in the parish; a chancel aisle containing a vestry and space for an organ has also been built; and the nave and north aisle has been lengthened by one bay. These alterations give 130 additional sittings, and they improve the appearance of the church. The architect employed was Mr. J. Lawrence Randal, of this town; and the work has been carried out by Messrs. Everall & Morris. The masonry was executed by Mr. J. Maddock. A stained glass window, which was erected a few years back, by O'Conner, in memory of the late Mr. W. W. How, has been removed from the west end of the aisle

and re-fixed in the east window of the new chancel; and the glass from the east windows of the old chancel has been re-arranged and incorporated in other windows. A two-light window on the south side of the chancel has been filled with stained glass, by Ward & Hughes, as a memorial of the late Mr. Thomas Howells, of Highfields, and the old window containing the figure of St. Giles has been placed in the north side of the new chancel. In the west end of the nave two new windows have been inserted, and it is anticipated that a stained-glass window will, before long, be placed in the aisle in memory of the late Mr. R. Bryan Smith. The chancel and sanctuary are laid with tiles from the manufactory of Messrs. Minton, Hollins, & Co., of Stoke-upon-Trent. The wood and stone carving are the work of Mr. G. Landucci. The windows have been glazed by Messrs. Dore & Davies; and the chancel will be heated with hot-air stoves, erected by Mr. Dodwell; so that the whole of the work, as far as possible, has been executed by tradesmen of the town. Owing to the strike which has recently taken place among the builders of the town and some other causes, the work in the interior of the church is not yet altogether completed.

BRITISH AND BELGIAN MARBLES.

SIR,—Without reference to any particular work, or desire to say anything that might seem captious, I wish to ask a few questions in the interest of our native materials:—

1. Can the Belgian black marble be got in sufficiently large sizes, free from treacherous, almost invisible, rents, to warrant any architect using it for decorative purposes in an important building?

2. Are there not marbles in Devonshire, the Midland Counties, Ireland, and another place at the edge of the world, viz., Wales, which far surpass the ordinary Belgian specimens for strength and beauty?

3. Cannot these British marbles be worked in Great Britain at 20 per cent. less in cost than marbles can be by Belgian or French masons?

4. Are the Government and our architects sufficiently alive to the interests of the masons of Great Britain?

5. Cannot the master masons of London give their men 9d. per hour and nine hours per day, and accomplish my question No. 3?

If some one will kindly answer these few plain questions, he will oblige a twenty years' master mason from the

BANKER.

SUN DIALS.

PREFACING some notes on Sun Dials in Derbyshire, Mr. George Roberts, of Lofthouse, Wakefield, says:—The materials for the history of the sun-dial are somewhat scanty. Ashur, King of Judah, who lived about 740 B.C., had a dial (Isaiah xxxviii.). The Greeks had dials 550 years B.C., and Pliny says that Anaximander, the Greek philosopher, was the inventor. The Romans had both the dial and the clepsidra, an instrument by which time was marked by the running of water or sand from one vessel to another: they erected dials in their public squares and walks and their temples, and most probably introduced them into Britain. I cannot discover that the Druids had any sun-dials. The ancient inhabitants of Mexico and Peru had a sort of rude-dial, by which they ascertained the hour of the day and period of the solstices. The different kinds of sun-dials were the only astronomical instruments which the Aztecs and Incas possessed. The clepsidra, the sand-glass, and subsequently the clock, succeeded the dial, which was inconvenient as it only marked time in sunny weather. The Romans had a motto expressive of this inefficiency—"I only count the hours of sunshine." The venerable instrument is now so rapidly going out of use, especially on churches, that in another century it will be as rare as are the May-poles. Though not now commonly useful, it is worthy of respect as antiquity, and ought to be looked upon as a superannuated servant, grey with age and full of honour, for assuredly it was more faithful and certain than many of the complex instruments which have succeeded it.

Exhibitions.—The private view both of the "Society of Painters in Water-colours" and the "Institute of Painters in Water-colours" will take place on Saturday, the 20th inst.

CHURCH-BUILDING NEWS.

Onestry.—It has been resolved to employ Mr. Street in restoring the parish church. A sum of 3,325*l.*, out of a total of 7,586*l.*, as the estimated cost, has already been subscribed at one meeting. Mr. Street's report of the necessary alterations, renewals, and restorations gives the following items:—Nave—new roofs, 1,815*l.*; new columns, arches, &c., 1,200*l.*; new oak seats, 1,275*l.*; new vestry, 250*l.*; new floors, 400*l.*; sundries, 260*l.*; warming and lighting, 400*l.* Interior of nave—Repairs of stonework, new windows, copings, crossings, openings, lower stage of tower, drainage, and new south porch, &c., 780*l.* Chancel and chancel aisles—ceilings, 240*l.*; floors and steps, 201*l.*; chancel seats and screens, 420*l.*; children's seats, 112*l.*; repairs of windows and walls, new south door, &c., 230*l.*—total, 7,586*l.* Some of these items were capable of reduction, if necessary.

Limpsfield.—The parish church has been reopened, after having undergone a restoration. Previously, the whole of the external walls were covered with plaster, which has now been removed, and the rubble work has been pointed. The interior was completely blocked with large pews, whilst a gallery stretched along the west side projecting far into the church and obscuring the windows. The whole of the inside fittings have now been taken down, and in place of them open sittings of oak have been erected throughout the church. The tower, which is massive, rests upon three arches; the belfry windows which had been in part built up, have now been restored to their original length; the brickwork which blocked up the northern and western arches has been removed; a new window inserted in the south wall, and the whole thrown into the church. The chancel, at the east end, in place of a late three-light Perpendicular window, has now a triple lancet, two jambs of which were found in the wall. The north chancel was restored in 1870, at the expense of the Lord of the Manor; it has at the east end a triple lancet window, exactly similar to that in the principal chancel, the old jambs here also having been found bedded in the wall. The lights are filled with stained glass, the subjects the twelve Apostles. It is a memorial window, presented by Mrs. Lereson-Gower. The church is capable of yet further improvement. Mr. J. L. Pearson was the architect employed.

Darlaston.—The new church of All Saints, Darlaston (the Mills Memorial Church), has been consecrated by the Bishop of Lichfield. The church has been erected solely at the cost of the Mills family, in memory of the late Samuel Mills, ironmaster, of Darlaston. The edifice occupies 3,364 square yards of land, near the high road. It is in the Early English style, and is built of red brick, with Bromsgrove stone dressings. The roof is covered with Broseley tiles, and the western doorway is surmounted with a bell-turret, containing two bells. The interior arrangements consist of a nave and two aisles, a chancel and chancel aisle, and a vestry; and an arcade of pointed arches, separating each aisle from the nave. The Bromsgrove stone pillars, from which the arch springs, bear carved foliated capitals, the work of Mr. Earp, of London. The roof is open-timbered. The chancel seats are of English oak, and those in the body of the church, all being free, are of pitch pine. The pulpit is of Bromsgrove stone, octagonal in form, with open panels, and the outer angles bear the heads of the four Evangelists. The chancel and nave are inlaid with Godwin's encaustic tiles. A series of two-light windows in keeping with the general design give light by day, while by night the building will be lighted with gas. The gas-fittings were supplied by Messrs. Pater & Son, of London; the heating apparatus by Messrs. Haden, of Trowbridge. Accommodation is provided for about 520 persons. The cost of the edifice amounted to 5,000*l.* The architect was Mr. G. Street, R.A., London; the builder, Mr. H. Lovatt, Wolverhampton; and the clerk of works, Mr. W. H. Williams.

Crewe.—The new chancel of St. Paul's Church, which, with an organ-chamber and organ, has been lately added to this edifice, has been consecrated by the Bishop of Chester. The organ is new, having been recently built by Messrs. Wadsworth, of Manchester. The chancel is built in the Gothic style, in accordance with the rest of the building, and the floor is paved with Milton tiles. The supports to the roof, which is of wood, are carved, the ends of the buttresses having figures of angels bearing shields, on the

face of which are various ecclesiastical devices. The walls behind and around the communion-table are inlaid with tessellated work; and at the entrance to the chancel the choir is situated. A stained window has also been placed at the east end of the church. It consists of five lights, the centre containing a representation of the Crucifixion; and in this work of art the distance views of Jerusalem and the Mount of Olives are prominent features. The lights at the right hand contain pictures of the Nativity and Baptism of Christ, and the left hand shows the Entombment, and the discovery by the woman of the departure of Christ. In a circular light, at the top of the window, the Ascension is the subject treated.

Amersham.—The parish church of St. Mary, Amersham, has been re-opened by the Bishop of the diocese, after a restoration of the interior and the erection of a new chancel aisle. The restoration has been carried out from the designs of Mr. Preeley, architect; and the cost has amounted to about 3,800*l.*, exclusive of the cost of font, altar-cloth, reredos, pulpit, and lectern, which were presented to the church. The completion of the work thus far is mainly due to Mrs. Tyrwhitt Drake. The church is supposed to be built on a Norman foundation, as fragments of late Norman work have been found. The style of architecture is of the Perpendicular character; the greater part is fourteenth-century work, but the piers, arches, &c., date from a period a century earlier. The east window has been raised nearly 4 ft., and deepened about 2 ft., and the floor of the sanctuary has been raised about 18 in. The chancel arch and roof have been raised, and the plaster ceiling replaced by a wooden groined roof. The organ has been removed from the old west gallery, and placed in the chancel aisle, and the choir are seated in the chancel. All the galleries have been taken away, and the plaster removed from the roof of nave, transepts, and aisles; the old principals are left, and the ancient boarding under the rafters shown; the decayed corbels have been renewed and carved. Two tilted arches of peculiar shape were accidentally discovered and opened out. The piers on the south side appear to be of earlier date than those on the north, and are of more elegant shape; all have been taken out, and the stone re-worked or replaced by new material. The clearstory windows had no tracery, but the original tracery was found, and copied in the present windows. All the windows have been taken out, and with very few exceptions the present windows have been copied from the tracery found during the restoration. The church is heated by hot water apparatus, furnished by Mr. Skinner, of Bristol. The stone-work has been carried out by Messrs. Whitehead, of Aylesbury; the stone carving by Mr. Edward Whitehead; the wood carvings by Mr. Bromfield, of London. The contractor for the whole of the work is Mr. Cooper, of Aylesbury. The architect employed is Mr. Preeley, of London. Further restorations of the exterior and of the tower are proposed, for which an additional sum of 1,000*l.* is required.

Bedlington.—A temporary wooden church at Baudon-hill has been opened by the Bishop of Winchester. The church, which is built from a design of Mr. Richard Martin, of Caterham, is 100 ft. long, by 24 ft. wide; the nave is 60 ft. in length, the north and south transepts 10 ft. by 20 ft., and the vestry and organ-chamber each 10 ft. by 10 ft. The roofs are 32 ft. high, surmounted by a spire 60 ft. high from the ground line. The chancel is apsidal, and contains a large five-light stained window, by Clayton & Bell; the floors are laid with Maw's tessellated pavement, and it is calculated that the building will accommodate 350 persons. Messrs. Taylor & Son, of Bromley, have carried out the work, the cost of which has been defrayed by the rector, the Rev. A. H. Bridges.

Thorne and Hatfield.—A meeting of the seat-holders in the parish church has been held, to consider the report of Mr. Jackson, of London, on the question of taking down the west gallery of the church, and opening out the old arches at the west end of the edifice now bricked up, &c. The projected improvements are estimated to cost 230*l.* Ultimately, the architect's plan was adopted, and a committee appointed to confer with the seat-holders in the west gallery, who will have new seats provided for them under the tower, to collect subscriptions, and afterwards to see to the efficient carrying out of the work. **Ainstable.**—The old parish church of Ainstable was given up last April to the architect and

builders to be pulled down and completely rebuilt. The new church was finished in the February of this year, and has now been consecrated by the Bishop of the diocese. The church consists of nave, 41 ft. by 26 ft., and chancel, 26 ft. by 20 ft. A tower, 6½ ft. in height, is placed with its south-east angle coinciding with the north-west angle of the nave. The lower stage of the tower, having a doorway in its south side, forms an open porch to the church; and an inner closed porch connects the tower with the nave and vestry, thus affording a sheltered entrance to the church, the situation being elevated and exposed to storm. The roof is open-timbered, ceiled to the diagonals above the rafters. The seats in the nave are of pitch-pine, stained and varnished. The pulpit and prayer-desk are of carved oak; the lectern of polished brass. The chancel is completely fitted with oak left unstained and simply rubbed with oil. A short south transept forms an organ-chamber, and affords accommodation for school children. The chancel being occupied by private seats, a small choir has been arranged by placing seats in the east end of the nave facing north and south. The church is warmed by a slow-combustion stove (Muggrave Brothers, Belfast), placed in a chamber under the floor in the choir, and covered with an open grating. The architecture is Early English; the accommodation for 211; and the total cost about 1,400l., raised by voluntary contribution. The architect was Mr. C. Watson, Penrith; the contractors were Messrs. Sprout, Talkin, for masonry; Mr. John Richardson, Penrith, for joinery; Mr. George Bailey, Penrith, for slating; Mr. Porter, Penrith, for plumbing, &c.

Clent.—A new clock, striking hours and quarters, has been placed in the parish church of Clent, Worcestershire. It was supplied from the manufactory of Mr. Smith, of Derby.

Fishponds (Bristol).—The reopening of the parish church of St. Mary's, Fishponds, has been arranged for the 4th of April. During the time it has been closed extensive alterations and improvements have been made. The former chancel, most unsuitable for its size and general character for the purposes of divine worship, has given place to an apse-chancel, more than 30 ft. in length, and having on either side convenient aisles, the intervening wall being carried on arches springing from pillars of blue Pennant stones, surmounted by capitals of carved Bath stone. The interior of the church has been cleared of the pews and seats, which have been replaced by open sittings, with carved finials. The gallery at the west end of the church has been taken away, and the organ is now being erected in the north aisle of the chancel. The south porch has been removed, as also the entrance to the church on that side. The nave, however, remains, with this exception, in the same state as before the alterations were undertaken; but it is hoped that the parishioners will, at no distant period, rebuild this portion of the church, and place it in harmony with the chancel. The cost of the present restoration will amount to about 1,700l. The plans have been supplied by Mr. Seddon, of London, architect, and the works have been carried out by Messrs. Yalland & Foster. It is proposed to fill in the seven lancet windows in the chancel with stained glass, from the architect's designs, which are illustrative of the seven gifts of the Holy Spirit. Four of these windows have already been contributed, and will be placed in position prior to the reopening of the church. In addition, Mr. R. L. G. Vassall, Oldbury-court, has promised three windows of stained glass for the south aisle of the church. The organ is in the hands of Mr. Vowles, who is re-erecting it and supplying it with new stops and pedals, and introducing many of the most recent improvements.

Wolverton.—The church has been re-opened. Previously to the alterations the tower was separated entirely, and could not be entered from the body of the church, the intervening space being filled up with arcades of massive brickwork, which formed the ringing-floor. In front of this ringing-floor, but separated by two large doors, which may still be seen within the precincts of the God's-acre, was a gallery, which stretched nearly 12 ft. into the nave. These, the ringing-floor, the gallery, and all the brick-work, have now been removed, and the tower has been thrown open. The length of the church is it is now is 67½ ft., and the breadth is 18 ft. This, of course, does not include the transept. The tower, with its lofty arch, and series of round-headed niches and corbels, is a singular specimen of the era of Sir Christopher Wren.

Underneath the arch of the tower stands a new font. The tower has been furnished with new open seats, which, with the improved seating of the nave and transepts, are the work of Messrs. Garrett & Son, Kingsclere. All the carving in the church is the work of Grinling Gibbons or his pupils, and the old oak of that and the pews, now it is renewed and refreshed, is very striking. The windows, instead of being plain with wooden frames, are now divided with red brick mullions. The east window is the work of Messrs. Barraud & Westlake. The chancel side-windows are from Horwood & Sons, Frome. The remaining windows are by Messrs. Powell & Sons, the transept and west windows being quarries, the others cathedral glass. The general carrying out of the work has been completed by Messrs. Wheeler, Brothers, under the supervision of Mr. C. Smith, of Reading.

DISSENTING CHURCH-BUILDING NEWS.

Jarrow.—A church, which has just been completed at Jarrow for the use of the United Presbyterians of that town, has been formally opened for public worship. The structure stands a short distance from the railway station at Jarrow; but from its proportions and its spire it is seen from distant places in the surrounding country. It has been built in the Gothic style of architecture, from the designs of Mr. Joseph John Lish, architect, Newcastle. The plan of the building comprises a nave and two side aisles, with entrance porches and vestibule, there being at the west end a sessions-house, ministers' vestry, lavatory, and heating chamber. The nave roof, which is lofty, is divided by a light arcade, carried on ornamental cast-iron columns, whilst the nave ceiling, which is "coved" its full length, is divided into panel spaces by the roof timbers of the longitudinal ribs, each of the latter being enriched by a perforated wooden cornice. Ventilators are placed continuously along the length of the ceiling, to give exit to the vitiated air and allow of the introduction of fresh air without draught and annoyance; and these, from their design and position, form a feature in the decorative treatment of the interior. The galleries are placed over the side aisles and across the west end, and are approached by rooney stone staircases, each gallery having a separate approach. Provision has been made for the rapid clearance of the church, there being six different exit-doors, all so arranged that the congregation from each division can pass out without intermingling with each other till the outside is reached. The whole of the internal wood-work is pitch pine, varnished, the sittings being without doors. The pulpit, which is placed on a raised platform at the east end of the edifice, is composed of Yorkshire stone, with a moulded string-course and cornice, columns of red stone supporting carved capitals, and the whole being relieved with incised and carved work. Over the pulpit in the east gable there is a three-light window of ornate design, filled in with stained glass. The lower part of the window contains figures illustrating three periods in the life of David, who is represented as a shepherd, as a psalmist, and as a king. The west window and the heads of the side windows are also filled with stained glass. The whole of the glazing has been done by Mr. W. J. Boer, of Leeds. The gas-fittings, which are of brass and iron, have been designed to harmonise with the architecture of the church. The building has been heated by hot-water apparatus, put in by Messrs. Dinning & Co., Newcastle. The total height of the spire is 135 ft., its junction with the tower being marked with a moulded cornice, having at each angle a carved grotesque of the lizard type. The edifice gives accommodation for 900 adults. It has been erected at a cost of about 3,200l., a large proportion of which sum has already been obtained. The contractor for the work was Mr. Richard Wylan, of Jarrow, and the architect, Mr. Lish. The sub-contractors were:—for slating, Mr. J. Place, North Shields; for iron-founders' work, Messrs. Abbot & Co., Gateshead; for plumbers' and gas-fitters' work, Mr. Thomas Grieve, North Shields; and for painting and staining work, Messrs. Cooper, of Newcastle.

Utley.—A new Independent chapel has been opened at Utley. The edifice stands on the roadside, in the pastoral district, about midway between Keighley and Stoston. There has been no attempt at elaborate ornamentation or striking architectural effects. The edifice is Gothic. The front view shows a doorway, with a two-light

window on each side, and a four-light tracery window over. One side has six two-light windows, and the other five, and the whole are glazed with cathedral tinted quarry-glass, with coloured borders. The angle to the right of the entrance is occupied by a tower, which rises a few feet above the apex of the roof. The ground-floor pews have bench-ends and framed doors. A small gallery is placed across the end of the chapel, above the vestibule. The choir is accommodated in a pew which projects from the organ recess, and the front is decorated. A staircase which opens below the pulpit leads to the school underneath, which occupies the whole of the lower portion of the structure; but, on account of the formation of the site upon which it stands, the school is entirely above the level of the surface of the ground. The school consists of one large apartment and three class-rooms, the entire edifice being heated by hot-water pipes. The chapel will accommodate 400 persons, and the school upwards of 250 children. The original estimate was about 2,300l., but the original plan having been extended in its details, this estimate has been exceeded by several hundred pounds. The architect of the building was Mr. George Smith, of Bradford and Keighley.

Luxulyan, Cornwall.—Rosemelling Wesleyan Chapel, in this parish, recently reopened, has undergone internal rearrangement from the designs and under the superintendence of Mr. Silvanus Treval, of Bodmin; Messrs. Phillips & Sons, Luxulyan, being the contractors. The upper surface of the seats is concave, and the backs are inclined. A rostrum takes the place of the former pulpit.

Basford.—The foundation stone of a Baptist Chapel for New Basford, has been laid. The site chosen is a large piece of ground in Chapel-street, and the design will be Gothic, with a principal entrance in front, above which will be a window with traced ornaments and a Gothic arch. There will be a small lobby immediately within the entrance, with lights on either side. The side and front entrances give access into a lobby and staircase leading to the gallery. The roof will be built upon timbered semi-circular principals, and the seats will have stall-ends and leaning backs. The platform for the ministers, and the communion pews will be surrounded by railings, and there is to be a vestry on both sides of the chapel, which will be heated with hot-water apparatus, and lighted with starlight pendants and ventilated. The cost will be between 900l. and 1,000l. Mr. Thomas Horsfield, of Halifax, is the architect; and Mr. Ellis, of Nottingham, the contractor.

Manchester.—The Welsh Presbyterian congregation, formerly of Oak-street, have opened their new chapel in Igrwood-street, Cheadam. The chapel is built of brick, with stone dressings, the style of architecture being principally Gothic, from plans by Mr. Richard Owens, of Liverpool. The builder was Mr. Thompson, of Cheadam Hill-road. The grounds are laid out with shrubs and trees. The pulpit, pews, and general fittings of the interior are pitch pine. The chapel is seated for about 400 persons. Behind are a school-room, vestries, and bouse. The cost of the whole has amounted to 3,000l. The organ, which has been erected by Mr. Watson, was presented to the congregation by Mr. Evan Thomas, of Cheadam.

STAINED GLASS.

Ripon Cathedral.—A window, to the memory of the late Hon. and Very Rev. B.D. Erskine, D.D., dean of Ripon, and has been inserted in the south aisle of the nave of this cathedral. The window contains two scenes from the life of Christ. The "Nunc Dimittis" occupies the upper part, the centre light representing Simon with the child Jesus, and on the right and left the Virgin Mary and Joseph. In the lower compartment the Nativity is represented; in the centre light, the Virgin seated with the infant Saviour; and on the right and left are portrayed the wise men and the shepherds. The window, which is of the style of the fifteenth century, was done by Messrs. Clayton & Bell, and is erected at the cost of one of the dean's daughters.

Bath Abbey Church.—There is at length some prospect of the east window of this church being filled in a manner becoming the character of the edifice itself. The matter has been taken up by the Bath Literary Club, and several conferences have been held. It appears to be necessary that the work should be accomplished separately from the general restoration, and the cost of the glass

alone is estimated at 1,000l., apart from the stone work, which the rector has undertaken to provide for.

St. Paul's Church, Cambridge.—A new east window has been placed in this church, as the result of subscriptions among the parishioners. The church being dedicated to St. Paul, the artist has chosen subjects taken from incidents in the life of the patron-saint. The upper-tier openings of the window represent St. Paul's conversion, his first miracle, his conversion of Lydia, the burning of the books at Ephesus; and the lower ones, St. Paul preaching at Athens, his imprisonment, his being brought before Agrippa, and the casting of the viper from his hand after the shipwreck. The centre lights display the Last Supper and the Ascension. The tracery of the window is filled in with the emblems of the four Evangelists, and the "mystic passion" or crucifixion of our Lord. The work has been executed by Mr. W. H. Constable.

Birkdale Church.—A window of stained glass has just been put into the five long lights of the east window in this church. In the centre is a figure of St. James, after whom the church is named. It is nearly of life size, with a shepherd's crook in the right hand. The other four lights are fitted with geometrical patterns. Messrs. Edmondson, of Manchester, were the artists.

Workshop Abbey Church.—A memorial window has been placed in the north aisle of this church, to the memory of Robert John Gainsford, formerly of Darnall Hall, by the members of his family. The artist was Mr. Westlake. The subject is St. John's advice to little children:—"Little children, love one another." The design has been executed by Messrs. Lavers, Barrand, & Co.

Berkeley Church.—It is proposed to place a stained window in this church, in memory of Dr. Edward Jenner, the discoverer of vaccination, who was born at Berkeley, lived and died there, and was buried in the chancel of the parish church. The subject of the window, which will cost 600l., of which 100l. have been subscribed, is to be "Christ healing the sick."

St. Barnabas's Church, Hengoed, Wales.—A stained-glass window has recently been placed in the north transept of St. Barnabas's Church, Hengoed, by Captain Hasband, of Manchester, in remembrance of the late Mrs. C. A. Lloyd, M.A., rector of Whittington. The window was executed by Mr. Ashwin, of Great Russell-street, London.

Mark Church, Glastonbury.—This church has just received its last stained-glass window. Most of the churches in that neighbourhood were originally built during the period from the fifth to the twelfth century, out of funds which accumulated from the revenues, &c., of Glastonbury Abbey, and they were of the simplest form and character. They were rebuilt from the thirteenth to the fifteenth century on the same sites. At first the churches were so small that, on rebuilding, the former site was occupied by the chancel alone. Moreover, they were not rebuilt at once, but added on to from time to time, according to the state of the abbey funds, generally finishing with the tower and the north aisle. In Mark Church these successive steps are easily traced. But what distinguishes Mark Church is the accurate geometrical proportions of all its parts.

County Asylum Chapel, Lincoln.—A stained glass window has just been presented to the chapel of the County Asylum, by Mr. G. K. Jarvis, chairman of the visitors, in commemoration of the recovery of H.R.H. the Prince of Wales. It is in the Norman style, by Messrs. Wailes, of Newcastle, and represents in the chief compartment our Saviour stilling the tempest, with a medallion cross overhead, and the figure of an angel beneath, holding a scroll.

Christow Church, near Exeter.—Messrs. Ballantine & Sons, of Edinburgh, have prepared a stained-glass window to be erected in this church, in memory of the late Hon. E. Pelew, formerly vicar of the parish. There are three upright compartments, and these contain illustrations of the 6th, 11th, and 15th verses of Revelation six. This portion of Scripture was selected by the late Lady Exmouth, as suggesting the subjects for illustration in the window. The dexter compartment illustrates the 6th verse, showing an angel flying through the heavens, bearing the everlasting gospel to those that dwell on the earth. The central compartment illustrates the 11th verse, and shows, seated on a white cloud, the Son of Man, having on His head a golden crown, and in

His hand a sharp sickle. The sinister compartment illustrates the 15th verse: an angel is seen leaving the Temple, as if crying to Him who sits on the cloud,—"Thrust in thy sickle and reap, for the time is come for thee to reap, for the harvest of the earth is ripe." This text is inscribed on the base of the window, and in the top tracery are angels with harps, as if engaged in singing the new song before the throne. The central figure of Christ seated on the white cloud is surrounded and surmounted by an emanation of benedictive rays of golden hue, contrasting with His under-garment of silvery white and His robe of ruby. The upper part of the sky is of a light cerulean blue, while towards the earth it assumes a deeper and less ethereal tone.

SCHOOL-BUILDING NEWS.

Blackburn.—St. Peter's Schools, commenced about twelve months ago, have been formally opened by the Bishop of Manchester. The cost is something like 2,800l., and provision is made for 550 children. The architect was Mr. Simpson. The wall, to the height of about 1 yard, displays red bricks pointed; the remainder, to the roof, is painted of a lightish hue; and the ceiling is formed into panels bearing devices, which much enhance the general appearance of the place. Chandeliers are suspended from the centre, to supply artificial light. Mr. Canliffe, decorative artist, did the paneling and painting. The walls, too, are relieved by mottoes and devices.—The Bishop of Manchester has also taken part in the opening ceremonial of St. Thomas's Schools. In all, extra accommodation has been provided for 2,400 children. St. Thomas's new schools have cost 3,000l., and will accommodate 1,000 children.

Leeds.—The foundation stone of a new school in connexion with the Hanslet Union Workhouse has been laid. The site of the building is contiguous to the workhouse. In the year 1866 the then infirmary was converted into a school-room; but in the latter part of 1870 Mr. Farnall, Poor-law Board inspector, having reported that the building was ill-contrived and unhealthy, it was determined to erect a new school. The plans, which have been approved by the local Government Board, have been prepared by Messrs. Hill & Swann, architects, Leeds. The building will accommodate 100 children, and will be of two stories, with apartments for the school-mistress attached. There will also be provided for the girls a washhouse and laundry, and for the boys a workshop. The contractors for the whole work are Messrs. George Onkes & Son, Hanslet. The total cost is estimated at 2,500l.

Chapel Allerton.—The foundation stone of a church school has been laid at Chapel Allerton. The site of the new building is in Back-lane, behind Queen's-place. The school, which will be surmounted by a bell-gable and cross, will consist of two departments, one for girls, which will be 45 ft. by 18 ft.; and the other, for infants, 66 ft. by 18 ft., the two together accommodating about 300 children. Attached to each department will be a playground with out-offices. The plan also includes a mistress's residence. The style of architecture will be modern domestic Gothic. Sir Thomas Beckett has presented the site, which consists of half an acre of ground. The estimated cost of the building is 1,500l. Messrs. W. Perkin & Sons, Leeds, are the architects, and the contractors are as follow:—Brick and masons' work, Messrs. John Garland & Son; carpenter and joiners' work, Messrs. Wm. Shires & Son; slaters' work, Messrs. Wm. Pycock & Son; plasterers' work, Mr. John Franks; plumber and glaziers' work, Mr. John Edward Bedford; and painters' work, Messrs. Chas. Wales & Son. The school desks and benches will be supplied by Mr. Ward, of New Wortley.

Wolstanton.—A bazaar, in aid of the completion of the new National School buildings, is to be held. The buildings, in point of style, are a novelty in the neighbourhood. They are from the designs of Mr. Brooks, of London, and are in brick, in the style of the thirteenth century—domestic Gothic. The plan is three sides of a parallelogram, having the infant-school and class-room on the north, girls' class-room and school on the east, and boys' school and classrooms on the south and south-west. The windows have flat stone heads, supported by a small column, which divides the lights into two parts. They are all of the same character; but a variety is got by some of the windows having six, some three, but most four lights. The roof

is covered with red tiles, the eastern ridge being surmounted by a *flèche*, covered with blue slate, containing a bell, under which is the principal entrance-doorway. A master's house is built at the boundary of the playground. Mr. N. Bennett, of Burslem, is the builder. The total cost, including furnishing, is, we are informed, expected to be about 2,800l., of which about 700l. are still deficient.

Kilburne (Leicestershire).—New National Schools have been opened in this populous village. These schools will be an auxiliary to Horsley Schools, and are intended for the education of girls and infants only, the boys continuing to attend Horsley as heretofore. The building was designed by Mr. Knight, of Nottingham, architect, and was built by Messrs. John Berrford and James Knifton, of Kilburne.

Folkestone.—New national schools are in course of erection. The buildings include a master's house, and infants', girls', and boys' rooms, and class-rooms, with accommodation for 290 children, and are being carried out from the designs and under the superintendence of Mr. S. S. Stallwood, of Folkestone.

Miscellaneous.

The New Invention in the Iron Manufacture.—A number of gentlemen connected with the Iron and Steel Institute and from most of the leading works in the north of England, assembled at the Deeside Works, Middlesbrough, to inspect the new American machine of Mr. Danks, which supercedes puddling by hand. The machine has just been erected, and worked admirably. Mr. Danks was present, and explained the nature of the machine to inquirers. The charge when put into the furnace is carried round in a revolving cylinder, whereby it is worked sufficiently in about three-quarters of an hour, and then withdrawn by mechanical contrivances. Between 600 lb. and 700 lb. was generally the weight of the charge, but it has been in most cases greatly enlarged. The trials were mostly made with molten metal,—pig iron taking a considerably longer time, generally about an hour and a half. The quality of the iron produced, which was from Cleveland pig, was highly spoken of by practical men. Six ironmasters of the United Kingdom combined together and arranged to give Mr. Danks 50,000l. for the right to erect and have the full use of 200 of his machines, but some doubt as to the force of the patent is said to have prevented the completion of the arrangement in the meantime.

The Brighton Sewers.—At the usual monthly meeting of the Brighton Intercepting and Outfall Sewers Board, the engineer's report showed that the total length of brickwork which had been put in the 5 ft. diameter sewer was 9,100 lineal feet, or, including the portion between Hove-street and St. Anby's-villas, 9,800 ft. In the 7 ft. diameter sewer the total length of heading that had been driven was 10,200 lineal feet, of which 5,800 lineal feet had been lined with brickwork. The ironwork and machinery for the penstocks were on the site of the works at Portiello, as was also the dressed granite for the penstocks and outfall chambers, and the brickwork had just been commenced in the penstock chamber. In the course of a discussion as to the advisability of appointing a committee to inspect the works during their progress, it was remarked that if the Board were to take upon themselves the duty of inspecting the sewer it would take away the responsibility from Mr. Hawkshaw.

Proposed New Workhouse for Rochdale. The local guardians intend to build a large workhouse at Dearnley, and by one concentrated staff reduce their expenditure. The workhouse, when complete, will accommodate 784 inmates, but it is only intended at present to provide for 630. The cost of the erection and furnishing is estimated at 50l. per head for each inmate. The adopted design has been prepared by Messrs. Woodhouse & Potts, architects, Bolton.

The Megaliths at Avebury.—The danger which seemed to threaten the megalithic remains at Avebury has been averted by the intervention of Sir John Lubbock, who has purchased the ground on which building operations were about to be commenced. Grateful thanks are due to Sir John for coming forward to the rescue at the critical moment, when a few years' or even months' delay might have resulted in the complete destruction of the remaining stones.

The Horton Infirmary.—The Horton Infirmary at Banbury was built at a cost of 10,000*l.* by the late Miss Horton, of Middleton Cheney, Northamptonshire, and Highbury, London, and intended by her to be a gift to the town. The building stands in its own grounds in the Oxford-road, and is Domestic Gothic in style. It consists of a centre block, with tower, containing the executive portion or establishment and two wings, in which are the wards for patients. The wards are constructed on the pavilion system. The operating-room is large, and the students' gallery is lighted by four windows and a lantern. There are convalescent wards, dispensing, and consulting rooms. The floors are wainscot and wainscot over, and the dressings to doors and windows and the walls of the wards are plastered with Parisian cement, thus providing as far as possible against the absorption of foul matter into the plastering of the walls, a fruitful source of ill in many old infirmaries. Mr. Charles H. Driver was the architect.

Society of Arts Endowment Fund.—The Committee of the Society of Arts are seeking to raise an endowment for the Society of Arts of at least 100,000*l.*, to enable it to carry on its work with increased advantage to the community. The Council have a belief that it could render further public service if it had adequate funds placed at its disposal for the attainment of objects for which there are now no public trusts, and are willing to become trustees for the administration of any moneys which private individuals may choose to devote for any special public purpose coming within the scope of the Society's objects. Their desire is to establish permanent departments, with competent officers, who may investigate and report on the progress of new discoveries calculated to promote new industries in connexion with chemistry, electricity, mechanics, agriculture, and raw produce generally, thereby affording increased advantage to the people generally.

Conservative Land Society.—At the seventy-eighth quarterly meeting, held at the offices, in Norfolk-street, on the 9th inst., Viscount Ranleigh in the chair, the receipts for the quarter, ending Lady-day last, were declared to be 26,215*l.* 19*s.* 6*d.*, and the grand totals to the same date, 1,770,428*l.* 10*s.* 9*d.* The total withdrawals amounted to 466,803*l.* 6*s.* 10*d.* The number of the last share issued was 37,194. The reserve fund, exclusive of office premises, &c., amounts to 10,500*l.* The rate of interest remains at 5 per cent. on shares, and 4 per cent. on deposits. Among the gentlemen present, besides Viscount Ranleigh, were Col. B. Knox, the Hon. and Rev. W. Talbot, Col. Meyrick, Mr. Goodson, Mr. Holmes, Mr. N. W. J. Stode, Mr. N. Winstanley, Mr. C. L. Grneisen (secretary), Mr. J. Ashdown, Mr. P. Basall, Mr. W. Poole, Mr. G. F. Talbot, Mr. J. Hugh Thomson, &c.

Destruction of Property at Oldham.—Early on Sunday morning an accident resulting in considerable damage to property, occurred at the Hartford New Ironworks, Oldham, belonging to Messrs. Platt, Brothers, & Co. Connected with these extensive works are storerooms, in which are placed finished machinery. The floors rested upon beams of considerable strength, and were otherwise supported with stout iron pillars. About the time indicated, the whole fell in with a tremendous crash, rendering the carefully-finished and valuable machinery a heap of almost worthless *debris*, and causing a damage roughly estimated at from 3,000*l.* to 4,000*l.* Fortunately, no one was near at the time, and no injury to human life resulted. The accident is said to have been brought about by the large quantity of machinery in store.

A Dispute as to Four Inches of Land.—The case of Rayner v. Snelson, in the Nisi Prius Court at Chester, before Mr. Baron Chammell, was one in which the plaintiff, in accordance with the defendant, took down a wall on which the defendant's roof-tree rested, and rebuilt the wall 4 in. within the extreme limits of plaintiff's own property. Defendant then made use of the new wall as a party-wall, and plaintiff allowed his builder, or his sons, to cut the connections with defendant's property. This was settled by arbitration in defendant's favour, but the present action against defendant followed, on the ground that defendant had built upon the 4 in. of space adjoining plaintiff's wall. The judge said the action had been unadvisedly and imprudently brought; and the jury returned a verdict for defendant, a poor widow.

Cheap Churches.—The Bishop of Manchester at the annual meeting of the Diocesan Church Building Society at Preston, expressed a hope that the society would see to it that the new churches which were being built should be "substantial" churches. He had been rather alarmed at the unsubstantial character of some of these new churches. A friend had told him that there was hardly a new church in Manchester that would live for fifty years. The Bishop hoped that was an exaggerated way of putting the case, but there was a foundation of truth in the saying. He observed that roof-timbers sometimes were slender, and in some instances churches which had been built only two or three years ago were giving way in the roof. Everybody knew that a cheap article proved often the dearest article in the end. If they would forego in the building of churches the use of frittering ornament, which was often an excuse for veiling an architect's inability to comprehend the laws of architectural proportion, and be content with solid substantial outlines with good proportions, the results would be more satisfactory. Very good advice.

Charge against Mr. E. B. Smith, the Surveyor to Shrewsbury Local Board.—Mr. E. Jones moved, at a recent meeting of the town council as a local Board, that the surveyor be requested to resign. He regretted to do so, because personally he had no objection to Mr. Smith; but he had felt, long before he (Mr. Jones) became a member of that Board, that the business of the town belonging to the surveyor was not well done, or likely to be economically managed. For business, whether private or public, to be successful, those who had to manage it must be thorough masters of it, and had to tend to it closely. The duties of the surveyor were, no doubt, multifarious, and required great watchfulness and attention. After entering a good deal into detail, a discussion of five hours ensued, and Mr. E. Jones then replied, and said he would withdraw his motion, not that he was satisfied with the explanations of the surveyor, but because he saw that the feeling of the Board was against him (Mr. E. Jones). The motion was then withdrawn.

Co-operative Congress at Bolton.—The fourth annual congress of the members of the co-operative societies of England has been held in the Co-operative Hall, Bolton. There was a large attendance of delegates. After some preliminary remarks from the Bishop of Manchester, Mr. Hughes, M.P., delivered an address. A discussion took place on the desirability of establishing a co-operative bank. It was resolved "that the Congress fully recognises the imperative necessity of establishing a central office and appointing a permanent secretary, earnestly recommending the central board to take immediate steps to secure the accomplishment of these objects." The following were appointed the London section of the Board:—Messrs. Thomas Hughes, Q.C., M.P.,—Morrison, M.P., E. Neale, J. M. Ludlow, D. Pare, Hon. A. Herbert, M.P., Lloyd Jones, H. Pratt, G. I. Holyoake, E. O. Greening, G. Howell, Captain Maxse, R.A., Dr. H. Travis, Mr. Applegarth, and J. B. Huntington.

The Removal of Christ's Hospital.—The governors of Christ's Hospital have resolved to accept the offer made by the Mid-London Railway Co. for the purchase of the buildings and 4 acres of ground on which the institution stands, the company's Bill having passed its second reading in the House of Commons by a majority of 27. The sum of 600,000*l.* was offered for the land, hall, and buildings. A thousand boys will be transferred to new buildings in some healthy country district, and half a million of money will remain for planting day-schools in various parts of London. The company are to pay at once 10 per cent. deposit, and the officers of the hospital are directed to take all necessary steps for completing the transfer of the property.

The New Peabody Buildings in Bermondsey.—The Peabody trustees have decided to erect several blocks of buildings in Bermondsey, similar to those in the Blackfriars-road, and are just about to proceed with the erection of the first block, the site for which is in East-street, near New Church-street; and in connexion with the intended building, the Bermondsey local authorities are endeavouring to secure the making of a new and improved thoroughfare between East-street and New Church-street.

Relief to Crowded Footways.—It is said of the Chinese and other Eastern nations that they do many things in a way the reverse of that of the Western. The out-and-out Westerns,—the Trans-Atlanticers,—seem disposed to make the extremes of East and West meet, and to do things in a way quite out of the ordinary run of us semi-Westerns. It is seriously proposed in New York to relieve the passenger-traffic of Broadway by a "travelling side-walk" on a line with the second stories of the houses, mounted on pillars, and worked through these pillars by shafts of stationary engines, which will cause the travelling side-walk to run along one side of the streets and back along the other, in united sections, like an endless band, with curiously-contrived local ears, to fasten on and shove off with passengers, at corner stair-ways, so that the side-walk never stops, and the cars never move on, along the route. The inventor of this odd scheme is a Mr. Spear, and we hope he may succeed with his "Rapid Transit Sidewalk Company." He has patented his invention in America, and is about to do so in Europe.

The English Church in Rome.—The church proposed to be built in Rome is calculated for 800 persons. A covered corridor connects it with the house, the basement of which will contain a large room for the library now existing, and an ample sacristy where meetings and classes can be held. Mr. Street has chosen the Pointed style proper to Italy, and for his materials those most available in Rome, brick, with the mullions and tracery of stone. The dimensions of the church will be 160 ft. by 56 ft. externally, 37 ft. in height internally, and 79 ft. to the battlement of the campanile, which will carry a peal of bells. For these purposes it is desired to raise 15,000*l.*, including the cost of a site, for which some favourable and healthy spot within the city will be chosen.

The New Market Hall, Knutsford.—The memorial stone of the new Town-hall, now nearly completed, has just been laid. The inhabitants, according to their ancient custom at festive times, made various devices in sand on the ground fronting their houses; from many windows flags were flying; and the church bells were rung. Lord Egerton of Tatton, with a desire to meet the necessities of the town, is building a Gothic Market Hall, with Assembly and Committee Rooms, where, not only can his Lordship's court gather, but the inhabitants of the town generally, not simply for business in the Market House, but for public meetings, concerts, and entertainments, in the Assembly Room over the Market House. Mr. Waterhouse is the architect.

Portraits.—Mr. Samuel A. Walker, of Margaret-street, Cavendish-square, has sent us some admirable photographs of the late and present Viceroy of India, Lord Mayo and Lord Northbrooke, which will doubtless interest a number of persons just now. Lord Mayo's portrait has that aspect of sadness, at a moment when no cause for sorrow seemed to exist, which has been so often remarked in the case of other persons who have afterwards suffered. Mr. Walker has made the clergy a specialty, and prints a remarkable list of portraits for sale. He is also issuing an interesting series of photographs of the interiors of churches.

Startling Phenomenon at Pontypool.—On Saturday before last the inhabitants of Pontypool were alarmed by a peculiar noise, resembling the falling of planks and stones, and, under the impression that some houses had fallen close at hand, there was a general rush to the doors, but as they got there the sounds deepened into the unmistakable roll of a prolonged clap of thunder. The lightning, it turned out, struck the chimney-pots of houses in Maxwell-street, and, descending the flues, fortunately passed out of doors without doing any serious damage. The escapes, however, were miraculous.

Reading Architectural Society.—At the general meeting of the Reading Architectural and Archeological Society, held on Wednesday evening, the 3rd inst., at the Athenaeum, the Hon. Sec. (Mr. E. J. Shrewsbury) read a paper "On the Ecclesiastical Architecture of England," being a continuation of the subject of a former paper, and comprising a general historical review of the rise and fall of Gothic architecture from the First Pointed period, with a concise sketch of the revival in the present century. A discussion, opened by Mr. Morris, ensued.

Utilisation of Slag.—Further uses for slag are noted in the monthly scientific article of *Chambers's Journal*. An ingenious inventor in Philadelphia has devised a way of blowing a jet of steam through a current of liquid slag; and thereby he produces fine threads of slag from 2 ft. to 3 ft. in length, and more or less elastic. To this material (which gives one a hint as to the nature of the process whereby asbestos is made) he gives the name "mineral cotton," and as it is found to be an admirable non-conductor of heat, it is to be manufactured in quantities, and tried as padding for pipes and steam-boilers, and in places where escape of heat is to be prevented. A specimen of this thread or fibre has been exhibited at the Manchester Philosophical Society. It has a lustrous white fibre, singularly like cotton-wool from the pod. Its cost is trifling; and it can be used as a coating for refrigerators as well as for steam-boilers. Small quantities of similar wool, it is said, are sometimes produced while the blast is on, in the Bessemer steel converters. Near Osanbrick, in Hanover, in imitation of shot-making, molten slag is let fall from a height of about 8 ft. into water, where it forms into "large bean-shaped gravel," which is used in great quantities for the metalling of railways. At some of our English works slag is now broken up by Blake's stone-breaker, and sold for road-making; and we are told that the Bessemer slags, from hematite, make excellent concrete, because of the large quantity of lime they contain; for which reason, and for the silica which they also contain, they make excellent manure for potatoes and barley. In the fields, the broken slag crumbles to powder.

Royal Italian Opera.—An admirable performance of "Fra Diavolo," was given at Covent Garden, on Monday night last, Mlle. Pauline Lucca making her first appearance, and filling the theatre with an air of gladness. Mlle. Lucca has made the part of *Zerlina* her own; both as regards acting and singing the representation is perfect. Signor Nauvin is an exceedingly good *Fra Diavolo*, as all opera-goers know; and the other characters were effectively supported. Mr. Gye is fortunate in his new venture, Mlle. Albani: her *Adina* ("Somanbula") gave great pleasure and much promise.

The Royal Academy.—Some erroneous reports as to the opening of the Exhibition having been circulated, it may be useful to say that the ordinary arrangement is not to be departed from. It will be opened to the public as usual on the first Monday in May (the 6th), and the private view will be given on the preceding Friday, May 3rd.

Fall of a Building in Manchester.—In Brook-street, Old Garratt, a large portion of the back part of the shops, Nos. 103, 105, and 107, has fallen into the River Medlock. At the time, the river, which runs under the street at this point, was flooded by excessive rain to a height of something like 16 ft., or 12 ft. above the ordinary level, but it subsided very shortly, leaving the mass of rubbish, which almost blocks the stream, fully exposed to view.

The Institution of Civil Engineers.—There are now on the books of the Institution 11 honorary members, 745 members, 1,109 Associates, and 235 students, together 2,105, as against 1,995 at the same time last year.

Exhibition Palace, Dublin.—The decorator engaged is Mr. Bell, not Mr. Buer, as printed last week.

TENDERS

For the erection of a fever hospital, at Barming, near Maidstone, Kent. Mr. George Livingstone, architect. Quantities supplied:—

Carey & Bulmar	£2,229 12 4
Grested	3,500 0 0
Wright & Co.	3,415 0 0
Lacy & Torkington	3,307 0 0
Dover & Co.	3,253 0 0
Ansonbie	3,275 0 0
Almetts	3,250 0 0
Walls	3,240 0 6
Arad	3,157 0 0
Addock & Rees	3,101 0 0
Stephenson	3,124 0 0
Bridge	3,100 0 0
Cox & Brothers	2,870 0 0
Davis	2,547 11 2

For new school-room, &c., at Abbot's School, Guildford. Mr. Edward Ward Lower, architect:—

Swayne & Sons	£319 10 0
Burdett	327 10 0
Mason	325 0 0
Strudwick (accepted)	318 0 0

NEW Practical SCIENTIFIC WORKS
publishing by R. A. SPILGO, ATCHLEY, & CO. on Engi-
neering, Civil and Mechanical Drawing, Land and Building
Surveying, Ecclesiastical and Domestic Ornament, Works on Timber,
Hydrology, and Cabinet Work; and on Monuments, &c.—106, Great
Russell-street, Bedford-square, London. A new List sent to order for
no stamp.

CONTRACTS.—Continued from p. ii.

TO BUILDERS.—BUILDERS who desire
to TENDER for NEW SHOPS and other BUILDINGS, for
Messrs. Jacobs & Co. in Leicester may obtain all particulars by
applying on or before the 10th INSTANT, to
MILLICAN & SMITH, Architects, Leicester.

BUILDERS desirous of TENDERING for
the ERECTION of TWO PAIRS of SEMI-DETACHED
VILLAS at Dulwich, can see the drawings and specification upon
application to the undersigned. The lowest or any other
Tender will not necessarily be accepted.—W. ADAMS MURPHY, Architect and Sur-
veyor, 47, Church-street, Chislehurst.

BUILDERS and CONTRACTORS desirous
of TENDERING for the ERECTION of WORKSHOPS, &c. in
the King's-road, Chelsea, may see the plans and specification on and
after the 15th INSTANT, at No. 12, Pall-mall, London. The lowest or any other
Tender will not necessarily be accepted.—F. A. DOVEY, Architect,
Netherwood-road, Hammer-smith.

TO BUILDERS.—Notice is hereby given,
that Plans and Specifications for BUILDING NEW SCHOOLS
at Chobham, in the County of Surrey, are lodged at the House of
Mr. CHARLES EDWARD PEARCE, Clerk, and will remain for
inspection till APRIL 20th, 1872. All persons wishing to Contract
for the Building must send, on or before APRIL 20th, sealed Tenders,
addressed "School Tender," The Secretary of School Committee,
St. George, Chobham, near Basingstoke. The Committee do not bind
themselves to accept the lowest or any Tender.

TO SEWAGE COMPANIES and OTHERS.
TAUNTON LOCAL BOARD of HEALTH, DESIRES LOOKING
out of Health for the district of Taunton, in the County of Somerset, are
desirous of receiving APPLICATIONS with plans, for the UTILI-
ZATION and DISPOSAL of the SEWAGE of that town, which con-
tains a population of about 15,000.
The Board desire to carry the whole of the Sewage to
one outlet, about a mile from the town, where they possess a piece
of ground, about three acres in extent, which will be found very
suitable and convenient for the erection of all requisite and necessary
works for the purpose.
Plans may be seen and full particulars obtained on application to
Mr. JAMES HENRY SMITH, the Board's Surveyor, at his Office,
Buckingham Palace-road, London, W. on MONDAY, the 16th

TRAVELLER to the BUILDING TRADE.

WANTED, a YOUNG MAN, of good address, having some knowledge of the building trade, and to assist at the books. Apply, by letter only, to Mr. MAUNDER, Stationer, 115, City-road.

TIMBER TRADE and SAW-MILLS.

WANTED, a Young Man, as CLERK. Must be thoroughly acquainted with the English and foreign trade. Will call on or attend general sales, by auction. Apply, by letter only, to WHEELER & WESTBY, Suburb, Suffolk.

SEWAGE FARM.—The Swindon New

Town Local Board require a competent Person to undertake the MANAGEMENT of a FARM of 100 acres, irrigated with sewage. A suitable dwelling-house will be provided for the manager.—Apply, at the office, with testimonials and references, to Mr. J. C. TOWNSEND, Clerks to the New Swindon Local Board, Swindon.

PAPERHANGER WANTED: one com-

petent to do best work and willing to do ordinary work at fair prices, to take the parcelling of a Wet end firm.—Apply, by letter only, to Mr. BAUFELLS, Builder, 9, Shepherd-street, Mayfair, W.

JOBING PORTER.—WANTED, a Handy

Man, accustomed to Epistolary business. For a permanent, if suitable.—Address by letter only, N. 37, Wells-street, Oxford-street, W.

A JUNIOR CLERK WANTED in a

BUILDER'S OFFICE, aged about 20, to book time and sundry matters.—Must be well up in figures and have been in a Builder's Office before. Address, stating age and salary expected, to R. B. 14, Clarence-street, St. Peter's-street, Edinburg.

A JUNIOR CLERK WANTED in a

JOBING BUILDER'S OFFICE. State age, salary, and where last employed.—Address, A. B. care of Mr. Pike, Stationer, Chapel-street West, Mayfair, W.

A BUILDER in Lancashire is in WANT of

A GENERAL FOREMAN or MANAGER. He must have a good practical knowledge of building in all its branches, as well as of measuring and estimating, and must be competent to take entire management of the business in the occasional absence of the principal. Estimate salary required, and references.—Address, W. D. "Gondian" office, Manchester.

WANTED, by a JUNIOR BUILDER'S

CLERK (aged 24), a RE-ENGAGEMENT. Is a neat draughtsman, and is used to assisting at book-keeping and in the usual routine.—Address, M. Thomas Works, Beaufort-street, S.W.

TO DECORATORS, BUILDERS, &c.

WANTED, a SITUATION or JOB, by a first-class PAINTER, WELDER, and DECORATOR. Willing to make himself useful.—Address, A. B. 38, Cotton-street, Poplar, E.

TO BUILDERS.

WANTED, a SITUATION, by an active

clerkly Man, as CLERK or otherwise, and to make himself generally useful. Good references.—Address, W. S. care of Mr. Strutt, 100, Old Kent-road.

WANTED, a SITUATION, as PAINTER,

GLAZIER, and PAPERHANGER. Money not so much an object as work.—Address, X. Y. Z. 16, Waterloo-place, Richmond, Surrey.

TO BUILDERS, STEVEYERS, and OTHERS.

WANTED, a SITUATION, by a

BUILDER'S CLERK, aged 27. Can take out quantities, measure work, estimate, &c. and is well acquainted with accounts.—Address, A. B. 41, Embury-street, Clerkenwell.

TO BUILDERS.

WANTED, a RE-ENGAGEMENT, as

FOREMAN of WORKS, or would take STUNTWORK. Good references.—Address, by letter, 405, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as

FOREMAN of WORKS or WORKING FOREMAN, by a Middle-aged Man, Carpenter and Joiner. He will attend in all branches of the trade and drawings. Is a good measure, and can set out works. Town or country.—Address, A. B. Mr. Bishop's, 10, Clurton-street, Finsbury, S.W.

TO ARCHITECTS and BUILDERS.

WANTED, a RE-ENGAGEMENT, as

SHOP or GENERAL FOREMAN, Joiner by trade. Has had a good practical experience.—Address, K. 9, 20, Victoria-street, Pall-mall, S.W.

WANTED, a RE-ENGAGEMENT as

GENERAL FOREMAN. Well up in City work. Five years with present employer. Good references.—Address, T. W. 30, Brunswick-terrace, Grosvenor-park, Waltham.

TO BUILDERS.

WANTED, a RE-ENGAGEMENT, by a

competent SHOP FOREMAN, of twelve years' experience. Is systematical, firm, of irrefragable character and abilities and well up in figures and drawing. No objection to the country.—Address, H. 4, Office of "The Builder."

TO BUILDERS, &c.

WANTED, a RE-ENGAGEMENT, as

BUILDER'S CLERK, aged 18. Well used to office routine, measuring up work, taking out quantities, or keeping out of work. Good draughtsman. Personal references.—Address, H. E. 24, Park-road, St. James's-street, Southampton.

WANTED, a RE-ENGAGEMENT in an

Architect's Office, by a young Man who has been eight years in the profession, is accustomed to prepare working and detail drawings with accuracy, and having a knowledge of perspective.—Address, C. L. 3, Stock-Exchange-street, Holloway, N.

TO BUILDERS and CONTRACTORS.

WANTED, a RE-ENGAGEMENT, as

GENERAL FOREMAN or FOREMAN of BRICKLAYERS, or would take PAPER, and Joiner by trade. Well up in setting out work and superintending the country. Several years' testimonials from last employer.—Address, H. H. Post-office, High-street, Croydon.

TO BUILDERS, &c.

WANTED, a RE-ENGAGEMENT, as

GENERAL FOREMAN, and Joiner. Ten years' experience from one employer. References available.—Address, J. C. 3, Connaught-terrace, High-street, Kensington.

TO BUILDERS, DECORATORS, and CONTRACTORS.

WANTED, a RE-ENGAGEMENT, by a

competent BUILDER'S CLERK, well up in the routine of the Office, Book-keeping, and General Office work. Practically acquainted with all branches of the trade, been used to a jobbing business. Age 27. Good references.—Address, M. 44, Billings-road, Northgate-road, N.

WANTED, a permanent ENGAGEMENT,

by an experienced DRAUGHTSMAN and DESIGNER.—Address, A. B. care of Housinger, 3, Adam-street, Adelphi.

TO CIVIL ENGINEERS, &c.

WANTED, a permanent ENGAGEMENT

WANTED, EMPLOYMENT, by a first-

class GLAZIER and MARBLER. Piecework.—Address, A. C. 37, Wiles-road, Kentish-town, N.W.

TO BUILDERS and OTHERS.

WANTED, EMPLOYMENT, by a good

GRAINER and PAPERHANGER. Piecework or otherwise. Address, H. W. 1, Little George-street, Hampstead-road, N.W.

TO SMALL BUILDERS and OTHERS.

WANTED, EMPLOYMENT, by a Jobbing

Man, in the PAINTING, GLAZING, and PLUMBING line. Address, G. W. K. Millfield House, Edinburg.

TO GLASS MERCHANTS, &c.

WANTED, an ENGAGEMENT in a

leading firm.—Address, care of H. C. 51, City-road, London, E.C.

TO ARCHITECTS and STEVEYERS.

WANTED, an ENGAGEMENT in London,

by a fair DRAUGHTSMAN, who is well up in quantities and all branches of the profession.—Address, No. 34, Office of "The Builder."

TO ARCHITECTS and STEVEYERS.

WANTED, an ENGAGEMENT, by a

GENERAL ASSISTANT. A good draughtsman and land surveyor. Ten years in one situation. Salary moderate.—Address, C. 41, Hill-street, Fencham, E.E.

TO BUILDERS, &c.

WANTED, by a first-rate CLERK, of

eleven years' experience, in West-end and country offices, a RE-ENGAGEMENT. Is a keen observer and FOREMAN up in estimating, measuring, and accounts. Has testimonials and references.—Address, 229, Office of "The Builder."

TO ARCHITECTS.

WANTED, by the Advertiser, a SITU-

ATION as JUNIOR ASSISTANT.—Address, T. C. 2, King-street West, Finsbury, Smith.

TO ARCHITECTS and STEVEYERS.

WANTED, by the Advertiser, aged 19, an

ENGAGEMENT in the Office of the above (four years' experience under articles.—Address, W. WOODING, Estate Agent and Valuer, No. 20, Bethnal-green-road, London, E.

TO BUILDERS and CONTRACTORS.

WANTED, by the Advertiser, a RE-

ENGAGEMENT as CLERK, or otherwise. Well up in book-keeping, prime cost, and general office routine. Aged 27. Good references.—Address, A. A. SPENCER, 10, Abchurch-lane, S.W.

TO CONTRACTORS and BUILDERS.

WANTED, by the Advertiser, a RE-EN-

AGEMENT as CLERK or CASHIER. Thoroughly conversant with the duties of a Clerk and FOREMAN up in estimating works, and levelling. Town or country.—Aged 25. Good references.—Address, 228, Office of "The Builder."

TO BUILDERS and CONTRACTORS.

WANTED, by a practical Man, a SITU-

ATION as GENERAL FOREMAN or CHARGE of a JOB. Is well up in all branches, setting out, and management of men. CARPENTER. No objection to the country.—Address, No. 19, Office of "The Builder."

WANTED, by a practical and energetic

and energetic Man, a SITUATION as WORKING FOREMAN of CARPENTERS and JOINERS, or CARPENTER and JOINER on an ESTATE, or any place of Trust. No objection to take a General Foreman's place in a City town or country. Can give good references.—Address, D. H. H. Mr. Morgan, Bookeller, Anglin-street, Worcester.

WANTED, by a thoroughly practical Man,

a RE-ENGAGEMENT as GENERAL FOREMAN of CARPENTERS and JOINERS, or country, or in any situation. Fifteen years' experience. Good references.—Address, F. S. No. 3, Duke-street, West Smithfield, E.C.

WANTED, by a thoroughly efficient CLERK

of WORKS, an ENGAGEMENT as above, or to superintend all descriptions of building operations, in the care of Mrs. HEALLEN, 54, Northampton-square, Hyde Park, London, W.

WANTED, by a thoroughly practical Man,

a RE-ENGAGEMENT as SHOP FOREMAN. Joiner by trade. Well up in setting out work and superintending men. Accustomed to all kinds of machinery.—Address, T. R. 30, Sussex-street, Warwick-square, Finsbury, S.W.

TO BUILDERS and CONTRACTORS.

WANTED, by a thoroughly practical and

energetic Man, a RE-ENGAGEMENT as GENERAL FOREMAN or CHARGE of a JOB. Thoroughly conversant with setting out or measuring up any description of work, and good management of workmen. Carpenter and Joiner. Aged 25. Reference from present employer.—Address, S. P. Post Office, Ashford, Middlesex.

TO BUILDERS.

WANTED, by a thoroughly practical

middle-aged man, of great experience and energy, an EN- GAGEMENT as OUT-DOOR FOREMAN. Carpenter and Joiner by trade. Well up in setting out, and management of men and materials. Good references.—Address, H. G. 3, St. Mark-street, Clapham, S.W.

TO DECORATORS, &c.

WANTED, by a steady, middle-aged Man,

a SITUATION, or PIECEWORK. Is a first-class Paper hanger, and would be found very useful as a Decorator's Shop, having a thorough knowledge of the business.—Address, No. 90, Office of "The Builder."

WANTED, by a Young Man, aged 25

(Joiner by trade), a SITUATION in a Builder's Office. Through knowledge of drawing, and setting out, and being a very good draughtsman. Good references.—Address, H. C. 15, University-street, Tottenham-court-road.

WANTED, by a Young Man, a CONSTANT

SITUATION as PAINTER, GRAINER, and PAPER- HANGER; used to FINISHING WORK. Country preferred. Wages moderate, if constant.—Address, J. PAUL, 7, St. Andrew's-road, Roper-street, E.C.

TO MASTER BUILDERS and PLUMBERS.

WANTED, by a Young Man, a CONSTANT

SITUATION as PLUMBER, or on a Job. Can do plain fine work. Would make himself useful in other branches if required. Address, G. L. 2, Bliven-road, near the Junction, Edinburg.

WANTED, by a PLUMBER, or THREE-

TO PLUMBERS, GASFITTERS, &c.

WANTED, by a respectable Young Man, a

SITUATION as IMPROVER or LABORER, as above. Town or country. State Wages.—Address, S. L. Post-office, Upper Tottenham, N.

TO ARCHITECTS and SURVEYORS.

WANTED, by an ASSISTANT, aged 21, an

ENGAGEMENT, in a London Office. Is a neat draughts- man. Salary, 100 a quarter.—Address, G. H. 115, London Wall, E. C.

TO ARCHITECTS, &c.

WANTED, by an ASSISTANT, a RE-EN-

AGEMENT. Can prepare drawings from rough sketches, and gas fitting and plumbing work. Terms moderate.—Address, A. B. THORNBOROUGH, Lower Aldersburgh-road, Croydon, S.

TO ARCHITECTS and SURVEYORS.

THE Advertiser of three years' experience,

is desirous of obtaining a SITUATION in short Office. Next best to an Architect, or Surveyor, and qualified. Good references.—Address, H. K. 3, College-avenue, Hockney, N.E.

TO ARCHITECTS.

THE Advertiser, of thirty years' experience

in both countries, wishes for a Permanent ENGAGEMENT in the country. Would like the management of an office, or some portion of trust. Good references, and quotations. Practical class references. A view to partnership desirable.—Address, 82, Office of "The Builder."

TO BUILDERS and DECORATORS.

SITUATION WANTED, as a GRAINER, PAPERHANGER, &c. Country preferred.—Address, J. B. E. Salisbury-street, New North-road.

STAIRS and HANDRAILING WANTED

by THOS. BYER, 5, Branksome-road, Acre-lane, Britton, S.

PLUMBER (Good).—WANTED, a SITU-

ATION. The Advertiser is above. Can do gas-fitting and sink-work (plumbing and plain iron work). Terms moderate. If required, Balling-green, W.

TO ARCHITECTS.

QUANTITY-TAKER and MEASURER, or

ASSISTANT, and a RE-ENGAGEMENT, by a REPUTABLE SURVEYOR, 25, Thornton-street, Brickton-road, S.W.

TO ARCHITECTS and DECORATORS.

OCCASIONAL ASSISTANCE required in an

Office.—Address, stating terms, to ARCHITECT, care of Mr. Fox, Stationer, 56, Coleman-street, E.C.

TO BUILDERS and CONTRACTORS.

CORNER and MARBLER WANTED,

by the Advertiser, a Constant SITUATION in Town or Country. Willing to fill up time in painting.—Address, J. C. 140, Regent-street, West, near Currier's, S.W.

TO BUILDERS and PLUMBERS.

EMPLOYMENT WANTED, by a good

PLUMBER. Well up in all branches, and can do hot-water and gas fitting and plain iron work. Good references. If required, Address, J. B. Plumber, 42, Doughty-hill, Cannon-street, City.

CLERK of WORKS.—WANTED, a RE-

ENGAGEMENT, by a practical Man. Good testimonials and references.—Address, No. 61, Office of "The Builder."

A QUANTITY SURVEYOR, of great

experience in both Engineering and Architectural Work, would be happy to PREPARE DRAWINGS, SPECIFICATIONS, or BILLS of QUANTITIES for the Public, or for private Gentlemen.—Address, HENRY BOSTON, 28, Russel-street, Bloomsbury, W. C.

TO CIVIL ENGINEERS, ARCHITECTS, or BUILDERS.

A GENTLEMAN, lately engaged on Railway

works, and knowing perfectly well the Construction of Buildings on Railway Works, wishes to find a SITUATION as DRAUGHTSMAN, or otherwise. Can give the highest references. Salary not so much obtained for PROSPECTIVE advantages.—Address, A. F. 13, No. 50, Manor-street, Clapham.

TO CIVIL ENGINEERS, CONTRACTORS, &c.

A GENTLEMAN (24) who has been en-

gaged for the last eight years in the construction of large works and other works, desires an ENGAGEMENT under an engineer or other works, where he may be able to prepare quantities, estimates, and tend work, erection of large buildings, and the most modern principles of sanitary engineering. Quick and accurate surveyor and level, and all practical business, and in proper quantities, estimates, &c. Excellent references.—Address, 42, Office of "The Builder."

TO ARCHITECTS, BUILDERS, and OTHERS.

A SUPERIOR SURVEYOR of fifteen

years' practice in the metropolis, OFFERS his SERVICES on moderate remuneration and terms as a QUANTITY SURVEYOR and ARCHITECT.—Address, R. 10, Trinity-square, Finsbury, S.W.

TO ARCHITECTS.

A GOOD JUNIOR ASSISTANT requires

an ENGAGEMENT.—Address, A. Z. 39, Finsbury-street, Gray's-inn-road.

TO ARCHITECTS.

A GOOD DRAUGHTSMAN, having had

four years' experience, seeks an ENGAGEMENT. Country not objected to. Highest references.—F. W. K. 13, Holborn-street, Chelsea, S.W.

TO ARCHITECTS, SURVEYORS, and ENGINEERS.

A GOOD DRAUGHTSMAN, well versed

in building, practically OFFERS his SERVICES in Town, at a moderate salary.—Address, A. 106, Chesham-road, Notting-hill, W.

A PERSON of very great experience in the

Building, who is just completing a good contract, for a contractor, OFFERS his SERVICES to a respectable Firm in the capacity of MANAGER or otherwise, at a moderate remuneration.—Address, A. B. 53, Marlborough-street, Bedford.

TO GASFITTERS, &c.

A YOUNG MAN, aged 20, wishes for an

ENGAGEMENT, where he can improve himself. Wages no object.—Address, F. 21, 21, Tottenham-court-road.

The Builder.

VOL. XXX.—No. 1524.

Pressure on Foundations, and Strength of Materials.

For late years, the methods of forming foundations mentioned in our last,* have been generally superseded by that of sinking into the bed of the river long upright cylinders, formed of rings of iron plates bolted together, by which means much greater depths of foundation can be attained at (in most cases) a mere fraction of the cost required for the expensive system of coffer-dams. These cylinders are usually sunk in the following manner. A frame or stage

of timber piles is first erected around the head of the cylinder, and a sufficient length of cylinder is then lowered from a platform on top of the stage, to rest on the head of the river. The cylinder is kept in its precise position, as well as kept truly upright, by cross-embers laid horizontally from pile to pile of the stage, at two or three different levels above the water-surface, which prevent all lateral movement in the cylinder, though they do not impede its vertical descent. The soil is then excavated from the interior of the cylinder, either by workmen in diving-dresses or by machinery specially provided for the purpose; and the cylinder itself is weighted heavily by "rings" of iron or other convenient loading being placed temporarily around its inner circumference. The result of this operation is, that as the soil is removed from the inside of the cylinder, its lower edge forces or cuts its way downwards from the influence of the heavy loading, and the cylinder gradually descends through the soil till the required depth is reached. As this takes place, fresh rings of iron plates are added on the top, so that the upper portion of the cylinder is always kept above water, and is retained by the timber guides above mentioned in a vertical position. The outer surface of the cylinder, which is in contact with the guides and with the soil below, is dressed to present always a smooth surface; and the flanges or projections by which the several rings are bolted together are kept on the inside of the cylinder, and serve also the double purpose of carrying the pig-iron loading for assisting the sinking of the cylinder.

By this method cylinders have been carried down to 100 ft. below water-level, and to even greater depths occasionally; and the cases are comparatively rare where a solid bottom cannot be reached.

It is then usual to fill the cylinders with concrete, made of hydraulic lime or cement, and to render them suitable for supporting the superstructure of the bridge. In some cases the upper rings of the cylinders above the level of the lowest water are removed, and the portion of the pier above that level is built up in masonry,

so as to present the appearance above water of an ordinary brick or stone pier.

The pressure on the foundations in this case is evidently caused not only by the weight of the superstructure, but by that of the cylinder itself, and of the concrete which fills it. When the depth of the cylinder is considerable, the weight of the concrete makes so large an addition to the pressure on the foundations, that it is frequently very difficult to so apportion the size of the cylinder that the area of ground on which it rests shall have sufficient bearing-power for sustaining the load which it has to carry. In such a case every contrivance is used to lighten this pressure, both by diminishing the size of the cylinder above the river-bed, and by making the superstructure as light as is consistent with stability. The friction of the soil on the sides of the cylinder (especially in the case of clay, which has a tendency to swell when cut into), is also useful in aiding to prevent the cylinder from sinking further when the weight of the superstructure comes upon it.

It is also generally found that ordinary soils will bear more weight at great depths than nearer to the surface. This is mainly owing to their becoming more condensed from the superincumbent weight; and also (especially in clay soils), to the increased difficulty of displacing laterally the soil under pressure. This may be understood by considering the action of an ordinary pointed pile, which, as it is driven into the ground, displaces the original material which is forced outwards or sideways, and renders the soil more condensed in its immediate vicinity. A somewhat similar effect takes place in clay under the pressure of superincumbent weight, which causes the soil to yield or ooze away sideways in consequence; and this movement is found to take place with less facility at great depths. An example of this is found in the railway bridge over the Thames at Charing-cross, the pier cylinders of which are stated to exert a pressure of 8 tons to the square foot on their foundations on the London clay; a pressure to which the same soil could not be exposed at a less depth from the surface without causing some risk of undue subsidence.

When sand of good quality, however, is protected from being washed away by running water or heavy rains, it forms an excellent foundation. It is firm and compact in its nature, and when in beds of sufficient thickness, it may be loaded in practice, with pressures of 6 to 8 tons per square foot with perfect safety.

Before proceeding farther, however, some practical considerations must be alluded to which modify the question of the amount of pressure which may safely be put upon a given soil.

Suppose, for instance, a solid block of masonry, 20 ft. square and 20 ft. high, and a thin wall of the same material, also 20 ft. high, were placed upon the same soil. On this supposition, the conditions both of soil and of pressure upon each square foot of the foundations would be alike in each case; and yet the thin wall, as regards the stability of its foundation, would be far less advantageously situated than the square block. A much slighter inequality in the bearing-power of the soil would disturb its equilibrium, or throw it out of the perpendicular; and it would also be more liable to damage from external causes affecting the ground on which it stood. Again, if the construction were a tall shaft or column instead of a wall, and therefore capable of being easily deflected sideways in any direction, these liabilities to injury would be still further increased. To place the two structures, therefore, on an equal standing, it is necessary to reduce considerably the pressure on the foundations of the weaker one; and this is generally done in practice. It is customary to extend the foundation courses of a wall or column to a considerable width beyond the face of the superstructure; and

various contrivances are used for effecting this purpose. The most usual of these is to extend the width of the foundation by means of footing courses, which, if properly constructed, have the effect not only of diminishing the pressure on the soil, but of otherwise increasing the stability of the structure, by augmenting the leverage with which the foundation resists the force of the wind or other external causes acting on the building above and tending to overturn it.

Where it is desirable from the weakness of the soil or otherwise, to extend the foundation still more than can be conveniently effected by footings, it is usual to place a layer of concrete of still greater width beneath the footings, or to prepare a foundation of timber piling or cross planking upon which the superstructure can be erected.

In this way it generally occurs in practice, that the foundations of thin walls on the weaker soils are compressed to about half the above-mentioned amounts only. But in the piers and abutments of bridges, and in other structures covering a large space in proportion to their height, the pressures indicated above may be generally adopted with security.

The rocky soils, which vary from the hardness of granite, to that of soft crumbling stone easily worn by exposure to the weather or to running water, may be considered in the same category of bearing-power as masonry itself, which will be subsequently treated of. In fact, it scarcely ever occurs in practice that such soils are loaded with the full amount of weight which they are capable of sustaining; the extent of base necessary for the stability of the structure being, in almost all cases, sufficient to ensure a sufficient area of foundation on rock and the harder soils.

The weight of the structure having been calculated, the pressure per square foot on the soil determined, and the area of the foundations deduced therefrom as above described; the base of the structure must be extended, either by footings, concrete, or otherwise, so as to cover that area and transmit the pressure equally and uniformly over it.

Great care is of course required when sudden changes or variations in the soil take place, to ensure that the settlement of the structure, if any occur, shall be uniform over its whole extent.

It now remains to consider the pressures which may be safely adopted on the materials themselves used in foundations, as distinguished from the soil on which they rest.

Good ordinary brickwork will crush with a load of about thirty tons, and may be loaded safely in practice up to ten tons per square foot. Brickwork of the best description, set in Portland cement, can be loaded in practice with double this quantity, although this should be considered an extreme amount; and it is more advisable to keep well within it, especially in thin walls and columns, which are liable to deflection under such heavy pressures; the latter cause of failure being quite independent of the inherent resistance of the material to crushing weights.

The limit of load which should be put upon stonework depends upon the nature and quality of the workmanship as well as upon the hardness of the stone itself. Thus, rubble walls with thick and irregular joints of mortar are weaker than even inferior brickwork for the support of heavy superincumbent weights, while well-headed ashlar masonry will bear loading to an immense extent. In general, from eight to thirty tons per square foot may be taken as the practical limits of such loading; but so much depends in each case on the quality of the materials and workmanship, that it is impossible to specify more precisely what limit should be adopted in each case, which must be left in a great degree to the judgment of the constructor.

The bearing-powers of concrete may be taken at from six to twenty tons per square foot

* See p. 277, ante.

according to the goodness of the materials of which it is composed, and the proportions of lime or cement used in mixing it.

The bearing-power of timber piles is an important feature in foundations, and varies according to the nature of the soil and the size and length of pile driven. The more ordinary application of piles is to drive them through a loose or weak material to a firm stratum underlying it; in which case they may be considered as columns or pillars supporting the superstructure, and stayed or steadied along their length by the contact of the soil through which they are driven. In this case, and under ordinary circumstances, long piles of whole timber driven to the usual extent (as, for instance, that a ton hammer with a 15-ft. fall should not drive the pile more than a quarter of an inch), may be trusted to carry a load of from ten to fifteen tons. Where the soil is very loose or fluid, however, this load should be diminished; as such a soil affords insufficient lateral support to the length of the pile, and allows it to deflect sideways, which materially diminishes its strength. In this case, a greater number of piles is generally used, which has the double advantage of both condensing the soil and of diminishing the loading upon each pile.

Piling is also frequently used in semifluid soils of great depth, where no firm bottom stratum is attainable. In Holland this takes place to a great extent, the large houses in that country being universally built upon a foundation of this description. In the swampy lands of America also, the same foundation is in very general use for engineering works. The bearing-power of the piles in this case consists mainly of the friction or adhesion of the soil to their surface, and this amount varies greatly, according to the nature of the soil. In fine sand, which is a very adhesive material, it has been found by experiment to be fully one ton per superficial foot of the pile surface (the piles being long and fully driven); but this amount of resistance is seldom attained. The load which piles in this condition will sustain may be ascertained with facility by using one of the undriven piles as a horizontal lever to withdraw a pile already driven; the lever having, of course, its short arm attached by a chain to the pile which is to be drawn, and its long arm loaded; the measure of the weight required to draw it will be of course the friction of the ground upon the surface of the pile. The pile should not be loaded in practice, however, with more than one-sixth of the weight sufficient to draw it, when the soil is throughout of a weak and fluid character.

When foundations of planking are adopted (which, though liable to rapid decay in a dry situation or in one where the timber is wet and dry alternately, may be used with a tolerable amount of safety in wet soils), the planks are usually cut in short lengths and laid crossways to the wall; and tied longitudinally together by longitudinal planking under the superstructure, of the full width of the footing course. The longitudinal and cross planks are spiked together and are found to make an excellent foundation. Good timber may be loaded in this position up to eight or ten tons per square foot, and affords an excellent means for distributing the superincumbent pressure over a large surface, which is especially valuable in the case of the weaker soils.

The above remarks show the general principles upon which foundations can be laid with security in the cases most ordinarily occurring in practice. They are, however, necessarily subject to modification in the endless variety of circumstances met with by the practical architect and engineer in the exercise of their profession.

AS TO THE USE AND ABUSE OF ARCHITECTURAL ORNAMENT.

WHAT is "ornament," as used in reference to architectural design? Perhaps it may be defined broadly as including all features, and all treatment or arrangement of material, the introduction of which does not add to the real stability of the structure. But in ornament, as thus defined, there is an important subdivision; and we may recognise two main branches of architectural ornament, viz., that which has for its main object to emphasize and illustrate the functions of various parts of the construction, and which we may call constructive ornament; and, secondly, that which adds nothing to the constructive expression of the building, but is introduced merely to relieve the design, and give it

more interest for the eye, and which might be called (to borrow a phrase from the plasterers), "enrichment," or surface adornment. The value of these two classes of architectural ornament is very different, as also are the degree and manner in which they may respectively be employed with advantage; and perhaps a suggestion or two on these points may not be superfluous.

Constructive ornament, when truthful and expressive (and when it is not this it will fail to be recognised at all as ornament, can hardly be too generally admitted in a design; indeed, any important feature destitute of such treatment would give as a sense of bareness and incompleteness, a feeling that the architect had altogether fallen short in his duties. As a typical specimen of what is included under this head, perhaps nothing better could be mentioned than the two or three forms of the Greek column, with its striated or "fluted" shaft, its cap and base. The column being a feature for resisting vertical pressure, the strong vertical lines of the fluting, which add nothing to its strength, nevertheless, emphasize this object, giving sense so to speak, to what would otherwise be a nerveless rounded mass, and directing the eye to the vertical line of force in which the column acts. No large column can lose this feature in its design without losing some of its characteristic expression; and the frequent omission of it by the Romans is one of the many instances of their want of perception of the meaning and value of ornament in this description. Such vertical markings on a long Gothic shaft, on the other hand, would be a superfluity, the vertical tendency being sufficiently indicated by the proportions of the shaft, which does not require to have this tendency and expression further exaggerated. The abacus in its simple form is a purely constructive feature, but its ability to take the weight of the architrave and transmit it to the column is emphasized by the ovolo moulding of the Doric capital, which gathers the pressure of the abacus and concentrates it on the column. The lighter Corinthian capital is a less sincere feature in this respect, and, indeed, so far as the foliage which makes its chief glory is concerned, oversteps the line of constructive ornament and becomes enrichment, being, in fact, a forecast of the principle which ruled the Gothic architect; that of using constructive ornament not to emphasize resistance to weight, but to conceal the fact of there being any weight to be resisted. The Greek architect could not achieve this, for he had still the palpable dead weight of his architrave over the column; and in consequence the stability and unity of expression which characterised the Doric style were here weakened, and the Corinthian architect had to pay for the elegance of his foliated capital by the loss of the monumental grandeur belonging to the older and sterner style; no actual magnitude of scale sufficing to restore the grandeur of expression which this one feature had impaired.

An excellent instance of constructive ornament, again, is the use of rustication in masonry, where the junctions of the horizontal layers of masonry which form the wall are marked and emphasized to us to increase the appearance of stability and "bond" between the various parts which make up the mass. This very artifice, when applied to a column, becomes, on the contrary, in most cases a fault and a contradiction, giving a built up and disconnected appearance to a feature which is always best as a monolith, or in as few pieces as possible, and destroying the vertical expression of the column by a series of strongly marked horizontal divisions. The archi-volt of the Classic arch, the moulding of the Gothic arch, are equally examples of the true and correct employment of constructive ornament in emphasizing and giving strength to an important feature in the architectural design; and in some cases, as in the set-offs and drip of the Gothic buttress, we find the construction and design so identified that it is almost impossible to discriminate them, and the best form for expressing the functions of the feature becomes also the strongest and most sensible and durable method of constructing it.

It is most with regard to enrichment, however, that caution and judgment on the part of the designer are so necessary. Constructive ornament, being merely the treatment of features which are necessary portions of the building, so as to emphasize their constructive value, imposes its own limits on the architect, and cannot be extended too far without destroying its own object. But in regard to mere enrichment there is no such natural check on the designer, and the views, practical and theoretical, as to the extent

and manner in which this class of ornamentation may be used, are various indeed: "Where you can rest, there decorate," said a well-known critic on art and on some other things. A distinguished architect, the late Sir Charles Barry, on the other hand, left on record, in his handwriting on the wall as well as on paper, his opinion that a building could never be too much decorated, provided that all parts of it were treated with equal or proportionate richness. We are inclined to think this a dangerous maxim, and that the truth lies more near the former canon, when adequately interpreted. Surface enrichment of an elaborate description should not, as it seems to us, be applied to features which, like columns, are manifestly doing the heavy work of the construction; indeed, such features admit advantageously of no ornament except that before described, that which emphasizes and helps their constructive expression. Anything which is quite independent of this, tends to weaken the expression and character of the design, by obscuring the real function of the column,—that of supporting weight. In this view the Egyptian column, with its elaborate and varied painted ornament; the Hindoo, with its ragged outline and incrustation of irregular carving; many types of Renaissance columns, rusticated and wreathed, are alike mistakes in treatment. An exception to this rule may be, when the structure in which columns are employed is on a very small scale where lightness and piquant effect are mainly sought, and where the supports really have not much work to do: in such a case the expression sought may sometimes be very much assisted by enriching those portions which in a larger structure should be left plain. In decoration on a wall surface, the portions of the wall which form piers would naturally claim a plain and solid treatment, and surface decoration would be applied to spandrels and intermediate spaces where the principal mass of the structure did not press. It may be said, on Sir C. Barry's principle, that where the pier portions are decorated in a simpler manner, and the richer decoration reserved for the other portions of the surface, there is then no objection to a universal application of enrichment to all parts of the surface. There may be cases in which such treatment might be suitable, and, when carried out with great care and judgment, successful; but, as a rule, we believe architecture requires perfectly unadorned wall space, more or less, to give the necessary dignity of expression to a large building, and the full value to the portions which are decorated. We can scarcely believe that a building entirely encrusted with decoration can look otherwise than somewhat weak; and such a treatment is likely to defeat its own object, by confusing the eye of the spectator, and leaving him nothing sufficiently marked or definite to rest upon; besides obscuring and overlaying the architectural motive of the design. The Houses of Parliament themselves, however great a work in many respects, furnish, we cannot but think, an instance of over-decoration, leaving an effect of fritter on the eye; and we can feel little doubt that the river front, impressive as it is, would have been far more so had a certain amount of broad untouched wall space been left, to give massiveness to the whole, and greater value by contrast to the decoration of the rest. Internally too, where richness is more allowable and to be expected, this has been overdone. There is this to be said, too, about very extensive surface decoration, that in such a case both design and execution are likely, in a majority of instances, to suffer. In few cases can the architect have time to give for really considering and designing ornament enough to cover a building; in few cases either can money or time enough be spared to have it executed in a first-rate manner. A little original, effective, well-considered ornament, though the rest of the building be left plain, is surely better than a quantity of mere repetition of ornament for the sake of a certain richness of effect, which, after all, is by no means one of the highest aims or results in architectural design; and which, in fact, has a tendency to give to a building a semi-barbaric character, like that of the elaborately decorated Japanese cabinets we were referring to a few days ago.

A glance at the styles of architecture now recognised as the greatest seems to bear us out in this view. The Greek architecture certainly was not overdone with the enrichment; but what there was of the highest and most intellectual interest possible; being, in fact, nothing less than sculpture of the very noblest school. This, perhaps, hardly comes under the term "ornament," or "enrichment," except in

so far as it answers to our previous definition of this, as decoration applied independently of construction, to relieve and add interest to the building. But in the Mediaeval style we see the full force of the distinction drawn here. The early modern users of this style among us worshipped the panelling and fretwork of the fifteenth-century builders; but as our knowledge and appreciation of the works of the great age of building proceeded, we went back, chronologically, step by step, in our admiration, which is now, for the most part, centred, and rightly so, upon the earlier works of the earliest branch of the Pointed style. And we find here ornament, for the most part, very sparingly applied, but generally very effective in treatment and design, and only placed just where the eye seems to require a point of interest to attract it; a hand of carved ornament meeting the eye at the point which separates one style of the design from another, and coming out with a sparkle by contrast with the plain masses of masonry adjoining it. A single line of panelling or diaper over a broad expanse of unbroken wall will often have a most piquant effect, doubling the value of the wall as giving mass to the composition, doubling also its own value by the contrast. When we speak of enrichment, however, as ornament "independent of the construction," we mean this only in a qualified sense. The ornament must be so placed as to fall in with the main lines and sections of the construction, not to cross and contradict them; nor must it contradict, or appear as an excrescence on, the nature of construction employed. In masonry, for instance, a row of small panels, as remarked, along a single course of the masonry, is a legitimate treatment: it is, in fact, treating one course ornamentally (a suggestion which might be extensively adopted and improved upon); but to panel a stone wall over in panels independent of the courses is to ornament it in a manner which contradicts construction; which represents, in fact, the outer aspect of a form of construction only suited to another material. The use of carving, too, in its more elaborate forms needs to be very much checked; the object now, in many of our new buildings, seems to be to carve as much stone-vegetation over them as can possibly be had for the money, and many blocks of offices have nearly as much carving distributed over them as would have served a whole cathedral in the "Transitional" period. This is not only vulgarising what, rightly employed, is a very beautiful source of decoration, but in towns it is often practically the very worst kind of decoration to employ, as likely to be so quickly worn away and choked up, as to its edges and hollows, by the combined influence of soot and dust.

In fact, we would see architectural ornament suited to the material it is worked in, expressive of or harmonising with the construction, and only introduced where it will really be effective and add value and point to the design. To employ a little ornament according to these requisitions will be found, we think, to demand more time and thought on the part of the designer than at present is often bestowed on the incrustation of a whole façade, turned over to the devices of that amphibious person, the art-workman, who is too often allowed to do, after his own fashion, what should be the result of the care and thought of the architect himself.

AMALGAMATION OR STATE RAILWAYS.

RAILWAY amalgamations are not a novelty, although the subject is at present exciting an unusual degree of interest. For more than a score of years past the process of amalgamation by actual purchase or lease has been steadily progressing, and the great systems, as they are called, are composed of dozens of small, originally independent companies. The larger and more powerful company, like the Octopus, concerning the nature of which naturalists have of late been so much exercised, stretches out its tentacle, and for the smaller and weaker company there is no escape. Each fresh acquisition adds to the power of the railway Octopus, and increases the number of its tentacles; and we find accordingly that some single companies of the present day, if resolved into their primitive elements, would furnish a goodly roll of some dozens of titles of companies that came into existence with their own distinctive local designations, that are now merged in titles indicating extensive territories; as the London and North Western, at first Liverpool and Manchester,

London and Birmingham, joined by the Grand Junction; the Midland, the Great Northern, the Great Western, the South Western, the South Eastern, the North Eastern, &c., all of which had originally in their germs their restricted local titles. Many more railway amalgamations have been effected, "not with observation," but not the less really. The amalgamations now on foot, which have led to the appointment of a joint committee of members of the Houses of Lords and Commons, to inquire into the whole question of the policy of amalgamation, and, incidentally, into the desirability or otherwise of the acquisition of railways by the State, are of another character.

A few months since the railway amalgamations on a large scale, proposed by companies, were four in number. 1. The amalgamation of the Caledonian and the North British Companies, which for the last fifteen years have carried on a ruinous competition and intestine strife with each other. Of late friends of peace in the companies have urged the attempt to arrive at the terms that might be accepted by both as the basis of "a Parliamentary peace," either by an equitable division of competing traffic or by amalgamation. Certain terms were laid down and proposed; but, unhappily, acquiescence of the shareholders of both companies could not be obtained, negotiations were broken off, and the draft Bill consigned to the waste-paper basket. 2. The proposed amalgamation of the London and North-Western and the Lancashire and Yorkshire Companies that would together constitute a corporation of great wealth and power, the united capital amounting to 105,000,000. For this amalgamation there is a Bill before Parliament in the present session. 3. The proposed amalgamation of the Midland and the Glasgow and South-Western Companies, which would give a third continuous route between London and Scotland. For this amalgamation also there is a Bill before Parliament. 4. A Bill now before Parliament to authorise traffic arrangements between the Great Western, the London and South-Western, the Bristol and Exeter, and the South Devon Companies. Mr. Grierson, the general manager of the Great Western Company, in explaining the provisions of the Bill, stated that it was not in any sense an Amalgamation Bill. If will, if sanctioned, be for all practical purposes, as regards rates and charges, and as its provisions will affect the public, an Act amalgamating the companies having railways to the west of a line drawn from Worcester to Oxford, and from Oxford to Portsmouth. The four companies engage to procure the consent to the agreement of the smaller companies in Somerset, Devon, and Cornwall, and the arrangement is to be in perpetuity, subject only to such changes as the contracting parties may agree upon.

It seems surprising that there should be so much divergence of opinion among eminent railway officers, and among men of large experience, as to the policy of amalgamation, and the principles of railway management, as has been displayed in the evidence given before the joint committee presided over by Mr. Chichester Fortescue, president of the Board of Trade. Mr. Cawkwell, manager of the London and North-Western, was called in support of the Amalgamation Bill in which his company is concerned. He admitted that the public should have security in the event of amalgamation, and stated that they would have it in the competition that would still exist. As regarded running powers, it was impossible to give other companies running powers over their line between Liverpool and Manchester, as both the line and the stations were inadequate to accommodate their own traffic, although their stations in Liverpool had cost $\frac{1}{2}$ millions sterling.

Mr. Allport, general manager of the Midland Company, on the other hand, in supporting the Amalgamation Bill in which his company is interested, said that the Midland must oppose the proposed amalgamation of the London and North-Western and Lancashire and Yorkshire, unless the Midland had running powers conceded to them over the amalgamated lines. Mr. Allport expressed himself as favourable, in general terms, to amalgamation, but with the essential condition of running powers to other companies over amalgamated lines. Such running powers Mr. Cawkwell showed to be impracticable, and the railways in and near London furnish many similar illustrations. Running powers to "foreign" companies over such lines as the Charing Cross, the Metropolitan, the North London, and the metropolitan extensions of other companies could never be more than a name.

A large number of witnesses have been, or are ready to be, examined in opposition to the proposed amalgamations. The opposition has been, in some instances, more nominal than real; and witnesses that have come to hand have remained to bless: instead of opposing, they have approved of the proposal. From the conflicting opinions that have been expressed by the presidents of chambers of commerce, mayors, aldermen, and others, who have been examined, it is evident that these gentlemen have not agreed among themselves either as to the policy of railway amalgamation, or as to the principles of purchasing the railways, or as to the principles of railway management. It is certain that they have not come before the committee with any complete predetermined theory. On certain points there is agreement: that goods' rates, as well as passenger fares between stations should be published by the companies, and that the amount of fares should be printed upon passengers' tickets. On the subject of equal mileage rates there is no agreement. One witness urges that there should be equal charges for equal service over the whole of a railway system. Another witness declares that a rigid system of equal mileage rates would be unwise and impolitic; another pronounces such a system impracticable, inasmuch as there are many instances of more than one railway route between the same points, the one route longer than the other. An equal mileage rate would throw one of the lines out of use for traffic between the two places, unless the rates were reduced over the whole system of the Company owning the longer line. Again, liberal rates were frequently necessary to develop the resources, and to nurse into a state of prosperity, a new mineral or manufacturing district. This had been the case with the Cleveland Iron District. The Government authorities that ought to be appointed over railways, and their functions and powers, are other points on which the opinions of witnesses were widely divergent. One asks for a Board of Control and a Board of Arbitration; another for a Board of Appeal, but without power to determine a matter. One witness was of opinion that it would be of the utmost advantage to the public that the State should purchase the railways. Another witness deprecated the idea of Government taking over the railways, which could not be better managed than they are managed now.

Whatever may be the finding of the joint committee, it seems certain that a great change in railway affairs is impending, and that the tendency is towards concentration either by traffic arrangements, by amalgamation, or by the purchase of the railways by the State.

The time is opportune for recalling some past Acts of the legislature in relation to railways.

In 1844 an Act of Parliament was passed for the purpose of enabling Government to purchase, on certain specified terms, all railways in the United Kingdom from that time forward to be constructed. Under that Act, Government took power to purchase the railways that came under its operation at the end of twenty-one years, which expired in 1865, when five-sixths of the railways of the United Kingdom became subject to its provisions. Government had then the option of purchasing the railways, and a Royal Commission was appointed in the following year, 1866, to determine whether and, if any, what action was to be taken under the Act of 1844. The Commission was also to inquire, *inter alia*, into the economical question connected with our railway system; that is, the cost of conveyance on railways, and into the charges which are made by railway companies to the public. The Commission, consisting of divers "right entirely beloved," "right well beloved," and "trustworthy and well beloved" cousins and councillors, took a large amount of interesting and valuable evidence, but deterred, possibly, by the magnitude and gravity of the responsibility, did not recommend any very sweeping change in the railway system of the country. On the contrary, the Commissioners reported "that it is not expedient at present to subvert the policy which has hitherto been adopted of leaving the construction and management of railways to the enterprise of the people, under such conditions as Parliament may think fit to impose for the general welfare of the public." The Commission made numerous recommendations as to improvement in Private Bill legislation, conveyance of mails, interchange of traffic, conveyance of merchandise and minerals, &c. The Commissioners deprecated interference on the part of the Government with the freedom of those who have provided the capital to fix the rates and

charges at which they may perform their services to the public, and the Commissioners expressly say that it would not be expedient, even if it were practicable, to adopt any legislation which would abolish the freedom railway companies enjoy of charging what sums they deem expedient within their maximum rates when properly defined.

The Report of the Commission cannot be said to point in the direction of a State railway system; but the great amalgamations now proposed, and the certainty that, if these are sanctioned, they will lead to others, until the whole of the railways of Great Britain are consolidated into four or five great companies, will doubtless incite to renewed attention and fresh discussion of the subject. In connexion with this important topic there is a prevalent fallacy in the assumption that the purchase of railways by the State involves their management by the State. The one thing is not by any means a necessary corollary of the other. Provided that the public, the shareholders, and the Government are agreed, there is nothing to prevent the conversion of railway stock into a new species of Government stock; nor is there anything to prevent Government from leasing the working and management of the lines to competent men.

The proprietors of the telegraphs received a bonus of a few millions more than the value of their property; the proprietors of railways are well entitled to as liberal treatment. If the railways can be acquired by Government upon equitable terms, and the difficulties can be avoided of throwing immense power and patronage into the hands of Government, in connexion with the acquisition; if the management of railways can be retained, for the greater part, in present hands; it may scarcely be doubted that a homogeneous railway system might be worked in a manner to confer immense advantages on the community. Under such a system equal mileage rates would present no difficulties. The plethora of the rich and populous districts would be available for the nourishment of those that are poorer and more sparsely peopled. Experiments could be made unhesitatingly in the direction of reduction of fares and charges, and the important problem could be solved with absolute certainty as to the minimum rates and charges that would yield maximum profits.

The time may not be yet come, but it will come, when the prediction of a writer in the *Quarterly Review* nearly thirty years since will be realised:—"It is impossible not to see that the system is developing itself to such an extent, penetrating all districts, superseding all other communications, affecting every species of public and private interests, and acting as the life blood arteries of the empire, as to render it probable almost to certainty, that the time must come when this great public trust can no longer be left to the management of private companies scattered over the face of the country. In truth, it seems only a question of time; railways must be made subject to some unity of management, and through whatever intermediate process it may pass, that management must finally be vested in the Government of the country."

PUMPS AND DRINKING FOUNTAINS.

Our whole confraternity of working people have a good deal to do and to hear with. Their hours of labour are long, and their work, for the most part, monotonous and unremitting. It is very difficult, if not impossible, for any one who has not had a trial of it to realise to himself what it is to get out of a warm bed at five o'clock on a cold winter's morning to begin some dull, mechanical, and totally uninteresting work; to plod at it all day long, till the nine, or the ten, or the twelve hours are over and gone; and then to find your way to a cold, cheerless room, or, still worse, a dirty coffee-house, of the universal English type. We say it is impossible to realise all this till you have tried it. It is the working man's lot in almost an infinite number of cases; and, what is more, there is at the present moment no escape from it, or the like of it, but the dangerous "public-house,"—a perfect harbour of refuge to such by the side of the aforesaid British coffee-shop. To many, many thousands of single working men does this apply with painful force. Letting this pass, we want to say a word or two about water, *i.e.*, spring-water; common cistern water, as supplied by the water companies; and our public drinking-fountains?

In the first place, it is in the recollection of

most that not many years ago there was every here and there in London streets an old-fashioned pump, tall and gaunt enough, with convenient strong handle and iron ladle, from which the coolest and pleasantest of spring-water was to be had by the thirsty for the mere trouble of pumping for it, and as often as not without, for there seemed to be always ready and eager for the work of pumping some small mortar or other close by to pump for you. For the fault of some of those antiquated pumps, they have been either altogether removed or their strong handles are tightly chained to their strong bodies, so that pumping is impossible either to great or to little people. Science stepped in, and reported against them and their doings; and all of them, not those only in bad or suspicious places, were condemned. There was one, for instance, in the Regent's Park, far from impurities, and from which the water was always delightfully clear, and cool and pure to the taste; but it suffered with the rest of them. A not a little curious history would be that of the London pumps; even a list of them would be interesting to see. Some of them have been right down famous. There was and is "Aldgate Pump," a queer-looking monolithic stone structure it was in times of yore, but it had to make way for Sir William Tite's more architectural structure. But even that improvement, but a year or two back, was doomed to destruction, and now there is another "design," by we know not whom, with a small attempt at a scientific and improved way of holding up a pail or water-can. But the famous pump is still there, luckily. There is another pump not far from it, and it is worth noting, for it is almost hidden among the slaughter-houses, but wherein the water, we are bound to say, is as good and clear as water needs be; and for this simple and plain reason, that the well or source of the water is so far from the surface, where the pipes and drainage abound, that it does not suffer from either of them. Go through some 100 ft. or 200 ft. of sand, gravel, and closely-pressed earth and stones, and almost any amount of impurity is taken away from the water passing through it. It is simply a gigantic filter, and does its work thoroughly and completely, and beyond any power of imitation by any mere human contrivance, as may be sufficiently proved by a comparison between the water from a natural well, and the water as it comes to the Londoner from the scientific apparatus of the water companies. It would be difficult to instance a more useful public work than the "restoration" of a few of the old London pumps, deepening the wells from which they are supplied, so as to be beyond the reach of any contaminating influence. No water is like *spring* water, and from a natural well only it is to be got. There is another curious remnant of Old London water supply in the Strand, the well-known Roman Bath and Well, as it is called. It dates from the days of the Roman occupation, and is, indeed, a natural well of the purest and clearest water. It is a plungo bath, and the water is constantly changing. We will mention but one other of the London pumps, though we could name not a few which have given place to the mean little dribbling drinking-fountains, shut up half the year round, with their little stream of semi-warm bad-tasting water and dirty mouth-pieces. The one we refer to is a right celebrated one,—almost, if not quite, classical. We refer to the one in the Dean's-yard, Westminster. Quite a story might be told of this famous little pump, and its varied fortunes. Two or three years ago it was a most unpretending iron structure, without ornamental details of any sort or kind; but happily for those who lived near it, and for St. Peter's College, and the clerical surroundings, it was always ready with its hest of spring water. But alas! consequent on the startling fact of the great railway works then going on at the "Willesden Junction" of the North-Western Railway,—and nothing less did it take to upset this sturdy little hydraulic apparatus—it suddenly (who would have thought it?) ran dry, and there was no more water from it, spite of all the pumping. So much did this grieve those who lived near,—and well it might, for it was the only *protected* pump for miles round,—that the non-supply of the water formed the subject of the "prologue" to the Westminster Latin play of that year, and the learned public were informed in good scholastic Latin verso that the scholars sighed for water, and that their pump was dry! But science was not to be beaten; for now, though you cannot draw spring-water, you may pump up common cistern-water from a slate tank sunk some foot or two beneath the ground, supplied as in an ordinary

cistern, with the nearest company's water. The learned scholars still call it a well and a pump, though the pump is a superfluity and a sham, and the water is *not spring* water, nor from a well. What a pity it is that the Dean and Chapter do not here, in their snug and comfortable precincts, sink a little and comfortably deep, and bring up from below a real well of pure spring-water, always drinkable, constructing an open marble or stone tank, as well as a pump, if that, indeed, be necessary,—the water to be visible. Thus may they set a good example to the rest of London; for what an infinite advantage it would be to have water,—spring-water,—overflowing, fresh and clear, for the thirsty wayfarer. The common cistern-water, as supplied by the water companies, is hardly drinkable, so that few can avoid the public house, even if they wished it ever so much. And here we connect the subject with our opening observations.

Notwithstanding the many, many evils resulting as we know from intemperance in this country, it is not a little to be wondered at, considering the temptations, how very little there is, comparatively speaking, of downright "drunkenness." You may go through on a Saturday night, where everything is favourable, miles on miles of low East-end streets, look into every comfortably-warmed and lighted "house," and see absolutely nothing of the intemperance so often cited. And, at the same time, you would be compelled to ask, Where else are to be found the passing comforts of light, warmth, and drinkables? Not in the open streets, certainly; for in no city in the world are the streets so entirely empty of every kind and species of comfort and accommodation. There is, in truth, in this tight little island no *public life*, no open air and street life, such as there was in the great antique cities of days gone by, or such as is yet to be seen in Oriental cities. John Bull is as a home mortal, and it is his weakness as well as his strength that he lives and enjoys himself, after a fashion, in his own house, almost unconsciously that there is a street on the other side of his own street-door. But though he knows it not, there is; and there are those who almost literally live in them, night as well as day. It is a curious subject, well worth a little thought and a few words, but not now.

METROPOLITAN TRAMWAYS.

ON Monday last, the joint committee of the members of Lords and Commons met in one of the Lords' committee-rooms, to take evidence for a report on the reference committed to them. This reference, it may be remembered, embraces the points,—whether it is desirable to increase the number of tramways in the metropolis; whether limits should be fixed to the metropolitan tramway area; what such limits should be; under what authority tramways should be constructed and managed; through what streets or thoroughfares additional tramways, if any, should be authorised, and under what restrictions. The committee consists of Earl Beauchamp, the Earl of Longford, the Earl of Arkle, Viscount Eversley, and Lord Clinton; with the following members of the Lower House:—Mr. Selator-Booth, Sir Ed. Colebrooke, Mr. Arthur Peel (of the Board of Trade), and Messrs. Arthur Guest and James White. Viscount Eversley, late Speaker of the House of Commons, presided, and conducted the proceedings with his characteristic urbanity.

The witnesses examined at the sitting were Messrs. C. Hopkins, engineer, of the London Street Tramways Company; Mr. Rowbotham, manager of the South London Tramways; Mr. Sheldon, who has been extensively engaged in tramway promotion at home and abroad; and Mr. John Morris, of the firm of Ashurst, Morris, & Co. The most important evidence presented to the committee was eloquent and interesting, although silent; it consisted of a very large diagram, showing in distinctive colours, the tramways in the metropolitan district already constructed and opened, or authorised; the additional lines proposed, with which the promoters intend to persevere in the current session; and the additional lines that have been proposed, that they are ready to give up, if the joint committee, or the private Bill committees to which the projects may be referred, are so minded.

The authorised lines show, as yet, a very partial system of tramway accommodation to the metropolis. They are almost exclusively to the east of a line drawn north and south intersecting

Charing-cross, and afford communication to north, south, north-east, and south-east, on the proposed line, and from Charing-cross as a centre, but do not touch the populous districts to the north-west and south-west, excepting only some lines, inconsiderable in extent, in the neighbourhood of Camden-town, and an irregular triangular communication between Vauxhall and Lambeth Bridges and Victoria Station.

The chief thoroughfares now or to be traversed by the tramway-cars are,—on the south side, running mainly east and west, from Victoria Station across Vauxhall Bridge, west of Kennington, past the Oval, Camberwell, Peckham, Hatcham, New Cross, Deptford, and Greenwich, to Woolwich Arsenal. A loop is formed that passes from Victoria Station along Lambeth Bridge, and along Lambeth-road to Blackfriars-road, and along that road to the south end at Blackfriars Bridge. At the junction of Lambeth-road and Blackfriars-road another authorised tramway reaches to Westminster Bridge on the Surrey side. It may be here convenient to say that the extensions in this locality that are to be persevered with include a short length to pass along Westminster Bridge and along the Victoria Embankment to the end of Whitehall-place; the promoters being willing to surrender a short length to Whitehall.

Another short length in this locality that they propose to persevere with is a continuation of the tramway communication from Victoria Station to the end of Victoria-street, leaving there a short gap between the point indicated and Westminster Bridge.

Other important extensions to the South of London are from the Strand, along Waterloo Bridge and Waterloo-road, to the junction already referred to, from which the authorised lines will afford continuous communication with Clapham, Brixton, Camberwell, and from Camberwell with all the localities east and west of that point on the original Pimlico and Peckham and Greenwich lines. From New Cross a tramway is already authorised to Westminster Bridge, passing along the Old Kent-road, and past the Elephant and Castle. The additional links, however, requiring to be filled in are from along the Kennington Park-road, past the Elephant and Castle, to the end of Backman-street, Borough; and from a junction there a new line continuing the communication into the Old Kent-road. It is not proposed to traverse High-street, Borough by tramway, but it is designed to lay a line from Stamford-street, along Southwark-street, to the London Bridge station. The proposed line to cross London Bridge is also surrendered, and the line along Southwark-road and Southwark Bridge; and the authorised crossings by tramways over Thames bridges, it will thus be seen, are by Vauxhall and Lambeth, and the additional crossings for which powers are to be asked are by Westminster, Waterloo, and Blackfriars Bridges. The proposed surrenders on the Surrey side of the Thames, in addition to those already indicated, are from Battersea Park to Wandsworth-road, and along that road, by Kennington-lane, to Newington, with a fork from Vauxhall Station, along the Thames Embankment to Westminster Bridge.

In the City the chief surrenders are a proposed line from Holborn to Ludgate-circus; a line from Blackfriars Bridge, and along Queen Victoria-street, to the Mansion House, with another from Aldersgate, *via* St. Martin's-le-Grand, to the east end of St. Paul's; thence along Cannon-street to King William-street; and the continuation from Moorgate-street, past the Bank of England, and along King William-street, intended to have been continued along London Bridge, is also given up.

Turning now to the tramways proposed or relinquished in the north and west, it would appear that the great area bounded by Paddington, Marylebone-road, Tottenham Court-road, Holborn, and New Bridge-street, Blackfriars, with the Thames for its southern boundary, is, for the present, to be left untraversed by tramways. The lines surrendered in this area include one from Kennington, *via* High-street and Knightsbridge, to Hyde Park Corner, and another from Notting-hill, Uxbridge-road, and Oxford-street, to the junction of that street with Tottenham-court-road. It is also proposed to give up proposed lines between Camden-town, and two short lengths, one from the Marble Arch along part of Edgware-road, the other from Praed-street into the Uxbridge-road.

The new lines in the north and north-west, for which powers are to be asked, are very important, and include,—Holborn, Oxford-street (as

far as Tottenham-court-road), Tottenham-court-road, Harrow-road, Edgware-road, Finchley-road, Caledonian-road, and King's-cross-road; with a connexion east and west between Islington and Bayswater, by the Pentonville, Easton, and Marylebone roads. The proposed lines are intended to join up numerous defective links in the metropolitan tramway system, and provide continuous tramway communication from Upper Holloway on the north to Camberwell, Brixton, Clapham, and numerous other localities in the south, with "correspondence" lines radiating in almost all directions, excepting to the west.

The Committee, at its rising, adjourned to Friday, the 19th instant.

HINDRANCES TO THE PROGRESS OF APPLIED ART.

In the course of a paper under this title read at the Society of Arts, Dr. Dresser said.—One of the chief hindrances to the advancement of decorative art is to be found in designers themselves, for there are many pattern-drawers who are a disgrace to the profession, inasmuch as the works which they produce manifest only gross ignorance, and are, therefore, altogether unworthy of notice. Of these I will not speak, but I desire that they should understand that whatever is produced which is of debasing character tends to the extermination of decorative art, for who would not prefer a plain article to one covered with graceless forms and inharmonious colours?

Passing from these men, to whom the name of "artist" cannot be applied, to those designers who have a certain amount of art-ability, we notice that the works produced by these latter are often inconvenient to use while they are beautiful in form, and are thus of a character calculated to bring art into disrepute. An art object should be useful as well as beautiful, if it is intended to fulfil a utilitarian purpose; yet not one poker out of a hundred is so formed that it can be used with comfort, nor is one tea-pot out of fifty so made that it will admit of the tea being poured from it without an expenditure of force greater than is necessary in order to the support of the weight which has to be lifted. By leverage a pound may balance a hundred-weight, as in the steel-yard; so in the case of a tea-pot, by leverage that which weighs four pounds may be as heavy to lift as that which weighs eight. Although the law which regulates the placing of handle and spout on all vessels from which liquids are poured is thoroughly understood, yet it does not appear to be known to one designer in a hundred, judging from the vessels which we see offered for sale in our shops. In like manner, pokers have become so inconvenient to use that it is impossible to break coal or even poke the fire with one without hurting the hand; hence, ladies have begun to regard fire-irons as mere ornaments, and to keep a little second poker and tongs for use, which latter are hidden in some corner, as objects unfit to be seen. There is nothing which tends to retard the progress of applied art more than the production by designers of objects which are inconvenient to use; and he assured that the most perfect beauty may be combined with the most complete utility; in other words, that which is most beautiful may be perfectly useful. How is it, I ask, that designers will not inform themselves upon subjects which, to them, are all important, and without a knowledge of which they cannot produce acceptable works? I am often amazed at the ignorance of my fellow ornamentists upon subjects which they ought perfectly to understand; and yet many of these men can draw well, and combine forms in a truly artistic manner, but their works, through not being adapted to answer the end of their creation, only tend to bring the beautiful into disrepute, by leading persons to suppose that if a work is graceful and lovable it cannot be used with comfort.

Our worst enemies are those of our own household; so, in like manner, the worst enemies to the progress of applied art are ignorant designers. If we, as designers, will but educate ourselves, we shall thereby remove one of the chief hindrances that impede the progress of applied art.

It is a strange thing that to this hour the great majority of the designers, or pattern-drawers, employed in our manufactories are men almost wholly without education, and chiefly from comparatively low life. The son of a weaver in a carpet-works or lace-factory, if he manifests any taste for drawing, is put in the

designing-room and is trained to draw patterns; but as he is placed there at the age of from ten to twelve years, and is the son of parents who could not afford to have him educated beyond being taught to read and write, he has but little knowledge when he commences his art-training; and as, in the great majority of designing-rooms, he never sees a work on ornament, nor a good example of true art-work, he gains simply a technical knowledge of the manufacture, and acquires no insight into the character of true art. A man cannot help his origin, neither is he to be despised for being the child of poor parents; but if he remains in ignorance he cannot be expected to produce noble works, nor to exalt the manufacture which he strives to adorn with forms and colours. While a man is not to be blamed for being born of poor parents, he is open to censure if he does not strive to gain whatever knowledge is placed within his reach. Nearly every town in the Kingdom has now its drawing-school, where a certain amount of art-knowledge may be gained, and connected with these schools there are frequently art-libraries. That youth who is worthy to be called an art-student will avail himself of whatever means are open to him, and even if he be employed for long hours in the factory, he will strive by reading, sketching, and, beyond all things, by thinking; and by the study of nature, to gain such knowledge as will lead him to draw patterns such as will please persons of education, by revealing to them the fact that he who addresses himself to them through the agency of form and colour is also a man of education.

If it is any consolation to you, my fellow-students of applied art, let me say that I, with you, have felt the want of education, and have known the poverty of small means, but by foregoing for a time the pleasures which others enjoyed, and by continued close application to the study of our beloved art, I gained the victory over that poverty, and that niter want of education under which I for a time suffered; and now I can say that I sit at the tables of rich men, and that men of learning honour my table with their presence. I would not for a moment say what I do were it not for the thought that these words may encourage some poor student to work on till he rises through his poverty to that position in which he can present his works fairly before our notice, and charm us with his knowledge.

Certain manufacturers may truly be regarded as hindrances to art progress. Some men are honourable, others are dishonourable; some men are noble, others are ignoble; some men are pioneers of progress, others retard all onward movements. It is curious that there are many men who would not rob another of a farthing, and yet who eagerly look for every new pattern which more honourable manufacturers than themselves produce, with the view of copying them if they be good and are not protected by registration, or of producing others as nearly like them as they can if they be registered. Such men I regard as not only hindrances to the progress of art (for who likes paying a high price for a well-considered design if immediately it is issued others copy the idea, if not the actual design, and by saving the cost of the pattern are enabled to undersell the original producer?), but as nothing more nor less than thieves, who should be engaged on the tread-wheel with others of their kind. This detestable piracy of new patterns, which is constantly carried on by those who are truly little men, is one of the great hindrances to art progress. Did it ever strike these detestable rogues, I wonder, that by every piracy they commit they not only degrade themselves but exalt both the manufacturer and the designer of the pattern which is stolen? The very theft acknowledges the want of power to produce what is of equal merit. To those noble men who continue to produce what is new and what is beautiful, while they constantly suffer from theft, I would say,—Persevere, for the tribute which the mean pay to your nobleness and enterprise is sufficient in itself to build up in time your worthy reputation.

Much has been said respecting the unwillingness of manufacturers to issue designs of an art character, and to pay such prices for patterns as will fairly compensate the designer for producing a carefully-considered work. I have had as much to do with manufacturers, I think, as most artists, and perhaps more, and I am bound to say that I have found most of them both willing to try new things and to pay handsomely for well-considered designs; but as the object of

business is, in a sense, money-making, the manufacturer cannot be expected to produce many patterns such as will not sell when placed on the manufactured article. Some men I could name who nobly contribute towards the education of the people by yearly producing a few works in good art which do not command a large sale, owing to their being too advanced for the public taste; but these men are few in number, yet they do exist amongst us. However, with the exception of a few mean hounds, such as we find in every class of society, I exonerate manufacturers from the charge of being hindrances to the progress of a true decorative art.

The public, in some instances, impedes the progress of art. The public is of two classes,—the educated and the uneducated. The educated, in many instances, seek better art than is to be found on the goods procurable at most of our shops; but the utterly ignorant, having no art knowledge, are pleased with whatever is "loud" and showy. These latter undoubtedly retard the progress of art, as some manufacturers will cater for the patronage of the most vulgar; but this hindrance will disappear with the increase of art knowledge.

Whatever is bad in art tends to vitiate taste. If a person whose taste is highly cultivated, and who is sensitive to every deformity both in colour and form, is obliged to contemplate what is ugly, he, after a time ceases to feel the hideousness of what he views; thus, if he takes his abode by the sea-side, and the walls of the room in which he sits are covered by a hideous paper, and the floor by an obtrusive carpet, and if every piece of furniture is uncomely, and every so-called ornament in the room a mere offence to good taste, however repulsive all this may be when first seen, it will become less and less offensive as he dwells upon it, until finally it ceases to impress the sense as that which is uncomely at all; and in order that its true nature be understood the judgment has to be appealed to: thus the sense which leads us to discriminate between the beautiful and the uncomely becomes deadened. This leads us to perceive the necessity for surrounding ourselves with beautiful objects, if we would keep alive within us a quick perception of the beautiful, and to see that whatever is presented before us which is beautiful tends to exalt our taste and sharpen our perception of the beautiful. But we also perceive that whatever around us is not excellent tends to degrade our taste and to deaden our perception of the refined and graceful. This brings me to consider the effect which museum objects have upon the taste of the country.

The Chairman (Sir Digby Wyatt), at the close of a discussion which followed the reading of the paper, said success in certain technical directions was of the utmost consequence, and, to a great extent, the museums which had been most useful in foreign countries in instructing the workmen, were those in which elegance of design was the first consideration, and the illustration of the historical arts of the country the second. He was far from desiring to see an academy for applied design in one place, and one for imitative design in another. The proper thing would be to amalgamate the two, and make one great central institute, and then some good might be done. He should like to see more attention paid to applied art in the Royal Academy, and considered it a disgrace that Mr. Owen Jones was not an associate of it. With regard to schools, it must be remembered that the first essential was to teach a person to see with his eyes, and to work or imitate with his hands,—to make those two organs so tractable that the student might, in the first place, so distinguish tints as to imitate colours accurately. Until he had learned the whole gamut of colour he could not produce a pattern or design, however clever he might be. The reason why, as Dr. Dresser had said, students from South Kensington were not found to be of much use in designing-rooms in manufactories was, that the student becoming learned, imitative art went where it was not required. A manufacturer might send for a student, thinking he would be a treasure, and find when he came that he could not design the branch of manufacture which he wanted, though no doubt he could do something else very well. In truth, he wanted that practical element in education which should really be the life's labour of every man. The common error with regard to education was to suppose that, having been taught up to the age of twenty, we are then to cease learning, and only practise what we know. Education was then in reality only beginning. When a student had been thoroughly taught form and colour, and

was then set to master the practical requirements which he had to meet, he would become a much more valuable artist than one who had been simply dragged up, step by step, in the manufacturer's designing-room. Elementary knowledge and correct principles should be taught in schools, but the same results must not be expected from a youth as from a man with life-long experience.

LIVERPOOL WATER-COLOUR SOCIETY.

This society, at present, we believe, the only water-colour society in the provinces, has been formed with the laudable object of promoting and extending the taste for this branch of art in Liverpool and the neighbourhood. The promoters are chiefly local artists, and the inaugural Exhibition was opened on the 15th inst. The collection numbers somewhat over 200 drawings, among which are included contributions from eminent English water-colour artists,—Branwhite, Newton, Absolon, J. M. Jopling, and others; most of whom figure in the catalogue as "honorary members." With the exception of these works with well-known names (and they are not very numerous), the standard of merit is not high. Mr. R. T. Pritchett, a non-resident member, is an extensive contributor of drawings, all showing more or less ability, of which a little "Sunset on Esher Heath" is the best. Among local names challenging attention are those of Messrs. Bond, Norbury, and Sullivan; the works of the last-named being, however, more ambitious than successful. Mr. Clark Stanton, of Edinburgh (a name not familiar to us), contributes, among other things, a slightly finished drawing under the title "A Rest by the Way," a young lady resting on a bank by the roadside, which indicates, in colour and general treatment, no ordinary degree of refinement and artistic feeling.

While welcoming with pleasure all signs of a revival of art-interest in an important town where it has long been dormant, we cannot but regret the want of judgment shown in regard to the work admitted into this first exhibition of a new Society. A considerable proportion of the drawings hung are poor and commonplace to the last degree; some are solidly bad that they can only have been hung with a view to cover the walls. This is not the way to advance art. Better confine an exhibition to fifty drawings, and have those good, than cover the walls with productions which can only have a deteriorating influence (if any) on public taste. We hope the Society will manage these things better in future.

FALL OF IRON ROOF, SARATOGA SPRINGS, U.S.

SOME short time ago the roof of the new passenger depot at Saratoga Springs fell.

The roof was arched, of 30 ft. span, and made of corrugated iron, with wrought-iron tie-rods, five-eighths of an inch in diameter, and was supported by round columns, 4 in. diameter, 15 ft. distant from centres. On the inside of each column, about 5 ft. distant down from its top, was attached one end of a wrought-iron tie-rod, supporting the roof; and on the opposite side was a bracket, extending out 10 ft., whose bottom exerted a diagonal transverse strain in the same direction as the tie-rod. These brackets supported a roof, forming a shed over the gangway beyond the arched roof, making, with the 30 ft. span of roof, an entire width of 50 ft. Mr. P. H. Jackson, inspector of iron construction, New York, writes,—

I have been induced to go into a calculation of the strains on the weakest part of this man-trap, namely, the columns and tie-rods.

The weight of snow and ice upon the roof, in accordance with the leading authorities, is considered at 40 lb. per superficial foot as a maximum load in our climate. On the day of the falling of this structure, there had been a light fall of snow, and the ground was frozen. I question if the weight on the roof at the time exceeded 20 lb. per foot, as snow is ordinarily light. What causes it to become heavy is a subsequent fall of rain, then freezing, and snow again. Forty pounds per foot is considered a maximum load under the most unfavourable circumstances.

The column was 4 in. in diameter, and, say, 1 in. in thickness, and about 18 ft. long. Its proportion of vertical pressure would be the

weight coming upon half the roof of 30 ft. by 15 ft. distance from centre to centre of columns. Taking the weight of roof alone, exclusive of any contingent weight, at 12 lb. per foot, we have 32 lb. per foot for the weight of roof and load upon it.

The following is a summary of the strains on the column:—

Vertical pressure, weight of roof, 6.15 net tons; unnecessary transverse strain of tie to break the column across, 11 net tons; diagonal transverse strain at the bottom of the bracket, in the same direction as that exerted by the tie, 2½ net tons.

Taking these spindle columns, whose dimensions are about suitable for a summer-house or verandah, at a safe weight of one-fifth the breaking weight, when subject to a vertical load, and then only when the ends are at planes with their axes, we have the safe weight at 8½ tons. Noting less than one-fifth the breaking weight will do, as at one-fourth the breaking weight it was found, by experiment, that incipient crushing took place. This safe weight allows nothing for a lateral blow caused by merchandise falling, in transmission, against the column. For calculation should be made in accordance with the formula for strength of beams, as well as that for the columns.

In regard to the tie-rods, they were not nearly up to the standard required for safety; a ½-in. round rod is equal to about 3.10 lbs square inch of cross section. The working strain should not exceed the limit of its elasticity, which is about 8 tons per square inch. The Board of Trade of Great Britain permits, as a maximum working strain, but 5 gross tons per square inch of cross section. In this case, the tie-rods should have been at least 1½ in. in diameter to resist the thrust of the arch; and the columns 7 in. in diameter, and 1 in. thick, providing the tie-rod was not attached to it.

"UNDERGROUND JERUSALEM."

MR. WILLIAM SIMPSON, who has made himself known by many illustrations produced under difficulties, and especially by his pictures of India, Cashmere, and Russia, which he visited on the occasion of the marriage of the Princess Dagmar, has plunged into the cisterns, vaults, and drains opened by Captain Warren in Jerusalem, and has recorded, with faithful, and in most cases effective, brush, all that was to be seen. Many of these excavations have since been filled up again, thus making the drawings additionally valuable.

The Church of the Sisters of Zion, of which he gives a view, although not underground now, was so until very lately. The arch behind the altar was recently laid bare, and this is the first drawing of it since. One side of this church is formed by a wall of rock cut in past times; and underneath the convent are two tunnels, one of which is represented in the collection. They are of some importance, as bearing on the water supply of the Temple. The Tomb of Joseph of Arimathea, almost unknown, is given. The entrance to the Royal Quarries was only discovered a few years ago, and may be said to be entirely new as a subject for pictures.

The drawings are on view at 48, Pall-mall, and will reward a visit.

At the next meeting of the Society of Biblical Archaeology, Mr. Simpson is to read a paper on "Underground Jerusalem, more particularly the Plateau of the Haram es Sherief," when some interesting information will probably be added by members of that society.

HOSTILE OCCUPATION OF REGENT-STREET.

THE demon that presides over the local government of London seems to delight, not in evolving order out of chaos, but in blending the elements of order in inextricable confusion. The London season being at its height, the time has naturally been selected for the occupation of Regent-street by a hostile force of "navvies." We pause to describe the scene, now under our eyes. Trestles are placed in the very centre of the roadway; veritable barricades they prove, whatever might be their fate at Paris. Under shelter of this *l'été de pont*, a small gang of sturdy labourers proceeds to break up the surface of the road with pick-axes. New stones,

rudely broken into blocks of some eight to ten cubic inches each, are laid in a thick stratum along part of the street. Close by this stratum of destruction to horse and to carriage, one or two of the biggest "navvies" are, as we write, coolly scattering shovelfuls of stones that have once formed part of the "metal," scattering them with that peculiar sweep and fling of the arm by which the obnoxious missiles can be spread over the widest surface, and all thus rendered at once most useless and most dangerous. A horse-roller is at hand,—as if to make the mockery of the patient public more keen. After pausing to watch the whole process for some time, we came to the conclusion that it would be difficult to suggest any alteration of plan that could increase its danger, its costly wastefulness, or its cool insult to the public; or that could render the work of the road surveyor at once more inefficient and more expensive.

Where are the officers of the Society for Prevention of Cruelty to Animals? No owner of a fine horse can now ride or drive without imminent danger of laming the animal. No carriage can go along this main West-end thoroughfare without having at least a month's durability shaken out of its future existence. It is difficult to account for the procedure. Is it done with the idea, like regulations made in the time of James I., of keeping strangers out of London? Unless the most unfit time must be selected for re-metalling Regent-street, the operation could and should be effected between the hours of midnight and six in the morning, by an adequate force of men, who should strip, cover, and properly level a portion of the street at a time; consolidate it by the steam roller, leaving it perfectly fit for traffic; and disappear, like good people, before the London cockerow.

THE PENTATEUCH.

A COMMITTEE of Rabbis and doctors, at the request of the Society of Biblical Archaeology, have met at the Soane Museum, to examine the sacred roll of the Pentateuch sent over from Aden by Lieut. Prideman, and presented by him to the Society. Rabbi Hermann Adler; Rabbi and Professor Marks; Rabbi Schiller Sinsinsky; the Rev. George Small; Rev. Dr. Currey, Master of the Charterhouse; Itudus T. Pritchard; S. M. Drach; Joseph Bonomi, Curator of the Museum; and W. R. Cooper, Secretary of the Society, were present; and Professor Donaldson, Ph.D., as Secretary for Foreign Correspondence, and one of the trustees of the Soane Museum, was in the chair. The examination was very minute, and occupied to considerable time; and with the intelligent explanations of the Cambridge Professor of Hebrew, and the other Rabbis, brought to light many important peculiarities. The most ancient part dates from the tenth century. A full report will be read at the meeting of the Society on the 7th of May.

THE TRADES MOVEMENT.

Cambridge.—A deputation appointed by the building operatives has been received by the representatives of the Builders' Association. The chair was occupied by Mr. Bell; the other members of the Builders' Association being Messrs. A. Gray, T. Bradwell, Thoday, Kett, jun. (secretary), and Tompkins. The deputation from the building operatives consisted of Messrs. F. Bowick, J. H. Cooke, W. Cooke, Hyson, Loenes, W. Scott, and R. Riddle (secretary). The deputation said they wished to know whether the masters would accede to fifty-four hours, so as to employ the men summer and winter. They also wanted an increase of wage of 6d. a day. The average wages of the men in Cambridge were 21s. In other places, the men were receiving as much as 27s., 28s., 29s., and 30s. One of the deputations said that (as a labourer) he was receiving 15s., out of which he had to pay 8s. 4d. per week for board and four, 2s. 2d. per week for rent, and 1s. 2d. for 1 cwt. of coal; and he had eight months to feed. Some of the deputation complained that they were unable sufficiently to support themselves on their wages. Others wished for more time for recreation or amusement. On the part of the masters, it was remarked by the Chairman and Mr. Gray that the employers were perfectly willing to make an alteration if it could be done satisfactorily. They denied, however, that Cambridge was paying less than other places; on the contrary, the

chairman produced evidence to show that the wages were quite as high as in Huntingdon, St. Neot's, Diss, Bury St. Edmund's, Ely, Lynn, Norwich, or, in fact, anywhere in the Eastern or surrounding counties. After a long and desultory discussion, in which various points *pro* and *con.* were argued, the chairman said the matter would be laid before the Builders' Association, and the result duly reported to the operatives.

Sittingbourne.—About 100 brickmakers at Sittingbourne were engaged at 3s. 6d. per thousand, and lately the masters gave an advance of a penny. The gangs demanded 2d. more, which the masters conceded conditionally on the market remaining at its present height, and the men leaving 6d. in hand as "pence-money." This was refused, and the men have struck.

Dumfries.—The masons in the employment of Messrs. John Edgar & Son, Dumfries, have struck work. It appears that the firm had employed two plasterers, to point the interstices in the freestone courses in a range of dwellings they had contracted to erect. To employ plasterers at such work has hitherto been a common practice; but a meeting of the trade-union was held, at which it was resolved, that unless the plasterers were dismissed, Messrs. Edgar's workmen were to strike, and a deputation was appointed to wait on their employers. At breakfast-time next day the deputation saw Mr. Edgar, sen., who, on being told the object of the deputation, said that he had engaged the plasterers for the job, and was determined they should finish it, whether there was a strike or not, upon which the whole of the workmen left, but did not remove their tools.

Hawick.—Some time ago the journeymen connected with the building trades in Hawick,—masons, joiners, and plasterers, resolved to ask for the adoption of the fifty-one hours system, with an advance of 3d. per hour on wages, from the 8th of April. The present rates are,—masons, 6d.; joiners, 5 1/2d. per hour; and plasterers, 2 1/2s. per week. The master masons declined compliance with any of their demands, and no further action has followed. The master plasterers agreed to give 5 1/2d. per hour, and left it to the option of the men to work either nine or ten hours daily, after the 8th of April. The operative joiners have refused the offer of the masters to advance wages 3d. per hour, and another farthing on the 1st of June, with the option of working nine or ten hours, and resolved to stand out for their full demand of 3 1/2d. per hour advance. As the employers declined to concede these terms, a number of the men, but not all, struck work.

THE COVERED MARKET, PRESTON.

The Preston Covered Market question, to which we have already alluded, is, we regret to say, far from being settled. The new contractors, Messrs. Bennett & Co., of West Bromwich, engineers of good repute, have refused to proceed with the work, on the ground of radical defects in the design, which they allege preclude the possibility of a safe structure being erected from Mr. Garrick's plans. The Messrs. Bennett say that having investigated the principles of construction of the proposed roof of the Covered Market, they have discovered that "it is utterly impracticable to construct, with safety, a roof in accordance with the details shown on the plans;" and they speak of "certain fatal defects in the structure that render the safe construction of the roof impossible." The Markets Committee, as we have already mentioned, resolved to call upon Messrs. Bennett to execute their contract, and the Council has now confirmed the resolution of the committee. The contractors urge the Council to refer the plans to some disinterested engineer of high standing.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

On the 6th inst., the members and friends of this Society paid a visit to the works of the Native Guano Company (by permission of the directors), situated within the grounds of the Crossness Pumping-station of the Southern Main Drainage system.

The system of sewage conversion about to be tried is that known as the "A B C" process, and will soon be in full operation, it having already been experimentally tried here on a small scale. The *modus operandi* was fully explained to the members, and some samples of sewage

were treated for their information. After fully inspecting all the works, they were shown some samples of dried sewage, which when ground is sold as manure (native guano), and was said to be much sought for by farmers who had once tried it. The members then, by permission of Mr. Bazalgette, visited the engine-house and works of the Crossness pumping-station, where the four engines required to pump the sewage up into the reservoirs were examined and explained to them. These engines caused much interest on account of their great size and power. Two are continually kept working, each making six strokes per minute, and pumping 2,000 gallons at each stroke. The other two are kept as reserve engines, in case of a storm occurring in the London district, in which case the united power of all four engines, pumping 48,000 gallons per minute, is not more than sufficient to keep under the storm-water pouring down.

SCHOOL BOARDS.

Ipswich.—At a meeting of this Board the clerk stated that, in accordance with the directions of the Board, he had written a letter to the Education Department, the reply to which says,—

"There should be sufficient space in the general room and class-room together to accommodate all the children. If the general room is of itself large enough to accommodate all, and is then subdivided into class-rooms, it will not be necessary to provide additional class-rooms; but if the general room is not large enough, and the accommodation should be calculated at nearly ten superficial feet per child, then it will be necessary to furnish class-room for the deficiency.

Supposing that the aggregate area is about 10 ft. per child, it will be sufficient if, in the general room, accommodation is provided at the rate of 4 ft. per child for the whole number of children provided in the school and class room.

There should be not less than two class-rooms for each school; each class-room should be about 20 ft. by 16 ft.

In reply to your final inquiry, I am directed to state that an additional class-room allowed to a drawing-class may be used alternately by boys and girls, provided it is so placed as to be conveniently accessible for each school."

Some conversation then took place with reference to the kind of division the Education Department would require between class-rooms in a large school-room divisible into class-rooms.

Aberystwyth.—The following architects were a short time ago invited to send competitive designs for the new schools at Aberystwyth, providing accommodation for 600 children:—Mr. J. P. Seddon, Messrs. George Jones & Son, Mr. R. Owens, Mr. Sherwin, and Messrs. Szlumper & Aldwinckle. The Board have selected the designs submitted by the last-named gentleman, and the buildings will be commenced at once.

Great Driffield.—Mr. H. J. Pail has been appointed architect to the School Board of Great Driffield, in the East Riding of Yorkshire. A block of school buildings is to be erected forthwith for 700 children, on a site on the Bridlington-road, in the outskirts of the town. The same gentleman holds the appointment of architect to the Hope School Board, near Wrexham, and plans are passed and tendered for to accommodate 600 children for that Board in two blocks of buildings, viz., 250 at Ffrith, and 350 at Hope.

ARBITRATION IN THE BUILDING TRADE.

MR. RUPERT KETTLE has been sitting in Birmingham as arbitrator over a conference of masters and representatives of working men in the building trade. The carpenters, labourers, and plasterers were represented. Notice had been given by the men, under the rules agreed upon in 1867, for a reduction of the hours of work to 50 1/2 per week. After the conference had lasted some hours, the employers proposed that the hours should be fixed at 54. On the other side, a proposition was made that the hours should be 53. On this difference there was a split, all the masters' representatives voting on the one side, and all the men's representatives on the other. The matter was left to the decision of Mr. Kettle, who, in giving his award on the general question of time, said:—

"In deciding this question, I have not only to consider the desires of the parties in contention before me, but the combined interest of both, so as not to disturb their trade, and check the desire for building. I have come to the conclusion that, although from what has happened in this town and elsewhere, customers may be disposed to accept the result of what is called the nine-hours movement, they could not at present willingly enter into bargains based on still shorter hours. I therefore, as much in the interest of workmen as of the employers, decide that an average of nine hours a day,—that is, fifty-four hours,—be the working week. This does not apply to the three winter months."

The deputations then made a vain effort to arrange the hours for beginning and leaving off work. These deputations then withdrew, leaving the question in dispute to be settled by each branch for itself. The plasterers' deputation next took their place at the table, and the question which had just been debated by their predecessors was again discussed. The time for beginning and leaving off work could not be agreed upon, and the Empire said he would prefer not to decide that question by itself, but to take the whole case together. The question of wages was then discussed. The present rate of wages in the plasterers' trade is 6½d. per hour, and the men's demand was for 7½d. Mr. Briggs made an offer on the part of the employers of a rise per hour equivalent to the reduction of time, namely, a farthing per hour. The Empire observed that it was five years since there had been a rise of wages in this trade in Birmingham, and that was a long time, as things were going now. He would ask the representative of the employers to consider whether their proposal to give a rise equivalent to the reduction of time was equal to the increase of wages which the nine-hours settlement had practically amounted to in other trades and other places. After some discussion and a short adjournment, Mr. Holmes proposed that the payment should be 7d. per hour, as a settlement for two years. This proposition was seconded and discussed without result, and the Board proceeded to consider the question of overtime, but no conclusion was arrived at. It was agreed that 2s. should be allowed for lodging-money on out-town jobs, and that payment of railway-fare should be left for arrangement between the parties. The Court shortly afterwards adjourned.

HEIGHTS OF BUILDINGS AND ANGLES.

A "LEVEL AND ANGLE INDICATOR" has been brought out by Messrs. Fletcher & Sinclair, of Liverpool, including, in a compact case, a compass and sun dial. It is described by the inventors as being a simple form of theodolite, there being a sight hole and horizontal wire at the base, and its price is within the means of most mechanics. It strikes us that the instrument will need great practice before it can be used with anything approaching accuracy, and then it must of necessity be placed on some steady support. All who use the theodolite know the care and the anxiety required to sight and adjust the instrument by means of finely-cut screws, and standing on a stiff stand. The Angle Indicator may be of service for taking approximate angles in the case of those who will master it.

NEWGATE AND THE SESSIONS-HOUSE.

HAVING read in your paper that the Mid-London Railway Company have purchased the Christ-Church or Blue-coat School buildings, with four acres of land, for 600,000l., the governors of the school intending to erect schools in different quarters of London, and one in the country for 1,000 scholars, it appears that land in the locality of Newgate-street must be of enormous value; and an excellent opportunity offers itself for the pulling down of that melancholy building called Newgate and the adjoining Sessions-house, disposing of the sites, and with the proceeds erecting a new gaol and sessions-house on the confines of the county of Middlesex.

It has always occurred to me that it was unjust that the county of Middlesex should have the odium and expense of finding a sessions-house and a gaol, for the trial of the offenders (in addition to their own) for the counties of Surrey, Essex, and Kent, according to a certain radius from the centre of London, which the Act establishing the Central Criminal Court has enacted; for it gives the world an exaggerated idea of the state of crime in the county of Middlesex, although, no doubt, the present position of the Central Criminal Court is very convenient for the barristers who have chambers in the Temple, Lincoln's Inn, and Gray's Inn, to attend; but in consequence of the facilities for travelling now offered by the railways, it is no longer necessary for gaols to be fixed in the heart of populous cities.

The surroundings of the melancholy Old Bailey are very different at the present time from what they were twenty years since. It had not then the terminus of the London, Chatham, and Dover Railway on Ludgate-hill, the Metropolitan

Railway terminus in Farringdon-street, and the forthcoming Mid-London Railway Terminus, in Newgate-street. Let the citizens take into consideration the changes time has made in their City, and what a great improvement would be effected by the pulling down of Newgate Gaol and the Sessions-house, and making a communication from Farringdon-street, crossing the Old Bailey to Paternoster-row, leading to Cheapside, which every one must consider a great and necessary improvement, and one that could be made, from the high price of land in the locality, profitable to the City of London.

I have abstained from suggesting on what part of Middlesex the new gaol of Newgate and the Sessions-house should be built. Middlesex is a large county, and a suitable spot could be selected, with railway facilities; so that, as county gaols are now conducted, only the smallest amount of inconvenience to the particular neighbourhood would be experienced.

MARCO.

THE RAILWAY BRIDGE IN LUDGATE-HILL.

WHY must this be always called "the ugly bridge," as, for instance, by "J. B.," at p. 274 of the *Builder* for April 6th, in introducing his novel suggestion? The bad habit of sticking on handles, used as certainly as any "Aldon" or "Sir," grows upon people sadly:—

"In all debates where critics bear a part,
No one but nois, and talks of Jonson's art,
Of Shakespeare's nature, and of Cowley's wit," &c.

Yet even when you can call a man "the judicious Hooker," or "the vivid Frodoe," or a building "the majestic St. Paul's," or "the elegant Travellers' Club," it is well at times to treat the reader to an omission of the appellation, sanctioned though it may be by usage. Further, "ugly," in its usual sense of "offensive," "deformed," "of very disagreeable aspect," seems not quite happy in this case. The bridge has of course marred the aspect of the street and of the neighbourhood; the railway so near upon the thoroughfare has all the effect of a Temple-bar of an extremely determined kind on the view up the hill, and in descending absolutely destroys the perspective. The proportion of height to width,—the headway being so small and the street fairly wide,—has never been pleasing in an opening of any kind. The necessity of making use of every inch of height has not allowed any show of constructive purpose in the soffit; the beams and filling-in have been kept rigorously to the same level.

It is from this pretty clear that, on general grounds, the bridge ought never to have existed; a remark that might be made of lots of other triumphs of science, did not one recognise the wisdom of silence in the face of imperious destiny (at any rate, the level of the line should have been at least 15 ft. higher). The greatest efforts and skill would be as likely to be productive of perfect grace or dignity, as they would be in a dance by an artist bound for the rope-trick, or in a State reception by a princess under the conditions that struck Apollodorus as uncomfortable for goddesses in Hadrian's Temple of Venus and Rome. But, the conditions taken for granted, the treatment of the bridge with bracketed sides may be pronounced ingenious and not ineffective; the open-work parapets introduce a satisfactory variety, and the design and execution of the ornamentation are certainly not contemptible. Of course no one would expect the iron images of the City wild beasts,—rampant after their manner,—to be more beautiful than is their wont.

All this amounts to wishing that buildings (and other things) shall be praised or blamed for their obvious and acknowledged defects, and not by rote or by epithets that are at best misfits.

The fountains in Trafalgar-square are good standing instances of the force of habit,—being almost invariably described as "the ugly fountains." Mr. Helps has furnished what will be taken by the diligent antiquaries of posterity as the opinion of our own time about them: yet I doubt whether many people who have made a real examination would eagerly maintain its correctness. The fountains may be too small, the parts of the square may be out of scale (the Nelson column would ruin any place on this head), the water may be a little scanty, and may have been still scantier when they were christened; the reservoirs may have contained dirty water and have leaked enough to make their surroundings sloppier than lovers of monumental

architecture looked for. But this ought not to have led men well out of the blues to denounce the artistic design of the fountains themselves.

Without indulging in all Mr. Walter Shandy's enthusiasm, perhaps one may be allowed to interpose so much on "that mysterious influence of naming which determines so much of mortal choice," inasmuch as often "the right word is a power and communicates its definiteness to our actions." (G. Eliot, *Middlemarch*, book iii.)

S. F. C.

MERCY FOR MASONS.

THE bright sun has at last taken its place with a promise to last, bringing comfort to many. The exceptions I wish to name are the masons, whom you see working in the open with the full glare of the sun upon the white stone at which they labour, with the result, as one expressed himself, that when he "turned his head aside he could see nothing." And naturally so, the glare affecting the eyes. Why do they not work in the shade when possible? If not possible, why do they not wear coloured glasses, and so preserve the eyesight for future years? I should like to know the average of injured eyesights among masons in comparison with other trades. A light respirator also, I should imagine, could be contrived to preserve their lungs, which would lessen the number of deaths from consumption and asthma considerably. If a few were to start such appliances, and prove the beneficial results, rest assured the many would not be backward in resorting to a present remedy for the prevention of a future injury. Y.

ADULT INDUSTRIAL SOCIETIES.

SIR,—May I be permitted to call attention, through your columns, to a section of the working community who, however willing to earn an honest livelihood, are unable to do so from the fact of their being brought up to an industry which has been superseded by the introduction of machinery, or which they cannot follow profitably from accident having deprived them of the means of so doing.

Some years ago a lady, well known for her deeds of practical charity, assisted those of her own sex who suffered from a similar cause. Will any gentleman come forward and help to provide an institution where men of good character may learn a new calling, earn enough to keep their homes together, and get together a few tools, if required, till proficient enough in their new form of work to be able to earn a decent living and become more useful members of the community?

Boys in our reformatories, and convicts in our gaols, are taught some useful craft, to enable them to live honestly, if so minded. Give honest men, who equally deserve our care, the same chance of preventing themselves or their children drifting into such poverty as would tempt them to despair, to intemperance, and to crime.

J. J. A.

THE WESTWOOD TOMB, LITTLE HORKSLEY, COLCHESTER.

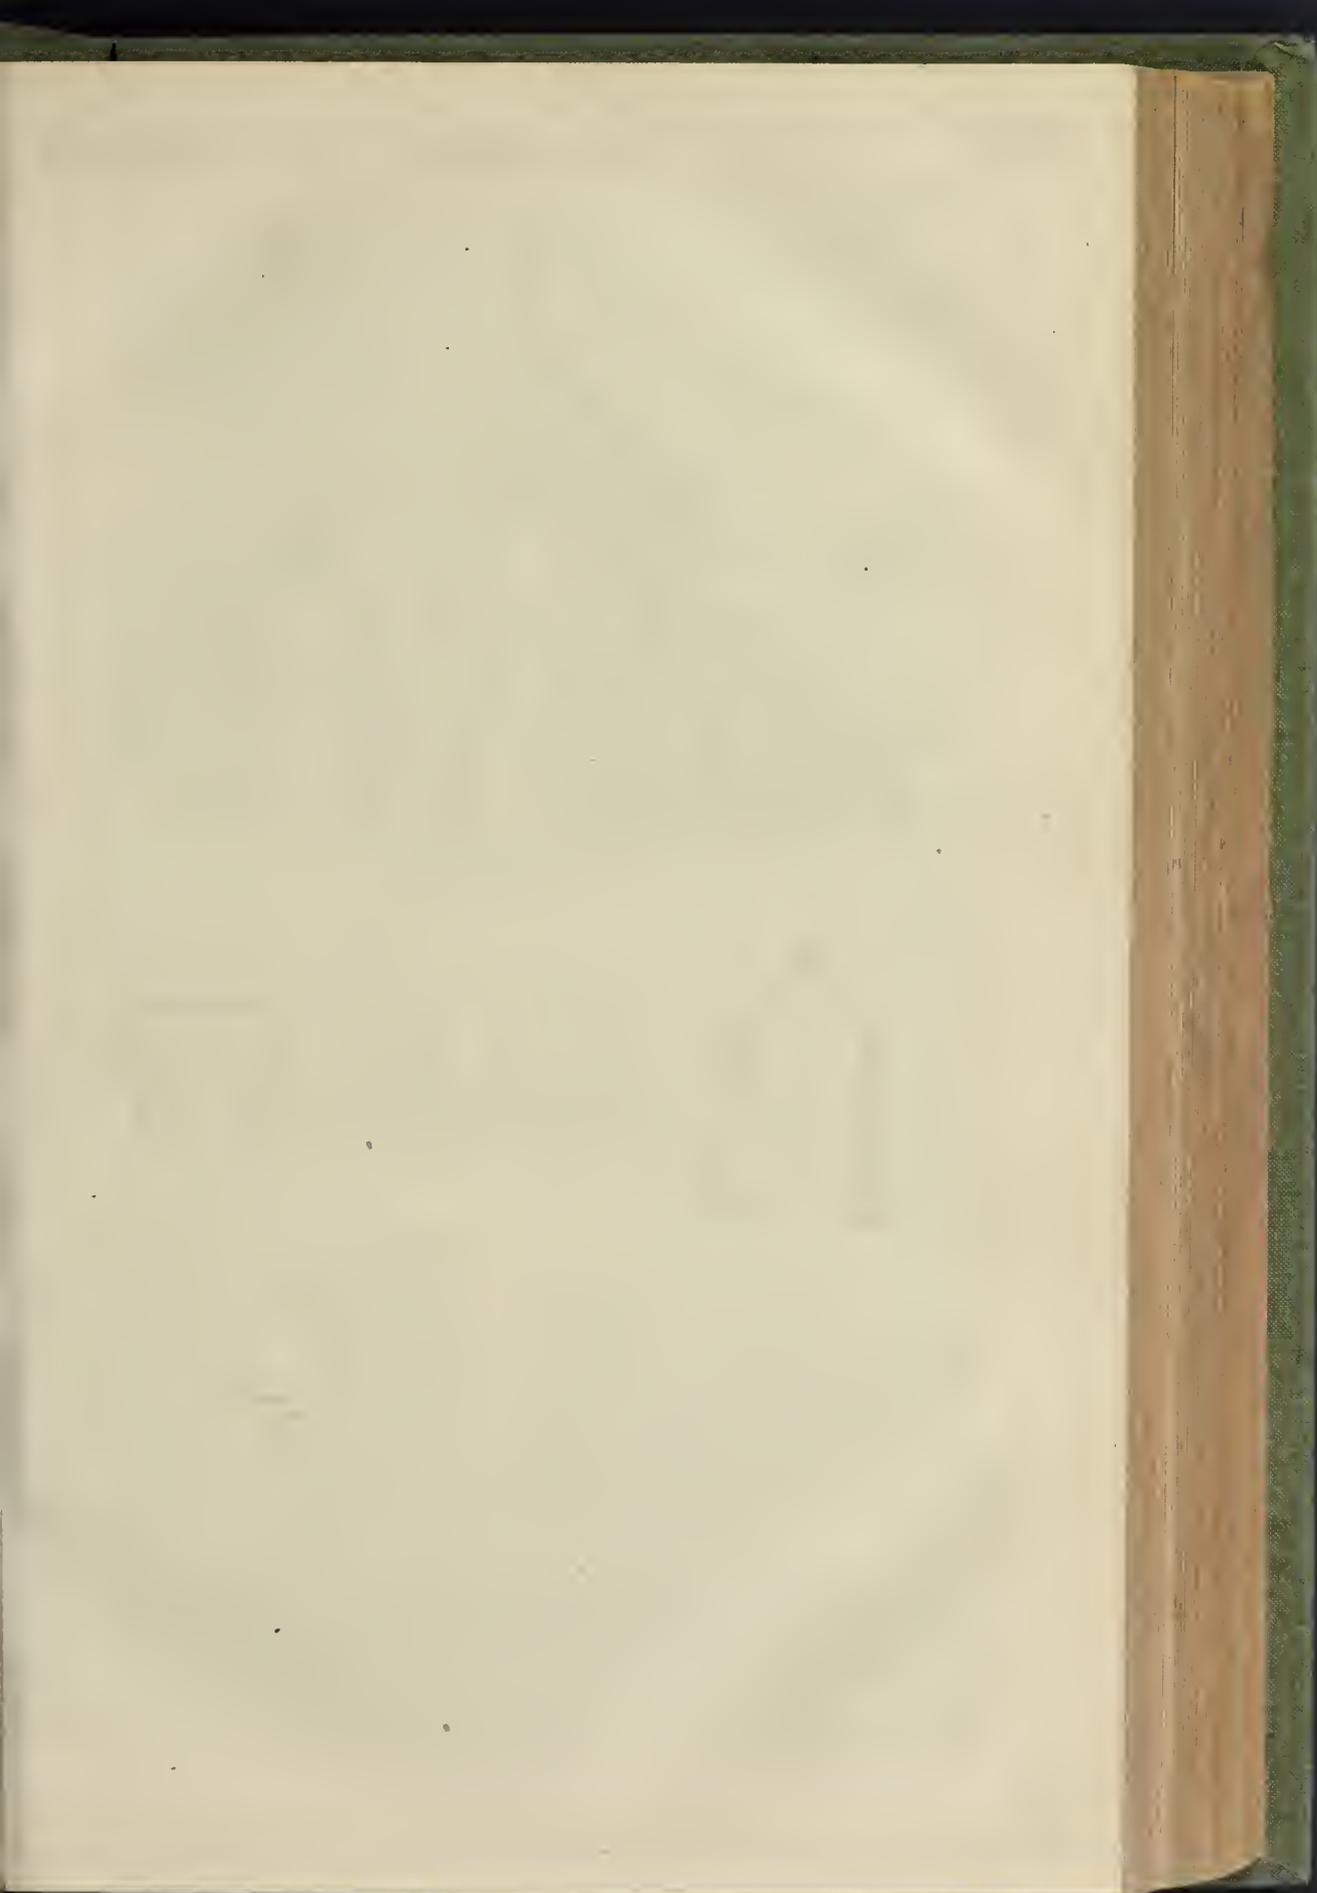

THE building of which we give an illustration in our present number has recently been erected as a family mausoleum for Mr. Wm. Macandrew, J.P., of Westwood House, Colchester.

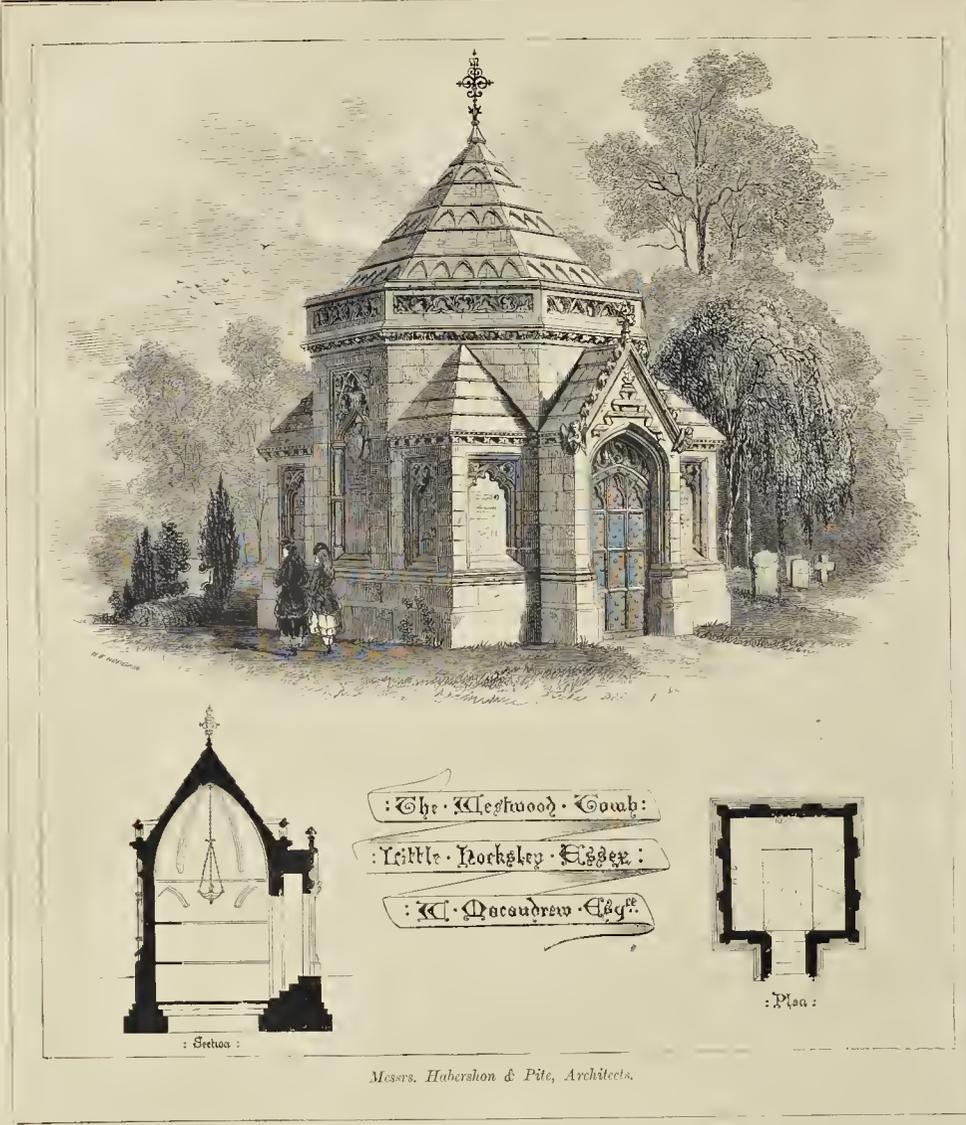

The octagon form adopted by the architect is based upon a simple quadrangle, so as to cover the actual ground at their disposal, having sufficient depth for a lower story, and carrying two ranges of shelving round the space at equal heights, the upper portion being broken up into an octagon, carrying an upper range of shelves, and the whole space being covered with stone vaulting, having moulded ribs at intersections. The floor is laid with encaustic tiles, with a monogram in the centre.

Externally, the Decorated style is adopted. The whole of the work was contracted for by Mr. McCullo, of Victoria-street, Westminster, and all the art finishings were supplied by London workmen.

The stone used throughout was obtained from the Confans quarry in France. The masonry and carving were executed by Birtchnell, of Clapham. The slate shelving was from Magnus, of Pimlico. The iron doors and fittings were supplied by Hobbs, Hart, & Co.; and the ornamental ironwork is from Hart, Peard, & Co.

The total cost was 600l.; and the works have been carried out under the direction of Messrs. W. G. Habershon & Pite, architects, of Bloomsbury-square.

UNION BANK OF LONDON: CHARING CROSS BRANCH.

We illustrate in our present number the structure which has been erected at the corner of Spring-gardens, Charing-cross, as a branch-office of the Union Bank of London, from the designs and under the superintendence of Mr. Frederick W. Porter, architect. It is of considerable size. The length of the Charing-cross front (north) is 42 ft. 6 in.; the flank in Spring-gardens (west), 73 ft.; and the hack (south), 61 ft. The height, from pavement to the top of main cornice, is 50 ft. 6 in.; and from the main cornice to the top of roof, 17 ft. The clear height of the various stories is as follows:—Double basement, 16 ft.; bank, 17 ft. 6 in.; first floor, 12 ft.; second floor, 11 ft.; and third floor, 9 ft. The columns, pilasters, dado, and pedestals of the ground story are of grey granite, from the De Lank quarries, near Bodmin. The columns and pilasters of the upper stories are of polished red granite. The whole of the columns and pilasters are monoliths, with the exception of the pilasters of the two upper stories, which are

in two stones each. All the other masonry is of Portland stone. The clustered chimney-stacks at the angles of the building, also the terminal vases on the attic story, are of terra cotta.

All the balcony-railings, and the bank entrance-gates, are of wrought iron, executed by Mr. Winstanley. The latter are excellent specimens of ironwork, and received a premium from the Society of Arts. The curved roofs are covered with plates of embossed copper, from the manufactory of Messrs. Tyler.

Entering the building, we find that the bank-room is 47 ft. by 26 ft. 6 in., the manager's room adjoining, and separated from the latter by a glazed screen, is 17 ft. 6 in. by 17 ft. 6 in. The walls are lined with woodwork, in the form of pilasters, pedestals, &c., principally wainscot, with teak panels; the doors, window-frames, and bank fittings are of Spanish mahogany. On the same floor are also waiting-rooms, and private room for manager.

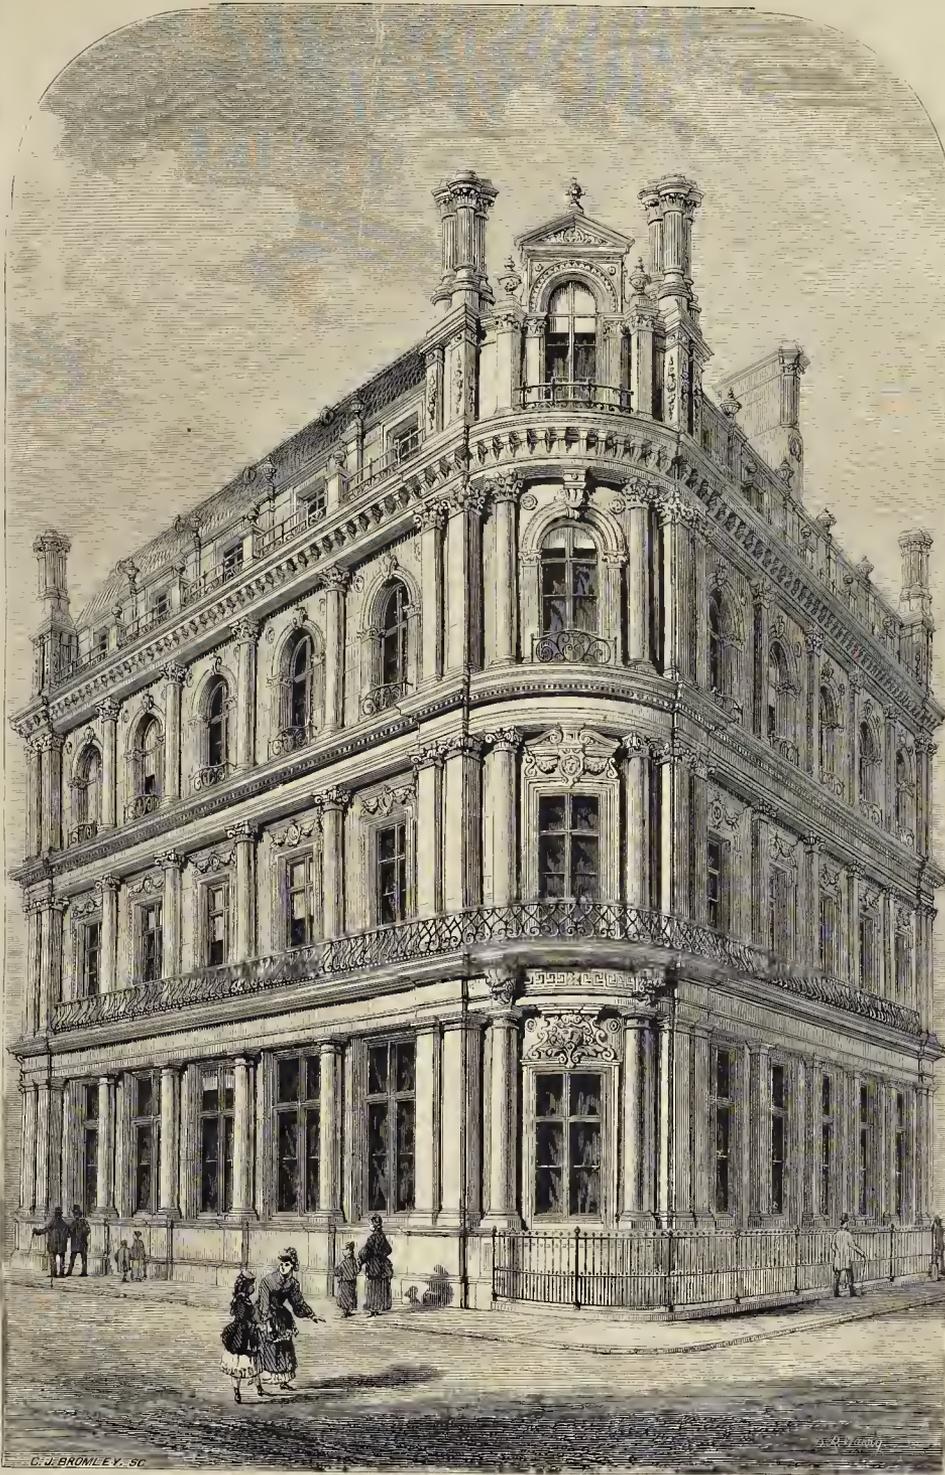

The ventilation of the bank-room is effected by means of a ventilating engine, worked by hydraulic power, placed in a small room over the bank entrance-lobby, with drawing the air through

a perforated ornamental frieze below the cornice of the ceiling, while fresh air is supplied through openings under the counter, and other parts of the room.

There are two stories of strong rooms in the basement, having a total area of 3,660 ft. superficial. The intermediate floor is, to a great extent, formed of cast-iron perforated plates, resting on wrought-iron bearers, and the height from lowest floor to floor of bank, 18 ft. The remaining portions of the basement stories are used as porters' living-rooms, clerks' lavatories, and store-rooms.

The first, second, and third stories are divided into sets of apartments, each consisting of a sitting-room, bedroom, and bath-room; access to these is by an entrance in the south front next Spring-gardens.

The manager's apartments consist of rooms on the south or Spring-gardens side of the building. The wrought-iron tanks in the roof, holding 4,760 gallons, supply water to lift, ventilating engine, and baths. We have only to add, that the builders were Messrs. Perry & Co., Stratford, and the amount of their contract was 28,473l.

UNION BANK OF LONDON: CHARING CROSS BRANCH.—MR. FREDERICK W. PORTER, ARCHITECT.

SEVENOAKS WEALD CHURCH, KENT.

This church was re-opened on the 10th inst. by the Suffragan Bishop of Dover after enlargement by the addition of a new chancel and organ-chamber, from the designs of Mr. T. G. Jackson, of London.

The new building is of Kentish rag stone, with dressings of Tunbridge sandstone; the roofs of Baltic timber, covered with Penmoyle green slating. The window traceries are founded upon what is known as the Kentish type, of which the chancel at Clarendon, near Canterbury, affords the finest instances.

The ceiling is polygonal in section, hoarded below the rafters, and divided by moulded ribs into panels, which are decorated with an arabesque design in simple colours at the intersection of the ribs. The choir seats are of oak, with carved elbows and turned shafts of walnut wood, and their front hook-hoards, as well as the altar-rail, are carried on wrought ironwork parcel gilt.

The east window is filled with painted glass, which has been executed by Messrs. Powell, of Whitford, from the cartoons and under the superintendence of the architect. The general tone of the window is light, and the colouring restrained in tone; the arrangement consisting in a field of silvery glass painted *en grisaille*, across which a band of colour is formed by the figure subjects in medallions which occupy the central part of each light.

The central part of the chancel floor is laid with a rather elaborate mosaic pavement, executed by Messrs. Powell in their new opaque glass.

The contractor for the general work was Mr. Wiltshire, of Sevenoaks. The warming apparatus was supplied by Messrs. Fraser, of London; the floor tiling by Mr. Godwin, of Lurgwardine; the wrought ironwork by Messrs. Gibson, of Stamford; the organ is now being built by Mr. Henry Willis, of London; and the carving is by Messrs. Farmer & Brindley.

THE SAFETY OF SASH-FASTENERS.

As I left myself open to a challenge by a sentence in a former communication, I will not shrink from holding my own, while expressing thanks for each new bit of information that may come in the way. With all respect for Mr. Fletcher, I am forced to say that his communication, as far as it relates to my remarks, leaves the subject exactly where I left it.

Before making a few more observations on sash-fasteners and their safety, let me say that I spoke not as an amateur, but as one who had long practical experience of almost every form of sash construction and fastening throughout the three kingdoms, and in part of the Continent, and that the matter in discussion has engaged my attention for many years. I am, therefore, equally interested on behalf of the building profession with Mr. Fletcher in seeing some practical remedy applied, and will be ever anxious to assist in the endeavour.

In advocating rebated meeting-rails to sashes, I did not necessarily argue the adoption of either the spring fastener or the one in present use. I proposed the rebate as an additional security, no matter of what kind the fastener might be. Of course, if servants or others neglect to adjust the fastener on a sash, there can be no security in any form of sashes that work in halves like the present. Now, as to the objections to the rebate, which was intended by me for all new sashes, it does not need either a section or a model to see at a glance its action. Its sufficiency depends, as every architect and builder knows, on the thickness of the parting slip. It might be put as a little sum to a school-boy in this fashion:—"If the groove in the sash frame or the parting slip in that groove is $\frac{1}{2}$ in., what will be the breadth of the rebate he?" The answer is obvious. Surely, then, $\frac{1}{2}$ in. or $\frac{3}{4}$ in. rebate is quite sufficient when both sashes are well fitted and the fastener is tightened.

If it were even required to alter present made sashes, having a $\frac{1}{2}$ in. parting slip, I see no difficulty in the way, though I do not advocate it as a rule. Yet it might be done with advantage to the windows in the lower stories of houses.

If that would be required would be to plane off the present splay or hooking and joint and screw slips of hard wood to form the new rebates.

Mr. Fletcher must admit that with a rebate to be present ordinarily made sash, and the fastener tightened, the thief could not push back the

catch with a pocket-knife, or a steel blade of any kind; but with the majority of the present sashes, there would be little difficulty indeed. He remarks that it is foreign to the subject to say that if the thief cannot get in he will resort to other modes, and he thinks that men would be afraid to carry drills, jemmys, centre-hits, diamonds, &c., and that the finding of them on their person would insure conviction. He seems to forget that there are dishonest carpenters, bricklayers, house-smiths, bell-hangers, plumbers, painters (Ishmaels of the trades), who, in carrying the above-named tools, would only be carrying the instruments of their craft, and that the finding of them in their possession by the police would not afford even circumstantial evidence of their guilty intentions. A CRAFTSMAN.

Sir,—Your correspondents in their letters seem to have overlooked three essential conditions required in a good sash-fastener.

1st. To force the top sash up towards the head of the sash frame.

2nd. To force the bottom sash down towards the sill.

3rd. To draw the meeting-rails together and prevent rattling during high winds.

"Craftsmen's" screw fastener does only one of these, and I have had experience of many of this kind rendered useless by a coat or two of paint raising the bottom sash and lowering the top and causing the screw and nut not to meet.

I have given much attention to this subject and believe that nothing at present made equals the quadrant sash-fastener, and after many attempts and failures I believe I have at last succeeded in making an improved quadrant sash-fastener that will not only fulfill the conditions I have mentioned, but will also prove a safety and partly a thief-proof one; but I feel convinced no sash-fastener will answer except it fulfills these conditions.

ROBERT PHILLIPS.

SITE FOR BARRACKS.

Sir,—It is possible that those who have the selection of sites for barracks may have omitted in their inspection one part of the Kent coast at present undefended except by troops from Dover or Canterbury,—namely, Romney.

In the early part of this century there were barracks at Tenterden, a town situated about seven miles from Appledore Station, on the South-Eastern Railway, through which runs the Military Canal from Hythe to Rye. Tenterden has many local advantages for troops, but Romney would, with the prospect of Dungeness Harbour, be an admirable spot for such a purpose. Some years ago, the War Office were willing to grant the Military Canal to a celebrated engineer for a railroad from Hythe to Rye, especially for the conveyance of troops.

Perhaps a word of suggestion at this moment may avail. A MAN OF KENT.

LORD DERBY ON SANITARY ADMINISTRATION.

NEARLY two years ago Lord Derby, whose family have for generations been large owners of land in the neighbourhood, laid the foundation-stone of an hospital in the borough of Bootle, which was recently only a suburb of Liverpool. Lord Derby gave a valuable site for the building, and contributed in money besides. The hospital is now complete, and has just been opened by Lord Derby, accompanied by the countess. The event was observed as a *fete* in Bootle, and after the opening ceremony the mayor entertained the earl and countess and a large party to lunch in the Bootle Town-hall, or Assembly-room. In the evening there was a *soiree* at the hospital. The customary formalities concluded.

Lord Derby said: I congratulate the inhabitants of Bootle on the completion and opening of this hospital. We are, though not one of the smallest, yet one of the very youngest of English boroughs; but I hope we shall not be found behind our neighbours either in public spirit or in thoughtful care for the welfare of those on whose labour our prosperity depends. It is just a week since an eminent public man, speaking at Manchester on all the subjects of the day, referred to the sanitary question as that which lies at the bottom of all national well-being and greatness. Thirty years ago—perhaps even a dozen years ago—language of that kind from a political leader would have been thought eccentric and paradoxical; now it is accepted as a fair expression of the feelings and wants of the time. That is a remarkable change: let the credit of it be given where it is due. It is owing to the collective labour of many individuals, personally for the most part obscure, but who have worked in a spirit of unselfish devotion to a great and useful cause. I am not going into questions of sanitary

legislation. But let me just observe this—that the conviction which sanitary knowledge brings with it as to the preventibility in general of disease is one of quite incalculable importance. Men are very slow to learn the extent to which their destinies are in their own power. They are apt to be astonished if you point out to them that nine-tenths of the calamities that have afflicted the human race are directly and obviously the work of men's own hands. They are inclined to confound that feeling which we all respect, that of cheerful acceptance of the inevitable, with that other kind of resignation to evils which are not inevitable, which is mostly laziness and apathy, and the prevalence of which is one of the most characteristic distinctions between the savage and the civilised man. And why do I say this? Because I am deeply convinced that no sanitary improvement worth the name will be effected, whatever acts you pass, or whatever powers you confer upon public officers, unless you can create a real and intelligent interest in the matter among the people at large. It is very comforting to those who have worked long years in this direction to hear how our governing men now talk, and how they are praised for it too!

WATER SUPPLY PIPES.

Sir,—Allow me to suggest to "Expertus" the only way I have found to keep water free from sewage gas; at the same time I keep the pipes empty to prevent their bursting. I do away with ball-taps, and prevent any pressure being put on the pipes after the water enters the house, and I reduce the waste of water to a minimum.

I have just finished the re-arranging of water supply to a large house, and have had the fittings fitted up as follows:—The service-pipe enters the kitchen from water company's main and passes through an apparatus (which forms a kitchen trough), and has a tap attached to the supply-pipe above the apparatus for kitchen use; the pipe then passes up into the upper cistern (without ball-tap), and after filling the cistern the overflow water runs down the waste-pipe and supplies the cisterns at lower levels; when the lowest cistern is full, one quart of water runs down its waste-pipe into the apparatus, which shuts off the supply to the upper cistern. The water is procured by lifting a lever (which cannot be tied open). This apparatus does not require any attention as it is constantly in use, it being a kitchen trough, and the tap over attached to the supply-pipe. By not using ball-taps there is no pressure on the pipes after passing the apparatus. When the apparatus is shut off the water passes out of the pipes above it, whereby they become empty; therefore the frost will not burst them. In summer time this escapement can be shut off.

I think this is a good system and should be generally adopted. CHARLES PINX, Architect.

SALTING OF PARIAN.

I SHOULD be obliged if some of your readers would suggest an explanation and remedy for a very serious case of walls saltpetreing. My walls are principally built with Portland cement, floated out with Portland and sand, and set with Parian. When finished about a week we claircoiled and distempereed on some and painted on other parts, when at once began the most universal process of saltpetreing I ever saw; the greater part of distemper and paint are thrown off, and in places the efflorescence stands out three-eighths of an inch.

The sand was partly Thames and partly a very sharp pit sand dug on the premises. J. S.

FALL OF STAND.

Sir,—With reference to the notice you make in last week's issue of your paper about the falling of a stand to witness the laying of the memorial-stone at a new chapel, Kentish-town, allow us to say it was not the platform which we erected for that purpose, but an ordinary scaffold used by the bricklayers which fell, upon which a very heavy crowd stood, and insisted upon standing on after many repeated requests and cautions not to do so; and as the whole of the arrangements were entirely out of our hands for the admission of visitors on the works and platform for the occasion, we do not consider ourselves to blame, and trust to your usual fairness to give this as public a position as you have the report, that the matter may be fairly represented. The architect superintending the works, also the clerk of works, consider there is no blame attached to us. NIBLETT & SON, Builders.

STRIKES IN GERMANY.

FOR some time past the workmen have been at war with their masters in Berlin and other German towns. The Prussian correspondent of the *Times* has given some interesting details of the existing state of things. He says in their origin the strikes were not unjustifiable. Even upon the assumption that the former rate of wages was satisfactory, the workmen had a right to demand an increase. Seeing that rent and provisions had become so much dearer, why should not manual labour, too? It is admitted on all hands that the cost of living at Berlin has been doubled for large strata of the middle classes in the last six or seven years, and increased 60 or 70 per cent. even for the poor. It is nearly, though not quite, the same thing in other considerable towns. Who, then, can blame

the workmen for advancing a claim that their pay, which was certainly never excessive, should at least keep pace with what was exacted for house-rent and estates?

The strikes began by the working-men asking for an increase of wages of 25 per cent, and a reduction of hours from twelve to ten. When they obtained their terms, peace was re-established; when they had to give in, the attack was resumed a little later, and, in many cases, with better success. The result of the entire campaign is a general rise of the price of labour by 25 per cent. in a single year.

The strike of the Berlin masons began in the June of last year, and went on for six weeks. The workmen demanded an increase of their daily wages from 2s. 3d. to 3s., a reduction of hours from twelve to ten, and extra pay of 5d. for each hour overtime. Upon this 300 builders of Berlin formed a counter association, which negated the programme of the working men *à toto*. Negotiations were repeatedly resumed, but as often broken off, both parties remaining firm. At last the masters gave in upon the condition that their defeat should be concealed under some concessions of a merely formal nature. Since then the workmen have been giving their services for something like eleven hours at 3s. 6d. per day.

An even vaster operation was the joiners' strike, which broke out after that of the masons had been settled, and lasted nine weeks. Of the 3,000 joiners in the city, 5,000 struck; 2,000 went off elsewhere; while 1,000 married people, with large families, remained staunch to their work. The claims put forth were similar to those of the masons,—25 per cent. more wages, and a reduction of time to nine hours and a half. The masters, who in Berlin number no less than 1,000, with 500 wealthy contractors among them, answered these demands by the counter proposition that piecework, which had not been very general, should be made universal, after which they hoped to be able to allow higher wages. After the expiration of seven weeks, these masters who had taken contract work for builders, and who, owing to the steady increase of house-rent, were enabled to accord higher wages, began to relent. Thus an opening was made for a compromise, by which the weekly wages, formerly at from 15s. to 21s., were raised to 21s. to 25s., the number of hours remaining the same. Piecework under the new conditions yields from 30s. to 36s. per week.

A TECHNICAL DICTIONARY.

Str.—“Rabbet, *n.*, a corruption of the word rebate.” Such is the decision of the editors of the last edition of Webster's Dictionary, and, as far as I can judge, that decision is accepted.

I have long felt with your correspondent the want of a trustworthy technical dictionary of the Arts and Sciences, and I am taking every opportunity to prepare such a work; but I trust some one with more ability and more leisure will outrun me. The art dictionaries we now have are very confusing and overstocked with words of use only to the antiquary. I think if half these words were omitted, and their place occupied with the every-day terms of the studio, architect's office, and workshop, a really useful work would be the result.

GEORGE ALFRED RODERS.

LONDON WATER SUPPLY.

In the House of Commons, in reference to Professor Frankland's report, already quoted in the *Builder*, and in reply to Mr. Kay-Shuttleworth, Mr. C. Fortescue said,—Major Bolton, the water-examiner of the Board of Trade, agreed with the Royal Commission on the Supply of Water to the Metropolis in thinking that Thames water, if only properly filtered, was harmless, and formed a fit and proper supply for the use of London. That gentleman also said that during the last winter two of the companies referred to had supplied water not properly filtered; the cause of that failure being that they were at the time carrying on large works for the purpose of improving their establishments, and also owing to the heavy floods. During that time, from want of sufficient storage room, the filtration was carried on hurriedly, and the water supply was by no means what it ought to have been. Major Bolton also reported that those companies were engaged in enlarging their works in a way which, in his opinion, would

remove those evils, and would meet the requirements of the case, by making large additions to the reservoirs. If it should prove that this was not the case, it would be necessary for the Board of Trade to interfere. With respect to the last part of the question, he meant to insure, so far as the Board of Trade powers extended, careful filtration of the water supplied by those and other companies. Remedial measures were being taken, and he did not think that legal proceedings need arise at present.

HEALTHY HOUSES.

This was the title of the paper by Councillor Gowans read at the last meeting of the Edinburgh Architectural Association. The reader commenced by stating that the kind of houses we lived in was of such vital importance, not only to ourselves individually, but to the community at large, that he did not think it necessary to make any apology for introducing the subject of his paper. As he believed it was quite possible to design and construct houses so that those who lived in them might not suffer either morally or physically, he would state what, he thought, were the faults of our present mode of arrangement and construction, and what ought to be the chief requirements of a healthy home. In speaking of what he considered necessary to keep suburban dwellings from contaminating influences, he said that the subsoil upon which the houses rested should be thoroughly drained to such a depth as would secure a crust of dry soil upon which to erect the structure. The walls below the floor level, as well as the space between, should be covered over with some substance to prevent that capillary attraction which the walls of the building and the internal heat of the rooms after the house is occupied exert upon anything which would supply moisture. The external walls of the building should be of such a thickness as would allow of a house being kept at an even temperature. Gables with fireplaces could not be too thick, as thin walls, especially at the chimney-head, were sure to produce smoky vents. Bedrooms and kitchens should be of the largest dimensions compatible with the size of the structure. No drains should be allowed to pass under a building, and he held that an architect knew little of his profession if he was driven by the arrangement of his plans to carry them there. Drains should never be allowed to pass further into a house than half the thickness of the outer wall, and if such were the law, he believed much less disease would exist in the city. He did not wonder at people getting into bad health, or having their constitutions so deteriorated and made liable to the attacks of every epidemic, when he considered that most of the pretentious houses in the suburbs of the city had drains passing underneath them. Such drains, from their fanly construction, permitted the sewerage to soak the base of the building, and render it a hotbed for the generation of disease. If drains were kept outside of buildings, he held that it was quite possible to trap them so that no bad air from the main sewers could find its way into the house. He knew that the trap generally in use was not effective for this purpose, but he had himself devised a double trap which completely secured the desired end. As to the cisterns of houses, he considered they should be placed where they could be easily reached, and where they would be free from contamination of any kind. He would have a room in the house, with plenty of light, entirely devoted to the main cistern of the building—a place into which the occupant could go as freely as into any open part of his dwelling, and where he could observe that such an important element as water was pure and wholesome. There should be no limit to the number of windows, and the position of the rooms in regard to light should guide the architect in fixing the fronts of his buildings. He considered that a great mistake was made by the builders of detached villas in making the entrance to the dwelling through the principal front of the house. This arrangement, of course, could not be avoided in street houses, but in suburban villas an architect had no excuse for adopting such a course. Mr. Gowans then went on to refer to street buildings. He objected to the main drains being allowed to run along the centre of the streets, because, as the kitchens, sculleries, and water-closets were generally at the back of the buildings, it naturally followed that the drain passed under the house before it could reach the main sewer. The only cure for

this state of matters, he felt, was to have the sewer running along the back of the building, and the clean water in the front. He spoke against the system of having water-closets in the centre of buildings, and maintained that more than enough of water could not be had in order to keep drains pure.

SCHOOL-BUILDING NEWS.

Manchester.—The Bradford Memorial Schools were opened on the 1st inst. They are Gothic simple in detail, with lofty belfry for principal roof. The chief school is 80 ft. by 35 ft., with two class-rooms, each 20 ft. by 16 ft. Separate entrances are provided, with lavatories adjoining. The site is inclosed with wrought-iron railing. The whole of the works have been executed by Messrs. R. Neill & Sons, builders, at an outlay of 1,600*l.*, under the superintendence of Mr. John Lowe, architect, Manchester.

Chorlton-upon-Medlock (Manchester).—St. Paul's schools, which stand in Higher Temple-street adjoining the church, were opened on the 9th inst. The lower story was erected a few years ago, and the additions which have just been finished complete the building. It now comprises a large room (64 ft. by 30 ft.) on each floor, and five class-rooms, besides the usual offices for boys, girls, and infants, and a boiler-room and other arrangements required for tea parties. The rooms are fitted up with desks and galleries are warmed by means of open fireplaces and Haden's heating apparatus, and are provided with means of ventilation. The roof of the upper room is open to the collar-beam, and the woodwork of this and other parts of the building is stained and varnished. Access is provided to the upper floor by means of two stone staircases. The building is of brick, faced externally with white headers, and with stone dressings to doors, windows, and other openings. The gable end in Higher Temple-street has the large windows of the upper floor filled in with stone plate tracery, while the apex of the gable coping is finished with a wrought-iron finial. The elevation to Frances-street is agreeably broken up by three gables, the centre one of which also has a wrought-iron finial. The building has been erected from the design of Mr. John Lowe, architect, Manchester, by Messrs. Davies & Maudslayi; the present additions costing about 1,700*l.*

York.—St. Lawrence and New Fulford Mission Schools have been opened. The schools occupy a position in the suburbs, on a plot of ground immediately in rear of the church of St. Lawrence, and comprise a boys' school, 45 ft. by 20 ft.; girls', 50 ft. by 20 ft.; and infants', 50 ft. by 24 ft. There are also two class-rooms and out-offices, and the building has three separate entrances. The structure is of red bricks with stone dressings, surmounted by a spiral bell-tower. It is roofed with patent self-locking tiles from Hormsae. There is a high-pitched open roof, boarded; the rooms are well ventilated and lighted, fitted with gas, and heated with Gurney's stoves. The boys' school is divided from that of the girls' by an arch of stone corbels with granite shafts; and each of the schools has been erected and fitted up in accordance with the rules of the Committee of Council on Education. On the side of the schools facing the church is a Gothic window, and the only separation from the churchyard is a light palisading. The entrances to the schools are from the lane leading from Lawrence-street to Heslington-road. The playgrounds are spacious and asphalted, and are enclosed by low walls and palisading. The cost of the schools has been upwards of 2,200*l.* The fees of the parish gave the site. Mr. C. T. Newstead, of York, was the architect. Mr. J. Brown had the general contract, the various works required having been executed under his superintendence by the following firms:—Mr. Warin Taylor, brick and stone work; Mr. G. Bailey, mason's work; Messrs. Hodgson, plumbing and glazing; Mr. Arnitt, painting.

Sheffield.—St. Silas's new schools have been opened. The new building adjoins the existing school. Its exterior is remarkably plain. The building is in the shape of the letter L, and consists of a boys' and girls' school, each capable of accommodating 300 scholars. In addition to these large rooms, there are four for class purposes. The old school-room will now be used as an infant school, and it will afford accommodation for 350 children.

Parkgate.—On the 9th inst. the foundation-stone was laid by Lady Gertrude Foljambe of new Church of England Schools, at Parkgate,

near Retherham. They consist of large mixed school, with class-room; and infants' school, also with class-room attached. They will accommodate a little over 400 children, and the cost will be about 1,200l. The material will be stone from the local quarries. The style is Early English. Messrs. Tacen & Rawsen are the architects.

St. Briavels.—A new school has been opened here. It is intended also to erect a master's residence, making the total outlay 850l. The site was given by the late Mr. Peel, of Aylesmere, and the architect is Mr. W. T. Allen, of London, the vicar's son, who has given his services, and the builder is Mr. Meredith, Gloucester. There is a turret with spire. Accommodation has been provided for 170 children, with a class-room for sixty infants.

Cheadle.—The foundation stone of a new Wesleyan Sunday School, in Charles-street, has been laid. The building will be of brick, with stone dressings, its dimensions being 61 ft. by 32 ft. inside. The cost of the site and the building will be about 1,000l. The architect is Mr. Wm. Sugden, of Leek, and the builders are Messrs. Collis & Waugh, of Cheadle.

Hulme.—The new schools recently erected in connexion with St. George's Church, Hulme, and which now situate in Arundel-street, Chester-road, have been opened by the Bishop of Manchester. The schools will accommodate about 1,100 scholars, and have been built by Messrs. S. & J. Higham, contractors, Chetham, from plans and designs prepared by the architect, Mr. Ernest Bates, of Manchester, and are in the Gothic style of architecture. There are separate rooms for boys, girls, and infants, and attached to each are a class-room, and room for hats and cloaks. The principal room is 81½ ft. long and 32 ft. wide, and is fairly ventilated and well lighted, and has two large traceried windows. The rooms are lofty. The principal entrance to the boys' school is in Ellesmere-street, to the girls' school in Cawdor-street, and to the infants' school in Arundel-street. The entire length in Ellesmere-street and Cawdor-street, is 73 yards, and in Arundel-street 20 yards. The cost of the building has been 4,500l., towards which sum 1,000l. have been contributed by Lord Egerton. The site was given by the Bridgewater trustees.

Wakefield.—The new Wesleyan Sunday School buildings are designed by Mr. William Watson, of Wakefield, architect, and are intended to be built of brick, with stone dressings. They consist, on the ground-floor, of principal entrance facing South-parade, with spacious staircase; the large room, 71 ft. long, 33 ft. wide, and 20 ft. high; and a class-room, 14 ft. by 13 ft. On the first floor are planned a school-room, 33 ft. by 31 ft., and 15 ft. high; five class-rooms, each averaging 14 ft. by 13 ft. In the basement are arranged the heating apparatus-room, kitchen fitted with hoilers, &c., and other conveniences; from this floor, on the level of Graham's-terrace, is an entrance and staircase to the large room. On the ground and first floor are proper water-closets, lavatories, &c. The contracts for the various works amount to 1,481l., and the contractors are Mr. George Fawcett (who is also contractor for the restoration of the parish church), for the brick and stone work; Mr. C. F. Ryeroff, slating work; Mr. Charles Driver, plastering work; Messrs. Cruven & Lloyd, carpenter and joiners' work; Mr. W. Woodhead, plumbing and glazing work; Mr. S. Kirk, ironwork; Mr. C. Turner, and Messrs. G. Blake & Co., of Coventry, for the heating apparatus, which is on the hygienic hot-air system. The memorial stone of the new building was laid last week.

Dukinfield (near Manchester).—The foundation-stone of St. Mary's School was laid on March 30th. Accommodation is provided for 200 children. Mr. Colbeck, Ashton-under-Lyne, is builder; and Mr. Edmund Kirby, of Liverpool, architect.

Stratford.—On Wednesday, new National Schools, which are situated in the densest part of Stratford, were opened by Mr. N. Powell, J.P. They are capable of accommodating over 900 children, and consist of boys', girls', and infant schools. Mr. W. F. Meakin is the architect, and Mr. James Rivett the builder. The cost of their erection has been 4,383l. Mrs. T. Curtis gave the freehold, the value of which is estimated at 1,000l.

Rawtenstall.—The corner-stone of a church school for the district of Constablee has been laid. The school is to be a stone building, in the Gothic style of architecture. The principal room will be 81 ft. in length by 26 ft. in breadth.

Besides this there will be two class-rooms, each 15 ft. by 16 ft., with cellars underneath for heating apparatus, &c. The school will accommodate upwards of 300 children. The plans are by Mr. B. W. Jackson, of Halifax. The site is given by Mr. Taylor, who is also the largest contributor to the building fund.

Cheshunt.—The new girls' and infants' national schools, Church Fields, have been opened by the Bishop of Rochester. Mr. Barker, of London, was the architect, and Mr. Bentley, of Waltham Abbey, the contractor. The site was presented by the Rev. Alfred Preston, formerly curate of Cheshunt. The cost of the schools was 1,250l., which sum was raised by voluntary subscription. The porch was the gift by legacy of Miss R. Preston, sister of the founder of the schools. The structure is intended for the accommodation of about 250 girls and infants.

Kilnhurst.—A new school in connexion with the parish church of Kilnhurst has been opened. The plans were prepared by Mr. Blackmoor, architect, of Rotherham, and the building has been erected by Mr. Simmonds, of Kilnhurst.

Handborough.—Handborough schools, now reopened, have recently been very much enlarged, so as to meet the Government requirements. This has been effected through the liberality of various voluntary subscribers interested in the work. The additions to the schools were made in accordance with a plan furnished by Mr. Wilkinson, of Oxford, and have been carried out by Messrs. Merry & Mansell, of Handborough.

CHURCH-BUILDING NEWS.

Hull.—The plans of Messrs. Adams & Kelly, of Leeds, architects, have been selected, after a competition, for the erection of a new church in Holderness-road, to be dedicated to St. Andrew. The church will cost about 5,000l.

Folkestone.—The committee for re-peping the parish church, with Messrs. Stallwood (the architects), received the following tenders for re-peping the church, erecting a new porch, and for the enlargement of the vestry:—Dunk, 1,072l.; Webster, 948l. 2s. 10d.; Holdom, 919l. 19s.; Bowley, 825l. 10s. It was agreed to accept the lowest tender. Some discussion took place as to re-tiling the church with Minton tiles, for which a separate estimate had been given by the builders. Mr. Stock said that he objected to having the stones in the church removed, many of which contained inscriptions, to be replaced by a gaudy pavement. Mr. Woodward said it was not the intention of the committee to do this at present, although he wished it could be done, and the work be finished at once. The secretary said they had 220l. in hand, and altogether 350l., and the vicar stated that by Easter they would have 600l.—enough to commence with.

Bristol.—The little old-fashioned church in Dowry-square, used as a chapel-of-ease to Clifton parish church, is in such a sad state of dilapidation that it has been determined to take it down and rebuild it in a style more convenient and more in harmony with modern usages. All the available material of the present building will be employed in the construction of a church capable of seating 500. The old-fashioned high-backed pews will give place to open seats of pitch pine. The building will consist of a nave, side aisles, and chancel, with a tower at the south-west corner. It is proposed to divide the nave into four bays, with moulded arches, labels, and carved terminals, the last of which will extend into the chancel, and will be filled in with wrought-iron screens. The column nearest the chancel will have a carved foliated cap, from which will spring the chancel arch. The reredos will be of marble and other stone. There will be no east window, the building at that end extending to the adjoining houses, and in its place there will be a recess immediately over the reredos, filled in with geometrical tracery, and upon the panels will be painted the Lord's Prayer, the Creed, and the Ten Commandments. The outside of the building will probably be of freestone and Pennant, and the internal columns will be of blue Pennant. The church will be paved with encaustic tiles. The total cost is estimated at about 2,000l., of which a considerable portion has yet to be raised. We understand that the work will be commenced soon after Easter.—The foundation stone of St. Nathaniel's Church, which is intended to meet the wants of the population of that part of Cotham near Lovers'-walk, has been laid. The foundations of the edifice are already laid, at a

cost of nearly 900l. The church, which is intended to accommodate 700 persons, will be in the Early Gothic style, the chief material being Pennant stone, with freestone dressings. The roof will be open-timbered, and covered with slate. There will be a tower and spire, 150 ft. high to the vane, at the south-east corner of the church; and the principal entrance will be on the south, or Elm Grove-road, side of the building. Under the tower will be vestries for the clergy and choir. The chancel will be octagonal, and have a bearded reef; and on its north side will be an organ-chamber. The seats will be of red deal, stained and varnished; and the building will be warmed by one of Haden's heating apparatus. Messrs. Wilkins are the builders; Mr. Bevan is the architect. Between 3,000l. and 4,000l. have been raised towards the cost of the building.

Ruabon.—The parish church of Ruabon has been re-opened after restoration. The organ, upwards of a century old, built by Snatchley, and originally the gift of the Wynnstay family, has been entirely remodelled by Messrs. Gray & Davison, of London, at the cost of Sir W. W. Wynne, bart., M.P., who also, at his own expense, repaired and considerably beautified the chancel, and besides has subscribed the greater portion of the sum raised for the whole of the works. The restoration has altered the appearance of the interior. An entirely new roof has been put up, the stone pillars which supported the arches between the nave and side aisles have been replaced by others of a lighter character, and the pews have given way to open sittings, free and unappropriated. The gallery at the west end is to be replaced by a smaller one. The whole of the works, which, in addition to those mentioned, include others of a minor character, have been carried out by Mr. Wm. Williams, of Bangor, under the superintendence of Mr. Fervey, of London, architect.

Uppingworth.—St. Mary's Church has been closed for some months to undergo a restoration internally. In the re-arrangement of the seats, the architect has found it necessary to re-plan the area, to fit the purposes of the modern style of service, the centre aisle remaining as at present, but the side aisles will be placed immediately against the walls, thus bringing the congregation together to form two masses. The whole of the seats will be open and free, the ends and rails being in pitch pine, and the rest in deal. The organ will be placed at the south side of the communion, with the singers' stalls in oak on the north and south sides of the altar-steps. The pulpit will be placed in front of the altar-steps, at the south corner. The west gallery will be entirely filled with children's seats, and will give accommodation for about 145. The north gallery will remain as at present, except that the high doors will be taken away. The oak fronts to the galleries will be cleaned from paint and varnish, and left in their natural state. An increase will be made in the accommodation by this renovation for 37 adults and 40 children, in addition to 250 sittings which will be made available for the use of the rapidly-increasing population. The estimated cost is about 600l. Mr. J. Henry Wadsworth, of Halifax, is the architect; and the various artificers' works are let to the following contractors:—Masons' work, Mr. W. Farrar, of Holdsworth; joiners' work, Mr. T. Plant, of Halifax; plumbers' work, Mr. J. Holdsworth, of Halifax; painters' work, Mr. J. Hodgson, of Queensbury; and Messrs. W. & S. Thornton, of Huddersfield, will supply the heating apparatus.

Arnley.—The foundation-stone of a new church, to be dedicated to St. Bartholomew, has been laid at Arnley. The old church known by that name will give place to the new edifice. The site of the new church borders on the churchyard. The designs of the building have been prepared by Messrs. Walker & Athron, architects, Leeds. Its proportions will be considerably larger than the existing church. The estimated cost is 15,000l., and already subscriptions amounting to 9,600l. have either been received or promised. Mr. S. E. Wilson has contributed towards the building fund 5,000l. The plan of the building is that of a Latin cross, consisting of nave, six bays in length, transepts, and sanctuary, with roofs of equal height, and a tower at the intersection. The nave has aisles, north and south, with porches opposite the westernmost bays of the nave arcade; and the vestry is placed in the angle formed by the junction of the sanctuary with the south transept. The sanctuary is apsidal, and the tower is surmounted by a saddle-back roof; and both

sanctuary and the space under the tower are intended to be vaulted. The church is to be built of local sandstone, and faced internally with limestone from the Ancaster quarries. The design is Early English, and its symmetrical proportions and simplicity of detail, combined with the size and solidity of the structure, forcibly remind one of the architecture of our Yorkshire abbeys. The principal dimensions are as follows:—Length of church, 157 ft.; width across transepts, 65 ft.; length of nave, 98 ft. 6 in.; width of nave, 30 ft.; width of transepts and sanctuary, 27 ft.; height to wall-plate, 46 ft. 6 in.; ditto to ridge of roof, 73 ft.; ditto to summit of tower, 153 ft. The contractors are,—Mr. H. Bramly, mason; Mr. J. Hall Thorp, joiner and carpenter; Mr. W. B. Myers, plumber; Messrs. Nelson & Sons, ironfounders; Mr. Ezra Walker, painter; Mr. R. Branton, plasterer.

DISSENTING CHURCH-BUILDING NEWS.

Colnbrook, near Windsor.—A new chapel, with vestry and schoolroom adjoining, has recently been erected in this town for the Baptist denomination. The building is of the Corinthian style of architecture, with a red brick front and white stone dressings to windows, &c., the whole being executed at a cost of about 800*l*. The internal arrangements are the same as usually adopted in modern places of worship, comprising three rows of seats, with gallery immediately over the entrance, the whole being stained and varnished. The warming apparatus, on the hot-air principle, was executed by Mr. Harris, of Thame. Mr. Daniel Singer was the contractor, the brickwork and masonry being executed by Mr. Henry Mole. The work was superintended by Mr. James Wells, of Thame.

Penitance.—Mr. John Rhodes, of Penitance, has sold to the Wesleyan congregation a plot of land, upon which it is proposed to erect a new chapel, with schoolroom, class-room, &c., underneath, and minister's vestry, organ-gallery, &c., at a cost of 1,000*l*., exclusive of cost of site. The building will be in the Gothic style of architecture, from designs prepared by Mr. Moxon, of Barnsley. Accommodation will be provided in the chapel for 400 persons, and in the schoolroom for 200 scholars. It will be in the midst of a population of about 2,000 persons, and in the immediate vicinity of the extensive steel and iron works of Messrs. Charles Cammell & Co.

Hollingsworth.—The foundation-stone of a new Congregational chapel and school at Hollingsworth, near Hatfield, Cheshire, has been laid. The new edifice will be in the Gothic style of architecture, built of stone obtained from Millbrook quarry, and faced with Dunford Bridge porphyry. There will be a tower, with buttressed angles, and slated spire. The total height is 86 ft. The chapel will be lighted at the sides by pointed three-light windows, and the bays will be marked by buttresses between the windows. The total length of the chapel, measured in the centre, exclusive of the entrance, will be 62 ft. 6 in.; the width, 40 ft.; the height, from floor to ceiling, will be 36 ft. The chapel will accommodate about 500 people. The school will be under the chapel, of the same size, the floor on a level with the ground, and 14 ft. high. There will be six class-rooms, three at each end. The walls will be plastered inside, and the school will be lighted by three three-light windows on each side. The schools will accommodate about 600 children. The buildings will be warmed by means of hot air or hot water. The site will be enclosed by stone walls, with gates at the front and side entrance. Mr. Henry Pinchbeck, of Manchester, is the architect; and Messrs. Higham Brothers are the contractors.

Tunstall.—The memorial stones of the new Wesleyan Chapel, Harsisehead, have been laid. The site of the building is in a central and public position. The style is Gothic, and the materials to be used are red bricks, relieved by bands and vousoirs of blue and white bricks. The plan of the chapel, which will accommodate about 380 persons, is that of a parallelogram, 45 ft. by 35 ft. internally, and is approached from the front through a porch, 6 ft. wide, and inner vestibules. At the rear of the chapel, behind the pulpit platform, will be the orchestra, with a class-room underneath. The principal front of the building has a three-light window, the heads of which are to be filled up with tracery. The central part of the front is to be finished with buttresses on each angle, with stone terminals rising somewhat above the roof. On each side of the central

front gable will be the two circular vestibules, terminating with roofs at a somewhat lower level than the other part of the front. Each side of the chapel is divided into four bays by buttresses, with a two-light window in each bay. The ground-floor of the chapel, and the gallery across the entrance end, will be fitted up with open benches, and a number will be free. The woodwork, internally, will be partly of pitch pine, and the whole will be stained and varnished. The designs are by Mr. G. B. Ford, architect, Burslem, and are being carried out by Mr. Samuel Booth, builder, Kidsgrove. The cost of the building, exclusive of land, will be about 1,300*l*.

Finchingfield.—The Congregational chapel at Finchingfield, which has undergone extensive alterations and improvements, has been reopened. The works carried out in the restoration and improvement of the building comprise the following, viz.,—Re-flooding and reseating with benches of stained and varnished deal throughout the ground floor and gallery. A platform, containing pulpit and deacons' seat, has been constructed at the end of the chapel, with a door on each side of the pulpit to the minister's and deacons' vestries, the end of the building being relieved with a large arched recess. The gallery-front has been lowered, and new windows and doors have replaced the old throughout the building. An external loggia, the entire width of the chapel, has been erected in front, forming two lobbies to the body of the building below, and containing a staircase on each side to the gallery above. The chapel has been heated by means of hot-water circulating pipes. The walls, ceiling, &c., are distempered and painted in plain colours. The works, which have cost a sum of over 500*l*., have been carried out by Messrs. Cole, builders, of Thaxted, under the direction of Mr. C. Pertwee, architect, Chelmsford.

Fenton.—The memorial-stone of a new Wesleyan chapel at Fenton has been laid. The style adopted is Italian. The materials to be used are red bricks, with bricks of other colours sparingly introduced for relief, and Hollington stone dressings. The accommodation in the chapel will be for about 700 persons, and a portion of the sittings will be free. At the rear of the chapel will be a class-room and a minister's vestry. The central portion of the front gable will contain the two entrance-doorways and a five-light window, with tracery head. The interior woodwork will be of pitch-pine and red deal, stained and varnished. The building is to be warmed by hot air, and the front of the site is to be enclosed with iron railing and gates, with stone piers. Mr. G. B. Ford, of Burslem, is the architect; and Mr. T. Newbon, of Longton, the builder. The amount of the contract is 2,100*l*., exclusive of lighting and heating, and the total outlay will be about 2,350*l*.

Books Received.

The Elementary Education Act, 1870 (33 & 34 Vict., c. 75), and Elementary Education (Elections) Act, 1871; with Introduction, Notes, and Index. By HUGH OWEN, Jun., of the Middle Temple, Barrister-at-Law. And an Appendix. Seventh Edition. London: Knight & Co., Fleet-street.

The present edition of this work contains, in addition to the several orders of the Educational Department as to applications for and the elections of School Boards, the new code as to Parliamentary grants, the general order of the Poor Law Board, and the instructions of the Education Department as to the planning and fitting up of schools, &c. The accuracy and utility of the work are testified by the number of editions through which it has already passed.

Transactions of the Indian Engineers' Association; for the half-year ending June, 1871. Vol. I. Calcutta: Printed by H. C. Gangooly & Co., 23-24, Mangoe-lane.

This interesting association, which seems to have been started entirely by native engineers, was established on a permanent basis in January, 1871. It regularly holds monthly meetings, and the present volume contains interesting and able papers by native Indians on various subjects, and in good English, such as On the Laterites of the District of Bannoorah, by Baboo Jodu Nath Roy; Notes on Brick-making, by Baboo Khetter Molum Bose; on

the Temple of Juggernaut, by Baboo Radhica Prasad Mookerjee; a Brief History of the Steam-engine, by Baboo Madhub Chander Roy (one of the three secretaries, all natives); Memoranda on Macadamising Roads in the Province of Bengal, by Baboo Jodunath Roy. There are also an Appendix containing extracts from Professional Papers, and several plates, besides some business-like observations on the objects of the Association, and on the proceedings, by Baboo M. C. Roy, hon. sec.; besides whom there are the two other secretaries, Baboo Nilmony Mitter, and Baboo Deno Nath, sen. The president and vice-presidents are not yet elected.

VARIORUM.

The economy of heating greenhouses by means of gas has been more than questioned by some of our correspondents. It would of course depend to some extent on the mode adopted. A writer in *The Gardener* says on the subject:—"Wherever gas is to be had at a reasonable price I am convinced that it is much more economical to heat a greenhouse with it than with an ordinary boiler; and where a large greenhouse is in question it will pay any one well to make his own gas. Outside a room, 17 ft. by 10 ft., and 10 ft. high, I have a small conservatory, 7 ft. by 3 ft., just covering the opening of the window, which has been taken entirely out. Round this little greenhouse runs a 1½ in. iron pipe, communicating with a copper boiler outside on the leads. This boiler is broader and shallower, and during the last two winters I have maintained a temperature of 50 degrees, without any fire in the room, by merely lighting the gas under the boiler from eight o'clock at night until the same hour the next morning. Of course the boiler is sheltered from wind and rain. The burner, which is one of those known as a 'roarer,' is 5 in. high, and shaped like the chimney of an ordinary paraffine lamp, rising up through a globe. The gas enters the gaspipe and passes to the globular part of the burner, where the pipe is closed, except at an orifice considerably smaller than an ordinary sized pin's head. Through this hole the gas rushes upwards towards the tube or chimney, and before entering it becomes completely mixed with air in its passage through the central opening. On applying a light at the top of the chimney, the mixed gas and air unite to form an almost colorless flame, which emits intense heat, accompanied by a 'roaring' noise, which, however, paradoxical as it may appear, is very slight." If owners of greenhouses were to place the heating pipes so that they could be regularly blackened, they would find a saving in fuel of at least fifteen per cent., after all expenses attending the process were paid.—"Building Societies and Borrowers," by C. D. A. Friedlein, offers refutations of principles on which private building societies have been worked; illustrates the mutual interest and security which borrowers, investing members, and depositors should have in building societies; and the exorbitant rate of interest paid by borrowers in building societies worked upon unsound principles. Its tone is shown by the circumstance that on its first appearance an injunction in Chancery was asked for against its publication, but it was refused. Some of the building societies certainly want looking into.—Binding together the little "Shilling" books, by Mr. Edward Walford, Mr. Hardwicke has issued a most compact "Peerage, Baronetage, Knightage, and House of Commons." It makes little more than a pocket volume, and is wonderfully comprehensive.

Miscellaneous

Opening of a New Cattle-Market at Leicester.—A new cattle-market has been laid out on nearly twenty acres of land and opened in the south-western suburbs of Leicester, at a cost to the corporation of something like 30,000*l*. It is laid out in the most improved manner, and comprises not only an area of several acres for horse-fairs, but also ten slaughter-houses, in two blocks, for cattle, two for pigs, and one for condemned animals; besides offices and houses for the clerk and other officers connected with the market. The slaughter-houses are connected with the main line of the Midland Railway by a short branch line; while close to the market the Midland Company have, at a cost of about 10,000*l*., constructed cattle-docks, from which cattle have easy access to the market, and vice versa.

The Prosperity of Berlin.—Writing under this head, the correspondent of the *Manchester Guardian* in Berlin says:—"Joint-stock companies are springing up daily like mushrooms, and for every conceivable branch of industry. Mines, railway stock, breweries, gutta-percha, new streets and new suburbs, sewing-machines, chemical works, &c., offer a wide field for the choice of investors. . . . The Berlin Exchange, one of the largest and handsomest in Europe, is no longer nearly big enough for the immense increase of business, and is to receive considerable additions. . . . In the neighbourhood of Französisch Buchholtz, a few miles from Berlin, a handsome carriage stops before the door of a milkwoman's cottage, and a gentleman asks if she is the owner of the plot of ground. The woman is rather taken aback, and before she can answer, the stranger continues: 'Will you take 10,000 thalers for it?' Had he offered 500 she would probably have closed at once; but the liberality of the offer made her hesitate. 'I must first consult my son in Berlin,' was accordingly the reply. The son, who keeps a hearth-shop, is consulted, and says, 'Mother, I smell a rat. You may get twice the sum if you stick out for it.' The next day the gentleman offers 20,000 thalers. 'Well,' says the woman, 'I must consult my son once more.' The son shakes his head more wisely than before, and advises his mother to refer the intended purchaser to himself. Next day he says to the applicant, 'Ah, sir, you have come just too late. I sold the land to a company yesterday for 50,000 thalers to build a manufactory on, and am to sign the agreement to-morrow.' 'But if I give you 60,000 thalers, what then?' 'Why, then, of course you have the preference.' The bargain was struck at once."

Accident at the New Colonial Offices.—Mr. Bedford has held an inquest at Westminster Hospital on the body of Patrick Collins, aged 46, a labourer employed at the extensive range of buildings now being erected in King-street, Westminster, for the new Colonial Offices. Michael Mahony, a labourer, said that on the 8th inst. he was working with the deceased at the new Colonial Offices. They, with other labourers, were employed in moving scaffold-poles across a wall from one side to the other. They were standing on the top of the brick wall, which was 14 in. wide, and 75 ft. in height from the ground. The work had been finished, and the scaffolds taken away, all but a few of the poles and putlogs, which they were then removing. The deceased, who was standing on the top of the wall, was in the act of handing a pole across, when his foot slipped, and he becameiddy, and fell off the wall on to the ground below, striking his head in his descent against one of the putlogs. He fell more than 75 ft. Deceased and other men complained of the work being dangerous. The jury, after some deliberation, returned a verdict of accidental death, but added their opinion that the manager of the works should take precautions to prevent accidents amongst the workmen.

House Property.—At a recent sale of house property by Mr. F. Godwin, at the Auction Mart, Lothbury, the following prices were amongst those realised:—No. 107, Fulham-road, held for an unexpired term of 34 years at 15l. ground rent, 575l.; No. 8, Brompton-square, held for an unexpired term of 48 years at 7l. 10s. ground-rent, 770l.; No. 9, Brompton-square, held for an unexpired term of 48 years at 7l. 10s. ground-rent, 750l.; 54, Brompton-square, and 2, Cheval-place, held for an unexpired term of 48 years at 7l. ground-rent, 900l.; 16, Exeter-street, Chelsea, held for 14 years at 4l. 6s. ground-rent, 135l.; 12, Motcomb-street, held for an unexpired term of 29 years at 7l. ground-rent, 1,180l.; No. 13, Motcomb-street, held for an unexpired term of 51 years free of ground-rent, 1,620l.; No. 14, Motcomb-street, held for an unexpired term of 33 years free of ground-rent, 1,260l.; No. 18, Wilton-place, Belgrave-square, held for an unexpired term of 50 years at 6l. 6s. ground-rent, and let for 15 years at 140l. per annum, 2,600l.

The South Kensington Museum.—A public meeting was held at Wostbourne Hall, Paddington, in furtherance of a movement for the opening of the South Kensington Museum on Sundays. Resolutions were adopted to the effect that a petition to Parliament be submitted, praying for the opening of the Museum on Sundays, and appointing a deputation, who have since waited on Earl de Grey and Ripon and the Right Hon. W. E. Forster.

The Restoration of Croft Church.—A consistory court, says the *Darlington Times*, has been held in the parish church, at Croft, before the Right Hon. T. E. Headlam, M.P. for Newcastle, chancellor of the diocese of Ripon, to consider an application made by the Rev. Frederick Henry Law, Rector of Croft, for a faculty authorising them to take down and entirely remove the chancel of the church and vestry on the north side thereof, and the pews and sittings and other erections now in the chancel, and also the pulpit and lectern, and to rebuild and restore the said chancel and vestry, and to replace therein the pulpit, lectern, pews, and sittings, and for other purposes set forth in the citation. At the conclusion of the inquiry, the chancellor said the church ought to be restored throughout, as well as the chancel. The great difficulty was that the clergyman had submitted a clear and definite plan, while the opposition had no counter scheme to present. He thought it exceedingly desirable that the parishioners should put into a clear, definite shape what they proposed to do; therefore he proposed to delay the issue of the faculty to give them time to apply to the court, and he thought it would be wise on the part of the rector to make considerable concessions; and the court might then adjudicate. It was finally resolved that the faculty should take effect in three months, with this condition. Mr. Street and Mr. Fowler have respectively reported on the state of the church, and in favour of the rector's views.

The late Rev. W. H. Black.—We mention with exceeding great regret the death, on the 12th inst., of a remarkable man, the Rev. W. H. Black, F.S.A., the Palaeographer of the British Archaeological Association. Mr. Black died at Mill-yard, Goodman's-fields, the place of his parastate, at the age of sixty-two (according to the *Times* obituary: we should have thought him older), and will be buried at Abney Park Cemetery, on (this) Friday, the 19th, at half-past two o'clock. We have often had occasion to speak of his rare skill in rapidly mastering the contents of ancient documents, and conveying the pith of them in a popular form to a mixed audience. He was equally genial and erudite.

London Institution.—At a *conversazione*, on the 17th inst., a lecture "On Colour," by Mr. F. S. Barff, was delivered. It treated of,—Facies respecting colour—Chemical illustrations—Composition of the sulphide of mercury; action of heat upon it; action of friction on the volatilised sulphide—Changes produced by heat in certain metallic iodides, and in crystals of cobalt and copper salts—Structure of the eye; comparison of its functions with those of some other organs of sense—Pure colour—Colours viewed by different coloured lights—Illustrations with the electric light—The Spectrum—Absorption of portions of white light—The three primitive colours—Methods of testing the purity of pigments by the prism—and Fluorescence.

Fall of a Girder on the Midland Railway.—On Tuesday last, Benjamin Gamini died in the infirmary of St. Pancras Workhouse from the effects of an accident which took place by the falling of, or as it is alleged, the breaking of an iron girder on the Midland Railway. The deceased and other workmen were employed on Monday afternoon in removing a girder for some improvements which were being effected at the bridge which crosses the Midland Railway at the Camden-road. They had just succeeded in swinging the iron girder, when, it is stated, it suddenly broke in three pieces, one of which, a heavy mass, fell upon the unfortunate man Gamini, crushing him in a frightful manner.

The Proposed Covered Cab-stand at Knightsbridge.—Shopkeepers of Knightsbridge and others have memorialised the Westminster District Board of Works against the endeavour,—first proposed in the *Builder*,—to improve poor cabs' hard position, by adding a cover to his stand, and enclosing a part of it as a waiting-room. The Board, however, had already given their consent, conditionally, to the proposal, and have sent a copy of the memorial to Colonel Henderson, of the police, whose plan it is.

Imperial Theatre, Newington Causeway. We are asked to say that the dimensions we gave as the size of stage, viz., width 30 ft. and height 40ft., are the measurements of proscenium opening. The stage will be 67 ft. wide and 58 ft. high.

The Proposed New Fruit and Flower Market for the City.—The Markets Committee have reported to the Court of Common Council, recommending that the Farringdon Market should be reconstructed as proposed, at a cost not exceeding 150,000l. The rents, it is anticipated, will be increased from an average of 712l. a year to 9,592l., and the tolls and casual lettings from 507l. to 4,000l. The Council have adopted the report, and given the committee authority to apply to Parliament for the requisite powers, and to raise the necessary sum.

Hucknall Church and Byron's Grave.—A correspondent of the *Notts Guardian* states that with the view of realising a monument worthy of Byron in Hucknall Church, where his remains and those of Ada lie, a sum of 2,150l. has already been subscribed towards the reparation and enlargement of the church itself, by residents in the locality, and that aid is now further wanted from the public to promote the objects in view. The plans for the restoration have been prepared by Messrs. Evans & Jolly, architects, Nottingham.

Fixed Indian Ink.—We have received from Mr. Laurence Cowen some fluid Indian ink, which has this advantage amongst others, over ordinary Indian ink, that it will not move under colour; tint after tint may be applied without disturbing the lines. The somewhat ugly plan hitherto pursued of colouring at the back of tracing-cloth and paper may thus be superseded. It is claimed for the new material, too, that it will remain in a fluid state, and when in use does not turn ropy.

Recreation Ground at Deptford.—Mr. W. J. Evelyn has signified his willingness to allow the townspeople of Deptford to use six acres of ground for purposes of recreation, a nominal rent only being charged. The ground is to the west of Old Sayes Court Farm, and, as including the site of the house in which Peter the Great is said to have lived while learning the art of shipbuilding in this country, possesses historical interest.

The Ordnance Survey of London.—The report of the progress of the Ordnance survey for the past year has been issued. It states that the plans of London on the scale of 60 in. to a mile are now complete. They are drawn on 326 full-sized sheets of paper, and probably form the largest and most complete plan of a city ever produced. Of these plans, 144 sheets have been engraved and published, and the remainder are in progress.

Railways and Working-class Dwellings. An ardent opponent of the Mid-land Railway writes to complain that "nearly 200 families, chiefly of the labouring classes, are being turned out of their homes at a short notice," in the vicinity of the Holborn Viaduct, in order to make room for the new station of the London, Chatham, and Dover railway. He urges that families who are weekly tenants should receive compensation for being summarily ejected.

A Relic of Exeter House, Derby, has been advertised for sale. It consists of the entire lining of the "council chamber," which was wainscoted with dark oak from floor to ceiling, adorned with pilasters in the doorways and casements, and finished with heavy cornices. The wood, according to the local *Advertiser*, is in good condition.

Docks at Portlehead.—A contemporary is informed that the whole of the capital required for the completion of the docks at Portlehead has been subscribed, and refers to the fact as showing that the promoters of the scheme have the greatest confidence in the work they have undertaken. It appears that only 5,000l. of the entire sum have now to be made up.

Public Baths on the Thames.—Mr. Ayrton and the Thames Conservancy have, it appears, consented to the construction of a bath off Battersea Park, and the company which has undertaken the work intends fitting up another (provided, of course, with a filtering apparatus) close to the Embankment, between the Temple and Waterloo Bridge.

Monument in Dublin to the late Lord Mayo.—A meeting has been held in Dublin, for the purpose of making preparations to erect a monument to the late Lord Mayo.

Church at Winterton, near Brigg.—Complaints have reached us of the manner in which "restoration" is being carried on here without professional advice.

Sale of Sites in Northampton.—A number of freshhold plots of building-ground, situate in the new street leading from the Town-hall to the new Northampton and Bedford Railway Station, have been sold. Lots 1 to 8 were sold at from 3s. to 3s. 8d. per foot by private contract. Lot 9 (14,620 ft.), was sold by auction, at 2s. 6d. per foot; lot 10 (1,080 ft.), at 4s. 6d. per foot; lot 11 (2,970 ft.), at 3s. 6d. per foot; lot 12 (2,200 ft.), at 4s. 6d. per foot; lot 13 (10,408 ft.), at 3s. 6d. per foot; and lot 14 (1,040 ft.), at 3s. 1d. per foot. Lots 11 to 14 are about the centre of the east side of the new street, between Angel-lane and St. John-street. Lot 9, the most extensive piece, and which was purchased by Mr. Pickering Phipps, runs from the New-street into St. John's-street on the west side. Lot 10, bought by Mr. John Collier, forms the opposite corner.

Practice makes Perfect.—Mr. Bessemer, giving evidence before a committee of the Society of Arts, the other day, said, I have observed the sleight of hand that men acquire in various mechanical arts where they have a certain thing to do, and that only; and it is really marvellous how, in three or four weeks, a man will do with ease what would have been pronounced an utter impossibility. Take, for example, the forging of steel. A man will take a bar of steel, which has to be forged into an octagon shape, and he will pass it under a heavy hammer, striking about 300 blows a minute, and will turn it exactly one-eighth of a revolution at each stroke, and the whole of the bar is forged with the greatest exactitude, though he has to alter the angle every 300th part of a minute.

New Roman Catholic Schools at South Stockton.—The foundation-stone of new schools to be dedicated to St. Patrick has been laid here on a piece of ground between Gilmore and Westbury streets, near Mandall-road. The schools will be built of plain red brick, the architects being Messrs. Goldie & Child, of London; and the clerk of the works is Mr. Atkin, of Leeds; and the contractor for the whole of the work, Mr. J. F. Craggs. The building will accommodate 300 children; will cost about 800l.; and is expected to be finished in July.

The New Post-office, Chester.—At a recent meeting of the Town Council it was unanimously resolved, "That a communication be addressed to the proper Governmental department, expressing the hope of the council that the new post-office, proposed to be erected in St. John-street, may be so designed as to harmonise with the architectural features peculiar to the City."

The Severn Tunnel.—The Severn Tunnel Railway Bill empowers the Great Western Railway Company to provide and subscribe the whole of the spare capital of 750,000l. required for the undertaking. The opposition has been withdrawn, and the Bill will come before the chairman of Ways and Means as an unopposed Bill.

Leatherdale	1,150 0 0

* Accepted, for residence only.

For stabling for eleven horses, coach-houses, and living-rooms above, for Lord Anckland, in Buckingham-row. Mr. W. S. Chapman, architect. Quantities supplied by Messrs. Woodzell & Colouitt.—

Ennor	£1,449 0 0
Cooke & Green	1,313 0 0
Smith	1,297 0 0
Newman & Mann	1,265 0 0
Scriveners & White	1,254 0 0
Wagner (accepted)	1,120 0 0

For two houses and shops, at Leytonstone, Essex, for Mr. Cullen. Mr. J. W. Forge, architect.—

Cains	£1,450 0 0
Brown	1,250 0 0
Ingham	1,065 0 0

For repairs, painting, decorations, &c., to house at Heron-hill, Newark, for Mr. Moss Isaac. Mr. J. D. Hayton, architect.—

Pearce	£890 0 0
Blott	765 0 0
Maxwell	729 0 0
Deacon	685 0 0
Richards (accepted)	433 0 0

For enlarging the United Methodist Free Church, Mills-street, Vauxhall. Mr. S. J. Steadman, architect.—

Richards	£475 0 0
Keast	420 0 0
Mallett (accepted)	395 0 0

For additions to house, High-street, Battersea, for Mr. William Griffin.—

Baker (accepted)	£210 0 0
------------------	----------

For warehouse and drying-shed, Russell-street, Bermondsey, for Messrs. Axell & Co. Mr. G. Elkington, architect.—

Coleman	£1,089 0 0
Maxwell	1,067 0 0
Deavin	1,025 0 0
Preston (accepted)	895 0 0

For three warehouses in Fetter-lane, Holborn. Mr. W. S. Witherington, architect.—

Eaton & Chapman	£3,257 0 0
Mark	3,068 0 0
Little (too late)	3,075 0 0
Robbins & Co.	2,890 0 0
Elkington	2,550 0 0

For stabling, coach-house, &c., Kendall's-mews, Portman-square, for Mr. J. Taylor. Mr. W. S. Witherington, architect.—

Mark	£317 0 0
Brown	298 0 0
Eaton & Chapman	290 0 0
Cole	285 0 0
Edmondson	275 0 0
Little	235 0 0

Office, Ludgate Circus.—Messrs. Perry & Co.'s tender for Messrs. Cook & Sons' offices at Ludgate-circus, as reduced, has been accepted at 18,000l.

No. 7, Backleybury.—Mr. G. S. Pritchard says his name should be added to the list given by us, and that his tender, 1,783l., has been accepted.

TO CORRESPONDENTS.

W. S. W.—S. J. S.—F. V.—S. W. G.—Experius—T. B.—E. M.—A. E.—L.—E. T.—E. F.—L.—A. S.—J.—L.—A. R.—P.—H. J.—P.—W. C.—A.—B.—O.—E.—S.—T. G.—J.—Roy.—Mr. R.—S.—T.—A.—S.—G.—B.—S.—N.—& Son.—T. W.—A.—R.—G.—T.—G.—S.—P.—Perry & Co.—A. W. (we cannot take mere assertion on trust.—Property in *lines* should be added to the list given by us, and that his tender, 1,783l., has been accepted.)

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Notiz.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants.

Ashton & Green, Slate and Slab Merchants and Quarry Agents.

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings.

Architects, before committing themselves to any system of Warming, should send to TRUSWELL, BROTHERS, & HOLDEN, 100, Nottingham-street, Sheffield, for a prospectus of their Improved Patent Hot-Air Apparatus.

FOR SALE, the "BUILDER," complete, from 1855 to 1871, inclusive, with old numbers (8 vols. bound, Cost 171. 16s.)

THE QUARTERLY REVIEW, No. 264, is published THIS DAY.

THE STUDENTS GUIDE TO THE PRACTICE OF MEASURING AND VALUING ARTIFICERS WORKS; containing copious Measurements for the Valuation of Labour, DOORS, &c. in addition, written by E. WYNDHAM TARN, M.A.

THE SCIENCE OF BUILDING: An Elementary Treatise on the Principles of Construction. Especially adapted for the use of Architectural Students. By E. WYNDHAM TARN, M.A. Architect.

PRACTICAL GEOMETRY for the ARCHITECT, ENGINEER, SURVEYOR, and MECHANIC. By E. WYNDHAM TARN, M.A.

PERFECTION IN BOOKKEEPING.—Builders and others desiring a really good system can have a NEW MODEL for BUILDERS BOOKS by DOUBIE EMBRY, to which was added the system of bookkeeping, the most complete and which has been adopted by many large firms.

TESTIMONIALS. "I have tried your system of bookkeeping, and like it very much." "Your system seems thoroughly to meet our requirements." "I like your system very much, and shall adopt it." "Having adopted your system of bookkeeping, we can recommend it to the builders generally. Having had it in use over twelve months, we find it saves much time and trouble."

NEW ELEMENTARY WORK ON PHYSICS BY PROF. GANOT. SATURDAY next, in convenient form, with 200 woodcuts, price 7s. 6d.

THE EDINBURGH REVIEW, No. CCXLXVI. APRIL, was published on MONDAY last.

DILAPIDATIONS. A Text Book in Tabulated Form, with Copious Index. By BANISTER FLETCHER, Author of "Model Houses," &c.

LITHOGRAPHED BILLS OF QUANTITIES. SPECIFICATIONS, &c. ROBERT J. COOK & HAMILTON have made such arrangements for this special description of lithography, as to print to any extent as completed in a given time, under the personal superintendence of one of the firm, thus ensuring accuracy and promptness.

PARTNERSHIP.—WANTED, a BUSINESS, able to manage about London and to take the cash and coming home department.—Address, Y. F. B. care of Mr. G. Street, No. 20, Cornhill, E.C.

WANTED, a PARTNER, to take the Painting, Gilding, and Decorating Department in an established Plumber, Glazier, and Painter's Business, in an improving part of the Middle counties.—Address, J. J. care of Mr. Reeva, Printer, Stratford-on-Avon.

WANTED, by an Architect and Surveyor, an ASSISTANT for about a week or a fortnight. He must be thoroughly acquainted with the preparation of drawings.—Address, stating salary required, to H. P. B., East-street, Walworth.

WANTED, immediately, a competent DRAUGHTSMAN. Must be able to make complete working drawings from rough sketches preferred.—Address with references and salary, M. M. care of Mr. Wheeler, Newsgate, Manchester.

WANTED, immediately, a good Draughtsman, in detail and construction.—Apply, personally, to DEURY & LOVEJOY, 38, Baskinbury, between Euston and One on Saturday, 20th inst.

WANTED, immediately, for a limited period, a first-class DRAUGHTSMAN, accustomed to the Italian style and detail, and possessing a thorough knowledge of construction. It will be useless for any to reply but those perfectly competent, and in the above particulars especially. State age, terms, experience, and references.—Address, 143, Office of "The Builder," Walworth.

WANTED, an ASSISTANT (Architect and Surveyor) competent to work under the principal, had measuring, plan taking, preparing working drawings, &c. Next-hand writing independent. Permanent engagement.—Apply by letter, stating terms, &c., 89, Office of "The Builder."

WANTED, in an Architect's Office, twenty rates from London, for a permanent, an experienced practical ASSISTANT, first class Draughtsman, and Designer, having a good knowledge of domestic architecture in all styles. It is requested that none but those whose qualifications and references are first-rate, will address 124, Office of "The Builder."

WANTED, the ASSISTANCE of a BUILDERS' CLERK, of good practical knowledge and experience, to compute and keep a set of books on a checking system, and to take out quantities. One who has been employed where machinery is used would be preferred.—Apply by letter, stating age, salary, and last employment, to the Saw Mills, Sreemack.

WANTED, an AGENT, having a connexion with London Architects and Builders, to sell a material extensively used in the building trade.—Apply by letter, addressed A. K. No. 85, CHARLWOOD-STREET, FULHAM, LONDON.

WANTED, in a Builder's Office, an intelligent YOUTH. Must be quick at drawing, write a good hand, and have some knowledge of tracing drawings.—Address in own handwriting, A. B. 75, Whitechapel-street, E.C.

WANTED, a good PAINTER, to take the charge of a job in the country.—Apply to Mr. STOKES, No. 8, DUNGATE-STREET, St. James's.

WANTED, in the Office of a BUILDER and DECORATOR, a respectable YOUTH about 18 or 24. He would have a good opportunity of grounding himself in office duties and business routine.—Apply to ROSS & LYON, Builders, &c. 113, Fulham-road, S.W.

WANTED, a Practical THREE-BRANCH HAND, with a knowledge of bookbinding. Must have had experience in superintending jobs.—Apply by letter to Mr. G. S. STEARMAN, Surveyor, Park-road, Northolt.

WANTED, a first-class GASFITTER and BELLOANER, for the Jobbing Trade. A permanent position and good wages.—Apply by letter, stating age, wages, and references, to H. B. GOSWELL, Librarian, 35, Chapel-street, Bockvale square.

WANTED, ONE or TWO first class HANDS. Must be well used to stencil work and good at classing.—State wages, &c., to No. 124, Office of "The Builder."

WANTED, a thoroughly good PLUMBER, accustomed to old and new work, one well up in all branches, who can do hot water and gas fittings, plain sink work, &c. Constant work.—Applications, stating age, wages required, &c. with references, to be made to DE BAVIN, 11, Superintending, Burnwood Ashton, near Lechliff, from whom any further particulars may be had.

WANTED, by PARENTS and GUARDIANS, an ARCHITECT in the country, with average works in hand, a PUPIL.—Address, C. M. Office of "The Builder."

WANTED, by CARVERS and GILDERS, an ASSISTANT, a first-class CARVER and GILDER, who can undertake every branch of the business.—Apply to Mr. W. S. SPANTON, Bury Saint Edmunds.

WANTED, TWENTY or THIRTY good JOINERS and FIXERS, for twelve months certain. Wages, 4s. 6d. a week, overtime 6d. per hour.—Apply at the Saw-mills and Joinery Works, Sevenoaks, Kent.

WANTED, an active and competent SHOP FOREMAN.—Apply, by letter only, stating age, particulars of former engagements, and salary required, to Mr. B. B. SPURWELL, No. 8, St. Stephen-street, Mayfair, W.

WANTED, a GENERAL SHOP FOREMAN, in the country.—Apply, by letter, giving name and references to Mr. A. REYNOLDS, Builder, Milborne Port, Sherborne, Dorset.

WANTED, a WORKING FOREMAN of PAINTERS and DECORATORS, for a Mansion in the country, stating wages required and references, to CLARK & SMALLWOOD, Woodton Warren, near Henley-in-Arden.

WANTED, a WORKING FOREMAN, to manage a branch business.—Apply by letter, stating references, to No. 111, Office of "The Builder."

WANTED, a FOREMAN, a BRICK-LAYER by trade, to conduct a job near London.—Address, stating wages required, with references from last employer, to No. 112, Office of "The Builder."

WANTED, a FOREMAN, for extensive FIRE BRICK WORK in the County of Durham. None but experienced parties need apply.—Address, S. J. Ball, 7, Horsemarket, Dr. in two.

SEWAGE FARM.—The Swindon New Town Local Board require a competent Person to undertake the MANAGEMENT of a FARM of 120 acres, situated with sewage. A suitable dwelling-house will be provided for the manager.—Apply, stating wages required, with testimonials and references, to Mr. J. C. TOWNSEND, Clerk to the New Swindon Local Board, Swindon.

FOREMAN of PAINTERS.—WANTED, in the North of England, a MANAGER, to superintend the decorating department of a first-class business, a good situation would be offered to a thoroughly competent man.—Address, A. B. C. Kennedy's Office, Advertising Agents, Manchester.

GOOD, quick PENCIL HAND WANTED. Address, W. GIBBS, 108, Union-street, Borough.

A JUNIOR CLERK WANTED in a Builder's Office, aged about 18, to book, time and materials, &c. Must have been in a Builder's Office, and a good penman.—Address, stating age and salary expected, to No. 94, Office of "The Builder."

A BUILDER in Lancashire is in WANT of good practical knowledge of building to all its branches, as well as of measuring and estimating, and must be competent to take entire management of the business in the occasional absence of the principal. State age, salary required, and references.—Address, W. 113, "Guardian" Office, Manchester.

PUPIL.—A CIVIL ENGINEER, having work of considerable magnitude in operation, has a VACANCY in his Office for a PUPIL. The district in which the work is situated being one of considerable extent and importance, affords unusual opportunities for the acquisition of engineering experience.—Address, A. B. 163, Strand, W.C.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as GENERAL FOREMAN of PAINTERS and JOINERS. Town or country, or to go abroad. Four years' experience. Good references.—Address, T. B. No. 4, Duke-street, West Smithfield, E.C.

WANTED, by a thoroughly practical Man, a RE-ENGAGEMENT as FOREMAN of BRICKLAYERS. Has no objection to work himself, or will take work by the piece, good reference to last employer.—Address, A. T. 7, London-street, London-road, Southwark.

WANTED, by a thoroughly experienced Man, a SITUATION as ONE OF GENERAL FOREMAN. Just finished a large job. Five years' testimonials from his last employer.—Address, 137, Office of "The Builder."

WANTED, by a thoroughly practical and energetic Man, Bricklayer by trade, an ENGAGEMENT as FOREMAN of a JOB, or would take brickwork by the piece. He will set up in setting out work from drawings, measuring, &c. Town or country.—Address, A. M. 58, Lillington-street, Fulham, S.W.

WANTED, by a thoroughly practical and energetic Man, a RE-ENGAGEMENT as GENERAL FOREMAN or CHARGE OF JOB. Thoroughly versed in drawing, setting out or measuring up any description of work, and good management of workmen, Carpenter and joiner. Aged 37. References from present employer.—Address, S. F. Post Office, Ashford, Middlesex.

WANTED, by the Advertiser, an EN-GAGEMENT in an Architect's or Surveyor's Office in London. Has a fair knowledge of design and surveying.—Address, H. & L. Post office, Dalwell, S.E.

WANTED, by the Advertiser, a RE-ENGAGEMENT as OUT-DOOR FOREMAN (carpenter and joiner by trade), or would take piecework in either of the above branches. Town or country. Aged 37. References from present employer.—Address, S. F. Post Office, Ashford, Middlesex.

WANTED, by the Advertiser, an EN-GAGEMENT as CLERK or CASHER. Thoroughly conversant with the duties, preparing plans and details, quantities, measuring up work, and settling Town or country. Aged 28. Good references.—Address, 93, Office of "The Builder."

WANTED, by the Advertiser, seventeen years of age, a RE-ENGAGEMENT in an office Town or country. He would have an opportunity of improving himself in keeping the books, taking out quantities, estimating, &c.—Address, A. B. 7, Argyll-street, King's-cross, N.

WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK or CASHER. Thoroughly conversant with the duties, preparing plans and details, quantities, measuring up work, and settling Town or country. Aged 28. Good references.—Address, 93, Office of "The Builder."

WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK or CASHER. Thoroughly conversant with the duties, preparing plans and details, quantities, measuring up work, and settling Town or country. Aged 28. Good references.—Address, 93, Office of "The Builder."

WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK or CASHER. Thoroughly conversant with the duties, preparing plans and details, quantities, measuring up work, and settling Town or country. Aged 28. Good references.—Address, 93, Office of "The Builder."

The Builder.

VOL. XXX.—No. 1525.

The Mid-London Railway: Traffic of the Streets.

HE important project of providing railway communication through London in the direction of its greatest dimensions from east to west, is not, in the current session of Parliament, a novelty.

In 1866 a scheme, the same in its essential features, was brought into Parliament, but rejected on the motion for the second reading, without inquiry into the merits of the Bill. The "incur circle," still far from completion, and not likely, indeed, ever to be completed, was then in course of construction, and it was thought desirable that further progress should be made with the works of the underground line, and that additional instalments of that system of communication should be opened to the public, before any other schemes of a similar character should receive Parliamentary sanction. The Mid-London Bill was not rejected, as has been said, on its merits, which were not inquired into.

The Mid-London railway scheme now before the public fares differently; it raises questions of vast importance as affecting removal of buildings, disturbance of business, displacement of dwellings, and especially as it may affect street traffic, railway connexions, facilities for locomotion, and the convenience of the population in its movements, in contradistinction to what may be called stationary local interests. In this session, Parliament in its wisdom has ruled that the merits and details of the project of a Mid-London railway are fit subjects for scrutiny and inquiry before a select committee, and the number, variety, and magnitude of the interests involved in the inquiry, combine to make the contest one of the most protracted and costly that Parliament has to deal with. It is certain that in the present session the Mid-London inquiry will prove the great contest of the session.

It may only be necessary to recall here the principal features of this scheme. The project is prosecuted by two Bills, the Mid-London Railway and the Mid-London Railway (Western Section). Taking the two schemes together, they are for a line of railway which will commence at Willesden Junction in the west, and will proceed in a direction nearly parallel with the Edgware-road to the Marble Arch, and from thence in a direction not far from the line of Oxford-street and Holborn to Coleman-street, and eastwards to Mile-end Old Town. The scheme embraces the formation of a new street from the angle of Giltspur-street and Newgate-street to the junction of Commercial-street, Commercial-road, and Whitechapel High-street. The proposed railways would be about nine miles in length and the estimated expenditure 4,766,616*l.*, including 1,400,000*l.* appropriated to the cost in part of making the new street. The line would have connexions, or exchange-stations, with numerous important railways.

This remarkable case was opened on the 15th of April in the Committee on Group I of Railway Bills, over which Mr. J. A. Hardcastle, member for Bury St. Edmunds, presides. Mr.

Rodwell, Q.C., opened the case for the promoters in an able address that lasted for nearly three hours. He detailed fully the particulars as to the direction of the line, the localities of the proposed stations, the estimates, and the multifarious public advantages calculated to accrue from the execution of the scheme. With Mr. Rodwell were Mr. Serjeant Sargood, the Hon. Mr. Thesiger, Mr. Gorst, and Mr. Kingsford. Mr. H. Toogood is agent for the Bill. The promoters have to face above sixty adverse petitions, many of them from powerful and influential associations, firms, and individuals. The former classes include,—the Metropolitan Board of Works, the Lord Mayor, Aldermen, and Corporation of the City of London, the Commissioners of Sewers of the City of London, the Governors of Christ's Hospital, the Governors of St. Bartholomew's Hospital, the Hon. Society of Gray's Inn, the Metropolitan Railway Company, the Metropolitan and St. John's-wood Railway Company, the Ecclesiastical Commissioners for England, the Marquis of Westminster, Lord Portman, John Neal, Daniel Neal, Lucy Fogg, and other unknown petitioners; with petitions from a large number of vestries, district boards of works, firms, owners, and occupiers. The array of counsel against the Bill is very formidable, and embraces Messrs. Venables, Q.C., Cripps, Q.C., Romd, Q.C., Clerk, Q.C., Sir Mordaunt Wells, Q.C., with about a dozen of other Queen's Counsellors and juniors.

Much of the evidence given in this *cause célèbre* is of a very interesting character. Mr. Wm. Casey, a traffic-taker, gave evidence that on the 28th March last, in Cheapside, from 8 a.m. to 12 midnight, 9,032 vehicles passed a given point, and 80,257 passengers, on foot or in omnibuses and private carriages. At the Post-office end of Newgate-street, the number of vehicles was 9,322, and of passengers 61,212. The traffic was taken at twelve stations on or near the line of the proposed railway. In Oxford-street, near Tottenham-court-road, the number of vehicles was 8,803, and of passengers 62,110. In the same thoroughfare, near Regent-circus, the number of vehicles was 9,361, and of passengers 68,872. The witness stated that it had been ascertained that 853 omnibuses passed along Oxford-street in each direction, east and west, daily. The proportions of vehicles of various kinds, and of passengers and their modes of conveyance, varied considerably at the different points of observation. For the sixteen hours, from 8 a.m. to 12 p.m., the numbers in Cheapside, near Old Jewry, were:—Omnibuses, 2,604; cabs, 3,477; four-wheeled wagons, 1,438; two-wheeled carts, 1,104; private carriages, four wheels, 326; private carriages, two wheels, 83. Passengers on foot, 54,677; in omnibuses, 21,247; in cabs, 3,307; in private carriages, 1,022; equestrians, 4.

Mr. Forbes, Managing Director of the London, Chatham, and Dover, and Metropolitan District Railways, gave very decided testimony in favour of the proposed railway, as calculated to afford great accommodation to the public, and to furnish important facilities to the passengers by other lines of railway with which it would be connected. The proposed line would provide facilities that could not be more effectively given by any other scheme that could be proposed. The traffic at Ludgate-hill Station amounted to about 8,000,000 of passengers a year, many of whom wished to get farther on, in one direction or another, which they would be able to do by means of the proposed Mid-London line. The witness was of opinion that the Metropolitan Company was now very nearly at the limit of their capacity, in regard to the traffic between east and west, from King's-cross to Bishop's-road. The Chatham Company was under contract to run eighty trains each way per day in and out of Moorgate Station, and they had got to fifty-six a day. The Mid-London line, if

made, would, he felt certain, accommodate a very large amount of traffic that at present could not be accommodated at all. It would be in communication with nine or ten of the terminal stations of large railway systems, from which it would at once collect traffic on the one hand, and deliver it on the other. The Mid-London line would have the advantage of a ready-made traffic, waiting to be carried, to enter upon at once.

Mr. Cawkwell, General Manager of the London and North-Western Railway, was called by the promoters, and stated his opinion that the line would give great accommodation to a part of London that is not at present supplied with railway communication. He believed the proposed line would very effectually relieve the streets of a large amount of traffic. Of 300,000 cabs leaving Euston Station, 237,685 were for destinations close to the line of the proposed railway.

Among other statements as to street traffic, made by Mr. Haywood, Engineer to the Commissioners of Sewers, and put in in tables, were the following:—Passengers by the Metropolitan District Railway in the seven months ending January 31st, 1872, 11,010,467; season tickets at twelve journeys per week, 203,449—total, 11,213,916. The Chatham and Dover passengers to Ludgate-hill in 1871 amounted to 8,361,595. Mr. Haywood gave evidence as to the street improvements that had been effected in the City of London during the last twenty-five years, amounting to more than 150 in number. He spoke also to the density of the population of different parts of London, and of the districts that would be accommodated by the proposed railway. St. Luke's contained a population of 159,909 to the square mile. The whole population of the City proper was 74,000. In the observations of street traffic made under directions, he had found that on different days in February last there passed in 12 hours a point in Oxford-street, between Tottenham Court-road and Regent-street, 8,236 carriages; near Great Turnstile, 10,560 carriages; at the Mansion House, east of the junction with Queen Victoria-street, 13,660 carriages. In Newgate-street, 33,000 foot-passengers passed a given point in twelve hours; and in the Poultrey, before Queen Victoria-street was opened, the foot-passengers numbered 75,100 in twelve hours. Mr. Haywood spoke in strong terms of the accommodation that would be given by the proposed new street, and the relief that it would afford to the present thoroughfares east and west, that were now so inconveniently crowded with traffic.

It may give some idea of the importance and the probable costliness of this inquiry to state that the greater part of the first fortnight has been occupied with the statement of the promoters' case, and the examination and cross-examination of their witnesses. It must be admitted that they have shown a strong case; but the hearing of the other side may alter its complexion. In addition to the witnesses already mentioned, the promoters have called numerous representatives of large trading houses in the City, and near the proposed line of railway in other parts of London, all of whom have offered testimony in favour of the scheme.

The engineering evidence in support of the line has been given by Mr. J. Hawkshaw, engineer-in-chief, Mr. Falkner, Mr. T. E. Harrison, and Mr. Jas. Fairlie Blair.

The Marquis of Westminster opposes on public grounds, as we understand, because instead of running under Edgware-road, Oxford-street, and Holborn, the line will run behind those thoroughfares, displacing thousands of houses and persons, and especially of the working-classes. We sympathise with this view, and trust some means will be devised to prevent the threatened evils in that direction.

THE KNOT OF SANITARY LEGISLATION.

We have recently called attention to the details of the Public Health Bill, as introduced by the Government into Parliament; to the criticisms offered by some of the leading advocates of sanitary reform; and to the history of sanitary legislation. We have especially pointed out the great national importance of deciding on the unity of system which it is necessary to design and adopt, at a time when it is first proposed to control the course of the functions which have been hitherto performed mainly by the unaided operations of nature. It is yet necessary, in order to attain a comprehensive grasp of the subject, to consider the influence of the special or subsidiary Acts of Parliament, now existing, on the administration of sanitary law; and to refer to the mode in which the Sanitary Commission, appointed in 1869, has advised that the subject should be dealt with.

Fifteen Acts of Parliament, as we have before noticed, deal with sanitary enactments in general; under the distinct heads of facilitating local government, of preventing the spread of disease, of removal of nuisances, of utilisation of sewage, and of raising money for any of those purposes. London, Scotland, and Ireland are chiefly regulated by special Acts. But the Acts which have a direct, although subsidiary, relation to sanitary measures proper are so numerous that they can be conveniently cited by us only in categories or groups.

The first of these groups consists of the Burial Acts, of which there are eight, without counting the special clauses introduced into Acts passed under some other title. The powers granted to the Privy Council, by the Metropolitan Interment Acts of 1850 and 1852, to close certain cemeteries, were a result of the reports of the Commission appointed in 1843, by Sir Robert Peel, to inquire into the state of large towns and populous districts. In 1853 this legislation was extended to the provinces. The general purport of these enactments was, to provide such sites and to enforce such provisions, with regard to burial, as should obviate the evil influence which neglect in this matter had been shown to exert on the health of this population.

Upwards of thirty Acts of Parliament have been passed in order to regulate the employment of children and young persons in factories and workshops. With these may be classed enactments referring to special trades or manufactures, such as those of the baker, the leecher, and the printer. An Act for the Regulation of Mines is now under the consideration of Parliament. While these Acts may be considered, so far as their sanitary character is concerned, as chiefly intended to prevent the deterioration of race caused by the over-working of the young, they also include provisions as to cleanliness, ventilation, over-crowding, and similar matters, which come naturally under the review of medical inspection; but they more properly belong to the educational, than to the sanitary, branch of administration.

Two Acts of Parliament, dated in 1846 and 1848, give facilities for the establishment of public baths and wash-houses; and there are provisions respecting bathing, in the Towns' Police Clauses Act of 1847, which are incorporated in the Local Government Act of 1858.

The question of overcrowded and unhealthy dwellings is dealt with by half a dozen Acts of Parliament, including those clauses in the Public Health Act of 1815 which enforce the registration of common lodging-houses. Notice of any contagious disease occurring in any lodging-house is required by the Acts of 1851 and 1853. There are similar provisions, especially with reference to overcrowding, in the general Acts; so that consolidation and simplification of the law as to this branch of medical police is much required.

Another class of Acts has provoked a more persistent opposition than any other detail of modern reform from persons who would resent being stigmatised as the friends of disease, misery, and crime, but whose activity actually tends to the degradation and destruction of the people. We refer, of course, to the Vaccination Acts, which were consolidated in 1867, and to the Contagious Diseases Act of 1866. The further simplification of the provisions of the law in this matter, and the exercise of such a stringent measure as might and would effectually stamp out two of the greatest scourges of humanity in modern times,—diseases of only some three hundred years' standing, and com-

municable exclusively by contagion,—is much to be desired.

Another class of Acts of Parliament is perhaps less directly to be regarded as of a sanitary character, in the first instance, than either of the preceding. This consists of measures intended to prevent the fraudulent adulteration of food, and the unregulated sale of poison. In 1860 the Act 23 and 24 Vict., c. 84, facilitated the appointment of analysts, by whom any purchaser of food may, for a small payment, have any article of food analysed; and provided penalties for adulteration. It is to be regretted that an Act of so benevolent a scope, and one which applies to the whole United Kingdom, is not generally in operation. Under the Nuisances Removal Act of 1863, already referred to, powers are given for the entry on premises to inspect food, and to destroy it if unfit for use. The regulation of the sale of poisons is under the Pharmacy Act of 1868. A striking instance of the isolated and tentative mode in which sanitary legislation has been attempted is afforded by the Alkali Works Regulation Acts of 1863 and 1868, directing the Board of Trade to appoint an inspector of all such works, which must be registered for this purpose, and carried on in an innocuous manner. The pressing nature of the nuisances arising from this particular manufacture spurred the public to seek for this special protection. A train of smoke, charged with sulphurous gas, has been traced from the mouth of the lofty chimney of one of these works till it struck the ground at a distance of nine miles, scorching and withering the vegetation on which it alighted. This Act bears a close relation to the Smoke Acts, so called. The nuisance of smoke is dealt with both in general and in local Acts. The provisions of the Towns Improvement Clauses Act of 1847, for its prevention, are incorporated into the Local Government Act of 1858, by which a penalty of 40s. *per diem* is imposed on factories the chimneys of which are improperly constructed. The Sanitary Act of 1866 classes all chimneys that emit dense and opaque smoke as nuisances. Acts also exist to prevent nuisance from the smoke of steam-vessels and of railway locomotives. The consumption of coal by the latter class of machines would appear, however, to be practically unchecked.

Finally may be cited the Quarantine Act, of 6 George IV., c. 78, which is a special sanitary measure, enforced through the Privy Council. The Sanitary Act of 1866 adds to the conditions by which vessels come under the provisions as to quarantine. In the operation of this law there is a division of responsibility between two central administrative departments, and a further confusion, in many instances, between harbour authorities and local jurisdictions. This, again, is a portion of that branch of administration which might be properly styled medical police.

The Registration of Births and Deaths, under the statute of 6 and 7 William IV., c. 86, has been already mentioned, as rather a means of collecting information of a statistical character, valuable for its sanitary nature, than as a portion of sanitary legislation, properly so termed. Thus we find eight distinct groups of laws, one of them alone containing thirty Acts of Parliament, which, as special or subsidiary measures, form more or less important portions of our present Statute Law on the subject of the Public Health; in addition to the fifteen distinct Sanitary Acts above enumerated.

We have seen that the Commission of 1869 divided, in their second report, the subjects of local government into the two branches of police and of supply. The latter, again, they divided as cleansome, or, in print of fact, the Poor law, with which they had no concern, and ordinary, or the public health. To rank sanitary legislation as a matter of ordinary supply, regulated by local government, is not a very admirable specimen of the art of classification. But let that pass, except in so far as a wrong title may often influence men to entertain a wrong conception of that which it describes. The Commission appear to have been admirers of that very easy, but often misleading, method of classification, which is familiar to logical students as dichotomising, or dividing in two, an artificial order of arrangement, long since abandoned by all serious thinkers. Passing this question of method, they speak of the duties of local government as being, in a wider sense, economical and, in a more restricted one, sanitary. But they find no reason for the division of medical from engineering functions, nor for any distinction between the

prevention of disease, or the removal of that which creates it, nor between the supply of wholesome air, water, and food, and the suppression of maladies caused by their unwholesomeness. In other words, the Commission have regarded the question of public health as a Medical Board may be supposed to do. They seem to have been unaware of the more accurate estimate of the subject which is formed by the practical publicist; and mainly or entirely ignorant of the great difficulties attendant on the engineering portion of the question, which is the very life of the matter.

Under these impressions they state local sanitary government to comprise eleven several heads. These are, the supply of water; the prevention of the pollution of water; the provision of sewers and utilisation of sewage; the regulation of streets, highways, and new buildings; the healthiness of dwellings; the removal of nuisances and refuse, and consumption of smoke; the inspection of food; the prevention of disease; burial arrangements; regulation of markets, &c.; public lighting of towns, &c.; and the registration of deaths and sickness. The result of following this view of the subject would be, that on the various and often most imperfectly informed vestries, town councils, and local Boards throughout the country, would be imposed the several distinct responsibilities which appertain to the sanitary engineer, the architect, and inspector of buildings, the medical inspector of health, the inspector of markets, of weights and of measures; the examiner of cemetery arrangements, the gas purveyor, and the Government registrar. To lump together these very different subjects is a species of consolidation which may be more properly termed confusion. We cannot wonder that Mr. Stansfeld should have demanded more time to consider the subject than would have sufficed for bringing in a Bill founded on so heterogeneous a plan. Sanitary legislation, pure and simple, is a matter of sufficient importance to have its boundary distinctly drawn. If, on the one hand, it is confused with the totally distinct subject of the reorganisation of the local administration of the country, and the determination of a new social unit, to replace the old order of Alfred the Great, which has now grown into decrepitude; and on the other hand it is sought, while omitting the engineer, to absorb the duties of the medical man, the architect, the policeman, and the public registrar, we shall find human life itself to be classed as an accident of sanitary legislation.

It is well for serious men to look this great subject boldly in the face. Two distinct principles are at issue. On the one hand the sanitary reformer, the medical reformer, the social science student, the Government, and, we may humbly add, ourselves—have one great object in view. It may be stated more or less mildly, more or less boldly. But it is not too much to say that it is this: To prevent the declination, or yet further destruction, sooner or later, of the rapidly increasing population of this country, by a pestilence generated by the results of their own neglect.

Opposed to this aim is what we may call the pocket interest. We do not wish to throw a stone at any one; or to attribute to any local committee, vestryman, or other unit of local authority in the country, any unworthy motives. Still, we can be blind neither to facts nor to human nature. There can be no denial that the objection entertained by people to tax themselves, even for the worthiest purpose, is great; and that it has a tendency to make them shut their eyes to the necessity of any reform for which they have to pay. "A Pack of Doctors who want they have to pay." Such is the emphatic summary in which Farmer Clubbshanks and Mister Cent-per-Cent will include the advocates of provisions for public health. To make way against this feeling is difficult. It is only by giving stringent power, whether legislative or administrative, to the sanitary reformer, that this dead weight can be set rolling.

Easy enough, no doubt, it would be to draw up a plan as nearly perfect as it is allotted to human theories to be. But here comes in the third difficulty. How will Parliament deal with it? The temper of assemblies like our two Houses must not be ruffled. Prepossessions—we will not call them prejudices,—must not be shocked. The minister may see clearly, not only what he wishes to do, but what, on the highest principles of statesmanship, ought to be done; but can he persuade the House of Commons to see with him?

It is on this view that we have, in our humble capacity, given to the measure now brought before Parliament an adherence which we might hardly have considered due to it on its own merits alone. The question of the consolidation of such a mass of confused legislation as we have shown to exist is not one that, according to precedent, is likely to be satisfactorily settled the first time it is brought before Parliament. Let any one look at the dates of the existing Acts, and see how enactment has been invariably followed by amendment. Ultimate, and even proximate, consolidation is the object, we believe, of all. But do not let us lose the present year in discussing a question that cannot be settled out of hand. To have to amend such a consolidating law the year after passing it would make us look ridiculous in the eyes of Europe.

We confess that, in our opinion, the main consolidation to which we look forward is the repeal, pure and simple, of the confused mass of laws above described; and, if a return to the principle of the common law on the subject,—that the committee of a nuisance can be compelled to abate it at his own cost (in which way Shakespeare's father seems to have been dealt with)—be impossible, at all events such a brief enactment as may be necessary to give force to that principle. All comes to that; and, we think, all might be said in comparatively few words.

But the real knot of the question is not this. Whether we go on for a few years more, building detail upon detail in our labyrinthine legislative structure; whether we pass a monster Act of 400 or more clauses out of hand, to amend and consolidate up to to-day; or whether such a briefer mode as we suggest should prove to be practicable, and not too stocking to legal legislation; or whether the Government Bill pass, *tal quel*, is not, after all, the most pressing question. The real knot of the matter lies in the administration. Under any circumstances, how are we to reconcile efficiency and local autonomy? How are we to insure that antonomic activity, if produced, shall do good, and not harm? We call on local authorities to act. We leave their hands, if not absolutely untied, yet at liberty to experiment to a great extent. In the course of these experiments, if carried out with all despatch, energy, and honesty, shall we not do at least as much mischief as good? And may not the mischief be irreparable, and the good lingering? So numerous, for instance, are the schemes for the utilisation of sewage, that a barrister has just published what he calls a hand-book on the subject; which is, in fact, little more than an index to some half a dozen reports of Royal Commissions, and one from the engineer of a particular undertaking. Are we to say to the local authorities, the question is so large, so important, and requires such high facilities for its successful treatment, that—we remit it to the wisdom of the vestry?

The President of the Local Government Board will have, if his Act pass, the same duty to perform in his department that the Secretary of State for war has to carry out in his own. He has to grapple with the two giant evils of poverty and disease; and we believe that he looks them resolutely in the face. On the organisation of administrative sanitary measures depends far more than on the words printed in the Statute-Book. Hitherto no one has spoken distinctly on this part of the subject. Fairly considered, it is the key to the whole. Let us, then, direct the attention of those who think and work with us rather to the administrative, than to the legislative, side of the question. Falling excellence in the former, the latter, even if it could be at once rendered perfect, would be as unimportant as are some of those excellent laws which we have above mentioned. Sanitary administration is the knot of the sanitary question. How is it to be cut? We look to the Government to propose the reply.

LAND AND RAILWAYS IN THE CITY OF LONDON.

Sir,—At a time when railways are covering the land, and the cry is "still they come," a Londoner feels perplexed as he contemplates the probability of his premises being required for some new line of railway, and generally a state of uncertainty exists among men as to fixing the locality of a business, as from the operation of a new line old and populous thoroughfares will be deserted, and the streams of traffic diverted into new channels. Take Broad-street, for instance, at present the terminus of so many lines of

railway, that for so many years was seclusion itself, the home of merchants, who required quietness to study their great commercial speculations, the effect of which was a colossal fortune or irretrievable ruin. This street is now all hustle and excitement,—vehicles and foot-passengers passing backwards and forwards. Moorgate, Farringdon-street, London, Chatham, and Dover Railway-stations; the District Railway, in Cannon-street, and soon the Mid-London, from Kilburn to the Marble Arch, along Oxford-street, to a terminus in Newgate-street, and similar scenes of hustle and noise will occur in these respective localities. My object in making these prefatory remarks is to draw attention to the evident wish of the railway companies to pass through the City of London, and it must be admitted that this is an important question, and requires careful consideration.

While on this subject I will allude to what must be considered an error on the part of the shrewd citizens of London, in reference to the waste lands within the City, a considerable amount of interest having to be paid annually on the purchase-money of this unproductive land. No doubt the reply will be that the City surveyor has not received any offers from any enterprising builder or other person for the surplus land in question; or if an offer has been made, it has been of too low an amount to be entertained. Now, in order to arrive at an impartial judgment, the market value of the land will inflexibly be the guide. I will take, for instance, the surplus land in connexion with Farringdon-street and its neighbourhood. The Holborn Viaduct, although a great public improvement, inasmuch as it reduces the labour of horses and the toiling pedestrian, also depreciates the value of the vacant land, because it takes the traffic away from the lower ground on to the higher level of the Viaduct, and therefore no shop-keeper could expect to prosper located on a spot deserted by the public, and consequently land thus situated will be covered by buildings devoted to manufacturing or other useful purposes, where it is not necessary to have shop-windows teeming with a display of fancy goods; and although the land would be valuable, a less price must be expected for it than if situated in a more attractive spot.

As this letter is devoted to City affairs, there is one that particularly demands instant attention. I believe it is a fact very well known, that the Farringdon-street Vegetable Market has proved a failure, involving a large annual pecuniary loss to the City treasury; but, notwithstanding this, in consequence of a reported misunderstanding of the fruit and flower dealers of Covent Garden Market, with the Duke of Bedford, their landlord, and an expectation that these tradesmen would leave Covent Garden Market and settle in Farringdon Market, a very expensive plan has been made by the City Surveyor, said to amount to more than 100,000*l.*, to accommodate these tradesmen; but it now turns out that the duke has come to terms with his tenants, and they have resolved to remain where they are. Fortunately this altered state of things has become known in sufficient time to warn the City authorities to hold their hand and withdraw from the contemplated unprofitable expenditure on an unsuccessful market.

RICHARD WHITTINGTON.

THE FEVER OUTBREAK AT BURBAGE, LEICESTERSHIRE.

It is now about fourteen years ago since any epidemic outbreak occurred in this village, whose population numbers less than 2,000 persons, until recently, although autumnal diarrhoea appears to have been prevalent for many years. Burbage forms part of the parish of Aston Flamville, one of the constituents of the Hinckley Union, and is situated on the Warwickshire border of Leicestershire. It presents the usual straggling form, stretching about half a mile along the Hinckley road, commencing at about a mile from that town; it then branches out to the right for about a quarter of a mile along a cross road, where it terminates.

The village has a gentle slope towards the junction of the two roads, which forms the lowest point. The occupation of the inhabitants is chiefly stocking-weaving, with agricultural and some other branches of labour. Work appears to have been abundant and wages good. The position of the village geologically seems to be on the red marl of the new red sandstone, and

overlying the lower Keuper sandstone. The subsoil is for the most part very loose, permitting the free passage of water, which lies at a depth of a few feet from the surface.

The water supply of the village (for domestic purposes) is derived from numerous wells sunk through this soil to an average depth of 20 ft., into the permanent water-bearing strata; these wells are for the most part lined with dry stones or bricks. Most of them are covered, and are supplied with pumps. Wells constructed in this manner of dry steining through a loose subsoil are always liable to contamination by surface drainage and percolation of faulty sewers and cesspools.

The water from all the pumps appeared clear and sparkling, free from smell or taste, and containing, in some instances, but a little flocculent matter in suspension when viewed through a considerable stratum. The water of a pump in Barrack-yard—the source of all the mischief in this epidemic—was an especial favourite, and no little indignation and dissent were expressed by many of the inhabitants when it was condemned and closed as unfit for human use.

The drainage of the village is such as is usually found in country districts. The central sewer receives surface water, house-slops, and the overflow of privies and middens. These drains are egg-shaped in section, constructed of earthenware-pipes longitudinally divided in two and jointed with clay, so that the system practically admits of free interchange of internal sewage and external subsoil-water varying with the circumstances of alternately wet and dry weather. The drainage arrangements are very defective; middens foul and wet, and fully exposed.

Touching the previous typhoid epidemic,—towards the end of 1857,—the complaint suddenly broke out simultaneously in a row of houses adjacent to the church, and here there were about 100 cases. The disease then rapidly spread to other parts of the village, so that finally more than 500 cases occurred.

The recent typhoid attack, with which we have now more especially to deal, seems well defined in its origin and course, for in the spring of last year an infected person arrived at the village. Some time afterwards a member of the family, a married woman, took the disease and ultimately died of it in the following June. Barrack-yard, before referred to, consists of a group of buildings, eight of which were occupied by families: one side comprises half a dozen houses, the opposite is formed by a school, the third side is not built upon, and the fourth consists of three houses partially separating the yard from the road. The central portion of the yard consists of gardens, four privies, many middens, and a pump and well. Now the privy-pit nearest to the well was always dry from leakage, and inquiry on the spot shows that this necessary was used by the first female patient. The water of this well furnished the domestic supply to the inhabitants of the yard and others; Dr. Dupré's analysis showed it to be highly charged with animal excrement, the nitrates and chlorides were present in such proportions as would be furnished by a mixture of equal parts of pure water and London sewage! In about fourteen days after the patient had had access to the yard privy a number of fever cases broke out simultaneously in Barrack-yard,—ultimately about twenty typhoid cases, fifteen of which occurred in five houses, and not a house escaped! Other inhabitants round about made use of this foul water—for it was in good repute as a beverage—and suffered from the same complaint; indeed the disease was confined entirely to those who drank of the water, some persons coming from distant parts of the village to partake of it, but the fever was always confined to those members of the family who had used the infected water. In all, about 100 persons were attacked with typhoid fever, of whom fifteen or so died.

Soon after the commencement of the epidemic, the village established a "sewer authority," and this board very properly instituted an inquiry into the condition of the waters of the public wells, and exerted themselves praiseworthily in carrying out various sanitary improvements, including the construction of new lines of sewers. Half a dozen of the public well waters were submitted to analysis: all the specimens were declared to contain sewage and animal oxidised matter, whilst the greater number contained unoxidised polluting matter, in one instance to a notable extent. Subsequently to the analyses being reported, the wells were examined and cleaned out, whilst some were closed, and with one exception, all the waters were discovered to

be polluted by percolation from sewers and cess-pools lying in immediate proximity to the wells. The exceptional well was an open one, and in close contact with a foul ditch; indeed the communication between the two was so intimate that it appears doubtful whether the well supplied the ditch or the ditch the well. In wet weather there can be no doubt that the flow is from the ditch to the well.

Condition of the various public wells examined:—

No. 1. *The Church-wall Pump.*—This well abuts upon the graveyard, and is on ground presenting the appearance of having been cut out by a curved line for the latter; in addition to the probable contamination from the burial-ground, there is the certainty of it from the intersection of the adjacent main sewer and the chief spring of the well, as before stated.

No. 2. *The Hall-lane Pump.*—Some sludge was removed from the bottom of this well. A sewer ran close by and a leakage from it into the well was ascertained.

No. 3. *Tony Lodge Pump.*—This well was in very close proximity to a cesspool, separated only by a 9-in. brick wall; the sewage ran through the joints and crevices mingling with the water. A cartload of black, stinking mud was taken out.

No. 4. *The Horse Pool Pump.*—A privy-drain was discovered at a distance of 18 in. or so from the edge of the well, and the intervening soil was saturated with filth; moreover, there remained marks of sewage trickles upon the face of the stoning.

No. 5. *The Long-street Pump.*—A disused cess-pool was found about a foot from the margin of the well; however, house-slopes and street drainings ran into it, and from there into the well. Also, two other drains from adjacent houses ran close by the well.

No. 6. *The Camberly Well.*—This is an open well about two yards deep, and contained a good deal of muddy deposit. It is in juxtaposition with a foul ditch.

The history of this typhoid epidemic at Barage is very instructive: it is another instance of many in which slops and excrements are allowed to soak into the ground and again be pumped up at a little distance, and called drinking water, thus becoming the medium of communicating pestilence and death to the consumers.

There is no reasonable doubt that these waters have been charged with sewage matter for a very long time, some of them to a remarkable extent; and beyond occasional diarrheal attacks not much inconvenience has been experienced from this practice until the virus of contagious disease is imported, when, by the agency of the domestic water supply it is spread in every direction. That the people should be allowed to poison themselves reflects discreditably upon the local health authorities whose duty it is to see that adulteration and pollution of water, air, and food are not permitted under any circumstances.

INSTITUTE OF PAINTERS IN WATER-COLOURS.

The exhibition now open in the Gallery of the Institute of Painters in Water-Colour, consisting of 243 pictures, is above the average of excellence, and the number already marked "Sold" show that the public have discovered this. If we were called on to name the case in which the greatest progress had been made, we should certainly point to the drawings contributed by Mr. Edward H. Fahey, whose early training as an architect is serving him well in the presentation of landscapes in which buildings form prominent portions. There is a great charm about the drawings he has contributed on the present occasion; we would especially point to 27, "St. Peter's and the Vatican, from the Viale di Prate, Rome," and 156, "Sta Maria Maggiore, Rome;" and we argue for this young artist a brilliant career if he continue to progress in the way he has done since the last exhibition. Mr. Edmund Warren has given up some of his hody-colour with advantage, and contributes several landscapes of considerable beauty. 35, "Banten," by Chas. Cattermole; 60, "Jonas Hanway and his Umbrella;" 195, "Richard and Kate;" H. Tiley; and 170, "The Brickfield;" C. Green, are amongst the subject pictures that will attract most attention, the last-named especially, which tells its story well, and is full of natural expression. Mr. L. Haghe contributes several elaborate interiors

displaying his well-known skill, as does Mr. Carl Werner, especially 44, "Interior of the Temple of Karnak." 81, "The Rest," Hubert Herkomer, and 103, by the same artist, will be noticed with pleasure; and it would be unjust if, even in so brief a notice as this, we did not point out with commendation 77, "Sea Roamers," H. G. Hine; 84, "The Listener," Emily Farmer; 117, "The Sacred City of Benares," T. L. Rowbotham; and 129, "Handling up Wreck after a Storm on the French Coast," by R. Beavis.

ON REREDOSSES.

ARCHITECTURAL ASSOCIATION.

The Saturday afternoon visit (13th instant) was made to the parish church, Croydon, nearly rebuilt, after the fire, and always notable for its broad fine nave and imposing western tower. Archbishop Whitgift's Hospital (almshouses), not quite robbed of all their old-worldliness by renovations, and Beddington Church, reached by the pleasant river-side bridge-path, were also visited; the latter building, not long ago added to, decorated with painting on roofs and walls, with mosaics, much stained glass, marble pavements, and other modern additions to its excellent old brasses and woodwork in screens and stalls.

At the meeting of the Association, on Friday evening, the 19th, thanks were voted to the vicar of Croydon and all who had assisted in these very successful visits. A paper was read by Mr. L. W. Ridge, "On Reredoses," of which the following is an abstract.

The term reredos is used in other senses, but for the purpose of this paper it is to be taken to mean "the wall or screen at the back of an altar or communion-table in a Christian church." Its object is to give importance to the altar, usually considered the material centre of the church, up to which all the architecture should lead, and so nearly a fixture in practice as to justify a fixed, solid, and permanent character in its accessories, and varying itself in size to so comparatively small an extent as to call for in these surroundings some adjustment to the general dimensions of the building. The original form (1.) was probably the retable, without truly architectural features, decorated only with painting and sculpture, and more or less portable. Examples at Norwich, Worstead Church, Aichen (reproduction at South Kensington), and the retable kept in the south-east aisle at Westminster. Next in the order of time (2.) is the type found in the Chapel of the Nine Altars at the east end of Durham Cathedral, adapting the arcade round the chapel. An arrangement similar in idea occurs at Chichester, a complete specimen remaining at the east of the north aisle of the nave (both illustrated in Architectural Association Sketch-book). A range of thirteen small niches (total size about 7 ft. by 2 ft.), containing standing figures of apostles, with emblems, and one in the act of blessing in the centre, remains in Bampton Church, Oxfordshire, date about 1350, built into the east wall of the north transept. Parker's "Glossary" also gives a range of ogee crocketed niches at Somerton Church, Oxfordshire, date about 1100, and eight panels, with foiled heads, probably painted originally, and with horizontal cornice occupy the whole width of the east end of the chancel of St. Thomas, Salisbury (date about 1450). At Hampton Bishop, Herefordshire, two rows of statues are found. Emstone Church, Oxfordshire, has at the east end of the south aisle a three-light window, six shallow panels, of the same total width as the window, fill the space between the altar and the sill, and canopied niches are formed in the window-jambs, which also remain at St. Ives, Cornwall. The detached screens, such as that to the high altar at Westminster, to the people's altar of the nave of St. Alban's, the Neville screen at Durham, &c., supply another type (3.), being solid altarscreens, containing also, in some instances, within their area a sort of reredos proper. These were eventually outdone in size and magnificence by the gigantic erections (4.) reaching up to the vaulting, as at the high altar at St. Alban's, at Christ Church (Hants), at St. Mary's Overy, at Winchester Cathedral, &c. A Spanish work in wood, in the South Kensington Museum, of considerable dimensions, covered with paintings of the history of St. George, may also be quoted as an example of the prominence attained by this feature. (All the great English examples suffer greatly from the destruction of the figures which formerly adorned them; their vacant

niches merely suggesting their possible effect.) The post-Reformation reredoses, with few exceptions, seem to supply no real lessons; the habit of using them mainly for long, more or less legible, inscriptions dictated a class of treatment hardly likely to have been adopted under other circumstances. Of the modern examples, without specially naming particular specimens, it may be said that the architects of the Gothic Renaissance have had to develop the reredos mainly by themselves, and have rarely done so with complete success. It is a purely ornamental feature; and, in the absence of direct practical purpose, without the guidance of precedents, it cannot be pretended that the Gothic school have been lately more successful than any other. In consequence of the thorough destruction effected at various times, very few instances, and perhaps no complete instance, of the arrangement at the high altar of a parish church remains. From a consideration, however, of specimens in other positions, some of which are named above, and of their general treatment, we may conclude that a reredos should be considered as properly a work in which architecture, sculpture, and painting, or at any rate two of the arts, should be shown; and that it should not be isolated in character, but the roof, the walls adjoining, the window-jambs, &c., should all combine with it to form a satisfactory whole. If the east window cannot be parted with for any reason, a central pier, as at St. Columba, Hackney-road, will often put the centre as least of the reredos in a better light; in all cases powerful side-lights must be had, as effective shadow in sculpture can only be obtained,—or the whole at all properly lighted,—by their means. Generally speaking, a subdued restful effect, due to strongly-marked horizontality in the composition, will be found conformable to the best precedents; this horizontality to be given by the preservation of certain fixed levels for similar features when continuity of line is interrupted, and by the absence of many raking lines. The subjects sculptured or painted should be such as may be deemed specially appropriate to this part of a church, composed of emblems, types, and a Crucifixion,—a single figure conventionally rendered.

Mr. F. T. Dollman said,—“A curious piece of information has been communicated to me by a distinguished architect (Mr. B. Ferrey), and I am at liberty to mention it again. In the work of restoration at a church, under a painting by Sir James Thornhill was found a text-inscribed surface; and on removing this latter a very splendid reredos was brought to light. This occurred only a few weeks ago. The reredos contains painted subjects, some in very good condition: a Crucifixion, figures of St. Mary and St. John, figures of founders, &c. Strange to say, however, it has been deemed advisable to cover up this work of art, to preserve it for a future generation, as it has been pretty satisfactorily concluded that it would be either impossible or unwise to trust it to the custody of this. A statement like this may appear almost improbable; yet it is quite borne out by my own experience of the disappearance by absolute destruction of many works of Medieval painting. As to the paintings on reredoses, any historical treatment seems a mistake in portions of a distinctly architectural framework.”

Mr. G. H. Birch (the chairman of the meeting) remarked on the inappropriateness, in his opinion, of a painted or mosaic conculcum as an altar-piece. On art and mystic grounds, he thought it most undesirable; and, on the score of more appropriate, a dramatic presentation of the treasury of Judas—even in Leonardo da Vinci's great work the prominent motive—would commend itself to few considerate people.

PROPERTY IN IDEAS.

It was a long, long time before the commoner and his property were at all safe, the one from the possible malignity, the other the cupidity of the barons; and it has taken several centuries to frame those laws which now render the liberty of the subject and the rights of material property less violable. As the rights of property became more respected, men turned their minds to its improvement; to the development of the material resources at their command; and mind so invested became of greater and greater value and importance,—of such value, indeed, that mental capital so invested, perhaps the only true capital, has long since been recognised as property, and a special code, the patent laws, devised for its

protection. In this direction the best order of minds, the inventive and constructive, has found its reward; and, turn which way we may, there is on every side an overwhelming wealth of material resources and appliances, whereas the political and social machinery, for the improvement of which all these superior means were said to be designed, remains pretty much *in statu quo*, or, perhaps, from an inevitable increase in bulk, clumsier than it was fifty years ago. But as the field for the application of mind to the improvement of material property becomes more restricted by the vast amount of work already accomplished, intellectual effort naturally turns towards the political and social chaos, to the re-organisation of the national fabric, affording, as this does, ample opportunity for the exhibition of the constructive faculty. Unfortunately, however, property in ideas is not so well respected and protected as goods and chattels, and therefore is as much exposed to the deprivations of the powerful and unscrupulous as material property was of old time. Now, if there be any kind of property more valuable than another, it is ideas of this order; for they not only enrich and render a nation more powerful, but often confer benefits upon the whole world. As there is, however, no protection for this kind of mental investment, it is only the noblest order of mind that will hazard years of thought on such a risk; for all the results of his labour may be pitilessly wrested from him, and his intellectual wealth and credit appropriated. Seeing, then, of what vast importance ideas are to a nation, to the world, it behoves all honest men to hand together to protect such property, and till laws can be framed to punish robbery of this kind with inflictions as great as those for larceny and hurglary, to visit such malefactors with a swift moral lynching.

It is not at all improbable that before long we shall have an association for protecting the originators of ideas, and a kind of intellectual police organised for the protection of mental property. It is the more needed, as the thoughtless who see nothing in "the right thing" when it is done, are as numerous now as in the days of Columbus; it appears so simple, everybody ought to have thought it; yet the fools who "cannot see anything in it" when it is done, may be as easily nonplussed on the spot as they were a century or two since with the egg.

Now then a great idea may be accidentally stumbled upon; but in the majority of cases ideas come of great natural ability, thoroughly cultivated faculties, and self-devotion; of a very considerable investment of time, vital energy, and money. The seeds of great thoughts fall here, there, and everywhere, but seldom, indeed, do they fall on sufficiently good ground to fructify. And are the fruits of the harvest reaped from such golden soil as this to be at the mercy of any powerful but lawless free-hunter, appropriated without possibility of appeal or redress?

Evidently people believe such flagrant spoliation is possible. There is a shrewd suspicion abroad that the powers ruthlessly appropriate any person's ideas, they will; and the question naturally arises, "Whose turn will it be next?" No one can be certain that he himself may not soon be a sufferer.

Men of the order of intellect referred to ought to be the very first objects of a nation's regard and protection, and to be brought to the front as soon as the possession of such powers is discovered. Such men there are, though their fame does not perhaps as yet extend beyond a very limited circle; and it is well we have such "watchers," with power to point the way, and who, being free from the distracting influence of official detail, can conceive and be the expounders of the general forms of a new order of things. Men of this calibre of intellect require the more protection, inasmuch as being too proud to solicit either acknowledgment or reward, they are the more easily despoiled of their own.

Although, as we have said, there is a very prevalent and strong suspicion that the powers that be appropriate whatever they will in the way of ideas, without acknowledging or rewarding the originators, we are very loth to believe that any body of English gentlemen would coolly and wittingly despoil any man of his intellectual property and title,—would filch and strut in borrowed plumes,—because their owner happens to be a modest and silent worker, powerless as things are constituted to hold his own against such tremendous odds. We are well aware that it lies within the power of the Imperial Government to appropriate, under

certain circumstances, private property for the benefit of the State, and this power may properly extend to ideas. "The Queen can do no wrong," but if compensation can be legally demanded for an appropriation of goods, much more ought compensation to be obligatory in case of an appropriation of ideas, and the public have a right to know the name of the original owner of the intellectual property appropriated. It is the duty of every Englishman to see that justice is done to proprietary in ideas, as well as of goods and chattels. To deprive a man of his fair acknowledgment and reward, after having originated some important project of State reform, is to rob him of his intellectual wealth,—of the most valuable of all property. But although we cannot bring ourselves to believe that any body of English gentlemen would be deprecators of this kind, there is, doubtless, a predatory class which preys on other men's ideas. This is the class which furnishes the pick-brains of society. But, as we have said, petty larceny in ideas, much less wholesale appropriation, will no longer be tolerated. Like other thieves, the pick-brain will try to erase the crest and initials from the stolen property, and usually adopts similar scoundrelly tactics when morally prosecuted, but all in vain. If he parades the stolen property, it is seen to be out of keeping with his mental antecedents and consequences, and, to use a material analogy, as incongruous as a diamond pin in the cotton necktie of the "emcksmann." The pick-brain, as the highway robber or the pickpocket, can never make the property appear as if it were his own; and even should a knave of this kind succeed for a time in wrongfully withholding the credit of an idea from its rightful owner, the future will have no difficulty in deciding to whom the title and property really belonged.

CROWN RIGHTS AND THE BUILDING ACT.

At the usual meeting of the Metropolitan Board of Works, on Friday in last week, the superintending architect stated that during the recess it was found that a building was in course of erection in Whitehall-gardens, beyond the line of frontage of Gwydyr House. A letter was therefore sent to the secretary of the Local Government Board, calling attention to the 13th sec. of the "Local Management Act," 1852, and the necessity of an application to this Board for consent. The secretary replied that the matter had been referred to the Office of Works, and Mr. Lawrence of that office pleaded that the 6th sec. of the Building Act exempted Crown buildings. The solicitor of the Metropolitan Board took the contrary view, and held that the Office of Works had no right to go beyond the general line of frontage in any street. After a brief discussion, in which the opinion was expressed that the matter was of importance, and should be definitely settled, the solicitor was empowered to take such steps as he might consider necessary.

ORIGIN AND HISTORY OF THE GREAT CENTRAL GAS COMPANY.

A PAPER on this subject has been read at the Society of Arts by Mr. A. Angus Croll, who was the mainpringer of the Great Central Gas Company; but in dwelling on what he did to help the breaking-up of the metropolitan gas monopoly, he forgets or fails to allude to the primary force which not only destroyed gas monopoly in the metropolis, but in many other places throughout the country, and reduced the prices on an average two or three hundred per cent., while it raised the dividends of the gas companies, as always predicted, in fair proportion to the reductions in price. The *Builder*,—which the first opponent (a creation of the *Builder*'s, as an opponent), characterised as "the monopolist of incendiary gas intelligence,"—alone did all this work, by its articles, continued for years, on "The Gas Movement;" and Mr. Croll's origination of the Central Gas Company was just one of the innumerable results of that movement.

In reference to the later history of the Central Gas Company, Mr. Croll says:—

"It is with great pain and reluctance that I proceed to speak of the subsequent history of the company. It is, however, necessary to glance at it in a sentence or two. The embezzlement of 79,000*l.* by one of the clerks of the company a few years ago excited the astonishment of the whole empire, and the disastrous Wood-street fire involved them in a loss of 30,000*l.* Thus, from these two circumstances alone a sum of 109,000*l.* has been lost to

the supporters of the company, and yet its property was laid upon so firm a basis that it has paid 10 per cent. upon its capital from the commencement of the undertaking, in spite of all losses. And now the company has checked all further prosperity and development by allowing another and less thriving company to absorb their own, on condition of receiving a dividend of 10 per cent. This being the highest legal dividend, the shareholders have only suffered indirectly by losing the prospective advantages of investing additional capital at a high rate of interest in extensions of plant and works, such extensions, and consequently all such further profits being reserved for the shareholders of the Chartered Company, which has absorbed them.

But if the shareholders have only lost this privilege, what have the gas consumers in the City of London lost? The Great Central Company were paying 10 per cent. dividend, the highest permitted by the Act of Parliament; and therefore if the contract with the writer had remained, and he would have realized a good profit, and the price of gas ought now to have been reduced 6*d.* per 1,000*ft.* The gas rental of the Central Company for the year ending June, 1871, must have been about 93,000*l.* per annum; adding 10 per cent., the usual annual increase, and we have for the present time a rental of about 102,300*l.*

Taking the quantity of gas required to supply this rental at 2*s.* per 1,000*ft.*, viz.,—i*s.* 9*d.* for the gas supplied at the company's meters in accordance with the New Central, and 3*d.* per 1,000*ft.* for increasing the illumination six candles in addition, it is evident that the price of gas ought now to be reduced, had it not been for this last and most improvident act of the Central Gas Company, which would not only have effected a saving of 20,000*l.* to the consumers supplied by the Central, but the gas would have been of a purer quality, and of an illuminating power equal, as shown by the present mode of testing, to twenty candles.

At the close of the discussion which followed the reading of Mr. Croll's paper, he said:—"As regarded the general question altogether, he had no desire to say one single word in reference to gas companies generally, but only wished to put on record the connexion which he had had with the promotion of the Central Gas Company, as it had now ceased to exist. The result of the paper amounted to this, that whilst the gas companies opposed it at first, saying it was impossible to sell gas for less than 7*s.* per 1,000*ft.*, they were now selling it at 4*s.*, and getting a dividend of 10 per cent. Mr. Chubb (who is secretary of the Imperial Gas Company) shook his head, but Mr. Chubb's company derived a larger amount now than it did before, and at the same time supplied gas to the public at 3*s.* 8*d.*, instead of 7*s.* Looking at all these facts, he did not think he need be ashamed of the action he had taken in the matter."

We are certainly not ashamed of the part we took in the matter.

EMPLOYERS AND EMPLOYED.

As the question of strikes and the relations of employers and operatives is occupying so much attention, Mr. John Smedley, the principal of a well-known and very old-established firm at Matlock, sends us particulars of his own experience. He says:—"We have never had a strike, or any disagreement with our hands in my time, nor in my father's or grandfather's time. We have been engaged in spinning and manufacturing long before the commencement of this century. My ancestor's idea was, that those who rode inside the coach should make those as comfortable as possible who are compelled, from the mere accident of birth, to ride outside. Mr. Smedley then enters into particulars as to arrangements for preparing refreshments and meals at the option and chiefly at the cost of the operatives, and as to other conveniences at the cost of the firm, such as soap and towels for washing, which is done in the time of the firm, and so on; and he thus continues:—

"Many years ago I had to follow the changes constantly going on in manufacturing and go into a class of goods more in general demand, in which, of course, we find keen competition; but that did not induce me to try to alter the policy towards the workpeople, and I have still found it the most profitable to keep to our plan in trying to make them as efficient as possible for the work they have to do. I believe the present disagreements between employers and employed is the long neglect of consideration for the workers, and the want of sympathy and personal knowledge and intercourse with them, and now, like a neglected family, it is bringing its natural and inevitable result, and till this be altered masters may meet and pass resolutions just as effective as if they passed one that there should be fine weather for the next three months."

Amongst other arrangements, Mr. Smedley says:—"We keep a supply of dry stockings for those women to put on who come from a distance and get their feet wet, and every overlooker has a stock of mackintosh petticoats to lend the women going a distance on a wet night. When I go amongst them all recognise me, and it is always a pleasure to go through the mill. I wish I could make their lot easier, for with all we can do factory life is a hard one. . . . It is a sad state of things when masters have to combine against the hands and the hands against the

employers: it has just the same effect as parents combining against their children and the children against their parents. If the children are not what they ought to be, it is very certain to be the parents' fault in not gaining their affections and confidence."

RENFREW MUNICIPAL BUILDINGS.

CHOIRS of persons, including Freemasons, Good Templars, Odd-Fellows, Foresters, Knights of Malta, and all sorts of associated bodies met together in Renfrew on the 13th inst. to lay the corner stone of the new Municipal Buildings designed by Mr. J. J. Lamb, architect, of Paisley. The style adopted for the building is a free adaptation of foreign modern Gothic, with a colouring of Scottish baronial. The principal front, towards Hairstreet, presents a façade 70 ft. in length, two stories in height, with a tower at the north-east corner 21 ft. square. It is finished at the angles with large corbelled turrets, awfully out of place, notwithstanding the locality, and rises to a height of 103 ft. to the platform of its lofty roof, finished with ornamental crossing and finials. About 80 ft. from the level of the pavement, and between the turrets of tower, are balconies entered by four doors from the prospect room. In the centre of the elevation to Hairstreet is a balcony, from which the public in the square can be addressed on the occasion of open-air public meetings at election and other times. The walls of the building are built in random rubble. On the entrance floor, entering from Hairstreet, there is the chamberlain's office, a bank office, and private room; and entering from Fulbarstreet there are the town clerk's public and private offices. The council chambers are also on this floor, 39 ft. long and 24 ft. wide, entered from a corridor. From this corridor, and also from Dmlopstreet, the police office, superintendent's and witnesses' rooms are entered, and these are furnished with cells, strong-rooms, &c. The public-hall is on the first floor, is 65 ft. long and 41 ft. wide, and will be seated for about 800 people.

The construction of the building is under the superintendence of Mr. Chas. Henderson; and the following are the names of those tradesmen whose offers up to this time have been accepted:—Masonry, J. Drysdale & Son, Glasgow; joiner work, Mr. Wallace, Paisley; slater work, John Robertson & Son, Johnstone's; plumber work, John Morrison, Paisley; plaster work, John Brown, Greenock; iron girder, John Stewart & Son, Irvine; miscellaneous ironwork, Alex. Pottie, Renfrew.

THE KING'S SCHOOL, SHERBORNE.

THIS school, which was originally founded by Edward VI., has been lately reconstituted under the Endowed Schools Act, it being intended that it should be the chief school of the West of England, and number between 300 and 400 boys. For this purpose, large building works will have to be undertaken, including either the building of a new chapel or enlarging very much the present one, which was a portion of the old Abbey buildings, restored and enlarged by the late Mr. R. C. Carpenter. There are also in contemplation a large schoolroom, library, and governor's room; study buildings, class-rooms, laboratory, and scientific lecture-rooms; masters' houses, with dormitories; besides a swimming-bath, covered five-court and workshops. Instructions have been given to the architects, Messrs. Slator & Carpenter, to report on and prepare alternative schemes for the consideration of the governors.

BRIGHOUSE CEMETERY COMPETITION.

THE designs submitted have been exhibited. The local Board expressed their approval of the style of the Pontefract cemetery chapels generally, and they also stipulated that premiums would be given for the three best plans, the cost of erection not to exceed 2,000l. The three chosen as the best have each a spire rising from the centre. In one a mortuary chapel is annexed, so that the hier would not need to be taken into the chapel proper at all, and in the chapel a mirror is shown, so arranged that the hier could be seen by the mourners in the chapel during the burial service. This plan is much approved by the Board, but it is considered that the building, as shown, could not be erected for the sum stipulated.

This plan, drawn by Messrs. Gay & Bartram Payton, of Bradford, is placed first—premium, 25l. The second, 10l., is given to Mr. T. W. Helliwell's plans. The third, 5l., is awarded to Messrs. Holtun & Connor, of Dewsbury.

THE TRADES MOVEMENT.

LONDON.—A public meeting of carpenters and joiners has been held at Wilcox's Assembly Rooms, Westminster Bridge-road, for adopting measures in furtherance of the nine-hours movement. Mr. Sadler, having been voted to the chair, stated that a memorial had been presented to the master builders, asking that the hours of labour be reduced from ten to nine hours per day, and that the wages be increased to the extent of 1d. per hour. The result of that would be that, making allowance for the Saturday half-holiday, the hours of labour would be 51 per week, and the wages would be 11. 18s. 3d. per week. A resolution was unanimously passed approving of the course the delegates had adopted.

Maidstone.—A meeting of bricklayers and carpenters has been held at the Sun Inn, High-street, Maidstone, Mr. Tonlin occupying the chair and Mr. Horscroft the vice-chair, to receive the reply of the employers, after a conference with the deputation of workmen held in the week previous. The reply stated that at a meeting of the master builders the following resolutions were adopted:—

"Firstly, 'That on and after the 1st day of July the standard wages of bricklayers and carpenters of this town be 6d. per hour.' Secondly, 'The full time of 56 hours to commence on the second Monday in February and terminate the second Monday in November, and that the short time of 50 hours commence on the second Monday in November and terminate the second Monday in February, beginning at 7.30 a.m., having breakfast previous to commencing, and a half-hour only to dinner.' Lastly, 'That all other existing regulations remain unaltered.'"

After some discussion, the following resolution was adopted, which was directed to be forwarded to the employers, after which the meeting terminated:—

"That this meeting, having heard the offer made by the employers to their memorial and code of working rules after the conference with the deputation, think it a step in the right direction, but that it is still most unsatisfactory as six years ago a struggle of six weeks' duration was maintained for the same amount per hour the employers now offer, and this meeting could not think accepting any sum less than 7d. per hour all the year through, 5d. hours to constitute a week's work from the second Monday in February to the second Monday in November, and 40 hours from the second Monday in November to the second Monday in February. And, further, this meeting declines to deviate from the general tenor of the code of working rules."

Birmingham.—The question of increased pay has been discussed by the arbitration board, and ultimately the question was left to Mr. Kettle, who decided that, considering the position of the town of Birmingham, and the advance of the wages of skilled labourers, an advance of 10 per cent. should be granted. He therefore fixed the pay of carpenters and joiners and plasterers at 7d. per hour up to September, and for the rest of the year 7½d. The labourers he decided should be paid 4½d. per hour throughout the year.

Altrincham.—A strike of painters at Altrincham and Bowden has come to an end, the masters acceding to the demands of the men for an advance of wages from 6½d. to 7d. per hour, and a reduction of the hours of labour from 58 to 54½ per week. Several minor propositions on the part of the masters with regard to the working rules have been accepted by the men.

Newcastle.—When the late strike at Newcastle for nine hours was settled, it was agreed that overtime should not count until the whole of the 54 hours had been worked. The workmen were dissatisfied with this, and the dissatisfaction has been greatly increased, and the delegates of the Nine-hours League have agreed to call a meeting, at which a resolution will be submitted asking a conference with the employers with a view of obtaining a revision of overtime. The workmen want each day's overtime to count for itself. Trade is busy, and it is feared the matter may not be easily settled.

Cockermouth.—The joiners of Cockermouth have struck work, in consequence of the refusal of the masters to grant them an increase of wages amounting to 2s. per week, in addition to adopting the nine-hours system. Since then a compromise has been effected to adopt the nine-hours system, the men withdrawing the proposal for an increase of wages. On this understanding the men have resumed their employment.

Barrow.—The painters in Barrow have struck for an advance of wages. The men some months ago gave the masters notice that on and after the 1st of April the sum of 7d. an hour would be demanded,—the working hours to be fifty-four per week. On the 1st of this month no arrangement was agreed upon, and the men granted another week to enable a decision to be made. At the expiration of the week the masters made an offer of 6½d. per hour, but this the men refused. After consideration, the workmen agreed to accept 6½d. With the exception of two or three of the masters, the 6½d. was refused, and the result was that between forty and fifty men have struck. Hitherto the painters have been paid at the rate of 26s. per week.

Dumfriess.—The workmen of Messrs. J. Edgar & Sons, Dumfriess, who struck work on account of slaters being employed to point the interstices in the courses of the walls, have removed their tools. On the other hand, all the masons in the employment of Mr. James Halliday, at Cowhill Mansion, and at Sir James Anderson's new villa at Dumfriess, struck for slaters being employed pointing the walls at Cowhill. Hitherto it has been quite common to employ slaters for that purpose, as masons will not work on a hanging scaffold beyond a certain height.

Edinburgh.—After a struggle of six weeks the marble masons of Edinburgh have gained their demands,—the fifty-one hours limit, with the same weekly wages.

Arbitration and Compensation for Injuries.—We read in a Leeds contemporary that Mr. Mundella is about to introduce a Bill "to make further provision for arbitration between masters and workmen." The Bill is being drafted by Mr. Wright, barrister, and Mr. George Howell, who is acting on behalf of the working classes. A Bill is also in preparation for the amendment of the law with respect to giving compensation to workmen who may be injured, whilst performing their duties, through the negligence of their employers in failing to take proper precautions for their safety.

Berlin.—The master builders and carpenters of Berlin have issued a notice stating that, in consequence of the journeymen carpenters not having relinquished their strikes against particular masters, notwithstanding the warning against that course of action already published, they have determined to discharge all journeymen carpenters, and to close their workshops.

LONDON CARPENTERS AND JOINERS.

Sir,—I am instructed by the committee of the Carpenters and Joiners' Nine Hours Movement to forward you a copy of a resolution passed at a general delegate meeting on Saturday evening last, at the committee-rooms, Brown Bar, Bloomsbury, for insertion in your valuable paper. It was passed after hearing a second letter read from the secretary of the Master Builders Society, stating that they think all further discussion on the subject unnecessary, and therefore decline to receive a deputation from the carpenters and joiners, giving as a reason that they have already received a deputation from the Masons' Society, and that we are to take it as actually a deputation from our own body, which is absurd, and in our (the delegates') idea no answer at all to our reply to their first letter, which was also a refusal to receive a deputation or meet us in any way to discuss the question of the nine hours, and if possible to bring the matter to an amicable settlement without having to take more serious action in order to gain our object; for the men are determined to stand by the principles contained in the memorial, and the responsibility will lie with the employers, and not with the men, if a strike takes place, and which very likely might have easily been avoided, had they condescended to meet us. There have been several large and influential meetings held, at which resolutions approving the course taken by the delegates have been unanimously passed, and for supporting them in bringing the movement to a successful issue.

Copy of resolution passed April 26th, 1872.—"Resolved, that no overtime be allowed on the nine-hours movement is settled; and should any man, or number of men, be discharged through it, we pledge ourselves to support them."
CHAS. MALKIN, Secretary.

THE NEW WORKS ON THE EAST LONDON RAILWAY.

THE East London Railway Company have just commenced the extension of their line from Wapping to the Shadwell Station of the Blackwall Railway, which will place the company's line in communication with all parts of London north of the Thames. The works will necessitate the difficult engineering task of passing under the London Docks, the route being through the St. Katherine's Dock basin, which will connect the company's intended northern lines with their present southern system, *via* the Thames Tunnel. When the new works just commenced are completed, the company will not

only have obtained railway communication as far as Shadwell, but by means of an exchange station which they intend to erect, they will also have access to the Fenchurch-street station of the Blackwall line. The passage through the docks will not only be an unusually heavy piece of work, but also by far the most expensive portion of the entire undertaking, as, independently of the actual cost of the work itself, the dock company have power to charge the railway company 120,000l. for the privilege of their line being allowed to pass under the docks. The line was intended to pass under the docks by a tunnel, at a deep low level, so as not to impede the dock traffic; but in consequence of the dock company not consenting to the railway company tunnelling under them at a lower depth, the railway company have been compelled to fall back upon the old plan of constructing the railway through the docks in a coffer-dam; and we understand that it is probable that the company will have to execute this portion of the work themselves, under the direction and advice of Mr. Hawkshaw, their engineer, in order to relieve the contractor from possible penalties. The estimated cost of this extension is 270,000l., the whole of which has just been raised by the recent debenture issues. On the completion of the new line, a new and commodious station is intended to be erected at Wapping, in lieu of the present temporary structure. It is intended to carry the line still farther, from Shadwell to Whitechapel, where it will join the Metropolitan extension of the Great Eastern line now in progress; thus giving the East London Company direct access to the intended main terminus station of the Great Eastern Company in Liverpool-street. It is fully expected that the works on this section will very shortly be commenced, and proceeded with simultaneously with the construction of the line under the docks to Shadwell.

BUILDERS' CLERKS AND THE SHORTENING OF THE HOURS OF LABOUR.

At a general meeting of the builders' clerks of Manchester and neighbourhood, held at the Hare and Hoards Hotel, Shudehill, at which most of the principal building firms in the district were represented, it was resolved that the following memorial for shortening the hours of labour be presented to the Master Builders' Association:—"Our memorialists most respectfully bring this before you with confidence, knowing the kindly feeling at present existing between employer and employed. That we have good grounds to complain of the long hours now made in the builders' offices of this city and neighbourhood we think you will allow. On comparing our hours with those of the clerks in engineers', merchants', and other offices, we find that we are engaged from three to four hours per day longer, and at books and calculations that for technicalities and intricacies are not to be surpassed in any other profession. We are also employed longer hours than any of the tradesmen or labourers connected with the building trade, and at a sedentary occupation which it is well known is anything but conducive to health. We beg, therefore, that our hours may now be from 8.30 a.m. to 5.30 p.m., with the usual interval for dinner, so that we may have greater facilities for mental and physical improvement. We feel assured that your interests will not suffer, as, from the increased energy which must follow such a concession, we shall then be better able to perform our several duties, and the good feeling existing will be greatly strengthened."

CHURCH OF ST. MARY THE VIRGIN, CROWN STREET, SOHO.

The first stone of the new chancel of this church was laid on April the 17th by the Rev. Canon Liddon. The chancel stands on ground lately occupied by mean houses at the east end of the church, and adjoins the new clergy house. The present nave has no architectural merit, but is interesting as having been formerly a Greek church. It has been, however, much altered and widened when used as a Dissenting chapel. It is intended ultimately to take the whole down, and the new chancel is designed on a scale to harmonise with the design of the future nave. The site, though broad, is not long, and being situated in a crowded and confined street, the church has been designed by the archi-

teets, Messrs. Slater & Carpenter, on a large scale as regards height and width. The chancel is of two bays, with windows on the south, and with the east end facing Crown-street. It is groined in sexpartite groining, with stone ribs and red brick vaulting. This is supported by massive buttresses, terminated above the parapet by gables. The side walls are relieved of all weight by heavy arches inside and out from one buttress to the other, and are placed midway, these forming deep recesses on both sides. The windows are coupled lancets, with cusped circle over. The clear width inside between the buttresses is 29 ft., and between the walls 36 ft. The height from the nave floor to the groining is 60 ft.; to the top of the gable from the pavement, 85 ft. The east wall has five cusped lancets, with a rose over in the gable. The whole will be built of red brick inside and outside, with stone dressings sparingly used. There will be twelve steps to the altar, over which there will be a magnificent baldachino; but no fittings are at present in hand. On the north side is a small window into the chancel from the oratory of the clergy house. The nave will be of equal height with a north aisle.

Designs for the new schools on the north of the clergy house and church are being prepared by the same architects.

For the chancel works Messrs. Gibson, Bros., of Southall, are the contractors, and Mr. Boulden is the clerk of works.

SCHOOL BOARD FOR LONDON.

The first series of competitive designs,—viz., those for the Johnson-street, Stepney, group of schools—were delivered on the 16th of April. The buildings are to accommodate 1,080 boys, girls, and infants. The schools for the boys and girls are required by the conditions to be designed on the system of class-room division, with a large general hall, in which both boys and girls will assemble at the opening and closing of the school, and for singing lessons, drill, and other purposes. We gave a list of the architects invited in a late number, but some of them declined the competition. Messrs. T. R. Smith, J. W. Newman, Jarvis & Son, and Arthur & C. Harston are amongst those who have sent in designs.

The Board has confirmed the provisional agreement entered into between Mr. Robson, on behalf of the Board, and Mr. Macey, for the purchase of some freehold land near the Temple Station, as a site for their offices. The price is to be fixed by arbitrators,—viz., Mr. Clark (Messrs. Farebrother, Clark, & Co.), Mr. Currey, and Mr. P'Anson.

SCHOOL BOARDS.

Derby.—At a meeting of the General Purposes Committee tenders for the erection of Gerard-street School were considered. The following were the estimates sent in:—Mr. Bridgart, 2,895l.; Mr. Dusanoy, 2,950l.; Mr. Woodiwiss, 3,235l.; Mr. W. Slater, 3,090l. It was resolved to recommend the Board to accept the tender of Mr. Bridgart, which was the lowest. The committee further recommended the Board to ask the Department to sanction the borrowing of 4,500l. from the Public Works Commissioners, repayable during a term of fifty years. The loan was for the following items:—2,895l. for building; 250l. estimated cost of desks and fittings; 790l. cost of land; 150l. commission; law charges unknown. These recommendations of the committee were agreed to by the Board.

Dewsbury.—The Dewsbury School Board met to examine the plans sent in by competing architects for the three School Board schools intended to be erected at Dewsbury Moor, Boothroyd, and Springfield. The plans selected were by Messrs. Holtum & Connor, of Dewsbury, architects.

ST. LUKE'S CHURCH, LOWER NORWOOD.

This church, after having been closed for eighteen months, undergoing a complete internal reconstruction, was re-opened on Sunday last, when the Bishop of Winchester preached to a large congregation. The church, which was originally opened in 1825, was constructed to seat 1,412 persons, 688 being free seats. The cost of the church was 12,387l. It is stated that the accommodation in the church, as reconstructed, instead of being increased, is much curtailed, the total number of seats being only

1,100, according to the architect's plan. As a rule, church alterations and improvements are usually accompanied by increased accommodation; but in the case of the reconstruction of this church the rule has been reversed.

THE BUILDING FOR OFFICIAL BODIES.

It has been stated officially that the building proposed to be erected on the Thames Embankment, for the accommodation of the School Board, is also to accommodate the Metropolitan Board of Works and the Asylums Board. If this arrangement be carried out the present habitat of the Metropolitan Board of Works may come into the market, and might be made to serve the purpose of several of the scientific and other societies who are seeking appropriate accommodation, with one large meeting-room, to be used jointly.

THE NEW SCHOOL OF SCIENCE, MUSEUM, AND ART GALLERY, AT SOUTHAMPTON.

The new school of science and the new museum and art gallery at the rear of the Hartley Hall, Southampton, are just being completed by Mr. J. Crook, the contractor. The school is approached from the vestibule of the Hartley by a long corridor on the south side. There are two class-rooms of about 20 ft. by 16 ft. 6 in., and 16 ft. high, and a large drawing-class room 32 ft. by 16 ft. 6 in., and 16 ft. high, with a small room over the lavatory for the use of the master. The art gallery and museum are connected with the science schools on the south, and the art school on the north, and approached by a temporary passage on the west between the Hartley Hall and the new buildings. There are two large rooms of about 42 ft. by 20 ft. wide, and about 18 ft. high, with a connecting door both to the science school and the school of art. They are lighted from the roof, with a glass counter-light in the centre of the coar'd ceilings, which are moulded and panelled. The large circular-headed swing doors are filled in with embossed plate-glass panels. The gas fittings are three large brass starlights in each room, and the ventilation has been studied and provided for by Mr. Lemon, the surveyor to the Corporation, from whose designs and under whose superintendence the works have been carried out by Mr. Crook. The science classes will shortly commence their studies in the new rooms.

SALTING OF PARIAN.

The late Mr. C. H. Smith suggested brushing the crystals of saltpetre off the walls as fast as they appeared, and so remedying the evil complained of by "J. S." The crystals are reabsorbed in damp weather if allowed to remain upon the surface, and crop out again when the air is dry; but if removed as they appear in the solid state, the supply, of course, ultimately fails, and the desired end is attained.

Sir,—I have used Parian cement continually, and have found it answer exceedingly well; but last autumn I cemented some internal walls with it, and the paint applied is now perfectly destroyed. A part of it has salted, as your correspondent remarks; a portion has so destroyed the paint that it has become a mere powder; and a part has apparently separated the oil from the paint, the former running down in small streams. To add to the annoyance, a most disagreeable smell is emitted.

I should be obliged if any of your correspondents can account for this, and suggest a remedy. ARCHITECT.

COMPLETION OF ST. PAUL'S CATHEDRAL.

Sir,—The latest proceeding of the "Decoration Committee" does not augur well for the success of this undertaking. The members have thought it advisable to appoint a consulting architect who should advise them upon, and therefore, to a certain extent, control, Mr. Penrose's design. The least to be expected was that an architect who had had great experience in classic work would have been chosen, instead of which one has been appointed whose speciality is Gothic of the severest type.

The following is an extract from a speech made

at a meeting held during the recent Conference of architects:—"Nobody ever heard me, or the school with which I happen to be identified, say a word against Greek architecture; but we have fought, and will fight, against the *Sir Christopher Wren abominations*." Mr. Burges understands Gothic architecture, but, holding such opinions as the above, is he the man who should be called upon to assist in completing St. Paul's, "in accordance with the ideas of Sir Christopher Wren"? Is it true they manage these things better in France? ONE ANXIOUS.

FROM AUSTRALIA.

Melbourne.—The Corporation have had an organ built in London suitable to their town-hall. It is said to be the largest and finest organ which has ever left Great Britain. Messrs. Hill & Son were the builders. The organ was taken out by the ship *Lammermoir*, and is being put up by Mr. Robert Mackenzie, who has in charge its erection. The erection of the instrument will take six to eight months, principally through an error in laying the foundation for the organ when the hall was built. It was supposed that it would stand on a level with the orchestra, but instead of this it will be sunk a depth of 6 ft., and a stand is being made for it which will rest on iron pillars reaching to the basement of the Town-hall. The hall itself is 63 ft. high, by a width of 74 ft., and the organ's dimensions are, height, 46 ft.; breadth, 52 ft. 6 in.; with a depth of 24 ft. The great organ has seventeen stops; the choir organ, ten; the swell organ, fourteen; and the solo organ, thirteen. One of the pipes is large enough for a man to pass through.

The promoters of the new opera-house, proposed to be erected on the triangular piece of land in front of the Model Schools, bounded by Albert-street on the one side, and Nicholson and Spring-streets on the others, have been active of late, although their movements have not been made public. An application was recently made to the Minister of Lands for a grant of the site just mentioned for the Academy of Music, under which title the opera-house will be designated. Plans were forwarded to Mr. Grant, showing the various elevations of the proposed building, as also the interior, which, according to the design, it is said, will vie with many of the finest edifices on the continent of Europe, having several tiers of boxes, and a great depth of stage. The Minister of Lands has notified to the promoters his willingness to issue them a grant of the site. The proposal is to build the opera-house by the formation of a company.—The Church of St. Peter and Paul, Emerald-hill, of which the *Australian Illustrated News* presents a view, is designed in the Decorated Gothic style of architecture, and shows a slight mixture of French ideas. The plan embraces a nave, 25 ft. wide, terminated by a polygonal apse, and side aisles, 12 ft. 6 in. wide each, a "ladies chapel" on the southern side and lesser chapel and sacristy on the northern. Two projecting porches, one on either side, give access to the aisles. The tower stands at the north-west angle, and is surmounted by an octagonal spire, terminating with a wrought-iron cross at an elevation of 110 ft. The tower projects about 8 ft. beyond the west gable, which likewise projects about the same distance beyond the south aisle, thus obtaining a broken and picturesque outline. The angle formed by intersection of the tower and nave is occupied by circular turret stairs, which lead to the organ-gallery and upper floors of the tower. The organ-gallery extends the entire width of the nave. A large wheel-window of elaborate design occupies the centre of the west gable. Irregular-coursed bluestone ashlar has been used for the general construction, the base strings and weatherings being dressed. The bracing of the different windows has been executed in pressed cement. The total internal length will be about 120 ft., a width of 54 ft., and the height to the ridge is 50 ft. The estimated cost of the building complete is about 9,500l., affording accommodation for nearly 1,100 persons; but at present only so much as will accommodate 600 people has been built, involving an expenditure of about 4,500l.

—A new Welsh Presbyterian or Calvinistic Methodist Church has been opened for divine worship in Latrobe-street, Melbourne. It was designed by Messrs. Crouch & Wilson, and was erected by Mr. Ireland, the total cost being about 1,800l. Its style is Early Decorated. It is built of brick, on stone foundations, and measures, over all, 65 ft. 6 in. by 42 ft. It is intended to stucco the whole interior of the

church, but at present only the front elevation has been so treated. This façade stands upon an axed bluestone base, and is 50 ft. high to the top of the finial on the gable. The principal entrance is in the centre, and above it is a large triple-light window, with geometrical tracery filled with stained glass from the manufactory of Messrs. Ferguson, Urie, & Lyon. The interior is divided into two portions. The church proper, which measures 34 ft. by 48 ft. 6 in. in the clear, has a sloping floor, and the walls rise to the average height of 25 ft., the mean height of ceiling being 29 ft. At the rear of this are two vestries, together occupying the whole width of the church, and so arranged that should the extra space be required to meet the growing wants of the congregation, the throwing down of the dividing wall will not mar the proportions of the building. The height of these rooms is 11 ft., the space above being in one room, to be used for lecture purposes or smaller week-night services.

CORWEN CHURCH.

THE parish church of Corwen, North Wales has lately been restored, and also enlarged by the erection of a south lean-to aisle. Previously to the recent works the building was a harn-like structure, possessing scarcely any architectural character, although the main walls were in a good condition. The debased windows have been cut away, and new ones of a proper design inserted. The east end of the chancel had a triplet window of Early English date,—blocked up, however: this has been opened out. The old church possessed transepts, the south one being of no antiquarian interest whatever. The latter has been pulled down, and a lean-to aisle substituted for it, the north transept being still retained. Stone copings and carved crosses to all the gables replace the common slate verges of the old building. A stone arch has been corbelled out over the entrance to the chancel, which is not otherwise now constructionally divided from the nave. The exact position of the ancient rood-screen (not now existing) was discovered, and so supplied an authority for the length of the chancel, and the south chancel door, with its remarkable stone head, has been carefully preserved. The tradition is that Owen Glendower, from a neighbouring mountain height, violently threw his sword against the church, where its impression still exists. The nave and south transept roofs have been opened out and repaired where necessary. New wood brackets have been placed under some of the tie-beams. It was found necessary to put an entirely new roof to the chancel, with a polygonal-shaped panelled ceiling to it. The nave arcade, opening into the south aisle, is in four bays, with simple carved capitals of an early character. A fragment of the frieze of the old rood-screen has been utilised for the altar-rail, uprights and brackets being placed underneath it. The roofs are covered with the local slates, a simple serrated tile cresting serving to emphasize the chancel. The nave, aisle, and transept are paved with tiles. The sanctuary has been laid with rich encaustic tiles of Mr. W. Godwin of Llangwladine's manufacture, according to the architect's design. A reposes of brown alabaster and marble inlay has been placed over the altar, and is the gift of Archdeacon Ffolkes. The chancel seats are of oak, with pierced fronts and shaped moulded bench-ends. The pulpit is of Bath stone, and has been given as a memorial to a relation. The emblems of the sacred Cross, Star of Bethlehem, Purity, Christian Hope, and the immortality of the soul, are introduced in the pannels. The fragment of the rude old Norman font has been set upon a base of suitable character. The nave is seated with deal stained benches, having square panelled ends.

The carving to the church, the pulpit, and the reposes have been executed by Mr. J. Lewis Jaquet, of Vauxhall Bridge-road. Mr. W. E. Samuel, of Wrexham, was the contractor for the work, the total expense of which amounts to about 2,000l. The architect is Mr. Ferrey, F.S.A. The restoration of the tower has been deferred to a future period.

Music and Drawing in the City of Paris Schools.—The municipal council of Paris has voted a sum equal to 4,800l. for the teaching of singing in the city schools and the expenses of the Orpheonic meetings. It has also awarded a subsidy of 3,420l. to the schools of design.

ARRANGEMENT AND CONSTRUCTION OF FARM BUILDINGS.*

In former years nothing, perhaps, was more neglected, in an architectural point of view, than the designing and arrangement of farm buildings; and I think it cannot be denied that most of the sites were badly chosen, some being on low ground where drainage—which, however, at that time was little thought of—would have been impossible, and in many cases instead of the floors being raised from 6 in. to 8 in., which they ought to be, were probably sunk to that extent or more below the level of the surface, the result of which is, that the floors of the buildings were occasionally standing 2 in. or 3 in. deep with water and liquid manure coming in from the folds.

Other sites are on the slope of a hill, and the ground excavated to make it sufficiently level for the buildings, and some important parts, such as the stables, byres, or the barn, are built against the side of the thus formed embankment with the roofs nearly level with the surface: the consequence is, that the water percolates through the walls, causing the floors to be always wet and damp; and in many cases, although drainage was easy, still, perhaps, not attended to or thought of.

Again, some buildings are placed on the top of a hill, without having the slightest shelter; consequently in stormy weather the roofs have been blown off and the cattle almost starved to death by being exposed to the bitter blasts.

I have also noticed that the farm-houses were sometimes placed on the low side and close to the steading, and the moisture from the folds running in waste almost to the very entrance-door. And in addition to these evils how often we see the buildings placed at one side or in one corner instead of in a central position of the farm.

With regard to the arrangement of the buildings, no care or thought seems to have been entertained for the comfort or health of the horses and cattle, or for the convenience or saving of labour of the farm servants, but have the appearance of having been placed by accident rather than by design; for, instead of the straw-horn being placed in the centre, and contiguous to the stables, byres, and folds, where straw is mostly required, how often is it placed in an isolated position? as if it made no matter what distance the straw was to be carried and littered about,—no matter whether the byres, stables, &c., were at a considerable distance from the folds, and the manure from them never trodden by the cattle, but merely laid up in a heap at the outside of the door, and perhaps the cattle, placed by themselves, exposed and without sufficient shelter during feeding in winter months, in wretched hovels unfit for the purposes for which they are required.

I have also seen the stable and byres, with, perhaps, one or two hovels placed together, and the barn and straw-house in quite a different part, or at the other side of the stackyard, with a road running between them and the stables, and probably a more modern cart-shed, with a granary above it, in some distant position, and in some cases the granary is placed above the farm-house at a considerable distance, so that the corn had to be carted to it from the barn.

And with regard to the stables and byres, neither light, ventilation, nor drainage, was ever considered, which are now known to be so essential to the health and constitution of the horses and cattle.

This is but a brief description of this class of buildings, and which might be treated upon at greater length, but I think sufficient to show the absurd manner in which the site and the arrangement was carried on, and the slight regard which was paid to the comfort and convenience of the stock as well as the oversight in not providing the means for saving of labour in attending upon them.

From the bad arrangement of such steadings, whatsoever new buildings may be required to increase the accommodation, there is little chance of being able to design them to advantage, or to make a suitable and necessary improvement either in the plan, the accommodation, or the site; therefore, in such instances as those which I have already described, and when they are in a dilapidated state, I consider it the cheapest and best plan to have them taken down and have new buildings erected in a modern style, and on a suitable and convenient site.

During the last few years agriculture as a

* By Mr. J. E. Watson, architect; read at a Meeting of the Hexham Farmers' Club.

science has made rapid strides in the cultivation and improvement of land, and with the aid of the steam plough and other implements which have been invented, large tracts of land, which formerly lay waste, are now in a productive state, consequently larger crops, as well as greater extent of grazing-land for sheep and cattle, have been obtained. It has, therefore, been found essential and necessary that additional and more convenient accommodation in the farm steadings should be obtained for the housing of stock and cattle, as well as for the advantage of both landlord and tenant, by the erection of suitable and well-arranged buildings, totally different from the inconvenient and unsuitable erections which have existed for years; and for this purpose different agricultural societies have offered premiums for the best plan and design, and in the year 1861 the Royal Agricultural Society of England, at their exhibition at Leeds, offered a premium of 50*l.* for the best arranged plan, and in that competition I had the honour of gaining the first prize. The plan now exhibited is almost a correct copy, and which I intend taking as my model in giving a description in this paper.

The first thing to be considered is the site, and in choosing this for a new building I am of opinion that it ought to be as near the centre of the farm as possible, this being the proper position for convenience. Keeping in view that it be of easy access by sufficient and good roads, that it should be a dry situation, and easily drained by taking away both the day water and the water from the spouts, as well as the drainage of the liquid manure into the tanks, and also that it should be capable of affording a good and sufficient supply of water; not to be too much exposed, but in a sufficiently sheltered position; free from the faults described in the sites of old buildings, and to keep in view that the folds always face the south, so that the cattle may be sheltered and have the advantage of the warmth of the sun. By attending to these points, not only is expense saved, as less excavation is required, less labour in laying the drains and foundations, and probably less expense in the cartage of the materials, but also additional comfort and convenience may be obtained.

In designing farm buildings I have always considered compactness and symmetry the great elements of composition, by placing the parts which depend upon each other as near together as possible, and removing to a separate place the buildings in which no stock is housed, also to provide ample means for sufficient light and ventilation.

The designing and arrangement of farm buildings are generally open to a deal of criticism and contention, perhaps more so than any other class of buildings; for in various parts of the country different systems of farming are adopted, consequently contrary opinions are entertained, and even in the same locality sometimes there exists a difference of opinion as to the arrangements of the steadings and the methods of rearing and feeding of stock, some preferring stall feeding, some in favour of large folds, others in favour of small folds, to contain four or five cattle each; some are in favour of open folds, with the feeding-triangles covered over with sheds, to protect the cattle in wet weather; whilst some are in favour of the folds being entirely covered in, and which system seems to be advancing and gaining ground. I have also known in some cases objections made to liquid-manure tanks; whereas others are favourable to them.

As improvements in agriculture continue to advance, suitable and improved buildings will be still more required, and no doubt many of these differences of opinion will in course of time cease to exist.

I have endeavoured to combat with these differences of opinion as much as possible in making the arrangement, so that it can easily be altered to suit either of the systems just mentioned, and the form I have adopted is simple and compact, easy access being obtained to each portion of the building, without being much exposed in stormy weather, as any one attending the horses, cattle, &c., can do so with comfort and little labour in comparison to that which was required in an old farm-steading, owing to the want of proper arrangement and the isolated position of some of the buildings.

I have always arranged my plans so that the barn and straw-house should occupy a central position, as the straw is an article in constant request; therefore, the buildings, folds, &c., which require the greatest supply, ought to be grouped round it as much as is compatible with

the size and extent of the building, and to have a direct communication with the feeding-boxes, stable, byres, hovels, and so on, to enable the supply to be easily kept up, and as much under cover as possible.

The same arrangement applies to the turnip-houses, having passages to the feeding-boxes and sheds; and in some cases I have made these passages sufficiently wide for a tramway, with a suitable truck or wagon to convey the cut turnips to the cattle.

The passages between the covered feeding-sheds are sufficiently wide and spacious to allow of a sufficient quantity of turnips being always stored for the use of cattle in the adjoining folds.

The granaries are above the hovels, for the sake of ventilation, extending each way right and left so as to store different kinds of corn, and having a direct communication with the under and upper barns, as well as with each other, the straw-house being in the centre, the full height of both stories, to afford space and accommodation for packing a large quantity of straw.

It is essential that the barns and granaries ought to be constructed so that they may be kept free from vermin. To accomplish this, I invariably have the bottom or ground floors laid with concrete cement on a foundation of broken stones or bricks, from 6 in. to 9 in. in thickness; the floors of the upper barn and granaries may be done in a similar manner, by laying the floors in the first instance with rough narrow battens, upon at the joints to give a key to the cement work; the walls ought also to be plastered up to the window sills with a good thick coat of cement, which, as well as making them proof against vermin, is also a preventive of damp.

The feeding-boxes are placed in close proximity to the folds, and are well ventilated and lighted from the top with squares of rough white glass as skylights, slated in with the slates; a passage is arranged in connexion with the turnip-house for feeding the cattle; the doors may be hung in two halves in height, so that the upper part may be left open when extra ventilation is required; the division rails are made movable, so that they can be taken out when larger boxes are required.

The feeding-sheds are open, and made sufficiently wide for cattle to feed entirely under cover; the remaining part of the fold is open, but as contrary opinions are still entertained as to the desirability of having the folds covered, it will be seen on reference to the plan that a roof can easily be placed over the open part at a small cost, or the whole may be left open without interfering with the general arrangement.

The stables, byres, &c., are placed at right angles to and at the end of the hovels, in such a position that they can without much labour be supplied with straw and fodder; the manure also can easily be thrown into the folds. In some localities there is a difference of opinion as to whether a hay-loft ought to be placed above the stable; some prefer it, and imagine that without it a sufficient quantity of hay cannot be stored; others condemn it entirely. My experience teaches me to think that it is better without, and to keep the stable open to the roof, with proper ventilation at the ridge, and a few glass squares, which can be had for a trifling cost, slated in to give additional light as well as an additional degree of comfort. The Inclosure Commissioners object to lofts above the stables, and request well-ventilated houses for hay attached to each stable. Or in some instances I have introduced a small window at the head of each stall, made with solid frames, and hung on pivots; this not only throws light into the racks and mangers, but when the stables are empty they can be opened, and having windows at the other side, a thorough draught is created, which thoroughly ventilates the stable.

Metal fittings for partitions of stables, also for racks and mangers, are now greatly manufactured, and if some of a cheaper and less expensive style could be adopted, I think they might be used to great advantage in stables of farm steadings.

In fitting up the byres I always recommend the partitions between the cows to be made of stone slabs, about 4 in. in thickness, and the feeding-troughs of fire clay or cement. I find by experience that woodwork soon goes to decay, and that stonework is more easily kept sweet and clean.

The calf-house is in direct communication with the byre, fitted up with pens, and properly lighted and ventilated.

Separate loose boxes are provided for sick horses and cattle, without having any communication with the other parts of the building.

The piggeries are also placed convenient to the folds, so that the manure can easily be put into them. But as metal fittings are now much used they are sometimes fitted up more in connexion with the other parts of the building.

With regard to the floors, which are generally done with rough paving, I am inclined to think that the whole area of the building ought to be laid with concrete cement flooring, that for the stables, byres, &c., to be well grooved to prevent the horses and cows from slipping, the remainder may be plain; the channels can be formed without the aid of dressed stone, and it would be the means of preventing damp and harbour for vermin; the extra cost would perhaps be something like 2 and 2½ to 1 at the outset; but as no repairs would be required for a considerable length of time compared to what is required for common paving, it would, perhaps, be as economical in the end. I have adopted this method successfully in stables attached to noble-men's and gentlemen's mansions.

Machinery can be fitted up in connexion with a shed and saw-frame for the purpose of cutting gates, railing, &c., which are always required for the use of the farm.

The drains ought to be properly laid, and to communicate with each stable, byres, feeding-sheds, &c., so as to convey the liquid manure into the cesspool. Drains ought also to be laid to convey the rain-water from the roofs to some convenient outlet, for the purpose of keeping the steadings always dry.

The superintendent's house, cart-shed, work-shops, &c., are placed on the south side of the square, the back wall of which forms an excellent garden wall in connexion with the farmhouse. It will be observed that these buildings, where fires are required, are placed in this range to be as far as possible from the straw, so as to prevent the danger of fire.

Another advantage is, that the superintendent's house being placed at the entrance, no one can have admittance without being seen, and the entrance-gates, as well as the other gates leading to the folds, being locked at night, makes the place secure, and the superintendent living on the premises can always attend to the horses and cattle, especially when required in cases of necessity.

Dairy-farms can be constructed on a similar plan, having the byres and the feeding-byres under one roof, similar to what an entirely covered fold would be, having a direct communication with the straw and fodder-house, dairyman's house, &c.; the stables, cart-shed, with granary above, barn, straw-house, &c., forming a distinct part, but all in connexion with each other.

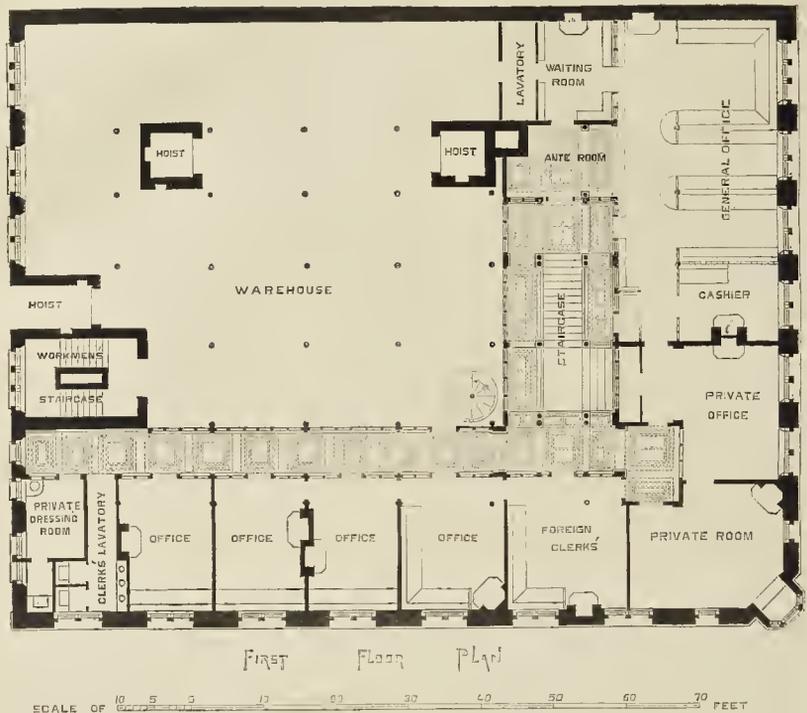

In the erection of farm-buildings, care should be taken that the floors are always kept well up from the surface of the ground, to prevent damp as much as possible.

Not only have improvements taken place in the plan and arrangement of steadings, but likewise more taste is shown in the elevations, and the introduction of some central feature in the form of a simple campanile gives it a neat and picturesque appearance.

The future advantage to be gained is, that the buildings may be enlarged to any necessary extent; in fact, by mere contraction or expansion of dimensions, may be adapted for a farm of any size without in the slightest affecting the design or arrangement. And as it is now considered by several eminent practical agriculturists that in a few years open folds will be considered "as things of the past," a glance at the plans will show that in addition to the roof over the feeding-sheds in the folds, which are at present generally sufficient, how simply another roof may be put over the open part, making it entirely enclosed, or otherwise the folds for the fat cattle may be covered in, and those for the young cattle left open. The hovels, then, not being required, could easily be converted into additional byres, feeding-boxes, or store-rooms, as might be required.

I trust, therefore, that the design I have adopted will be considered not only good in itself, but that it is capable of alteration and adjustment so as to meet the ideas of different people for some years to come, whatsoever their opinions may be as to the arrangement of farm buildings, and the methods of rearing and feeding of cattle.

With regard to the cost of buildings, it is generally understood that the stones are to be had on the estate for the expense of winning

NEW SHIPPING WAREHOUSE, DEANSGATE, MANCHESTER.

only, and that the cartage of the materials is done by the tenant. In such cases the general cost amounts to something like 3d. per cubic foot. No doubt there is a difference with regard to some of the buildings, as a stable, lyre, &c., with its fittings and requirements, will cost more than a plain straw-barn or feeding-shed; but, taking the whole into consideration, the price I have mentioned is near to what the cost will be. Of course the advantages of different localities must be taken into consideration.

Perhaps the roofing is a subject which requires most consideration, as the Royal Agricultural Society of England, at their show in Manchester, in 1869, offered premiums for the best description of roofs, and at which I was appointed one of the judges to report upon them. There were models of slate, iron, and felt roofing exhibited, and I cannot explain their merits better than by quoting from our report. "Slate roofing being familiar to all persons, it is unnecessary to describe the mode of construction, which professes no speciality. The cost per square of 100 ft. may be taken at 5l. 0s. 10d., or rather over 1s. per foot. The models or examples of galvanized corrugated iron roofs, on wrought-iron framing, were tied together by the ordinary wrought-iron rods, with king-post rod and key. The cost per square was stated to be 3l. 18s., or nearly 9½d. per foot, including wall-plates. The felt roofing was in the form of a circle, of which it was stated that the pitch should be 1¼ in. per foot, preserved in its shape by a girder formed of 'bows and strings,' with lattice-work between them, tied by a solid web of timber equal to one-fifth of the span, to give extra strength to the bearings. These lattice-girders are from 8 ft. to 10 ft. apart. On these are purlins, 22 in. apart, covered with a sheet of ½-in. boards in long lengths, and from 9 in. to 15 in. broad, upon which is laid the felt, which is again covered with tar or varnish properly prepared. It was stated that spaces 75 ft. in width had been covered

with perfect satisfaction, and that spaces 100 ft. in width could be covered without any intermediate supports. The cost per square is stated to be 1l. 12s., or nearly 4d. per foot. The period of durability of slate roofing may be stated to be at least fifty years; that of iron, twenty-two years; and that of felt, eight years; the first requiring no other act of maintenance than ordinary repairs; the second requiring strict attention in painting, to preserve it from the corroding effects of uprising vapours; and the third, in addition to repairs, requiring a coat of tar or prepared varnish every other year, to preserve it from the effects of the sun and weather. The question of economy is not, therefore, determined by the first course, but must have special reference to the periods of duration of each description of material; for, as the roof will require to be replaced at the termination of each period, it is necessary that the principal money first expended should be repaid within such periods. The true state of the case, as respects economy, will be understood, therefore, by comparing the annual amounts per square of ground covered which must be gained to repay the cost within the periods mentioned; and calculating the value of money at 5 per cent. interest, they are as follows:—Slate, 5s. 6d.; iron, 5s. 10d., with painting once in three years; felt, 4s. 11d., with tarring once in two years. Each is liable to ordinary repairs,—iron and slate requiring very little indeed, and felt requiring more."

A NEW WAREHOUSE, DEANSGATE, MANCHESTER.

A new shipping warehouse, covering about 1,000 superficial yards of land, has been recently erected for Messrs. Reiss, Brothers, in Quay-street, Deansgate, a district in which other warehouses will be erected within a few years, as the city is rapidly extending in that direction, and

it is intended to open out a new street into Salford by a bridge over the river Irwell, and to widen Deansgate, which is one of the main thoroughfares.

The building consists of eight floors, the lowest two of which are beneath the street level, the sub-basement being devoted to the machinery, viz., boilers, engines, pumps, &c., and the basement-story to the packing-room, with hydraulic-presses (which have been executed by Messrs. Norbury & Shaw, engineers, Salford).

The ground-floor is used as a twist-room, and the offices are placed on the first floor. These are handsomely fitted up with desks and counters in wainscot oak. The remaining floors are appropriated to the grey-room, the print-room, the making-up-room, and to stores, respectively.

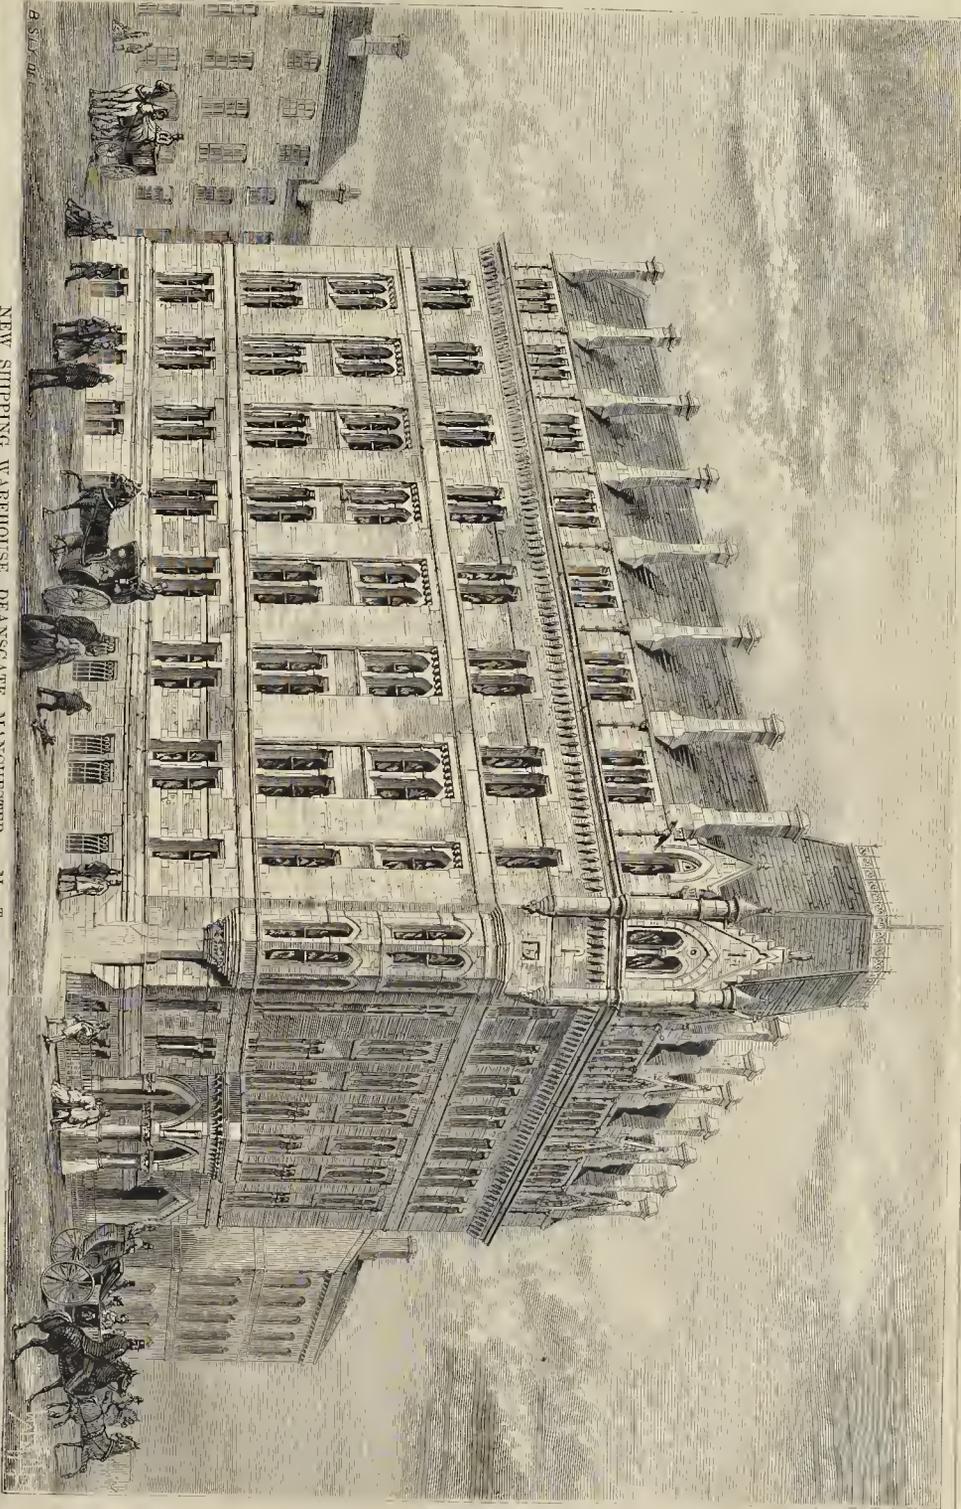

The principal entrance is in Quay-street, with a porch projecting over a sunk area, which affords an unusually good opportunity of lighting the sub-basement story, the area being 6 ft. wide, and lined with white glazed bricks.

The floors are connected, in addition to the principal staircase leading to the offices, by separate stone stairs for the workmen, as well as by three hoists from bottom to top of building, and from the first-floor upwards by a circular wooden staircase.

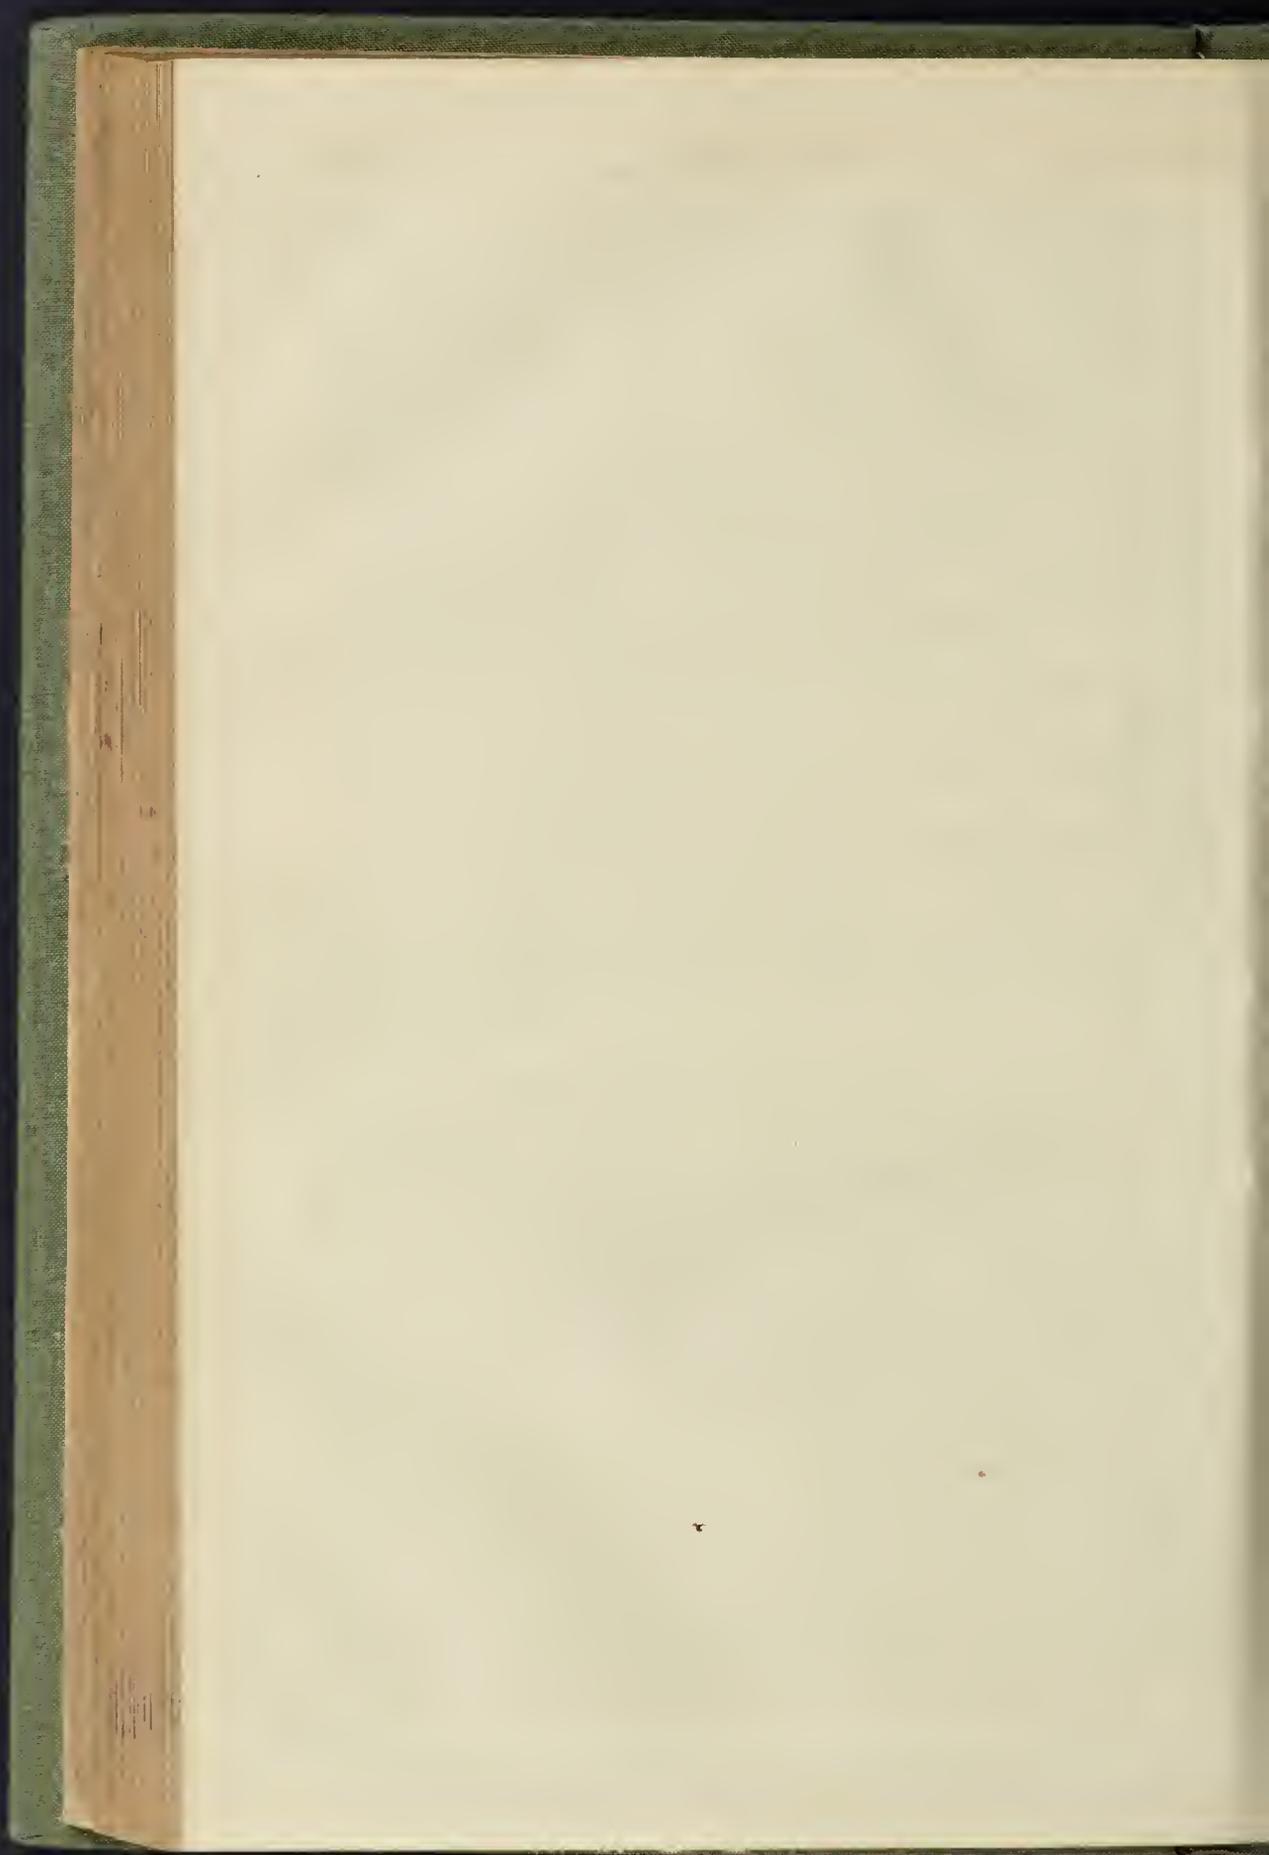

The exterior is mainly of red brick, with stone dressings; and the angle at junction of Quay and Longworth streets is filled with an oriel window of stone, two stories in height, with projecting base on ground floor.

The building is surrounded on three sides by streets, and there is a loading-place, or hovel, extending the whole depth from Quay-street to the back, with cartway through, and loading-stage in direct communication with the two steam-power hoists.

The architect is Mr. Thos. Worthington, and Messrs. R. Neill & Sons have executed the building under his superintendence.

NEW SHIPPING WAREHOUSE, DEANSGATE, MANCHESTER. — MR. THOMAS WORTHINGTON, ARCHITECT.

GAS FROM WOOD.

The substance of the following is from "Musspratt," and may help your correspondent, Mr. A. Morse. Dr. Pettenkofer was the first to use gas made from wood to illuminate the city of Munich. It matters little what kind of wood is used, provided it be dry, or as free from water as possible; as the principal chemical constituents of all common woods are nearly alike. The wood is placed in the usual U-shaped retorts, previously made, and is made to pass through a freely given off, and is made to pass through the same arrangement of condenser, scrubbers, and impo-purifiers, as for coal gas; but as wood contains no sulphur, the heat of the retort is lower than for coal; and as it is given off more freely, it is sooner done, and in about a quarter the time required for coal. Liebig and Steinheil give the illuminating power of this gas as one-fifth greater than coal gas. The tar is more abundant and the charcoal more valuable than the coke made by the coal process. The charcoal when drawn from the retort is cooled with wet sand. E. G.

COMPENSATION CASE AT PENZANCE.

In the case of Mr. William Fox, of Penzance, against the Local Board of the same place, the under-sheriff of the county, in which the Local Board of Health for the north-east corner of Albert-street to be widened and improved. Mr. Fox, the claimant, said he wished to point out that the piece of land in question had a 40-ft. frontage Market-jew-street and a 41-ft. frontage in Albert-street. The piece retained by the Local Board was 26 ft. deep at its widest part, and together they required 720 ft. of Mr. Fox's frontage. In May, 1869, the Board offered 1000, which was refused; in January, 1871, Mr. Fox offered to take 420. Evidence for the claimant having been given, Mr. T. Cornish, for the Local Board, said this was the first case of the kind in Penzance, and the second, he believed, in the county, in which the Local Board of Health for the purpose of effecting a public improvement restricted a man from building, but offered him compensation. They had offered for this very property 5000, at a public sale, but Mr. Fox secured it for 525. They offered him 1,800, for the sole of his rights in the neighbourhood. And when he came to deal for this particular corner they tendered him a sum which they deemed adequate, and in fitting which they were guided by several other similar compensations. Having smartly criticised valuations given, of 1 and 1/2 a foot, Mr. Cornish gave several precedents in the purchase of frontages in Penzance. 1000, is an ample sum for the piece of ground now sought for 400, an unreasonable amount. The Sheriff very carefully summed up, commenting on the widely divergent views of truthful and estimable witnesses of property as to its value; and the jury, after a deliberation of quite an hour, gave an assessment of 3000, for the land and 500, for consequential damages.

CHURCH-BUILDING NEWS.

Stradbroke.—The restoration of the spacious parish church of Stradbroke has just been completed, the work having been carried out by Mr. R. M. Phipson, of Norwich and Ipswich, architect, and the building has been re-opened at the same time the row of wretched cottages which formerly stood to the south of the church, and blocking out the view of the church on the south side, have been bought by the parish and pulled down, the ground on which they stood being thrown into the churchyard, round which an iron palisading, with stone and flint piers at the gateways to the west and the south, has been erected. The works the architect recommended for a very comprehensive character, and have been carried out to the letter. The open roof of the nave had suffered less than any other part of the church, and has been restored all its details according to the original framework, the rotten beams, purlins, rafters, &c., being replaced in oak of exactly the same size and mouldings. The roofs of the north and south aisles were too far gone for repair, and entirely new roofs of pitch pine, moulded and carved, with ornamented spandrels and carved stone corbels, have been put up. The north chancel aisle has a similar new roof, but the south chancel aisle was in a better state of preservation, and required simply restoration. The old chancel roof turned out to be even better than Mr. Phipson had anticipated, and an entirely new roof has been put up. This roof is in the Decorated style. The nave and chancel roofs are covered with green slates, and those of the aisles with lead. The clerestory of the nave consists of four clustered two-light windows in the north, and the same number in the south, walls, and one two-light single window at each end; and were in a very decayed state, and have been almost re-made, the walls being re-faced with flint. The chancel arch, a considerable portion of which was debased brickwork, has

been reformed by a moulded arch, with stone shafts, caps, and bases. The stonework of the windows throughout the church has been restored, and the west gallery has been cleared away. The walls of the interior have been relieved from their coating of plaster, and have been cemented and stuccoed. The square pews have all been swept away, and the whole church re-seated with oak open benching, the nave and aisles having square ends, on the panels of which is executed tracery work varying in pattern. The chancel benches have carved poppy-heads representing chiefly natural foliage. The west window has been filled with stained glass of Geometrical design, by O'Connor. A new panelled ceiling has been put under the belfry floor of the tower, and the circular stairs leading to the belfry have been repaired. All the doors are of oak, with ornamented wrought-iron hinges, handles, locks, &c. The passages are all paved with red and buff tiles. The church is warmed by Boulton's heating apparatus. The south porch was a large semi-modern excrescence, mean in the extreme, and was condemned. In its place is a new porch with hammered flint facings and carved stone doorway and parapets. The old north porch has received attention. In many places the outside flint work of the walls was bad or had been made up with bricks, and in all these places it has been replaced, and the buttresses, quoins, copings, crosses, parapets, gables, &c., have all been restored, and, in fact, the whole exterior has been made good. The belfry windows formerly had wooden louvres, which have been taken out, and the stonework of the windows having been restored, new slate louvres have been inserted. The whole was carried out by Mr. Grimwood, builder, of Weybread. Mr. H. Vine, Eye, has done the mason's work; the superintendence of the bricklaying portion of the work was entrusted to Mr. Grimwood's foreman, Mr. G. Bullen; and Mr. Gibson, Fressingfield, did the glazing. The total outlay, after allowing for old lead and other materials, will amount to nearly 3,500. The only thing that remains to be done is to put in a new five-light east window, the present four-light one not being large enough for the restored church, and to supply a reredos, and we understand this addition is in contemplation. At present there is no organ, but a fund to purchase one has been commenced.

Chichester.—An addition has recently been made to the interior of the church of St. Peter-the-Great, by the erection of a new reredos, a gift from the vicar and Mrs. Gruggen. The reredos, which is principally of stone, is divided into three compartments, separated by short columns of coloured marble with carved capitals, supporting four angels, who carry in their hands the crown of thorns, the instruments of scourging, the spears, the dice, the cross, and the shroud, all emblems of the Passion. The subject of the sculpture in the central compartment is Our Lord in the act of breaking bread with the two disciples at Emmaus. It is said to be intended to place a new reredos in the church of All Saints, to be composed of encaustic tiles, and that it is also in contemplation to pave the east end of the church, and erect three stone steps for the communion-table.

West Bromwich.—The memorial stone of the restored parish church of All Saints has been laid. The contractors to the new building are Messrs. Burdett & Co., of Wolverhampton; and Mr. Somers Clarke, jun., of London, is the architect. The contract is for 6,3000, towards which 3,0000 have been already obtained. The church, when completed, will seat about 700 persons. The style of architecture will be that of the fourteenth century. The congregation will be provided with chairs until the funds will be sufficient for pews. Memorial windows will be put in the west end of the church by Colonel Bagnall. The Dartmouth memorial window will be restored, and another memorial window will be placed in St. Chad's Chapel by the vicar's brother, Mr. Charles Willett. The cost of the chancel has been defrayed by the Earl of Dartmouth, and the sacristy by the vicar. The bells will also be re-hung, at the cost of Colonel Bagnall.

Halifax.—At the annual meeting of the Ripon Diocesan Church Building Society, at Leeds, a grant of 3700. was made towards the erection of the much-needed church of St. Augustine. The plans have been prepared by Mr. Coad, of London. The edifice will consist of a nave of five bays, transepts, and chancel, with apsidal termination. The style is Early Decorated, and the church will possess one or two special

features not to be found in any other church in Halifax; for example, the apse, with its five long two-light windows, and the lofty clerestory windows. The nave will be 34 ft. long, and the chancel will be ascended by three steps, three others leading to the sacristy. The total accommodation will be for 750 persons.

Lakenheath.—At a meeting recently held as to the repair of the parish church it was resolved, at the suggestion of the Archdeacon, that the architect for the archdeaconry shall be called in, who will make a survey of the building without charge, on condition of his being selected for architect in case any repairs were really set about.

Birkenhead.—Bebington parish church has been re-opened, after being closed nine months for re-seating and other improvements. In the present restoration the fabric has not been altered in any way, the works being confined to cleaning the interior thoroughly, and rendering it dry by asphaltting the whole of the area under the floors, re-tiling, heating and ventilating, and seating throughout with open benches of oak, and constructing a choir and chancel by screening between the piers of the eastern portion of the interior. The fittings of the choir and chancel are of carved oakwork, in keeping with the few portions of ancient work which are in the church. All the ancient oakwork has been conserved and incorporated in the new fittings. The windows have been re-glazed with beaded glass. The floors have been renewed, and are laid with tiles and marbles. The total cost of the restoration of the edifice will be about 2,6000, of which 2,0000 will be subscribed by the parishioners generally. The cost of the chancel will be about 5000, or 6000, and the rector of the parish has taken upon himself to find the amount.

Chester.—The new Church of St. Thomas, at the end of Parkgate-road, has been consecrated by the Bishop of Chester. The adjacent burial-ground was consecrated at the same time. The new church is erected from designs of Mr. Gilbert Scott; the builder being Mr. Roberts, of Chester. It is of Early English architecture, the material being red Roman sandstone. The original plan of the architect was calculated to accommodate about 1,000 persons; but some important portions yet remain to be erected, and as far as at present completed only about 520 can be seated. The cost has been about 5,0000, raised by subscription, with the exception of the site, which was given by the Ecclesiastical Commissioners. About half an acre is intended to be devoted to the erection of a school, at some future time, in connexion with the church. The new church is a chapel-of-ease to St. Oswald's. Two more bays, the north porch, and the tower have yet to be added. The interior is floored with Minton's encaustic tiles. The present seats are only temporary chairs, of the same character with which the public are familiar, in the nave of the cathedral; two covered chairs in the chancel were given by Mr. Lamont.

Croydon.—The new church of St. Luke, Wood side, has been consecrated by Dr. Parry, the Suffragan Bishop of Dover. The new edifice is built in the Early English style, and was erected at a total cost of 1,13000, raised by voluntary subscriptions. The architect was Mr. W. V. Arnold, who gave his services gratuitously, the builder being Mr. T. J. Witt, of Dingwall-road. The church is capable of seating 300 persons, and 100 of the seats will be free and unappropriated. St. Luke's is the first church erected at Woodside.

Pittlevell.—The church has been re-opened by the bishop of the diocese, after having undergone partial restoration, during which many interesting architectural features have been disclosed. There have been five stained-glass windows added. There remains much to be done, as the whole of the windows in the south side are still in a state of decay, and the interior has yet to be re-seated. A new roof has been erected throughout, in English oak. In the nave and aisle it is plastered between the timbers, and in the chancel boarded. The chancel is further enriched with carved angels as finials of hammer-beams. The roofs of the nave and chancel are covered with green Westmoreland slates, with Bath stone rigging, and the roof of the aisle is covered with lead. The internal walls have had all the plaster stripped off and have been newly pointed, thus showing all the ancient work, notably some very early Norman windows in the arcade between the nave and the aisle, evidently belonging to the original church on the site. The flooring has been com-

pleted, boarded floors being laid and the passages paved, the chancel in tiles and the nave and aisle in black and red Poole tiles. The east window represents the four evangelists, with their respective emblems beneath, by Mr. A. Gibbs, of London. The west window is also by Mr. Gibbs. It is a three-light, representing St. John the Baptist (centre), Peter, and Paul. The north window of the chancel (three-light) is by Messrs. Clayton & Bell. The subject is the Presentation in the Temple. There is a small two-light window over the east window. The subject is the Amniction. This window is the work of and presented by Mr. A. Gibbs. The south window of the chancel, within the sacarium, by Mr. A. Gibbs, represents Christ found amid the Doctors in the Temple. The church is warmed by hot-air apparatus, by Messrs. Haden, Trowbridge, Wiltshire. The cost of work executed is about 3,000. That which remains to be done will cost about 1,250, exclusive of the tower (about 500*l.* more). The church bells (six in number) have been restored—five recast by Messrs. Stainbank, Whitechapel—and hung in a frame for eight, with the view of adding two others eventually. The cost of this is about 200*l.*, and 30*l.* has been expended in making the organ as efficient as possible. The architect is Mr. Ewan Christian, of London; and the contractor, Mr. Walter Aris, Hastings.

Lindley.—The corner-stone of the chancel to the parish church, Lindley, has been laid. At the north side of the chancel, which is in process of erection, there will be an organ-chamber, and on the south side ministers' and choir vestry. The chancel will be 25 ft. long and 21 ft. wide. A tracery stained-glass window, by Ward & Hughes, of London,—subject, the Ascension,—of the value of nearly 400*l.*, will be placed in the east end of the chancel by Mr. H. B. Taylor. The architect is Mr. J. N. Crofts, Liverpool; contractors for mason work, Messrs. J. Royston & Sons, Lindley; joiners, R. Whiteley & Nephew; plasterer, E. Jowitz; plumber, H. Garton; painter, W. T. Earnshaw. The estimated cost is 1,500*l.* A new organ by Messrs. Conacher, of Huddersfield, is in course of erection, making altogether an outlay of 2,000*l.*, towards which about 1,500*l.* have been already raised.

Catterick.—The parish church has been reopened after restoration, at a cost of 2,000*l.* The alterations and improvements are as follows:—A new chancel, built by Messrs. Forster & Andrews, of Hull; oak reredos and altar-rails (present); new vestry, with heating-chamber underneath, and porch; windows reglazed with cathedral glass; new choir-stalls, prayer-desk, and stone pulpit (the gifts of the Booth family); new chancel-floor of encaustic tiles, given by the vicar; brass standards (a present), &c.

Tamworth.—St. Paul's Church, Dosthill, a village situated about three miles from Tamworth, in the parish of Kingsbury, has been consecrated. Great efforts have been made to supersede the old building, which has served as a chapel of ease, and the result has been the erection of a Gothic edifice, built of the sandstone from the neighbouring quarry at Whaley. The church consists of nave and chancel. In the latter is a stained east window. The building, we believe, was designed by Mr. Holmes, of Birmingham, the work being executed by Mr. Lilly, of Ashby, contractor.

Alvescott.—The parish church has been reopened after restoration. The old ceiling of the roof has been removed, the floor has been repaired, open varnished pine benches have been substituted for the pews, all the doors have been renewed in English oak, a new pulpit has been substituted for the old one, and the church is heated with a warming apparatus. Among the features of the alterations are the reredos and a new east window. The latter is filled with stained glass from Munich, and has been erected in memory of the Rev. A. Neate, the late rector. These alterations have been carried out on the designs of Mr. Slater, architect, Westminster, by Mr. Plaster, of Bampton. The total cost of the restoration has been between 600*l.* and 700*l.*

Waverthorpe.—This Late Norman church has been re-opened by the Archbishop of York, but the addition to the churchyard was not consecrated, the enclosure not having been completed. The church, which was closed in August, 1870, has been restored at the sole cost of Sir Tatton Sykes, bart., of Sledmere, being the third church recently built or restored by him; a fourth, at Helpthorpe, being nearly complete, and another, at Lutons Amho, having been begun. The restoration was placed in the hands

of Mr. G. E. Street, R.A., of London, and the work, as at Thexendale and Fimber, has been carried out under the supervision of Mr. R. Hayward, of London, the resident clerk of the works. In the restoration every ancient feature has been preserved, the old walls and windows have been restored, the gables of the nave and chancel have been raised to the pitch of the original church, and the roofs have been covered with lead. The peal of three ancient bells has been re-hung in the tower, to which a leaden roof has been added. Externally, the church presents its old appearance. Internally, the edifice consists of tower, nave, and chancel, with south porch. The three lights of the old east window have been filled with stained glass, by Clayton & Bell, of London, representing the Ascension; and the two-light windows on the north and south side,—and, in fact, all the other windows,—have glass from the same artists. A south one-light window in the chancel has a figure of St. Andrew, and in the nave, upon an ancient corbel in the south pier of the chancel arch, is placed a full-length effigy of St. Andrew, in Caen stone, by Redfern, of London. The windows on the north side of the nave contain figures of St. Mary and Mary Magdalene, and an ancient Norman north door has been opened out. The windows on the south side have figures of St. Peter, St. James, and St. John. In the south-west angle of the nave is placed the old carved Norman font. An iron screen separates the nave from the tower space, which forms a vestry, over which is the belfry. The church is seated with oaken stalls throughout, and the warming is by Porrett's hot-air system. The spaces of nave and chancel are paved with coloured tiles. The pulpit is by Leaver, of Maidenhead; the screen by Parker, of London. The builder was Mr. Booth, of London; and the decorators of the ribs and roof are Messrs. Bell & Arnold, of London.

Oxford.—St. Frideswide's Church has been opened and consecrated. The foundation-stone was laid on the 13th of December, 1870, and lack of funds compelled the cessation from the work for a time last summer. The site upon which the new church stands is to the left of the Botley turnpike-road, just beyond the bridge which forms the main entrance to New Osney. The land is rather more than an acre in extent. With respect to the interior, we may state that benches have not yet been provided, chairs being used throughout the nave. The choir has, however, been fitted up with permanent benches. The floor within the apse is laid with encaustic tiles, relieved by freestone steps. The floor of the chancel is also laid with encaustic tiles. As the space is now allotted there is accommodation for about 250. Not only has the building of the tower been left, but also the benches and the interior stone carving. Messrs. Honour & Castle were the contractors. The original contract, as taken by them, was 3,950*l.*, but, owing to the lack of funds, not more than about 2,500*l.* have been spent. The architect of the works is Mr. S. S. Teulon, of Westminster.

DISSECTING CHURCH-BUILDING NEWS.

Nantwich.—The foundation-stone of a new Baptist chapel has been laid on a site in Market-street, Nantwich. The building will be in the Gothic style. The width of its frontage is 36 ft., sides 71 ft. It will be built of red painted bricks, and ornamented with white and blue bricks in string-courses, and white stone from Grinsell quarries. There will be projecting gables at each side. The interior will seat about 400 people. There will be one gallery in polished pitch pine, and the pews open seats. The upper portion of the building will form a lecture-room, vestry, and school. The estimated cost of the building and land is upwards of 1,300*l.*, towards which 700*l.* have been already promised. Messrs. Horsfield & Son, of Halifax, are the architects; and Mr. Henry Ray, of Nantwich, is the builder.

Edgeley.—The foundation-stone of the third Wesleyan chapel in succession on the same plot of land in Edgeley has been laid. The Italian style of architecture has been adopted in the design. The building will be of brick, with stone dressings. The principal feature in the front is a Corinthian portico of four columns, surmounted by a balustrade. Within the portico is the principal entrance to the chapel. On each side of the portico are two tiers of windows, giving light to the staircases. The length of

the building internally is 72 ft., and the breadth 41 ft. 6 in. At the rear of the building, on the ground floor, a large class-room, suitable for week-night preaching and prayer-meetings, and a minister's vestry and a staircase for the children are arranged. The gallery is the whole length of the chapel, extending over the vestibule in front and class-room, &c., at the back. The entire height of the chapel from the ground-floor to the ceiling is 31 ft. The building will be well lighted and ventilated. The accommodation is for 750 persons. The total cost of the building will be about 3,000*l.* Mr. P. Hodgkinson, of Hulme, Manchester, is the contractor for the whole of the work. The chapel was designed by, and will be carried out under the superintendence of, Messrs. Hill & Swann, architects, Leeds and Sheffield.

Fartown, Pudsey.—The foundation-stone of a new chapel for the Methodist New Connexion has been laid at Fartown, Pudsey. The estimated cost of the new building is 1,650*l.* It is to furnish sittings for 450 people. Messrs. Nelson, of Leeds, are the architects, the style being Italian. It will have a gallery at one end and an organ and choir recess at the other, and two vestries, with other offices, will be provided. Messrs. W. Wood & Son, of Pudsey, and Mr. E. Boys, of Pudsey, have entered into contracts to do the main portion of the work.

Gateshead.—The memorial-stone of a new Congregational Church, situated in Hexham-road, Gateshead, has been laid. The principal feature of the building, the walls of which are to be of local wallstone, the dressings being ashlar, also from a local quarry, is the tower and spire, which rise to a height of 113 ft. from the ground to the top of the vane. The church is lighted in the front by a four-light window with a recessed head, on each side by lofty two-light windows of a similar character, and at the back by a rose-window. These will be all filled with Hartley's cathedral tinted glass. In lead quarries, with margins of colored glass. Entrance is obtained by three doorways, one in the centre for the ground-floor of the church, and one on each side communicating directly with the gallery staircases. Internally the church is divided into nave and aisles by arcades of iron pillars supporting wooden arches, from which springs a wagon-headed roof. A narrow gallery runs along each side of the building and extends on the front to a much greater depth, being carried over the front vestibule. The seats, which will provide accommodation for 800 adults, are all open, with slanting backs, and are of stained deal. The passages are to be paved with mosaic tiles. The warming is to be by Lewis's patent warm-air apparatus, and the lighting by gas pendants and brackets. A special feature in the design is a ladies' and deacons' room, provided in an annex communicating with the tower entrance. The schools externally will be the bulk of stone like the church, and will accommodate 500 children. They comprise, on ground-floor, infants' school and five class-rooms, and on first-floor a library and a large school-room, which latter, when arranged, as intended, for lectures, will accommodate 400 adults. It will have a gallery at one end, and a curved brace roof. The heating and lighting will be on the same principles as the church, special attention being paid to ventilation. The cost of the church is estimated, at 3,360*l.*, that of the school at 1,000*l.* The contractors are:—For the whole of the building work, Mr. J. A. McMartin, of Gateshead; Mr. G. Wilson, of Leeds, for the glaziers' work; Mr. J. W. Lewis, of Newcastle, for the heating apparatus; and Mr. Dovey, of Manchester, for the ornamental metal work. The whole is designed and carried out under the superintendence of the architect, Mr. J. B. Pritchett, of Darlington.

Handforth.—The corner-stone of a new Wesleyan chapel has been laid at Handforth. The building (which will be of brick, with stone dressings, and in the Gothic style of architecture) will accommodate 250. It will cost about 1,600*l.* The architect is Mr. Sutton, of South-

Saltire.—The corner stone of a new Primitive Methodist Chapel and Schools, in course of erection about midway between Shipley and Saltire, on the Bingley-road, has been laid. Sir Titus Salt, bart., in consequence of a severe attack of gout, was unable to be present. The building is to be erected from the designs of Messrs. John Kirk & Sons, of Huddersfield and Dewsbury, architects. The basement floor will contain school-room, lecture-room, infant class-rooms, three small class-rooms, and kitchen. There will also be separate yards on each side of

the building for boys and girls. There will be spacious staircases communicating with the ground floor and gallery of the chapel. The ground floor will contain large and small vestries, lavatories, the main body of the chapel, and two side wings, containing entrance, vestibules, and staircases to galleries and schools. These entrances will be approached by bold flights of stone steps from Bingley-road. The gallery will extend round the entire chapel, and will be supported on ornamental cast-iron columns, the gallery front being moulded with panels filled in with ornamental perforated cast-iron work on carpet ground. The body of the chapel and gallery will contain sitting accommodation for 1,000 persons. The paving and other wood-work will be of red deal, stained and varnished. The chapel will be lighted by means of ornamental sunlights suspended from the ceiling, and will be warmed by hot water on the best principle. The style of architecture will be Italian, freely treated, the principal front being towards Bingley-road, from which it will be separated, by a distance of eleven yards, by a low boundary wall, surmounted by ornamental iron palisading, with gates of similar design to each of the three entrances. The whole of the building will be constructed of hammer-dressed wallstones and plaster dressings from the local quarries. Its entire cost will be about 4,500*l.* The whole of the works are being carried out under the immediate superintendence of the architects, Messrs. Kirk; the clerk of the works being R. Walsh, of Shipley. The contractors for the various works are:—Masons' work, Mr. G. Horsfall, Heckmondwike; joiners, Messrs. Bacon & Whitaker, Shipley; plumbers, Messrs. Ransworth & Sons, Shipley; slater, Mr. E. Norton, Shipley; plasterers, Messrs. J. Wilkes & Son, Baildon; painter, Mr. G. L. Smith, Hindhill.

Hatfield.—The chief stones of Holywell Green Congregational Church have been laid on the site of the new church, now in course of erection, at the sole cost of Messrs. John Shaw Sons, in an one of the prominent hills of the land, and the spire will be seen for miles round. The design is the Geometrical style of Gothic architecture, and comprises nave, 48 ft. by 6 in.; aisles, 58 ft. 6 in. by 10 ft. 1 in.; choir, 18 ft. by 14 ft. 3 in.; two vestries the rear, and two porches in front, formed by a tower on one side, and the staircase on the other. The nave is divided from the aisles by a series of five arches each, which will be of solid stone, supported by polished granite piers, with ornamental foliage caps of stone. The roof will be wagon-headed in form, having gilded braces and purlines of pitch pine, with stercorated ceiling between. The present accommodation on ground floor, and in an end gallery be constructed in the recess between the tower and staircase, is designed for 600, but the addition of transepts, for which the design is being specially arranged, 400 more seats can be provided at any future time, giving the total up to 1,000 sittings. The seats are designed to be 34 in. from back to back, and are to be allowed to each individual. They are to be open, with slanting backs, and fitted up with book and hat boards, and all of pitch pine finished. The pulpit will be of Caen stone, with marble pillars. The windows will all be filled with stained and painted glass. The sills and margins of the passages will be paved with mosaic tiles. The warming of the church will be effected by Lewis's patent warm-air apparatus, and the vestries by the patent warm-air chamber fireplaces of the same maker. Originally, the galle end to the road contains two light windows under the gallery with a five-light window over them, occupying the space, which will be surmounted by a stone cross. The angle stands the tower, the ground floor which forms one of the vestibules to the church, entered by a door with moulded arch, supported by granite columns. Over the door is a five-light window lighting the ringing-room; the next stage is the clock and top or belfry, being filled by moulded two-light belfry windows. From an arched cornice springs a spire, surmounted by a vane rising to the height of 20 ft. from the ground. The spire is decorated at the angles by ornamental pinnacles called "broaches," and is relieved by a series of "lozenged" lights. At the angle of the tower is a second entrance lobby, lighting the staircase to the children's gallery. The building is surmounted by an octagonal spiral roof. A connexion is designed between the school and this lobby by a covered

and glazed corridor. Each side of the church is designed with three two-light windows, surmounted by gables, the larger two being designed so that they can be extended to form the gables of transepts, when an enlargement of the church becomes necessary. The choir has at the sides simple windows lighting the vestries, and at the back a rose window, which will be seen above the organ. The building is being erected of local stone, which is said to be among the best in the kingdom, the brown being used for the outside chiselled; the white cleansed for the inside. The architect is Mr. J. P. Pritchett, of Darlington; the clerk of works Mr. Dowgill; and the contractors for masons' work Messrs. B. Edwards & Son, Holywell Green; slating, Messrs. Hill & Nelson, Batley; plastering, Messrs. Bancroft & Son, Halifax; joiners' work, Mr. Joseph Hodgson, Holywell Green; plumbing, Mr. J. Aspinall, Elland; glazing, Mr. W. I. Booer, Leeds; painting, Messrs. E. & B. Briggs, Lov Moor; iron and brass work, Mr. J. Dovey, Manchester; granite and marble work, Messrs. Penning, London; carving, Messrs. Walker, Emley, & Beall, Gateshead; warming, Mr. J. W. Lewis, Newcastle-on-Tyne. The cost will be about 6,000*l.*

Tatenhall.—The new Congregational church has been opened for divine service. It is Gothic in style, and built of the white stone of the neighbourhood, except the carved portions, for which stone from the Grinsbill Quarry has been used. The entire length is 63 ft. 10 in. by 31 ft. 6 in., while the height from the basement to the eaves is 15 ft. 6 in., and from the basement to the ridge of the high-pitched roof, 38 ft. For the roof, Bangor congres slates, with green bands, have been employed, and fancy ridge-tiles. The front elevation to the street is a gabled one, with an entrance-porch and vestibule on each side, the outer porches being ornamented with small octagonal hutresses and the doors with columns on either side, and carved capitals and bases. Between the porches is a four-light window, with circular traceried lead and moulded arch, and extending in each direction from the window-sill to the porches are carved and moulded panels. On each side of the building there are five windows, three two-lights and two three-lights, with cusped trefoil heads and carved capitals and bases, and on each side one of the three-light windows is used for the porch, having two lights in that and one in the chapel. The windows are glazed with cathedral-tinted rolled glass, with stained borders. The roof is celled, but so as to show the four principals, which rest on moulded corbels, below each of which are gas-jets. The whole of the woodwork is of pitch-pine, stained and varnished, the most prominent part of that being the minister's pulpit, or rather desk, which stands on a raised platform in front of a recessed moulded arch, with carved capitals and pillars. The building is warmed by one of Porritt's hot-air stoves, lighted by gas, and ventilated by circular apertures in the ceiling, a current of air passing between that and the roof from the louvres near the apices of the gables, and the front galle is terminated by a stone finial. The architect was Mr. T. M. Lockwood, and the builder, Mr. Charles Holland, of Chester. It was estimated that the cost of the chapel would be 1,350*l.*, and that, together with the adaptation of the old chapel to school purposes and a mausoleum for the minister, the total cost would be 2,200*l.*

SCHOOL-BUILDING NEWS.

Stafford.—A meeting, presided over by the Earl of Shrewsbury, has been held at Stafford, to consider what means should be adopted for carrying out a proposal to build new schools in Rowley-street for the parish of Christ Church. Lord Shrewsbury said that, for one, he thought the subscriptions should not be returned, and he should be very happy to increase his own gift as a quasi-memorial of his late friend the vicar. They would require 48*l.* 16*s.* 3*d.* to complete the undertaking. He had been thinking how he could help in the matter. Whit-Monday was a shoemakers' holiday in Stafford, and he should have much pleasure in placing his grounds at Ingrestre at the disposal of a committee for the holding on that day of a *fête* at which intoxicating drink should, as at Alton, be served out at intervals only. In that way enjoyment might be afforded to the people of Stafford, and an addition be made to the Christ Church School fund. The proposal was heartily received, and the Mayor thanked his Lordship for his kind offer.

His Worship expressed the opinion that larger schools than those contemplated should be built. A committee, consisting of the borough members, the Mayor, and other gentlemen, was appointed to give effect to Lord Shrewsbury's offer.

Shanklin.—The new parochial schools at Shanklin, the foundation-stone of which was laid in August last, have been opened. The buildings comprise three large and lofty schoolrooms, intended to accommodate 100 boys in the upper room, 120 infants in the centre room, and 100 girls in the lower room. In connexion with these are lavatories and other rooms. There is a large playground, in one corner of which is situated a commodious house for the master.

West Mersea.—The newly-erected schoolhouse at West Mersea has been opened. The school and master's residence are erected with red bricks, jointed with dark mortar, and Bath-stone dressings. All the windows and doorways are of Bath stone, and the windows are glazed with tinted cathedral glass. The interiors of the school and class-room are arranged in accordance with the requirements of the Committee of Council on Education. The roof is celled under the collar-beams, the exposed timbers and all the joiner's work being wrought, stained and varnished. An abundant supply of pure water has been procured from a well sunk near to the school, and is conveyed to the several offices by a force-pump. The playgrounds and master's garden are divided by rustic fences, and the whole site is enclosed by an ornamental brick wall. The school is entered by a porch at each end for boys and girls. The schoolroom is 40 ft. in length, and 18 ft. in width; and the class-room is 24 ft. by 16 ft., and 11 ft. in height to the wall-plates. The work has been executed by Mr. Alfred Diss, builder, under the superintendence of Mr. Horace Darken, architect, Colchester.

Farington.—The committee of the British School are about to erect new school buildings near the entrance to the town from Lechlade, the present school being found inadequate to the number of children attending; and a sum of 600*l.* has been raised towards this object. The contract for the erection of the new school buildings has been taken by Mr. Williams, builder, Abingdon.

Pendleton.—St. Thomas's Schools, Hanksinon-street, Pendleton, have been opened for school work. The plan comprises girls' schoolroom, 60 ft. by 30 ft.; little boys' schoolroom, 43 ft. by 24 ft.; infants' schoolroom, 35 ft. by 19 ft.; class-room, boiler-room, store-room for spare forms, &c.; three porches, latrines, &c. Attached is a good-sized master's house. The walls are faced with stock bricks. The latrines are entered under cover from the schoolrooms, and have a constant current of air passing through them, securing thorough ventilation. The heads of the windows are filled with a floriated kind of stained glass, in three or four tints. The large school-room will be used for Sunday services, the little boys' school forming a quasi-chancel. The accommodation is for about 450 day-scholars. The work has been carried out by the builder, Mr. James Birch, under the superintendence of the architects, Messrs. Medland & Henry Taylor, of Manchester.

STAINED GLASS.

St. Martin's, Scarborough.—Miss Mary Craven is giving three new stained-glass windows to this church, as an expression on her part of loyalty and devotion to the royal family. One will be a thank-offering for the recovery of the Prince of Wales, and the adjoining window will be given as a tribute of respect to the Princess. The third window will be given in token of loyal and devoted attachment to the Queen. This latter will be a companion to the window of the "Three Kings," which Miss Craven gave in memory of the Prince Consort nine years ago. The Archbishop of York has given his sanction to Miss Craven's intention. When these windows are placed, every window in St. Martin's will be filled with stained glass with the exception of one, and that we believe is also promised.

St. Michael's, Cambridge.—Messrs. Hardman, of Birmingham, have completed a memorial window for the east end of this church. The window has been so coloured as to admit as much light as possible. The subjects illustrated are:—The Expulsion of Adam and Eve from Paradise; our Saviour, with the gloria, surrounded by angels; the Sacrifice of Isaac; St. Michael and Diabolus arguing over the Body of Moses; the Angel slaying the First-born in Egypt; St.

Michael and the Dragon; the Slaying in the Assyrian Camp; the Angel appearing to Joshua; the Fiery Furnace; and Daniel in the Lions' Den. At the top are six angels. The whole has been adapted to the fifteenth-century architecture of the window. The cost was 500*l.*, which was defrayed by subscriptions. The chancel is being altered and improved from plans by Mr. Gilbert Scott, but although the work is not nearly completed, the church has been re-opened.

All Saints', Wington.—A window of stained glass, to the memory of the late Rev. John Vane, for forty-two years rector of Wington, has just been placed in the south side of this church. The work has been executed by Messrs. Clayton & Bell, of London, at a cost of about 150*l.*, which sum was raised by voluntary subscriptions. The top portion of the window represents St. James, St. Thomas, St. Andrew, and other saints. The centre represents the Raising of Jairus's Daughter, the Raising of the Widow's Son, and Christ Blessing Little Children; while the lower lights contain representations of the Nativity, the Presentation in the Temple, and the Flight into Egypt.

St. Andrew's, Whittlesey.—The east window of this church has been put in, and gives an appropriate finish to that ancient structure. The window is "Flanboyant;" it has been reduced 18 in. in order to allow room for the reredos erected on the design of Mr. R. R. Rowe, of Cambridge. This, however, is not noticed inside the building, as a still larger part of the window was before hidden by a grotesque, "Belief," &c., executed by some native artist in times gone by. The window is the work of Mr. Constable, of Cambridge.

St. Sidwell's, Exeter.—A stained glass window has just been placed in this church, to the memory of two sisters, daughters of the late Mr. William Kennaway, of Exeter, who were lost at sea. The window is composed of three lights, the centre representing our Saviour walking on the sea. The side compartments contain two medallions set in tracery, the one representing a cross wrapt in light shining over the sea, and the other a dove bearing an olive-branch above the waters. The whole is the work of Messrs. Mayer & Co., of Munich, its erection being superintended by Mr. Blake, of Exeter.

Trinity, Stockton.—A stained glass window has been placed in this church, by Mr. Joseph Wron, of Boston (formerly of Stockton), in memory of his mother. The stained glass was manufactured by Messrs. Mayer & Co., of Munich and London, and consists of four lights, which represent eighteen subjects chosen from the life of our Saviour.

Dudley Parish Church.—A memorial window for this church to the late Dr. Browne, has just been completed. It is in the style of the fifteenth century, and consists of three lights. The subject chosen for illustration is the Resurrection of our Lord. It was by Messrs. Hardman & Co.

Warbleton Church.—The large east window of this church has just been filled with stained glass. The work, which was completed for Easter Day, has been executed, both as to colour and design, by Messrs. Horwood, Brothers, of Frome, Somerset, and represents the four scenes of—1. "The Agony in the Garden." 2. "The Crucifixion." 3. "The taking down from the Cross." 4. "The Burial."

Higheles New Church.—A stained-glass window has been inserted at the western end of this church, as a memorial of Mr. Herbert, whose murder by Greek brigands produced such a painful sensation throughout the country two years since. Below the window a brass plate has been fixed, bearing the following inscription:—"To the glory of God and in memory of their friend, Edward Herbert, born 1st Sept., 1837, and murdered by Greeks at Oropos, 21st April, 1870, this window is erected by Fanny, Edith, Eveline, Ogilvy, Alan Herbert, and Henry and Norman Ogilvy."

Holy Trinity Church, Halifax.—The stained glass for a memorial window to the late Rev. Austin Henry Weston, curate at this church, has been placed in its position at the west end. The glass is from the works of Messrs. Ward & Hughes, of London, and the subject is, "Our Lord Blessing Little Children."

Earls Barton Church.—Stained glass has recently been placed in the east window of this church by Mr. Edward Thornton, at whose expense the chancel is now being restored. The window is a narrow Early English triplet, each light being filled with five Scriptural subjects, arranged on types and anti-types from the Old and New Testaments. The subjects illustrated

go across the window, and commence with—1. The Birth of Isaac foretold; The Annunciation; Samson's Birth foretold. 2. Creation of Adam; Our Lord's Nativity; Birth of St. John the Baptist. 3. Sacrifice of Isaac; Our Lord's Crucifixion; Moses lifting up the Brazen Serpent. 4. Lowering Joseph into the Pit; Our Lord's Resurrection; Jonah cast on the Dry Land. 5. Translation of Enoch; Our Lord's Ascension; Elijah taken to Heaven. The whole of the subjects have white diapered backgrounds. The work was executed by Messrs. Bell & Almond, of London.

Books Received.

How to make a House Healthy and Comfortable. By HENRY J. LANCHESTER. London: F. Harvey, 1872.

If we were to say that a reader of the *Builder* would find in this brochure anything he had not seen before, we should say what was not true; but it is necessary to state a truth many times before it will be attended to; and as Mr. Lanchester has set forth succinctly two or three important matters in connexion with fresh air and drainage, his very little book may be usefully circulated. To brighten it up, and end with something like effect, the writer reprints our rhymes, "The New House that Jack built."

The Natural History of the Year. By the late B. N. Woodward, B.A. London: Partridge & Co.

This revised edition of the late Mr. Woodward's pleasant and thoughtful sketch of the history of the months is illustrated by a number of delicate woodcuts from drawings by Mr. Birket Foster and others. It is addressed to the rising generation, and is well calculated to induce an interest in country life, to lead to the study of Natural History, and to open young eyes to what, though around and about them, is often unseen. The cover is a little overdone with gold and colour.

VARIORUM.

THE new number of the *Quarterly* contains what must be called a slashing article on the "State of English Architecture." Slashing to right of us, slashing to left of us, slashing in front of us, echoes and thunders. Much of it is our own thunder, with which, of course, we are satisfied; to some of the other thunder we may offer objections or comments if an opportunity occur. The following paragraph will show the tone in which the writer deals with various modern works:—

"The Church of St. James the Less, at Westminster, has been greatly praised for its decorative work, though it really is but a baby house. Its parti-coloured tower is built with polished marbles up among the clouds, and of magnificently bejewelled level with the eye. Its organ-towers, designed by an architect and manufactured by a mechanic, is so disproportioned as to be absurd, and is quite incongruous with the mean wall that it screens. The interior, chequered all over with bits of colour, is not the serious effort of a man, but mere effluviary and child's play, giving the same wide-mouthed pleasure as a new trick of sleight of hand. The decorations of the roof are for the most part inivisible. The mental debasement which we have already referred to has in this and in many other churches shown itself by making it what children would call 'a place for loggins.' There is a great deal of nonsensical scorn of those who object to Gothic work that it is dark and gloomy; but these childish church architects are the cause, and their works are a justification of this, at first sight, very reasonable objection. At St. James's the aisle windows are mere slits in the wall, not to admit daylight evidently, but to show some small panes of differently stained glass, which cause this dismal darkness, and serve to mystify the weak-headed people for whom such work is sympathetically designed."

Architects "have been the bane of art for the last 300 years," "the architectural gibberish of St. James's Club is cognate with similar discordant and incoherent utterances at Manchester and Balliol;" the new buildings at Kensington Museum are, "in fact, neither 'art' nor in any sense true handicraftsmen's work, but mere machine and copy work; heartless, senseless, and absurd;" Blackfriars Bridge "is really a wonder of depravity"; the Midland Railway Terminus is "a monument of confectionery"; the London University buildings are pointed to as a work of "painful incapacity," and the Piccadilly side of Burlington House is signalled as "the most contemptible public building that the architectural profession has achieved." The denunciation is so general and so loud that it is likely to miss much of its intended effect.—"Notes on Continental Schools. By John F. Moss,

Clerk to the Sheffield School Board. Grant & Co. Fleet-street." Having spent his vacation in visiting some of the schools of Holland and Germany, Mr. Moss wrote these intelligent notes, intending them exclusively for presentation to the chairman and members of his own Board, but they were thought deserving of publication. With regard to the size and general arrangement of the Dutch school buildings, some particulars will interest:—

"In the province of Utrecht the usual dimensions of school-rooms are fixed as follows:—Length, 16 metres, or thereabouts; breadth, 8 metres. (Metres=39.3707 in.) Such a room is calculated to accommodate about 150 children. Wherever practicable a room this size is divided into two parts by glass doors, or some similar contrivance. In villages; however, this is often considered undesirable, owing to the difficulty of employing more than one head teacher. As a rule the elementary schools of Holland are conducted in buildings of one story only. In some districts of the large towns it is not always convenient to follow out this rule; as, for instance, in Amsterdam there is a free school built in three stories, with three large rooms or departments, on a spare lot of ground near the 'School Zeemanshop,' the economists in the council have decided that the ground that part of the town was far too valuable to be lavishly used for one-storied buildings only. But this kind of arrangement is considered objectionable by the educational authorities, and especially by the large schools at Amsterdam which came under the writer's notice, however, the rooms were apparently larger than the size prescribed by the authorities. In the case of Utrecht, the schoolmaster has stated to be upwards of 300 children congregated in one room without any division except in the ordinary arrangement of the classes. The number is sometimes much larger."

"In the planning of Dutch public schools great care appears to be taken that there shall be a thoroughly convenient and well-arranged system of desks, and in all the schools I visited there are gymnasiums, which are occasionally used for other purposes during working hours—such as for singing lessons. But many schools are as yet incomplete in this respect, though the great desirableness of such a provision seems to be generally admitted. In other respects the arrangement of the buildings seemed very complete."

"The desks are placed in groups along the whole length of the room. The teachers seem unanimous in their approval of the short length of desks, and they hold the system to have very marked advantages. As much space as possible is left between each class, and the teachers' desks are placed immediately in front, with blackboards and other apparatus close at hand. The head master's desk seems to be usually fixed on a small platform, so as to command a full view of the whole school. Each child has his or her particular place in the school, assigned at the commencement of the quarter, half-year, or year, as the case may be, and the children retain their places until a change is authorised by the teacher."

Miscellaneous.

Homes for the Working Classes.—At a meeting of the Board of Works, Colonel Hogg, M.P., in the chair, the Parliamentary committee reported on a letter from the Hampstead Vestry as to the desirability of the Board obtaining power to make provisions for house accommodation for the working classes, who will be dispossessed by the proposed improvements of the Board. It had been suggested that certain portions of the land to be taken by the Board should be set aside as building sites for the accommodation of the working classes. The architect had selected three sites to be so set aside, and the committee recommended that the solicitor be instructed to prepare a clause for insertion in the Improvement Bill of the Board, now before Parliament, to this effect. Mr. Dalton, in moving the adoption of the report, said that the works of the Board would turn 1,457 persons out of their homes, and the plots to be set aside would accommodate 3,452 persons. Mr. Richardson moved the postponement of the debate. The chairman said he had been in communication with the Home Office on the subject, and he had been much pressed by members of Parliament to come to a decision at once. The result of his communication with the Home Office was embodied in the report. Mr. Alderman Stone warmly supported the report, which, after some discussion, was adopted.

The Metropolitan Extension Railway.—Erection of Waiting-rooms on the Platforms.—In compliance with a memorial which has just been presented to them, the directors of the London, Chatham, and Dover Railway Company have decided to erect waiting-rooms upon the platforms of the several stations of the Metropolitan Extension line between Ludgate-hill and Victoria. At present the only waiting-rooms at most of the stations on this line are on the lower level adjoining the booking-offices, and passengers must either seek shelter there, and run a great risk of missing their trains, or constantly expose themselves to the inconvenience arising from rain and inclement weather.

The Northampton New Cattle Market.—The new cattle market, now being constructed on the Cow-meadow site, will not be ready for use probably till the end of the year, but progress is being made with it. Roughly speaking, the market occupies about the centre of the ground between the back of Bridge-street, and the railway-embankment. The principal entrance is from the newly-constructed road, which, commencing against A'Beckett House, runs parallel with the New-walk. It is 40 ft. in width, and the actual entrance consists of a double gateway, and the two openings each being of 20 ft. The two gates are to be divided by a large pier, and on each side a lodge, the foundations of which are already laid, will be erected. The lodges will be small structures, will have sharp-pitched roofs, with round turret, their character being of a quaint Continental type. The entrance-road breaks into three branches. One of these continues straight down the centre of the market, whilst the other two branch off to the right and left at right angles along the top, with a width each of 25 ft. There is an octagonal space, in the centre of which a fountain, with drinking-troughs, &c., is to be erected. Besides this fountain there will be four drinking-troughs in the market, near to the main entrance. The works are being executed by Mr. R. Dunkley, of Blisworth, under the superintendence of the architect and surveyor, Mr. E. F. Law. The process of "filling in," so as to raise the level of the market, is now being rapidly proceeded with, and the brickwork is also in a forward state.

The Prizes of the Painters' Company.—The educational movement on the part of some of the London guilds is a good sign, and has not come too soon. The Painter Stainers' Company, which was anciently called, was one of the first, and a comparatively small way, to offer medals and premiums for works connected with "the art and mystery of painting." The subject for which they offer rewards to decorators, artisans, apprentices, and others is described as "altarpieces and decorative paintings," and the prizes, three in number, are,—1st. The Company's silver medal and freedom of the Company; 2nd. The Company's silver medal; and 3rd. The Company's bronze medal. These rewards are open any under the age of thirty years engaged in no trade, and residing within a radius of twelve miles from the Company's Hall. The specimens must be sent in between the 18th and 25th of May. It is to be hoped that some good work will be elicited. The Company do not ask for design (they would probably be disappointed in the result if they did), as the programme says the subjects may be copied either from an antique bust, cast of ornamental grouping, decorative moulding, or otherwise.

Worcester Cathedral Chimes.—The new set of twelve bells in this cathedral has just been furnished with a set of chiming hammers, which very simple contrivance the whole peal may be easily chimed for service by one person. This arrangement is the invention of the Rev. T. Ellacombe, rector of Clyst St. George, Devon, who first set them up at Bitton, Gloucestershire, in the year 1821, where they have been used ever since. They have this great advantage, that they are cheap in construction, and are not liable to get out of order; they are perfectly free from noise, are ever ready, and never the way; neither do they at all interfere with the ringing of the bells, while the lines may be brought down to a manual in any part of a church. The work has been done by Mr. Thos. Cooper, of Woodbury, Devon, church-bell hanger, who has set them up in many other churches. The cost is but 11. a bell, exclusive of travelling expenses.

South Kensington Museum.—Visitors during the week ending 20th of April, 1872:—Monday, Tuesday, and Saturday, free, from a.m. to 10 p.m.;—Museum, 15,753; Naval and other collections, 2,726. On Wednesday, Thursday, and Friday (admission 6d.), from a.m. till 6 p.m.;—Museum, 2,936; Naval and other collections, 131. Total, 21,547. Average corresponding week in former years, 13,280. Total from the opening of the Museum, 535,811.

New County Lunatic Asylum for Kent.—Justices for Kent have approved of the purchase of 114 acres of land on Chartham Downs, at a cost of 5,866l., being at the rate of 51s. per acre, upon which to erect a new asylum for lunatics.

Railway Conference on the Refreshment-room System.—A meeting of directors and managers of railway companies, at the Westminster Palace Hotel, has been conferring upon the present arrangements and management of refreshment-rooms at railway stations, especially in regard to the increasing facilities thereby afforded for the sale of intoxicating liquors, not only to the public, but to railway officials and servants, and upon measures to mitigate the evils arising from the present system. It was convened by the National Temperance League, who propose the prohibition of the sale of intoxicating liquors to railway servants whilst on duty; the provision of tea and coffee of good quality; and the free supply of filtered water. At the close of the discussion it was unanimously decided to suggest, amongst other proposals, to railway Boards throughout the kingdom: that intoxicating liquors should not be hawked on any station; that the rules against the railway servants on duty purchasing intoxicating liquors should be rigidly enforced; that the propriety of excluding the sale of spirits at refreshment-rooms (at any rate at many stations) should have the attention of the Boards; that in relating the refreshment-rooms care should be taken by the Boards that simple refreshments, such as tea and coffee of good quality, should be sold at moderate prices; and that all the main stations on each line should, as far as possible, be supplied with good drinking water, in convenient places, free of charge.

Royal National Hospital for Consumption.—This institution is making good progress towards the completion of the design of its founder, Dr. Arthur Hill Hassall. The hospital is destined to find accommodation for upwards of 100 male and female patients in eight separate blocks of buildings on the cottage principle, erected at the Undercliff, Ventnor, Isle of Wight. Three blocks of buildings have been completed, and a fourth block is now commenced, Sir William Martins having undertaken to bear the entire cost of its erection. During the past year 53 men and 36 women in-patients have received the benefits of the hospital, besides 22 out-patients. The Chairman of the Biennial Festival, the Bishop of Winchester, stated that at present the hospital had only 500l. per annum of annual subscriptions, whilst it required at least three times as much. At this moment there were 50 applicants for admission who could not be admitted for want of room. The chapel fund was progressing; about 700l. had been subscribed for the purpose. A gentleman had undertaken to build one of the houses of the fifth block as soon as some equally benevolent friend came forward to erect the adjoining house. The secretary (Mr. Ernest Morgan) subsequently announced a list of subscriptions amounting to 2,000l. Dr. Hassall also announced that "An Anonymous Lady" had made a gift of 1,500l. towards the erection of the fifth block.

New Thoroughfare from Woodbridge-street to Clerkenwell-close.—The Clerkenwell Local Board are taking steps for the construction of a new thoroughfare from Woodbridge-street to Clerkenwell-close, passing the south boundary wall of the House of Detention. For the purposes of this improvement, the magistrates have offered to transfer gratuitously to the parish a strip of land outside the wall recently purchased by the county for the enlargement of the prison. The proposed new road will lead into St. James's-walk, and it is considered that it will be a great public improvement.

Lamps on the Thames Embankment.—At the meeting of the Metropolitan Board of Works last week, a letter from Mr. Parkes, contractor for the globe lamps on the Thames Embankment, was read, asking permission to supply the United States Treasury, by request, with a duplicate of the lamp and drawings of the standard. The Works Committee recommended that the request be granted, and that the United States Treasury be also permitted to have the use of the core-boxes, for the purpose of casting the standards at their own expense. On the motion of Mr. Runtz the recommendation was carried.

Bells and Gun Metal.—Much of the cannon taken by the Germans in the French war is to be turned into church bells. In this way not less than twenty parishes on the Rhine alone have been provided with bell-metal. The Cathedral of Cologne and that of Frankfort-on-the-Main have also received some.

Proposed New Town-hall, Northallerton.—The directors of the Northallerton Market and Public Improvement Company have approved of the designs submitted by Messrs. Ross & Lamb, architects, Darlington, for the erection of a Town-hall, consisting of a covered Market-house and Assembly-room, in the centre of the town, and the old, insightly shambles, which have disfigured the fine town-street for so many years, are being pulled down. The new town-hall will cover a space of 110 ft. by 35 ft., and will afford shelter and accommodation for country butchers, parties attending with butter, eggs, and farm produce. There will also be vaults and cellars for depositing and packing the same, and every requisite convenience. The public room will be 72 ft. long by 32 ft. wide, with a handsome staircase, a raised platform, ladies' and gentlemen's retiring-rooms, cloak-rooms, &c. The contractors are Mr. Richd. Peacock, Northallerton, for excavation and brickwork; Mr. I. Hope, Darlington, plasterer; Mr. Thomas Thompson, Northallerton, joiner; Mr. J. Baines, Ripon, slater; Mr. George Layfield, Northallerton, plumber; Mr. W. T. Cooper, Northallerton, painter; Messrs. Hyerleid & Spence, Middlesbro', founders; and Mr. James Dodgson, Northallerton, stonemason.

Great Western Telegraph.—A company, to be called the Great Western Telegraph Company (Limited), has been incorporated, with a capital of 1,350,000l., in 67,500 shares of 20l. each, to connect New York with England, and the West Indies directly both with New York and England. A comparatively short cable may also continue telegraphic communication to Brazil. The route will be from the Land's End to Bermuda, and with one line, thence to New York, and another to St. Thomas's, in the West Indies. A contract for the making and laying of the cables for the price of 1,330,000l. has been made with Hooper's Telegraph Works (Limited), upon the basis of a specification for a similar cable recommended by Sir Samuel Canning, C.E., and Mr. Latimer Clark, C.E., last year, and recently revised by Sir William Thomson, F.R.S., and Mr. Fleming Jenkin, the company's engineers and electricians.

Worcester Model Dwellings Association.—An adjourned meeting of this association was held at the Guildhall on Thursday, April 18th, Mr. John Parker presiding. Mr. Aldrich, hon. sec., stated that the committee had investigated the financial condition of the association, and found that there were liabilities, principally to tradesmen, amounting to 300l. Mr. Parker had offered to allow 100l. due to him to remain unpaid, and Mr. G. W. Hastings had undertaken to advance 100l. if an equal sum were provided by other members of the association. It was pointed out that either the liabilities must be met, or the property sold. A strong desire was expressed that the work of the association should be continued, and ultimately the gentlemen present agreed to advance the amount required to make the 300l., with which all debts will now be paid.

The Universal Foul Air Purifier.—Under this title Mr. Lidstone has registered a compact little arrangement for holding charcoal to be affixed to the end of vent-pipes of drains carried to the tops of houses or other positions. He says,—

"For ventilating public sewers, vent-pipes can be carried into the interior of lamp-posts, and this purifying apparatus may be placed in the lower part of such lamp-post or receptacle, the pipe being carried from the top of the purifying apparatus to the top of the lamp-post." The specimen sent to us is much too small to be of any use, but this defect is, of course, open to easy remedy.

International Exhibition.—In connexion with the western annex of the International Exhibition building, South Kensington, Mr. T. G. Messenger has erected for the Commissioners a Cotton House, or house for the growth and exhibition of the cotton plant. The framework is of iron, and the enclosing materials are slate, slabs and glass. The heating-apparatus evidently provides for a high temperature, and the arrangements for opening all the lights at once are simple and ingenious.

Discovery of Antiquities in Belgium.—Excavations for archeological purposes have been lately undertaken at Jupille, in an ancient place of sepulture in Belgium, and have resulted in the discovery of a considerable number of skeletons, one of which had on the neck a golden collar. A remarkably fine mosaic pavement has been discovered.

Restoration of the Spire of St. John's Church, Bury St. Edmunds.—A meeting of the parishioners of St. John's having been called for last Tuesday evening, to receive the report of Mr. J. D. Wyatt, of London, the inspector of churches for the Archdeaconry, on the condition of the spire, the report was read, and the Chairman observed that there could be no doubt from this report that they ought to repair the spire without loss of time, and the first thing would be to decide who should erect the necessary scaffolding. In the course of conversation the opinion was generally expressed, and confirmed by Messrs. Tooley & Robinson, that the scaffolding should be constructed by the builder who did the repairs, and whose men would work on it with more confidence if they raised it themselves as they went along. Mr. Tooley believed the work would not cost in all less than from 200*l.* to 250*l.* The Chairman remarked that it was important there should be no delay, so that they could get the lightning-conductor up before any thunderstorms came. He had no fear of being able to raise the money. The meeting appointed a committee to collect subscriptions—first in the parish and then out of the parish, and it was resolved that advertisements should be inserted in the local papers, calling attention to the report and soliciting subscriptions.

The Difficulty of Estimating Cost of Drainage.—As a proof of the difficulty of estimating drainage works, where water is present in the soil, we may mention that Mr. Aird, one of the leading contractors in the Metropolitan Main Drainage Works, made the following statement publicly at a meeting of the Institution of Civil Engineers in London:—"With respect to the cost of construction, he could state that, with few exceptions, they were executed within the contract price. One of these exceptions occurred in a portion of the work on the premises of the Deptford Gas Works, where it was intended to put up a gasholder. To facilitate this, the work of the sewer underneath, for a length of 130 ft., was commenced. Unfortunately, the contractors were not able to carry it out. His firm then undertook the work, and completed it. The estimated cost was about 2,000*l.*, whereas it actually cost upwards of 16,000*l.*"

Northern Architectural Association.—The fourteenth annual meeting of the members of this association was held on the 10th inst., at the Old Castle, Newcastle-on-Tyne, Mr. J. Hogg presiding. Mr. Thomas Oliver, the hon. secretary, read the annual report, which gave a *resumé* of the operations of the association during the past year, and also expressed congratulation on the number of members, which amounted to sixty-one, being an increase of one. The finances were also in a satisfactory condition, there being a balance of 19*l.* 7*s.* 9*d.* in the hands of the treasurer. The report was adopted. Mr. W. J. Shotton, of Sunderland, and Mr. Robert Lamb, of Darlington, were elected members. Mr. Oliver and Mr. Thompson were appointed delegates to the Architectural Alliance meeting, and to the annual Conference of Architects proposed to be held in May next.

Restoration of Exeter Cathedral.—A preliminary meeting, under the presidency of the Earl of Devon, and subsequently of Earl Fortescue, was held, on Tuesday last, at the residence of Mr. E. B. Stevens, A.R.A., 110, Buckingham Palace-road, for the purpose of forming a committee of Devonshire and Cornish men resident in London to promote a subscription in aid of the restoration of the cathedral of the diocese. The meeting was unanimously in favour of such a committee being formed, and we believe a list of members will shortly be published.

The Lister Statue.—At a meeting of the committee charged with the duty of arranging for the erection of a statue of Mr. S. C. Lister in a central part of Bradford, it was resolved to give a commission to Mr. M. Noble, of London, sculptor, to execute a colossal statue of Mr. Lister in Sicilian marble, at the price of 1,000*l.* The figure will be 10 ft. in height, and will be erected on a granite pedestal of 11 ft. or 12 ft. in height.

Metropolitan Water-Supply.—In reply to a question in the House of Commons, the President of the Board of Trade (Mr. Fortescue) said the Board had no power whatever to regulate the sources of the water-supply of the metropolis, except to prevent the water being taken from below Teddington Lock.

Archaeological Discoveries at Uttoxeter. Mr. F. Reelfers, of this town, has within the last nine months made a series of discoveries of interest, sites of Roman stations, from three of which he has Roman pottery. One station he points out as being on Uttoxeter High Wood. He has pottery from this station of which the north side remains perfect. He believes the premises of Dr. Taylor, situated in High-street, is the site of another, a small part of the terrace of which remains in the croft near the Hope and Anchor inn. He points out a third station at Stramshall, where he has made numerous excavations, and in all met with Roman potsherds, one piece of which is ornamented. The site of the fourth station he is enabled to identify as at Madeley Holme, in the Madeley field, where he has dug and met with ample evidence of the character of the place by the discovery of many fragments of late Roman pottery. He connects with the last a series of fine terraces at each side of the hill, remaining perfect on the west side, and constructed, he believes, most probably for defensive purposes rather than for cultivation. He also connects with these stations a meshwork of Romano-British mazes.

New Well-Boring Engine.—A new boring apparatus has been made at the Eagle Foundry, Ipswich, for Meux & Co.'s London brewery. The leading feature is the employment of a large flat rope in lieu of iron rods, the advantage of rope over rods being that the former can be drawn from the bottom of the well to the top or lowered from top to bottom in three minutes, while the rods would take more than an hour. The jumping cylinder is so adjusted that the tool can give a very powerful blow and also one hardly sufficient to crack a nut. The double cylinder winding-engines in connexion with the boring-engine are capable of drawing out 10 tons at a time. The depth intended to be bored at Messrs. Meux & Co.'s brewery will exceed 1,100 ft. The well will be sunk under the direction of Mr. Allison, who claims patents on parts of the boring-machine.

Alvescott Parish Church.—During the restoration of this church the following remains were discovered, and have been preserved.—An altar slab, reredos, Easter sepulchre and ambrey, double sanctus bell niche, leper's window with two book ledges in thickness of the wall adjoining, two squints from north and south chanceries, piscina, reliquary, and three consecration crosses. The old fifteenth-century panels in the south transept, alternate red and blue, with gilded stars and bosses, were too rotten, owing to past neglect, for present restoration; but the new roof of the transept has been so arranged that at any time the panels may be reproduced and set on the inner face, so as to restore the old appearance.

The Mazarin Bible.—An important discovery has recently been made by Mr. Richard Sims, of the British Museum, in the course of his researches in the Archbishop's library at Lambeth Palace. He found that a volume, described as a manuscript, was in reality a fine example of an early printed book, which further examination proved to be the second volume of the celebrated Mazarin Bible. The "Mazarin Bible" is the earliest printed edition of the Bible known. It is supposed to have been printed by Gutenberg and Faust, at Mentz, between the years 1450 and 1455, and it is probably the first book printed with movable metal types.

Slip of Wall.—An accident occurred last week at Pathhead, Fifeshire, whereby five men were killed, and four severely injured. The men were employed in building a retaining wall at a new floorcloth factory at present in course of erection by the Messrs. Naum. The wall had reached a height of about 60 ft., when it gave way, burying the men in the ruins. It appears that the wall was about 4 ft. thick, and as it rose it was filled in behind with sand and earth from the bank which it was intended to keep up. The earth is supposed to have sunk, and by its pressure caused the wall to give way.

Houses unfit for Habitation.—The Holborn Board of Works, acting upon the recommendation of their surveyor and medical officer, have required the owner of these houses in Ormond-yard to demolish the premises, under the provisions of Mr. McCallagh Torrens's Artizans and Labourers' Dwellings Act. It was stated at the Board meeting that no structural alterations or improvements could possibly render the houses fit for human habitation.

Opening of the Free Museum, Nottingham.—The museum in Wheeler-gate, now the property of the town, has been formally opened by the mayor, in the presence of an influential company. The greater portion of the objects of interest which the museum now contains was the property of the Nottingham Naturalists' Society, and a considerable number of valuable objects were from time to time added, until the museum assumed the dimensions which it has had for the last few years. The place in which the exhibition was placed was for some period the old Mechanics' Hall, but previous to the fire by which that institution was destroyed, convenient rooms had been secured in Wheeler-gate. When the corporation resolved to adopt the Public Libraries Act, the society offered the museum, and a small but useful library, to the town, and the offer was accepted by the council. The re-arranged cases occupy two good-sized rooms, and objects of interest and value are to be found therein, illustrative of many very important departments of natural history.

The Crystal Palace Picture Gallery.—The annual exhibition of new pictures of the English, French, and Belgian schools opened on Saturday last. The private collection of Mr. James Virtue, containing eighty valuable pictures and water-colour drawings, also being shown in a special side gallery. In one of the private galleries there is a collection of modern paintings lent to the company for exhibition by the proprietors of the *Art Journal*. Mr. S. C. Hall has lent for exhibition some water-colour copies of Frith, Creswick, Ansell, Herbert, MacIse, Enslin, Elmore, Leslie, J. H. Mann, Webster, Newton, and Bellows. At the south end of the gallery there are 131 copies of celebrated paintings by the old masters, culled from the principal picture-galleries in Europe. The copies have been made in water-colours by Mr. West, and being the property of the Crystal Palace Company, who value them as artistic studies, are not for sale.

Extension of a North London Railway Station.—The railway-station in Broad-street, jointly used by the North London and the London and North-Western companies, has for some time been undergoing a considerable enlargement by the erection of additional offices and buildings for the London and North-Western Company, built at the expense of that company. The additional buildings, which have just been completed, have extended the principal elevation of the station to almost double its former dimensions. The newly-erected portion of the structure is uniform in design with the rest of the building, but a special feature in the added part just finished is that the elevation is composed of an admixture of red, black, white, and yellow bricks.

The Reconstruction of Farringdon Market.—The Court of Common Council has had a strong party debate as to whether the decision of the Court that the Farringdon Market should be reconstructed, in order to provide room for the sale of vegetables and fruit, should be frustrated or not. Mr. Isaacs led an opposition which objected to the raising of 150,000*l.* necessary for what modification might be made in the original plan. A long and noisy controversy ended in Mr. McGeorge carrying the adjournment of the debate, and giving notice to move the rescinding of the resolution.

The London Gas Companies.—An important conference has been held at the Vestry-hall of St. Martin-in-the-Fields, to consider how the interests of gas consumers are affected by the Chartered Gas Company's Bill, in the Lords. The conference was unanimous in resolving to oppose the Bill, which has already been challenged as unfair to consumers by the Metropolitan Board. The Chartered Gas Company seek additional capital to the amount of 1,000,000*l.*, and power to pay upon this a dividend of 10 per cent. to the shareholders.

The City Surveyorship, Norwich.—The council have considered the appointment of a surveyor in the place of Mr. Benest, resigned. It was resolved that the matter be referred to the corporate officers' salaries committee to report to the council. It seemed to be the general feeling that there should be only one surveyor instead of two as heretofore.

Theatre Burnt.—The Theatre Royal, Melbourne, has been destroyed by fire.

The Royal Pier at Southampton.—The works connected with the extension now approach completion. The pontoon, having been repainted and fitted into its place, the iron bridge connecting it with the pier has been dropped upon the iron tanks provided for its reception. The strengthening of the pier provides deep water at all tides for the steamers of the Isle of Wight company, and is an additional attraction to romancers. The steam packets will also have advantages in embarking and disembarking their passengers and freight.

Reading Architectural and Archæological Society.—At a general meeting of this society, held on the 17th inst., at the Athenæum, an essay was read on the subject of "Bells," by Mr. A. E. L. Oswell, who, in the course of his paper, dealt exclusively with the general history of the bell, the origin of chime-ringing, the number of variations possible to be played on various peals, and the history of some remarkable specimens of bells. In the concluding part of his essay, he gave a description of the method manufacture.

Figledean Vicarage.—On the 6th instant the corner stone of a new vicarage was laid in this village by the Bishop of Salisbury. There was an appropriate service, conducted by the Rev. H. C. de St. Croix, assisted by a village choir. Enough of the brickwork appeared to give the visitors some idea of the nature of the new building, which is to be externally decorated with red bricks, relieved with bands of paper brickwork, &c. The designs are by Mr. T. White, London; and the builder is Mr. T. Gregory, of Clapham Junction.

New Pottery Galleries.—Extensive galleries are nearly completed in Orchard-street, Portman-square, for Mr. John Mortlock. The new galleries are 120 ft. long by about 22 ft. in breadth. The main gallery is some 22 ft. high, with recessed and panelled ceiling, frieze, and dado. The works, which have been in hand about four months, are being carried out under the direction of Mr. Nash, architect, Royston, by R. J. Sutton, of Putney. The foreman of works is Mr. M. H. Judge.

TENDERS

For villa, at Teddington. Messrs. Thicke & Wilson, architects.—

Table with 2 columns: Name and Amount. Includes Dove, Brothers (£1,825 0 0), Bishop (1,785 0 0), Sibly & Son (1,765 0 0), Williams & Son (1,742 0 0), Grover (1,685 0 0), Hurst (1,650 0 0), Macy (1,645 0 0).

For new verandah round the present refreshment-room, at Horseay Park, for Mr. Gatti. Mr. A. J. Bolton, architect. Quantities supplied by Mr. Pimmsall:—

Table with 2 columns: Name and Amount. Includes Mann (£500 0 0), Bowman (670 0 0), Williams & Son (555 0 0), Carter (547 0 0), Hill & Sons (accepted) (524 0 0).

For new factory, in Hornsey-road, for Mr. W. Culmer. Mr. John Viney, architect:—

Table with 2 columns: Name and Amount. Includes Toop (£738 0 0), Heath (698 0 0), Danford (630 0 0), Spurgeon (573 0 0), Hawkes (accepted) (510 0 0).

For addition and general repairs to house, Lordship-lane, Stoke Newington, for Mr. Bird. Mr. John Viney, architect:—

Table with 2 columns: Name and Amount. Includes Madgin, Jun. (£515 0 0), Deveraux (510 0 0), Garland (390 10 0), Hawkes (365 0 0), Heath (accepted) (353 0 0).

For new residence, at Hornsey, for Mr. E. Smeeton. Mr. John Viney, architect:—

Table with 2 columns: Name and Amount. Includes Hawkins & Ward (£549 12 6), Parsons (530 0 0), Heath (483 0 0), Hawkes (accepted) (465 0 0).

For stables, looms-houses, forges, and chimney-shaft in the of the Oxford and Cambridge grounds, Chalk Farm, for Mr. Chas. Martin. Messrs. Tosh & Hayward, architects. Quantities supplied by Messrs. Pimmsall & Co.:—

Table with 2 columns: Name and Amount. Includes Hill & Son (£5,661 0 0), Kelley, Brothers (5,030 0 0), Mann (5,565 0 0), Manley & Rogers (5,462 0 0), Aitchison & Walker (5,268 0 0), Robbins & Co. (5,275 0 0), Scrivener & White (5,267 0 0), Bowman (5,257 0 0), Williams & Son (5,177 0 0), Jay (5,134 6 8), Goodman (4,897 0 0).

For school and residences, at Grays, Essex, for the School Board. Mr. T. R. Naples, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Gibbons (Total £3,440 0 0), Taylor & Son (2,903 215), Thora (2,797 238), Wallis (2,733 247), Blake (2,730 255), Cobham (2,672 268), Joslyne (2,633 270), Stephenson (2,503 278), Tyler (2,500 300), Niblett (2,440 320), Cattell (2,440 335), Dover, Walls, & Co. (2,317 339), Wright & Co. (2,275 339), Crook & Will (2,135 330), Shipman (1,750 200).

For Newdigate School:—

Table with 2 columns: Name and Amount. Includes Lynn & Dudley (£1,550 0 0), Johnson (1,421 0 0), Hill & Sons (1,399 0 0), Shearburn (1,340 0 0), Hamplin, Brothers (1,252 0 0), Putney (1,223 15 0), Inkpen (1,150 0 0), Chart (accepted) (1,100 0 0).

For free library and museum, at Blackburn, Lancashire, Messrs. Woodzell & Collett, architects. Quantities by Messrs. Taylor, Son, & Jackson:—

Table with 2 columns: Name and Amount. Includes Stephenson (£8,000 0 0), Abbott (7,350 0 0), Ashworth & Broughton (6,807 11 0), Cotterall (6,980 0 0), Cooke & Green (6,915 0 0), Mansell & Dent (accepted) (6,920 0 0), Higham, Brothers (6,475 0 0).

For a family residence, Brunswick-square, Brighton, and alterations to adjoining property, for Mr. John Preston. Mr. F. Warburton Stent, architect:—

Table with 2 columns: Name and Amount. Includes Perry (£6,284 0 0), Gammon (6,246 0 0), Turner (6,138 0 0), Chappell (5,972 0 0), Colls (5,628 0 0).

For a hop warehouse, in Bermondsey-street, for Messrs. Beeman & Hotokin. Messrs. Wadmore & Baker, architects. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Myers & Sons (£3,427 0 0), Dowds (3,290 0 0), Dove, Brothers (3,185 0 0), Rider & Son (3,108 0 0), Jackson & Shaw (2,955 0 0), Gammon & Sons (2,894 0 0), Browne & Robinson (2,867 0 0), Scrivener & White (2,804 0 0), King & Son (accepted) (2,570 0 0).

For new house, on Hampstead-heath. Mr. C. Eales, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Watson, Brothers (£1,975 0 0), Mann (1,945 0 0), Kelly (1,883 0 0), Scrivener & White (1,828 0 0), Clowser (1,792 0 0).

For shops and offices, corner of the Poultry and Old Jewry, City. Mr. Herbert Ford, architect. Quantities supplied by Messrs. Karslake & Mortimer:—

Table with 2 columns: Name and Amount. Includes Nightingale (£8,876 0 0), Higgins (8,628 0 0), Stinson (8,176 0 0), Meyers & Son (8,155 0 0), Perry, Brothers (8,039 0 0), Brass (7,931 0 0), Kilby (7,782 0 0), Couder (7,791 0 0), Perry & Co. (7,676 0 0), Browne & Robinson (7,439 0 0), Scrivener & White (7,431 0 0), Turner & Sons (7,430 0 0), Henshaw & Co. (accepted) (7,995 0 0).

For additions and alterations at "The Cedars," Old Charlton, for Mr. Sharpe. Mr. Geo. Elkington, architect:—

Table with 2 columns: Name and Amount. Includes Fox (£3,060 0 0), Elliott (2,274 0 0), Cawdran & Corne (2,132 0 0), Wood (1,708 0 0), Cooke & Groome (1,423 0 0).

For new manufacturing premises, at Chelsea, for Mr. F. Bell. Mr. Dovey, architect. Quantities supplied by Mr. Shrubsole:—

Table with 2 columns: Name and Amount. Includes Perry & Co. (£1,875 0 0), Turrell (1,712 0 0), Sawyer (1,590 0 0), Peares (1,450 0 0), Gough (1,449 0 0), Brown (1,415 0 0), Cooke & Groome (1,287 0 0), Tucker (1,162 10 0).

For house in Bloomham-road, Bedford, for Mr. James Corcoran. Mr. Horsford, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Moore (£1,685 0 0), Power (1,628 0 0), Haynes (1,505 0 0), Freshwater (1,450 0 0), Litchfield (1,332 0 0), Spencer (1,268 0 0), Dover, Wills, & Co. (1,229 0 0).

For farmhouse, Irnham, Corby, Lincolnshire. Mr. J. Lavender, architect:—

Table with 2 columns: Name and Amount. Includes Story (£1,235 5 11), Putnam & Co. (1,155 0 0), Kirk & Parry (1,130 0 0), Hubbard (1,095 0 0), Ridd & Son (975 0 0), Langmaid & Way (945 0 0).

For four shops, at Rotherhithe. Mr. George Stooke, architect:—

Table with 2 columns: Name and Amount. Includes Daniels (£1,825 9 0), Machine (1,184 10 0), Stentford (accepted) (1,107 0 0).

For alterations to stables, Frognaul-rise, for Mr. W. H. Wills. Mr. R. Walker, architect. Quantities by Mr. W. E. Stouler:—

Table with 2 columns: Name and Amount. Includes Clowser (accepted) (£541 0 0).

Athenæum, Camden-road.—Add to list given in our last Health, 3,265.

TO CORRESPONDENTS.

Country newspapers should be marked.—F. B. P.—Nemo.—F. R. G.—Messrs. H. J. V.—A. H. G.—R. H. C.—O. J. P.—M. F.—S. L.—T. G.—J. S.—E. K.—W. R. R.—L. & W.—W. & C.—L. & Co.—B. N.—C. E.—Dr. M.—R. F. C.—A. H. G.—J. R.—S. & Co.—P. & B.—H. C. W.—P. S. A.—A. C. P.—Thurman Jun.—H. J. W. (was forced to decline recommending)—H. T. E. (next week; too late for this), Messrs. F. (ditto)—M. H. J. (ditto)—Nemo (ditto).

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

NOTICE TO SUBSCRIBERS.

Advertisements cannot be received for the current week's issue later than THREE o'clock p.m. on THURSDAY.

NOTICE.—All communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

In consequence of the Reduction in the Newspaper Postage, Subscribers within the United Kingdom can now be supplied with THE BUILDER direct from the Office at the rate of Nineteen Shillings per annum, PAYABLE IN ADVANCE.

The Publisher cannot be responsible for TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[ADVT.]

Ashton & Green, Slates and Slab Merchants and Quarry Agents.—Shippers, Merchants, and Contractors furnished with Price-lists of every description of ROOFING and MANUFACTURED SLATE, Railway-rates, &c. Agents for London and Country for the Sale of the celebrated WHITLAND ABBEY GREEN SLATES. Drawings and Prices of A. & G.'s RED RIDGE TILES, specially prepared for use with these Slates, on application.—Offices and Show-rooms, 14 and 15, Bury-street, St. Mary Axe, London, E.C.—[ADVT.]

Turret Clocks.—Mr. Streeter, 37, Conduit-street, London, W., Manufacturer of Turret Clocks (with gravity or dead-beat escapement) for Churches and Public Buildings. Estimates and plans on application. Price.—Village clocks, from 15l.; church clocks, from 40l. The wheel-work throughout these clocks is of best hard brass or gun-metal. No iron wheels used. Timekeeping and durability guaranteed. Wholesale Entrance—Burlington Steam Works. [ADVT.]

Architects, before committing themselves to any system of Warming, should send to TRUSWELL, BROTHERS, & HOLDEN, 100, Nottingham-street, Sheffield, for a prospectus of their Improved Patent Hot-Air Apparatus. [ADVT.]

The Builder.

VOL. XXX.—No. 1526.

Conference of American
Architects.

ARCHITECTS in America are moving anxiously. We have just now received the printed report of the "Proceedings of the Fifth Annual Convention of the American Institute of Architects," held in Boston at the close of last year, and may usefully give some extracts and particulars. Mr. Richard Upjohn, the President of the American Institute of Architects, opened the meeting. In the course of his address, he said:—

"The increasing appreciation of the subject of architecture by the community at large, though gradual, affords cheering indications that our labours are beginning to impress and educate the minds of our people. In this connexion it may be well for us to consider with what aids and among what influences and associations we are working in our endeavours to perfect and embody our art. In the first place, as regards ourselves, we are differently situated from those of our profession who labour in countries abounding with ancient examples. Such witness of evidence and power as it spread over the Old World, it is not ours to enjoy. It is true, many of us have had our experience of architecture enlarged and improved by a twelve months' tour, more or less, through Europe and other countries. But, after all, this is a poor repeat when compared with the continued feast of those who dwell among the works of past ages, and are awakened to note the wonderful creations surrounding them. The innumerable precedents which older examples present are invaluable to those who are anxious to learn. Then, again, the people of those countries, whose civilisation and culture so long ante-dates what is to be found amongst us, are more or less alive to the beauty of the works of their ancestors, and they are ready to accept the labours of those whose vocation it is to restore and recreate the works of old.

We have not those advantages, our situation is different; our country is in its youth, our fathers, for generations back, were not reared on the soil which the present generation call, by right of birth, their own. No great monuments of finished art and laborious devotion, such as grace the Old World, have been for ages impressing their lessons on the minds and hearts of the children of this new land of ours. We and our children have grown and matured without such influence and education. But it is our mission, as a profession, to worthily supply in this new field these educators, so that at least we be not less faithful to the men of the future than, in other lands, the men of the past have been to those of the present. We are engaged in this very work now, when we produce, with fitting accompaniments and originality, what has been taught us by those of old time. Following in the well-chosen steps of those who have preceded us asking for the old paths, yet ourselves leading in the direction of an intelligent and timely progress, we shall have followers who will appreciate our aims, and labour with and after us in establishing truthful works. And, indeed, we are not without encouragement from the great mass of intelligent people among whom we labour. The increased facilities of communica-

tion with Europe, which are yearly drawing great numbers of our people into contact with the very examples which we would wish them to study, have been the means of leading them to accept and appreciate the well-directed efforts of the profession. Men who have once seen and tasted of the beautiful, will not be long satisfied with what is inferior, especially if they have the means to provide for themselves what they have learned to admire and wish for. In the single instance of decoration, witness what an encouraging advance has been made during the past ten or twenty years. And generally it might be said that the revival of architecture, in all departments, which is to be found in France and England, is being felt to a large extent, as a salutary influence and impetus amongst us. The art of photography, which has reached so high a standard, has contributed much toward the spread of enlightened views and appreciation of architecture. Another encouraging feature of the times is to be noticed in the increased facilities of transportation, which have brought within the reach of almost every market the large varieties of stone and other building materials, in which our country so abounds. Owing to those facilities, we have been able to utilise, and that sometimes in combination, stones and marbles of various formations and colour; therein, certainly, the architect finds a wide and interesting field for the exercise of his best taste and skill."

Amongst the various reports brought up came one on Education. The committee said:—

"The problem of architectural education, then, as a practical problem, is simply this: How can a young man, in addition to the general culture to which he may aspire, attain such training in the elements of this professional knowledge as will entitle him to a cordial reception as a paid draughtsman in an architect's office?"

The practical answer to these questions is twofold. There are two courses that a young man may pursue to this end. He may enter an office as a pupil, or he may enter a school of art or science as an architectural student. The office-training has the advantage in point of pertinence, it being an exact training for office-work; but it is almost necessarily deficient in breadth and system. A young man trained in this way is taught the use of his instruments, and soon acquires the handiness needful for the kind of work he is set to do; but he has no opportunity to learn to draw except with his T-square, and for the history and principles of his own art or of art in general, he must depend upon his own enterprise and such resources as he can, out of hours, command. An intelligent fellow may, in this way, learn a good deal, but it cannot be said that he is taught much. It has been proposed, and has of late been urged in England,—where the problem of professional education is receiving much attention,—that the numerous educational appliances already existing, in the shape of isolated courses of history, construction, crayon drawing, water-colours, &c., should be made use of to supply the deficiency of training, and that if students and draughtsmen will not attend the evening courses, which it appears they do not, time should be allowed for the article pupils, at least, to profit by these opportunities in the day-time. But it would seem hardly to require argument or the test of experiment to show that this demand is unreasonable, and impossible to be met. On whatever terms a pupil may be received in an office, he cannot, in the conduct of office work, be distinguished from the draughtsman and assistants. The work given to him is as necessary to be done as that given to them, and he, no more than they, can be sent off in the middle of the day to improve his mind."

It was pointed out that courses of architectural instruction had been established in various educational Institutes. The report from Chicago showed that there are about sixty architects practising in that city with little or no uniformity as to general rules and regulations; further, that they greatly needed a library for general reference, all the private libraries with but one or two exceptions having been destroyed by the fire.

The report of the Secretary for Foreign Correspondence (Mr. H. A. Sims) showed that with a view to establish friendly relations with foreign art societies, he had been in correspond-

ence with the Institute of Portuguese Architects; the Architectural Institute of Scotland; the Royal Institute of Architects of Ireland; the Architects' Union of Berlin; the Architectural Union of Hamburg; the Austrian Engineers' and Architects' Union of Vienna; the Imperial Academy of St. Petersburg; the Archaeological Society of Athens, through Mr. Robert P. Keep, U.S. Consul; the Architects' and Engineers' Union of Hanover; the Architects' and Engineers' Union of Breslau; the Central Society of Architects of Paris; and the Society of Architects of the Department of the North, at Lille; an interesting list.

The Committee on Professional Practice, in their report, after commenting on the childish and barbarous spirit of professional rivalry, at once suicidal and fratricidal, that damages the profession, proceeded:—

"If it is true that it is rather through ignorance and want of thought than from any malicious purpose that the public deal so hardly with the profession, it is even more the case that it is thoughtlessness and ignorance of the real and permanent good in the profession itself rather than malice that has prevented, and still prevents, a hearty and even generous co-operation in the endeavour after a more wholesome professional life. It is owing to the absence of well-understood and intelligently accepted principles of conduct, and of clearly-defined maxims, that the false lights of momentary interest lead men astray. Now, in our own professional relations nothing is defined or clearly understood, and an intercourse with each other is too often that of well-meaning blunders, inflicting the greatest injuries and committing the most unpardonable breaches of manners and morals in utter innocence and ignorance. Hence jealousies, slights, heart-burnings, backbitings, and all manner of uncharitableness. It is just so in business: amateurs in stock-johing do things, in a conceit of shrewdness or smartness, and under a general notion that all is fair in war. They are the more to blame, for the difference between honest conduct and swindling. The rules of behaviour in these particulars, however ignorant of them we have grown up, were, in fact, settled long ago. But with us it is not so; the profession is, in a sense, a new one. Its relations are exceedingly complicated and difficult. The distinction between the proprieties and the improprieties is by no means an innate idea; and so it happens that, confident in our integrity, but quite ignorant of any general principles of conduct and of scruples, we do things for which the terms unprincipled and unscrupulous are a feeble characteristic. These things are not confined to the young or to the viciously-inclined. We all, trusting in the absence of any well-established principles of professional conduct, to the rectitude of our purposes, stumble blindly at times into regretted ways. It is by bringing light into such obscurity that professional associations like this find their best work. It is thus that in the medical and legal professions well-understood codes of behaviour have been established, that, like the code of manners which regulates the intercourse of daily life, lifts them out of the mere brute struggle for existence into life of intelligent and fraternal co-operation. We are still very much in the barbarous ages. But something may easily be done by a comparison of opinions upon some prominent points to settle the right rule of conduct. It is the uncertainty of the moral law that provokes these sharp animosities, and the very existence of such a code, even if it were difficult and uncertain in its applications, would at least tend to foster the spirit of scrupulousness, that sense of the difficulty of the situation and of the need of care and circumspection, which is the essence of practical morality, the chief safeguard of conduct."

The question whether an architect should give "supervision" or "superintendence" to his building, led to an interesting discussion. It was generally agreed that the architect should retain the chief control, but this, as it seems to us, was not the real point of the inquiry, which, in reality, opens a question that may be very usefully discussed further.

A paper on Terra Cotta was read by Mr. Sturgis; and Mr. Wight made a valuable statement as to the effects of the fire at Chicago. A

dinner closed the proceedings at the end of the second day, when several addresses were delivered of more than average interest. A few sentences from one of them must close our notice. "We know," said the President of Harvard College, "that beauty and enthusiasm for beauty are not dead but sleeping, and we live in the hope that if we succeed in holding fast our political and social freedom, fair fruits will yet grow from the rich soil of our material prosperity. Indeed, we see signs of this fairer growth. Our very institutions of finance, transportation, and trade, are becoming magnificent as they get substantial. The most elaborate rooms of Medieval finish which I know in these parts are occupied by a bank in Court-street. Our railroad companies are beginning to realise that brick and wooden sheds do not offer all the accommodation which the public may profitably get. Our successful insurance companies are building palaces. These better buildings, though they are for business purposes, will bring us Americans one step nearer palaces for painting, sculpture, music, education, and religion; yes, and palaces, too, for that noble and refined family life which is the most characteristic product of Christian civilisation. Architects must watch with pleasurable anticipation the distinct strengthening in this country of the tendency to accumulate money in families. After all, there is no patronage for an artist like that of the single patron who has only himself to please, and is thoroughly master of his own resources. Hitherto our form of government and social mobility have not seemed favourable to the transmission of great properties from one generation to another; but we already see that education and culture have become hereditary, and soon wealth will be. The catalogues of Harvard, Yale, and the other older colleges, prove the transmission of culture. There are already families which have had four, five, and even six consecutive generations at Harvard College. New methods of securing property to descendants, particularly to women, are constantly invented, and some of these methods will succeed. Let us all look forward to that cheerful day when competitions and building committees shall be no more; when the individual owner, or representative of owners, shall engage the first leisure of his architect by a handsome preliminary fee, and pay his architect's bill for professional services when the work is finished, in the same spirit in which he pays the bill of his legal counsel, and when the architect's bill shall be based on the equitable value of services rendered, and shall be limited only by his desire to keep the business of actual clients and get that of other sensible persons."

The whole of the proceedings serve to show that the questions under discussion by our professional brethren on the other side of the Atlantic are very like those which occupy our solvers, and that the inquirers are characterised by high feeling and wide intelligence.

THE INTERNATIONAL EXHIBITION OF 1872.

THE International Exhibition of 1872 may be said to have opened on the 27th ultimo; not with a flourish of trumpets, but with what was simply the largest, and in some respects the most brilliant, evening party of the season. The name of H.R.H. the Duke of Edinburgh, as *locum tenens* for his brother, the President, was on the invitation cards; and his Royal Highness, with his sister, the Princess Louise, if they cannot be said to have done, at all events received, the honours of the evening. On no previous occasion, in all probability, has the mere mass of visitors formed a spectacle so imposing in itself. Toilettes of all kinds, light, music, motion, and a crush, made up an evening that must rank as a success. Complaints have been made by some of our contemporaries of want of organisation,—that is to say, people were free to come and go, as at any private party, undirected by the police. It would be well for us to fall more readily into

the self-organising habits of our continental neighbours, on occasions of this kind. We cannot sympathise with the demand for more of the "move on" style of arrangement. Only, as unfortunately, all the visitors are not provided with carriages of their own, we must plead for more ship-shape cloak-room accommodation on other similar occasions for those who require it.

Of the Exhibition proper it is hardly fair to give details, in the present state of imperfect arrangement. A good deal, however, is already in place. The gallery which will probably be regarded by most visitors as the scene of the chief attraction,—that which contained the pottery last year,—is now in course of rapid adornment by cases of jewelry. Some of them contain objects of great beauty, value, and interest. British manufacture bears the palm, as far as we have at present seen. The costly *parures* of certain London jewellers are not more remarkable than are some of the specimens of the artificial jewelry of Birmingham. One case contained a number of shell *caues*, which purported to be English, but which we should have thought to be Roman. Some of the peasant jewelry of Continental countries is also extremely interesting.

The lower gallery, on the west side of the gardens, is filled, as it was last year, with machinery, to be exhibited in motion. It seems to be in a much more forward state, and also, it struck us, more numerous in specimens, than in 1871. The upper gallery on the east is devoted to foreign pictures, and that on the west to British pictures. To the subject of these we shall, of course, return. The galleries are much less crowded with sculpture and other objects than last year. On the other hand, there is less to distract the attention from the pictures themselves. Above all things, it is to be remembered that these objects can here be seen. The walls are fairly covered in each gallery, and not overcrowded.

English sculpture is arranged in the semi-circular arcade on the ground floor, together with water-colour drawings, engravings, and photographs of all kinds. On the upper floor, cotton fabrics are arranged in frames and cases. Passing through the galleries to the south of the garden, we come to a room devoted to South Kensington terra-cotta. There is a division allotted to scientific instruments, a number of machines for printing and similar processes are in course of erection, and the Birmingham manufacturers present a shop of working jewellers, busily engaged in their craft. The galleries devoted to paper, *papeterie*, and all the wares of the stationer, are very elegantly filled, from the 2½-mile roll of paper manufactured for the *Times* newspaper down to the minute requirements of the desk. Connected with the paper department is a novel and very instructive collection. It purports to contain all the newspapers of the world, or at least so many as very fairly to represent that extraordinary kind of literature. Permanent photographic processes are at work near the door.

Last year we devoted a special article to the architectural contributions to the International Exhibition, regretting at the same time that there was not more of novelty among the designs, and that foreign architectural ability was so meagrely represented. This year there is not enough, either in quality or quantity, to warrant any such special mention, and we must be content to give a passing notice to the architectural work, along with other branches of design which are more or less represented in various parts of the buildings. Such architectural designs as there are to be seen are, at all events, more within public reach than last year, when they were elevated to the Albert Hall Gallery. The present position for architecture is on the ground-floor of the east quadrant. Here are hung about eighty drawings, a good many of which, however, represent buildings some time since completed, many Exhibitions that they may fairly be considered exempt from further criticism. Among those sufficiently new or original to invite special mention, one of the first we notice is a pen-etching of the new premises for Messrs. Sotheran, in Piccadilly, now erecting from the designs of Messrs. George & Vaughan; a building of which we may take an opportunity of saying something more in detail. The etching severely represents the effect of the design. Two or three designs for schools for various school boards, by Mr. Charles Henman (Alexander & Henman), are all more or less good, in a quiet, unpretending way, and very agreeably drawn and coloured; No. 3, 672,

for the Stockport School Board, is the best, and indicates some originality in grouping and (apparently) in planning; but the plan is not given. "Interior Decoration of a Ball-room" (3,613), by Mr. T. Cox, is satisfactory, as showing a harmonious arrangement of quiet colour, chiefly secondary and tertiary, with no great originality of detail. It is a relief to find a Renaissance colour-design without the odious pinks and yellows commonly supposed to be proper to the style by modern decorators. M. Schoy, of Brussels, deserves mention, as the one foreign contributor. He sends a finely-executed drawing of a very questionable design, entitled, "An Architectural Composition." Mr. Young's "Garden and Entrance Fronts of a Country House" (3,688) is very pretty, in half-timber construction, with, perhaps, just a little too much determination to be "picturesque." The same gentleman exhibits "designs and executed examples of modern domestic architecture," possessing the same kind of merit. We rather think this frame of drawings has been exhibited before. Mr. Edis's "New Houses in Queens-

borough-terrace, Bayswater" (3,632) show that the author is not wedded to one style; it is a very agreeable design for street architecture of an unpretentious description; and Mr. Sorby's "Pair of Villas at Peterborough," show both solid picturesque treatment and plenty of work for the money. Messrs. Perry & Hanson's "Altar to be erected in the Church of the Augustines, Bruges" (3,648), is a good Classic design of the kind, shown in a neatly-executed line drawing. Mr. Truefitt's "Additions to Aboyne Castle" (3,650), is an interesting specimen of architectural self-restraint in dealing with a severely plain building; the only architectural expression in the new portion resulting from a slight grouping of the windows, in massive and perfectly plain walls. The "Devonport Mission Chapel" of Mr. Glover (3,678), is a good specimen of picturesque treatment of a single apartment under one roof. Other exhibitors are Messrs. Tenlan, Waterhouse, Seddon, T. R. Smith, and others, whose names are more or less known; but with the exception of those already mentioned, the drawings are mostly either what are well known, or do not contain sufficient novelty of treatment to call for remark here.

From modern architectural design to reproductions of ancient ones is an easy transition, and the Room XVII. (in the east gallery), mainly occupied by this class of objects, contains specimens of considerable interest, including casts or copies of a good deal of Indian work; chiefly from remains at Fattipur, Sikri, near Agra, modelled last year by Corporal Jackson and native moulder, under the direction of Lieut. Cole, R.E. The largest and most interesting of these is the "Porch of Sheik Salem Chist's Tomb" (3,901), a specimen of Mogul architecture of the latter half of the sixteenth century. The treatment of the large brackets supporting the canopy, in serpentine curves, with the bands filled with pierced tracery, is most remarkable, and certainly picturesque, though far more wooden than marble in character; and the gentlemen of the Kensington Science and Art Department, who exhibit and notify this as a "pure specimen of architectural truthfulness," have possibly something to learn on that head yet. The four pillars (3,903) are characteristic specimens of the same school; these are, of course, covered with surface carving, in one case the diaper on the column being formed by a collection of bud-like knobs (something like the "Early English" halfloffer) entirely covering the surface. More interesting, and beautiful in their way, are the pillars and other details from the Sultana's apartments (same school and date), said to have been carried out by Akbar for one of his wives who was of Turkish extraction, and whom he wished to please with something in the style she was accustomed to see. The delicacy and variety of surface diaper on this work is most remarkable. A "Portion of Carved Band of the Khat; Pathan Art, probably end of twelfth century" (3,912), is a very fine specimen of free scroll-work and leafage design in stone; the surface nearly flat, and the interspaces between the ornament sunk about an inch or more, very much after the manner of decoration which an English architect (Mr. Colling) has largely affected. There is nothing new under the sun; but this peculiar bold treatment is what one would expect to find under a northern rather than a southern sun. Adam Kraft's bas-relief of "Christ bearing the Cross," from the church of

St. Sebaldus at Nuremberg, is shown in a cast (3,950) from the original; a design full of intense expression, and noteworthy for the effective yet not over-elaborate treatment of the drapery. In this room are sundry electrotype imitations of English goldsmiths' ornamental work of the seventeenth century,—not remarkable, certainly, for purity of style or effective treatment. Somehow gold seems to betray its votaries, in art as well as other things, into a taste for the showy and meretricious. A Russian gold goblet (seventeenth century) in one of the cases shows far more artistic and refined treatment, the ornament, partly figures, being a low and delicate *repoussé* much more fitting to the material than the lumpy scrolls of the English work, which seems chiefly adapted to impress one with an idea of its market value as bullion. A fac-simile of a very little bit of Irish illuminated border in this room (3,957), dated to the sixth century, is worth a note for its peculiarity and alleged antiquity; the ornament being formed by three sets of narrow bands of deep orange, light orange, and green, respectively, very cunningly intertwined. This room contains sundry other reproductions of Indian details, copies of ancient European work of different kinds, &c., a cast of the Roslyn "Prætoric Column" among others. Fac-similes are shown, by Messrs. Salvini, of the S. Vitale mosaics from Ravenna,—very quiet, and almost grey in prevailing colour of drapery, against a gold ground, and with that pronounced and formal stiffness of style and attitude which some of our friends wish to see adopted as the model for whatever further mosaics may be introduced into St. Paul's Cathedral. Copies of the Fairford windows appear; but these have been well seen before.

In the North-east Staircase (according to our recollection, though it is printed North-west in the Catalogue) we may notice, in passing, the only bit of stained glass design to be seen (up to date of writing these remarks) showing anything of originality or speciality of treatment calling for remark. This is a small "domestic" window, by Messrs. Gibbs & Moore (1,036), consisting of a centre circle, with a small heraldic design, the rest made up of small panels, with flowers and a little conventional foliage in the upper and lower portions. The treatment is emphatically that proper to stained glass, and the colouring rich and harmonious. A small Renaissance window, of the same size, and by the same artists, has a very nicely conceived centre figure; the rest is a somewhat commonplace pattern of scrolls and shells, the colouring of which leads us again to ask why the word "Renaissance" should be of itself enough to frighten away all pure colour from a window, and reduce it to dirty drabs and browns; and why pure colour cannot be applied to a design "Classic" in its general outlines, as well as to anything else? Will no artist in stained glass make the experiment? The rest of the stained windows have mostly nothing to distinguish them from a hundred others of the ordinary type; unless we except one on the North-west staircase, part of a window for St. Paul's, Dock-street, in which there is some novelty in the lines of the design in the upper and lower portion, and of novelty certainly in the centre design (Christ rebuking the storm), where there is stained glass work modulating in conventional waves, and curving in conventional spray round the rudder. It is high time to prove offered for the best treatise on the "True Limits and Capabilities of Stained Glass Design," and the result circulated among the "artists."* We shall find somewhat more satisfaction in looking at the specimens of furniture design, which are not so numerous, nor on the whole so interesting, as last year's, but exhibit a good average of merit in design, and much beautiful workmanship. This is mostly in Rooms VII. and IX., in the west galleries. In a general way, we are glad to see less of that ostentation of simplicity, shown in excessive squareness and plainness of form and outline, which we protested against in reviewing the last collection, and which is just as much an affectation, in its way, as the weak, sprawling curves of the French "fashionable bouclor" style; of which, also, there is less, indeed very little, to be seen this year. Ebony and inlay predominate considerably. Among the best of the ebony cabinets is one designed by Mr. Talbert (2,770) in a quasi-Renaissance manner, with very little that can be called

carving, the ornament being mostly very flat or incised; the back to the cupboards is formed by a naturalistic diaper of dark green leaves on a gold ground; the whole effect is very artistic. No. 2,767, exhibited by Doulton & Co., shows a new suggestion in cabinet ornament, the panels being filled with bas-reliefs in pottery (figure subjects), but the result is hardly satisfactory, the material being too incapable of sharp finish to be used successfully on such a small scale. A glazed terra-cotta mantelpiece (2,785), designed by Mr. Gamble for the South Kensington Museum, forms another of sundry indications either that this material cannot be a medium for high-class decoration, or at all events that the right treatment of it has not been hit upon: the smooth, washed-out look of the glazed foliage decoration (of a very commonplace character) is anything but pleasant to look upon. A "stained and painted ash cabinet," by R. Chapman (2,780) is a suggestion for speciality of treatment which might be very successfully applied where economy is an object; the ornaments (including small figure subjects) are drawn in dark line upon the slightly-stained surface of the wood, the grain showing through the whole, the misfortune in this instance is that the ornament is poor in character and the figures very bad: the general shape and make of the article is solid-looking and purpose-like. A "Mediaval" sideboard, designed by Mr. Tarver (2,764), shows the good effect of gilding upon plain oak, the ornaments being mostly incised and gilt, a very pleasing and simple method of decoration. No. 2,761 is another individuality in cabinet-work, a carved piano, by Luis Cavaige (Spain). The wood is left untouched by varnish or any other compound, and every portion of the surface carved in elaborate flat enrichment of a semi-Moorish character, with great variety of detail; there is not the slightest attempt at colour decoration. The general effect is very pleasing, and in very good taste, but it wants just a little more decided motif; a little plain surface, or a few inlaid darker bands, would have given a little point to the design; it is interesting, however, to come across a mode of treatment so entirely different from what we are mostly used to in modern work. No. 2,760 is a cabinet, with panels formed of what are called in the catalogue "stoneware bas-reliefs," but which are not bas-reliefs at all, but mere incised designs on the stoneware surface, the lines filled in black. The effect is good, and may be taken as a suggestion worth notice. An "ebonised" cabinet, with painted panels (2,781), is fashioned by the "Decorative Art Society," *en masse*, as it would appear from the catalogue,—the panels painted with figures, on a gold ground, of a hawk and a lady feeding a swan. The figures are up to the average of this sort of work in merit. An inlaid table (2,783), by E. Prignot, is one of the very best things of the kind that we have seen. The design is Renaissance in character, but treated with conventionalised ornamental details of considerable novelty, as well as elegance, and with a very happy and effective combination of tints in the various woods employed. The designer has contrived also to render the supports of the table elegant and pleasing in form, without looking weak or flimsy, a point in which few furniture artists seem to succeed. An inlaid cabinet (2,786), in rosewood and lighter woods, near this, is also worth attention as a good piece of work of the kind. No. 2,777 is a good specimen of modern Gothic oak furniture, by J. Pencknots. It is a little too architectural in form and detail, but a very good, solid piece of work, the ornament chiefly formed by black inlay and panels of rich brown tint. There is more refinement in the details than we sometimes see in modern work of this school. No. 2,772 is a better thing of the same class, by S. J. Nicholls: a very good and refined piece of work, indeed, especially in the clever way in which the ends are treated; the design of the upper portion here is particularly elegant, more noticeable as this is just the portion which it is generally most difficult to treat satisfactorily in this kind of work. A "fire-place, with painted tiles, oak cornice and framing" (2,771), is the largest and most important piece of work of this kind in the room; the base of the composition is formed by marble and tiles; over this an oak carved Gothic framework and a large painted cove cornice, crowned with a heavy oak moulding which works in to the framework of the ceiling, the joists of which are shown. The tiles are too heterogeneous, being painted with all kinds of small subjects in that

disconnected haphazard way which some of our modern designers are too fond of, and which indeed is, in fact, an avoidance of "design;" the carving above is exceedingly good. The cove is painted with a green diaper, and three figure-subjects, indicative generally of domestic felicity, introduced in medallions on gold ground: there are on the framework below also two very elegant figures, similarly treated, apparently representing "work" and "play." The combination of the tiles and oakwork is pleasant in effect, and though we think much more might have been made of the tiles by a different method of treatment, there is no doubt that on the whole this is a fine piece of work, generally creditable to the two gentlemen whose names are appended to it, S. J. Nicholls and C. Rossiter. The figures, which are of a much higher class than we ordinarily find in furniture work, are, we presume, Mr. Rossiter's contribution to the design.

We may have more to say next week as to some of the other specimens of ornamental design of different kinds, which are scattered in the usual indiscriminate style up and down the building.

THE ART UNION.

The annual meeting of the Art Union was held on Tuesday last in the Adelphi Theatre, Lord Houghton in the chair. Among those present were Sir Walter Stirling, Bart, Sir W. Bodkin, Mr. E. Antrobus, Mr. J. Martin, Mr. J. B. Butterworth, Mr. Z. Troughton, Mr. W. Smith, Mr. R. Wilde, Mr. Francis Bennock, Mr. Lumb Stocks, R.A., and Mr. W. E. Frost, R.A. Mr. L. Pocock, hon. sec., read the report, of which we print the pitch:—

The Council have the gratification of announcing that the sum subscribed for the year now ended amounts to 11,930, 12s. 6d.

The eight plates of coast scenes engraved from the works of English artists in water-colour have proved exceedingly popular. A large proportion of the impressions are already in the hands of the members, and the remainder will be delivered as soon as possible. The success which has attended this issue may induce the Council to consider the expediency of making a somewhat similar experiment on a future occasion.

Since the last meeting the Council have been deprived by death of two valuable members, Dr. Mortimer, formerly head-master of the City of London school, and Professor Westmacott, R.A. The latter, especially, has been a frequent attendant at the meetings, and constantly rendered valuable assistance by his professional knowledge and experience. To fill up one of the vacancies thus caused, Mr. W. E. Gunbleton has been elected.

The Council continue to receive very efficient aid from the local secretaries and agents in all parts of the world, and on this occasion they would refer more particularly to the services of Mr. Whitcombe, Cheltenham; Mr. Baily, Birmingham; Mr. Furst, of Christiania; Messrs. Foye, Von Beckroth, and Dreyer, in Prussia; Mr. Walsh, in Hobart Town; Messrs. Hutton, Tonkin, and Watts, at the Cape; Mr. Glazier, of Hartford, and Mr. Ranlet, at San Francisco, in the United States. The accounts have been audited by three members of the finance committee, and by Mr. Atkinson, of the Bank of England, and Mr. W. Wright, to whom thanks are due.

The following is a brief summary of the receipts and expenditure; a detailed account will, as usual, be printed in the report.

Amount of subscriptions.....	£11,930 12 6
Allocated for prizes.....	28,410 0 0
For print of the year, almanack, report, &c., and reserve	3,051 0 0
Agents' commission and charges, advertisements, postage, &c.	2,469 11 8
	£11,930 12 6

The amount to be expended on prizes will be thus allotted:—

22 works at.....	£10 each.
20 " "	15 "
13 " "	20 "
12 " "	25 "
10 " "	30 "
10 " "	35 "
8 " "	40 "
6 " "	45 "
4 " "	50 "
4 " "	55 "
2 " "	75 "
3 " "	100 "
2 " "	150 "
1 work at.....	200 "

To these will be added:—

- 1 Marble "Wood-nymph."
- 8 Nelson Columns.
- 2 Cameos.
- 30 Townley Vases.
- 2 Bronze Medallion Inkstands.
- 40 Wood-nymph Statuettes.
- 20 Small Tazzes.
- 300 Chromos of "Bellagio."
- 60 Chromos of "Kite Flying."
- 80 Busts of Princess Louise.
- 30 "Ety" Silver Medals.

These, with the prizes given to unsuccessful members of ten years' standing, will raise the total number of prizes to 940.

For the coming year the Council have prepared a plate, admirably engraved by the Late Wm. Holl, from the

* One or two windows there are still to be filled, apparently, "for better or for worse;" we sadly fear the latter.

picture, "Rebekah at the Well," by F. Goodall, R.A. The picture sets forth the scene at the moment when Abraham's servant, having accosted the damsel, and asked for a little water out of her pitcher, she gave him to drink, and drew water for his camels also; and as the camels had done drinking, the man took a golden carrying and two bracelets, and put them on her ear and wrists, and "wondering at her, held his peace, to wit whether the Lord had made his journey prosperous or not."

The artist has with consummate skill rendered in the face of Rebekah an expression, emblematic of the tender she feels at the unexpected address of the servant,—joy at the prospect of a wedded life, which, by the women of Judah especially, was considered as necessary to escape contempt,—and a kind of inspired awe at being chosen as the one who was destined to be the mother of "thousands of millions," and in whose seed should "all the nations of the earth be blessed." The anxious look of the servant, also, waiting to see if his suit should prosper, is admirably given. The Council have every reason to believe that this plate will be a great success.

During the last twelve months which have elapsed since the last annual meeting, there has not occurred, in connection with matters of art, any event which appears to call for particular notice in this Report, and it has been thought, seeing that a new generation has grown up since this association first saw the light, thirty-six years ago, that a slight sketch of the origin, progress, and present position and prospects of the Society might be acceptable. To give a full and exhaustive account of the transactions would require more time than can on such an occasion be devoted to it.

In the year 1837 the Kunst-Verein of Germany had taken for some years in operation, and there was an association of a somewhat similar kind formed in London, which occurred to a few lovers of art that it would be a public benefit to establish an institution of the same kind in London. A committee was accordingly formed, of whom four are still members of your Council, and they published their first programme in February of the above year. In one most important particular, however, their plan differed from those with which we are acquainted, inasmuch as in all existing art-unions the selection of works to be given as prizes was made by the governing body, it was determined in this case that the selection of the prizes to the prizeholders themselves. We have the managers of this Society ever seen any reason to repent of this arrangement.

The amount of subscription in the first year of the Society only reached the sum of 897. 6s., with which the prizeholders were able to purchase thirteen works, varying from 10s. to 100s.

In the second year of its existence, the Society adopted the principle of setting apart a certain sum for the purpose of engraving a picture, that each member might have an impression of the plate,—feeling that, by combination, a work could be produced, and placed in the hands of every member, of the market value, at least, of his subscription, without unduly trenching on the fund for the purchase of prizes, and that every subscriber would have a direct and certain return for his outlay.

By the third year the amount of subscriptions had reached 1,252. 1s., and relations had been established with thirty-seven gentlemen in the provinces, who gave valuable assistance, in making known the objects and advantages of the association. This amount, to which much attention has always been paid, and the result is, that there is scarcely any part of the world to which the publications of the Art-Union have not penetrated, through the instrumentality of gentlemen who devote a large amount of time and trouble to the promotion of the cause of art.

In 1841, His Royal Highness the late Duke of Cambridge became President of the Society. His Royal Highness always took great interest in its proceedings, and generally presided at the annual meetings.

In 1841 a sub-committee was appointed to consider the future prospects, and the most efficient mode of working the enlarged means of the Association.

Their proposals in particular emanated from the deliberations of this Committee, which have since held prominent places in the Society's programme.

It was determined to endeavour to give the production in England of artistic statues in bronze.

It was proposed to commence a medallic series of the history of Britain—to produce five or six medals each year; having on the obverse the head of some distinguished painter, sculptor, or architect, and on the reverse, a subject from one of his works.

The first result of the sub-committee's recommendations was the offer of a premium of 600. for a series of designs in outline, illustrative of some epoch in British history, or of the work of some English author, and a further remuneration for the artist's superintendence, if it should be deemed expedient, to engrave the composition selected. The object of the committee was to call the attention of our artists generally to that purity and correctness of drawing, and severe beauty of form, which, apart from colour, and all the effects of light and shade, exist in the compositions of the finest of the ancients, in the outlines of our own Flaxman, and in the compositions of Kleophasen, and some later Germans.

All the preparations for holding the annual meeting in 1844 were made, the date being fixed, as usual, for the last Tuesday in April, when the Committee were startled by the receipt of a letter from the Treasury to the effect that the proposed exhibition was illegal, and that the continuance of the same would render all parties concerned liable to prosecution. The Committee thereon immediately suspended all proceedings. A memorial was addressed to Sir Robert Peel, setting forth the amount of benefit already conferred on the artists of the country by the Art-Union, and the great loss and disappointment which would arise from stopping the distribution of the large amount of money then actually in hand. The Committee had an interview with the Minister's Secretary, but were unable to obtain any guarantee to allow them to proceed with the drawing.

A meeting of artists was held, numerous petitions were presented, and, on the motion of Mr. W. W. W. a Committee of the House of Commons was appointed to consider the whole question of art-unions, and what are the most expedient and practicable means to place them on a safe and permanent basis, and to render them most subservient to the improvement and diffusion of art through the different classes of the community."

In the meantime a temporary Bill was prepared by Lord Montagu, and carried through Parliament to enable the distribution of prizes to take place, and the meeting was held on the 13th of August.

The Report of the Select Committee of the House of Commons was a complete investigation of all the points which could be urged for and against art-unions, and the conclusions in their favour were thorough and unanswer-

able. Nevertheless, there was some difficulty in getting the Government of the day to use their influence in getting the Bill, founded on the Report of the Committee; but the assistance of the Duke of Devonshire, and of the legal art-unions, under certain conditions, received the Royal assent on the 13th of August, 1846, and on the 1st of December of the same year the Association was incorporated by Royal charter.

In the year 1845 the Committee offered a premium of 500. for an original picture, illustrative of British history. Twenty-six artists were sent into the field, and on the 18th, 1846, and the premium was awarded to one of Queen Philippa interceding for the lives of the Burgesses of Calais, afterwards found to be by Mr. H. C. Selous, who had, on a former occasion, received the premium for his illustrations of the "Pilgrim's Progress." A premium of 500. was at the same time offered for a group or single figure in marble, to be completed for by models in plaster, the size of the intended work. In reply to this proposal twenty models were sent in, and exhibited in the concert-room of the Princess's Theatre. The premium was awarded to "The Dancing Girl Reposing," found to be by Mr. Calder Marshall, now R.A. The figure was most successfully executed in marble, and in the year 1868 it was the chief piece in the collection, and fell to Mr. Kenning, of Brighton, Northampton.

In 1845, almost the first experiment in producing statues in porcelain was made. A reduction of Mr. Gibson's beautiful figure of "Narcissus" was sent into the field, and in the hands of Messrs. Copeland and Garrett, and a very satisfactory result was obtained. This was the beginning of that series of twelve statues which are now in the hands of the most popular of the Society's productions. It may be mentioned incidentally that of the Clytie bust in porcelain, which was copied and distributed.

In 1846, with a view to affording encouragement to the art of gem-engraving, but little practised in this country, the Committee offered premiums of 600., 300., and 150. for the best canoes in profile by British engravers, the work of Minerva, in the collection of bronzes in the British Museum.

The first and second premiums were awarded respectively to Miss Elena Pietrucci and Mr. Henry Weigall.

A very important feature in the Society's programme is the *Reserved Fund*—a fund formed from the reservation of 25 per cent. of the amount subscribed to each work, as required by the charter of incorporation,—from the portion of the amount set apart for prizes, not expended by the prize-holders, from the amount reserved for the purchase of the exhibition of prizes,—and from the interest of the fund itself. The object of this fund is to obtain a gallery, and otherwise assist in promoting the objects of the Association.

The Council have at different times had before them proposals in reference to the erection of a gallery and the purchase of a picture, but have not as yet been able to combine the qualifications which appear to them essential for such a purpose. They are still anxiously endeavouring to effect the object in view, and, in the mean time, the fund is employed in the production of works for distribution in future years. The interest of the money thus borrowed is repaid to the fund from the subscriptions of the year in which the work so produced is made use of. This fund now amounts to 10,114.

In the year 1848, the Council were much surprised to receive, from the Lords of the Committee of the Privy Council for the Arts, a letter to the effect that their intention to interfere with the constitution of the Society in three several particulars, viz. that the works of art to be given as prizes should be selected by a committee instead of the prize-holders themselves—that the annual issue of a print from some picture by an English artist should be discontinued,—and that 10 per cent. should be reserved out of the subscriptions for the purchase of works, not for distribution, but for public exhibition. The Council energetically opposed these alterations, and, after much correspondence and many interviews, the Board of Trade forbore to urge their views "against the strongly expressed sentiments of the Association."

In 1849 the Council offered a premium of 100. for a bas-relief for the purpose of engraving. Twenty-five designs were sent in, and the premium was awarded to "Eusebe" for a design of "Christ Entering Jerusalem," by the same artist, "Christ led to Crucifixion," by the same artist, was engraved, and both prints are now in the collection of the Society. The first has been reproduced in bronze, and the second in plaster.

In preparing the annual work for presentation to the members, it has always been the wish of the Council to treat directly with the engraver. Only those, however, with whom the duty rests can tell how difficult it is to have ready, year after year, a work which shall combine the necessary qualifications of artistic excellence and interest for the public at large, being dependent besides on the health and strength of the individual engraver.

A difficulty arose in this direction in the year 1850, when it was found that the work intended for distribution could not possibly be completed in time, and the Council were fortunate in being able to secure a pair of steel-plate line-engravings from Mr. Webster's pictures of "The Smile" and "The Frown," which proved exceedingly popular, and in addition to which was given a series of etchings illustrating Shakespeare's "Seven Ages" by Daniel Maclise, R.A.

In 1850 the Council offered premiums of 100. and 50. for the first and second-best model in plaster of a single figure to be produced in bronze. Forty statues were submitted, and of these twenty-four were selected, and formed a very interesting feature in the first Great Exhibition of 1851. The first premium was allotted to "Satan Disarmed" found to be by Mr. Armstrong, and the second to "Solitude," by Mr. J. Lawler. The first has been reproduced in bronze, and the second in plaster.

In 1851 the Council had to lament the loss by death of their president, H. H. the Duke of Devonshire, who strove with kind readiness to advance the interests of the Society. The Council were glad to have an opportunity of showing their appreciation of the services rendered by Lord Montagu, at a time of great personal and public danger, in 1834, by electing his lordship to the vacant office.

In the year 1855 was instituted the custom of presenting to members having paid ten consecutive subscriptions without gaining any prize, a consolation prize, in the shape of one of the best or other works, and this arrangement has been found to give the greatest satisfaction, and has had the effect of retaining many members who might have seceded, on account of their want of success in the annual distribution.

In 1860, a premium of 100 guineas was offered for a series of designs, in outline, illustrative of Tennyson's "Idylls of the King," in reply to the invitation forty-three sets of drawings were sent in. The premium was awarded to a series found to be by Mr. Priolo. They

were engraved, and formed part of the annual presentation to the subscribers of a subsequent year.

In 1862, the Council commissioned Mr. John Leighton to design a large tazza, to be produced in ceramic ware, as a memorial to the Prince Consort. The tazza was to contribute, in however small a degree, to the preservation of the memory of one to whom this country is in so many ways—especially in the numerous and important services so deeply indebted, Her Majesty was graciously pleased to accept one of these tazzas, and desired to have three of the same prepared for her, for presentation to special persons.

At the International Exhibition of 1862 the bronze and parian works of the Society, arranged on a raised stand, formed one of the most attractive of the "trophies" placed along the central nave of the building.

In 1863, a premium of 600. was offered by the Council for a life-sized figure or group in marble, to be completed for by finished models in plaster. In reply, fifteen models were sent in, and, by permission of the Committee of the Privy Council for Art, were exhibited in the South Kensington Museum. The premium was awarded to a group, "The Wood-Nymph," found to be by Mr. C. B. Birch. It was successfully reproduced in marble by the sculptor, and will be the first prize of the kind ever presented to be placed along the central nave of the building.

In 1864, a premium of 600. was offered by the Council for a life-sized figure or group in marble, to be completed for by finished models in plaster. In reply, fifteen models were sent in, and, by permission of the Committee of the Privy Council for Art, were exhibited in the South Kensington Museum. The premium was awarded to a group, "The Wood-Nymph," found to be by Mr. C. B. Birch. It was successfully reproduced in marble by the sculptor, and will be the first prize of the kind ever presented to be placed along the central nave of the building.

In 1865, arrangements were made with Mr. Stocks for engraving Mr. Maclise's noble wall-painting in the Palace of Westminster, of "The Meeting of Wellington and Waterloo." The work was entrusted to the hands of 700 artists from Germany, France, England, and elsewhere, received princely hospitality during the whole time, and who were employed in the execution of the work, and in effectually carrying out the promise of the motto, everywhere displayed, of "Welcome to Rubens' Land." The work was completed in the month of August, 1865, and the impressions will be the presentation to the subscribers of the Society.

By the lamented death of Mr. Maclise—with whom the Council had many transactions, and as many opportunities of estimating his talents as an artist, and as a man of the most honourable and large-hearted nature—they lost the advantage of his superintending care in bringing these works to completion. They feel, however, that the result will be, in every respect, most satisfactory.

In 1866, the Council had to deplore the loss of their president, Lord Montagu, whose genial and efficient assistance was afforded to the Society, and who continued opportunities of acknowledging. The office was offered to, and accepted by, the Right Hon. Lord Houghton, long a member of the Board, who has since generally presided, and frequently aided with his advice and experience at the meetings.

In the year 1868, Art-Union became again the subject for Parliamentary inquiry.

It was felt by many persons taking an interest in the advancement of art, and by none more strongly than by this Council, that, in the act for legalising Art-Union, the conditions on which such an Association should be permitted to be formed were too lax, and that sufficient power was not vested in the Board of Trade to prevent the fraudulent use of the name of Art-Union, which sheltered themselves under the name of Art-Union.

A committee of the House of Commons was appointed, with Lord Robert Montagu as chairman, which examined the witnesses, and made a report recommending that the administration and enforcement of the Art-Union Laws should be placed under the charge of the Science and Art Department, on which such a report was made, and a code of regulations should be adopted, which were, in nearly every particular, identical with the regulations of this Society. The Council had every reason to be satisfied with the mass of evidence which came out, proving beyond controversy the value and importance of their operations; and even those most hostile to us admitted the excellence of its management, and called it the model Art-Union.

Unfortunately, in consequence of the pressure of business in the House of Commons, the matter went no further, and the regulations recommended by the committee are still a desideratum.

At the International Exhibition in Paris, in 1867, none of the Society's prints and bronze statues were exhibited.

In the same year the Council offered a premium of 200 guineas, with 100 added if the result proved very satisfactory, for a set of drawings illustrating some poetical or historical work of a British author, or events in British history. Thirty-five sets of designs were received, and the premium was awarded to a series illustrating Canon Kingsley's story of "Hereward the Wake," which was found to be the production of Mr. H. C. Selous, who had on two former occasions carried off premiums offered by the Society. The drawings were engraved by Mr. Charles Lewis, and formed the presentation work for the year 1870.

At the International Exhibition at South Kensington, last year, the marble statue of the "Wood Nymph," occupied a conspicuous position. A very effective collection of our bronzes was also contributed, together with two canoes beautifully cut by Mr. Rogers, of "St. George," and "Ariel." These will be given as prizes in to-day's distribution.

A similar contribution has been made to the exhibition, to be opened to-morrow.

Such is a brief review of the progress of the Art-Union. It has had its varied fortunes, but has pursued steadily its path of duty, in the face of circumstances at times very critical and difficult to meet. Its present position proves that it has triumphed over all.

It has fostered native talent and assisted rising artists,—cultivated and diffused a love and taste for art through every class, and raised the standard of ornament to be found both in the cottage of the peasant and in the palace of the noble,—and the cause and the noblest of the empire.

It must be a work of time and labour to imbue with a feeling for art the great bulk of a mercantile community, where the return in pounds, shillings, and pence does not lie on the surface. In the short spaces of relaxation obtainable by those pressing forward in the battle of life, there are but a few minutes to be spared, and it is not possible that art should be a mere recreation, or that art should be content to take its position on its unwhimsical and refined nature may be able to gain. It

is only by degrees that its rotaries can be taught to feel the exquisite enjoyment which its full appreciation is capable of conferring.

LEWIS POCOCK,
EDWARD E. ANTROBES, Hon. Secs.

The Chairman, after alluding to the interesting sketch of the progress of the Society which had just been read, paid a tribute to the memory of the late Professor Westmacott, who, notwithstanding his advanced age, had been so vigorous, that his decease had come upon his friends with the shock of a surprise. He had been identified with the interests of British art; and, if he had not been so prolific as some, his memory would remain among British artists with a fame singularly pure, and as one whose works were characterised by extreme grace and elegance. Alluding to British art, Lord Houghton said he understood that the exhibition of the Royal Academy now about to be opened was extremely rich in *tableaux de genre*, and if these were not of the highest class of art, they were at least the most popular. Alluding to the wonderful sale of the collection of Mr. Gillott, he said it showed how good a thing it was to invest money with judgment in pictures. It might, however, be well to consider whether these immense prices of works of art were really very beneficial. An artist whose pictures fetched such large sums could not fail to experience a feeling of some hardness from learning that others were reaping the largest fruits of some of his hardest labour. However, there was reason to believe that, notwithstanding the large amount of money contracted on these pictures, there was still enough left to go into the pockets of the artists of today. In the encouragement of rising art this Society was of great value, and what a prize-holder might select with judgment would be no other than a lasting pleasure to himself, but might prove a good investment for his children. He would recommend prizeholders to look out for young artists, and for such as displayed genius; not to object to buying a picture with an unknown name, for there was not one of the greatest painters who had not been once unknown. He recollected when he had been in Parliament that in going round to canvass he had always met some good-natured people who kindly wished all the candidates to succeed, and now he could only follow their example, and hope that all present might get prizes, though there might be some physical difficulties in the way of this. He concluded by moving the adoption of the report.

Sir Walter Stirling seconded the resolution, and said he thought that the enormous prices which had recently been obtained for pictures might be in some degree attributed to the love and appreciation of art which had been fostered by this institution. Sir Walter made some strong observations condemning the removal of Carlton House and Burlington House, and on the anticipated pulling down of Temple Bar. The report was adopted.

Mr. F. Bennoch moved a vote of thanks to Messrs. Lewis Pocock and Edmund E. Antrobes, non-secretaries, remarking that to the ever-watchful care of the past and present non-secretaries the great success of the Association must be mainly attributed. He said that some time since a gentleman surveying a wild portion of Australia had met in a house far from any large settlement a series of the Art-Union pictures. Mr. Butterworth seconded the resolution, which was agreed to.

Mr. L. Pocock returned thanks to the meeting, and moved a vote of thanks to Mr. B. Webster or his kindness in granting the use of the theatre, and to Mr. Kilooh for his assistance.

Mr. E. Antrobes seconded the resolution, and spoke in acknowledgment of the vote of thanks to the non-secretaries.

The resolution having been passed, Miss Ingram and Miss Peregrine proceeded to draw the prizes, the principal of which were allotted as follows:—

- 209.—Hayluck, T., Lower Wandswoth-road.
- 366.—Lott, Ed., New-cross; Rhodes, J., Leeds.
- 109.—Morris, K., Oakham; Slee, G., Bermondsey; Lehart, W., Hill street.
- 73.—Ashurst, H. G., Richmond; Milson, J., Canterbury, New Zealand.
- 50.—Fraser, J., Camden-road; Hulson, W. G., Plumstead; Newman, R., Hobart Town; Val, S., Coventry.
- 50.—Bishop, J., Wimbledon; Phillips, J., South Shields; Saunders, J., Kildermunster; Shepard, C. P., Boston, United States.
- 45.—Ferguson, Col. G., Pitfour, N.B.; Crickey, W., Meridian; Salmon, G. P., Distall-hale; Shaw, T., jun., Impington; Victoria, W., Northampton; Woodard, C. H., Croxson.
- 40.—Boswell, C. S., Redditch; Coleridge, Rev. E., Appleby; Harper, J., Newcastle-on-Tyne; King, M., Q.-D. G.O.E., Fall-naul; Marsland, N., Falmouth;

road; Stevens, J. C. M., Winscott; Taylor, W., Maidstone; Wilson, W. F. A., Maid-a-hill.

307.—Bishop, M. J., Paternoster-row; Blackstone, W. W., St. Ann's-road; Butler, C., 141, Drury-lane; Cross, Rev. E. H., Canterbury; Hammond, W., St. John's Wood-park; Nicholson, Master E., Sanderland; Noseworthy, E., Tavistock; Smith, J. F., Camden-road; Stuart, A. C., Customs; Sumner, Rev. J. H. R., Ellesborough, Tring.

306.—Eiso, A. C., Matlock-bridge; Bertemati, Don Jose, Jerez de la Fronteira; Ferguson, W., Stock Exchange; Fitcher, G. F., Barriage, Marlborough; Harvey, C., Alderminter; McKenzie, R., Brewery, Soho; Paton, J. P., Bedford; Prowse, W., Horseay; Richardson, J., Barcelona; Wade, G., Sheffield.

251.—Alicock, D., Waterloo; Browne, R. P., Greenwich; Couldery, H., Lewisham; Gnard, C. M., Bernadon-road; Hutchinson, R. W., Hartlepool; Littlecott, Rev., Rushall; Manger, J. W., York, Australia; Sherwin, S., Boston, England; Tate, E., Godalming; Ward, A., Loumba, Peru.

201.—Barber, S., Old Ford; Brown, T., 69, St. Paul's Churchyard; F. H., per H. C., Pidgeon; Greenwood, E. B., Arundel; Hallifax, Miss, Cludae Hall; H. E., Long, C. G., Maidstone; Lumsden, D., Port Elizabeth; Macleod, G., St. John, New Brunswick; Myhill, H., Saffron Walden; Rawle, J. S., Nottingham; Seaton, P., Selby; Webster, Mrs., Halmie, Manchester.

201.—Adams, Sam., Ware; Aplin, B. W., Banbury; Bewes, C., Plymouth; Birch, W. R., Banbury; Bradridge, G. J., Enfield; Copeland, J., Hanley; Dendun, Vienna; Ellis, J. S., South Hackney; Flemming, Miss, Acoch, roads, Great; Frinces-gardens; Greenhalgh, E., Bolton; Harley, E., Saffron Walden; Kewenig, J., Bramley; Portway, S. G., Lincoln-inn-fields; Roberson, C., Lougacore; Rogers, J. C., Blackford; Spencer, A. J., Harrow-road; Wells, G., 12, North-street, Westminster; Williams, Mrs. C. M., Cardiff; Wright, W., Preston Brook.

201.—Adams, T. W., Wells; Angus, Dr., Regent's Park; Ashdown, E., Hanover-square; Buckley, H., Manchester; Bulson, J., Moota; Dykes, E. O., Leeds; Esae, A. F., City-road; Fawcett, N. C., Kapunda; Fernandez, Dou, Gads; Gilbert, T., High Wycombe; Ivers, H., Birmingham; Hope, J. C., Scotchwood, Australia; Hirstfield, J., Bolton; Jackson, Mrs. H. D., West Brompton; Lohley, J., Hanley; McKnight, G., Wellington; Selwyn, Masson, H., Malton; Oates, J. H., Leeds; Poole, W. F., Paddington; Rutt, H. P., Barnsbury; Vero, C., Aberstrove; Watson, W. W., Glasgow.

Ascribed to the marble group "A Wood Nymph."

Bronze Vase.—Alexander, J., Borough; Bolton, J., jun., Sussex Hotel; Cairns, J., Mossel Bay; Chioley, J. J., George-road; Dally, G., San Francisco; Duns, J. C., Cork; Eveson, J. G., Scourie; Ford, W. J., Maid-a-vaile; Fraunce, Col., Hull; Gerulherdt, P. E., Mawn City; Grant, Miss, Belfast, Victoria; Harris, G., Covent-garden; Heron, J., Pockham-rye; Jolland, C. J., Newington-butts; Lees, W., Ashton-under-Lyne; Lowson, A., Abroath; Martin, E., Braton-street; Michelson, J., Pickering; Moody, J. B., York; Nova Scotia; Ness, J., Helmsley; Nicholson, W. L., Lander-terrace; Paxton, W., Little Gaddesdon; Reid, P., Dundee; Scott, 34, Great Marlborough-street; Sizer, J. J., Cheltenham; Taylor, J., Salsbridge; Turner, J., Pimlico; Wilson, S., Launce's Conduit-street; Wood, J. C., Church, Accrington; Wright, W., Preston Brook.

A Bronze Copy of "The Nelson Monument."—Core, H., Bedale; Davies, H. P., Seaford; Fotheringham, T., Gawler; Jackson, W., Garton; Knowles, H., Salford; Parry, Mrs. C. J., Torpoint; Rawlins, J., Newman-street; Webster, S. M., Warrington.

A Cannon "St. George."—Burton, W., 171, Avenue-park.

A Cannon "Ariel."—Chapman, C. W., Victoria-street, Hackney.

A Bronze Inkstand.—Alum, F. E., Craven-street; Matthews, T. B., Montreal.

THE PASSAGE BETWEEN ENGLAND AND FRANCE.

CAPTAIN WILLIAM DICEY, of Walmer, who has long given attention to the possibility of lessening the inconveniences at present attending the transit between the two countries, has devised a vessel which he thinks will obviate to a very great extent the present inconveniences of the sea journey between the English and French ports.

The principal difficulties to surmount are the rolling and pitching of the vessel, and the deficiency of accommodation on deck for passengers, and the object is to surmount these difficulties, if possible, consistently with not increasing the draught of the vessels, and in not rendering them crank or unseaworthy, and also in not diminishing the speed at which the present vessels travel.

Captain Dacey says:—It is well known that the operation of a supported heavy weight parallel to and at a distance from a floating body, will have a tendency to steady such floating body, causing it to be less sensible to the movements of the waves. This fact has suggested to me the invention of which I speak. Instead, however, of affixing a useless and dead weight at a distance from the original vessel, I convert such weight into a hull similar in all respects to the hull upon which it is to act, so that instead of a vessel consisting of a single hull, as now constructed, I have two distinct hulls parallel to and at a considerable distance from each other. By means of the girder principle, which has been found so efficacious in the construction of iron bridges, I connect these two hulls together, and thereby produce the result

that each hull acts upon the other, so that any movement which would be caused to one hull by the force of the waves is counteracted by the opposite hull, and the entire vessel remains comparatively unaffected by the motion of the waves. The vessel will consist of two hulls parallel to each other, each being 400 ft. long, 20 ft. beam, and 20 ft. depth of hold, secured together by means of girders, at a distance of 35 ft. apart, with the propelling paddles working between the two hulls. Each hull will be very sharp at each end, and flat in the floor. Estimating the draught of water at 6 ft., these dimensions will give a clear side-on of the water between the two vessels of 14 ft., and will admit of girders of this depth of a slightly arched form being placed between the two hulls—the upper part under the deck, the lower part just above the water-line. The dimensions will admit of a deck 60 ft. wide and 200 ft. in length, and this would admit of saloons, cabins, and every accommodation and convenience being constructed above the deck for the comfort of passengers, without the inconvenience of the confined cabins in the vessels as now constructed; in addition, there will be a space round for the working of the vessel."

Captain Dacey has had long experience in the East Indian marine service, and is entitled to speak. We commend his design to the attention of those who are in a position to aid in testing it.

PROPOSED NEW SCHOOLS, JOHNSON STREET, STEPNEY.

The designs for these schools, submitted in competition to the London School-Board, have been exhibited at the Guildhall, to such architects as happened to hear of the opportunity. It occurred too late, however, to enable us now to say anything about the drawings. The designs are by Mr. Roger Smith; Messrs. A. & C. Harston; Mr. H. Savon Snell (6,500 l.); Messrs. Jarvis & Son (10,200 l.); and Mr. Basil Champneys.

THE ROYAL ACADEMY.

ALTHOUGH the periodical press was courteously admitted to a quiet view of the 10th Exhibition of the Royal Academy of Arts in time to enable us to review it in our present number, it was with the express condition that no account of the exhibition should be published till after the day of the private view, this, Friday, May 3rd. We are forced, therefore, to postpone criticism till next week. We may say, however, that it is an interesting collection (consisting of 1,583 works of art, in the whole), and includes a number of pictures of very high merit. Mr. Elmore, Mr. E. M. Ward, Mrs. Ward, Mr. Frith, Mr. Millais, Mr. E. Long, Sir J. Gilbert, Mr. Richmond, Mr. Wells, Mr. Watts, Mr. Mason, Mr. G. Leslie, Mr. F. Leighton, Mr. Calderon, Mr. F. Walker, Mr. James Sant, Mr. Hook, Mr. Cope, Mr. Mann, Mr. Armitage, Mr. G. Smith, Mr. J. F. Lewis, Mr. Poynter, Mr. J. P. Knight, and Mr. P. Graham, with some others, are all worthily represented.—Sir Edwin Landseer largely. The architectural drawings and designs are about 100 in number, and will have attention in our next.

COMPETITIONS.

St. Helen's New Town-hall.—A special meeting of the St. Helen's Town Council has been held. The Council considered the report of Mr. Waterhouse, architect, on the plans for the new town-hall and the final selection of a design. Out of the six competing architects Mr. Waterhouse chose three, who contributed four plans, and he finally recommended one bearing the motto—*Respice Finem*. The meeting now accepted his judgment by ten to nine votes, and on the letters being opened it was found that the successful design had come from Messrs. Culshaw & Sumner, Liverpool. It was decided to ask Mr. Culshaw to meet the committee immediately, as alterations will be necessary.

Newington Mission Church.—The committee have decided to award the first premium to Mr. Cuts; the second to Mr. John Giles; and the third to Messrs. Giles & Gane.

Gateshead.—The congregation of the United Presbyterian Church in Gateshead, finding their present place of meeting too small, have resolved upon the erection of a new church in Bewick-road, and out of three designs for the building

sent in in competition by Mr. John Johnstone, Mr. Thomas Oliver, and Mr. Lish, of Newcastle-upon-Tyne, the design by Mr. Lish has been selected; and it is intended, we understand, to proceed with the work at once.

Nevington Parish Church.—The premiums have been awarded,—to Mr. Fowler, first; Mr. Pearson, second; Mr. Blomfield, third. Messrs. Brooks, Jarvis, and Bignell also sent designs. We shall probably take a look at them.

SCHOOL BOARDS.

Canterbury.—The Board's school is to be altered under the direction of their architect, Mr. J. G. Hall. Messrs. Gaskin & Godden's tender for the execution of the work has been accepted.

St. Austell.—At the meeting of this School Board on Saturday, the tender of Mr. J. Body, of St. Austell, was accepted for the carpenters', joiners', smiths', &c., work, and that of Mr. H. Ede for the masons', bricklayers', slaters', &c., for the erection of the Mount Charles Schools. Mr. S. Trevail, of Carne Par Station, from whose designs the schools are to be built, is appointed the architect to superintend the execution of the work: the cost will be under 2l. per child.

LIGHTING THE STAGE.

"It is interesting," says the *Athenæum*, "to notice, in an architectural contemporary, a statement that the stage of Mr. Fichter's theatre in New York is to be lighted by means of a line-light fixed in the ceiling of the auditorium, with reflectors, so as to illuminate the stage, not in that preposterously unnatural manner which custom has made less than intolerable, and the effect of which is the reverse of truth, but so that the features, and consequently the expressions, the limbs, and therefore the attitudes, of the performers, will be displayed as they were intended to be displayed, while spectators will be allowed to see the stage without the pain of facing the glare of the footlights. If any of our ablest artists would be good enough to exhibit two portraits of the same actor, one of him as he appears in the conventional stage-light, i.e., with his features illuminated from below, and another of him as he appears in the light by which human features were designed to be seen, that painter would secure the cause of true art."

It was a wise remark of Sir James Simpson to the present writer that he was half inclined to think that "there is nothing new but what has been forgotten." We have often occasion, in cases such as this, to recall the origination, or publication, in the *Builder* of past years, of ideas long subsequently put forth as something new; and so it seems to be in this instance. Twenty-five years ago, in our volume for 1847, p. 281, is a letter from Mr. J. E. Dove, in which he gives an account of this very mode of lighting the stage of the Greenock Theatre, invented by him, and executed for the manager under his superintendence. In this letter the writer says:—

"I had often been struck with the classical or picturesque expression thrown over the features of even a very plain and inelegant countenance by the elevation of the artificial light, when alone reflected on it from a point exclusively above its level. Let any one, for instance, place a mirror before his own face, and elevate the candle [now the lamp, as candles are scarce now-a-days], so that the light by which it is to be seen, to various levels, higher or lower, before it; and he will at once perceive that as the shadows come to fall exclusively downwards, a classical elegance and even beauty of effect will be shed over the most rugged countenance. Of course I do not mean that the light be elevated directly above the head, but immediately in front of it, at an angle, probably, of 45 degrees, so that the expression of no feature be lost.

On the other hand, while in a theatre, and especially in the pit [now orchestra stalls, chiefly], I have frequently been annoyed and disgusted with the effect of the unnatural glare of light from the footlights, particularly on the faces of those on the stage. The false and unnatural effect thus produced every one must have remarked. Even the very cavernous interior of the nostril of any the most beautiful countenance, which nature discreetly casts into shade, is thus explored with unmerciful, trying, and by no means beautiful distinctness. But I need not further enlarge on those reasons which led me to endeavor to get rid altogether of footlights. I did realize my idea, and that successfully, and to the satisfaction both of actors and spectators. The principle consisted in the entire removal of the footlights, and the bold substitution of a central congeries of lights in the very body of the house (a small one certainly), and almost in the place usually occupied by the chandelier, with a reflector sufficiently large and powerful to turn the whole flood of light upon the stage at about an angle of 45 degrees. A second congeries was found necessary, however, at a like elevation, but within the proscenium, or above the general range of the actors' heads, to aid in the proper and uninterrupted display of the scenery on the like principle, the complete design for which displayed comprehended the systematic use of scenery so illumin-

ated also from behind as to give the dioramic effect as far as possible."

The experiment, it thus seems, was carried out to a sufficient extent to prove not only its practicability, but its great superiority to the usual method of lighting the stage, and to show that nothing else was requisite to the most brilliant realisation of this still striking *mode* in all its details but the well filled treasury of a metropolitan theatre. The "sun-light" system in halls and churches, we may add, was introduced in Liverpool shortly after the date of this letter, and was obviously based on the idea therein described.

ARCHITECTS TAKING RETAINERS FROM THE CLERGY.

At the last sittings of the County Court of Durham, a case interesting to architects was tried. The plaintiff, Mr. J. C. Ebdy, is an architect, of Durham, and the defendant is the Rev. F. Thompson, vicar of the ancient church of St. Giles, of the same city.

The plaintiff gave the following particulars:—"1866, April 16th to May 9th. Making restoration survey of St. Giles's Church, and plans and specifications for restoring the same, at a cost of 1,200l., at 2½ per cent., 30l.; paid for excavating foundations, 6s. 6d.; total claim, 30l. 6s. 6d."

The plaintiff said that, in April, 1866, the defendant, with whom he had been long acquainted, called at his office and instructed him to make a report of the condition of St. Giles's Church, and also to show by plans how 1,200l. could be best spent in the work. He stated that the chancel of the church was not to be included in the work, as it belonged to Earl Vane. He gave a written retainer, and said he (the witness) was to look to him for payment. The first paragraph in the retainer was, "Proposed that a professional surveyor be employed to inspect the building and state its fitness for the purpose, and what should be done to make it a proper place of worship for the inhabitants of the parish, and also how 1,200l. can be best spent for the purpose." Signed by Mr. Thompson and Mr. Ebdy. He (the witness) remarked at the time that he did not consider it necessary for the vicar to sign the document, as he would take his word. Before he signed the document the defendant said he (plaintiff) should have to do the work of the rebuilding, and that he would have reduced to writing. A few days after the vicar showed witness a rough report of a survey he had made himself. The defendant did not give him any report of what he thought was requisite should be done. He merely made some suggestions about the church and the bells. He (witness) attended at the church three times, and was engaged altogether six hours and a half. Defendant was present, and witness's clerk was taking measurements of the church. He made the report and the plans, and gave them to defendant. The plans show the church as it now stands, and what it would be like when restored. One plan shows the different periods of architecture, another shows the building as it now stands, and what it would be like when restored. There are also alternative plans. The defendant made an objection to some of the details of the plans, and they were altered at his request. He said he had consulted some of his brother architects, and they would not allow a Norman window in the church to be interfered with. This rendered the alteration in the plans necessary. The plans were sufficient for all practical purposes. Altogether he was engaged thirteen and his clerk eleven days in the preparation of the plans and the report. Witness is a fellow of the Royal Institute of British Architects, and the medium charge for remuneration is 3 guineas a day, and the usual percentage when the work is finished. Some architects charge 5 guineas a day. The charge is modified if the work is not completed. If the work is tendered for by contractors, the charge is 3 per cent. If the work had been carried out he should have charged 5 per cent. Had not sued before for the bill in the expectation that the work would be carried out. Expects it will still be carried out.

By defendant's counsel (Mr. Skidmore).—Had been in practice twelve years. Is not aware whether the defendant has the reputation of knowing something about architecture except reading a paper before the Archaeological Society. The defendant said that as witness

was a young architect he would explain to me the beautiful proportions of the church; he did not point out to me the various styles of architecture displayed in the building. Would have taken it as an insult had he done so. Only went over the church with defendant out of courtesy. Defendant would never acknowledge the trustees to the church, and refused them admittance. Defendant said he must have been a fool to give witness the document before the Court. Never knew that the committee had refused to adopt the report. The report was addressed to the churchwardens as well as the incumbent, according to the usual custom, as they generally act together. Does not care to prepare plans for the chance of getting a job. It is quite common for these matters to be taken in hand by the clergyman. Professors to bind himself by the rules of the Royal Institute of British Architects, and by the rules of that body he is entitled to all claims in this demand. Would have been entitled to charge 5 per cent. for the job had he prepared the specifications. Would not have prepared plans like these for a builder, nor would have made the report. For a builder he would have prepared specifications and shown the elevations. Defendant did not say he had presented the report at the meeting of the trustees, and they almost threw them at his head. Witness did say he would abandon the present claim if he could get a guarantee he would be employed when the work was carried out.

Mr. Thomas Oliver, of Sunderland, said he was a Fellow of the Royal Institute of British Architects. He understood the nature of the plaintiff's claim. He should not have charged in the way Mr. Ebdy had done, but by time; and his bill, according to time scale, would have amounted to 40l. He did not consider Mr. Ebdy's work came fairly under the scale of 2½ per cent., as he had neither provided sections nor shown the elevations, but these could easily have been prepared from the plans.

By defendant's Counsel.—The value of a report depends upon its accuracy and its skill. Should have expected twenty guineas for such an elaborate report as Mr. Ebdy's. Probably, if Mr. Street had prepared a similar report he would have charged 200 guineas. The value of such documents altogether depended upon the skill and standing of the architect.

The rev. defendant, upon being called, gave a qualified denial as to retaining the plaintiff on his own responsibility. He told him that the nave and the tower were to be built by the trustees of the church property, and if he chose to make a report as to the state of that portion of the church which the trustees had to repair, it would give the plaintiff a little standing with the committee. He made the proposition as an act of kindness to a young man commencing business, but witness never agreed to pay for the report, merely offered his influence to get him the work. The document before the Court was merely a memorandum to submit to the trustees, and he was at a loss how Mr. Ebdy got it. At the meeting one of the trustees said he wondered how he, the vicar of the parish, had the impudence to produce any plans. Witness read a paper on his church, before the members of the Archaeological Society, but was certain he did not get any information for that paper from Mr. Ebdy's report. The report was perfectly worthless to witness, and he was prevented reading it or producing it before the committee.

Mr. Hodgson C. Fowler, of Durham, architect, said he put a very small value on the report and plans in question. There was nothing grand about them. No sections or elevations or description, showing what they were intended for, and nothing in the report but what could be gathered from any county history. It merely contained a few suggestions for a clergyman or churchwardens. The whole he should have charged for the work, and a man might charge more. The ground measurements for the plans could have been done in a morning, and all the other work in a couple of days. After a plan has been adopted, the architect makes out complete specifications, so that the different tradesmen can measure off their quantities; and he should say the specifications ought to be done in pencil by the architect, and the other work done by clerks. After the specification had been prepared, the architect would then be entitled to 20 per cent. Witness would have supplied a plan like these free of charge. He had a great deal to do with churches. Young architects often prepared plans on the chance of getting

work. He had often had letters from clergymen inviting him to make plans, on the terms mentioned by the defendant, and there was nothing unusual in what the defendant had done. He would have been rather glad, under the circumstances, of Mr. Thompson's offer, especially as the work was to be done in his own city.

Cross-examined by Mr. Grainger. Has frequently done work on the terms mentioned by the defendant. Heard Mr. Oliver give his evidence, and did not think his estimate of the value of the report and plans a monstrous exaggeration; but Mr. Oliver did not know the church, while witness did. The value of a report depended on the way a building was dealt with. The report was inaccurate and the plans were bad. Should not like to allow one of his clerks to do all the works in preparing sections and elevations. One of the plans could be used; but a larger plan would still be required, and if he had the restoration of the church to carry out, should start the whole thing afresh; in fact, he could have got more information in the course of a single walk round the church from Mr. Thompson himself.

Other evidence *pro* and *con*, but of no importance, was adduced, and defendant's counsel at great length urged that the resolution above referred to was but a private memorandum, and had not been given to the plaintiff as a guarantee for payment or employment. That there was no retainer in point of law, and it had been clearly proved that it was not an uncommon thing for architects to do work on the terms stated by the vicar of St. Giles.

The judge said there were many facts in favour of the plaintiff's demand. The production of the document purporting to be resolutions that a professional architect should be employed, and that such architect should be Mr. Ebdy, was in defendant's handwriting. There was also the performance of the work and the entries of it at the time in the plaintiff's books of account, which showed that the architect expected to be paid by some one for his services. If Mr. Ebdy had merely volunteered to make a report on speculation of getting the work, he thought the plaintiff would not have taken the trouble he did, but merely thrown out a few suggestions. He thought the natural course, if the defendant really wished to get the work for the plaintiff, would have been to have used his influence with the trustees, and if he had succeeded, then to have got full plans, and the strong censure shown by the trustees seemed to show that the incumbent had, without any authority from them, employed an architect to make a report on the church; for surely no one could be offended because a young architect had volunteered to give an opinion. The evidence of the defendant was not clear and decisive on the point urged on his side, or he should have been strongly inclined to have given him a verdict. As the plaintiff had proved many facts and circumstances in his favour, the balance of evidence was on his side. He thought, however, the charge was capable of modification, and he should find for the plaintiff for the sum of 12*l.* and full costs.

The court was crowded with architects and surveyors from all parts of the north.

TRAFFIC IN OXFORD-STREET.

Mr. GREENWELL, the vosty-clerk of St. Mary-above, in his evidence given to the Parliamentary Committee on Metropolitan Tramways now sitting, and who said he represented the owners of Oxford-street, occupying property assessed at 172,000*l.* per annum, who had upwards of six millions sterling invested in their businesses and premises, and who included many high-class tradespeople, who were almost unanimously opposed to the proposal to lay a tramway in that thoroughfare, stated that it had been ascertained that a street of less than 48 ft. wide between the curbs could not afford space for two lines of tramway, and allow carriages to pass or draw up on the sides of the street. There were parts of Oxford-street that were 31 ft. 4 in., 3 ft., and 42 ft. wide respectively. A double line of tramway in Oxford-street would prevent tradespeople from having carriages opposite their doors, which was a necessity of their business. The vehicular traffic of Oxford-street was of a peculiar character, both as regarded vehicles in motion and having occasion to main at rest for a time. All sorts of light and heavy carriages were combined in the traffic on a recent day, for instance, when the state of

the weather justified the belief that the traffic was considerably under the average, the following vehicles passed Regent-circus, between 9 a.m. and 6 p.m. :—

	Going West.	Going East.
Cabs	2,489	1,979
Carriages	707	731
Omnibuses	622	640
Carts	657	451
Vans	428	246
Waggon	114	251

Or 9,902 vehicles taking both directions. At other two points in Oxford-street the numbers were respectively 8,687 and 6,508. In some parts of the street it was not unusual for ten to twenty carriages to have occasion to stand on the sides of the street, at a short distance from each other. A double tramway was totally incompatible with such a traffic. We are of the same opinion.

SASH FASTENERS.

If a perfect sash-fastener he produced, it will not improve the thousands now in use. Here is a cheap and simple security for them:—Take a brass drop key-hole-escutcheon; lay it lengthways on the meeting rail of the bottom sash, so that the drop just touches the end of the lever when fastened; put in the two screws, and the thing is done. You just move the drop to let the lever pass, and push it back when re-fastened. One hand only is required. If the manufacturer would introduce a little enlarged catch-plate, with the movable stop on, it would be desirable; if with a spring, it would be self-acting.

H. F.

SEWAGE FARMS.

The statements made by Dr. Letheby, at the Slough Inquiry, in objection to sewage farms, are of such a damaging character, and so opposed to the particulars given by other competent witnesses, that the advocates of sewage irrigation should feel it to be their duty to inquire farther into them. If what Dr. Letheby said be true, much that has been said by others must be false, and *vice versa*.

THE SHRINE AT ST. ALBAN'S ABBEY.

The visitor to St. Alban's Abbey Church last year found on the centre of the floor of the Saint's Chapel, (the extension of the choir eastwards), behind the great altar-screen, a framing of Purbeck marble and an inscribed stone; marking, as he was told, the traditional site of the shrine of St. Alban, the proto-martyr of Britain;—the object erewhile of countless pilgrimages, and of world-wide reputation. The shrine itself had disappeared; but some carved Purbeck marble and some mouldings placed at the end of the chapel, were probably pointed out as fragments, supposed at one time to have been parts of it. In the course of the many, continued explorations undertaken by Dr. Nicholson, the then rector, with the scanty funds at his disposal, the filled-in arches at the east end of the Saint's Chapel seemed likely to repay his investigation. In 1848, the northern of the three arches opening into the eastern aisle or ambulatory (now a public passage-way) was opened out; but with no special results, beyond the discovery of part of a low altar-screen, a painted figure of an archbishop, and of some strongly-coloured surfaces, sprinkled with detached conventional flowers. A few years later the centre arch was cleared, and yielded nearly a score of pieces; and then a temporary halt was made, which came in time to be full fifteen years long. When Mr. G. G. Scott was called on to report (April 5, 1871) as to the works to be forthwith undertaken and desirable in the future, speaking of the arches at the end of the Saint's Chapel, and its aisles, his report stated that,—“These walled-up arches will probably be found to be perfect mines of antiquarian wealth. Some portions of them already partially cleared by Dr. Nicholson yielded a rich return of architectural detail, including a considerable part of the marble substructure of the shrine of St. Alban,—as charming fragments of ancient carving as can well be conceived; and we may hope that the mine is far from being exhausted.” The removal of the walling filled in to certain recesses in the south aisle, furnished the first additions to the store previously accumulated, (see page 122 ante). From this were obtained solid masses of dunch, cut into grained forms, and panels of the same;—in strictness bits of panels; for, in some, with their longest dimensions under 12 in., twelve pieces, may now be counted. But

the arch at the east end of the south aisle, one of those mentioned in the report quoted, proved, on investigation, by far the richest storehouse; hence came, among other things, the Purbeck marble, gabled panels of the sides and ends,—certainly, on art grounds, the richest find of all,—made in the last week in February. The south arch of the Saint's Chapel also contained a length of cornice, &c. To sort the larger of these resurrected pieces, and arrive at the design of each part,—of basement panels, of traceried arcades, of niche divisions: to use shellac dissolved in spirits of wine to fit together morsels almost comminuted; to trace from the form of those portions the obvious general form of the whole shrine; all these fall so well into the likeness of a natural process, in intelligent hands, that it would seem almost superfluous even to hint at them; and perhaps it is also a work of supererogation to add that, with backings of brickwork to give solidity, with roofing-slats cemented in Portland cement at the backs of broken slabs, with temporary wooden struts and other devices, the shrine is, as might have been expected, growing into shape; is partially grained over, and steadily gathering to itself the stray bits of stone and marble, that must have looked vastly like a rubbish-heap to the eye of the uninitiated.

The very general interest that has been felt and will be maintained with reference to this matter, will warrant some amount of what might otherwise appear rather trivial detail. “Of all the shrines which once adorned our island, there remain but the lower basement of the one at Westminster and a portion of that at Ely;” says Mr. W. Burges in his paper in the “Gleanings from Westminster Abbey,” (second edition, 1863, p. 128).

Two steps, each 4 in. high; a substructure, with its plinth 30 in.; open niches, 23 in. to springing of arches; arches, with crocketed gables over, 35 in.; a 7-inch cornice and 4½-inch slab on the top of all; give a total height of 9 ft. from the floor of the church to the top of the masonry of the shrine. Each of the longer sides is in four divisions (2 ft. 0½ in. centres); and the shorter sides (which we will call the ends) in one, subdivided by mullion and sub-arches (1 ft. 6 in. centres). These dimensions will show how the size of the substructure comes to be a parallelogram about 8 ft. 6 in. by 3 ft. 3 in., and how the projection beyond this of the plinth and steps equally on every side calls for an occupied floor space of 12 ft. by 6 ft. 9 in. The relative position of the parts has been determined by placing the tympanum containing the martyrdom at the west end. The Chronicle, speaking of an earlier shrine, states that the then abbot “set it up in a more exalted place, that is to say, above the high altar, in front of the celebrant, that as before his face, so also in his heart, whoever was celebrating mass at the same altar might have the memory of the martyr. And on that account, as an object of the sight of the celebrant, the martyrdom of the same, that is to say, the decollation, is figured.” This, whether the original position or not, now fixes those of the other panels, &c., at least of the superstructure, and it is therefore convenient to speak of them by the ordinary methods used as to orientated churches. The longer sides of course run east and west, as indicated by the old marks on the pavement.

The steps are of Purbeck marble; as, indeed, is all the rest of the structure, with the exception of the vaulting of the niches and their panelled divisions above the springing level. Though not all quite complete, there are some fair straight lengths,—in some of the bays with marks of usage; those fixed at the west end being rounded, and the lower step fixed on the north side worn into observable hollows, where the feet of those kneeling on the upper step would have to find their bearings. The substructure has quatrefoils in all divisions, flattened in those at the ends, each foil sub-trefoiled; a delicate moulded cornice, with carved enrichments at intervals, completes this portion; a slab jointed to the back of this cornice starting the superstructure fairly. The two central niches on each side are rectangles, those at the ends are triangles (12 in. deep), the four angle niches of the sides are trapezoids on plan (10 in. wide at back); the including rectangle is thus fully occupied with the ten niches. Cinquefoiled arches, each foil sub-foiled, hunches of foliage over the arches in the tympana of the gables, three sitting figures over the mullions, angels swinging censers at the corners, and the cor-

nice, are the details of the sides. The double arch, with sitting figure over the mullion, the sculptured tympanum over included in the gabled form, centring angles at the corners, and of course the cornice, are repeated at the ends. There are buttresses (fourteen in all) at each division, and double ones at the angles; all standing free but connected to the springings of the arches and to the cornice. The groining is hollowed, as well as the upper portions of the cross partitions of the niches, out of solid stones;—to all appearance in two heights in all cases, making ten stones for all. It is to be regretted that the varied surfaces of the groining interfered with the convenience of form of one of the stones, when wanted time ago for some rough building purpose; and consequently it was scabbled all round; so that, with the exception of just one or two clear enough indications, it is now forced to take its place without its expected form or decoration. The top of all was a single slab, $\frac{1}{2}$ in. thick, now cut down into several portions,—one end, 3 ft. 6 in. by 2 ft. 9 in. remaining, and parts of the ornamented sides in scantling. The old inscribed stone that bore the inscription, "S. Alhams, Verolamensis Anglorum, Proto-Martyr, 17 Junii, 297," and, after greatly exercising his mind, was ignominiously reversed by Dr. Nicholson, and was re-inscribed with "Britan: Protomart:." &c., now puts in very fairly a claim to be considered part of this coping stone.

Of the subjects of the carving it is unnecessary to speak in complete detail, and thus prolong a description necessarily tedious. The modelling of the foliage, the cornice is vigorous, and the execution full of spirit; the crockets of the eastern end, with their crumpled and twisted edges are very refined; the hunches in the tympana and the other crockets are of the best art, albeit some of them are a little less decisively handled. These crockets are more thoroughly conventional than the rest of this carving, which is marked by the characteristics of what has been aptly termed "the conventionalism of approach to nature." The figure sculpture, though not unpleasing, being thoroughly inoffensive and without distortion, is not of the best class, either in modelling or execution; it is, however, thoroughly subordinated to the general effect, and till something more is exacted, of each separate work, does its part very honestly.

The date of the design may, from its general character, and from the details, be placed with some certainty in the first years of the fourteenth century, when the details of the Geometrical style were in the process of undergoing changes that led to the style we call Decorated.* The eastern end of the church had for many a year been gradually assuming the form visible to the mind's eye in the mutilated, battered, desecrated condition of to-day. From the commencement about 1256 by John of Hertford (Abbot 1235-1260), of works upon the old choir, down to the completion of Lady-chapel at the extreme east in the rule of Hugh Everiden (1301-1326), a sort of regular course and progress seems to have been maintained,—albeit with some intervals of cessation. The erection of a suitable shrine was probably had in view from the very commencement of these works.

As to the method of destruction of the structure; Mr. Smith, the very intelligent mason whose hands have put together all the work as it may now be seen, has concluded from the forms of the fractures where cramps have been torn out;—that the whole was violently overturned by some battering force, and crashing down in a mass, the greater portion at least of the breakages were made at once; that it needed no iconoclastic fury to carry further the destruction that the weight of some of the stones and the form of others sufficiently account for. (For instance, the south side above the springing is almost wholly a single slab of Purbeck, about 8 ft. by 2 ft. 6 in., and only 2 in. thick in the portions between the gables; the north side is different, there being four pieces false jointed behind the figures and vertical mouldings.) No doubt the materials

nearest to hand were thrown almost at random into the walls, intended to block the various openings that then laid open what was to become the parish church; being probably carried at once to the builders from the heaps in which they had lain since the destruction. The difference of the light from that for which the shrine was designed may here be noticed; the gigantic altar-screen (erected about 1450), the blocking up of the eastern arches, the watching loft, and Duke Humphrey's monument, are all of much later date.

This discovery is likely, according to all precedent, to afford plentiful opportunity for ingenious speculation, and the amicable controversies of wit and knowledge. As a method of affording information with respect to some details not above mentioned, we subjoin a statement of a few of the points not yet cleared up. They all seemingly stand a better chance of elucidation from analogy or conjecture than from further actual discoveries. . . . As to the exact nature, form, material, &c., of the upper portion, for which the now-discovered pedestal was only the preparation;—probably, as usual, a metal or wooden structure covered with plates of gold or silver, enriched with jewels and enamels; doubtless torn to pieces and the most precious portions melted down or dispersed very shortly after the order for destruction had been given;—the knowledge is, for instance, at present very limited. The top slab previously described ($\frac{1}{2}$ in. thick) has a hole in each angle, and one in the centre of each side; all the six being $\frac{1}{2}$ in. diameter, and clean cut as for metal; not leaded or otherwise secured, but running well down into the stone. The weight of the roof, no doubt, supplied mooring enough in ordinary times, and these were also dowels to it. Between these larger holes are smaller ones ($\frac{1}{4}$ in., less deeply cut, but evidently at one time containing some infrangible standards. For,—(let us suppose on a violent overturning of the covering),—these metal standards seem to have broken their way out;—to have, in fact, extricated themselves by destroying the front walls of their prisons,—not, of course, to the profit of the delicately-carved hand encrusted along the edge of the surmounting slab. . . . The destined purpose of the ten niches so elaborately panelled and canopied has not yet been the subject even of very plausible conjecture. On the sides each is 23 in. wide by 18 in. clear depth, and about 3 ft. high. Statues or groups seem out of the question, as the scale of the sculpture is apparently finally given by the figures only about 14 in. high. Places in which the rich offerings of well-to-do pilgrims could be placed under their own eyes, or even by their own hands, have certainly been here provided in a way to gladden by anticipation the hearts of a community, not ungraciously disregardful of benefactions. Near upon 25 ft. superficial of table area bestowed even at intervals (of course) with proper objects, may have rendered precious in the delight of "well building," which mainly keeps green their memory to this day: while the results of their main labours and strivings have passed, unremembered and almost unwritten, into the everyday lives of their countrymen. How difficult at times was the task of meeting every claim, even with the apparently magnificent possessions of the Abbey, may appear from the words wrung in his last moments from John de Marinis (A.D. 1308):—

"Let not my successor fail to explain the heavy debts,—the very indigence,—of our house to our Lord the Pope —*pro cupiditate Curie Romane*" (Walsingham's "*gesta*," vol. ii., p. 108, where the very small balance of cash in hand is also carefully specified). The level of the niches and their shapes and sizes of course differ from those of the remaining substructure of the Confessor's shrine at Westminster; there, — "The lower parts of the north and south sides are pierced with three niches each. It was in these that sick people were frequently left during the night, in the hopes of a cure being effected by the intercession of the saint." Unfortunately the large slab that originally tied the whole structure together, and formed the floors of the niches, has not been discovered, another stone now supplying its place in the restoration; we are thus deprived of the information that might be afforded by a sight of the original surface. . . . The 7-in. squares placed with their diagonals on the axes, cut clearly through the Purbeck grounds of the two outer panels of each side of the substructure are also ornamental. Were they open or closed by metal work? Was it permitted to privileged visitors to touch

some objects within the structure with the fingertips of their outstretched hands?—on occasion to batho shattered or withered limbs in an atmosphere deemed of peculiar sanctity? "The infirm persons may be seen (in the illuminations) creeping through the holes in the tomb. The latter is by no means an uncommon practice, and in several parts of France tombs of this description still remain." ("Gleanings, Westminster," p. 136). But here we have 7 in. by 7 in. Can this at any time have been suitable for Englishmen, however reduced by sickness? . . . The tripartite sub-bases, by all reason may be supposed to belong to the trefoil-shaped (in section) 4-inches-across shafts of a slow twisted kind, of which numerous fragments have been found. These sub-bases cut into the lower most expanded stop,—the 12 ft. by 6 ft. 9 in. step mentioned above; one opposite the centre buttress, and one opposite each end buttress of each side of the shrine. Their complete form has not yet been ascertained. May the account given by Matthew Paris of certain fittings of Abbot Symon's (1168-1183) shrine be accepted as an indication of a possible use for these little twisted pillars in the one that eventually superseded it? "Abbot William (1214-1235) appointed that the six wax tapers should be lighted on those feasts which are celebrated in copes, and especially on the principal days; for the maintenance of which he assigned, with the consent of the convent, a mark to be received of the house at Bingham." (In Norfolk, a priory,—not always very willingly,—subject to this monastery), "instead of the pickle which we are accustomed to receive annually." . . . The four-lobed (quatrefoil on plan) shafts, in-dimension about equal to the three-lobed last mentioned, with appropriate nicely-moulded caps and bases, would seem to have been destined for some similar purpose, but their situation is indicated by no traces yet hit upon. Here the conclusion, come to under the guidance of an illuminated MS., that "two columns one at each end of the Westminister Shrine did not bear lamps, but figures (of St. John and the Confessor)" may occur to the memory of the reader.

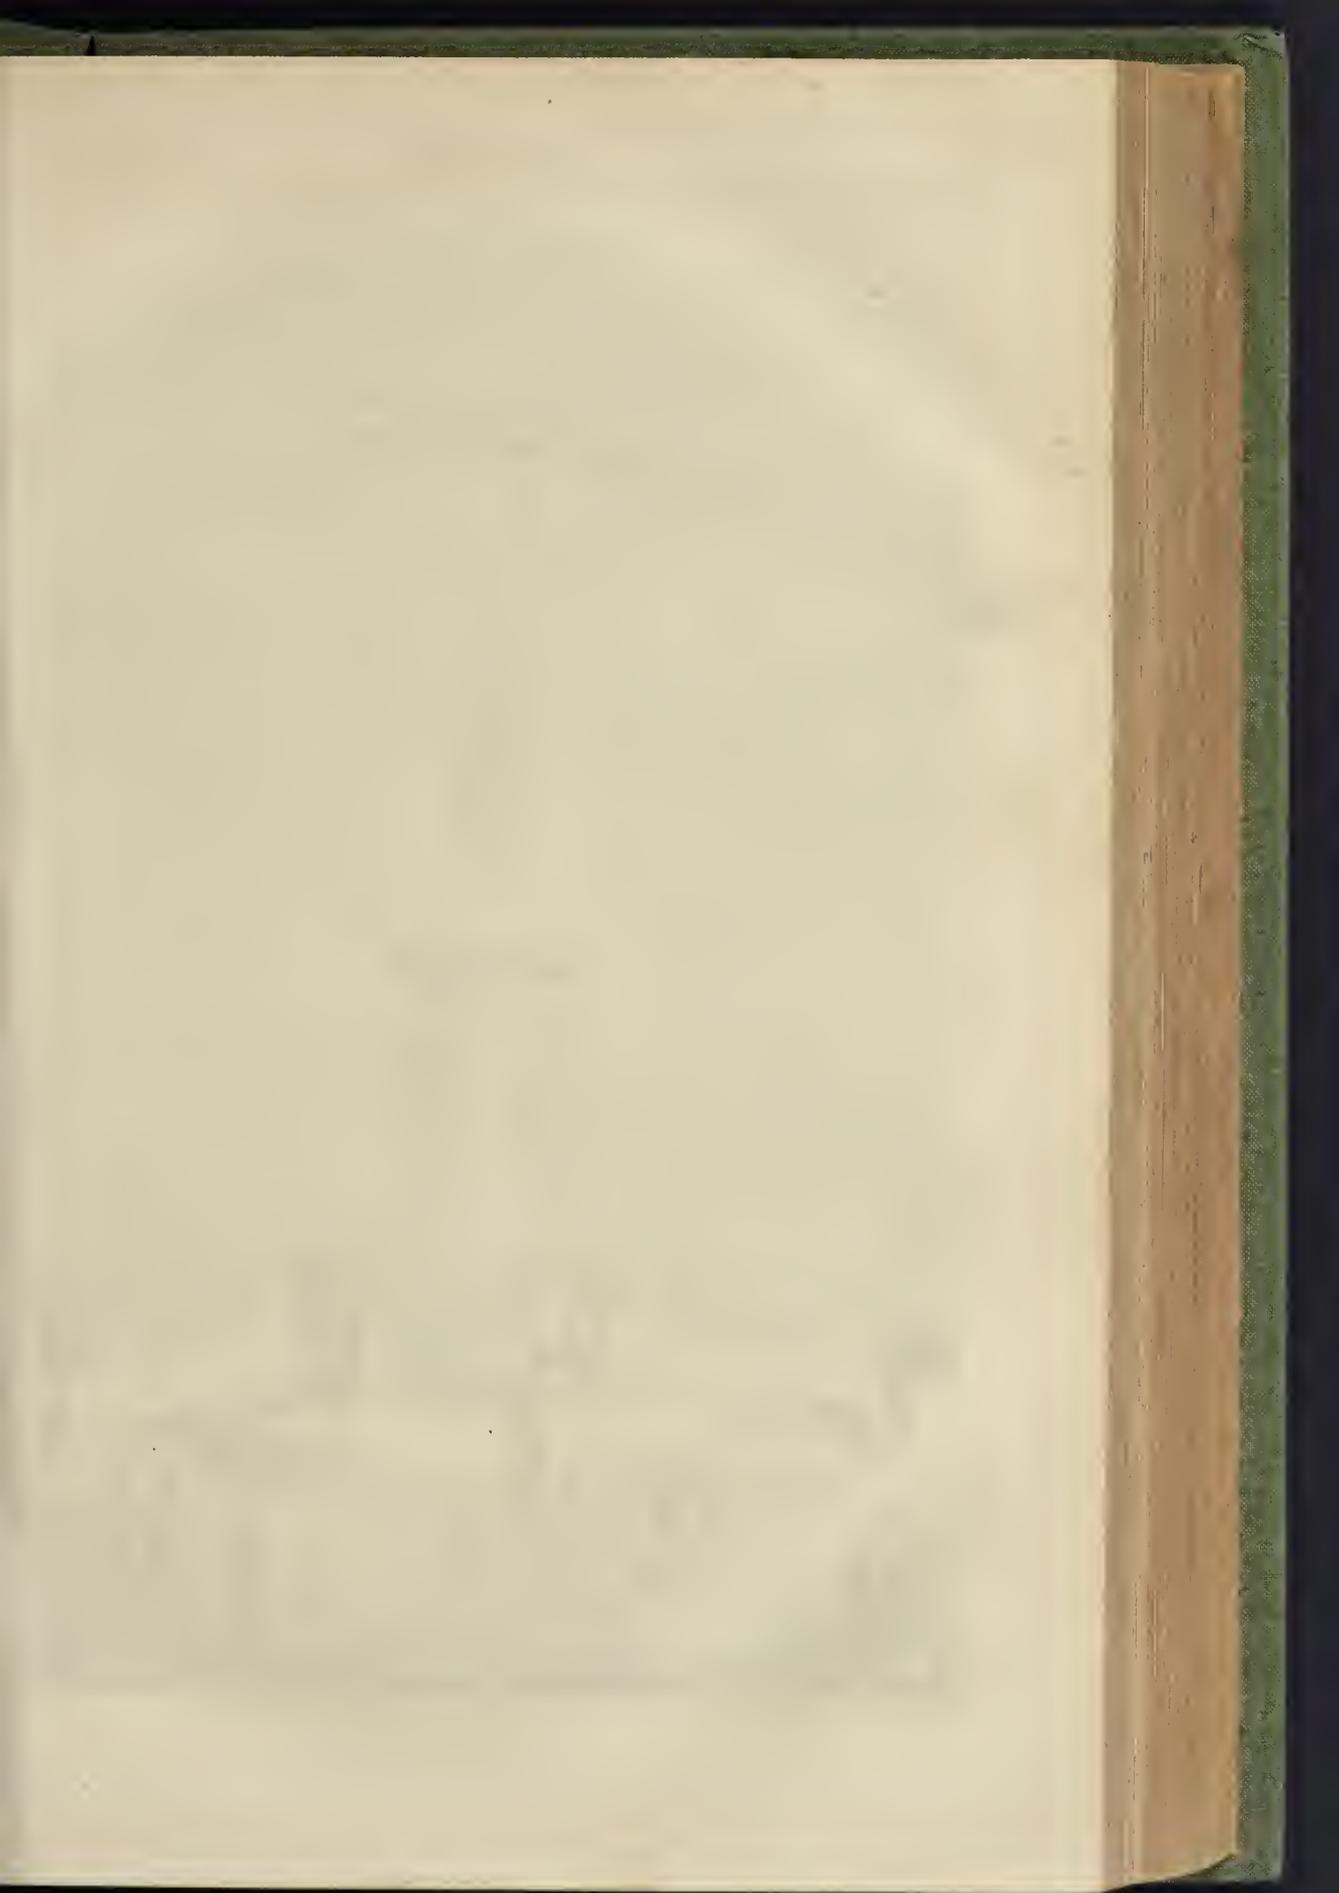

And,—so as not to extend indefinitely a sort of catalogue of bones of contention,—the colour applied to the visible surfaces of the clunch panelling and groining of the niches may be considered the last ground for controversy now to be pointed out. So liberal and so bold a use of vivid red, blue, and yellow, on skillfully-cut and admirably-designed ornamentation, should provoke from the advocates of unpainted stonework some protest against the bad taste of a later time, which disguised the pure forms of the work of an earlier age; and perhaps in return extract from others an expression of admiration for the variety and the harmony also, visible now at least when the hues are sobered by time and evil usage. The thin partitions between the niches are formed of Purbeck (14 in. thick from ground of panel to ground of panel up to the springings of the arches, finished similarly on both sides); but above of clunch (of only half the thickness wrought on one side only, as the joints of the groining centre with the supports); and the lower trefoils of the clunch tracery being on the same face with the Purbeck, are painted in its exact tone and semblance; perhaps hardly to be avoided if anything of this sort was to be done, but liable to be treated to some oblique regrets by true oligo-chromatians.

We may mention that in order to keep all changes in respect of the shrine apart from the Reparation Fund, so urgently required for the very extensive works of substantial restoration, Mr. G. G. Scott has from the first made himself personally responsible for the cost of the tentative putting together, and for the more laboured experiment now in progress (estimated roughly at 100l.); not, of course, refusing the proffered help of any taking a peculiar interest in the bringing again into complete form of one of the most admirable productions by most skilful hands, in what many are inclined to consider the period of the full perfection of Gothic architecture in England.

Looking at the arches now put up as the south side, the gable on the right hand side contains the Hawthorn in fruit; the next, Oak in fruit; the third, Bryony in fruit; and the gable on the left hand side, Maple in fruit. All the subjects being in fruit, it follows that if they were carved from nature, which seems probable, the work must have been done in September or October.

* The drawings we have engraved were made from photographs produced by Mr. Downer, of Wotford.

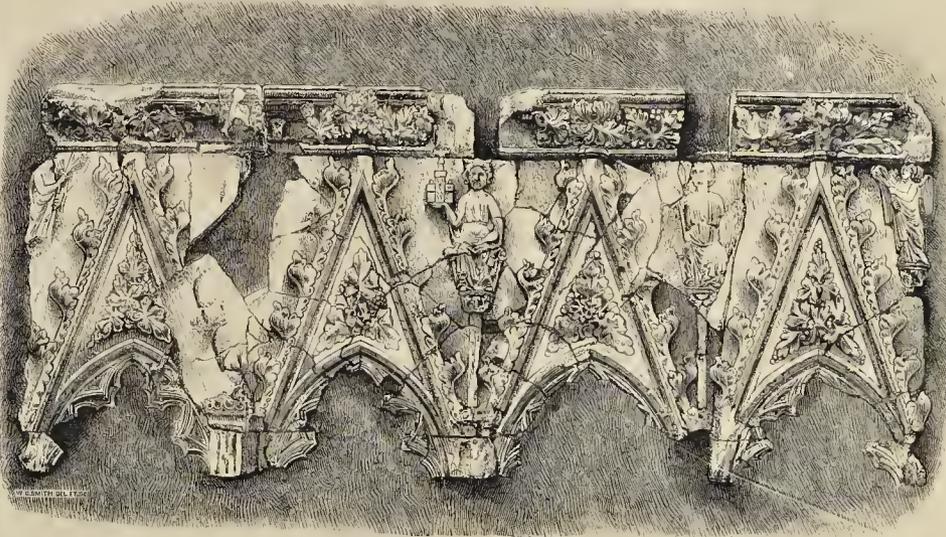

* Notice of works to the Shrine, in the time of John IV. (de Marinis or Marins), Abbot 1302-1308, may be found in the "*Gesta Albatun Monasterii Sancti Albani*," a Thoma Walsingham, regemate Ricardo Secundo, compilata." Edited by Mr. H. T. Riley. Longmans, 1867 (3 volumes). A compilation of the date of the last ten years of the fourteenth century—from 1308 by Walsingham himself, for some time manager of the copying-room of the Abbey immediately previous, from materials no longer in existence,—the date of the original redaction is therefore not known. Among the acts of Abbot John IV. — "Tumban autem Sancti Albani, ad ferendum, amover fecit, honorifice istud decorando, et expensas exposuit, sine multis curialitatibus, plus quam centum sexaginta marcas in pecunia numerata." Vol. ii, page 107.

spaces occupied by the benches is of wood blocks laid on concrete, which makes a dry and almost noiseless floor, while according with the tile paving of the aisles better than a common floor on joists, &c.

The warming of the church, which is understood to be satisfactory, has been carried out by Mr. Porritt, of Manchester. The general contractor was Mr. J. Grimes, of Colchester.

WHO SHOULD DECORATE ST. PAUL'S.

SIR,—It is not many years since that, at the instigation of the late Prince Consort, a Royal Commission was appointed for the purpose of obtaining all the practical experience available on the subject of mural decoration, and the mode of conducting works of this kind and on a large scale, to a successful termination. Sir Charles Eastlake, whose profound knowledge of the principles of art, scrupulous care, and learning admirably fitted him for the post, was unanimously elected secretary, and a body of information collected, methodised, and so lucidly expressed as to leave nothing to be desired. All this information was expressly gathered to help our inexperience in the conduct of great mural works, such as that proposed in the completion of St. Paul's. Yet, scarcely credible as it is, a committee, in seeming total ignorance of the existence of such a body of information for their guidance, at once proceed to act upon their own conceits. In the great art-epochs it was the artist who determined the decorations of an edifice, for it is only painters who are capable of executing monumental works that are fit to determine a scheme of decoration for such a building as St. Paul's. And in the appendix to the Report of the Royal Commissioners, we have the mode in which such works should be conducted thus enumerated:—

"On no point is Cornelius more decided than on the necessity of placing a given series of frescoes under the control of one directing artist. This appears to be quite compatible with the employment of many such directors, by subdividing the works; but he thinks it most desirable that in one complete series there should be a congruity of style and general execution. In Munich, where great execution has now been gained in these undertakings, several independent masters have formed scholars to work in their style, and these have been ultimately employed on original works."

I think the public have a right to call upon the Royal Academy and the press to interfere in this matter, and to see that those few painters who understand the subject of mural decoration have the direction of this national undertaking.

SCULPTOR.

THE SUBSIDENCE OF TURNMILL STREET.

On Friday last week, at the Westminster Palace Hotel, Mr. Clutton, the arbitrator appointed by the Board of Trade in the case of the Clerkenwell Vestry v. the Metropolitan Railway Company, resumed an issue and the causes which led to the subsidence of Turnmill-street, and the damaging of the sewer in that street to an extent that rendered its reconstruction necessary. The question in dispute is one between the Clerkenwell Vestry on the one hand, and the Metropolitan Railway Company on the other, as to whether the giving way of the sewer, and the injuries it sustained, was the result of the railway excavations, or any inherent defect in the sewer itself, or owing to its age. The amount claimed by the vestry is 1,700*l*.

Mr. Horace Lloyd, Q.C., appeared for the vestry, and Mr. Horatio Lloyd represented the railway company.

On the previous occasion when the arbitrator sat to receive evidence in the case, the witnesses examined were on the side of the vestry. Mr. Hayward, the engineer to the City, and Mr. Gregory, C.E., were among the witnesses then examined, and they ascribed the sinking of the roadway in Turnmill-street, and the cracking of the sewer, to the depth at which the railway excavations were carried. They regarded the damage done as a natural consequence of the railway works.

On the resumption of the case on Friday, rebutting testimony was adduced on the part of the railway company.

Mr. Wm. Morion, the first witness examined, said he was resident engineer to the railway company in 1862, when the excavations at the Farringdon-street station were made. He superintended the construction of the work. The bulging of the wall he ascribed to the lodging of water behind it. The wall was sufficiently strong to keep back the earth at the back, but it was not strong enough to resist as well the pressure of water which escaped from the sewer.

Mr. Fayer, the engineer to the Metropolitan Railway Company, said the cutting opposite Turnmill-street was made on a slope, and afterwards the retaining wall was built. It was a very solid, strong-vaunted wall. Witness could conceive no other plan which would lead him to the conclusion that the sinking of the sewer was the consequence of the railway excavations. The sewer was an old one, and, doubtless, built in a defective manner, as most old sewers were. In former times, there was a tendency on the part of builders to "scamp" the sewer work.

Corroborative evidence was given by Mr. Baker, designer in the engineering department of the Company.

Confirmatory testimony was also adduced by Mr. Brooks, the foreman of the plate-layers.

Mr. Horatio Lloyd submitted that it was not for him to prove that the damage was the result of the railway excavations, but that the burden of proof rested with the learned counsel on the other side to prove that such was the case. He contended that the circumstances connected with the giving way of the Fleet sewer and the cracking of the Turnmill-street sewer were quite different, and pointed out that each of the witnesses on the other side had a different theory to account for the damage done.

Mr. Horace Lloyd, in reply, laid stress upon the fact that Mr. Fowler had, in the case of the Fleet sewer, expressed similar views to those which he expressed on that occasion; but the arbitrator was satisfied with the evidence given by Mr. Hawkshaw, that the damage done to the sewer was the result of the railway works, and those alone. He (the learned counsel) maintained that the circumstances of the case were analogous. The railway company seemed to have a most convenient theory. If a sewer were new, they held that it was imperfectly constructed, or had not had time to consolidate and settle itself; and if it were old, they contended that it was badly constructed, and by reason of its age incapacitated from performing the work it was constructed to fulfil.

Mr. Morion asked the arbitrator when he would give his decision.

The arbitrator said the time allowed him by the Board of Trade for giving his award terminated on the 30th of April.

SALTING ON PARIAN.

REFERRING to a letter signed "J. S." in your pages under the above heading,—parian cement, manufactured according to the patent and properly manipulated by the plasterer, will not effloresce, having nothing whatever in its composition to cause it to do so.

In the case in point, the following questions should be answered before any blame can be laid on the cement, viz.:

Was the Portland backing allowed to get thoroughly dry before the finishing coat was put on? What thickness was the finishing coat? What proportions of sand to cement were used, and what proportion of water to cement?

Parian stuccoed on Portland after the letter has become "bone dried" will almost invariably make a good job, providing the parian is not overused with sand, and not painted on for at least twelve hours after using.

EXPERIENCE.

DISTRICT SURVEYORS' FEES.

At the Metropolitan Board of Works, on Friday in last week, the Building Act Committee presented a report on the question of what are to be considered separate tenements, for which an additional fee can be charged for surveying. It appeared that a house belonging to a Mr. Flight had to be surveyed under the Dangerous Structures Act, and the district surveyor charged one fee for the dwelling, and another for the privy building, which latter he deemed a separate tenement. Mr. Flight appealed against the double charge to the Metropolitan Board, and the question being submitted to their solicitor, the charge was declared by that gentleman illegal. The Board, however, referred the matter to the Building Act Committee, who recommended "That proceedings be taken by the solicitor against Mr. T. Flight, in order that the legal question might be raised." Another report was presented on a letter from the District Surveyors' Association, dated the 9th ult., suggesting that in any Bill for the amendment of the Building Act a provision should be inserted making the district surveyor's fees a charge upon the building, relieving them from the payment of costs in appeals to the superior courts in cases where the appeals are not made by them, and enabling them to state their cases before magistrates when proceedings are taken. The committee in this report recommended that the request of the Association be not acceded to. Both reports were adopted.

ACCIDENTS.

DURING a recent thunderstorm the lightning struck one of the pinnacles of the tower of St. George's Church, Kidderminster, and injured it so much that it will probably have to be taken down. The pinnacle was completely twisted round by the force of the electric current, and several pieces of stone were thrown a considerable distance right over the tower.—A stack of chimneys, at Nostal Priory, about five miles from Wakefield, has also been struck by lightning. The stack is built of extremely strong stone-work, the top of it being more than 50 ft. from the ground. The lightning seems to have entered two contiguous chimneys, divided by a thin partition. This thin partition was untouched, but the stonework of each chimney, nearly 1 ft. in thickness, was completely shattered and blown out, leaving a hole in each nearly big enough for a wheel-barrow to enter. Stones larger than a man's head were blown out horizontally, first, over 25 ft. of roof, and then over a flight of steps extending more than 20 ft.

from the wall of the house. Thus, they were thrown nearly 50 ft. from the chimney into the carriage-road below. A thunderclap was heard at the same moment, like the report of a cannon. The trace of the electric force can be observed lower down in the chimney than the fracture described.—The chimney of a house situated in Edmonds'-buildings, New-street, Worcester, has fallen upon, and passed completely through, the roof of the Swan-with-two-Necks, and that of the adjoining house. The property is in a dilapidated condition.

SCHOOL-BUILDING NEWS.

Tower-hill, London.—The new Roman Catholic Schools here have been formally opened, in the presence of a vast concourse of people. The district is one of the most densely populated in London, and is inhabited by very poor people. The foundation-stone was laid in June, 1870, by the Princess Marguerite of Orleans, who has always taken the deepest interest in the education of Roman Catholic children in the district. Prior to her leaving England, on the occasion of her marriage with Prince Czartoryski, the princess sent her crucifix as a present to the school children. The schools are large and commodious. The block is four stories high, and built of red brick, relieved with white and yellow archings and stone coigns and dressings. The lower floor is the infant school, which is fitted with galleries and all necessaries for teaching. Attached to this is a kitchen, where food is prepared for the children whose parents are of necessity away from home during the working hours of the day. The next floor is the girls' school, which has commodious classrooms. The second story is used as a school for the older girls, where they are taught to make shirts, dresses, &c. At certain hours they are taken to the kitchen and taught how to cook the children's dinners in order to fit them for discharging wifely duties later in life. Many ladies join in this good work. For the boys' school on the next floor, lay masters are provided, and the educational work—pure and simple—is under Government inspection. The clergy found the need of establishing something whereby a bold might be maintained on the elder girls who had left school. With this end in view, a "Protectory" was established, where they are taught various trades, and furnished with one substantial meal each day, receiving a small sum weekly in addition.

Litley, Bishop's Castle.—The foundation-stone of a new school has been laid at Litley, for the parish of More and part of Lydham. The new building will be completed as early as possible, by Messrs. Coles & Sayce, the builders employed upon Mr. More's estate.

Findon (Sussex).—The foundation-stone of the new national school has been laid here. The ex-President of the Board of Trade, the Right Hon. John Bright, M.P., was present, and while Miss Willett, who laid the stone, was performing her part of the ceremony, stood beside her, and intimated to her how she was to act. Several new coins, as usual, being placed in the hollow of the stone, the vicar, before the hollow was covered up, stepped up to Mr. Bright, and asked him if he would like to place a bean new sovereign with the other coins; to which the right hon. gentleman laughingly replied, "No, thank you, I would rather not lose it." The estimated cost of the building is about 1,000*l*.

Bradford.—Holy Trinity Church Schools, which have recently been erected in Mount-street, New Leeds, in connexion with Holy Trinity Church, have been opened. The schools now consist of a boys' school to accommodate 202; a girls' school to accommodate 193; and an infants' school to accommodate 193. The infants' school is an enlargement, but the other two rooms are entirely new. The infant school is 60 ft. by 21 ft. in extent, the girls' 60 ft. by 20 ft., and the boys' 71 ft. by 19 ft. Each room is provided with a classroom. The total cost has been 2,100*l*., and all the money has been obtained except about 250*l*.

Yarmouth.—The corner-stone of the new schools in connexion with the St. James's Mission has been laid. The building will consist of boys' school, 50 ft. by 20 ft.; girls' school, 48 ft. by 20 ft.; and infant school, 66 ft. by 20 ft., with the requisite class-rooms, lobbies, and offices. The style will be of plain Gothic character. The external walling material will be of red brick, with stone and brick dressings, faced internally with red bricks, and having

white brick bands at intervals. The roof will be open-timbered, stained and varnished, and will be of good height. The buildings will form three sides of a square, with an open arcade round the central portion. Accommodation will be provided for about 500 children, according to Government regulations; and the total cost of the buildings will be about 1,500l. Mr. J. T. Bettle of Yarmouth, is the architect; and the contractors are Messrs. J. Leggett & J. H. Want.

CHURCH-BUILDING NEWS.

Rushock.—The re-opening, after restoration, of Rnshock Church, has taken place. The sum of between 300l. and 400l. found necessary for the work, having been speedily raised, Mr. T. D. Baker, architect, Kilderminstor, prepared the plans and superintended the restoration gratuitously, and his instructions were carried out by Mr. Tolly, of Lady's Wood, builder. The old square seats have been removed and substituted by stalls, the ends and rails of which are of oak, and the backs and seats of stained deal; the west gallery has also been entirely re-seated, and a new paneled front, formed of the same material as the sittings in the body of the church, supplied. The reading-desk, pulpit, and lectern, are all of oak, and entirely new, and a new organ, by Cox & Spiers, of Banbury, placed in the north transept. This instrument is the gift of the Rev. Melville R. Moore. A stained east window has also been presented to the church by the Rev. J. Percy. The chancel-arch has been cut back, choir stalls placed just without the chancel, and the whole of the interior of the building has been coloured. The repairs to the exterior have been confined to the roof, which has been rendered impervious to the weather, and covered with Broseley tiles.

West Bridgford (near Nottingham).—The parish church of West Bridgford, an ancient and venerable structure, has been again thrown open for public devotion. The dilapidated state into which the edifice was rapidly falling, rendered a restoration necessary, and Messrs. Hine & Son, of Nottingham, were engaged to prepare the necessary plans. The builder, Mr. Young, of Lincoln, commenced operations six or seven months ago. The loft and pews were swept away, the plaster stripped off the walls, and the interior made to present a renovated appearance. A new roof has been erected at the eastern end, an organ-chamber has been provided, new windows put in, and in the place of the pews free and open sittings have been substituted, capable of accommodating about 180 people. Many of the interior fittings are new, and the entire alterations have, we understand, involved an expenditure of between 700l. and 800l.

Lincoln.—The church of St. Mary-le-Wigford has been re-opened, after restoration and enlargement. There are three east windows—two lancets and one vesica—painted by Messrs. Clayton & Bell, and the gift of Mr. H. K. Hebb, in memory of his father and mother. The restoration of the edifice has been carried out according to plans prepared by Mr. Clarke, of Nottingham, the contractor being Mr. Robert Young, of Lincoln.

Wokeley.—St. Matthew's Church, Wokeley, has been restored. It has been re-opened by the Bishop of Bath and Wells. Prior to 1871 the many inconveniences associated with the architecture and arrangements of a remote period had long been felt, and on the Rev. M. Drummond succeeding to the living, the exertions of the parishioners were renewed, and sufficient funds were soon forthcoming to warrant the promoters of the restoration scheme in commencing their work. The vicar has taken the responsible office of director of the works, unaided by any committee, but it is only fair to add that he has been ably supported, in a pecuniary point of view, by Messrs. Perkins, of Eastcott House, and the family of the late Rev. Burnett-Stuart. The restoration, which has been carried out by Mr. Andrew Knowles, of Wrington, builder, at a cost of nearly 1,700l., from designs prepared by Messrs. Giles & Gane, architects, London, includes new roofs of oak and pine, the re-seating of the entire building with stalls of oak with deal panelling, a new pulpit and lectern, reredos, and windows of stained glass. The reredos, which is composed of Bath stone, with alabaster panels, representing "The Passion," is the gift of Mrs. Perkins; and the east window is contributed by the Stuart family, in memory of the late vicar. The window in the north aisle, representing "The Annunciation," has been erected

at the expense of Mrs. Perkins, to the memory of her late husband.

Melsohy.—The church of St. James the Great, Melsohy, near Richmond, in Yorkshire, has been re-opened, after repairs and restoration. The flat roof with its heavy cross-beams has given way for a pitched roof, the old square barn-like windows have disappeared, and have been replaced by stained glass lancet-shaped windows, and the old-fashioned high, straight-backed pews, with doors, are superseded by convenient pews, with sloping backs and without doors. Several alterations have been made in the chancel. The vestry has been placed on the north instead of the south side, and has an entrance from without. The old pulpit has been substituted by a reading-desk and rostrum. A new organ has been obtained for the church, and stands near the chancel. An additional bell has been hung in the belfry, and a clock in the tower.

Dalworth (near Barnsley).—The large east window of St. John's Church has been filled in with stained glass, as a memorial of the late Thomas Taylor, and under it a reredos erected of the new painted tiles lately introduced by the artist. In the former, which is of two lights, size 12 ft. by 4 ft., with circular heads and tracery, are represented in panels the subjects of Christ and the woman of Samaria and Christ in the house of Mary and Martha, the background and border forming the remaining portion of the window being composed of coloured diaper and ornament of twelfth-century character. The reredos combines, it is said, in itself a system of painting which can be carried to the highest point of art, producing when completed an imperishable mural miniature. The design over the altar-table is arranged in three panels, the centre one containing the Agnus Dei, and the two side panels the texts, "I am the true vine," "Abide in me and I in you," interwoven with the vine, passion-flower, and corn. On either side of this central design are the Lord's Prayer, Creed, and Ten Commandments. The sides of the sanctuary as high as the reredos have been painted a dull green and diapered. New decorated iron standards and an oak rail have been erected across the sanctuary. The whole of the work has been executed by J. W. Knowles, glass stainer and mural decorator, York.

Bristol.—The restoration of Temple Church is about to be forthwith commenced, and tenders for the works (from plans supplied by Messrs. Ponton & Gough) are being obtained.

Austey.—The ancient parish church of Austey, Herts, has been re-opened, after a partial restoration. The old pews have been replaced by open seats of stained deal, copied in design from some of the original oak seats found in the church. The new sittings are provided with kneeling boards, and the flooring upon which they are fixed is of yellow deal, with oak borders, and is level with the tile pavement. The west gallery has been taken down, and the choir have now accommodation in the south transept. The *misereere* seats in the chancel have been repaired, cleaned from paint and colour, and refixed in their old position. The altar-rail, altar-table, lectern, and prayer-desk are new, and of wainscot oak and walnut, and the pulpit which is of similar materials, with open-tracery panels, fixed upon a Portland stone base, is the gift of Miss Sale, the rector's sister, in memory of her father. Red, black, and encaustic tiles mixed with some portions of Portland stone paving are used for the chancel floor, which is laid to a pattern designed by the architect. The other floors are laid with Peake's red and black Staffordshire quarries. The church is heated by a Porritt's stove, the flue from which is carried up the north-east buttress of the tower, in a new shaft of masonry. The north transept gable wall, which was in a very dilapidated condition, has been taken down and rebuilt; the old windows have been reset with new stone where they were found to require it; and the whole of the stonework of the columns and arches of the arcades, of the windows in the chancel, of the sedilia and piscina, and generally throughout the church, has been cleaned and restored. The bells in the tower (six in number) have been rebung, and they have been fitted by Mr. Hooper, of Woodbury, Devon, with the new chiming hammers, invented by the Rev. H. B. Ellacombe, rector of Clyst St. George, Cornwall, by means of which a whole peal of bells may be easily chimed by one person. The work of re-erection has been carried out (under the superintendence of Mr. Butterfield, the architect) by

Mr. Gibbons, of Buntingford, at a cost of upwards of 1,000l.

Bognor.—An influentially attended meeting has been held to consider the state of the parish church of South Bersted, of which parish the town of Bognor forms the most important part. The chair was taken by the Bishop of Chichester, and it was resolved that the parish church should be restored and enlarged, and a committee was appointed. The cost of the works has been estimated by Mr. Christian, the architect, at about 3,000l. It was at the same time strongly urged that church accommodation was greatly wanted in the town, the parish church being about a mile from Bognor.

Petersfield.—The committee entrusted with the carrying out of the restoration of the parish church have met to consider the report, and to inspect the plans, &c., prepared by the architect, Mr. A. W. Blomfield. The plans, except a few minor details, were approved. The cost is estimated at something over 6,000l., and a subscription list was opened, commencing with 1,000l. from Mr. W. Nicholson, of Basing Park, M.P., supplemented by other subscriptions raising the amount to 2,250l.

Radford.—The large and commodious new chancel which has been erected in connexion with Old Radford parish church has been consecrated by the Bishop Suffragan of Nottingham. The new chancel, organ-chamber, vestry, and half of the nave resented, have cost 1,250l. The designs were obtained from the architect, Mr. R. C. Sutton, of Bromley House; and the contractors were Messrs. Stevenson & Weston. One hundred and thirty-five additional sittings have been provided. The pews and the gallery at the west end have not been interfered with, but the seats are all free. The construction of the chancel corresponds with the other portion of the building. The stained-glass window at the eastern end has been erected by the tenantry of the late Mr. Sherwin Gregory to the memory of that gentleman. The subject is the Crucifixion. The makers are Messrs. Heaton, Butler, & Baines, and the cost is about 150l. The entire estimated cost of the present restoration and improvements is 1,310l.

Books Received.

Natural Philosophy for General Readers and Young Persons. Translated and edited from Gano's "Cours Élémentaire de Physique." By E. ATKINSON, Ph.D., F.C.S. London: Longmans, Green, & Co. 1872.

This well designed and illustrated popular treatise is not a translation of Gano's chief work, nor is it an abridgment of that work; but is translated and edited from another and minor work of Gano's, which has had an extensive circulation in France, and is more suitable to general readers and young persons. It is not a strict or mere translation even of that work, however, but has such additions and alterations as were thought fitted to render the book more useful to the classes for which it is especially designed, namely, as a text-book of physics for the middle and upper classes of boys' and girls' schools, and as a familiar account of physical phenomena and laws for the general reader. In range it is considered to represent the amount of knowledge required for the matriculation examination of the London University.

An Elementary Treatise on Curve Tracing. By PERCEVAL FLOST, M.A., Mathematical Lecturer of King's College. London: Macmillan & Co. 1872.

This is a preliminary treatise on the properties of curves. The author says he supposes himself to be instructing a student whose reading has been confined to very narrow limits. Regarded as a special preparation for a special subject, it may be considered useful in giving clear ideas when the student enters upon the systematic treatment of the properties of curves; especially since the classification of curves according to degrees, and the subdivision of curves of the same degree into species are now being taken in hand by some eminent mathematicians.

Pocket-Book of Mechanics and Engineering. By JOHN W. NYSTROM, C.E. Eleventh Edition, revised and enlarged. Philadelphia: J. B. Lippincott & Co. London: Trubner & Co. 1872. THERE is much valuable matter, both practical and theoretical, in this pocket-book, and hence

its numerous editions. Besides its memoranda, it contains numerous tables.

A Treatise on the Metallurgy of Iron. By H. BAUERMAN, F.G.S. Third Edition: Illustrated. London: Lockwood & Co. 1872.

MUCH information which practical workers of iron, students, and owners of iron mines require, is furnished in this volume in a condensed and portable form, although it is not intended to be classed with the large and expensive works on the metallurgy of iron already published. It contains outlines of the history of iron manufacture; methods of assay; analysis of iron ores; processes of manufacture of iron and steel, &c., and is illustrated by numerous wood engravings from drawings by J. B. Jordan. The author is an associate of the Royal School of Mines. This third edition brings up the work to recent improvements, among which are notices of the Siemens-Martin steel process, and the various plans proposed by Heaton, Ellershausen, and others. The second edition was issued in America.

Miscellaneous.

Public Baths and Washhouses, St. Pancras.—The report for last year of the Commissioners for this Institution has been presented to the Vestry and printed. The Commissioners draw attention to a great advance made during the last twelve months; the progress made during that period having been most satisfactory in every respect. The classification of the bathers or the year ending March, 1871, was—first-class, 23,147; second class, 100,069; and for the year ending March, 1872—first class, 58,054; second class, 107,284. The working expenses have this year been considerably reduced under several heads. In wages the saving is 34, 8s., and 1d.; fuel, 37l. 17s. The balance sheet shows that 032l. 2s. 9d. have been received, and 022l. 10s. 2d. expended in working expenses, including repairs and alterations, leaving a surplus profit of 1,009l. 12s. 7d.

Ship's Lines.—Messrs. Wigham Richardson & Co., of Newcastle-on-Tyne, are making a wide reputation by their care and skill in this respect. Last week the first steamer of a new line, connected by some leading coalowners for the Canada trade, was launched by that firm from their yard at Walker. A numerous company was present. The steamer was christened the *Vibilia* (the goddess of wanderers), by Miss Rogers, and after the launch she was towed up. Messrs. Hawthorn's shears, at St. Peter's, here her engines and boilers, constructed by that firm, will be put on board. The *Vibilia* has on built to carry 2,500 tons of cargo, her machinery is over 1,000 effective horse-power. The beauty of her lines was a theme of general admiration, and the firm of Messrs. Richardson is warmly complimented on all sides for the design.

Property in Dover.—Messrs. Terson & Son recently sold by auction a considerable amount of property at Dover, Hougham, and Ilkestone. We quote some of the prices realised:—Freehold farm buildings at Buckland, containing 2r. 11p., purchased by the present tenant for 300l.; two plots of freehold arable land, adjoining the last lot, 17a. 3r. 18p., 995l.; plots of freehold land and two cottages, joining the Union-road, Buckland, 34a. Or. 24p., 30l.; West Hougham Farm, 112a. 3r. 12p., in farm-house and buildings, 4,060l.; plot of meadow-land, 1a. 2r. 18p., adjoining the last lot, 4l.; meadow-land and garden, 2r. 20p., in Ivy Tree-lane, 135l.; 2a. 12p. of meadow, 1,455l.

Harbour Scheme for Calais.—Another new one for making Calais Harbour available for boats of 3,000 or 4,000 tons at all times of tide, has been brought before the authorities. The engineers are Messrs. Liddell & Richardson. Their proposition is to construct a landing and working pier about three-quarters of a mile from the water from Calais, and to connect this by a subway from the railway-station. By going so far out into the Channel they will avoid "dig up," and by making a basin for the ships at the extreme distance they will be able to land in shelter at any time of tide, wind, or weather. It is estimated that the cost will amount only to about 400,000l.

Lectures at the Crystal Palace.—A series of lectures, under the management of the Committee of the Crystal Palace Company's School of Art, Science, and Literature, have been in the course of delivery in the theatre near the transept of the Palace on Thursday evenings. The twelfth session has been concluded by a lecture from Dr. T. Spencer Cobbold, F.R.S., upon the "Antiquity of Man." He explained that our knowledge of the age of man upon this earth was derived from the evidences of his existence which were found in the drift, in caves, &c., and that astronomy had come to the assistance of the geologist in his endeavour to fix the distant date of the appearance of man upon earth. The post-pliocene geological period was divided into the post-glacial and the [glacial and?] pre-glacial periods, and certain geologists believed the first appearance of man on earth to have been post-glacial; whilst others, who were of the most advanced school, supposed that man had been in this world before the glacial period. There was a good deal to be said for each view of the question, but he thought the balance of the evidence was more in favour of the post-glacial than the pre-glacial view. The difference between the post-glacial and pre-glacial theories of the origin of man was between 50,000 and 500,000 years ago. There were some grounds for believing that man may have been living in the pre-glacial period, say about 600,000 years ago. There was, however, no doubt in the minds of sound geologists that the shortest period must be set down at 50,000 years. He had no desire to attack any religious views, but merely to expound grave scientific truth.

Public Buildings.—The vote proposed for the new Courts of Justice will comprise 4,000l. to complete the 954,000l. for purchase of the site, and a vote of a second sum of 30,000l. towards the 750,000l. for the erection of the building. There is to be a further vote of 100,000l. towards the estimate of 285,186l. for new offices in Downing-street for the Home and Colonial Departments, &c., on which above 100,000l. have been already expended. The vote for Burlington House is to be 47,000l., leaving less than 7,000l. to be hereafter voted to make up the estimated 178,000l. The vote proposed for the enlargement of the National Gallery is 50,000l., leaving only 33,000l. more to come, in order to make up the original estimate of 92,975l. The vote for new buildings at South Kensington is 29,674l., completing the 195,000l., the original estimate. A vote of 40,000l. will be proposed for the erection of a Natural History Museum; the estimate is 350,000l., and only about 6,000l. have yet been expended. The Post-office requires a vote of 119,700l. for new works and alterations, 59,500l. completing the estimated 150,000l. for the new offices in St. Martin's-le-Grand; 8,000l. for a tunnel between the old and the new offices; 29,000l. for the new post-office (and the site) at Birmingham; 10,000l. Newcastle-upon-Tyne; 6,000l. Aberdeen; 5,000l. Colchester; and smaller sums for other new post-offices, some serving also for the Inland Revenue Department.

Improved Cabs.—The Council of the Society of Arts have turned their attention to the defective construction of London cabs, and have offered a reward of 60l. for the best improved cab of any description; two prizes of 20l. each for the next two best; and two prizes of 10l. each for the next two best. The Council consider that the cabs now in use are defective in various particulars; but it is to be regretted that they make no allusion whatever to the most serious defect of all in the "rickety hansom" safety cab. Whenever the horse suddenly falls, both cabman and passenger are liable to be pitched out head foremost. The writer of this, though very seldom in the streets, has seen the cabman thrown upon the horse on two occasions, and once the passenger in a similar predicament. The two wheels act as a fulcrum, and the shafts and body of the rickety "safety" as a lever; and the sudden fall of the horse brings down the shafts with force, throws up the cab, and out its contents. Hansom cabs are thus especially dangerous as well as inconvenient, confined, yet draughty, and uncomfortable.

The Bridgwater School Board.—This board has appointed Mr. Hay, of Bath, the architect for the proposed schools in the eastern portion of the town, and has contracted for the purchase of a site adjoining Wellington-road, near the railway-station, for the sum of 400l. The execution of the work is undertaken by Messrs. Harvey & Son, of Torquay, whose tender amounted to 1,875l.

Fall of a Wall "founded on a Rock" and Loss of Life.—A melancholy accident has occurred at Pathhead, Kirkealdy, in connexion with the erection of a wall adjoining Messrs. Nairn's Floorcloth Works. The wall, which was founded on a rock about 20 ft. from the bottom of an excavation, had been built up about 20 ft. without giving the slightest indication of insecurity, the whole fabric slipped from its rock foundation, carrying with it a number of masons, and literally burying eight quarrymen who were engaged beneath. A large staff of men at once set about to remove the rubbish, and after some time a young man, a mason, was extricated alive, but died shortly afterwards. Three other men were taken out about the same time. One mason was found to have sustained severe spine injuries; and another to have suffered fracture of the collar-bone. The next discovered was a labourer, but he was fast sinking, and has since died. The bodies of another mason and two quarrymen were afterwards found. Two of the three injured are not expected to recover.

The London Institution.—The annual general meeting of this institution was held on Wednesday, the 24th ult., in the Theatre, Finsbury-circus; Sir William Tito in the chair. The secretary, Mr. Thomas Piper, read the annual report, which stated that the circulating library had been augmented by 255 volumes, besides 75 transferred from the general library. During the present season there had been a marked improvement in the attendance at the lectures. One evidence of increased public interest had been manifested in the demand for the shares of the institution. The income for the year amounted to 3,511l. 18s. 4d., and the expenditure to 3,039l. 9s. 3d., leaving a balance in hand of 472l. 9s. 1d.

Indian Civil Engineering College.—Some of our readers may thank us for repeating what has been said already in our advertising columns, that it has been determined by the Secretary of State for India in Council that, in the examination for admission into this College intended to be held in July, 1874, and in all future examinations, no candidate will be allowed to compete who shall, on the 1st of the month, have attained the age of twenty. For the examinations in 1872 and 1873, the maximum limit of age will remain, as at present, at twenty-one.

Value of City Property.—On Thursday, 25th April, the freehold of a small house in Finch-lane, Cornhill, known as the Cock and Woolpack Tavern, was sold by auction at Garraway's Coffee-house, Change-alley, together with the goodwill of the business, for the sum of 20,800l. It is situated on the eastern side of Finch-lane, which runs from Cornhill to Bread-needle-street, and the house has a frontage of 18 ft., with a depth of 55 ft. It also includes two arched cellars under Finch-lane, held on lease, 14 years of which are unexpired.

Strike in the Sheffield Building Trades.—The workmen employed in the Sheffield building trades have struck work. They ask for 50 hours per week all the year round in every branch, and that the carpenters' and joiners' wages shall be 73d. per hour throughout the year. The employers offer 53 hours and 71d., which the men will not accept, and have drawn off, with the exception of twelve shops, where the concession has been made. The carpenters and joiners of Rotherham have also struck work for a similar advance and shorter time.

The New Fortifications at Strasburg.—Strasburg, according to German journals, is to be surrounded by a girdle of eighteen forts, at an average distance of about one German mile from the *enceinte* of the town. Five of those forts to the north-west of the city will be first built. Their construction has been undertaken by various companies of contractors, and are to be completed by the 1st April, 1875.

Mr. Peck's Prizes.—The Council of the Institute of Architects have made two supplementary awards in the Peck Prizes Competition, viz., a medal of merit to Mr. Henry Avery, of York-buildings, Adolphus; and a medal of merit to Mr. Walter L. Spiers, of Bernard-street, Russell-square, for the skill displayed in their drawings of Eastbury Manor House.

Land in Surrey.—The Middlesex magistrates have agreed to purchase 100 acres of land at Banstead, Surrey, for the purpose of a site for building a third County Lunatic Asylum. The price to be paid is 10,000l. Banstead is sixteen miles from the metropolis.

Words! Words!—From penny-a-lining some literary men have reached halfpenny-a-wording. Mr. George A. Sala, according to the *Printers' Register*, made a curious contract for writing the "Thanksgiving Number" of the *Graphic*. He was to put together 37,000 words, and to be paid for his task at the rate of a halfpenny a word. It is asserted that upwards of a quarter of a million copies of it were printed. One halfpenny per word, however, was not such very great pay as may be supposed, more especially to a paper which has already yielded 100 per cent. on its capital. Mr. Sala had a heavy task to perform: he had something like a volume to write, in a great hurry, and he got less than 80. for it. A halfpenny a letter would have been good pay, but not by any means unprecedented.

London Slaughterhouses.—Dr. Brewer has laid before the House of Commons a Bill enacting that the slaughtering of cattle or sheep by a butcher in his private slaughterhouse, duly licensed, shall not be held to be the carrying on of an offensive or noxious business within the meaning of the Metropolis Buildings Act of 1844. That Act provides that after the expiration of thirty years from its passing it shall cease to be lawful to carry on such a business at a less distance than 40 ft. from a public way, or 50 ft. from buildings of the first or dwelling-house class, save as is provided in that Act.

Another Thames Embankment.—Mr. Bean, the surveyor to the Fulham Local Board, acting under the instructions of the board, has just prepared a plan for the embankment of the Thames at the Mall, Hammersmith. The proposal is that this embankment shall be carried out partly at the expense of the Fulham Board and partly by the Metropolitan Board of Works.

The "Quarterly" and Architecture.—As the article in the present *Quarterly* has proved very distasteful, and some public writers have misled their readers as to its authorship, it may be as well we should say, though it ought not to be necessary, that Mr. Ferguson had nothing whatever to do with it.

Employers' Responsibilities.—A paper will be read at a meeting of the Social Science Association, at their rooms in Adam-street, Adelphi, on Monday, the 6th instant, at 8 o'clock, by Mr. P. H. Holland, on "The Civil Responsibilities of Employers to those Injured in their Employ."

Hanging Paper.—Carbolic acid is recommended by the *Journal of Applied Chemistry* as an ingredient in the paste used, as it will prevent the annoyance of insects and the sour smells frequently experienced in rooms newly papered.

Chapter House, Westminster.—On Monday last, the newly-restored Chapter-house of Westminster Abbey was thrown open to the public, and was largely visited throughout the day.

Gas Lighting by Electricity.—In order to ensure as far as possible the safety of the gunpowder works at the Royal Arsenal, Woolwich, the gas-lumps are in future to be lighted by means of electricity.

The Staffordshire Brick and Tile Makers. The brick and tile makers of North Staffordshire employed by ten firms have got a substantial advance upon nearly all the articles they are employed in manufacturing.

Maryport Dock Extension.—The Maryport trustees are advertising for loans for the construction of a new dock and works at Maryport.

TENDERS

For villa residence, lodge, gardener's cottage, &c., Worcester Park, Surrey, for Worcester Park Building Company, Limited. Mr. John Giles, architect. Quantities by Mr. Gooke:—

Manley & Rogers.....	£4,526 0 0
Morter.....	4,515 0 0
Henshaw & Co.....	4,404 0 0
Thompson.....	3,990 0 0
Ladley, Brothers.....	3,950 0 0
Rankin.....	3,770 0 0
Adamson & Sons.....	3,730 0 0
Atvis & Co.....	3,624 0 0
Hibbins & Tresler.....	3,393 0 0

For new farmhouse and buildings, for Mr. T. W. Downes, at Letton, Herefordshire. Mr. W. Chick, architect:—

Welsh & Son.....	£4,665 0 0
Colman.....	4,634 10 0
Everall.....	1,972 0 0
Thompson.....	3,395 0 0
King & Godwin.....	4,380 0 0
Biggistone.....	4,361 0 0
J. & W. Bowers (accepted).....	4,200 0 0

For the front portion of new business premises, in the Market-place, Reading, for Messrs. Sutton & Sons, Messrs. W. & J. T. Brown, architects. Quantities supplied:—

Lovatt.....	£4,710 0 0
Higgs.....	4,590 0 0
Sheppard.....	4,219 0 0
Strong & Son.....	4,209 0 0
Mathews.....	3,893 0 0
Woodruffe.....	3,859 0 0
Barnicoat.....	3,639 0 0
Gibson, Brothers.....	3,487 0 0
Aitchison & Walker (accepted).....	3,555 0 0

For parsonage, adjacent to Holy Trinity Church, in the Barking-road. Mr. Henry Ongly, architect. Quantities supplied by Mr. A. L. Buzzard:—

Sheffield.....	£2,636 0 0
Mortar.....	2,323 0 0
Adanson & Sons.....	2,262 0 0
Ennor.....	2,279 0 0
Rivett.....	2,272 0 0
Shapley & Webster.....	2,268 0 0
Palmer (withdrawn).....	1,850 0 0

For the erection of No. 51, Bishopsgate-street Without. Messrs. John Young & Sons, architects:—

Ashby & Horner.....	£2,075 0 0
Renshaw & Co.....	2,012 0 0
Newman & Mann.....	1,956 0 0
Brass.....	1,897 0 0
Conder.....	1,875 0 0
King & Son.....	1,860 0 0
Fritchard.....	1,858 0 0
Merritt & Ashby.....	1,779 0 0

For stabling, at Howlede, near Taunton, for Mr. J. E. Anderson. Mr. J. Houghton Spencer, architect:—

Davis.....	£2,400 0 0
Pollard.....	1,730 0 0
Moss & Rendell.....	1,590 0 0
Shewbrooks (accepted).....	1,520 0 0

For school-house and teacher's residence, for the parish of Norton Fitzwarren, Somerset. Mr. J. Houghton Spencer, architect:—

Fox.....	£954 0 0
Shewbrooks.....	855 0 0
Moss & Rendell.....	749 0 0
Giles.....	694 0 0
Templeman.....	680 0 0
Manning.....	634 17 0
Macey & Yandell (accepted).....	635 0 0

For Mission Hall, at Kingsland. Mr. H. Shaw, architect. Quantities supplied by Messrs. Pimms & Bolton:—

Shurman.....	£589 0 0
Harper.....	547 0 0
Potter.....	530 0 0
Freddy & Son.....	530 0 0
Robbins & Co. (accepted).....	496 0 0

For re-seating, repairs, &c. of Angersleigh Church, Somerset:—

Shewbrooks.....	£217 0 0
Ruddell & Moss.....	196 0 0
Giles.....	181 0 0
Hartnell.....	167 12 0
Dinham.....	160 0 0
Hartnell.....	160 0 0
Fox.....	160 0 0
Yandell.....	157 10 0
Templeman (accepted).....	155 0 0

For new business premises, in Broad-street, Reading, for Mr. C. E. Wilson. Messrs. W. & J. T. Brown, architects. Quantities supplied:—

Barnicoat.....	£1,800 0 0
Mathews.....	1,790 0 0
Seadle.....	1,650 0 0
East.....	1,650 0 0
Sheppard.....	1,640 19 6

For new business premises, in the King's-road, Reading, for Mr. A. Allen. Messrs. W. & J. T. Brown, architects. Quantities supplied:—

Sheppard.....	£1,333 0 0
Woodruffe.....	1,202 0 0
Mathews.....	1,197 0 0
East.....	1,175 0 0
Barnicoat.....	1,160 0 0
Goswell.....	1,097 0 0

For new north aisle and chancel roof to Willesden parish church. Mr. E. J. Tarver, architect. Quantities by Mr. L. E. Riddett:—

Jackson & Shaw.....	£2,698 0 0
Macey.....	2,555 0 0

Dove, Brothers.....	2,795 0 0
Adamson & Sons.....	2,753 0 0
Shearburn.....	2,694 0 0

For making roads and drains on the Eversfield Estate, St. Leonard's-on-Sea. Messrs. Fowler & Hill, architects:—

Kenwood.....	£3,470 0 0
King.....	2,300 0 0
Bridgeland.....	1,830 0 0
Hughes (accepted).....	1,853 10 0

For alterations and additions to 171, Marylebone-road, and in erecting warehouse buildings at side of ditto, for Mr. Mills. Mr. Alfred Wright, architect. Quantities supplied:—

Mitchell.....	£1,550 0 0
Watson, Brothers.....	1,488 0 0
Simpson & Son.....	1,465 0 0
Logginer & Burge.....	1,449 0 0
Marsland & Son.....	1,337 0 0
Harris & Sons.....	1,303 0 0
Sharpping & Cole.....	1,363 0 0

For villa residence at Chislehurst, for the Rev. D. Macduff. Mr. John Norton, architect:—

Waters.....	£4,550 0 0
Taylor & Sons.....	4,031 0 0
Nisbett & Son.....	3,311 0 0
Reynolds.....	3,261 0 0
Carey & Co.....	3,020 0 0
Adcock & Rees.....	3,091 0 0
Stephenson.....	3,083 0 0
Farrant.....	3,023 0 0
Gooding.....	3,000 0 0
Howard.....	2,970 0 0
Jarret.....	2,968 0 0
Grover.....	2,885 0 0
Moore & Grainger.....	2,857 0 0
Waterson & Co.....	2,845 0 0
Aitchison & Walker.....	2,845 0 0
Wright, Brothers, & Goodchild.....	2,395 0 0
Cook & Co.....	2,562 0 0

* Accepted.

For painting, decorating, &c. at Loxford House. Mr. R. Martin, architect. Quantities not supplied:—

Warne.....	£165 0 0
Bridgman, Nuttall, & West (accepted).....	163 0 0

For alterations of three houses in Charterhouse-square. Messrs. Tress & Innes, architects:—

Hawley & Son.....	£5,123 0 0
Conder.....	4,559 0 0
Sewell & Son.....	4,556 0 0
Hill & Son (accepted).....	4,264 0 0

For new schools, and schoolmaster's and school-treasurer's residences, at Glemsford, Suffolk. Messrs. Salt & Firmin, architects:—

Pearson.....	£3,614 0 0
Tooley.....	3,400 0 0
Gibbons.....	3,245 0 0
Greenwood.....	3,157 0 0
Brown.....	2,934 0 0
Scott & Twinn.....	2,878 7 6
Theobald.....	2,830 0 0

For rebuilding house, 14, Blenheim-street, Oxford-street, for Mr. Camp. Mr. W. G. Bartlett, architect:—

Conder.....	£320 0 0
Watson, Brothers.....	797 0 0
Collis & Son.....	777 0 0
Wood.....	711 0 0
Pritchard.....	683 0 0

For alterations and repairs at 13, Quebec-street, Mr. Jones. Messrs. Finch, Hill, & Farnley, architects:—

Watson, Brothers.....	£328 0 0
Watson, Brothers.....	275 0 0
Eaton & Chapman.....	250 0 0

For schools, at Melyn, near Neath, for Messrs. Le Flower & Co. Mr. John Norton, architect:—

Diment.....	£3,355 0 0
Ward.....	3,343 3 5
Pearse & Langdon.....	3,190 0 0
Moreland.....	2,849 0 0
Roderick (accepted).....	2,172 4 0

For house for Mr. J. T. Davis, at Bromley, Kent. Quantities by Mr. J. Scott. Mr. T. C. Sorby, architect:—

Sharman.....	£1,414 0 0
Pimms & Collingham.....	1,425 0 0
Ames.....	1,314 0 0
Pearce.....	1,215 0 0

For alterations and additions to 12, John-street, Chelsea-square, for Capt. P. H. Custance. Mr. John Norton, architect:—

Holland & Hanneu.....	£307 0 0
Smith & Co.....	938 0 0
Myers & Sons (accepted).....	938 0 0

For repairs, painting, &c. at Westminster-cham for the Mutual Tontine Association. Mr. George architect. Quantities supplied:—

Lucas, Brothers.....	£695 0 0
Wagner.....	808 0 0
Pemberton.....	849 0 0
Fish.....	835 0 0
Foster (accepted).....	787 0 0

For additions to business premises, Milk-street, City side. Messrs. R. Tress & Innes, and Mr. H. A. architects. Ashby & Son (by schedule of prices) £10,314

Camberwell Vestry Hall.—Messrs. David King & Taylor, of 4, 435, together with two alternative estimates respectively 1664. 13s. and 3694. 2s., making a total of 7,413. 15s., was held accepted by the Board of Guardians of the new Vestry Hall for the Parish of St. Camberwell.

The Builder.

VOL. XXX.—No. 1527.

Notes at the International Exhibition.

THE arts accessory to architecture are, as we have already noted in the case of stained glass,* but very meagrely represented in the Exhibition, as to quantity at all events. The two life-size mosaic figures exhibited by Minton, Hollins, & Co. (1,070-1), from the designs of Messrs. Hart & Bowler respectively, and worked by female students at South Kensington, are very satisfactory specimens of the art; and the latter of the two is a fine

and impressive figure. The former is marred by an indefinable weakness of pose and character. The head of Daniel, from the design of Mr. Stevens, intended for St. Paul's Cathedral, is a very noble one; and the broadly-massed treatment of the lights and shadows is highly-characteristic of and suitable to the material employed. Is the title correct in the catalogue? The head suggests rather David than Daniel. A mosaic portrait of the late Prince Consort, after Winterhalter, executed by Salviati & Co. (1,078), is a capital specimen of what may be done in mosaic in the way of gradations of tone, by the use of small cubes, and negatives the opinion which has been expressed by some critics that mosaic cannot be effective at less than 50 ft. from the eye; though, of course, the employment of this fine mosaic would involve a proportionate expense. A head of Christ, after Taddei, by the same firm (1,074), shows even closer approximation to the effect of painting; but here the real characteristic beauties of the material are, to a certain extent, sacrificed. The attempt to imitate the freedom of painting is as great a technical mistake in mosaic as the imitation of the stiff archaism of the early mosaics, urged by some, would be an æsthetic mistake.

Of painted tile-work and porcelain there are various specimens, some of the best of which are from the designs of Mr. W. S. Coleman. The two painted plaques (1,054), representing nude figures, flatly treated, with conventional accessories and backgrounds, are very pleasing, and show knowledge of the figure. What is the use of the same designer's "painted tile-panels on red ground" (1,001: exhibited by Minton & Co.'s art studio) we fail to see: flowers and birds straggling heterogeneously over a red surface (*à la* Japanese art) are not very available as ornamental accessories, nor good for much in themselves. Two vases from Minton's art studio (1,034) are worth mention as pleasing in colour and form; the classical figure subjects, nearly white on a green ground, are designed with grace and freedom. The *terracos* exhibited by Messrs. Cox & Sons, a poor piece of commonplace modern Gothic with all the regulation details that we are getting wearied of, is embellished, however, by a painted tile design by Mr. Talbert (1,053) of the Last Supper, which is a very good specimen of the

correct way of treating this kind of work, the drapery being drawn in straight precise lines, with no attempt at texture or relief effect, yet not without a certain agreeable sway and balance of line; unfortunately, the faces are far less successful than the general composition, partly we fear from a concession to the foolish ideas prevalent about the treatment of the figure in what is termed "ecclesiastical" art. Adjoining this latter are two very good specimens of metal design by the same artist, in the shape of two elaborate brass lamp standards; a brass font-cover also (upon a poorly-designed font) deserves mention. These are all exhibited by Messrs. Cox & Sons, who also show a specimen of the brass standards with iron base supplied for lighting Luxembourg Cathedral. A case of church tapestry, plate, &c., by the same firm, exhibits the usual things in the usual style; one of the gold vessels is a very elegant specimen of this class of work. Among the metal work, into which we have now dropped, a small silver dessert-stand (2,701) is pretty sure to be looked at, as being the design of Sir Noel Paton, and is a very fine specimen of design and execution in silver, as far as the treatment of the material is concerned; the design is curiously *bizarre* for modern work, a satyr-like figure, with a bird's head, supporting the bowl, while the pedestal on which he stands, and on which a lizard crawls, is in turn supported by three frogs, which look grotesquely out from under it and form the feet. Perhaps it is supposed to be the grotesque character which gives the article its value; we should doubt many persons being willing to give the 200 guineas asked for it. Some of the finest bits of metal work are the damascened articles, tazzas, and vases, by Zuloaga (Spain: 2,714-15). These are exquisitely finished things, in a style of ornament combining something of Moorish richness with classic elegance of detail, and surely in no qualities that should belong to ornamental art are these inferior to the Japanese ornament just now held up to us as the only work in the world worth mentioning. Some specimens of ornamental glass design (claret jugs and glasses, decanters, &c.) on a stand in Room VII. include some very elegant and beautiful work, especially those by Messrs. Hanser & Palme: the Venetian goblet, by Salviati, which surmounts the collection, is one of those things which would be very valuable if it were old, as a specimen of a certain type of work; but we scarcely think its artistic value as a modern production very high: the funny little twists of coloured glass which give the character to it are really curious rather than beautiful. We omitted to mention, in reviewing, in our last number, the work in these galleries on the west side, one of the best specimens of wood-carving there, a sideboard, by R. Jefferson, exhibited by Gillow & Co. (2,762); but, unfortunately, in that French "scroll and Cupid" style, which is really not worth throwing away good workmanship or good money upon, the sight of which, too, in contrast with other articles (already mentioned) with the name of the said firm attached to them, suggests again the reflection we made last year as to the bad effect on ornamental art of using all styles indiscriminately, the same firm turning out anything and everything, from Louis Quatorze to the barest and squarest Medievalism, without regard to principle or taste of any kind. Why cannot some of our rich and prosperous furniture-making firms collect around them a school of artists of one mind in art, and work out a school of design of their own on definite principles? There would be some chance then of their really benefiting and improving ornamental art and public taste, instead of benefiting, as is too often the case now, nothing but their own pockets and those of their employes.

Among the east galleries are scattered some objects of ornamental art of more or less

interest. Of these, we are inclined, however profane it seems, to rank the numerous productions of the Sèvres porcelain manufactories, in the French gallery, as among those of "less" interest. That the French artists in this work do all that they aim at, and do it well, can scarcely be questioned; and the great size and perfect make of some of the larger specimens form a triumph of technical skill also. But the feeling for colour betrayed in these specimens of ware is anything but satisfactory; nor were we able to find more than one or two pairs of vases, and those among the smaller ones, which showed any richness or attractiveness in colour. Mostly the tints affected are lively pinks and reds and buffs; in short, the regulation Renaissance scale of colour, against which we have before protested in reference to stained glass. In a great many of the larger vases the artistic design consists mainly of figures, of a "Classical" nature, all of which are respectably delineated, and have a certain sensuous grace and elegance. Why is it, then, that this sort of decoration repels us, deadens our admiration, more than most others? Because, in the first place, these nymphs and Bacchuses are like old "properties" used up long ago; and because also the judgment is not satisfied at seeing figures used merely as elegant objects, adjuncts to a design, without any definite meaning or sentiment attached to them. The human figure, as the highest medium of expression in art, should not be thrown away in this way; carelessly applied as merely so much of a designer's stock-in-trade. Our own decorative artists are arriving at a perception of this, and are either studying the figure better themselves, or getting into the habit of calling in the aid of artists who can treat it worthily. At one end of the French gallery is to be found a casket worth looking at as a piece of delicate and highly-finished work. The decorative portion of this consists in panels of light wood carved in bas-relief, with classical subjects, with many figures and much detail; the figures are only 2 in. or 3 in. high, but the whole is executed with a delicacy, precision, and minuteness of finish very remarkable, and shows also a great deal of freedom of composition and pose in the little figures. The artists are Messrs. Allard & Chopin. In one of the French galleries has been placed a grand piano, from the manufactory of Erard, painted all over top and sides with forest scenery, in monochrome, in some villainous dark red compound. Anything more disagreeable in colour, and more out of place as ornament, could scarcely be imagined; yet the manufacturers evidently think great things of it, and have set a special custodian to take care of it. The mischief was done in Paris, we believe; indeed, the names of the offenders are affixed, but we forbear to give them. What is to be said or done to this kind of work?

In the gallery devoted to Belgium and Russia (the opposite end of the east galleries) are some exceedingly well-executed silver bas-reliefs from the latter country; one in particular of a female figure floating in the air, with flying draperies, which is very charming both in conception and execution: the artist's name has escaped us, and we cannot find it in the catalogue, where (as last year) it is sometimes difficult to find what is wanted. Some gold work from Brussels, in a case not far from the last-named objects, is an unpleasant contrast to the Russian work, and is, in fact, that kind of ornamental work which is almost entirely worthless as art, and which nobody would give anything for were it not executed in gold. Virgil must certainly have been thinking of art as well as of morals when he uttered his celebrated declamation against the "*auri sacra fames*."

In the ground-floor room, reached through the east quadrant, is a considerable though very heterogeneous collection of works from Japan,

* See p. 338, ante.

China, and elsewhere. Some specimens of the Japanese *cloisonné* enamel are to be found, also a good deal of gold and lacquered work, some of the most beautiful description; one gold or gilt casket, with a diaper of very flat foliage over it, is exquisite; and what a contrast to the vulgar gold work from Brussels, just mentioned, or the specimens of English work of the last century exhibited among the "reproductions" in the east gallery! The Japanese tapestries show, too, specimens of their admirable way of representing birds, and equally of their total and absurd failures in the human figure; the attempts at representing the latter appearing like the figures of a nightmare. The Chinese vases to be seen here show (as usual) very fine execution and elaborate ornament, with far less feeling for colour than in the Japanese work; on the other hand, in ornamental tapestry designs (without figures) the Chinese, as far as one can judge by the comparatively few specimens here, have the best of it, both in colour and design, the patterns being chiefly geometrical, but with sufficient variety of colour to avoid monotony. Some of these are well worth attention as suggestions for wall-paper or wall diaper design. In this room is also hidden away one of the best specimens of furniture design in the Exhibition, a buffet, by Vanderschueren (who dates from England), ebonised and with ivory inlays, the lower panels filled with groups of flowers in slight relief, in coloured stones, so as to produce a naturalistic effect not quite in keeping with the rest. An inlaid figure would have been preferable; but this is a very good piece of work, especially pleasing in general design and detail. Adjoining these are two articles, a buffet and *dagère*, both by Ricci (Venice), in very meretricious style, but admirably executed, the latter, with its boldly undercut scrolls turning from stage to stage, is as fine a piece of wood-carving as we have seen for a long time.

We have thus endeavoured roughly to indicate what there is of ornamental art worthy of notice in this year's Exhibition, so far, exclusive of the jewelry, which may be taken as a separate branch. With this exception, we believe we have alluded to most of the work that is of much consequence, so far as the Exhibition is at present arranged. The Indian Court of last year is as yet closed,—whether it is to be filled we know not; and the French annex is in a state of chaos—a jumble of boxes and cases. If these two rooms are eventually arranged, there will be further opportunity of instituting comparisons between some of the best ornamental schools of the East and the West respectively.

ARCHITECTURE IN THE ROYAL ACADEMY.

The architectural drawings, which are this year to be found in their old situation in the "Lecture Room," are in the main a very good collection, the best in average merit, we think, since the Academy went into its present quarters. Domestic architecture is the most largely represented, and there is a fair collection of civil and ecclesiastical designs, some of them of exceptional interest. To mention first the great building of the day, we may allude to the very large and finely executed bird's-eye view of Mr. Street's Law Courts design, prepared by Mr. Brewer (1,190), and which shows what the architect's own fine ink drawings could not show, the colour design, if we can so describe the use of a light and a dark tinted stone, in the usual arrangement of quoins and bands. The drawing, however, does not suggest any fresh commentary on the design; nor will the exhibition of Mr. Street's own sketch of the centre portion of the Strand front (1,163), at all avail, we fear, to change the opinion of the majority, who are so sadly disappointed with the design, however they may admire the freedom and effective touch of the drawing, which, nevertheless, is certainly out of perspective in some of the details, arches, &c. Among other "civil" buildings is the competition design of Mr. E. W. Godwin, for the Leicester Townhall, exterior front and interior of Council Chamber (1,162 and 1,188); the exterior in the architect's usual style of very solid and massively treated Early Gothic, a good deal like some other designs by the same hand, but with the improvement in this case of carrying the tower wall in an unbroken plane into the masonry below, instead of cutting it off by a cornice run right through, a defect which, in some previous designs, conveyed the impression that the tower

was utterly unconnected with the substructural design, and might have been slid backward or forward at pleasure along the whole front. The Council Chamber is an agreeable-looking interior, treated with wall tiling and profuse gilding and colour on the wooden ceiling, which takes the shape of a pointed arch wagon-vault; not a very happy form for wooden construction. Mr. Emerson exhibits (1,177), "A View of a new Mahomedan University at Allahabad," near which is a drawing of the "Rajaram High School," described as in the "Hindoo Sarcenic" style, designed by Captain Munt, R.E.: the first of these illustrating an architect's, and the second an engineer's, treatment of an Oriental style; we prefer the former. Mr. Waterhouse exhibits a view of the "Liverpool Seamen's Orphan Institution" (1,173), a picturesquely-grouped building, in his usual manner, and of which we shall give a view; and a small sketch of the "New Buildings at Owen's College, Manchester" (1,213), already illustrated in our pages. The "Hospital for Sick Children in Great Ormond-street," by Mr. E. M. Barry (1,186), is a sensible-looking brick building, also already known to our readers, with outside galleries of communication, and ventilating shafts (apparently) forming prominent features in the external design. It is a good specimen of economical architectural expression obtained in a simple manner. Mr. Seddon sends a large and apparently highly-finished pen-and-ink drawing of his Aberystwith College, which is hung too high to be properly seen for this kind of drawing, but the design is well known.

Domestic buildings are more numerous, and we start here with the name of Mr. Norman Shaw, who is in great force this year, and whose drawings, as drawings, are masterly. "Two Views of a House for F. Goodall, R.A." (1,166), show the architect's usual manner in plain and unpretentious mansions, the usual simple picturesque treatment of windows, and the usual cutting up of roof and walls in a somewhat exaggerated effort at piquant and picturesque expression. The studio, placed (why, we do not see) at an oblique angle with the rest of the building, is a marked feature in the design, indicated externally by the large square side-windows and the end oriel, which ensure light from whichever side it may be required. "Cragside, Northumberland" (1,196), another beautiful drawing, is a house of somewhat more pretension, and treated in the author's very high and elegant manner; the projecting bay at one end of the front, with its deep base of battered masonry, strongly-marked plinth lines, two tiers of windows, and finishing in what appears to be a kind of open gallery under the eaves, is in itself a feature for study. In No. 1,219 there are sketches on a larger scale of the tower and dining-room fireplace from the same house; the former an admirable bit of masonry design and grouping, the latter too ostentatiously rude and massive to be really in keeping with modern domestic life.

"Interior View of panelled Drawing-room, Cowes-fair House," by S. Salter, Jun. (1,169), is a capital drawing of an apartment which might easily have been made much more original and picturesque at the same expense; a concourse of square panels (wainscot) over the wall, and thin lines of plaster moulding crossing each other on the ceiling, are features not so new or remarkable as to bring any special credit to their designer, or he worth such a careful drawing. "The Douglas Room in Stirling Castle, restored under the direction of R. W. Billings" (1,181), is an admirable clear sepia drawing of a bit of restoration, by an architect who has made Scotch Gothic his speciality; the piquant effect of the open carved wood cornice, and the treatment of the panels of the wainscot, will not escape notice. Mr. E. M. Barry's "Cobham Park" (1,187) seems to us, for an Italian design, rather too much broken up with small pinnacles, many and various pedimented dormers, &c.; the massive brackets carrying the balconies over one or two of the windows form a good and striking feature. "Wykehurst" (1,208), by the same architect, we like much better; it is a design showing considerable novelty and originality of style, and might be described as Italian treated in a Gothic manner, with high roofs, round turrets with an arcade open story at top, and a general verticality of line and proportion giving considerable individuality of character. Some of the same features appear in the next design, "Shabden" (1,204). "Wyfold Court, Oxfordshire," by Mr. G. S. Clarke (1,193), is a remarkably-grouped design for a mansion, consisting mainly of a tower and more ornate block to the left, diversi-

fied with bay windows, and evidently containing an entertaining-rooms and "show" portion of the house, and an adjoining lofty block, irregularly grouped with the first, of much plainer and more massive character; a portion of this goes up at one angle, forming a kind of tower, with high mansard roof and long lucarnes. The merit of the design could be estimated better were there a plan, to show us the motive and origin of the grouping; but there can be no question that, as it appears here, it is a very striking and picturesquely-grouped mansion. No. 1,210 is a "View of House being erected at Cardiff" from the designs of Mr. Burges (whose name, we may remark, is invariably spelt wrong in the Academy catalogues), a beautifully-executed drawing; the style is a plain, simple treatment of Early Gothic of a somewhat French character, a little heavy, but very solid and satisfactory-looking; the upper windows are square-headed with a centre shaft, and a deep relieving arch over, with a scroll of light in the tympanum; this looks well enough on the outside, but from the interior the window design would have, we should think, rather a scattered look. "Mansion at Greenlands" (1,208) is a cold, formal Italian block with quoins at the angles, which we refer to because it is so typical a specimen of the kind of house in which the average "respectable" English gentleman delights, the merit of which in his eyes consists in its being utterly without any feature that can attract attention or give occasion for a remark. No. 1,224 is a design for (we conclude) an imaginary "Elizabethan Mansion" by Mr. Heffer: it is a very good water drawing and an elaborately-enriched design, but with no features or treatment calling for special comment. Sir D. Wyatt's "View of Alford House, Hyde Park" (1,222), is a very effective and powerful drawing in sepia (or bistre), which shows in a perhaps flattering manner the general dignified though somewhat square and heavy aspect of the building: much use is made, and successfully, of ornamental ironwork in balconies and gates; a strongly-marked cornice gives unity to the composition, and is a base to the very steep-pitched French roof above, which forms an important part of the design: we wish there was not such an array of great carved festoons under the cornice; what, let us seriously ask, is the gain to the building for the time and expense that must have been bestowed in carving this used-up ornamental feature all round? Mr. H. Jones's "Additions to the City Meat Market" is in keeping with the main structure which he carried out previously; and is as like a meat-market as blank walls and plasters can make it. Mr. G. Aitchison shows a small and unfortunately rather feebly-executed pen drawing of a "Proposed House for Lord R. Grosvenor, Dorset" (1,233); the design itself, like most of the author's, shows some originality of manner and treatment, with a considerable employment of what appears to be pierced woodwork; but it certainly wants more force and breadth of treatment to make it a successful work. "Messrs. Elkington's New Premises" (1,241), by Mr. F. Peck, an Italian design presenting nothing special in detail, is well and effectively grouped, with two high blocks, not symmetrical, divided by a lower intermediate portion lighted from the roof; at least, we assume that the whole of the block of buildings shown is included in the establishment. The "Hall and Staircase at Summerfield, Roehampton" (1,239), by Mr. Brydon, is noticeable as a capital pen-and-ink drawing of good plain work, with no striking features. Two small drawings by Mr. Edis are up to his usual mark; a "House at Bexley" (1,161) and "Riverside Premises, St. Paul's Wharf" (1,180), the latter a capital specimen of simple architectural treatment of a utilitarian building, and in point of execution one of the best, though among the smallest drawings in the room.

In ecclesiastical design there is less than usual of that class of "regulation Gothic" churches, one of which can hardly be distinguished (in the memory at least) from another; and there are one or two rather remarkable specimens. First among these we must again mention Mr. Norman Shaw, whose "View of the English Church at Lyons" (1,194) is, in fact, a drawing of one gable end only, towards the street; perhaps the rest is crushed up between adjoining buildings after the manner common in French towns. This is a rather large scale drawing, showing a bold and massive treatment of a tall gable, with wide buttresses on each side, crossed at the top by a lower gable parallel to the front, one end of which is octagonal on plan, and forms the finish to the stair-turret, the treatment of which

feature is an excellent specimen of real masonry design; the whole thing, indeed, is like a bit out of the Middle Ages, without, however, suggesting direct plagiarism. "Interior View of Trinity Church, Finchley New-road" (1,155), by Mr. Legg, is a good brick interior, with a canted wooden ceiling and solid curved braces; which, albeit not a very good way of treating timber constructively, is one which certainly produces more pleasing lines, and looks better generally, than the thin moulded tie-beams which some church architects are getting so fond of, and which are shown in one or two other designs here, accompanied by that kind of scribbled line decoration all over the walls which is so easily devised, and demands so little thought in the devising. Mr. Hakewill's brick church at Brompton (1,175), with the tower detached from the main design, and only connected by a short cloister, is not its author's best work. The "South-east View of Church of St. Augustine, Kilburn" (1,202), by Mr. Pearson, is a somewhat remarkable thing. It is a fine pen-drawing of (apparently) a brick design; the whole character extremely bold and simple; the west end flanked by two square towers, perfectly plain in the lower portion, with only one story of wall arched below the cornice, over which each is finished with a square slated spire. Behind these rises a *façade*, and still further, over the nave-roof, is seen the main tower and octagonal slated spire, with very good picturesque treatment at the point of junction, and lacunæ near the base of considerable originality. From the point of view here shown, this is a very fine group of building. Another of the more notable church drawings is that by Mr. Burgess, of the "Monumental Church at Skelton" (1,217), a small, finely-executed water-colour of the interior view of the nave. The best point in the design is the arrangement of deep, recessed panelling and sculpture in the surface of the east wall of the nave, over the chancel-arch. The same architect also exhibits a highly-coloured interior of the "Chancel of St. Mary the Virgin, Studley Royal, Ripon" (1,242). Mr. Goldie's "St. Paul's College Chapel, Stony Stratford" (1,223), is a view of an interior, plastered (or cemented), and with red brick dressings and brick wall-shafts, carrying a plain tie-beam, looking, in the drawing, almost like a piece of rough timber; as Sir Hugh Evans said, "this is affectations." In other respects, this is a satisfactory design. A bird's-eye "View of St. Peter's, Clerkenwell," showing church, parsonage, and schools, by Mr. Blackburn (1,226), is hung too high to be properly made out. It looks well. "St. Mary's, Loughton," by Mr. Watson (1,215), is a very pleasing specimen of a small country church, with a red-tiled roof, picturesquely treated, without the slightest pretension or strain, ing after effect. Then we come to an interesting design, in regard to the associations connected with its locality, &c., Mr. Street's "Proposed English Church at Rome" (1,216). Uninitiated eyes might say at first that this was a "design for a barn," so far has the architect carried his recent tendencies towards plainness of treatment; but there are character and expression about it. The side elevation shows single-light windows between deep buttresses. There is an apse, without buttresses, and with the roof-line broken by a series of rather low-pitched gables all round, not very happy in effect. A square tower, with a low pyramidal roof, is the prominent feature, and a somewhat heavy-looking square porch adjoins one bay of the south aisle, the porch-walls coinciding with and forming part of two of the buttresses. The one piece of ornament is a string of decorative wall-panels carried round under the sills of the windows. Certainly anything like "fritter" would have been out of place in the "Eternal City," but we cannot help fearing that Mr. Street, in avoiding the Scylla of over-decoration is in danger of falling into the Charybdis of dullness.

Among what may be termed decorative designs we have an elaborate drawing of an interior, by Mr. Talbot (1,201), showing a "Design for a Fireplace," deeply recessed beneath a segmental marble arch, with wall-tie-decoration above. The whole effect is very good; but the carved foliage seems too large and heavy for the scale of the rest, and rather spoils it. "The Interior of St. Stephen's Church, Dulwich" (1,211), by Messrs. Banks & Barry, may be counted among the decorative designs, as the main object is to show the proposed colouring, which seems to us somewhat gaudy and with too much preponderance of light blue

in the chancel roof and elsewhere. "A Design for Sideboard Decoration" (1,214), by W. S. Stacey, is the work, we suppose, of a connexion and admirer of Mr. H. Stacey Marks, whose characteristic style in this kind of design is here attempted to be imitated; not very successfully, we think. "The Queen of Sheba's Visit to Solomon" (1,240) is not a bad piece of conventional figure grouping, with a good effect of colour. Some small painted windows for the apse of the church at Fishponds, Bristol, by Mr. J. P. Seddon, are very good in colour, with red and green diaper grounds alternately; the figures much like most figures in stained glass windows.

Among drawings which are not designs, but sketches of existing work, may be mentioned five of Mr. Spiers's capital series of sketches among the ruined buildings at Paris, the style and merits of which are known. Mr. G. R. Clarke's view in Westminster Abbey is a fine drawing, careful and successful in realising the effect of light; of the same character, and perhaps better, is "Seville Cathedral" (1,197), by Mr. George. Mr. Brower has a good architectural oil painting, "Aus Alten Zeiten" (1,192); and Mr. Deane a very picturesque view in Verona (1,200), looking up a street, under two large arches, to more distant buildings. Mr. Naish's "Interior of Speke Hall, Lancashire," with figures in old costumes (1,170), is a very good specimen of the kind of thing, carefully and minutely finished, both as to light, effect, and figures. Mr. Florence has two small Continental sketches, of which "Study in Mantua" (1,182) is the best. We must not pass over a decidedly fine drawing by a foreign name, F. Hoffmaier, called "The last Five Days of Pompeii" (1,236), in reality a painting of the entrance of a Pompeian house, looking from the interior, which is comparatively in shadow, out into the sunlit landscape; the architectural decorations and the effect of the polished marble in walls and columns are very successfully given. As a contrast, we find on the opposite wall, just facing this, the "View from the Tunnel Mouth of Metropolitan District Station, under Victoria-street;" a well-executed drawing, sent, we suppose, to show to every one how hideous a locality may be made by the aid of modern engineering science.

On the whole, this is a very fine and interesting collection of drawings, which we have had pleasure in passing under review; the proportion of designs which have no interest, or are of a very common-place description, is much smaller than in most collections of the same kind that we have seen during the last two or three years.

NEWINGTON COMPETITIONS.

We mentioned in our last the award of the premiums for designs sent in for the proposed new Church of St. Mary, Newington. The various sets of drawings were on view last week in the committee-room of the Newington schools. The main points in the conditions of the competition were that the church was to seat 1,100 persons, and the cost to be 10,000*l.*, or not to exceed 10 per cent. on that sum; in other words, to be between 10,000*l.* and 11,000*l.* This was exclusive of any tower or spire, for which a separate estimate was to be given.

The design to which the first place has been awarded is by Mr. J. Fowler, of Louth; the style is "Early English" (lanet), of a very solid sterling character, and showing true comprehension of and feeling for this style of architecture, but not presenting any novel or very original treatment either in plan or design. The side elevation is very simple, with single lancet windows between simply-treated buttresses; the west end shows a triplet of large windows, flanked by a similar blank window on each side; the tower is treated very plainly in the lower stages, with a little enrichment by straight-lined canopies and traciced spandrels over the windows in the bell-story; the spire is very pleasing in proportion, but the composition at the junction of tower and spire appears somewhat crowded. We should suggest separating the lacunæ a little more from the angle carried and hroach pinnacles. The roof is treated by rather heavy but not ineffective timber principals, with curved braces forming a large trefoil arch. The plan is spacious, and shows in particular plenty of spare room at the west end to provide against crowding on leaving the church, and also for services around the font. On the whole, we are not surprised at a committee choosing this design, as it is a very sensible and practical one, with suffi-

cient architectural merit; but there is nothing remarkable about it.

Mr. Pearson's design, the second chosen, disappoints us, and is scarcely what we expected from him. The very lofty tower and spire would form a striking feature; and the tower is finely treated, carried up in the lower portion in almost an unbroken mass; the spire, also, is very satisfactory; but the stage between the two, the most important point in the design, is decidedly weak, and this is rather the character of the work throughout; the plain portions of the windows and details of tracery, &c., are weak and starved-looking. The west end is more boldly treated, with three large two-light windows, and a relieving arch spanning the whole, abutting against the turrets which flank the composition; another small window occurs within this arch, over the heads of the others, but the composition is somewhat ragged here, and does not combine naturally. The walls are of red brick and Bath stone, the roofs to be entirely vaulted with stone ribs and brick filling.

In the third design, by Mr. Blomfield, brick is again substituted for the Kentish rag suggested in the Instructions for the outer walls; the dressings to be of Bath stone. This arrangement of brick and stone dressings always militates against the homogeneous and monumental character which we like to see in a church; but the design is a good one, with considerable originality, especially in the treatment of the upper portion of the tower, the upper stage of which breaks into an octagon, and is finished above by a short octagonal slated spire, with picturesque angle pinnacles; this would have been still more effective had the lower portion of the tower been treated with rather more unity and severity of design, and carried up with little break or incident until the octagon stage was arrived at. The author knows how to ensure dignity and solidity of character by linking his masses of wall together in continuous planes; this is well done in the treatment of the large buttresses which flank the "crossing," and which run into the main transept walls on each side, the north transept assuming the form of a "lean-to." The roof is a wooden tie-beam and king-post construction, with a canted ceiling over; the interior proportions are spacious and lofty, but the plan is somewhat cramped, especially at the west end. On the whole, we should call this a better design than Mr. Fowler's, but not so serviceable a plan.

Mr. Brooks's design is much the finest, architecturally,—the only one of the set which exhibits anything of what may be termed the great qualities of architectural design. It is plain, even stern, in character, and with the small windows which the architect has persuaded himself give light enough,—an opinion we should be inclined to question. The main feature in the design is a tower of almost disproportionate width and massiveness, carried up to a considerable height, broken into an octagon in the upper portion (there are no "stages" here), with large flanking turrets, and with a short, massively-proportioned spire, forming an appropriate termination. On this same tower the architect has wrecked himself, as far as this competition is concerned; its cost being regarded, apparently, as quite disproportionate to the rest of the structure. There is a plain moulded cornice to the exterior, the only bit of external "ornament" being a little carving in the corbel-table of the spire. A *façade* adds another feature to the exterior, and breaks the heavy lines of the composition. The general outline of this object is very good, but the details want reconsidering and refining. The plan is rather obstructed by the large piers at the crossing. The south aisle of the chancel is arranged (with an apsidal termination) for occasional use as a chapel for early morning services, or on occasions when only a small congregation might be expected. The crossing and the portion eastward of it to be vaulted; the remainder timber-roofed. The organ is absurdly placed,—a little thing bracketed out high up on the wall, only large enough for a church one-third the size. A big church requires a big organ, if the grandeur of the music is to be proportionate to that of the architecture. Why cannot church architects learn this, and arrange accordingly? *Au reste*, we look with some regret on the non-success of this design. It may not be a very practical one, but the tower would have been a grand object, and worth paying, as Pugin said, "thirty shillings extra" for.

The design by Mr. H. Jarvis is one with con-

sideable faults; the design of the tower is very unsatisfactory, the details generally are not in very pure taste, and the whole composition is too heterogeneous in manner, wanting in unity; one part does not seem to belong to another. There are, nevertheless, very decided merits which deserve recognition; the treatment of the side windows (clearstory) is decidedly effective; so is that of the narthex which crosses the west end, the two ends of which are worked into octagonal apses which contain the stairs to the west gallery. The chancel is groined, and is loftier than the nave, an arrangement which we are not prepared to say is not the truest architecturally, as giving a better effect of climax to the internal composition; externally it is difficult to treat satisfactorily, partly, perhaps, on account of the prejudice acquired by the eye in favour of the other arrangement. The last design to be named by Mr. Bignall scarcely affords room for comment; it is sufficient to say that it is a modern Gothic design of an ordinary type, and neither better nor worse than many others of the same kind.

Five designs for a "Mission Church" for the same neighbourhood, to seat 600, at a cost of from 3,500, to 3,750, were exhibited at the same time. The first chosen of these, by Mr. J. E. K. Cutts, is a plain, sensible, brick design, of no particular merit architecturally, and which we fancy owes its place in the lists a good deal to the exceedingly neat and effective drawing of the elevations. The second one, by Mr. J. Giles, is, on the whole, a more pleasing design, with an effective timber roof with deep carved braces; the nave arches, with flat soffits, springing from coped shafts or pedestals; the materials brick inside and out. The apsidal east end is spoilt by an over-attempt at decorative effect in the shape of interlacing arches with ornament of some kind in the spandrels and interstices; the result is not happy. The third design, by Messrs. Giles & Gane, is a single-span building, looking very squat, but, of course, providing a very good and unencumbered interior area; a reminiscence of the three-aisled arrangement is presented by the manner in which the east gable wall of the nave is carried upon a large centre and two smaller side arches, springing from circular piers. The gable, as in the other two designs, is surmounted by a brick and stone heltry; an alternative slip shows a second treatment of the east end, much superior to that in the main drawing, and with a light timber heltry and fliche substituted for the brick one; this helps the design wonderfully, and carries off its squareness and low appearance: we wonder the other designers have not tried the same thing; they would have got a far better and more picturesque effect (quite suitable to a small building) in this way, than by the conventional pigeon-hole heltry. Messrs. M'Murdie & Wagstaff's is a design in buff brick, and red brick dressings, out of proportion in its parts, and looking more like a model of a larger church than a design for a small one; the turret over the entrance is pretty and picturesque in outline, but has the great misfortune of being lower than the gable adjoining. The design of Mr. Wigginton is so barely shown in a mere outline drawing, that it is in no position to be fairly compared with the others. We may take the author's own estimate, however, on the presumption that he would have taken more trouble with it if he had thought much of it.

We should have been more interested in the competition designs for the larger church (to revert for a moment) if any one of them had shown any marked attempt to adapt architecture (plain in particular) to the real requirements of modern worship. Of this there is scarcely a trace; and the design which has been selected as the best, and which we suppose will be carried out, is, though without any serious defects, as completely destitute of anything like novelty of suggestion, and indication of progress in architecture, as could well be imagined.

THE DOGE'S PALACE AND THOUGHT IN THE WORKMAN.

In these days of artistic and architectural change and uncertainty, and in which we cannot be sure, even for a few months, what will be the next phase and fashion of art, it is some comfort to think of a few principles of artistic action and ways of doing things which are and must ever be, always and absolutely certain. Happily there are a number of such principles, and with-out at present attempting even a list of them, we

may adduce one, viz., that of the absolute necessity of *bona fide* and *individualised* work in the details of buildings laying claim to architectural excellence. In other words, it is not the mere workman, as part of an apparatus, or as a machine, however good a one, that is needed for the work; but the *artist-workman*, or the yet higher artist that is demanded. Style itself, important as it is, is yet, after all, but a matter of almost secondary interest to this vital principle, for who would not rather become the possessor of a fine building, nobly and truly worked out, with studied and impressive details, in a second-rate architectural style, than to have one, even in the very noblest and best of styles, if in detail but the work or result of mere copying and machine-made work. There can be no comparison between them. This important subject has been but little, if at all, dwelt upon or recognised, yet is it one of the vital questions in art and a-ctitecture—the art and architecture of the future.

We have been led to these thoughts by some curious examples, which we have collected of the painstaking and thoughtfulness and skill of the artist-workmen of past times. Nearly all old buildings exemplify this, but perhaps there is not one of them fuller of it than the far-famed Palace of the Doges, of which so much has been written and sung. The very name seems enough, for round and about it, even apart from any technical knowledge of the architecture of the building, there clusters a host of memories and associations. What would this practical world of to-day do, we may ask, without at least a little dreaming and waste of active energy? It must die out from mental weariness, for human nature cannot live solely on the merely "*utilitarian*" and the profitable! But our purpose here, as usual, is not to dream, but to ask, whether so much could have been made out of this world-famous palace, had—all its uses and history having been the same—its structure of the ordinary machine-made modern type, the *artist-workmanship* of it, as that is now, being absent. Would this palace with its columns, carved capitals, and arcades and dispersed wall face, have produced the same effect on man's mind if *art-manufactured*? We confidently declare that it would not and could not; and it becomes, therefore, not a little interesting to discover how and in what way it was that such mental effects were produced. There is all the difference between something and nothing, between such work and mere machine work; and it would, perhaps, be impossible to point to anything more instructive in its way than to the carving and *thoughtful workmanship* to be found in the capitals of the columns of this very palace. Each capital would seem to have been a study in itself, and to have been wrought out after a careful thinking out of how it could be made to harmonise with the rest of the capitals, and at the same time to be an individual thought in itself. All this has been done in the most thoughtful manner: each cap is a new design, both in the upper arcade range of columns, and in the lower and larger columns which stand on the street pavement. There are not a few specialities which we could point out, after a good deal of study, in these capitals and columns; and there is one most notable hit of detail in one of the capitals of the lower range which is not only curious in itself, but as indicative of the age in which such work was done, and as showing how much individuality of thought and painstaking was expended in *one single capital* of one single column, out of a vast series. We refer to the one which Mr. Ruskin has named the eighteenth, and which he has described to a certain extent, as will be seen in one of the volumes of the "*Stones of Venice*." The singularity in it is its Latin inscription, or rather Latin verse, carved on the *abacus* of the capital. This *abacus* is octagonal on plan, though the column on which the capital stands is circular. On the capital itself the compositions of animals and figures are descriptive of the Signs of the Zodiac, so that we may call it the "*astronomical*" cap. There is,—to give a mere list of them,—on one of the sides of the octagon which we will call No. 1. The Creation of Man; on No. 2. Saturn and the Water-Bearer (*Aquarius*); No. 3. Jupiter, the Fishes (*Pisces*), and the Centaur; No. 4. Mars, the Scorpion (*Scorpio*), and Aries; No. 5. Leo and the Sun; No. 6. Venus, the Bull (*Taurus*), and the Balance (*Libra*); No. 7. Mercury, the Twins (*Gemini*), and the Virgin (*Virgo*); and on No. 8, completing the octagon, the Moon and the Orah (*Cancer*). All these little ingenuities to be thought about and

cleverly carved on *one capital*! Why, there is as much to puzzle over and think out as in all the details of a good-sized modern church, for having these quaint ideas in words, it was necessary to think a good deal to work them out and embody them in actual forms. Indeed, it may be a question whether the rough thinking out and working out of all this is not quite as much of a mental and artistic effort as the designing of a Parthenon capital, with all its subsidiary curves and blending of them with straight lines, or rather lines which are meant to look straight. And this, it is to be recollected, but one single capital out of a long series,—a combination, indeed, of architecture and sculpture. We might describe at some length the various sculptures, eight in number, which go to make up this clever capital, but as there are a number of fragments of it in the Architectural Museum collection, it will be merely necessary to call attention to them, that the reader may refer to the work itself; and for this other reason, that our present remarks refer more especially to the "*inscription*" or text on the *abacus*, and from which the subjects themselves are taken. This inscription is thus written; we copy literally both *spelling* and *constructions*—

DEIIMO DSADA. DECO STANMAVIT 7 EFA.*
This may be thus put into modern shape:—*De limo Deus Adam de costa formavit et Evam. The Lord formed Adam of Dust, and Eve of a rib. (We take all these inscriptions from casts taken from the capital itself. They are letter by letter accurate.)*

On the next face, reading from left to right:—*ET SATURNE. DOMVS EGILOCEVNTIS 7 VRNE; or, Est Saturne domus Egeocerotist et urne. It is, O Saturn, the house of Capricorn and of the pitcher.*

No. 3. INDE IOVI DVNA. PISES SIMVL ATQI.
CIBONA; or, *Inde Iovi donant, Pisces simul atque Chirona: Next they give to Jupiter, together with the Fishes, and Chiron.*

No. 4. E ARIES MATIS. 7 ACUTE SCORPIO PARTIS; or, *Es aries Martis: et acuta Scorpio partis. Thou art the ram of Mars: and thou Scorpion, with sharp limb.*

No. 5. ES DOMVS SOLIS. TV QVOQI SIGNE LEONIS; or, *Es domus Solis, tu quoque signum Leonis. Thou art the house of the Sun. Thou art, also the sign of the Lion.*

No. 6. LIBRA CVM TAURO. VENVS T PVRIOR AVRO. *Libra cum Taurus, Venus et purior auro. The Balance with the Bull, and Venus purer than gold.*

No. 7. OCCVPAT ERIGONE. STILBONS GEMINIQI LACONES. *Occupat Erigone, Stilbo, Geminique Lacones. The Virgin comes next, Mercury and the twin Laconians.*

And No. 8, and the last, and which completes the octagon, LYXE CANCER DOMY. T PSET IOBE SIGNORVM. *Lyxe Cancer domus, tunc pset in orbe signorum. Cancer, the house of the Moon, then shewest thyself in the circle of the Signs. Thus in these curious and quaint lines did the able sculptor of this capital find the subject for it, and the rule of *lettering* will show how little seems to have been thought of that precision and exactitude which characterises modern work. Letters are misplaced or left out, just as suited the hit of stone in which they are incised. The idea was everything.*

It would, perhaps, be impossible to find in the whole range of Gothic art any one single object affording greater proof of the great principle of individuality of work, which always characterised it, and which, indeed, made it "*Gothic*." No two things were alike; each one had its workman, and that workman was expected to think as well as to work; and there can be no manner of doubt that one of the great charms of the Doge's Palace is to be sought for in this individuality of workmanship, and in the fact of the workmen of it being *artists*, but still *workmen*. In this fine capital—but still but one out of so many—the sculptor seems to have wished to embody, as far as in him lay, the formation of the planets made for the service of man; the subjection of the fortunes of man to the will of a higher power; and as determined from the time when the earth and the stars were made. What a great lesson for men modern is here; for, if so much thought and work has been expended in the production of one single hit of what many would think insignificant detail, what are we to think when we know that the whole of a vast palace is full of it,—full of thoughtful and real artistic work, every part and

* The mark 7 stands for et, and.

† This word is a mere transcription of the Greek word corresponding to Capricorn.

detail a study? Compare this for a moment with a modern "restoration," wherein the whole of the work, however carefully done, is all mechanical, and foreign to the heads of the executive workmen. How much is there yet to be done before the real idea of art, as the expression of individuality in material forms is seen, and grasped, and realised! No amount of skill, as it seems to us, in mere designing,—no determination of style, whether Classic, or Gothic, or any other, can avail without this recognition of the vocation of the workman; and this Venetian palace is of those buildings which go to prove this artistic value of the workman. But in this little fragment of antiquarianism, out of which grew so pretty a bit of sculptured form, there are yet one or two things to be remembered to enable us thoroughly to comprehend it; and in an antiquarian view of the matter, it is of infinite importance to do so. Two things are to be kept clearly in mind. First, that each line is a sort of rude hexameter keeping the rhythm, but disregarding the rules of prosody. Secondly, that each line consists of two parts, which rhyme together; and in order to secure the rhyme, any liberties are taken with the terminations of the words. Thus, as we have said, the idea was everything: the rhyming lines satisfied the ear, the sense being well known. We have ventured to call this beautiful capital the "astronomical cap," but perhaps it should rather be the "astrological" cap, for the stars at one time dwelt in "houses." Full of errors, doubtless, were the men who thought thus, and did these things, and the like of them; and, as far off are we moderns from them in scientific knowledge as astronomy is far off from astrology. But one thing they of that distant day most certainly had, which we have not, and can never have, as things now are; and that was, the time, and temper, and working power to make practical use of their dreamings, and to embody them in sculptured and painted forms, and thus to write legibly their world's history—the history of things as they then were.

SCHOOL PLANS FOR THE LONDON SCHOOL BOARD.

We have already briefly referred to the designs sent in competition, by five architects, for the schools proposed to be built in Johnson-street, Stepney.

The "Instructions to Architects," as we understand, made the following provisions:—

1. The School to be for 1,080, in three equal departments of boys, girls, and infants, and arranged on the principle of class division (sometimes called the Prussian system).
2. The Boys' and Girls' Departments to be arranged in twelve class-rooms, each accommodating sixty children, and having an area 9 ft. superficial per child. A general room to be provided for the assemblage of the whole of the boys and girls at one time, calculated at not less than 1 ft. superficial per child, and available for one of the classes. This room to be used as one of the twelve class-rooms. One of the rooms to have a top light, suitable for a drawing-class.
3. The Infants' Department to have two class-rooms for sixty each of the youngest and most advanced, and a general room for the remaining 240 children. These rooms together to have not less space than 8 ft. superficial to each child.
4. Generally.—The class-rooms to be not less than 13 ft. high. Provision to be made in each department for masters' and mistresses' rooms and W.C.s. Each department to have separate out-offices (approached, if practicable, by covered ways), lavatories, cap and bonnet rooms, playgrounds, entrances, and stone staircases. The building to be not less than two nor more than three stories high. A care-taker's residence of two rooms to be provided. The views of the Committee of Council on Education to be carefully considered in reference to structural detail not herein described.

One of the competitors, Mr. T. R. Smith, in his descriptive particulars, says that the principle of class division in schools, sometimes called the Prussian system, is carried out in Prussia, at Berlin, for example, much as follows:—The children are entirely taught in class-rooms; the maximum number recommended in a room is sixty, seventy being considered an exceptional number. The class-rooms are oblong; it is indifferent whether they be lighted from the end or the side, but they must be lighted from one side only, and the children must have their light on the left hand. There seems no limit to the

depth from front to back of a block of seats, but the length of each bench is so limited as to allow the master to inspect every child's work from the end of the bench. For the purpose of facilitating this inspection, a gangway is preserved all round the block of children, narrow at the back and at the side nearest the windows, but made wide enough next the wall facing the windows, to be convenient for the ingress and egress of the children; and the block of seats is broken up into at least two masses by an additional narrow gangway from front to back. No child, it is thought, ought to be more than 30 ft. from the easel where diagrams, &c., are shown, and it is recommended that, as far as possible, the seat most remote from the window be not further from the wall than 1½ times the height of the top of the window from the floor. The master's desk, on a slightly raised platform, faces the block of children; an easel for the display of diagrams, a book-closet, and the stove or fireplace, occupy the space on either side of him.

The class-rooms, it appears, are ordinarily put together so as to form a compact oblong block of buildings several stories in height, and are frequently divided on plan into three portions by two staircases extending from front to rear; one of these is for boys and the other for girls. These staircases, however, often occupy the ends of the block, and sometimes a corridor connects them together; but this is sometimes omitted. On an upper floor, and between the two staircases, is placed the Aula, or general room, calculated to seat about half the number of children provided for in the class-rooms. This room generally receives some amount of architectural decoration; it is not customary for it to be divided by movable partitions or other means when not in use for collective teaching. Private rooms for the teachers, and sometimes one or more consultation-rooms, complete the essential parts of the building, which is heated and ventilated on a general system.

The principle of a side-light referred to has been adopted by all the other competitors but one, Mr. H. S. Snell, who gives a quotation from the reported evidence of Mr. Adolf Sommenschein before the Committee of the School Board for London, as to the Prussian school system, to show why he has placed all the children with their backs to the light:—

"The class-rooms each contained a platform, on which were placed a black-board and the teacher's desk and chair. All the children faced the platform, and the windows of the room were at the back of the children, so as to give each the benefit of a full light."

It is somewhat strange that such a difference in opinion should exist on a matter of fact. For our own part, we see no reason for forcing children here to stand in their own light, even if they do so in Prussia.

As to the best size for the class-rooms, while Mr. Smith arrives at the conclusion, after careful examination, that one 20 ft. by 27 ft. gives the best results, whether end-lighted or side-lighted, and whether seated for junior children at 18 in. per child, or for senior ones at 22 in., Mr. Snell makes them each 26 ft. by 21 ft., and Messrs. Harston have some 25 ft. by 20 ft., and others 27 ft. by 20 ft.

The latter make the approach to several of their class-rooms from the central hall, the other two competitors of whom we have spoken give all their rooms an approach independent of the central hall.

The committee should take evidence on these points before making their selection.

The other two designs seem to us to have fewer points to recommend them than those we have named.

YESUVIUS.

EIGHTEEN HUNDRED years and more have passed since Vesuvius vomited its ashes, mingled with rain, on the beautiful city of Pompeii, and buried it with its accumulation of treasures of art from the sight of man, till the present century. And now again has the Mount, that still stands like a threatening avenger, made its voice heard from the depths and sent forth its pent-up fires, threatening the very capital of the South itself with destruction. Science, in the shape of its sismograph, gave no warning; the oldest and most intelligent of guides—men horn and bred up on the lava-clad slopes—knew nought of the approaching awful danger.

The afternoon of the 23rd ult. began the wonderful spectacle, without warning of any kind. Signor Palmieri, stationed at the Observatory, perceived no motion of the sismograph,—an

instrument so delicate that the slightest volcanic motion at other times could be marked by it. By eight o'clock of the evening of Wednesday, the mountain had opened orifices here and there on all sides, sending down rivers of lava, thrusting out tongues of fire long and broad, appearing here and disappearing there, like some gigantic process of illumination of a vast amphitheatre.

The sea, just slightly rippled, reflected the pallid light of the moon and the kindled streams of lava. As the cones of lava were lighted up, the volcano seemed alive, and threatened terrible consequences. All the night the affrighted inhabitants of Torre del Greco (built on the ruins of Herculaneum) watched on the house-tops, with anxious eyes, the spot whence issued a new menace of destruction of their town. Theirs was not the gaze of curiosity, but of deep, anxious, fearful presentiment. The morning of Thursday, the volcano appeared calmer, but in the afternoon broke out with increased vigour. Thousands rushed to the shores of the bay to see the sublime spectacle. Caravans of the curious, of both sexes, started to Resina, "to begin the weary ascent" of the mountain, defying all danger, forgetting what destruction Vesuvius had wrought of old. And between the hours of four and eight on the morning of Friday, with horrifying sounds, it broke its hard crust, and under the feet of those most advanced on their perilous ascent opened up a deep gulf, and on their heads poured torrents of lava, while above hung a deep roof of the blackest smoke. The sufferings of those engulfed in the open chasm may have been less than of those spared for some short time in the many hospitals open to receive the sufferers.

From that time the eruption acquired fresh vigour. A hollow, incessant rumbling, accompanied by a certain trembling of the ground, and becoming duller and more monotonous as Naples, and in the villages around Vesuvius, an earthquake movement continued. The showers of lava flowing in so many different directions drove off the inhabitants of the little farms.

This eruption is not considered to be the greatest from the volcano, but the severest in the memory of man.

By the evening of the 26th, the mountain presented the form of a funeral car,—the flame bursting out of the cone, forming the top, the tongues of flame at the base, the lamps around, while over the whole rested, like a baldachin, the dense white cloud,—the sea coloured red as far as Prosilipo. At dawn of the 27th it became less, the deafening roaring, the terrifying sounds, added to the fiery tongues that issued from the mountain, and the smoke and fog, had formed a dense white mantle that enveloped the mountain, touching the sky and sea with its edges. The height to which the stones were projected during the eruption was calculated at half a mile—the summit of the dense canopy of smoke a mile; while down the sides of the mount rose, at different points, the fires from the newly-opened craters, fourteen in number, each having its canopy of dense smoke. Amid all these horrors, the Observatory, with its brave professor Palmieri, remained untouched; but, standing, as it does, somewhat elevated, it was surrounded with the newly-flowing lava. Towards the night of the 27th, the horrors partly ceased; Vesuvius was hidden partly from sight; slight detonations were still heard, flames from the cone seen, but the dense mantle was not yet raised. The sight had lost its grandeur, but fear had not been dispelled. Three nights and days of terror had been passed by the inhabitants of the surrounding villages; fourteen hatteries had been opened on the defenceless trenches of Torre del Greco, San Sebastiano, Ponticelli, Torre Annunziata, Castellamare, Naples, fulminating the fiery lava at them, and threatening to reach them with certain destruction.

The villages that certainly have been struck with the volcanic scourge are San Sebastiano, with its 1,982 inhabitants, and Massa di Somma, with 1,736. These have not been entirely destroyed,—about five or six houses still stand in the former, and the campanile of the church, though much shaken, still stands. In Massa di Somma all the buildings are not destroyed. The lava that struck San Sebastiano was divided into two currents. Ponticelli and Pollina were the most severely menaced, Portici and San Giorgio came under the third stream of lava; Resina and Torre del Greco under the fourth; the other places near, the fifth and sixth. Before reaching these parallels the enemy was silenced. The emigration of the fugitives produced a scene

never to be forgotten. And how often have the people been driven by the volcano from these spots, and again returned to take up their abode on the very site of their destroyed habitations, with a dogged, perverse courage of perseverance.

From the king and his ministers to the national guard, the noble to the peasant, all offered succour to the houseless.

The number of victims cannot as yet be correctly stated. Above 2,000 houseless are lodged in the hospitals and convents of the city.

With very few exceptions all those who were overtaken by the lava, have died from their wounds. Up to the time of writing, Vesuvius is hidden. No one can vouch for its tranquillity.

It may not be interesting to take a brief retrospect of the history of this volcano. Of its primitive eruptions few traces remain. In 63 A.D., Pompeii, Herculaneum, Stabia, were visited by a violent earthquake, which partly destroyed them. Ten years after these cities had been restored. The fatal volcanic explosion that destroyed these three gems of southern Italy occurred in 79. Subsequently, in A.D. 203, 471, 512, 685, 983, 993, 1030, 1043, happened the eight great eruptions, threatening all the inhabited parts around, and ruining many villages, as in modern times. New cities rose on the ruins of the old as now. Torre del Greco has been destroyed eleven times, and eleven times has been rebuilt.

In 1631, after being silent for 130 years, Vesuvius broke out in flames, and overran with its lava five-sixths of the territory adjoining it. New towns arose on the lava. In 1794 an immense torrent of lava reached the sea. Another disastrous eruption happened in 1800. In all these latter disturbances Torre del Greco has suffered.

In referring to the description given by Pliny the younger of the eruption, during which his uncle Pliny the elder lost his life, the similarity of the attendant phenomena is very striking, and one might be reading an article from a journal of the 25th of last month; the "ashes mixed with water" and the suffocating atmosphere (the cause of Pliny's death) were the same in both. Naples, now as then, is black with fine ashes like soot.

The terrific visitation occupies all minds. The bustling, progressive city for the time has forgotten its plans of aggrandisement,—and it has many in view. A brisk lucrative trade is about being organised with Japan—principally for the introduction of silkworms from the latter. Japanese warms are to be brought in, in plenty. Manufactured silk is to be exported. A free trade is to be opened between the two countries. Of the progress of education in the South of Italy we will write another time. That a great movement has commenced is undoubted, but the trammels of old use and prejudices have to be removed before it can flow apace.

IMPROVEMENTS FOR KENSINGTON.

ADVANCING with the times, this most important suburb is increasing in buildings and population, and sites and plots have risen in value fourfold within twenty years. The widened thoroughfare and new church add a stimulus to progress, and, as at the Bayswater side of the Park and Gardens, it bids fair to reach the outlying railway boundary of Shepherd's Bush. There is, however, a great default in the want of a transverse line of open road between these two most important western lines of road, the only one being the narrow crooked way leading from the church to Silver-street, Notting-hill.

On the 13th ult. allusion was made in the *Builder* to improvements in the line of Church-lane, the driftway whereof is in parts only 15 ft. in width; but on further consideration and inspection, a much more effective and direct, as well as a more level route, can be recommended to the ecclesiastical and municipal authorities, if upon due consideration arrangements can be made for concession to the public of a material easement, that would require all parties, and tend to the prosperity and embellishment of the town.

On looking up Church-lane from the High-street it is direct, save that the churchyard curves out upon the roadway some 20 ft., and at a distance of about 250 yards, the vicarage crosses the line at a right angle, facing down to the church. From this point the street runs westward, at an angle of 35 or 40 degrees, curving again to the line of Silver-street. Now,

to avoid this turn, and to save the demolition of eight or ten forecourts, shops, and houses, there is but one course, and that is to take a new line which would lead straight to the end of Palace Garden-terrace, at the site of the iron church; but to accomplish this the old vicarage must be removed. The intervening space is church land, the glebe extending to five acres, meadows, garden, and site of vicarage and offices, together with the iron church included. A road in this direction, through Palace Garden-terrace and the Mall, would make a straight line to Notting-hill; and the glebe grounds sloping southwards, and looking towards Kensington-gardens, would offer an invaluable site for houses of a superior class; besides that ample space could be reserved for a new and commodious vicarage, with offices and grounds.

A new road through the vicarage garden would be in length barely 130 yards, and along either side might be erected terraces, which would amply compensate for the expropriation of about one acre of land. On the east side, again, there is a frontage of 150 yards facing the Palace Garden-road, the Palace and Kensington Gardens, the choicest site in the Royal precincts for first-rate mansions. These would produce a large income, and leave enough to spare for a better vicarage, offices, and garden, in a vastly better position than the present antiquated house.

On the Bayswater line, the finest ranges of houses are built on church lands, and there is no reason wherefore church lands in Kensington should not yield their full increased value, more especially when a great and pressing public requirement calls aloud for a line of intercourse from which a large community is debarred.

As there is great solicitude amongst the inhabitants and local authorities about the widening of Church-street, and it is under arrangement to give out a portion of the Church-yard to the main thoroughfare, the present is the moment for considering the aptitude of the new and direct line of thoroughfare recommended as above; which, in addition to the advantages it must confer on a large and growing business town, would also open out a better line of access to the improved neighbourhood of Campden-hill.

Thirty years back the vicarage glebe nestled amongst these groves; the thorn and philomel warbled their delights of blooming shrubs and meads hedged in cowslips: now the scene is changed, for stately mansions, barracks, and rude brick walls surround it; therefore, although the palace-gardens and forest trees are still in view, it no longer possesses the amenities of aylvan retreat; and so the vicarial incumbent, if suited with a better manse and offices, need not lament, in tender pastoral measure, "dulcia liquimus arva;" seeing that the exchange would make him the possessor of a better placed and more modern abode, together with the addition of another 500*l.* a year to his stipend.

QUONDAM.

PROPOSED CLOSING OF RED LION STREET.

WITHIN the last few days the Clerkenwell vestry have been thrown into a state of considerable trepidation, on suddenly discovering that the Metropolitan Board of Works, in their one end of Red Lion-street, propose to close up the Bill now before Parliament, their reason being that the level of the proposed new thoroughfare will be much lower than the gradient of Red Lion-street, and that for this new street a fine frontage is required. It appears that the clerk to the Clerkenwell vestry admits that, although the plans of the proposed street improvements had lain in the vestry since the month of November last, he never observed that it was proposed to close up the one end of Red Lion-street until within the last few days. The discovery places the vestry in a peculiar position, for they have already petitioned in favour of the Improvement Bill; but notwithstanding such petition they have now resolved to oppose the Bill, alleging that the closing of the street would materially reduce the value of property in the neighbourhood, and cause great inconvenience to the public. They further urge that Red Lion-street is the main communication between James-street and John-street, and that if they were to be blocked up in the manner proposed it would be most disastrous to the traffic of Clerkenwell. So important a thoroughfare ought not to be closed. The vestry have

agreed to memorialise the Board of Works on the subject, and also to appear before the committee of the House of Commons against this portion of the Bill.

THE STORY OF A COMPETITION.

AN architect sits in his office alone:
"The night; work is over, the drawings are done—
Ground plan, elevations, and sections are there,
Ink'd in, neatly tinted, and figured with care;
And a block plan completed with infinite pains,
Crimson lake for the levels, and indigo drains;
And a charming perspective, to show the good people
How the building will look when they've finish'd the
steeple—
That is, if the public don't strongly object—
To pull down half a street to produce the effect—
In the foreground,—to add to the charm of the scene,—
Are—a curate, a dog, and a lady in green.
In short, the best judges would soon be agreed
They're a very superior set of drawings indeed.
He scans them with pride—not unmix'd with dismay,
At the time and the money they've fritter'd away—
For, in truth, he had something far better to do,
His clients were waiting and clamorous too;
But a church-competition demanded his skill,
So he left all the rest of his work to stand still.
'Twas the old tale,—nine architects handsomely ask'd
To allow all their pockets and brains to be task'd,
That a "local committee" might meet and select
One design, and the rest unrequited reject.
So he could not be such, as he counted the cost,
Odds were heavy his money and labour were lost;
But his'd one, and too late to indulge now in sorrow,
For the terms must be sent in by midday to-morrow,
And then for a month or six weeks he must wait,
Till they write (most politely) to tell him his fate.

The day has arrived, the committee have met
To look over the plans and decide on a set
Which their wisdom united pronounces the best,
And without more ado to return all the rest.
You'd think that the best of those who take part
In the judgment some few have a knowledge of art.
No such thing; but the best for their portraits shall sit
You will see if for such a selection they're fit.

First the vicar; a good man, but young—fresh from college—

With plenty of zeal, but a small stock of knowledge,
Next to him comes the senior churchwarden, a grocer:
He advocates "comfort without any show, sir!"
The next is a young man, who having never married his part,
Goes hard in for what he calls "taste," first of all.
Next a chemist—who gravely expresses a hope
That "whatever they do they'll succeed in the pope."
He's heard 'em all—here the vicar turns red—and "feels
sure,
That remarks such as this will be deem'd premature."
"He's a laid!" and a cough from our friend Mr.
Boddie.

Who, though we all know he's a terrible noodle,
Contrives on all sorts of committees to sit,
But ne'er speaks—so that 't doesn't matter a bit.
Then—a rich undertaker—whose dictum has weight
(His knowledge of churches they say must be great).
A former churchwarden—as dead as a post—
He ne'er miss'd a meeting, and that is his boast;
When a point's raised and settled, discuss'd through
and through.

He starts it soon after as something quite new.
Last, the doctor; he has a young nephew who, men
Of discernment say, one day will emulate Wren:
"A pupil of Scott, sir," clever young man,
So the nephew comes in, and he thinks it a pity
If his uncle can't manage to square the committee;
He says he'll give up, and under advice,
Takes "a Nil" for his motto—'t's modest and nice—
For the plans (if it answer'd 't would really be fine)
Are anonymous, much as they might seem to be.
And the names, each in separate envelopes seal'd
Till the final decision, remain unrevell'd.

Well! 't's clear that with such a committee of taste,
To spend time in looking at plans would be waste;
So the doctor gets up, and with much tact and skill
Moves at once they select the design mark'd with
"Nil."

He points out its merits, pooh-poohs all the rest,
And really persuades them that "a Nil" 's the best.
The good vicar wince, yet feels he's but one,
And against odds like this there is ought to be done;
So he too gives in with the best grace he can,
And they end by all voting for "Nil" to a man.

Now, whether the embryo rival of Wren
Carried out his first plan—and if so how, and when—
Or whether they found what they ought not to proceed,
And so forth, we'll leave to the figure agreed,
And so let him make them a second design,
Just about half the size and not nearly so fine;
Or when they've given up, and under advice,
Takes "a Nil" for his motto—'t's modest and nice—
The gentleman's living, or dying, or dead,
This history tells not,—but what's been said
Shows the exquisite folly of young men competing
In cases like this with the notion of meeting
Fair play, or of coming out first from the rack,
Except by some high good luck, or else by good luck;
If it make one committee-man modestly own
That he can't by the mere light of nature alone
Know what architects (less gifted men, it appears)
Only let by the study and practice of years; a
If, in short, it shows reason why sometimes we may
Object to competing in this kind of way,
Then the point of this commonplace story is plain,
Nor has it been told altogether in vain.

Engineering. Glasgow University.—Mrs. Elder, of Claremont-terrace, has set aside a sum of 5,000*l.* as a supplemental endowment in connection with the Chair of Civil Engineering here, in memory of her husband, Mr. John Elder, the well-known engineer.

THE MEYRICK COLLECTION OF ARMOUR.

This fine collection of armour, together with a number of valuable ivories and some in-valuable miniatures, as exhibited at South Kensington, was offered to the Government for 50,000*l.*, and might have been had, we believe, for 45,000*l.* Unwisely, however, the offer was not accepted, and the opportunity of making the national collection of arms and armour a really fine one at comparatively small cost has been lost. If an ordinary observer were to visit the Meyrick collection in the Grosvenor-street Gallery, where it now stands, he would suppose that he saw there all that he had before seen at South Kensington, and would surely be surprised to hear that the owner had received no less a sum than 30,000*l.* for a portion of it, which is hardly missed. If we understand rightly, the specimens have been bought chiefly for French collectors. Our Government is not well advised in such matters as this.

THREATENED DESTRUCTION AT TENBY.

The remains of the fortifications at Tenby are an interesting feature, and should be carefully preserved by the inhabitants of the town, if for no higher reason than desire to maintain its attractiveness. Nevertheless, the best part of these, namely the fine archway gateway, is threatened with immediate destruction, on the ground that it obstructs the traffic. We beg the town council to look carefully into the matter, and to think well over it before they take this step. These tangible records of the town's history, landmarks of history, should not be carelessly dealt with.

PARIS.

The Theatre of the Porte-St. Martin is to be rebuilt on an enlarged scale and as a model theatre. The question of compensation for damage done during the riots has caused delay, but the drawings are now all ready, and if nothing unforeseen occur, the new theatre will be ready, it is said, by the 1st of November.

The amount of building going on in Paris is extraordinary. A correspondent now there writes.—Great as my amazement was to see the terrible destruction of this beautiful city wrought by the Communists, it has been exceeded by astonishment at the rapidity with which the Parisians have rebuilt long rows of tall, handsome houses, to fill up the cruel gaps. The erections going on everywhere are marvellous. This does not, however, apply to the public buildings. They still remain masses of ruin, and such strange ruins too,—much more as if thrown down by an earthquake than burnt; but this, of course, is accounted for by the fact of petroleum being used, which caused explosions rather than fire. In only small patches is there any mark of smoke or burning.

THE STRASBURG CHURCH COMPETITION.

The first three premiums offered for the best design for the Temple-Neuf in Strasburg have been carried off by the pupils of one architect, M. Questel, of Paris, viz.—First premium, Messrs. Bernard, Motte, & Tournade; second, M. Beau; and third, Messrs. Farge & Sanier. The fourth was awarded to M. Salomon, architect, Strasburg; and the fifth to M. Riederer, architect, Paris. The premiums offered were 200*l.*, 80*l.*, and 40*l.*, no promise being given that either of the rival competitors would be employed to carry out his design.

SCHOOL BOARDS.

Hull.—It was recently resolved that at a special meeting the Board should proceed to the election of a surveyor, at a salary of 200*l.* per annum, whose duties should be to survey and measure school sites, prepare plans for the erection of schools, superintend the erection and fittings of schools, &c.

Huddersfield.—At the usual fortnightly meeting of the members of the Huddersfield School Board, the minutes of a special meeting of the Board, held on the 27th of April, with a view of selecting designs for School Board schools, were read. The minutes stated that it was resolved "that, as none of the plans approved by the

Board in committee only, as the Board are advised, be executed for a sum of about 2,500*l.*, the Board feel that they cannot proceed to allot either of the prizes offered; but that the Board selected "Lucius Ordo" as an architect for one of the schools proposed to be erected." It was also resolved that the Finance Committee take the whole matter into their consideration, and communicate with "Lucius Ordo" (Mr. C. Fowler, Leeds), requesting him to furnish the Board with a new design for a school to accommodate 800 children; and that, after the design had been received, the committee be empowered to instruct some competent person to estimate the cost of the building on the new plan, and then report the whole matter to the Board. The minutes were confirmed.

THE TRADES MOVEMENT.

Birmingham.—A conference of the master builders and operative bricklayers and stonemasons of Birmingham has taken place in the room of the Builders' Association. At the end of last year the plasterers, carpenters, and labourers gave notice for a reduction in the hours of labour and an increase in the rate of wages, which was referred to Mr. Rupert Kettle as arbitrator, who gave a decision in favour of the men. As the bricklayers and stonemasons did not give the necessary notice at the proper time, they were bound to adhere to the existing terms for the present year. The masters, however, offered to advance the wages of the men one halfpenny per hour, making 7*d.*, and reduce the hours to 5*h.* per week. The stonemasons accepted the offer made by the masters; and the bricklayers, finding it impossible to obtain the advance they required (7*d.*), agreed to accept the terms offered by the masters, at the same time stating that they should give notice at the end of the year for a further advance.

Leeds.—It was anticipated last week that the bricklayers of Leeds would turn out, the dispute between them and the masters turning upon the question of a further increase in the rate of pay of 4*d.* per hour, which the men demand and the masters refuse to give. Six months ago, when the rate of pay was 6*d.* per hour, the operatives made a demand of 1*d.* advance, the employers conceded 4*d.*, which was accepted by the men, they, however, giving notice at the same time that at the end of six months they would demand the other 4*d.* At the same time they submitted a code of rules. In view of the near approach of the expiry of the notice, and in order to endeavour to arrive at an amicable settlement, a conference was held between deputations of the masters and men, and the result of the interview was an arrangement with regard to the rules, but no settlement could be arrived at in regard to the further advance demanded. The masters offered to give 4*d.*, making the rate of payment 7*d.* per hour; but the men stating that they had no authority to accept less than the halfpenny, the conference terminated. A meeting of employers, which was well attended, has since been held, for the purpose of hearing the report of the deputation with regard to their interview with the men. After hearing this report, the meeting passed the following resolution unanimously:—"That the offer made by the deputation on behalf of the masters of 7*d.* per hour to the operative bricklayers be withdrawn." During the meeting a communication was received from the Brickmakers' Association, who were also holding a meeting at the Nag's Head, enclosing a resolution as follows:—"That the members of this association (brickmakers) pledge themselves not to supply any bricks to master builders or bricklayers who are not members of the Builders' Association during any dispute or strike that may arise between the master bricklayers and their men." Thereupon the meeting of master bricklayers resolved,— "That this meeting presents its best thanks to the Brickmakers' Association, and that a list of the members of this association be forwarded to the chairman of the Brickmakers' Association." Several gentlemen not before connected with the association attended the meeting and enrolled themselves as members, expressing their determination to stand by the association.

York.—Nearly three months ago the building trades of York struck for advance of wages and diminution of hours of labour, but after remaining out for several weeks, the masons and bricklayers went in at the concession offered by the masters. The carpenters, however, still remain

out on strike, their demands being fifty-three hours per week, and 6*d.* per hour; while the employers offer fifty-three hours per week, and 6*d.* per hour. There appears to be little prospect of settlement; for, whilst the masters are advertising for hands from distant places, the men are taking the same course, and cautioning carpenters not to visit the city.

Edinburgh.—A meeting of the master builders of Edinburgh has been held for the purpose of considering the following circular, which had been received from the operative masons in the city:—"We are directed by the members of the Edinburgh and Leith Lodges of the United Operative Masons' Association of Scotland to inform you that, after much consideration, they have come to the conclusion that the following bye-laws should be introduced.—1st. Wages to be paid weekly, and on the job, before dropping time on pay-days. 2nd. That sufficient shed accommodation be provided for both hewers and builders in wet weather, and proper plates kept hot for heating tea and coffee at the meal hours. In the event of this circular not being returned, duly signed by you, before Friday, May 3rd, 1872, we will consider you not favourable to the foregoing proposed bye-laws.—By order, William Armstrong, chairman; Thomas Walker, secretary." Mr. James Steele, builder, occupied the chair; and after some discussion, it was agreed that the master builders should meet the demands of the operatives as embodied in their circular, "so far as they possibly could, and in the most liberal spirit, although they considered some of the demands unreasonable."

Dumfries.—The whole of the journeyman masons in Dumfries not previously on strike have now struck work. There were meetings of masters and men, in order to come to an agreement as to the matters in dispute, which are the employing of slaters to point walls and the nine-hours limit. In regard to the latter, the men wanted the alteration to commence on the 1st of May, without any advance of wages. The masters were willing to grant the change on the 1st of August, and give 4*d.* per hour advance. A deputation of the men waited on the masters' meeting, and intimated that they accepted these terms, provided the masters would agree henceforth not to employ slaters in pointing. The masters declined to comply with this demand, and the men resolved to strike, and to withdraw the proposal to accept the nine hours on the 1st of August.

THE PRESERVATION OF NATIONAL MONUMENTS.

A PAPER on this subject was recently read by Mr. Robert Young, C.E., at a meeting of the Natural History and Philosophical Society, Belfast. In the course of it Mr. Young said,—

A nation's life may be said to be recorded in its monuments,—using the word in the widest sense, to include everything bearing the impress of man's hand and brain. The earthworks of our own island, which are variously known as duns, raths, lises, forts, or moats; the cromlechs, menhirs, and rude stone circles of the earliest times; the round towers, sculptured crosses, anchorite cells, and churches and castles, from the sixth to the fifteenth century, would all be included in this category as historical monuments. Without going the length of saying that the destruction of any one of the thousands of monuments thus referred to would be a serious national loss, it would be a perfectly correct statement as applied to the destruction of a number of the same class, as of the round towers, or the earliest churches, or stone-roofed cells, or again, as applied to the case of a monument which is unique or very rare, as our Giant's Ring at Drumbo, or the great rath at Downpatrick and Moylena, near Antrim, both of which are intimately associated with early Irish records of the greatest interest.

To take an illustration from what has occurred in our own neighbourhood within the last generation. The destruction of Trummery Round Tower was a national loss, as from the drawings which represent its aspect some thirty years ago, it seems to have been of quite a peculiar type, the only other tower then resembling it being at Dungiven, county Derry; but this, sad to tell, has also been swept away; both might have been saved by care.

Not far from Trummery, but on the south side of the town of Moira, there stood, on the edge of the chalk cliff which here overhangs the Lagan, a very fine mound enclosed by several rings; in fact, it was the Moy-rath (Moira),

which gave its name to the district, and to the famous battle in which Congall was slain. The levelling of this some years ago by the tenant of the lands in which it stood, did not possibly create much indignation in the neighbourhood; still it was an outrage, and a loss which will be felt more and more as education spreads, and a better taste prevails.

The modern school of farmers, and more especially those who have lately migrated from Scotland, with their desire for level ground for their sowing and reaping, are very much inclined to clear off all protuberances, whether prehistoric or recent, and grub up and cart away, or, what equally offends the archaeologist, bury in a deeply-dug pit the standing-stone or cromlech that interrupts the even tenor of his patent plough. To men of this type there is no appeal except through their pockets; but, fortunately for modern antiquaries, it was very different with the old Irish farmer, who had both superstitions and sentiments, the one making him dread the vengeance of the "little folk," if he put a spade into the old rath, and the other causing him to respect the ruined chapel or wayside cross which was from childhood associated with his religious ideas.

Whilst these sentiments are rapidly losing their hold all over the country, it is much to be wished that more correct notions of the real value to the community of these remains should be implanted in their stead. Why should there not be brief notices of the principal antiquities of our country placed in the books of lessons for the National schools of the three kingdoms? And along with this could there not be some instruction in this subject given to the teachers both at the head training establishments and in the model schools, by a properly-qualified professor? If this were done (and there really seems no good reason why it should not be), a very few years would bring about a marked improvement in the feeling of the lower classes towards these objects.

TURNER'S DRAWINGS.

The extraordinary prices realised by Turner's drawings in the Gillott sale, on the 4th inst., compels me to remind you that you some years ago published a letter of mine warning the possessors of these wonderful works of the fugitive nature of some of the colouring materials used by Turner in his water-colour pictures. The astonishingly increased value set upon them by purchasers seems to render needful a repetition of my detailed statement, published in the *Builder* at a time when Turner's drawings could not be sold for as many hundreds as they now fetch thousands. The "Bamborough Castle," Turner made for me for 100 guineas. As far as the subject is concerned ("Morning after a Storm") it was done from a very slight sketch of David Cox's, which I supplied to Turner. It was four years in hand; and Turner, when it was completed, said he had more than half-finished another from the same suggestion, which he had laid aside for the one he let me have. I suppose the unfinished was a very different thing, for he said I had better let him finish that also for me. Now, sir, with regard to the fading, my former letter to you on the subject will show that I had one other of the drawings, sold on Saturday for 1,210 guineas,—I gave 60l. or 70l. for it,—hanging for perhaps a year in a frame too small for it, so that on taking it out of the frame, to clean the glass, or for some other purpose, the margin which had been under the rebate of the frame, protected from the effect of light, was very much stronger and more vivid in effect than the rest of the picture, which, by comparison, was seen to have greatly faded. My letter went on to say that I took the drawing up to London, for the purpose of showing it to Turner, and that on calling on him, without the drawing, I met, at his house, in Queen Anne-street, the gentleman from whom I had the drawing. When Turner "pooh-poohed" my report of the fading, I asked him and the vendor of the drawing if they would wait together for an hour, that they might see and judge. They very willingly did so, and on my throwing the drawing on the table, Turner said, "I will never make another water-colour drawing." I replied, "There is no need for that; but let me beg of you never more to use indigo. The drawing before us shows that it is not the colour, but the light and shade which have so miserably perished, and any one can see that the whole effect of light and

dark is given by indigo." "Well," he replied, "what else can I use?" I said, "I suppose there is nothing which would so exactly suit your purpose if it could stand, but you must make shift with cochal, which you use freely enough as colour, though not as shade." Then he reminded me that in the days of Girtin they had nothing they could use but indigo. "True," I replied, "and you show me a single framed and glazed Girtin drawing, or Turner drawing of the Girtin period, that has not become feeble in the grey, and foxy in the warm parts, because of the fugitiveness of the indigo, and the permanency of the iron pigments?" Those who knew me at the time when I made the discovery of the fading of the drawing in question, know that I made no secret of it, but, on the contrary, spoke out at once to my numerous Turner collecting friends; but neither that nor my letter to the *Builder* in years gone by seems to have damped the ardour of those by whom these over-rich picture-collecting people are led captive at their will.

J. H. M.

THE PROPOSED NEW BUILDINGS AT ST. LUKE'S WORKHOUSE.

The guardians of the Holborn Union have just placed themselves in a somewhat questionable position by rescinding the resolution passed on the 20th of March, adopting the recommendation of the building committee to proceed forthwith with the administrative block of new buildings at the City-road workhouse, at an expense of 7,500l. It was urged by those in favour of the resolution being rescinded, that they were not in a financial position to proceed with the buildings, nor were they required, as there was a great decrease of pauperism in the union; but it was contended, on the other hand, that the Farringdon-road workhouse was in a state of decay, and they did not know how soon it might be condemned; and it was further alleged that, by the workhouses being amalgamated, there would be a saving of 1,669l. a year, and matters would be better managed. It was also shown that, as they were allowed to dispose of the Bath-street property on the clear understanding that they were to erect a new block at St. Luke's Workhouse; and, as the plans had been approved by the local Government Board; a refusal to erect the building now would be a breach of faith, and that they would find themselves in an awkward position with the Local Government Board. The clerk informed the guardians that, if they failed to erect the new buildings, the Local Government had power to employ men to do it for themselves; but notwithstanding this advice, the resolution that the building be proceeded with was rescinded.

THE CONNEXION OF ART AND SCIENCE.

At the Academy dinner on Saturday last Professor Tyndall said, happily; there is no reason why art and science should not dwell together in amity; for, though they are both sutors of the same mistress, Nature, they are so in a sense and fashion which preclude the thought of jealousy on either side. You love her for her beauty, we for her order and her truth; but I trust that neither of us is so narrow-hearted as to entirely exclude from himself the feelings which belong to the other. Indeed, each is necessary to the completion of the other. The dry light of the intellect, the warm glow of the emotions, the refined exaltation of the æsthetic faculty, are all part and parcel of human nature; and to be complete we must be capable of enjoying them all. Trust me that we, whose light on earth is for the most part that dry light to which I have referred, often seek, and sometimes have, "glimpses that make us less forlorn" of those aspects of nature which reveal themselves in all their fulness to the eyes of art. We need such glimpses as a compensation for much that the times have taken away from us. There are some of us, workers in science, who largely share the poet's yearning to "hear old Triton blow his wreathed horn," and who, nevertheless, in opposition to natural bias, have been compelled to give up, not only Triton, but many later forms of the power which for a time assumed his shape. Emptied of the hopes and pleasures flowing from such conceptions, we stand in more special need of all that nature has to offer in the way of grandeur and beauty, of all that history has to offer in the way of strength and inspiration, and of such interpretations by men of genius of

nature, history, and contemporary life as at this moment adorn these walls. If I might employ, in a sense so qualified as to render me sincere in using it, a form of language familiar to you all, I would say that we interpret these works of genius, these achievements in which our best men embody their highest efforts, as the outcome of the cultivated, but at the same time inborn and unpurchaseable gift of God. For though the labourer be worthy of his hire, and though the leaders both in arts and science may now by good right make pleasant terms with the world, they reached the position which enables them to do this, through periods of labour and resolute self-denial, during which their arts and their science were to them all in all; and reward was the necessary incident and not the motive power of their lives.

SIR CHRISTOPHER WREN'S SISTER.

Has it ever been accounted for why there is no mention in "Parentalia" of Anne, one of the sisters of Sir Christopher Wren? From an inscription at Strocham Church, in the Isle of Ely, it would appear that she is buried there. It runs thus: "Anna filia Christophori Wren, dec. Windsor et Wolverhampton, uxor Henr. Brounsell, LL.D., et mater Henr. Christophori, qui hic sepultus; et Anna adhuc supersitit, exigne quidem molis; sed genuinum istis magis pretii est virtutis; vitam egit alius juvenissimum, sibi unquam acerbam propter varios corporis dolores, quos admirabili patientia et æquanimiter perpessa, animam placidissimè Dec reddidit 27 die Febr. A.D. 1667, æt. sue 33."

She was born, like her great brother, in Knoyle, in Wilts, of which place Sir Christopher's father was rector, and her name appears in the parish register (1634). She married a Dr. Henry Brounsell, Prebendary of Ely and Rector of Strocham, in the Isle of Ely, where he was buried in 1678. As may be seen from the inscription, she died in 1667.

Perhaps the reproduction of these simple facts of history at a time when the "completion" (?) of St. Paul's is attracting so much attention, may elicit some further notice concerning the family and the descendants of the great architect.

SVO MATTE.

THE HARMONY OF NATURAL LAWS.

It may be accepted as an axiom in art, with the few exceptions which substantiate the truth of natural laws, and the harmony and beauty of natural ornament, that what is beautiful in form is substantially correct in construction. A subtle sympathy seems to exist between the purpose for which a structure is designed and the materials of which it should be composed; at once the key-stone of its beauty and its strength. It is this which creates in the mind of a true artist a feeling of disgust for the stucco abominations of speculative builders, and causes, even to the uneducated eye, a disagreeable sensation of fear on looking at anything which is structurally incorrect, without, perhaps, being aware of the existence of the error. The form of the arch which gives to a building the appearance of grace and lightness possesses the greatest properties of strength; it is true that the latter qualification might be possessed by a horizontal beam of iron; but it would be at the sacrifice of truth and beauty unless it outwardly declared the truth of the material. The beauty of the character of Moresque architecture is destroyed by the apparent instability of the horseshoe arch, and it need scarcely be added that this principle of construction is incorrect.

The mathematical regularity of the parabolic curve is the basis upon which the strongest engineering works have been erected; and this curve, which is the beautiful outline of a conic section, is that which is traversed by the projectile, and followed with undeviating accuracy by the jet of water. In the modern use of iron it has enabled the engineer to calculate with the greatest precision, and without any waste of material or falsely-exerted power, the proportions of these gigantic structures which cross some of the widest rivers in the world; and it is, as it were, the natural rout by which the strain which is brought upon the structure is transmitted to its supports. Suspend a rope from any height and it falls into the beautiful and natural catenary curve upon which the principals of a suspension bridge are formed. There is no falsehood, no weakness, no deception in these laws. The weakness is always in the workmanship of man. It

cannot exist in the beauty and simplicity of their action, or in the unity and harmony of their power.

When several streams of water are collected and confined, it may be from many natural causes, the engineer knows that he is dealing with a power like that of Frankenstein: that having created it he must properly employ its proclivities or it will retaliate through its own *noted* laws upon its creator. "Natural processes come to us," says Professor Tyndall, "in a mixed manner, and to the un instructed mind are a mass of unintelligible confusion. Suppose half a dozen of the best musical performers to be placed in the same room, each playing his own instrument to perfection: though each individual instrument might be a well-spring of melody, still the mixture of all would produce a mere noise. Thus it is with the processes of nature. In nature, mechanical and molecular laws mingle and create apparent confusion. Their mixture constitutes what may be called the noise of natural laws, and it is the vocation of the man of science to resolve this noise into its components, and thus to detect the 'music' in which the foundations of nature have been laid."

We have only to refer to the study of astronomy to illustrate the harmony and regularity of nature's laws, the discoveries which rewarded the patient labours of Kopler and Tyco Brahe, and in later years, those of the two Herschels. We may see, in the most simple works of nature, in her diversity of form, in her combinations of curve and colour, the music in which, as Professor Tyndall says, the foundations of nature are laid. In the strange analogy now known to exist between the waves of sound and the waves of light calling colour into existence, so that we may actually detect the artistic merit of a picture by that which, long before this singular similarity of the noises of the chromatic and harmonic scales was detected, we know as the harmony of colour. In the proportions of a tree it will be found that the sectional area of the stem is equal to that of its limbs combined; and if the stem branches into three their total area is equal to that of the stem itself; and this extends to the smallest twig upon the topmost bough.

In the haste to become rich, in the consequent necessity of evading the labour and patience of research, these lessons are frequently forgotten, outcroppings of falsehood and error are accumulated, and the promise is never realised, "Ye shall know the truth, and the truth shall make you free."

In contradistinction to this, the man of science is reminded that he is not working for himself alone, and it may be, not exclusively for the age in which he lives, but that future generations may be saved the labour of a lifetime by his additions to science, and the health and moral advancement of a nation be increased; while the artist (and it is almost impossible, as it has been shown, to separate the man of science from the artist) will improve the surroundings of his fellows by his adaptation of Nature's works in forms of beauty, and, by the means of natural laws, increase the happiness and prosperity of man; for ugliness, it matters not in what it may exist, is not only unpleasant to behold, but it is morally depraving to the mind.

BING CHAUD.

TECHNICAL TERMS AND "STANDARD" DICTIONARIES.

WHENEVER the technical dictionary appears I think its compilers will not be a little indebted to the labours of the *Builder*, and I venture to say that they will commit no small oversight should they omit to consult its many volumes. I say this much because I feel my own indebtedness to its pages, extending over a number of years, represents a considerable amount of practical information obtained, and a cultivated love of study and research, which I would never have otherwise acquired.

This aside for the present. My object now is not to pour out a volume of unmitigated abuse on the heads of our technical teachers and dictionary emendators, but to try and lead to the correction of these correctors, some of whom much need to stand corrected.

Before me as I write lies a new edition of a work entitled "The Standard Pronouncing Dictionary of the English Language." The title-page announces that it is based on the labours of Worcester, Richardson, Webster, Goodrich, Johnson, Walker, Cunig, Ozilvie, French, and other

eminent lexicographers. Here is a goodly host of authorities as auxiliaries to the editor's labour. He tells us, moreover, that there are many thousand words which modern literature, science, art and fashion have called into existence, embraced in this new edition. Well, I will confine my remarks to one of those branches which may be included under the term of arts or handicrafts specially belonging to my province.

Now for a few technical specimens, which will call for further comment hereafter:—

"Plane, s.—In joinery, an instrument used in smoothing boards."—Wrong.

"Plank, s.—A broad piece of sawn timber." Not a correct definition.

"Balk, s.—A great beam or rafter." Wrong again.

"Lintel, s.—The head-piece of a door or window-frame, the part of the frame that lies on the side pieces."—Doubly wrong.

"Rabbet, s.—In carpentry a joint, a groove cut longitudinally in a piece of timber to receive the edge of a plank."—Wrong again, though in part right.

"Joiner, s.—A long plane used by joiners to smooth surfaces, the largest smoothing plane used by carpenters and joiners."—Wrong again.

"Batten, s.—A piece of board or scantling of a few inches in breadth."—Not a correct definition.

"Deal, s.—A pine board or plank." Not a clear or full meaning.

"Board, s.—A piece of timber sawed thin, of considerable length, and usually between 1 and 9 inches in breadth."—Not a clear explanation.

"Rib, s.—In ship-building a piece of timber for strengthening."—Incomplete and misleading. What about loose building.

"Riser, s.—Among joiners the upright board of a stair."—See "Step."

"Step, s.—A stair, the round of a ladder."—Incomplete and misleading.

"Pilaster, s.—A square column usually set within a wall."—Wrong again.

"Newel, s.—In architecture the upright post about which are formed winding stairs."—Clumsy definition; also, newels are used with stairs that do not wind.

"Traverse, s.—In architecture a gallery or loft of communication in any large building."—Means a great deal more both in architecture and joinery: and the above is not the usual meaning.

"Ladders, s.—In architecture pieces of timber used to support the platform of scaffolding."—What else in stonework?

"Strut, s.—In architecture a piece of timber obliquely placed to support a rafter."—What about partitions, floors, &c.; and are struts always placed obliquely?

"Standard, s.—In carpentry an upright support."—Short, clear, and sweet, is it not? What about its many meanings in ecclesiastical architecture, chests, staveions, the ends of oak benches and pews, massive candlesticks, &c.?

So much for the "Standard" dictionary. I might multiply instances to a very great number, but I have refrained on the present occasion from producing all the bad examples. In those words I have selected some are entirely wrong, some more passable though incomplete, and more in that confused or vexatious position that is sometimes not imaptly termed "neither right nor wrong." When so many examples can be selected belonging to the domain of the architectural and building professions it is only reasonable to infer that the practical and professional men belonging to various other professions would find no difficulty in gleanings a number of wrong terms bearing upon their branches.

A dictionary, like an art, is not the growth of a day; it must grow with the language of a people, and be ever ready to interpret their wants. Dictionaries are things that are never made, though always in process of manufacture, and lexicographers are but compilers, collectors, and collators. It would be well, therefore, when technical terms in general use are about to be included in a "Standard" work, that the compilers of these dictionaries, and their publishers too, should consult a council of living, practical men, instead of merely referring to a collection of, in many cases, doubtful authorities. Had one experienced architect and one intelligent and practical artisan in the building trade been consulted when this "Standard" dictionary was compiling, its editor would not have fallen into some scores of errors connected with architecture, and terms used in the routine of building and the workshop.

It was my intention when I began these remarks to supply proper definitions in place of those given, but on second thought I do not see that I am justified in occupying space in the *Builder* in doing work that some lexicographers have already been paid for (not) doing.

Every schoolmaster now-a-days thinks he can write manuals of *typillum* on the whole circle of the sciences. In architecture, engineering, and the cognate branches, I at least know what has been attempted and the result. How very few of these works which have lately flooded the country are really useful to architects, engineers, or mechanics. A technical dictionary is, therefore, one of the wants of our time.

A CRAFTSMAN.

A HINT TO THE CITY GUILDS.

RECENTLY, though not for the first time, we directed attention to the position of the City guilds or companies, pointed out some of their defects, and briefly mapped out a plan of action that the majority of them might pursue with credit to themselves in the cause of education and art. We have been glad to note that a few of them whose names are associated with the building profession, and one or two outside of it, have made a move. Since the appearance of our last notice, we have been at some trouble in investigating the administrative machinery of some of these City companies, originally formed for skilled trade purposes, and the result of our inquiries irresistibly leads to the conclusion that one and all of them must undergo a radical reform.

These guilds number very little short of a hundred, and their income and property otherwise represent some millions. Their courts are self-elected, and there is a family relationship among a great number of their members. The money which they hold and disburse has been left from age to age in their keeping, and was given originally for the purpose of charity, education, and apprenticeship, and it is only the simple truth to say that they are no more than trustees to these funds. A Parliamentary Commission seems indispensable, as well as unavoidable.

We find that some of these companies, which it is hardly necessary to name, are *de facto* trading companies, trading on the funds, and yet not amenable to the laws of trading companies; but there are other facts of a different complexion which will not bear the light or brunt of public criticism.

The companies are to a great extent "feeders" to the municipal council, and municipal councils, we know, are now required by law to permit a proper audit of their accounts. To what extent have these minor corporations complied with these requirements, which are an absolute necessity in these suspicious and searching days, or on what ground can they claim an immunity from this fair and open order? None that we know of. Large sums of money are voted away annually in these courts to fellow associates for merely taking a part in the honourable office of administering charity funds. Then we have expensive dinners to crown these labours, votes of thanks and addresses emblazoned in gold, and portraits taken of men who have done little more than make a speech and feed upon charitable trusts. This is surely not right. Occasional dinners or refreshments, within decent limits, are good; but there is no excuse at present for the lavish expenditure and the impractical action of some City Guilds.

In the internal clockwork and elective rule of these companies there are matters which form a grievance on the part of those lamely connected. Some of these companies compel men to be free, to take up their *livery*; and many of the poor freemen are complaining of being forced to pay what is known as *quittance*. Resistance to these exactions brings results down on the heads of the offenders, which are unpleasant for them to bear.

Outside of all this internal economy the broad question before the public is, how long are the ancient handicraft guilds of London to remain in their present anomalous position? Will they move, and more at once, of their own accord, while they can do so with credit and safety, or will they procrastinate until a Minute of Council wakes them up to a sense of their insincerity, and a thunder-bolt immediately follows, in the form of a Commission? How often do the guilds require to be warned, and warned, too, by their friends, and not their enemies? We can see at a glance what they might and could do

VENTILATING DOUBLE FIREPLACE FOR HOSPITALS.

and, as a beginning has been made by some, why do not the others hasten and follow the good suit? The cause of technical education, art, and trade, and its direct encouragement, are within their province, and the labour is easy. There is a large amount of landed estate in this country and in the north of Ireland. In Londonderry, for instance, the Salters', and, we believe, other companies, hold estates which have formed more than once a subject of discussion as to their management.

We might point out what vast good these companies could effect for the agricultural interests, as well as the mechanical and manufacturing interests, of the British Empire, if an earnest resolve were made on their part. Changes must be made. Self-elected courts, composed of governing bodies numbering from ten to fifteen persons, and under, have often the entire control of immense sums, and are, from the nature of their composition, quite irresponsible. It is not to be expected that such a state of things can much longer last. Let the courts look to it themselves, and at once.

VENTILATING DOUBLE FIREPLACE FOR PROVISIONAL HOSPITALS.

We have received from the Surgeon General's Office of the American War Department a Report on Barracks and Hospitals, also a Circular giving plans and specifications for Post Hospitals. These include some valuable information, and we may find an opportunity to return to them. Our present purpose is to illustrate a cheap ventilating fireplace which is described in the Circular. The instructions are that at all posts where con-

tinuous artificial heat is required for three months in the year the wards will be ceiled and have boxed openings carried from the centre of the ceiling to the ridge for summer ventilation. There will be two of these openings, each 10 ft. long by 2½ ft. wide, and 10 ft. apart. In winter the heating will be effected by a ventilating double fireplace, the form of which is shown in our engraving.

It consists essentially of two open fireplaces, placed back to back in the centre of the ward, and enclosing an air-chamber between them. This air-chamber opens above into the ward by two pipes, controlled by registers, and communicates below with an air-box, 18 in. square, which passes underneath the floor of the ward from side to side, and the ends of which open to the external air.

The pipe from this ventilating fireplace, 8 in. in diameter, passes up through a close-fitting earthen tube or collar in the ceiling. One foot above the ceiling it enters a shaft or jacket about 21 in. in diameter, which pierces the roof, and, extending 4 ft. above it, is covered with a sheet-iron cap, which in its turn is pierced by the stove-pipe, which will be capped in like manner. This shaft through which the stove-pipe passes should be of clay or earthenware, but if a wooden shaft be used a sheet-iron tube 18 in. in diameter, should intervene between the stove-pipe and the wooden tube. At each end of the ward, and 2 ft. from the centre, will be an opening in the ceiling 1 ft. square, from which an air-box will pass to a box enclosing the lower mouth of the tube surrounding the stove-pipe. The heat of the pipe above the ceiling will thus create a continuous upward current in the surrounding tube, which will be supplied by the vitiated air from the ward through the air-boxes.

CONGREGATIONAL MEMORIAL HALL AND LIBRARY, FARRINGDON-STREET, LONDON.

The first stone of the Memorial Hall is to be laid this Friday, the 10th of May. The building will contain twenty-seven offices, including board-rooms and committee-rooms to be used by the various societies in connexion with the denomination; a library (58 ft. by 45 ft.); with gallery, and a hall for meetings, &c. (87 ft. by 45 ft.), which will also be used for public worship, and, with galleries, will accommodate about 1,500 persons; and a spacious hall and staircase, with entrance lobbies from Farringdon-street. There are also a commodious entrance and staircase at the back from Fleet-lane. Provision is made for lavatories and other conveniences. There are also apartments for hall-keeper. The library, hall, staircases, and passages will be constructed on fire-proof principles; and the whole of the basement will be vaulted with brick arches, forming extensive warerooms and cellars, with entrances entirely separate from the other entrances to the premises. The outside of the walls above the plinth will be built with Devonshire Limestone in drop courses; the plinth in Aberdeen grey granite surmounted by a bold moulding in red granite.

The jambs, mullions, and heads of the doors and windows will be executed in Portland stone, and the whole of the joiners' work in pitch pine.

The architects are Messrs. John Tarring & Son, of Basinghall-street, London.

The tender of Messrs. Jackson & Shaw, at something under 28,000*l.*, has been accepted.*

* A list of the tenders will be found on another page.

CONGREGATIONAL MEMORIAL HALL, FARRINGTON-STREET, LONDON.—MESSRS. JOHN TARRING & SON, ARCHITECTS.

ARCHEOLOGICAL SOCIETIES.

The Chester Archaeological Society.—A meeting of the members of the Chester Archaeological and Historic Society has been held in the old Bishop's Palace, to hear a paper read by Mr. C. W. Duncan, on "Ancient English Land Tenures, with illustrations from the history of the County Palatine of Chester." The chair was occupied by Mr. Sheriff Gerrard. A vote of thanks was passed to Mr. Duncan for his paper, and to the sheriff for presiding, and also for presenting the society with a medical MS.

Norfolk and Norwich Archaeological Society.—The annual meeting of the members of this society was held at the Guildhall. Sir F. G. M. Boileau, bart., occupied the chair. The secretary (the Rev. C. R. Manning) read the report. The treasurer (Mr. Fitch) read the cash account, from which it appeared that the year commenced with a balance in hand of 41l. 14s. 6d. Three coloured drawings of six of the figures upon the panels of a rood-screen at Fritton were exhibited by Mr. Fitch, who read a paper descriptive of them, written by the Rev. R. Hart. Another coloured drawing of two figures painted upon a panel of Barton Turf rood-screen was exhibited, and a paper by Mr. J. Gunn, describing one figure, that of St. Citha, was read by the Rev. C. R. Manning, in the absence of that gentleman. The Rev. A. G. Legge, vicar of North Elmham, exhibited a collection of pieces of pottery, stained glass, ornamental tiles, thimbles, a portion of a weapon, and other relics found upon the site of the old castle at North Elmham, hilted by Bishop Spencer, in the time of Richard II. Mr. T. G. Bayfield exhibited a portion of a rood-screen (which he had framed) and respecting which he read some remarks. Mr. Bayfield also showed other panels, which were also described. Mr. Fitch exhibited three original drawings, by Kirkpatrick, of brasses once in the Church of St. Clement, Norwich; some coloured drawings of figures on the rood-screen of the Church of St. John de Sepulchre; and the manuscript book of Mr. T. Tawell, founder of the Blind Hospital. Mr. Morant exhibited a tray of curious old keys, locks, a fibula, flint and bronze instruments, and other curiosities.

WORCESTER DIOCESAN ARCHITECTURAL SOCIETY.

The annual meeting of this society has been held in the Council-room of the Natural History Society. There were present—Mr. G. J. A. Walker, Vice-president (in the chair), the Revs. W. Thorn, T. G. Currier, C. Bontell, H. Kingsford, T. J. King, and H. G. Pepps; Messrs. Hyla Holden, E. Lees, H. J. Vernon; J. Severn Walker and G. S. Munn (hon. secs.). Mr. Severn Walker read the annual report, which says, in respect to the cathedral:—

"The most important work executed at the cathedral during the past year is the polychromatic decoration of the choir and sanctuary vaulting. On a buff or vellum ground extends scroll-work in more decided colours, interspersed with silver stars, medallions of angels and saints, on a blue ground, &c. Over the sanctuary our Lord is surrounded by rays of glory and groups of angels, SS. Peter, Paul, John, and James, being represented in the angles. The whole has a rich appearance, without being heavy enough to diminish the apparent height of the interior, which is often the effect of colour on ceilings when not judiciously applied. A satisfactory opinion of what will be the full effect of this decoration cannot, however, be formed so long as the choir remains in its present incomplete state, and the vaulting stands almost alone in being thus decorated. The stalls, with their interesting *miserere*s, have been admirably restored, re-fixed, and provided with new carved oak desks and subsella, of excellent workmanship. The throne and the side screens are nearly completed, a rich marble and the pavement is being prepared by Messrs. Poole, of London, and great progress has been made with the arrangements for lighting the cathedral with gas. The finials are now in perfect order, and the clock has been fixed and in admirable working condition some time. The great hour-kell, when struck, is heard at a considerable distance, and is universally acknowledged to be a most acceptable boon to the inhabitants of the city and surrounding neighbourhood. Mr. Aldis, of Worcester, has taken a series of brilliant photographs of the miserere carvings, with the remarkable stone sculptures in the wall arcades of the eastern transept and the Lady Chapel, and the eastern

panels and statues, from the Chantry Chapel of Prince Arthur, which he intends publishing by subscription in a 4to. volume, under the able editorship of the Rev. Charles Bontell, M.A."

The meeting unanimously adopted the report. The president, vice-president, auditor, secretaries, and other officers were re-elected.

The Rev. W. J. Blew, M.A., was elected an honorary member of the society.

It was decided that the next excursion should be to Wenlock and Buildwas.

On the motion of the Rev. W. Thorn, seconded by Mr. Lees, thanks were accorded to Mr. Severn Walker for services rendered to the society.

INFRINGEMENT OF A PATENT.

JUDGMENT has been delivered by the Lords Justices in the case of Murray v. Clayton, which came before their lordships by way of appeal from an order of Vice-Chancellor Bacon in Hilary Term. The bill prayed for an injunction to restrain the defendants from using or selling a brick-cutting machine which, the plaintiff contended, was substantially identical with a machine patented by himself. In the court below the bill was dismissed with costs, the Vice-Chancellor being of opinion that the plaintiff's claim to the novelty of his patent could not be sustained and that his specification was insufficient. His judgment was reversed by their lordships, who held that the plaintiff had established both the novelty and the utility of his patented invention, while the defendants had wholly failed to make out the case of alleged anticipation. The order of the Vice-Chancellor was discharged and replaced by an order granting the injunction as prayed for by the plaintiff.

INLAND SEA BATHING.

A BILL is now before the House of Commons for carrying out an idea suggested by me in the *Builder* for bringing water from Brighton by means of pipes. It will be as well to point out the necessity, in the case of such a lake being introduced as a feature in this scheme, that it will be necessary that a supply of fresh water be also supplied to the lake equal to the quantity of water lost by evaporation, as, otherwise, the water evaporating and the salt remaining, the latter element will accumulate till the water acquires the specific gravity almost of quiescent brine, rendering it anything but desirable or healthy for bathing.

W. SCARLETT.

WORKING MEN AT THE INTERNATIONAL EXHIBITION.

Sir,—Will the authorities of South Kensington allow the working classes facilities for seeing this year's exhibition? Will they understand that it is almost impossible for workmen to visit it as they would wish with the same regulations as last year? It seems to be assumed that we only regard a visit there as a holiday recreation. This is a great mistake. We wish to pay a number of visits. We would like to inspect it thoroughly, but by the six o'clock closing we cannot do so. No sooner are we fairly there than (owing to the distance most of us live from it), it is nearly time to close. I found this the universal complaint last year.

The refreshments, too, why should they be on a scale suited only to the pockets of the middle and upper classes? Is this fair? Are we not entitled to better treatment? Is this the matter very plain indeed, is it honest? Was not the surplus that originated these yearly Exhibitions contributed to by all, and should not all be considered in the arrangements? Are we told of our ignorance, too, and want of taste. Is this the way to cure us?

OMYX A TAILOR.

COMPETITIONS BEGINNING TO PAY AT LAST.

Sir,—If you have space in your columns, I think you really ought to notify to your readers the extremely liberal offer now open to them. Seeing the advertisement of the Scarborough School Board, who wish to obtain plans for their schools in the most approved manner, I wrote as requested for particulars, and was informed by letter from their clerk, that on *payment of 5s. in stamps*, they would forward a plan of the site. Since then they advise competitors not to proceed with the plans of one of the schools until the site is approved. Will the competitors be entitled to demand the return of the 5s? It would be proper treatment of them, at all events.

"OLD STAGES."

THE TURNERS' COMPETITION.

Sir,—In your impression of April 6th, there is a letter from Mr. Barber, upon "the prizes offered by the Turners' Company," and with your permission I desire to make a few remarks upon the subject.

Firstly, with respect to competitions of working men, I quite approve of them. If England intends to keep up her name for handicraft, she must do something of the sort, or in time we shall more or less fall into that carelessness which many mechanics know exists to a great extent in the manufacture of articles too numerous to mention. I coincide with Mr. Barber as regards the way in which the competition in turnery was carried out last year. Not knowing whether work was to be polished or not, I wrote to the secretary, and his answer was, "not polished," so the articles I sent were unpolished, and the work which gained the prizes turned out to be polished wood and ivory! Now, most people know that work looks better when polished. Further, if the judges had made mention of second and third prizes, it would have been some encouragement to defeated competitors, and no doubt help them in their work or business; for I can assure you, Mr. Editor, that it is a great pull on the bank of a turner in the country to lose time in taking and bringing back his goods from London, and such were the

conditions. Again, I took mine, and also the efforts of my son, and had I not done so, the articles might have been served as others were—never unpacked at all, which savours of injustice, I think. I respectfully observe, invite all the competitors of last year to send their work again polished, and when the judges are awarding the prizes for this year, let them say which is second and third, or award the tribute of honourable mention. There is another circumstance I would wish to mention—the labels of some of the competitors were changed. To say the least, that was a movement that must have led to confusion, if nothing else.

JAMES STARBUCK.

LINE OF FRONT AND THE METROPOLITAN BOARD.

The Queen v. Vallbany.—The questions for the opinion of the Court of Queen's Bench, May 7th, in this case were whether the Thames Embankment, designated at the opening "The Victoria Embankment," was or was not to be considered, within the meaning of the Act, a "street;" and whether the superintending architect of the Metropolitan Board of Works had power to lay down a line which would have the effect of materially diminishing the space upon which it was intended to build the club-house.

A rule had been obtained, calling upon the superintending architect of the Metropolitan Board of Works to show cause why an order made by him on the 18th of December last should not be brought up by certiorari, with a view to its being quashed. It appeared that the masters of St. Stephen's Club had purchased of the Metropolitan District Railway Company the waste spot of ground at the corner of Bridge-street Westminster, and the Thames Embankment, whereon they proposed to erect a building for the purposes of the club. The Metropolitan Board of Works had laid down a general line of building on the spot, extending to the end of Mr. Horsman's house, at the end of Richmond-terrace, which abutted on the Embankment. Between that and Bridge-street there was only one other building, that of the Board of Control, and the question for the consideration of the Court was whether this was such a street or continuous line of buildings as gives the Metropolitan Board of Works power to instruct their superintending architect to lay down a line of building so as to insure uniformity. The superintending architect had laid down a line.

After viewing the site,—

The Lord Chief Justice said that he and his learned brothers had visited the spot, and they were of opinion that there was no pretence for saying that the ground in question was a street or place within the meaning of the Act that gives the Metropolitan Board of Works power to interfere. It was not a continuous line of buildings. Mr. Horsman's house considerably projected beyond the houses below it on the Embankment, and the Board of Control projected much farther. It must be an actual, and not an imaginary, line of buildings to bring the matter within the meaning of the Act. The rule would be made absolute to quash the order.

Order of the Board quashed accordingly.

SOME RECENT EVIDENCE ON THE INFLUENCE OF SEWAGE FARMS ON PUBLIC HEALTH.

Sir,—The recent inquiry at Slough into the expediency of acquiring land for sewage irrigation purposes disclosed some extraordinary evidence as to the influence of sewage farms upon public health. It was then stated, that when sewage farms had been inspected at periods when no notice had been given of the intended visit, they had invariably "all been in an offensive condition, and at almost all of them the sewage was allowed to flow into the neighbouring water-courses." This assertion, with regard to Rugby, has already been contradicted in the columns of the *Times*; but, admit it to be true, it shows that sewage can be successfully purified after notice is given: therefore such evidence only tends to show that there may be periods of mismanagement on sewage farms, but that with proper management no such state of things, as before said, can occur. Fortunately, in the interests of the advancement of sanitary science and sanitary agriculture, we have the evidence of the Rivers Pollution Commissioners, who, for a considerable period, and at unknown times, took samples of the effluent water from the irrigation works of Croxson, situated at Beddington and Norwood. The analyses of these samples show incontrovertibly that even with a moderate degree of attention, such works are successful in purifying sewage, and using up, for beneficial purposes, those matters so detrimental to health. With regard to the influence of these farms upon public health, the more closely this question is investigated, the more completely will it be found that instead of such works having a detrimental influence upon public health, the evidence collected tends in quite another direction. For example, at Norwood, which has its irrigation area of sixty acres within seventy yards of the nearest houses, and within 400 yards of the densely populated district of South Norwood, the works came into operation in the year 1866. The rate of mortality of the district of Norwood

for the six years previously to the use of the sewage farm was 18.71 per thousand; and for the six years subsequently to the execution of these works, the mortality has only been 13.25 per thousand. The irrigation works of Croydon proper, containing an area of 500 acres, are situated in the parish of Beddington, and in the hamlet of Wallington: the combined population of Beddington and Wallington at the last census was 2,845. At least one-fifth of the whole of this population reside within a quarter of a mile of the irrigation farm. I find, on looking over the register of the deaths of those districts, that between March, 1871, and the 1st of April of the present year, there have been in the districts of Beddington and Wallington only 26 deaths and 101 births, or the death-rate has been at the rate of 9.13 per thousand, and the birth-rate upwards of 35 per thousand. Of the 26 deaths there were but five in the immediate vicinity of the irrigation works, arising from the following causes:—one, disease of the lungs; one, disease of the brain; one, diarrhoea (an infant); one, anasarca; one, natural death. In the whole year there has been no death from typhoid or typhus fever, and but two deaths from scarlet fever, and these occurred in a portion of the district lying a mile and a half to the south-west of the irrigation farm, and separated therefrom by the river. In the year 1870, after some extraordinary evidence given before Parliament, as to the noxious effects of the Beddington Sewage Farm on the health of the neighbourhood, I was called upon by the Croydon Local Board to inquire into the sanitary state of the inhabitants, and the sanitary condition of the district in the immediate neighbourhood of the irrigation works at Beddington. I then found there were no cases of illness that could be ascribed to the influence of sewage irrigation works upon the inhabitants residing in the immediate vicinity; on the contrary, it was shown that in many cases the inhabitants had, upon the advice of the medical practitioners, abandoned the wells in the immediate vicinity of their houses, on account of the pollution from the neighbouring cesspools, and had recourse for their water to the wells which lie in the natural drainage area between the irrigation works and the River Wandle, and that the use of this water had not been attended with any outbreak of disease; but, on the contrary, its substitution for water known to be polluted by cesspool matter in every case was followed by beneficial effects. At the time of making that inquiry I received considerable assistance from residents in the neighbourhood, who came forward to hear testimony to the innocuous character of the works upon public health. One gentleman wrote, "I have lived here ten years (living near the sewage grounds, with a large family), and have had no disease, neither has there been seated disease in the locality." Dr. Shorthouse wrote, upon the same occasion, "I have practised here for upwards of nineteen years, and I believe I have attended families in every one of the houses named in the schedule of your report. Upwards of two-thirds of the inhabitants of those houses are patients of mine now; that is, I attend when anything is the matter; and, with a solitary exception, in all my experience I have never seen a single case of disease which could have arisen from miasmata emitted by sewage. I have attended different members of the families inhabiting those houses for all sorts of diseases; but, with the exception to which I shall refer, I never saw a case which could be traced to malaria emitted from sewage. The exception occurred in a family named Hodges, who inhabited a house which I believe you have numbered 29 in your schedule (now occupied by Woodall), and the members of that family (both mother and children) several times suffered from remittent fever." An examination of that particular house in which they had remittent fever showed that they had two cesspools on the premises, one of which was within the dwelling-house. If further evidence were required as to the innocuous character of sewage-farms on health, it may be taken from the state of things in Croydon itself. The sewage-farm of Croydon is located to the west of the town, or in the locality in which the prevailing winds would carry any miasmata to the town, did they arise; yet Croydon, with its population of nearly 60,000 persons, has had a rate of mortality during the average of the past ten years of a little over 18 per 1,000, which is a low rate of mortality unapproachable in any other town of similar population. It may be

taken as an established physiological fact that, in the rapid utilisation of the waste products which are cast off by the human species, as practised in sewage utilisation properly carried out, such works, instead of having a detrimental influence on health, can be shown to have quite a contrary effect. Indeed, it is now well known that air, water, or food, that has subserved the use of animals, and has thus ceased to promote animal life (having certainly become converted into matter destructive to its existence), has by this very process been made fit for the support of vegetable life. The vegetable kingdom utilises those waste elements which have been cast off by the animal kingdom, and after utilising them retains only those substances which the air or water had originally taken up from the animal, and in its turn again gives up the air, water, and food in a fit and healthful state for the use of man.

BALDWIN LATHAM, M.L.C.E.

THE ALEXANDRA BREWERY, MANCHESTER.

AN addition to the Alexandra Brewery, in Erskine-street, Hulme, Manchester, belonging to Mr. James Cronshaw, has just been completed, and opportunity has been taken to add to the architectural appearance of the building, as well as to introduce many improved appliances. The brew-house is in the form of a huge tower without floors, 46 ft. 9 in. square, and rising 120 ft. above the street. It contains two sets of vessels supported on beams, and the utensils of each set are placed one above the other. The process of brewing is commenced at the top, and is continued on the various stages as the liquor gravitates; thus pumping, which is supposed to injure the wort, is dispensed with. In each of three walls of the brew-house are inserted two arched openings, filled in with windows and louvres. Each opening is 34 ft. high by 8 ft. 9 in. wide. The roof is surmounted by a louvre turret, which affords a ready exit for the steam arising from the liquor-pans, and has on each side a dormer containing a window or loading door. The chimney is built up from the south-west angle of the tower, and has an altitude of 126 ft. The cooler adjoins the tower, is 80 ft. by 40 ft., and has a gangway round. Two working-rooms will ultimately contain fourteen rounds of 120 barrels each; these vessels are considerably above the ordinary size. The floors are fireproof, and covered with the Val-de-Travers asphalt pavement. The whole of the basement story, 11 ft. high, under the working-rooms and yards, has a vaulted covering, and is occupied as a store. The boiler-house and stabling are detached, and built in the yard. The style adopted is of an early Lombardian Gothic type. Stock brick facing is used to two of the elevations, and common to the others, finished with hack jointing, and relieved with blue Staffordshire and moulded red bricks and Colne stone dressings. The tower has a bold cornice, with trusses and string-course, of stone, an arcade of ornamental brick-work, and vitrified glazed green and red brick panels in the frieze. The chimney on plan is square, with canted angles, and has a capping of stone, with ornamental brick blocks under. The woodwork throughout is of red deal. Special attention has been given to facilities for thoroughly cleansing all vessels. The building has been designed and supervised by Mr. James Redford, architect, of Princess-street, Manchester. Mr. John Tomlinson, of Lucy-street, City-road, was the contractor.

LETTING PROPERTY IN THE CITY.

A DISCUSSION of between two and three hours' duration took place in the City Council, the other day, respecting the letting of City property, in the course of which it was alleged by several members of the council that the City Lands Committee proposed to let certain property under its value. It appeared that the committee had recommended that a lease of No. 2, Falcon-square should be granted to Mr. Petrus Mondon for eighty years, from Christmas, 1873, at 110l. per annum, his present rent being 40l. per annum, and several members opposed the proposal, Mr. Deputy Fowler stating that the property ought to be 140l. a year, and that he knew of a responsible person who would take it at that price. It appeared that the property had not been advertised; but this was explained by a statement that the lease did not expire until

December, 1873, and the committee supported their recommendation by stating that, along with the architect, they had viewed the property, and had come to the conclusion that when a good offer was made, of something like 300 per cent. more than they had already received, they had no right to keep the property in the market, and wait for two years, in the chance of getting an additional sum. Several amendments were proposed, with the view of defeating the proposal of the committee, and the prolonged discussion was animated and warm; but the recommendation of the committee was ultimately carried.

MID-LONDON RAILWAY.

AFTER a contest not surpassed in costliness by one in a hundred of the private Bills that came before Parliament, the Mid-London Bills were settled in Mr. Hardcastle's committee on Group I. of Railway Bills on Thursday afternoon. The committee declared the preamble of the main or eastern portion of the scheme not proved, but passed the western section, from Willesden to the Marble Arch. This is practically a rejection of the whole scheme, which has been presented to the committee with great power, care, and ability.

BIRMINGHAM SEWERAGE SCHEME.

THIS important scheme, which has been under consideration by a committee of the House of Commons for nearly three weeks, has been passed by the committee, but with very important modifications of the scheme as presented in the Bill.

FAIL OF A BUILDING IN PRESTON.

ON Saturday morning last, the large malt-kilns and storehouse belonging to Mr. Brown, situate in Canal-street, Preston, fell with a heavy crash, without previous warning. Fifteen men were in the place at the time, but all except two, named Crook and Hunt, escaped, the latter being buried in the ruins. The body of Crook, who leaves a wife and six children, was recovered, but Hunt's was not found till afterwards. Three adjoining cottages were destroyed. The loss is estimated at from 10,000l. to 12,000l. At the inquest, held on the 6th instant, Mr. James Tallis, contractor, said his men erected a great portion of the building, which he considered had been well erected. It was 50 ft. high, and was in two divisions. The rods were extended across the rooms. He attributed the cause of the building falling to the giving way of two relieving arches, which were put in the foundations before the building was erected. The abutment of the arches, he thought, had gone down, and the pressure of the walls had been on the centre of the arches, and so caused the wall to bulge out. The foundations of the tower were entirely on brickwork. The ground itself was of a soft, marshy description. He did not attribute the giving way of the building to the quantity of malt in it. If the cause of the building falling had been ascertained an hour before the accident, the walls could have been relieved of over a hundred tons pressure. There were from three to four hundred tons of malt in the building. The ages of the deceased having been proved, the coroner summed up, and the jury returned a verdict of "Accidental death."

ARCHITECTURAL ASSOCIATION.

THE general business meeting for the current session was held on Friday evening, the 3rd instant. It was decided to form classes at once for the study of geology, chemistry (experimental), and surveying and levelling with field work, if a sufficient number of members give their names before the 16th of May. The delegates to the Architectural Alliance for the past year attended, and reported that, in their opinion, it was advisable to maintain the Alliance, in any case, for the present, till it is seen how the Conference under the leading of the Royal Institute of British Architects succeeds in dealing with the questions to be brought before it. The Alliance, which first connected in some sort of bond the previously isolated provincial societies, and the Architectural Association, having rendered the Conference of last year feasible, had the delegates considered, and done real service, though no one felt any wish needlessly to call much attention to it now or for the future. After some discussion, a vote of thanks was passed to

them for their services; and Messrs. J. D. Mathews, T. M. Rickman, T. R. Smith, and R. P. Spiers were re-elected for the ensuing year.

Mr. T. R. Smith, representative of the Association on the Committee of Selection at the International Exhibition, 1872, reported to the meeting; and complained of the few suitable drawings submitted. Out of twelve screens allotted only five had been used. He hoped that the exhibition of drawings, which is, in practice, more thoroughly under the control of the architectural profession than any other in London, and is held in well-appointed buildings, visited by large numbers of people, would be more enthusiastically supported in future years.

Other business, of no general interest, was transacted. The paper by Mr. G. Aitchison, on "Coloured Decoration," was postponed, at his request.

ROMAN STATION, UTTOXETER.

SIR,—Will you allow me to add a few lines to the notice you have done me the honour of making in the *Builder* (see p. 334, ante) of the interesting discoveries I have made in this neighbourhood of Roman stations? The remarkable terraces mentioned are associated with the Roman occupation of Stramshall, and not the station at Madeley Holme. "Romano-British mazes" should have been "Romano-British ways," connecting the station with other parts; a matter which I have yet to make out.

FRANCIS REDFERN.

P.S.—Working as I have to do at the trade of a dairy cooper, now much deteriorated, I have to follow up my researches under many disadvantages; but I hope they are not on that account any less valuable.

CHURCH-BUILDING NEWS.

Lanncoston.—The quaint little church of St. Thomas has just been restored at a cost of £1,000, and will shortly be re-opened. The works have been carried out under the direction of Mr. J. Piers St. Aubyn.

Debenham.—An instalment of the work of restoring the parish church has just been completed, and the building re-opened for divine worship; but it is to be hoped that before long it will be found possible to complete the restoration. The whole cost of finishing, both internal and external, the restoration of the nave and aisles has been estimated at 600l. The present restoration has been confined to the interior of the nave and aisles, where the need for some step to be taken was most pressing, and the exterior of the church presents the same dilapidated and dilapidated appearance it has had for years. In place of the high pews, however, open oak benches now cover the area of the nave and aisles, the bench-ends being ornamented with carved poppy-heads and the panels with tracery, and by the alteration additional accommodation is afforded for 70 persons, notwithstanding the removal of the west gallery. This latter, too, has disclosed the semicircular-headed west arch. Most of the stones used in this arch are of a reddish tint, and others of the same kind are to be noticed in the piers of the nave. In the passages the pavement of irregularly worn pavements has been taken up and another substituted, which consists of red and yellow bricks laid on their edges in such a manner as to form squares, with small encaustic tiles at their corners. The church is now lighted with gas from jets arranged round the capitals of the piers of the nave. The re-flooring and re-seating have been carried out by Mr. R. Coley, of Bury St. Edmund's, from plans by Messrs. Cory & Fergusson, of Carlisle; and the work was laid on by Mr. A. Pank, of Norwich; the cost of the improvements being 750l.

Saltash (Cornwall).—The old church of St. Stephens-by-Saltash, built in the early part of the fourteenth century, has, after undergoing a rough restoration, been re-opened for divine service. The work of restoration commenced in August last, and has been finished at a cost of 3,000l. for the body of the church, and 300l. for the chancel. The restoration, however, may be said to have commenced long before, the north roof having been taken down in 1863, and replaced by a new roof, built by Mr. John Sager, Barraton, and the late Mr. John King, of Trehan, at a cost of 100l. The chancel has been attended to by the Ecclesiastical Commissioners. In the chancel there are new

screens of oak, and tiles are laid down. The ceiling here is of oak. In the body of the church red and black tiles, from the Architectural Pottery Company, Poole, Dorset, are laid down. All the old high seats have been removed, and open pine benches, stained and varnished, are put in their stead. Many of the windows have been re-glazed, and a new one has been put in the eastern end of the south chancel aisle, this window having been specially subscribed for. The western gallery has been removed, and the main entrance has been made at the western door, which had been closed for a number of years. The font has been taken from the south aisle and placed in the tower, and a number of monumental slabs have been re-laid in the east end of the north chancel aisle, and around the font underneath the tower. The belfry floor has been done away with and taken into the church, and another floor higher up has been erected for the ringers. The ceilings have been cleaned and whitened, and the bosses and woodwork painted. The granite pillars of the church have been re-dressed, as will as the granite work of the windows. The granite work has been obtained from the Choesewing quarries. The church has been entirely re-floored. The tower requires re-dressing. The architect was Mr. Ewan Christian, and the builder Mr. Shaddock, of Saltash.

King's Pyon.—The little church at King's Pyon has been re-opened. The changes have materially altered the appearance of the interior. The leading feature in the alterations is the restoration of the north transept, in memory of the late vicar, the Rev. J. B. Peplow. A memorial window has been placed in the transept by Mrs. Peplow, in memory of her husband. It is a three-light window, and, in addition to tracery, with which the stained glass is enriched, armorial bearings occupy the centre pane. The old east window has been reset. The building has been reset with open pitch-pine free sittings, and the floor is paved with encaustic tiles, supplied by Mr. Godwin, of Lugwardine. The old roof has been opened up, and the oak beams varnished. A warming apparatus has been provided. The pulpit, reading-desk, and altar-rails are all now, being formed of oak taken from Wells Cathedral when it was restored. They are covered with floral carving, executed by Mr. Halliday. The eastern memorial window at the end of the chancel, over the altar, represents the Nativity of Christ, the Crucifixion, and the Ascension. This, together with the window in the north transept, is from the establishment of Mr. Evans (late Chance, Bros.), Smethwick. The cost of the restoration is calculated at about 1,200l. The architect who has professionally superintended the restoration gratuitously, is Mr. Ward, of Stafford.

Earl's Court, Kensington.—The new nave and aisles of St. Matthias Church (the ground of which had been consecrated on the completion of the chancel) were opened for divine worship on the 11th of April. The nave has an open-timbered roof, of large span, being 40 ft. 3 in. from centre to centre, of clearstory walls. The building has been erected over a temporary iron church: the services were carried on as usual, the iron church not being interfered with till the permanent building was completed. The vicar is the Rev. S. C. Haines. The stained-glass window at the west end was presented by Mr. C. F. Trollope. The bells were given by Mr. F. F. Rose. Mr. J. H. Hakewill was the architect; and Messrs. Robt. Avis & Co., of Baltic Wharf, Putney, were the builders.

Botus Fleming, Cornwall.—The restoration of the parish church (now in a very dilapidated and dangerous state) is about to be commenced at once, from plans supplied by Mr. H. Elliott, of Plymouth. Mr. P. Blowey, of Buckland Monachorum, has been engaged to carry out the work. The tenders will be found in another page.

DISSENTING CHURCH-BUILDING NEWS.

Middleton-in-Teesdale.—The foundation-stone of a new Primitive Methodist chapel has been laid at Middleton-in-Teesdale. Its style will be Italian, and the dimensions 56 ft. by 44 ft. The greater part of the building will be of rubble stone, faced with smoothed freestone. At the front there will be three entrances. After passing through the porch on the ground floor will be found two aisles, and a gallery round the whole of the building, supported on metal pillars with ornamental capitals, and faced with castings of an ancient shield pattern. The whole of the woodwork, including the rostrum,

will be of the best pitch pine. The roof will be high-pitched, and the ceiling will consist of sixteen panels with corner pieces, the four ventilators also being ornamented. A recess will also be provided for an organ. The total estimated cost is 1,450l., and accommodation will be provided for 600 persons. The architect is Mr. Race, Westgate. Contractors:—Masons' work, Mr. R. Walton, Middleton-in-Teesdale; joiners' work, Mr. G. Race, Westgate; plumbers' work, Mr. Bell, Middleton-in-Teesdale; slaters' work, Mr. Wanless, Darlington; plastering, Mr. Ormerod, Darlington.

Back-of-the-Bank, near Bolton.—The memorial stone of a new Wesleyan Methodist school-chapel has been laid. The buildings, which will be one story high, comprise a schoolroom, 40 ft. by 30 ft.; a large class-room, 20 ft. by 13 ft. 6 in.; and two other small class-rooms, each 12 ft. by 9 ft. Under one of the small class-rooms a cellar will be formed, accessible from the back-yard, and fitted up eventually with apparatus for heating the large room and infants' class-room, and also with hot-water boiler for cleaning purposes, tea-meetings, &c. According to the ground plan, the rooms are arranged so that each will be accessible without necessarily opening or lighting the others. The schoolroom, which will also be used as a preaching-room, is placed parallel with Latham-street, occupying the entire length of the plot available, and is lighted by four windows in the gable end, fronting Draycott-street, and three small clearstory lights to the side wall above the roof of the class-rooms adjoining. This room will be 14 ft. high to the square, and 16 ft. high to the ceiling. Behind the schoolroom and adjoining Draycott-street is placed the large class-room for infants (also suitable for teachers' meetings, &c.), 12 ft. high, lighted by four windows, and separated from the schoolroom by a passage, 6 ft. wide, forming the principal entrance, with vestibule having folding-doors. Beyond this are placed the other two small class-rooms, 10 ft. high, and each lighted by two sash windows. The remaining space between the class-rooms and Back-street and adjoining houses, is devoted to boys' and girls' yards and conveniences, each yard being accessible by a separate passage from the schoolroom, 3 ft. wide. Externally, the general design of the buildings is an adaptation of the Italian and Gothic styles of architecture, but of a plain and unpretending character, being necessarily devoid of much ornament. The estimated cost of the works already contracted for is about 560l., exclusive of lighting and heating, and other matters left in abeyance, which it is estimated will increase the cost to 650l., towards which 570l. are promised or subscribed. The architect is Mr. Thomas Ormerod, of Bolton, and the contractor for all the works, Mr. William Townson, of Bolton.

Melbourne.—The new Congregational Church here has been opened for divine worship. The new building was designed by Mr. G. H. Sheffield, of Derby, architect. It is in the Early English style, approaching to the Transition. It has a tower and spire 55 ft. high. The body of the church is 58 ft. in length, and 34 ft. in width, with transepts and apsidal chancel. The accommodation is for about 300 sittings. In the front gable is a large rose window, 8 ft. diameter. The whole of the external walls are of stone, and the interior plastered, with strings of mosaic tiles. The roof and interior woodwork are of pitch pine, varnished. Messrs. Bullock & Barton, of Melbourne, were the contractors. The whole cost will be about 1,200l.

Grimby.—The Wesleyan Methodists of Grimby have determined to erect a new chapel adjoining their present school in Duncombe-street to seat 1,000 persons. The entire proposed cost of the new erection is to be 2,000l., three-fourths of which are to be raised by the time the building is complete. Several subscriptions have been already promised, and there is every probability that the money will be raised.

Westminster Abbey.—We learn that in the excavations consequent upon the rebuilding of the Receiver's house at Westminster, the bases of the pillars and a part of the encaustic tile floor, as well as some other remains, of the ancient chapel of St. Catherine have been brought to light. Previously a large number of the capitals of the pillars of the ancient Norman cloisters, some of them covered with figure subjects, were turned up.

VARIORUM.

The current number of the *Art Journal*, speaking of Art Teaching in Rome, says,—“The Eternal City has always been a passive rather than an active inspirator and teacher of the fine arts. It is the stately ruins, the art-treasures, the beauty of position and climate, rather than its elementary schools or professors, which make it of inestimable value to the artist. Let a young man come here, well trained in England or elsewhere, and then make use of his own eyes rather than of oral instruction, and he will never regret the labour nor the expense; otherwise, unless he possess rare ability, the direct loss will be great. It might be different were there at this time any prominent painter or sculptor to give a decided tone to art; but since the death of Canova, Thorwaldsen, and Gibson, there has been no one of sufficient merit to act as a leader, though we have had, and still have, many artists of great merit. Each coterie has its favourite sculptor or painter, around whom it considers that the art life of Rome will centre, but these do not affect the world at large. Again, the standard of art is much higher in England than here. We may cite the case of a youth who was sent at great outlay by his friends to be educated as an artist in Rome. He received three medals and considerable credit at the Academy of St. Luke, but on returning to London proved incompetent for the primary class of the Royal Academy. The French, nevertheless, show their wisdom and generosity in the important school which they established many years since for their countrymen in the spacious and stately Villa Medici, and which they still maintain, in spite of rumours as to its being converted into the French Embassy, and of the fact of the Italian Government having offered to purchase it for ministerial purposes.”

“Hammond’s Wages Calculator for Nine Hours per Day,” is neatly printed on stout card, and varnished to hang up in warehouse or counting-house. It will be found useful in large factories.—“The Twelfth Annual Report of the Amalgamated Society of Carpenters and Joiners, from December, 1870, to December, 1871. John D. Prior, General Secretary. Manchester: North of England Co-operative Printing Society. 1872.” In speaking of the results of recent misunderstandings, this report says:—

“The newly-elected Executive Council felt it to be their first and most important duty to give practical effect to the clearly expressed will of the members, and although they have been reluctantly compelled to expel several refractory branches, yet confidence and harmony have been restored throughout the Society. Our provincial branches, with but trifling exceptions, remain loyal; our Irish, Scotch, and American branches have all proved true to the Society; and at the end of the year we have in London 43 branches, and 1,832 members. At the end of 1871 we have 414 less members than we had at the end of 1870, and the decrease in our funds during the year amounts to 739*l.* 1*s.* 3*d.* We have paid during the past year to our unemployed members the sum of 5,396*l.* in replacing stolen and burnt tools, 360*l.* to our sick members, 5,595*l.*; four of our members who have become permanently disabled from following their employment as carpenters and joiners have each received the sum of 100*l.* for the funeral of deceased members and their wives we have paid 1,105*l.*; to our aged and infirm members, 134*l.*; in maintaining the privileges of the trade, 1,120*l.*; and in benevolent grants to distressed members, 42*l.*”

Our receipts during the year have amounted to 21,916*l.* 1*s.* 7*d.*; and at its close we held a balance in hand of 16,529*l.* 1*s.* 11*d.* or 1*s.* 11*d.* 6*d.* per member. This is highly satisfactory, when we consider the very unfavourable circumstances under which we commenced the year, and leads us to anticipate a speedy and large increase in our accumulated capital, should the short time agitation become satisfactorily settled.”

—“How to make Money by Patents. By C. Barlow. London: published by Barlow & Co. Patent-office.” This pamphlet, although somewhat in the nature of a trade circular, gives useful hints and suggestions to inventors and patentees. This second edition has been enlarged and mostly re-written.—“The Journal of the Historical and Archaeological Association of Ireland (late Kilkenny Archaeological Society). Twenty-fourth session, 1872. Vol. II. Part I, fourth series. Dublin: printed at the University Press for the Association, 1872.” The contents of this number (9 of fourth series) includes, besides an account of proceedings, an interesting paper “On Ancient Lake Legends of Ireland.” It relates to the vision of “Cathair’s druid, Bri Mac Bairbreach,”—a poem foretelling the origin of Wexfordshire; translated and edited by J. O’Beirne Crowe, A.B.; another paper is titled “The Approaches to Kilkenny in Olden Times,” and another, with an illustration, is on “The Whitty Monument in the ruined Church of Kilmore, County Wexford,” by M. J. Whitty.—In the current number of the *Leisure Hour*, Mrs. Henry Mackintosh commences, under the title of “The Children of Olden Time,” to develop, “chiefly

for young readers,” a very capital idea. The portion already published says something about Saxon and Norman children, their dress, habits, toys, and so on, and is pleasantly illustrated from Strutt and other authorities.

Miscellaneous.

The Building Societies Bill.—On the 2nd inst. Mr. Bruce received a deputation of representatives of building societies and members of Parliament in the Lohly-room of the House of Commons on the Building Societies Bill. Mr. Higham, the representative of the London building societies, said there had recently been a conference of representatives of seventy-five building societies from all parts of the kingdom, the amount of whose investments exceeded 5,000,000*l.*, and they unanimously approved of the Building Societies Bill. There were probably 20,000,000*l.* invested by 50,000 persons; and what the deputation desired was that the Bill should be passed without any unnecessary delay, and thus settle the uneasiness now widespread throughout the country. Mr. Bruce said the best solution of the question would be this,—the Bill to be re-committed and their proposed amendments inserted, and then they might re-consider points as to which some difference of opinion existed. The opinion of the Government would have to be taken on the question of registration, whether it should be undertaken by the Government and connected with friendly societies. They would have the new Bill printed, and if they could dispense with a Select Committee they would do so.

Artists’ General Benevolent Institution. The anniversary dinner in aid of this important charity will be held on Saturday, the 18th inst. Notwithstanding the prosperity of our popular artists, there are others out of sight, and almost out of mind, whose prosperity has been clouded by accident or disease, their efforts not attended with success, some of whom have died, leaving widows and orphans unprovided for. It is for the purpose of mitigating these sufferings, and so mitigating them that delicacy of feeling shall not be wounded, that this Institution was established. Relief is extended to distressed meritorious artists, whether subscribers to its funds or not, as well as to their widows and orphans, merit and distress alone constituting a claim; the names of persons thus relieved are not promulgated. We invite for the assistance of our readers.

They Will and they Won’t.—Large numbers of artisans have made a general strike against working overtime. Some workmen in Birmingham think differently. The labourers engaged in the construction of the postal telegraphs received, a short time ago, an order forbidding them to make overtime. In consequence of this privilege, as they considered it, being withdrawn, they asked that their wages should be raised from 2*s.* to 2*s.* 6*d.* per week, urging the fact that they had to go away from home to work. This request was not complied with, and on Monday they went to the head office in Birmingham and demanded the day’s wages which was always kept in hand. The money was paid them and they left, and are now on strike.

The New Record Room at Lewes.—The foundation-stone will be laid this month. The contract has been taken by Mr. Berry, and the building, which will be from designs furnished by Mr. Carl, architect, of this town, will cost about 430*l.* On the ground-floor space will still be reserved for a provision market, and the New Record Room will occupy the first floor. It is approached by an easy curved staircase, 11 ft. wide, and its dimensions are 30 ft. by 20 ft. and 16 ft. high. The ceiling to the collar beam is to be covered with match-boarding, laid diagonally on moulded timbers.

The Holborn Statue of the Prince Consort.—The design for a pedestal for this statue being considered unsatisfactory, Mr. Edmondston, in the Court of Common Council, proposed that it be referred back to the committee to obtain a more suitable design, to be considered with especial reference to the proportions of the statue, at a cost not exceeding 2,000*l.* This was carried; and it was further resolved, on the motion of Mr. Hammack, that the committee should forthwith advertise for designs, and that a premium of fifty guineas be given to the author of the selected design.

Excursions round Oxford.—The committee of the Oxford Architectural and Historical Society have arranged a fresh series of Saturday walks and excursions in the Oxford and the neighbourhood, which promise to be interesting. On Saturday, May 4th, they went to the Roman villa at Northleigh, and the Churches of Northleigh and Handborough, also at Northleigh. They saw the interesting Roman remains, consisting of the foundation-walls of the buildings surrounding the large central court, the chambers for the hot and cold baths, and the beautiful tessellated pavement over the hypocaust. The Church of Northleigh is interesting as having one of the so-called Saxon towers. For May 18th, All Souls Chapel is selected, the restoration of which is in progress. The original carved stone ceredos has lately been discovered here behind the wall-painting at the east end of the chapel. On May 25th, Wantage, the Icknield Way, and Letcombe Castle will be visited. Letcombe Castle is a remarkably fine British earthwork, the most extensive of any along the whole line of the Icknield Way. It comprises some twenty-six acres, and has its trench and vallum complete. Uffington Church, the White Horse hill, Uffington Castle, Hardwell Camp, and Wayland Smith’s Cave are the objects named.

New Bridge at Great Waltham.—This new bridge, which has been long in course of construction, at Howe-street, Waltham, is now open for public traffic. It is built to replace an old wooden structure, the property of Trinity College. It is built with brick abutments and iron girders, and is 16 ft. wide and 35 ft. clear span. The roadway is formed with four cambered cast-iron girders, each about 40 ft. long, and filled in with brick arches turned in concrete. Over all there is a covering of 6 in. of concrete and 4 in. of gravel. The fencing on each side is formed with moulded iron standards, having square wrought-iron bars fixed diagonally, running through them. The approaches on each side have been heightened, and it is hoped that even in the highest floods, the public will be able to pass over, not only dry-footed, but in safety. The work has been carried out by the Chelmsford Highway Board, from the designs and under the superintendence of Mr. Frank Whitmore, architect, Chelmsford; Messrs. Coleman & Morton being the contractors for ironwork, and Mr. George Last for builder’s work.

Gas v. Horses.—“R. T.” writes,—“There are various reasons against steam-engines being used on public roads, yet there is a desire to overcome these objections. Let us see what can be done with the gas engines. Two and three horse power engines are now common for manufacturing purposes. To start and stop, the gas has to be lighted and extinguished: a hand tube, such as lamp-lighters use, would serve. Some of the advantages to be gained thereby would be,—no coal, fire, gushing steam, boiler water, cinder dust, noise, nuisance, danger, weight, nor delay; and cleaner roads. Take a tramway-car: a gasholder underneath would afford supply all day; the piston-rod could be fixed to the present iron wheels; the cost about a pair of horses, the keep less. So let us go ahead, and send horses to the dogs.”

The Carlisle Infirmary Extensions.—Tenders have been sent in to Messrs. Cory & Ferguson, architects, for the new wards, and for the whole of the contemplated new buildings to be added to the west end of the Cumberland Infirmary. No contract has yet been entered into; but one or more of the tenders for the whole work is under 5,100*l.* The estimated cost of this portion was 5,200*l.* The *Carlisle Journal* states that it is contemplated to enter into a contract for this portion first, and to decide on a provisional contract for the dispensary block and buildings on the east side, to be carried out as the funds accrue.

Theatre for Aberdeen.—Steps are being taken to erect a new theatre and opera-house here, the want of which has been much felt. A company has been formed, and most of the shares have been taken up. Building operations are to commence at once, and it is to be ready by December 1st. It is expected to cost about 7,000*l.*, and the architect is Mr. Phipps, of London.

A New Asylum.—The Metropolitan Asylum Board have purchased nine acres of land in the Old Kent-road, as a site for an additional asylum, which is shortly to be erected, and the local Government Board have confirmed the purchase.

The Wellington Monument for St. Paul's.—Some discussion has taken place on this subject in the House of Commons, in course of which the Chancellor of the Exchequer explained that the supplementary contract with Mr. Collmann on behalf of Mr. Stevens, the sculptor, was that the work should be finished in two years and a half, and it was undertaken on the part of the Government to authorise the payment of 250*l.* a month on the certificate of Mr. Fergusson and Captain Galton that the work was satisfactorily done. Ten of those payments had already been made. During the winter Mr. Stevens had been so ill as to be unable to do actual manual work, and consequently one portion of the work had been delayed, but he was informed that it was nevertheless in a satisfactory state of forwardness, and that it would be completed within the two years and a half. A third of the time had expired, and more than a third of the work to be done in that time was already done. He was informed that the work was most excellent and admirable, and a beautiful specimen of art, and it was because it was so beautiful and good a work that the Government did not wish to take it out of Mr. Stevens's hands. Whether the site was the best that could be found for the purpose or not, it was not for him to say; he thought the Government had done right in the steps they had taken to have the work completed.

The Proposed Enlargement of Lincolnshire Lunatic Asylum.—At a quarterly meeting of the visitors of the asylum, the report of the visitors was read, which stated that the Commissioners in Lunacy required a workshop to be built, and a hospital for the accommodation of sick lunatics during epidemics. The visitors had referred these requirements to a sub-committee, who found that the cost of adopting them would be 9,000*l.* The suggestions with regard to the enlargement of the building and the expenditure of another heavy sum of money, however, met with no encouragement. Sir M. Lopes therefore moved that no further steps be at present taken for the enlargement of the building. The chairman, who said he believed that neither of the Quarter Sessions benches would sanction the cost of an enlargement, took the sense of the meeting, and every hand was held up for the motion, which he declared carried, adding that something must be done to isolate patients suffering from epidemics.

Progress of the Chelsea Embankment.—The contractors for the Chelsea Embankment have already made considerable progress with the works. Several thousands of cubic feet of earthwork excavated to make way for the foundations of the Holborn Viaduct railway station, have already been made use of for the embankment, having been conveyed from the intended railway station site to Blackfriars, where it is emptied into barges and thence taken to Chelsea, where it serves to form the embankment now in course of construction. Next week an important sale of property required for the new embankment will take place. The property comprises the building materials of three houses, wharfs, stabling, and buildings in Duke-street and Lombard-street, Chelsea, at the corner of Paradise-street.

Cost of Road-scraping.—At Paddington Vestry, on Tuesday, Mr. Stephens, the surveyor, presented a report upon the different methods of road-scraping now in use in the parish. He states that the ordinary road-scraper costs 3*s.* 7*d.*; the hand-machine, 4*s.* 10*s.*; and the horse-machine, 15*s.*; while the expense of working is respectively 2*s.* 4*d.*, 3*s.* 2*d.*, and 8*s.* 6*d.* a day. The horse-machine will do an amount of work equal to that of sixteen men with the hand-scrapers, and eight men with the hand-machine. In the winter months, after a fall of snow, or during a rapid thaw, the horse-machine will perform the work more speedily than by manual labour, and with greater success, provided it be used before the surface of the road become soft. No report was adopted.

Gift to Openshaw of a Mechanics' Institute Building.—Mrs. Mary Brundret, *née* Miss Vhyatt, of Openshaw, has laid the foundation-stone of a Mechanics' Institute in the township, which she has generously consented to build and furnish at her sole expense. The building will have two stock-brick fronts, relieved by stone dressings. The internal arrangements will be a complete description, and in the plan provision is made for reading, billiard, and class rooms, and library, with house for the persons in charge. The cost will be about 3,000*l.*

The Scandinavian Sailors' Church, Rotherhithe.—The inauguration of this building for worship (the foundation-stone of which was laid by Prince Oscar, last July) has taken place, in the presence of Baron Hoebischild, Envoy of Sweden and Norway, the Dean to the Royal Danish Navy, the incumbent of the church, and several other gentlemen connected with Scandinavia and its interests. A novelty in connexion with the church (which will hold 350 persons) is a building of club-rooms for officers and men. The total cost, apart from the site (which was given by the directors of the Surrey Commercial Docks, who have in various other ways assisted the undertaking) amounts to about 2,500*l.* Mr. Biven is the architect. The design for this church is illustrated by a view in the *Builder* for 1870, p. 207.

The "A B C" Sewage Process.—A number of gentlemen, consisting of directors and shareholders of the Native Guano Company (A B C Process), and a few invited visitors, have visited Crossness, to inspect the works now going on there at the reservoir for the southern sewage of the metropolis, whence it is discharged into the river at a proper period of the tide. There were about 150 visitors altogether, and they were conducted over the works by Mr. Rawson, the general manager, who claims for the process a decided commercial success, and states that each ton of native guano leaves a clear profit of 2*l.*, at which rate the sewage of the metropolis alone would produce an annual income of 1,282,500*l.*! The chemist and engineer were present during the inspection, and readily gave information to the visitors on all points of interest.

The Maypole at Otley.—A new maypole has been erected at Otley at a cost of 34*l.* It is 71 ft. long, and 8 in. in diameter at the top, by 15 in. at the bottom. It is surmounted by a weathercock. The cost of its erection and of other proposed improvements around it, will be defrayed by public subscription. The last maypole at Otley was struck by lightning in June last, after standing more than thirty years, and the new one is provided with a lightning-conductor. A procession took place on the occasion, headed by the May Queen (a Miss Crofts), crowned and decked with flowers, and dressed in white; and the ancient circling dance round the maypole took place to a band of music in attendance. The dancers had a "scene morning" for their outing and their innocent "orgies."

Engraving by Sand-Blast.—The use of the sand-blast for engraving and ornamenting stone and glass is now fully recognised in the United States. The Franklin Institute have conferred a medal on the inventor; and they say of the process that glass ornamented thereby can only be compared with that etched by powerful acids, yet the entire absence of all undercutting renders it superior; and that some of the effects produced would be hard to imitate by any other known mechanical process, and yet the sand-blast produces them with an ease and precision truly remarkable, and worthy of the special attention of natural philosophers.

Grimsby Bells.—The bell for St. Andrew's Church, presented by the Bishop of the diocese, has arrived, and will shortly be placed in the tower of the church. Its weight is 4½ cwt.; its diameter, 26 in.; and it is from the foundry of Messrs. J. Warner & Sons, of Cripplegate. His Lordship has placed a prayer in Latin as an inscription,—thus translated:—

"I praise the Lord for sickness chased away:
Here to sick souls, O Christ, give health, I pray."

An effort might, without difficulty, be made to complete the peal of eight. The estimated cost is 600*l.*

Cost of Repairing Victoria Embankment of Thames.—The Select Committee of the House of Commons have passed the Thames Embankment Bill, which proposes to throw the cost of repairing and lighting the Victoria Embankment on the whole of the metropolis. One of the witnesses examined by the committee was Colonel Hogg, M.P., chairman of the Metropolitan Board of Works, who stated that the cost would be covered by a rate of one-tenth of a penny in the pound.

Kent House Estate, Rutland-gate.—Louisa, Lady Ashburton, and Colonel Spencer Clifford, have purchased the greater part of the Kent House Estate freehold, at Rutland-gate, for the erection of family mansions.

Improvements at Blackfriars.—An enterprising Belgian, Mr. Polydore de Keyser, of the Royal Hotel at Blackfriars, now a citizen of London, has, it is said, matured a vast plan by which a hostelry, such as can only be paralleled by that called "grand" at Paris, will be shortly added to the few handsome buildings to be seen along the river front. This hotel, when completed, will extend from the corner of William-street, along a curved frontage of 380 ft., on to the entrance of the ground at the back of the embankment, sweeping away the gasholders at Blackfriars Bridge. The hotel, the design for which is in the Modern French style, will have an entrance from the embankment into a spacious courtyard, into which carriages can drive, whilst the ground floor and basement will contain a series of elegant shops. The hotel is to be fitted up on the Continental system. Mr. Gruning is the architect, and Messrs. Trollope & Sons are the builders. The foundation stones is laid.

Metropolitan Water Supply.—In answer to Sir J. Kay-Shuttleworth, in the Commons, Mr. C. Fortescue said that the water companies of the metropolis had complied with the requirements of the Metropolitan Water Act of last session by submitting regulations on which they were agreed to the Board of Trade and the Metropolitan authorities, but which were of no authority till confirmed after an inquiry by the Board of Trade, at which the water and Metropolitan authorities would have the right of being heard. A circular had been sent by the Board of Trade to the authorities whose interests were affected to state their objections to the regulations, and the time of the inquiry, at the request of the Metropolitan Board of Works and the Corporation of London, had been extended to the 28th inst., but he could not say how long it would last.

The Brenchley Garden and Chillington House.—The extensive improvements at Chillington House, and the work of laying out the public garden to be presented to the town of Maidstone by Mr. Julius Brenchley, approach completion. Mr. Mackenzie, the landscape gardener, under whose supervision Battersea Park, Finsbury Park, and other public pleasure-grounds were laid out, has made the most of the land at the rear of Chillington House. About five acres of the old apple-orchard adjoining the private garden have been converted into a picturesque spot, and when the garden has been finished in all its details, it will form, it is said, quite a little Paradise in the centre of the town, from all parts of which it will be easily accessible. The restoration of the west wing of the house is the other chief work that is being done.

Opening of a New Cattle Market at Leicester.—A new cattle-market has been laid out on nearly 20 acres of land, and opened, in the south-western suburbs of Leicester, at a cost to the corporation of something like 30,000*l.* It is laid out in an improved manner, and comprises not only an area of several acres for horse fairs, but also ten slaughter-houses, in two blocks, for cattle, two for pigs, and one for condemned animals; besides offices and houses for the clerk and other officers, connected with the main line of the Midland Railway by a short branch line, while close to the market the Midland Company have, at a cost of about 10,000*l.*, constructed cattle docks, from which cattle have easy access to the market, and *vice versa*.

Wood v. Asphalt.—While the municipal authorities in London are replacing the last relic of the old wooden pavement with asphalt, experiments with wood pavements are being made in Paris, whence we derive the asphalt system. The trials are made with rectangular blocks about 7 in. in depth by 8 in. long, and 3½ in. wide, set on a 4-in. bed of cement. The wood is specially prepared, and rendered damp-proof beforehand, and the ends of the blocks are cut at an angle of 45 deg. The surfaces of the street are level in one case, and on a slope in another. The cost is about 10*s.* per square yard.—*Mechanics' Magazine.*

New Theatre for Sheffield.—It is proposed to build a new theatre in Sheffield. A company, we understand, is now in process of formation, and nearly half the required capital has been subscribed or promised.

Destruction of Niblo's Theatre, New York.—A telegram from New York states that Niblo's Theatre has been totally destroyed by fire.

The Newcastle Antiquarian Society.—At the monthly meeting of the Newcastle Society of Antiquaries, held on Wednesday night, in the Old Castle, the Rev. J. C. Bruce, LL.D., read a most interesting paper on his recent researches in connexion with the old bridges that crossed the Tyne at Newcastle, and the remains of them found while the excavations for the new bridge have been carried on. At its close, the learned doctor said:—"In concluding, I may say a word in reference to the bridge of the future. In order to admit of the passage of large ships to the quays above Newcastle, the roadway on each side of the central pier must be capable of speedy removal and replacement. This is to be done, as is well known, by making it swing upon a pivot. This roadway must have a stone pavement, and it must have strength enough to admit of the passage over it of a four-wheeled wagon, loaded to the extent of fifty tons. When it is borne in mind that each arm of the roadway, as it swings upon its pivot, will be 140 ft. long, the difficulties to be overcome in its construction and working will at once be seen to be very great. When it is constructed, the inhabitants of Tyneside will have to boast of the greatest work of its kind in the world."

The German Houses of Parliament Designs.—Ten English architects have sent in plans for the new German Houses of Parliament. The *Cologne Gazette* says they have set much value on appearance. Gigantic water-colour paintings, richly framed, represent, in the most interesting manner, the masses of buildings, with many towers, or richly crowned with mighty cupolas, with the effect of sun glances breaking through a grey, clouded sky. The German architects, whose works are modest and kept within narrower limits, will have their difficulties in presence of these fairy works as they come forth from the English fog.

A New Labour Bill.—A Bill, says the London correspondent of the *Leeds Mercury*, will shortly be introduced by Mr. Morrison, which will, I am told, cause somewhat of a flutter among employers. Its object is to alter the existing law with respect to compensation granted to workmen in case of accident, and to make it more favourable to the latter. Mr. Hinde Palmer and Mr. Melly have agreed to place their names on the back of the measure, which has received the sanction and approval of the Parliamentary Committee of Trade Unions.

The Royal Polytechnic.—The Directors state that they have elected Professor E. V. Gardner, F.R.S., a gentleman well known for many years past as an experienced chemist, to be the Professor of Chemistry to the Institution; and under his direction the laboratory is being re-fitted and re-stocked, and will shortly be opened for the reception of pupils, and for conducting analyses, assays, and scientific investigations of every description.

The Institution of Civil Engineers.—Mr. Hawksley, as president of this Institution, has issued invitations for a *conversations* in the western galleries of the International Exhibition at South Kensington, on Tuesday, the 28th of May. The portion of the buildings to be opened to guests will comprise the Machinery Court, the machinery being shown in motion, and the British Picture-gallery, immediately over that court.

Busts of the late Earl of Derby and Sir E. Murchison.—Mr. H. P. M'Carthy, of Osna-burgh-street, has just completed a bust in marble of the late Earl of Derby for the Merchant Taylors' Company. The likeness is said to be a striking one. The same sculptor has just received an order to execute a bust of another of the deceased honorary members of the company, viz., Sir Roderick Impey Murchison.

Drainage of Weymouth.—The Town Council of Weymouth have adopted Sir John Cooke's plans for the drainage of Weymouth, instructing the Town Clerk to apply to the Local Government Board for authority to borrow 25,000*l.* on mortgage of the general district rates. The work, if carried out, will, it is said, put the town in a thoroughly sanitary condition.

The Aquarium Clock Tower, Brighton.—A model of a clock tower has been erected at the aquarium for the town authorities to form a judgment upon the proposed erection. The local *Herald* states that opinions differ, and thinks the design "might safely be 'referred back' to Mr. Birch for improvement."

TENDERS

For the Congregational Memorial Hall, library, and offices, Farringdon-street. Messrs. John Tarring and Son, architects:—

	General Estimate.	Additional cost if Johnson's work is executed in pitch pine.	If Kemball's is used instead of Barry's—based on 1000 masonry, deducting—
Higgs.....	£32,287	£250	4100
Hill & Sons.....	30,200	810	350

Bone & Son.....	764	0	0
Clarke.....	710	9	0
Crocker & Bramblecombe.....	696	7	0
Dingle & Co.....	664	0	0
Blowey.....	650	0	0

For alterations and additions to house, at Fairmile, Esher, Surrey. Mr. Herbert Winstanley, architect:—

Asford.....	£1,253	0	0
Wood.....	1,194	0	0
Mason.....	1,018	0	0

For alterations and additions to 185, High-street, Camden-town. Messrs. Newman & Hewett, architects:—

Newman & Mann.....	£610	0	0
Scrivenner & White.....	585	0	0
Foxley.....	564	0	0
Fairchild & Co.....	549	0	0

For alterations to house on the Ridgeway, Enfield, for Mr. T. G. Hill, architect:—

Bares & Rammage.....	£496	0	0
Rist & Brown.....	379	0	0
L. & W. D. Patman.....	308	0	0

For drainage to Belsize House, Hampstead, for Mr. W. H. Stallard. Mr. C. H. Lowe, architect:—

Hart.....	£292	0	0
Mansbridge.....	259	0	0
Watts.....	237	0	0
Crockett.....	225	0	0
Thurst.....	213	0	0

For Primitive Methodist chapel and schools, Williamson-street, Holderness-road, Hull. Mr. Frank N. Pettin-gell, architect:—

W. & J. Hall (accepted).....	£5,950	0	0
------------------------------	--------	---	---

For alterations, &c. at No. 7 Ward, Peckham House Lunatic Asylum. Messrs. Tolley & Dale, architects:—

Wicks, Bangs, & Co. (accepted).....	£2615	0	0
-------------------------------------	-------	---	---

For pulling down and rebuilding 76, Oxford-street, for Mr. Ince. Messrs. Tolley & Dale, architects:—

	Party-wall
Macey.....	£3,396
Coffey.....	3,050
Pritchard.....	3,034
Wicks, Bangs, & Co.....	2,830

Flude.....	2,508
Stanyan.....	2,503
Mistock.....	2,497
Mason & Sons (accepted).....	2,490
Loveday.....	2,359

For extension of shops and repairs to two houses, 444 and 446, Edgware-road, for Mr. J. Windle. Messrs. New & Cummings, architects. Quantities supplied:—

Green.....	£2,605	0	0
Mark.....	692	0	0
Thompson & Smith.....	683	0	0
Edis & Son.....	683	0	0
Harris & Sons.....	648	0	0

The Builder.

VOL. XXX.—No. 1528.

Royal Academy
Pictures:
Reflected Lights.

ITH due regard to the specialities of this journal, our first duty in reference to the Royal Academy Exhibition is to indicate the nature and value of the architectural contributions. Having discharged our conscience of that office, and quitted that comparatively deserted chamber where no admiring crowds block the way, we are at liberty to take a glance at the more numerous and brilliant productions of the painter's art which constitute the main part of the show, and to form conclusions upon the merits and demerits

of certain examples, or philosophise generally upon the whole gathering (spectators included). Indeed, by the time these remarks will be printed, special description will have become almost superfluous: the public will already have been instructed in the columns of we know not how many literary journals and newspapers, what to admire and what to pass over; and various critics will have written up or written down their particular friends (as considerations of business or pleasure may have predominated), in that peculiar style of "art-critic" phraseology, which forms one of the chief blessings of life. Perhaps, however, we may not quite uselessly return to the charge from another quarter, and look at some of the characteristics of this year's exhibition, not so much with the view of criticising technicalities, as of considering the matter in regard to the ultimate ends of painting, as a means of expressing emotion, or of ministering to intellectual enjoyment.

In the first place we must record our conviction that the present exhibition is not equal to its two predecessors in general interest. There may be about the same proportion as usual of good painting, but there is a larger amount of uninteresting pictures than we have seen for two or three years past; pictures with which no special fault can be found, but which are simply like any others, and affect us in no possible way that is worth speaking of. We take it also that the constitution of the hanging committee has been peculiar this year, and that somewhat old-fashioned tastes and principles have been in the ascendant. Only thus can we account for the presence on the line of so much respectable mediocrity of the dullest kind, viz., that which belongs rather to the conception than the execution. In this way we must also account for the absence of that special school which for the last two or three years gave so distinctive a character to Room VII., where its productions were usually placed in juxtaposition; the school whereof Mr. A.

Moore is the most typical representative, and which, whatever its mistakes may be, includes among its members talent which may justly claim representation.

Taking the art of painting on what (*pace* M. Taine) we still think its highest ground, the utterance of feeling and sentiment through the medium of representation, we can have little hesitation in pronouncing Mr. F. Walker's contribution to be the picture of the year, and congratulate the artist on his entire success in his own peculiar walk of art, which he had abandoned last year with somewhat less happy result. "The Harbour of Refuge" (227) is one of that class of paintings in which the scene represented is subservient to the deep human interest embodied in the figures, and is chiefly valuable as accessory to their sentiment. We are in the central court of an old almshouse; the old-fashioned red-tiled buildings cover the picture as a background, with a quiet evening sky above them; in the centre of the court, around the statue of the "founder," sit a group of old men half conversing, half dozing; along the path on the left (in the foreground) comes an old woman, bowed down with weight of years, leaning on the arm of a young robust girl, who, with the selfishness of a commonplace nature, contents herself with mechanically supporting her companion, and turns her looks and her interest in another direction. These alone would form the elements of a pathetic picture, but the real force of the whole thing is dependent on the figure of the man mowing the grass in the foreground: as a mere piece of drawing we have seen few more successful things than the sway and action of this figure, with the scythe thrown back for the sweep which we expect to hear next moment in the grass; but as a matter of feeling, the introduction of this image of eager, earnest labour, as a contrast to the ebbing life of the aged inmates of the place, is a perfect masterstroke, the eloquence of which will be felt, we think, the more it is studied. Viewing the picture as a mere scene, exception might be taken to the want of decision and knowledge in the details of the building, and to a certain want of atmospheric softness in the sky (though the painter has got rid to a great extent of the disagreeable mannerism of colour which characterised many of his previous landscapes); viewed as a whole, it is a work of which not only the artist, but the English school, may be proud.

Heartily do we welcome back Mr. Mason, another painter who puts mind on his canvas, and whom illness, we believe, has deprived us of for the last two years at the Academy. Some of his mannerism of execution, too, is worn off; but it was a mannerism so pleasant and so suited to the peculiar feeling of his pictures, that we half regret its abatement. In other respects, "The Harvest Moon" (125) bears its authorship on its face completely, and exhibits in its train of figures (particularly in the young man and girl who come last) that peculiar feeling for the sentiment of rustic life with which the painter has been identified. We are not quite satisfied with the attitude or gait of the figure with the scythe and pitcher, who looks a little unsteady on his feet; and the attempt to indicate the sunset sky (behind the spectator) by the red light on the distant cottage-window is not successful, and is not borne out sufficiently by the light in the foreground figures. From this point to Mr. Leighton is a long step indeed, reminding us forcibly of the almost boundless scope of painting in the expression of various phases of feeling. The best and most individual work Mr. Leighton exhibits this year, "Summer Moon" (202), is one of those subjects which might be termed "classical," but is so, in fact, only in its being so far idealised, in circumstance and costume, as to remove it completely from associations of every-day life, and leave the

spectator free to conjure up his own fancies and associations in connexion with it. Two female figures, heavily draped, are half-reclined on a stone seat in a warm and deep slumber, the summer sky, with a few faint stars, seen behind them. The red and purple draperies, with their tone tempered by the moonlight, form a beautiful study of colour. Deep shadows are thrown from them on the side of the stone seat. Simple as its motive is, this is a picture which will well repay study, and is a very fine type of a class of subject demanding not only high executive power, but genuine poetic feeling on the part of the artist. "A Condottiere" (518), a three-quarter length of a dirty-looking ruffian, in a breastplate, painted with much power and realism, is a good illustration of Mr. Leighton's versatility; but in genuine intellectual interest, how far below the work previously mentioned. Of the works of Sir E. Landseer, "Lady Emily Peel and her favourite Dogs" (25) is the favourite with the public. Like the larger painting of "The Lion and the Lamb" (409), it is very slightly finished, but showing, in the treatment of the animals, that facility in giving expression, and defining muscle, almost by a single touch, which only a life's study could give. "The Baptismal Font" (190) is an unhappy mingling of realism with a rather unnecessary and out-of-place symbolism. Mr. Frith, we are glad to say, does not exhibit this year any of the rather sensational pictures of modern life which have made him popular with the less thoughtful portion of the picture-viewing public. His scene from "The Relapse" is as well painted as usual, but not particularly interesting. The two life-size female figures, "The Miniature" and "The Love-letter" (157 and 460) are more to the purpose, in an art point of view.

Mr. Frost's only work of importance is his diploma picture, a "Nymph and Cupid" (126). This is a classical subject, in the usual acceptation of the term,—a beautifully-finished and bright-looking thing, with high colour in the drapery, though somewhat hard. The real defect, however, lies deeper than this, and consists in the work being purely a painting, and nothing more. It is instructive to contrast this with Mr. Leighton's painting, just now mentioned, and note the distinction between this prosaic use of the classical type of figure and drapery, as an end in itself, and its employment merely as a means for the embodiment of a poetic thought. A superficial critic might class the two works together; but there is a wide chasm between them. We notice, *en passant*, Mr. Hennessy's "Summer Eve, Long Island Sound" (179), with the figures reclining in two boats, on a calm reach of water, as suggestive of a comparatively new local interest and colouring, and note "The Return from Flight" of Louis XVI. and family, by Mr. E. M. Ward (182), as an interesting specimen of the work of an artist who has done more to set forth and illustrate modern history than any other of our living painters. The next picture, "An Elopement, A.D. 1790" (183), is one with a marked individuality, in which Mr. Leslie, while charming us with a beautiful representation of early morning light, broken by trees, and reflected in the quiet stream, has given to his scene a further interest by reviving a bit of English life of eighty years ago. The pretty girl who, in a riding-dress of the period, waits on the bank while her lover is ferried across, is a capital figure in pose and expression, and looks very much alarmed at the bold step she is about to take. The number of horizontal lines in the composition is remarkable, and gives a distinctive character to a painting which is both pleasing and original in a high degree; the more so as being a change from the painter's frequent repetition of "the woman in white," who, however, appears in No. 416, this time with the name of "Lucy." Some of Mr. Le Jeune's charming children (195) have "great expecta-

the profession are shouldered and elbowed on all sides, and confounded with a cloud of persons of very inferior status and calibre. Thus the largeness of the charges made has brought a punishment. The proper consideration, however, of this part of the subject would lead us too far away just now. The whole army of distributors, intermediaries, agents, and middle-men generally will have a rude shake one of these days.

SOCIETY OF PAINTERS IN WATER COLOURS.

THE sixty-eighth exhibition of this society is fairly up to the usual mark. There are, in fact, few drawings on the walls that are not worth study; and a large number that are worth looking at; the only drawback being, with some of the older members, a degree of sameness of style which renders one year's works scarcely distinguishable in character from those of two or three previous exhibitions. This applies, for instance, to the drawings of Mr. Richardson and Mr. Duncan, who cannot certainly in any bad sense be called mannerists, but whose excellencies are so uniform in character that we might be excused for wishing a little variety, even if it were gained at the expense of a deficiency in that finished and rounded execution which marks their works. The above-named veteran artists, together with others who work in a uniform manner, Messrs. Callow, Birket Foster, Collingwood Smith, and others, maintain their position; Mr. Cox, jun., makes a good show, and Sir John Gilbert is as recognisable as usual; even, we are sorry to say, in his singularly unfortunate attempt to portray *Malvolio* (237), where he has turned the pompous steward into the likeness of a sneaking dependant. Among artists who have their speciality in looking at and transcribing nature, Mr. A. Goodwin demands attention, especially for his "Abingdon Churchyard—Old Man going to Prayers" (15), a quiet scene, clothed in a peculiar mist of sunlight, and with a distinctive feeling of no common order; "Weed Burning" (50) is another original little drawing, the subject consisting merely of a barren field with the smoke from the burning heaps drifting across the picture, and a very faint indication of distance; yet this is a most suggestive drawing; one or two others by the same artist will equally repay attention. Mr. A. W. Hunt shows his usual ability and individuality, though we are inclined to question the tone of the water in "Streatley on the Thames" (31), a somewhat unhealthy-looking blue. The brothers G. A. and A. D. Frigg contribute exceedingly well this year; the former showing in "Corri Etichan" (18) and "The Thames at Hardwicke" (48), complete success in two very different classes of subject; the latter also giving evidence of versatility in a charming figure-subject in his well-known style, "The coming Storm" (220), and in a landscape, the first drawing of the kind, we believe, that he has exhibited, "Corrie Castle, from Poole Harbour," a beautiful bit of calm water, and distant landscape. Mr. Bramwhite's "Post Haste," looks like a man galloping after a rainbow: a certain whimsicality rather than a fine drawing. The new member, Mr. Clarence White, sends drawings which fully justify his election; among others an architectural subject, "The Basilica of Constantine, Rome" (105), treated with much power and brilliancy, a warm glow suffusing the yellow stonework, with nearly pure blue in the shadows in the deeply-coffered arches. Mr. Hale is a very large contributor, the best and most original of his drawings being that of a huge rock rising up from sloping meadow-land, with the title of "A Giant asleep" (109), the sun behind sending rays of light over the peak. The same artist's other drawings are larger and more ambitious, but less successful on the whole than this. "Twilight after Rain" (156) is a fine drawing. At one end of the room is one of the finest water-colour sea-pieces we have seen, by Mr. Powell,—"A Channel Tug making up to a Dismasted Ship" (177). The vessels are small, the real picture being the sea, which has been the subject of much and careful study. The continued appearance of weight and transparency in the water could hardly be better given; the smoke of the steamer, blown downwards from the funnel in a cloud to the whole, adds much to the windy effect of the whole. Can there be poetry or interest in the hack yard of an old inn? Mr. Boyce thinks so, and gives us the "Bull Inn Yard, Ludlow" (94); that is, a bit of the yard, and the roofs of some out-buildings, diversified by a pigeon or two; there

is also an "Old Shropshire Farmhouse" (78), with its heavy brick chimneys, painted to the life; it is difficult to know whether to be discontented with an artist for spending his powers on such menial subjects, or to admire the talent which can enable him to invest them with an interest of their own. There is another little bit, "A Street Corner in Ludlow," consisting really of nothing but a high stone wall and a brick house, which is quite perfect in its way.

Figure pictures seldom form the staple excellence of a water-colour exhibition, the material, in fact, lending itself in general so much better to the requirements of landscape art; and the exhibitions of the Society are the less likely to prove exceptions to this rule, since the secession (to be regretted, from whatever motive) of so original an artist as Mr. Burne Jones. Mr. Topham's drawings, always well executed, lack intensity of interest; not to speak of a certain want of refinement. "Preparing for the Fight" (21) is the one likely to be most looked at. Carl Haag's large and (of course) finely-executed drawing, "Fillal Love" (68), prevails a generation or two back,—in general motive and feeling, we mean. It is impossible to feel much interested in such a work. Mr. Walter Goodall's "Venetian Fruit Boat" (82) is a very good work, clear and precise in execution, without the prominent exhibition of labour, though it is a very carefully executed drawing. Mr. Pinwell is, of course, highly finished and original, in his own peculiar style, in "Gilbert à Beckat's Troth" (127), but he is an artist seeking too much after peculiarity and piquancy in manner and choice of subject. In both respects, the present drawing, talented as it undoubtedly is, really is too *outré* to give pleasure. Perhaps the most original of the figure subjects is that of the "Rival Florists" (192), by Mr. E. K. Johnson; two old flower-fanciers seated on the lawn before a country-house in eager dispute as to some horticultural point; some females seated at the door of the house sallying regarding the controversy. The colour composition, though somewhat low and cold, is very harmonious, and anything but commonplace; the faces have been finished with great care. We should be glad, however, in future exhibitions, to meet with some works showing stronger feeling, more appreciation of the poetic side of life, among the drawings in which figures form the principal subject.

THE WORKS AT ST. PAUL'S CATHEDRAL.

The election of Mr. Burges by the committee, to act jointly and upon equal terms with the surveyor to the fabric, Mr. Peacock, has been already mentioned in these pages. It was not stated, however, that previously to the election the question was debated in this shape, namely, whether a "Medieval" or a "Classical" architect should be elected for the post; and, after long discussion, the question was resolved in favour of Medievalism by the votes of the members of the committee present, given as follows:—
