The following architects have been invited to submit designs in competition for the proposed building for the London School Board on the Thames Embankment:—Mr. Blomfield, Sir Digby Wyatt, Mr. G. F. Bodley, and Mr. J. O. Scott.

LEAD ON CATHEDRAL ROOFS.

WITH reference to the danger attending the use of solder for mending cathedral roofs, the clerk of works at Lincoln Cathedral says:—

"The method of laying on lead is to have the sheets of a reasonable size, which should never exceed 12 ft. long, and the narrower they can be conveniently put in, the better the work, and the less liable to be affected by sudden changes in the temperature. In the laying of gutters proper drips should be provided, not greater than 12 ft. apart; 8 ft. would be better. The mode of covering roofs is to use what is technically termed *tabs*; that is, square pieces of lead of about 6 in. These are nailed on to the boarding of the roof at the meeting of two sheets, having their edges turned up about 4 in. each. These edges are turned with the tabs into a roll, forming a complete protection to the roof below from the rain. The tabs used for steep roofs are more numerous than for flat ones, for the reason that the lead has a greater tendency to slide down.

In some recasting that was done early in this

year I took an account of the cost of the labour, and found that, with coals added, the cost was less than three-fourths of a penny per foot super. I am, therefore, satisfied that it is less expensive to have the lead taken off and recast whenever it becomes had than to endeavour to mend it with solder, for with solder there is a perpetual expense and a leaky roof."

WORCESTER CATHEDRAL.

It has been customary, for some years past, on the occasion of each returning Festival, to detail, for the information of readers, the architectural condition of the cathedral, and the progress of the work of restoration which has been so long in hand. Although we are not in a position to record the completion of the works, it is satisfactory now to be able to state that the year 1873 will probably witness the re-opening of the entire cathedral in its completely restored condition. Meanwhile we collate a few notes of what has been done in and upon the building since the last assembly of the three choirs in Worcester.

In the December following the Festival of 1869 the new peal of bells arrived, and were hoisted into position in the renovated tower. They were from the foundry of Messrs. Taylor & Co., of Loughborough, and their total weight is 221 cwt. 3 qrs. 22 lb., besides the great clock-hell, which weighs 41 tons. There are twelve bells which ring in peal, and a small extra bell for the quarter chimes. A new clock, from the designs of Mr. Denison, Q.C., manufactured by Mr. Joyce, of Whitechurch, has since been added; and to complete the arrangement in the tower, Mr. Ald. Lee presented a set of chimes. They have been manufactured by Messrs. Gillett & Bland, of Croydon, will play twenty-eight tunes, and will cost between 400l. and 500l. The chimes will be completed in two or three months. The cost of the clock and bells was nearly 6,000l.

Three years ago it was found that the execution of the contracts for the work already done had exhausted the available funds, and that after an expenditure of 50,000l. another sum of 15,000l. would be required to place the cathedral in a complete state of restoration. At this point Earl Dudley stepped in, and early in the year 1870 made the offer to complete at his own expense the entire restoration of the cathedral, provided that structure was never again used for the purpose of a musical festival. Earl Dudley's proposal was declined, after which his lordship made another offer, wherein he proposed to give 5,000l. towards the restoration, on condition that the remaining 10,000l. should be raised by the city and county during the next three years.

Within less than three weeks nearly 11,000l. were raised, besides Earl Dudley's donation. The amount was contributed by only 130 subscribers. Among the first works done in consequence of this successful movement was the relaying of the floors of the Lady Chapel and aisles with a new pavement of stone and marble, in large quatrefoil patterns. The next thing undertaken was the decoration of the choir-roof, which had been previously scraped till it presented the bare masonry only. Messrs. Hardman, of Birmingham, undertook this work. Messrs. Farmer & Brindley, of London, undertook the execution of the new stalls, screens, wood-carving, &c., of the choir. This work is not yet completed. This information we have condensed from the *Worcester Herald*.

The Lord Bishop of the diocese has presented an episcopal throne, at a cost of 300l., but this has not yet been erected, nor have all the choir-screens and grilles been raised. A pavement of Devonshire marbles, Greek green, and encaustic tiles, is now being laid down in the choir, by Messrs. Poole & Co., of London, at a cost of 1,100l. Mr. Skidmore, of Coventry, is supplying the metal-work.

At the close of the present festival, the work of repairing the nave and north porch will be commenced, and handsome gates will be erected in the porch. Gas will be introduced to the cathedral for evening service; it is to be laid on in string courses on the walls and piers of the nave, and lofty standards in the choir. A new organ, by Hill, of London, will be ready for the re-opening of the choir and nave. It is stated that Government has made a grant for the restoration of King John's tomb, and Prince Arthur's mortuary chapel.

Among the exterior improvements of the precincts, the visitor will be pleased to note the

clearing of the college yard of building materials, sheds, and rubbish; the levelling of the ground, and the appearance of a nicely-kept turf, which is by far the most appropriate setting for architecture. At the west end the old house, formerly occupied by Canon Benson, had been destroyed, and a better view opened for that end of the cathedral; but a portion of the remains, of Early Norman date, has been allowed to stand as a relic. A new pathway of stone has been laid down from the western entrance, communicating right and left with the college precincts.

SEWER GAS AND LEAD PIPES.

SIR.—It seems to me that soil-pipes should be made of pure lead, and not of the compound which is used in many lead-mills, and which contains a mixture of different kinds of old metal, such as old spoons, portions of what is called Britannia metal, zinc, &c., collected by marine-store dealers and many others who buy and trade in old metals. Many tons of this compound are melted and cast into pigs and other shapes, and sold to the lead-mills, where it is manufactured into pipes, sheets, &c. I do not doubt the efficiency of these sheets and pipes for ordinary water-pipes, gas-pipes, flashing, &c., where there is no chemical action; but I think the particles of zinc, &c., will be strongly acted upon by the gases arising. I have detected this in pipes made from this mixture of metals used in our paper works in this locality, which our plumbers have called being honey-combed; whereas the pipes made from pure, or what we call virgin lead, have not been so. I do not wish it to be understood that the mixture of metals named is used at all lead-mills, as many use lead direct from the mines or the smelters, and any of the lead-mills will supply sheets or pipes made from pure lead, if specially ordered, and which is certainly preferable to the compound before named. I should be glad to hear some suggestions with respect to a substitute for leaden soil-pipes. I am convinced by experience that iron soil-pipes are corrosive and offensive. A PLUMBER.

REMOVAL OF CITY CHURCHES.

THE old City churches are one after another disappearing under the influence of street improvements and other kindred causes. It is now stated that the Merchant Taylors' Company are about to deal with St. Martin's Church, Outwich, by removing the church, selling the site, and applying the proceeds of the sale, together with the tithes, to the endowment of churches where they are wanted; and that the Dean and Chapter of St. Paul's are dealing in a similar manner with St. Peter-le-Poer, the arrangement being that on the next avoidance of the rectory the income is to be paid towards the augmentation of the benefices of several churches in St. Pancras, and 125l. per annum to St. Mary, Charterhouse. All-hallows, Staining, is also to be removed.

OPENING OF THE NEW SOUTH YORK SHIRE LUNATIC ASYLUM.

THE spacious asylum erected in Wadsley Park near Sheffield, for the accommodation of the pauper lunatics of the West Riding, has been formally opened. The building is situated on the western slope of the Don Valley, half-way between Wadsley and Oughtibridge, and is one of the largest structures near Sheffield. It rises in three great blocks—a central edifice, with wings at right angles, which communicate with each other by corridors. The estate comprises about 163 acres, purchased at a cost of 23,000l., so that there will be ample ground for recreative purposes, as well as to afford the inmates healthful employment. The building altogether will cost fully 100,000l. Mr. B. Hartley, of Pontefract, the West Riding Surveyor, was the architect, and Messrs. Robert Neill & Sons, Manchester, were the contractors. The engineering work has been executed by Messrs. G. Haden & Sons, Trowbridge. Mr. Ryall has acted as general manager; and Mr. D. Kershaw as clerk of the works.

At a meeting of magistrates and others at luncheon after the opening, Mr. Stanhope, M.P., in proposing the health of the architect, referred to several improvements made in the internal arrangements of the building, the principal of which was that they had none of the old-fashioned gloomy passages, with rooms which

was impossible to light, opening from them on each side. Every room in the asylum had a window on one side and a fire-place on the other, and he believed that in the end was the most simple and cheap style of building that could be adopted, although the effect on the outside might be rather grand. Altogether, it was as cheap a building as could well be put together. They had been fortunate in getting hold of a satisfactory contractor in the person of Mr. Neill, of Manchester, a gentleman who occupied a high position in that city, and who had carried through the work most conscientiously. He deserved all praise. Mr. Neill, by the appliance of machinery, had been able to utilise the clay which was got in excavating the foundations of the asylum. The whole of the bricks of which the building was composed had been made out of the excavations, and there were a great many left over, sufficient to go on with another ward, which he feared would very shortly have to be put in hand. He proposed the health of Mr. Hartley, the architect, whose labours had been extremely great; and of Mr. Kershaw, the clerk of works, who had also efficiently performed his duty.

SOMERSET ARCHÆOLOGICAL SOCIETY.

The twenty-fourth annual meeting of this society has been held in the great hall of Taunton Castle. There was a good attendance of members and others interested in archaeology. The large room contained a considerable number of ancient and valuable manuscripts, historical relics, and other interesting objects, lent for the occasion by members and friends of the society. Mr. E. A. Freeman, D.O.L., took the chair.

The Provost of Eton proposed, and Mr. R. K. M. King, seconded, the election of Mr. W. A. Sanford, F.G.S., as president, and the motion was carried.

Mr. Sanford then took the chair. Mr. W. A. Jones, M.A., read the report of the council, which stated that the indexes to the three principal record-books at Wells Cathedral had been copied, together with the contemporaneous marginal notes, and published in the proceedings of the society. The council had appointed a committee to co-operate with the promoters of a legislative measure for the protection and preservation of historical monuments. The report having been adopted, the chairman delivered an interesting address, in the course of which he remarked that three great works of repair of their ancient monuments were approaching completion. First, the west front of their cathedral was sufficiently advanced to enable them to judge somewhat of the effect. He said, that in some respects this was at present disappointing. In the next place, the fair form of the spire of St. Mary Redcliff pointed heavenward over the bustle and commercial activity of the great city of which its parish forms a vital portion. It was a noble finish, and a noble work of repair honestly and patiently carried on through many years. The stone ceiling of the nave of the great church of St. Peter, at Bath, was worthy of the golden age of English building. After remarking that St. James's, Taunton, would now rise in simple and graceful imitation of St. Mary's, the chairman went into a long and interesting argument respecting geology and natural history, which was listened with great attention.

Mr. G. T. Clark followed with a paper on "Taunton Castle," in which he pointed out that the structure stands upon one of the many low mounds of gravel, often with a face of red marl, which rise out of the extensive fen lands of that singular district, and which, before agriculture drained the marshes, was more inaccessible than even the hill fortresses of the upper country. Upon the right bank of the river, whence the town derives its name—the celebrated leader and lawyer of the West Saxons was reported to have established himself in 702, being engaged in securing his frontier against the Western Britons, who still maintained a footing in the border-ground east of the Tamar, and among the Brendon and Mantock Hills, holding probably the camps which still remained but little altered by the lapse of 1,000 or 1,100 years. That seemed to have been the origin of the town of Taunton, as the sequel of his paper Mr. Clark gave some interesting particulars relative to the castle of Taunton.

Subsequently the castle, the Church of St. Mary Magdalene, the priory, and the Grammar-school were visited, and in the evening there was a luncheon at the London Hotel.

The evening meeting, on Tuesday, in the Castle Hall, was presided over by Mr. Sanford, and the body of the chief hall was quite thronged. Mr. W. Boyd Dawkins, M.A., F.R.S., gave an address, illustrated by charts, on the "Ancient Geography of the West of England." Mr. Freeman (the ex-president of the society) read a treatise upon the history and work of Ine, king of the West Saxons. Ine raised Taunton as a bulwark against the Britons, and gave the western part of his dominions the first bishop of their own, and placed the holy Eald-helm in the church of Sherborne, which he founded. He was the second founder of British Clonbury, and the first founder of English Wells.

On Wednesday the first excursion was taken. Hestercombe and the quarries of syenitic granite were visited. Mr. W. A. Jones, who is one of the hon. secs. of the Society, pointed out the junction of the syenitic granite with the Devonian strata. Mr. R. K. M. King read an account of the rock, written in in Corner's Geological Survey. Mr. J. H. Parker, C.B., pointed out fragments of the old hall of Hestercombe, constructed in the time of Henry VII. The minstrel's gallery and pictures attracted much attention. A paper upon the history of the family having been read by the Rev. T. Hugo, a move was next made for Kingston Church, which Mr. Parker described. Luncheon, in the adjacent schoolroom, provided by Mr. W. E. Sartes, having been partaken of, Norton Fitzwarren Church, and the camp lying above, were then inspected.

On Wednesday evening, Mr. W. A. Jones read a paper on "The Customs of the Manor of Taunton Deane;" the Rev. W. Tuckwell, head master of the College School, one "On the Flora of the Quantocks;" the Rev. J. Coleman, one "On the Old Register of the Parish of Stoke St. Gregory;" and the Rev. T. Hugo, one "On St. Margaret's Hospital, Taunton," huilt about the year 1270.

In reply to Mr. Paton's request that the next meeting might be at Sherborne, Mr. Jones promised the council's consideration of the point, but gave reasons why Wells should be selected.

STABLES IN WESTMINSTER.

EXTENSIVE stabling has been erected, with a frontage towards Buckingham-row, Westminster, for Lord Auckland, consisting of stalls, loose boxes, droms and single coach-boxes, and living-rooms for servants above. The elevation towards Buckingham-row, in the Domestic Gothic style of architecture, is built of white granite brick, with moulded strings, and relieving arches of yellow marble, having an entrance-archway, which is protected from the road by light wrought-iron gates. A small gablet rises above the entrance-arch, containing a floriated circle, in which are carved in bas-relief the crest and monogram of the owner. The gablet is finished with a top stone, surmounted by a light finial of ironwork. In the interior, pine, stained and varnished, is used for all skirtings, and the roofs are covered with Vieille Montagne zinc. The site of the present building formed the subject of a law-suit between Lord Auckland and the Westminster District Board of Works. That body, thinking it its duty to deprive him of at least 20 ft. of his land, and refusing him compensation, lost the day, both in the first case, before Vice-Chancellor Malins, and on the appeal, before the Lords Justices.

The contract was taken by Mr. Henry Wagner, builder, for 1,120l., and he has carried out the works. Mr. William Scott Champion is the architect.

THE INSCRIPTION ON THE TOMB OF THE BLACK PRINCE, CANTERBURY.

THIS inscription is ascribed by Dean Stanley and others to the Black Prince himself. Sir F. Madden writes to the Times:—

"What authority the Dean of Westminster may have for the above assertion I am ignorant, but I beg to point out (what has hitherto escaped notice) that the epitaph in question is borrowed, with a few variations, from the anonymous French translation of the *Chronicles Distinctes* of Petrus Alphonsus, composed between the years 1106 and 1110. In the original Latin work it may be found at page 186, part I. of the edition printed in 1824 for the Societè des Bibliophiles Français. The French version is of the thirteenth century, and entitled *Castolement d'un Pèrè à son Fils*. It was first printed by Barbaran in 1790, and more completely by Meun in 1806, in whose edition the epitaph may be read, page 196, under the heading of '*D'un Philoſophe qui passoit parmi un Cimetière*.' The Black Prince, however, is not the only distinguished personage who has availed himself of this inscription, for more than half a century previously it was placed in an

abbreviated form on the monument of the famous John de Warenne, seventh Earl of Surrey, who died in 1304, and was buried before the high altar in the Priory of Lewes. It is printed by Dagdale (not very correctly) in his *Heritage*, vol. I., p. 80, from the Lewes Cinerary, which is preserved among the Cottonian MSS. in the British Museum, Vespas. F. xxv."

SUNDERLAND SCHOOLS, AND COMPETITION.

THE Clerk said they had, in answer to their advertisement, received thirty-four architects' plans, competing for the prizes of 20l., 10l., and 5l. offered by the Board for the best designs for schools to be erected on a site in James Williams-street. The plans have been catalogued, and were now on view at the Grange School, where they would remain during the week.

The Chairman said he had examined all the plans very carefully, and he thought they had obtained a very fine collection. In awarding the premiums, they must, of course, consider what was best for their own locality and requirements, and, as far as he had seen, he thought there were eight or ten plans which would be found very suitable. He suggested that the Board should be divided into two committees of six each, one committee to decide on the best block plan, and the other on the best elevation. The chairman's suggestion was agreed to.

Sir,—Under the impression that the above extract may be of some service to you, as showing the manner matters are being conducted here by the local School Board, I would draw your attention to the parts in italic in the report of the meeting, with a view to the noticing of the absurdity of selecting separate elevations and block plans.

The plans have been thrown open to the public for inspection, and after careful review any person competent at plans may arrive at the conclusion as to the class of competitors who have contributed their efforts. In my humble opinion, it will be difficult to obtain three designs which meet the requirements of an elementary school, or that of the Commissioners of Education, so that the Board are likely to fall lamentably short of what they expected for their money. I have examined the plans, and find that the more showy or well got up are the elevations, the less are the plans belonging to them adapted to schools of the class required.

NON-COMPETITOR.

THE METROPOLITAN BUILDING TRADES MOVEMENT.

ON Saturday in last week the delegations from the London carpenters and joiners, who have had the carrying out of the recent movement and strike for the "nine hours and the ninepence," was virtually dissolved, and the central committee all retired from office, the treasurer, secretary, and the two auditors alone remaining for the purpose of bringing out the audited balance-sheet of the movement. One of the last acts of the central committee, however, was, unhappily, to declare that they looked upon the recent compromise between the masters' committee and their deputation, not as a final settlement of the claims put forth in their memorial, but more the nature of an armistice, leaving the trade free to renew its efforts in favour of the full terms of the memorial on the first favourable opportunity. The secretary was instructed to call together a new delegation from all societies, shops, and jobs, to assemble on Thursday evening in this week, having for its object the adoption of measures to enforce compliance with the terms of the new agreement in those firms—about forty in number—who continue working on the old system of 5½ hours, at 8d. per hour; the extension of the union organisation throughout London; and the laying down a plan of action for renewing the movement to obtain the 6l hours at 9d. per hour in the spring of next year, should the state of business justify such action being taken.

A serious complication has arisen between the Master Builders' Association and the Masons' Society. It appears that in the agreement made between the committee of masters' and the masons' deputation, they were to leave off work at 12 o'clock on Saturdays all the year round, but the agreement entered into with the other trades specifies 1 o'clock as the leaving-off hour on Saturday during the winter months. The masons' deputation made no distinct arrangement with the masters' committee as to payment for overtime, it having been a recognised custom in the trade that all overtime worked by masons beyond the regular working hours each day was paid for at the rate of time and a half for every hour up to 10 p.m., and double time up to 6 a.m. The agreements made with the carpenters and the other trades include arrangements for overtime, and its payment at the rate

of 1d. extra for the first hour after 5 p.m., at the rate of 2d. per hour extra for the next two hours, and time and a half afterwards. Thus the payment for overtime to be made to the other trades is considerably less than the amount now secured by the masons. The masters have called upon the masons to accept these terms as regards the hour for leaving off on Saturday and overtime payment, and to modify their agreement accordingly. This the masons' committee have refused to do, and have further informed the masters that any attempt on their part to tamper with the terms of the agreement, or to infringe upon the recognised payment for overtime received by the masons, would be resisted by the whole power of their society. A general meeting of the masons, held on Friday in last week, endorsed the action and letter of their committee.

As to the cost to the masons of the lock-out and strike, it appears from their balance-sheet that the three weeks' lock-out and strike cost the masons close upon 830*l.* A sum of 521*l.* 2s., being 2s. a day from 1 to 17 days, was disbursed for "dispute pay" amongst 428 members of the Operative Stonemasons' Society of England and Wales, most, if not all, of whom were also included in the 430 members who shared in three dividends, amounting in the aggregate to 151*l.* 5s. 6d. obtained from levies and subscriptions; and 191 non-members received 52*l.* 1s. 6d. from the same source. After the settlement with the employers on July 5th, 12 members and 9 non-members were "withdrawn" from work to enforce the new terms, the former receiving 6*l.* and the latter 8*l.* 13s. 4d. from levies, or 2s. 8d. a day, the time ranging from 1 to 18 days. The charge for collection and distribution was 89*l.* 19s. 7½d.—viz., executive, 43*l.* 4s.; deputations, 16*l.* 5s. 11d.; printing and stationery, 16*l.* 15s. 9d.; postage and telegrams, 3*l.* 1s. 6d.; hire of rooms, 2*l.* 7s.; newspapers, 13s. 11d.; and auditors, 7*l.* 11s. 6d. The receipts comprised 537*l.* 5s. 3d. from the C. C. (central committee) of the society; 112*l.* 19s. from levies of 3s. per week upon men working in the London district; 3*l.* 4s. from a sixpenny levy; and 162*l.* 17s. 7½d. from general subscriptions; making a total of 847*l.* 5s. 10½d. The number of men locked out and on strike embraced in the account was a little over 550. There are from 18,000 to 20,000 members enrolled in the society throughout England and Wales, and the masons are probably the most highly organised of all the branches of the building trade in London.

The turnout of the masons, bricklayers, plasterers, carpenters, joiners, painters, and labourers in the employ of Messrs. Corbett & McLymont, has suspended some of the building operations in the neighbourhood of West Brompton and Earl's-court, where for some time past residences of a superior class have been springing up in all directions. It was upon a part of this work the four hundred and seventy men and boys now on strike were engaged up to Saturday last. The firm had conceded the new terms as to hours and wages all round; but it withdrew the concession at the expiration of a week. There are seventy-eight carpenters and joiners amongst the turn-outs. The Operative Painters and House Decorators' Society have already taken action on behalf of the sixty-five of their trade who have "come out," and similar appeals are being made to their respective trade societies by the bricklayers, plasterers, and labourers who make up the rest of the workmen on strike at West Brompton. The members of the late (?) Central Committee of the Carpenters met on Tuesday at the Brown Bear to discuss this "Brompton" strike. Mr. Shipton advised that a deputation composed of representatives of each trade should seek an interview with the firm, to endeavour to persuade it to stand by the arrangement come to a week ago. With the exception of the plumbers, who were receiving 9½d. an hour, every one had turned out, and, upon second thoughts, seeing the unanimity that prevailed, the firm might be disposed to abide by the terms of the Masters' Association. While on the spot he was informed that a numerous meeting of master builders was being held at the Redcliffe Estate Office, where the firm transacted most of its official business, being the builders upon that extensive estate.

The members of the Builders' Labourers' Union have met in Pentonville-road, when Mr. Kenny, their secretary, argued that even 6d. an hour, which the labourers demanded, was not sufficient remuneration for them. He said he wished to see the employers have a fair return

for their capital, but he did not want them to retire from business after ten years, and take country mansions; while the poor labourer, after twenty-five years' hard work, had nothing left for him but the workhouse. Mr. Halloran stated that 250 men were being added to the union weekly. A resolution was adopted establishing an additional lodge, the members of which are to meet at Pentonville every Monday. The union now consists of fifteen lodges.

A correspondent writes to us that the statement that the "dividend" in the eleventh week of the strike was 13s. to lock-out men is an error, and that it should have been 10s. for that week; nor had it been more than 12s. on any week before the "settlement," that sum being paid only once (except to men from Brass's and Jackson & Shaw's).

SANITARY STATE OF BECKENHAM, KENT.

SIR,—Having lately paid a visit to Beckenham, I was entirely disgusted with the state of some of the old conveniences there. It appears that in the vicinity of Brackley-road there are existing at the present time some which have not been cleaned out for years, although Beckenham is, or is supposed to be, properly drained. Yet such a state of affairs is allowed. Why is this? Is there no sanitary inspector? or, if there is, why does he not perform his duty?

ONE WHO HAS EXPERIENCED THE NUISANCE.

SEWER GASES.

SIR,—It having become necessary for drainage purposes to empty a cesspool which probably had not been emptied for several years, this work was done at night, and the next morning when one of the men was engaged throwing lime into the pit to disinfect it, an offensive smell arose from it, and the man suddenly became pale, staggered, found great difficulty in breathing, and was some time before he recovered. The cesspool in question was about 7 ft. deep, and when a lighted candle was put down into it kept alight for a depth of 4 ft. or 5 ft., but when it was lowered to within a foot or two from the bottom it was immediately extinguished.

Will any of your readers kindly inform me what gases, if any, could cause these symptoms in the man and extinguish the candle? L. L.

EVERSHAM SEWERAGE.

SIR,—I wish to correct a statement reported in your issue of the 14th inst., namely, that my proposal involved an outlay of 49,000*l.*, while another estimate was only 4,000*l.*

I beg to say my estimate for sewerage and waterworks complete was 11,800*l.*, and that the one of 4,000*l.* was for sewerage works, and did not include waterworks. The population of Eversham being about 5,000, I think from your knowledge of such matters that you will agree in thinking that my estimate does not involve an excessive outlay for these works (sewerage and waterworks), and that the 4,000*l.* would be inadequate for the required purpose. JOSIAH FORSTER FAIRBANK, C.E.

THE ANT NUISANCE.

It would be a boon if any of your readers could prescribe an effective agent for the destruction of that troublesome little insect, the house ant; and tell us whether any, and if so what, special conditions favour its existence and reproduction. I have exhausted every nostrum known to me to be a destroyer of ants, and tried various original preparations, but all to no purpose.

At the present time I have a large, well-built house, the basement of which is literally alive with them, though every crevice has been carefully stopped, and the ceilings, walls, and floors, thoroughly saturated with various kinds of supposed specifics. Possibly a better knowledge of the habits and natural history of these ants might aid the discovery of a real antidote to their existence in our houses, though, doubtless, the only radical exterminator is the discovery and destruction of their nest or nests.

After many patient trials, I must frankly confess that to attempt to free a house from them by simply destroying those which infest the floor and walls, &c., seems to me much like trying to exhaust a well with an inexhaustible spring of water.

It is certainly important to ascertain whether these insects make their way into the building from the earth upwards, or whether they are introduced with the building materials, or how they do get into solid structures. B.

SCHOOL-BUILDING NEWS.

Bristol.—The foundation-stone of new schools for St. Silas parish has been laid. The schools are intended to accommodate 700 children,—200 boys, 200 girls, and 300 infants; and the site is a piece of ground adjoining the church. The school buildings will form three sides of a square,—the girls' room being on the left, the boys' on the right, and the class-rooms and the infant-school at the back. The quadrangle, which will form a playground for the infants, will be separated from the roadway by the boundary-wall of the premises. The boys' and girls' playgrounds will be behind their schools. The rooms for the girls and boys will be 68 ft. by 20 ft., and there will be a class-room of 16 ft.

by 20 ft. for each department. The infant school-room will be 75 ft. by 33 ft. The necessary accommodation in the way of cloak and bathtubs, lavatories, closets, &c., required by the Education Department, has been provided for. The building will be in the Early English style of architecture, and the material Pennant stone with freestone dressings. The roofs will be open-timbered, and covered with Bridgewater tiles, in patterns. Over the entrance to the infant-school will be a bell-tower. The contract has been signed for 1,500*l.*, but the school-fittings, and some extras for foundations will bring up the cost to 2,200*l.*, of which 500*l.* have yet to be raised. It is hoped that the buildings will be completed early in the spring. The architect is Mr. Joseph Neale, and the general contractor, Mr. R. J. Crocker, of Bedminster. The mason's work will be carried out by Mr. J. P. Stephens, who is engaged rebuilding St. Silas's Church.

Liverpool.—The plans of Messrs. Reade & Goodison, of Canning-chambers, South John-street, architects, for the public elementary schools in connexion with the School Board, in Church-street, have been adopted by the Sites and Building Committee of the School Board. The architects who have been successful for the Queen's-road site are Mr. Thomas Cook of South Castle-street, and Mr. John E. Reeve of Lord-street.

Catworth, Hunts.—Plans for these schools and master's house have been passed by the Privy Council, and the works are to be commenced at once. Mr. William Streather, of Ramds, is the builder; and Mr. John Ladds, of London, the architect.

Books Received.

Ancient Examples of Domestic Architecture in the Isle of Thanet. By J. P. SEDDON. 1872. John B. Day.

EVERY one who has walked in the Isle of Thanet with his eyes in his mind has noticed the specimens remaining of a peculiar mode of cottage construction, in brick and flint work, dating from the seventeenth century, the principal feature of which is a gable, mostly made up of portions of a circle, and usually coped with brick. Mr. Seddon has usefully brought together ten examples from Broadstairs and Readitt Street. They are somewhat roughly set forth, but answer the purpose.

VARIORUM.

"THE Dictionary of Practical Receipts. By G. W. Francis, F.L.S. New and improved edition by D. Francis. London: Allen, Ave Marlane." This volume contains upwards of fifty thousand receipts in trade and manufacturing domestic economy, artistic, ornamental, or scientific processes, pharmaceutical and chemical experiments, &c. It is not only alphabetically arranged, being a dictionary, but contains a copious index for still more ready reference and connexion of subjects. It is by no means likely that it is faultless: no such book ever can be so; but we find it correct so far as we have tested it, although in some cases wanting in freshness of information. It might have had something about magenta, for example, in receipts for dyeing processes; but no such heading as magenta exists in it. And, by the way, we may here suggest, for new edition, a simple receipt, which no freshener of information could have hitherto supplied, as has only been used in one case, so far as we know.

White muslin curtains can readily be tinted with a beautiful rose colour by magenta dissolved in water. A chilling's worth of magenta powder dissolved in barely as much water as to stain the curtains in completely, and then wring out tinted two pairs of large window-curtains after being starched, and another pair after they were done. The tint fades soon where much exposed to the sun, but it can readily be renewed where faded, by a soft brush, or by dipping anew. Our lady friends will thank us for this novelty in "domestic economy." There are various applications of it,—for example, to toilet covers, &c.—"The Royal Guide to the London Charities for 1872-73. By Herbert Fry, London: Hardwick." This is the tenth annual edition, an astonishing evidence of charitable feeling on the part of the Londoners, and painstaking of the part of Mr. Fry. It contains upwards of 200 pages of mere arranged titles of London charities, besides nearly 100 more of charitable advertisements!

Miscellaneous.

Canterbury and the New Public Health Act.—A meeting of the Canterbury Town Council was called for the purpose of taking into consideration the provisions of the Public Health Act. The town clerk said he was in doubt as to whether it was not necessary to hold a meeting of the Sanitary Authority within twenty-eight days of the Act, and that was the reason of his calling the meeting. He did not anticipate that there would be anything to do, as it would be better to defer the appointment of a medical officer till the regulations of the Local Government Board came before them. He read the 6th clause of the Act, which provides that the Local Board shall transfer all their powers to the body to be called the Urban Sanitary Authority, which in the case of boroughs (said the clerk) would be the Town Council. The clause also provided for the appointment of a medical officer of health and an inspector of nuisances, and the Local Government inspectors would have the power of being present at the meetings of the Board and exercising the same power as the Poor-law inspectors at boards of guardians. The meeting was ultimately adjourned till the 9th of October next.

Leicestershire and Northamptonshire Archaeological Societies.—The annual meetings of the members of these societies commenced on Tuesday last week at Lutterworth, with divine service in the parish church. Subsequently, the Rev. G. A. Poole (Welford) explained the principal features of this edifice. The company then returned to the museum, which had been fitted up by the local committee in the large room of the town-hall. Some illuminated manuscripts were shown of the thirteenth and fifteenth centuries. The Rev. A. Pownall read a paper on Medieval glass vials found at Lutterworth and South Kilworth. The excursion took place on Wednesday, when about fifty ladies and gentlemen started at nine o'clock from Lutterworth. The following places were visited:—Newham Paddock, the portraits by Vandyke and some interesting relics being shown; Monks Kirby Church, Brinklow (church and tumulus), Combe Abbey, site of a religious house of the Cistercian order, cloisters, rebuilt by Lord Harrington, temp. James I.; many pictures of the Stuart family and period; Wiltbrooke Church, and Claybrooke Church. This brought to a conclusion a very successful meeting.

The Statistical Congress in Russia.—The foreign members of this Congress have been hospitably entertained in Moscow as well as in St. Petersburg. The municipality provided them with accommodation in the best hotels, and with horses and carriages. They visited the Exhibition, and the monuments of the city, and were entertained by Prince Dolgorouki, Governor-General of Moscow, at a concert, ball, and supper. On the 4th instant they visited Warsaw, where a banquet was prepared for them by Field-Marshal Count de Bcrq, Lieutenant of the Emperor in Poland; and on the next day a review was held in their honour.

A Large Chimney.—The large chimney-shaft which has been in course of erection for some months at the alkali works of the Connah's Quay Chemical Company, was finished last week. As it is the largest square chimney in England, its principal dimensions will doubtless be interesting to our readers. The foundation, which is 28 ft. square, and 13 ft. 6 in. deep, is composed of 620 tons of stone and rubble. The chimney is 17 ft. 6 in. square at the base (inside measurement), and 7 ft. square at the top (inside measurement), and is 245 ft. high from the surface. The cap for the top, weighing 25 tons, is composed of fireclay and stone. The number of bricks used in building the chimney is 1,078,000, and the total cost a little over 2,000. The chimney will be provided with two lightning-conductors.—*Chester Chronicle.*

The Dublin Exhibition.—The executive of the Dublin Exhibition have been fortunate enough to secure for exhibition Lord Londesborough's valuable collection of arms and armour. It was formed many years since by the late Lord Londesborough, and consists principally of European arms and armour, and a choice selection of Oriental, derived from well-known sources; and it may be considered (now the Meyrick Armoury is dispersed) one of the finest private collections in Europe.

Gibbs's Hay-drying Machine.—A letter from Mr. Amersford, of Lake Haarlem, to Mr. W. A. Gibbs, Gilwell Park, Sewardstone, says,—"Your hay-drying machine proved the great attraction of the day. It had been announced by the Agricultural Society that grass could be made into hay by this machine in ten minutes. We had spared for this purpose a beautiful crop of Timothy grass and clover, in the immediate neighbourhood of the hay-dryer. It was cut by a workman with a scythe before the eyes of the assembled crowd. On the day before we had been able to dry it satisfactorily in exactly six minutes; the people now of course hindered the men a little in their work, but it was done in ten minutes, and I saw with satisfaction a great many farmers taking samples of the beautiful green but perfectly dry hay, to show it at home to their friends. After this feat was accomplished, we showed to the public the real work for which the hay-dryer is intended, taking hay that was half dry and drying it in three minutes ready for the stack, as will be necessary on wet days, when is the real use of the hay-dryer, as it was used frequently on my farm in the autumn of 1871."

Australian Meat.—We have reason to think that a dislike to Australian meat has arisen from the fact that there are purveyors who force upon the market meats which really deserve all the ill that is said of them. These meats, however, are of very different kinds from those got from the more respectable purveyors. A writer in the *Food Journal* says of Australian meats:—

"Against the ignorant, slipshod expressions which we hear now and then among us, such as 'I like to see the joint,' 'I like to know what I eat,' &c., we protest energetically; the question is a serious one, one which affects the well-being of millions, and deserves the serious attention of sensible beings. We like hothouse grapes, but we do not like to pay five shillings a pound for them; we like fresh green peas, but we like 'tinned peas' when we cannot get them green. We should like to see a leg of mutton or a side of beef of every family taken all the year round, but, as that is scarcely to be hoped for at present, we should like to see a good dish of Australian meat there instead."

One of the great obstacles to the general adoption of Australian meat is that unless eaten cold, when it is excellent, it requires some little knowledge of cookery to manage it properly. It cannot be roasted, or baked, or boiled like a fresh joint. Those who wish to get variety, to make the most of Australian meat, must take the trouble to learn how to cook it. To use good Australian meat is one of the best ways to obtain good English meat at moderate prices.

A Boston Idea.—A discovery is said to have been made and applied in Boston which, it is claimed, will reduce the cost of steam-power more than 60 per cent. It consists of a novel process by which the great amount of heat which escapes into the air in the waste or exhaust steam from engines is utilised by conducting it through the tubes of a boiler filled with the bisulphide of carbon, a fluid which boils at 110° Fahr., and at the temperature of exhaust steam gives a pressure of 65 lb. to the inch in the boiler. The vapour formed in this boiler [how does the bisulphide act upon it and all the other apparatus?] is used to drive an engine, instead of steam; and, after being used, is condensed by cooling, pumped into the boiler again, and used continuously, without loss. It is claimed that experiments prove that by this process the same fuel now required to produce 100 horse-power with the best engines in use will produce 250 horse-power. We wish the Bostonians could show how to utilise the waste noise of whizzing engines and rampant steam whistles. What a waste of active force there is in these!

Sanitary Report on Southwark.—The annual report of the medical officer of health for Southwark (Dr. H. Bateson) has been presented to the Vestry, and printed by their authority. The death-rate for the parish for the past year has been 25 in 1,000 persons living; and the parish, "which has been, far away beyond the remembrance of the present generation, a by-word and reproach, remains no longer so; it may no more take its rank as the lowest amongst the low and wretched parishes of London, in which disease and death hold high and continued carnival." It is notable that the Peabody Buildings have had a higher death-rate than was expected, namely, 23½ in 1,000 persons living, or 1 in 43. In other metropolitan model buildings a more favourable state of health prevails, the death-rate averaging only 17 per 1,000. Peabody's Buildings, the reporter remarks, were too soon occupied, and months afterwards he found many of the ground floors still very damp.

St. Louis, U.S.—The chief citizens of St. Louis, now the third city in point of population in the United States of America, have addressed to the inhabitants of this country an invitation to come and see the wealth, the fertility, and the resources of Missouri. The time suggested is during the twelfth annual Exhibition of the State Agricultural and Mechanical Association, which will begin on the 3rd of October, and will continue open for nine days. The invitation is contained in a letter to the People of Great Britain, signed by fifty-eight representative men of St. Louis. The signatures include an ex-Governor, and an ex-Lieutenant-Governor of the State of Missouri, bankers, merchants, newspaper proprietors and editors, and others. They urge their desire to establish a direct and profitable exchange of products between Missouri and the Mother Country. The city of St. Louis stands at the junction of the Mississippi and Missouri rivers, and enjoys advantages of position which ought to render it the centre and key to the commerce of the West. The St. Louis merchants ask, in short, for capital to develop their facilities for trade.

You shall not Save your Money.—So say the Driffield School Board to the ratepayers. Plans for a school having been submitted and examined at the last ordinary meeting of that Board, the clerk was instructed to communicate with Mr. Paul, the architect to the Board, on some suggested alterations in the plan, and to prepare the specifications so that the advertisements for tenders might be got out at once. Mr. Paul having recommended that the advertisement should appear in the *Builder* and other London papers, a discussion arose whether it would not be desirable to confine the advertisement to the local papers; and it was the opinion of the Board that the work for building the schools should be kept in the town as far as it was consistent with economy. It was ultimately agreed that the advertisement should be inserted only in the York, Leeds, Hull, and Driffield papers.—For fear, of course, some London builder who does not read a country paper should offer to build the school for a less sum than any of the country builders would ask;—clever, certainly!

A Substitute for Coal.—Great results are expected from some experiments which are being made by the Duke of Sutherland on the waste lands of Sutherlandshire. He is utilising surface peat by making it into composite fuel. The first attempt was made with a combination of sawdust and peat, which, being mixed by steam machinery and then dried in cakes, was found to be excellent fuel, sixty of the cakes being equal to 1 cwt. of best Sunderland coal, while the cost is 25 per cent. less. The coal composites are even a greater success, thirty of these being set down as of the strength and value of sixty of the sawdust peats. If the cakes can be dried by artificial means,—and there is no reason to doubt this,—there will, we are told, soon be abundance of peat fuel in Scotland, and the successful working of the invention will greatly facilitate the reclamation of the waste lands.

A Startling Occurrence.—An incident of a singular nature has taken place at Retford. In the Market-place, on the site of the old town-hall, there was standing a large iron pillar, which supported four gas-lamps. It has been completely wrenched from its hold, and flung down with such force that the surrounding buildings were shaken to their foundation. An iron slate at the base was broken, all the lamps were smashed to pieces, but the pillar, singularly enough, was not damaged, although falling with such a thundering shock. The real cause is at present unknown. Could it be from electric action between the earth and the air? The most probable supposition, perhaps, is that there was an escape of gas from some subterranean piping, and that it was accidentally fired by some one passing by, and exploded.

Pencils for Japan.—The steam-pencil factory of Messrs. Wolff & Son, of Great Queen-street, was visited last week by several members of the suite attached to the Japanese embassy now in England. They were attended by Mr. Brunton, engineer to the Government of Japan. Their visit lasted about three hours, and at its conclusion they not only expressed themselves to have been highly gratified with what they had seen, but also requested to be furnished with specimens of pencil-making in all the various stages of manufacture from the raw material, for deposit in the Imperial Museum.

The Monument at Dunrobin to the late Duchess of Sutherland.—Her Majesty has laid the memorial stone of a monument to the memory of the late Duchess of Sutherland in the grounds of Dunrobin Castle. There was a large attendance of subscribers and the public. Her Majesty said:—

"It gives me the greatest pleasure to testify on this occasion my love and the highest Duchesse, my valued friend, with whose children I am now staying. I wish to express my warmest thanks for the hearty and loyal welcome I have met with at Sutherland."

The monument is in the form of an Eleanor cross, with a bronze bust of the late Duchesse, and will be built of freestone from a quarry on the estate. It stands on a green terrace on the right of the principal avenue, and will be seen from the railway and the public road which passes by the Lichies.

Worcester City and County Fine Arts Exhibition.—The first public exhibition of pictures and works of art in connexion with the Worcester City and County Fine Arts Association, was held during the Festival week, the gallery being formally opened on Saturday by Sir E. Lechmere, in the absence of Earl Dudley, who is the president. The mayor (Mr. H. Willis) presided on Saturday, and called upon Sir E. Lechmere to manage the proceedings. The committee stated that arrangements would be made to have the exhibition open to the public in the evenings, the collection being on view for a fortnight. Among the paintings exhibited are several by the old masters, lent for the occasion by residents of the neighbourhood.

Galvanisation of Iron and Wooden Beams.—A discovery interesting to iron-builders, relative to the conservation of the iron beams used in hydraulic works, has recently, it is said, been made in France. It consists in the application of a chemical process, operated at once, without any particular tools, and at trifling cost. Supposing two beams have to be joined together, holes have to be bored, and next filled with some zinc-filling mixed with any fatty material, then the peg or screw is introduced in the ordinary way. A galvanisation is thus slowly produced, absolutely the same as when iron is dipped into molten zinc. This process can even be applied to timber. Experiments have been made, and are declared to be perfectly conclusive.

The Danger of Whitehall Stairs.—An inquest at the Guildhall, Westminster, has just been held, touching another death at Whitehall Stairs from accidental drowning. A juror pointed out that several fatal accidents had occurred at the place named, and he thought Whitehall Stairs very dangerous. He was of opinion that a railing ought to be placed down the side of the steps, to prevent persons falling therefrom into the river. The Metropolitan Board of Works ought to see that this place is protected. Several other jurymen recommended that the coroner should write to the Board on the subject.

South London Working Men's College. This institution, 91, Blackfriars-road, has reopened for the winter session with new classes in drawing, mechanical construction, history, grammar, and French. A new elementary and an advanced French class have begun this week, under Mr. Oswald. A night-school, of an advanced character, for men only, meets three nights weekly; and the members of this are admitted to the history and grammar classes without further charge. The secretary is Mr. Rossiter.

New Light at Buffalo.—The entire town of Buffalo, U.S.A., is now lighted by hydrogen gas, it is said, extracted from hydrate of lime, carburetted, and burnt with the oxygen extracted from the atmosphere. The cost of the hydrogen is about 1d. per cubic metre; that of the oxygen varies with the price of coal, and is estimated at the value of 6 kilogrammes (13 lb.) of coal, say 2d. to 3d. The oxygen is nearly pure, containing only about 3 per cent. of azote.

Trial of Electric Light again in Paris.—A wooden tower is being raised on the Battes Montmartre, Paris, of about 3 metres in height, and designed to receive an electric apparatus of great power, intended to light by night the whole quarter of the 18th Arrondissement, of which Montmartre is the chief seat. One light for a whole district, it is to be feared, will leave many deep shadows for thieves to skulk in, however bright and elevated it may be.

Roman London.—Within the last few days, in digging the foundations for some buildings in Queen Victoria street, distinct traces of what was known as Wall-Brook were reached. The spot is now surrounded for a good distance by houses, but at one time was known as "The Old Barge Yard." A mass of broken masonry indicates the course of the ancient stream, and a small portion of Roman pavement of not very rich design reveals the capabilities of the old workman. The specimen to which we refer was discovered at about 18 ft. below the level of the present street, and is surrounded by the clay that once formed part of the Brook's bed.

Iron Store at Chatham.—Workmen have commenced excavating for the foundations of a large store that is ordered to be built at the Chatham Gun Wharf. It has been found necessary to have a building erected in which to store the new gun-carriages and slides as they arrive from the manufactory. The building will be very massive, and will be constructed principally of iron. Messrs. Ford & Sons, Government contractors, Rochester, will be the builders.

Compliment to Surveyor of St. Olave's, Southwark, Board of Works.—As a recognition to Mr. Newman for his services in relation to the recent improvements in Tooley-street, effected without any call on the ratepayers as to it, the Board have unanimously resolved to present him with 100l., out of the surplus improvement fund.

Co-operative Partnership.—Messrs. Bell, Goodman, & Co., Walker Ironworks, Newcastle-on-Tyne, who have been working on the co-partnership principle for twelve months, have made a profit of 21 per cent., of which 10 per cent. goes to the firm and 10 per cent. on the wages earned to the men; thus a man who has earned 50l. in the year gets 5l. dividend.

Highgate Workhouse.—At the last meeting of the Holborn Guardians it was reported by the architect to the Board that the walls of the south-west wing of the Highgate Workhouse were cracked, and that the foundations had sunk. The Building Committee were instructed to take steps to secure the building, and also to investigate the cause of the subsidence.

Sanitary Appliances.—The Sanitary and Economic Manure Company of Manchester exhibited their closet arrangements at the Manchester and Liverpool Agricultural Society's show at Bolton, and were awarded the Society's silver medal for the advantages of their system.

The London International Exhibition.—For the general convenience of the public and of the exhibitors it has been resolved to keep the Exhibition open till Saturday, the 19th October.

TENDERS

For farm-house and offices at Runwell, Essex, for Mr. Thomas Kemble. Mr. F. Whitmore, architect. Quantities by Messrs. Curtis & Son:—

Gozett	6,982 10 0
Brown	891 0 0
Lart	899 12 0
Letch	763 0 0
Walsh	746 3 0
Kennell	737 0 0

For Greenham Viaduct, Berks, for the Rev. O. E. Sloocho. Mr. J. H. Money, architect. Quantities supplied:—

Harrison	£3,313 10 0
Elliot	2,790 0 0
Williams	2,720 0 0
Cooke & Groom	2,692 0 0
Adey	2,683 0 0

For erecting paper warehouse, in St. Bride-street, Mr. L. H. Isaacs, architect. Quantities supplied by Mr. L. C. Haldet:—

Elkington (accepted)	£2,500 0 0
----------------------	-------	------------

For two mission halls, Poplar and Canning Town:—

Cawdon & Co.	£1,897 10 0
Gough	1,960 0 0
Darby & Son	1,463 0 0
Hoskin, Brothers	1,295 0 0
Turner	1,273 0 0
Webb	1,150 0 0
Ware	987 0 0
Robbins	893 0 0
Omer	895 0 0
Mason & Bristy	825 0 0
Christ	809 0 0

For building new public elementary schools, Queenborough, Isle of Sheppy. Mr. B. Atkins, architect. Quantities supplied by Mr. T. T. Green:—

Bligh	£1,693 10 0
Miller	1,428 0 0
Shrubsole	1,348 0 0
Naylor (accepted)	1,167 0 0
Gamma	1,158 0 0

For additions to floor-cloth factory, Manor-road, Rotherhithe, for Messrs. Rolfs & Sons:—

Aitchison & Walker (accepted)	£615 0 0
-------------------------------	-------	----------

For additions to the Pwllheli National Schools, Messrs. Roberts & Morrow, architects:—

Roberts	£210 0 0
Williams (accepted)	204 7 3
Humphreys	199 0 0

For the enlargement of a mansion at Totteridge, Middlesex, for Mr. Shuttleworth. Quantities supplied:—

Scrivenor & White	£1,729 0 0
Woodhall	1,490 0 0
Thomas	1,288 0 0
Gilmour (accepted)	1,260 0 0

For alterations and additions to house, and building stables, &c., at Star Grove, East Woodhay, near Newbury, Berks. Mr. F. C. Dyer, architect:—

Cooke & Groom (accepted)	£1,560 0 0
--------------------------	-------	------------

For the erection of hop warehouse and offices, Denman-street, Borough, for Mr. G. Gibbon. Mr. J. W. Reed, architect:—

Niblett & Son (accepted)	£2,790 0 0
--------------------------	-------	------------

For the erection of four houses, with shops, Crouchend, Horsaey, for Mr. H. W. Elder. Mr. J. W. Reed, architect:—

Niblett & Son (accepted)	£2,690 0 0
--------------------------	-------	------------

For alterations and additions to the Bank, at Horsham, for the London and County Banking Company. Mr. F. Chancellor, architect. Quantities by Messrs. Curtis & Son:—

Dearden	£1,988 0 0
Potter	1,888 0 0
Corder	1,828 0 0
Mann	1,815 0 0
Shankland	1,794 0 0
Sharp	1,780 0 0
Hill & Son (accepted)	1,780 0 0

For re-building the Masons' Arms Tavern, Union-road, Bow, for Mrs. Wingham. Messrs. Jewell & Co., architects. Quantities supplied by Mr. J. S. Lee:—

Merritt & Ashby	£3,466 0 0
Patman & Potheringham	3,450 0 0
Newman & Mann	3,435 0 0
Dewell	3,390 0 0
Mark	3,348 0 0
Sewell	3,333 0 0
Sayer	3,295 0 0
Cressall	3,236 0 0
King & Son	3,205 0 0
Lindfield	3,198 0 0
Stentford	3,150 0 0
Cohen	3,010 0 0
Peare	2,875 0 0
Lovell & Co.	2,793 0 0
George	2,697 0 0
Smith	1,870 0 0
Cooke & Groom	1,470 0 0

For the extension and improvement of Plumtree-court, Shoe-lane, for the Corporation of the City of London. Mr. H. Jones, architect:—

Wignone	£1,599 10 0
Ritson	1,585 0 0
Brown & Robinson	1,543 0 0
Hart	1,497 0 0
Carter & Son	1,467 0 0
Mowlem, Burt, & Freeman	1,450 0 0

TO CORRESPONDENTS.

Economic Store, Turin.—We are unable to comply with a number of requests for the address of maker of this stove. Perhaps our correspondent F. C. will send it.

Major A. L. Ince.—A. B. & Son the T. Iron will answer the purpose best with the fringe at bottom: mode B. — A Reader (write to the Inventor, Office of Works, Whitehall). — L. L. — R. S. — E. — D. — E. R. — R. S. — H. C. — C. R. & Co. — P. & B. — The Lord Mayor. — W. D. — T. H. S. — M. A. — W. D. F. — Mr. R. — J. V. — M. & Co. — C. J. P. — Nemo. — F. C. D. — H. C. J. — L. T. T. G. — A. & W.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

Bath and other Building Stones of Best Quality.—**RANDELL, SAUNDERS, & CO.** Limited, Quarymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[Adv.]

Ashton & Green, Slate, Iron, and Marble Merchants, and Quarry Agents, keep the largest and best selected Stocks of Bangor, Portmadoc, Green Roofing Slates, Slate Slabs, and every description of Slate Goods, Marble and Enamelled Slate Chimney-pieces, Stoves, Ranges, Rainwater Goods, and General Castings. A. & G.'s special Red Ridge Tiles. Drawings and prices upon application. Offices and Show-rooms, 14 and 15, Bury-street, St. Mary-Axe, London, E.C. Agents for sale of Whitland Abbey Green Slates in town and country.—[Adv.]

Bills of Quantities, Specifications, &c., Lithographed by ROBT. J. COOK & HAMMOND, 29, Charing-cross, S.W., with accuracy and punctuality. Plans and Drawings Copied, Traced, or Lithographed.—[Advvt.]

PERFECTION IN BOOKKEEPING.—Builders and others desiring a really good system can have a BIPARTITE SYSTEM OF BOOKKEEPING, BY DOUBLE ENTRY, for which was awarded the prize offered in "The Builder," No. 1180, and which has been adopted by many large firms. Also a Modified Arrangement by Single Entry, suitable for small business.—Address E. A. S. George's-road, Regent's Park, London.

For post free on receipt of Six Penny Stamp. SOME OBSERVATIONS ON FIRE-PLACES, STOVES, and VENTILATION. By Messrs. FRED EDWARDS & SON, Stone and Range Manufacturers, Hot-water Engineers, No. 41, Great Marlborough-street, Regent-street, London, W. They also can be obtained through Messrs. LONGMANS & CO. Paternoster-row, E.C.

MISS BRADDON'S NEW NOVEL, "THE BITTER END." The New Novel, by the Author of "Lady Audley's Secret," &c. In 3 vols. at all Libraries.

WEALES' SUPPLEMENTARY SERIES. Gas Works (a Treatise on), and the PRACTICE OF MANUFACTURING and DISTRIBUTING COAL GAS. By SAMUEL HUGHES, C.E. Third Edition. Revised by W. RICHARDS, C.E.

DRAINAGE and SEWAGE OF TOWNS and BUILDINGS. By D. DUFFY, C.E. Cloth limp, 2s. post. 3d. PLASTING and QUARRING OF STONE, &c. By FIELD-MONKTON, C.E. Cloth limp, 1s. 6d. post. 2d. COTTAGE BUILDING. By G. D. ALLEN. Cloth limp, 1s. (post. 2d.) FOUNDATIONS and CONCRETE WORKS. By F. DOBSON. Cloth limp, 1s. 6d. (post. 2d.) LIMES, CEMENTS, MORTARS, CONCRETE, &c. By G. R. DUNNELL, C.E. Cloth limp, 1s. 6d. (post. 2d.) WARMING and VENTILATION. By CHARLES TOMLINSON, F.R.S. Cloth limp, 2s. 6d. (post. 2d.) ARCHES, PIERS, and BUTTRESSES. By W. BLEAND. Cloth limp, 1s. 6d. (post. 2d.) ACQUISITION OF PUBLIC BUILDINGS. By T. B. FORMAN. Two in one. Paper cover. London: LOCKWOOD & CO. 7, Stationer's Hall-court, E.C.

NOTICE.—To the ARCHITECTS of GREAT BRITAIN; also the CONTRACTORS. Early in AUGUST a NEW WORK will be published, EXECUTED EXAMPLES by MODERN ARCHITECTS. Four Plates. Imp. 4to, with Four Pages of Engraving and Wrapper Monthly. Price to Subscribers, 7s. 6d. The First Number will contain a CHURCH, SCHOOL, MANSION, and VILLA. The Architects have kindly consented to lend their drawings, to be bound as subscribers. All Architects wishing the insertion of their drawings, will please forward same, carriage paid, with a subscription order. The name and address of each Architect will be given, also the Contractor's estimate for erection, and each monthly number.

A New Work just published on SPECIFICATIONS, by F. ROGERS, Architect, after the MODEL of BATHOLOMEWS, &c. re-issued, 11, 10s. London: A. S. BARNES, 21, Abchurch-lane, at all Booksellers & G. & P. Publications, 106, Great Russell-street, Bedford-square.

ARCHITECTURE. RE-ISSUE OF THE FOLLOWING STANDARD WORKS BY J. JOBBINS. 3, WARWICK COURT, HOLBORN, LONDON, W.C.

EXAMPLES OF BUILDING CONSTRUCTION. Intended as an Aid Memoire for the Professional Man and the Operative. In Forty-eight Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

DETAILS OF GOTHIC ARCHITECTURE. Measured and drawn from Existing Examples. By JAMES K. COLLING, Architect. In Forty-eight Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

AN ANALYSIS OF ANCIENT DOMESTIC ARCHITECTURE. Exhibiting some of the best Examples in Great Britain. From Drawings and Measurements taken on the Spot, by P. T. DOLMAN and J. K. JOBBINS. In Forty-eight Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

ARCHITECTURAL, ANTIQUARIAN, NAVAL, MILITARY, and MEDICAL DRAWINGS. Landscapes, Ship Plans, Railway Plans, and Sections. Included in the best style. Bills of Quantities, Circular Notes, Invocives, Cards, and Sections. In Forty-eight Parts, 2s. 6d. each; or in Two Volumes, bound in cloth, Five Guineas.

MR. ARCHIBALD D. DAWNEY, C.E., CONSULTING ENGINEER and SURVEYOR, 22, Waterloo, London.—CALCULATIONS, DESIGNS, and ESTIMATES prepared for TRAMWAYS, RAILWORKS, & LEVELLING and SURVEYING. Professional assistance generally.

PERSPECTIVES, COMPETITION, or PERSPECTIVE and DRAWING PREPARED and Riched or Coloured in the best style. Terms strictly moderate. Also OCCASIONAL ASSISTANCE. In or out of Office. Address, T. H. 14, Argyle-street, Argyle-square, W.C.

TO BUILDERS, HOUSE AGENTS, and OTHERS. DRAWINGS of every description for buildings or alterations, &c. accurately PREPARED, COPIED, or TRACED. Estimates and DRAWINGS PREPARED.—Address, A. B. 1, Roscolli-gardens, Regent's Park, N.W.

LUNATIC ASYLUMS.—An Architect, who has experienced and successful in designing and carrying out lunatic asylums, would be glad to receive applications for such work.—Address, 106, Office of "The Builder."

EVENING EMPLOYMENT.—WANTED, for occasional assistance, a JUNIOR ASSISTANT, accustomed to preparation of working drawings; also a good tracer.—Apply, with references, and for particulars, to the Office of "The Builder."

PUPIL.—A CIVIL ENGINEER, having works of considerable moral value in operation, has a VACANCY in his Office for a PUPIL. The district in which the works are situated being one of considerable extent and importance, affords unusual opportunities for the acquirement of engineering experience.—Address, A. B. 31, Grosvenor-street, E.C.

TO PARENTS AND GUARDIANS. A FIRM OF ARCHITECTS are seeking a PUPIL. A premium required, and a salary given after the second year, to a young man of energy and education.—Apply by letter, to ARCHITECT, care of Mr. E. W. Dale, Stationer, New Market-street, Strand.

AN ARCHITECT and SURVEYOR, of good practice, has a VACANCY for a PUPIL. An intelligent Youth would have an exceptional opportunity of becoming practically acquainted with the various branches of the profession.—Address, R. C. SITTON, Bromley-by-Low, Nottingham.

TO PARENTS AND GUARDIANS. A BUILDER and CONTRACTOR, doing a large business, is in want of a PUPIL.—For particulars, address C. C. Post-office, Euston-square, Thames.

TO PARENTS AND GUARDIANS. THERE is a VACANCY for an APPRENTICE in the Works of a Manufacturer of first-class Decorative Papers, &c. Premium required.—Address, A. E. care of A. W. Simmons & Co. Stationers, 45, Coleman-street, E.C.

CURATOR WANTED.—Museum of Building Appliances, 23, Maddox-street, W. Office hours 9 to 6.—Apply, by letter only, stating age, previous occupation, and salary expected.—RESIDENT SECRETARY, 4, Grosvenor-street, W.C.

MECHANICAL or ARCHITECTURAL DRAUGHTSMAN WANTED, to execute some large Lectures Diagrams. He would be required to reside about twenty miles from London.—Apply, stating qualifications and terms, to M. N. Office of "Engineering."

A COMPANY for the treatment of Sewage is in desire of obtaining the services of a young ENGINEER who has been employed on such a service, and can produce testimonials of qualifications.—Apply to W. K. care of Mr. Edwards, 109, Bishopsgate-street, within, E.C.

WANTED, immediately, an ASSISTANT, accustomed to FIELD WORK, Situation permanent.—Address, stating terms, R. 20, Queen's-road, Dudley.

WANTED, an ASSISTANT, in an ARCHITECT'S OFFICE in the country.—Address, stating qualifications and salary required, Z. 2, Abdon - chambers, Oswestry.

WANTED, by an Architectural Firm in Manchester a first-class QUANTITY TAKER and BUILDING SUPERVISOR. None need apply unless thoroughly competent.—Address, stating terms, references, &c. Reform Club, Manchester.

WANTED, a thoroughly practical Man, who can give a specification, and estimate for repairs and alterations to buildings, measures up for fixtures and outbuildings, and understands accounts together with the usual duties of the office.—Address, 127, Office of "The Builder."

TO MASONS. WANTED, a practical WORKING MASON or TAMP FOREMAN. State references.—Address, YORK, care of Mr. James Roberts, Advertising Agent, 130, Shoreditch, opposite the Great Eastern Railway.

WANTED, a good BRICKLAYER (one who understands task pointing), for a constant. No one else's habits and good ability need apply.—Apply to H. R. WAGNER, Builder, Victoria Works, Piccadilly, S.W.

WANTED, a first-class PLASTERER, To take a Job by the Piece.—Apply to H. R. WAGNER, Victoria Works, Finsbury, S.W.

WANTED, a good MULDING MACHINERY, who is able to make cutlery and work clean mouldings with detail. Also a LAD for papering.—Apply, No. 105, St. Paul's-road, Lorraine-square, S.E.

SEWAGE IRRIGATION.—WANTED, a thoroughly practical man, competent to SUPERINTEND the DRAINING, LAYING OUT, FORMING, and CROPPING of a SEWAGE FARM.—Address, with references, and salary required, to R. C. Office of "The Builder."

ELY LOCAL BOARD OF HEALTH.—To ENGINE DRIVERS, &c.—WANTED, by the Local Board of Health for the District of the City of Ely, a PERSON, competent to drive, take charge of, and do ordinary repairs to two high pressure stationary STEAM ENGINES, of 15-horse and 18-horse power respectively (working alternately), under the direction and superintendence of the Surveyor to the Board; to lay out and wrought iron water-pipes, to fit hydrants and sluice-cocks, and make plumber's joints in connection with the water-supply of the city. The person appointed will also be expected to superintend the fire-escape, and to do any other description of actiion's work that may be required of him, so as to fill up his time when not employed in attending to the engines or laying water-pipes, &c. The wages will be 30s. a week, and a bonus of 10s. for every engine repaired. Applications to be sent in writing, accompanied by testimonials as to character and competency, to the undersigned, before TWELVE O'CLOCK, at noon, on WEDNESDAY, the 25th inst. Preference will be given to candidates that have filled similar situations. The candidate appointed will have to enter upon his duties forthwith.—By order of the Board. Ely, September 12, 1872. W. M. MARSHALL, Clerk.

RIVER WEAVER NAVIGATION.—A COUNTY OF CHESTER.—To CIVIL ENGINEERS.—WANTED a RESIDENT CIVIL ENGINEER to SUPERINTEND the WORKS on the River Weaver Navigation. He must be acquainted with hydraulic engineering, and fully competent to carry out dock works and the extensive improvements already commenced, consisting of the construction of new enlarged locks and the widening and deepening of the navigation, and also to originate and compile any further improvements which may hereafter be required, and efficiently to maintain the existing works in good condition. He will have to devote his entire time and attention to the duties of the office. The length of the navigation is about twenty-four miles, passing through the salt districts of Cheshire, and communicating with the River Mersey at Weston Point. Salary, 500l. a year, with an excellent house and garden, and a carriage, to be delivered at the Office on or before the 28th inst.; but it is requested that no personal or written application be made to individual trustees. W. WOOD BLAKE, Clerk to the Trustees of the River Weaver Navigation. Navigation Office, Northwich, September 2nd, 1872.

GRANER and WRITER.—WANTED, a first-class WORKMAN, to go out to Australia, and to act as agent for permanent work. Good wages.—Apply by letter, giving full particulars, age, references, &c. to AUSTRALIAN, Besant's, Leadenhall-street.

AN efficient ASSISTANT required in an ARCHITECT'S OFFICE. One competent to take out quantities and having a knowledge of surveying will be preferred.—Apply by letter to W. K. 4, Tenison-street, Nottingham.

FOREMAN of GOTHIC METAL WORKERS in BRASS and IRON WANTED. Must have considerable experience in preparing working drawings and looking after men.—Apply, by letter only, stating salary where last employed, and salary required, to Messrs. COX & SONS, Southampton-street, Strand, London.

WANTED (aged 18), a SITUATION as JUNIOR CLERK in a Builder's Office.—Address, G. B. 5, Bell's-terrace, Cook's-Grand, Chelsea.

WANTED a SITUATION, by an experienced PLUMBER and GASFITTER.—Address, W. B. 21, Chumleigh-street, Albany-road, Camberwell.

WANTED, a SITUATION as GENERAL SMITH, GASFITTER, and BRILLIANT and GENERAL JOBBING HAND.—Address, C. J. 4, The Retreat, Lewisham.

TO BUILDERS and CONTRACTORS. WANTED, a SITUATION as FOREMAN of MASONS or FOREMAN of JOB. Can be well recommended from last employ.—Address, G. 43, Leard-street, N.

TO PLUMBERS and BUILDERS. WANTED, a SITUATION, by a thoroughly good PLUMBER, Gas and Hot-water Fitter.—Address, T. W. 45, St. James's-Place, Chelsea.

TO BUILDERS and OTHERS. WANTED, a SITUATION, as FOREMAN, or to take Charge of a Job or Estate. Understands building in all its branches. Letter by trade. Aged 30.—A. B. at Clark's, News-agent, 16, Bonnell's-road, Clapham.

WANTED, a SITUATION, as Plumber, or THREE-BRANCH HAND. Can do plain showings, fluids, &c. repairing or new work.—Address, W. LAWRENCE, Plumber, 6, Park-road, Grosvenor Park, Camberwell, S.E.

TO ARCHITECTS, SURVEYORS, BUILDERS, and OTHERS. WANTED, a SITUATION, by a CLERK. Aged 20. Can take out quantities, measure work, estimate, &c. and is well acquainted with bookkeeping and accounts.—Address, A. B. 5, Walton-street, Chelsea, S.W.

TO BUILDERS, DECORATORS, HOUSE AGENTS, SHOP-FITTERS, & OTHERS. WANTED, a SITUATION, by a good GRAINER, WRITER, &c. Used to stenciling. Willing to fill his time in painting and paperhanging. Town or country.—Address, G. B. 10, Leckie-street, Albany-road, Camberwell, S.E.

TO BUILDERS and DECORATORS. WANTED, a SITUATION or JOB, by a good GRAINER and MARBLE. Well up in gilding and general decorating, capable of taking charge of work, or willing to fill up time at other work. Wages moderate. Good references.—Address, C. B. 4, Devereux-court, Finsbury-square, Clerkenwell.

TO ARCHITECTS, SURVEYORS, BUILDERS, &c. WANTED, a SITUATION, Served four years' articles with Architect and Surveyor.—Address, as with Builder, Contractor, &c. Has a knowledge of all the branches. Aged 27. Terms 30s. per week. References.—A. B. 10, Mount-pelican-place, Brighton, W.

TO BUILDERS and OTHERS. WANTED an ENGAGEMENT, as WORKING FOREMAN of CARPENTERS. Many years' experience in the building trade. No objection to the country.—Address, S. 16, Finsbury-square, Chelsea, S.W.

TO BUILDERS and CONTRACTORS. WANTED, an ENGAGEMENT, as MANAGING CLERK to the above, by a Gentleman, who is a first-class estimator and surveyor, and possesses a thorough knowledge of the business. No objection to the country.—Address, No. 38, Office of "The Builder."

TO BUILDERS and CONTRACTORS. WANTED, an ENGAGEMENT, by a thoroughly BUILDER'S CLERK. Is a good estimator, bookkeeper, and correspondent, well up in prices cost, extras and discounts, and generally managing practically acquainted with all the trade. First-class reference. Married. Aged 23.—Address, D. D. Post-office, Cold Harbour-lane, Camberwell, S.W.

TO BUILDERS and CONTRACTORS. WANTED, a RE-ENGAGEMENT, as FOREMAN of WORKS, or would take the Stone-work of a Job in Town or country. A man by trade. Good references.—Address, 115, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as GENERAL or WORKING FOREMAN of BRICKLAYERS, having just completed a four years' job. Good reference.—Address, C. W. 43, Stokes-road, Brompton, S.W.

WANTED, a RE-ENGAGEMENT, by an ARCHITECTURAL ASSISTANT. Good draughtsman. Working drawings, details, &c. Good knowledge of quantities, perspectives, &c. of all branches.—Address, E. P. No. 2, Berners St. Lozells, Birmingham.

WANTED, a RE-ENGAGEMENT, as CLERK, TRAVELLER, or any Position of Trust, by a Young Man, aged 26. Has been engaged in the building and timber trades. References unexceptionable.—Address, R. 2, Halsbury-street, Hoxton, N.

WANTED, a RE-ENGAGEMENT, by a thoroughly competent BUILDERS CLERK. Practically acquainted with the trade. Accustomed to general supervision and the management of workmen.—Address, No. 52, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as CLERK of WORKS, or FOREMAN in charge of a Job, by a capable and experienced man. Just completed a church and some details at a lunatic asylum. Well acquainted with every branch, detail, drawing. Carpenter by trade. No objection to go abroad.—Address, J. G. H. 5, Whitechapel, New-cross, S.E.

TO BUILDERS, WITH MACHINERY. WANTED, as SHOP FOREMAN, an ENGAGEMENT, as CLERK of WORKS on a gentleman's estate, by a practical JOINER and MACHINIST. Well up in carpentering, repairs, horticultural buildings, &c. Any party starting job must have a minimum of three years' experience as foreman at a low salary for a permanent.—Address, M. N. 16, Campden-street, Kensington.

WANTED, by a PLASTERER, who has completed a large job in LONDON, WORK, in Town or country, either as piecework, or to conduct a job as Working Foreman. Abundant references.—Address, B. 15, Harcourt-street, Marylebone.

WANTED, an APPRENTICE or IMPROVER to the PLUMBING.—Apply to T. MILLS, Plumber, 23, Broad-street, after six o'clock in the evening.

TO CIVIL ENGINEERS. WANTED, to PLACE a respectable, well-educated YOUTH (aged 19), under a competent Person, to LEARN CIVIL ENGINEERING.—Address, stating premium, &c. A. Z. Post-office, Rickmansworth.

The Builder.

VOL. XXX.—No. 1547.

On Motive, in Architecture, Sculpture, and Painting.

IN the pursuit of every art, the student encounters a certain number of technical terms, which are as indispensable to the description, as implements are to the execution, of the several processes. Exact comprehension of the meaning of those terms is necessary to a clear intelligence of the art itself. When those words are unnecessarily used, the language degenerates into slang. It might not be difficult to point out writers who have endeavoured to establish a reputation as connoisseurs and critics in art by a copious use of this slang.

Again, there are words which are by no means of a technical origin, but which, in the course of time, have received special meanings with reference to particular branches of art. Among these are such expressions as "breadth," in painting, and as "colour," in engraving. Not only is it essential, in order to understand the language in which works of art are described, to have a clear and distinct understanding of such special uses of words; but, further, it may be of great service to the student to trace the usage to its origin, and thus, it may be, to find how some important canon of art has been treasured up in an epigrammatic form.

The word *motive* is one of those which are thus occasionally used. It is an important example of the class of terms to which we refer. For, rightly understood, it conveys in itself a lesson to the artist; and it involves a very distinct condemnation of many works, in architecture, in painting, and in sculpture, which not only meet with much ignorant admiration, but which have even been pointed out by writers as objects worthy of imitation.

The musician has long been taught, by the subtle elegance of the Italian language, to speak of the motive of a musical composition. Without entering into a subject beyond our province to discuss, we may yet remark how often the ear is struck by the frequent recurrence, in some magnificent passage of music, of the magical sequence of notes that forms the central idea of the piece, the veritable motive of the composer. Again, it has often fallen to our lot to be perplexed by a wilderness of sounds, strung together, it may be, with great mechanical skill, but in which the divine informing idea is absent or undiscernible.

In every organised existence may be recognised the embodiment of an idea. We are not about to quote Plato, or to touch the province of metaphysics, but we wish to bring out clearly the meaning of the term *motive* as applied to any live being. The scientific anatomy of the vegetable physiologist, indeed, carries back the unit of vegetable life, not to the plant, but to the leaf. In each leaf, in each petal, in each

anther, he recognises a distinct individuality, bound to its fellows by laws of intimate association, but representing in itself a distinct centre of vital energy. In a bud we may with more propriety recognise the features of separate individual existence. A bud may be excised from one plant, and grafted or budded into another, so as to thrive and flourish, and to produce from the wild stem a branch of its own cultured beauty. But however far we may push the analysis, none can deny that there exists a distinct, and an always recognised, individuality, in the plant itself. In the oak or the willow, the elder or the plum, we are conscious of the presence of an idea which is common to all individuals of the same species, under whatever different modifications they live it out. We may regard such a plant from very distinct standpoints. We may consider it as a producer of human or of animal food; as a means of re-oxygenating the air; as a mechanism for fixing carbon in the form of wood; as an element in the hygrometric condition of the soil on which it grows; or as a feature of pictorial beauty. But any or all of these functions are performed by plants of the same species in a manner different from that which characterises plants of any other species. There is a physiognomy which can at once be recognised,—a specific form, a peculiar fragrance, a special beauty,—which are peculiar to the idea or motive of the individual species.

Again, in animal life, as we rise from those obscure tribes which share with the vegetable kingdom the character of social or compound existence, as in the corals and polyps, we find the central idea of specific form to be more and more distinctly wrought out the higher we ascend in the scale. Special gifts are bestowed on different genera, and, in a subordinate degree, on different species. These gifts are in harmony with the habit and the structure of the animal. They are distributed in a manner that gives token of compensating justice. Thus, the mole, in which the visual power is reduced to a low condition, which to us would seem to be total blindness, is endowed with a muscular energy greater in proportion to its size than almost any other beast, with formidable and apt instruments for digging, and with a form and integument in every way suited to its humble subterranean life. Urged by a mighty hunger, by an appetite more insatiable than it is easy to parallel, this paragon of industry no doubt revels in a fierce enjoyment as he excavates tunnel after tunnel in pursuit of insect food. If we anatomise the mole we can have no doubt of the motive of the structure.

We might easily pursue the theme, and, indeed, the subject of the wonderful instinct of all the huddling tribes is one that would not unnaturally illustrate our pages. We could show how it has not been among the forms which are zoologically the most highly developed, not among the tribes which possess the most perfect mechanical power (enabling them to rise in the air), the most resplendent beauty of colouring, or the most pure melody of voice, that the motive of a reasoning, teachable being has been wrought out. But we have said enough if we have shown the presence of a distinct and appreciable motive in every material form. Thus, true art, which is not a mechanical reflexion, but a quasi-creative imitation of nature, must be impossible in the absence of motive.

Indeed, in the absence of some sort of motive it may at once be admitted that art is altogether impossible. In this seems to lie the great distinction—the barrier which is of kind rather than of degree—between man and his poor relations, the other animal tribes. Skill of the most exquisite and perfect character is possessed by many, especially of the winged species. The groups of arboreal birds contain genera that weave textile nests of a beauty that fingers cannot rival. The hymenopterous tribe of insects, and a few of the neuropterous genera,

contain those creatures which are, *par excellence*, the BUILDERS of our planet. But industrial energy applied under the guidance of a wisdom that, for want of a better term, we call instinctive, is the highest phase of non-human skill. The emotions may be, and to a far greater extent than we generally admit actually are, common to man and to other animal tribes. Industry in the provision, and even in the storing of food, and in the construction of abode, is displayed by the squirrel and the beaver, the ant and the bee, the weaver-bird and the social grosbeak; but the clothing of an idea with form, however rude, the slightest scratch inspired by the motive of the artist, has never yet been observed, in our world, except among mankind.

This being the case, it follows that the very central virtue of art is the dignity, purity, or beauty of its motive. It is, to external form, what the soul is to man himself. Thus we can understand at once the great charm which the works of, let us say, for instance, the early English ecclesiastical builders, exercise on the imagination. In pure technical ability of execution, the recent works of the Italian sculptors show that the human hand has attained a power and delicacy of execution such as have certainly never been witnessed since the overthrow of Roman civilisation by the invad of the northern tribes. We cannot doubt that, as regards manipulation, there are masons, stonemasons, and sculptors now to be found who can execute work of a boldness, as well as of a delicacy, which could not have been attained, or only with the utmost difficulty attained, in the reign of Henry III. or of Edward I. But can we for that reason excel the beauty of the architectural work of these reigns, as shown in Westminster, or Lincoln? Can we approach it? The fact is, that the earlier worker had a noble motive. With him work was a religious act. He meditated upon it long before it took outward form. He performed its humblest offices in a grave, earnest spirit. He was not chiefly occupied with the effort to secure at once the greatest number of pence per week, and the greatest number of unemployed hours. Working with his heart in his task, the motive ennobled the toil. It left its impress on the material wrought; and thus, with a rudeness, in some instances, of detail, is blended an elevation of character such as later times have failed to rival.

The motive or main idea of a building or work of art may be more or less clearly, elaborately, and successfully wrought out. Its development will depend not only on the genius of the artist, but on the civilisation of the period; the climate; the material afforded by the locality; and many other surrounding influences. At different eras, and among different people, the mode in which identical motives are embodied in artistic form will differ as widely as will the form of a poem, if translated into different languages. At times the language is so old as to have become absolutely lost,—or at least for a time as unintelligible as were hieroglyphics in the eighteenth century. At times the ruling motive is unmistakable, even when but the ruins of a structure remain. Thus if we find the plan of a hall, or one-chambered building, of certain dimensions, and in certain countries, the idea of a religious purpose is one of those which suggest themselves to the mind. If we find that the astronomical bearing of the building is perpendicular to the meridian, the idea is confirmed. If we trace the place of a *cello*, sanctuary, or chancel, to the east of, and somewhat smaller than, the main building, we become yet more confident. If further we detect the bases of columns, and the foundations of the walls of apsidal or lateral chapels, we become convinced not only of the ecclesiastical nature of the edifice, but even of the character of the rite for the celebration of which the structure was intended. On the other hand, that rite may be so ancient

and that structure so unlike any modern example, that while we may have grounds for ascribing a religious character to the building, we can go no further in our explanation. Our great megalithic remains may be cited as an example. On last Midsummer-day,—and we are told that it is an annual custom,—some thirty-five watchers had assembled before sunrise in the inner circle of Stonehenge, to see the sun rise over the large stone known as the Pointer, and strike its first rays through the entrance on to the so-called altar-stone of the ruin. To call this a proof of the astrological character of the builders of this magnificent relic of the past would be a hasty and ill-founded generalisation. Direction of a main line of the building to the point of sunrise on a given day has been held to be a mark of Christian architecture, the day indicated being that of the Saint under whose invocation, as it is called, the church was placed. But we find a like orientation in the case of the Great Pyramid. We find it constant in Persian, Syrian, and Grecian temples. Thus we may find the indication of a religious motive in the plan of a building, although of the nature of the cult we have not the remotest knowledge.

There is an expression which has attained a certain fashionable prevalence in art, to which we may refer as an indication of the very general absence of any true appreciation of motive, as an essential element, or rather rudiment, of excellence. People will talk of a bit, and when they put the monosyllable in turned commas they regard the expression with complacency, as an evidence of artistic taste and of the command of technical language. In plain truth, nothing can be more opposed to a correct appreciation of the subject. Every artist, who has to trust to his note-book rather than to his memory, is likely to have his own method of taking artistic memoranda. He will jot down the garbled form of a tree, the picturesque outline of a building, the profile of a beautiful face, the hidden gesture of a surprised figure; and in each of these records of incident he will have a hint for a detail of some future picture. But to take the hint for the idea itself, to present the public with the elaborate study of the trunk of a beech-tree, or with the arrangement of the pots and pans on a kitchen shelf, or the tiles and quarries of the floor, is not to study, but to abuse, art. The "bit" is only of value to the artist; and to him not for itself, but as an element for future utilisation. Purchasers who encourage the production of bits, *pro tanto* discourage the genuine progress of art.

The more distinctly we grasp the motive of any work, whether that of the sculptor, the painter, the architect, or that of the Great Architect of creation—the more accurately we are able to detect the presence of a genuine inspiring idea, even under imperfections of execution—the more shall we enter into the very *arsena* of art. We then contemplate those regions where spiritual and intelligent life strives to embody its conceptions. A powerful impulse may be given to that which is the highest phase of history, the philosophy of human life, by the intelligent study of motive. In regarding the works of art, and especially of the art of the architect, in the present or in past times, we shall be able to unfold, one by one, the successive developments of the primary motive, or the addition of new, and not always harmonious, elements to the original idea. We shall rise from plan to design; from expression, in artistic or industrial form, to primary intelligent motive.

Thus we trace in the architectural sequence of the form of the churches of our own and of other Christian countries the evidence of a great, though a gradual, change in the habits, the wealth, and the form of faith of the builders. Emerging from the gloomy catacombs in which the earliest symbols, visible in *graffiti* on the walls, are far older than the adoption of the cross as an emblem (although they recall the initials of Jesus Christ, or the declaration of belief in his nature which is implied by the words of which the mystic $\text{I} \times \text{O} \text{Y} \text{S}$ contains the initials), we find Roman Christianity, under the reign of Constantine, coming forth to take possession of the Basilica, or court of justice, for the celebration of its unnamed rites. As the records written by Pope Damascus, and by other Medieval historians of the Papacy, enable us to trace, step by step, the prolongation and formalisation of the services, so does the history of the external church,—the shell, as it were, of the ritual,—show an increasing complexity of structure. The small apse, or rather alcove, in which was placed

the chair of the presiding functionary, deepened into the semicircular or polygonal apse, or became transformed into the choir, or chancel, in emulation of the *cella* of the earlier temples. As more room was required for the worshippers, the building was made to reveal its purpose by its plan; and thus arose that beautiful feature, the transept. Ecclesiastical grandeur outran the state of acoustic science. Detailed commemorations rose to acts of worship; and thus around the original nave, the borrowed *cella*, the appropriate transept, nestled and clustered lateral and apsidal chapels; attaining their utmost development in a lady-chapel, which was to the church almost what the church was to the precinct; as in such instances as the abbey churches of Westminster and St. Alban's, the cathedrals of Canterbury and of St. David's, and many others. In all these examples, besides the archaeological knowledge that enables the student to fix the date of a moulding, or to trace the history of an arch, there is room for the application of that more philosophical inquiry which shall seize the motive of every modification of structure, and read, in the very structure of the church, an illustrated chapter of the progress of the human mind.

As we carry back this kind of inquiry into the remoter past, the philosophical interest far exceeds the technical or artistic interest. Thus in the plan of the great stone-girt Temple of Jerusalem, which in a few months will be unveiled to the world as regulated by distinct motives of the most unexpected and most unmistakable character, we shall be able to enter into the very council of the founder, whose name is yet a magic word in the East. In the explorations which have been made,—often brutally and ignorantly made,—of the most important of the Egyptian pyramids, a unity of plan has been discovered, as to the purport of which there can be no doubt. These enormous piles (the Great Pyramid itself contains three millions and a half cubic yards) were reared by the Lords of the labour of Egypt, each in turn, for the preservation of his mummied body, till his spirit should return to reanimate it, after the long year of its disembodied existence. The sepulchre of the dead, as far as we can trace it, is but a partial performance of the rite of embalment. It looks forward,—we believe universally,—to that return of the spirit to its former tenement, which many persons conceive to be the meaning of the phrase, the resurrection of the body. On the contrary, whenever we find, as in the *Via Sacra* at Pompeii, *columbaria*, or places for the deposit of urns (a new feature of Palestine, at which the research of the present explorers has unexpectedly arrived), we find the indication of a very different idea. The incineration of the body, which is attested by the use of an urn to contain its ashes, does indeed imply a belief in the immortality of the soul. But it is not as a re-embodiment, but as a shade, that the spirits of the races who consume their corpses by fire, are believed to live. In the elegant lyrics of Horace, and in the libations and flowers which the most cultured of the Greeks and Romans offered to the *manes*, is present the same conception which leads the savages of the Australian groups of islands to burn the war-clubs of their departed chiefs, and led our own ancestors to sacrifice a war-horse on the tumuli of their own.

It would be easy to extend our illustrations of the mode in which, by grasping and apprehending motives, we may glide from art into science, and from architectural study into that of philosophy. But the fact that the unity, purity, and dignity of motive are the noblest characteristics of art, is one that cannot be brought out in too high relief, or insisted upon with too much single-minded urgency.

THE ARTIST AND POLITICS: A QUESTION FOR THE FUTURE.

We are always ready to benefit by the wise annual utterances of the President of the Royal Academy, and it is a good thing at times to start with a good and well-defined idea, to examine it, and may be to profit by it. A year or two ago President Grant told the illustrious company then assembled before him that the Royal Academy and artists generally had and could have nothing to do with politics. Let us admit it, and even go a step further, and say that the less the artist has to do with other people's affairs, and the more he attends to his own, the better and the more profitable it must be for

him. If he be a true and a *bond-fide* working artist, he has and must have all his time and attention pretty well occupied without political puzzles to solve and questions to answer. Still, admitting all this, there is now going on in Europe a series of movements, slow though they may be, and to the multitude unseen and unnoticed, which will in the future have no small influence on art, not only out of the pale of the Royal Academy, but in it as well. It is a very wide and lofty question indeed, and a deep one as well, and some little attention is needed to get a good glimpse of it. We must steer well clear of prejudice, and come to see and admit fairly that there are more ways of doing things, artistic and otherwise, in this world than very many dream of.

Civilisation is a very hard word, and many people think they understand its full scope and meaning who never have even taken in its most common signification. Europe is civilised, and Asia is not; but what is "civilisation" in its abstract and most positive sense? We have but just been reminded that there is now going on in Europe a great contest between "civilisation" and what is called "nationality," and that they seem destined to fill up a large space in the records of modern history. The whole subject, comprehensive and profound as it is, is so far from being out of the pale, though it be political, of artistic inquiry and research, that it is of all others the most comprehensive and interesting, artistically, to the thoughtful artist; for in it is the great and, to say the truth, mysterious question, or questions, of the *future* of art and *art-action*. Let us, then, put the great question in its very simplest form, confining ourselves, of course, to its purely artistic aspect. Civilisation and nationality express the idea certainly, but with not a little vagueness. Civilisation is not confined to the *present* age. The old Roman, Cicero, surely was a civilised man, just as much so as a modern Westminster Hall advocate. The old Roman was a civilised man, not a savage or a mere barbarian. The man who wrote the Book of Job, the greatest of all "literatures," as we are told, surely he had in him a something very much like civilisation, if book-writing be a component and necessary part of it. The Greek was "civilised" when he built and decorated the Parthenon; and what would not the world now give if somebody like a Greek, civilised or no, could but go to work and do a little of such work among the monuments of St. Paul's, or Westminster Abbey? We must not too accurately define such a big word, or go into too much detail about it, for the fact is that it is of such very wide significance and comprehensiveness of meaning, that it may and does include almost everything and everybody that is not actually barbarous or savage. But we need not puzzle ourselves about it. There is no doubt whatever about what the word, as *now used*, signifies. Civilisation means simply and shortly *modern ways of life*, the shopkeeping, and housekeeping, and furnishing of the hour, just as we see it all about us. There are shops and houses in Algiers, and shops in Damascus, and even in "Yarkand"; but no one calls them, or those who serve in them, "civilised." It means, then, the modern ways of life of such places as London,—mighty brick-and-plaster London. There is indeed no word that defines civilisation, but the *fact* does, and with considerable accuracy. And this it is that brings us at once into the very heart of the matter; for the question then is, are there not fairly many and diverse "civilisations" expressive of different nationalities and orders of mind, and of different artistic instincts? In other words, may not civilisation have different and even *opposite* branches, one going one way and one going another and a different and opposite way; so that, looking at two of the opposite branches, many might doubt whether *both* could claim the same title. This is, indeed, the war of the age, above all asking of leave of great potentates or national councils. Surely it is a most happy omen for the future, far distant though it be, that there are powerful instincts and aspirations now at work, which are compelling some nationalities to a growth of their own; each to get, or to keep, a nationality of its own, and, we would add, a "civilisation" of its own, a refinement of its own, and, it is to be hoped, a *fine art* and an *architecture* of its own, and of arts subsidiary to it.

What a thought is this, and how opposite from the general European talk and present aspirations. The tendency of the time, truth to say, is to work the whole of diverse Europe into one

uniform whole. Telegraphs, railways, international coinage movements, building "improvements," may, free-trade itself; is, as we are so perpetually told, bringing all nations under one influence, and making all things in them common to all. It would, indeed, seem to be almost the instinct or passion of the time to do this, and as quickly as possible; but not only are all causes operating everywhere to do it, but actual political and social forces are needed to bring it about the more rapidly and entirely. But,—and it surely is a happy thing that this small world is here useful and necessary to the story,—nature is obstinate, and not a little obstinate sometimes; for such seems to be the force of the national instinct in some races that they will not or cannot accept this one "civilisation." The "Scandinavian and the Muscovite" have now equally learned to reject the Teuton and his "gifts," great as they may seem to be, and indeed are. It would almost seem as if the old spirits of the dead past had risen from their frozen graves to remind those who have succeeded them, and who occupy the ground on which they once trod, that they have yet a language and a nationality of their own, and a mental caste, and, may we say it, a *fine art* of their own. Material, social, and even intellectual and moral progress is becoming, nay is becoming, of less value in Northern Europe than *independent existence*. National pride and aspirations, and pride of race, are, as they ought to be, the predominating feelings. It is impossible to reflect on this magnitude of theme without a hope for the future. What, for instance, would it not be to see a new city,—let us say it boldly, a *new city*,—in the very heart of Scandinavia or Poland, or anywhere indeed wherein things are even but a little given to glory in their "national shortcomings," *i.e.*, as compared with things in other more fashionable and favoured localities, but which are yet unsuited to them. What an interest would there not be in such a course of things? Instead of as is now the case almost everywhere, from Naples and Venice to St. Petersburg, and from Paris to Moscow, in all the newly-built parts where the iron girder from Thames-street may be seen, cast, it may be, from the very self-same mould, and with the girder all that is necessary to make up a building. It is absolute uniformity,—and what the modern imperial statesmen are asking and trying for in reality, though perhaps they do not know it, already to be found in building and architecture! All building and architecture are getting alike all over Europe, and of one uniform type, as though the work of one firm. The style may differ here and there, but the *style-maker* is the same man, and the workman is simply a producing machine.

But, instead of this, suppose this new city to be built up of the thoughts and instinctive feelings and wants of the Scandinavian people, and expressive of them, as are their language and their legends and folk-lore. Of course, it is all but impossible to imagine such a city, or even a single street of it, or a temple, or, indeed, anything in it. Things are completely nowadays in the hands of the international trader. The time was, as we all know, when this state of things we are supposing would have been no novelty at all. It was the normal state of things, and had at all events this one advantage, that it fostered art and fine art, and allowed it to develop itself, each national art-centre doing its own work. And this was *real progress*, though not perhaps that progress of which we hear so much, and which is thought to be all that common humanity can possibly have been brought into this world for. *Progress*, indeed, is a difficult word to define. It was progress when the great Romanesque passed into the Early Gothic, but to be remembered that something was lost by the change as well as *gained*. Nature, be assured, *gives* nothing; a price is demanded for everything, even for progress. So that if it be progress to bring all Europe together, a something is lost by it,—that of the development of each "trihed unit," or European individuality, artistic and otherwise. Indeed, we may fairly say that the battle has fairly commenced, and the future can also show what is to be the loss and the gain. It cannot be *cheap* art. It cannot be infinite in amount, but it *will* be *real* and true, and it is surely better to have a little reality and truth to look at than whole floods of stupidities and falsehoods, and of some things that belong to nobody.

May we not confidently affirm, then, even on the strength of these few and hasty thoughts on a great subject, that *politics* are, after

all, most interesting to the artist, even from an artistic point of view? The tendency of the time is to equalise, and to level all things, and to make them alike; and if things go on for another generation or two as they are now going on, there will really be little or no difference between the look, and architecture, and "arts subsidiary" of Venice and London, or of St. Petersburg and Madrid! Where precisely the vast *factory* will be that is to distribute the ready-made and cut-and-dried bricks, and iron, and joinery, it might puzzle a good economical prophet to say, for things are getting into good order elsewhere than here for all these purposes. But of one thing we are quite sure, somebody will do it, and the perfection of the work done will consist not in its *variety*, but in its *sameness*. All will be alike, for such work becomes all the cheaper in exact proportion to its sameness. It all falls from some producing engine, as coins from a mill, and this is only to be accomplished by all things being alike and the same thing over and over again. But, as we have said, "politics" tell us that this is being sturdily resisted, even where it would least have been suspected. Cold Scandinavia will not take it. The "Slaves" even object, and think that there are two ways always of doing the same thing. Unfortunate Poland cannot but dwell on the past of its own, and the "Bohemian man" thinks that there may be a future for him, as well as a dreamy past—so full of romance and shadows!

FUNERAL ARCHITECTURE.

M. CÉSAR DALY has placed before French architectural circles an essay on "Society and Architecture apropos of funeral Architecture," of which our readers may like to see some account.* His first proposition is: Joy and grief have their expression in architecture. Our existence, he argues, is shared between joy and grief, for indifference is but a vegetable state of the soul, or a momentary suspension of sensibility. Sometimes man laughs, and sometimes he cries, manifesting physically, by a law of his nature, his sentiments of gaiety or chagrin; and art, the magic mirror of the human soul, renders visible, in like manner, emotions and passions, happiness and sadness. In literature, he continues, comedy laughs and tragedy cries; and architecture has its edifices of feasting and triumph, and also its monuments of grief and burial. Of all monuments, the tomb most readily brings to light the plastic talent and poetical sentiment of the architect. M. Daly then dwells upon the troubles of the esthetical instinct in our day. As a cry issues from the throat, sharp or sonorous, according to whether it is caused by grief or joy, or as the face contracts into rigid lines, or expands in gracious curves, according to whether the heart is filled with anger or sadness, so the post-architect, by a natural instinct, finds beneath his pencil forms expressive of the emotions of his soul; but in the course of the development of civilisations there occur crises, as in physiological development, in which all instincts have to submit themselves to the trouble or disarrangement of the general functions; and, he believes, we are now passing through a social crisis of this momentous description. Contemporaneous architects, he deploras, have fallen into a habit of copying, or of following a vulgar routine. They fail to set before themselves a clear idea, and to work it out with a warm heart and sincere faith. The public, far from being offended with their servility to the past, delights to inhabit a Gothic house, or a villa of the time of Louis XIII., with a *salon* of the date of Louis XVI., and a boudoir in the style of that of Madame Pompadour; or, after death, to repose under the shadow of a Greek *stela*, marked or not by a Christian cross, or, like the painter Delacroix, beneath the Classic tomb of Sélpio.

After investigating the cause of the alternative harmonies and troubles in question, and tracing it to the fact that we have not, like the great civilisations that have gone before us, a style of our own, but are content with a resurrection and *renaissance* of other styles, M. Daly proceeds to consider evolution as a reign of principle, and transition as a reign of expedients; and thence, passing to the embarrassment of architects of the present day, owing to the confused and com-

plex social condition, comes to the question,— "Is it possible, in the matter of funeral architecture, to furnish a guide to the contemporary architect?"

This query is answered in the affirmative. Three leading ideas, M. Daly asserts, should be enfolded in funeral architecture. First, the idea of death; then, the homage rendered to the dead, and also invocations in favour of the dead. It is impossible, he urges, to separate the first idea from the tomb. It may vary in its character according to the acceptance or rejection of the doctrine of the immortality of the soul and the resurrection of the body; but it must always be there. The two other ideas, the glorification of the dead and the invocation of celestial powers, are sometimes discarded altogether, and sometimes but partially admitted. Every specimen of funeral architecture he adds, may be classed under one of two sections. In the first may be grouped the monuments representing one of the three radical ideas, faith, death, glorification; in the second can be united those compositions expressing two of them or all three. Every tomb is the dwelling of the dead, and consequently the expression of an individuality; it is also a word of adieu addressed to the dead by the survivors, whose image is, thus, to some extent, also stamped upon it. In periods of evolution, this double expression has no inconvenience; every one has the same faith, and the tomb is a religious monument to all. But in times of social transition, of doubt and research, he asks—when, perhaps, the dead may have been a free-thinker (*un libre penseur*), and those who rendered him the last offices ardent believers—who shall determine whether the tomb shall be, or not be, an essentially religious monument? Architects, for the most part, accept the decision of those who are going to pay for the tomb; but though this plan is inconceivably practical, it is not precisely of the nature to satisfy serious souls. In conclusion, M. Daly avers that religious contests explain the troubles of funeral architecture in our days. All the architectural difficulties arise from diversity of doctrine. Death, the first radical idea to be expressed in a monument, to believers means a new life. Glorification of the dead, the second radical idea, has to be tempered by the fact that one of the Christian virtues is humility. Invocation of celestial powers, the third idea that he considers should find expression, is all in all to believers in its efficacy, but ought but folly to the sceptic. What M. Daly says on this head, of course falls dead in Protestant England. All three ideas he urges, are religious questions. In the middle ages, in the presence of a common faith, agreement in these matters was easy; but to-day it is often difficult. Religion has always been the synthesis of the state of the knowledge and sensibility (moral and physical) of the society that has embraced it, and architecture has been in all time the most complete scientific symbol of the society that has cultivated it. On the reconstruction of a social synthesis (scientific, moral, and material) depends the reconstruction of a collective taste and aesthetic unity, and consequently of the evolution, or *eloston*, of a new style of architecture.

It is an elegant essay, the result of thought, and likely to lead to thought in others.

THE ETHICS OF NATURAL LAWS.

"He that will learn them," says Carlyle, speaking of natural laws, "hold nature is on his side: he shall yet work and prosper, with noble rewards. He that will not learn them, nature is against him: he shall not be able to do work in nature's empire."

The first consideration in the application of natural laws to works of art, it need scarcely be said, should be the *purpose* to which they are to be applied. It is not enough that houses and churches and works of art in general should simply be composed of stone, or brick, or wood; each having some humanising mission to fulfil, should have its voice to speak, and having this should be made to speak the truth; and care should be taken that it does faithfully exercise these duties which it outwardly professes to perform: even the surface ornamentation of a building need never be destructive to this result.

The use of an iron lintel made to represent stone, stronger in its texture, and therefore, if it is to answer any purpose, less in its sectional area, does not conceal its falsehood by a coat of miserable paint. The weight of the superstructure and the width of a span expose a lie.

* De la Société et de l'Architecture à propos de notre Architecture funéraire. Par M. César Daly. Paris: Ducher & Cie. 1872.

It may be said that this is the result of comparative deduction; that we judge everything by theoretical comparison with something of which we have a previous knowledge; but I am disposed to consider that the appreciation of the harmony of natural laws received through the senses may be made to form a very large part of man's moral education, and it cannot do this if the principles of its subject are false.

The beautiful form of a flying buttress, however elaborately carved, obviously performs its duty in unison with the lofty Gothic roof from which it transmits the strain. Its ornamental details, therefore, although subservient to its use, should be as a garment clothing the human figure without destroying the grace of its curves, concealing the natural appearance of its strength, or destroying its physical action: anything, in either case, which is false is injurious in its moral result. Science by these means is allied to art, and art to poetry, and "the sermons in stones" preached by our *old masters of arts* have been handed down to us not only as records of history, but as inspired poems, appealing perhaps more strongly in the latter through their traditions. The spirit of a nation that prompts the destruction of its ancient landmarks arises from that poverty of thought which it perpetuates, and which is the foundation of its decay. "The hand of man," says De Lamartine, "is the only machine of the spirit." We have yet to know more of the vital energy of the mind as transmitted to the hand in the execution of works of art. As an orator can only move an audience in proportion as he feels himself, so an artist leaves behind him the intrinsic value of his work on canvas, or on stone, which finds a tongue.—

"When years have drifted onward,
And the stone is grey, and dim, and old,
And the hand forgotten that has carved it,
And the heart that dream'd it still and cold."

And whilst it is impossible to deny that the association with the supervision and companionship of machinery does give to the character a certain force and power, chiefly exhibited when action and presence of mind are most demanded, it has nevertheless a tendency to destroy the finer perceptions of man's nature, and weaken the sensitive reception of natural beauties, together with the more ideal conceptions which should appeal to man in what we call the leisure moments of his life; so that his faith is weakened in those things over which he cannot, by an effort of his will, produce a visible and tangible result. That this is the necessary consequence of the material age in which we live, science, though she owes so much to machinery, has no reason to assert. By the connecting link of art, she is allied to all that is poetically beautiful in nature, whilst nature herself is the great source from which all her materials are drawn. Happily, there appear to be those among us who seem to have recognised what I cannot but think is the demand of the age—the motive-power which can raise us above the dead level of materialism, and spiritual inactivity (which has successfully contended to a great extent not only against art, but against the higher purposes of man's existence), by giving to those whose constant occupation is an impediment to their seeking it, the opportunity of preserving the finer instincts of their nature, by bringing works of art and natural beauties more, as it were, into the highways of their lives.

The faculty which men of science tell you is known as "involuntary cerebration," highly as it may be esteemed as a term of philosophy, is a mental reception of that which is externally good or bad. Surround a man with deluding objects, and involuntarily his mind is quick to receive and fertile to reproduce them. Combine in harmonious relation the laws of nature, in forms of beauty, for his use and pleasure, and their reception is equally secure.

Every age should have,—we know, indeed, that it has,—the materials for its own representative art. It is for the artist, and for science, in the spirit and with the knowledge of the past, to realise, from its materials, with the facilities of the age in which we live, those forms of beauty that shall be to a future generation more even, if that be possible, than the past has been to us; valuing always that which is left us in the *hand-work* of antiquity, as breathing almost with the vitality of the old masters, and knowing, as we must, the inspired originality of their conceptions can never be reproduced by an *insensible machine*. The heart in the feeling and sentiment of their genius is developed in their work; and this, and this only, is that which must

make our work of value to future generations, so far, and so far only, as it speaks to the spirits of others, in the same language, of the truth in which it was conceived. BYNG GIRAUD.

THE ENGINEER AND THE DOCTOR.

WITH diseases in general we have but little concern; but with those which are preventible by proper structural works we have always claimed to be concerned equally with the medical profession—if, indeed, the question be not even more within our province than theirs. We therefore are not going out of our line in introducing Mr. Wolff's hook* to the notice of our readers. A consideration of the manner in which death usually occurs, he says, may be roughly divided into three modes:—

1. Natural death, or natural decay.
 2. Premature death, as when some organ necessary to life takes on an action of disintegration, and death ensues as a consequence, the other organs being healthy; and
 3. Accidental death, in which class are zymotic diseases. "All organs being healthy, and during the perfect performance of their functions, some cause external, and in a measure accidental, causes them to take on an action that is an interruption of their natural healthy functions, that disturbs the harmonious balance of waste and repair of the tissues."
- "Whenever it has been possible to trace zymotic disease to its commencement, we shall find such origin invariably marked by the presence of decaying organic matter,—of organic matter that is gradually undergoing a process of disintegration."

The various diseases which make up the class called zymotic, or rather the various forms which they assume, are named; but Mr. Wolff does not agree with those who say that each one is a specific disease—as typhus, enteric fever, cholera, small-pox, &c.; but says they only assume various forms accordingly as various parts of the body are brought into contact with decaying organic matter. These differences of opinion the doctors must settle how they may. They are agreed on the main point, that it is the presence of decaying organic matter in the atmosphere we breathe and the water we drink that causes zymotic disease; and the consideration for us is to inquire whence it comes, and to remove the cause of it, if possible. This is why we want in every town, small as well as large, and in every rural district, the services of a medical officer allied with those of the constructive engineer. Local rates must be levied to a sufficient degree to produce the funds with which all necessary works may be done; but we should never approve of large and costly works being undertaken for which an absolute necessity cannot be shown. We say that all works are absolutely necessary the effect of which is to prevent disease; but we go no further in advocating the levy of local rates, and making that levy compulsory. We should not, for instance, approve of a particular street being paved in an exceptionally expensive manner, except with the almost unanimous consent of the whole of the inhabitants; nor that a new town-hall should be screwed out of the pockets of those who are satisfied with the old one, unless they should be so few in number as to make the action a just one. There are, unfortunately, ill-conditioned and unreasonable people who would be content with anything at all, or nothing, if the execution of something better would require them to contribute to it,—men who have no *esprit de corps* or public spirit; and these we should think it quite within the limits of justice to leave out of consideration. At the same time, we think local rates should not be compulsorily levied for such works as we here indicate merely because a bare majority may be on some occasion got to sanction it. In respect of works, however, that can be shown by scientific reasoning to be necessary to prevent disease, in all alike, we do think that local rates should be levied compulsorily, and without hesitation. The day, happily, is gone by when it could be discussed whether the old form of cess-pools should be abolished,—those, namely, which received all the house-refuse, liquid as well as solid, and were ingeniously contrived to let out the liquid almost as fast as it went in, and so did not often require to be emptied. These do exist in places yet undiscovered by sanitary insui-

tion, but nobody can now defend them when discovered. Much the best way, as far as we know at present, of preventing exhalations of decaying organic matter into the atmosphere we breathe is to sluice it all away by means of drains and sewers to some place where the solid and useless parts of it may be retained, and land irrigated with the liquid part; but land is not everywhere to be had, and where land cannot be had it may not be at all impossible yet to construct dry cess-pits which shall give off no exhalation of decaying organic matter, and so contribute nothing to the cause of zymotic disease. We are afraid, however, that there is something else which contributes greatly to it in towns of much traffic, and which is not so easily to be dealt with. The horse-dung, we imagine, is a great contributor to the cause of zymotic disease, tritinated and blown about as it is. The engineer can prevent this, but the medical officer must take it upon himself to say whether the means to be adopted would or would not cause other evils as great as that to be done away with. Then, in overcrowded houses, or, indeed, in any house to some degree, exhalations from living bodies contribute their quota to the cause of zymotic disease. These, although we cannot prevent them, we can nullify to such a degree as to reduce their influence to harmlessness; but to do it we must have plenary power to pull down and reconstruct houses,—styes, or what shall we say?—which have been built or bought with the private moneys of individuals, and therefore have become personal property. How is this to be interfered with? Vested interests in anything that is for the good of the community, or, to say the least, that is not positively objectionable to it, may well be regarded with jealousy, lest an autocratic interference might do an injustice; but what shall we say of these wretched tenements wherein people, both good and bad, are crowded by their pecuniary necessities, to the destruction of their own health and to the filling of the pockets of speculators in this kind of thing? We can say nothing new: we can only reiterate that it is abominable and unjust, and that it is for statesmen to find a remedy, and to show how the health of the people of this country may be maintained and perpetuated.

Self-government is a great idea, and probably the ultimate form of any "government" whatever will be reduced to this form; but in the meantime let us own that we are in leading strings, as children are, in sanitary science, disguise it as we will, and we cannot afford to let pass unnoticed any contribution, such as this book, towards a better understanding of the subject. If it does no more than point to the kind of man we want for medical officer, it will do much. Those who happen to be acquainted with the kind of man, often appointed to this office by Poor-law Guardians, and who appreciate at the same time the vast importance of the office, will best appreciate the value of what we say. It is highly important that the colleague of the engineer who is to construct sanitary works, should be able to report with no uncertain sound upon what is necessary to be done.

We have said that Mr. Wolff attributes all zymotic diseases alike to the presence of decaying organic matter,—as, indeed, do other medical men; and that he says that the various forms they assume are not to be attributed to specific poisons, which produce specific diseases or forms of disease, but that the form assumed depends upon the part of the body brought into contact with it. He says, "climate has undoubtedly a powerful influence in determining the form that zymotic action shall assume. Thus, in India, the special home of cholera, scarlatina is comparatively unknown; and typhus is so rare, that it is even now a subject of debate whether it ever occurs in those climes. Egypt appears to be the cradle and favoured site of the plague. Ireland is known to be never free from typhus, whilst enteric fever is well known to be endemic in England. . . . Certain meteoric conditions, the precise nature of which cannot in the present state of science be explained, must be admitted as an additional determining cause, that has an immense influence in fixing the prevailing form that zymotic disease shall assume. Thus, for several successive years, the intestinal canal is the favourite structure affected by zymotic disease, and we see year by year the numbers of deaths from diarrhoea increasing until the cycle culminates in an epidemic of cholera. It has been remarked that the sum of deaths from all forms of zymotic disease is a tolerably constant quantity, whilst

* Zymotic Diseases: their Correlation and Causation. By A. Wolff, F.R.C.S. J. & A. Churchill, 1872.

the distribution of the sum amongst the various forms is a quantity constantly varying; and he quotes from the returns of the Registrar-General the number of deaths from all causes and from zymotic diseases from the year 1840 to that of 1867, distinguishing the various forms of small-pox, measles, scarlatina, diarrhoea, cholera, and typhus, by which it is seen that, excepting the two cholera years of 1849 and 1854, the whole numbers are nearly even, while the separate numbers vary greatly. This seems to confirm the author's views, and of course he adduces these numbers to prove his case; but why do we refer to them in the *Builder*? For the purpose of making the remark that we believe that all this slaying of thousands of healthy and upright people may be prevented. Death, of itself, is rather a blessing than an injury to the world, after we have done our work; but it is a beggarly and poor philosophy that would teach us to regard the killing of people as necessary because statistics do show that out of a thousand living a certain number have died; and this because of the neglect of those who can prevent it.

LEEDS.

ROUNDBAY PARK has been opened and the chief stone of the new Exchange laid by Prince Arthur.

The opening of the park; in presence of 50,000 people, preceded the laying of the stone, which was done on the day following. The park is situate about three miles and a half from the centre of the town, and was originally in the possession of the Cistercian Order of Monks; but after the dissolution of the religious houses it passed into the hands of several distinguished families. It possesses several objects of interest to the lover of nature, and also, what is indispensable to a park of any pretension, a lake, nearly three-quarters of a mile long, and more than a mile and a half in circumference, presenting an almost unbroken expanse of 33 acres, and a depth of about 60 ft. It occupied ten years in its formation, and cost the late proprietor 15,000*l.* There is a cascade formed by the water of the lake, rushing over an embankment of stone into a leafy dell some 50 ft. below. There are various other objects of interest, such as the ivy castle, rustic bridges, and the many picturesque views which strike the eye at almost every turn. The park was purchased by the people, and had to be paid for by money raised on the security of the rates. Originally the park consisted of 733 acres of land, a considerable portion of which had been laid out by the former owners as a park, with gardens and the extensive lakes, at a great cost. From 300 to 400 acres are devoted to the purposes of the park, and the remainder of the land not required for park purposes is sold for villa residences and gardens, which will provide a considerable sum towards the cost of the park, which will be 139,000*l.*

The style selected for the Exchange, which will occupy the site of the old Commercial Buildings, Boar-lane, is Perpendicular Gothic, picturesque in outline, and in harmony with the architecture of Mill-hill Chapel, which adjoins the site. The building will consist of four stories. Over the principal entrance, which will be at the junction of Boar-lane and Park-row, there will be an oriel porch, composed of three arches resting on polished granite shafts. Over this will be an oriel window, and above this again a two-light window with broad mullions. A prominent feature will be the tower, surmounted by a spire which will reach the height of 178 ft. from the ground. In the upper stage of the tower provision is made for an illuminated clock. Facing Park-row there will be an oriel window, and the angle of the block next to Mill-hill Chapel-yard will be surrounded by a turret, with conical spire, rising to a height of 84 ft., and covered with slate. The roof will be covered with green Coniston slate. The Exchange will be in the centre of the block, and the news-room on the same level to the left. The Exchange, according to the present designs, will be circular in form, its diameter being nearly 60 ft., and the area will be increased somewhat by a large semi-circular bay. Round the room there will be an arcade of twelve arches, composed of brick and stone, and resting on pillars with curved capitals and corbels. From the corbels will spring ornamental iron trusses to support the roof, which will be 56 ft. from the floor at the highest point, and divided into hexagonal panels. Over the

arches will run a panelled course in stone and brick, and the walls to a certain height will be of bleached ashlar stone. A large glass dome in the roof will throw light into all parts of the hall, but it has been thought desirable to make the lighting still more effective by windows overlooking the chapel-yard. The floor of the Exchange will be formed of Bennett's fire-proof concrete, and covered with encaustic tiles. Beneath will be the basement, which will be of nearly the same dimensions as the Exchange, excepting in point of height, that being 17 ft. from floor to ceiling. It is intended that the apartment shall, if possible, be let as a restaurant, with a separate entrance from Boar-lane. It will be lighted by lofty windows, also facing the chapel yard. Under the news-room, on the basement, will be a room of proportions equal to those of the restaurant, and this it is intended to devote to the purposes of a billiard-room, the light to be obtained from Park-row. The news-room will be 45 ft. by 24 ft., and in height 17 ft. 6 in. It will be lighted by large windows looking into Park-row and the Chapel-yard. Over the news-room will be a suite of apartments suitable for a club, the entrance to be from Boar-lane. The cost of the erection of the entire pile is estimated at 18,000*l.*, including fittings. The designs of the building have been prepared by Messrs. T. H. & F. Healey, architects, Bradford. The clerk of the works is Mr. J. T. Brown; and the contractors for that portion of the building now in progress are Messrs. Bookman & Broomhead.

The first side of Leeds New Bridge, on to which it is intended to divert the traffic now passing over the temporary bridge, slowly approaches completion. It is some time since six girders which span the river, and fifty cross-bracings by which they are united, were completed, and for the last few weeks the buckle-plate flooring has been proceeded with. The ornamental parapet is also nearly complete. In the centre of the parapet, on each side, there will be a pediment, supporting a pillar, which will contain three glazier lights, and some progress has been made with one of the pediments. On the top of the buckle-plates it is intended to lay down bituminous concrete to the thickness of several inches, and above that will come the wooden pavement which, we understand, it has been determined to lay down. A portion of the concrete has been laid. It is expected that the portion of the bridge now going up will be sufficiently advanced to allow of the diversion of the traffic about the end of next month. The completion of the whole, it is estimated, will be attained about March or April of next year.

A fatal accident has occurred at the stonework adjoining to Messrs. Ackroyd, adjoining the New Dock Basin, near Crown Point Bridge, Leeds. An immense block of stone, weighing eight or ten tons, had been consigned thither on a wherry from Birstall, in order that it might be sawn into slabs; and whilst it was being removed from the wherry by means of a Goliath crane, one of the large parallel beams on which the crane travelled broke in two, and with the pieces fell the ponderous crane itself. Three men were meanwhile standing on the small platform surrounding the crane, having been engaged in heaving up the huge block, and they were also precipitated from the elevated position to the ground, which was covered more or less with stones of similar dimensions. One of them was killed on the spot, a portion of the crane having fallen upon him; and the other two were seriously injured. At the inquest, the jury, after an inquiry which lasted for three hours, found a verdict of "Accidental death," and recommended the periodical examination of cranes, which, in their opinion, should be of wrought iron. Mr. Ackroyd said, if the same crane was again used, the girders should be of wrought iron.

In connexion with the improvements in Market-street, Call-lane, and other parts of the town, a number of building sites have been offered for sale by the corporation. Only eight of the sites offered were sold, the others being withdrawn. The following were among the lots sold:—Building site, at the corner of Park-cross-street and St. Paul's-street, containing 73 square yards, at 10*l.* 1s. per square yard; a plot of land, with part buildings, at the corner of Park-square and St. Paul's-street, containing 84 square yards, at 7*l.* per square yard; a plot of building land, adjacent to the last-named lot, containing 54 square yards, at 5*l.* 7s. 6d. per square yard; a plot of ground and buildings thereon, at the west end of Brunswick-place, containing 138

square yards, at 2*l.* 10s. per square yard; three dwelling-houses, near to the Cattle Market, containing 464 square yards, at 4*l.* 5s. per square yard; a site in connexion with Regent-street extension, containing 180 square yards, at 12s. per square yard.

The new building of a music publisher, in Park-row, now completed, has the principal front towards Park-row, and has been designed to work harmoniously with the adjoining building recently erected for the Royal Insurance Offices. It has a frontage of about 53 ft., and the height from the street to the apex of the centre gable is 65 ft. It is entirely of stone, with granite shafts to the windows. The ground-floor front is divided into three bays, the centre one having 13 ft. clear width, containing the shop entrance, which is deeply recessed and flanked with side windows. The side-bays have 12 ft. clear width. These bays are all 16 ft. high from the causeway. This story is flanked on each side by a stone pier, formed into three shafts, with moulded bases and carved caps. The piers are carried up above these, corbeling out to form the ends of the balcony. Each of these has the figure of an angel projecting boldly from the pier, one holding a harp and the other an organ. A balcony runs the whole length of the shop front, immediately over it, the front being formed by a wrought-iron railing, which, however, is not yet fixed in place. The first floor has a range of six windows coupled, with polished granite pillars dividing them, and deeply-moulded circular arches and carved hood-moulds. The pillars and the jambs have moulded bases and carved caps. The second-floor windows are of similar character, a triple window being in the centre and a double window on each side. The centre window has a stone balcony, projecting on corbels, and with pierced panels and carved dados. A corbel-course immediately over these windows divides them from the windows of the top story. These are three dormer windows, the centre one double, with pillar between; the side ones single. The staircase is placed between the saloon and the Royal Insurance building, and is carried up to a level with its cornice, and finished with a pavilion roof, so as to break the transition from the higher to the lower level. It has an entrance-door from Park-row, and windows of varying character. The saloon extends from Park-row to Basinghall-street, and is 105 ft. in depth, and in width varies from 40 ft. to 49 ft. The ceilings are coffered and enriched in plaster. The whole is painted and decorated in quiet colours, by Wood & Son. Mr. James Wood, of Leeds, is the contractor for the woodwork throughout. Various woods are used in the fittings,—pitch pine, American walnut, mahogany, and bands of inlay. The floor of the front part is laid with parquet, by Arrowsmith, of London. The gas brackets and standards are by Charles Smith & Son, of Birmingham. The carving throughout has been done by Mr. Mawer, of Leeds; and the stonework by Mr. John Wood.

CO-OPERATIVE BUILDING.

ONE result of the strike in the London building trade has been the formation of a London Company of Builders, established, in great measure, at the instance of Mr. Hughes, M.P., and Mr. Morrison, M.P., to test the principle of co-operation as a preventive of strikes. In connexion with this movement, a meeting has been recently held at the Co-operative Hall, Castle-street, Oxford-street, when its objects were explained by Mr. C. R. Roberts, the secretary. It was stated that the experience of the past few years has satisfactorily proved that the only remedy for strikes,—"disastrous alike to employers, workmen, and the community at large,"—consists in securing, in one form or another, the personal co-operation of the workmen, and that this can obviously best be effected by their becoming, in a greater or less degree, capitalists themselves. Allusion was made in the prospectus to the success which has attended the co-operative movement in the North of England; stress being especially laid upon the case of the Rochdale Pioneers, whose capital has risen from 28*l.* to upwards of a quarter of a million in twenty-five years. The nominal capital of the building concern is 10,000*l.*, and the company gives each employe an opportunity of becoming a shareholder, and employs any shareholder, if suitable, in preference to one who is not a member. They also propose dividing amongst

all employes one-half of all surplus profits after paying 10 per cent. on the subscribed capital. Mr. Roberts stated that fifty of the London workmen have already become connected with the committee, and that on the last pay-night 40l. of their money were received. With the exception of Mr. J. S. Laurie, of the Inner Temple, the directors are working men, and, in addition to that gentleman, Mr. T. Hughes and Mr. Morrison act as trustees.

JERUSALEM: MASONS' MARKS.

The last quarterly publication of the Palestine Exploration Fund includes a plan of the Church of the Knights of St. John in Jerusalem, drawn by Herr C. Schick, after explorations of the site made by him in connexion with the Prussian Government. A number of the masons' marks found on the stones of the building accompany the plan, and are seen to be precisely similar to those that we have given at different times from various other countries.—England, France, Germany, Spain, Portugal, Belgium, Switzerland, &c.,—including particularly the five-pointed star (formed of a continuous line), and the hour-glass shape. These marks would have served to show, had it been necessary, that the builders were European and Christian. There is yet more to be said about these symbols and the occurrence of exactly the same marks in many countries between the eleventh and sixteenth centuries. A belief in the usefulness of the inquiry has grown since the conductor of this journal first pointed out, now many years ago, the wide-spread existence of masons' marks, and published a collection in the *Archæologia*.

The report contains also some interesting communications from Mr. Tyrwhitt Drake, in which he gives a lamentable account of the physical and mental condition of the fellahs. The heat at the time of writing (June, 1872), was intense, and justified, he thought, the fitting, though somewhat coarse, expression a fellah used to him,—“A gate of hell is open to-day.”

DANGEROUS SUBSIDENCE AT JARROW.

An extraordinary destruction of property has occurred at Jarrow-on-Tyne. Within recent years extensive chemical factories have been established there, and large extensions have been made to them during the past two years, especially in carrying the works well out into the river upon wharfs. One of the largest of these chemical factories belongs to Messrs. Kemmish. It occupies a site on Jarrow Quay, a short distance from the Tyne General Company's landing, and it has a river frontage of from between 150 to 200 yards. The works are continued up to an old ballast-hill. Along the quay-wall were erected a number of warehouses and chambers, the chambers being appropriated to the manufacture of carbonate of soda and bleaching-powder. These last erections rose in tiers to a higher portion of the works, the ball-furnaces and acid-chambers being erected upon the ballast-heap. The River Tyne Commissioners have been deepening the river in the neighbourhood of Jarrow. The chamber on the wharf nearest the river seemed lately to have a tendency to fall over. It was noticed that a slight fissure ran along the “tank” upon which the outside of the acid-chambers stood in a line with the river. Work, however, was resumed at the factory as usual; but, as the tide ebbed, it was clear that those portions of the works situated between the quay and ballast-heap were settling down, and the men withdrew to a place of safety. One by one the erections connected with the bleaching-powder department tumbled down in ruins, and the massive levels of tank gradually broke up and subsided into the ground, until the whole of the erections covering the area of the entire length of the works, and for some 60 yards or more backwards, were one mass of ruins. The chamber, which was the first to give way, was soon followed by that of the general warehouse built on the east end of the quay, the crystallising-house, the still-house, the bleaching-powder chambers, the lime-house and lime-kilns, the dissolving-house, and a new bleaching-powder chamber of extra size, which had only that morning been packed for the first time. The large range of pyrites furnaces escaped with comparatively slight damage at the east end; but the whole of the dissolving-pans, immediately in front of the range of furnaces, have sunk completely out of sight, and a quantity of bleaching-

powder, packed in barrels ready for shipment, has disappeared also. The sinking of the ground seems to have been greatest midway between the quay and the top of the ballast-heap, where the ground has subsided fully 30 ft. Near to the extreme west end of the works a crane on the quay has also been demolished. At the extreme west end of the works the subsidence becomes gradually less, until it assumes the appearance of a mere ordinary crack. The total extent of the main fissure from east to west is about 300 yards, and the damage done may be roughly estimated at about 20,000l. In the departments which have suffered there were employed between 200 and 300 men. The cause of the slip is differently accounted for. One theory is that the deepening of the river has caused the sand to wash out from under the foundation, and that the excessively wet season has so weighted and softened the surface as to cause it to break in. Another is, that the workings in some old Jarrow coal-pits have shrunk, and have caused the subsidence of the surface and the immense destruction of property. About a fortnight before there was a slip on the works of Messrs. Sheldon & Co., at Hebburn, fronting the river, and 3,000l. damage was done. The quay wall remains sound, and that it has been more a subsidence than a slip is manifest from the incline of the wrecked buildings, those next the river falling landward, and those next the land falling riverward. We are disposed to ask if an architect was employed in the erection of the warehouses?

THE PIPES OF THE HYDRAULIC PRESSURE COMPANY.

The Wharfs and Warehouses Steam-power and Hydraulic Pressure Company are about to lay down their pipes along Blackfriars Bridge, having obtained the consent of the corporation to do so, and the work is to be executed under the direction of the City architect. It appears, that had the company not been permitted to lay down the pipes along Blackfriars Bridge, they would have been unable to complete a circle of pipes, which they are empowered by Act of Parliament, to lay down. The pipes, which are 6 in. in diameter, will be laid down under the carriage-way, near the footpath, as they cannot be carried along outside it. It was suggested that the pipes might burst, and that if they did so under the pavement on such a crowded bridge, a number of persons might be blown into the river; but in answer to this it was stated that Mr. Haywood, the engineer, had given it as his opinion that there was no danger.

AMERICAN FINANCES AND CREDIT.

COMMENTING on the financial condition of the country in its relation to the Presidential contest, the *New York Herald* states some interesting facts:—In all civilised nations the foreign commerce of a country is the method by which its commercial standing is measured. In this respect Great Britain is and has been pre-eminently the first nation. Her foreign commerce has steadily increased until the enormous figure of 3,000,000,000 dollars has been reached. This result has been accomplished by wise statesmanship and the most liberal support by the Government of all enterprise looking to the extension of British commerce. Besides, the Chancellor of the Exchequer is in constant and daily communication with the leading tradespeople and representative commercial men, attentive to their wants and suggestions, open to instruction, and never attempts to force a policy upon the country against the protest of the commercial body. France, in point of foreign commerce, is the second nation of the world; the annual value of her foreign commerce being now about 1,500,000,000 dollars. The United States have made rapid strides in commerce during the last two decades. Notwithstanding the interruption caused by the rebellion—and our improvement in this respect is remarkable,—our total foreign commerce in 1852 was 422,000,000 dollars, which was increased in 1860, at the outbreak of the rebellion, to 762,000,000 dollars. From that period to the close of the war our foreign commerce passed through many vicissitudes, and one year ran down as low as 435,000,000 dollars. After the close of the rebellion there was a rapid improvement, until for the fiscal year ending June 30th,

1871, our foreign commerce reached a total of 1,100,000,000 dollars. For the fiscal year which closed last June the official figures have not yet been made out, but it is estimated the total will reach 1,200,000,000 dollars, the largest in the history of the country, which, when we consider that this result has been accomplished in the face of virtually hostile legislation, presents an evidence of commercial progress and greatness of which any people may be proud. It is interesting to note the steady increase of railroad mileage there. In 1850 there were twenty-three miles of railroad in operation in the United States; in 1845 there were 2,218 miles; in 1850, 9,921 miles; 1850, 30,635 miles; and in 1871, 60,852 miles. The gross value of the internal commerce of their railroads during the fiscal year ending June, 1871, is stated in round numbers at 15,000,000,000 dollars, greater than the entire foreign commerce of the whole world.

LONDON SCHOOL BOARD.

At the usual weekly meeting, on the 25th, it was stated that the Works Committee had found it desirable in many cases, not only of sites scheduled, but also of sites which it was proposed to secure by agreement, to call in the aid of an experienced valuer of land before determining on the amounts to be offered or paid for interests in the various sites. In consequence of this, the committee asked the authority of the Board to appoint such a valuer in such cases as they may think necessary.

The authority asked for was at once granted. A resolution was passed by the Board on the 19th of June last deciding that a competition of four architects should be held for a school to be erected on the Northgreen Sawmills site. As no architects had been communicated with in this case, the Works Committee recommended that the plans be prepared by the architect of the Board, and that the previous resolution be cancelled.

It was explained by Mr. Reed, chairman of the Works Committee, that this would effect a saving of money.

The recommendation of the committee was approved of.

Since the previous meeting of the Board the Works Committee had considered the reference in which they were instructed to make the necessary selection of officers for the architects' department, and they now recommended that the following be appointed by the Board, at salaries mentioned below, subject to one month's notice on either side:—Chief draughtsman: Mr. T. J. Bailey, salary 200l. per annum (appointment to date from September 18, 1872). Senior draughtsman: Mr. Jas. Howes, salary 140l. per annum (appointment to date from September 20, 1872); Mr. A. Edwards, salary 140l. per annum (appointment to date from September 30, 1872); and Mr. Edward Rake, salary 120l. per annum (appointment to date from September 1, 1872). Junior draughtsmen: Mr. Arthur Harland, salary 80l. per annum (appointment to date from September 17, 1872); Mr. James Lackie, salary 80l. per annum (appointment to date from September 1, 1872); Mr. W. A. Green, salary 80l. per annum (appointment to date from September 17, 1872); and Mr. A. W. O. Burton, salary 80l. per annum (appointment to date from September 17, 1872). Writing clerk: Mr. George H. McFarlane, salary 80l. per annum (appointment to date from September 1, 1872).

THE ADMIRALTY AND BUILDING AT GREENWICH PARK.

WITHIN the last week or two, a strong feeling has been manifested in Greenwich against a proposal by the Commissioners of the Admiralty to let, for building purposes, the land adjoining the vicarage, known as Park Lodge, and which, it appears, was given by Act of Parliament for the use of the seamen of Greenwich Hospital; but which, it is now contended, it is illegal to build upon, inasmuch as it is “dedicated to the people by a king, in holy commemoration of the death of his queen.” The land in question immediately adjoins the park, and forms part of what is known as the Greenwich Hospital lands. Last week, two special meetings of the vestry were held, for the purpose of protesting against the proposals of the Admiralty Board. At the first of these meetings the Rev. Canon Miller, vicar of Greenwich, presided, and the proceedings were of an excited character, in consequence of a per-

positional alteration between the vicar and Mr. Pook, which induced the former to leave the chair, and the meeting broke up without coming to any decision. It appears that the vicar's house is built upon land immediately adjoining the land now proposed to be built upon, and that he has since entered into an agreement with the Admiralty for about 20 ft. of land to be added to his premises. At the meeting in question the vicar observed that, as the land had been given by Parliament for the use of the seamen of the hospital, there could be no question that it was at the disposal of the Lords of the Admiralty. This was denied by Mr. Pook, who added, that the vicar's house had no right to have ground built there, and that the addition of the 20 ft. more to his premises was the result of a hole-and-corner movement. Hence the vicar's leaving the chair, and the breaking up of the meeting. At a second meeting held, which was numerously attended, a more unanimous feeling against the proposals of the Board of Admiralty prevailed. One of the churchwardens presided, and several speeches were made strongly commending the attempt to build upon the land. One of the speakers said it was the hounden duty of the inhabitants to prevent it, and they should do all they could to get the land thrown into the park. He added that it was purely a question of Greenwich Hospital v. The Public, and it was quite clear the Hospital must give way. A resolution was proposed and carried to the effect that the vicar, churchwardens, and certain members of the vestry seek an interview with the Lords Commissioners of the Admiralty, to protest strongly against the proposed leasing for building purposes of certain land adjoining the park, the same being contrary to former action, and opposed to the wishes of the people of Greenwich.

THE COAL AND IRON TRADES.

The prices of coal and iron seem now to be clearly pointing to a fall. Coal and iron are becoming more abundant at the northern furnaces; and at Wolverhampton on Wednesday last week the tone of the market was decidedly in favour of purchasers. Bars were offered at a reduction of 3l. per ton without finding buyers. The unprecedented prosperity of the malleable iron trade in Lanarkshire, however, is threatened with a sudden collapse in consequence of the continued rising of the prices of pig iron and coal, and the slackness of orders this month. Two large works have already given their men the usual fortnight's notice. With regard to coal, it may be stated that the last alleged rate of 3s. 6d. per ton appears to have been a dodge on the part of some of the agents who have bought heavily.

There is much foreign competition, both in iron and in coal. Belgium is making girders far and near at low quotations; and Germany has just secured a good order for railway tools which had been previously offered to firms in this country. Our coal-owners and iron manufacturers seem to be killing the goset hat lays their golden eggs, and while plundering the public unmercifully, they are destroying their own business.

A Dumfries coal-merchant writes, pointing out what appears to him to be the chief, if not the only, cause of the present extraordinary state of the coal trade. Speaking of the high rate of wages, he remarks that the men have only got 9d. per ton more than they had last year, when coal was 6s. a ton. Since that time coals have risen enormously. "Last month," says our correspondent, "I was charged 17s. per ton nett at the pits, and the carriage costs 4s., making in all 21s. Thinking that a change might soon take place, I sold the same coal for 20s., thus losing 1s. per ton, and all my labour. More recently I have had an intimation that 2s. 6d. has been added to the price at the pit." It seems a little foolish to sell coal at a loss. The fact of his doing so, however, is not quite pertinent to the argument: so we pass on.

"Do the coal-masters," he asks, "pay more than they did formerly for the leases of their pits? No; for they know to a certainty that they have leases for fifteen, twenty, and thirty years, and I should like to know how many of these expired within the last twelve months, and if any were increased in price on renewal. Again, the price of coal at the pits in September, 1871, was 6s. per ton, less 23 per cent. for cash in a month. Out of this sum they paid the lord of the manor, the colliers, and the whole working expenses. They were very anxious to take orders at that price; so, I presume, they made a profit. Turning now to the present trade, I add 9d. for the increase of wages, which gives 6s. 9d. per ton. This 9d. is all that the coal-masters can show as a reason for the present extravagant rates. They must, therefore, be making profits of 10s. 3d., 12s. 9d., and 13s. 9d. on the three

qualities of coal which they sell at present at 17s., 19s. 9d., and 20s. 6d. Moreover, the 23 per cent. discount which was formerly got for cash payments is not now allowed, and that itself must represent a considerable sum."

A joint-stock company is now being formed in Titusville for the manufacture of pig iron by means of petroleum oil in place of coal. At present rate the fuel for making a ton of charcoal iron costs 17 dollars, while it is calculated that the oil for making an equal quantity of iron would cost only 7 dollars. The Lake Superior ore can be laid down at comparatively little cost almost at the mouth of the oil-wells, which will thus be invested with a new and increased value.

LEICESTER SCHOOL BOARD.

The Architects' Committee submitted a list of the tenders received for the erection of the school on King Richard's-road; and recommended the Board to accept the lowest tender, namely, that of Mr. Thomas Bland, subject to its being sanctioned by the Education Department.

The committee also recommended that the school be erected with hollow exterior walls, the nature of the locality making them in this instance especially desirable.

	Extra for hollow walls	Amount of tender.
Brown	£199 0 9	£2,982 1 0
Fast	133 7 0	7,729 0 0
Foster	109 0 0	6,799 0 0
Winkles	98 0 0	6,738 0 0
Hutchinson & Son	98 0 0	6,685 0 0
Lovely	109 0 0	6,574 0 0
Osborne Brothers	74 0 0	6,507 0 0
T. & H. Herbert	90 0 0	6,349 0 0
Neale & Son	135 0 0	6,095 0 0
Bland	120 15 0	6,060 0 0

These tenders do not include the cost of the internal fittings. The report was adopted. The Architects' Committee recommended Mr. Jackson's plans to the Board (subject if necessary to some minor modifications) as the most suitable for utilising the site in Oxford-street for 876 children, in accordance with the resolution of the Board of August 19th, 1872. This recommendation was also approved of.

SIR JOHN BOWRING ON THE VALUE OF STATISTICS.

In course of the paper read by Sir John Bowring, at the last Congress of the Social Science Association, he said:—It may be doubted whether there is any topic of social or individual interest which is not in some way or other to be tested by statistical and economical results; at all events, it may be contended that when such results are attainable they will tend much to the elucidation of any and every controversy. Every argument is strengthened if it can take a mathematical or arithmetical shape, and the tendency of all inquiry is to subject every contingency to some law of harmony or order. The great controversy of the day is, whether any event in the wider regions of space or time does escape, or can escape, from the irresistible despotism of an universal law. Thoughtful men are beginning to test the great workings of Providence, once deemed inscrutable, as they would test the working of any instrument produced by the hands of man. If they look at the machinery of a watch they would judge of its excellence from the absence of aberration, that it went well, and recorded the progress of days or hours, or minutes or seconds, with unvarying accuracy. If it failed, they would properly deduce from its failures the imperfect hand of the watchmaker. It is not necessary that they should be personally acquainted with the watchmaker to assist the conclusions at which they would arrive; nay, it would be utterly impossible for them to trace the various parts of the complicated work to their origin; and so in the infinite variety of the machinery of creation. May not the study of statistics have a moralising effect upon public opinion? May it not influence sovereigns and legislators when the cost of great national evils, and sometimes of great national crimes, is taken into account? Ask, for example, the returns of the waste of human life, of the sacrifices of money, which we owe to the devastations of war,—though these sacrifices are not confined to statistical tables, but ramify into all the researches of human suffering; and it is hoped that the startling figures in figures which have been published connected with international hostilities may not be deemed inappropriate, as they certainly cannot fail to be instructive. It is obvious that a refer-

ence to a friendly and well-constituted tribunal for the settlement of matters which have so frequently led to the "outspit of the dogs of war," could not but greatly serve the interests of economy and commerce: nothing can be more opposed than war to the cultivation of brotherly affections nor to the extension of trade. Civilization has done something,—much less than it ought to have done,—for the suppression of internecine quarrels; it has more effectually broken down the barriers which separated town from town, district from district, province from province, which are now almost universally allowed to trade with one another. Every reason which justifies the removal of local restrictions applies to the custom-house codes of nations; and if not for the adjacent present, we may anticipate for a remoter future the abolition of tariffs grounded on a supposed hostility of interests,—a hostility which has no foundation in fact.

PRIVATE DWELLING-HOUSES AT THE VIENNA EXHIBITION.

It has been already noticed in the newspapers that at the Universal Exhibition to be held in Vienna in 1873 the private dwelling-house will have the importance of forming a group to itself. This group has been destined to help to solve one of the most important questions of social science of the day. Its object is not to exhibit a collection of ethnographical objects, neither is it to show how most of the private dwelling-houses are built and arranged in different countries; but to show how the private dwelling-house can and ought to be built in order best to fulfil its purpose, taking into consideration the climate, local circumstances, and mode of life of the different peoples, as well as their wants and habits.

One very common error, for instance, hitherto, in undertakings with the special object of providing houses for working men, has been the construction of huge nests of brick and mortar, in which there is no private ownership beyond the two or three rooms enclosed within a separate door, and a right of way down a common staircase. Whatever may be the architectural or economical advantages of this kind of building, it has one fatal fault,—it is not liked, and there is no reason to suppose that it ever will be liked, by the persons who are intended to benefit by it. It is very doubtful whether the flat system has any future in London, even for the richer classes. The experiment begun in Victoria-street has not been often repeated.

The group destined to represent the private dwelling-house, firstly, by models, drawings, and finished buildings; and, secondly, by drawings, models, and examples of thoroughly furnished apartments, at the Vienna Exhibition will show the rooms, the kitchen, the cellar, &c., with all the requirements of housekeeping and all most approved arrangements, as a whole and ready for immediate use; and thus it is hoped present to the visitor an arrangement which cannot by any other means be exhibited in so complete or clear a manner, and which imagination can never represent to itself.

This Exhibition will enable the architects of all civilised nations to exhibit the private dwelling-houses which suit best the climate and habits of their country, and also enable visitors who give their attention to this problem to make instructive comparisons, and to adopt the arrangements which may be suited to their own country and customs. It is intended that the houses exhibited, besides being fully and completely furnished and decorated, shall be likewise, as far as practicable, inhabited.

One particular feature of prominent interest to English manufacturers and exhibitors deserves to be specially noticed in connexion with this group. Iron constructions are almost unknown in Austria, and it is believed that if introduced by enterprising firms (and such are not wanting in England) they would meet with a ready sale. Even a very profitable investment might be made by erecting several of these iron houses previously to the opening of the Exhibition; for it is a well-known fact to residents in Vienna that at present there is not enough accommodation for the resident population, and that in consequence rents are enormously high.

By the exhibition of these iron constructions the manufacturer may derive a double advantage. In the first place, he will be receiving rent for the houses whilst they are inhabited, and, secondly, it will, perhaps, do more to convince Vienna capitalists and building societies of the

practicability of iron houses, than all the advertisements in the world.

The houses which are mostly required at Vienna, are not those enormous ten and twelve-story structures which are familiar to every one who has visited Continental cities. The most urgent want of the people there is a good transportable dwelling for working men, containing from two to four rooms, and others with one room and a kitchen, only suitable for a man and wife. Such buildings are almost unknown in Vienna, and considering that the town has a very large labouring population, they are as much needed as elsewhere. To men employed in large manufactories a dwelling of this kind would be specially acceptable, for, on account of want of good accommodation, and the very high rents which prevail in a densely-populated district, the Austrian artisans and mechanics have often a distance of three or four English miles to walk morning and evening. Summers and winters in Austria are more severe than in England, and hence the greater need of a decent dwelling nearer the man's daily work. Many of the manufactories there have plenty of spare ground which they now appropriate to depositing rubbish, but which, in many instances, would be available for the erection of constructions as heretofore suggested.

Ordinary building materials are very dear at Vienna; bricks cost from 30 to 35 florins (50s. to 60s.) per 1,000, and other materials are in the same proportion. In the interest of working men and the poorer classes, the co-operation of manufacturers in England, France, and elsewhere, in the direction above indicated, is earnestly solicited by the Austrian people.

CIVIL ENGINEERING AND ARCHITECTURE AT THE VIENNA EXHIBITION.

A CORRESPONDENT from Liverpool asks to be informed as to the works admissible. The following extract from the programme will answer the inquiry, and probably be useful to others:—

"CIVIL ENGINEERING, PUBLIC WORKS, AND ARCHITECTURE."

- (a.) Building materials; processes and apparatus for quarrying, brick-making; iron girder work; preparation and preservation of wood; artificial stone, terra-cotta work, &c.
 - (b.) Materials and appliances for foundations (pile-drivers, screw-piles, cofferdams, caissons, pneumatic and diving apparatus).
 - (c.) Contrivances and tools for earth-works (excavators, dredging machines, apparatus for raising, carrying, and transporting earth and materials).
 - (d.) Materials and apparatus used for roads and railways (road rollers; railway superstructure, switches, crossings, turn-tables, traversing-tables, inclined planes, lifts; pneumatic and other modes of propelling; water stations and their apparatus, railway station buildings of all kinds, and systems of railway signals).
 - (e.) Hydraulic engineering works, excluding sea works (river works, canal works, dikes, locks, dams, &c.).
 - (f.) Models and plans of viaducts, bridges, and aqueducts, &c.
 - (g.) Plans, models and drawings of public buildings, dwelling-houses, barracks, penitentiaries, prisons and hospitals, schools and theatres, labourers' cottages; apparatus for lifting and moving heavy weights in buildings, as lifts, &c.; plans and models of cheap dwelling-houses; tools and implements of artisan builders.
 - (h.) Apparatus and inventions for health, comfort, and convenience in buildings (for lighting, water supply, drainage; water-closets, lightning conductors, &c.).
 - (i.) Agricultural engineering; plans for culture, fencing, draining; farm buildings; buildings for cattle breeding; stores, stables, manure tanks, &c.
 - (k.) Industrial buildings; spinning-mills, weaving-mills, grinding-mills; distilleries, breweries, sugar manufactories; warehouses, saw-mills, and docks, &c.
- Finished buildings, models, and drawings of farmhouses of the different nations of the world."

Let us add that the buildings to which architectural drawings, &c., relate must have been designed, commenced, or finished since 1863. Architectural drawings and designs which have gained the Travelling-Studentship of the Royal Academy, the Gold Medal of the Royal Academy, or the Soane Medallion of the Royal Institute of British Architects, within the preceding five years, will be considered admissible without other question than that of sufficiency of space. It is desired that each architectural work should bear the name of the architect who designed, as well as that of the artist who drew or painted it.

Gas Referrees.—Professor Tyndall, Mr. Augustus G. Vernon Harcourt, and Dr. William Pole, have been appointed gas referrees under the City of London Gas Companies Acts, 1863, for one year, at a salary of 200l. each.

SEWER-GAS AND LEAD PIPES.

Sir,—I agree with your correspondent, "A Plumber," at page 750, in his advocacy of pure versus adulterated lead. I cannot, however, agree with him when he states that "iron soil-pipes are corrosive and offensive," for I consider that, especially where hot water flows through them, iron soil-pipes, if properly put in and of a proper size and thickness, are preferable to lead. It is an every-day occurrence to come across old lead soil or waste pipes with holes eaten through them, but the same as regards cast-iron is *vera vis*,—at least in my experience. When iron pipes are put in only about 1.16th of an inch thick on one side and 1.6th of an inch on the other side, we often find them split up, rusted, and broken; but then such thin iron pipes should not be used, especially for soil-pipes. Cast-iron soil-pipes, $\frac{1}{4}$ in. thick, and $\frac{1}{2}$ in. or $\frac{3}{4}$ in. internal diameter, give great satisfaction if properly fitted up and supported, and also ventilated. As to the ventilation of soil-pipes, I think it not far off the mark to say that in ninety-nine cases out of every hundred the soil-pipes are not properly and efficiently ventilated.

ANOTHER PLUMBER.

LANDS THAT WANT HANDS.

Sir,—I am pleased to read in the *Builder* that the Land Question has been revived. I would beg to say that a plan something like "E. G.'s" proposal was started about twenty-four years ago, in this way:—An active friend of the working class, an M.P., started a land scheme, in shares, for working men, at four shillings per month. When there was a certain sum in hand, inquiry was made, and part or the whole of an estate was purchased; then the land allotted to two, three, and four acres each, with houses of three and four rooms: a fair price was fixed upon them, and, when ready for occupation, the members who had paid certain sums in subscription, drew by ticket. After some time, three or four estates were thus established. One estate, that only employed three or four hands, was divided so as to locate thirty families, but, through opposition, the scheme failed.

G. STUBBINGS.

NEW ZEALAND ADVANCING.

On the 13th of April last, a stream of emigration commenced to flow from the United Kingdom to this important colony, sometimes spoken of as the Great Britain of the Southern Hemisphere, that is destined to exercise the most important influence upon both colony and mother country. On the date named the ship *Shehallion* left the port of London, with a large number of carefully-selected navvies and agricultural labourers on board, destined for Wellington, the capital of New Zealand, whence they were conveyed to Picton, in the province of Marlborough, to commence operations in the construction of a system of railways to be made in New Ulster, or North Island, and in New Munster, or Middle Island, the main portions of the colony. New Leinster, South or Steward Island, small and sterile, uninhabited and uninhabitable, is left out of consideration.

The New Zealand railways are to be made by Messrs. John Brogden & Sons, under contracts with the Colonial Government, and five contracts have already, as a commencement, been entered into between the firm and the Government. There is no surplus labour in the colony to be relied on for the execution of such extensive and important works, and Messrs. Brogden have accordingly to send out their own work-people. Navvies and agricultural labourers are not of the classes that have a balance at their bankers, and the employers are necessitated to pay the passage-money and provide the clothing outfit of most of the emigrants, taking promissory notes for repayment of the amounts thus advanced from wages earned in the colony in Messrs. Brogden's employment. The conditions under which the labourers engage are fair and liberal on the part of the employers, and the engagement indicates their possession of faith and courage in no mean degree, as must be manifest from the fact that they will have invested, on the security of these promissory notes, from 30,000l. to 40,000l. for passage-money and outfits, before the "first sod" has been turned in the colony. The first ship has been followed by the *Halcione*, also for Wellington; the *City of Auckland*, destined for Auckland; the *Ballarat*, for Port Napier, Hawkes Bay; the *Bebbington*, for Otago;

the *Lady Jocelyn*, for Canterbury; the *Christian McAusland*, for Otago; last week the *Ohite*, for Port Napier; this week, the *Jessie Beadman*, for Wellington; with the *Zealandia* to follow for Port Bluff, in the Province of Southland, and other ships afterwards for that and other ports. The contribution already made by Messrs. Brogden to the population of the colony, or the emigrants that they have despatched thither from London, numbers no less in men, women, and children, than 1,300 souls. The employers are required by Government to include a certain proportion of females in each batch of emigrants, but the obligation to send an absolute equality in numbers of the sexes would be to impose a burden too heavy to be borne, and the disturbing element of an inequality in the number of males and females applies in this, as in all other instances of emigration, the males being always in excess, more or less. The proportions in 932 emigrants sent out by the first seven ships were 660 males to 272 females, or roughly as 7 to 3. Applications for employment are made from all parts of the country, and not a few Warwickshire agricultural labourers have taken advantage of this fortunate opportunity for bettering their condition. The *Ohite*, that sailed last week took a number of emigrants from Cornwall and Dorsetshire. The natural probability, as we learned from the ship's doctor, is that three more names will be added to the passenger roll before the ship reaches Port Napier. The additions will be of natives of the somewhat extensive parish of the Pacific. Advice has been received of the safe arrival of the *Shehallion*; and the other ships, it may be hoped, have either reached their respective ports, or are pursuing their peaceful and pleasant voyage.

The qualifications for employment on the New Zealand railways are strength and health, a certain maximum age, and the being, or having been, a *bonâ fide* navvie or labourer. The emigrants are guaranteed not less than two years' work at such wages as may be agreed on from time to time, or as may be settled by some person to be appointed by the Governor of the colony, but such wages are to be not less than five shillings per day of ten hours. The employers take power to retain a fifth of the wages of the employed for repayment of passage-money and outfit, but the men may repay the amounts of their promissory notes as quickly as they please, and when these have been fully paid they may work where and for whom they choose, for such wages as they can command. It need scarcely be said that from England, with its present rates of wages and prices of provisions, to New Zealand, with 5s. a day and beef and mutton at 2d. and 3d. a pound, promises to be a stride in the direction of comfort. The ship outfit of the emigrants is provided by Government, to be repaid if advanced by Messrs. Brogden; it includes the necessary mattresses, bed-clothes, pannikins, and other utensils, which, much to the satisfaction of the emigrants, remain their property on arrival in the colony. In the first instance, the immigrants will be lodged in the Government barracks, from which they will move to the locality in which they are to be employed, and be lodged in roomy and comfortable wooden huts, that are being provided by Messrs. Brogden. These huts are to be portable, and as one section of a line is finished, they will be taken to pieces and transported to other localities, where they will be re-erected.

The lines of railway to be first constructed by Messrs. Brogden, have their termini at, or near, ports widely apart from each other, from Invercargill, near the southern extremity of New Munster, in about 47° S. lat., to Auckland, near the northern part of the mainland of New Ulster, 37° S. lat. Three of the lines contracted for are in the middle island, and two in the northern island. The three southern lines are from Invercargill, Southland, to Mataura, 42 miles; from Dunedin, Otago, to Clutha, 34 miles; and in Cook's Strait, from Picton, Marlborough, to Blenheim, 19 miles. The lines in the northern island are from Auckland to Waikato, 41 miles, and a short line of 8 miles from Wellington to Hull. The lines aggregate about 150 miles, and the five contracts about 512,000l., the average cost being a trifle over 3,500l. per mile. One line of 42 miles, the Invercargill and Mataura, will only cost 2,047l. per mile. These figures, however, exclude rails and rolling stock.

The lines now contracted for are only a small beginning of a great enterprise pregnant with stupendous material and moral results. Experience so dearly bought at home, in the construction of duplicate lines and unprofitable extensions,

in the elaboration of a railway system that is "a maze without a plan," will doubtless be avoided in New Zealand, where the system of railways will be system worthy of the name. The colony is rich in natural productions; in forests principal of valuable timber; in farms produce, flocks, and herds; in fertile valleys and succulent pasture-grounds; in mines, easily accessible, of coal, iron, copper, gold, and other mineral and metallic treasures. The intention of the Government, in the first instance, is to carry the railways into, and to tap, the mining districts. The Auckland and Waikato line will pass through a district in which excellent coal abounds; the Dunedin and Clutha lines takes the direction of the gold regions in the valley of the Clutha, and it is the same with the other lines laid out. Future contracts, it may be expected, will be for lines from Clutha to Mataura, which will provide continuous railway communication between Invercargill, Southland, and Dunedin, Otago. A line is in contemplation from Nelson to Westport and Greymouth, in the province of Nelson, and embracing extensive coal fields; another is projected, we believe, from the Wellington and Hutt line, through an exceedingly fertile country to Port Napier, in Hawke's Bay. The introduction of railways will hasten the advent, if anything can do so, of Maori's native—a native New Zealander, in the same sense as Stanley is a native American—who is to perform the sketching feat on the ruined arch of London Bridge. Centuries will probably elapse before St. Paul's and London Bridge fall into ruins, if they are ever allowed to do so, and generations may possibly have to come and go before the railway system of New Zealand is completed, considering its great extent, and the present sparsity of its population. It is not within the power of one generation to construct a railway system to permeate the necessary points of regions that are more than 1,000 miles in length, with a mean breadth of about 200 miles, and enclosed in a coast-line of 1,000 leagues. As regards the present population of the colony, its numbers forbid, if not render impossible, a very rapid construction of railways. In 1872 the colony had only 256,167 white inhabitants and 85,510 aborigines, or together less than a tenth of the population of London; so that a heavy "passenger traffic" on New Zealand railways will be impossible for yet awhile. Nothing can be more certain, however, than that the railways and population will act and react upon each other. As the resources of the country are opened up by railways, population will be attracted, and as population is increased and dispersed, more railways will be required. A few generations hence will doubtless see a wonderful modification of the contrast now presented between Lancashire and Cheshire, with a population of 1,082 persons to the square mile, and New Zealand, with no more than the odd two persons for each of its 122,000 square miles of territory.

The streams of emigrants to New Zealand, and the important works they are sent thither to execute, are doubtless sources of satisfaction, but the good is not unmingled. A large number of the applicants for employment are ineligible, being either loafers, broken-down men, or deficient in physical stamina. There is not any prudence exercised in scrutiny of the moral character of applicants, but the line must be drawn somewhere; and they may be rough, but they must not be known as rogues. The exodus brings Goldsmith's lines unpleasantly to mind. Many of the emigrants are really of the "old peasantry, their country's pride." They leave for the good of the colony, and for their own good, but not for "their country's good" in the sense in which the phrase is sometimes used. They take with them strong arms, and iron tools and sinews, the rogues and vagrants, the aged and infirm, being all left at home to prey upon, or to be provided for by, the workers that remain.

A number of single young women accompany the emigrants, professing to take "domestic service" in the colony. In numerous instances it is expected that an interesting ceremony will be performed soon after arrival in the colony, between certain of the gallant young bachelor navies and the fair spinsters that accompany them. The single women, by going out as such, save ten pounds on their passage-money. They are under the superintendence of a matron on the passage out. The single men are herded in the fore-cabin and fore-hatch, the married couples in the middle hatch, and the single women in the

after-batch. The arrangements for the comfort of the emigrants, as we saw them in the *Châte*, had nothing that could be complained of, and left little that could be reasonably desired.

PARIS PROMENADES.

The view we give of the *café-restaurant* on the Ile de Bercy, in the Bois de Vincennes, is from a recently-published part of the fine work, "Les Promenades de Paris," now in course of publication by M. J. Rothschild,* and to which we intend to make early reference.

This restaurant is constructed in wood, after the fashion of a Swiss *chalet*, and covers an area of 525 metres. It was bought for the purpose by the City of Paris, at the Universal Exhibition of 1867, and cost, when erected in its place, 1,600l. Around the *chalet* there is an extensive platform, planted with trees, to receive the tables for customers.

OFFICES OF THE LIVERPOOL UNITED GASLIGHT COMPANY.

A HANDSOME and commodious building has been completed for the Liverpool United Gaslight Company, in Colquitt-street. The style is Franco-Italian Renaissance.

The building comprises, on the principal or ground floor, a general office, 65 ft. by 75 ft., placed at the rear, lighted on three of its sides by large, lofty windows, and, in addition, by a dome-light over the centre of the room. This office is intended for the transaction of general business with the public, and access to it is obtained from the principal entrance. The general office is fitted up with a range of counters on the two sides, and at the end opposite the public entrance, the centre part of the room being intended for the public use as a waiting-hall, whilst the space behind the counter is fitted up with desks and seats for upwards of 100 clerks, collectors, and other officials. Communicants to the general office, and placed conveniently for access from the chief entrance, is the manager's private office, adjoining which, within the general office, is the office of the chief clerk and his assistants. In the basement beneath the general office are two large strong-rooms, fitted to receive the books and cash-safe. A hydraulic hoist is provided to raise and lower the books, safes, &c., to and from the general office to the strong rooms. There are also beneath the general office a cloaks-room, extensive lavatory accommodation; large stores for fittings, and a kitchen and dining-room for clerks. The whole of the basement of the building is lighted by external windows, which open into wide areas, affording means of access from the yards and workshops to the basement offices and the dining-rooms. The front part of the building comprises a basement story, containing offices and storerooms.

On the ground-floor are two show-rooms for fittings, one on each side of the main entrance, with a corridor of communication and manager's rooms. From the corridor access to the yard is obtained at each end of it, and the chief staircase to the board-room and engineer's offices on the floor above is approached from the entrance-hall. A workmen's staircase is also placed in this part of the building, from the basement to the upper floor, near the engineer's office. On the first floor are the board-room, ante-room, engineer's office, and engineer's clerks' drawing-office and plan-room, forming a suite of rooms the extent of the Duke-street frontage, and behind these rooms is a corridor of communication; from the corridor access is obtained to the staircases, and a photometer-room and engineer's room for experiments. Above the suite of rooms last described is an attic story to be used as stores and offices, and for storage of books and documents. The building has a frontage towards Duke-street of over 120 ft.; the depth from front to back is nearly the same. The Duke-street front and its two flank return walls are built of Cefn stone. The front cornice comprises a central pediment in coupled fluted columns with responds, and a flight of six steps to the main entrance door. The building has its ground-floor about 4 ft. above the street level at the centre. The wing walls to the steps cross the area towards Duke-street, and the area is divided from the street by a parapet wall and balustrade, with handsome gas pillars and lamps on the chief piers.

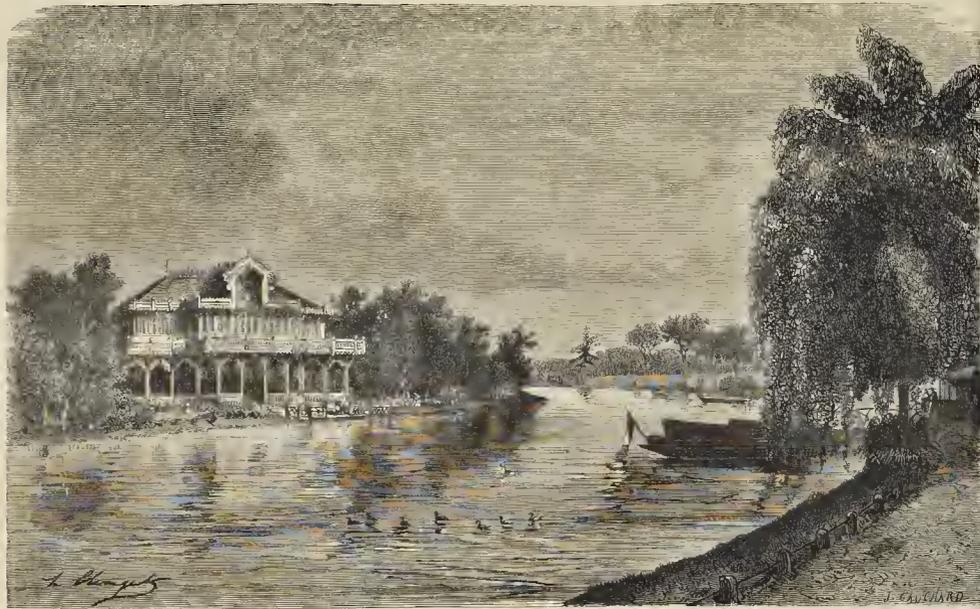

Above the basement, the front is divided

* 13, Rue des Saints Pères, Paris.

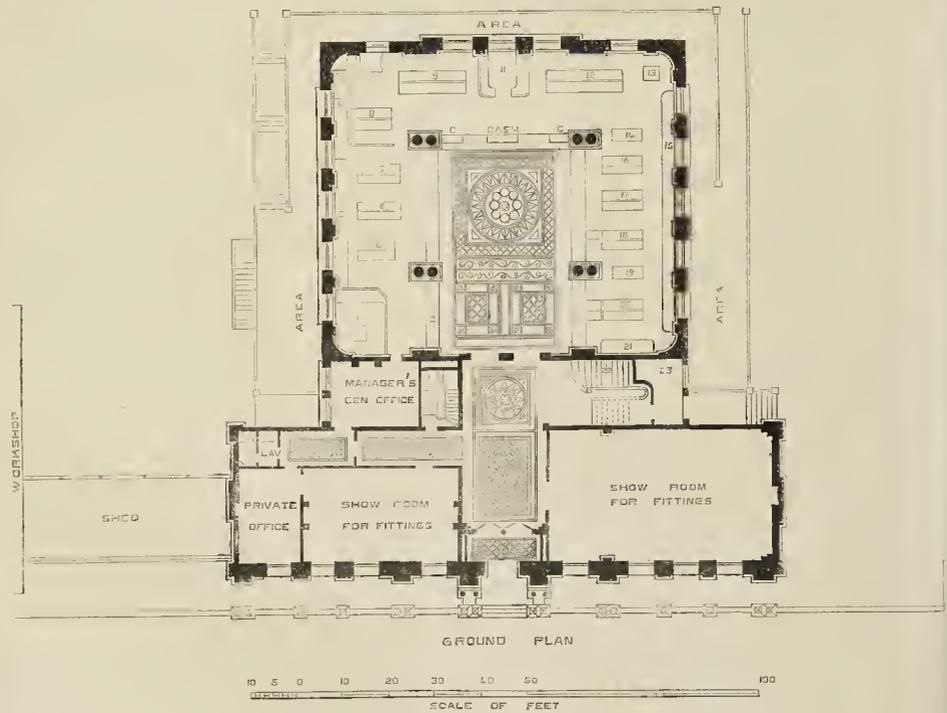

horizontally into two orders, or stages, each having continuous subbase and dado, and entablature, the upper order being surmounted by a bold cornice, supported on consoles, which are accentuated over the pilasters by being repeated there. Above the main cornice is an open balustrade parapet, broken in the centre by a large dormer window, carried to the height of the main ridge, and flanked by shafts on the pedestals of the parapet. Similar shafts are placed on the angles of the parapet, and they contain flues for ventilating the different rooms. The ground-floor has, on each side of the entrance, four square-headed windows, with boldly-moulded architraves, divided by pilasters, the intermediate wall-piers being rusticated. The base and entablature of the pilasters are continued along the front and flank walls, and thus mark out the ground-story. The division of the first floor is similarly arranged: its windows have semicircular archivolts, enriched by carving. The centre window over the main entrance is similar in character, with side-light, forming a Venetian window. The capitals of the fluted pilasters of this story serve as impost to the archivolts, and a moulded and carved string, corresponding with them, is continued on all the wall-piers of the front and flank of the building; and the pilaster, dado, and base are similarly continued, excepting that in the window-openings the dado is filled in with balusters. The same line of base is broken round the portico in the form of a balustrade, with pedestals and terminals at the angles, forming a parapet to the flat over the portico, which may be approached from the central window, which opens to the floor. The building is of a substantial character, and, with the exception of the Duke-street front and its flank, no attempt at embellishment has been made to the exterior of the building.

Internally, the general office has a richly-panelled ceiling divided into compartments by moulded beams in plaster work. The centre and largest panel has within it a dome, 17 ft. diameter, filled with stained glass divided into sections by ornamented ribs. The drum of the dome is panelled, and busts of life-size figures are placed beneath the ribs of the dome, which springs from the flat of the ceiling by an enriched cove. A ring of triplet gas-jets encircles the dome at its base. The ceiling is supported by eight Corinthian columns of polished stone, fluted, each with its pedestal 25 ft. high placed beneath the junctions of the main ceiling beams in couples, and on the walls are corresponding pilasters. The windows on the three sides of the room have circular heads, and their arches spring from a continuous enriched impost moulding. The desks, counters, and other fittings are of oak of a serviceable character, and in design to accord with the style of the building. Each desk is in communication with the manager's office by a bell-signal on the atmospheric system. The apparatus was furnished and fitted by Messrs. Barr, of Leeds. The painted decorations of the room, and of the building throughout, are purposely of a quiet subdued character, and subordinated to the purpose for which the building was designed. The floors of the halls and corridors are of tiles. The building is heated by warm water, the apparatus being furnished and fixed by Mr. J. Combe, of Glasgow.

The general contractors for the building are Messrs. Jones & Son, of Pleasant-street, Liverpool. The undernamed contractors have executed the various branches of the work for them, viz.:—Messrs. Wells & Son, the masonry; Mr. J. Hook (the late) brickwork, &c.; Mr. Thomas Jones, the plasterers' work; Mr. Radcliffe, the plumbers', glaziers', and painters' work (all of Liverpool). Messrs. De Bérge, of Manchester, furnished the iron girders; Messrs. Chatwood, the safes, &c. The fitting of the ground-floor was done with Maw's tiles by Messrs. Rutter, Powell, & Co., of St. George's-crescent; and that on the upper floor with Minton Taylor's tiles, by Mr. R. G. Powell, of Duke-street. The wrought-iron and brass work, and the chief gas-fittings, were furnished by the Midland Art Metal Works Company, of Coventry; the hydraulic hoist came from Messrs. Richardson & Boyd, engineers, of Preston. Mr. T. S. Trumble, of Liverpool, did the internal painting and decorating. Mr. J. Kitchin acted throughout as the clerk of the works. The building was designed by the late Mr. Charles Lucy, of Liverpool, and was partially erected under his superintendence. Since the death of Mr. Lucy, the works have been carried out from drawings furnished by Mr. Henry Littler, of Manchester, and under his superintendence the works have been completed.

OFFICES OF THE LIVERPOOL UNITED GAS-LIGHT COMPANY.—Plan of Ground Floor.

OFFICES OF THE LIVERPOOL UNITED GAS-LIGHT COMPANY.—Mr. Henry LITTLE, AND THE LATE Mr. LLOYD, ARCHITECTS.

SCHOOL DESKS.

SIR.—Mr. Robson does not deal with the question of space, which you raised, when giving us his opinion in favour of Mr. Moss's desk, and as against "convertible" desks, in your issue of the 14th instant. Will he tell us what superficial area is required to seat, say, 100 children in a mixed school, on the plan of Mr. Moss's dual desks, and what space for the like number is required on the parallel-desk plan, in groups, which alone is sanctioned and set forth by the Educational Department of the Privy Council in their "Instructions to Architects"? The question of space is a material matter; because if Mr. Moss's plan necessitates a larger school-room area extra cost is involved in the building, and this, though of little consequence to a school board dealing lavishly with rates, is of great import to the numerous voluntary schools erecting throughout the country. In the one case a thousand pounds may be easily obtained, while in the other the promoters have great difficulty in scraping together a hundred.

Mr. Robson states that "convertibility" is the very thing which no one now wishes to see adopted. It may be some information to him, as his attention may be concentrated on the school-buildings in charge of great school boards, had to your readers, when I state that, owing to the indefatigable exertions of Archdeacon Lamilton, there has not been occasion, so far, for the formation of a single school board in his archdeaconry,—that of Lindisfarne,—comprising fifty-eight parishes, and extending over the best half of the county of Northumberland, and including Berwick-on-Tweed. In his archdeaconry there are 126 church schools, providing for 11,648 children; and in most of those recently built and now erecting, the voluntary principle, with the aid of the Privy Council, "convertible" desks are being generally adopted. In my own practice these desks were introduced on the suggestion of the promoters in large schools which I erected in a parish, three years ago, where they have answered so admirably that I am instructed to use them in another school now building in the same parish, and I propose to use them in four other schools building elsewhere. The "convertible" desks, while they in no way interfere with "the best shape and disposition of a school, in reference to its educational use," and with the system of the parallel desks in groups required by the Privy Council, also afford the opportunity of adaptability to school-treats, lectures, concerts, and literary readings, and entertainments, though referred to somewhat slightly by your esteemed correspondent, are, in rural districts all over the kingdom, not only helpful to the education of parents as well as children, but their only mental recreation in the long dreary winter evenings. Until, therefore, the Privy Council recognise the dual desks in their "Instructions to Architects," and consequently rescind their present regulations, or more forcible reasons for their use are put forward, I, for one, can certainly not adopt them for voluntary schools.

FREDK. R. WILSON.

Adwick.

SANITARY MATTERS.

Sanitary Work on the Thames.—It is somewhat fortunate, says the *City Press*, that the exact limits of "the Port of London" have not been fixed. At present the term is applied for other purposes to a district comprising about seventy miles of the river Thames, with a mile and a half of the land on each side; but it is obvious at this area cannot be looked after by the staff set forth in the Act, consisting of a medical officer and an inspector of nuisances, so that one of the first things to be done will be the settlement of the boundaries within which the work committed to the corporation is to be performed. Probably the "Port of London" will ultimately be taken to imply the district between Gravesend and London Bridge; and if the efforts of the new authority are confined to this sphere, all that can reasonably be expected may be accomplished. The great thing will be to intercept all infectious diseases at Gravesend, and carry out there such a system of extinction as shall prove of service to the entire metropolis.

Mortality of the Children of Burslem.—The chief Bailiff of Burslem made what he very justly regarded as a "startling" statement, at a recent meeting of the local Board of Health. Referring to the deaths in the town, he said that of 787 deaths in the year, 421 were of children

under five years of age. This mortality is more than "startling,"—it is frightful. Some of the causes, no doubt, are on the surface,—crowded houses, bad drainage, absence of pure air, improper methods of treatment, and, above all, the employment of mothers at work away from their homes. Some of these causes are capable of removal; but, after all is done that authority can do in this direction, the evil will not be completely met. There must be other conditions, discoverable only by the help of local knowledge, to account for such an excessive loss of infant life.

THE LAND LAWS.

MR. McNEEL CAIRD, of Stranraer, writes:—If an enterprising farmer erects farm buildings, or labourers' cottages, or executes drainage or other permanent improvements, the law is prompt to punish him for his rashness. The house is no sooner built—the moment the improvement is executed, the law takes the ownership of it from the man who built it, and transfers it without compensation to the landlord. The high priests of the law pronounce the formula, *in edificantium solo, solo cedit*, and every tenant must bow his head and submit, so potent is this mystic phrase in the work of his own hands. It contains a dogma of the legal creed which lawyers generally accept with unquestioning reverence. In plain English, it just means, "What is built on the land belongs to the land." It is an assertion, not a principle or even an argument—an assertion not always supported by fact or reason. We are told in God's law, "The sea is His, for He made it," but in man's law the reading is reversed; the house is the landlord's, though he did not make it. That is the law of Scotland. Is it reasonable? Is it just? Is the law to cast the balance always and irreversibly against the tenant? Our Yankee brothers have adopted the opposite principle for their unoccupied lands in the West. They call it the homestead law, and it is one main secret of the amazing growth of that great country. Its principle is, "Where a man builds his house and settles, the land shall be his." It is a wise and noble law for an unappropriated country. So, you see, the rules of law are capable of being adapted, as they ought to be adapted, to the circumstances and wants of society.

With the exception of the commons, all the land in this island is appropriated, and our circumstances therefore require a rule regarding buildings different from the American rule, as well as from that which has hitherto prevailed in this country. I hope to see Parliament establish some such rule as this,—what a tenant builds shall be his, and he may take it away unless he is paid for it. That would be just to both landlords and tenants. Our law, in spite of the big words which enshrine its theory of property, is so accommodating as to allow half the houses in this good city of Edinburgh to be sliced horizontally across into flats. In the High-street there may be twelve or thirteen flats built in tiers one on 'another, each of which may belong to a separate owner, not the owner of the soil. So there can be no inherent difficulty in making the slice a few feet lower down, so that all that is below the surface shall belong to the landlord, and all that is above shall belong to the man who put it there, to be sold (if he be the tenant) when his lease is out to the landlord or incoming tenant, or to be taken away if they do not choose to buy it. If such a rule were established it would lead to the improvements being generally valued over at the end of a lease; for it would not be the landlord's interest to let substantial and suitable buildings be pulled down, and it would be the tenant's interest to make them so. A right to have improvements valued over, when suitable to the holding, is really the practical result; and that, I think, is the result to which Parliament is likely to come.

In examining some statistical papers a few years ago, I came on facts which made a very painful impression on my mind. I have not had any opportunity of lately verifying the notes which I then made, but according to these, there were in one county—the wealthy county of Ayr—more than 18,000 families, not fewer probably than 80,000 persons, living in houses of one room; and in all Scotland more than a million of human beings—actually above a third of the whole population—living in houses of that miserable kind. Of these, about 8,000 families, or from 30,000 to 40,000 persons, live in houses of one room without a window, lighted only by

the door, or by an opening in the roof or side-wall serving both for window and chimney. Who will stand up to justify such a state of things as this? Our law of strict entail disables, our law of settlement disinclines, a great many landlords to do much for the labourer's dwelling. And the labourer's employer, the tenant farmer, his natural ally, who is most deeply interested in his well-being and well-doing, and who would gladly do something to lift him out of his degraded position, is sternly prohibited by law from improving the house—accommodation of his people under the pain of having his expenditure confiscated to the landlord. If the people of Scotland were not an enduring and law-abiding people, the empire would have been ringing with the wrongs of that million of silent sufferers.

DEAD LOCK AT THE BOARD OF WORKS.

SIR.—On this, the day of the publication of your journal, the members of the Metropolitan Board of Works will meet after six weeks' vacation. Nothing very unusual in that, will be said. But what I wish to ask in a few temperate words is, why should matters in the building line—such as desired alterations and improvements,—be entirely stopped during these six weeks, to the loss of fine weather, and to the inconvenience of families returning from the country. I speak from personal experience of certain works requiring the sanction or approval of the Board, which could not be obtained until after,—and no one could say how long after,—the six weeks. I know the want of trust or jealousy vestrymen have in one another, but surely in such a constituted Board as this the members ought to have sufficient confidence in one or two who might receive full authority to act during the vacation, to sanction such matters as might be required, rather than cause delay for six weeks. If there be no such members in whom confidence can be placed, a re-constitution of the Board would seem desirable.

AN OLD BUILDER.

THE ANT NUISANCE.

SIR.—I consider that your gratuitous admission of questions of personal interest in your columns is a great public benefit; and having to thank you for such occasional favours on my own account, have much pleasure and satisfaction in replying to your correspondent "B." on this subject, if you think proper to afford my experience an insertion in your next number. Some years ago, when in business, I let a mansion of importance (which I need not particularise), belonging to a man of title, to a lady of title, whose people discovered what I had not, that the kitchen department in the basement was infested with white ants. The lady declined to occupy it, nor did the owner wish her to do so, until this evil was remedied, which I undertook to accomplish. They abounded in millions, yet singly appeared like grains of dust, hardly perceptible without the aid of a microscope, yet in a few minutes coated any article of food with a white appearance. We first tried baits of ravenant, which were speedily covered with them. These we rinsed off in hot water and relaid. Two men were actively employed for two days in this operation without any apparent diminution of quantity, or affording any trace of their haunts. I then had all the woodwork stripped from the walls of the kitchen, scullery, and larder, where we found abundant evidence, and immediately, not only gave the walls a good dose of fresh hot lime whitening, but also the back of the old woodwork, which was considerably decayed, before it was broken up to be burnt, and afterwards fumigated those places with sulphur for three or four days, to destroy any stragglers. We then coated the brickwork with compo instead of woodpancing, leaving no crevice in the wall or in the joints of the stone flooring, to afford a future harbour, and yet after this they seemed as abundant as ever. Being then convinced that the chimney and fireplace were the only inlets left, I had the jambs and mantel removed, where we found them in great abundance, dosed the whole event to the rubbish, with quick lime, and then restored all carefully, so as not to leave any crevices or spaces.

This was an effectual remedy, and I never heard of any complaint afterwards. I have referred to the cost, which I find was 26l. 15s.,

and it was accomplished in a fortnight, to the great satisfaction of all parties.

At that time I heard of one or two houses in the same locality being similarly infested with white ants; but the owners seemed indifferent to the nuisance or thought it irremediable. These are the only instances of house-ants that I have ever met with. I believe they were generated in the decaying woodwork, and found haunts for themselves afterwards. W. B. Kensington.

P.S.—Since writing this letter, I have been informed on good authority of some almost new London mansions being infested with ordinary black ants, which I apprehend must come from the earth. Were the case mine, I should try sulphur fumigation; then well stopping all crevices and painting; but I hope "B.'s" grievance may be white ants, and that the knowledge of my experience may be useful on the subject.

IN ANSWER TO "B." arsenic and honey, mixed and placed here and there, prove very effective in the destruction of ants. A.

SIR.—If your correspondent "B." would persevere with scalding water wherever he sees the ants predominate, as the best remedy, he would eventually be free of them in his house. A SUBSCRIBER.

THE LATE THOMAS BRASSEY, CONTRACTOR.

The life of any man correctly sketched will be of interest to other men, and may be of use to some. Biography requires the greatest intellect and art, just as portrait-painting requires the greatest intellect and skill. Any generation which produces one first-class biographical writer, and one true portrait-painter, is endowed with enduring fame. The man to describe and the man to delineate must have that touch of nature which makes the whole world kin. Men are not made giants, either by mental or by bodily training; they are from their birth gigantic. Hercules strangled the serpent in his cradle, and in maturity performed his celebrated labours. No academy imparted to him this strength. This fact (or myth) is not remembered by those who deal in superlatives when writing of men. "Some men are born great, some achieve greatness, and some have greatness thrust upon them." Our biographical writers do their best to thrust greatness on the men whose lives they should describe truly. Sir Arthur Helps does not escape this charge in his elegant and kindly biographical notice of Thomas Brassey, late railway contractor. A life it is not. To describe a man, he must be known to his biographer, as Shakspeare knew the men he described; the entire man must be present to his mental vision. Shakspeare saw the men Hamlet, Lear, Macbeth, Othello, and Falstaff in their entirety, and measured their ambition, their passions, their virtues, and their vices, through the range of their natures; hence such accuracy in the sketches given. To describe what Shakspeare saw and did not write would require an intellect greater than Shakspeare's. When such a man lives he will, however, do his work without straining effort. God-like power will be used in god-like manner. He will see where others grope, he will walk where others stumble, he will describe where others caricature.

Thomas Brassey, railway contractor, was by nature a great and good man. He was honest; he inherited a sound mind in a sound body; the work he set himself to do was a pleasure. Prosperity did not elate—misfortune did not depress. He was hopeful, cautious, and enduring. He never broke his word. Thomas Brassey worked to make money, but he did not worship money. Business did not trouble him—did not spoil his digestion, and, consequently, did not sour his temper. He made money, and he lost it, in far greater proportions than most men. The result of his entire life's labour did not give him 5 per cent. on the contracts executed, and during his career he lived unostentatiously and moderately. He made his bankers his bookkeepers, and for the earlier years of his life was his own secretary. He could abstract himself for correspondence in the midst of company, and could explain his views and wishes tersely. Any room he occupied was, for the time, his counting-house, any table his escritoire, and his despatch-box was a large breast-coat pocket. He believed

in the honesty of men, and men believed in him. He was cautious, and begot caution; he confided, and begot confidence; he trusted, and begot trust; he was truthful, and begot truth; and he was generous, and begot generosity. Men who served under him learned truthfulness and self-respect, whilst they bettered their worldly fortunes. A man cannot be praised for a sound constitution, but he may have credit for preserving it. Nature gives him a good digestion, and he does not tamper with it. He devotes his life to labour, and pursues it to the end, acquiring wealth, respect, and honour. Such was the man Thomas Brassey, late railway contractor. Long may England produce such men and such contractors!

BEDFORD.

At St. John the Baptist's Church, the whitewash which had accumulated upon the tower of this church for centuries has been all removed, and the walls are re-pointed. The tracery of the belfry and west windows is partly new also. In the niche there has been placed a figure of the patron saint, and in a square sunk panel just underneath has been carved the Agnus Dei,—lamb and flag. The figures are by Mr. Harry Hems, of Exeter. The whole of the contract has been carried out by Mr. John Hinton, of Bedford, from the designs of Mr. Wing, of that town.

A new shop has just been erected in the High-street, from the designs of Mr. John Usher, architect. It is of Gothic character, and the whole terminates in a crocketed gable, which in itself forms a conspicuous feature in the skyline of the main thoroughfare in which it stands. The materials used are red brick, with dressings of Hare Hill and Bath stone. The shop is supported by columns of iron-work, with foliated capitals in the same material, picked out with gold and colour. A sprinkling of carving is scattered about the front. Two dogs, carried in Portland stone, and each about 3 ft. 6 in. high, sit upon dwarf columns, one on either side of the spring of the upper gable. The whole of the works have been carried out by local tradesmen. The carving here also is by Mr. Hems.

THE BREWSTER GATES AT LINCOLN'S INN.

SIR,—In the article entitled "Improvements at Lincoln's Inn," in the *Builder* of the 21st inst., the Brewster Memorial Gates are stated to have been "designed in Belgium." This is not the case. They are an adaptation of the design of a grille, bearing date 1576, in the town-hall of Lüneburg, in Hanover, and were executed in Coventry. They were intended to be placed across the terrace-walk of the Temple Gardens (close to the Thames Embankment), and to form part of a boundary-fence between the gardens of the Inner and Middle Temple. The complete design includes the armorial bearings of those two Inns of Court, one on each of the side-gates. After the work had been executed, it was determined to throw the two gardens into one, and the memorial was thereupon erected (minus the lamb and winged horse) in its present position at Lincoln's Inn.

A BARRISTER OF LINCOLN'S INN.

THE BUILDING TRADE.

THE position of affairs at Messrs. Corbett & McClymont's, West Brompton, remains, we are very sorry to say, the same as it was last week. The general committee of the Central Association of Master Builders met on Thursday, to receive the report of the sub-committee appointed to draw up the rules for the permanent organisation of the society, which is intended to take up the ground occupied by the General Association of Master Builders, prematurely dissolved after the great strike in 1859. According to the prospectus, "workmen's trade-unions are so well organised and so extensive that the only possible way of meeting the various demands continually being made by the men is an extended combination of the employers of labour." It is therefore proposed that the reassociated society shall consist of any employer connected with the building interest in England, Scotland, or Ireland, who should be approved by the committee, the subscription to be one guinea annually. The main objects

to be attained will be the collection of statistics and other information useful to the trade. The association will be in communication with all the other kindred societies throughout the country, and will endeavour to secure by its organisation the prevention of unjust strikes against individuals, or oppressive demands on the part of the men.

BRISTOL.

New schools for the parish of St. Gabriel, Upper Easton, Bristol, were opened on Monday, under the presidency of the mayor, Mr. Proctor Baker. The schools will accommodate 550 children, and the buildings have cost 1,260l. Messrs. Wilkins & Son are the contractors. The sum of 90l. was allowed for the foundations, owing to the loose nature of the soil; but on making excavations it was found necessary to expend 350l. on this part of the work.

Another "British Workman Institute" was inaugurated at Bristol, on Monday evening last, under the most auspicious circumstances. The locality selected is the Broad Plain, St. Philip's, and the building is a substantially-built house that had apparently at one time been occupied by people of no mean position. On the ground-floor is the coffee and reading room, capable of seating upwards of 100 persons, and here newspapers and periodicals will be kept for the use of those frequenting the institute. On the first floor is a spacious club-room, suitably furnished, and large enough to accommodate from seventy to eighty persons. A smoking-room is on the same floor, and will contain bagatelle and chess boards, and other means of amusement, and the rooms above are set apart as bedrooms.

SANITARY CONDITION OF NEW HOUSES.

SIR,—I should feel obliged if you could give me a small space in your columns to describe to your readers the sanitary condition in which many of the houses are in the north-west district of London. I shall only take one house as an illustration which equally applies to many. The one in question is of a block of good-looking houses recently erected by a once celebrated speculating builder. On entering one of the principal rooms, which is of large dimensions, lofty, with large windows, I remarked to the tenant as to a bad smell which he said was "the answer was," "That it proceeded from the next house; the drains were out of order. That answer not being satisfactory, I raised the window-cash, and found, not 12 in. from a window-sill, a stack-pipe, with rain-water heads to receive the water from a back roof, which pipe was connected to top of lead bend from W.C., which lead bent ran into a cast-iron pipe, and discharged itself into a catch-pit at bottom. Presuming that there is a trap at the junction with the main sewer, which is many feet distant, the serious and crying evil arises from the fact that in any way; hence the external air gets in at these apertures, and causes a current of poisonous gases to rush upwards and discharge themselves into our rooms and the surrounding atmosphere. Have the public authorities no power to put an end to such poisonous arrangements? A PRACTICAL MAN.

BUILDING IN BITUMEN.

SIR,—Referring to statements made with reference to Norton's Patent Bituminous Building Construction, at the formation of a "limited" company to work the same, I should wish before investing to make one or two observations and inquiries; and if you will allow me to do so through the medium of the *Builder*, the answers might interest numerous readers. I may premise that I have seen some specimens of his work as Mr. Norton had shown recently in Manchester.

First, as to its combustibility. All bitumens, when found, burn readily in atmospheric air. Italian bitumen is no exception. For many years past inventors have been striving to produce a non-combustible material with which to build, and they have succeeded, and houses are now built which cannot be burnt down by any fire originating inside them; but here we have a proposition by Mr. Norton, not only to use a highly combustible material, a cement, but actually to use the same material to build bricks with. Would not walls so constructed be highly inflammable?

But Mr. Norton says bitumen is a most excellent conductor of heat, and gives as a proof the surprising fact that a 9-in. wall having a thin partition of asphalt between the outer and inner halves, and a thin coating of plaster on the inside, resisted the action of an intense coke fire for five weeks, while the wall on the outside was "comparatively cool." How am I to reconcile this with the statement in "Masprati's Chemistry," that Italian bitumen softens at 210° Fahr., and fuses completely at 234°? Does Mr. Norton mean to say that bitumen will not melt at a red heat? And if the bitumen melted (as most undoubtedly did), what held his wall together? Such an event would place the wall completely at the mercy of the wind, and I do not see that that would help him much. The softening of the asphalt would allow the superincumbent weight to come into play, and the wall would settle or sink, such an event would place the place by the burning of furniture of a single room, especially if the walls were lined with wood boarding, as Mr. Norton proposed.

Coming now to the question of cost, as compared with ordinary brickwork with mortar, I observe that Mr. Norton states 1,600 bricks are necessary to build 1,000 square feet of 14-in. work with mortar joints, whereas 1,200 bricks fill the same space with asphalt. These bricks are all of the same size, the difference in

thickness of the joints must be equal to the contents of

of the mortar. Mr. Norton allows only 7s. 6d. for the necessary
phosphate in 100 ft. of 14-in. work, which as I have shown
the mortar plus 28 feet cube: a sum obviously
Again, 1,200 bricks, 8½ in. by 4½ in. by 2½ in., are made
the necessary mortar just sufficient to make 100 ft.
14-in. work. Mr. Norton says 1,600 are necessary, and
and penalises the cost accordingly. If these 400 bricks are
dusted,—as I maintain they must be,—it will make a
Revenue of 13s. 6d., together with their mortar and cost

Then, again, we are told that under the present system
bricklayer can lay some 700 to 800 per day only, whereas
the new method he can lay between 3,000 and 4,000 per
day. The first statement is near the truth; but Mr.
Norton must not expect any practical man to believe the
ter. So far is it from the truth, that as face-boards
be fixed on both sides of the work, scaffolding to
fixed, bricks to be carried up, asphaltic melled, carried,
and poured, and the boards removed, and wall pointed,
is reasonable to suppose that the man will have done
prospects state that "assuming in getting 500 bricks
position, instead of over 3,000. For the whole
these operations to 100 ft. of 14-in. work Mr. Norton
works the magnificent sum of 5s. 7d., the workman to find
own coal and tools, and all other labour and carriage
materials necessary to complete the work. I should
to ask how it is that Mr. Norton is very much to secure
out at such a scandalously low figure, because if I take
a licence to build in this way, I very much doubt my
ity to get it done for less than tribute the money he
ows for the operations.

Not only is it stated to be the intention to license
holders to use the patent methods, but the company pro-
be to become builders and contractors themselves, and
prospects state that "assuming the company only
construct 90,000 rods of brickwork per annum—
tionally trifling quantity—it would earn a profit of
1000." I should like to ask what data Mr. Norton has
such a sum? Why 40,000 rods of brickwork
annum must be a very large part of all that is done,
this country at least, seeing that its value would be
out a half-million of pounds. What are the licensees
of those who will still build with mortar and cement
do?

A BUILDER.

THE RECREATION GROUND FOR
WARRINGTON.

It was glad to read in your publication of the 14th
inst., a letter signed "M.D.," upon this subject, showing
the utility of the proposed purchase, both as re-
spects price and locality.

can fully endorse every word of "M.D.'s" objections,
since the appearance of his letter, I have seen what it
is seen almost every day—viz., the proposed recreation
and almost enveloped with smoke and malarial eman-
ations from the various works contiguous to it, fully bear-
ing out the statement of the right Hon. John Lubbock
Patton himself said of it, more than two years
—viz., "that it was no longer a place fit to reside on."
yet with an unaccountable perversity, the corpora-
of Warrington deem it advisable site for a recreation-
ground for the people.

I am in hopes that the attention of the local Govern-
ment may be drawn to "M.D.'s" letter before re-
ferred to, in your valuable publication, and institute an
impartial inquiry into the whole subject. It is worth
to be here to remark, that while Leeds has just purchased
"park" or "recreation-ground" for 100s. per acre in
a similar situation, the extravagant corporation of this
city have actually agreed to give (subject to the approval
of the local Government Board, of course) 1,000s. per acre.

SEXES.

PREMIUMS AWARDED BY INSTITUTION
OF CIVIL ENGINEERS.

The Council of the Institution of Civil
Engineers have awarded the following pro-
grams:—

- A Telford Medal, and a Telford Premium, in Books, Bradford Leslie, for his "Account of the Bridge over the Gossai River, on the Goaldoo Extension of the Tern Bengal Railway."
- A Telford Medal, and a Telford Premium, in Books, Carl Siemens, for his paper on "Pneumatic Despatch Boxes."
- A Telford Medal, and a Telford Premium, in Books, William Bell, for his paper "On the Stresses of Rigid Beams, Continuous Beams, &c."
- A Telford Medal, and a Telford Premium, in Books, John Herbert Latham, for his description of "The Venkatesa Canal of the Madras Irrigation and Canal Department."
- A Telford Medal, and a Telford Premium, in Books, George Gordon, for his Paper on "The Value of Water, and its Storage and Distribution in Southern India."
- A Telford Premium, in Books, to Frederick August Abel, F.R.S., for his Paper on "Explosive Agents for Industrial Purposes."
- A Telford Premium, in Books, to Bashley Britten, his Paper on "The Construction of Heavy Artillery."
- The Manby Premium, in Books, to Charles Andrews, his Paper on "The Somerset Dock at Malta."

THE FALL OF A GRAND STAND

AT OUTLAINE, NEAR HUDDERSFIELD.

Our readers will remember the fall of a grand stand at certain athletic sports and races near Huddersfield last month, and the injury of be-
neen sixty and seventy persons. An inquest on
death resulting in one case has been held, and
verdict is as under:—"We, the jurors, unanim-
ously find that Harriet Widdop came to her
death on the 15th of September, from injuries
received by her by reason and in consequence of
fall, on the 25th day of August last, of the

grand stand at the steeplechase and athletic
sports at Outlane, in the township of Longwood.
We also unanimously find that the said grand
stand fell in consequence of defective construc-
tion, but that such defective construction does
not amount to criminal negligence on the part of
any person or persons. And we are unanimously
of opinion, and strongly recommend, that grand
stands and platforms at all public entertainments
should in all cases, before being used, be care-
fully examined, and certified as properly and
suitably constructed, by a competent architect
or surveyor.

CHURCH-BUILDING NEWS.

St. Michael, Eaton Hastings (Berks).—This
interesting little church, containing, specimens
of Early English work, and a fourteenth-century
roof intact, is undergoing restoration of the
nave (the chancel having been previously re-
stored, at the expense of the rector), under the
superintendence of Mr. W. Scott Champion,
architect.

Margate.—St. Paul's Church, with parsonage,
has been commenced, under the direction of
Mr. R. H. Blessley, architect, Eastbourne, the
site being on the Cliftonville Estate, given for
that purpose by Mrs. T. D. Reeve and Mr. J.
Andrews. The contract has been taken by
Messrs. Cook & Green, of London, for the sum
of 8,500l., inclusive of boundary-walls. The
church will be spacious and lofty, measuring
internally 89 ft. long and 56 ft. wide, and the
roof is to be carried through a uniform height of
51 ft. The chancel measures 22 ft. by 31 ft.
The nave is to be of six bays, with arcade arches
springing from circular columns, with clearstory
windows over. Arches divide the north and
south chapels from the chancel, designed for
vestry and organ-chamber. The church is to be
built of brick, faced with random-coursed Kentish
rag stone. The dressings to the doors and win-
dows will be of Box-ground Bath stone. The
aisles will be paved with encaustic tiles, as well
as the chancel. The reredos, pulpit, and font
are to be of Bath stone. The tower will be 80 ft.
high, and will contain a peal of bells. The style
adopted is the architect's Early Decorated;
and there will be accommodation provided for
800 people. The roofs are to be open-framed,
and stained, as well as the seats, and the whole
building is to be heated with hot-water pipes.
The clerk of works is Mr. Mark Davison. The
foundation-stone was laid on the 14th inst. by
the bishop suffragan of Dover, and it is expected
the church will be completed by the middle of
September, 1873.

Maldstone.—The works connected with the
new church of St. Faith are being rapidly com-
pleted, and the church will be consecrated on
the 20th inst., by the Archbishop of the diocese.
The building is of Gothic construction, and the
details are wrought out under the Early English
Decorated style. The internal arrangements
comprise a nave 68 ft. 3 in. long, and 30 ft.
wide; aisles 13 ft. 4 in. wide, and chancel about
30 ft. each way. The pillars at the sides of the
nave have a basement of Bath stone, the rest of
the work being done in red Mansfield stone, sur-
mounted by carved designs, exhibiting natural
foliage conventionally treated. The representa-
tions include oak-leaves, ivy, lilies, columbines,
strawberry-leaves, roses, and ferns. The pulpit,
which is placed at the left-hand side of the nave,
is supported by Peterhead granite pillars, and
is principally formed of white Caen stone, carved
and inlaid with red and green marble. It is
reached by four steps leading from the chancel,
which is slightly elevated from the body of the
church. From the sides of the chancel, figures
representing Praise and Adoration are extended,
and others bend over the communion, holding the
emblems of the Sacrament in their hands. The
whole of the carving has been performed under
the personal direction of Mr. E. Whitehead,
sculptor, London. There are seven windows at
the east end of the building, ten at the north
and south sides, and two large ones, of the lancet
shape, at the west end, which are surmounted
by a rose-window, and a smaller circular one.
There are besides several lights in the upper
portion of the church, and these, in common
with the rest, contain cathedral glass. The
building will be capable of seating 600 persons.
The oak polished seats are open at the ends.
The flooring of the nave aisles, and east end, is
tessellated with Staffordshire tiles. In the outer
western wall a niche is cut for the reception of a
figure of the patron saint, St. Faith, but means
are wanted in order that the statuary may be

procured; a similar need prevents the erection
of the contemplated steeple. The architect of
the building is Mr. E. W. Stephens, and his
designs have been carried out by Messrs.
Clements & Walls, contractors. It is proposed
to enclose the church within iron railings, and to
convert the "green" into a spot more worthy of
its name. When this is done, the neighbourhood
of St. Faith, including the Brencley gardens,
will form one of the most pleasing features in
the town of Maldstone.

Lincoln.—The font has been placed at the
west end of the interior of the new church of
St. Martin. It is a curved octagonal stone font,
standing on a shaft of red Marlston column.
The givers were Messrs. Huddleston & Son.
The seven apse windows have also been put in.
The centre one represents Our Lord as the
Good Shepherd holding a lamb in his arms.
This is the gift of Mr. Robert Dawber, jun. On
the right hand is Our Lord blessing little chil-
dren—the gift of Mr. Charles Allison. On the
left Our Lord as the guardian of children—the
gift of Mrs. Johnson, Newland. Next, Christ
walking on the water—the gift of the late dean.
Opposite to it is Christ knocking at the door—the
gift of the young ladies of Mrs. Roome's
school. Then two decorated windows—the gift
of a friend of the vicar. There are yet the larger
west window, and a nine arched window to be put
in shortly. The whole of the glass is furnished
by Messrs. Hughes & Ward, of London, and will
cost about 600l.

Tattingstone.—The church here has been re-
opened. The funds at the disposal of the com-
mittee were limited, and compelled them to
confine their attention to the repairs which were
absolutely necessary, and to the reseating of the
church. The advice of Mr. Henry Hall, archi-
tect, London, was sought, and upon the report
and designs, and under the supervision of that
gentleman, the restoration has proceeded. Upon
examining the plaster ceiling the architect found
that it covered an open-timbered roof, and this
has been restored so far as the funds allowed,
but the panelling has only been completed in
the easternmost bay. The roof, which is a
double hammer-beam roof, is divided into five
bays by oak trusses, with moulded and curved
bricks springing from carved corbels, and having
angels carved at the ends of the hammer-beams.
The figures had been a good deal mutilated, but
what remained was enough to serve as a guide
for the restoration of the remainder. There is
no chancel arch; a truss is placed at the junc-
tion of the nave and chancel, with crowned
heads at the ends of the hammer-beams, and in
olden times there was a roof-screen. The com-
pleted bay is panelled, the panels being divided
by moulded oak ribs, with bosses at the inter-
sections. The whole roof is boarded with pitch
pine. Vertical pieces, with tracery between,
are placed above the wall-plate. The roof of
the chancel is wagon-headed, and the plaster
having been removed, it has been boarded in a
similar manner to the nave roof, with moulded
ribs having carved bosses at the intersections.
The floors of the nave and chancel are on
the same level, and are now covered with
light open benches, in place of the old pews.
The seats have a slight incline towards the
sloping backs. In removing the old pews some
of the original bench-ends were discovered, and
these have served as patterns for the new ones,
some of which are of a conventional type, whilst
the others have been carved with fruit, flowers,
corn, leaves, &c. The backs of the benches are
panelled. The pulpit stands at the north-east
corner of the nave, and is placed upon a stone
base. It forms four sides of an octagon; is
made, like the benches and roof, of pitch pine;
and has open tracery, with spandrels and patera
in the cornice, carved. The hemlock of the
chancel is similar in character to that of the
nave, and on the north side the old organ, which
has been repaired, and fitted with a pine case
and gilt front, by Mr. Green, of Ipswich, has
been placed, the heavy gallery at the west end
in which it formerly stood having been removed,
and thus opening out the west window. The
space within the communion-rails has been laid
with Minton's encaustic tiles, supplied by Messrs.
Simpson & Son, of London. The stone reredos
is divided into panels. The ground space of the
tower, which was not formerly utilised, has
been slint off from the nave by a screen of
pitch pine, so as to form a vestry. The north
porch, which is that chiefly used, has been re-
paired and restored by the present incumbent,
and a new two-light Decorated window has been
inserted in the north wall of the nave, on the

west side of the porch, the corresponding window on the east side having been lengthened. The roof has been re-tiled throughout. The whole works, the cost of which is about 700l. or 800l., have been carried out by Mr. H. B. Smith, of Ipswich. The peal of five bells has been re-hung by Mr. Naunton, Ipswich. At the re-opening services, these bells were rung by the company of ringers of St. Mary Tower, Ipswich.

Hastings and St. Leonards.—Alterations are going on at St. Mary Magdalen Church. The most noticeable portion of the improvements are the enlargement of the chancel, and the erection of an organ-chamber on the north-east side. A new and larger window of stained glass, representing the Life of Christ, has been placed over the communion, by Messrs. Clayton & Bell. All the details of the alteration are not yet completed. A reredos is still in course of preparation. There are other minor improvements, which have been carried out by Messrs. Hughes, by whose firm the church was originally built. A special re-opening service has taken place.

Keyworth.—The parish church has been reopened. The improvements that have been effected may be briefly summarised. The loft has been removed, the pews replaced by chairs, a new roof has been erected, new windows put in, and accommodation provided for about 270 persons. The work has been done by the day and not by contract, Messrs. Bodley & Carner, of London, being the architects. The east window is by Messrs. Burlinson & Crylls, of London, and the other windows were supplied by Mr. Sollory, of Nottingham. A number of ladies formed themselves into a committee, and to their efforts the insertion of an east stained window is due. A sum of 80l. was collected, and with this money the window has been purchased. The subject is the "Crucifixion." The interior of the chancel is in need of further fittings, and there is a deficiency in the building fund that will have to be met.

Heene.—The foundation-stone of a new church has been laid. It is to be built on the site of the old one. Messrs. E. Nash & Co., of Brighton, have undertaken the contract, at about 2,000l. The style is Gothic, and the edifice will be faced with flint on the outside, and cased with brick on the inside. The west wall is so built that it can be taken down at any time to enlarge the church. The seating accommodation is for 350 people. The size of the nave is 49 ft. in the clear—the chancel will be about 32 ft. The chancel arch will be of red moulded brick, and all the arches will be of the same material, moulded by special design. The inner moulding will be in chalk. The pews will be stained and polished, with sloping backs. The windows, with dressings, and the columns, will be in Bath stone. The chancel will have a fancy cresting, with slate roof, the timber being stained and varnished. The architect is Mr. E. E. Scott, of Brighton.

Darlington.—The Church of St. Paul, North-road, Darlington, opened a short time ago by special licence, has been consecrated by the Bishop of Durham. The edifice stands on a prominent site, and is the only architectural ornament of which that portion of the town can boast. Its style is Early Decorated. It has a nave, 75 ft. by 26 ft.; chancel, 28 ft. by 22 ft.; aisles, each 7½ ft. by 14 ft.; vestry, organ-chamber, and a tower and spire at the south-west angle of the nave, 130 ft. high. The west end, which faces Durham-road, has a spacious doorway in the centre, with a large three-light window over it, the end of the north aisle being relieved by a two-light window, and the end of the south aisle being finished by the tower. The sides of the aisles are pierced by two-light windows, separated by buttresses, and a lofty clearstory is similarly arranged. The east end is filled by a large four-light window, and the sides of the chancel by long two-light windows, and each gable is surmounted by an ornamental cross. The tower is divided into four stages, the first being a porch; the second, the ringing-chamber; the third, the clock-chamber; the fourth, the heltry, and a lofty spire surmounting the whole. Internally the nave is separated from the aisles by five arches on each side, springing from pillars of red stone, with moulded bases, and caps of white stone, which is relieved by a little carving. The roof of the nave is open to the ridge, that of the chancel wagon-headed or arched. The seats are all of pitch-pine, open, with low slanting backs, and moulded ends, accommodation being provided for 600 adults. The floors of the chancel and passages are all paved with mosaic tiles. The pulpit and

font are of Caen stone; the reading-desk, of oak; the communion-rails, of iron and brass. The windows are all filled with cathedral-tinted glass, having coloured borders. The woodwork is stained and varnished. The church is warmed by Lewis's patent warm-air apparatus, and lighted by gas-standards. The whole of the works were carried out from the designs and under the superintendence of Mr. Pritchett, of this town; and the total cost, including iron railing, lighting, warming, and professional charges, is about 4,000l., exclusive of site.

DISSENTING CHURCH-BUILDING NEWS.

Hebden Bridge.—A new Wesleyan chapel has been opened here for divine service. The edifice is in the Gothic style, from plans by Messrs. Whitaker & Russell, of Rochdale. The woodwork is of pitch-pine. The following are the contractors for the several sections of work:—Jonas Kershaw, mason's work; Kershaw Smith, Mytholmroyd, joiner's work; plastering, Messrs. Sugar & Son, Heptonstall; plumbing, gasfitting, warming apparatus, Walsh, Halifax. The chapel will provide accommodation for 300 persons, and has cost 2,000l. It is 55 ft. long and 35 ft. 9 in. wide, with schoolroom the same size underneath. The chapel-floor is reached by a flight of stone steps, terminating at an entrance-porch. The whole of the chapel is fitted with pews, affording accommodation to 300 persons. The schoolroom under the chapel is well lighted and ventilated, and will accommodate about 200 children. There are four class-rooms, formed by partitioning off one end of the schoolroom, and every convenience for holding meetings has been provided. The stone used in the building is all from local quarries, and the exterior is faced with pitch-faced parquits in regular courses, the asblar dressings of the windows and doors being of a somewhat lighter colour. The gables are finished with plain coping, with moulded apex stones at the top. The roofs are covered with Welsh slates and red Brossley ridge cresting. The roof is ceiled half-way up the gable, the principal timbers are exposed, and on each side there are curved braces resting on moulded corbels. The whole of the timber exposed to view, and the pews, and other inside woodwork, are in pitch pine, varnished. The windows are glazed with glass of a simple pattern and tint. The chapel and school are warmed by hot-water pipes.

Pendleton.—The new United Presbyterian church at the junction of West High-street and Seedley-grove, Pendleton, has been opened. The new edifice, which is after the Gothic of the thirteenth century, has been built by Mr. E. Johnson, of Manchester, from designs made by Mr. W. H. Ward, Birmingham. Sitting accommodation has been provided for 500 or 600, and schools attached to the church will hold 300 children. The cost of the building has been about 3,000l.

Clavering (Essex).—The chapel which was opened last week for the Congregationalists consists of the chapel proper, fronting the high road, and several rooms behind, required for week-day services, classes, public meetings, and the Sunday school. Facing one on entering, at the farther end of the chapel, is the preaching platform,—the lower stage for the communion-table and the upper for the minister. It is formed of turned and pierced woodwork, stained and varnished, as is also the whole of the woodwork of the chapel. The galleries surround three sides of the chapel, and are supported on iron columns, coloured and gilt, and the front is framed of wood, fitted in with ornamental iron panels decorated in colour. Sitting accommodation is thus provided for over 370 people. The principals of the roof are exposed to view, but the common rafters are plastered. During cold weather the building will be warmed with a Curney's stove, sunk under the floor. On each side of the platform is a pointed arch door, that on the right leading to a minister's vestry, and on the left to a large class-room. In the rear of the vestry is a scullery, &c., for use at tea-meetings, and a separate entrance. Above these rooms is a large room, with open-timbered roof, for the use of the Sunday scholars, and for public meetings. It is approached by a separate stone staircase from the exterior, and has doors leading into each gallery to enable the children to enter the chapel without going outside the building. The walls of this room are left without any plaster, and have bands of coloured brick worked in as ornament. The

chapel itself is plastered, and it is intended if the course of next spring to decorate the walls and roof with painting and stencilled ornament in ditto temper colour. The building is of Early French character, simply treated. The walls generally are of white Cambridge bricks, relieved by red and black in bands, arches, &c., and by Bath stone and red Mansfield in the tracery of the window shafts, bases, &c. The entire cost will be about 1,800l. The works have been carried out by Mr. Cornwell, of Bishop's Stortford, builder from the designs of the architects, Messrs. Sulman & Rhodes, of London.

Walker (Newcastle).—The new Wesleyan chapel is completed and opened. It is closely adjacent to the old building in which for many years the Wesleyan Methodists have performed service. The chapel consists of a central nave, 72 ft. length, with two side aisles, 50 ft. long, with entrance porches at the west end of the latter. At the east end of the building is a minister's vestry with the singers' gallery over it, and when full will permit it is intended to add a large vestry with rooms over for the residence of a chapel-keeper. Accommodation is provided for about 400 persons, and in the gallery for nearly 600 more. The pulpit platform, surrounded by the communion space, is placed against the east wall separating the minister's vestry from the body of the chapel. The contracts for the building were taken by Mr. Stewart, of Walker, furnaces and bricklayers' work, Mr. Aiston, North Shields, for carpenter and joiner work, Messrs. M. Johnson & Sons, plasterers; Mr. P. Paton, plumber; Messrs. Danler, slater; Mr. Frazier, painter and glazier; and Mr. Somers for iron-founders' work. The whole of the work has been carried out under the superintendence and direction of the architect, Mr. F. R. N. Hill, well, of North Shields. The ground on which the building is erected was presented by the late Mr. Cutburt Hunter.

Leicester.—The memorial-stone of a new Particular Baptist chapel has been laid in Erskine-street. The building will be in the Italian style of architecture, of brick, with stone dressings. The size of the chapel will be 61 ft. by 44 ft. It will be galleried all round, and will accommodate 650 people, exclusive of children. There will be a schoolroom below, the same size as the chapel, and 12 ft. high, 5 ft. of which is below the ground line. The total cost is estimated at about 4,500l. Mr. R. J. Goodacre, the architect, and Messrs. Hewitt & Sons, are the contractors.

Reading.—The Wesleyans have found the chapel in Church-street inadequate to accommodate their congregation, and have determined to erect a more commodious building in the Queen-road. The site selected is at the corner of Watlington-street, and has the advantage of three frontages,—to Queen's-road, Watlington-street, and South-street respectively. The design is Early Gothic, and the chapel will be constructed of red bricks, with white stone dressings. It will furnish 900 sittings, and schoolroom, 60 ft. by 31 ft., will be built on the South-street side. The cost, including site, will be over 7,000l. The work will be executed by Mr. Woodroffe, under the supervision of Mr. Morris, architect, and will be at once commenced. Nearly 3,000l. have been already promised.

SCHOOL-BUILDING NEWS.

Brentwood.—During the past twelve months the building has been gradually approaching completion in Rose Valley. It has been opened as a middle-class commercial school. The school-house itself is a large and commodious structure capable of accommodating 120 boys. The front of the road is of stocks, with bands and dressings of coloured brick and Portland. Projecting windows on either side of the main front and a bell-tower and flagstaff break the outline. The ironwork on the bell-cote is more than 70 ft. above the ground. The schoolroom is a lofty building measuring about 50 ft. by 20 ft., having a high pitched roof, while abundance of light and ventilation are provided. Beneath is an asphalt playground, for use in wet weather. A plot of land opposite the school premises has been secured as a playground. The dining-hall is 11 ft. in height, and nearly in the centre of the building on the ground-floor. The principal dormitories are about 50 ft. in length by 10 ft. in height, and are fitted with a separate spring bedstead for each scholar. The lavatories are supplied with water upon a recent patent, preventing waste or overflowing. A bath-room,

which hot and cold water is always at hand, is provided. Gas is laid on to every room in a house. The school is within two minutes' walk of the railway station.

Templecombe.—New church schools have been opened at Henstridge, near Templecombe, near, by the Bishop of Bath and Wells. The new school stands in a picturesque and central position, within a short distance of the celebrated Henstridge Ash, the tree beneath which, according to local tradition, Sir Walter Raleigh smoked tobacco. The buildings consist of a schoolroom and a teachers' residence, attached to which are boys' and girls' playgrounds, and a garden for the master. The exterior is forest marble, rock-faced, with gilding and dressing. The total cost is about £200, including site, &c. The schools are calculated to accommodate 136 in the large room, and in the infant room, being the full number for which accommodation is required by the Education Department.

PROVINCIAL.

Wavertree.—The foundation-stone of a town for the ancient village of Wavertree, near Liverpool, has been laid by Mr. J. A. Picton, surveyor of the local board of the district. The site of the hall is in high-street, in close proximity to the existing public offices, which have lately been sold to the Roman Catholic community for the purposes of a church and schools. The general character of the front elevation of the building is to be Italian, and it will be built of stone from the Cefn Quarries, the lower strata being Rancorn redstone. The entrance porch will be carried up the two stories, and finished with a pediment, the cornice being carried across the front and surmounted by a balustrade. The lower part of the porch will be supported on columns having caps of an Ionic character, the upper part being somewhat of the Corinthian type. The window in front will have an architrave, the lower ones having engaged keystones, the upper ones carved gilloche capitals, and supported on trusses. Between the windows engaged pilasters, corresponding to the columns, will be placed with suitable intervals. The whole of the ground-floor will be finished with rusticated ashlar, the upper portion being plain polished work. On the ground-floor situated the offices of the board, the board-room, a strong room, &c. The public hall will be situated in the rear, having lavatories, and a large dining-room attached thereto, access being given to the back of the hall and retiring-room through a private corridor for the use of "proprietors." This hall will be 60 ft. long, 34 ft. wide, having an ornamented and enriched ceiling in an elliptical form carried by an ornamental cornice, supported by pilasters having ornamental capitals. The heating of this room will be by hot-air pipes carried above the floor behind the chimney. The lighting of the room by day will be by means of large windows on one side, and at night by tripod lights placed all round the room on the top of the cornice. Attention has been paid to the ventilation of this room. On the first floor are placed officers' residences and a secondary board-room, also additional retiring-rooms for the use of the large hall. At the rear of the township yard, having a separate access from Chesnut-grove, for storage of coal and carts. Messrs. Okills & Morrison, of Wavertree, are the sole contractors. Mr. Reeve, of Liverpool, is the architect.

FROM AUSTRALIA.

VICTORIA.

Melbourne.—The new Temperance-hall, erected by the Melbourne Total Abstinence Society, has been opened. The front of the building is to be in the Italian style of architecture, with the entrance in the centre, between two shops: it is 9 ft. wide, laid with marble tiles, and has pilasters on each side supporting festooned trusses. At the end of this front are polished cedar pedimented doors opening into the lesser hall, 43 ft. by 33 ft., which will accommodate 250 persons, and will be used for ordinary meetings or smaller assemblies, at right and left are the main staircases leading to the large hall, which is 76 ft. long, 36 ft. by 33 ft. in height. It is finished with ornamental pilasters, with enriched moulded brackets, frieze, and cornice; a gallery runs round three sides, with a light ornamental iron

railing. The hall, with its gallery, accommodates 1,000 persons. The building is of brick, and the front is stuccoed. There are three rows of windows, although there are only two floors. The two uppermost rows light the floor hall upstairs. The foundation-stone of the hall was laid by Mr. M'Pherson, as Mayor of Melbourne, on the 30th September last. Mr. Ellerker was the architect, and Mr. Lockington the builder. The hall, with its fittings, will cost about 6,500L. Towards this 5,000L. have been raised on mortgage at 6 per cent. Melbourne will soon be well provided with public halls sufficient for its demands. In a few months' time the Mechanics' Institute will have its alterations completed and the new hall built. A sum of 6,200L. is to be expended in transforming the institute into an improved building.—The foundation stone of the new hall in connexion with the Melbourne Mechanics' Institute has been laid. The building, which will cost about 6,000L., is being rapidly proceeded with. The erection of a new synagogue for the St. Kilda Hebrew congregation, at Charwood-grove, St. Kilda, has also been commenced.

Keew.—A Jesuit college is about to be erected here on an elevation whence the entire of Melbourne and suburbs will show as a panorama. The architect is Mr. T. A. Kelly, of Elizabeth-street. The style selected is Classic, such as that of Southern Italy. The main block consists of a parallelogram, with projecting central and side blocks crowned by dentilled and moulded pediments, and connected by overhanging eaves of a similar character. The wings are connected on the different floors with the central portion by broad verandahs to each floor. The hall runs transversely, and is 12 ft. wide, and opening off it are broad corridors running the entire length of the building. At the termination of these corridors the main staircases will be met; these are carried up in towers which rise to a total height of 100 ft., and terminate in a low flat pointed roof. To the right, on the ground-floor, are the play-rooms, class-rooms, and study; while on the left will be found the parlour, private rooms, and refectory, this last 42 ft. by 24 ft. This floor is 17 ft. high. On the upper floor are the dormitories, infirmaries, lavatories, bath-rooms, and chapel; the larger dormitory is over 60 ft. square. To the north will stand in a detached block the kitchen buildings, their usual adjuncts, and the offices for the service of the college. The projecting wings are pedimented, and enriched by moulded freestone quoins springing from a moulded blue-stone base, and are pierced with windows having the usual freestone dressings. The general character of the building is similar, the principal entrance consisting of projecting and recessed circular-headed doorways, flanked by small similar windows. The towers are pierced by windows similar in character, and divided at the different stages by projecting cornices. The roof springs from the eaves, and, sloping back all round, forms a large lead flat, centrally protected all round by a wrought-iron balustrade. The verandah all round is supported by coupled iron columns resting on bluestone bases, and enriched with fancy ironwork of classic design. The contemplated expenditure will be about 16,000L.

Wages at Melbourne.—The following wages for skilled labourers and other tradesmen are without rations, unless where specially mentioned.—Stonemasons and plasterers receive 10s. per day; carpenters, from 8s. to 9s. per day; slaters, 10s. to 11s. per day; bricklayers, 10s. per day; labourers, from 6s. to 7s. per day; pick-and-shovel men, 6s. per day; the day's work is eight hours. The average earnings of cabinet-makers, for good workmen, are 2l. 15s. per week; and for second-class workmen, from 40s. to 45s. per week.

Miscellaneous.

St. James's Park.—The Westminster District Board of Works have just carried out of their own expense, aided by a contribution of 160L. from the residents in the neighbourhood, an excellent local improvement in the construction of a carriage-way from the Birdcage-walk, in St. James's Park, to Queen-square, and the demolition of unsightly railings which have for many years separated Park-street from Queen-square. This will enable the Metropolitan Board of Works to get rid of one of the "Park-streets" of the metropolis.

The Choir-Screen, Exeter Cathedral.—Our readers will remember a sharp discussion that occurred as to the retention or otherwise of the choir-screen in Exeter Cathedral, at the time the restorations were commenced. One party advocated its removal, and the other insisted upon its retention. The dean and chapter were averse from the removal, and Sir Gilbert Scott strongly opposed it, intimating that if it was intended to pull down such an interesting relic of antiquity, another architect must be employed in his stead. Both with the chapter and the architect the propriety of piercing the screen was allowed to remain an open question, but at last the matter has been settled. While adhering to their determination to retain the screen proper, and to the belief that the organ cannot be placed in a better position than where it is, at the top of it, they are agreed that the general appearance of the building will be improved, and the convenience of the worshippers be increased, by the perforation of the unsightly stone and rubble wall of separation against which the return-stalls of the choir rested. The inner arches, now filled up by rough masonry, will, in fact, be cleared out, and the open stonework, similar to that which runs down the north and south aisles, from the pinnacles to the screen, will be extended across the back of the screen, and against it the western walls will stand. This piercing of the screen will afford a partial view into the choir from the nave, and will enable people in the nave to hear the service, and probably the preacher in the choir. Sir Gilbert Scott approves this plan of dealing with the screen, because the principle of preserving what is worthy of preservation is adhered to, and the objection to the complete cutting off of one part of the building from the other by a thick wall is surmounted.

Institution for the Blind, and the Deaf and Dumb, at Stockport.—The foundation-stone of a new institution for the blind, the deaf, and the dumb, at Stockport, has been laid by Miss Louisa Walthew, the eldest daughter of the mayor of that borough. The new building will occupy a central position in the town, in St. Peter's Gate. It is estimated that it will cost over 3,000L. It will be built in the Italian style of architecture, will consist of three floors, and will have a stone frontage. On the first floor will be the committee-room and a work-room; and on the two top floors will be other store and work rooms. Accommodation will be provided in the whole of the building for from 60 to 100 patients, but none of these will reside in the institution. They will go day by day, and work at several light trades, for which they will receive remuneration in accordance with the trade tariff. A library and reading-room will be established. The building is being erected by public subscription, and about two-thirds of the amount required for its completion have already been obtained. The architect is Mr. T. H. Allen, of Stockport; the contractor, Mr. Adam Goddard, builder, Stockport; sub-contractors, for the stonework are Messrs. Hulme, Brothers, Stockport; and for the brickwork, Mr. H. Barlow, Stockport.

Optical Errors in Painting.—The *Revue Scientifique* contains a paper on this subject by Professor R. Liebreich, ophthalmologist, who went to visit the National Gallery on purpose to study the Turner collection, and, after viewing the first works of that artist, was surprised to find in his later works, posterior to 1830, quite a different, nay, a morbid manner of treating his subjects. While in his earlier productions the solar disc is clearly defined, and the rays proceeding from it are equally diffused all round, in his later paintings every luminous point is transformed into a vertical line, the length of which is proportional to the intensity of the light. Thus, for instance, houses situated on the brink of a lake, or people in a boat, are so completely mixed up with their reflection in the water that the horizontal line of demarcation between the two elements is completely obliterated, and all becomes an agglomeration of vertical lines. All that is abnormal in the shape of the objects, in the design, and even in the colour of the pictures of this period, may be explained by this vertical diffusion of light.

Ephesus in Bloomsbury.—Since the publication of our notice and illustration of the sculptured column from the Ephesian Temple of Diana, Messrs. Mansell & Co. have issued photographs of other deeply-interesting relics from the same site referred to in our article.

Gas on Board Ship.—The problem of the manufacture of gas on board sea-going ships has, it is said, been solved by Messrs. J. T. B. Porter & Co., of London and Lincoln. The gas will be manufactured from oil. The apparatus consists of three sections, viz., retort-stack, washers, condensers and scrubber, and gas-holder: the whole being contained in a space of 1,600 cubic feet, or 22 tons measurement space. The washers, &c., for the purification of the gas after it leaves the retorts, are provided with overflow pipes, so arranged that, however heavily the ship may roll, the water will be maintained at a uniform level. The holder is a combination of tank and holder. The holder is so guided in ascent and descent as not to be affected by the motion of the ship. The regulator or governor, like the holder, is also unaffected by it. Every precaution is taken against the possibility of danger from explosion: each section is separated from the others by iron bulk-heads, and every portion of each section is isolated by shut-off and bye-pass valves, so that any one or more of them may be thrown out of use, for inspection or cleansing. The gas produced is pure and bright, a jet burning 1½ to 2 cubic feet per hour being equal to eleven or twelve wax candles. The large saloon of a steamer, when lighted with thirty or forty of these jets, presented a brilliant appearance.

Drawing.—We learn from the *School Board Chronicle* that the Legislature of Massachusetts, in order to facilitate the further culture of its artisans, has issued a law by which the State is authorized to establish schools of design in every village, and compelled to maintain at least one of such schools in every town of 10,000 inhabitants.—The committee of the Berlin Women's Association for the Encouragement of Kindergärten, &c., invites essays on the following subject:—Demonstrates the necessity of instruction in drawing for all grades of the national elementary school, and indicate a method of teaching drawing such as is applicable to the national school, and based on the writings of Fröbel and his followers, as likewise on experience gathered in the Kindergärten. The essay pronounced to be the best is to receive a reward of six Friedrichs d'or (over 5*l.*), and the second best an honourable mention. Every essay must be signed with a motto of some kind, and the same motto, with the name and address of the author in a sealed envelope, is to be addressed to Herr M. C. Luther, Melchiorstrasse, 10, Berlin, on or before December 31, 1872.

A New Ventilator for Railway Carriages.—The Queen's saloon carriage on the London and North-Western Railway has had affixed to it a new description of ventilator. Outside the carriage are three little projections on the roof right over where the lamps are generally let in. These protrusions are what are called the caps of the ventilator. The movement of the train causes them to work and keep up a thorough ventilation inside each carriage to which it is affixed. The arrangement in the interior of the roof of the carriage is nothing more than an ornamental grating. Between the grating and the cap outside there is a cavity for the lamp. The cap is so constructed that ingress to wind and rain is wholly prevented. The cap rotates without noise, and by a mechanical arrangement creates an upward current which carries away all impure gases that may be generated. This little appliance can be fixed upon any railway carriage without disturbing present arrangements. It can be fitted into omnibuses, holds of vessels, as well as railway carriages.

A Mechanics' Institute for Carlton.—The foundation-stone of a mechanics' institute and workmen's club has been laid, by the Earl of Carnarvon, at Carlton, near Nottingham. The village of Carlton forms a portion of the estates which belonged to the Chesterfield family. The institution is intended as a memorial of the late Lord Chesterfield and the Hon. Sophia E. Forester, and is to be erected at the sole cost of the rector of Carlton, Gedling, and Stoks, the Hon. and Rev. Orlando Forester, who built new schools and renovated the parish church. The institute, or club-hall, will be erected near the church schools, and the architects (Messrs. Goddard & Son, of Lincoln) have prepared the plans in accordance with the general style of the schools. The building will have a frontage to the main road, and will include a newsroom, 22 ft. by 20 ft.; a lecture-room, 32 ft. by 22 ft.; together with the other rooms necessary for such an institution. The site has been given by Lord Carnarvon.

An Aquarium for Great Yarmouth.—Under the name of "The Great Eastern Aquarium Company," a scheme has been started, having for its object the establishment of an aquarium at Yarmouth, similar, in some respects, to those at Brighton and the Crystal Palace. The capital of the company is 40,000*l.*, in 20,000 shares of 2*l.* each. The plans and elevations of the proposed building have been prepared by Mr. E. Welby Pugin, who is the architect to the company, and amongst other things a central hall is talked of, capable of containing 2,000 people, and restaurants for providing refreshments for visitors. The site selected is on the north side of the Britannia Pier, commencing in a line with the north side of Prince's-street, and extends northwards 800 ft., and is 350 ft. wide. The western boundary will be in a line with the original Marine Parade, and the eastern boundary will be about 130 ft. eastward of the present Drive, and opposite Norfolk-square.

Restoration of St. David's Cathedral.—The Building Committee met at St. David's on the 13th instant, the Dean in the chair. The financial statement showed that the total receipts amounted to 21,487*l.*, and the total expenditure to 21,460*l.* A letter from Mr. King (Sir Gilbert Scott's assistant) was read, which certified that all the works connected with the first contract had been completed at a cost of 17,253*l.* 1*s.* 4*d.* The repair of the roof of the nave, with its beautiful carved ceiling, and of the south side of the nave, has been very nearly completed, but at a greater cost than Sir Gilbert Scott anticipated. The Committee resolved to repair and make perfectly water-tight the roof of the north aisle of the nave, leaving alone for the present the restoration of the parapet. They also resolved to floor the whole of the nave with concrete. The amount required for the completion of these works is 3,400*l.*

Sheffield Architectural and Archaeological Society.—The last excursion for this summer of the members of this society took place on Thursday before last, when a large party started by train to Worksop, where carriages awaited them. They immediately drove off to Clumber, accompanied by Mr. White, of Worksop, and were kindly permitted to go over the house, gardens, and pleasure-grounds, after which they proceeded to Thoresby. Here, also, by the kindness of Earl Manvers, they were permitted to examine the new house and garden, accompanied by Mr. Horncastle, the Earl's agent. They then proceeded to Edwinstowe, where, after visiting the church, the president (Rev. J. Stacey) read a paper upon "Sherwood Forest and Neighbourhood." After visiting the "Major Oak," the party returned to Worksop, and had tea at the Lion Hotel, before leaving for Sheffield. The weather was excellent.

Ancient Mural Paintings in South Leigh Church.—The parish church of South Leigh, near Oxford, was lately re-opened, after restoration, for divine service, by the Bishop of Oxford. The church has been entirely re-seated and re-floored, heating apparatus introduced, walls and windows repaired and partially rebuilt, roof-screen repaired and painted, and other renovations carried out. The paintings on the roof-screen and new altar have been executed by Mr. Sidney Gibbs, of Great Russell-street. On taking off the many coats of white-wash on the walls of the church, some wall paintings of the fifteenth century came to light. The paintings (in distemper), though faded, were quite capable of recovery, and Mr. Sibthorp undertook the charge of the work. The oldest are "The Resurrection" and the "Weighing of Souls." About 1,000*l.* have been already spent on the restoration.

Fatal Accident at Littleborough.—An inquest has been held at Littleborough, before Mr. J. Molesworth, touching the death of Sarah Stott, Jane Elizabeth Harrison, Elizabeth Hannah Mason, and Mary Devine, who were killed by the falling of a wall 70 ft. high at Frankfort mill. Mr. Heap, the manager of the mill, stated that about twenty minutes past five the weather was windy, and he saw a very bright flash of lightning, thunder following a few seconds after, and then he heard a noise which lasted a second. At once he opened the iron door, and found the east end gable had fallen. He went down and discovered that it had gone through the floor of the bottom room, and that six workpeople were buried, and then got assistance to release them. The inquest was adjourned.

Columbia and Farringdon Markets.—Deputy Fry asked the chairman of the Mark Committee, at the last meeting of the Comm. Council, if he would explain the present state of Columbia and Farringdon Markets. Mr. Friel, the chairman, replied that as to Columbia Market the committee had lost no time in procuring evidence as to the practicability of making tramway into the market; that the matter was still under consideration, which had been somewhat interrupted during the recess; and that meanwhile, the market continued unoccupied. The question of making Farringdon Market an institution worthy of the City was also under consideration, but it was an important subject, and involved many interests. We think the Corporation will find Columbia Market "white elephant."

Spontaneous Combustion of Wood.—At the opening sitting of the Paris Academy of Sciences, a letter was read from M. Goussier, describing a case of spontaneous combustion of wood. A manufacturer, M. Watlier, of Ribemont in the Aisne, happening to be in his yard one noon, on one of the hottest days of the year, perceived a wall, emitting a very slight curl of smoke. It had been standing there many days, and there was nothing that could have set it on fire. On blowing upon it at a point where it was in contact with some old boards, a glimmer perceived through a thin film of ashes that had been formed on the surface,—in short, the wood was being consumed by this superfluous ignition, which, when observed, appeared to have lasted several hours.

New City Library.—The new library-museum for the City are rapidly approaching completion. The opening must depend on circumstances not altogether within the control of the committee under whose superintendence work has been carried out, but it certainly cannot be far distant. The main edifice, comprising in the basement the museum, strong-rooms for the safe keeping of deeds, documents, and the library above, with adjacent reading-room, committee-room, &c., are all actually completed. They are now receiving final touches, and in the course of a week or two will be ready for the reception of the library and archaeological treasures.

The Historical Medals of the Loan Corporation.—At the last meeting of the Common Council, a letter was read from the librarian of Trinity College, Cambridge, expressing a hope that the corporation might be willing to augment the collection of the college. A grant of copies of the several medals struck by the corporation in commemoration of various important events in its history. The application was well received by the Court, and referred to the Library Committee to consider and report, and Mr. J. T. Bedford took care to say that it would be a graceful act on the part of the corporation to distribute copies of a fine collection of medals among the various Continental towns and universities.

Free Library at Rochdale.—A free public library and a reading-room for the borough of Rochdale have been formally opened. The collection of the library is in the town-hall, and the books have been classified, removed to the proper places in the library-room at the town-hall, and all the necessary arrangements completed. The total number of books purchased for the library is 11,274, at a cost of 1,916*l.* These various donors have added 496, making the total 11,770, divided thus:—Reference department, 3,738; lending department, 8,032. The specifications of patents have been arranged. There are also some interesting early specimens of the typographical art, of the dates of 1484, and 1520.

Opening of a New Miners' Hall, Chesterton.—The corner stones of a new Miners' Hall have been laid at Chesterton, in Staffordshire, by Sir C. B. Adderley and E. M. Buller, the members for North Staffordshire. The hall is to be capable of accommodating a thousand people, besides having a room for reading-room, library, &c. After the first stone has been laid, Sir C. B. Adderley and E. M. Buller addressed the vast assembly to witness the ceremony.

School Grate.—A silver medal has been awarded to the "Manchester School Grate" for its domestic and other purposes, at the Great International Show.

Surveyor's Report, Montreal.—The report of the city surveyor of Montreal, Mr. P. Macdonald, of the various works executed by the 1st department of the city during the year 1871, has been presented to the council, and read in a printed form. New sewers are being laid in various streets, and the surveyor recommends that all service-sewers from main sewers should be of clay pipe, trapped, and constructed by men employed by the corporation. Great St. James-street is to be paved in wooden blocks, by Mr. D. McNevin, contractor. Tar composition is being laid on foot-boards. Inspectors of contracts are advised.

Proposed Memorial Hall, Chesterfield.—Effort is about to be made on the part of the Chesterfield and Derbyshire Institute of Engineers to erect a public hall to the memory of the late George Stephenson, who resided at Tapton House, and was buried at Chesterfield. It is proposed to purchase a piece of ground, and to appeal to the whole mining district, comprising the town of Chesterfield as the metropolis of the eastern midland mining districts, asking for support towards the erection of a large institution for lectures, meetings, &c., and a training school of mechanical and mining instruction.

Reduction in the Price of Copper.—Messrs. W. & A. G. Parson, & Co., of Birmingham, in their circular, remark:—"Copper has to-day been sold reduced 10l. per ton, making present prices—Tough ingot, 93l.; best selected, 95l.; sheets, 100l. per ton." Messrs. Sims, W. & A. G. Parson, & Co., announce present quotations as follows:—Copper, official reduction; manufactured (strong), 100l. per ton; ordinary ingot, 93l. per ton; heat selected, 95l. per ton; locomotive plates (plain), 102l. 10s. per ton. Yellow metal reduced 2d. per lb.; sheet-lead and bolts, 81d. per lb.; composition nails, 1l. per lb.

Improved Cabs.—The Council of the Society of Arts have issued a paper announcing their intention to give a prize of 60l. for the best improved cab of any description; two prizes for next two best, and two prizes of 10l. each for the next two best. The competing cabs must be exhibited at the International Exhibition to be held in South Kensington in 1873, and on or before the delivery at the Exhibition buildings, to be certified to the satisfaction of the judges. It has been in regular use in the streets of London, or other city or town of the United Kingdom, for three months previously. They will be delivered on or before the first Saturday in April.

all of Part of a Chimney-stalk at Aylth.—A brick chimney-stalk, in connexion with a new wind-mill, at Aylth, in Scotland, is at present under erection, and when the men left the work on Tuesday, at dinner-time, it had been raised to the height of 25 ft. On the return of the men, one of them was being pulled to the top, when about 10 ft. from the ground the apparatus gave way, and several feet of the brick-work fell amongst a group of people at the bottom. Two of them were struck by the falling mass, and severely injured. Considerable damage was caused, and the work will be retarded.

Lirkbeck Literary and Scientific Institution, Southampton-buildings, Chancery.—This institution has just issued its programme for the winter session. Numerous courses in language, history, mathematics, physics, and mental science, art, &c., are open to ladies and gentlemen. A legal department has been added, comprising equity, conveyancing, common law. Arrangements have also been made by which a complete course of technical instruction can be obtained. This will be available for students preparing for the examination for the Whitworth Scholarships.

Working Men's College, Great Ormond-street.—We would direct attention to the programme for the new term, just now issued. There are six art-classes under the direction of W. Cave Thomas. The Rev. Dr. Barry, principal of King's College, will deliver the inaugural address on Wednesday, October 2nd, at 4 p.m. Several courses of lectures are announced.

Salver.—The Rock says it is proposed to erect a district church at Salver, as a memorial to the late Rev. George Fisk, the much-respected minister. It is estimated that the cost will be 10,000l.

Money-making Underground.—A huddler at Ashton writes:—"Whilst my workmen were engaged getting up the foundation of some cellaring at Winson Hill House, Soho, on Friday last, they came upon some large coiners' heating furnaces, in a fine state of preservation, totally hidden from view, and fully 5 ft. under the surface. They were bricked up in their furnace head, and had no apparent opening thereto. They were found under the second or false floor of the ground-floor closet, and had no doubt been in that position more than a hundred years."

Workmen Abroad.—At a moment when the high price of provisions and the unsettled state of the labour market make the position of the working classes in this country somewhat uncertain, the appearance of a blue-book containing further reports from her Majesty's diplomatic and consular agents abroad respecting the condition of the industrial classes and the purchasing power of money in foreign countries, is opportune. It gives a general survey of the condition of the workman in the leading countries of the world.

National Monument to Robert the Bruce.—The local committee appointed to carry out the erection of the above monument met in the Council Chambers, Stirling. Mr. George Cruikshank's model was highly approved, and it was resolved that it should be publicly exhibited in a shop in King-street. The site granted by Government on the esplanade of Stirling Castle was cordially approved. The committee determined at once to raise the necessary amount of funds, which the chairman stated would not exceed 1,500l.

Proposed Statue of the Prince Consort.—On the motion of Mr. George Shaw, in the Court of Common Council of the City of London, the resolution of the 2nd of May last, referring it to the Improvement Committee to obtain a design for the pedestal of the statue of the late Prince Consort more suitable to the site, and considered with a special reference to the proportions of the statue, was rescinded, and it was referred to the committee to provide a suitable pedestal at an expense not exceeding 2,000l.

The New Law Courts.—An Act was passed in the late session to make considerable improvements in the Sale-street and Carey-street, fronting the new Courts of Justice. The contemplated alterations, with the improvements, nearly completed in Lincoln's-inn, will form important metropolitan improvements. A company, called the Metropolitan Estates Company, has been dissolved, and a new company has been formed, with 300,000l. capital, by which a new class of buildings for the legal profession will be erected.

Remains of Old Westminster.—In making the foundation for St. Stephen's Club, at the corner of the Victoria Embankment, the workmen, after cutting through the road to the old bridge, and clearing away the accumulated rubbish and made soil of ages, reached in the maiden earth, at a depth of 20 ft., a thick wall built of stones of great size, and standing upon piles about 8 ft. long, topped with thick planks. The wall inclosed a considerable space.

A Strike in Paris.—A strike (says *Galignani*) has just broken out amongst the journeyman stone-cutters employed in the works of the new Palace of Justice, in Paris. The movement was at first insignificant, but has now become more serious, owing to an attempt made by the malcontents to deter others from their labour. Warrants of arrest have been issued against ten of the leaders.

Proposed Extension of the Factory Act.—Sir John Lubbock has, it is stated, undertaken to introduce a Bill to extend the provisions of the Factory and Workshops Act to all shops open for the manufacture, sale, or repair of any article, or part of an article, throughout the United Kingdom.

TENDERS

For new parish church at Reading, Berks. Mr. Wm. Allen Dixon, architect. Quantities supplied:—	
Masley & Rogers.....	26,736 0 0
Wicks & Bangs.....	6,689 0 0
Nightingale.....	6,146 0 0
Staines & Son.....	5,876 0 0
Mann.....	5,739 0 0
Gibson, Brothers.....	5,685 0 0
Aitken & Walker.....	5,595 0 0
Niblett (accepted).....	5,462 0 0

For extension of offices for the Imperial Gas Company, at John-street, W.C. Mr. Francis Edwards, architect. Quantities by Mr. Cubitt Nichols:—	
Manbridge (accepted).....	23,439 0 0

For Blackburn Congregational Church. Messrs. John Tarring & Son, architects:—	
Ives & Son.....	218,923 0 0
Neill.....	18,829 0 0
Cooper & Tulks.....	14,825 4 7
Higson.....	13,728 0 0
Abbott.....	13,439 0 0
Peto, Brothers.....	12,136 0 0
Cook & Green.....	11,993 0 0
Luscombe (accepted).....	11,437 0 0

For alterations and additions at No. 43, Leman-street, Whitechapel, for the East London Shoe Black Society. Mr. John Hudson, architect:—	
Sparks.....	21,747 0 0
Read & Son.....	1,734 0 0
Little.....	1,688 0 0
Outwaite & Son.....	1,679 0 0

For warehouses and shops for the Co-operative Society, Lincoln. Messrs. Bellamy & Hardy, architects:—	
Chappell.....	27,690 0 0

George.....	1,100 0 0
Cook.....	1,080 0 0
Hendall.....	1,008 0 0

The Builder.

VOL. XXX.—No. 1548.

What are we Doing for Public Health?

On the 7th day of September, now expired,—that is to say, within twenty-eight days after the passing of the "Act to amend the Law relating to Public Health," which bears date 10th August, 1872,—it was enacted by clause 6 of that measure, that "the first meeting of a sanitary authority under this Act shall be held; or," it adds, "at such other time as may be directed by order of the Local Government Board."

We have failed to notice accounts of these important contemporaneous meetings of the new local authorities. One remarkable exception, recorded in our pages on the 21st ult., serves but to prove the rule. The

question arises, how was the provision to be enforced? In what practical manner are the inhabitants of every or of any sanitary district, urban or rural, drained or undrained, improved or unimproved, really affected by the passing of the law?

Remembering the extreme degree of interest that was developed in many instances by the election of members of the school boards, on the passing of the Educational Act of 1871, it strikes us as somewhat ominous that hardly a single sound should have fallen on the public ear as to the proceedings ordered to take place on the 7th of September. It may be urged that the education boards were new creations, and that the sanitary boards are but the old union or borough authorities, with powers that are not new, although they are transferred or concentrated. But that consideration hardly tends to increase confidence in the unreported activity of the sanitary movement.

It will be evident to those of our readers who have either consulted the abstracts given in our own pages, or studied the actual words of the Act to amend the laws relating to public health, which was the fruit of the past session, that general sanitary reform is as yet only in what may be called a permissive state. We cannot even see in the new law such a machinery for individual action as was proposed in what, by a remarkable distortion of the English language, was spoken of as the "permissive prohibitory" condition, with reference to another class of reform. The one sole element which is provided by the Bill to spur, or to check, the action of the new Board, is the authorised interference of the Government inspector. But this, also, is only permissive. It is not even promised. There is no method provided by which a medical man, or other person deeply interested in the health of a district, can readily grease the wheels of the slumbering law, or call the attention, except as a matter of personal favour and responsibility, of an inspector to even the most urgent danger.

It must be clear, and can hardly be too loudly urged, that the Administration has thus incurred a large amount of serious responsibility. We shall not be accused of making any querulous or hasty complaint. We urged our friends to

support the small measure for which alone time was found. We did not carry with us the full sympathy of some of the oldest supporters of sanitary reform in thus urging that half a loaf was better than no bread. But we felt that there were certain conditions which limited the possibility of action. It was certain that time would not be given by the House of Commons, considering the work actually before it, adequate to allow of the consolidation of the law during the session of 1872. And it was also clear, to our view, that the matter was in the hands of a Minister fully aware of its primary importance, able and willing to grasp the question with a masterly hand, and not unconscious of the ultimate fame that would attach to the successful combating of the two master evils of poverty and disease.

But the more confidence has been placed in the wisdom and the energy of the Government; the more readily the House of Commons passed the stamp of the Bill; the more hopefully sanitary reformers, in and out of Parliament, looked for the beneficent development of the one active element of the measure, the power of inspection, set in motion by the Administration,—the more necessary is it to watch the commencement of this activity. There is one alternative clause, as we mentioned in our first paragraph, under the shelter of which we very strongly suspect that the greater part of the new district authorities are taking a convenient slumber. "Or," says the Act, "or—at such other time as may be directed by order of the Local Government Board." Is the care of the health of the country waiting for the construing of a legal sentence?

It is past question that if the various local authorities, urban and rural, to whom, under a new name, the exercise of already existing powers has been attributed, had felt any real desire to take care of the public health, they had abundant means of showing their disposition before the passing of the Bill. But it is notorious, and it is to a great extent natural, that the reduction, or at all events the non-increase, of local taxation, is the main motive that actuates many members of those Boards. To call a man a sanitary authority, instead of a burgess or a guardian, will not instil into his mind one grain more of that dread of pestilence which is the ultimate motive power as to sanitary measures. Dread of rates, which are a tangible evil, will, in the minds of nine-tenths of the new authorities, assume a much more positive form than dread of fever, of cholera, or of consumption.

This great, ugly fact did not escape the notice of the framers of the original Bill. A complete organisation was apparently contemplated by its provisions,—which is, indeed, possible under those of the present Act, but which is far less probable,—which, in fact, has become highly improbable,—except from centrifugal pressure. Thus, the Bill says, "It shall be the duty of every urban sanitary authority, from and after the expiration of three months from the commencement of this Act, to appoint a medical officer of health." As far as we can understand the language of Acts of Parliament, we apprehend that this meant that such officers were to be appointed at the end of three months from the passing of the Bill; that is, the Act being dated the 10th of August, every district of England was to have its proper medical officer by the 10th of November. But what says the Act? "It shall be the duty of every authority to appoint from time to time an officer." When does that render action imperative? We are fully aware that while the words of clauses are liable to be "amended" by every one of the 656 members of the House of Commons, no minister is altogether responsible for verbal changes of this nature, however important they may be. Still it is highly necessary to look the actual fact in the face.

A body of medical officers, spread over the country, must consist of men subject to the infirmities of humanity, and liable to be influenced by its lower motives. That they may be, and we believe as a rule are, far more readily influenced by the best and noblest motives, is our unfeigned belief, founded on a more than ordinarily extensive acquaintance,—that is to say, compulsory acquaintance,—with physicians and general practitioners in this country and in Ireland. But in all legislative measures we ought in wisdom to regard the motives of self-interest rather than those which are disinterested.

In this case, the wisdom of the arrangement depends upon the propriety with which the term "body" can be used. If measures are taken for establishing a common bond among these medical officers; if, by quarterly meetings, by being required regularly to report to a superior medical authority, or by any other form of mutually informing and supporting action, an *esprit de corps* be encouraged, we shall have established a very efficient medical police, and the Government will be able to lay its finger on the pulse of the country.

If, on the other hand, we have nothing but the appointment of a medical officer, quite isolated from his brothers, under the sole authority of the local board,—we do not say that there is one who will not do his duty, but we do say that, in nine cases out of ten, that duty will conflict with his interest.

On the plain words of the Act, then, the appointment of a medical officer is left much to the good pleasure of the ratepayers,—a rate regulation; and his post, when he is appointed, is one in which he has more encouragement to do nothing than to exert himself.

While one of the branches of the care of public health,—that is to say, medical inspection,—is thus so far from being placed on a thoroughly efficient footing, what are we to say as to the other, and not less important, part,—the physical aspect of the case? The aid of the doctor is, to a limited extent, invited, but nothing is said as to that of the engineer.

It is very certain that the medical officers of health have neither the time nor the mechanical education which should fit them to be removers as well as inspectors of nuisances. Throughout the whole of our urban districts the question of sewerage is assuming every year fresh importance. The question is one within the province of the engineer. It is exactly one of those questions which most loudly demand thorough and effective superintendence by men specially educated and accustomed to the subject. It is so from its very simplicity, as well as from its wide range. If a man wants to make his will, he sends (if he has common sense) for a lawyer. If he has to grapple with an attack of disease, he sends for a doctor. But if he wants to put in a drain, or if his house becomes pervaded with noxious gas, he does not send for an engineer. He thinks any one can put in a drain-pipe,—at all events, the builder's men may be trusted to do so. The subject is uninviting in every way. Cost is deferred,—that is to say, money cost,—as long as possible; and then the cheapest rule-of-thumb man is set to work. It is such a trifle,—a rain-water pipe that has a close, unpleasant smell proceeding from it,—mere fancy, perhaps, or disagreeable, indeed, yesterday, but not perceptible to-day; when, moreover, *paterfamilias* has a slight cold. A trifle, no doubt; and so is the death of a child a trifle,—to the Registrar General. It is only one unit in that grim sum which he is perpetually adding up. But what is it to the parents? Even so the amateur drainer or non-drainer of his own house may be the sower,—as we have only very recently seen to be the case in India,—of the fertile seeds of a disease that shall devastate a province.

The engineering inspector is a man as neces-

sary to the health of the country as the medical inspector. The latter is the eye (and indeed the nose), the former is the hand. We are not arguing that it needs the presence of a Brunel to lay down every drain-pipe, or even to superintend the outfall of every town. But we do insist that each and every link in the great water circulation of the country should be closed only by hands amenable to educated supervision; that there should be an officer responsible for the sanitary engineering of every district,—one to whom the builder and the negligent or ignorant creator of a nuisance should be responsible; or at least a man who should, as a matter of duty, set in motion the remedies provided by law.

As we rise from the very smallest details of the daily service of our domestic water supply and sewage to the consideration of the questions which are now pressing for solution in every urban district in England, the need, not only of local surveyors, but of some method of combining the local information, and of making any engineering district that is planned or carried out subservient to the thorough drainage and sanitary, as well as economical, distribution of the water supply of the whole kingdom, becomes more imperative. Powers are given by the new Act to enable one local district to drain, by mutual agreement, into the carriers of another. Such an arrangement, instead of being facilitated, ought to be rigidly forbidden by the law, except on proof that the drainage of the recipient, as well as of the contributing, district was not only adequate, but so laid down as to be consistent with the ultimate drainage of the whole country in the most efficient manner. No one can have any practical acquaintance with such works as, for example, the carrying of a railway through a town, without becoming aware of the extreme complexity, cost, and danger to health that are incurred by the ill-considered location of drains. That their cost is thrown away is the least evil. Every drain that is not built with a proper relation (intentional or not) to the general system of ultimate effectual drainage of the district in which it is situated, is a source of expense, of delay, and of danger. And as water will not wait, and commuted supplies work their own means of exit, the importance that a thoroughly scientific direction, in the first instance, should be given to every sanitary work, is paramount. In fact, efficient engineering inspection is a want in every way as urgent as efficient medical inspection.

What do we see throughout the country? Puzzle and alarm. Costly experiments, conducted everywhere on the most gigantic scale, because primary principles have not been laid down in the first instance. The costly sewage of Liverpool, on which so much skill and money has been expended for nearly a quarter of a century, relies on the swift current of the Mersey for its outfall. It may be remembered that the Mersey has a bar. It must also be noted that the death-rate of Liverpool is still the highest in England, being equal to that of Manchester, and nearly a sixth higher than that of London; while the infant mortality of that borough presents the frightful proportion of 39 per cent. (not per thousand) in the first year after birth! Is the question of the disposal of the sewage of London settled? What says the Government inspector, Mr. Rawlinson, in his "Report upon Inquiry into the Truth or otherwise of certain Allegations contained in a Memorial from the Vicar and other Inhabitants of Barking, in the County of Essex, calling Attention to the Pollution of the River Thames by the Discharge of Sewage through the Northern Main Outfall Sewer of the Metropolitan Board of Works?" The memorialists "call attention to the present dangerous condition of the river Thames—dangerous alike to navigation and to the health of the inhabitants of Barking, and of all the populous and industrial towns below London, consequent upon the concentrated discharge of sewage through the main outfall sewers of the Metropolitan Board of Works." Mr. Rawlinson reports that "the allegations in the memorial have been only partially proven;" that "the Metropolitan Board have objected to the admission of sewage into the Thames from towns above London, and therefore inferentially justify the objections to river pollution below London;" that the river Thames is polluted by metropolitan sewage, and that that pollution may be prevented. There is a world of menace in Mr. Rawlinson's very temperate and judicial report, sentences of which only we extract.

What is the spectacle presented by Birmingham,

played like a shuttle-cock between the Court of Chancery and the House of Commons? What shall we say to the experiments at Bishop's Stortford, where acres of country are subjected to the play of permanent fountains of sewage water, roughly filtered through faggots, and conducted through a system of pipes which, not to mention any other objection, involves a cost of thirty shillings per acre per annum for interest alone!

Again, in criticising the Bishop's Stortford process, a writer, evidently not new to the subject, urges that it is from its mineral contents that sewage derives almost its sole agricultural value. In the estimated theoretical value of 2s. per ton, ascribed to ordinary town sewage, undiluted by storm water, half is set down to the value of the organic matter, which one of the most practical investigators of the subject proposes to burn—a step that, at all events, will make sure that it shall not propagate. This organic matter constitutes 4.6 per cent. of the undiluted sewage poison. Of the remaining matters, chemical analysis gives 1.8 per cent. of gaseous to only 7 per cent. of mineral elements. The latter includes soda, potash, lime, manganese, silicon, phosphorus, sulphur, oxide of iron, and chloride of sodium. The mineral ingredients of the sewage, therefore, other than those which exist in the form of soluble salts, must be almost entirely due to the road-scrappings and other detritus brought down by the storm waters. The excessive cost and cumbersomeness of conveying matter of this kind to the fields, by mixing it with sewage, need hardly be pointed out. In fact, it is difficult to find any of the thousand schemes proposed for extracting gold from our drainage, that will stand before the pitiless logic of arithmetic. The great demand of agriculture is for concentrated, portable manure. The mode generally adopted in conveying sewage to the land, commences with diluting it to an unmanageable degree, and often proceeds on the supposition that, by adding other matters, we are adding to the value more than we do to the cost, the very reverse being generally the case. Here again the whole country is looking for guidance as to the best course to adopt.

The town clerk of Canterbury, referred to in our recent number, may no doubt be taken as a fair representative of the legal advisers of the new sanitary authorities. He was in doubt as to the necessity of calling a meeting, on which point he took the safe side. "He did not anticipate that there would be anything to do." He waited for the regulations of the Local Government Board. We re-read the Act with care, to discover the cause of this hesitation. We could find nothing to justify it. But here is a fresh and a most significant proof of how patiently the country is awaiting the initiative of the Administration.

Again, the omission from the Act of the prohibitory and penal clauses contained in the Bill is a matter that throws a great onus on the Local Government Board. By this insertion in the Bill it is plain that it was the deliberate opinion of the Government that they were necessary. Their withdrawal from the Act was in consequence of want of time for full discussion of the measure. But the fact renders it all the more intelligible how the country is looking to the Government for a vigorous and comprehensive initiative. Had the original Bill passed, and proved ineffective, ministers would have been fully justified in waiting till they could refer the matter afresh to Parliament. But not so as it is. The real gist of the matter is this. The Government said, in effect, "We have no time this session to do more than enable local action to commence. We have a definite plan of our own. We require some time to complete our organisation. But we take power, vague but comprehensive, to enable us to organise. With the inspectors to whom you give powers by clause 15, we shall quietly, rapidly, and thoroughly block out the normal plan for the entire country. See what our organisation is, and we will come to you again, when you have more leisure, to consolidate the law."

Such, unless we are much mistaken, was the understanding with which the House of Commons passed, without hesitation, the measure of last session. Such, we think there can be no doubt, is the expectation of the country. Parliament has entrusted to the Minister of Public Health a power all the more complete from the vague terms in which it is accorded. The public expect to see this power in visible, effective, beneficent action. Every day adds complexity, delay, cost, loss of life, to the difficulties of the

case. Every sanitary reformer is looking anxiously for the sight of an action that shall begin at the beginning, by organising the medical and the engineering system to which the whole country has to conform. Isolated action, in this case, is worse than idle; for it may clash with systematic action. Every opponent of sanitary movements will rub his hands, and do nothing. Right or wrong, the country is looking to the Government for the signal. That extreme constitutional delicacy which has so often hampered efficient action, is out of place in view of a great danger and a great difficulty. We trust that the Government will feel that the general consent of the country will strengthen their hands in a prompt, efficient, and well-advised treatment of a problem which is medical in its indications, but engineering in its practical treatment. Happily, this vital question has not hitherto been seized upon as a party question. England is in earnest about it. The proof of science has been said to be the power of prediction. This has, indeed, been mainly confined to astronomy. Our readers will have seen, in the marked rise in the price of coal, a proof that engineering science is not altogether to be excluded from the category of predictive knowledge. It remains dependent on the fact whether the machinery for improving the public health be based, from the beginning, on sound engineering science or not, whether the Act of 1872 shall prove a wise step in the path of civilisation, or a deplorable failure.

NEWS FROM EDINBURGH.

The clearance of the congeries of densely-packed houses to the north-east of the High-street in order to form the new thoroughfare, to be called Jeffrey-street, is nearly completed, and from amidst the mass of *débris* appears the substitute for the ancient Trinity College Church, like "the new moon with the old one in its arms." So far as at present appears, the amalgamation of part of the ancient structure with the new work is not particularly happy.

In connexion with the city improvements, the lofty gable which surmounted the piazza at the north end of Blackfriars-street has had to be pulled down, owing to defective construction; and a movement is on foot to have the piazza done away with altogether.

The centre portion of the Museum of Science and Art is now finished so far as regards the stonework. To complete the facade, the west wing is still wanting. The portion just erected embraces the central entrance, consisting of three lofty arches. Keystones have been used in these arches, and the spandrels are panelled, which imparts to this part of the building a different character from the remainder, where such features are not used. If we mistake not, the original design has been departed from, and it would have been better had it been adhered to.

The restoration of the choir of St. Giles's is being rapidly pushed on under the superintendence of Mr. William Hay, and it is expected that operations will be completed in the course of next month. The stonework seems to have been of an inferior description, necessitating a more liberal use of cement than is desirable. Now that an idea can be formed of the interior as an architectural work, it strikes us as greatly inferior to many others of the ancient churches in Scotland. The arcade, with its octagonal shafts, is heavy; and the clerestory very bald; but in a city having so few ecclesiastical remains, it is deserving of careful preservation.

The competition for the new Apostolic Church to be erected in East London-street, which we referred to in a former notice, has been decided in favour of Mr. Robert Anderson, of Edinburgh. The design, according to the instructions, is Norman in style, and consists of a spacious nave in the form of a double cube, with an unusually deep chancel, terminated by an apse. The chancel is flanked by aisles, in one of which is to be placed the choir organ; and the other, which terminates in an apse, is to be used as a chapel. The grand organ is to be placed in a gallery in the tower, which occupies the centre of the west elevation; under this is the main entrance, from which diverge passages leading to the baptistery on the right, and a hall to the left. The window lights of the nave are placed well up from the floor, and slender attached shafts run up between them to support the beams of an open-timber roof of very simple character. Severity and dignity of effect have

been aimed at, and, if carried out in its entirety, the building will form a marked feature in the city.

Messrs. Macgibbon & Ross are the successful competitors for the new Free Church at Morning-side, which is to be erected at a cost of about 3,000l.

A hall in connexion with a new United Presbyterian church in London-road, from the designs of Mr. Starforth, has just been completed. The site of the church is occupied by a temporary one, and the congregation will use the hall as their place of worship till the permanent church is completed.

In Grove-street a new mission-house, with small chapel in the rear, in connexion with the Barclay Church, has been erected from the designs of Messrs. George Beattie & Son. It is a heavy example of the chamfer and splay Gothic sort.

On the sloping bank to the south of the Castle new quarters for married soldiers are to be erected, at a cost of 8,000l. The building is to be three stories in height and 250 ft. in length, similar to what is usually produced as artisans' dwellings. Each couple will be provided with a room 16 ft. by 14 ft., and other conveniences are supplied for the general use of the inmates.

On the east side of St. Giles-street, new premises are being erected for the *Edinburgh Cowart* newspaper, from the designs of Mr. David Bryce. The design is a highly ornamental one, in the Scottish domestic style of street architecture. The windows of the first floor are richly decorated in a quaint manner, and the sky-line is broken by gables and moulded chimney-shafts.

In the rear of the Merchant Company's School, in Archibald-place, a hall for lectures, exhibitions, and examinations is to be erected in harmony with the classical design of the school.

The erection of the new Royal Infirmary is proceeding in a very laudable manner. The basements of all the pavilions, twelve in number, have been contracted for and are nearly completed, but it is said that the funds in hand are insufficient to meet the cost of the superstructure of all of them. If such is really the case, the wiser course to have followed would have been to complete only such a number of the pavilions as the funds allowed. The present state of the matter does not appear satisfactory in any sense; for, from the disposal of the building, we do not anticipate that the architectural effect will be happy.

The very picturesque statue of Dr. Livingstone, the African traveller, by Mr. D. O. Hill, of which we gave a description at the time it was exhibited in the rooms of the Royal Scottish Academy, is now exciting some attention. Proposals are now broached for producing it in bronze both for this country and America. It would form a marked contrast to the generality of public statues now produced, the costume and general treatment being very unlike the usual conventional style of such.

The sketches by the selected sculptors for the statues to be placed in the Scott Monument have been examined, and half-sized models have been ordered for the approval of the committee. In addition to the statues already ordered, Mr. Currie, of Darnick, is commissioned to prepare a statue of "Old Mortality."

No decision has yet been declared regarding the cathedral designs. We have received statements of odd gossip on the spot, but it is unnecessary to print them.

NEW SCHOOL OF ARTS, EDINBURGH.

The new School of Arts, the foundation-stone of which is to be laid with full Masonic honours on the 9th of October, stands in the centre of Chambers-street, now being opened up by the Improvements Trustees, and is immediately opposite the centre of the Industrial Museum. It will thus form a prominent feature of the north side of the street, and the site seems in every respect peculiarly suitable for what has long been looked upon as the firmly-established technical college for the working classes in Edinburgh. Its close proximity to the various collections connected with art-manufacture forming the Industrial Museum, may reasonably be expected to be of much advantage, both to teachers and students, in illustration of the lectures and classes of the Institution; and, if for no other reason, this, we think, makes the site selected a very fortunate one for the purpose.

The School of Arts has been in full prosperity

and success for upwards of half a century, and its reputation is at this moment higher than it ever was before. Indeed, it has gradually developed itself into a great and valuable national institution, with every reason to anticipate that when this new building is opened it will enter upon a still higher and more extended sphere of usefulness and prosperity than it has hitherto enjoyed, great as that has been.

The building being at the west side of the extended open space in front of the centre compartment of the Industrial Museum, has the advantage of a front both to the south and the east. The south, or Chambers-street front, is rusticated on the ground-floor, having balusters under the first-floor windows. The first-floor windows have architraves, trusses, and cornices, except in the west pavilion, where the building goes up an additional story, ornamented with pilasters at each side and decorated windows.

Over the first floor is the main cornice, having dormer windows over, which are intended as a feature in lighting a richly-decorated cove in the larger lecture-hall.

There is a projecting porch at the main entrance under the pavilion at the west end, a novel and effective feature of which is the statue of James Watt, removed from Adam-square, which will sufficiently mark the building as the Watt Institution, while at the same time it will be a thoroughly appropriate feature of the School of Arts.

The great entrance at the west end is by a hall and staircase leading to the various lecture-halls and class-rooms. The whole is spacious, and well suited for what is now required; and, indeed, ample for what may be anticipated as the wants of the Institution for many years.

There is a lecture-hall, 53 ft. by 33 ft.; and a smaller one, 34 ft. by 33 ft.; with a chemical class-room, 33 ft. by 23 ft.; and also a chemical laboratory and apparatus-room for mechanical philosophy. The other class-rooms are also of ample size for their respective purposes; and there are a library, directors' room, master's private room, with all the minor accommodation for lavatories, &c., and a keeper's house.

The architect is Mr. David Rhind, Edinburgh; and the contractors are Messrs. David Sutherland & Son, Edinburgh.

POLLUTION OF THE RIVERS OF SCOTLAND.

DR. FRANKLAND and Mr. MORTON, who, since the death of Sir William Denison, form the commission appointed to inquire into the best means of preventing the pollution of rivers, have given their report on the rivers of Scotland, dated June 29th, 1872.

The Tay, the Dee, the Don, and some other rivers, are purer than the standard recommended by themselves as a test of non-pollution; but the Tweed, the Clyde, the Irvine, the Esk, the Water of Leith, and the Almond, with their tributaries, are very much fouled. The watershed which divides the basin of the Tweed from that of the Clyde runs nearly north and south, and throws the Tweed waters into the North Sea, and the Clyde waters into the Atlantic.

The Tweed basin is in shape a somewhat rounded oblong area, containing 1,870 square miles. "From its edge, on all sides, inwards, there is a wide margin of grassy hills, many of them upwards of 2,000 ft. high, occupying a large proportion of its surface. Unbroken slopes of green, for the most part above human habitation, constitute the very ideal gathering-ground for the water-supply of towns; and the pastoral regions of the Cheviots on the south, the hills surrounding Biggar on the west, and the Lammermuirs upon the north, send the abundant rainfall of those upland districts, almost as pure as they receive it, into the Tweed and its tributaries. Below the margin of these grassy uplands there are, indeed, extensive cultivated tracts; but these are occupied by a comparatively scanty agricultural population, and the rainfall on them is but little fouled on its way to the drainage-channels of the district." These two areas, together, form about two-thirds of the whole area, and the water flowing from it is represented as free from pollution; but the lower third portion, occupied by the manufacturing towns, is very bad. The Commissioners say that, notwithstanding the obviousness of the change in the waters of the Tweed ensuing immediately on their passage

through or near the manufacturing towns, some attempt was made by the manufacturers to attribute the altered condition of the Tweed during the past twenty or thirty years somewhat to the altered agricultural practice of the country during that period. It was declared that the drainage from heavily-manured or recently-limed land is deleterious; and it was also said that the great extension of land drainage of late years has had the effect of shortening floods, and thus intensifying the mischievous effect of a consequently longer time of drought. "The latter allegation is, no doubt, true. The water which was formerly held in marshy grounds, from which it trickled gradually and continuously, until once more replenished by the rainfall, now flows directly to the river. such reservoirs have in fact, been drained, and the condition of the river, therefore, answers more immediately than it used to do to the character of the weather. A flood in the river channel now begins and ceases almost as abruptly as it begins and leaves off from the clouds. It is, indeed observed, that land which has been deeply drained withstands a drought better than a wet soil; but that is not so much because a deeper and larger sponge, as it were, has been thus provided in which water can be stored for the use of plants, and from which it may be expected very gradually to find its way to the stream, as because land-drainage so facilitates the operation of husbandry that an earlier seed-time becomes possible, and thus the cultivated plants have time to acquire deep-seated roots, which are well established before the summer drought arrives."

Woolen manufacture is the staple industry of the district, and at Galashiels there are sixteen mills, in which nearly 3,000 persons are employed, and upwards of 3,000,000 lb. of wool manufactured in a year, worth about 600,000l., with a consumption of coal of 16,350 tons in the year 1870. At only one of these mills is any attempt made to remedy the nuisance occasioned by the liquid refuse of the woolen manufacture. But with all this and much more refuse from other mills in other parts of the district, the Commissioners say, "There is not, except for a mile or two below Galashiels, any instance in the whole of the Tweed basin of such an entire destruction of river beauty and utility as we have witnessed in the basins of the Mersey and the Ribble, in Lancashire, or in those of the Aire and Calder, in Yorkshire." On the whole, the Tweed is not yet seriously injured, and the Commissioners say that it is most desirable that remedies be at once applied, by which, without serious injury to the important interests of the manufacturers on its banks, the charm and usefulness of a beautiful river may be retained unspoiled, or restored to their original perfection.

The remedy recommended by the Commissioners for the purification of the waste liquids from woolen works is, first, to separate the foul wool-scouring and dye-vat liquors from the comparatively harmless washing-water. By the adoption of this simple precaution, the volume of polluting water requiring remedial treatment would be reduced to a minute fraction of the total discharge from the works; and its purification would be to a corresponding degree simplified, since the washing-water, which constitutes the great bulk of the total discharges, can easily be kept within the standard. This separation being made, the rest is to be purified by intermittent filtration, at the rate of about six gallons in twenty-four hours per cubic yard of filtering material, the liquid being first treated with lime, so as to precipitate most of the solid matter. The Commissioners have experimented on this process for twelve months, from the beginning of 1871 to the beginning of 1872, and they find that in all cases when 5-6 gallons of the liquid per day are apportioned to each cubic yard of filtering material, the result is to reduce the impurities much below the standard. "There are, doubtless, woolen manufactories situated in towns in which intermittent filtration would be inconvenient, perhaps impossible; but it is precisely in such localities that this process would not be required. The strongly polluting liquors kept separate from the comparatively clean washing-water would form a suitable and moderate contribution to the sewage of the town, to be cleansed along with that sewage at the outfall, by irrigation or intermittent filtration; whilst the washing-water would be at once restored to the river in a condition fit to be used by other manufacturers and riparian proprietors lower down the stream."

The Clyde has its origin near that of the

Tweed, but on the opposite side of the watershed. It is one of the most beautiful rivers in Scotland for about two-thirds of its length downwards, but below that its character is wholly changed. At about three-fourths of its length is situated the large manufacturing city of Glasgow. About eleven miles above Glasgow the Clyde receives the smaller river North Calder, into which drain paraffine-oil works, iron works, coal workings, paper-mills, and print works, a succession extending almost from its very source, besides the sewage of the large population in and around Airdrie and Coatbridge. At three of these paraffine-oil works 18,000 tons of bituminous shale are annually distilled, the quantity of coal consumed amounts to 30,000 tons a year, and the volume of crude paraffine and paraffine-oil produced exceeds one million gallons annually. At the Caldercraix paper-mill, near Airdrie, 1,200 tons of rags are used annually in making 800 tons of fine packing-paper. It is, however, to Glasgow itself that the principal pollution of the Clyde is due. "Owing to the enormous water-supply, Glasgow is more perfectly washed out than any other city in the island; so that, notwithstanding the very laborious and productive operations of the scavenger, a large proportion of the personal waste of its population—one half, according to the estimate of Mr. John Carrick, Master of Works and City Architect,—together with all its industrial waste, is sent directly and completely into the river." The water supply of Glasgow is alone more than half the estimated minimum flow of the Clyde as it passes through the city, being twenty-seven million gallons daily. In order to allow larger ships to come up to Glasgow, the river has been deepened from time to time, all the way down to Greenock, and the effect has been, of course, to lessen the velocity of the downward course of the stream, so that when the sewage of Glasgow is poured into the river it is almost like pouring it into a cesspool. By experiments with floats, made in 1857 and 1858 by Mr. Bateman and Mr. Bazalgette, it was shown that sewage which entered the river at the centre of the city when the natural volume of the river was small, did not travel more than 2½ miles in a week. "In summer weather the time during which the river is thus made to loiter on its way to the sea is more than sufficient to establish in full operation those processes of putrefactive fermentation—inevitable whenever the thermometer exceeds 13° C. (55° Fahr.)—to which the formation of sewer gas and other filthy products of this fermentation is due."

On the south-west of the Clyde basin lies that of the Irvine, and about seven miles inland stands the town of Kilmarnock, in which nearly 23,000 people are engaged, chiefly in various woollen manufactures. Kilmarnock water, which joins the Irvine just below the town, "is a striking example of most of the evils connected with neglected river economy to which our attention has been directed in the course of this inquiry." The effect of the more perfect land drainage of the river basin has been perceptible here, as elsewhere, in the greater abruptness of floods, and the longer duration of droughts; but, "formerly, these consequences were alleviated by the operations of Loch Goin, a reservoir of about 140 acres, holding 300 million gallons of water, in which flood-waters were, to some extent, impounded, being allowed to escape during dry weather." This reservoir is situated at the head of the river basin, and belongs to one proprietor, who leased the use of it to the millowners below; but as soon as the lease expired, its renewal was refused, and the water was drained off, "the owner declining any longer to incur the risk to which his attention had been directed by the then recent disasters produced by the bursting of the Holmfrith and Dale Dyke reservoirs in Yorkshire. The evil of an unequal river flow, to which this reservoir had opposed a very efficient remedy, is thus felt at Kilmarnock with all the force of the contrast between the present and the recent past."

According to a section of the bank of this reservoir given in the Report, its proportions are excellent in point of stability, the slopes being for about half the height 4 to 1, and above that 3 to 1 inside, and 2 to 1 outside, the height being 18 ft. and the top of the bank 4 ft. above the top-water level. It is difficult to understand the reluctance of the proprietor to continue the use of a reservoir with such a bank as this. Nearly all the banks of such reservoirs in England have slopes of not more than 3 to 1 inside and 2 to 1 outside, for their full height, that height being in most cases much more than 18 ft.

Messrs. Gregory, Thomsons, & Co., worsted spinners and carpet manufacturers, of Kilmarnock, who employ 200 hands, suggest to the Commissioners, "that the reservoir at Loch Goin should be maintained, and the flood water there impounded, so that, as formerly, an equal flow might be allowed to pass daily down the stream, and the water in the river be in a comparatively pure state." They further suggest "that manufacturers, town authorities, and others, be strictly prohibited from casting solid and liquid refuse into rivers and streams; that proper regulations be enforced for conserving rivers, and that inspectors be appointed by Government for enforcing those regulations, such inspectors to be entirely free from all local influence." Rather strong language this for a local manufacturer; very sensible, and probably is shared in by many more manufacturers than we know of or hear anything about; but to suggest it to a Royal Commission with the hope of any practical result is about as effectual a proceeding as that suggested by the Rev. Sydney Smith—to tickle the dome of St. Paul's to please the dean and chapter.

SILICA PAINTING AND SILICA CASTS.

In the Seventh Cantor Lecture on Silicates, Professor Barff said:—On the evening of my first lecture I received a letter, without a name to it, in which I was asked to explain how it was that the famous painting by Maclise, "The Meeting of Wellington and Blücher," in the House of Lords, was coated all over with an apparent mildew. I did not notice the letter then, because that was not the time for me to speak upon the subject, but I have borne it in mind, and now I will tell you how it has happened. This particular difficulty has been experienced by most who have tried silicious painting. Silicate of potash usually contains an excess of alkali. It is acted upon by the air, and then carbonate is formed, and as this goes on, a certain quantity of silicic acid is set free. You remember I showed you an experiment in which carbonic acid precipitated silicic acid; so that in the case of a quantity being contained in a vessel, there will be more silicic acid in the lower portion of the silicate and less in the upper portion. Now, Mr. Herbert, who was intimate with Mr. Maclise, has told me that Mr. Maclise was continually painting with the top of his silicate and not the bottom, and the consequence was he was using an insufficient quantity of silica in the silicate. There was also no doubt some sulphate in the silicate. When the picture was finished, the sulphate and carbonate came out. I fancy you all know that if you take a lump of common washing soda, and leave it for a time, it becomes covered with white powder; this is called efflorescence. If you show it with moisture, you will find it will soon destroy itself again as the soda dries. The soda will keep on efflorescing. That is what is going on in the picture by Mr. Maclise. In the other picture,—that of "The Battle of Trafalgar,"—you do not find this to be the case; there is only a little efflorescence in one or two parts. Now that picture was differently painted. It was painted with much better silicate, and with much greater care. My authority for this statement is Mr. Herbert, and he and Mr. Maclise were perpetually together while the work was going on. In the "Battle of Trafalgar" a large quantity of zinc white, was used, and that prevents efflorescence. One reason why I introduced aluminate of potash along with the silicate of potash was to prevent this efflorescence, and it does so effectually. If you will coat a wall with this material you will never get efflorescence on that wall.

There are methods, no doubt, by which this efflorescence may be got rid of in existing pictures. At present my idea is that the proper thing would be to wash them over with some salts, which would convert the efflorescent salts into deliquescent ones. I hope to be allowed to try an experiment on a small part of one of the pictures some day. My idea is that some acetate, say acetate of baryta, would do; for when applied to the picture, sulphate and carbonate of baryta, which are insoluble, would be formed, and deliquescent acetate of potash. I believe some such method as that might be employed, so that we might have that beautiful picture without its present disfigurement.

I will suggest a method in which silicious painting may be used in conjunction with oil or varnish painting. It is the custom to admire an old painting, and especially the works of certain

old masters, though oftentimes very little of their own work is seen. For my part, I care not whether a picture is painted by an old master or not, if it does but truly represent nature, and if the principles on which it is treated will bear the test of scientific investigation; for what is not true cannot be beautiful, and the artist's imagination and creative powers have limits set to them by nature. Some time ago I was asked by Mr. Leighton to examine a piece of a picture by Tintoretto. I did so, and analysed parts of it very carefully. I removed, little by little, all the varnish, and whatever came between me and the canvas, and I found that the whole of the picture was painted up to a high degree of perfection in distemper. It was not painted in oil at all at first. Not only was it painted in whites and greys, but painted in and shaded up to a considerable amount of finish, and all this was done in distemper. The vehicles used were size and starch, and no oil whatever; and then afterwards the painting was painted with oil or varnish, I cannot tell which at this distance of time. The glazings were put on with some resinous substance. Certainly this method of painting has wonderful advantages. When an artist puts a touch on a canvas with such materials he knows exactly what he is doing, and never depends upon chance effects. There is no running together, there is no "cessing," as in oil, in the use of this material, with which it is quite clear the old masters did produce some wonderful effects, as we see when we come to clean their works, for this Tintoretto was almost invisible before the covering of varnish was taken off, but when it was, the extreme beauty of his work was manifest.

Now, the silicious method of painting may be used up to a certain point. Supposing an artist wants to glaze with lake, he cannot do it with silicious painting, because the potash will not allow of it. But there is not the slightest reason why he should not use the lake as a glaze, providing he does it with the knowledge that in years to come the lake, being fugitive, may disappear. There is nothing to prevent the use of silicate, and then of resinous vehicles upon that silicate. You can have the first painting done in silicate, which will be more enduring than distemper, and then afterwards you can glaze it with transparent colours used with resinous vehicles.

I have two other masters to speak to you about, and will, therefore, pass on to them, for they are of importance in the applications of silica. I have here lying on the table some blocks of excessively hard material. You can examine them for yourselves after the lecture, and you will find that they are as hard as granite. Here is some of the same material pressed into moulds, showing that it is capable of being moulded. Now, this is used for paving; and a piece of pavement of this material has been laid down opposite the Mansion House, and I have been informed by the patentee, the Rev. Mr. Highton, that the pavement is standing and wearing better than the Yorkshire flags. I feel interested in all applications of silicates. For the last twenty years I have been working upon them; and upon this very subject also have I been working, though not with the success with which Mr. Highton has done, for he has hit upon a plan of doing the thing in an economical way, whereas my method was rather too expensive to be generally used. You here see a lump of material which is called Farnham sand, and some of this lump is here crushed to a fine powder. This Farnham sand contains 50 or 60 per cent. of what is called soluble silica. Ordinary sand must be melted with soda or potash in order to convert it into glass prior to making it soluble. This Farnham sand requires nothing of the kind. If you put this into silicate of potash the soluble silica will be dissolved, even in the cold, by any excess of potash which may exist in the solution of silicate of potash. These blocks are made in the ordinary way. They are made of granite chippings, mixed with Portland cement, and cast into this form. The blocks are piled up, one upon another in a tank, and the whole is filled in with silicate of soda, and the silica from the silicate of soda goes into these blocks and forms silicate of lime with some of the lime which is in the Portland cement. The carbonic acid that is taken up by the silicate of soda also leaves the soda and goes to the lime, so that the caustic soda is able to dissolve the soluble silica of the Farnham sand, which is added in quantities. You remember an experiment I showed you, to the effect that lime can take carbonic acid from carbonate of soda. From the hardness of this

block you will see there is penetration throughout nearly the whole of it. Now an invention of this kind is useful in various ways. There are certain wall decorations which it is perfectly admissible to repeat, and which may be cast in moulds. I should not advocate its being used in the place of carving, but it might fairly be used for certain purposes outside of buildings where cement is now used, and it would not be acted upon by damp. The use of silicate of soda and silicate of potash, together with other materials, as a protection for stone, has been before the public for a long time; but the difficulty that one has had to contend with has been this, namely, we cannot get it to penetrate the stone to any depth, and when we do get it to do so it will not hold the disintegrated particles together and bind them into a solid mass. I tried an experiment upon some old stones which were crumbling away, and I found that the decayed portions must be removed before the application of the silicate. There is a great deal yet to be done before soluble silicates can be used with much success in coating stone. At present we only get them in just skin deep; but if soluble silicates are to be used they should be used with some such substance as the aluminate of potash, which causes a rapid hardening, and prevents efflorescence.

SCHOOL BOARDS.

Norwich.—The General Purposes Committee recommended the Board to adopt the tender of Messrs. Downing & Webb, for £,163*l*. 17*s*., for the erection of the Board schools, on the Heigham-street site. The Rev. Hinda Howell moved the reference of the tender to the Tender Committee for reconsideration. He said that when in the first case the specifications were placed before the Board a considerably smaller sum was named as the amount that would be required to build a school for 500 children. After some procedure, Mr. Brown (the architect) said that the former estimate was for 2,650*l*. The rise in building materials and labour, he said, would account for a good portion of the excess. The Rev. A. C. Copeman said that the Board had been anxious to get to work upon the schools. They had been impatient of delays. When the estimate was first brought forward it was distinctly stated by Mr. Brown that it was only a rough one, as the trade was in such a state as to render it almost impossible for any man truly to determine what would be the cost. Mr. Brown's explanations had brought up the estimate to within 73*l*. of the lowest tender. The tenders were 4,630*l*., 4,316*l*., 4,815*l*., 4,286*l*., 4,227*l*., and 4,163*l*. What object could possibly be served by a reference to the sub-committee? Were those who tendered to be called to account, or was the architect to be taken to task? Every work the architect had specified had been carefully examined, and everything was considered to be absolutely essential. That being so, what purpose could the reference serve except delaying the works? It was possible that the works might be less expensive by delay, but it was upon that contingency alone. Mr. Pinder calculated that the estimate would give 300*l*. above the 6*l*. per child; and suggested that reductions should be made to that amount. Mr. Birkbeck said that it ought to go forth, in justice to Mr. Brown, that the rise in prices largely accounted for the difference in the estimates. If the reference were to be made with a view to save expense to the city, he should support the motion. The resolution was then agreed to.

Newcastle.—At an adjourned meeting of the Board, it has been resolved, on the recommendation of the Science Classes Committee, to give 15 guineas to those classes, instead of 5 guineas, as last year. Mr. Casse moved that the plans of the three new schools, which had been before a committee of the board, be received. The motion was carried unanimously. Mr. Casse moved that the plans be adopted, and sent without delay to the Education Department for its approval, stating that 17,973 children were to be schooled, and there was only accommodation for 15,044, leaving 2,929 unprovided for. After a long discussion, the motion was carried, with the addition that a requisition he asked for.

Dronfield.—At a meeting of this board, the following resolutions were passed:—

"That the architects to the board be instructed to prepare plans and estimates for the erection of a school and master's house at Dronfield Woodhouse, including all fittings and furniture for the school." "That Messrs. H. May & S. Lucas be requested to examine plans, &c., for school buildings at Dronfield Woodhouse."

Portsmouth.—At the last meeting of this Board

held on the 26th ult., it was resolved to adopt the following recommendation of the Sites Committee, viz:—

"1. That Messrs. Alexander & Henman, of Stockton-on-Tees, conjointly with Messrs. Henman & Harrison, of Bedford-row, London, be appointed to furnish the design and superintend the work for the proposed school in Fratton-street, provided that their plans, having been approved by the board, are likewise satisfactory to the vendor of the site and the Education Department.

"2. That Messrs. Mileham & Kennedy, of 40, Great Marlborough-street, conjointly with Messrs. Davis & Emanuel, of Finsbury Circus, London, be appointed to furnish the design and superintend the work for the proposed school in Keut-street, Portsea, provided that their plans, having been approved by this Board, are satisfactory to the Education Department, and that such appointments be made subject to such conditions and details as may hereafter be resolved by this committee."

Newport.—Mr. Benjamin Lawrence, of the firm of Lawrence & Goodman, has been appointed architect to the Board, and a new mixed school for 210 children will be commenced forthwith. The plans prepared by him, and selected by them, have been approved by the Education Board, and the buildings will comprise a school-room, 50 ft. by 24 ft.; a class-room, 24 ft. by 17 ft.; with lobby, 24 ft. by 7 ft. between these; at the end of which will be a lavatory, and entrance by an inclined way to the playground in the rear. Beneath the schoolroom will be a covered playground, and there will be a separate entrance by an inclined way from the street to the playground. The building will be Domestic Gothic, in brick-work, with Bath stone dressings, and covered with slate.

Proposed Congress of School Boards.—At the London School Board meeting a letter has been read from the Liverpool Board suggesting that the London School Board should take the initiative in calling a congress of delegates from all the school boards throughout the kingdom. This letter was referred to a committee.

HORNSEY NATIONAL BOYS' SCHOOLS.

The parish of Hornsey has long suffered in consequence of inadequate school accommodation, and it was not until the Government grant had been withdrawn that an effort was made to secure a more eligible site and raise funds to build a large schoolhouse. About six months ago an application was made to the Bishop of London for permission to erect the schools on the glebe lands, and the request was readily complied with, his lordship being well acquainted with the requirements of the parish, having been four years minister of Muswell-hill Church, twenty-six years ago. At that time the Hornsey National Schools, small though they be, were the only public schools in the parish, and to them all the children in the parish had of necessity to attend. Since that time the parish has more than doubled its population; and if building operations be carried on with as great vigour during the ensuing six years as in the past, the population will have quadrupled. The new buildings are situated at the western boundary of the glebe lands, which surround the parish church, and are close on the main road. The structure does not possess any striking features in architecture, and is planned more with the view to utility than architectural beauty. The building, which is of stock brick, is interlaced with ornamental purple brick. The walls are 16 in. thick, with a hollow of 2 in. through the entire length of the building, and are bound with iron ties. The roof will be high-pitched, covered with red tiles, having an ornamental ridge or cresting. There is a porch at the north-west gable, over which is the turret with the bell. There are two large school-rooms, about 59 ft. long, and a class-room, leading off the principal school-room. The building will be ventilated with Ching's patent talc-flap turret ventilators fixed in the ceilings. The walls inside will be lined with white brick. To the east is the house intended for the schoolmaster, which consists of a parlour, kitchen, and offices on the ground floor, and three bedrooms above. There will also be a yard to the master's house, independent of the schools. To the south-west of the building is the lavatory. The schools will accommodate about 300 boys, and the cost of the building is 1,900*l*. The old site has been sold for 1,000*l*.; 317*l*. have been received from

the School Commissioners, 37*l*. from the National Society, and 800*l*. have been subscribed by the parishioners; the schools will therefore start free of debt, and the plans having been approved by the Government inspector of schools, the teacher will at once be entitled to the grant. It may be observed that the playground to the rear of the school will extend back several hundred feet, and form the boundary of the glebe lands. The architect is Mr. H. Martineau; and the contractors are Messrs. Manley & Rogers, Regent's Park.

THE NEW GOODS DEPOTS OF THE MIDLAND RAILWAY COMPANY IN LONDON.

AMONGST other new works and buildings now in progress for the Midland Railway Company, along the line of country through which their railway passes, the company are about to erect and open new premises in different parts of the metropolis. We understand that the company have secured the site upon which Whitecross-street prison until recently stood, and that they are about to erect upon it an extensive goods depot, and receiving-house for the district around the east end of the City. We are informed that the buildings in question will cover an unusually large area, and be of great magnitude. They are further about to construct a coal and goods depot, of enormous dimensions, at Wandsworth, on land which they have purchased from the London, Chatham, and Dover Company, to the extent of 10 acres. They have also secured a portion of the buildings now in course of erection at the junction of Fleet-street and St. Bride-street, for Messrs. Cook & Son's tourist offices. The portion of these premises taken by the company, includes the basement and the two shops forming the ground-floor in St. Bride-street, which will be fitted up as goods and parcel receiving offices for this district. The large new premises just erected by the company, in High-street, in the borough, for a similar purpose, at a cost of 15,000*l*., have just been opened. This depot covers an area nearly 2 acres in extent, the building itself, which has its main frontage to High-street, and which is three stories in height, being a prominent architectural feature in the neighbourhood, and containing the offices and store-rooms, with two large and handsome shops which the company intend to let. The depot, where the goods are received and forwarded to the main goods station at St. Pancras, is at the rear of the building, and is approached through a spacious gateway at the west end. The principal portion of the area of the depot, which is nearly an acre in extent, is covered over with a glass roof, supported by iron columns and girders, and on the east side is a large platform raised about 4 ft. above the ground level, on which the goods are deposited, the rest of the space being set apart for marshalling the company's wagons and trucks. Immediately in the extreme rear beyond the goods depot, large and commodious stables have been erected for the company's horses. These stables, which have stalls for 50 horses, are constructed on two heights, one above the other, the upper stables being approached by an inclined plane.

VALUE OF BUILDING LAND IN WALTHAM.

THE twentieth letting by auction, for building purposes, of land on the Waltham Common Estate, took place on Monday last, at the Elephant and Castle Tavern, when there was a very large attendance of builders and others interested. Messrs. C. Stuart Barker & Son officiated as auctioneers, and Mr. Barker, in opening the proceedings, made some interesting preliminary remarks as to the value of the land on the estate, and the houses which had already been erected upon it. He stated that about 1,000 plots of land had been disposed of up to the present time, and an equal number of houses and shops erected, the present estimated population consisting of persons residing in houses belonging to the estate being about 8,000. The plots let on Monday, on leases granted for a term of eighty years, comprised sites for the erection of twenty-six private houses, containing an average area of 17 ft. by 62 ft., together with a site for a tavern at the junction of Thurloe-street and Faraday-street, 68 ft. by 57 ft., containing an area of about 560 square yards. The

sites for the private houses were all readily let at an annual rental of from 5l. to 7l. each. The site for the tavern, which was described as one of the most valuable plots on the whole estate, commanded an active competition, and was eventually let at a yearly rental of 270l. The result of the day's letting amounted to an annual rental of 428l. 15s. The aggregate rental of the plots on the estate let up to the present time is upwards of 6,800l. per annum.

THE COAL AND IRON TRADES.

The force of combination has been taught by the trade-unionists, and, above all, by the building trade-unionists, to others besides the working classes proper; and we now have those engaged in trade or commerce, as well as proprietors and capitalists, combining, virtually or purposely, to raise prices to heights dictated solely by their greedy desire to make money, and only limited by the impossibility to extract more from the public purse. The principle of competition in this respect is a failure,—for the present at least; and the question is, what sort of principle is to supersede it? Co-operation has been considered the proper antidote or remedy for the evils of competition; but what is combination but a kind of co-operation? Coal-owners combining are just coal-owners co-operating; and so it is with coal-dealers who follow suit; so is it with iron-owners and dealers. The poor coal-workers force their masters to raise their wages 9d. per ton, and forthwith the price of coals is raised 9s. A host of intermediaries are attacked by the epidemic, and act upon a like principle; and by the time the coal reaches the consumer, 9s. are by no means the whole increase on the price. No one is satisfied with his previous profits; each must have more; and it is only the absolute inability to get more still, that arrests the price at last. The price of hutchers' meat has no doubt been increased in a similar way by intermediaries or middlemen; and no wonder one bears, as the writer of this happens to have done, of a mere hand-over of cattle, or small salesman, earning 15l. on a single transaction, and another paying 30l. for diamond earrings for his wife (who has absolutely become insane, and raves about millions of money, in consequence of her husband's extraordinary prosperity).

Whether coals will fall in price during the coming winter seems very doubtful: in the meantime, a mania appears to have seized upon the coal-owners and traders.

At a meeting of West Yorkshire colliery proprietors, held at the Queen's Hotel, Leeds, it was unanimously resolved to maintain the present high prices for coal.

Some uncomsolable wretches in the north have announced another rise of 5s. a ton. It is to be hoped they will have just the same sort of success as if they had insanely called it 55s.

Meantime, other countries are benefiting by the British coal mania; and so are our own colonies. The finest quality of steam coal (equal to the best Lanarkshire) is now being sold free on board at New London, Nova Scotia, at 8s. sterling per ton of 20 cwt. The same quality of coal is now selling free on board at the Bromielaw, Glasgow, at 21s. per ton of 20 cwt.

The search for more coal still continues, and with success; but are not the searchers bitten with the coal mania themselves? And will they not just charge "the market price" to the public, as do others? Or will the principle of competition induce them to forego the powerful influence of combination or co-operation amongst their fellows? Coal consumers are working the co-operative principle in self-defence. A co-operative society is being organised at Leicester among the working classes. A committee reports that coal could be bought at the pit's mouth at 10s. per ton, and good household coal at 8s., being from 10s. to 12s. per ton lower than the prices demanded in Leicester! The committee recommend that the coal be conveyed by canal instead of by rail.

Much good may be done in economising fuel, as by the *Builder* fire, now coming to the front again, on the small or domestic scale, and also by other means on a larger scale. The manufacturers of Sheffield, goaded to make experiments in the way of discovering new sources of fuel supply, have been pleased by a new process, which has been immediately adopted,—a process of burning engine slack into coke. Seeing that coke cannot be had under 30s. or 35s. per ton, the discovery promises to be exceedingly valu-

able, and is being very generally tested in all directions.

Speaking of the hardships of the coming winter, the *Sunday Magazine* for October says:—

"Food is dear, fuel is dearer, the potato crop is diseased, and much—only sufficient to be an excuse for an outrageous rise of prices, perhaps; struggles of labour and capital become more intense; the English labourer, slowest and most immovable of men, has begun to agitate; the whole under-stratum of society appears to be heaving. What is to be the result? Or to look only to what is immediate, how is the winter to pass over? If the upper and middle classes will feel a difference, and if the working classes will find that nearly all that they have gained in higher wages is taken back in higher prices, what will become of that class whose incomes, fixed and unelastic, can undergo no improvement? What will become of the clergyman and the teacher, the clerk and the annuitant, the widow and the invalid, who find it so hard to make ends meet even when the times are favourable, and who cannot but be chequered when prices suddenly rise? It is a strange experience to come upon us in the heart of a spell of such unwonted prosperity. It will at least serve to give scope to the thoughtful benevolence of those who are not satisfied with appeasing the outcry of the noisy, but would fain contribute to the adjustment of more honourable claims."

There seem to be symptoms of a decline in the prices of iron, which bid fair for a fall in coals also. The following prices are quoted by Messrs. Underhill, the leading iron merchant firm of South Staffordshire, at Wolverhampton:—We have this day (1st October) reduced the price of iron as under, from our list of July 12th, 1872:—

Bars, hoops, and strip.....	2l. per ton.
Sheets and plates.....	3l. per ton.
Thin-plates.....	3s. per box.
Iron wire.....	1s. per bundle.

The iron trade still displays an upward tendency in Belgium, but prices are rather uncertain, and vary considerably from day to day. Merchants' iron makes from 12l. to 12l. 16s. per ton; refining pig, from 5l. to 5l. 12s. per ton; and plates, between 17l. 4s. and 18l. 8s. per ton. Rails average about 12l. per ton. Some works show little inclination to undertake fresh rail contracts, but others display a readiness to accept even lower rates than the average quotations. Old rails have advanced from 7l. 4s. to 8l., and in some cases to 8l. 4s. per ton. The French iron trade continues in rather a feverish state. No. 1 rolled iron has been dealt in at the Haute-Marne at 12l. 16s. per ton. In the Meurtbe-et-Moselle pig remains in great demand, and it is very difficult to obtain deliveries with punctuality, as there is scarcely any disposable stock. The export iron trade of France is considered to be extending to Germany, Italy and Russia have forwarded the most orders of late. The production of Bessemer steel is also increasing in France; the Denain and Auzin Forges Company has concluded a contract with the Northern France Railway Company for 80,000 tons of steel rails, to be delivered in the course of the next ten years. The French coal trade remains in much the same state; neither merchants nor proprietors of works have been able to lay in all the supplies which they require. In common with their Belgian *confères*, French colliery-proprietors complain of a great scarcity of working miners. There is still much activity in the Belgian coal-mining districts.

THE IRON AND COAL TRADE IN THE NORTH-EAST OF ENGLAND.

ERECTION OF NEW FURNACES.

The iron trade in the Durham and Cleveland districts is in such a state of activity that the erection of new blast furnaces is necessary. The district at present contains 136 blast furnaces, against 127 erected in August, 1871; and those are reported to be producing 162,808 tons of pig iron per month, or nearly 2,000,000 tons per annum. But increased furnaces are required, and seventeen are now being built, which will give an increase of 15 per cent. on the present productive power. Of these new furnaces the Luckerby Company are building two near Eston; and Bolekov, Vaughan, & Co. one at the same place; Cochrane & Co. one at Garro Fleet; W. Whitwell & Co. two at Stockton-on-Tees; the Consett Iron Company, one at Consett, near Durham; the North of England Coal and Iron Company one at Carlton; the Rosedale and Ferry-hill Iron Company two at Ferry-hill; Downey & Co. two at Coatham, near Redcar; the Tees Bridge Iron Company two at Stockton-on-Tees; Robson, Maynard, & Co. two at Redcar; and Messrs. Thomas Richardson & Co. two at West Hartlepool.

In connexion with the coal trade of the dis-

trict new mines are being opened in several parts of it. A new shaft is being sunk at Crook Hall, near Durham, and at Waldrige Fell preparations for opening two pits are in progress. The owners of the Byron Colliery are sinking a shaft near South Edmonstone; and at Acon Close another shaft to work the Hutton and Busby seams is in course of construction near the Charlow Colliery, whilst at Sacriston a large number of workmen's houses are being built, as well as 400 new coke-ovens. A company is also being formed consisting of practical men to re-win the Hutton seam in the county of Durham, Mr. J. Lishman being the engineer, and also one of the proprietors of the undertaking. It is said that the Beaupark Company have come across the Hutton seam, and will soon have coal in the market. The Chilton mines are also about to be worked on an extensive scale. The whole of the mining property in this district is reported to present a scene of great activity, and it is said that as the royalties are opened out and worked, there must, beyond all doubt, be an early decline in the price of coal.

THE PURCHASE OF THE BRIDGEWATER CANAL.

The purchase of the Bridgewater Canal, which amongst its other ramifications, traverses the part of Lancashire between Manchester and Liverpool, is a somewhat gigantic enterprise for two gentlemen to be engaged in their private capacity. It appears that the purchase has been negotiated by Sir Edward Watkin, chairman of the Manchester and Sheffield, and by Mr. Price, chairman of the Midland, Railway Companies, but that the purchase is the private speculation of the two gentlemen in question, and is in no way connected with the two railway companies which they respectively represent. The Manchester Chamber of Commerce appear, however, and no wonder, to be incredulous on this point and have passed a formal resolution to the effect that "it concurs in the opinion of the Select Parliamentary Committee of last Session that waterways should not be absorbed by railways, and hereby expresses its opinion that the transfer of the canals between Manchester and Liverpool to certain railway directors is adverse to the commercial interests of the two towns." It is stated that one object of the purchase is so to alter the canal as to adapt it for steamship traffic, which would doubtless have a most important effect on the freight of cotton and other merchandise between Liverpool and Manchester.

THE GREAT FIRE IN THAMES-STREET.

Most of our readers will have heard of the great fire which took place at 118, Upper Thames-street, on Friday evening in last week, whereby nearly the whole of Mr. George Mitchell's valuable stock of marble mantelpieces, stoves, and sculptured work has been totally destroyed. Although Mr. Mitchell has in consequence lost property to the extent of between 5,000l. and 6,000l., which is only partly insured, we are happy to say that the loss is not ruinous. The circumstance of this fire is only one more striking incident in a very singular career.

From a book which has recently been published, "The Romance of Peasant Life in the West of England," by Francis George Heath, we learn that about twenty-eight years ago Mr. Mitchell was a poor farmyard boy in Somersetshire, earning 4s. a week in the employ of a hard and cruel master. He possessed, however, a singular amount of energy and perseverance. At nineteen years of age he left his native village,—Moutacnte, near Yeovil,—and although he could not read or write, he came to London. He had previously picked up some knowledge of the stone-mason's trade. We extract the following from the book to which we have referred:—

"The remainder of George Mitchell's career may be told in a few words. During the twenty-five years that he has been in London he has exhibited a truly remarkable amount of perseverance and ability in the prosecution of his business. From step to step he slowly and surely advanced. From a mason's lad he became a journeyman, and from a journeyman a small proprietor; and from the position of the small proprietor he advanced to that of the rich and prosperous merchant; and I am assured that at the present time his business is one of the most prosperous of its kind in England. 'But,' said Mr. Mitchell to me, 'in my great prosperity I have not forgotten my former condition in life. My heart bleeds for the poor farm labourers in my native village, and I have told them that if the farmers will not better their condition, I will guarantee to find employment for a number of them in connexion with my own trade in London.'"

Mr. Mitchell has taken a very active part in the agricultural labourers' movement, and his time and his money have been expended upon the cause. We are glad to know that the present loss will not in any way interfere with his business. The Upper Thames-street branch is now being temporarily carried on at 1, Duck's-foot-lane; his show-rooms in the Brompton-road are full of stock; and his works in Walton-street, Brompton, are in full activity.

CONSECRATION OF ST. GILES'S PARISH CHURCH, READING.

St. GILES'S, Reading, has been enlarged and restored, and is now open for divine service. The work of restoration and enlargement embraced the demolition of the former chancel, vestry, sham arcade, and the whole of the roofs throughout, the nave being now lengthened out eastward some 22 ft., and new north and south transepts, each 22 ft. by 28 ft., added on either side, thus increasing the area of the body of the church to the extent of 1,870 square feet. An entirely new chancel, 42 ft. by 22 ft., has been erected, with a vestry on the north side, 32½ ft. by 18 ft.; a chancel aisle for children on the south side, 26 ft. by 18 ft.; and a porch at the south-west end of the south aisle, 12 ft. by 10 ft. internally. The interior dimensions of the church now are:—Extreme length from east to west, 126 ft.; width across nave and aisles, 70 ft.; width of nave and transepts, 85 ft.; height to ridge, about 42 ft. The new walls are built of brick and rubble stone, with flint facing on the outside, Donling stone being used for all exterior dressings, including the tracered windows, which are mostly of large size. Gorsham Down stone has been used for all the dressings on the inside, including the sedilia, with polished granite shafts, piscinas, &c.; the various steps, kerbs, and landings being of Forest of Dean, York, Pennant, &c. The new roofs, constructed chiefly of pitch pine, are of high pitch and open-timbered, having principals at frequent intervals, of the collar-beam type, with moulded ribs springing from the wall-plate, forming a series of pointed arches, which, with the great number of curved wib braces introduced in the sides of the roofs, are effective when viewed from below. These roofs are covered with local tiling, of the manufacture of Messrs. Wheeler Brothers, of Reading, the ridges being formed with ornamental red tiles, supplied by Mr. Cooper, of Maidenhead. The church is seated throughout with low pitch-pine benches of simple design, fixed to board-pitches. The remainder of the floor-space is paved with 6-in. tiles, of three colours. The chancel floor, except a portion occupied by choir-stalls, is also laid with tiles of a richer design. Seats of wainscot oak are placed in the chancel for the accommodation of the choir, with prayer-desks at the west end for the clergy. The pulpit is of wainscot oak, semi-octagonal in plan, having six panels round the sides filled with tracered heads, and carved paterae along the cornice. The pulpit proper rests on a base of rubbed white Mansfield stone, approached with four steps of the same material. The nave arcades consist of four wide-spreading pointed moulded arches on each side, resting on three somewhat slender pillars, with deeply-moulded caps and bases; these pillars being small in diameter and few in number obstruct the view only to a small extent. The chancel arches, with their moulded members, carved capitals, and clustered shafts of polished red granite, have an effective appearance, improved by the metal screens on each side, with gas-jets along the top (by Mr. Leaver). A low metal screen and gates separate the chancel and nave; these stand on a low wall of wrought and moulded stone, with three central steps leading up to the chancel. The portable furniture of the church, such as the Litany-desk, font-cover, vestry-table, &c., are executed in wainscot oak, from the architect's designs; the communion-table is made of old English oak, selected from the old timbers of the former church, by the clerk of the works.

The walls throughout the interior are plastered with trowelled stucco, and the spaces between the rafters of all the roofs are lathed, plastered, and whitened. The warming and ventilation of the church have been carried out by Mr. Woodcock, of London and Paris, and are on the "hot-air" principle, a special vault being provided for the apparatus under the vestry, and small lids have been formed in the wooden floors under the seats,

for the purpose of assisting the warming and ventilation of the whole church. The spaces under the floor are concreted over to the thickness of 6 in., and the concrete and the whole of the floor timbers have been washed over with a chemical solution to prevent the growth of fungus and the spread of dry rot. These precautions are due to the architect, and were included in the contract.

The works to the tower, which consist of a new stago and a lofty stone spire, are matters for a second contract, now entered into by the Messrs. Davis, but certain works to the lower stage have already been done. These consist of a new west doorway, a new tile floor and steps, sundry repairs to the walls, and a screen of pitch-pine under the tower arch. The ceiling of the ringing-floor has been caased with pitch-pine boarding stained and varnished, and collected with old oak ribs and bosses from the former work. The porch at the west entrance has been removed, and the approach generally improved. The carving has been done by Mr. Earp, of London; some of the heads in the arcades, &c., are quite works of art, and reflect the highest credit on the carver, whose abilities have a wide and enduring reputation. The whole of the works of the restoration and enlargement of the church have been carried out by Messrs. J. & T. Davis, of Banbury, builders, at a cost of between 7,000, and 8,000*l.*, from the designs of Mr. James Piers St. Aubyn, architect, London, under the immediate supervision of Mr. Robert Dampier, as clerk of the works.

The whole of the gasfitting arrangements were done by Messrs. Wright & Shackel, of Reading. Twenty polished brass Gothic standards were so arranged in the church that an equal light was everywhere observable. Two brackets with triple lights were fixed in the entrance porch, a small Gothic standard to the pulpit, and corona for the vestry.

An improvement has been effected in the exterior by taking down the high iron fence, which rendered any good view of the church almost impossible. This has been reduced about 2 ft., and re-fixed in a more modern style by Messrs. Wright & Shackel.

Among special gifts may be enumerated the east window, representing our Lord in glory, presented by the Misses Hulme, and the two-light window, also in the chancel, presented by Mr. O. G. Maurice, and Mr. Lowndes; both these windows were executed by Messrs. Glayton & Bell; the reredos, executed by Messrs. Powell, of London, in "opus sectile" mosaic, the joint gift of the Revs. A. A. Gameron, B. R. Body, G. R. Honey, and the Misses Hulme; two-light window, by Ward & Hughes, replaced with additions by Lady Dukinfield, in memoriam; two-light window by Hardman, in memoriam, presented by Mrs. Sherwood; one light of a painted window, given by Messrs. Gladden & Son, which will be fixed as soon as a second portion is provided.

PARISH MORTUARIES.

THE St. George's, Hanover-square, Committee of Works having been requested by the vestry to consider the necessity or otherwise of having a mortuary or mortuaries in the parish, together with a suitable site, and the cost of erection, the surveyor reported that, in pursuance of instructions, he had written to forty parishes and district boards on the subject, and received twenty-six replies. The St. Pancras Vestry returned for answer that they have no mortuary, but there is a dead-house in the work-house, which, however, is seldom used, but for paupers. St. Saviour's had no mortuary, nor had Mile-end Old Town, or Old St. Pancras, or the Plumstead and Westminster District Boards of Works. The Strand District Board of Works had no mortuary, but dead-houses in the different parishes of the district. Rotherhithe had a dead-house in the churchyard for the reception of dead bodies found in the Thames, but no mortuary. Hampstead had a dead-house, under the control of the guardians, which they considered quite sufficient, without a mortuary. Gambervell had no mortuary, but a dead-house in the cemetery, which was in the parish. Kensington has no mortuary, but the vestry have the subject under consideration. Shore-ditch had at one time no site for a mortuary, but it now possesses one at the rear of the Vestry-hall. St. George the Martyr's has no mortuary. The Wandsworth Board of Works has six parishes in the district each of which possesses a dead-house. St. Mary's, Newington, has a mortuary

in Manor-place, which the authorities invite the surveyor to inspect. The Chelsea Vestry have replied that they have two mortuaries,—one for the poor entirely. From Fulham the answer was that the mortuary was seldom or never used. St. George's in the East had no mortuary, but a dead-house, where bodies were taken to await an inquest. The Hackney authorities have had a mortuary since 1866, used considerably, and by respectable people. During the past year 158 dead bodies were deposited in the mortuary. St. Olave's, Southwark, had no mortuary, but a dead-house, available for casual street deaths. The Islington Vestry have a mortuary, under the control of the guardians, in the grounds of the chapel of ease. Here were taken the bodies from the workhouse infirmary, and bodies awaiting an inquest; but it was seldom used by the poor. Clerkenwell has had a mortuary since 1866, but it was not extensively used. There was a dead-house at the workhouse for dead bodies and bodies awaiting a *post-mortem* examination. Paddington Vestry replied that they had a dead-house in St. Mary's Churchyard which had been improved so as to be almost as good as a mortuary, and was used twelve times last August. St. Martin-in-the-Fields has a mortuary. The City authorities sent an account of the mortuary in Golden-lane; while the St. James's, Westminster, Vestry had no mortuary, and no site. Mr. Mitchell considered it necessary to have a mortuary,—a decent place, and not a receptacle for contractors' coffins,—and he would, therefore, move that the Vestry be recommended to erect a mortuary. Mr. Glickman seconded. Mr. Walker thought there should be a mortuary somewhere near Hyde Park-corner, as no mortuary was not sufficient for St. George's parish. Mr. J. Morris did not think the mortuary necessary. The Chairman thought there should be a postponement, as there was not sufficient information. Mr. Barlow said it would be advisable, perhaps, to ask undertakers if they ever had applications to receive corpses into their houses. Mr. Walker said corpses had to be removed from St. George's Hospital, shortly after death, into undertakers' houses; and he knew of a case where a person who had died of the small-pox lay in a coffin in an undertaker's room, and a man made a coffin by the side of it. The suggestion of the Chairman as to the postponement of the question was adopted.

LINCOLN.

ON Monday, 30th ult., the town council of the city of Lincoln held a special meeting, as a local sanitary authority under the provisions of the Public Health Act, 1872, and reappointed the officers of the late Local Board, at the following salaries:—Clerk, 250*l.*; treasurer, 60*l.*; surveyor, 120*l.*; medical officer, 20*l.*; waterworks manager, 275*l.*; inspector of nuisances, 100*l.*; they also decided to advertise for a sub-surveyor, a new appointment rendered necessary by the corporation having taken most of the sanitary work of the city into their own hands.

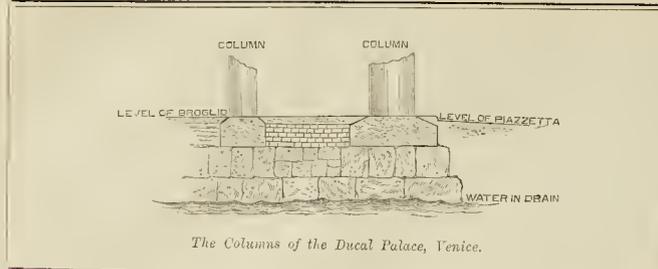

"WANTED."

SIR,—It may suit the ideas of the powers that be to retain the testimonials of unsuccessful candidates for appointments advertised in your paper, and never so much as think that the said unfortunate people deserve a reply.

Possibly, ideas of economy have something to do with this practice; but would it not be well for parties advertising for professional men to remember that, although the returning of an unsuccessful candidate's testimonials may cost 2*l.* of postage-money, the said candidate had the same amount to disburse, plus an excessive amount of time, trouble, and inconvenience, happily unknown to the advertisers. In many points, and especially so in intellectual capacity, we assert our equality with those who "want" us. Apart from that, on the ground of common courtesy alone, the trouble we are put to deserves some sort of recognition. And we have simply to assure the class of advertisers we refer to that where they retain our testimonials, and neglect to tell us whether or not we have been successful, they are guilty of behaviour anything but honourable.

DOUBLE ELEPHANT.

* * * Our advice has long been that candidates should send copies of testimonials, not the originals.

The Columns of the Ducal Palace, Venice.

THE COLUMNS OF THE DUCAL PALACE, VENICE.

WERE the columns (of the lowest tier of arches) of the Ducal Palace any longer originally than they are now? This question has been put to me constantly by travellers of all kinds, when I have replied,—“I do not believe they were longer than we now see them, for, to my mind, they would be out of proportion, judging from existing work of the same date at Verona and other places.” I have been met thus:—“But ‘Murray’ says they were.” What says Murray’s “Guide to Northern Italy,” p. 391, edition of 1869:—

“The columns of the lowest tier of arches are partly embedded in the pavement, the level of which was raised (1732) about a foot, in consequence of the inundations to which the Piazzetta and Molo were subject, which gives them an undesired appearance of clumsiness. They stand, however, not upon bases, but upon a continued stylobate, as discovered some years ago, when the Piazzetta was repaired.

It appears from observations made with care, that the mean level of the sea at Venice has risen about 3 in. in every century; so that, as these columns have been erected five centuries, about 15 in. of the lower part of them are now concealed, owing to the repeated and necessary elevation of the pavement.”

Now what is the fact? About two months ago the south-west angle of the Ducal Palace was covered in, so far as the lower story is concerned, for the purpose of examination, and the removing three or four capitals, which have become so ruinous as to endanger the existence of that part of the palace. The superintendent of the works gave me permission to go in and make what observations and sketches I wished.

When the pavement was removed, I found that the bottoms of the columns were precisely on a level with the existing pavement of the Broglia, which is about 4 in. raised above that of the Piazzetta. The columns rest upon blocks of Istrian stone, the upper one but a trifle larger than the diameter of the column, and rough-hewn, so that they never could have been finished bases. The edges of these upper blocks have been cut away in a slanting direction, to allow the close-fitting of the paving-stones just up to where the column rests upon the block, neither covering the joint nor below it.

These blocks are, in the opinion of the superintendent, the original foundation of the building, and they seem to-day as perfect and good as when placed there. The space between each column, or rather the group or tier of stones on which they stand, is filled in with red bricks and rough stones. Three layers of blocks were seen, the water (which rose and fell with the tide coming into the drain which carried off the rain-water) covered whatever there was below; but, I believe, so far as I could judge by feeling with a stick, that under the water there was also solid stone.

It was not possible to insert even the point of a penknife between the column and the stone below, so sharp and close-fitting are they.

JOHN BUNNEY.

THE TRADES MOVEMENT.

London.—On Wednesday last Messrs. Corbett & McClymont were waited upon at West Brompton by several gentlemen desirous of ascertaining what were the prospects of a speedy settlement of the dispute. The deputation were frankly told that it rested entirely with the men themselves how long the conflict lasted, as the firm had sufficient hands, and had no intention of receding from the position it had taken up. The

feeling of the public was adverse to the firm; but its friends, who were acquainted with the facts of the case, quite approved of the course it had adopted. The reason why the increased wage was withdrawn, had not yet been accurately stated. The firm had never objected to pay a mechanic 8½d. an hour, or even more, no matter what branch of the trade he belonged to, provided he was worth the money. On the occasion of the recent arrangement with the Master Builders’ Association, the foremen of the various departments were directed to make the halfpenny increase wherever it was deserved. Before, however, a week had elapsed, dissatisfaction arose, because all had not been treated alike, and placed on one and the same footing. The firm thereupon resolved to return to the old system, and the strike took place solely and simply on account of its refusing to pay good, bad, and indifferent alike. The 52½ hours there was no objection to what, over; but, at the same time, it should be understood the firm did not occupy the position of ordinary builders and contractors who regulated their prices by the ruling or standard wages of the day; but more resembled an independent gentleman employing workmen to build on his own land. No matter what he paid, he could get no more than a certain rent for his houses, and was fully justified in purchasing his labour cheap if he could, without reference to the custom or regulations of the trade.

Ten years ago, Mr. McClymont added, he and his partner Mr. Corbett came into possession of the Redcliffe Estate, when they commenced operations with fifty houses, and year by year since had gone on building roads, squares, terraces, and crescents, until the property had arrived at its present state of prosperity and extensive proportions. During that time they had got around them a great body of workmen, whom they were now sorry to part with, but whom they had never ceased to classify or pay according to merit and ability. They never had, and never would recognize any hard and fast rule, placing all men on an equality as mechanics, and reducing the highly skilled to the same level as the lesser skilled operative. That being so, Mr. McClymont thought the men might have been a little more circumspect in some of their statements; while, as for Mr. Matkin, the carpenters and joiners’ secretary, pretending to speak contemptuously of middlemen, he should like to know what would become of the workmen if there were no middlemen, in the building trade especially. He had himself risen from the ranks, and perfectly well understood that part of the question, and his opinion was it would be a poor look-out, indeed, for labour if there were no enterprising men of that kind.

The closing meeting of the Amalgamated Building Trades’ committee, which originally represented the masons, carpenters, joiners, bricklayers, plasterers, painters, smiths, and labourers, in the late struggle, has been held in the Sutherland Arms, St. Martin’s-lane, when the following resolution, moved by Mr. Coulson, bricklayer, and seconded by Mr. Sainsbury, plasterer, was passed, viz.:—

“That this Committee, having accomplished the work for which it was constituted, shall be and is hereby dissolved. At the same time we express our willingness to co-operate with all other bodies should any difficulty hereafter arise which may affect the general interests of the building trades.”

After a vote of thanks to the chairman of the evening, and to Mr. George Shipton, the secretary, the committee was formally declared dissolved, and the meeting broke up.

A settlement has taken place at Messrs. Gillin’s firm, and the joiners have resumed work on condition of working fifty-three hours per week, with the usual time for breakfast and dinner, leaving off at one o’clock on Saturdays.

A large builders’ labourers’ meeting has been held at Kingston-on-Thames. Messrs. Kenny & Halloran addressed the meeting, and the following resolution was proposed and carried unanimously:—

“That in the opinion of this meeting of builders’ labourers of Kingston and the adjoining districts, we pledge ourselves to unite with our brother labourers in London in any steps they may take to obtain 6d. per hour for our labour, which we think is little enough to enable us to procure the common necessities of life, at the present increased prices.”

Another builders’ labourers’ meeting has taken place at Chelsea New Bridge. The meeting was addressed by the same speakers, and a similar resolution was passed.

Birmingham.—A meeting of the glass and china decorators of Birmingham has been held at the Shakespeare’s Head, Livery-street; Mr. Griffiths in the chair. Mr. Biddle referred to the indifferent attitude of several employers, which, he believed, was calculated to bring about serious complications. After some remarks from other workmen present, a deputation was formed to wait upon the Brassworkers’ Society, with a view to combination, and the meeting was adjourned.

Edinburgh.—An aggregate meeting of the Edinburgh joiners has been held in the Waverley Hall, to consider “the present condition and future prospects of the trade, with reference to the rate of wages, and on the position necessary to maintain the balance of power between capital and labour.” Mr. Rintoul was called to the chair. The meeting was first addressed by Messrs. Goodfellow and Boveridge. Mr. Ramsay moved:—

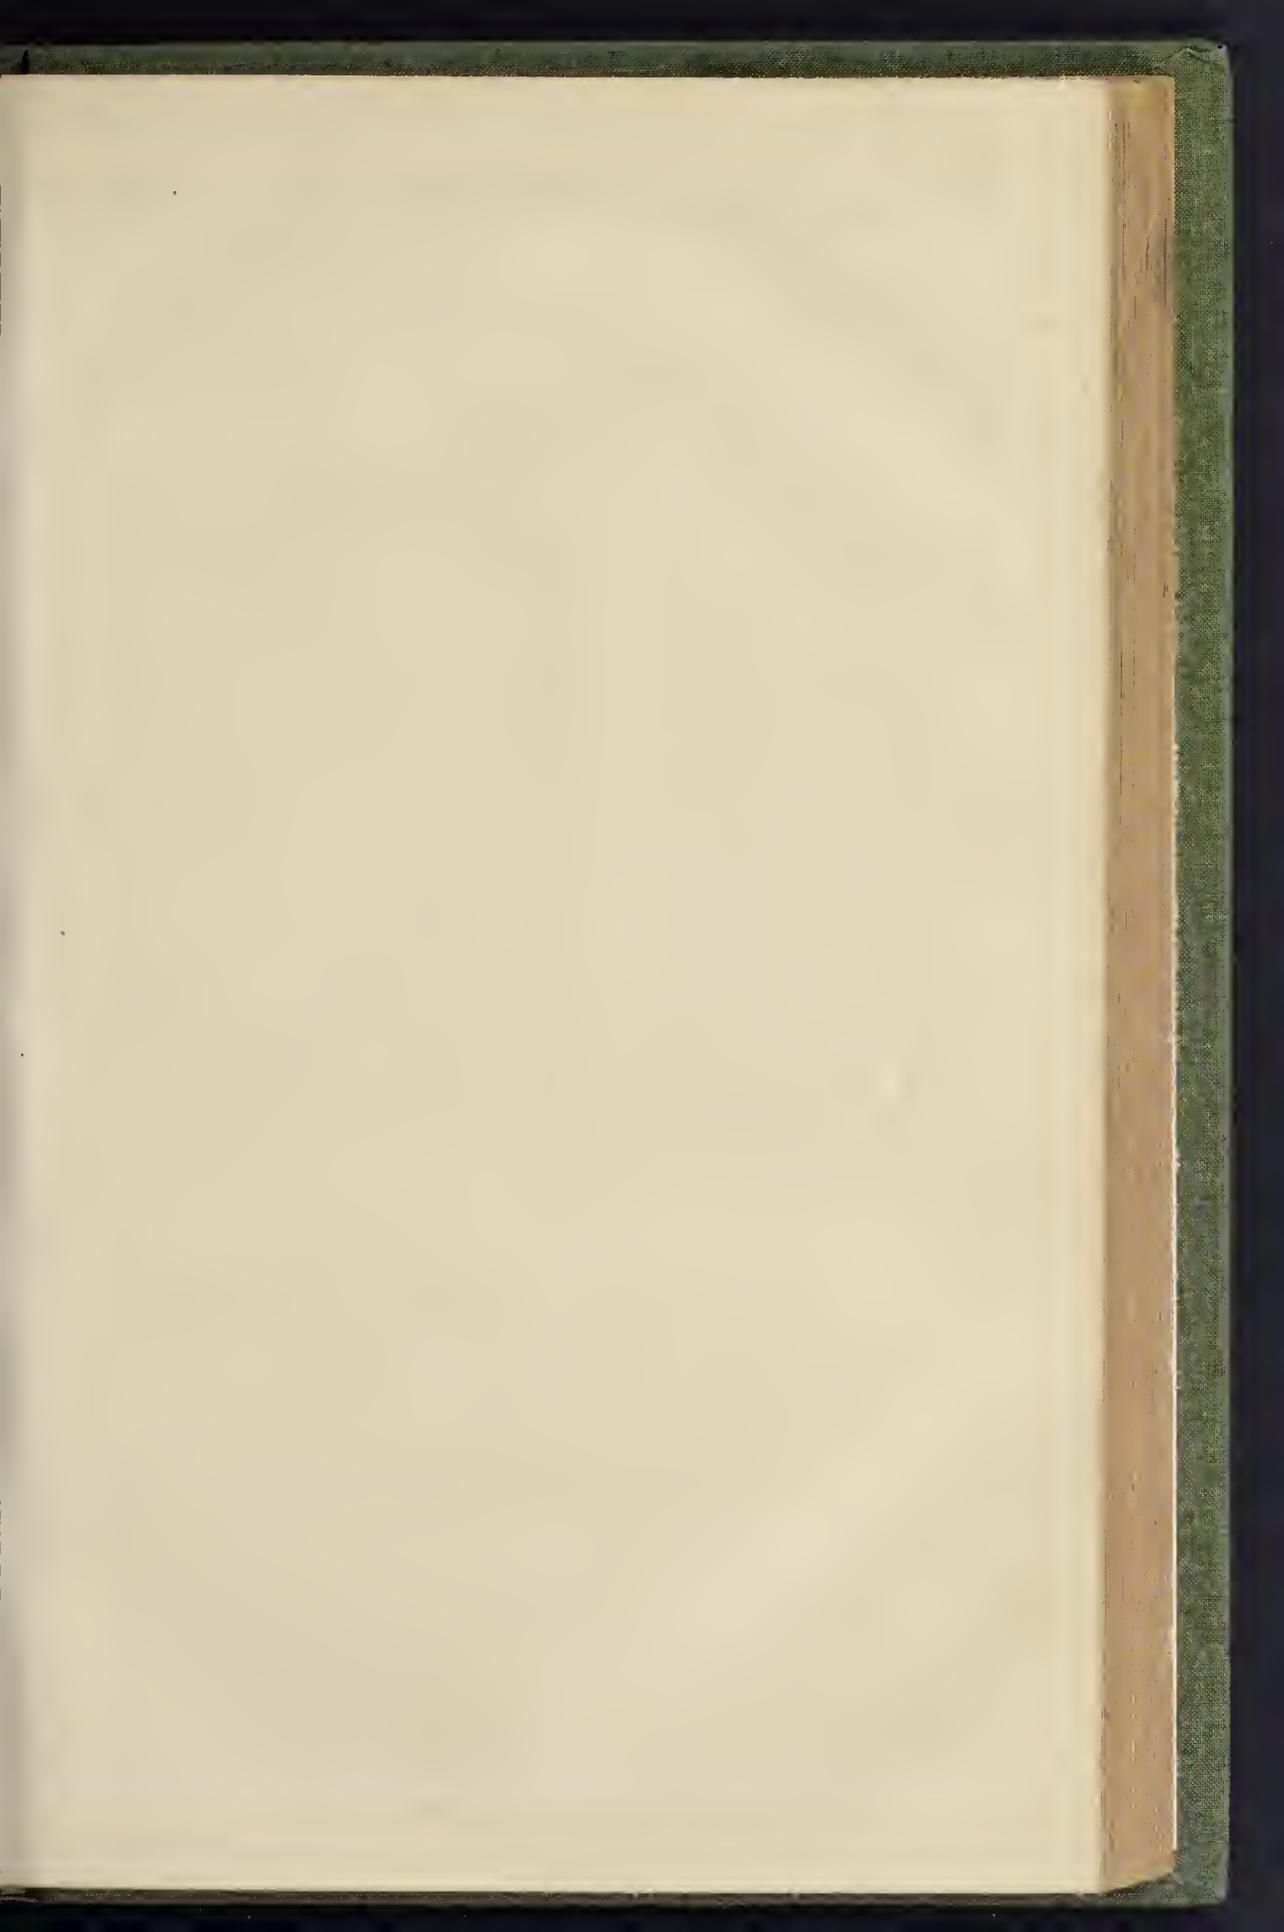

“That this meeting, being convinced that we, as a trade, are not in a properly consolidated position,—the result of which being that we do not, and cannot, in our present position, receive that remuneration for our labour to which we are entitled, and that we are not in this respect on an equal footing with the other trades connected with building,—and that in the past we have been guilty of a great dereliction of duty,—we therefore resolve that for the future we shall use all lawful and constitutional means of a practical kind within our reach for our pecuniary advancement, which, of necessity, includes our moral, social, and intellectual elevation.”

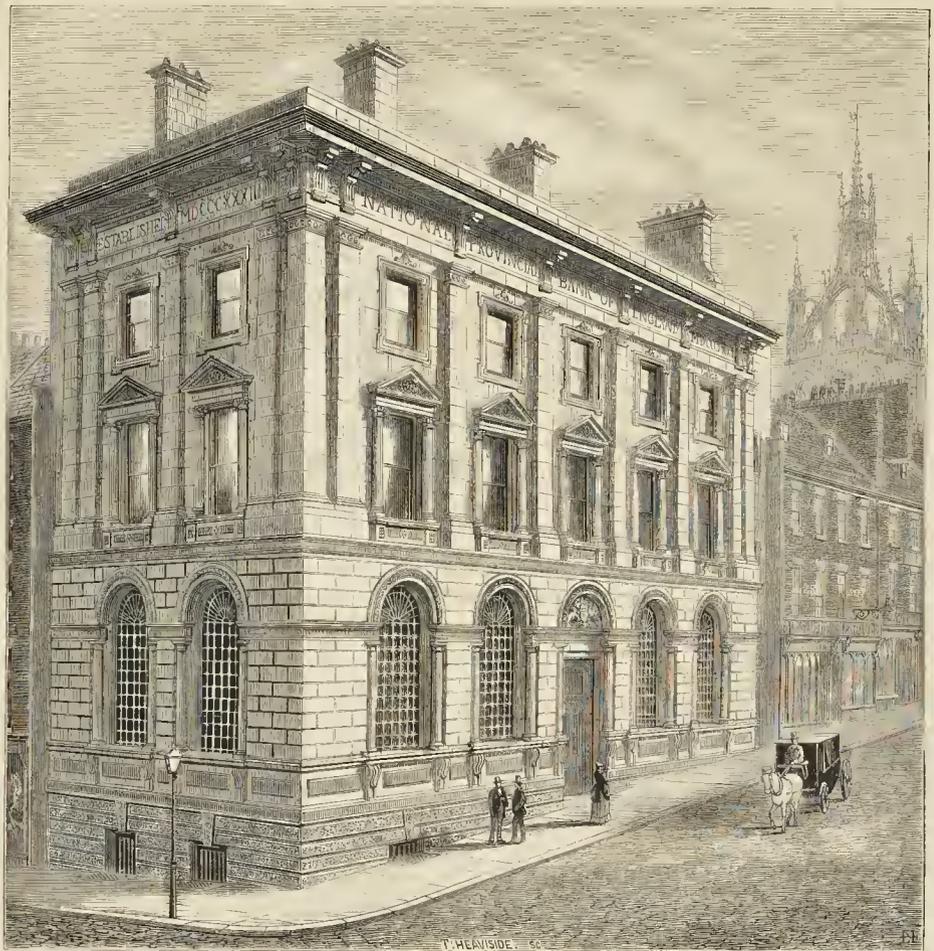

Mr. George Baird seconded the motion, and it was unanimously adopted. In respect of the second part of the programme of the business, Mr. Paterson gave a statement as to the present condition and future prospects of the trade. He said that the trade in Scotland never was better; and though in Glasgow it might not be so good this winter as in the past winter and spring, in Edinburgh it would be equally good with what it had been recently. He thought the trade should press for an advance, and that there could be no question that they were underpaid. Mr. Thom, seconded by Mr. Nisbet, thereupon moved that they should give their employers notice of a demand for 1d. per hour increased, pay to begin on the 1st of March next; and of another 1d. per hour to begin three months later. As an amendment, Mr. Vallance, seconded by Mr. Stewart, moved that the demand should be for 1d. per hour, to begin on 1st of March. A further amendment, that only ½d. per hour should be asked to begin on the same date, was moved by Mr. Baird, and seconded by Mr. McKay.

The second amendment only received 14 votes, and was set aside; the first amendment and the motion were next put together, and the amendment adopted by 136 votes against 24. It was thereupon unanimously resolved to support the demand for 1d. per hour of increase. A proposal to take up the subject of weekly pays was negatived as at that meeting, which was then adjourned.

Mr. Lowe on Strikes.—On the question of strikes, Mr. Lowe argued at great length, in Glasgow lately, against the prevalent impression that strikes permanently increased the value of commodities, or could be of lasting benefit to the working classes. Just as prices increased most the demand be diminished, unless substitutes were found. If the demand were diminished, a certain proportion of workmen must lose their employment. The rest might, indeed, gain higher wages, but that increase would be lost as improved machinery, or other agencies, reduced the cost of production. One class would be sacrificed, and the other would gain nothing.

Monumental.—A memorial cross has been erected in the grounds of Sir Percy Shelley, at Boscombe Place, to mark the intended burial-ground of the family. The design is by Lady Shelley, and consists of a sculptured base of rock-work, from which springs a rough fir-tree, nailed in the form of a cross. Three nails pierce through the cross. The inscription on the rockery is in solid lead letters, the words being “The resting-place.” The work has been executed by Mr. S. Hornor in white marble, under the personal superintendance of Lady Shelley. The four huge statues erected at the two ends of the Pont du Carrousel, Paris, have been entirely repaired, and covered with a coating of some composition to protect them against the weather.

NATIONAL PROVINCIAL BANK OF ENGLAND : NEWCASTLE-ON-TYNE BRANCH.

MR. JOHN GIBSON, ARCHITECT.

NATIONAL PROVINCIAL BANK OF
ENGLAND :
NEWCASTLE-ON-TYNE BRANCH.
STRONG ROOMS.

Our view of the above building is drawn from a photograph, which also shows the upper part of the well-known tower of St. Nicholas Church. Adjoining the churchyard is the resident clerk's and messenger's entrance to their apartments.

The front in Mosley-street is 85 ft. in length, and in Dean-street 36 ft. The height of the building averages 65 ft.

The walls generally are built of brick, the two street fronts above-named are faced with Kenton stone. The building is constructed fire-proof on the Dennett system.

The banking-room on the ground-floor is entered from Mosley-street, and is 72 ft. long by 28 ft. wide; its height being 22 ft. It is lighted by seven large windows; the ceiling, being coved, is grained to receive their semi-circular heads: the glass is embossed, and protected externally by elaborate wrought-iron grilles in lieu of shutters. On each side of these windows are polished red granite shafts. These are altogether well designed, and on another occasion we will give a view of one of the windows at large.

The artificial lighting is by three sunburners

with ornamental zinc gilt pendants, which act as ventilators; the field of the ceiling being panelled.

The warming apparatus, contracted for by Phipson, is a hot-water one; the warm air being admitted into the banking-room through flues in the walls above the level of the desks, and by other gratings in front of the counter.

The fittings are of Honduras and Spanish mahogany, contracted for by Sopwith & Co.; the public space being laid with Minton's tiles. The entrance has two sets of doors,—a folding pair on the outside, screen doors on the inside; and the outer doors are enclosed by night doors lined with iron.

The strong-room which contains the treasury is formed in the middle of the building, having another strong-room immediately underneath; its walls and arching are lined with $\frac{1}{2}$ -in. iron, and it is completely fitted for deeds, securities, vouchers, and so on. The treasury itself is placed within this room, and is 6 ft. 6 in. square by 7 ft. high. It is constructed throughout of three thicknesses of wrought iron, with non-conductors of heat between. The door to this, as well as to the outer chamber, is hard steel plated: into the lock of the latter a night-bolt passes from one of the residents' rooms; there is also an iron gate on the inner side of the door last-named. There are about nine tons of metal employed in the

construction of the above, which was contracted for by Chubb & Son. In addition to the above-named, but below the banking-room, are two strong-rooms reached by a distinct staircase: one of these rooms is 41 ft. long by 13 ft. wide for hooks: the end of this grilled off is a strong-room for the use of customers. It is inclosed with fireproof walls and arching, and is fitted with a centre rack and side shelving. Adjoining is a store for stationery. The other strong-room is in the rear of the building, and is of smaller dimensions,—it is also fireproof; and all are warmed by the bank apparatus, and have distinct ventilating shafts.

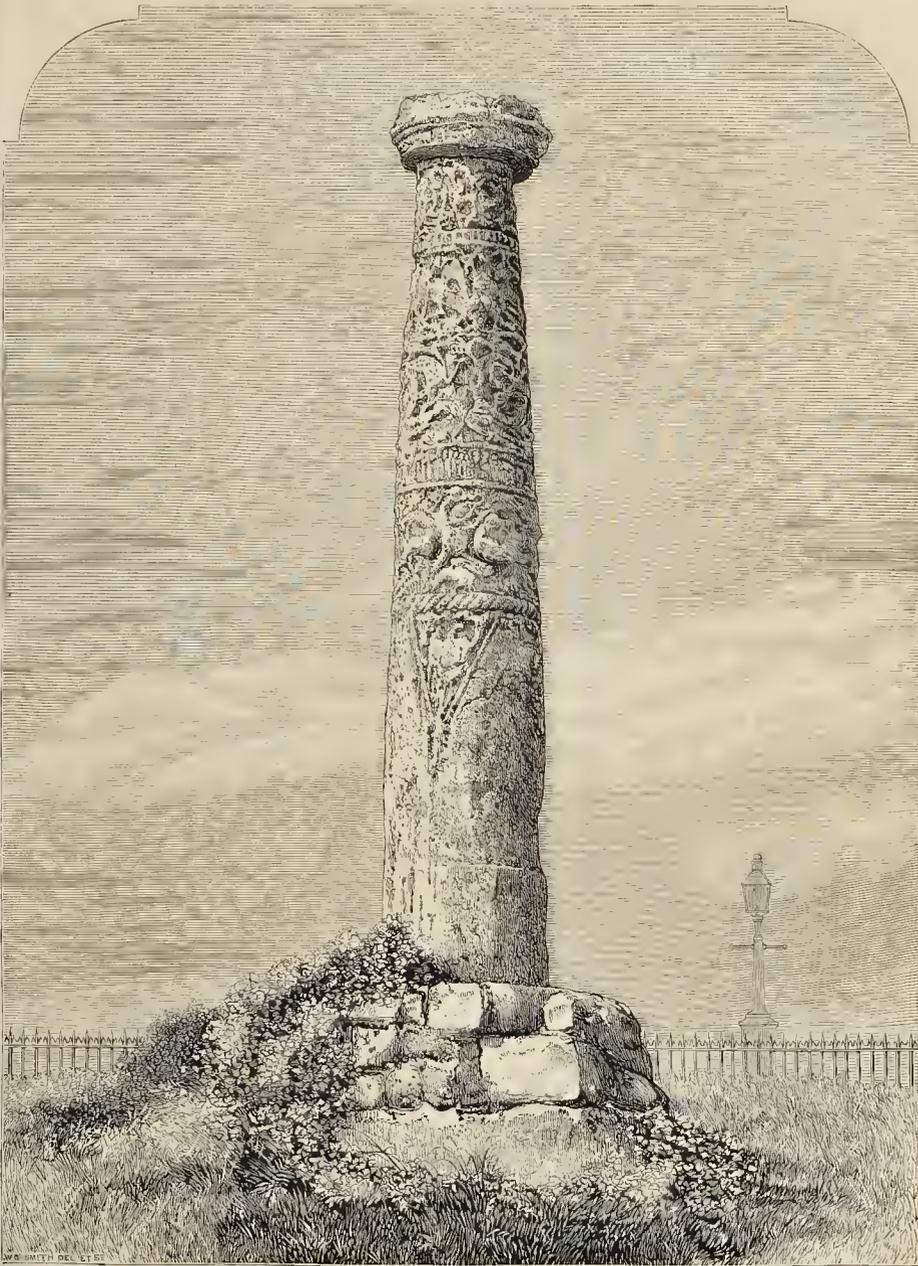

A hoist communicates with the banking-room. At the end adjoining Dean-street is the clerks' luncheon-room, lavatory, &c. The remainder of the basement consists of kitchen and other offices.

The two upper floors of the rear portion of the building are occupied as dwelling-rooms by the resident clerk and messenger.

The two upper stories of the main building are occupied for commercial and legal purposes, and in the attics are rooms for a messenger.

Mr. John Gibson, of Westminster, is the architect; Mr. Joseph Elliot the contractor for the building works; and Mr. Glover the clerk of works.

The cost of the building and fittings has been about 14,000l.

ANCIENT PILLAR IN WOLVERHAMPTON CHURCHYARD.

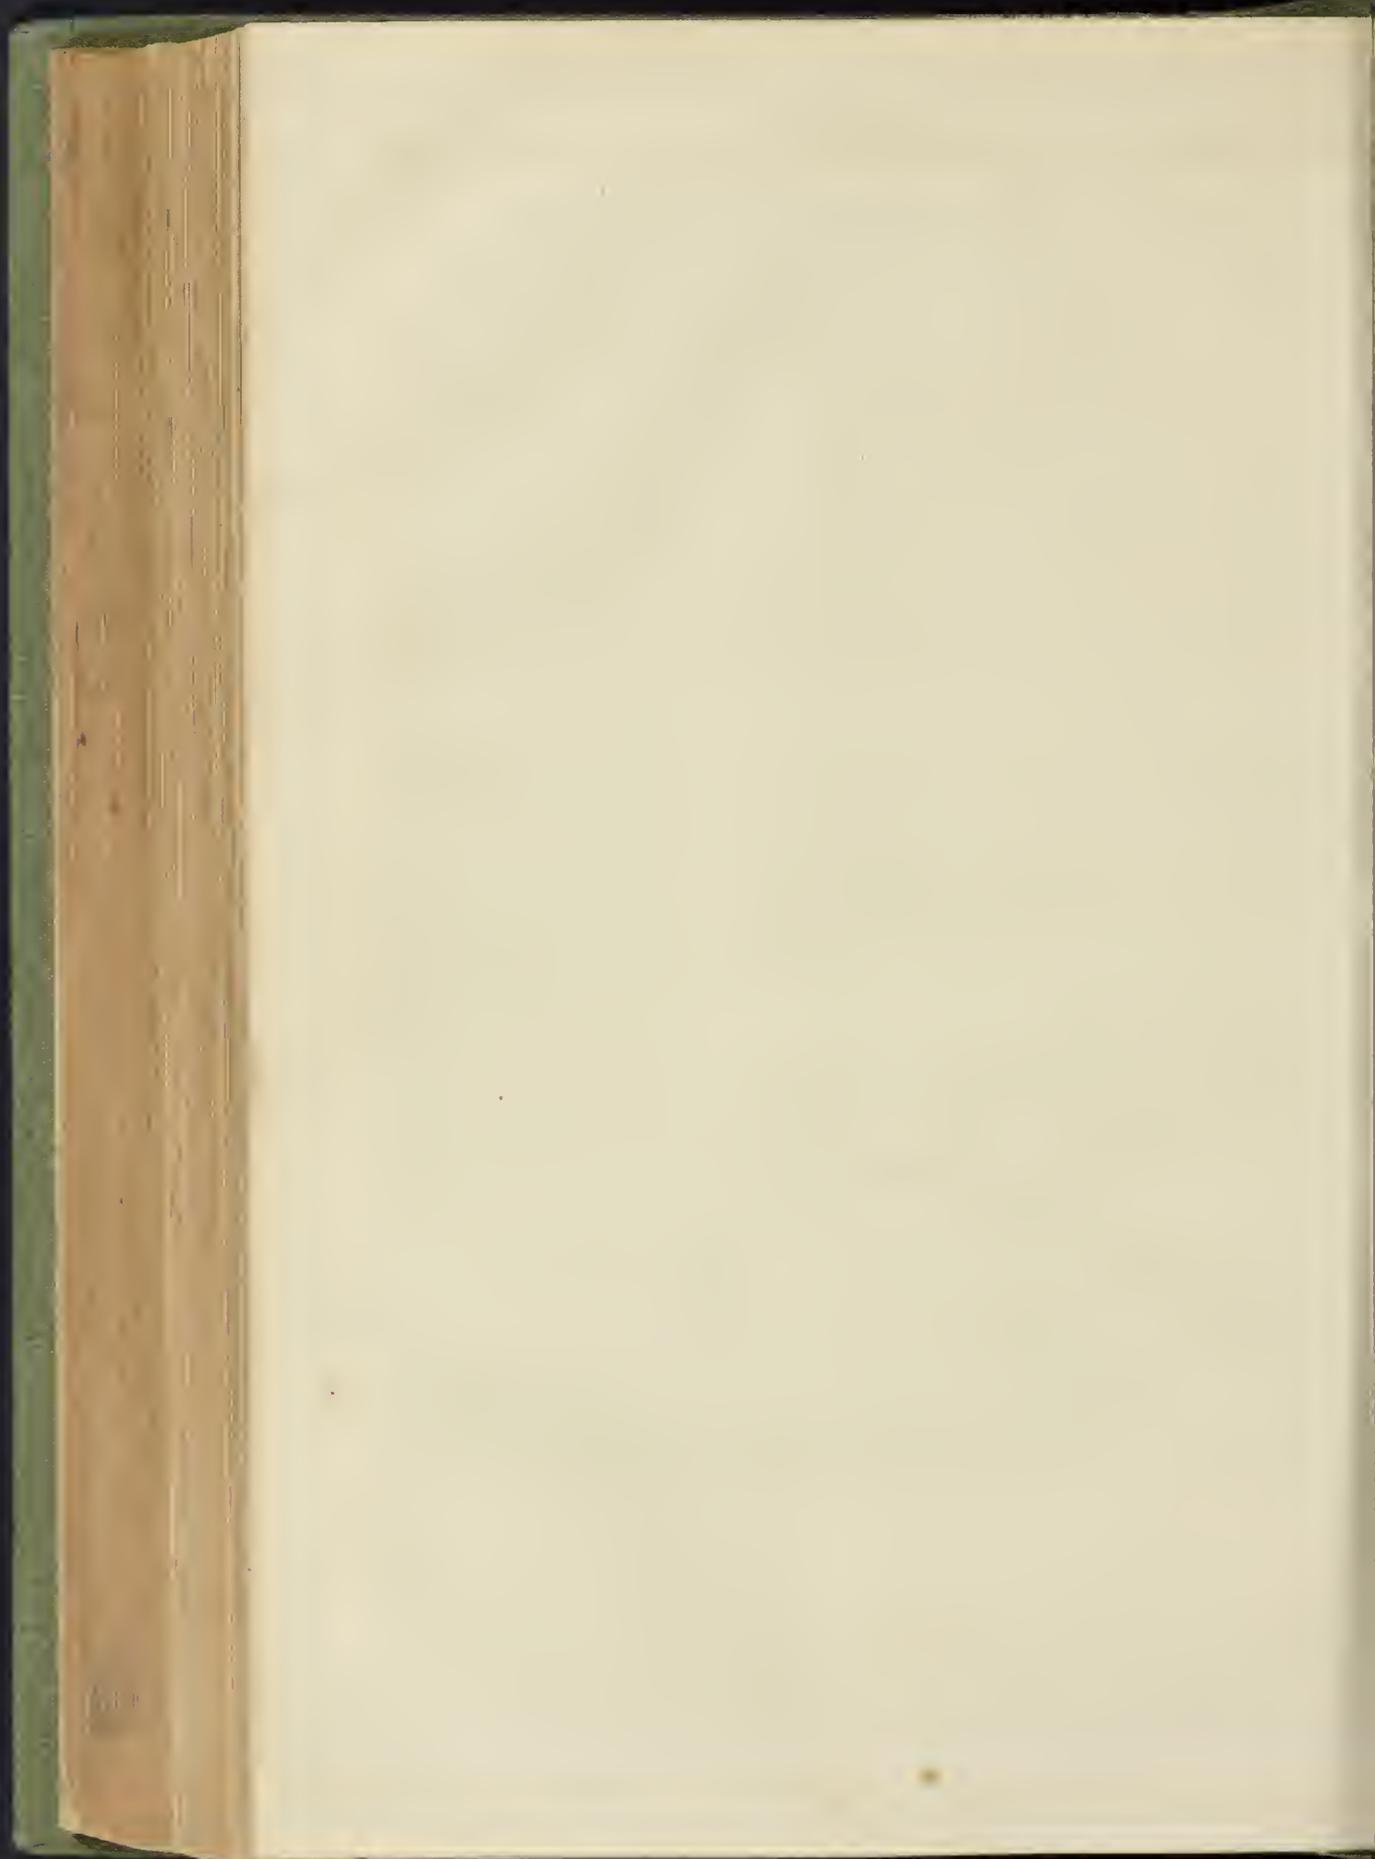

THE ANCIENT PILLAR IN WOLVERHAMPTON CHURCHYARD.

WHEN the British Archaeological Association visited Wolverhampton in August last, much interest was excited by the ancient pillar-stone or cross which stands on an elevated spot in the churchyard there, on the south side of the church, and its probable date was discussed with

much amusing pertinacity on several occasions during the visit. In our notice of the meeting we mentioned something of what had been said as to this very interesting monument, and promised that we would give a view of it on another occasion. We fulfil this promise in our present issue, and shall be glad if it enable some of our correspondents to throw light on its date by comparison with other monuments or other-

wise. We shall not scruple to repeat part of what we have already printed so as to bring together the various opinions expressed.

It has been long called locally "the Danes' Cross." Mr. Levien, on first introducing the subject, said it was so named from the remains of what were supposed to be the figures of ravens sculptured upon it; ravens having been held in great veneration by the Danes as the

of their god Odin, as eagles were believed to be those of Júpiter, the owl tho' attendant of Minerva, and the dove of Venus. The Danes had two emblematical ravens—one indicative of victory and the other of defeat; and the inscription was which of these two ravens seen by some on the pillar were. It was known that the Danes committed excessive ravages in Mercia, and it was thought on the one hand that this pillar was put up to commemorate some victory by that people, as it was not usual for people to commemorate their defeats. The Saxons, on the other hand, were quoted to show that the Danes suffered an enormous defeat in his part of Mercia; but that was the Saxon version, while there was no doubt that the Danes succeeded in firmly establishing themselves there. The cross, he thought, might have been erected to commemorate some victory; but whether of the Danes or Saxons remained undecided.

In a report on the church made some years ago, Mr. Christian says, he thinks the pillar may be called Norman work, and that it may have formed the shaft or pedestal of a cross, the upper part of which has been long destroyed. The material of which it is composed being sandstone, and the block being set contrariwise to a quarry bed, the weather has greatly acted on its surfaces, and, by plunging them out in grooves and holes, has produced marks and indentations which have so much the appearance of the carver's work, that at first sight it appears much more richly wrought than a closer examination proves it to have been. The upper step circular in form, and is a single block of stone 18 in. in diameter. Other steps, continues Mr. Christian, probably he buried beneath the efface, the soil having been much raised in this part of the churchyard. This supposition as to buried steps, let us say at once, has been disproved. A hole was dug and no other steps were found. The pillar is in this respect as it is originally placed.

Mr. Gordon Hills, in expressing his opinion as to the date of the monument, said it was well known that in ancient times crosses were erected as landmarks. Without any idea of a religious character, the Romans raised crosses as landmarks; in fact, it was one of their rules, when surveying a country, that crosses should be erected at special points. It was very probable that a cross, occupying the position which this did, belonged to very ancient times; its date depended very much upon what meaning they attached to the words "very ancient." He had no hesitation in saying that the cross was of great antiquity; but he failed to discover anything known of the Danes upon or to see anything of the ravens of the Danes about it. They would observe certain openings in the lower part, and then certain figures the form of half a lozenge. Five of these could be traced half-way up, leaving five spaces over for a figure under a canopy. In one of these spaces there were distinct remains of a figure. The figures to be traced above those spaces showed that it could not be a Danish, but that it must be a Christian monument. He believed he saw in one of the ox of St. Luke; in a second, the angel of St. Matthew; in a third, the ox of St. Mark; and in a fourth, the emblem of St. John; while the fifth was filled with scroll-work. This showed that the design was to give symbols of the four Evangelists, and from these they could venture to hazard a notion of what filled the spaces below the canopies; and in the absence of symbol in the fifth canopy, they could venture to assume that in the fifth one the Crucifixion was represented. The niches above were merely scroll-work, with various animals, griffins and others, represented in grotesque form and of monstrous description. He had examined the top of the monument, and found evidence of provision for the ornament and fixing of another stone, probably a cross. He had no doubt it was Norman work, and belonged to the twelfth century.

Mr. Godwin, when an opportunity occurred in evening, said he felt bound, in consequence of an inquiry addressed to him, to say that he could see no reason whatever why the pillar should not be of the Saxon period. His outline, which had the *entasis* of an antique column, was not Norman work of the kind that he had seen, and this outline, with the hands which were around the column, made it approach that of a later form which was generally understood to be the work of an earlier people than the Saxons.

Mr. Edward Roberts was at first disposed to consider that the work had been executed by

Saxon workmen, just before or after the Conquest; but afterwards came to the conclusion that it must be a work of the Norman period, dating from about the year 1185 to 1190.

Speaking on a later occasion, Mr. Hills said, that by the observations he had made, he had not intended to combat the question whether the pillar was Norman or Saxon. The point to which his remarks were applied was as to whether the origin of the pillar was Danish, as had been believed by some persons,—whether it owed its origin to Christianity or Paganism. He thought that any one who studied the matter, and tested the different opinions that had been expressed with regard to the pillar, would have no difficulty in arriving at the conclusion which he had arrived at with regard to it, and which it appeared Mr. Godwin had arrived at, viz, that it owed its origin to Christianity. As to whether it was of Saxon origin, that required a close examination, and a careful comparison of the carvings upon the pillar with other carvings, which were known to be Saxon, before coming quickly to any definite conclusion. He had often endeavoured to show in his arguments that the Saxons had more to do with architecture and monuments than for many years past it had been the custom to allow them. Still he thought that if any one would carefully look at the pillar, particularly at the scroll ornaments upon which he might term the second tier, he would be forced to the conclusion that it belonged to the twelfth century, for there was a decided tendency to Early English work in its carvings. That was his belief. The Danish theory was perfectly untenable. There might be something said in favour of the Saxon theory, but he thought the balance of argument was established in favour of a still later period.

We see nothing to discredit the belief that it is of Saxon workmanship, and are ready to believe that, having been erected by that people to commemorate a victory over the Danes, it became known as the Danes' Cross for the same reason that we call Mr. John Bell's fine work in Waterloo-place the Circian Monument. The cap, as it seems to us, if original, can scarcely be in its original place. This pillar is a most interesting relic, and we trust that it will be carefully preserved by the people of Wolverhampton. We are almost inclined to suggest the erection of a sort of umbrella, as rain and frost are gradually destroying it.

THE SEWAGE PROBLEM AT BISHOP'S STORTFORD.

The local board having decided to establish an irrigation-farm, plans were prepared, and Messrs. Lawson & Manser were contracted with to carry out the necessary works for 10,000. About 90 acres of land were required, situated far enough outside the town and having a sloping surface, so that the effluent water could run into the Stort. A main drain was laid down, conveying the sewage to a suitable point, where screening-tanks and pumping-engines were erected. A portion of the farm was marked out and prepared with open carriers and drains for flooding; and the ground this year is bearing its first crops, while the work of remodelling the drainage of the town is in active progress and approaching completion.

The principle acted upon in draining the town is that of keeping the rainfall and surface-water separate from the sewage, the former being discharged into the river. Two 15-horse power horizontal engines are at work forcing the manurial liquid up to the irrigation fields, the highest part of the undulating ground exceeding an altitude of 80 ft. above the level of the outfall tanks.

During the progress of these operations, Mr. James Odams, of the Grange, Bishop's Stortford, an active member of the local board, has devoted much attention to the whole question of the disposal of town sewage, and, after personal inspection of the working of many different systems, has arranged, in connexion with the works just described, a practical exposition of what he believes to be the most economical solution of the sewage problem. The *London Daily Chronicle* gives an elaborate account of Mr. Odams's plan, which essentially consists in screening the rough sewage with faggot-bundles (easily slashed afterwards), and so separating the worst of the sediment; using behind the faggots a vertical screen of copper wire-gauze of 50 meshes to the lineal inch, so that the fine scum is caught on its surface, to be also cleaned

by a douche, as the faggots are. The bad odour is thus nearly removed. The cleared liquid then runs through perforated lead piping over the ground of the farm in gentle showers forced by the steam-pump to a height of 10 ft. to 15 ft., distributing it equally over the entire surface of the field in drizzly showers, the arching jets of spray spanning to 20 ft. on each side of the perforated pipe, and leaving no spot unvetted.

"The great advantage claimed for the new system is that, by artificial showers, it applies the fertilising liquid with the utmost economy, as well as in the manner most natural and beneficial both to plants and to the soil. Not a particle is wasted, unless it be by evaporation, which is not considered to be serious in amount. But in the flooding system, the water being its own carrier, and flowing upon the surface of the land, must of necessity saturate or overdose the nearer portion of each bed or slope before it can wet the farther side; while it is most difficult, if not impracticable, to give a full dressing to the side of a bed furthest from an open feeder, without a portion of liquid running over into the waste drain. On the fountain-system no less arises from streams sinking into cracks and fissures flowing away in the subsoil drains. The gentle showers are suitable for all crops, and may be given during any period of time, by night or day, in cloudy weather or in sunshine, as found advisable; and there is neither soaking of the roots and stems of plants, nor neglect of portions of the ground with inevitable detriment to its mechanical texture and condition.

The crops of grasscut upon the acre of old meadow land now under experiment at Bishop's Stortford certainly tell wonders in favour of this good imitation of natural irrigation.

It should not be forgotten that this new system is a mechanical improvement upon the very earliest practice in sewage irrigation: the marvellous products of Canning Park and Myre Mill, in Ayrshire, and of Tiptree Farm, in Essex, having been obtained from surface application to the growing plants by manual distribution with pipe and hose.

We understand that the entire outlay for the lead piping amounts to somewhat less than 30*l.* per acre. This, indeed, exceeds the general cost of preparing land for ordinary flooding. For though the cost of preparation at Aldershot was 4*l.* to 5*l.* per acre, and that for Merthyr Tydfil is said to have been very much more, the work at Bedford, including the covered earthenware pipes, was executed for 10*l.* per acre; and from the experience at Lodge Farm, Barking; at Mr. Hope's Breton Farm, near Romford; and at other places, the average expense of laying out may be considered to be about 15*l.* per acre. But there is this important consideration—the lead remains at all times marketable at about three-fourths of its original value; and, what is a great saving, no manual labour or attention is required to keep the field apparatus in order, as with carriers, gutters, drains, stops, hatches, &c., in overflow irrigation.

Another application of Mr. Isaac Brown's invention, we may add, may also be seen in operation at Stortford. Some of the principal streets for a length of 1,000 yards are watered by fine jets from lead piping, laid down in the foot-pavement just on the inner side of the kerbstones, the little gutter in which the pipe is inserted being filled up with asphalt, excepting, of course, where the springing-holes are exposed, these places having small iron caps or shields to prevent injury of the pipe while giving free egress to the upward-shooting jets. It appears that by directing the jets in arches no higher than horses' legs, or by watering half the width of the roadway at once, there need be no hindrance to traffic, or discomfort to passengers in open vehicles. Objections made to this system when tried at Hyde Park are said to be here obviated; and we observe that the London authorities are urged by one of their own members to try a similar system in London.

The operations at Bishop's Stortford, both in sewage utilisation and street-watering, Mr. Odams, we understand, will be happy to show and explain to gentlemen on any Saturday during the next few weeks.

CHELSEA EMBANKMENT.

The Chelsea Embankment Committee have recommended the Chelsea Vestry to negotiate for the purchase of the Cremorne Wharf freehold property for the sum of 13,000*l.* In the vestry, Mr. Fisher moved the adoption of this report, and recounted the various previous acts of the committee. First of all they negotiated with Mr. Simpson, of Cremorne, whose freehold price was 20,000*l.* They then tried the Thames Conservators, who wanted a scheme carried out in connexion with the wharf which would have cost 20,000*l.* exclusive of compensation. There were two other schemes, one of which would have involved an expenditure of 30,000*l.* or 40,000*l.* They could borrow the money required for sixty years, and the freehold wharf would save the parish 1,000*l.* a year. Mr. Cobb denounced the idea of giving 13,000*l.* for land which a few years ago was going a hogging, and he could not vote for this extra burden on a poor grogging parish like Chelsea. Mr. T. Symons reminded the Vestry that at one time the rates were 4*s.* 6*d.* without the police rate, and now all the rates were only 2*s.* 1*d.* Mr. Davidge said that both

the Thames Conservators and the Metropolitan Board endeavoured by every way to shut them out from access to the river. Mr. F. Jackson said 13,000l. was the price of the land only, and before the land was ready for wharfage purposes 20,000l. would be spent. The working expenses, too, would be considerable. The recommendation of the committee was adopted, and the committee instructed to negotiate for the purchase of the land.

THE PARK-LANE SEWER.

The great Park-lane sewer question has just been settled in a rather unexpected manner, and by the sewer itself, and stranger still in favour of H.R.H. the Duke of Cambridge, in dead opposition to the St. George's Vestry. For after H.R.H. had consented to have the sewer in Park-lane opposite Gloucester House altered, at his own expense of 140l., the surveyor, Mr. Tomkins, informed the St. George's, Hanover-square, Committee of Works that during the progress of the 3 ft. 9 in. by 2 ft. 6 in. egg-shaped sewer in Park-lane, a portion of the old sewer cracked and fell in, thus rendering a new sewer necessary the whole length (about 200 ft.), so that instead of 120 ft. of old sewer and 80 ft. of new invert, there must be a new sewer of 200 ft. Mr. Tomkins thought this new sewer would be a benefit to the parish, though one of the committee entertained a different opinion.

BRISTOL CITY SURVEYOR.

At a special meeting of the Council, held on Tuesday, under the presidency of the Mayor, a lengthened report on the subject of the appointment of a city surveyor was presented. The committee recommended the appointment of Mr. Josiah Thomas on the following terms:—

That he shall not practise as an architect within the borough.

That he shall not be in business as a builder within the borough.

That he shall cease to prepare plans for laying out ground for building purposes within the borough.

That he shall not be concerned in any manner adversely to the interests of the Corporation, either within or outside the borough.

That his private business shall practically be restricted within the borough to surveys for the purpose of valuations, and valuations only.

That the whole of his work connected with the City surveyor's office shall be carried on in Prince-street, proper accommodation being afforded.

That he shall be paid a salary of 750l. per annum, to include the expense of a horse and carriage to be found by him.

That such clerks, draughtsmen, inspectors, and assistants as shall be deemed necessary shall be paid by the Council; but the power of appointment and dismissal of such clerks, draughtsmen, inspectors, and assistants shall be vested in the Streets Improvement Committee for the time being of the Sanitary authority, Mr. Thomas being empowered to suspend any of them.

That Mr. Thomas be allowed to collect and receive for his own use all the district surveyors' fees under the Bristol Improvement Acts; and that he shall pay over to the Corporation the net sum of 900l. per annum in respect thereof.

Mr. Alderman Green moved as an amendment, "That the city surveyor shall devote the whole of his time to his office, and not engage in private practice." The amendment was negatived by 19 votes to 14.

ROADS IN BRISTOL.

A NEW road from the centre of the city, in the direction of Cotham, Kingsdown, and Clifton, has just been completed. It is called Colston-street, and connects St. Augustine's-place, near the Drawbridge, with Perry-road. The new road is about 450 yards in length, 40 ft. wide, and the gradient one in sixteen. This is an improvement on Park-street, the gradient of which is one in eleven, and which has hitherto been the principal route to Clifton. The carriage-way in Colston-street is macadamised, and one of the city tramways will be laid down here when the price of iron justifies the authorities entering on such an undertaking. The new thoroughfare has been constructed under the superintendence of Mr. F. Ashmead, city engineer, assisted by Mr. T. H. Yallicom, and its construction has necessitated the demolition of several ancient buildings. Steep-street, too, has disappeared. This was a strange old street, very steep, with projecting dormicles, and used to be the route of the Welsh mail, over St. Michael's Hill, by way of Redland-lane and the Passage.

MECHANICS' INSTITUTE, COED-Y-GRIG, PONTYPOOL-ROAD.

The employees of the Great Western Railway propose building a mechanics' institute from plans by Messrs. Lawrence & Goodman, Newport, Monmouthshire. The building will comprise a reading-room, 28 ft. by 22 ft. by 20 ft. 6 in.; a library, 11 ft. by 22 ft. by 20 ft. 6 in.; separated by a movable wooden screen, and with gallery over: these can be thrown into one for a lecture-room.

There will be a curator's residence at the end, and the entrance to the building will be an arched lobby, 19 ft. by 6 ft. 6 in., with circular staircase at the side leading to the gallery. This staircase will form a turret with slated spirelet roof, and the end of lecture-room will be finished as an apse forming the platform. The cost will be about 600l.

"WORCESTER CATHEDRAL."

The *Builder* of September 21st informs us (p. 750) "that the year 1873 will probably witness the re-opening of the entire cathedral in its completely restored condition."

May I venture to suggest that the present mean appearance, caused by "the lead removed from the roofs, and slates substituted, 1791" (according to "Deighton's Guide to the Faithful City"), should be amended before the entire edifice can be deemed to merit that flattering description?

So much has been done, and is in progress, with no niggard hand, in the way of restoration and amendment, that I would fain think the replacing of the metal covering must form part of the contemplated operations, and that it is a question only of time, depending for its accomplishment on the essential one of finance?

N.

THE NEW SCHOOLS FOR STAPLEHURST.

A MEETING has been held at Staplehurst, to consider the amount of expenditure proposed by the School Board, in the erection of their contemplated school buildings. The tender of Messrs. Bridge & Cox, of Maidstone, which the Board had accepted, amounted to 3,307l., and this was, by many of the parishioners, thought to be quite an unnecessary outlay. It was ultimately resolved by the meeting to send the following letter:—

"To the Right Hon. Edward Forster, Vice-President of the Educational Department.—SIR,—We respectfully ask your assistance to prevent the School Board of this parish from incurring a heavy outlay in the building of their proposed schools. We have 1,800 persons in the parish, and the number of children likely to attend school is about 300. Our School Board have invited tenders for the erection of the buildings, and the lowest sent in amounts to 3,307l., which the parishioners consider to be a most excessive outlay. We therefore address you, as a majority of the inhabitants of this place, with a view to secure the prevention of so large an outlay, and asking you to withhold your consent."

Some seem willing to go to the length of a 2,000l. tender.

METROPOLITAN BOARD OF WORKS.

At the meeting last week a report was brought up from a committee of the whole Board to whom several tenders were referred for consideration, and they recommended that one by Mr. Good-year for the Hammersmith work for 796l. 10s. be accepted; for the second work, that of Messrs. Easton & Anderson, for 800l.; and for the third work, that of Mr. George Wall, for 54,600l.

Value of Land in the City.

Mr. Dresser Rogers, as chairman of the Finance Committee, announced that the National Safe Deposit Company had paid a cheque of 5,500l., being one year's rent of the triangular piece of ground near the Mansion House. This company hold a lease for this piece of ground for eighty years.

District Surveyors.

A letter was received from Mr. C. A. Long, district surveyor of Newington, stating that he was desirous of removing his office from the Walworth-road to No. 11, Clapham-road, and requesting the approval of the Board thereto.

Mr. S. Barker (representative for Newington) opposed the application, and said that Mr. Long had not been much more than twelve months at his former residence; that he was altogether opposed to the shifting about of district sur-

vveyors, as it led to great public inconvenience and mentioned the fact that Mr. Long had not waited for the permission of the Board to make the change, as he had already vacated his premises in the Walworth-road and gone to the place he then asked permission to go to. He moved that this application be referred to the Building Act Committee for consideration and report.

Mr. Runtz, in seconding the motion, said the builders and others were put to the greatest inconvenience by the district surveyors changing their residences.

The motion was then put and unanimously agreed to.

LEAD ROOF-COVERINGS.

SIR,—In a recent published statement I observed it said, that in covering the flats and sides of roofs with lead, the sheets "were laid between 'rolls' running up and down the roof, which were protected by 'roll caps,' also of lead, each sheet or 'cap' being only hung, as it lay inclined in its place, by its upper end, where alone it was fastened, if fastened at all, and not merely held by friction against the wood 'rolls' to the timber sheeting beneath, with which the roof framing was wholly covered." And it goes on to say,—"No better practice than this of the plumber's art of leading roofs has ever been devised" &c. Now I question this, because my locality we have for many years been in the habit of practising a different, and as it appeared to me a better, system of doing the work. In our style we neither require "wood rolls" nor "caps" when covering flats or sides of roofs with lead (although, when zinc is the material used, we employ both); but, owing to the manner of coupling the sheets together at their side, said coupling, if I may so speak, in itself forms "roll" and "cap" all in one. The writer very properly observes that lead gutters were, ought to be, laid in "drips;" but, as I understand, there is much difference in practice as to the depth of these drips. In many places they are only about 1½ in., or, as in some cases, even only 1 in. deep. Now, for various reasons, consider that far too little; and, in my opinion, for a good job, the depth of "drips" ought to be about 3 in., or as much more as you can afford, or choose to give.

ANOTHER PLUMBER.

ALBERT MEMORIAL: A SUGGESTION.

This costly monument, combining much that is graceful in architecture and sculpture, is not attracting crowds of visitors, who daily ascend the steps and linger in converse with the philosophers, poets, painters, and sages who are perfectly sculptured in life-size upon the massive frieze which surrounds its base. Altogether stands unique, and, to my mind, is unequalled by any other extant. Having said so much, may, however, be permitted to make a remark through the *Builder*, as to the pyramidal basement of granite steps, which would seem to have been heaped up after its erection; conceal what ought to be a pedestal or base, of character suitable to the superstructure. This pyramid granite rises to the height of 13 ft. from the pavement of the grand plateau (which occupies a square of 74 yards), having at the angles four pedestals, about 13 ft. high, supporting groups magnificently sculptured, representing Engineering, Commerce, Agriculture, and Manufacture.

The granite steps rise from an interior base of 144 ft. square, and mount to within 8 ft. the elevation of the massive pedestal, which is 36 ft. in width, exclusive of the four angular sculptured buttresses, thus giving a very proportionate elevation to the pedestal of structure so varied and so massive, a width of 36 ft. by a height of 8 ft. 1 in.

Now, were all this pyramid of steps cleared away down to the level of the plateau, the pedestal finished in suitable style, as also the four angular groups, this memorial would be a vastly improved effect; besides that the surrounding woodland scenery, which is now obscured by the graduated mound, would lend grace not enchantment, to the view.

Looking from the Long-walk towards Albert Hall, that building is five digits eclipsed as viewing it from the Park-drive side, a shallow mound of granite despoils the integrity of the monument, having the aspect of blocks temporarily heaped and deposited there, but hav-

affinity to the general design, which it fearfully mars.

Were this pyramid cleared away down to the plateau, and the pediment finished, as are our other lofty memorial columns, theulptered figures on the frieze might still be seen from a distance of only 12 ft., and being freed from constant manipulation, would in a rich finish to a clearly-defined pedestal, and at the same time leave an opening between the groups, showing rich and ornate plantations, which always contrast so favourably with works of art and architecture.

QUONDAM.

"* Our correspondent seems to have overlooked a suggestion to the same effect made on several pages some time ago by Mr. James Ferguson. In truth, however, the idea has occurred to many observers, and is spreading."

BUILDING IN BITUMEN.

SIR,—“A Builder” addresses some observations and inquiries to you, “before investing” in “Norton’s Patent Bituminous Building Connection Company, Limited.” The arrangements for granting patents must be curious if Attorney-General has sanctioned an application for a patent for building with bitumen. Sixteen years ago I was requested by a contractor to make him an estimate for some water-casks in Yorkshire (Halifax, to wit), and for that purpose he put into my hands the specification, a printed copy of which had been sent to me. The conduits, or some of them, were to be built with parpint wall stones, and the joints of which was to be poured melted asphalt, asphalt, tar, or bitumen,—for I forget the exact form in which the material was to be used; and although we do not commonly call a building a building, yet one would think that the Attorney-General, in the exercise of his public duty, when this patent was applied for, would consider the use of this material in the manner I have named to be sufficient to preclude the grant of any patent for its use in the manner named “A Builder.”

It is stated that this is the same Mr. Norton to some years ago invented a dangerous compound,—one, it was asserted, that would procure fire by being driven into the ground in almost any open space,—or, for the matter of that, in any place whatever, open or not, provided there was water in the ground at all. It was said, at the time of the Abyssinian war, that these compounds were found very useful to a marching army. That may be well understood to have been true, for they marched through an uninhabited country, comparatively with our own; and to introduce such a contrivance to the towns of England is a pestilent thing. I am glad to believe that the common sense of my countrymen has been sufficient to prevent any use of this stuff, so far as I have been able to ascertain; but I have known inquiries to be made by people living in towns whether they could not procure a supply of water for their household purposes from the porous ground of their back premises by driving down one of these pumps, the inducement being, of course, that the pumps were cheap, and the evil being that the men were ignorant, and believed in speciouses.

AN ENGINEER.

COLOURED GEMS.*

THE name of emerald is applied to three different minerals.—

The green variety of corundum known as the emerald of the East, is a variety of beryl, and is in Ceylon, Ava, Peru, &c. The coloring matter is derived from the presence of a metallic oxide, and it is only another name for a green sapphire or a sapphire of green colour. I have seen emerald, not exceeding half an inch square, valued at 500l.

A more common stone, but not less precious than the choicest character, is a variety of beryl, which is a crystallised anhydrous silicate of alumina with glucina. The gem is preferred of deep grass-green colour, arising from the presence of animal matter,—a hydro-carbonate, derived from fossilised organic remains belonging to the lower cretaceous formation. It is associated with black micaceous schists.

The pale varieties of green beryl are called aqua-marines,—pretty, but not costly. The emerald is met with in crystals of enormous size,

but of inferior quality, varying from leek-green to a waxy yellow.

3. Prismatic emerald is a name for the variety of mineral called *euclase*. It is a hydrated silicate of alumina and glucina. Examples may be found of various colours. A. HALL.

THE ANT NUISANCE.

SIR,—Your admitting the letters of “B.” and “W. B.,” on the subject of the ant nuisance in houses, induces me to hope that, now the question is raised, it may not be lost sight of until a satisfactory cure is mentioned.

“W. B.’s” suggestion of sulphur fumigation is out of the question in very many cases. Will any one tell us of something that ants *dislike*, and that will drive them back into the gravel under the house, whence they come? I am alluding to the little black ant. It infests ladders and basements, generally of perfectly new houses, in London, and because it does so it is a subject quite proper for treatment in the *Builder* as to how to get rid of the nuisance.

I hope you will not allow this matter to pass until it is thoroughly sifted, and oblige,

A LONDON HOUSEHOLDER.

SIR,—A correspondent has asked to be informed of a remedy for swarms of ants, by which his house is infested. A similar inquiry was made a year or two ago by a correspondent of the *Times*, and in reply numerous remedies were given by various persons, who had tried and found them all effectual. I subjoin some of them for your correspondents’ information:—

1. The wing or wings of a turkey or other similar animal, with the feathers left on, and laid in the places frequented by the ants. Swarms of the insects attach themselves, and they are then destroyed by dipping the wing in boiling water, and then again placing it to attract others.

2. Place saucers filled with weak rum and water, sweetened with brown sugar. The insects are attracted by myriads; and the liquor must be changed daily.

3. Sprinkle the embowders and other places infested with strong liquid ammonia,—the “*liquor ammoniac fortiss*,”—which will also destroy black beetles.

4. Washing the places infested with a solution of alum causes the insects to disappear.

5. Sprinkling the places infested with creosote. 6. Placing camphor in small muslin bags, and hanging these in the infested places, causes the insects to disappear.

7. Soft soap and water smeared in the various haunts of the insects expels them rapidly.

The various parties giving these remedies all state they have extirpated these pests by the means stated. C. H.

ACCIDENTS.

TEVOLI.—The thoroughfare in Middle-street has been stopped through the dangerous condition of the Temperance Hotel. The wheels of a trolley broke through the road, and discovered a rather alarming subsidence of the soil underneath the metal crust of the road. Late in the evening there was a more serious accident of the same kind immediately in front of the Temperance Hotel. The road soon caved in for half the width of the street, the doorstep of the house gave way, and then the foundation on the right-hand side of the doorway became exposed and quickly sank several inches. The house is a three-story building of brick, and the effect of the sinking foundation was at once visible in threatening cracks of the brickwork front, with breakage of window-glass and bulging of the window-frames. Two or three builders and a number of workmen were summoned to the scene, and the superintendence of the work was intrusted to Mr. F. Cox. Under his directions short pieces of balk timber were placed in the chasm as supports to the foundation, and the face of the house was shored up with long planks. The town surveyor and other officials visited the spot. The house still stood; but the tenant has removed his furniture. The house projects beyond the line of a recent improvement in the street; but we doubt whether the owner sees it in this light. The house was built on the edge of an old sewer, which was only partially filled up when the new sewer was put down. The excavations on that occasion, and again when the water mains were laid, disturbed the soil under

half the road; and probably for some time past the soil has been washing away by the action of water from the old drain, recently assisted by escapes from the water-pipes that burst when first charged. Anyhow, many cartloads of earth must have disappeared from this site before such a tunnelling could have been formed under the road as has now been discovered.

BARROW.—A number of men were engaged in the erection of a bridge at the terminus of a loop line from Marsh to Ormskill, and for the purpose of facilitating the work, a scaffold had been erected, upon which a crab was placed. At the time of the accident four men were on the scaffold, ready to lower, by means of the crab, a large piece of stone which had been swung, and four others were underneath prepared to place the stone in position on one of the piers. Without any warning, the structure fell with a crash. The men working underneath managed to escape uninjured, but the other four were very seriously hurt, and one of them now lies at the hospital in a very precarious state.

HANLEY.—A loop line of railway is to pass under the bottom part of Waterloo-road, just outside the borough of Hanley. The earth has been excavated for some distance under the road and props placed under the portion undermined. As a horse and cart were passing over this spot the road gave way, and the horse and part of the cart fell in. On their being extricated the horse was found to be much injured by its fall of from 17 ft. to 18 ft., and it died in about half an hour. The cart, which was empty at the time, was damaged. The insecure part of the road was at once fenced off. It is supposed that the supports did not extend far enough under the road, and that the portion which gave way was not sufficiently supported.

HOSPITAL PROVISION IN ROUEN.

SIR,—I have lately read a History, &c., of Rouen, translated (abridged, yet considerable) into English, perhaps rather a topographical curiosity, from foreign Press.

So much has been said of the history of this renowned city, that I will not enlarge on it. But its “hospital” charity seems noble, even by comparison with London and our principal cities and towns, and even to be further suggestive.

The number of beds in the Hôtel Dieu, for a city population, omitting vicinity of (I believe) within 123,664, is six hundred, nearly approaching the number in Bartholomew’s, 720.

But this is not all. There is a large subsidiary hospital for incurables also. Patients are kept in the first for six months, and then only, if incurable, transferred to the other. We have, sir, so little done yet for incurables, that I must humbly think this might be worth the notice and recollection of some of our best philanthropists.

Might I crave this opportunity, as not many more might be accorded me, of mentioning a medical anecdote (not hackneyed), highly honourable to, though I believe far from unusual with, that honorable profession, the more that I have had the pleasure of private confirmation of similar spirit in Abernethy, who, often rough eccentrically (intentionally) with the rich, was never so with the poor; always treating them with tenderness.

A cardinal prime minister, on sending for the most eminent surgeon of his day, said to him, “You must not expect to treat me as roughly as you do your poor wretches at the Hôtel Dieu.” “My lord,” answered the surgeon, with dignified consciousness, “every one of those ‘poor wretches,’ as your eminence is pleased to term them, is a prime minister in my eyes.” J. D. P.

SUBJECTS FOR PRIZE PAPERS.

AMONGST the subjects on which the Council of the Institution of Civil Engineers invite communications are the following:—

Account of the Progress of any Work in Civil Engineering, as far as absolutely executed (Smeaton’s Narrative of the Building of the Edfystone Lighthouse may be taken as an example).

On the Application of Graphic Methods in the Solution of Engineering Problems, and in the Reduction of Experimental Observations.

On the Elasticity, or Resistance to Deflection, of Masonry, Brickwork, and Concrete, with Observations on the Deflection of the Tops of Bridge Piers, by unequal loading on the Arches abutting on them.

On the Methods of Constructing the Foundations of some of the principal Bridges in Holland and in the United States.

On Bridges of large span, considered with reference to examples, now in progress or recently completed, in the United States, including an account of the loading, and of the effects produced by variations of temperature.

On the Theory and Practical Design of Retaining-walls for sustaining Earth or Water, and on Experimental Tests of the Accuracy of the various Theories.

On the Use of Concrete, or Béton, in large masses, for Harbour Works and for Monolithic Structures.

On the various Modes of Dealing with Sewage, either for its disposal or utilisation.

On the Separate System of Sewerage Towns, with a detailed description of the works in a town to which this system has been wholly or partially applied, and particularly as to the results.

On the Ventilation of Sewers, with a résumé of the experiments as to the motion, pressure, &c., of gas in the sewers.

On the Constant Service of Water Supply, with special

* See *Builder*, p. 739, ante.

reference to its introduction into the metropolis, in substitution for the intermittent system.

On Street Railways and Tramways through Cities and Towns, and on the best mode of working them.

On the Present State of Science in regard to the Manufacture of Gas for the Purposes of Illumination.

On the Practice and Results of Irrigation in Northern India.

On the Manufacture of Iron and Steel as now pursued; the effect on strength and tenacity of the admixture of substances with the ore.

IRRIGATION AND STREET CLEANSING.

Mr. Brown (of Messrs. Isaac Brown & Company, Edinburgh), to whom we alluded on p. 789 has, by desire of the Duke of Sutherland, exhibited, at Dunrobin, the capabilities of the system of irrigation which he recently patented. The *modus operandi* is as follows:—Lead pipes, having perforations about a yard apart, are sunk in the earth. The water, turned on at several taps, and, forced through the jets in the pipes, is thrown up like spray. On the pressure obtainable depends the distance to which the water may be thrown. On a piece of ground near the main avenue to the Castle, and also on the garden terrace, Mr. Brown introduced his plan. The water was procured from the main by which the Castle is supplied. The grass at the avenue before the application of the process had a dry, parched appearance, but since, it has become green and luxuriant. In addition to the water appliance, Mr. Brown uses a top dressing of manure of his own preparation. The change effected is best seen by contrasting the appearance of the grass operated on and that growing all round it; and it should be mentioned that all this has occurred within a fortnight. There are now feeding on the pasture twenty-five sheep to the acre. The same results are apparent on the terrace, and Mr. Brown has published a variety of statements showing the benefit of this system relative to the reclamation of straths, so that they might be made available not only for the breeding but for the fattening of sheep, and he contemplates its use for watering the public streets. The duke explained the system to the Queen, who saw it in operation, and expressed her admiration of its simplicity and utility.

The cleansing of the streets of Paris is an affair of greater importance than many people would imagine. It costs the municipality more than four millions of francs per annum. There are 11,000,000 square metres to be swept every day, of which 2,220,000 are at the cost of the municipality, 5,520,000 at the cost of such owners of property as do not subscribe, and 3,560,000 undertaken by the municipality for the subscribers. The average cost is 29½ centimes per annum. A bill is about to be submitted to the Assembly for compelling all proprietors to subscribe to the cleansing of the streets.

MASTERS AND MEN.

MR. FRANKLIN writes to the Society of Arts' Journal, suggesting that there should be such diversities of engagement between employer and employed as might secure us against desertion by all simultaneously.

"The following," he says, "seem to be practical diversities of the kind required, and we invite the suggestions of others:—

1. In the case of large contracts, often lost to English firms because they are afraid to rely upon a calculable scale of wages, let the hands be invited by the heads to engage for the term required by the enterprise, and at a normal rate of wages, either subject to adjustment by cost of living, as in the case of corn-rents, or otherwise, with recourse to arbitration in need, and in manner made binding in advance.

2. Modes of sub-contract, as in mining enterprise, in railway construction, &c., a mode found most successful by the Postmaster-General, *vide* his last report.

3. Spontaneous or other modes of supplementing wages, by contributions to sick or superannuation funds, to life insurance or mutual guarantee funds, to building or common supply unions, to savings-banks, or other provident associations, all more or less for advantage of workers, in concert with the same employers. Instances of such inducements to employes, plus salaries or wages, abound, both in the public service, in banks, and in other first-class establishments.

4. Reversal of relations between capital and

labour, so as to enable combinations of workmen to take lease of factories, hire management, and borrow capital, in security of the products of their labour, less 'subsistence money.'

5. Co-operation of heads and hands on the joint-stock principle, as it exists both at home and abroad, with improved methods of audit."

STRONG ROOM FOR THE NORTH-EASTERN BANKING COMPANY, NEWCASTLE.

At the premises now in course of fitting up for this company, under the superintendence of Mr. Matthew Thompson, architect, provision has been made in the course of the alterations for a strong room of rather large dimensions: 8 ft. by 7 ft. by 7 ft. high, is the size, and the construction is as under:—The outer casing is of half-inch plate-iron; then there is 1½ in. air-space, and inside a casing filled with fireproof material, 2½ in. thick. The top and the bottom are protected in a similar manner. At the back of the interior a space is divided off, and called the inner treasury; that is the full size of the safe, and 20 in. deep, and is designed for the deposit; and around the sides of the remainder are iron shelves, 20 in. wide for cash and deed boxes. The safe is enclosed by a pair of folding doors, 6 ft. 2 in. by 4 ft. 10 in., throwing twenty-three bolts of 3½ in. by ¾ in. all round the circumference, as well as at the meeting style. A peculiar arrangement has been made by which the striking bar being removed, or unscrewed, either door can be opened independently of the other. The outer plate of the doors is ½ in. wrought-iron, next comes ½ in. thickness of steel, then a plate of ½ in. and inside the fireproof composition. The safe is approached by a lobby, a complete case of ½ in. wrought plate-iron, bolted together and to the safe; the wall in which is the door is 20 in. thick; on the inner side are a pair of folding open grills, and on the outer side an external door, of the character commonly used for bankers' purposes. It will be seen that to get access to the inner treasury, four doors,—the external door, the grill, the door of the safe, and the door of the treasury proper,—have to be opened. The work is now completed, and the fixing will begin in a few days. The work has been carried out by Messrs. Chubb & Son, of St. Paul's Churchyard, and their patent locks are affixed to the doors throughout.

SCHOOL-BUILDING NEWS.

Rotherhithe.—The memorial stone of new schools, to be called the Gomm Schools, has been laid here by Field-Marshal Sir W. Gomm, K.C.B. The schools are in connexion with the new Church of St. Barnabas. The design, by Mr. G. Legg, is Gothic, and the building will accommodate about 400 children. The site is in Plough-road, and has been granted at a low sum by the Commercial Dock Company; and the total cost is estimated at 2,600*l.*, of which 2,000*l.* have already been subscribed. A piece of land was originally given by Sir W. Gomm, but the ground was acquired by the East London Railway at a cost of 800*l.* under the powers of their Act, and the present site was then obtained. Including the value of the original site and a donation of 200*l.*, Sir W. Gomm has presented 1,000*l.* in aid of the funds.

Bristol.—St. Gabriel's Schools, Easton, have been opened. The site was given by the Ecclesiastical Commissioners and the lease-owners, Messrs. Jones & Hamilton. Having ascertained that the ground was made ground, and bad for foundations, they inquired, and found that the foundations would not cost more than 50*l.* They entered into a contract with Messrs. Wilkins & Son, builders, of Surrey-street, for 1,260*l.* for building the school. This did not include the extra foundations; and, relying on the assurance of the architect that they would not cost more than 90*l.*, they applied for 1,560*l.*; the contract, 1,260*l.*; foundations, 100*l.*; architect's commission and law expenses, 100*l.* They had secured nearly the whole of the amount (1,560*l.*), and they were then astonished to hear that the extra foundation, instead of costing 90*l.*, would cost 350*l.*, making the total building and fitting up cost 1,810*l.*, instead of 1,560*l.*, leaving 250*l.* to be cleared off. This sum must be raised before they could get either the Government grant or that of the National

Society. The schools will accommodate 550 children.

Henstridge.—New schools have been opened here. The buildings are centrally situated on the turnpike road near Henstridge Ash, being about equally convenient for Henstridge and the hamlet of Xenston. There are two commodious schoolrooms, and a master's residence, built of the local forest marble stone, rock-faced, with Doubling dressings, and roofed with red and blue tiles in horizontal bands. Behind is a walled playground for the boys, and another for the girls, with the necessary offices; and there is also a garden for the master. Entrance to the building is given by two porches, which are covered by lean-to roofs, being, in fact, continuations of the main roof. The schoolrooms are lighted and ventilated by means of large windows, square-headed, stone mullioned, and fitted with movable casements; and there are also zinc ventilators in the ceilings. They are to be heated by open stoves, the flue-pipes of which are carried through recesses in the walls, covered by ornamental gratings. The dimensions of the principal schoolroom (intended for a mixed school under a master) are 60 ft. by 18 ft.; and the infants' schoolroom, which has the usual gallery at one end, is 36 ft. by 18 ft. The architect who designed and superintended the work was Mr. H. Hall, of London; and the builder, Mr. A. Reynolds, of Milborne Port. The total cost was about 1,300*l.*, including site, &c. The schools are calculated to accommodate 136 in the large room and 80 in the infant-room, being the full number for which accommodation is required by the Education Department, the population of the parish being about 1,300.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Manchester.—The new Roman Catholic Church of St. Francis of Assisi, situated in Gorton-lane, has been opened, Archbishop Manning, and other dignitaries of the Roman Catholic Church, taking part in the opening ceremony. The church has been in course of erection for the last six years, and it belongs to the members of the Franciscan community, who settled in Gorton in 1862. Mr. E. Welby Pugin is the architect, and the style adopted is the Geometrical, somewhat modernised. The building is 184 ft. in length, 72 ft. in width, and 98 ft. in height. Though the exterior is plain,—being built, for the most part, of red brick, with stone dressings,—the stonework and sculpture of the interior render it ornate. The whole of the carving, which symbolical, has been designed by Father Cuthbert, one of the resident fathers, and executed by Messrs. Williams & Milson, of Manchester. Above the altar is a stained-glass window from the works of Messrs. Edmundson & Son, Manchester. It represents historically the life of St. Francis, and is the gift of the Rev. G. Durand. The other two chancel windows are destined to contain a representation of the lives of St. Clare and of St. Louis of France, so that the three chancel windows will represent the three orders founded by St. Francis. The Lady Chapel, at the south of the chancel, will contain a stained-glass window, by Mr. Casalini, of St. Helier, the subject being the Immaculate Conception. This is the gift of Mr. G. F. Kighley. The chapel corresponding to this, on the north side of the chancel, is to be dedicated to St. Joseph. From it two doors lead to the sacristy and cloisters. These last are constructed in the ancient style, and are 100 ft. long. On the north side of the church six confessionals are provided, which are designed in the architecture of the building. The main columns of the interior are of Halifax stone; the carved and ornamental work of Bath stone; and the chancel columns of red Mansfield stone. The chancel will be lighted by a corona and lamp of ornate character, which is being manufactured in Birmingham. Mrs. Fossata, of Manchester, is the donor. Eight standards, each 13 ft. high, will light the nave. These have been made by Messrs. Hibbert & Co. Messrs. Sidebottom & Co. have supplied the benches. Brother Patri, one of the resident priests, has superintended the erection of the building.

Haverfordwest Congregational Chapel Competition.—The plans of Messrs. Lawrey & Goodman, Newport, Monmouthshire, have been selected.

Miscellaneous.

The Great Eastern Railway Extension.

The Society of Engineers paid a visit to the works of the Great Eastern Railway Extension to Broad-street, and the Locomotive of the North London Railway at Bow. Visitors assembled at Broad-street, and first reached the site of the intended new station, which will cover an area of 9 acres. The station has a frontage of nearly 300 ft., and is laid out with eight platforms, covered in iron and glass roof, in four spans. The portions of the side-walls have been built excavated trenches, and the 9 acres of soil next have to be cleared out to a depth about 15 ft. The platform-level will be below the level of Broad-street, and will approach from the roadway by an easy slope. The line will eventually be connected to the Metropolitan Railway. From Broad-street the line will be carried on the level for three-quarters of a mile, to Brick-lane, where it will pass under the existing viaduct of the Great Eastern main line. From Brick-lane there is a rising gradient of 1 in 70 to its junction with the main line, at Bethnal Green. Works at this end of the line are in a forward state, a station, between Commercial-street and Bishopsgate-street, for the relief of the present main-line station, being nearly ready for the construction of this extension line.

The construction of this extension line involved the diversion of the high-level sewer which intersected the route, but which has now carried direct from Norton Folgate, under Bishopsgate-street, to Gracechurch-street, where joins the original main sewer. Mr. Edward is the engineer, and Messrs. Lucas, Bros., the contractors for the line, which is expected to be opened about a year from the present date.

Case for Estate Agents.

At the Leeds City Court, before Mr. T. H. Marshall, the case of Mr. Joseph Lawton, of Wortley, estate agent, sued Mr. John Redshaw, of Armsley, for 10*l.* 10*s.*, for commission on sale of land in Tong-road, Armsley. Mr. Malcolm (Mr. Granger) appeared for the plaintiff; and Mr. W. Eansley for the defendant. The plaintiff stated that in May last he sold 2,600 yards of land for the defendant, and drew up a contract, which was signed by the purchasers, the conveyance having to be completed on the 1st of July. The defendant agreed to give him 10*l.* 10*s.* for commission, which was to be paid on the sale, but he had applied for the same several times, and the defendant refused to pay, as the conveyance had not been completed. Mr. Eansley, for defence, said his client denied that the commission was to be paid until the land was paid and, unfortunately, owing to the wording of the contract for sale, which had been drawn by the plaintiff, it was doubtful whether it could be recovered against the purchasers. The law was that an agent was not entitled to his commission until the purchase-money was paid. His client said that no doubt that was so, unless there was an agreement between the parties to the contrary, and in this case the plaintiff stated the commission was to be paid when he had the land; but the defendant's evidence was, no commission was to be paid until the purchase-money was received and the conveyance completed. Neither of the parties being corroborated, he should nonsuit the plaintiff, each party paying his own costs.

Work in Ereter Cathedral.

We are inclined to think that an entire clearstory window, probably similar in character to the beautiful flow still in its place (though sadly mutilated), opposite the Bishop's Throne, has been found in the Minstrels' Gallery. The old leading of the principal portions of the glass remain, so the window can be well restored by an ingenious glass-painter to its original state. This discovery affords convincing proof that the glass of the clearstory of the cathedral at least (if also in the aisle windows), was of light and clear *grisaille*, free from gauzy colour and opaque glass, and well calculated to display the architecture of the cathedral.

Railway Union.

An association has been formed between twenty-seven companies, representing 5,535 miles of railway, in Germany, for the purpose of establishing a common charge to pay all expenses and indemnities arising out of accidents of every description.—*Mechanics' Magazine.*

Proposed New Gaol and House of Correction for Bristol.

A letter has been received by the Mayor of Bristol from the Secretary of State, enclosing a report from Mr. Briscoe, the inspector of prisons, to the effect that nothing has yet been done to adapt the city gaol, or more than a portion of the house of correction, to the requirements of the Prisons Act, 1865, and that both prisons are unfit for the confinement of prisoners, and therefore that immediate steps may be taken by the authorities to build a new gaol and house of correction. On Wednesday a very large committee met at the Council House to take this communication into consideration. The committee included the gaol committee, who are members of the town council, and a good many magistrates who were associated with them; and, after a very long discussion, a sub-committee was appointed to wait upon the Secretary of State and point out to him the very heavy pecuniary burdens under which the city is now labouring, and that the gaol, although not fitted up under the requirements of the last Prisons Act, is healthy, and in all respects, in the opinion of the committee, adequate for its purposes; and to ask, under those circumstances, that the order, if not withdrawn, might be suspended until they are better able to bear the expense. The committee were requested, in the event of an unsatisfactory reply being given to this proposal, to ask if the Secretary of State would sanction the erection of a new gaol and house of correction on the site now occupied by the city gaol.

Japanese Progress.—The Japanese are an interesting and now, at least, a progressive people. They are decidedly clever: the bronzes especially which the Duke of Edinburgh exhibited at the Kensington Museum were remarkable. Sometimes, however, they are too clever by half, as an anecdote in the *Marquis de Beauvoir's "Voyage round the World,"* translated by A. & H. Stephenson, will show:—"The Japanese, who are as thoughtless as they are bold and enterprising, amiable, but as simple as children, and who believe they know anything when they have seen it once, threw themselves eagerly into steam navigation. They bought a number of vessels, and insisted on managing them themselves. They obtained one from the firm of Dent, a splendid ship,—the *Latouan*. It arrived one morning in the roads, and at midday they had turned out all the European sailors and engineers; and, sole masters of their vessel, off they went at full steam. So far so good; but when they wanted to stop her,—impossible: they did not know how. Then our imprudent friends put the helm aboard, and began to turn round constantly in a circle, calling out for help, to the great delight of all the crews in the roadstead, till one of our men-of-war, taking pity on them, sent them a boat with an engineer to stop the insane engines."

Setting a Drawing.—If a drawing is worth anything, it surely is worth setting, that is, fixing the lead or chalk with which it is drawn, so that, under ordinary treatment, it cannot injure by rubbing. For highly-finished drawings, or where the chalk or pencil has been very liberally applied, it will be better to proceed in this way:—Nearly fill a shallow dish or tray, somewhat larger than the drawing, with a weak solution of gum-water, or—which may sometimes be more convenient—a mixture of milk and water, half of each; pass the drawing carefully through the mixture (face uppermost) backwards and forwards; then fix it up on the wall by a corner to drip and dry; or the drawing may be pinned down to a board, held on an incline over a dish, and the milk and water poured over it with a spoon, beginning at the top; it is necessary to see that all parts of the drawing have been passed over. If the drawings are merely outlines, or having very little shading over them, then the fixing medium may be passed over the whole paper with a broad, flat camel-hair brush. With careful treatment, this method of preserving drawings will be found to be quite satisfactory.—*Cassell's Popular Educator.*

The Surveyor of Winchester.—At a meeting of the town council, held on the 3rd inst., Mr. John James Lanecefield was unanimously elected city surveyor. There were thirty-five applications for the appointment.

The Building Trade in Sheffield.—There has been a general advance of 5*s.* per 1000 in the price of bricks at Sheffield. The building trade is stagnant in this town in consequence of the advance in the price of materials.

The Holborn Valley Improvements.

A local statute of last session authorises additional works in connexion with the Holborn Valley and Farringdon Market improvements. There are two pieces of ground near St. Sepulchre's Church, the keeping of which open and unbuild upon is desirable and advantageous to the public. It is declared to be just and reasonable that the cost of such public improvements should be borne by the parish and the Corporation. By one section eight weeks' notice is to be given to the labouring classes of land required on which they live. By another, the Corporation may apply any funds belonging to them (not being trust-money) in erecting on any lands acquired by them for the Holborn Valley improvements, or for the purposes of this Act, improved dwelling-houses or lodging-houses for mechanics and other persons of the working classes who have been or may be displaced by improvements effected or to be effected by the Corporation. The City may make additions to the site of Farringdon Market and effect other improvements.

Employment of Children in Brickyards.

Joseph Taylor, the lessee of a brickyard at Round Hill, Tipton, was charged with employing Charles A. Taylor, aged eight years and a half, in his brickyard. Mr. Alfred Jones, the inspector of factories for the district, said the case was brought forward to check the universal practice in brickyards of setting children to work when they brought the workpeople's meals. He found the boy in the defendant's brickyard, when he had a large apron on, was without boots or shoes, and was bespattered with clay. The defendant's son (aged 25) stood by, and said the boy would not have been at work had his father been in the yard. Emma Summerfield, a girl employed at the brickyard, stated that the boy came on an errand to her, and wanted to help her; he put on a small apron, and carried a few lumps of clay, when the inspector came up. David Taylor, the father of the boy, said he did not wish the child to work there. The Bench said it was clear that the boy was at work, and the defendant should not have allowed it; and as an example they fined him 1*l.* and costs.

Approaches to the Courts of Law.

The new company, empowered by statute to widen Serle-street and Carey-street, and erect new buildings suitable for the legal profession, will soon hold its first meeting. There are several provisions as to the directors, and the mode of procedure under the statute. The capital is to be 300,000*l.*, in 2,000 shares at 150*l.*, and no shares to be issued until one-fifth part thereof be paid up. The company are empowered to take lands and houses, the compulsory powers of purchase to continue for two years. The widening of Serle-street, as described in the plans deposited with the clerk of the peace of Middlesex, is to be effected within five years, to the satisfaction of the Metropolitan Board of Works; and in the same period Carey-street is to be widened. Further widening of Carey-street and Serle-street is to be at the option of the authorities, and the consideration for such enlargement is to be paid by the Commissioner of Works to the company. There is to be a restriction as to the height of the buildings to be erected by the company fronting Carey-street.

The English Church at Spa.

At Spa, on the 24th ult., the Bishop of Ely, on his way from the Cologne Congress, laid the corner-stone of a new English church. The Belgian Government have always contributed liberally towards the stipend of the English chaplain, but the service has hitherto been performed in a large room at a building called Vauchall, which was formerly dedicated to the very different purposes of gambling. The want of an English church has been much felt, and a subscription was opened some years ago, which, with the generous aid of the Belgian Government and Town Council of Spa, has at length enabled the promoters to commence the erection. The site selected is beautiful as well as convenient. Messrs. Habershon & Pite are the architects, and Messrs. Blackmore & Morley the contractors. The amount of the contract is 3,560*l.*

The Manchester Concrete Company

have had awarded to them a silver medal by the Manchester and Liverpool Agricultural Society, a bronze medal by the Middleton Agricultural Society, and a silver medal by the Altrincham Agricultural Society, at their shows held during the past month of September, for "superior concrete flooring."

Islington.—An appeal was made to the guardians by the contractors for sinking the workhouse well. At the last meeting of the Board a report was received from the special committee appointed to inquire into the subject, recommending that a sum of 500l. be paid to Messrs. Baker, by way of compensation, for losses in carrying out their contract. Several members of the Board objected to this proposal: it was admitted that the well was a great success, and would be the means of effecting a large saving to the ratepayers; the Board, however, declined to adopt the committee's recommendation.

Workmen's Club.—A club for the working men of Clerkenwell and its neighbourhood has been opened in Cowcross-street, just opposite to the Farringdon-street Station of the Metropolitan Railway. The fee for admission is a penny daily, or twopence weekly; or if the working man prefers, he can compound for mob subscriptions by a lump sum of eightpence quarterly. On Monday evenings, and occasionally on other evenings too, lectures of a practical, instructive, and amusing kind are delivered, and concerts are given every Saturday.

Stopping Leaks in Iron Ships.—An ingenious method of stopping leaks in iron ships when at sea, has been patented by Mr. M'Cool. "Safety-plates" are "dished"—that is, made like a dish in shape;—and when the hollow side, lined with india-rubber, is pressed against the plates of a ship, the "safety-plate" fits close, and will keep water out when held firmly in place with screws. By a simple contrivance, when the leak is discovered, means can at once be taken for fitting on the new plate.

Stonehenge: a Suggestion.—The conduct of those who, during the late autumn manoeuvres, amused themselves by carving their own miserable names at Stonehenge, has met with severe reprehension. The *Pall Mall Gazette* suggests that the names thus inscribed should be publicly advertised, and that a dummy stone be erected for the express purpose of enabling such visitors to record their names, for public exhibition thereafter in Trafalgar-square, previous to deposit at South Kensington. This plan would, to a great extent, protect the sublime from being defaced by the ridiculous.

Laying the Foundation-stone of a New Church at Bexley-leath.—The foundation-stone of the new Christ Church has been laid by Mrs. Tait, the wife of the Archbishop of Canterbury who was also present. This church, which is to cost about 8,000l., of which, however, 2,000l. only have been obtained, is to be built in the Early English style of architecture, and the length of the interior will be 150ft. clear, by 61 ft. in width. The chancel will be 47 ft. by 21 ft., and the height to the spring of the roof 39 ft., and to the ridge 60 ft. The material used is Kentish rag, with Bath-stone dressings.

The Lacustrine Era in Europe.—Lacustrine dwellings have been found in several of the Polish lakes which are now being drained; urns containing ashes have been discovered in them, together with various skulls, declared to be Asiatic and African; all of which circumstances tend to prove an antiquity extending beyond the historical times; and go to corroborate one of the chief ideas entertained in recent leading articles in the *Builder*, that Africa aboriginally contributed, in an essential degree, along with Asia, to the peopling of Europe.

The Royal Academy, according to the *Art Journal*, has arranged for another exhibition of the works of ancient masters and of artists deceased in recent times, in the winter of this year; and we are informed they have resolved on following up the plan in 1874. It will probably be an annual exhibition for some years to come. The wealth of the country is almost inexhaustible.

The Fleet Sewer.—The Metropolitan Board of Works have decided to accept the tender of Mr. George Wall, of Kentish Town, to carry out, for the sum of 64,000l., the work of the sewer which it has been resolved to construct for the relief of the Fleet sewer.

Society of Engineers.—The first meeting of this society for the new session will be held in the society's hall, Westminster Palace Hotel, on Monday next, when a paper will be read on "Telegraphic Batteries," by Mr. E. G. Bartholomew.

Printing in Enamels on Porcelain.—A machine has recently been invented by a citizen of New Haven, Conn., for printing in coloured and gilt enamels on china and pottery, which, it is claimed, will greatly reduce the cost of the process.

The Escurial has been struck by lightning, and is in flames, as we go to press.

TENDERS

For the erection of a building in Willow-walk, Shore-ditch, E, for Messrs. Smith, of Queen-street. Mr. R. F. Notley, architect:—

McLachlan	£3,948 0 0
Macey	8,620 0 0
King & Son	8,570 0 0
Myers & Sons	8,419 0 0
Turner & Sons	8,374 0 0
Newman & Mann	8,326 0 0
Perry, Bros.	8,277 0 0
Browne & Robinson	8,166 0 0
Hart	7,885 0 0
Eaton & Chapman	7,600 0 0
Morter	7,637 0 0

For stabling for Mr. A. Hector, Worcester House, Cuddington, Surrey, Messrs. John Giles & Gough, architects. Quantities by Mr. Goods:—

Jocelyne (accepted)	£871 0 0
---------------------	----------

For alterations and repairs to No. 1, Gloucester-street, Haggerston, for Mrs. Baker. Messrs. Ebbetts & Cobb, architects:—

Foulson	£218 0 0
Paine	169 0 0
Ferne (accepted)	145 0 0

For rebuilding Nos. 2 & 3, Gloucester-street, Haggerston, for Mrs. Baker. Messrs. Ebbetts & Cobb, architects:—

Paine	£702 0 0
Foulson	580 0 0
Ferne (accepted)	475 0 0

For new schools, Beazley-crescent, Old Ford, for the London School Board. Mr. Keith D. Young, architect. Quantities supplied by Mr. Sidney Young:—

Newman & Mann	£8,445 0 0
Roberts, Brothers	8,884 0 0
Perry, Brothers	8,804 0 0
Ennor	8,270 0 0
Williams & Son	8,574 0 0
Kilby	8,153 0 0
Hearing & Son	8,120 0 0
Dove, Brothers	7,995 0 0
Adamson & Sons	7,651 0 0
Hill & Sons (accepted)	7,548 0 0

For new library, &c., to Park House, St. John's Wood Park, for Mr. J. E. Gardner. Mr. C. Skerrett, architect. Quantities supplied by Mr. Sidney Young:—

Brass	£2,329 0 0
Conder	2,265 0 0
Dove, Bros.	2,135 0 0
Jackson & Shaw	2,100 0 0
Longmire & Burge	2,070 0 0
Macey	2,050 0 0

For new wharf at Rotherhithe, for Mr. J. Brandram Peete. Mr. G. A. Young, architect. Quantities supplied by Mr. Sidney Young:—

Smith & Co.	£9,695 0 0
Myers & Son	9,620 0 0
Dove, Bros.	9,475 0 0
Brass	9,440 0 0
Jackson & Shaw (accepted)	9,160 0 0

For Oval-road School, Croydon:—

Nightingale	£3,969 0 0
Taylor & Sons	3,658 0 0
Walkley	3,635 0 0
Allen	3,040 19 1
Heade	3,196 0 0
Wright, Bros.	3,157 0 0
Waterson & Co. (accepted)	3,045 0 0
Spearing*	2,969 0 0
Peskest & Taylor*	2,861 0 0
Coles*	2,840 0 0
Crooke & Wall*	2,678 16 0

For alterations to the King William the Fourth public-house, Streatham:—

Loat	£920 0 0
Parsons	875 0 0
Mason (accepted)	797 0 0

For alterations and additions to the Prince Regent Tavern, North-street, Walworth. Mr. F. Sparrow, architect:—

Kellaway (accepted)	£612 0 0
---------------------	----------

For alterations, &c., to the Rutland Arms, Rutland-street, Hampstead-road, for Mr. R. Miles. Mr. C. Bradley, architect:—

Cairns	£179 0 0
Durrant	175 0 0
Berridge (accepted)	175 0 0

For additions to Elmstons Court, near Canterbury, Kent, for Mr. W. J. G. Barrett. Mr. Richard Martin, architect:—

Bridgman, Nuthall, & West	£2,478 0 0
Wilson & Son	2,290 0 0
Jarrett (accepted)	2,157 0 0

For additions and decorations to Ivy Lodge, Maidalale. Mr. H. M. Burton, architect. Quantities by Messrs. Corderoy & Sandall:—

Cracknell	£988 0 0
Elms & Son	776 0 0
Nightingale	720 0 0
Mitchell	720 0 0
Tinewell	687 0 0

For dwelling-house at Manners-road, Hainpale. Mr. W. W. G. Messrs. Spalding & Co., architects. Quantities supplied by Mr. Fleetwood:—

Hyde	£21,888 0 0
Simpson	1,822 0 0
Boys	1,688 0 0
Mann	1,639 0 0
Temple & Foster	1,610 0 0
Brass	1,570 0 0

IMPERIAL FIRE INSURANCE
COMPANY. Established 1803.
No. 1, Old Broad-street, E.C. and 18 and 17, Pall-mall, S.W.
Capital, £1,000,000. Paid up and invested, 700,000.
Policies falling due at Midsummer shall be renewed before
15th October, or the same will be void.
JAMES HOLLAND, Superintendent.

NORWICH UNION FIRE INSURANCE
SOCETY, instituted 1851.
The rates of this Society are the same as other offices, whilst
its profits have been made to the parties insured, amounting
to £25,000.
This Office is distinguished by its liberality and promptness in
the payment of claims, 2/3rd being paid to Insurers for
losses by fire.
In respect of the public confidence in the principles and conduct of
this establishment, it will suffice to state that the total business now
amounts to £1,000,000.
No charge is made for policies. Duty repealed.
Offices: 24 Fleet-street, E.C. and Survey-street, Norwich.
September 25, 1872.

COUNTY FIRE OFFICE, 50, REGENT-
STREET, and 14, CORNHILL, LONDON.
The County Fire Office was established in the year 1808, upon the
principles that interested the Policy-holders and its own should be
identical. A system of strict economy and caution has enabled the
Company to return to their Policy-holders a considerable portion of
the premiums demanded by its excess of the risks. These returns,
which originally varied with the profits of the year, are now fixed at
the rate of 25 per cent. on the sum insured, and are specially pro-
vided for the purpose, and also precedence of the dividends to the
Shareholders. The assured are exempt from all personal liability.

EXAMPLES OF RETURNS.
Table with 3 columns: Policy, Name and Residence of Insured, Bonus.

WANTED, by an experienced London Foreman, a RE-ENGAGEMENT as GENERAL FOREMAN, CLERK OF WORKS, or takes out charge of Job. Bricklayer by trade. Success-street, Clerkenwell-square, Finsbury, S.W.

TO PLUMBERS, BUILDERS, AND OTHERS. WANTED, by a Young Man, aged 18, a SITUATION in a Builder's, or TIMEKEEPER. Has had experience in the same.—Address, J. BETHELL, 24, Draycott-street, Chelsea, S.W.

TO HOUSE DECORATORS, BUILDERS, &c. WANTED, by a Young Man, a SITUATION as PAPERHANGER, and would fill up his time in painting, glazing, distempering, &c. Having a general knowledge of all the branches in a decorator's shop.—Address, J. J. TOWN, 2, New-road, Battersea Park, London.

TO PAINTERS, PAINTERS, GLAZIERS, &c. WANTED, by a Young Man, a SITUATION as above. Good paperhanger, painter, &c. Has had five years' experience. Wages not so much an object as a constancy. Would not object to ARTICLE himself for TWO YEARS. Good reference if required.—Address, S. W. C. Working Man's Institute, Merton-road, New Wimbledon, S.W.

TO BUILDERS, PLUMBERS, AND OTHERS. WANTED, by an experienced Man, a SITUATION as good PLUMBER, Gasfitter, Pump or Deep Work, Bath, Flood-work, &c. Can have good reference.—Address, G. B. 140, Portland-road, Notting-hill.

TO BUILDERS, PLUMBERS, AND OTHERS. WANTED, by a highly-respectable married Man, of good address, an ENGAGEMENT as FOREMAN or otherwise. Has a thorough practical knowledge of the trade. Has had the management of first-class work and men. Can estimate, measure, and value work. First-class references. Wages moderate. A permanency required. Country preferred.—Address, J. H. 31, Post-office, Abingdon, Berks.

YOUNG MAN seeks EMPLOYMENT in a Wholesale TIMBER MERCHANTS OFFICE.—Address, A. F. 113, Grosvenor-street, Roper's N. Park.

TO ARCHITECTS. THE Advertiser desires a RE-ENGAGEMENT. Working drawings, details, &c. Neat draughtsman.—Address, X. No. 5, Deacons-street, West Dulwich, S.E.

TO ARCHITECTS, SURVEYORS, BUILDERS, AND OTHERS. THE Advertiser will shortly be OPENED FOR AN ENGAGEMENT as MANAGER at home or abroad. To an contemplating the erection of plant would do well to avail themselves of his experience in describing, estimating, and supervising machinery.—Address, G. M. care of W. Barber, Wood Engrover, 88, White-lane, Fleet-street, E.C.

THE Advertiser (CARPENTER) desires an ENGAGEMENT as CLERK OF WORKS, ESTIMATING CLERK, or MANAGER, in modern construction, or other ten years' experience. Is a thoroughly efficient quantity measurer and estimator, a fair draughtsman, and is well versed in the superintending of all branches of his trade. Country or town work, and can be well recommended.—Address, ALPHA, 22, Potomac-pool, Red Bank-common, S.W.

TIMEKEEPER, &c., thoroughly experienced, desires a RE-ENGAGEMENT. Has been engaged on large works. Good references.—Address, L. B. C. Wandhurst-street, New-cross.

TIMBER TRADE.—A Wholesale Foreman in the Foreign Timber Trade has a VACANCY for a TRAY with a connection in the Mill and Working SPECIALLY trouble, now need apply whose character and ability will be the strictest investigation.—Address, L. T. Post-office, Great C.

STAIRCASE WORK WANTED, by Piece, in Town or country. No objection to joiner's Apply to J. P. 11, Wadding-street, Walworth, S.E.

STAIRS.—A first-class STAIR HAND is in WANT of a JOB, either by day or piece as Shop or Out-door Working Foreman, either in Town or Country. W. R. 29, Portland-street, Oxford-street, Soho, W.

REQUIRED, a RE-ENGAGEMENT ASSISTANT in an Architect's Office, by one who has had five years' experience in the profession. Town preferred.—W. T. A. care of E. Footner, esq. 156, Larkhall-lane, Clapham.

QUANTITY TAKER and MEASURER of upwards of twenty years' experience, with a practical edge of building, and well acquainted with prices, and no objection to be offered to any part of the country. Terms moderate.—Address, SURVEYOR, 25, Thornhill Brixton-road, London, S.W.

QUANTITIES and MEASURING. A SURVEYOR of considerable experience in TAKING QUANTITIES, MEASURING, and in the use of the THEODOLITE, &c. can give TEMPORARY ASSISTANCE to Architects and Builders.—SURVEYOR, 123, Stanhope-street, Hampstead-road, London, N.W.

TO BUILDERS. PLASTERING WANTED, by a practical Man. Plain and ornamental work. Labour only, 2 country. Not completed here with any trade-unions. Good reference if required.—Address, 448, Post-office, Clarendon-street, London, E.C.

MODELLING and PLASTERING. WANTED, Plasterwork, or otherwise superintended as a Foreman, having filled the office. A thorough practical expert London work, and completed thirty years' experience. No objection to be offered to any part of the country. References of the most strict investigation, as to salary.—Terms reasonable.—Address, 228, Office of "The Builder."

CLERK OF WORKS—WANTED, a RE-ENGAGEMENT, by a thoroughly practical and experienced Man.—Address, A. B. 37, Wajley-street, Oxford-street, Reading.

GRAINING and WRITING.—A first-class GRAINER and WRITER is OPEN to a JOB.—B. YOUNG, 105, Vauxhall Bridge-road, Public.

EMPLOYMENT WANTED, by a Young Man. Carpenter or Joiner. Used to bench or fitting.—B. C. 107, Clapham Park-road, Clapham, S.W.

TO ARCHITECTS, &c. WANTED, a RE-ENGAGEMENT, as CLERK OF WORKS, present works are near completion. Address, J. Clark of Works, Messrs. Flower & Sons, New, New London-street, Finsbury.

CLERK OF WORKS—WANTED, a RE-ENGAGEMENT, by a thoroughly practical and experienced Man. Just completed large work in Nottingham, and a present time superintending the large Wesleyan Chapel in Mill Lane. Testimonials. Terms 30s. per week. Address, T. M. 33, Caroline-street, Pans Hall-road, Nottingham.

TO CIVIL ENGINEERS, RAILWAY CONTRACTORS, &c. A CIVIL ENGINEER, of long experience in Surveying, Levelling, and Getting up Parliamentary bills, is open to an ENGAGEMENT.—Address, C. E. 25, Lorraine-terrace, Kensington, S.W.

AN efficient CLERK OF WORKS, with highest testimonials, seeks a RE-ENGAGEMENT.—Address, No. 285, Office of "The Builder."

AS CLERK OF WORKS, or the Manager of a Job, by a Builder's Son. Ten years' experience. Good testimonials and references. No objection to go to any part of the country.—Address, J. W. 173, Auckland Lower Newcross-hill, London, S.W.

AS CLERK OF WORKS—A thorough practical CLERK OF WORKS is in want of a RE-ENGAGEMENT. Has been employed on buildings of materials, under architects, for twenty years. First-class reference to the architect is about to leave.—ADDRESS, CLERK OF WORKS, 29, Tottenham Kingsland-road.

A JUNIOR ASSISTANT seeks a RE-ENGAGEMENT. Is a fair draughtsman. Has a large quantity of detail, working drawings, specifications, &c. Good reference if required.—Address, A. R. 45, Penrose-road, Kilburn Park, N.W.

AN ASSISTANT desires a RE-ENGAGEMENT for a permanency. Can prepare designs from sketches, detail, working drawings, specifications, &c. Good reference.—Address, A. B. 15, Victoria-place, Eastbourne.

AN ASSISTANT requires a RE-ENGAGEMENT. Good draughtsman and colourist. Terms moderate.—Address, ARCHIBUTT, Thornbury, Lower Addlestone, Croydon, S.

TO ARCHITECTS. AN efficient ASSISTANT, having 7 years' experience, WANTS a RE-ENGAGEMENT.—Address, ARCHIBUTT, Thornbury, Lower Addlestone, Croydon, S.

TO ARCHITECTS AND SURVEYORS. A FULLY-qualified ASSISTANT will take the MANAGEMENT of an OFFICE, or Charge of large works requiring experience. A thorough knowledge of structure and accounts.—Address, X. Y. Deacons' Advertisement, 4, Leadenhall-street, E.C.

A THOROUGHLY accomplished ARCHITECT'S ASSISTANT, who has been used to the management of detail drawings, and to making complete sets of working drawings in pencil, pen and ink, or colour.—Address, R. M. Colgate, Eings-road, Post-office, London, S.W.

A FIRST-CLASS DRAUGHTSMAN, DESIGNER, and COLOURIST is prepared to render PERSONAL ASSISTANCE to the profession. Preparation of plans from rough sketches, and supervising the execution of the same and mutual terms.—Address, ARCHITECT, 34, Stanley-street, Eccleston-square, S.W.

The Builder.

VOL. XXX.—No. 1549.

Pollution of Rivers.

ET us speak a little further of the recent Report on the condition of the rivers of Scotland.* The North Esk rises in the Pentland Hills and flows into the sea at Musselburgh. On this river the paper manufacture (chiefly writing and printing paper) is carried on largely. Between Dalkeith, which is a few miles above Musselburgh, and Penicuik, which is situated about the centre of the river basin, the distance being about eight miles in a straight line and twelve by the river, there are eight paper-mills, employing 1,600 persons, and making 8,000 tons of paper in a year from 3,000 tons of rags and 8,000 tons of esparto grass. These mills use for power, besides that of the water of the

river, 50,000 tons of coal in a year (1870). The Commissioners say:—"The North Esk is one of the few rivers in Scotland on which attempts have been made by manufacturers to supply the natural want of water in the summer time by the provision of upland storage reservoirs." The North Esk reservoir, situated nearly at the river head, was constructed twenty-five years ago by the paper-makers on this river at a cost of 14,000*l.* Messrs. David & Thomas Stevenson, of Edinburgh, being the engineers. It holds 24,133,700 cubic feet of water, and is fed by a gathering ground of 1,700 acres. This, it is stated, is sufficient to give more than 200 cubic feet per minute to the mills during a period of three months,—a contribution which, when the minimum flow of the river without this aid falls to 80 cubic feet per minute, is of the greatest value.

The Water of Leith rises in the Pentland Hills, and is a smaller stream than the North Esk. Almost the only pollution it receives is the brown and frothy drainage from paper-mills, of which there are seven on the stream. Compared with the water of the North Esk at Dalkeith, it contains about six times as large a proportion of polluting matters. At five of these mills 386 hands are employed, 1,160 tons of rags are used in a year (1870), and 4,172 tons of esparto grass; the produce of paper being 4,070 tons, with a consumption of coal of 17,100 tons. Both here and on the North Esk, as well as in England, the rags and esparto grass are each boiled for several hours in a strong solution of caustic soda.

"During this operation the soda combines with silica and with resinous matters to form soap compounds, and the causticity of the alkaline ley is destroyed. The digestion is carried on in large wrought-iron boilers. Heat is

applied by means of free high-pressure steam, by which a temperature considerably above that of boiling water is obtained. The highly polluting liquid resulting from this process is technically termed 'bollings.' It is dark brown, approaching to a black colour, and is so soapy in its nature that one volume of it added to 2,000 volumes of pure water produces on agitation an extremely persistent lather or froth. After the bollings have been drained off, cold water is injected into the boilers for the purpose of cooling and partially washing the fibrous materials. This water becomes, of course, greatly polluted by the residue of the bollings, which remains soaked in the rag or esparto fibre even after the most effective drainage. This liquid, when drained off, constitutes what is known under the name of 'coolings.' The next process consists of washing and 'breaking in' or 'pulping' of the boiled rags or esparto. The quantity of water employed for every ton of esparto grass varies from 3,500 to 12,000 gallons. A very large volume of more or less polluting liquid known as 'washings' results from this treatment of the rags. As the greater part of the organic matter in suspension is useful fibre, the manufacturer suffers a great loss when he allows this polluting liquid to be charged into a river or stream without purification."

On the river Almond, the drainage area of which is similar in extent to that of the Esk, the great paraffine-oil works are situated. Young's Paraffine Light and Mineral Oil Company employ 1,200 hands; operate on 370,000 tons of shale annually; use 7,700 tons of sulphuric acid, 1,360 tons of caustic soda and other alkalies; produce 270,000 gallons of naphtha, 2,300 tons of crude paraffine, 422,000 gallons of lubricating oil, and 3,785,000 gallons of illuminating oil, besides 700 tons of sulphate of ammonia; and burn 113,000 tons of coal a year. Three other works together operate on about half as much shale, their chief produce being crude paraffine, of which they make about 600,000 gallons a year. Paraffine and petroleum oils, it is said, furnish a given amount of light as cheaply as it can be obtained from good candle gas, and much more cheaply than it can be got from coal gas. Except that which comes from the petroleum-wells of Canada and the United States, the source from which it is got is the cannel or bituminous shale, and

"The first process in the manufacture consists in heating this shale to dull redness in cast-iron retorts. The volatile products are condensed in appropriate refrigerators, and constitute crude paraffine oil, which, mixed with condensed water, runs into the tap-reservoir. From this the warm liquid is pumped into stills, where it is submitted to a current of steam, by which a very volatile spirit or naphtha is distilled off. The residual oil is then run into the water-separating apparatus, consisting of an iron tank, surrounded by a water-jacket, which is kept at a temperature of 60° C. for about ten hours. At the end of this time the water, which forms about one-third of the crude tar, becomes almost completely separated. The tar, thus freed from water, is now placed in immense stills of cast-iron, furnished with the necessary condensing apparatus. The distillation is carried out until nothing but a kind of coke remains in the still. The coke is of good quality, and is used as fuel. The distillation is transferred to wrought-iron tanks lined with lead, where it is vigorously agitated with sulphuric acid. This operation renders the oil very black, and at its conclusion the sulphuric acid subsides to the bottom of the vat, and can be run off through a cock provided for that purpose. After being washed with water, the oil is next thoroughly agitated with a strong solution of caustic soda. On being then allowed to stand at rest, the oil (now of a light yellow colour) floats above the solution of caustic soda, whilst a thin black layer of tarry matter takes up its position between the two. The purified oily layer is now submitted to distillation, when three products are successively condensed in the refrigerator, in the following order:—1. Illuminating oil; 2. Lubricating oil; 3. Crude paraffine. All these, with the naphtha already mentioned, are marketable products, the crude paraffine being sold to the paraffine-refiner or candle manufacturer."

The manufacture of textile fabrics from flax and jute has received very extensive development in Scotland. The Avon and the Almond, in the basin of the river Forth, are in the autumn months injuriously polluted by the water in which flax has been steeped. Several hundred acres of flax are grown within the area drained by these streams, most of the farms in the upper part of the valley having a field or two. "The process of steeping consists simply in placing the sheaves in a pit filled with water, loading them so that they shall sink beneath the surface long enough to cause the partial putrefaction of the stem, or of those softer portions of it which hold its fibre and its woody part together. When this process is completed, the sheaves of flax are taken out and spread abroad to dry, after which the stem is broken, and the fibre is then scouted free of it." About 250,000 sheaves are annually grown in these valleys.

"Some of the upland streams running into both the Avon and the Almond are entirely spoiled for several weeks every year by this extremely filthy waste, which, being much stronger in fertilising matter than average town sewage, and more than twice as strong in polluting ingredients, ought not to be allowed to escape from the farm on which it is produced. There is ample evidence of the agricultural value of this liquid manure thus wasted; and there is ample evidence of the power of soil and plants to cleanse and defecate such extremely offensive stuff."

As to the pollution of the rivers by town sewage the Commissioners still hold to the system of irrigation of land as being the best remedy where land can be had for the purpose, but they are confirmed, they think, in the opinion they formerly expressed, that where land cannot be had of sufficient extent for broad irrigation the system of intermittent filtration is to be recommended, based upon the experience that has since been had on twenty acres of land at Merthyr Tydfil. Every one loves his own production, and Dr. Frankland first suggested this method, after experiments in the laboratory, as those know who have read the *Builder*. Knowing something of the Merthyr drainage, there has often seemed to us a want of candour on the part of some of the advocates of this system (not, however, Mr. Denton) in keeping back the fact that the so-called sewage there dealt with is far from being equal to ordinary sewage in the quantity of polluting matter. Merthyr is often spoken of as being a town with a population of 50,000, the sewage of which is purified on twenty acres of ground; but it is not always at the same time said that not much more than one-third of the houses are connected with the sewers. This is recognised by the Commissioners, and they state that "it must not be forgotten, however, in taking the Merthyr Tydfil intermittent works as a model for other localities, that the sewage of this town is exceptionally weak as compared with that of other towns, the Local Board of Health being restrained by injunction from connecting the drainage of a large number of houses with the sewers." The objection we have to the system, so far as it goes, is that it wastes fertilising matter; and that, being a cheap process in the first instance, local Boards may for this reason be led to adopt it in places where, on a better consideration of the whole question, a more advantageous system might be adopted. There has been some return in crops at Merthyr from each of the small number of acres cultivated; but it is inherent in the system that, because the acres are so few, the manure cannot be applied to the best advantage.

ON SHADOW.

It must be due rather to the influence of Italian painters and Italian writers on art, than to any want of richness in the English language, that the word *chiaroscuro* has obtained a half-recognised naturalisation among us. It has, indeed, the great advantage of being one which a plain man is not unavoidably familiar, and thus one of which the judicious use, in order to produce an impression of the learning of the speaker, is a godsend to amateur critics. In M. Rigand's translation of Leonardo da Vinci's Treatise on Painting, the term is defined as the correct distribution of lights and shades; but the chapter which deals with the subject is headed, in good plain English, "Light and Shadow."

Shadow differs from shade in its greater individuality. Thus, we may have a lighter or a darker shadow, but it must be cast by a definite object. Shade, on the other hand, is sometimes used to denote tint, as in different shades of blue or of red, and sometimes to comprehend shadow, or a group of shadows. The leaves of a wood cast a shade beneath the trees; but each tree, or each leaf, if it stands directly in the sunlight, will cast a definite shadow. The arrest of a direct ray of light is necessary to this end

* See p. 773, ante.

When a mist covers the face of the sun, a shade is cast over the landscape. But a flying cloud casts its own fugitive shadow; and when the sun emerges from obscurity, the shadow of the observer is projected at once by the sunbeam.

The mastery of light and shadow forms one main section of the power of the artist. It has been, consequently, often dealt with, in lectures and works on art. But the point on which we now wish to dwell is this,—the painter has a special advantage, in being able to use different colours. The effect of simple light and shadow, or of what we call monochromatic work, is less powerful than is that of rich and harmonious colouring. But the work of the sculptor, regarded, not as it leaves his hand, but as it produces an effect on the eye, depends almost entirely on shadow.

It is true that this is not the ordinary distinction that is drawn between these two sister arts. We are accustomed to be told that sculpture regards form, and painting regards both colouring and shadow. But, in fact, the definition of form is the object of all art, whether graphic or plastic. The difference between the two is, first, in the way in which that definition is effected; and then, in the way in which it is accentuated or enriched. A fine, delicate outline, such as that which is employed by Moritz Retzsch, and with that most graceful draughtsman, forms the whole of his work, is the graphic form which most closely approaches to the outline of sculpture. Such drawing is appropriate either for a sculptor's sketch or for the copying of a statue. But to look at sculpture in outline only, is to lose almost all that gives it power and beauty. The simple black shadow of a face in profile, commonly called a *silhouette*, is that likeness of the person which Lavater considered to be the most characteristic, and thus, physiognomically, the most valuable, that it is possible to take. But a statue seen only in outline, like a face represented in *silhouette*, while possessing a truth of its own, has but a very simple and rudimentary character as a work of art.

The moment that we pass beyond the condition of outline sketch, of *silhouette*, or of sculptured form seen in dark relief, against a light background, it is obvious that the effect of sculpture depends on shadow. In this, it may be, lies the main secret of the grandeur of the art.

If we regard a relief in marble, or the surface of a statue, as distinguished from its linear contour, the effect which is produced on the eye is due to the variously distributed and modulated shadows. The form and depth of these shadows depend on two causes, namely, the modelling, or accentuation, of the surface, and the direction and intensity of the light that falls on it. Thus, in any given case, we may consider the modelling, or sculpture, and the illumination, as functions varied, a change is produced, such as would be effected by a variation of the latter, the light being unchanged. It is hardly necessary to attempt to prove a proposition which is so simple and obvious. The most simple experiment will show what is the effect of a change in illumination. Even in the living human figure this may be seen. Without reference to the magic effect of complexion, and the beauty which a delicate proportion of white and of red will throw over the most homely features, let us confine our attention strictly to such an effect as can be produced, either on a live person or on a statue, by a change in the incidence of light. Look, for instance, at any face, when daylight is absent, by a descending light. Then let the person stand before a bright fire, in a room not otherwise lighted. If there be a looking-glass on the chimney-piece, the entire change of expression produced by casting the shadows upwards, instead of downwards, will strike even the most unobservant. Traits of unsuspected power may at times be thus detected. But the usual result of the reversal of illumination is the destruction of any vestige of beauty. We recommend any fair reader who makes the experiment, to make it, in the first instance, alone.

Of the mode in which the Greek sculptors dealt with shadow we are unable to speak with all the precision that is desirable, from the fact that we have no knowledge of the effect of these works *in situ*. It is owing to the vandalism of a Venetian commander that we are unable to compare the illumination of the two companion groups, erected by Phidias on the eastern and the western pediment of the Parthenon. Over each of them was thrown a deep shade from the projection of the cornice, which must have varied with the position of the sun in the heavens. We

have ample proof that the subject received careful attention, though no canon or artistic utterance has been committed to writing. The Greek sculptors wrought; they did not write. It is more than probable that it would have been thought impious, or, at all events, an offence against art itself, to commit its secrets to the untrustworthy toll-tale of written speech. With regard to those extremely precise laws which have, within the last few months, been shown to regulate the proportions of statues, hardly a hint is to be found in writing; and what exists is in the pages not of a Greek artist, but of a Roman man of letters.

Among our proofs of the thoroughly truthful manner in which shadow was dealt with by the Greek artists, are the following. The modulation of the human figure, especially of the male figure, was detailed with the utmost minuteness. Such modulation is lost to the eye, unless duly illuminated. The light must fall in a given direction, to give full force and beauty. It may be said that hunger was the great artist that produced this modulation. It is true that at Sparta the young men had to appear periodically before the *ephori*, for personal examination, and that if they showed signs of fat, they were restricted in their allowance of food. But we are not told of such practice out of hard Sparta. The object there was the maintenance of robust health and well-nerved muscular strength. A beauty of their own attends on these qualities; and that beauty was appreciated and reproduced by the sculptor. In the female form, on the contrary, to which, in modern art, a modulation of any delicacy is almost exclusively confined, the Greek view of beauty differed widely from our own. Aristotle names size as the first virtue of woman. A colossal proportion was given to the queen of the gods. Thus, as we find to be the case, in a very exaggerated way, at the present moment in Italy, the women of the Greek artists appear to be better fed than the men. A full, round swell in every limb and every contour; a neck like a tower; powerful arms, that could grasp a weapon; stately legs, that the chase or the dance could not readily tire; a full rotundity of trunk, as well as a graceful swell of the bosom, characterise the female ideal of the Greeks; and the effect of the shadow, either of a form or of drapery, depended on the exact illumination that threw out these headful charms.

Again, we see, in Greek sculpture, the absence of that expedient, we may almost call it a trick, with the effective force of which we cannot doubt that such masters of the chisel were familiar. In a statue sculptured for no particular object, site, or illumination,—and such is most modern sculpture,—the artist will at times endeavour to compensate for his absence of the former to his architectural name and proper illumination to his work, by adding something by way of head-dress, that shall give a shadow under any ordinary light. Such, in real life, is the square piece of cloth worn by the Italian Contadina, as a protection from the sun. Its well-defined gloom gives a picturesque effect even to an ordinary face. The same expedient in sculpture, a shadowy hat, a hollow helmet, a mantle folded above the head, has often been introduced, and that with admirable effect. In the hall at Burlington House, which is an admirably-lighted *salon* for the display of sculpture, we have seen an ordinary plaster cast, with a shadowing head-dress, appear a finer piece of sculpture than any marble around it. By the absence of this provision, for producing good effect under casual illumination, the Greeks give us a mark of their care in selecting the light that would be proper for each individual statue.

Again, we have distinct proof that the Greek sculptors wrought their finest works to produce an effect on observers from a fixed and limited point of view. This shows a rigidity of rule more inflexible than the requirements of illumination itself. Shadow, truly regarded, depends on the relative position of the illuminating body and the illuminated surface, not on that of the spectator. If the latter see the figure at all, he sees it as it is actually illuminated. A hundred spectators would see the same shadow. With a perspective view, or where any obstacle to the visual rays intervenes, the case is quite different. There is an eclipse of the moon,—the actual shadow of the earth is thrown on the orb of her satellite. To every observer who can see the moon at all, the magnitude and progress of the eclipse is the same. But an eclipse of the sun is not a shadow thrown on the source of terrestrial light. It is the interposition of the dense body

of the moon, which throws, on the earth, a limited and fleeting shadow, the exact course of which is predicted, with the utmost accuracy, by the "Nautical Almanack." Our most enlightened astronomers are engaged in the study of tracing the course of these fleeting sun-paths back, to the very dawn of history. At no two places,—mathematically speaking, to no two observers,—does an eclipse of the sun appear, at the same moment, identical in its magnitude. For this reason, an observation of a solar eclipse is of so much more determinative value than an observation of a lunar eclipse. The case is more than analogous. If Phidias wrought his masterpieces to be regarded from a restricted point of view, he cannot have neglected the far easier task of working them for a distinct and prescribed illumination.

We will continue the subject in our next issue.

CONCRETE CONSTRUCTIONS AND THE METROPOLITAN BOARD OF WORKS.

The following paper, which has been forwarded by the Board of Works to the district surveyors, although in answer to a special application, will serve to show the views entertained by the Board and their professional advisers on the subject of concrete, and includes other information which may be useful.

It is right to mention that the Board have made a remarkable exemption in the case of one patentee, concerning which other patentees may excusably feel jealous:—

"Whereas, by the Metropolitan Building Act, 1855, it is provided that buildings to which the rules contained in the schedules in that Act, relative to the construction and materials of walls, are inapplicable, require the special sanction of the Metropolitan Board of Works.

And whereas it has been shown, to the satisfaction of the said Board, that buildings of certain moderate dimensions may be advantageously constructed of Portland cement, or sea-water lime, and similar concrete, combined with proper attention to the quality of the said cement or lime, and the proportion thereof to the concrete materials, and to the due application of a mould or machine for giving coherence to the work during its progress, together with proper consolidation by ramming and pressure.

And whereas Mr. Philip Brannon, of No. 8, Boulevard-street, in the City of London, on behalf of R. Bell, esq., of Bridlington, in Yorkshire, has applied to the said Board for their licence and approval for the use of the said concrete in the construction of certain blocks of sanitary dwellings and buildings at Balliol-square, adjoining Bishop Wilson's Memorial Hall, Islington.

Now, therefore, the Metropolitan Board of Works do hereby approve of and license the use of the aforesaid concrete in the construction of the houses and buildings aforesaid, subject to the conditions following, viz.:

1. The Portland cement shall be of the very best quality, ground extremely fine, and weighing not less than 12 lb. to the struck bushel, and capable of maintaining a breaking weight of 350 lb. per square inch seven days after being made in a mould, and immersed in water during the intervening days. Such test, when necessary, as ordered by the district surveyor, to be made at the works of the Metropolitan Board. When sea-water lime or other substitute for Portland cement is used, it shall be on the certificate of approval by the said surveyor.

2. The other materials of the concrete to consist of clean Thames ballast, or of gravel, crushed stone, or brick-burns, or small broken stones, or any hard and durable substance; and each to pass through a screen or mesh not exceeding 2 in. diameter, and to be washed. Such materials in the proportion of one to two. All such materials to be perfectly clean, and free from all greasy, loamy, or clayey matter, and, if necessary, to be washed in the evening frames, moulds, or clamps, so long as the district surveyor shall direct.

3. When it is desired to use, instead of Portland cement, sea-water lime, blue lias, or grey lime, then the gaugings shall not be more than one thereof, to five, four, and three of ballast respectively, and not less than each one part shall be ground with burnt clay. And all concrete materials so compounded shall be thoroughly consolidated by treading, ramming, or other pressure, and sustained by the evening frames, moulds, or clamps, so long as the district surveyor shall direct.

4. In making the concrete, a box, 2 ft. by 4 ft. by 2 ft., or other like proportions, is to be used for the materials, and a smaller box capable of holding one such or half a sack containing two bushels of the cement. The cement and materials are to be turned over at least three times, and thoroughly mixed together with water.

5. The concrete thus composed is to be laid into the walls of the buildings all round in equal layers, and to be firmly compacted by treading or ramming, and ground with cement in the proportion of one cement to two of clear washed, sharp sand, or ground ballast, after each layer, until the walls are completed in height. The ground to be made as mortar first, and then thinned with water to the necessary consistency.

6. The above materials and matters are to be well and thoroughly bound together, and fixed and applied by use of other of the processes now in use for concrete building, so that security shall be provided for the complete coherence of materials and work during its progress, and to guard against the delay, risks, and errors of the work being put up otherwise than by a well-arranged mould or machine.

7. If it be desired to use bricks or broken pavement stones, or other battens and like materials, suitable to be laid in horizontal beds alternately with the concrete layers (which are about 9 in. deep), any such material shall be firmly bedded, rammed, and grouted, so as to

become one body with and assist in consolidating the walls.

9. Flat roofs, constructed as herein directed, may be formed, provided they are fully protected on all sides by parapets not less than 9 in. thick and 3 ft. high; and in cases in which such roofs being continuous over any one terrace or block, they need not be subdivided by party-walls carried through the roofs. All such roofs to be properly waterproofed over the cement-work with asphalt or other effective means.

10. All such flat roofs shall be of a thickness proportioned to the area, and be constructed strictly according to the provisions of the patent specification submitted by the said Philip Brannon to this Board, with an embedded sustaining skeleton of iron and strained wire-work, and a sufficiency of wire and fibre tension seams, and wire mangled with the concrete and cement materials to give the utmost tension and transverse strength requisite. Every layer to be properly flushed with grout, and the concrete to be composed and treated as provided for walls.

11. For all such floors, stairs, partitions, or other internal constructions as are not within the provisions of the Building Act, and are made of concrete materials, or of the same combined with embedded iron skeletons, wire, and fibre, as in said patent provided, the builder and owner must be held responsible for the strength and sufficiency thereof, as in ordinary internal constructions.

12. The thicknesses of walls to be equal, at the least, to the thicknesses for brickwork prescribed in the Building Act.

13. Suitable cores to be provided for fireplaces and for connecting them with flues, and also for recesses and flues; or flues may be formed with tubes of earthenware.

14. Door and window frames, if any are employed, shall be built into the walls.

15. No timber will be allowed to be used in the walls of buildings under this licence; but otherwise the rules of the Building Act generally to be observed as in ordinary buildings.

16. Such concrete buildings to be carefully supervised by the district surveyor, and his fees in respect thereof to be one half more than the scheduled fees provided by the Building Act for new buildings or additions. The fees for supervision thereof, as in ordinary internal constructions.

17. A clerk of the works, or other foreman, shall be appointed by the architect or builder, subject to the approval of the district surveyor, and have constant inspection of the quality, mixing, and consolidation of the concrete during the progress of the works, to see that the foregoing conditions are faithfully fulfilled, in addition to the supervision by the district surveyor as aforesaid."

ON CONCRETE BUILDINGS.

NORTHERN ARCHITECTURAL ASSOCIATION.

At the quarterly meeting of this Association, held on the 3rd inst. in Newcastle-on-Tyne, the president, Mr. M. Thompson, introduced the subject of concrete buildings. He said he believed architects would have to turn their attention to the adaptability of some new material for buildings, the cost of stone and brick at the present time being so very high. It was the duty of all practising architects to look out for some other substance, the use of which would bring buildings down to a reasonable cost, while, at the same time, they were sufficiently substantial. He did not believe that architects were either educated or employed to spend money, but rather to save it, and therefore it behoved them to look forward and keep up with the times. He had tried concrete in two or three instances in Newcastle, and found it very much cheaper than either brick or stone. They also attained another object, and that was securing a wall, where space was limited, of great strength, with less thickness than would be necessary if it were built of brick or stone. It was a very admirable substitute where great heaps of gravel or slag were accumulated; for while such refuse was available for scarcely any other purpose, it afforded an excellent material for the formation of concrete buildings. Mr. Thompson here referred to a photograph of a large seed warehouse, which had stood the test of grain, an article that produced a greater strain upon the walls than almost any other class of goods that could be stored. He then gave details of various experiments which had been adopted to test the strength of concrete as compared with brick, the result being greatly in favour of the concrete, especially when built with brick and stone bondings. It was, therefore, very important to know that such rough materials as broken bricks and stones could be put together and run in with grouting, and produce a wall of such great strength and cheapness. In preparing foundations, he believed it was quite competent, instead of digging out the soft stuff and putting in concrete, to force down the soft substance and make it a perfectly solid mass, thus securing one of the best foundations. In laying down concrete floors, he thought there was an advantage in covering them with water, because they set better under such a condition, and became harder and stronger than if they were allowed to dry under the influence of the ordinary air. At Cullercoats a great deal of concrete building was going on. The walls were generally formed of iron slag and sandstone, with grouting; and when dry, if struck with a hammer, they sounded like the ring of a piece of

metal. The inner walls of a three-story building need not be more than 6 in. and the outer walls 9 in. thick. Concrete houses were, of course, exceedingly dry and comfortable. The inside required simply a finishing coat of plaster, and the saving in that department more than covered the cost of the outside stucco, which did not peel off the concrete as it did off stone and brick walls. Buildings, constructed with concrete walls, floors, and staircases were perfectly fire-proof, the windows and door-frames being alone capable of burning.

Mr. Ebdy, Sunderland, agreed with the president that the bricklayers and stonemasons were becoming so independent in the present day that it was absolutely necessary to become independent of them as soon as possible. He believed that where stone and brick were scarce, it was necessary to fly to some such substitute as the concrete method, and it was no doubt well adapted for the construction of workmen's houses or ordinary dwellings. They had not seen it used in superior buildings, however, and up to the present time they had had little experience of its durability. They knew it made a solid body, but the question was—would it last? Would the thin frail walls be there being put up endure, and be found as solid ten years hence as now? The effects of contraction and expansion in some property put up three years ago had been such as to rip up the building as though there had been a pit working beneath it. In all concrete floors provision had to be made for expansion and contraction, and it would no doubt be found that the same effects took place in concrete buildings.

Mr. Sbotton, Sunderland, gave an instance of a floor 41 ft. by 56 ft. where no such defect existed as either the expansion or the contraction of the material.

Mr. Oliver was doubtful as to the durability of the material. The question was, would atmospheric influence not affect it, as was the case with Portland stone. Another objection was, that in concrete buildings they would never be able to produce anything like architectural or aesthetic effect. Instead of brick and stone, they had a smooth surface, and would have to resort to stucco and painting.

LONDON LOCAL GOVERNMENT.

The Metropolitan Board of Works have just issued a series of returns furnished by the vestries and district Boards to the central Board, of the works and improvements effected by them since the passing of the Metropolitan Local Management Act, 1856. The returns have been prepared in accordance with a wish that the Home Secretary, who expressed a wish that the Metropolitan Board should assist the Government by presenting to them the result of their experience with regard to the local government of the metropolis since the Act of 1856 came into operation, with a view to enable them to consider how the present system has worked, and what improvements appear to be called for. It therefore occurred to the Metropolitan Board that it would be useful to show what the Board and the various vestries and district Boards have effected in the way of sanitary and street improvements during the period of their existence, up to the year 1870, and by this means rebut the allegations that have been freely made as to want of energy on the part of the local authorities, and indifference to the interests entrusted to them. For this purpose the following list of questions was sent to each local Board:—What extent of sewerage work have you executed since January 1st, 1856, and what has been the cost? What was the condition of the drainage of the district in 1856, and what is it now? What other sanitary improvements have you carried out since 1856, and at what cost? What quantity of paving have you executed since the same date, and what has been the cost? What amount have you expended in other works of improvement since the same date? Total amount expended in sewerage, paving, and other improvements since January 1st, 1856? Of this amount, what has been paid out of the rates, what by means of loans, and of the loan what has been repaid? What was the mileage of the streets and roadways under your jurisdiction on January 1st, 1856, and what is the present mileage? What part of this increase has been occasioned by the abolition of turnpike tolls? How many miles of streets are watered in your parish or district? What is the cost per mile for water and cartage separately? What regulations

existed with regard to the inspection and improvement of courts, alleys, and dwellings, and for lighting and paving in your parish or district in 1856, and what are the regulations now in force? How many additional street-lamps have been put up since 1856? What is the price charged for lighting, cleansing, and supply of all the public lamps in the parish or district? What is the sanitary and general condition of your parish or district now, as compared with its state previous to the Metropolitan Local Management Act coming into operation?"

From the replies to these questions, it appears that St. Marylebone has executed 12 miles of sewers and 7½ miles of drains since 1856, at a cost of 59,397l.; and that, whereas in 1856 the sewers were, in many cases, dilapidated and dangerous, and in several cases above the basements of the houses, they are now clean and well ventilated, and many have been repaired or reconstructed. A great number of sanitary improvements have also been effected, and paying to the amount of 343,726l. executed. The total amount expended in sewerage, paving, and other improvements, since January 1st, 1856, was 408,230l., of which 343,430l. were paid out of the rates, and 65,800l. by loans, of which 3,681l. have been repaid. The regulations for inspection and improvement of courts, alleys, and dwellings, and for lighting and paving, were, in 1856, carried out under the management of vestry committees; but since then there is a sanitary committee for the inspection of such work, aided by a large official staff. The result is great improvement in the health of the inhabitants. No house is without water-supply. The quality of water and gas is greatly improved.

St. Pancras has executed 15½ miles of sewers since 1856, and the condition of the drainage in the district was generally good; it has since improved. Among other sanitary improvements, public baths and wash-houses have been erected at a cost of 28,900l.; and 122,000 square yards of new paving have been laid down. The total amount expended in sewerage, paving, and other improvements has been 884,774l., of which 791,271l. have been paid out of rates, and 93,503l. by loans, of which 40,450l. have been repaid. In 1856 there were in many parts no regulations with regard to the inspection and improvement of courts and dwellings, whereas now there is a rigorous supervision; disinfection is enforced, and the Nuisances Removal Acts carried out. The local authorities of St. Pancras therefore report that the sanitary condition is improved, and the rate of mortality is below the average; but pauperism has increased.

In Lambeth 53 miles of sewers have been executed since 1856, so that the condition of the drainage, from being very shallow and inefficient, is now quite effective. 550,000 yards of paving have been executed, and the total amount expended in sewerage, paving, and other improvements has been 709,505l., of which 568,505l. have been paid out of the rates, and 141,000l. by means of loans, of which 55,938l. have been repaid. Under the system of local government the sanitary and general condition of the district has greatly improved.

In St. George's, Hanover-square, 21,427l. worth of sewerage works has been executed, a sanitary staff appointed, workshops, &c., inspected, impure water prohibited, many cess-pools abolished, and 189,000l. worth of paving executed. The total amount expended in sewerage, paving, and other improvements since 1856 has been 475,238l., of which 462,637l. have been paid out of the rates. The local authorities report that the sanitary condition has been much improved; the death-rate is 16·8 per 1,000; and water and gas are supplied to a monthly test.

In Islington 9·3 miles of sewerage works have been executed at the public expense, and 32·3 at private expense; the drainage has been much improved generally; and 2,707,611 square feet of paving have been laid down. The total amount expended in sewerage, paving, and other improvements has been 1,143,384l., of which 95,066l. have been paid out of the rates, and 3,435,000l. by means of loans, of which 3,500l. have been repaid. Whereas there were no known regulations for the inspection and improvement of the poorer parts of the district in 1856, the whole department is now conducted by four sanitary inspectors and a medical officer; and the general condition of the parish is reported to be much improved.

In Shoreditch 39,466 ft. of sewerage works, 146,767 ft. new granite cubes, 29½,621 ft. new foot-paving, and 64,100 ft. kerb have been executed; and the drainage, which in 1856 was in

many parts very defective, is now nearly perfect, and cesspools are abolished. The total amount expended in sewerage, paving, and other improvements has been 140,000*l.*, of which 42,000*l.* have been paid out of the rates, and 98,000*l.* by means of loans, of which 23,000*l.* have been repaid. Under the old régime, six separate rates were levied by three different authorities, but virtually no provision was made for the inspection and improvement of courts and alleys; whereas now the various Sanitary Acts are enforced by a full staff of officers, and the condition of the district has immensely improved.

In Paddington, the total amount expended in sewerage, paving, and other improvements has been 104,257*l.*, of which 64,900*l.* have been paid out of the rates. There is systematic inspection; cleansing and drainage are enforced. The result has been that disease is greatly diminished; there are no fever dens; and great sanitary improvements have been effected.

In Bothal Green, thirteen miles and a half of sewerage works have been constructed, and 309,000 yards of paving executed; and whereas in 1856 the greater part of the parish was almost without drainage, almost all the houses are now drained and improved. The total amount expended in sewerage, paving, and other improvements, is 95,324*l.*, of which 25,324*l.* have been paid out of the rates, and 70,000*l.* by means of loans, of which 18,700*l.* have been repaid. The district has very much improved generally; and there is a growing appreciation of the value of sanitary measures.

In Newington, the total amount expended in sewerage, paving, and other improvements (including precepts of Metropolitan Board), has been 399,624*l.*, of which 385,124*l.* have been paid out of the rates, and 14,500*l.* by means of loans, of which 3,875*l.* have been repaid. The district has been much improved; sickness has diminished; and there is a greater appreciation of sanitary knowledge.

In Camberwell, the total amount expended on sewerage, paving, and other improvements, has been 507,355*l.*, of which 427,355*l.* have been paid out of the rates, and 80,000*l.* by means of loans, of which 11,000*l.* have been repaid. In 1856, the district was almost wholly undrained, except into open sewers; but now the sewerage is complete as far as required. Formerly there was a large proportion of cesspools; they are now nearly all abolished; and the water supply is greatly improved; disinfecting apparatus and mortuary instituted; vigilant inspection from house to house by four officers; and special regulations for lodging-houses.

In St. James's, Westminster, the total cost of the sewerage, paving, and other improvements, has been 110,218*l.*, of which 104,000*l.* have been paid out of the rates, and 6,000*l.* by means of loans, of which 2,700*l.* have been repaid.

In Clerkenwell, the total amount expended in sewerage, paving, and other improvements, has been 80,740*l.*, of which 51,739*l.* 17s. have been paid out of the rates, and 29,000*l.* by means of loans, of which 8,533*l.* have been repaid. The sanitary condition of the district has very greatly improved, although the inhabitants are more crowded than formerly.

In Chelsea, the total amount expended in sewerage, paving, and other improvements, has been 95,466*l.*, of which 89,101*l.* have been paid out of the rates. The sanitary and general condition of the district is highly satisfactory as compared with its state before coming under the operation of the Metropolis Local Management Act.

In Kensington, the total amount expended in sewerage, paving, and other improvements, has been 206,469*l.*, of which 140,075*l.* have been paid out of the rates, and 16,464*l.* by means of loans, of which 1,000*l.* have been repaid. The condition of the parish has altogether changed since 1856; many acres of fields are now built upon, nevertheless the sanitary and general condition of the parish is very satisfactory.

In St. Luke's, the total amount expended in sewerage, paving, and other improvements, has been 71,625*l.*, of which 49,825*l.* have been paid out of the rates, and 21,800*l.* by means of loans, of which 790*l.* have been repaid. The sanitary condition has been greatly improved since 1856, and is now very good.

In St. George's, Southwark, the total amount expended in sewerage, paving, and other improvements, has been 145,305*l.*, of which 125,305*l.* have been paid out of the rates, and 20,000*l.* by means of loans, 3,000*l.* of this last having since been repaid. The result is that the sanitary con-

dition of the district has been greatly improved, especially in the worst localities.

In Bermondsey, the total amount expended on works has been 91,968*l.*, of which 74,219*l.* have been paid out of the rates, and 27,749*l.* by means of loans, 4,570*l.* of which have been repaid. In 1856 a considerable portion of the parish drained into open sewers and ditches; but the entire district now drains into the low-level sewer. The sanitary and general condition of the district is described as most satisfactory.

In St. George's-in-the-East, the total amount expended in sewerage, paving, and other improvements, has been 50,820*l.*, all of which has been met by the rates. In this district it is reported that the crowding is not abated; and pauperism has increased. But there is now a daily supply of good water, and the paving and scavenging have been much improved.

In St. Martin's-in-the-Fields, the total amount expended in sewerage, paving, and other improvements, has been 6,654*l.*, which have been paid out of the rates; and the result of the sanitary improvements is that there is greater cleanliness, and the death-rate has decreased.

In Mile-end Old Town, the total amount expended in sewerage, paving, and other improvements has been 68,624*l.*, and cesspools and old and defective sewers have been abolished, while as regards the sanitary and general condition of the hamlet, there has been a great improvement.

In Woolwich, 22,637*l.* have been expended on sewerage, paving, and other improvements, 11,137*l.* of which were paid out of the rates, and 11,500*l.* by means of loans, of which 1,974*l.* have been repaid. The local authorities state that the sanitary and general condition of the district has been much improved, and that sanitary regulations are better appreciated by the poorer classes.

In Rotherhithe, the total amount expended in works has been 46,660*l.*, of which 29,198*l.* have been paid out of the rates, and 17,462*l.* by means of loans, of which 4,146*l.* have been repaid. There were 15 miles of open sewers; these have been abolished, and the drainage greatly improved. Nuisances are suppressed, and slaughter-houses, &c., inspected; and there is a good water supply. The rate of mortality has been diminished, and the health of the population improved.

In Hampstead, 57,572*l.* have been expended in works, of which 16,472*l.* have been paid out of the rates, and 41,100*l.* by means of loans, 11,396*l.* of which have been repaid. Besides this, 70,589*l.* have been expended in sewerage, and paving works by private individuals, under direction of the local authorities. It is difficult to compare the rural parish of 1856 with the suburban parish of the present day; but there can be no doubt that great sanitary and general improvements have been effected.

In Whitechapel, the total amount expended in sewerage, paving, and other improvements has been 88,942*l.*, of which 69,942*l.* were paid out of the rates, and 28,000*l.* by means of loans, of which 10,367*l.* have been repaid. The district has much changed for the better; offensive business and other nuisances abolished; dustbins emptied daily, where required; and the water supply greatly improved.

In Westminster, the total amount expended in works was 119,807*l.*, the whole of which has been paid out of the rates. There is a careful supervision of slaughter-houses, &c., and a vigilant sanitary inspection; the result being that the district has greatly improved.

In Greenwich, 292,452*l.* have been expended in sewerage, paving, and other improvements. Scarcely one-fifth of the district was drained in 1856, whereas more than four-fifths are now. The result of sanitary improvements is seen in the reduction of the rate of mortality, and the decreased virulence of epidemics.

In Wandsworth, 906,609*l.* have been expended in works, 613,297*l.* of which have been paid out of the rates, and 228,000*l.* by means of loans, of which 26,492*l.* have been repaid. In 1856 this district was almost entirely unsewered, and was full of open ditches and cesspools; but 142 miles of sewers have been constructed, and the whole district is thoroughly drained into the main sewers. The sanitary and general condition of the district is described as good, and the public health much improved.

In Hackney, the expenditure on works has been 52,029*l.*, of which 12,029*l.* have been paid out of the rates, and 40,000*l.* by means of loans, of which 1,159*l.* have been repaid. In this district the sanitary and general condition has been very

much improved; 33,920 nuisances abated since 1856, and the drainage and ventilation attended to.

In St. Giles's, 108,303*l.* have been expended in sewerage, paving, and other improvements, all of which has been paid out of the rates. Under an efficient staff the district is in a much better sanitary condition, and there is a constant suppression of nuisances.

In Holborn, the total amount expended on sewerage, paving, and other improvements, has been 53,146*l.*, of which 47,146*l.* were paid out of the rates, and 6,000*l.* by means of loans, 4,000*l.* of which have been repaid. There is a marked improvement in the district as regards its sanitary and general condition, although it is in a state of transition, owing to the great disturbance caused by recent alterations.

In the Strand district, 76,728*l.* have been expended on works of sewerage, paving, and improvements, 64,728*l.* of which have been paid out of the rates. The sanitary and general condition of the district has materially improved.

In the Fulham district, the total amount expended in sewerage, paving, and other improvements has been 78,572*l.*, all of which has been paid by means of loans, of which 19,818*l.* have been repaid. In 1856 the sewerage system was very bad; it is now tolerably complete, and the district greatly improved in its sanitary and general condition.

In Limehouse district, the sum of 179,945*l.* has been expended, of which 162,145*l.* have been paid out of the rates, and 37,800*l.* by means of loans, of which 12,437*l.* have been repaid. The sanitary and general condition of this district has been greatly improved.

In the Poplar district, 136,443*l.* have been expended in sewerage, paving, and other improvements, 89,127*l.* of which have been paid out of the rates, and 47,316*l.* by means of loans, of which 8,792*l.* have been repaid. Very full and strict sanitary provisions are put in force in this district, and to meet special exigencies there is an inspector of factories.

In St. Saviour's, Southwark, the total amount expended on works has been 57,850*l.*, of which 50,350*l.* have been paid out of the rates, and 7,500*l.* by means of loans, 6,700*l.* of which have been repaid. The sanitary and general condition of this district has in many respects been materially improved.

In the Plumstead district the total amount expended on works has been 106,379*l.*, of which 39,329*l.* have been paid out of the rates, and 67,050*l.* by means of loans, 10,497*l.* of which have been repaid. The local authorities report that the district to have been always healthy; but it is now greatly improved, for whereas in 1856 there was no drainage beyond that afforded by open ditches and cesspools, there is now a proper sewerage system, the water supply is improved, and various nuisances have been abated.

In the Lewisham district the total amount expended in sewerage, paving, and other improvements, has been 49,796*l.*, of which 10,027*l.* have been paid out of the rates, and 39,769*l.* by means of loans, of which 14,558*l.* have been repaid. This district was also formerly undrained, but is now properly sewered, and the sanitary improvements cause it to be healthy.

In the St. Olave's, Southwark, district, 54,316*l.* have been expended in sewerage, paving, and other improvements, 50,616*l.* having been paid out of the rates, and 3,700*l.* by means of loans, of which 1,600*l.* have been repaid. Cesspools have been abolished, drainage system perfected, water supply improved, and there is strict sanitary supervision. The local authorities report that the sanitary and general condition of the district has in every sense infinitely improved.

It thus appears that the vestries and District Boards of Works of the metropolis, have exceeded since the period of their constitution under the Metropolis Local Management Act, 1856, works of sewerage, paving, and other improvements in their respective districts to the amount of 7,212,319*l.*

The "Father of Steam Ploughing."—Mr. J. A. Williams, of Baydon, farmer, known as "the father of steam cultivation," has been presented with a purse of 200 sovereigns and a valuable gold watch, in recognition of the services he has rendered to the cause of agriculture, and the sacrifices made by him in working out the principle of cultivating the soil by the aid of steam. The testimonial was subscribed for by a large number of agriculturists in Berks, Wills, and elsewhere.

PROGRESS IN THE '72 EXHIBITION.

RETROSPECT.

It seems an easy thing to define a word, and there are not a few who think they can do it readily and obviously; but it is in reality a most difficult thing to accomplish, and requires for each individual word a fund of knowledge, and not a little patience. Sometimes it is impossible to do it at all with any accuracy and comprehensiveness; and sometimes, what is more difficult still, it takes no little time and skill to convince those who fancy they understand some common word in its true significance, that they interpret the said word wrongly, and that things will grow clearer if but they amend their wrong interpretation, and look out for a true one. Is not this the present state of the common word *progress*? "Progress" is now in every man's mouth. We are all "progressing," and everything almost about us, from children's toys to palatial mansions, is also progressing in a way, and at a pace never before known. But what is *progress*? Lord Bacon defined *progress* to mean *advancement, notion forward*, and this is perhaps the general sense in which it is understood; but Shakespeare's definition, he not being quite so great a man of business as the philosophic Chancellor, was *course, procession, passage*; while Locke, it may just be noted by the curious, limited the definition to *intellectual improvement, proficiency in knowledge*. It will be seen, therefore, that this one simple and common word admits of a great variety of interpretations, and is applicable to very many different states of things. In the remarks we propose to offer on the '72 Exhibition, now about to close, it will be seen how usefully this changeable word may be brought to bear on some things in it.

We would impress this on the reader from the fact that each successive Exhibition is said to be a "progress" beyond that of its predecessor, and that each year in the civilised world of Europe is a progress beyond that of the last; and it becomes therefore not a little important to know what *progress* is, and whether it is indeed a reality. This present year's '72 Exhibition at South Kensington is, of course, a progress beyond the last, the '71 Exhibition; that is, as is supposed, the things exhibited in it are a progression beyond those exhibited in the last year's show. The world is a year older, and a year a year wiser, and more capable, and shall we say, it? a year "cheaper," for surely cheapness is a part of progress. But is it indeed so? and, if so, in what way? and shall we take Bacon or Shakespeare as our dictionary, or help us to come to a conclusion about it? In the first place, there is one thing that has not "progressed," at least in one sense,—the number of new machines for the superseding of human labour is not so great as in last year's show. There are some quite as ingenious truly, but they are fewer in number. There is the "Walter Printing Press," and, by the bye, we should like to see the name of the clever inventor and contriver of this wonderful machine in partnership with that of its far-seeing promoter and proprietor. It does all a machine can well do, as far as things have yet gone; it does ill but write, and that with a speed truly marvellous. A great rag-washing machine, too, is quite a marvel in its way. There is also, among peculiarly modern affairs, for time was, but a few years ago, when the envelope was not known, but here is a machine which does all but direct "the said envelopes. Machinery in these days is most surely triumphant. Thus we may truly say that, in Lord Bacon's sense, machinery "progressing" in every sense: increasing in quantity, going forward, and riding down all things. The great lawyer would surely have been himself satisfied with this progress had he lived to our day. So far, therefore, there is progress. But what will seem to so many to be the triumph of this, as of other "Exhibitions,"—as it will be doubtless of the great Vienna show of next year, with its Machinery Court, a resplendent mile in length,—has still its melancholy and solemn side; for no man can, with any of the feelings and aspirations of the artist in him, fail to see that this so fairly boasted "progress" and power of the dead machine is, in other words, *artist-work*, out of the world together. It is a curious but most significant circumstance that nearly all the best specimens of hand-work to be found in the building were here and there, would seem to have been put away into corners, and to be waiting for "pro-

gress and improvement" to come to their aid, and to fit them fairly with their manufactured and machine-made competitors. We do not think that this was done intentionally: it was evidently the result of the instinct of the place and time. It is in the very nature of things as they are now going on and progressing to cast everything into the *machine*,—the man having nothing to do but to look at the machine as it does its work, to feed it with fuel, and to oil the joints of it. We say that this is the very genius of the time, and the way in which the "form and pressure" of it is manifested. But where is the artistic faculty all this time, and where is it allowed to show itself? This is the question!

In this Exhibition, as in the last, the French Court, as was to have been expected, is not a little conspicuous for what it exhibits. There is truly a neatness, and finish, and inventive faculty shown in French work which can hardly be found anywhere else. It seems wonderful, however, that there was not in this year's show, it was so in the last, any example of work which can be called in strict language *modern French*. It is copied, or in some way or other borrowed work,—borrowed, too, from all sorts of things, and from all sorts of places and times. There are *mechanical* copies of objects from *Eastern art*, which the French in Algiers seem to take to, after a fashion, and we see in this show "Cufic" inscriptions to a large scale in metal admirably executed; but who can read Cufic characters? What does the inscription mean? It is probably a text from the Koran, and means something certainly to those who first wrote it on its proper object,—as a Mosque lamp; but what is it, and what does it convey to the common Frenchman, or to the Englishman, in this new show? Why, the French workman, with all his ingenuity and skill, might do not a little for the world of art if he would but, instead of copying Cufic, go to work and mould into some sculptural shape, the common Roman letters, with which he prints all his hooks, or writes his letters. This would indeed do something, and spread his fame far and wide, for it is surely a desideratum to be able to write over even a shop-door a name and a trade, even as the Chinese do, in an *artistic* way, and worth the looking at.

Again, all cannot but have noticed that there was nothing in this year's French show which could for a moment compare, as an artistic production, with the magnificent carved chimney-piece of last year, wherein the sculptured drapery in white marble, so light and full of folds, and so truthful to our minds, eclipsed everything of the sort in the building. In vain we asked the name of the artist, the working artist; it ought yet to be on record, for it showed in a way not a little consoling what strength there is yet in the artist's power of Europe and modernism.

We need not go into detail, for this has been done in many ways already, and our object is not so much to criticise the objects exhibited as to point out results, and to indicate a something, if possible, in the future. No one can have gone through this French part of the Exhibition without a feeling of regret that the idea of "art-manufacture" should dominate the French art, as it does the English, and for this very simple reason, that it fairly strands the Frenchman, and leaves him high and dry, and takes from him the use of his real art-power. He might as well be without it: it is a glorious faculty thrown away; and to show this, it is but necessary to look at and to examine, with some little care, the examples of hand-work exhibited in the French Court. We would specially instance the goodly show of painted dinner-plates, and other objects of the like sort. Some of these painted plates are admirably done, and it seems to be a pity indeed that the subjects on them were not a little better chosen, and from actual French life,—both town and country life. We were glad to see that our hope of last year has, to a certain extent, but not enough by a long way, been fulfilled; for a number,—a certain number,—of the objects have had the name of the *executive artist* written or attached to them. In one case, in a somewhat unlucky way, for the lady artist who painted some of these things so cleverly posted up her name in such a very conspicuous and staring way that all the world could not but suppose, as we did, that it was the name and advertisement of the exhibiting firm. This was a pity; for the lady's name ought to be known, not as mere exhibitor, but as *artist*. We have thus dwelt on the French part of the show, not because we have missed sight of the rest of it, but from the hope that the French artists will

come to see what it is they are made of, how much they can do, and what a world of fame and wealth there is in that power which they possess, if they but use it aright, and throw not away the great and precious gift which is theirs by birthright, and which cannot be taken from them by conquest, but can only be lost in the process of art-manufacture! wherein the observer cannot tell one man's work from his fellow's, and where all alike, the dull and the gifted, are as one man, or one machine,—all doing the work, but no one man's hand being visible in it. Let the reader ponder on this, and carefully compare the ideas of progress in the mind of the "play-writer" and in that of the lawyer with each other. There will be found more in it than he at first sight thinks for, and the deeper he looks into it the more he will find. Some things there are which do not need "to progress": they are good and perfect as they are: they need but to be added to, and for the world to find more of them, it may be. Stars, and flowers, and blue sky, and cloud-forms, and mountain-tops, and a thousand other things, do not progress, except still to live, day by day, and age after age,—a "procession of marvels! So of artistic work,—the Madonnas of Raffaele, the heads of Michelangelo, and Titian's picture-colours: they could hardly progress; but they live, and the world's work, its true artist-work, is to add to them,—each artist, mud and hand, as it has been given him to do it, individually.

We have exceeded our limits already, and could have wished to say something a little in detail on the English side of the great show. There is one special thing which ought not to be passed by in this record. It is English,—that is certain,—and fashionable, and big enough, in all conscience, and illustrates what "progress" really, in these modern days, does indeed mean. It is mechanical, too. We mean the ponderous gun of the latest scientific make and power, and with the shot or bolt by its side, beyond the power even of gunpowder to move, one would almost have thought. It did show and illustrate truly and vividly what "progress" is,—what the word means, and what it is to progress with an idea. Not only was the actual metal here shown in ponderous section; but close to it, and fixed to the wall, was the section, full size, of the biggest gun which, it seems, could well be imagined,—not in metal, be it observed, but in wood, painted iron-colour. Now, here was, indeed, "progress," in a sense in which neither Bacon nor poor Shakespeare, with all his imagination, could well have dreamed of. "Progress," from the possible and the actual, all on the move, and going on day by day, before the astonished world's eye, but progress even far beyond this, into the regions of the *impossible*. But we do not like to be heated even here. Why was not a piece of armour-plate shown so thick and so big, and so tough, and so impassable, as to defy even the gigantic imaginative war-tool! Such is modern progress!

PROGRESS OF CARDIFF.

THE onward expansion of the commercial and maritime emporium on the coast of South Wales bids fair, at no remote date, to be a formidable competitor with the great port on the south-western shore of Lancashire. At least, within the last half-century, Liverpool has been the main maritime outlet between this country and the Atlantic. The Thames has, indeed, contributed to a certain extent to this end, but the shores of the Mersey have for some years been the chief scene of Anglo-American intercourse. Indeed, from the establishment of the Cardiff line of mail steamships, now some thirty years ago, down to the present time, when no less than six distinct American fleets can be numbered as trading between Liverpool and New York, the port of Liverpool, practically having no rival, has been in undisturbed possession of the American passenger and merchandise trade.

This unruled monopoly is about to be invaded. Cardiff,—commercial and marine,—has for some years been making rapid strides, and she now appears to have attained a position which justifies her in bidding for a share of the trade between this country and America, and to-day practically illustrates the venture. A body called the West Atlantic Steamship Company are about to place on the station between Cardiff and New York, a fleet of steamers for passenger traffic similar to those which now sail between Liverpool and New York. The pioneer of this line of steamers sails

to-day for the West from the enterprising Welsh port. The vessel, which has appropriately been named the *Glamorgan*, is a large ship of 2,500 tons register, with a carrying capacity of 4,000 tons, and having compound engines of 450-horse power nominal, but which will work up to 1,800-horse power. The *Glamorgan*, in addition to the usual fittings and decorations, is supplied with one of Allen's gas-making apparatus, capable of supplying from 100 to 300 burners; and the large capacity of the *Glamorgan* will necessitate the adoption of the larger number. The intention of the promoters is to place a full complement of ships upon the line, and a sister ship to the *Glamorgan*, to be called the *Pembroke*, is now in course of construction on the Clyde. In connexion with this enterprise, it may be stated, that the Great Western Railway Company, in anticipation of an increased source of traffic, are about to expend 40,000, in the erection of a new station at Cardiff, and a new floating harbour is also in contemplation at the neighbouring district of Neath.

THE HOUSES AND POPULATION IN ST. GEORGE'S-IN-THE-EAST.

The annual report of the St. George's-in-the-East Vestry, which has just been issued, contains some interesting statistics as to the number of houses and the population in the area within the district. It appears that both as regards houses and inhabitants the census returns of 1871 show a decrease as compared with the returns of 1861. The number of occupied houses is less by 262 than in 1861, whilst there is a falling off in the population to the extent of 656. This decrease is in some measure accounted for by a considerable number of houses having been taken down to make way for the works of the East London Railway, and also by the guardians having demolished a number of tenements for the purpose of erecting the new workhouse infirmary on the site. Notwithstanding, however, that there is this numerical falling off in both houses and population, the latter is relatively more dense than it was in 1861, as at that period 48,891 persons were residing in 6,186 houses, being at the rate of 7.9 persons in each house; whereas, according to the late returns 48,239 persons are living in 5,924 houses, or 8 persons in each house. The Vestry contemplate the widening of Wapping, which they think is desirable in consequence of the erection of the new station of the Great Eastern Railway Company in Leman-street, shortly to be opened, but they consider that it ought to be carried out as a metropolitan rather than a local improvement, and they have resolved to apply to the Metropolitan Board of Works on the subject.

FROM OXFORD.

The Restoration of Christ Church Cathedral.—The restoration of this cathedral is still being proceeded with. The nave is being lengthened 20 ft. at the west end, and the new entrance to the office from the "Tom Quad," will shortly be completed. The cathedral has been rescaled throughout with Italian walnut-wood seats, richly carved. A new altar-table of cedar wood, with carved caps and bases, and four ivory crosses on the surface of the table, has been placed in the chancel. The total cost of the restoration will be upwards of 21,000*l.*, towards which 100*l.* have been given by the Queen, in her capacity as visitor, a like amount by the Prince of Wales; 1,000*l.* have been given from the corporation fund of Christ Church; a like amount from the chapter fund; 2,625*l.* by individual members of the governing body of Christ Church; and 6,925*l.* by its present and former members.

Restoration of Merton College Hall, Oxford.—The hall of Merton College has undergone a complete restoration at a cost of upwards of 4,000*l.* About the year 1790 some alterations were made in the Hall by Mr. Wyatt, architect, who destroyed the then existing roof, windows, and all the architectural features of the building, and substituted for the open-timber roof one in plaster-groining. He blocked up all the window-seats and openings, and concealed the walls behind the plaster partitions, thereby leaving none of the original features of the Hall open to view. In fact, those alterations were a mixture of classical and we may almost say debased Gothic work. A short time since Sir Gilbert Scott was engaged to restore the building, and the whole of the work that Mr. Wyatt executed has been cleared away. The

new work is in accordance with the original construction of the Hall, which is of fourteenth-century date. The whole of the interior has been restored, and the exterior renovated, and the walls are refaced with Tynnton stone.

McKEAN'S ROCK DRILL.

The production of a satisfactory rock-drill for tunnelling, mining, well-sinking, and other similar purposes is a matter of so much importance and difficulty that many minds have been employed upon it for some time past. Several such machines have been invented, and have done and are doing good work, still leaving, however, something to be desired. The last placed before the public is one of which a diagram appears in our advertising columns, McKean's Rock Drill. We went to look at it the other day, and feel bound to say that in respect of simplicity, strength in the right place, and applicability to varying situations, it seems to us to make a strong claim on the attention of those interested in such an invention. The machine we saw is of the size ordinarily used for quarry-work or open-cutting, weighing about 150 lb., with a single drill mounted on a frame. A smaller, and for many purposes a still more convenient form, is being manufactured, which can be handled by one man. With a steam-pressure of 75 lb. to the inch, it will drill, as a maximum, a 2½-in. hole to a depth of 12 in. per minute in Aberdeen granite, but the average duty is estimated at from 6 in. to 9 in. per minute, and the number of strokes from 500 to 1,000. It is driven by steam, but compressed air would be applied for tunnel-work. We advise such of our readers as may need a rock-drill to make a journey to the Borough-road, and look into the matter for themselves.

METROPOLITAN DISTRICT SURVEYORS.

The superintending architect of the Metropolitan Board of Works, Mr. Vulliamy, has issued his report for 1871, on the monthly returns of district surveyors, giving a general abstract of the returns of fees for the year 1871, along with a list showing the comparative revenues of the several districts into which the metropolis is divided.

The total of the gross fees received for the year is 29,099*l.* 10*s.* 6*d.*, in respect of 18,948 works, of which above two-thirds were done within the year. The gross fees received in thirty-seven districts vary from 60*l.* to 490*l.*, five being under 200*l.* each, six under 300*l.*, fourteen under 400*l.*, and twelve under 500*l.* In twenty-two districts the incomes vary from 598*l.* to 1,221*l.* The expenses of district offices are 7,459*l.* 3*s.* 7*d.* The fees remaining due for all arrears are 29,199*l.*, but probably mostly of little value. The sums asked or lost are 2,262*l.* 1*s.* 10*d.* Compared with the results of former years the present abstract shows still a decrease.

Year	Works	Fees received.
1862	15,707	£26,315 2 3
1863	17,954	29,440 9 9
1864	18,984	31,883 3 2
1865	19,251	32,972 7 9
1866	20,196	34,989 11 4
1867	21,303	36,674 6 0
1868	21,915	37,790 13 5
1869	19,947	33,248 19 6
1870	18,899	30,003 2 4
1871	18,948	29,099 0 6

A NEW THEATRE FOR DARLINGTON.

The present building in Northgate, now used as a theatre, is to be pulled down, and a new one to be built upon its site. The new theatre will be much larger and more commodious. The street façade,—not so extensive as at first proposed,—is in the Gothic style of architecture, adapted to modern times, and the front is broken up, in making a feature of the main entrance, which is the central object, and the superstructure, by recessing the other portions of the façade. The doorway is arched, finished with a hood-mould stopped on the foliated capitals of the pilasters: the tympanum of the arch is intended to have some dramatic scene carved in either wood or stone. The second story is formed of an arcade of windows, with circular shafts and foliated capitals. The upper portion is reserved for three niches. The whole is broken up with horizontal strings, and finished with a cornice. The principal entrance is by a corridor, on the left of which is a ticket-office, so planned as to supply tickets to the pit and gallery occupants,

and the occupants of the dress circle, without coming into contact with each other. The staircase to dress circle is intended to be of stone, at the top of which is a large landing, from which is the entrance to the dress circle and private boxes. The auditorium at this level is 46 ft. wide and 48 ft. deep. The stage is 47 ft. wide and 46 ft. deep, and so constructed that it may be removed if required, and be used for acrobatic and equestrian performances. Entrance to the pit is obtained through a door in the passage on the right of the main entrance, and a wide staircase leads to the gallery. Provision has been made in the shape of lavatories, &c. The ceiling is flat, with a cornice round, which is intended to be relieved with centre flowers and medallions, the latter formed for carrying off vitiated and heated air. Ventilation shafts in the walls with air-grates are let into each tier. On the top of the roof is a large louver, which supplements the other ventilators. The lighting of the theatre will be from a fan-light. The means of egress in case of fire have been considered. Besides a broad flight of steps from the gallery, in addition to the admittance entrances, there are two other doors opening into a spacious yard, which may be thrown open on an emergency. The doors also slide. The building is calculated to hold 1,300 persons sitting. In the large yard at the back there is room for dressing-rooms, &c., and also for stabling accommodation for circuses. Mr. W. Hodgson is the architect.

SALARIES OF ENGINEERS TO MUNICIPAL BOARDS.

The following list gives the amounts of salaries paid to some of the principal engineers and surveyors to municipal bodies and local Boards of Health:—

Name of Towns.	Amount of Salaries paid.	Population, Census of 1861.
Local Government Board—		
Chief Inspector	£1,000	—
Two other Inspectors	800 each	—
Metropolitan Board—		
Chief Engineer	2,000 and private practice	—
Assistant Surveyors	1,000 each	—
Liverpool	1,300 allowed pupils	443,639
Manchester	750 applying for 1,300 <i>l.</i>	367,979
Birmingham	600	236,075
Leeds	300	207,165
Sheffield	400 and private practice	155,670
Bristol	500 and 120 <i>l.</i> for horse and trap	151,093
Wolverhampton	550	147,670
Newcastle-on-Tyne	600	109,108
Salford	350	102,449
Hull	250 and private practice	97,660
Oldham	300	91,344
Brighton	400	87,000
Norwich	400	74,571
Nottingham	400	74,683
Leicester	500	68,636
Birkenhead	500	61,648
Portsmouth	400	49,779
Southampton	400	46,960
Derby	350 and private practice	43,991
Exeter	300 and private practice	41,747
Cheltenham	300 and private practice	39,693
Wigan	300 and private practice	37,688
Hullers	310	37,104
Ruddersfield	350 and private practice	34,577

THE ESCURIAL.

As briefly stated in the *Builder*, last week, the Escorial was struck by lightning and fired. The damage, fortunately, however, was localised. It spread by the angle of the Colegio and roof of the Library. The Seminary tower and the Lantern tower have fallen.

The damage done will cost about 40,000*l.* to repair, and this King Amadeus offers himself to defray. The Library, around and above which was the principal seat of the fire, is of world-wide renown. It contained fourteen to fifteen thousand of the rarest books and the oldest manuscripts. These were all saved, as were also the valuable paintings which hung on the walls.

The Escorial is situated about thirty miles north-west of Madrid. It was begun in 1567 by the moody monarch Philip II., whose amatory advances were so sternly refused by our own virgin Elizabeth, and was erected in commemoration of the battle of St. Quentin, which was won by the force of Spanish arms, on the day dedicated to San Lorenzo, in the Papal calendar. Hence, its name, "El Real Sitio de San Lorenzo, el Real de Escorial."

The first architect was Juan Baptista Mangro, of Toledo, and upon his death, in 1567, the work was continued by Juan Bustamante, one of his pupils.

The building is whimsically constructed in the

form of a gridiron, on which instrument of torture the saint to whom it is dedicated is said to have been broiled alive. Everything in the Escorial is commemorative of his martyrdom. The gridiron is seen upon the doors, windows, stairs, and even the rituals and sacerdotal habits display it. As to the edifice itself, the principal front faces the west, and behind it is a mountain: one opposite side looks towards Madrid, and the other the form of the shortened handle of the gridiron, while the bars are represented by the interior intersecting buildings, and the four towers are portrayed by the spires of four little square towers, which arise at the four angles. The western front shows a fine portal formed by large columns of the Doric order, half sunk in the wall, on each side of which are two huge doorways. The whole edifice is of a species of black granite, called heroqueano, and the brownish hue which it has assumed through time tends to rather than diminishes the natural verity of its aspect. The quarry whence it was dug is close by, and its vicinity is said to have been one reason for the choice of such a convenient and unattractive site. The same one is also seen in the little village of the same name, which nestles at the foot of the main building.

The central structure, around which all the rest aggregate of buildings spreads, is the magnificent temple built on the model of Peter's at Rome. It stands in the centre of a parallelogram which forms the gridiron, and is the shape of a Greek cross, with a splendid dome 330 ft. high in the centre, and lofty towers at the ends. All the wealth of Spain was vished on this church. It is 374 ft. long and 100 ft. broad; is divided into seven aisles, paved with black marble; and the walls are everywhere covered with porphyry, jasper, and other marbles of infinite variety, and with statues, portraits of the kings of Spain. This church forms one side of the central court of the building. On the other side is the grand central atrium and Ionic portal which opens twice for every Spanish monarch,—first, when he is crowned by his baptism; last, when he is borne to the grave, by three nobles and three monks. The *Capilla de los Reyes*, where the present confagration is said to have broken out, is so called because it is surrounded by six statues, 17 ft. high, of the kings of Judah, who were connected with the Temple of Jerusalem. They were all carved from one solid block, and enough remains of it to complete the dozen. The church itself contains forty chapels, each with its own altar. The ceiling is covered with the frescoes of Giordano, forming a pictorial history of Christianity; and of the forty-two pictures which adorn the sacristy, each one is said to be a masterpiece. The church is described by Ford

"The triumph of architecture. It takes away the breath of the beholder, from its majestic simplicity, its quiet, solemn, unadorned. No tinsel statues or tawdry paintings mar the perfect proportion of the chaste Christian temple. The religious sentiment pervades the whole of the House of God; everything mean or trivial is forgotten."

The royal tomb is under the high altar, in which that when the priest raises the Host he pray do so exactly above the dead. Descending to a flight of polished marble steps, between walls of yellow jasper, we come on an octagonal chamber, 36 ft. wide and 38 ft. high. In the centre is a black marble sarcophagus, between which, with a black marble sarcophagus in each. Of these sarcophagi sixteen are full, and the rest await their occupants. None but reigning monarchs are buried here, the monarch to the right of the altar and the consort to the left. The Queen Isabella remained on the throne until she would have been laid, at her death, under her father, and her husband would have been covered among the queens on the other side. Her royal personages are buried in a chapel called the Pantheon of the Infantas.

The great library is above the front of the hall called the Patio de los Reyes. It is an arched hall, 194 ft. long by some 32 ft. wide and 36 ft. high. The books had their edges, not their backs, turned on the shelves. They were originally arranged so, and the arrangement was never altered till now.

According to some accounts the length of all the rooms and apartments in the Escorial is above 11,000 English miles, and it contains 14,000 doors and 11,000 windows. These statements may be exaggerated. The fire broke out at half-past seven on Tuesday night (1st inst.). Only a single effective engine was at first brought to bear upon it; those from Madrid not arriving till

6 a.m., when the conflagration was already much reduced. The people of the village made such exertions as to remove some 14,600 books within an hour.

The *Correspondencia* believes that this is the fourth time that the Escorial has been set on fire by lightning. Ford does not mention any such occasions, but notes with surprise that an English translation, bearing date 1671, of Santos's "Description del Escorial," announced on its title-page that the Escorial had lately been consumed by fire. As it is, one has reason to be thankful that the great gridiron has been saved from the fire, in which, to carry out its symbolic idea, it ought to have been incombustible.

A fine painting of the Escorial, with its surroundings, by Rubens, will be remembered by visitors to the Royal Academy Exhibition of Old Masters.

THE WOLVERHAMPTON PILLAR.

I should like to see the pillar for myself; but I think the engraving in the *Builder* is quite enough to show that the column has more affinity to Roman than to Norman work, and in, as you say, *Saxon*. As for the term, "Danes Cross," it is only interesting in showing that the column is very old; and that people gave the name to cover their ignorance, as they ascribe everything they deem wonderful to the Devil. The Danes left a strong impress of their savage nature upon the land; and thus with Satan they divide the glory of the unknown, the desolate, and the remarkable. The field at Hartlip in which the Roman villa stood is called "Danes Field."

C. ROACH SMITH.

CASERTA MARBLES.

We have been interested by some specimens, now in Fenchurch-street, of marbles quarried in the Apennines, not far from Naples. Those quarries were opened by Vauviteilli in the last century, and were used exclusively for the royal palaces of Caserta and Naples, the noble halls and staircases of which will be remembered by many of our readers. The great cost of transport prevented these marbles coming into general use, but it seems they can now be obtained at no greater cost than ordinary fancy marbles, many of which they far surpass in beauty. The rich agathe, the large mottled jasper, the rose and grey drifts are certainly beautiful, and should be made use of.

THE LORD MAYOR AND ALEXANDRA PARK.

The newspapers announce that the skilled workmen, who are anxious that the working classes should possess the palace, with the unenclosed park of 500 acres, have presented to the Lord Mayor a unique work of fine art, executed by one of their number. It will bear an inscription expressive of their appreciation of the Lord Mayor's efforts to acquire and save the estate for their benefit. Surely it would be wise of the Lord Mayor to wait till he had really done something towards effecting the object. At present, the most unbusiness-like description.

We are very anxious to see the Park and Palace secured as a public recreation-place, but we are unable to persuade ourselves that this is at all likely to result from the present proposals.

MADELEY CHURCH.

The parish church at Madeley, near Newcastle-under-Lyne, which is one of the most ancient, and, from an archaeological point of view, one of the most interesting ecclesiastical edifices in North Staffordshire, has been reopened by the Bishop of Lichfield, after having undergone a renovation and having a new chancel built. The work has been done at a cost of about 5,000l. The new chancel has been built at the expense of Lord Crewe, who, in fact, has defrayed the entire cost of the alterations, with the exception of about 500l. contributed by parishioners and friends.

The chancel is about 35 ft. long by 20 ft. wide; and the body of the church about 60 ft. by 50 ft., and it measures about 72 ft. across the transepts. The church affords accommodation for about 400. The works now about complete principally consist of the rebuilding of the chancel, the erection

of an organ-chamber, the obliteration of many coats of whitewash from the walls, piers, and arches; the destruction of flat plaster ceilings, western gallery, and high and square pews in the church and chancel; the total renovation of the floors, glass of windows, lead roof coverings to north and south aisles; and a complete refitting of the interior.

The whole of the chancel has been rebuilt in fourteenth-century character. The walls are of coursed stone inside and outside. On the north side are two arches between the organ-chamber and the vestry; on the south a priests' door and windows,—one of two lights and the other of three. The east end has a five-light window, and the old chancel arch remains at the west end. The roof is entirely of oak, and has six bays with arched ribs, moulded timbers, open rafters, and plain boarded ceiling between rafters. The floor to stalls is of wood, all the other part being of tiles. There are five steps of stone from nave to altar. The eastern bay of the roof is decorated in gold and colour; the other bays are of simpler character, the oak in all cases forming the ground-work for decoration. The tiles of the floor are of varied patterns, mostly enriched by indented outlines, and some encaustic taken from old tiles found in the church during the restoration. The stained glass is by Messrs. Clayton & Bell. The east window represents in the main lights the following events in the life of our Lord: in the centre, the crucifixion; to the north, the bearing of the cross, the agony in the garden; to the south, the entombment and the resurrection. The tracery above contains emblems of the four Evangelists. The eastern window in the south wall has the adoration of the Magi; the western, the Last Supper. The sanctuary is fitted with sedilia, credence, altar of oak, reredos, altar-rail, bishop's chair, and two, seven-light standards. The super-altar is of polished Dorsetshire marble. The centre of the reredos has a red marble back, and on it a white statuary marble cross under an arched recess, the spandrels of which bear the monograms Alpha and Omega. The two side compartments contain medallions with initials *Jesur-De-Isis*. The principal members are of alabaster found in the church, the plainer surfaces being of Hoptowood stone. The arch mouldings, cornice, and impost are carved with the rye, wheat, and lily. On the north and south sides of the chancel are stalls for the clergy and choir, all of oak, slightly carved on the ends and fronts. There are standards for lighting at each end of the stalls. The present organ is a temporary one, a strike in the organ-building trade having delayed the erection of the permanent organ.

In the body of the church the ancient stone-work in the walls, piers, arches, and window dressings has been completely restored, the clerestory windows being entirely new. The variety of tint in the natural stone, the difference of workmanship of the several styles, and the multifarious plan give interest to the simple architecture of the interior. The timbers of the nave roof, as put in about 100 years ago, although very simple, are of oak and of large dimensions. They have been thrown open to view, and slightly decorated in colour. The roof timbers of the south aisle remain unaltered beyond necessary repairs. Those to the north aisle are old, but have been raised from a flat to a slight pitch. The trusses in the transepts have been thrown open and the rafters boarded beneath; the whole slightly decorated in colour. The windows generally are glazed with cathedral glass, in patterns and tints of varied design, executed by Messrs. Heaton, Butler, & Bayne. One two-light window on the north side is of stained glass by Hardman; it is the gift of Mr. E. H. Martin, in memory of his father, and represents the sower of good seed and of evil seed. The three-light west window of the south aisle is also of stained glass, the gift of the Rev. J. W. Dalry, the vicar, in memory of his daughter, and is the work of Messrs. Morris & Co, representing Noah, typical of the old church; St. Peter, of the new church; St. Philip, the work of the church; and the crucifixion as its crowning act. The floors under the benches are of wood, the passages of plain tiles, varied by sundry ancient brasses, coffin-lids, and monumental slabs of stone and alabaster found in the old walls and floor. The fittings consist of brass lectern by Messrs. Hardman & Co.; oak pulpit, Litany-desk, and benches; and stone font. The pulpit is hexagonal, of early seventeenth-century work, richly treated. The panels have been decorated in gold and colour, having in them the emblems

of the four Evangelists, representations of the five wounds, instruments of the passion of our Lord, &c. The pulpit has been illuminated at the cost of the architect. The benches made a few years ago have been refixed, the remainder being designed from ancient examples found under the modern pewing. The heltry floor, formerly hidden by the organ, is now disclosed, and is thrown open to the church, whence the ringers are visible while at their work. The quaint halustrade of this loft bears date 1634. The provision for lighting is by candle standards of wrought iron. The several doors are screened by bangings. The heating is by hot water.

In the exterior of the building every ancient stone and other material that could be preserved has been left in its place. The new works are the chancel, organ-chamber, parapets to aisles, east-ayle, and tower, lead on roof of aisles to the east chapel, and north porch.

The architect was Mr. Charles Lynn, of Stoke, under whose superintendence the whole of the work has been completed. The contractor for the general works was Mr. John Stringer, of Sandiach; the decorations have been done by Messrs. Heaton, Butler, & Bayne; the iron and other metal works by Messrs. Hardman & Co.; the general carving by Mr. O'Shee, of Manchester. The reredos was executed by Mr. J. C. Daniel, of Hanley.

The churchyard has been enlarged and improved by the lowering of the ground and tombstones and by the erection of new boundary walls.

THE DRINKING FOUNTAIN MOVEMENT.

The Lord Mayor of London has publicly opened a drinking-fountain at Bow, as a memorial of the successful opposition to the proposed match tax of 1871, and in honour of the firm of Bryant & May, who were mainly instrumental in averting what was considered a serious injury to many thousands of the very poorest class of workpeople in the metropolis. The site fronts the North London Railway Station. The fountain was designed by Mr. Rowland Plimbe, and executed by Mr. J. W. Seale. It has been made over to the Metropolitan Drinking Fountain Association, who have undertaken its care, and will supply it with water. It is handsome and appropriate.

At the last meeting of the Norwich town council, a letter was read from Mr. E. Freestone, offering to give half a dozen drinking-fountains to the city. The letter stated that he had seen in Scotland some very simple drinking-fountains, and feeling that they would be appreciated in Norwich in a sanitary point of view, be of great service to the working classes, and might be used for horses and other stock to drink at, he enclosed a drawing of one of them, and if the City would allow him to put up half a dozen, he would be happy to make a present of the fountains and fittings, so that the City would only have to supply the water. Mr. Freestone proposed the following places as sites for the fountains:—Stump Cross, St. Giles's (near the branch road to Bethel-street), St. Stephen's-plain, near Timberhill church, Trowse end of King-street, and Foundry-road (near the triangular plantation). The letter was referred to the Executive Committee, Mr. Youngs remarking that to Mr. Freestone's liberality many were indebted for the comfort of the iron seats upon the Castle-hill. The thanks of the council were unanimously accorded to Mr. Freestone.

SCHOOLS OF ART AND OF SCIENCE.

The Watford School of Science and Art.—Lord Ehury distributed the prizes gained by the pupils at the Science and Art Class at Watford. After referring to the origin of the classes in the establishment of a school of design in Spitalfields, his lordship said he was told that all the pupil-teachers in the elementary schools in the town were students in the Science and Art classes. They would carry, no doubt, the knowledge they there obtained to the elementary schools, and thus the standard of education would be raised by the exertions which had been made in the successful establishment of these Schools of Art and Science.

Bradford Art Society's Exhibition.—The third annual exhibition of the Bradford Art Society has been opened in the Freemasons' Hall, in Salem-street, Manor-row, Bradford, and the collection of pictures and drawings—about 150 in number—constitute an interesting and credit-

able exhibition of the original productions of the local artists, professional and amateur.

Proposed School of Art at Stafford.—This town has been visited by Mr. Chittenden, a Certificated Master of the Department of Science and Art in London, who has had interviews with some of the most influential inhabitants with a view of establishing a School of Art in the town. An important county town like Stafford should not have so long been without such an institution. The local *Advertiser* states that most of the gentlemen upon whom Mr. Chittenden called expressed themselves as being fully aware of the benefit that would accrue from his proposal, but doubted its success, as there was no particular branch of business in the town requiring art instruction. But this would appear to be a mistaken view of the object and effect of Schools of Art, as with few exceptions they are supported by artisans of every description—engineers, carpenters, joiners, paperhangers, decorators, &c., and by any person from twelve years of age to thirty who wishes to avail himself of the opportunity of improving the leisure time he has at his disposal. Mr. Chittenden instanced to our authority the fact that at Wol-verhampton School of Art, where he was head-master for five years, the janitors, for whose benefit the school was originally intended, never attended it in any number; but that the pupils consist of every description of mechanic and tradesmen's assistants in the evening class, and the sons and daughters of the principal inhabitants in the town in the morning and afternoon. As the Committee of Council on Education now make drawing so conspicuous a feature in the curriculum of school education, it is to be hoped that Stafford will no longer be unprovided with the means of acquiring so refining and useful an attainment.

Wedgwood Institute Schools of Science and Art. The annual public meeting of the friends of the Schools of Science and Art connected with the Wedgwood Institute, Burslem, has been held in the town-hall. There was a large attendance. Sir Edward Manningham Buller, bart., M.P., presided. The report of the committee stated that there is every reason to regard the progress and prospects of the school as eminently encouraging. Mr. Theaker, the head-master, in his report, said that, while there was room for further improvement, he was enabled to say the studies had been of a steady, progressive character, as evidenced by the number of works sent up to London for examination, and the increased value of the awards.

SLATE versus LEAD AS A ROOF COVERING.

WORCESTER CATHEDRAL.

Sir,—In the remarks of your correspondent, "N.," on Worcester Cathedral, in the current issue of the *Builder*, he seems to take exception to the restoration of this cathedral being considered complete while the roofs remain covered with slate instead of lead, the original covering; and thinks that the "replacing of the metal covering" is being delayed simply from a lack of the necessary funds.

It is somewhat surprising to find the superiority of lead, as a roof covering, insisted upon, so soon after the recent disaster at Canterbury Cathedral has shown that its use may be attended with much danger.

Experience teaches that stone-slate or slate practically answers all the purposes of lead, as an entire covering for roofs, without many of its disadvantages; while their capacity for architectural treatment is quite equal to that of their metallic rival.

Roofs covered with these materials, need not necessarily be "sloped" in appearance: their first cost is considerably less than that of lead, and they need but little attention and reparation afterwards.

Lead, on the contrary, is not only very costly, but is always a source of trouble and expense in reparation, and very liable to suffer from defective laying. Being fusible at a low temperature, it facilitates the action of a fire when it has once broken out in a building. Many other obvious disadvantages combine to make it an undesirable covering; and by many of our leading architects, its use is now judiciously restricted to flats, gutters, and the like, it being superseded by slate and other materials as an entire covering.

It is scarcely necessary, perhaps, to remind your correspondent, that "literal copyism" is

not "intelligent restoration." Let us, therefore, hope that his suggestion will fail to impress the authorities of Worcester Cathedral, and that they will refuse to recognise in it a justification of an extravagant and unwise expenditure. J. S.

MODERN ARCHITECTURE IN GERMANY. BOEDDEKEN MANOR HOUSE.

The Manor House of Boeddeken, about three miles from Paderborn, in Westphalia, the seat of Herr George von Mallinkrodt, was, until the commencement of this century, a convent of Canons Regular of the order of St. Augustine. The history of this religious house dates from the year 836, when it was founded by St. Meinolphus, archdeacon of Paderborn, as a convent for nuns. In 1409 it was refounded, and given to the Canons Regular. In 1803 the monastery was secularised, and a few years afterwards the ancient church was destroyed,—a work of considerable difficulty, owing to the great solidity of its construction. Nothing, however, was left of it but the base of the old Romanesque tower and the walls of the chancel, which latter date from the earlier part of the fifteenth century. The present possessor of the building, Herr George von Mallinkrodt, the brother of Prince Bismark's most talented and courageous opponent in the German Reichstag, is restoring the chancel and tower before mentioned as a domestic chapel. The drawings we reproduce, and which we should mention, are *fac-similes* of the architect's working drawings, represent the additions now being carried out in connexion with the partial rebuilding of one of the wings of what was originally a portion of the monastic buildings. This wing contains the drawing-room, principal staircase, and reception-rooms of the mansion; and our drawings represent especially the bow window of the drawing-room, front and side; and the folding-doors of the same apartment. The whole of the timber-work is executed in the finest oak, and the upper portions of the windows are filled with stained glass, in mosaic patterns. Considerable use will also be made of colour and gilding. This same wing also contains the grand staircase, which is now completed, and is a very noble work. The stairs are composed of solid logs of oak supported upon columns of the same material, which, being carried up to the ceiling, support the timbers of the roof. The whole is richly carved and moulded, and decorated with gilding and colour. The architect of these works is Mr. Gulpenpennig, of Paderborn, whose works have been frequently mentioned in this journal.

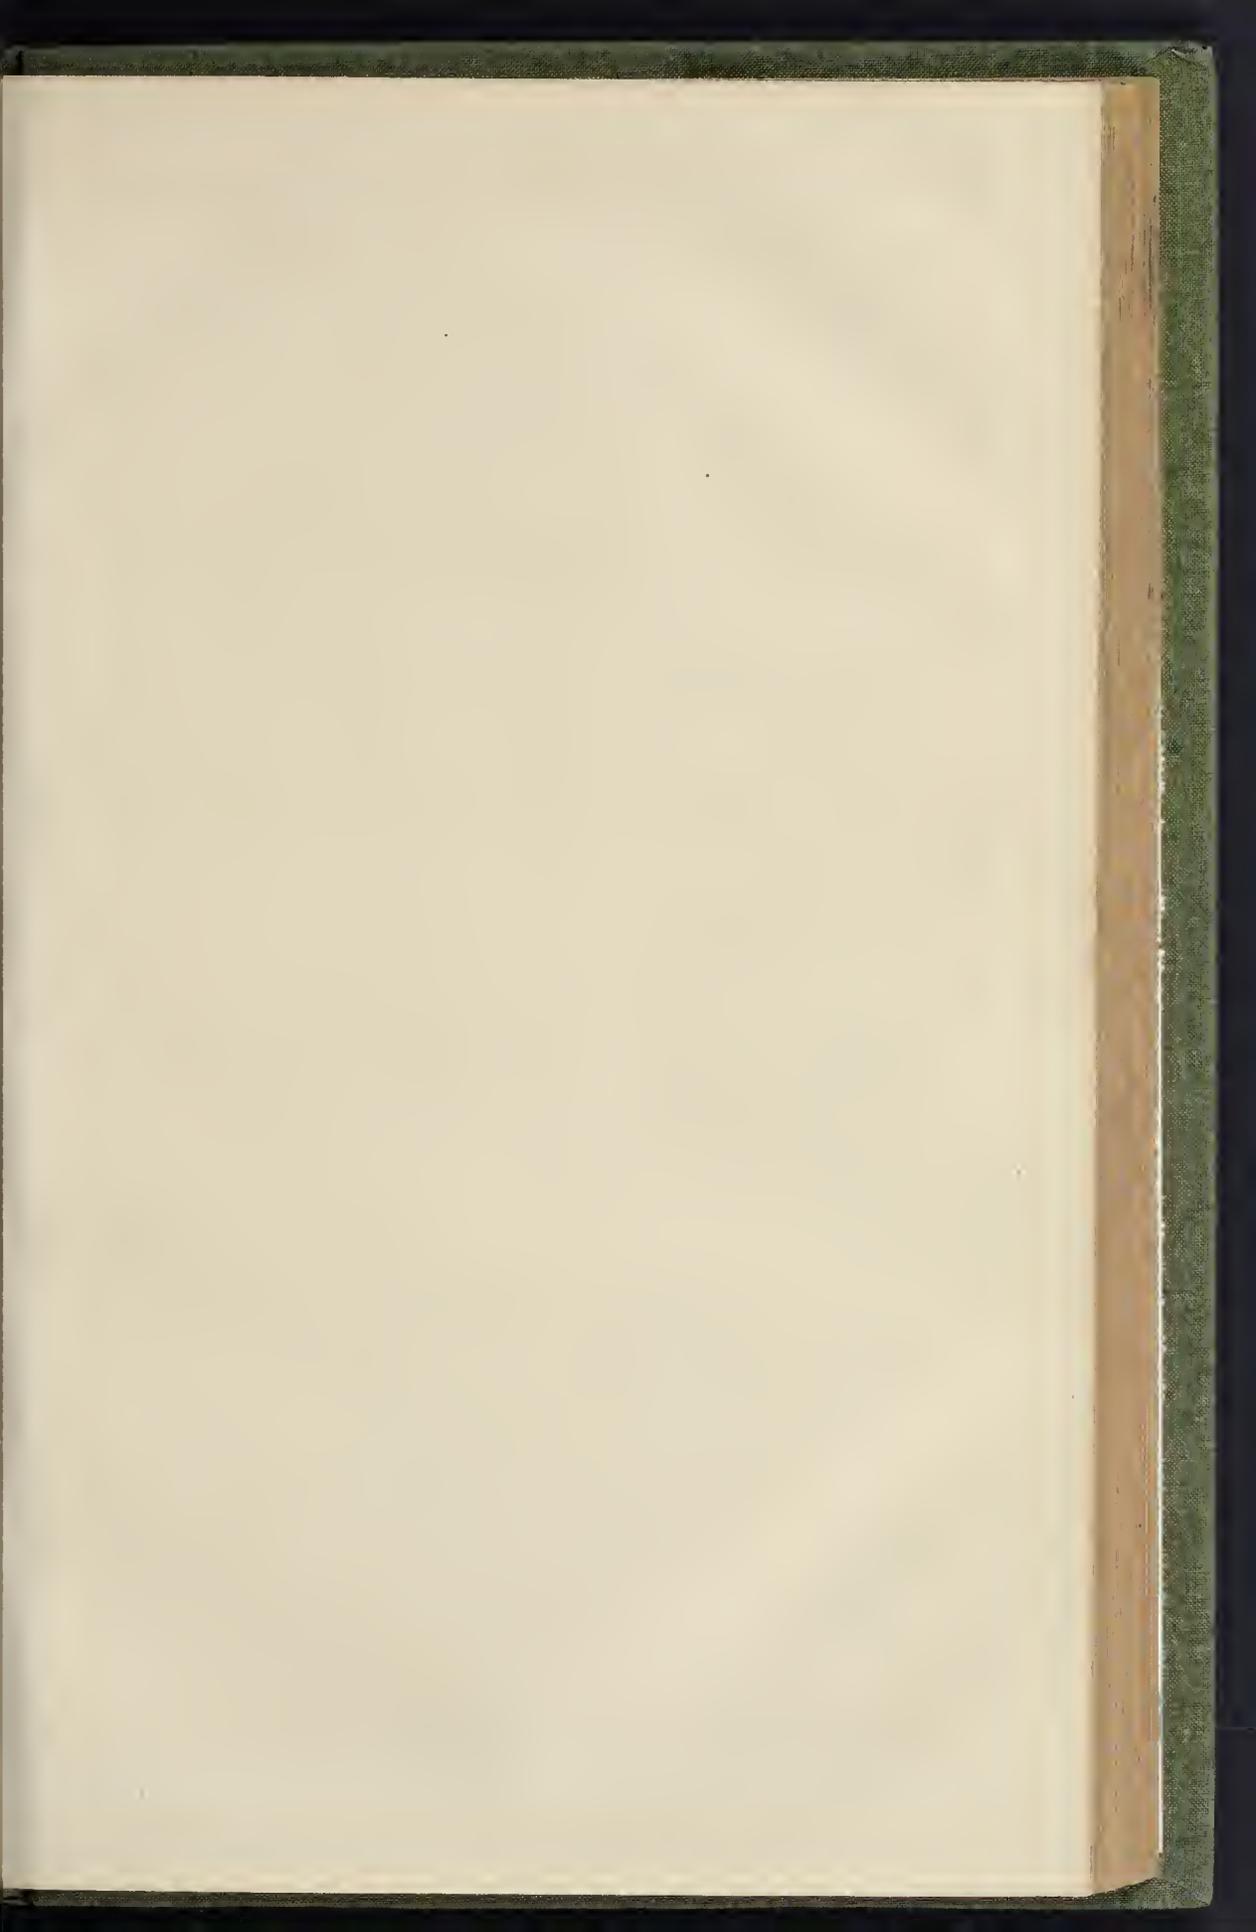

It will be seen from the drawings which we publish that the whole is being carried out in an elaborate style, and the designs show the originality and skill possessed by the architect. We would draw our readers' attention specially to two points in these designs which show how well a good architect can get over a difficulty. The first is the way in which the bow-window is corbelled out, and the second is the way in which the space between the folding-doors and the ceiling is filled up. It should be recollected that these folding-doors are not like our English ones, intended to be kept open, but are like the French doors, which are always kept shut, and their purpose is to provide a large and important means of ingress or egress when receptions, &c., are given, or by opening only one valve, to give sufficient room for one person to pass, when a large aperture is not requisite. We think that this kind of doorway might be advantageously introduced more often into this country than it is as it has many advantages over the ordinary room-door in use here. The whole opening is some 5 ft. wide; but by this arrangement only 2 ft. 6 in. need be open at one time, and when the whole space is open the doors, of course, only project into the room 2 ft. 6 in.

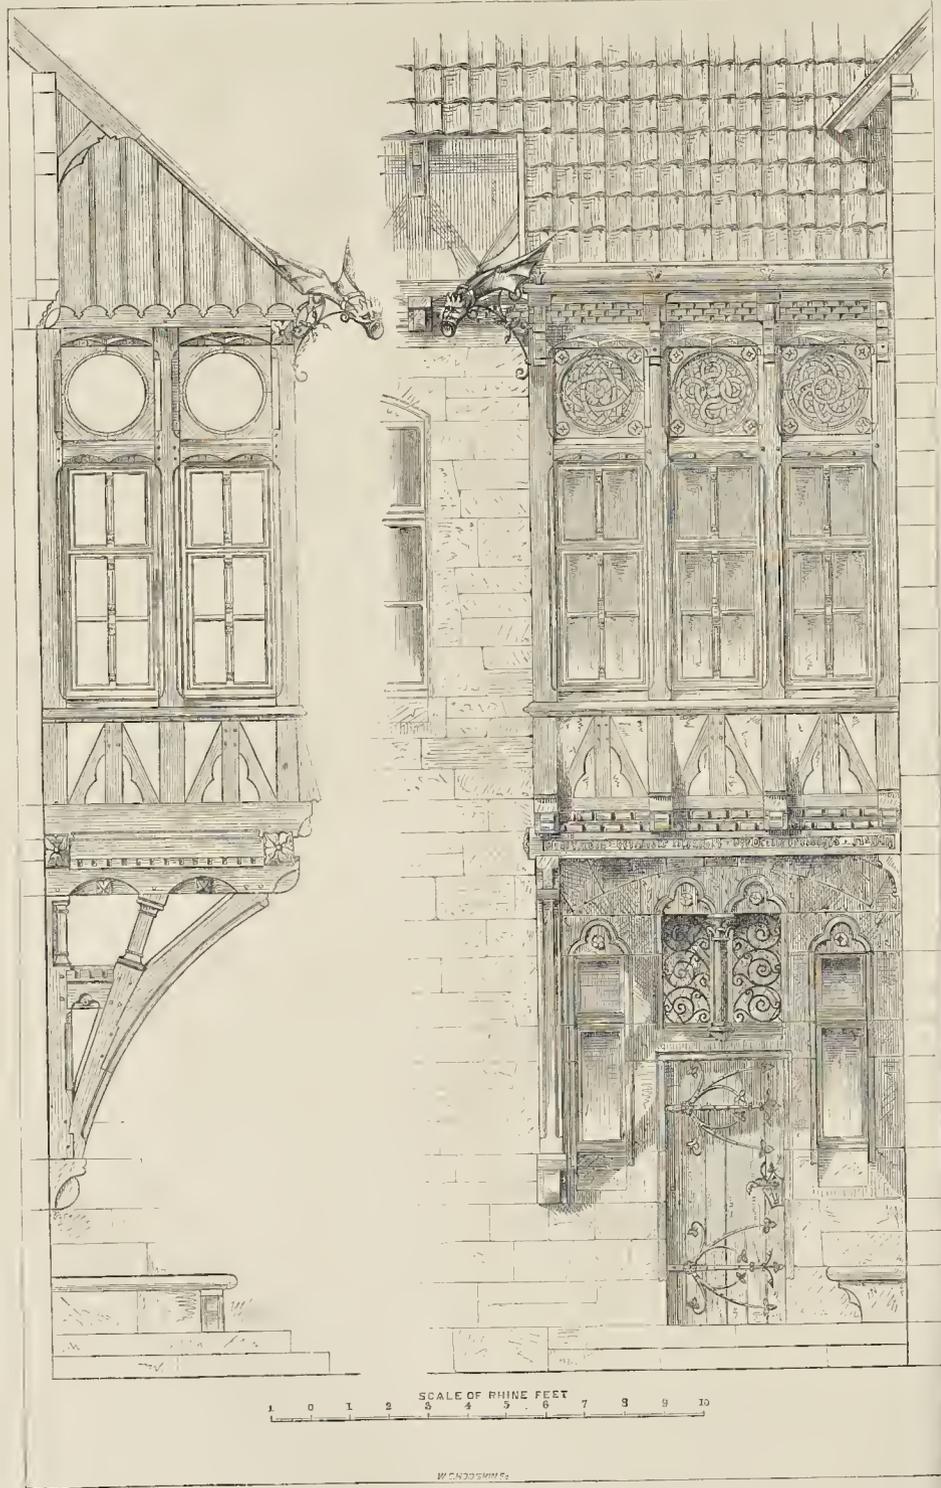

Great use seems to have been made of quaint German and Latin inscriptions in various part of this building; thus, over the folding-doors is the following legend:—

"Herscht heut der Teufel auch auf Erden
Morgen wird Gott meister werden. A. D. 1871."
"If the devil rules on earth to-day: God will be master to-morrow. A. D. 1871."

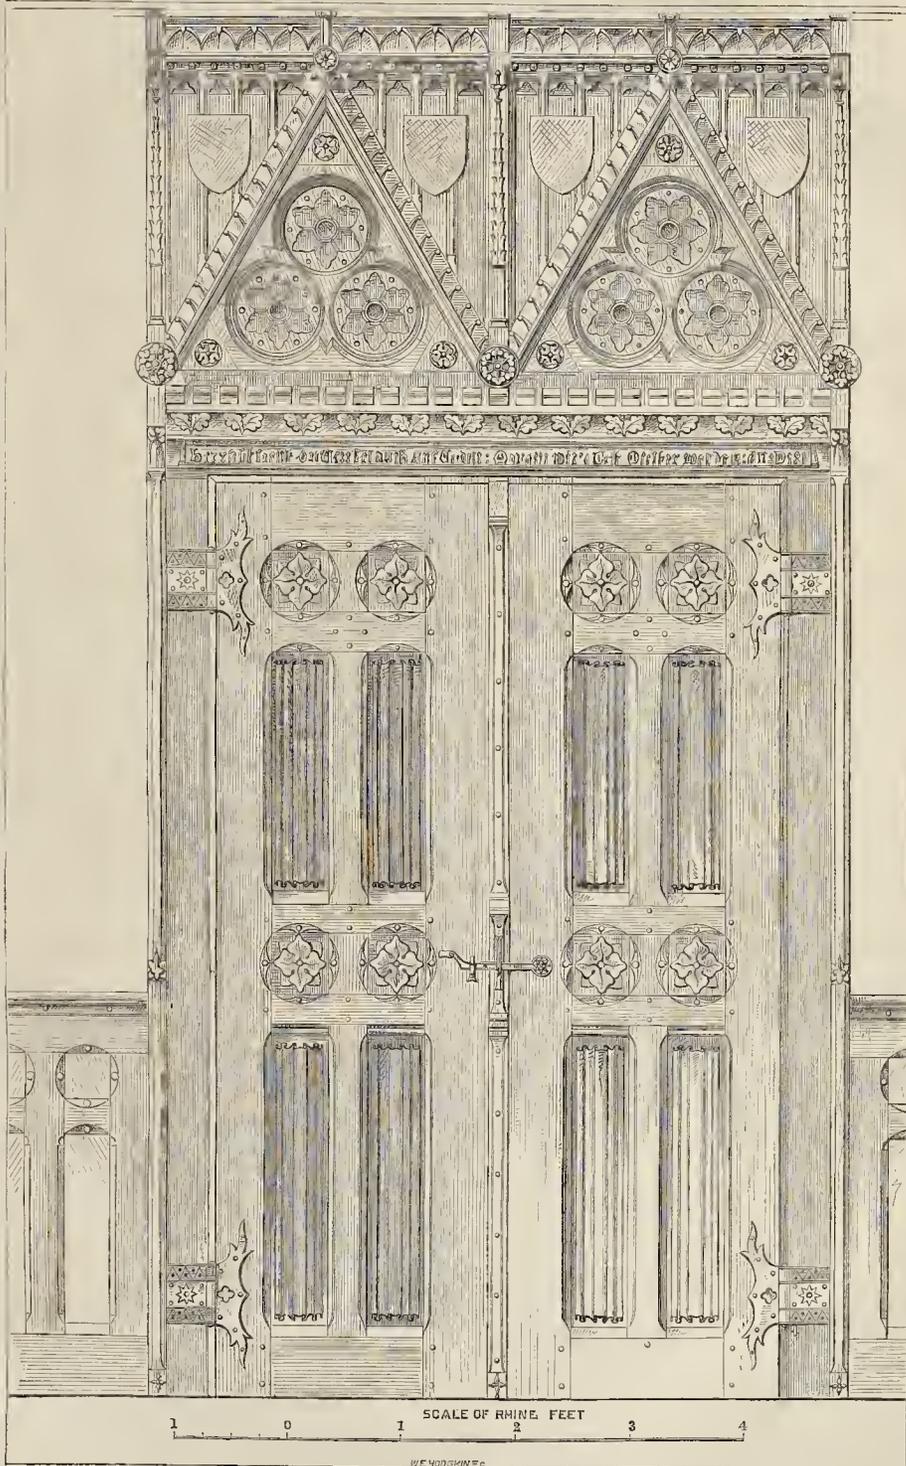

Over the chief door of the dining-room is the following inscription:—
"Quidamque agas prulenter ages et respice finem."

"Whatever you do, do it prudently, and look to the end!"—an excellent piece of advice before partaking of a German dinner, which often consists of eight or ten courses.

DOORWAY AND BOW WINDOW, BOEDDEKEN MANOR HOUSE, NEAR PADERBORN.
 HERR A. GULDENPFENNIG, ARCHITECT.

FOLDING-DOORS, DRAWING-ROOM, BOEDEKEN MANOR HOUSE, WESTPHALIA.

ARTIFICIAL STONE FOR HYDRAULIC WORK.

In the paper read by Mr. F. Ransome at the recent Brighton Congress, on "Some Recent Improvements in the Manufacture of Artificial Stone," the reader, after describing his new process, by means of which the field has been widely extended for the application of the stone produced, and which, for convenience, as distinguishing it from all others, has been termed "Apenite," said,—It is now no difficult task to produce blocks of this material of any form and of any size, the only limit being the means available for handling them upon the spot where they are employed. Moreover, the materials which form the bulk of apenite are, as a rule, generally to be found in abundance where hydraulic or other important works are being carried on, and for which purposes the new stone is eminently suited.

The want of such a material for such a purpose has long been felt, although that want, until recently, has only been partially supplied. In 1870, Mr. J. W. Butler applied for and obtained a patent for improvements in the application of concrete to structures and foundations, and also to cofferdams and similar constructions. Mr. Butler's obvious desire was, in the first place to provide a cheap and efficient substitute for stone for hydraulic operations, and in the second, to render unnecessary the construction of false works, &c., and thus to avoid the expense connected with the employment of iron cylinders, hitherto so extensively used. The idea was certainly an excellent one, but its realisation appeared to Mr. Butler very remote, until it occurred to him that the material then introduced under the name of "apenite" would answer the purposes of his proposed methods of construction. He accordingly communicated with the author upon the subject; and with the sanction of the engineer a set of hollow cylinders, 8 ft. in diameter and 9 in. thick, were made to form part of a retaining wall to protect the fore-shore of the Thames at Hermitage Wharf, where they were accordingly sunk, and the result was satisfactory.

The arrangement proposed for economically carrying out this class of work is as follows:—A timber staging is erected, upon which the materials may be mixed and moulded, the moulds consisting of an inner and outer framing, the space between the two forming the mould for each ring of a cylinder or hollow block, as the case may be. The courses are joined by means of a cement formed of similar materials to that of which the rings or blocks are composed. These are lifted from the staging on which they have been made, and lowered into position by an overhead traveller or crane, as may be most convenient. The lowest course is chamfered, as shown in the diagram, and when necessary from the nature of the soil, may be shed with iron. The operation of sinking is carried out generally in a precisely similar manner to that adopted with iron cylinders. The horizontal joints are made with alternate projections and depressions, and the several courses are connected vertically by dowel piles, which also serve as guides in sinking the work.

The application of this principle is capable of modification to suit almost every variety of construction, and it would be found especially applicable in structures requiring heavy foundations, particularly where the ground is uncertain. For forming a face-wall in building quays or docks, instead of cylinders, rectangular hollow blocks or caissons may be used. By employing hollow blocks of hexagonal form, no interstices are left, a thin layer of the cementing material rendering the structure practically homogeneous. Cylinders constructed upon this principle are also adapted for deep wells, apertures being formed in the sides for the admission of water.

Turning to works of greater magnitude, it will be seen that apenite forms a suitable substance for the construction of bridges, sea-walls, piers, and similar undertakings. The structure could be carried up to the underside of bridge girders, or built with ordinary masonry above high-water level. For sea-walls or piers, the arrangement given in the previous paragraph could be adopted. Here two rows of caissons are employed, separated from each other longitudinally, the intermediate space being filled in with dry rubble heaving, and the blocks themselves with a similar material, or, if necessary, with concrete.

In the case of an embankment for a reservoir, the heart of the bank, which is usually made with a puddle wall, is proposed to be substituted

by two rows of cylinders, the contained spaces being filled in with puddle, and the cylinders themselves with material similar to that of which the bank is made. In sinking the cylinders, they would be carried some distance below the natural surface, so as to obviate any chance of leakage below. Should a leak occur above, it could be held to a very small extent, as it would be prevented from extending by the proposed structural arrangement. It is obvious that this plan could, without much difficulty, be applied to embankments already constructed where there was reason to apprehend that any settlement had occurred. By sinking the cylinders from the top through the puddle-bank, but without removing any of the slope on either side, they would be carried down to sound ground, rendering the embankment safe, and removing all fear of danger in the future.

It would not be difficult to multiply the instances in which this material can be practically applied; but sufficient has been said on this point. An artificial stone, combining the advantages of apenite,—one, moreover, which can be so readily moulded into any form and size with but small expense and little or no delay,—is necessarily applicable to a great variety of uses. The author will therefore only briefly remark upon its applicability for ornamental and decorative purposes.

Besides possessing the several properties which have been described, the apenite, when prepared with suitable materials, is capable of receiving the most delicate impressions, and, by the incorporation of various metallic oxides, any variety of colour can be imparted to it.

By the use of the native red oxide of iron, manganese, and other mineral substances, artificial marble and granite of almost every description can be produced. These artificial stones, like their originals, are capable of taking an excellent polish, are extremely hard, and can be readily moulded into the most elaborate forms at a very small cost.

A LARGE CHIMNEY.

ON reading a paragraph in the *Builder*, a fortnight ago, under the above heading, I was astounded to find the statement that the shaft, containing over 1,000,000 bricks, 620 tons of stone, &c., cost but a little over 2,000l. As I have just prepared an estimate for a somewhat similar one (but circular), I cannot but think there is a mistake as to cost of "a large chimney," and write to ask you to insert this letter in your paper in the hope that the builder may read it, and take the trouble to set the matter straight, or it may tend to mislead as to the real cost of high shafts. T. L.

* * * The Cannah's Quay Chemical Company, for whom the chimney was erected, inform us, on inquiry, that the cost was but a little over the sum named, 2,000l.

A LESSON FOR ARTIZANS.

At a time like the present when there is a general movement on the part of artizans throughout the country to raise the prices of manufactured commodities or of emigrating to other places where wages are much higher than at home, the following facts, which are well authenticated, concerning the printing trade in the United States, whether many of our printers are now proceeding, may be usefully digested, not only by the class concerned, but by persons engaged in all other businesses. The employing book-printers of New York are all complaining of the want of remunerative work, and there is scarcely an office in the city that has not material enough to do thrice the work that is done; and the types and men are idle half the time. A reduction of wages has been partially acted on, but it is not enough to meet the views of publishers. They get the work done in interior and eastern cities and villages. But this competition is not so menacing as that of Europe. When the price of labour began to rise in the United States, buyers went abroad to seek advantages they could not get at home. They found that in England labour could be had at half the American rate; in Holland and Germany at nearly a third of the prices. The result was a transfer to foreign printers of a large proportion of the work. It now pays an American printer to have his books made in England, and one of the largest houses is negotiating for the establishment of a printing-office in London. Several

others are making preparations. The offices which have initiated this experiment of foreign manufacture deliberately decide to let a portion of their capital invested in printing machinery lie idle and to have their work done in offices abroad; and elect that it is the lesser evil to submit to the inconvenience of dependence on a manufactory three thousand miles distant. Even what is called "job" printing is not secure, and the cities of the United States are now canvassed by agents of foreign printers, chiefly French and English. One printing establishment in London has thirty machines in constant employment on American orders, and at the same time there are in America the skill, the men, and the materials lying idle that would do the work. At the present prices, however, they cannot be used. A large type-founding establishment in Edinburgh has just been bought by an American firm, and types can be manufactured there and sent over to the States with a saving of at least 30 per cent. on the home prices. These facts supply an admirable illustration of some of Mr. Lowe's remarks the other day at Glasgow.

STEPNEY JEWISH SCHOOLS.

THESE schools are curiously arranged. The approach is through a long, narrow playground and under an archway which has been formed beneath the upper part of an old house. By this contrivance, the accommodation contained in the seven rooms forming the upper part of the old house is retained as a master's residence, and a covered playground is formed where the ground-floor of the old house formerly stood. The new school building in the rear consists of a two-story building, each story 13 ft. clear in height. On the ground-floor is a girls' school, 34 ft. long and 21 ft. wide; and an infants' school, 23 ft. long and 21 ft. wide; and, on the first floor, a boys' school, 58 ft. long and 21 ft. wide. Attached to each floor are ranges of Macfarlane's sanitary latrines and lavatories, and the lobbies are fitted with the usual cloak-pegs. The buildings are so placed on the ground as to form a separate playground for girls and infants out of one portion of the site. The school buildings are lighted on three sides by ordinary lifting sashes, and the warming and ventilation are effected on Boyd's principle, by open grates placed in the usual fireplace openings, but with fresh-air external inlet gratings at back of stove, where the air, coming in contact with the stove, is warmed, and, rising, passes through an internal inlet grating along the top of the stove into the schoolrooms. The vitiated air is to be drawn out of the rooms by air-flues built in the brickwork close alongside the smoke-flues of the fireplaces, and separated from them by a thin iron fue division, which, becoming heated by contact with the smoke, causes an upward current in the air-flue of which it forms one side.

The new building will accommodate 280 children in all, and allowing 200l. out of the total amount of builder's contract for the work in altering the old house to form master's residence, the cost of the new school building will be about 1,260l., viz., 4l. 10s. per child, exclusive of desks and forms, and curtains or movable partitions, which may perhaps bring the cost up to 5l. per child. The roof is formed with strong wall-plates, so that at any time if required it may be raised bodily by a few screw-jacks under the plates, and a new story inserted under it. The architects are Messrs. Davis & Emanuel of London; and the builders Messrs. David King & Son, of Mitre-street, Aldgate.

LEAD v. ZINC.

A DISCUSSION took place last week at the Camberwell Vestry, respecting the roof of the new vestry-hall now in course of erection, and which will shortly be covered in. The point under consideration was the adoption or otherwise of an alternative estimate substituting lead for the roof of the new vestry-hall in lieu of zinc, involving an additional expenditure of 400l. The *Metropolitan* says,—The vestry-hall committee had recommended that the alternative estimate be not adopted. Several members contended that the expenditure of an additional 400l. in covering the roof with lead was altogether unnecessary, remarking that several of the large public buildings in the metropolis were covered with zinc, amongst others the Cannon-street and Charing-cross Hotels, and that what was good enough for those buildings

ought to be sufficient for their new building. On the other hand, it was urged that, as compared with lead, zinc was a perishable article, and that the wisest economy would be to cover the roof of the new building with lead, inasmuch as that zinc would have to be renewed, whereas lead would last for an indefinite period; and what was more, the lead would always be worth the money laid out upon it. The chairman said the committee had no feeling in the matter. The question was one entirely of expense, and, apart from that, there could be no question as to the superiority of lead over zinc. The vestry, by a large majority, ultimately decided that lead should be used for the roof instead of zinc; and it was also further decided, on a representation from the architect, that the figures and vases to be placed upon the balustrades and pediment of the hall should be carved in Portland stone instead of being executed in Portland cement. These two alterations will involve an additional expenditure of 450*l.*, and it was incidentally stated at the meeting that although the contract is for 8,000*l.*, the building will ultimately not cost less than 11,000*l.*

MONUMENTAL.

A NUMBER of gentlemen interested in the Liverpool Library have joined together to erect a monument in the Toxteth Park Cemetery, Smithdown-road, in memory of the late Mr. John Perris, who, for fifty-six years, was connected with the library. Mr. Hoffer, architect, of Castle-street, was commissioned to prepare a design for the proposed monument, which was executed in stone by Mr. A. Norbury, sculptor, and a few days ago it was removed to its place a few yards from the principal entrance to the Cemetery. The architect has adopted the form of an ancient Roman altar, which is embellished and finished in an artistic manner. The monument is more than 3 ft. broad at the base, and stands 6½ ft. high. It is of grey Yorkshire stone, with a slab of red polished granite on the front containing an inscription in gilt letters. The base is deeply moulded, and the body of the monument tapers slightly to the entablature. On the frieze, and running round the four sides of the structure are the words "John Perris, died Jan. 22, 1872, aged 67 years," in raised Roman letters very bold in character. The enrichments of the entablature consist of a representation of a book-back and some ornamental work, the whole being surmounted with a book with its leaves thrown open, forming an ogee pediment.

COMPETITIONS.

Surrey New Church.—The committee for the erection of this building (Rev. Newman Hall's) have approved the general design as prepared by their architects, Messrs. Paul & Bierkeide, of London. It is intended to provide a church capable of accommodating 2,000 appropriated sittings, and a lecture-hall for 800 adults, with numerous vestries and class-rooms, and other apartments attached. The style adopted is English Gothic of the Geometrical period, and the structure will be faced with stone throughout. At the point of junction of the Westminster and Kennington roads, a tower and spire will be erected about 200 ft. high.

WOOD PAVEMENT AND ASPHALTE.

It appears that the London Tramways Company refuse to lay down the Val de Travers asphalt opposite the British Home for Incubables in the Clapham-road, on the ground that it would be very dangerous both to the company's horses and the general driving public to lay down asphalt on so steep a gradient. It further appears that the Val de Travers Asphalt Company themselves object to lay their asphalt on a steeper gradient than 1 in. in 60, on account of its slippery nature, and that the London Omnibus Company, who provide horses for the Tramway Company, refuse to carry on their contract if asphalt is laid down, but that they are willing to lay down granite setts in the part of the road in question, if the Board will agree to it. After a discussion on the subject, the Board (Waudsworth) decided to lay down wood pavement along that portion of the roadway above named.

The fact is not to be blinked, that under certain conditions roads laid with asphalt be-

come unsable. To be precise, on Saturday morning (September 28th) the whole of the City traffic where asphalt prevailed was conducted at a walking pace; any attempt at more rapid locomotion would have resulted in a fall. This we saw and avouch. The effect of this sudden pull-up on all sides was most singular; the loss of time provoking.

ANTS, &c.

Sir,—I sympathise very much with those of your correspondents who are troubled with ants, beetles, and other vermin in their houses. Without doubt, such a state of things is a very great nuisance. I do not think, however, that they are to be got rid of by means of any of the remedies "C. H." copies from the *Times*. These appear to me to be only "sops to Cerberus." The evil is much too serious to be played with in that way. My plan would be to do that which vermin eminently dislike (to use the phrase of "A London Householder"), viz. *stop them out*. I should take up the whole of the floors, skirtings, &c., of the infested rooms, and take out the grates or ranges; then well pun or ram the earth below, and on this lay down a Portland cement concrete floor, 2 in. thick at least, which, if finished smooth on the top surface, would be a most excellent substitute for flagging, being without joints, and perfectly even. Carry the flooring into the chimney-breast, so as to form a good back hearth, and well render the fireplace opening throughout with cement and sand, 1½ to 4, up to the gathering over for flue. Run cement skirtings all round the rooms of a good depth, and reset the grates or ranges, and I venture to affirm, from much experience, that the remedy will be complete. Wooden floors may be laid over the concrete floors if desired, as the rooms will be perfectly dry.

E. G.

SCHOOL BOARDS.

Llanaelhaiarn.—The Llanaelhaiarn School Board has appointed Mr. Walter W. Thomas, architect, Liverpool, as their architect, and have accepted his design for a school and master's residence submitted in competition, which will be carried out under his superintendence without delay.

OPENING OF MACCLESFIELD INFIRMARY.

This new edifice, we are glad to observe, has at length been devoted to its intended purpose, as we strongly urged it ought, and was opened as an Infirmary on the 2nd instant, with appropriate ceremonial, by the Lord Lieutenant of the county.

The foundation-stone of the building was laid on the 8th of August, 1867, by Earl Grosvenor, now Lord Westminster. The entire building, exclusive of site, the laying out of grounds, &c., will cost about 18,061*l.*, the whole of which has been raised by donations and subscriptions. The endowment fund bequeathed by the late Mr. Tannicliff and the late Dr. Swanwick now amounts, with the accumulations, to a total of 33,000*l.*

The building stands pleasantly in close contiguity to the Public Park, over which there is a fine view from the western wing of the building; and the roads which have been opened up around it since the adaptation of the site make it convenient of access from all parts of the town.

The infirmary is built upon the Pavilion principle as our plan and view in last year's *Builder*, pp. 700 and 707, will show.

The style is Italian, but with limited pretensions to ornamentation. The prominent feature is the facade of the principal entrance, which is carried up in clustered columns and pillars. This entrance, which is approached by a grand flight of stone steps, in three tiers, is protected by a porch colonnade in keeping with the entire front. The centre block is surmounted by clock-tower and spire, rising to a height of upwards of 100 ft. from the basement, the towers being fringed with ornamental ironwork. The whole is built of stone from the Tegsnose Quarries, with finely-worked ashlar facings from the Windaway Quarries.

The grounds in front are to be ornamentally laid out, and encircled with wall and palisadings, in accordance with the design shown in the engraving.

The architect for the building is Mr. James

Stevens, of Macclesfield and Manchester, and the work throughout has been executed under his superintendence by Messrs. R. Neill & Sons, of Manchester, the principal contractors. The sub-contractors are Mr. Charles Frith, of Macclesfield; for the stonework; Mr. Robert Davies, Macclesfield; plumbing and glazing; Messrs. Kitchen & Brown, Manchester, for the inside iron work; and Mr. Best, of Manchester, for plastering and painting. The joiners' work throughout has been done by Messrs. R. Neill & Sons. The floors are of pitch-pine, to be polished with bees-wax. The internal hot and cold water apparatus, electric bells, gas-fittings, grates, and mantelpieces, fire-plugs, and hose, &c., have been supplied by Mr. William Wilson, of Manchester; all the above being under Messrs. Neill & Co.'s contract.

The institution starts with a total of thirty-nine beds, and to this extent the infirmary is furnished.

BUILDING WITH BITUMEN.

Sir,—My attention has just been called to the two letters in your impressions of 28th ult. and 5th inst. in relation to the above subject, to reply to the former by "A Builder," it is evident from his remarks that he has not even read the memoranda from which he quotes, or he would perceive that the walls therein compared are of 14 in. and 9 in. work respectively, which at once dispels of his argument respecting the "difference in the thickness of the joints." Next, as to "combustibility." "A Builder" quotes "Manspitt" to prove that because pure bitumen will melt at 284° Fahr., the composition which I use would be equally affected. And here again his logic and chemistry are equally at fault. Would he tell us, for example, that because hydrogen gas is highly inflammable, so is water?

Moreover, the furnace referred to is not built of fire-brick, as he assumes, and open to "A Builder's" inspection, I may further state that insurance companies in London are prepared to grant policies on all buildings constructed on my system.

Referring to the number of bricks which can be laid by one man per diem, I am prepared to supply "A Builder" with men, each of whom, paid as per rates quoted, will lay more than the number I have stated, and I am open to take contracts based on the figures referred to.

In conclusion, taking "A Builder's" figures for a basis, I find that the profits on "half a million of pounds" (which he quotes as "a large part of all that is done in this country") taken at 10 per cent, would be 50,000*l.*; and this sum, divided among the 1,500 builders in London alone, would give each the "magnificent sum" of 36*l.* per annum.

Need I comment further upon a "A Builder's" figures? In reference to "An Engineer's" remarks respecting my patents, I presume the Attorney-General is quite able to substantiate the views he took of them, which have since been fully corroborated by the highest professional authorities.

"An Engineer's" remarks on my "Tube Walls" are so clearly expressive of vindictive feeling, that I hope he may be induced to unmask, and if he will favour me with his name and address I shall be happy to furnish him with thousands of references both at home and abroad as to the effective working of what he is pleased to call my "dangerous pump," and the introduction of which to the townspeople of England he looks upon as a "pestilent thing."

I presume my friend never indulges in that universal beverage, *bitter ale*, or is unaware that Messrs. Allsop & Co., of Burton-on-Trent, use thirty-two of my tube-walls for the supply of water for their brewery J. L. NORTON.

THE NEW LICENSE ACT AND SANITARY REFORM.

A PROVISION in the new License Act, empowering magistrates and the police to suspend or refuse licences to public-houses that are out of repair or not in a good sanitary state, is now being put in force in the county of Durham, and the readers of the *Builder* will perceive from the following shocking statement that it was time some remedy was applied to alter a state of things which is a disgrace to civilisation.

At a recent Petty Session at Castle Eden, a district dotted all round with collieries and mines, Superintendent Scott handed the following to the magistrates:—

"To the Magistrates in Brewster Sessions, assembled. Gentlemen.—According to your request, I accompanied by Mr. Barker, your clerk, have made a careful inspection of alehouses licensed for the sale of intoxicating liquors within the Castle Eden Petty Sessional division. The houses undermentioned, in their present state, are so filthy and unfit for public-houses, that I would recommend the Bench to temporarily withdraw the licences until the owners met the requirements of the Bench.—I am, gentlemen,

PERCIVAL SCOTT, Superintendent of Police.
J. Cook, innkeeper, of Hutton Henry, bad stable, coach-house, and back premises in bad repair. James Hutton, innkeeper, house out of repair. William Wilson, innkeeper, of Sheraton, roof of house bad; no 'convenience' or coach-house. John Pattinson, innkeeper, of South Wingate, convenience and stable out of repair. Thomas Dixon, of Trimdon, six entrances to his house, Mark Hogg, of Trimdon Colliery, neither urinal nor convenience. James Hanson, of Trimdon Colliery, house in bad repair. Valentine Hamilton, innkeeper, Trimdon Colliery, convenience not satisfactory; no urinal; stable in bad repair. James Arrowsmith, of Thornley, back premises in bad repair. Isabella Walker, innkeeper, of Thornley, no convenience. George Greenfield, no convenience. Thomas Watson, innkeeper, Castle Eden Colliery, no convenience. William

Herricks, no convenience, and house out of repair. Thomas Humphrey, Wingate, house and back premises out of repair. James Scott, Wingate, no crinal or convenience. George Campbell, Shotton Colliery, no back convenience, and place to bad repair. Francis Smith, Shotton Colliery, no convenience. Mary Day, innkeeper of Haswell, stable and convenience out of repair. Thomas Webb, of Haswell, no convenience. William Richardson, South Hetton, no ash-pit or convenience, and place out of repair. William Lawson, innkeeper of South Hetton, no convenience. Benjamin Dobson, of Blue House, four rooms and passages out of repair. David Hutchinson, Wingate-lane, no convenience or ash-pit, back premises out of repair, and unfit to retain a spirit licence.

The landlords of the above disgraceful houses were called before the magistrates, the Rev. William Mayor and Mr. Stephen Robinson, and having promised to make their places decent, the hench allowed the owners and occupiers a certain amount of time, failing which, the licences would be refused. In several of the cases the houses were owned by wealthy brewers and distillers; and it appeared that scarcely a miner's cottage in the district had any sanitary accommodation, and those occupied by the agricultural labourers are in the like uncivilised and dangerous condition.

The action taken by the Castle Eden magistrates is being followed up in the other divisions, and, incredible as it may appear, even Castle Eden district proves to be better off than several other places in North and South Durham.

The writer, who has recently been in the north, and who is well acquainted with other counties, can state that so far as sanitary measures and decent dwellings are concerned, the north of England is as primitive and disgusting as Caffre land, and in no other part of England is such a fearful state of things to be found.

The want of water is universally complained of in Durham.

THE BUILDING TRADES MOVEMENT.

London.—Mr. McClymont, of the firm of Corbett & McClymont, last week took a deputation that his firm would pay each man such a price as they thought he was worth. Some of their best men were paid 8jd. per hour, and some less; but they declined to be compelled to pay 8jd. per hour to the men all round, when many of them might not be worth more than 6d. or 7d. per hour. He regretted to lose so many of his old workmen through the strike, but he had no offer to make to them, as he had the full number of men he required. The men on strike held a meeting, when they denied that they either claimed or expected the firm to pay 8jd. per hour to every mechanic on the works. They said they contended for was that the firm, like other master builders, should recognise 8jd. per hour as the standard rate of wages, and to be given to those men in the firm who were considered worth that sum by the foremen. A deputation was appointed to wait upon Mr. McClymont, and the interview took place on Friday, when Mr. McClymont consented to pay 8jd. per hour to all efficient skilled workmen. We understand, however, that the firm were able to take back very few of the old hands, having already as many as they needed.

On Saturday night a meeting of the Carpenters' and Joiners' Delegates, elected to secure uniformity of time and wages in the London district, on the basis of the agreement entered into with the Master Builders' Association, was held at the Brown Bear Tavern, Bloomsbury. The number present scarcely reached twenty-five. It was resolved to wind up the business, and terminate the movement. Mr. Mackin, the secretary, estimated that they had received and paid away during its progress £1,000; and now everything was paid for with the exception of printing the balance-sheet, which would be ready for issue in nine or ten days.—At a meeting of masons on Thursday, it was resolved to resist an application from the Master Builders' Association, asking the men to conform to the regulations made with other branches of the building trade, namely, to work till one o'clock on Saturday instead of twelve during the winter months, and accept 9d. per our for overtime instead of time and a half, i.e., 1s., as settled in the late agreement at the close of the strike.—A few days since 110 masons in the employ of Messrs. Jackson & Haw, of Earl-street, Westminster, turned out because the firm would not discharge a man, named Day, who was said to be a spy and an informer, and to have made mischief between the masons and the men. Messrs. Jackson & Haw deny that the man had ever given them

any information, but have discharged him, and, as this was all the men required, they resumed work.

Hull.—The joiners' strike at Hull, which has lasted thirteen weeks, has been brought to an amicable termination. The wages of skilled workmen are to be at the rate of 6jd. per hour. The working time is to be 53 hours for 40 weeks in the summer, and 47 hours for 12 weeks in the winter each year. The men resume work at once.

Paisley.—A difference has arisen between Mr. William Gillespie, of Paisley, and a number of men employed by him in the slating trade. Mr. Gillespie has had in his employment several men not connected with the union for a length of time, and he was informed one morning lately that unless he immediately dismissed one of them, who had rendered himself obnoxious to the society, all the members of it who were working for him would strike. Mr. Gillespie declined to dismiss a good and faithful workman at the dictation of the union, and those connected with it at once left his service. Some four years ago Mr. Gillespie successfully resisted a similar attempt to control his business.

THE LAND QUESTION.

Sir,—Mr. Stubbings fails to catch the spirit of my proposal when he compares it with the scheme of the M.P. (Fergus O'Connor, I presume) set forth twenty-four years ago, and which has been largely developed by various land and building societies since. These deal with freehold land, which they buy out and out, and on which they erect dwellings for their shareholders; most of whom are several degrees removed from the working-with-the-hands class, which I desire to benefit.

My proposal is to rent on long leases parcels of land of from three to ten acres each, according to the number in the occupying family, or the ability of the lessee to cultivate the same. The landlord to erect on each plot a decent dwelling, house and outhouses, with a good large barn, and keep the same in repair.

This land question has become so pressing that it will not matter much in what part of Great Britain the land is situated, provided it be accessible by a decent road, and of fair average quality; but poor land need not be neglected, as its poverty would be considered in the rent, and under spade cultivation its condition would soon be changed. "The wilderness would blossom as a garden."

The great superiority of a leasehold over a freehold holding lies in this, that a poor man may enter upon the land at once, with nothing but tools and seed, to which his labour and that of his family are to give value, and his yearly rental is only the interest of the money value of his holding; whereas in purchasing the freehold by a society he will not only have to wait a long weary time before he can get possession, but having to pay principal with his yearly interest will so cripple his resources, that in very many cases there will be a break-down in the attempt. E. G.

RISKS FROM FIRE IN CHURCHES.

WITH reference to the fire at Canterbury Cathedral, Mr. Richard Coveney, of Canterbury, who states that he has had many years' experience in the metropolis, principally in connexion with works executed for the Corporation of the City of London, suggests to those engaged in such work as the roofs of churches and other important public buildings that they may not only lessen but obviate the risk of fire by using coal instead of charcoal. It is an ascertained fact, he remarks, that in blowing the charcoal to make hot metal, the sparks in windy weather are uncontrollable, and consequently great risk is incurred by such a process. He would submit that a safer plan would be thus:—Use a coal fire; let the "devil" stand in a sheet-iron safe, large enough for the fire-basket, with about 3 in. depth of water at the bottom. By this plan the coal-embers must drop into the water, and be rendered innocuous. During many years' employment on the corporation works, he says, he practised this process without the slightest dangerous results. As to the risk to churches and large buildings from the liability of the warming apparatus to become overheated, and thus tend to the destruction of the entire fabric, he suggests an arrangement by which, he says, danger may be obviated. It con-

sists of a mechanical contrivance acted upon by electricity. Upon the apparatus becoming heated beyond a given point, a bell is instantly and loudly rung, and the precise spot where the overheating occurs is indicated. This alarm may be communicated not only within the building itself, but at any distance from it, and at any number of places at the same moment. Another great source of danger, he adds seems to be generally overlooked, in the modern practice of fixing gilded metal finials on roofs of buildings, without attaching any efficient means of conducting into the earth the electricity which they attract. These ornamentations might be rendered efficient lightning-conductors, and thus supersede the necessity of the ordinary appliances of that nature.

CHURCH-BUILDING NEWS.

Rochester.—The Church of Rochester, near Uttoxeter, the state of which had long been bad, has recently been almost completely rebuilt, and it has been reopened for divine worship. The services of Mr. Christian, of London, were secured as architect, and his designs have been carried out by Mr. Fern, of Leicester. Nothing now remains of the old church except the tower, and this has been capped by a spire, the battlements and hase being also renewed. The restored structure consists of tower, nave and south aisle, chantry, and vestry. The style is Early English. The chantry is divided from the vestry and the nave from the south aisle by four arches, the pillars of which are of Devonshire marble, with foliated capitals. The roof of the church is open-timbered. The pews are in the modern style, and will seat about 420 persons. The flooring is of encaustic tiles, supplied by Mr. R. M. Taylor. The east window represents scenes in the life of our Saviour. This is the gift of Mr. C. M. Campbell. It was from designs by Mr. de Morgan. The communion-table, of inlaid wood, is the gift of Mrs. Dawson, of Barrow-hill. It was designed by Mr. Christian, and made by Mr. Stuhls, of Denstone. Another of Mr. Campbell's gifts is the organ, built by Messrs. Foster & Andrews, of Hull. The font and pulpit are of Bath stone. The entire cost of the restoration is upwards of 4,000l. Mr. Campbell, besides 1,000l. to the church, has given a valuable piece of land as an addition to the graveyard, and had it laid out and fenced at his own expense.

Iltingworth.—The ancient church at Iltingworth has been reopened for divine service. In the spring of the present year the edifice was temporarily closed for restoration. The primary object of the present restoration was to remove the old-fashioned high-backed square pews. The modern style of seats now introduced are of pitch-pine, and fill the body of the church, consisting of two groups, with a partition running midway, the seats being entered from the nave, and the north and south aisles. In the gallery, the vacancy made by the removal of the orchestra has been filled in with seats, uniform with the rest, and the oak gallery-front considerably lowered, and the superfluous coating of paint and varnish removed. The painting and decorating were undertaken by Mr. Binns, of King's-cross. The eastern wall is decorated with a design of the fleur-de-lis as a ground-work. On each side of the cast window is a piece of scroll-work, bearing texts. The decoration of the ceiling consists of a design of fourteen circles, twelve of which enclose escutcheons bearing the badges or emblems of each of the twelve Apostles, and the two remaining circles, north and south of the centre, enclose a square circle bearing respectively the fleur-de-lis or the Lily and the rose. Each of these fourteen circles, forms the centre of a design, which extends the length and breadth of the ceiling, the whole having for its centre an oval-shaped artistic centre-piece. The reredos occupies one-third of the east end. It is divided into three parts, by coupled and carved capitals and marble columns, each side compartment formed into panels. The pulpit, the gift of Miss Moss, of Field Head, is (like the reredos) executed in Caen stone, by Mr. Charles Mawer, of Leeds. The organ has been removed to the south-east angle of the chancel. It has been recased in pitch-pine, with music-board and front of American walnut, and several improvements have been introduced. For these alterations it has been in the hands of Messrs. Ratcliffe & Sagar, Leeds. The pipes for the introduction of gas are now laid, in anticipation of gas being this winter

supplied to the village. The gasfitting has been done by Mr. J. Holdsworth, Halifax. An extensive heating apparatus, on the hot-water principle, has been supplied and fixed by Mr. Thornton, of Huddersfield. There yet remain to be erected three stained-glass windows (not yet complete), by the same friends who contributed to the adornment of the building, viz., the Holdsworth family, of Shaw Lodge, Halifax; and a fourth window (not yet completed) is presented by Mrs. T. Hartley, of Taunton. The recent improvements have cost over 1,000l.

Whitby.—All Saints' Church, at Uggelbarnby, near Whitby, has been re-opened. Before commencing the present new church, it was intended to restore the ancient church to something like its twelfth-century condition; but upon close examination it was found that nothing remained to show what the building had formerly been, and that the only traces of an old Norman church were the columns of the chancel-arch and a few disjointed stones, all of which have been preserved in the new building. The style of architecture adopted in rebuilding is thirteenth-century Gothic. The church was at first intended to be finished in a plain and similar manner; but, through the liberality of the Allan family, the interior has assumed an elaborate appearance, which will be more apparent when the whole is completed. The several works have been carried out from the designs of Mr. Chas. Noel Arnfield, York diocesan surveyor, and architect, Whitby, and under his superintendence by local tradesmen.

—The Bishop of Ripon has consecrated a piece of ground recently added to the churchyard, Aldborough, near Boroughbridge. The newly-added ground, provided by the burial board, is situate on the west of the church, and was formerly gardens and ground occupied by cottages. It has been cleared and trenched, and surrounded by a wall, with entrance-gate. The newly-consecrated piece will provide burial sites for 228 adults and 262 infants.

Trydalya.—A movement, with the restoration of the parish church here for its object, has been in contemplation for some time past, and with the view of initiating it, a vestry meeting was convened at the National School-room, and it was then resolved unanimously,—"That this meeting having fully considered the architect's report on this church, together with the sketch-suggestion of a new church, pledges itself to use every effort to carry out the proposed undertaking." A Church Building Committee was named, and a subscription list opened.

FROM SCOTLAND.

Partick (Glasgow).—The new town-hall and burgh buildings of Partick have been opened. The buildings are situated near to the public road, in Maxwell-street, to which they present a frontage of about 130 ft. There are two entrances from that street, the main one opening into a corridor which runs from the front to the back of the building, separating it into two wings. On the west side of the corridor is the Town-hall, with retiring-rooms for ladies and gentlemen. The hall is in extent 75 ft. long by 50 ft. in width, and the ceiling rises to a height of 45 ft., the roof being supported by open semi-circular iron-bound couples or joists. At one end of the hall is a platform, and at the other end, and also round the sides of the hall, is a gallery. Behind the platform an organ has been erected, built by Mr. Connacher, of Huddersfield. To the east of the corridor, on the ground floor, are the Commissioners' room and a committee-room, while to the back of the building, also on the ground-floor, are the ball kitchen, in which preparations can be made for entertainments in the hall, and the hall-keeper's house. On the second floor of the eastern wing is the lesser hall, which is 38 ft. long by 26 ft. in width. The architect of the buildings is Mr. Leiper, of Glasgow. The foundation-stone was laid on the 12th of March, 1871. At the front of the building are several sculptured figures done by Mr. J. Young, of Glasgow.

Books Received.

General Conference of Architects, 1872. Report of Proceedings. No. 9, Conduit-street. We need only mention that a report of proceedings at the last General Conference of Architects has been published by the Institute, and is now obtainable at their rooms. It gives the papers

and reports read, and the result of the discussions, but not the discussions themselves. We observe, with regret and wonder, on the cover and on the title-page this threatening intimation:—"N.B. The copyright of these papers is reserved." Under a wiser policy, we should read in its stead:—"N.B. Journals of all kinds, and in all countries, are earnestly requested to reprint such papers and statements herein as they may find worthy of additional publicity.

The Proportions of the Human Figure, as handed down to us by Vitruvius. With Outlines by JOSEPH BONONI. Roberson & Co., Long-acre, 1872.

In the third edition of this curious and interesting brochure Mr. Bononi gives Leonardo da Vinci's translation of the passage of Vitruvius in question, with an English version of it, and an additional plate, showing the difference in width between the male and female figures. Tried by the ancient standards, a truly fine female form is a rarity in England.

VARIORUM.

"A SUMMARY of the Principles of a Comprehensive Measure for the Improvement of the Sanitary Laws. By Henry W. Rumsey, M.D., &c. London: Ridgway." This paper, by Dr. Rumsey, late Crown member of the General Medical Council, and an honorary member of the Metropolitan Association of Medical Officers of Health, was intended for perusal at the Social Science Congress, but the author was unable to attend. It is brief and comprehensive, and is well worthy of consideration with a view to more complete legislation on the subject.

"The Public Health Act, 1872, with special reference to Plymouth, Stonehouse, and Devonport. By Christopher Buteel, F.R.C.S. London: Churchill." This paper was read at the Plymouth Congress of the Social Science Association, as already noted in the *Builder*. The author is surgeon to the Royal Albert Hospital at Devonport.—"Examples of Conics and Curves. By the Rev. W. H. Laverly, M.A. London: Rivingtons." The author of this pamphlet is a Fellow and Mathematical Lecturer of Queen's College and Public Examiner in the University of Oxford. The examples are of course illustrated with diagrams of curves and conics.

The *Garden* says, one of the most singular consequences of the late war has been the addition of a number of new plants to the Flora of the environs of Paris. The numbers of species found since the siege, which were before unknown there, amounts to 190. Of these, fifty-eight belong to the *leguminosae*, thirty-four to the *compositae*, thirty-two to the grasses, and sixty-six to other families. The seeds of these plants were for the most part conveyed in the forage of the French troops who were recalled from Algeria, Italy, and Sicily. Three kinds only appear to have been brought by the Germans, viz., *Vicia villosa*, *Stenactis annua*, and *Lepidium perforatum*. In other parts of France a similar result has been observed wherever there had been an encampment of troops. Should the Algerian and other plants thus introduced into so many parts of the country succeed in establishing themselves, it is obvious that in a few years the Flora of France will have to be rewritten.—The "Household Edition" of "David Copperfield," by Charles Dickens, just now issued by Chapman & Hall, is a marvel of cheapness. It is full of illustrations, some of them very good. The book itself we have always held to be the most charming of the author's creations.

Miscellanea.

The Polytechnic College.—The Polytechnic College (formerly the Polytechnic evening classes) has been formed for the purpose of giving a more permanent and influential character to the course of instruction long carried out at this Institution, under the management of the Rev. C. Mackenzie, M.A. At several meetings which have been held by the promoters, it has been resolved to give to the classes a corporate form, consisting of a president, vice-presidents, a council, members, and students. The college has for its object the interests of the middle classes, both ladies and gentlemen, during their evening leisure, and consequently has very great claims on the attention of those who desire to repair defects in their early education.

Artistic Training.—Professor Poynter, in his address as Slade Professor, University College, dwelt upon the higher position of foreign artists as regards technical excellence, and the amazing facility with which French or German artists combined unity of effect and even thoroughness of execution in carrying out large and small works alike. That was the result of the system of constantly working from nature, which, giving but a limited time for the completion of a study, obliged the student to work in the simplest and most straightforward manner. That system he had introduced into those schools with the object of obviating as far as possible the timid and unmethodical style of work which seemed to be the prevailing fault in our exhibitions. With a view to encourage a good style of work he wished to direct students where to look for examples for imitation. Although following pretty closely the French system, he did not consider that the result at which French artists arrive was by any means to be held up for imitation. They did not make that use of their technical facility which should be the aim of a true artist. The skill of French artists was almost entirely due to that thorough training and constant study of nature which all French students received, and it was their fault or misfortune if they could not derive a better result from their studies. To that system he should adhere, believing that the unmistakable English love of nature would lead English students, under the same system, to a much higher result. To that love of nature, however, there must be added an appreciative love which is capable of selecting what is worthy of imitation, and setting aside what is unimportant. Looking at the English pictures of the present day it would be found that this point was the one in which they were most deficient. The sort of execution which passed current popularly now was generally of the flimsiest kind, the latest fashion being to make a picture somewhat resemble the wrong side of a piece of worsted work.

Foundation for Carriage-ways.—The Liverpool Corporate authorities are trying an experiment in North John-street of laying the street with a concrete foundation, overlaid with sets, the joints of which are filled up with asphalt. The cost is considerably over that hitherto incurred in making street-foundations and laying the sets; but it is confidently expected that, where heavy traffic prevails, this will be amply repaid. The concrete consists of five parts of gravel to one of Portland cement. This concrete is laid upon a thin layer of broken stones, similar to macadam, a layer of these stones and a layer of concrete following each other in succession until the desired height, about 9 in. or 10 in., is reached. As each layer is put on, the workmen beat it in, and the result is a firm, homogeneous mass of concrete, the proportions of which are about eight or ten of gravel and stone to one of Portland cement. As soon as this portion of the work is completed the sets will be laid over the concrete. These will be about 6 in. deep, and from 3½ in. to 4 in. broad, and the joints will be firmly secured by asphalt being poured in between the interstices, into which there will previously have been brushed clean dry gravel. By this means it is hoped to make the surface impervious to water, and to confine the wear and tear of the street to the sets themselves, without at all interfering with the stability of the foundation underneath.

Removal of the Dead under the Union of City Benefices Act.—"A City Incumbent," writing to the editor of the *City Press* about the cost of working the above Act, instances the cases of St. Benet, Gracechurch-street, and St. Mary Somerset, and says,—"The removing of the dead from these two churches only (observe, not from the churchyards, but only from under the floor of the churches) has cost 4,949l. 6s. 7d. Surely an Act of Parliament which cannot prevent such extravagant charges as these needs to be amended or abrogated."

Encroachments on Greenwich Park.—A deputation has waited upon the Right Hon. G. J. Goschen at the Admiralty to protest against the letting for building purposes of certain land contiguous to Greenwich Park, and at one time forming part of the park. Mr. Goschen, after listening to the arguments of several members of the deputation, said the matter should have the best consideration of the Board of Admiralty, to see by what means they could comply with the wishes of the inhabitants.

Experiments with "Lithofracteur."—A series of experiments with an explosive material known by the name of Lithofracteur, have been made on the Minehead Railway, not far from the town of Watchet. There were present as spectators, Sir Alexander Acland Hood, bart, and Messrs. Mr. F. Fox, C.E. (engineer of the Bristol and Exeter Railway); Mr. W. Dennis, E. (engineer of the Minehead Railway); and Messrs. Knobbs, Brothers, & Co. of Cologne, represented on this occasion by Mr. Oliver Kirkman, assisted by Mr. G. H. Daw, London (inventor of the central-fire gun and cartridge), and Mr. F. Hawkins, of Timinhall Court, who conducted the proceedings. This material has for a considerable time, it is said, been used in foreign countries, and by the Germans during the late war. It is composed of 50 per cent. of nitro-cellulose absorbed in 25 per cent. of earth, and 25 per cent. of various chemicals, which it was made to render it safe in transport, stowage, and very-day use. It is made up in the shape of cartridges, and its explosion can only be effected by a long percussion-cap, filled with detonating composition, fixed on the end of a time fuse, and then inserted in the cartridge and secured to its paper envelope. If brought into contact with a flame, it does not explode it seems, but merely turns away like rosin. Its power is said to be twelve times greater than that of gunpowder. So far as could be judged, the experiments were considered very successful, and of the safety of the material there is said to have been no question.

The Rateable Value of the Metropolis.—From an official return just prepared by the direction of the Hackney District Board of Works, it appears that the rateable value of the various districts and parishes within the metropolitan area is as follows:—Marylebone, 173,316*l.*; St. Pancras, 1,105,836*l.*; Lambeth, 770,000*l.*; St. George, Hanover-square, 231,180*l.*; Islington, 981,156*l.*; Shoreditch, 46,420*l.*; Paddington, 920,544*l.*; Bethnal-green, 275,508*l.*; Newington, 280,000*l.*; Camberwell, 380,000*l.*; St. James, Westminster, 13,156*l.*; Clerkenwell, 264,744*l.*; Chelsea, 26,972*l.*; Kensington, 816,808*l.*; St. Luke, 43,812*l.*; St. George, Southwark, 175,000*l.*; Bermondsey, 234,000*l.*; St. George-in-the-East, 231,000*l.*; St. Martin-in-the-Fields, 20,564*l.*; Hamlet of Mile-end Old-town, 55,552*l.*; Woolwich, 69,400*l.*; Rotherhithe, 55,552*l.*; Hampstead, 236,680*l.*; Whitechapel, 25,808*l.*; Westminster, 457,964*l.*; Greenwich, 34,990*l.*; Wandsworth, 584,220*l.*; Hackney, 70,788*l.*; St. Giles, 318,200*l.*; Holborn, 24,407*l.*; Strand, 315,524*l.*; Fulham, 279,500*l.*; Limehouse, 273,424*l.*; Poplar, 481,410*l.*; St. Saviour, 194,000*l.*; Plumstead, 205,848*l.*; Epswicham, 310,000*l.*; St. Olave, 141,000*l.*

North Oxfordshire Archaeological Society.—This society had an excursion on Wednesday, the 25th ult., under the guidance of the Rev. Philip Hookins. At Cropredy Miss Loveday and several other ladies enhanced by their presence the pleasure of the day. The first place visited was Horley Church. The Rev. W. J. Flavel exhibited his collection of carved oak furniture, ancient china, Etruscan ware, Roman and mediæval relics, including part of a pax, string of beads, &c. The large church of Hanwell was next visited. It is greatly in need of restoration. The remains of Hanwell Castle, now a dwelling-house, were thrown open to the visitors, by the kindness of Mr. French. A short halt was made by the excursionists at Great Bourton. At the Church of Cropredy the visitors heard from Dr. Wood a résumé of the ecclesiastical history of the church and its appurtenant chapels; and at the historic scene of Cropredy ridge the same gentleman explained the position of the rival forces who met there on the 29th of June, 1644. Miss Loveday exhibited a gilded "histle," which was dug up on the site of the "leagard." A large yew-tree in the garden of the manor at Cropredy attracted attention. A dinner at eleven guests partook, at the White Lion Hotel, Banbury, was the immediate precursor of the breaking up of this friendly gathering.

Hindoo Temple in London.—Canon Trevor, writing in the *Record* on the controversy between the Archbishop of Canterbury and "the heathen," says:—"I learn from Professor Garin de Tassy's *Revue Annuelle de l'Indoustan Literature* for 1871 that there is actually a subscription on foot in Bombay to build a pagoda in London for the worship of Vishnu and Siva."

Inhabited Houses in London.—A statistical report from the Joint Parliamentary Committee of the Hackney District Board of Works has been issued, showing the progress made by the several parishes and districts under the jurisdiction of the Metropolitan Board of Works. By this it appears that the number of houses in the parish of Marylebone at the end of the last official year was 16,328; St. Pancras, 24,079; Lambeth, 29,123; St. George, Hanover-square, 10,425; Islington, 27,088; Shoreditch, 15,624; Paddington, 11,832; Bethnal-green, 15,981; Newington, 12,545; Camberwell, 17,755; St. James, Westminster, 3,381; Clerkenwell, 6,808; Chelsea, 8,989; Kensington, 15,492; St. Luke, 5,871; St. George, Southwark, 6,903; Bermondsey, 10,624; St. George-in-the-East, 5,924; St. Martin-in-the-Fields, 2,083; Hamlet of Mile-end Old Town, 13,037; Woolwich, 4,670; Rotherhithe, 3,934; Hampstead, 4,340; Whitechapel, 8,313; Westminster, 6,531; Greenwich, 16,170; Wandsworth, 19,091; Hackney, 19,355; St. Giles, 4,541; Holborn, 3,748; Strand, 3,271; Fulham, 10,177; Limehouse, 7,789; Poplar, 16,259; St. Saviour, 3,716; Plumstead, 7,960; Lewisbam, 8,271; St. Olave, 1,764.

Light from Air charged with Mineral Oil Vapour.—A renewed endeavour to bring this sort of light into use is being made. The air appears to be driven by bellows through the liquid "gasogen" and stored in a gasometer for use. It gives a brilliant light, but we should fear it is apt to become deteriorated by deposition of the liquid again, if allowed to stand. Air itself stored in the gasometer, and only charged with the vapour on its way to the burners would seem to be what is requisite to obviate this in the use of such a light. As for its liability to produce explosions, it is said to be admitted that it ranks with ordinary gas in this respect. The light has been exhibited in a new building in Chancery-lane, Cornhill. At a subsequent meeting, Major-General C. Scott, at the request of the chairman, Sir John Murray, explained the patentee's invention, according to particulars afforded him by Messrs. Harrison. Mr. H. Child, he said, had analysed the gas, which, we may add, is free from the offensive contaminations of coal gas, and smells a little like ether.

"Testing" a Gas-holder.—An accident has occurred to the new gas-holder at Hollinwood, belonging to the Oldham Gas and Water Works. The holder, which had been erected by Messrs. Mahon & Co., Ardwick Iron Works, Manchester, was considered complete, and the other day arrangements were made for "lifting" or testing it before it was formally handed over to the corporation. Mr. Mahon had promised to be present; but before either he or any one connected with the committee had arrived, the person connected with the building in course of erection took upon himself the task of testing the gas-holder. He accordingly set the engine to work; but instead of forcing air into the holder, he reversed the machinery, and, as a consequence, the air already inside began to become exhausted. In a short time the gas-holder gave way, under the force of the atmospheric pressure, and, in addition to a good deal of damage being done to the roof, a number of rods bolts, &c., were snapped and bent.

Railway Matters.—A contract has been recently entered into by the Crown agents for the Colonies on behalf of the Government of Natal, for the construction of 345 miles of railroad in that colony. The Colonial Government, when the requirements of the contract have been fulfilled, is to pay the company a subsidy of 40,000*l.* per annum for twenty years, and to make a grant of 2½ million acres of land. The latter is subject to the condition that the company introduce, within a certain time, 7,500 immigrants. It is stated that since the arrival of the Japanese embassy to England a contract has been made by Messrs. Brassey & Co. for the construction of a railway from Yokohama to some distance in the country, and that a good deal of the plant will be constructed at Manchester, and the Canada Works, Birkenhead.

Builders' Responsibilities.—A case has just been tried in the Clerkenwell County Court (Barford v. Bishop) in which 100*l.* damages for loss of services were sought to be recovered from a builder, on the ground that his servant threw a piece of lime into the eyes of the plaintiff's son, and injured his eyesight. The judge nonsuited the plaintiff, as there was no evidence against the defendant.

Mr. Emerson.—Mr. Edmund Waldo Emerson, son of the well-known American author, has written to the *Pall Mall Gazette* in the following terms:—"My attention has been recently called to a paragraph that appeared in your journal a short time since stating that subscriptions would be received from the English friends of Mr. Ralph Waldo Emerson for the purpose of rebuilding his house, by Mr. Hilliard, of Boston. Will you kindly allow me to state through your columns that I know that while my father would gratefully recognise the kind thought that prompted such a call, he would be extremely sorry to know that it had been made? Immediately after the partial destruction of his house by fire a number of his near friends in America kindly insisted upon taking upon themselves the cost of restoring it, and by the new year it will be finished and much improved. As my father knows nothing of the paragraph to which I have alluded, I feel called upon to make this statement for the benefit of his friends among your readers."

Good Advice.—At the opening meeting of the Working Men's College, Great Ormond-street, a word of good counsel was given by Mr. Cave Thomas, in a letter excusing his absence, which may be usefully repeated. Addressing Mr. Rawlins, the secretary, he begged that his congratulations might be given to Mr. Mark Carey, who has won high honours as an art student, and has rendered good service as an elementary teacher. Mr. Thomas said,—"Mr. Carey's work is a very remarkable exemplification of what may be accomplished in leisure hours. It exhibits not merely the mechanical results of industry, but great artistic feeling and power; that degree of ability, indeed, which might fairly tempt the possessor to make art a profession. Mr. Carey has decided, however, I think wisely—to make art a work of love, and the recreation of his leisure. This, too, is an example needed very much in the present day, when anybody who is able to scratch upon paper some resemblance to an object forthwith determines that art is his vocation."

St. Leonard's Tower, Bridgnorth.—At a meeting of the Building Committee last week it was decided that the architect's original design in regard to the tower should be carried out *in toto*, and that the spire should be erected. The extreme width of the tower is 41 ft. 6 in., and this additional feature will make the entire height 122 ft., as the spire will rise 23 ft. from its springing, and 14 ft. 6 in. above the top of the finials of the present pinnacles. The work is being proceeded with. Mr. Harry Hems, of Exeter, has modelled a half-sized figure of St. Leonard, as a model for the statue of the patron saint, which is designed to occupy a niche, 47 ft. from the ground, immediately over the large window on the south side. St. Leonard is represented in the simple garb of a religious recluse. His niche is to be carved. The rest of the carved work upon the outside and inner part of the tower, under Mr. Hems's supervision, is progressing.

Carlisle Gas Works.—The new gasholder erected at these works has been completed. It is a telescopic holder, and is erected in the same tank in which a single gasholder was erected in 1852, and which has now been replaced by the present one, in consequence of the increased consumption of gas. The new gasholder is 83 ft. in diameter by 46 ft. in height, its cubical capacity being about 250,000 ft.³, or double that of the former holder. Special means have been taken to secure the safety of the holder by the use of diagonal rods between the columns. The gasholder has been erected at the cost of about 3,000*l.*, by Mr. Daniel Howard (late B. Whitehouse & Co.), West Bromwich, near Birmingham, from specifications prepared by Mr. J. Hepworth, manager of the works.

Dante's House.—Dr. H. L. Barlow, writing to the *Athenæum*, says:—"By a letter just received from a devoted admirer of Dante, now in Florence, Colonel Gilliam, I learn that the poet's house in his native city is allowed to remain in the same disgraceful state to which it was reduced a few years ago, without anything having been done to restore it, or to effect those renovations which had once been proposed. 'The windows are still out, and the house has the appearance of having been gutted, and is looking utterly neglected.' These are the Colonel's own words, and they correctly describe the state in which I found it when last in Florence, in 1869. The only parts uninjured are the arch over the door and the inscription."

Settlement of the Coventry Sewage Question.—At a recent meeting of the Coventry City Council, it was unanimously resolved "that the draft lease to the General Sewage and Manure Company, Limited, of the sewage works, sewage message, and 28 acres of land at Whitley, agreed upon between the Sewage Committee and the Company, be approved." The mayor congratulated the council and the city generally upon the prospect of seeing this difficult question settled not only without incurring the enormous expense that was laid before them at previous meetings by Mr. Hawksley's plans, but, as Mr. Franklin had said, without any expense at all. He believed it was the determination of the company to make the system a success in Coventry, and a place that they might refer to in future.

The Sewage Question at Dover.—Alderman Finnis appears to have been successful in convincing the town council of the necessity of doing something in connexion with the sewage outfalls, of which serious complaints were made some time ago by the military authorities. At a recent meeting of the sewer outfall sub-committee of the council, Mr. Hanvey's plans for taking the sewage through a tunnel in Shakspeare's Cliff were examined and approved, and the co-operation of the War-Office authorities was invited. The minute was confirmed at the meeting of the managing committee, and the War Department will be asked to pay a share of the expenses of the works. The estimate is 10,000l.

Damage to Leeds Bridge.—A recent storm of wind and rain which swept over the country caused the river Aire to be very much swollen, and three coal-barges upon it broke for their moorings, and were carried down the current, coming in contact with Leeds Bridge. One of them was dashed against the new structure, and sank immediately; and another came so violently in contact with one of the piles supporting the temporary bridge that it was rendered unsafe, and all vehicle-traffic across it was stopped. Buildings in course of erection also suffered somewhat during the storm. A portion of a house which was being built by Mr. Dyson, of Carlton Mount, behind Cromer-terrace, was blown down.

Arrival in New Zealand of Brogden Workmen.—The *Marlborough Press*, a New Zealand newspaper, announces the arrival of the first batch of emigrants sent out by Messrs. John Brogden & Sons to work upon the New Zealand railways, as already spoken of in the *Builder* of the 28th of September. As to the attention to the wants and comforts of the immigrants on landing, the New Zealand paper says:—

"We cannot conclude without giving a word of praise to J. Brogden & Sons, for providing so well and amply for the housing and accommodation of the new arrivals. There was no hitch, no hurry, no disarrangement of plans; and everything worked so harmoniously that the men, women, and children were conveyed without delay from the steamer in which they arrived to the houses prepared for them, in which cheerful fires were burning, and provisions in quantity stored. The thoughtfulness of somebody in having lighted fires deserves mention, as the warm glow must have felt to many like an hospitable welcome to the land of their adoption."

Chelsea.—The Chelsea Vestry have under consideration a proposal to borrow about 8,000l. to cover the expenses of putting in brick sewers in the following streets, &c., at present served with pipe-sewerage more or less defective:—Limerston-street, 720l.; Victoria-grove, 600l. 10s.; Camera-square, 692l. 15s. 6d.; Radnor-street, 510l. 5s.; Shawfield-street, 540l. 6s.; Manor-street, 1,563l. 14s.; Godfrey-street, 621l. 7s.; Cadogan-place (north end), 720l. 4s.; Wellington-street, 520l. 6s.; Collingwood-street, 520l. 6s.; Arthur-street, 240l. 10s.; College-place, 350l. 16s.; Upper Manor-street, 529l. 9s.; being a total of 8,531l. 8s. 6d.

Ohan Church Competition.—The committee appointed to make a selection from the thirty-four plans that were received in connexion with the proposed new church, have decided upon the design of Mr. David Thomson, of Glasgow. The proposed edifice will cost about 3,000l., and is to be proceeded with at once.

A Local Museum for Newington.—At a vestry meeting in Newington, Mr. Malthouse has proposed that a portion of the waste space in the vestry-hall be turned to the uses of a local museum, where the antiquities of the parish may be exhibited for the inspection of ratepayers and others.

The Holborn Valley Improvements.—It is stated that the Improvement Committee of the Corporation are able to show that no expense has been incurred by the Holborn Valley Improvements—that they have been paid for (with 100,000l. to spare) by the improved value of the land which they caused to be vacant.—*City Press*. [We shall be glad to find this confirmed. At present we must be permitted to doubt.]

The Darlington Fever Hospital.—At a meeting of the Darlington Town Council, held on the 3rd inst., the report of the Hospital Committee was adopted, and it was resolved to erect the building forthwith, at a cost of 9,000l. The architect is Mr. G. G. Hoskins, of Darlington, to whom the first premium was awarded in March last.

"£22,000 for a Ceiling."—The paragraph thus headed, which has been circulated with reference to works in course of execution by Messrs. Cubitt & Co., for the Marquis of Westminster, under Mr. Henry Clutton, architect, is a fabrication. There is no mahogany nor ebony in the ceiling: it is of Jackson's composition, gilded. The doors and shutters are of mahogany.

Sale of Rosherville Gardens.—This property was submitted for sale by auction by Mr. Samuel Green, of the firm of Green & Son, on the 8th instant. The biddings commenced at 15,000l., and the hammer fell at 24,600l., at which sum the auctioneer declared the property to be sold. The hotel adjoining was sold separately.

Fire in the Theatre Royal, Cambridge.—A fire broke out the other evening at the Theatre Royal, Cambridge, soon after the performance commenced, whereby the "flies" were all destroyed. The fire, however, was discovered in time to prevent further damage. A similar fire occurred there last year.

TENDERS

For one pair of semi-detached villa residences on the Tramway Estate, Brixton-rise (No. 2 design), for Mr. W. Everett. Messrs. Gouly & Gibbins, architects.—Rowe & Verran (accepted).....£1,071 0 0

For boundary enclosures to St. Stephen's Church, North Bow. Messrs. Tolley & Dale, architects:—
Scriveners & White.....£458 0 0
Perry & Co.....447 0 0
W. & D. Brown.....438 0 0
Broome & Robinson (accepted).....373 0 0

For the erection of stables, cart-shed, &c., for the Corporation of the City of Lincoln. Messrs. Bellamy & Hardy, architects:—
Taylor.....£620 0 0
Young.....598 0 0

HANDY BOOK OF VILLA ARCHITECTURE; being a Series of Designs for Villa Residences in the Swiss Style. With Detailed Specifications and Estimates. By **C. WICKES**, Architect. First Series, containing 30 Plates; Second Series, 31 Plates, complete in 1 vol. 4to. price 1s. 6d. half morocco. Either series, complete, price 1s. 7d. each, half morocco. London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Just published, crown 4to, cloth, 3s.

THE TELEGRAPHIC CONSTRUCTION AND OPERATION OF WOOD-PULPING MACHINES; giving a History of the Origin and Progress of the Manufacture of such Machinery. Illustrated by numerous engravings, showing the modern practice of prominent Engineers in England, and America. By **J. RICHARD**, Mechanical Engineer. London: S. & P. N. SPIN, at Charing-cross.

On the 19th of November next will be published, No. 1 of **THE MONTHLY ILLUSTRATED REVIEW OF ELECTRICAL SCIENCE.** Edited by the Rev. **WILLIAM HIGGS**, M.A. Sometime Assistant to Sir Charles Wheatstone, D.C.L. F.R.S. The arrangement of this Journal will be as follows.—Leading articles on subjects of Immense Interest and Importance; original Papers—Abstracts of Proceedings of Scientific Societies—Views of Scientific Books—Abstracts of all Foreign Memoirs upon Electrical Science—Share Lists and City Notes—A Scientist's Column of Letters Patent. The Journal will also be a medium of intercourse between Relaters; a Channel through which Operators can declare their views upon a subject, and those interested in the General Progress of the Science. The "Telegraphic Journal" will contain articles of value to the Electrotypist, Electro-plater, and amateur Experimentalist. Price 6d. per copy—6s. per annum. London: HENRY GILLMAN, Post-office, Ludgate-hill, E.C.

New Work by Sir M. Digby Wyatt. Immediately, in post 4to, with an introduction of the Rev. Dr. Stubbs, price Two Guinea and a Half.

AN ARCHITECT'S NOTE-BOOK in 4to. By **M. DIGBY WYATT**, M.A. Principally illustrating the Domestic Architecture of that Country.

Slide Professor of Fine Art at the University of Cambridge. Also containing a series of 100 admirable Sketches, made in Spain, in 1868, from subjects as novel in character as they are important for the history of architecture in that country. Reproduced in absolute and permanent facsimile. Each Sketch is accompanied by Critical Notices, in which Sir Digby Wyatt discusses all the points of interest which he observed in the subjects selected for illustration. Subscribers' names for copies may be addressed to the Secretary of the **ATYPOTYPE FINE ART COMPANY** (Limited), 36, Bathmore-place, London, W.

BUILDING GROUND TO BE LET, in most eligible situation on south side of Brunswick-square, Cambridge-street, No. 27. Frontage to square 27 feet.—Apply to GEO. CROSSMAN & CO. 116, Fenchurch-street, City.

STAMFORD HILL.—An excellent SITE, for one or more BUILDINGS TO BE LET, for a term of 99 years. Frontage 120 feet. Frequent trains to City and King's-cross.—Apply to Mr. CHESTER CHESTON, Jun. Manor Office, West Hackney, E.

WESTMINSTER.—TO BE LET, near FLEMING'S, spacious WAREHOUSE or MANUFACTURING PREMISES, with a large yard, &c.—Apply to Messrs. T. LEE & CO. Builders, Wood-street, Westminster.

WESTMINSTER.—TO BE LET, spacious WAREHOUSE or MANUFACTURING PREMISES, with ranges of stabling, lots, counting-houses, two separate entrances, the whole occupying an area of about 9,000 feet.—Apply to Messrs. STUBBINS & SONS, 27, Royal Exchange.

CAMBERWELL (near the Green).—TO BE LET, large PREMISES, suitable for a Builder, or any manufacturer requiring a large space. There are good worksheds, iron-stabling, good houses, rent, and water. Also a good steam engine for the whole, on lease, 800 per annum.—Address, W. ADAMS MILLER, Barringer and Estate Agent, 47, Church-street, Camberwell.

TO BUILDERS.—TO BE DISPOSED OF, the LEASE and GOODWILL of an old-established BUSINESS, doing a good general trade in one of the best positions in the south of London. It would be a valuable acquisition to any one only required.—W. ADAMS MURPHY, Architect and Surveyor, 47 Church-street, Camberwell. Letters enclosed stamp.

The Builder.

VOL. XXX.—No. 1550.

The Exact Relation between the Food of Plants and the Refuse of Towns.

REQUENTLY and fully as the subject of the treatment and utilisation of sewage has been discovered, there is a mode of in-

vestigation that has not hitherto been applied with the accuracy that is both possible and desirable. We have analysis, indeed, pushed to the utmost minuteness of detail, both as regards the chemical composition of plants, and the chemical

elements that we send to poison our rivers. A certain balance is known to exist between what is taken from the soil for human and animal food, and what is returned to the soil, or to the atmosphere, by the result of the vital process. But what has been, in our opinion, overlooked, is the mode in which the question is affected by that the word *or*. Food is consumed in a tangible form. The results of the digestion of food are utterly tangible and partly invisible. The effect of the combustion that goes on in the living animal is a matter of primary importance. We wish, then, again to inquire into the subject of what is returned to the soil, and to investigate how far the actual chemical outcome, by balancing the consumption of the food of plants, allows of an economical utilisation of sewage.

The food of man is composed of certain elementary substances, known to chemistry, which exist abundantly around us, but which man's skill has not hitherto been able directly to combine, so as to produce the same result that is continually being effected in the laboratory of organic life.

Human food consists of two great groups, or categories; first, that which is the direct product of vegetation; and, secondly, that which is a secondary product; having been assimilated, the first instance, by herbivorous animals, and then presented to human consumption in the form of flesh, milk, eggs, or some edible of animal origin.

The attention of scientific chemists has been directed to the important quest of the means of directly combining the chemical elements of food. But the greater progress in this direction which we are acquainted consists in the chemical formation of certain flavours, indistinguishable from those of fruits.

In regarding the production of human food it will be convenient, in the first instance, to regard the case of wheat, which in this country forms the staff of life, and on which subsistence, though not luxurious, is possible.

It results from statistical inquiry that the consumption of wheat may be taken at one sack of flour, or 5.71 bushels of wheat, per head per annum. This allowance is equal to 3,483 lb. of wheat per head per annum, or 93 lb. per diem. The fair average return of our cultivated wheat-lands is stated by the most careful students of the farm statistics of the day at quantities which, reduced to the simplest expression, amount to a yield of 1,570 lb. of wheat per acre per annum. We take at present no notice of the straw, because, in one form or another, it is returned to the soil, if not exported.

In the discussions now raised as to the value

of sewage as manure, while very much information has been collected, the subject has never yet, so far as we are aware, been brought to that definite test for which analytical chemistry furnishes the means. In fact, from the form in which the ultimate analysis yet carried out has been left by the best writers on the subject, it is tolerably certain that the method we now propose to pursue has not hitherto been pursued.

We are not about to enter into that question of the relation of population to area which is suggested by the remark that the annual consumption, per head, of wheat is equal to the produce of nearly one-quarter ($\frac{1}{2.57}$ parts) of an acre. We have to see, first, what we take out of the land by a wheat crop, and what we therefore require, in some way, to return to it; and, secondly, how far the refuse of our towns is adapted to furnish that supply.

We take the average wheat crop at 25½ bushels, of 61 lb. per acre, which gives, in round numbers, 1,570 lb. of wheat.

This wheat, by analysis, consists of (1) 220 lb. of water, of which we take at present no further heed; (2) 25 lb. of mineral ingredients; (3) 230 lb. of flesh and force producing, nitrogenous matter; (4) 1,095 lb. of force-producing matter, which includes 523 lb. of pure carbon.

The elements of the food of plants, besides the small portion of mineral matter which they accumulate in growth, are these,—water, ammonia, and carbonic acid. From the ammonia that is fixed in the process of vegetable growth the nitrogen in the vegetable substance is derived. From carbonic acid the large quantity of carbon is extracted. Both carbonic acid and ammonia are evolved by the organic processes of animal life. They are so produced, to a large amount, in the form of imperceptible vapour. Much of this is dissolved in rain, and thus brought to the roots of plants.

We require, therefore, either by natural or by artificial means, to return to every acre of wheat-growing land 25 lb. of mineral matter in the year. This matter consists of lime, magnesia, silica, soda, potash, sulphur, phosphorus, oxide of iron, and chloride of sodium or common salt, in proportions into which it is not necessary here to enter. We arrange them according to their proportionate weights.

With regard to the more universal elements of vegetable tissue, it will be seen that the flesh and force producing, or nitrogenous, portion forms but the fifth part of the force-producing, or carbonaceous, matter. Each of these supplies is derived mainly, under ordinary circumstances, from the atmosphere. But if we seek to feed our plants as it were by hand, we must be careful as to the appropriate mixture of the food which we supply. To give in undue profusion a single element, or even all the proper elements with a single exception, is not to feed, but to starve. It is therefore necessary to learn first how much of the mineral matter necessary for the crop is already abundant in the soil and what is deficient and has to be returned; and, secondly, how far we can supply a store of the more subtle elements which, in a liquid or aerial state, are equally requisite for the luxuriance of the crop with the solid mineral matter.

We have now to consider the question of how far the ordinary contents of town sewage contain, in the proportion required by vegetation, the proper elements for its support.

The chemical composition of the *excreta* of human life, entirely undiluted, contains 92.88 per cent. of water, and 7.12 per cent. of suspended and dissolved matter. If we allow 25 gallons per individual for the water-supply, which is a smaller allowance than is considered desirable, we shall have a dilution of 100 gallons of *excreta* by 9,130 gallons of water, or 91 to 1. We may say in round numbers, therefore, the dilution is 100 to 1.

These suspended and dissolved matters may

be conveniently classed in three groups. Of the seven parts of which we first spoke, the mineral matter forms a tenth. Gaseous matter, including the non-mineral constituents of the sulphuric and phosphoric acids, forms a fourth; and the remaining 65 per cent. consists of organic matter.

In other words, we may take a unit of population as the equivalent of 9,000 gallons of undiluted sewage, and regard it as producing in the year 7 lb. of mineral water, 18 lb. of gaseous matter, and 46 lb. of organic matter. This result is closely accordant with analyses carried on for different purposes, and is at all events sufficiently accurate to form the basis of further inquiry.

The commercial value of the mineral matter it may be difficult precisely to fix. The most valuable portion is the phosphorus, which is found in small quantity. Phosphorus of lime is reckoned as worth 2s. 3d. for every 1 per cent. in a ton. The proportion of the mineral elements is that in which they are required for the crop, but the value of their return to the soil depends not only upon this fact, but upon the question of what mineral elements are naturally abundant in a given soil, and what are those in which it is deficient. The phosphorus is the only mineral for the collection of which it is absolutely necessary to have recourse to manure of animal origin.

The gaseous matter, whether present in the form of nitrates or other salts, or as ammonia dissolved in the water, may be taken with the mineral matter in forming an estimate of commercial value. If the 21 lb. of mineral and gaseous substance be priced at 1d. per pound, it will probably exceed the purchase-money likely to be obtained.

There remains the important question of the organic matter, which forms nearly two-thirds of the non-aqueous contents of sewage. In this, it is evident, lies the main knot of the subject. In the various methods proposed for the treatment and utilisation of sewage the most opposite views are entertained as to the value of the organic matter. In the various analyses it always appears in this comprehensive and uninvestigated condition. By some persons it is regarded as a fertilizer of high value; by others it is considered as merely the carrier and seed-bed of poison. It is desirable, therefore, to discuss this portion of the subject with some precision.

Before passing, however, from the consideration of the mineral elements, we must refer to a point which, although by no means novel, comes out unsought in our calculations. The mineral matter contained in the wheat consumed, at the above rate, by four persons in a year is a little over 22 lb. The sewage resulting from the same number of persons contains 28 lb. Ultimately, no doubt, that returned to the soil must equal that taken from it, with the exception due to our mode of sepulture. The difference in this case arises from comparing the crop containing the smallest proportion of mineral matter with results derived from a mixed diet. Oats, for example, contain 3.0 per cent., and barley and beans each 3.5 per cent., of mineral, against 1.6 per cent. in wheat.

But the balance is very suggestive as to the questionable economy of conveying to the soil, for the purpose of fertilisation, the sewage arising from a population at the rate of from 25 to 1,100 per acre; the first being that recommended as the most lucrative, and the second being that actually in use at Merthyr Tydfil.

The organic matter which forms 64 per cent. of the solid contents of undiluted sewage is not more minutely analysed in any of the works that we have consulted that discuss modes of treatment and of utilisation. The suspended, as distinguished from the dissolved, solid matter may be taken principally to consist of albumen.

At all events, if we take the analysis of that substance for our guide, any error of deduction will lie within limits that can be readily ascertained.

The albumen of the blood, according to MM. Dumas and Cahours, consists of 53.32 carbon, 15.70 nitrogen, 7.29 hydrogen, and 23.69 oxygen in 100 parts.

It is a remarkable and interesting fact, which seems to have escaped notice, that 100 parts of albumen, thus analysed, have required for their production exactly 250 parts of carbonic acid, ammonia, and water combined. The elimination of 150 parts of oxygen has converted that mixture into organic substance. At least, such is the exact result of the numeric value of the elements and their known combinations.

The combination of 150 volumes of oxygen, if we allow the degree of heat to be produced that is due to combination with carbon, is accompanied with the production of 200 units of heat. Omitting the addition due to the combination of the hydrogen with the nitrogen, we have thus the measure of the heat required for the liberation of the same weight of gas. In the vegetative process by which albumen is formed, the heat of the sun supplies this requisite. The leaves act as the organs for expiring the liberated oxygen. We thus obtain a view of the mode of formation of vegetable albumen, by weight and proportion.

The compound thus formed is one of the constituent parts of the vegetable structure, and is especially to be found in the seeds and fruit that form the main part of animal food. In the process stimulated by hunger, the albumen is taken, unchanged, into the animal system. We need not trace the entire circulation, but we find the substance finally either consumed by the respiration, giving out its proper *quotum* of heat, for the supply of the animal warmth, or passing in an undecomposed state into the localities in which we now have to deal with it.

Albumen, thus formed, is of course unfit for animal food. It is equally unfit for vegetable food. In order to allow of its assimilation by the plant, it is necessary to return to it that proportion of once and a half its weight of oxygen, of which it was deprived by the vegetative process that formed it. When this has not been done in the natural course, that is to say, in the animal body, it is only to be done either by extension of surface, so as to expose the greatest amount possible to an oxygenating process, or by raising the temperature, so as to turn a slow into an active combustion.

There is, indeed, one class of organism to which decaying organic matter furnishes an appropriate *pabulum*. The fungi are ordinarily regarded as vegetables; but they possess not a few of the peculiarities proper to the animal kingdom. Chief among these are the nitrogenous character of their tissues, and their habit of feeding upon decaying organised substances. Their appearance, under conditions favourable to pestilence, is invariable. Their growth and reproductive power are of fabulous rapidity. They are the scavengers of nature; but, like their superior brethren in the practice, are best kept at arm's length. Among them are to be found the cholera fungus, the potato fungus, and, if medical men are right in their suspicions, the countless and invisible spores that are the very means of communicating zymotic disease. In the albumen of the sewage this order of beings has a naturally provided home and vehicle. The assimilation, made by man, is out of the ordinary course of nature to remedy. Her sole organism, for the purpose, is the fungus; its activity is extreme, but the effect is at least as redoubtable as the mischief which has called for its commencement.

Each of the four elements which constitute albumen is necessary to the growth of plants. But they are only available, so far as we know, to support that growth, when they are present in due proportion, and in such combinations as are suitable for vegetable assimilation. The organic matter of sewage, therefore, as far as it is albuminous, is entirely valueless as manure, besides being liable to be regarded as the seat of an active poison. It is of primary importance to give prominence to this often neglected truth.

While the above analysis exhibits the value of town sewage as rather less than one half-penny per ton of effluent, undiluted liquid, or 1s. 9d. per unit of the population per annum, it is well to check the calculation by the results attained by the best cases of sewage farming.

For the economical treatment of sewage we are told that an acre should be allotted to

every 25 souls of the population. At Merthyr, on the other extremity of the scale, an acre appears efficiently to disinfect the sewage of 1,100 souls. Here is a wide margin.

The highest expenditure that we have yet seen recorded in high farming for manure has reached the price of 3l. per acre per annum. This, of course, is unusual. The crops on this farm have been worth 13l. 10s. per acre in wheat, and 14l. 16s. in clover and sainfoin. We refer to Mr. Prout's farm in Hertfordshire. Generally speaking, 40s. would be an outside price per acre for manure.

If we take the recommended allowance of 25 souls per acre, and what has been hitherto regarded at the low value of 5s. 8d. per head of inhabitants for the sewage, fertilising matter to the amount of 7l. 1s. 8d. is annually placed on every acre thus treated.

If we apply the same theoretic value to the proportion in force at Merthyr, of 1,100 souls to an acre of filtering ground, we shall find that fertilising elements, according to theory, to the value of 311l. are annually poured into that acre. The highest returns claimed from the use of sewage manure have been at the rate of from 32l. to 40l. per acre. We have not the exact details, but we find that a growth of Italian rye grass amounting to 7 tons per acre is stated to have been produced. If we took last year's price for hay,—this would give a higher value, but that may be considered as exceptional,—31l. 10s. would be the return for the hay at 3l. 10s. per ton.

In water-meadows without manure, or with an occasional top-dressing of bone-dust that will not amount to more than 1s. per acre per annum, crops of 5 tons per acre, including that which is eaten on the ground, are about the maximum. There is little doubt that these may be materially augmented by such a disposal of the irrigation as should avoid the present wasted area of innumerable water-carriers. But it is possible that this may cut both ways,—so that we take the difference of yield between the ordinary water-meadow and the sewage-farm at 2 tons of hay, say 9l. per annum. This is, therefore, the total produce of the application of a quantity of sewage averaging, in the value hitherto nominally attributed to it, at from 6l. 10s. to 312l. Thus it seems that the result of practice is in exact accordance with our analysis.

That the effluent water from sewage must go through the ground to be purified, we take to be an undoubted maxim in the present state of sanitary science.

But if we complicate this problem, in itself not a simple one, by attempts to derive from the sewage materials fitted for the food of plants which do not exist in it, in a state in which plants can assimilate it, and which we cannot convert into such a state, we go in the wrong direction. Chemistry and practice unite in one testimony. The organic contents of sewage are not manure. They are only poison. They must not be preserved, but destroyed.

THE EDUCATION OF THE ARCHITECT.

At the opening meeting of the new Architectural Association of Ireland, mentioned in another page, Mr. J. J. O'Callaghan, the first president, read the following instructive address:—

By learning to make truth the foundation of your education, you may hope in time to be able to design; truth is absolutely necessary to it, and no originality can assist a design without this one grand element; once depart from it, and you get into troubled waters. As written recently by an eminent architect, "It is truth only in every line and every detail which can ever make great architecture."

A more extensive course of study than is generally given is necessary for the architectural student. It is too much the habit now-a-days for a student to start too early in practice for himself; it often happens that he begins immediately on being out of his articles, as if the three or five years spent in the principal's office is all that are necessary. This is but a small portion of his education, even when supplemented by all the exertion of which he is capable. I know many pupils work very hard in this way, but I fear that with others it is only the mere routine of the office that constitutes their art-education.

The preparation for the profession is one of our weakest points, and in this respect France and other continental countries have the greatest

advantage over us. It is necessary that a good general and scientific education, and a fair knowledge of drawing, should be learned at school; this should include a general knowledge of perspective, its principles and practice, and good training in freehand drawing. When you have entered on your duties as pupils you will find you are in the right way to become artists not only in name, but also in reality; and you will the more readily work your way up in the office, and will the sooner be entrusted with responsibility. Then a knowledge of construction and the uses of materials should be your next care; this will give you a great confidence in your office work, because you shall then understand what you are doing, and there will be no hesitation in any constructional matter.

You should lose no opportunity of acquiring a thorough knowledge of all the trades; this is absolutely necessary for the making of your working drawings. When some new ideas are well and clearly laid before workmen, you find it difficult to get them to realise them, they find too much their habit to endeavour to do things their own way. How can you, then, possibly expect they should understand them if they are imperfectly sent from your office, much less hope they will follow you with confidence or respect? Without this knowledge your client will not have that confidence in you which is necessary; while the builder, who is really anxious to have the benefit of your assistance, and to follow your plans, so often finds that in matters under his own province you are at fault, that your influence is weakened. Were the educational defect removed, this state of things could not exist, and the aid of the architect would more generally be sought. The public would know their interests were safe in your hands; they would feel that technical knowledge and artistic taste were employed in their behalf, and they would unreservedly place them selves in your hands, and the cause of art and the public would be served in the end. The necessity for this is very apparent in our own country, where the position of the architect is very little understood, and good architecture, I fear, very little appreciated.

In immediate connexion with the attainment of this knowledge, the student should ever remember that a liberal education ought to be the ground-work of his profession, and that it will require his utmost exertion to fit him for that which ought to lead the sister arts. Architecture is the real foundation of the fine arts, and ought to be the guiding spirit to them. For this purpose the intellect must be educated and the imagination cultivated. This will be necessary, if we wish to imprint on our works,—which are so influenced by our modern requirements, as by the influences which science has opened up,—the spirit or life which is visible in those works which we would probably take as our model, from either the Classic or Gothic schools, or, may be, a combination of the two.

It is of the greatest consequence that a thorough knowledge of our history should be known, for the architecture of a country is intimately connected with its history, and the contemplation of the one brings forcibly before our minds the beauties and peculiarities of the other. And here I may mention the great fun of study which the ancient buildings of Europe afford the student. In our own country we have many examples of every period, although the are not so extensive or so elaborate as those in England or on the Continent. They afford most interesting studies to the student, and the details of a distinctive character that marks them as once as national. I would, therefore, suggest that you begin at home, and let your tastes be formed there. I know no more interesting study for the junior members than a day's, or a week's, or a month's, sketching at some of our fine old ruins, and I trust it may be my good fortune to join the members of the Association in the journeys through Ireland on the occasion of inspecting some of those splendid monuments of the piety and art-knowledge of our ancestor. We owe a deep debt of gratitude to those who like Petrie and others, drew our attention to those splendid monuments erected by our forefathers. I do not know a better way for a student to learn the rudiments of real architecture than by carefully sketching and measuring the spot those remains, particularly noting the mouldings and construction; and this is reckoned of such importance that I believe nearly all the art societies offer special prizes for this purpose. I am happy to see one included in the prize-list of this Association. Not only the

details should be sketched: the plan should be well studied; the purpose of the building, and how it has answered that purpose, should be carefully investigated. In this investigation I would suggest that no one style be adhered to, as beauty and good may be found in all. The remains of Athens and Rome have their admirers, and those of the Middle Ages are affectionately regarded by numbers. As for my part, I believe it is quite possible to cull from all without losing any of the feeling or beauty which either possesses,—not, indeed, to attempt to produce a mixed style of architecture, which I consider most undesirable. Ground your necessities of the age either on Gothic or Classic works, treat them with originality, and you will have a sufficiently new style, if you combine in your work those truths which they so beautifully express. I see no reason whatever why, though loving the pointed arch, should neglect the use of the round, and in our Gothic architecture we may well introduce that simplicity and repose which is to be seen in some Classic work. This has been very successfully achieved by the Italian architects, who introduce into their work some of the distinctive features of the Classic, and with unity and harmony. Even in the same windows they introduced the two kinds of arches, the inner arch being often semicircular, while the outer one was pointed. This gave a great appearance of strength, and the effect is exceedingly good. We must remember ever that literature has great influence on architecture, and is intimately associated with it.

I am very happy to believe that great strides are being made in the direction of educating the public mind, and that exhibitions of art are being more and more appreciated. I believe we may trace in the recent revival of Gothic architecture, that the very education for it was being prominently before the minds of the people the associations connected with those interesting remains; that the very way was opened for the actual results achieved by Pugin and others who laboured in the same field.

The pupil should early learn to sketch, and sketch well. Sketching is a power in the hands of an architect. It is impossible for you to be able readily to put together your ideas unless you sketch well: it gives you the greatest facility in grouping your buildings, and even planning them. You have the means of storing up in your mind every good idea, detail, and group. This power of sketching, combined with a thorough knowledge of perspective, is of the greatest benefit to yourself in your future practice; it enables you to take in constantly those works which may pass before you on all occasions. If you have this power, you will be able to get through a much greater amount of work than would be possible for you without it, no matter how well versed you may be in everything else that relates to your profession. When you have acquired this power of sketching well and freely, you can then take up some works, and measure and draw them carefully; by this means you will be doing more to understand their spirit, and feel those principles of truth and reason which they contain. It is only when you have carefully gone through this work, and understand thoroughly their plans, sections, and elevations, and their construction, that you can catch their ideas, which ideas once thoroughly impressed on your minds can never be completely effaced.

You can use them as copyists. These very ideas will arise in your minds, and will be to you of the greatest assistance when you most require them. Then from the power that sketching gives you in educating your eyes and your tastes, when you have the mind filled with the good things which you have already seen and sketched, it will not be possible for you to be satisfied yourselves, or to satisfy others, with what is unreal or bad. It will give you an easy path over many difficulties, and the fears that may perhaps arise when you have planned an original group will soon disappear, if your minds are stored with those ideas which have been formed long before in your sketching tours. You will then avoid starting with a sham. This is a very serious evil, and one against which you will have carefully to guard—this endeavour to appear what you are not. It is of the utmost dishonesty, and yet appears to be almost universally practised; the worst feature of it is, that it precludes us from the use of really good materials, and how disappointing in the end it is. These shams are practised almost everywhere and in almost every place, and yet every one appears to know it is so. How often do we see that plastering—very

good in itself, if properly applied—is utterly destroyed when made to imitate stone? This is so generally adopted that it is most difficult to get even the workmen to do this class of work without their putting the stone lines upon it. It would be annoying, if it were not such a serious subject, to hear the explanations given and the defence offered by them on this subject. Then we have metal and wood painted to imitate stone and marble, and how often are we allowed to have the simple colours applied to our work? No! we must have our wood painted to imitate oak, or maple, or such like, forgetting all the time how very beautiful the natural colour of the wood is, or how much better and more beautiful the simple colours would be. This we must never fail to oppose with all our powers, no matter from what quarter it proceeds; it is a combination of extravagance and vile taste. It removes us altogether from what we should have in view. Then in the matter of representing marble, do we not see it every day, or on every side of us? and this in a country where we have most beautiful specimens of the real material to select from. It is sad to find that all this occurs amongst us at the same time that real materials and rich colours are abhorred: we are very far behind in this respect. The public appears to be devoid of true feeling on this most important point; we should therefore do all in our power to awaken a love for truth, and beauty, and colour, in our architecture. We certainly have many opportunities of doing so in using the brick, granites, limestones, sandstones, and marbles, which may now be easily obtained in this country, and which in every respect are such admirable materials. By using our materials thus we shall tend to educate the eye and give strength and interest to our buildings; we may then hope to see love for the picturesque and beautiful become more general, and regularity and plainness shall not be considered the only beauty.

Sketching and measuring also lead on to the closer examination of those works you take up, and give you a power of thinking for yourselves otherwise very hard to attain; you will find out the points of them that please you most, and shall be enabled to mark carefully the treatment adopted for different works, and how the various difficulties were overcome; and, though last, not least, it will give you a thorough knowledge and power to use the materials in their best and most natural manner. You cannot love those buildings too much, nor is there any fear you may become copyists if you approach them in a proper spirit, determined to educate yourselves by them, not to select a piece of them for a particular work. It is impossible for a man who loves his art well not to cultivate it, and derive pleasure from its practice, which will be utterly impossible to a mere copyist. The study of those works will also tend to tone down that spirit which would perhaps sometimes tempt you to do queer things, in order to indulge in what is termed "originality." That which is natural will produce sufficient originality. In fact, to my mind, if you make use of your wants properly and naturally you shall always produce that originality which is desirable; truth in planning and in construction will always produce as much of it as is necessary to make our architecture picturesque and beautiful. It is the absence of truth in our architecture, coupled with the want of art-education, that produces the thoroughly uninteresting character of almost all our buildings. That which is actually bad and inconvenient is adopted, more particularly in our dwellings, because the public mind cannot realise the fact that truth would govern our architecture; the spirit of doing what has been already, though very badly done, appears yet to govern the masses, and they dread anything in the way of real art in architecture.

Then what must be avoided,—that spirit of singularity which is occasionally visible,—that restless, uneasy striving after effect which marks conceit or disregard of truth. This uneasy spirit generally arises from ignorance in treating the materials we have in hand, or the neglect of the study of those models we have been speaking of, but generally in the absence of that truth which is the real foundation of good design. You should approach each work in its true spirit, endeavouring to meet each case on its own special merits, making the design as natural and as suitable as possible.

You should above all avoid laziness in design; you must quit that spirit of mere imitation which your case would sometimes prompt. You should blush to copy or to make use of any of

the works you may see in your principal's office; you should imitate what you find there in order that you also may one day become original. The practice of copying and making up a design of another's works, and trying to deceive yourselves thereby that you have designed a building, is a most dishonourable practice, and it is utterly opposed to the true spirit of art. Once you rest satisfied with mere copying in this respect, you are lost to the spirit of the true artist, and you cannot take any pleasure in your profession. The true architect is always contriving, and never rests satisfied until he is convinced that he has realised the best effect possible. He goes on, ever improving on the past, till when old age comes on, he feels himself young still in the pursuit of art, and there will be no fear that his work will become uninteresting to him. The ever-changing, ever-grappling with the work will be to him a constant source of pleasure, and he has his own reward in contemplating the life-like creations of his fancy,—than which I know no greater pleasure. You have many opportunities for variety in your practice, for although sameness in general appearance is too generally sought for, yet in very few cases does one client wish to have that which has been already adopted by another. If you go into each work with spirit, it will prevent poverty in design, and produce that originality which we should all look for.

It is most essential that architecture should hold a prominent place in our public schools and universities, for is it not sad to find that, in many cases, the first idea a pupil gets of that which is to be his profession is in the office in which he is articled, and that he oftentimes takes a pencil in his hand for the first time when he enters the office as a pupil? I hope the day is not far distant when professorships of architecture will be established in all our colleges and universities, and thus architecture and the fine arts will form part of general education for all classes.

In England we find many opportunities for art-study open to the student, not only in the colleges and universities, but in the Royal Academy and the magnificent collections at South Kensington and elsewhere. I believe in only one university or college in Ireland does a chair of Architecture exist: this is a very great want, and one that should not be allowed to exist; but the architects of the country must agitate, when perhaps attention will be paid to their wants. In the face of those discouraging facts, it is the duty of the younger members of the profession to be diligent and industrious, and show thereby that, had they the means prescribed above, they would avail themselves of them. I believe, notwithstanding all the drawbacks, if a student is industrious, he has all the necessary means open to him for a good art-education, if he will only supplement the information he receives from his principal by his own exertions in the workshop, on the building or sketching tour; and pupils had better realise this fact as soon as possible,—that architecture is an art not to be learned easily or slightly, and the sooner they put their shoulder to the wheel the better. If pupils will not educate themselves, or at least receive the education afforded by their opportunities voluntarily, then the sooner we have examinations for admission to the ranks of the profession the better. Let the Institute establish an examination, the passing through which will be recognised as a necessary qualification for the profession. I am afraid in many cases the position of the profession must suffer, unless compulsory education be established; outsiders will come into the profession,—men without sufficient education. Even in this age, the position of an architect is not understood; the difference between an architect and a builder is not yet sufficiently defined. It will be said, and truly, that you cannot teach a man to design,—that it is a gift; but it is a power assisted very much by education and training, and it is only just to the profession at large that this education and training should be possessed by all those ambitious to join its ranks, and thereby put it on a level with other professions. If the want of any regular training for the artist in the higher walks of life is so apparent, what shall I say of the system adopted at our schools of art? I believe a considerable number of pupils have learned to draw in them, and I feel certain they deserve a large amount of credit for what they have done; but there is, I fear, a great absence of observation or investigation in the education provided: the effort appears to be more to realise an elaborate drawing. We

want spirit and life in drawing of the different forms, not a painfully over-studied drawing. Then I fear also the pupils do not sufficiently understand what they are copying, and a large amount of interest is removed from their work. Let us have vigorous and intelligent treatment rather than mere mechanical precision.

The study of painting, sculpture, and drawing forms a most important part of an architect's education, and it will be for the members of the Association to show by their co-operation and diligence their appreciation of this fact, when, I have no doubt, the Royal Hibernian Academy will be happy to afford all the assistance in its power to members who should seek admission to its halls.

You will perhaps say this is very hard work to go through, and you probably ask what is the reward for all this. I would say in reply that you are about to become members of a most honourable profession. It is an ancient profession, notwithstanding the efforts of those who try to prove that it did not exist in the Middle Ages, but that each workman designed his own part and depended on his devices. The examination of any of those buildings will at once convince you of the absurdity of such a statement, even if we had not actual evidence of the fact. It is an intellectual profession; for, though we know cases unfortunately that would prove the reverse, they are, I am happy to say, the exceptions, and the high standard of Vitruvius is that aimed at, I am sure, by those who approach it as they ought. It is also a profession that can confer the greatest honour on its members, for I believe no matter under what discouraging circumstances you begin, if you only work diligently you shall win your way, you shall gain the respect and esteem of others, and, even though you should fail, you shall have the reward of your own consciences that you traversed the right path.

ON SHADOW.

PURSuing the observations on the subject of shadow, commenced in our last issue,* it may be noted that with regard to the attention paid by the Greek artists to the point of view, there can be no doubt. The anecdote of the competition of Phidias and Alcamenes is well known. Two statues, by these two artists, were exposed to the public, *unpainted*, at the same time. The verdict was altogether in favour of Alcamenes. But on the next day, the statues were raised to their destined elevation above the observers. Then every voice was raised for Phidias. His rival was nowhere. We may observe this mode of treatment for ourselves, in the Elgin and Greco-Roman marbles at the British Museum. The thigh of one of the magnificent draped figures representing the Pates, who was seated in the pediment of the Parthenon, is altogether out of proportion as viewed by the spectator on the level. The head of an Apollo, which is dignity itself when viewed at a proper angle, recalls the account of the physiognomy of Titus Oates (whose mouth was said to occupy the centre of his face) as seen on the pillar where it is actually gibbeted in the gallery.

With regard to the art of Egypt, so much older, and so much more long-lived, than that of Greece, there is not the same reason for believing that the sculptors paid great regard to securing a fixed illumination. In their temples, indeed, the Egyptians knew how to take advantage of the effect of shadow, as they did also of the laws of perspective. They at times increased the apparent length of a vista, by the introduction of a false perspective, or an unnatural diminution of size, that gave the effect of increased distance. How far artificial illumination formed a part of their rites we are only partially aware. But in Egypt, shadow is so dense—mighty—palpable—that it cannot be played with as it can in Greece and in Italy, during the time when people can work in those countries. In the months when a vertical sun sheds a semi-tropical ray, no one *does* work there, or work, at least, in the heat of the day. The summer was the seed-time of Greek art. Then by shady stream, or dark cliff overhanging the blue sea and golden sand, as on the more public occasions of the great sacred games, the artist caught those glimpses of the unclothed form, in its natural grace of proportion and elegance of motion, which were reproduced in his finest works. Sculpture, in a country that has no summer, or has only what English people call a summer, must be a starved and stunted art.

But in Egypt, heat and shade are too decided either to allow of such instruction to the artist, or to teach him to deal with shadow as his great *organon*. Colossal magnitude was the grand means by which the Egyptian sculptors sought to affect the imagination. Shadow, indeed, there was, vast and pronounced, as that which the mighty figures of Memnon and his companion cast for furlongs over the sands. But it was a shadow like that of a rock; not like the dancing network of shade thrown by a forest. At the same time, in those magnificent portrait statues which, as portraits, vie even with the excellence of this branch of Roman art, while, as massive monuments, they are worthy of note even in the land of the Pyramids, we have the effect of the natural illumination under which men ordinarily live and move. The Egyptian artist has not enslaved shadow as his workman, but he has never, like modern workers, allowed it to distort and deface his work.

To the student of more recent art, the magical effects which Michelangelo knew how to produce by the disposal of shadow, will at once occur. It is the finest characteristic of his sculpture. It consists with the gloomy, grand, stormy, aspect of his mind. In the Medicean Chapel, the vast forms of day and night, of morning and evening twilight, seem almost spiritual and unsubstantial, from the well-directed shade. And to the central figure of the whole wonderful mausoleum, the seated form of Lorenzo de' Medici, the shadow of his helmet gives a ghastly life that seems to have stepped back from beyond the tomb.

In such a work as the Medicean Chapel, however, the sculptor disposed of the appliances of the architect. Thus in the brooding figure beneath the casque, we have more than sculptural shadow, we have pictorial shade. Something of the magic of aerial perspective is cast over the pensive face; and we seem not so much in the presence of a statue as of a ghost. Wonderfully powerful as is the effect, it is due to a combination of causes, in which, it is true, definite illumination holds the first rank. But the difference between those sharp shadows which define form, of which we have been speaking, and the diffused shade that obscures it, is marked. In the mouth of Mrs. Nightingale, in the monument by Roubiliac in Westminster Abbey, and again in that of the Newton, by the same sculptor, at Cambridge, the effect of a definite, contained, shadow is most remarkable. The study of these very different monuments brings into strong relief the difference between shadow and shade.

We have recently had occasion to remark how one of the main defects of a photographic portrait is the deep black stain, into which the shadow of the upper lip is converted, by the camera. It must be remarked that this is not the sculptor's shadow,—that cast within the parting of the lips,—which is, in itself, of extreme physiognomical importance, as defining that tell-tale trait, the outline of the lip itself. It is a shade thrown not by, but on, the lip, and tends not to intensify, but to obliterate expression. So marked is this unfortunate peculiarity of the portraiture effected by the camera (when reduction is employed) that in some of those shadowy half-defined figures, by which certain photographers, in this country and in America, have pretended to fonn the very features of the spirits of the departed, the black stain, which tells of light reflected from a solid body, and not of the nature of phosphorescent illumination, at once betrays the imposture.

In passing from shadow to shade, we pass from the province of sculpture to that of painting. We do not deny the command of either effect to the sculptor, any more than to the painter; but to each should he first assigned the mastery of his proper method. The shade, of which the sculptor avails himself, is that of nature. It is determined chiefly by locality; but the shadows by which he defines the sharpest and most delicate modulations of a relief or a statue, are the very characters of his art, and are due, in about equal proportions, to the true conditions of accentuation and illumination.

In shade, on the other hand, we approach the province of colour, and enter into a wide field of considerations that form an important chapter in the philosophy of art, but which are foreign to the art of the sculptor.

We referred to the shade cast by the cornices of the Parthenon, on the sculptured groups in the pediment. In dealing with shadow, as one of the main elements of the effect of architectural detail, the architect has to contend with the difficulty of the never-ceasing movement of

the sun. The Greek architect learned how to meet that difficulty. He so sunk and undercut the recessed members of his mouldings, that they caught a shadow at every angle of illumination, and brought out the delicate details of their workmanship, by deep lines of shade, ruled by the sun, from whichever direction his rays were incident. This is a very instructive and a very beautiful contrast to the mode in which shadow is dealt with by sculptors. In ever varying illumination, the architect gives deep hollows that must ever contain shade. The sculptor, for a fixed incidence of light, produces the most beautiful effects by delicate traits, that would escape the eye if the incidence were altered. Each artist deals with shadow as a most effective element of beauty; but each deals with it in the manner special and proper to his art.

"THE COMPLETION OF ST. PAUL'S."

THE October Number of *The Quarterly Review* contains an article under this head which will excite much anger. Written possibly by more than one hand, it includes truth and falsehood, justice and injustice. In abuse of modern English architects, it even outdoes a recent article in the same journal; and so, from the want of qualification and discrimination, overshoots its mark. In respect of the present system of art-manufacture and the destruction of individuality in the artist, the writer adopts the views we have set forth on several occasions. We may have occasion to return to the article, and in the meanwhile reprint its conclusion:—

"The Committee and the Dean and Chapter would be well advised to undertake first those works that would be most obvious and satisfactory to the greatest number, and at the same time most beneficial to the building; and if the exterior and interior are made properly approachable, and cleaned, and lighted, much will be gained for further operations. Then, secondly, the interior might be made suitable for the future work of the cathedral; and, thirdly, Wren's suggestions for the decoration of the dome and ceiling should respectfully be followed. The inlaid marble work is no affair of Wren's; it would be entirely inartistic, and worse than a waste of money. Were there no pilasters or 'Orders,' the plain walling might with propriety be decorated with a veneer of colour, a sort of large-patterned mosaic; but in St. Paul's the parti-coloured marble panels and pilasters would be a feeble imitation of the low-bred extravagance displayed by the more disreputable Papal families at Rome. At St. Peter's, the marble work and gilding impart a fuller idea of sumptuousness than Wren ever thought of for St. Paul's, and make the interior look like a splendid vestibule for a huge palace. It is not simple but imposing, and addresses itself to the low and worldly rather than to the more lofty and pure-minded portion of mankind. St. Paul's 'wants light' more than colour; and the effect of coloured marbles would be to damage rather than to glorify the church. Some slight panelling of colour might, perhaps, with great care be introduced; but the contrast between the piers and walling, and the rich but—emphatically—not heavy ceiling should be well maintained. The floor should be of marble; dark, to give solidity to the building, mixed with verd antique, that the cool colour may by contrast make the walls look warm, and highly polished to reflect the light. A building such as this requires different treatment from the choir at Chichester. The stained glass, home and foreign, at St. Paul's is of various qualities and styles, but all alike abominable, and should be promptly sold to any bidder. We would advise advertisements to speculating builders. This glass is another evidence of the absurdity of entrusting decorative work to distant manufacturers. The workmanship and material of Munich glass are excellent, but its principle is all erroneous, and its use entirely without appropriateness or artistic sense. We find stained glass used daily throughout England and the Continent, without the least regard for decency or fitness, till our churches have expressive rivals in the class of showily-dressed women, or disreputable-looking and bedizened scullery-maids. St. Paul's wants no stained glass; it has no 'storied windows.' The 'dim religious light' does very well as a poetic phrase, but it is nothing more. Windows were evidently *storied*, that in spite of all the 'richness' the light might not be dim. King's College Chapel is light enough, but, we apprehend, not therefore ireligious. Wren did not design St. Paul's for

* See p. 797, ante.

tained glass, and if Wren's intentions are to be regarded, then stained glass is out of the question. The building is entirely unsuited for it, and fit for the building. The present light is insufficient, and all that can be gained will not be more than enough. The walls are thick, and the piers large and obstructive, so that the windows are not obvious at a glance, but are only visible in small groups, or one by one. Thus there can be no general effect of colour from the windows in conjunction with ample light, as in a Gothic building like the Chapel at 'King's,' but only a very stupid observation, with no religion in it, and some isolated and entirely incongruous patches of colour. Great men are not always wise, and can afford to learn: let the Committee remember St. Michael's, Cornhill. The glass, then, should be white, as at St. Peter's, or very lightly flecked with colour, to neutralise the dirty tone of atmosphere and light; the glazing delicately fine, with narrow bars, but the panes of large, in order to avoid the drawing-room effect of modern churches of the Italian style. When all the childishness and fanciful profanity that assumes the name of 'Christian Art,' should be quite cleared away, and carefully excluded from the church. We need not spend our time upon 'Deum' puzzles, or make playthings of the emblems of the Passion, and then, like the Worcester's Chapel critic, become 'impressed' by them, or seriously play the fool with all the calendar. No man of any genius or power could degrade himself by taking any part in any 'eccelesiastical' imposture, or so deliberately ride with the childish public. That was not Giotto's way, nor Buonarroti's. Their art was certainly not 'eccelesiastical,' but manly, dignified, progressive, original, and true, and also appropriate to the 'Sistine' and 'Arena' chapels; there no stained glass obscures the necessary light, and there are no obtrusive 'Orders,' but the paintings are the decoration of the buildings. When we produce a Giotto or Massaccio, and have sufficient knowledge and artistic sense to lead him out, by all means let us seize him, shut him up in the cathedral, cut away all the 'Orders,' Wren notwithstanding, and let him glorify the building in a way not 'eccelesiastical,' but human and divine,—a way that Wren himself had no conception of. Such men may be, perhaps, found among us. They are really wanted, but not certainly until we have considerably got beyond the people who call tenth-rate 'architects' and decorators men of eminence, or who declare that the 'eccelesiastical element' is wanted at St. Paul's. It is remarkable that at its stage of architectural depravity we should be unable to supplement its weakness by any other art. The figure carvings at St. Paul's do not afford us hope; they are, in fact, a group of national 'ex-votos,' with all the hideous deformity and bad taste that are the special characteristics of such 'thankful' and 'memorial' displays; and of the paintings that were shown this year, the most attractive seemed to be those that exhibited the abject combination of man-millinery with knack and greed; but of the dignity and power of mind that indicate the artist, and would be worthy to adorn a Christian church, not the least evidence.

The duty of the Committee is certainly a difficult one. They have to satisfy the public, whose intense ignorance must be beguiled by some name with which they may have that familiarity which is a substitute for confidence, and they have unfortunately taken to voting, if course, there must be two parties, and those who are best informed will perhaps, when judgments differ, be most decided in their views and advocacy, so that the wavering balance of decision remains with the less instructed or determined men. We are stating now the rule without any reference to the actual fact in the present case. But we may ask the several members of the Committee whether they are each of them ready to undertake the responsibility of a decision; or, putting the question less *à bonhomie*, whether they are prepared to intrust to any other member? For, after this voting method, St. Paul's may at any time be at the mercy of some gentleman whose opinion on the subject in question may be entirely valueless. In such cases, the result is almost always a mixture; and then all handily admit that, though there is a public injury, it is done in the most excellent and equitable way, and that, after all, it is the principal thing. Trial by jury is the British nostrum, but the true specific is the judge, the learned and life-long practitioner of the law, and he directs the jury; he is not a mere copyist or transcriber of old forms, but has

personally practised long, a thorough working man, under the supervision of accomplished able men,—not *connoisseurs*, with anxious clients and astute attorneys, not a dull public or spasmodic clergy, looking on. So when the Dean tells us that 'we can judge' on Mr. Burges producing his designs, we must respectfully demur. There may be a decision, as is the manner of committees, anticipating or avoiding judgment; and this is headlong folly. But 'wisdom dwells with prudence to find out knowledge of skilful plans,' and the true method of such wisdom is not difficult to find. Let us listen to 'Socrates':— 'When the assembly meets to elect a physician or a shipwright, or any other craftsman (artist), will the rhetorician (cleric or *connoisseur*) be taken into counsel? Surely not. For at every election he ought to be chosen who has the greatest skill; and again when walls have to be built, for barbers or docks to be constructed, not the rhetorician, but the *master workman* will advise.* The Master of Balliol has not overlooked the value of the word *apricotisme*, 'master workman,'—not 'architects,' as we call our drawing-masters, who are not master workmen at all. So here we find that the Greeks, avoiding the rhetoricians (committee-men), went direct to the craftsmen whose work Mr. Burges has actually 'studied at Athens.' Let the St. Paul's Committee also go to the 'master workman,' and leave Mr. Burges to resume his studies at Athens.

Then, with reference to the qualifications of those entrusted with great public works, again let us hear 'Socrates':— 'Well, then, if you and I, Callicles, were engaged in the administration of political affairs, and were advising one another to undertake some public work, such as walls, docks, or temples of the largest size,—ought we not to examine ourselves, first, as to whether we know or do not know the art of building, and who taught us? Would not that be necessary, Callicles? Cal. (and the St. Paul's Committee). 'True.' Soc. 'In the second place, we should have to consider whether we have constructed any private house, either of our own or for our friends, and whether this building was a success or not. And if upon consideration we found that we had had good and eminent masters, and had been successful in building, not only with their assistance, but without them by our own unaided skill, in that case prudence would not dissuade us from proceeding to the construction of public works. But if we had no master to show, and no building, or many which were of no worth, then surely it would be ridiculous in us to attempt public works, or to advise one another to undertake them. Is not this true? Cal. (and the Committee of St. Paul's). 'Certainly.'†

One word more for ourselves: 'And now by the god of friendship, I must beg you, Callicles, not to jest, or to imagine that I am jesting, with you; for you will observe that we are arguing about the way of human life, and what can be more serious than this to a man that has any sense at all?'

DISTRICT SURVEYORS AND RUINOUS BUILDINGS.

At the meeting of the Metropolitan Board of Works held last week, a discussion ensued as to the fees allowed to district surveyors in respect of dangerous buildings.

Mr. Newton said, a widow in his parish called upon him and stated that she had been asked to pay 1l. 15s. in respect of two houses which were reported to be dangerous, and that by an expenditure of 12s. on each she had put those dangerous structures into a condition that was satisfactory to the officers of the Board. He gave this as her statement, without vouching for the correctness of it; but if this went on, the Board need not wonder that there were serious complaints of the extortionate claims for fees. He thought it should be referred to the Building Act or some other committee to see whether the matter should remain in the hands of the district surveyors.

Mr. Richardson is reported to have said he was not at all surprised at the remarks Mr. Newton had made, because there were many cases of the same kind, yet it was impossible to prevent them. When a surveyor examined premises to see whether they were dangerous, he charged 10s. 6d. for his visit, and if there were two houses together, he charged 10s. 6d.

for each house. There were instances of an examination being made of a coping where there were five houses together, and he had 10s. 6d. from each house, although there was only one visit. Then, if the parties did not immediately attend to the notice sent them that the structure was dangerous, fresh charges came upon them. The surveyor went to see whether the work was done, and there was another half-guinea. He had known cases in which, although the repair had not cost 5s., a man had been obliged to pay 35s. for fees, owing, in a great measure, to his own neglect. The smallest charge, he thought, was 15s. 6d., the charge of the surveyor, and 5s. for office expenses, although that 15s. 6d. might not cost the party 2s. 6d. in repairs. He did not know whether this arose from the Act of Parliament or from some bye-law of the Board.

The last speaker, if correctly reported, is in error in saying the district surveyor charges 10s. 6d. for a visit. He makes no charge at all in such cases,—has no control over the charge,—but simply accepts whatever fee the Metropolitan Board in each separate matter awards him. In most cases these prove far from remunerative. The district surveyors often spend much time in endeavours to induce owners to repair dangerous structures without invoking the interference of the Board, and nearly as often without effect. The widow's case mentioned by Mr. Newton by no means proves overcharge on the part of the Board. The amount of costs has no relation whatever to the extent of the work required to be done to protect the public. To obtain the removal of a dozen loose bricks, the fall of which would kill a man if he happened to be in the right place, might entail costs to the extent of say 30s. The fact that the bricks might be removed for 5s. would be no proof that the costs were excessive. The possible value of the man saved would have to be considered.

CHURCH ARCHITECTURE AT THE CHURCH CONGRESS.

DURING the recent Congress at Leeds an evening meeting in the Theatre of the Mechanics' Institution was devoted to the consideration of church architecture, when two papers were read. The first was by

Mr. G. G. Scott, jun., who dwelt chiefly on the desirability of building larger churches than are now generally erected:— 'The churches they built in their towns, he said, were founded too generally on the type of the Mediaeval village churches. They had the look of small designs done large, and there seemed to be a want of dignity even where the scale would admit of it. Several causes contributed to bring about this unsatisfactory state of things. The smallness of their ancient churches was due, no doubt, to the fact that in the large towns there was, if not a cathedral, some great monastic church, to which the small churches were practically chapels of ease. Thus the smallness of their churches was due to tradition. He could not but think, although it was almost heresy to say so, that subdivision of parishes had been carried too far. They had pushed the parochial system to extremes. Everywhere they saw little churches, little parsonages, and little schools, where, to meet the wants of the day, large churches and numerous clergy were required. He did not think that among the causes of the present poor character of our churches was niggardliness. There was plenty of generosity, but it should be borne in mind that a district possessing many thousand souls needed corresponding adjustment. If a church was viewed as God's house, and was erected for a high purpose, it never failed to meet with support. It was bad policy to content themselves with such small buildings as they were now in the habit of erecting. If the object was to provide private places, where respectable people might pay their Sunday tribute to propriety, well and good; but he maintained that such a building partook of the character of a semi-detached villa. If the poor and the artisans of our land were to be considered they would provide a totally different kind of building. Men and women of different classes of society would never meet in any church which lacked accommodation or plenty of elbow-room. In foreign churches the poor and rich worshipped together, simply because the buildings were large enough. It was only in large buildings that persons of all classes could be brought together with mutual satisfaction. Small churches would always be monopolised by the respectable classes. In

* Plato: 'Gorgias,' p. 455 B.

† Ibid., p. 514 A—D.

foreign churches this monopoly did not exist. The churches there were essentially public places of worship, and until this feeling extended to our own churches our national churches would never be the churches of the nation. He was not asking for the erection of grand and stately buildings of Medieval architecture, but that their churches should be on the scale of their factories, town-halls, and railway stations. He believed they would have no difficulty in erecting churches imposing from their size alone. A large parish, with a large church and a numerous staff of clergy, fed by mission chapels, would be far more efficient than the present system. It should specially be kept in view that the interior of a church was of more importance than the exterior. The exterior was sure to give a certain dignity from its dimensions. The Roman Catholic Cathedral at Birmingham was a building in point, harmonising and yet contrasting with the surrounding buildings. It was essential that they should economise in the erection of their churches. This could be done to a great extent by having little street frontage, a plan pursued very generally in erecting Italian churches. In other cases the tower of the church might stand to the street front, with the church behind; and by this plan funds otherwise spent in acquiring an available street frontage could be used for purposes of general dimensions. They should not, in the planning of their churches, blindly follow Medieval precedents, but consider their own requirements. The whole area of nave, transepts, aisles, and chantry chapels filled with pews, presented to his mind a most unsatisfactory effect. Their wants were not the same as their forefathers'. They must look less to the form and more to the principles, and not produce buildings which might have been built for the Middle Ages, but which the builders of the Middle Ages might have built for the present day. What they needed was large space, where all might see and hear when in the church. Whilst on the subject of plan, he might observe that the chancel arches might be dispensed with, and it would be better to fence off the choir with screens.

Mr. J. P. Seddon, in the course of a paper read by him, said:—The standpoint that we have attained is, a fair acquaintance with the spirit of Gothic, as well as a tolerable familiarity with its details; we have, in fact, learned to read and spell in it; and the question now is, how, as authors, we ought to say that which is to be said in each particular case. Hitherto, it must be owned, we have been too much of copyists after the Chinese fashion, imitating even flaws. Our models having become reduced to mere empty shells, shorn of furniture and decoration, we have taken their poverty for purity, and their bareness for purposed design. If we would sum up what has been effected, allowing for exceptions, we have built a multitude of churches, the vast majority of which would be best described in the language of passports, as having naves ordinary, aisles ordinary, chancels ordinary, towers and spires most ordinary, and so on. We reckon up the capitals carved after every plant in the hedge-rows, the windows dyed with all the tints both in and out of the rainbow, the marble shafts to pulpits and fonts, and the number of yards of encaustic pavement, as if a collection of things indifferent could make a satisfactory whole. Perhaps till we learn to measure art by merit, and not by superficies, it is as well that our church interiors have bare walls and some plain glazing left. But it is sad to reflect that these many years of church building and restoration have done so little towards raising up a school of decorative artists, that art-workmen generally are a myth, and that an expenditure of millions has not given us as many works of real high art in our churches as might be counted on one's fingers. Now that funds are forthcoming for the decoration of St. Paul's Cathedral, a difficulty arises in finding hands to execute it, since our many able painters have, from sheer want of encouragement, devoted all their energies to another branch of their art, which seems absolutely to snuff them for this. It would, in speaking thus, be unjust not to mention the isolated examples of artists of high eminence who have lent their great talents to this decorative work with more or less success,—such as Mr. L'Estrange and Mr. Gambier Parry for the roof of Ely Cathedral; Dante Gabriel Rossetti for the reredos of Llandaff Cathedral; and in connexion with E. Burne Jones and Ford Madox Brown, on the able glass paintings of the firm of Messrs. Morris, Marshall, & Co., Mr. Leighton at Lyndhurst Church, and Messrs.

Watts and Cave Thomas, &c., elsewhere. Turning now as I must to the few experiments my limited opportunities have afforded me to put principles into practice, with painful consciousness of their openness to criticism, I proceed to explain what those principles are. In the first place, much greater scale than usual seems needed for churches in large towns. It would be cheaper to build a few of noble size than many inferior ones, and the former would be far more impressive. If churches are to maintain dignity as compared with secular buildings, they want greater height, having to stand amid many-storied houses. As to area, too, they are now very much pinched, and the sight of a congregation issuing in rain, donning cloaks and unfurling umbrellas while hustled in a crowd, is ignominious. What it would be in case of fire may be conceived. Ample space in the approach, as common in German churches, would be both a useful and dignified addition. Within doors it would be well that there should be room, beyond what is occupied for seats and necessary for passages. Vestries for clergy and choir should not be mere closets; and if at the western end, instead of, as usual, at the east, a more direct and wider processional path would be obtained. A different arrangement of plan, consequent upon change of ritual, seems desirable in town and large churches, though, perhaps, for small country ones there is no such need. The division into nave and aisles has lost its original use and significance, and the columns it entails cause inconvenience to many in a large congregation. The desirability that as many as possible should see the single altar, and that all should hear both service and sermon, calls for altered treatment of the body of such churches. I assume that the entire accommodation is on the ground floor; for, although galleries could be treated, as in many German churches, with excellent architectural effect, they are quite inadmissible, as opposed to the proper ideal of Anglican worship. There are, however, limits to the size of the single unobstructed hall that would best meet the demand. Its width calls for corresponding height, for the sake of proportion. This is a desideratum to towns, but costly, and, as economy has usually to be studied, it would necessitate sacrifice of other features and in character of material. Brick, however, may well be used for stone and ornament eschewed to gain that effect which scale alone can achieve. One rule of the Incorporated Church Building Society, which restricts the width of naves to about 24 ft., would have to be honoured rather in the breach than in the observance. It has recently been waived at my application. Modern science and appliances may well be called upon to do what has been done before, and precedents, if needed, are not far to seek.

I can only touch further upon a few points connected with the treatment of such buildings as instances in which the last suggestion may be carried out. Instead of making nave and chancel separate, and each too short for effect, one continuous roof covering both is preferable, and the very considerable sum that the arch and wall of division would cost would be far more effectively spent upon an open screen, which might bear paintings, such as render many ancient ones in Norfolk rich treasures of art. Towers and spires,—weaknesses of the age, without which no committee would think the most ordinary class of church complete,—were better omitted, unless worthier far than scores or so of the numbers that have been erected, and to compass which most modern churches have been starved in other respects. Built usually as mere ornaments, irrespective of bells, a good peal of which would rock one-half into mists, they hardly rise above the adjoining roofs, and do not generally even clear the structure to which they are attached, so as, like old ones, to send forth, all around, the music of their bells. Let us have towers and spires, too, when they can be really fine ones, and well furnished with good bells; otherwise, let us be content with more modest turrets, the best of their respective kinds. Within the walls, in place of profusion of indifferent ornaments, let each church be the shrine of some one jewel of art, at least, that it might thus be worth the pilgrimage of those who now must seek such abroad,—not that churches should be turned into mere picture-galleries or museums. I wish that they were made less so than they are by the enterprising so-called art-manufacturers of the day; but they were once the Bibles of the poor, and their influence as such was great. It is a mistake to think that this office of theirs has

been superseded, although we have now the written Scriptures in every hand. The church should make use of all means of driving home to the hearts of men the great truths it is commissioned to preach, and in art it might still find a most able assistant. But the art I mean is not the architectural millinery which is now too often made to stand duty as for such. To be plain, the general conception of church decoration of the present day is an erroneous one; and we have often reason to be thankful for the prudery which makes it a sin to look at it when we are assembled for prayers, and for the heedlessness which prevents our doing so afterwards. Scant minutes only are fortunately allowed adventurous strangers, at the close of service, to peep through the chancel screen, if there be no distinction in design between the finery of tiles in the reredos and on the floor, and if it be but the gloss of mosaic that has been substituted for the former. The decoration of the church should be other than we usually find it. If its children ask for artistic bread, it is hard to give them fantastic diagrams of coloured stone instead. A better intellectual feast is needed than a bizarre medley of coloured bricks, or even a few panels of carving with figures of the size and with the expression of dolls, and smothered amid crocketed canopies, supported on twisted columns, and studded with agate balls. If our church-doors were not shut out of service time, what valuable aids to education might not their walls be made! We blame the poor for dulness of apprehension, but do little to enlighten them. Our own houses are closed to them, and the art provided for their cottages is but pet dogs and bad lithographs. Suppose, however, our churches were common withdrawing-rooms, stored with works of sacred art, leaving the secular to grace museums, such might be studied as pictures now are without the distraction caused by other objects competing with them for attention, and in peace and quietness. Surely here is an element of influence well worth cultivation. Donors would be more ready to give, and more careful as to what they gave, if they thought that their gifts would be looked at with other than sidelong repented glances. A higher style of art would be encouraged than the *tableaux d'genre* which artists are now doomed to paint since private houses alone receive their works. Art would be appreciated more than now when it can only be seen in monster collections, where the gilt frames jostle each other, and spectators are dazzled by the crowd of incongruous objects and people would find out that it had a tale to tell, and that that should be both worth telling and worthily told the church could and should ensure.

NEW SCHOOL BUILDINGS IN HOLBORN.

A SPACIOUS block of school buildings has just been erected close to Red Lion-square, Holborn, which are in connexion with the intended new church of St. John the Evangelist, about to be built in the immediate neighbourhood. The new schools, which will be completed and opened about a fortnight, are situated at the corner of Kingsgate-street and Fisher-street, close to Kingsgate-street Baptist Chapel, with entrances from each of the two streets named. The Kingsgate-street frontage is 72 ft. in length, and the depth into Fisher-street is about 40 ft. The height of the building from the street-level to the cornice is 48 ft., the roof being carried up to an additional height of 14 ft., and over the roof there is a belfry. The structure is built of yellow stock brick, with red brick and stone dressings. The brick bands being carried along the building at the bottom of the first and second story windows. The ground-floor and first story in Kingsgate-street have very lofty windows, three of those in each of the stories being double, whilst those at the south end are triplets. The windows in the Fisher-street frontage are similar in form. The second-story windows are also double and triplet, but oblong in form. The building contains three spacious school-rooms, with two class-rooms to each. They are 15 ft. in height, and including the class-rooms, 68 ft. in length, and about 36 ft. in width. The ground-floor is intended for an infants' school, and the first and second floors for girls and boys respectively. The estimated cost of the schools is a little more than 4,000l., which has in part been supplied through a Government grant, the remaining portion having been raised by subscription. Messrs. Young & Tasker, of Furnival's Inn, are the architects, and Messrs. Henning & Son, of Chiswick, the contractors.

THE DAVY MONUMENT.

A MEMORIAL of Sir Humphry Davy, erected in Penzance, opposite the Post and Telegraph offices, has been unveiled by the mayor. The pedestal rests on a base of unwrought granite, 10 ft. square, consisting of four blocks, each weighing over 8 tons. The pedestal itself is of blue Lamorna granite. The shaft consists of one block, 8 ft. square, 2 ft. 4 in. high, and weighs over 11 tons. The plinth is of one block, 5 ft. 4 in. square, 2 ft. 4 in. high, and weighs 5 tons. On it is placed the disc, one stone, 4 ft. square, 1 ft. high, in the centre of the front face of which the name of the great Cornishman, Davy, is cut in relief. This is surmounted by the cornice, formed of one stone, 5 ft. 6 in. square, 1 in. thick. The mouldings of the cornice are finely cut, and show the capabilities of the Cornish granite to receive delicate work. On the cornice rest six blocks to receive the figure. The weight of the base and pedestal is about 60 tons. The statue of Davy is well executed. One of his most useful works of his valuable life is embodied by a model of the safety-lamp, which he holds in his right hand. The figure is 8 ft. 6 in. high.

The erection of this monument is mainly due to the energy and perseverance of some working men of Penzance, conspicuous amongst whom is Mr. John May, who for many years has devoted himself to its accomplishment.

The sculptors are Messrs. W. & T. Davids, of London; the contractors, Messrs. Freeman & Co., of Penzance and Penryn; and the architects, Messrs. Tronson & Son, of Penzance.

THE CORNWALL MINERAL RAILWAY.

SIR SAMUEL MORTON PERO, the contractor for the Cornwall Mineral Railway, is giving employment to several hundreds of artisans, and last week he advertised for an additional number. It appears that there is now great activity on this and other mineral railway works now in progress in Cornwall, and that for the next eighteen months there will be constant employment for a large number of artisans on twenty-seven miles of new work, and twenty miles of building on the Cornwall Mineral Railways, the principal works on which are now in hand. The construction of the Lidford section of the Devon and Cornwall Railway works is one of the works in progress.

CAMBRIDGE HALL, SOUTHPORT.

The foundation-stone of the new building to be erected at Cambridge Hall has been laid by the Princess Mary of Cambridge, who was accompanied by her husband, the Prince of Teck. The new structure is in immediate continuity with the old town-hall, and will when completed, add materially to the convenience of the town and corporation. The design was submitted to public competition, and the prize of fifty guineas was ultimately awarded to Messrs. Maxwell & Clarke. In an architectural point of view the building, according to the design chosen, will be treated in the Free Italian style, but it is intended to subject the drawing which has been in circulation to considerable alteration. One-half of the ground-floor will be devoted to a new post-office. The remainder of the lower story will consist of two large dining-rooms and various retiring apartments. Upstairs will be the new assembly-room, designed to accommodate 1,500 people, and to supply a want which has long been felt in this fashionable place of resort. Externally the structure is to have a colonnaded front, and over that a balcony ranging along the entire extent of a carriage-porch beneath. The present assembly-room is only capable of accommodating from 500 to 600 people, and the advantages of the new hall, of more extensive proportions, combined with increased post-office accommodation, are recognised in Southport as matter of public congratulation. The estimated cost of the building is £40,000.

After the laying of the foundation stone, a banquet was given at the townhall.

In the mayor's address to the Princess and Princess, at the laying of the stone, he said, in reference to Southport,—"The pier they would see that day was open to the public, and was built at a cost of from 40,000l. to 50,000l. They were now extending the promenade, so that there

should be a carriage-way which could not be excelled in any other part of the kingdom. They had an asphalted drive reaching for nearly eight miles in the borough and in Birkdale. The improvements in the town had also been extended; they had new boulevards and other works which would enhance the beauty of the place, and they hoped would increase the number of people who came to enjoy the salubrious air of this healthy part of Lancashire. They had a park second to none in the country, extending over thirty acres, which was presented to them by their worthy rector. A system of tramways was about to be laid down at a cost of about 20,000l. The gas-works were about to be removed two miles from the town, so that they might have neither smoke, smell, nor anything which could annoy any one. In the midst of all this their town was prospering. Last, but not least, it was proposed to form a winter garden for the aged and invalid, at a cost of some 50,000l., and nothing smaller than the Crystal Palace would approach it. There was excellent accommodation for travellers, and excellent accommodation in the shape of churches and chapels. Southport is evidently moving.

OPENING ST. PAUL'S CHURCHYARD.

ACCORDING to the daily papers it is now arranged that the dwarf wall of stone which surrounds the cathedral facing Ludgate-hill, with the iron railings with which it is crowned, shall be removed as far as the north-west and south-west corners of the fabric itself, and that the entire area or courtyard, in the centre of which stands the statue of Queen Anne, shall be thrown open to the bottom of the steps which lead up to the great western door. These steps will be newly faced or cased, and nearly on the lowest step will be an iron railing, which will not be seen at all by day, but will be raised up at night, fall by machinery somewhat analogous to that now used for raising iron window-shutters from below. This change has been conclusively arranged in consideration of a money payment from the City to the Cathedral body. We hope this statement is correct. When the matter was discussed by the late Dean and a committee of advice from the Royal Institute of Architects, the boundary talked of was a little west of the statue. We have our fears about the winding-up machinery; but the arrangement is in perfectly good hands, and will doubtless come right.

EFFECT OF LIGHT ON GLASS.

THAT the colour of glass is affected by long exposure to light is well known: the violet tinge which the window-panes in some of the older houses in London have assumed has been often commented on.

At the last meeting of the British Association, Mr. Gaffield, an American, brought forward the results of a long course of experiments extending over a period of nine years, and embracing eighty different kinds of glass, of English, American, French, Belgian, and German manufacture, of rough and polished plate, crown, and sheet window-glass, of flint and crown optical glass, of coloured pot-metal, and of flashed and stained glass of various colours. The changes in the colourless glass were from white to yellow, from a greenish colour to a yellowish green, from brownish yellow to purple, from greenish white to bluish white, and from bluish white to a darker blue. By the colours of colourless glass was meant those faint tinges of colour that were seen by looking through the edges of the glass. In his first experiments of a few months, Mr. Gaffield found only a slight change in a specimen of purple pot-metal. A subsequent experiment, continued for five years with red, yellow, blue, and purple glass, produced no change in any pot-metal except purple. A change was observed in the colourless body of some of the flashed and stained specimens; a yellow or purple tint was produced when the colourless body was uppermost, and also when the coloured surface met the sun's rays, and transmitted them at different degrees to the colourless body beneath. Among the changes that took place, glass of an amber colour became of a rose tint. As glass of this latter kind was used in the painted glass windows of the past ages, this series of experiments may be considered as an important aid in solving the question of the alleged superiority of the old cathedral window glass, which it is not impro-

vable has been much modified in respect of tint by the sun acting on it for centuries. A curious fact was mentioned in connexion with this discoloration of glass, namely, that no matter how deeply it became stained or discoloured by light, it can be restored to its original colour by being exposed to the heat of the glass-stainer's kiln for a short time. The cause of the change is thought to be found in the peroxide of manganese, long used as an ingredient in glass-making.

RAMSGATE.

THE sewerage of this favourite watering-place is now being actively pushed forward, with the view of having the whole town sewered before the influx of visitors next year. The storm waters are being carried by a separate system into a tunnel, 5 ft. 9 in. diameter, the outfall of which is under the West Cliff. This separation has been adopted to prevent the recurrence of the inundation which took place last July, when the main streets of the town were 1 ft. deep in water. A new sea-wall, for the protection of the West Cliff promenade, is nearly completed. These works are being carried out by Mr. E. Ellice-Clark.

BELFAST ARCHITECTURAL ASSOCIATION.

ON the 14th inst., a meeting was held in Messrs. Young & Mackenzie's office, Calender-street, for the purpose of forming an architectural association for Belfast. Mr. John Lanyon, architect, occupied the chair. There was a large attendance of those connected with the profession.

Resolutions were unanimously passed approving of the formation of such a society, and a committee was appointed, with Mr. R. Young, jun., as secretary, for the purpose of framing a set of rules and arranging for future meetings.

Much interest was evinced by those present in the objects of the association.

SCHOOL BOARDS.

Ipswich.—The Wherstead-road School Committee reported as follows:—"The committee having conferred with Mr. Butterworth, the architect, recommended that the tender of Messrs. Gibbons be accepted for the erection of schools in the Wherstead-road; that the contract be prepared by Mr. Butterworth; and that six months from the date of the notification of the acceptance of the tender be allowed to the builders, subject to an extension of time if the architect certifies that the delay is caused by weather; and that the plans and specifications be returned to the department with form No. 7 filled up for their confirmation." Considerable conversation followed, from which it appeared that Messrs. Gibbons had originally asked nine months for the completion of the building, and on being told that the Board considered it too long, urged that possibly the frost might prevent their working, and being under a penalty of 10l. for every week over the time allowed, they could not reduce the time. To meet this objection Mr. Butterworth, the architect, had drawn out a weather clause to insert in the contract. It provided that the walls should be finished in three months, the roof on in four months, and the buildings ready for occupation in six months, and that in the event of the work being delayed by inclement weather or frost, an extension of time should be granted. At the suggestion of Mr. Westhorpe, a provision was added that the architect should be the judge of whether or not the inclemency of the weather was sufficient to delay the work. Mr. Christopher Gibbons attended, and expressed on behalf of his firm, his assent to the reduction of the time upon the insertion of the proposed weather clause; and also his assent to a similar provision with regard to the Argyle-street schools, as to which the committee reported as follows:—"The committee, having conferred with Mr. Eytton, the architect, recommended that the tender of Messrs. Gibbons & Co. for the erection of the Argyle schools, for the sum of 2,305l. he accepted, and that the contract be prepared by Mr. Eytton, and that six months from the date of the notification of the acceptance of the tender he allowed to the builders, subject to the same clause in regard to weather as in the Wherstead-road schools." The reports were each received and adopted.

The Chairman raised the question of the desirability of appointing a clerk of the works, as the Board would be building several schools, but at the suggestion of the Vice-Chairman the subject was deferred.

Nottingham.—A letter was read from the Education Department, by which the Department returned the plans for the alteration in the Bath-street schools. The Department considered that the arrangements in the boys' school were still unsatisfactory with regard to the desk and bench space. The document also stated that it would be desirable that the entrance to the school should be through the playground, and that the galleries and class-rooms should be placed at right angles with the windows. Messrs. Evans & Jelly, the architects, having been communicated with, wrote a letter to the effect that any further alterations would be injurious, and that an entrance to the playground would make it too much of a thoroughfare. The appearance of the building was improved by the present front.—Mr. Peret said the architects might have referred to the fact that it was not desirable to have an unnecessary expenditure of money.—Mr. Bentley said it was of very little use being careful over sixpence if you intended to spend 10,000. at last.

Gateshead.—The tenders for the erection of the Prior-street schools had been received, there being twelve contractors for the whole work, and twenty-one contractors for separate portions of the work, the amounts ranging from 7,000. to 8,900. The sub-committee had considered the whole of the tenders, and recommended that the tender of Mr. John Harrison for 7,000. be accepted. Mr. J. M. Redmayne moved that the committee's report be adopted, that the clerk apply to the Education Department to sanction it, and that steps be taken for the purpose of raising the money required.—The Chairman stated the entire cost would be 10,000., and in answer to Mr. Franco, said the last-mentioned sum would include the price of the land. The motion was unanimously carried.

Brierley Hill.—At an adjourned meeting of the Kingswinford School Board, the plans of Mr. Smith, of Stourbridge, architect, were chosen for the School Board school to be erected at Brierley Hill. Fifteen architects from various parts of the country submitted plans.

THE ANT NUISANCE.

Sir,—There is no remedy for the black ant, that I know of, at all comparable with powdered borax. I have often used this in America, where these insects are much more numerous and troublesome than in England, and they literally have always vanished. Once I have recommended it in England, and the result has been the same. ALFRED RIMMER.

TAKING UP my last week's *Builder*, I find your inquiry respecting the getting rid of that disagreeable pest, the black ant, and having succeeded myself, would advise you simply to shake down a dusting of "chloride of lime," near and about the runs of the insect. This you will find will obtain for you the desired result.

M. M.

THE "ANGEL" IMPROVEMENTS, CLERKENWELL.

THE scheme propounded by the Clerkenwell Vestry to enlarge the area at the "Angel" by removing the shops at the south corner of Goswell and City roads, which form a kind of neck to the City-road, and the whole cost to be paid out of the general rates, has virtually got the go-by from the Metropolitan Board of Works, who promise to take it along with a host of other mushroom schemes into consideration next July. The meaning of the resolution adopted by the Board is simply that the subject is shelved until Clerkenwell can undertake to pay half the cost, and then probably the superior Board will be prepared to treat with them, as the gain is wholly on one side. It would be a very desirable thing to widen the thoroughfare at that particular point, as both goods and passenger traffic are daily increasing, owing mainly to the rapid growth of Islington; but the difficulty is by no means insuperable, for if the tramway-cars and omnibuses be ordered to draw up beyond the narrow neck of road which does not extend more than 25 ft., no inconvenience will be felt, as the road suddenly widens, and is equal to all the traffic that passes during the day. The sewer-

committee of the Board of Works concurred in the opinion that a wider thoroughfare at that particular point was desirable; but it was so limited in extent, and the benefits to be derived from it being specially confined to one parish, they could not see their way to recommend it to be included in the list of metropolitan improvements. The vestry of Clerkenwell opposed the improvement, as being a metropolitan one, and refused to contribute towards it if adopted on payment of half the cost, on the ground that by the judicious arrangements of the two parishes the passenger traffic could be so diverted as to prevent delay in the transit of goods. Additional space will be given at that point by the removal of the Angel column clock in the course of next week, the vestry of Clerkenwell having ordered that it be taken away forthwith, so that every available inch of ground may be devoted to traffic. It may be urged, however, that the clock is a refuge in the midst of a crowded thoroughfare.

INCREASE OF HOUSES IN SOUTH LONDON.

AN official return which has just been issued, and already referred to by us, shows the immense expansion of the several metropolitan parishes, as indicated by the great increase of inhabited houses, during the last twenty years, or since the formation of the Metropolitan Board of Works in 1861. In no part of the metropolis has the increase of houses more strikingly manifested itself than in some of the districts south of the Thames. The increase in the number of dwellings in Wandsworth during the period in question amounts to no less than 130.55 per cent., the present number of houses in that parish, as shown by the return, being 19,091. According to the same return Camberwell had 17,755 houses at the end of the last official year in 1871, or an increase of 88.63 per cent.; Lambeth, 29,123 houses, or 42.43 per cent. increase; Bermondsey, 10,624 houses, or 51.61 per cent. increase; Rotherhithe, 3,934 houses, or 40.90 per cent.; and Newington, 12,545 houses, or 18.32 per cent. increase. It will thus be seen that during the two decades Wandsworth has more than doubled the number of its inhabited houses, and that the dwellings in Camberwell have increased in number almost to the same extent. It is not a little remarkable that within the same period the houses have decreased in some of the parishes in the district, notably in St. Olave's, in which the houses are reduced to 1,761 in number, showing a decrease of 33.79 per cent.; St. Saviour's also shows a decrease amounting to 23.75 per cent., the number of houses in the parish being 3,716 only; whilst in Southwark, which has now 6,903 houses, there has been a slight falling off, the decrease being 1.01 per cent. Amongst the causes which have contributed to this decrease in the three last-named parishes, the probability is that the absorption of dwellings by the railway companies may be regarded as one.

HORTON LANE CHAPEL, BRADFORD.

THIS building has been closed for three months, to allow of a thorough cleansing and decoration. The work is now finished. The walls have been painted in a quiet maize, the pilasters and finishings of the windows in stone colour, relieved by maroon bands. The columns supporting the arched ceiling are in green bronze, with gold introduced in the ornaments. The great cornice which runs round the building at the springing of the ceiling arch has been treated in cream colour, with ornamental panels between the carved trusses in gold colour, and the broad groundwork of the frieze in maroon. The arched ceiling is divided into panels, with centre decorations in each; the stiles or divisions between the panels in cream colour, and the panels themselves in French grey. At the intersections of the ribs of the ceilings are large pendants, which are brought out in maroon and gold. The gallery front is panelled, and filled with iron ornamental work, brought out and gilded. The windows all round the chapel, both on the ground and gallery floors, have margins in red coloured glass, with a white scroll pattern cut upon them. The general woodwork throughout preserves the natural colour of the wood, and is varnished. The organ is in the centre of the chapel, in a large recess behind the pulpit, with pilasters at the sides and angles. The pipes have been diapered in gold and maroon

upon a bronze-colour ground, and the woodwork relieved by maroon and gold. Considerable additions have been made in the heating power of the chapel, so as to bring it entirely under control, and preserve an equal temperature in all seasons.

The decoration has been carried out by Mr. Haley, under the direction of Messrs. Lockwood & Mawson, the architects of the building.

THE CHALLENGE. PRIZE OF THE NATIONAL MUSICAL UNION.

THE challenge-prize of the National Musical Union, value 1,000l., is now being manufactured by Messrs. Cox & Sons, of Southampton-street, Strand, who are making rapid progress with the work. The design was selected in open competition by Sir M. D. Wyatt and Professor E. J. Poynter, A.R.A., who acted as judges, and is by Mr. S. J. Nicholl, architect. It comprises a loving-cup, with a cover, resting on a platform and pedestal; the whole of silver-gilt, enriched with enamels, engravings, repoussé-work, pierced and flageooc work; a very important part of the decoration being shields suspended in an open arcade, and fixed in panels, to bear the devices and title of the successful societies, the society holding the cup having the place of honour in the crowning wreath. The pedestal has canopied niches, with statues of Guido Arefino, Palestrina, Handel, and Mozart; the base being 18 in. square; the whole rising to over 3 ft. in height. The design is of Medieval character. The following are the

INSCRIPTIONS:—

"Blest pair of sirens, pledges of heaven's joy,
Sphere-born, harmonious sisters,—Voice and Verse;
Wed your divine sounds, and mix'd powers employ;
Dead things, with unbreathed sense, able to pierce."
"Praise God in His holiness; praise Him in the firmament
of His power;
Praise Him in the sound of the trumpet;
Praise Him upon the lute and harp;
Praise Him in the symbols and dances; praise Him
upon the strings and pipes;
Let everything that hath breath praise the Lord."

HINDOO TEMPLE IN LONDON.

Sir,—I was much interested at observing amongst your miscellanea, at p. 813, a note to the effect that subscriptions are being taken up at Bombay, for the purpose of erecting a Hindoo temple in London. At first sight, this information will doubtless appear startling to many, yet upon second thoughts, when we remember that the natives of India are our fellow-subjects, and that in accordance with the spirit of toleration which allows Christian churches to be erected in Hindustan, it is only fair that Hindoo temples may be erected in Britain. I trust the intended temple will soon be a reality; and when such is the case, it is possible that the present popular ideas about the religion and worship of our Indian brethren will be considerably modified. W. P. BUCHANAN.

A CHIMNEY-PIECE.

IN designing the chimney-piece illustrated in the present number the desire of the architect was to harmonise the various coloured marbles used with the woodwork, so as to produce a rich effect. The chimney-piece is chiefly composed of Spanish Brocatello, with plinth and sunk panels of black and gold, the moulded bases being of green marble. The festoons, cartouches, and armorial bearings (the latter emblazoned) are white marble.

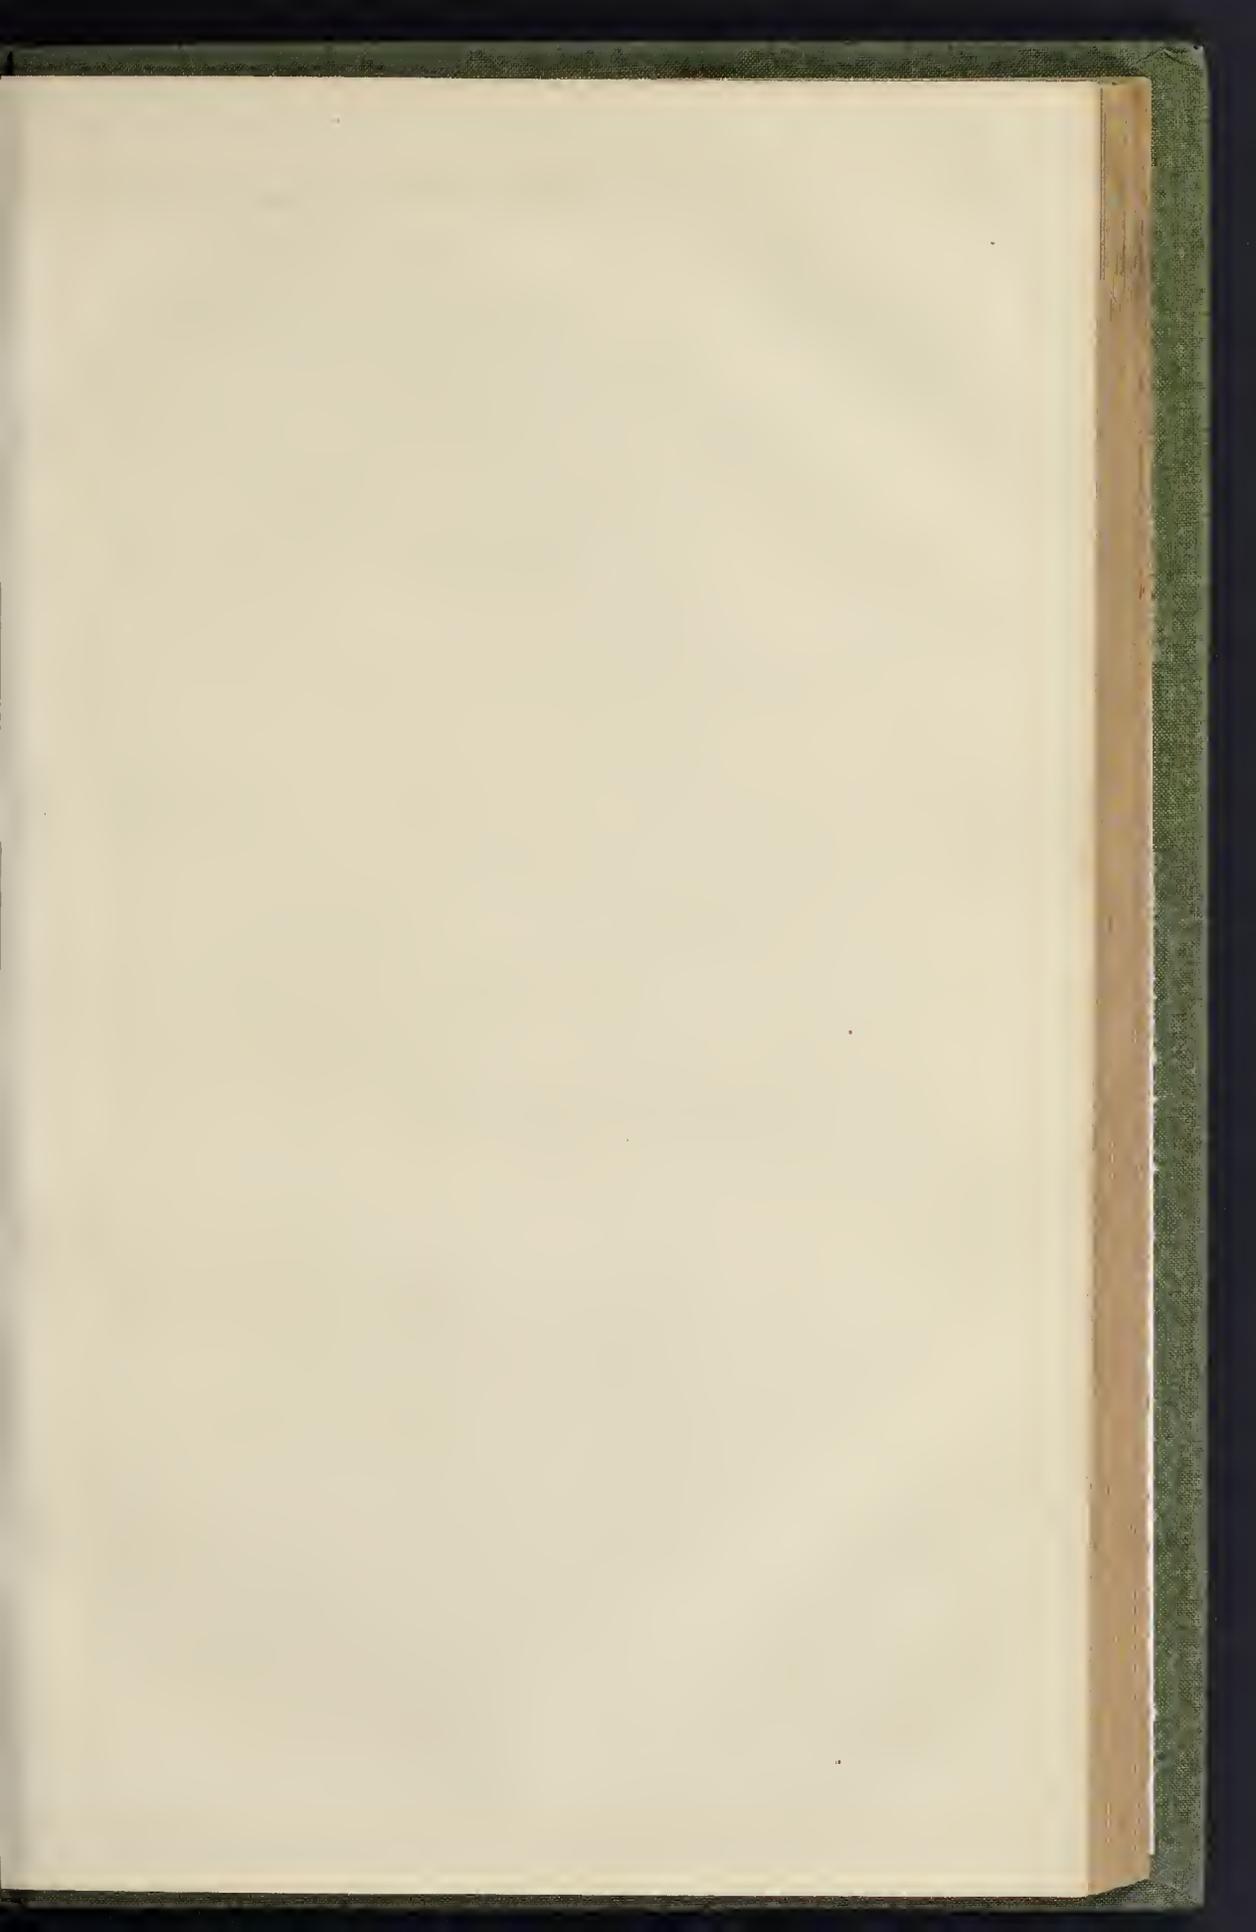

The fluted portions of the columns are griotte, the upper half being Sienna, and the astragal between of white marble. The capitals, of statuary, are in high relief, and support an entablature of diagonal projection. The latter, with the pediment, lunette, and frame at the back of the columns is mainly of camphor-wood, relieved by darker woods and marble bosses. The baserelief in lunette ("Summer") has a gilt background; other parts of the woodwork are gilded.

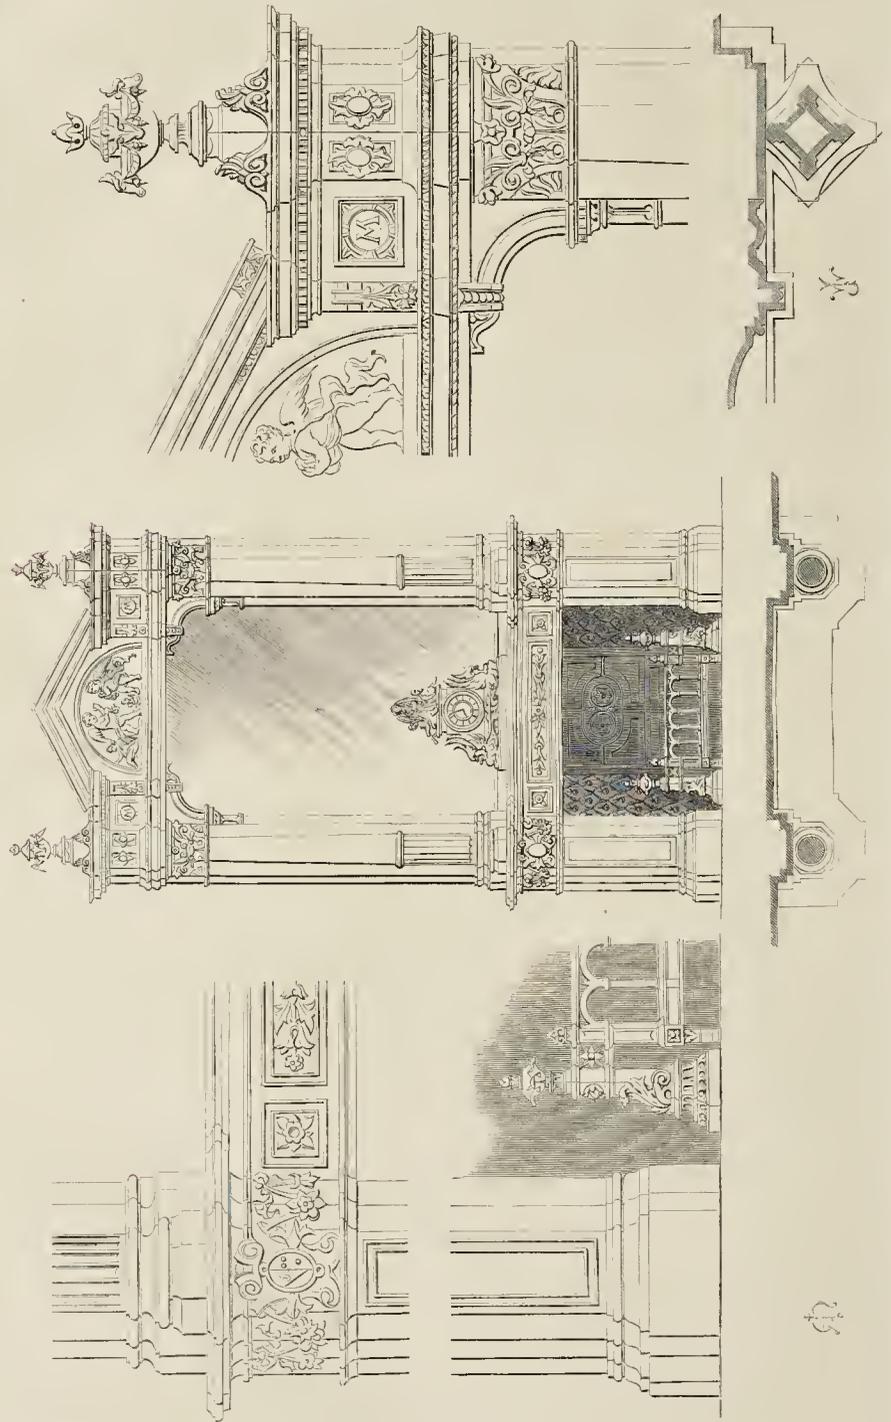

A black and gold marble fender, not shown in the engraving, encloses a heartily laid with encaustic tiles, which, like those on the splayed jambs, are from special designs. The hand-irons are electro-bronze enriched with ormolu.

The fire-basket, a combination of cast and wrought iron, is constructed to insure strength and durability. The cast-iron back has suitable fire-tiles below. The ash-pan, made to run on noiseless wheels and easily removed, forms a desirable feature.

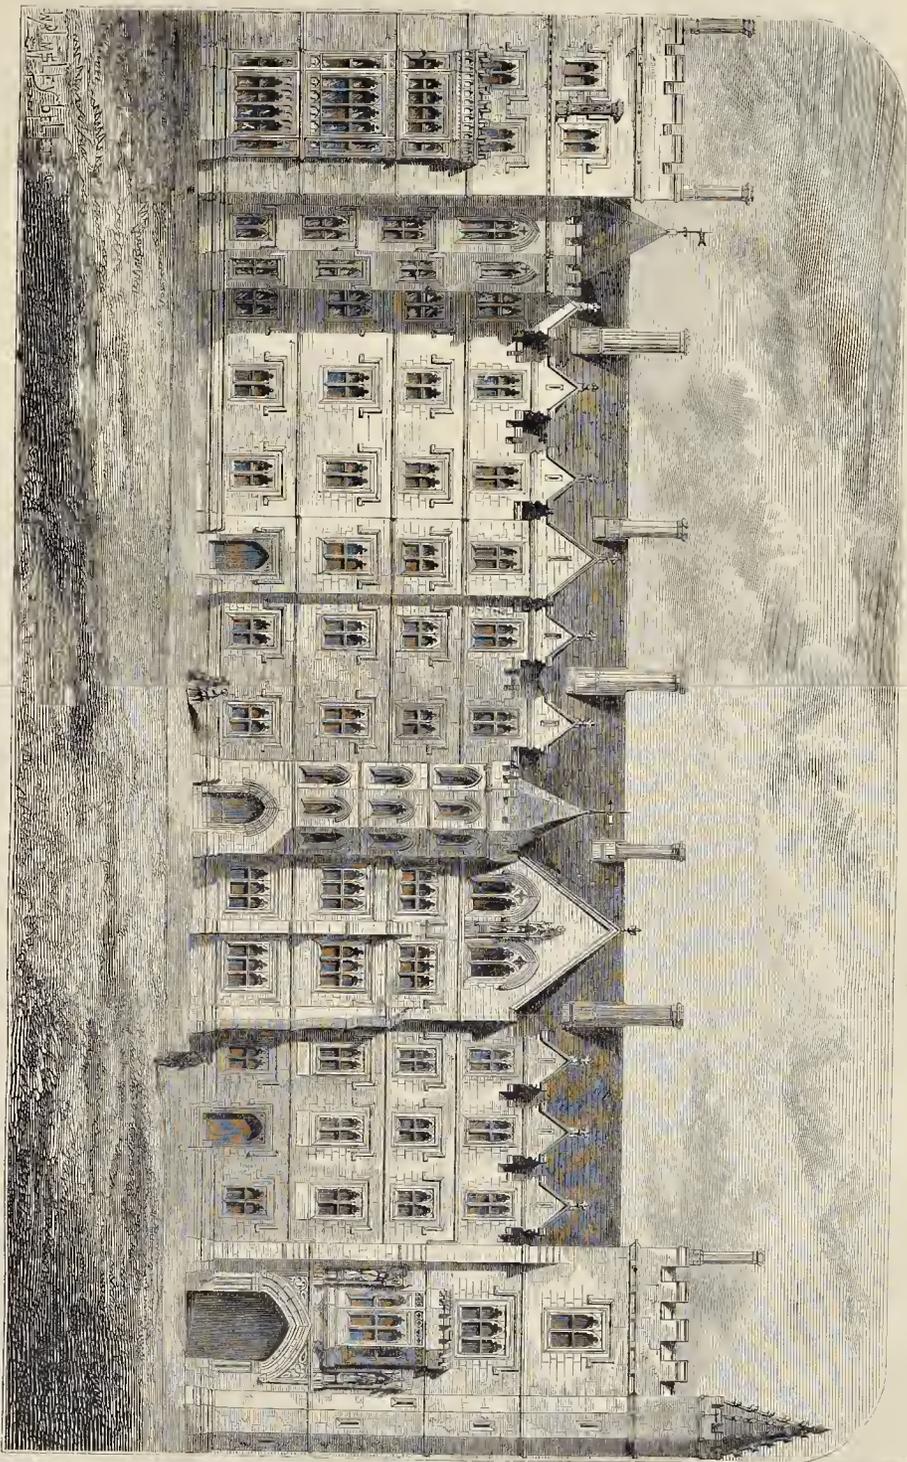

The elevation and plan are drawn to a scale of $\frac{1}{4}$ in. to the foot; details, 1 in. to the foot.

The whole is from designs prepared by Mr. Edward A. Heffer, of Liverpool, architect.

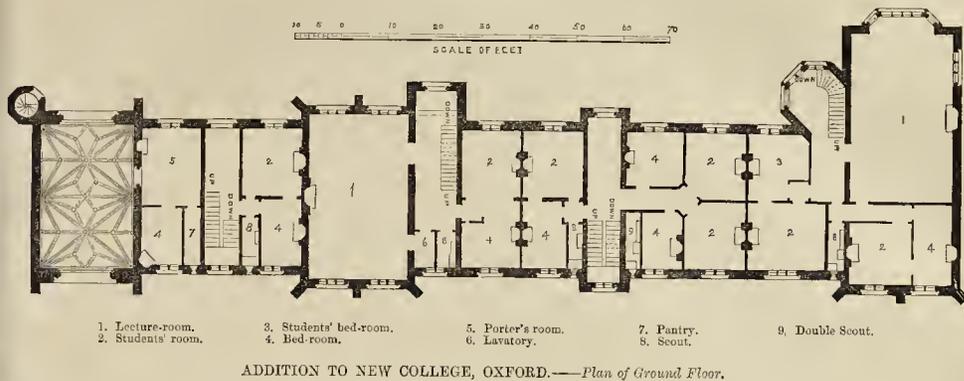

A CHIMNEY-PIECE.—MR. E. A. HEEFER, ARCHITECT.

ADDITION TO NEW COLLEGE, OXFORD.—SIR G. GILBERT SCOTT, R.A., ARCHITECT.

ENLARGEMENT OF NEW COLLEGE, OXFORD.

This college is being considerably enlarged, at a cost of upwards of 20,000. The architect is Sir George Gilbert Scott, and the builders are Messrs. Jackson & Shaw, of Westminster. We give a view and plan of the new building, which will be 177 ft. long, 33 ft. wide, and 62 ft. in height from the bottom of the plinth to the ridge of the roof, and is situated on the north side of the college, in Holywell-street. It will afford thirty-eight sets of rooms to the college,—two for fellows, and thirty-six for students, besides two lecture-rooms. There will be four sets of staircases to the building. The external dressings and ashlar work will be of Milton stone, carefully chopped, and the internal portion of the walls will be of brick. On the south side, at the west end of the building, a tower, about 26 ft. square and 70 ft. high, will be erected. It will project about 22 ft. beyond the main building, and in the angle there will be an octagonal staircase. There will essentially be a gateway tower erected at the eastern end, but it is not included in the present contract. The front of the building will be on the south side, facing the city-wall. The work is expected to be completed by Christmas, 1873. The buildings now in course of erection are only a third part of an intended extensive range of rooms, stretching the whole length of Holywell-street.

vigorous resistance to the railway-smoke and other obstacles, and still would present me with fruit by the bushel in a favourable year; but I now fear that even that is going the way of the apple-trees, and of all flesh, and succumbing to the general desiccation of the soil.

There is just one practical remark that this state of things suggests,—namely, that where a building operation in the neighbourhood of garden-ground involves a blind end to a new sewer, it should be the special business of somebody to see that the blind end is made impervious to water, and innocuous in draining the ground, when the gardener does not wish it drained.

NEMO.

MEMORIAL OF THE LATE SHERIFF YOUNG, M.P.

The foundation-stone of the above memorial has been laid by the daughter of the Mayor of Wisbech (Mr. F. Ford). The monument takes the shape of a column, standing in all 40 ft. high. At each corner of the base are antelopes, standing in all 4 ft. 7 in. high, the paws supporting a shield, each bearing arms carved in low relief, viz., the city of London and Middlesex, county of Cambridgeshire, Wisbech borough arms, and his family arms. On the sides of the base are engraved the following inscriptions:—

“A Memorial Tribute from many Friends to
ALDERMAN RICHARD YOUNG, J.P., D.L.
Born 1803. Died 1871.
Mayor of Wisbech, 1858—1863.
M.P. for Cambridgeshire 1863—1868.
Sheriff of London and Middlesex, 1871.”

On one side is also erected a drinking-fountain, of Portland stone and marble. The column is in red Kinstery granite, the base of column in grey Aberdeen, the cap of column being metal and Portland; the steps in Yorkshire stone; the whole of the other work, including the antelopes, is in Portland stone. Mr. J. Wallis Chapman, of the Harrow-road, London, is the architect; and the contractor for the whole of the works was Mr. John Whitehead, of London. The granite is from the quarries of Messrs. D. & A. Davidson, of Limerick; the Portland stone from Messrs. Thornton & Co.'s quarries, Portland; the Yorkshire stone from Mr. J. Haigh's quarries, Morley, near Leeds; and the metal-work, from Messrs. Richardson & Slades, of High Holborn. The foreman in charge was Mr. W. Doncaster.

OPENING MEETING OF THE NEW ARCHITECTURAL ASSOCIATION OF IRELAND.

The opening meeting of the above association was held on the 3rd inst., the president, Mr. J. O'Callaghan, in the chair. Mr. J. H. Longfield having read a report from the committee, the president delivered his inaugural address, which will be found on another page.

Mr. Owen, president of the Institute of Architects of Ireland, in proposing a vote of thanks to the president for his wise, earnest, and encouraging address, said it would afford him the greatest pleasure to assist the Association in any way in his power. He was certain every

member of the senior branch of the professional association of this country would feel satisfied at the prosperity of this new work, for to it they would look for the best recruits to the ranks of the profession.

Mr. Drew seconded the motion, which was adopted with acclamation.

Mr. Rawson Carroll proposed:—

“That the Association is deserving of the support of the profession at large.”

Mr. Charles Geobegan seconded the motion, which was adopted.

On the motion of Mr. Maguire, seconded by Professor M'Manus, it was also resolved:—

“That it is most desirable to enlist the sympathies of the other professions connected with architecture,—painting, sculpture, and engineering.”

SALARIES OF ENGINEERS TO BOARDS

Str.—In the list of salaries of engineers to municipal Boards, given at p. 802, *ante*, the amount, as regards Manchester, is not correctly stated. The salary of the city surveyor is 1,150*l.* per annum. I think it only right to make this correction, as public bodies are never too liberal in remunerating their officers; and the statements of a journal like the *Builder* are likely to be referred to when such appointments as those in question have to be made. J. CHOXPOND.

Sir,—With reference to Hull, in your list, the present population of Hull, from the Registrar-General's return, is 124,976*l.* The salary of the borough engineer is 450*l.* S.

WORCESTER CATHEDRAL.

“LITERAL copyism is not intelligent restoration.” Granted this dictum of “J. S.” in last week's *Builder*, some explanation seems desirable to justify the propriety of the rough internal masonry now seen in places in the walls and vaulting, and of patches of green colour introduced in certain parts of the latter in the nave of the cathedral.

It was a dark age in the history of this building when the roof-covering was stripped off, and ordinary slates, such as are used in *small* sizes for domestic purposes, substituted. Attenuation has been made in our day for acts of Vandalsim perpetrated about the same time at Salisbury and at Hereford. Much has been done at Worcester with the same praiseworthy purpose; but still I must maintain that alteration in the present covering, as suggested in my communication of the 8th inst., is essential to the satisfactory completion of the work of restoration.

If slate must be the material, we have examples of its use in large slabs,—producing the effect desired,—on the church at Camborwell, by Sir Gilbert Scott, and on the Reform Club, by the late Sir Charles Barry.

Still, hearing in mind the covering generally used on the other edifices of this monumental description, which adorn our country, and remembering instances of their restoration, which have come, in the course of years, under my own observation, I venture to repeat the suggestion made in my former communication. N.

INCIDENTAL CONSEQUENCES OF DRAINAGE OPERATIONS.

Str.—Your pages have heretofore contained forcible reflections on the injuries to which great buildings are liable when, as in the case of the Somerset House river front, the normal condition of their foundation, as regards moisture, is materially altered, by draining and pumping. I wish to point out that consequences, akin, so far as cause is concerned, to such injuries to great buildings, are probably at present developing themselves in multitudes of little buildings in the suburbs of London, in a manner rather unpleasant to the inhabitants than absolutely ruinous to the structures themselves.

Say that my neighbour's house or my own was formerly furnished with a cesspool, disused since the Metropolitan Drainage Act came into operation. Say that the soil was removed either very carelessly or not at all, the jobbing builder employed saying that the hungry clay thrown in would soon sop up all cause of offence. Years roll on: the earth becomes desiccated through the action of the drainage scheme; fissures open in all directions, and serve as ventilators to all the old cesspools in the neighbourhood, whose effluvia distill into the houses.

Meanwhile, suppose that my pride lies in a miniature Busby Park, consisting of a single horse-chestnut tree, formerly luxuriant in flower in the spring and in foliage in the summer and autumn. By the end of September it has now become nearly bare of leaves as in mid-winter, for want of water to the roots. My suburban orchard of apple-trees had for some seasons declined in produce, but my pear-tree made a

THE GLOBE BRIDGE, PECKHAM.

HAVING noticed, a short time since, some very un-authentic articles in the local papers relative to these works, which are very detrimental to the contractor, I am induced, in justice to the contractor, to trouble you with a few remarks.

An article has appeared in the *Peckham Times* upon the subject of the memorial-stone having been laid on Thursday last, the 10th inst., wherein it is stated that a Fenian flag floated over the stone. This was quite incorrect. No Fenian flag was there. The national flag of Ireland waved opposite the Union Jack, which floated over the head of Mr. E. Dresser Rogers whilst he successfully set the stone. The ceremony over the contractor, Mr. S. Stanley Peach, provided the men with a substantial dinner at the Surrey View.

As I believe it to be the object of your journal to circulate only that which is fair and true, to every one, under every circumstance, I shall esteem it a favour if you will give these remarks a place in your next issue.

FAIR PLAY.

THE AMENITIES OF COMPETITION.

SIR,—The unsuccessful ones in the late competition for the prizes offered by the Sunderland School Board will have small reason to regret contented with their want of success, if, as in my case, they have failed to receive that small modicum of courtesy which always soothes, viz., a word in acknowledgment of their efforts.

It would be injurious on my part to cast at the decision of the Board, as I am in ignorance of the process by which it has been arrived at, or even, perhaps, to quarrel with the scheme of appointing two committees, the one to decide upon the best plan, and the other upon the best elevations; yet I am strongly of opinion that such a course can result only in injustice, unless the two sets of judges are in accord as to both plans and elevations of the same author. If otherwise, as would be the case, to a certainty, I presume A has received half a premium for his plans, and B the other half for his elevations.

It is, after all, annoying (setting aside the wound to one's amour propre, in the event of a failure, which is always supposed to smart, whether it be the case or no), to be judged by a set of rules, which one's efforts were never meant to be subjected, and which are directly at variance with the true spirit of competitive endeavour.

JUSTITIA.

THE WINCHESTER SURVEYORSHIP.

SIR,—Finding that no notice has been taken of the above municipal hoax, I can only conclude that, unless they consider it beneath their contempt, none of the victims have had access to the local newspapers, and consequently are ignorant of what took place at the meeting of the Winchester Town Council, on Thursday, Oct. 3. Perhaps the following extract from the *Southampton Times* of Oct. 5th, may tend to throw some light on the subject:—

"TOWN COUNCIL MEETING.—The monthly meeting of this body was held at the Guildhall on Thursday; the Mayor (Allerman R. P. Ford) in the chair. The Finance Committee reported that in accordance with instructions from the Council they advertised for candidates willing to fill the office of surveyor, and that in reply thereto they received thirty-five applications, accompanied with testimonials; and having perused the same, arranged for a personal interview with three of the candidates, viz., Mr. Edward Dudley, of Kingston, Herefordshire; Mr. J. J. Lanceland, of Winchester; and Mr. J. B. E. Bruce, of Kingston-upon-Hull; and pursuant to the terms of the resolution, submitted their names for the Council to make the selection.

Mr. Alderman Budden proposed, and Mr. Councillor Gale seconded, the adoption of the report, which was agreed to *nem. dis.*

Mr. Alderman Fielder, in proposing Mr. Lanceland for the office of surveyor, said he had the greatest confidence in his knowledge of the work to be carried out; he had been accustomed to buildings from his boyhood, and from his excellent testimonials he would also be able to carry out the system of drainage, and give the greatest satisfaction.

Mr. Councillor Gale seconded the nomination.

Mr. Harris thought the qualifications as indicated by the testimonials were insufficient.

Mr. Morris thought that the advertising was useless, and the discussions of the committee a waste of time. They had previously pledged themselves to vote, and could have saved the twenty-four gentlemen the trouble of dealing with what was a foregone conclusion.

Mr. Godwin observed that it was a doubtful fare to bring down those two gentlemen.

Mr. Warren, as a member of the committee, said there had been nothing done to induce Mr. Newman to resign, and though he should vote, he had not pledged himself to do so for Mr. Lanceland.

Alderman Fielder replied by stating that it was the unanimous opinion of the council that the office should be put up for public competition, so as to select a good man, and no other candidate being proposed, Mr. Lanceland was declared duly elected."

The inference from this is, that bad the Winchester Town Council remembered what was due to their own honour, and been sufficiently candid to have added to their advertisement for a surveyor a note to the effect that the appointment was then virtually filled, they would not only have saved thirty-four gentlemen the trouble and expense involved in preparing their testimonials, to say nothing of the trouble given to their friends and supporters, but have merited the esteem of all right-thinking men. However, it is somewhat refreshing to find that even the Town Council of Winchester contains one or two men not wholly lost to a sense of justice.

It is not stated whether those two rival candidates who unwittingly took part in the "doubtful farce" of coming all the way from Kingston-

upon-Hull, and Kingston, respectively, had their travelling-expenses paid; but even if they had, it is still a matter of question whether the Corporation of Winchester is not liable to thirty-four actions for damages from the several victims of this dishonourable hoax.

JUSTITIA.

BAPTIST COLLEGE FOR MANCHESTER.

LAST week the foundation-stone of the new Baptist College, to be erected in Brighton-grove, Rusholme, was laid. The new building will be a spacious structure. The total frontage is to be 115 ft., and the total depth 77 ft., faced externally on every side with white fire-bricks, and relieved with terra-cotta moulded strings, label-moulds, bands, and friezes, with sunk and moulded devices on the face of the bands, and an elaborately moulded terra-cotta cornice. The principal feature in the front elevation will be a tower, with a slated high-pitched roof, surmounted with iron cresting, the total height being 70 ft. The bay-windows are also carried up above the roofs, breaking the line, and forming minor towers, having high-pitched slated roofs, terminating with ornamental ironwork. The principal entrance to the college is under the tower, leading to a spacious hall; from thence to the students' rooms, provision being made for the accommodation of about twenty-five students, each having a separate room, also a residence for the president. The ground-floor contains dining-hall, 40 ft. by 24 ft.; lecture-hall, 33 ft. by 24 ft. (by removing a sliding division, the dining and lecture halls may be converted into one room); class-rooms, study, president's rooms, and servants' department. The first and second floors contain the students' rooms, bath-rooms, lavatories, and president's bed-rooms. The works will be carried out under the direction and supervision of Mr. Henry Pinchbeck, of Norfolk-street, Manchester. Mr. James Herd, of Clarence-street, Cheetham, Manchester, is the contractor.

BUENOS AYRES.

A SUPPLEMENT to the *Packet*, a Buenos Ayres paper, of the 14th of September, contains a report by Mr. Revy, who was chief assistant there to Mr. Bateman, C.E., who proposed a scheme for a port at Buenos Ayres. Mr. Revy reports to the Provincial Government against Mr. Bateman's scheme, and in favour of one of his own for the construction of a port at Boca, and the cleansing and canalisation of the Riachuelo for the sanitary improvement of the district. A port for Buenos Ayres, according to Mr. Bateman, can be made: according to Mr. Revy it cannot. The construction of a port at the Boca, in Mr. Revy's opinion, offers every facility, at a comparatively trifling expense. There would be no breakwater, no embankments, no dry-dock excavations; nothing but simply to dredge the bed of the Riachuelo, and on one or two short canals, and build wharfs, quays, and warehouses along the banks, for which a solid foundation of loam is obtained at 20 ft. to 30 ft. deep. The plans of the Boca Port present three large docks, together, 100 acres, with 4,000 yards of quays for loading or discharging merchandise. Several other docks could be afterwards constructed, as found necessary. The work would cost, in all, 144,000*l.*, without including wharfs, quays, and warehouses. Mr. Revy only undertakes the canalisation, and to provide a port of 16 ft. deep, suitable for hundreds of vessels which are at present obliged to anchor in an open roadstead, and which could discharge and take in cargo at the Boca in as many hours as at present days are necessary. The project is not an original one of Mr. Revy, for the late Don Manuel Lynch agitated an identical one in the columns of the *Packet* ten years ago.

The Louvre.—A new sculpture-gallery is about to be opened in the museum of the Louvre. This gallery is to be devoted to the sculpture from the national palaces, and to some of the finest productions already in the Louvre. At the end of the gallery is to be placed the statue of Michelangelo, which for a long series of years formed one of the glories of the famous Chateau de Chenonceaux, the art collections of which were dispersed five or six years ago; and the gallery will take its name from the great master. The decorations are now being completed, and the catalogue is being prepared.

CHURCH-BUILDING NEWS.

Dunstable Abbots.—The ancient church of St. Peter, Dunstable Abbots, has been reopened for divine service, after having undergone a restoration. The village is picturesquely situated five miles north-east from Cirencester, and about half a mile south-westward from the high road from Cirencester to Gloucester, the "Irmin-street" of the Roman occupation. The church is a small stone building in the Early English style, and consists of a tower with three bays, nave, chancel, and porch. Having become dilapidated, the rector (who is also the patron of the living), the Rev. Thomas Hanor, and other land-owners and inhabitants of the parish, called in Messrs. Waller & Sons, of Gloucester, architects, under whose superintendence a restoration has been carried out. The south wall has been taken down, and a new aisle and organ chamber erected. The east wall of the nave has also been taken down, and there has been erected a new chancel arch, supported on Aberdeen granite columns with carved stone caps. The whole of the interior fittings have been taken out, and new floors laid, with benches of varnished pitch-pine. The chancel fittings are of oak, and consist partly of the old seats. The chancel and altar floor is laid with Godwin's tiles. There are a new stone pulpit and a pitch-pine reading-desk. The organ-chamber is parted from the south-aisle by an open screen of pitch-pine. The porch has been rebuilt. The timbers in the new roof are of pitch-pine, stained. The old roofs of the nave and north aisle and chancel have been generally restored, and strengthened with new timbers. The tower and the walls of the north aisle have also been restored and pointed. The total cost has been about 1,000*l.* The whole of the works have been executed by Mr. A. Estcourt, of Gloucester.

Honor Oak.—The foundation-stone of St. Augustin's Church, Honor Oak, has been laid by Mr. J. G. Talbot, M.P. The new building is situated on a hill near Honor Oak-road, and will be in the Early English style. At present it is intended to contain only one aisle, but a second will be added, together with a tower, whenever the requisite funds are forthcoming. It will accommodate 350 persons, and the estimated cost is 3,200*l.*, of which the greater part has been subscribed. The architect is Mr. Oakley, of London; and the builders are Messrs. Roberts, of Islington.

Cowley.—The church here has been re-opened by the Bishop of Gloucester, after restoration. The restoration consists of a new roof to the chancel, with trussed rafters and principals resting upon moulded oak plates, and a stone dog-tooth cornice, with corbelled shafts under the principal timbers, provision being made for a roof-screen (the remains of which were discovered) at the junction of the nave and chancel. The curved timbers and braces of the nave roof have been opened out, and the woodwork repaired. The nave has been filled with oak open seats, copied from the existing old late fourteenth-century seats, some of which have been retained in their original positions. The remains of the stairs to the roof-loft that were discovered during the progress of the works have been opened out, the font restored, and the Jacobean pulpit replaced by the old fifteenth-century stone, one that was used as a base to the more modern work. In the chancel the new work further consists of oak seats, prayer-desk, lectern, and sedilia; new steps of red Mansfield stone; and a new communion-table. The remains of early decorative colouring have been retained as far as was possible. The whole of the stonework has been cleansed from the many coats of whitewash with which it was covered. The spaces within the steps in the chancel have been paved with Minton's encaustic tiles, and the rest of the chancel with the old monumental slabs. In the nave the passages are paved with small black and red tiles. On the outside the walls have been under-pinned and strengthened with buttresses. The windows have been glazed throughout with pale lilac and white glass in patterns. In the chancel three of the windows have been filled with painted glass by Messrs. Powell, viz., in the east the Crucifixion, and in two side-lights figures of the Virgin Mary and St. John. The north-east doorway has been opened out, and, with the south and west doorways, fitted with oak doors, framed in small panels, and hung with wrought-iron ornamental hinges, lock-straps, &c. The work was under the superintendence of Mr. Albert Hartshorne, and

has been executed by Messrs. Wall & Hook, of Brinscombe. The cost of the restoration of the nave has been in great part defrayed by the squiro of the parish, Mr. J. Hutchinson, Cowley Manor, and his relatives and friends; that of the chancel by the rector and some of his family.

Welford.—The ancient Church of St. Mary the Virgin, Welford, has been reopened for divine worship, after restoration. The chancel of the church was restored about four years ago, and its internal ornamentation was carried out by the rector, the Rev. G. A. Poole. At that time the nave and aisles were in such a condition as to require immediate restoration. In the early part of the present year this difficulty was fairly grappled with, and the result was that the whole fabric, with the exception of the tower, has been restored. The architect employed was Mr. E. F. Law, of Northampton. The total cost of the restoration is about 2,300*l.*, the work done to represent that sum being somewhat as follows:—In the first place, the north aisle has been rebuilt. Previously to the restoration, this part of the church was blocked up with enormous square piers and semicircular arches, the arcade apparently at some time or other having been removed. A new arcade, of the Decorated period, has been inserted, having carved capitals, with natural characteristic foliage of the period. The north aisle at the west end is also carried beyond its original position, and the extension is converted into a small sacristy. Its entrance arch is supported by two decorated columns, of the same character as those just noticed, and it is lighted in the west wall by a small Early English window, which has been filled with coloured glass. The south arcade was considerably out of plumb, and it was Early English, and in order to preserve its character, it was deemed expedient to take it down stone by stone, which were either marked or numbered, so that, when rebuilding, each might be fitted into its original position. The tracery in the windows of the south aisle had been destroyed, but their ridges have been reinstated in original form, and are filled in with lead-lights. On the exterior of these windows a number of old carved heads have been inserted. The west gallery has been removed, and the tower-arch having been opened and restored, its proportions are no longer hidden, the effect being considerably heightened by the Perpendicular west window which comes into view. The nave-walls have been restored. The roofs to the nave and aisles are new, and are made of pitch-pine, moulded. The church has been re-seated in oak throughout. The seats are of modern construction, without doors. The four windows in the north aisle are filled in with coloured glass. A coloured window has also been placed with the east window of the south chapel by members of the Ferraby family, and the subjects represent the "Annunciation," "Espousal," "Wise Men," and the "Presentation at Jerusalem." Towards the total cost, that for the north aisle, including windows, has been about 800*l.* Mr. Phillips, of Northampton, executed the carving work.

Elstead.—St. James's Church, Elstead, has been reopened after alterations and repairs. The original structure, dating back probably to the thirteenth century, had not only become dilapidated in some parts, through age and exposure, but was manifestly insufficient to afford the accommodation required for an increasing congregation. It was, therefore, determined to erect an additional aisle, and to effect other improvements, so that the interior might be rid of its characteristic mustiness, and the general arrangement of the edifice suited to the present period. The expense attending the alteration amounts to 1,000*l.* A south aisle has been built, and a vestry added to the east end of the church, while the sittings have been altered, and the character of the building so changed, as to allow a better distribution of light, ventilation, and sound. The antiquated fabric to which these desirable additions have been made, consisted only of a nave and chancel, with a low wooden steeple at the west end, the gallery, to quote the expression of the bishop of the diocese, being of "a most villainous description," the pews "horrible," and the ceiling "low." Additional accommodation is now afforded to about 100 hundred persons, the total number of sittings being about 300. The plans were prepared by Mr. H. B. Goring, architect, of Southborough Hall, near Tunbridge Wells, and carried out under the personal superintendence of his manager, Mr. Johnson, by Mr. Pink, builder, of Milford, near Godalming. The new aisle is

lighted by eight windows, some of the heads of which are formed of stonework of the former windows, belonging apparently to the thirteenth and fifteenth centuries. A new three-light window has been inserted beneath the tower at the west end, the stained glass in which was contributed by Mrs. Cornwall, and the tracery carved by Miss Cornwall, her daughter. The building is composed of Bargate stone with Bath stone quoins and dressings, red and black tiles being used in the pavement, excepting the chancel, where Maw's encaustic tiles are laid down. The new portion of the roof rests upon four columns with five arches. The shafts of these are composed of Forest of Dean stone, with capitals and dressings of Bath stone.

Buxted.—The church at Highhurst Wood, erected mainly through the liberality of Colonel and Lady Catherine Harcourt (and consecrated some time ago by the Bishop of Chichester), has been publicly reopened for divine worship. Highhurst Wood is a hamlet of Buxted; it is distant some three miles or so from the parish church. In the early part of last year the building was commenced by Mr. Charles Lulham, of Uckfield, from designs furnished by Mr. Christian, of London. The principal materials used in its construction were obtained from the immediate neighbourhood; the stone, of which the church is exclusively composed, being excavated from a quarry about 500 yards from the spot, and the sand used in the composition of the mortar being equally well to hand. The church, which consists merely of a nave terminating in a semi-circular apse with a side aisle on the north for children, is built in the old English style, and is of a simple character. The roof of the nave is supported by stained wood rafters, that of the apse being domed, and the spaces decorated. The chancel is approached by several flights of steps, and is backed by the altar. The floor is laid with pitch pine, the aisle being paved with Staffordshire tiles; Minton tiles forming the floor and steps of the chancel. The church is lighted by six windows, and the apse by five. The principal window, which faces due west, is glazed with coloured glass. This is the special contribution of Lady Catherine Harcourt, who has painted the window with her own hand. It is not yet finished. The building provides accommodation for 260 adults and children; the seats, which are movable, being hacked, and fitted with book-shelves. Arrangements have been made for heating the church with hot air in the winter time. Surrounding the nave is a small bell-turret, in which are hung a couple of bells. The structure is surrounded with a wall of stone; and in the rear half an acre of ground has been appropriated for the purpose of interment. The total cost of the erection is about 6,000*l.*, nearly the whole of which has been borne by Colonel Harcourt. A parsonage is in course of erection about 300 yards from the church, and a school for upwards of 100 children will shortly be commenced, not far from the spot.

Stoke.—The chancel of the parish church has been re-opened. It has been restored by the liberality of Mr. W. F. Pridmore, Wyken House, at a cost of 300*l.* It is lined throughout with encaustic tiles, and the altar-railing was designed by Mr. F. Skidmore.

STAINED GLASS.

Market Weighton Church, Yorkshire.—A stained-glass window of one light by Mr. J. W. Knowles, of York, has recently been placed in this church, near the font. The subject is our Lord Blessing little Children. The cost of the glass has been defrayed by subscription from the ladies of the parish. The drawings for the stonework were a present from Messrs. Atkinson, of York, under whose care the church was restored last year.

St. Martin's, Brighouse.—A stained-glass window has been placed in the north side of this church, to the memory of the late Mr. Brooke, of the Rhydings. The subjects represented are the Birth of our Lord, and the Presentation in the Temple. The window is from the works of Messrs. Morris & Co., of London.

St. Andrew's, Gravesend.—Three stained-glass windows have been presented by Lady Franklin to the St. Andrew's Waterside Mission Church, in memory of the petty officers, seamen, and marines of the *Erabis* and *Terror*. Beneath the windows brasses, with the names of each of the crews will be placed. These ships sailed from Gravesend.

St. Peter's and St. James's, Belgrave-cum-

Birstall.—The east windows of the two churches of Belgrave-cum-Birstall, Leicestershire, have lately been filled with stained glass by Messrs. Ward & Hughes, in memory of the Rev. Richard Stephens, B.D., late vicar of Belgrave-cum-Birstall. The window in St. Peter's, Belgrave, consists of five main lights, which are occupied by ten representations of events in our Lord's life, two in each, under characteristic canopies—viz., the Adoration of the Shepherds, our Lord's Baptism, His Accusation before Pilate, Bearing His Cross, the Crucifixion, the Entombment, the Angel and Women at the Sepulchre, the Appearance of the Twelve with Thomas, and the Ascension. The large circle in the apex contains a seated figure of our Lord in glory, orb and sceptre in hand, surrounded by the Heavenly Hosts, and below this are two groups of censing angels. The architecture is of the latest geometrical, and the glass accords with it. The colours are deep-toned. St. James's, Birstall, was restored by Sir G. G. Scott, R.A., only two years before the death of the late vicar, and the simple east window, of the Early English period, consists of three main lights, which are occupied with representations of the Adoration of the Shepherds, our Lord's Crucifixion, and the Angel and Women at the Tomb after the Resurrection; above are emblems of the Trinity, with the Lamb and Dove, and between these an angel choir in two groups. The canopies and ornamental work are in character. This window is raised by his widow and his unmarried daughter. A reredos in each church is about to be erected under the direction of Sir G. Scott, by the parishioners and a few friends, in memory of their late pastor.

St. Thomas's, Halifax.—A stained-glass window has been placed at the east end of this church, in memory of Alderman Midgley and his wife. The window, erected at the expense of the various members of the family, is done in the style of the German school of glass painting, and is from the studio of Mr. Wailes, of Newcastle. The window is a five-light one, and the subject chosen is the Good Samaritan, three pictures from which are portrayed. On the dexter side the window, at the lower portion, the traveller is represented as falling among thieves; occupying the whole centre of the window is the scene where the good Samaritan relieves him, whilst the priest and Levite pass by "on the other side;" and in a corresponding portion on the sinister side of the window, the departure from the inn is pictured.

Cromer Church.—The west window in the tower of this church has just been completely restored, and fitted with stained glass, at the expense of Mrs. Charles Buxton, as a memorial of her husband, the late Mr. Charles Buxton, M.P. It is a Perpendicular window, 35 ft. high and 13 ft. wide. Fortunately, there was sufficient evidence remaining on the jambs and fragments of the tracery upon the old churchyard wall to enable the original design to be followed. The battlemented tracery is of a similar character to the aisle windows, which were restored ten years back. The tracery of the head and transoms is filled with stained glass, of a foliated pattern, in bright colours, and the upper panes are glazed with Powell's embossed quarry glass, having coloured borders. Five painted figures, representing St. Thaddeus, St. Mark, St. Paul, St. Simon, and St. Philip, are introduced in the lower panes. They came, we understand, from a church in Posen, Prussia, and are very old. The stonework has been executed by Mr. Stanley, of Norwich, from the design of Mr. J. H. Brown, architect, Norwich.

Miscellaneous.

Accidents.—In Derby, at a bakehouse in Upper Brook-street, a pateut oven was being erected, with divided compartments in order to facilitate the dispatch of baking. Whilst a workman was engaged in finishing one of the archways, the roof fell in, and he was instantly buried. The removal of the *débris* took upwards of half an hour, and the poor fellow was quite dead before his body could be recovered.—A bricklayer at Uddington has been killed by a fall from a chimney-stalk. He had been, at the dinner-hour, coming down the inside of the stalk, at present being erected at one of the new pits near Uddington Railway Station, when the rope which was attached to a nesdie at the top of the chimney gave way, and he fell to the bottom, a distance of 64 ft., and was killed instantly.

Constant Metropolitan Water Supply.—Alderman Sir Sidney H. Waterlow (the Lord Mayor elect) has published in the *Times* a statement as to the supply of water in a district crowded with the working population, and in which the Improved Industrial Dwellings Company, over which he presides, have recently erected, at a cost of nearly 17,000*l.*, 112 three, four, and five-roomed tenements for the working classes; namely, upon a large plot of land leased from the Baroness Burdett-Coutts, in Crah-tree-row, Bethnal-green, nearly opposite Columbia Market. An improved system of constant water, he said, has been adopted during the last two years in buildings erected by his company in Pimlico, George-street Grosvenor-square, and Goswell-road. In all these dwellings the system has been found to work admirably. The water is supplied by meter at a fixed price per 1,000 gallons, and at the end of each year the total cost has been less than under the ordinary system of rating each tenement. When the buildings in Crah-tree-row, however, were opened, it was found the East London Water Company were unable to deliver a drop of water into three out of five tanks, the three being 9 ft. above the others, and at an elevation of only 55 ft. above the level of the pavement. The Water Company said that, under a private Act of Parliament obtained about twenty years ago, the highest point to which they are bound to raise water is 40 ft. At the Gladstone Buildings, containing 168 dwellings, and situate within a few hundred yards of Crah-tree-row, the New River Company give a daily supply at 59 ft. Yet the East London Company charge as much 1,000 gallons as those who serve the other districts. What, he adds, would the wealthy inhabitants and legislators who dwell in the lofty houses at the West End say if the water companies refused to supply water on the third floors of their houses, or at a height greater than 40 ft.? He is afraid the public can have no redress in this matter until the Legislature interferes.

The New Chelsea Embankment.—Since August last, the works have been progressing in the hands of Mr. Welster, the contractor. The length of the wall of the new Embankment is 4,430 ft. The segment of reclaimed land at its widest point, opposite the angle of Cheyne-walk, is about 140 ft. in width; and the area to be laid out in ornamental gardens is about 9½ acres. The thickness of the wall at the bottom is 12 ft.; it is being built with Portland cement concrete, the cement being supplied by the Burham Company, and regularly submitted to engineering tests before use. At the top of the wall, which is to the level of the road, the thickness is diminished to 5 ft.; it is faced throughout with granite, only roughly axed. The use of cement concrete for the wall in lieu of brickwork reduced the expense of the undertaking by about 21,000*l.* The granite is being supplied partly by Mr. Fyfe, of Aberdeen, and other portions by Messrs. Freeman, from Cornwall, and the Dulbeattie Granite Company. There will not be an open balustrade, but a solid pannelled parapet, with hold moulded coping and square pedestals at intervals. There are 3,173 ft. of the lowest portion of the wall completed, and 1,220 ft. of the parapet. The filling-in of the area behind will require about 200,000 yards of earth, of which a large quantity has been already provided. The low-level intercepting sewer, corresponding in length with the Embankment, will be constructed of Gault bricks from the Burham Company, the lower third of the inner ring lined with blue Staffordshire bricks from Messrs. Donlton & Co., of Lambeth. Some portion of the sewer at the lower end has already been put in. The ultimate destination of the low-level sewer is the western pumping station. Mr. Welster has also obtained the contract for erecting buildings connected with the western pumping station, and for the extension of the low-level sewer westward to the Chelsea Embankment. The tender amounted to 126,950*l.* The same contractor has got the work of providing engines, pumps, and machinery at the station: amount of tender, 56,789*l.*

Tax on English Locomotives.—At the last meeting of the Great Luxemburg Railway Company, the chairman stated that the Belgian Government had imposed a duty of 200*l.* upon all railway engines imported from England. He added that English engines were much better than those made in Belgium, and more economical, although the first cost was greater.

Utilisation of Water Power.—Of the use that might and ought to be made of now wasted water power in many districts we have often spoken. A step in the right direction has been taken at Bellegarde, where the Rhone, after issuing from the Lake of Geneva, falls into a deep chasm. After passing for some distance between these walls of stone, the river falls suddenly into a huge fathomless gulf. An American conceived the idea of turning the force of this mass of water to account, and creating a power for a number of industrial operations. England and Switzerland found the necessary capital, seven millions of francs, and the work is approaching completion. About 100 yards above the fall, is a dam and a basin, by means of which the water is diverted into a tunnel, 600 metres long, 10 metres wide, and 20 metres high, and which opens into the ravine of the Valserine. At this point a large building is erected to receive turbines, which are calculated to give a force equal to 3,000 (steam) horse-power. The subterraneous aqueduct is continued 700 metres beyond this first point of operation, and conveys the water to another set of turbines, of 5,000 nominal horse-power. The total force of the water diverted is said to be equal to 12,000 horse-power, so that 4,000 remain for future application. The motive power is obtained and brought into subjection, and will soon be applied to various industrial purposes.

The New Church of St. Silas, Bristol.—In the spring, St. Silas Church, St. Philip's, was found to have subsided 20 in., owing to the bad foundations, and as it was in a dangerous condition, it was resolved to take the church down and rebuild it on piles. Mr. J. P. Stephens was the contractor for the taking down and rebuilding, and Mr. W. Merewether, of Bedminster, undertook the piling. Mr. Davis was clerk of the works. About 300 piles of 28 ft. in length and 10 in. in diameter, of English larch, have been driven in, and it is intended to build the church of the old materials, and on nearly the same plan as before. The cost of the building was estimated at 2,100*l.*, exclusive of the boundary-wall, not in the estimate. According to the altered plan the height is reduced, and wooden arches constructed to support some of the weight of the roof. The piling having been finished, the ceremony of relaying the foundation stone has now been performed by the Rev. Flavel S. Cook, who, in the course of an address, said he had appealed to the public for 1,500*l.*, and they had given him 1,700*l.*; but, as usual, the cost was more than was estimated, and about 200*l.* were required to complete the undertaking, exclusive of the boundary wall.

Distribution of Forests in India.—An important and able paper, signed "D. Braudis," appears in the October number of *Ocean Highways*, "On the Distribution of Forests in India." The author is of opinion that in India forest conservancy, in Government hands, has become necessary, in order to meet the growing demands for timber, wood, bamboos, and other forest produce, all the more especially as the peasantry and others begin to desire substantial houses, and there seems no prospect of finding coal in sufficient quantity in North-western India; but he is not hopeful of the possibility of increasing the rainfall to any considerable extent by preserving and extending the forests, or of thereby in any way altering the climate; and, indeed, he considers that there is not yet sufficient evidence to prove that any material deterioration of climate has been the result of denudation in any part of the country. The seasons in India are regulated by the two half-yearly winds, dry and wet, which are cosmical. But a great deal can be done by improving and extending the wooded tracts along the borders of the dry country, and these and other like extensions may be beneficial to the sanitary conditions of districts.

The Annual Trade-Union Congress.—The Trades' Union Parliamentary Committee, of which Mr. Alexander M'Donald is president, and Mr. George Howell secretary, in exercise of the powers conferred upon it by the last Trade Congress at Nottingham, has just issued a circular to the various trade councils and trade societies throughout the United Kingdom convening the fifth annual Trade-Union Congress, to be held in Leeds in the first week of January next. The Congress is to last six days, and the details connected with its sittings will be under the superintendence of Messrs. Denton and Plockett, the president and secretary of the Leeds Trades' Council.

The Preservation of Alexandra Park and Palace.—A meeting was held on Thursday in last week at the Mansion House, for the purpose of enabling the Lord Mayor to report to the committee the result of an interview which he had had with the proprietors of the Alexandra Palace and Park. After doing so, it was resolved that,

"as the owners of the property are unwilling to sell unless a deposit of 100,000*l.* can be paid or guaranteed to be paid at a certain date to be named in the contract; and believing that if time be given to the skilled artisans and working men to subscribe money for the purchase of the property the whole of it will be forthcoming; believing also that the 100,000*l.* required to be paid as a deposit will be forthcoming by a certain day to be named in the contract of purchase, provided the Lord Mayor and sub-committee be able to purchase the property on such fair terms and conditions as they may consider to be fair and reasonable; that as soon as the terms of the contract shall have been agreed on, the Lord Mayor's suggestion be adopted of holding an evening meeting at the Mansion House."

A form of guarantee with regard to the 100,000*l.* was agreed upon, by which any deficiency which the guarantors might have to make good should be paid out of the first money forthcoming from the shareholders. An executive committee was formed for the purpose of collecting subscriptions for shares.

The Sand Process of Engraving on Glass.—A new step of progress in this very curious process has been made. It consists in the substitution of the force of mere gravitation for that of steam or blast power. A box, or hopper, of suitable dimensions, is placed near the ceiling of the room, and from it depends a small tube of about 8 ft. long. No machinery whatever is used. The sand or emery-powder to be used for engraving is placed in the hopper, and regulated by a slide at the top; it falls down through the tube, under the end of which is held the glass, watch-case, cup, or other object to be engraved. In a few minutes the designs are cut with a great degree of exactness and beauty. Sufficient protection is afforded by designs of paper being pasted upon the surface to be engraved, or by writing or drawing the design on the glass with gelatinous or india-rubber ink. The cutting-powder is used over and over again, being transferred from the tray in which the work is placed to the hopper.

New Music Hall in Southampton.—This place of amusement has been erected at the rear of the Royal York Hotel Above-bar. The large hall is nearly completed. The walls are divided by piers finishing above the main cornice, with circular tops, having a shell ornament on the face of same; from the cornice springs a cove, having circular-ended panels, fitted with enriched ventilating gratings. The ceiling is divided into three compartments. In the centre of each compartment or panel a large circular ventilating flower is introduced. Twelve smaller flowers are placed at regular distances, and from these the chandeliers will descend. Private boxes are provided at the east end. There is a gallery the length of the hall on the south side, arranged outside the main walls and over the entrance passage to the stalls. The stage is at the west end. The building was designed by, and is being erected under the superintendence of, Mr. Bedborough, architect. Mr. Gambling is the builder.

Fall of a Suspension Bridge, Paris.—The suspension-bridge known as the Pont de Constantin, erected in 1838, to connect the island of St. Louis with the Quai St. Bernard, has just fallen into the Seine. It was suspended to two cables of iron wire, to which were attached long rods supporting the planks. These had been gradually worn away by the continual oscillations caused by the tread of passengers, and the iron had become rusty, so that it had been undergoing repairs for nearly a month past. At about five o'clock on Tuesday afternoon, owing to the rupture of the cable on the side of the Jardin des Plantes, it gave way. About fifteen workmen were precipitated into the water, but were all rescued.

Proposed New Pier and Harbour for Newlyn.—A meeting of the promoters of the new harbour at Newlyn has been held at the offices of Messrs. Borslase & Milton, solicitors to the proposed company, under the designation of the Newlyn Harbour and Pier Company (Limited). The plans of Messrs. Trauson & Son were submitted and approved of by the meeting, and who are to be the working engineers, under the direction of Mr. N. Douglas, C.E., who will be the consulting engineer of the company.

The Albert Memorial Chapel, Windsor Castle.—A number of wooden cases, containing portions of the sarcophagus which is to adorn the interior of the Albert Memorial Chapel have arrived. The marble sculptures composing the sarcophagus were forwarded by Baron Triqueti at Paris, and immediately upon their arrival were deposited in the Albert Memorial Chapel, when the sarcophagus will be erected upon the floor of the interior, at the east end. An effigy of the Prince Consort will surmount the sarcophagus.

Extension of the Meat Market at Smithfield.—A meeting of the members of the Markets Improvement Committee has been held at Guildhall, to further consider the plans and specifications of the intended extension of the Metropolitan Meat and Poultry Market, Smithfield, and also to give directions for taking out quantities and nominating builders to be written to for tenders for the execution of the works.

Unveiling of Two Statues at the Wickliffe Congregational Church, Leicester.—The ceremony of unveiling the statues of Wickliffe and Latimer, which are placed in niches in front of the Wickliffe Congregational Chapel, London-road, Leicester, has been performed by Mr. J. Stafford (mayor). The attendance was not numerous. The statues are the work of Mr. John Finn, of the Midland-street Marble Works, Leicester, and are cut in white stone.

Mortuary for Warrington.—The Town Council of Warrington has determined to erect a public mortuary in their borough, and has fixed upon a portion of the borough cemetery, about a mile from the centre of the town, as a site for the building. In style the building will be Gothic, and it will be constructed chiefly of bricks, and with an open timber roof. Mr. R. Vawser, of Warrington, is the architect.

A Great Bridge over the Nile.—A bridge has just been completed spanning the Nile at Cairo. Its total length is 1,353 ft. and its width 38 ft. It is composed of girders resting upon stone piers, and the centre span swivels to allow vessels to pass through.

A Find near Rome.—We hear of the discovery of an antique statue near Aspra, not far from Rome. It is of white marble, life-size, and is described as representing a Venus naked to the waist, and of the best school of Greek art. It has been sent to Rocca-Antica.

Builders' Benevolent Institution.—We mention, with desire to assist, that the anniversary dinner in aid of this institution will take place on Thursday, November 7th. Mr. Edwin Lawrence will preside.

The Architectural Association.—The first trumpet to announce the opening of the Society season in London is blown as usual by the Architectural Association, who will lead off with a conversation next Friday evening, the 25th inst.

Hyds Park.—The Commissioners of Works have caused to be erected in Hyde Park a granite pedestal and iron standard surmounted by a board, to mark the spot where alone it shall be lawful to hold public meetings.

Fleet Sewer.—The Metropolitan Board of Works have entered into a contract with Messrs. Novell & Robson to carry out this work for the sum of £2,997l., Mr. G. Wall having withdrawn his tender for 54,000l.

Holloway Workhouse.—The roof of Holloway Workhouse being in a dangerous condition, the City guardians, to whom it belongs, have given order for its reparation.

The Crown Lands.—The net income from the Crown lands in the year ending the 31st of March last was 375,000l.

TENDERS

For alterations at the Lord Hill, Westbourne Park. Mr. Cotton, architect. Quantities not supplied.—
Brown £2,075 0 0
Capps & Co. 1,836 0 0
Kelly, Bros. 1,877 0 0
Beach 1,649 0 0

For the erection of nineteen cottages at Camberwell. Mr. H. Connew, architect:—
Allen (accepted) £2,800 0 0

For new house and warehouse, in Commercial-road, Whitechapel, for Messrs. J. Nixon & Sons. Quantities supplied:—
Thorpe £1,590 0 0
Shedfield 1,473 0 0
Wicks & Langley 1,387 0 0
Moyle 1,360 0 0
Ennor 1,820 0 0
Brown 1,313 0 0

For the erection of seven dwelling-houses, with shops and other premises, St. Andrews-road, Hastings, for Mr. John Woodcock. Messrs. Cross & Wells, architects. Quantities supplied:—
Bridgland £7,372 0 0
Jones 6,390 0 0
Parks 6,313 0 0
Yidler 6,223 0 0
Longhurst 6,157 15 0
Avard 5,872 0 0
Stentford 5,100 0 0

For offices and stalls on the Hastings and St. Leonard's Promenade Pier, Messrs. Cross & Wells, architects. Quantities supplied:—
Partly Roofed with Lead,
Howard £3,350 £3,475
Yidler 3,270 3,000
Tupper & Carr 2,980 3,066
Brown 2,971 3,030
Avard 2,971 2,978
Jukes, Coulson, Stokes, & Co. 2,935 3,013
Fatman & Fotheringham 2,829 2,978
Stentford 2,793 2,830

For warming the Pavilion on the Hastings and St. Leonard's Promenade Pier with hot-water apparatus, Messrs. Cross & Wells, architects:—
Truss £368 0 0
Bacon & Co. 850 0 0
Jukes, Coulson, Stokes, & Co. 730 0 0
Cheale 725 0 0
Smeaton & Co. 710 0 0
Huggatt 690 0 0
Jennings 676 0 0
Barrow & Wilson 670 0 0
Fraser, Bros. 615 0 0
May 598 0 0
Jones & Son 578 10 0
Alderton & Shrewsbury 570 0 0
Wootner & Smith 535 0 0
Cunning & Edmonds 500 0 0

For building new schools, &c., in Church-court, Kensington. Mr. Gordon Hills, architect. Quantities by Mr. William Smith:—
Chapple £6,135 0 0
Patman & Fotheringham 5,975 0 0
Myers 5,921 0 0
Hockey 5,709 0 0
Higgs 5,693 0 0
Sawyer 5,693 0 0
Hills & Sons 5,155 0 0
Dove, Bros. 5,135 0 0
Stimpson & Co. 5,275 0 0
Manley & Rogers 5,087 0 0
Cullum 4,894 0 0

Reinstating Mount Ash-road, Upper Sydenham. Messrs. Cortis & Parier, architects:—
Lawrence £100 0 0
Clark 165 0 0
Cole 130 0 0
Wood 123 0 0

For alterations and repairs to seven houses, Quaker-street, Spitalfields, London. Messrs. F. & W. Stone, architects:—
Petigrew & Moyes £472 0 0
Anley 439 0 0
Langmead 435 0 0

For alterations and additions to factory, No. 65, Mansell-street, Whitechapel, for Messrs. J. Jacobs & Co. Mr. John Hudson, architect:—
Wall £290 0 0
Little 753 0 0
Read & Son 716 0 0
Jacobs 694 0 0

For Stanningfield new Parsonage-house and stables, &c., near Bury St. Edmunds, Suffolk. Mr. E. Christian, architect. Quantities not supplied:—
Allowed for old House Materials.
Rednal £2,450
Pearson 2,550 £10
Sanders & Bolls 1,836
Vickers (accepted) 1,522 50

For new school at Stanstead, Suffolk. Mr. Fowler, architect. Quantities not supplied:—
Scott £246 0 0
Cadge 251 13 6
Pearson 237 0 0
Theobald 219 10 0
Smith (accepted) 291 13 0

For the erection of vineries, melon-house, and sundry works at Shooter's-hill, for Mr. N. Carter, Mr. G. Judge, jun., architect:—
Blake & Lamplen (accepted) £300 0 0

For new Wesleyan Chapel, Nunston, Warwickshire. Mr. W. S. Burton, architect. Quantities supplied:—
Marriott £1,850 0 0
Linnells 1,570 0 0
Towers 1,436 15 2
Neal 1,350 0 0
Sackree 1,350 0 0
Hardy 1,290 0 0
T. & G. Harford 1,247 15 0
Spencer 1,133 13 8
Fox & Hood (accepted) 1,160 0 0

For wool-spinning mill and offices, Newark-street, Leicester, for Messrs. Drierley & Sons. Mr. W. S. Burton, architect. Quantities supplied:—

For Building.
Bland £3,795 0 0
Ratcliffe 3,754 0 0
Monte 3,687 0 0
Dexbury 3,663 5 0
Osborne, Bros. 3,460 0 0
Neal & Sons 3,457 0 0
Scott 3,420 0 0
Hatchinson 3,409 0 0
Eagle (accepted) 3,378 0 0

For Ironwork.
Richards £1,121 0 0
Pegg 1,068 11 0
Cort & Paul 1,033 0 0
Gimson & Co. (accepted) 1,033 0 0

For pulling down and rebuilding Nos. 15 and 17, Great Cumberland-place, for Mr. G. E. Peters. Mr. Seward, architect. Quantities supplied by Mr. W. W. Gwyther:—

Credit.
Old Materials.
Brass £8,595 £85
Perry 8,270 180
Lucas 8,050
Monte 8,052 162
Hayward 8,095 210
Myers & Son 7,849 300
Axford & Co. 7,827 189
Allen & Son 7,697 159
Axford 7,502 119

For new public elementary schools for 1,520 children, at Wilmot-street, Bethnal-green, for the School Board for London. Messrs. John Giles & Gough, architects. Quantities by Mr. C. H. Goodall:—
Thornton £11,500 0 0
Gammon & Sons 11,210 0 0
Nixon & Sons 11,102 0 0
Webster 11,079 0 0
Brass 10,995 0 0
Nightingale 10,800 0 0
Cooke & Green 10,673 0 0
Morter 10,745 0 0
Higgs 10,457 0 0
Sheffield 10,389 0 0

THE Celebrated GRANITIC PAINT. Manufactured Solely and only by the Silicate Zopissa Company, Granitic Paint Company. For price lists, testimonials, and patterns of colours, apply to THOMAS CHILDS, Manager, 39a, King William-street, London, E. C.

THE SILICATE ZOPISSA COMPOSITION.—TO CURE DAMP IN WALLS and Preserve Stone, &c. from Decay. Manufactured Solely and only by the Silicate Zopissa Company and Granitic Paint Company. For particulars and testimonials, apply to THOMAS CHILDS, Manager, 39a, King William-street, London, E. C.

THE NEW PETRYFIFYING SILICATE PAINTS. Manufactured by the SILICATE PAINT COMPANY, LIVERPOOL, in all Colours. FINE HOUSE, SHIP, AND GENERAL USE, have the following valuable Properties over ordinary Lead Paints:—No chemical action on Iron or other metals. Will stand any degree of heat without blistering. One cwt. will do the work of two cwt. of Lead Paint. Non-poisonous. Absence of smell. Their hard petryfying nature.

These Paints contain Silica in a peculiar form, extracted from a mineral of volcanic origin, only as yet discovered in a single deposit, rendering the surface of iron and wood indestructible and unchangeable, guarding the paint to petryfy. It has no chemical action like lead paint when applied to metal; it sets quickly, and dries as hard as marble; its covering properties are so much greater than ordinary paint that it is the most economical of all paints, and retards the action of salt water.

It is particularly adapted for Paving purposes and all kinds of Out and In-door Iron and Wood Work, Railway Bridges and Carriages, Iron Houses, Ships' Bottoms, Mining Plant, and all descriptions of Wood and Iron Work.

DAMP WALLS, DAMP CHURCHES, &c. CURED by the PETRYFIFYING LIQUID, at a cost of 2d. to 3d. per square yard.—See article in "The Builder," March, 1872. For Particulars and Testimonials, apply to the SILICATE PAINT COMPANY, No. 24, FENWICK-STREET, LIVERPOOL.

Wholesale Agents for Bellamy's Patent Grinding Machines.

The Builder.

VOL. XXX.—No. 1551.

The Materials of the Architect.

ELECTION of materials for architectural use is a subject that so continually demands the attention of the architect, the engineer, and the builder, either directly or implicitly, that it is desirable from time to time to review our knowledge of the subject, and to see how far new discoveries, or local or even temporary causes, may tend to modify our practice.

The chief considerations which should regulate the selection of material for any structure are, on the one hand, hygienic qualities, durability, and beauty; and, on the other hand, economy. We place these qualities in two distinct categories, because it is thus, for the most part, that they are regarded; whether properly or im-

properly remains to be seen. Under the head of economy rank the questions of local convenience and supply; and these again are often closely connected with the sanitary qualities of a material, whether as a conductor or non-conductor of heat, an absorbent or non-absorbent of moisture, or with reference to qualities yet more subtle, as to which scientific investigation is yet in its infancy. But there seems to be good reason to hold that, apart from the physical properties to which we have referred, there are others the nature of which we have as yet been unable to grasp, but the effect of which is more direct on human health than may be at first imagined. We see this very clearly marked in the selection of site. Apart from any question of drainage, there is a difference, which we will not for the sake of expressing what we mean, speak of as of something resembling a magnetic or electric character, directly due to the chemical nature of the soil, which is most sensibly perceived by delicate or unhealthy persons, and which we may thus be justified in regarding as of some importance to us all. Such, for instance, is the difference experienced by many persons between residing on a clay, a sand, or a limestone soil. This cannot be attributed altogether to hygrometric causes. For we may instance the "rab" of Pembrokeshire, which is a species of stratified clay, so indurated that it breaks into small fragments that may be used as gravel for paths and footways. The soil above is dry from the innumerable fissures of this geological rock, and yet the peculiar effect of clay soil on delicate health is experienced by those who reside on the soil, and who give attention to such subjects. Again, those who have resided on a volcanic soil, such as the Italian *tufa*, are well aware of the extreme fatigue which attends walking on the surface. This is not a question of latitude and solar heat; for on limestone soils, in the immediate vicinity, this special fatigue is absent. We have here a direct illustration of the relation between soil, site, and structural materials. When in our own country, the natural asphaltes which are imported are used for pavements or roadway,

something of the fatigue experienced on the *tufa* soil may be detected by the pedestrian. On the other hand, a marble floor, or a marble staircase, in a *tufa* country, gives a freshness and vivacity to those who command such a domestic luxury which is well known to persons of experience; and which is not at all dependent on causes to be detected by the thermometer.

There are many things which lead us to suppose that there is something specially akin to human health in the earth, whether we regard the mass of the planet or the mixture of various elements that forms good agricultural soil. The marvellous powers of earth as a disinfectant, though long known, have been only recently brought into prominent notice. Lime and clay each has its special value; and the experiments that are in progress as to the deodorisation of sewage by the admixture of these simple materials deserve attention. Again, the benefit to health that is often obtained by sending a sickly child to follow the track of the newly-turned furrow, is not a mere result of air and exercise. The warmth and substantial comfort of a turf bed, such as those which rise, like mushroom cities, along the course of great public works, cannot be spoken of as they deserve, except by those who, like ourselves, have made experience of them. They have, no doubt, like thatched roofs, their special disadvantages. We are not about to advocate a return to the aboriginal wigwam; but we say that there is so much that is good in this rudest form of dwelling, that it is well worth the attention of the builder how far earth that is thoroughly dry and protected from moisture may be rendered more available than is our present custom for increasing the comfort and sanitary excellence of our dwellings.

Earth, it may be replied, is what we do use, in the greater part of England, in the form of brick. The reply is not exactly correct, as the use of clay for the material of bricks is the selection of the species of natural soil which is least favourable to human health for the staple of our building materials. Yet, even so, there are special advantages proper to brick. When well burnt, it is by far the most durable of materials. Neither metal nor stone can compare with it in this respect; and not only is this true with reference to durability, under ordinary circumstances, but it is especially true with regard to the terrible casualty of fire. It is on evidence, from the results of the operations of the Fire Brigade, that neither stone nor iron can be relied on when exposed to great heat. The stone flies, the cast iron cracks, the wrought iron bends and yields. In transmitted heat alone,—that is to say, great elevation of temperature without actual exposure to flame,—a wooden staircase has been found safer than a stone one. Solid beams of wood are considered, by the experience of the Fire Brigade, far more reliable than iron standards. Again, the superiority of a tile roof, for the maintenance of a mean temperature in a house, over one of slate, is very great. In this case, indeed, it is rather owing to the relative thickness of the roofing stratum than to any other quality, as clay passes into slate by imperceptible degrees; but the difference in the action, as regards the sensible comfort of the inmates of a dwelling-house, of a tile roof and of a tile floor, is very deserving of attention. If the influence which is either transmitted or arrested by the clay be of a nature akin to terrestrial magnetism or electricity, we may form some idea why a tile roof should be a comfort and a tile floor a discomfort.

Recent improvements of various kinds, and the knowledge which the International Exhibitions have served to spread, have turned the attention of the architect to the use of terracotta in building, of which we have not infrequently spoken. But it is matter of very serious regret that nothing seems to arrest the increasing

deterioration of ordinary building bricks. Their extreme roughness is such as to demand a quantity of cement altogether disproportionate to that used by the old bricklayers. We use the word in its general, and not in its special, sense. With the increase in the quantity of cement employed comes an increased temptation to mix it with inferior materials. Thus the main good quality of our brick buildings, their durability and defiance of weather, is becoming seriously impaired by the struggles of the brickmaker to use every sort of earth obtainable.

The main architectural novelty of the last twenty years has been, as most of our readers are aware, the increased use of iron as a building material. This has reacted on structure, and on pictorial design. In some instances the action has been most desirable. Thus we have attained a power of covering large apertures, whether with heavy rolling weights, as in our estuary and intra-mural railway-bridges, or in the way of mere shelter, as in railway stations and slip-roofs. We find a legitimate and admirable use of iron in such structures as the Albert Hall. We regret the power of bigness which has been placed at the command of the builder in such places as the Charing-cross and Cannon-street roofs. But there are so many and so great objections to the use of iron as a building material that it is well to review them.

To a certain extent, we may speak of these objections as, in the main, economical. But economy is not all,—or, at least, the word must be taken to include the economy of life. It is only the other day that the traffic on the St. John's Wood branch of the Metropolitan Railway was arrested by some threatening symptoms in the bridge over the Regent's Canal. The company are to be congratulated on their vigilance, as one of the main evils of iron as a structural material is the entire absence of warning before fracture.

Then we have to bear in mind the constant invitation which any unprotected surface of iron continually offers to the subtle and destructive power of rust. Careful and constantly-renewed painting is of vital importance to the durability of iron. In large exposed spaces where the metal is thin and outspread this source of danger becomes disproportionately large. Thus, on the one hand, all those fittings and ties which are exposed to atmospheric influence (as to which the fact of being under cover is not of so much importance as might be imagined), but removed from ready inspection and access, and, on the other hand, those plates and sheets which cover large areas with comparatively small weights of metal, are sources of danger which the architect who builds for posterity will carefully avoid.

Added to its structural fickleness, especially when exposed to fire, and to its liability to stealthy erosion by rust, is another peculiarity of iron that will render the provident designer very chary of its use, except in those circumstances for which no substitute can be readily procured,—that is, the great fluctuations of price to which it is subject. These amount, as we have recently seen, to 300 per cent. Fluctuations in the price of labour, and thus of materials, are among the difficulties with which the architect has always to reckon. But nothing that has yet occurred among carpenters, masons, or bricklayers, either as regards the materials on which they work or the wages they may demand, is at all comparable to the violent fluctuations that take place in the price of iron.

A further caution to be observed in the architectural employment of iron depends on the excessive variability of its tensile and compressive strength. In bar iron there is a difference in tenacity, between the best Yorkshire bar and the ordinary merchants' bar, of 40 per cent. In elasticity, the difference is yet larger, amounting to 75 per cent. over the minimum, or average of from 14,000 to 8,000. In toughness, the work

done in breaking a 1 in. bar, 1 ft. long, differs from 730 to 3,700, the best Yorkshire iron having eight times the tenacity of the common bar, and the disproportion in plates being even greater. Even in specific gravity differences occur to the amount of 22 per cent. It is therefore evident that, when we speak of iron, we speak of a group of metallurgical products differing, as much as if they were known as distinct metals, in all the qualities which are of value to the architect; although they may very closely agree in one of the properties with which he has to contend, viz., liability to corrosion. Absolute test, in the case of any important ironwork, is a *sine qua non* for the engineer. And the tests, to be worth anything, must be applied either to the whole supply, or to samples selected at will by the purchaser, without any communication with the provider. We could give striking examples of the manner in which iron is got up for special testing; and we believe that Mr. Kirkaldy, the inventor and proprietor of the best mechanism employed for the purpose of testing iron of any kind, could tell much more.

But even this is not all. It is now seventy-one years since the first successful application of cast-iron beams to the purposes of building, which took place, according to Mr. William Fairbairn, in 1801, in a cotton-mill at Manchester, after designs by Messrs. Boulton & Watt. Tredgold's work was published in 1822. Mr. Hodgkinson commenced his well-known inquiry into the strength of iron beams in 1827; and we have a Parliamentary Blue Book, the report of the commissioners appointed to inquire into the application of iron to railway structures, which dates in 1819. Yet on a subject which certainly ought, by this time, to have been reduced to scientific certitude, we have recently seen published a new treatise, in which the author establishes at all events a *prima facie* case, to the effect that in all the wrought-iron beams that are constructed according to the *formule* now generally accepted, fully one-sixth part of the iron employed is wasted; while in cast-iron beams, repeated applications of the recognised working loads will subject the upper flange to a repetition of the proof stress, and are thus likely ultimately to cause failures. Thus, in a word, iron, as an architectural material, is not perfectly understood in its scientific theory; is subject to extreme variation in quality; to a variation in price of from one to three; and to the never-failing action (unless carefully counteracted) of the corrosive elements of the atmosphere.

Our recent experience with regard to stone has been enlarged in both an upward and a downward direction. How far stone, which has not been carefully selected from a known bed, is from being a durable material, or even from equalling the durability of wood, may be estimated by any architect who will take the trouble to examine the condition of the New Palace of the Legislature at Westminster, and any of his own buildings. The most striking instance within the range of our own personal experience is the case of St. David's Cathedral. Beds of red and purple sandstone, of colours most charming to the eye, are to be obtained in Pembrokeshire, which are almost indistinguishable on inspection, when first quarried; but which differ in their durability as much as Portland and chalk differ. Nash, the architect, restored St. David's in his time. He used some of the perishable stone, and much of the restored work is more decayed than that which it replaced. Some of this stone was used in the station buildings of the South Wales Railway, to the great satisfaction of Mr. Brunel's staff in the first instance. Symptoms of decay, however, soon made their appearance; but were arrested by the application of a silicate.

On the other hand, we have recently had the opportunity of comparing the condition of massive stonework that may be definitively assigned to known dates, differing from each other by periods of 540 and 570 years respectively, the most recent of which is 1,900 years old. We refer to the results of the exploration of Jerusalem by Capt. Warren, which are such as to enable us to identify with certitude, in certain points, the work of Herod, of Nehemiah, and of Solomon. Of the former, which was constructed without cement, but with the joints strengthened by mortises and tenons in the solid stone, there are stones now *in situ*, with the quarry marks, in red paint nobilitated, in perfect preservation. There are others of the same or later date, much decayed. The result of the observation is, that in 2,800 years the difference in durability between stone from different beds in the same

quarry has been such, that we have reached the limit of that of the inferior quality. It may be said that this is a long life for masonry. We may contrast it with the cathedral work to which we have before referred. The result is, that or a stone building on the durability of which the architect desires to rest his fame, the selection of bed is a matter of as much importance as the selection of quarry. No beauty of appearance, or behaviour under the pick or the chisel, is a proof of durability. Actual experience of the power of any particular stratum of stone to resist atmospheric influence, can alone assure the builder that he is working securely for the future.

It ought to be hardly necessary, in the present day, to call the attention of the architect to the extreme danger of an intermixture of iron and stone, or, indeed, of iron and brick. When brought into direct contact with mortar, nothing will prevent the slow erosion of iron. It is not necessary for the atmosphere to have access. The materials requisite to allow of destructive chemical change are to be found in the iron and in the mortar. And it is not merely the gradual disintegration of the former that is to be feared. That would be a source of positive danger, so far as the tenacity of the iron had been depended on by the builder. But the evil is active and unceasing. Beds of rust, of three or four times the thickness of an ordinary iron plate, grow within the structure, with an energy as destructive as that which is exercised by the roots of plants. The marble sarcophagus of King Henry VII., is an instance of which we can speak from personal observation. Most of the metal work of the beautiful structure was either copper or brass. But there were iron plates introduced as washers between the horizontal slab and the walls, which behaved exactly as we have described. They coated themselves with beds of rust, of three times their thickness, and were, when removed, slowly shattering the tomb.

Hoop iron laid in as bond to brickwork is a not unmechanical method of increasing cohesion to a very considerable amount. But it requires care that it should not become an engine of destruction from its chemical action. Such is invariably the case when it is laid in mortar. In cement, however, the destructive action does not occur. The iron lies chemically dormant, and does its mechanical duty. But in all cases where the use of metal is absolutely necessary for the support of masonry,—as, for instance, where a delicate pinnacle, or the acute quoins of a skew arch, are pierced with a bolt,—we most strenuously urge the use of copper.

We do not wish to introduce moral reflections into an architectural inquiry. But it is impossible to investigate the question of durability of building material without being struck with the immense difference in the treatment of their work by ancient and by modern builders. Men build now for a livelihood. We do not speak of this as discreditable,—far from it. Yet it has the invariable accompaniment of the temptation to build cheaply, and therefore not durably. The old builders wrought for durability. The Great Pyramid, or the Great Temple Enclosure, or the mysterious Stonehenge, might have been executed at the tenth part of their actual cost, and so as to have presented, when spick and span new, as brilliant an appearance as could ever have been their pride. But where would they have been now? Where will any of our public buildings be, we will not say 3,000, but 300 years hence?

THE ANTIQUE, AND MODERN STUDY.

So many differences there are between the way of bringing into existence an art work in these modern times, and that of doing the same thing in times gone by, that one hardly knows what special difference to select that shall most interest those students of art who care to go into such matters. We will know that it is too theoretical and abstract, and unpractical for many; but to the few who can see into it, it is a matter of no small interest, for before *practice*, or a change in practice, there must be *theory*, and thought, more or less. What very remarkable difference, therefore, is there between the old art action and the new, which shall take in, so to phrase it, the greatest possible sum of difference between the two systems? We think we shall be safe in saying that in no one respect is there a greater distinction between the old or past method of artistic procedure and the new, than in the fact, so seldom if ever noticed, that the old art, as the

Greek sculpture, came direct from nature, while modern sculpture for the most part, and always in the Royal Academy Schools, comes from "precedent," i.e., sculpture produced in past days by almost extinct races of men. It is almost impossible to imagine in these times what the position of a Greek sculptor was. With his block of marble before him, as yet unshewn, his mallet and chisel in hand, and with every mental and bodily capacity to do the work, what did he go by without precedent, or "ancient examples," to adopt a favourite phrase? Let any one who thinks this commonplace, fancy, if he can, what our Royal Academy would be were the "antique" away from it. What would be said, what done? No man can imagine. But yet this was the precise position of the old Greek, and we may fairly add the Roman, and most surely the still older Etruscan. Yet did the Greek with all this lack of our artistic helps, do his work right well, as the Greek fragments and remains in the British Museum alone will evidence to any one who will give but a little thought to it. "Imaginative power" of the highest order, say some, did the work: it all lay in the mind,—what need of precedent? Then there is the "anthropomorphic" theory, as adopted by Mr. Gladstone; and then again the notion that the "haphazarding" of Homer, and his inspiration, wrought such wonders out of the dull and formless marble. All or any of these, for we need not go into the controversy just now, may or may not be true, or may or may not account for what the Greek did; but of one thing we may be quite certain, that the great sculptors of Greece could not but see the fine and noble forms about them, and seeing them, could not but admire and be impressed by them, and influenced by the magic of their constant presence. To see was to profit practically by the seeing. The impression once made could not be effaced, and the power of mind and hand could not but be helped, nay, almost created, by the perpetual presence of such well nigh perfect models: not still and lifeless, and void of expressional power, as our academy models are, but ever living and moving in the common and every-day Greek life. What need of "precedent," indeed, could there well be for those who have created precedent for us? What precedent could there be for the production of the perfect Theseus, or, according to Canova, the yet more perfect Iliuss?

If all this be not a little curious, and significant of the difference between the old and the new,—between the antique mode of doing things and our modern and, as some will, perhaps, say, improved method of work,—there is yet a more singular evidence of the vast change that has taken place in principle between the old-world ways and the new and modern. It is, and we ask attention to it especially, that of the little use made in such a place as the Crystal Palace of a collection of antique examples. Let us explain. In the Royal Academy, as is so universally known, the "antique" is everything. It is the life, and soul, and body, of the place, as an art-school. The antique in it lives again,—a sort of galvanic life only, it is true, but still there it is all and everything, the only true foundation and guide to art-action. But at the Crystal Palace all this living antique is no longer the all-animating inspiration, but is found to be nothing more than a collection of interesting fossil bones,—mere antiquities,—neither more nor less,—interesting to the student of history and the instructed sight-seer, but no longer the guide to actual action of any kind. The Crystal Palace action, as all know, is made up, to a great extent, of what may be termed amusement,—artistic amusement, if you will. Quoit-throwing, running, dancing,—dancing, prohibited almost everywhere else,—gymnastics of very various, if not actually classic, kind: all these things are done instinctively, and because people naturally like them, and like to look at them; but who ever saw any one human being, whether art-student or not, attempt to imitate the antique in any way whatever? Whoever, for instance, ever thought of casting even so much as a glance at the "Discobolus," for the purpose of classically handling the *discus*, or throwing it well? Who has ever thought of looking to his own "muscular development" by the side of the "Fighting Gladiator," to find out, it may be, what progress, if any, has been made in the vast interval between the days of old Homer, or Phidias, or Miron, and our own in the facts of muscular development, of increased strength of arm-power, or of hand-grasp, or of flexibility of foot, or indeed of anything which could or may have

been added to the *power* of living humanity? No one, of course, has ever thought of this for a moment, and still less has any one ever dreamed of acting upon it. Yet why not? If to multiply "sculpture," to make new statues, to study how to draw the "figure" or how to become a great sculptor, it is necessary to go to the antique, and to copy it, and almost religiously to imitate it why should not the modern gymnast, and lover of muscular action and the exercise of the bodily powers, go direct to the glorious antique, and learn of it, and, if not directly to imitate it, as they do at the Academy, in learning to draw it, to, at least, be guided by it, and to have it ever and always in view, and within call, so as to be able to refer to it, and test power by comparison? We say, why should not this be? For if the insensible marble be necessarily lifeless without perpetual reference to the old Greek antique, why should not the living athlete be alike mortal of it?

These things cannot but strike the thoughtful student of art with a little astonishment, for the impression made by the antique being so powerful, it seems a wonder that it has not a greater practical and common influence,—influence that is on every-day life; and we cannot but think that there is, and must be, a germ at least of a right good idea in it. The Greeks and Romans! What would all our schools and colleges be without them, and their memories, and writings, and wonderful ways? We yet live on them, and dream about them, and in "sculpture" certainly, if not in architecture, and in decoration, imitate them as closely as we can. A wonderful race of artist men! We are all led to these thoughts on old Classic times every now and then, for the modern cultivated man could not live without the "Classics" in some form or other. Even a Latin play, acted out by college students, in Westminster, is a something, and in spite of all sorts of hindrances and odd mistakes, and an almost unpronounceable language, school-boy Latin, it seems somehow or other to carry one right into the great times when the plays were written. Could not this idea of seeing into the old Classic ways be extended, if only a little? Mr. Thomas Carlyle in his last lesson to the modern student, and on a very special occasion, emphatically recommended the study of the Greek and Roman writings and ways; and it is quite certain that, whatever their failures and shortcomings, there was very much in them well worth the looking at, and very careful study, if not imitating; and it seems strange that more has not been done to give it expression, and to place the semblance of it before the mental and bodily eye of the art-loving public.

We have noted the action of the Crystal Palace as one of some singularity if carefully looked at, and that of the Royal Academy as one equally so in another direction, and the thought has struck us more than once, could not these ideas be extended, and, may be, combined somewhere,—say,—for there would seem to be some small difficulty in spite of every effort to utilise it,—in the Alexandra Palace. That building is now a blank space, and no one seems to know well what to do with it, or in it. Could it not be made effective for real, and *bona fide* artistic purposes? There is ample room for it, we should think; for the general public, truth to say, see but little or nothing of art in action. Let us, by way of example, and to make our meaning as clear as may be,—a little difficult, for the thought is somewhat new,—cite *horse-racing*. That there should be a *racecourse* in such a place, and in connexion with such a building, may seem somewhat strange, but the *fact* is quite certain, there is a *racecourse*, and it has been on more than one occasion brought into practical use. Horse-racing in this country is pretty much the same everywhere. Horses, men, mode of riding, dress, and all the surroundings are the same, and no one can deny that it is "popular," and meets the wants of a large bulk of the British public. It fills the pulpit eye, and everybody is satisfied; and the whole show is to the British man an artistic display, quite as much so as the famous Olympic Games were to the ancient Greek, or the great Gladiatorial shows to the Roman.

Of all this no one can or will doubt, though the facts are somewhat of the strangest, but not more so than the conclusions that may be drawn from them or the lessons that are to be learnt from them. No one who will with some patience go into the subject will dispute the fact of how much the Greek got out of his great Games artistically. They were, indeed, his "pre-occupant." In them he found his models, and his life and action, and could make out of them the

pictures,—the status-pictures, if we may use the term,—which we see and go by, and try to copy, but only in despair, and call the "antique." Of the magnificent power displayed in those wonderful fragments no one needs to be told, or that they are truly representative of the antique classic life. But turn to the modern horse-race, and look at it as an artistic show and as the precedent out of which to create an artistic work, capable of being placed side by side of the Greek work, even supposing the art-power of the *executive* artists to be the same. What must be the art result? It is surely needless to say, or even to hint at it. It must fail, the conditions being so different. How much, therefore, must there be to learn, and what a really useful purpose might the now empty Alexandra Palace be put to if filled with instructive evidences of the highest artistic power, and a "school" in combination with it, for the purpose of making it all practically useful. Much might be added in detail to show how all this that we have thus hastily glanced at, might be best worked out; but we must be content to simply indicate the way.

VARIETIES IN RAILWAY GAUGE.

THE Government of New Zealand has wisely determined that the railways they are about to lay down in the colony are to be on the comparatively narrow-gauge of 3 ft. 6 in. The "huddle of the gauges" has been a long and obstinate conflict, and has extended to very remote regions,—to India and Australia,—but there is no reason for any contest in New Zealand, where the question of working junctions with existing lines can scarcely be said to present itself for the embarrassment of the question, the lines now or about to be commenced being practically the beginning of a system of railways for the entire colony; with this notable exception of an existing line in the province of Canterbury, which includes a work of the same nature, and nearly equal extent, as the once celebrated Box tunnel in this country.

The history of the gauge question is interesting, and presents some curious features. The prevailing impression probably, amongst those who are not called upon to interest themselves specially in railway matters, is that there are two gauges only,—the prevailing 4 ft. 8½ in. gauge, adopted by George Stephenson, and the 7 ft. gauge laid down by Brunel on the Great Western system. The fractional ½ in. in the ordinary narrow-gauge may appear whimsical, but it is accounted for very easily. Railways, as they are, are a growth rather than a creation. They were preceded first by wooden tramways, then by plateways, next by flanged rails, and finally by flanged wheels running on iron rails. The ordinary gauge of carts and wagons that were used upon the primitive tram, plate, and flanged railways, was 4 ft. 8 in. This width was found to answer very well practically, and when the flanges were changed from the rails to the wheels, it was retained, no reason presenting itself probably for an alteration, which if made would have caused considerable disturbance and cost in the adaptation of rolling stock: 4 ft. 8 in. was really the gauge; the odd ½ in. was added to afford play without side friction. The gauge served its purpose on the Stockton and Darlington line. Stephenson looked to a future when, as he said on an occasion to his son Robert and John Dixon, "Railways will come to supersede all other modes of conveyance in this country,—mail-coaches will go by railway, and railways will become the great highway for the King and all his subjects. The time is coming when it will be cheaper for a working man to travel upon a railway than to walk on foot. What I say will come to pass, as sure as you live. I only wish I may live to see the day, though that I can scarcely hope for, as I know how slow all human progress is, and with what difficulty I have been able to get the locomotive adopted, notwithstanding my more than ten years' successful experiment at Killingworth." The result, we need scarcely say, has even exceeded Stephenson's most sanguine anticipations. Having such views, it was natural that the same gauge should be adopted for the Liverpool and Manchester line as that upon which the Stockton and Darlington line had been laid. Very early in the history of railways, a curious accident led to an unintentional diversity of gauge. At the same time as George Stephenson was giving evidence in favour of the Stockton and Darlington line in one of the dingy committee-

rooms of the old House of Commons, the Llynvi Valley line was being promoted in another. The principal promoter of the South Wales line, inspired probably by Stephenson, and sharing his belief in the ultimate reticulation of the country by railways, prepared for the future junction of the Llynvi line with the Stockton and Darlington by adopting the same gauge,—a junction, however, which was never to take place, from the inadvertent mistake of placing the flange on the *outer*, instead of the inner, side of the wheel, and making the gauge so much less, by the thickness of the two rails, than 4 ft. 8½ in. The old Llynvi road was so laid, and for many years served usefully as a mineral line. Portions of this old railway still remain, although not now used, and others have been incorporated with the amalgamated Llynvi and Ogmore system, by which the original Llynvi has been absorbed. The communication with the North has only recently been completed; and it is a curious fact that the first "foreign" wagon that came upon the Llynvi and Ogmore, a few months since, was from the Stockton and Darlington line, forty-five years after the Llynvi Valley Act was obtained, 6th Geo. IV.

The question of increasing the width of gauge arose with Isambard Kingdom Brunel, engineer-in-chief of the Great Western Railway, an imaginative, self-reliant, and daring genius, who was thoroughly averse to follow any man's lead in the gauge of a railway, the design of a bridge, the construction of an engine, or ought also coming within the *role* of the engineer. He aspired to make the best possible road, irrespective of cost; the Stephensons, father and son, were content to make good and safe roads that would *pay*. Brunel's adoption of the 7 ft. gauge for the Great Western, opened the question, and led to the long and keen contention not yet settled. Engineers sought for perfection in a *via media*, between the 7 ft. and the 4 ft. 8½ in. gauges; but no one at first proposed a gauge narrower than that last named. The arguments in favour of the broad gauge were, that greater steadiness would be secured, and higher speeds attained with safety than were possible with the narrow gauge. To give better space for the machinery of the locomotive, to secure greater steadiness and higher speed, it was thought that the 4 ft. 8½ in. gauge might be widened with advantage, and without material increase to the cost of the line or of the rolling-stock. For the Eastern Counties a gauge of 5 ft. was adopted. In Scotland some short lines were made with a gauge of 6 ft. Ireland could not, of course, be affected by the question of junctions with British lines; but the promoters of Irish railways might have been expected to be influenced by the consideration of junctions between lines in their own island. Thus they do not seem to have been, seeing that the Ulster company adopted a gauge of 6 ft. 2 in., and the Drogheda company a gauge of 5 ft. 2 in. The Irish Board of Works had much more contracted notions, feebler faith, and shorter sight, than George Stephenson, as to the ultimate extension of the railway system. When he was consulted as to the gauge of the Carbury and Whitstable and the Leicester and Swannington railways, he said,—*"make them both alike; they are a long way apart now, but they will be joined together some day."* When complaint was made to the Irish Board of Works as to the discrepancy of gauge, their reply was that "the two ends were complete; there was little chance of the intervening space ever being filled up by a railway, and that, therefore, there was no harm done." General Pasley, to whom the matter was referred, fixed the gauge for Irish railways at 5 ft. 3 in., which was different from three other gauges then in operation.

The question of gauge of railways is now presented in a totally different light from that in which it appeared fifteen or twenty years since, and the contention is not now between the 7 ft. and the 4 ft. 8½ in. gauge, but to how much less than 4 ft. 8½ in. can it be reduced? On the Great Eastern line the gauge was long since reduced to 4 ft. 8½ in. On many portions of the Great Western itself the 7 ft. gauge is abandoned, and the 4 ft. 8½ in. gauge substituted. Numerous important improvements have been effected in the construction of the locomotive, and much has been done to demonstrate the capabilities of narrow-gauge railways. Mr. Robert Fairlie has conclusively demonstrated with his "Little Wonder" on the Festiniog line, that heavy loads can be conveyed, with perfect safety, at fair speed, on a line with stiff gradients, and some curves of two and three chains radius, that has a gauge of not more than 1 ft. 11½ in. We have

travelled upon this "toy line," as it has been called, and were certainly startled by the quickness of the curves, and the daring nature of its sinuosities, as it ascends and descends the mountains between Portmadoc and Festiniog; but we could not fail, in the face of its immunity from accidents, and of its wonderful performances, to conclude that if a 2 ft. gauge line can do so much, and do it so well, a 3 ft. 6 in. gauge should be capable of doing anything that can reasonably be expected from railways or the locomotive.

Some of those most directly interested in the development of the material resources of India are urging that future extensions should be on a gauge of 3 ft. 3 in. instead of the 5 ft. 6 in., laid down by Lord Dalhousie's administration. The fractional $\frac{1}{2}$ in., like the $\frac{1}{4}$ in. in the English gauge, is probably an allowance for play. In Victoria there is an agitation for the reduction of the gauge for extensions from 5 ft. 3 in. to 3 ft. 6 in. In India the proposed narrow gauge for extensions is opposed by Colonel Kennedy, on the ground, chiefly, that the loosely-packed cotton brought from the interior cannot be carried upon narrow-gauge trucks. That is rather an argument for an improved mode of packing, than for the construction of hopelessly unremunerative broad-gauge railways. In the International Exhibition, just closed, a bale of Indian cotton, pressed by West's hydraulic press, was shown compressed to the density of timber, and hard enough to hold a nail driven through the hoop-iron lashing into the cotton as firmly as it could be held by a deal plank. Every separate cotton plantation might not have its own press, or full work for one, but packing stations would surely be practicable, and narrow-gauge branch railways that would give a reasonable prospect of a return upon the capital expended upon them, would be an immense improvement upon the bullock drays by which the cotton is now dragged tediously to the stations on the trunk lines. If a given weight of cotton as packed cannot be carried upon one wagon on the narrow gauge, it may be carried on two. The narrow, as compared with the broad gauge, effects a large saving in the road-bed, in cuttings, tunnels, and embankments, in rolling stock, in dead weight, in working expenses, and in other respects. In many localities at home, abroad, and in the colonies, where railways are greatly needed, comparatively inexpensive narrow-gauge lines furnish the only possible or satisfactory solution of the important problem of "railway or no railway."

In New Zealand, free from the embarrassing element of physical junctions, and where the principal commodities carried will be mineral and agricultural produce, including wool, the 3 ft. 6 in. gauge may be confidently expected to answer satisfactorily all requirements.

THE LATE MR. ALLOM, ARCHITECT.

On Monday, the 21st inst., Mr. Thomas Allom, architect and artist, died at his residence, Barnes, Surrey, of disease of the heart, after several weeks of severe suffering, which he endured with an exemplary patience. Mr. Allom was born in London, March 13th, 1804. Showing early signs of artistic talent, he was articled to the late Francis Goodwin, architect, in whose office he spent nearly eight years, engaged upon many important public and private architectural works. Proposing to travel to improve his knowledge and taste, his artistic powers soon led to offers from Messrs. Fisher, Son, & Co., Messrs. Virtue & Co., and Messrs. Heath & Co., the well-known publishers, which were accepted, and resulted in beautiful illustrated works from Mr. Allom's pencil, being published in periodicals, extending over a course of twenty years. These were eagerly sought after, not only in this country but in many Continental cities.

The following are some of the works in question:—"Cumberland and Westmoreland;" "Devonshire and Cornwall;" "Yorkshire, Derbyshire, and the Midland Counties;" "Surrey;" "Scotland;" "Belgium;" "France;" "Constantinople;" "Asia Minor," including the "Seven Churches of Asia;" and "China."

Mr. Allom (who was at an early age a student of the Royal Academy) exhibited at the Royal Academy and other exhibitions for many years, where his charming pencil usually gained a place of honour. He was frequently called upon to assist his professional brethren, and there are few artists who forget the vigour and beauty of the drawings, made for the late Sir Charles Barry, of the new Houses of Parliament, and presented

by him to the late Emperor Nicholas. We may also recall the designs made for the embellishment of the Thames in 1846, which had great merits.

Mr. Allom was one of the founders of the Royal Institute of British Architects, and of late years devoted his attention to his original profession (that of an architect), but continued to produce from time to time many beautiful pictures in water and oil colours.

Among his chief works as an architect are the following:—During his partnership with Mr. Lockwood were executed—the Kirkdale Industrial Schools, for 1,200 inmates; the Liverpool Workhouse; the Wesleyan Chapel at Hull; the Holy Trinity Church, Hull, &c. Subsequently, Mr. Allom designed and carried out the following works:—Kensington and Colne Union Workhouses; Christ Church, Highbury (now being enlarged in accordance with the original designs); the Loudon and Lancashire Insurance Office, at the corner of Leadenhall-street and Bishopsgate-street; the Cambridge Asylum for Soldiers' Widows; the Harwich Hotel; Hanwell Cemetery; the Islington Vestry-hall; and the covering the Kensington Park Estate with mansions, for the late Mr. C. H. Blake, at a cost of nearly 200,000*l.*; besides numerous other buildings for private individuals. Several of the above works were obtained in public competition, in which Mr. Allom was successful; but he was, however, doomed to a great disappointment in the year 1856, when, in the competition for the Free Public Library at Liverpool, his designs having been awarded the first premium, were handed over to the town surveyor. In the Manchester Assize Courts, Mr. Allom's designs, as his friends state, so far as the plan is concerned, carried out.

It is painful to reflect on the number of artists, architects, and men of letters, friends and fellow-workers with the late Mr. Allom, who have passed away, most of them within the last ten years. David Roberts and Turner, two of England's greatest painters; Rorn, Smith, Leech, Kenny Meadows, Samuel Lover, Mark Lemon, Charles Barry, Douglas Jerrold, Stirling Coyne, Professor Cockerell;—these and many others were his early companions and valued friends.

A widow, a married daughter, and two sons,—one following ably the profession of his father in London,—are left to mourn their loss.

There remains with the family a collection of many hundred original drawings and sketches of interesting places visited by Mr. Allom in his travels through Europe and the East. It is not many years since his "Seven Churches of Asia," works in oil, painted for Mr. George Virtue, were engraved in the *Art Journal*. These are now being exhibited, with Mr. Virtue's collection, at the Crystal Palace.

FROM FLORENCE.

THE floods and inundations in the north of Italy have been dreadful. The canal made here in 1668, parallel to the Arno, has since saved Florence from its ravages, but great fears were entertained on Sunday night and Monday morning that the river would break all the barriers, and guards with torches were parading the quays the whole night to watch for any breach. The waters rose 5 ft. ! Such torrents of rain, such sudden inundation, had not been known since 1814. The damage around Florence has been very great and very distressing. Houses were washed down. At Ligma, the water reached to the first floor of the houses. The railroad from Pistoia to Lesto was utterly disabled for two days.

Notwithstanding the great damage done at Pisa by the inundations of last year and in 1869, the prevention had only this year been taken; but after an expenditure of five millions of francs the engineering has proved to have been this week of no avail, or rather has been so badly executed that 50 metres of the work have been carried away, and the Arno there is having its own way as of old. The inhabitants, more alarmed than before, have shut up their shops all the length of the quays. The people, terrified, are rushing from their homes, and strangers escaping as fast as can be, after settling down for the winter.

I can never forget the rain of the early morning of the 14th. The heavens, indeed, seemed to have opened, and no hope of their shutting seemed to present itself. The thunder and light-

ning were most awful. The frightful devastations and, unfortunately, loss of life—either by the floods or the falling of houses—are not yet known. Florence is looking forward to a very abundant influx of foreigners. It can no longer be recommended as an economical residence, so exorbitantly is everything increasing in price. Meat, on account of the immense exportation of cattle to France, is dearer than in England. Its attractions, however, are increasing; it promises more advantages than ever for education and improvement.

You have doubtless heard that the first architectural society in Italy was established this year. Its first meetings were in Milan; but Peruzzi, the Sindaco of Florence, has induced the society to make the ex-capital the seat of its operations, meetings, &c. It is a curious fact, that a country possessing so many architectural riches should have never, until this year, established a society for the study and consideration of the kindred art to painting and sculpture, of which it can boast that it possesses the most perfect specimens. Italy is progressing on all sides, thanks to the peace it is now enjoying. F. C.

THE "BULLETIN MONUMENTAL" AND M. DE CAUMONT.

WITH a recently published number, the last of the thirty-eighth volume, the *Bulletin Monumental* is announced as discontinued. When, thirty-eight years ago, M. de Caumont commenced this review, nothing of the kind was published in France. The *Revue Archéologique* of M. Didron commenced in 1844, ten years after the *Bulletin Monumental*. The *Revue de l'Art Chrétien*, at Amiens, and the *Revue Archéologique*, of Paris, are of a yet less early origin.

The "Société Française d'Archéologie," established also by M. de Caumont, had also preceded the *Comités Archéologiques*, of the Minister of Public Instruction. It may date its foundation so far back as 1831, and it was formally inaugurated in July, 1834. From that year it has never ceased to hold Congresses in all the chief cities and towns of France; and these meetings have widely advanced the science of archaeology. As director, M. de Caumont, by his earnestness, his perseverance, and capacity for organisation, with intelligence and liberality spread, has succeeded triumphantly in disseminating a vast amount of archaeological knowledge, as the *Mémoires* of the society testify; but they cannot be spoken of independently of his other works, among which stands pre-eminently the *Cours d'Antiquités*, of which no less than 20,000 copies have been sold. The *Bulletin Monumental* is, however, the work which has been mainly instrumental in giving the most extended impulse to archaeology as a science throughout France, Belgium, Germany, and England: it is, indeed, indispensable, to every true antiquary.

Of course a life so spent demands an enormous amount of physical as well as intellectual powers; and thus, through this long series of years, we find M. de Caumont ever active in the field as well as in the closet, directing and encouraging researches with zeal and good nature; while, at the same time, his private purse has ever revealed that he has not only had the means but also the heart to give freely. Indeed, everything connected with M. de Caumont is replete with liberality and unselfishness; and he stands a bright example to societies as well as to individuals, who would be archaeologists in deed as well as in name.

C. ROACH SMITH.

THE EXTENSIVE NEW DRAPERY BUILDINGS IN HOLBORN.

THE palatial block of new stone buildings, at the west end of the Viaduct, which have for some time been in course of erection for Messrs. Meeking & Co., are now fast advancing towards completion, so far as regard the central portion, and the east end, the boundary of which will form a part of Holborn Circus. When the eastern portion now in progress is completed, the west side, uniform with it, and extending to Fetter-lane, will be proceeded with, and on the entire block being finished from Fetter-lane to Holborn-circus, the Holborn elevation will be no less than 200 ft. in length, the height of the central portion, exclusive of the cornice and balustrade, being 60 ft., and that of the east and west por-

ions, 50 ft. The building throughout contains a very lofty ground-floor, with plate-glass windows, running the entire length of the Holborn, Fetter-lane, and Holborn-circus frontages, as well as the frontage southwards in continuation from the circus. The central portion of the building contains five stories above the ground-floor, the fifth story having eleven circular-headed clustered windows, with ornamental dormers between the balustrades. The east and west sides of the central portion of the elevation contain four stories, surmounted by a cornice and balustrades uniform with the central portion of the block. The first and third floors along the entire elevation have pediment-headed windows, and the magnitude and capacity of the building may be imagined, when it is stated that the number of windows in the Holborn elevation alone, exclusive of the ground-floor, is 112. Whether as regards their colossal extent or general appearance, these buildings form one of the most prominent architectural features in Holborn, and are perhaps unequalled by any other drapery establishment in the metropolis. Indeed, with the exception of Compton House, in Liverpool, which is a distinct square block, having four elevations, immediately surrounded by an equal number of thoroughfares, it is stated that the new buildings in Holborn surpass any similar place of business in the country.

ASTLEY'S AMPHITHEATRE.

The well-known establishment in the Westminster Bridge-road, which within a few years has undergone several alterations, has within the last week again been placed in the hands of the builder, with the view of the interior being entirely reconstructed. Messrs. Sanger, who last Christmas had their equestrian company there, have just purchased from Mrs. Barry the lease of "Astley's," thirty years of which are yet unexpired. The new lessees have determined to reconstruct the interior upon an entirely different principle; and with the view of carrying out this object workmen have been engaged in gutting the building during the last few days, and nothing whatever now remains beyond the main walls. We understand that the interior is to be so reconstructed as to serve both as an equestrian establishment and a theatre proper, with an entirely new stage and machinery, so as to adapt it to dramatic performances as well as those of the ring; and the auditorium is to be so arranged that the full extent of the ring, and the equestrian performances in it, will be seen from every part of the house with the same ease as the seat of the house with the same ease as the seat of the house. The designs for the new interior have been furnished by Mr. J. T. Robinson, architect, who has recently reconstructed some other metropolitan theatres, and the contractor is Mr. Snowden. The works will give employment to one hundred of carpenters, plasterers, painters, and decorators, and as Mr. Snowden is said to be under very heavy sureties to have the building ready for opening on "Boxing-day," relays of hands are to be employed on the works both day and night. The cost will be about 5,000l.

THE COST AND SEQUEL OF STRIKES.

The principal building trades who took a prominent part in the recent and former strikes and lock-outs have been furnishing their members and the public for some weeks back with their balance-sheets. Each has preceded the financial statements by an explanatory preface on the course of the respective struggles, the masons leading off first, in consequence of their earlier settlement with their employers. The carpenters and joiners, more ambitious than the others, have accompanied their balance-sheet with an introductory preface, containing a brief history, or rather outline, of former strikes and lock-outs during the last forty years. This last account published by the carpenters and joiners is not worthy, for more than one reason. As an expression of operative opinion, it proves that workmen in the building line have learned much, not forgotten little. At last they have candidly acknowledged the evil of strikes and lock-outs, and desire that they may soon be superseded; yet they proclaim their determination to still resort to the former on an opportune occasion, for the full terms of their late memorial—"nine hours and 9d. for fifty-one hours per week all the year round."

After an agitation, extending over eight

months, and an exhaustive financial struggle of upwards of four, counting the subsequent partial strikes against particular firms, the carpenters and joiners wind up their warfare at a cost of 7,251l. 13s. 11d. There is every reason for believing that the cost even exceeded the above by a pretty large sum, in disbursements for "dispute pay" to members of the General Union and the Amalgamated Societies of Carpenters and Joiners.

It will be instructive to those outside the trade, as well as within, to scan the following figures, showing the sources of income in support of the recent strike. Under the list of "subscriptions" from workmen in firms, there were realised 342l. 5s. 6d.; local Joiners' Societies, 280l. 13s.; the London branches of the Amalgamated Society of Carpenters and Joiners contributed 914l. 6s. 9d., and the Amalgamated country branches, 108l. 7s. 2d. The eight lodges of the General Union of Carpenters and Joiners in London gave 88l. 2s. 8d. and the various General Union provincial branches, 110l. 5s. 5d. The Associated Carpenters and Joiners of Scotland sent 18l. 9s. 6d. The Ship Joiners altogether gave 120l. 12s. 11d. The Cabinet-makers, 170l. 2s. 8d.; Plane and Tool makers, 15l. 19s. 6d.; Pianoforte makers, 8l. 1s. 6d.; Tailors, 81l. 1s.; Bookbinders, Printers, Compositors, &c., 47l. 5s. 8d.; Goldsmiths and Jewellers, 9l. 0s. 7d.; Bricklayers, 6l. 4s. 7d.; Engineers and Metalworkers, 37l. 2s. 11d.; Painters, 7l. 8s. 3d.; Plasterers, 1l. 18s.; Masons, 26l. 7s. 4d.; Patternmakers' Society, 8l. 2s.; Zinc Workers' Society, 5l.; Rope Makers' Society, 11s.; Basketmakers' Society, 5l.; Gilders' Society, 3l.; Polishers (Carter's), 11s.

From public and coffee houses there was an income derived of 93l. 14s. This account is explained perhaps from the fact, that there are either societies or meetings held in all of these places, or they are otherwise "lonesome cells" for the members of the trade. Country friends, from various parts of the kingdom, contributed 669l. 11s. 8d.; and "Friends of the Movement," 540l. 18s. 7d.; levies at several local districts, 452l. 19s. 10d.

Between the 3rd of February and the 19th of October the total of the above sums, with the exception of a balance of 1l. 9s. 2d. was expended in "strike pay" dividends to men locked out, and in the collection and administration of the funds, including stationery, printing, postage, committee, and officers' expenses, "pickets," &c. A few of the principal disbursements may be stated. The two firms—Messrs. Jackson & Shaw's and Brass's—cost the carpenters and joiners alone, for fourteen weeks' payment to 293 men withdrawn on the 1st of June, upwards of 1,800l. Add to this the dividends paid in ten districts to men locked out during eleven weeks, with the sum of 117l. 12s. 4d. in support of the partial strikes at Messrs. Corbett & McClymont's, Adamson's, Morant & Boyd's, and "half-wages" (25l. 15s. 4d.) paid to men for refusing to work overtime, and we have an outlay, according to the carpenters' and joiners' own statement, of 6,375l. 7s. 2d.

During the early part of the struggle there sat as many as from twelve to fifteen committees, who received 2s. per night for their labours; but in the months of June, July, and August the committee-men sat during the day as well as in the evening. Here is one item. From June 24th to July 24th, there were twelve committees, the majority of whom sat during the day, for which they received their 6s. 8d. and 2s. for their evening sitting.

Some sat upwards of twenty-six days during the month, with night and day pay, also travelling expenses, averaging from 5s. to 8s. per day. One month of this form of administration cost the carpenters' and joiners' funds, according to their own entries, 56l. 12s. 11d.

Clubbing the general committees, the district committees, the chairman, secretary, treasurer, two auditors, and adding the expenses allowed for deputations, district meetings, and some other matters appertaining, there were nearly 600l. expended. The printing, postage, telegrams, stationery, newspapers, and small sundries in connexion, approach to nearly 160l. The cost of the strike stands thus:—Total receipts, 7,251l. 13s. 11d.; total expenditure, 7,251l. 13s. 11d.; balance, 1l. 13s. 2d. As the cost of printing the present balance-sheet is not included in the above expenditure, it will necessitate the sale of nearly 2,600 copies at 3d. per copy to relieve the trade from an actual liability. This would be a small item indeed if the carpenters and joiners could point to material advantages

gained by their late struggle. The working hours are now 52l, and the wages they receive less. The shortening of the hours of labour is, doubtless, or ought to be, an advantage, but one of the objects sought is still unattained. Surplus labour will still exist in the market, and were even the nine hours, yea even the eight hours obtained, the absorption of the surplus labour in the London building trade would scarcely be appreciable. The increase of wages and the diminution of the hours of labour cannot, under the present condition of society and trade, take place at the same time save to a very small extent. It is perfectly visionary to suppose that, if strikes were determined upon every other or alternate year the principle that admits of wages being increased admits also of reduction in the hours of labour. The cost of production depends on the rate of remuneration; and in the cost of materials used, as well as in the workmanship, there is an amount of labour embraced. There is scarcely aught of the building operative uses in house-construction or in the practice of his art but has passed through several hands previously to reaching his own. The stone from the quarry, the lime from the kiln, the brick from the earth, the timber from the forest, ore, colour, and pigment, all have to be torn from the soil, and pass through various manipulations ere they are finally utilised. Supposing for a moment these materials, in their various forms of production, were subjected to a like tax upon the labour that supplies them as that which utilises them in a building, what would be the result? All workmen are at liberty to strike at one time, and, whether striking or not, each is equally free to demand an increase of wages. Were this concurrence of events to take place, the building operatives, not being the first producers, would fare badly indeed. Too many houses may be built for the population, and of these there may be a great number unsuited for the incomes of their would-be tenants. As there cannot be a uniformity in the rent of all classes of houses it is scarcely possible that there can be a continued uniformity in the time and wages of all classes of workmen. No person will pay 50l. rental for a cottage worth only 25l., nor will he pay 150l. for a dwelling worth at the outside 90l. The position of a house of course often enhances the value of a building; but, on the other hand, property will be found depreciating in one locality, while it is rising in another. So with trade: a scarcity of labour in any particular place will have the effect of either absorbing the surplus hands elsewhere or of adding to the rate of pay. Wages have for years gradually increased in the building line, while they have decreased in other branches of trade; but this is no criterion that the increase will continue. The workmen in the building line in London always exceed the demand.

In the late struggle the non-society men were the weak point. The carpenters and joiners had to support several hundreds of them during the lock-out, and this constant drain upon their resources told in the end, and hastened their agreement. Non-society carpenters and joiners who are competent workmen, and thousands of them are, receive equal wages to society hands; but outside the society there are numerous hands who are only receiving still from 6d. to 7d. per hour for their labour; and there is a large class of young men called "improvers," who receive less. The absorption of all the competent non-society hands into the Union would undoubtedly strengthen the societies, and render strikes more prevalent; but it would eventually fall in the object sought,—the constant increase of wages. There is no way of estimating the number of incompetent workmen. They are to be found in numbers, within the union as well as without it. The fact of their joining the society does not insure them continuous employment, though it has the effect of having them looked on with more favour by their fellow workmen.

The carpenters and joiners say, in winding up their late struggle: "The late agreement concluded between the carpenters and joiners and the master builders can only be accepted as a temporary arrangement, instead of a permanent settlement, or a compact binding for any length of time;" and they give their employers to understand that the struggle will be renewed for the full terms of their demand. The injury that will be done by this threat, through the doubts and fears thus raised with reference to future building arrangements, will be enormous, and will be felt by themselves as well as others.

The wisest words they have given utterance to are the following, which, we trust, they may every day more and more realise the truth of:—"The carpenters and joiners believe that strikes and lock-outs are evils, and, after all, but clumsy weapons of offence and defence; and they trust that the day may soon arrive when they will no longer be necessary, and that Courts of Conciliation may supersede them. Technical knowledge and skill will at no distant period assert their legitimate sway, and with that knowledge will grow the power that will enable the workman to ennoble himself and elevate his trade to its proper position."

Had the "clumsy weapons of offence and defence" been flung aside, and conciliation and arbitration been resorted to last May; had the compromise we early proposed been accepted; the carpenters and joiners might have saved the members of their trade and others nearly 8,000*l.*, much privation and suffering, and a good deal of business for this city. Masons, bricklayers, plasterers, painters, smiths, and labourers, have probably, in one form or another, collected and expended nearly 3,000*l.* during the late strike and lock-out. The income of the great strike and lock-out of 1859-60, in which all the building trades were affected, was 23,065*l.* 6*s.* 6*d.*, and the total expenditure 22,717*l.* 2*s.* 11*d.* There was a balance of 318*l.* 3*s.* 8*d.* The partial strikes and lock-outs in 1861-2, in opposition to the "hour system" and in support of the masons, cost the carpenters and joiners nearly 1,000*l.* About the same period the "bour strike" cost the masons' body, according to their recent balance-sheet, upwards of 6,000*l.* The masters, in their turn, have lost thousands.

The financial loss is small, after all, when compared with the magnitude of the aggregate evil that strikes have always produced, and will always produce, when resorted to by workmen under a mistaken notion of their utility. It is not because strikes are lawful, and in some cases even unavoidable, that they are the less pernicious; and the resort to them cannot be justified except under the most exceptional circumstances and necessity—when all other obvious and honourable modes of adjustment have been exhausted.

SCHOOL BOARDS.

London.—Mr. C. Reed brought up reports of the Works Committee. The committee had received the following tenders from builders for the school for 1,010 children to be erected on the site in St. Paul's-road, Bow Common:—

Longmire & Burge	£9,980
Nixon & Son	9,977
W. Brass	9,949
W. Webster	9,925
W. Higgs	9,876
G. S. Fritchard	9,777
Perry & Co.	9,438
Cooke & Green	8,992
B. E. Nightingale	8,990

On receiving these tenders, the committee felt it necessary to reduce the cost of the school, and the architect was instructed to revise his plans accordingly. The reduction thus effected amounted to 1,029*l.* 16*s.* 9*d.*, and the committee now recommended that Mr. Nightingale's reduced tender, amounting to 7,969*l.* 3*s.* 9*d.*, be accepted. The committee thought it desirable, for the sake of economy, to obtain a general tender for the supply of wire-guards for windows; they accordingly recommended that the tender of Messrs. J. J. Thomas & Co., of Edgware-road, for strong wire-guards, in all cases where necessary, at the sum of 7*d.* per square foot (exclusive of fixing), be accepted, and that in each case the architect be instructed to include provision for the same in his specification, the amount being deducted at prime cost, and paid direct by the Board. For the same reason, the committee recommended that the tender of Mr. W. Wright, of Westminster, for the general supply of tar paving, at 2*s.* 3*d.* per yard superficial (exclusive of preparing ground), be accepted, and that in each case the architect be instructed to include provision for the same in his specification, the amount being deducted at prime cost, and paid direct by the Board. The committee's reports were received by the Board.

Notwich.—The Board have resolved,—“That the tender of Messrs. Downing & Wegg, for the erection of the Heigham-street School, at the sum of 4,163*l.* 17*s.*, subject to a deduction of 293*l.* 10*s.*, according to the amended specifications, be accepted.” Canon Howell was the only member of the Board who voted against the motion. It was also resolved,—“That the clerk

be instructed to apply in the name of the Board to the Public Works Loan Commissioners for a loan of 4,842*l.* 4*s.* 4*d.*, as sanctioned by the Education Department, for the Heigham-street Schools, and as to the terms upon which they will grant such loan.” It was also agreed,—“That the question of the appointment of a clerk of the works for the Heigham-street School be left to the Building Committee, with power to appoint such clerk.” In course of a discussion as to the estimates, which preceded these resolutions, and in which Canon Howell called upon Mr. Browne, the Board's architect, for explanations, the chairman quoted instances from the *Builder*, showing that in large places, such as Bradford and Southampton, discrepancies between architects' first estimates and the tenders received, had been common in consequence of the state of the labour market and the increased cost of materials. In justice to their architect, Mr. Browne, he desired that their statement should go forth. In answer to Mr. Hinds Howell, the architect said that he supplied all the builders who contracted with the quantities. It was usual to supply the builders with quantities in such cases. He showed this from the *Builder*, and also said that he was authorised by the committee to supply them. Mr. Hinds Howell said it was a bad plan for the payer to give the quantities. Mr. Browne contended that it was the only way to secure a correct estimate, and stated that the Institute of British Architects approved of its being done in the provinces, though not in London. In all the schools Mr. Hinds Howell had cited, he had no doubt the architects supplied the quantities. Mr. Pinder said that no fault could be found with Mr. Browne for giving out the quantities, as it was done with the sanction of the committee.

PNEUMATIC WELLS ON DONNET'S SYSTEM.

THE *Technologist* for August gives the annexed details of a method adopted by a French engineer, M. Donnet, of Lyons, for increasing the yield of water in ordinary pump-wells.

When a pump, no matter what may be its principle, is employed in raising water from a well, the quantity of water so raised must be proportioned to the draught of the well; in other words, the volume of water thrown out by the pump in a given time should be less, or at any rate not greater, than the volume of water which finds its way into the well in the same time. Now, the draught of the well is determined by the depression, i.e., by the difference in level, at the end of a stroke, or at some other given moment, between the water within the well and the source whence the water is supplied.

To increase the draught of the well, and, consequently, the volume of water yielded by it within a given time, we must increase the depression of the well, by deepening it, more or less. Where this cannot conveniently be done, recourse may be had to Donnet's system, of which we have now to speak.

Donnet's wells differ from those in ordinary use in that the water within them is shut off from all contact with the outer air: the steining is made air-tight, and the mouth of the well is hermetically closed. This may be effected in three ways:—

1. By steining with headers set in cement, with a backing of puddle, the whole inside of the shaft being faced with cement; and the mouth of the well being closed with a metal plate luted down on the steining, so as to be air-tight.

2. By forming the shaft with the aid of a bell-shaped metal case, sunk in the ground, so that the mouth of the bell may be lower than the minimum level of the water in the well. The space between the sides of the excavation and the bell should be filled in with concrete. The suction-pipe of the pump passes through the upper portion of the bell, with an air-tight packing. A small pipe, furnished with suitable valves, connects the space above the surface of the water in the well with the suction-pipe, so as to prevent the air given off from the water accumulating within the bell.

3. When the piston of the pump is cased, the well may be rendered air-tight without removing the machinery. It will be sufficient to chisel holes in the steining, a little above the maximum level of the water in the well, to receive the ends of wooden or metal rods forming a grating, upon which is laid a flooring of planks: the whole is then cemented over, so as to be air-tight. This

method is cheapest, and may readily be adopted in country places.

As already stated, the inventor's object has been to increase the supply of water in ordinary pump-wells without deepening them, and thus incurring increased outlay in the process of construction and on the pumping-machinery required; and this object is said to have been fully attained by the removal of the atmospheric pressure from the surface of the water within the wells. For example, at Lyons, where the wells are fed by water filtering through a succession of sandy and gravelly beds from the Saône and Rhone, it has been found that to insure a constant supply of 2,000 litres of water per minute in uncovered wells of not less than 2-50 m. diameter, it is necessary to have a depression of 3 m. or 3-50 m., i.e. the level of the water in the wells must be kept constantly 10 ft. to 12 ft. below the mean level of the rivers, to give the requisite head of water. Now, if we remove the pressure of the atmosphere from the surface of the water within the well, it is evident that the draught of the latter will be increased by the atmospheric pressure without. As a practical illustration of the increased power thus obtained, it is stated that a well at M. Millard's establishment at St. Etienne, supplied by three springs of water rising in rocky while in an uncovered state yielded, on an average, 65 litres of water per minute. Three years ago it was hermetically closed, on M. Donnet's principle, and has since given an uninterrupted supply of 400 litres per minute from the same sources.

HYDE PARK AND KNIGHTSBRIDGE BARRACKS.

IMPROVED of late years from the aspect which it wore in memory of this generation, our park, an enclosure of 360 acres, in the richest centre of aristocratic London, has become an indispensable resource to the whole population. Nearly encircled by an open iron railing, planted around by the Woods and Forests officers, adorned with flower borders and marginal shade walks, encircled with drives and rides, it becomes every year more valuable to the pent-in denizens of the metropolis. On one side only it is margined and degraded by the old Cavalry Barracks, which are as comfortable to the troops as they are unsuited to the age we live in; and this antiquated pile, extending one quarter of a mile along its border, not only spoils the unity and beauty of the *enclave*, but degrades and depreciates the most valuable quarter of our choicest suburb from Albert Gate to Rutland Gate, a distance of about half a mile.

Public opinion, expressed through the press, and frequent remonstrances by the *Builder*, had induced hopes that this hideous bane on London's fairest park would soon be removed. It had been surveyed, and found inadequate to afford proper accommodation to her Majesty's Guards, save only the officers' quarters and mess-room, which opens out to the park: suggestions were made, and hopes induced that suitable Cavalry Barracks should be erected at Chelsea; but on passing the sentinels to-day, we observed painters at work, giving a white coat to the windows, sashes, back and front.

This seems not to portend an early evacuation, but rather fixity of tenure. Is there no authority to weigh expediency in such a case? Have the Woods and Forests, or the Horse Guards, or the Board of Works, any authority or discretion in such a matter, where great public interests are at stake?

The barracks were, in fact, first erected on public park—the people's property; they occupy a length of 450 yards; they advance upon the fair mile drive 30 feet, and they curvet outwards 40 ft. upon the most important of our metropolitan boulevards, the Kensington-road, which in this open and elevated position ought to be the choicest site for aristocratic mansions, but which, owing to the profusion of night houses of entertainment and grog-shops, has long been degraded and depreciated.

Surely it is worth a little sacrifice to accomplish a great public benefit,—to give integrity to London's grandest feature—Hyde Park; more especially when by such a change the condition of the soldier and of the citizen would be equally improved.

If barracks are needed in this quarter, there is a plot of waste ground between the entrance to the palace and Kensington Garden-road, amply sufficient, too, to accommodate the whole

ment of Horse Guards; and it needs but a small comparative outlay for the completion, in the year of a permanent structure, which would secure solace to the regiment, and a satisfaction to all residents or wayfarers.

There is also another public benefit that might at the same time be assured,—the removal of the misshapen and misplaced guard-house, and other *non-adjuncts* from the centre, which should be most sequestered portion of Hyde Park, as also the withdrawal of the powder-magazine, which ought to be removed to a safe distance from the most important ranges of aristocratic mansions.

Lastly, some allusion may be made to a fenced enclosure of about 10 acres, in the central wood and dell, where a crowded village is yearly on the increase,—a goodly-sized country manse, with meadow, gardens, stables, and numerous offices, representing a ranger's house, where no ranger has ever resided; at least, during the present century. Four other buildings have been erected on the outer bounds, all tenanted. In the New Forest, or at Epping (even reduced to the extent as it now is), there may be some duties or a woodreeve, if not a ranger, but for Hyde Park, with 300 acres of parker, there can be no possible occasion, unless to qualify him for a stipend.

As to the receiving-house, at one end, and the new police-station at the other,—these establishments are indispensable; but to keep up other refuges for desolate pensioners seems to be a wasteful intrusion upon the most valuable of our public liberties. This dell is the most picturesque portion of the whole expanse, which, in the present swollen state of our city, ought to be dedicated to the health and freedom of range for so still-growing population.

QUONDAM.

THE SOUTHAMPTON DOCK COMPANY'S NEW OFFICES.

LARGE and extensive new office buildings have just been completed for the Southampton Dock Company. In the erection of these buildings the company have looked beyond their present requirements, and taken into consideration what the necessities of the port may eventually demand. Acting upon this view, the building just finished not only provides accommodation for the company's existing purposes, but it has been designed to meet the future, and an anticipated increase in the business of the port. On the ground-floor there is a large public office for the transaction of the general business, with offices for the export and import warehouse keepers and other officers of the company. Also book and strong rooms. On the upper floor are the board and directors' rooms, and the offices of the superintendent and accountant. The building, which is of stone, was designed by Mr. A. Gibbs, the dock company's engineer, and has been erected under the superintendence of Mr. John Howell, as clerk of works, over the company's own workmen.

THE NEW CHAPEL AT RUGBY SCHOOL.

The chapel of Rugby School, which has been consecrated by the Bishop of Worcester, completes the list of new buildings which have been erected at Rugby during the last thirteen years. The chapel has been nearly rebuilt. The entire length of the building has been extended from 2 ft. to 133 ft., and double aisles have been brown out on each side. The tower is 105 ft. high and 22 ft. 6 in. square, finished by an octagonal lantern, with a timber spire. An organ-chamber upon the north side of the tower has been built from subscriptions raised as a testimonial to Dr. Temple amongst his old pupils. On entering by the west door, we still see facing the well-remembered east window by Albert Oliver, of the Wise Men's Offerings, which Mr. Butterfield has specially adapted his new work to receive. The four remaining windows, two on each side of this in the apse, are filled with stained glass, presented by his friends in memory of Dr. Cotton, Bishop of Calcutta, and formerly assisted-master in the school. The various stained-glass windows, with the mural and other monuments, have been preserved and incorporated in the new building. The decoration of the east end in panels with mosaic on a gold ground has been by private subscription. Seven panels have already been filled with six figures and a centre cross. The gymnasium, 100 ft. by 45 ft., with dressing-rooms, &c., raised

upon a basement, hereafter to be used as work-shops, although not absolutely completed, has just been opened to the school. The old bath and the building known to most old Rugbyans as "Sam's Farm" have been swept away. It is on the site of the latter that the gymnasium stands. It is, perhaps, the most complete building of the kind which has yet been erected in England. This with the pavilion, the racquet-court, and two Eton five-courts, stands on the edge of the new Big-side, which, formerly known as the head-master's field, was added to the school-close by the then head master, Dr. Goulburn. The levelling of this field, a great and costly work, has been carried out by the Old Rugbyans.

SLOANE-SQUARE AND THE DISTRICT RAILWAY COMPANY.

About a fortnight ago the Chelsea Vestry resolved to take proceedings against the Metropolitan District Railway Company for the non-fulfilment of their contract in reference to restoring the houses in Sloane-square. It now appears, however, that in consequence of a purchase by the Earl of Cadogan the railway company are powerless in the matter. At the last meeting of the vestry a letter was read stating that the Earl of Cadogan had purchased the surplus land from the railway company, and that the company, though legally liable, were unable to fulfil the contract they had entered into with the vestry. But it was stated that his lordship was most anxious to do away, as soon as possible, with the unsightly appearance of the severed and broken-up buildings in Sloane-square, and hoped soon to be able to restore the uniformity of the street.

THE PROPOSED FIRE-ENGINE STATION IN PIMLICO.

At the last meeting of the St. George's (Hanover-square) Vestry, the question of erecting a new fire-engine station in Pimlico again came up for discussion, when Mr. Walker moved a resolution to the effect that the Metropolitan Board of Works be asked to place a fire-engine station in Ebury-street, Pimlico, ground having been offered as a site by the Marquis of Westminster, and the immediate neighbourhood not being protected from fire. He stated that there was a distance of two miles between the fire-engine stations in the district, and that the site in Ebury-street was as good as could be procured. After some discussion on the subject, in the course of which it was denied that the inhabitants of Ebury-street were unfavourable to having a fire-engine station there, the motion was carried unanimously.

THE NORTH CAMBRIDGESHIRE HOSPITAL.

MISS M. E. THAPFORD SOUTHWELL has given the poor of Wisbech and its neighbourhood a cottage hospital, and has just now laid the chief stone. On the suggestion being first made, plans for the building were obtained from Messrs. Adams & Son, and after some alterations suggested by Miss Southwell had been made in them, she approved of them, and the work was placed in the hands of her own builders, Messrs. J. & M. Challans, of Grantham. The contract sum is 3,260*l.*, and the entire cost will be borne by Miss Southwell, who, we understand, intends to furnish the hospital with every surgical appliance. A piece of land has also been given by Miss Southwell, which will be made into a carriage-drive, from Ruby-street to the hospital. But, besides the gift of the site, and bearing all the cost of erecting the building, Miss Southwell has generously endowed it with 3,000*l.*, to provide for its future maintenance. Further sums have been given by others.

The building will be Gothic in style, and there will be a tower on the north side, 50 ft. in height. It will be built of white brick, with red banding, and relieved by stone ornamentation. The height of the main building will be 36 ft. The following are the interior arrangements. There will be sixteen beds provided, six of which will be fitted up in each of the large wards, which are 37 ft. by 18 ft., and 13 ft. in height, 1,500 cubic feet of air being allowed to each patient, or double the average allowance in hospitals. There will also be two occasional wards, 15 ft. 2 in. square, for isolated cases, and two special wards,

in which persons who are able to pay for their maintenance will be nursed. A commodious convalescent-room, 20 ft. square, was one of the rooms added to the plans by Miss Southwell's desire. On the ground-floor are the nurses' operating, and committee rooms, store and bath rooms, dispensary, kitchen (20 ft. square), pantry, and the customary domestic offices. On the basement are large cellars, which will be fitted up as larders, wine-cellars, and store-rooms. The chamber floor, which will be approached by a stone staircase, will contain, besides the wards, store-rooms and other conveniences. The ventilation of the lower ward will be by hollow air-chambers, built in the walls, which will pass round the back of the fireplace, and admit the warm, fresh air, the vitiated air passing off by regulating ventilators in the ceiling, communicating with the external air. The same arrangement applies to the upper ward, the air passing off through ventilators in the roof. The building will be warmed by open fireplaces. The drainage will, at present, be carried into a cesspool, until the new drainage works are carried out. To prevent any escape of gases from the pipes, charcoal ventilators will be placed at the junctions, and other precautions will be taken.

THE OLD BILLS OF EXETER CATHEDRAL.

At the invitation of the Dean and Chapter, the mayor and the civic authorities of the city attended recently at the cathedral for the purpose of witnessing the progress that has been made in the work of restoration. The inspection was of an official character, and the procession from the Guildhall was headed by the sword and mace bearers in their quaint costumes, and the mayor also wore his robes of office.

Archdeacon Freeman pointed out what had already been done in the way of restoration, and at the same time brought before them such matters of interest as had been brought to light in the progress of the work. In reference to the Lady Chapel, he said they knew for certain the painting they would now see there, and which had been lately restored, had been there ever since 1301. They had found a bill for painting in that year forty-nine bosses, and otherwise colouring the vaulting. It did not say what building, but if they took the trouble to count the bosses, they would find that there were thirty-one in the Lady Chapel, and eighteen in the two side chapels. Therefore they knew that in the first year of the fourteenth century the Lady Chapel was completed, for it could not have been painted and coloured until the wall part was finished. The windows presented very early specimens of that period, and the bosses were carved in a great variety of foliage, all the leaves being gilded, and the branches painted in different colours. In the bill he had mentioned, they found exactly the colours to be seen there. The roofs of the two side chapels were painted in imitation of the sky, with the gold stars and silver moons, and the colours mentioned in the account. They would perceive that the restoration was really the bringing back to its original condition the colours found on the bosses of the roof, as mentioned in the account.

The Archdeacon then spoke of the part of the building in which the party was assembled,—the choir, which was now in all main particulars to be restored to its original condition. To the eight windows, four on each side, which form the presbytery, or eastern part of the choir, he paid particular attention. The Chapter, he said, possessed a bill taken from the accounts of 1301, showing that one Master Walter, the glazier of those days, received 4*l.* 10*s.* each for glazing the whole of those eight windows. The quantity of glass in each window was exactly named. The two side ones contained 1,271 ft. of glass, according to the bill. Each of them was 25 ft. high, by 10 ft. broad, and contained 275 square feet of glass. Each cost 6*l.* 10*s.* The smaller clearstory windows, 19 ft. by 10 ft., cost 4*l.* 10*s.* The whole of them were filled with stained glass.

The Episcopal Throne was placed where it stood in 1317. It used to be referred to the date of 1470, but Sir Gilbert Scott pronounced it on first sight to be of the earlier date, and since then the bill had been found for it, supporting his judgment. It was built by Bishop Stapleton in 1317. It was entirely of wood, was 57 ft. high, and contained a number of figures that were now lost. It was of carved oak, and was originally coloured. It was now being taken to

pieces; point by point the paint would be removed, so that the natural wood, with a slight admixture of colouring, would be brought to view. The oak for it cost 4l. 10s., and the carving 6l. 10s. Its restoration would be effected in the most careful manner.

As they had found the bill for the colouring of the bosses in the Lady Chapel, so also they had found a bill for the carving of thirty large bosses of the vaulting in Bishop Bytton's time, in 1305. They were carved for 5s. apiece, the work being done on the ground, and then the bosses were lifted to their positions. Every fourth boss was the key of an arch, so that if it were removed the whole arch would fall. There were very happy devices used in the carving of the figures, and the style adopted was a favourite mode of ornamentation. It would detain them too long to point out the various figures.

HINGHAM CHURCH, NORFOLK.

This church, which is dedicated to St. Andrew, and is one of the largest churches in the county of Norfolk, has recently been restored, and the nave and aisles reslated. The whole church, with the exception of a few minor portions, is of fourteenth-century work, and is said to have been rebuilt by Remigius de Hethersete, A.D. 1316 to 1359. It consists of a nave nearly 100 ft. long by 28 ft. wide; north and south aisles, each 14 ft. 6 in. wide; a chancel, about 60 ft. long, by 28 ft. wide; a western tower, 22 ft. square inside; a south porch, and a vestry (now in ruins). From the floor to the apex of the new nave roof is about 60 ft.

The nave piers and arches are of lofty and elegant proportions, with well-moulded caps and bases; the aisle windows are of two lights each, filled with very good Decorated tracery. The east window of the south aisle, which is of three lights, is a very elaborate specimen of the tracery of this period. In the chancel is a handsome and lofty monument to a Lord de Morley, erected in the fifteenth century.

The restoration, as far as it has gone at present, has consisted chiefly in removing the low pitched, decayed nave roof, and replacing it with a hammer-beam roof of oak, in the position and of the pitch indicated by the original dripstone on the east wall of the tower. The new roof is of simple character: moulded and curved ribs, springing from carved stone corbels, support the moulded and crenellated hammer-beams, from which spring the lofty main-moulded and curved ribs. The spandrels between the lower ribs and the wall are filled with foliage of varied design, and the spaces of hammer-beams with tracery.

The aisle roofs, which are also formed with hammer-beams, are not entirely new, but have been carefully restored. The roofs of the nave and aisles have been covered with Whitland Abbey green slates, which harmonise well with the old work.

The stonework and walls throughout, with the exception of the south porch, vestry, and tower, have been restored both outside and inside. New eaves cornices have been put to the nave and aisles, new copings to the gables, and a cross to the east gable of the chancel. The internal stonework of the nave and chancel bore evidence of having been much damaged by an extensive fire, which apparently extended from the west end of the nave to the east end of the chancel. Several of the nave-shafts were scaled from top to bottom. The defective parts had at some time been patched and covered up with plaster, and then the whole stonework and plaster alike had been coloured with a yellow wash. Upon the removal of the plaster much of the stone was found to be still in a very loose and unsound condition. These portions were cut out and replaced with solid stonework, making every part perfect and substantial. The remains of a piscina and three sedilia were discovered in the south wall of the chancel, which appear to have been inserted in the fifteenth century. They were so much injured and scaled by the action of the fire, and mutilated by projecting parts being chopped off when the walls were plastered, that it was not considered advisable to restore them. Parts have, however, been left exposed to view, which give a good idea of what they have been originally.

After some opposition, usual in such cases, it was decided to clear away the whole of the old boxed seating with which the church-floor was covered, and which was in a dirty and dilapidated

condition, and to reset the nave and aisles with open benches, of oak, resting upon deal flooring, with oak curbs, for the bench-ends, the rest of the floor being paved with red and black Staffordshire tiles. All the seats have sloping backs, and the solid oak bench-ends, as well as the front and back framing, are ornamented with carving, consisting of a great variety of foliage, with which beads and other animal and insect forms have been introduced. It has been all designed and arranged conventionally from nature by the architect, and executed, with a few exceptions, by Mr. James Forsyth, of London, from full-size drawings.

The church has been fitted up and lighted by gas; this has been effected in the nave and aisles by simple jets above the capitals of the piers: the chancel is lighted by a handsome brass corona. The gaswork has been done by Mr. Pank, of Norwich.

The whole of the works of the restoration, with the exception of the oak seating, have been carried out in a very satisfactory manner, by Mr. Robinson Cornish, builder, of North Walsham, for the woodwork, and by Mr. J. Lacey, builder, of Norwich, for the stonework.

The oak seating was made and fixed by Mr. William Hubbard, builder, of East Dereham. The architect was Mr. James K. Colling, of London. The cost of the restoration and re-seating has been about 3,250l., and it is estimated that about 500l. more are required to rebuild the vestry, now in ruins, and restore the south porch and tower.

CRYSTAL PALACE COMPANY'S PRACTICAL ENGINEERING CLASSES.

THE Crystal Palace directors have established these classes for the purpose of affording to students of civil and mechanical engineering the advantage of thorough practical instruction in the rudiments of either profession and in the manipulation of materials. The classes are also available for gentlemen anxious to become engineering draughtsmen or to compete for the Whitworth scholarships, or to enter the Steam Mercantile Marine. We need scarcely say such a preparatory course will render pupils on entering an engineer's office at once useful to their employers, and enable them to take advantage of the opportunities offered to them during the time they are articled. One term will be spent in the drawing-office, one in the pattern-shop and foundry, and one in the smiths' fitting and erecting shops. The students will be engaged in mechanical drawing, estimating and calculating, pattern-making, and constructing machinery for the market. Lectures will be delivered from time to time by the principal or by some eminent professor, on subjects connected with theoretical and practical engineering, and the students will be required to pass an examination upon such lectures at the expiration of each term. Mr. J. W. Wilson is the principal. The code of regulations which has been drawn up shows that work is intended, not sham; and we cordially wish success to the undertaking. The foundry, smithy, pattern-makers', fitting, and other shops that are being fitted for the purposes of the engineering class will be finished and the tuition commenced before the end of the year.

Classes for the study of drawing and of modelling in clay are in operation, under the direction of Mr. W. K. Shenton.

FROM AUSTRALASIA.

VICTORIA.

Melbourne.—The Prince of Wales Opera House has been built according to designs furnished by, and under the superintendence of, Mr. Geo. R. Johnson, architect. The site is that where the Varieties once held sway, opposite the Theatre Royal. The piece of ground extends from Bourke-street to Little Collins-street, being a depth of 315 ft., and possesses a frontage of 66 ft., being the same area as that of the Theatre Royal. The theatre will be approached by three entrances from Bourke-street to the auditorium, and two entrances from Little Collins-street for the use of the stage and for means of escape in case of any sudden panic. The western entrance from Bourke-street will be for the grand tier or dress-circle alone. A polished blue-stone staircase leads to the level of the grand tier. In this entrance there is a flower-stall formed in a recess

in the wall. There are also fruit-stalls on each tier. Adjoining the grand tier are a large crush-room, *cafés*, ladies' cloak-room, and lavatories. There are only three rows of seats in the dress circle, but ample provision is made for extension. The seats are of polished cedar on iron framework, filled in with cane, with movable cushions for the winter season. The seats in the stalls will be of similar construction. At the back of the dress-circle is a spacious promenade, fitted up with marble tables and couches. Under the stage there is a depth of 20 ft., in order to sink large set scenes; the height above the stage is 48 ft. The ceiling is in the form of a large dome, with a sunlit in the centre 15 ft. in diameter. There is a large ring of silvered glass, and from this shoot rays of gold on a blue ground-work, filled in with gold stars. This sunlit supplies light to the whole of the auditorium, so that chandeliers attached to the front of the tiers are unnecessary. The decorations throughout have been executed by Messrs. Schemmell & England, under the direction of the architect. White and gold are the chief ornamentation. There is accommodation for seating 2,500 persons, and this can be increased to 3,000, exclusive of private boxes. The seating to the dress-circle and stalls has been manufactured by Messrs. Cohen, Brothers. The ironwork has been executed by Messrs. Joseph Laughton & Co., and Mr. T. Laughton. The plasterer's work is by Mr. Parry. The general scenery has been painted by Messrs. Fry, Holmes, Clint, and assistants. The act-drop has been painted by Mr. A. C. Habbe, the artist who painted the scenery and ceiling of the Princess Theatre, and of late has been engaged in Sydney. He has also left his mark in San Francisco and on the Continent of Europe. The gasittings have been carried out by Messrs. Hague & Colley, of Emerald Hill. Messrs. Roche & Co. have done the upholsterer's work. The whole of the works were contracted for by Mr. G. Cornwell, the contractor who also built the late Haymarket theatre and the Olympic. He has completed the whole within three months from the date of commencement. Mr. Cornwell has been assisted by his head foreman, Mr. James Johnson. There is an entire absence of paper and canvas on the walls and ceilings. The total cost will be about 15,000l.

Williamstown.—Trinity Church of England, which will be a prominent feature in Williamstown, is built in the Early Decorated style, of blue-stone with free-stone dressings. It has nave, aisles, chancel, organ-chamber, vestry, and lofty tower and spire. The lower slope of the tower forms a porch, and the roof is of open timber-work. The clearstory and nave roof are supported by ten arches, with Malmesbury stone pillars. The length of the nave and aisles is 81 ft., width 50 ft.; the length of chancel 28 ft., width 22 ft. 6 in.; organ-chamber, 17 ft. by 16 ft. 1 in.; tower, inside 14 ft. square; height to top of spire, 168 ft.; height of nave-walls from floor, 34 ft., to ridge, 55 ft.; height of aisle-walls, 16 ft. The doorways are deeply recessed, having three pillars in the depth, and the arches have bold mouldings. The window near the central entrance of the nave has four lights with geometrical tracery; the chief window of the chancel has three lights, and the aisle and clearstory windows have two lights each. Considerable cost was incurred in obtaining a proper foundation for the walls and pillars of the church, the site being covered with large boulders and other unsafely placed stones, which have been removed and the space filled with concrete. The building will accommodate upwards of 600. Mr. Leonard Terry is the architect. Our authority is the *Australian News*, which gives a view of the edifice, and the following.

Mount Gambier.—A new Presbyterian church has been recently opened at Mount Gambier. It is constructed of the salmon-colored stone locally called dolomite, with white coral limestone string-courses and facings. The style is Early English, with enrichments in bands, mouldings, labels, and buttresses of a later period. The windows are lanciform, with mullions and tracery, and the main entrance is in the western gable, beneath a large four-light tracery window. A tower, with belfry and spire, occupies the north-western corner of the edifice, designed to contain a gallery, entrance and stairs. The church is on a gentle eminence, a very short distance north-west from the centre of the town. The interior dimensions are 65 ft. by 38 ft., and it is calculated to seat over 400 persons. The lofty ceiling is open, with stained roof-timbers and lining, with tracery enrichments. Just within the western door is a stone vestibule, and

gives access to two aisles, which divide the fittings into the usual sections. The floor has an incline of 2 ft. from the western door to the preacher's rostrum, to which access is obtained from a vestry. The total cost of the building is estimated to be about 2,000.

Sandhurst.—The *Bendigo Advertiser* reports the opening of the new Sandhurst Mining Exchange. The *Advertiser* says:—

"That the interior of the new exchange presented a truly magnificent appearance. The elaborate ornamentation of the building was much admired, and its convenience and suitability for the purposes for which it is assigned was admitted on all hands, while its great extent seemed to take every one by surprise. Ranged on each side are cedar desks, tables, chairs; in fact, every convenience possible for the transaction of business. The lower floor of this hall would amply and comfortably accommodate some 2,000 persons."

A new Wesleyan Church, in Golden-squares, Sandhurst, which is now in course of erection, is from designs by Messrs. Creuch & Wilson, of Melbourne. It is to be built wholly of brick, on stone foundations, in the Early Decorated style. The exterior is relieved with dressings of white bricks and pressed cement. The turret has a slated spire rising to the height of 110 ft., and will be furnished with a large bell. The side walls are 24 ft. high, the length and width of the church being respectively 90 ft. and 45 ft. in the clear. At the rear of the church there are three vestries or class-rooms and a deep organ-loft, in which it is intended to place an instrument to cost 350*l.*, having modern improvements. The height of the church to the ridge is 46 ft. Galleries are planned all round the church capable of accommodating nearly 600 persons. The estimated accommodation of the whole edifice is 1,500. Attention has been given to means of ventilation, and the requirements of the Central Board of Health as to external doors have been complied with. There are six doors to the body of the church, and four to the galleries. The total cost will be about 2,000*l.* A portion of the design was erected about two years since; and the remainder now in hand is to be completed early next year.

Abbotsford.—The (R.C.) Church of the Immaculate Conception, erected in the Convent of the Good Shepherd at Abbotsford, is a building of blue stone, with freestone dressings, and will, when the whole of the design is carried out, cost upwards of 8,000*l.* At the present time only a portion of the building has been completed, but this is sufficient to hold 800 persons, and has cost 2,000*l.* The plan of the church is cruciform.

A square transept is intended for the accommodation of penitents, and has been completed. Of the western transept, intended for the use of the public, only a small portion has been built. The nave is unfinished, though intended exclusively for the use of nuns. Internally, the extreme length of the church will be 110 ft., by a width of 25 ft. across the nave, and 82 ft. across the transepts. Only the northern end of the church has at present been built. It will eventually extend to a further length of 75 ft., divided about 18 ft. from the extreme end by a partition, open at the top. This end will also be octagonal in form, and will be divided, like the transepts, into two floors, the upper one to be used as a choir, and the lower devoted to conventual requirements. Two-light traceried windows will light the nave, the designs of which will vary throughout. Internally, the roofs are shewed so as to form a six-sided barrel, divided into panels by the ribs. The entire of the woodwork has been stained and varnished. Bluestone has been selected for the superstructure, Mahabury stone for the springs, bases, and copings, and Spring Bay freestones for the dressings to the doors and windows. The works have been carried up under the immediate personal superintendance of the architect, Mr. T. A. Kelley, Mr. Thompson acting as his clerk of works; while Messrs. Reid & Stewart, of West Melbourne, were the contractors for the undertaking.

Artisans' School of Design, Melbourne.—The third annual meeting for the distribution of prizes to the pupils of this school was held on July 19th, in the Trades Hall. Judge Bindon occupied the chair, and the hall was filled by young people. On the walls were exhibited a number of admirable drawings by the pupils. The report stated, that during the past twelve months the school had continued to be prosperous. There were now 194 pupils on the roll.

East Collingwood School of Design.—The first annual meeting and distribution of prizes to the pupils at this school took place on July 26th, in the local council-chamber. The mayor of the

borough (Mr. Rushall) occupied the chair. The secretary read the report, from which it appeared that in the first quarter of the year 55 pupils joined, the average attendance being 45. In the second quarter there were 62 pupils,—average attendance, 40; third quarter, 41 pupils,—average, 23; last quarter, 50 pupils,—average, 36; making a total for the year of 129 pupils, with an average attendance of 44.

The Census of Victoria, 1871.—Returns of the census of the colony, taken on the 2nd of April, 1871, have been laid before the colonial Parliament. From these it appears that, of the total population of 731,528 in the colony on that date, 401,050 were males, and 330,478 were females; the Chinese numbered 17,935, of whom 17,899 were males, and 36 were females; and the aborigines 1,330, of whom 784 were males, and 546 were females. There were 150,618 occupied and 6,997 unoccupied [Colonial] habitations in the colony, and 866 in course of erection. Since 1861, the males increased by 22 per cent., and the females by 56.13 per cent. The population in the cities, towns, and boroughs was 374,150, the males exceeding the females by 6,700. The increase of population in the mining districts since 1861 is 42,247. There were 38,588 occupiers of land, who held 36,928,104 acres. Nearly 20,000,000 acres were still unoccupied. There were under cultivation 804,508 acres. There were in the colony,—209,025 horses, 212,193 milch cows, 561,534 other cattle, 10,477,976 sheep, 188,109 pigs, and 122,164 goats. The live stock numbered 6,641,023 in 1861, and 11,643,837 in 1871. Between the two periods the number of sheep was almost doubled, having been 5,780,806 in 1871. The table showing the religious of the people gives 257,835 Episcopalians (including 5,997 Protestants not otherwise defined), 112,983 Presbyterians, 94,220 Wesleyan Methodists, 18,191 Independents or Congregationalists, 16,311 Baptists, 170,620 Roman Catholics, and smaller numbers of various other sects, besides 17,650 Pagans. From the table showing the birthplaces of the people it appears that 329,697 were born in Victoria, 28,669 in other Australian colonies and New Zealand, 164,287 in England, 6,614 in Wales, 56,210 in Scotland, 100,468 in Ireland, 3,870 in other British possessions, and 16,637 in Continental Europe and the French colonies (of whom 8,995 are from Germany).

NEW ZEALAND.

Queenstown.—An Atheneum and Town-hall has been erected by a joint stock company (limited), with a capital of 1,500*l.* in shares of 5*l.* each. The materials employed are stone and brick, finished outside in Portland cement and inside in plaster. The accommodation provided is as follows:—On the ground floor: entrance-hall and staircase, coffee-room and council-chamber, and concert-hall, the latter 55 ft. long by about 30 ft. wide and 19 ft. in height, lighted by ornamental lantern lights, and having a gallery in the end, the front of which is finished with ornamental open woodwork. On the first floor there are library and reading-room, lodge-room, and ante-room. The design of the building is in the Italian style of architecture. The principal part is of an ornate character, with a balcony, to be used by public speakers. The architect was Mr. F. W. Burrell, of Queens-town. The contractors were Messrs. Smyth & Arnal.

HOSPITAL FOR SICK CHILDREN, PENDLEBURY, MANCHESTER.

The Children's Hospital, which has been for the last eighteen months in course of erection on an elevated site at Pendlebury, four miles to the west of the city of Manchester, under the superintendance of Messrs. Pennington & Bridgen, architects, of that city, whose designs were selected in a limited competition, is fast approaching completion.

The building is intended to accommodate the establishment now located in Bridge-street, and which has, for some years past, owing to its situation and the small extent of its premises, been found totally inadequate to the wants of the city and to the successful working of an institution of this kind.

In many respects this hospital may be considered an advance on the arrangement of similar buildings on the pavilion system, inasmuch as, with the exception of the administrative block, it is one story only in height, an arrangement which, while it completely embodies the idea of each pavilion containing within itself a complete

hospital, and counteracting the serious evils which are always experienced by the hospital atmosphere ascending through the staircases when the wards are placed one over another, diminishes both the labour and cost of administration. The distance, also, between the pavilions (100 ft.) and a very large air-space afforded to each patient, upwards of 1,600 cubic feet, and the abundance of light throughout the building, are also noteworthy.

The hospital will accommodate 170 patients when completed, but at present only three of the pavilions on the north side of the corridor have been erected; the administrative portions, however, for the entire hospital are, in all respects, finished and fitted up.

The land falls very considerably from the north to the south, which, though it has added somewhat to the cost of the building, has enabled the architects to place all the kitchens, stores, and offices in the necessarily formed third story (the corridors being level) under the administrative block, and to devote the whole of the ground-floor to purely hospital purposes and to the accommodation required for the resident surgeon, matron, and other officials of the establishment.

On the first floor are the sleeping-apartments for the nurses and servants in the north and south wings respectively, to which separate staircases give access and effect the necessary separation.

Each pavilion is arranged for twenty-six patients, with a window between each bed 3 ft. 100 ft. long, 23 ft. wide, and 16 ft. high to the flat ceiling; and is heated by four open tiled fire-places in the centre of the wards, built back to back. At the entrance to each pavilion is a special ward for two beds, a nurses' kitchen, and a linen, brush, and water closet. At the other extremity are baths, lavatories, and water-closets, on a scale adapted to the age of the patients, and a verandah, accessible from the pavilions.

The extreme easterly pavilion being devoted to fever patients, a separate entrance and reception-room are provided.

The pavilions are connected by a spacious corridor, 12 ft. wide, ventilated and lighted on both sides, with an open boarded ceiling, and octagonal lanterns at the intersections of the main with the connecting corridors. The operating-room, with the ward for one bed attached, the gymnasium or play-room, reception-room for general patients, together with the dispensary service (with lifts from the basement), linen and house-keeper's rooms, are placed conveniently on the main corridor.

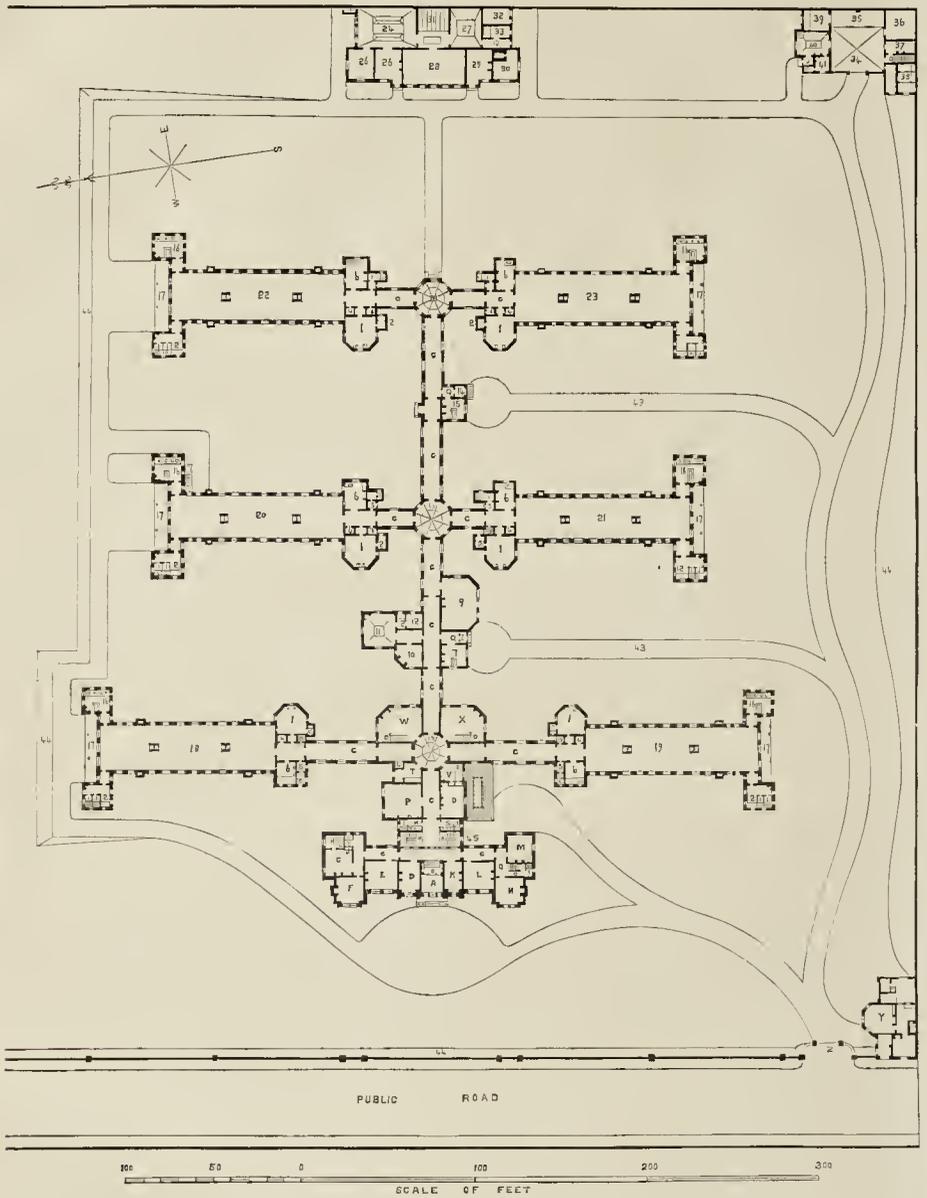

The remainder of the building consists of the laundry and block of buildings containing the stables, coach-house, post-mortem-room, dead-house, &c. The lodge-entrance is on the road approaching from Manchester. The administrative block is surmounted by a clock-tower, rising to a height of 100 ft.

All the buildings are of plain but substantial character. The front pavilion, administrative block, and lodge are faced with yellow Raabon bricks; all the cornices and chimney-tops have been executed in similar materials, interspersed with a few bands of chocolate glazed bricks. The stone, of which a sparing use has been made, has been quarried in the locality. The other buildings are of common brick, with arches in stocks, an earthenware or damp-proof courses being carried round all the walls. The floors of the pavilions are of oak. The internal walls are finished in Parian cement, and the windows glazed with plate-glass. The walls of the kitchen, and of all lavatories, water-closets, and bath-rooms are to be lined to the height of 5 ft. with glazed wall-tiles; and the whole of the woodwork is of red pine, stained and varnished.

The floor of the main corridor is paved with patent concrete, with a border of Staffordshire tiles on each side. The corridors of the administrative block are fire-proof, and, together with the vestibule and entrance-hall, are laid with Minton's tiles. The carriages, landings, and rias of the nurses' and servants' stairs are of iron, with treads of teak.

Mr. W. Southern, of Manchester and Salford, is the contractor for the entire building, including the boundary walls and fences. Messrs. Willson supplied the cooking and heating apparatus, gas and water mains, engine, boiler, &c., for the washhouse, which is fitted with Messrs. Bradford's washing-machines. Mr. George Gilbert executed the earthworks, formation of roads, and the drainage.

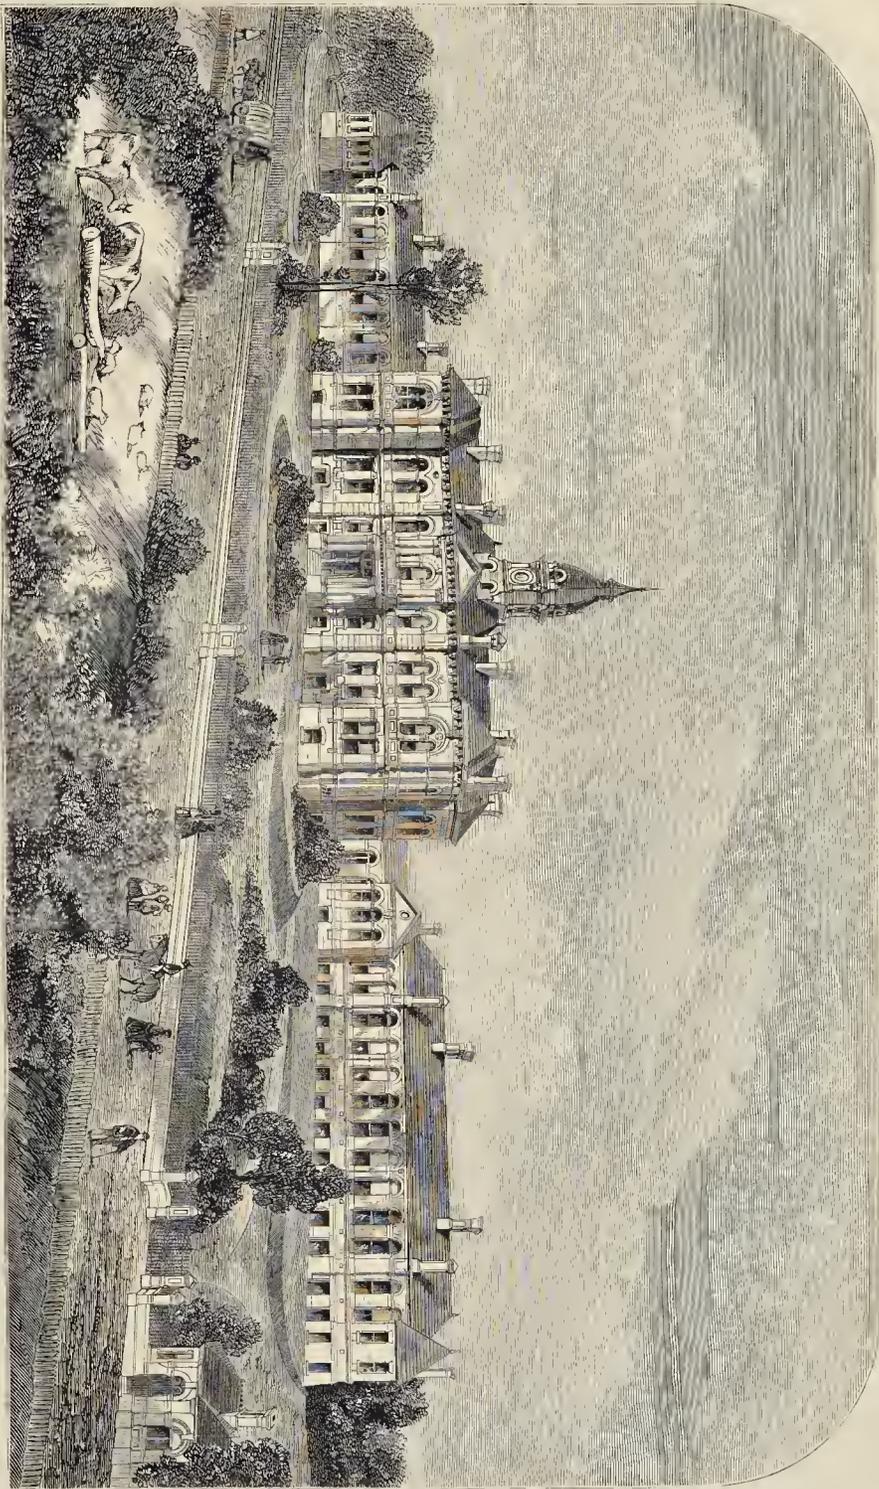

The total amount of the various contracts is 15,500*l.*

HOSPITAL FOR SICK CHILDREN, PENDLEBURY, MANCHESTER.—Plan.

HOSPITAL FOR SICK CHILDREN, PENDLEBURY, MANCHESTER.—Messrs. PENNINGTON & BARDEN, ARCHITECTS.

THE COST OF PAVING.

The following tenders, received for paving Chipping Barnet, Herts, under the direction of Mr. John Laddis, architect, afford information. The quantities were supplied by Mr. T. Laddis:—

	High-street.	Wood-street.	Union-street.	New-road.	Moxon-street.	Total.
New York Stone.	Old York Stone.	Brick.	Brick.	Brick.	Brick.	
J. Asplund & Sons	£2,053 6 0	£469 13 0	£252 8 0	£328 13 0	£306 14 0	£3,740 19 0
P. G. Alderson	1,998 10 0	636 0 0	368 0 0	230 0 0	185 10 0	3,481 10 0
P. Barton	1,810 0 0	394 0 0	440 0 0	258 10 0	182 10 0	3,093 0 0
Lloyd	1,915 7 7	383 14 4	369 16 0	245 7 0	184 15 0	3,093 1 3

Asphalte Company	£819 0 0	—	£290 0 0
General Asphalte Co.	1,032 10 0	—	363 2 0
			£1,400 0 0

Mr. Ewens's tender has been accepted, subject to approval of surties, &c.

THE LABOURING POPULATION.

In a South of England newspaper, a few weeks ago, I saw the statement of an agricultural labourer, living under forty miles from London. He says, "My wages are 12s. a week. I have a wife and five children to support. I spend my 12s. thus:—Rent of cottage and garden, 2s. 2d. per week; eight loaves of bread, at 8d.—5s. 6d.; 1½ lb. of bacon, at 10d. per lb., 1s. 8d.; butter, 1d. per day—7d. per week; leaving for tea, butter, sugar, soap, cheese, and candles, 2s. 6d. per week." Much has been recently said upon the deterioration of the agricultural labourer, and it has been ingeniously explained that the cause is to be ascribed to inter-marrying.

I am convinced there are many causes in operation rapidly deteriorating the race of agricultural labourers in England. 1st, as the above statement will show, they are miserably underfed, and we all know the animal frame cannot be developed unless it receives the requisite support. For instance, look at the sheep and cattle, and ponies, reared on bleak moorlands. 2nd, The habitations of the labouring classes of England are small, overcrowded, and generally situated in the most unhealthy spots; often beside some brook, or elsewhere, on some out-of-the-way spot of little value. Anywhere will do for the site of a row of cottages, as long as they are far enough from a gentleman's grounds; therefore, if it is desirable the gentleman should secure the healthiest spot in the locality, the cottagers must accept the worst. Beggars must not be choosers. I have seen cottages in country districts that are a positive disgrace to a civilised country, these same cottages belonging to persons of great influence, which of course secured them immunity from the visits or inquiries of the sanitary inspector.

In addition to the violation of the merest rules of sanitary science in the cottages of labourers in the country, a large proportion of the strongest and most energetic leave the locality either for manufacturing or mining districts; emigrate, or go for soldiers, policemen, or sailors, and a very small portion of those that once leave an agricultural district ever return to settle there. It is the worst that stop quietly at home, hand the best, as far as regards energy, that leave the locality or the country.

The populations of the industrial centres of England have a deeply impressed conviction that the country is done up for the working class. I have seen them in possession of passage tickets for the United States, even when their trade has been in a prosperous state; and when questioned, they would remark, there was no telling how soon there might be a slack time come, as there was no dependence to be placed in work, and directly there were symptoms of there being a slackness they should be off to America. If a man has high wages in England, in comparison with the working man of France and Germany, his cost of living is very much greater. Some thirty-five years ago, several thousand weavers migrated from England to Saxony, to the great detriment of their English employers; they got 6s. per week in Saxony, but then they could purchase more for that 6s. there than they could for 20s. or 24s. a week in England.

I anticipate an exodus of the working classes from England to the United States, especially as the resources of that country are being developed daily. The iron ore of the shores of Lake Superior, the coal-fields of Indiana and Nova Scotia, may be destined to become vast centres of industry at present unthought of. For the

Nova Scotia coal-pits machinery is being made in this locality; and in the course of a few years, instead of the cry being, "Ireland for the Irish!" it may be, "America for the English!" but in a different sense.

Any man willing and able to work ought never to be in want of remunerative employment. But the feeling of employers or the buyers of labour has been that they ought to buy labour at whatever price they choose to offer; and when a man did not feel disposed to work for their terms, they were highly indignant that their offer was not gratefully accepted, however inadequate. That such a state of things should be customary sufficiently shows the degraded, servile position of the labourer of England.

Just shift the scales, and what indignation would be expressed if a buyer of merchandise were to tell the seller to deliver a certain quantity of goods, and after the buyer had received them he paid the seller what price he thought fit, and if the seller grumbled, the buyer told him he would prevent him selling to any one else.

That the upper classes might do more for the welfare of the lower can scarcely admit of a doubt. But there seems to be a steadily-increasing antipathy between them, which the occasional indiscretions of the great unpaid do not tend to smooth down. The enclosure of commons, the game laws, the throwing of small or moderately-sized into overgrown farms, that are half-cultivated only, all tend to operate against the interests of the agricultural labourer. The game-preserves tend to keep large areas from being cultivated, to say nothing of the injury done to the crops of the farmer by the system. It is also had in principle. It is hopeless for a working man to think of acquiring even a small freehold in England. A small freehold allotment, at an exorbitant price, he might, by great denials, acquire. I have had cottage allotments pointed out to me, in the adjoining county of Yorkshire, that a working man bought, one for 12s. 6d. per square yard, or at the rate of 3,025l. per acre; and I was told that it was worth 20s. per square yard at the present time, or 4,810l. per acre. I admit this is an extreme case; still, there is very little chance of the lower classes acquiring any freehold land in England, as there is nothing that is bought or sold in England that there is so much difference between the wholesale and retail prices as there is in land. I have known land worth about 40l. or 45l. per acre, in a country district about half a mile from a small town, and when cut up in quarter-of-an-acre pieces, eligible for gardens, 3l. per perch, or even more, asked for it. This is purchasing garden-land with a vengeance, and shows the little prospect an English workman has of acquiring a cottage and garden of his own.

A tenant farmer is sadly under the caprice and whim of his landlord, who, if he cannot at once turn him out, can make matters very awkward for him; for instance, in many cases preserve so much game as to nearly destroy his crops, to say nothing of having the tenant farmer and his men systematically annoyed by the gamekeepers. In too many instances a tenant farmer is deterred from improving the land he rents, lest he should by such improvements have his rent raised next term.

Nearly every other branch of industry, excepting agriculture, may be overdone. It is not a great calamity to have more bullocks, cows, and sheep than the population can eat, as in Australia; neither is it a very great misfortune to have good wheat in such abundance as

to be worth only 1s. 6d. per bushel, as I have seen was the case in some of the Western States of America,—Illinois, I think.

The proportion of waste lands in England is enormous, when the length of time the country has been a leading European Power, and the denseness and requirements of the population, are taken into consideration. In these particular respects it compares most unfavourably with Belgium, where almost every blade of grass is utilised. I wonder what some of the small Belgian agriculturists would think if they were located upon some of the farms that have hedge-rows all round the fields, one to two perches in width, with here and there a coppice plentifully stocked with strictly-preserved game. I maintain, as well try and mix oil with water as think of a game preserve or hunting-ground in a well-cultivated district. The one is an imitation of a primitive state of nature, and the other a refined state of civilisation, and each in its most prosperous days is hundreds of years apart from the other. I have seen somewhere in print that 500 acres of hunting-ground only yield as much support to a population as one acre of cultivated land, and I am under the impression this comparison was made in North-West America, where large game was abundant; but it is now becoming a thing of the past, owing to the influx and increase of population; and if the preserving of game is not compatible with the requirements of an increasing population in such a vast area as North America, where freehold land is worth less than a year's rental of the same area in England, how injudicious it must be in England, with a large population requiring land to cultivate, and largely dependent upon foreign countries for agricultural produce for her population, in fact, to live upon. Were we to read in ancient history of an isolated nation keeping land out of cultivation for amusement, and sending vessels across the seas for food their land could partly produce, what should we think of such a people? And that is not all: we have an agricultural population ready and willing to till these same waste lands.

A VOICE FROM THE NORTH.

THE NEW WORKS AND BUILDINGS ON THE GREAT NORTHERN RAILWAY.

The vast expansion of the Great Northern and Midland Railways in new works and buildings connected with their respective undertakings has, within the last few years, been something marvellous; and an analysis of the expenditure of the first-named company upon works in progress during the past half-year, as shown by the accounts, as well as the prospective expenditure on other new works which are about to be commenced, is a proof of the great resources of the company. It appears that during the half-year the completion of sundry land-purchases and works about London, and the widening of the lines between London and Peterborough, amounted to 47,457l.; the extension of the telegraph-block system absorbed 4,464l.; and a new goods station at Leeds, 16,040l. The lines in course of construction wholly owned by the company include the Bradford, Ecclehill, and Idle, and Idle and Shipley Railways, and the Batley and Dewsbury extension, on which the sum of 64,379l. has been spent during the past half-year. The contributions to other new lines now in progress, in which the company is jointly interested with the Midland and Manchester and Sheffield Companies, and which include what are known as the "Cheshire Lines," were 88,237l. The subscriptions to these lines, with the new line from Manchester to Liverpool, and the Liverpool new central station, now in course of erection, have already absorbed no less than 1,288,850l. of Great Northern contributions; and the sum which the company will yet have to contribute towards the completion of these particular works is estimated at 425,424l. The magnitude of the works in connexion with the Liverpool extension and the very large new central station there, is proved by the fact that the amount contributed by the Great Northern Company only represents about one-third of the entire cost of the undertaking, inasmuch as the Midland and Manchester and Sheffield Companies contribute in equal proportions. The aggregate cost of these works alone, when completed, may therefore be set down at between 5,000,000l. and 6,000,000l.; but the expenditure, large as it is, is expected to be remunerative, as it will, amongst other things, give the three associated companies

direct access from Manchester to Liverpool, for which they are now paying the London and North Western Company upwards of 60,000*l.* a year in consideration of running over twenty-four miles of the last-named company's line; and the associated companies will also—in addition to having direct and independent communication between London and Liverpool,—secure the advantage of being competitors for the enormous local traffic between Liverpool and Manchester. The new railway between the two great Lancashire towns is now about completed, and it is intended to open it for goods traffic immediately, and for passenger traffic in spring; but the works on the central station at Liverpool are so heavy that it is not expected to be ready for opening before July or August next. The future expenditure of capital on the Great Northern line on works in progress was estimated last year at 1,440,356*l.*, but to this there is now to be added the extensive outlay to which the company is committed by the passing of the Acts of last Session of Parliament. These Acts involve the construction of the lines from Nottingham to Derby and Burton, to the collieries in the Erewash Valley, the new line from Bradford to Thornton, and the important junction by which the Great Northern will gain access to the North London line at Highbury, and also by this route to the City. The cost of these various new undertakings is estimated at not less than 2,861,700*l.*, bringing up the total future expenditure of the company in new works to the sum of 4,302,056*l.* With the exception of the Midland, which has very extensive works on hand in different parts of the country, this is the largest amount required in new works by any of our great railway companies.

SCHOOLS OF ART AND OF SCIENCE.

Hanley School of Art.—The annual meeting of the friends and supporters of this school has been held in the town-hall. The hall was crowded, and the proceedings, the successes of the school at the recent national competition having been of a striking character, were animated and enthusiastic. A large number of meritorious models and drawings were exhibited, and remained on view on the following day. Mr. George Melly, M.P., presided. The report of the committee said:—In presenting their annual report your committee express more than ordinary satisfaction with the continued and increasing success of the institution. In the last report the committee ventured to express a hope that the remaining room at their disposal would soon be occupied, and they are gratified to say that not only has this hope been realised, but during the year so many new students have sought the advantages of the institution as to make it necessary that the committee should provide additional teaching accommodation. Since your last meeting the committee have appointed Mr. Joseph Ellis an additional master. The actual working of the school under Mr. Bradbury has more than justified the high character with which they received him. The results of his efforts, combined with those of the assistant masters, Mr. Lees and Mr. Ellis, have been a marked advancement of the pupils, a larger number of works for national competition, and a higher acknowledgment of merit by the department than any hitherto attained by the school.

Liverpool Operatives' Science Classes.—The distribution of the prizes gained by the students attending these classes took place at the Trades hall, Duke-street. Owing to the inclemency of the weather, the attendance of members was but limited. The chair was occupied by Professor Henry F. Roscoe, F.R.S., who distributed the prizes. Mr. M. Fitzpatrick, the hon. secretary, made a brief statement, as to the progress of the classes during the past session. The session, he said, had been a very satisfactory one. Fifteen students had passed in chemistry, and eight in mathematics,—a result with which the committee are perfectly satisfied. With regard to the arrangements for the next session, they had taken up one or two additional subjects,—free-hand drawing, acoustics, light and heat, magnetism, and electricity. Professor Roscoe delivered an address on the subject of the scientific education of the working man. He divided the labouring men of all nations into two classes,—those who worked with the brain and those who laboured with the hand. The man who worked with his brain by an expenditure of nervous energy was as much a working man as he who

laboured solely by the force of his muscles. Indeed, they had only recently a sad instance of the complete destruction of such nervous energy in the case of the lamented judge who had just lately died. He died a martyr to hard work as much as did the slave who fell under the lash of his master. The great object of education was to enable men to ascend in the scale of intellectual development; it enabled men to use their nervous instead of their muscular energy. There was in the nation a certain amount of nervous energy, just as there was in a pound of coal a certain amount of latent force; and the object of education, he took it, was to get out of the nation more of its latent energy than was previously developed, to gradually raise the whole mass of the people from the exertion of their power as merely mechanical up to an exertion of their intellectual activity, which, when educated, they were able to use.

Leeds School of Art.—Speaking at this school, Sir John Pakington mentioned a touching incident which is worth columns of specifying as an encouragement to perseverance under difficulties. Holding in his hand a drawing which had been done by a former pupil of that school, he said,—Here was a boy in this Leeds school so poor, so humble, that he worked at that drawing two days without food, in the hope of getting something on which to live. It was an honourable fact, and he hoped it would be widely circulated; it ought to be most encouraging to other students that this young man, evidently a person of talent and an artist, had now obtained complete success, and, after undaunted effort and continual striving, was earning an honourable income, and he had sent from Manchester to Leeds to beg as an especial favour that he might be allowed to re-purchase this picture which he had sold in his moments of distress.

CORPORATE HONOURS TO A SURVEYOR.

ON the 11th of this month, the Durham Borough Surveyor, Mr. John Henry Collinson, died of consumption, at the early age of twenty-eight, leaving a young wife to deplore his loss. Mr. Collinson had filled the post of borough surveyor for the city of Durham for about two years only, and had been unable to fulfil his duties for some time past. He came to the city of Durham from Oldham, at which borough, and also Bradford, he had held a similar position.

The corporation of the city, as a mark of esteem, attended his funeral to St. Giles's churchyard, on Monday, the 14th inst., the Mayor, Alderman White, the Town Clerk, and several members and officials of the city being mourners. The Freemasons of the district also attended in regalia, the Granby and Norman Freemason Lodges assembling in great numbers, the deceased being one of the stewards of the Granby Lodge. A great number of working men left their jobs to add their respect to a worthy man's memory, and his professional brethren were present in strong numbers.

SLATES AS A COVERING.

SIR,—Your last week's impression contains a letter on "Worcester Cathedral," objecting to the roof covering, because the slates are similar to those used for ordinary buildings, and suggesting that large slabs should be used instead. Now, without going into the question as to whether the roof-covering of a Gothic cathedral should be copied from an Italian club-house or not, it seems that if the theory of rejecting the use of suitable materials in an ecclesiastical fabric because they are used in buildings erected for domestic purposes were carried out, there would be an end to church building.

With respect to the use of large slabs, the writer some thirty-two years ago superintended the rebuilding of a village church. The roofs had a flatish pitch, with principals at moderate distances, and strong purlins, eaves, plates, and apex-pieces all framed flush on the upper side, covered with two rows of 1-in. planed slate slabs, lapped on the purlins, with fillets over the vertical joints, bedded in oil cement and screwed to the woodwork, making a neat, light, and rain-proof covering, with a panelled appearance to the interior; but it was a failure: the atmospheric vapour, condensed upon the lower surface of the slabs, trickled in a stream from the horizontal timbers, and rendered the church quite unfit for comfortable occupation. Where

the slates are small, the currents of air passing through the interstices counteract the evils of condensation, and there is great credit due to the ruling powers of any cathedral who have the moral courage to remove the heavy, costly, and difficult covering of lead from the roof of the edifice under their charge, and replace it with the lighter, cheaper, durable, and easily-repaired material of slate, a good example of which can be seen on Peterborough Cathedral. R. Y.

* * * Apart from the real question under discussion, it is not likely that large slabs would be used for the proposed purpose without a ceiling of some kind that would prevent condensation and its annoyances.

HOLLOWAY HALL, LONDON.

THIS hall, which has lately been erected, was opened on Tuesday evening last. It has a bold, handsome front of brick, with stone dressings and effective carving. The front portion contains committee-rooms, large library and reading-room, billiard-room, &c. The great hall is 112 ft. long and 47 ft. 6 in. wide, with a large room, 10 ft. high, below it, of the same size. The great hall has a dado, some 6 ft. high, of dark brown, then a few lines of colour, and cream-colour above, the ceiling (a panelled one) being nearly white, with simple red lines round each panel. The "Creation" was the oratorio performed at the opening meeting.

Mr. George Traflet was the architect, and Mr. Enoch the builder.

MONUMENTAL.

The Scott Monument in New York.—The pedestal of this monument, by last accounts, was expected to arrive by the steamer *Love* in a few days. On its arrival, it was to be taken, together with the statue (which still remained on the dock of the Anchor line of steamers), to the foot of Fifty-seventh-street, on the North River, from whence they would be transported to the Central Park. In the meantime the foundations were being prepared at the new site on the Mall, so that the work of erection would commence as soon as the granite reached the ground. The announcement was premature that the ceremony of unveiling would take place on the 20th of October.

German Monument in Liege.—A monument has just been completed in Liege to the memory of the German soldiers who died there in the ambulance. It consists of a column, surmounted by the German eagle; and four cannons are placed round it, connected together by chains, so as to form an enclosure.

Memorial in Higham Ferrers.—A monument has just been completed in the churchyard of Higham Ferrers, Northamptonshire, erected to the memory of Mr. A. R. Hacon, surgeon. It consists of a plain column of red granite, 15 ft. high, and weighing about 5 tons. The memorial was erected by the voluntary contributions of 1,160 persons, chiefly of the working classes.

COST OF HORSE AND CART WORK.

THE St. George's, Hanover-square, Vestry have received from a committee appointed to inquire into the management of the stable department, the following report:—

"There are two systems for the vestry to consider; first, that of buying eight horses to increase the present number to eighteen, besides hiring for the summer months eight additional horses to stand in the stables. Second, that of transferring the whole of the responsibility of buying and maintenance of horses, carts, harness, &c., to a contractor, thus relieving the vestry from the purchase of horses and carts. The committee having advertised for tenders, report that they have received the following from Mr. Perkins, for a term of seven years:—At per horse per week, 3*l.* 3*s.* 6*d.*; from Mr. Covington for five years, 3*l.* 1*s.* 11*d.*; ditto, for three years, 3*l.* 2*s.* 5*d.*; from Mr. Reddin for three years, 3*l.* 3*s.*; from Mr. Emerton for five years, 3*l.* 2*s.* 9*d.*; ditto for three years, 3*l.* 3*s.* If the vestry decide upon buying and keeping its own horses, there will be necessary at once an expenditure of nearly 800*l.* to buy eight first-class horses. If the vestry resolve to adopt the contract system, the committee recommends that the tender of Mr. Covington for three years be accepted.—Signed (Col.) Brownlow Knox, chairman.

Addendum.—From inquiries made by order of the committee, it is found that the horse and cart work of the principal metropolitan parishes is done by contract, and there is reason to believe that the same system obtains generally—some parishes letting the watering and slopping by lump sum contract, and others hiring daily as required. A return made of the cost of the stable department, for five years, ending Lady-day, 1871, shows that the average cost per horse, cart, and driver, including every expence except rent, is 2l. 19s. per week.

H. J. TOMPKINS, Surveyor."

After some discussion, the vestry decided to adhere to the present system, and not contract.

COVENTRY SEWAGE QUESTION.

SIR,—In your publication for Oct. 12th, under the head of "Settlement of the Coventry Sewage Question," you have conveyed the erroneous expression that some enormously expensive scheme of mine has been rejected. Allow me, then, to state that, so far from this being the case, the adoption of the method of precipitation in preference to the enormously expensive method of irrigation (not at all suited to the particular and peculiar circumstances of the city of Coventry) is consequent upon my earnest representations and advice. T. HAWKLEY.

* * * We simply repeated what the mayor was understood to say.

COLLIERY CALAMITIES.

HOW MANY? ECHO ANSWERS, "MANY."

AGAIN and again the colliery disasters occur, with frightful rapidity. Our Government complains that they are not a paternal government; colliery owners decline to do more than they must for preventing holocaust. Pitmen, be independent; organise a penny subscription, and a remedy will be presented from the ranks. Arkwrights and Stephensons still live: Not in England yet *ex-wisè-head*.

R. T.

THE ANT NUISANCE.

I HAVE mentioned to a friend in this country that which I have read in the last few numbers of the *Builder* on the "Ant Question." My friend has large experience in building, and considers himself to be familiar with the habits of all animals which interfere with the comfort of the householder. "My remedy," he says, "is one which is disagreeable for the time, but effectual. Let the places frequented by the ants be smeared with petroleum oil, and they will go elsewhere." Destroying the nuisance in its source he seems to consider impossible. I leave this suggestion to the appreciation of your correspondents. A SUBSCRIBER IN BELGIUM.

ST. PANCRAS VESTRY AND THE LONDON SCHOOL BOARD.

A SPECIAL meeting of the vestry of St. Pancras has been held, pursuant to the requisition of nineteen vestrymen, and have resolved:—

1. That in the opinion of this vestry the School Board for London has lost the confidence of the representatives of the ratepayers of this parish by a course of extravagant expenditure in erecting schools, which have had the effect of closing the schools hitherto supported by voluntary contributions, and more particularly in purchasing a site for 15,000*l.* for the erection of offices on the Thames Embankment, at an enormous cost to the ratepayers.

2. That a copy of the foregoing resolution, with a copy of the resolution adopted at the public meeting of ratepayers held in the Vestry-hall on the 15th instant, be forwarded to the Education Department of the Privy Council, and to the School Board for London.

3. That a copy of each of the foregoing resolutions, with a copy of the resolution adopted at the public meeting in the Vestry-hall on the 15th instant, be forwarded to each of the vestries and district boards in the metropolis, respectfully urging them to call a meeting of the ratepayers of their respective districts to take an expression of opinion as to the policy and expenditure of the School Board for London.

The vestry was very thinly attended, there being only some thirty-three or thirty-four members present, out of the 120 composing the vestry.

Mr. Watkins, in proposing the first resolution, charged the London School Board with extravagance, and doing injury to existing schools, without attending to the education of the very class they were called into existence to look after. He strongly condemned the expenditure of 18,000*l.* on a site on the Thames

Embankment for offices, charged the appointment of survey with being a job, and said before the building was finished and occupied it would cost 100,000*l.*

Mr. Hawkins moved as an amendment,—

"That in the opinion of the vestry the School Board for London should compel every child between five and thirteen years of age to attend an efficient school, and to [and should?] exercise the most careful economy in every department of their work."

The amendment, however, was negatived, and the original motion carried, with two dissentients,—the mover and seconder of the amendment.

Other resolutions proposed were also adopted.

NEW CORN EXCHANGE FOR BEDFORD.

The foundation-stone of a new Corn Exchange for the borough of Bedford has been laid by the lord-lieutenant of the county, Earl Cowper, accompanied by the mayor and other members of the corporation in their official robes, the Duke of Bedford, and others.

The Mayor addressed the company. Some twenty years ago, he said, the adjoining market had been erected, and it answered its purpose for its time. The requirements of the population had so increased that the erection of a new building became absolutely necessary.

Earl Cowper congratulated the town of Bedford on such an increase of trade as to require a new Corn Exchange.

The Duke of Bedford said that he was at that moment having a statue of John Bunyan,—who was so nearly connected with the town,—made; and if they thought it worthy of their acceptance, it would be a great gratification to him to present it to them.

The new building is to be in the Italian style, and its internal dimensions will be about 100 ft. long and 60 ft. broad. It consists mainly of one long room, forming the Corn Exchange, the various offices of the corporation being located in the basement. It will be lighted by three segmental domes in the roof.

Messrs. Ladds & Powell, of Bedford-row, are the architects, and were appointed by competition. The builder is Mr. Moore, of Bedford, and the cost will be about 7,000*l.*

PAYMENT OF ARCHITECTS.

SIR,—At the present time, when strikes are almost universal amongst workpeople, has it ever occurred to you that the principal reasons assigned for them applies equally to the professional man?

The cost of nearly everything since I commenced practice (a quarter of a century ago) has increased about 30 per cent, but the fee of 5 per cent,—which is the utmost ordinarily an architect can charge,—has never been raised.

Would it not be desirable that the institutions connected with architecture and engineering should consider this subject, and see if some revision of fees cannot be arranged?

I am quite prepared to hear it stated that a professional man should not place himself on a level with the ordinary "strikers"; but surely it is reasonable when not only the cost of living, but the very salaries of clerks and assistants are so materially increased, that some addition should be made to the emoluments of the architect and engineer, who appear at present to be about the only people unthought of. SENIOR.

WIVELISCOMBE CHURCH.

ON Wednesday the new chancel of St. Andrew's Church was opened. The church was erected about forty years since, and superseded a building chiefly of the fifteenth century, having carved oak-work in screen and benches, portions of which, with the old windows, were used in the present church. In common with all churches built at that time, the style is defective, but, thanks to the spacious arcade and height of ceiling, there is not any absolute barrier to improvement. At present the works executed are all in relation to the formation of a chancel, by inclosing a space within a screen westward of the shallow apse hitherto serving as a chancel. The central window of the apse has been built up, and a reredos of Corsham stone erected in lieu of it. This is divided into three gabled compartments, the panels enriched with monograms. A picture,

by Broughton, presented some years since by Mr. Collard, of Abbotshild, is hung over the reredos. The communion-table stands on a paved dais, and the floor is of ornamental tiles, by Messrs. Maw & Co., of the Brosley Works. The railings are on metal standards, illuminated with gold and colours. There is a descent of two steps to the choir-floor, on which are placed stalls for the clergy and choir, having metal coloured standards, with book-boards for the younger singers. The inclosing-screens, fixed on Bath stone, are of metal, coloured and gilt, by Messrs. Richardson, of London. The contractor is Mr. H. Davis, of Taunton; and the architects are Messrs. Giles & Gane, of London. It is proposed to reseat the whole chancel.

A BIG CHURCH FOR BRIGHTON.

THE Rev. A. D. Wagner has just commenced the erection of an immense building in Annet-street, within a few yards from the London-road, the first stone of which was laid on the 2nd of February. Mr. E. E. Scott is the architect, and the Messrs. Stonning, builders, London-road, are the contractors for this edifice, which, we are informed, will not only be the largest church in the county, but will contain as many superficial feet as any church in England, except the cathedrals. We have the following account:—Height from pavement to the spring of the roof, 90 ft.; from the pavement to the ridge of the roof, 135 ft.; 46 ft. space in the clear. There will be eight bays to the church, and the whole length of the building, when the chancel is built, will be 225 ft., so that it may be calculated to hold an immense congregation, all of whom are to be seated in chairs. The walls, which will be all brickwork, with stone bands, are of unusual thickness, as can be already seen. There is a very large semicircular entrance-arch of moulded bricks, of which all the arches will be composed. It is proposed to complete the building in about two years.

THE COAL TRADE.

THERE is a threatened stoppage of the South Staffordshire Collieries. The colliery engineers of the Black Country, having made a demand for an increase of pay to 5*s.* a day, and for a working day of eight hours, a deputation of men was received at a large meeting, specially called, of the United Coal Masters' Association. It was decided unanimously that the masters could not concede the demand of the workmen, and that they would be allowed to go out. If the men adhere to their resolution, nearly all the works in the district will be without fuel, and above 50,000 men will be locked out. No notification of a reduction has been made, nor is it considered probable that coal will be reduced this side of Christmas.

Matters are evidently coming to a crisis in the Scottish coal trade. The Messrs. Dixon, of Glasgow, one of the largest iron and coal firms in Scotland, have twice reduced the price of coal 2*s.*—that is, 4*s.*—within a week. Some of the principal manufacturers of bar-iron in the West of Scotland have determined to suspend operations until the market improves. One of the reasons given for this resolution is, that the cost of producing bar-iron involves, on account of the extravagant price of coal, a heavy loss, and that the demand for their material in the market at the present time is limited.

OPENING OF BAGSHAW HALL, TIDESWELL, DERBYSHIRE.

THE opening of Bagshaw Hall has been a subject of festivity at Tideswell, a town about thirty miles from Derby. The building and the fittings are the gift of Mr. John Bagshaw, one of the oldest residents in the town, and the site was presented by the Duke of Devonshire. The hall is principally intended for the use of the Tideswell Old Sisk Club, but it will also be let for public meetings and concerts, and the proceeds so realised will be applied to the club funds. The site of the building is in the Market-square, directly opposite to Mr. Bagshaw's house. The entrance is gained by two broad flights of steps, which are lighted by means of two gas-lamps fixed at the top, and on the ground on either side of the steps is separated from the street by an ornamental iron rail. Over the entrance-door is a clock which can be

illuminated with gas. The structure, which is of limestone, is after the Elizabethan style of architecture, and measures 88 ft. by 42 ft. At the right-hand side of the entrance-hall a door opens into a moderate-sized apartment, which will be used as a reading-room, and on the left is a similar arrangement for a committee-room. Over the entrance-hall and the two rooms already mentioned there is a gallery, capable of holding about fifty persons. The hall proper measures 50 ft. by 36 ft., the height from floor to ceiling being 21 ft., and is lighted by five large windows on either side. At the rear of the hall there is a small retiring-room, which also forms a back entrance to the building. A cottage has been provided for the person taking charge of the hall. The whole of the building is fitted up with gas, and heated by means of hot-water pipes. Mr. Samuel Howard, jun., of Stockport, was the architect; and Mr. Bullock, of Tideswell, the clerk of the works. The total cost of the structure is about 2,000l.

ST. NICHOLAS PARISH CHURCH, GUILDFORD.

At a vestry meeting of St. Nicholas's parish, held in the vestry of the church, to consider a report relative to the state of the roof, and to act thereon, a report which Mr. Molyneux had obtained from Messrs. Jackson & Shaw, London, builders, was handed in and read, and was found to confirm in every particular, a previous report of Mr. Teulon. Indeed, so insecure is the roof considered to be by those best able to form a sound judgment thereon, that the first step taken by the vestry was to authorise the churchwardens to adopt such measures as would be necessary for the securing of the present building, and the safety of the lives of the parishioners. That being done, the following practical resolutions were agreed to:—

1st. That it is inexpedient to attempt to put a new roof on the present walls of the parish church.

2nd. That a sum of 2,262l. having been promised towards the erection of a new church, on a new site near the rectory grounds, a committee be appointed to collect further subscriptions, and to take steps towards carrying out this object.

3rd. That a committee for the above purpose be appointed.

SANITARY AFFAIRS IN PADDINGTON.

The medical officer of health for Paddington, Dr. Hardwicke, has sent in his sanitary report on the parish for 1871-2 to the vestry authorities, and it has been printed by their order.

The density of the district population, the report states, is equal to that of Liverpool, Glasgow, and Manchester,—97.9, 94.8, and 78.6, respectively; being the highest density of population in twenty of the largest towns of the kingdom. Of the whole area of 1,280 acres in the parish, the open fields and part of Kensington Gardens in the parish are estimated at 256 acres, where there are, of course, fewer houses; but this only shows an increase of density elsewhere.

In speaking of the inevitable re-breathing of foul air in close rooms, the reporter notes that it is the duty of those who live in the parish but can remove elsewhere, when and where they like, for health, to remember that the poorer classes in general cannot do so, but are comparative fixtures, and that those favoured ones ought therefore to combine in improving the condition of their less fortunate fellow-citizens as far as possible. It is a scandal, he remarks, that the reverse of this is the rule in spite of all warnings and suggestions; and the industrial orders, like doomed men, look in vain to the Legislature for help.

From a table given it appears that there are six times the number of children amongst the working people compared with an equal number of inhabitants of the squares and mansions.

The filling up of made ground with road scrapings is deprecated as forming unwholesome sites for houses.

On the subject of a constant water supply, Dr. Hardwicke says:—

"In poor neighbourhoods it would be difficult to say what plan is best; in the worst kind of property (of which there is very little in this parish) where expensive brass taps would be stolen, injured, or left running, a stand-pipe from which the inhabitants could fetch water is the simplest and most economical; but on the better class of tenant house property the inhabitant will insist upon a draw-off tap inside the house, or some

where on the premises at least. The w.c. supply could then remain as now attached to the ordinary cistern, or abolished; a special water supply. The Public Health, at a small cost, can be fitted on to the constant supply pipe.

I think landlords must go a step further.—Those who let out floors and rooms to separate tenants ought to provide a separate water supply on each floor,—that is, a tap and a sink,—the one being quite as essential as the other."

HARDNESS OF WATER.

SIR.—Can any of your readers inform me why the rain-water which flows from our house roof, "covered with ordinary plain tiles" into a tank or cistern formed in a stratum of solid blue clay, is so hard as to be unfit for purposes to which soft water is desirable? Is it owing to some chemical action in the composition of the tiles, or attributable to the stiff and impervious clay?

G. BENTING.

TYPHOID FEVER IN VILLAGES.

A CORRESPONDENT of the *York Herald* says:—

"Unfortunately our authorities do not seem to note one of the facts of astronomy, viz., that it is not a necessity for large bodies to move rapidly. The Public Health (1872) requires (amongst other things) the appointment of an inspector of nuisances, and there is a serious urgency in this simple matter owing to the prevalence of typhoid fever in some of the villages of the county, a village which from its elevation ought to be one of the most salubrious spots about York, has had thirteen cases of this fever in a population of fifty, and three deaths. I mention this instance freely, as the epidemic is now subsiding. Other two villages I could refer to, in one of which fatal cases are occurring. The medical profession tell us that this fever is caused by moist air and bad water in the first instance, and then propagated by infection. I am therefore not surprised at typhoid fever in our villages, especially in the streets. The pure air of heaven permeates all readily, but the very doors of the dwellings, and there, in too many instances, it is poisoned by pestiferous drains, piggeries, dungheaps, and cess-pools. The beautiful well-water is poisoned by the sewage."

The local Poor-Law Guardians have it in their power, in the meantime, to vastly promote the health of the rural population by ordaining an immediate, independent, and periodical inspection and improvement of sanitary arrangements.

LIABILITY OF A WORKMAN FOR DESTROYING HIS WORK.

At the Sheriff Small-Debt Court, in Edinburgh, before Sheriff Hamilton, William Gray, joiner, Dalry-road, sued Peter Boyle, joiner, Pleasanton, for 3l. 18s., as the value of five window-frames destroyed by him on the 12th ult. It appeared that the defender was a workman in the employment of Gray, being supplied with wood to make the window-frames. He offered no objections on the score of incompetency, but on being finished the frames were found to be so mortised as to be unfit for the purpose for which they were intended. The defender admitted that the window-frames were made by him in a defective manner, but contended that as they were not destroyed willfully he was not liable. He did the work the best way he could, and having been dismissed, had raised an action for wrongful dismissal against the present pursuer in the County Justice of Peace Court, but lost his case. After a proof, the Sheriff held that the defender was liable for the damage done, because, if ordinary care had been taken, the work would have been properly executed. A remit was made to a person of skill to assess the damage, and the pursuer intimated that he would limit his claim to two guineas.

CHANGE OF BUILDER UNDER BUILDING ACT.

KNIGHTLEY v. WILKINSON.

In this case, heard by Mr. Bridge, Hammersmith Police Court, the defendant, Mr. Wilkinson, is the owner of a building estate at Hammersmith, upon which a large number of houses have been erected. Towards the end of last year, he let a plot of land to Mr. Foulkes, who gave a proper notice, and erected a carcass, but abandoned it at the end of December, when plate-ships. In this roofless condition it remained till July of the present year, when the district surveyor found men again working. The brickwork had been undertaken by one man, and the carpenter's work by another. Upon each of these a change-of-builder notice was served; but each returned it, saying he was not the builder, but working for Mr. Wilkinson, to whom a change-of-builder notice was also sent, but who paid no attention: hence the proceedings.

For the defence, the interpretation of the word "builder" was depended upon, but as the work of finishing was let out to several persons, the magistrate held that Mr. Wilkinson had control, after the manner in which builders usually control their undertakings,—that Mr. Wilkinson had stepped into Mr. Foulkes's shoes,—and he fined him 10s. and costs.

Notice of appeal was given.

CHURCH-BUILDING NEWS.

Messey Hampton.—The church here has been re-opened for divine service. The architect employed was Mr. James Brooks, of London, and from his designs a school-building for seventy children was completed a year ago. The restoration of the church was then proceeded with, divine service being conducted in the new school during the continuance of the work. Three fourth parts of the church have been renovated internally, in addition to external

repairs, and the erection of a vestry. In the nave the ceiling, and the western gallery, have been removed, dilapidated high pews have been replaced by open benches, and the buttresses of the central tower, which had been largely cut away for the greater accommodation of the high pews, have been restored. The south transept has received a new roof, and the masonry of the windows has been renewed. The nave, chancel, and south transept have been paved with Milton's tiles, and the western window of the nave has been filled with painted glass by Messrs. Clayton & Bell. The transepts are Early English, and contain two double-lancet windows, a copy of which has been reproduced in one of the new windows of the nave. The chancel is of the fourteenth century. It contains sedilia and a tomb, which have been repaired. The east window, the masonry of which was in a very shaky condition, has been taken out and refixed; and new freestone panelling has been fixed under the east window, with a view to a future reredos.

Sawbridgeworth.—The old parish church of Sawbridgeworth has been re-opened after having undergone restoration and repair. The work just completed was commenced about four months ago. Formerly the school children were scattered about in seats where they could neither hear nor see; now they have a gallery at the west end of the south aisle. The font has been rehabilitated, and, although composed of some 200 fragments, has all the resemblance of a short distance of a new font. The south door has been restored to its original proportions, and the steps down from it into the church have been moved back to the entrance of the porch. The windows, walls, pillars, and other parts have been repaired, and the masonry made good. Several of the monuments and mural tablets had to be removed in the course of the work, but care has been taken not to damage them. The work has been executed by Mr. John Egan, of Buckhurst-hill. The cost of the whole will amount to nearly 500l., which have almost, if not entirely, been already subscribed. The Ecclesiastical Commissioners have caused the chancel to be repaired, at an additional cost of 300l., which has been done under the direction of their architect, Mr. Christian. The upper doorway of the roof-loft has been brought to light during the restoration, and a carved head of an ecclesiastic was discovered in nso as a stop-gap. The gas is not yet laid on to the church, owing to a want of funds.

Chale (Isle of Wight).—The old church here has been re-opened by the Bishop of Winchester. The restoration was not undertaken before it was needed. Standing in one of the most exposed places in the island, the roof had fallen into such a state of dilapidation as to render it really dangerous. The restorations have been chiefly in the form of re-roofing, re-flooring, and re-pointing. In addition to these alterations, the tower has been opened up, and the arches have been relieved of the coating of whitewash with which previous renovators had disfigured them; and while there has been no interference with the prominent architectural features of the building, the church has been so improved as to afford increased accommodation.

Brighton.—A commencement has been made of the foundation for the Church of St. Martin's, to be erected in the Lewes-road, in memory of the late Vicar of Brighton, by his sons. The Rev. A. D. Wagner was present on the spot, examined the plans, and threw in the first shovelful of earth. The foundation-stone is to be laid next St. Martin's Day, and it is expected that the bishop of the diocese will be present at the ceremony. The contract has been taken by Mr. Jabez Reynolds, who will carry out the work from the designs and under the direct superintendence of Mr. Somers Clarke, jun., of Westminster, architect, who has appointed Mr. R. Hayward clerk of the works.

Didmorton.—A new church for Didmorton and Oldbury, to be called the Church of St. Michael and All Angels, has been consecrated by the Bishop of Gloucester and Bristol. It is intended for the use of the residents of the two parishes of Didmorton and Oldbury-on-the-Hill. The nave of the church is built in the parish of Oldbury, and the chancel in the parish of Didmorton. The foundation-stone was laid in the summer of 1871 by the Duchess of Beaufort. The funds for building were gathered chiefly from local sources. The stone, a hard white stone, was given by the Duke of Beaufort; and but a small balance of debt rests on the building. The style is Early English, the building being cruciform in shape,

ad consisting of nave and chancel, 85 ft. by 1 ft. wide, north and south transepts, an organ-trunk in the angle of the chancel and south transept; and it is intended at some future time, probably very shortly, to build an ornamental tower and spire at the opposite side wing, in the angle of the chancel and north transept, where the bell at present is temporarily hung. The wall stone is faced with Bath stone dressings, and the high-pitched roofs are covered with stone tiles. The ceilings are open-timbered, the principals being arched, and supported on projecting corbels. The windows are filled with stained glass, the chancel window being one of three lights. The building is warmed with hot air, the apparatus for which is put in by Messrs. Haden, & Trowbridge. The sacarium and chancel are covered with Minton tiles, and the altar-rail is a simple bar of oak, supported on ornamental iron brass standards. The architect was Mr. T. I. Wyatt, of London; and the builder and contractor Mr. Francis Brown, of Tethry. The cost of the building has been about 2,100l.

Portsea.—The foundation-stone of a new church, on a part of the glacis of the old fortifications on the landward side of Portsea, and which are now being levelled, has been laid by the Duke of Cambridge. The ground,—about an acre in extent,—has been given by Government, and representations made by the Bishop of Winchester, and adjoining a thickly-populated district which is principally inhabited by mechanics and the poorer classes and their families, and is also closely contiguous to all the great barracks at Portsmouth and Portsea. The church will contain 1,000 sittings, which are to remain free for ever.

Ashley.—The parish church here has been repaired. Messrs. Clark & Holland, of Newmarket, architects, prepared the plans and specifications of the alterations; and the contract, to the amount of 850l., was secured by Mr. R. Tooley, of the Church Restoration Works,bury St. Edmund's. The terms of the contract included the provision of a new chancel, with altar, north and south aisles, and organ-chamber, together affording extra sitting accommodation for about 160 persons. The structure is of stone, surmounted by a roof of the usual span and dimensions,—the frame of which is of hewn stained pine, and covered with the ordinary church tiles. The windows are of the cathedral plain pattern. The altar-rails are of iron. The extra expenditure, beyond the contract, will amount to something like 150l., the whole cost of which has been covered by a small rate and voluntary contributions.

Reading.—The alterations and enlargement of St. Mary's Church are almost completed. The west gable of the new aisle is coped with stone, finished with a cross, and contains a faintly traceried window, the principal mouldings of which are copied from the old two-light window, which formerly stood in the arcade now opened out between the transept and the new organ-chamber. The new aisle is covered by an open stained lead roof, with arched ribs, and the piers are relieved by plaster work between the rafters. The flooring, seating, and gas standards correspond exactly with the south aisle. The choir-seats and prayer-desks have been remodelled, and the chancel—which has always had a crowded appearance,—is thereby improved. The west gable and buttresses of the south aisle being, with the porch, the only unretored portions of the old fabric, are under the workmen's hands. The porch was much dilapidated, and is being restored, new windows inserted, and new galle coping and brass added is the gift to the church of Messrs. Wheeler, Brothers, the contractors, by whom the whole of the restorations, past and present, have been performed. There are six windows still requiring painted glass.

SCHOOL-BUILDING NEWS.

Monks Eleigh.—A new school, erected in the Elizabethan style by Mr. Hawkins, builder, has been opened in this place. The school consists of two lofty rooms, one 42 ft. by 20 ft., and the other 16 ft. by 20 ft., and will afford accommodation for about 130 children.

Sibson-cum-Stibington.—The new school built for the parish of Sibson-cum-Stibington has been opened. The building has been erected by Messrs. Richardson, of Stamford, at the entire cost of the late Duke of Bedford, and it will be supported by the present Duke. The school stands midway in the village.

Bernonsey.—The memorial stone of new schools in connexion with St. James's Church, Spa-road, Bernonsey, has been laid by Canon Gregory. The building is designed by Mr. R. Heskeith, of London, and is intended to accommodate 192 boys and 172 girls. The cost is estimated at 1,350l., of which 1,050l. have already been subscribed.

Manchester.—The foundation-stone of a new college for the reception of the Baptist students who are at present located at Chamber Hall, near Bury, has been laid in Brighton-grove, Rusholme, Manchester. The total frontage will be 115 ft., and the total depth 77 ft. Provision is made for the accommodation of about twenty-five students.

Padiham.—A new school-chapel has been opened at Hapton, Padiham. Four new Church schools, providing accommodation for 530 scholars, have been founded and completed in this parish since the passing of the Education Act of 1870. The last of the four has been opened at Hapton Bridge, with special services. This school, built by public subscription in the midst of a distant hamlet, will serve the threefold purpose of a day school, under a certificated teacher, a Sunday school, and a licensed chapel for Church services on Sunday and week-day evening. All classes have contributed liberally to the erection, which has cost nearly 1,100l., and is of Gothic design by Mr. W. Waddington, architect, Burnley.

Kemble.—A new school building has been opened here. It has been erected, together with a teacher's residence, at the sole cost of Miss Gordon, the lady of the manor. The elevation of the building is "in rock work." There is a playground at the rear. The contractor was Mr. William Newcombe, of Kemble.

Retford.—New Wesleyan Sunday and day schools have been opened here. The new building, designed by Mr. William Liller, is in the Gothic style. It is located in Grove-street. The principal room is lofty, commodious, and well ventilated, and the convenience of the interior is much augmented by the addition of four or five ante-rooms, into which scholars may be draughted when the largest room is too much crowded.

Nottingham.—School the foundation-stone of a new Congregational School has been laid in Kirke White-street. Mr. Simpson is the architect of the building, a portion of which faces Kirke White-street. It is considerably above water level, and on the entrances right and left there will be a green sward. The basement of the building is of brick-faced Bulwell stone, and supports a superstructure of dressed brick and Ancaster stone. The style is Decorated Gothic, and the school itself is 60 ft. long and 30 ft. broad. The height is about 30 ft., and the roof is composed of open timber. There are to be some large vestries behind, which may be used as class-rooms. There is a considerable portion of ground reserved for a chapel which will be built in due time.

Liverpool.—St. Peter's schools in Gilbert-street have been completed, and are in full working order. They are of a simple, solid kind, and consist of two large rooms, 70 ft. by 30 ft., with adjoining class-rooms and offices. The rooms are lofty, well lighted, and furnished with the most modern appliances for educational purposes. Accommodation is provided for 650 children. There are class-rooms, and retiring-rooms for mistresses and pupil teachers. Mr. Edmund Kirby was the architect; and the builders were Messrs. Nicholson & Syre, all of Liverpool.

Clapham.—A parochial school has been opened here. In its origin a committee was formed and plans obtained from Mr. John Day for schools to accommodate 122 children in two rooms, one for 72 boys and girls, and another for 50 infants, with teacher's residence detached; and tenders having been invited, Mr. R. Carter, of Bedford, entered into a contract to carry out the work, exclusive of cartage and school-fittings, for 1,146l., the several occupiers of land at the same time undertaking to cart the bricks and other materials in proportions calculated upon their respective acreage. The buildings consist of a mixed school for boys and girls, 42 ft. in length and 19 ft. in width; an infant school, 25 ft. long by 16 ft. in width, with separate entrances for the boys, girls, and infants; these are fitted with hat and cloak rails, and each has a slate lavatory. Attached are places for coats and closets for galls, brushes, and other necessities for cleaning and lighting the rooms, and Moule's patent earth-closets, with the latest improvements. A spacious earth-drying shed is

also erected, containing the stove for drying the earth. The mistress's house is a detached building. The whole of the interior woodwork is stained and varnished. The interior walls of the schools are hickwork distempered, and are from floor to ceiling 17 ft. in height. The principals only are visible, the ceilings being carried under the common rafters and in a line with the collar-beam. Ventilation is provided by means of zinc tubes, conducting the vitiated air into a foul-air flue, which is carried up in the chimney-shaft, two wide openings being provided in the ceiling of the large, and one in the small room. Fresh air is admitted through grated apertures in the walls covered on the inside with fine perforated zinc. The walls are lined to the height of 5 ft. from the floor with matched and beaded boarding, and the whole of the interior woodwork is stained and varnished. Red bricks are used generally in the buildings, with bands and devices of Staffordshire blue bricks, and the window-heads, copings, weatherings, and corbels are of Bath stone. The roofs are covered with plain tiles from Mr. Franklin's kilns, Marston, near Amphil. The windows throughout are the ordinary sashes as used in dwelling-houses. The buildings generally are very plain Domestic Gothic in style or character, as far as can be carried out, with roofs of a high pitch, and the western gable is surmounted by a turret, in which is a bell for the use of the school.

Leeds.—The Bishop of Brechin has laid the corner-stone of schools that are to be built in the parish of St. Saviour, in Cross Green-lane, Leeds. It is intended to make the new schools the centre of a district divided from the present extensive one of St. Saviour; and in order to complete this project, an iron church will shortly be erected. The piece of land on which the intended schools are to be erected has been presented by Mr. Francis Darwin, and the style of building is plain Gothic, from designs by Mr. D. Dodgson, architect, Leeds. The accommodation will be for 220 children, and the schools will be well heated and ventilated, and contain necessary lavatories, conveniences, &c. The total cost is estimated at about 1,150l., towards which the sum of 800l. has already been subscribed.

Leek.—Christ Church School, Compton, has very lately been enlarged and reopened. The cost of the enlargement will be about 800l. Most of this sum has been given. Mr. Edgar, of London, was the architect, and the work has been executed by Mr. J. G. Smith, of Leek.

Fleckney.—The foundation-stone of a new national school has been laid at Fleckney, by Mr. A. Pell, M.P.

Burnley.—The opening of new Church of England schools, which have recently been erected in the village of Worsthorne, near Burnley, has just taken place. The old school, which has been erected forty years, has become far too small for the requirements of the place. The new building will accommodate 300 children; and the entire cost, when fully completed, will be nearly 1,000l. The school is built on the best site in the village, the land having been given by the Rev. W. Thursby, the late vicar of the parish, and the late General Scarlett. This is the only day-school in the parish. Between 1,400l. and 1,500l. of the cost of the building have been raised.

Books Received.

The Water Supply of Bombay; being a Report submitted to the Bench of Justices of that City.

By their executive Engineer, HERCUL TULLOCH, Major, Royal Engineers. London: printed by W. J. Johnson, Fleet-street. 1872.

In this voluminous and able report, the author does not advocate any one special scheme for the requisite improvement of the water supply to Bombay, although on a previous occasion he did suggest a project for impounding water in the Toolsee Valley, which was set aside by the Justices, rightly, as Major Tulloch thinks, till fuller inquiry had been made on the whole subject. There have been various projects, such as those of Mr. Conybeare, Mr. Aitken, Mr. Walton, and Captain Tulloch himself. These projects are known by the names of the Kenney project, the Ewoor project, the Vehar lake extension project, the Kansa project, the Kamun project, and the Toolsee project. The author treats of all these projects respectively, ending with a summary and recommendations, after treating of the history of the Bombay water supply, describing

the country, and considering the questions of masonry versus earthen dams, masonry conduits versus iron pipes, and the advantages of a service reservoir, and the necessity for laying pipes above ground. The reporter recommends the bench either to carry out the Kennerly and Toolsee projects for a supply of 8½ million gallons daily, or to carry out the Kansas project for a supply of 13 million gallons. The volume is illustrated by numerous maps and other plates.

The Strength of Materials and Structures. By JOHN ANDERSON, C.E., LL.D. London: Longmans, Green, & Co. 1872.

ONE of the greatest mistakes that a capable writer can make, is the adoption of a misleading title, and this mistake has been made by Mr. Anderson. Dozens of persons reading the advertised title, "The Strength of Materials and Structures," will order this book, expecting to find it treating of the strength of all the materials used in buildings, and of the strength of buildings themselves, and will be apt, when they open it, and find that, with a trifling exception, it gives information only as to the strength of iron, and that the structures referred to are cast-iron pipes, tanks, and guns, to consider themselves taken in, and so will disregard the actual contents of the volume. The book includes a number of valuable experiments and much useful information within the limits the author has given it.

Miscellaneous.

Freeing the Metropolitan Bridges.—At the last meeting of the Metropolitan Board of Works, the Works Committee presented a report stating that, in their opinion, it is expedient to free the toll-bridges within the area of the coal and wine duties by an extension of those duties, and recommending that the subject be referred back to the committee, with authority to confer with her Majesty's Government thereon. Mr. Newton, in moving the adoption of the report, stated that the whole duties produced a total of 315,000*l.* per annum, of which the city of London received a little less than 100,000*l.* a year, and the Board a little more than 200,000*l.* These charges would expire in 1888, and the committee proposed to ask for their reversion, in order to purchase the bridges of the metropolis. Mr. Deputy H. L. Taylor urged that, as the Corporation of London had had the control of the coal and wine dues for so many years, the Board might at least have consulted them before wishing to have the expenditure of the whole of them. Mr. Newton deprecated any idea of hostility to the Corporation, and would willingly co-operate with them. It was proposed to raise the money in the first instance by loan. The motion was carried by 31 to 2, only the City members voting against it.

The Sewerage Works, Kidderminster.—The memorial stone at the pumping-station for the Kidderminster sewerage has been laid by Ald. Jefferies, in the presence of a number of the members of the corporation. The pumping-station is a little way out of Kidderminster, on the Stourport-road, and covered tanks are to be erected to receive the daily discharge from the main sewer. From the tanks the sewage will flow into a well, and thence it will be pumped a distance of four miles, to the highest point of the sewage farm, near Stourport. The ceremony was the laying of a dressed stone in the stack of the chimney of the engine-house. Mr. Fairbank, C.E., on behalf of the contractor (Mr. Joseph Walker, of Crewe), presented Alderman Jefferies with a mallet and silver trowel, each bearing a suitable inscription, and the stone was then formally laid. Mr. Fairbank gave some account of the works, and said he thought that, when completed, they would have the best and cheapest sewerage and water works in the kingdom. At Doncaster they were going to spend 100,000*l.* in improving the water supply alone, while in Kidderminster they would have a complete system of sewerage and water supply, and a freehold sewage farm of 170 acres, for considerably less than that amount.

Fall of a Chimney.—At the works of Mr. Donnell Buchanan, metal refiner, Anderston, Glasgow, a chimney, between 60 ft. and 70 ft. high, has fallen through the roof of an engineering shop. One person was instantaneously killed, but, with this exception, the large number of men in the shop escaped.

Proposed Additions to the Surrey County Lunatic Asylums at Wandsworth and Brookwood.—The Committee of Visitors of the County Lunatic Asylum, at Wandsworth, recommended, at the recent Surrey Sessions held at Kingston, that a sum of 20,000*l.* be granted for the erection of additional buildings at the said asylum. The intention was to provide for about 50 men and 100 women. For that part of the buildings for 100 females, the estimate for work was somewhere about 9,000*l.* On the motion for the adoption of the report, it was moved, as an amendment, "That any further progress in this question be suspended for the next six months." The amendment was lost by 27 against 9, and the recommendation of the committee was afterwards agreed to. The report of visitors to the Asylum at Brookwood was next read. The Committee of Visitors submitted plans for the accommodation of 100 male and 300 female additional patients, and recommended that the said plans be carried out at an expense not exceeding 55,000*l.*, including architect's commission, salary of clerk of the works, furniture, clothing, and every other expense. The recommendation of the committee was adopted, without discussion.

Accidents.—Holborn Theatre has had a narrow escape. Between two and three o'clock on Saturday morning last a fire, attended with a great loss of valuable property, occurred on premises close to it in Brownlow-street. One of the inmates gave an alarm, and the other inmates, in order to reach the street, had to roll down the stairs to avoid the flames, which were then crossing the street and fring the front of the premises opposite as well as the side windows of the Holborn Theatre Royal. Several hours elapsed before the fire could be extinguished. The injury to the theatre was confined to the scorching of the side window frames and the breakage of window glass. Some slight damage was done to the contents by water and smoke.

—At Eagley, near Bolton, two men were killed at the Church of England school, in School-street, which was being enlarged. They were fixing flags in an upright position, each flag being 7 ft. 6 in. high, 4 ft. wide, and 5 in. thick: the men had got six of these fixed temporarily, and were in the act of placing the seventh, when the second flag gave way, knocking down all the other six like ninepins. The deceased were crushed beneath the flags, and were killed on the spot.

Reopening of the Lady Chapel in Chichester Cathedral.—The Lady Chapel of this cathedral has been restored and reopened as a memorial of the late Bishop Gilbert. Sir Gilbert Scott prepared the plans, and, except the colouring of the groining—remains of which are seen,—the chapel now stands almost as it left the hands of its builder in the thirteenth century. The builder, singularly, was another Bishop Gilbert, surnamed Leofardo. The work has been carried out by Mr. J. Marshall, of Chichester. The stone work of the chapel has been thoroughly restored, with the exception of the carving of the capitals of the restored vaulting shafts, the sedilia and the mullions of the windows, to accomplish which a fund is now being raised. Several traces of painting on the walls have been brought to light. The floor is paved with tiles, from patterns of old tiles found during the restoration.

Fall of a Circus Gallery.—An accident has occurred at Mr. Hengler's circus in Sheffield. The structure is of wood, and was only recently opened. The place was crowded, and during some acrobatic performances a gallery which ran across the passage from the stables to the arena, suddenly gave way, and from thirty to forty persons were precipitated to the ground, a distance of about 14 ft. A panic seized the remainder of the spectators, and a great many rushed from the building. Seven persons were taken to the General Infirmary, and a similar number to the Public Hospital. The full extent of the injuries sustained by some of the other persons has not been ascertained. One of the lady performers was much shaken and crushed.

Diocesan Surveyors, Norwich.—At a meeting of the archdeacons and rural deans, held under the presidency of the Bishop of the diocese, for the purpose of appointing Surveyors of Ecclesiastical Dilapidation for the Diocese of Norwich, the following gentlemen were re-elected:—E. L. Blackharn, of Bernard-street, Russell-square, London, architect; J. H. Brown, of Norwich, architect; and R. M. Plipson, of Norwich and Ipswich, architect.

Edinburgh.—According to the *Scotsman*, a committee of the Edinburgh Town Council, charged to report on a better organisation for accomplishing the sanitary business of the city, have agreed to recommend the appointment of a Public Health Committee to look after such matters as the supervision of burying-grounds, lodging-houses, and underground or overcrowded dwellings; the prevention of smoke nuisance; the consideration of proposals for the establishment of new manufactories, and supervision of manufactories already established; the inspection of workshops, bakehouses, stables, &c.; the adulteration of food and diseased meat; and the prevention or mitigation of epidemic disease.

New Ventilating Fan for Mines.—The Monkland coalmasters have just inaugurated a new and better system of ventilation for coal-mines. A pair of patent fans have been erected for providing ventilation for two coal-pits. The fans are of the ordinary construction, but slightly hollowed towards the middle. They measure 5 ft. in diameter, and are driven at a speed of 600 revolutions per minute, and 33,000 ft. of air are sent out by the fans every minute. There are two sets, driven by a pair of horizontal engines, of 12-in. cylinders, the motion being direct from the fly-wheel. The fans, once erected, are kept working at a very small sum compared with the great consumption of coal on the old system, while the first cost of the whole apparatus, including a pair of engines, holers, &c., is only about 700*l.*

Sewage Irrigation, Windsor.—The drainage works for Windsor Castle and Frogmore House are approaching completion. At Old Windsor the Thames Conservators are erecting a new bridge over the navigation cut between the pumping station and the Ham, upon which the sewage farm is situated. The bridge will be of iron girders, supported upon buttresses of red brick, concrete, and stone. The pipes conveying the sewage from the station to the farm will be carried over the water on the bridge to the Ham bank, whence the liquid will be distributed over the field. The buttresses of the bridge are nearly finished, and the iron work will soon be placed in position. The pumping station is in a forward condition, while a number of soldiers from the Windsor garrison are engaged upon the earth-work of the irrigation field.

The Institution of Civil Engineers.—Mr. Thomas Howard, of the King and Queen Ironworks, Rotherhithe, who was for thirty-seven years an associate of this society, has bequeathed to it the sum of 500*l.*, free of legacy duty, which sum he has by will directed "to be invested and the interest thereof to be applied in such manner and under such conditions and instructions as the council of the said Institution may think most expedient, for the purpose of presenting periodically a prize or medal to the author of a treatise on any of the uses or properties of iron, or to the inventor of some new and valuable process relating thereto, such author or inventor being a member, graduate, or associate of the said institution."

Dunderran House, Walsall.—This house is situated in a conspicuous and pleasant site on the outskirts of Walsall, and was commenced early in the spring, and is now approaching completion. It is built of local red pressed bricks, with white brick bands, with Hollington stone dressings, and the whole of the external walls are built hollow, and tied together with iron ties, and there are grey marble columns to the porch. There has not been any contractor for the works, but Mr. William Kirkpatrick, the owner, has bought the whole of the materials, and employed his own men to fix. The estimated cost is about 1,100*l.* Mr. Ralph Chamberlain, of Walsall, was the architect.

Sewage and Cement.—The Local Board of Tunstall, Staffordshire, instructed Mr. John Elliot, C.E. (of Newcastle), to inquire into all the recognised systems of dealing with sewage, and to report to them on the subject. After examination of the principal irrigation farms and of the different precipitation processes, Mr. Elliot has advised the board to adopt General Scott's process of precipitation and conversion of the product into cement, of which we have before spoken. The cement made by the process, Mr. Elliot said, was very good.

Institute of British Architects.—The new session will commence on Monday evening November 4th.

A New Temperance Hall and Hotel at Barrow.—Last week a Temperance and Band Hope Conference was held at Barrow, and at one of the meetings Sir James Ramsden, bart., the mayor, presided, and spoke strongly against drunkenness, which he said was one of the great drawbacks to the rising town of Barrow. It transpired in the course of the proceedings that spacious temperance-hall in connexion with a hotel is about to be erected in the borough, and that Sir James Ramsden has given the site.

The Town Surveyor of Brighton.—The town Council of Brighton have shown their estimation of Mr. Lockwood's talents and his services to the town in the office of town surveyor, by raising his salary from 400l. to 500l. a year. "Mr. Lockwood," says the local Herald, "has now filled the office of surveyor for fourteen years, in the course of which the town has made unprecedented progress, and demands have been made on his talents and energy, both as architect and surveyor, such as have never been exceeded in any previous epoch, if, indeed, qualified."

Sanitary Arrangements, Vienna Exhibition.—We are glad to hear that the whole of the sanitary arrangements of the Vienna Exhibition have been entrusted to Mr. George Jennings, Baron Schwartz Senborne, as also the water supply and the drainage of the Exhibition buildings and grounds. Mr. Jennings may well accept this as a compliment, and will, we know, endeavor, to the best of his ability, to be worthy of the trust reposed in him.

New Submarine Cables.—After overcoming many difficulties, Sir Charles Bright has just completed one of the most arduous of submarine telegraphic undertakings,—that of connecting the United States with the majority of the West India Islands, and thence with South America, by 3,000 miles of cable. There is now also direct communication by telegraph with Adelaide, in South Australia.

The Surveyorship of St. George's, East.—There are sixteen candidates for the office of surveyor to the Vestry of St. George's, East, ordered vacant by the death of Mr. Andrew Wilson. Among these are Mr. George Wilson, son of the late surveyor; Mr. Arthur Harston, architect; and Mr. C. R. Peters, son of an influential member of the vestry.

New National Theatre for Copenhagen.—The King of Denmark has laid the foundation stone of a new national theatre, the whole of the royal family and the heads of the public departments being present. The members of the opera opened the proceedings by singing a hymn, after which the Minister of Public Worship delivered an inaugural address.

Vaults in the Roadway.—The St. George's, East, manover-square, Vestry have refused the application of Mr. Thompson, of No. 12, Canterbury-place, Lambeth-place, for permission to extend a vault at No. 46, Mount-street, Grosvenor-square, 22 ft. under the roadway.

Pictures.—Private views will be given on this Saturday (26th) of the Exhibition of Cabinet Pictures in the Dudley Gallery, Egyptian Hall; and of the Winter Exhibition of British and Foreign Artists, 120, Pall-mall.

Italian Marble.—The Italian journals state that the exportation of marble from Italy continues to increase, as is shown by the shipments from the port of Genoa during the first eight months of the present year.

Co-operation.—The Yorkshire Post states that the workmen in the Sheffield trades have combined for the purpose of erecting works and manufactories on their own account.

TENDERS

Table with 2 columns: Description of work and Amount. Includes tenders for villa residences at West Wood, Isle of Wight, and other construction projects.

Table with 2 columns: Description of work and Amount. Includes tenders for ice-well at Islington, alterations to Royal Oak, St. Luke's, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for alterations to the Royal Oak, St. Luke's, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for new premises in Plough-court, Lombard-street, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for pulling down and rebuilding Nos. 416 to 419, Oxford-street, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for sundry alterations and additions at the Inns of Court Hotel, Holborn, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for general repairs, cleaning, and painting throughout, at the Inns of Court Hotel, Holborn, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for the erection of five cottages, at Chiselhurst, Kent, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for the erection of boat-house, on the bank of the Thames, at Putney, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for the erection of cow-stables, at Putney, for Mr. F. J. Morrison, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for works, at 94, North-road, Brighton, in new shop, and alterations and additions, Mr. John Hill, architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for mansion, for the Rev. W. Smith, Woolmer Forest, Hants., Mr. John Hill architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for drainage work, cesspits, and pumping machinery, at Industrial Schools, Mitcham, Mr. H. Saxon Snell, architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for painting and general repairs, at the Shrubbery, Shooter's Hill, for Mr. Carter, Mr. G. Judge, jun., architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for erecting residence, at Cudham, Kent, for Mr. S. Packman, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for alterations, at the Castle Hotel, Childs Hill, Finchley-road, for Mr. Randle, Mr. George Stooke, architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for loose boxes, Horseshall Hall, near Norwich, for Mr. Edward Birkbeck, Mr. John Norton, architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for tenders for double stables, Crystal Palace Park Estate, Mr. John Norton, architect, and other projects.

Table with 2 columns: Description of work and Amount. Includes tenders for the City Temple, Holborn Viaduct, Messrs. Lockwood & Mawson, architects, and other projects.

Table with 4 columns: Description of work, For main Building, For Towers, For extra on main Building, and For extra on Towers. Includes tenders for various construction projects.

VOL. XXX.—No. 1552.

Curiosities of the Moscow Polytechnic Exhibition.

RUSSIA seems determined that Exhibitions, industrial and others, shall keep pace with the rapid extension of her railways. It is only a few years since an ethnological exhibition was held at Moscow, and two years ago took place at St. Petersburg the great Russian Industrial Exhibition, the largest ever witnessed in that country, and of which we gave an account in these pages. In the summer of the

present year was opened the Moscow Polytechnic Exhibition. This event took place on the day of the bicentenary of the birthday of Peter the Great, the founder of Russia's greatness and prosperity. It is perhaps not generally known that this is already the fifteenth Exhibition, held alternately at St. Petersburg, Moscow, and Warsaw, since Russia became a manufacturing country. Every exertion is now being made in Russia to promote technical knowledge and education. With this view, technical schools are being established; a technical society has been formed, which has its branches in the chief towns of Russia, and its corresponding members in every commercial and mercantile centre. The present Exhibition is intended to be the commencement of a polytechnic museum in Moscow, and it has been brought together rather as an instructive than a competitive show; and although not international, in the sense in which we are accustomed to regard such displays, every civilised country has contributed to its various departments and sections. Nor are the buildings containing the exhibits, in an architectural point of view, like anything which we are accustomed to associate in our minds with such undertakings.

The site of the Moscow Polytechnic Exhibition is the garden of the ancient Kremlin, at the foot of the castle wall. The peculiarity of this show is, that the exhibits are not contained in one single building, but are displayed in more than eighty pavilions and buts, decorated in the Russian style, sheds, and tents of all imaginary sorts and sizes. There are in all about twenty-seven departments, and the articles are so grouped as to bring out the qualities of each department without any regard to their national origin. As an exception, however, may be taken the department of rural domestic economy, which is almost purely Russian in its character, and that devoted to the country of Turkistan, which has characteristics entirely of its own. It is with these two departments that we propose to acquaint our readers. The most striking object in the department of rural domestic economy is what one might call a model in its natural size of a village church erected on the top of an eminence in the garden of the Kremlin; there is also a landowner's dwelling-house, a village school-house, a village hospital, an infirmary, a dispensary, and a village *crèche* or nursery. The church is constructed entirely of wood, the walls being formed of squared logs, in the architectural style of most Russian churches, with its bulb-shaped and gaily-painted domes and belfry-tower at its side—a style which gives such a

gay and picturesque appearance to the landscapes of the interior of Russia. This church is constructed to contain from 150 to 200 people. The windows, door-casings, shutters, cornices, and barrel-shaped pediments, and other parts, carved and painted in variegated colours, are made so as to be easily taken to pieces, removed and put together again, which can be effected without ever damaging the sheet iron of the roof. The guide to the exhibition informs us that the object of exhibiting this village church in its natural size is this, that it offers the advantage of the merits of this proposed new system of building being more easily examined, and affords an opportunity of judging of the proportions of the most prominent parts of the structure, of the various details, as well as of the convenience of arrangement; and at the same time the bringing together of all kinds of church appurtenances executed chiefly in the Russian style, and concentrating them in one place, serves to display their peculiar character, and illustrates the conditions necessary for producing them. The advantages claimed for this mode of construction with squared logs, which can be taken to pieces, is that it can be applied to all manner of wooden structures; it does not require, as with common round logs, weather boarding outside, nor any kind of boarding inside, where it affords more room, and a considerable saving in the cost of labour. Besides, another very essential advantage of this system, is pointed to particularly for Russia, and which can be easily understood, viz., that buildings of this kind can be produced in those parts of the country where wood is plentiful and comparatively cheap, and more particularly in those districts and establishments where, by the employment of steam power, together with the advantages of railway communication, the price of joinery and carpentry work is reduced to a minimum. Of such establishments there is one in Tver, belonging to Mr. H. D. Meyerovich, and another at Kolomna owned by the architect, Mr. P. C. Kamponi. The entrance to the church is from the side of the terrace near the belfry tower, and the visitor who wishes to view the interior and the articles therein contained is recommended to commence his inspection of the various groups and separate articles from the right-hand side, and make a tour of the church round to the other entrance, which faces the Troitsky Tower of the Kremlin. Here are shown in detail all the parts and decorations which are peculiar to the interior of Russian orthodox churches, such as ikonostases,* ikonas, or holy pictures, in the execution of which, as well as of all the other articles belonging to the interior of the church, the following objects were had in view;—to preserve as much as possible the simplicity and character suitable to an orthodox Russian village church; to acquaint both the specialists and the public with the most practical method of constructing and decorating ikonostases, manufacturing candelabras and candlesticks, and other church appurtenances in turnery, carved, and metal work, all of which being in point of artistic merit very little inferior to more costly articles of the same description; and to develop the local trades in Russia, which are carried on by thousands of workmen in scores of villages. It should here be remarked that these village factories form a peculiar feature of Russian industry which has been preserved for centuries. As an example may be taken the village of Kholoni, situated in one of the districts of the government of Vladimir, the inhabitants of which, considerably over 1,000, are entirely engaged in painting "ikonas," or holy pictures. From early boyhood to old age the peasant of Kholoni is constantly at work with his painting-brush and maulstick, but the productions are of the most miserable kind, owing

* The partition which separates the altar from the rest of the church.

to the rapidity and carelessness with which they are executed. Some of these "artists" are able to paint 600 faces in a week, and others can complete these pictures, 12 in. square, in the same space of time, single-handed. These ikonas are painted on boards made of the lime pine, fir, alder, and aspen. The colours, instead of oil, are mixed with the whites of eggs; and when the painting is done, it merely receives a coating of boiled linseed oil, and the ikona is finished. As might be expected, these productions are manufactured only for the use of the poorer classes. The demand must be enormous, considering that the peasant population of Russia is something like 60,000,000, and that every orthodox peasant has a painting of this kind hung up in the corner of his room, these pictures generally representing some favourite saint whom he holds in great veneration. At Kholoni ikonas, 12 in. by 12 in., are sold as low as 6s. per 100; and that village alone produces from 1½ million to 2½ millions of them yearly. They are sold wholesale, chiefly to the *ofenias*, or itinerant merchants, who travel from fair to fair over the wide expanse of the Russian empire. The different monasteries are also customers for these productions; but they are executed better, and the price is much higher. The supply of the raw material, i.e., the boards for painting on, is obtained in the winter time during Lent, when as many as 100 sledge-loads of them per week are brought over the ice from the other side of the Volga to Kholoni. In the village of Palekha, situated about 90 versts from the above place, the paintings produced are of a superior kind; they are executed in oil, in the Greek style, and are sold chiefly in the capitals of St. Petersburg and Moscow. Some of these paintings produced by peasants, it is said, are really beautifully done, particularly miniatures,—which is the more astonishing, since these village artists are totally uneducated, and have acquired the art of painting, as it were, intuitively. In the same manner the village of Pavlovo, in the government of Nijni-Novgorod, is celebrated for its lockmakers, where, besides cutlery, all kinds of tools are manufactured, some of which will bear comparison with the best Sheffield ware. Thousands of dozens of penknives are exported from Pavlovo to Persia. Great quantities of travelling-boxes are also made here, fitted with locks manufactured in the village, which are sent in whole cargoes to Khiva and Taskent, reaching even the frontiers of Afghanistan. The Pavlovo circuit extends over an area of 200 versts, contains 33 so-called settlements, all more or less engaged in the production of locks and hardware of that description. Vorsma, another village not far from Pavlovo, is also celebrated for this branch of industry. The government of Tver, again, is noted for its nail-smiths' villages, where a system of co-operative labour has lately been introduced, and supported by capital lent at a moderate interest by the local administration, which has considerably improved the position of the producers, who, like those of Pavlovo and Vorsma, or in fact all village artisans, have always remained entirely in the hands of fore-stallers and jobbers. It is not at all unlikely that at some future time not far distant we shall become large importers of the products of Russian village labour, particularly of articles in wood in connexion with building; for it cannot be denied that Russia possesses many advantages in manufacturing which are denied to other countries of Europe; her many industries need only to be developed and improved.

The following peculiarities of the interior of the church are pointed to as being novel in Russia in a structure of this kind;—the framed timbers supporting the roof, such as tie-beams, king-posts, and the rafters forming the same, all made to be taken apart and put together again; to the alms-box, fixed in the wall inside, with an opening on the outside for dropping in the

money. It should here be remarked that it has been the custom to place the box outside of the church, chained or locked to some fixture. Of late years these boxes have often been wrenched off and carried away. The shutters are made to lift up and down, without any kind of ironwork, and so constructed as only to be opened from within. In the middle of the church, and in the corners is arranged a collection of church-plates manufactured entirely in the Russian style. Of these, a set of silver with enamel is the most expensive; another, of silver alone, is of moderate price; and a third is made of non-oxidising melchior, suitable for the poorer country parishes. In front of the altar, forming part of the ikonostas, are what are called the Tsarskie Vorota or Royal Gates, leading into the *sanctum sanctorum*, and at the sides the north and south doors and ikonas. These are different ikonas from those which we described above: they are painted by professed artists, encased in silver and silver-gilt, the latter metal in *repoussé* work, forming the drapery of the figures of the picture. Some of the ikonas of the rich churches are encased in pure gold, and studded with precious stones. The rich merchants also affect this kind of ikonas in their homes, which are generally enclosed in an elaborate glass case. In this shape it is called a kiota, one of which is also shown in the church. A kind of night-light is kept constantly burning before this shrine, the gilt crowns and haloes of the saints reflecting the light in a thousand brilliant rays. The silversmiths of Moscow were celebrated already in the seventeenth century all over Russia for the production of holy pictures of this kind.

Among the holy pictures shown in the church deserves to be noticed a painting which was executed in commemoration of the miraculous escape of the present czar from the hand of the would-be assassin in 1866, at St. Petersburg. It represents four saints, with a guardian angel, and the Virgin Mary, the *fiat-days* of these saints corresponding to four events of the emperor's life,—his birth-day, baptism, coronation, and the day of his deliverance.

The royal gates are decorated in the ancient Russian style, the carved work being substituted by mouldings formed of a peculiar mass. Generally speaking, for a Russian church the whole ikonostas is simple. The gilding has been done in imitation gold, which looks as well as real, and has the advantage that it can be washed when dirty, while the cost is considerably less. Next to the altar in one of the corners is a carving in antediluvian (mammoth) ivory, in high relief, of a head of Christ with the crown of thorns heartily executed. Apparatus for heating and ventilation are also shown. Among other things is exhibited a model of a small chapel called a Tchasovnia, to be used in villages as a depository of the dead before burial, with the object of preventing hurrying alive, and also as a sanitary measure. The outside of the church in the summer time was decorated with all kinds of plants, with a lawn in front.

In the same garden of the Kremlin where the church stands is a full-size model of a landed proprietor's house. It is in the usual style of Russian wooden buildings which we described on a former occasion, but with a terrace and several additions and improvements borrowed from Western Europe. The house has a ground-floor, *mezzanine*, and *nansard*, the kitchen being built out. The ground-floor has ten spacious rooms, a corridor dividing the house into two parts; on the right is the dining-room, opening on to the terrace; to the left the drawing-room on the other side of the corridor, where also the study is situated. The ground-floor contains also a lady's boudoir and a school-room for the children. The staircase, with water-closet underneath, leads from the hall to the mezzanine floor, which is likewise divided into two parts by a passage, on each side of which are the bedrooms, lady's dressing-room, wardrobe-room, &c. The kitchen, built out in the yard, communicates with the main structure by means of a passage, near which is the bedroom of the cook, and a bath-room. In the kitchen are shown all kinds of crockery and cast-iron ware, hot plates, &c. The furniture corresponds to the destination of each room, and is most tastefully got up. Certainly there could be nothing more comfortable as a dwelling than this landowner's house exhibited in the Kremlin garden. In the front is a small garden laid out with great taste, with iron seats, and a gymnasium for the children. The village schoolhouse is a simple wooden building. It has a spacious schoolroom, with two rooms for the teacher,

There are exhibited all kinds of school furniture appliances, &c.

The village hospital illustrates the manner in which a common peasant's izba, or several of them together, may be converted into an establishment of this kind. Every requisite for the patients is here displayed. The village dispensary contains a general room for the out-door patients and a doctor's reception-room, and also a stock of medicines, with every requisite instrument and appliances, &c. The village crèche, or nursery, is an unpretending building, intended as a place of refuge for infants and young children, where they will be taken care of during the time the parents are engaged working in the fields.

The nucleus of the vast Russian Empire, the old czarism of Moscow, which since the reign of Ivan the Terrible has gradually expanded eastward, and from the time of Peter the Great southward and westward, has ever since continued to absorb territories, tribes, and whole nations almost imperceptibly to Western Europe, and so within the last eighteen or nineteen years acquisitious have been made in Asia, on the coast of the North Pacific an enormous territory gained in the basin of the river Amur, extending to the island of Sakhalin. Since the Crimean war also the Russian Government has permanently established its authority over the mountain tribes of the Caucasus, with whom it has so long been in a state of chronic warfare; and, what is most important of all, the territory of Central Asia known in our geography as Independent Tartary has added another vast area to the Russian dominions by the conquest of Turkistan, a territory extending beyond Samarcand, in the direction of our own Indian possessions. The Turkistan department of the Polytechnic Exhibition is most interesting both for its novelty and for the information it affords of a country which is almost unknown to Europeans. It is curious to reflect that these several millions of new Russian subjects, the inhabitants of Turkistan, consisting of tribes such as the Tadzhiks, Onzbeks, Kirghizes, and Sarts, are the remnants of the ancient Tartars their forefathers, who for nearly 200 years remained masters of Central Russia; and that the Kremlin, where the present Exhibition is being held, was during a great part of the above period the citadel and palace of the Tartar deputies in Moscow. The Turkistan department was formed by the members of the Turkistan section of the lovers of natural science on the means afforded by the governor-general of that country. The chief object sought is to acquaint the Russian general public and specialists with a country which has only recently become thoroughly accessible to explorers. This is already the fifth attempt in this direction. In 1866, immediately after the taking of Taskent, General Tcherniaev sent to Moscow a collection of the productions of the country. In 1867, Turkistan was represented at the Ethnographic Exhibition held in the ancient capital in that year. In 1869 there was a special Exhibition held at St. Petersburg of the productions of the country; and, lastly, in 1870, there were sent to the St. Petersburg Exhibition collections of articles representing the various branches of native industry. Some of these objects form part of the present display. We are told that the fresh researches which have been made in the country have enabled the committee to render the present Exhibition more complete and varied than all the preceding ones, and that, notwithstanding every effort, there are still many things wanting, owing to the incomplete information possessed upon several important questions. All this will tend to show what importance Russia attaches to her new possessions in Central Asia. The building containing the Turkistan collection is a model, on a large scale, of a Samarand *medresse* (ancient religious school). Nowhere in the country of Turkistan are there so many ancient Mussulman buildings of this kind as at Samarand, and offering such a variety in decorative art. Even before the occupation of

Taskent and Khodjent, the Russians often met with structures of this kind; but they were unable to form from them any just idea of these monuments of antiquity. The ancient buildings of Samarand, which at one period was a flourishing town, and the seat of learning of Central Asia, have been so far preserved that the remains of one structure serve to complete another, so that they afford the possibility of studying both the mode of construction and character of the decorations. One of the most characteristic styles of these buildings may be seen in the medresse called Shirdar, which stands on the market-place at Samarand,

together with two others, very similar in form,—Mirza-ulg-begi and Tili-Kari. The Shirdar, owing to its antiquity (it was built by Yalantash Bagadour, a descendant of Timour), its elaborate design and finish, and being in a better state of preservation, is more interesting, in an architectural point of view, than the others. The front of the building faces the market-place, and consists of a large pediment, 109 ft. high and 115 ft. wide, in which is formed a pointed arch, with a wall at the back, forming a very large niche, the pavement of which is reached by about five steps. On both sides of the pediment extend buildings of two stories, about one-third of its height, which terminate at the corners with round minarets. On the roof of the side-buildings, *i. e.* between the pediment and the minaret, are erected two small cupola-shaped towers. The whole of the facade of the building is decorated with coloured glazed tiles, formed into regular and very beautiful designs.

We want more space, however, than we can take in our present number, and must continue the subject in another.

THE "ECCLIASTICAL" ELEMENT IN ART.

ST. PAUL'S.

REFERRING the other-day to the article in the *Quarterly Review* on the decoration of St. Paul's, which has stirred sundry folk, not unreasonably, out of their propriety, we could not but point out and regret the exaggerated and, in places, abusive tone which detracted very much from the value which might otherwise have been attached to that essay. The effort to startle people by saying very strong things is often successful for the moment, but always brings its own revenge with it, not only in the determined hostility which it provokes from small minds, but in the mistrust both of the writer's entire honesty and of his critical ability, which such a tone of writing awakens in persons of calmer judgment. There is, however, one subject in regard to which the remarks in the article in question can hardly be said to be too strong (however we may feel surprised at the quarter from whence they come), and on which the most decided concurrence would probably be found among the best educated and most thoughtful readers. We allude to the raid made by the reviewer against what is called "ecclesiastical art,"—an attack which, from almost every point of view, is so entirely justified and justifiable, that although we have expressed ourselves on the subject more than once already, we cannot think it inappropriate to take the present occasion of returning to the charge, whilst the public mind has been in some degree aroused upon the subject.

The view taken by the *Quarterly* writer, in a passage too lengthy for quotation here, is that there never was in any great age of art such a thing as ecclesiastical art at all, in the sense in which that word is understood now. "Those who most advanced the art of painting," for instance, "were just those in whom the simple human element was most pronounced. Giotto, Masaccio, and Michelangelo had small regard for the ecclesiastical element. They painted in churches and for the church, but the church was very glad to get them to paint their own and not 'ecclesiastical' ideas." In regard to the three artists named in this quotation, there can be no doubt at least of the entire truth of the statement made; and we are inclined to assent to the broad statement as one which investigation will show to be correct in the case of all really great artists of all classes. Without, however, committing ourselves at present to an assertion which it would require considerable space and research to substantiate fully, our object is rather to indicate the fallacy of the popular art ideas in regard to ecclesiastical art in the present day, on general grounds, as well as in reference to the special object of the decoration of St. Paul's Cathedral.

It is in regard to the highest form of pictorial art,—that which includes the representation of the human figure,—that the subject assumes its most important aspect. In what light is it, then, that pictures of this class, in our Academy and similar exhibitions, have an intellectual interest for us? Excluding portraits, which occupy a special and peculiar position, our interest in representations of the figure is of two kinds. Such representations are to us visible emblems of an ideal beauty, imaginative

poems expressed to us through the medium of painting, as in such pictures as Leighton's "Summer Moon," or "Helios and Rhodes"; or they are representations of some phase of human life and character, historical or imaginary, which interest us by their appeal to our sympathy with humanity at large, with human hopes and feelings under all possible circumstances. This last class of pictures is that which appeals most widely and to the greatest number of minds. True to the declaration of our great poet, that "no touch of Nature makes the whole world kin," we find that a truthful representation of some incident of human happiness or sorrow, or even of humor and grotesque incident, comes home to the mass of the people, and interests even those who have no capability of judging of the artistic execution of the work; who cannot appreciate the finer strokes with which the story is told or the feeling displayed. Those who have the education or natural perception which will enable them to appreciate these more refined touches, have of course an additional enjoyment in the contemplation of the work. And when we come to consider the higher or ideal branch of figure-painting before referred to, we then contemplate a form of artistic expression which can only be adequately apprehended by those whose minds are prepared for it by a high culture and a naturally imaginative faculty; for this ideal art does not deal with human nature as it is, but with human nature and human form, in the grandeur or beauty which they may be supposed to be capable of attaining under certain conditions, and when freed from the defects and imperfections incident to actual life as we see it around us. And in art of this class the human form, or a sublimated ideal of it, is used in fact as a kind of type and symbol of the beautiful in the highest development in which colour and form can express it to our senses.

This is the real object, then, of the higher forms of pictorial art; to appeal, by pictorial representation, to our higher sympathies and aspirations; our sympathies with what is human, our aspirations after an ideal beyond what is human; or beyond, at least, every-day humanity. And it must be noticed, in considering the art in this manner, that the actual execution, the result of the whole, the general impression made thereby upon our feelings, is of far more importance to us than the arbitrarily chosen story or incident which has been the artist's basis for the idea set forth. In proper terms as the picture embodies more of the actual incidents of every-day life, in that proportion certainly we require to have a general idea of the nature of the situation which it was the painter's intention to set forth: in proportion as the picture departs from every-day life, and verges on the ideal, does its interest become broader and more comprehensive, appealing to us on the higher grounds of pure feeling, and freeing us from all necessity for detailed information as to the "subject" it illustrates. To exemplify: in "The Rent Day" we have a representation of the pathos of common life, evolved under circumstances connected with every-day social economy, and we are unable fully to enter into the point of the picture until we know what was the situation which suggested to the artist these groups of figures with their varied expressions of distress and perplexity. But, the general situation being understood, we have no need of further detail; it would add nothing to the effect of the work if we could have names and histories appended to the various figures; the interest lies in the expression of human feeling and character exhibited by the painter, in manifestations which we all recognise and understand at a glance. Again, in Faed's striking and powerful painting of an old woman resting by the wayside, exhibited at the Academy two or three years ago under the title "All by Herself," we scarcely even require this statement of the painter's intention, to enable us to enter fully into the spirit and meaning of the work. The subject here is removed further from the details of every-day life; its interest was of a broader and more imaginative kind; it is a typical representation of old age in one of its most impressive forms; and half a dozen other titles might have been chosen for the picture, equally suitable to it, and which would neither have added to nor diminished our interest in it. So again, when we come to a still more ideal type of subject, such as Leighton's "Helios and Rhodes" before alluded to; we are conscious that the mere legend which it professes to illustrate is of very little consequence to us in

looking at such a work; what we care for is the intrinsic beauty of the picture, which may suggest to us a score of beautiful imageries quite independent of the title arbitrarily appended to it. And where the display of artistic and intellectual power is of the highest order, even subjects less vague and visionary than this can be made to assert their entire independence of any definite statement as to their subject. Who, for instance, in looking with eyes of understanding at that magnificent painting by Giorgione exhibited at the Old Masters Exhibition last year, under the title "La Richiesta," would feel that any definite history or names attached to the two figures could add anything to its effect? The work could stand without such aids; it was simply a representation of human feeling in one of its highest and most impassioned phases; to have added names to the figures, had it been possible, would merely have been to limit its effect, to tie down to actualities that which was the more real from embodying one of the noblest and most comprehensive of ideals. And so we might illustrate by numberless instances, showing how, in the highest art, the beauty attained and expressed, is itself the object; and the so-called subject is merely the opportunity seized by the artist as the suggestion or basis for working out a new ideal.

But in the present day we are confronted by a species of art, having its own apostles and disciples, which claims to be regarded as something distinct from and superior to what we have been alluding to as the highest form of artistic embodiment of ideas. That the claim of superiority, if not always made in so many words, is practically insisted upon, must be evident when we consider how continually it is sounded in our ears by this eclesiological party, that art can have no such high mission as in the service of religion, and the decoration and beautifying of religious edifices; *a fortiori*, therefore, the art used in these objects must be supposed to be the highest of which we can avail ourselves. That it is also supposed to be something distinct in character from ordinary art, is evident from the frequency with which we hear it insisted upon, that the decoration in churches and cathedrals must be of an "eclesiastical" character. But when we come to examine wherein this distinctive character consists, we are somewhat puzzled. For instead of finding the most distinguished among our artists, and those of most original genius, employed on this work, we find that the artists who rank as distinguished therein are names almost unknown in the great world of art. And if we come to examine their productions, the discrepancy between the claims and the achievements of the "eclesiastical" school, is still more striking. We find a tameness, a feebleness of conception, which would stamp such works at once as hopelessly mediocre if shown on the walls of a public exhibition-room; and a deficiency in mere power of delineation, which would probably prevent them from finding a place in such an exhibition at all. In place of human interest and character, we find a sameness of expression which entirely fails to appeal to our feelings in any way; in place of the higher ideal beauty possible in art, we find stiff angular drawing and conventional attitudes repeated with mechanical regularity. What is the explanation of all this? How is it that art in our exhibition-rooms is, however defective, a thing of free, varied, many-sided nature and interests, while in our great edifices it is shorn of all these characteristics, and reduced to a single type, and almost a single expression? The explanation is, that we are here in a region where the order of things artistic is inverted, and where the interest of a pictorial delineation lies entirely in *what* is represented, not in *how* it is represented. We are called upon to admire and to be impressed by figures, not because they are grand or beautiful in idea and execution,—not because they embody some beautiful conception or ideal,—but because they are stated to represent some event or some personage specially interesting and venerable to the adherents of the religion which they illustrate. It is not really the figure itself that we are to be impressed by, but the fact that it is placed there as the sign or symbol of St. Peter or St. Paul, or some other name in sacred history. We say intentionally, "as the sign or symbol," for that is what this class of painting really is, and nothing more. This, which is trumpeted forth as the highest art, and supposed to be so by a certain clique of persons, is in reality the lowest, for it is that in which power and originality on the part of the artist is

considered of least account. It is, if the truth were told, only a somewhat elaborate development of what philosophers call "fetishism," which consists, to put it broadly, in attaching a conventional and arbitrary importance or reverence to something selected as a type or symbol for this purpose. With the savage it may be a stone or a tooth; with the modern eclesiologist it is a figure with a nimbus and some conventional symbol. And nothing indicates more strongly the real nature of this so-called art than the anxiety of its practitioners to be all right and according to precedent in their employment of the symbols attached to each figure. They are in one sense right enough in this; for it is only by such means that one can tell which is which among their lay figures; and in the scheme for the figure-decoration of St. Paul's, drawn up at the instance of the committee, a copy of which is in the library of the Institute of Architects, it is distinctly recommended that all the multitudinous saints therein set forth should, in addition to the proper symbols laboriously sought out for each, have their names inscribed under them: a wise provision certainly, since without this we should probably find ourselves, if the decoration scheme were carried out on the true principles of eclesiastical art, in no better plight than the children at the wax-work show, who, on asking vociferously, "Which is the Duke of Wellington, and which is Napoleon?" &c., &c., got no answer but—"Whichever you please, my dear; whichever you please!"

It is not our province to point out (though we may just refer to it as an undeniable fact) that all this multiplying of saints and symbols and orders of angels, &c., is directly contrary to even the religious spirit of the masses in the present day, and by nine ordinary men out of ten would certainly be stigmatised in the vulgar but emphatic monosyllable, "hosh." But, looking at it from an artistic point of view, is it likely that any artist of high intellect and genius would be willing to give his time and his mind to the elaboration of decoration for a great building on such a basis? Would he not rather find his genius starved, his powers stunted and repressed, by such a mechanical and soulless task? And in regard to the proposition for carrying out the display of this eclesiastical wardrobe over the interior of St. Paul's, we can only heartily wish that such a scheme had been rendered impossible by a complete decoration of the interior in the style of Wren's day, offensive as it would have undoubtedly been in many ways, rather than that his building should have remained only to become the prey of the nineteenth-century eclesiastical milliner. Even the decorative works of Verrio, the adopted Raffaele of the period, had, hopelessly vulgar as they were, had some salt of art about them,—a certain power and boldness of conception,—at all events, a perception of art as something apart from mere symbolism. But what are we to expect when we find proposals for depicting "Cerberus full of eyes," and an interminable list of saints, known and unknown, ticketed and labelled somewhat after this fashion: "St. Boctes: dress, a dark-coloured, tight-fitting tunic; symbols, a pot and a blacking-brush," &c. &c. Had the building to be operated upon been a Mediaeval cathedral, there would have been one shadow of excuse for such treatment, which does not exist in the present case. It might have been urged, with some show of reason, that the men who built the cathedral, and who believed in saints and symbols, would have decorated it so, and that to make it a complete Mediaeval work we should follow out the same method. Such an excuse in the case of St. Paul's does not exist. The building has no connexion, either artistic or moral, with anything of the kind; it is the embodied type of the artistic and religious feeling of the Renaissance, which was in every respect opposed to the Mediaeval feeling. And the symbolic and eclesiastical decoration proposed for it, though in minor ornamental details it may of course be harmonised with the style of the building, embodies as a whole things which nobody cares for or has any interest in now, although dilettanti who want amusement, and eclesiastical decorators, who find it a paying trade (as it should be, considering the amount of thought required to carry it out), may get up a fictitious enthusiasm on the subject. And it will be to the lasting discredit of the common sense and good taste of the present generation if they allow themselves to be persuaded to countenance and to provide the means for the so-called "decoration" of our great Renaissance Cathedral on a scheme which, viewed in the

light of the present day and in connexion with the higher possibilities of art, can only be described as an absurd and childish anachronism.

THE ARCHITECTURAL ASSOCIATION CONVERSAZIONE.

THE opening *conversations* of the new session was held at the Galleries, in Conduit-street, on Friday evening, October 25th. Although the weather could not be deemed thoroughly satisfactory, the rooms were completely filled. The president for the session is Mr. J. Douglass Mathews, for several years secretary, and to whom the present form and position of the Association are in many respects due.

The names of the successful competitors for the prizes offered by and through the Association, were announced, and the students heartily applauded as they came forward to receive their books from the president.

The following is a list of the prizes thus awarded:—

For Essays.—1st, to Mr. Fredk. P. Johnson, for Essay on "The Special Characteristics of Mediæval Architecture pertaining to particular Districts of the United Kingdom"; 2nd, to Mr. T. E. Holloway, for "A Life of Philippe Brunelleschi."

For the best Set of Designs in the Class of Design.—1st, to Mr. R. Morrison Marnock; 2nd, to Mr. H. W. Pratt.

For the best Set of Drawings in the Elementary Class of Design, to Mr. V. Trubshawe.

For the best Summary of Subjects treated at the Class of Construction and Practice, to Mr. V. Trubshawe.

For a Design for a new Mansion suitable for a Nobleman, offered by Sir W. Tite, C.B., M.P.—1st, to Mr. G. H. Blagrove; 2nd, to Mr. S. J. Newman.

For Measured Drawings from existing Buildings in England, erected previously to the Eighteenth Century.—1st Prize, offered by the Architectural Union Company, to Mr. W. J. Cudworth, for Drawings illustrating the Old Hall at Gainsborough, Lincolnshire; 2nd Prize, to Mr. H. G. McLachlan, for Drawings of the Chapel in the Tower of London and of the Gateway of Barking Abbey.

For the best Set of Sketches actually made on the Spot in Preparation for the above Prizes, offered by Mr. W. White, to Mr. W. J. Cudworth.

For a Design for a Two-light Domestic Window, offered by Mr. E. W. Godwin (Drawings made at the Rooms of the Association on six Evenings in this Month).—1st, to Mr. R. C. Page; 2nd, to Mr. J. W. Stone.

Mr. Mathews then delivered a short address, treating of the work of the architectural profession, and the opportunities afforded in this Association for special study and preparation. After noticing the duties of architects towards the general public and towards their employers, duties frequently leading to a contest between emolument and principle, due at times to the special needs, and at others to the injudicious prejudices of employers, he proceeded to remark on the valuable services that might be and are rendered by competent art critics. By their influence a desire for artistic, as well as utilitarian, design is fostered; and though individual architects may on occasion be harshly judged, a standard is erected that cannot remain unnoticed. The existence of such a standard is a support to the conscientious architect in his contention with the practical difficulties of his work, and the knowledge that he has approached it his best personal pleasure. Turning to some practical details, he remarked on the timidity felt often by architects in adopting or recommending very recently introduced appliances. Regretting any such tendency, he thought that some of the responsibility for the introduction of novelties should be borne by the client; that an employer should be urged to give some personal attention to the results to be obtained and the means at disposal, and a special warrant for anything experimental. A progressive character in building would more frequently be aimed at, even at the expense of greatly-increased personal trouble on the part of the architect, if his responsibility was thus somewhat lightened. An architect should also, as a matter of usage, have the opportunity of advising with specialists, so as to bring the best and most thorough existing knowledge to bear in the furtherance of his aims. As a solicitor consults a barrister on doubtful or difficult law, or a general practitioner a physician in intricate cases, an architect should be encouraged to obtain the best guidance on points of special difficulty, or out of the course of ordinary practice. Of the education of workmen something ought also to be said, in view of the wholly useless addition to the work of the architect, so frequently the result of want of care and want of skill on the part of the workmen, who should be prepared to readily undertake and faithfully and earnestly carry through whatever the mind of a practical designer can conceive. After treating of other obstacles to desirable results, and the means of overcoming them, the president proceeded to give a sketch

of the special work of the Association, instancing its body of members, between 500 and 600 in number, as a proof that a large number of the future architects of our time have entered into membership, and advertising to the fact that many architects in successful practice have studied in its classes as proof of real work done. With a wholesome confidence in each other, and the mutual forbearance practised in other liberal professions, the profession of architecture, in the hands of upright men and good students, he thought, would maintain in the world the position it had won, and thereby maintain for their art its proper place as the senior sister of the three arts,—architecture, sculpture, and painting.

Mr. T. Roger Smith, on being called upon, alluded to the hard things said, especially very recently, as to the position and nature of the profession; advocating, in fact, its complete suppression, or radical changes in its character. No doubt, we are less inclined to regard such criticism when we detect in it such admixture of error,—so little evidence of the work of a wise and enlightened judge,—such evident desire to say smart and telling things, and to disregard the actual world, and its tendencies and wants. But, roughly shaken by such criticism, we are thereafter ready to examine keenly for ourselves the professions and the actual service rendered by architects, and judge of them afresh. He, for his part, saw in the sudden demands, made by our quickly-moving society, for the rapid adaptation to fresh needs,—a demand also for specially educated men, ready for any emergencies, capable of infusing intelligence and power into all work directed by them, capable of using up every new resource to its full extent. When the rebuilding of Chicago had been carried on at a rate giving the completion of one building per hour during the last nine months, it sounded like the language of dreams to advocate, or consider possible, that a congeries of workmen should always be turned out to a large work, in order, by their joint efforts, to muddle out a successful whole. This accords little with the ordinary current of modern life. Seeing the class of talent and power required, and knowing intimately the internal working of the Association, he saw in it means of training,—supplementing the ordinary practical office education where most necessary, and testing by actual contest with other students the quality of each student's mind.

Professor Kerr stated, that he found the profession of architecture most unpopular,—the most unpopular profession of modern times. He considered its position most critical; and found the reason of this remarkable unpopularity in the prevalence of Fashion in Architecture. He had witnessed the Fashion before that now current at the flow and at the ebb; and awhile ago he saw the present Fashion at the flow. Now, he fancied that the tide is turning, and the signs of the turning are to be found in the dissatisfaction and doubt so frequently expressed. What is to be done in order to be prepared for such a change,—from the prevalent Gothic style? He would recommend an increased attention to the stone and mortar work of architecture. In proportion to the increase of skill in mere draughtsmanship, a skill of which English critics may now well be proud,—just in this proportion he thought he detected the loss of the solid qualities of good design. Study photographs in order of drawings, in order to correct this; and, in order to be prepared for new times, be more eclectic in the range of study. In the volume of art, read and mark well the learning and the lessons of more than a single page.

Mr. G. E. Street said that, with time at his disposal, he should be disposed to rebut Professor Kerr with zeal. He did not, in his experience, find his profession by any means an unpopular one,—rather the reverse. There is, it is true, within it and around it a strange habit of indulging in a sort of criticism not practised in some other professions, which leads casual and some other observers to erroneous conclusions. It is commonly said that Painters enjoy, Architects dislike, and Sculptors detest the works of others,—no doubt, an epigrammatic statement having some foundation. He hoped to see it become less justified,—by improvement of actual work and also by an altered tone of mind,—by a habit being acquired of first looking for what is good, instead of not looking beyond defects. If his voice could be listened to in practical counsel, he would say, confine yourselves to one style, learn it in all its range, and in all its details, and practise it,—less as the result of habit than of

strong conviction and attachment. In the designs by students shown that evening he found good evidence that, with life, and health, and perseverance, their authors would cover themselves with distinction in time to come.

Mr. T. H. Wyatt, president of the Institute, for himself individually, and speaking also for the council of the Institute, expressed the great interest felt in the work and progress of the Association, and wished good speed in every direction. His only advice to the students would be, in the language of Lord Salisbury, "to keep firm hold of one rung of the ladder till the next is securely grasped."

The Rev. W. Hutchinson, from his personal experience of the intelligence and ardour of a number of the members, whom he had been privileged to meet during the three excursions conducted by Mr. E. Sharpe, knew that the Association comprised many men of talent and devotedness, who were or would be agents in the progress of the ever-progressive architecture of modern Britain.

Amongst the drawings and other objects of interest were a set of studies, in colour, by Mr. E. C. Lee, in Italy and Sicily, made during his travels as holder of the Soane medallion,—buildings, Classical, Romanesque, and Mediæval; mosaics, costume and colour at Pisa and Assisi, landscape *enque*; a dozen water-colour drawings of Yorkshire abbeys by Mr. R. P. Spiers; sketches by Messrs. Belcher, W. Paris, J. O'Connor, Lewes, J. Sulman, J. Conder, T. Battersby, &c.; drawings of decorations by Messrs. Heaton & Co. (Trinity College Chapel, Cambridge), Green & King (Bolton Town-hall), Collmann, &c.; photographs illustrating the Northamptonshire excursion (views and details at Fotheringay, Warrington, &c.) by Mr. Robinson, of Stamford; furniture, and church-plate, and silken hangings, and the yet unfinished 1,000 Challenge Cup (and stand and cover) of the National Mosaic Union, exhibited by Messrs. Cox & Son; Lyons silk damask, Japanese paintings on silk, paper-hangings, &c., by Messrs. Green & King; cabinets in ebony, satin-wood, &c. by Messrs. Gillow. These, with other drawings, students' designs, rubbings, &c., covered the walls and filled the recesses of the galleries.

We shall hope to be able to report the satisfactory carrying out of the items of the syllabus issued for the session thus pleasantly begun.

THE LATE MR. E. C. HAKEWILL, ARCHITECT.

WITH great personal regret we announce that Mr. Edward Charles Hakewill, architect, died on the 9th ult., after a short illness, at Playford, in Suffolk. Mr. Hakewill was articled to the late Mr. Philip Hardwick in the year 1831, and soon after the expiration of his term of seven years he commenced practice.

The first work of importance upon which he was engaged was South Hackney Church, which remains at the present day, although erected more than twenty-five years ago, a good example of our revived church architecture.

He was elected district surveyor for the parishes of St. Clement Danes and St. Mary-le-Strand upon the death of Mr. Goldicut, who held the appointments; and, upon the division of the large parish of St. George, Hanover-square, into two districts, he exchanged into that portion known as the Hanover-square district. This he held until 1867, when the Metropolitan Railway requiring his house in Thurloe-square, he gave up the district and retired into the country, building himself a house at Playford, in the eastern division of Suffolk. It was his intention here to give up all practice of his profession; but when it became known that he had come into the country, his advice and assistance were sought in many directions, and the churches of Wickham Market, Sition, Stonham Aspall, Grandisburgh, and others, testify to his abilities and love for this branch of his profession.

Rushmere and Myland churches, which he had previously built, are also good evidences of his skill. But it will not be by his profession alone that he will be remembered. His loss will be felt by a large circle, by many who only knew him as a kind and generous friend, always ready to assist in any good work, always alive to the wants and necessities of his poorer brethren, and an intelligent and agreeable companion. He was an early member of the Royal Institute of British Architects. Mr. Hakewill married in 1853 the widow of Mr. H. Davidson, of Cantry, daughter of the late Mr. W. Monkhouse.

THE LATE GEORGE HEMMING MASON,
A.R.A.

MR. MASON died at his residence, 7, Thersenterrace, Hammersmith, on the 22nd ult., from disease of the heart, from which he had long been a sufferer. He was the oldest son of the late Mr. George Mason, of Wotley, North Staffordshire. He was educated at a surgeon, but having always had a passion for painting, he left surgery to become an artist. He studied for some years in Birmingham, and after travelling through France, Germany, Switzerland, and Italy, he established himself in Rome, and lived there for the best part of twenty years. Although well known as an artist to the English visitors of Rome, his works were not generally known in England until he exhibited at the Royal Academy his picture of a peasant family moving their goods in a cart through the Roman marshes, called "Nelle Maremme." This picture was exhibited in the International Exhibition in 1861. In 1858 he settled in England, and began to paint English subjects. The exquisite composition of his pictures, and their harmonious colour rapidly attracted the attention of artists, and he was made Associate of the Royal Academy; the public were equally charmed by the way in which the commonest outdoor incidents of peasant life, while absolutely true to nature were invested with a poetic charm not common in the British school. He exhibited many small works at the Royal Academy, all showing the same poetic feeling, in the same harmonious low-toned key, and with the same mastery of subtle composition of line.

"Catch," a boy watering horses at a pool on a rough stony common, and throwing an apple to a little girl; "The Cast Shoe," in which a belated horseman is crossing a moor, in a drenching shower; "A Girl driving Calves" to shelter from a coming storm; the wind blowing her hair and frock, and waving the branches of the trees, may be pointed to; but the pictures of English life that excited most public attention were—the "Evening Hymn," a troop of girls coming home from church in the twilight singing the evening hymn, a man with a dog looking on entranced by the singing; and the picture exhibited this year in the Royal Academy, called the "Harvest Moon." The former of these received the prize at the Manchester Exhibition.

Though blessed with an extraordinary fertility of invention, his finished works were comparatively few. The fastidiousness of his taste was such that, if it appeared possible to him to improve his pictures, he not unfrequently, to the very eye of completion, substituted one group for another; but his falling health prevented prolonged application to the easel. The fortunate possessors of his works will cherish them as gems; for, like Burns in song, he has invested the ordinary events of peasant life with an equally poetic charm. His friends will have to deplore the loss of the most amiable and genial companion, whose brilliant powers of conversation could enchant them the whole evening through. It is to be hoped that the Royal Academy will set apart a room for the exhibition of his works; for very many of his pictures, and most of his sketches from nature, and sketches for subjects of pictures, are quite unknown, except to a few friends, and yet nothing can convey so full an impression of the exquisiteness of his taste and the fertility of his invention, as many of these small sketches for pictures, destined, alas! never to be carried out. Those who have once seen his "Horses treading out the Corn in the Campagna," or his "Girls, dancing by the Sea," will not forget them.

Below is a list of his principal works:—
"Nelle Maremme;" "A Girl Dancing;" "Matlock," in the possession of Mr. E. L. Benyon;
"Catch," Lady Ashburton; "The Cast Shoe," Mr. Stewart Hodgson; "A Girl driving Calves," Mr. F. Leighton, R.A.; "Gipsies on a Moor," Mr. Arthur Lewis; "The Evening Hymn," "The Swans," "A Harvest Field," the Hon. P. Wyndham, M.P.; "Girls with Milk, taking Shelter from the Rain," "Wotley Rocks," Mr. Trist; a small Landscape, Mr. E. Sartoris, M.P.; a small Landscape, Mr. Cholmondeley; "The Harvest Moon," Mr. S. Eustace Smith, M.P.; "A Girl," Lord Westminster.

Society of Engineers.—At the meeting to be held on Monday next, a paper will be read on "Milford Haven, and its new Pier Works," by Mr. Henry Davey.

RE-OPENING OF RIPON CATHEDRAL.

ON Thursday last week, Ripon Cathedral was formally re-opened, after complete restoration, a sermon being preached on the occasion by the Very Rev. the Dean of York. The service was conducted in the choir, which was crowded with the *élite* of the city and neighbourhood. The work of restoration has been carried out under the direction of Sir Gilbert Scott. It is now ten years since the cathedral was given into the hands of the workmen. The first and most important work was to place the building, which, in 1861, had reached such an alarming degree of dilapidation as to threaten its absolute ruin, in a state of security, a labour of no small ingenuity, since it involved the underpinning of the two western towers, to supply them with new and secure foundations. At the same time, the low-pitched roof of the choir was replaced by an exterior roof of lead, raised to the original pitch, and the whole of the exterior of the building was thoroughly repaired. The next work was the renovation of the interior of the choir. The galleries and private boxes and closets which shant out the aisles were removed. The plaster canopies of the stalls were replaced by canopies of carved oak, exactly corresponding with the stalls at the western end of the choir, which, fortunately, had remained intact. The stone sedilia were removed to the easternmost bay of the chancel, and restored to their proper use. The whole of the choir and its aisles were re-floored, and to a great extent restated. The ancient arcading round the eastern wall of the chancel was restored, and a pavement of various coloured marbles laid down within the altar-rails. The choir was provided with an altar of suitable design and size; and lastly, the plaster ceiling was replaced by an (interior) oak roof, ribbed with gold, and decorated with various colours. The central tower and transepts also were thoroughly repaired. Carved oak ceilings were substituted for the sham groining which disfigured the transepts, and the lantern or central tower was enriched by a painted ceiling, bearing the emblems of the four Evangelists, with the "Agnus Dei" in the centre. All these works, besides extensive repairs in the chapter-house, library, and other parts of the building, were completed by the end of the year 1868, and the choir was reopened for divine service on January 27th, 1869. The last portion of this great work, that which has just been completed is the restoration of the nave, where an interior oak roof has taken the place of the flat ceiling. The new interior roof has had to be constructed without disturbing the exterior roof, although there are not 6 in. of space between the two roofs, the beams of which in some places touch one another. The new roof is ornamented with a variety of bosses emblematic of the Holy Sacraments, the Evangelists, &c. The work of restoration has cost, in round numbers, the sum of 40,000*l.*, of which the Ecclesiastical Commissioners have contributed 15,000*l.* The rest has principally been raised in the diocese of Ripon.

RE-OPENING OF ROCHESTER
CATHEDRAL.

THIS cathedral has been re-opened for divine service. The interior of the church has been renovated. The tower-arch has been thrown open, and the tower-window brought into view. This west window, perhaps the most interesting relic of the original church, has been repaired and reglazed. The tower-arch has been denuded of the accumulated plaster and whitewash of many generations, and now presents a bold relief to the west wall of the church. The marble basin which did duty for a font has been replaced by a massive octagonal font, the gift of Messrs. Alfred Smith, supported by clustered shafts, the design being somewhat plain, and the only decoration being a narrow floral moulding separating the shafts. The windows in the north and south walls have been improved, and in the east wall a new memorial window to the late Rev. W. H. Drage has been placed. This window is filled in with stained glass, the subjects represented in the three principal lights being the Annunciation, the Crucifixion, and the Appearance of our Lord after the Resurrection. A pulpit, upon a stone pillar, decorated with the ball-flower moulding, stands near the south gallery. The upper part is of wood, divided into panels by banded shafts. Open seats have replaced the stiff high-backed pews

on the floor of the church. The new communion-rail, which is somewhat heavy, is supported by a series of banded shafts, of the same design as those decorating the pulpit. The reredos is simple, and is composed of mosaic, alabaster, and Siena marble. A Latin cross ornaments the central compartment. The pavement within the rail and in its neighbourhood is of encaustic tiles. The fluted pillars supporting the gallery are painted chocolate and light red in the flutes alternately, while those which run from the gallery to the roof are treated in a similar manner, the colours used being light red and white. The front of the gallery is painted in different shades of a soft dark green, relieved by lines of buff. The walls and ceilings throughout the building are treated with varying shades of stone-colour. The organ is placed in the south gallery, and is ornamented. The old ponderous roof, covered with lead, has been removed, and replaced by a new one, covered with blue slate, and of a much lighter construction, and of less elevation than the former. The entire work has been carried out at a total cost of 1,400*l.*

SURVEYOR

FOR ST. GEORGE'S-IN-THE-EAST.

THE Vestry have elected Mr. George Wilson to this office. Some of the ratepayers complain greatly because it was not as usual submitted to public competition. If, however, the majority of the vestry had made up their minds to appoint Mr. Wilson, it was much better to do so at once than to give a number of gentlemen the trouble and put them to the expense of coming forward as candidates for an appointment that was already in point of fact disposed of.

THE BISHOP OF HEREFORD'S STAFF.

THE new pastoral staff, subscribed for by the clergy and laity resident in the diocese, has been presented by the Earl of Powis, on behalf of the subscribers, to the bishop. It was made by Messrs. Cox & Sons, of London, and exhibited in the International Exhibition just closed, and is carved out of a piece of oak which formed one of the pillars of the episcopal residence at Hereford, built about the year 1180. The tree of which the staff is made was growing long before the Norman Conquest, and possibly when the see was re-established, under the Saxon prelate, Putta, in the seventh century.

The height of the staff is 6 ft. 3 in. It is divided into four sections, the whole skill of the artist being chiefly expended on the upper portion, which is very elaborate. In the centre of the crook is the carved figure of our Lord, with right hand erect, and emblems of royalty in the left. The Agnus Dei is carved on the reverse. An angel with displayed wings, beneath the crook, carries a shield with the arms of the diocese. Silver is the only metal adopted, but the greater part of it has been oxidised, and relieved with gold and elaborate enamel work.

The projections of the staff are surrounded with metal bands, in which are set malachites and carnelians, cut in the ancient manner.

The lower projection bears the inscription,—
Pasce oves meas.—Evang. sec. Joan. xx. 17.

SHEFFIELD ARCHITECTURAL AND
ARCHÆOLOGICAL SOCIETY.

A GENERAL meeting of the members of this Society has been held at the local School of Art. The president, the Rev. J. Stacey, occupied the chair. On the table were a number of fine old engravings, kindly lent by Mr. Wilson, of Sheffield moor, and some photographs contributed by Mr. Syson. In the course of the evening two papers were read, the first by Dr. Syson, of Manchester, and the second by Mr. J. D. Leader, treasurer of the Society.

Dr. Syson spoke of the need for such societies as the one he was addressing. They exercised an influence upon domestic and public architecture, and did much to modify the very ugly buildings usually put up.

Mr. Leader's paper embraced the result of some inquiries he had made on the subject of Sheffield Castle and Manor Lodge, since April last, when he read a paper on that subject before the local Literary and Philosophical Society. He said, about four years ago an opportunity offered itself for an investigation on the site of Sheffield

Castle, which it cannot be too much regretted passed away without coming to the knowledge of this Society. In carrying out the works connected with the main drainage of the town it was found necessary to drive a drift right through the Castle-hill. The tunnel was at a considerable depth below the present level, being 18 ft. 6 in. below the surface of Waingate, and probably 40 ft. below the level of Messrs. Charles Chambers & Co.'s yard. It passed under the river Sheaf a little above the weir, at the back of the Alexandra Music Hall, and went obliquely across the Castle-hill to the end of Bridge-street. Having tunnelled under the river, the workmen bored through an alluvial deposit, in which numbers of bones were found, the antlers of deer, and other remains. Arrived at the Castle-hill the drift came upon the rock. To facilitate the work two shafts were sunk; one in Messrs. Chambers's yard, and the other nearer Waingate. In the first shaft a discovery was made that vindicates the authority of tradition against the incredulity of modern learning. Mr. Hunter mentions, only to dismiss as a fable, the old story of a subterranean communication between the castle and the manor. The excavators in sinking the shaft nearest to the Sheaf cut across a subterranean passage excavated out of the solid rock, and running in the direction of the Market-hall, but whether it extended to the manor or not we cannot tell. It was partially obstructed by debris, but was still some 4 ft. in height, and perfect as to its roof. The workmen never explored it; and, when the shaft was filled up, a rubble wall was built across the passage. In sinking the second shaft, portions of the Castle walls were found, about 20 ft. below the level of the ground; and a mason who saw them concluded that the Castle had been built of large rubble, with dressed quoins.

THE WEST LONDON DISTRICT SCHOOL, ASHFORD.

The brick-built buildings which arrest attention on the South-Western Railway, in the parish of Ashford, about midway between Ashford and Staines stations, are the result of the determination of the Local Government Board to remove from the workhouses of the parish of Paddington, the St. George's union, and the Fulham union, the children therein housed, and to place them in a thoroughly healthy situation, where they will be cared for, clothed, maintained, and educated in a manner intended to render them hereafter useful members of society. A district board of management was created for the West London School District, on whom devolved the selection of the site, and who, nearly four years ago, invited a select number of architects to furnish designs for the intended buildings. They selected those submitted to them by Mr. H. Collins, of Chesham, and from the drawings supplied from time to time by Mr. Collins the works to the school buildings have been carried out. In the early part of 1870 the board of management advertised for tenders, and the lowest,—that of Messrs. Bull & Sons, of Southampton (about 13,500*l.*), was accepted. This tender included, in the buildings proper, the supply and fixing of the water-tanks, gas-mains, gas-piping, pipes for hot and cold water, the iron-tube ventilators, and the railing enclosure to yards and playgrounds. There were, however, several additional contracts. The buildings, which were designed to accommodate 800 children, are now completed, and partly occupied.

The spacious dining-hall is fully 100 ft. long by about 50 ft. wide, and is about 33 ft. in height. Its roof is of wrought iron, by Moreland & Son, and has a bell-turret at the end next the front. At the junction of the walls with the ceiling is an enriched open *papier-mâché* cornice assisting the ventilation. The moulded red bricks are from Messrs. Bull & Sons's works; the white bricks from Poole. There are Bath-stone caps moulded and moulded sashes to all pilasters around this room. Light is obtained from twenty-six iron-sashed windows in the surrounding walls, each 12 ft. 6 in. high and 4 ft. 6 in. wide, with semi-circular heads. The marginal lights are glazed with toned cathedral glass; the other portions with Hartley's patent rough plate; in each sash there is a circular portion, 2 ft. 9 in. in diameter, made to open, by which means ample ventilation is obtained. This room is in the centre of the main building, the whole frontage of which is 82 ft.

All the dormitories have windows front and back. The sashes are in three heights,—first, a

pair of ordinary hung sashes, below a transom rail; the top or third sash is hung to transom with hinges made to open and fall-to with lines and pulley. There are also in each dormitory, constructed in the outer walls, twenty small flues for the admission of pure air through an air-brick on the outer face of the walls. On the inside, near the ceiling, the upper half of the number have perforated zinc panels, in wood frames; those near the floor have hit-or-miss panels on the face of the wall, to regulate the quantity of air admitted. The day-rooms and school-rooms have a proportionate number of these flues.

Every dormitory throughout the several buildings has in each chimney-shaft a flue or flues formed for the escape of vitiated air, and on the face of the walls internally, near the ceiling, are built in perforated bricks, communicating with these flues. The heat generated by the gas-burners absorbing the foul air passes through iron plates, 2 ft. in diameter, in the ceiling perforated, with which are connected iron tubes, 3 ft. by 4 ft. These run into the flues between the floors and ceilings, and over the top of the upper ceilings.

On the whole premises there are eight lifts, by Johnson, of Wandsworth-common; ninety-two Moulé's earth-closets, and in the lavatories the tilt-up washing-basins number 238. Gas-works are being erected by the Messrs. May.

It is thought that the total cost, including additional works, fittings, furniture, roads, &c., will be little short of double the amount of the original contract for the buildings.

Messrs. Bull & Sons's contract was carried out under the direction of Mr. Thomas Epps, the whole of the works being under the supervision of Mr. James Roberts, clerk of the works to the board of management.

PAVING IN MANCHESTER.

The highway authority of Manchester, having to rebuild the iron bridge over the canal at Gaythorn, determined to give a trial to Mr. Norton's patent bitumen and wood system of paving, instead of the usual stone sets, and during the past week workmen have been engaged in laying down slabs of this material, under the direction of Mr. Fullwood. These slabs consist of 1-in. deal boards, in two layers, one longitudinal and the other transverse, and on these are placed pitch-pine sets, 4 in. by 3 in., with the grain on end, the whole held together by and ceased in hitumen. These slabs are laid with their ends resting on 9 in. by 1 in. deal boards, laid longitudinally with the roadway, the intervening space being filled with sand, so as to give an even bearing surface. The work, when complete, is neat, and has a good appearance; but time alone can show how it will wear in so crowded a thoroughfare, and with so crowded a traffic as usually passes there. The time occupied in laying has been about as long as would be required to lay sets without a concrete foundation, although the patentee claims that his system requires much less time than any other, the slabs being made in the yard, and brought to the spot ready for use. The work has excited much interest.

SEWERAGE INQUIRY AT TORQUAY.

A LOCAL Government inquiry on the sewerage question was opened at the Town-hall, Torquay, on the 26th ult., before Mr. R. Morgan, C.E., for the purpose of hearing an application on the part of the Local Board for borrowing 55,000*l.* for a drainage scheme, and also to hear objections to it. The inquiry was continued through two other days, and excited much interest. Mr. Hooper showed the prejudicial impression that existed against Torquay in consequence of the evil of the existing state of things, however ill-founded, and no one knew how this would end if some remedy were not applied. It was absolutely necessary for the welfare of the town that the prejudice should be removed. Since 1867 there had been two had seasons, caused by popular prejudice. He knew that up to 1867 the progress of Torquay was very considerable; the number of houses built might have been numbered by hundreds; but how was the building trade affected now? Building operations had almost entirely ceased since that time.

Inhabitants deposed that it was absolutely necessary to remove the stigma from the town. Mr. Bazalgette, who gave evidence, had at first

advised a farm for utilisation, but circumstances had altered his opinion, and he advocated a scheme for pouring the sewage into the sea. He was badgered a good deal on his change of opinion.

Mr. Appleton, C.E., in the course of his examination, said he was satisfied that Mr. Bazalgette's reports up to 1871 were the result of his convictions, but that his present recommendations to go to Hope's Nose were the result of his instructions.

Mr. Carter, on behalf of the ratepayers, said he appeared for those who were of opinion that the present state of things ought to remain subject to some improvements, and that if these improvements were effected, the present drainage would answer every purpose. He thought every endeavour should be made to utilise the sewage on land, rather than spend 40,000*l.* in throwing so valuable a commodity into the sea. He drew attention to the fact that Mr. Appleton estimated a profit of 4,000*l.* a year by irrigation, and asked, in the face of this, if it was expedient to spend such a large sum in causing what would most probably prove a greater nuisance than at present.

At the close, the inspector, who must have had a hard time of it, from the length of the meetings, the conflict of opinions, and the vitiated state of the atmosphere in the room, recommended

* That the Local Board of Health obtain the services of those gentlemen connected with schemes they advocate, with a view to the preparation of a final and comprehensive scheme to be finally determined upon by the Local Board for dealing with the sewage of the town, and that when such is determined upon, fresh estimates be prepared and an application be then made for sanction to borrow the sum required—the whole to be under the jurisdiction and management of the Local Board, who may receive the assistance of the ratepayers' committee on the subject. In the event of no decision being arrived at as to the scheme to be finally adopted, the Local Board to call in an independent engineer, whose decision shall be final, and that no time be lost so that the works may be commenced during the present session of Parliament.*

COAL AND IRON.

THE Steam Coal Owners' Association have held a meeting at Cardiff, and passed a resolution reducing the market price of steam coal 6s. per ton. This step has been taken "in view of the general fall in the price of coal throughout the country." How is it, we should be glad to know, that the "general fall" has so little been felt in the metropolis, where coals remain at their highest point?

The export of coal from the United Kingdom (including coke and manufactured fuel), in the first three quarters of the year 1872, has reached the large amount of 10,997,526 tons, of the value of 7,208,767*l.* In the corresponding period of 1871 the quantity was only 9,358,730 tons, or less than in the present year by 788,793 tons; and the value of the export was only 4,489,962*l.*, or less by 2,718,805*l.* The export of September, 1872, is valued at about 21s. per ton. In the first three quarters of 1872, 1,657,441 tons of coal have been exported to France, 1,652,420 tons to Germany, 722,330 tons to Italy, 720,230 tons to Russia, 524,593 tons to Denmark, 484,007 tons to Spain and the Canaries, 401,329 tons to Sweden, 861,259 tons to British India, 358,675 tons to Holland, 209,371 tons to Brazil, and 2,998,868 tons to other countries. Seven years ago the entire year's export of coal did not reach 10,000,000 tons.

The export from the United Kingdom of iron and steel in all stages of manufacture has amounted in the first three quarters of the year 1872 to 2,608,883 tons, of the large value of 26,599,681*l.* In the corresponding period of 1871 the quantity exported was 2,381,916 tons, or less than in the present year by 220,967 tons; and the value of that export was only 19,337,896*l.*, being less than that of 1872 by the large sum of 7,252,785*l.* The export of pig-iron has increased from a little over three-quarters of a million tons upwards of a million, and the value of this year's export is more than double that of last year, having risen to upwards of five millions sterling. The export of railroad iron has rather decreased in quantity in 1872, but the value of the smaller quantity has greatly exceeded the value of last year's larger quantity, and amounted to above 7 millions. More than half this year's export of railroad iron, 378,053 tons, of the value of 3,787,493*l.*, went to the United States. The export of tin plates has increased this year to 1,899,166 cwt., of a value exceeding three millions sterling; 1,443,754 cwt., of the value of 2,262,852*l.*, have gone to the United States. The

export of steel, unwrought, has risen to 33,068 tons, of the value of above a million sterling, and more than half of this export has been to the United States.

THE SCIENTIFIC AND

MECHANICAL SOCIETY, MANCHESTER: SECTION I., ENGINEERING.

THE fifth monthly meeting of the session of this Society was held at the Trevoyan Hotel, the vice-president in the chair. Several gentlemen were elected members of the Society, and the honorary secretary then reported that the special committee which had been elected at the last meeting to devise some improvement and reorganisation scheme, for the Society, had held four sittings, at the first of which it was decided that no decisive steps be taken until a sufficient number of experienced, efficient, and influential gentlemen, representing the sections to be at present organised were added to the committee. At a subsequent sitting it was resolved that sections be formed, at least, one additional, viz., a chemical section; also that a reference library, reading-room, and museum, be established; and that the meetings be so arranged that all sections met on a different day, so that each member might attend any meeting he pleased. It was hoped that other sections would be formed in due course. The next business of the special committee would now be to construct as efficient a code of regulations as could possibly be done, and that was at present under consideration; and at the next monthly meeting, which was also the "general half-yearly meeting," the committee would be prepared to lay a complete arrangement before the Society for approval. The committee thought it also desirable that this Society should be known under a more suitable name in future, but as the utmost importance was attached to this consideration, no resolution had as yet been come to. Mr. Hacking then read a paper "On the Ventilation of Mines."

THE SYLLABUS OF THE INSTITUTE OF ARCHITECTS.

At the opening meeting of the session on Monday evening next, the president, Mr. T. H. Wyatt, will deliver an address.

The portraits of Professor Donaldson and of Mr. A. J. B. Horsford-Hope, M.P., past presidents, painted by Mr. Charles Martin, will be formally presented to the Institute, in the name of the subscribers.

The following papers have been promised, and will be read during the session:—

- "On Professional Esprit de Corps." By T. Roger Smith, Fellow.
- "On Arbitrations." By B. Fletcher, Associate.
- "Notes on the Architecture of Chester." By C. H. Heathcote, Associate.
- "On the Valuation of House Property in London." By E. T. Anson, Fellow.
- "On St. Peter's Orphanage and other Buildings in the Isle of Man." By J. P. Seck, Fellow.
- "On the Principle of Sub-Ordination in Design." By H. H. Statham, Associate.
- "On the Medieval Brickwork of Pommerania and Mecklenburg." By J. Tavorer Perry, Associate.
- "On the Old Hall at Gainsborough, near Lincoln." By C. Hadfield, Fellow.
- "On the Laying out of Cities." By J. B. Waring, Fellow.

RAILWAY AND DOCK WORKS IN YORKSHIRE AND THE NORTH EAST.

SEVERAL railway and dock works of an extensive character are now in course of construction, in the North-Eastern and Yorkshire and Lincolnshire districts, amongst which are the works in progress at the Royal Docks at Grimsby, where Messrs. Logan & Hemingway are now making several additions and enlargements. They have also just entered into a contract with the railway company for the construction of a dry dock, 300 ft. long, between the Fish Dock and the Clearethorpe Railway. The new railway from Whitley to Redon, through the Cleveland ironfield, which fills up an important gap in the North-Eastern system, is rapidly approaching completion, and will shortly be opened. Loft-house, which is situated on the north-eastern coast, and intersected by the new railway, is likely to be materially developed and benefited by the opening of the new line. Iron furnaces are about to be erected there immediately, and it is also proposed to make Loft-house an important shipping place by the construction of docks. The North-Eastern Company are also

about to construct a new short railway between Stockton and Middlesbrough, at an expense of upwards of 100,000l., together with new branch lines between Leeds and Wetherby, and between Knaresborough and Boroughbridge. A connecting line is also in course of construction from the Parkgate Ironworks, near Rotherham, to the Midland railway, whilst the Lancashire and Yorkshire Company are about to construct a new line from Clayton West to Huddersfield. The North Lancashire loop line belonging to this company, as also branches to Astley Bridge, near Bolton, and to Heap Bridge, near Bury, are in course of formation.

SCHOOL BOARDS.

London.—The Works Committee invited tenders for the erection of the Essex-street, Stepney, School, to accommodate 1,000 children. The following were received:—Axford, 8,644l.; Brass, 8,420l.; Nixon & Son, 8,390l.; Hill & Sons, 8,210l.; Webster, 8,120l.; Higgs, 7,987l.; Sheffield, 7,983l.; Pritchard, 7,877l.; Nightingale, 7,799l.; Cooke & Green, 7,767l. The committee felt it necessary to reduce the cost of the school, and the architect was instructed to revise his plans. The reduction thus effected amounted to 1,465l. 8s., and the committee recommended that the reduced cost of 6,311l. 12s. be accepted. The Works Committee also received tenders (already given in the *Builder*) for the erection of the Wilmot-street, Bethnal-green School, to accommodate 1,500 children, and recommended that the lowest tender, that of Mr. A. Sheffield, amounting to 10,389l., be accepted. The reports were agreed to. The report of the Works Committee was then brought up, and the following, amongst other recommendations, were agreed to:—That the tender of Mr. J. D. Hobson, of No. 7, Duke-street, Adelphi, amounting to 11,650l., for the erection of a school for 1,500 children on the site in Johnson-street, Stepney, be accepted (a list of the tenders will be found on another page); and that the supplemental tender of Mr. B. E. Nightingale, amounting to 89l., for the increase of the accommodation for infants from 240 to 400 in the Mary-street, Bromley School, be accepted. The Works Committee reported as follows:—

"The Board have now several sites, which are, or will be, immediately available for building purposes, and the Works Committee are desirous that no time should be lost in getting out plans for the schools to be erected upon them. With the present staff, the utmost that can be done by the architect is to prepare plans on the average for one school per week. The committee understand, however, that by increasing the cost of the staff by less than one-half, this average could be doubled. As it is of the utmost importance that no delay should take place in the erection of schools, the sites for which have already been secured, the committee accordingly recommend that the following additional officers be appointed for the architect's department, and that it be referred back to the Works Committee to make the necessary selection for appointment by the Board. Two senior draughtsmen, at a salary, in each case, of 140l. per annum; one junior draughtsman, at a salary of 80l. per annum; two traciers, each at a salary of 62l. per annum; an office boy, at a salary of 5s. per week."

The report was adopted.

Bradford.—Mr. Neill moved the acceptance of the tenders for Dudley Hill School, amounting in all to 8,486l. 11s. 6d. He explained that in this instance the tenders had been let in sections. On the recommendation of the architect the committee had agreed to accept them, subject to the approval of the Board. Although some of them thought that they had got low tenders, he might say that the school would cost 1,200l. more than the architect's estimate. They had at one time thought that this was to be one of the cheapest schools they were building, but it would be the highest priced school per child of any they had resolved to build. Still the committee did not see that they could get the work done cheaper, and they therefore recommended the acceptance of the tenders. The resolution was carried.

Norwich.—A ratepayer thus writes to the *Norfolk Chronicle*—

"A school is in course of erection in the parish of St. Michael at Colney, designed to afford the necessary cubic space for 200 children. That it is a handsome edifice no one who has seen it (for it is nearly completed) can for a moment deny. That it will be well built and will answer all requirements, the high character of the building firm and the professional repute of the architect afford a sufficient guarantee. The cost per head for this school will be 31. 10s. 6d., exclusive of the land upon which it is built, a little less than 2l. per head, the contract being for 1,230l. and the fittings being, I believe, to cost about 300l. more. Just across the water, upon a site of a deserted quarry, another school is to be built. It will be in a populous neighbourhood, and will be of sufficient dimensions to

contain 540 children. The cost, therefore, of cubic space should be smaller in proportion to that of a smaller building. I am informed that the School Board have already entered into contracts to build this larger school in the hamlet of Heigham, at the sum of 4,200l., inclusive of fixtures and gas, or in other words, at a cost per head of 74. 15s. 6d. If these statements be true, and I have no reason to doubt them, the School Board has something to answer for."

THE TRADES MOVEMENT.

Bristol.—The carpenters and joiners have resolved to apply for an increase in their wages of a halfpenny per hour from the 1st May next year. This would raise their wages to 7d. per hour, or—summer, 1l. 11s. 6d.; winter, 1l. 5s. 6d.; average in the year, 1l. 9s. 5d.

Bradford.—The operative stonemasons have issued the following circular to employers:—

"At a general meeting held in the Secular Hall, Southgate, Bradford, on Friday evening, the 4th inst., it was resolved that we give you the required six months' notice for an advance of 3s. per week on the present rate of wages; such notice to expire on May 1st, 1873. Owing to the present high price of coal, and the other necessities of life, it was thought expedient that this course should be adopted, as we are confident we are not asking too much, seeing that other trades, such as overlookers and others, are receiving 3s. to 6s. per week, and also that the banks of Scotland have advanced their employees 25 per cent. in some instances unqualified. We hope that there will be no suspension of labour when the time arrives, but you will generously concede our most reasonable request."

Kinghorn, Fifeshire, Scotland.—A strike of a somewhat novel nature took place a few days ago at Kinghorn Shipbuilding-yard, Fifeshire. It seems that the employees, who number between 300 and 400 men and boys, had been asked to agree to an alteration of the work-hours, which would do away with about half an hour's artificial lighting; but, instead of complying, they left the yard en masse.

ACCIDENTS.

London.—On the 26th ult., William Peace, bricklayer, was killed by falling from a scaffold in King-street, Southwark. Deceased was standing upon the wall of a house which was in course of rebuilding. A scaffold had been erected in front of the wall by means of bolts driven into it, to which brackets were fastened, the men working on hoards laid along the latter. Scaffold-poles were thus done away with, but there were no ropes provided to prevent a man from falling over should he miss his footing. Deceased fell a distance of 30 ft., and expired almost immediately from fracture of the skull. The jury, in returning a recommendation to the effect that steps should be taken to make the scaffold safer, and that on all such structures in future there should be some extra protection for the safety of the men.

Vienna.—A telegram from Vienna says the landing and adjoining wall of the fourth story of an unfinished house (3, Shottening) have given way, and large portions of the staircase were demolished. Many workmen and women were buried beneath the ruins. Several were killed, and eight were severely, and others slightly, injured.

Louisville (Kentucky).—A fatal accident has occurred at Louisville, Kentucky, involving the death of six persons. A new house being erected on Market-street, between Third and Fourth streets, four stories high, fell, crushing in the rear part of the two houses adjoining. The family of Mr. H. Nattes, a merchant tailor, consisting of himself, wife, and five children, and a journeyman named Lewis Johns, were buried in the ruins, and all killed. It is reported that the walls were put up too quickly before the mortar was well set.

OUTBREAK OF TYPHOID OR GASTRIC FEVER IN LANCASHIRE.

At Wesham, a village adjoining Kirkham, near Preston, there is at present an outbreak of typhoid or gastric fever, which has in two instances ended fatally, and which causes alarm amongst the inhabitants of that and the neighbouring villages. Mr. Tyndal, police superintendent for that and the Blackpool district, at the earnest request of some of those interested, examined the district, and found that the sewage at the lower part of the village was frequently hauled up the drains into the cellars of the dwelling-houses. Some of the ashpits were overflowing, and the back yards of most of the houses, which are very small, he found in a very filthy state; many of them containing one or

more piggeries close to the back doors of the dwelling-houses, and the manure from the piggeries remaining in the yards. He likewise found that there was a midden in the village near the public street, composed of garbage from slaughter-houses, which was highly offensive and injurious. Mr. Tyndal wrote a statement of the facts to the guardians of the Fylde Union, who are the sanitary authority for Westham, but they had not appointed their officers, in consequence of their awaiting further instructions from the Local Government Board. Mr. Noblet, at a meeting of the guardians, said that at Fleetwood they were awaiting the like instructions before they appointed their officers: the same at Blackpool and Lytham. The Rev. G. R. Brown said that something must be done at once, or the results might be very disastrous. The guardians were unanimously of opinion that immediate action should be taken in the matter. Mr. Birley moved, and it was unanimously carried, that Dr. Shawe and the surveyor of the Kirkham Board of Health should at once make a report, and that a committee appointed by the guardians should immediately on the reception of the report take such steps as were considered necessary for stopping the progress of the disease.

NEW CHURCH AT SOUTHGATE.

THE rapid development of the neighbourhood of Woodgreen (says the *London Daily Chronicle*) has called into existence religious and educational wants which are being principally met by local effort. A few months only have elapsed since the foundation-stone of a new school was laid in the district, and now on a piece of land closely adjoining, the corner-stone of a new church has been laid by Mrs. Harvey Lewis. The site, which was presented by Alderman Sidney, is on the Boves Manor Estate, Southgate, and immediately adjoins a road on which a number of detached villas have already been erected, and where building operations of an extensive character have been commenced. The church, which has been designed by Sir Gilbert Scott, R.A., will be built of Ancaster stone, with Bath stone dressings. Its length will be 10½ ft., its breadth 54 ft., and its height about 50 ft., and it is intended to accommodate altogether about 600 persons at one time. A bell-turret, 70 ft. in height, will be attached to the church, and immediately adjoining it a paragon will be erected. The builder is Mr. C. N. Foster, of Whitefriars, and he had already advanced the work considerably before the ceremony took place. Alderman Sidney, besides the site, has given 1,000*l.* to the endowment fund, and 2,000*l.* to the building fund; the Bishop of London Fund, 500*l.*; and the architect, 21*l.*

Sir Gilbert Scott was called upon to speak at the laying of the stone, and was warmly received, but assured his hearers that making speeches was not a part of his profession. All the thanks that are due, he said, are from me to Alderman Sidney, first for doing me the honour to place this work in my hands, and next for inviting me to attend this ceremony. I must disclaim having rendered any help to Mrs. Harvey Lewis; and if she was for a moment a pupil of mine I never met with one who was more apt. With reference to my having undertaken this work, it is an honour to any architect to be concerned in building a house of God, and I rejoice that I have designed many, but I only wish there were more of them than there are.

SCHOOLS OF ART AND OF SCIENCE.

Lewes.—There has been a large assembly of ladies and gentlemen—the former largely predominating,—in the County Hall to witness the distribution, by the Earl of Chichester, the Lord Lieutenant of the County, of the prizes and certificates gained during the year by the students of the Lewes School of Science and Art. The general report stated that the results of the examination in April last had been most satisfactory. In the second grade examination in free-hand drawing, five students had obtained prizes, their work being described as "excellent," and twelve passed. In model drawing, four had obtained prizes, and four had passed. In geometry, one had obtained a prize, and two had passed. In perspective, one had obtained a prize, and one had passed. Full certificates had also been awarded to Miss Bacon, Miss Colgate, and Miss Davey, for having passed in the four

subjects already named. In drawing of the third grade, prizes had been awarded to the students, and one student (Miss Turner) had been so successful in the national competition as to be the winner of the Queen's Prize. The report expressed regret at the resignation of Mr. Fisher, who had contributed so greatly to the prosperity of the school; he had, however, been worthily succeeded by Mr. T. W. H. Robinson. In conclusion, the report spoke of the desirability of building a new school. Towards that object, 500*l.* had been raised, and an appeal was now ready for circulation, inviting contributions for a further sum of 500*l.*, without which it would be impossible to build a school well adapted in every respect for the important educational work it was designed to carry on.

Saltire.—The distribution of the prizes of the art and science classes of the Saltire Club and Institute was made on Thursday in last week, Mr. Edward Salt, the president of the institute, occupying the chair, and Mrs. Edward Salt giving the prizes. There was a large gathering of the members and their friends. Mr. G. Morrell, the hon. secretary, presented a report, showing encouraging results; and then the speakers—Mr. Swire Smith and Mr. Frank Carzon, who had been invited to address the meeting—spoke of the value of art as an educator, and of the importance of the working man seizing the opportunities offered him. The institute has cost about 25,000*l.*—banks to the Salt family; and for the completeness of its appointments, and the artistic character of its elaborate decorations, is worth the visit of any lover of education.

Grimsbury.—The Hall of Science Company have accepted the tenders of Mr. John Surflet and Messrs. Coulson & Heywood, for the erection of their new building in Freeman-street. The amounts are 728*l.* 18*s.* and 347*l.* The hall will have a frontage of 40 ft., and will be 90 ft. deep. There will be two small rooms in the front, a large lecture-hall and two sitting-rooms at the back. The building has been designed by Mr. David Pick. It is to be completed by the 6th of April next.

A WHISPER FROM WINCHESTER.

Sir,—Now that the work of restoration among buildings similar to myself is being so liberally carried on, cannot something also be done for me? There is still too much paint and white-wash about me, with which Goths have disfigured me, to my great discomfort: the stone on my exterior needs a great deal of renewal, and cracks are appearing in some parts of my walls. My magnificent altar-screen sadly wants figures to fill its vacant tabernacles; the glazing of my windows might be improved upon, and I dare say there are other fanits in me, which Sir Gilbert Scott would gladly see corrected. I feel sure I shall meet with sympathy at the hands of the readers of your paper, and if those who do not know me will come and look at my nave, my choir-stalls and my chanceries, they will not consider me undeserving of such restoration as may be thought desirable.

WINCHESTER CATHEDRAL.

SOIRÉE OF THE WHITBY INSTITUTE.

THE *soirée* of the "Whitby Institute of Popular Literature, Science, and Art" has been held in St. Hilda's Hall, Whitby, under favouring circumstances, and with unabated vitality. Amid many vicissitudes this Institute has steadily persevered in its course. It is now in a more healthy and prosperous state than it was a few years ago, and it has the promise and the earnest of future success. The active secretaries, Messrs. Harrison & Tinley, and the *soirée* committee, were enabled, by the kindness of many supporters, to make excellent preparations for the re-union.

After the *soirée*, a public meeting for the distribution of prizes was held in the hall, which was crowded. The chairman (the Rev. J. B. Brodrick) said that the last year might not have been very eventful, but still it had been a period of decided progress. They had increased both their numbers and their means. They had found, as they had always found, that their greatest means of usefulness consisted in their library and classes. They had received fresh subscriptions for the one and fresh pupils in the other. It was a gratifying fact that some of their pupils had obtained prizes and certificates from the Society of Arts in connexion with the

Museum at Kensington, which it was his pleasing duty to distribute a few weeks ago. He hoped that the prizes then to be distributed would be incentives to further exertion.

The Chairman, after his address, distributed the prizes to the most successful pupils in the drawing and general instruction classes.

Mr. C. M. Palmer, Lord W. Phipps, and other gentlemen afterwards addressed the meeting. Mr. Palmer said he thought that hall was not capacious enough to be worthy of the annual meeting of such an institute, and he fancied they required to raise a larger institute, more in accordance with their wants. He then humorously advised them to get a capitalist to lay the foundation-stone of such a structure. He did not know a town where a large institute would be of greater advantage, because they were largely dependent on the finest description of art manufacture.

Of the celebrated Whitby jet, as an art manufacture, we some time since gave a pretty full account in the *Builder*.

COTTAGE HOSPITAL, HARROW-ON-THE-HILL.

A subscription having been raised at Harrow to provide for the town a cottage hospital, Mr. Charles Leaf kindly forwarded the scheme by presenting the necessary plan; and Messrs. George & Vaughan, of Argyll-street, were appointed architects.

The building just completed is on the Roxeth-road, and whilst at a convenient distance from the town, is yet in the country, and being opposite the school cricket-ground, amusement will be afforded to the convalescents.

The entrance is beneath a covered carriage-porch, and from its lobby access is obtained to the dispensary for out-patients without entering the building.

A well-ventilated hall and staircase occupy the centre of the hospital, and on the ground-floor are two wards and a sitting-room for convalescents; the latter, through French casements, opening into an oak verandah or porch provided with seats. This gives shelter in the front garden for a poor man to smoke a pipe on a warm day.

At the back of the hall are the kitchen-offices and the dispensary, and beyond the latter is the operating-room, lighted mainly by a skylight, and having a door into the yard. A special ward is attached to this room for severe cases that may require absolute quiet. Beyond this yard is the dead house, well lighted for *post-mortem* examinations.

The first floor contains three wards, nurse's room, bath-room, &c., rendered light and cheerful by ample window space.

The usual number of beds in the five wards will be nine, besides the additional bed in the special ward.

The roof provides a large spare room, readily convertible into a ward in the event of any infection breaking out.

There is no papering in any of the rooms, and in order to prevent the accumulation of cobwebs or dust, the internal angles of the walls in the wards are splayed.

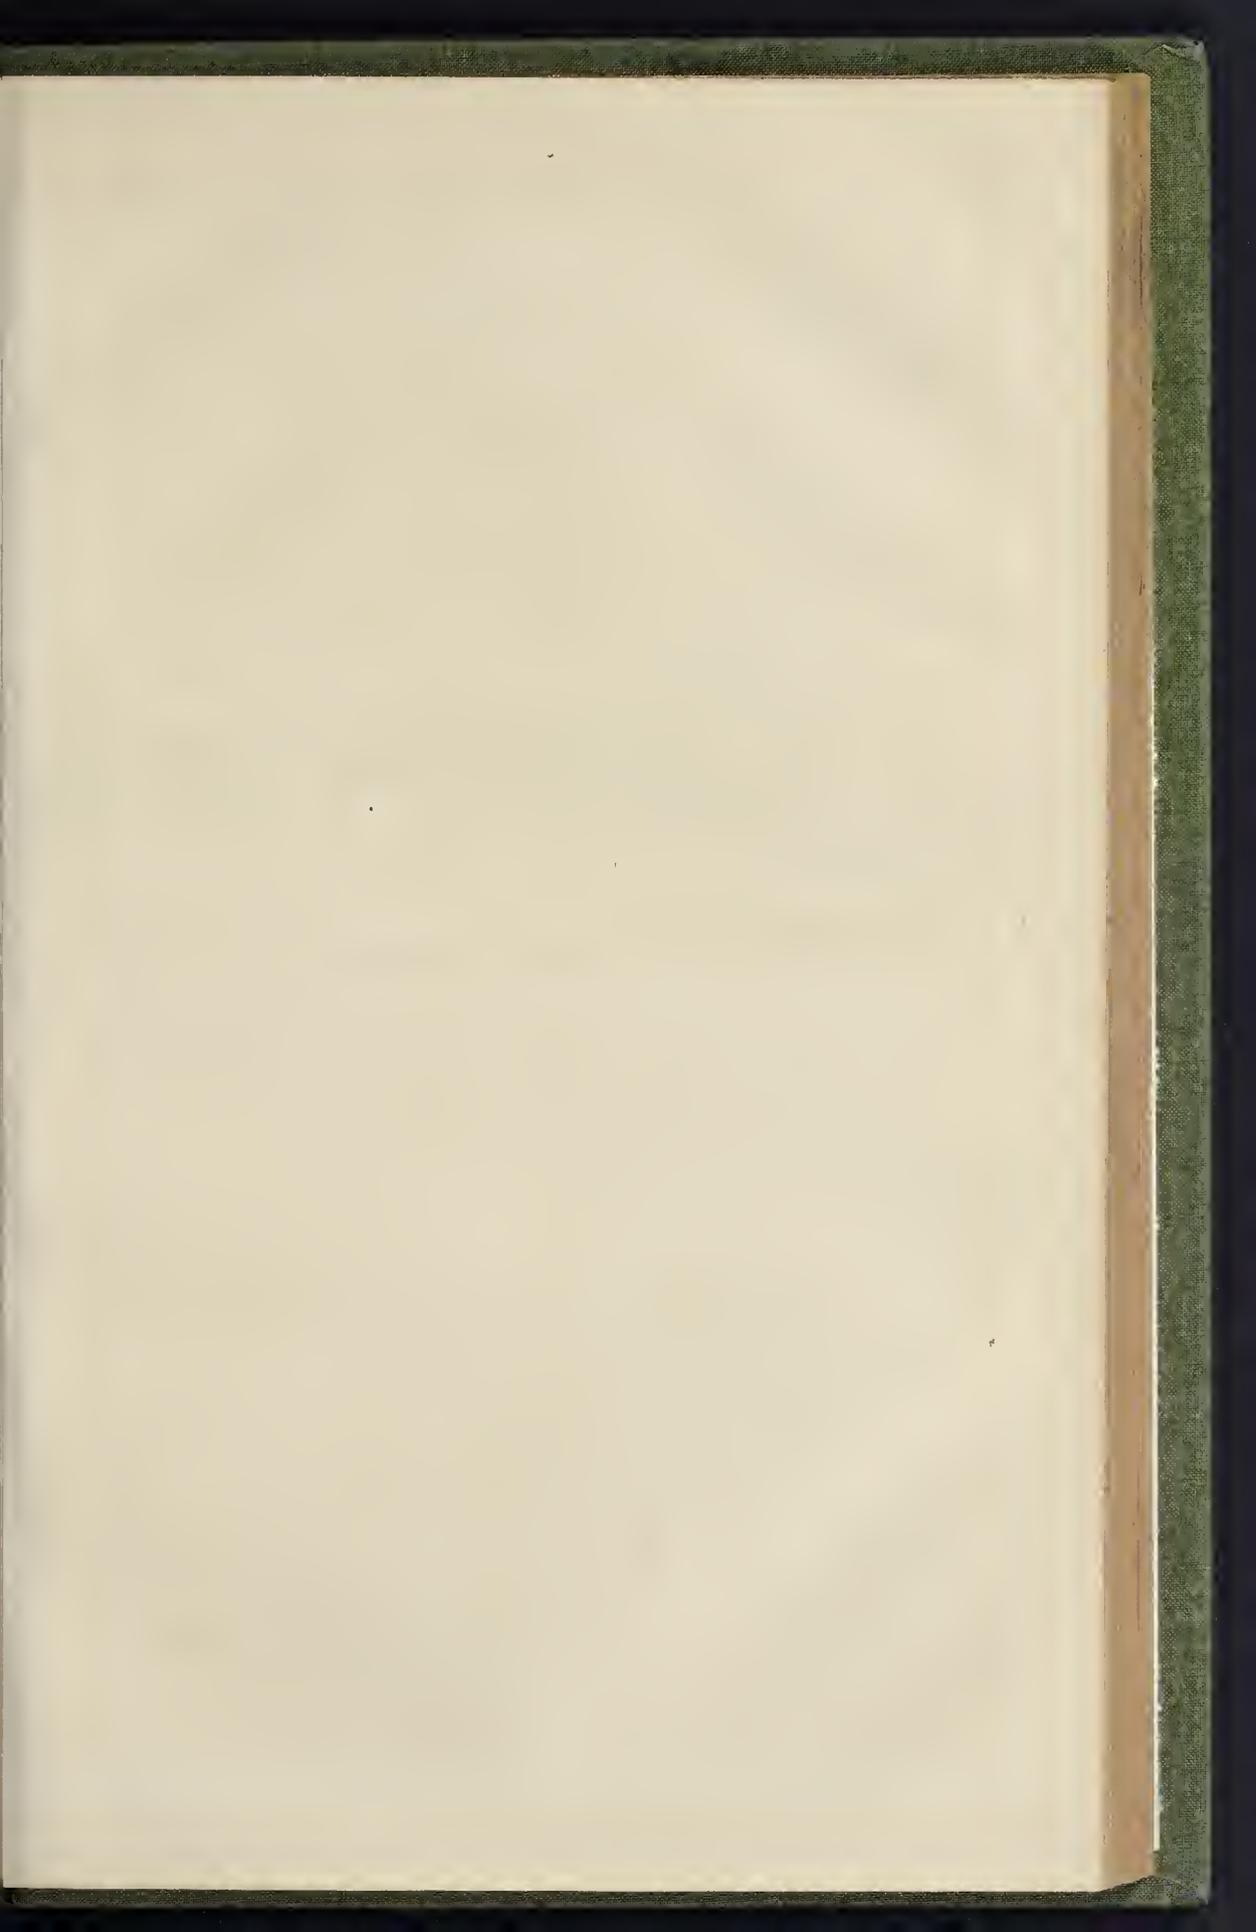

The ground-floor externally is of brickwork, with Bath-stone window dressings, while the upper story is weather-tiled, thus having a homely and countifed appearance. To prevent future outlay in paint, all the external woodwork is of oak; the window casements are of iron.

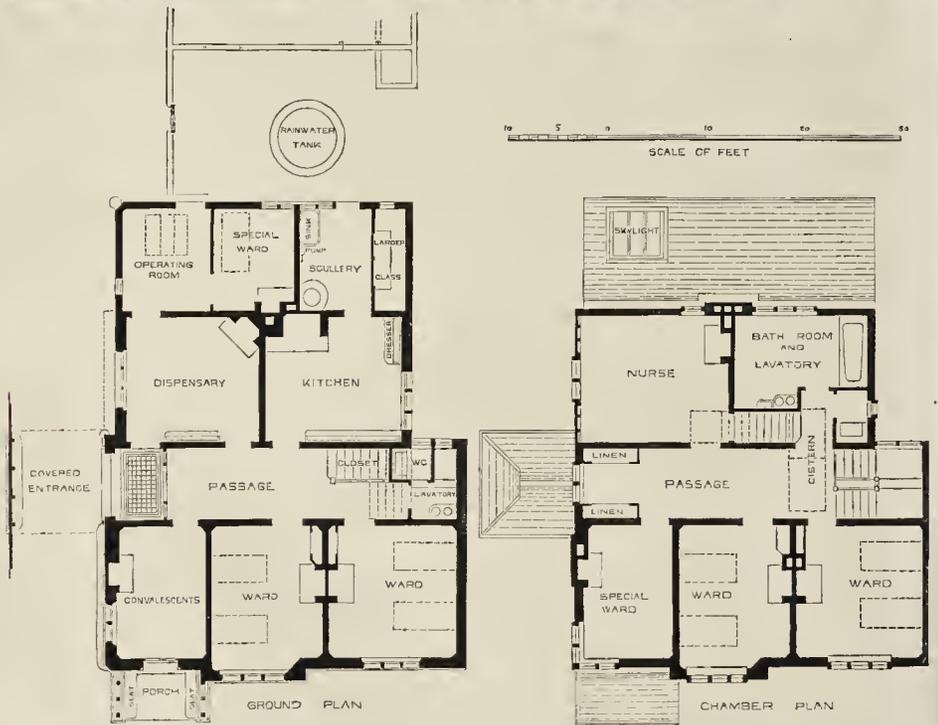

For ventilation of the wards there are large-hinged fanlights over the door opening to the passages, in which it is supposed there will always be a free circulation of air. This arrangement, though good in one respect, is questionable in another.

The builder is Mr. Lander, of Harrow, who has executed the work at a cost of about 1,500*l.*

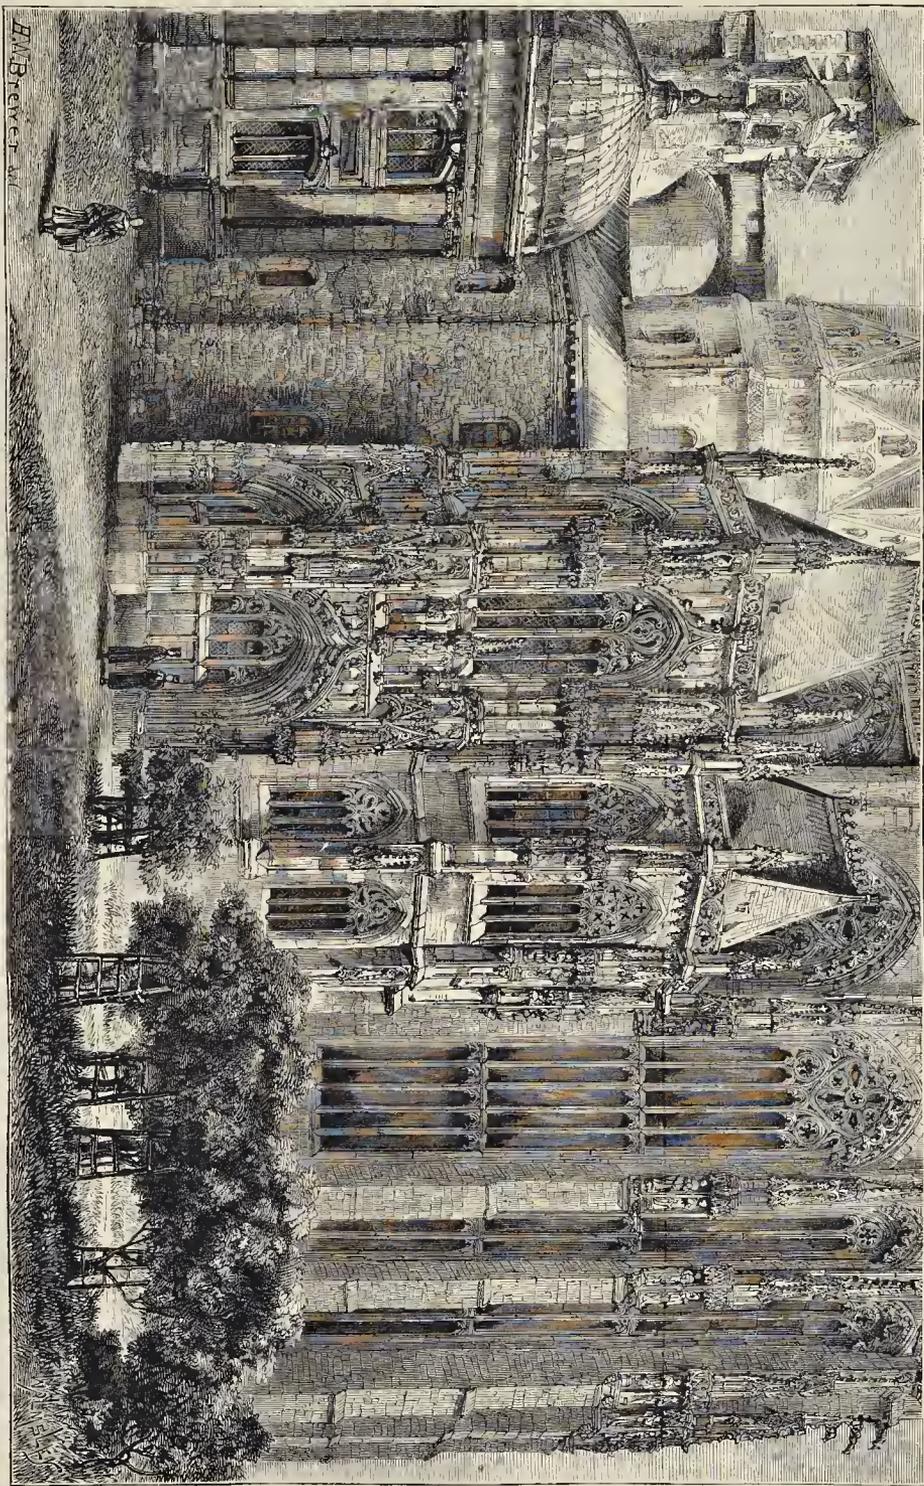

Harrow has for some time endeavoured to carry on the work of the hospital in a hired cottage, and we are glad to see that a convenient and pleasing building has now been erected with all the necessary appliances.

The institution of the Cottage Hospital, which we early urged and aided, cannot be too greatly valued; and we trust that, before long, a hospital will be found in each of our country towns, so impossible is it for the poor to have proper care and quiet in their own too frequently overcrowded and ill-arranged rooms. Payment, however small, should be required from the patients.

COTTAGE HOSPITAL: HARROW-ON-THE-HILL, MIDDLESEX.—MESSES. GEORGE & VAUGHAN, ARCHITECTS.

THE CATHEDRAL OF AIX-LA-CHAPELLE.

THE MINSTER OF AIX-LA-CHAPELLE.

The minster of Aix-la-Chapelle is celebrated including the most ancient of all the circular polygonal churches north of the Alps. Erected between the years 796 and 804, the nave or central portion of the building has preserved its original character, and when its mosaics have been restored (a work now in course of operation) under the direction of Monsieur Dehance, will give us a better notion of the general appearance of a Byzantine church than any other building in Europe, except only the churches of St. Mark at Venice and St. Vitale at Ravenna. It is not, however, of this more ancient portion the church at Aachen that we wish now to speak, but rather of the additions which it received during the thirteenth, fourteenth, and fifteenth centuries. These additions consist of a large nave-hall or narthex, erected in the thirteenth century, with a square tower above it. This tower was evidently intended to have been carried up considerably higher than it is at present, and probably capped by a spire or lantern. The great peculiarity of this tower is the fact that it is flanked by a semi-octagonal section on its north and south sides. Each of these terminates in a graceful apsidal chapel, retaining its original altar. It is singular to find chapels in this position, nearly 100 ft. above the floor of the church. These chapels are approached by an open gallery, which surrounds the four sides of the square tower, and also by a bridge, connecting the square tower with the upper portion of the dome above the vaulting. One of these singular little chapels and its connecting bridge are shown in our view. Beside two chapels are now in a sadly ruinous condition, but they are about to be restored from designs of Herr Becker, who has shown his ability and painstaking in his restoration of the eastern portions of the cathedral. The next, in point of date, and by far the most important addition to this church, is its noble choir, which commenced in the year 1353. It is one of the boldest and most daring works of the Middle Ages; in fact, had not its architect attempted outside all other works of the kind, he would have succeeded in producing a more pleasing and more secure building. As it is, the iron ties in the vaulting, and one or two settlements, show that he was more bold than wise in attempting to suspend a stone vault in the air. This noble choir is about 120 ft. long, of the same height to the crown of the vaultings as of the richest and most elegant decorated series of very fine staves. The thirteen great piers (each nearly 90 ft. long) are filled with terra glass, of good design, but crude and shabby in colour. A new bishop's throne, and a splendid altar-carpet, the latter from the designs of Herr Kleinertz, the decorator of St. Maria-in-Archie, at Cologne, are worthy of notice, as also some old pictures attached to the west end of the choir stalls.

The two apsidal chapels shown in our view probably contemporary with the choir. They entered from the circular portion of the choir. Their lower stories form the sacristies, treasury of the cathedral, and their upper portions are chapels, which are approached from the triforium or gallery of Charlemagne's church. They will be seen from our drawing, one of these chapels has rather an earlier appearance than the other, but, in all probability their erection nearly contemporaneous. These two chapels have been judiciously restored.

On the north side of the cathedral, close to the western extremity, and opening into the side of the polygonal nave, is a very large chapel, with aisles to the east and west. The plan of this part of the building is early Flamboyant, and is probably a work of the fifteenth century. The great window in the gable-end of this chapel is another apsidal chapel, which is similar to those shown in our drawing, and which of great beauty, a portion of which has been screened off, and serves as a chantry-chapel. The plan of this great transept are the same as those of the building connected with them. This was probably the chapter-house. There is also a porch of great beauty. Near to the west end of the cathedral is a small isolated chapel, which originally served as the baptistery to the cathedral. It is very much modernised, but beautiful panelling is still to be seen on the northern side.

The treasury of this cathedral is the richest in Europe, but its wonderful treasures have been so ably described by Canon Bock that we shall not attempt even to give a list of them. The presses which contain these marvellous examples of ancient church-plate are themselves well worthy of notice. They consist of three huge cupboards, each with two large folding-doors, and these doors are decorated both internally and externally with oil-paintings of great beauty, executed by an artist of the latter part of the fifteenth century. The great corona, the bronze railings round the triforium, and the bronze doors (which are evidently coeval with the building), are all worthy of careful examination. In fact, Europe possesses few more interesting churches than the Cathedral of Aix-la-Chapelle.

"THE MATERIALS OF THE ARCHITECT."

SIR,—I have read with some interest your able article under the above heading, in your last number, and agree with the major part of it. As regards the evidence of the Fire Brigade (London, I presume), that neither stone nor iron can be relied on when exposed to great heat, the question arises, what kind of material generally used in the building trade will stand the greatest heat. I believe the carboniferous rocks of Derbyshire, Staffordshire, and Yorkshire will resist fire better than either iron, brick, terracotta, artificial stone, or any other kind of stone generally used in the building trade; and if your space permitted, I would give you numbers of instances, but will confine my proof to two, where the heat was most intense, viz., the Midland cheese warehouses at Derby, and the old Soke Mills, on Wakefield Bridge, a few months back. The heat of the latter was so great that the iron ran down like water, and some of the stone was "red-hot,"—in fact, so hot, that some of it was changed from its natural white colour to that of the red Nottinghamshire stone, or similar to stone taken from the walls of a furnace. Nevertheless, but little of the stone had to be taken down for the rebuilding of the mills. Your following paragraph is so good that it will bear repeating, and ought, in my humble opinion, to be on the desk of every young architect; for it is rather his province than the builder's to be acquainted with the nature and properties of stone: "Actual experience of the power of any particular stratum of stone to resist atmospheric influence can alone assure the builder that he is working securely for the future."*

STEPHEN SEAL.

SIR,—I should like some additional evidence that, as stated in your article, headed "The Materials of the Architect,"—"hoop-iron bond built in, in mortar, is invariably an agent of destruction. I should like to hear the experiences of some of your readers on this matter before I commit the statement to my note-book as a fact.

R. L.

NEW WINDOW IN CHESTER CATHEDRAL.

The stonework of the east window of the chapter-house of this cathedral has at last been restored, and has been filled with stained glass to the memory of the late Dean Anson.

There are horizontal rows of subjects across the window, and these subjects illustrate the founding of the Abbey (of which the cathedral is part), its sustentation, and its dissolution; the last subject relates to the restoration of the chapter-house, in which there is a good likeness of the dean.

The first row at the top of the window relates to the life of Saint Werburgh, daughter of Walfines, king of the Mercians.

Next in order come a row of figures, all benefactors to the abbey, and some of them benefactors also to the town of Chester. First is Queen Ethelfreda, or Alfreda, daughter of Alfred the Great, and wife of Ethelred, Earl of Mercia. She was a woman of superior mind, and not only endowed the abbey, but in A.D. 907 liberally restored the walls of Chester after they had been destroyed by the Danes. King Edmund; King Edgar, who in A.D. 971 made Chester a station for the Saxons navy; Earl Leofric, who was appointed Earl of Chester by Canute; Hugh Lupus, the first Norman Earl of Chester (he brought from Normandy, in Normandy, a body of Benedictine monks, and at the instigation of

Anselm, afterwards Archbishop of Canterbury, richly endowed the abbey); King Athelstane; Earl Ranulph, to whom is due the honour of building the chapter-house; and King Henry VIII. follow.

Under the figures of these benefactors are five subjects, including the most striking events in the history of the monastery.

On the griaillie groundwork of the window are a number of shields, the most prominent position being given to those of King Henry VIII., Dr. Jacobson, and the late dean. The dean's arms are placed between the obverse and reverse of the corporate seal of Chester. The other armshere those of the city of Chester; the see of Chester, the ancient arms of Chester, Queen Ethelfreda, Hugh Lupus, Earl Ranulph, Dean Arderne, Dean Copleston, Dean Phillipois, and Dean Davis.

The window is very light in tone, made so that it should not overpower the interior of the chapter-house.

It was designed and executed by Messrs. Heaton, Butler, & Bayne, of London, under the superintendence of the Rev. Canon Blomfield.

BLOCKING UP THE EMBANKMENT.

SIR,—Allow me again to call attention (to what appears to me a stultification of all our efforts in making and paying for the Thames Embankment. At the Westminster Bridge terminus the St. Stephen's club is laying down the foundation for a structure that, when finished, will hide the clock tower basement from the view on the one side, and a view of the Embankment until you are upon it on the other side. It is making a splendid avenue, and then shutting the door to prevent your looking at it. Of course they have law on their side, but surely some step should be taken to alter the law, and save a great work from being a great failure. We have pulled down a street to open a view, and we are now allowing the space to be rebuilt upon.

COMMON SENSE.

PAYMENT OF ARCHITECTS.

SIR,—An architect complains that the old scale of 5 per cent. will not now remunerate him for the same services for which it was formerly a sufficient charge.

"Stentor" says he has been twenty-five years in practice. We must presume he has been engaged on the ornamental department of his profession, not in the financial, or he would better appreciate the difference between 5 per cent. on the old prices and 5 per cent. on the current rates of wages and building materials.

The fact is, an architect's remuneration is increased to the full as much as the rise in general commodities. AN ENGINEER.*

TUMBLE-DOWN HOUSES.

SIR,—I have had occasion, in times past, to call your attention to the "scamp-work" of London and the "jerry-work" of Liverpool, and to invite your condemnation thereof. To-day I have to do the same for Manchester.

One side of Lowcock-street, Lower Broughton, is being formed of some nineteen cottage houses, now in course of erection. These are being built in the usual "bandbox" style of the locality,—front and back rooms on the ground floor, front and back rooms on the first floor, with the addition behind of a small washhouse, with room over the same. The fronts of the houses are built of pressed brick, 9-in. wall, Flemish bond, the headers all broken, to make two, and be economical; and as our friends, the brickmakers, will persist in making pressed bricks much thicker than ordinary common bricks, the party-walls which are of 4½-in. work only, get no bond whatever throughout the whole height of the front,—simply a straight butt-joint, held together by the mortar, which is a fine, soft sand, entirely innocent of lime. Still, they held up together, and the front and back walls were complete, and the chimneys of the last half-dozen cottages were being built, on the morning of Friday, the 25th ult. On that day, and for many previous, we had much rain; and as the last straw broke the back of the camel, so the last storm broke the cohesion of the mortar—"Heaven save the mark!"—and down the whole came in one general collapse. The fronts of five houses fell into the street, and the party-walls, with their chimneys,

* See p. 836, ante.

* Nine other letters to same effect received.

flooring-joists, scaffolding, and workmen, came in one general ruin to the ground. By great good fortune no one was actually killed; but several, I hear, have received very serious injuries, and will be long before they recover. The builder, however, is nothing daunted, but, taking heart of grace, is rebuilding in the same manner, with no bond, but a little lime in his mortar,—hoping, doubtless, that this time, at least, he will succeed in getting his work complete, and drawing his pay before it falls again; but there ought, surely, to be some local authority who should have power to stop or prevent the erection of trashy buildings,—an authority which seems sadly wanting, and one not likely to be instituted so long as local Boards have the power to appoint, the members of the said Boards being often the greatest offenders in that direction.

E. G.

ST. ANDREW'S CHURCH, HOLBORN.

THIS church, after being closed for some months, was reopened for worship on Sunday, October 13th. The ancient tower, which was separated from the nave of the church by a screen-wall, with gallery in front, has been thrown open to the nave by the removal of the wall and gallery. The Gothic arch thus thrown open now unites the nave with the tower.

A ritual chancel has been formed at the east end, the floor-level of which has been raised 2 ft. above the floor-line of the nave, and choir-stalls have been arranged north and south of the same. The old high-backed square pewing has been removed, and substituted by new low oak seating. A new organ has been constructed, which, spanning over the Gothic arch before alluded to, rests upon the galleries on each side. The old windows have been removed, and new iron ones substituted, glazed with tinted cathedral glass. New and powerful sunlights have taken the place of the old gas arrangement, and the church has been heated by a system of hot-water pipes. A new clock, with Westminster chimes, has been erected in the tower.

Besides these structural alterations, the church has undergone a general repair and decoration. The nave ceiling and groined ceilings of galleries are in panels, of a tempered turquoise blue hue as ground colour, with margins in stone and vellum, and the enrichments in white. The hills grounds are filled with a classic diaper, in soft-colouring and white; the walls are a neutral of silver gray. The shafts of columns are finished in Indian red. The chancel ceiling is treated uniformly with that of the nave, with the exception that the enrichments to the panels are gilded.

The oak case of the organ is stained and varnished, and the pipes are artistically treated. The general oak work, including the new seating, has been stained and varnished.

The restoration has been executed from the designs of Mr. S. S. Teulon, architect, under the superintendence of his surveying clerk, Mr. J. Burford. The structural repairs and alterations were done by Messrs. Patman & Fotheringham; the new oak seating by Mr. Chapman, of Hanworth, near Norwich; the tile-work by Mr. McColla, of Parliament-street; and the artistic decoration to both church and organ by Messrs. Phillips & Son, of Baker-street, Portman-square. The organ is by Messrs. Hill, of Camden-town; the new stained-glass window in the tower by Messrs. Heaton, Butler, & Byrne; the new clock by Messrs. Thwaites & Reed, of Clerkenwell; and the glazing by Mr. Odell, of City-road.

THE PARKS.

SIR,—When you can afford the space, will you allow me to say a few words on a subject which has already been touched upon in your columns, and which is so far appropriate to them that it concerns one of the most prominent features of London? Any one returning from abroad,—as we are all doing at this time of the year,—must be struck with the contrast between the perfect order in which the public spaces and gardens are kept there, and the dilapidated state into which, with the exception of certain favoured spots, they are allowed periodically to fall in this country. The blame of this is partly attributable to the people. In France, and in Germany especially, no guards are necessary to preserve the grass from being cut up in every direction. But if the circumstances in our case are not precisely similar, something more might be done than has yet been attempted to keep

our large surfaces of grass in at least a tolerable condition. It seems to have been overlooked that the chief injury is not done by those who saunter in the parks for fresh air, but by the hundreds (perhaps thousands) who pass across them on their way to and from their business. The most direct path will of course be sought by these, and this suggests at once the principle on which the majority of the paths should be laid out. And since the gravel-path will only be used in wet weather, and as a guide, it is clear that to lay it out broader than is necessary (as in the case from the Marble Arch to the Serpentine) is only to extend the surface over which the grass on each side will be cut up. These considerations apply especially to Hyde Park, where, for military reasons, the paths cannot be protected by hurdles. It will be seen, too, even without a plan, that the paths in this park are not laid out in the best way to suit the public convenience. Since they were originally laid out every feature in the neighbourhood, and probably every object in view in designing them have changed. To take another illustration from St. James's Park, the gate opposite the Duke of York's steps, through which a stream passes most of the day, has no direct communication either with the water opposite or with the bridge, and the grass in front of it is consequently always in a disgraced state, in spite of the hurdles or the notice-board. The paths leading from this gate, parallel with the railings, are without beauty and of no particular use, as the paths outside the railings are as direct and shady. In fact, the whole of this part of the park requires relaying out; and as the paths would be short, they need not be necessarily straight. Then, where it is necessary to protect the grass, this can be done only by a better form of hurdle, which cannot be climbed over as easily as the present one. The dividing bars should not run horizontally, but vertically, so as to give no hold to the foot; and if the upper bar formed a curve they would be less easily vaulted over. These are a few suggestions which might be carried out with advantage; and it certainly is not too much to hope that, as there is so much less than usual to be done in the parks this winter, Mr. Ayrton might be persuaded to allow the whole thing to be undertaken for the first time, and perhaps finally, in a thoroughly effectual manner.

LEUT.-COL.

WRECK-CRUISERS IN CONNEXION WITH THE LIFE-BOAT SERVICE.

SIR,—It has occurred to me that wreck-cruisers might be put afloat in connexion with the life-boat service.

The wreck-chart shows the regions where wrecks are most likely to occur.

These wreck-cruisers should be able, furnished with all needful appliances, to keep the sea and watch the dangerous regions in any weather.

There is no doubt that Mr. Thornycroft, C.E., could design and have constructed an iron or steel steam-craft which would live in any sea, and be the means, with a brave and competent crew, not only of rendering invaluable assistance to ships in distress, but of saving hundreds of lives.

W. CAVE THOMAS.

PROPOSED REBUILDING OF ST. GILES'S CHURCH, DURHAM.

A SPECIAL meeting of the Architectural and Archaeological Society of Durham and Northumberland has been held in the vestry of St. Giles's church, Gilesgate, Durham, to consider the best means of preserving the existing historical features of this church, while complying with a desire on the part of the parishioners to enlarge its accommodation to meet the growing wants of the parish. The Rev. Canon Greenwell, who occupied the chair, while disclaiming all intention to meddle with other people's business, held that the church was the property of the Church of England, and of the whole kingdom, to which it was a record of the progress of time. On these and many other grounds their protection was claimed, and it was the duty of that Association to prevent the destruction of such a building. He proposed that Dr. Farrer, Mr. Longstaffe, Mr. Hodson, and Mr. Hodgson Fowler, form a committee to inquire into the subject, and report on what was best for all parties.

Mr. Longstaffe read a paper which he had prepared, descriptive of the church, which was founded on the 3rd June, 1112, by Bishop R. Flambard. The Rev. Mr. Hodson gave a state-

ment of the ancient features of the church, and expressed an opinion that if it were left alone it would last for a thousand years longer.

Mr. C. H. Fowler said that by throwing out an aisle and an arcade of arches on the south side, and moving the door on that part of the building forward, all the ancient character of the building would be preserved and the desired object attained.

The Rev. J. G. Norton, the newly-appointed incumbent of the parish, while expressing his admiration of the exterior, thought the interior most ugly and requiring rebuilding. He required that the church should be fitted with not less than 500 sittings, all of them free to the poor. The body of trustees had passed a vote approving his views, and pledging themselves to carry them out with the money at their command—about 1,700*l.* In conclusion, he said if the views of that meeting harmonized with those of the parish, he would avail himself of their aid. Mr. Le Keux seconded the chairman's motion, which was carried.

WAITING FOR THE INSPECTOR.

I HAVE just re-read your article, "What are we doing for Public Health?" in your number of October 5th, which is very interesting. I would say that the town council of this town (Louth) have invited a Government inspector to visit the town, and report upon the sanitary condition; but six weeks have elapsed, and he has not come. Two visits to the Government authorities have been made by the Government inspectors since the passing of the Public Health Act, 1872. The advice given is to wait for the Government code of regulations before doing anything. The Rural Board in this town has ninety parishes to care for.

W.

QUEENBOROUGH, ISLE OF SHEPPY.

ON Friday last the memorial stone of a public elementary schools was laid by Captain Comyn, the chairman of the Queenborough School Board. The new building stands upon the site of the old national school, and comprises a boys' school for ninety boys, a girls' school with accommodation for sixty girls, a class-room for the joint use of these two schools and also an infants' school for ninety children, the requisite cloak and basket-rooms, lavatories and usual offices. The building is of grey stone relieved with moulded and diaper brickwork, the roof high-pitched and finished with ornamented cresting, and the design generally will be of pleasing and suitable character.

The old most belonging to the ancient case of Queenborough, and which formed the boundary of the narrow strip of ground belonging to the School Board, is also to be filled and levelled, and the land thus reclaimed is to be used for the purposes of separate play-ground. The total cost of the works will amount to about 1,500*l.*; Mr. Naylor, of Rochester, is the contractor for the school-buildings, and Mr. Gamon, of Sittingbourne, for the earthwork and fencing, and the whole is being carried out under the direction of Mr. Benjamin Adkins, of Faversham, the architect to the School Board.

OLD AND NEW STAINED GLASS.

In the *Times* a few days since, Mr. Stuart Moore contributed an account of some interesting respecting the direct evidence afforded by contemporary documents extant amongst the fabric of Exeter Cathedral, as to the date and of the ancient glass lately discovered there. The course of his remarks, which he did not limit to their true value, he stated, with that conspicuous courage peculiar to amateurs revelling in half-understood technicalities, that the windows of the Lady Chapel "had figures under canopies, on fine grisaille grounds," the tracery openings "having pot-metal centres on grisaille grounds." The "grisaille" in question, further told us, was of a character "exquisite light and delicate," although in the same sentence he daringly declared it to be "boldly and richly executed." He further informs us that no case did it—the grisaille—resemble "gorgeously-stained abominations of the modern school of glass-painting."

As an artist, practising "glass-painting," should like to know why the word "grisaille" seems with the amateur so inevitable to produce the emotion which Mrs. Malaprop ascribed to

blesed word, Mesopotamia." If ever a hook
 will be written "on the curiosities of obfusca-
 tion," the chapter on "Grisaille" will be rich
 illustrations. The very ordinary traced
 pattern-work, in brown enamel on white glass,
 their remarkable in design, execution, nor
 ticular in the Exeter work, is, under the
 tion alluded to, declared unhesitatingly to be
 "exquisite," "bold," "rich," "delicate"
 "grisaille." The "grisaille" grounds of the
 "vases" are innocently stated to have "pot-
 tal" centres, as though the "grisaille" was
 necessarily as much of "pot-metal" as any
 "vase" could possibly be.

Then, we are told, *appropos* of the Exeter
 "grisaille," that it did not resemble the "gor-
 geously-stained abominations" of modern times,
 "moderns," in glass-painting as in other
 things, have no doubt much to answer for, just
 also the ancients have,—saying in glassing
 their gain in the effects of time and
 tation; but why the moral of grisaille should
 pointed by the disparagement of "gorgeously-
 stained effects," seeing that the noblest glories
 "stained windows" have resulted, not from
 "stained," but from the "gorgeously-stained"
 t works of Canterbury, Sarasbourg, Char-
 Milan, Florence, and Pisa, is a problem
 which only the amateur, soaring above the
 es of technical consistency, can solve.

EXPERIENTIA.

COMPETITION.

At a meeting of the River (Dover) School
 held on the 25th of October, it was re-
 solved to adopt the plans of Mr. J. Edwin
 son, architect, for the proposed schools.
 There were only three competitors.

THE RIVAL CARPENTERS' SOCIETIES.

The long-standing dispute between the London
 Manchester sections of the Amalgamated
 Society of Carpenters and Joiners, which affected
 interests of some 13,000 members and funds
 to the amount of about 20,000*l.*, has been brought
 to a satisfactory termination. After certain
 proceedings, the following were appointed arbi-
 trators:—Mr. John Kane, secretary to the Iron-
 ers' Society, Dartington; Mr. D. Guillo,
 secretary to the Ironfounders' Society, London;
 Robert Anstie, secretary to the Engineers' So-
 ciety, Manchester; Mr. W. Hicking, of the
 Iron Union of Carpenters, Nottingham; and
 George Odger, London. These have been
 sitting at the Bell, Old Bailey, for the last eight
 days.

The unanimous award of the arbitrators
 that the title of Amalgamated Society of
 Carpenters and Joiners should be conferred upon
 Manchester section, and that the locked-up
 fund be of two branches, Hoxton and Poplar,—
 should be equally divided between the two
 sections. The arbitrators passed a resolution
 strongly urging both parties to re-unite.

THE "ANGEL" IMPROVEMENTS,
CLERKENWELL.

Attention having been drawn to a paragraph under
 the heading in your issue of the 10th inst., I shall
 be obliged by your permitting me to correct one or two
 inaccuracies.

The meaning of the resolution adopted by the
 Metropolitan Board of Works (of deferring the con-
 sideration of the subject till next July) is simply that
 the Board will undertake to pay the cost, and then
 probably the superior Board will be required to
 be treated with them, as the gain is wholly on one
 side.

The difficulty of the passing traffic is by no
 means insuperable; for, if the tramway cars and om-
 nibuses are ordered to draw in beyond the narrow neck
 of which does not extend more than 25 ft., no incon-
 venience will be felt, as the road suddenly widens, &c.
 The committee of the Board of Works concurred in
 the opinion that a wider thoroughfare at that particular
 point was desirable, but it was so limited in extent,
 and profits to be derived from it being especially confined
 to the area they could not see their way to recommend
 it to be included in the list of Metropolitan Improve-
 ments.

The Vestry of Islington opposed the improve-
 ment as being a metropolitan one, and refused to con-
 tribute towards it if adopted on payment of half the cost,
 on the ground that by the judicious arrangements of the
 two as the passenger traffic could be so diverted as to
 be of delay in the transit of goods. Additional space
 given at that point by the removal of the Angel
 in a clock in course of next week, the Vestry of
 Islington has ordered that it be taken away forthwith
 that every available inch of ground may be devoted
 to it. It may be urged, however, that this is a refuge
 amidst of a crowded thoroughfare.

It is to be said that the buildings proposed to be removed,
 necessary for widening the thoroughfare, comprise
 2, St. John-street-road, and Nos. 355, 357, and 359,
 and the way in which you will see constitute more than
 100 ft. in extent.

The thoroughfare being not within, but on the outskirts

of the parish—one side of the road being Islington and the
 other Clerkenwell—it is scarcely likely that the latter
 would ever feel itself called upon to contribute half the
 cost if carried out, it being not a question of the improve-
 ment of the parish in any way, but purely and simply
 a question of providing for the public traffic. Even could
 it be deemed a local question only, the adjoining parish
 should be more interested in the matter than Clerkenwell,
 the improvement being rendered necessary, "mainly," as
 you say, "by the rapid growth of Islington."

If the improvement involved the removal of inferior,
 and the substitution of superior property, there would be
 some reason for thinking that Clerkenwell might be ben-
 efit; but as the present property is some of the best in
 the parish, it is doubtful whether we should not "gain
 a loss" by its removal. It is therefore obvious that the
 gain would not be "wholly on one side," and that "the
 benefits to be derived from it" would not be "especially
 confined to one parish."

Islington does not oppose the scheme upon its merits.
 They opposed the Street Improvements Bill, not upon its
 merits, but upon the question of how the necessary funds
 were to be raised, having in view some possible legislation
 upon local taxation; and therefore they felt bound, for
 consistency's sake, to oppose this upon the same grounds,
 though, doubtless, object to pay half the costs, as a
 local improvement, on the same grounds as Clerkenwell,
 viz., that they would not be pecuniarily benefited.

If the removal of the Angel, as proposed, is not
 for the purpose of adding to the space for traffic, but for
 the purpose of placing a lamp on the site, so as to afford
 more light and space as a refuge in this overcrowded and
 dangerous thoroughfare, I would not think that about 3,000
 vehicles pass each way through this narrow gorge daily
 according to police returns obtained in June last, and that
 the tramway traffic especially has considerably increased
 since then, I think you will agree, that though small in
 extent, there is scarcely an improvement more urgently
 required in the metropolis, as regards facilities for the
 public traffic.

ROBERT PAGE, Vestry Clerk.

TEMPLE BAR: PAST AND PASSING.

WARWORN Keep and Civic Warder,
 Arch against the City's border;
 London Wall and Roman gateway,
 Bridging o'er old Britain's great-way;
 Portal through which armed legions
 Passed to subjugate foreign regions;
 Phoenix pile, amidst many crèches,
 Rising from the City's ashes:
 Lasting on through years, the wonder
 Of all men who pass you under
 Praised, yet doom'd for being a scandal,
 By the great improving Vandal:
 For Temple-Bar, grim progress marches,
 To crush you, 'neath the Court of Arches. C. H. C.

IMPORTANT TO BUILDERS FORWARDING
MATERIALS AND WORKMEN'S TOOLS
BY RAILWAY.

An action was brought in Uxbridge County Court
 (Tuesday), by the Great Western Railway
 Company, by Mr. James Hickman, the younger, a painter
 and decorator, carrying on business at Uxbridge to re-
 cover the sum of 3*l.* for loss sustained by the delay in
 delivery of workmen's tools and decorating materials,
 entrusted to the Great Western Railway Company for
 delivery, as common carriers. It appeared that as far
 back as July 26th the plaintiff went to the Uxbridge Station
 on the Great Western line, and delivered a bag contain-
 ing 10 lb. of plaster of Paris, whitening, and several dis-
 temper brushes, addressed to himself at Londwater, to be
 left till called for, when it would be taken on to where
 the plaintiff and his men had a job.

He was informed by the railway officials at Uxbridge
 that the materials would either reach Londwater that
 night, or very early the following morning, which was on
 a Tuesday. The bag did not arrive that day, nor until
 Friday, during which time the plaintiff and his two men
 were kept idle at Londwater, expecting it by every train
 from Uxbridge. The consequence of this annoying and
 injurious delay was, both master and men being unable
 to proceed with their work, much to the annoyance of the
 parties employing them. The plaintiff was unable to get
 the tools and materials necessary at his job at Londwater,
 wishing to be particular, as the work would undergo
 a surveyor's inspection, the plaintiff purchased new brushes
 of the very best description, which cost 6*s.* 6*d.* each. He
 also had to pay his men the same wage as though they
 were at work, and he claimed for his own loss of time.

The company did not deny the neglect and delay, but
 objected to the amount of the claim. The judge, Mr. J.
 Whigham, in giving judgment, said the case was no doubt
 one of great importance to master builders, and also to
 workmen, who depended upon railway companies to
 forward materials and tools. It was also evident that
 railway companies were frequently made the object of
 actions by persons who entered the belief that the
 companies would be no losers by any amount of claim
 made against them; but that was quite an erroneous
 impression. He held that if a common carrier between
 Uxbridge and Londwater had undertaken to take these
 goods and had left them at a roadside inn, he would have
 been liable; and that a railway company was in a like case,
 and were bound to make compensation for the delay.

It, however, appeared to his view that the actual loss
 incurred was 1*l.* 10*s.* 3*d.*, and he should therefore make an
 order for payment of that amount with costs.

St. Andrew's Church, Lambeth.—This
 church has undergone a general renovation and
 cleansing. The organ has been removed from
 the gallery at the west end, and placed adjoining
 the chancel. The woodwork has been restored
 and varnished, the ceilings are treated in a
 pearl-grey, and the "Tables" written in gold
 text upon a deep blue ground. The several
 works have been executed by Messrs. W. Phillips
 & Son, under the direction of Mr. S. S. Teulon,
 architect.

PUBLIC BATHS FOR HANLEY.

THE foundation-stone of the public baths to be
 erected in Lichfield-street, Hanley, has been laid.
 The design of Mr. R. Dain, architect, Burslem
 and Hanley, for the erection of the building, was
 selected at the beginning of the year. The
 design is not at present to be carried out in its
 entirety; but sufficient will be done under the
 contract entered into with Mr. Matthews, of
 Hanley, builder, and Mr. Bickley, engineer, to
 provide accommodation for both male and female
 bathers which may be extended at any future
 time. The ground to be covered will be to the
 extent of 10,264 superficial feet. The building
 will be one story in height, except the central
 block facing Lichfield-street, which will be two
 and three stories. Provision is made for two
 swimming-baths, 55 ft. by 29 ft., one Turkish
 bath, and twelve private baths for males. One
 swimming-bath, 20 ft. by 15 ft., six private baths,
 and one Turkish bath for females. Also, wash-
 house, laundry, stores, boiler and tank-house, and
 bath-keeper's residence. The general arrange-
 ment of the ground plan may be said to consist
 of four blocks. The central block, facing Lich-
 field-street, will contain, on the ground-floor,
 attendant's room, store and Turkish baths for
 males; and on the first and second floors Turkish
 baths for females and residence of bath-keeper.
 On each side of the central block will be private
 hot baths for males and females with separate
 entrances to each, corridors from which will com-
 municate with the first and second-class swim-
 ming-baths for males, placed at the rear of the
 building. The second-class swimming-bath for
 males may also be entered, if desired, from Back
 John-street. Between the block containing
 private baths for females and the large swim-
 ming-baths for males will be the wash-house,
 laundry, chimney, boiler and tank buildings,
 with coal-yard and cart entrance thereto from
 Back John-street. The general character of the
 design is Gothic. The central portion, facing
 Lichfield-street, as already stated, will be two
 and three stories high. Over the female entrance
 will be a tower and spire, with staircase com-
 municating with the bath-keeper's apartments.

DISSENTING CHURCH-BUILDING NEWS.

Liverpool.—A new Congregational Church for
 the district of Toxteth-park has been opened.
 The church is situated at the junction of Aig-
 burth-road and Ullet-lane, and has been erected
 for the congregation of the church in South-hill-
 road. Since the church in South-hill-road was
 built, the population of Toxteth-park has greatly
 increased, and the building has consequently
 long been found too small for the district. About
 two years ago a movement was commenced for
 the erection of a larger church, and the founda-
 tion-stone of the new edifice was laid in No-
 vember, 1870. The church is in the English
 Gothic of thirteenth century. It is almost cir-
 cular, having two transepts, and has a tower
 with spire nearly 160 ft. high. In the arrange-
 ment of the interior the object of the architect
 was to form a large area without pillars, and the
 roof has therefore an uninterrupted span from
 side to side. The pulpit is of stone, carved, and
 is situated in an apse, the walls of which are
 tinted. The seats are of pitch-pine, and will
 accommodate 950 persons. The walls are lined
 with the diamond pattern. The architect was
 Mr. H. H. Vale, of Liverpool; and the con-
 tractors were Messrs. Wisbart & Irving, of
 Southport. The total cost of the building is
 6,678*l.*—The memorial stone of a new
 English Presbyterian Church has been laid in
 Catherine-street, in the presence of a large
 number of spectators. The church, which when
 completed will be one of the most prominent
 ecclesiastical structures in Liverpool, is intended
 for the congregation (the Anglo-Welsh branch of
 the Calvinistic Methodists) heretofore worship-
 ping at Windsor-street Chapel. The church will
 afford accommodation for 510 persons on the
 ground floor, and provision is made for galleries
 to accommodate about 300 persons more, making
 a total of 810. The building will be in the De-
 corated style of architecture, and will consist of a
 nave, two transepts, a spacious vestibule, space
 for stair for future gallery, an engaged tower
 and spire rising to a height of 127 ft., and an
 organ chamber. At the rear of the church will
 be a lecture-room capable of accommodating 400
 persons, two classrooms, a minister's vestry,
 porch and yard. The tower at the north-east
 angle will stand upon a massive plinth, on the

east of which will be a tower door, with a recessed and moulded arch. This doorway will be surmounted externally by a crocketed pediment, and finished with a fleur-de-lis. In the four sides of the upper part of the tower will be coped windows of bold design, filled in with louvres and tracery heads, and having weathered sills. Above them will be a sunk traciced parapet, at each angle of which rises an octagonal pinnacle, terminated with a wrought finial. The branch of the spire here commences, and a few feet higher are the lucarnes, surmounted by finialled canopies of original design. Above this the spire is almost plain, and completed with a light wrought-iron finial. The staircase will be entered by a moulded door, and within this staircase is an entrance to the vestibule similar to the one in the tower. The pulpit will be of Caen stone, and will stand upon a tiled platform, slightly recessed, immediately under the west window, by which arrangement the minister will be visible to every one in the church. Above this recess is a moulded arch, carried upon columns with floriated capitals and moulded bases. The transepts and organ-chamber will form a feature in the design, being divided from the nave by moulded arches, with columns, floriated capitals, and corbels. The whole of the windows will be traciced. The roof is to be open-timbered and of peculiar design, forming as it were externally a nave and aisles, but it is one span internally. The external facing of the church will be of shoddies, with Stanton yellow stone dressings, and the entire cost, inclusive of the land, will be about 5,000l. Messrs. John Parker & Son are the general contractors, and the architects are Messrs. T. E. Murray and G. H. Thomas, Liverpool.

Hereford.—The Eign Brook (Congregational) Chapel has for some weeks past been in process of demolition, to make room for a more commodious structure, to be erected from designs prepared by Mr. G. H. Haddon, of the firm of Haddon, Brothers, architects, Hereford and Great Malvern, at a cost of about 3,000l. The memorial stone of the new building has been laid by Alderman T. Rowley Hill, of Worcester.

Bailiff Bridge.—The foundation stone of a Methodist New Connexion Chapel has been laid at Bailiff Bridge. The new chapel is being erected from designs by Mr. F. W. Helliwell, of Brighouse. On the ground-floor is the school-room, 48 ft. by 36 ft., to accommodate 400 children. Class-rooms are attached. A short internal flight of stairs connects the school with the chapel above. The chapel will be 59 ft. by 36 ft., having coped windows, and panelled and carved ceiling. At one end is a vestibule, communicating by a broad stairway with the principal entrance. The children's gallery is over this vestibule. Opposite is the pulpit or rostrum, placed at the back of the communion, which is on a raised platform, railed off on three sides. Accommodation will be provided for 400 persons. All the woodwork will be stained and varnished. The chapel will be lighted by gaseliers from the centre of the ceiling. There will be a hot-water apparatus for warming in winter. The works have now advanced to the sills of the windows. The following are the contractors:—Masons, Messrs. L. & W. Crowther; joiner, Mr. B. Marsden; plumber, Mr. Jabez Wood; plasterer, Mr. W. Firth; painters, Messrs. Hirst & Barraclough; slater, Mr. D. Smithies, all of Brighouse.

Halifax.—The new Unitarian Chapel at Halifax has been opened. It has been erected on the site of the old one in Northgate-road. Mr. Davis was the architect. The total estimated cost of the building and fittings, not including the organ, which is not yet in the chapel, nor two memorial windows, given by Messrs. Ed Eaton, and other two memorial windows, was 4,000l.

Brighton.—The foundation-stone has been laid of a new Protestant chapel for "Bible Christians," who, however, repudiate all connexion with Chelsea "shakers." The "Bible Christians" commenced their ministrations in Brighton, in 1812, in a small chapel in Cavendish-street; but of late years have carried them on in Upper Bedford-street. The site of the new chapel is at the south-west corner of Montague-place, situated in St. George's-road, and facing the eastern end of Bristol-road. The building, which is being erected by Mr. John Fielder (of Chichester), from designs prepared by Mr. Thomas Lanson, architect (of Brighton), will be of red brick, with stone dressings for the doors and windows. The entrance will be covered by a porch, the corners on each side of which will be ornamented with a small turret. The general style of the

building will be Byzantine. The contract price is 2,650l. When completed, it will accommodate 450 persons, and provision has been made for a gallery at the southern end, should one be required.

Northampton.—A Primitive Methodist New Chapel has been opened here for divine worship. The building is a structure capable of seating 600, with a school affording accommodation for 300 children; also two large class-rooms, copper-house, &c. The exterior of the chapel is in a mixed style of Italian and Corinthian architecture. The interior has a horse-shoe gallery, the front of which is panelled with open ironwork, and at one end is the organ, which has been considerably enlarged and beautified. The ceiling is divided into four compartments, the whole being enriched with twelve centre flowers and gilt headings, &c. The fronts of the galleries, rostrum, &c., are tinted with lavender, pink, and gold. The acoustic properties of the building are said to be good. The new building is erected on the site of the old chapel. The plans and specifications were prepared by Mr. J. Kerridge, architect, Wisbeach; and the building has been erected by Mr. H. Rands, of March, Cambs.

SCHOOL-BUILDING NEWS.

Mansfield.—The opening of new national schools and of a new organ in connexion with St. Peter's Church, Mansfield, has taken place. The schools are in close proximity to the church, and they occupy a site which, together with a donation of 500l., has been given by the Duke of Portland. The accommodation afforded is for 350, namely, 200 infants and 150 girls, and the total cost of the works is estimated at from 1,100l. to 1,200l. The necessary funds have been raised by voluntary contributions. The new organ has been erected at the cost of the late Mr. Martin Furniss, one of the churchwardens. The instrument, costing about 540l., has been purchased of Messrs. Brindley & Foster, of Sheffield. It has about thirty stops.

Tibberton.—The foundation-stone of a Church of England national school, with house for teacher, has been laid in this parish. The building is to be erected on a site given by Mr. T. G. Smith, of Droitwich. The plan, designed by Mr. W. J. Hopkins, of Worcester, architect, is of a simple character. Mr. J. Smith, of Tibberton, is the builder.

PROVINCIAL.

Stafford.—At the termination of the last council meeting, the Mayor stated that Mr. Alderman Pochin had given him such instructions as would enable him to purchase, in the name of Mr. Pochin, a suitable site for the erection of a good public hall. There was a very eligible site in Crabtree-street, which would cost about 1,500l., and Mr. Pochin, in his desire for the public good, would at his own cost purchase the site for the benefit of the town. A vote of thanks was accorded to Mr. Pochin for his generous offer, and it was understood that immediate steps would be taken for carrying out the object in view, as well as for widening Crabtree-street and enlarging the market-hall.

Hastings and St. Leonards.—The St. Leonards Commissioners have disapproved of giving the projectors of a pier at St. Leonards another chance of carrying out their design. The Rev. J. Tottenham and others urged that the proposal to build another pier was not good (like the Eversfield-parade Pier) a project of the inhabitants so much as of strangers; and the common sense of the Commissioners could see no propriety in encouraging a speculation which was not locally popular.

Napoleon Relics.—By the death of Miss Isabella Mather, of Mount Pleasant, Liverpool, in her eightieth year, an interesting and valuable collection of miniatures will be added to the Liverpool Town Museum. About twenty-five years ago, when Louis Napoleon was in pecuniary difficulties, Mr. John Mather purchased from him or his creditors, through Mr. Joseph Mayer, a number of miniatures,—many of which were unique,—of the different members of his family, including the parents of Napoleon I., and of his most celebrated marshals. After Napoleon III. was declared Emperor he attempted to buy back the miniatures, but Mr. Mather declined to part with them, and by his will bequeathed them to the town on his sister's demise.

Books Received.

The Garden. Conducted by W. Robinson, F.L.S., author of "Alpine Flowers for English Gardens." London: 37, Southampton-street, Covent-garden, W.C.

The first volume of the *Garden* has been recently completed. It contains not only a great variety of matter connected with the laying out of gardens, and the principles by which the higher branches of horticultural work, in landscape or flower gardening, ought to be governed, but also many valuable hints, by various writers, as to the most correct and successful methods of connecting garden effects with those of architecture. Among the more prominent articles bearing immediately on the last-named subject are those containing discussions on the garden features of Versailles, and their successful blending with those of the adjacent palace, which are worthy of the serious study of architects who would wish the noble country mansions which they are erecting all over the kingdom to be fitly framed by judicious and harmonious surroundings. The articles on the great villas of the suburbs of Rome which arose during the fifteenth and sixteenth centuries, especially in connexion with the elaborately-designed garden features, are also well worthy of serious attention. Lastly, though not least in importance, we would call to notice the essays (especially those of the editor) in which the merits, or, rather, demerits, of modern gardens, designed with a view to the bedding system, and their invariable adjunct of ribbon-borders, varied only by geometrical masses of monotone colour, are treated of. The theories so forcibly urged in this section of his art should be diligently studied by all who are interested in those decorative features of horticulture which come into immediate contact with our houses, large or small. The editor, as well as several of his best contributors assure us, and apparently with sufficiently good reason, that the higher branches of horticulture are still in their infancy though symptoms of a rapid advance are now setting in; and the object of the publication is evidently to guide that advance in a proper direction. We can cordially recommend the publication to those members of the architectural profession who are interested in the progress of those branches of decorative horticulture which come more immediately in contact with the works of the architect; and we cannot close this brief notice without calling attention to a life of John Claudius London, commenced in the present volume, which promises to be exceedingly interesting and instructive. He was undoubtedly the hero of British horticulture and in other ways a very remarkable man. It will be recollected by many of our professional readers, that he was the founder of the *Architectural Magazine*, which was the first publication of importance devoted exclusively to the pursuits of that profession for the use of which the *Builder* was subsequently established, and it is admitted on all hands, that *London's Architectural Magazine* had, during the time of its publication, a marked influence on the progress of English architecture.

The Architects' Text-book of Useful Information for Engineers, Architects, Surveyors, &c. By FREDERICK ROGERS, Architect. London: Sprigg.

In the compass of 110 small pages, Mr. Rogers has booked a variety of information which will be found useful by students, especially as leading them to look farther elsewhere; and Mr. Francis Campin adds a Treatise on Civil Engineering occupying 125 pages, which speaks briefly but ably of waterworks, railways, canals, and so forth.

Books of this kind require very careful editing. In the architectural portion (to illustrate the observation), speaking of crushing weights, it is said of limestone,—“Upon three inch cubes [which by the way, may mean either of two things] Anglesea limestone, in four experiments, the average crushing weight was 7,579 lb. per square foot.” Provokingly diverse as the published accounts of experiments on stone and other materials are, all who know anything about the matter see that the above statement must be erroneous. Very soon after the author writes “the weight required to crush this limestone is 471.15 tons per square foot,” and the reader is satisfied that *for per square foot* in the statement, *per square inch* must have been meant.

Miscellaneous.

Opening of new Chime Clock and Bells at Walsden.—The new chime clock, which is now completed and fixed in the tower of St. Peter's church, Walsden, near Todmorden, has been set in motion, in the presence of the Bishop of Manchester, the vicar, churchwardens, and a large number of the inhabitants. The clock has been manufactured by Messrs. Gillett & Bland, chime clock factory, Croydon, and strikes the hours upon the tenor bell of 12 cwt., which can be heard for miles round, and chimes the four quarters on four other bells similar to those at Westminster Palace and St. Mary's, Cambridge. The time is shown upon two dials, each ft. 6 in. in diameter, the raised figures and minutes being gilt. The clock-frame is made of cast iron, on an improved horizontal plan, the advantage of which is that any single wheel can be removed at pleasure, without disturbing any of the other parts. It has a gravity escapement, and a compensated pendulum. The clock, including all the works, weighs over 1 ton, and is ft. 6 in. long, 3 ft. wide, and 3 ft. high. The hammer for striking the hours also weighs 1 lb. Messrs. Gillett & Bland are now making a great clock for Bradford Town-hall to strike a bell of 4 tons, and also a carillon machine, their patented system, to play fourteen tunes on thirteen bells, weighing altogether about 10 tons, which will cost about 5,000l.

Building Societies' Disabilities.—Among "slaughtered innocents" of the late session, the Building Societies Bill was one which deserved a better fate. Its principal object was to isolate the law of benefit building societies, and to remove the necessity of which has long been a burden to them. The *Law Magazine*, referring to it, says,—"First, the power to borrow must be limited, defined, and limited; and the directors and managers of these societies relieved of the heavy responsibility many of them have incurred in this respect. Second, provision must be made for the realisation of the properties of these societies, in the event of winding-up, by a method less ruinously costly than the compulsory process of the Court of Chancery. Third, the sense of legislation must be adapted to the present state of the law with regard to friendly societies, and to those more enlightened modern societies which tend to simplify the incorporation of societies, and to sweep away the cumbersome machinery of trusteeship. Few persons are aware of the extent of the transactions of these societies, and the amount annually distributed by them in the way of advances for building may be measured by tens of millions of pounds."

Mosing of Holland-street, Blackfriars.—London, Chatham, and Dover Railway Company have closed that part of Holland-street which passes under the Blackfriars passenger bridge, between Blackfriars-road and Green-lane, and the carriage traffic to and from Blackfriars, from the east side of the railway in Holland-street, is now diverted along Green-lane and Southwark-street into Blackfriars-road. The pedestrian traffic between the two points is, however, to a certain extent impeded, the railway company having constructed a subway, which is reached by descending flights of steps in Blackfriars-road and the land-street and Green-walk junction. The way is lighted with gas. There are iron gates at each end, which will be closed between 10 o'clock p.m. and five o'clock a.m., the foot-traffic being thus diverted round along Southwark-street and Green-walk into Holland-street. The railway company thus absorb into a goods station under the railway level an area of about 1,500 square yards, or nearly one-third of an acre in extent, in consideration of which they have converted Green-walk, between land-street and Southwark-street, into a thoroughfare for carriage traffic twenty yards wide.

rick-kilns.—In the design of Mr. A. Batchelor of Brockham, Surrey, for improved kilns for firing bricks, pottery, and lime, a series of distinct kilns are so arranged round one non-furnace as to allow of three of them being worked in rotation for drying, burning, cooling, while the fourth is in reserve, ready for refiring. The kilns save, according to the inventor, from four to five cwt. of fuel per thousand bricks, and reduce the ordinary time of burning from ninety-six to forty hours, result being obtained by utilising all the heat given off from the burning bricks.

Town Sewage.—Mr. A. Aird, of the firm of J. & A. Aird, of Berlin, engineers, writes under date of the 16th ult., to Mr. J. T. Mechi:—"About twelve years since the Prussian Government sent over a Commission to England to report on sewage works, and somewhat later (Gehim-rath Wiché prepared a detailed project for the town of Danzig (population 100,000), including a proposition to utilise the sewage water on the waste lands by the seaside at Neufahrwasser, two miles from Danzig. We have carried out the works, and the same have been in operation during the past twelve months. The Government made the house connexions compulsory, so that the sewage water is unusually strong. We have also undertaken the pumping, flushing, and maintenance for a term of thirty years, the municipality granting us as compensation the sewage water and possession of 2,000 acres of land for the same period. This land was partly forest, but chiefly a sandy desert, in which nothing could grow. We have this year planted and irrigated rather over 100 acres, with really marvellous results,—since May five crops of eye grass; potatoes and beetroot of enormous size."

Paper Wheels for Railway Carriages.—The contemplated introduction of paper wheels for railway carriages is again spoken of, this time in the *Philadelphia Ledger*. It is stated that a Connecticut railroad is about to make a trial of the so-called paper car-wheels under the forward truck of their locomotives. These wheels are costly, but run safely and easily. They have been known for some time to car-builders, but their introduction into general use has been prevented by the expense:—

"Sheets of common straw paper are forced into a compact mass by a pressure of 350 tons. The mass of paper is turned perfectly round, and by a pressure of 25 tons a hub is forced into a hole in the centre. This paper wheel, by a pressure of 250 tons, is next forced into a steel tyre, with a quarter of an inch bevel upon its inner edge. Two circular iron plates are then bolted on to the tyre to keep the paper filling in place. By this arrangement the steel tyre rests upon the paper only, and partakes of its elasticity. It is claimed that these wheels wear longer than those of any other description, injure the trucks less, and run with less noise."

Death of the Clerk to Metropolitan Board of Works.—Mr. John Pollard, who has for some years served the public as clerk to the Metropolitan Board of Works, died on Wednesday last week. For several months past the deceased gentleman had suffered severely from diabetes, and the Board, in consideration of the state of his health, allowed him a long respite from the performance of his duties. In 1868 he was appointed an assistant clerk to the Westminster Commissioners of Sewers, and he held that position under successive Sewers Commissions and the Metropolitan Board of Works until 1859. In that year Mr. Woolrych, one of the present magistrates at Westminster Police-court, resigned the office of clerk to the Board, when Mr. Pollard, as the senior officer, was appointed in his stead. The deceased was in his 57th year at the time of his death. We understand that the office filled by Mr. Pollard was worth 1,000l. per annum. Mr. J. E. Wakefield has acted as clerk to the Board during the illness of his chief.

A Cottage Hospital for Paulton.—A cottage hospital has been opened at Paulton, in Somerset, the ceremony being preceded by divine service at the parish church, and a sermon by Lord Hervey, bishop of the diocese. The want of a cottage hospital has long been felt in the district, which has a population of 10,000 persons within a radius of a mile and a half, and including as it does extensive collieries, the workers at which are liable to many dangers and accidents. Hitherto the patients have had to be conveyed to the Bath United Hospital, a distance of nine or ten miles. A house in Paulton, standing in a field, and well adapted for the purpose, has been taken and fitted up as a cottage hospital. The institution will be open to all cases of accident and illness, except those of a contagious character. Patients who are in a position to do so will be expected to contribute to their maintenance while within its walls, where clothing and all necessaries will be provided for them.

New Memorial Brass in Exeter College Chapel, Oxford.—We learn from the *Oxford Journal* that a memorial brass has just been placed in the chapel of Exeter College, in memory of Arthur Looman Burleigh, late Comptroller of the College, and of Cotham, near Bristol, where he died in May last. The work was done at the expense of the deceased's Undergraduate friends.

Proposed South London Museum.—A meeting of the inhabitants of South London has been held for the purpose of establishing a "South London Museum and Free Library." The chair was taken by Mr. F. J. Clements. It was stated that a committee, which had been formed of influential people in South London, had obtained a site for the proposed museum where the Rectory of St. Mary's, Newington, Newington-butts, which is, with the church, to be swept away, now stands. The cost of the proposed building would be between 30,000l. and 40,000l., and it was proposed to open it in two years. It was resolved "That the gentlemen present at this meeting are hereby formed into a committee, with power to add to their number, and that those who are supposed to be favourable to the project be invited to join."

Royal Architectural Museum.—A member of the Council (Mr. William Brindley) has arranged to deliver a series of Practical Explanations of the Architectural Ornament Casts in the Museum, with a view of increasing its usefulness and benefiting art-workmen and others interested, on four Saturday afternoons, to commence at a quarter past three, p.m. Admission free. Workmen will be welcome in their working clothes (the council say), but will best consult their own dignity by putting on a decent coat. The course will run:—"Saturday, Nov. 2, Greek, Roman, Romanesque, and Byzantine; Nov. 9, Norman, Early French, and Transitional to Early English (First-pointed); Nov. 16, Early English and Early Decorated (Early First and Second, or Middle-pointed); Nov. 23, Decorated and Perpendicular (Second or Middle and Third-pointed)."

Public Baths and Washhouses in Hackney.—A public meeting has been held in the townhall, Hackney, to consider the expediency of adopting the Public Bath and Washhouses Act of 1846. Mr. John Kelday occupied the chair. Mr. John Holms, M.P., was present, and a letter of apology was read from Mr. C. Reed, M.P. Mr. Runtz moved the first resolution, to the effect that the meeting, acting upon a resolution passed at a meeting of the vestry held on the 5th of April, considered that, as the question had been before the Parliamentary committee of the vestry for six months, the time had arrived for the ratepayers to take action in the matter. Mr. Johnson moved an amendment practically annulling the resolution, and, after a discussion carried on amid some impatience on the part of the meeting, the resolution was carried.

The Church Institute, Leeds.—The large lecture-hall has been decorated throughout by Messrs. Powell, Brothers, of Leeds, under the direction of the architects, Messrs. Adams & Kelly, of the same town. The wall decorations consist of a dull green dado, powdered with pomegranate in white and gold. Above this is an alternate treatment of the rose and the lily, whilst above this again the walls are lined out in courses of ornamental bricks on a greenish grey ground. It is also intended to have subjects from church history painted in all the wall panels; one, the landing of St. Augustine in Britain, has already been done. The hall has been further enriched by the introduction, in the east window, of stained and painted glass by the same firm who did the wall paintings.

The New Pumping Station at Pimlico.—The Metropolitan Board of Works have accepted two tenders from Mr. Webster, the contractor, who completed the Sewage Pumping Stations Nos. 1 and 2 at Crossness and Abbey Mills—the first, for the erection of the No. 3, or Western (Sewage) Pumping Station at the Grosvenor Basin, Pimlico; and the second, for supplying and fitting it up with engines, gear, and all requisites. The competitors were numerous, and there was a marked difference in the estimates, the accepted ones being respectively—for the buildings, 126,950l. against 135,950l. (highest); while for the engines, &c., Mr. Webster's tender was 56,789l. against 98,038l. (highest), and 55,810l. (lowest). Preparation is being made for the immediate commencement of the work.

Status of Sir Robert Peel.—Mr. Theed has completed the colossal statue of the late Sir Robert Peel, which he was commissioned to execute for Huddersfield. It is executed in white marble, and represents the deceased statesman in his official robes as Chancellor of the Exchequer, hearing a roll of parchment in his hand and addressing the Senate.

Great Extension of the Liverpool Dock Accommodation.—An elaborate report by Mr. Lyster, the engineer to the Liverpool Dock Board, is being circulated largely among the commercial associations of the port, and the proceedings of the special committee appointed to bring the matter to this bearing have been confirmed by the Board. Notice has been given by Mr. Forwood of his intention to move that the plans be included in the Bill to be promoted in the ensuing session of Parliament. The engineer states that the scheme in its entirety would take twelve or thirteen years to complete, if all taken in hand at once. The Dock Board, however, have the report still to consider and decide upon.

Old House at Putney.—Messrs. Adamson & Sons inform us that they are about to pull down a house in the High-street, Putney, known as Essex House, which was built in the year 1596, no doubt for the Earl of Essex. There are some very old plastered ceilings (of that date), with the royal arms of England and the initials of Queen Elizabeth upon them, and that queen is supposed to have passed some time at this house. They say that if any architect or other person interested in relics of the past wish to see the old house before it is pulled down, they will be happy to enable him to do so on application to their office in the High-street.

The Dock Excavations at Chatham.—During the excavations for the large docks and basin at St. Mary's Island, for the extension of Chatham Dockyard, from time to time the remains of large numbers of Frenchmen have been discovered who died during the time they were detained here as prisoners from the Peninsular war. The remains have been re-interred in selected ground, and a handsome monument is to be erected to mark the spot. The monument will be some 20 ft. or 30 ft. high, the base of it being very massive; it will be made of white and red polished marble, granite, and Portland stone, some of it being carved. The work is being executed in St. Mary's Prison.

Church Building on the Yorkshire Wolds. The vicar and churchwardens of Weaverthorpe, as representatives of the inhabitants of one of the most populous villages of the Yorkshire Wolds have presented Sir Tatton Sykes with a silver trowel, with ivory handle, beautifully carved; ivory mallet inlaid with silver; and other marks of the appreciation in which his work of church building and church restoration is held. Sir Tatton Sykes has, during the last few years, built and endowed a church at Thixendale, built a new church at Fimber, restored the church at Weaverthorpe, built a new church at Helpertorpe, and is now rebuilding the churches at Lutton and Kirby-Grindalby, all on the Wolds.

Baths on the Thames.—The Chelsea Vestry have received from Capt. Roberts, C.E., a letter stating he has made application to the Metropolitan Board for a concession of the foreshore within the area required for the Chelsea Embankment as a site for public baths, soliciting the vestry's moral support and an assurance that no assessment shall be made upon the property or building. The site would not interfere with the subway or the outfall sewer. The capital for the undertaking, and Mr. Webster, the contractor, were ready, he said, to carry out the works. The vestry took no action.

The Maidstone Public Gardens.—An interesting ceremony has taken place at Chillington House; Mr. Edward Hoar, on behalf of Mr. Jubus Brencley, having formally presented to the mayor and corporation of Maidstone, a deed conveying to them, in trust for the public of Maidstone, the gardens at the rear of the Museum building, purchased by and laid out at the sole cost of Mr. Brencley.

The Biggs' Memorial, Leicester.—The first stone for the Biggs' Memorial, comprising the pedestal for the reception of the statue in the Welford-place has been laid in the presence of numerous spectators, by the honorary secretary, under the direction of Mr. John Finn, of Leicester, stonemason, under whose superintendence is placed the fixing of the pedestal and statue. Money having been deposited on the stone by the honorary secretary, the workmen engaged were regaled with refreshments.

The Great Bell for Cologne Cathedral.—French guns are to be used for this, and the work has been commenced.

Analysts under the Adulteration Act.—A committee of the Whitechapel District Board of Works have been considering the question of appointing an analyst under the new Act, and have recommended that neighbouring Boards should be first of all written to, to know whether they would be willing to co-operate in the appointment of an officer conjointly. It was also resolved to make inquiries as to what the services of a competent analyst would cost. It thus appears that not much work is expected from a district analyst, which seems to mean that the Act will shortly be shelved altogether.

The Institution of Civil Engineers.—The fifty-sixth session of the members of this body will be commenced on Tuesday, the 12th of November. During the recess the premises occupied by the Institution in Great George-street, Westminster, have been elaborately decorated, especially the theatre, and additions have been made to the library.

New Church for Oxford.—According to the *Church Herald*, a large and handsome church is to be shortly erected in the parish of Cowley St. John, Oxford, in the memory of Dr. Longley, the late Archbishop of Canterbury, who was at one time curate of Cowley. A site has been secured, and it is proposed to erect the edifice at a cost of 20,000l.

Fire at the Post-Office.—A fire was said to have broken out a few days ago in the new Post-Office buildings in course of construction at St. Martin's-le-Grand. Although the rumour proved true, the fire was early discovered, and the flames, which were confined to a few shavings and beams, were extinguished ere a Fire Brigade engine arrived.

Society of Biblical Archaeology.—The session will be opened on Tuesday, the 5th of November, when several papers will be read, including "On an Assyrian Prayer," and "On the Religious Beliefs of the Assyrians," by Mr. Fox Talbot; and "On the Tomb of Jacob at Shechem," by Professor Donaldson.

Opening of a Russo-Greek Church.—The very unusual circumstance of the opening of a Russo-Greek Church in England, with an Englishman as the priest, took place on Wednesday in last week in Wolverhampton.

A Use for the Pyramids at last.—The Khedive of Egypt, with the spirit of a true utilitarian, has commanded a French engineer to convert the tops of the Pyramids into light-houses for the benefit of the Nile sailors!

Institution of Surveyors.—The first ordinary general meeting of the session will be held on Monday, November 11th, when the president, Mr. Edward Norton Clifton, will open the session with an address.

New Mansion for Lord Lorne.—It is said to be the intention of the Marquis of Lorne to build a new mansion at Macharoch, in Kintyre, larger and more substantial than the present one.

Truth in Hyperbole.—"See Naples and die," says an Italian proverb. "I saw it," says an American traveller,—"I saw it and survived; but it was a narrow squeak, for the stench of it nearly killed me."

The Southampton Dock Company's Offices.—The new building which we called of stone is, we find, faced with the *Exbury* white bricks, made by Messrs. Charles Hooper & Co.

The Female School of Art.—The exhibition of students' drawings will be open at 43, Queen-square, this Friday (November 1st), morning and evening, and on Saturday morning.

COUNTY FIRE OFFICE, 50, REGENT-STREET, AND 14, CORNHILL, LONDON. The County Fire Office was established in the year 1806, upon the plan that the interests of its Policyholders in its own should be fully protected. A system of strict economy and caution has enabled the office to return to their Policyholders a considerable portion of premiums found to be in excess of the risks. These returns are annually varied with the profits of the year, are now fixed at 25 per cent. They are paid out of a fund specially provided for the purpose, and take precedence of the dividends to the holders. The interest is exempt from all personal liability.

EXAMPLES OF RETURNS.

B. 2, Green-church, E.C.

MONTGOMERYSHIRE COUNTY SURVEYORSHIP.—The office of COUNTY SURVEYOR being now VACANT, Candidates for the APPOINTMENT are requested to send their applications and testimonials to the Clerk of the Peace, The Office, in Walslop, on or before the 20th day of NOVEMBER next. Candidates are required to have a practical and theoretical knowledge of construction in civil engineering and architecture. By the assent of the County Surveyor a 5000 per annum, and so will be required to reside in the county.

GODFREY DEVEREUX HARRISON, Deputy Clerk of the Peace. Walslop, October 17th, 1872.

THE Directors of the East and West India Dock Company are desirous of obtaining the services of a Gentleman to undertake the ARRANGING, CONSTRUCTION, REPAIRS, and SUPERINTENDANCE of ALL BUILDINGS, DOCKS, and Machinery now existing, or hereafter to be erected; also the SUPERINTENDANCE and DIRECTION of the Engineer's Office and the Office of Mechanics. Salary 5000 a year, rising by annual increments of 500. Probable age 35 to 40. Attention to the education of the candidates will be furnished with the necessary form of application, and on addressing the Secretary in writing, or by letter, if he attended to, and any answers of the Directors, either directly or indirectly, will be considered as a violation of their wishes. The applications, accompanied by testimonials, must be sent in on or before the 1st DECEMBER.—By order of the Court.

J. L. DU PLAT TAYLOR, Secretary. East and West India Dock-house, Billiter-square, 22nd October, 1872.

UPPINGHAM UNION.—THE PUBLIC HEALTH ACT, 1872.—The Rural Sanitary Authority of the Uppingham Union are desirous of receiving applications for the APPOINTMENT of an INSPECTOR of NUISANCES for the Union, which comprises thirty-six parishes, and contains a population of 17,252, and an area of 48,236 acres. The appointment will, in the first instance, be to the 25th of March next, and the salary at the rate of 1200 per annum. The Inspector will be required to devote his whole time to the duties of his office; to make perfect sanitary surveys of the whole Union, and report generally upon its condition and requirements; as well as to perform all the duties of Inspector prescribed by the Sanitary Acts. Applications, with testimonials, to be delivered at the Office of the Union in the Morning of SATURDAY, the 3rd of NOVEMBER next. The candidates only whose testimonials are approved will receive notice to attend the meeting of the Committee at the Board-room, Uppingham, on WEDNESDAY, the 13th day of NOVEMBER, when the appointment will be made subject to the approval of the Local Government Board.

J. L. DU PLAT TAYLOR, Secretary. Uppingham, October 29th, 1872. WILLIAM H. BROWN, Clerk.

SUPERINTENDENT OF ROADS AND WORKS FOR THE PARISH OF HAMMERSMITH.—The Board of Works for the Parish of Hammersmith hereby give notice, that they will be prepared to consider APPLICATIONS from CANDIDATES, between the age of thirty and fifty years, for the above Office, on WEDNESDAY, the 6th day of NOVEMBER, 1872. The person elected will be to hold the Office for 12 months, to be held at Haggerston House, Hammersmith, W. on WEDNESDAY, the 6th day of NOVEMBER, 1872. The person elected will be to be paid the rate of 10s. per week, will be required to live on these premises, with the privilege of gas, fuel, &c. in consideration of which he will have to undertake the charge of the work premises, and perform all the duties attached thereto, and will have to devote the whole of his time to the duties of his office.

Information as to the nature and extent of the duties to be performed may be obtained at Broadway House. Applications to be in the Candidate's own handwriting, stating age and previous occupation, accompanied with testimonials, must be sent here on or before the 3rd of NOVEMBER in the morning of the 3rd of NOVEMBER, addressed to the Chairman, and have written thereon "Application for the Office of Superintendent of Roads and Works for the Parish of Hammersmith." No travelling or other expenses will be allowed.—By order, THOMAS EDWARD JONES, Clerk to the Board. Broadway House, Hammersmith, W. 29th October, 1872.

JUNIOR EXAMINER in the OFFICE of H.M. WORKS—An open COMPETITION for One SITUATION will be held in London on NOVEMBER 29th and following days. Persons between 22 and 30, who have acquired the requisite technical knowledge of building and building accounts are eligible to compete. Application for the necessary form should be made at once to the Secretary, Civil Service Commission, Cannon-row, London, S.W.

THE Tynemouth School Board are desirous of obtaining the SERVICES of a CLERK of the WORKS to Superintend the Execution of the Western and Clifton Village Board Schools. He will be required to devote the whole of his time to these duties. Sealed applications, properly endorsed, stating age, salary expected, and accompanied by testimonials of character and ability, to be forwarded to me not later than 6th NOVEMBER.

F. R. N. HARRIS, Architect to the School Board.

WANTED, in a Surveyor's Office, a CLERK who can Abstract and Bill, and who would be generally useful in every kind of office, stating salary previous to the care of Messrs. Norris, Stationers, Blomfield-street, E.C.

WANTED, a CLERK, by a BUILDER in the country. Must have a general knowledge of the business, able to measure, estimate, keep accounts, and make working drawings.—Apply, in own handwriting, stating age, nature of references, hours, and terms, to W. W. Post-office, Ascot.

WANTED, a Young Man, as CLERK. He must possess a knowledge of drawing, to enlarge plans, be quick at figures, and squaring dimensions.—Apply, by letter, stating age and remuneration expected, 367, Office of "The Builder."

WANTED, for the country, a good PLUMBER, who can do gasfitting, and not object to a little painting (if required). Wages 2s. per day. Constant employment. Apply, by letter only, to 600, Office of "The Builder."

WANTED, an active GENERAL FOREMAN, to take Charge of Works in London. None but men of ability need apply.—Address, Office of "The Builder," stating age, salary required, and address of last employer.

TO JOINERS.
WANTED, a good MACHINIST, to work at ISAAC WARD'S, Builder, Uttoxeter. Constant employment to a good hand.

WANTED, an intelligent YOUTH accustomed to the routine of a Builder's Office. Must be quick and accurate at figures. Also, a FINE and STORE KEEPER.—Address, in both cases, to No. 624, Office of "The Builder," stating salary required and address of last employer.

WANTED, a respectable Youth, as an APPRENTICE. A premium required.—Apply to B. & J. Carpenters and Builders, 40, 13, Gower-place, Easton-square, London.

WANTED, a few PLATELAYERS, to go to India, who can read and write, and have been leading hands.—For further particulars, apply, by letter only, to Mr. GEORGE DEKLYFF, C. E. & Victoria-chaussée, Westminster.

TO MACHINISTS.
WANTED, a good, practical Man to WORK and SUPERINTEND in STEAM SAWING, PLANING, and MOLDING MILLS. Must have a thorough knowledge of the various wood working machines.—Apply, with terms and references, to EDWARD WILLIAMS, 84, Helen's Wharf, Abingdon, Berks.

WANTED, through good PRESSERS and FINISHERS, accustomed to terra-cotta work. Also good PLASTER-MODELLERS and MOLDERS.—Apply, stating wages and where last employed, to J. M. BENEFIELD, General Manager, Terra-cotta Company (Bishfield's), Limited, Stamford, Lincolnshire.

TRAVELLER WANTED.—A Wholesale House requires a LONDON TRAVELLER in the BRICK, LIME, and PORTLAND CEMENT trade. To a person of gentlemanly address and experience, with a good connection amongst London builders and contractors, a liberal salary would be given.—Apply, by letter, with full particulars, to No. 623, Office of "The Builder."

STONE-CARVERS WANTED.—Several first-class steady MEN, accustomed to church work, for Midland and West of England jobs. Winter's work.—Address, HARRY HENS, Fairs-street, Exeter.

WANTED, EMPLOYMENT, by a CARPENTER and JOINER. Used to cutting home fittings, disalignments, and has a good knowledge of plans, specifications, and accounts. Capable of taking charge of a job or a site.—Address, Z. No. 167, Cannon-row, New road, S.E.

TO BUILDERS and DECORATORS.
WANTED, an ENGAGEMENT, as MANAGER or GENERAL FOREMAN. First-class reference. Well up in measuring and estimating.—Address, L. A. Post-office, Vere-street, W.

TO BUILDERS, CONTRACTORS, and OTHERS.
WANTED, an ENGAGEMENT, as GENERAL OUT-DOOR WORKING FOREMAN, or to take Carpenter and Joiner's Work, firing only, by the piece or job.—Address, W. B. 3, Wanshall-row, Kensington-road, London, S.W.

TO BUILDERS and CONTRACTORS.
WANTED, a RE-ENGAGEMENT, as FOREMAN of PLUMBERS, or to take the entire charge of Plumbers and Painters. Good reference.—Address, B. T. K. 24, Churchill-road, Hammersmith.

TO BUILDERS and CONTRACTORS.
WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN of a JOB. Carpenter. Well up in all branches. Reference to first-class London firms.—Address, H. F. No. 28, Clapton-street, Clapton-road, Islington.

WANTED, a RE-ENGAGEMENT, by a thoroughly competent BUILDERS' CLERK. Well up in the routine of the office, measuring by work, taking out quantities, preparation of plans, estimating, &c.—Address, No. 575, Office of "The Builder."

TO BUILDERS, &c.
WANTED, a RE-ENGAGEMENT, by a thoroughly efficient SHOP FOREMAN, at 20 per cent. above subordinates. Is a clever draughtsman, systematical, zealous, and experienced. Country intempered.—Address, T. T. S. care of Mr. Skide, 5, Manor-terrace, Kilmarn, N.W.

TO ARCHITECTS AND SURVEYORS.
WANTED, by a JUNIOR ASSISTANT, a SITUATION in a London Office. Good general and practical draughtsman.—Address, T. D. 31, Warner-street, Great Dover-street, S.E.

WANTED, by a DRAUGHTSMAN, COLOURIST, QUANTITY CLERK, &c., an ENGAGEMENT, as ASSISTANT in a London Office. No objection to a builder, contractor's engineer, &c. Terms, from 31s. 6d. weekly.—Address, Z. Puckridge, Herts.

WANTED, by a DRAUGHTSMAN, a RE-ENGAGEMENT. Accustomed to the usual duties of an Architect's Office. Good references.—Address, G. PARKER, Mr. Laycock's, 268, Gray's Inn-road, W.C.

WANTED, by a thoroughly efficient CLERK of WORKS, an ENGAGEMENT as above, or to SUPERINTEND any description of BUILDING Operations.—Address, J. C. care of Mrs. Bunden, 13, Queen-street, Goswell-street-road, London, E.C.

WANTED, by a good PLUMBER, a SITUATION or JOB. Can fill up time in other branches.—Address, G. B. 30, Stamford-street, Blackfriars.

TO BUILDERS and PLUMBERS.
WANTED, by a first-class PLUMBER and GASFITTER, a Constant SITUATION. Address, H. J. 2, Grove-village, St. Peter's-grove, Hammersmith, S.W.

WANTED, PLASTERING, PIECE WORK, by a practical Man. Is well experienced in taking plastering to any amount. Either Town or country. Labour only.—Address, 633, Office of "The Builder."

WANTED, by the Advertiser, a SITUATION as OUT-DOOR FOREMAN. Has had the superintendence of building work in Town and country. Carpenter by trade.—Address, J. E. 26, Glyan-street, Vauxhall, Lambeth.

WANTED, by the Advertiser, a SITUATION as FOREMAN in a Timber Yard. Has a practical knowledge of the business.—Address, A. B. 25, Albert-street, St. Ebbes, Oxford.

TO MASTER PLUMBERS, BUILDERS, and OTHERS.
WANTED, by the Advertiser, a CONSTANCY or JOB, in Town or country, as PLUMBER or THREE-BRANCH HAND. Good references.—Address, R. C. 24, Felsy-street, London, W.

WANTED, by the Advertiser, a RE-ENGAGEMENT as TIMEKEEPER, or TIMEKEEPER and CLERK. Bookkeeping by double entry, and considerable references.—Address, BETA, Jacob's Library, Railway-place, Grosvenor, Kent.

TO MASTER PLUMBERS, BUILDERS, and OTHERS.
WANTED, by the Advertiser, a Constancy as PLUMBER. Can do plain zincwork. Would fill up time with other branches. Town, country, or abroad.—Address, DONKO, Plumber, 45, Liverpool-road, Holloway, London, N.

TO QUANTITY SURVEYORS.
WANTED, occasional EVENING EMPLOYMENT, in ABSTRACTING and BILLING, by a thoroughly efficient ASSISTANT. Terms moderate.—Address, R. 9, Park Prospect, Little Queen-street, Westminster.

WANTED, by an experienced Carpenter and Joiner, PIECEWORK, or CHANGE of a JOB or SHOP, Town or country. Good references.—Address, A. 56, Princess-road, Notting-hill, W.

TO BUILDERS and OTHERS.
WANTED, by an experienced BRICK-MAKER, a JOB, to dig, make, and burn bricks, by the 1,000. Good character given.—Address, E. W. 14, Waterloo-place, Upper Clapton.

WANTED, by an experienced London Foreman, a RE-ENGAGEMENT as GENERAL FOREMAN, CLERK of WORKS, or to take entire Charge of a JOB. Bricklayers by trade. Just completing a large job in the country. Good references, &c.—Address, N. N. care of Mrs. Gope, Upper Beppan-street, Sutton, Nottingham.

TO BRICK MANUFACTURERS and OTHERS.
WANTED, by an experienced Man, a SITUATION as MANAGER or FOREMAN in a BRICK-FIELD, or in any occupation as superintendent of out-door labour. First-class references can be given as to character and capability.—Address, S. T. Foot-locks, Hayes, near Uxbridge.

TO BUILDERS and CONTRACTORS.
WANTED, by a Youth, aged 19, a SITUATION as EMPLOYER in good JOINER'S WORK, or as Carpenter and Joiner. Country preferred. Good references.—Address, G. A. B. Station-road, Post-office, St. Leonard's-on-Sea.

TO BUILDERS.
WANTED, by a Young Man, aged 27, a SITUATION as FOREMAN of JOINERS' WORK, with a good Reference. Has served three years' apprenticeship as a Carpenter and Joiner. Country preferred. Good references.—Address, No. 656, Office of "The Builder."

TO BUILDERS.
WANTED, by a thoroughly practical steady Man, a SITUATION as FOREMAN of JOINERS. Well up in setting out. Can set up drains. Good references. Aged 30.—Address, T. M. 113, Malden-road, Kennington, N.W.

WANTED, by a respectable Young Man, aged 23, a SITUATION as CARPENTER and JOINER. Well up in repairs. Wages moderate if constant.—Address, Mr. SMITH, 5, Waite Hill-street, Kennington.

TO BUILDERS.
WANTED, by an energetic Man, a RE-ENGAGEMENT as FOREMAN of BRICKLAYERS. Quick at setting out work, and well up in drawing. Good testimonials. No objection to town or country.—Address, W. V. Post-office, Aldenham, Berks.

WANTED, by the Son of a Builder, aged 23, a SITUATION in Office or Place of Trust. Would not object to make himself generally useful. Understands the practical part of the carpentering. No objection to country.—Address, B. A. 13, Fentonville-road, S.

WANTED, by a first-class BELL-HANGER, a SITUATION. Can undertake other branches (required), or as Foreman of General Work. Can give highest references as to character and ability. Town or country.—Address, No. 656, Office of "The Builder."

TO NOBLEMEN, GENTLEMEN, MASTER BUILDERS, and PLUMBERS.
WANTED, by a steady, respectable Man, a total abstinence, a SITUATION, as THREE-BRANCH HAND. Can do gasfitting and zincwork, understands paperhanging, and is thoroughly acquainted with the trade of jobbing work.—Address, 660, Office of "The Builder."

TO CONTRACTORS and BUILDERS.
WANTED, a SITUATION, in an Office. Well up in estimating, copying, drawing, and able to keep a good book, and willing to be useful in any way.—Address, A. 21, Gower-street.—Address, G. F. G. Post-office, Marylebone, W.

TO ARCHITECTS, SURVEYORS, or BUILDERS.
WANTED, a SITUATION. Twelve years' experience, with good testimonials and references for long periods. Is a quick and neat draughtsman, &c.—Address, A. T. 2, No. 21, Kempton-road, Kensington-road, London, S.W.

TO PLUMBERS and BUILDERS.
WANTED, a SITUATION, or JOB, by a good PLUMBER and PLAIN ZINCWORKER. Well up in deep well, pump, and closet work, &c. Can fill up time in other branches if required. Good reference.—Address, Z. E. No. 11, Marlborough-square, London, S.W.

TO BUILDERS and PLUMBERS.
WANTED, a Constant SITUATION, as good PLUMBER. Can do zincwork, and has no objection to fill up time in stone planing or painting if required.—Address, G. G. Plumber, 3, Tooting-place, Tooting Park, Holloway, N.

TO CATHOLIC ARCHITECTS, ENGINEERS, SURVEYORS, and AUCTIIONEERS, &c.
WANTED, to PLACE INDOORS a well educated YOUTH, aged 16, with a good taste for drawing. For a term of three years.—Address, with full particulars, to J. M. care of Mr. Pickering, Bookseller, Boyston, Herts.

TO BUILDERS and OTHERS.
WANTED, by a practical London Plasterer, to TAKE PLASTERING (Piecework). Good references given.—Address, 650, Office of "The Builder."

TO SLATE QUARRY OWNERS.
A Gentleman, thoroughly acquainted with the SLATE TRADE in all its branches, seeks an ASSISTANT, either as MANAGER or SUPERVISOR.—Address, ADVERTISEE, Clarendon-road, Greenhill, Harrow.

QUANTITY TAKER and MEASUREER of upwards of twenty years' experience. Offer TEMPORARY ASSISTANCE in estimating and measuring Bills of Quantities, Specifications, &c.—SURVEYOR, 25, Thornton-st., Bristol-road, W.

OCASIONAL ASSISTANCE.—A most efficient ESTIMATOR, MEASUREER, and ACCOUNTANT offer TEMPORARY ASSISTANCE. Plans and specifications prepared, Bills of quantities, &c. Terms moderate.—Address, 73, Stockwell-road, Clapham-road, S.W.

TO CARPENTERS and BUILDERS.
EMPLOYMENT WANTED, by a Young Man, aged 24, a CARPENTER. Well up in jobbing work, and is most particular as regards wages.—Address, J. W. 35, Gray's Inn-road.

A FIRST-CLASS ASSISTANT, thoroughly well up in Gothic and Classic designs, details, perspectives, &c. OFFERS his SERVICES as ARCHITECT, Designer's Litterae.—No. 333, Fulham-road, S.W.

TO ARCHITECTS.
AN ASSISTANT desires a RE-ENGAGEMENT. Aged 23. Salary moderate.—Address, A. B. 11, Park-street, Stafford.

TO ARCHITECTS and SURVEYORS.
A USEFUL ASSISTANT, who has had considerable experience in RE-ENGAGEMENT. Good references.—Address, H. N. J. care of D. J. Brooks, esp. 142, Ke-nington-road, S.W.

A WELL QUALIFIED JUNIOR ASSISTANT is open to an ENGAGEMENT. Four years in the office. Terms moderate.—Address, A. 120, Stanhope-street, Regent-park, N.W.

TO ARCHITECTS, SURVEYORS, and OTHERS.
AN experienced ASSISTANT, many years in a London architect's office of varied practice, is desirous of an ENGAGEMENT, with a view to permanency. Has been occupied in preparing working drawings, details, specifications, and superintending the execution of work. Reference to testimonials.—Address, A. care of W. Saunders, 6, Adelaide-place, London Bridge, E.C.

AN ARCHITECT and SURVEYOR ASSISTANT is OPEN to an ENGAGEMENT. He is versed in design, construction, and surveying, and has a knowledge of quantities. Satisfactory references.—Address, 690, Office of "The Builder."

TO BUILDERS, SURVEYORS, and OTHERS.
A PRACTICAL CLERK, aged 28, seeks an ENGAGEMENT. Can take out quantities, estimate, and keep accounts.—Address, A. B. 25, Blythe-street, Chelsea, S.W.

TO TIMBER and GENERAL MERCHANTS.
AS TRAVELLE, or Otherwise.—The Advertiser, aged 20, is open for RE-ENGAGEMENT as THOROUGHLY EXPERIENCED and zealous workman. Can undertake a charge of an office.—Address, R. 105, Aldersgate-street, E.C.

A GOOD PLUMBER, or THREE-BRANCH HAND, is desirous of a SITUATION, by an experienced Foreman, PLUMBER, 34, Rapsheet-street, Kilgill-bridge.

TO BUILDERS SURVEYORS, &c.
A SITUATION WANTED, by an experienced ESTIMATOR and MEASUREER, who will give TEMPORARY ASSISTANCE with Quantities or Accounts, on reasonable terms.—Address, G. 43, Office of "The Builder."

TO ARCHITECTS and SURVEYORS.
A PARTIAL or TEMPORARY ENGAGEMENT required by the Advertiser, aged 31. Has been in practice and carried out numerous works. Can undertake a charge of an office. Terms moderate.—Address, B. C. J. 125, Kensington Park-road, S.E.

TO TIMBER MERCHANTS and SAW MILL PROPRIETORS.
A YOUNG MAN seeks an ENGAGEMENT as CLERK, COLLECTOR, or TRAVELLER in the office of a firm that has been many years in the timber trade in London, or the keeper in a building firm. Wages moderate.—Address, OBION, F. office, Brighton.

A YOUNG married MAN wishes to obtain a CONSTANT SITUATION as good THREE-BRANCH HAND, PLUMBER, GASFITTER, and PLAIN ZINCWORKER. No objection to fill up time painting, paperhanging, and gasfitting. Thoroughly acquainted with the trade of jobbing work.—Address, W. E. G. C. 77, Beaver-road, South Actford.

The Builder.

VOL. XXX.—No. 1553.

Railway Facts and Promises.

THE Board of Trade has issued its official statement of the position of the railways of the United Kingdom at the close of the year 1871. Under the provisions of the Railways Act of last year, every company is now bound to make a special return to the Board of Trade, for statistical purposes. Wherever the blame may lie, it is not creditable to our character for organisation of intelligence to find that there is so much difference of result between two methods of inquiry, founded upon absolutely the same data. The present return credits the empire with the possession of 161 miles of railway at the end of 1871, short

of that of which we were said to be in possession at the close of 1870. We propose, however, not so much to enter into any minute detail as to inquire into the broad results of our great national means of intercommunication, both with reference to the present and the future. And we think that our readers will more readily grasp, and more easily remember, the inferences that we shall venture to suggest from the statistical aspect of the case if we offer them approximately round numbers, instead of copying exact details; which are important in arriving at accuracy, but which lose their value when apparent in an ultimate form.

So far back as the year 1866 the authorised capital of our railways had attained the amount of 620,000,000*l.* sterling. The actual expenditure of capital, however, up to last Christmas, we now learn was only a little over 550,000,000*l.*, showing a drawing in of earlier anticipations to the extent of 70,000,000*l.*, or more than ten per cent. of the whole outlay authorised by the legislature. The mileage stated is 15,376 miles, which may be compared with that of Franco on the one hand, and of America on the other, as being one-half as much again as the first, and about one-fourth of the second. We have before us the statements that the French lines, in 1867, amounted to a length of 15,639 kilometres; and that the United States railways, in 1871, made a run of 60,852 miles. The former had cost about 80,000,000*l.*; the latter, about 1,800,000,000*l.* Our own railway outlay, last year, produced the net earning of 49,000,000*l.*, or 4·65 per cent. on the capital invested.

These large figures are enough to show that a national interest of primary magnitude is here at stake. The last forty years have witnessed an entire revolution in the internal communications of this, as well as of most other civilised countries. The impetus given to production and to commerce has been unexampled. But what we wish more particularly to hold up to view is

this. Our railway property, in the Imperial ledger, may be regarded as the *per contra* of our national debt. The balance is almost exact. For, while the nominal capital of the latter is that of the former something in the proportion of 8 to 5½, the dividends are in an inverse ratio. We have 4½ per cent. on the latter against 3. Now, while to a private individual it makes little difference whether he draws his annual income from funds or from railway stock, the case is entirely different as regards the country. It is a case in which the whole is *not* equal to the sum of the parts. This paradox is explained when we inquire into the nature of the parts. When A. gains what B. loses, the gross gains of A. plus B. bear no relation to the gain of A. But the 26,000,000*l.* of annual income from our railways is direct produce. It is as much added to the national wealth as if it were so much more corn produced from our fields by improved cultivation. For while, it is true, the amount is made up by the contributions of passengers and freighters, we must remember that each journey and each despatch, on the average, not only pays its own cost, but is an actual source of profit to the traveller or the freighter. It is like money laid out in seed or in ploughing.

Our 550,000,000*l.*, therefore, are *bona fide* property, rooted to the soil, and earning a fair and tangible income, in addition to its incalculable results in accommodating the march of commerce. The 26 millions per annum which it returns is sheer gain to the nation, and good rent (*reditus*, return) to the proprietors. But the 23 or 24 millions which go to the fund-holder—as *reditus*, we freely admit, for money which he found for the nation at a pinch,—has to be raised annually by taxation. Good faith must be kept; but, as far as the nation is concerned, railway capital is to the credit, and funded debt to the debit, side of the account. The former may bewitch advantage increased, and largely increased. It would be a national relief to extinguish the latter; and every statesman endeavours, either by lightening the incidence of taxation, or by formal redemption, actually to reduce it.

Of our gross intake of 49 millions, 26½ millions are derived from goods traffic. When we compare, on the one hand, the cost, and, on the other hand, the return, of conveying a ton of goods and a ton of passengers, it is pretty clear that the development of the two branches of the carrying trade must be regulated by very different principles. In all great commercial undertakings, two opposing interests have to be regarded: those of the buyer, and those of the seller. The subject is complicated, at first sight, by the intervention of the merchant or middleman. But, as far as the purchaser is concerned, the distributor must be ranked together with the producer. Now the great problem which the managers of the railway companies have been endeavouring, for the last third of a century, to solve, has been how to procure the largest returns from the public. Whatever they have given of luxury of carriage, high velocity of transit, or moderation of fare, has been, so to speak, tentative. When they have had, or thought they had, a monopoly, they have run their shabbiest and most uncomfortable vehicles, and timed their trains to their own convenience, and not to that of the country. When competition has arisen, they have endeavoured by frequent, rapid, well-appointed, low-priced trains to take the bread out of one another's mouths. We are not imputing this to any company as a stigma; it is the natural and certain outcome of the principle of commercial competition. But it should be remarked that it is due to this cause, and to this alone, that statistical elements of comparison have been placed within the reach of the engineer. By trying how to gain traffic in one direction, and how to keep it in another, our railway companies have accumulated an experience

which would not, by this time at all events, have been otherwise gained.

Thus it will be remembered by those whose personal acquaintance with the subject stretches back to the years 1833 and 1834, that the main reliance of the engineer of that time as to his future passenger income was placed upon the first-class passenger. The mail coach was, indeed, the only guide as to traffic to which we could then look. Thus everything was planned, in the start, for a first-class traffic. Comfort in carriage, speed, station accommodation, all were designed for the same end. Nor was this all. Purposed discomfort and discouragement were thrown in the way of the second and third class travellers. The luxurious travelling saloons of the Great Western, which, when quite new, were unrivalled for their luxury, were contrasted with the odious cattle-pens in which the unfortunate third-class passengers were permitted to make a wretched use of the new means of transport. This was, perhaps, the extreme case; but the same principle was in operation on every line of railway, more or less apparently.

What do we find now to be the case? Let us ask the Board of Trade. Their return replies that nearly seven-tenths of the whole number of passengers are third-class; two tenths are second-class; one-tenth alone are found to be those first-class passengers on whose support, in the first instance, we principally relied. So striking and indisputable a fact ought not only to be borne in mind, it ought to be accepted as indicating the propriety of a reconsideration of the entire general arrangements of our railway traffic. Our system was, in the first instance, and to a great extent still is, arranged with an express reference to the special requirements of one-tenth of the passengers.

If we look at receipts, they are respectively from the first, the second, and the third class passengers—4,000,000*l.*, 5,000,000*l.*, and 8,000,000*l.* Nor must it be thought that the net profit derived from the three classes is to be estimated by a comparison between the numbers conveyed, and the amount earned. The total passenger receipts, including season ticket-holders, who do not figure in the above division, was over 18,000,000*l.* in 1871. While one-tenth of the amount (or perhaps, more accurately speaking, one-tenth of the 17,000,000*l.* before indicated) is less than the half of the fares paid by the best accommodated part of the passengers, it by no means follows that the latter are doubtfully profitable to the railway company. Luxury of accommodation, speed, all that depends on the carrying out of our original idea as to the true source of income, make it far more expensive to earn these four millions than would be the case if the attention of the companies were directed, in the first instance, to the practical and business-like conveyance of the bulk of their traffic; and, in the second place, to the provision, not often than once a day as a general rule, of those special luxuries, both of vehicle and of speed, which cost so much more to the line, and for which 10 per cent. of the travellers are willing to continue to pay.

We are of opinion, then, that a great change is indicated as necessary in the future management of our railways. The traffic which, properly regulated, will be the most lucrative in its net results is the third class. It is this, also, of which the future development may be made to assume the largest proportions. The facts before us show that the source of income thus open is one of incalculable fecundity. What a third-class traffic, properly organised, may amount to, must be inferred from the fact that this kind of traffic, hitherto so much discouraged, forms already seven-tenths of the whole in numbers, and eight-sevenths in actual returns.

We are not asking for anything Utopian. To see a Welsh cattle-driver, as we have seen him years ago, seat himself on one of the velvet

faucets at Swindon, and look round on the then unprecedented elegance of the refreshment-room with the art of a master, is a degree of communism not sought for. Moreover, it is one which, from the nature of things, could only be of very transitory duration. But what we advocate, and what we are sure must be done, sooner or later, by every railway that will hold its own, is, to make a serious and scientific application of the resources at their command to the best accommodation of the wants and habits of the great mass of their customers. To attempt to give more than a proper return for the fare is unwise. Luxury of vehicle is not to be expected; but decent convenience is. Drafty open carriages, made uncomfortable on purpose, should be rectified or abandoned. If not, perhaps some day they may be smashed. Great velocity, knocking everything to pieces in order to gain a few minutes of little productive value, is not demanded. But fair and reliable punctuality is. And so is the timing of trains, early and late, to suit the habits and requirements of the working man.

Again, it is not necessary to maintain a great establishment of porters to hurry with his luggage, arriving forty seconds beyond the time fixed for starting, to the goods van. The third-class passenger is rarely overburdened with luggage. What he brings he mostly carries for himself. In this respect, as in those of cost of vehicle, and of rate of running, he is a far less costly customer than the first-class passenger. But then ordinary, quiet, decent civility is due to him who is, we repeat, the best customer. Let no one feel that he need blush to ask for a third-class ticket. Let no one find that his production of one elicits a saucy sneer. *Suum cuique.* Luxury of attendance to those who choose to pay for it. Fair accommodation, as per bargain, to the man who travels by the cheap train as a matter, not of pleasure, but of business.

With regard to the goods traffic, the elements for dissecting the relative profit which it earns are not readily offered by the reports, nor indeed are they, in all particulars, easy to grasp. 67,000,000 tons of general merchandise have been carried for a charge of nearly 151 millions sterling. Of course the distance for which this has been done is a main feature in the cost. Of the 180,000,000 train miles run in the year 1871, about half are credited to the passenger and half to the goods traffic. But goods and mineral trains are so much intermixed that it would be very difficult to arrive at the respective gross and net earnings of these two descriptions of traffic. 10,000,000^l. have been received for the transport of 80,000,000 tons of minerals. Even these rough totals indicate the great error of the railway companies in grasping at that description of traffic that would, with far more advantage, be water-borne. We may roughly take the probable goods mileage as equal to the mineral mileage. (In point of fact, it must be larger, as the radius of the true mineral transport is restricted, and that of the goods is more proportionate to that of passengers.) Thus we have a ton of minerals earning $\frac{1}{10}$ of a pound, against a ton of goods earning $\frac{1}{10}$ of a pound, or as 125 to 231. The mineral trucks are less costly than some of the merchandise trucks; but the destruction both of plant and of permanent way that is due to this traffic is very large; and mineral traffic, to a great extent, is all in one direction, so that the cost of returning empty wagons, which is not at all felt in passenger traffic, and only to a limited and calculable extent in goods traffic, is here a constant source of expenditure. When we add the fact that the greater number of accidents are traceable to the interference of mineral (or sometimes mixed merchandise) trains with the punctuality of the service of the lines, we find another proof of the importance of reconsidering the question of water-carriage. The railway companies are already owners of much of our admirable but neglected system of internal water communication. In all cases where time is not an object, we strongly suspect that the dividends of the proprietors would be amended, though the nominal income of the companies might be reduced, by turning the mineral and heavy goods traffic on to the canals.

Four hundred and fifty thousand pounds have been paid, in the year 1871, by railway companies for damages, two-thirds of which were for personal injury, and one-third for damage and loss of goods. This charge amounts to 1.75 per cent. on the net earnings, and has reduced to 4.65 per cent. on the capital an average dividend that would otherwise have reached 4.73 per cent. Let every railway proprietor study these im-

portant figures. He is mulcted by this income-tax of 1l. 15s. out of every hundred pounds of his net returns, to pay for avoidable accident. Yes, avoidable!—that is the plain truth. Whether we trace the actual cause of collision to the overworking of underpaid men (a matter which is, perhaps, tending, rather abruptly to right itself); to the gross neglect of punctuality; to the attempt to convey over a line traffic which ought to flow through some other channel; or to some other cause; there is no doubt that railway accidents, as a rule, are avoidable. That the proprietor should not insist, at all events, on the adoption of that system of universal maximum assurance for every passenger which we have before proposed in these columns, is one of the things that we fail to understand. As it is, every railway proprietor accepts a tax of nearly two per cent. on his income, in order to pay compensation for accidents.

With reference to the relative proportions of length of railways completed in this country, in France, and in the United States, to which we above referred, the areas and the populations of the respective countries must be compared, in order to arrive at any instructive result.

Thus the 9,754 miles of French railways were distributed over an area of 210,000 square English miles, the population of which in 1866, was 38,192,064.

The 60,852 miles of American railways ran through a country of the area of 3,542,903 square English miles, of which the population, in 1860, was 31,574,919.

Our own 15,376 miles serve an area of 122,511 square English miles, of which the population, at the middle of the year 1869, was estimated by the Registrar-General as 30,611,305.

Thus, while we have a mile of railway to every 2,000 souls, the French have only about half that rate of accommodation; while, in America the figures give the extraordinary proportion of a mile of railway to less than every 600 inhabitants. But, on the other hand, while the United Kingdom has nearly a mile of railways for every eight square miles of territory, France has only a mile to every 21 square miles; and the enormous area which at present constitutes the United States, has only a mile of railway to an area of 59 square miles. This is a remarkable gauge of the energy and of the future of the respective populations. We give the actual figures for the satisfaction of our readers, as the results are so striking. The English area and population are given by the Registrar-General; the French and American by the Almanach de Gotha.

We must remember, too, that our total length of railways is yet by some 5,000 miles shorter than that of the turnpike roads, which, in 1854, were held by 1,000 separate trusts. And the minor system of highways and parish roads, which small-gauge railways will hereafter, we conceive, replace, are as yet undisturbed in their monopoly of accommodation, such as it is. Enough, we trust, has been said to show that in the anticipation of this future great development of our carrying facilities, and without losing sight, on the other hand, of that great rise in the price of coal, iron, and labour, which we recently showed (see *Builder* for August 18), must affect the forthcoming dividends, there is an important element of profit pointed out by the figures published by the Board of Trade; in a systematic and enlightened development of the third-class and second-class traffic, more especially the former.

NEW LIBRARY AND MUSEUM OF THE CORPORATION OF LONDON.

On the 5th of November about 2,200 persons assisted at the opening of the new library and museum adjoining the Guildhall, the Lord Chancellor, the Lord Mayor, and Dr. Sedgwick Saunders playing the principal parts in the ceremony. A remarkable collection of works of art had been got together, and literally covered every available foot of wall. This included some very fine pictures lent by Mr. Francis Cook, "Visconde de Montserrat" (the well-known wonderful portrait of Raffaele's "Fornarina," by Sebastian del Piombo; a capital Holbein, and marvellous Andrea del Sarto, attracting particular attention); Mr. Anderson Rose's collection of engraved portraits; Mr. Gardner's topographical collection; the Shakspeare autograph, and the Runic stone found far below the surface in St. Paul's Churchyard. This bears the figure of a stag, with the head turned backward, and is

covered with those volutes of a single line, which on many sculptured stones of even earlier time are found alone. The date of this most interesting relic is probably the ninth century. Close by, in a glass "table-case," was an important collection of autograph letters,—one from "O. Cromwell"; another signed by Buckingham; the letter of Nelson presenting the sword of the French admiral, Blanquet,—surrounded at the mouth of the Nile,—with the sword itself above the letter; and another by Wellington, speaking of the action of the troops in Portugal. In the next case were magnificent treasures lent by Baron Rothschild,—silver cups and tankards and very fine Limoges enamel,—grey and coloured,—dishes and beakers. Amongst a grand collection of old engravings, a fine impression of Albert Dürer's quaint "Journey of Sintram with his companions Sin and Death," stood out prominently, and some lovely etchings of Rembrandt's. In the microscopic room many of the "preparations" were extremely beautiful: the arrangement of feathers from the wing of a butterfly into a spray of fuchsias, for instance; the "peacock copper"; sections from the spines of some atomy thing. The aquarium in which the hippocampus, or sea-horse, kept floating about attracted continual attention. The peculiar arrangement of fin at the back of the little creature, which, when in motion, takes the exact appearance of a rapidly-rotating wheel, was therein displayed to advantage. In this apartment was the grand Satsuma vase, lent by Mr. Hewitt. It stands about 2 ft. high, is a very fine specimen of this ancient Japanese porcelain, and is, of course, almost priceless. Two Chinese screens beside it, belonging to the same gentleman, are likewise handsome specimens of carved and coloured openwork in ivory. The large modern majolica vases, placed lavishly everywhere, with rare plants in them, added greatly to the beauty of the brilliant scene. In the museum below, the large album given by the city of Vienna to the city of London in 1862, was a noticeable object. The drawings, with which this apartment was literally crowded, were too numerous to mention. Here, too, were ancient stone coffins, amphore, and other curiosities, many of them found under London,—interesting relics and evidences of its past history.

A full and comprehensive catalogue, including an introductory history of the library, has been published, and is a valuable record of the remarkable collection gathered together in the Library and Museum on this occasion. In connexion with the history of this important institution there will be no need to say hereafter,— "Pray remember the Fifth of November."

We make use of some official data in describing the new buildings.

They occupy the site of some old houses formerly fronting Basinghall-street, and extending back to the Guildhall. Their total frontage to this street is 150 ft., and the depth upwards of 100 ft. The structure consists mainly, as our readers know, of two halls, placed one over the other, with reading, committee, and museum rooms surrounding them. Of these two halls the museum occupies the lower site, the floor being level with the ancient crypt of the Guildhall, with which it will directly communicate, and is consequently somewhat below the present level of Basinghall-street. This room, divided into nave and aisles, is 83 ft. long and 64 ft. wide, and has a clear height of 20 ft. Large fire-proof museum-rooms on this floor, entered from the museum, are intended to hold the valuable archives of the City.

The library, above the museum, is 100 ft. in length, 65 ft. wide, and 50 ft. in height, divided, like the museum, into nave and aisles, the latter being fitted up with handsome oak book-cases, forming twelve bays, into which the furniture can be moved when the nave is required, on state occasions, as a reception-hall; one of the principal features in the whole design of this building being its adaptability to both the purpose of a library and a series of reception-rooms when required. The hall seems light, the clear-story over the arcade of the nave, with the large windows at the north and south ends of the room, together with those in the aisles, presenting a considerable area of glass. The oak roof, the arched ribs of which are supported by the arms of the twelve Great City companies, with the addition of those of the Leathersellers and Broderers, and also the Royal and City arms, has its several timbers moulded, and spandrels filled in with tracery, and contains three large louvers, for lighting the roof and thoroughly ventilating the hall. The aisle-roofs, the timbers

of which are also richly wrought, have louvres over each bay, and the hall at night is lighted by means of sun-burners. Each of the spandrels of the arcade has, next the nave, a sculptured head, representing History, Poetry, Printing, Architecture, Sculpture, Painting, Philosophy, Law, Medicine, Music, Astronomy, Geography, Natural History, and Botany.

The several personages chosen to illustrate these subjects are Stow and Camden, Shakespeare and Milton, Gutenberg and Caxton, William of Wykeham and Wron, Michelangelo and Flaxman, Holbein and Hogarth, Bacon and Locke, Coke and Blackstone, Harvey and Sydenham, Parcell and Handel, Galileo and Newton, Columbus and Raleigh, Linnæus and Cuvier, Ray and Gerard. There are three fireplaces in this room. The one at the north end, executed in D'Aubigny stone, is very elaborate in detail, the frieze consisting of a panel of painted dies, executed by Messrs. Gibbs & Moore, and the subject an architectonic design of a procession of the Arts and Sciences, with the City of London in the middle, emblematised by an enlarged representation of the ancient seal, viz., St. Paul and some Mediæval buildings with a river in the foreground. The quatrefoil panels on either side have the sculptured heads, executed by Mr. J. W. Seale, by whom most of the stone carving has been done, of Carpenter, the founder of the City of London School, who left certain books by will to the Guildhall Library in the year 1442, and Chaucer, the "Father of English Poetry." It is altogether a praiseworthy work. The two chimney-pieces at the south end are also carved and foliated with the words "Anno Domini MDCCLXXII." on the frieze of one, and "Domine Dirige Nos," the City motto, on the other, surmounted in both instances with the Royal, City, Middlesex, Westminster, and Southwark shields of arms. The screens in front of these fireplaces are executed in oak, the panels being inlaid with coloured foreign woods, and the bases of the screens forming dwarf book-cases which are fitted to receive large folio books. The whole of the furniture throughout the building is oak, and has been executed by Messrs. Cooper & Holt. The hall, with the rest of the rooms, is warmed by means of hot-water pipes, with open gratings in the floor.

Adjoining the library, on the east side, is the committee-room, which is lighted by windows looking on to Basinghall-street, and has a rounded wagon-headed roof, the principal ribs of which are supported on stone corbels, bearing the shields of arms of the several members of the committee specially appointed for the erection of this building.

The public reading-room, at the south end of the library, is a commodious apartment, 50 ft. in length by 24 ft. wide, lighted by a window at the west end, and also by skylights in the roof.

The building is entered by a porch having wrought-iron entrance-gates in Basinghall-street, and on the left-hand side of this porch is placed the marble foundation-stone, the scroll, containing the following inscription, being held by a cultured female figure, typifying the City of London, in bas-relief:—

"This Stone
Was laid October XXVII., A.D. MDCCLXXII.,
by
WILLIAM SHERWOOD SANDERS, M.D., D.L.,
Chairman of the Library and Museum Committee
Of the Corporation of the City of London,
During the Mayoralty of
The Rt. Honble. ROBERT BENEY,
HORACE JONES, Architect."

Passing through the porch, the lower hall is reached, from which short flight of steps descends to the museum. On the right of this hall is a room tiled up with cases around the walls, for the reception of books, &c.; and on the left, through an oak screen, the principal staircase is reached, the whole of the staircase is executed in stone, the balustrade being pierced with open tracery. The entrance to the reading-room is from the upper landing.

The total amount expended upon the building by the Corporation of the City of London, will be above 50,000*l.*, exclusive of the value of the land; but this amount includes the whole of the furniture and fittings, which are in keeping with the architecture.

The building has been erected from the designs and under the superintendance of Mr. Horace Jones, the architect to the Corporation. He committes mention with commendation, and doubtless with the concurrence of the architect, the good services of Mr. Chas. Bailey, his chief assistant.

The style of architecture is Perpendicular

Gothic, in accordance with that of the Guildhall. The work of the new Library was commenced in 1870, the contractors being Messrs. George Trollope & Sons; the fittings being supplied by Messrs. Cooper & Holt, the painted windows by Messrs. Ward & Hughes, the gas-fittings by Messrs. Dodson, and the hot-water apparatus by Messrs. Haden & Son. The solid parquet border, of oak, ebony, and walnut, in the committee-room, was laid by Messrs. A. J. Arrowsmith & Co.

The principal window (at the north end of the library) is seven lights in width, divided in height by a transom, and was presented by the ward of Aldersgate. The subject of the upper three middle lights is the introduction of printing into England. The scene is Caxton's printing-press in the armoury at Westminster, the centre figure being the printer showing Edward IV. and the Abbot of Westminster his works. Wynkyn de Worde is engaged at the press; in the background is a boy mulling the ink. The figures in the lights on either side are Gutenberg, the inventor; Wynkyn de Worde, the foreman at Caxton; and Pyenson, one of his workmen, who afterwards became King's printer. The other figure is that of Bishop Coverdale, the translator of the Bible. The lower middle lights have for their subject the purchasing of the library of the Bishop of St. Alban's for 50 *l.* weight of silver. The side lights have the figures of Whittington and Gresham, benefactors of this library in its early days; and Stow and Milton, London's famous citizens.

When we gave a view of the design in 1870,* and plans of the two floors, we said:—"There is every reason to expect that the new Library and Museum will reflect great credit on the Corporation and all concerned in the creation of them." We are glad, now that the buildings are finished, to be able to say that this anticipation has been in no way falsified.

THE PRESIDENT'S ADDRESS
AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the opening meeting of the Institute on Monday evening last, November 4th, the President, Mr. T. H. Wyatt, according to custom, delivered an address, first mentioning the steadily-increasing numbers of the Institute and the great facilities now offered to the architectural student for acquiring a proper knowledge of his profession,—facilities which, he feared, were not so generally appreciated as they might be. He referred especially to the establishment of art classes in the Architectural Museum, to the Royal Academy Drawing Class, and to the praiseworthy efforts towards self-improvement made by the Architectural Association. Adverting to the professional examination established some years ago by the Institute, he remarked that its rules had recently undergone considerable revision, with advantage to candidates, who might now present themselves either in the "Artistic" or "Scientific" section at one time, and who, on having passed successfully in both, would receive a certificate of professional proficiency, together with certain privileges in connexion with membership of the Institute. After referring to the financial condition of the society, the President alluded to the death of some of its members during the past twelve months. Passing on to speak of the Architects' Benevolent Institution, Mr. Wyatt urged the great claims of that society on the support of the profession, stating that its funds were far from adequate for their charitable purpose. He thought that the general conference held in July last had done good work in settling certain points of professional practice, and in drawing up a series of rules and suggestions for the better management of architectural competitions.

We take from his obituary notices the references to such of the deceased members as have not already been spoken of at any length in our pages, and print the remainder of the President's address.

MR. HENRY ASHTON was born in London in 1801. He was advised to Sir Robert Smirke, R.A., and on leaving his office went into that of Sir Jeffrey Wyatville, R.A., who was then engaged on important works at Windsor Castle, and with whom he remained up to their completion, and to the death of Sir Jeffrey. Mr. Ashton was subsequently employed by her Majesty to erect the

Royal Mews at Windsor, and the Kennels at Frogmore. Amongst the public works for which he competed were, the Houses of Parliament, the Nelson Monument, the new National Gallery, and the Great Exhibition of 1851. Though unsuccessful in these competitions, Mr. Ashton's designs were marked by considerable originality and taste, and great power of execution, for he was an elegant and artistic draughtsman. He was employed by the late king of Holland to make a design for a summer palace at the Hague, and for many years had extensive practice on the private mansions of some of the nobility and gentry of our own country, in many of which his works show evidence of considerable professional skill and fertility of invention. The buildings which he erected for the "Westminster Improvement Commission," in Victoria-street, and that neighbourhood, were amongst the first which offered to the inhabitants of this metropolis the advantages of extensive suites of apartments disposed "de plain pied," like the Continental and Scotch flats, which have this additional advantage, that they enable the architect to deal with larger masses of building in one frontage than he possibly can with the usual contracted breadth of modern houses, driving him to inordinate and inconvenient height to obtain the necessary accommodation for a family. His numerous private friends were well acquainted with his painter-like illustrations of his foreign travels, but beyond that there was the charm of a polished intellect, pungent wit, and a well-stored mind. He died on the 18th of March last, after a long and trying confinement to his room from partial paralysis.

MR. JAMES SPENCER-BELL.—I am unable to obtain particulars as to Mr. Bell's professional life. He was, fortunately for his own ease, in a position requiring little labour on his part, but he was attached to the profession he nominally followed, and for some time showed his interest in it by acting as honorary secretary to the Institute. He was a pupil of Mr. Railton's, but did not attempt to practise after the age of thirty. Mr. Bell travelled much, and was indefatigable with his pencil. He represented the borough of Guildford for some time in Parliament. He took an active part in the committees of the House of Commons, and was a diligent worker in several societies of a benevolent and religious character. He was in declining health for some time prior to his death, which occurred in February last, at the age of 52.

MR. WILLIAM JOSEPH BOOTH was one of the earliest Fellows of the Institute, his name appearing in the first published list of the members. He followed his professional studies in the office of his father, and imbibed a decided taste for Greek architecture, then almost the only, certainly the favourite style of the English school. He travelled in Italy and Greece, and at Athens had many casts made from the finest monuments of that city. On retiring from the profession he presented these casts to the Institute. Mr. Booth had a very refined appreciation of art in all its branches, and made a valuable collection of books and prints. The works he executed were chiefly for his own company, with whose committee he periodically visited their large property in the north of Ireland, where he designed many churches, schools, and farms. He left London to reside at Torquay, where he died. His widow, conscious of the interest he felt in the Institute, presented several of his architectural books to the library. He was a man of modest retiring habits, a devoted lover of his art, and of a benevolent generous disposition.

MR. WILLIAM POWELL, an associate, who died of consumption, in the spring of this year, at the age of thirty-two, was a pupil of Mr. Whitehead's and a member of an old Kentish family residing at Lenham. He was an excellent musician, and otherwise accomplished as an artist. In his very short independent professional career, Mr. Powell was the architect of the schools and literary institution at Lenham, and of some villas at Forest-Hill and Sydenham. Mr. Powell is spoken of by those who knew him well as an amiable and honourable man, and one whose early death cut short a very promising future.

MR. H. J. WILLIAMS, an associate of the Institute, was the son of Mr. Herbert Williams, a fellow of the Institute, and surveyor to the Drapers' Company. His death occurred from an accident on the ice. He was associated with his father, and took a considerable share in designing and carrying out the new Drapers' Hall. He also had the credit of redecorating

* Vol. xxviii., pp. 681 to 687.

the Church of St. Michael, Cornhill, which was originally restored and decorated some years since by Sir Gilbert Scott. Our associate was also a student at the Royal Academy. He was much esteemed by all with whom he was brought in contact, and his career opened with considerable promise.

Mr. ARTHUR BAILEY DENTON, who died on the 3rd of October last, at the early age of twenty-eight, was an associate of the Institute, and a pupil of Mr. Blomfield's. He was an intelligent and industrious pupil, with considerable habits of business. Mr. Blomfield speaks of him as one for whom he had a great regard, and who would, he thinks, have done very creditably in his profession, and made a valuable member of the Institute. He superintended the working out of all the architectural drawings and details in his father's book on "The Homesteads of England," and took the architectural department in his father's office.

I was somewhat severely taken to task a year or two ago for not including in the obituary I laid before you the names of *all* architects who had died during the past year, and I was accused of exclusiveness or ignorance! Gentlemen, I shall again lay myself open to the charge, and confine my remarks as to the lives of those members of our profession who were members of this Institute. The sad list is quite long enough as it is, and the lives and works of other architects not belonging to us find abundant opportunities of being fully described and (when deserved) duly honoured in the architectural publications of the day. As an exception proves a rule, so I think there may be cases in which a departure from that rule is permissible, and such a case I believe will be the mention of Mr. Wightwick's name. He was probably more generally known as the author of several works on professional subjects than as the practising architect; and he was thus far specially connected with our Institute that on two separate occasions he presented books and drawings to our library, and competed for and carried off the silver medal of the Institute, for an essay on "The Architecture and Genius of Sir Christopher Wren."

Mr. GEORGE WIGHTWICK for many years lived at Plympton. His early career was briefly described by himself in a short poetical effusion, entitled "On my Retirement after Fifty Years' Voyaging over the Waters of the World:"—

"An orphan'd infancy, an anxious youth,
A struggling manhood, with its loss and gain."

Mr. Wightwick was born in Flintshire in 1802; and was articled in 1817 to Mr. Edward Lapidge, architect, of London. On the expiration of his articles, he spent some time in Italy, and on his return went into the office of Sir John Soane, when he published his first work, "Select Views of the Roman Antiquities." He subsequently settled at Plympton, where (to use his own words) he had "a considerable and ever-increasing practice." His principal works were the Orphan Asylums at Plympton and Devonport, the South Devon and Plymouth Hospital, additions to the Cornwall Lunatic Asylum, important additions to Theguma Castle and to Thegurbam House, and several of the principal terraces and street-houses in Plympton. Mr. Wightwick was the author of several works connected with architecture,—such as "The Palace of Architecture," "Hints to Young Architects," &c. He retired from practice, and settled at Portishead, in Somersetshire, in 1855. Mr. Wightwick was deservedly a great favourite with the Literary and Artistic Society of Plympton. As a student of dramatic literature, few would excel him in the rich fund of knowledge with which he illustrated his Shakespearean readings. He gave to the Institute during his life a large number of illustrations, which he had prepared for the numerous lectures on Architecture he gave from time to time, and in his will bequeathed to us copies of his literary works, and a considerable number of the drawings he made during his residence abroad.

Last year I was able, through my brother's kindness, to give you some particulars of the interesting work going on in Germany, Austria, and Belgium; to that list I have now little to add. The award of the first prize for the Houses of Parliament in Berlin is in itself a very important act. However little satisfactory to the disappointed candidates, and to many others, that award may be, it is no doubt an important step towards the realisation of a great European work. In Vienna, the erection of the Austrian International Exhibition cannot fail to be full of

interest as a matter of constructional science and artistic treatment. Under the former head, the authorities have sought the aid of our countryman, Mr. Scott Russell, whose experience and fertility of invention in such matters are well known, and for the taste and elegance which will be brought to bear upon its decoration and its accessories, we need have little misgiving. We have seen on more than one occasion how readily and artistically the Viennese can deal with such matters.

In Holland, the completion of the fine church of St. Catherine, at Eindhoven, by our honorary and corresponding member, Mr. Cuyppers, of Amsterdam, deserves special mention.

In France, borne down as she now is by the weight of her terrific debt, and still more, I fear, by the incuhus of utter uncertainty as to her political future and the antagonism of parties, it was not to be expected that there should be much architectural progress; but I think we must all be pained and surprised at the apathy or failure of the students in architecture which has been reported. Europe can ill afford to lose France as one of her leading spirits in the pursuit of an art under any one of its civilising forms: so all here will join with me in wishing her a speedy resurrector from her many troubles. The Americans, free from such drawbacks, seem to be exhibiting their usual energy in numerous public and private buildings, where expenditure seems boundless, and where the scale on which their buildings are erected seems to bewilder. Imagine, in one town, three new hotels building at the same time with 830 rooms, 475, and 275 respectively. In their town of Chicago alone more than 1,000 buildings of the first class have been erected since the great fire, valued at 40,000,000 dollars: great as have been the precautions against a recurrence of such a calamity as visited their city but lately, little or no control has been exercised over the architects' designs, and as an evening contemporary, no doubt truly, says,—"The amusing confusion of orders and schools in the new Chicago is startling. It was inevitable, and does not prevent the revival of the city being even more startling than its original growth."

In our own country I think the architect has little to complain of, as far as the demand for his services is concerned. There has seldom been a time in which the national prosperity of a country has shown itself more fully developed in the erection of costly private dwellings for her citizens, in handsome and capacious public buildings for her municipal and county requirements, banks and insurance offices for her commercial pursuits; in the care and re-erection of almost numberless churches and places of worship for every sect and calling; hospitals and asylums and homes for the afflicted in body, or mind, or estate; and, though last not least, in the erection of schools without number.

It would be, probably, difficult to ascertain what proportion of these works has been entrusted to the architect on the faith of his own special qualifications, and how many have been the result of competitions. I am inclined to believe it would be found that the former cases predominate. That this should be so is not, I think, so surprising, seeing how unsatisfactory almost all the results of modern competitions appear to be to the competitors, if not to the public. Certainly we have not yet succeeded in England in arriving at the form of tribunal, whose decision shall inspire confidence, and the office of the present referee is about as disagreeable and thankless as can well be imagined. How far the "General Regulations for the Conduct of Architectural Competitions," which were approved and adopted at the General Conference of Architects in June last, may, if generally acted on and honestly carried out, remedy this unsatisfactory state of things, remains to be seen; certainly it will not, unless they are resolutely insisted upon by all architects entering on the competition. We have now before our eyes a most interesting and important competition still undecided. I allude to that for the Edinburgh Cathedral. One of our members (Mr. Ewan Christian) has, I understand, been called in to report and advise on this subject, and if abundant knowledge and experience, and the most unquestioned integrity, can ensure a satisfactory and equitable decision, then I think the distinguished competitors who are engaged on this "concourse" should wait with confidence, and accept his award without murmuring (at least to the minimum extent to which human

nature is capable). Since I addressed you last year we have seen in the metropolis the rapid advancement or completion of several important public works, such as the Albert Memorial, the Chapter House at Westminster, the group of buildings for the learned societies in Piccadilly, and the adjacent works for the Royal Academy, the new Post-office, and the Guildhall Library in the City.

In addition to these there are still in progress other important works, some in their infancy, such as the Law Courts, the Natural History Museum at South Kensington, &c., and others in a more advanced state, such as the Home and Colonial Offices in Whitehall.

I purposely avoid dwelling on the numerous important works now in progress, or lately completed in the provinces and in the sister kingdoms. They are from week to week so well illustrated and so abundantly described in the architectural publications of the day, that any fresh recurrence to them would be unnecessary and tedious. Their name is "legion," and many of them do great credit to the advanced architectural taste or knowledge of the day.

Last year I indulged in some mild criticisms on the architecture of some of the public buildings in progress, or undergoing the ordeal of public criticism. I thought I had done so carefully, and without the possibility of giving offence; but as I subsequently found that an interpretation was put upon my opinion which I had not intended; that an importance was attached to it from my official position, which it would not otherwise have been entitled to; and, though I am personally I have much regard, and for whose ability and power I have every admiration, I have determined to avoid a recurrence of such contretemps, and from this chair to express no opinion on the architectural merits of the works I allude to. I retain, of course, my individual privilege of criticism, and of that which is so dear to an Englishman, the right to growl and grumble. I trust I may ever exercise that right with moderation and care, and with a due regard to the feelings of others, to the difficulties and drawbacks they have had to contend with (of which the critic frequently knows nothing, and cares even less). Gentlemen, I wish that in our profession there was, as a general rule, somewhat more consideration for the sensitive feelings of others; less of the self-sufficient criticisms we have so frequently and so satirically thrown about on the works of others. I believe in no profession is such licence condemned by the public.

I hear this custom condemned by the public. What with an unusually long obituary, and a certain amount of preaching, my address has up to this time, I fear, been of a very lubricious character. The few remaining remarks I have to offer will be of a more cheerful and congratulatory nature.

All here will, I feel convinced, be glad to think that another member of our profession has received such honour at the hands of his sovereign as is sometimes accorded to English architects. Nor is it less gratifying to us to feel that, with the honour, Sir Gilbert Scott has received the still greater boon of restoration to health. His many friends will desire that he should not trespass too much on that restoration, but that as he deals with the numberless cathedrals placed under his care, tenderly and conscientiously, so should he deal with his own health, that he may be spared many years to enjoy his honours.

It will be remembered that much interest was created last autumn by a letter which appeared in the *Times*, from Mr. C. Tyrwhitt Drake, describing the ruins of Baalbek as "fast perishing from neglect and wanton deprecation."* I was requested, as your president, to put myself into communication with Lord Granville, the Secretary of State for Foreign Affairs, with a view to see if some steps could be taken to check such desecration. Nothing could be more courteous, or show greater interest in the matter, than the action taken by Lord Granville and by Lord Enfield. The result has not been less satisfactory, for Lord Granville has forwarded a communication made to the Foreign Office to the effect that "the Turkish Government would itself take measures for the preservation of the ruins of Baalbek."

Not less important, nor less interesting to the members of this Institute, was the continuation of a grant from Government for the excavations at Ephesus, which had been conducted with such

* See also letter in our volume for that year (xlix, p. 1004) from Mr. J. D. Crace.—Ed.

perseverance and signal success by our countryman, Mr. Wood, for a period of thirteen years, and which promised "to restore to the world one of the most renowned edifices of ancient times, the Temple of Diana of the Ephesians." This interest found a vent in the presentation of a memorial from the President and Council of the Royal Institute of British Architects to Mr. Gladstone as First Lord of the Treasury. On the 24th of July last I had the honour to receive a letter from that gentleman to this effect:—

"Downing-street, July 24th, 1872.

Sir,—Mr. Gladstone desires me to acknowledge the receipt of the memorial from the President and Council of the Royal Institute of British Architects on the subject of the excavations now proceeding at Ephesus. I am directed to call your attention to the Supplementary Estimates for 1871 Services which have been presented to the House of Commons, in which the amount of £3,000 appears for the excavation of the Temple of Diana at Ephesus, being a moiety of the sum of £6,000, required to complete that work; and I am to express Mr. Gladstone's hope that the decision which has been arrived at by her Majesty's Government may be satisfactory to those on whose behalf you have presented this memorial.

I have the honour to remain,

Your obedient servant,

W. B. GEDDON.

T. H. Wyatt, esq.,

Gentlemen, the memorial we presented stated truly that the temple (so lost to the world for more than 1,600 years) had always excited deep interest amongst historians, students of classic art, and writers on Biblical archaeology, and that to architects it had been a subject not only of interest, but of some perplexity, arising from statements of certain peculiarities in its design peculiarly unique, and which hitherto had been difficult of elucidation. It was not to be doubted that so accomplished and so devoted a student of classic art and classic lore as Mr. Gladstone would share in the general desire to see this mystery unravelled and these treasures collected in our own glorious department of Grecian antiquities in the British Museum. As has been well put elsewhere, "England is once more to make up by the spirit of enterprise (of which she has abundance) for the love of knowledge (of which she has not so much)." English spades are, as heretofore, to clear the way for German spades; nor is the spade, as was for a moment threatened, to be thrown aside in mistake after the first shovelfuls.

I will not suppose that the precious fragments now in Great Russell-street have not been visited by all present. If, however, there are any here who have not yet seen them, let them lose no time: they will be abundantly repaid, whether they go to study history or art. It has been truly said that "their historical value cannot be overrated; their artistic value is considerably greater than has at present been recognised; and they belong to a school of design which is full of genius as well as of skill and training." I hold that it is an honour to have aided, in however small a degree, in the furtherance of this precious work, and I can fearlessly ask the approval of the members of this Institute for the action taken by their council in the matters of Baalbek and Ephesus.

Since the foregoing was written, I have been informed by one well qualified to speak on such a subject, and whom you have honoured by the award of the Queen's gold medal, that amongst the recent additions to our knowledge of ancient architectural art, one of the most important has been the discovery of a Sassanian palace in the desert behind the Dead Sea by the Rev. Mr. Tristram, in the spring of the present year.

This palace, which dates from the first year of the seventh century, is the only specimen of the decorative style of that age which is known to exist, and supplies, in part at least, the missing link that was wanted to connect the styles of the West with those of India, and enable us to understand much in the Saracenic architecture of Persia and India which has hitherto been wrapt in mystery.

The details of the building, which are of extreme beauty and delicacy, will probably soon be published by the discoverer, and will no doubt prove a most interesting addition to our knowledge of the thousand and one styles in which mankind has expressed the idea of beauty and fitness in our noble art.

At some later period in the session I have reason to hope that Mr. Ferguson (who is my informant) will be able to give us some further information on this interesting discovery and show us some photographs of its details.

Mays at the British Museum.—A correspondent complains that certain map-publishers do not send their works to the British Museum, or they are not to be found in the catalogue.

THE WINTER EXHIBITION AT THE FRENCH GALLERY.

FORMERLY the Winter Exhibition at the French Gallery bore nearly as distinctive a character as that for which the summer season has so regularly taken the credit of appropriating. It was better worth appropriating a time ago than it is now: before our cousins—German, and brothers—in mutual esteem—French, who can paint, were so sure of kind welcome to house-room and honour at the Royal Academy of Great Britain.

It used to be the case, that when at Lammastide the doors were closed on all further opportunity of wondering at the proficiency of Continental artists, at the delightful grace and ease with which a paint-brush could make itself generally understood, if it expressed an intention or a sentiment, in its best French language, some consolation lightened the regret at losing it, in the pleasant recollection of how often in the interregnum this foreign power of excellence had been taken advantage of to help in showing that we at home had a share of a similar power; for though the British pictures that were to be seen on these walls when the fogs of November, and the darkness common to it, and its nearest sequent months, took holiday, and allowed of it, were never the chief works of the painters contributing them; in this respect, for one, differing from so many instances provided in the carefully selected examples of the French, Belgian, and other schools, that Mr. Gambart and Mr. Walhs, have furthered in celebrity; yet they numbered amongst them enough of what were admirable and delightful to make the Winter Exhibition at the French Gallery one of the pleasantest resorts to be chosen on a clear, cold day; a luxurious place of shelter from a shower on a wet one, or from the valuable clouds of dust that March may bring on a dry one. There is a change for those who love change; the nice comfortable room remains, but its decoration for Christmas-time is no longer all English.

"And a good job, too!" some will say; but "All for the worse," say we.

Second and third rate pictures of foreign schools show no great difference from those of similar status at home; for it is only by the best instruction that the best learning is to be acquired.

So much has been said and written in comparison of foreign and native artists, the desirability of an English painter becoming like a French painter, and of other unational and unartful results, that the question remains to be asked, "if, allowing for all the exquisite qualities that characterise the best Continental artists, a British painter who attains the nearest approach to perfection that the conviction of the learned deem possible, would not be less like the very best of any other nation's best painters?" Our Royal Academy has held, and holds at the present time, a *quorum* of the ablest painters in the world; but of these some have done their best, and others will never do the best they could do.

The present collection of pictures, though the authors of them are of various countries, affords very little opportunity for comparison: all alike of a mild order of merit, they ask but for a similar degree of acknowledgment, such as patient devotion of clever labour to small effect can exact.

Mr. T. Faed, R.A., is a conspicuous contributor. The force and dash of his splendid method of laying on beautiful colour gives a value even to so small a matter as his portrayal of a village coquette arranging her hair. "The Cottage Toilette" (45) is killing to every object near this artful representative of warm complexion: the glass before her tells others as well as herself how highly she is to be prized—and priced. In quite another form of attractiveness, the "Britanny Milk-girl" (137) of M. E. Hublin will offer proof that styles may vary, like languages, and yet be truthful. For the precision of drawing and firm solid painting with which an ordinary peasant maiden has been depicted in her quietest and most natural mood, like plain print as opposed to autograph, makes it the more easy to read and judge of the author's excellence: yet, for the indescribable charm that appears to vitalise Mr. Faed's damsel, there are many who would prefer it, and think the consummation of all artistic skill best attained when the necessary means of obtaining it are quite lost sight of in the successful result of their application,—the success itself. "A Turkish Dancing-girl" (94), by M. E. Vernet Lecomte, suggests more academical perfections than may really belong

to her (N.B. No doubt is imparted by this of her dancing capabilities). The head and massive throat and arms from elbow downwards seem disproportionate with so narrow shouldered and slight a torso that the little body presents. However, this may be really intentional; and some ballet-girls are more than metaphorically "all legs and arms": it would be a pity to think otherwise, with such excellence of workmanship that this production displays.

Admirable technical qualities constitute the chief claim to such interest as is excited in the spectator of a very melo-dramatic representation of one of those scenes from French history that illustrate the national chronic disorder,—Revolution. The royal family at "Versailles, October 6th, 1789" (127), are depicted awaiting the invasion of the mob. The king, in the resignation of despair, is seated, surrounded by a demonstrative group of terrified ladies and children, amongst whom the queen alone shows any indication of being at all equal to the situation, and this indication is not sufficiently marked to realise one's conception of the heroic Marie Antoinette. The figure kneeling, in a distraction of terror and grief, is very graceful, and forms one of the most beautiful points of colour in the picture, throughout which a fine sense of it is manifested. The artist, M. G. Bencure, may more justly boast of power than of his control of it. If size and a very obtrusive framing of strong assertion go for anything, Mr. E. Long is exceptionally powerful, too; indeed, it is very well known he is, though his ambitious attempt to become classical and correct does not help very well to prove the fact. "A Dorcas Meeting in Rome,—Fourth Century of the Christian Era" (58), looks so little like former, proper, emanation, and so like the work of a less-experienced master, dominated and howled over by combined admiration of M. Alma Tadema and Mr. Dobson, R.A., that only with the unfinished and best portion of its composition,—the Spanish Gipsies,—a picture, though unfinished, in themselves,—to help at a guess, could this clever painter be identified. By-the-bye, Mr. Dobson is a contributor to the present exhibition; but his children "In the Garden" (143) will not assist much in proving how he could have influenced Mr. Long; for though he idealises, as does M. Le Jeune, A.R.A.; and how pretty his peasant children are "At the Spring" (3), or as "Gleaners" (145), though tamed by an artificial grace, it is by more important productions they are both best known. Similar acknowledgment is due to similar trifles that winter exhibitions give opportunity of showing and make known as pretty things that leisure from harder work gives birth to; but art can elaborate trifles until they become exhibitive of art's utmost manipulative resources. Patient devotion to completeness, even so far down as to the fit expression of a shoe-tie, will account in no great degree, unless the object aimed at is some end in view beyond mere show of wonderful but wasted means. "The Garde-lettre" (66), by M. F. Verhas, that would only out-Follet *Le Follet*; and "The Jewel Casket" (100), by M. E. Moche, are examples to assist at explanation.

If Mr. T. F. Dicksee agrees with many others in the wish that museums, and all places for intellectual cultivation, should be open on the day of rest, why does he not say so? To paint such an opinion is far more difficult (55). Far better would it have been had he proved bow tawdry and forced are M. H. Schlesinger's idealities, "Fiorella" (72), and the loose-limbed female at home with "My Nancy Perroquet" (93); for these productions gain praise from those who contemn and despise Greuze! "Death of Manon Lescaut" (16), and "Ophelia" (17), by M. J. Bertrand, are not favourable specimens of French art.

If it were possible to designate any emanations from M. E. Frere, poor and trivial, "The Schoolboy at Home" (47), and the girl "Feeding the Rabbits" (155), might well be a basis for a one-sided argument.

"Evening at Home" (19), very agreeably and broadly painted by M. Crackorski; "The Country Lawyer" (25), C. Schlosser; and "Their First Bottle of Champagne" (120), by the same; "Feeding the Chicks" (27), J. Trayer; "A Severe Mistress," T. E. Duverger; and "Off to the Wars" (48), by the same; "Toddles" (63), by J. Morgan; "Friends" (69), by F. D. Hardy,—a poor indication of what Mr. Hardy can do; "The Young Invalid's Birthday" (73), by M. E. Moulain, would be very bad in a bad collection; "The Toilette" (76), very clever, but spoilt by the reflection of

so ugly a face as the glass shows; "A Brittany Peasant's Home" (79), by L. Caille; "A Decisive Move" (80), by A. Casanova, tessellated and lined by hard finish; "The Ante-Room" (83), in which a widowed mother is waiting to learn if her daughter's accomplishments can be sold for much less than they were bought, to keep the wolf from the door, by E. Delfosse; and "Road-side Shelter" (116), by J. C. Thom, give a fair idea of what the collection is comprised of.

Mr. A. H. Tourrier's smaller replica of his clever picture, "Drilling Recruits of the League" (89), is a notable item; and Mr. A. E. Mulready's metropolitan Arabs, though their ragged draperies are peculiarly unaffected by London dirt and smoke, and their pretty faces have a scented-soap-washed look, are attractive, whether as "Wandering Minstrels" (41) or "Echoing the 'News of the Day'" (62).

There are pleasant bits of landscape here and there, amongst the comparatively few contributions of this kind; and some sheep, by Mr. T. S. Cooper, R.A., with a study of "Black Cane and Head of Deer" (12), by Mr. Ansdell, R.A., give a little variety where a good deal more is wanted.

THE FEMALE SCHOOL OF ART.

THE school in Queen-square, Bloomsbury, under the direction of Miss Gann, is making satisfactory progress, and has carried off many prizes. A national gold medal and Princess of Wales's scholarship has been awarded to Miss Emily Selous (now Mrs. Fennessy), for an original study in modelling, and a head from the antique; the Queen's gold medal and a national bronze medal, book prize, and third-grade prize, to Miss Alice Blanche Ellis, for an original design of a fan, and other drawings; the Queen's scholarship, value 30*l.*, and a bronze national medal, to Miss Emily Austin, for water-colour drawings; a national silver medal, to Miss Julia Pocock, for an original study in modelling; a silver medal, to Miss Ellen Hancock, for a study from nature in tempera; national book prizes, and third-grade prizes, to the Misses Elizabeth A. Dorrington and Anne Elizabeth Hopkinson, for water-colour studies; third-grade prizes, for water-colour drawings, designs, and other drawings, to the Misses Ellen Ashwell, Louisa Baxter, Elizabeth Hodge, Eleanor Manly, Mary Ann Pickering, Jennie Moore, Edith Tegetmeier, Mary Whiteman Webb, Charlotte Amelia Anstee, Susan Ruth Canton, Alice Hanslip, and Rosalie Watson. The subject of Mrs. Fennessy's work is Cimabue, seated as at work; a lifelike figure, highly creditable to the artist. Sir John Bennett's prize, a gold watch for the best design for the front and back of a watch, has been awarded to Miss Ireson, who has given the vivacious knight full value for his money. Miss Alice Ellis came second. We must note, with a view to improvement in that direction, that the drawings made in the school from casts of architectural ornaments are for the most part somewhat hard and uncertain.

THE WATER-SUPPLY QUESTION: SHEFFIELD.

THE difficulty of supplying Sheffield with water may be measured by the number of Acts of Parliament the Waterworks Company have found it necessary to obtain. Since 1830, when they started, they have been getting an Act of Parliament about every six years, on the average; and yet they have fine moor-land on the west of the town from which to gather water, with an average rainfall of nearly 40 in. in depth. The two causes of their having always been short of water in the town are,—first, that they have promised to give the millowners in compensation more water than was their due; and secondly, they have wasted a great part of that they retained for the town. Speaking on a question of water-supply, at the Institution of Civil Engineers, about two years ago, Mr. Hawksley said of the Sheffield Waterworks, in respect of the loss to the town by the great quantity of the company's water abstracted to supply the mills, and other bad arrangements, that they formed the most important case that had ever presented itself in this kingdom; and one may, without much fear of misconstruing his argument, say, that had it not been for this undue quantity given or allowed by the Legislature to the mills, and had the loss by evaporation not been underrated, there would always have been plenty of

water for Sheffield. In February last the House of Commons asked for copies of all reports made by Mr. William Pole to the Board of Trade and the Home Office, in 1870 and 1871, on the constant service system of water-supply, and in his report on the Sheffield Waterworks, dated February, 1871, he says, the domestic supply of the poorer districts had theretofore been obtained largely from underground cisterns (supplied with water by the company), which have formed a peculiar feature in the water arrangements of this town. A cistern, or tank, holding perhaps 600 to 1,000 gallons, is excavated in a courtyard surrounded by small houses, and is lined with brickwork, and covered in with flag-stones, one of which is left movable, for access. The tank is supplied by a pipe and ball-cock from the company's main, and the water is obtained for the use of the houses by a pump fixed in the yard, the suction-pipe of which dips into the tank. These cisterns are, of course, objectionable, in a sanitary point of view, as the water is liable to be fouled by drainage from the yard and privies; and it is such a troublesome process to clean or even to examine them, that neither is often done; but the great objection to them by the water company is on account of the opportunity they give for waste. The tanks often leak, the ball-cocks get out of order, and then waste may go on continually, unseen and unsuspected, to an enormous amount, and for a great length of time.

There were at the date Mr. Pole made his report about 1,330 such tanks in Sheffield; but, under regulations made in the previous year, the company were causing them to be disused for water purposes, and, in substitution for the underground tanks, as a simple plan, one or more stand-pipes are erected in a courtyard, supplied directly from the main, and from which the inhabitants can draw water at all times. This is a gain to the inhabitants, as it saves the trouble of pumping, and the quality of the water is, of course, much better; but in most cases it is preferred to supply the water into each house, for which purpose a lead service-pipe is introduced over a sink, and furnished with a simple tap at the end. The number of baths in Sheffield is small, and they are confined to the best houses, so that they form no important element of waste. The few baths in Sheffield being confined to the best houses, there can be none at all where they are most wanted; for who that has been in Sheffield will deny that they are rather more wanted there than elsewhere? The Lancashire woman, finding herself crowded in a third-class carriage, angrily cried out, "There's always 't' most thrutching where there's 't' least room"; and if she had had to speak on a question of water-supply she might have said, with equal truth, there is always the least water where it is most wanted.

The Act of 1853 imposed on the company the duty of giving a constant supply, with, however, the proviso that the enforcement of constant supply should be delayed; that eight hours' supply per day was to be given immediately; twelve after four years; and the full constant supply was to be given in ten years after the passing of the Act (that would have been in June, 1863), if required by the town council. The Act of 1860 authorised the company to make regulations to prevent waste or misuse of water supplied by them; but it was provided that these regulations must be subject to approval or modification by two justices of the peace. When approved by the justices, the rules and regulations were to be compulsory on the consumers. When the time came, in 1863, for giving a constant supply the corporation made no demand for it, but in February, 1864, they made inquiry of the company whether they were in a position to give it. The company were, in fact, not able to give a constant supply, because the new works that they had been hurrying on to meet that demand,—the most important work being the Bradfield reservoir,—were not completed. About the beginning of March, however, the bank of that reservoir had been brought up to its top level, and the water was allowed to accumulate, and the reservoir was nearly full by the 11th; but about midnight the bank gave way, and something like 100 million cubic feet of water, or more than 600 million gallons, were suddenly thrown down the narrow and steep valley, causing immense loss, for which the company had to make compensation; and to enable them to do that, they obtained an Act in the same year, which contained a clause postponing the adoption of constant service, until the 29th of July, 1869, when it was to be

put in force, if required by the town council, under the penalty of paying no dividend. When the proper time arrived, the corporation required the constant service to be given, and on and after the day fixed by the Act, the water was turned on for the whole twenty-four hours. The immediate consequence was an enormous waste of water. During the month of July, 1869, the consumption had been about 4,500,000 gallons per day, or 2½ gallons per head per day, the population being 210,000. In August, immediately after the introduction of the constant service, it rose to 8,500,000 gallons, or 40 gallons per head per day. This was very alarming to the company, and they proceeded to prepare a set of rules and regulations in accordance with the powers given them in the Act of 1860, which were submitted to the justices at the end of September, 1869. On the 4th of November, the justices opened the public inquiry which, from its nature, extent, and cost, forms, says Mr. Pole, one of the most remarkable episodes in the history of water supply. This inquiry, it was thought, might only occupy a few hours, but it was protracted over three months, owing to the antagonism between the company and the corporation, each side calling a long array of witnesses, and the money spent on the proceedings was enormous,—estimated at between 8,000*l.* and 10,000*l.*

In February, 1870, the justices adopted and published a modified set of regulations, to the following effect:—

After a period of six months from the date of the instructions, all service-pipes were to be of lead, and of at least the following weights, except that when the diameter is more than 1 in., the company may require the pipes to be of cast-iron, of such weight as they may consider necessary:—

Lead pipes,	in. diameter,	5 <i>lb.</i> per yard,
"	½ in.	7½ "
"	¾ in.	9½ "
"	1 in.	11½ "
"	1½ in.	16½ "
"	2 in.	22½ "

The joints are to be of the kind called a plumbing joint, and not a blow-pipe joint. All drawing-cocks, stop-cocks, and ball-cocks, are to be of hard brass. No overflow or waste pipes to cisterns are allowed to be used, other than detective or warning pipes. These consist of pipes brought from the top water level of the cistern to the outside of the house, and the ends placed at such a level above the ground that they can easily be seen, and any run of water from them detected by the company's inspectors. The ball-cocks of the cisterns therefore have to be kept in working order. Every water-closet is to be provided with a waste-preventing cistern, and the valves of the closet-pans are to be worked by brass rods, at least 3-16ths of an inch diameter, and not by wires or chains. Every bath is to be provided with a well-fitted and perfectly water-tight ground outlet plug or cock.

The consumption of water at Sheffield is about 6,500,000 gallons per day. The number of houses laid on (at the date of the report) 47,000, and the estimated population about 225,000. This gives a consumption for all purposes of about twenty-nine gallons per head per diem. The total quantity of water supplied in 1870 by meter for trade purposes was 226,000,000 gallons, and for corporation purposes 14,500,000 gallons. The consumption per head per diem may be divided thus:—For domestic purposes, twenty-six gallons; total, twenty-nine gallons.

The amount expended on the works of the company before the bursting of the Bradfield reservoir was 415,000*l.*; but now, including the cost of the damage done, it is something over a million. The dividends on the ordinary shares were, before the accident, 5 per cent.; now they are 3 per cent. Before the accident, the water-rate had been about two-thirds of the maximum allowed by Act of Parliament to be charged, and in 1853 this reduced rate was made law; but after the accident, the Act of 1861 raised the rates 25 per cent.—that is, to about five-sixths of the maxima allowed by the original Acts.

The whole history of the Sheffield Waterworks shews the impolicy of leaving such a public duty as that of supplying a town with water in the hands of a private trading company. If the works from the beginning had been in the hands of the corporation of the town the rates would, in all probability, have been much less than they are,—allowing for some bad management even then.

NOTTINGHAM ARCHITECTURAL ASSOCIATION.

On Wednesday evening, October 30th, a meeting of the above Society was held at the School of Art, Mr. T. C. Hine, President, in the chair, when Mr. S. Dutton Walker, F.S.A., the honorary secretary, read a paper "On the best Means of making the Society useful." We subjoin a few paragraphs.—

I hope to see the day when a disgrace to the town will be swept away: I allude to the ruinous state of Nottingham Castle, and although I am personally a strong conservative of every structure and every thing having anything of an archaeological feeling about it, I do think that in this case the transposal of our ruins castle into a Science and Art Museum would be eminently advantageous. I hope to see a museum there in which we as scientific men may find examples of the many varied scientific productions which are almost daily being brought out. For instance, terra-cotta in its various forms; locks, with their thousand combinations; moulded brickwork, the manufacture of which, I holdly say, after knowing what has been done in North Italy, is but in its infancy; stone samples, with their geological description and localities; specimens of iron in their wonderful variety; details and examples of constructive sanitation; in fact, all novelties connected with and bearing upon the science and art of our profession should there be found; and this Society should encourage the establishment of such a museum with all the warmth and by all the means at its disposal. In fact, and in few words, we should have a provincial South Kensington; and our Association should be the curator, and use its lover in giving the necessary impetus to art and science studies in Nottingham.

In a modern poet's words:—

"In art and in science exists no division;
As the hilt to the sword or the oord to the bow,
So science and genius unite in communion,
Both facts to elicit and grace to bestow.
There is harmony, ever unseen, unsuspected,
In the forces of Nature, the powers of the mind;
And when by the counsel of talent directed,
The soul of the student that union shall find.
No art without science has risen or flourish'd,
No science is lovely when wanting in art;
They are flowers of one stem, by one influence nourish'd,
Twin rays from one sun, of one system a part."
—H. B. Cooper.

This brings me to another part of my subject, which is the establishment of a reference library. We all know how costly many of our professional books are, and though opinions may differ as to the use and value of many which are published, there is no doubt that both the art and science departments of our profession would be improved by a more thorough knowledge of their literature. It is, I believe, not generally known that the authorities of South Kensington distribute artistic and scientific books on loan, and there is no doubt that, to a society like our own, properly and permanently established, an application of this character would be treated with the highest respect. I have personally, through the School of Art, studied various books in this way. And here I may remind you of the admirable list of books recommended by the Institute Examination Council, which I have not now time to quote, but a copy of which can readily be obtained. (See *Builder*, July 13th, 1861.)

There is in my mind a strong conviction that, as a profession, we are not advancing so rapidly as we might. When I regard the character of the education which the young of the present day have every means of obtaining; when I consider that, at our Mechanics' Institutions, our working men are being taught, not only the elements, but some of the higher branches of scientific knowledge—such as geology, botany, geometry, steam, applied mechanics, chemistry, &c.—I feel, that, unless some steps be taken these working men will be stepping into the places our professional men should not have left vacant.

I need not say how strong is my conviction that a course of study at a school of art should be the starting-point in the career of every student. How often do we find that many pupils have been taught to sketch a landscape before they knew how to draw a straight or a curved line, or how often they have been instructed in water-colour painting previously to the acquisition of the knowledge of free-hand drawing.

At the close of the paper an animated discus-

sion took place; and Mr. M. O. Tarbotton proposed, and Mr. F. Bakewell seconded, a vote of thanks to Mr. Walker for his suggestive paper. After this the meeting resolved itself into a very pleasant *conversazione*.

ALEXANDRA PARK.

Two meetings were held at the Mansion House, on the 4th inst., on the subject of the preservation of the Alexandra Park. The first, at which the attendance of persons disposed to advance, or to guarantee, 1,000*l.* each towards the purchase, was very thinly attended; the second, intended to attract those who are really very deeply interested in the subject,—the working classes,—was larger. No result but a self-stultifying resolution was arrived at in either case.

The gist of the matter lies here, and it is remarkable to see men of known position step upon a platform without having grasped it. The owners of the property would be only too happy to dispose of it to-morrow; and, no doubt, would submit to sacrifices in order to do so. But, if unmanageable, and hitherto unproductive, the property is one of great *bona fide* value. No owner, be he man or company, will aid in the putting up of such a property to sale by a kind of Dutch auction. The Mansion House Committee say in effect, "Name your lowest price, and we will try to get it, in guinea subscriptions." The proprietors say, "We will not trouble you to do anything of the sort. If you come prepared to buy, we will enter into the subject as matter of business; if you only come to us for a leverage by means of which to hawk about our property, you had better stay at home."

TO SOFTEN HARD WATER.

The following are Dr. Frankland's directions for performing this operation:—

To soften 500 gallons of the water supplied by the Chelsea, West Middlesex, Southwark, Grand Junction, Lambeth, New River, or East London Company, shake thoroughly 14 oz. of quick-lime (chalk-lime is the best) in a pailful of water, stir up the milk of lime, and pour it immediately into a cistern containing, at least, 30 gallons of the water to be softened, taking care to leave in the pail any heavy sediment that may have settled to the bottom in the few seconds that intervene between the stirring and the pouring.

Fill the pail again with water, and stir and pour as before. The remainder of the 500 gallons of water must then be added or allowed to run into the cistern from the supply-pipe. If the rush of the water thus added does not thoroughly mix the contents of the cistern, this must be accomplished by stirring with a suitable wooden or iron paddle. The water will now appear very milky, owing to the precipitation of the chalk which it previously held in solution, together with an equal quantity of chalk, which is formed from the quick-lime added.

After standing for three hours the water will be sufficiently clear to be used for washing; but to render it transparent enough for drinking at least twelve hours' settlement is required. Before softening, Thames water has a brownish-yellow tint, when viewed in a cistern 4 ft. or 5 ft. deep: this is owing to the presence of coloured organic matters in solution; but after being softened and settled, it displays the blue-green tint of pure water, and resembles the Rhone as it emerges from the Lake of Geneva, the water of which has, in fact, been deprived of its organic colouring matter in a perfectly analogous manner, viz., by agitation with the mud of the glaciers of the Rhone and Zermat valleys. The chalk mud precipitated from Thames water by milk of lime performs the same functions as the glacier-mud of Switzerland in removing coloured organic impurity from water.

The water supplied to London by the Kent Company being considerably harder than the Thames and Lea water delivered by the other companies, 500 gallons of it require 16 oz. of quick-lime for the softening operation.

Such are approximately the proportions of lime required to soften the London waters, and, by observing these proportions, a tolerably satisfactory result will always be obtained; but, as the hardness of these waters is subject to some variation at different seasons, it is necessary, in order to produce at all times maximum softness, to vary the proportions of lime in a corresponding degree. To enable the operator to do

this, a very simple chemical test is employed, viz., a solution of nitrate of silver in distilled water. This solution has the property of striking a yellow or brownish-yellow colour when it is added to water which contains a very minute trace of uncombined lime. During the final running of the remainder of the 500 gallons of water into the cistern as above described, a dessert-spoonful of the milky water should be from time to time taken from the cistern and put into a white tea-cup containing a couple of drops of the nitrate of silver solution. If a brownish colouration be produced, the alkali lime is still in great excess, and more hard water must be admitted; but if the tint produced be a very faint yellow, only just visible, the proper proportion of lime to hard water has been attained, and the inflow of the latter must be stopped.

This process of softening is only applicable to such water as owes its hardness entirely or chiefly to the carbonates of lime and magnesia held in solution by carbonic acid. All the water supplied to London is of this character, and so is the water generally which is derived from chalk, limestone, or oolite districts.

Any water which softens by being boiled for half an hour will be softened to an equal extent by this process.

It deserves to be mentioned that the patent for this valuable process, invented by the late Dr. Clark, having expired, the public are now free to use it; but the antiquated system of intermittent supply, which is still maintained in London, opposes a serious obstacle to its adoption in private houses, on account of the necessity for performing the operation in the few minutes during which the water is daily delivered from the companies' mains.

THEATRE ROYAL, HAYMARKET.

The interior of this always-pleasant resort has been handsomely decorated, under the superintendance of Mr. G. Somers Clarke. The style adopted is Pompeian,—more Pompeian, in fact, than Pompeii,—and the result is somewhat dark and heavy. The panels, moreover, of the box-fronts are all so precisely similar as to suggest that they come rather from engraved blocks than the hand of a painter. The ceiling represents a velarium strained round the outer diameter of it; and the central portion is made so bright with "little stars," as to lead to the belief that Juliet has at last fulfilled her threat and cut up Romeo.

In the proscenium-cave Mr. Thomas Ballard has painted a picture on a gold ground, typifying the Rehearsal of a Roman Comedy. A new fairy comedy, by Mr. W. S. Gilbert, is announced as in preparation, and is looked for anxiously by all who are interested in good dramatic literature.

COAL AND IRON.

The price of coal in Bristol is considerably less than it was a few weeks ago. The best local coal for domestic purposes may now be obtained for less than 1*l.* per ton.

On the 1st of August last the price of the Stratford Collieries Company's old Silkstone coals was quoted at 20*s.* per ton at the pit's mouth. These coals are now being offered at 16*s.* 6*d.* per ton at the pit, being a reduction of 3*s.* 6*d.* per ton.

A meeting of a large number of South Yorkshire coalowners has been held at the King's Hotel, Barnsley, for the purpose of considering the present state of the coal trade. After some discussion, it was resolved that the members of the South Yorkshire Coal Association, and the owners of pits generally, should, if necessary, reduce the price of steam coal to the extent of 2*s.* per ton. It may be stated that the demand for steam coal is just now only moderately active, and at many of the pits the coal is accumulating.

The coal trade of Durham keeps very firm on the whole, as compared with the Tyne and other districts. Whilst some classes of coals have succeeded 3*s.* or 4*s.* per ton on the Tyne, the demand in South Durham, where there is such a large consumption for ironworks, has kept up the price. Some few collieries are selling coke at about 37*s.* 6*d.*, but the general figure for best is scarcely less than 40*s.* Households, 17*s.* to 20*s.* at pit. About 12,000 tons of coal and coke were sent into Cumberland and Lancashire from Durham collieries last week for iron-making, and

about 59,000 tons into Cleveland for a like purpose.

But whilst in some districts colliery proprietors have met and decided to reduce prices, others have agreed upon quite an opposite course.

One lesson meantime that has been partially learnt by hundreds and thousands of householders is that good fires may be kept with a considerable economy of coal if care be exercised; and this and the falling off in the iron and other trades of the country is acting as a warning to coal-owners that there may be a limit to their rapacious demands.

There can be no real reason for the large advances in the price of coal that have taken place during the past few months; and whatever may be said of the increased price of labour, it cannot account for a tenth of the increased amount asked for coals. We should advise all consumers to use the utmost economy, whether in the furnace, the kitchen, or the drawing-room, as this course will exercise the most beneficial influence on the owners of coal-fields, and have the greatest tendency to reduce prices.

By the monthly circular of Messrs. Higginson, of Liverpool, we learn that the quantity of coal exported in September, was 1,076,091 tons, against 1,171,244 tons in the corresponding month of 1871, showing a decrease of 95,153 tons. The particulars are—From the Northern ports, 549,933 tons; Yorkshire, 79,649 tons; London, 3,166 tons; Liverpool, 56,804 tons; Severn ports, 279,875 tons; and Scotch ports, 106,674 tons. The increase was—Yorkshire, 14,185 tons; and Scotch ports, 15,099 tons. The decrease—Northern ports, 80,024 tons; London, 6,013 tons; Liverpool, 8,311 tons; Severn ports, 30,089 tons. Total, January to September, 9,246,876 tons; same period last year, 8,715,271 tons. Increase, 531,605 tons.

The leading ironmaking firms are preparing circulars announcing a further drop in finished iron. The last drop of 40s. on bars, and 60s. on sheets and plates, brought out only few specifications. Customers will now learn that the drop is repeated, making a total drop of 4l. on bars, and 6l. on sheets and plates. Thus, at two falls nearly half the late immense aggregate rise has been abandoned. Pigs must fall proportionately. Wages cannot be altered till Christmas, when, however, the men look for an advance.

THE DULWICH COLLEGE MANAGEMENT NEW SCHEME.

PROPOSED NEW SCHOOL BUILDINGS IN CAMBERWELL, SOUTHWARK, AND BISHOPSGATE.

The scheme of the Endowed School Commissioners which has just been issued for the future management of Dulwich College, and the disposal of the large property belonging to the foundation, provides for the expenditure of a large sum of money in the erection of new school buildings in the several parishes above-named, all of which are included in the benefits to be derived from Alley's foundation, and in other districts near London, south of the Thames. According to the proposals of the Commissioners one of the first duties of the governing body will be to raise 60,000l., or, with the consent of the Charity Commissioners, 80,000l., by sale of some of the real property of the college. The sale of the college property, and the raising of the sum named, are made obligatory on the governors, within one year after their constitution. Out of the money so received the governors are to appropriate 20,000l. in the purchase of sites and the erection of school buildings in the parish of Camberwell. One of these schools is to be for boys, and the other for girls, and each school is to have accommodation for 300 children. The schools are to be called "Alley's Middle Schools," and the nature and extent of the education to be given, as detailed in the scheme, proves that the school buildings must necessarily be of considerable dimensions. The scheme next provides that 10,000l., out of the 60,000l. thus raised, are to be expended in the purchase of sites and the erection of four schools in the parishes of St. Saviour, Southwark; St. Botolph, Bishopsgate; St. Luke, Middlesex; and in another district south of the Thames, the scheme providing that the last-named school is to be near London. Thus, according to the scheme of the Commissioners, six schools are at once to be erected in the metropolitan districts out of the proceeds of the sale of the college estates, at an expense of 60,000l.

As regards the celebrated picture gallery at

Dulwich, the scheme provides that the governors, with the sanction of the President and Council of the Royal Academy, are to make provision for the custody of the pictures in the present gallery, or elsewhere in Dulwich, the erection of a new gallery in Dulwich being suggested; and the Commissioners further propose that, after paying the expenses of management and maintenance of the gallery, instruction should be given, out of the remaining income, in drawing and designing, to a certain number of boys and girls.

THE LIVERPOOL CORPORATION AND THE PUBLIC PARKS.

PROPOSED SALE FOR BUILDING PURPOSES.

It is only within the last few years that Liverpool, which before that period was almost destitute of them, has been in possession of public parks for the recreation and benefit of its large population. Loud complaints were made by the inhabitants that there was no large city in England so badly off in this respect, and the result was that the corporation, at a very large cost, had public parks laid out at the various outskirts of the town, and one of these—Sefton-park, at the south end—has only just been completed. Amongst the parks thus formed, one at the east end, called Shell-park, was opened a few years ago. It was so called out of respect to a late alderman of that name, who, in his place in the town council, proposed its construction out of a number of fields belonging to the corporation. Shell-park, although small—being only about 20 acres in extent—has, since its opening, been exceedingly popular as a place of resort for the very large and increasing population by whom it is immediately surrounded, and more especially, so far as the juvenile population is concerned, it very much, in this respect, resembles Kennington-park. At the eastern boundary of the park, running north and south, is a fine thoroughfare nearly a mile in length, and upwards of twenty yards in width, called Shell-road, and immediately adjoining this road are the lodgings for her Majesty's judges when on circuit. The east side of Shell-road is laid out for villa residences, of which several have already been erected, and overlook the park. Within the last few weeks considerable surprise has been caused in the borough by an intimation that the finance committee of the corporation have resolved upon disposing of the park for building purposes, and the announcement has evoked a strong feeling of dissatisfaction, not only on the part of the residents adjacent to the park, who complain that their favourite resort for breathing fresh air is about to be invaded; but it is further urged that the corporation are about to commit themselves to a most unwise step in practically reversing the general demand for open spaces in densely-populated districts, and permitting what has for some years been an area for healthful recreation, to be covered with hundreds of dwellings of an inferior character, to the injury of the sanitary condition of the neighbourhood.

STAINED GLASS IN EXETER CATHEDRAL.

SIR,—Your correspondent "Experientia," "an artist practising glass-painting," has fired such a volley of inverted commas and subtle sarcasm at me for not understanding the technicalities of his art, that I hardly dare to answer him; but as he has perverted the meaning of my letter, I must do so at all hazards. To my description of the side windows of the Lady Chapel I adhere. Any reasonable person, with the slightest knowledge of stained glass, will understand what I mean by "figures under canopies on a grisaille ground, with flowing borders to the lights, the tracery openings having pot-metal centres on grisaille grounds." "Experientia" complains that I describe this grisaille absurdly. I do not describe it in particular. If he will read my letter with common care he will see that I describe the character of the windows of the choir generally as "of exquisitely light and delicate grisaille, bold and richly executed on greenish white glass of various shades, with a fair proportion of colour cleverly disposed." I think my description will be found to be sufficiently lucid for ordinary folk. I am sorry it displeases "Experientia." I will beg him also to note that I describe, not the grisaille, but the glass of the choir generally, as differing from

the gorgeously-stained abominations of the modern school of glass-painting. Since, however, "Experientia" describes the glass at Exeter as "very ordinary traced pattern-work in brown enamel on white glass, neither remarkable in design, execution, nor material," I care very little for his anonymous criticism, for it is clear to me that he has not studied it as it should be studied, but, like other eminent artists practising glass-painting, he has passed over the fragments of it as of little value because they did not agree with his ideas of what stained glass should be. Happily the task has fallen into better hands, and Mr. Drake's intelligent care has rescued Exeter from the fate of too many of our cathedrals. Its beautiful windows will not now be filled with glass (so well described by Mr. Edmund Sharpe) of all the colours of the rainbow, with figures whose attitudes and drapery may be of the thirteenth, and whose faces and hands are of the nineteenth, centuries, the backgrounds to the subjects being of no century at all, and the general effect of the design being half Mediæval, half modern, and altogether nondescript;—the proportion of colour, four-fifths rufy, blue, green, purple, and yellow, to one poor fifth of white and light. The delicate workmanship and graceful design of the stonework of the windows, which must have cost the architect so much thought and care, will not now be degenerated into picture-frames for the glorification of artists who practise glass-painting. God's glorious light, for which the architect so amply provided entrance, will not now be blocked out, or only used to show to what extent of bad taste garish colours can be placed in juxtaposition in a Decorated window; but Exeter will be seen as its architect designed it,—a model of the art of its period.

Far be it from me to decry the use of colour in its proper place. I am heartily willing to agree with "Experientia" that the noblest glories of stained windows have resulted from the gorgeously-stained works of Canterbury, Strashourg, Chartres, Milan, Florence, and Pisa; but I think "Experientia" will find that all these examples exist in buildings of an earlier or later period of architecture than Exeter,—buildings whose style is massive and hold, and has no pretension to elegance or delicacy of workmanship, and the more simple the stonework the richer will be the glass and the smaller the proportion of (dare I use the word?) grisaille. As the style of architecture becomes lighter and less massive, so the glass follows it, and we have more and more grisaille and less colour, till we reach the Decorated period, a period it is my misfortune to admire, and then we have windows such as I have described at Exeter, in which I am able to prove that the proportion of colour to white glass very slightly exceeded one-fourth of the entire window. Here it is that I cry out against the rage for colour. Put colour in its place, by all means. Enrich a sombre, massive building with it, and succeed; but do not destroy the grace and elegance of our Decorated cathedrals by blocking out that great essential element of their beauty,—the light. When will our glass-painters take heed of these things, and condescend to learn from their predecessors? When will they cease to put bad imitations of thirteenth-century glass into Decorated and even Perpendicular windows? When will they leave off mixing colours in a way no "artist" ought to be capable of doing? Simply when they cease to degrade their art into a trade and to sell glass at per square foot or square yard, according to pattern, with plenty of colour for the money. Simply, when they will condescend to learn that their art should be subservient to, though aided and assisted, that of the architect; that his design is first to be considered, and that theirs must harmonise with his. I speak of course of glass to be placed in ancient buildings, and I refer not to the works of Hardman and a few of our best artists, who are far above my poor criticism, but to those of the trade of glass-painters generally.

STUART A. MOORE.

New Masonic Hall for Liverpool.—The corner-stone of a new Masonic hall for Liverpool has been laid by Brother the Right Hon. Lord Skelmersdale, V.V.P.D., Prov. G. M., with full Masonic honours. There was a numerous attendance of brethren in their Masonic clothing. In the evening there was a banquet at one of the principal hotels in the town, with a large attendance, Lord Skelmersdale presiding.

THE POLLUTION OF RIVERS.

NATURE, in her purification of water, performs one of those chemical transformations so consistent with the earth as the habitation of man; but she requires from us, in return, obedience to her laws, and the retribution of disease and death is frequently the result of their neglect. The Romans were aware, in the construction of their aqueducts, of the necessity of affording every facility for the aëration of their water in its flow, and for lessening its turbidity by means of depositing basins in the line of their conduits. More than 300 years before the Christian era they abandoned the Tiber as the source of their consumption, and sought the purer springs of Tusculum for their supply. With the experience of 2,000 years, we are not only content with sewage-polluted water of our rivers, but we have been doing all we can, even with this burden upon it, to render its self-purification impossible. If we were dealing with the mighty rivers of America, the result would, perhaps, be scarcely apparent, and there would be some little reason in the excuse now being made by manufacturers that rivers are the natural drainage for the refuse from their works; but with our rivers, which are only streams, in comparison, it is folly to suppose that the length of their flow, or the body of water they contain, can effect a process of purification sufficient to render it fit for domestic use. They are either the natural drains for our refuse or they are the natural water supply of our towns; in England, with its population and industry, they cannot be both. What are we to expect, then, if we set the laws of nature at defiance, but that they will operate against us?

When populations are becoming yearly more consolidated and condensed; when cities are absorbing to themselves, as they are, the rural population, and crowding that which should be a neighbourhood into a street, and those who should inhabit a house into a single room,—they need not in the polluted air of their dwellings an extra poison to be brought to them by the means of one of their necessities of life. In addition to this, the cisterns in the dwellings of the poor are often in inaccessible places, or, at any rate, where they cannot frequently be cleaned, in courts where light and air come through the circumscribed areas which are left by the surrounding walls. Our mechanical filters, consisting, it may be, of sand and gravel to the depth of 7 ft. or 8 ft., are but feeble imitations of natural filtration; and, while they remove the objectionable impurities in suspension, are powerless to but a very limited extent to remove those which are in solution. A greater depth of material, and a higher standard of purity in the rain which falls upon the earth give effect to the operation, which yields to us natural springs of water, or enables us to reach it by the means of wells. Pleased with its clearness, and satisfied that it is consequently pure, the consumer often receives his water, after mechanical filtration, burdened with the deadly seeds of malignant fever, for the water has been so poisoned in its progress to the works that nature is powerless, either by aëration or aggregation, to render it fit for use.

The natural filtration of water through permeable strata, which sends it forth again from subterranean springs, is nowhere, perhaps, more apparent than when it passes from the surface through peat and sand. I have been shown a distinct line of filtration, where the suspended impurities have been deposited in their passage through the sand, and above this line the sand is completely leached by the action of the acid from the peat, and below the line of filtration the sand is unacted in colour, and the water is frequently hardened by the transformation, we are told, of what remains in it of organic matter into nitrates and nitrites; but the impurities which floating water gains from vegetable decomposition, as accumulated in its passage through the air in the form of rain, are as nothing in comparison to those which the refuse of manufacture, the high state of cultivation of agricultural land, and the sewage of towns contribute to our rivers; and we have only lately awoken to the truth by the increasing and reiterated discoveries of science. Much of our sanitary neglect is doubtless to be attributed to the tendency in all classes to avoid that which is not easy and close at hand; we will not often take the trouble, for a future convenience or a prospective advantage, to adopt an immediate remedy: to be satisfied with what we have,

rather than trouble ourselves greatly to improve it, has been, at least in sanitary matters, the doctrine of the past. In matters of less importance than bodily health we are often considerably more energetic; things which were formerly the luxuries of the few may now be said to be the requirements of the many; and yet in the matter of baths and personal cleanliness we are infinitely behind the ancient inhabitants of Rome. What we have lost by this inaction, as a nation, in moral and social advancement, it is impossible to tell; but we do know, beyond dispute, what we lose by it every year from preventable disease. A keener perception and clearer intelligence is only the natural result of improvement in physical health; and the lethargy which burdens the mind of an unhealthy frame may be read in the department and social existence of thousands of the dwellers in our crowded courts and lanes; even in the provinces, too, and in rural districts. The energy that once was successful in contending against this moral degradation departs and leaves behind it simply the animal desire,—we cannot say to live,—but to exist.

BYRON GIRAUD.

THE NEW ROMAN CATHOLIC CEMETERY AT MALTA.

The Malta Government having lately enforced extramural interments, a new cemetery has been prepared for the purpose, in the open country, nearly midway between the chief city of Malta and the populous towns within the Cottonera lines, about two miles from the Valetta Gates.

The cemetery was commenced in 1862, and was opened for public interments on the 1st of July, 1872. It is beautifully situated on a gentle declivity, having its principal entrance at the lower extremity, and a church towering with its acute spire on the higher ground.

A broad avenue, planted with trees, leads to the main gate, which opens on to a spacious circular piazza, having a large cross in its centre, ornamented by trees, shrubs, and flower-beds, and surrounded by two blocks of buildings flanking the gate, and an arcade for tablets, semicircular on plan, facing the main entrance. The building to the right of the gate comprises the residence and registry-office of the priest, who officiates in the cemetery church; the other contains the keeper's lodge and a mortuary chamber, intended for the reception of corpses. Each of these buildings has a separate garden attached to it. The arcade is intended to contain tablets, with inscriptions to the memory of illustrious men. At each end of the arcade a carriage-road, lined with trees, ascends with a gradual incline in a zig-zag direction towards the summit of the rising ground, intersecting each other in front of the elevated esplanade on which the church is situated. These two roads border this esplanade, join behind the church, and abut at the back entrance of the cemetery. A foot-path, 466 yards long, intersects the cemetery in a longitudinal direction and in a straight line from the central arclway of the arcade in front of the principal entrance, to the back entrance, separating the whole ground in two grand divisions. The eastern division contains thirty-two sections, and the western twenty-nine sections. Each section is intersected by footpaths, which form several compartments (103 in the eastern sections, and 144 in the western). Each compartment is occupied by graves, and interspersed by flower-beds and trees.

A gallery crosses the whole length of the cemetery, under the aforementioned footpath. It carries the superfluous rain-water out of the cemetery, and a 4-in. cast-iron main-pipe, with branch communications, placed therein, communicating with a grand reservoir of water at the top of the hill, and outside the back entrance, affords the means of irrigating the whole grounds of the cemetery.

This necropolis is enclosed by a wall 1,504 yards long, and the aggregate length of its two carriage-roads is 2,103 yards. It covers an area of twenty acres of land.

In the centre, and on the most prominent portion of the ground, rises the cemetery church, under the title of the Virgin Mary Addolorata. The architecture of this church, and that of all other buildings in the cemetery is in the modern Gothic style. The plan of this church

is cruciform. It comprises a nave, with aisles, terminated by transepts and chancel; on either side of the chancel there is a sacristy, one either side having a private entrance for the clergy, and a staircase leading to the crypt underneath. The nave is divided by an arcade of four bays on either side supported by piers, with moulded bases and carved capitals representing lilies and roses symbolical of the Virgin. Above the nave there is a clearstory of six windows on either side. Between each of these windows are carved stone corbels supporting the principal ribs of the roof. The bays of the nave arcade, which open into the transepts, have no clearstory. Their arches, extending the whole width of the transepts, spring from the same level as that of the nave arches, but they extend higher up. The groined ceilings of the church are divided into compartments by beams, and into panels by ribs, having enriched bosses at the intersections and crisp in the panels. The church is decorated externally with buttresses, pinnacles, parapets, windows, and roses with carved tracery. The tower is of three stages. The organ-stage, which is over the entrance-door, has a gallery projecting into the nave; this stage is gained by a stone winding staircase. The tower is surmounted by a spire, having two heights of windows. From a carved finial which finishes the top of the spire rises a gilt cross. The chancel is raised 1 ft. over the pavement of the nave and transepts forming two steps. The church contains three altars. The length of nave and chancel is 73 ft. 3 in., and the breadth across transepts is 57 ft.; the width of the nave is 19 ft. 3 in.; of chancel, 17 ft.; of transepts, 16 ft. 3 in.; of aisles, 10 ft. 6 in.; the height from the floor of the nave to the outer ridge of the roof is 50 ft.; the height of the tower and spire, from the pavement to the highest point, is 116 ft. All the windows are filled in with stained glass, geometrical lead work, and ornamental quarry glass (from Messrs. Cattam & Co., of London), representing,—the chancel window,—the Assumption of the Virgin Mary, having on each side two subjects from the life of Mary, and in the tracery the Holy Ghost descending. The transept windows,—that on the right,—the Crucifixion in the centre, and on either side the Adoration of the Magi, the Baptism, the Agony in the Garden, and the Ascension; in the tracery, the Holy Father. The subjects of the other window, on the left, are:—Our Saviour in the centre, and the Four Evangelists on either side; in the tracery, the Transfiguration. The tower window is filled in with geometrical leadwork with coloured borders in lights and tracery. The eight aisle windows are filled in with ornamental quarry glass, having in the central light and in the tracery the Apostles and Disciples; the ground of these windows is ornamented alternately with the monograms of our Saviour and of the Virgin Mary. The twelve clearstory and four vestry windows are filled in with grisaille and ornamental quarry glass.

The roofs are covered with zinc from Messrs. Tyler & Co., of London. The clock is by M. A. Sapiano, of Malta; and the bells were cast in the foundry of Messrs. S. Cauchi & Sons, of Malta.

To the east of the church, a quadrangular structure serves as a deposit for corpses that cannot be buried at once in their proper graves. This place of deposit is partly subterranean, but it rises 5 ft. over the ground. A staircase on each side leads to the terrace, in the centre of which the entrance stands, having a staircase descending to the vaults underneath.

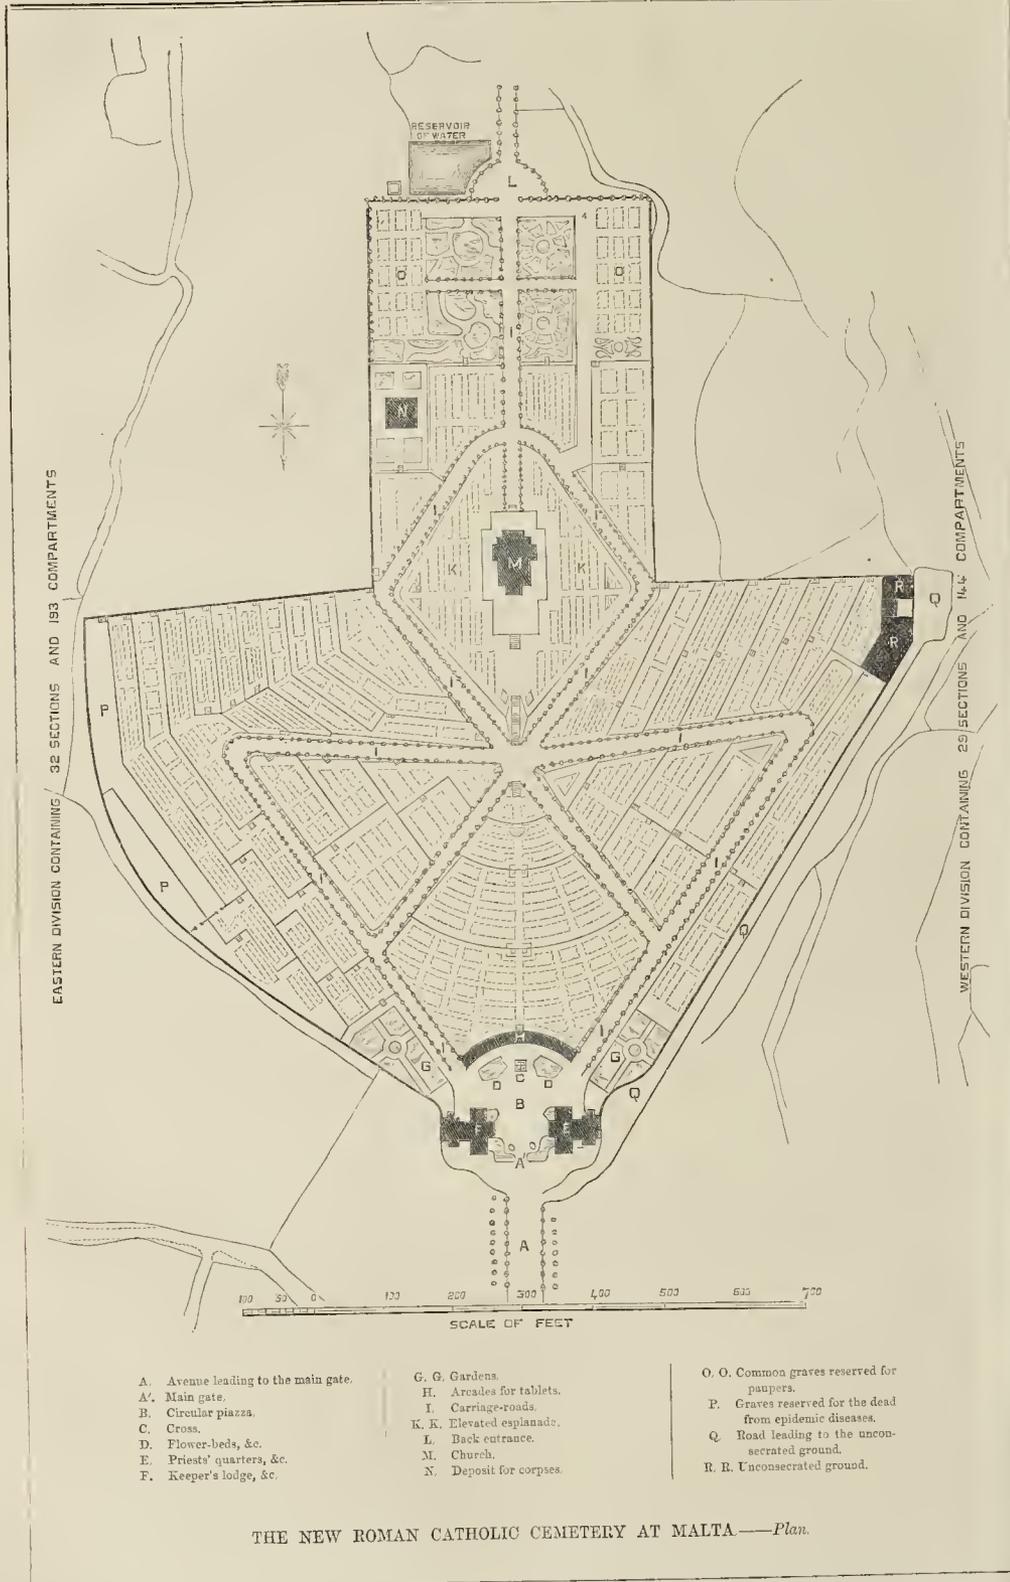

In the crypt under the church are tombs for the secular and regular clergy.

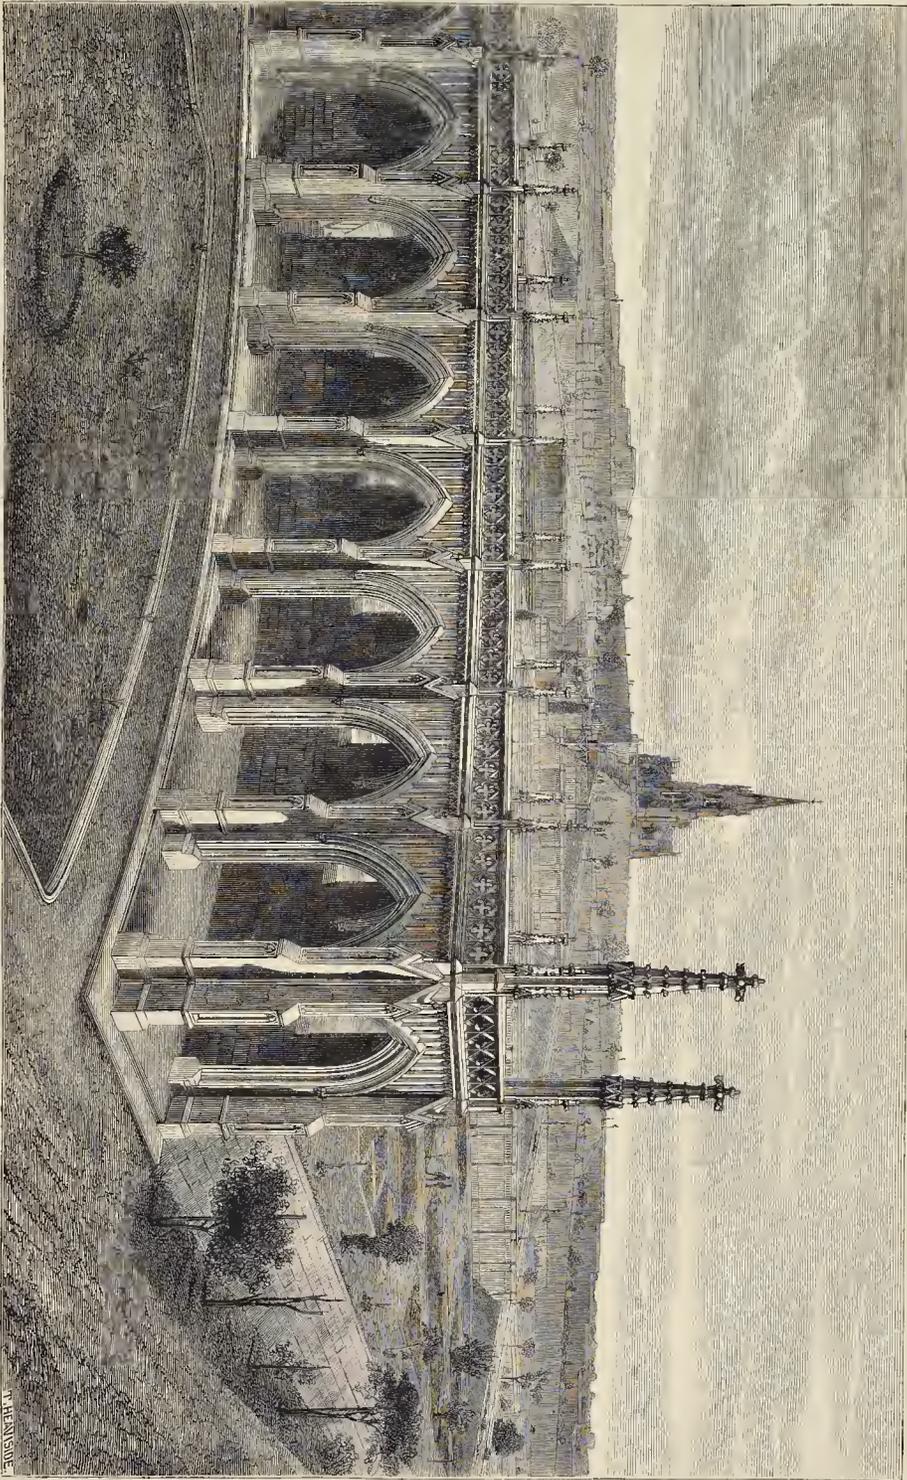

The greater part of the area of this cemetery is for the interment of the public in general; two spaces are, however, reserved,—the one to the south being intended for paupers, and the other to the east for the dead from epidemic and contagious diseases.

To the right of the lower main entrance, a road running externally along the boundary wall of the cemetery leads to an unconsecrated portion of the ground intended for the interment of Roman Catholics who, for religious reasons, may not be admissible into consecrated ground.

The material used is the Malta sandstone, from the quarries of Tad-Danil, near Mtaibiba.

Mr. E. L. Galizia, chief Government surveyor, is the architect of this cemetery, and of all the buildings we have described; and all the works have been executed under his direction.

THE CEMETERY DELL'ADDOLORATA, NEAR VALETTA, MALTA.—MR. E. L. GALIZIA, ARCHITECT.

W. HENNING

CRAFTSMAN AND ARCHITECT.

Str.—A writer in the *Quarterly Review* has been creating a sensation of late by his architectural criticisms on our modern buildings and their designers. His views are in nowise novel, but, from the style of his treatment and the volume of his opinions have been given to the public, considerable interest has been awakened, and a less considerable has been awakened, the thoughts of many on architectural subjects, the said many never having had previously any settled opinion of their own on the matter under discussion. At what particular period of the world's history the craftsman ceased to be the architect, or to what extent craftsmen were architects in days long past, there is little evidence in book form or MS. materials, as far as I am aware of, to show. By a system of deduction there can, of course, be an amount of possible evidence evolved in support of the belief that the master workman was both a craftsman and an architect, and, consequently, a designer and an artist. From the building of the Pyramids to the building of the Parthenon, or from the construction of the Roman Wall in Britain to the days of William of Wykeham, architecture at home and abroad achieved many triumphs and met with many reverses; but at the earlier as well as at the later date who can dispute that an organisation of building labour did not exist? Allowing for all the modifications and changes effected by modern society, the brickmaker, quarryman, stonecutter, or mason, the bricklayer, the carpenter, the woodcutter, splitter, or Sawyer, and some other branches, existed in the building line thousands of years ago abroad, and probably upwards of 1,500 years ago in this island. Now, which were the master workmen, *i.e.*, the architects, in the days of Alfred the Great or William of Wykeham? The prelate was the architect in the last instance, and in learning this and other facts about his life and career, we do not find any statement as to his being either originally a mason or a carpenter. History does not tell us who were the architects of all our early and splendid cathedrals, churches, and abbeys, and we are still in darkness how many of the said architects were masons or carpenters, or other craftsmen. There were undoubtedly master workmen, chief men, or foremen, in early building operations, as well as now; but who will inform us of the proportion of architects or craftsman-architects each large building embraced? Which was it, the carpenter or the mason, supplied the designs, and which the inspiration? Was every grand design manufactured on the modern principle of pin-making? Did one supply the idea, and another the drawing materials; a third the plan, a fourth the elevation, and a fifth the working drawings, and so on through theory and practice, each craftsman in his own respective branch pleasing his own sweet fancy and agreeing with his brethren? Is it possible that all the wonderful harmony of our ancient buildings was obtained, both in design, plan, and ornamentation, by entrusting them to the erection of some half-dozen architects representing the different branches of trade?

To carry the notions of the writer in the *Quarterly Review* to its limits, it presupposes something like the above condition of things. Consistency is generally absent in arguments which are ventilated before they are well considered. A little thought and common sense must convince any one who possesses some experience and practical knowledge of architecture and building operations that there must have been always one chief directing mind,—an architect or “master workman,” if you will,—from whom the general design emanated, and who always (during his time), more or less, controlled the erection of the building. In the method employed in construction or putting together of several portions of the work, or in ornamental details, it is most likely that the craftsmen of old were allowed great latitude, and in their own peculiar ways embodied a good deal of thought, and displayed a good deal of ingenuity and fancy, in the execution of their work. One thing is, however, practically certain, that they did not work at random, and that they were amenable to the designer or architect. The custom of long ages has established an organisation of labour in building operations, from the designer or architect down to the excavator, and it is the sheerest folly to suppose that we can so revolutionise society as to make it possible that our competent craftsmen, masons, car-

penters, bricklayers, and so forth, can all become architects, sculptors, and painters,—artists and workmen at the same time,—and that, if it were possible, ordinary building operations would go on as usual. There is one thing that may be granted,—architects may be craftsmen, and craftsmen architects. Masons have before now become sculptors, and carpenters, bricklayers, and masons architects; but as soon as they become such they cease to be workmen, in the ordinary sense. None of them, to my knowledge,—and I have an experience of the professional practice of a few,—led to any new reform in architectural practice. It would not be amiss, in my opinion, however, for the future race of architects to become practically, as well as theoretically, acquainted with one or two of the leading branches in the building trade. For a youth intended for the architectural profession a novice of some period in the workshop or building would be a great advantage; and actual work performed by him in such capacity, first as a craftsman, and, secondly, as a foreman or clerk of works, would in no manner be derogatory to the subsequent dignity of his profession as architect. Although modern craftsmen-architects have not been many nor very distinguished, for lack of requisite education, working drawings have been distinguished for plainness. Knowing the wants of workmen, architects who were once craftsmen are, as a rule, easy to follow in all their details. This in itself is one great advantage, even though their elevation betray as yet no great inspiration or advance in the direction looked to by the *Quarterly Review* writer. Although I see both the possibility and the probability of a great change in architectural creation being effected by the training of the workman and the utilisation of his latent talent, I cannot, as a whilom workman myself, see any possibility at all of our building workmen becoming a race of angels.

There can be no comparison as far as the art of the sculptor and the painter and the architect is concerned. If it be contended that the latter should be a *bona-fide* craftsman as well as an artist-architect, he must needs be, to carry out the theory now ventilated, a “jack of all trades” as well,—a general building operative, or at least a sort of “three-branch hand.” The sculptor certainly designs and executes, but his little microcosm is his own studio. He is given a block of marble: he sketches, he models, and by actual workmanship creates the embodiment he previously designed. The painter is also a workman as well as an artist, and is necessarily a draughtsman as well as the architect. There is a subdivision of labour in sculpture and painting as well as in architecture, and in the former art there are very few large pieces of statuary but have been partly executed by several hands. The construction of a palace or a cathedral from its design to its execution admits of no comparison whatever with the routine of the sculptor's or painter's art. Architecture embraces many professions or callings; sculpture and painting only one. As sculptors and painters in the past had a great deal to do with the ornamentation of buildings, it would be quite as reasonable to expect that they should be architects and inspired master-workmen, possessed of a practical knowledge of architectural design and building execution, as to expect that our architects should be master-workmen in the sense of the *Quarterly Review* writer. All admit that there is great room for improvement in architectural design, but that improvement will not come through any hot-headed process applied to either the architectural or operative community. Time will produce a higher class of architects, and a more skilled class of craftsmen; the former possessing a more practical and technical knowledge of the trades on which their profession depends, and the latter becoming more versed in the principles of design and construction, and consequently executing their work with a greater artistic taste. A well-planned building, be it a dwelling, church, or palace, is in itself a piece of workmanship to be proud of, and in the region of original designing and planning, and all its details in architectural and building construction, there is a quite sufficient and ample field for the architect. I would by all means elevate the craftsman and improve the architect, but I would do no party to preaching an inconprehensible logic that, however it may please for the season, is certain to become one of those Dead-Sea fruits, turning to ashes and disappointment upon the lips.

As to the question of men designing works and

leaving others to execute, there is nothing at all strange in this, any more than in statesmen making laws, and judges and magistrates administering them. It is of course possible for an architect to design as an artist, and execute as a mason and an architect. What then? Think you, if Sir Christopher Wren worked the stones and performed the carvings, as well as designing St. Paul's, his great work would have presented any marked difference, supposing he accurately followed the drawings (whether these were all his own or not being an open question)?

If a real improvement in architectural designing is earnestly desired, let a system of model construction be insisted upon in all great public and ecclesiastical works, and that the construction of these models be under the eye of an architect. Let him insist, in all great works on which his fame and character are to rest, that a model be first made,—the expense, of course, to be paid by the clients. If models had been first made of some of our recent public buildings and some more in course of erection, much that is faulty in the design would have been remedied. It is nearly impossible for architects, no matter what their experience may have been, to see in their mind's eye or produce by any process of paper-drawing the appearance that certain portions of some buildings will present when completed. The exigencies of site will lead to the divergence from ordinary methods of construction, but it is only when the model is seen or the actual building put up that an alteration is seen to be necessary. Therefore I would strongly advise the construction of models, believing that it is one of the plainest, most practical, and feasible modes of developing an improvement in architectural design, and tending to the improvement and elevation of both architecture and handicraft.

A CRAFTSMAN.

THE NEW REREDOS IN GLOUCESTER CATHEDRAL.

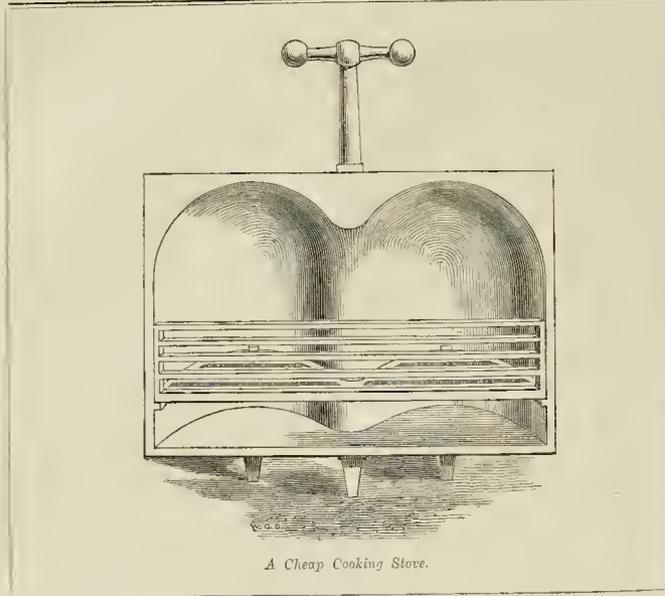

This work of art, the gift of the Freemasons of the province towards the restoration of the cathedral, is now nearly finished. It is 17 ft. 6 in. in width. A horizontal line of carved stone extends across where the communion-table will be placed. Above this arc seven niches, filled alternately with statues and sculptured groups. The subjects, from left to right, are,—Moses hearing the tablets of the law; group, the Nativity; St. Peter; group, the Ascension; St. Paul; group, Entombment of the Saviour; David hearing the harp. The central one, the Ascension, is 5 ft. in height; and the side groups are each about 4 ft. 3 in. high. The statue of St. Peter is of Painswick stone; the other figures and the groups are of stone from Mr. Wingate's quarry, at Crickley Hill. Over the figures and groups are wrought canopies; above these are three open pinnacles, with statues of angels; and surmounting the central pinnacle is the cross, 27 ft. from the floor, but not interfering with the view of the east window of the choir. The groups and statues are by Mr. J. H. Redfern, of London, sculptor; and the other portions of the work have been executed by Messrs. Farmer & Brindley, also of London. The restoration of the south porch is now nearly completed.

THE FREE-BRIDGE MOVEMENT.

On Saturday night last, a densely crowded meeting, convened by the Metropolitan Free-bridge Association, was held at the St. John's School room, Waterloo-road, to consider the recent decision of the Metropolitan Board of Works with reference to the toll-bridges of the metropolis. Mr. George Hill (Lambeth Vestry) presided. The following resolution was unanimously adopted:—

“That this meeting has heard with satisfaction the announcement that the Metropolitan Board of Works has taken the necessary steps to introduce into Parliament a Bill having for its object the freeing of the metropolitan bridges from toll, and pledges itself to render every assistance in its power to the Board in its endeavour to effect one of the most important metropolitan improvements—an improvement which will remove a direct tax from the shoulders of thousands of the poorest of the population, and will contribute to the well-being of all classes of the community.”

It is to be hoped that the object in view will now be carried out, both for the sake of convenience to the public and advantage to house property generally in the various districts to be benefited. It is an object which has always had our sympathy and aid.

A Cheap Cooking Stove.

ECONOMICAL ROASTING STOVE.

The accompanying view illustrates a stove of cast-iron, which I have in constant use in my kitchen in Florence.

The meat or poultry or game is placed in a tin oven like that called a Dutch oven, but instead of being square, this is made so as to fit the front of the iron stove, and arched over at the back.

The spit on which the meat is placed is provided with a side prong that fits into holes made at the side of the tin oven, and into which holes the prong is moved as the meat is cooking, where a movable "jack" is not in use, so as to turn all parts of the meat to the fire.

Charcoal is placed in the iron stove, and when kindled, the tin oven is placed before it. The quantity of charcoal expended in cooking well 6½ lb. of meat was 2½ lb., at a cost of less than a penny. The heat concentrated in the arches of the iron stove causes less time to be used in roasting. The size of the stove is 19 in. wide by 13½ in. high; the depth of the arch is 4½ in. The cost in Italy of the stove is eleven francs, and the tin oven, six francs, making in English money about 13s. There is no smoke from the charcoal to preclude the stove being placed on a table, on the stone floor of a kitchen, or any side stone projection of the fireplace. The operation of cooking by charcoal is cleaner and quicker, requiring less care and attention than coal. Surely charcoal could be imported into England from Belgium and France in sufficient quantities to make it serviceable in reducing the consumption of our coal. The cost of charcoal is about 2s. 10d. the 100 lb. (on the Continent).

I cannot too strongly recommend the use of this simple economical mode of roasting. A saving would thereby accrue of all the enormous amount of coal used for "making up" the kitchen fire preparatory to roasting.

Square 9 in. iron pans could be used, 4 in. in depth, to contain charcoal, on which could be placed a saucepan with compartments for holling. F. C.

Harrow Public Hall Company.—A company has been formed, under the Limited Liability Act, for the purpose of erecting a public hall in Harrow. The necessity for such a building has long been recognised. A site in the High-street, nearly opposite the King's Head Hotel, with a double frontage, can be secured for a term of 99 years, at a ground-rent of 35l. per annum. Mr. C. F. Hayward has been appointed architect, and has supplied designs for a building to cost 3,000l.

* Means of escape for the fumes ought nevertheless to be provided.—Ed.

THE LEICESTER SEWAGE WORKS.

A NUMBER of gentlemen interested in the utilisation of sewage met last week at the Sewage Works, Leicester, their object being to witness the working of the sewage-drying and pulverising machine recently erected there by Messrs. Milburn & Co. The machine itself consists of an iron floor, about 6 ft. wide and 30 ft. long, which is heated by a furnace underneath. At one end of this floor the sewage is placed, in a damp state, and, by means of the apparatus above, is gradually moved to the other end. In its course it is subjected to the action of a series of dividers, between which it passes, and which prevent it caking. On leaving these dividers the sewage passes underneath some bars or pulverisers, and is ultimately scraped off at the other end in a dry powder, sufficiently fine for sowing, and easily removable. The experiments showed that the machine was capable of turning off manure at the rate of 651 lb. in the hour, or nearly a ton in three hours. We are informed that about 8 tons of wet sewage are converted into a ton of dry manure, and the cost of doing this with coal at 12s. a ton is about 4s. a ton. After the process had been witnessed for some time with apparent satisfaction, the company adjourned to the Bell Hotel, where they partook of luncheon.

THE NEW BUILDINGS AT THE LOUGHBOROUGH-ROAD STATION OF THE CHATHAM AND DOVER RAILWAY.

DURING the last few months large works have been in progress at the Loughborough-road Station of the London, Chatham, and Dover Railway Company. The opening of the new loop-line to the Crystal Palace, which commences by a junction with the company's main line at Loughborough, has necessitated a very considerable enlargement of the station, at which three of the company's lines now converge,—the Metropolitan Extension between Ludgate-hill and Victoria, the main line, and the new Crystal Palace loop line.

The new buildings, and other arrangements, which are on a very extensive scale, have just been completed, and the station, now called the "Loughborough Junction," is intended to be opened on Thursday next, the 14th inst. The arrangements include the erection of new booking-offices, on the ground-floor, with spacious waiting-rooms; six long and commodious platforms, with ladies' and gentlemen's waiting-rooms, and other conveniences attached; together with wide corridors under the several lines of railway, from one extremity to the other, which have been ingeniously and skillfully formed by cutting through and connecting the

arches supporting the respective converging lines. The new booking-offices have been erected on the triangular piece of land between the Metropolitan Extension and the main lines, close to the point of junction between the two lines named. The building is only small and limited in extent, although the interior arrangements are very complete. We understand that it is the ultimate intention of the company to erect a much larger block of offices on the site, of finer architectural proportions, the remainder of the large area of the company's land in front being partly laid out for carriage approaches to the station buildings, whilst the rest will be set apart as a cab-rank.

The passengers to all the three lines of railway, on leaving the booking-offices arrive at the respective platforms by passing along the corridor already named, in connexion with which there are spacious staircases, 8 ft. in width. The several platforms, all of which are covered, are supported by substantial and ornamental arches of yellow and red stock brick, the flooring of the main-line platform, which is asphalted, resting upon iron joists. The average length of the platforms is about 320 feet, and the ladies' and gentlemen's waiting and retiring rooms in connexion with the Crystal Palace line more especially are large and commodious. The entire area of the station as reconstructed, with its network of rails, and new buildings, is now upwards of two acres in extent, and, when opened, is expected to be one of the most important junctions on the company's lines. The works have all been designed and carried out under the superintendence of Mr. Mills, the company's chief engineer; Mr. Risson, of Brixton, being the contractor.

IMPROVEMENTS AT THE LAMBETH VESTRY-HALL.

SOME time ago the Lambeth Vestry determined upon making considerable alterations and improvements in the vestry-hall at Kennington-green, and for this purpose they appointed a special committee to inquire into the subject and report to the Board. The committee have just presented their report, and they recommend extensive alterations and re-arrangements. Amongst other improvements they propose that the Board-room be raised 13 ft., and the underneath part converted into four committee-rooms separated by two corridors, one 54 ft. in length by 9 ft. in width, running from the back to the front of the building, and the other at right angles to the first, 19 ft. by 5 ft. They also propose that an entirely new suite of rooms be erected for the hall-keeper, and they estimate the expense of the proposed alterations at 3,500l. At the discussion which took place on the subject, the proposal was favourably received by the vestry, but the further consideration of the subject was deferred for a month, in order that the plans might be examined, and it was also suggested that the plans be lithographed, and distributed amongst the members.

A VALEDICTORY DINNER.

THE dinner given to Mr. Thoms, on the 1st inst., at Willis's Rooms, in recognition as well of his social qualities as of his services to literature as Editor of *Notes and Queries*, was presided over by Earl Stanhope, and attended by about 12 gentlemen, more or less well known. The chairman, in proposing his health, showed cleverly the value of such a publication. Cases might be mentioned, he said, in which, if regard were paid to one set of observations only, very erroneous conclusions might be formed. Thus, a person leaving the Thames might ask who was the principal authority in the neighbouring district. He would be told the Sheriff of Middlesex. The same person might make the same inquiry in the Red Sea—say at Jeddah—and he would again be told the Scherif of Mecca. If the inquirer relied on the resemblance of name he would be inclined to suppose that there was close kindred between the two officers. But had the Arabic scholar would at once have shown that "scherif" was pure Arabic, and some Anglo-Saxon student that our word "sheriff" came from quite a different root—the shire-reeve or chief civil officer of the county—so that there was not the smallest connexion between the two words. Again, suppose inquiry made by a person into the derivation

"equerry." He would find it meant a mounted attendant on a prince or princess, riding on horseback by the side of a royal carriage. A Latin student would say, of course, the word must come from *equus*. But here, again, a student of French would correct him, and show that "equerry" came from the old French *escuyer*, the bearer of a shield, and had, in fact, no connexion with *equus* or *equus*. So, very plausible explanations were often entirely delusive; and reasons which seemed perfectly clear so long as they were derived from a single source, here quite another aspect when other minds were directed to the same point.

Mr. Thoms replied in effective and touching words. Professor Owen, answering for science, launched into a lecture on its present position, and was obliged to break off suddenly. Lord Doughton, who spoke for literature, "the muse's friend, himself a muse," did what no one else could have done without a tumble;—laughed at the utterly useless character of what was treated in *Notes and Queries*, and yet never ceased to admit the usefulness and value of the publication itself. Mr. Shirley Brooks, called up by the toast of the Press, made a merry little hit in flouting the guest of the evening, whose opinions on longevity are well known, with the intelligence that he would find a confidante in his breakfast-table next morning, the said confidante turning out to be the *Morning Post*, established November 2nd, 1772; and Dr. Doran, replying as the new editor of *Notes and Queries*, told capitally a capital story, and applied it admirably. Lord Lytton, Mr. Moran (of the United States), Mr. W. D. Christie, Sir Edward Smirke, Sir Frederick Pollock, and some others lent their sweet voices, and the evening was spent pleasantly and well.

WINCHESTER WHISPERS.

SIR,—In your number of the 2nd inst., you publish a letter headed "A Whisper from Winchester" to which my signature is attached. I beg to state that it is no letter of mine. I am sorry to say that I am little troubled with paint but with whitewash, and what few cracks I have are not recent, but as old as my walls, and they give me no trouble. Some of my pinnacles certainly need restoring, my altar-screen also would look better filled with figures; otherwise I am very well cared for. I am, however, seriously oppressed by the two bell-floors in my lantern-tower over my choir. I should be very pleased to have these removed, and also my choir-screen removed, so that those who come to worship in my ave might see into my choir.

(The mark of Winchester Cathedral).

A BIG CHURCH FOR BRIGHTON.

SIR,—I have read in the *Builder* of the 26th of October that the Rev. A. D. Wagner has just commenced the erection of an immense building in Ann-street, Brighton. There is a fact which should be taken into consideration for the advantage of a congregation attending a church. It is known that the voice can only extend to a certain distance to enable the congregation of otherwise to hear distinctly; and at the time St. James's Church, Piccadilly, was erected, it was considered a model for other churches, in regard to the capabilities of hearing distinctly. It is the same in regard to height.

OPENING OF THE NEW MARKET HALL, WHITCHURCH.

THE NEW Market Hall was opened amid the ringing of bells and the flaunting of flags, on the 15th ult. The new building, which was erected by Mr. Stringer, of Nantwich, is commodious. The front portion is in the Gothic style of architecture of the thirteenth century. A gable as a central feature terminated by a bell-turret, with lancet and cardinal points, has been carried to a height of 72 ft. The front portion of the building consists of a corn exchange, about 56 ft. in length, by an average width of 32 ft., having three separate entrances. Adjoining are placed the offices of the Local Board and their board-room; above these apartments and occupying the entire first floor is the large public-room, 63 ft. 6 in. in length, 41 ft. in width, and about 24 ft. in height to ceiling. The general market is situated immediately behind the front block, and is 126 ft. in

length by a width of 60 ft. In it there are sixteen butcher-stalls, 116 butter-stands, and eight stalls for vegetables. Beyond the general market is a market for cheese sales, 61 ft. long and 78 ft. wide. A large raised cheese-stage, 60 ft. by 35 ft., is also provided. On the south side of the cheese-market are eight lock-up offices for higglers. The fish-market is 35 ft. long and 17 ft. in width, with separate roof and ventilation, and stands are furnished with broad slate slabs, with complete arrangement for drainage.

OXFORD ARCHITECTURAL AND HISTORICAL SOCIETY.

IT HAS been decided to continue the series of walks and excursions commenced in 1870. On Saturday, November 9, it is proposed to meet in the hall of St. John's College, where the rev. the president will receive the members, and the Rev. H. Deane, M.A., will give a lecture on the college, and conduct the party over the buildings. From here the party will go to St. Giles's Church, where the vicar, the Rev. G. F. West, will make some remarks upon the history of the building. It is the finest specimen of the Early English style existing in Oxford. On the 16th, Jesus College and St. Martin's Church at Carfax, and the ruins of St. Peter-le-Bailey Church, will be visited.

An ordinary meeting of the Society was held November 6th, when the Rev. J. S. Treacher M.A., read a paper on "Early Printing and Engraving."

THE ARCHITECTURAL MUSEUM.

A VERY respectable and intelligent body of workmen, about 150 in number, assembled on Saturday afternoon last, in the Museum, and Mr. W. Bindley, read a paper introductory to his proposed explanations of the casts, treating chiefly of the Egyptian and Classical times. Norman, Transitional, and Early French work, will be treated of on (this) Saturday, 9th. It may be useful to hint to the reader, that the place is not very well adapted for teaching, and that he must keep up his voice if he wishes to be heard.

OPENING OF ST. STEPHEN'S SCHOOLS, SPITALFIELDS.

THESE schools, in which secular instruction will be combined with religious teaching, have been opened by Bishop Claughton. The schools present a frontage to Quaker-street, Brick-lane, near the Bishopsgate Terminus of the Great Eastern Railway, and are in close proximity to St. Stephen's Church, with which they are connected. The building is of brick, from a design by Messrs. Stone, architects. The edifice has three stories. Each story is capable of accommodating 200 children. There are schoolrooms for boys, girls, and infants, into which the latest improvements are said to have been introduced. The largest room is the infant schoolroom, which can upon occasion be used for religious meetings. The dimensions are 50 ft. by 33 ft. The other rooms are nearly corresponding in size. There is a drill-ground below the schools. The cost of the building has been 6,000l., derived from voluntary contributions and the Government grant in aid. Accommodation is provided for 600 children in the institution. The works have been twelve months in progress. The schools are opened free from debt, so far as the structure is concerned.

SANITARY MATTERS.

The Drainage of Richmond.—The committee of the Richmond select vestry have applied to the Local Government Board for sanction to borrow 20,000l. to enable them to execute a scheme of sewerage for the district. Mr. J. T. Harrison, C.E., the Government commissioner, held an inquiry respecting the application at the vestry-hall, and having heard all the arguments for and against the application, said he would advise the Local Government Board on the subject, and inform the vestry of the result.

The Utilisation of Sewage.—A conference has been held at Southsea to discuss the practicability and desirability of introducing carbon into the purification and utilisation of sewage, by means of a system invented by Mr. Edward C. C. Stanford, F.C.S. Lieut.-General Lord Templeton, K.C.B. presided, and the company in-

cluded representatives of the military and naval departments. Colonel Synges, R.E., entered into an elaborate exposition of the main features of the system, and an interesting discussion ensued. The "carbon system" is now being tried at Glasgow.

WARE AND HERTFORD.

MR. T. W. GRINDLE, C.E., has been appointed engineer to the Ware Union Board, to survey and carry out the necessary sanitary arrangements for the fifteen parishes and townships comprised within the union under the recent Public Health Act. The same gentleman has just now completed a re-arrangement, at a cost of about 2,250l., of the deodorizing works, originally constructed for the purification of the sewage of the town of Hertford before passing into the river Lea. The scheme now in operation includes lime and chloride of lime, both of which are added to the sewage as it enters the tanks; the matter is then allowed to subside till clear, when it passes over weirs formed of white glazed tiles, which are so arranged as to allow the effluent water to escape in a quantity corresponding to the amount of sewage which enters the works. From these weirs the water is carried into the filters, which are composed of finely-crushed coke, and from thence it passes through a conduit 1,000 yards in length, and eventually finds its way into the river Lea.

HOOP IRON BOND IN WALLS.

SIR,—I read with much surprise in your paper of the 26th October, under the heading of "Materials of the Architect," of the injurious effects of hoop-iron, when used as bond in the mortar joints of brick walls. This question is raised by "H. L.," in the last issue of the *Builder*.

I must say that my own experience is directly opposed to the statement made in your article. I have used slight hoop-iron as bond in mortar joints for the last five-and-twenty years, and never saw or heard of any but the most beneficial results from its use.

A fellow tradesman has just had to remove a wall he built twenty-five years ago; the hoop iron is as clean and tough as when it was laid in the work; the mortar appears to have altogether stopped the corrosion of the metal.

About ten years ago I built a garden-wall near the sea, of grey stock bricks, with Hailling lime mortar. As the soil was very treacherous, I used much more than the usual quantity of iron-hoop bond. I have looked carefully at the wall within the last few days, and cannot see a single joint that has failed.

Under these circumstances I must be excused when I hold the opinion that the use of slight hoop-iron in mortar joints in brick walls is one of the best uses, and can seldom be used but with advantage. I readily admit that it would be quite as well if laid in cement.

A CANTERBURY BUILDER.

THE IRON CHURCH AT PRESTONVILLE.

WARREN P. ROBINSON.

THIS was a claim of 45l. 1s. 6d., at the Brighton County Court, for furnishing certain plans and specifications for the building of a church at Prestonville. The case was heard before the following jury—Messrs. F. Bury, Geo. Brown, W. W. Buckman, Alfred Beckwell, and James Balguy.

Mr. Penfold appeared for the plaintiff; and Mr. Gell for defendant, a clerk in holy orders.

It appeared, from Mr. Penfold's statement, that plaintiff, who was a draughtsman and modeller, had been for some time acquainted with the defendant (a curate at Emmanuel Church), who was desirous of erecting a church at Prestonville, which, he estimated, would cost 2,000l., if he could raise the money. Plaintiff was instructed to prepare plans and certain models and specifications for the proposed edifice, and of which he was to superintend the building. Plans were prepared, but the money was not forthcoming, and plaintiff was then instructed to superintend the building of an iron church, which, it would be remembered, was burnt down about the 5th of November of last year.

The defence made by Mr. Gell was, that the plaintiff had charged most exorbitantly for the plans, tracings, and specifications, and he called Mr. Laisson, surveyor, in support of his statement; but, after the case had lasted about three hours, defendant denying the statement of plaintiff, the jury ultimately found a verdict for plaintiff, damages 40l. 8s. 6d.

There was another jury case on the list, in which the son of the plaintiff sued defendant for work done at the same place as a builder; but the hearing was adjourned for a fortnight.

WHITEHAVEN BATHS COMPETITION.

SIR,—I hope none of your younger readers will be tempted to compete for the above baths, until the committee give a straightforward statement of what remuneration they are prepared to offer. At present, they require a statement of terms from architects. I presume the cheapest will win.

I do not fear that established architects will enter for the competition, which is at the best but a very little one, but I fear that some of the younger men who are just entering business, and have some spare time on their hands, or some young gentlemen engaged in offices, may consider that it is a nice little thing well within their power and time, and so go in. Let them remember that when they are older men the position of the profession will be, to a certain extent, what they have made it; and

if for a microscopic chance of present gain they encourage this sort of attempt to lower the status of the profession, they will surely to some degree suffer, when in their turn they take the place of the older men in the business.

If there were no responses to this sort of advertisement, committees would soon cease to spoil your advertising pages with their economical offers.

FORSEYER.

P.S.—In this competition, "Rejected designs will be returned if required."

WATFORD PUBLIC LIBRARY COMPETITION.

The committee have informed the architects who sent in designs for this building, that the following designs have been selected out of the fourteen sent in:—

The design deemed by the committee best,—
"Non quo sed quo modo," Messrs. Sedgwick & Son, Watford; second, "Faith," Mr. John Ladd, 4, Chapel-street, Bedford-row, London; third, (without motto), Mr. P. J. Byrne, 53, High-street, Windsor.

The committee propose to exhibit all the designs in a public room in Watford.

THE NEW COUNTY LUNATIC ASYLUM, CHARTHAM, KENT: COMPETITION.

The design of Messrs. John Giles & Gough, 28, Craven-street, Strand, has been selected, in a limited competition, for this asylum, to accommodate upwards of 1,100 patients.

LADIES' READING-ROOMS.

SIR,—As you have at all times been a champion of the true interests and rights of women, you will doubtless have many fair readers. I therefore beg to suggest, through the medium of your widely-circulated journal, that these should interest themselves in the establishment of ladies' reading-rooms in the most frequented thoroughfares of the metropolis and great provincial towns. Refreshments, too, might be supplied at these rooms.

The unprotected female often knows not where to rest during waiting intervals in town, and I believe the establishment of such rooms would be profitable to either individual or collective enterprise. But if not, the suggestion ought to be carried out by public subscription.

THOUGHTFUL.

PLANNING OF THE NEW LAW COURTS.

SIR,—I see in some of the papers that Mr. Street is now engaged on the contract drawings for the new Law Courts. I think the legal profession would be grateful to him and to you if he would furnish to the *Builder*, and you would be willing to print, a detailed sketch (which he could now, doubtless, easily have made) of a court such as he proposes to make them. The success or failure of his great building will mainly turn on the practical convenience of the courts; and as, no doubt, they will be all alike, at least in the main principles of their design, I think lawyers in general would be very glad to learn precisely what Mr. Street proposes to do for them, from a drawing sufficiently detailed to convey an accurate idea.

TEMPLAR.

* * * We should be quite willing to comply.

STATE OF CARDIFF.

The inquiry recently held here by the Rivers Pollution Commissioners has shown a very bad state of things existing. The whole of the sewage of Grangetown is discharged into the Taff below the bridge. All Cardiff, Canton, and a part of Llandaff are supplied with water from the waterworks. The soil of Canton is very porous, and there are about 1,300 cess-pools, which rapidly fill up, the matter flowing over to the backyards of the houses. There are plenty of wells near them, and the soil is seen flowing into them. There are frequent complaints. Houses run from 4s. a week up, the majority of them being working men's houses. Many of them have no other water to drink but from the wells. No stand-pipes, and they are compelled to use the water pumps.

Per Contra.—An Irish gentleman, of a mechanical turn, took off his gas-meter, to repair it himself, and put it on again upside down, so that at the end of the quarter it was proved that the gas company owed him 3l. 7s. 6d.!

VENTILATION OF ROOMS.

SOME of the Liverpool papers publish a plan which they describe as Dr. Elliot's (of Carlisle), and as exhibited by that gentleman at the meeting of the British Medical Association in Birmingham:—

"The peculiarities are to be seen in the upper panels of the door (being made to open downwards into the room, or to fasten up, as required); the roller of the blind so placed (a foot from top of window, and so far into the room) as to suspend the blind on a level with the inner surface of the wall, instead of close to the top, and up against the window, as usual; and the bar of wood, dark coloured, placed, whenever wished for, beneath the lower sash, so that a chink is left, across the middle of the window, excluding rain and all avoidable dust, yet admitting air very freely, but with a strong upward direction to the ceiling, by which means it is thoroughly tempered and seasoned, as well as dispersed like a shower near the ceiling, before descending for use. A screw fastener inserted at each end of the open chink, being passed through the thickness of the lower sash, and only half through that of the upper sash, secures the window effectually against being opened from the outside, without, of course, breakage of panes."

The plan, however, is not exactly Dr. Elliot's: it was set forth in our pages a long while ago, and has been largely acted on.

Books Received.

On Diet and Regimen, in Sickness and Health; and on the Interdependence of Diseases, and the Diminution of their Fatality. By HORACE DOBELL, M.D. Fifth and revised edition. London: Lewis, Gower-street. 1872.

IN this edition of a standard work already noticed in the *Builder*, the author has introduced, amongst the new matter, some useful remarks on ventilation and heating, as well as a valuable letter from Mr. G. E. Pritchett, architect, on house drainage and other kindred subjects. Mr. Pritchett writes so as to force attention on the most indolent-minded purchasers of things as they are, as proprietors, buyers, or tenants of dwelling-houses. For example, he says:—

"If you are about to purchase or hire a nice-looking newly-built house, do not for a moment suppose or take for granted that the drains are 'all right,' for in many new houses the drainage is only run out a little way from the walls, and not led anywhere, but left for some one to complete after his family has been struck down, and who upon digging up his flower-beds and destroying the growth of his shrubs and everything else, pursues the drains, finds that they are choked, and full of worms and black stuff, and go nowhere."

Whether you occupy an old or a new house and premises, caution is equally necessary. Look at your surface-gratings, whether in your paths, your stable-yard, your conservatories, porches, lobbies, or wherever they may be, with great suspicion, especially in dry weather. People will sometimes say to themselves, when walking about premises, "Wherever does that smell come from?" little thinking that the water has evaporated from the traps. These surface drains should not be connected with sewer drains at all, but should have a separate service of pipes.

See where the rain-water descending pipes run to: look well at the joints of those vertical pipes. If you notice discoloration of the paint at the joints, you may know at once that they are connected with some cesspool or sewer-pipe."

"Formidable sums of money are being spent in draining towns so as to lay on sewer-pipes by means of pipes to our very bedroom doors. Is this right?"

A First Book of Mining and Quarrying, with the Sciences connected therewith, for Use in Primary Schools and Self-Instruction. By J. H. COLLINS, F.G.S. With Numerous Illustrations. London: Lockwood & Co., Ludgate-hill. 1872.

THIS little work is intended much more to show what has to be learnt by the miner and quarryman than to impart actual knowledge. Still, a good deal of useful information will be found in its pages. We have observed a sentence or two about blasting with gunpowder, but no hint as to the variety of blasting-powders lately coming into use, such as dynamite, pudrolite, &c. The author, however, must be well enough acquainted with the subject, as he is lecturer to the Miners' Association of Cornwall and Devon.

Cassell's Technical Manuals: Colour. By A. H. CHURCH, M.A. Cassell, Petter, & Galpin, London.

A Few Hints on Colour and Printing in Colours. By P. B. WATT. London: W. J. Adams.

THE first of these treats of the laws and theories of light and colour in a way to interest the reader, and ends with practical remarks on coloured glass and colours of pottery and porcelain, mineral pigments, enamelling, gold and silver, lacquering, coloured marbles, &c. The author of such a technical treatise is a very competent one, Mr. Church being professor of chemistry in the Royal Agricultural College at Cirencester.

He regards Maxwell's new theory of colours, which Mr. Benson, architect, has done much (in the *Builder*, and afterwards in a separate form) to advance, as being conclusively proved by his experiments, although in actual work with pigments themselves he thinks the older theory affords a more immediate though often a less exact answer to any question which may arise.

The "Hints" under the second title given, appeared first in the pages of the *Lithographer* and were intended chiefly for those connected with the lithographic art. The text, however, has been made applicable to colour printing in general.

VARIORUM.

SPEAKING of cast-iron steam pipes, the *Nautical Magazine* says,—
"The testing of cast-iron pipes is much more satisfactory than the testing of wrought-iron work. The limit of elasticity of the latter is, as we have shown above, at not more than one-third of its normal strength. Wrought-iron, therefore, cannot, without risk of injury, be tested to much above one-fourth of its breaking strain, for the limit of elasticity should not be passed, but as the limit of elasticity of cast-iron is above 80 per cent. of the ultimate cohesive strength, the hydraulic test can be carried very nearly to the full factor of safety required for wrought-iron boilers. This will, of course, be the case in all materials in which the limit of elasticity approximates towards the breaking strain."—We take from "Cassell's Technical Educator" for November a paragraph on "Amateurs' Lathes:—"
"Turning is such an interesting art that it is not surprising its practice is very far from being confined only to engineering works. Indeed, from the earliest age of the lathe it has been a very favourite instrument of amusement with persons having leisure and a taste for mechanics; and amateur turning, both plain and ornamental, is now so extensively practised, that not only are lathes and apparatus specially designed for such work, but the construction of such mechanism has become almost a distinct business. The distinctive features of lathes used by the amateur and ornamental turner are lightness, high finish, and the power of being applied to the execution of a great variety of work not usually performed in the lathe. Some of the simple forms of lathe may be termed amateur lathes; but the lathe best of all suited to the amateur mechanic is light screw-cutting lathe of about 5-in. centre with treadle motion, and carefully designed slide rest. Such a lathe as this, when provided with the necessary tools and apparatus, is capable of executing almost any kind of light work, and altogether a most useful instrument."—The recent decision of the Emperor of Germany having brought Vancouver Island into notice, *il va sans dire* that Mr. Wylde has published a map of the island, showing the San Juan Boundary as awarded by the Emperor. It shows also the line contended for by England. Oddly enough, Vancouver's Island is not named on the map, but as the adjacent parts are, can he easily guessed at.

Since our readers were furnished with an account of the reforms that were being effected in the drainage of Windsor Castle, these works have been pushed rapidly forward, and will be entirely completed before the arrival of Her Majesty's Windsor next month. The *Lancet* says,—
"The alterations at the castle itself are, indeed, already finished, and the late heavy rains have given to separate system a full and successful trial. Additional ventilators, not contemplated in the original plan, have been fixed to the old soil-pipes, and their outlets have been in all cases carried completely up to the battlements of the castle. The overflow of pure water from all the cisterns and fountains has been intercepted and conducted outside the castle walls, but is so abundant, and at so high an elevation, that some plan for its utilization should be adopted. The drains at Frogmore, and at the adjacent buildings, will be entirely completed in a few days. Numerous ventilating shafts have been fixed along the course of the drain, and, when near roads and houses, are carried up walls or trees. None of them are furnished with charcoal or any other filtering medium."—*Old Merry's Month* (Warne & Co.) adapts itself successfully to a juvenile public.—*Little Folks* (Cassell) for November includes no fewer than forty pictures, and a sort of stories, for 6d.—*Ocean Highways* for November (32, Fleet-street), contains a comprehensive chapter of the Island of San Juan, which we may regard as pronounced San Wan. The territory

until lately in dispute is about 400 square miles of island-studded sea, the islands varying from two miles to twelve miles long. The value of San Juan Island is simply strategic. The writer of the article says,—"The decision of the German Emperor is in defiance both of the words of the Treaty, and of its spirit, and will entirely destroy all trust in the impartiality of any future arbitration from that quarter."—A letter from Rome, according to the *Art Journal*, states that the event of the day is an important discovery in the Forum Romanorum, made by Senator Pietro Rosa, so well known for his excavations in Rome, Ostia, and the Villa Hadriana. "Under the remains of the tower of the Middle Ages, standing near the column of the Emperor Phocas, which formed the *ultima Thule* of the excavations in this quarter of the city, and served as an abutment to the arches over which the road was made, the fragments, pretty well preserved, of a bas-relief have been found. At two different places of this tower, separated by a space of about 18 ft., and serving as fundamental supports below other materials to it, stand pieces of walls, taking up a space of nearly 50 ft., still upright in the ground, covered on both sides with a closely-fitting row of marble slabs, from 5 in. to 6 in. thick, containing precious sculpture, which served evidently as ornaments of the rostra. This row shows in its upper part traces of having borne a railing, and may have surrounded originally the platform of the tribune. On the outside, towards the listening multitude, the marble slabs illustrate remarkable events having reference to the history of the Forum, in order of time, executed by masters of no ordinary skill in bas-relief. The crescent which they have formed begins with the Rminal Fig-tree, and ends with the Lotus-tree. Splendid forms on this remarkable monument rise already out of the rubbish and mud which have covered it for centuries, and not only the historical representations, but also the well-executed monuments of the background, will serve to make this extremely important discovery a source of enlightenment on the topography of ancient Rome."

Miscellaneous

Fatal Scaffold Accident.—The corner of Westminster has held an inquiry at St. George's Hospital respecting the death of Jeremiah Murphy, a mason. Patrick McKay, a mason, stated that for some months past a pole scaffolding had been erected outside Kent House, Knightsbridge. About 35 ft. from the pavement there was a footing of deal boards for the men to work on, outside of which was a scaffold-pole used as a landing for huge masses of stone which were raised from the ground, rested upon the pole, and finally moved into position. The deceased, two labourers, and witness were standing upon the scaffold superintending the landing of a block of stone, weighing 5 cwt. As the block was placed upon the pole one end snapped, and the deceased, who had one foot upon the pole, was precipitated to the ground and instantaneously killed. The pole was but 1½ in. to 2 in. in diameter where it snapped, and was old. The jury returned a verdict of "Accidental death," expressing an opinion that the pole in question was not at all fitted to bear so heavy a weight as 5 cwt., and that in future great care should be taken in selecting larger poles for such purposes.

London Association of Foremen Engineers and Draughtsmen.—At a meeting of this society at the City Terminus Hotel, Cannon-street, on Saturday night last, after a paper by Mr. Thomas Webster, F.R.S., "On the Promotion of Practical Science and Technical Education by Museums of Inventions established and maintained by the surplus of the Inventors' Fee Fund," the following resolution, proposed by Mr. W. Lloyd Wise, and seconded by Mr. D. Campbell, was carried by acclamation:—"That this meeting considers the Patent-Office Museum at South Kensington totally inadequate to the requirements of the age, and is of opinion that, after suitable provision has been made for the efficiency of the Patent-office, a reasonable proportion of the surplus funds arising from the granting of patents for inventions should be devoted to the establishment and maintenance of a more comprehensive museum of inventions for the advancement of practical science and technical education."

Geologists' Association.—At the opening meeting of the session 1872-73, held at University College, on Friday evening, November 1st, the president, the Rev. T. Wiltshire, M.A., occupied the chair, and an address was delivered by Mr. Hyde Clarke, "On the Influence of Geological Reasoning on other Branches of Knowledge." The influence of geology on the general thought of the age, in confirming and rendering general the habit of observation, was ably dwelt upon; and Mr. Clarke proceeded to show that the determination of stratification had exercised a powerful effect on modern thought, since with it were connected the ideas of succession and progression. The vast duration of the globe shown by geology harmonised with the boundless extent of the material universe, of which astronomy gave us evidence, and in like manner geology had afforded support and assistance to zoology and ethnology, as well as to philosophy, while it had rendered great service to theology, by the broadening influence of its teaching. The president, in calling for a vote of thanks to Mr. Clarke, said geology taught us most cogently the wisdom and goodness of the great Eternal.

Opening of the New Convalescent Home, Saltburn.—This structure has been opened for the reception of patients. The building is of white fire-brick, and was designed by Mr. Olliver, of Newcastle-on-Tyne, architect, and the work carried out by Mr. Robson, of Darlington. The aspect is western, and the new Home is the first object seen by travellers approaching Saltburn. The principal sitting-rooms face the west, and they are all lofty, and of a cheerful character. One side of the house is set apart for males, and the other side, corresponding in size, for females. The sleeping-wards vary in size, and contain from three to nine beds each. These also face the west. The entrance-hall and passages are floored with encaustic tiles. The lavatories, baths, and other conveniences are well arranged near to the respective suites of rooms. The dining-hall is spacious and well lighted, as, indeed, is the whole of the building. The kitchen is also large and airy. The building is adapted for receiving fifty patients. Members of the Pease family, of Darlington, have had it erected at a cost of upwards of 12,000l.

Proposed Restoration of the Priory Church at Brecon.—In pursuance of a numerously and influentially signed requisition by the freeholders, residents, &c., in the archdeaconry of Brecon, a public meeting was convened by the high sheriff, and held in the Shire-hall, Brecon, to consider the best means of raising a sufficient sum to complete the restoration of the Priory Church. The high-sheriff of the county (Mr. Jayne) presided, and among the large assembly were the lord-lieutenant of the county, Lord Tredegar, and the bishop of the diocese (St. David's). The meeting resolved that it was desirable to complete the restoration of the Priory Church, and that the report of Sir Gilbert Scott be received and adopted. A number of gentlemen, including the high-sheriff, the lord-lieutenant, the members for the county and borough, and the mayor and corporation of Brecon, were appointed as a committee to solicit subscriptions, and generally to carry out the restoration. The meeting also pledged itself to use every exertion to carry out the object in view.

Opening of the New Covered Market, Bradford.—The new covered market, which has been erected by the Bradford Corporation, has been opened by the Mayor. The interior of the market has cost about 17,000l., and it contains 117 shops and stalls, most of which have been already let, and will produce a revenue of 2,400l. per annum. The market is surrounded by a number of shops, which front Kirkgate, Darley-street, and Godwin-street; and when these are finished, the total expenditure will have been about 35,000l. It is intended at some future time that the space at the back of the present building shall be enclosed, if it is found that extension of accommodation is needed. To complete the whole scheme, it is estimated that a further expenditure of 10,000l. will be necessary, which will make the total cost of the market 45,000l.

General Line of Buildings under Metropolitan Local Management Act.—An article has been bringing together several recent decisions will be found in the current volume of the *Solicitor's Journal and Reporter*, p. 929, the number for October 26th.

The Enlargement of the Sheffield Infirmary.—The new wing to the Sheffield General Infirmary has been opened with an interesting ceremony. The new building stands at right angles with, and is about fifty yards from, the old structure, with which it is connected by an underground passage, which can, in case of need, be hermetically sealed. It is erected of stone, in a plain style. There are four wards, each 50 ft. by 27 ft.; lofty, well lighted, and well ventilated. Connected with them are lavatories, sculleries, nurses' rooms, and so on. The resident medical officers' rooms are on the top story; and on the basement are the scullery, kitchen, and larder. The total cost is about 12,000l. Mr. Henry Currey was the architect; and the contractors were Messrs. Chambers & Sons, of Bishop Monkton.

Slag Bricks.—The prospectus of the Tees Scoria Brick Company (Limited) has been issued. The Company is formed for the purpose of purchasing the right of working in the Tees district a patent taken out by Mr. Woodward, of Darlington, for the utilisation of slag. The capital of the company is fixed at 10,000l., which is divided into 1,000 shares of 10l. each. Hitherto, the daily accumulation of refuse material from the ironworks has involved not only the waste of large quantities of land, but also serious expense for removal. For the future that refuse material, by Mr. Woodward's patent, is to be converted into bricks, tiles, slabs, and blocks suitable for building, paving, flagging, flooring, &c.

The Widening of Ludgate-hill.—At the meeting of the Metropolitan Board of Works last week, the Board came to a resolution to "contribute one-half of the cost (estimated at 50,000l., exclusive of professional charges) of further improvements proposed to be effected by the Commissioners of Sewers of the City of London in Ludgate-hill, such contribution not to exceed the sum of 28,000l., and that it be paid to the Commissioners on a certificate by the architect of this Board of the completion of the work." It is intended to widen Ludgate-hill the width of the railway bridge, as far as Martin's-court, nearly opposite the Old Bailey.

The Ornamental Water in Victoria Park. The First Commissioner of Works has ordered that the large lake (five acres) and the lower bathing lake shall undergo a thorough cleansing process precisely similar to that of the Serpentine. Messrs. Mowlem & Co. have already opened a culvert connecting the large lake with the main sewer, through which the water is being drawn off. The culvert of the lower lake is constructed with large earthenware pipes, and between the joints the roots of trees have insinuated themselves, and prevent the slightest outflow of water. This will necessitate the pulling up and relaying of the entire length.

The Bristol Timber Trade.—Notwithstanding the advance in prices of most kinds of timber and deals, the demand continues active, says F. K. Barnes & Sons' *Monthly Timber Circular*. The importation into this market is beginning to show some falling off, and was last month nearly 4,000 tons register less than in October, 1871. The stock is moderate of most kinds of wood, and of some descriptions almost bare. There can be no question now as to the state of prices for the next twelve months; the foreign shippers have already commenced selling at prices quite 20s. higher than last year, and we believe considerable business has been done at the advance; with this in view, as well as the limited quantity of wood on hand here, prices will continue to rise for many months to come.

Junior Examiner, Office of Works.—In the open competitive examinations for the situation of junior examiner in the Office of Her Majesty's Works, to be held November 28th, the limits of age for the situation are twenty-two and thirty. The examination will be in the following subjects, viz.:—1. Handwriting; 2. Orthography; 3. Arithmetic (to vulgar and decimal fractions); and 4. The requisite technical knowledge, including an acquaintance with the terms and processes of building, such as to enable the candidate to prepare and examine building accounts.

Portsmouth Docks.—The contractors on Monday week commenced operations upon this great undertaking. A gang of men are now employed clearing the ground for the erection of workshops, stables, &c., and the works will be pushed on as rapidly as possible.

Sale of Property in Brighton.—A recent property sale, by Messrs. Wilkinson, included the freehold house, No. 22, Grand-parade, let at 40l. per annum, which realised 630l. Mr. George Atree has also had a property sale. The following prices were realised:—For the freehold house, 34, Buckingham-street, 510l.; 33, Mount Sion-place (freehold), let at 19l. 10s. per annum, 255l.; Mount Sion Cottage and workshop adjoining, of the estimated rental value of 20l. 16s. per annum, 200l.; a ground-rent of 16l. per annum, arising from property in Centurion-road, 305l.; 19, Tiddy-street (freehold), 310l.; 19, Surrey-street (freehold), let at 22l. 2s. per annum, 285l.

The Rise of Middlesbrough.—Though there is a new dock being built by the North-Eastern Railway Company at Middlesbrough, at a cost of above 100,000l., which is approaching completion, the shipping facilities of the River Tees will not, it is stated, be thereby made adequate to the requirements of the greatly increasing trade which the progress of the iron manufacture of the district imposes. A project has, therefore, been set on foot—the cost of which is variously estimated at from 200,000l. to 250,000l.—to construct new docks, jetties, &c., on the foreshore reclaimed by the Tees Conservancy, about four miles below Middlesbrough, near South Bank.

Streeter's Carriage Indicator.—Mr. Streeter has patented an invention, intended to do away with the check-string and speaking-tube in carriages. It consists of two dials, one placed inside the carriage and the other on the dash-board. The handle of the dial inside is connected by a chain with the outer dial, and by a simple and instantaneous motion directions can be telegraphed to the driver. The attention of the latter is attracted by a gong or bell, and by glancing at the dial he can tell whether he is to "stop," "turn to the right" or "left," "go slowly," "go fast," "proceed home," &c.

Bavarian versus Austrian Workmen.—The manager of an equestrian company received permission to erect a circus in the Prater of Vienna. He invited the local builders to send in tenders, the lowest of which was 80,000 florins, and the highest 130,000 florins. The manager, however, found even the lowest tender too high, and contracted at Munich with a firm for erecting the whole circus for a sum of 45,000 florins. All the parts were finished in Bavaria, and the building was put together by Bavarian workmen.

Technical College of Glasgow.—A meeting of the General Committee of the proposed Technical College has been held in the Mechanics' Institute, when a report by the Finance Committee was read. The Finance Committee report that the subscriptions intimated to them up to the present time amount to 11,050l. The committee think this result very satisfactory, considering that the amount has been given by thirty subscribers, of whom twenty-two are members of the General Committee.

Destruction of the new Oxford Music-hall, London.—This hall, as many of our readers must know by this time, has been again destroyed by fire. The destruction is more complete than before, the body and balcony of the hall having been nearly burnt out, and the roof destroyed, and the rest of the building and contents damaged. On the last occasion, if we rightly remember, it was believed that the fire originated in the balcony seats, from cigar-ends, matches, or such like, setting fire to combustible matter in the stuffing of the seats.

Society of Engineers.—At a meeting of this Society, held on Monday evening last, Mr. Jabez Church, president, in the chair, the paper read was "Ou Milford Haven and its New Pier Works," by Mr. Henry Davey, C.E. The author advocated the extension of piers and engineering works for ship accommodation in the Haven, his reason being that the estuary, from its geographical position, as well as for other important reasons, was admirably adapted for an extensive export and import commerce.

Proposed Emigration of Half-a-Million Labourers.—The Birmingham News is desired to announce that a number of influential gentlemen, despairing of a satisfactory settlement of the land question, are making preparations whereby will be offered a scheme of emigration for half-a-million of the agricultural population of this country.

The Museum at Antwerp.—The great series of large pictures on canvas by M. de Keyser, which were ordered to be executed on the walls of the vestibule of the Musée at Antwerp, is finished, and has been "inaugurated." These pictures are monumental in their character, and their subjects are events in the artistic history of the school of Antwerp. The labour devoted to their production has been enormous; it has occupied the artist for ten years.

Statue of Dr. Whewell.—Mr. Woolner has completed the statue of Dr. Whewell, which is of the heroic size. After being exhibited in the Royal Academy, it will be placed in the ante-chapel of Trinity College, Cambridge. The commission to execute this figure was given to Mr. Woolner by the authorities of the college; and the work will be placed near the artist's "Lord Macanlay." It represents the Doctor seated in a chair.

Hastings.—Mr. Butterfield, architect, has examined St. Clement's Church, Hastings, in company with the Restoration Committee, in order to ascertain what steps should be taken. In order that a full view might be obtained from the street, Mr. Butterfield stated his opinion that a large portion of the earth in the churchyard should be removed, and the town-ball be entirely cleared away.

Proposed Coleridge Memorial.—With reference to the 100th anniversary of the birthday of Samuel Taylor Coleridge, October 31st, it has been determined to commemorate it in his old school, Christ's Hospital, by a memorial (probably some commemorative group in silver or bronze), to be called the "Coleridge Memorial," and to be held each year by that ward which has most distinguished itself in the work of the school.

Gloucester New Schools of Science and Art.—A meeting of the general committee of subscribers was held in the new building, at which the accounts of receipts and expenditure in the erection of the building were presented and passed. It appeared that the total cost of the building, site, and fittings, had been 5,460l., and the receipts, including the Government grant, 4,560l., leaving a deficiency of 900l.

A Museum for South London.—The proposal for the establishment of a museum in South London has been very favourably received. At a meeting in the Westminster Assembly-room, the question has been discussed, and a committee appointed to take steps for carrying out the project, for which numerous promises of public support have been received.

Articles of Silica Paste.—In the *Revue Chimie*, M. Müller describes a process of forming ornamental and useful objects of pure silica. The silica is reduced to an impalpable powder, formed into a paste, and moulded. When heated to bright redness, the grains fuse together, become very coherent, and form objects of great durability.

Restoration of Great Horwood Church. At a meeting in the vestry-room of Horwood parish, the rector in the chair, it has been resolved to restore the church, and a committee has been appointed to carry out the work and receive subscriptions, to which the rector and his friends will liberally subscribe.

Health Officer for Bradford.—At the usual monthly meeting, the town council have agreed to appoint a public officer of health for the borough, at a salary of 500l. a year, it being a condition that the gentleman appointed should resign his private practice, although he might hold another public office.

Strike in Belfast.—A strike has arisen in the building trade at Belfast, in consequence of a resolution of the employers that on and after the 1st of November the workmen should be paid by the hour instead of a fixed sum per week, as hitherto. The workmen held a meeting and resolved to stand out for the old system.

The New Co-operative Hall, Heckmondwike.—The inauguration of this new co-operative hall took place a few days ago. The hall and stores have been built at a cost of 9,000l. The hall will accommodate about 900 persons.

Rochester Church.—To the particulars of this church we have already given, we may add that the heating apparatus was supplied by Messrs. J. & H. Redfern, of Hanley.

TENDERS

For the erection of new brewery and additional tun-room at Stamford, for Messrs. Melbourne, Mr. George Seammell, architect. Quantities supplied by Messrs. Curtis & Son:—
 Pattison £1,885 14 6
 Brown 1,980 0 0
 Richardson 1,898 0 0
 Halladay 1,815 0 0
 Hutson 1,738 0 0

For warehouse, St. Mary Axe. Mr. H. H. Collins, architect. Quantities supplied by Messrs. Batstone & Hunt:—
 Moreland & Co. £3,417 0 0
 Henshaw 2,734 0 0
 Newman & Mann 2,650 0 0
 Oliver 2,320 0 0
 Merritt & Ashby 2,345 0 0
 Kirk (accepted) 2,496 0 0

For alterations and building works at 94, Regent-street. Mr. H. H. Collins, architect:—
 Merritt & Ashby £841 0 0
 Cohen 835 0 0
 Colls (accepted) 825 0 0

For making roads, West London District Schools, Ashford, Middlesex. Mr. H. H. Collins, architect:—
 Jones £887 14 6
 Richardson 858 0 0
 Helton 736 0 0
 Kirk 717 0 0
 King 704 0 0
 Bell 694 0 0
 Cole 613 0 0
 Nicholson (accepted) 575 0 0

Fittings to the Schools.
 Oliver £1,895 0 0
 Kirk 1,893 0 0
 Richardson 1,863 0 0
 Merritt & Ashby 1,824 0 0
 Sale 1,457 0 0
 Moreland & Nixon (accepted) 1,429 0 0

School and Chapel Fittings.
 Edwards £747 10 0
 Freighton 683 0 0
 Neaton 606 0 0
 Sidebottom & Co. (accepted) 562 0 0
 Turner 549 0 0

Gas Fittings to the Schools.
 Strodie & Co. £277 0 0
 Comyn, Ching, & Co. 258 0 0
 May & Co. 213 0 0
 Farraday (accepted) 453 0 0
 Hodge & Co. 441 0 0

For a Friends' meeting-house at West Hartlepool. Messrs. Alexander & Henman, architects:—
 Purden & Glass (accepted) £696 5 0

For the erection of a smithy at Portmadoc, for Mr. R. Jones. Messrs. Roberts & Morrow, architects:—
 R. Griffith £210 0 0
 Hughes 200 0 0
 O. Griffith (accepted) 180 0 0

For schools, Kender-street, Hatcham, for London School Board. Messrs. J. Gale & J. P. Manning, architects. Quantities by Mr. D. J. Brown:—
 Nightingale £8,955 0 0
 Ashford & Co. 8,825 0 0
 Sheffield 8,481 0 0
 Browne & Robinson 8,190 0 0
 Brass 8,150 0 0
 Scrivener & White 8,150 0 0
 Crockett 8,130 0 0
 Higgs 7,963 0 0
 Cook & Green 7,865 0 0
 Nixon 7,636 0 0
 Cooper 7,631 0 0
 Carter 7,605 0 0
 Mann 7,494 0 0
 King & Son 7,355 0 0
 Shepherd 6,750 0 0

For elementary schools, Old Castle-street, Whitechapel, for the London School Board. Mr. E. Biven, architect. Quantities supplied by Mr. Thomas Nixon:—
 Gammon & Sons £10,910 0 0
 Shepherd 10,349 0 0
 Wood 10,183 0 0
 Hill & Sons 10,104 0 0

The Vestry of Saint Pancras require the Services of an ASSISTANT SURVEYOR, Salary, 1000 per annum, with a certain annual increase of up to a maximum of 1200 per annum. Candidates must be between twenty-five and thirty-five years of age. The person elected will be required to commence duty immediately, and reside in the parish. The appointment to be determinable by one month's notice from any time, by either party, or by payment of one month's salary in lieu of notice.—Particulars as to duties may be known upon personal application at the Vestry hall, or at 10, Edward-street, Hampstead-road. Applications, upon forms printed for that purpose, accompanied by testimonials of recent date, and not exceeding six in number, must be forwarded to me, not later than FRIDAY, the 15th of NOVEMBER, at THREE o'clock, on WEDNESDAY, the 20th of NOVEMBER, at THREE o'clock. No travelling or other expenses allowed on any occasion of attendances.—By order, THOS. ECCLESTON GIBBS, Vestry Clerk, 10, Edward-street, Pancras, November 2, 1872.

SURVEYOR, &c.—Notice is hereby given, that the City and Local Board require a Person to perform the duties of SURVEYOR, INSPECTOR OF NUISANCES, and COLLECTOR OF RATES. Salary, 1200 per year.—Applicants to send particulars of their qualifications, with references to the members of the Board, on or before the 17th day of NOVEMBER next. Dated the 31st day of October, 1872. JOHN POOLE, Clerk.

MONTGOMERYSHIRE COUNTY SURVEYORSHIP.—The office of COUNTY SURVEYOR being now VACANT, Candidates for the APPOINTMENT are requested to send in their applications and testimonials to the Clerk of the Peace at his Office, in W. Whiphop, on or before the 20th day of NOVEMBER next. Candidates are required to have a practical and theoretical knowledge of construction in civil engineering and architecture. The salary of the County Surveyor is 2000 per annum, and he will be required to reside in the county. ROBERT DEVEREUX HARRISON, Deputy Clerk of the Peace, Welshpool, October 17th, 1872.

The Directors of the East and West India Dock Company are desirous of obtaining the services of a Gentleman to undertake the ARRANGEMENT, CONSTRUCTION, RETAILING, and SUPERINTENDANCE of ALL BUILDINGS, DOCKS, and Machinery now existing or hereafter to be erected, also the Superintendence and Direction of the Engineer's Office and the staff of Mechanics. Salary 5000 a year, rising by annual increments till he attains to 7000. Preferable age 25 to 40. Gentlemen desirous of becoming candidates will be furnished with the necessary form of application, and, if desired, will be considered as a candidate of their wishes. The applications, accompanied by testimonials, must be sent in on or before the 1st DECEMBER, by order of the Directors. J. L. DU PLAT TAYLOR, Secretary, East and West India Dock-house, Bullwharf-square, 22nd October, 1872.

ASSISTANT ENGINEER.—REQUIRED, the SERVICES of a Gentleman experienced in the Construction of Sewerage Works. He will have to take the necessary jobs, prepare the working drawings under the direction of the Engineer for the Works, and superintend the works during construction. Salary at the rate of 1500 per annum.—Address, THE BOROUGH SURVEYOR, Barrow-in-Furness, Lancashire.

LANCASTER UNION RURAL SANITARY DISTRICT.—The Rural Sanitary Authority for this District intend to employ a Person as an INSPECTOR OF NUISANCES under the Public Health Act, 1872, at a salary of 1500 per annum, exclusive of certain allowances. Preference will be given to candidates who have a practical knowledge of surveying, drawing, and building operations.—Applications, with testimonials of character and qualifications, may be sent to me on or before FRIDAY, the 16th inst. J. GRANT, Clerk to the said Authority, Lancaster, 4th November, 1872.

TO MASTER BUILDERS AND PLUMBERS. WANTED, by a young Man, a CONSTANT SITUATION as PLUMBER, or on a JOB. Can do plain site work, painting, and glazing. Wages not so much an object in other work if required.—Address, G. L. No. 2, Malvern-road, near Junction, Kilburn.

WANTED, by a respectable young Man, who has had several years' experience in the timber trade, a SITUATION as CLERK or FOREMAN in a yard or mill. Can measure well, either by the standard or by the gauge, as to ability, &c.—Address, C. H. 102, Brompton-road, S.W.

TO PLUMBERS AND BUILDERS. WANTED, by a thoroughly good Plumber and Plain Zinc-worker, a SITUATION or JOB. Well up in all branches of plumbing.—Address, E. 8, Bayham-street, Camden Town, N.W.

TO TIMBER MERCHANTS. WANTED, by a respectable young Man, who has had several years' experience in the timber trade, a SITUATION as CLERK or FOREMAN in a yard or mill. Can measure well, either by the standard or by the gauge, as to ability, &c.—Address, C. H. 102, Brompton-road, S.W.

TO PLUMBERS AND BUILDERS. WANTED, by a thoroughly good Plumber and Plain Zinc-worker, a SITUATION or JOB. Well up in all branches of plumbing.—Address, E. 8, Bayham-street, Camden Town, N.W.

WANTED, by an ASSISTANT, of seven years' experience, accustomed to prepare Finished, Working, and Detail Drawings, Land Surveying, and can assist at Taking out Quantities, or at SOUVENIRING, at a moderate salary. Resident testimonials.—Address, E. C. 3, Burton New-road, Lisson.

TO ARCHITECTS AND SURVEYORS. WANTED, by an ASSISTANT EMPLOYMENT, who has had some years' experience. Is a neat draughtsman, and prepares plans and details from Finish sketches. Good references can be given.—Address, B. P. The Priory, Fratton Bridge, Portsea.

TO ARCHITECTS. WANTED, by a neat DRAUGHTSMAN, an ENGAGEMENT, to PREPARE DESIGNS (of stone) from rough sketches, detail or working drawings. Satisfaction guaranteed. Address, M. B. Ferncroft, St. Nicholas-road, Upper Tooting.

TO CATHOLIC ARCHITECTS, ENGINEERS, SURVEYORS, AND CONTRACTORS. WANTED, to PLACE INDOORS a well-educated YOUTH, aged 16, with a good taste for drawing, and either of the above for term of years.—Address, with full particulars, to J. M. care of Mr. Pickering, Bookeller, Boyton, Hart.

WANTED, by a first-class HOUSE and DECORATIVE PAINTER, WRITER, GRAINER, and GILDER well-versed in drawing, and making out patterns for decorations, cutting stencils, or printing or painting, &c.—Apply to R. W. Post-office, Madamshouse, Whiston-cum-street, W.C.

TO BUILDERS AND CONTRACTORS. WANTED, by a practical Man, an ENGAGEMENT as FOREMAN of MASONS, in town or country. Well up in church work. Good references can be given.—Address, W. T. 9, Brookly-street, Liverpool-road, Islington.

WANTED, by a practical Bricklayer, a SITUATION as WORKMAN or CHARGE of a JOB.—Address, A. G. No. 15, Denney-street, Stepney, E.

TO BUILDERS, SLATE MERCHANTS, AND QUARRY WANTED, by a practical Man, a RE-ENGAGEMENT as QUARRY MANAGER or FOREMAN of MASONS. Has a thorough knowledge of drawing and machinery work. First-class references can be given to clerks of trade. Aged 24. Good testimonials.—Address, J. R. care of Mr. Garrett, High-Brompton, S.W.

TO BRICK MANUFACTURERS AND OTHERS. WANTED, by an experienced Man, a SITUATION as MANAGER or FOREMAN in a BRICK-FIELD, or in any occupation as superintendent of out-door labour. First-class references can be given to clerks of trade and capability. Address, S. T. Post-office, Hayes, near Uxbridge.

WANTED, by an experienced London Foreman, a RE-ENGAGEMENT as GENERAL FOREMAN, CLERK of WORKS, or take entire Charge of Job. Bricklayer by trade. Just completing a large job in the country. Good references.—Address, A. N. care of Mrs. Cope, Upper Portland-street, St. Martin, Nottingham.

TO PLUMBERS AND BUILDERS. WANTED, by an experienced young Man, a SITUATION as PLUMBER or THREE-BRANCH HAND. Can do plain zinc work. References if required.—Address, J. G. 123, Portland-road, Stottville Hill, W.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT as GENERAL FOREMAN, CLERK of WORKS, or to Take Entire Charge of Job, or a SHOP FOREMAN. Carpenter and Joiner by trade. Good references and testimonials.—Address, T. G. 3, Ravensworth-gate, Falmouth.

TO BUILDERS, SAW-MILL PROPRIETORS, AND OTHERS. WANTED, by an experienced Man, a SITUATION as SAW-SHARPENER or to WORK any kind of saw in the above line. Thoroughly acquainted with all kinds of steam-engines, and capable of doing all repairs.—Address, J. F. P. New-place, Paradise-street, Rotherhithe, London.

TO STEEL-BUILDERS, BUILDERS, AND OTHERS. WANTED, by a young Man, a JOB or CONSTANT PLACE as PLUMBER or THREE-BRANCH HAND. Can do plain zinc work. Town or country.—Address, J. H. No. 8, Bishopsgate-place, Frederick-street, Crosswell-road, Brixton-hill, Surrey.

TO ARCHITECTS AND SURVEYORS. THE Advertiser wishes for a permanent ENGAGEMENT as a JUNIOR, aged 21. Four years' experience.—Address, G. 7, Old-barn-street, S.W.

TO BUILDERS AND OTHERS. THE Advertiser is open to an ENGAGEMENT as GENERAL MACHINIST. Can sharpen or work iron or circular saw, or a hand saw. Can brace his own saws.—Apply to L. D. 10, Brixton-street, Wandsworth-road.

TO TINDER MERCHANTS, SAW-MILL PROPRIETORS, &c. THE Advertiser, aged 36, is open to an ENGAGEMENT as MANAGER, TRAVELLER, or BOOK-KEEPER, in Town or country. Good references. Thoroughly experienced.—Address, 720, Office of "The Builder."

STAIRS.—A first-class STAIRCASE HAND. I do not WANT a JOB, either Day or Piece-work, or as SHOP or OUTDOOR FOREMAN. Town or country.—Address, W. B. 1, Ingeneir-place, Broad-street, Golden-square, W.

REQUIRED, a TEMPORARY ENGAGEMENT, by a first-class PERSPECTIVE DRAUGHTSMAN and COLOURIST, in a Jobby News-office, 1871, in London.

RE-ENGAGEMENT, as FOREMAN or CLERK of WORKS, in a Job. Just completed large job in country. Joiner by trade.—C. G. No. 16, Rutland-street, Piccadilly, S.W.

EMPLOYMENT WANTED, by a young Man, as PAINTER, GLAZIER, and TAFFERANOR.—Address, J. H. 10, Leffer-road, Old Ford.

EVENING EMPLOYMENT required by a BUILDER'S CLERK. Aged 22. Damaged after six p.m. Satisfactory accounts prime cost, &c. made up.—Address, A. C. 2, Post-office, 75, Aldersgate-street, London, E.C.

CIVIL ENGINEER and ARCHITECTS ASSISTANT wishes EMPLOYMENT.—Address, ENGINEER, No. 31, South Clerk-street, Edinburgh.

CLERK of WORKS.—WANTED, a RE-ENGAGEMENT, by a thoroughly practical and experienced Man. Aged 40. Prime cost, &c. made up.—Address, STAFFORD, 41, Wharton-street, Lloyd-square, Finsbury, W.C.

A GOOD PLUMBER is in WANT of a SITUATION. No objection to fill up time in other branches. Address, B. C. 6, Commercial-road, Lambeth.

The Builder.

VOL. XXX.—No. 1534.

Curiosities of the Moscow Polytechnic Exhibition.

IN the Moscow Exhibition, the pavilion containing the collection of the Turkistan department is a model of the buildings described in our first article,* represented in a restored state, the decorations being taken mainly from the Shiridar, and where they are defective or wanting, substituted by designs from other structures of the same kind. Some portions have been altered a little,

to suit the requirements of space and the situation of the building. The pediment is reduced in scale, and the same proportion has been observed, as far as possible, in the dimensions of all its parts; only the side walls of the building have been made comparatively higher. The cupola-shaped turrets on both sides of the pediment are not shown here, but the turrets on the minarets remain in their original form and place. The designs in their original configuration may be said to be of two kinds: to the one belong designs which are produced by a combination of regular geometrical figures and lines made of small squares and oblong glazed bricks, or they are formed of simple Arabic inscriptions; the other is already more refined and carefully executed work in mosaic, the design appearing in the shape of flowers, leaves, and inscriptions. In the former there are only three colours besides the red ground; in the latter there is a great diversity of colours, the design being formed of small bricks, of different shapes, beautifully joined together. Of particular interest are the corner decorations above the vaulted niches. Here are to be seen innumerable variations of one and the same design in detail, which at first sight appear as one design. At the corners over the arch of the pediment are painted two lions, with a rising sun behind them and hind legs running before them.

The principal gates are enclosed within a railing, and it is this part which is used, properly speaking, as a place of devotion by the people living in the Medresse. The entrance to the yard or court at the back is through two side-wickets. The interior of the structures containing the Turkistan department is arranged in the following manner:—The entrance through the left door leads to a small gallery constructed in the style of the country, with small pillars surrounding a miniature garden, the flowers being such as are generally cultivated by the natives and a few wild specimens.

In the large hall to the right are arranged various collections belonging to the sections devoted to geography, natural history, technology, and rural economy. Then follows, outside, the ethnological section, which is most interest-

ing, as it gives one an idea of the type, character, and mode of life of the people of Turkistan, for which purpose are shown, (1) a bazaar, containing several shops, with its usual surroundings; (2) the inner court of a Sart's house; (3) a Sart's room on the woman's side of the house; (4) models of Sart's houses; (5) figures representing types of other tribes in Central Asia; (6) a Kirghiz yorta, or tent, with its arrangements, and a scene representing the everyday life of the Kirghizes, formed of figures in the natural size; (7) Sarts' summer tents. In order to render the bazaar as much like reality as possible, a scene is introduced in front of it of people going to market: there are Duvans, female Sarts, a Sart on an ass, and a Kirghiz on an ox, leading two camels loaded with Kirghiz household goods, and a female Kirghiz seated on one of them. These are supposed to be wandering out into the Steppe, for the purpose of changing their abode. A street-waterer is represented watering the bazaar, &c., and an arba, or Sart's cart, stands close by. The Duvans mentioned above form a mendicant order of monks in Central Asia. They go about the streets and bazaars soliciting alms, for which purpose they usually carry with them a vessel formed of a gourd, which they use as a depository for the victuals they receive. Some of them chant as they go along sacred songs; others carry a kind of chafing-dish of clay, with hot coals, into which they strew aromatic herbs. Their costume is different from that worn by the other inhabitants of Turkistan; they have a morose appearance, and all are very dirty in their person. This order is very common in Central Asia. There is also another order of Duvans that are neither monks nor beggars, who live in towns, settlements, and villages, in families, who occupy themselves with commerce, agriculture, and the breeding of cattle, and who are not to be distinguished from the regular population, only they wear a peculiar kind of cap. This order is also very common. To all appearance, the Duvans seem to be divided into small communities, having no connexion with each other, forming a kind of religious brotherhood, each subjected to its own Ishan, or teacher; but this is not the case. The Ishans constitute the highest ecclesiastical authority; and, owing to identity of interests, calling, and condition, form a secluded society. They have extensive connexions, and exercise a most powerful influence over the people and their affairs. It may be said that the Duvans are in a state of unconditional subjection to their Ishans, who exercise a power over them which has no parallel on earth. If an Ishan orders a Duvan, or several of them, to follow him without saying whither, they are compelled to go, leaving even their occupation and families. This is not all. If an Ishan orders his Duvans to kill anybody, if even a Mussulman, saying at the same that the Shariat (the dogmatical Mussulman law) requires it, the Duvans are bound to obey. The initiation into this order is very simple. A Mussulman has only to give his hand to an Ishan, and he becomes his Murid, or disciple, from that moment. To give one's hand to an Ishan is tantamount to giving him one's soul, body, and estate, to dispose of as he likes. Among other things, the Ishans occupy themselves with treating the sick with different kinds of herbs and extracts, but they mostly pretend to heal by reading prayers over their patients.

The Kirghizes are nomads. In the winter they wander in the lowlands, near the shores of the rivers and lakes grown over with rushes, and in sandy places, where they can get shrubs for fuel. In the spring they proceed to the Steppe, where they find fresh grass for their cattle, and the nearer the summer approaches the higher they get to the mountains, so that in the middle of the summer they wander in the mountains themselves, reaching even the line of everlasting

snows, where the cattle can always find fresh and juicy grass; towards the autumn they descend from the mountains again, and so wander the year through in this manner. Cattle are constantly provided with fresh fodder. During these wanderings the camel is the only beast of burden employed by the Kirghizes. It carries all the household goods, the young and the old, and the dwelling itself. This roving from place to place of the Kirghizes bears a festive character, and is celebrated by them with great rejoicings. This is partly due to habit. They do not become attached to any particular spot: they soon get tired of remaining in the same place. This moving from place to place is also owing to economical, or rather domestic, considerations; for when the old spot becomes exhausted, and there is no more fuel or fodder to be got, they are compelled to seek fresh pastures. If the spot chosen by the Kirghizes happen to offer plenty of fuel and an abundance of food for their cattle, they will remain there the whole winter, and move only a small distance in the summer, as the area they occupy becomes exhausted. Generally speaking, the Kirghizes do not roam in the winter time, but establish themselves in some convenient spot until the spring. Some of the rich Kirghizes employ from 20 to 100 camels in their wanderings.

Owing to the absence of proper roads in the country, the natives usually travel on horseback, and the native cart, or arba, a very primitive two-wheeled conveyance, is only used for carrying goods. The Russians are, however, introducing regular post-roads, and no doubt, ere long, railways will also be established in Turkistan. The women of the fixed population, the Sarts and Tadjik, according to the Mussulman law, are compelled to cover the face when abroad. The married women wear for this purpose a kind of thick veil made of horsehair. The young girls cover their faces with a sort of muslin kerchief, through which only the outline of the face is visible. The costume worn by the women is invariably the same, and on this account it is said it is difficult for a husband to recognise his own wife in the street unless she has something extraordinary in her gait, is unusually tall or uncommonly short, or has any other outward peculiarities. In Turkistan a female is inviolable in the street, and is at liberty to go wherever she likes. They walk slowly, gracefully, and their gait is modest. In every town with any pretensions in Central Asia there is a peculiar class of labourers called waterers. The heat of the atmosphere and the dryness of the air calls for a continual watering of the streets, bazaars, &c., and it is for this purpose that the waterer is called into requisition, who is paid by the shop-keepers for his trouble. But besides, every rich Sart, and generally speaking every large establishment, such as a mosque or medresse, have their own waterers, who are, however, engaged in other household duties as well. Thanks to the watering of the streets, courts, and gardens in the towns of Central Asia, the extreme dryness of the atmosphere is obviated, and in places which are well and carefully watered the air becomes even humid. We have been describing the aboriginal inhabitants of Turkistan; on the same platform are figures representing types of other nations living in that country. The figures are those of a Hindu, an Afghan, a Jew, and a Persian. There are only a few Hindus in Turkistan, who are engaged chiefly in money-lending at the rate of from 2 to 3 per cent. per month, a simple receipt on a scrap of common paper only being required of the borrower when known to the lender. Since the introduction of the Russian administration of justice, however, the Hindus have adopted the forms and regulations prescribed by the Russian law in relation to such transactions.

The number of Jews or Djougouts in Turk.

* See p. 857, ante.

istan is far greater than that of either Hindus or Afghans, and they may be reckoned among the fixed population of the country. The Turkistan Jews afford a striking example of the vitality of their race. They have lived in this country for several centuries, and it is probable that they were settled here even before Mahomedanism was introduced. During the whole of this time they have suffered oppression and persecution, yet have remained intact, retaining their religion and the customs of their forefathers, although like the Mussulmans, they shave the head, wear the costume of the country, and the women cover their faces when abroad. How hard was their lot before the occupation of Turkistan by the Russians, may be imagined from the fact, that they were not allowed as witnesses against Mussulmans, consequently had no power of prosecuting them in a court of justice; they were prohibited from riding on horseback, or wearing fine apparel; they were compelled to go about in a common khalat, or kind of dressing-gown, and to wear the Kirghiz baggy kalpak, as a covering for the head. Into some of the towns they were not even admitted. They now enjoy all the privileges of their former rulers. Petty trade and money-lending is their chief occupation, and they do a little in illicit distilling, as they did formerly, under the Mahomedan sway. After viewing all these figures, it is interesting to enter the bazaar, and visit the several shops, &c., contained in it. The bazaars of Central Asia, both large and small, have the same characteristics; a small bazaar is a large one in miniature. The streets and passages are dirty, partly protected from the rays of the sun by awnings made of rushes; the air is damp, heavy, and in the winter the smells are unbearable. The shops are small and low. Besides being the place for trade, the bazaar is the centre of nearly the whole of the public life of the town, and a greater part of handicraft activity. Here in shops, quite open in the front, jewelry is manufactured, turvery and cabinet work executed; boots and goliobes are made, and table-cloths and coats embroidered. In the same place are locksmiths, copper-smiths, blacksmiths, slaughter-houses, eating-houses, tea-rooms, and baths, and in close proximity may be found tanneries and soap-boiling establishments. Sometimes the shops are of two stories. The top one is called the "balliakhana," which is usually occupied by the shopkeeper, his assistants, or his bachelor sons engaged in the business. Every evening after business is over may be heard the sound of the tambourine accompanying the dance of the hatches. These hatches form a peculiar class of young boys, celebrated for their beauty, who are hired as dancers at the so-called men's evening parties. The first shop we come to in the model bazaar is a barber's shop. The aborigines of Turkistan, being Mussulmans, invariably shave the head, and as we have observed, even the Jews are compelled to submit to this operation, which should be looked upon rather as a religious ceremony than the force of habit. For this reason the barber's shop is a considerable feature in the towns and settlements of Central Asia.

In the bazaars of the larger towns the barbers' shops are open-fronted, or people are simply shaved in the open air. Although this trade has been carried on for centuries in Central Asia, everything about it is rough and primitive. The eating-houses of Turkistan are represented by a room fitted up in the style of the country, and among the cooking utensils is shown a boiler, or kind of steaming apparatus, in which pelmens, or pasties, are cooked by the natives. The steamer is constructed in four divisions, the bottoms of which, except the lower one, are perforated like a strainer. When in operation, it stands fixed on a vessel with water. The raw pasties are placed in the lower compartment, and the steam cooks them. When ready, they are placed in the other compartments, to keep hot. A pillow of rice is also a favourite dish, and is prepared much in the same manner as in other countries of the East. The tea-rooms of Turkistan are another feature. These establishments are very common, and are extensively patronised. They are conducted entirely by the batcha pretty boys, mentioned above, who form a kind of attraction for the natives. The tea is served, ready-made, in a copper kettle, and a single cup serves for two or three customers to drink out of. No sugar is supplied, nor anything else, so that any one wishing to enjoy his tea properly must bring with him a supply of raisins, dried apricots, cakes, &c. A handkerchief is spread on the floor instead of a tablecloth, and the

articles are emptied out on to it from the girdle, where such articles are usually deposited. The trade of embroidering is carried on extensively in Turkistan, and embroiderers' shops are here, among the rest. This art is practised entirely by men, Sarts and Tadjijs. Women are not at all acquainted with this branch of industry. Since the Russian occupation of Turkistan this business has increased very much, owing to the demand which has sprung up for articles of this kind in both the capitals. The ready-made clothes-shop comes next, where a number of khalats are shown in different varieties. These coats are made entirely by women. Then comes a shop, or store, where are sold all sorts of spices, sweetmeats, and fresh fruit in the summer. Here can be bought also, flour, rice, onions, sugar, ribbons, beads, &c. Next to the shops comes the interior court of the Sarts' houses, i.e. the court on the women's side of the house, adapted to the requirements of the harem. A covered gallery, in which the room-door opens, is constructed round the court. In the middle of the court of a Sart's house there is generally a small pond, surrounded with trees, on a raised platform, called a "tourpak." In the latter case the pond is at the side, or situated in the garden, if there is one, attached to the house.

The tourpak is resorted to in the evening, at night-time, when the weather is fine. It is kept very clean, and is covered with felt rugs, paillasses, and carpets, and even with silk counterpanes. The court is also kept clean, and scrupulously so among the rich. The houses of the poorer sorts are usually provided with steps of clay leading to the flat roof, to which the women and girls of the house resort in the evening to take a peep at the passers-by. It is used also as a playground by the children. The houses of the Sarts have, properly speaking, no windows; they are furnished instead with a kind of door, with an extra opening above: the latter among the richer Sarts being protected by a lattice, and in the winter covered with oiled paper. The doors invariably open on to the court, and for this reason there are no doors leading from room to room. The interior arrangement of the rooms of course depends upon the rank and means of the proprietor; their measurement is usually from 12 ft. to 21 ft. long by 12 ft. to 14 ft. wide. The walls are invariably furnished with niches, some of them serving as receptacles for the bedclothes, and so on, in the day-time; others have cupboard fitted in them, and are used for keeping all kinds of household utensils. The wealthy have these niches decorated with very pretty carving in gypsum, and are divided into small compartments by shelves. Stoves and fireplaces are not used, and in a town like Tachkent, with its 70,000 inhabitants, there are only five houses having stoves in their rooms. The walls are of brick and glazed tiles of various colours. The ceilings are sometimes painted in fantastic colours; the floors are either of clay or bricks, and are covered with carpets or felt rugs. The Sarts' room contains three figures of females, life-size, in the model dwelling-house: one of them, the mistress of the house, dressed in rich apparel; the two others representing the servants of the establishment.

In the gallery round the yard described above, are small models of Sarts' houses, illustrating the methods of constructing houses in Turkistan. The dwelling-houses and other structures are built entirely of lumps of clay, which are held together by wooden frames, with the exception of buildings like the Medresses and a few mosques in some of the large towns, which are constructed of burnt bricks. In constructing their houses, the inhabitants of Turkistan dispense with the foundation, merely fixing the frames into the ground, and they are covered from the inside and outside with thick lumps of clay, smoothed off and then coated on both sides with plaster made of clay mixed with finely-chopped straw. The richer people have these walls whitened in the inside with alabaster. The flat roof is also made of clay, and is formed in the following manner. Beams of poplar are placed on the walls, at a distance of about three quarters of a yard from each other; between these are fixed rounded sticks placed close to each other. This, properly speaking, forms the ceiling of the house. Then the beams are covered with a layer of rushes about 7 in. thick, which is again covered with a layer of earth; all this is then plastered with the composition of clay and chopped straw about 1½ in. in thickness. It is said that a skilful and careful workman can

form a perfectly water-tight roof in this manner; generally speaking, however, the work is slovenly done, and the roof begins to leak whenever the season is unusually wet. The roofs of some of the better houses will last ten years or more. The rich often have their houses constructed of two stories. In this case, of course, the framing forming the lower story is made stronger, and thicker beams are employed on the walls.

In the Turkistan department are also displayed all kinds of building materials, such as lime, clay, bricks, and marble. Owing to the absence of forests, wood is dear, and cannot be extensively employed; the chief material used in the erection of houses, as we have seen, being clay dug out on the spot where the building is carried on,—the bricks in use are only sun-dried, kiln bricks being seldom employed. Slabs of lime-stone are also rarely used, as well as marble; of the first are built only the foundations of large buildings, such as mosques, and slabs are used for the floors of the same. Of the second are made bases of columns, monuments, and such like; wood being employed only for the skeleton frames of houses, the ceilings, as described above, and for jambs and doors. As specimens of wood for building purposes are shown beams made of the poplar, and pieces of walnut-wood for making doors. This dearness of wood has made the joiners and carpenters of the country very careful in the working of that material; the axe, which plays such an important part in Russia, is scarcely used, the saw being mostly employed. The high price of wood is also the cause why all joiners' and cabinetmakers' work is so slightly made, and finished only on the side exposed to view. The turner's craft is limited to things of small dimensions. On the other hand, the carver has a more extensive field for exercising his ingenuity. The woods employed for cabinetmaking and turnery work, of which specimens are shown, are the following,—the willow, juniper, pear, apple, plantain, apricot, peach, also poplar and hirc. Of appliances and instruments used by the natives there are also specimens, such as lathes, grindstones, carpenters', joiners', and cabinetmakers' tools, but they are very rude and primitive to look at. Samples of workmanship are also exhibited, in the shape of doors of walnut-wood, window frames, and cupboards. Among the curiosities of the Turkistan department may be classed also a collection of musical instruments, such as copper horns, drums, tambourines used at festivals and at the men's parties, and a peculiar kind of drum used in hawking to frighten the birds from their hiding places amongst the reeds and the lares from the bushes; the hawks are trained by the natives to attack a bird or hare with equal facility. There is also a curious collection of idols worshipped by the inhabitants professing Buddhism. They are:—Dintchouk, the father of mankind; Bakchee, the god of fortune; Ayonchee, the prolonger of life; Bunkuba, the follower of Bakchee; Maiduir, the god of health; Manzouchire, the god of the Khans, &c.

CONCRETE BUILDING.*

Materials.—Half-measure of Portland cement; half-measure of air-slacked lime sifted through a fine sieve, mixed together dry. Seven measures of sand and gravel, if possible, of all degrees of fineness, from peas to large eggs, or stones broken to pass through a 2 inch ring,—the finer should just fill the intervals of the coarser materials. Then all to be mixed together dry and measured. The mixture of cement and lime to be then added, and mixed dry, and the whole tempered with as little water as possible: any more than will just moisten the whole is in excess. The most convenient mode of mixing is to prepare a sufficiently large mortar-board,—say, 5 ft. by 10 ft.; at one end form a shallow box, with three fixed sides, the fourth side, next the middle of the hoard, movable. The sides to be as many inches deep as the concrete is to contain measures of material,—if one to seven, it should be 8 in. deep. At 7 in. from the bottom fix a lath all round the three fixed sides. In using, the ready-mixed sand and shingle should be thrown into the box up to the level of the lath-gauge; the surface should be levelled and struck with a straight edge resting on the top of the gauge; the cement and lime

* Read at a meeting of the Architectural Association of Ireland, by Mr. J. H. Owen, M.A., President of the R.I.A.I., Nov. 14.

should then be added, and the surface struck also. It is plain that by this means the materials and measures in the exact proportions directed to be used are attained. The movable side should then be withdrawn (this side can be fixed in its place when required, like the tail-board of a cart), and the whole mass well mixed together. The best tool for this purpose is a long-handled rake, like a four-pronged fork, with the prongs sent down about 4 in. When the mixing is complete, water should be added gradually, not thrown on in quantity, while the heap is still being turned, until the whole is sufficiently moistened, when it should be at once carried away to the work. Where practicable, it is desirable that the mixing should take place under cover.

It must be constantly borne in mind that by rightly using concrete we ought to get, as the result of the operations, a continuous slab without joints, and of equable strength in every direction, and not admitting of any motion, except as the result of fracture of the mass. In all brick or stone building the several parts are joined together by material of inferior strength, and the parts are capable of motion, whenever a local strain is applied, the pressure resulting from which exceeds the resisting power of the building. This should not be the case in concrete building. With concrete, the whole wall, from end to end and from top to bottom, should form one continuous slab of artificial stone; and to attain this, not merely must each course be continuous in itself (for obvious reasons, the work must be carried up in courses), but it must be attached—cemented firmly,—to the courses above and below it; and to effect this, it is only necessary to leave rough surfaces, and take care not to add any fresh concrete to a dry surface or edge. If any previously-laid stuff has dried, either in the same or in a lower course, moisten it, not to excess, before adding fresh concrete. For this purpose an ordinary garden watering-pot, with a fine rose, will be the most convenient tool.

It is plain, from what has been stated, that a foundation of concrete may be of much less bulk than one of masonry or brickwork. Considering that a 4-ton railway-engine, travelling at forty or fifty miles an hour, and therefore acting with an impact infinitely exceeding the dead weight of the wall of any ordinary house, is borne by a sleeper 9 in. wide resting on about 9 in. of ballast, there seems every reason to believe that a small footing would be ample. To take another illustration: a man of average weight,—say, 15 stone,—is able, with Indian snow-shoes on, which each would be under 2 superficial feet in area, to stand on and walk over the surface of snow without sinking to any extent. The weight of a concrete wall 30 ft. high and 12 in. thick would be nearly three times the weight of a man, but the solidity or power of resistance to pressure of any ordinary soil in foundations is infinitely greater than that of snow. In wet or marshy ground I would recommend that the breadth of the footing at top should be increased by one-fourth, one-third, or one-half, even up to doubling it, forming the sides to the same batter of one to four, but without going deeper, unless it be found, on making trial, that a reasonably good foundation can be got at a moderate depth, in which case an ordinary footing should be laid on the firm stratum, and the wall commenced at its finished thickness so much lower down.

The most embarrassing site of all to build on is when one portion is soft, and others hard and solid. The best plan is not to build on such a site at all; but if it must be done, I would recommend to reduce the footing on the hard ground down to having hardly any, or even no offset at all, and largely increasing the breadth of footing over the soft parts, so as to approximate as nearly as possible to an equal subsidence over the whole area. No rule or measure can be laid down as to the extent to which this should be done; we can only get a rough idea of the variation in quality from the different penetrations of a bar driven with about the same force into both sorts of soil; but where such differences exist, I think it would not be a bad plan to dig, in the soft places, a trench below the level of the intended concrete footing, and of about 2 ft. greater width, and fill it in with gravel without lime or cement, and level it to form a bed for the concrete footing. The additional resisting power would be nearly, if not quite, equal to that of the same amount of concrete.

It may not be amiss to give here an extract

from Viollet le Duc,* describing the foundations of the great cathedral at Amiens, which he had an opportunity of examining down to the very bottom. He describes it as consisting "of a layer of brick earth, 16 in. thick, placed over a virgin clay; next is a bed of concrete 16 in. thick; next, fourteen courses of from 12 in. to 16 in. in thickness each, of rough blocks of a sort of chalk, full of flint, and very hard, which comes out in large masses; above this are one course of coursing stone and then courses of freestone under the surface. . . . Behind the facing of the foundations is a filling of large pieces of flint, of hard chalk, and coursing stone, grouted (noyé) with a very hard and well-made mortar. On this artificial rock rests this immense cathedral. At Notre Dame, in Paris, the foundations are also made with extreme care, faced with strong quarry blocks of great thickness, the whole resting on a good soil: that is, on the lower sand of the Seine, which is coarse, and of a greenish colour. As for the piling which is generally believed to be under the masonry of most of our great cathedrals, we have never found a trace of it." And in a note he adds,—“It is the same with this supposed piling under Notre Dame de Paris and Notre Dame d'Amiens, as with so many other myths current for ages as to the construction of Gothic buildings. It would not be possible to construct a great cathedral on piles. These buildings can be founded only on broad footings; the masses to be borne varying considerably in elevation, the primary condition of stability required a formation perfectly homogeneous, and capable of continuous resistance under the surface.” Without endorsing all that is said as regards piling, in this respect M. Viollet le Duc seems to be led away by the enthusiasm inspired by his subject. We have in the last sentence an exact description of a perfect foundation, and such as you can only be sure of getting by using concrete.

We will turn next to what in ordinary specifications would be comprised under the heads of Mason, Bricklayer, Stonemason, and Paviser, and, in substituting cement for each and all of these, we must bear in mind the nature of the material proposed to be used, and the qualities belonging to it which distinguish it from the materials in ordinary use. The only operations it undergoes are mixing the materials and casting them in a mould; for, however it is applied in detail, or whatever we call the machinery employed, it comes practically to this, that it is cast in a mould (though the moulds differ in some respects from those in ordinary use for other materials), and when so cast the whole mass is homogeneous, without joints, of great cohesive strength, and impervious to moisture. We shall never rightly appreciate concrete and the mode of using it, unless we put out of our heads that it is a mixture of cement and gravel, and all associations with ordinary combinations of lime and brick or stone. We shall best realise the work to be done if we fix in our minds the idea of cast iron. Just imagine a sort of iron which can be moulded cold, in a leisurely manner, and which is only about one-twelfth as strong as common iron, and you have then the right sort of ideas with which to begin working in concrete. There is only one other element to bear in mind, but it is too important not to mention it separately, and it is this,—that every other material used in building, except the hard granites and most compact limestones, depreciates with time and exposure, and requires an initial excess of material to be used, and all sorts of surface applications constantly renewed to preserve it; whereas Portland cement concrete is permanent and durable under all circumstances, and increases rapidly and enormously in strength, and continues to increase,—but in a continually diminishing ratio,—for as long as observations have up to the present time been made with it. This is a most important quality, as it enables us to use it with great economy of material, and with the certainty that if it bears the weight imposed on it at first, it will continue not merely to bear it, but will become continually more able to bear it as time elapses.

The first portion of the “mason's” work to be settled is, of course, the walls. For an ordinary two-story house, with walls not exceeding 24 ft. high, 9 in. is quite sufficient thickness. For walls above that height I would recommend that the thickness should be increased by about 3 in. for every 6 ft. added to the height,—of course taking advantage of the occurrence of

the floors to reduce the thickness. As concrete hardly arrives at its initial strength in less than a month from the time of mixing, it is evident that it is very unsafe to fill up the walls to a great height with too much rapidity. I believe that it will be the safest course to build at the rate of only about 3 ft. in height per week; and then let the work rest and consolidate for 6 ft. per month, which at first sight may appear to be slow progress; but, considering the great rapidity with which the internal finishing of a concrete house can be carried on, the total time occupied in building would not exceed what would be required with ordinary materials. In building the walls, as in the foundations, care must be taken to moisten the surface of old work before adding fresh concrete; and this, as before stated, is best done by watering through a very fine rose. As a concrete wall is intensely hard, its surface will be subject to damp from condensation. In inferior houses this may probably be met sufficiently by covering the inside surface with very rough mortar plaster, and washing it with two or three coats of thick lime wash; but for houses of a better class the walls may either be battened or built hollow. If battening be decided on, provision must be made for fixing the battens as will be described hereafter. If the walls are to be built hollow, the simplest course to adopt is to lay on the footings a series of brick on edge, tailing with the spaces to be filled by the inner and outer concrete walls, and set about 3 ft. apart, and on these to lay a piece of plank in the direction of the length of the wall, tapered on its cross section and notched to pass down an inch or two in the bricks, which it will keep in their places during the operation; the concrete is then filled in and well rammed up to the level of this plank core, after which it is removed, and another course of bricks is laid, breaking joint with the previous course, and the operation is repeated. As regards the thickness of these walls: the inner wall should not be less than 4½ in. thick, nor the outer one than 8 in., and of course the concrete must be carried the full thickness of the wall round all openings.*

THE ESCURIAL AND ST. JAMES'S PALACE.

SENTIMENT IN ARCHITECTURE.

THE unfortunate fire at the Escorial called attention to a subject which but for it might have long been unthought of. Spain is a kind of *omni-de-way* place, in somewhat curious and exceptional circumstances. It is half Oriental to begin with, and so gives a sort of midway idea of a nationality between the pure Orientalism of the opposite coast of Africa, and the “Westernism” of Europe generally. Some people seem hardly to know whether to call Spain “civilised” or not. We hear it called bigoted Spain, improvident, incapable, and even pitiable; but nevertheless Spain has had a history, and a telling one,—a language none better, a literature and an art, and an architecture; and so certainly a “nationality” and an individuality of its own. To develop the vast resources of Spain according to the general view, nothing is wanted, at least in the way of a commencement, but railways in all directions. Railways give birth to towns, towns to population, and populations—at least all modern ones—dig into the earth, and cultivate it, and build upon it, and fairly “subdue” it,—a not a little expressive word, for *subdued* it may be said to be in every sense. But all countries have a past as well as a present, and a future. Spain certainly has had a great past, and one of the memorials of that past is this very palace of the Escorial, just so nearly destroyed by “fire from heaven.” What, therefore, is the Escorial, and what is there especially remarkable in it, or about it, that makes it architecturally interesting? To us there seems a good deal. And, again, is there any building in this small island which has any sort of similitude, in any way, to it, not in an architectural or building sense merely, but in “sentiment”? Is there any sentiment in modern architecture?

Now, the truth is that this famous Palace and “Tomb” has but little pretension to a place in architectural history, if parity of details, and elaborate ornament, be the test points of architecture. It is a structure which rather comes

* “Dictionnaire d'Architecture,” iv., pp. 175-7. Art. “Construction.”

* To be continued.

under the head of "building" than architecture. That it contains 1,000 outer windows, and 1,500 inner windows, and 1,200 doorways, and that there are in it, among very many other things of note, 32 leagues of space to walk in, does not make "architecture" as a fine art, any more than do our immense railway stations and vast blocks of warehouses, and miles upon miles of brick streets. What really makes the Escorial world-famous, and mentally and visibly interesting, is the *sentiment of the place*: the why it was built, the by whom it was built, and more than all perhaps, from the expression it conveys to us of the sentiments and feelings of the time in which it was reared. All this it most certainly does. We would again ask, is there any "sentiment" in architecture, as things go, and if so, will it raise a mere building into the rank of architecture? This is a great and a new question, for it may very well be doubted whether we, in this practical age, have any time for sentiment in building. All things are too practical for it; we build for use, and not for sentiment, or feeling, whether in marble or in brick. A railway station is, of course, a pure matter of utility and business, as is a common house; and a church is, after all that is sometimes said, really nothing more. A practical want is supplied, and that is the end of it; for if there be any sentiment, it is borrowed from the past. But with the vast edifice, or rather many edifices, with which we are now concerned, all this is reversed. Philip of Spain had as it was many palaces in which to take up his abode, and to live happily, or gloomily, as he best could; but none of them satisfied him, not even those which romance itself may almost be said to have reared, and wherein any one with an imaginative faculty might well have dreamed away existence; but these did not suffice. A new sentiment was needed, and a building wherein this sentiment might find expression, and place in which to work; and it must be confessed that no greater harmony could well exist between the mind of a man, and the material structure in which the man chose to live and die than this. Its very place among the solitary mountains in which the vast pile of building was placed, the bare simplicity of the architecture of it, and the main idea itself, and to which all else is subordinate and accessory, viz., that of a church to live in, or as close to as could be, and a tomb ever to contemplate, and in certain time to lie in: all expressed in a way not often paralleled, even in past days, the feelings and sentiments of the builder of it, and in as complete a way as can well be conceived. If the Escorial contains no architecture, it certainly has that which might have created it. When we think of our plain and mentally simple way of doing things, it is not a little strange to think of such a place, filled with an ever-present "darkness," and in which even the distant successor of the gloomy founder never missed the opportunity of lighting up this gloom—midnight gloom,—to say all that is possible in this world for her dead ancestors who lie entombed in it! Such is sentiment. May we not therefore fairly contend that there is "sentiment in architecture, or say, if you like, building?" And that such sentiment, whether wise or not, is not now the question, will go a good way towards raising the bald and simple into the great and artistic. So the old Romanesque, or Norman architecture, as we love to call it, of this country, the plainest of forms, and with the least of ornament, always has seemed to us to possess a dignity and solemnity and grandeur which even the best of the pure Gothic does not possess, and "sentiment" doubtless has a good deal to do with this. The ways and manners and feelings of the old Norman knights and their "retainers," and their religion, who can do more than dream of them? It must be borne in mind always that man does not live by "bread alone," but must have a something else, even if it be but a romance or an Escorial to dream about.

But the Escorial was not only a church and a tomb, it was and is yet also a palace, though a deserted one; and being so full of all that is strange and romantic, and beyond the things of every-day existence, it must be of some interest to know of any building, all bustle and business as it is, which is at all or in any way like it. We do not mean in plan, and arrangement, and architecture; but in sentiment and forgotten or almost forgotten use. We say in London. Well there is, truth to say, St. James's Palace—a place that seems to be, as it were, waiting to be "improved off the face of the earth. One cannot

help wondering why it continues to exist, covering, as it does, such a space of valuable building ground. Yet to our minds it is a very remarkable structure. Like the Escorial it is not remarkable for its architecture. It is as severely simple and plain as it well can be, quite as much so as the Spanish palace. It is out of use, too, for it is only now and then, in an almost accidental sort of way, that it is utilised. There is a chapel,—the chapel royal,—in it which now and then wakes up into a sort of life, in a strange enough way too. There are courts in it, and windows enough, and doors, and staircases; but for all that, the palace is the abode of silence and almost forgotten things. In the "Ambassador's Court," but for the noise in the distance, one might fancy oneself in the very Escorial itself. It lies low, and seems almost buried, and but for the traffic, such as it is, through it, it would really be in sentiment a complete counterpart of the old Spanish palace. Of course the origin of it was different; it did not come of the desire of a recluse for a "church and a tomb," but it sprang up in an age so totally different from the present that the "sentiment" at work in the origin of its building was almost as strange to modern men and ways as was that of the Escorial itself. We do not here mean that the architecture of St. James's is not worth a little study; to our mind it is. The plan of the building, irregular though it be, would seem to be not a little convenient for palatial purposes, and certainly far superior to what Buckingham Palace can afford, for the state drawing-rooms in it have a quaint and old-fashioned dignity about them which could hardly be in any more modern and "improved" building. We hope to see it preserved for its own sake, and as a lesson to those who fancy that architecture consists in ornament and decoration, and as one of the old landmarks of a past and fast disappearing way of aristocratic life. It is good to preserve the memory of some things, even if dying out and their origin almost forgotten. St. James's Palace is of this kind, and no one can go through it without some impression of a hygone day springing up in his mind. We see our forefathers in these quaint places. There must be, then, something in architectural sentiment, and something to be got out of a building "educationally," even when it does not contain any very impressive architecture or ornamental details, and is nothing but a plain brick or stone or granite structure, with doors and windows and rooms strange to look at, and of whose precise use we can but speculate at leisure, and imagine anything, and people, as we love to do, with forms long since dead and forgotten. "Sentiment" in architecture! Can we expect any in the future, and of what kind is it to be? All fancies of the past go, and well educated out of us; another Philip of Spain an impossibility. Even the Spaniards are emphatically told to make every effort to rid themselves of the strange fancies which made the Escorial a reality. And if Spain, still more enlightened England must amend all these old-age ways and modes of thought and feeling, and turn to something else for "sentiment,"—even architectural sentiment. If there are those who, fond of architectural puzzles and hard questions, want a something to speculate upon and to test the strength of their "imaginative faculty" by,—why here it is!

PRESIDENT'S ADDRESS: INSTITUTION OF SURVEYORS.

At the opening meeting, November 11th, the president, Mr. E. N. Clifton, after glancing at the position and prospects of the society, and congratulating the members upon the evidences of its growing usefulness, said:—The difficulties in the way of the disposal of the sewage of large towns do not seem to be less than heretofore, nor to have been relieved in any way by the energetic endeavours of corporate bodies to find some solution to this difficult problem. It is true that, under legislative pressure and legal threats, the authorities of many towns have carried on investigations and instituted costly experiments with a view to the discovery of some plan of escape from their embarrassment; but little else has resulted from their efforts than the usual crop of conflicting recommendations and reports, making the difficulty of choice not less onerous and bewildering than heretofore. It is remarkable that, of the rival systems under trial for years past, not one has headed the others so much in the race for supremacy as to

make its adoption, in any particular case, a matter of unhesitating selection.

The result of the determined effort made by the borough of Birmingham to escape from the network of injunctions and Acts of Parliament in which it was involved, is hardly calculated to afford much encouragement to those who looked to the elaborate and costly inquiry which preceded the application to Parliament as likely to evolve some system, which, tried upon a scale which should put its merits or demerits beyond contention, might serve as a guide to other and smaller towns similarly circumstanced. As a preliminary step, the town council appointed a committee, with power to collect information from all sources, to invite the opinion of experts and men of science, and to recommend some definite plan for adoption. How thoroughly and exhaustively their work was done a perusal of the able report issued last year by the committee will show. Reports were received from the committees of the various systems; the relative merits of the filtration, precipitation, and irrigation methods were carefully considered; and visits of inspection were paid to various sewage-farms in different parts of the country. It was decided by the committee that the precipitation system was too uncertain in its operation and too costly for application to the sewage of a population of 345,000 persons, and a daily minimum sewage flow of something like 16,000,000 gallons. Neither did the so-called filtration system commend itself to the committee. The irrigation system was next considered, and found more favour, but the question arose whether, in adopting that system, it would be better to distribute the sewage over a small area of land, having regard mainly to its purification by filtration through the soil,—making its agricultural uses a secondary consideration,—or proceed upon a plan of perfect utilisation over a large area of land, with a view to a commercial profit on the undertaking. For the former purpose, it was estimated by the advisers of the committee that from 175 to 300 acres of land would be sufficient, but, as the supply of sewage would be constant, it was resolved, in order to avoid "clogging" the land, to recommend an area of 850 acres, with an intermittent supply to various parts of the land in succession. In order to fully utilise the sewage of Birmingham, according to the plan pursued in smaller places, it was estimated by one eminent authority on the subject that something like 10,000 acres of land, with an expenditure of a quarter of a million of money in the mere drainage and preparation of the ground, would be necessary. It was, therefore, resolved by the committee to recommend the smaller area and the adoption of the system known as "downward intermittent filtration."

Setting aside all questions of private rights in land,—and with which there is a tendency, just at present, at least, sufficiently marked, to interfere in a somewhat arbitrary fashion,—and entirely dismissing the question as between the Corporation and the land-owners, there remains behind one matter of regret. It is, that a scheme of the highest and most pressing sanitary importance—one, moreover, which was forced upon the Corporation by legislative pressure, and in the preparation of which the highest scientific and practical knowledge of the subject was brought to bear—should have proved abortive. It is difficult, under the circumstances, to resist one of three conclusions:—either that the Legislature has been premature in insisting upon a sanitary revolution inconsistent with the existing state of our knowledge of the best methods of sewage disposal or utilisation; that enactments which contemplate the diversion of the sewage of enormous populations from the river drainage system, and its distribution over vast areas of land, in a country so thickly populated as ours are altogether, and in the nature of things, impracticable; or, the contrary being the case, that powers should be conceded to corporations of large towns, enabling them, upon a basis of fair compensation, to override the wishes or the opposition of land-owners in the endeavour to comply with the terms of an otherwise impossible requisition. It may be, and no doubt is, in many cases, an extreme hardship that owners of land should be called upon to relinquish property possessing, to them, elements of value, for which money is no sufficient compensation. We must not lose sight of the fact, however, that it is not a little hard upon the ratepayers of large towns to be denied an avenue of escape from statutory statutes and injunctions of the most uncompromising kind, save by the purchase of land at a price five and six times in excess of the market

value,—a price which, in many cases, represents payment for not only the proprietor's actual commercial interest in the land, but for his prejudices, his ignorant opposition to anything new, and, not seldom, his avaricious desire to make capital out of the embarrassment of his urban neighbours.

Among the most remarkable of the awakenings of the public mind within recent years is the movement—which may be said to have had its commencement early in the present century,—towards a national care for those matters of public health which come properly within the range of State control.

It may be that the intimate correlation of dirt and disease had failed to impress itself upon the minds of our fathers; that the local authorities of the day were endowed with sufficient power to deal with such matters; or that, the general habits of the people being less sedentary, and the population more sparse, it was not till those conditions became altered that the full effects of such indifference to the main origin of disease came into action. Certain it is, however, that in the foul cesspools, open middens, overcrowded burying-grounds, and ill-ventilated dwellings of that time the desolating epidemic waves which swept over this country during the cholera years, found, if not a percentage, at any rate an alliance, and taught us (though in a sorrowful fashion) a lesson for which we can hardly be sufficiently thankful. Much has been done since that time to improve the health of towns, and some little—though but very little—towards the same end in rural districts.

It is worth while observing here that the attention of sanitarians is so much directed, at the present time, to the question of the effluvia of sewage, that there seems to be some danger of their forgetting the importance of completing the system of house-drainage, and attending to the perfect collection of sewage matter and refuse.

What shall I say of the state of things in rural districts? Are our villages really those abodes of health and pure air which the fancies of those who contemplate them from a distance delight to picture them? Is the village brook, with which we associate such pleasant thoughts, really what we fancy it, or is it a pestilent stream, laden with the contributions of the scores of privies which hang over it and the pigsties which drain into it? And which is victorious in the struggle for mastery, our old friend the honeysuckle round the porch or the filthy pool of refuse at the gable-end, which lies reeking in the sunshine? No doubt, much has been done to improve our country cottages in the mere matter of breathing-space; but in all that relates to the application of a real sanitary system we have scarcely moved since the days which, a few pages back, we visited with such reproaches. It is little more than four years ago that a fever epidemic of almost unexampled violence broke out in the village of Tering, in Essex. Public attention was much excited by the circumstance, but the usual lassitude soon got in, and men's minds settled down upon the complacent conviction that there were special features in the Tering case to account for the epidemic, and little or nothing has been done since to improve the sanitary condition of most of our villages. The residents in country districts may be, and, no doubt, are, fairly healthy; but it is due mainly to their outdoor lives, and in spite, not in consequence, of their surroundings.

Although "The Public Health Act, 1848," provided for a thorough system of control, and for the appointment of a staff of inspectors, the powers reposed in the General Board of Health may be taken, in the main, as intended to be supervisory rather than initiatory. In particular cases where, for instance, the death-rate had reached a certain maximum, the Board was empowered to institute inquiries and direct measures of prevention; but its powers were, in most instances, to be put into operation only by the application of a certain proportion of the inhabitants, for an inquiry into the sanitary condition of the locality. It was also invested with power to direct the appointment of local boards to carry out its instructions in places where its interference was needed.

In the year 1854, considerable changes were effected in the constitution of the Board, and the period for which it was created having expired, its powers, with certain modifications, were transferred to a new Board, consisting of a president, the Secretary of State, and the Presi-

dent and Vice-President of the Board of Trade. This Board exercised its functions until the year 1858, when it ceased to exist. After that time, such of its powers as related to disease were vested in the medical department of the Privy Council, under the able direction of Dr. Simon, such other powers as it possessed being transferred to the Secretary of State. Under the Local Government Board Act, 1871, the whole of these powers have been vested in the new Board constituted under that Act.

In the year 1858, the statute known as the 21 & 22 Vict. cap. 98, more commonly as the Local Government Act, was passed. The general effect of this Act was to render the sanction or approval of the General Board of Health, or of the Legislature, unnecessary,—the ratepayers, or proprietors in any district, adopting the provisions of the Public Health Act as they should see fit. The Local Boards were thus emancipated from the control of the General Board of Health; but the consent of the Secretary of State was still necessary in all cases where the Local Boards sought to take property compulsorily.

This Act may be taken as a concession to the principle of local self-government, and great good was expected to result from its operation. It was, however, essentially permissive, and the voluntary adoption of its provisions here too much of the complexion of a self-inflicted fine to secure it a very large measure of success. No broad and systematic attempt has as yet been made to provide proper sanitary authorities for every local administrative area, if I may use the phrase, although abundant machinery had been provided to meet the cases where epidemics or pressing inconveniences had induced single places to apply for State intervention.

It has long been felt that some comprehensive measure which should map out the whole country into sanitary districts, provide for the appointment of qualified sanitary and medical officers to those districts, and abolish the jumble of local boundaries, was urgently needed. Some such measure is that which received the Royal assent at the end of last Session under the name of "The Public Health Act, 1872," but whether it exactly fulfils the requirements above mentioned is very questionable.

The main effect of the new measure is to parcel out the country into urban and rural sanitary districts, the Act reciting that "from and after the passing of this Act, England shall be divided into sanitary districts, to be called respectively urban sanitary and rural sanitary districts." The Act also defines the authorities who shall, in each case, preside over the respective districts. Every district is called upon to appoint a "medical officer or officers of health, an inspector or inspectors of nuisances, a clerk, and a treasurer, and such other officers or servants as it may deem necessary." Powers are conferred upon the New Local Government Board, enabling it, when necessary, to amalgamate sanitary districts, or to transfer districts from one category to another, and to merge small districts, constituted such for special purposes, into the larger ones to which they are contiguous, or upon the boundaries of which they encroach wholly or in part. The Act also very elaborately defines the elective and voting authority, and guards against voting in a double capacity. Borrowing powers are also conferred upon local Boards, and provision is made for combined action for the purposes of improvements extending beyond the boundaries of any one district.

Thus the machinery, at any rate, is provided, by means of which the sanitary matters of the whole country may be regulated, under some law not yet in existence, with less confusion and conflict of authority than heretofore. I say less, for it is difficult to see how it is possible, without the appointment of a class of independent, State-paid inspectors, invested with great powers, and without local interests or ties, to insure such a supervision of sanitary matters as to render the measure really operative.

The address treated of several other topics, and elicited the thanks of the meeting.

The Embankment and Charing Cross.—The Metropolitan Board of Works have instructed their solicitor to prepare notices for an approach through Northumberland House to the Embankment, but that will only be proceeded with in the event of the arrangements with the Duke being satisfactory.

THE INAUGURATION OF THE NEW OBSERVATORY IN FLORENCE.

The earnestness with which the new observatory in Florence was inaugurated on Sunday, the 27th of October, marks a new era in the advance of experimental, inductive,—we may say, true,—science. It forms a new proof of the progress now making in Tuscany, and sends us back to the times of Bacon and Galileo, the great apostles of the Renaissance of human reasoning and philosophy.

All who know Florence will remember well the Torre del Gallo,—the old grim square tower, looking like an old English country church, and which is usually known as "Galileo's Tower," whence for so many years the great man sent forth the fruits of his labours to the scientific world. With vast and fertile brain, but living in an age of moral weakness, any heroic strength he might have displayed under other circumstances was annihilated by the atmosphere of corruption and deceit which he breathed; and, great though he was by the light bestowed on him, he yielded before his pursuing enemies, and, in spite of his inward convictions, denied his doctrine, modifying this act with the half-uttered, "*E pur si muove*" ("But it does move").

Ascending from the Porta Romana by the road to the Poggio Imperiale, the hill called Arcetri is reached, chosen for the site of the new observatory. It is but a short distance from the old Galileo Tower, and at nearly the same elevation. The new building is severe in style, grey coloured without, the façade looking direct south. The entrance-hall, adorned with marble busts of the king, Galileo, Amici, Plana, and portraits of the most eminent astronomers, is reached by a handsome flight of steps. Thence, by a room through which the telegraphic wires pass, we enter a room destined for scientific observations. To the left, a portrait of Galileo looks down on the astronomical instruments already fixed on the solid rock. A staircase leads thus to the upper story, with a movable tower that surrounds the great telescope of Amici. This is fixed in the rock, by which it is secured against the slightest perturbation in the building, the flooring being placed over transverse arches, skillfully constructed by the engineer, Boccini. The solid casings of the telescope are from the Benini Foundry. The walls of the tower are covered with photographs, executed in America, representing divers phases of the comet Donati; and on an elegant pedestal is a marble bust of Arago. On the east and west sides of the central tower are terraces, whence the beautiful panorama of Florence can be seen on one side, and on the other richly-clothed hills dotted with villas. An external winding staircase leads to the cupola surmounting the tower.

Unfortunately, Professor Donati—the hero of the day, we may say, the instigator and great promoter of the enterprise, and already appointed as director,—was prevented being present, owing to a fall that he had had the previous day, causing contusion of the knee. Professor Targioni read the speech already prepared by Donati, of which we add some short extracts. It must be prefaced that in the autumn of 1869, three scientific congresses were held in Florence,—the International Medical, the Geodetical (for measuring degrees in Europe), and that of several Italian astronomers, to discuss the observations to be made of the total eclipse of December, 1870. All the members of the congress assembled on the hill of Arcetri to visit the preparatory works for the new observatory. That day, the 26th of September, saw the inauguration of the commencement of the work of which the completion was celebrated this 27th of October, 1872.

Mentioning this fact, Donati proceeded: "These learned and illustrious guests came to this spot to render homage to the glorious memory of the great Galileo, who, on this very hill passed the last years of his laborious life; and because it had been decreed that here should arise a new temple, consecrated to the culture of those sciences into which that great genius infused a vigour of new life." "Thou, not far from here, but on a spot less elevated, existed only a narrow temporary shed to receive the great refractor of Amici, which later will be replaced by a magnetic observatory. But the actual spot on which we are assembled, has always been the fertile field of an industrious colony. Ceres, therefore, has only yielded it to Uranus. Now is seen accomplished this solid admirably-disposed edifice, of which

in 1869 the designs alone could be exhibited to those who assembled here."

"Let all the disagreeable occurrences connected with the erection be obliterated in the grateful pleasure of seeing its completion. It is pleasing also to recall that many learned and experienced men, when visiting the spot during the course of the construction, approved so highly of the enterprise, and urged me to persevere in the completing of the means to so great an end. Among others came the Russian astronomer, Struve, the learned director of the vast observatory at Pulkowa, a thoroughly regular scientific palace, of which he is prince, who had deplored incessantly the unhappy condition of our observatory, and whose voice of authority reaching the Government, added no little influence to the realisation of the project. The numerous and unanimous co-operations lent for the carrying out of such a work should encourage all those who know how hitherto it has been impossible that the strict operations of physical science can flourish, if an efficacious protection be not at hand to assist. Without material force, nowadays, languishes also scientific force; if the former is defective, the latter diminishes. Woe be to the people who do not know how to prevent the breaking of such a connecting link. This observatory is not raised to satisfy any circumscribed need, and still less any private caprice; the feeling was common throughout Italy, that at last an observatory should be raised, worthy of modern times, and a reform of this kind he made where, through the powerful impulse of the great Galileo, arose that celebrated school whose motto is 'provando e riprovando,' and whence issued the first regular rays that illumined the world with a new and fertile light. Historical eras—dates of empires—are little in comparison with that glorious and memorable era which Galileo marked in science; and I venture to affirm that the rising in Italy of an observatory such as this, will mark in future scientific history a date almost as important and memorable." "And undoubtedly our nation has not been nor is behind others in the study of the stars; and you, my excellent brothers in science here present, are a proof of it; and if we except the celebrated observations of Piazzi, and a few others (which constitute the foundations of the mechanism of astronomy, because they were made in remote times, and with instruments and in places incapable of producing the precision arrived at in modern times), all the other works and discoveries are to be attributed more to individual exertions and our happy climate than to an established law for maintaining in due honour most glorious scientific traditions."

Praises were lavished on the architect Jacchini, who designed and constructed the edifice, and on Boccini for his efficacious aid. For the future of the great undertaking, Donati noted with reason how much its useful results depended on the supply of a complete set of scientific instruments for which he confided in the generous liberality of the Mæcenæ who had joined in erecting the building.

AN INTERNATIONAL TECHNICAL DICTIONARY.*

A book has been published which will be found of considerable utility in technical circles. It is an abridgment of "The Technological Dictionary," by Drs. Rumpf, Mothes, and Unverzagt, and contains most of the words in use in German, French, and English arts and manufactures, with their equivalents in each of these three languages. The original work includes technical terms used in the sciences, and is therefore of much greater bulk. Savans will have to refer to this dictionary as before; but the artist, architect, contractor, manufacturer, and commercial man will save himself trouble by consulting the present abridgment. Words from the department of mathematics, geometry, heraldry, gun-casting, and horing, have been discarded in this pocket edition, as well as words of rare occurrence among metal-workers and pyrotechnists; while, on the other hand, some terms have been added which are not to be found in the larger work, but which are likely to prove useful in the conduct of foreign business.

* A Pocket Dictionary of Technical Terms used in Arts and Manufactures. English, German, and French, abridged from the Technological Dictionary of Rumpf, Mothes, and Unverzagt. With the addition of Commercial Terms. London: Trübner & Co., Paternoster-row, 1872.

Apart from the absolute necessity of giving the correct designation of objects and processes in commercial and artistic intercourse with foreigners in their own language, it is highly instructive to compare the different words in use by the three nations to express the same thing. Sometimes we are struck with the general resemblance of terms, as in the German equivalents for heat (*wärme*), cold (*kälte*), fire (*feuer*), water (*wasser*), and numerous other instances; sometimes with the ease with which our own language expresses with a few letters an object that requires double the number of syllables before it can be written or spoken in another tongue, as in the instance of *water-bath*, in contrast with the German *wasserbadapparat*; or our simple *statement*, or old-fashioned *reckoning*, in opposition to the German *rechnungsanszug*; as frequently, perhaps, with the corresponding difficulty; sometimes with the serious importance, or comical consequences, of the omission of a single letter in a translation, or the substitution or addition of one; or of the addition of a hyphen only, as in the work before us, in *journey-man*, by which an ordinary worker appears in the guise of a traveller, or by the omission of one, as in *horse hound*, by which a product of the vegetable world is raised to that of the animal kingdom; and as we turn over page after page we are always brought face to face with a sense of the value of the study of languages in all attempts to trace out the history of man and his works, as well as of the extra light, size, and interest it imparts to our individual shares of the world.

A German merchant, settled in England, has contributed the mercantile terms, as well as the names of all articles mentioned in Custom-house tariffs, to the work before us. To be candid, we must premise it would have been well if the English section of the work had been placed in the hands of a competent Englishman for a closer scrutiny for errors than a German merchant could give. It is notorious that we have idioms no foreign scholarship can master, and the merchant in question has proved himself no worse than the generality of his compatriots in allowing, occasionally, a blunder to remain uncancelled. Every one, we might conclude, who is settled in England, is familiar with the signal, "All-right," now in use by omnibus conductors, cab-drivers, railway guards, and the general public, as an indication that the driver can put his vehicle in motion. But the German writer has it "All's-right," evidently confusing it with "All's well." Again, he writes a *cog* of herrings, for a "keg." Queer combinations, reverses, and explanations take us, too, sometimes, by surprise. We come to "hilder-stap" for "step-ladder," "master" of the works" for "clerk of the works," and "plumbery" for "plumbing." These are, however, scarcely chargeable to the merchant, whose assistance is stated to be confined to mercantile entries. What, we would ask, is a label-corbelt-table? or a nebule-corbelt-table, or case-bay-table, or plank-way cleaved wood? or a chestnut-tree, or a cloak-room with reference to "cees"? The error in the last word is clearly traceable to a mistake as to the origin of the word, which with us is a chamber in which cloaks and coverings are deposited before guests enter rooms full of company, and bears no reference to the *cloaca, mazina* or otherwise. Then as to the participle of "rivet," instead of solving a doubt often manifested as to doubling the consonant, we have "riveted bolt," and are referred to "bolt," under which the word is "riveted," while "riveting" has a second t in parenthesis, giving a riveter an option as to being right to a T, but to which a riveted girder would demur.

As a set-off to a few short-comings of this kind, we may speak with all praise of the fulness with which many items are given with all their variations. We have called attention, before now, to the difficulties attending the use of different names for the same object or process in various localities. Mortar, as one of our recent correspondents remarked, composed of lime and sand, is called mortar in the south and lime in the north. Purins are "pans" in South Lancashire, and "side-pieces" in the West of England. Rafter's are called "spars" in Lancashire, and principal rafters are called "backs." Turning to our international dictionary, we note the modes in which it helps us over this difficulty. The authors give us our choice of clay-mortar, bad mortar, mortar of plaster, mortar of wax, mortar made of lime and sand (*der kalksand-mörtel*), *mortier à chaux et à sable*, air-mortar, hydraulic mortar, poor

mortar, thin mortar, and grout. Then turning to "lime," we have quite as wide a range. We are told the German and French for lime of Vienna, brown lime, caustic lime, quick-lime, dead lime, dead-burnt lime, over-hurmt lime, fat lime, white lime, fibrous lime, hydraulic lime, water-lime, shell lime, slacked lime, lime slacked in the air, wetted lime, and, lastly, hird-lime. Looking to "purlin," we can account for purlins being called pans in some parts of this old Norman-French country, for *panne* is the French for purlin to this day. Next, turning to "rafter," we can see that its Lancashire name, "spar," is but a lingering relic of the old Anglo-Saxon carpenters, for "sparren" is the every-day name for those pieces of construction in modern Germany.

A short time ago the question was discussed in these columns whether we should use the word "rahbet," "rabit," or "rebate," to signify the operation known by all those names in carpentry, and we pointed out that there was more to be said in favour of "rahbet" than some think, for the French word from which we are said to derive it is *rabatre*, not *rabatre*. The international work before us throws no new light on this subject. It is impartial as far as "rahbet," and "rebate" go, and introduces another version, and "rabato." And we have rahbeting (*Die Einfallzung*), Encastrement), rahbet-plane, rabbit-plane, rebate-plane, rahbet-wall, rabbit-beam, rehated door, related joint, related slender shaft, rebated plank, &c.

We should not, however, give a clear idea of the scope of the work without a quotation from it as a sample. We select a portion of the paragraph translating the word "roof" from the volume in which the English is placed first:—

"Roof s. 1) of a building (Build.). Das Dach, Toit m., combis m., Composed r. s., Compass-r. s., Span-r. s., Pent-r. s., Das Dach mit sichtbarem Dachstuhl, T. à ferme visible, ornic. — False r. s., Die obere Hälfte eines Mansardendaches, Faux-comble m., Faise or Half hip-r. s., Das Halbwalnd., Krüppelwalnd., Hammerde, Kiehlende, Toit m., en demi-croupe.—Flat r. s., Platteform s., Die Platteform, das flache D., Plattenform f., c. m. plat., Gable-r. s., Gable-r. s., Das Giebel, T. m., à pignon.—High-r. s., Pointed r. s., Das gotische, altdeutsche, altfranzösische, steile D., T. m., en pointe.—Hipped r. s., Hip-r. s., Das Walmd., Schiefl., T. m. en croupe.—Imperial r. s., Das Kaiserd., wälsche D., die Wälsche Haube, das Zwiebeldach, Comble m., à l'imperiale, impériale f.,—Killessed r. s., Pavillon r. s., Das Zelt, T. m., en c. m., en navillon.—Rigged r. s., Saddle-r. s., Twice hanging r. s., Das zweieckige D., Satteld., T. en battère, à deux égouts, à deux pentes. — Shed-r. s., Lean-to s., Das einseitige D., Schind., Schiepland, Terehd., einseitige D., T. m. en appentis, en potence, à un seul égout.—Square r. s. (Carp.) Das Satteld., mit rechten Winkel, rechteckige D., C. m. en égoutte.—Thatched r. s., Das Strohd., T. m. en chaumière.—Tiled r. s., Tiled-r. s., Das Ziegeld., T. m. convert en tuiles.—Truncated roof s., Flat r. s., Das neugotische D., Mansardend., mit Terrasse, Terraced., Comble m. terminé en terrasse, ou tronqué.—Zink r. s., Zink-covered r. s., Das Zinkd., T. m. convert en zinc.—To Cover s. a. a. r., to Lay v. a. the covering (Tiler.) Das D., eindecken, decken, Poser in couverture.—3) R. s. of a tent (Milit.) R. s. of a tent (Milit.), R. s. of a room (Build.) Die Decke, Plafond m., Comp. Ceiling.—Groined r. s., Inserted r. s. etc. See under Ceiling.—5) R. s. of a fire-box (Cook.) Das Zeltchen, T. m. d'une tente.—6) R. s. of a coach. See Tester.—6) R. s. of the fire-box. Crown s., Fire-box-top s. (Locom.) Die Feuerdecke, Plafond m., ciel m., (de la boîte à feu.—8) R. s. of a beam (Min.) Das Dach, Hangende eines Flötzes, Toit m. d'une couche."

This minute foreign specifications would be made plain by reference to this work, and intricate English directions easily translated. No office,—a word which the translators consider equivalent to pantry, by the bye, though we only apply it so when in the plural number, as offices, and then only in connexion with kitchen arrangements;—no office, we repeat, where international business is transacted, and no library where there are foreign authors on art or mechanics, should be without a copy.

FIRE IN THE CITY FLOUR MILLS.

The destruction by fire of the interior of the City Flour Mills, Upper Thames-street, on Sunday Morning last, has caused considerable excitement, and may lead to fresh consideration as to the best mode of constructing buildings capable of resisting fire. These mills, the property of Messrs. J. & J. Hadley, situated close to the end of Blackfriars Bridge, form an immense brick structure of eight stories, 250 ft. deep and 65 ft. broad. It was built by Mr. Ponsford in 1852; and the floors, with the exception of the lowest, appear to have been formed with cast-iron girders and wrought-iron joists, supported one over another by cast-iron columns, and floored with stone slabs. The lowest three stories are filled with machinery. In the floors above were grinding-mills, including heavy revolving stones, and it is stated, about

200,000 quarters of wheat. The fire appears to have originated in the third story; and although some thirty engines and 200 firemen were soon at work, floor after floor above, as well as the roof, accumulated, and the interior was virtually destroyed. The brick walls are cracked in parts, but all stand. Some shoring has been put up, but the height of the building makes it difficult to do this effectually.

This disastrous occurrence affords another proof of the insufficiency of iron under fire, and the folly of trusting to it when unprotected, as it does also of the necessity of dividing buildings into compartments of moderate extent. When fire gets ahead in a building beyond a certain size it is uncontrollable. It is to be hoped that a careful and technical inquiry will be made as to the circumstances which enabled the fire to spread with such rapidity as it did, and to wreck so utterly a building popularly regarded as fireproof. The scene within the walls is very remarkable.

GREAT FIRE IN BOSTON, U.S.

A FIRE, ranking but too well with that of Chicago, has devastated and destroyed the finest business district of Boston. This city has several times been the scene of destructive fires, but probably has never been visited by one of such magnitude as that which has now occurred. It appears that the fire broke out at half-past seven on Saturday night last, in the store of Tebbets, Baldwin, & Davis, wholesale dry-goods dealers, at the corner of Sumner and Kingstone streets, near the site of Edward Everett's old home. The fire-engines had to be drawn by hand, owing to the lack of horses,—it is said from horse disease, so that pestilence has aided fire in the destruction. The fire made great headway during the delay. The flames swept from story to story, and from block to block, the Mansard roofs first communicating fire, and the efforts of the firemen were unavailable.

The burned district is bounded by Sumner, Federal, Broad, Central Water, Washington, and Bedford streets. The area includes a large part of the Fifth Ward,—probably two or three square miles. The damage is estimated at from twenty to fifty millions sterling. The district, which consists of some of the largest business blocks in Boston, is the centre of the wholesale dry-goods trade.

Among the prominent buildings gutted are the Exchange, the Mercantile Library, the old Post-office building, the new Post-office now constructing, Trinity Church, the Cathedral block near Winthrop-square, the *Transcript* newspaper building, the Hartford and Erie Railroad depot, and many of the ostliest structures in the best business parts of the city. In all, it is said, upwards of nine hundred business premises, the finest in the city, have been burnt down, as well as sixty dwelling-houses and other buildings. The stocks on hand, especially in the case of wool, were particularly heavy. The houses burnt were almost, without exception, of granite, iron, or freestone.

THE PREVENTION OF FIRES.

A SUGGESTION AND INQUIRY.

SIR,—The *Pall Mall Gazette* wisely draws attention to the danger of open "lifts" communicating from floor to floor. Besides this, I would suggest that many fires are both originated and kept going by the escape of gas from broken mains and meters when a large fire occurs.

As regards the one at Boston, a telegram, November 11th, 5 a.m., states "the second fire was caused by explosion of gas." This raises an important question, viz., What means do gas companies provide for shutting off the gas from separate streets in which large fires may break out? If it is answered that, by so doing, total darkness would be felt for a short time in such quarters, it is only a result which must be submitted to for speedy extinction of the fires and for protection of surrounding property.

W. H. ESPENETT.

An Aquarium for Naples. — A great aquarium is being made in Naples by a young German naturalist,—Dr. Dohrn, of Stettin,—at an expense of between 7,000, and 8,000, nearly all of which comes out of his own pocket.

A TRIFLING DIFFERENCE.

AMONGST tenders recorded on another page will be found those sent in last month for some sewer work in Marylebone. Sixteen persons tendered: the highest, Mr. Wall, asked 6,200*l.* for the work; the lowest, Mr. Haynes, 3,020*l.*; the intermediate amounts being in pretty regular progression. Neither the highest nor the lowest was unsupported in his view, for while Mr. Stevens named 5,930*l.* as the fair amount, Mr. Killingsback proposed to carry out precisely the same specification for 3,091*l.* Will some one please explain these mysteries of the deep?

THE LATE MR. JOHN CHUBB.

MANY of our readers must have heard of the painfully sudden death of Mr. John Chubb, the head of the well-known firm of Chubb & Sons, of St. Paul's Churchyard. On the 20th ult. he attended divine worship as usual at Mostyn-road Chapel, presenting his infant child for baptism; and there he was seized with paralysis. He afterwards appeared slightly to improve, but ultimately expired. He was born at Portsea in 1815, and accompanied his parents on their removal to London twelve years afterwards, and on the death of his father succeeded to the management of the business which they have so long carried on in the metropolis, with branches in other provincial centres. His integrity, firmness, and promptitude as a man of business were combined with a kind consideration for those whom he employed, which gave him a strong claim on their regard. This claim they were not slow to acknowledge, and some years ago presented him with an address declaratory of their high esteem. Mr. Chubb's death has led to some strong expressions of admiration from the Wesleyan Methodists, to the interests of which body he had greatly devoted himself. Mr. Chubb was buried at Beckenham, Kent, on the 30th ult. The funeral was largely attended.

FRANKFORT-ON-THE-MAINE INSTITUTION OF ARCHITECTS AND ENGINEERS.

AT the annual general meeting of the Frankfort Institution of Architects and Engineers, consisting of fifty-five members, held in the "Saalhan," on Monday evening, the 4th inst., the report of the council, setting forth the lectures which had been given by members at the monthly meetings, together with the inspections of works which had taken place during the summer months, giving at the same time a general review of the working of the institution was read and approved of.

According to the bye-laws of the Institution, the council, consisting of five members, must be balloted for at each annual general meeting, three of the five members serving during the preceding year being eligible. The following gentlemen have been chosen for the ensuing season:—Mr. Burnitz, architect (president); Mr. Passavant, architect; Professor Sommers; Mr. Vogel, telegraph engineer; and Mr. Gordon, C.E.

The president, in thanking the members of the Institution for the honour they had done him in re-electing him to the presidential chair, took occasion to impress upon the members, especially the younger members, the importance, not only to themselves, but to the Institution, of their contributing papers during the ensuing winter, on works either of structure or of art on which they might severally be engaged, and which present novelties or features of interest to their professional brethren. He had been urged by several members to publicly allude to two subjects, inasmuch as his efforts to prevail upon the gentlemen concerned to give them papers on two such important subjects as he was about to allude to had hitherto been unavailing. Indeed, he found wherever he turned his attention that members were too much engaged, and he knew from experience that there was a great deal of truth in all this, under the presence of the unexampled building progress prevailing in Frankfort and the neighbourhood at the present moment. Still he hoped this public appeal to the patriotism of the two gentlemen in question would not be without its due effect. He was free to admit, with other members, that he watched with great interest, but with a certain amount of anxiety, the progress of the important works for the supply of the town of

Frankfort with water from the springs of the "Vogelsberg," and as they must all shortly make themselves more acquainted with the subject, since the water company had laid down certain regulations with regard to the fittings of the houses, with reference to which there seemed to be a considerable amount of ignorance prevailing, he hoped Mr. Schmidt would favour the Institution with a paper elucidating the subject; and although the question of the house-drainage was much more advanced, many of them no doubt having gone through the mill, yet there were large numbers of them who had kept aloof, and were afraid of this day of burning their fingers in preparing the plans to be laid before the Sewerage Works Office. Hence the establishment of special offices for this class of work. He hoped, therefore, that Mr. Gordon, who had been elected to the council, and had, notwithstanding his apparent reluctance, duly taken his seat at the council-table, would no longer turn a deaf ear to their entreaties, but favour them during the next month with a paper on the important sewerage as well as house-drainage works of this city. He had great hopes that two such interesting papers upon the most important public works ever undertaken by the city of Frankfort could not fail but to be encouraging to other members to make such contributions as their practice afforded them opportunities of doing.

Mr. Albert having proposed that the Institution should identify itself with the Hamburg scale of commission and fees, and that it should be recorded on the books of the Institution, with instructions to the council to give a copy thereof to all persons applying for it, an animated discussion arose, from which it appeared that a case is pending in the Frankfort Courts at the present moment, which would practically be decided by the voting of the Institution, the Court having required proof that the architects' charges in the case in question are customary.

Ultimately the original resolution of Mr. Albert, with some slight modifications, was unanimously adopted, after which the members sat down to a substantial supper.

COMPETITION.

Hull Cemetery.—The Hull Board of Health have resolved to accept the design "Experientia" for chapels, &c., and that the author be employed to carry it out at 5 per cent, less the amount of the premium offered by the Board. The design, Early English in style, is for two chapels, connected by a porch, surmounted by a tower and spire, and for a lodge, &c. The estimated cost of the chapels is 1,850*l.*, and of the lodge, 550*l.* The author is Mr. F. B. Payton, of Bradford.

HEALTHY HOMES.

At a meeting of the National Health Society, held in the rooms of the Social Science Association last week, Mr. R. Rawlinson, C.B., told effectively the "old, old story" of what was necessary at home if people would enjoy health. It has been told so often in these pages, that there ought to be no occasion to repeat it; but there is occasion, and it will have yet to be repeated again and again. We can find room, however, for only a part of it:—The subsoil beneath a house should be naturally dry or be made dry by draining. The ground-floor of a house should not be beneath the level of the land, street, or road outside. A site excavated on the side of a hill was liable to be dangerous, as external ventilation might be defective, and subsoil water from above might soak toward and beneath such houses. Middens, ashpits, and cesspools at the back must faint the basements. The subsoil within every basement should have a layer of concrete placed over it. Cesspools, sink-holes, or drains, should not be formed within house basements. The ground around should be paved, flagged, asphalted, covered with concrete, or prepared and gravelled. Outside channels should be in good order, and be regularly cleaned. House-eaves should be guttered and spouted. Swill-tubs should be near doors or windows. Pigsties should be at a distance, and where pigs were kept rigid cleanliness should be observed. Improperly keeping pigs had resulted, he believed, in more human sickness and loss of life than all the battles in which the country had ever been engaged. Many houses, from the mansion to the cottage, were unwholesome owing to damp basements, to cess-

pools and foul drains within the basement, to rotten timber in floors and skirtings and putrid wall-paper, to kitchen sinks being in improper places and unventilated, to rooms being without adequate means for ventilation, and to water-cisterns and pumps being in improper places and so contaminated. These defects should, he contended, be remedied by the landlord. Houses were also rendered unwholesome by personal dirt and neglect. Rooms were not, for instance, sufficiently cleaned, carpets were left down too long and never swept, windows were seldom opened from the top, closets were left dirty and without ventilation, dirty beds were left unmade and shrouded by dirty hangings, and nooks, corners, and shelves, were never dusted. Such neglect resulted in sickness and squalor, and banished comfort. It was not, then, true charity which gave cake and wine in fever cases, while filth remained unremedied. As to the construction of cottages, he would say let them not be built on heaps of rubbish, manure, chemical waste, or on swampy ground which could not be drained. Thousands of cottages were so placed in the suburbs of our towns, and disease had been the consequence. A bed of concrete would vastly modify objectionable sites, and it should be used in all cases. Back-to-back houses entered by a covered passage, with divisional walls half-brick thick; joists and rafters of $\frac{1}{2}$ in. boards, which a cat walking over would shake; stairs so steep and narrow as to be difficult and dangerous; chamber-windows which would not open; cellars underground, in a hole and without drainage; conveniences crowded against cottage-walls; chambers over middens and ashpits, must be unwholesome. Sewering and draining had, it was true, been vastly improved in England of late years, but they were still far from perfect. London, after the millions which had been expended on it, was defectively house-drained. Most of the houses were drained from the back to the sewer in the street in the front, so that the basement was traversed by drains, and even new earthenware had leaky joints, so that the subsoil was saturated with sewage and became putrid. Then there were cesspools which served no good purpose but to retain sediment. Such foul drains and cesspools should be removed with the tainted subsoil, and new water-tight drains be laid on concrete and fully ventilated externally. There had been a great blunder committed in draining many west-end houses—making no connexion with the sewer, and although the defect had been pointed out over and over again, no remedy had been applied. House-drain ventilation was, too, almost altogether neglected, and many cases of suffering to the weakly from sewage-gas poison were the result. The danger was one, however, which might be very easily prevented by simply making the drain external to the house and ventilating it, as he had done for several friends since the illness of the Prince of Wales.

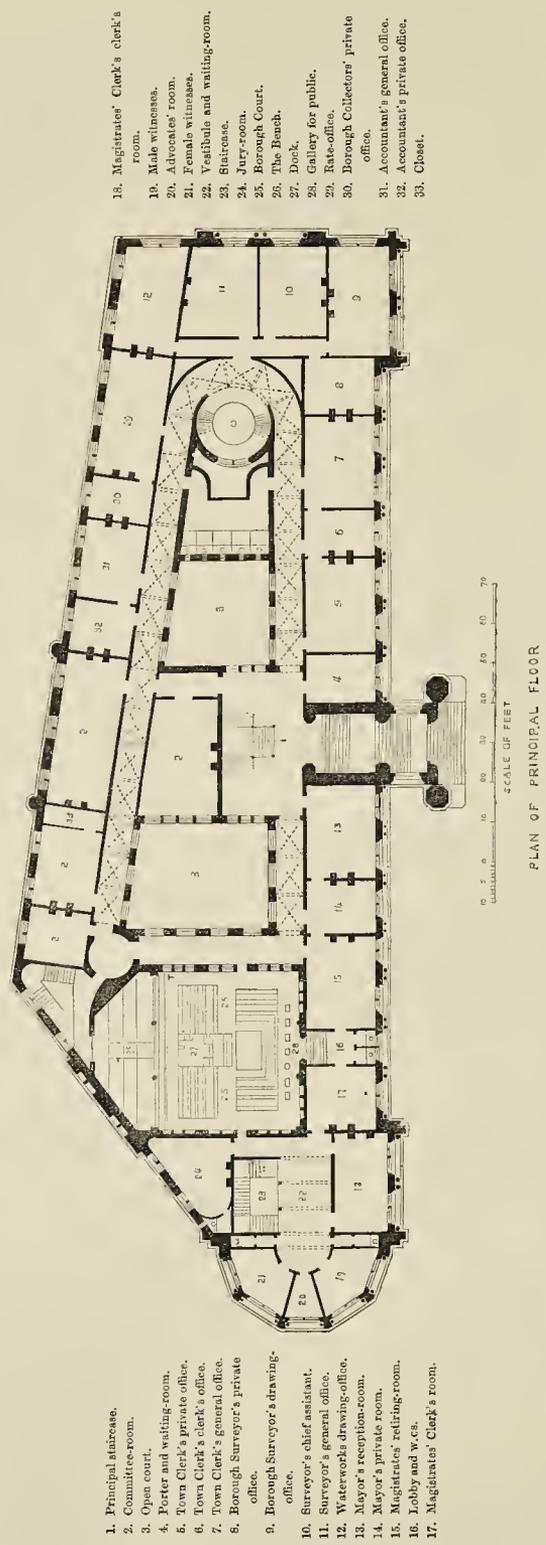

ST. MARGARET'S CHURCH, ROCHESTER.

The particulars given at p. 861, under the heading, "Reopening of Rochester Cathedral," with the exception of four lines towards the end as to the removal of the roof, in reality refer to the reopening of St. Margaret's Church in that city, our informant having been led into error. The restorations at the cathedral are still in progress. The works at St. Margaret's were done under the superintendence of Mr. Gordon M. Hills, architect; and the cost was, as already stated, 1,400l.

ITALY AND THE POST-OFFICE.

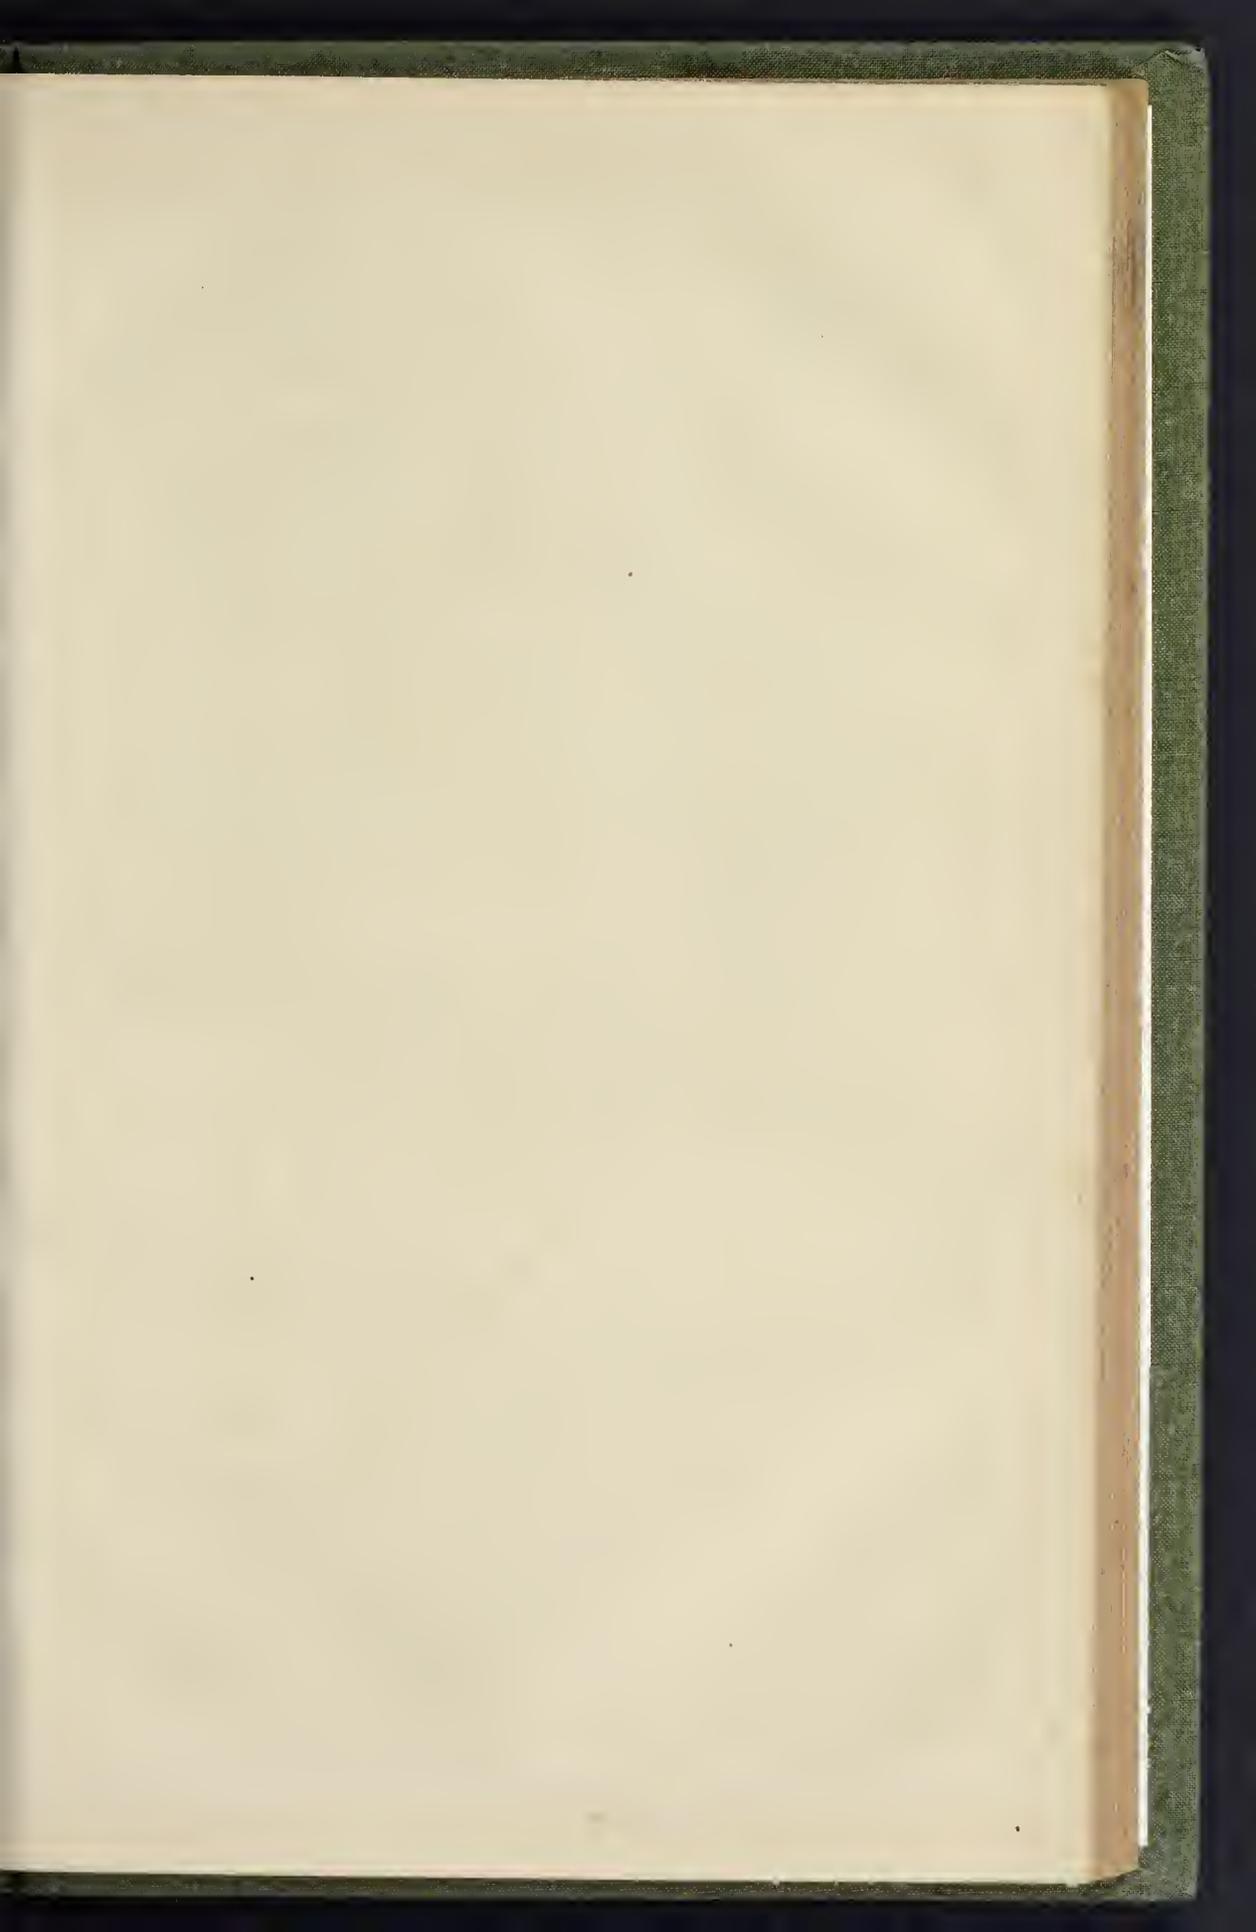

Why is the postage between Italy and England now so exorbitant and so unreasonably irregular in its charges? For example, all the English daily papers cost 3d. from London to Florence; while the same can each be sent from Florence to London for twenty centimes. A correspondent writes,—"The Quarterly Review came this month, postage 1s. 6d.; it was sent to the director of the Florence post to be weighed, and the price ascertained for sending it to England, when the reply was, *one franc*. Another extraordinary fact is, that the postage for books, papers, &c., is considerably *less* between England and Sicily." The effect of this increase is sensibly felt by many residents, and is causing a great diminution in the circulation of English periodicals in Italy. Some explanation is required.

WILLIAM I.

RICHARD I.

BRADFORD TOWN HALL, YORKSHIRE.

BRADFORD TOWN HALL.

This building is now rapidly approaching completion, and is intended to be opened about August in next year. It is built of the finest description of Yorkshire freestone, from the quarries of Cliffe Wood, and presents a frontage towards Market-street of nearly 300 ft. in length. Perhaps a more appropriate name for the building would have been "Corporation Offices," as it provides solely for the accommodation of the Borough Court and its requirements, the council chamber and mayor's apartments, and the suites of rooms for the town clerk, borough engineer, and other borough officials.

The grand entrance is in the centre of the main front, and gives access to the principal staircase and to the rooms of the magistrates and members of the council. At each end are entrances, one for the borough court, approached by the court staircase; and one for the offices, by the municipal staircase.

The whole building is devoted exclusively to business purposes, and has no large hall attached to it.

The centre tower rises to a height of 200 ft., and is arranged to contain a clock-chamber on its principal stage, and above, open on all sides, will be placed thirteen bells, the largest weighing four tons. These bells will strike the hours and the Cambridge quarters, and also, by

means of a carillon machine, will play fourteen tunes. In the interior of the building are two open courts, from which the corridors are lighted, and the irregularity of the site, has been thrown into these spaces in such a manner that the whole of the rooms are rectangular.

The second floor of the principal front is divided into an arcade, with niches between the windows; there are also niches in front of the buttresses, and large pinnacles to the centre entrance. These will receive statues of the kings and queens of England since the Conquest, which are now being executed by Messrs. Farmer & Brindley, of London, who have done the stone-carving throughout. We illustrate two of the figures.

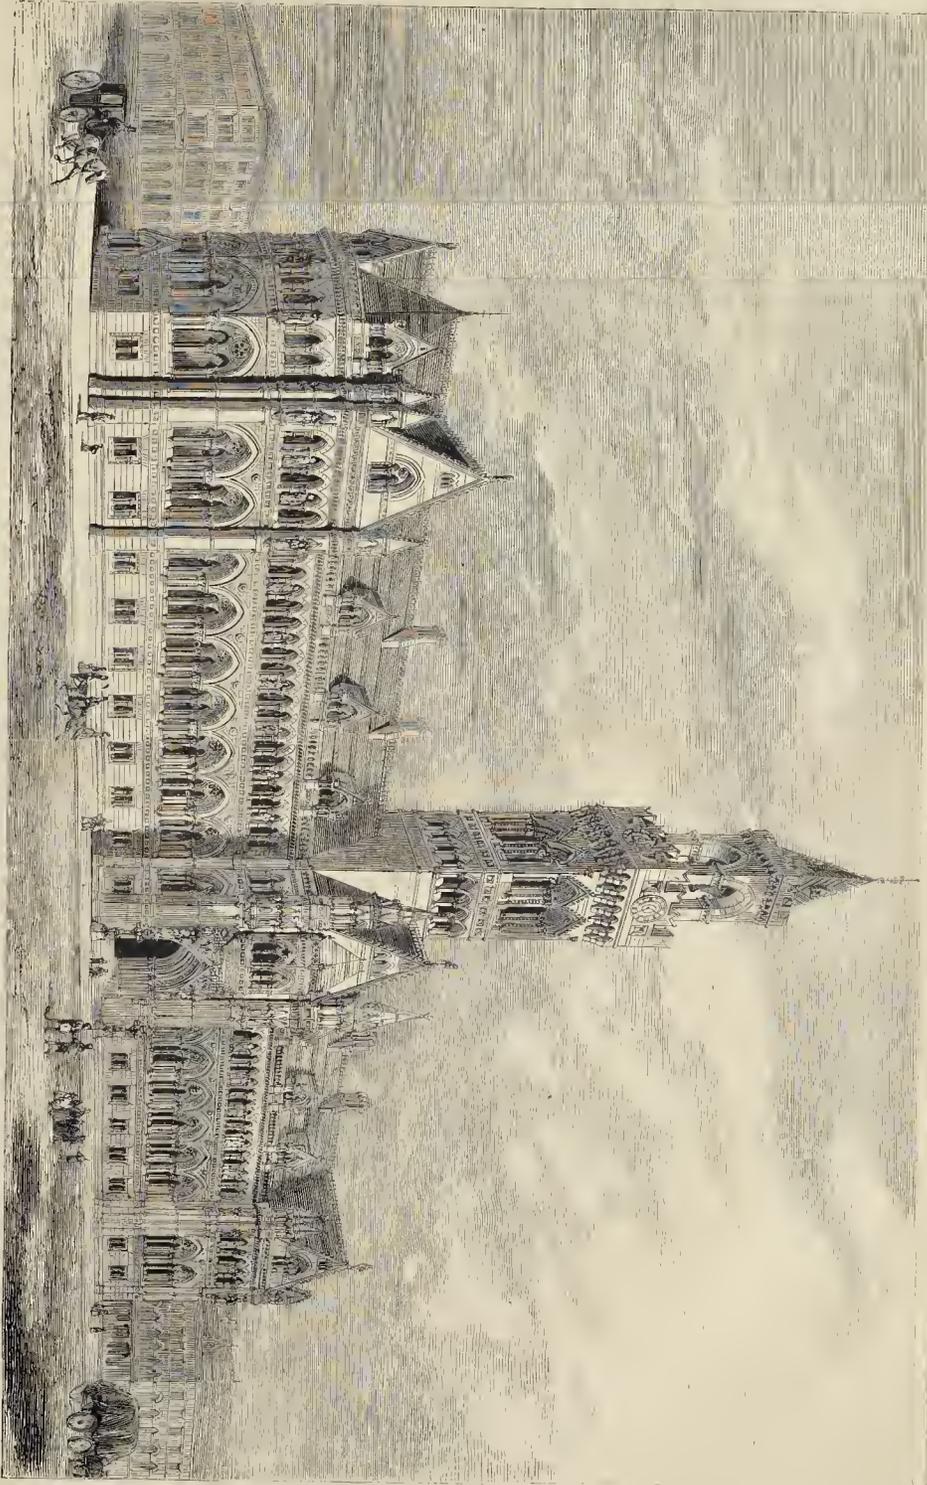

Means have been adopted for the warming and ventilation of the building by shafts leading into the great tower. This work is in the hands of Messrs. Haden, of Trowbridge.

Messrs. Ivcs & Son are the general contractors, and Messrs. Gillett & Bland, of Croydon, are supplying the clock and bells, with their patent carillon machine. It is intended to furnish the building throughout in oak.

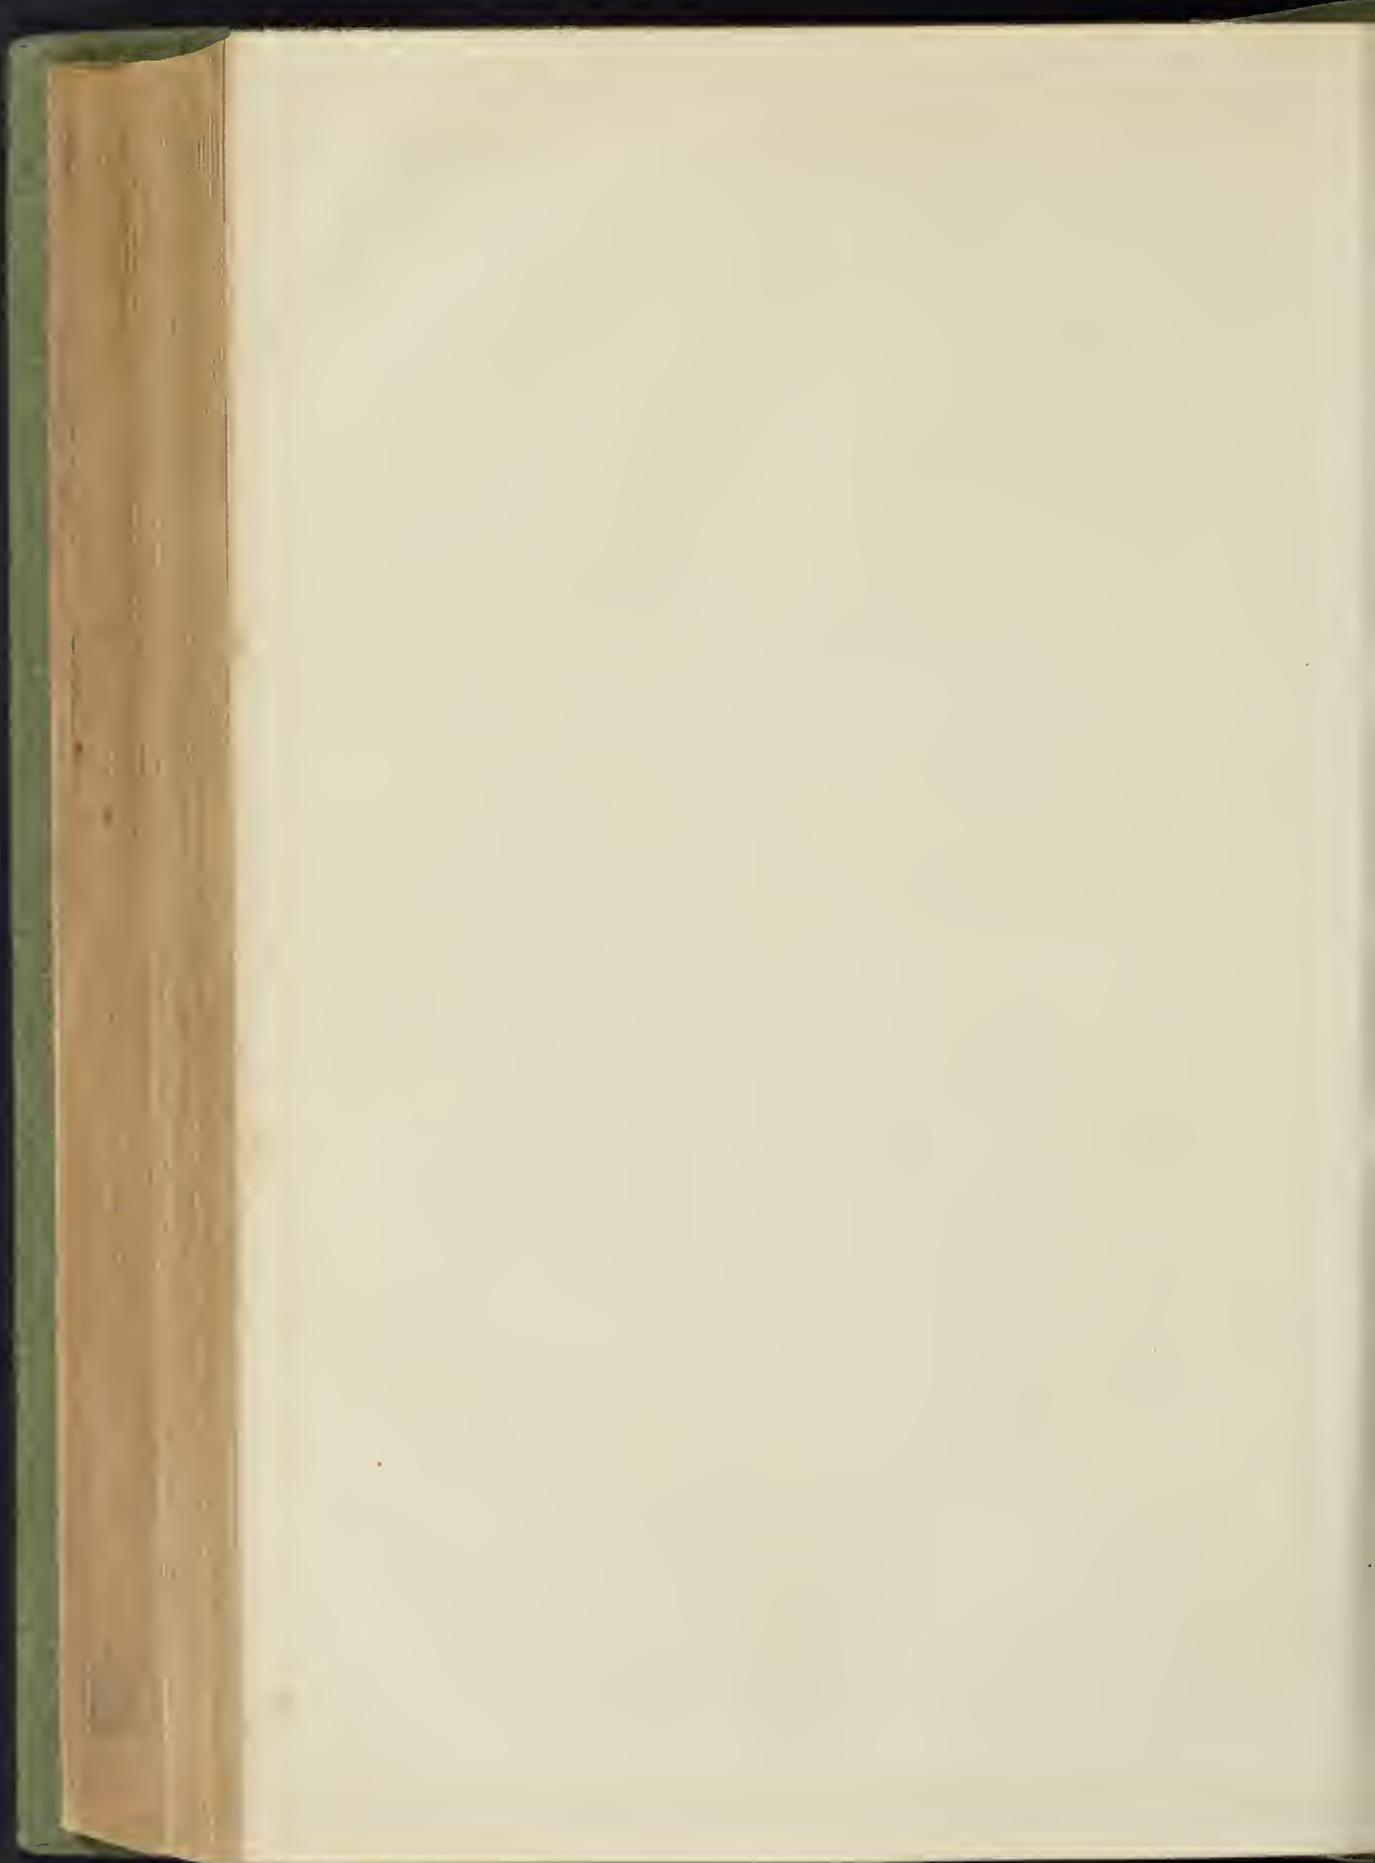

The architects are Messrs. Lockwood & Mawson, of Bradford and London.

We may add as to the clock and bells that the clock will strike the hours upon a bell of 4 tons, and chime the first, second, third, and fourth

quarters on four other bells, which will weigh respectively 52 cwt., 37 cwt., 32 cwt., and 14½ cwt. The time will be shown upon four dials, each 10 ft. 6 in. in diameter. The figures and minutes will be cast iron, all cast in one piece, painted and gilded, and glazed with patent opal glass, illuminated at night with gas. There will also be an automatic self-acting gas apparatus fitted to the clock for the purpose of turning the gas on and down at the exact time, so constructed as to suit all seasons of the year. The weight of the carillon bells will be 16 tons 6 cwt. 3 qrs. One of the bells of about 13 cwt. will be furnished with a clapper and wheel, for the purpose of ringing as a fire or alarm bell, and all the thirteen bells being hung in an open belfry exposed to view, will be heard at a greater distance than large bells generally are. There will be two barrels with seven tunes on each, so that by taking one barrel out at the end of seven days and putting the other in (which can be done in a few seconds by any one), a fresh tune will be played every day for fourteen days. At present it is arranged to play a tune three times over every three hours, day and night, at twelve, three, six, and nine o'clock, but it could be made to play a tune every hour, as at Boston. The whole work, including clock, carillons, machine, bells and their fixings, &c., will cost about 4,500.

BRADFORD TOWN HALL.—Messrs. Lockwood & Mawson, Architects.

quiet way. From those enjoying health and hope, such thought for others—such care for those whom God has seen fit to deprive of the power of working for themselves,—he thought especially fitting. On a somewhat allied subject—the establishment of a provident society among architectural assistants,—something might usefully be said. Many men most fitted to do useful work in that station would much prefer a fixed income to the responsibilities and anxieties of a small general practice, if only their future could be made more sure to them.

In the discussion which followed, some anxiety was manifested with reference to the somewhat relaxed enthusiasm said to be manifested among the younger members, and the want of thorough success in the work of some of the classes last session. Some of the speakers advocated a more regular contemplation of the examination offered by the Institute, as a necessary part of the students' course, and a hope was expressed that at the next examination the number of candidates for the title of graduate would be considerable. The president in his reply, asked members to do well their part in at least one branch of the work of the Association, and having undertaken some stated task, "to go into it with a will."

SCHOOLS OF ART AND OF SCIENCE.

The Nottingham School.—The annual meeting of the donors and subscribers to this School has been held in the Mayor's parlour. Mr. Richard Enfield, presided. The report of the committee congratulates the subscribers and donors on the high position which the institution still maintains amongst the Art Schools of the country; and states that during the past twelve months, the twenty-ninth year of its existence, great success has attended the exertions of the pupils and masters. The last Government examinations of the work of the students had resulted in an award of two silver medals, three bronze medals, and fifteen Free Art Studentships. The Blue Book for 1871, now published, enabled the committee to make a comparison of the numbers gained by a few of the chief Art Schools in the country. Free Studentships:—Nottingham, 20; Birmingham, 16; West London, 9; Lambeth, 7; Stoke-upon-Trent, 7; Glasgow, 6. It will thus be observed that though Nottingham is inferior in size and population to some of the towns just named, yet that from the 186 free studentships granted to the 117 Art Schools of the United Kingdom, Nottingham has gained one-ninth of the whole number. The report of the headmaster, Mr. Rawle, contained the following tabulated statement of the ages of the students who attended the school:—

Under 15 years of age	196 students.
From 15 years to 25 years of age	291 "
From 25 " 35 "	31 "
From 35 " 62 "	16 "

The total number of adult students was 85. There were thus a greater number of students between 15 and 25 than in any former year.

"The school," continued the Report, "obtained in the National Competition, 2 silver and three bronze medals, and 5 Queen's prizes; total, 10 awards (last year, 13). Also 23 Government Art Prizes (last year, 23), 2 season tickets of admission to the Royal Academy (last year, 2), and 15 free studentships (last year, 20). The prize works consist of drawings and paintings from the cast, flower drawing and painting, groups in oil, as compositions in colour, designs for lace, ribbons, and wall decorations, &c."

The Coventry School.—The annual meeting and distribution of prizes in connexion with this institution took place in St. Mary's Hall. There was a large attendance of pupils and their friends, the hall being completely filled. The chair was occupied by Mr. Samuel Carter, and the mayor (Mr. Hill) and other influential gentlemen were present. The chairman in his address said the students have this year obtained more national prizes than they have hitherto won—the list includes one silver medal, four bronze medals, and three Queen's prizes. Well, I think that is as good an account as you can fairly expect of the School of Art in Coventry; it is a most decided advance upon all that has yet been done, and if the institution continues to advance at the same rate, I think it will eventually answer all your expectations. There is one very remarkable circumstance, as it seems to me, in connexion with the school—the students represent almost every occupation that the town of Coventry can afford. I have counted the number, and I find there are nearly fifty different occupations represented. I think that is a

highly gratifying circumstance. In this report it is stated that the number of students in attendance has been 192, against 180 last year. A small number presented themselves this year for the local examinations in free-hand, model, geometrical, and perspective drawing; twenty-six passed, against forty-four last year; and the successful papers were thirty-three, against fifty-eight last year.

The Leeds School.—The report at the distribution of science and art prizes stated that the committee were pleased to record the increased success of the school during the past year. The following were the returns of the Art School for the past year, compared with 1871:—

"Number of pupils under instruction in the school of art for the quarter ending 30th September, 1871, 326; 1872, 358. Number of pupils who submitted works to Art Department, 1871, 356; 1872, 411. Number of works submitted for examination to the Art Department, 1871, 2,592; 1872, 3,196. Number of sets of works which obtained the mark 'satisfactory' from the Art Department, 1871, 41; 1872, 46. Number of third-grade prizes awarded by the Art Department, 1871, 9; 1872, 13. Free studentships, 1871, 1; 1872, 5."

In the School of Science the following subjects are taught:—Practical, plane, and solid geometry; machine construction, building construction, mathematics, inorganic chemistry, organic chemistry, theoretical mechanics, and metallurgy:—

"Number of individual pupils during the session, 1871, 108; 1872, 129. Number of students who obtained certificates, 1871, 58; 1872, 62. Number of works obtained prizes, 1871, 19; 1872, 24. Number of certificates obtained, 1871, 118; 1872, 121. Number of gold medals, 1871, 0; 1872, 1. Number of silver medals, 1871, 1; 1872, 1. Number of bronze medals, 1871, 0; 1872, 1."

The number of visitors to the exhibition of students' works from the opening to the close was 5,161. In all grades of study great progress had been made, even as compared with the works shown at the previous exhibition. The improvement was as marked in the elementary classes as in the more advanced. This year Dr. Packer, the head master, has introduced some new stages of study which cannot fail to have beneficial results. One of these is a costume life class, of whose successful studies there were several examples on the walls. Another is the giving of a subject in words—some dramatic, poetic, or historic incident—by the head master in each half-year, leaving the student, unassisted, to give pictorial expression to it. Of original compositions of this nature, there were examples on the walls, the subject being the finding of Perditia by the shepherd ("Winter's Tale"). The display of mechanical drawings was large, and it embraced several meritorious designs.

THE LEAMINGTON WATER-SUPPLY.

A LARGE and influential gathering of the gentry, medical practitioners, and tradespeople of Leamington was held in the Royal Pump Rooms, in that town, to hear the report of a committee of gentlemen as to the verdict of the London jury in the case of Ellen Hiscocks. The deceased, while on a visit with her mistress at the Arboretum, was taken unwell, and died after she returned to her friends in London. Dr. Young, who was called in, gave it as his opinion that typhoid fever was the cause of death; but Mr. Maberley, of the Arboretum, was confident that it was not a case of fever at all. At the inquest, held before Dr. Hardwicke, the jury found death to have resulted from typhoid fever, and severely censured the Board of Health of Leamington for not providing a better supply of water. This produced strong indignation in the town; and the meeting was specially convened to hear the report of a committee in the matter. Mr. P. Locke, chairman of the Local Board of Health, was called to the chair, and with him on the platform were Dr. Jones, Dr. Hornblow, Dr. Slack, Dr. Bickmore, Dr. Thompson; Mr. S. U. Jones, chemist; Mr. Smith, chemist; Mr. Marriott, surgeon; and others. The water was read, in which he stated that the water contained the usual organic contamination of autumn.

"Taking this into consideration [he adds], I am of opinion that although the Leamington water is, like other river water, a little abnormal in its quality at the present time, yet it is a perfectly wholesome water, and is well suited for the supply of a town where the manufacturing operations do not require soft water. I need not add, in reply, to your question, that there is no ground for assuming that the Leamington water has had anything whatever to do with the causation of typhoid or any other disease."

The following resolution was moved:—
"That this meeting, having heard the report of the analysis, by Dr. Letheby, of the water supplied to the town by the Local Board, compiled with the official returns

published by the Registrar-General for many years past, is of opinion that it is a perfectly wholesome water, and that it is fit to be supplied to any town; and that there is no ground for assuming that the Leamington water has had anything whatever to do with the causation of typhoid fever or any other diseases."

The medical men present seemed to be unanimously of opinion that the water had nothing to do with the death.

Dr. Birt said, "as one of the oldest practitioners in Leamington, I can state that in the whole course of my experience, there have been only about half a dozen of such cases, and not one but I could trace to local contamination."

Dr. Thompson said there was nothing to show that the deceased had drunk of the Leamington water at all, and it was a curious fact that the actual residue of the water was exactly the same then as nineteen years ago, which showed there had been no increase in the pollution.

The resolution was carried, only one voting against it. The following was also carried:—

"That this meeting cannot too strongly condemn the gratuitous statements embodied in the verdict of the coroner's jury, on the body of Ellen Hiscock, that the water supply of Leamington is in a most unsatisfactory state; and they consider that the conduct of those ratepayers who instructed Mr. Edwards Wood was highly reprehensible, and calculated to do serious damage to the welfare and best interest of the town."

The medical men seem to us to have professed a little too much.

BEXLEY HEATH HALL.

THE public hall of Bexley Heath, Kent, has been recently finished and decorated internally. Curved ribs of timber have been introduced under the principals, springing from moulded stone corbels well down the walls between each bay of the roof. The wall in the rear of 8 ft., the framing of which is stop-chamfered, the upper panels being filled with quatrefoils showing the plastering behind, upon which is stencilled in oil colours a pattern of flowers and leaves. The whole of the internal walls have been painted and flatted in a greenish neutral tint. Horizontal strings, foliated in Venetian red and green, run all round above the wall boarding and under the windows, with a diapered pattern upon the space between them. The outline of the windows is marked by a surrounding foliated spray. Upon the wall in the rear of the platform above the boarding is painted in relief an arcade of five arches with troilied crocketed heads, the panels of two outer arches having ribbons, with the names of celebrated musicians and poets, the three centre ones being filled with pot-flowers upon a dark ground; the gable of the wall above is finished with a bold bower of leaves and berries forming a Gothic arch. The opposite end wall is similarly finished with a bower, and below the oriel window is a horizontal ribbon with the motto, from Shakspeare's poem, the "Passionate Pilgrim," "Music and sweet poetry agree."

The buildings, which were erected about two years ago, are of a free Gothic character; the large hall seats about 500 people. The contract was carried out by Mr. Thomas Blake, of Gravesend. The painted decorations have been executed by Mr. Alexander Gibbs. The company's architect is Mr. Joseph Hewitt.

NEW GRANGE AND PRE-HISTORIC MONUMENTS.

In a lecture on "Our Pre-historic Monuments," at Belfast, last week, Mr. J. S. Plenc F.S.A., said, as to the destruction of relics,—found, upon a close inspection of the stones at New Grange, that many of them have been scrupulously worked over, with no other object than I can imagine than erasure. This working done with a studied irregularity, so as to assimilate to a natural roughness of some of the stones, would not be noticed by an ordinary observer, but one used to examine mason's work could not mistake the markings of the tool. Some stones have a species of "tooling" all over, some only partially, always on the face of the stone as a rule, but several angles (which may have had oghams) are clearly worked down. It is remarkable that, where this tooling is on partial, the remainder of such stones is carved but with devices much more recent than the original spirals, such as chevrons, and the like, in case of detection of the erased portions, to give the impression that the erased portions were simply in device to the more modern. There are certain natural irregularities in the stones,

which, of course, I do not refer, and which the mabbings identify. It is stated in a recent work that where the angle stone has fallen forward some of the stones are not to be carved on the reverse side; this is not so—it is a misreading of Sir William Wilde's excellent account. The carving so seen is on the underside of the lowest course, which extends far behind the fallen stone, but which cannot be seen on its reverse side. Nor could these carvings be made from the outside before heaping the tumulus, as also suggested, as they are continued where the tone rests upon its perpendicular support, and could not have been carved after erection. I mention these facts to re-attest the great antiquity of New Grange, and the injury I feel convinced it has already sustained. It is most important that our monuments and every relic should be kept intact, sent to local museums, and drawings taken of them as found, with data of locality, &c. Every peasant should be made to feel an interest in them by popular, untechnical descriptions in his own vernacular, and not in Greek or Latin terms. Let the peasant feel a personal relationship with the great Oriental family that peopled these lands, and know that these relics are so many links in the chain of his own national history, and the desire to know more will prevent concealment or destruction.

PUBLIC HALLS.

Tunstall.—A meeting called by circular has been held in Tunstall, to consider the desirability of having "a public hall in the town, so that meetings of any kind may be held on neutral ground." About sixty persons were present. The meeting was in favour of erecting a temperance hall to seat not fewer than 1,000 persons, and to carry out the plan as far as possible by subscriptions. About 100l. were subscribed for the room, and the meeting was adjourned. A site in Well-street was spoken of as suitable for the erection.

Tonbridge.—A new and commodious town-hall at Tonbridge is projected. Two or three gentlemen in the town have secured property at the top of High-street, and the tenants are under notice to quit. In other directions arrangements have been made for at once raising the necessary amount of funds by means of 5l. shares, of which about 600 are already taken up.

PRECIPITATION OF SEWAGE OVERSIS IRRIGATION.

Str.—Mr. Hawksley's affirmation, in your publication of the 26th October last, raises the question, in the disposal of sewage, of precipitation or irrigation. Notwithstanding his alleged preference and advice for precipitation in what he calls "the particular and peculiar circumstances of the city of Coventry," it would have been well for the corporation, in its deliberations on this subject, to have taken Lord Leigh into account for the use of the sewage over his lands of Stoneleigh, which, in the same valley of a tributary of the Avon, can be commanded by gravitation; a fact, to the ratepayers of Coventry, which means that their sewage matters can, by the cheapest conveyance for them, be taken to a destination to which they, as elements of re-education, point, and for the best account.

With any material as well as town sewage, a maximum return to be expected from it, that which involves the minimum, both of fringe and manufacture. If the manure process which the Coventry people have adopted in present deals with the sewage, together with returning refuse of their sewage, together with other useless, general matters of it, which men in the sewage of a highly-scavenged and over-torn of fashion are to be found, then there must be considerable manufacture to separate matters of fertilisation; otherwise the fringe of them (like that of water in any way to its own logs) is a thankless item in the scale of manure.

A case of more extended distribution of sewage than any which has yet been attained, or ought necessarily, is much wanted, and such extensive landowners as Lord Leigh, who would accept, and carry into practice the wide irrigation of sewage, would earn the thanks of the kingdom for their benevolent efforts.

Sewage accepted for distribution amongst landholders, &c., in place of, and auxiliary to, the manure, fold and artificial,—at present applied to the soil, is, whether at Stoneleigh or any-

where else, a step much to be commended in the history of both the sewage schemes and the agriculture of this country. Possessed of those acres, which in rich land make a subject one of the choicest in "merry old England," no doubt Lord Leigh has that knowledge of the condition and requirements of land, either for a fertiliser, auxiliary, or mesoicider in sewage to it; and in looking to the results of late extensive and judicious improvement of his property, it is no doubt his experience, as it is that of people higher and wetter in the world, that in the good practice of freeing water from the soil, or draining, a fact is discovering itself that we cannot escape adopting its complement, irrigation. As parties to this arrangement, the town of Coventry, in considering itself particularly fortunate in having escaped much lavish and fancy expenditure to several proprietors, in becoming not only filter-farm landlords but tenants as well, should signify its willingness to place a sum (were it only a tithe of the alleged enormous expense that was laid before "its corporation" at the previous meetings), at 3 1/2 per cent. interest on the usual security, in the option of the whole body of likely customers, farmers and gardeners, with which to lay out their land, and thereby encourage and secure the utilisation of its sewage in the best market conceivable. But considering that Coventry has been lucky in getting its sewage off its hands for so long, and at no cost, it remains to be seen whether it, in its dry-disposal belief, is to be the fortunate exception to the many other towns which in sewage projects, wet or dry, are just about their wit's end.

JOHN MARTIN.

STOVES IN ITALY.

A CORRESPONDENT from Florence says, there are many really astonishingly economical stoves here. One I have just seen, to be heated by coal, consisting of two small ovens, quite large enough to admit a good sized pie-dish or joint of meat, a boiler to contain half a gallon of water, and four receptacles for saucepans at top—all heated by one pound of coal or coke, so they say, and will guarantee. The price used to be 102 francs, but on account of the increase of cost of iron, it is now 119 francs. Larger size, with larger ovens, and six holes for saucepans, costs 160 francs. There are others equally economical, cheaper, but perhaps not so durable.

THE INTEREST OF BUILDERS IN LEGAL REFORM.

At a time when the urgent necessity of reforming the administration of the law is occupying much public attention, I have been long thinking that the builders of England should do all they can to urge the good work forward, and it happens very oddly that on two consecutive days the following letters have appeared in the *Times*—

"A Small Legal Reform."

Sir,—The first report of the Judicature Commission, published some three or four years since, contained a strong recommendation that the system of costs in the Common Law Courts should be assimilated to that of the Courts of Equity, viz., that costs should not as a matter of course follow the verdict. The Attorney-General was a party to the report, and I should be glad to be informed why this very simple and reasonable recommendation has not been carried out. The present practice in the Common Law Courts is notoriously a disgrace to the law, as holding out inducements to low-class attorneys to promote and foster litigation. An Act of a few lines would settle the question. Is it beneath Sir J. Colclidge's dignity to pass such an Act?—PRACTICAL REFORM.

"Another Small Legal Reform."

Sir,—The Courts are about to open after the Long Vacation, and, as one of the inferior branch of the profession, I am reminded of an extraordinary state of things to which we have too long submitted in practising in the Common Law Courts. The leading counsel at the Common Law Bar, unlike their brethren of the Equity Bar, attach themselves to no court. They practise in the Queen's Bench, Exchequer, and Common Pleas, the Divorce Court, the Privy Council, and elsewhere, besides accepting briefs in compensation and arbitrator cases, so that you are at a loss what counsel to retain. You deliver your brief in the Queen's Bench, for example, and the chances are 19 to 1 that when the case is called on, your counsel is either in the Exchequer or Common Pleas, or one of the other Courts, and the advantage of the consultation you have had is so much less of time. The case is disposed of somehow, and the result is the unfortunate attorney has to bear the brunt of his client's anger, and, perchance, lose his client as well as his case, although he has taken the utmost pains in getting the case up for trial, and has been advised that he must win.

This is a state of things that no one will deny, but what is the remedy? I submit, etiquette and equity. In short, that, as a matter of etiquette, counsel should select one of the three Common Law Courts, like their brethren of the Equity Bar, where the arrangement works perfectly well, and you are sure to have your case properly and

fairly tried, and it is not a mere question of loss-up dependent on the presence of counsel. I am aware on circuit counsel must practise in all the courts; but this is a comparatively small matter, and even there the counsel would in all probability be selected with reference to the court in which the action was pending. Anyhow, this would be an enormous improvement on the present system, and one in which, when fairly considered, I can help thinking the Bar would gladly acquiesce, as I know many deplore the present system, which they say they are powerless to remedy.

A SOLICITOR OF TWENTY YEARS' STANDING."

These two letters hit points which have been personally brought home to me within the last few months, and it may be interesting to builders in general to state my case shortly.

About four years since I completed a building, and obtained the proper certificate from the architect. There was a dispute as to payment, but payment was made, and the matter had passed out of mind, when a few months ago a writ was served on me without a word of previous warning, in an action at law, the damages being laid at about 2,000l. On particulars being demanded, it was stated that the drains had been badly laid, and that about two years ago they had been taken up and relaid by another builder, and that the proprietor had lost tenants, &c. My defence was, that the drains had been well laid; that my attention had never been called to the drains since we left the job; and that if it had, and the drains found out of order, I should instantly have had them repaired, but it was not possible after such a lapse of time to look into the question. The heavy demand made it impossible for me to endeavour to meet the action, except by defending it. I was advised we had a good defence, but on the trial I lost the action, and damages were given at about 25l. (not 2,000l.). The Judge made some severe remarks on the action having been brought, but he said, "Although any respectable man would have given a builder the opportunity of setting any imperfection to rights, he was not bound to do so." The attorney for the plaintiff sneered visibly at the Judge's remark; he knew that the verdict carried costs, and that was all he cared for. The costs, I need hardly say, were about 300l. No Equity Judge would have given, in such a case, any costs at all.

This brings me to the subject of the second letter to the *Times*.

I had engaged a very able Q.C., gone fully into the question with him, and he said I had a very good defence. On the morning of the trial I found my attorney in a fury. Our able Q.C., Mr. A., was in another court, but had handed his brief to his friend, Mr. B., Q.C. Mr. B. at the last moment was called away, and gave the brief to Mr. C., and Mr. C., gone to another court, also had handed it to a junior, Mr. D., so that I was left in the hands of a gentleman who did his best, catching up the points as he went along, but of course he was not prepared, and hence I lost the verdict.]

In mentioning the matter to legal friends, they only laugh, and say I may thank my stars it was no worse, for such things happen every day. I must say I think the professors of the law, from the Attorney-General downwards, ought to be ashamed of such a state of things.

A VICTIMISED BUILDER.

THE HALL OF THE MERCHANT VENTURERS, BRISTOL.

EXTENSIVE alterations have recently been made at the hall, in King-street and Marsh-street, Bristol, which for many years has been the headquarters of the Merchant Venturers' Society. The improvements are on the Marsh-street side of the premises. The new buildings are from the designs of Mr. J. A. Clark. Some time since, says the local *Times*, the late Mr. Thomas Daniel presented to the society a house which adjoined the treasurer's offices, and this, together with the offices, has been pulled down, and a new structure has been reared on the site. The building is of two stories, the right wing being appropriated as offices, whilst on the left are the apartments of those who take charge of the hall. The frontage is of Bath stone. In the centre is a large arched entrance, flanked on either side by four windows, and surmounted by the arms of the guild. The upper windows are pedimented, and over the halustrated parapet are four large urns. Inside the entrance-door is a vestibule, leading to the offices on the right, and to the domestic apartments on the left. The rooms are all spacious, but circumstances have not permitted of the lower apartments being so lofty as could have been desired. A broad flight of steps immediately opposite the entrance leads into a

tilled corridor, 42 ft. long and 7½ ft. in width, with stuccoed walls and panelled ceiling. This corridor is lighted by day from the roof by means of four small lantern lights. There is access from the corridor to the treasurer's office, and on the opposite side is the entrance to the new committee-room, which is 33 ft. long by 24 ft. wide, and 19 ft. high. The total cost, it is said, is over 2,000. The collection of old and modern paintings in the rooms of the Merchants' Hall has recently been restored.

MR. PETER GRAHAM.

ON Wednesday last, at the Langham Hotel, a dinner, given by manufacturers and artists in the various departments of the cabinet and upholstery trade, took place for the purpose of presenting Mr. Peter Graham, senior partner in the firm of Jackson & Graham, with a magnificent silver-gilt shield in *repoussé* work. This testimonial was offered by the principals of nearly fifty establishments, some of them associated with the house of Jackson & Graham during a period of nearly forty years, and the occasion for its presentation was afforded by the recent return in restored health of Mr. Peter Graham from Germany. The initiatory proceedings took the form of a banquet, over which Mr. John Dyer presided.

Mr. Graham, in responding to the chief toast, expressed his grateful thanks for the compliment conferred upon him. The house of which he was at the present time senior, might have done something towards elevating their particular branch of trade, but it must not be forgotten that they had many coadjutors, without whose aid their own efforts would have been of small avail. He believed, however, that unitedly they had done something towards raising manufacture to an art, for it should not be forgotten that the present age was not like that in which Cellini flourished—himself at once the designer and the worker in art. Now the manufacturer had to embody the ideas of the artist, to modify them, and complete the design. On looking round the table he had the pleasure of seeing the gentleman of whom he purchased the first log of mahogany he ever bought, and another friend had travelled from the marble quarries at the Land's End in order to be present. The testimonial was well deserved.

FALL OF HOUSES, MANCHESTER.

SIR,—I enclose for your perusal a report of a debate in the Salford Town Council, on the recent fall of cottage-houses in Lower Broughton, already mentioned in your pages. The event seems to afford an opportunity to urge upon the authorities of Manchester and Salford the adoption of a code of regulations analogous to the Metropolitan Building Act. Such regulations are badly wanted; and the great influence of the *Builder* might fairly be used in that direction. The contractor and his foreman, in some published letters, attribute the fall of the houses to the subsidence of the *made-up ground*, 10 ft. deep, caused by the rainfall, and to the statement of the foreman, that the local building inspector saw these houses a few days before their fall. From this it is evident that the authorities are quite unaware that such a surface of land, covered with ashes and general *débris*, 10 ft. deep, is quite unfit to build on, for sanitary reasons; and that, even if it were fit, they do not insist upon a broad foundation of concrete being laid under all walls, but allow the foundations to be laid on the surface.*

E. G.

A CHANCE FOR SOUTH LONDON.

SIR,—In the *Builder* for the 9th of this month I observe notice that it is in contemplation to form "a museum for South London," and that at a meeting, held in the Westminster Assembly Room, a "committee was appointed to take steps for carrying out the project." As one of the old, if not the oldest inhabitant of the south side of the Thames, I am most anxious to promote scientific recreation for the neighbourhood, and having formed during my life a very large and valuable miscellaneous collection, I had arranged with Mr. Strange, of the Surrey Zoological Gardens, for its exhibition in my late residence, the old Manor House, close to the

* The provisions of the Metropolitan Building Act are not sufficient to prevent similar doings in London.

Surrey Gardens (the temporary St. Thomas's Hospital). Mr. Strange, as you are aware, is in difficulties, so that I may have to remove all my collection; and had I known that it was in contemplation to form a museum for the South of London, I should have attended the meeting, only too happy to have assisted.

If you can oblige me by giving me the names of the chairman and committee, or to whom I could apply for information, I should be greatly obliged.

R. G. WHITEFIELD.

St. Thomas's Hospital.

** We shall best bring about what our correspondent desires by printing his letter.

ALTERATIONS AT WINDSOR CASTLE.

SIR,—At page 892 we read that at Windsor Castle "additional ventilators, not contemplated in the original plan, have been fixed to the old soil-pipes, and their outlets have been in all cases carried completely up to the battlements of the castle." Now as this is a public or national building, I would respectfully ask, through your columns, what are these "additional ventilators," and how and where are they attached to the soil-pipes? B.

THE ANCIENT CITY GUILDS OF TRADE.

With the past and with the present,
Quaint old manners still are link'd;
Olden customs, grave and pleasant,
Ling'ring still, though nigh extinct.
Earth has changed, 'mid throes volcanic,
Kings have fallen, thrones decay'd;
London holds her great mechanic,—
Ancient City Guilds of Trade.

Through each ill and darksome omen,
Dating from the Norman time,
When our freemen foil'd their fœmen,
Battling in their early prime;
Down through civil war and panic,
And with other ills inlaid,
London held her grand mechanic,—
Ancient City Guilds of Trade.

Blest be all those genial, olden,
Skillful master-workmen, who
Till'd and plow'd, with day-dreams golden,
With the common-weal in view,
Kings and queens have been tyrannic,
And have seized bequests erst made,
By and for the great mechanic,—
Ancient City Guilds of Trade.

Noble craftsmen, merchant-princes,
Ye were great in thought and deed;
And the City still evinces
Love for you, her friends in need.
Zealous, though not Puritanic;
Prompt to punish or to aid,
Were the blunt and once mechanic,—
Ancient City Guilds of Trade.

Alms-house, hospital, and college,
Parish church and grammar school,
Were endow'd, that care and knowledge
Should distinguish civic rule.
These and other goodly gifts,
Of our fathers' worth display'd,
London holds from her mechanic,—
Ancient City Guilds of Trade.

Time has come, and hearts are yearning,
As they yearned once of yore;
Lo! our workmen thirst for learning,—
Yes, they long for something more.
By the sovereign will Britannic,
And the peoples' power array'd,
Let us raise our great mechanic,—
Ancient City Guilds of Trade.

Out from London court and attic,
Workshop, mart, and cellar damp;
Voices call in tones emphatic,—
Light our craftsmen's Safety-lamp,
Art and Science, with galvanic
Power and purpose undimay'd;
Give us back our skill'd mechanic,—
Ancient City Guilds of Trade.

C. H. C.

SOUND.

SIR,—Can one of your readers inform me of any remedy to destroy sound in a new residence? The rooms are 10 ft. high, and the construction of the flooring is as follows:—Joists, 9 in. by 3 in., laid over with 7 in. by 1 in. flooring-boards, and the floor ceiled under. A. SUBSCRIBER.

HEALTHFULNESS OF THE SEWERS.

EVERY now and then, when the dangers of sewer gases are spoken of, we get utterances in reply to the effect that the men who work in them are particularly healthy. Hear what Mr. Bateson, the medical officer of St. George's, Southwark, reports with reference to the health of the men employed in the sewers. Six men were employed by the vestry, whose ages ranged from twenty-four to fifty-five years, and who had been employed in sewer-work from one year to twenty-five. Three had lately died, two from consumption and one

from lock-jaw, resulting from a slight bruise on the finger, incurred while at work in a sewer. The deceased was forty years of age, and had been employed fourteen years. The other two were aged respectively fifty-one and fifty-six years, and had been fourteen and sixteen years engaged in the work. Both were remarkably healthy men when they entered upon their employment. The men work eight hours a day and frequently complain of headaches, giddiness, faintness, and occasionally vomiting. One of them, while opening a drain, some time ago, to let off a stoppage, fell down insensible, and remained so for about twelve hours. His illness continued eight months; and had he returned to the same kind of work, he could not, Dr. Bateson stated, have lived.

Moreover, unhealthy as the breathing of sewer gases thus is, typhoid or gastric fever,—fever of the bowels,—as a speciality, is believed to originate mainly in susceptibility to infection arising from the contamination of water by such gases, or by sewage, and by the internal use of such water, in food or drink, which fevers the stomach and bowels, or produces gastric fever. This special form of illness may thus be escaped by sewer-men, even while breathing the sewer gases, and suffering otherwise from that cause, and not so much in the bowels, or in the form of typhoid fever. The cholera virus in sewage is also believed to depend, for its action, upon water contaminated by it, and swallowed in food and drink, and acting on the bowels, just as in the case of the closely affinitive gastric fever. Thus sewer-men may escape both cholera and gastric fever, just as others may do, unless they drink sewage, or poisoned water, which their business does not necessitate, although they must breathe sewer gases, and must suffer in health otherwise from that cause.

DAMAGES DONE BY STORMS.

IN the North of England, as well as in Scotland and Ireland, there has been very boisterous weather, which has done damage in many places.

At Darlington there was a chimney, about 70 ft. high, blown down in Mr. Middleton's brickyard. A good portion of a new house being built was also blown down in Bondgate. At the North-Eastern station a quantity of glass was blown off the roof.

At Scarborough, roofs and buildings in several places have been much injured. The side wall of a new building on the South Cliff fell on to the footpath.

At Consett ironworks, Mr. Bailey, contractor is erecting a girder bridge across the cinder ovens, and a large travelling crane is employed to lift the stones. A man was on the top working the crane, when it was suddenly seen to rock and fro, and then with a loud crash fell to the ground a distance of 30 ft. The man's death was instantaneous, and two other men who were struck with portions of the falling crane had their bodies dreadfully mangled.

At Shields, a new house, in course of construction in Percy Park, Tynemouth, was blown down. A stack of chimneys at the Tynemouth Union Workhouse was blown down, and did considerable damage to the buildings.

At Jarrow, near South Shields, several of the roofs of new houses in Heworth-place were blown off, besides damage being done to other houses.

The fall of chimneys, chimney-cans, and tiles in this district, as in other places, was frequent. At Stockton, the chimney of a puddling furnace at the Bowsfield Ironworks was blown down, and the falling mass has seriously injured two men. A portion of the roof took fire, and the fire-brigade was called out, but no very serious damage was anticipated. A number of house chimneys were blowing about, and locomotion about the streets was impossible. Part of the South Stockton Railway-station roof was displaced. At Messrs. Jacques & Co.'s Ironworks, adjoining Bowsfield, another chimney fell. One man was killed, and several injured. At the Richmond Ironworks, seven puddling furnaces, with part of the roof, were destroyed. The first stack of chimneys fell upon a large boiler, fracturing some of the plates. Most of the puddlers had just got clear, when two more stacks of chimneys fell through the roof. At the brick-yard of Messrs. Darmand & Co., a large chimney was blown down, but without injuring any of the workmen. At Messrs. Harwood's Norton Pottery, on the north side of Stockton, the roof was displaced and damaged.

A terrific tornado has occurred at Osceola, Arkansas. The storm struck the town, containing perhaps 300 houses, and before the citizens could realise its extent, or before they could even get to their doors, it had burst upon them with unprecedented fury and violence, sweeping down before it houses, trees, cattle, fences, and everything movable. Trees were carried by the winds like straws; cattle, horses, and mules were blown about the streets, and a screaming wild with fright, ran bolter-skoller in all directions, and the air was literally thick with fragments of every imaginable thing. The town, once a beautiful place, was turned into a mass of ruins. Three churches and six school-houses were blown down in a moment, many of the heaviest timbers being carried entirely away, and nearly every dwelling-house in Osceola and its immediate vicinity was either blown down or unroofed. The mills and cotton-gin belonging to Mr. Eddings, near the town, were torn into fragments, and hardly a vestige was left of the buildings to mark the spot where they stood. Eighteen persons were killed or badly wounded.

SCHOOL BOARDS.

London.—The Board have resolved that the tender of Messrs. Merritt & Ashby, of 89 and 90, London-wall, E.C., amounting to 7,193*l.*, for the erection of a school for 1,040 children, on the site in Hunter-street, Old Kent-road, be accepted. Further, that the tender of Mr. John High, of Clarence-yard, Lower Clapton, E., amounting to 8,995*l.*, for the erection of a school for 1,040 children, on the site in Old Castle-street, Whitechapel, be accepted. That the tender of Messrs. L. H. & R. Roberts, of 4, Rheidol-terrace, Islington, amounting to 8,996*l.*, for the erection of a school for 1,040 children, on the site in Harper-street, New Kent-road, be accepted. That the tender of Mr. Thomas Ennor, of 1, Devonshire-place, Commercial-road, E., amounting to 2,450*l.*, for the adaptation of the warehouse on the site in Broad-street, Ratcliff, to the purposes of a school to accommodate 900 children, be accepted. That the tender of Mr. Thomas Ennor, of 1, Devonshire-place, Commercial-road, E., amounting to 3,751*l.*, for the adaptation of the rice-mills in Semer-street, Whitechapel, to the purposes of a school to accommodate 800 children, be accepted.

Coventry.—The Board have unanimously resolved to accept Messrs. Goodmau & Burnmore's tender for building the Spon-street School for the sum of 3,814*l.*, after allowing 200*l.* for the old buildings.

Middlesbrough.—The plans of the Gladstone-street School, prepared by Messrs. Alexander & Kemman, could not be carried out for less than 4,000*l.* Amended plans upon a reduced scale, estimated to cost 5,000*l.*, were submitted to the Board and referred to a sub-committee. Some conversation followed as to Messrs. Alexander & Kemman's remuneration for work already done, and it was arranged that they should be paid 50*l.* in full of all claims.

Driffield.—The following tenders were received for the erection of schools, including fittings, &c.: Messrs. Bretherick, Gage, & Co. (Norton and Driffield), 5,396*l.* 16*s.*; J. F. Shepherson (Driffield), 4,795*l.*; J. Brown (York), 4,695*l.*; Thos. Foster & Son (Driffield), 4,645*l.*; Thomas and Dickinson (Driffield), 4,625*l.* 15*s.* 6*d.*; Jos. Brown (Driffield), 4,580*l.*; Hewson, Brothers (Driffield), 4,567*l.* 6*s.* 6*d.* The tender of Messrs. Hewson, Brothers, was accepted, and it was agreed to make application to the Public Works Loan Commissioners for a loan of 5,800*l.*, for defraying the cost of the building and incidental expenses.

CHURCH-BUILDING NEWS.

Lapworth.—The church here has been reopened by the Bishop of Worcester, after having been closed for some months for restoration. The work which was done twelve years ago was mainly confined to the chancel. That which has now been done extends over all the remainder of the interior. At both times the work has been done under the direction and advice of Mr. G. E. Street, R.A. The fabric of the church, some portions of which are of great age, had suffered very considerably from the lapse of time. To ensure the safety of arches and pillars, the foundations having become insecure, a large amount of underpinning has been necessary. All the columns and their bases have been made

good. The walls have been denuded of their accumulated plaster, thereby revealing in many parts the traces of older work which had been wholly concealed. In the north wall of the nave, above the easternmost arch, a curious and interesting light has thus been exposed, which bears marks of dating from Saxon times, when this was the external wall of a church without aisles. In the south aisle have been opened out two so-called leper windows, and two other windows, remains of a much earlier church, together with a piscina and its credence-table in unusually complete preservation. From the west end of the nave a gallery has been taken away, which has hitherto blocked up two lancet windows of the Early English period. A new chapel has been added, leading to the tower from the north aisle, by which additional accommodation has been provided in lieu of that lost by the removal of the gallery. The stripping away of a lath-and-plaster ceiling from the nave has discovered a fine old oak roof, which is now laid open. The high pews, which still further concealed the proportions of the church, have been removed and replaced by open sittings. The building has been enriched by the addition of four new stained-glass windows. A large one at the east end is the gift of the present rector and his family: the centre light represents the Crucifixion, and the side lights represent the Virgin and St. John, and the holy women at the Cross. Another, in the chancel, is the gift of Mr. John Fetherston, jun., of Packwood House. Another, in the south aisle, is the gift of Mrs. Tyndall. The last, in the north aisle, is the gift of Mr. and Misses Kirshaw. These windows are all by Messrs. Powell & Son, of London, except that given by Mr. Fetherston, which is the work of Messrs. Clayton & Bell. At the west end of the church is a porch, with a chantry over it, dating from the middle of the fourteenth century. This porch was bricked up on the one side and closed by a door on the other, and used as a sort of lumber-room. It has been thrown open, and reveals some groining. The estimated cost of these works is upwards of 1,600*l.*, and the restoration has been effected by the joint contributions of the rector and parishioners, aided by various friends, together with a donation from Merton College, Oxford (patrons of the living), and with a sum of 200*l.* from the trustees of the Lapworth charities. The contractors for the work have been Messrs. Hardwick & Son, of Birmingham.

Brierfield.—The Church of St. Luke, Brierfield, Little Marsden, near Burnley, has been consecrated by the Bishop of Manchester. There has hitherto been no church in Brierfield, but service has been regularly performed in St. Luke's schoolroom. The foundation-stone of the building was laid about twelve months ago, by the late Sir James Yorke Scarlett. The interior of the church has been adorned by many gifts. The architect is Mr. James Green, of Portsmouth. The land for the site of the church is the gift of Colonel Holden. The cost of the building with the gifts is estimated at upwards of 5,000*l.*, nearly the whole of which has been subscribed.

Dover.—The Bishop of Dover has consecrated the portion of the new cemetery at Charlton that is to be used by the Church of England. The total area of the land secured by the Burial Board is ten acres. Four acres of this have been consecrated for the Church of England portion of the parish, two acres are allotted to the Non-conformists, and the other portion remains for future use. The architects of the buildings were Messrs. Brown & Pearce, of Norwich; and the builders, Messrs. Adcock & Rees, of Dover. The following figures show the cost of the cemetery and buildings:—Land, 2,000*l.*; buildings, including entrance, 2,165*l.*; iron fencing (south boundary), 242*l.* 7*s.* 11*d.*; oak fencing, 237*l.* 15*s.* 11*d.*; total, 4,645*l.* 9*s.* 10*d.*

Huddersfield.—Lindley parish church has been re-opened, after being closed for some months, during extensive alterations and additions. A chancel, organ-chamber, and clergy and choir vestries have been added. The flat ceiling has been replaced by an open-timber roof of higher pitch. The church has been partly re-pewed with open pitch-pine stalls, making a considerable addition to the accommodation, under the superintendence of Mr. J. N. Crofts, architect, Liverpool. A painted tile reredos, by Mr. J. W. Knowles, of York, is being placed. The east window has been filled with stained glass, by Messrs. Ward & Hughes, of London, at the expense of Mr. H. B. Taylor, of Huddersfield, in memory of his son. The principal subjects are the Ascension and the Lord's Supper, besides several subsidiary groups. The entire cost, ex-

clusive of the window, will be 1,500*l.*, towards which 1,000*l.* have been already raised.

Newsome (near Huddersfield).—The new church at Newsome has been consecrated. The edifice comprises nave and chancel of the extreme length of 100 ft. outside walls by a width of 27 ft. within, and 40 ft. to ridge. The chancel is separated from the nave by a lofty arch supported upon corbel shafts, with moulded caps and bases. Only one aisle is provided, and that is placed on the north side, together with an organ chapel and vestry adjoining the chancel. The aisle is separated from the nave by an arcade of four bays, supported upon alternate octagonal and circular shafts, with moulded caps and bases. The porch is placed on the south side at the west end, and the west gable is surmounted by a bell-cote, which is carried up in ashlar with stepped and moulded copings, reaching to the height of 64 ft. The windows on the south side are single lancet lights, with cusped heads; and the east window is composed of five lights, with mullions and late Decorated tracery. The floors of the chancel are laid with encaustic tiles, and the passages of nave and aisle are paved with rubbed flags. The roofs are open-timbered, of deal, stained and varnished, with moulded and curved braces, and ribs forming panels for plaster. The seats are open, of deal, also stained and varnished; and the chancel stalls and screens are of pitch pine. The stall ends are finished with carved poppy-heads, and the fronts are open. Messrs. Brunner & Co., of Newsome, were the contractors for the mason's work; Mr. Joseph Sunderland, of Lockwood, for the joiners' work; Messrs. Walsh & Sons, of Halifax, for the plumbers and glaziers' work; Mr. Longbottom for plasterer's work; and Messrs. Goodwin & Sons for slater's work. The church will accommodate 410 people, including special seats for sixty children. The whole of the work has been executed from the designs and under the superintendence of Mr. W. H. Crossland, of London, at a cost of about 3,000*l.*, including boundaries.

VARIORUM.

"Light Railways. By H. S. Ellis. London: Bell & Daldy." This is a paper read at the Exeter Chamber of Commerce, Exeter. The author advocates the extension of light railways, submitting the example of the Duke of Buckingham's railway from Quainton to Brill, in Bucks, in the hope of interesting landowners in the construction of similar lines. The clauses are given of the Act of Parliament which provides for the construction and working of light railways. The paper is dedicated to Sir Stafford Northcote, who filled the office of Secretary of State for India during the consideration of the proposed railway extensions in that country.—"To the Urban Sanitary Authority of the Borough of Leicester. J. & T. Spencer, Printers, Leicester." This is a paper read by Dr. Clarke before the local Sanitary Sub-Committee at Leicester. The purpose is to show that even when drained the midden and privy system is wrong; and that the water-closet and ash-pit system, as a substitute for the other fails greatly in the poorest localities. The author of the paper urges that an auxiliary system should be introduced. The system he proposes is the one tried at Rochdale, that at Salford, or the Gonx system at Halifax and Aldershot. In these cases galvanised iron pails for privies, and ash-tubs, are used, and changed weekly or oftener.

Miscellaneous.

Willenhall.—A new Wesleyan School Chapel, erected at Monmore-lane, has been opened for divine service. The chapel has been built in a plain manner, and is 49 ft. by 24 ft., exclusive of two vestries, each 12 ft. square. The permanent seats are only seven in number, the remainder being movable, so that the room may be conveniently used as a Sunday school. More land has been purchased than necessary for the present purposes, but it is intended that at a future time a chapel shall be built, and the present building used solely as a Sunday school. The whole of the land has been enclosed. The total expense already incurred has been 500*l.*, of which 250*l.* have been raised. The architect is Mr. Baker, town surveyor, and the builders are Messrs. Taylor & Hall. The accommodation provided in the chapel is for 250 persons.

Proposed Tramway between Tenterden and Headcorn.—A public meeting of the inhabitants of the town and district of Tenterden was recently held in the Town-hall, which was filled to overflowing. The Mayor said he had called the meeting to receive from the promoters of the Tramway Company a statement of what they proposed doing, and then to ask those present if they thought a tramway between Tenterden and Headcorn was necessary. Mr. Latter said that in his opinion a tramway between Tenterden and Headcorn was not sufficient; it should go on to Maidstone, as then it would derive a large revenue from the carriage of hops and other produce of the neighbourhood to the Medway. He was quite willing to take the present project as a beginning, and he hoped that the company would also, starting from London Beach, construct a tramway to Ashford. Mr. Cullen, one of the surveyors, said their project was to connect Tenterden with the South-Eastern Railway by means of a tramway starting from West Cross, following the same road as now used by the omnibuses. If the tramway was constructed under an order of the Board of Trade, or by an Act of Parliament, the maximum rate for first-class passengers would be 2½d. per mile. The goods rates would also be fixed, and for heavy goods would be about 6s. per ton. As yet, a company was not formed; a survey had but just been made. If the meeting decided in favour of it, they would then form a company. It was unanimously resolved "that a tramway from Tenterden to Headcorn was desirable." Before December 15th another meeting will be held. As a beginning, such a tramway would no doubt be very useful; but it is obviously desirable that it should go on to the railway at Appledore or Rye. It is much wanted.

Distribution of Prizes of Turners' Company, London.—The ex-Lord Mayor (Sir S. J. Gibbons) presided at the distribution of prizes given by the Turners' Company. The proceedings took a wider scope than the immediate object of the meeting, holding out as they did the promise of a revival of the old influence—long in abeyance—of the civic guilds in promoting the highest degree of skill in the various arts and handicrafts, and also in controlling and adjusting trade disputes from time to time. The ceremony was held in the Egyptian-hall of the Mansion-house. The clerk to the company read the award of the judges, which was as follows:—

First prize, Lewis Donne, silver medal and the freedom of the company, for a chronometer balance, staff, and rollers, perfectly true in practice, turned in a period of extraordinary hardness; second prize, Henry John Mann, a bronze medal, for a chronometer balance, staff, and rollers, indicating workmanship of the highest truth, squareness, and finish; third prize, Thomas Arthur Nelson, an apprentice of 18, for a well-executed chronometer balance, staff, and pinion.

The ex-Lord Mayor distributed the prizes, and addressing Lewis Donne, the first prizeman, who is a young working man, said he would receive, in addition to the freedom of the Turners' Company, that of the City of London itself.

Sanitary Report on Mile-end Old Town. The report on the sanitary condition of Mile-end Old Town for 1871-2, by Dr. Corner, the local medical officer of health, has been printed. The deaths from all causes during the year ending March, 1872, it states, were 2,200 compared with 2,000 for the preceding year, showing an increase of 200, and an increase of 10½ upon the average of five previous years. This excess was almost entirely attributable to the small-pox epidemic. The rate of mortality per 1,000 population was 23·5 in Mile-end, 24 in the metropolis, and 25 in the combined east district, comprising seven registration districts. Dr. Corner points attention to the unwholesomeness of many new houses in the district, both from faulty sanitary construction, and from the nature of the site, on made ground,—ovils which we have too often had special occasion to bring under notice. Stringent sanitary legislation is the only hope of inducing speculating builders to give heed to a subject on which many of them are densely ignorant, or reckless.

Underground Cisterns in North Avenue. The Clerkenwell Vestry have resolved "that the underground cisterns in North-avenue be abolished, and that above-ground cisterns be substituted in their stead;" and "That this matter should be referred to the sanitary committee, with instructions to see that the objectionable underground cisterns were at once removed."

The Manchester Free Libraries.—The twentieth annual report (for 1871-2) to the Manchester City Council on the working of these valuable libraries has been issued in a printed form. The most noteworthy event of the year was the opening of the Cheetham branch. The number of times that persons have availed themselves of the Free Libraries during the year is estimated at 2,264,688, against 2,112,900 the previous year. Of these, 470,549 were loans of books to read at home; 128,844 were consultations of works in the reading-rooms of the Branch Libraries; and 41,934 in the Reference Library; lastly, 1,623,361 were visits to the newsrooms for the perusal of newspapers, magazines, and periodicals. There is thus an increase of 151,788 in the number of persons using the Institution. The unfortunate locality of the Reference Library is alluded to, as well as its increasing want of accommodation, and a hope is expressed that the Chief Library may soon be rescued from its present unsuitable position, and removed to a more central one.

Coal.—Professor Ansted mentions, says the *Cornhill Magazine*, that a quarter of a million of square miles of the earth's surface are covered with sandstones and shales of the carboniferous period, among which coal is buried; and this coal is for the most part accessible. Now, there are upwards of 3,000,000 square yards of surface in a square mile, and assuming an average total thickness of 10 yards for all the distinct seams of each coal-field, we find for the total number of cubic yards of available coal the enormous figure of 7,500,000,000,000. As a cubic yard of coal weighs nearly 1 ton, we may say that there are in round numbers 7,000,000,000,000 of tons of coal available for the use of the human race. If we took the average number of human beings living at each moment during the next 3,500 years to be 2,000,000,000, and the annual consumption for all purposes to be at the average rate of 1 ton per human being, the supply would last for that enormous period.

Instruction in Science and Art for Women.—The winter course of lectures at South Kensington Museum, for the instruction of women in science and art, has been opened by Professor Duncan. The course is to consist of three series: the first by Professor Duncan, on "Cosmogony and the World as a Planet;" the second by Professor Carey Foster, on "Physics;" and the third by Professor Butlerford, on "Physiology." There was a large attendance of ladies. Professor Duncan, in beginning his series of lectures on "Cosmogony and the World as a Planet," said his purpose was to explain the general results of scientific discovery during the last twenty or thirty years as hearing upon the great theory of the universe. He then proceeded to treat of the fixed stars in an interesting manner, and was attentively listened to.

A Sewage Farm.—The sewage of Cheltenham, after passing through tanks, where the solid matter is precipitated, flows by gravitation over a farm of 127 acres, three miles from the town, and which cost the town, with necessary works, some 18,000l. This farm is divided into seven lots, and is yearly let by auction, it being a condition that the sewage shall be applied at the discretion of the surveyor, who has control of the irrigation works. With the exception of a lot of six acres, the farm is ordinary pasture, the excepted field being laid with Italian rye grass. The third annual letting of the farm took place by auction a few days ago. The total of the letting was 8157. 1s. 6d. for the year. In addition to the liquid distributed over the farm, surplus fluid is diverted over the adjoining lands, at a charge of 15s. an acre.

St. Leonard's Tower, Bridgnorth.—The last stone of this tower has been laid by the Rev. M. E. Stanborough. Mr. Wiggall, the foreman of the works, assisted by Mr. Harry Hems, the sculptor, placed the final immediately over the position it was to occupy, and the vicar then fixed it upon its bed. This tower, says a correspondent, will be the finest in the county. The entire height is 122 ft., whilst the extreme width is considerably greater in proportion to the height than is usually the case. Messrs. Slater & Carpenter, of London, are the architects; Mr. Escourt, of Gloucester, is the builder; and Mr. Harry Hems, of Exeter, the carver.

The Worcester Guildhall Competition.—Nothing is yet settled: there is still squabbling going on between the partisans of Mr. Day and Mr. Wray.

Early Closing for Freemasons.—At the Taunton Police-court, Mr. H. C. Trenchard, legal representative of the Licensed Victuallers' Association, applied to the magistrates for a special licence for the proprietor of Clarke's Hotel to keep open until twelve o'clock on the monthly lodge nights of the Freemasons, on November 20th and December 18th, and the annual dinner, or "Feast of St. John," December 30th. The justices refused to grant the application, though it was supported by the master and officers of the lodge, but were willing to grant any single night; which, however, was not accepted. The result, it is said, will be the erection of a Masonic Hall,—a course which other societies in the town intend to adopt.

Improved Dwellings for the Poor.—The Administration Committee of the Charity Organisation Society have recently exchanged communications with gentlemen acquainted with and interested in the question of improved dwellings for the poor, as to the probability of a report from a committee of members of Parliament and others upon the subject being of practical value at the present time. The proposition was most favourably received by those who were consulted upon it, and hence at the last meeting of the Council of the Charity Organisation Society, the Administration Committee recommended that a committee of members of Parliament and others, similar to the special Vagrancy Committee, should be formed to consider what more could be done to improve the dwellings of the poor in London.

The Westow Tumuli.—The Rev. Canon Greenwell, of Durham, the well-known explorer of British barrows, with other archaeologists, has been engaged in the examination of two tumuli, on the estate of Mr. Phillips, of London, at Westow, near Malton. The results have been of considerable archaeological interest, although the burials were poor, being without relics of any kind, except one flint knife. One of the barrows, however, had originally been a "long barrow," and had been added to until it became oval, the added portion containing the secondary burials, burnt and unburnt; while the primary burials, all doubled up, were found in line and burnt *in situ*, having been covered with slabs of oolite, so arranged that a draught would be occasioned, and a thorough roasting of the bodies insured.

The Ruins of Troy.—H. Heinrich Schliemann, a German archaeologist, who possesses a large fortune, acquired in commercial pursuits, is, it appears, at present engaged in making excavations on the site of ancient Troy. He has persevered in this work for about twelve months, and in last September succeeded in reaching what he considers to be the primitive surface of the ground, after digging for about 45 ft. from what is now the surface. At this depth he discovered the ruins of a house evidently scathed by fire, and in it the skeleton of a woman, with her golden ornaments. He also found the bones of a child, and some thousands of specimens of tiles, or pieces of baked clay, which are supposed to appertain to pre-historic times.

The Restoration of Exeter Cathedral.—A meeting has been held in the hall of Exeter College, Oxford, in aid of the restoration of Exeter Cathedral. The Bishop of Exeter presided, and there was a large attendance. Sir Gilbert Scott pointed out the work that was required to be done to the cathedral, and said that to thoroughly restore it would entail a very great outlay. It was resolved,—

"That as the diocese of Exeter has been for many years closely connected with several colleges in this university, the restoration of Exeter Cathedral is an object justly calculated to excite a special interest in Oxford, and has a strong claim for pecuniary support."

And a committee of gentlemen were appointed, for the purpose of diffusing information and collecting subscriptions.

Accidents.—While the Petty Sessions were being held in the upper room at Durres, near Bantry, the flooring gave way, and a crowd of 200 persons fell through to the ground, a distance of 12 ft. Two persons were reported killed, and about forty injured more or less severely. The portion of the floor on which the bench rested did not give way, and the magistrates and their clerk escaped. The frightened crowd did one another great injury in their frantic efforts to escape. —A house in course of erection on the Stanford estate, at the top of the London-road, Brighton, has fallen, burying three men and a boy. The boy, when extricated, was found to be dead. The men were seriously injured.

Roman Catholic Schools, Hatton-garden.—Archbishop Manning opened the new schools attached to the Italian, or St. Peter's Church, Hatton-garden, on Wednesday last, in the presence of a large number of the Catholic clergy and laity. The schools, which are erected in the centre of a neighbourhood largely populated by the very humblest classes of Irish people, have cost 1,500*l.*, and will accommodate some 600 children, including boys, girls, and infants. The foundation-stone of the buildings was laid last March, and the chief cost of the undertaking has been defrayed by an English lady.

Continuation of the Thames Embankment (North).—The Metropolitan Board have unanimously adopted the following motion of Mr. T. J. White, seconded by Mr. Runtz:—"That it be referred to the Works, &c., Committee to consider and report upon the desirability of completing the Thames Embankment (North) by carrying it on to Millbank, with power to confer with the Chief Commissioner of Works with a view to ascertain whether the Government would be willing to co-operate with the Board for the execution of such works."

Society for the Encouragement of the Fine Arts.—At the first meeting of the Council, held on Tuesday last, Capt. J. Britton was elected chairman, and Dr. Temple, deputy chairman, for the new session. It was announced that Mr. George Browning, honorary secretary, has done much, during a tour in Italy and France, to develop a system of foreign correspondence on matters of fine art, proposed by the council of the society.

The Demolition of Houses.—On Monday evening last a public meeting was held at the Workmen's Club in Smithfield, to protest against the demolition of the houses of the poorest classes, and to demand the erection of more suitable dwellings. Sir John Bennett occupied the chair. The object of the gathering met with general concurrence, and it was resolved to send a deputation to the Lord Mayor on the subject.

Fire at the Dublin Post-office.—Flames were observed issuing from the upper story of the General Post-office, Dublin, on Thursday in last week. The fire originated in a store-room adjoining the telegraph instrument-room. All the city fire-engines were at once on the spot, and succeeded in a couple of hours in extinguishing the flames. The damage is believed to be considerable.

Agricultural Hall, Islington.—The directors of this hall have just laid down a plank-floor, covering the whole area between the columns, consisting of 3 in. planks on dovetailed sleepers, laid in 6 in. of cement concrete. Mr. George Trautnit was the architect employed, and Messrs. Longmire & Burge the builders.

Stained Glass in Calcutta.—Some stained-glass windows have been set up in the Cathedral, Calcutta. When the glaziers had finished, and were waiting for public approbation, it was found that the whole of the glass had been fixed inside out. It took them some time to turn it outside out.

The Snow, when it comes.—The First Commissioner of Works and the Thames Conservancy have granted an application of the Westminster District Board of Works for permission to deposit snow in Hyde Park, and throw the same into the River Thames at Millbank, during the coming winter.

Clerk to the Metropolitan Board of Works.—Mr. Wakefield, the senior clerk connected with the Metropolitan Board of Works, has been elected clerk to the Board in the place of Mr. Pollard, deceased, at a salary of 500*l.* per annum. The election was unanimous.

Increase of Wages.—The Westminster District Board of Works have increased the wages of their fishers and gullymen 3*s.* per week, the present prices being 21*s.* per week; while the salaries of the two foremen,—31*s.* and 35*s.* respectively,—have been increased 5*s.* per week each.

Echoes.—An American newspaper mentions that great improvement in a new Court House, wherein a speaker could scarcely be heard, was effected by straining a few small wires across the apartment at a certain height and distance apart.

Sales at International Exhibition.—The sales of works of art and other objects at the recent Exhibition, effected through the agency of the price clerks, amounted to 10,590*l.*,—viz., for British works, 4,410*l.*; Foreign works, 6,180*l.*

Explosion at Ludgate-hill.—A stone slab in the pavement at Ludgate-hill has been blown several feet into the air, from some unexplained cause, probably an explosion of gas. Fortunately no one was injured.

TENDERS

For sewer works in Seymour-road, &c., St. Marylebone. Mr. A. G. Browning, chief surveyor:—

Wall	£6,290 0 0

WANTED, a SITUATION as PLUMBER. Good reference if required.—Address, C. H. 2, Carlton-mews, Carlton-road, Kilburn.

TO BUILDERS, PLUMBERS, AND OTHERS. WANTED, a SITUATION, by a first-class PLUMBER, GAS-FITTER, HOT-WATER-FITTER. Has no objection to fill up time in painting or glazing.—Address, H. H. No. 6, Fend-terrace, Leader-street, Chelsea, S.W.

TO BUILDERS. WANTED, a SITUATION, by a first-rate CLERK, of many years' experience. Well up in estimating. Age 38. Salary, 3, per week.—Address, A. C. 10, Bruce-road, Devonport, Brixley-by-Sea, E.

TO BUILDERS AND IRONFOUNDERS. WANTED, a SITUATION as CLERK. 7 years' experience in one of the first houses in the iron trade, and 5 years' previous in the black trade. Age 30 years. First-class reference as to ability, &c.—Address, H. 3, 400, Colindale-road, N.

TO PLUMBERS AND BUILDERS. WANTED, a SITUATION or JOB, by an experienced PLUMBER and GAS-FITTER, willing to take placework. Well up in painting and glazing. W. B. 21, Church-leigh-street, Albany-road, Camberwell.

WANTED, a SITUATION, by a thoroughly experienced PLUMBER. Has just finished a large job in the country. Understands both water and bath fitting, plain ironwork, and is required to fill up time painting or glazing.—Address, PLUMBER, No. 26, St. John-street, Midland Park, Kilburn.

TO PLUMBERS, BUILDERS, &c. WANTED, a SITUATION or JOB, by a thorough PLUMBER, a SITUATION or JOB. Take work wherever.—Address, PLUMBER, No. 1, Mallinson-road, Battersea-rise.

TO BUILDERS AND OTHERS. WANTED, by a young Man, aged 23, a SITUATION, as JUNIOR CLERK, in the office of an architect, or as Time or Store Keeper. Six years in last situation.—Apply to ALPHEA, 18, Clayton-street, Kennington Oval, S.E.

WANTED, by a young Man, aged 19, a SITUATION as IMPROVER, as CARPENTER and JOINER. Has had six years' experience.—Address, J. B. 83, Middle-valle, W.

TO ENGINEERS, BUILDERS, &c. WANTED, by a young Man, a SITUATION, as FOREMAN CLERK of WORKS, &c. Has had considerable experience in the management of works and machinery. Address, K. G. 4, Mr. Scripps's Advertising Agent, South Molton-street, W.

WANTED, by a respectable Man, a SITUATION, or a JOB, as a good practical PLUMBER, Painter, and Lead-liner. Thoroughly understands all kinds of pump, cistern, or brass work, every description. Old or new. Good testimonials given. Wages moderate.—Address, J. A. 240, Edgware-road, W.

WANTED, by a practical Man (Carpenter by trade), a SITUATION as OUT-DOOR FOREMAN, who has had the management of some large jobs. Good references.—Address, H. B. 26, Glyn-street, Vauxhall-gardens, Lambeth.

TO BUILDERS, SLATE MERCHANTS, and QUARRY OWNERS. WANTED, by a practical Man, a RE-ENGAGEMENT as QUARRY MANAGER or Foreman of Maons. Has a thorough knowledge of drawings and machinery for working or quarrying stone of all kinds. Good testimonials.—Address, S. care of Mr. Garrett, Higher Belsham, by Birkhead, Cheshire.

The Builder.

VOL. XXX.—No. 1555.

The City of Cities.

VERY one who has visited Rome, or has longed to do so, will find pleasure in M. Wey's handsome work, with its 345 engravings and good map, on that city of cities (the Urbs, the old Romans phrased it), just now published.* Though not written specially for the architect or antiquary, M. Wey's appreciating and discerning admiration for the remains of the ancient world and of the Middle Ages, leads him to give almost every particular that either can desire; while his quick observation of all

things belonging to every-day life and to-day gives his remarks and descriptions a general and living interest. Those who have only studied the works of antiquaries before they visit Rome are notoriously disappointed with the real aspect of the city when they see it for themselves. With their minds full of an anticipation of the surpassing tranquillity of the ruins of the old world they are not prepared for the moan streets, the ill-kept courts, the poor shops, the ragged people, the cooking of brocoli in large cauldrons at the corners of the streets for their consumption, the black mud under foot, the frequent *immondissain*, and the terrible smells in the air. If they think of a beggar, it is of Belisarius. If they think of eating and drinking at all, it is of the old Roman banquets, beginning ceremoniously with eggs, and ending with apples. "*Ab ovo ad mala*," they say to themselves. If they have thought of Roman costumes, and are not artists already bewitched with the dress of the Italian peasantry, they picture to themselves the *toga alba*, chalked to increase the whiteness thereof; the *toga pretesta*, guarded about with purple silk; the *paludamentum*, enriched with scarlet and gold lace; and the *toga picta*, embroidered with needlework. If they have brought themselves to think of Rome otherwise than as the silent site of the successive structural works of the kings, the republic, and the emperors, in fine, their expectations are filled in with the results of classic learning, or of Byronic sentimentalism. M. Wey will change all this.

Advised to leave Florence, on account of the state of his health, he tells us, he arrived, one misty night, at the Roman railway terminus. A friend was awaiting him, who first despatched his luggage to his house, and then conducted him to a dirty *trattoria*, in a mean-looking street, to partake of supper. He concluded from this first hasty introduction to Rome that he was in a small tavern in a remote and deserted suburb, and was astonished when his friend informed him he was in one of the principal quarters, that he had crossed the end of the Piazza di Spagna, and snpped at the renowned *restaurateur's* of the Via de' Condotti. This is the key-note of M. Wey's

hook. To see Rome aright, you must grow to it,—you must rise to it. The first beggar you meet will not be Belisarius; the first banquet of which you partake may have neither egg nor apple in it; the first costume you notice may be that of a snuffy cleric, supplemented by a yellowish umbrella: but, if you stay long enough, there will come to you a realisation of your highest anticipations, your rarest imaginings,—a perception, in a word, of all the majesty, pathos, and poetry of the city.

A distrust of Rome and its ascendancy over thought, opinion, and doctrine, and a fear lest he might lose instead of gain by his visit, were in M. Wey's heart when he sallied forth on the morrow after his arrival. He saw some muddy streets without footways; some mean arched shops, with narrow doorways, which reminded him of La Châtre and Dinan; dilapidated walls; here and there a church among the houses, with a shabby modern façade; and people full of animation and babble,—the women, noticeably, in rags, with their hair elaborately dressed. He came upon an ill-kept court, in which there was a large building, with a tolerably new look about it, and a portico crowded with soldiers. This was the palace of the Barberini. He turned from this to an open, irregular, unpaved space close by, thoroughly disappointed and disenchanted, and seeing a poor alley of squat trees, a seventeenth-century church, and a mission-cross on a pedestal, flanked by four boundary-stones, could scarcely realise that he was not in Vannes or at Brive, where the lamps had creaked as they swang to and fro in precisely the same manner, and the rain had fallen as drearily, in some old experience. He found his way to the Corso. "Another deception!" he exclaimed. For all that he could see, besides the narrow road, with its poor footways, and the number of small shops, where wares of no great value were exposed for sale, he might as well be in Paris, in the Rue Neuvo des Petits Champs. There was a tall shaft of white marble, to be sure, but it made scarcely the smallest impression upon him, though he found afterwards it was the Antonine pillar. However, whilst he was still seeing objects that reminded him only of the smaller French towns, a passer-by uttered a joyful exclamation of recognition. This proved to be a French abbé, whom he had known in Florence, and who had resided in Rome for fifteen years. After they had embraced in the middle of the gutter, they made their way to a *café* to breakfast together.

"I shall take you straight to St. Peter's," said the abbé, whom M. Wey describes as being Pliny, Vitruvius, Ammianus Marcellinus, and Vasari, all resuscitated and incorporated in one genial being. They set out, passing an interminable row of streets of wretched and repulsive aspect; but as they walked the abbé filled the dingy places with bright names. "Where those two lanes divide, is the Albergo del Orso, where Montaigne lodged," he remarked, whilst his companion was absolutely laughing at the ugliness around. "Nothing changes in Rome," he added; "and the market people put up their wagons under that gateway, where the Bordelais gentleman dismounted with his suite." And so on, with a hundred distracting names and a hundred souvenirs, past the bridge of San Angelo, with Hadrian's mausoleum crowning it, to the end of the Borgo Nuovo, where, from the bottom of the Piazza Rusticucci, the façade of St. Peter's was in sight. "This was the great deception of the day," writes M. Wey. He had hoped that his strong expectation of not being surprised would have helped him to some new impressions as he looked upon it, but as he drew nearer and nearer, he only seemed to be gazing at a building that must have been erected after the engravings were made with which he was so familiar. There was a cold grey sky. The pale columns of Borini, as he advanced, seemed to

fold in a cold grey circle behind him, and form, with the portal, a sort of scorpion with a double tail. The immensity of the proportions did not strike him. He noticed that the open space was well paved, and that a carriage drew up at the foot of the great steps which looked curiously small, and that two or three ants got out of it. But all seemed to him commonplace, or, as he phrased it, "an abuse of the permission to pile stone on stone for the amusement of the eye." Nothing stirred him, till the abbé whispered, "that small, low roof on that corner of hure wall yonder, is the roof of the Sixtine Chapel."

He resolved not to enter the church while in this state of mind. His friend drew him close to the portico, and told him to measure with his arms the dimensions of the columns and their flutings. On complying, and realising their enormous size, he hurried out, "Come away,"—overwhelmed and discouraged,—"come away: I have no longer any occasion to seek the origin of our decline of the last two centuries; from Louis XIII. to Thermidor, all is there, down to the endive wreaths of our Pantheon Ste. Geneviève." But his companion would not hedge. He assured him that the more he studied the building the more unforeseen revelations he would find in it; all its faults were on its surface; and once seen, which they were at the first glance, they would oppress him no more; and by degrees a surprise, which would develop into wondrous admiration, would take possession of his soul. "As soon as you can appreciate St. Peter's you will have taken a great step," he added.

However, they turned away without entering the church, to allow the abbé to attend a reception of a cardinal, and, after this little ceremony was over, they made their way to the Pantheon. Then M. Wey's ice began to thaw. The alleys, which were so repulsive and disappointing before, now began to bring before his eyes an ideal of the Latin country. He passed under vaults which rested on ruins of the Lower Empire, and here ruins above them. He perceived that the habits of the people reproduced the past; he called to mind that it was usual to buy victuals cooked at stalls and sauces for them elsewhere in ancient times; he noted that the common brown earthenware vessels were shaped like amphora; that the shops contained wares such as were not sold in any other place within a century; that their owners exhibited a careless indolence, and were as regardless of customers as if they did not require any; that the people began to appear "gay and sympathetic shadows"; that he began to forget chronological exactness. Whilst the past was thus making itself felt, his companion, without warning, took him into the Forum and pointed out spots associated with the memories of Cicero, Pompey and Cæsar, Virginius and Nero, and straightway there resounded in his breast, he tells us, the salvo of great names and great deeds, suddenly fired by all the cannons of history. "I reckon here," he continues, "one of the three most overwhelming commotions that a spectacle ever gave me. The two others are: the first sight of the Alpine glaciers, 4,000 ft. above the Lake of Geneva; and my arrival one evening, by the arcades at the bottom, at the Piazza of St. Mark at Venice." He was entranced with the spectres of temples, the indications of vanished basilicas, the old footways losing themselves in ruins, and, apparently, most of all, as it stood spread out at the back of a white portal on a ground of purple mountain, with the Coliseum. There were blue shadows falling from this, he avers, and the circumference shone with the furnished gold of the sun and of the ages. But the abbé hurried him away to receive one more impression before the close of the day. They crossed the Tiber, came to the Trastevere, saw, in passing, the old bakery where Raffaele's

* Rome. By Francis Wey. London: Chapman & Hall. 1872.

Formarina lived, climbed the Janiculum, and entered the Church of San Pietro in Monte, built near the site of the Apostle's Crucifixion. "We will repose by looking at this church, here, and its little convent, which our soldiers share very fraternally with the good Capucins," said the abbé; "you will see them, snuff-box in hand, performing friendly offices with unwearied profusion for all those military noses." And then, when they had rested and the right time had come for the proper light, he led the way out upon the terrace. We will quote M. Wey:—

"To describe what meets one on this terrace, from which Montaigne three centuries ago threw his eye over a noble winter prospect (26th of January), one would have to introduce into the description the abridgment of Roman history. Rome is only a foreground of the picture; for the view extends towards the north over the plains reaching as far as the Apennines, whence once rushed down Equi, Sabini, Hernici. Towards the south-east, at the foot of the Alban mountains, it embraces those plains of the old Latium which open out by the country of the Rutuli on the swamps of the Volsci. The sun ready to set behind us in the Tyrrhene sea, inflamed with its crimson purple the domes, towers, and pinnacles, the façades of palaces and ruins, as well as the volcanic mounds scattered at the foot of the chains and over the plateaux: a few peaks silvered with early snow crowned the violet Apennines with a pyramid of rose colour, where brighter lines marked here and there a hamlet perched high. Between these two extreme points, the blue-tinted mountains, the city glowing and ruddy in the midst of the bronze zone of its Byzantine walls, lay stretched before us, a mixture of verdure and russet outlines, the country crossed by aqueducts, covered with ancient villas, and pierced by long roads of old renown, marked out and lined with tombs. The yellow Tiber, *Janus*, as Horace called it, winds at your feet like a tract of sand; going up towards the horizon it melts, on one side in the azure of the sky, on the other in the fires of the setting sun."

After gazing at this splendid scene till the light fell, he turned to the abbé and cried in sincere distress, "Do you know, I am undone? Never shall I have the courage to quit Rome and give up the sight of all this." His friend replied, with the modesty proper to a victor, "Come, there are three months gained in a single hour. You will now have to wander at your will, to traverse the whole pell-mell, to acclimatise yourself without fatigue; and after five or six weeks of such a life as that, thanks to so fortunate a preparation, we shall then be in a state to begin to see Rome."

From this point the author falls into the hack-ground. As he describes the famous sites and the grand buildings, he remains comparatively out of sight, not, however, "like a bird singing unseen in a sacred wood," as he puts it, but rather as his own abbé, only stepping before us, occasionally, to show the way. For forty days he went hither and thither, from church to baths, from basilicas to museums, seeing too many new things in succession to retain more than confused memories of them towards night, before he settled to his work and began to make the numerous notes that we feel bound to praise to our readers, as being more suggestive, more sparkling with effects, more satisfying, in a word, than the work of ordinary guides. He returned again and again to the Forum, Coliseum, and Pantheon; but we prefer, for the reason that we are enabled to reproduce his view of it* (thus showing how the book is illustrated), to follow him, now, to the Church of St. Paul, *extra muros*.

This edifice, we need scarcely inform the majority of our readers, is one of the seven major basilicas. It is also one of the five patriarchal basilicas classed apart to represent the bishoprics in all parts of the world over which the Pope has sovereignty. Thus, St. Peter of the Vatican represents the church of Constantinople; St. Lawrence, *extra muros*, is the church of the patriarchate of Jerusalem; St. Maria Maggiore is the church of Antioch; St. John Lateran is the chief seat of the Western church; and St. Paul, *extra muros*, represents the church of Alexandria. St. Paul's has further the especial privilege of possessing one of the four holy doors, kept closed up, to be opened only at certain jubilees at the stroke of a golden hammer by the Sovereign-Pontiff. And over and above, it is built over the last resting-place of St. Paul. Thus it is that though burnt down in 1823, from the carelessness of plumbers, and though situated at a league's distance without the walls, it has been deemed imperative to rebuild the edifice with great richness, at an enormous cost. All the world joined in the task. M. Wey reminds us. "Schismatical Russia offered the gift of an altar of malachite; Mahomet brought as tribute to the sanctuaries of Christ four columns of Oriental alabaster, presented by the Sultan; gold, silver, and jewels flowed in from every side. Hence the porticoes

of veined Greek marble; the pilasters taken from the quartz of the Simplic; the walls, of Carrara, framed with gems of varied hues; the entablature of Paros with its varied frieze; the enormous capitals, so lavish in size, so delicate in execution." The general effect of all this richness is that of a colossal reliquary, he adds, but it does not satisfy the mind, which, after being lost in astonishment for a few minutes, begins to seek out, as consolation for the poverty of design, or "of existing artists," every vestige, however insignificant, of the primitive basilica. The mosaic of the apse, representing Christ with Apostles, is ancient, though retouched. At the arch, named after the daughter of Theodosius, which divides the nave from the transept, there is a sixteenth-century mosaic, showing Jesus and the Twenty-four Old Men of the Apocalypse. There is also a ninth-century white marble candelabrum, 12 ft. high, sculptured with figures representing scenes from the Passion. The thirteenth-century altar was saved, and has been put back again. But the most popular piece of antiquity, perhaps, still preserved, is the famous crucifix that spoke to St. Bridget, wrought by the "most mystic" of the pupils of Giotto, Cavellini. The thirteenth-century cloister was not destroyed; and this is considered a work only equalled by that of St. John Lateran. Only students of Gothic architecture, who find in Roman masterpieces, on their first introduction to them, more wonders that are dispiritingly foreign to their sympathies, can describe the admiration this cloister evokes or the consolation it gives.

When he visits the Church of St. John Lateran, M. Wey brings forward various historical particulars relating to it, so that his readers have no occasion to look elsewhere for the reason that this edifice is called *Mater et caput ecclesiarum urbis et orbis*. He reminds them how Plautius Lateranus was oxiled for being one of Messalina's lovers, and subsequently put to death by Nero for having taken part in a conspiracy, when his domain was confiscated; how Constantine gave a portion of the enclosure of his palace, which included this domain, for a church and residence for the Christian bishops; how this primitive church was so gorgeously enriched that it was called the Golden Basilica; how St. Sylvester consecrated it to the Saviour; Lucius II. dedicated it to the two Saints John; and how it has always retained the name of the original owner of the site, and remained the cathedral of Rome. "At St. Peter's of the Vatican," he explains, "the pope is the spiritual sovereign of the world; at St. John Lateran he is bishop." The first church lasted ten centuries before it was burnt down. After 1308, the date of the fire, it was gradually rebuilt by the successive popes. In the cloisters of this famous building the rich arcades rest on pillars of varied outline, some cylindrical, some fluted, and others twisted, in different combinations, and are surmounted with mosaic work and a double cornice. Within the quadrangle is a well with a circular enclosure of sixth-century workmanship. Two columns, one on either side, support an entablature, from which depends the appliance used for lowering the bucket. We give, as another example of the admirably-executed wood-engravings with which the book is illustrated, a view of this well in the cloister court of St. John Lateran.* Our readers may believe our author when he says "this cloister is one of the most delicious erections in Rome or in the world."

The recent archaeological discoveries, including the traces of the barrack of the Vigiles of the Seventh Cohort, the frescoes of the crypt of St. Clement, the paintings of the house of Livin and others, made by Pietro Rosa, on the Palatine Hill, are carefully described; moreover, M. Wey falls in, now and then, with facts hitherto not noticed, and objects which other writers have not mentioned. Mixed up with all his studies, always, are notes upon the men and manners around. When he is describing the Arch of Titus, he has a word for the angry old Jewess who shouted to a disobedient child dying before her in the direction of it, not to pass under that "accursed arch." When he has paid a late visit to a lonely site, such as the Coliseum, he tells us the current stories of nocturnal amusements and rolhery, and relates his own detention, on his way home, when near the Piazza Barberini, by a man who had been following him for some time, who, after an allusion to his pride, dignity, and clouded fortunes, begged an old pair of trousers. The artists, the scholars, a retired

brigand turned guide, who sends messages of respect to the abbé whom he formerly waylaid; a fisherman on the watch before his grotto; a harber shaving peasants in the street; the market-people; players at bowls, in green arhous in rural taverns, and countless other characters, all figure in his pages as well as accounts of the great festivals and other observances, details of the pictures of the great masters, the mosaics of the early Church, landscapes, and the monuments of ancient and modern times. "Rome is a world," he tells us. "Whatever has possessed greatness in the West,—art, religion, history,—has left its traces in this city." Again, "Rome is the museum of all the ages. Above erudition, above scrupulous accuracy and the best conducted researches, what ought to rule here is the love of what Rome has loved. She has preserved her greatness in the world by the passion she declared for all that is beautiful;" and all that goes to make up Rome, modern and ancient,—all that tends to recall memories of life there, or is likely to help those who are strangers to the great city to imagine its nature,—finds a place upon his page. There is more than usual freshness for English readers from the fact, that when he draws upon literature for a reference, it is upon French literature instead of English. In the department of illustrations he has been so fortunate as to secure very worthy assistance. Henri Regnault, whose heroic death may be fresh in remembrance, furnished the only designs he ever made on wood to this work.

Not till he has touched upon most of the objects we have enumerated does M. Wey approach the Vatican, which he calls an assemblage of palaces belonging to all the ages. On that first day in which the abbé took him to St. Peter's, he saw the Loggia of Raffaele from where he stood with him, and they gave him the impression of a cage, because they were glazed in by the direction of Cardinal Antonelli, to prevent their further decay; and he is never able to get over this innovation, which, he more deliberately declared when he visited them, gave them the appearance of a greenhouse or clock-factory. He declares, too, that the preservation aimed at has not been assisted; for in summer these galleries are turned into a furnace, which is far more perilous to the paintings than the wind; but if he had seen the decorations before they were restored by Mantovani, he would probably have formed a different opinion as to the propriety of this protection. Of course, he does not take us through the 11,000 chambers he was told the Vatican contained, nor up its 208 staircases, nor even into its twenty courts; but he shows the residences of the pope and Cardinal Antonelli in it, and all the leading art wonders of the place, as well as some of the less-visited works. One day he had an opportunity of seeing the Borgia chambers, with their paintings by Pinturicchio, of which no engravings have yet been made. Another day he lagged behind the guardian of the Museum of Benedict XIV., and caught sight, under a glass case, of the ancient bronze medallion showing the profiles of St. Peter and St. Paul. He saw, in the Etruscan Museum, among sarcophagi, geni, urns, and vases, a complete biga, or two-wheeled car, of wood, covered with copper, with the nave of the wheels adorned with Cynocephali. He finds many glowing words to describe the library, which is also shown by an illustration. Not a volume is to be seen in it, although there are more than 25,000. All are under cover of low, shut, and gilded presses or cabinets, illuminated by fresh colouring. Seven pillars divide the hall into two aisles, 220 ft. long, and this perspective is one mass of decorations, illuminations, frescoes, gilding, vases, and various gifts from sovereigns, glittering like a lantern of colours and images. "Have patience," remarks M. Wey; "you will see a line of 794 metres of paintings." You will not, however, see the rare Armenian, Coptic, Hebrew, Persian, Arabian, or other MSS., unless you are armed with very adequate authority, as they are rigorously guarded. The vigilance is so severe and the restrictions are so numerous, that M. Wey came to the conclusion that an exploration of these virgin forests of erudition and curiosities would absorb the lifetime of a Methuselah.

From the sculpture-galleries, our author gives several illustrations. Among others, he pictures the Aridne, formerly supposed to be Cleopatra; the Meander in the Pio-Clementine gallery; a group of an attack upon a stag, in the hall of animals, before which he has seen American

* See p. 925.

* See p. 924.

and Swiss forget the hours; the Persens of Canova; the famous torso of the Belvedere; the Augustus and the Demosthenes in the Braccio Nuovo; a sarcophagus with Bacchantes, among others. He dwells, too, with great satisfaction, upon the superiority of museums built for museums, and not made out of an abandoned monastery or church. Raphael Stern knew what he was about, he points out admiringly, when he constructed the Braccio Nuovo. He knew there were forty-three important statues to be housed. So he divided his gallery into twenty-eight niches, and the apse into fifteen more, thus contriving a niche for each statue; and before each pilaster between the arches he placed a pillar of red granite to hold a bust; consoles at the intersections of the arches to support busts; and between the frieze and the keys of the arches he set bas-reliefs. There is an engraving of this hall.

The Sixtine Chapel also awakened his most vivid enthusiasm. He leaves scarcely a feature of it undescribed by pen and pencil. The altar, with its great altar-piece of the Last Judgment, a portion of the ceiling, several details from the ceiling, the entrance, the Swiss guards, are illustrated by the pencil; and he gives besides a sketch of the grand ceremonial he saw in it, in which the Pope officiated. The gardens, too, of the Vatican are shown by the pencil as well as the pen, and their cypress-shaded solitudes made enjoyable. As every one must do who proposes to see more than a very limited number of the galleries, M. Wey passed several days in the Vatican. The Camera della Signatura, sacred to Raffaele, detains him long, for here he remains at the conclusion of his work, in a rapture of admiration, gratitude, and exhortation, crying,—

"Are not these galleries the most ancient, the most splendid of the public museums of Europe, and are not all bound to gratitude for the examples given by the sovereign possessor in these national collections of which they are now so justly proud? What the Vatican is for the things of the spirit, I will say in a word or two, while leaving its precincts you may remark at the present springs the teaching of divine and human letters; sculpture and painting, arts ancient as well as modern, revealed by the most perfect models."

He has forgotten the muddy streets; the ill-kept courts; the brocoli cauldrons; the little arched shops, that reminded him only of La Châtre and Brian; the stunted trees and poor appearance of the Piazza Barberini, that made him uncertain whether he was at Vannes or Brive; the terrible smells; the dirt-chaps; the babbling people and their rags. You have no concern with Rome, he says, obviously, unless you recognise two sentiments in yourself,—love of the beautiful, and respect for what is great.

But he has produced a beautiful book, which will give pleasure to every one who turns or reads its pages with understanding.

FIRE-PROOF CONSTRUCTION AND THE FIRE IN THAMES-STREET.

AMID the changes which are so perpetually going on in the *fine art* of architecture, and while "style" is ever on the move,—what was fashionable yesterday being out of date to-morrow,—there is always one thing in architecture which remains,—the very foundation of it,—construction. Whatever the "style" may be of the architecture, it must be put together to form a building, no matter for what purpose: it must be constructed. Stonehenge is constructed, and so is that latest of building inventions, the corrugated iron roof, which now does such multifarious duty, from the covering over a mortar-making-and-mixing machine to the huge space occupied by a central railway station. But, without going at present into any general talk on the subject of common architectural construction, we would say a few words on what is called "fire-proof construction," if, indeed, as we have before now remarked, there really be any such thing. Having seen the building in Upper Thames-street, and having known it as well before the burning, a few remarks on this particular building, and on fire-proof construction generally, will be useful to many readers who may not have seen it, and to whom the subject is somewhat new. For this purpose, we can hardly do better than shortly describe, from personal observation, this so-called fire-proof building, and what the fire did with it.

In the first place, we must notice that this structure was remarkable, not only for hugeness, to which, on its erection, we took grave objection, as obstructing and marring the view of

St. Paul's from Blackfriars Bridge, but for plainness. It was of no style of antique architecture, that is certain. It was a simple mass of "construction," and usefulness. In point of position, it stood as well as building ever did stand; and those who are curious in such comparisons may well pause a moment to compare this Thames "ornament" with the delightful architecture which the unimproved old Venetians contrived to ornament the banks of their sea and canals with. Let any reader who feels sure that everything is progressing compare the two things, while the walls of this huge warehouse yet stand. It was made up simply of four tall straight walls, like a great packing-case, 65 ft. broad and 250 ft. deep, with a long creek or draw-dock on one side of it, with some really picturesque surroundings. It was about 80 ft. in height, and contained no less than seven stories or floors, for the storing of grain and flour, and for the necessary grinding and other machinery. It was built in 1852, by Mr. James Ponsford, the builder of many mansions in Tyburnia. Altogether a somewhat remarkable structure,—a mere building, without architectural detail of any kind, and what is, perhaps, more suggestive, without *outline* of any artistic power, so that its huge dimensions simply enlarged its unskillfulness,—a huge, ungainly lump of a building! But it was fireproof,—fireproof until the fire seized it!

It seemed impossible to conceive how such a building as this could have been set fire to, supposing any one had tried to do it. There really seemed—and we knew it well,—nothing in it as a building, or even in its contents, that could burn, or he set fire to. The four walls were of solid brickwork, the floors of slate, and stone supported by iron girders and columns. The window-frames of the 400 windows which the building contained were of iron. The whole of the machinery was iron, and the quantity of wood or timber in the place was so very small as to be altogether unnoticeable. Flour and corn in stout sacks will hardly burn, but only smoulder away at a red heat; and piles of sacks themselves will scarcely ignite into flame. It would be impossible to find in all London a building apparently more unlikely to fire itself, and burn itself clean out. There seemed to be, as we have said, nothing to burn, or that could burn. But nevertheless it did burn, and that most completely, like loose wood in a common grate. It may be interesting to observe here that the late Mr. Braidwood, the clever and brave Superintendent of the Fire Brigade, expressed his opinion that this special building, if but once it did catch fire, would burn itself clean out, and that no part of it would or could be spared. And we now see that he was right. Now, how is this, and what is or can be a "fire-proof" building? Mr. Braidwood's idea was that the entire absence of party walls in the structure left the whole of it open to the action of fire if but once it seized any portion, however small of it. No doubt he was right as far as his idea of it went; for there can be no question that had this building been divided into small square apartments, or boxes, of brickwork and iron, with iron floors and iron roofs, with iron doors, kept shut, from one apartment into another, a fire occurring in one of them, however fierce, could not well have penetrated into the one next to it. And even if the floors and ceilings had been of wood, the fire might have been got under with comparative ease, from the time it must have taken necessarily to spread. It must, therefore, be evident that it is not so much the materials of which a building is composed, or even the contents of it, however combustible, that makes fire so certainly destructive, as the form and disposition of such materials. The plan and arrangement of the building, indeed, it is which makes it fire-proof,—at all events up to a certain point. Thus a structure, as a large warehouse, even if filled with the most combustible of materials and goods, may be made almost, if not quite, fire-proof, as a whole, if it be divided into separate sections or rooms, with partition walls dividing one from another, if of incombustible material, as is brickwork, i.e., good and well put together brickwork. We do not pretend to be able to account with certainty for the origin or progress of this great fire, but knowing something of the building constructionally, and of its contents, we may perhaps be allowed to theorise a little on it. There is really, after all, but little mystery about the completeness of destruction; for any one must have observed the power of heat and flame to spread itself, and to grow more and more intense, as it spreads

and increases in fierceness. It is quite certain that this fire began in one spot, probably at first from a single spark.

But a very slight draught, as through a broken window-pane favourably situated, would soon blow this spark into a small fire, no bigger than that in a common grate. This would spread, and the spreading and gathering fresh and fresh material, although so incombustible as flour and closely-packed corn and piles of flour-sacks, would go on just in the same way as the fire spreads in a brick-kiln. It is only necessary that the draught of air be enough and rightly placed. In this building there were no less than 400 windows or holes for letting in the air-currents; and, as we happen to know, most of those were broken, so that the whole interior of the building was as one vast accumulation of slowly combustible material,—indeed, just the same as cinders in a brick kiln, with the fire-supporting air rushing in from all points. Nothing could be better contrived indeed for the purpose. It was a vast furnace, with the stove-holes just sufficiently open, and no more. This was accidental, of course, but it was complete. This being so, and we can hardly doubt it, the low red heat, as it accumulated and spread and increased in strength, soon intensified itself into a white heat, in which, as all know, almost anything will burn, and even break out into flame.

Corn, flour, sacking,—indeed, everything but slate and bricks,—will burn in such intense heat. There being no dividing walls, the whole mass of matter in the building fell a prey to the vivid heat, just as Mr. Braidwood prophesied it would do. Into the wonderful nature of heat it is vain to go: why it should seize on one substance and not on another, is among the profound mysteries of nature. Advanced chemistry can tell us nothing about it: it can but point to plain facts which everybody can see, but into the causes and essence of the matter no philosopher has as yet got a glimpse! Iron itself, as the chemist knows, will burn as readily as wooden matches if the heat be but strong enough or sufficiently intense, so that but few substances in ordinary use can be said truly to be absolutely incombustible. We have seen even cast-iron girders partially melted in the fire of an ordinary warehouse.

How, therefore, and it is still a question, ought a large building to be planned and constructed, so as to provide in the best possible way against the spread of that powerful force, *fire*,—so good a servant, but so terrible a master? Why simply to confine it. Mere fireproof, or incombustible material ordinarily so called, will not insure against fire, and certainly not against the spread of it. And not only to confine it in separated sections of a building, but to look well to the window openings, and to the broken panes of glass in them. In all human probability it was through a hole in a broken pane of glass that the wind blew this great fire into such vivid power. It was without doubt on a small mass of slowly combustible substance, like tinder, that the air, entering through a broken window-pane, of which there were so many, fanned some accidental spark, or may be heated corn, into a glowing mass of intensely-heated matter. And this could have been done, he observed, only,—it is well worth noting,—by the action of a powerful draught, induced by an opposite open or broken window. We hear so much of ventilation, and how best to ventilate rooms and public places, that it really seems wonderful that the very best and very simplest of means for the ventilating a room should ever be a mystery at all. Open the window of a room as wide as you will, and keep the door shut, and there will be but little ventilation, unless the wind blows right into the room, or the window stands, as the sailors say, right in the wind's eye. But open the door as well as the window, and the whole of the air in the room is totally changed in a few seconds, and if the wind be high, it is accomplished almost instantaneously. No one can stand for long in such a draught, or thorough ventilation. We cannot have everything all at once, and without any inconvenience, so that the providing the means of a thorough ventilation of such a building as this warehouse, provides at the same time for its thorough burning, if not well looked after. The opposite windows, nearly all of them more or less broken, must have ventilated those vast floors completely, but they allowed at the same time of the admission of powerful currents of air at all times, and where they were the least wanted, and were the most dangerous. Had there been shutters to these windows, or had

the broken glass been well looked to, and the windows on three of the open sides of the building closed at night, only opening them occasionally, to clear the air, this fire, perhaps, might never have occurred; or if it had, it might not have got the upper hand as it did. Or had there been a parting-wall running north to south, dividing the building into two parts, and so practically having window-openings on one side only, this disastrous fire might not have occurred. In the rebuilding, may not these thoughts be useful?

But, after all, considering the vast importance of this subject, and the doubts that evidently surround it, even in professional minds, would not a series of experiments, inaugurated, it may be, by one of our architectural societies, do infinite good? The theories as to what is "fireproof construction" are many enough; and nearly all the great fires that have recently occurred may be adduced to support some special remedy for existing evils; but, what certain test is there? What sort of material, for instance, is that, whether natural or artificial, which can protect stone, solid stone, from the action of heat,—white heat? Will plaster, a ½ in. thick, do it? The firemen, experienced men, will tell you, no. What will prevent iron from doubling up, or even melting, as we have seen it do in a great fire? It seems, indeed, almost impossible to hinder the progress and final destructiveness of a great fire when it has once got good hold of a large building. Everything goes before it; but, still we must contend that there would be infinite good done by a few judicious experiments. For our own part, if we may be allowed to express a definite opinion, we would infinitely rather trust ourselves in a house of the Wren build, with all its imperfections, than in one filled and fitted with every "patent" contrivance known to the modern builder. It is wonderful how long wood is in catching fire. There can be no manner of doubt that it is a much safer thing to trust oneself on a good wooden staircase, as every fireman knows, than on one of stone, with one end in the wall some 6 in. or so. In the good old construction there is much yet, if we mistake not, to be learned, even as regards fireproof construction.

POSITION OF ARCHITECTURE AND BUILDING FROM A SCOTTISH POINT OF VIEW.

At the opening meeting of the Edinburgh Architectural Association, the president, Mr. John Paterson, delivered the inaugural address, in commencing which he alluded to the call that had been made upon the profession at large to invent something to lessen the expense of warming domestic buildings, and generally to adapt scientific principles and apparatus to domestic wants; he afterwards continued:—
"The high price of building materials and labour is coming to be a matter of much concern, being the cause of some works being delayed or cut down, and others stopped altogether. How many have failed to reach the architect it is impossible to say. But this we know, that strikes and trade disputes are taking place every day. Contractors are insisting upon a strike clause being added to the conditions of every building contract. They say 'the knowledge of the insertion of such a clause has a tendency to prevent strikes on the part of the workmen, and enables builders to tender with more confidence for any contract.' I have also been told by engineers and bricklayers that some contracts were now taken on what might be termed the 'sliding scale;' that is, the prices of the contract are so adjusted as to rise and fall with the prices of material and labour. Now, the object of the strike clause and of contracts upon sliding principles is to transfer to the proprietors the benefit of any reduction or the burden of any rise in the wages or price of materials, instead of paying a margin upon the contract price sufficient to cover the whole risk of the contractor. In general the proprietors would prefer the price to be fixed, and the whole risk added to the estimates, rather than become partners with the contractor in the manner indicated. Contractors have the same privilege of making their conditions on a contract as the architect or proprietor; they do not need to take one unless they are pleased with it. As times and circumstances change, the same clause cannot apply in all cases, and any strike clause for extending time should be so worded as to limit the time for endurance, &c., and not to take effect in the case of any factitious or

unnecessary dispute. The wages in every class of labour connected with building have risen notably, and the working hours of all at the same time have been shortened. The masons of Edinburgh may be instanced, as they claim the credit of the short-time system of the nine-hours movement. Well, they have reduced their working time 15 per cent., and increased their labour is now 65 per cent. higher than the average rate before the movement began. Although some of the other departments may be more and some less, that may be taken as an average of the whole. As to materials, it may be remarked that those dependent on labour or coal to make or bring them to hand have risen highest in price. Bricks and iron are up 100 per cent.; lime, 35 per cent.; rubble stone, 33 per cent.; cubic stone, 50 per cent.; ashlar, 25 per cent.; and rybats, 12 per cent.; glass, 25 per cent.; joinery work and ironmongery from 10 to 35 per cent. The high price of coals has already seriously affected the coal trade, so much so that the advisers of the miners are getting alarmed at the condition of things. They now see that they have carried matters too far, and wish to abolish strikes and to settle trade disputes by arbitration. It is to be deeply regretted that they have drifted so long on the stormy sea of strikes, before discovering the hopeful channel of arbitration which leadeth to the calm waters of contentment. It is to be feared the present high prices will have a similar effect in destroying the building trade, and driving off investors. But before this is accomplished, to any serious extent, it is to be hoped that the men will learn wisdom, and, instead of striking, take to arbitration. It is to our advantage, as acting for our employers and our own behoof, to do what we can to promote a conciliatory spirit between masters and men; to impress upon them that our advantages are all bound up together; that if building ceases, we are partners in the consequences. The effect of high-priced labour will be, for a time, to separate architecture from building. Necessity may demand the constructive part of buildings at any price, or at any time, independent of the price of labour or materials. But in these urgent cases the necessitous people will be content with the most ordinary and unadorned form into which the rude materials can be converted to form a place of shelter and protection. Expensive labour will tend to retard the growth of architecture, properly so called, and introduce a "utility style," the grand object of which will be to produce buildings weatherproof and water-tight, minus architecture, but with as much rude grandeur as may be compatible with the scanty supply and high price of labour; and which will bring the workmen of the present to mere hewers of wood, and drawers of water in the future. I have considered it expedient to make these remarks in consequence of the unsatisfactory state of the building trade at the present time.

Mr. Paterson then proceeded to consider some matters which have interested the architectural world during the past year, especially noticing points which indicate progress, and mark the present period of architecture as one of progressive excellence and grasp. "Probably no event of interest in this country is more worthy of primary notice than the completion and uncovering to public view of the National Memorial to the late Prince Consort. The fertile imagination of the architect has here produced a design and conceived methods of construction, ornamentation, and decoration, which the country has now, after ten years' labour, seen realized, and which not only cause the Albert Memorial to be regarded as a success, but claim for it a position as the best or one of the best monumental art structures of the kind, produced in any country in modern times. It combines in its construction as singular and beautiful a variety of materials as it does in its architectural features and detail, the whole being gathered together and skilfully grouped into one harmonious and orderly combination."

The new Courts of Justice in London, the Manchester town-hall, and the Fettes College, Edinburgh, were alluded to; and he also took occasion to advert to the architecture of Cockburn-street, Edinburgh, disfigured as it is by "the great bald north wall of our municipal factory" [council chambers], which he contrasted with the splendid hôtels de ville of Belgium. The president went on to speak of the state of architecture on the Continent, which he had made his study during a recent tour. Referring to the cathedral of Cologne, he said,—
"I walked through the workmen's sheds, where

I was told that some 500 men were employed, building the stone towers and stone cutting, under Zwirner, the architect entrusted with the completion of the cathedral. Some of the stones which I saw in progress were large, and of the most complicated description of inter-sectional lines and curves, and adorned with rich and beautiful carving. The work was exceedingly well executed, and the mitreing beautifully done. The men worked hard and cheerfully, and sang at their work in beautiful harmony. The music was taken up from shed to shed in a style which forced one to believe that they were not only good masons, but capital musicians as well. Here was art aiding the art-workman. The fine art of music lending her charms to cheer honest labour."

In Amsterdam and Frankfort extensive restorations are in progress at the cathedrals. At Strasbourg the stonework and the stained-glass windows which were destroyed during the bombardment, are being rapidly restored; but there are two shot-holes through the roof of the north aisle, which, with much propriety, may be left as mementoes of the merciful escape made by the cathedral in comparison with the fate of the museum, the theatre, and other large buildings in the town. The synagogues at Amsterdam, Cologne, and Frankfort, are fair architectural examples, and evince the desire of the Jews to beautify and adorn their places of divine worship. In Amsterdam, the Church of Moses and Aaron has a classic exterior; but the synagogues at Cologne and Frankfort are of elaborate Byzantine architecture. The interiors are evidently designed and intended for elaborate decoration; indeed, at Cologne, the decoration and stained glass are magnificent.

The new synagogue at Frankfort, situated at the south end of the Jews' Quarter, called the "Cradle of the Rothschilds," is an imposing and interesting building, and when the interior decorations are completed, it will be well worth visiting. Indeed, tourists interested in architecture or decorative art should not miss a sight of the interiors of one or other of these buildings.

Here, too, in our native city, the movement begun some years since for the restoration of St. Giles's Cathedral has taken root, and the work has begun, and is being carried on in earnest. Let us wish the architect and the promoters all success in the work that is before them.

At the close of the address, Mr. James Ballantine moved, and Mr. H. Ross seconded a vote of thanks to Mr. Paterson. We understand that at the next meeting the competitive designs for the new cathedral will be discussed by this Association.

PROGRESS OF ARCHITECTURE IN IRELAND.

At the opening meeting of the Royal Institute of the Architects for Ireland, on the 21st instant, the president, Mr. J. H. Owen, in the course of his inaugural address, said a correspondent of one of the London journals, recently visiting Dublin, mentions in his communication that in former times the architecture of Dublin used to be justly commended as exhibited in its public buildings, such as the Bank, Custom-house, Post-office, and Four Courts, &c.; but that now alongside these are springing up on every side new banks, insurance-offices, shops, and other establishments, which are remarkable both for the talent displayed in their design and also as exhibiting a state of things strongly contrasting with the stagnation of trade and decay of prosperity which have been such prominent features in most pictures which have been drawn of the state of Ireland. And what is so truthfully stated of the metropolis may be stated with equal truth, varying only in degree, of nearly every provincial city and town; and the country itself is gradually becoming dotted over with buildings of a new and important character,—in those for religious uses especially is the change most strikingly shown. Perhaps nowhere else in Europe were the ecclesiastical structures erected for the last few preceding generations of so utterly mean and degraded a character,—and this was one point on which all sections of religious belief among us were at one; whatever other differences of opinion, whatever distinction of form of worship, there might be among them, in this one point there was perfect unanimity of both creed and practice. It is much to be feared, however, that improvement in the direction of architecture is receiving a severe check. Without entering into

any discussion as to the merits of the several questions which have disturbed the labour-market, it is sufficient for us here to note that the cost of building has increased by a very large percentage, and that this must, to a great extent, postpone the extension of improvement until matters find their level. I do not see any cause for any feeling of alarm or uneasiness at this state of things; there is nothing really new in it; the same sort of thing has occurred over and over again. The statute book is full of laws for regulating the prices of labour and commodities, which, of course, became a dead letter, in so far as they were opposed to the real progress of the age. In all old chronicles are to be found innumerable notices of such marks of progress, and in almost every case they refer back to some golden age of bygone cheapness, and predict the end of all things as soon to arrive; but the world has waggled on, and there seems no great reason for desponding now. Matters are sure to right themselves, things will find their level; but meanwhile there are grounds for both hopes and fears as to the future prospects and condition of the artisan, based on the uses to which he may apply the increased leisure and pecuniary resources which the march of events has bestowed on him. "What will he do with it?" Will the extra hours and increased wages he spent in the beer-shop and gin-palace, or in any other form of mere animal enjoyment; or will they exhibit their effects in increased comfort and culture of the man himself,—more care in educating his children? It is hard to say; perhaps somewhat of both. The better class of men in each trade will probably be the better for it; the middling and inferior class will probably become worse workmen day by day, until they sink down to the workhouse or the grave; for the after-effect on them must be, that the less the necessity for working, the more the distaste for working will grow. The man who "plays" one or two days in each week will work very reluctantly and unwillingly on the remaining four or five; and when the competition with imported or machine-manufactured goods shall have attained the fuller development which is certain to be brought about when manual labour is at its maximum of high price and irregular and uncertain supply, the weaker man must go to the wall. This, I confess, is the only fear for the future suggested to my mind by the present unsettled state of the labour-market.

The same commentary on our new buildings to which I have already alluded suggested to me another train of thought, to which I think it will not be inappropriate to request your attention for a few moments. In comparing the recent architectural decorations of our streets with those older examples, which have challenged for the city the admiration of most travellers and writers, we perceive a difference between them of a very striking character, which, however, while strongly exemplified here, is not by any means confined to Dublin, but exhibits itself everywhere, and in a greater or less degree, according as the mind of the architect is more or less imbued with the ideas that this generation has reproduced. I say reproduced, for the principle to which I allude is one which always has ruled supreme whenever and wherever there has been true architecture, irrespective of age or country, and without which there may be a good deal of building, but no architecture. This golden rule, this *symbolum stantis vel cadentis architecture*, is "FITNESS,"—adaptation of the design of the building to the uses to which it is to be put. Whether consciously or by mere force of habit and imitation, this is the rule which prevails in modern buildings. There is a very wide range of selection made as to the character. The ornamentation and details may reproduce ideas Classic or Mediæval, and in the latter may range over the whole lapse of time from the earliest revivals of art in the Dark Ages down to the mongrel style of the Renaissance. All countries,—England, Ireland, Scotland, France, Germany, Italy,—are put in requisition to supply ideas of form and character, but the one central, distinctive idea which distinguishes the building of this day is the one of fitness, and the rule deduced from the idea, which eliminates from all good architecture such parts which are not essentially and constructively necessary to the building, in order that it may fulfil the purpose for which it is designed. Let me for a moment call your attention to two of the most beautiful of our older buildings, with reference to this one point. Perhaps no city in Europe can show a more beautiful perspective

view of Classical architecture than what one sees, either by daylight or moonlight, from Grafton-street, by standing at the Provost's gate and looking toward the Bank of Ireland. It is a glorious bit, and as pure in its detail as it is picturesque in outline and grouping; and yet there is not one particle of what meets the eye that might not be removed—cleared away utterly—without interfering for a moment with the business of the bank. What you are admiring is not the building itself, but a screen which hides it. In the same way the façade of the central portion of the Four Courts wants only deeper shadow from somewhat bolder projection of the portico to be perfect; only in looking at it you must take care to stand so as only to see the front of it: a look at either flank will destroy the illusion. It is very beautiful, but, like stage scenery, it is meant to be seen only from the front,—and for the same reason, because it is put there to represent what is not there really, and to hide what is. The whole façade is a mere screen wall,—a picture of a building executed in stone. Now I think it will be admitted that it is not the true aim and object of architecture to erect buildings, and then construct elaborate and costly contrivances for hiding or disguising them, and that a design which treats the exterior in a manner independent of, and bearing little or no relation to, the interior, is radically bad, however beautiful it may be *per se*. No one would think a surgeon entitled to credit who should perform an operation merely to show his own dexterity in handling the knife.

I have sometimes thought, when looking at such buildings as those which I have been considering, that, to most people's minds, the idea of a really noble building must be that of one built regardless of expense, and apparently of no earthly use; but the fact of the matter is, that in these things we are only just beginning to think for ourselves,—to shake off the bonds of old associations, and get rid of an empiricism that had become engendered in all our thoughts, habits, and practices. In architecture, as in every other direction of modern thought, our culture has been built on the revival of Classical modes. In art, as expressed in painting and sculpture, the surviving antique models were themselves perfect, and nature was always present, forcing the artist's mind and hand out of mere slavish imitation and reproduction. In science, Bacon first taught us to throw off the bonds of authority, to test facts and phenomena by analysis, and appeal from the philosophy to Nature herself as our sure guide; and how slow we were to accept the teaching! I can remember myself having in very early days had the maxim impressed on my mind that "Nature abhors a vacuum." Two hundred years after the death of Torricelli. Law, the most conservative of sciences, has in these latter days been cleared of much of the dead branches of previous growth,—is becoming every day less purely technical and arbitrary, and is likely before long to start on a new basis of codified principles as opposed to mere practice. A similar reform in architecture is in progress, but hardly yet acknowledged by the profession, and scarcely at all understood by the non-professional world.

THE GARDNER COLLECTION AT GUILDHALL.

We have already mentioned the admirable display made at the opening of the new City Library and Museum, at Guildhall.

No less famous an historical personage than Lord Mayor Sir Richard Whittington was the founder, in the year 1421, of a library at Grey Friars, at the cost of 400l. of the currency of that date. We are told by Stow that this library was 129 ft. long by 31 ft. broad, and that it was furnished with twenty-eight desks, and eight double settles of wainscot. These desks are enumerated in King Henry's patent. A second sum of 400l. was devoted, by the same hero of civic story, to the erection of a "lybrarye atte Gyldhale," to which Sir Richard also gave many manuscripts of value. To this "Common Library at Guildhall" John Carpenter, the founder of the City of London School, left by his will, proved in 1442, "any good or rare books found among the residue of his goods." In 1444 we find "lyflood, honsing, and casement of the gardyn" granted by the "Maire and Aldermen at their prest and bedeman, John Clipstone, capellanus, et custos Librarie, Gyldhald." But "in the raigue of Edward VI. the

bookes were sent for by Edward Duke of Somerset, Lord Protector, with promise to be restored shortly. Men laded thence three cartes with them; but they were never returned." This was in 1552, and appears to have been the end of the library founded or augmented by Whittington.

Two hundred and seventy-two years had passed since the high-handed robbery by the Duke of Somerset before the City of London bethought herself of the need of a new public library. In 1824, the late Mr. Lannher Jones began to direct attention to the subject, and a committee was appointed to undertake the formation of, not a public, but a corporation, library. Books have since that time been collected, sometimes slowly, sometimes with more spirit. At the present day, the collection is said to be complete, as far as concerns books relating to the City of London, while other departments of literature are also, to some extent, represented. The early manuscript hooks of the corporation commence with the *Liber Custumiarum*, in 1154. The *Liber de Antiquis Legibus*, written in Latin and Norman French, dates in the first year of King Richard I., A.D. 1188. Nine other volumes, the titles of each of which begins with the word *Liber*, bring down the series to the year 1576. Transcripts of the City Charters, written in Saxon, Latin, and Norman French, commence with the charter of the Conqueror, which itself is only a confirmation of the previous charters granted by the Confessor, and by earlier Saxon kings. The last in the series are the charter dated in the fiftieth year of King Edward III., A.D. 1376, and the *Inspecimus* of Charles II., in 1664, two years before the fire. Letter-books, Journals of the proceedings of the Common Council, *Remembrancia*, and Repertories complete this interesting series of civic monuments.

In 1869, Dr. W. Sedgewick Saunders brought the subject of the library before the Common Council. A committee was appointed by that Court to deal with the subject, and the result has been already described in our pages. A reference to earlier volumes of the *Builder*, would show how we, at various times, when the existing library was little known or thought of out of doors, brought it to public notice, and urged the want of better premises.

However, never mind that now. Our present object is to speak of one particular feature of the exhibition only slightly referred to in our account of the opening night.

The whole of the museum proper is lined and filled with a series of drawings in pencil and in water-colour, prints, and woodcuts, illustrative of the topography of London. The number printed in the catalogue as that of these objects is 1,390, but three or four separate views of ten come under the same index number. These exhibits are the contents of only four out of eighty portfolios which have been thus filled by Mr. J. E. Gardner, who has devoted the leisure of his lifetime (and something less readily attainable than leisure) to their collection, arrangement, and illustration. All refer to the topography, the history, the architecture, the antiquities, or the manners and habits of London.

Fortuno has favoured Mr. Gardner in one respect. The period during which he has been collecting the materials for an exhaustive history of London has witnessed the sale of the great collections of the latter part of the eighteenth, and the commencement of the present, century. The Strawberry Hill collection has been brought to the hammer; so has the Stow collection; so has that of Dr. Wellesley. At these, and numerous other sales, Mr. Gardner was a judicious and fearless purchaser. He has thus not only become the possessor of many prints that are unquestionably unique, but he has based the completeness of his own collection on an accurate knowledge of those that preceded it, which have thus furnished him both with ready-collected matter, and with indications of all that was accessible, or known, down to his own period.

While the lover of engravings, and the collector proper, will linger over the stained and gilded sheets that represent some otherwise extinct work of the burin; and while the lover of antiquities, the historian, or the moralist will take most delight in the satirical and comic prints that scoured the follies of the day, we are much disposed to think that the highest service rendered by Mr. Gardner to the history of the metropolis has been the formation of the series of sketches in pencil and pen-and-ink, and water-colour drawings, which have been taken by his direction and at his expense; and

which now form the only records of much of ancient London that is swept from the surface of the earth. These views are of various descriptions, some picturesque, or giving the general effect of ancient streets, alleys, and squares; some architectural, giving details of many Gothic arches, shady cloisters, massive crypts, well-proportioned towers, and hospitable halls, now destroyed; some full of decorative detail, of pargetted ceiling, or quaintly-carved canopies. The cost of this great work (like that of the far less useful hobby of Louis le Grand), the collector has concealed even from himself. But those who know how readily ten, twenty, or a larger number of guineas are obtained for a few square inches of paper, so that it be marked with a rare impression, may form the notion that the collection, and the creation, of some 40,000 illustrations of the history of London, must have demanded a considerable outlay of capital.

The prints and drawings exhibited have been selected as illustrations of well-known portions,—at least of portions that, until now, would have been called well-known,—of the City, of Southwark, and of Westminster. The first group consists of spots that are passed in a walk, starting from East Smithfield, taking the leading thoroughfare to Temple Bar, through Fleet-street to Whitechapel; and thence by Bishopsgate. Starting again from Temple Bar, the course of the illustrator is by the Strand to Millbank and Lambeth, and by the parks to Piccadilly. The Southwark ramble leads by the High-street to St. George's Fields. We commence a notice that must of necessity be disproportionately brief, at the Tower.

From the large group of drawings illustrating the topography of this locality, a portion of which only were sent to the Guildhall, the architectural history of the Tower may be traced in a manner of which written accounts give but little idea. Much that is now swept away is to be found recorded in these prints. There is a view of the Traitor's Gate, as it must have appeared to many an illustrious captive on landing from the Thames, that is worthy of the ominous name. There is a south-east view of what was known as the *Castrum Royale Londinense*, taken A.D. 1560, with a plan of Tower-hill. This is a drawing. It is accompanied by an engraving from the same, denoting the White Tower, as erected for the Conqueror by Bishop Gundulph, in 1078, and strengthened by William Rufus in 1097. There is "a true and exact draught of the Tower Liberties, surveyed in the year 1597 by Gulielmus Harward and J. Gascoyne," and reprinted by the Society of Antiquaries in 1712. There are pencil drawings of the celebrated canteen, called the "Stone Kitchen," and of the "Golden Chain"; both now demolished. There is a ground plan of the fortress, by Lempiere, in 1726. There is a view of the gateway chamber where the young Princes were murdered. There is the room where Anne Bolyn was confined, and a *fac simile* drawing, followed by an engraving, of her autograph. There is an original drawing of the breaking into the strong-room by the notorious Colonel Blood, with an engraving of that ruffian's portrait. There is another view of the breaking into the strong-room on the night of the fire, October 30, 1811, and of the removal of the Regalia, with several engravings of the conflagration on that night, and of the ruins of the long armoury, as they appeared afterwards. As a contrast to these dismal and gloomy scenes, we refer to a quaint view of the Sailors' Cavalcade, conducting to the Tower the thirty-two wagons loaded with treasure taken by Commodore Anson from the Spaniards in 1744; in which ten lines of laden trucks and shouting citizens cross and recross the page from right to left, something after the fashion of the Assyrian processions in the British Museum. These are but a few out of the illustrations named on three pages of the catalogue, which again form but a part of this single chapter of Mr. Gardner's illustrations of London.

In close proximity to the Tower of London nearly four pages of catalogue are filled by the list of various views of the secular, though irregularly returning, Festival of "Frost Fair." This extraordinary jubilee is held on the surface of the Thames whenever an unusually hard winter renders the thing feasible. The first of those illustrated in the Guildhall is that in the winter of 1683-4; the second in that of 1715-16; the third in 1789-10; the fourth in 1814. These most interesting prints partake of the nature of the marvellous; and are the precursors of the

sensational penny literature of to-day. Then we come to the history of St. Katharine's Dock, to the elevation, the plan, the interior, and other views of the church pulled down, and re-erected, in name and in form, in the Regent's Park; a drawing of the excavation—the progress of the works; in short, turn where we may we find the same order, far-reaching, exhaustive illustration. As to London Bridge, the series of views extends from the old, many-arched structure, with more pier-surfaces than water-way, and the ancient chapel and gate-house on its surface, to the opening of the present bridge. Many of these drawings belonged to the great engineer Rennie, and their professional value is hardly less than their topographical importance. The narrow passages between the great boat-shaped staircases of the early bridge must have made the edifice, at low water, the scene of a terrific current. Some of the views represent the first widening of the water-way, by the removal of a pier, and the substitution of one arch for the former two.

We have not space even to glance, on the present occasion, at the remainder of this interesting series. We have mentioned one locality alone. The imagination is actually oppressed by the magnitude and the completeness of the collection. How is it to be secured to posterity? How will the City of London endeavour worthily to honour, and sedulously to preserve, such a memorial of her history, from the time when her sons first learned the art of engraving?

CONCRETE BUILDING.*

I PURPOSELY refrain from attempting any description of the various forms of moulds or machinery for forming concrete walls; each practitioner has his own invention,—most of them patented,—but one and all answering the old description, "The one is as good as the other, and a great deal better too," if we may judge from the puffing advertisements that meet one on all sides in the professional prints; but if it be desired to act without having recourse to any of these patentees, I would recommend the following course to be adopted:—Provide a sufficient number of stakes of squared timber, say 4 in. by 4 in. about 3 ft. long, tapered and sharpened at one end; having excavated the trenches ready for putting in the concrete for the footings: before doing so mark out by lines the thickness of the walls plus twice the thickness of the planking necessary to form the wall moulds, and drive the prepared stakes into the ground hard enough to keep upright during the filling of the trenches, and at such places, at angles, and along the length as will be convenient for the future uprights to support the planking. If necessary, the width of the footing may be increased where the stakes occur, in order to surround them. When the stakes are withdrawn after the footings are set, there will be a set of sockets provided, into which posts of the same scantling may be set; these can be easily plumb and tied together on top by ropes or bands of iron or strips of timber. Then it is only necessary to slide in planks, and the mould for the wall is complete. To keep the planks apart, cross pieces of the required length can be jammed between them, and removed after the intervals between them have been packed with concrete. Such an apparatus can be prepared anywhere, and worked by any one who can use a plumb-line.

We next come to the formation of the openings. If a mere hole in the wall is intended, a core, solid or hollow, will be inserted of the proper size and at the proper level; and, in building with concrete, every hole must be foreseen and provided for beforehand, whether it be for drains, air, water, or gas-piping, or tubing for bells: after-boring must be avoided as far as possible. For openings intended to be filled in with windows, doors, or grates, frames or moulds must be made of the shape and size of the interior of the opening; these need not be of the whole height, as they can be raised from time to time until the proper height is attained, and in this way one mould would suffice for several openings of different heights, so long as the width and form of head were the same: thus, if the windows are segment-headed, and the same width in all the stories, but varying in height,—say 7 ft., 6 ft., and 3 ft. 6 in.,—if the mould be made to fit the upper two first it can be used for all; and in the same way with doors,—no lintels

will be required in concrete building, because it forms its own lintels, and requires no arch over it. And here let me call your attention to an ancient example of concrete lintel given by Viollet le Duc in the *Dictionnaire d'Architecture* under the article "Béton," p. 206, vol. ii.:—"We saw in the castle of the city of Carcassonne windows and doors of the end of the eleventh century, the lintels of which, of considerable bearing, are formed of concrete run in a mould. The lintel is of concrete of extreme hardness, and we have not seen one of them broken by the loading, which, however, is considerable." He adds in a foot-note:—"The shaft which divides this window into two parts is of white marble from the Pyrenees, as also are the base and capital; the jambs and second lintel are of green sandstone. The constructors thereby have admitted that a piece of concrete was less fragile than the natural stones, when supported only at its ends, and loaded in the middle. This lintel is only 9-84 in. thick, with a bearing of 3 ft. 74 in., and a breadth of about 11-8 in." The floor girders rest immediately on it without any intervening wall-plates. This example is of great importance as giving confidence in the right use of the material.

All frames must be made without joggles, because it is evident that if the horns or joggles are left on they must be bedded in the work as it proceeds, and any after repair would be very difficult.

For fireplaces and chimneys, the breasts as far as they will should be constructed in the same manner as the ordinary walls. A simple mould of three planks will enable the opening to be formed up to the arch; this and the guttering should be formed in one mould of sheet iron or zinc on a timber frame somewhat similar to those very admirable articles made of terracotta, and queerly named "oncorns" by the Scotch manufacturers. A timber drum, about 2 ft. long, with a handle for drawing it up, will serve as core to the flues, which cannot by this means of building be left foul or gutted too quickly. Almost any amount of corbelling can be done most easily and economically with concrete, and fireplaces can be put in positions that would be considered impossible in ordinary building; flues can be left for ventilation also with great ease. The only precaution which I would recommend is not to carry ventilation flues up to the top of a chimney-shaft, but to give them outlet just over the roof at the bottom of the shaft, so as to avoid return smoke, the nuisance of which is a very dear price to pay for ventilation. Outside the roof preparation should be made for fixing the flushings by bedding thin laths of deal in the course they are intended to take, which when withdrawn will have a groove into which the lead can be pinned. All offsets and the top of the shafts must be left rough, and afterwards moistened and finished with fine cement mortar, well trowelled and sloped to throw off the wet. I would recommend also to bed on top of each flue a length of fine-lining, projecting about 4 in.,—it will arrest the draught, and save the arrises round the flue from wear and tear.

No wall-plates, tassels, bond-timber, or any such thing must be bedded in concrete walls. The plates for the roof will be bedded on the walls, and all those for carrying floors on corbel courses of concrete, which can be easily formed by attaching a mould of the shape and size required to the face of the wall at the proper height, and can be afterwards covered with plaster so as to form a cornice to the room. For security, the joists should be trimmed to the size required. A strong fillet of deal should be fixed against the inside face of the joists, with rough boarding thereon sufficient to bear the weight of the concrete until it sets. The box thus formed should then be filled in with concrete extending to the back of the fireplace; and by finishing the surface with fine stuff, well trowelled on the face, you will have trimmer-arch, hearth, and back hearth all in one solid block, and perfect security against fire. This operation had better not be done until the floors are laid. From what has been stated, there will be no difficulty in constructing any portion of a building which may not have been described, hearing in mind that any width of opening can be spanned without lintel or iron arch-bar, and that all idea of spreading may be left out of the calculation of the jambs; it is only necessary to give them mass enough to sustain the load pressing vertically upon them. There is no lateral pressure, provided the mould is kept up until the concrete has consolidated. In all building operations

* By Mr. J. H. Owen. See p. 568, ante.

over-haste is the evil of the day, and this is specially dangerous in concrete building.

It may be convenient now, before passing to what is usually out-stone work, to describe the nature of the materials. For the sake of economy, I have recommended a mixture of air-slacked lime with the cement in the foundations, but in the shaft walls cement only should be used. It should weigh not less than 112 lb. to the imperial bushel; if much lighter than this it cannot be depended on, and should be rejected. It will be safest, I think, to adhere, for the body of the work, to the same proportions as given for the concrete in the foundations—1 to 7,—but finer stuff should be used for some purposes: thus for forming the quoins, the angles of jambs and arches, a mixture of 1 to 3 or 4 should be used, rejecting the coarser materials. This fine stuff will take a sharp aris from the mould, and retain it, and save a good deal of time in the after-finishing. All corbeling, and wherever great strength is required, should be done with oven finer stuff, say 1 to 2, as the strength of the mass decreases very rapidly with the increase of the quantity of sand or gravel, and for this reason I would not recommend the common practice of inserting in the heart of a concrete wall lumps of stone; it should never be done where strength and coherence are of importance.

Now, as regards the out stonework. Suppose that a wall is to have a foot not boarded, and steps that would be stone ordinarily, the proper course will be to fill to within 3 in. of the finished level with any dry rubbish, level the surface, fill in with concrete, and float it over to the required level, and finish the surface with fine stuff, placed in a thin coat over the moistened surface of the coarse concrete, and continually trowelled until it is quite smooth and hard. The steps must be formed one by one, by fixing a board of the required height where the face of the riser will come, filling with fine stuff against the face of the board, and beating with coarse stuff. The upper surface would be finished with the floor. If a flight of steps is required, they may be constructed with perfect safety, attached to the wall only on one side, if required, and of any projection, varying the thickness of material in proportion to the work to be done. The steps should be formed simultaneously with the walls, but of the finer material, say 1 to 2. The mould would be constructed of a soffit of timber planking, securely fixed, as it will have great weight to bear; a timber string at the end of the intended projection, and a movable board of the size of the face of the riser. This movable board will be fixed in its place for each step in succession, from the bottom to the top, each in turn being the foundation of and incorporated with its successor, so that the final result is not so much a set of individual steps, but one continuous mass with steps notched out of it. There is no difficulty, except in the case of windows, where the moulds of the soffits will be of some expense and trouble, but, of course, infinitely less than carving out each separate stone. The soffit-mould, in this case, may either be made of heavy boards, bent to the shape, or a rough stage can be erected and a solid core formed by building with half-mortared rubble up to the shape, and grooving over with mortar. By this means great accuracy can be attained, and a surface of paper spread over the plaster will prevent its adhering to the concrete, although it would be no great matter if it did, as the soft mortar could be very easily removed.

As regards window sills, it may be asked,—why have them at all? But as this may be considered an unsatisfactory mode of getting rid of the subject, it may be as well to provide for them. In building the walls, the bottom of the opening left for the window should correspond with the bottom of the sill; and in proceeding to form the sill, a board should be fixed so as to form the rim of the inside face, and a mould should be made in the form of a box with a bottom, and one side and two ends, on the bottom a fillet should be fixed to form the throating. The box, when fixed in its place, would be filled, and the upper surface formed by securing a mould formed to the shape along its length just as an ordinary cornice. All cornices, eave, string, and barge courses would be treated in a similar manner; but it should be matter of consideration whether the finishing of all continuous moulded faces would not be executed more cheaply if run in the ordinary way than by casting in a continuous mould.

In building the walls, projecting corbel courses have been left all round them. On them the tassels will be laid, and the joists on the tassels.

On the upper surface of the joists I would suggest that a fillet should be fixed of the same thickness as the floor, and that then a skirting of cement should be run round each floor. My reason for this is, that it obviates the necessity for inserting plugs for fixing timber sheeting. The inner face of the walls may be either skimmed over with lime-putty or whitewashed; the outer face coated with a very thin coat of fine cement, or tinted with a cement-wash; the ceilings and floors would be treated in the ordinary way.

As regards the mode of roofing, there is no necessity for any variation from the ordinary mode; but if it is desired to have a very cheap form of roof, I would recommend the following, of which I extract the description from a treatise on Portland Cement, by A. Lipowitz:—

"1. The inclination of the framework of the roof (which must have an even surface) should be at the rate of $\frac{1}{4}$ in. or $\frac{3}{8}$ in. per foot. The rafters or joists should not be more than 2 ft. 3 in. apart, so as to give sufficient strength. Boards of 1 in. or $\frac{1}{2}$ in. are fastened on the rafters, and should be rebated. These are then covered with a layer of sand $\frac{1}{4}$ in. or $\frac{3}{8}$ in. thick, to produce an even surface.

2. Strong brown paper, in continuous rolls, and as broad as possible, is then laid upon it so that each length overlaps the other by about 4 in. When the whole or a large part has thus been covered with paper, the mixture is put into a cauldron, in the proportion of 100 lb. of tar to 180 lb. of Portland cement. Care must be taken to heat the tar gently, and to mix the cement with it gradually, in order to prevent its boiling over. This mixture of tar and cement must then be laid as hot as possible on the paper with a tar brush. The next layer of paper is then laid on, and smoothed with a light wooden roller. In this way the whole roof must be covered. In order to break the joints of the paper, begin the second layer with half the breadth, and proceed as before. The third and fourth layers are in like manner laid with alternate layers of the mixed cement and tar and brown paper.

The last layer must be carefully covered with cement, and then strewn with sifted ashes to the thickness of $\frac{1}{2}$ in. Next to the gutter is a board covered with zinc, and projecting about 2 in. It should be laid on after the second layer has been completed, so as to be covered by the third and fourth. If there be any chimneys projecting through the roof, they should be surrounded with zinc, immediately after the first layer has been finished, and before the gravel is strowed upon it. This zinc should rise 6 in. up the sides of the chimneys, and 3 in. upon the roof; the upper edges should be bent, so as to be let into the joints of the brickwork, where they should be carefully fixed with cement.

3. The whole is then finished with a coating of sifted gravel containing about one third of dry loam truly levelled with rakes and scrapers.

This work should not be attempted in rainy or frosty weather.

The workmen should wear very light boots, or better still, none at all; and should always stand on thin boards when working at the roof.

The advantages of this system of roofing are:—

1. A smaller quantity of wood is used.
2. The roof, being flat, gives more room in the upper floors of the house.
3. It is more convenient for constructing garrets.
4. Protection from external fire, and affords easy access to firemen.
5. If properly constructed, these roofs never require repair.

Several roofs at Heischberg, in the Reisinger-gebirge, constructed on this principle, are now twenty-two years old, and have never been repaired.

I have tried this mode of roofing myself, and have every reason to be satisfied with it. It is, of course, much cheaper than the ordinary roof. The imaginary house is now floored and roofed, but it still remains to fit it with doors, windows, grates, and chimney-pieces, shelving, rails for hanging up clothes, and the innumerable sort of things comprehended under the title of fittings. All these must be carefully borne in mind, and provided for beforehand. The walls are like cast iron; they do not admit of the rough-and-ready driving in of plugs wherever a carpenter fancies, for preference into a fine, if it is at all possible to do so. These walls can only be pierced with great difficulty; the place of all those things must be fixed beforehand, and while the walls are in building swallow-tailed plugs of

dry wood must be built in for the purpose of fixing them; and that there may be no mistake, every bit of carpenters' and joiners' work should be delivered on the ground before the walls have got many feet high; and if the plugs are placed in the right position, there will be no difficulty in fixing any of the joiners' work, except the door and window frames. This, I think, can only be properly secured by confining them in their places by jamb-linings and architraves, which are themselves securely fixed to the plugs.

I think there remains nothing more to add as regards the use of concrete in ordinary houses; one built as I have been describing would be cheap, durable, quieter than one built of brick or stone, safer as regards fire, and free from rats and mice and other vermin. I propose to continue this paper by a consideration of the subject of fire-proof building in general, the special advantages attending the use of concrete, the modification of the ordinary mode of using concrete, and the materials of which it is composed which should be adopted in fire-proof buildings.

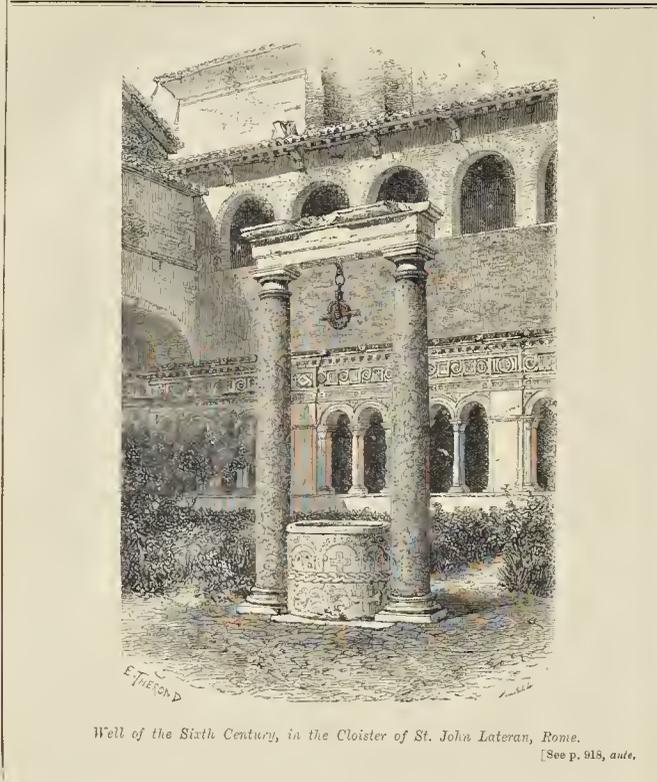

PROFESSIONAL PRACTICE.

At the last meeting of the Architectural Association, on Friday evening, the 15th instant, a lecture was delivered by Mr. T. Roger Smith on "Professional Practice," being the introductory lecture to a course open to members of the Association, to be delivered on certain Monday evenings during this and the two following months.

Mr. Smith began by showing that actual practice of a profession is the end properly looked forward to during all preliminary study, and that a clear vision of the requirements of active life should be had, if possible, from the beginning. Then each step taken may tend more directly to the wished-for goal, when practice and thorough fitness for it have been arrived at together. The profession of architecture, in the form it has now taken, has been the product of what we call the accidental course of events.

Ships and machinery are brought into existence without the intervention of professions distinct from the trades, and it might have been possible that, for buildings also, the design and the execution should have fallen into the same hands. Indeed, a large proportion of the buildings actually erected are carried out without architects,—probably, half of the buildings in the metropolis, for instance; and they do not tumble down. Architects would seem thus to be universally-necessary outcome of human life. Work can generally be done without them, provided that it is common-place enough not to call for the use of special taste, skill, and experience. When these qualities cannot be dispensed with, the architect called in should be able to put them at the service of his employer, and complete his work so as to justify the impression that the buildings thus originated and controlled have been ably and wisely (1) designed, (2) constructed, and (3) conducted. In all, the architect is the representative of his client, doing for him what he is unable, or unwilling, or not anxious to do for himself; and it can only be by the exhibition of the results of special training, showing complete adaptation to the work, that the profession can justify its separate existence as at present, or its professors look forward to a sound and lasting future for their occupation. Though a model architect is, perhaps, as rare as the phoenix, it is quite possible to see what, at the present time, he should be, and to indicate how nearly any one *must* approach this standard in order to avoid entire or partial failure. To make clear to pupils and young men in the profession the nature of this standard in some detail,—affording them an exposition of the matter not hitherto attainable in a definite form, and quite out of reach of many,—will be the purpose of the lectures to which this is to form a general introduction.

1. As to design. The art qualification needs little insisting upon, and is really a great subject by itself. Here as elsewhere, study and pains are all-important. Many men of promise have been ruined at the beginning of their career by premature success and unwise praise. In this section of the architect's work, the temptation to the clever draughtsman to confine himself to the art of pleasing on paper may be too strong for the sober teaching, which points to the building as his real work, and as the true test of his skill. Beyond and before the consideration of this hearty or fitness of decorative form, is the question of fitness for practical

Well of the Sixth Century, in the Cloister of St. John Lateran, Rome.

[See p. 918, ante.]

needs,—the proportioning of each part of a structure to its special use,—the subordination of each part to the general use of the whole building,—the exercise of a fertile contrivance in reconciling with good judgment and good taste at times apparently conflicting directions and demands. For this kind of work effectively performed, an architect must be trained to grasp many details, and, as a simple, necessary preliminary, to hold numbers of such details in his memory. The sizes of doors and windows, room proportions, arrangements of ranges and stoves, spaces in stables, how a carriage will stand in a coachhouse, the position for a grand piano,—these are a few samples of a large number of very elementary facts which the architect must fix in his memory and imagination, in order to recall them without effort in the process of design. Special knowledge of buildings constructed for special uses, is another necessity of the thoroughly competent architect. The principle of the design,—the key of the plan,—should be acquired for most of various classes of buildings. For instance, the shape and position with relation to each other of the wards of a hospital once understood, the details of such buildings group themselves round this key idea in further studies, and radical failure from want of clear perception of the ruling principle becomes impossible. Though an architect may not often run risk of depreciation, because he has not seen out-of-the-way buildings for special uses,—he will contend, if he neglects such guidance from experience, at great disadvantage with others who systematically familiarise themselves with the principles and details of all original structures, demanded by the ever-shifting forms of our social system.

2. As to skill in construction. A young architect cannot, safely and wisely, plead ignorance or inexperience in the case of things going wrong. He must counterbalance his inexperience by taking great pains. Practice is said to make perfect in other things, but in building an architect is supposed to know all about materials and the putting of them together before he begins practice—any want of pains and care may lead to great risks; architects have been tried for manslaughter, and otherwise more or less justly

sought after legally on account of errors of judgment or non-detection of the misdoings of others. Knowledge of structural science,—or, at the least, a good confidence as to being readily able to get at the right sources of information when required,—this must be had, and no little insight and knowledge,—in any case enough to enable a reliable judgment to be come to on the spur of the moment,—as to the fitness or the reverse of most building materials. The building materials of special localities may be the subjects of particular investigation on occasion; but the principles on which judgment of them should be founded, and a fair amount of real experience of their characteristics, should be more frequently obtained by students than has in many cases been the rule heretofore.

3. Business qualities. A good man of business will be honest, systematic, and courteous; and possess some amount of tact. He will be dissatisfied with himself if the builders' tenders far exceed his estimate. He will adjure utterly the detestable practice called "leading a client on." He will be trustworthy,—because he will have the courage to tell unpleasant truths when they must be told. He will have the indispensable habits of steady labour and punctuality, and a knowledge of good precedents for all formal matters; and will rarely dispense with such precedents or any punctilio recognised by custom as serviceable for record or against contingency. These business details form, in fact, the large bulk of the hidden part of "professional practice," transacted in the private rooms of architects or kept to themselves; these reach only very imperfectly even the best trained pupils; and each man has often by painful experience to acquire for himself a method of conducting business. This, the lecturer said, he desired to remedy to some extent, wishing to make a beginning on a subject which the committee has often considered without seeing their way to introducing it as part of the regular training obtainable by and in the Association. Temper and mischance are the real causes of many failures. An architect will, therefore, always show full self-control, though he may not deem it necessary to wholly suppress the manifestation of high temper. Much of the

work of the architect has little connexion with the direct putting up of buildings, and many of the qualities thus suggested as being desirable in him are really quite as necessary in many other occupations.

Mr. Smith then proceeded to notice the system of payment, a system roughly adjusting the pay according to the relative importance of buildings, and regretted its occasional results,—such as correspondence and interviews out of all proportion to the remuneration: the Gs. Sd. of a lawyer actually checks the eagerness for information by letters, and perhaps also adds weight to the words therein. In fact, the profession is not a lucrative one; partly because there are far too many men in it, and partly because the putting up of a new building mostly occurs only once, if so often, in a lifetime. Thus the bulk of the work requiring skilled direction is always limited, and not uniformly diverted towards the profession. This makes every possible extension of legitimate practice desirable. Taking out quantities, managing building estates, valuations, district surveyorships, are examples of such extensions; and for such work, often most valuable to clients or to the general community, special training is a matter of necessity. The moral throughout is that an architect is made,—not born. The highest eminence is to be won by no single step, but by patient, continual climbing. Work,—work,—work,—well directed and persistently carried on,—will train latent powers, and enable a man to take a position well worth working for—a position in which he will be able to use all his attainments and acquirements in turn and to the full; in which matters of vital importance to others are trusted confidently to his care; in which his advice is sought as well worth the having; in which a large part of the work of his life will have a real permanence; and, giving to that work a charm belonging to little of the work of many other professions, he will have the task and the self-training and pleasure of dealing with and directing at one and the same time men and the forces of nature.

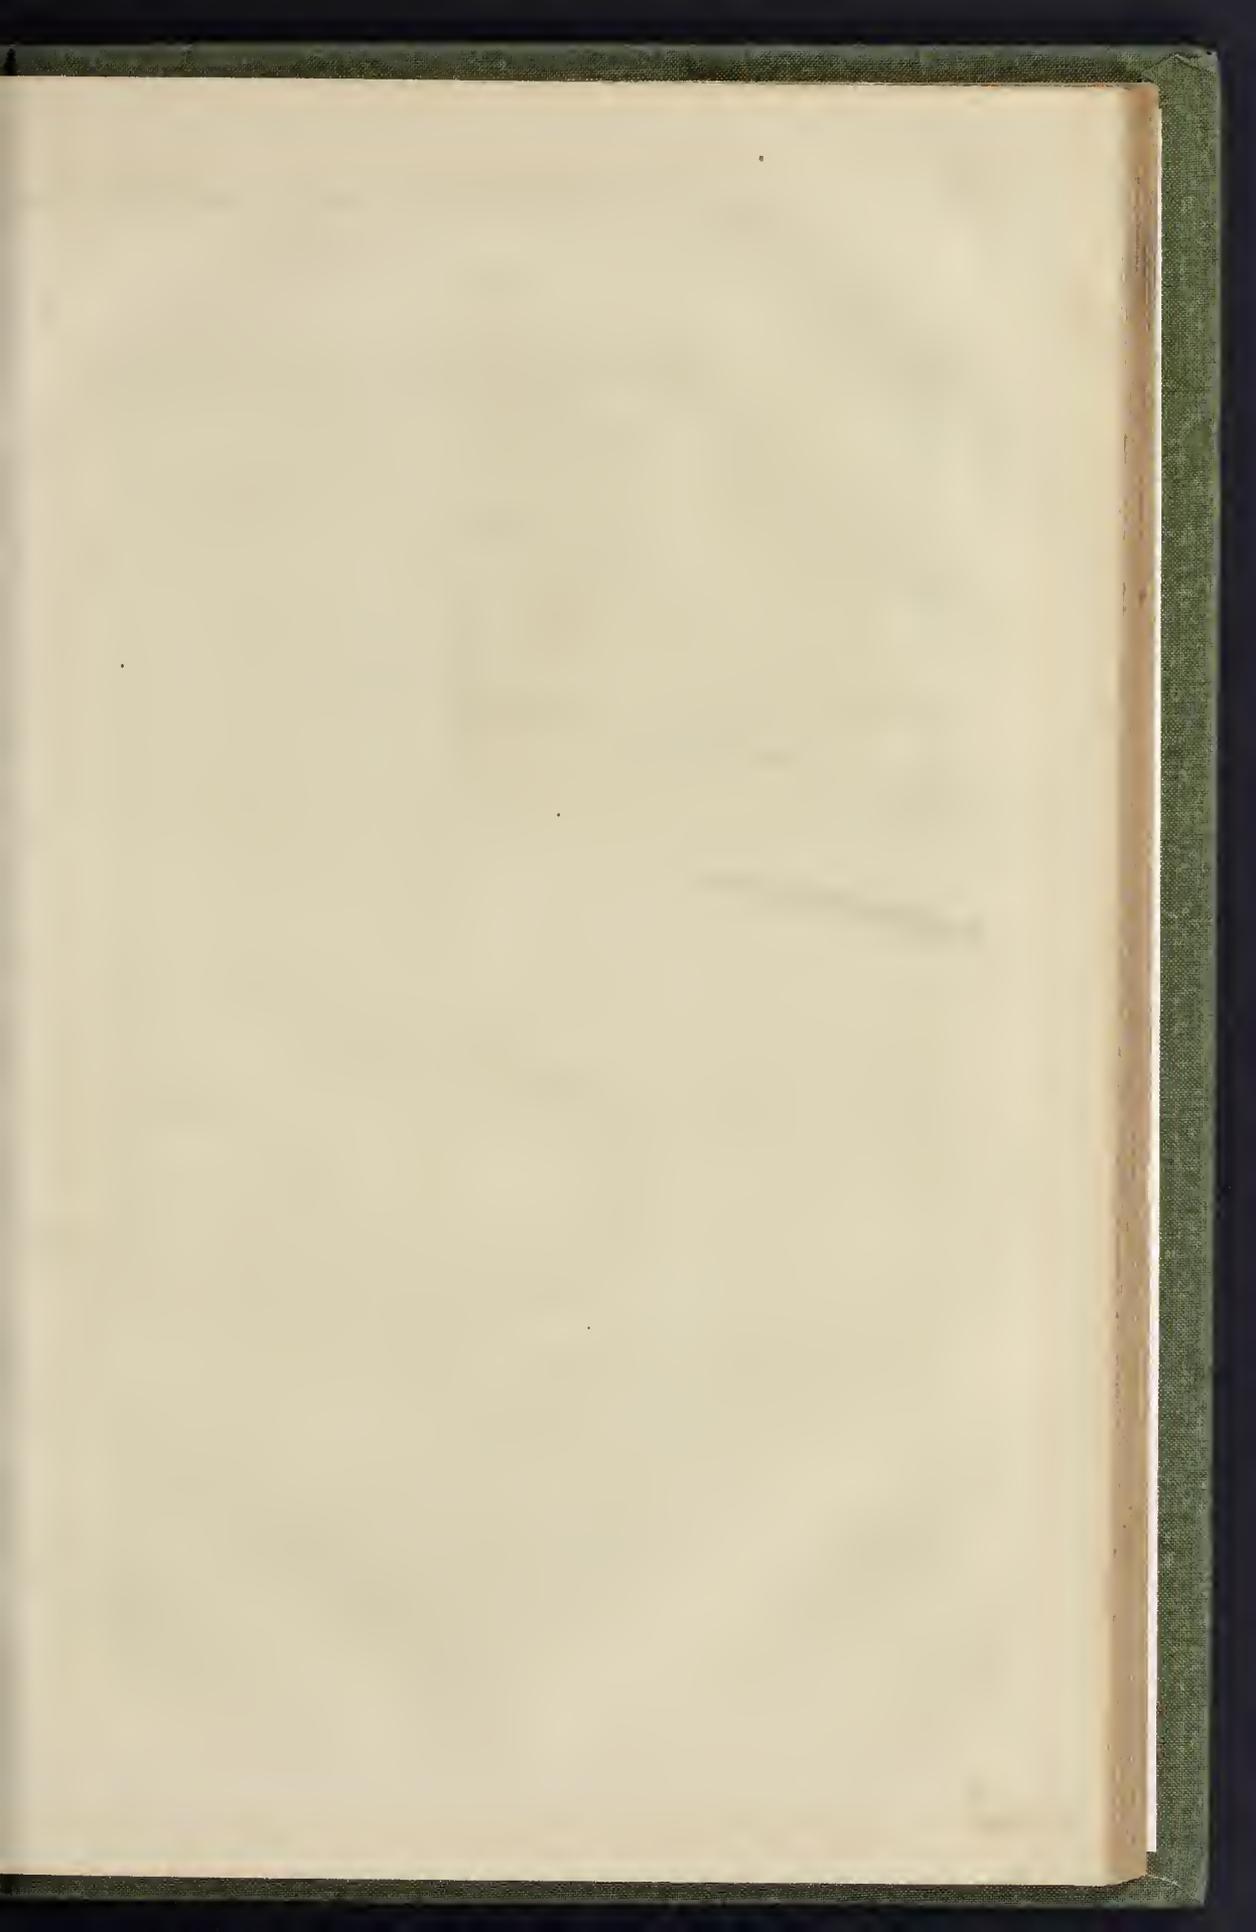

ST. GILES'S CHURCH, DURHAM.

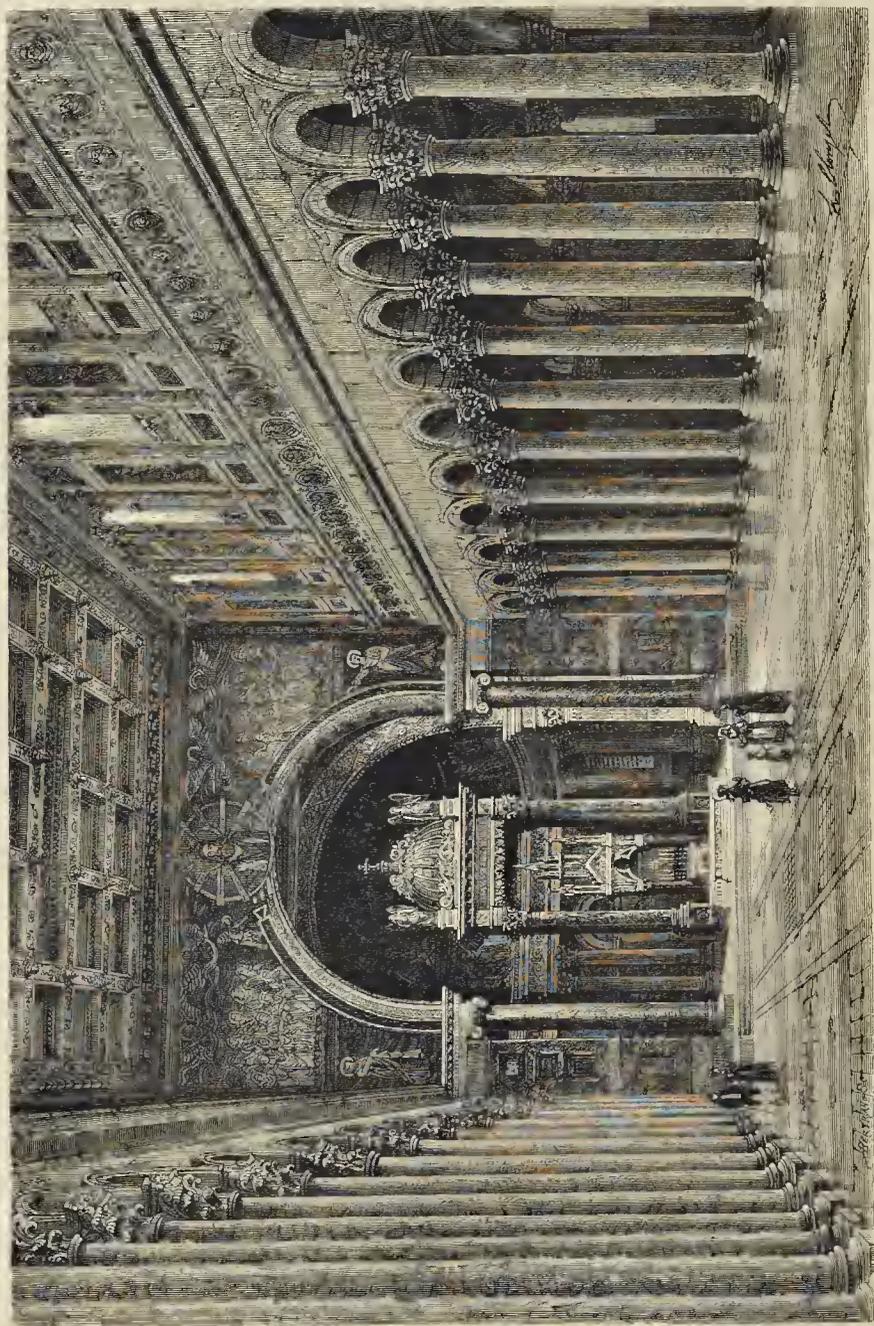

LAST month the Architectural and Archaeological Society of Durham and Northumberland took into consideration a scheme, of which the society had heard, for the partial or entire demolition of St. Giles's Church. The meeting was unanimous in disapproving and deploring the proposed plan, and appointed a select committee, with instructions carefully to examine and report upon the building, historically and architecturally. The committee was further instructed to suggest a plan by which, with the least possible destruction of the existing fabric, the required increase of accommodation could be most effectually provided. The committee so appointed has just now issued their report, the purport of which may be gathered from the concluding paragraph:—

"We cannot, however, take leave of a building so intimately bound up as it is with the ancient history of the Bishopric, and so full of interest, alike to the architect, the antiquary, the historian, and the citizen of Durham, without expressing, most respectfully, but most earnestly, our protest against its contemplated destruction. We trust we have shown that demolition is wholly unnecessary. It would involve a grave and, we believe, needless expense; whilst it would obliterate from the city an ancient building, which is next, after the cathedral (with the history of which its own is curiously and closely parallel), the most conspicuous and venerable in the city. We hope that those who are entrusted with the alteration of the church will give a thoughtful and serious consideration to the statements which we have made, and will hesitate in prosecuting a scheme involving the destruction of a church, which, from its connexion with the history of the old Palatinate, has so strong a claim on the city and county of Durham."

We add our voice in deprecation of the proposed destruction of this ancient and interesting building.

Halifax.—Bursting of a Mill Dam.—On Monday evening last week a dam in connexion with Lily-lane Mill suddenly burst, and the whole of the houses immediately below the mill were inundated. The mill adjoins the Lancashire and Yorkshire Railway, near the Halifax Station, and the line crosses the front of the mill on a viaduct. On the upper side of the mill were two dams, and works were in progress between these dams and the mill for the erection of a shed, and it is supposed that the excavations for the foundation of one of the reservoirs, which was about 12 yards square, and 6 ft. deep,

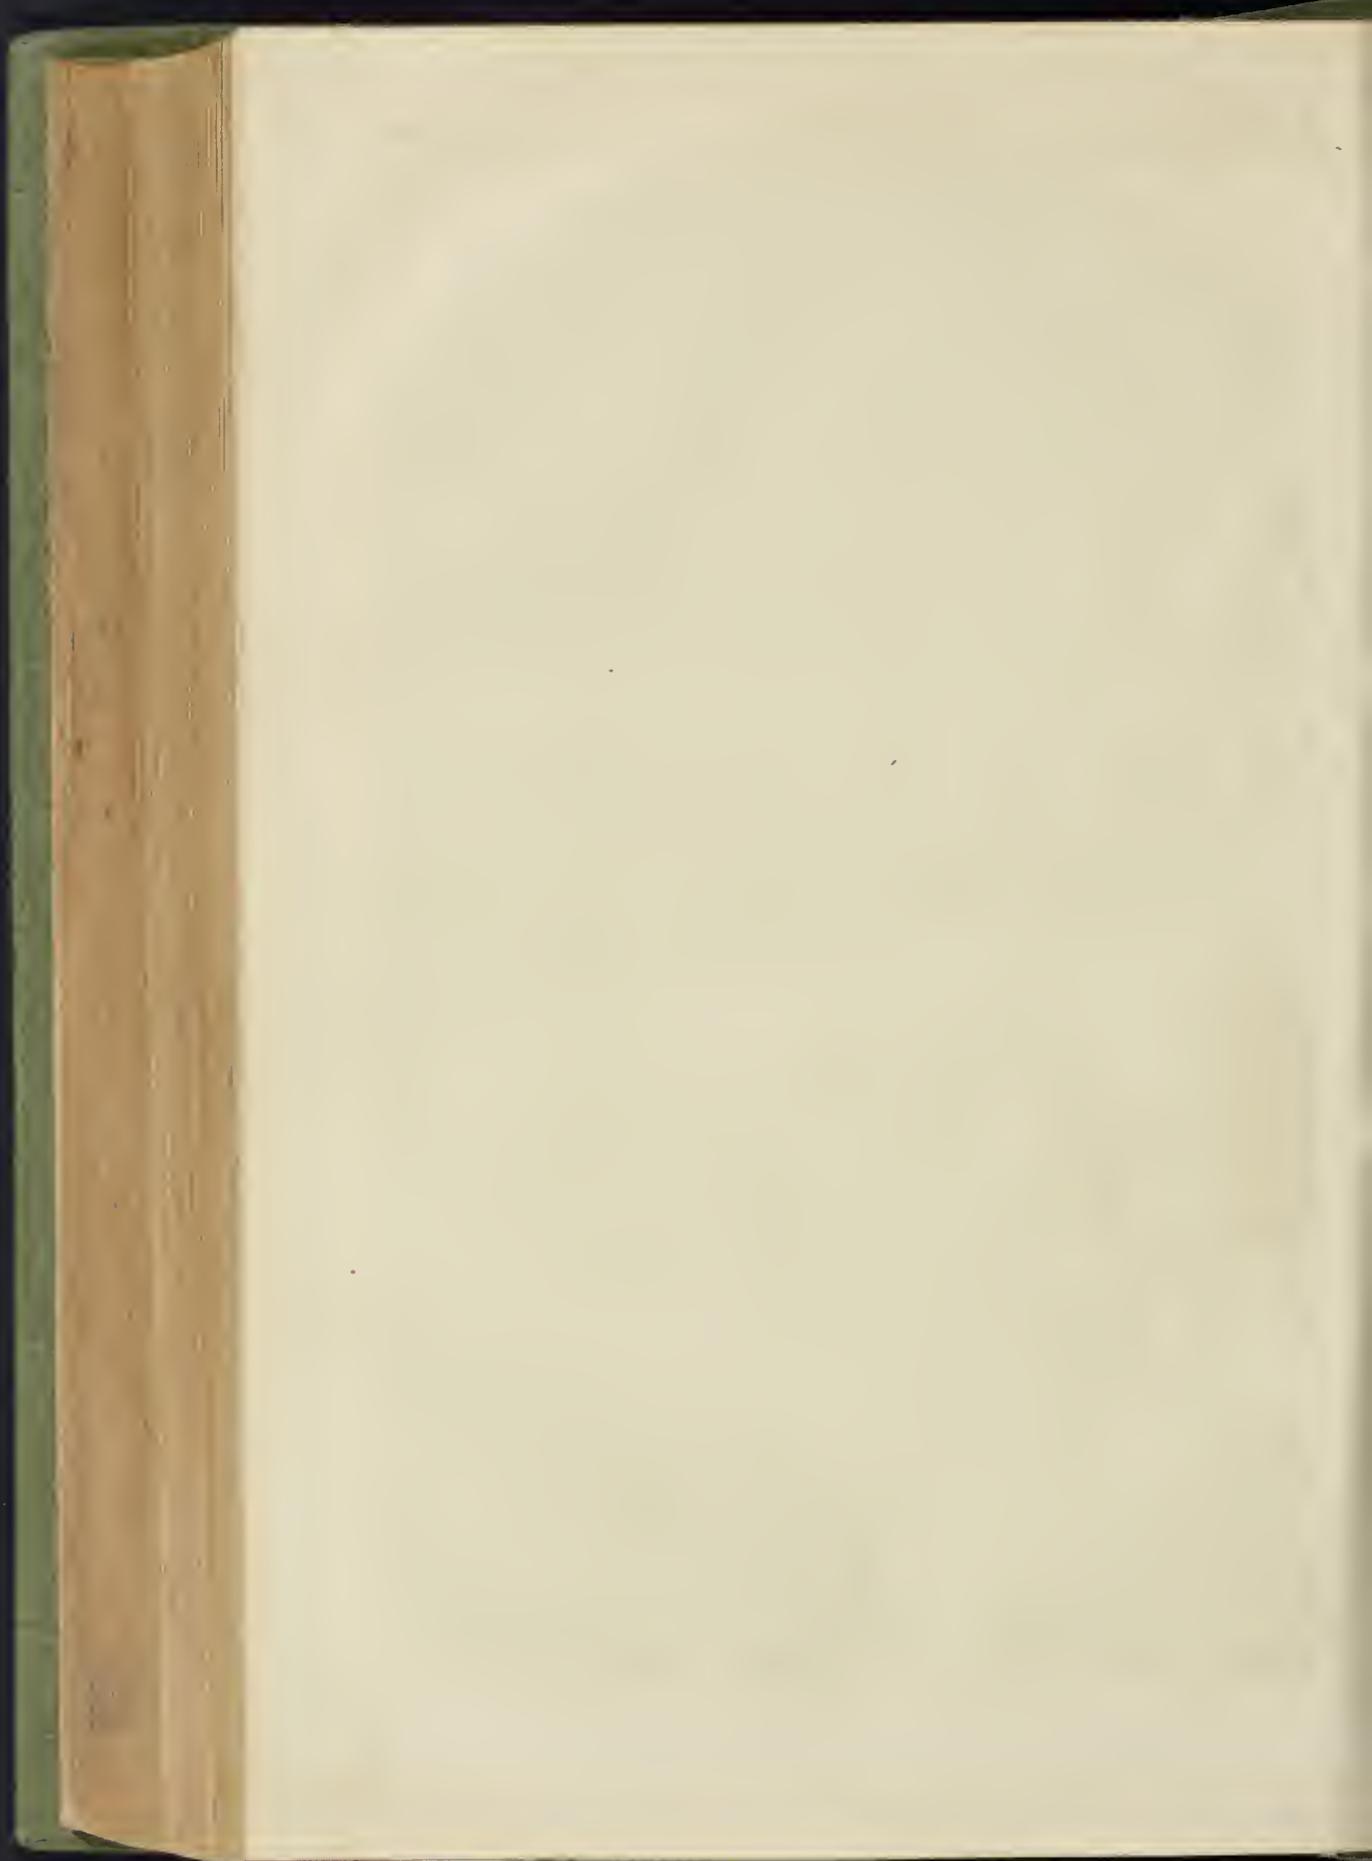

CHURCH OF ST. PAUL, EXTRA MUROS : ROME.

[See p. 913, ante.]

CHURCH OF ST. MARY ABBOTTS, KENSINGTON.—SIR G. G. SCOTT, R.A., ARCHITECT.

KENSINGTON NEW PARISH CHURCH.

In our volume for the year 1870, we published a view and the plan of the new church, then just commenced, for the parish of St. Mary Abbots, Kensington, from the designs of Mr., now Sir, G. G. Scott.* Since then, the nave, aisles, transepts, chancel with its aisle, the lower stage of the tower,—in fact, the whole church, except the upper stages of the tower, fittings in the nave, the reredos, pulpit, and lectern,—have been completed. We now give a view of the interior, looking east, and including the probable reredos. The cost to the present date has been about 23,000*l.* A special fund is being raised to complete the tower and spire, and the aid of all able to assist is urgently invited.

A fine organ has been built by Messrs. Hill & Son, at the cost of 1,500*l.*, provided by a separate subscription.

The church is calculated to afford sittings for 1,600 persons, including children.

THE BUILDING OF THE GLOBE BRIDGE, AT PECKHAM.

WITHIN the last fortnight, the Camberwell Vestry, for whom the Globe Bridge across the Grand Surrey Canal, in Commercial-road, Peckham, is in course of erection, have been engaged in prolonged and excited discussions respecting the delay which has taken place in the completion of the bridge; and during these discussions, some odd disclosures have been elicited as to the causes of the delay. At the meeting of the vestry on Wednesday week, a deputation of tradesmen and others in the Commercial-road was introduced. This was the same deputation that waited upon the vestry a few months ago on the same subject. The spokesman, on behalf of the deputation, explained to the vestry the serious loss to which they had been subjected, endeavoring to show that the business of several shopkeepers had been entirely ruined. He added that on the former occasion when they appeared before the vestry the contractor wrote to the *Builder* stating that he (the speaker) had libelled him, whereas he had no intention of doing anything of the kind, and only desired to show the vestry how he and other shopkeepers had suffered by the delay in finishing the bridge. The discussion on the subject on Wednesday week occupied between two and three hours, and was exceedingly warm, if not absolutely personal, several members of the vestry accusing the committee under whose superintendence the bridge was being built of a neglect of their duty in not having determined the contract, or enforced the penalties in consequence of the terms of the contract not having been complied with, and also expressing sympathy with the shopkeepers who had suffered. Mr. Dresser Rogers, as the chairman of the committee, said they had done all they could with the contractor, whom they had had before them. He added that, although they could not altogether exonerate the contractor from blame, he had had several unexpected difficulties to contend with, one of which was the state of the iron market, and that he had been unable to obtain the girders and other ironwork from the parties at Middlesbrough, with whom he had contracted, although he had given the vestry authority to pay them for the iron as it was delivered. In the discussion which followed, several members contended that they had nothing to do with the iron-masters with whom the contractor might have entered into arrangements, and a motion to take the construction of the bridge into their own hands, and enforce the penalties, was lost. One gentleman (Mr. Denny) contending that the time for the completion of the bridge had not expired, and that, although it might be easy to tear a man to pieces, it was well to know that they had the power to do so. On the surveyor being appealed to, he said he did not think the ironfounders were behaving well to the contractor, and that, in his opinion, there was something which did not appear on the surface. It was ultimately resolved that the surveyor should personally ascertain whether the iron-work was in progress, and report to another meeting that day week, and that, if it was not being executed, the contract should be determined. At the adjourned meeting on Wednesday last, Mr. Reynolds, the surveyor reported that he had been to Stockton-on-Tees, and found that Messrs. Hend & Co., who had taken the contract, had sub-let it,—one portion to Messrs.

Foster, Lloyd, & Co., of Wednesbury, and the other to Messrs. Woodhall, of Dudley. He then went to the last two places, and received a promise that the girders and the other portion of the iron works should be delivered at the works in Peckham this week. Under these circumstances, the vestry declined to proceed farther, but directed the surveyor to report at the next meeting as to the progress made in the construction of the bridge.

PROPAGATION OF DISEASE BY FUNERALS AND WAKES.

How often must the same warning be given before it will be attended to?

At the monthly meeting of the local Board of Health at Leagiate, a district surrounded by collieries, in the county of Durham, Mr. George Renton, the medical officer, acquainted the authorities that scarlet fever had broken out in a malignant form in the district, no fewer than *eighty-two* cases having come under his notice during the month. He had not been able to trace the cause of the growth of this epidemic to any defect in the sanitary condition of his district, but rather to the indiscretion of the people in visiting infected houses and in attending funerals and wakes.

Over and over again we have pointed out the evils of these practices, illustrating them with pen and pencil; but they are still continued, and still do their evil work.

WINTER EXHIBITION AT THE DUDLEY GALLERY.

EXHIBITION succeeds exhibition so rapidly at the Dudley Gallery that it is seldom its walls are not bearing testimony to the activity of artists in these days, when pictures would seem to have become as necessary an adjunct to a civilised existence as at one time it was difficult for pictures to procure for those who produced them a civilised existence at all. Nowhere else is there a fairer opportunity afforded the amateur of modest means to get good change for a moderate check upon a superabundance for more real requirements: many clever and agreeable paintings, of an average degree of merit, are to be found here, with just enough instances of greater worth to emphasise and assist the meaning of what may be expressive or promising of excellence in less convincing speech of it.

A few pictures in this present collection take a superior and helpful position; but there is still cause for regret that the clear-stage-and-no-favour system of an institution like this should not obviously lessen the cause for never-ceasing complaint of "want of room," and, by mitigating a difficulty elsewhere, make it the more easy to improve the character of these exhibitions and others generally. The imaginative, and even the narrative, are elements that scarcely mix with the productions to be found here.

Mr. G. F. Watts, R.A., sends two classical compositions, on a smaller scale than he usually adopts; but Mr. Watts stands nearly alone in the possession of such qualities as make a painter original and painting poetic. The Greek ladies on the rocky shore, "Watching for the Return of Theseus" (70), so unsophisticated, with regard to care for personal appearance,—unless the electric cable is not nearly so late a convenience as many believe it to be, and having learnt something of the impudent persuasiveness of those naughty syrens, they meant to out-argue all argument in adverse favour by statement of the naked truth,—form a very beautiful group, though the arrangement of the lower limbs of the principal figure detract from its gracefulness, and here suggests that "nature, not altered," might be "to advantage dressed": though, so far as a refined sense of beautiful colour and other attributes belonging to the artist go, it is richly clothed already. This, with another admirably-conceived design, showing Eurydice withdrawn from the arms of Orpheus, just as they were free of Pluto's dominion, can only assist an appreciation of Mr. Watts; for he is nearly as imitable, if not quite so singular, as Mr. J. A. McNeill Whistler, whose studies of moonlight effects on the river would divide London's opinion. His "Nocturn," whether performed under the influence of "Grey and Gold" (187) or "Blue and Silver" (237) is nocturnal enough to perplex a Thames waterman as to the time of day, and that such a pretty blue or pale-grey fog could necessitate the lighting up of the moon

and other lamps must perplex him more. He would wonder how the small craft so near should be merged in mist, and yet that a forest of masts should be more visible miles away. Moonshine; moonshine! what a great latitude there is for moonshine! Diorama, panorama, and conjuring tricks are very astonishing in their several ways, and one-half of those who see these performances will wonder how such illusion could have been attained, whilst the other half will wonder—just the same.

Atmospheric phenomenon has been far more rigorously dealt with by Mr. Jerves McEntee, and in an extremely clever way. "October Snow—Squall in an American Forest" (294), makes the spectator shiver, and his thoughts to concentrate on chest-protectors and cough-lozenges. Too long a look at this would make one numb, and dumb, and deaf. The warmest weather is surely preferable to such a deadly-cold state of things, that would seem to defy all general influences. In hot countries it is possible to find a stray breeze occasionally; and Mr. J. E. Hodgson intimates that Eastern law-courts are, even, well ventilated; he has found a very strong breeze in one, and made the most of it; and a very capital picture was in the wind,—at once. As for story, it was supererogatory to add one to the many that are issuing from the wet lips of his clamorous, litigious Arabs, so loudly invoking "An Appeal to the Knit" (17), who deprecates such a waste of energy over a matter he can so easily adjust; let them produce the disputed emulation of Chancery fashion; for half the grandeur of law and equity exists in their universality of appropriation. But Mr. Hodgson perfectly identifies national administration; his Arabs are Arabs, though the knid is not quite so big as a more delinquent apprehensiveness might conceive him to be. "Youth and Age" (51) are illustrated by Mr. Arthur Hughes, in definition of a time's difference,—the span that divides an old woman, that is, from the duck she was: it is very well and delicately done; whether with regard to the duck of the past, the ducklings of the present, or the pleasant spread of English landscape, they alike betoken great imitative skill, and no common taste in their combination. Mr. H. S. Marks, R.A., is represented by a study of "An Elizabethan Rough" (53), who,—with this artist's partiality for a by-gone period,—is not so significant of his social grade, as representatives to be met with nowadays; he is very well drawn and painted, however, and his type not the worst of his belongings.

Mr. E. M. Ward, R.A., sends a "Portrait of Lord Lytton" (244), taken some years ago, and very characteristic of the author of "Zanoni": it is admirably done, and has the advantage of picturesque surroundings. Far simpler and less adorned is Mrs. E. M. Ward's "Summer" (12), a pretty little boy in grey knickerbocker suit: this is both natural and nice in its unaffected treatment and good representation. The sketch for Mr. F. Walker's notorious "Prisoner at the Bar" (33), is very valuable for most of what constituted the worth of the larger version is here, more than indicated. "Barnard's Inn, Holborn, in the Seventeenth Century" (269), has served to good purpose in enabling Mr. H. Wallis to emulate the Dutchmen who, by brilliant colour that they seemed to mix with sunlight, made such use of old buildings and quaint courtyards as ensured a longer existence for the transcriptions than the realities themselves were favoured with. The result of this clever application of Mr. Wallis's precise drawing and clear dexterous painting, if it does not quite equal the perfection aimed at, is very agreeable.

There is no lack of variety amongst the many noticeable works here. Mr. E. Crofts gains an interest for his military heroes, who are so comically disregarding shot and shell, "Artilleur's Bederung" (4); Mr. F. Slocombe's cavalier "At Bay" (27), does not promise quite so much resistance,—he is rather weak; "Mid-day in June" (32), passed by a young girl tending the rose-trees that are burdened with blossoms, Mr. R. W. Machett paints with a vigour that does more than approach coarseness.

Mr. P. I. Calderon, R.A., sends a cleverly-painted picture, a "Lesson of Charity" (135): his straightforward and capital method of depiction would save platitudes from staidness; and such a touch of nature as a mother's direction to her little girl to be kind, whether in France, Italy, or elsewhere, would make "the whole world kin"; and so nicely done as it is, the old lesson is newly impressed, and will last the

* Vol. xviii, pp. 8 and 11.

longer from being so ably handed down. Capital workmanship is, too, displayed in Mr. Calderon's portraits of two brothers of the brush, Messrs. W. F. Yeames, A.R.A., and D. W. Wynfield (169); the latter of whom contributes similar proof of the great value and increase of interest a novel treatment gives to portraiture; if the naturally graceful figure posed in the mild difficulties that such a pretty piece of business as embroidery may involve, and her no less charming conductor, be portrait, the style of work shown in "The New Stitch" (177) may be recommended for imitation. Mr. Val. Prinsep's very brilliant presentation of a beautiful head, "Lily" (126), must add to his reputation for achieving life-likeness.

"The Last Days of the Old Hack" (71), by Mr. Heywood Hardy, must be very weary ones indeed, if such change from honoured recognition of breed and speed to the heavy travel of a four-wheeled cab has been a sudden one: if the poor old horse is as capable of contemplation as the cab is of being the vehicle of sentiment, he has, at least, the consolation of knowing that his very last day will not quite end his usefulness: there are dogs to be fed. Mr. Hardy possesses very clever means of expatiating on such matters so far as manipulation goes and good taste for colour, though this is not so strongly set forth in another specimen, "The Dilemma" (101), which is a bull,—and one would not care to be on the horns of such a one,—encouraged at sight of a fair damoise's red cloak. "After the Run"—this has no reference to the bull, but is the finish of a deer-stalking expedition, by Mr. J. Richardson (87), and shows some very good animal-painting, whether with regard to stag or hounds; "The Fisherman's Pet" (115) is rather a dirty-faced one, by Mr. J. Barr. Mr. James Gow depicts the traditional author, in "A Garrot in Grub-street" (163), when the street was more easily found than the grub; "A Word of Advice," from a hard-looking young woman to an easy, lounging young man, by Mr. R. W. Macheth (222); "Study of a Spanish Bullfighter" (251), by Mr. J. B. Burgess,—we do not believe in Spanish bullfighters, and should like to see one tackle Mr. Hardy's little "dilemma": "Setting Out" (262), by Mr. T. Graham; "A Partial Critic," by Mr. W. D. Sadler (279); "The Post-script,"—remarkable for length even as compared with a lady's P.S. generally,—by Miss M. E. Edwards (308); "Midsummer" (311), by Mr. T. Davidson; "Caleh in his Pantry" (316), by Mr. W. F. Douglas, R.S.A.; "Second Reading," by Mr. A. Ludovic, jun. (329); "The Critic" (336), by Mr. E. Hughes; "Study of a Head," by Mr. J. H. S. Mann (343); "Still Life" (349), by Mr. W. Hughes; "Nemesis Approaching," by Mr. L. C. Henley (358); and "Love Letters" (359), by Mr. J. M. Burfield, are amongst the best of this variety.

There are some beautiful little studies from nature by the late Mr. G. Mason, A.R.A., and amongst other choice items may be reckoned the "Carnations and Corn" (328), and a bit entitled "Our Village" (341), by Mr. G. D. Leslie, A.R.A., and plenty of such pleasure-giving work as is to be found in "Mowers" (38), by Mr. C. J. Lewis; "Gleaners" (39), by Mr. G. W. Sant; "Asters, &c." (63), forcibly and exquisitely touched in by Mr. H. Fantin; "Sunset over St. Mark's, Venice" (102), by Mr. Arthur Severn; "A Spring Morning on the Thames" (103), by Mr. W. J. Hennessy; "A Welsh Hay-field" (109), by Mr. T. Lloyd; "Study at Elche, near Alicante" (127), and "Sketch of Knole" (128), by Mr. A. Ditchfield; "A Pastoral" (139), by M. Fisher; "A Creche" (142), by Mr. F. Walton; "The Lock of the Lowes, Perthshire" (176), by Mr. C. P. Knight; "The Carpet Bazaar, Cairo," by Mr. F. Dillon; "A Garden at Nuremberg" (200), by Mr. C. N. Henry; "Yearsley Lock, near York,—Evening" (203), by Mr. H. Moore; "Waiting" (213), by Mr. W. Small; "Chagford" (231), by Mr. A. Goodwin; "Yew Trees,—Borrowdale" (252), by Mr. C. R. Aston; "The Old Farm House, Sussex" (296), by Mr. E. H. Fahey; and "Off with the Ebb" (353), by Mr. W. L. Wyllie.

"An Orchard" (61), by Mr. E. Gurdon Dalziel, might be an early sketch by Mr. Walker; and "Twilight" (64), by Miss Hannah Hopkins, very successfully imitates Mr. Boyce.

Rock, and sea, and wind, to help shape the sea, have been subjects enough for many a fine picture, and the infinite variation that the sky alone can be an index of, leaves it possible for many more to come that shall yet look new. Mr. A. W. Hunt, paints nearly as well in oil as he does in water-colour. "At the End of the

Reef" (65), shows an angry sea foaming its wrath away in repeated assaults on the firm rock that already holds captive in the hollow of its fortress some of the attacking waves. In sheltered rest spent water sleeps, and waits till higher tide shall bring release, or the wind annihilation. Mr. N. Moore's study of "A Winter Gale in the Channel" (82), bears a remarkable appearance of truthfulness; "On the Test—Low-water" (72), and "Steam Tug leaving a Vessel in the Downs" (54), by Mr. Robert Leslie, convey the same impression, excepting the two-miles-and-a-half-long trail of several tons of coal-smoke, that would prove steam-tugging a very expensive means of locomotion. "Salcombe, South Devon" (18), by Mr. J. G. Naish, with a misty evening effect. "Shadows" (80), by Mr. T. J. Watson; "Better small Fish than None" (120), by Mr. H. Mac-callum; "An Open Shore" (152), by Mr. C. Hunter; "Coast of Artois" (371), by Mr. C. J. Lewis; and "A Stormy Sea" (392), by Mr. T. J. Watson, again, all bear evidence of close observation, with the power of rendering it apparent. It is not all who can write as well as they can read.

SOUND.

It is impossible to prevent sound from passing through such floors as mentioned by "A Subscriber" in the last number of the *Builder*; and the ordinary receipt of "pugging" between the joists is worse than useless, as it only assists the passage of sound. A layer of cockle-shells, laid in on battens between the joists, has been used; and I have myself used brocku crockery, but both remedies are only very partially successful. One thing is certain, that solid materials only conduct sound, and therefore the more open the material, and the more air-cells that can be produced in any filling-in, the better; but unfortunately the sound is carried through mainly by the joists themselves, in a single floor, and therefore the filling-in between is of secondary importance. The only practicable remedy is to prevent the formation of the sound by the use of thick carpets or Kemptulion. The better a house is built, and the more solid the materials used, the more sound passes through it.

This is a subject which wants ventilating, for we know very little about it at present.

J. K. C.

PUBLIC ANALYSTS UNDER THE NEW ADULTERATION ACT.

On the recommendation of the Sanitary Committee of the Vestry of St. George the Martyr, the following have been adopted:—

"That Dr. Muter, M.A., Ph.D., of the South London School of Chemistry, be, pursuant to the provisions of the Act to amend the law for the prevention of adulteration of food and drink and of drugs, and subject to the approval of the Local Government Board, appointed, during the pleasure of the vestry, analyst for this parish, receiving for his remuneration such fees as the Act prescribes."

"That application be made to the Local Government Board for their approval of the appointment of Dr. Muter."

"That Mr. John Edwards, Inspector of Nuisances, be appointed under the 8th section of the Act aforesaid, to perform in this parish the duties of an inspector under the said Act."

The Local Government Board sent a letter to the Lambeth Vestry, asking for the testimonials on which the vestry appointed Dr. Muter as public analyst. The vestry, by a majority of 40, have replied that no testimonials were required, as they knew Dr. Muter as having, close to the vestry-hall, a laboratory in which he had more than fifty pupils under instruction; and that testimonials were of less value than personal knowledge.

It must be greatly to the public advantage that the analysts appointed have abundant resources in the way of assistants or pupils, especially if more than one district have only one analyst. Indeed, our objection to such appointments is thus obviated; and we still hope, therefore, to see a good deal of the laborious work of analysis done under the Act.

Dr. Lankester has been appointed analyst for St. James's Vestry, at a nominal salary of 50l. per annum; all analyses to be made in the Vestry-hall laboratory.

Dr. Barclay has been appointed analyst for the Chelsea Vestry, with a nominal salary of 25l.

Dr. Griffith, the medical officer of health for Clerkenwell, has been offered the office of analyst for the Clerkenwell Vestry. Dr. Griffith had himself suggested 50l. per annum as the analyst's salary.

The Local Government Board are looking sharp after the appointment of analysts. They have just requested of the Wandsworth District Board of Works, and of other district Boards, &c., to inform them what steps they have taken or are about to take to provide an analyst; and it is to be hoped that where nothing is being done the Local Government Board will itself step in and appoint analysts. The very appointment of such officers will have a wholesome influence on tradesmen and manufacturers; and, if speedily followed up by a few analyses, and a few detections and punishments, there will soon be less occasion for public complaint.

The metropolitan dairymen and cowkeepers of their own accord appear to have let go the handle of the pump, and taken the cow by the horns. They have laid their heads together, and have resolved (with closed doors) to appoint a committee to consider the question and draw up a report. The result is expected to be the sale of pure milk to the public at 1d. a quart in advance of the price at present charged.

The Liverpool Health Committee have resolved to authorise the inspectors of weights and measures and the market inspectors to assist the public analyst in the performance of his duties.

THE FIRE AT THE CITY FLOUR MILLS.

With reference to your correspondent's proposition that some means should be provided for shutting off the supply of gas from separate streets in case of fire, I would suggest that the mains to all large premises should be fitted with one of Donkin's valves, placed in some convenient position outside the building, that the individual supply of gas may be entirely shut off. Numerous cases are on record where such a precaution would have saved a building; as, for instance, the large fire some time since in Leicester-square.

If the use of valves were made compulsory, the police and firemen could be instructed in their action. Accidents to meters are not infrequently the cause of fire, and an external valve gives the only means of immediately subduing such an outbreak.

One difficulty in the construction of warehouses and mills arises from the tendency to reduce the area of internal support to the smallest practical extent, and so to indicate the use of iron instead of timber or brick. Timber, no doubt, to resist fire must be in large pieces; but such girders or supports are free from all the dangers to which iron is exposed, viz., bending or snapping, and a sudden rush of water would not only not harm them, but might reduce the fire.

I do not know whether Dennett's floors have ever passed the ordeal of a large fire, but a stont timber-framed floor, filled in with or imbedded in gypsenous concrete (Dennett's patent), using more refractory materials than the brick and Bath stone commonly used by Dennett, would resist fire as well, if not better, than an iron-framed floor, and cost much less in construction.

If staircases and lifts are permitted to be so arranged in the centre of a building that they shall form the most effective means of communicating fire from one story to another, no known construction of floor can long withstand reduction in such a scientific furnace.

THOS. CHAS. SORBY.

MODERN GOTHIC FURNITURE.

MUCH has been said and written about the want of taste and the absence of truth and art displayed in the usual forms of modern domestic furniture, yet far less progress has been made towards amendment than might have been expected, especially when we consider the advance that art has made in other directions. This tardiness of improvement is, no doubt, due in some measure to the history of fashion, the high prices charged for any furniture differing in construction from the prescribed forms, and to the frightful caricatures of Gothic displayed in upholsterers' shops; still, difficulties of a similar kind have been encountered, and are gradually being overcome in other branches of art. The question remains why, furniture, which plays a most important part in domestic architecture, still lags behind. This is sufficiently curious to call for some especial explanation. Possibly the best reason may be found in the fact that the

disciples of the Gothic revival, while preaching against a want of truth, have, in practice,—and more particularly in designs for furniture,—forgotten their precepts, and endeavoured to apply to modern requirements not merely the thoughts of their ancestors, but an actual copy of their works; in other words, they have, in their eagerness to assimilate themselves in thought with Medieval artists, forgotten that they are designing in an age and for a society whose requirements are totally different. The result has been that many designs have been produced which would have done credit to the thirteenth and fourteenth centuries, but which are quite out of place in the nineteenth. This being felt to be the case may be the reason why Gothic as applied to furniture, and, perhaps, to domestic architecture generally, has not received so much support from the public as it has when applied to churches, where the requirements of the present age remain sufficiently the same as those of the Middle Ages, to render what was convenient then tolerably applicable to our present wants. If the principle of design which made the works of the Gothic period so far superior to those of our own age had been adhered to, we should have had designs as totally different from anything actually executed by Medieval architects as is one age from the other, and we should never have heard complaints of the clumsiness or inconvenience of Gothic furniture, nor should we be haunted by those stumbling-blocks to progress in the shape of Medieval cabinets terminating with a sloping top to represent a roof, a falsehood carried further by being carved as though covered with tiles, and even surmounted by dormer windows, the acme of absurdity being reached when the whole is daubed with rude devices in paint in imitation of a combination of circumstances which do not now exist, and on which the greatest care is bestowed to render them as though careless in execution. That there is authority for such forms is worse than no excuse. The moral is, that so long as modern architects affirm that they do not copy, and yet practically do so, we can look for no advance in truth, and therefore none in art.

J. M. C.

FILTRATION OF SEWAGE.

Will any of your readers advise me as to the best and simplest plan for upward filtration of sewage, to intercept the solid matter only?

B.

COMPETITION.

In an invited competition for a new Congregational church in the city of Gloucester, the design by Mr. Tait, of Leicester, has been adopted. It is in the Early English style.

SCHOOLS OF ART AND OF SCIENCE.

The Oxford School of Science and Art.—The distribution of prizes in connexion with this school has taken place in the town-hall, Mr. W. C. Cartwright, M.P., one of the members for the county, in the chair; and among those on the platform were the Regius Professor of Medicine, Dr. Acland; Professor Rawlinson, Canon of Cathedral; Professor Rolleston; the Mayor, Mr. J. R. Carr; and other gentlemen.

The report congratulated the meeting on the success attending the classes from an educational point of view. The following is an abstract:—

Science School.—The statistics of the science school show an increase in the number of students under instruction in the various classes; but a decrease in the number of individuals attending more than one class. In session 1870-71 the number of students was 593, on the class registers, 149; and those attending more than one class were 64. In 1871-2 the numbers were 106, 142, and 38 respectively. Taking the statistics of success and failure in the whole United Kingdom in 1872, and comparing them with those of Oxford in the same year and in the same subjects, we have the following results:—

	Percentage of		Percentage of	
	Failures.	Successes.	U.K.	Oxford.
Mathematics.....	4	5	6	6
Magnesian and Electricity	1	None	8	All
Inorganic Chemistry.....	2	2	8	9
Animal Physiology.....	4	9	9	4

From which we may fairly conclude the standard attained by the students in Oxford to be quite up to the average; above the average in magnesian and electricity; the average in inorganic chemistry and mathematics; and a shade below the average in animal physiology. This statement should be qualified by the fact that between 60 and 70 per cent. of the students presented in the two latter subjects were boys under fifteen years of age.

School of Art.—The condition of the School of Art from an educational point of view is most satisfactory. In the session ending July 31, 1872, the number of persons that have received instruction in the school has been 218, all of whom have attended the School of Art; from these a sum of 97, 10s. 2d. has been received. As the result of the examination in May, 1872, the school received one prize of books at the National Competition; seven third-grade prizes of books on account of students whose works were sent up for inspection; and four second-grade prizes at the Local Examination. Two hundred and thirty works were sent up to the Annual Examination in London by sixty students, of whom twenty-five were successful in passing one or more exercises.

Subsequently to the distribution of the prizes, the Mayor said he was anxious to detain them for a few minutes, for he felt strongly on one of the clauses contained in the report. He collected that the School of Science and the School of Art, although two, and separate and distinct, had been under the management of one committee; and that now it was the intention of Mr. Ruskin not to interfere with the School of Science, but materially interfere with the School of Art. He understood Mr. Ruskin to take over now the united School of Art, the higher classes of the University members and the higher classes of the citizens under his separate and distinct control, and to leave to Mr. Macdonald the working classes. It seemed to him that by this arrangement the working-classes were left in the shade, or rather out in the cold.

THE BRIGITON AQUARIUM.

A WARNING.

SIR.—With a view only to the safety of the public, will you draw attention to the very extensive dimensions of some of the water-tanks in the new Aquarium here.

The tank-space labelled "Smelts, mackerel, turtle, conger-eels, bass, dog-fish," &c., pushes its long length for many yards on the northern side of the building. The water contained in it seems to be from 4 ft. to 5 ft. deep vertically, and occupies a considerable space horizontally. This tank-space contains many thousand gallons of water.

This great tonnage of water is held in its lateral position by glass fronts! Should fracture of this glass take place through sudden unequal-sided temperature; by accident; by a slip of the artificially-placed rock-work, through the struggles of a turtle jammed in the rocks, or otherwise, some persons only, in its vicinity, might survive the destructive collapse.

Any persons who may have witnessed the disastrous effects of a mass of water escaping suddenly from one confined area into another and lower area, would at once advise water-tight subdivisions of such tanks as those mentioned to be formed without delay, not only for the sense of security to the visitors, but for the safety of the light building itself.

A VISITOR.

WATER-TIGHT MAIL-BOXES FOR THE COLONIES.

Why should not the mail-boxes for the colonies be made water-tight before they are shipped? This is a question which may have occurred to many a recipient of pulpy and half-obliterated letters at home and abroad;—letters which, having passed through all the wonderfully well-ordered machinery of the Post-office, have been consigned by some casualty to the bottom of the sea. Surely this might be obviated by the simple expedient suggested.

But I would venture to suggest something more than this, viz., that the mails should be packed, in bulk, in a large iron water-tight compartment, so stowed on deck that it would float, should the mail-steamer founder. This large buoy might be furnished with some distinguishing signal, and have the name of the vessel upon it. It might also prove a life-buoy to many of the wrecked.

W. C. T.

DANGEROUS STRUCTURES.

SIR.—I wish to call your attention to the want which has existed for years past, and which is likely to remain until some decided step is taken, of an official inspectorship of new buildings which are erected in those places to which the power of the Metropolitan Board of Works does not extend, and where, as most of the work is done for speculative purposes, the premises collapse, either during the time of erection or when finished, often with injury to the men employed, and sometimes even with great loss of life.

In this parish (Walthamstow) I have seen a pond of about 50 ft. diameter and 7 ft. deep below the water-mark, filled up with cinder and other rubbish; the footings immediately laid on this unconsolidated mass; and the carcasses completed, and sold at once, for fear they should fall down. In another instance, the ends of the first-floor joists not only rested in the chimney-breast, but actually projected into the flue; and in a third, a 10-ft. opening was left for a bay-window; the brassummer, to carry the brickwork for the first floor, was 6 in. by 3 in.; and, to weaken this still more, the ends of the joists were mortised through it.

There is only one way to remedy this sort of thing, and that is, that an Act of Parliament should be passed making it imperative that in all parishes outside the limits of the Board of Works there should be a local surveyor appointed to inspect all buildings during their erection, such surveyor being selected by the Metropolitan Board of Works or by the parish authorities, and paid by the proprietors.

E. T. B.

STATE OF ORNAMENTAL AND PICTORIAL ART.

At the last annual meeting of the Reading School of Art, Professor Poynter read an address "On the State of Ornamental and Pictorial Art in this Country." In the course of his remarks he said that his object was to show whether a more practical turn might not be given to the study of art. There was scarcely a town in the kingdom which had not its school of art, and in the course of two years more than 60,000 works of art had been submitted for inspection. Next to political matters, there was no subject which was so continually discussed amongst them as the study of art and art manufacture. Still, the condition of the country in this matter was not so satisfactory as could be wished. Unfortunately the aim of manufacturers and designers had not been to produce good works of art, but rather to produce works which should pass muster. He had had the opportunity of examining some of the works of art and design executed by the pupils in the Reading School of Art, and although he should presently dwell on what he must consider as a defect in some of these works (and he should do so with all deference), he could not but commend the industry evinced by the students in that school. It was thought to be a good plan for a student to draw a flower in its simple and natural form, and also dissect it and make drawings of each particular part; also that geometrical patterns should be taken. Here was the idea,—that a design must turn out well because the student had been taught that nature's flowers were "beautiful." This process of reasoning, however, did not lead to the production of works of art. Nature was not necessarily beautiful. Many flowers were not beautiful either in form or colour, and no amount of ideas would be of the least use in the production of artistic designs. Some of the works of the ancients, and of the Oriental nations, were perfect, and nature must be studied entirely with the view to its beauty. When once the student's mind was imbued with a true knowledge of nature, he would be able to use that knowledge as he pleased. After expressing his conviction of the advantage of drawing from the living model, Professor Poynter proceeded to observe that he was glad to find that in the Reading School of Art there were no elaborate backgrounds in the works of the students, and this was, no doubt, due to the good influence of the head-master. He (Professor Poynter) only gave to a student a limited time for drawing a picture, and then the time could not be wasted.

BUILDERS' BENEVOLENT INSTITUTION.

The twenty-fifth anniversary dinner of this Institution took place on Thursday evening, the 7th inst., at Willis's Rooms, St. James's, Mr. Edwin Lawrence (of the firm of Lawrence & Sons) in the chair. The usual loyal toasts having been responded to, The Chairman, in proposing "The Builders' Benevolent Institution," said that the Institution was founded in 1847, by Mr. Cozens, who he was very sorry to see was absent on that occasion, although he (Mr. Cozens) had always been a very regular attendant, and it was only his increasing age and infirmity that precluded his attendance. The Institution now stood in the position,—It was possessed of funds amounting to 13,200*l.*, and a sum of rather more than 3,000*l.* set apart to be devoted to a building fund whenever the Institution thought proper to build. It had now on its books twenty male and twenty-five female pensioners, or rather there would be that number after the next election of pensioners on the 28th, when four candidates would be elected. In some sense it might be

called a fortunate circumstance that they were going to elect four persons next time, but he was sorry to say that that increase of two over the ordinary number of pensioners elected was only occasioned by the decease of two pensioners. He wished that the friends of the charity could increase their subscriptions, and induce their friends to become subscribers. If every one who was a subscriber at present would get an additional subscriber of half a guinea per annum, they would very much increase the usefulness of the Institution. At present, the Institution had paid away in pensions a little over 10,000*l.*, and it was certain that that amount had gone a long way to increase the comforts of the homes of the poor recipients. No one engaged in the building trade could tell how his business would turn out, especially when such elements had to be considered as the late strike. The toast was drunk with enthusiasm.

Mr. Plucknett (Cubitt & Co.), treasurer of the Institution, next proposed the health of "the Chairman." He said that many men waited until the declining years of their lives before they exerted themselves very much in the cause of philanthropy. They then strove to make up for lost opportunities, and did all they could to benefit their fellow-men. But that was not the case with the chairman. He did not wait until declining years, nor indeed until middle age, before he came forward to support such charities as the Builders' Benevolent Institution, which were so numerous, and which sought to provide for the vicissitudes of life and suffering humanity. The chairman and his brothers had been from the very first three of the most liberal benefactors to the Institution. They delighted in doing charity, and were ever ready to do their utmost to encourage and support charitable institutions. Two brothers had already received the highest honours which was in the power of the City of London to bestow on a citizen,—honours which it was hoped might one day fall to the lot of the chairman,—and they represented two of the largest metropolitan constituencies in Parliament.

The Chairman having replied, proposed "the Patrons, Vice-Presidents, and Trustees," to which Mr. Russell Freeman briefly responded. Mr. A. G. Harris, the secretary, read lists of subscriptions amounting in the aggregate to 292*l.*, and the Chairman appealed to the company to make up the sum to 300*l.*. This was more than done for at a later period of the evening it was announced that 315*l.* had been subscribed. The remaining toasts were "the Treasurer," responded to by Mr. Plucknett; "the Architects," responded to by Mr. Henry Strudwick; and "the Directors and Stewards," responded to by Mr. Wilfred Nicholson.

ADVERTISING AND CANVASSING FOR VACANT SURVEYORSHIPS.

In a recent number of the *Builder* there appeared a deserved tribute of respect by the Corporation of Durham towards a rising surveyor in their service, Mr. Collinson. The death of that gentleman necessitated a successor, and a host of applicants beset all having an interest in the valuable appointment. It is well here to state that the Durham Corporation, following the rules of other bodies, advertises for gentlemen to fill posts; and when this appears in the newspapers, aspirants by scores apply, forwarding testimonials, and at great trouble and expense. Many, indeed, travel long distances to try what canvassing will do to carry the election; but it usually happens that the man is already fixed on, and thus the advertising is a downright waste of money.

In the present case, at a meeting of the Durham authorities, the Town Clerk read a memorial urging the Board to appoint Mr. William Ground to the office of borough surveyor. This memorial is signed by many of the influential gentlemen of Durham. Its reception caused considerable discussion, and ultimately it was received; and Mr. Richardson and Alderman Boyd moved that it be referred to the finance and general purposes committee to report upon.

When brought before this committee, a discussion took place, and it was resolved to advertise for a new surveyor. Aspirants for the post, it appears already numbering scores, may gauge their chance by the above.

STAINED GLASS AT EXETER CATHEDRAL.

Sir,—I had anticipated seeing an answer from "Expatriation," to Mr. Moore's letter, in your issue of the 9th inst., in this week's issue, and am disappointed at finding him "shut up."

As an outsider, but as one who to some the proper and careful preservation—restoration if you like—of our cathedrals has always been a topic of the liveliest interest, I would inquire how is it that the existence of this beautiful old glass was not known until it was discovered,—if anything which for years has laid in so conspicuous a place as the Minstrel's Gallery may he said to be discovered,—by Mr. Drake, who is not connected with the cathedral in any way?

Sir Gilbert Scott has had the cathedral in hand some two years, and for that space of time a clerk of works, at a high rate of wage, has been his resident representative upon the spot. Yet he has no intimation about the existence of this old glass; and had it not been for Mr. Drake, it is not unlikely that windows, as unsatisfactory and as unlike the old work, as is the now vulgarly-coloured east window in the Lady Chapel, would have been put in. Mr. Moore says that brilliant colour would be the ruin of Exeter. I would ask, has it not already, in a great measure, been so? Those who knew the cathedral years ago, and have not been in since the "restoration," will be astonished and confounded at the want of height one perceives upon entering the choir now. Always somewhat low, the roof, since the decorative scaffolds have been removed, is brought down infinitely lower by the glaring manner in which the bosses of the roof and the ribs of the groining are painted. The spandrels being plain, the unhappy zebra-like effect obtained from the ribs running down to their springers, one mass of gorgeous colour, has been the means of bringing down the roof in an unfortunate degree.

I saw, the other day, a notice respecting the further restoration of the nave as well as the choir now in hand. I learned thereby that a considerable sum of money would be required for the purpose, especially as there is a deal of debate carrying to be restored.

The bosses in the roof need little doing to them; the

glorious corbels from which the vaulting springs, are in excellent preservation, and at most require the application of a little potash and hot water, to remove the whitewash; and the same may be said of the charming little capitals in the triforium. All of importance that then remains is the Minstrel's Gallery, which is in a fair state of preservation. Every architectural student knows there is little else in the sculptor's art, save these items to be attended to. Exeter is not ornate like Ely, or Lichfield, or Lincoln; why then is such a large sum wanted, more particularly for the restoration of the carved work of the interior of the nave? I must confess to have felt rather puzzled when I read this notice.

AN EXONIAN IN A FAR COUNTY.

WHARF FOR CHELSEA.

THE Chelsea Embankment Committee presented a sixth report, reiterating their recommendation that the vestry accept Mr. Thoron's offer to sell land for a wharf for 13,000*l.*, to be built a stone wall on the river front, &c., at his own expense. The committee said they had considered a plan for the formation of a dock at the bottom of Lindsay-row, but the surveyor reported it would cost 14,000*l.*, and that the cheap shelving proposed was decided in an engineering point of view.

After discussion, the vestry, by 40 to 3, adopted the report, subject to the Metropolitan Board's consent to allow the vestry to borrow the purchase-money.

THE CARRIAGE INDICATOR.

Sir,—In a late impression you notice a "Carriage Indicator," patented by Mr. Streeter, the description of which tallies with one that I made, and unsuccessfully offered to the trade three years ago. Mine, however, by means of a ground-glass face, covering a quantity of phosphoric oil, was luminous in the dark. The principle and means employed are, however, the same. I was advised at Mr. Kesterton's, the carriage-builder, of Long-acre, to take it to Paris, and offer it there, "as such improvements were only done" from abroad. The model is in the possession of Mr. Stubbings, of 72, Wood-street, City. Wm. G. King, the original inventor, if there is any invention about it.

Frankfort.

FIRE-ROOFING.

With reference to certain recent configurations, it has been asked how the term "fireproof" is to be understood. The incidental remark, very confidently made by Professor Barff, in one of his very interesting Cantor lectures, on soluble silicates, given at the Society of Arts (some of which have appeared in the *Builder*), as to a method of rendering wood perfectly unflammable by an easy, simple, and inexpensive process, which he explained, and also illustrated with entire success, observing he was quite sure it was well worth notice, may serve to answer the question.

The use of material so prepared would, perhaps, help somewhat to clear up the means of solving delicately what is thought to be still a question. Another advantage and security of wood thoroughly and efficiently prepared in this manner, would be, that it neither expands nor contracts, nor bursts, cracks, or crumbles, as a state of all kinds does. "Nemo."

SCHOOL BOARDS.

London.—The Board have resolved, "That in accordance with the recommendations of the report of Works Committee of the 21st October, the following he, and they are hereby, appointed additional officers of the architect's department, subject to one month's notice on either side:—

- Senior Draughtsman.—Mr. J. Jefferys, at a salary of 140*l.* per annum. Appointment to date from November 11th, 1872; Mr. Herbert W. Dale, at a salary of 140*l.* per annum. Appointment to date from November 11th, 1872.
- Junior Draughtsman.—Mr. G. L. Wade, at a salary of 80*l.* per annum. Appointment to date from November 6th, 1872; Mr. W. J. Murray, at a salary of 80*l.* per annum. (In place of Mr. Burton, resigned.) Appointment to date from November 6th, 1872.
- Tracer.—Mr. J. Ratcliff, at a salary of 52*l.* per annum. Appointment to date from November 9th, 1872; Mr. A. W. O. Barton, at a salary of 52*l.* per annum. Appointment to date from November 5th, 1872.
- Office Boy.—John Robertson, at a salary of 8*l.* per week. Appointment to date from November 11th, 1872.

Northampton.—The Board considered the propriety of appointing an architect or architects to prepare plans and specifications for the building of the new schools. The chairman said the appointment need not be permanent; and the clerk said the Board might appoint an architect for this particular job. The feeling of the Board was strongly in favour of throwing the plans open to competition, and a discussion ensued as to whether the competition should be confined to the town and county, or be unlimited. Ultimately it was resolved that the Sites Committee be empowered to insert the necessary advertisements in the *Northampton Herald* and *Northampton Mercury*, and in the *Builder*, inviting plans for the proposed new schools. Mr. Phipps suggested whether the Board would not require the services of a professional architect to decide what they wanted. The chairman said, as chairman of the Sites Committee, he should be very happy to draw out an advertisement as to what was necessary, and to render what preliminary assistance was required. It was understood that the commission of 5 per cent. would be expected

to cover all the architect's travelling and other expenses, but that a clerk of the works should be employed.

Driffield.—The Board having considered the tenders, already published in our columns, for the erection of new schools, accepted Messrs. Howson Brothers' tender, being the lowest, if approved of by the Educational Department.

Gateshead.—The committee recommended that the tender of Jacob Atkinson, of Gateshead, for the erection of the Alexandra-road schools be accepted. The tender was for 3,482*l.* There were nineteen tenders, some of which were for the whole contract, and some for portions only, the estimates varying from 3,482*l.* to 5,590*l.* for the entire erection.

Wakefield.—Four school designs were submitted in competition, and the Board have accepted that sent by Mr. William Watson, architect, of Wakefield, who has received instructions to prepare the necessary contract drawings. The buildings are for 350 children.

Hatfield.—The Queen's-road Board Schools, the plans for which have been designed by Messrs. Horsfall, Wardle, & Patchett, are to be proceeded with as soon as the Education Department have passed the plans. They will be erected on the upper side of Queen's-road, and abutting on Gibbet-lane, the front elevation being to Queen's-road, but set back about 60 yards, so as to allow of ample playgrounds in front. The style of architecture will be Italian, and the schools will consist of centre and two projecting wings. The centre building will be the infants' school, and the wings the schools for boys and girls. Over the entrance to the infants' school will be a bell-turret. The windows are coupled together with columns and pilasters of the Corinthian order, being surmounted by pediments, the tympanums of which are to be filled in with carving and open ironwork for ventilation. The girls' school will be 50 ft. by 25 ft., and there are to be three class-rooms attached, the accommodation being for 220 scholars.

The boys' school is of the same size, and has the same number of class-rooms, the accommodation being also for 220. In the infant-school accommodation is required for 250, and the school is 53 ft. by 27 ft., whilst there are four class-rooms. To each school there is a lavatory and cloak-room attached. In the ceilings there are perforated ventilators, and the whole building will be heated by hot-water pipes. In front of the building will be extensive playgrounds for each department of scholars, that for the infants being in the centre, and the boys and girls opposite their respective schools. These will be divided from each other by a low stone wall, surmounted by iron palisades. At the rear of the schools are separate yards for each department, the conveniences being approached from the school by covered ways. The ground upon which the schools are to be erected is bounded on the south by Gibbet-lane, on the north by an intended new street, on the east by Queen's-road, and on the west partially by Arundel-street.

PERSPECTS OF ARCHITECTURE IN ITALY.

Sir,—Many of us would be glad to hear from your correspondent in Florence what are the present prospects of architecture in Italy, now that the country is reviving from its long sleep, and an architectural society has commenced its work in Florence itself. We are all interested in modern, as well as ancient, Italian art, and would gladly hear of a healthy revival of its power, or, at least, that part of it that is really good and noble. We should like to know if there are signs in the air of any real progress. FLORENCE.

IMPROVEMENT IN STREET LAMPS.

This is a subject which has occasionally engaged attention in our columns, and we are glad to think there is now a prospect of improvement, independently of any hope of amendment in the light itself.

One of the most defective points in the construction of street lamps has been that they waste the light where it is not wanted, and do not radiate it along the street from lamp to lamp. A new form of lamp-glass has been invented by Mr. T. A. Skelton, of Essex-street, Strand, architect, and named the Catoptric Lamp-glass. This new form of lamp is being tried in Moorgate-street, London, and also at

Southampton. It intercepts and reflects the whole of the upward and wasted rays of light into the dark intervals between the lamps, and not downwards towards the foot of the lamp, as gas reflectors have done. The effect is to diffuse the light cast in the centre of the interval between two lamps, at about the ordinary distance of 45 yards apart. It is calculated that the lamp gives a net increase in the force of light in the ratio of 36 to 10—i.e., about 3½ times the light at present received.

A perforated zinc case is filled with lime or other absorbent of moisture, and fitted into the lamp, to prevent any dimming condensation of moisture on the inner surface of the glasses.

VARIORUM.

MR. BONONI has printed a "Project for an Instrument for the Identification of Persons," for use in military establishments and police offices, and for physiological and artistic research (Longmans & Co.). In the normal form of a human being, the distance from the extremity of one hand to the extremity of the other is the same as the measure from the top of the head to the sole of the foot.

"From this fact," says Mr. Bononi, "it follows, that every individual of the human family must belong to one or other of three classes: for, either they must belong to that class in which the measure of the extended arm exceeds the height; or, to the class in which the height exceeds the measure of the arms; or, thirdly, to that class in which the measure of the extended arms is exactly equal to that of the height."

The pamphlet before us is devoted to a description of an ingenious arrangement for taking these dimensions with a view to record them for after-identification. — The "Cosmopolitan Masonic Calendar and Pocket Book for 1873," contains lists of lodges in the United Kingdom, France, Germany, and Italy, together with particulars of every Grand Masonic body throughout the globe (198, Fleet-street), — certainly a remarkable array. — The *Belgravia Annual* is more than a good shilling's worth, including some stirring stories, and seven page engravings. — We can honestly give the same praise to *Tom Hood's Comic Annual* for 1873. The cuts are numberless and funny, while amongst the numerous contributors of literary matter are Messrs. W. S. Gilbert, Walter Thornbury, Mark Twain, and the editor, Mr. Tom Hood.

Miscellanea.

The Proposed Demolition of Houses in Clerkenwell.—A deputation waited on the Lord Mayor, at the Mansion House, in respect to the proposed demolition of the homes of the poor in Clerkenwell and neighbourhood of the new street about to be made by the Metropolitan Board of Works. The deputation asked the co-operation of his lordship in obtaining better houses for the poor by inducing the Corporation to build houses on vacant plots of ground. The Lord Mayor said he was quite aware of the great demolition of houses proposed by the new Act; but for the last eighteen months the Corporation had been quietly working in the matter. The improvements committee of the Corporation had considered the question of building on the plot between Ely-place and Farringdon-road, but they found that three of the houses had no tiles, and the present owners could not give a transfer of them. In a Bill before Parliament last session a clause was inserted giving them power to take these houses, and the Bill only received the Royal assent in August last. He had urged on the improvements committee for the last two years the importance of building better houses for the poorer classes, who were now herded together, and he hoped, now that they had got the Act, no delay would take place. The association with which he was connected had provided good and cheap houses for a large class of working people, and they were prepared to build more, but were afraid to do so owing to the strikes in the building trade. There was no want of money.

A Hint to Seamen.—Rockets are not always available: time, place, and distance, alas! too often prevent aid being rendered. The gale that drives a vessel ashore will take a linen kite from the ship: the kite to have a very long tail, string to drag along the ground, with directions printed on linen in various languages to draw the kite down, then haul a rope from the ship, and to make it fast ashore.—R. T.

Metallic Wall Hangings.—A material to supersede paperhangings is spoken of as coming from France. According to the *Medical Press*, tinfoil in sheets, the thickness of ordinary writing-paper, is the material on which this new style of mural decoration, including gilding, is executed. Tinfoil is pliable and supple, sufficiently tough not to be easily torn, and offers a smooth and uniform surface. It forms an excellent base for the work executed upon it. It also possesses the advantage of being waterproof, a property well known to architects and builders, who frequently use it to cover damp walls, on which, without that covering, any decorative work would soon perish. The process of executing the painting on tin offers no difficulty. The sheets are manufactured of a width and in lengths suitable to their application on the surfaces to be covered. The application of the painted metallic hangings to either wood, stone, plaster, or iron surfaces offers no difficulty. The operation is somewhat similar to putting up paperhangings, with this difference, — that with the latter the paper is pasted over at the back before being hung, and with the former the surface to be decorated is covered with a thin coat of adhesive varnish, on which, after it has been left to dry partially, the painted tin is affixed with great ease. The varnish used for fixing the material is of the nature of gold size, but more adhesive.

The Prince Consort's Memorial Chapel at Windsor Castle.—The sarcophagus, which is to bear the recumbent effigy of the Prince Consort, has been set up. It occupies a position in the chapel a few yards in front of the altar. There is an angel at each of the four corners. Those at the head bear each a shield, one representing the arms of the Queen, and the other those of the Prince. The angels at the opposite end are represented as mourning. There are three panels on each side, and one at the head and foot. In the panels on the south side are figures representing Charity and Science, the centre one having an angel bearing a shield with the words—"I have fought a good fight, I have finished my course."—2 Timothy, iv. 7. On the north side the figures represent Truth and Justice, the centre panel containing an angel with a shield, and the same inscription as on the other side. The panel at the foot contains a figure of the Queen in the attitude of prayer; and that at the head contains a figure of Science, weeping. The cenotaph is made of several kinds of marble: the top slab, upon which the recumbent effigy of the Prince is to rest, is of Pyrenee black and white marble. The base is of black and gold Sicilian marble. The angels at the four corners are of Sicilian marble, all the other figures being of statuary marble.

A New Metropolitan Railway.—Among the new schemes to be submitted to Parliament, says the *Railway News*, is one for completing the inner circle by a new line of railway starting from the Metropolitan Station at Brompton, and effecting a junction with the Metropolitan at Farringdon-street. The route of the proposed line would be along the Brompton-road to Knightsbridge, with a station near Tattersall's; then passing along by Piccadilly (partially under a portion of the Green Park to avoid disturbing traffic) to Regent-circus, where will be a large station, with accommodation for the Midland, Great Western, Great Northern, and North-Western Companies, making this in effect a central railway station for the metropolis. From Regent-circus the line would pass north of Leicester-square, through some low-class properties in St. Giles's and Bloomsbury, and along the south side of Holborn to Lincoln's-inn-fields, where would be a station, with wide approaches at Great Turnstile to the New Law Courts. From thence the line would continue to the Metropolitan at Farringdon-street station.

New Congregational Chapel in Cambridge. The first stone of a new Congregational Chapel, to serve in lieu of the existing chapel next Downing-street, was laid a few days ago at Cambridge, by Mr. Samuel Morley, M.P. The site of the building is immediately opposite Pembroke College, in Trumpington-street. The architects are Messrs. Fuller & Cullitt, of Finsbury-place, London; and the building is intended to seat 750 persons. The cost will be 8,000*l.*, exclusive of site.

New Church for St. Giles's, London.—It is proposed to build a place of worship in St. Giles's for the working classes, the Rev. G. W. McCree to be the minister.

Gallery of Illustration.—No one capable of enjoying quaint fun, good acting, and charming music, can fail to enjoy the entertainment provided for him by Mr. and Mrs. Gorman. Read if it be listened to with the right spirit. Mr. W. S. Gilbert's "Happy Arcadia," set by Mr. Clay, is full of droll and original notions, capably presented by Mr. Arthur Cecil, Mr. Corney Grain, Mr. Alfred Reed, Miss Holland, and Mrs. Reed, who likewise all appear in the latest novelty, a fishing piece with the taking title "Very Catching," written by Mr. Burnand, with music by Mr. James Molloy. The scene for this, a retired nook of the Thames, with trees, rushes, stepping-stones, and sedgy banks, gives a remarkable effect of extent, considering the narrow limits of the reality. The well-trained little company play and sing to perfection. Mr. Corney Grain adds his amusing sketch of the doings at a "Five o'Clock Tea," and the result is a thoroughly merry and enjoyable evening in the Gallery of Illustration.

The American Seal Lock.—This is a new lock in which the key-hole is covered by a seal which is a small square piece of glass, held in position by grooves in which it slices. The "seal" covers the hole through which alone the spring catch is accessible, and this cannot be released until the seal is broken. The "seal" itself is a piece of common window glass, marked on the back with a letter and number, and also with various irregular dots and splashes, in a sort of chocolate colour. The lettering and numbering are conducted on the same principle as on the Bank of England notes, so that no duplicate of a seal will ever be made; and the dots and splashes are accidental in shape and position, being sprinkled on at hap-hazard. Before the seals are cut the entire sheet is photographed, and the printed photograph is perforated like a sheet of postage-stamps. The purchaser of the seals is supplied also with photographic *fac-similes*, so that he can send one of these to any person whose business it may be to verify the security of a package.

Fall of a House.—A shocking accident has just occurred at Brighton. For some time past a number of men have been employed at a building in course of completion in Viaduct-terrace. While the men were at work as usual, the building fell to the ground. The plasterers, who were engaged in finishing the interior, had a narrow escape, but three men and a boy, who were at work in the basement, were buried beneath the falling materials. The three men were taken out alive, but the boy was quite dead. At the inquest it was stated that the deceased was digging a trench in the basement of the house at the time of the accident, and that it was caused by his digging too close to the foundation. The jury returned a verdict "That the deceased was accidentally killed by the fall of a house."

Monumental.—In the beginning of the present year, says the *Scotsman*, friends of the late Horatio Macculloch, R.S.A., associated themselves together, under the presidency of Sir George Harvey, P.R.S.A., for the purpose of obtaining a permanent memorial of that distinguished artist. The necessary funds were soon subscribed, and Mr. James Drummond, R.S.A., prepared a design, which was entrusted for execution to Mr. D. W. Stevenson. The monument has just been completed, and may now be seen over the painter's grave near the north-west corner of Warriston Cemetery. The design is that of a Celtic cross, treated in a style of severe simplicity. The memorial also comprises a bust of Macculloch, which is now being executed by Mr. Stevenson from the admirable model by Patric Park, R.S.A., and is intended to be deposited in some public place.

"The Mayo Memorial" for Cocker-mouth.—Messrs. W. & T. Wills, Sculptors, of London, have been commissioned to execute a colossal marble statue of the late Earl Mayo in his costume of Viceroy of India. It is to be erected on a moulded granite pedestal, to be placed in the cross road of the main street of Cocker-mouth.

Manchester and Salford Sanitary Association.—A meeting in connection with this association has been held in the Hulme Town-hall, to inaugurate the series of lectures for 1872-73. The chair was occupied by the Bishop of Manchester, and there was a large attendance. Mr. Thomas Turner, F.R.C.S., delivered an address on the "Use and Abuse of the means of Sustaining Life."

Presentations.—On the 1st inst. a portrait of the Dowager Marchioness of Westminster, painted by the Hon. H. Graves, was presented to Lady Theodora Grosvenor, at Motcombe House, by subscription of the neighbouring tenantry and others, together with a richly-bound volume, in vellum, containing the subscribers' names, and illuminated by Mr. Soppitt, of Shaftesbury, architect.—On the 4th inst., the carpenters and joiners employed by Messrs. Mansbridge, on their works for the Imperial Gas Company, in John-street, Bedford-row, presented their foreman, Mr. S. Pooley, with an ivory rule, a brass level, and a tape measure. On the 11th the bricklayers and plasterers in the same employ presented him with a gold chain. Each of the gifts was accompanied with a kindly address.

The Proposed Improvements at the Lambeth Vestry-hall.—A fortnight ago we noticed in the columns of the *Builder*, certain proposed improvements in the Lambeth Vestry-hall, as recommended by a special committee to whom the subject had been referred, stating that the matter stood deferred for a month, to admit of an examination of the plans by the members of the vestry. In the meantime, an agitation against the proposal has been raised on the part of a portion of the ratepayers, who contend that it is altogether unnecessary; and that, instead of the estimated cost of 3,500*l.*, the proposed improvements will involve an outlay of at least 5,000*l.* It is urged that the present hall having been cleaned, painted, and embellished not more than three months ago, its reconstruction now is unjustifiable.

Society of Arts.—The opening address was delivered on Wednesday evening last by Major-General F. Eardley-Wilmot, chairman of the council. The Prince Consort's prize and the medals awarded during the last session were presented by the chairman. The following arrangements have been made:—November 27:—"On Technical Education, and the Means of Promoting it." By Mr. Thomas Webster, Q.C. December 4:—"On the Manufacture of Horse-nails by Machinery." By Mr. J. A. Huggitt, December 11:—"On Galvanic Batteries." By the Rev. H. Highton, December 18:—"On Russia, her Industries, Commerce, and Means of Communication." By Mr. Leone Levi. The first course of Cantor Lectures for the ensuing session will be on "The Practical Applications of Optics to the Arts, Manufactures, and to Medicine," by Mr. C. Meymott Tidy, M.B.

Charmouth.—Mr. Gale, the waywarden for this parish, having had certain works done in the parish, costing over 60*l.*, without calling a vestry meeting or consulting the surveyor, and also having done the hauling connected therewith himself contrary to law, an adjourned vestry meeting was held, in order that the parishioners might examine the accounts relative to the said work. A resolution was proposed and carried unanimously, that Mr. Gale's bill for hauling, amounting to upwards of 10*l.*, be disallowed, and that he be compelled to take certain pipes which were not used, and have been charged to the parish, and deduct the cost of them from the bill for pipes. The resolution was ordered to be laid before the Highway Board.

A Trade Arbitration.—Mr. Rupert Kettle has given his decision in the matter in dispute between the carpenters and joiners and their employers. He rules that it is quite optional with any employer whether he provides artificial light in the winter months, so that his workmen can commence work before seven o'clock in the morning. If any master does provide artificial light he must pay his out-door workmen the same wages as the in-door men, although they may not be able to work such long hours. In all cases where the master does not choose to provide artificial light the working-day for the period between six weeks before and six weeks after Christmas should commence at seven o'clock in the morning and terminate at five in the afternoon.

Mechanics' Institute, Tunbridge Wells.—The new building in Dudley-road for the Belgrave Mechanics' Institute has been formally opened, with an exhibition of art-treasures in the various rooms.

Columbia Market.—The Court of Common Council have resolved to make a tramway from the Great Eastern Railway to the Columbia Market, at a cost, we hear, of about 9,000*l.*

The New Waverley Bridge and Station, Edinburgh.—In the construction of the new Waverley Bridge station, every section of the new works has had to be proceeded with separately, but it is expected that the entire station will be completed in the course of a few months. The passenger-shed—containing the arrival platform for the North and West trains, and the departure platform for Berwick and Carlisle trains,—is now finished, with the exception of the angle at the west end. Messrs. Hannab, Donald, & Wilson, Paisley, are the contractors for the iron work; and Mr. R. Hutchinson, Edinburgh, for the mason's work.

The Ryde Gas Company and the Corporation.—The Ryde town council having purchased the gas works in opposition to the wishes of the public, nearly the whole of the members have resigned and been replaced. The gas company have now issued a writ against the corporation for payment of 60,000*l.*

"Economical Stove."—A dozen correspondents wish to know where the little cooking-stove illustrated in our Number for November 9th, can be obtained in England. We are not aware that it is to be found anywhere in England. Probably one of our enterprising iron-men will take up the matter.

Fatal Fall from the Clock Tower at the New Town Hall, Manchester.—A stonemason in the employ of Messrs. Smith & Taylor has fallen from the clock tower which is in course of erection at the new town-hall. He fell from a height of 50 ft., and was killed.

Master Builders' Association, Liverpool. The sixth annual dinner in connexion with this association was served on Wednesday night, in last week, at the Adelphi Hotel. Mr. George Rome, the president of the association, occupied the chair.

Cautionary.—Part of the flooring of the entrance to the Odd Fellows' Hall Concert-room, Halifax, gave way on Saturday night (last week), under a sudden rush. About 100 lads were precipitated into a vault below. Eleven were injured.

Camberwell Green-Coat and National Schools.—These schools, recently rebuilt, have been opened by the Bishop of Winchester. The buildings provide accommodation for children of both sexes, and for infants.

Society of Biblical Archaeology.—On Tuesday, December 3rd, a paper will be read "On a Cuneiform Inscription containing the Chaldean Account of the Deluge," by Mr. Geo. Smith.

TENDERS

Nearly 300 exercises in drawing. "An indispensable book for teachers of engineering drawing." - Mechanical Magazine. London: LOCKWOOD & Co. 7, Stationers' Hall-court, E.C.

TEXT-BOOKS OF SCIENCE, EDITED BY T. M. GOODVEY, F.R.S. and G. W. HERVEY, F.R.S. Just published, in small 8vo. price 3s. 6d. cloth.

ON THE STRENGTH OF MATERIALS and STRUCTURES: the Strength of Materials as depending on their quality, and as ascertained by Testing Apparatus; and on the material of which they are composed. By JOHN ANDERSON, C.E. LL.D. F.R.S. &c. Superintendent of Machinery to the War Department.

"Probably no more competent writer than Professor Anderson could have been found to treat of these subjects, and to lay them out in such a manner that the young mechanic or engineer can readily make their acquaintance; and those who wish to rise above the mediocrity of the average artisan must do their best to acquire a knowledge of the facts here presented to them. The book announces with one glance the nature of the materials and the employment of the testing machines. We then have chapters on cast and wrought iron, steel, brass, copper, zinc, tin, and timber; the resistance of materials to tension, shearing, and punching; to transverse strains, and the consequential actions of impact and vibration, a theoretical knowledge of which is essential in all those in any way responsible for the design and construction of iron railway bridges; the practical application of the correct principles which the student will learn in the second part, will enable him to design a bridge, or other structure, of iron, timber, or stone, the parts twice or thrice as strong as they used to be. Most of the experiments which furnished the facts here given were carried out under the direction of Professor Anderson, at Woolwich, and many of the examples to illustrate the principles are taken from actual works recently passed through his hands. The book is full of that kind of information which will play an important part in the immediate future, and is decidedly a valuable addition to the series." - English Mechanic.

Text-books previously published, price 3s. 6d. each: GOODVEY'S MECHANISM, HUXHAM'S METALS, MILLER'S INORGANIC CHEMISTRY, GRIFFIN'S ALGEBRA and TRIGONOMETRY, WATSON'S PLANE and SOLID GEOMETRY, MAXWELL'S THEORY OF HEAT, MERFIELD'S TECHNICAL ARITHMETIC and MENSURATION.

Now ready, in the same Series, price 3s. 6d. ELECTRICITY AND MAGNETISM. By EILEMING JENKIN, F.R.S. L. & E. Professor of Engineering in the University of Edinburgh. London: LONGMANS, GREEN, & Co. Paternoster-row.

SWISS WOOD ARCHITECTURE. Now completed, price 6s. GLADBACH'S SWISS WOOD ARCHITECTURE. 40 engraved Plates, folio, with German Text. By Professor GLADBACH, of Zurich. Boards, price 6s.

WILLIAMS & NORWATON'S CATALOGUE, containing Foreign Architectural Works. Post free, One Shilling. WILLIAMS & NORWATON, No. 14, Hurdstone-street, Covent-garden, London; and 20, South Frederick-street, Edinburgh.

Can prepare estimates, assist at bookkeeping, &c.; or would take the Work of a Builder, Piecework.—Address, W. W. Post-office, Upper Norwood.

WANTED, by a steady, middle-aged Man, a SITUATION as GATE or TIME KEEPER. To see character and other references if required.—Address, A. B. 4, Church-court, High-street, Kensington, S.W.

TO PLUMBERS, BUILDERS, &c. WANTED, by a young Man, a thorough PLUMBER, a SITUATION of JOB. Task work taken.—Address, PLUMBER, No. 3, Mullin-road, Finsbury.

WANTED, by a young Man, of good address, a SITUATION as CLERK of WORKS, or Manager of a Building Business. Has worked at the bench to acquire a practical knowledge, a good draughtsman and estimator, and in every way, both in theory and practice, well acquainted with the business. Aged 25. References from present employer.—Address, A. X. 1, Post-office, Kensington.

TO BUILDERS. WANTED, by a YOUTH, aged 15, a SITUATION in a Carpenter's Shop. He regularly attends the drawing school of art, and has for the last seven months been working a fitting machine at a large West-end cabinet-makers.—Address, R. M. 9, Pall-mall East, S.W.

TO BUILDERS and CONTRACTORS. WANTED, by a Youth, aged 20, a SITUATION in a BUILDER'S OFFICE. Has served three years apprenticeship as a Carpenter and Joiner. Salary not so much an object as a comfortable situation. Where an opportunity would be afforded of gaining a thorough knowledge of book-keeping and of the trade generally. First-class references.—Address, N. V. Z. Post-office, Goring Station-road, St. Leonards-on-Sea.

WANTED, as SHOP FOREMAN, OUT-DOOR FOREMAN, or CLERK of WORKS, a SITUATION, by a thoroughly practical London Builder's foreman. Joiner and address hand by trade. Aged 36. Good draughtsman, and well up in piece-work and machinery of all kinds. No objection to fill up time in the office or at the bench. First-class testimonials from London builders and architects. A personal interview esteemed a favour.—Address, C. K. FRANKLIN, 1, Brand-street, Coleridge-road, N.

TO BUILDERS and CONTRACTORS. WANTED, by a respectable Man, aged 32, a SITUATION, as AGENT, BUILDERS FOREMAN, or Piece-work on large Building or Railway. First-class references. Town, country, or abroad.—Address, H. A. 47, Usher-road, Roman-road, Old Ford, London.

WANTED, by a respectable and well-experienced Man, aged 38, a SITUATION, as FOREMAN or MANAGER, in a Timber-yard or Saw-mill. Thoroughly understood his duties, and has had considerable experience in the management and working of all kinds of wood-cutting machinery, including cabinet and joinery machinery; can undertake bookkeeping and accounts, and willing to undertake generally useful. Excellent testimonials. No objection to country.—Address, A. B. 22, Alexandra-terrace, New-cross, S.E.

WANTED, by a middle-aged Man, a SITUATION, as an ARCHITECT, SURVEYOR, and thoroughly practical BUILDER. References of the highest respectability by architects, builders, and others. Fully qualified to prepare finished and working drawings of every description. Having for the last five years been architect and builder of several of the most superior houses, &c. in the west and south-west of London. Having but recently built a very large mansion not more than twenty miles from Town, the gentleman will reply to any application in reference to ability, &c. of the Advertiser.—Address, A. B. 39, Cliph-stone-street, London, W.

TO ARCHITECTS and SURVEYORS. WANTED, by an ASSISTANT EMPLOYMENT, who has had some years' experience. Is a neat draughtsman, and can prepare drawings from rough sketches. Good references can be given.—Address, B. P. The Priory, Frinton Bridge, Frinton.

TO ARCHITECTS. WANTED, by an ASSISTANT, of seven years' experience, an ENGAGEMENT in London. Can prepare finished, working and detail drawings, some STAIRS of iron, tiles, &c. Salary moderate. Gained a first-class prize in competition for labourers' cottages at the Royal Agricultural Show, W. Manchester. Excellent testimonials.—Address, E. C. 3, Barton New-road, Lincoln.

WANTED, by a good PLUMBER, a SITUATION, permanent or otherwise.—Address, 836, Office of "The Builder."

WANTED, by a practical Man (Carpenter and Joiner) by trade, a SITUATION as OUT-DOOR FOREMAN, who has had the management of some large jobs. Good references.—Apply, B. E. 23, Glynn-street, Vanhall-gardens, Lambeth.

WANTED, by the Advertiser, a SITUATION as MANAGER or FOREMAN, in a good jobbing business. Aged 30. Good references.—Address, No. 6, Office of "The Builder."

TO BUILDERS, CONTRACTORS, and OTHERS. WANTED, by the Advertiser, a RE-ENGAGEMENT as GENERAL FOREMAN. Carpenter by trade. Aged 39. Has done good job in both large and small firms. Town or country, or would go abroad.—Address, H. 2, Chapel-place, Belgrave-square, W.

TO BRICK MANUFACTURERS and OTHERS. WANTED, by an experienced Man, a SITUATION as MANAGER or FOREMAN in a BRICK FIELD, or in any occupation as superintendent of out-door labour. First-class references can be given as to character and capability. Address, S. T. Post-office, Hays, near Uxbridge.

TO DECORATORS and BUILDERS. WANTED, by an experienced and practical Man, a SITUATION, as MANAGER or FOREMAN, in a decorative and building firm.—Address, A. B. 87, Carlisle-road, Kenilworth, N.W.

TO PLUMBERS and BUILDERS. WANTED, by an experienced young Man, a SITUATION as PLUMBER or THREE-BRANCH HAND. Can do plain piecework. References if required.—Address, O. P. Post-office, Fortland-road, Nottingham, W. Will call for it.

WANTED, by an experienced London Foreman, a RE-ENGAGEMENT as GENERAL FOREMAN, CLERK of WORKS, or to take entire Charge of Job. Bricklayer by trade. Just completing a large job in the country. Good references.—Address, A. N. care of Mrs. Cope, Upper Peapoint-street, Seinton, Nottingham.

TEMPORARY ASSISTANCE by a QUANTITY SURVEYOR and MEASURER, practically acquainted with building, drains and cuttings upon contracts measured up. Disputed accounts adjusted. Specifications prepared. Quantities priced. Terms as agreed.—Address, SURVEYOR, 25, Thornton-street, Brighton, S.W.

TO AUCTIONEERS, ESTATE AGENTS, and SURVEYORS. The Advertiser, aged 20, having had experience in office of the above, seeks a RE-ENGAGEMENT. First-class references.—Apply, W. H. F. Post-office, Fulkington.

TO ARCHITECTS and SURVEYORS. The Advertiser, who has had good experience in estimating and superintending works of some size, seeks an ENGAGEMENT. Quantities.—Address, J. W. 6, Great Queen-street, Westminster.

TO BUILDERS, STEAM JOINERY MANUFACTURERS, and SAW-MILL PROPRIETORS.—An energetic SHOP FOREMAN & JOINER, and thoroughly experienced Manager of Wood-cutting Machinery, will be DISENGAGED on the 25th inst. Good draughtsman. Aged 31. References from present employer and leading London firms.—ADDRESS, TEMPLE, 316, St. Paul's-road, Kensington Park, London.

SAW-MILLS.—EMPLOYMENT. S WANTED in the above by a Young Man, aged 24, to WORK FRAME-BENCH or MOULDING MACHINE (four cutters).—Address, W. H. 4, Church-court, High-street, Kensington, S.W.

RE-ENGAGEMENT WANTED, by an efficient BUILDERS CLERK. Accounted to drawings, estimates, prime cost and extra accounts, and measuring up work. Nine years' experience. Age 31.—Address, 838, Office of "The Builder."

TO CARPENTERS and BUILDERS. EMPLOYMENT WANTED, by a respectable married Man. Town or country. Good bench hand. Could take the lead of a job or management of work on an estate. Wages low for a country.—Address, H. F. 17, South-street, New North-road, Islington, N.

EVENING EMPLOYMENT.—AN ARCHITECT'S ASSISTANT is desirous of EVENING EMPLOYMENT in tracing, copying, or drawing from rough sketches.—Apply, by letter, to H. G. E. 2, New-street, Charing-cross, S.W.

TO ARCHITECTS, BUILDERS, ESTATE AGENTS, and OTHERS. EVENING EMPLOYMENT WANTED. Drawings of every description, for buildings or alterations, accurately and expeditiously prepared, copied, or traced. Quantities prepared. Disengaged after four p.m.—Address, A. B. 1, Boscobel-gardens, Alperton, N.W.

CLERK of WORKS.—WANTED, a RE-ENGAGEMENT, by a thoroughly practical and experienced Man. Just completed a large estate in Nottingham, and is at the present time superintending the large Wesleyan Chapel in Mansfield-road, Nottingham. References.—ADDRESS, THOMAS STAFFORD, 59, Gresham-street, Peas Hill-road, Nottingham.

CARPENTER and JOINER.—WANTED, a SITUATION, about to leave some ESTATE or HOUSE, work preferred.—Address, A. B. 1, Bedford-place, Loughborough-road, Brighton.

TO AGENTS and OWNERS of HOUSE PROPERTY. A PLASTERER, of some years' experience, wishes to keep some ESTATE or HOUSE PROPERTY in REPAIR on reasonable terms, for a permanency. Well acquainted with jobbing work.—Address, 876, Office of "The Builder."

A SURVEYOR, aged 29, well up in the usual routine of his profession, and an experienced quantity taker, desires an ENGAGEMENT for three or more days per week.—Address, 874, Office of "The Builder."

ARCHITECTURAL.—WANTED, by a good DRAUGHTSMAN, a RE-ENGAGEMENT immediately. Good references. Terms moderate.—Address, N. Z. 135, Brunswick-street, Chorlton-on-Medlock, Manchester.

TO ARCHITECTS, SURVEYORS, &c. A RAPID DRAUGHTSMAN requires an ENGAGEMENT. Temporary or otherwise. Terms moderate. Address, 290, Office of "The Builder."

TO ARCHITECTS. AN ASSISTANT desires an ENGAGEMENT. Good draughtsman and estimator. Can prepare designs, details, specifications, &c. Good references.—Address, ARCHITECT, 15, Victoria-place, Eastbourne.

A S CLERK of WORKS, SHOP or GENERAL FOREMAN. Efficient and trustworthy.—Address, GARDNER, 318, Strand, W.C.

A S CLERK of WORKS. Energetic and trustworthy. Carpenter and Joiner. Experienced, expeditious, and efficient in practical details.—Address, STRATHFORD, 72, Swanton-street, Gray's-inn-road, W.C.

TO ARCHITECTS and SURVEYORS. AN experienced CLERK of the WORKS, having just completed some large works, is open to an ENGAGEMENT. Good testimonials and references.—Address, O. A. Z. Deacon's Advertising Office, Lendal-street, E.C.

A THOROUGHLY competent ARCHITECT ASSISTANT desires an ENGAGEMENT, either in the Office or as CLERK of WORKS. Is a good draughtsman, both artistic and constructive. Would not object to go abroad.—Address, ARCHITECT, 2, Catherine-street, Finsley, S.W.

THE ASTRONOMER ROYAL. In his report to the Admiralty (Ann. 18, 1870) on Forty Chronometers entered for annual competition, says of M. F. DENT's Chronometer: "This is the finest Chronometer that we have ever had on trial."

M. F. DENT, Chronometer, Watch, and Clock Maker to the Queen. 33, COCKSPUR-ST., CHARING-CROSS. Manufacturer of Astronomical and Planet Clocks.

The Builder.

VOL. XXX.—No. 1556.

The Country Houses of the British Labourer.

CERTAIN public speakers, seeking to discredit and oppose the endeavours now being made to improve the condition of our agricultural labourers, have spoken in such positive language of the admirable manner in which they are now lodged; of the dry, airy, well-drained residences provided for them; and the ingratitude of discontent under such circumstances, that we began to hope the unhealthy holes and foul dens we had visited by hundreds, and in numerous cases described, had at length been razed to the ground, or at least so improved that healthy life and decent behaviour were possible within them. It was time then,

to go out again and see with our own eyes the happy change that had been brought about by labours in which we might fairly claim to have helped. We recalled the close, reeking holes, not high enough to allow a man to stand upright in (either in body or mind), with damp walls, broken windows, rotten floors, no trace of comfort,—places which had gradually stamped the of the occupants every rising hope and content feeling,—

“The countenance worn out
As the garment:”—

and gloried in the notion that a better time had come, and that the better part of man would be a chance. It must have come quickly, though, we thought; for it is not long since we saw hundreds of wretched houses utterly unfit for occupation, whole villages in which everything that could be done to defeat the natural advantages of the place was being done persistently and continuously.

We give illustrations, for example, of some miserable houses at Abergavenny sketched in October, last year.* The view shows a set of wretched dilapidated dwellings in what, we suppose, may be justified in terming one of the principal streets in this town, considering it forms the main road from the railway station, past Breckfield, the residence of Dr. McCullough; and that there is a turnpike gate on the road close proximity to these very dwellings. The sketch is taken just beyond the bridge over the small stream, and at the time the drawing was made there was an immense heap of muck and decomposing refuse on the left-hand side, whilst the houses illustrated are on the right. The picture speaks for itself of the utterly miserable state of these structures, few of the roofs being so high but that a man of ordinary height might easily place his hands upon them. Further up the road, on the left, a house existed at year with a large hole in the thatched roof.

This roof, like many others in the street, was profusely covered with wild flowers growing on the rotten thatch,—a dismal mockery of the squalor and wretchedness to be found within. Nearer the High-street were houses of a still worse description than these now portrayed: we content ourselves for the present with giving a plan of one, with a sketch showing how the house would appear if the front wall and part of the roof were removed. It will be seen that this house (one of a series) consists of two stories (1), ground and first floor, the stairs from one floor to the other comprising four steps only, two having very deep risers to two very shallow ones, as shown: the first deep riser forms the coal-cellar and safe. Such luxuries as bandrails are, of course, unknown; and when the bedroom at the top is reached there remains a dangerous “stair-hole” in one corner. We will not describe what we saw in that room: the time has gone by: we should be told things had been altered since then.

Oh, yes; things are so altered, says one writer, that in Wiltshire “there is scarcely room for further improvement.” “Things are so altered,” says a farmer-correspondent of our own, “that in all Somersetshire you could not now find such places as you described a few years ago.” Well, we have been into Somersetshire,—not last year, but last week,—and we will try to give our readers a notion of some of the cottages we saw there. The upper view* represents four human habitations at Wincanton, the property of a considerable land-owner living in the neighbourhood. That there might be no exaggeration, the front was photographed (the sun never lies), and our illustration is a copy of the photograph,—with this difference, that it gives too pleasant an aspect to the wretched huts. Inside the rooms it was unfortunately impossible to catch sufficient of the sun to do similar work;—the wise rays would not enter. The houses may be called Nos. 1, 2, 3, and 4, beginning at the left hand.

No. 1 is occupied by a man, his wife, a grown-up son, and six young children; No. 2 contains an old man and his wife; No. 3, a man, wife, and seven children; and No. 4, two men, one woman, and three children.

The living-rooms are generally without plastering, that on the walls having been knocked off; the ceilings look as if they had never been plastered. The living-rooms of Nos. 1 and 2 are about six feet in height; the others are about 7 ft. The floors were once paved with rough stone in irregular pieces, but at present the stones are split into bits, many less than the size of a hand, and there are some holes in the floor 1 ft. square. The state of dilapidation of the whole is beyond description. The bedrooms appear to have been only partially plastered, and for the most part are now bare to rafters and thatch; there are many holes through the rotten thatch, which let in the rain and show the stars at night to the inmates, who put up umbrellas when it rains. Festoons of cobwebs depend from the rafters in black, thick masses. The side-walls are from 2 ft. to 2 ft. 9 in. in height. The floors and stairs are in such a state that one would hesitate to walk on them, for fear of falling through. The condition of some of the rooms is such that they cannot be occupied, so that the crowding in others must be pretty considerable. The fearful state of ruin, dirt, and squalor that prevails cannot be easily described. These “homes” have no back-doors. As to drainage, we observed some holes in the ground, near the entrance-doors, into which the refuse from the houses appears to be poured. The rains had penetrated No. 2, so that the living-room floor was a pool of water. The drinking-water used by the people is obtained, we believe, from a “pit” dug out of the garden

near No. 4; and this, we were told, is sometimes covered with a green scum. There is one “convenience” for the whole; and for the discouragement of notions of delicacy, it is in a conspicuous situation, right facing the houses, at a distance of some few yards. The door of this place faces the dwellings, and is at the side of the path leading from the road to the houses. It empties into a ditch, and distributes its odours with perfect impartiality.

Has the owner ever visited these dens? We can scarcely believe it, and yet they are in a ring-fence with his other property; within three fields of his own residence. The rent received for these houses, let us add, is 1s. 6d. per week in three cases, and 1s. 8d. in the fourth.

Last week a case of *delirium tremens* was reported to the Wincanton Board of Guardians, and we sent for some particulars of the home of the patient. It is situated in a lane in the town; has a living-room about 12 ft. by 9 ft., and 7 ft. high to the boards of the upper floor; no ceiling; and above there is one room, 12 ft. by 13 ft., and 7 ft. high, containing two beds. In this room generally sleep the man and his wife, three children, the wife's mother, and a young unmarried woman.

Is it much to be wondered at that the husband, a labourer, had fled for comfort too often to the public-house? Sad! but, we assert, not wonderful. At the time of our informant's visit the man was raving mad, occupying one of the beds, and attended on by three other men. The window was closed, the room hot and poisonous; the poor woman looking nearly dead from fatigue. In this house, as in many we had visited, there is no back outlet. In one cottage not far from that last referred to we found a small room in which eight persons usually slept,—rare school for morals; prime shelter for health!

It is really quite wonderful that labourers are still discontented, and do not cultivate amicable relations with their employers.

Postscript.—The sick man is dead. The old woman and the young one have gone out to lodge; the widow and her three children are sleeping in the same room with the corpse.

AN ARCHITECT'S NOTE BOOK IN SPAIN.

WHEN Sir Digby Wyatt went to Spain in 1869 he made a considerable number of sketches, 100 of which have been reproduced in *fac-simile*, and published by the Autotype Fine Art Company.*

The course he took, and which he recommends to those who want to see much in a short space of time, was, as he tells us, from London, *via* Paris, Bordeaux, and Bayonne, to Spain, beginning with Burgos; then successively visiting Valladolid (rail), Venta de Baños (rail), Leon (rail), Zamora and Salamanca (*by diligence* from Leon), Avila (*by diligence* from Salamanca), Escorial (rail), Madrid (rail), Segovia (*by diligence* from Madrid and back), Alcala de Henares (*by rail* from Madrid and back), Toledo (*by rail* from Madrid and back), Cordova (rail), Sevilla (rail), Cadix (*by the Guadalquivir steamer*), Gibraltar (*by steamer*), Malaga (*by steamer*), Granada (rail and *diligence*), Andujar (*diligence*), Madrid (rail), a second time, Guadalajara (rail), Saragossa (rail), Lerida (rail), Barcelona (rail), and Gerona (rail); thence to the frontier *by diligence* and home by rail, *via* Perpignan, Carcassonne, Toulouse, and Paris. Each sketch has a critical notice accompanying it with reference to the salient points of interest in the subject selected. Good reason is given to show the desirability of such records. The ancient monuments are fast disappearing:—

* The beautiful Moorish decorations of the Alcazar at Segovia had been all but entirely destroyed by fire, attributed to the careless cigar-lighting of the cadets, to whom the structure had been abandoned. The finest old mansion in Barcelona, the Casa-de-Gralla, probably the masterpiece of Damián Forment, and dating from the commencement of the fourteenth century, has been pulled down by

* An Architect's Note Book in Spain, principally illustrating the Domestic Architecture of that Country. By M. Digby Wyatt, M.A., Slade Professor of Fine Art in the University of Cambridge, &c. Autotype Fine Art Company, 36, Rathbone place, London.

* See p. 616.

* See p. 946.

the Duke of Medina Celi to form a new street. The beautiful wooden ceiling of the Casa del Infante at Guadalajara, the finest of its kind in Spain, in the absence of its owner, who I was told lives in Russia, is coming down in large pieces; and once fallen, I scarcely think it will be in the power of Spanish workmen to make it good again. The exquisite Moorish Palace of the Generalife at Granada, second only to the Alhambra and the Alcazar at Seville, is never visited by its proprietor, and is now one mass of whitewash, a victim of the zeal for cleanliness of a sanitary "Administrator." In short, to visit a Spanish city now, by the light shed upon its ancient glories by the industrious Ponz, is simply to have forced upon one's attention the most striking evidence of the "vanity of human things," and man's inherent tendency to destroy."

Other interesting buildings are diverted from their original uses. The college at Alcalá de Henares is turned into a young ladies' boarding-school; the Convent of the Knights of Santiago, at Leon, the masterpiece of Juan de Badojoz, and one of the finest buildings in Spain, is now in charge of a policeman and his wife, awaiting its possible conversion into an agricultural college; the Palace of the Dukes of Alva, at Seville, is let out in small tenements, and affluently whitewashed; the Colegiata of San Gregorio at Valladolid, and the old cathedral at Lerida, the richest Byzantine monument in Spain, are now both barracks; the exchanges of Seville and Saragossa are generally shut up; the "Casa de los Abades," at Seville, is converted into a boys' school and lodging-house for poor tenants; the Casa del Infante, at Saragossa, containing the most richly-sculptured Renaissance Patio in Spain, is chiefly occupied as a livery-stable-keeper's establishment; Cardinal Mendoza's famous Hospital of the Holy Cross, at Toledo, is now an infantry college; the great Monastery of the Cartuja, near Seville, with one of the finest Mudejar wooden ceilings in the country, is turned into Pickman's china factory; and the "Taller del Moro," a Moorish house with beautiful decorations, at Toledo, is now a carpenter's workshop.

We shall best show the amount of information which is to be found in the book by skimming through it and condensing a few passages from the author's own words. We just now mentioned a "Patio." The patio is the most striking feature of all important Spanish houses. It is an internal courtyard, perpetuating the atrium of Roman architecture, with its impluvium and compluvium, and corresponding with the ordinary cortile of the Italians. It is usually rectangular in plan, and entirely surrounded upon at least two stories by arading, behind which run passages, and into these open the doors of every principal set of apartments of the house. There are rarely many windows in the walls of the patios, as the rooms generally occupy the whole width intervening between the patio walls and the external walls of the house, from which the light is mainly derived. There are, however, usually more windows on the lower story of the patio than on the upper, since the chief alcoves requiring most light were on the first floor, while much of the lower floor was occupied, as was also usual in Italy, by retainers, servants, poor guests, mendicant friars, and administrators,—to say nothing of mules and horses, with stores and munitions of all sorts. Of several of these patios Sir Digby gives sketches.
