The three features which distinguish the measure of legislation now under discussion in the House of Commons, viz., that the State shall pay half the salaries of the medical officers of health and of the sanitary inspectors, and shall, before the appointment or dismissal of any officer, inquire into his merits or demerits, and that the State shall advance money to local authorities for the construction of those works required by the necessities of the public health at a low rate of interest, are all sound in principle, and the measure, taken as a whole, has but this defect, that it proposes to pay only half the salaries of these officers. To begin with, the effect of their work is not local, but national. It is their office to prevent disease, and chiefly so in the poorer districts. Disease prevented amongst the labouring population means an increase of national wealth, independently of the benefits accruing to the individual by the absence of sickness. When such works and regulations are devised to rid the atmosphere in which a labouring population live of those foul emanations which induce low fevers and other forms of illness, the people go merrily to their work; they live more contentedly at home; there is less crime and less pauperism. To reduce the amount of crime and pauperism is a national work. The sanitary inspector and the medical officer, taking them together, are the prime movers in accomplishing this desirable end. Render them independent of local influence, and you take the first step towards a real improvement of the public health. Now, a long acquaintance with local boards, town councils, and other local sanitary authorities has made us aware that the question of salary of a public officer, whether it be much or little, is made the ground of factions contention, quite irrespective of either the merits of the officer or the amount of his salary. It is not the amount that troubles them, but the payment of any salary at all; and once the appointment made and a salary fixed upon, it remains a standing bone of contention over which factions try to get the better of each other, out of pure resentment and personal opposition which arise from causes wholly independent of the incident which gives them the opportunity to quarrel. That this contention should be obliged to be made of the actions of local boards as at present constituted is grievous, but it is only too true. And what are the public interests over which they contend? These, probably: whether the rate required shall be laid in the pound or whether it shall be 2d., for the supervision of the conditions upon which the health and welfare of the population chiefly

depend. Or, to put the calculation in another form, whether the charge for that supervision shall be 1s. 6d. per house per annum or whether it shall be 2s.

The salaries of the sanitary inspector and the medical officer, taken together form no real burden upon the local rates at all commensurate with the benefits received, but they do afford opportunities to the local authorities to wrangle amongst themselves, and keep up perpetual ill-will. Therefore, we say, let the local authorities be relieved altogether of this disagreeable situation, and let these officers be wholly officers of the State. This, of course, would lead to the appointment of those officers solely by the Local Government Board. So much the better. The sanitary inspector is the right-hand of the medical officer. He is the forerunner of the actions of the other. Together they perform a national work. They should have no local interests whatever. They should not depend, even partially, for their appointment, and for their continuance in office, upon the favour of the inhabitants amongst whom they administer the sanitary law; for they bring wealth into the national exchequer just as well as revenue officers do; and surely the health of a people is as much worthy of the protection of the State by the payment of persons to do that duty as is the payment of an army and navy to protect their lives and property. Indeed, without the one the other is of but little value.

Might it be said that this would be an interference by the Government with local interests? Well, it is admitted that it would be an interference, but not with strictly local interests. And it is a necessary interference. The favour with which even this proposed half-measure of the Government is received by both sides of the House of the people's representatives, and the popularity of the measure in the country generally, show how much such interference is desired; and we feel well convinced that the measure would be of greater popularity if it were made complete by the appointment and pay of the two sanitary officers in question being left solely in the hands of Government. If the inhabitants of any locality, in council assembled, should have any real ground of complaint of the actions of these officers, nothing can be easier than to appeal to the Local Government Board to cause an inquiry to be made into the merits of their complaint, and nothing easier for that officer and replace him. The Department must feel it to be a part of its public duty to take the responsibility of these details, in order to make the interference of the State in this great national affair of any real use and benefit to the people. These things which affect the health of the people have been managed solely by local authorities now long enough to have proved the weakness of men, and their ignorance of the true interests of even their own locality; and the time has come when an improvement in this respect must be made. Then let that improvement be made in accordance with the knowledge we have gained, and thoroughly, as with confidence in ourselves. To do this much cannot, surely, be temerity. After an accumulation of facts which afford a sure basis upon which to act, a bold stroke saves a deal of confusion thereafter, and saves the wound from which we suffer.

There are reasons why this Bill should be passed this session, notwithstanding that it cannot be said to be a complete Public Health Bill, and confessedly so by its promoters. Nevertheless, it is one step on the line of policy that we must quickly pursue, if we would avert alarming dangers to the State. We, therefore, confine our remarks at present to the few enactments of the proposed measure.

It will tend to preserve the true line that we must pursue if we begin with a true appreciation of the qualities which the two officers named should possess. In the medical officer (which, by the bye, is a misnomer, for he should be called the chief health officer) we want not a physician, but a physician and a chymist. To cure persons of disease they may have contracted is not his office,—that is the business of physicians; his sole work is to prevent disease. If he is well acquainted with the conditions produced in men, women, and children, by living upon a damp soil; if he knows by examination whether a soil is too damp or not to satisfy the conditions of health; if he knows what is the smallest space of a sleeping apartment that satisfies the same conditions; if he can analyse the atmosphere, and ascertain with tolerable

certainty what is in it, and knowing what is in it, whether and to what extent it is injurious to health; if, on finding a deleterious atmosphere, he can point to the cause of it; if he has given his attention to the study of these things rather than to the cure of disease—he shows the first signs of qualification for the office of chief health officer.

Then what do we want in the sanitary inspector? We want less scientific knowledge and more industry. This man must have a conviction that the work he is doing is no ordinary work, and he has almost to create in the public mind an appreciation of what his work consists of; for it is certain that a great many of the people he meets with do not see at present what his work really consists of; yet the last thing he must do is to do nothing because he is not appreciated. His faith in the importance and usefulness of the unpleasant work he has to do must spring from conviction. He is to take one straight course, and that is, to carry out the instructions of the chief health officer without fear or favour of the inhabitants amongst whom he works, and yet, of course, civilly. He sees whether the houses are properly supplied with water, and takes doubtful samples to the chief officer for analysis. He gives notices to whom it may concern to remove nuisances. He disinfects whatever the chief officer orders to be disinfected. The scavengers are under his charge. He reports the want of drainage where there may be none, and the defects of existing drains. If a house-drain is not properly ventilated according to rules laid down by his guidance, he reports that, and he will probably find this to be the state of things in nearly every house-drain.

He is to lead people in his intercourse with them on their own premises, to get out of dirty habits into cleanly ones. He is to be no tyrant or jack-in-office, but a counsellor of the ignorant.

The whole result of his work may never be known, but if it is faithfully performed, one outward sign will be that the people will look upon his inspections, not as meddling with their rights or liberty, but as work that is tangibly useful and beneficial to themselves.

The condition of the labouring population must be raised, by no violent means whatever, but by their own efforts. As long as their homes are dirty, from whatever cause, and they are sick and overcrowded, they will make no effort. They do not know what to do even when they are willing. But the sanitary inspector may do many things to direct them to study whatever common things of interest may be about them, and there is always something or other of interest everywhere. The more general knowledge he has then, providing it be sound, the better will he fulfil his office. The sanitary inspectors of the country may be looked to to make a practical beginning of that which must be done,—the elevation of the condition of the labouring population. They, therefore, deserve the utmost consideration and encouragement that the State can give them.

"RECOLLECTIONS AND REFLECTIONS."

UNDER this title, Mr. J. R. Planché, dramatic author and antiquary, has produced two very charming volumes, calculated to do something more than amuse.* The writer calls his work a Professional Autobiography: it bristles with amusing anecdotes and witty sayings; brings before the reader all sorts of well-known persons, and carries him along with delightful vivacity. When we read at the commencement, "To my dear grandchildren I dedicate these recollections of a life, the decline of which has been cheered by their smiles and blessed by their affection," we feel sure that we shall not find a thought or a word to offend the purest mind; and when we reach the end we rejoice in the justice of our impression. Beyond the pleasant relation of pleasant things, Mr. Planché discusses many matters of serious interest to all lovers of art: we have "Reflections" as well as "Recollections;" and as his anecdotes will doubtless be quoted in many pages, we shall confine ourselves in what we have to say to the more serious parts of the book. Many will hear for the first time that dramatic authors owe to him their first protective Act. His drama, "Charles XII.," proved a great success, as every one knows. The piece not being printed and published, which at that period would have entitled any manager to perform it without the

* London: Tinsley, Brothers, Catherine-street Strand, 1872.

author's permission, Mr. Murray, of the Theatre Royal, Edinburgh, wrote to inquire upon what terms he might produce it. The author named the very moderate sum of ten pounds, which Mr. Murray admitted he was perfectly justified in asking, but declined paying, on the plea that since the introduction of half-price into the provinces, the expenses attendant on the production of afterpieces was barely covered by the receipt they brought. This was all very well; but Mr. Murray had the dishonesty to obtain surreptitiously a MS. copy of the piece, and the effrontery, in the face of the above excuse, to produce the piece, without permission, at *whole price*, leaving the author to his comedy. He did not bring an action against him, but asked Poole, Kenny, Lunn, Peake, and some others of the working dramatists of the day, to dine and talk the matter over; and it was agreed that steps should be immediately taken to obtain the protection of an Act of Parliament. The Hon. George Lamb, at Melhourne House, was called on, and he kindly consented to bring in a Bill for that purpose. He did so, but was unable to get it through the third reading. Mr. Lytton Bulwer, now Lord Lytton, then took it in hand, and succeeded in carrying the measure through both Houses. It received the Royal assent June 10, 1833 (3rd of William IV.), and though, from the difficulties of enforcing it against managers who are unprincipled enough to resort to any means by which they can evade payment, it does not enable the author to—

"sit at ease,
Under the shade of his own laurel trees,"

as was more poetically than truthfully stated in the prologue to his lordship's play, "The Duchess de La Vallière," it must be thankfully acknowledged that it has greatly improved the dramatic writer's position, by giving him an indisputable control over his own property; and managers have to thank the unworthy conduct of one who was considered the most respectable of their fraternity, for the existence of the first Dramatic Authors' Act.

On the introduction of the Bill, an outcry was raised by the country managers of their inability, in the depressed state of theatrical affairs, to bear any, the smallest, additional burden. Upon the same ground it might have been argued that a man who could not afford to purchase goods to retail was entitled to steal them. Mr. Planché says "the great champion of these dissentients, Mr. Wilkins, an architect [could it be Wilkins of the National Gallery?], and proprietor of several provincial theatres, declared before the committee of the House of Commons that, in his opinion, no modern dramatist, Mr. Knowles perhaps excepted, deserved to be paid; while, in the same breath, he admitted that nothing but the melodramas and other pieces successfully produced in London by the writers he was insulting would draw money in the country."

The position of the dramatic author in England is much improved since then, but is still far inferior to that of the dramatic authors in France, and calls for consideration.

In connexion with endeavours made to improve the costume of the stage, Mr. Planché gives various anecdotes to show that some of our greatest painters, poets, and novelists were, as far as regarded a correct idea of the civil and military costume of our ancestors, involved in Cimmerian darkness. To Sir Walter Scott the honour is due of having first attracted public attention to the advantages derivable from the study of such subjects, as a new source of effect as well as of historical illustration; and though his descriptions of the dress, armour, and architecture of the Anglo-Norman and Medieval periods are far from correct, those in the romances and poems, the scenes of which are laid in his own country or elsewhere during the sixteenth and seventeenth centuries, are admirable for their truth and graphic delineation; but though writers of fiction, inspired by his example, took more pains to acquire information on these points, painters continued to perpetrate the grossest absurdities and anachronisms, often knowingly, under the mistaken idea that they were rendering their productions more picturesque. Did West, the President of the Royal Academy, render his composition more picturesque by representing Paris in the Roman instead of the Phrygian costume? Did Etty gain anything by placing a helmet of the reign of James or Charles I. by the bedside of Holofernes? As our author remarks:—

"Is it pardonable in a man of genius and information to perpetuate errors upon the ground that they may pass

undiscovered by the million? Does not the historical painter voluntarily offer himself to the public as the instructor of habits and manners, and is he wantonly to abuse the faith accorded to him?"

As an example of the extraordinary hallucinations which occasionally possess artists of first-rate ability, my old friend John Liston called on me one day and flattered me by expressing the request of Sir David Wilkie, who was a connexion of his, that I would pay him a visit at Kensington and see his great picture (now so well known) of 'Knox preaching to his Congregation,' before it was sent to the Royal Academy for exhibition, in order that I might point out to him any real inaccuracies in the time of the figures he had introduced. I accompanied Liston with great pleasure, and on being shown the picture, immediately pointed out to Sir David that the armed men in the gallery were depicted in helmets of the time of Charles I. or Cromwell, instead of those of the period of his subject. His answer was that he intended to represent persons who were curious to hear the discourse of the preacher, but did not wish to be recognized, and therefore came in armour. I could not help smiling at this explanation, and asked him wherefore, as such was his intention, he had not given them the helmet of the sixteenth century, which when the vizor was closed, effectually concealed every feature, in preference to that of the seventeenth, with its simple nose-guard or slender triple bars, which allowed the face clearly to be seen? He mused a little, and then half-promptly to make the alteration; but he didn't, and there is the picture and the engravings from it handed down to posterity with a wild anachronism which diminishes the effect, whilst it utterly defeats the object of the painter!

At the close of the first volume a remarkable correspondence with Mendelssohn is printed, and should interest the admirers of the composer. It seems to show that he feared to commit himself to the production of an opera; and gave bad reasons, rather than none at all, for not fulfilling an engagement to that effect.

The value, or otherwise, of the part played by the Lord Chamberlain in connexion with the stage is discussed by Mr. Planché at some length. Under present arrangements, a copy of a new piece is duly sent to the licenser, and not performed till the official permission is received. But are the alterations and additions, however important, ever submitted to him? Are his directions as to the omissions which are to be made invariably attended to? Does he ever ascertain personally or by deputy that his request has not been complied with, or that some new matter which he would have objected to, has been introduced? And if he do ascertain, are any steps taken to compel the manager's obedience to the official mandate? It is notorious that such is not the case. Then what is the use of law? asks our author. What is the value of the regulation to the morality of the drama, or the preservation of the peace of our sovereign lady the Queen? Any profane expression or indecent situation, any coarse allusion or personal insult to those in authority over us, may be, and has been, foisted into a burlesque or a pantomime after its performance has been sanctioned by the licenser; and, in the recent instance of the Christmas harlequinades, it is well known that the examiner's directions to omit the common-place jokes upon certain members of the Cabinet, while they gave rise to considerable acrimonious correspondence in the daily journals, and some mild expostulations from the honorable and amiable gentleman who is the present occupant of that responsible and important office, the examiners of plays, were never paid the slightest attention to, but continued to be uttered and to excite the roars and plaudits of the galleries to the last night of the representation. Is such a state of things creditable to our legislation in the nineteenth century? There can be no escape from the horns of dilemma; either the regulations are just and reasonable, and compliance with them should be strictly and invariably enforced, or they should be rescinded, as either no longer necessary, or incapable of being carried into effect.

Our author nevertheless arrives at the conclusion that the censorship of the drama is necessary, and that we had better leave things as they are—in a sort of indeterminate condition.

We have before now drawn attention to the very unsatisfactory manner in which the national armoury is managed, and Mr. Planché has in our pages set forth his views on the subject. He returns to it in these volumes, and shows indisputably the necessity for improvement:—

"The Tower armoury is self-supporting. The money received for its exhibition renders it unnecessary to go to the House of Commons for assistance. The purchasing power already exists; it is the misapplication of the calls for remedy. More than enough is taken annually for the payment of the requisite officers and attendants and the purchase of antiquities. The surplus is now transmitted to the Paymaster-General. I believe, I respectfully submit that every penny received from the public for admission to the armoury should be expended in its improvement and preservation. In calling attention to these circumstances, I feel I am performing a duty to the public generally, as well as to that literary and antiquarian portion of which I have been for upwards of forty years a humble but hardworking member."

It is annoying to hear of the losses that have

been suffered under the present arrangements. Amongst others, they include:—

The complete suit in which Sir Philip Sidney was killed at the battle of Zutphen, the embossed figures on which were of solid gold. This national and magnificent relic was at Strawberry Hill, and is now at St. Petersburg.

A hearse of the time of King John, now at Warwick Castle.

The gambutes of a fine suit, made for King Henry VIII., now in the Tower, imperfect from their absence. They had found their way out of the Tower, and on being brought back to it were ignored and refused by the authorities, and are now at Grimston.

A most singular ancient helmet, probably as early as the time of Stephen, if not actually the helmet of that monarch, or his son, now in the Musée d'Artillerie, at Paris.

Two other helmets, one temp. Henry III., the other of the fifteenth century, with part of the crest remaining.

At the time these curious relics were rejected, a helmet, newly made at Vienna for theatrical purposes, was purchased at the price of 50*l.*, and is now in one of the glass cases at the Tower.

The only armour at Alton Towers that could possibly have belonged to the great Talbot was suffered by some gentleman sent down by the Tower to pass into the hands of dealers.

The hack plate, a most elegant specimen, sold for 10*l.*, and is now in the collection of Lord Londesborough, at Grimston.

A chapel de fer of the twelfth century (unique), now at Geneva.

Mr. Planché concludes his work with his letter on the want of a national theatre, elicited by some observations to that effect made by the conductor of this journal, and which we printed at the time. Mr. Tom Taylor also wrote on the subject, and several meetings were afterwards held to discuss the steps that could be taken in furtherance of the movement. Nothing, however, has yet been done; "but there are unmistakable signs," says our author, "of the awakening of a better spirit, and I have not abandoned the hope that the metropolis will, ere long, be enabled to boast a theatre in which the rising generation will enjoy, not spasmodically, but regularly, the best plays, acted with intelligence, and placed on the stage reverentially and artistically. How is it, I ask again, that Government has never appeared to comprehend that such a theatre would afford the greatest assistance to the cause of education, which it professes to have so deeply at heart?"

Here, however, we must stop, and have not space to do more than commend to our readers this very interesting and valuable budget of "Recollections and Reflections."

ARCHÆOLOGICAL EXCURSIONS.

Suffolk Institute of Archaeology.—The scene chosen by the members of this institute for their annual summer excursion was the sparsely populated tract of country surrounded on three sides by the Ald, the Ore, and the Butley rivers, which, however, contains several buildings of unusual interest. The rendezvous was at Woodbridge Railway Station, where a party of about thirty—hardly so numerous as usual—assembled under the presidency of Lord John Hervey. They visited Butley Priory, Chillesford Church, Sudbourne Church, and Orford Castle and Church. At Butley, a paper on the Priory was read by Mr. R. J. Day. At Sudbourne, Mr. Plipson was their *cicerone*. Under the lee of Orford Castle, the president, Lord John Hervey, read a paper on the Castle, after which luncheon was partaken of in the Castle. The party, after visiting Orford Church, returned to Woodbridge. There was a little rain during the excursion, but never heavy enough to be unpleasant.

Cumberland and Westmoreland Archaeological Society.—This society had their second expedition for the season on Friday week. The party started from the Citadel Station at Carlisle in the morning for Burgh, and there visited the church; afterwards to Newton Aycliffe Church; and thence to the Abbey at Holme Cultram. Notwithstanding that the weather was beautifully warm and fine, and the programme laid down very attractive, the attendance was exceedingly small. Only three gentlemen—Mr. Browne, Dr. Lonsdale, and Mr. Charles Ferguson—started from Carlisle, and they were accompanied by two ladies. On arriving at Burgh they were joined by a few others. At Burgh, Mr. Charles Ferguson read a paper on the Church formerly prepared by Mr. Cory, and

published and entered on the records of the society. On reaching Newton Arlos, the members at once repaired to the church, where the Rev. W. M. Shepherd pointed out the prominent features. On the top of the tower the Rev. T. Lees read an extract from Lysons's "History of Cumberland," describing the church as it was, and also exhibited a sketch of the ruin as it stood in 1816, before its restoration. Major Ferguson, of Morton, joined the party at Abbey Town. Mr. Charles Ferguson read a paper on the old edifice. Mr. Ferguson then took the party round the church, and pointed out the extent it formerly occupied. After a conversation in the yard of the Abbey concerning its former grandeur, the party, wended their way to the station, and thence by train to Carlisle. Several of the members dined together at the Comity Hotel in the evening.

THE WIMBLETON PARK ESTATE.

WIMBLETON is a charming suburb, and has many attractions. It has a history and associations, as well as natural beauties, and Mr. S. C. Hall, F.S.A., has written an interesting little book about it (now before us), including a number of illustrations.* The real object of the publication, as is properly set forth, is to assist in making known the fact that the Wimbleton Park Estate, late the residence of Mr. John A. Beaumont, is about to be divided for building on; and in pointing out its beauties. The little book, however, does much more than this, and affords some pleasant information. The Roman earthwork, known popularly as Caesar's Camp (the destruction of which, by the way, is just now threatened) shows how early Wimbleton was occupied, and to the next great era, that of the Anglo-Saxon period, it owes its present name, which is stated to be derived from its possessor,—*Wibba, Wimbold, or Wymbald, and dure or dun, a hill or fortress.* † "Wibbandune, now called Wimbleton," says Camden, stands on the other bank of the Wandie, where, when long prosperity had produced civil wars among the Saxons after their contests with the Britons were ended, Ethelbert, king of Kent, first sounded the alarm against his countrymen; but Canlin, king of the East Saxons, fortunately defeated him here, with great slaughter, having slain his generals Oslac and Cnochen, from which last, probably, the fortification to be seen here was called Bensbury, for Chensbury.‡ Subsequently Wimbleton passed into Danish hands.‡

At the time of taking Domesday survey, Wimbleton appears to have been included in the manor of Mortlake, and belonged to the see of Canterbury, and was seized by Bishop Odo, Earl of Kent. In 1320, during the time of Archbishop Reynolds, that prelate was called upon to pay 20s. for half a knight's fee in Wimbleton on the marriage of the king's oldest daughter, and in 1327 it is described as a grange belonging to Mortlake.

In 1398 the estates of Archbishop Arundel were seized and confiscated, and at this time there appear to have been two capital mansions, one with a park at Mortlake, and the other at Wimbleton,—the former an ornamental residence of the archbishop and of the king, and the latter a grange with part of the demesne lands attached. These were afterwards restored to the archbishop. The Manor of Wimbleton ceased to belong to the Archbishops of Canterbury, in right of their office, during the reign of Henry VIII., having been exchanged, by compulsion or otherwise, by Archbishop Crammer with Henry VIII., for other lands; but by special grant of Queen Mary it was afterwards assigned to Cardinal Pole.

Wimbleton, continues Mr. Hall, "having in this manner become the property of the Crown, was, about 1533, given to the royal favourite, Thomas Cromwell, Earl of Essex, who thus became owner of the place, where he, the son of a Wimbleton blacksmith, first drew breath. The father of Cromwell appears to have lived in what, in 1617, was described as 'an ancient cottage,

called the blacksmith's shop, lying west of the highway leading from Putney to the Upper Gate, and on the south side of the highway from Richmond to Wandsworth, being the sign of the Anchor,' and it was here that this strange child of fortune was born."

It came back to the Crown when Cromwell's estates were confiscated, and after various vicissitudes was sold to Sir Theodore Jansen, one of the South Sea directors, in 1717.

After the failure of Jansen, Wimbleton was purchased by Sarah, Duchess of Marlborough,* for 15,000*l.*, and became one of the favourite retreats of that beautiful woman (so well known, first as Sarah Jennings, and next as "Mrs. Freeman," before her marriage with the duke). She died here in 1744. By the duchess, the Wimbleton and other estates were devised to her favourite grandson, John Spencer (youngest son of Charles, Earl of Sunderland), whose son was created Baron, Viscount, and Earl Spencer and Viscount Althorpe. In this family the manor has remained ever since, the Manor House and surrounding park and estates having been sold by the Spencers in 1846 to their present owner, Mr. Beaumont.

William Benson, the "Bold Benson" of Pope, architect to the Crown; Charles James Fox, Sir Francis Burdett, John Horne Took, William Wilberforce, and scores of other well-known men have resided here.

Concerning the present church, Mr. Hall says it was erected about 1543, from the designs of Messrs. Scott & Moffatt, in reality from those of Mr. G. G. Scott, R.A., and is understood to be "his maiden effort." It took the place of a very ugly affair, erected, with the exception of the chancel, from the designs of Mr. Holland, in 1786, on the site of the ancient church.

Some of our readers may thank us for directing their attention to this Wimbleton Estate. We speak from our own knowledge when we say it is a very charming place, and ought to be looked after.

RESTORATION OF HATFIELD CHURCH.

THE parish church of St. Etheldreda, Bishop's Hatfield, which, through the munificence of the Marquis of Salisbury, has undergone an extensive and thorough restoration, was re-opened by the bishop of the diocese on St. Peter's Day. The church, said to be the largest in the county with the exception of St. Alban's Abbey, was before the restoration disfigured by high pews and unsightly galleries, and the building had fallen into a state of extreme dilapidation and decay, when Lord Salisbury generously determined to take in hand the work of reparation at his own cost. Large portions of the edifice had to be taken down and entirely rebuilt.

The plan of the church comprises a nave, 102 ft. long by 30 ft. wide, with north and south porches, and an embattled tower at the west end; a chancel, 41 ft. long by 20 ft. wide, with chapels on the north and south sides; and north and south transepts with aisles. The nave was of the Decorated period of Gothic, the tracery of the windows being of the kind known as reticulated. A soft kind of stone (Chunnel) had been used for the mullions, tracery, and other portions of these windows, which were in such a state of decay that nothing short of entire reproduction in new stone was found practicable; the old mouldings and tracery have, however, in all cases been strictly adhered to. The open porches are also new, made of oak taken from the old roof. The external walls are faced with flint.

The tower has not been affected to any material extent. The ringing-floor of the belfry has been done away with, so that the bells are now rung from the floor of the church; and the memorial tablets, which were formerly placed in various parts of the church, are now to be found all collected together on the walls under the tower.

In the north and south transepts, windows of a debased style have been replaced by two fine four-light windows; and in the east wall of the south transept a curious discovery has during the progress of the work been made of what was apparently the east end of an early church or chapel; fragments of other interesting objects

* Mr. Beaumont has a picture of Sarah, Duchess of Marlborough, by Sir Godfrey Kneller. It represents her as very beautiful; certainly she was so when the fascinating Sarah Jennings of the Court of Charles II. On the back of the picture, in an old handwriting, is the following:—"Sarah Jennings, Duchess of Marlborough; Sir Godfrey Kneller, painter. This portrait was declared by the Duchess herself to be the best ever painted of her."

have also been brought to light, among which are two piscine, a very handsome one in the south wall of the chancel, and another in the east wall of the nave, which have been restored.

The south transept, which is the most ancient portion of the church, contains a circular arch (late Norman or Transitional), and the piers supporting it furnish an excellent specimen of the same period.

The chancel roof timbers were found to be sound, but of a very rude description; the ceiling has been decorated at the cost of two of the parishioners, Dr. Drage and the Rev. C. J. Robinson, and the decoration of this and the other ceilings has been executed by Messrs. Bell & Almond. The chancel arch has red Mansfield shafts and foliated capitals.

The east window has been restored, and filled with stained glass, the latter being the gift of several members of the Salisbury family, in memory of the late Marquis and Marchioness of Salisbury, and of the late Viscount Cranbourne. The subject, "The Ascension," has been ably treated by the artists, Messrs. Clayton & Bell.

The window in the north transept aisle was given by the youthful family of the Marquis of Salisbury, and the servants of the household.

The window in the south chancel wall was given by Mr. T. G. Barclay, who was also the donor of the Communion pavement.

The west window in the south transept is the gift of Mr. Webb, of Hatfield, and members of his family, in memory of their father and mother.

The new reredos, constructed by Mr. Earp, of alabaster, Caen stone, and marble, is the gift of the Rev. C. J. Robinson and Dr. Drage; the carved group in the centre compartment represents the three Marys at the Cross, and the figures on either side are those of St. Etheldreda (the patron saint of the church) and St. Alban. The sculpture is relieved by a background of mosaics, executed by Salvati.

The chapel on the south side of the chancel is the property of Mr. Wynn Ellis, and has been restored at his expense. The roof timbers which were concealed by an unsightly plaster ceiling, have been exposed and decorated with colour; and the windows restored with tracery of appropriate character. The chapel contains several monuments of the Brocketts and Reads, of Brocket Hall.

On the north of the chancel stands the Salisbury Chapel, erected by the first earl, in the reign of James I. His own monument stands at the east end of the chapel, and, it is reported, was ordered by himself when travelling in Italy. The sculpture is certainly unlike the work produced by English sculptors at that period.

The chancel is fitted throughout with oak seats (all exactly alike, whether for rich or poor), and will accommodate between 700 and 800 persons, including children.

The font, which is of carved Tisbury stone, is circular, supported by clustered shafts of various coloured marbles, and is the gift of the Marchioness of Salisbury. The pulpit, given by Mr. Wynn Ellis, is of Caen stone and marble; the figures in the niches are those of the four evangelists, St. Peter, and St. Paul. Both this and the font have been carried out by Mr. Earp, from the designs of the architect. The figures and foliage have been skillfully treated.

The design of the lectern consists of a stately eagle, with four lions at the base. It was made by Messrs. Cox, of Southampton-street, the cost being defrayed by the rector, the Hon. and Rev. W. C. Talbot.

The general works have been carried out by Messrs. J. & C. P. Anson, from the designs of Mr. David Brandon, F.S.A.; Mr. A. King being clerk of works.

THE BRADFORD NEW COVERED MARKET.

THE new Market building approaches its completion. The exterior, as seen from Kirkgate, is ornamental. The style of architecture adopted is Italian. In the centre of the facade is the principal entrance, which consists of an archway enclosed by a sliding gate, provided by the Colebrook Dale Company. The sculpture of the brackets above the gates has been executed by Mr. Keyworth, of London. The design represents Pomona and Flora. Round the exterior: belt of the Market-hall are thirty shops, all of which, so far as completed, have been let. The portion of the building immediately over the gateway displays some elaborate carved work.

* "Wimbleton: Illustrated Details concerning the Parish: its History; Notes of Residents there; with Descriptions of the Wimbleton Park Estate." By S. C. Hall, Esq., F.S.A., &c. London: Virtue & Co., 26, Ivy-lane, Paternoster-row, 1872.

† "Like most places, its name has been variously spelt at different times: we accordingly find Wibbandune, Wipandune, Wymbaldon, Wymbelton, Wymbylton, Wincendon, Wibleton, Wymbleton, Wimbleton."—BARLETT.

‡ "Several tumuli have been opened at different times on Wimbleton Common, but scarcely any vestige of them remains."

A zinc turret has been erected on the top by Messrs. Tylor & Co., of London, and a market-hall has been hung there. A clock, made by Mr. Potts, of Leeds, will be put up in the central compartment of the building. The rooms over the gateway are intended to be used as offices for the superintendent of the market, Mr. Bradbury. Above the shops on the Kirkgate front stretch two stories of offices. The entire frontage to Kirkgate is 150 ft. long, and 50 ft. high.

The market will when finished occupy the centre of the space inclosed by Kirkgate, Darley-street, Godwin-street, and Chapel Court. The portion now nearly completed will form the half of the entire scheme. There are three entrances to the building, each of which is of a distinctive design. The Kirkgate entrance, already described, is ascended by thirty steps of 6 in. each in depth; the entrance from Darley-street is on a level with the street; and the entrance towards Godwin-street will have a descent of thirty steps. The entrance from Kirkgate opens into an octagonal pavilion, 50 ft. in diameter, and gives access to six avenues. A similar dome will also be erected in the upper half of the building yet to be undertaken. The height of the dome is 60 ft. It is supported by ornamented cast-iron pillars, and ventilated by glass louvres. The interior of the hall is chiefly constructed of ornamental ironwork and glass, and decorated in green and gold bronze, relieved by gold colour. The roof, which is 50 ft. in height, is divided into sections and glazed with ground glass, allowing louvres for ventilation.

The interior accommodation comprises thirty-six covered stalls and fifty-two open stalls, with ample circulating space for the public through conveniently arranged avenues.

The lighting of the building is so arranged as to hinder the penetration of the direct rays of the sun. The south side of each roof is covered with slate and lined with felt, and the northern side glazed with obscured ground glass, admitting light abundantly while excluding heat. Round the entire building a series of semi-circular apertures, filled in with ornamental castings, is arranged, by means whereof a considerable amount of light and ventilation is obtained. The illumination of the hall by night will be by means of gaseliers, thirty-six in number, made by the Midland Architectural Metal Company, Coventry. In addition to this, each stall will be provided with gas-fittings.

The floor of the hall is laid with 3-inch flags. The interior shops, to the height of 7 ft., are lined with white glazed bricks.

The northern end of the portion of the market now finished is closed in by a temporary wooden screen, which will be removed when the entire project comes to be carried out.

The mason is Mr. Squire Hildsworth; the joiner, Mr. W. Ilingworth; plumbers, Messrs. Sutcliffe & Wilkinson; plasterer, Mr. J. Tatter-sall; slaters, Messrs. Hill & Nelson; painter, Mr. Pullan; and decorator, Mr. H. Briggs; all of Bradford. The interior fittings of the market, and also of the Kirkgate and Darley-street shops, have been erected by Messrs. J. Ives & Son, Shipley; the general carving of the building has been done by Mr. C. Maw, of Leeds; and all the ornamental ironwork has been modelled by Mr. Benjamin Dixon, of Bradford, from the full-size drawings of the architects. Mr. Wilson is clerk of the works. The architects are Messrs. Lockwood & Mawson, of Bradford and London.

SCHOOL-BOARDS.

Bradford.—The Board have accepted Messrs. J. & W. Beauland's tender for the erection of the school in Whetley-lane, at 7,900l., exclusive of the heating apparatus. In addition to the 7,900l. there will be 300l. for heating, and over 400l. for the architect's commission, making a total of 8,675l. The school is to accommodate 600 children; the site has been selected; and the plans are passed by the Board. The tender of Mr. Beauland was not the smallest, but was considered the most practical one. It is less than the original estimate, which was accounted for by the price of material. It was also resolved to ask the permission of the Education Department to borrow 8,670l. for the erection of the school, and also that the Department should recommend the Public Works Loan Commissioners to lend the money.

Heckmondwike.—The plans of a proposed school and school-master's house in Batye-street were

presented by Messrs. Holton & Cannon, architects, of Dewsbury, and were unanimously passed, and when completed will be sent to the Education Department for approval.

Caterham.—The plans and specifications, prepared by Mr. Richard Martin, of Caterham, for schools for 125 boys, 125 girls, 100 infants, with teachers' residences, for this place, have been approved of by the Education Department, and the work is to be proceeded with at once. These schools are to be erected on the old site, on the hill. Other schools are proposed to be built for the children in the valley.

COVERED CAB STANDS.

The Kensington Vestry have received a report from their Works Committee, respecting the application of the Police Commissioners for permission to erect a covering for a cab-stand in the Cromwell-road, opposite the entrance to the South Kensington Museum. A letter was read from Mr. H. Cole, C.E., stating that in his opinion the covering would be a benefit to the drivers. Letters were read from various inhabitants in the neighbourhood, protesting against the proposed covering, while Messrs. Whyte, Collison, & Pritchard, solicitors, of Bedford-row, attended before the committee on behalf of Major general Sir Vincent Eyre, in opposition to the covering. The committee decided to apply to the Police Commissioners for a sketch of the elevation, pending the receipt of which the question stands adjourned. The Vestry adopted the report.

THE PRICES OF IRON AND COAL.

It is announced from Wolverhampton that the prices of all kinds of iron are advanced 20s. to 50s. per ton, and we hear that no positive orders will be taken even at these prices or for less than 40s. more per ton. This time last year British bar iron was quoted at 7l. per ton, and a week or two ago the price was 12l. per ton. As regards coal, the unwelcome tidings come from the Midland Counties that the miners are following the example of their fellow toilers in Middlesex; and as to the rise in colliers' wages already, a coal-owner says that the moral injury that is being done to the miners themselves is lamentable in the extreme. Their present high rate of wages is beyond the humble necessities of their families; and the obligation seems to have sprung up to squander the surplus of their earnings in the numberless pot-houses which stud the coal districts. By the roadside and in the fields the men lie wallowing in drunkenness. If such a dissolute picture can be painted of the labourers in the coal-mine, a condition not less revolting forms the chief recreation of the labourers in the iron-mine on the day after the receipt of their pay. Hence the scarcity and rise in prices. Maintaining other things the advantages which the mad folly of our own is nationally casting away.

FRENCH VIEWS OF SOUTH KENSINGTON.

In the course of a report to the French Minister of Agriculture and Commerce on certain divisions of the London International Exhibition of 1871, M. Adolphe Viollet-le-Duc is led to make some remarks on the Museums of South Kensington. He visited England in 1862, and, like M. Mérimée, the reporter in the fine-art portion of that Exhibition, he expressed in print some fears of the effect on France of the active and intelligent concurrence of that establishment. Now, after a second visit, his opinion is altered, and he declares that France has nothing to fear from the kind of teaching produced at South Kensington and in the schools connected with the Department. The general tenor of the criticism will be evident from the following passages:—"It is in our opinion an utterly false idea, that of creating an 'industrial art.' There is no such thing as industrial art. Industry borrows the genius of art, dresses itself up in it, and ennobles itself, but it does not control or direct it; or, if it does, it denaturalises and corrupts it." Speaking of the magnificence and liberality of the South Kensington establishment, the reporter says,—"They compose from the collections a series of rare and precious models, but these treasures are wasted by interpretations which exhibit inability and want of discernment." He denounces the misapplication of productions of the old artists to uses to which they are totally unfit, and adds, "If this is what is called industrial art, it consists in a determined absence of method and forgetfulness of proportions and harmony."

M. A. Cruyer, the reporter on the Applications of Art to Industry, takes a somewhat similar view. "The Exhibition itself," he says, "gives

evidence of the inherent faults which reside in the Kensington system. He considers the admixture of picture-galleries and museums of sculpture with collections of decorated workmanship, however excellent in themselves, a great mistake, and as having prevented the Kensington Museum from producing all the results expected from it; and he blames his own countrymen for being inclined to follow much the same road. Art is held under the yoke which we all submit to, that of money. We talk more of the market-price of works of art than of aesthetic value." Applying the reasoning to France, he adds,— "Let us keep art pure in our museums, like a treasure which must be kept aloof from all profane contact. Let us bring back the dignity of art, and our decorative arts will recover their importance of themselves. Let us have our Kensington, but let us keep our Louvre; let us have our decorative arts, but let us preserve art independent and disinterested; let us perfect our professional education in drawing, but touch not our school of fine arts except to raise it and give it back its prerogatives." The essential thing is art itself,—art regarded, I repeat, without any consideration of application or speculation. Make art grand and pure, and you will have in addition, and consequently, good and charming industrial arts. Have not all the great epochs of art left us admirable technologies?"

THE TRADES MOVEMENT.

London.—The settlement with the masons has not been attended by the results that were expected, and while the large outside jobs are pretty well supplied with masons, the yards and shops have but few men at work, the employers being either unable or unwilling to take on masons under the circumstances. The masters' committee, having refused to entertain a memorial sent in from the bricklayers claiming a working day of nine hours at 9d. per hour, with a code of working rules for the regulation and payment of overtime, the bricklayers' committee issued a notice on Saturday striking against three of the largest employers of bricklayers in London, viz.—Messrs. Rider & Son, Union-street, Borough; C. & W. Aldin, South Kensington; and Jackson & Shaw, Westminster. Since then, three others have been struck against. The house painters and decorators received on Saturday morning a reply to a memorial sent in to the associated master painters, a different organisation from that of the master builders' association. The memorial claimed nine hours per day, or fifty-one per week at 8½d. per hour, and a code of working rules. The masters' offer is 8d. per hour, which has been declined.—A number of joiners who have all through the contest, been at work on one of Messrs. Cubitt's jobs in the City, "came out" on Saturday rather than continue on under the new arrangement, which, for the next four months, would have required them to work 5½ hours per week instead of 56½, receiving 1l. 17s. 2½d. per week in lieu of 1l. 17s. 8d. The United Trades' Conference have passed five resolutions, viz.—

1. That this meeting of United Trades Delegates do hereby constitute ourselves into a Central Trades Committee.
2. That Mr. Sinclair be chairman, Mr. Shipton, secretary, and Mr. Westaby, treasurer.
3. That we instruct our secretary, Mr. Shipton, to communicate with Mr. Stanley Bird, the secretary of the Master Builders' Association, requesting that a day may be arranged to receive a joint deputation of this committee to confer with the masters on the terms of our memorials, with a view to a settlement of the present dispute in the building trade.
4. That the secretary be requested to draw up a circular setting forth the position of the committee, and appealing to the entire country for support.
5. That no branch of the building trade connected with the joint-committee shall enter into any negotiation with the master builders relative to our present dispute other than through the duly appointed officers of this committee.

The Central Committee of the Plasterers having been out three weeks, forwarded a letter to the Master Builders' Association in these terms:—

"We, the committee, acting on behalf of the plasterers of London, beg to inform you that we are instructed to make the following demands, viz., that nine hours do constitute a day's work for the first five days of the week, and six hours on Saturday, making fifty-one hours per week, and that the rate of wages be 8d. per hour; also that we have a working code of rules."

This memorial, together with the anticipated request to be made in accordance with the third resolution of the United Trades Conference, formed the subject of some of the discussions at the weekly meeting of the General Committee of the Central Association of Master Builders, at which Mr. Hannen presided, and Mr. Piper, the

secretary of the old association, was present. The committee came to this resolution:—

"That the employers having agreed to terms of compromise respecting the hours of labour at an increased rate of wages, and the shops having been opened accordingly, the committee of the Central Association of Master Builders will feel it their duty to decline receiving any deputation having for its object the disturbance of this arrangement."

We are forced to express our regret at this step. The memorial of the labourers was also dealt with at this meeting, and it was resolved:—

"That the labourers be informed in reply to their memorial, that the master builders have agreed to raise the wages of ordinary labourers 4d. per hour."

Birkenhead.—A meeting of the operative house-painters has been held. There was a large attendance. Mr. McCarthy occupied the chair, and it was resolved that an advance of wages, one penny an hour, be asked for.

Tredegar.—The iron-workers and colliers seen determined to bring down the price of mutton and beef, and have given notice that they will abstain altogether until they can have it at 6d. per lb. Tradesmen have been earnestly requested to join in the "meat strike," and more than one publican has been threatened with the loss of a host of hard drinkers if they do not resist the present exorbitant demand.

The Eight Hours Movement in America.—In the *New York Commercial Chronicle* of June 29 we have the following information as to the latest phases of the eight hours movement:—

"One of the most sensible movements which have been made by the labour agitators took place on Thursday evening at Baltimore. The Bricklayers' Union of that city resolved by a unanimous vote that, as their masters were fulfilling contracts which, if interfered with by strikes, would involve heavy ruinous losses, they would take no action on the question of an eight-hour change in the hours of labour during the present year. It had been well for the strikers in this city if they had shown like appreciation of their own true interests. Here, from the strikes and the eight-hour agitation, with the consequent rise in prices, work has fallen off so much in several departments of industry that some of our mechanics and artisans may soon have some difficulty to find employment at all in New York. It is clear that the movement is rapidly dying out. After two months of privation and suffering the men are as far from the final goal as when they started. Several thousands of them have, it is true, got work at the rate of eight hours a day with the old ten hours' scale of wages. But the statistics on the subject are doubtful, and we have no trustworthy means of finding out either how many men have struck, what number are still out, or what proportion of those at work labour eight or ten hours respectively."

THE HOSPITAL FOR SICK CHILDREN.

The foundation stone of the new building, which is intended to replace the existing hospital for sick children in Great Ormond-street, Bloomsbury, has been laid by the Princess of Wales, in the presence of a large and fashionable assemblage of the friends of the institution. The scene of the ceremony was in the space immediately behind the present hospital in the street which runs between it and the Homeopathic Hospital. The new building is to accommodate two hundred children, and is to be built in sections as the funds come in. The building, of which we gave a view in our issue for 27th of January last, will consist of a central block and two wings. The central block will be built first, and the wings added afterwards. This central block will accommodate about ninety patients, and will contain kitchens and all other essential offices for the accommodation of a large number of out-patients. The site is convenient for the purpose. It is in the centre of London, yet close to one of its most open districts. To the south and east lie some of the most densely populated parts of London, to the north and west lie the gardens of the Foundling, and the series of squares on the Bedford and Foundling estates, which occupy the whole area between Euston and Holborn.

PUBLIC HEALTH (RECOMMENDED) BILL.

BEFORE putting the question to the House to go into committee on this Bill, the Speaker called upon Mr. M'C. Torrens to propose the instruction which he had placed upon the paper, and which was as follows:—

"That it be an instruction to the committee that they have power to provide for the rebuilding of workmen's dwellings in cases where the same shall have been extensively pulled down under or by the authority of any Acts of Parliament."

The hon. gentleman complained that the useful clauses in the Bill of 1868 had been struck out by the House of Lords, and described the shocking condition of many of the poorer neighbourhoods in the metropolis, and the misery which was caused by the pulling down of houses by

speculative companies and railway companies. All he asked was that the House would agree to what they had unanimously assented to in the year 1868.

Mr. Stansfeld sympathised with the object of the hon. and learned member, but said that, as he had himself unwillingly discarded a great many clauses in the hope of passing the Bill this session, he hoped the hon. and learned member would not press his instruction, but would leave this and other important questions bearing on the same subject to be dealt with next session.

Mr. J. Goldsmid thought that some check should be placed upon the promoters of railways and other projects which had the effect of destroying the homes of thousands of the humbler classes. In consequence of the improvements connected with the Holborn Viaduct a vast number of houses inhabited by those classes had been removed, the result being an increase in rents of from 30 to 50 per cent., and the crowding of families in one or two close rooms. He, however, did not think that the instruction proposed should be adopted on the present occasion, as this was merely a consolidated measure, and hoped the hon. and learned member would accede to the appeal which had been made to him for its withdrawal.

After some further discussion, Mr. M'Culloch Torrens withdrew his motion.

The House has since gone into Committee on the Bill.

THE MAURICE MEMORIAL FUND AND THE WORKING MEN'S COLLEGE.

THE first object of this fund will be to provide a bust of Mr. Maurice, to be placed in Westminster Abbey; and II. from each contribution will be applied to this object. The remainder of the fund will be invested in the name of trustees, for the benefit of the Working Men's College, in Great Ormond-street, founded by Mr. Maurice, and aided by him up to the last. As our readers know, the freehold of an adjoining house has lately been acquired. Upon this ground there have been lately erected, mainly out of funds (about 2,000*l.*) and for the purpose by friends of the college and the public, and in part by a loan from a few members of the council, a large additional building, comprising class-rooms, art schools, and museum, so arranged as to admit of other buildings being added when needed. The whole property is valued at 5,000*l.*, subject to a mortgage debt of 2,000*l.*, a charge which is being gradually extinguished by the appropriation to this purpose of the surplus rent of the adjoining house above mentioned, which is let on lease.

The college is thus amply provided with buildings, repairs, rates, and taxes is, of course, considerable, and a sustentation fund is much needed. Such a provision would secure the permanent appropriation of the buildings to the purposes of the foundation, and free future managers from the danger of allowing its work to be governed by merely commercial principles.

Subscriptions may be paid to Messrs. Coutts & Co., in the Strand, and we hope many will be.

BUILDING OPERATIONS IN CAMBRIDGE UNIVERSITY.

THE extensive works at Pembroke College are approaching completion, according to the local *Chronicle*. The block of buildings in Trumpington-street, containing seventeen sets of undergraduates' rooms, besides suites for fellows and lecturers' rooms, will be ready for use in the October Term. The Master's Lodge is in a forward state, and is expected to be finished this year, the upper floor being finished and the plasterers being now engaged on the ground and first floors making elaborate ceilings. It is considered that this lodge will surpass most, if not all, other college lodges in Cambridge. These extensive works, which will cost 25,000*l.*, are being carried out according to plans by Mr. A. Waterhouse, architect, under the supervision of Mr. Tiff, clerk of the works; the contractor being Mr. Horsman, of Wolverhampton.

At Trinity Hall, there are to be extensive alterations, the contract for which has just been signed. The old part where stood the Porter's Lodge has been cleared, and is to be replaced by twelve sets of students' rooms, all the external work of which is to be of stone. Here the same

architect, contractor, and clerk of the works have been engaged as at Pembroke; and the work will be commenced at once.

In connexion with contemplated improvements at Magdalen College, a large space has been cleared next the river; but as far as we can at present learn, nothing definite is decided upon.

At King's College, Mr. Thoday is progressing satisfactorily with the addition to the south end of the college, from plans by Mr. G. G. Scott.

Improvements are contemplated at Emmanuel College.

At Jesus College, a work of restoration is being carried on under Mr. Waterhouse, the main feature of which is the re-arrangement of the whole of the chimneys throughout the older portion of the college; and it is anticipated that improvements will be effected in the dining-hall.

Mr. Loveday, of Kibworth, Leicestershire, has been entrusted with the erection of a building for the department of experimental physics for the University, according to plans by Mr. W. M. Fawcett, architect, Cambridge, the contract being 8,450*l.* This building, the magnificent gift of the Chancellor of the University, will be situated in Free School-lane. It has already been commenced.

It may also be mentioned that a Ladies' College is to be erected on the Huntingdon-road, just beyond the Girton-gate, about two miles from the town, upon which about 10,000*l.* are to be spent. The buildings are to be of plain red brick, with terra-cotta dressings; and the arrangements of the rooms will be similar to those of the students' rooms in the University, with gym-rooms, &c. The architect here, again, is Mr. Waterhouse, and the contractor Mr. Loveday. The work is to be commenced forthwith.

TILE ROOFS.

Sir,—On Friday evening, the 12th inst., a fire occurred at No. 39, Finborough-road, West Brompton, being one of the houses on the Redcliffs Estate, and belonging to Messrs. Corbett & McClymont.

The roof, which was a flat cement and tile one, as usually constructed in terrace houses on this estate (and described and recommended in some of the back numbers of your paper), was found to give every satisfaction as far as its fireproof qualities were concerned, while at the same time it was the means of effectually preventing the spreading of the flames to the adjoining premises, and also of saving a considerable portion of the building.

FRANK WRIGHT KEMP.

POROUS TILES.

Sir,—Having seen "F. M. K.'s" inquiry in the *Builder*, let me say that if he will cause his tiles to be coated with either the petrifying liquid of the Silicate Paint Company, of Liverpool, or the patent improved composition manufactured by Mr. Thomas Griffiths, of the Laurels, Oxton, near Birkenhead, he will, in a very satisfactory and inexpensive manner, do away with the porosity of which he there complains. I have proved the utility of both methods.

CHARLES BENNETT, SURVEYOR.

WASTE POWER AND UNDEVELOPED FACILITIES.

Few give any serious thought to the waste power and undeveloped facilities to be noted in relation to the labours of the artist and craftsman, not to speak of others. The education of the eye has been lectured upon by more than one person from an artistic standpoint; but we have not met with any writer or artist who has endeavoured to increase our information, or enlighten us on the empire of the hand, or the utilisation of the waste power of the limbs.

For sake of illustration, we might pick out a craftsman belonging to any branch of trade, but as it is more kindred to our present treatment of the subject, we will confine our remarks to the building or other cognate branches of it. The part that the eyes and the hands, or limbs in general, play in the province of the building operative is a most important one. From the hour that the carpenter, joiner, mason, bricklayer, or plasterer, as an apprentice, begins first to really learn his business, his eyes as well as his hands undergo a system of training. The discriminating faculty of sight is exerted practically for the first time in the workshop. Objects and appearances that would not have attracted the schoolboy's attention, as a matter of necessity, and as a consequence of mechanical training and employment, henceforth attract the young workman's attention. He learns by practice little and little, and by the advice of his elders in the workshop or building, to detect what is technically called "out of square," "out of perpendicular," "in winding," "out of level." He can discover in time by the look whether a

line is exactly straight, or a curve regular. This embraces the education of the eye, and in the case of the mason, bricklayer, or plasterer, and others, it is equally applicable. The workman's hand possesses many faculties, too, allied to the senses, by which it can detect errors or act as a guide to their prevention, even though the powers of the eye were held in abeyance. Even in the holding of his tools and the using of them, the workman may lighten his labour, or materially increase it to his own discomfort. In the performing of certain work many artisans, and artists too, throw a considerable amount of labour on their arms, and other parts of their body, which they might avoid did they but know how to relieve these parts by proper training.

It is an old saying that the bad workman throws the fault of the bad finish of his work upon his tools. Too often, indeed, it has been the case, but it more often resulted from the workman's dislike or laziness to sharpen his tools, trusting to his power of arm to push him through a half-hour's labour which five minutes' time, judiciously spent upon his tools, would have shortened to a quarter of an hour, with the further satisfaction of finding that his labour was well executed instead of faulty. The workman is too prone to keep in the old grooves of manipulation that he has inherited from those who preceded him. Short methods of performing work do not necessarily mean bad methods. By whatever process the manual labour of the workman is lightened and his workmanship rendered as perfect, or more perfect, that mode is an improvement and a profit. Our workmen are little more, in many branches, than a race with single hands, the other seldom performing the functions which it was designed to perform. There exists no reason why the left hand should not be trained to perform more useful labour in art or handicraft than it does. Why it does not is simply the result of false and deficient training. What are called "left-handed" men will be found, as a general rule, awkward in many forms of labour. They appear unskilful in handling the instruments of their craft to some; but in reality they are not so. The mechanic who can handle a saw, a plane, or even a hammer, in driving home a nail with his left hand, and can use his left as well as his right, is an operative not to be despised, but to be encouraged. Some men are naturally left-handed from their earliest years, and but very few are so from custom or practice. Now we boldly assert that the left hand, and the left eye, and the left leg and foot can be taught to perform the same ordinary functions as the right; and with artists, mechanics, and even with literary men, the utilisation of the waste powers of these members of the body and head ought to be a matter of grave importance, inasmuch as we are all creatures of circumstances, and all liable to accidents during our lives, which may deprive us of our most cultivated and generally used members or faculties. The man who can draw and write, and perform other labour with his left hand as well as his right, possesses great advantages over his fellows; and to the surveyor, engineer, navigator, or mere sportsman, the cultivation of the power of "sighting" with the left eye is a matter worthy of his attention. Men mechanically employed generally sight an object by closing one eye, but if asked, they would experience a difficulty in closing the opposite eye to the one generally used, and sighting with the other. They would not experience any such difficulty if they subjected themselves to a course of training in their younger years. There are numerous instances before our mind, as we write, of blind authors, travellers, professional men, and craftsmen who have performed marvellous labour, when wholly deprived, not only of their sight, but some of their most useful limbs—hands or feet.

We have known men who were absent from their country from their early years, and in middle life lost their power of sight, yet these men learned a trade, and such was their power of mind (some may term it intuitive perception) that they could pass through a crowded city, and several miles into the country, north, south, east, and west, and back to their workshop in the city again, without any guide or direction whatever. Not only could they perform this labour, but they could make several distinct calls upon different individuals for whom they were commissioned to do work. This is mental sight. If these persons had been born blind, men might say that they were "gifted by nature." Having become blind late in years, they were

thrown on their own resources, and when given facilities for learning how to do some mechanical employment, they industriously set to work and overcame what the world calls "impossibilities." We therefore contend that loss of sight is not darkness, save in the common acceptance of the term, nor is the loss of limb or arm consequent incapacity. We know of the case of a certain German of the name of Matthew Buchiner, who was once exhibited in these kingdoms as a sort of an anomaly or abnormal being. This man had neither hands nor feet. Where his hands ought to be his arm or wrists terminated in a bunch or knob, and something in the form of a dwarfed thumb protruded. His legs terminated in a similar lump, and rounded themselves off at or above the knees. Despite of all these deficiencies and obstacles, this half-formed creature taught himself to play on several instruments, invented one or two, and even showed his proficiency in writing and drawing. Some of his art work in the shape of letterings and drawings may be seen in the Dublin Museum.

Returning, we consider that the faculties and powers of mechanical action, as well as mental thought, in connexion with the human body, have been greatly overlooked; and that the members which are only partially used should be trained henceforth, and used with advantage to ourselves and the human race. The lady who can stitch and embroider with her left hand as well as her right may also learn to write and draw with her left hand. The left foot should relieve the right at the treadle, at the lathe, or spinning or sewing machine, and so should the left hand at the winch, crane, grinding-mill, or other similar machine.

The turner works with his hands and his feet at the same time, and his left foot takes the place of his right when tired. Why should not his left hand also relieve his right in holding the tools he uses? We might cite operations belonging to various trades and professions where the left hand could be used with advantage, and where the physical leverage of the body might be changed from right to left, thus calling on one side of the system while the other was regaining its lost strength, or recovering power for prolonged labour. Not only in employments belonging to mechanical branches, but in agricultural labour the workman who can dig, plant, trench, stack, pitch, thatch, and do other species of work from left to right, as well as from right to left, will be found to be a most serviceable labourer.

The cultivation of the powers of sight, and the training of the eye to approximate distance, or rather to compute it without any actual measurement, is a process of some value, and there are some men who can do this from practice and experience. This is further illustrated by the power possessed by others, who can tell by almost a look or a walk round how many tons of sandstone, clay, manure, or other material are in a certain heap or given space. An experienced builder or bricklayer could tell in a few moments how many thousands of bricks are in a house front; and an intelligent stonemason or quarryman could approximate pretty closely to the number of cubic inches in a certain hewn stone by sight alone, suggesting the stone to be beside him, or within a few yards' distance. The uneducated, particularly country people and the peasantry, make greater use of the feet, hands, legs, and arms as standards of measurement, and for obtaining other ends than the educated townfolk. A labourer in the habit of taking piece or task work will "step" the area of the ground before he makes his price for doing the job; and on measurement afterwards he will be found not to be far out in his reckoning. Country housewives will go into a market town and buy a variety of yards, half-yards, and other lengths of cloth and ribbons, their standard of measurement being so many lengths of their middle finger, although the shopman may run over the purchase with his rod or yard measure. It may be remarked here also that the exercise of the powers of memory among the uneducated is more marked in many ways than among the educated. We have known many countrywomen who could neither read nor write, yet possessed of such retentive powers of memory that they would bring home to a dozen or more of their neighbours from the market town a series of articles required, ranging in quantities from half an ounce to several pounds, comprising in the aggregate perhaps about fifty articles of every conceivable household want, yet in the diversity of their orders of small and large quantities, they would not make a single mistake either in

weight, measure, or the money outlay, or change brought home. How few there are among town-bred folk could task their memories to perform this labour.

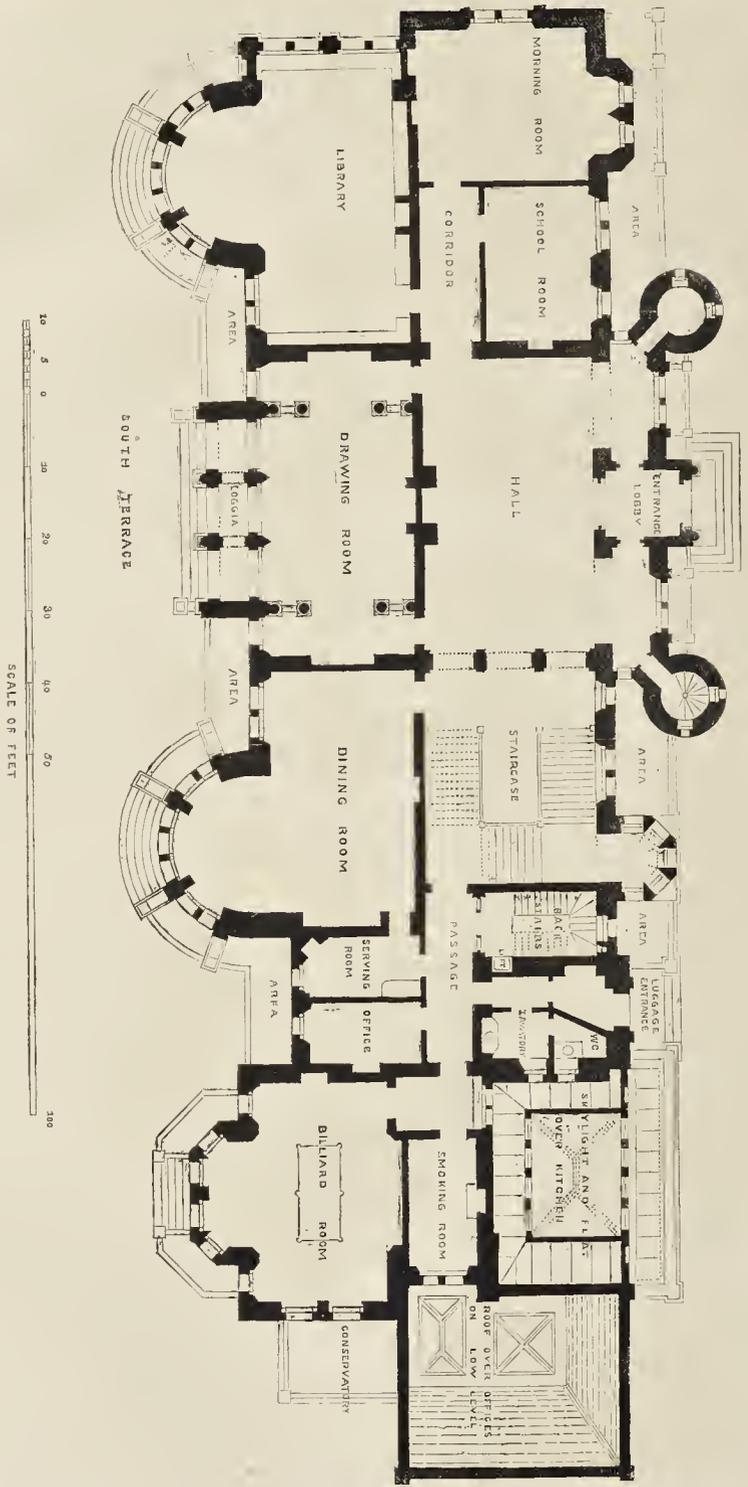

One great fault among our modern race of young men and women is, that they are utterly careless of cultivating the power of memory. Almost everything good they hear or read goes in at one ear and out of the other. Let them listen to a lecture, a sermon, or any public discussion, and not one out of every fifty could give you, in a few hours after, a connected summary of the subject. If people will not give themselves trouble to think and reflect, as well as read and listen, all the artificial aid to memory ever invented, or that may be, will avail them little. The remembering of dates and events may be useful to school folk, but there is no process by which a man or woman can remember, to know how to do that which they never learned to do. Truly, there is no royal road to learning, or to the acquisition of a science, a profession, or a trade, without study and practice.

To sum up, our object has been to show how much could be done in the science of man by the cultivation of many qualities inherent to his organisation by the development of faculties which he neglects to use. Some of these powers are mental, others are physical, but one and all capable of acting in unison. The memory can be made more retentive, the eyes to see and discriminate more effectually, the hands and limbs to perform further profitable service, and the human machine rendered more fit and durable, to stand the wear and tear of life in its too reckless struggle for independence.

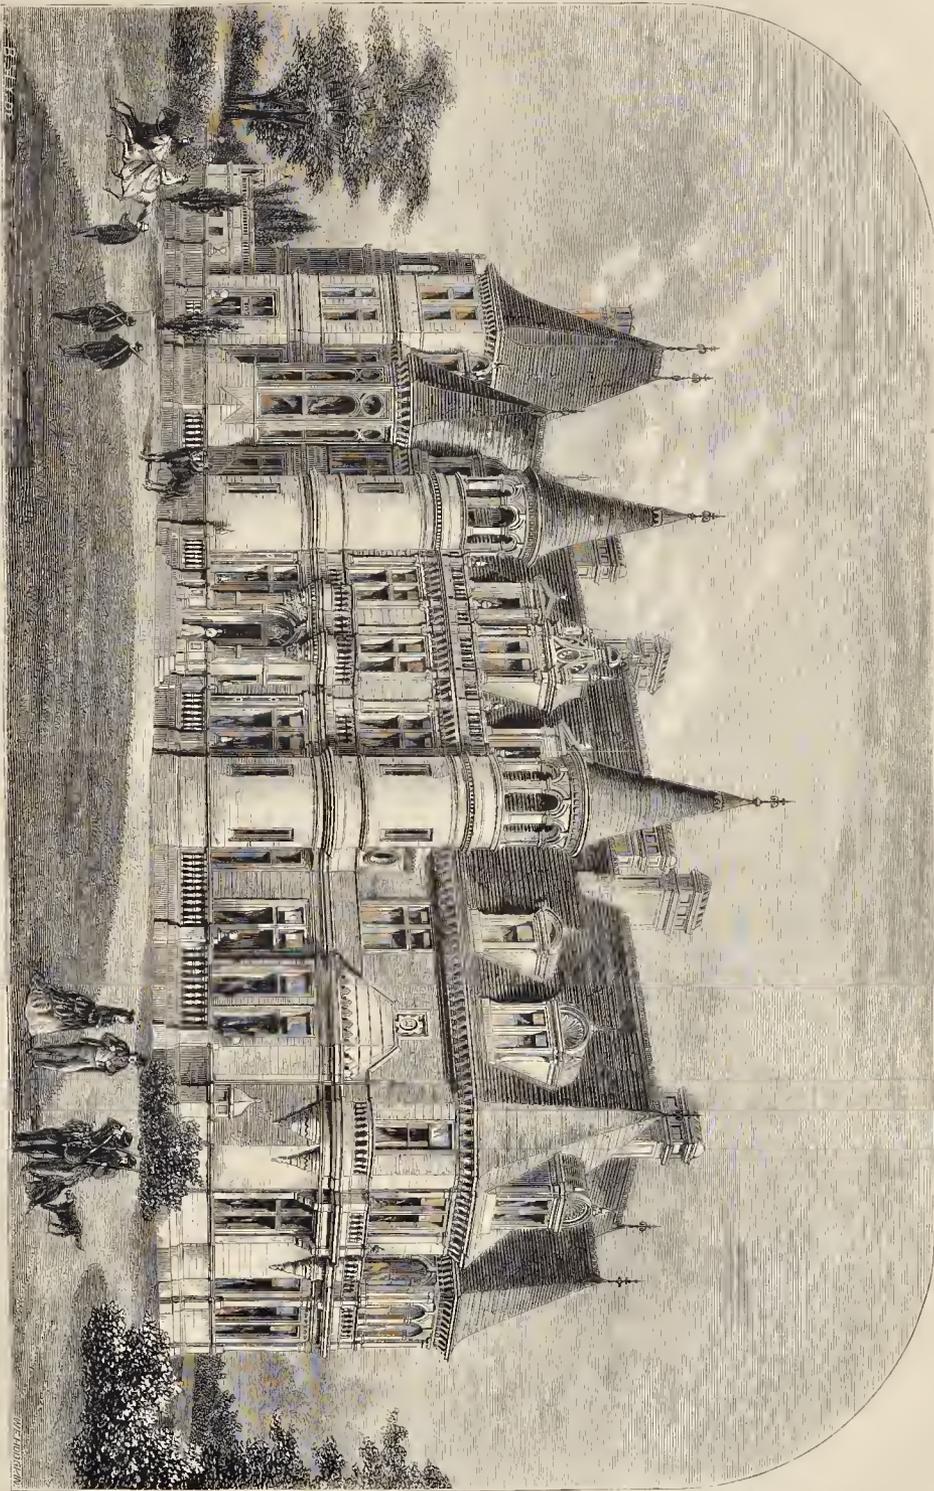

WYKEHURST.

This house is in course of erection, from the designs of Mr. Edward M. Barry, R.A., in Sussex, among varied scenery, and in a commanding position. The style of the architecture is based on that of the French *châteaux* on the Loire. The house is built of stone, and the roofs are of tile and lead. The hall and entrance are faced internally with stone. From the hall a triple archway of stone gives access to the principal staircase, which is of oak, with steps 7 ft. in width. The back stairs are of stone. From the nature of the site, a basement-story was considered advisable, and on this floor are placed the servants' offices. The floor over these offices is of fireproof construction, being composed of concrete, with wrought-iron joists. The kitchen and scullery are placed outside the main house, and have nothing over them. They are situated near to the back or luggage entrance and stairs. There is a warming apparatus under the hall, and from it flues convey warm air to all parts of the house. The various water-pipes are placed in a vertical shaft, and one of the warm-air flues communicates with this shaft, to avoid risk of frost. It is also made readily accessible, in case of accidents. There is a lift for luggage and coals, in the back staircase. All the external walls are built double, with an air-space between the two walls. The floors are double-framed, with main beams of wrought iron. Hot water is laid on to the various floors, and to the bath-rooms, from the kitchen-range, the flue from which passes up the outside of the tower, which forms the back entrance.

The first floor contains the best bed-rooms, with private sitting-rooms and drawing-rooms arranged in *suites*, having separate bath-rooms and private closets. There are other family bed-rooms, and also servants' rooms, on the second floor, the partitions and the framing of the roof being made double, with special precautions against cold and noise. All the best bed-rooms and sitting-rooms have balconies commanding a fine view; and each window towards the south and west is fitted with wooden "jalousies" or shutter-blinds, which, when not in use, fold back into the thickness of the walls, thus avoiding disfigurement to the architecture. The windows are glazed with plate-glass, in large sheets, hung as sashes, except where there are balconies, in which positions French casements are used. The turret staircase near the entrance is for the use of the servants, who can thus attend to the front-door without passing through the house. All the principal rooms have air-flues for ventilation, in addition to the ordinary smoke-flues. The whole of the works are being carried out by Messrs. W. Cubitt & Co., of Gray's Inn-road, London. Mr. Buckle is the clerk of works. The cost of the house will be about 35,000l.

WYKEHURST, SUSSEX.—Plan of Ground Floor.

WYKEHURST, SUSSEX: A COUNTRY MANSION.—MR. E. M. BARRY, ARCHITECT.

SCULPTURES IN THE ROOF OF NORWICH CATHEDRAL.

The roof of the nave of Norwich Cathedral is ornamented, at the intersection of the arches, by a very curious series of sculptured bosses, which represent (with the exception of an interval from Solomon to Christ) the whole course of Scripture history, from the creation down to the final judgment. These sculptures are a work of the fifteenth century, the present stone roof of the nave having been erected by Walter Lyhart, Bishop of Norwich (A.D. 1446-1472), in place of the original timber roof. The sculptures were painted (as they are executed) rudely, both sculpture and painting, being intended to be viewed from the floor of the church, at a great distance from the eye. At the beginning of the present century, when the colours were found to want renewing and the roof cleaning, it was determined, and of course greatly marred the effect of the old sculptures. The roof has been already cleared of the colour-wash and the stonework exhibited; and it is found that quite enough of the original colour remains to guide a faithful and skilful restorer. But meanwhile it is thought that these sculptures should be represented by means of photography, as a monument of Mediæval art. Dean Goulburn will edit them.

WAGES.

SIR.—Perhaps you will admit a few words from one of those believers in the potency of self-interest in governing the actions of average mankind, on whom some of us think you were a little hard in your recent article on wages. You justly denounce the "doctrine that it is self-interest alone that governs all the actions of every man." Yet self-interest is a very real force, and I venture to think may be a beneficial one. The whole question turns on the point whether it is blind or enlightened. Self-interest impels a thief to steal my purse. If he were better instructed, the same feeling would teach him to leave it alone. Similarly, if the workmen had been better taught they would often refrain from making demands which are simply suicidal. In fact, nothing could be more dissimilar than the effects of this same feeling in different instances; they may be wholly good or wholly bad. Our wisdom surely consists, not in ignoring or decrying the impulse, but in doing our utmost to insure that it shall be wisely directed. It is, doubtless, an evil that capital and labour should take up a hostile attitude. Both are necessary to the production of wealth, and if they are to co-operate efficiently, they must be in harmony. Still, so long as the labourer has no share in the capital employed, it is idle to ignore the fact that the labourer and the capitalist must be, to some extent, in opposition. The wealth produced by their joint efforts is to be divided between them in some proportion. What that proportion shall be is necessarily matter for discussion from opposite points of view. And I venture to think that any supposed settlement under which one party is conscious of sustaining a loss for the advantage of the other, is essentially a non-permanent and hollow affair. Substantial agreement must rest on the basis of mutual satisfaction. The old relations between master and servants, where a distinct tie was recognised on both sides, and into which a good deal of sentiment entered—what may be called the feudal theory,—these relations, with all their advantages and disadvantages, and there were many of both, are now practically extinct. The railways and the press have done that for us, and it would be vain to regret them or to look for their revival. The true solution of the difficulty lies in the near future, and it will be found, I think with you, in some kind of co-operation, or co-partnership, different perhaps from any we have hitherto seen, but such that the labourer shall have a share in the capital employed and the wealth produced in the process, and that all parties concerned shall have an *obvious* identity of interest.

In your aspiration for some such state of things this a good many of us will share, and he happy to do what we can towards bringing it about. "It no good will be done by ignoring the fact that under the present system we must be, whether we will or no, either side denouncing the other as selfish or ungrateful. Still less will

outsiders improve matters by preaching sickening sermons on universal benevolence.

If I have made my meaning clear, you will see why I must dissent from your opinion that in the present dispute in the building trade "the question for consideration is whether the increased amount supposed to be received by the workman is as well spent,—i.e., for the good of the community,—by him as it would have been by the capitalist." Surely a workman should receive the *value* of his work; and this value is not affected by consideration of what he does with his wages. Practically, however, it is enough that it would be impossible to obtain a correct answer to such a question. The questions which, I submit, should be asked and answered are such as these:—Has the value of money declined, and the real reward of the labourer thus decreased? Has the efficiency of labour increased? What is the proportion between the wages-fund and the labouring population? Are the profits on capital, exclusive of compensation for risk and wages of superintendance, above the current rate of interest? The result of a comparison of the answers to these questions should dictate the conduct of both parties. At present, unfortunately, the only questions asked would seem to be, "Can we enforce this demand?" on the one hand; and on the other, "Can we successfully resist it?" Ultimately, both will feel the result of flying in the face of laws which are as sure in their operation as the recurrence of the seasons.

I do not profess to decide on the merits of the present dispute,—that I leave to wiser or bolder spirits, who are not afraid to form an opinion on slender data; but if it be true, as I have seen it stated, that the object of the workmen is to reduce the hours of labour, in order to give employment to brother-workmen who at present seek it in vain, their conduct is founded on an economic fallacy. It amounts to this: that because the supply of labour is in excess of the demand they wish to raise the price; in other words, that since misery results from the present undue strain on the wages-fund, they propose to mend matters by increasing the strain. One thing, I fear, is only too certain. Whatever agreement may now be come to can be of no value towards a real settlement. It will but put off the difficulty for the present, to confront us anew at no distant day.

Meanwhile, some of the energies of the working man's instructors would be well employed in teaching him to regard his social relations from a scientific point of view. He should be shown that economic forces are forces in actual operation, and not empty phrases; that it is his interest and his duty to study them, and that to ignore or ridicule them is simple imbecility. A little knowledge of the elements of political economy would suffice to teach him some home truths,—that, for example, waste and destruction are not "good for trade;" that the wisdom of a demand for increased wages does not depend merely on the probability of its success; above all, that the rate of wages depends greatly on the proportion between the wages-fund and the labouring population; that, in fact, "no material improvement in the condition of the working classes can be permanent unless it is accompanied by circumstances which will prevent a counterbalancing increase of population." The men who will undertake the task I have indicated will not gain an immediate popularity, but they will act a patriotic part, and will prove themselves the true friends of the working classes. H.

RISK OF BUILDINGS FROM FIRE.

SIR,—I have read with great interest your remarks on the risk of buildings from fire, and I believe that the profession will benefit from perusing Captain Shaw's recent work on "Fire Stairs."

It has not been generally thought that stone staircases and iron columns are dangerous; and although they cannot be burnt, it does not appear that they resist fire equally well as brick or timber in large scancellings. I do not know whether I am advocating anything new in calling attention to the use which might be made of Portland cement for stairs. Bricks made of fine sand to one of cement will bear a pressure equal to the best stocks, and made with neat Portland cement they are as strong at six months as Staffordshire lime bricks or York landings. Such being the case, would it not be possible to cast Portland cement steps in moulds, with rounded and re-

turned nosings, &c., complete? They might, if desired, have sinkings on the top of each tread, for the insertion of ornamental tiles; and if manufactured in large quantities the expense would not be great.

It is well known that Portland cement, for furnace-work, will stand fire better than Roman cement.

Perhaps the insertion of this letter in your next number may be the means of bringing forth some better suggestion than the above.

T. A. BRITTON.

KENSINGTON GARDENS AND PALACE.

SIR,—I have read with much interest (as I do everything in the *Builder*) the remarks of your correspondent signed "Quoniam" on Kensington Gardens and Palace. There is another reason why his recommendation might be turned to advantage,—namely, should the palace be brought down to the round piece of water, room might be found for the Knightsbridge Barracks, as, I believe, might be found at present, between it and the Palace-garden houses. A. C.

House of Lords.

METROPOLITAN BOARD OF WORKS.

Ventilation of Sewers.—Last week the committee on the ventilation of sewers presented a report upon the resolution of the Board of the 26th of June, 1868, referring to them the question of the ventilation of the sewers belonging to the Board, especially to advise the Board as to the expediency of effecting a premium (by public advertisement) for the best practicable plan of effecting such ventilation; and stating that they have arrived at the opinion that it is undesirable to offer a premium for a plan of ventilation, as it appears that no one plan would be applicable to the whole of the metropolis, and recommending that the committee be further authorised to pursue their investigations, and to deal with each case that arises according to the particular circumstances of the same, reporting from time to time the results to the Board. Mr. Saunders, in moving the adoption of the report, said no one system was applicable to the whole of the metropolis, but each case must be treated upon its peculiar exigencies. They used charcoal-boxes, and in every possible instance the up-cast shaft of factories. Next to draining the land, there was nothing of such importance as keeping the noxious gases arising from sewage from reaching the population. The report was then adopted.

The York Water-Gate.—The works committee have considered the letter from the Science and Art Department, South Kensington Museum, requesting that the art-pupils might be permitted to sketch and measure the York Water-Gate in the grounds adjoining the Victoria Embankment, and to remove a portion of the earth for that purpose, and recommending that the Department be referred to the proprietor of the gate, with a view to inducing him to remove the gateway, so that it may form a finish to the street and be on the same level. On the motion of Mr. Runtz, the report was adopted.

ARCHITECTS' ACTIONS.

OSWALD V. THE GUARDIANS OF NEWCASTLE-UPON-TYNE UNION.

THIS action, tried on the 15th inst. in Newcastle, before Mr. Justice Willes, was for professional services rendered by the plaintiff, who is an architect in Newcastle, to the Guardians of the Newcastle-upon-Tyne Poor Law Union in the erection of an infirmary, and alterations of the workhouse buildings. The amount claimed was 538*l.* 18*s.* 1*d.*; 150*l.* had been paid into court; and the action was to recover the balance, 388*l.* 18*s.* 1*d.* The action was based on the following letters:—

"North Elwick Hall, 23rd November, 1867. Sept. Oswald, esq., Newcastle.

Sir,—The Guardians of the Poor of this union are about to build hospitals, &c., near the present workhouse. The plans are about ready, but the intention of the guardians is to engage a professional man to do the following work: 1st. To examine, and, if necessary, to alter or add to these plans, all of which are to be gone over with Mr. Brown, and our medical officer. 2nd. To revise and alter the plans as required by the Guardians and the Poor-Law Board. 3rd. To prepare estimates to submit to the Guardians on Friday next, if possible, but at the latest on Friday week, the 6th December, 1867, when the plans are to be laid before the Guardians. 4th. To superintend and carry out the whole of the works to completion; and 5th.

To do all and everything necessary to be done to commence, carry on, and finish the work. Great attention to be paid to warmth, light, and ventilation. If I succeed in inducing the Guardians to confer the appointment on you, you will undertake to work on the plan, and understand that your remuneration is to be 2½ per cent. commission on the gross actual cost of the works, and no more? If I do not succeed in securing the appointment for you, then in that case I undertake to pay you £100 (on guesses) for doing the work Nos. 1, 2, and 3, on the other side. But, if the Guardians do confer on you the appointment, then in that case the ten guineas are to be considered as part of the commission of 2½ per cent., and is to be deducted from the gross amount of the said commission. Please to say if you will undertake the work on the terms I have named.—Dear Sir, yours truly,

To the letter Mr. Oswald replied that he accepted the conditions stated. Mr. Herschel opened the case, and called the following evidence for the plaintiff:—

Mr. Septimus Oswald, the plaintiff, examined by Mr. Bruce.—I am an architect in Newcastle, and have been since 1855. On 23rd November, 1867, I had an interview with Mr. Milvain, vice-chairman of the Newcastle Board of Guardians. In consequence of that interview, I received a letter from Mr. Milvain, and replied on the same day. On the 25th November I first saw the plans; they were not at all mature; it was not possible to make an estimate from them. The committee saw the deficiency of the plans for themselves. I received no written instructions from the Board as to how the plans were to be drawn. I received all my instructions from the Workhouse committee, and they were all verbal. (The minutes of the committee were put in.) The plans shown to me made the building run north and south, mine made them run east and west; that change involved an entirely new plan. The plans I received were of no use whatever in the preparation of the plans I made. My plans were sent to the Poor-law Board, who returned them with certain requisitions, one of which was that the quadrangle should be open to the south instead of to the north. The ground falls from the south to the north to the extent of 14 ft. The alterations required by the Poor-law Board necessitated a new set of plans. I went to London with a deputation from the Guardians to wait upon the Poor-law Board, to see what alterations were required; and on the 24th April the Board approved of a small pencil plan [produced] showing the buildings turned round. A few days made a new set of plans in accordance with the change—that is to say, working plans. I also prepared specifications and took out quantities for tenders. On the 8th of August, 1868, I received from the clerk to the Board of Guardians the following letter:—“I beg to inform you that at the meeting of the Board of Guardians of this Union, held yesterday, you were appointed the architect to superintend and carry out the whole of the works of the above erection at 2½ per cent. commission on the gross actual cost of the works, and no more, in conformity with the agreement made with the vice-chairman of the Board.” The buildings were erected from my second set of plans, and I superintended. The usual charge for the preparation of plans and superintendence is 5 per cent. Assuming that there was no contract, the charge for the second set of plans, and an approximate estimate, would be 14 per cent. I charge 1½ for the first set of plans. The preparation of the plans down to the commencement of the works is 2½ per cent.; the plans for the latter were complete with specifications.

Cross-examined by Mr. Holker: The basement story at first was of necessity built by the Guardians did not rough, and have very few windows and no plastering, and the 5 per cent. was commission on 771l. 1s. 2d. for completing the basement, while the 2½ per cent. on 12,024l. was for superintending the works. A number of plans prepared by Mr. Brown were produced to me. One was a block plan.

By the Judge: This is a totally different plan from mine. This is for an enclosed yard; mine was for a quadrangle.

Cross-examination resumed: Mr. Brown's plan was for one long building. I had no plan laid before me from Mr. Brown for a quadrangle. Brown's plans were rejected by the Guardians. I suggested a variety of alterations.

Evidence having been given on both sides, the Judge said, in summing up, that he was glad the case would go to a jury of men of business, who would decide according to honesty and fairness. There would be no honesty, fairness, or equity in giving the plaintiff one farthing more than he was entitled to under the contract; at the same time, common justice suggested that that bargain was made with reference to what the parties were dealing with at the time, and could not bind the plaintiff or defendants in respect of a different thing which was afterwards substituted. Was the work which the plaintiff was called upon to do different from the contract? Was it known to the Guardians that it was different? Did the Guardians employ the plaintiff to make new plans? And did they do so, knowing that he would have to expend more labour and time upon them? Again, did Brown's plans become totally useless? If they did, Mr. Oswald must be paid as an architect introduced in the first instance. If the jury came to the conclusion that the 2½ per cent. on the cost of the Guardians, assuming there was work done under circumstances universally known to involve an extra charge, then the jury must find for the plaintiff, and then the question would be as to the amount to be paid.

The jury retired at ten minutes past five to consider their verdict, and in ten minutes returned with a verdict for the plaintiff, both as to the plans and the specifications. Amount, 200l., out of the 246l. claimed.

A TESTIMONIAL.

On Friday evening, the 12th inst., a dinner was given at the Sunnery Arms, Fulham-road, West Bromwich, by the foremen, pieceworkers, sub-contractors, and others employed on the Redcliffe Estate, to Mr. Henry Smith, on his retiring from the position of clerk of the works to Messrs. Corlett & McLymont. They at the same time presented him with a handsome marble timepiece, as a memorial of the regard they had always entertained for him. Mr. F. N. Kemp presided; Mr. Rattebury, foreman of carpenters, acting as vice-chairman. In presenting the testimonial the chairman said they had always considered Mr. Smith one of the corner-stones to the estate, and the good name the estate had obtained was in great measure due to his energy and exertion. It need not be added that Mr. Smith expressed himself very gratefully.

DRAINAGE AT TOOTING JUNCTION.

Sir,—I request to call the attention, through you, of the powers that be to the state of drainage at Tooting Junction. The sewage from Arnold-road, and the road adjoining, is carried by a pipe drain to an open ditch in the centre of the middle platform at the railway station. The stench has been so bad at times as to make the railway officials ill; and on the station-master complaining of the nuisance to the engineer of the railway company, he was directed to have the drain stopped up at once, which he did, and it now stands in this state; it is therefore only a question of a few days at the most to make the houses unfit for habitation. One of the landlords had his attention drawn to the state of affairs about twelve months since by the railway company, and requesting him to make some other provision for his sewage, and not to drain it into the open ditch. He took no notice of the request, and unless he can be compelled to make some improvement in the outlet of sewage, it will pollute the neighbourhood.

If a formal complaint were made to the Metropolitan Board of Works, would they step in and rectify the matter? L.

BEECH.

Sir,—Will one of your correspondents inform me of a receipt for preventing beech from cracking, as I make a large number of beech mallets, and as soon as I cut them they crack at the ends, which is a great loss? W.

DONEGAL GRANITE.

Mr. HARTE, the county surveyor of Donegal, has sent to the Dublin Exhibition some specimens of polished Irish granite, in the shape of slabs and columns, which are attracting attention. Plain white granite, in hammered blocks, ready to be set, can be supplied in Dublin at 83d. a foot, and the red polished granite, dressed, at 9s. a foot. The exhibitor says, a horse with 28 ft. of frontage and 43 ft. high, after deducting openings, will cost, polished, 321l.; add for mouldings, &c., 60l.; freight to London, 21l. 15s.; total cost for an entire granite polished front, 405l. 15s. By a combination of, say one-third polished red (at 9s. per foot superficial, and two-thirds white, plain, at 4d. per foot superficial), the costs, he says, would be reduced to about 167l., while the effect would be increased.

SEWAGE IN TOWNS.

On Wednesday last a meeting of municipal authorities and others, interested in remedying the nuisance of sewage in towns, was held in Stafford House, by the kind permission of the owner, the Duke of Sutherland. The meeting was very well attended, and the chair was occupied by his Grace. The immediate purpose for which the meeting was called was to discuss the plan of Major-General II. Y. D. Scott, for getting rid of such nuisances by fire, and to devise measures for applying the principle to the removal of the present difficulties. As our readers know, Gen. Scott's process is in actual operation at Ealing, and the subject has been discussed by the Society of Arts and the Architectural Association, Conduit-street. His plan of precipitating with lime or lime and clay, and the conversion of the deposit into lime or cement by calcination, has been strongly recommended, and the cement thus produced is valuable; General Scott says that he is at present getting 3l. 10s. a ton for it. A great variety of remarks and questions on these several points, proceeding from Mr. Morgan (Barking), Mr. Hawkesley, C.E., Mr. Rawson, C.E., Mr. Webster, Colonel Jones, M.P., Mr. Bennett, Mr. W. Hope, Mr. Hoegs (Ealing), Mr. Bramwell, C.E., Dr. Frankland, and others followed, which were answered by General Scott. Mr. Graves, M.P., moved, and Mr. Cole, C.E., seconded, a vote of thanks to the Duke, who responded.

BASILICAS AND CHURCH REVIVAL.

On Sunday morning last, the Rev. E. Salisbury Foulkes, B.D., preached to a numerous congregation in St. Bridget's Church, Waverley, Liverpool, on the subject of basilicas in connexion with church revival. The text was taken from St. Luke, xii. 2: “For there is nothing covered that shall not be revealed; neither hid that shall not be revealed.” The preacher said there was a striking harmony between those words and the character of the building in which they were assembled, and between the character of that building and the character of the age in which they lived. The words of the text were precisely what the walls of that church said to them. The walls were so constructed as to let in most light. There was no corner of the building where anything could go on long without being seen—there was no room in it for concealment or mystery; it was a

cheerful, transparent edifice, without gloom or obscurity. Nothing that could be lavished on the walls by way of decoration was thrown away, and as for the behaviour of the worshippers, and the manner of conducting the services, all was as patent as day. That church was by no means of the character of the Gothic or Mediaeval style, the style most prevalent in England formerly, and which had been so largely revived among us of late years. It was not his intention either to criticise or disparage that style; but looking to our existing habits and cast of mind, looking at what the services of the Church had ceased to be, and were likely to become again, he could not but think that Gothic would be the favourite style much longer in this country, where a new church had to be built and not an old one restored. The type of architecture presented to them in that church was not merely more suited to modern requirements than Gothic, but it carried them back to times far holier and purer than the middle ages, and reminded them of triumphs which ceased just as the middle ages commenced. The middle ages won lands to the Church, not souls; the ages to which that architecture carried them back won not merely souls but nations to the truth of the Gospel. The Christianity of the middle ages had its impressive, its attractions, its merits, if they would; but it was not the Christianity which the Apostles preached, or it would have produced similar effects in the world to what they did. Instead of that it never advanced; it mystified the faith itself. Beliefs, not only laymen, but slaves, women, and children not only laymen, but slaves, women, and children preached the Gospel by giving their lives and by shedding their blood for it. When Christianity was first preached it was arraigned in buildings such as those for contempt of the law. Buildings such as those were then called basilicas—i.e., royal edifices, or the king's courts. Their arrangement was substantially what they saw in that church. Having described the construction of the basilicas of which Christianity became possessed when the Roman empire became Christian, he said the central part was called the nave (the Latin word for ship), because Christianity had been early symbolised in a ship, and the lateral parts aisles, as though they were the wings to bear it heavenwards. Coming to the more practical part of his subject, including church revival in general, and with special reference to the character of the age in which they lived, he said that if the character of the present age was not absolutely straightforward and upright, it was the next thing to it, in that there was nothing it detested so cordially as underhandness and hair-splitting, moves in the dark and intrigues. The Church movement had never been distrusted in this country when it had been outspoken; it had gained the confidence of the public in proportion as its objects had been avowed, its reasons for them shown to be solid, and not the result of a halting between two opinions. Referring to galleries in churches, he said that nine-tenths of our church revivalists looked upon galleries in churches as an abomination for which there was not a word to be said. Why so? Simply because, without being conscious of it in all cases, they were mediocrities at heart; they judged things by the standard and rule of the Middle Ages, church architecture included. They professed to have done with the Middle Ages, and they were never more committed to them in practice than at the present time. Church revivalists seemed to think that, because galleries were not suitable to a Gothic church, therefore they could never be suitable to any church. Yet it so happened that in the style which preceded Gothic by so many centuries galleries found their natural place. Another vulgar error into which they had fallen by looking at church architecture through Mediaeval spectacles related to the ceremonial—the position of the celebrant at the administration of the Lord's Supper, a subject which was now, perhaps, the uppermost in the minds of all. In all basilicas the place assigned to the clergy was what had been occupied by the tribunal of the judge, and that stood on a raised platform at the further extremity of the central part, and was usually semicircular or apsidal in shape, and in front of the clergy was placed the altar.

St. Ann's Heath Lunatic Asylum.—We understand that the design submitted by Mr. Alfred Smith has been selected.

CHURCH-BUILDING NEWS.

Loughton (Essex).—The new church dedicated to the honour of St. Mary the Virgin was consecrated by the Lord Bishop of Rochester on the 5th inst. It consists of nave, apsidal chancel, chancel aisles, transepts, and south aisle (the completion of the north aisle has been deferred for want of funds). It is faced externally with Godalming or Bargate stone, from the pits of Messrs. Sisley, in random work brought up occasionally to single courses of squared stones with red tile bands to relieve the colour. The Bath stone dressings to doors and windows are carried through the whole thickness of the walls. Corsham Down stone is used for the interior finishings of nave arcade, &c. All the stones are put together with a wide joint, which is ironed back to form a V joint. The walling stone is used on the outside for all quoins which are formed by a chisel draft, 1 in. on each side. The roofs are covered with red tiles, with ridge tiles final, and on the chancel, crockets, of the same, made by Mr. Cooper, of Maidenhead, from the designs of the architect. All the timber construction remains as left by the carpenters, the seats only are stained to a low tone, and varnished. Various gifts of carving and other ornaments and fittings have been made; notably, the carving of the south porch, by the Rev. John Gott, of Beaulieu; the font, which is the gift of Mrs. Matland; a stained-glass window, given by Mr. P. Gethely. Mr. Bentley, of Waltham Abbey, is the builder; Messrs. Allen & Burge have done the carving. The architect is Mr. Thomas Henry Watson, of London.

Kilburn.—The new church of St. Augustine, Kilburn, has been opened for Divine Service. It is not yet consecrated, as the structure is not completed. The edifice has been built under the direction of Mr. Pearson, of Harley-street. All the seats are free. The plan of the church consists of a nave and chancel, together internally 155 ft. long and 28 ft. wide, and 56 ft. high up to the ridge of the groining. The outside facing is of red brick, and the inside of stock brick. Bath stone is used throughout for dressings. The style is an adaptation of Early Thirteenth-century. The church will accommodate, when completed, about 1,200 persons on the ground-floor, while the triforium can be made available for 250 more. A small portion of the area is intended to be seated with movable benches, the remainder of the church with pews. Part only, however, of the church is as yet built, and this includes the transepts, and two bays of the nave and all east of them. Four bays of the nave, with the additional aisles, porch, and tower, remain to be built; also the *arche*. Messrs. Colls & Son, of Moorgate-street, are the builders.

Podmore (Somerset).—The church here has been reopened, after restoration through the liberality of Mr. G. D. W. Digby, of Sherborne Castle; but the chancel is as yet left in a dilapidated state. The church has an octagonal First Pointed tower, with a belfry stage of later date. The great features of the church are the relics of the paintings with which the whole was covered. Many of the old oak benches have been repaired and re-used, as well as the fifteenth-century pulpit. The roofs are wagon-headed, of the usual local type, strengthened by oak tie-beams. Messrs. Slater & Carpenter are the architects; Mr. Creed, the clerk of works. The contractors were local tradesmen.

Aslington (Sussex).—The parish church of Aslington has been reopened. The consecration of an additional piece of ground lately taken into the churchyard was combined with the opening ceremony by the Bishop of Chichester. The enlargement nearly trebles the area of the old building, and consists of an extension of the nave to the west, about 15 ft., and a new south aisle, porch, and vestry. The new portions are generally built with local stone and Bath stone dressings, in the style of the old church, which was erected during the first half of the fifteenth century. Ancient work has been preserved, and used in again. The new aisle roof is open-timbered, and plastered between the rafters. In the porch the old roof has been reproduced, and some of the old timbers used in again. The old porch doorway is also refixed in the new aisle-wall. The chancel seats, pulpit, sedilia, altar, and table are all of wainscot. The nave seats are of English oak, cut from the estate of the Rev. John Goring, of Wiston Park. The floors are laid with encaustic tiles from Mr. Minton Taylor's works. The work has been

designed and superintended by Mr. R. Wheeler, of Tunbridge Wells, assisted in the latter part by Mr. G. Hanby. Mr. Dalby, of Steyning, was the contractor.

Bruton (Somerset).—The nave of Bruton Church was reopened on the 20th ult., being the first portion completed of the restoration of the whole under Messrs. Slater & Carpenter. The roofs of the nave and aisles are of the richest possible type, moulded and carved over the whole surface. Unfortunately, owing to the original bad construction of the gutters, these roofs were become dangerous, through the rotting off of the ends of all the timbers and wall-plates. Iron rods and struts had been introduced; but in the mean time the north walls of the nave and aisles had been pushed out of the upright; it was necessary, therefore, to rebuild entirely the north arcade and clearstory, and to take down and reconstruct the old roof, which, with the exception of three new tie-beams, wall-plates, and some few ribs, has been put up again. The missing angels, bosses, panels, &c., have been renewed and carved by Pepper & Son, of Brighton. The same treatment will now be adopted with the aisle roof. The nave has been re-seated with open seats, re-using the old Jacobean bench-ends. On removing the modern wood-and-plaster chancel arch, the original arch was found springing from corbels; but it was so much cut about that it has had to be rebuilt. The original rood-loft stairs remain; but the rood-screen has been for many years in a neighbouring church. Portions of a screen remain in the tower, but these probably were for St. Catherine's chapel, where a stone staircase yet remains, indicating the position of the screen. A very interesting crypt was discovered, partly under the nave and partly under the chancel. It is of six bays, vaulted with two detached columns. It formed at one time the substructure of an earlier chancel. It is now used as a burial-vault of the Berkeley family, and has been preserved, the level of the floor rising (as formerly) from west to east, so as to get over the crown of the vault. Its original doors and windows are, of course, now blocked up. The works have been carried out under the architects by Messrs. Clarke & Son, of Bruton, with Mr. Court as clerk of works. The warming is by Haden, of Trowbridge.

Southampton.—St. Michael's Church, Southampton, has been reopened after restoration. The whole of the galleries have been removed; the walls have been stripped of the plaster with which they were covered some forty years ago, when a new roof was provided; the pews and pulpits are gone, and the floor taken up, leaving the base of the area at its original level, which is a foot and a half or so lower than the street. New rafters and supports have been introduced under each of the aisle roofs; the vestry in the north-east corner has been thrown into the church, and forms a "chapel" for private communion, there standing within the rope railing, which only now separates it from the north aisle, a small altar, on which stand an ornamental brass cross, a couple of candlesticks bearing long tapers and vases filled with flowers. The old-fashioned staircase which occupied the opposite corner of the church leading to the belfry has been removed, giving thereby room for a spiral chapel, and in its place there has been a spiral staircase of somewhat temporary construction in appearance, which runs up close by the south-eastern support of the tower and spire. Within the chancel considerable alterations have been made, mainly in accordance with High Church ideas. The high altar is separated from the smaller chapel already alluded to by a dwarf wall of Bath stone, surmounted with a light iron railing painted blue. The chancel-space under the tower is occupied by the choir stalls, of oak plainly carved; the seats for the congregation are of modern pattern and comfortable construction, and are made of pine, the work being of the plainest possible character. All the sittings are unappropriated. The centre aisle is paved with red and black square encaustic tiles, and others of a more ornamental character are laid down in the chancel. The chancel ceiling has been painted and decorated, and the approaches are also coloured. This portion of the work was carried out by Mr. G. Vaughan. The general appearance of the church is at present one of incompleteness, the stone walls being for the most part left as they were found after the removal of the plaster. The work of restoration has been carried out by Mr. H. I. Sanders, of the Strand, builder, under the supervision of a committee. The work so far done has been at a

cost of about 1,000., of which there is a deficiency of about 200.; and 1,000. as well are required to complete the restoration.

DISSENTING CHURCH BUILDING NEWS.

Swansea.—The foundation-stone of a Wesleyan Chapel in the locality of Sandfields, has been laid. Quite a new town has shot up in the Sandfields within the past few years, and open spaces there are still being built upon with a rapidity bespeaking the material progress of the borough. There is now a large aggregation of the working classes in that district. The site obtained is in St. Helen's-road, opposite the Hospital. The architects are Messrs. Habershon, Peto, & Faulkner, of London, Cardiff, and Newport. The style of the building is "Victorian," and it will accord with the architecture of the buildings opposite. There will be a schoolroom underneath, 12 ft. in height, and 72 ft. long by 45 ft. broad. The chapel will seat about 350 persons, but provision will be made for galleries to be put up hereafter, which will seat 300 more. The contractor is Mr. David Morgan, and the amount of the contract 1,926l. 7s. 5d. The extra cost, including capitalised value of the ground-rent, will be about 2,300l.

Stockport.—The foundation-stone of a place of worship at Stockport Little Moor, called the "New Union Chapel," has been laid by Sir James Watts, bart., of Abney Hall, the term "Union" having been selected "to denote the fusion of all sects of Christians, in the erection of a tabernacle in a locality where the want of such a place has been long felt; and where all classes may worship from one common platform, gentlemen of all denominations having contributed to the work." The designs for the chapel are by Mr. T. H. Allen, architect, and the contractor is Mr. Henry Barlow. The site selected for the purpose is a fork of land where the Maple-road and that leading to Hazle-grove meet. The building will be in the Gothic style of architecture, faced all round with stock bricks, and relieved by stone bands and other dressings, with a circular rose-light window in the front gable. A tower at one corner forms a feature, with a porch on the opposite corner. It will have two entrances in the front; one in the tower has a staircase leading to the orchestra above the vestry. The chapel will be 47 ft. long and 31 ft. wide in the clear, and 25 ft. high to the ceiling, and is arranged to accommodate 250 people. The pews and roof-timbers will be of pitch pine, stained and varnished. The cost will be about 1,000l.

Bristol.—Pill Wesleyan Chapel, Bristol, has been opened for divine service. The contract, which includes a school, has been carried out by Mr. J. W. King, builder, Bristol, from drawings and under the supervision of Mr. E. A. Lansdowne, architect, Newport, Monmouthshire.

Leicester.—The memorial-stone of a Nonconformist church has been laid on a site in New Parks-street, Leicester. The building, when completed, will seat nearly 1,000 persons. Mr. Shenton is the architect. The church is cruciform in plan, but the intersection of the four arms of the cross is converted into an octagon, in which part the bulk of the congregation will assemble. The site being surrounded by streets partially dictated this form, as it was thought desirable to have a separate entrance from three of them, in order to give increased facilities of ingress and egress from the church. The principal or nave entrance, in New Parks-street, will be approached through an arched colonnade, leading to an open porch, from which access will be obtained to the gallery-staircase, as well as to the body of the church. The end of the apse is made semicircular on plan, and is appropriated to the organ and to the use of the choir. A gallery, five seats deep, will be erected at the end of the nave, above the open porch. The extreme internal length of the church, from the nave to the apse, is 120 ft., and the clear breadth across the transepts is 113 ft., the width of the central octagon being nearly 50 ft. The style chosen for the building is an adaptation of the Early Gothic; but as the church will be mainly a brick structure, no attempt has been made to give it a high decorative character, and the effect of the building will rely upon its variety of outline, rather than upon minute detail in its several parts. No endeavour has been made to construct decoration for the mere sake of ornament, but construction has been decorated where possible without great expenditure of money. The walls of the interior will be faced with red

bricks to a height of 7 ft. from the floor, above which they will be finished with white bricks, bounded with red courses, in order to break up its otherwise monotonous surface. The chief architectural features of the building will be the octagon, whose internal height is 55 ft., and whose elevation in the interior is 85 ft. from the ground to the top of the lantern. Around its upper part will be a range of lancet-headed clear-story windows, twenty-eight in number, which, it is hoped, may some day be filled with stained glass. From each angle of the octagon are projected stone shafts, with curved caps and bases, from which will spring the curved ribs of the roof-trusses. The ceiling will be partially domed, the timbers being visible, which, together with the boarding, will be stained and varnished. The height of the nave and transepts will be 32 ft. from the floor to the ceiling, and these roofs will be treated similar to that of the octagon. The seat accommodation, allowing a full width in each sitting for adults, will be as follows:—Ground floor, 700; gallery floor, 70; total, 770. The church will be warmed by means of hot water on the low-pressure system, for which two furnaces will be fixed in the basement. A vestry will be erected on the eastern side of the apse, and it was intended to have had a similar building on the western side; but this, together with the gallery which it was proposed to have in each of the transepts, has for the present been abandoned, although the foundations for them have been built. There will be accommodation in all provided for upwards of 900 people.

SCHOOL-BUILDING NEWS.

Stamford.—A draft scheme for the management of the Stamford Endowed Schools has been brought under the notice of the Corporation. A clause in reference to Radcliffe's High School, says:—"So soon as conveniently may be after the date of this scheme, the governors shall provide on some site convenient of access for the inhabitants of Stamford, school accommodation sufficient and suitable for a high school for at least 150 boys, and a residence for the head master, with boarding accommodation for thirty boys; they shall also provide a place for cricket and other games for the use of the scholars. For this purpose they may expend a capital sum not exceeding 6,000*l.*, unless with the consent of the Charity Commissioners."

Bradford.—The chief stone of St. Michael's and All Angels Church Schools, which are building in the rear of the church, in Brick-lane, Bradford, has been laid. The schools, which are being erected entirely by voluntary subscriptions, have been designed by Messrs. T. H. & Healey, architects, Bradford, in plain Gothic style. Accommodation will be found for 250 boys and girls in a mixed school, and there will be an infants' school for 222 children, with playgrounds attached. The total cost will be about 2,100*l.*, including furnishing and fittings, and towards this sum about 1,500*l.* has been either promised or received.

Haughton-le-Skerne.—The new schools at Drinkfield, in the township of Whessoe, in the parish of Haughton-le-Skerne, have been opened. These schools have been built by the Rev. E. Cheese, rector of Haughton-le-Skerne, and Mrs. E. Cheese, in memory of the late Hon. and Right Rev. Henry Montagu Villiers, D.D., Lord Bishop of Durham, for the benefit of the ironworkers who have lately been drawn together by the new ironworks at Drinkfield, in the parish of Haughton-le-Skerne, as well as for the use of the other inhabitants of the district. The site was given by Mr. John Henry Garbutt, on an open space between the ironworks and the new village. The schools are called St. Peter's Schools, in consequence of the parish church and schools of Haughton-le-Skerne being dedicated to St. Andrew, the brother of St. Peter. The plans, by the Rev. E. Cheese himself, have been brought to their completion by Mr. G. B. Scotson, of Haughton-le-Skerne, as contractor for the masons' work, and Mr. Robert Unthank as contractor for the joiners' work. They consist of two large rooms built in the form of two sides of a quadrangle. The principal school-room is 66 ft. long, 19 ft. wide, and 15 ft. high. There is a large mullioned window at each end, and three mullioned windows on either side. As it is to be a mixed school, there are separate entrances for the boys and girls, each having a separate lobby and separate yards, with conveniences attached. The second school-room is 28 ft. long, 16 ft. wide, and 12 ft. high. This

room is fitted up with a gallery for infants, and, as well as the large room, has parallel desks, which can be used either as tables or desks, and forms which can be easily moved as occasion may require. There is a kitchen attached to the schools. The buildings stand upon a quarter of an acre of ground, which has been walled in and drained. They are built of red bricks, slightly relieved with white fire-bricks. They are roofed with slate, and approached through large gates, and a convenient carriage drive.

Kingston.—The promoters of the scheme for building new church schools in Kingston, in two departments, for the reception of 262 boys and 263 girls, are now ready to commence operations. The site has been purchased and legally conveyed to the vicar and churchwardens for the time being, as trustees. Plans have been prepared by Mr. C. L. Luck, of Surbiton, and tenders are adopted by the committee; and tenders are adopted by the preliminary arrangements are now being made by a committee of management for laying the foundation stone by her Royal Highness the Princess Mary, Duchess of Teck, on the 14th August.

Books Received.

The Village Churches of Denbighshire. By Messrs. LLOYD WILLIAMS & UNDERWOOD, Denbigh, 1872.

A CONSIDERABLE number of plates have been published since we noticed the commencement of this work, and include subjects of greater interest,—for example, the fine old screens of Llanwrth, Gresford, and Derwen, which are well worthy of notice; the wall-painting at Ruhnog; the wooden font and the wrought-iron knocker on the door of Enechidd Church (plate 30). The wrought-brass candelabra at Llanunaw Church is a good specimen of old work. Messrs. Lloyd Williams & Underwood have made drawings of Denbigh Castle, Valle Crucis Abbey,—which contains some very exquisite detail,—and Wrexham and Ruthin Churches (the tower of the former is as fine as anything of the date), and when these are issued they will have illustrated nearly everything of architectural interest in the county, as regards Gothic buildings.

In the Burgesses' Tower and the grand gateway of the castle they have been careful in giving the masonry,—putting in every stone. The mixture of free and lime stone,—the latter often being so small as to look like tessera, is very interesting.

VARIORUM.

THE Fourteenth Annual Report of the Ladies' Sanitary Association (Office, 22, Berners-street, Oxford-street) has been issued. The committee state that they have good reason to hope that the work of the Association is progressing. In many localities much good solid work has been done during the past year among the poor and ignorant. The tracts have been widely circulated; in all 32,000, making a total of 777,810 since 1857. The park parties have been most useful and numerously attended; a total of 32,364 children went out in these park parties, at an expense of 53*l.* 16*s.* 8*d.* The Branch Associations continue their efforts to ameliorate the household condition of the poor in Aberdeen, Brighton, Birmingham, Cardiff, Manchester, Paisley, Reading, Ramsey, and Stornoway, the annual reports received being unusually encouraging. The committee, anxious to try, in the crowded parts of London, the experiment of deposits for the loan of cleansing materials, such as bath-tubs, pails, brushes, funnels, &c., raised funds by special efforts and established one in Rotherhithe and another in Poplar. They are much needed in St. Giles's, Bethnal-green, Lambeth, &c. The testimony of clergymen, of district visitors, Bible and mission women, has convinced the committee that practical aid given to the poor to cleanse their homes is a valuable auxiliary to the truths inculcated in the tracts.

—"Practical Suggestions to all Inventors and Patentees and Purchasers of Patents." By Julius Hall, Consulting Engineer. Hall, Chancery-lane." This pamphlet contains a good deal of advice to would-be patentees, but, of course, not enough to enable them to do without the services of a consulting engineer.—"Statement relating to the Home and Foreign Trade of the Dominion of Canada; also Annual Report of the Commerce of Montreal for 1871." *Montreal Gazette* Printing-house, Craig-street." This

is a kind of supplement to a daily paper. It contains a great mass of information, more especially as to the agricultural trade of Canada, both inland, and with Britain and the United States, and the trade and commerce of Montreal.—"Esse and Posse: a Comparison of Divine Eternal Laws and Powers, as severally indicated in Fact, Faith, and Record." By Henry Thomas Braithwaite, M.A. Longmans & Co." This book deals with matters quite beyond our scope; but many of our early readers will remember Mr. Henry Braithwaite's name, and will be glad to know in what direction he is now working. It is a book of denials, and will please but few.—"The Clergy Directory and Parish Guide, for 1872 (Bosworth)," appears to have been carefully posted up to the present time.

Miscellaneous.

Improvements at Stepney-green.—Under the superintendence of the Metropolitan Board, the land has been laid out as an ornamental garden. The area is nearly 1,200 ft. in length, or nearly a quarter of a mile from end to end, with a clear air-space between the boundary-walls of the properties on either side, of more than 100 ft., the total extent, therefore, approaching three acres. The great length of the plot necessitated the introduction of several cross thoroughfares, mostly old rights of way. An iron railing, 7 ft. 6 in. in average height, with enriched spearhead ornaments to the standards and decorative scroll-work in bands at various levels, indorses the whole. Nine sets of gates, corresponding in character with the railing, open into various parts of the garden. The total length of railing is nearly 2,500 ft., carried out by Messrs. W. McFarlane & Co., of London and Glasgow. The railing is carried by a dwarf wall in brickwork, averaging about 1 ft. 6 in. to 2 ft. high, with a stone coping, executed, with the other building required in connexion with the undertaking, by Mr. High, of Clapton. A sufficient number of large and well-grown timber trees, especially at the upper end of the garden, give a due allowance of shade. The laying out of the ground has been arranged by Mr. McKenzie, the landscape gardener to the Board. Additional planting has been done by Mr. Weston, the shrubs, &c., being supplied by Messrs. Barr & Sugden. The general superintendence was vested in Mr. George Vulliamy, the architect to the Board.

A Church Burnt at Paddington.—A fire occurred in Paddington early on Saturday morning last, which ended in the almost total destruction of the Church of St. Mary Magdalen. This church was erected from designs, we believe, of Mr. Street, and cost about 30,000*l.*, exclusive of the roof, just being finished, which cost an extra 4,000*l.* Inside the decorations were costly, the reredos, in particular. The organ, valued at 1,600*l.*, has not been destroyed, on account of its being situate in the transept, which is protected by a brick and grained wall, but it is seriously damaged by water. The fire is said to have originated in the following manner:—The temporary roof has lately been superseded by the permanent roof, and between the slates of the latter and the beams supporting it was a coating of pitch. A workman was engaged in the completion of these arrangements, and was endeavouring to ascertain whether what had been done would interfere in any way with the bell, when the candle which he was carrying fell from his hand on to the pitch, which it immediately set on fire. The man gave an alarm at once, but the inflammable nature of the pitch spread the flames so rapidly that the whole roof was soon burning. There is something odd about this story, and we should not be surprised to find it incorrect. The pitch when it fell set light to the seats below, and thus the whole edifice was gutted. The altar and its fittings, worth 200*l.*, were saved.

Memorial Reredos for Stroud Church.—The reredos intended to be erected in Stroud parish church as a memorial of the late Mr. William Stanton by his sons is approaching completion. The work has been designed by Mr. G. Scott, jun. It is composed of freestone from Cooper's Hill and Ball's Green, and will be about 23 ft. in width and 11 ft. high. Each end has two arches crowned with carved canopies. The central part is divided into three recesses with canopies, in which will be groups representing incidents in the life of the Saviour.

House-Lifting in Chicago.—It is by no means an uncommon thing in the United States, as our readers know, for a house to be lifted bodily from its site and removed by machinery to a new one, without disturbing the inmates; but in Chicago the operation was extended to almost the whole of the city, in 1867-68. The early buildings were generally erected without any regard to the laws of drainage, and eventually, as the city increased in size, the evil became intolerable. By means of screws acting under balks of timber, one of the largest hotels, known as Briggs's, was raised to a height of 4 ft. 2 in. above its previous level, although the building had a frontage of 180 ft., a depth of 80 ft., and was five stories high, presenting accommodation for 450 guests, none of whom were disturbed during the operation. This took twenty-seven days, although the weight lifted was upwards of 22,000 tons. Tremont House, another hotel of a similar size, was also raised without accident. The screws employed were about 2 ft. long, 2½ in. in diameter, with a pitch of half an inch. They worked in cast-iron sockets, and were moved by handspikes. 1,450 such screws, and 600,000 cubic feet of timber, were used in raising Briggs's Hotel. A similar plan was adopted in July, 1868, at Boston, when whole streets of houses were raised in blocks of six houses together.

Wolverhampton Congress of British Archaeological Association.—The proceedings of the Congress will include, on Monday, August 5th, reception by the Mayor and Corporation and address of the President, at the town-hall; visit to the Collegiate Church and Danish Cross, and Pettenhall Church; inaugural dinner. Tuesday, excursion to Wall, the Eboracum of the Romans, Elford Church, Low Hill, Haselow Hall and Beaudesert; Lichfield Cathedral. Wednesday, excursion to Longhich, Giffard's Cross, Brewod Church, Blackladies, Boscobel, and Whiteclades; reception by the President, Church at Chesterton. Thursday, excursion to Uttoxeter, Croxden Abbey, Checkley Church, Stafford, St. Mary's and St. Chad's Churches, Penkridge Church. Friday, excursion to Ludstone Hall, Claverley and Quatford Churches, Bridgnorth, Castle Ruins, Bishop Percy's House, the Hermitage, Upton Cresset and Worfield Churches, Morville and Aston Eyre Churches; and Saturday, excursion to Dudley, examination of the Castle and Priory, Kinver Church and Kinver Edge. An additional excursion is suggested for Monday, August 12, to Leek.

The Castle Gardens, Rochester.—After some delay the works at the grounds adjoining Rochester Castle have been completed, and the castle gardens have now been formally thrown open to the public. A large amount of labour and no inconsiderable expense have been necessary in carrying out the desirable object of providing a pleasant retreat, in which the inhabitants of Rochester and the general public can spend their leisure hours. The entrance to the gardens is by a gateway leading from the Esplanade. To form this gateway a breach was made by a party of Royal Engineers in a solid block of ancient masonry, which forms a part of the castle wall, and the jagged edges of the breach have been rounded into a Norman archway. Passing under this arch, the visitor ascends a flight of massive stone steps into the gardens, and is confronted by Rochester Castle, which stands at the opposite end of the grounds, which seem to have been laid out with taste and judgment. We gave a view of those grounds in the *Builder* for last year, page 1007. A covered stand has been erected on a stone base, for the accommodation of bands of music.

A Clock and Chimes for Bradford Town-hall.—This building approaches completion. The committee of the corporation which has charge of the structure have agreed to recommend the council to place a clock and chimes in the tower of the Town-hall, and to accept the tender of Messrs. Gillett & Bland, of Croydon, for the execution of the work. Tenders were also submitted from Mr. W. Potts (Leeds), Messrs. E. Dent & Co. (London), and Messrs. Cooke & Sons (York). The clock will be illuminated. There will, in all, be thirteen bells,—four bells to strike the Cambridge quarters, eight bells for the chimes, and one large bell, 3 tons weight, to strike the hours. This bell will be heard in the night-time beyond the boundaries of the borough. Fifteen tunes may be played on the chimes, and this number can be readily increased.

The Thunderstorms.—Several thunderstorms have occurred since our last notice, and have done great damage over a large part of England, especially by floods. The lightning and thunder are described as something unusual, the lightning being in general more vivid and sustained, and in some cases almost continuous, and the thunder roaring rather than in rattling peals. Of the damages we cannot give any account, but we may state that at Merthyr Tydvil a large reservoir on the hill-side, above the Plymouth ironworks, burst its banks, and the village of Troedyrhiw, near Merthyr, was submerged to a depth of from 4 ft. to 5 ft. Two reservoirs burst at Middleton, in Heaton Park, and a parsonage-house was struck by the lightning,—the third or fourth instance, this season, of parsonages being struck, as many other houses have been. At Hanley, a flash of lightning passed through the Primitive Methodist school-room while the children were in it, the lightning entering by one open window and passing out by another without injuring one of them, although they were greatly frightened, and in their flight downstairs trampled on each other as they fell, but without serious injury.

The Re-building of Chicago.—A local paper, titled the *Landowner*, gives an idea in rough engravings of the great scale on which Chicago is being rebuilt. The Illinois Staats Zeitung is seven stories high, and five and six storied buildings are frequent. The Union Buildings in process of erection on the old site at Washington-street is a massive building; but the most palatial-looking edifice among those before us is the Singer Building, also in process of erection at Washington-street, for the Singer Manufacturing Company. There is a plain-looking building, with marble front, in Walsh-avenue, under no distinctive name. A speciality of many of those illustrated is a wide open staircase descending from the upper stories right into the street, without any gate or door to close it. There are illustrations of buildings in Michigan and Detroit in the same paper; as also plans for showing an extensive transplantation of large trees into the streets and avenues of Chicago; and others showing additional dock accommodation by canals branching from the Chicago river.

Extension of Brookwood Asylum.—Two of the Lunacy Commissioners visited Brookwood Asylum recently, and reported the necessity for immediate consideration by the justices of the county for making further provision for the insane paupers of Surrey. The report says:—"We would also repeat the suggestion of our colleagues, that no time should be lost in the erection of a permanent detached hospital for the reception and isolation of patients suffering from fever or other infectious disease." The workshops in progress of construction at the last visit are now in use, and the skittle-shed and bowling-green in the airing court attached, are nearly ready. In addition to the improvements noted in the report, plus for the new recreation-hall have been approved by the Commissioners, and the committee will soon decide on the contract. This hall, for the building of which 5,500l. were voted at Quarter Sessions, will be built in the north front of the asylum. The magistrates have already adopted to some extent the recommendations of the Commissioners.

The Stein Monument, Nassau.—On a hill-side in the ancient Duchy of Nassau, a monument has been unveiled representing a Prussian politician, who renovated the domestic institutions at a time of dire misfortune, and whose liberal reforms enabled the country to recover strength, and eventually defeat the foreign conqueror, Napoleon I. Henry von und zum Stein was a baron of the Empire, and sovereign of the territory surrounding his paternal castle in Nassau. The monument is a white marble statue, placed under a Gothic canopy; it somewhat resembles Sir Walter Scott's monument at Edinburgh. It is the work of Herr Pfabl, a rising Berlin sculptor, and admired as including a striking likeness of the well-known aquiline features and proud portly exterior of the man.

Narrow Speech Room.—A meeting of the General Committee, and of the General Purposes Committee, was held on Tuesday, July 23rd, to authorise the appointment of an architect and adoption of designs for the speech-room. It was resolved that the appointment of Mr. Burgess as architect be approved, and the Building Committee were requested to consider with him a modification of his designs.

The Stamford Terra Cotta Company.—Our advertising columns have already mentioned the incorporation of this company, and we gladly direct further attention to it. The object of the company is to purchase of Mr. Blashfield, the well-known terra-cotta manufacturer, the whole of his business, together with the plant, models, moulds, machinery, stock, and other effects; and, by an increase of capital, fully to employ and develop the present works. The business carried on is for the most part the modelling and making of moulded bricks for cornices and ornamental details for architectural decoration, and for the ornamentation of gardens, terraces, and conservatories. The stock of designs and models and moulds for works of a high class in this branch of manufacture, now in daily use at these works, is the largest in England. The most important decorative features in terra-cotta for public and other buildings in England, India, and other places, have been made at these works. The manufacture is so important that we shall hope to find it efficiently and successfully carried on.

Sewage Farms not a Nuisance.—The Corporation of Birmingham have had printed, in pamphlet form, the speech of Lord Henley, M.P. (chairman of the Select Committee of the House of Commons), on the Birmingham Sewerage Bill. In one part his lordship says:—"As a matter of fact the Earl of Warwick, so far from finding the sewage farms—one of which was only a quarter of a mile from his lordship's park, and the other within a mile—a nuisance, has made an application for an additional amount of sewage to be placed upon his land on account of its fertilising properties. No less than 2,000,000 gallons of sewage daily are spread over 500 acres of land, and yet it is no nuisance whatever. One of the sewage farms received the sewage from Warwick, and the other that from Leamington; and Lord Warwick is so satisfied with them that he has agreed to take the sewage at 450l. a year for thirty years. That shows that Lord Warwick considers the sewage farm there no nuisance, and that the plan which has been adopted to get rid of the sewage of large towns is one which ought rather to be encouraged than discouraged.

The Bristol City Surveyorship.—At a recent council meeting it was resolved to secure the sole services of a gentleman to do the duties of city surveyor, and the matter was referred to a committee to make arrangements in accordance with the resolution. The committee, however, resolved,—on Mr. Thomas's proposal to perform the duties, reserving a right to do certain private work, namely, valuations within the borough, and all kinds of professional work outside it,—to recommend this to the council. There were nine for entertaining Mr. Thomas's offer, and eight against it, one member not voting. The question will therefore again come before the council in its original form, as to whether or not the city is to have the sole services of its surveyor.

Surrey Toys and Wood Carving.—In reference chiefly to the immense sale of toys and wood carving from Germany in the Crystal Palace, at Sydenham, a correspondent of the *Surrey Advertiser* says:—

"I propose to make the county of Surrey celebrated for the production of such articles, and that meetings should be convened in all the towns, to appoint committees, raise subscriptions, and hire cheap buildings suitable for homes, playgrounds, and workshops, for boys from five to ten years of age, and the machinery for carrying the plan forward under a committee of management appointed for the purpose. The children having thus acquired the rudiments of some mechanical art, their services would be eagerly sought for as apprentices in various trades."

The New Townhall, Wotton-under-Edge.—This new edifice has been opened. The market-house has simply been restored, and the hall rebuilt. It is 55 ft. by 29 ft., and 20 ft. high, with two staircases at the ends, a gallery, and ante-room. The style is chosen, as most appropriate to the existing columns of the Market-house, is Romanesque, with a light-arched roof covered with Staffordshire tiles. The work has been carried out under the superintendence of Mr. C. Pritchett, architect; the contractors being Messrs. J. Whitfield & Son, J. & W. Jotchan, H. Holloway, and G. Parker, all of Wotton-under-Edge. The cost of the building, including seats, gas-fitting, &c., has been 500l.

Baker's Deodorising Closet.—This is an ingenious and useful invention which well deserves looking into. It is automatic in its action; and the moment the lid is down, its deodorising and disinfecting properties are in action.

The St. Olave's Guardians and the Architect to the Infirmary.—A dispute which has been for some time pending between Mr. Turner, architect, and the St. Olave's Board of Guardians, in reference to a claim by the former for commission, in connexion with certain alterations in the infirmary, has just been decided in favour of the architect, by the arbitrator (Mr. Harrington) to whom it was referred. The arbitrator has awarded Mr. Turner the sum of 700*l.*, and, in addition to this amount, the Union will have to pay the heavy legal expenses on both sides of the action, together with those of the special case and the arbitration.

Salthurn Convalescent Home.—Through the liberality of the Pease family, Salthurn-by-the-Sea will soon be in possession of a convalescent home. This structure has been erected at the sole expense of the Messrs. Pease, of Darlington, for their various workpeople who may require the benefits to be derived from change of air, careful nursing, and nutritious diet. It is expected that the works will be finished by the end of August, and as the building is quite dry, the patients will be able to be removed to it at once. Mr. Thomas Oliver, of Newcastle, is the architect.

The Workmen's Club and Institute Union.—The annual meeting of this society will be held at the Albert Hall this Saturday, July 20th, at half-past six p.m., Mr. Mondella, M.P., in the chair. The Workmen's Clubs in the provinces are invited to send up delegates to attend a conference to be held in the Lecture Theatre of the South Kensington Museum on the same date, at eleven o'clock a.m., for the purpose of discussing various questions relating to the Club movement in England; Sir Harcourt Johnstone, M.P., in the chair.

A Public Hall for Greenland (Halifax).—West Vale and Greenland have very much felt the want of a public room for meetings and entertainments, and also educational facilities for the working population after factory hours. A company has now, however, been formed for the erection of a building, as a Mechanics' Institute, which will not only furnish a good public room, but a series of class-rooms for educational purposes. The amount of capital to be raised is 2,500*l.*, and already nearly 1,200*l.* have been raised in 1*l.* shares.

The Heat in New York.—The *New York Tribune* of the 4th writes as follows of the intense heat in New York:—"The sixth day of dreadful heat has passed, and still there is no substantial relief. A million of people pant for a breath of cooling air. Poisonous exhalations rise from the festering streets. Gutters reek with fever-breeding stenches. Seventy persons dropped dead from the heat in a single day, and the hospitals are crowded with delicious victims. The night brings no rest, for it is as hot as the day. The wretchedness is universal."

Lime and Cement Works.—It is announced that the old-established business of Messrs. J. & W. Eastwood, as lime, cement, and brick manufacturers and merchants, carried on for many years at Wellington Wharf, Belvedere-road, and Canal Bridge Wharf, Old Kent-road, has been joined by several gentlemen, and has been registered as a limited liability company. The business will in future be conducted under the style of "Eastwood & Company (Limited)."

The Proposed Building on the Embankment at Westminster.—The Metropolitan Board of Works are about to negotiate with the St. Stephen's Club trustees as to their projected building at the corner of the Victoria Embankment, opposite the Houses of Parliament, with the view of purchasing the land, and so obviating the erection of a large edifice which would hide part of the Clock Tower from view on the Embankment.

Improvements in All Saints' Church, Maldon.—The chancel roof is being coloured with a coating of blue, studded with golden stars. The walls of the chancel are also to bear a continuation of colour, which is to be changed with a quiet pattern of ancient devices. These additions are said to accord with the style of the church, as restored a few years ago from the designs of Mr. William Adams (then a resident architect).

The Prison Progress.—The proceedings have closed and we shall probably have to revert to them. We have no particular praise to give for the way in which they have been managed; but good has, nevertheless, been done.

A Tunnel under St. Martin's-le-Grand.—The City Commissioners of Sewers have been informed by Mr. Ayrton, First Commissioner of Works, that the Government are about to construct a tunnel under the roadway in St. Martin's-le-Grand, so as to form a means of communication between the two post-office buildings in the street, and that the Office of Works are prepared to pay the sum of 4,450*l.*, the estimated cost of diverting the sewers.

Lambeth Water Supply.—In reply to Colonel North, who asked whether, in consequence of the report of the medical officer of the Lambeth district, means were likely to be adopted to oblige the Vauxhall Water Company to furnish pure water, Mr. C. Fortescue said that the necessary notices would be issued, and that if these were not attended to the legal powers held by the Board of Trade would be put in action.

The Birmingham Sewage Injunctions.—Sir Charles Adderley and "the Gravelly Hill Relators" have served upon the town clerk of Birmingham, writs of injunction, prohibiting their present sewage works. It is said that the expense incurred by the council in connexion with the Sewage Bill, which was thrown out in the Commons, is no less than 70,000*l.*

Society of Arts.—Technological Examinations.—His Royal Highness Prince Arthur will preside at a Conference on this subject to be held at the Rooms of the Society in the Adelphi, on Saturday, July 20th, at twelve o'clock. Merchants, manufacturers, and others interested in the movement are invited to attend.

The Agricultural Labourers' Question.—Mr. George Mitchell, of the Brentford-road, has thrown himself resolutely into support of the movement for obtaining increased wages for agricultural labourers, a much-needed step, and has made a number of effective addresses in various parts of the county.

Proposed Police Station, Shipston-on-Stour.—A plan for building a new police station at Shipston, at a cost of 1,200*l.*, with a room over the cells, at an additional cost of 200*l.*, gave rise to considerable discussion at the Warwick Quarter Sessions. Ultimately the Court adopted the plan, and decided to proceed with the work.

Warrington.—At a meeting of the town council of Warrington, held on the 2nd inst., the council unanimously resolved to allow Mr. R. Vavser, their borough surveyor, to undertake private practice.

Offices of the London School Board.—Mr. Macey's timber-yard on the Thames Embankment has been cleared, ready for the foundation of the offices of the London School Board. Lucky Mr. Macey!

Egyptian Hall.—Professor Pepper and Mr. Tobin have added to their attractive entertainment here short dramatic readings by the well-known and admirable actress, Mrs. Stirling.

M. 30, Mr. Scott, Horseley-yard, Brook-street, Bond-street.

The Builder.

VOL. XXX.—No. 1538.

*The Character and
the Career of
Thomas Brassey.**

WHATEVER be the form of the literary memorial of Mr. Brassey, few men have ever left behind them such ineffaceable monuments of their career. A noble Latin sentence, which has been displaced from its apposite locality in the recent attempt to "improve" the choir built by Sir Christopher Wren, bade the reader who sought for the monument of that great architect, to look around. There are few regions of the world in which a similar advice might not be given to the person who asks for

the monument of Thomas Brassey. There are two modes, in either of which the biography of the great railway-maker and the history of his works, might have been worthily written. The subject might have been treated as a chapter of the engineering and industrial history of the world; or it might have been so dealt with as to present a clear and luminous view of a life and character remarkable for a combination of the qualities which command success with those which attract esteem. Either view, taken from a proper standpoint, would have possessed extraordinary interest. Mr. Brassey contributed, in his own department, more powerfully than any other man has done, to the progress of the greatest physical revolution that has occurred in the relation of man to the earth which he inhabits. Commencing with a clear and intelligent description of the condition of the British Islands, and of other parts of the world, at the time when it was first discovered that a smooth wheel would adhere to a smooth rail with sufficient tenacity to enable it to become an instrument of propulsion, such a work, as we describe, would have pointed out the great changes effected in the commerce, the social activity, and even the structural appearance of old cities, like Chester, Norwich, Peterborough, by the founding and prosperity of new centres of activity, as at Crewe, Swindon, Wolverton; and, finally, in the great architectural transformation which is now in progress in the metropolis itself. It would have probed the great problems of labour, and shown how great a revolution has been effected in the condition of the labourer by the two great elements, facility of transport, and facility of intelligence. It would have shown how the development of pith, and muscle, and skill, attendant on the introduction of organised work, good pay and generous diet, has raised the standard of manhood in our outlying counties;

it would have inquired how the different faculties and powers of men of different races and blood have been tested and utilised, and whether the strong English labourer, when well taught and well paid, can work more cheaply, because more rapidly and efficiently; than the weaker and lower paid Frenchman, or Italian, or Hindoo; it might have pointed out, not as matter of forecast or theory, but as the outcome of the experience of the lifetime of a generation, how immense an industrial, commercial, social and military revolution has been commenced by the locomotive—a revolution that bids fair to pass the limits of the material order of things, and to find its reflection and its counterpart in our views of philosophy, of political science, and of religion: all this, from the philosophical observer, who should have accompanied Thomas Brassey in his long and numerous journeys, and looked on the quaint and varied experiences of his active life, might have come out with a force and a truth that should have crystallised into a great book a memorial not unworthy of the subject.

Or, again, the task might have been attempted, not as a mere ordinary biography, but as a study of character of a high and unusual order. It would have traced the active development of qualities which are as rare as they are at once simple and noble, as much to be coveted for the welfare of nations as to be respected and admired in their unostentatious and conscientious exercise. Perhaps no biography is calculated so much to modify an ordinary definition of genius as that of Brassey. Of that quality, as we ordinarily define it, his character must be taken as almost wholly destitute. He had little of the extraordinary mechanical insight and invention of the Brunels, the species of genius most akin to his occupation. The inspiration of the artist, of the architect, of the musician, of the orator, of the revealer of the secrets and laws of nature, were foreign to his eminently practical mind. But in him common sense rose to proportions that may be termed heroic; shrewd, practical forethought ever hit the right mark; and, above all, an integrity, a generosity, a true kindness, and thus an inherent nobility of character were evident, to which we should feel it to be hard to point out a parallel. To trace the biography of such a character, to show how greatness, in influence and in wealth, came almost unwooded to the man whose first thought was the upright discharge of the duty and the obligations of the day, and how, in refusing all those short cuts and sharp grasps at wealth, power, and fame, which were inconsistent with the higher ideal of his life, Brassey, almost in his own despite, became rich, and powerful, and famous, would have been to contribute a golden lesson for the delight and the instruction of our descendants.

Sir Arthur Helps has given us a book that is eminently readable, and that, no doubt, will be read by thousands with pleasure. He has not attempted either of those graver methods of treatment to which we have referred. He commences his preface by acknowledging, as principal coadjutors, no less than thirty-six persons; and, indeed, the more fresh and striking portions of the volume are extracts from communications thus supplied. Of the special character of Mr. Brassey's occupation, his biographer has, evidently, no very distinct personal knowledge. Thus, when he speaks of the origin of railways, the distribution of contracts, and the organisation of labour, it is easy to trace the marks of an attention only recently directed to the subject. Much appears to be thought novel, or to be reproduced as original, that would be far more nervously and succinctly expressed by a writer more familiar with the profession of the engineer. We do not say that there is much that is absolutely incorrect; but we will cite one curious passage, as illustrative of our meaning:—"The English, very early in their career of railway construction, bethought them of the excellent idea of filling up

the hollows from the heights—without any intermediate operation." Such is hardly the language to be expected in an account of the life of a great railway-maker. Again, in the account of barrow-work; in the comparison of French, Italian, and English workmen; and in the reference to that well-known and admirable invention, now superseded by steam, the horse-run (which is not even mentioned by name), the man familiar with engineering work finds a strange inaptitude of phrase. At times, indeed, this unacquaintance with the technical part of his task betrays the author into positive mis-statements; at times, into self-contradiction. Thus, we are told (p. 27):—"Moreover—and this is a most important point—the system of 'sub-contracts' had not been devised, or, rather, had only been partially and slightly adopted." On the London and Birmingham Railway, under Robert Stephenson, sub-contracts, at the time referred to, were in as full operation as at any subsequent period. Again, we find (p. 96) a statement intimating the existence of an equality of the value of unskilled labour in different countries. But in Canada we are told "wages were very high. A man who received 5s. in England *per diem* would receive 7s. 6d. *per diem* in Canada. This difference in the rate of wages was caused not only by the scarcity of labour, but by the circumstance that, in Canada, out-of-door work is impossible for four months in the year." Equality of value and 50 per cent. difference in daily pay rather differ! The real pith of the matter is this. Absolutely unskilled labour is costly and extravagant, whatever be the nominal rate of wages. Whether it were on the public works of Ireland during the famine; on the first introduction of railways into Wales, and remote districts of England; or in the early experience of our engineers in France, in Belgium, and in Italy, the then prevalent low wages, the level of which they were fiercely assailed for disturbing, were simple expedients for the useless dribbling away of money. Each untaught labourer, man, woman, or child (for they set all to work in the first instance), was merely a paid idler. But the skill necessary to fill a wagon is of a low order. In two or three months it can be respectably attained; in six or eight, with good oversight, and, quite as important, with sufficient food, a raw-boned, shambling bumpkin can be made into an admirable wagon-filler. But to toss over his shoulder sixteen cubic yards of earth in the day, the labourer must be paid an adequate price. The human machine requires not only practice, but fuel. The first we call skill, and it is to be communicated, by good organisation, in a wonderfully short time. The second requisite implies the adaptation of a definite mechanical cause to produce a definite mechanical result; and it may be measured in grains of gold as well as in grains of carbon.

The most interesting portion of the book is the twenty-first chapter, consisting of Mr. Thomas Brassey's recollections of his father. With this should be coupled the first chapter, entitled, "A Brief Outline of Mr. Brassey's Character as a Man of Business," and some portions of the twenty-second, on "The Close of his Life." In those the author of the volume, although labouring under a somewhat regrettable tendency to digress from the matter in hand, speaks under the control of personal knowledge. The character, which is illustrated by many a passage interspersed in various parts of the book, is well described (p. 316) as "of a somewhat perfect kind." In this fact lies not only the charm of the volume, but, we are bound to add, its chief claim on public acceptance. "In truth," says Sir Arthur, in perhaps his happiest sentence, "Mr. Brassey was in mind one of those happily constituted and well-proportioned men who show forth a certain completeness of nature." Our readers will take a pleasure in lingering with us over the traits which justify

* Life and Labours of Mr. Brassey. By Arthur Helps. Bell & Daldy, 1872.

such a remark. They are to be picked up by the way, rather than met with as combined in a well-conceived portrait; but a certain charm attaches even to the inartificial form of the record.

The first characteristic mentioned by the biographer is Mr. Brassey's great trustfulness. "He chose his agents with great care and with consummate judgment. After he had chosen them, he placed implicit trust in them." "He looked to results, not vexing or wearying those who served under him by minute and tedious criticisms." To this ought to have been added that he *did* keep his eye on results, and that his trustfulness, noble in its loyalty, was neither blind nor sleepy.

His liberality in the conduct of business is acknowledged by all who knew him. Mrs. Brassey, whose sorrow for her loss has received such unusual consolation in the universal sense which has been entertained of its magnitude, says the great capitalist the unusual, but not undeserved, compliment of calling him "a most unworldly man." The wealth which came to him ungrudging, was but a fair return for his continued exertion, for the labour, no less than for the intelligence, which he devoted to his business. "He laid out seventy-eight millions of other people's money, and upon that outlay retained about two millions and a half." "There were periods in his career during which he and his partners were giving employment to 80,000 persons, upon works requiring seventeen millions of capital for their completion." In the continuance of "a career involving such anxieties and such labours, the consideration of the provision that it enabled him to make for so many friends and dependants, was one that was ever influential in his mind.

A consideration for the feelings of others, springing from a natural kindness of heart so genuine as to amount almost to a fault, was connected with a love of justice that was thus tempered and ennobled. If there was partiality evinced by him in any case of difficulty, it was a partiality that was the antithesis of selfishness. Perhaps no life, in modern times, has been such a daily illustration of the golden rule. Mr. Brassey had taken a leaf from the teachings of St. Louis, or rather from the same source whence that illustrious saint and king derived his own simple wisdom. "He asked me," says the *Sire de Joinville*, "if I wished to be honoured in this world, and enter Paradise through death. I answered yes; and he said to me, 'Keep yourself, then, from doing or saying anything wittingly which, if all the world knew it, you would not avow, and say, 'I did this; I said that.'" Mr. Brassey acted on this rule. He expressed it in a phrase more suited to the nineteenth century, and to the *salutis ratio* of but too many Englishmen. "How would that look?" he used to say, as to anything of the justice of which he had a doubt, "to twelve men in a box?" Perhaps this mode of putting it was more intelligible to his auditors than the motives suggested by the French king. The first wish intimated has been amply fulfilled. It is not for us here either to discuss, or to doubt, the fulfilment of the second.

Truth, regulating his own life, and therefore making him truthful, kindness and hatred of contention transforming justice often into liberality, outspoken integrity,—these are the moral elements of a noble character. With these may be noted those social virtues which partly spring from a happy and healthy organisation, and are partly of a moral origin. Such were a calm and equable temperament, a generous temper that never grieved for loss, and that found stimulus in danger, a presence of mind that was equal to the most unexpected emergency, and a courtesy that was of that grand old school that is now rarely to be found. Of the qualities of the mind, his forththought, decision, courage, perseverance, we are left to form our own estimate from that evidence to which most men are now accustomed to look, unreliable as it often is,—the evidence of success. That is one main defect in the book. Into the imaginative side of the character of a man so eminently practical, his son gives us a welcome peep. "He felt a great delight in the beauties of nature." He would diverge from a business journey to visit a beautiful country. His enjoyment in travelling in a hill country was invariable. He used to visit the churches, the public buildings, the picture galleries of the cities to which his engagements called him, with the keenest interest. He had an especial love of sculpture. He took great delight in fine paintings. He evinced excellent judgment in his admiration of architecture. He

appreciated both the art and the industry of the worker in faience. He loved to row round a fine vessel, and to compare her floating curves to those of the true model of the shipwright, the water-fowl. He was a fastidious and excellent critic of public speaking. He urged on his son not to neglect, for the lessons best enforced by the schoolmaster, the eminently English *fiat* accomplishment of good reading aloud. His hospitality was kind and genial. With no time for reading, he had the royal faculty of making those with whom he talked read for him, and of gleaming the course of daily events from conversation. Perhaps the greatest defect of his character was, that his hobby was subservient to, instead of being without, his daily life. He thus missed that refreshment, which, by diverting the action of the brain into an entirely fresh channel, a hobby is calculated to give to the mind. "Correspondence was his hobby."

Disposed as we are very generally to agree with the author on the various topics on which he takes occasion to express his private opinion, we should have gladly seen the space filled by those digressions devoted to some of those details of the life and works of Mr. Brassey of which we have so few given, in proportion to their actual number and magnitude. A large amount of sheer hard work was required in order to enable any writer to form a well-digested view of the character and history of such a man, a toil which demanded more time and leisure than appear to have been at the command of the author. Thus, in its collection of scraps and extracts, the book may be said to resemble the nest of the rat rather than that of the bee—the neat model, as Bacon well taught, of the work of the literary man; a style not to be rivalled by the happiest combinations of the skill of the ant and of the spider, of the compiler and of the essayist.

Our readers will perhaps wish for an abstract of the form and contents of a book, for the appearance of which many of them will have looked forward with interest. The first chapter attempts an outline of Mr. Brassey's character as a man of business. According to the rules of historic, or serious biographical writing, this character should be made to reveal itself in the course of the narrative, as is the case in real life; any summary or sketch being reserved for the conclusion of the volume. There is, however, a far more serious fault in this chapter, and one which pervades the entire book. The true figure of Mr. Brassey, as a man of business, is never brought before the reader at all. We hear much, and with much pleasure, of the fine moral traits of his character; but if any young man, anxious to emulate such a successful career, asks "What were the main elements of that success?" he will ask in vain. Of the rare business qualities of the man, of the sound rules of conduct which he laid down for his own guidance, which were, in many respects, peculiar to himself, and to which he adhered with undeviating consistency, we have not a hint. What is said of his trustfulness, of his mode of keeping accounts, and of his reliance on memory rather than on record, is such, taken by itself, as to give the idea of a weak and slovenly man of business. Nothing could be further from the mark; but the counterbalancing elements, the sound sagacity, the untiring industry, the penetration which seized on main points, and thus safely allowed detail to be committed to an organised staff, are by no means brought into due relief. For the conduct of his large business, Mr. Brassey laid down certain maxims, without which he would soon have been nowhere. We look in vain for a hint of anything of the kind in the book. On the other hand, matters which form the very A B C of the railway contractor are mentioned as if they were special instances of the skill of Mr. Brassey. Sir A. Helps repeats the worn-out phrase of Mr. Brassey being a representative man. He was eminently the contrary; he was unique in his calling. The means by which other men made their wealth were only in part his means; and the chief interest of his character, as a subject of imitation, lies in the manner in which the kind and liberal virtues, which usually distinguish the distributors from the acquirers of wealth, were blended, in his life and practice, with the keener qualities of his intelligence. It would be very charming if kindness and liberality alone would ensure success, as the author seems to think they might. Few men, no doubt, had their good qualities so highly developed as Mr. Brassey; but we could name those who have, and who, owing to their very want of vulgar "push," while they were not gifted with any

unusual business insight, have remained always in obscurity.

Eleven chapters are devoted to Mr. Brassey's character and career. Nine chapters are headed with the names of several of his most important works. But the works of Mr. Brassey are not more clearly grasped than his character. This chapter viii. begins with the promise, "in this chapter will be described one of Mr. Brassey's most important enterprises, namely, the formation of the Great Northern Railway." For description, however, the reader will look in vain. Some good practical, though by no means original statements, as to details of work in fen districts, and a hint that "certain difficulties arose as regards the financial part of the undertaking," form the chapter. From the chapter on the Grand Trunk Railway of Canada, no idea of the character of that disastrous speculation can be formed. The chapter on the Argentine Railway, to which readers would turn with eagerness for information as to the peculiar character of the contract, commences with informing us that the author has "for a long time thought that South America offers the finest opportunities for emigration and colonisation," and goes on to point out what these advantages are—a matter entirely foreign to the theme of the book. The extremely unsatisfactory character of the volume, viewed as a record of the labours of Mr. Brassey, may be judged from the fact that the only list given of his works makes no reference whatever to the essential element of their cost! We are left perfectly uninformed of either the individual or the aggregate magnitude of his undertakings, with the exception of the above-quoted reference to the sum of seventy-eight millions sterling.

The illustrations of the book are poor. There is a hieroglyphic on the cover unintelligible to us—containing a spade such as is not used for railway work—and a frame to which we can annex no meaning whatever. The most interesting print is a view of Bulkeley Old Hall, a charming example of timbered work; but we are not told whether it is the existing or the former house. The photograph of Mr. Brassey is said to be taken from a sketch; but it has the worst defects of camera distortion. The left side of the face and forehead are out of drawing, the line of the mouth is out of parallel to that of the eyes, and the alae of the nose are far too coarse. To those who remember the cheerful smile of the man, his features may be recalled by the portrait; but it can give no adequate idea of him to others.

We repeat, that the work before us is a readable book. It may be read with pleasure by many who have no practical acquaintance with engineering works, and no curiosity as to financial combinations. Our main cause of complaint is, first, that readers may go away with the idea that they have read the life or comprehended the character of Thomas Brassey; and secondly, that we fear there is reason to conclude that the publication of this sketchy and digressive volume will deprive the public of such a serious account of the life and works of Mr. Brassey as would be at once an honour to his descendants and a valuable source of instruction for our own.

THE STONE IMPLEMENTS AND ORNAMENTS OF PRE-HISTORIC MAN.

AFTER the manner and practice of savans in the older branches of scientific exploration, archaeologists are now dividing and subdividing their peculiar subjects into various threads of inquiry. The history of man in remote ages, as told by the dwellings and caves he inhabited, the rude monuments he has left, the tools, weapons, and ornaments that belonged to him, and his interments, is no longer one vast field, but has been cut up into allotments, so to speak, and in each of these allotments, spade in hand, or otherwise, antiquaries have set themselves to work up the particular evidence it contains. Thus, as we have recently noticed in these columns, Dr. Keller has exclusively occupied himself with the lake-dwellings; Mr. Tylor has investigated the correspondence of the habits of modern savage people with such traces of ancient customs as pre-historic relics afford; Mr. Fergusson has looked at the rude stone monuments and their bearings; and, again, the Rev. Canon Greenwell, season after season, untiringly, opens the grass-grown tumuli on the bleak moors and hills, and sunny sandy downs, to wrest the secrets of the dead from them. And now we have to notice the first work of extent upon another division of

the subject.* Mr. Evans, the hon. sec. of the Geological Society, has produced a handsome volume, treating only of the stone implements, weapons, and ornaments used and worn by early inhabitants of Great Britain.

Those of our readers who act upon our recommendation to study this substantial tome, and its four hundred and seventy-six wood-cuts, representing flint and other stone implements, will be amazed at the number of these objects that recent researches have accumulated. They will feel, however, as we do, that this quantity would be enormously increased if village libraries and mechanics' institutions familiarised every one with the forms of these rude tools and weapons, whose occupation brings them in constant contact with the soil, either in tillage or constructive works. Gravel passes in great loads through the hands of labourers, who, if thus instructed, might add to the relics of man lying in the earliest time yet certified, but who, for want of information, doubtless now pass for accidental natural resemblances, many rude bone and stone implements, or fragments of them, that collectors would, perhaps, value at their weight in silver. The weapons and tools of the bronze and iron periods are far less likely to be overlooked than those to which Mr. Evans has now drawn special attention.

The diversity of these ancient implements and ornaments will be another source of surprise. The flint arrow-head and celt that had formerly, in small museums, to content themselves with the fellowship of a few stuffed birds and fishes, a Chinese slipper or two, a tray of butterflies, and a dish of coins, are now ranged in companionship with rows of coeval objects, illustrative of the same people who discharged the one from their bows and wielded the other with their rough hands. Not only, too, is there a greater variety collected, but there are several differences in the same class of objects observed. The arrow is found to have been leaf-shaped, heart-shaped, lozenge-shaped, sometimes almost triangular-stemmed, and also stemmed and barbed. The celt, again, is found to have been some times long and narrow, sometimes widened at one or both ends. Sometimes it is found rough-hewn, unsharpened, and unsmoothed; sometimes ground at the edge only; and sometimes well formed and beautifully polished. The rough-hewn celts may have been the property of early generations of the same people, or they may have been reserved for coarse and heavy purposes, while the polished implements may have been kept for comparatively light work. The volume before us will materially aid the elucidation of this and similar uncertainties. All the relics are engraved on the scale of half an inch to the inch, and front and side views, as well as sections, are given.

Nearest akin to the celt are picks, chisels, gouges, axes, hammers, hammer-stones, grinding-stones, whet-stones, saws, scrapers, and awls or drills, all being implements used for the performance of various kinds of work. More removed are the weapons, which consist of javelins, sling-stones, balls, and lance-heads, besides the numerous varieties of arrow-heads. Many miscellaneous articles have been found that cannot be placed with either of these groups, such as spindle-whorls, discs, weights, and cups. And then we have the further division of personal ornaments, such as buttons, studs, necklaces, beads, pendants, bracelets, rings, and amulets. Specimens of these objects are figured, and minute descriptions given of them, as well as of the places in which they were found.

Mr. Evans has chosen to work up the stream of time. It is impossible, he considers, at the present stage of our knowledge, to begin at the beginning, for this has not yet been found, and no one knows where to look for it. He does not accept the views of the Abbé Bourgeois as to the occurrence of the remains of man in the Pliocene beds of St. Prest, near Chartres, and in the Miocene beds at Thenay, near Pontlevoy, but considers it probable that human relics will eventually be found in older deposits than the quaternary beds of river drift. Consequently he takes up his subject at the time originally distinguished by the Danish antiquaries as the Stone Period, and delving deeper and deeper, comes to the Cave Period, and after that to the dim, faint, mute traces of man in the River Drift. Though, as we have seen, this is by no

means the probable limit of man's antiquity, it takes us back into a hoary time, so remote that we can scarcely calculate by any method the number of centuries that have passed away since the sun shone upon it. The best way to realise the great age of the beds containing the remains of the old quaternary fauna, is to contemplate the changes that have taken place in the configuration of the land since their formation. "Who," asks Mr. Evans, "standing on the edge of the lofty cliff at Bournemouth, and gazing over the wide expanse of waters between the present shore and a line connecting the Needles on the one hand, and the Ballard Down Foreland on the other, can fully comprehend how immensely remote was the epoch when what is now that vast bay was high and dry land, and a long range of chalk downs, 600 ft. above the sea, bounded the horizon on the south?" Again, he points to the high terraces at Ealing, Acton, and Highbury, and bids us look over the valley four miles in breadth, with the River Thames flowing through it at a depth of 100 ft. below its former level, in which, beneath our feet, are human relics deposited at the same time as the gravels; and then remember that the traditions of the country do not carry us so far back as the close of the time when a bronze-using people occupied the island; that beyond this period was a time when man used only stone implements; and beyond this again, when the species of animals known to him were not in existence, and there were the mammoth, and woolly rhinoceros, and other strange forms moving about in the forests and swamps; and that all these periods must have intervened since the excavation of the valley. "It is impossible," he sums up, "not to sympathise with those who, from sheer inability to carry their vision so far back into the dim past, and from unconsciousness of the cogency of other and distinct evidence as to the remoteness of the origin of the human race, are unwilling to believe in so vast an antiquity for man as must of necessity be conceded by those who, however feebly they may make their thoughts known to others, have fully and fairly weighed the facts which modern discoveries have unrolled before their eyes." But sympathy does not prevent Mr. Evans making his long journey into the past very systematically; and, judging from the large number of references given in foot-notes, very carefully.

Looking at superstitions as remnants of extinct faiths which have survived down into an altered state of things, he thinks we may turn to early religious customs and rites to ascertain whether we have grounds for our belief in the antiquity of the use of stone implements. He points out that the ancient Egyptians, when practising the rite of embalming, cut the body open with a sharp Ethiopian stone, although they used a crooked piece of iron for the removal of the brain. Another rite performed with a stone knife was that of circumcision. The Romans ratified a solemn treaty with the sacrifice of a pig by a flint stone. And that the Greeks regarded flint arrow-heads as charms, we may ascertain from the beautiful gold necklace, of Etruscan or Greek workmanship, now in the British Museum, from the centre of which depends an arrow-head set in gold. The fact that flint implements should be held as valuable in classical times and should be used in religious rites in the days of the ancient Egyptians, appears to him to be due to the sequence that makes ancient objects discarded from every-day use at first venerable, and at last holy, and thus points conclusively to a far antiquity.

Before describing the various flint implements of the three periods—surface or neolithic, cavern, and river gravels, which last are linked together by Sir John Lubbock as archæolithic or palæolithic—Mr. Evans endeavours to show the method of their manufacture. He visited Etkingham, in Suffolk, and Brandon, on the borders of Norfolk and Suffolk, and there witnessed the process of production of gun-flints. The flint is first procured by sinking small shafts into the ground until a band of the right quality is found. The condition is the next matter of inquiry, for flint that has lain long on the surface is thought to be intractable, and that which contains too much moisture is also difficult to work. Five tools, only, are used, and of these four are hammers. The workman selects his block of flint, and breaks it by means of a quartering hammer. Then, holding one of the pieces in his left hand, in such a manner that one end of it can rest on a pad placed for the purpose on his thigh, he detaches splinter after splinter from it with a flaking hammer. Each flake is then fashioned by the knapping

hammer and a fixed chisel. Simple as this process appears, it has its difficulties. First, the blow of the flaking hammer must fall exactly in the right place; and, then, its intensity must be so proportioned that it shall not shatter the flake it has chipped off. But, with a little practice, 300 flint implements of a definite form can be produced in the course of a day with the tools at present in use. The ancient flint-workers, however, did not possess these advantages. They had to work with stone tools. When they desired to form a hatchet, they reversed this process, and, instead of splintering off the flakes they required and throwing away the core as useless, they shaped the core and threw away the flakes from it as refuse. Mr. Evans gives the following interesting particulars of the exploration of the seat of an ancient flint manufactory at Grime's Graves, near Brandon, by Canon Greenwell—

In a wood at this spot the whole surface of the ground is studded with shallow, bowl-shaped depressions, from 20 feet to 60 feet in diameter, sometimes running into each other, so as to form irregularly-shaped hollows. They are over 250 in number, and one selected for exploration was about 28 feet in diameter at the mouth, gradually narrowing to 12 feet at the bottom, which proved to be 30 feet below the surface. Through the first 13 feet it had been cut through sand, below which the chalk was reached, and, after passing through one layer of flint of inferior quality, which was not quarried beyond the limits of the shaft, the layer known as the "floor-stone," from which our flints are manufactured at the present day, was met with at the bottom of the shaft. To procure this, various horizontal galleries, about 3 feet in height, were driven into the chalk. The excavations had been made by means of picks formed from the antlers of the red deer, of which about eight were found. The points are worn by use, and the thick bases of the horns battered by having been used as hammers for breaking off portions of the chalk, and also of the nodules of flint. Where they had been grasped by the hand the surface is worn smooth, and on some there was a coating of chalky matter adhering, on which was still distinctly visible the impression of the cuticle of the old flint-workers. The marks of the picks and hammers were as fresh on the walls of the galleries as if made but yesterday.

Similar flint manufactories are to be seen at Cissbury, near Worthing, on the Sussex Downs, near Eastbourne, and at Preshyng and Spixwates on the Continent. From these and other centres the implements would be, probably, bartered away to those who had not learnt the knack of making them, or did not possess a supply of flint. In the north and west parts of Britain, where flint is scarce, various metamorphic and eruptive rocks were employed in its place.

An important class of relics is the perforated axe, or hammer, which has a hole made in it for the insertion of a haft; and much speculation has been indulged in as to the manner in which the hole was made. Some holes are thought to have been worked out with the pick; others may have been bored by the rotatory motion of a drill, hollow or otherwise; others are supposed to have been made with a pointed stick and sand and water. In Scotland, these stone hammers were called purgatory hammers down to the close of the last century, and were supposed to have been buried with their owners, so that they might thunder at the gates of purgatory till they were opened. In Sweden they are sometimes called Thor's hammers, and are thought to have been used by the valiant "war-smiths" of old as weapons as late as eight or ten centuries after our era. They, like all the other classes of objects, present many forms. These holes, too, are in various positions, some being in the centre, and others at different distances from it. And one perforated hammer has been found near Corwen, Merionethshire, covered with reticulated ornamentation. For minute particulars, we must, however, refer our readers to the volume before us.

We must pass, rather, to a slight notice of the examples of the more curious implements known as scrapers, which are supposed to have been used for scraping hides, preparing leather, scaling fish, making pins, and other small articles of bone. Some hundreds of these scrapers have been found on the Yorkshire moors. They are about the size of small oyster shells, and of horse-shoe, kite, discoidal, and duck-hill forms. On the downs, near Berling Gap, a few miles west of Eastbourne, Mr. Evans has found as many as twenty of them, in various degrees of perfection, within an hour. They are found in barrows, on the surface of the ground, and in and near ancient encampments. Frequently the edge is worn away as though by friction, sometimes completely, sometimes only sufficiently to remove its sharpness, and only on one part of it. These examples, we may be almost certain, have been used for scraping comparatively soft substances. But others are found with their edges battered and chipped to a greater extent than can be attributed to the wear of any amount of scraping. These, the author suggests, have

* The Ancient Stone Implements, Weapons, and Ornaments of Great Britain. By John Evans, F.R.S., F.S.A. London: Longmans, Green, Reader, and Dyer. 1872.

been used for striking a light, or procuring fire. "I have," he says, "already mentioned that, for the purpose of producing sparks, pyrites is as effective as iron, and was, indeed, in use among the Romans. Now the lower beds of our English chalk are prolific of pyrites, though not to the same extent as the upper beds are of flint; and it is not impossible that the use of a hammer-stone of pyrites, in order to form some instrument of flint, gave rise to the discovery of that method of producing fire, the invention of which the old myth attributed to Pyrodes, the son of Clix." Several pieces of pyrites have been found in early British barrows, in association with these circular-headed scrapers, and there is, apparently, no reason why we should not accept the suggestion that fire was procured by their means.

Another curious implement belonging to these old times, and to the same unknown, ninth century people, is the borer or drill, which is only a flat splinter of flint chipped away by concave curves into a tapering blade at one end, with a sharp point. The wide end of the flat piece of flint serves wherewith to hold it. These rude borers make true holes, it has been ascertained. Mr. Evans has bored perfectly round and smooth holes, through both stag's horn and wood, with flint flakes illustrated; and the late Mons. E. Lartet drilled the eye of a bone needle with an ancient flint borer found in one of the French caverns. By means of these sharpened flint flakes, the early people, whose tools we are now examining, perforated stag's horns, teeth, shells, fossils, and pierced the eyes of their bone needles. They have been found on the Yorkshire moors, in Derbyshire and Suffolk, Ireland, France, and Denmark.

It is a somewhat singular circumstance that the same feeling that prompted the Greek or Etruscan lady to wear a flint arrow fastened to her necklace, has caused people of many nations to regard this implement of prehistoric warfare and hunting with awe. Mr. Evans has strung together several instances in which a supernatural origin has been assigned to them. The Italian peasant calls them *lingue di S. Paolo*, and when he is so lucky as to find one, falls down on his knees, devoutly picks it up with his own tongue, and joyously preserves it. In some parts of Italy they are considered preservatives against harm from lightning; and in the isle of Elba they have been seen mounted in silver for amulets, as in Scotland and Ireland. In Scotland, if we may credit the writers of the Stuart period, they were supposed to have dropped from the clouds, because they were found, not by means of diligent search, but now and then, when least expected, and on beaten roads. Robert Gordon, of Straloch, goes farther than his contemporaries in details respecting them, affirming that they were sometimes found one day where there were none the day before, and that once a man and woman, riding, each found one in their clothes to their great surprise. In the north of Ireland, Sir W. Wilde has observed, they are supposed to be fairy or elfin darts, used by those tiny beings to shoot cattle. This view of their origin prevails, also, in Derbyshire. Aldrovandus points out their resemblance to a man's tongue, and adds they grow not upon the ground, but fall from heaven on the eclipse of the moon. Evidently they belonged to a people concerning whom not a tradition survived, or they would not thus be ascribed to elves. The chapter in which they are treated is full of interest.

There is one object found in the same class of graves as those from which many of the last-mentioned relics have been taken, the use of which is not so clearly made out. It consists of a thin oblong plate of slate, convex on one side, and concave on the other, about 5 in. or 6 in. long, and between 1 in. and 2 in. wide, perforated with a hole in each angle. One specimen found in a tumulus in the Isle of Skye, formed of pale green stone, polished, has an ornamental border composed of slightly indented ovals at one of its shorter ends; but this is a solitary example of enrichment. The others are polished, but plain. Another that we should mention specially was found in a harrow on Roundway Hill, near Devizes, in front of the breast of a skeleton, between the hones of the left forearm, with a small fragment of bronze, like the tang of a knife, adhering to it. The position of this specimen, taken in connexion with the oblong rounded form of all of them, has suggested to the Rev. Canon Ingram that they were braces, or guards for the left arm when using the bow and arrow. Mr. Evans approves of this solution of the speculation as to their use, and would accept it as

unassailable, if it were not that some of these plates have also been found on the right arm. The late Lord Lonsborough examined a harrow near Driffield, in 1851, in which, as we have heard him relate, he found a contracted skeleton, on whose right arm was "a very singular and beautiful armet, made of some large animal's bone, about 6 in. long, and the extremities, which were a little broader than the middle, neatly squared; in this were two perforations about $\frac{1}{2}$ in. from each end, through which were bronze pins or rivets, with gold heads, most probably to attach it to a piece which had passed round the arm, and been fastened by a small bronze buckle, which was found underneath the bones." Perhaps, however, there may have been an error in observation here, or the term right was inadvertently used instead of left. The only other explanations of their purpose which have been attempted are suggestions that they may have been charms, amulets, or ornaments; or they may have been made to equalise the size of cords by drawing them through the holes; but these do not seem to fit in so well with all the details as the supposition that they were used as guards.

Mr. Evans tells us he hesitated to include the ornaments found in the same interments as stone implements and weapons, because they appear to be nearly all belonging to the time when stone was nearly superseded by bronze. We are glad that he ultimately decided in their favour, as they are of peculiar interest. They bring before us the wives and daughters of the warriors whose weapons we have inspected, and are, in fact, a priceless illustration of the dim, far-away time these relics bring before us. There are no sparkling gems among them, no stone thrown into relief like a cameo, or incised like an intaglio, but, nevertheless, we learn from them that the ancient British beauty donned her necklets, bracelets and rings, as does her representative of to-day. But every ornament was not set aside to intensify female attractions. Many consisted of buttons, rude, irregular, and certainly not of attractive appearance which, from their size, we may conclude were worn by men, or used by them for a practical purpose. These have been found in interments of very early dates. "The usual shape," says the author, "is that of an obtusely conical disc, in the base of which two converging holes are drilled so as to form a V-shaped passage, through which the cord for attachment could be passed. These buttons, or studs, are formed of different materials, but most commonly of jet or shale." Bone, amber, ivory, and, very rarely, gold, have been used in the production of some of the more complicated ornaments, besides jet and shale. Beads are a common vehicle of ornament. Of various sizes and materials, and arranged in different patterns, they appear to have performed many offices. The thong or cord on which they have been strung has generally perished long before they have been exhumed; hence the exact position of the various portions of an ornament is occasionally difficult to make out; and it is to be feared that some of the whole number of beads are often lost. But, just as it is possible to outline a complete skeleton from one bone, so the archaeologist can make out the design of a necklet, or other ornament, from observation of a small portion of it. Some necklaces are formed of a mixture of jet and amber, and consist of jet beads and amber plates of graduated sizes to maintain them in rows one below the other, of forms so similar to those in use in the present that no mistake can be made concerning them. In one necklace, found by Mr. Bateman in Derbyshire, the plates were made of ivory; in another, they were made of Kimmeridgian coal; in another, there were 3-8 thin laminae of jet, fifty-four cylindrical beads, and eighteen conical studs and perforated plates of jet and bone. The heads are not always spherical, but quite as frequently long and thin, and larger in the centre than in the extremities. The pendants which drooped from these ornaments on to the bosoms of the wearers were of various forms. One, found by Mr. Lucas, in Derbyshire, resembles an eye-glass composed of three circles instead of one. The armlets of this period are also of great interest. The rings do not appear to have been worn upon the fingers, judging from their size, but to have been either brooches, or ornaments suspended from necklets or chains. Certain pebbles, too, appear to have been counted as ornaments, or valuables. In a harrow, near Everley, in which a heap of burnt bones was surrounded by a wreath of horns of the red deer, a small red pebble was found amidst the ashes with five

stemmed and barbed flint arrow-heads. A beautiful pink pebble was found in a kist at Brecon. Quartz pebbles are frequently found in ancient burials. Some of these are large enough to be sling stones. Others may have been thrown into the grave in token of respect, just as we now deposit *immortelles* upon coffins and tombstones. In India, Mr. Evans points out, the mystic Salagramma pebble, placed in the hand of the dying Hindoo, is considered a sure preservation against the pains of eternal punishment. With what awe, with what agonizing hope, may these pink, and red, and quartz pebbles have been placed in the tombs of these unknown, unremembered dead!

We have not yet touched upon Mr. Evans's review of the Cave and River-Drift periods. For the former we have, in England, centres in Kent's Cavern, Brixham's Cave, Torquay, the Wooky hyena den, the Gower Caves, and King Arthur's Cave, Whitchurch. But notwithstanding this *richesse*, Mr. Evans runs through the equally well-known Continental caverns, and arrives at the conclusion that we must agree there were two periods of cavern occupation,—a Mammoth period and a Reindeer period. French antiquaries go farther, and speak of four ages of occupation. The first, when all implements were large, broad, and rough, and made of flint, to the almost total exclusion of bone, and when mammoths and hyenas abounded; the second, when implements were more leaf-shaped and less clumsy, and the horse had made its appearance; the third, when scrapers were abundant, denoting more care in the preparation of skins, and, perhaps, the use of fire, bone implements common, and ornaments made of teeth of animals, ear-bones of horses and marine shells; and the fourth, when flint implements were well shaped, and included saws, dart-heads, harpoon-heads, and needles, when works of art began to appear on them and on the walls of the caves, and when birds and fish were abundant. The main fact that has impressed the author as he has studied this part of his subject, is the certainty that long before the Stone period had come to an end, there was a complete change in the *fauna* of these islands. Men were working in and with stone and bone, whilst the brown bear, the cave bear, the grizzly bear, the cave hyena, the cave lion, the Irish elk, the reindeer, the urus, the bison, the woolly-haired rhinoceros, and the mammoth, were prowling about; and were still humbly and patiently working with the same materials after many of these creatures were extinct, and others occupied their haunts. Forty-eight species lived in the earliest time in which it is known that man hunted and wrought, and of these only thirty-eight were able to live on into the later Stone period. Six more species subsequently died out, and the rest we have still among us. This fact is used as an argument in favour of the acceptance of a belief in the long duration of the earliest Stone period. For all the details, for all the clever marshalling of forces, and accumulation of evidence in favour of this view, we refer the reader to the work itself.

We find as much interest in the information Mr. Evans has collected concerning the drift period. Thirteen years have now elapsed since the discovery of the valley of the Somme first called removed attention to this period of antiquity. Since then numerous similar remains have been found in various parts of England, for the most part embedded low down in deep beds of gravel, sand, and clay, on the slopes of our river-valleys. In one of these beds, at Biddenham, Bedford, about sixty specimens of flint implements have been found. In another, at Brandon, Suffolk, some hundreds have been collected. Besides implements, these beds contain bones of animals which have been, like them, washed or carried there by water. So far, bones of the elephant, rhinoceros, hippopotamus, hyena, bear, bison, stag, horse, and ox have been discovered in the drift. A cell found in the gravel at Biddenham weighs rather more than 1½ lb, and has been chipped into shape both at the butt-end and at the point, showing that it must have been mounted in some handle for use. But another, smaller, has the natural crust of the flint left at the wide end, as though left to afford a comfortable hold. The original owners of these relics, also possessed scrapers, rude choppers, arrow-heads, knives, spear-heads, and lance-heads, all of flint. So far, no bones of human beings have been found in the drift, if we except the portions of a skeleton which were found in the neighbourhood of Paris, about the antiquity of which

some doubt is entertained. But the absence is accounted for by Sir John Lubbock by the calculation that, as man lived by the chase, he would require a proportion of 3,000 animals to one person: consequently, when so few remains of animals are found, it is not surprising that there should be none of man. Moreover, all bones that have hitherto been found on the gravel-beds are larger than those of human beings.

Mr. Evans has expressed a modest fear that his accumulations of hare facts may appear dull. But they do not do so. The period of which he treats is not an age of cloth of gold, purple, and fine linen; but it is a time of surpassing interest, and there is more to be seen in the dimmed sheen of the old flint implements he has represented than in many a magic crystal.

IRON AS A MATERIAL OF CONSTRUCTION.

It is highly characteristic of the present age that one of the most perishable substances with which nature supplies us should be almost exclusively employed in structures which are intended to last for centuries, and which were formerly built of stone, brick, or timber. This extensive use of iron arises from the cheapness at which it can be obtained, and the great facility with which it can be worked into any required shape. It must, however, be borne in mind that any structure of iron, if exposed to the action of air and water, will rapidly become worthless unless protected by a coating of some less oxidizable metal, or by having its surface constantly painted. In the case of such large national monuments as Westminster and Blackfriars Bridges, the author of the work before us* considers that a more durable material should have been used, and that "the handsome stone structures of London and Waterloo Bridges will be the glory of the nation centuries after their flimsy and cheap iron rivals have rotted away." The object of this book is to supply engineering students with reliable information on the nature and properties of iron, so as to facilitate the acquirement of practical knowledge on the subject.

There are three great divisions under which the material called iron is usually classified—malleable or wrought iron, steel, and cast iron; and of these there are endless varieties both as to quality and character.

Iron is never found in a chemically pure state, but always in combination with foreign substances, which it is the business of the manufacturer to get rid of as far as possible, as it is the presence of these impurities which deteriorates the metal. The ore, which is an oxide of iron, is first heated in a blast-furnace with limestone and coal or coke, the carbon from the latter combining with the oxygen of the ore and allowing the molten metal to flow away together with a "slag" composed of the earthy matters of the ore united with the limestone. The slag being light can be drawn off from the top of the molten metal, which afterwards runs out of the bottom of the furnace into furrows made in sand, and broken up into convenient lengths called "pigs."

Chemically pure iron, even if it could be obtained, would be much too soft for purposes of construction, and it is therefore necessary that a small quantity of carbon should be always combined with the metal to render it hard and strong; the proportion in which carbon combines with iron varies from $\frac{1}{4}$ per cent. to 6 per cent. In order that iron may be malleable, or readily worked by the hammer, it must not contain more than $\frac{1}{2}$ per cent. of carbon; and from this proportion up to 2 per cent. of carbon in combination gives us steel. If more than 2 per cent. of carbon is present, we obtain cast iron, the brittleness of which increases with the proportion of carbon with which it is impregnated, 6 per cent. being the highest that it is possible to combine with it.

The minerals, silicon, sulphur, and phosphorus, are found combined in greater or less proportion with all iron, and these impurities must be got rid of as far as possible, since their presence tends to weaken the metal.

Malleable iron is obtained from the "pig" by the process of "puddling," or exposing the molten metal to the action of the air, by which the greater part of the carbon is carried off, the metal being stirred until the above-named impurities are got rid of, and a spongy character is

imparted to it. The iron is then removed from the furnace to the squeezer, or hammer, by which the remainder of the slag is forced out, and the metal can then be placed between rollers and drawn out into flat bars. When bars or beams of large size are required, the puddled bars are piled up together, heated to a welding temperature, and passed several times through grooved rollers, the size of the groove diminishing each time until the required shape and size is obtained. By this means bars of any required section and length can be obtained.

Cast iron is obtained by merely remelting the pigs, and pouring the metal into sand moulds made to any required form. The quality of the metal is improved by frequent meltings, which remove the impurities, and for good work third melting should be used; and the strength is also increased the longer it is kept in a state of fusion. It is desirable to mix the pigs from different ores, as well as those obtained from different workings.

To obtain great hardness, the castings must be chilled or cooled rapidly, the surface metal which cools first being always harder and closer in texture than the interior where the castings are of large size.

The tensile strength of cast iron, or its power to resist a direct strain applied to stretch it in the direction of its length, is small as compared with its crushing strength, as well as with that of malleable iron; 7 tons being about the average force that will break a bar 1 in. square, although some bars that have been carefully prepared and kept in a state of fusion for several hours, bore double this amount of strain. It is in its resistance to crushing that the great value of cast-iron as a building material lies; experiments upon a large number of cylinders, $\frac{3}{4}$ in. diameter, and 13 in. high, gave the crushing strength per square inch, from 25 tons to 54 tons, or an average of 38 tons, the specimens shortening from 1-10th to 1-20th of their length before crushing; the ultimate tensile strength was found to be about 1-6th of the crushing, the elongation being about $\frac{1}{100}$ of the length.

The transverse strength of cast-iron beams is very variable, being greater in proportion in those of small size than in large castings. No sensible diminution of strength takes place in cast iron, if heated up to 600° Fahr., but beyond that temperature it gets rapidly weaker.

The ratio of the "working strength" of cast-iron to its ultimate strength, is as 1 to 3, or 1 to 4, for a stationary load, and 1 to 6 for a moving load, as in the case of a railway bridge. If the load is kept within the working limits, a beam of cast iron does not lose strength by a continuation, however long, or a repetition however often, of the same load.

The average specific gravity of cast iron is 7.1, or it weighs 7,100 oz., or 443 lbs. per cubic foot. One cubic inch weighs $\frac{1}{16}$ lb., so that to find the weight in pounds of a casting divide the number of cubic inches it contains by 4.

The great advantage of cast iron is that it can be made into any required shape; and when many copies of the same form are wanted, they can be supplied at a very moderate cost as compared with malleable iron. It has, however, the disadvantage of not being trustworthy, and liable to unsoundness from unequal contraction in cooling, which causes some parts to be more dense than others; this can only be provided against by allowing an excess of strength in the castings. Its brittleness also unfits it for use where it would be subject to heavy concussions or sudden changes of load; this can, however, be obviated by a process of annealing, which produces malleable cast-iron, the castings being first made in the usual way from soft and pure charcoal pig, and kept red-hot for some days in powdered red hematite ore, by which most of the carbon is extracted, and the metal is converted into malleable iron; the expense, however, of this process prevents it from being used for any but small castings, of which a large number are required. Cast iron does not oxidize (rust) so readily as wrought iron, when exposed to the weather, but the continued action of seawater is to convert it into a soft porous mass, which readily crumbles to pieces.

Although the ultimate resistance of cast iron to crushing is about six times that to extension, yet with moderate strains, such as 5 tons per square inch, they may be considered as nearly equal for practical purposes, the alteration of a bar being between $\frac{1}{100}$ and $\frac{1}{200}$ of its length, so that 5,500 tons may be taken to represent the modulus of elasticity, or that force which would

be required to extend a bar 1 in. square to twice its length, or compress it to half its length supposing the elasticity could remain perfect.

Wrought or malleable iron is the metal in its purest condition, and with the greatest proportion of carbon and other foreign matters removed in the process of manufacture. When a wrought-iron bar is broken by a tensile strain, applied in the direction of its length, it contracts in sectional area at some point before fracture, the amount of contraction depending on the quality of the metal, and being as much as 50 per cent. in some specimens. The average resistance to fracture, or tensile strength, is about 25 tons per square inch of original section, and no wrought iron ought ever to be allowed in a structure which will not stand at least 20 tons per square inch.

When a compressive force is applied to wrought iron it will stand about 9 tons per square inch before any perceptible change takes place in the form, but beyond this it becomes distorted, and yields like a lump of lead, its ultimate crushing strength being about 16 tons per inch. The tensile strength of rolled plates is 10 per cent. less across the grain or direction of fibre than with it, and the ductility is about one half.

Wrought iron may be considered as perfectly elastic as long as the tensile strain does not exceed 10 tons per square inch of section, the metal returning to its original shape and size when the strain is removed without any "set" or visible change of form; beyond this amount the extension becomes permanent, the limit of elasticity being passed, which may safely be taken at about half the breaking weight. If a slight permanent set is produced when a load is first put on, this set will not be increased by any number of repetitions of that load, but each time the force is removed it will return to the form it assumed after the first loading, provided the limit of elasticity is not passed. For every ton of load per square inch up to 10 tons the extension is $\frac{1}{1000}$ of the length.

When wrought iron is subjected to a compressing strain it is reduced $\frac{1}{1000}$ of its length for every ton per square inch up to 13 tons, beyond which the amount of compression increases more rapidly; so that up to the limit within which this material ought to be strained in practice, whether in tension or compression, it may be assumed as perfectly elastic, the modulus being 10,000 tons per square inch of section.

The toughness of wrought iron renders it useful for railways, machinery, armour defences, and wherever capability of resisting shocks and irregular strains is required; there is, however, great variety in the hardness of the metal, the soft irons being considered most valuable for withstanding heavy concussions or vibrations.

When a piece of wrought iron is broken suddenly it generally presents a crystalline fracture, but if the force is applied gradually the appearance is fibrous or silky; the fibres are, in fact, the crystals drawn out by the process of rolling or hammering. A crystalline fracture indicates hardness, while a fibrous fracture is a mark of softness and ductility; the finer and more uniform the crystals the higher the quality of the metal. As might be expected from the process of manufacture, the specific gravity of wrought iron is higher than of cast, being usually taken at 7.68, a cubic foot weighing 480 lb., and a plate 1 in. thick 40 lb. per foot super. A bar 1 in. square, and 1 yard long, weighs 10 lb.; so that the weight of a lineal yard of any section of bar is found by multiplying the square inches in the section by ton.

It is generally found that large masses of forged iron do not possess the relative strength of smaller ones, from being irregular in texture. Rolling improves the toughness more than hammering does, the latter processes hardening it, but at the same time rendering it more brittle.

Wrought iron can be case-hardened by heating it for some days in contact with bone-dust or other animal substance containing carbon; by this process the surface becomes converted into steel by the absorption of carbon.

If heat is applied to wrought iron its strength is not affected as long as the temperature does not rise above 350° Fahr., but beyond that it begins to lose strength. When the temperature is reduced very low the metal becomes less flexible and more brittle, so that its deflexion under a given load is diminished, but at the same time its liability to fracture is increased.

The decay of iron arises from the joint action of air and water, the oxygen from which combines with the metal, and forms a hydrated ses-

* Iron as a Material of Construction; Lectures at the Royal School of Naval Architecture. By William Pole, F.R.S. Spon, London, 1872.

quioxide, called rust. The prevention of rust in iron has received but little attention from chemists, but is a subject of the highest importance when we consider the enormous amount of exposed ironwork in modern structures, whose only protection is a coat of paint, which must be renewed every year to prevent loss of strength; hence there is a constant expense entailed for keeping up iron structures, and preventing them from falling into a dangerous condition. The process of coating with zinc, called galvanizing, can only be applied to small bodies: the surface is first cleaned with dilute acid, and then dipped in a bath of melted zinc, which prevents oxidation for a considerable period.

It is very important that the practical man should be acquainted with the varieties of malleable iron in the market, as they differ as much in quality as in price. The Swedish iron, being smelted with charcoal, is very fine, pure, soft, and tough, but is mostly used for making steel. The highest class of irons for structural purposes is the "best Yorkshire," made at Lowmoor, Bowling, and Farnley, which is noted for uniformity in texture, toughness, and soundness, and, on this account, the price is double that of the common iron.

The ordinary qualities of iron are generally known under the name of "Staffordshire," although often produced in Wales and Scotland, as well as the midland counties generally; of this there are three varieties, known as common, best, and best best, according to the strength and toughness.

The work before us is a valuable one to all who desire to become acquainted with iron—both as to its merits and demerits; but the author would have made it more complete by adding a chapter upon the manufacture and qualities of steel, a material which is likely to become an important building material, since the facilities for its manufacture are daily being increased.

LAMBETH PALACE AND THE HOUSES OF PARLIAMENT, AND THE LAMBETH POTTERIES.

The complaint of the Archbishop of Canterbury, made to the Home Secretary, and also by his Grace to the House of Lords, has been admitted by Mr. Secretary Bruce to the Lambeth vestry, and some practical steps to abate the alleged nuisance are likely to be the result. The archbishop's complaint is to the effect that the vapour of muriatic acid, emanating from the potteries, poisons the atmosphere, causes decay of the stone in the neighbouring buildings, and is highly prejudicial to health. The archbishop further states that the stone of Lambeth Palace has been greatly injured by it, and that it is well known that the decay of the limestone of the Houses of Parliament is attributable to the same cause. This communication having been considered by the vestry, they directed Dr. McCormack, their medical officer, to make an examination and report upon the subject. This report, which was submitted to the vestry at their last meeting, contains some interesting facts as to the effect of the vapour from the potteries on Lambeth Palace and the neighbouring buildings. After giving it as his opinion that the vapour in question (hydrochloric acid gas) is not injurious to health, and that, in his opinion, the vestry, as a nuisance authority, have no power to deal with this portion of the archbishop's complaint, the medical officer goes on to say:—"On the other hand, the allegations made by his Grace as to the effects upon the stone of the Palace and vegetable life are perfectly correct. It is a well-established fact that one part in ten thousand of hydrochloric acid gas will destroy a full-grown shrub in a short time. As regards its action upon the stone of the Bishop's Palace there can be no doubt. I subjected a portion of stone I obtained, after several days of dry weather, from the Palace, to chemical tests, and found, even in the very centre of the specimen examined, sufficient traces of the acid to satisfy me of its being the cause of the decay. I may here remark that the stone of which the Palace is built is peculiarly soft and porous, and very readily absorbs the acid, there being in this stone a large quantity of carbonate of lime, which is most readily acted upon by the acid." As regards this portion of the Archbishop's complaint, the medical officer leaves it to the legal adviser of the vestry to recommend what action, if any, can be taken. In continuation he then says, "As respects the

decay of the stone of the Houses of Parliament, I am not in a position to say whether or not it has been caused by the action of these gases; it is, however, a remarkable fact that portions of the Houses facing Parliament-street and the parks, and not therefore so likely to be acted upon by the depositing of this acid, suffer as much from decay as the river frontage."

A very long discussion, as to the course to be adopted by the vestry, followed upon the reading of Dr. McCormack's report, and it was ultimately resolved that the report be printed and circulated among the members prior to any ulterior steps being taken. It appears, however, that the proprietors of the potteries are themselves about to move in the matter, for the medical officer further stated that in reply to a suggestion from himself as to whether it was possible to suggest any means by which these gases could be condensed or prevented passing into the atmosphere, Mr. Doulton stated to him that he purposed consulting a first-class engineer, who was also a good chemist; and that on his mentioning the matter to the other manufacturers, they all expressed their willingness to co-operate with Mr. Doulton.

HEALTHY HOUSES.*

Mr. Eassie says the task he set himself in writing this book was to give the best information, and the results of the most recent inquiries, on all questions pertaining to this subject, and to write a popular treatise which should embrace all the sanitary requirements of a modern habitation, at a price within the reach of every one; and this he has done. All kinds of drain-pipes, traps, gullies, basins, water-closets, earth and ash closets, the ventilation of house-drains and soil-pipes, the construction of water-cisterns and filters, damp-proof and fire-proof constructions, the heating and ventilation of rooms, and the construction of cooling-houses,—all these things necessary to a modern habitation are fully described. If, however, more space had been given to the requirements of the poorest class of houses, and less to those of mansions, it would have been better. Those who build "good houses" can well afford to take and pay for professional advice in these matters (although they often fail to do so); while those who build houses for workmen to live in seldom ask this advice, and if the information could be given in a shilling book in an intelligible form, it would be a very excellent thing. Nevertheless, this little treatise is a very meritorious one, and useful more or less to the builders of all kinds of houses, as well as to their occupants. With the information it conveys—and it may be relied upon as sound and authentic—the tenant of a house who, either in his own person or in his family, may have suffered from the sickness caused by defective drainage and defective construction of the house he lives in, may find out the cause of it himself, and should then insist upon the landlord doing to the premises those things which are necessary to his health, and perhaps even more necessary to the health of his family, seeing that they probably spend more of their time in the house than he does.

In the matter of trapping and ventilating house-drains and soil-pipes, we are glad to see that the author takes the same view that we have always taken, and insists upon the necessity of ventilating pipes being carried up of the full size of the soil-pipe to a point above the roof of the house, and that the waste-pipes from kitchen and scullery sinks, as well as from baths, should be made, wherever practicable, to discharge into a trap outside the wall of the house.

"All theories of drainage which fail to inculcate the absolute necessity of the ample ventilation of drains and sewers are worse than useless,—they are even dangerous. So are all schemes which rely solely upon what is called trapping. Drainage without ventilation is erroneous; trapping without proper ventilation is illusory." . . . "The plain rule is this, at the head of every drain, or at the end of every ramification of the drain, fix an upright tube of as near the area of the drain-pipe as possible, but at all events not less than half its bore." (This should have been half its sectional area.)

"If a sink or wash-basin must communicate with the drain, care should be taken to carry a ventilating-pipe from the waste-pipe into the open air, and, if necessary, up to the roof."

* Healthy Houses: a Handbook to the History, Defects, and Remedies of Drainage, Ventilation, Warming, &c. By William Eassie, C.E. Simpkin, Marshall, & Co. 1872. Price 1s.

Like everybody practically acquainted with this subject, Mr. Eassie sees the absurdity of trying to ventilate the sewers of a town by a few tall shafts or furnaces, or by fans.

If the author should be called upon for a second edition, we would suggest to him the propriety of giving an example of the proper manner of draining "cottage property"—a fine name for a most wretched class of houses in towns,—for the foul gas that arises from drains and sewers is not attracted by persons' pockets, but by their lungs, and is as injurious to the labourer as to the merchant.

Within the last few years it has been insisted upon by the local authorities of certain towns, that every house-drain shall be ventilated at its head, or at the highest part of its system, by a pipe of considerable diameter, that is, from 3 in. to 4 in., carried up above the roof. This ought to be a general order throughout the country, and in course of time we hope it will be; in the meantime it behoves those who write upon this subject to remember that the inhabitants of a few well-drained houses, living in the midst of or near to large numbers badly-drained, will not gain much by their attention to their merely personal requirements and comfort, if the others are left without attention.

Where a town authority, by steady perseverance in breaking down the obstructions that are always raised by self-interested persons, ignorant of the benefits of proper drainage and water supply, has succeeded in getting over the "dead point," and getting a majority of the houses well drained and the drains well ventilated, the rest follows easily. But it is such uphill work for a local town authority to be always fighting with the inhabitants (or certain portions of them, rather), in order to get anything done, that they often never get over the dead point, or reach near to it.

If an individual is counselled to adopt in his house such means as have been proved by experience to be the proper ones to be adopted, he looks around him and says,—“What use? Why should I do what you do not make my neighbour do? Let all do alike, and then I shall be agreeable.” Here, then, we urgently want imperial legislation, and it is not too much to say that we must have it. We have plenty of Acts of Parliament, plenty of statutory law on the subject; but they are like so many bones over which lawyers wrangle, and those who look on and are waiting for the result become bewildered with their uncertainty of action.

The general Acts point out the necessity of house-drains being ventilated, but the framers of special local Acts have been allowed, while professing to incorporate general Acts, to exclude the most beneficial clauses, and in other cases, where these have been allowed to stand, they become useless, because the manner in which they ought to be applied is not specified. Thus we find that to come within the point of law in ventilating house-drains paltry little pipes of 3 in. or 1 in. in diameter are put up, and twisted round all sorts of angles, so that while the law (such as it is) may be complied with, in the opinion of a lawyer, any one practically acquainted with physical laws must know that these things are useless for the purpose they are intended for.

PROPOSED PUBLIC GARDEN IN EBURY SQUARE.

At the meeting of the St. George's Vestry last week, the Marquis of Westminster, through his solicitors, submitted a communication to the vestry to the effect that he is desirous of converting Ebury-square, Pimlico, into a public garden. His lordship states, in his communication to the vestry, that in consequence of the neglected state of the garden, which has almost become a public nuisance, he has put an end to the lease under which the garden was held, and that wishing to give the public the benefit of the ground, he has determined to lay it out and plant it, and let the public have access thereto. His lordship is also anxious, if possible, to avoid railings, as is often done on the Continent, but he suggests that the vestry should look after the property, and he further stipulates for not abandoning his rights for ever in the soil of the garden, as it might become advisable hereafter, if the place became a nuisance, to inclose it again. He wishes, however, to try the experiment of an entirely open garden in London, and thinks that the spot in question will give a good opportunity for doing so, and particularly so as it would benefit the working classes who abound

in the neighbourhood. His lordship makes it a condition that the vestry shall enter into an agreement so as to provide for the proper control and management of the gardens for the use of the public.

In a discussion which followed, some members of the vestry expressed an opinion to the effect that they were afraid we had not quite arrived at the time to appreciate the continental management of such places and that in the present case it would be necessary to look after the place. Ultimately, however, a resolution was adopted to the effect that every facility should be afforded by the vestry to enable the Marquis's liberal proposal to be carried out, and an agreement was sanctioned as suggested by his lordship. In a short time, therefore, we may look forward to see the completion and opening of this most praiseworthy undertaking for the enjoyment and benefit of the residents in Pimlico.

WIDENING THE STRAND.

ALTERATIONS AT ST. MARY'S CHURCH.

The improvement some time ago decided upon by throwing St. Mary's churchyard into the street for the purpose of widening and improving the carriage and footways in the Strand, is now being carried out. Nearly the whole of the old railings inclosing the churchyard have been removed, and workmen are now engaged in taking down the walls preliminary to the churchyard being laid out as a portion of the public thoroughfare. The alterations, so far as regards both the north and south sides of the church, will be a most important improvement, and a great public convenience, more especially that which will be secured on the south side. No one having to pass along this portion of the Strand can have failed to experience the inconvenience and danger which has hitherto been the result of absence of a footpath alongside the church. The improvements in progress will secure this desirable addition to the thoroughfare for the thousands of pedestrians who daily pass along the Strand, whilst the widening of the choked-up roadway on the north side of the church, although not to the extent of more than about 2 ft., will also confer a great advantage. We understand that the portion of the churchyard at the west end of the church is also to be entirely added to the street, with the exception of a small space in front of the steps forming the present approach into the church, whilst the footpath in Newcastle-street, at the east end, is to be widened and made more convenient for traffic by the absorption into the street of the space hitherto inclosed.

ALBERT MEMORIAL: A SUGGESTION.

I HAVE not, at present, any intention of expressing any opinion with regard to the merits or defects of the Albert Memorial, but there seems to me to be one mistake in the design which can even now be so easily remedied, that I would like to be allowed an opportunity of suggesting it.

Most people will, I fancy, agree with me in thinking that the great bas-relief, or panorama as it is called, round the base is placed too low. A Greek or classical architect would have placed it in the pediments or in friezes over the columns, not under them; nor can I call to mind, at present, any instance, either in Medieval or Eastern art, in which the feet of the sculptured figures are not placed higher than the heads of the spectators; and, indeed, common sense would seem to dictate this as a rule of art that should never be transgressed. In the present instance, those who stand on the top step to look at the sculptures, are so near that they cannot grasp properly even single figures, much less the whole group, and they cut up and hide the composition from those behind them, in a most painful manner. Add to this that they are so near that any one with a knobbed stick might break the noses or fingers of the figures, or otherwise damage them, with the greatest ease; and when King Mob adopts the Albert Memorial as a chapel of ease to the Nelson Monument in Trafalgar-square, this will certainly be done, and it may be to an irremediable extent.

The remedy for all this appears to me very simple. It would consist merely in removing the upper flight of steps, and replacing them with a boldly-designed granite sub-basement. A plain pyramid of ordinary steps, with 6-in. risers, without any ornament, and unbroken by pedestals,

or any architectural features, is, perhaps, the meanest basement that could be designed for this or any other monument; but a perpendicular podium, following the lines of the monument but projecting beyond it all round, would give height and dignity to the whole, and raise the sculptures sufficiently to be out of danger, and to allow of their being seen at a pleasing angle. The monument would then stand in a courtyard, the angles of which would be marked by the four great groups representing the four quarters of the globe, and thus, besides the additional height, would have sufficient room to stand in, which at present it certainly does not possess; the greater part of the court being now occupied by the steps in question.

Besides all this, though it may be both reasonable and appropriate to provide broad flights of steps leading to the spacious courtyard in which the monument would then stand, there seems neither reason nor appropriateness in providing unlimited stair accommodation to land the spectator exactly where he ought not to be,—where there is no door to enter by, nor room to move about, or to see properly what he came to look at. In conclusion, I may add that there would be no structural or mechanical difficulty in effecting this change. It would not cost much, and might easily be done long before the statue of Prince Albert is so far complete as to allow of the monument being finally dedicated to the purposes for which it was erected.

JAS. FERGUSSON.

ARCHITECTS ABSENT FROM THE ALBERT MEMORIAL.

ON the podium of the magnificent monument erected to commemorate the intellectual and benevolent character of the late Prince Consort, of which we may justly feel proud, as the finest thing in Europe of its kind, the architects have fared rather badly. Some of renown are ignored, while others, who have made no mark in the world worthy of perpetual remembrance, have found admission to the exclusion of the more deserving. It is distressing to find fault with any features of this national work, but justice must have her due, and a voice should be raised on behalf of those who have so strangely been neglected.

Since the days of Sir William Chambers, no British architect has deserved better of posterity than Sir John Soane. No one achieved in his lifetime a higher and more deserved reputation for originality and good taste, and no one has established a better claim on the gratitude of his country than he has by the magnificent bequest to it of his invaluable museum, with funds for its perpetual support: yet Sir John Soane is not here.

What Soane did for England, Schinkel did for Germany; or, at least, for Prussia. Like Sir John Soane, he was in his day a great reformer in architecture. The public buildings of Berlin attest his originality and cultivated taste, and the museum which he left to his nation is one of the choice attractions of the Prussian capital: yet Schinkel is not here.

Among French architects surely Claude Perrault deserved a place. There is nothing more classical in Paris than his admirable façade of the Louvre: yet Perrault is not here.

In Italy, the first to introduce the Classical style, and follow the precepts of Vitruvius, was Masuccio II. of Naples, 1328, he was somewhat anterior to Oragnas, and much anterior to Brunelleschi. The stupendous tower of S. Chiara, the earliest modern monument in Europe of regular architecture, is a marvel of simplicity and elegant proportions, and alone sufficient, one would have thought, to secure him a standing room among the immortals on the Albert Memorial: yet Masuccio is not here.

Where, also, is the worthy Pollio? Since the days of Augustus no one has rendered a greater service to architecture than Vitruvius. The whole fraternity of architects are deeply indebted to him, and always will be; he may not have erected any remarkable buildings of note, to the ruins of which posterity can still point with admiration, but he has left us what are much better than ruins, he has left us the imperishable records and rules of art; yet Vitruvius is not here. He ought to have been seen were it only in profile, like the distinguished designer of this costly shrine. Instead of these men of mark, whose presence in marble it would always have been a satisfaction to contemplate, we have other characters introduced with whom we cannot

sympathise. There is old Hiram, or Hiram, of Tyre, for his name is as uncertain as his figure is apocryphal, brass-founder to King Solomon; and there is one Bezalcel, a goldsmith and carver, whom Moses employed in the decorations of the tabernacle: what have these cunning workmen to do with the history of architecture? If a biblical association was deemed imperative, there was the builder of the Tower of Babel to draw upon, biblical to the back-bone; Nimrod had quite as much right to be here as Semacherib. Turn we from these stalwart fictions to a more genial subject: the gentle and amiable Nitocris, the only female figure here, and therefore entitled to be regarded as the personification of the art; we must all be delighted to see her, not for her own merits alone, but for the associations of 4,000 years which she represents in her ever-youthful person. Cheops, however, singular Cheops, carries us back in the world's history a thousand years beyond: it is a wonderful thing to have this giant in the building line brought home to our own doors. We may, probably, all recollect the lines of Byron—

"Let not a monument give you my hopes,
Since not a pinch of dust remains of Cheops."

But here he is, at least as large as life, or somewhat bigger. It is to be regretted that these grand figures did not begin their march from the opposite corner: architecture had its cradle in the east, but here it is made to be born in the west.

The Greek architects recall to mind some noble ruins—the Parthenon and the propylea at Athens—which rise up before our imaginations as we bear their names; but they are rather too numerous as representative men, and it is only in this capacity that they have been summoned from their graves to stand before us. The gentlemen at the opposite corner seem also too crowded. Historical fame is here made to appear by anticipation. This is quite contrary to the principle which has justly ruled the introduction of the poets on the sunny face of the monument: we there have no poet after Milton; and the reason, no doubt, was, that we had so many that the monument would not hold them all, and, as it might have seemed invidious to have selected some and rejected others, or too much savouring of partiality, especially in those of our own time, the artist very wisely omitted them all. Poetry was to be glorified in its greater gods only; personalities were subordinate to principle. The Church of Rome was careful not to canonise its saints too soon. The Victoria Tower will be the admiration of posterity; the present generation have somewhat slighted it, though nothing equal to it has been erected in Europe in modern times. Sir Charles Barry, therefore, is very properly here; but as to his associates, I have my own opinion.

The happy conception carried out on the podium of the Prince Consort's shrine, of bringing before us, in form and feature, so far as known, the effigies of those illustrious men, in poetry and in art, whose names are as beacons in the history of the world, and with whose works it is a privilege and an emolument to have our sentiments associated, is one which may be said to add to the charms of life—at least of London life; for here, though we cannot actually walk up and shake hands with Michelangelo, and Raffaele, and the divine Dante, and others, we can see them as they lived, we can stand before them as they were, and can come mune with them in our hearts in a language more eloquent than words.

H. C. BARLOW, M.D.

TECHNOLOGICAL EXAMINATIONS.

A CONFERENCE on Technological Examinations was held on Saturday, the 20th inst., under the auspices of the Society of Arts, at John-street, Adelphi; Prince Arthur, K.G., in the chair. Among those present were the Lord Chancellor, Lord Clarence Paget, Lord Alfred Churchill, and Sir J. Pakington.

The Secretary (Mr. P. Le Neve Foster, M.A.), read the council's report, which stated that the council had entered into communication with the various guilds, companies, chambers of commerce, and large manufacturers, and had convened this conference with a view of eliciting opinions and obtaining support to the undertaking. The council propose to hold their first technological examination in 1873, and to take up as the subjects the manufactures of paper and cotton.

His Royal Highness, on rising to address the meeting, which he did in a very able and appro-

private speech, was received with a round of applause.

The meeting was also addressed by the Lord Chancellor, and other gentlemen, and the following resolutions were passed:—

"That this meeting entirely approves of the proposed scheme for technical examination, and considers it well worthy of general support, with a view of meeting the admitted great deficiency of technical education in this country."

"That this meeting hopes that the advancement of technical knowledge in the manner now proposed be viewed by the public of the City of London as an object well worthy of their support and material assistance."

"That the council be instructed to form a committee, consisting of the masters of the City companies, the leading manufacturers and scientific professors, and the members of the Society of Arts."

Some remarks were afterwards made, to the effect that the council should reconsider some portion of their programme.

CONFERENCE ON WORKMEN'S CLUBS.

A CONFERENCE of delegates from provincial and metropolitan workmen's institutes was held on Saturday, in the lecture theatre of the South Kensington Museum. Sir Harcourt Johnstone, M.P., presided. There were ten subjects for discussion, the first being "The best means of interchanging the advantages of club membership between the various affiliated clubs."

Mr. Alsager A. Hill opened the discussion, observing that it was very desirable that the workmen's clubs throughout the country should be consolidated in some manner. He thought, before creating relationships between several clubs there ought to be a relationship established by the unions. If the members of clubs paid a small toll to the union the work of both institutions would be promoted and improved. He thought union cards should be issued to the members, and so show that they subscribed to the general unions as well as to their own particular club.

Mr. Edward Hall, F.S.A., agreed with Mr. Hill as to the issuing of cards, but thought they should entitle the holder to admission into other clubs. Considering that the chief reason for the existence of working men's clubs was the affording an alternative to resorting to the public-house for necessary rest and refreshment, it was not merely desirable, but essential to the success of the club movement, that each member of a club, as in London, should be free to resort to each other's club on presenting his card of membership. The whole question was connected with that of refreshments, which he had addressed himself to, along with the present one, on the occasion of the conference of 1868; but there need be no difficulty as to credentials; a card might be contrived with changeable numbers, "1," "2," &c., corresponding with the months, so that it would be at once seen whether the subscription had been paid at the club of which he was a member.

Mr. Hodgson Pratt said he had received information that there were fifteen London clubs and seventeen country clubs willing to receive members of other clubs on production of their cards.

The Rev. F. W. Beaumont moved that this discussion should be laid before the Council of Working Men's Clubs and a committee of the union, for them to arrange what should be done. This was passed unanimously.

It was thought necessary that a building fund for the erection of workmen's clubs should be established, and the question was sent up to the council. The means of rendering clubs self-supporting were discussed, and the proposals are to be laid before the council to choose the best. It was agreed to have a special organ to circulate information relating to the club movement. On the question of the payment of an annual subscription by all affiliated clubs, such payment to cover the privilege of using the library, it was considered best to allow two payments to be made. It was agreed that four "representative" members should be elected to serve on the council on behalf of the provincial clubs.

When the conference terminated the delegates paid a visit to the International Exhibition.

The annual meeting of the union was held in the arena of the Royal Albert Hall, Mr. Muddell, M.P., presiding. There were also present Lord Lytton, Mr. Cowper-Temple, M.P., Mr. T. Hughes, M.P., and all the delegates who attended the conference in the morning. The report, which was of a satisfactory character, stated that the work of the union was no longer confined to the United Kingdom. It had been extended during the year to America, France,

Belgium, and other countries on the Continent, from all of which prospects were held out of co-operation and support. During the past year sixty-six new clubs had come under the notice of the council. Of these, thirty-five had availed themselves of the benefit of affiliation. Amongst the most important undertakings in the year, the council pointed with gratification to the Grosvenor Club, towards which the late Marquis of Westminster contributed 1,000*l.*, and which promised to become a model for other clubs. In the provinces the work had not progressed at the rate which the friends of the movement could desire.

WORCESTER GUILDHALL COMPETITION.

THE designs submitted are, eight for a new building and two for restoration of the old. The cost of reconstruction is understood to be 18,000*l.*; that of restoration, 9,000*l.* To consider the entire question now brought before the city, a meeting was held at the Music-hall, on Monday, when the ratopayers had the opportunity of speaking their minds upon the advisability of expending either the larger or the lesser sum. It is thought more than probable that the town council will, at present, go no further than awarding the premiums offered.

THE PARIS INTERNATIONAL EXPOSITION OF DOMESTIC ECONOMY.

THE Paris Exposition, of which we have already given some particulars, will be opened on the 28th inst., and will be closed on the 1st of November, unless particularly successful, in which case it may remain open a fortnight longer. Medals of gold, silver, and bronze, will be awarded to successful exhibitors; and money prizes, with certificates, to workmen who have been concerned in the invention or production of objects rewarded.

The main object of the exhibition is to make known to the workman those articles necessary for his material and moral life which at the lowest cost best answer the purpose, with the view of procuring him the means of ameliorating his position by economy.

The *Société Nationale d'Encouragement des Travailleurs Industriels* have offered gold medals and premiums for the best essays on the Exposition, adapted for the use of schools and popular reading.

UNFAIR COMPETITIONS.

BRIGHOUSE.

SIR,—A few months since you published the result of the Brighouse Cemetery Chapel competition, showing that Messrs. Gay & Payton, architects, of Bradford, were the successful competitors, and that the design, in erection, was not to exceed 2,000*l.*

About a week ago, the tenders for the works were published in the local papers, showing that the lowest amounted to nearly 6,000*l.* I sum three times the amount of the cost stated as being the limit. The architects were requested to look over their quantities, to see if any error had been made, and to ascertain whether the cost of the buildings might not be brought within the limit. The result was, that a reduction of about 40*l.* was effected, so that the present lowest estimate of masons', carpenters', joiners', slaters', plasterers', painters', plumbers', and glaziers' work, is about 5,520*l.*

I leave your readers to draw their own conclusions. A NON-COMPETITOR.

P.S. Doubtless, some of your readers would like to learn, that upwards of forty sets of designs are submitted for the Blackpool New Market, and that the Board of Health met on the 19th, to consider the merits of the various designs.

WAGES.

SIR,—“H.” in criticising a recent article in the *Builder*, on Wages, says he is a believer in the potency of self-interest in governing the actions of average mankind. It did not seem to me that the article in question denied it, but, rather, admitting it, sought to show that no good could come of regarding the question of wages as having but two interests, and those opposed to each other—those that is to say, of capital on the one hand and of labour on the other; and it seemed to me to point out that, while both those interests must be satisfied, there is a third principle required to be regarded,—that of

abstract justice. “H.” says the whole question turns upon the point whether the self-interest is blind or enlightened. “Self-interest impels a thief to steal my purse. If he were better instructed, he would leave it alone.” Here we have the third principle imported at once into the question between “H.” and the thief. It is the self-interest of the one to keep his purse and of the other to steal it. As a thief, he sees only his own interest, and would steal the purse, but being better instructed, he leaves it alone. In his crude and natural condition as a thief, he sees only his own interest; but being instructed, he recognises another principle,—that of abstract justice, or, in other words, he is enlightened, and sees that to steal the purse would be unjust. Indeed, by the recognition of this principle the thief is converted into an honest man. You ought to thank “H.” sir, for giving you so apposite an illustration of the tenour of the article. “H.” says “it is, doubtless, an evil that capital and labour should take up a hostile attitude. Both are necessary to the production of wealth, and if they are to co-operate efficiently, they must be in harmony.” True; and that is what it seemed to me the article in question pointed to,—viz., that if harmony is to be brought about, the notion that the question has but two sides, and those antagonistic, must be discarded, and a third principle admitted, as forming part of the question. It may be quite true, and I am ready to admit it, that any supposed settlement under which one party is conscious of sustaining a loss for the advantage of the other, is essentially a non-permanent and hollow affair; but can anything be less permanent or more hollow than the present system, which excludes from consideration any other principle than the self-interest of the workmen to get all they can, without regard to the rights of others—their brother-workmen of other occupations than their own—and of the masters to give, not the value of the work, but as little as they can help giving? Indeed, instead of working together, and having a mutual interest in what they do, they pull in opposite directions until they break the link, and are separated until a new one can be made; but, as long as they continue to pull in opposite directions, the failure of the new link is only a question of time; and, in the meantime, dissatisfaction and class-hatreds are perpetuated in the country.

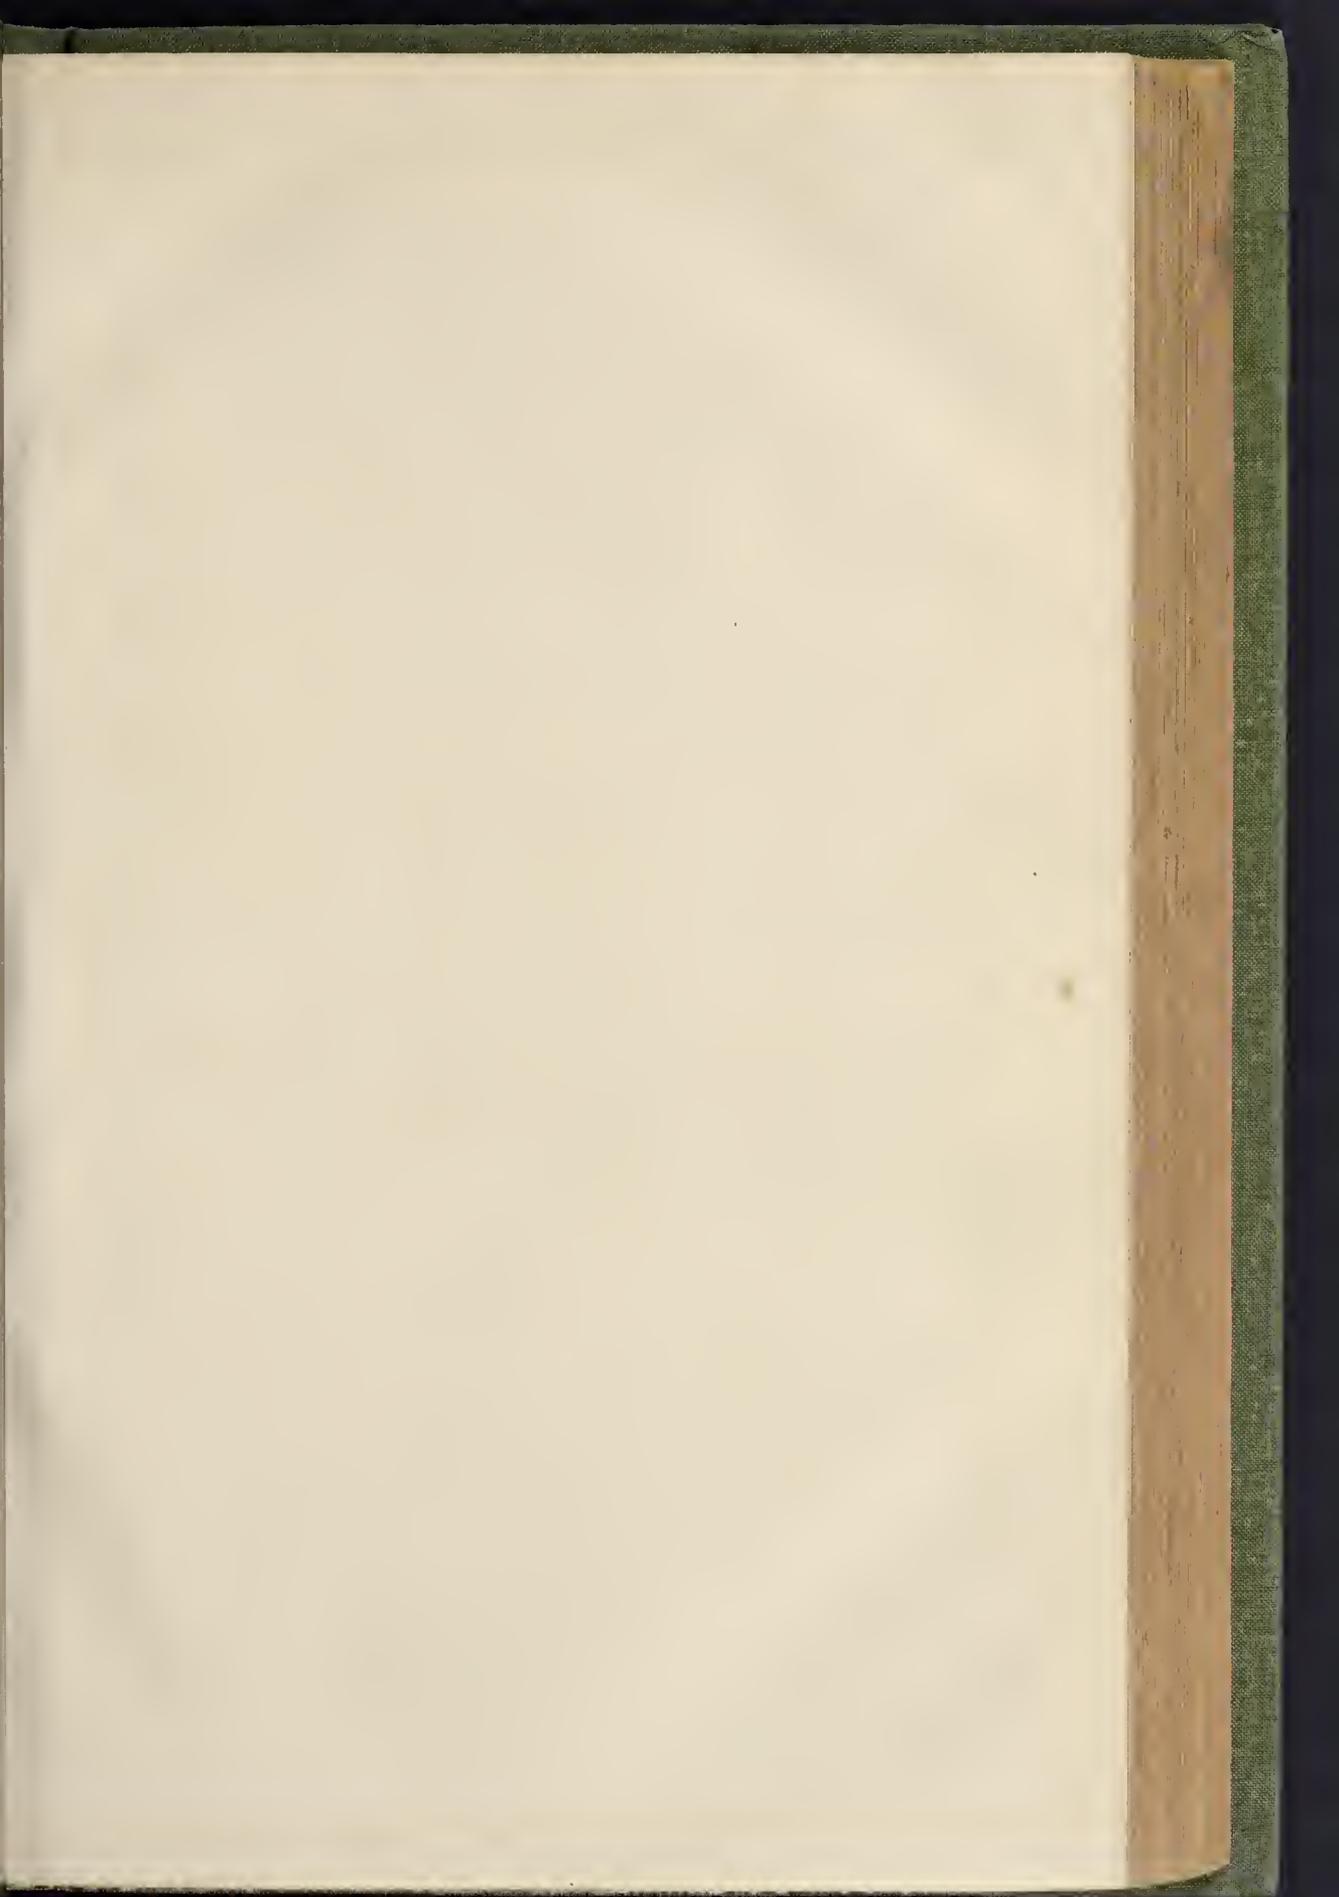

When “H.” says that the workmen should have a share in the capital employed and the wealth produced in the process, and that all parties concerned should have an obvious identity of interest, I fully agree with him; but I am at a loss to understand the relevancy of the remark, that matters will not be improved by “preaching sickening sermons on universal benevolence.” What is universal benevolence?

If it means universal patronage of one class of men by another, it is a “hollow affair,” and had better not be preached; but if it means universal effort to raise the status of those who are now called the lower classes, or the lower orders of men, and approximate their condition to that of those who are superior to them in wealth and intelligence, by giving those of them a chance to rise who have the capacity, but not the opportunity, at present, by reason of the action of those economic laws which are said to be so infallible, and which oppress those who cannot rise into the tide, and within the compass of their action; then, I think, it will not be “preached” too much.

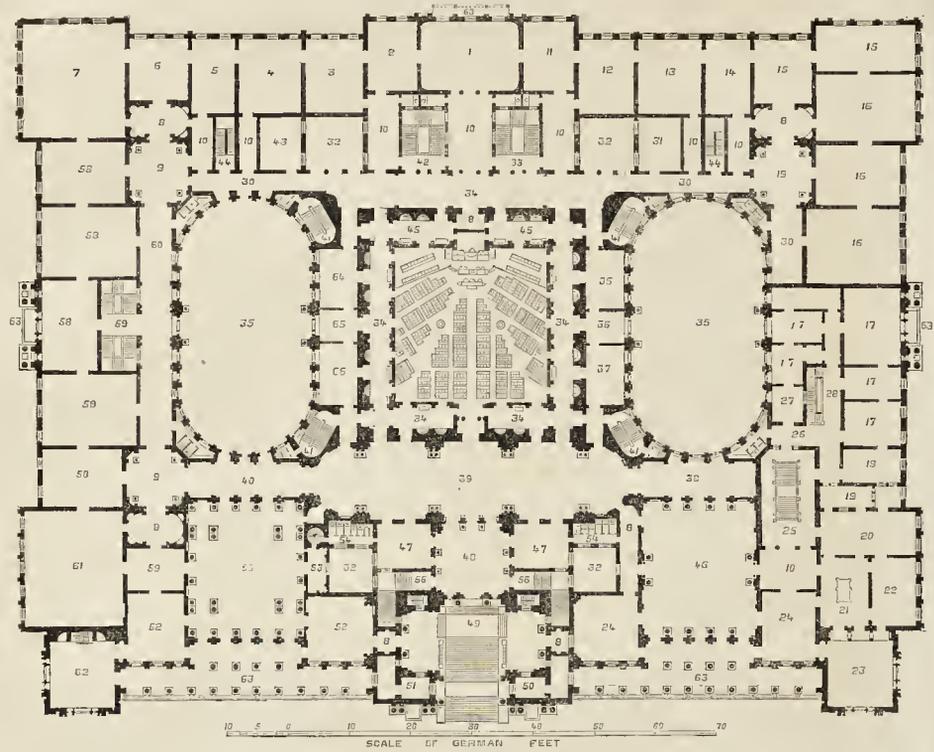

“H.” says, “surely a workman should receive the value of his work.” Surely he should; but who is to determine what that value shall be? Shall it be determined by a series of strikes and lock-outs, by which means it will be determined, in course of time, which side shall give way; the assumption being that the true value of the work is that put upon it by the side which holds out the longer? Unfortunately, while these people are trying to find the value in this rule-of-thumb way, they are preventing others from proceeding with their own proper work.

“H.” says, further, “one thing, I fear, is only too certain. Whatever agreement may now be come to, can be of no value towards a real settlement. It will but put off the difficulty for the present, to confront us anew at no distant day.”

Quite so; but these admissions are inconsistent with the tenor of the argument of his letter, and are at the same time a justification of the views of those who say that some other principle than self-interest alone must be imported into these questions before a satisfactory solution of them can be found. S.

SELECTED DESIGN FOR THE BERLIN PARLIAMENT HOUSE.

We mentioned some time since the allotment of premisses to a certain number of the designs for the Berlin Parliament House, submitted in competition in accordance with the published conditions. The first premium was awarded to Mr. L. Bohnstedt, of Gotha, and with the obliging assistance of the architect, we now give some illustrations of his design, viz., a view of the main front and plan of the principal floor. Up to the present moment the proprietor of the place chosen for the building,—Duke Raczinsky,—is not willing to sell the ground. The next Parliament will have to decide as to the site and the further steps to be taken concerning the execution. We use Mr. Bohnstedt's own words in describing the design:—

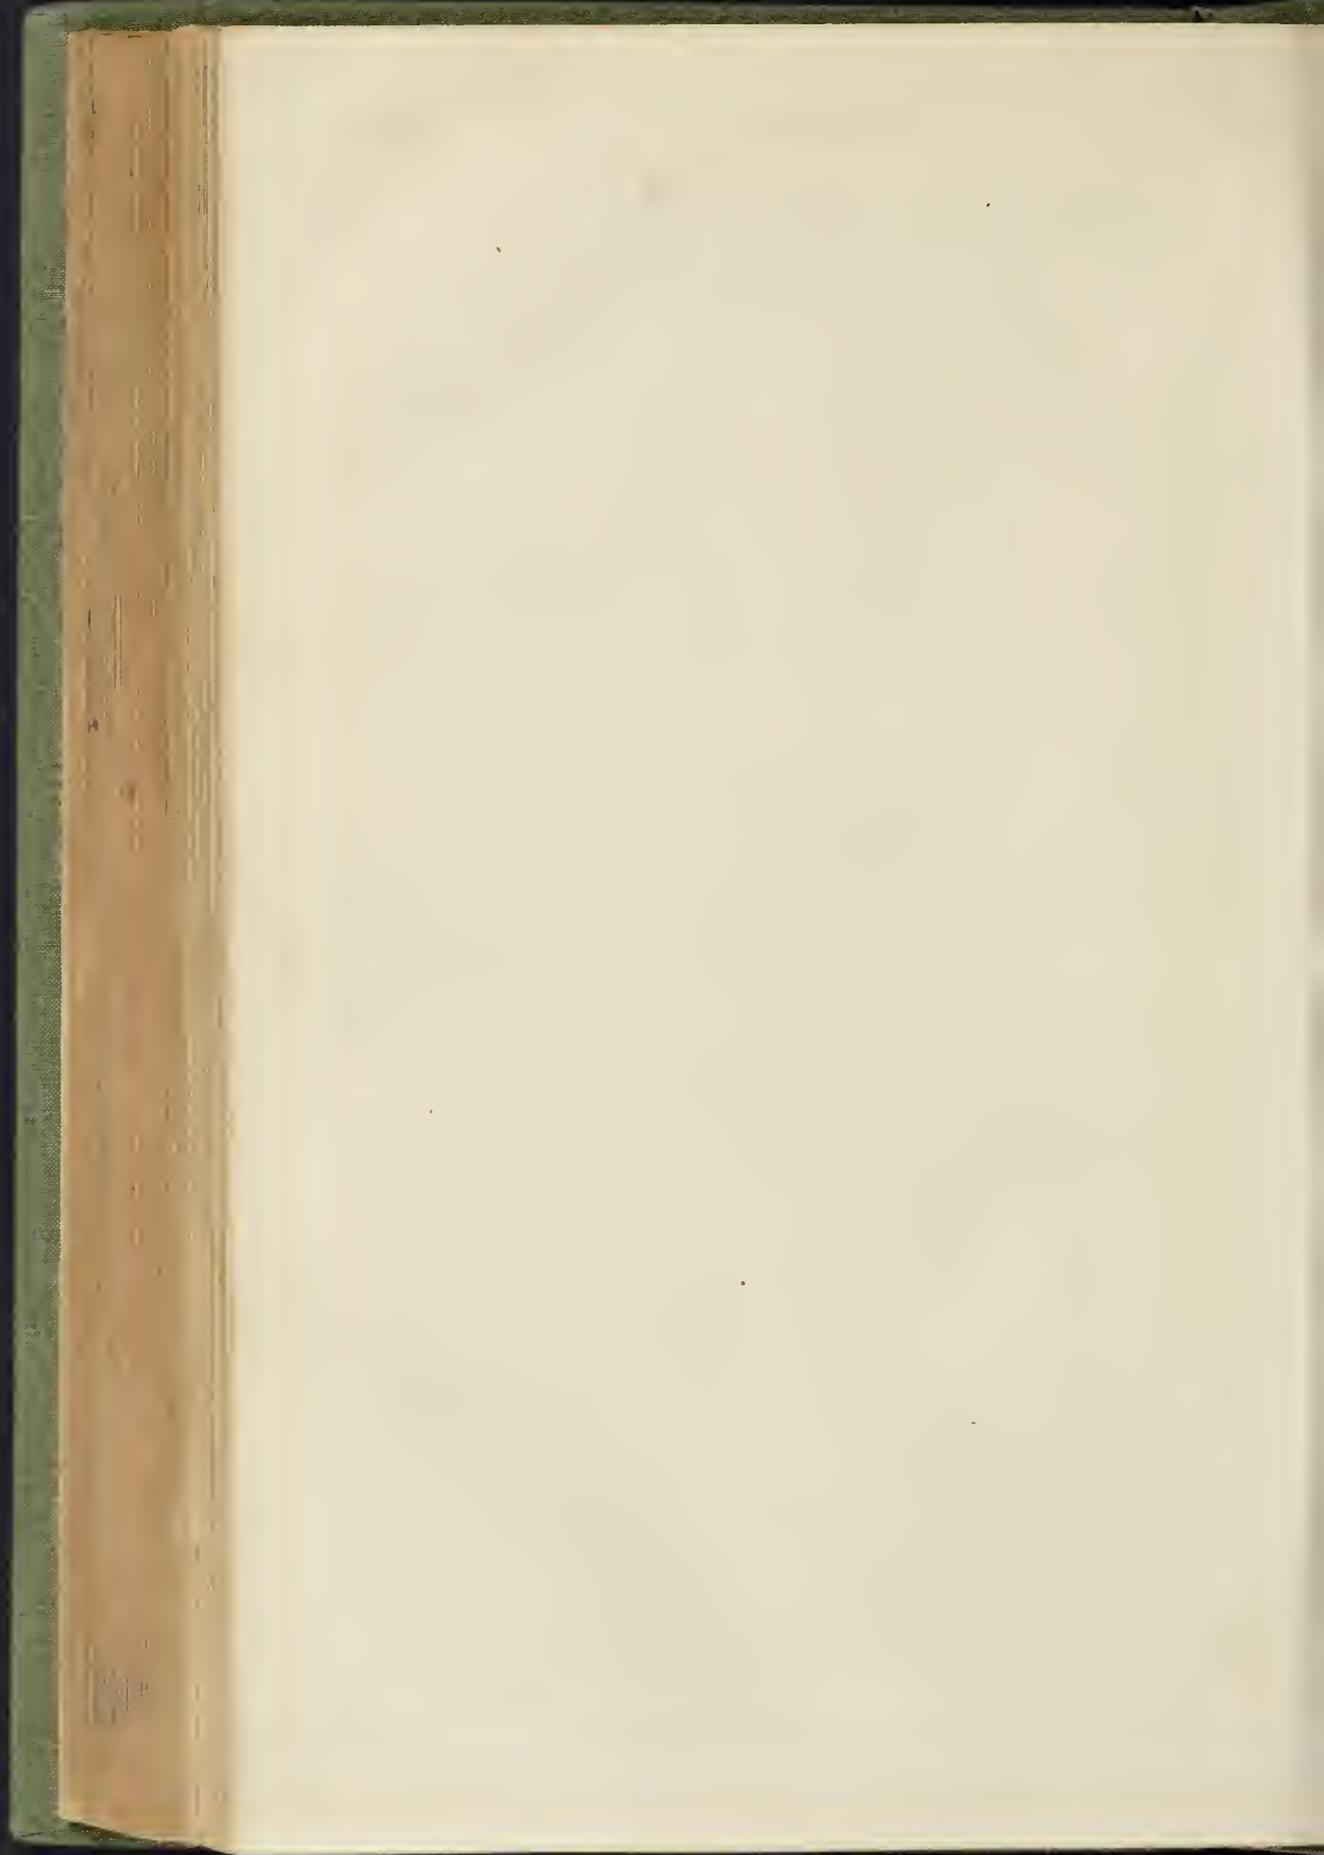

The different rooms disposed on the main story may be considered as forming the following groups:—1. In the centre of the building, the Chamber, with the shorthand writers' offices, the parlours of the members, the separate entrances, staircases and rooms leading to the boxes. 2. The offices of the Bundesrath, the president and the imperial chancellor, in the

middle of the east front (Sommer-street), with a large vestibule on the ground floor, connected with wide staircases, leading up to the rooms and boxes of the Imperial Court, and to the offices named before. 3. The committee-rooms, with their hall, special staircase, &c., on the north wing. Below them, on the ground floor, the smaller committee-rooms, the archives, &c. 4. The refreshment-rooms, with buffet, and the reading-room, which is placed at the north-west corner of the building, and connected by means of an inner staircase with the library, on the ground-floor. 5. The official residence of the president occupying the south front, connected with two drawing-rooms and a large saloon for festivals, placed in such a way as to serve, if wanted, separately from the president's private rooms, for meetings of the members. The fourth group is placed at such a part of the building where it is equally distant from the Chamber, as well as from the committee-rooms, and so that it does not interrupt the free communication between the groups numbers 1 and 3. It occupies the northern part of the west front (Königs-platz). Corresponding with it, the large saloon and the drawing-rooms of the fifth group are placed on the southern side of the same

front. 6. The lobby, the main ante-room—connected with the rooms for cloaks and hats and the closets—the large open hall, with the main staircase, &c. It occupies the centre of the west front, connecting the fourth and fifth groups, partly by the open hall, partly by the lobby, with the halls right and left, lighted from the main yards, and having direct entrances, one to the refreshment-room, the other to the saloon for festivals. In front of these two large rooms open balconies, with colonnades, are disposed for the use of the members. By such a suite of rooms (main hall, chief saloons, &c.), the west front became the main front, and a worthy preparation to the principal part of the house, the Chamber, which, by the large surface it occupies, its height and dome, is characterised even in the exterior as top and chief part of the whole building. Staircases, leading to the public galleries and closets, are placed behind the semi-circular ends of the main courts. Further, there are four small court-yards, two of which (joining the main entrance) are enlarged above the rooms for cloaks and hats, the closets, and the staircases, allowing by such arrangement to light directly the ante-room and the lobby. Gateways connect the main yards with the

PROPOSED BERLIN PARLIAMENT HOUSE: SELECTED DESIGN.—MR. L. BOHNSTEDT, ARCHITECT.

adjacent streets, on the north and on the south sides, as well as the yards themselves.

According to the programme, nearly all the rooms are covered with vaults, between iron girders.

The programme states, as one of the chief conditions, that the building ought to show a monumental character. It must be richly provided, outside and inside, with sculptures and pictures. The author of the selected plan has tried to avoid every unnecessary decoration or construction, being merely only show; he took care, he says, not to produce a false, theatrical effect, by erecting unsuitably high towers, vast useless domes, and such like.

The building is divided into two parts, the sub-structure (the basement and the ground floor being treated as one mass) and the main story.

The rich sculpture-work on the exterior of the house required simplicity in the architectural work and its groups. The main entrance, leading up to the principal story, is the prominent part of the west front, formed like a triumphal-arch (under which the chief staircase is laid open), crowned with a bronze group of figures.—German, the North and the South guiding the steeds of her victory-car. Sculptures on both sides of the central entrance bring to mind the deeds of 1812, 1815, and 1870, 1871. The inside of the hall is decorated with large semi-circular fresco pictures. The open balcony or colonnade is provided with historical *bas-reliefs*, and on the balustrade in front of the columns with statues of worthy men. The parapet is intended to show the arms of the chief places or provinces, executed in coloured mosaics. Brass-plates, with inscriptions, are enlaid in the walls. Like the west front, the other sides are decorated chiefly with historical *bas-reliefs* and statues.

Corresponding with the exterior, the architecture of the interior is treated so as to allow a rich decoration, principally with pictures. The walls of the Chamber above the floor of the galleries show panels in dark-coloured marbles and projecting pillars, bearing large marble statues representing the chief parts of Germany. The vaults there are decorated with coloured ornaments upon gold ground. The Chamber is lighted by a rich skylight, the upper part of its one being constructed of metal and glass.

FLAT TILE AND CEMENT ROOFS.

Sir,—With reference to the house No. 30 in Inborough-road, which was partially destroyed by fire on the night of the 12th inst., I can, as next door neighbour, fully corroborate all that our correspondent, Mr. Kemp, states as to the efficacy of the flat tile and cement roofs in resisting fire.

From my own experience as a building surveyor, I have no hesitation in saying that had the houses been constructed with ordinary roofing could have prevented the total destruction of the one that caught fire, and the, at all events partial, destruction of mine; instead of which, the former, although hardly burnt, was saved from entire destruction, and mine was saved from entire destruction, although the fire burnt upwards of two hours fiercely.

I think, in London at all events, these roofs would be generally adopted where houses are built in terraces, and the spread of fire from one to another is thereby facilitated; for, independently of the direct protection they afford, they greatly assist the efforts of the firemen by affording ease and safety with which they can ascend and walk upon, and I do not suppose that their cost is any obstacle to their adoption.

ROBT. RICHARDSON,
Assist. Surveyor H.M.'s Office of Works.

WEALTH AND WAGES.

Sir,—Your correspondent, "H." observes at,—“The wealth produced by the joint efforts of labourer and capitalist is to be divided between them in some proportion. What that proportion shall be is necessarily matter for discussion from opposite points of view.” For, overall, it is a clumsy expedient, cutting instead untying the knot, to add to the sufficient cost of building a percentage for additional wages. It seems to me singularly significant that neither has ventured in public prints to elucidate or establish definitely an equitable correlation; and such significance cannot, in these days, be missed by affected disregard of newspapers and public opinion. Such silence also appears, *seriatim*, to indicate in degree that both sides

prefer resting determinately on other forces than those on which prudent men readily rely, and that thus, so far, both are wrong, the employers certainly, in refusing to receive deputations. Reason appears riven, but ruin is ready; ruin to the carpenter, ruin also to the capitalist.

Still, in this desperate pass, even now, sir, I venture to suggest a proximate remedy. There is a great name,—known alike to builders and to most whom builders employ, known beyond shores, world-wide, wherever English science, literature, and politics are known:—Mr. John Stuart Mill, sometime member for Westminster, author of “Political Economy,” &c., and, in the opinion of many, the acutest thinker and most logical reasoner living, would probably, on reference, state such principles and conclusions as might, if the consummation be possible, and each side is disposed to be lenient with the other, convince and satisfy both parties, without infringing on that future which none can foresee.

E. L. TARBUCK.

PORTLAND CEMENT STAIRS.

Sir,—I have read with much interest your remarks on the risk of buildings from fire. Fireproof construction is a subject I have thought much upon for many years, and have largely carried into effect, as buildings I could refer to will testify, nevertheless, from impaired health, I might have allowed your remarks to remain unnoticed, thinking many better qualified than myself would reply to them, had not Mr. Britton, in your number of last week, invited some suggestion on Portland cement for stairs.

Presuming a matter of fact will be more to the point than a suggestion, I would refer him to a principal and back staircase wholly constructed of Portland cement concrete in a house erected under my direction, on Richmond-hill, near the church.

F. H. GROVES,
Late of Craig's-court.

A CONTRACTOR'S APPEAL.

At the last meeting of the St. George's, Hanover-square vestry, the committee of works recommended the vestry to decline to accede to the request of Mr. R. Coppock, of Buckingham-place, Piccadilly, who seeks to be relieved from his contract for the repair of these pipes, in consequence of the great increase in the price of copper and leather. In the discussion which followed, some members of the committee wished the committee to reconsider their decision, and not deal hardly with the contractor under the exceptional circumstances of the case, contending that scarcely any one could have foreseen the great rise which had taken place in iron and copper; but other members of the vestry urged that by acceding to the contractor's request a very bad precedent would be set, and that it would be useless to have contracts at all if they could be cancelled whenever either of the parties to them imagined they had the worst of the bargain. The recommendation of the committee not to comply with the request of the contractor was ultimately confirmed.

PROPOSED ASYLUM, ST. ANN'S HEATH.

Sir,—I beg to enclose to you a copy of the award made by Messrs. Donaldson & Wyatt, respecting the designs for a Lunatic Asylum at St. Ann's Heath, near Virginia Water Station, that you may publish in your next number if you think proper.

THOMAS HOLLOWAY.

In accordance with your request that we should examine the thirteen designs for the asylum which you are about to erect at St. Ann's Heath, in order to advise you as to those most entitled to the two first premiums which you have offered to the competitors, and as to those entitled to the sum of 50*l.* each, we beg to report as follows:—

Thirteen designs have been submitted, hearing the mottoes stated below, and arranged in alphabetical order:—

1. "Alpha," 2. "Au bon joueur vient la halle;" 3. "Choose the best, place the rest;" 4. "Con amore;" 5. "Economy;" 6. "Humilitas;" 7. "Inapropius labor omnia vincit;" 8. "Mens;" 9. "Mens sana in corpore sano;" 10. "Progress;" 11. "Quadrant;" 12. "Sanctas;" 13. "Vivere aut vincere."

We have carefully examined the drawings and the descriptions, having reference to the suggestions issued by you, and to the requirements of such an institution. We have also had tables prepared, showing the numbers and sizes of the

principal rooms, and the amount of accommodation provided in those designs which seemed indisputably to be the most promising, together with the cubical contents of the several buildings.

You were also so good as to call in the advice of Dr. Yellowlees and Dr. Lockhart Robertson, well known for their experience as able medical superintendents of asylums.

We must state that although there is considerable merit and taste displayed in the several projects, and evidence of a great amount of time and care having been bestowed upon the preparation of the drawings, yet there is not one of the designs which would not require more or less modification of plan and general arrangement ere it could be carried into execution for practical working, consequently we have selected that one as first which, with the least alteration and no sacrifice of its own individual character, would, we believe, be the most suited to your purpose, and the least costly.

We beg, therefore, to state our opinion that the first prize should be awarded to "Alpha;" the second to "Improbis labor omnia vincit;" and that the following should in the terms of your offer receive 50*l.* each:—

- "Au bon joueur, &c.," "Con amore," "Economy," "Mens," "Mens sana, &c.," "Progress," "Quadrant," "Vivere aut vincere."

We cannot forbear to notice the series of drawings bearing the motto "Quadrant,"—a very original and artistic design, displaying a novelty of conception in the plan, and much picturesqueness in the elevations, but with practical deficiencies and defects which prevented our placing it first or second.

THOS. L. DONALDSON,
THOS. HENRY WYATT.

TELEGRAPHY AT THE ALBERT-HALL.

The Commissioners of the Albert-hall, under the auspices of the Society of Telegraph Engineers, and with the necessary aid readily afforded by the Postal Telegraph Department, provided for the public on Thursday evening before last, at the Albert-hall, an interesting entertainment. A model of every kind of telegraph instrument used for commercial purposes was exhibited. Each apparatus was connected with wires proceeding from the central hall to the galleries, and thus the actual practical working of the telegraph system was made apparent to those present in an effective manner. By the side of the instrument by which the message was forwarded which caused the arrest of Fawcett, was placed a modern ink-writing Morse apparatus, connected up in one unbroken circuit, working at that moment direct, *via* Teheran, from the Albert-hall itself with Kurrachee, upwards of 5,000 miles. A descriptive lecture was also given by Mr. W. H. Preece, of the Postal Telegraph Department, who was introduced to the large assemblage by General Scott, and lucidly explained the action of the electric current in producing the simple elementary signals. The messages were printed in bold Roman type by the Hughes' type printer. In the instantaneous working with India, the meeting was informed, as a hit of news fresh from Kurrachee, that "locusts are swarming in Scinde," and that "Sutlej bridge has just been destroyed by floods." The Grand Viceroy of Persia sent from Teheran to the Albert-hall a message of warm congratulation to the Prince of Wales, a part of which was as follows:—"Je suis heureux que les relations entre l'Angleterre et la Perse se sont rapprochées à tel point que, pour ainsi dire, nous pouvons ici prendre part dans la réjouissance qui se trouve maintenant à Albert-hall." The rapid development of the telegraph under the Post-office was adverted to.

THE SANITARY CONDITION OF EDINBURGH.

In the House of Lords the other day, Lord Kinnaird moved for the production of the last return submitted to the town council of Edinburgh by the burgh engineer respecting the sanitary condition of that city. He considered that in anticipation of the Public Health Bill, which would soon come before their lordships, it would be instructive to them if they had the report before them for which he had moved. He had been informed that Edinburgh was in such a shocking state, from a sanitary point of view, that the death-rate had increased very much, and that the insurance companies had it in con-

templation to raise the rate of insurance. He believed that the report of the burgh engineer would show conclusively that further legislation was necessary. The only thing wanting was proper machinery. The carrying out of the law depended on the town councils of burghs and the local authorities of country parishes. It happened that a great proportion of the smoke and other nuisances which had to be complained of were caused by the very persons who were supposed to carry out the provisions of the Act. They were not, therefore, very active in enforcing its provisions. He considered that a Board appointed by the Government ought to see after the enforcement of the Act.

Viscount Melville said he did not doubt that the sanitary condition of Edinburgh required ceasing after; but that the insurance companies had ever thought of taking the action mentioned was more than he could credit. He quite agreed that an improved machinery for carrying out the Public Health Act of Scotland was needed.

The Duke of Buccleuch said that the great difficulty was to get persons to put the law in force. Even the public prosecutor himself would not proceed against offenders unless the incidental expenses and his own fees were secured. He hoped this fact would be remembered whenever Parliament came to deal with the proposition to appoint public prosecutors in England.

The motion was then agreed to.

On a subsequent occasion Lord Melville said that he had received a communication from Edinburgh authorising him to give a distinct denial to the statement that the condition of the city was so bad that the insurance offices were contemplating the raising of their rates.

Lord Kinnaird said he had received his information from the Standard Life Insurance Company, and he was told it was quite correct.

DISTRICT SURVEYOR'S FEES.

ARCHES UNDER PUBLIC WAYS.

At Guildhall, on the 19th, Sir Robert W. Carden gave judgment in a case, the particulars of which we have already published. Some time ago Mr. Wigmore, of Walham-green, contractor, built for the Corporation of London the arches under the foot-pavement in Newgate Market. Since the construction of the new market the old one had been taken down to make room for warehouses. The space formed a square, and round it were constructed fifty-two arches. Mr. Power, the district surveyor, claimed 10s. for each arch, and Mr. Wigmore offered to pay only one fee of 10s. for the whole of them. Sir R. W. Carden thought that they could not be called one building, but at the same time considered that the Act did not contemplate 10s. for each arch. He suggested that a compromise should be effected, but this was declined, and eventually Sir Robert was asked to give a decision, and then grant a case for the Court above, which he did. The case was argued in the full Court of Common Pleas, and the judges, after hearing counsel on both sides, decided that the whole of the arches could not be considered one building, nor could they be looked upon as fifty-two separate buildings; the Court, therefore, referred the matter back to Sir Robert, to ascertain how many buildings were to be placed on the ground, and to give a fee for each. Since the case was before Sir Robert there have been twelve houses commenced upon the ground, so that that question was settled beyond a doubt.

Sir Robert W. Carden made the order for the payment of twelve fees, and each party to pay his own costs.

SCHOOL BOARDS.

London.—The School Board have applied to the Metropolitan Board of Works for a loan of 40,000l., to be expended in the erection of offices. The application was referred to the Finance Committee. At the last meeting, Mr. Reed, M.P., gave notice that he would move at the next meeting that Mr. Robson be appointed architect to the Board at a salary of 1,000l. a year, with a view, amongst his other duties, to designing the schools of the Board; that Mr. Robson give his time to the Board, and that the Board provide the necessary staff and officers; also that he would on the same day move that a separate officer be appointed whose duty it shall be to assist the Works Committee in the acquisition of sites.

Bradford.—At a recent meeting of the board,

the mayor (Mr. Thompson) in the chair, a letter from the Educational Department intimated that loans would be recommended for the purchase of school-sites in Feversham-street, Bowling Back-lane, Ryan-street, Horton-hank, Whetley-lane, and Lily Croft-lane. The following tenders for the schools the committee recommended should be accepted, Mr. Neill explaining that there was an increase in the estimates of 30 per cent., owing to the time that had elapsed since the estimates were prepared, materials having risen in the interval.—Feversham-street school 14,350l., an increase of 5,850l.; Bowling Back-lane school 10,714l., an increase of 4,409l.; Ryan-street school 14,529l., an increase of 6,729l.; Horton-hank school 4,828l., an increase of 2,043l.; Whetley-lane school 8,200l., an increase of 875l. Mr. Dungan opposed the acceptance of some of the tenders, and moved an amendment that they be referred back with the view of reducing the cost, but as he failed to find a seconder, he said that his presence would only hinder the progress of business, and he thereupon withdrew from the meeting. In reference to the rise in prices, and consequently in the estimates, Mr. Neill said that in advertising for the tenders for the schools, three weeks had been allowed to the deposit of the offers, and the result was that 195 tenders had been received for the five schools. The tenders very much exceeded the estimates of the architects, amounting, he believed, to 30 per cent. That excess could be accounted for by the fact that a considerable time had elapsed between the time those estimates were sent in by the architects and the present time when the works were tendered for. It was well known that material of all descriptions had very much increased in value. Bricks, for instance, had increased by about 50 per cent., consequent upon the advance in coal, which entered in a much greater extent into the cost of producing bricks than was generally imagined. The advance in the price of coal had also affected almost all kinds of building material. Iron was much dearer; and stone had also advanced considerably in price, and particularly dressed wall stones, the advance on which would be fully 30 per cent. Taking the advance in the price of material, and also in wages, he did not think that the estimates of the architects were so far out as compared with the tenders. If they could have accepted some of the tenders sooner, they would have been able to let the work for less. Then they might be told that the cost might be reduced by referring the plans back to the architects; but to turn back necessitated the preparation of fresh plans, fresh quantities, and therefore involved additional cost. The result of that would be delay, and they might probably find that they were not a whit better than they would be by agreeing to go on with the plans as they stood. There was no hope by waiting of any reduction in the cost; the tendency, he was afraid, was the other way. He believed that the longer they waited the more they would have to pay. Looking at the price of coal, the cost of which entered largely into the cost of material, such as brick, and the tools used for dressing stones, and seeing the general advance of wages which was taking place, and especially in the building trades, there was very little hope of any reduction in the cost of building. He knew that there was at present a movement on foot, which he believed would soon convince them that the tendency was the other way.

BUILDERS' BENEVOLENT INSTITUTION.

THE twenty-fifth annual meeting of the subscribers and friends of this charity was held yesterday (Thursday), at Willis's Rooms, King-street, St. James's. The chair was taken at three p.m., by Mr. James Simpson, in the absence of the president, Mr. Joseph Taylor. The notice convening the meeting having been read, Mr. A. G. Harris, the secretary, read the minutes of the last annual meeting, which were confirmed. The secretary then read the report, which was as follows:—"In presenting the twenty-fifth report to the friends and supporters of the Builders' Benevolent Institution, the directors have the satisfaction of informing them that they have, through their kind assistance, not only maintained their previous position, but have increased the number of their annual subscribers, during the past twelve months. Four pensioners have been elected during the past year—two in November, 1871, and two in May last. The pensioners elected in November, 1871, were, Mr. W. Gale and Mrs. M. St. George; those elected in May last being, Mr.

M. Minry (blind) and Mrs. J. Brothill. The pensioners deceased during the past year were Mr. G. L. Williams, elected May, 1866, died August, 1871; Mrs. A. Buckingham, elected May, 1857, died August, 1871; Mr. G. Hunt, elected May, 1867, died November, 1871; Mrs. M. A. Farnell, elected May, 1861, died December, 1871; and Mr. W. Taylor, elected May, 1863, died February 1872. During the past year 752l. 16s. 5d. stock 372 per Cent. Consols, has been added to the funded property of the institution; 643l. 14s. 5d. for the relief fund, and 109l. 2s. for the building fund; making a total of funded property of 16,142l. 12,781l. 9s. 6d. for the relief fund, and 3,360l. 10s. 6d. for the building fund. The amount purchased for the relief fund includes the sum of 321l. 18s. 10d. received from the executors of the late Richard Alechin, Esq., of Brighton and Tunbridge Wells, who was a liberal supporter of the charity from its commencement. The annual ball, held at Willis's Rooms, King-street, St. James's, in January last, produced a profit of 76l. 6s. 7d., being an increase over the previous year of 21l. 16s. The directors, in thanking their kind supporters for their generous and continued efforts, which have enabled them to assist so many of their unfortunate brethren, hope that (there being so many applicants) they will not cease in their efforts, but endeavour themselves, and through their friends and connexions, to procure additional funds, so that they may elect a larger number at the next election. They have also the pleasure of announcing that Edwin Lawrence, Esq., has kindly consented to be the president of the Institution for the ensuing year."

The Secretary then read the balance-sheet for the year, from June, 1871, to June, 1872, which showed the receipts to have been 2,832l. 19s. 10d., and the expenditure 2,395l. 11s. 1d., leaving a balance in banker's hands of 437l. 8s. 9d.

On the motion of Mr. Joseph Bird, seconded by Mr. Thomas Stirling, it was resolved that the report and balance-sheet be received, adopted, and printed. Resolutions were then passed, thanking the patrons, the president (Mr. Joseph Taylor), the vice-presidents, the trustees (Sir S. Morton Peto, Bart., Sir J. C. Lawrence, M.P., Mr. Charles Lucas, and Mr. G. Spencer Smith), the treasurer (Mr. Geo. Plucknett), the directors (the hon. sec. to the ball (Mr. Joseph Bird), the auditors (Mr. S. H. Head and Mr. J. H. Hunter), and to the honorary solicitors (Messrs. Jacques, Edwards, & Co.) for their services to the Institution.

Mr. Joseph Taylor was added to the list of patrons, and the following gentlemen were added to the list of vice-presidents:—Messrs. G. Dines, R. Giles, M. Hall, G. Head, W. Lee, and E. Whillier. The following directors, retiring by rotation, were re-elected:—Messrs. G. Fish, F. W. Keeble, James Simpson, R. G. Smith, J. Thora, S. J. Thacker, and J. Waldram, and Messrs. R. K. Burstell, and G. P. Mace, were elected new directors.

On the motion of Mr. Joseph Bird, seconded by Mr. T. Stirling, it was resolved that Mr. Edwin Lawrence, be the president of the Institution for the ensuing year.

A vote of thanks to the chairman, Mr. James Simpson, brought the business to a close.

THE FATAL ACCIDENT IN THE COMMERCIAL ROAD SEWER, LIVERPOOL.

THE borough engineer has presented a elaborate report on this accident. The engineer states that he visited the works twice on the day of the accident, and on both occasions a very strong odour of sulphuretted hydrogen pervaded the engine room. The immediate effect was, in a modified degree, the poisoning with sulphuretted hydrogen, of which he has had personal experience. The engineer holds a very strong opinion that which may be termed the mechanical evidence is the true explanation of the cause of death and it is borne out by the chemical evidence, which shows that the deposit in the tunnel, even when stirred, was incapable of giving off gas sufficient quantities to account for death, the water containing a solution of sulphide of calcium, such as that which existed in the works was quite sufficient for the purpose. Ordinary precautions were taken to render the tunnel safe. All the manholes were open. The men did not enter until, so far as they could judge, the tunnel had been rendered quite pure by the current of air induced by the jet of water which had played for some time. He

been unable to detect the smell of sulphuretted hydrogen in any of the sewers which he has visited, and they include some of the flattest and most sluggish in the town. The engineer recommends that certain changes be effected in the Liverpool Sewage Utilisation Company's works. The report was agreed to.

HIGH ART IN THE BRITISH MUSEUM.

Sir.—The general opinion is, that pictures intended for public inspection should not be placed beyond the reach of human vision, but the authorities of the above-named establishment seem to think differently, as all the portraits are hung as near to the moon as the limits the building will allow, and any one under 5 ft. high can see no more of the paintings as a Tilburina saw of the Spanish fleet.

GEORGE ELLIS.

LIABILITIES OF AN ARCHITECT.

Some time ago proof was led before Sheriff Meigs Thompson, Aberdeen, in an action raised by Mr. Souttar, architect, Aberdeen, against Alexander Gouder, butcher, for payment of the ordinary architect's fee of 5 per cent. for the preparation of plans and superintending the erection of a cottage lately built by the defender. The defence was that there was a special agreement that the architect's fee was to be less than 5 per cent., at the original plans were deviated from, and that Mr. Souttar granted a certificate for the payment of the final instalment of the architect's contract-price before the work was completed, whereupon the money was paid, and the contractor left the town, leaving part of the work to be accomplished by another, at the defender's expense. The sheriff has issued an interlocutor, finding the pursuer entitled to his liability fee, less 3l. 8s. 6d., which his lordship deducts from the charge in consideration of the expenditure of the defender, consequent on the granting of the certificate referred to, the pursuer is found entitled to expenses.

THE THUNDERSTORMS.

PROVINCIAL newspapers of last week largely set out as to the physical commotions which are still going on; and we have had a share them in the metropolis more than once on our notice last week. One thing seems very probable in consequence of these storms of lightning and rain,—that we shall have no less this year in England; for cholera has always been close and un-thundery, and we have had no instance, that we collect of, ever since this plague first showed itself in Great Britain, of cholera after an open season like this. Meantime, great damage is being done by the storms throughout the country, especially by the floods, but there have also been fatalities to life as heretofore. In the Manser district there have been "alarming floods," at destruction of property, shocking scenes; in the Sheffield district there have been "great ds" by recent storms; and so on throughout a great part of the country. Leigh church has been struck by lightning, and part of stonework of a turret thrown down. There is no lightning conductor attached to the towers, houses, chimneys, &c., have also, as now and then, been struck, and while we write Brixton church has been struck and injured, and the arch in view of the writer has been turned into tall and flowing river. Two neighbouring trees here (in Holloway) have been struck; in one case the lightning cutting off a piece of ivy water-pipe, and in the other making a hole in a roof.

OMERSET AGRICULTURAL LABOUR QUESTION.

Sir.—As you ventured to mention my name as an actor in the farm labourers' question, I ask you kindly to send the following facts, proved at a meeting held at Lacaze, near Yeovil, June 11th, 1872, when 1,000 farm workers were present, to show to your readers whether I am right or wrong. I am, alias Jack Tucker, a very old man, in order to a question, said that he remembered when his father tried to reduce his wages to 6s. a week; but he did not accept of it. He was the forehook (first man) for six or six of the morning until nine o'clock at night, and could not make more than 10s. or 12s. a week. He did not now do a day's work. He received 1s. 6d. a

week and a loaf of bread from the parish. Mr. Mitchell asked—Do you pay house-rent? A. 1s. per week.

Wm. Chant, an elderly labourer, forty-seven years of age, was also called upon the platform, and examined by Mr. Mitchell. He said that when he was married he received 10s. a week, but he worked at Montacute House, and there were no perquisites. Farm-labourers were paid 5s. a week. Had had eight children, and paid 1s. 6d. a week rent. Q.—How much butcher's meat did you have? A.—I did not eat three-penny-worth of beef in a twelve-month.

Maria Bull, a respectable-looking woman, was called upon the platform, and said that she had had fifteen children. Q.—How much did your husband get a week? A.—7s., when we were first married. Q.—I suppose his wages were increased to 8s.? A.—Yes. Q.—His wages have been lately raised to 9s. A.—He has got 1s. extra. Q.—I suppose you have plenty of butcher's meat? A.—None whatever. Q.—Do you pay house-rent? A.—1s. 6d. a week.

Mr. Mitchell said, that he thought he had produced sufficient evidence to convince every one that something ought to be done for the labourer. He hoped that they would become members of the union, and if they had not sufficient money to pay the deposit, he would lend them some. Mr. Mitchell offered 1l. each to every man that had got a pig in a sty, and asked them to hold up their hands. There was not a hand held up.

P.S. The above are only a few of the facts.

SANITARY TRIUMPHS.

TACHE SANS TACHE.

CONELLA was not the only mother. Who rear'd sons to dedicate their lives To grand designs for building up the State, Far greater deeds than by the Græci won, More nobly work, in truth, have since begun. And sons perform'd—helped by mother's counsel, And their own strong consciousness of right. We see it in the pavement and the flags,— Find it in foundation stones and walls. The basements and the house-tops echo it, And art and science spread the knowledge far. The crystal waters welling from their fountains, God's fire undim'd in towers and cities. The music of the birds, the trees and flowers, And happy children's voices in the parks Proclaim it. But, lowering o'er all these, We greet it in the countless hearts and homes. Wou back to cleanliness and blessed health. C. H. C.

RECIPE FOR A BUILDING IN THE

"NEW STYLE."

FIRST, take an old tone, an age out of print, That's full of quaint copper-plates Of churches and mansions of antique mint, With some grim old courtyard gates. Take a piece from the post, a slice from the tower, Some doors, and windows from aisle, Mix well, and a work of most wondrous power You'll have, in the Newest Style. O.

"UTILISING DRAINAGE."

Sir.—In answer to "M. M." in the Builder, allow me to say,—Filter your sink-water through a heap of earth, stubble, or straw formed upon the surface of the ground before passing it into the drain. Use the dry-earth system indoors and out, and you will have more than solids to deal with. G. S. C.

HOME-MADE GAS.

Sir.—Having heard recently that new discoveries in the production of gas for domestic use have been made, I shall be indeed obliged if you or your numerous correspondents and readers will kindly give their experience and thoughts on the same. Some gas made of oil was mentioned as good and pure. C. W.

BEECH.

Sir.—If "W." will try the experiment of using thoroughly seasoned beech timber in his business of mallet-making, there is no doubt he will have found the only remedy he seeks. J. C.

THE TRANSPORT OF SALT WATER.

In addition to what has been said, it will be necessary to provide against the different effects of sea-water upon the pipes in which it is conducted from the sea to London. Metal pipes would, most likely, become corroded, and therefore it would be better to use earthen or stone ware. Another thing is, the deposit of calcareous ingredients which abound in a great degree in the south coast water. This may be in a great measure counteracted by depositing a small quantity of clean ballast in the pipes, to about one-fourth of their depth, at those parts where the pipes lie nearly level. Where a good fall is obtained this would be unnecessary, as there would be but little deposit, and also nearly impracticable, as the ballast would be washed down to the lower level, and cause obstruction; or burnt clay could be used instead of stone ballast; and when removed from the pipes, as it would have to be occasionally, and replaced, could be converted into a good cement. It would be worth while considering whether it would be the best plan to take the water direct from the sea, for reasons stated in my last correspondence, or whether it should be taken from the mouth of a river, such as the Adur. There are no large towns near this river, so the water ought to be tolerably clean, and should form the chief supply. The water should be first collected in a

* Seven miles west of Brighton.

reservoir near the river's mouth, and then there should be three supplies: 1. That above mentioned; 2. Pure sea-water; 3. Rain or other fresh water, for occasionally flushing the pipes, and for regulating the quality of the water. WALTER SCARGILL.

STOCKTON EXCHANGE COMPANY, LIMITED, COMPETITION.

Sir.—Inclosed, from the secretary, is a reply to my application for particulars respecting this competition. These particulars are so meagre, the demand of 10s. for a tracing of the outline of the ground so paltry an attempt at extortion, that perhaps it would be well to bring the matter under the notice of Mr. Strong, honorary secretary to the Committee on Competitions at the Late Conference, if happily his remonstrances may avail in securing even common decency to the profession. INDIGNANS.

MUDDLE.

Sir.—When Captain Coram's statue was placed in front of the Foundling Hospital, in Guildford-street, it was intended it should be seen by wayfarers from Ilolborn, along Lamb's Conduit-street. When the Metropolitan Cal-fare and distance tables were issued to the public, it was never supposed by them that the large, unsightly boards would be placed in such an elevated position as the top of a lamp-post, just beneath the lamp, which is the darkest part of the street at night, and where an average pair of eyes, over forty years of age, cannot read it by day, and after the gas is lighted can only see an angry black shadow. When the drinking fountain in Guildford-street was designed, it was supposed to harmonise with the hospital and its purpose, and was therefore made to face it; but let any one journeying that way stand a minute, and see the result of the combination. Noble-hearted Captain Coram is fix'dly gazing at the foggy gas flame, or wondering why his range of vision has been shortened by the intrusion of a cal-fare screen, and the pretty little girl of the fountain is cowering behind it, pouring out water by stealth, her presence quite unsuspected by the Captain (although close under his nose), whose world is shut out by a board and a lamp-post, which ought not to be suffered to stand there another week. The place for a lamp near that spot is behind, or over, or at each side of the fountain, certainly not in front of it,—cutting it in half with a thick black line; and the cal-fare board should be carried bodily away, and put up again in some more fitting place, where it may be read without the aid of a telescope. At present the fountain and hospital are two separate things, and if they are not to remain such, the impediment must come away; otherwise, the drinking-fountain should be turned round, so that the people may see it, though Captain Coram may not. O'GARTH.

CHURCH-BUILDING NEWS.

Belchamp St. Paul's.—The church here has been reopened by the Bishop of the diocese (Rochester). The church had been allowed to fall into a very dilapidated state, and though the fabric itself was tolerably well preserved, the fittings and whole interior were in a condition very unsuitable for the performance of public worship. The whole amount of funds collected was 1,071l. 15s. 8d., while that expended up to the present time is 108l. in excess. The architect for the Dean and Chapter is Mr. A. J. W. Blomfield, the alterations and fittings in the nave were made under close supervision, by Mr. Theohald, of Long Melford, and the restorations in the chancel and new chancel aisles were made by Mr. Rimmacles, of Halsted.

Southport.—St. Andrew's Church, Southport, has been reconstructed. The church is cruciform in plan, and consists of a nave 89 ft. 9 in. by 28 ft. 6 in.; north and south aisles, 61 ft. 6 in. by 13 ft. 6 in.; north and south transepts, 28 ft. 3 in. by 27 ft. 6 in.; chancel, 30 ft. by 24 ft. 8 in., with organ chamber and vestry on the south side. The tower, through which is the principal entrance, is placed in the angle between the chancel and north transept, in order to suit the peculiarity of the site and approaches. There is also a porch and entrance in the north aisle. The design is decorated, the principal feature being the tower and spire at the northeast. Internally the nave has an arcade of four arches on each side, the shafts being of polished sharp granite, with moulded and carved capitals. These arches support a clearstory, pierced with two light tracery windows, and opposite the transept, on each side, is a large arch, the apex reaching to the top of the clearstory. The arches east and west of the nave are supported by moulded and carved stone brackets. The chancel, which is raised three steps above the floor of the nave at the chancel arch, and two steps higher within the communion rails, has a tracery window of five lights, and an ornamental reredos of Caen stone, with marble shafts. The chancel arch is of large proportions. The large window at the west end is of six lights, and those at the north and south of transepts of four lights, traceried. The aisle windows are of three lights toward the west, and of two lights at north and south. The roof timbers are dressed and chamfered in panels. The building is con-

structed with brick walls, faced with Upholland parpentine in courses. The stone for the exterior is from the Cofn quarries, near Rulon, and that for the interior is white Stourton. The floors are of tiles, those in the chancel being laid to a pattern. The joiners' work is of selected pitch-pine, varnished. The contractors for the several works, have been—for the brickwork, Mr. Smallsaw; for the carpenters' and joiners' and ironwork, Mr. Duxfield; for the masons' work, Mr. Greenwood; for the slaters' and plasterers' work, Mr. H. Robinson; for the plumbers', painters', and glaziers' work, Mr. Boyd; and for gas fittings, &c., Mr. Rohson, all of Southport. The building contains nearly 1,000 sittings, of which half are free. Messrs. T. D. Barry & Son, of Liverpool, were the architects.

Whitby.—The Mission Chapel, at Kettlewell, near Whitby, on the estate of the Marquis of Normandy, has been opened for divine service. The style of architecture of the edifice is of a severe Gothic type. The edifice will seat 137 persons, and the total cost is about 300l. It has been erected from the plans and under the superintendence of Mr. Charles Noel Armfield, York Diocesan surveyor, architect, Whitby.

Earls Barton.—The restoration of the church here is gradually progressing. The chancel is nearly completed. The side walls (chancel) have undergone a restoration, and parapet walls of Weston and Weldon stone have been added, and suitable crosses placed upon each of the gables. On the north side of the chancel has been placed an organ chamber, which is connected with the chancel by a lofty arched opening, and the old Tudor window, which had to be removed, has been placed in the north side of the chamber. The old roof has been removed, and has been replaced by a high pitch king-post oak roof, and new leaded. The inside of the roof is oak panelled and moulded, which is set off by an oak cornice. The side walls have been stripped of the old plaster and whitewash, and have been fresh plastered. The old Norman recesses have been cleansed of all whitewash, colour, &c., so that the primary tooling has not been interfered with. The old triplet chancel window has not been overlooked, and the old mullions have been taken down and replaced with a new inner arch, and a stained window, with Scriptural illustrations, has been put in by Messrs. Bell & Almond, of London. The other windows, with the exception of two which are retained for stained glass, have been glazed with cathedral glass: one of the two low side-lights, previously bricked up, has also been glazed with cathedral glass. The floor is to be encaustic tiles, and the furniture to be carved oak. For accommodation a temporary wooden floor has been placed, so that the chancel will be used for divine service during the restoration of the nave, which is to be finished by the autumn. The architects are Messrs. Slater & Carpenter; the builder is Mr. Allen, of Irthlingborough. The restoration is under the management of the Architectural Society. There is no doubt that the Saxon tower will, under the management of the Architectural Society, be repaired in the manner it deserves.

Brixham (Devon).—Holy Trinity Church, situated in Higher Brixham, and said to be one of the most abominable specimens of Carpenter's Gothic of the Georgian era, is doomed, earlier or later, to come down. Already a new chancel has been erected, and being nearly complete, will shortly be consecrated. No chancel existed in the original church, so that this addition stands upon new ground, the site having been quarried out of the solid rock in the rear of the present building, not without much difficulty and expense. The chancel arch is supported by columns of Devonshire marble, springing from delicately-carved corbels, representative respectively of the wheat and wine, and lily, and passion-flower. Various corbels, &c., throughout the chancel, representing foliage of a Scriptural type, the rose, apple, oak, fig, &c. At present the walls are stuccoed. The roof is an open one of pitch-pine, varnished. The floors are laid with encaustic tiles. Some of the windows are of stained glass, by Messrs. Lavers, Barnard, & Westlake; the others of opaque cathedral glass. The seating is of local limestone, and the dressings throughout are of Bath stone, from the Corsham Down quarries. The builders are Messrs. Bragg & Dyer, of Paignton. The sculpture and the stone carving are by Mr. Harry Ems, of Exeter. The style of the building is Early Decorated, and has been designed by Mr. E. Asworth, of

Exeter, under whose supervision the works have been carried out. Mr. Asworth's design includes a new church in toto.

Bury.—The Church of St. Peter, near Bury, has been consecrated by the Bishop of Manchester. It is a building in the Early English period of architecture, faced with stone externally, but with red brick inside, Bath and blue Burnley stone being used in the columns, &c. The reredos, font, and pulpit are executed chiefly in alabaster, relieved with gold mosaic. An effect is gained in the interior by the contrast of the seating, which is black, with the colouring of the walls and columns. The stalls are relieved by gilding. The church is built to accommodate 500, on the usual plan of nave and aisles, with apsidal chancel, large organ-chamber, and two vestries. The remainder of the tower and spire are left for future erection. The contractors for the building are:—For the masons' work, Mr. H. Fleetwood, Manchester; brickwork, Messrs. T. Blease & Brother, Altrincham; joiners' work, Messrs. W. Jones & Co., Liverpool; slating, &c., Mr. J. Owen, Bowdon. The reredos, pulpit, font, and the carving of the chancel have been executed by Messrs. E. Williams and Millson, Manchester. The architects were Messrs. Maycock & Bell, of Manchester.

Colchester.—The rebuilding of St. Mary's Church is fast approaching completion, and was arranged to be opened on the 10th of July. As a first step towards the improvement, it was proposed last year to build an entirely new chancel, with an organ-chamber, vestry, and side chapel for children's or other seats, and, if possible, to re-seat the body of the church; it was considered to be quite impossible to undertake anything beyond this with the funds likely to be available. Mr. Blomfield was called in, and submitted a report to the committee, accompanied by a plan, each of which were adopted. When the tenders came in, however, the lowest was so considerably under the architect's estimate, that a design was asked for a new roof for the nave and aisles, next for new columns with brick arches, then a clearstory, and last of all the rebuilding the aisle walls. Thus it happened that the designs being asked for and submitted in this manner by instalments, the church as it now stands, although (with the exception of the tower) an entirely new building, was to a considerable extent necessarily carried out on the old plan, and to harmonise in general effect with the red brick building lately removed, rather than to reproduce what might be believed to be more in conformity with the original church. With the addition of a chancel, side chapel, organ-chamber, and vestry, the new church is identical in plan with the old one. The whole structure is of red brick, with a few bands of black and a moderate use of Bath stone for windows, &c. The roofs are of stained deal—as also the nave seats; those in the chancel are of pitch-pine. There is at present no reredos. The whole of the work has been carried out by Mr. Gardner, of Coggeshall. Mr. Heathcote has acted as clerk of the works. The church is to be heated by hot water by Mr. Joslin, of Colchester.

SCHOOL-BUILDING NEWS.

York.—The Clementhorpe and Bishophills new schools have been inaugurated by the Archbishop of York. The schools are situated in Cherry-street, near the junction of Numery-lane with Bishopthorpe-road. They were built from the designs of Messrs. J. B. & W. Atkinson. The length of the building is 120 ft. It is divided into infants', girls', and boys' schools, with separate class-rooms. There is a good play-ground, with conveniences. Coloured collar beams supporting the roof, give an ecclesiastical finish to the structure. The whole of the rooms are warmed by Stewart & Smith's hot-air apparatus, which, it is said, works economically, and can be made to raise or lower the temperature at pleasure. The schools will accommodate about 400 children, divided into the three classes. About 800l. have been raised towards the expense of the building by voluntary subscription, the Central York Board also contributing 300l., and the Government grant amounting to 190l.

Canterbury.—The chief stone of Holy Cross and St. Peter's New Schools has been laid. The schools will be built for the accommodation of 250 children, and include a separate school for boys (not connected with the other schools), 42 ft. by 19 ft., with an entrance from the lower part of Black Griffin-lane, and capable of accommodating ninety boys under twelve years of age.

The infants' school is 41 ft. by 19 ft., capable of holding ninety-five children under seven years of age, whilst the girls' school is 38 ft. by 17 ft., and will accommodate sixty-five children under twelve years of age. Adjoining the schools will be a teacher's residence, and the expense of the whole is estimated at 1,400l. Mr. W. O. Colard is the architect, and Messrs. Gaslin & Golden are the builders.

Doncaster.—Preparations are now being made for the erection of new Roman Catholic Schools, in Portland-place. The building is to be adapted for a mixed and infant school, and the cost is estimated at 500l. The schools are expected to be completed in about four months' time.

Worlaby, Brigg.—These schools were opened on the 12th inst. The buildings occupy an elevated site in the centre of the village, and comprise a mixed school, 50 ft. by 20 ft., with open roof of fir, stained and varnished; boys' and girls' cloak-rooms, with separate yards and offices, and commodious house, with yard and offices, for the master. The schools are surmounted with a neat bell-turret, and the total cost is about 800l. Desks were provided by Coleman & Co., Norwich. Gurnoy's stove, Moine's patent wrought-iron casements, and Dr. Arnott's ventilators. Both the schools and master's house are fitted with Moale's patent earth-closets. These schools are similar in design and construction to those at Elsbam, which were opened June 3rd and form a portion of the improvements on the Elsbam estates, in the counties of Lincoln and York, consisting of new cottages, schools, farmsteads, and houses, and repairs to existing buildings, all under the superintendence of Messrs. Dunlop & Bryant, of Westminster, with M. William Young as clerk of the works. It is intended at once to restore the village church plans of which have already been prepared by Mr. W. Scott Champion, of London.

Books Received.

Ross's Wages Calculator, for Fifty-one and Fifty-four Hours per Week, at Rates from 2s. 6d. to 4s. Edinburgh: John Ross & Co., Prince-street. London: Simpkin & Marshall. 1872.

The "Fifty-one Hour" Wages Reckoner: consisting of Computations per Week and Computations per Hour for a Working Month. With a Supplementary Comparative Table, applicable to Weeks of 48, 54, 57, and 60 Hours respectively. By a Retired Banker. Edinburgh: Johnstone, Hunter, & Co. 1872.

The titles of these publications explain the contents. It is scarcely necessary for us to more than make their publication known. *Ross's Calculator* is less than a farthing is reckoned a farthing, and less than three farthings is reckoned a half-penny, and three farthings a penny. In the "Banker's" little book farthings and three farthings are literally stated. *Wages Tables* in the latter from 4d. to 1s. 1 hour, continued from a quarter of an hour to 2 hours, can be used also as a Ready Reckoner showing the value of any number of articles from 1 to 231, at any price from 4d. to 1s. ea.

Beeton's Science, Art, and Literature. A Library of Universal Information. Vol. London: Ward, Lock, & Tyler.

This portly, closely-printed, and well-illustrated volume (991 pages, extending to the letter G) carries on the work begun in "Beeton's Dictionary of Universal Information." The latter deals with facts which relate to the names of persons and places; the volume now published gives an immense amount of information relating to things; it describes inventions, and all processes of every kind. Care and conscientiousness are obvious throughout the book, and we cordially recommend it.

VARIORUM.

The Gardener's Magazine, writing of trees in architecture, says:—"When planting in the vicinity of a dwelling-house, whether it be a mansion or a cottage, we often find ourselves under considerable restraint, because the foliage of the trees requires to be in harmony with the character of the building. It may not be necessary to consider every style or order of architecture as requiring a different assortment of trees for our purpose, it suffices to divide the trees into Perpendicular, of which the Gothic may be given as an example, and the Horizontal, which is fully exemplified by the Italian style. Irreg-

nd-headed, and weeping trees are in character either, but the laminate and round-headed most pleasing to my mind in connexion with perpendicular, and the columnar and regular with the horizontal. If the building low, tall-growing trees should be avoided, and round-headed, the laminate, and weeping especially desirable, because they direct the horizontally and downwards. It should ever be borne in mind that the presence of lofty trees in proximity to a low building has the desirable influence of still further depressing

Miscellanea.

Vienna Universal Exhibition of 1873.—Brief summary of the conditions upon which the Exhibition will be conducted has been published. The Exhibition will open in Vienna on the 1st of May and close on the 31st of October. 3. Lists of the exhibitors, with detailed plan space required, must be sent in to the chief manager at Vienna before the 1st of January. Liability on the part of the exhibitors for hangings, boarded floors, or the laying out of the dens. The motive-power for the machinery to be supplied gratis. The price to be charged for each foreign country for the entire area of space demanded, will be, in the Industrial Palace at the rate of 10 florins—1l. per square metre (a square metre contains about 10½ square feet), and the machinery hall at the rate of 4 florins—per square metre. In the courtyards of the Industrial Palace the rent per square metre will be 8s. In the park,—open air, 2s.; in spaces paved at expense of exhibitor, 6s. Exhibitors' fine arts are exempted from any charge for space. Arrangements are to be made by the Austrian Commission for the reduction of the transport charges in Austria and Hungary. Exhibitors or their agents are responsible for packing, forwarding, receiving, and unpacking of their goods. The removal of objects after the Exhibition must be completed before the 1st of December, 1873. The objects will be admitted to the judgment of an international jury. Objects for exhibition will be received at Vienna from 1st of February until the 15th of July, 1873. Exhibitors and their agents will receive tickets entitling them to free admission to the Exhibition. For further information address to Mr. Philip Cunliffe Owen, secretary, Vienna Exhibition Offices, 41, Parliament-street, London, S.W. Applications should be forwarded not later than 24th of August.

The Sewage, and what is to be done with it.—A meeting of gentlemen interested in the subject was held on Thursday last, in Willis's Rooms, under the auspices of the General Sewage and Manure Company, to receive an explanation from Dr. Anderson, of the nature of the system of which he is the author, and which is now in practical operation at London. The meeting, which was presided over by Lord Elibank, was largely attended by scientific gentlemen, engineers, and others. At fifty gallons of sewage from the Fleet were put in a glass tank, were experimented upon by Dr. Anderson. He showed how by treating sewage with sulphate of alumina in a crude solution, in conjunction with lime, the solid matter precipitated and converted into sewage manure, and the effluent water is rendered clear and non-offensive that it may without danger be allowed to run into streams. The experiment was watched with interest, and the precipitation effected in about twenty minutes. It happened, however, that the effluent water was not so odourless, and this was explained by Dr. Anderson, who said that the Fleet Ditch contained the very worst form of sewage, and that small arces from the area held in suspension could not be removed by any known process, either of precipitation, irrigation, or filtration, but which, however, would be converted into a harmless body, ammonia or its carbonate, and exposure to the atmosphere. It could be effected by intermittent filtration. Those present expressed their high opinion of the efficacy and practicability of the system, and urged the importance of its adoption by the large towns.

On Ore in Clifton.—The purchaser of a building site recently sold in the centre of Clifton, says the *Bristol Times*, has met with a mass of iron ore, in the form of iron ore, which he thinks will produce as much money as he can for the whole property.

Coal and Iron.—The increased cost of coal and iron tends to increase the cost of production in numerous departments of industry. In the Staffordshire potteries the china manufacturers have decided on an early advance in the prices of china, "to meet the increase in the cost of fuel and materials." Again, "in consequence of the increased price of coal, iron, and other materials used in the construction and working of steamboats," the penny boats on the Thames have become twopenny boats. If coal continues to rise in price, and it is said that it will, we may look for increased railway fares. In fact, prices altogether are going up fearfully, and the enormous cost of food and fuel will in all probability have very serious results among the poor during next winter. The coal miners of Northumberland have held a meeting in Newcastle, to consider what course should be pursued with reference to the advance of wages which the masters have offered them. After a long deliberation it was resolved to accept the 10 per cent., but at the same time the men considered themselves entitled to the full amount asked, viz. 20 per cent., and added that nothing short of this advance would be entirely satisfactory. The Miners' Union is a very strong one, and it is believed they will shortly apply for a still further increase.

The Restoration of Dorking Parish Church.—The inadequacy of the Church of St. Martin to meet the requirements of the parish has long been felt, and its gallery and pews make it impossible for many of those who do attend the church to see or even hear what is going on. The erection of the new chancel also threw out in striking contrast the inartistic body of the church, which is about as plain a structure as it is possible to find, though built only thirty-five years ago. A subscription list to raise the necessary funds for rebuilding has been set on foot. Mr. Cubitt, M.P., headed the list with 2,000l., and other sums given with proportionate liberality soon swelled the amount, until the committee were enabled to invite tenders for the work, from the plans of Mr. Woodyer, architect. About 6,000l. were required, and nearly the whole of that sum has been promised. It is believed that the contract will be signed forthwith, and the demolition of the present structure commenced early in the ensuing month. Negotiations are in progress with the directors of the Public Hall Company, to enable the vicar to conduct divine service in that building during the restoration.

Early Man.—According to *Galvani*, M. J. de Baye has communicated some information to the Academy of Sciences on certain grottoes in the department of the Marne, which, in times when polished flint was in use, served as burying-places. These caverns are all cut out on the same plan, and are evidently of similar origin. The sides and arched ceilings bear the marks of stone hatchets. Some are divided by a partition into two chambers; several were receptacles for the dead, but others were inhabited. The latter were more comfortably arranged, and admitted of being closed with doors, as certain grooves show. The walls are provided with hooks carved out of the solid clay; and lastly, the entrances bear traces of a degree of polish from constant going in and out. On a wall of one of these grottoes there exists a rude bas-relief representing a hatchet provided with its handle, and a sling. The flint instruments discovered here are hatchets of various shapes, knives, punches, saws, well-cut arrow-heads, &c. Some of these articles were not flint, but porphyry.

The Thames Embankment (Land) Bill. On the order of the day for the re-committal of this Bill, the Chancellor of the Exchequer expressed his regret that there was an amendment to the motion for going into committee; he had hoped the dispute might that night be settled. Mr. V. Harcourt moved that at this advanced period of the session, with a pressure of important public business, it was not expedient to proceed with the Bill. After some discussion, the House divided; and the result was, for Mr. Harcourt's amendment, 154; against it, 133; majority against Government, 21.

The Vendome Column.—Everything is now ready for the reconstruction of the column in the Place Vendôme, at Paris. The plans are all prepared, the expenses being calculated at 250,000fr., and M. Normand, the architect, is only waiting for orders to commence operations. The fragments of the pillar are arranged in one of the rooms in the right wing of the Palace of Industry.

Sales of Land.—The freehold premises, Nos. 16A and 17, Tokenhouse-yard, Lothbury, and the adjoining premises, No. 18, held for 7½ years, subject to a peppercorn rent, were on Tuesday sold by auction by Messrs. Debenham, Tewson, & Farmer for 23,800l. The freehold portion covered an area of 1,550 ft., and the gross rental of the whole amounted to 2,145l. a year.—The Freedy Estate, near Melton Mowbray, comprising 2,380 acres, producing an income of 4,250l. per annum, has been sold privately by Messrs. Chinnock, Galsworthy, & Chinnock, for the sum of 141,000l.—A sale of property in Chichester took place last week. It consisted chiefly of 42 acres of freehold building and accommodation lands near the New Cattle Market and the railway station, divided into thirteen lots. For lots 6, 7, 8, and 9, put up together, and consisting of about 11½ acres, in the parish of St. Peter the Great, Mr. Mallin (Greene & Mallin) gave 4,650l. Lot 3, consisting of over 8 acres, in the parish of St. Bartholomew, was knocked down to Mr. F. N. Hobgen for 2,350l. An enclosure, with 6 acres and 2 perches in the rear, in the parish of St. Peter the Great, was knocked down to Mr. H. J. Andrews for 1,250l.

Restoration of Croft Church.—The *Darlington Times* reports that the Chancellor, in giving judgment as to the proposed restoration or repair of Croft Church, said he had suggested that the parish could not do better than put themselves in the hands of Mr. Fowler, and Mr. Nicholson, the diocesan surveyor. They had not done so, nor had they come forward with any definite proposals. With regard to costs, the rector had plans prepared for the restoration of the chancel. That chancel he was legally bound to restore. Those plans he had submitted to this Court, to empower him to carry them out, under their sanction. An opposition had been raised, and he must say without sufficient cause. As he did not consider that sufficient reasons had been brought before him to justify the opposition that had been made to the application of the rector to restore his chancel, he felt bound to decree the faculty to issue at once, and with costs. Mr. Stevenson then, on behalf of the opponents, alleged his intention of appealing.

Opening of the New Colwyn Bay Hotel.—The *Chester Chronicle* states that the beautiful bay of Colwyn, since the estate of Pwll-y-Crochan was purchased by Mr. J. Pender, M.P., of Lady Erskine a few years ago, has made rapid improvement as a watering-place. A number of villas have been built and shops erected. A company of Manchester and Chester gentlemen have erected the Colwyn Bay Hotel, which has been formally opened. The hotel is situated in the centre of the bay. The station is about a minute's walk from the hotel. The style of the building is a domestic Gothic, and it has been built by Mr. Abel Roberts, Llaiduno, of the limestone of the district, from designs by Mr. John Douglas, of Chester, architect. The terrace-walk fronting the sea, with the rockeries and other landscape work, have been laid out by Mr. C. Ewing, of Chester. The promenade, which is of considerable length, is being further extended, and the grounds of Pwll-y-Crochan on the hill above are also free to the visitors at the Colwyn Bay Hotel.

The New Colonial Office.—In the Commons, Mr. B. Cochrane asked the First Commissioner of Works whether he was aware that when the houses in Parliament-street, opposite the public offices now being erected, are pulled down, the width of the space acquired for the public will be 87 ft. at one end and 60 ft. at the other; and what use he contemplates making of the narrow space if he did not add it to the width of Parliament-street. Mr. Ayrton said it was wholly unnecessary for him as yet to consider what was to be done with the ground. It would be time enough to do so when these houses were pulled down. He did not know exactly when the demolition would take place; but not before the new Colonial Office was finished.

Fall of a Building in Stockport.—In Rosemary-lane, Churchgate, the back part of a dwelling-house, with cellar, has fallen. It would appear that an imperfect sewer at the bottom of the cellar, added to the recent rainfall, had so affected the foundation of the building at that point, that the brickwork, separating from the adjoining wall, had fallen outwards into the yard, leaving the house-pipe and frontage, with the bed-rooms exposed, fortunately without endangering life.

Utilising Waste Substances.—Leather cuttings and scraps are, according to the invention of Messrs. Gale & Boyden, of Bristol, torn into shreds or ground into dust, then subjected to a solution of nitric, sulphuric, or other acid, and heated to make the mass glutinous, then washed in alkaline water and pure water, when it is again subjected to heat, adding glue or size prepared in acids or coal-tar; thus heated, the material is rolled or pressed into sheets, or the shreds or dust are mixed with water and glue prepared with acid or coal-tar. Before being dried, it may be used with paper pulp, also in making india-rubber, gutta-percha, and parkesine, but it is particularly applicable for the soles of boots and shoes and floor-cloths. When vulcanised, it is applicable to the purposes to which vulcanised india-rubber is applied.

Water Wanted in Kew Gardens.—The plants, we suppose, have plenty, but the thousands of people who flock to Kew at this season not only have almost literally no water supply throughout the gardens, but are restricted from taking either drinkables or eatables in along with them. If the purpose were to put a stop to the influx of the public, there would be nothing idiotical in such an arrangement, but Kew Gardens belong to the public, who are entitled and expected to flock to their own gardens, especially in the summer season. Mr. Ewan Christian suggests a simple and cheap arrangement whereby the water supply to the plants in the plant-houses might readily be made to afford an abundant supply also to the public. Here is a little work for the First Commissioner of Works to do.

How to Economise Prisons.—An interesting lecture on this subject, prepared by Mr. Aulic Schmidt, of St. Petersburg, architect, has been delivered, in English, in the rooms of the Social Science Association. The lecturer was based on the assumption that it is possible to make half the number of prisons accommodate, with equal convenience, the whole number of prisoners, by a system equally applicable to all countries. This he proposes to do by arrangements which might enable the authorities to use the existing workshops, for example, for several sets of prisoners at a time, successively; the cells of prisoners at work in the shops to be also utilised by others in the intervals of workshop occupation. How Sundays are to be got over we do not clearly see.

New Public Hall, Westbury, Wilts.—A meeting has been held for the purpose of recognising the gift of a public-hall to the town by Mr. A. Laverton. In a letter, Mr. Laverton explained that he proposed erecting, for the use of the inhabitants of Westbury, a building that should comprise, on the ground-floor, a school-room, a reading-room, and a committee-room; and on the upper floor, an assembly-room for lectures, concerts, and other useful objects. It was resolved that the gift of Mr. Laverton should be recognised in some suitable way when the memorial-stone is laid; and a committee was appointed to receive subscriptions, and, in connexion with the architect, Mr. Stent, to make the arrangements for laying the memorial-stone.

Temple Church, Bristol.—As the workmen engaged in the restoration of the interior of Temple Church were removing a portion of the floor in the south aisle, they suddenly came upon the entrance to a large brick vault, arched over, and filled with water to within 2 ft. of the arch. Floating on the surface was an air-tight leaden coffin, the wooden outer coffin of which had long since rotted away, and been left at the bottom of the vault. A cursory examination revealed the fact that there were three or four other coffins beneath the water, but the one we have alluded to was the only one floating. This case affords a simple explanation of occasional appearances in burial vaults, which have given rise to superstitious ideas as to supposed causes at work in moving the coffins.

Windsor Castle.—Extensive works are now in progress for the drainage of Windsor Castle and the utilization of the sewage of the Palace and Frogmore House. Some months back a site for the reception of the sewage was chosen upon the Ham, at Old Windsor, and a field of several acres, near the old course of the Thames, and between the latter and the navigation cut which leads to the Belles of Ouseley, was prepared by a number of the Foot Guards and gangs of navvies.

Bethnal-green Museum.—The visitors in the week ending July 20th numbered 59,619.

Prosperity of American Railways.—The *Money Market Review* says:—"Americans who understand the subject are of opinion that, should the present rates maintain, Pennsylvania will be able within two years to send pig iron to England at a profit. Never was so great activity displayed as is now being shown in opening up the coal and iron mines in the north-western portion of that state. Railways are being extended in every direction to tap the various coal fields at numberless points. Already there are no less than 5,113 miles of railroad in Pennsylvania, against 4,470 in New York; but they transport 12,000 tons per mile, against 3,615 tons per mile in the adjoining state.

Suffocation or Riddance of Vermin.—A new "patent vermin asphyxiator" has just been exhibited at South Kensington, under the superintendence of Mr. Frank Buckland, the zoologist. By means of a fan, turned by hand, sulphurous acid gas can be driven through a nozzle into drains, rat, rabbit, and snake holes [beetle or ant haunts?], and the gas either drives the vermin out, so that they can be killed outside, or it suffocates them in the holes. Sulphurous acid gas, too, is an excellent disinfectant: it is the same thing as sulphur fumes, and was long used by the Government (if not still) for fumigations of cargoes from plague ports.

Memorial Window to Sir J. Herschel.—A few days since a meeting, called by Lieut. Colonel Loyd, of Lillesden, was held for the purpose of considering a proposal to erect a window in the parish church, Hawkhurst, to the memory of Sir John Herschel. Colonel Loyd had procured a design from Messrs. Clayton & Bell, as well as an estimate of the cost. The subject of the window will be the Wise Men following the Star, and the cost 160l. The appeal has been liberally responded to, and a larger amount than is wanted for the window itself has been collected. It is expected the window will be completed at about Christmas.

The London Corporation.—The annual receipts of the City of London Corporation are nearly half a million sterling, the exact figure being 482,000l.; rents are set down at 80,000l.; markets at an almost equal amount; while loan repayments, &c., amount to 215,000l. The expenditure is pretty well equal to the imposing income, being 410,000l. The assets of the City are valued at 700,000l., exclusive of invested securities arising from the sale of properties, amounting to a third of a million sterling. The liabilities of the City of London, under bond, amount to more than five millions sterling.

Settlement of St. Silas' Church, Bristol.—The contractor for the rebuilding of this church has at length reached the bottom of the old foundations, and one of the causes of the settlement in the old building has been discovered to consist of a very old wall running transversely across the centre of the church. This wall acted as a kind of fulcrum, and where the building might have subsided equally had the wall not existed, it was prevented doing so; and the consequence was that the nave parted exactly over it. It need hardly be stated that it has been taken away, and the piling for the foundation is rapidly progressing. But why piling?

Shrine in Chester Cathedral.—Last week, while some of the workmen at the Chester Cathedral were engaged pulling down a portion of the wall at the west end of the cathedral, enclosing the staircase of the Old Bishop's Palace, they discovered a portion of what is described as the old shrine of the cathedral. It was at first thought to be part of an ancient monument, but after careful examination and comparison, it was found to be a part of the shrine, the remainder of which forms part of the bishop's throne and choir.

Antiquities.—The *Academy* says that some works undertaken in connexion with the construction of a new street at Lucera, have brought to light a statue of Venus, a marble vase, and portions of a mosaic pavement. The Venus is about seven hands high, and is undraped; at her feet are a child and a dolphin. The Italian papers speak of it as a good work, without assigning any date.

The Growth of Hove, Brighton.—We understand that the owners and managers of the Stanford Estate propose building 100 houses a year for the next fifteen years,—in all 1,500 new houses.

Royal Architectural Museum.—The Council wish to announce, as some of the results of the conferences recently held with art-employers, that two courses of lectures or explanations of the casts in the Museum, kindly offered by J. F. Redfern and Mr. William Brindley, members of Council, were arranged to take place at this season, but that in consequence of the unsettled state of the building trades it has been decided to postpone them until the autumn. Why they should be anxious to announce that they continue doing nothing is not clear.

The New Schools of Science and Art, Gloucester.—The building containing the schools and museum is about to be handed over by the builders to the trustees. The committee find that they are precluded from any further opening of the building at present. The work, although dry enough to permit classes to be held within them, are not in a fit state to allow of an exhibition of works of art, and the scientific collection is not yet sufficiently complete for an exhibition.

Sanitary State of Hammersmith.—A medical contemporary notices that it is high time that the Metropolitan Board of Works should give some attention to the creek at Hammersmith, which in its present state is nothing better than a "pestiferous open sewer." We endorse the observation.

Little Newcastle.—A new church is also to be built in this parish upon the foundation of the old one, which it has been found necessary to pull down. Mr. Thomas Richards has undertaken the contract for the first portion of the works, according to plans that have been prepared by Mr. E. H. Lingee Barker, of Hereford.

County Courts.—Upwards of 900,000 pieces are now entered in the County Courts every year, the claims exceeding in the whole at 2½ millions sterling; and, after many claims have been settled out of court, judgments given in above half a million, and for another 1,300,000l.

TENDERS

For alterations to Tutton Congregational Chapel. Mr. W. F. Pailton, architect:—

Ware	4125 0 0
Lewis	341 0 0
Toogood (accepted)	200 0 0

For enlargement of Trinity Congregational Chapel School, Reading. Mr. W. F. Pailton, architect:—

White	42,300 0 0
Mathews	2,200 0 0
Gover	2,158 0 0
Shppard	2,000 0 0

The Builder.

VOL. XXX.—No. 1539.

The Revue Générale de l'Architecture.

THE introduction to the second half of the twenty-eighth volume of the *Revue Générale* commences with an explanatory paragraph, bearing melancholy reference to events which had caused the temporary suspension of its publication for more than a year. "At the announcement of our

first defeats, the workman's tool was everywhere abandoned for the musket, and the press became but a military echo. Here and there we had pulling down enough, especially by means of cannon shot; but in the matter of construction, we were confined to cutting trenches and raising outworks; and under such conditions, journals such as the *Revue* had no pretext for existence." The twenty-eighth volume, which represented 1870, having thus been abruptly broken into at its fourth section, and not resumed till the middle of 1871, it was decided to complete the volume under the same number, but to regard it as comprising the two years 1870-71. We have before us the remaining numbers of the twenty-eighth, and the commencement of the twenty-ninth volume; and, congratulating our much esteemed contemporary, M. Daly, on the renewed excellence, both as to writing and illustrations, of the journal over which he presides, we propose to say a few words in relation to the contents of the portion before us.

The important place given in France to first principles, the predominance of the *idea*, in fact, is not less exemplified in her leading architectural journal than in her literary periodicals. A considerable portion, for instance, of numbers 5 and 6 of the *Revue* is occupied by description and illustrations of the new church at the small town of Fiers, designed by M. Ruprich-Robert. But this description is prefaced by a somewhat elaborate analysis of the conditions, and ideas, and demands upon the artist pre-supposed in the three words, "*bâtir une église*": the main tendency of these remarks being in regard to the due balance of "tradition" and "inspiration," to be preserved in the production of a design for a modern church. Archaeology, it is pointed out (the writer is M. Sirodot), with all the knowledge it furnishes as to ancient practice and the art of building, only serves to direct and facilitate the research after novel expressions; but it supplies a part only of the solution, the material element:—

"Pour obtenir l'élément qui complète la solution, qui la rend vivante et distinct de toutes les autres; entraîné par une ardente aspiration vers la vérité, animé par les grands enseignements de la religion, assisté de méditations assidues dirigées vers les célestes horizons, et soutenu par une ferme volonté, c'est à l'inspiration que l'artiste doit la demander."

All which is very true, and very well expressed.

"Fine words," however, in our homely English proverb, "batter no parsnips"; neither, we fear, do they design churches. In plain truth, we do not admire the external design of *l'église de Fiers*; and we have seen much more picturesque and beautiful churches built on much worse principles. The plan (a kind of transepted modification of the Basilica) seems an exceedingly good one; and the internal effect may probably be good, as the whole design is on Romanesque forms, which, as most of us know, lend themselves better to an internal than an external architecture. Considerable attention seems to have been paid to the internal decoration and furniture; and some of the masonry decoration (carving and diapers) is exceedingly good and well applied; and the pulpit, of wood with an ornamental canopy, a large illustration of which is given, is a very elegant and original design. It may be a melancholy satisfaction to some readers to hear that the architect in France is liable to the criticisms of amateur ecclesiologists, as among ourselves; and that the *Association Normande* at one of their meetings "sat upon" the church, and found divers faults with it, on the ground of want of adherence to precedent. The more pertinent question was also asked, why the architect had put a tower "franchement Gothique" upon a façade "franchement Romane"; a question which "the architect" has not answered apparently. His defender in the *Revue* gives excellent reasons for the arrangement; but then, if the result is bad, what is the value of the reasoning?

The same number of the *Revue* contains drawings of some of the designs for working-men's houses exhibited and premiated at the Paris Exposition of 1867; these and the descriptions and estimates annexed should be of interest to those engaged in studying this important subject. The plan which seems to have achieved the best results in comparison with the expenditure, is that of Herr Hofman, of Neustadt, whose scheme entirely abolishes wood and iron except for fittings, and employs arched construction in walls and floors, and areas for dryness in the former; the ground floor consists of a small kitchen and large living-room, the latter being warmed from the kitchen fire by a large sheet-iron box or stove, in which the smoke and heated air from the kitchen fire circulate before final dispersion by the chimney. The estimated cost of these habitations is 41 francs per square metre: some of the others are much beyond this. None of the designers seem to have succeeded in rendering the houses picturesque in appearance. The critique on the architectural works in the *Salon* of 1870, by M. Davioud, has, of course, lost its immediate interest; but some remarks suggested by the "restoration" schemes exhibited on that occasion are so well put and so much to the point that we may be excused for giving them further currency here. Speaking of the proposed restoration of the front of the church of Villeneuve-sur-Yonne, he observes that the architect, M. Rouyer,—

"Has succeeded in producing an ensemble by which the archaeologist and architect will some day be deceived as to the epoch which had witnessed this restoration. Is it so that one should think of completing the edifices which have preceded our time? We think not. Let us rejoice with the most scrupulous exactitude every feature destroyed by time, by fire, or by the hand of man; let us complete an ensemble by adding that which the history of the monument can give with certainty; nothing better. But to create new parts by circumscribing the creative spirit within a circle comprised by a score of years of art-history, under the pretext of unity of effect, is an error against which we protest. M. Chancel, for example, has been anxious to make a new project for the reconstruction of the façade of the Church of St. Eustache, at Paris, in the perfect style of the first part of the sixteenth century; but if M. Chancel, in place of a study of the Renaissance, had undertaken to find the means to add to that beautiful church a modern façade, where the proportions, the general forms, the principal lines would have been in relation to and in harmony with the corresponding elements of the church of the sixteenth century, we might have seen a very different kind of interest excited than that which results from the study in question. He should be of his own time, and speak with his own tongue, and not endeavour to deceive posterity as to the monuments which we shall transmit to them."

With which sensible remarks of the French critic

our readers will scarcely doubt that we concur; unfortunately the advice comes too late, in too many cases. In the continuation of the *Salon* article, in the following number of the *Revue*, amidst various interesting and incisive criticisms, we meet with some comments on a design for a château by our countryman, Mr. White; the same, we suppose, that was exhibited two or three years ago in London. The French critic thinks that in a house of this description, with such thickness of walls, such roughness (*après*) of details, a style so contemporaneous with Philippe-Auguste, the host of the château must have quitted the modern waistcoat for the coat of mail, and the rifle for the arquebus. All this prolonged imitation of an epoch that is no more wants the first law of beauty:—"L'unité dans l'harmonie. Il importe peu que les fragments matériels d'une habitation soient d'un même goût et conçus dans le même esprit; il faut encore que la muraille, le meuble, l'ustensile, et le vêtement, que disons-nous! la vie, les mœurs, les coutumes, et les pensées de l'habitant soient en harmonie de caractère, de forme, et de sentiment avec le cadre qui les enveloppe." In which also there is matter for consideration for some of our domestic architects.

The number from which the above quotation is made contains also a long letter from an amateur, Dr. Cattois, in relation to the design for the *Monastère de l'Assomption*, at Bordeaux, designed by M. Aymar Verdier. Dr. Cattois's letter is rather rambling and voluminous, divided between the importance of a modern Christian architecture with a correct "aesthetic," and an onslaught on the ignorance and presumption of the clerical amateurs or non-amateurs. The drawings and details of the building are very good and very interesting, the large parlour chimney-piece, in particular, of which a full-page illustration is given, is a very good piece of interior stonework, of considerable originality of design, solid, and not heavy; and the same may be said of some of the woodwork. A plan and section of the *Salamlik*, or grand reception-chamber for guests in Oriental houses, designed by M. Drevet, as an illustration for the '67 Exposition, is an interesting example of an experiment in Oriental art by a Western architect: the ornamental details, it is stated, were largely adopted from a splendid illuminated copy of the Koran, sent for exhibition at Paris on the same occasion, but which the Egyptian Commission previously availed themselves of for the purpose alluded to. The practical portion of this number includes also drawings of Swedish and Russian timber constructions, and illustrations of railroad material and mechanism.

The number 9-10 is mainly occupied by a very full report of the funeral of M. Duban (to which we alluded at the time), and of the four addresses delivered on the occasion, the fourth being that of Professor Donaldson, who attended as representing the Institute and the English profession generally; though this latter, says the editor of the *Revue*,—"No fut pas, en effet, un discours; c'était miens; quelques paroles simples et honnêtes, bonnes et fermes, le reflet de sa propre et sympathique individualité. Ces quelques mots produisirent une vive impression." An illustrated paper, "On the Strength of Cast-iron Columns," by M. L. A. Barré, engineer, and a beautifully-executed engraving of a very picturesque house at Boston, U.S. (Messrs. Cruce and Van Brunt, architects), are among the contents of this number. The concluding number of vol. xxviii. contains an amusing article from the pen of M. Garnier, "Les Envois de Rome." M. Garnier had been requested to review the designs sent from Rome, and proceeded for that purpose to the Ecole des Beaux-Arts, as he tells us, "with the dignity which belongs to a man about to fulfil a mission. I had already in my hand my notebook and pencil which I thought best to carry openly before

every one, that I might show them I was no ordinary visitor, but a veritable critic, fulfilling a sacred office," &c. When lo! as our critic arrived at the place of operation, his ears were saluted by a hot discussion between divors persons, and the words, "Parthenon," "Villa-Madam," &c., banded about, indicated that the speakers were anticipating his office. Among them were two particularly prominent in the discussion; "the one of an age that might be called respectable: he had white hair, which indicates experience; the rosette of an official, which indicates an honourable situation; and a crooked nose, which indicates a correct judgment. The other, younger, had a great black beard, indicative of goodwill; a thin frame, indicative of nervous excitability; and round eyes, indicative of a certain amount of presumption." How the pair discussed and contradicted each other about the proposed restorations of the Roman temples; how the critic followed them to make notes of their conversation; how he hid behind a kiosk for the better accomplishment of his purpose, and was subsequently nearly run over by an omnibus, in his eagerness to bag criticism; how he finally concluded to send the whole to his editor, with the sage conclusion that "Daly will have two opinions instead of one, and I shall not be responsible for the article,"—for the detail of all this, we must refer our readers to the *Revue*; but they will agree that M. Garnier has, at all events, a humorous way of putting his criticisms, and that we may fairly take the old gentleman with the "crooked nose and correct judgment" as the medium for expressing the writer's private convictions.

The volume for this year (vol. xxix.) contains in the *Introduction* some able and striking remarks on the past and future of architecture; in particular, an observation on the resemblance between the political and architectural "situations" of the present to-day. Architecture and politics are alike "cherchant toutes deux les fondements solides qui leur garantissent la stabilité et la sécurité."

"En politique, il nous faudrait un gouvernement définitif généralement accepté, un architecte un style généralement acclamé. Mais nous sommes loin de là; car, tandis que les politiques oscillent entre le Jacobinisme et la légitimité, en passant par le doute timide et le scepticisme pratiques, les architectes oscillent entre le rationalisme utilitaires et les renaissances historiques, en traversant l'éclecticisme et la fantaisie. Les hommes politiques comme les architectes ont pour limites extrêmes de leurs mouvements la *restauration* et l'*utopie*, c'est-à-dire le fait ancien qui a cessé d'être, et le rêve qui n'est encore entré et qui n'entrera même peut-être jamais dans la réalité extérieure. . . . A tout cela il faut substituer la science fondée sur l'exacte connaissance du passé et la rigoureuse observation du présent; car la stabilité et la sécurité n'existent dans l'architecture comme dans la politique, que là où il y a organisation, c'est-à-dire obéissance générale à des principes fondamentaux."

We quote the above passage, not only for its intrinsic truth, but as an instance of the manner in which, in France (and, we might add, Germany), questions as to principles of art are regarded as of equal importance with any other great questions of principle,—a point which we are very far from in England; for there are few readers, and scarcely a writer among the specially "literary men" of this country, who would not regard such a comparison of politics with architecture as an absurd parallel between great things and small. An idea which will have to be eradicated before the artistic theory of life can have any chance among us. We rather regret that the author of the admirable, well-written introductory essay should have admitted into his review, in the same number, the rather trifling and amateurish illustrated paper by M. Espérandien, on fanciful resemblances between head-dresses and buildings of different periods. The review of the exhibited designs of the late M. Duban is interesting; and also the article on the American Central Institute of Architects, one passage in which contains a suggestion in reference to France which, as it at present is equally applicable to England, we translate:—

"The success of the American Institute, as we see, is now an accomplished fact. It is, moreover, an example which young America gives to old Europe, which the Institute of America has given to our *Société Centrale des Architectes*, that it wants but the will to become itself the centre and the common bond of the local societies which may have been formed in the chief cities of our principal departments, if only it be willing to encourage them, to respect their local independence, and to call into the bosom of the Central Institute of Paris all the presidents of the departmental societies without exception. Assuredly, our central society would undergo a transformation considerable, but useful."

We leave our readers to make their own application.

Adding that the illustrations in this year's volume are, so far, fully equal in interest and excellence of execution to the standard previously maintained in the *Revue Générale de l'Architecture*, we take leave for the present of our admirable contemporary, with hearty good wishes for the future.

COAL, IRON, AND LABOUR.

THE remarkable inflation which has taken place, and which shows yet no signs of having attained its maximum, in both the price of coal and the price of iron, will hardly have failed to recall to the memory of many of our readers some of our recent remarks on the prospects of these important industries. In January last, in considering the very unreliable and optimistic report of the Royal Commission on the Coal-Supply, we said, "There are many reasons to lead us to expect an immediate increase in the price of coal. To say nothing of the nominal increase, due to the steady influx of gold, we may remark, on the one hand, the uneasy feeling among the coal-miners, and, on the other, the mode in which winning is becoming more costly and hazardous." One alternative, indeed, only presented itself to the thoughtful mind, after carefully weighing the facts that were rather obscured than brought into full light by the report above cited. The menace of the approaching diminution of our coal-supply could only be counterbalanced by the no less formidable menace of increase in price. "Between the two assumptions," writes the author of an article in the *British Quarterly Review*, for the past month of July, "of the total exhaustion of all our coal by the year 1945, and of the duplication of the present price by the year 1886, lies the curve that will determine the future consumption and price of this important mineral in this country." The limiting dimensions have shown an increase more rapid even than that here indicated. During the past few months, observes a writer in the *Daily News*, "fuel of all kinds has increased in price to such an extent that serious apprehensions are now entertained, especially by those chiefly interested in domestic consumption, lest next winter should bring us a great dearth of coal, and prices so high that the whole British public will be put to no small inconvenience, and to enormous expense for fuel alone." It is reported that almost within sight of collieries raising large quantities daily, it is often impossible to obtain supplies for local consumption, unless after considerable delay, and at prices that would have been regarded as purely visionary a few years ago. "It may be safely asserted that, as a general rule, coal of all kinds is now nearly double the price it was a year ago."

We hold it to be extremely undesirable to indulge in predictions of misfortune, or to seek either to produce or to aggravate panic. But undue optimism is a far more frequent, and a far more disastrous, cause of ultimate panic than is even undue anxiety. We were profoundly convinced, long before the attention of the public and of the legislature was directed to the subject, of the ominous gravity of the question of our future supply of coal. We endeavoured, to the utmost of our power, to call attention to the mischievous spirit of making things pleasant which, as it appeared to us, characterised the report of the Royal Commissioners. The movement of the last few weeks has been more rapid than there was any precedent to lead any one to expect; but it is only to be encountered by looking the matter full in the face.

There are several distinct elements that influence the great augmentation in the price of coal and of iron. The general depreciation in the purchasing power of gold, not in this country alone, but throughout the world, due to the large supplies of the precious metal which are steadily poured in from the New World and the antipodes, is one important element of this rise. It is, however, an element of almost infinitesimal magnitude, if regarded as influencing sudden rise, or variation from month to month. But, none the less, it must be steadily regarded, not only as a definite value in the equation which we have to solve, but as one which will prevent, in any contrary rebound of the tendency of prices, their fall to the low quotations which formerly ruled in periods of depression.

More rapid, and no less certain, in operation, has been the result of the time movement. Whoever may benefit by the reduction of work-

ing hours (and that great benefit may in some cases result we are not about to deny), it will not be, for the present at all events, the country at large. It is undeniable that a reduction in the hours of labour is equivalent to a reduction in the productive power of the country. We are not comparing spasmodic effort with steady work. We do not forget the result of a long experience, which has convinced us that one main reason why a French workman does so much less work in a day than an English workman is, that the former insisted on working seven days in the week, and the latter on not exceeding six; and we would give every man the means of occasional recreation; but we have gone far beyond such limits as these. We shall not be thought to exaggerate if we say that we are witnessing a general reduction of the normal working day in England from ten hours and a half to nine hours. That is a reduction in the producing power of the country to the amount of one-sixth—a loss to England of a day in every week. Do not let us be met with the reply that more hands may be employed. One great object of the movement has been to compel the employment of more hands; but that is a consideration entirely beside the mark. Our workmen are limited in number—whether employed or unemployed. Our time is bounded by yet more rigid lines to be used or to be wasted. Our productive power consists of our full amount of labour of man, and beast, and machine, employed for our full amount of time. That is our power, employed or not; and the reduction of either element—by the emigration of our workmen or by the non-employment of our daylight—is a reduction, to that extent, of our productive power.

Another point of extreme importance to the workman, which, we think, has never been fully brought to his attention, is the following. The actual cost of labour, as we have recently shown, forms but a portion of the price at which any article of consumption is retailed; but it bears a definite relation to that selling price, whether it be two-thirds, a half, or any other value. Let us call it a half, which is not far from the mark.

Now, it follows that for every increase in the selling price, a double increase takes place in the selling price. This is not matter of calculation; it is matter of fact. We have seen it in action within the past few days. Is there an advance of 1s. 6d. per ton in the winning of coal, the sellers instantly advance it by 3s. In fact, the advance of the market price of coal in London (which may be increased even during the interval between the writing and the printing of these words) may be taken at fifty per cent. already—say, from 22s. to 33s., with a steady tendency towards 40s. It must not be thought that this difference goes to the miner; but it is the action of the miner which has, to a great extent, set the stone rolling. So with the ironmaker; so with the engineer; so with the carpenter; so with every combined and organising trade.

It must be evident to every workman, of every class, that any advance which he obtains in his wages must, sooner or later, be balanced by an advance all round. But he may think that, in such general advance, each trade will benefit. Let us look at that view of the case seriously.

Suppose, for the sake of illustration, a law were made by which, on a given day, the value of every coin were reduced to one-half. What would be the result? First, of course, every one who had a certain amount of coin in his possession would be the loser of half that amount. That is simple. Then, every person who had neither coin nor engagement to pay, or he paid in coin would, at the very best, be no better off than he was before. Whether he would be worse off we will presently inquire, but in no way could his position be thought to be improved. Thirdly, the persons who were under engagements to pay or to be paid, in the old coin, would be thrown into a state of perplexity and confusion; and though some might for a little while appear to gain some advantage, no gross average advantage could result, and the usual distressing effects of disturbances in business relations would rapidly become manifest.

When the confusion had subsided, the following would be the result:—Every one who had a fixed income would be impoverished. Every one who had no fixed income would be free to earn what he could, but the money to pay his earnings would be diminished by great loss of custom from the persons of fixed incomes. The tradesman would re-adjust his profits. The man whose revenue is derived from his brain,—the literary man, the lawyer, the physician,—would be driven to demand higher salary, or larger

fees. He would suffer more than the tradesman, because it would be more difficult for him to raise his charges. The fundholder, the rentholder, the bondholder, would be mulcted in half his income. With regard to a species of property which we are accustomed to regard as more solid than such artificial property as funded debt, the result would be even worse. For not only would every 100l. of railway dividend be reduced to the purchasing value of 50l., but the working expenses would be so increased by the rise in the price of coal, the price of iron, and the price of labour, that the dividends would be materially reduced even in their nominal amount.

Now, no one who has the slightest acquaintance with the lessons of industrial history, can doubt that a terrible stagnation in all branches of trade would follow. We have put, let it be said, an extreme case. But the principle holds good whatever be the amount of displacement of value. When such displacement takes place in consequence of great natural causes, working over long periods of time, as in the case of the increased yield of the precious metals, the whole framework of our social relations will accommodate itself by degrees to the change. But when any artificial proceeding, such as the class action of any trade or body of men, alters the natural relation of prices, the result is sure to be disastrous to some, if not to all.

Now, it is a fact, that at this time when, owing to causes which we cannot control, prices are rapidly rising everywhere, the action of organised associations is directed to the restriction, as before shown, of the productive powers of the country. It does not need any very unusual foresight to see that the result must be mischievous.

To return to the topic which now comes so closely home to every householder, to every employer of machinery, to every one who, with limited means, has to cook or to warm himself, or to raise steam for any purpose whatever. Political writers tell him not to be alarmed, to wait a little, to remember that ups and downs occur in all human events, and that as prices rise, so do they fall. "The existing state of things," says one of the writers whom we have above quoted, "will be only temporary in its character. The iron trade has been many times before in a highly inflated state, but prices have afterwards receded to an exceptionally low point." It is natural for public writers to take that tone. Many will do so from party motives alone, others from that general cheerful frame of mind which is acceptable to the public, and which we would be the last to undervalue. But it is not too much to say that all these comfortable anticipations blink those facts which we have endeavoured to bring into daylight. They lose sight of the fact that, besides those causes which fluctuate from year to year, those recurring changes which drove the price of bar iron down to 11s. per ton in 1851, and raised it to 198s. per ton in 1855, or that raised the rate of discount from 3 per cent. in June, 1855, to 10 per cent. in May, 1856; there exist now positive elements of increase in price, which the leaders of the social movement of the day are unwisely doing their utmost to aggravate.

There is, however, a mode of relief open to the consumer, whether of coal or of iron, to which it is extraordinary that public attention has not been hitherto more steadily directed. The collieries of the United Kingdom have been the pioneers of the coal getting of the world. But they do not form a larger proportion of the area of the known coal fields of the world than the pioneers of an army do to the rank and file. They cover 4 per cent.—one twenty-fifth part only—of that area. Moreover, the English coal fields have, to a great extent, exhausted their most easily extracted beds. In other parts of the world the upper strata are still virgin. Now, of the increase which has already taken place in the market price of coal, so much occurs in the distributive process, so little goes to the miner, and so much to those who buy of the miner and sell to the consumer, that we must be near upon the limit when freight will cease to be a barrier. In other words, it will soon be cheaper, if matters go on as they do at present, to import coal than to burn our own. We will not attempt the details of a calculation at which, we do not doubt, shrewd brains and keen intellects are already at work. But we should not be surprised any morning to see an announcement of the arrival of foreign coal in our ports.*

* Since this was written such an incident has occurred.

We may yet see a new meaning given to the proverb, "Carry coals to Newcastle."

From a purely philanthropic point of view, such a new feature in our trade may be highly desirable. In fact, we shall only witness the operation of one of those laws which political economy attempts to define and explain. We shall see that the level of price can no more be permanently disturbed than that of water. The barrier which keeps prices at different levels, in fact, may he said to be ignorance. As soon as the merchant is certain, or even adequately hopeful, that he will make money in a new course, his ships will steer in that direction. As soon as the speculator is clear that he will obtain a sale for a certain product, he will find the money for its development. If labour in one part of the world costs more than its proportionate value, surplus labour in other parts of the world will flow in to supply its place. If our colliers, or our iron-workers, will only work two-thirds time, and expect full pay, or more than full pay, for so doing, it is only a question of time, and of no long time either, before colliers in other parts of the world, where men are content to work full time for moderate wages, will be called into active and remunerative operation.

The case of iron is even more serious than that of coal. The activity of our collieries intimately depends on that of our ironworks. The present state of the latter is unexampled. We have just seen an award fixing the price of Staffordshire bar iron, for three months, at 137. 10s. per ton; 137s. are quoted for several of the best-known brands. In 1851, as we have said, the average price of bar iron was 57. 11s. per ton. During the twenty years from 1845 to 1866, the extreme fluctuations were about 30 per cent. on the highest price, which was 97. 18s. in 1854. In 1861 and 1862, the price was 67. 5s. per ton. Thus the present rate is exceptional. Now, in coal, there is no doubt that we possess an article of unsurpassed excellence. We have, of course, all sorts. We are not speaking of everything that is black. But we have, in the best bituminous coals of the northern district, and in the pure anthracite of the Welsh basin, natural products which are respectively among the best of their kind. Secure in this excellence, we may allow inferior qualities of coal to contend in price with one another, there being always a means of balancing, more or less exactly, the commercial with the chemical, or heat-producing value; and the difference in the price of labour must be considerable before foreign coal can permanently compete with English coal in our own ports. That it may, almost immediately, have the effect of reducing any undue inflation of price we have intimated; but it is a great step from that to a permanent and successful rivalry.

This is not the case with iron. We have before mentioned the fact, that it is due to moral or political reasons alone, not to commercial and mechanical reasons, that Russia has not already become the great iron mine of the world. Charcoal-made iron, of the best quality, can be produced in Russia at a less cost than inferior coal-made iron in the United Kingdom. Now a certain amount of profit is enough to overcome almost every obstacle: that is the old secret of the smuggler. Such a price as iron now commands in this country is almost certain, humanly speaking, to kindle furnaces in Russia. The Government of that country is liberal and enlightened in matters relating to the development of the national resources. Such an opportunity can hardly fail of being seized. And there is this difference between the two industries, that of the winning of coal and that of the smelting of iron. The latter is harder to establish, but, when established, it takes a firmer root. The best colliery is at best but a temporary arrangement. The finest seam will be exhausted; the limit to be won from a given shaft will be reached, sooner or later. But a supply of fuel on the sixty years' division of the forests within easy tramway distance of its forges, is an establishment which, when once it gets command of the market by the low price of a good brand, may be regarded as very permanent in its position.

We confess to be among those persons who believe that, as charity begins at home, philanthropy, to be genuine, must first germinate as patriotism. The neighbour whom we ought to love as ourselves need not be one of our kith and kin, but he is not a yellow or a black imaginary sufferer at the antipodes, who is no neighbour at

all. It will be but little consolation for us if we hear that for a furnace blown out in Wales a better-appointed furnace is kindled in Russia. It is poor comfort to be told, if we see hundreds of our English fellow-subjects with straight backs and wan faces, that their suffering is economically active in equalising prices throughout the world! We own, in these matters, a selfish motive. We believe it to be a just and enlightened selfishness. We prefer to do good by acting, rather than contribute to possible good by suffering. We have, or had, in many important industries, the lead of the world. We do not wish to forfeit any advantage we have before it is unavoidable. We regret, and we do our best to fight against, whatever in our judgment tends to throw away that advantage. We are convinced that the present tendency of artificial trade combinations for at once losing time, and increasing the cost of working, must handicap us in the great race. And we know that it is on the owner and producer of labour that the first brunt of misfortune will fall. It is easy for the man of capital to displace the scene of his operations. It is far more difficult for the workman to do so. In fact, when the time arrives that labour is freed from local ties, and able to flow, like water, to the vacant place, prices will be close upon an universal equality. But a good deal of work, and, we fear, a good deal of suffering, must be gone through first. What we are chiefly anxious to show is, that artificial steps taken in order to raise wages, and to increase the number of hands employed, cannot be of any real or permanent service to the workman, but that, on the contrary, by disturbing the relations of commerce, they run the terrible risk of changing its course, and of inflicting an injury on the productive character of this country from which it may never recover.

PRINCIPLES OF MECHANISM.

A MACHINE is a contrivance interposed between the power to be employed and the work to be done, in such a manner that, firstly, the part to which the power may be applied shall be of suitable form and strength to receive it, as the piston of a steam-engine; and, secondly, that the other extremity of the machine, or the part which performs the work, shall likewise be suitable in form, strength, and the direction in which it moves, to the work to be done. Between these extremities lies the mechanism which transmits the power acting on that part of the machine which receives it directly from the motor to that other part of the machine which performs the work, as the cutting-tool of a lathe or the bucket of a pump. "Machines, in fact, are interposed between the power and the work for the purpose of adapting the one to the other." Professor Willis* says that by defining mechanism in the abstract to be a combination of parts for the purpose of connecting two or more pieces, so that when one moves according to a given law the others must move according to certain other given laws, this branch of the subject may be reduced to geometrical principles alone; whereas, by considering mechanism, as usual, as a modifier of force, the subject becomes embarrassed by a condition foreign to the connexion of parts by which the modification is produced; and which condition and its consequences admit more conveniently of separate investigation.

These three classes of mechanical organs are so far independent of each other that any given set of working parts may be supplied with power from any source. The principles upon which the construction and arrangement of these three classes are founded are different. Thus the receivers of power, firstly, derive their form from a combination of mechanical principles with the physical laws which govern the respective sources of power. The working parts, secondly, derive their form from a combination of mechanical principles, with considerations derived from the manner in which the work is to be performed. But the principles of the interposed mechanism admit of being developed without reference to the powers employed or transmitted, or to the resistance or work to be done.

The term mechanism must be understood to be in this work confined to those mechanical combinations which govern the relations of motion only, and which, therefore, admit of being entirely separated from the consideration

* Principles of Mechanism. By Robert Willis, M.A., F.R.S. Second edition. Longmans, Green, & Co. 1870.

of force. This is not the view that an engineer or millwright takes of a machine; he considers it necessary to investigate the proportion between the forces and resistances in any given case, and the strains thrown upon the different parts of the mechanism by their application, and thus to find the requisite strength of each part; but his investigations may possibly be much facilitated by adopting Professor Willis's view, which is to investigate the various combinations of pure mechanism upon geometrical principles alone.

The different forms which the details of actual construction of machinery may take, and their combinations and varied methods of framing them together, are mainly determined by the strains to which the machinery is to be exposed, and form the branch of constructive mechanism.

It will be useful to recapitulate some of the ordinary definitions and measures of motion and velocity.

A body may be at rest either absolutely or relatively, but it is only in the latter respect that the state of rest can be considered in the present case; thus a body which remains in the same place in a boat or a carriage is at rest with respect to the boat or carriage, although these may be in motion; and so a wheel or other portion of a machine may be carried into different positions relatively to the fixed frame, and yet remain at rest with respect to the arm or carriage which carries it. A body is in motion when it occupies successively different positions in space with respect to some other body, motion being relative as well as rest. Two bodies moving with respect to a third will be at rest with respect to each other if they retain in their motions the same relative positions; or a body absolutely at rest may be said to move with respect to another moving body, if the latter be assumed as the standard to which the motion is to be referred. The continuous line which a moving body describes in space is termed its path. The path being assigned, there are only two directions in which it can move in that path. The path and direction of a given point being assigned, it may move in this part and direction quickly or slowly, that is with a greater or less velocity; and this velocity is estimated by comparing the space passed over with the time occupied in describing it.

When a point describes equal portions of its path in equal successive times, the motion is said to be uniform, and the velocity is measured by the space (that is the length of path) described in the unit of time. The units usually employed are feet and seconds. Since the space described is proportional to the time employed in describing it, the measure of velocity is obtained by dividing the number of feet passed over by the number of seconds employed. Thus, if 9 ft. be passed over in three seconds, the velocity is said to be 3 ft. per second. The terms *rotation* and *revolution* are often both employed in the same sense by mathematicians, as well as in common language, but Professor Willis prefers in mechanism to employ the word *rotation* only for the act of turning about an axis, and *revolution*, or *turn*, for the course of a rotating body from one position with respect to some other given object to its return to the same relative position. Period should be confined to the sense of "time in which anything is performed, so as to begin again in the same manner," as defined by Johnson. The angular velocity of a rotating body is measured by the linear velocity of a point whose distance from the axis, or radial distance, is equal to the unit of space; and the body is said to rotate uniformly when its angular velocity is uniform.

The motion of every point of a given piece in a machine being defined by path, direction, and velocity, it will be found that its path is assigned to it by the connexion of the piece with the framework of the machine, but its direction and velocity are determined by its connexion with some other moving piece in the train. A train of mechanism is composed of a series of moveable pieces, each of which is so connected with the framework of the machine, that when in motion every part of it is constrained to move in a certain path; thus wheels, pulleys, shafts, and rotating pieces generally are so connected with the frame of the machine, that any given point is compelled when in motion to describe a circle round the axis, and in a plane perpendicular to it. Sliding pieces are compelled by fixed guides to describe straight lines, and other pieces in other paths. The pieces are connected in successive order, so that when the first piece in the series is moved, from any external cause, it compels the second to move, which again gives

motion to the third, and so on. The act of giving motion to a piece is termed driving it, and that of receiving motion from a piece is termed following it. The piece which transmits motion to the next is the *driver*, and that which receives motion is the *follower*. The various changes of motion are effected by the various modes of connexion, and the different cases under which these modes of transforming motion by transmission are arranged are termed the *mechanic connexions*. Thus motion is communicated by rolling contact (as at the pitch-circles of the teeth of spur-wheels), or by sliding contact (such as takes place between the individual teeth of wheels, by the action of a cam, or a screw), the connexion being in either case an actual contact; or the motion may be communicated by link-work (such as cranks, with connecting rods), or by wrapping connexions (such as bands passed over pulleys), in which cases the connexion is by intermediate contact.

Professor Willis groups all the simple combinations of mechanism for the modification of motion under four heads:—

1. Where the directional relation and the velocity ratio are both constant.
2. Where the directional relation is constant, but the velocity ratio varies.
3. Where the directional relation changes periodically, and where the velocity is either constant or variable.
4. Intermittent motions, wherein the continuous motion of one piece communicates a motion to the other, with intervals of perfect rest.

And he examines each one in succession, and passing on through "trains of elementary combinations," and "mechanical notation," we come to a chapter on "*Reduplication*," a term which is here applied to a mode of modifying motion which depends upon a totally different principle from those connexions before described as rolling, sliding, link-work, or wrapping connexions. It is principally employed in the construction of tackle all sorts. Then we have aggregate combinations, adjustments, and *friction*.

If we lay down horizontally a block or a slab, of whatever material, and upon it a similar block or slab of the same or other material, and having made an indent in the surface of the upper block for the purpose of abutting a rod against it, and making the upper block slide upon the lower one, we shall find the inclination of the rod to vary with the nature of the surfaces in contact, when inclined just sufficient to cause the upper block to begin to slide. If from any point of the rod we let fall a perpendicular upon the surface of the upper block, we shall resolve the two components of the force which presses in the direction of the rod into one which presses the two blocks together vertically, and another which tends to push the upper block horizontally, and make it slide along the lower one. If for any given material or state of the surfaces in contact, we find this limiting angle of resistance to be, say, 10 degrees, which is the limiting angle of resistance of metals on metals, no increase of the pressure in the direction of the rod will cause the upper block to move upon the lower one, because the ratio of the pressing component to the pushing component remains the same. If this angle be diminished by inclining the rod more nearly to a vertical position, the pressing component is increased, and the pushing component diminished. Hence the block cannot be made to slide, whatever force be applied in the direction of the rod. On the other hand, if the limiting angle be increased by inclining the rod more horizontally, the pressing component is diminished, and the pushing component increased; so that the block cannot be prevented from sliding, whatever be the amount of force applied to the rod.

The friction of materials in contact with unguents interposed is given as one-twelfth of the pressure, and the limiting angle of resistance 5 degrees; of metals on metals one-sixth of the pressure, with an angle of 10 degrees; of wood on wood one-third of the pressure, with an angle of 18 degrees; and of bricks and stones two-thirds of the pressure, with an angle of 33 degrees.

The magnitude of the friction between a pair of plane surfaces, the one fixed and the other movable, is governed by three principal laws, which have been confirmed by innumerable experiments. The first law is that the magnitude of the frictional resistance between a given pair of surfaces of any materials is proportional to the pressure that keeps them in contact. The second law is that the frictional resistance is unaffected

by the area of contact, which may be shown by placing the upper block first flatwise, and then on edge, when the friction will be found to be the same in both positions. The third law is that the frictional resistance of solids is wholly unaffected by the relative velocity of the rubbing surfaces. It is worthy of remark here that the laws of friction of solids and fluids are essentially different with regard to velocity, for while the friction of solids is independent of it, that of fluids increases as the square of the velocity.

It is curious to observe that, taking the mean value of friction at one-third of the pressure which generates it, if we take a cylinder of any diameter, as the barrel of a common windlass, and fix it, and then throw a rope over it, any weight tied to one end will support a weight about three times as great at the other end. If the rope be taken once round the barrel, and the two ends hang freely down, the small weight will support one twenty-seven times as great at the other end. Thus, with half a coil, as in the first case supposed, the rope will support at one end three times as much as at the other; with one complete coil nine times as much; with a coil and a half twenty-seven times; with two coils, eighty-one; with two and a half coils, 243; with three coils, 729; with three and a half coils, 2,187; and with four coils, 6,561 times the weight suspended at the other end. In drawing water from a well where the depth is not great, or winding up earth from sewer excavations, this property of coil friction is sometimes employed by taking three or four coils of the rope round the windlass barrel. The empty bucket or skip takes the place of the small weight in the illustration, and the full one that of the greater weight, the coils grasping the cylindrical surface so firmly as to sustain the load. But although the friction of these coils is sufficient to sustain the load, there is a practical difficulty in the method, from want of clearance room, where the buckets or skips pass each other up and down.

Professor Willis's book has already an established character: we need only mention the appearance of a new edition.

THE INTERNAL EMBELLISHMENT OF ST. PAUL'S CATHEDRAL.

THE "Surveyor to the Fabric," Mr. F. C. Penrose, having now completed his designs for the internal embellishment of St. Paul's, is exhibiting them, by the courtesy of the Dean and Chapter, in the Chapter-room. The question of the adoption or otherwise of these designs is not at present ripe for discussion, and we confine ourselves to publishing Mr. Penrose's own description of his scheme, simply promising that it is set forth in some very effective drawings by Mr. Woodington, Mr. H. W. Brewer, and Mr. Michael:—

Quite irrespective of the question of cost, there seem to be only two ways of ornamenting such a building as St. Paul's: one, that of profusely covering every available space from vault to pavement with subjects combined with enriched material or ornament; the other, that of concentrating the chief attention on certain points, and leaving much of the framework of the building unaltered, proper care being taken to connect the ornamented portions by adequate but subordinate embellishment. In designing the scheme, of which a considerable part is now submitted, conformity with the last-named principle has been aimed at.

There are four main points on which the ornament is concentrated:—

1. The choir, including the apse and the baldachin.
2. The dome.
3. The painted windows at the ends of the four arms of the cross.
4. The smaller dome at the west end of the nave.

With the exception, to some extent, of the last-mentioned, much less display of coloured decoration is proposed for the nave and transepts than for the choir and dome.

The connexion between the parts more elaborately treated is looked for from the vaulting, which is to be richly worked in mosaic throughout (although colour is to be used predominantly in the choir and dome), and from the pavement and the attic panels, in which a good deal of marble inlay is contemplated. Ceramic ornament might, however, be partly substituted for marble inlay in the attic panels.

In the apse, real marbles are proposed to supersede the painted work introduced as a tem-

porary expedient by Sir Christopher Wren. This would necessitate the carrying on the marble work to some extent along the choir, but not to the transepts or nave; and the principal cornice and the piers arches and their supports are intended to remain Portland stone, as at present. Some marbling to the panels and plinth, and gilding to the soffits of the arches, would, however, probably be requisite. The object aimed at, however, is to connect the rich work in the vault and clearstory with the pavement, with no great alteration of the existing framework, a treatment which not only appears peculiarly proper for St. Paul's, but has the advantage of having several very important and successful analogies in Italy.

As respects the windows. There are at the east end eight windows,—five already occupied; at the west end, three windows, all already occupied; and at the ends of the two transepts, six windows, all unoccupied, which admit of being treated pictorially; but the glazing of nearly all requires to be altered to suitable patterns, only seven of these windows having as yet been done.

The designs at present prepared for the committee are shown on three perspective drawings, and a section of the cathedral from east to west to serve as an explanatory diagram, and two models. The choir, roof, and tribune are shown by one of the perspective drawings, and a model to the scale of 1 in. to the foot. As respects colour, however, the vault in the model more nearly represents what is now intended for the nave and transepts, and the perspective drawing that proposed for the choir.

The principal feature in the tribune, after the precedent of several of the early Christian churches, is the colossal figure of our Lord, with the signs of the Apocalypse.

The subjects in the apse windows are those combined in that verse of the Litany, "By thine agony and bloody sweat: by thy cross and passion: by thy precious death and burial: by thy glorious resurrection and ascension: and by the coming of the Holy Ghost: Good Lord, deliver us." In connexion with these subjects are the figures of angels in the spandrels of the clearstory windows of the choir, hearing the "elements of the Passion,"—such as the Cross and Scourge, the Crown of Thorns, &c.

The pavement in the apse is of choice marbles, forming part of the original construction; but the pilasters and parts of the walls were painted as mentioned in the "Parentalia," "to serve the present occasion." It is now proposed to substitute real for the painted marbling. The group proposed for marble intarsia, under the apse windows, is from a design by the Baron de Triqueti.

The Baldachino, of which there is both an uncoloured model and a coloured perspective drawing, is composed, so far as it can be recovered, from an imperfect model and a short description in the "Parentalia." The columns and entablature are intended to be of marble, and the superstructure of bronze.

The dome is exhibited by a model to a scale of $\frac{1}{2}$ in. to the foot, as yet finished only as respects the cupola, and by a perspective drawing. The figures in the spandrels are intended to be the four major Prophets and the four Evangelists. One, that of St. Matthew, is taken from Mr. Watt's design already executed in mosaic, and three of the major Prophets from Mr. Stevens's designs; the others are mere sketches. The figures in the cupola are by Mr. Woodington, by whom are also those in the upper part of the model of the east end. The subject of the cupola is the Te Deum. There are two main horizontal lines of pictures, with eight compartments in each, the Apostles being seated at the twelve gates of the heavenly Jerusalem in groups of three. These occupy the north-west, north-east, south-west, and south-east compartments of the lower range, those toward the cardinal points being devoted to the Prophets and Martyrs.

Above these are the angels, cherubim, and seraphim, and the powers of the heavens, represented by angels hearing the signs of the sun, planets, and stars. These, with the worship of the Cross and of the Lamb, occupy the eight upper compartments; the last-named subject having been already suggested by the inscription running round the frieze of the drum, "Worthy is the Lamb that was slain to receive honour and glory." The whole is surmounted by a continuous ring of angels and blessed spirits, playing on various instruments of music, or singing "Holy, holy, holy, Lord God of Sabaoth." The interior of the cone

above the cupola is intended to have gold stars on a blue ground.

This treatment of the interior, whilst preserving the general framework of the architecture with very little alteration, offers very considerable and probably sufficient space for iconography, i.e., arrangement of subjects; for, in addition to the figures proposed for the apse and choir, the great west door, if covered, as has been proposed, with bronze, admits of a great series of Biblical subjects. The exterior might well be devoted to the history of St. Paul, and the interior to the acts of the other Apostles.

The western dome offers a fine scope for the Creation. This subject was first proposed for it by Archdeacon Hale, and has met with very general acceptance, including that of Mr. Burges, in his scheme for the iconography of the cathedral. The north and south chapels might receive on their panels subjects derived from more recent ecclesiastical history. The panels on each side of the windows of the aisles offer places suitable for historical subjects in bas-relief. There are twelve such panels in the nave, eight in the transepts, and twelve more in the choir. There would still be spaces below for monumental subjects in continuation of those which have already been commenced.

There are twenty-two windows, including one in the north chapel and two north and south of the western dome, which either have received or admit of receiving Scriptural subjects. Lastly, there is the great dome, with its eight spandrels, its eight niches in the drum, and its cupola, which, according to the design submitted, would have about 200 figures, many of which, especially the Apostles, Prophets, and Martyrs of the lower range, would admit of individuality of treatment.

F. C. P.

CHARING-CROSS HOSPITAL.

EXTENSIVE alterations and enlargement of this hospital have lately been effected. The establishment has for many years past had only a passage of entrance, and a small back staircase as its means of access to the several wards, accommodating about 150 patients. It has now a spacious hall, 28 ft. by 20 ft., with a periphery of columns, of simple character and effect.

On each hand are a pair of folding doors. One leads by a corridor to the board-room and other official parts of the hospital; the other to the out-patients' department, having a range of waiting-rooms, with physicians' and surgeons' departments, and a dispensary.

The out-patients have also a separate entrance provided in Chandos street, as well as a way of egress by a caged turnstile to avoid confusion in the stream of attendants.

The medical school has also a distinct approach; and, besides a hall and reading-room on the ground-floor, the greater part of the basement is devoted to their accommodation. It comprises a good dissecting-room with top-light, and lavatory for students, an enlarged post-mortem room, a museum, chemical and pathological laboratories, and lecture-room. The new staircase, exceeding 20 ft. square, and 40 ft. high from ground-floor, is well lighted by a cone lantern, as well as by side windows, and is provided with a sun-burner for winter illumination.

In the construction of the stairs, besides tiling into the walls, they have cast-iron carriages moulded and framed together, and a balustrade throughout; a lobby, of ample width, leads on each story to a range of wards about 200 ft. long and 28 ft. wide.

The first is devoted to female patients; the second to male patients; the third to obstetric cases and children's wards; and an operative theatre.

Each floor is provided with lavatories and sculleries, and groups of water-closets. Urinals, &c., are erected in the rear of the hospital. There has been also remodelling of the drainage by the substitution of glazed earthenware drain-pipes, so as to prevent the ravages of vermin, and its consequent escape of noxious gases. The latter operation has also enabled the authorities to form a new and lofty kitchen, which was greatly needed. These changes have placed the hospital in a greatly improved position before the public, and the Council have felt justified in giving more prominence to the structure by the addition of a portico. It is composed of four monolithic shafts of Portland stone, 11 ft. high (Greecian Doric), supporting an entablature and pediment of suitable proportions.

The architect, Mr. James Thomson, has been

careful both internally and externally to sustain the simple and appropriate character which had been given more than forty years ago to the original structure by Mr. Decimus Burton; and should public support justify the council in doing so, they propose yet further to extend their facilities of "doing good."

LABOUR-SAVING MACHINES FOR JOINERS' WORK.

It would almost seem that every fresh collision between masters and men leads to the production of improved machines for lessening the necessity for hand-labour. On Thursday, the 1st of July, a number of the leading builders and contractors met to test a new series of labour-saving machines for joiners' work, at the works of Messrs. A. Ransome & Co., King's-road, Chelsea.

The series of machines, eleven in all, have mostly been brought out within the last twelve months, and each exhibits improvements and features of novelty which have not hitherto been imported into this class of machinery. The chief point which distinguishes them from other machines of this class is the very high speed at which they are driven, which not only enables them to turn out a proportionately greater quantity of work, but the increased velocity on the cutting edge of the tool gives a remarkably high finish to it. In order to enable the machines to be driven at these high speeds, special arrangements have been made to secure effective lubrication of the various working parts. The bearings of all the high-speed spindles are constructed with a large oil-chamber underneath, from which the oil rises to the spindle through a piece of felt fixed in a diagonal slot running through the bottom brass. The speed at which these spindles revolve is such as to pump the oil through the felt, so that it flows freely over the spindle, and channels are formed in the bottom bearing, through which the surplus oil finds its way back into the receiver; the result of this is that the spindles are literally floating in oil, which is being continually pumped up, and filtered as it comes through the felt. The cutter spindles, many of which perform as many as 6,000 revolutions a minute, are made of a special quality of cast steel, which, although extremely hard on its outer surface, and capable of taking a very high polish, is also soft and tough in the centre, thus combining the greatest amount of strength and toughness with the minimum diameter. The bearings are all of great length, and, notwithstanding the high speed at which they work, run perfectly cool.

The first machine we noticed was one for cleaning off and sand-papering doors, shutters, parquetry, &c., entirely without skilled labour; and a good notion of the saving which it effects can be formed from the fact that when worked by two labourers, it will clean off both sides of a full-size door, leaving it glass-papered and ready for painting, in four minutes.

The machine exhibited (which was made in America) is of somewhat rude construction, but Messrs. Ransome & Co. are occupied in constructing one with various improvements, the framing of which will be of iron, and will have a self-acting feed motion. This alteration will enable it to be worked by one man, and thus dispense with the labour of the second man who is required with the American machine to assist in feeding the work through. We were surprised to see the very rapid manner in which the machine removed considerable inequalities in the doors that were passed through it; some of those which we saw cleaned off were very rough, but they left the machine perfectly flat and smooth. The glass-paper used is specially manufactured for the purpose, and we are informed that one set of paper, which costs about 4d., will last for five hours in constant work, without requiring renewal. This machine can scarcely fail to come largely into use.

The planing and moulding machines, of which there were two, are from entirely new designs; their chief features being their great compactness, the high speed at which they are driven, the powerful feeding apparatus, and the arrangement of the cutter-blocks, which are so placed as to enable the cutters to be readily adjusted. One of these machines was turning out a bold hollow moulding, with excellent finish, at the rate of 30 ft. a minute, while the larger one was running 7-in. architrave mouldings with equal finish at the rate of 24 ft. a minute.

The Richards's patent mortising machine at

tracted considerable attention on account of its simplicity and the novel method for reversing the chisel, which is effected instantaneously, while the machine is making 500 cuts a minute.

The tenoning machine, which is fitted with an upright center-spindle for forming double tenons, also describes the shoulders at the same apparatus, and the distance between the shoulder and the tenon is governed by self-acting stops, which avoid the necessity of marking by hand and ensure the greatest accuracy.

Messrs. Ransome's patent "complete" joiner is already pretty well known in the trade, having been exhibited for the first time at the Wolverhampton show twelve months since. The one exhibited on the present occasion will plane boards up to 9 in. wide by 3 in. thick on all four sides, or cut mouldings up to 9 in. wide, also worked on all four sides, at rates varying from 8 ft. to 15 ft. a minute. The same machine makes very perfect tenons; several being cut at the same time, and the shoulders scribed in the same operation. A peculiar feature of this joiner consists in the planing and tenoning arrangement being entirely independent of the saw-spindle; thus enabling either side of the machine to be worked, independently of the other,—two distinct machines.

A hand-saw, of entirely new design, was at work, cutting sweeps in wood of 12 in. thick. The main standard of this machine is cast hollow, giving great strength and stiffness without undue weight; and the design gives great space between the saw and the standard in which to turn the work. The saw is supported immediately above and below the work, by an improved packing-box, which Messrs. A. Ransome & Co. now fit to all their hand-saw machines. This packing-box supports the saw not only on the back, but on the sides, and enables it to bear considerably more forcing than it would take in the ordinary manner.

An improved saw-sharpening machine was working with Ransome's patent emery discs, invented by Mr. F. Ransome, of East Greenwich. These discs, besides cutting very freely, are entirely free from the nauseous smell, which is a great drawback to those in general use.

We also noticed a small machine for planing, shaping, chamfering, mortising, and boring, which is so arranged that two lads can work at it at the same time. It is more particularly suited for short work. The mortises are formed with revolving bits on the French principle.

A Sims's patent mitring machine, which cuts with ease mouldings up to 5½ in. wide, completed the set.

All these machines were driven by one of Messrs. Ransome, Sims, & Head's new patent economic expansion portable engines, fixed on cast-iron saddles. These engines appear to be peculiarly adapted for driving builders' machinery, as the boilers are constructed with large fire-boxes for burning saw-dust, chips, and other waste wood, and have various appliances for economising the fuel and heating the feed-water before entering the boiler.

LAW AND THE DRAMA.

THE recent decision in the case of funds left by the late T. P. Cooke for the advancement of dramatic literature, seems to show that no man can hope to have even his reasonable and proper wishes carried out after his death. The managers of the Dramatic College were made trustees of a sum of money in order that a premium might be offered at certain intervals for the best original drama connected with the sea that might be submitted, the selected drama being afterwards acted, if it could be so arranged, for the benefit of the funds of the Dramatic College. The first result was very successful, and "True to the Core" brought a considerable sum of money to the institution. Since then, through accident or want of proper management, a good drama has not been obtained; and on the argument that the sum offered is not large enough to induce capable authors to submit works in competition, and the assertion that Mr. Cooke's main object in the bequest was to benefit the Dramatic College (which we assert from personal knowledge is incorrect), the law has handed over the capital sum to be used for the general purposes of the college. The act seems to us equally unjust and unwise. The amount will be swallowed up, as hundreds and thousands have already been swallowed up before by this institution, and dramatic literature, the progress of which Mr. Cooke desired to aid, will be in no degree ad-

vanced. Surely if it were found that the amount offered was not large enough to obtain good plays, a reasonable course would have been to allow it to accumulate, and offer a larger premium at longer intervals. This occurrence will scarcely tend to increase the number of specific bequests to the college for specific purposes.

EDUCATION FOR THE STAGE.

THE following communication speaks for itself. We commend it to the attention of those who desire the improvement of our stage:—

I have long been impressed with the absence of professional education in many of those actors and actresses who essay a high standard (or any standard) in the dramatic world; and it has occurred to me that probably the most useful and appropriate memorial to Shakespeare would be to establish a school or college for the instruction of intended actors or actresses under such professors as have distinguished themselves in their art, and retired from the stage, many of whom would, no doubt, be delighted to impart their knowledge to the rising generation.

I should much like to see a "Shakespeare College" established, and throw out this suggestion for your opinion.

R. RICHARDSON GAEDNER.

ALEXANDRA PARK AND PALACE.

WE have received from the Lord Mayor copies of certain resolutions passed at a meeting held in the Mansion House, July 23rd, approving of a plan suggested to enable the people themselves to become the purchasers of the park, and pledging to ensure the prompt and complete success of the enterprise." As, however, the plan does not accompany the resolutions, we are unable to judge whether or not it is likely that the meeting will do what it promises. There have been so many flashes in the pan in connexion with the Alexandra Palace and the recreation of the people, that we have lost faith in promises. That it is quite time, and very desirable, that the building and grounds should be properly utilised, we say again, as we have said before; but, have the right men come? From the beginning till now, the whole affair seems to have vibrated between bungle and job.

WANTED: AN ECONOMIC STOVE.

SIR WILLIAM BODKIN has a friend who wishes to lead persons conversant with the subject to consider the practicability of producing a form of stove for ordinary sitting-rooms and kitchens, to consume as far as possible its own smoke, and to ensure the most perfect and judicious use of the coal to be consumed therein, and has empowered Sir William to guarantee any reasonable amount (say 500*l.*) for prizes or otherwise, in the confident expectation "that the effort may lead to a satisfactory solution of what has been truly stated to be one of the urgent problems of the day—the attainment of sufficient warmth for cooking and for comfort, with the least possible consumption of coal." The Council of the Society of Arts have accepted the duty of appealing for designs, and have appointed a committee to confer with Sir William Bodkin, and concert with him the proper action to be taken.

We advise some of our readers to set to work and get the prize, which will be not the 500*l.* offered, but a fine fortune.

THE PROPOSED DUBLIN CENTRAL RAILWAY STATION.

THE proposed new central railway station in Dublin, which has been before a committee of the House of Commons within the last few weeks, will be one of the largest ever yet built in any part of the United Kingdom. The station, which has been designed by Mr. Barry, is 2,000*ft.* in length, and 146 *ft.* in width at the narrowest point, the platforms being very extensive, and intended to meet the most extensive requirements of the anticipated traffic. In addition to the ordinary platforms, there will also be a special platform 700 *ft.* in length, which is intended for the marshalling of the trains, and there will also be ample accommodation for the exchange of traffic. In length of platforms and other points, the proposed station will exceed most of our city termini, and the cost is estimated

at 540,000*l.* The site selected is considered the best adapted for a central station, being in the vicinity of the Bank of Ireland, Deane-street, and the Castle. It is proposed to unite the new station by connecting lines with four of the railways having their termini in the city—namely, the Great Southern and Western, the Midland Great Western, the Dublin and Drogheda, and the Dublin and Kingstown lines. In proof of the citizens of Dublin being in favour of the project, it may be stated that when the Bill was before Parliament a large number of the most influential inhabitants of the city gave evidence in favour of the Bill.

MODEL OF THE HOLBORN VIADUCT.

MR. THOS. D. DIGHTON, who has executed in his time many very fine models of architectural and sculptural works, has just now completed for the Corporation of London an elaborate model of the Holborn Viaduct where it crosses Farringdon-street, as executed from the designs of Mr. Haywood. The subject scarcely lends itself to the production of a compact work of art, the sectional blocks of houses which butt diagonally against the bridge necessarily give it an aspect of incompleteness, but this was not the real object of the model, which is intended to show the actual construction of the bridge and adjacent roadway, with the chambers for gas and water pipes, the vaults and sewer. All the engineering work of the bridge is most carefully produced, and the ornamental ironwork, of which there is a very large quantity, is represented with amazing fidelity and elegance. The model is to be placed in the Guildhall Library, now rapidly approaching completion.

PROFESSOR DONALDSON.

THE King of the Belgians has conferred the Cross of the Order of Leopold on Professor Donaldson, and the Belgian Ambassador has delivered to him the cross and credentials of the order. Professor Donaldson has been a member of the Belgian Academy for thirty years.

We recently gave an account of the proceedings at the Centenary Festival of the Academy of Sciences and Fine Arts at Brussels, on which occasion Professor Donaldson attended as a delegate from the English Institute of Architects, and it is doubtless in recognition of his services in that connexion, as well as his numerous contributions to the history of his art, that has led to the honour lately conferred upon him. There is, perhaps, no member of the profession more universally esteemed, both at home and abroad, than Professor Donaldson, and not one who has striven more earnestly to uphold the status of the architect. We heartily congratulate him upon the well-merited distinction that has been accorded him.

THE ARCHITECT OF SOLOMON'S TEMPLE.

ONE of the great points sought to be made by the writer of the recent article in the *Quarterly Review* on "The State of English Architecture," depends largely on his assumption that Hiram, whom Solomon fetched out of Tyre, was the architect of the Temple at Jerusalem. Dr. Barlow, on the other hand, is content to allude to him, in your last number, as "Old Hiram, or Hiram, brassfounder to King Solomon." Can it be possible that they have headed the architects sculptured on the Albert Memorial,—Calliocrates, Erwin von Steinhael, Wren, and the rest,—with a brassfounder?

Such seems to be very nearly the case; for though he was an artist in brass, and a good many things besides, neither of the accounts which we have of him,—in the Books of Kings and Chronicles,—give the slightest hint of his responsibility for the design of the Temple. They are not merely silent as to his architectural qualifications, they do not bring him on the scene until after,—probably long after,—the whole of those arrangements which we call, for distinction, "architectural" had been settled. Not only were the various parts, with their relation to each other, determined on independently of Hiram, but the most minute details of the whole house, with its surroundings, were fixed. So far as we can see, therefore, nothing but the intelligent execution of the work remained for him and the other "willing skilful men" whom David fore-

told that Solomon would have with him for the service.

If, indeed, the account in Chronicles (xxviii. 11) is to be relied on, David, who undoubtedly projected the building, and left a vast store of money and materials for its erection, left also the drawings. He "gave to Solomon his son the pattern of the porch, and of the houses thereof, and of the treasures thereof, and of the upper chambers thereof, and of the inner parvouses thereof, and of the place of the mercy-seat, and the pattern of all that he had by the Spirit," even to the vessels for the service, in minute detail. ["All this, said David, the Lord made me understand, in writing, by his hand upon me, even all the works of this pattern" (ver. 19).—Ed. B.]

If there is any truth in all this, what title has Hiram,—however respectable otherwise,—(I will not say to the patronage of the *Quarterly Reviewer*—but) to that salient angle on the fringe of our new memorial? Indeed,—as Solomon lays no claim to the honour,—is there any person, other than King David, who ought to be regarded as the architect of Solomon's Temple? THOS. BEASELL.

INSURANCE AGAINST LIGHTNING.

Sir,—In reply to the letter of "R. J.," which appeared in your issue of the 29th ult., I beg to say that none of our fire offices insure "a house or other building against damage done by lightning."

The ambiguous announcement made by some companies that "losses occasioned by lightning will be paid," certainly fosters the erroneous supposition that some offices do hold themselves liable for "damage done by lightning" where no fire supervenes; but as such is not the case, the phraseology is misleading and objectionable.

In cases where lightning has actually fired property insured, no office could evade payment, unless it had specifically negatived such liability on the face of the policy.

The Britannia Fire Association goes so far as to state that "animals killed by lightning" are "paid for, if insured;" but, in other respects, adopts the common doctrine that to constitute liability there must be actual loss by fire.

It is obvious, however, from the very nature of a fire insurance policy, that, without specific notification to the contrary, it is simply a contract to indemnify the insured against loss or damage by fire; therefore, unless the property insured is *actually set on fire* by the lightning, or burnt in consequence thereof, there is no loss within the meaning of the policy.

Many offices, however, respond to claims for reinstatement of "damage done by lightning" with a liberal hand, and, while absolutely repudiating their legal liability, recoup the insured in the form of a donation equal to his loss.

Hence it is manifest that "no compensation can be obtained under existing policies" for such casualties as those contemplated by your correspondent, "R. J." The only security, therefore, which lessees who are bound "to uphold, maintain," &c., have against such accidents is to provide a lightning conductor to their premises. Indeed, no "tall factory chimney," or other high or exposed building, should be without one. B.

LIGHTNING AT BRIXTON CHURCH.

Sir,—I see that Brixton Church was damaged last week by lightning. I have found an interesting account of damage done to it by the same means on April 24th, 1832. This account is contained in the "Proceedings of the London Electrical Society," and is headed "The Effects of a Lightning Flash on the Steeple of Brixton Church, and Observations on Lightning Conductors generally. By Charles V. Walker, esq., Hon. Sec." It is illustrated with a sketch and section.

After alluding to a lecture that Faraday had delivered some time previously on "Lightning Conductors," Mr. Walker proceeds to give a description, which I have copied in an abridged form:—

"The localities of the damage done to the exterior are shown in the sketch to be at the summit by the cross, and at the base of one of the columns near the roof of the church, distant apart upwards of 50 ft. Some idea of the violence of the explosion at these two spots may be formed by considering that the masonry on which the cross stands is nearly 10 ft. thick, and that so much of it was disintegrated, and with such force as to drive the cross into the position delineated, and the column, the ball of which was shattered half through and to a height of 3 ft., was about 3 ft. in diameter. The portion of the dial which passed within the tower did no further mischief than to fuse or else tear apart (most probably the latter) an iron wire one-tenth of an inch thick, and in passing from this to an iron clamp, to tear up the woodwork with which the clamp was concealed. The glass was broken of three windows of the room containing the clock; also of the window of a door at the foot of the steeple. The frame of the latter window presented the appearance of having been blown outward. So far as I have been able to determine by a careful survey, the breaking of glass did not result from the direct force of the blast, but from the great concussion and vibration of air consequent on the terrific explosion. The probable direction by which the lightning reached the cross is shown in the section. It is a plain cross of thick sheet copper, containing an iron rod which passed through the masonry, and was secured by a nut below. The sections of the masonry are secured together by lead poured into the parts of juncture. The fluid passed from the cross, and pursuing its path down one of these lines of lead, made its escape from the termination offering least resistance, and produced the disruption. It then passed down the inner side of a column, and divided itself, the greater portion pursuing its course outside the building, but some part passing within. The latter obtained access through the metallic communication at the clock-faces, and travelled from the clock along an iron wire 30 ft. long by 1/16th in. thick, passed down this wire with comparative tranquillity (except as regards the destruction of the wire itself), and tore up the woodwork in reaching the iron clamp before mentioned."

Outside the tower the lightning was conveyed safely from the top of the belfry by an iron water-pipe; this pipe, however, terminated a few inches above the stone parapet supporting the columns, and here it appears to have traversed one side of the square tower, and shattered the base of a column on its way to a lead slope; from hence it passed safely to the ground, by means of the gutters and water-pipe.

Mr. Walker concludes his paper with suggestions for guarding against another such visitation. He says,— "The workmen have now removed the metal cross. Let its place be supplied by one of stone. I am no architect, but presume that could readily be accomplished. But if the summit *must* be of metal, then let the cross be furnished with a few points, to draw the lightning off quietly, and let the lower end of the rod be connected with an iron water-pipe by a copper rod or plate, and let a similar connexion be made between the end of the same pipe and the lower pipe by means of another copper rod or plate. Thus will provision be made, at very small expense, against the possibility of a disruptive discharge."

Mr. Walker also dwells on the necessity of guarding against a "lateral discharge," even supposing the former precautions were taken, and says, "This simple fact should be borne in mind, that every piece of metal, every bolt, or clamp, or har, within striking distance of the conductor, unless it be in direct connexion with it, is liable to cause a lateral discharge." I must confess that I feel some curiosity as to how far last week's damage resembled that of April, 1812, and also how far Mr. Walker's suggestions had been carried out. H. T. G.

A NEW JETTY AT CHELSEA.

THE VESTRY AND THE THAMES CONSERVATORS.

The Chelsea Vestry are anxious to erect a new jetty, but the Thames Conservators will not grant them permission to do so; at which the Vestry are indignant, more especially as, whilst the Conservators have refused them this privilege, they have just consented to allow a private individual to erect two at Cremorne. The subject was brought before the Vestry last week, when there was a warm discussion, several of the members suggesting that on any future occasion they should go direct to the Conservators' "masters" and Mr. Carter bitterly complained that the parish had been deprived of one or two landing-places, and could really get materials up in consequence of the Embankment. It appeared that the parish was not to have a landing-place because the Thames Conservators did not choose to allow one. He hoped the matter would be made as public as possible, and he thought it was quite important enough to warrant a public meeting being called.

TRINITY CHURCH, FINCHLEY NEW ROAD.

This church was formally opened by the Bishop of London on the 9th ult. It is calculated to contain 900 persons, and can, by the construction of galleries, be made to contain nearly 1,100. The nave is 90 ft. long up to the chancel arch, and of the unusual width of 34 ft. It is lighted by a lofty clearstory, with windows of large size. The north and south aisles are 11 ft. wide, and the same length as the nave. At the western end is a large porch, with three doors, the porch being as long as the width of the nave, viz., 34 ft.; from this porch are two doors opening into the church, to lessen the

usual draught from the western entrance; the two inner doors not being opposite to the three outer. There is also a north porch, and another doorway on the south side of the church, so that the egress of the whole congregation can be effected in a few minutes.

The arcade on each side the nave is supported by polished granite columns, 20 in. only in diameter, thus intercepting the view as little as possible, and the nave walls are decorated with ornamental brickwork and coloured brick bands. The capitals of the columns and responds are all carved to represent natural foliage, this being especially desired by the vicar. The style of architecture is Gothic of the Geometrical period. The chancel is not yet erected, nor are the tower and spire, but these will be proceeded with as funds permit. The chancel is intended to have a semicircular apse, and to be 36 ft. deep and 27 ft. wide, and to be brick vaulted; also to have a chancel aisle on the north side, and organ-chamber on the south, with vestry.

The architect is Mr. Henry J. Legg; and the contractors are Messrs. Dove; Mr. Austin being clerk of works.

The lord of the manor, Sir John Wilson, liberally gave the ground on which the church is built.

THE WHARFS AND WAREHOUSES STEAM-POWER PRESSURE COMPANY.

OPENING OF STREETS.

THE Wharfs and Warehouses Steam-Power and Hydraulic Pressure Company have given notice of their intention, within the next few days, to break up, for the purposes of their Act, New Bridge-street, Earl-street, Upper and Lower Thames streets, and Great Tower-hill. The company's pipes, which, it appears, are at present in use in several docks in Europe, will be laid under the direction of Sir William Armstrong, the patentee. It appears that any paving works rendered necessary by the operations of the company will have to be done at the company's expense, by the Commissioners of Sewers. In the course of a discussion which took place on the subject at the last meeting of the Commissioners, it was remarked that, if the pipes could be brought into use in case of fire, they would be found to be of immense benefit.

THE NOTTINGHAM TEMPORARY HOSPITAL.

Now that the epidemic of small-pox, which fell heavily on Nottingham, is at an end, congratulations are being offered as to the means employed. A temporary hospital, on the pavilion principle, was run up by Mr. Lyman, under the direction of Mr. Tarbotton. The buildings are fifteen in all. There is under one roof the committee-room, dispensary, and surgeon's apartment; the three apartments of the matron and store-room; the kitchen, laundry, nurses' apartments, stewards' apartment, servants' dining-hall, and general store-room; the night superintendents' apartment, the isolating ward, nurses' dormitory, bath-room, and disinfecting closet; the mortuary (suddenly converted from an old greenhouse), and wards for 120 patients (male and female separately arranged), with 2,000 cubic feet of air for every bed, and each building being considerably detached from the other. The service staff of the establishment consisted of nearly sixty persons. The building part of the hospital arrangements cost about 2,500l., and the establishment charges something under 5,000l.

The temporary institution will be finally closed with a thanksgiving service.

ROYAL ARCHEOLOGICAL INSTITUTE.

THE annual meeting of the Royal Archaeological Institute of Great Britain and Ireland, was to open to-day (Thursday), at Southampton, under the patronage of her Majesty and the Prince of Wales. The Bishop of Winchester is the president of the meeting, the patrons being the Duke of Wellington, the Earl of Carnarvon, the Earl of Malmesbury, the Earl of Normanton, and Viscount Eversley. The presidents of sections are:—Antiquities, Sir Edward Hume, A.M.; Architecture, Mr. A. J. B. Beresford-Spive, M.P.; History, Lord Henry Scott, M.P. The inaugural meeting was to be held in the Hartley Institution at noon, and an address presented by

* Considerably out of the perpendicular.—H. T. G.

the mayor and corporation. The afternoon would be occupied in examining the local antiquities, and the mayor was to give a *soirée* at the Hartley Institution in the evening. On Friday a meeting of sections, after which an excursion to Romsey and Porechester, with a *conversazione* at night. Saturday a long excursion to Christchurch, Beaulieu, Rufus's Stone, and Lyndhurst. On Monday, the 5th, another meeting of sections in the morning, followed by an excursion to Winchester and St. Cross, and a *conversazione* in the evening. On Tuesday an excursion to Silchester, Basingstoke, and Basing, and an evening meeting for the reading of papers. On Wednesday a meeting of sections, with an excursion to Newport and Carisbrooke, Isle of Wight, followed by a *conversazione* in the evening. On Thursday, the 8th, a last meeting of sections in the morning, with the general concluding meeting in the afternoon. Southampton and the neighbourhood are rich in historical associations and archaeological remains.

THE WORCESTER GUILDHALL RESTORATION.

A PUBLIC meeting, convened by the Ratepayers' Protection Society, has been held to consider the question, now before the Town Council, of rebuilding or reconstructing the Guildhall, the former at a cost of 18,000*l.*, and the latter at a cost of 9,000*l.* The attendance at the outset was somewhere about a hundred, according to our authority the local *Chronicle*, but it increased to double that number. Most of those present seemed to be working men of the mechanic class.

It was unanimously resolved:—

"That the proposal of the Town Council to rebuild or reconstruct the ancient Guildhall of this city is altogether unnecessary, and would entail upon the already heavily-taxed ratepayers an additional financial burden which is unequalled. This meeting is therefore of opinion that the project ought to be at once abandoned, and steps taken for putting the fabric into a state of necessary repair."

"That a memorial to the town council be signed by the chairman on behalf of this meeting, and that Mr. Councillor Atrey be desired to present the same, and to move such a resolution thereon as may appear necessary in accordance with the memorial."

The memorial urged the views of the meeting. It stated that the—

"Memorialists believe that, with necessary repairs, the present building is sufficient for all the ordinary uses of a town-hall, and would answer such purpose for many years to come; and especially would they regret to see the ancient front destroyed, being of opinion that it is an ornament to the city."

The memorialists, therefore, respectfully begged the town council to abandon for the present the contemplated rebuilding or reconstruction of the guildhall.

CUT NAIL WORKS AT MIDDLESBROUGH.

Messrs. Jones, Brothers, & Co., of the Ayrton Rolling Mills, have inaugurated a new branch of industry in Middlesbrough. On about an acre of ground adjoining their mills they have erected thirty nail-cutting machines, three shears for cross-cutting, a number of grindstones, lathes, and drilling-machines, requisite for making tools and keeping them in order. The cut nail trade is a special branch of a number of trades included in the term nailmaking. The nails are made out of sheets or strips of Cleveland iron, and the thickness of the sheet varies according to the length of the nail required. The sheets are cut into strips transversely, the width of the strip being identical with the length of the nail. A youth "feeds" the machine with strip, which is seized by a "claw," and turned over at each cut, the nails being produced at the rate of from two to three per second. The machines are constructed by the firm of Messrs. J. Rice & Co., of Birmingham, and embrace the latest improvements in nail-cutting machines. The machines are driven by a horizontal engine, the steam power being derived from two horizontal boilers, which are fixed outside of the building. Foundations are put in for another engine, to be coupled to the one already erected, when additional machines are laid down. Provision is also made for the erection of half a dozen "washer" machines. The sheets from which the nails are made are manufactured in the adjoining mill belonging to the firm, and an interesting system of three high sheet rolling has been introduced for the purpose of turning out those sheets more rapidly, and with a better surface than is done by the old process. Gene-

rally, cut nails are made in Birmingham, Leeds, Manchester, and Gateshead. At present, the price of cut nails, from 3 in. to 6 in., is 22*s.* per ton. There is no place in the United Kingdom where cut nails can be manufactured cheaper than at Middlesbrough. The town is also favourably situated for the London and Scotch markets. The works are producing rose, clasp, and clout nails, joiner's spig, ceiling brads, floor brads, lath nails, colliery plate nails, and any other class of cut nail not less than 1 in. in length. The machinery is capable of making about forty tons per week, but the works are laid out for ultimately turning out about 100 tons of cut nails per week. The building is erected with the view of giving as much light as possible to the interior, and for this purpose a good portion of the roof is constructed of glass.

ST. EDWARD'S SCHOOL, OXFORD.

THE foundation stone of new premises for this school has been laid at Summertown, their present premises in New Inn Hall-street being too small. A large and open space, covering five acres of ground, and situate at the corner of Woodstock-road and South Parade, Summertown, has been provided for the new buildings, and it is intended that they shall cover about one acre and a half, the remaining three acres and a half being devoted to cricket and playgrounds, and carriage-drive approaches, and there will also be a considerable portion of ground set aside for ornamental planting. Mr. W. Wilkinson, of Oxford, is the architect; and the contract for the work has been taken by Messrs. T. Orchard, Brothers, of Baubury, for 8,659*l.*, but this does not include the chapel, which it is proposed to erect close to and in connexion with the schools. The cost, it is understood, will be principally borne by the Rev. Algernon B. Simeon, and the works during their progress will be in the main charge of Mr. J. Hards, the foreman of the contractor. It was an instruction to the architect, we believe, to produce a plan for the building of a simple nature, and suitable for academical purposes. The soil is a marly one, and the site is free from surroundings of crowded buildings. The architecture will bear Early English characteristics, and will be ornate, but not pretentious in appearance. The main front will face the south towards Oxford, while the master's residence, which will be separate, although in communication with the main building, will be situated at the south-west corner. At the same end will be the school and class-rooms, and eventually it is proposed to continue a cloister to the projected chapel. The south frontage will extend nearly 200 ft., the west or kitchen front about 112 ft., and the building will comprise three stories, this being necessitated in consequence of the height of the large school-room and refectory, both of which are intended to be 60 ft. by 21 ft., with a height of 17 ft. The building will be of brick, with dressings of Bath stone, and all the windows will be provided with iron casements. The library and masters' rooms will be spacious. A main stone staircase will lead to the dormitories on the second and third floors, where accommodation will be provided on the "cubical" system—which means really a separate division for each boy, with a small window,—for 100 boys, the number on each floor being equally divided. There are in addition designs for private bath-rooms, and one larger one for the use of the smaller boys. In case of any infectious disease making its appearance, complete isolation will be secured by the sufferers being transferred to the gardener's cottage, where accommodation will be provided somewhat after the fashion of cottage hospitals.

CONCRETE WALLS AND ENCAUSTIC TILING.

Sir,—I have been very much struck with the suggestions of more than one of your correspondents of late as to the uses of encaustic tiling. That it would set at rest all questions as to repainting, repointing, and cleansing of stone, is evident, and would possess, what is so important in our climate, a power of being restored to pristine brightness and freshness with the minimum of labour, are advantages which cannot be overlooked by those who build, and by tenants. To architects it offers, by its capability of thorough and extensive use in an artistic and uniformly architectural character, an opportunity for the display of genius in a new direction, which

might open out a way from the perpetual charges against all our architecture that it is stale, and nothing but the working-up of old types of art.

But my object in writing this is chiefly to suggest that, if over concrete becomes largely employed in building, which seems very likely, the facing it in an architectural manner with encaustic tiling, suitably studied and worked out in colour and pattern in unison with the whole design, would be a natural and excellent combination; and there seems no reason to fear that there is any technical objection to the combination of the two materials, *i. e.*, concrete, with an encaustic tile facing. Its partial use, as at present employed, while giving a pleasing variety, does not come up to what we mean, which, we reiterate, is the making it the sole vehicle of exterior decoration, in a well-studied and artistic manner as to colour and pattern, in harmony with the design and uses of the building; and as solving the many problems which now afflict the profession. BETA.

THE DRINKING FOUNTAIN ON CLIFTON DOWNS, BRISTOL.

ON the completion of this drinking-fountain we printed a few particulars of its origin and construction, and we now give a view of it, repeating so much of the account as may render looking back unnecessary. It was erected at the cost of Mr. Alderman Proctor (late high sheriff of the county), and presented to the people of Bristol for ever. His motive for this liberal act may be learnt from the inscription cut in a panel at the base, and which runs thus:—

"Erected by a citizen of Bristol to record the liberal gift of certain rights over Clifton Down made to the citizens by the Society of Merchant Venturers, under the provisions of the Clifton and Durdham Downs Acts of Parliament, 1851, whereby the enjoyment of these Downs is preserved to the citizens of Bristol for ever."

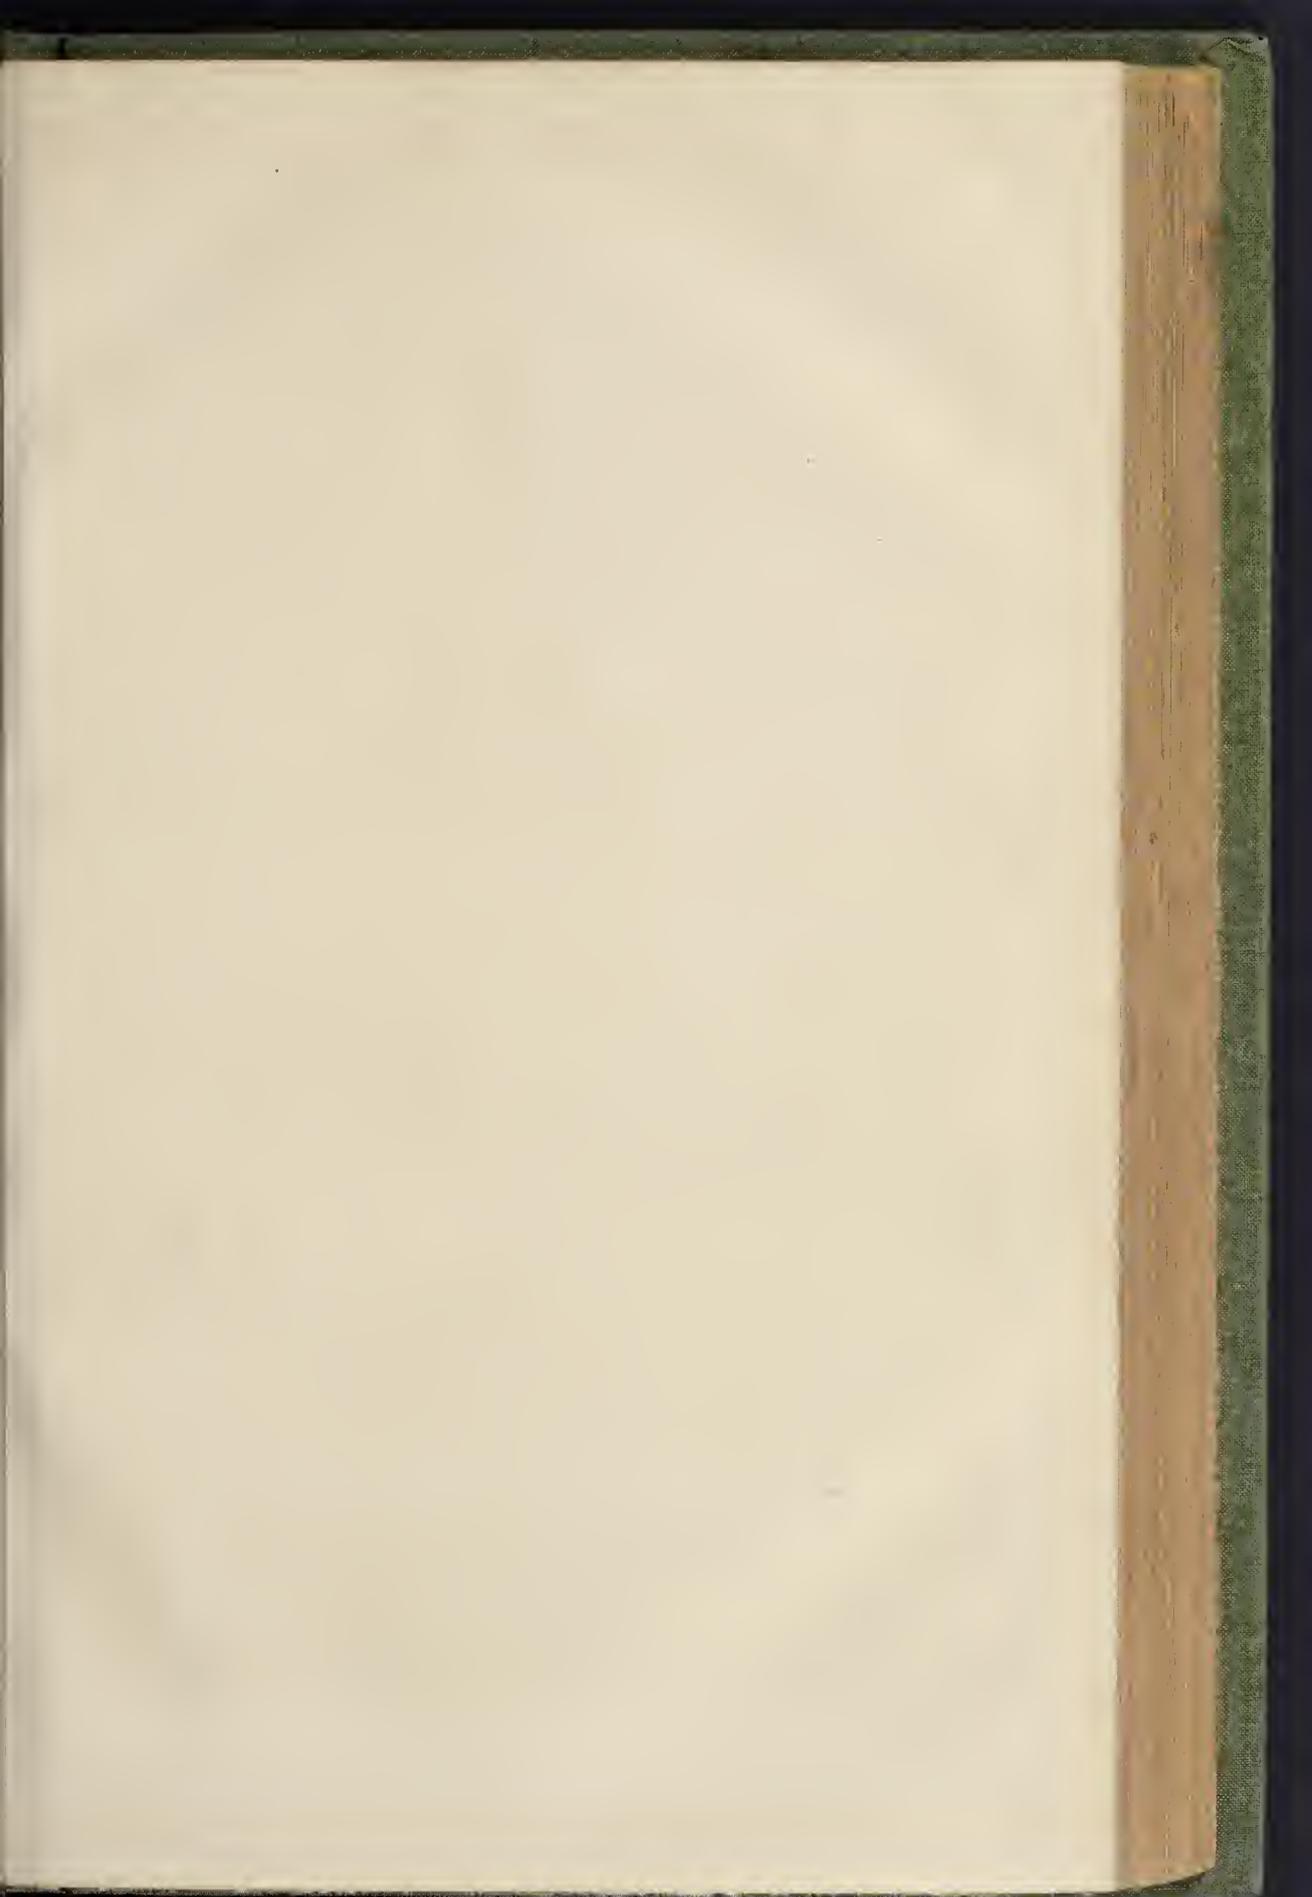

The fountain stands on the site of the old turnpike, and is approached by four roads, as well as by a pathway from the new zig-zag walk up the cliff. The structure has the novelty of being triangular on plan. The stone used is the Box ground, with alternate voussoirs to the arches of red Mansfield; the three arches spring from columns, the shafts of which are of Rouge Royal marble polished; the basin is of red Mansfield, with a veined marble curb. Inside the basin stands what may be termed the fountain proper, from which the taps project; this takes the form of the structure, and there is a tap in front of each arch. The under side of the superstructure is groined. Over the arches are gables, with coping and carving under it, and they have each a carved finial. At the three angles there are buttresses, terminating with gables detached from the pyramidal roof which rises from the centre, and is topped by a handsome finial. In the gables over the three arched openings are circular sunk panels containing the arms of the Merchant Venturers, the arms of the city of Bristol, and those of the donor, Mr. Alderman Proctor, carved in red Mansfield stone, with their several mottoes.

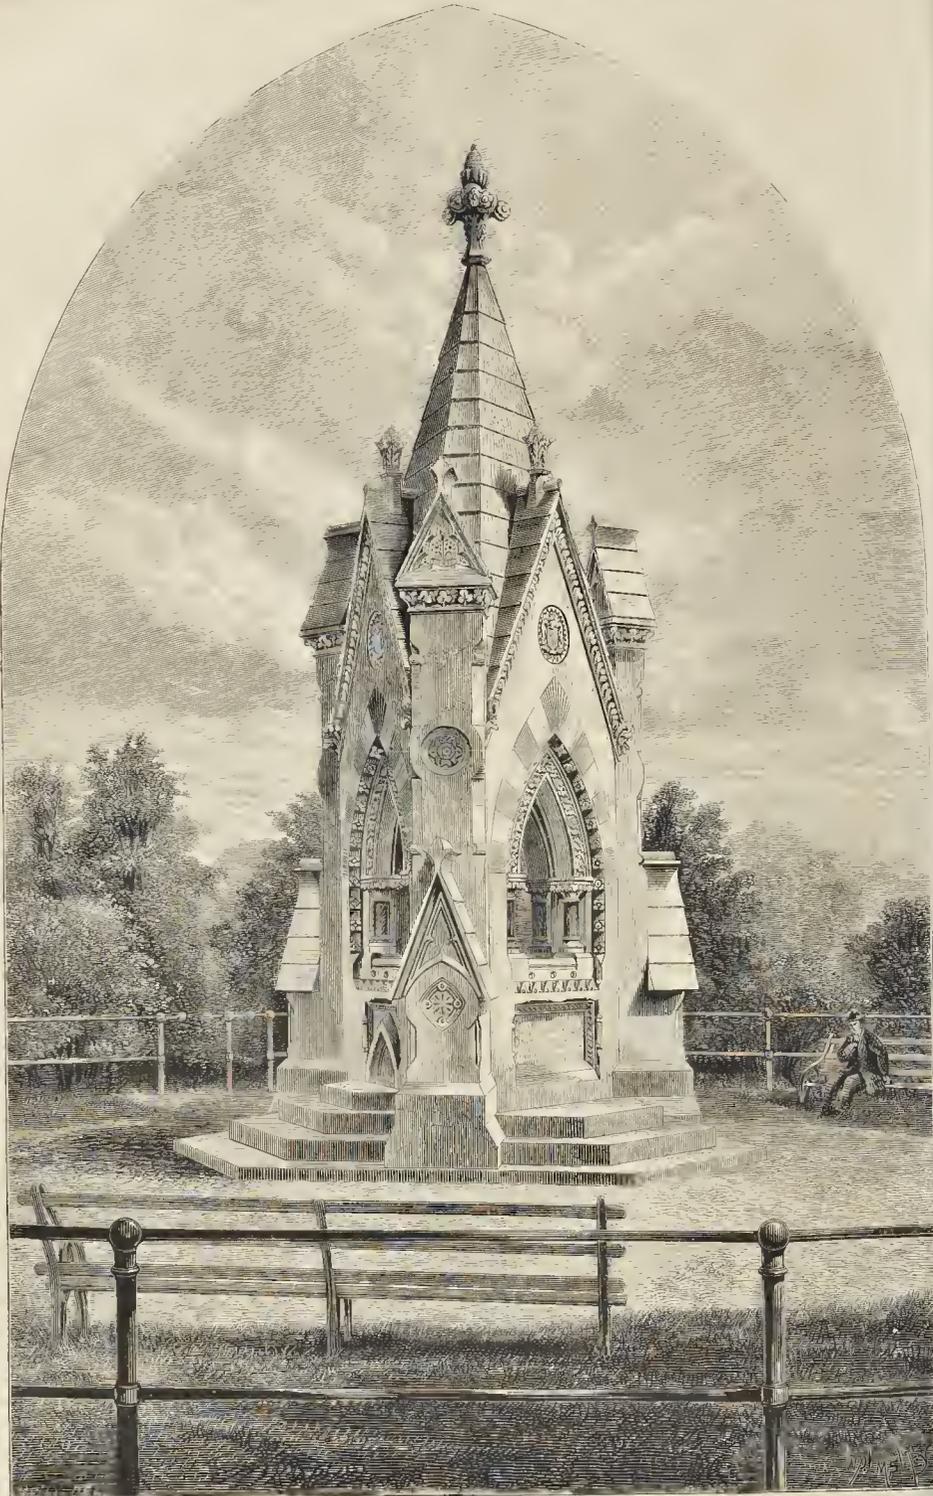

The structure stands on three Pennant-stone steps: on one side is a fourth, for the accommodation of children: a similar step will have to be added at the other openings. The whole erection is 25 ft. 6 in. high, to the top of the carved finial. In connexion with the fountain there is a cattle-trough, not far off, which is continually supplied with water.

The work has been carried out from the designs of Messrs. George & Henry Godwin, of London, architects, by Messrs. Broad & Tucker, of Bristol.

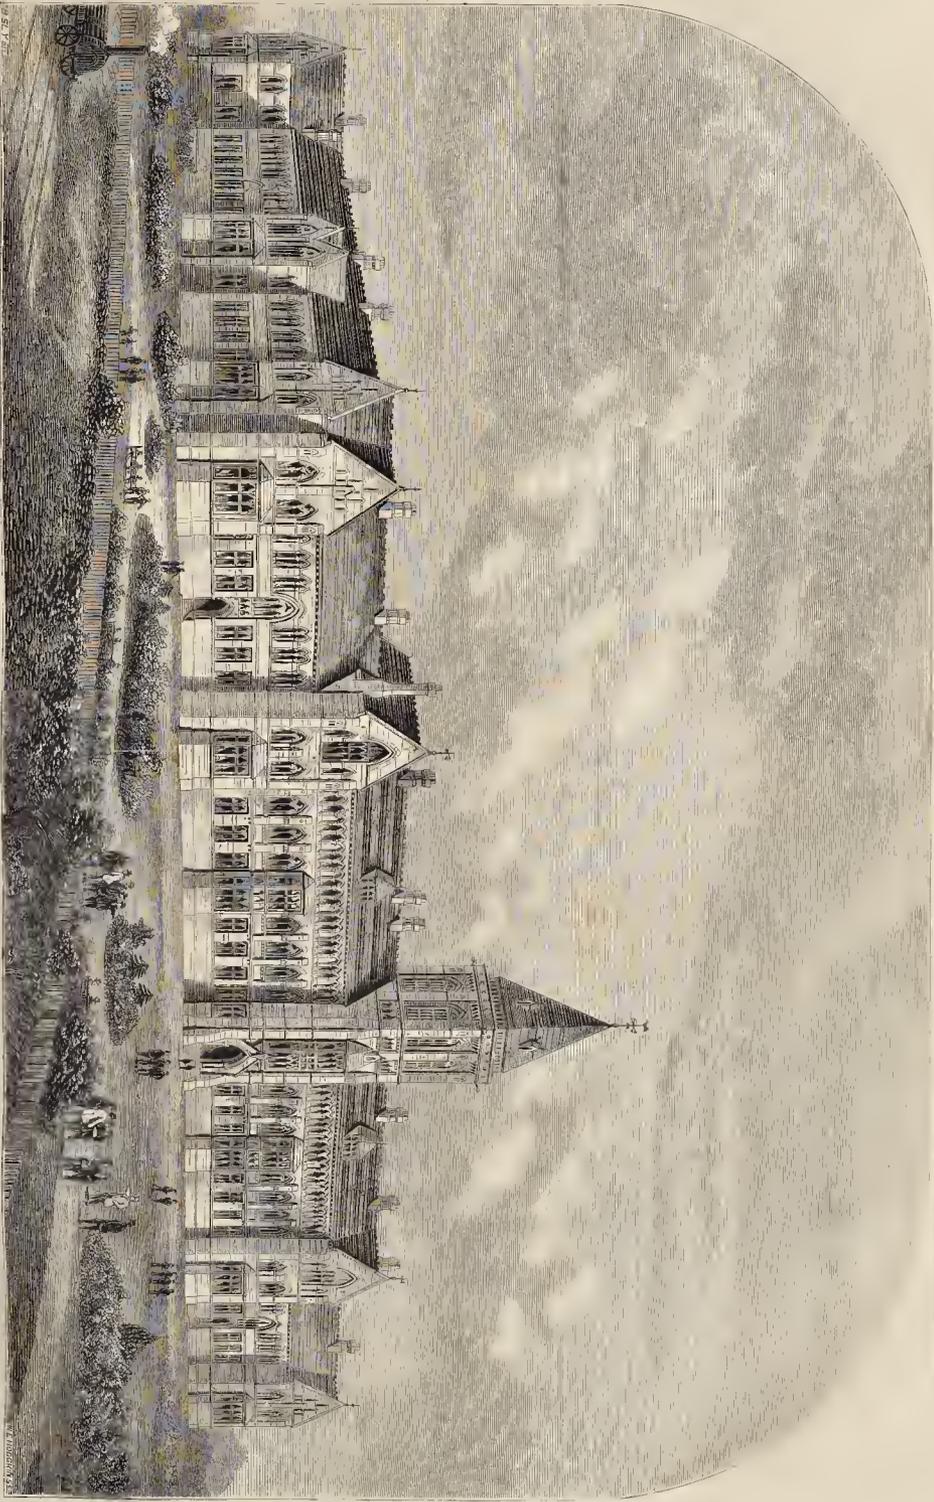

The donor writes as follows:—
"I am much pleased to find that the drinking-fountain is greatly appreciated by all classes. We find a great advantage in having the supply of water direct from the main, as it tastes cool and fresh. We are also enabled to satisfy any extra demand that arises from the visit of excursionists, the increased number of persons that walk on the downs when the band is playing, or the thousands who avail themselves of the advantage of the downs on the Sunday afternoon and evening.

Ordinarily, the three cups attached to the fountain are sufficient; but to meet any extra demand, my man takes out a number of half-pint mugs, and turns on an extra supply of water, according as it may be required. The Bristol Water Works Company supply the water by metre, at a charge of 1*s.* per thousand gallons."

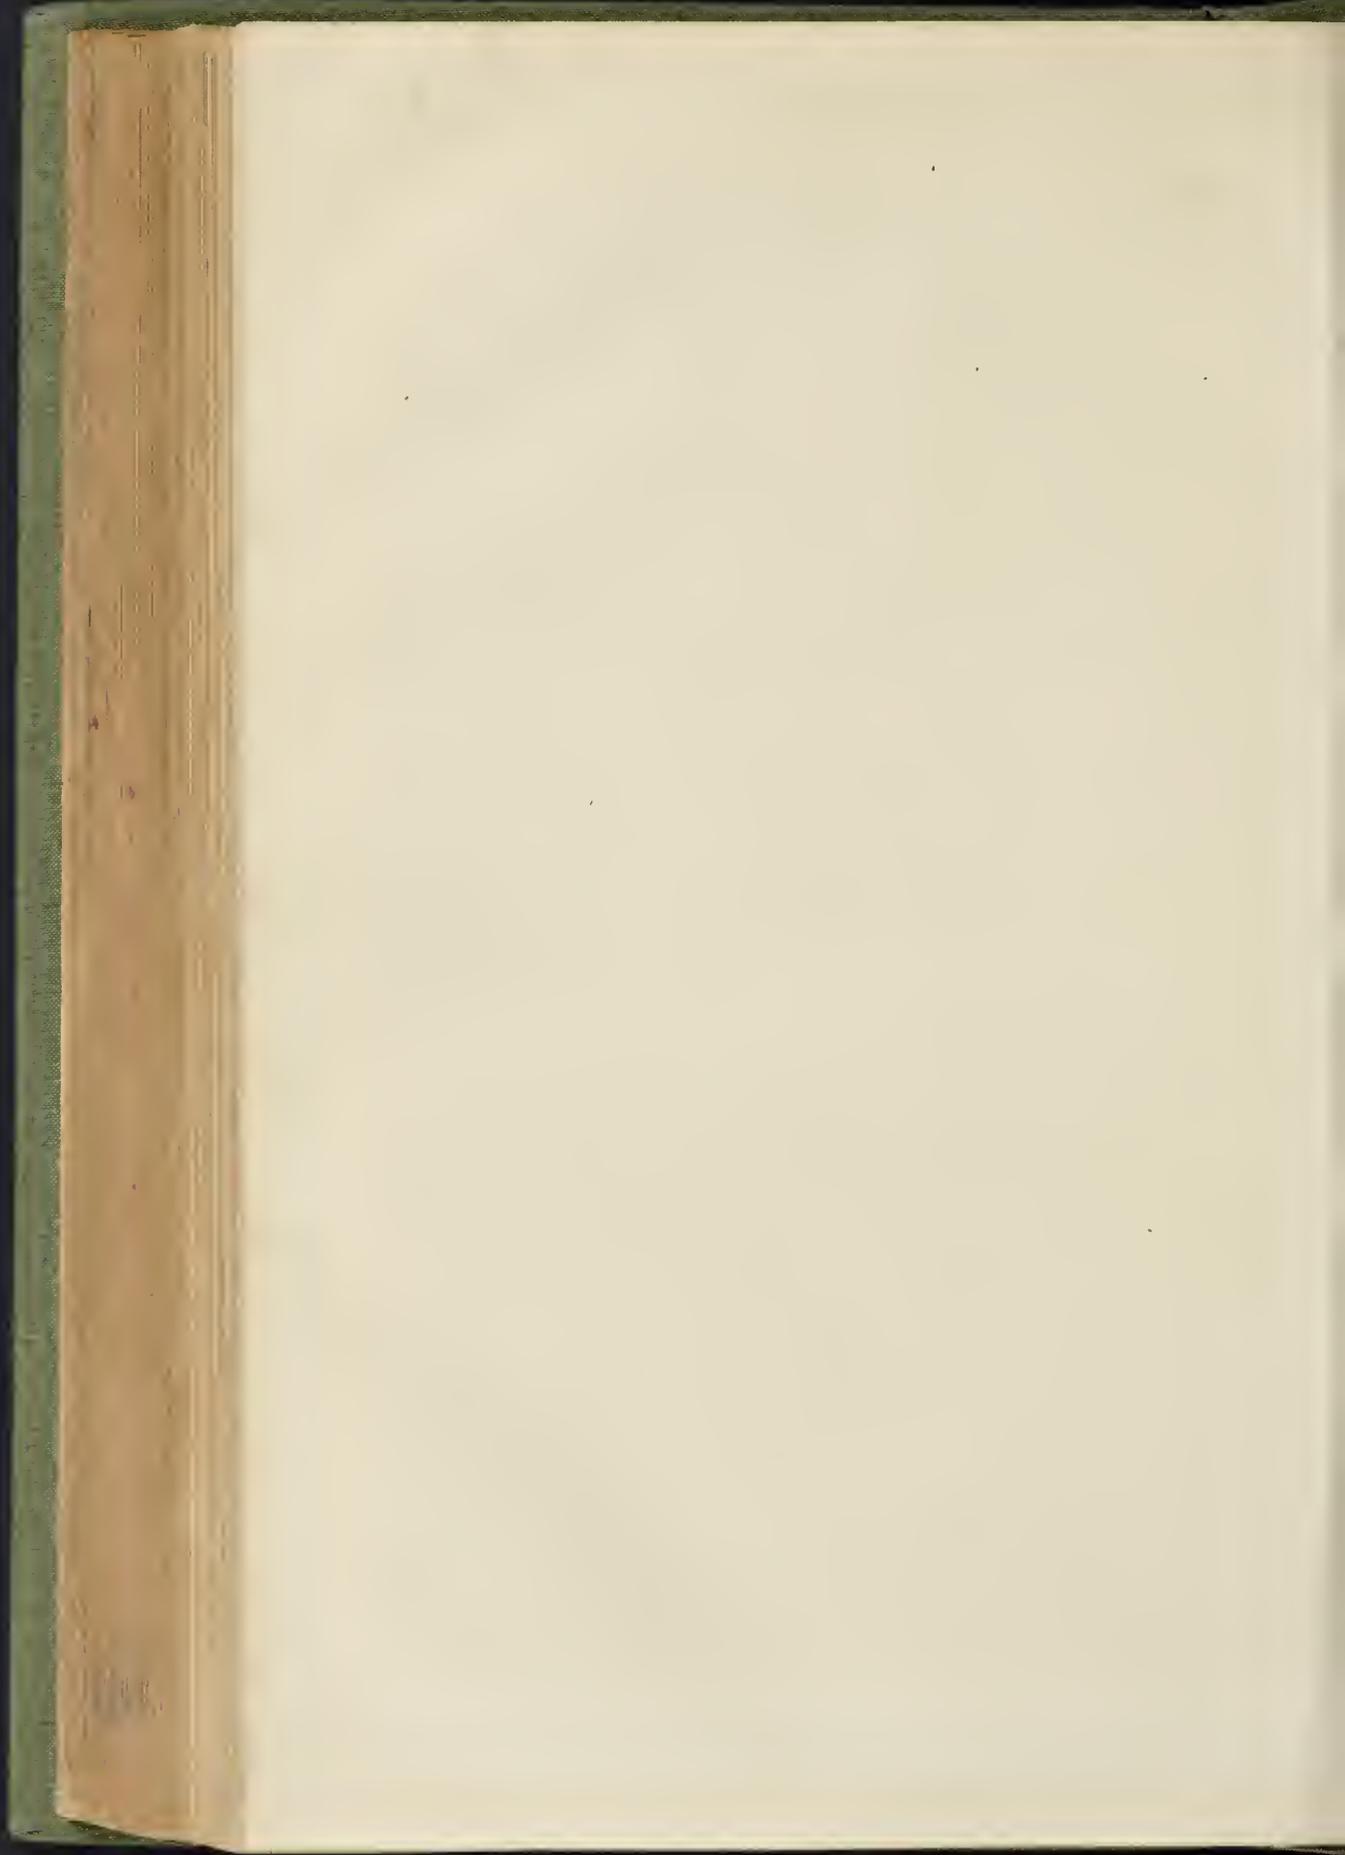

DRINKING FOUNTAIN ON CLIFTON DOWNS, PRESENTED TO THE CITIZENS OF BRISTOL
BY MR. ALDERMAN PROCTOR.—MESSRS. GEORGE & HENRY GODWIN, ARCHITECTS.

PROPOSED LUNATIC ASYLUM AT ST. ANNS HEATH, VIRGINIA WATER, WINDSOR.—DESIGN TO WHICH SECOND PRIZE WAS AWARDED: MR. ALFRED SMITH, ARCHITECT.

PROPOSED LUNATIC ASYLUM, ST. ANN'S HEATH, VIRGINIA WATER.

The report of the referees on the thirteen designs submitted to Mr. Holloway, was printed in our last. By this the first premium was awarded to the drawing marked "Alpha" (by Messrs. Crossland, Salomons, & Jones); the second to the set marked "Inprobus labor minus vincit," submitted by Mr. Alfred Smith, in our present issue we publish a view, illustrating Mr. Smith's design. It is right we should say, however, that in doing this, no reflection whatever on the referee's decision is intended; it is the result of a published mistatement, which gave the first place to the design we have engraved; and we know nothing of the other designs. We propose in an early number to illustrate fully the design by Messrs. Crossland, Salomons, & Jones, to which the first premium is really awarded.

Readers of the *Builder* will not require to be told that the plan of an institution such as this is the most important part of the design: at present it is not before us. With reference to the elevations, we quote Mr. Smith's own particulars:—

"I have endeavoured," he writes, "to make every part of the building graceful and of good proportion, and in perfect harmony and keeping throughout, so that the total ensemble shall be at once simple, dignified, and imposing, and derive all its effects from the well-studied arrangement and proportion of the necessary parts, and not from any gaudy or meretricious. Very little stone need be used, as it will be desirable, both for the general effect of the building and economy, to give it a thoroughly brick expression, using terra-cotta or Ransome's patent one for the portions which cannot be executed in brick, and to avoid the too common, unsatisfactory, and costly error of fitting stone and brick together in such a way that it is hard to decide whether it is intended to be a brick or one building. Under any circumstances, the repetition of good forms is an advantage as regards cost, whether stone is used or not. Very little ornament or carving has been introduced, because good carving is very expensive, and buildings of this nature ought not to depend upon its for success, and a few touches here and there from a master-hand is all that should be necessary to make them thoroughly effective."

We understand that all the designs will shortly be exhibited at the House in Conduit-street.*

WAGES.

Sir,—I did not expect that my former communication on this subject would please every one, and I see an unsparing criticism this week under "S." (By the way, to select that sibilant consonant as a signature was a most happy one. It is seldom that the whole essence of a letter is contained in the signature.) I do not, indeed, that your correspondent has a good word for a single sentence of my letter, unless follow it with a fatal "but," and it is perhaps very reasonable to infer that the parts passed over in silence have equally failed to secure his approbation. Of convincing so decided an opponent I have, of course, no hope. I will not use your indulgence, therefore, by replying to his criticisms. Most of these I am content to refer to the judgment of your readers, provided they that they will suspend their opinion until they have glanced again at what I did actually intend. It may be well, however, to notice so much of your correspondent's letter as will suffice to explain and briefly re-assert my position; namely, this, that in determining what is a proper rate of wages the question is simply a question of value. The labourer sells something which the employer buys, and the wage which the former receives is the supposed value of this. It is settling what that value is (in other words, the price) economical considerations could alone be introduced. "Abstract justice," contend, has no more to do with the value of our than with the value of wheat. In the former case the conditions are more complicated, the principles on which both must be decided are fundamentally the same. You must expect the labourer to be content unless he is conscious of obtaining the full value of his work; and, if he were instructed in economic science, his "enlightened self-interest" would only prompt him to insist on this, but would remind him that it is suicidal to exact more than this when he has for a time the power. I therefore regard the notion of "abstract justice" here as simply misleading. The very term, I confess, in this connexion grades on my mind. It conveys an idea of dreaminess and sentimentality, and seems to me to stand self-

condemned. I observe that "S.," though writing specially to censure me for wishing to exclude this notion, makes no attempt to show how it may be introduced with advantage. I believe it absolutely incapable of application. I would here remark that "self-interest" as a motive is often looked upon with unjustifiable disfavour. It is a very different thing from individual selfishness, and when actuating a class numbering perhaps many thousands, it is not incompatible with a great deal of *esprit de corps* and not a little chivalry. In the present strike, for example, there are no doubt many men who, for the sake, as they think, of the general benefit, willingly suffer losses for which they well know complete success would not compensate them.

I do not wish to be understood to assert that moral considerations should not govern the relations between masters and men. Only too glad should I be to see more employers whose object of existence is not simply to amass large fortunes as rapidly as possible, and on the part of workmen a little more of that pride and sense of honour which would prompt them to give good work for good wages. I do not think this inconsistent with my other opinions.

"S." is very severe on my simple illustration of the old maxim that "honesty is the best policy." After carefully reading the passage again, I can candidly affirm that I consider it quite incapable of the construction he puts upon it. I am almost forced to think he never heard the term "enlightened self-interest" before. Indeed, when "S." found himself involved in the curious assumption that "abstract justice" and "enlightened self-interest" are different terms for the same idea, he might have suspected he had somehow got wrong. This is surely logic in its swaddling clothes. Not many of your readers will follow "S.'s" example. I think, indeed, if our friend had not accidentally misquoted the passage he gives, and lost sight of the next three sentences, he would not himself have fallen into the error.

"S." does not see the relevancy of my remark that matters will not be improved by "preaching sickening sermons on universal benevolence." That I regret; but it is not for me to decide on the relevancy of my own remarks. The "universal benevolence" I alluded to, and which we are sometimes exhorted in the public prints to practise, is usually a kind of magnanimous self-denial by each party for the sake of the other. A very easy doctrine, indeed, to recommend to others; but to set each party watching to see if the other is acting on this golden rule (for this is what it amounts to) is not a likely way to abolish the "class hatreds," as "S." calls them, which we all deprecate. If "S." has not seen any of these "sermons" he is to be congratulated.

I have little sympathy with the benevolence whose object is solely to raise the status of those who are now called the lower classes, "by assisting some of them to rise." The qualities of the workmen who "rise" above their fellows are seldom those of the highest order, as is shown by the absence of sympathy they usually display towards the comrades they have left behind. Besides which, such benevolence will at the best benefit only an infinitesimally small proportion of the multitude. A wise philanthropy will rather try to benefit the workmen in their class than to raise one or two of them out of it, and this by teaching them how to improve permanently their general condition for themselves, both in material and moral respects. As Mr. Mill has well written on a kindred subject,—

"There is reason to rejoice at whatever makes the privileged classes of skilled artisans feel that they have the same interests, and depend for their remuneration on the same general causes, and must resort for the improvement of their condition to the same remedies as the less fortunately circumstanced and comparatively helpless multitude."

Those who will put into the workmen's hands the power which comes with knowledge, and teach them to understand the laws which govern the production and distribution of wealth, will earn their lasting gratitude, though they must expect to be regarded as visionaries for a time. Your correspondent's sneer at "those economic laws which are said to be so infallible," is amusing enough, and reminds one of the gentleman Sydney Smith knew, "who used to speak disrespectfully of the equator!" And if they "oppress," as he says, not only "those who cannot rise into the tide," whatever that may mean, but also those who are not "within the compass of their action?" they must be remarkable laws indeed, and no wonder "S." does not

like them. I am, of course, unable to say whether their doctrine will or "will not be preached" too much," but they must be preached a little more clearly if they are to be understood.

I dislike the present system of the complete dissociation of capital and labour as heartily as any one, and principally for the reason that under it we have two sets of interests necessarily hostile. So long as the labourers and the capitalists are distinct sets of men this will be the case. And it is because, in the present dispute, there are no signs of any change of system, that I fear, "whatever agreement may now be come to can be of no value towards a real settlement." The workmen will get most, perhaps, of what they now ask, grudgingly granted by their masters; the present mutual ignorance and blind distrust will continue; and in a few years the same fight will occur again. When workmen have acquired sufficient knowledge and public spirit to co-operate intelligently, so as to be able to do without the individual capitalist, then, and not before, trade wars will cease, for the cause of them will have passed away.

It is not to be concealed that workmen have still much to learn before that time can arrive. They are not without instructors. They have the teachers of Christian forbearance and abstract justice on the one hand, and on the other the positivists, who recommend combination,—not to render warfare unnecessary, but to make one of the helligens stronger for it. When the sentimental and the heroic teachers have both had their say, the scientific way may, perhaps, obtain serious attention. Mr. Tarbuck, I fear, will find that we are far too "practical" a people to place faith in any one who proceeds on principles. Nor is there any reason to suppose that the masters would place Mr. Mill in possession of sufficiently full information as to their profits, &c., to enable him to form a judgment.

I must apologise for the length of this letter; but I shall not trouble you with any further remarks on this subject. H.

BITS OF BROMPTON.

MR. T. F. DILLON CROKER, following up a pleasant work of his father's, is contributing to the *South London Press* some "South-Western Sketches," which will be read by many with interest by-and-by, as well as now. We reprint a few paragraphs from a chapter headed "The Oratory to Stamford Bridge":—

"A wag once observed to us that he did not know why so many actors lived at Brompton unless because it was the *Hamlet* that gave advice to the players. The street which divides Pelham-place from Thurloe-square is Pelham-street, the right side of which is now all down to make room for the railway, and which street takes us immediately up on the left to the South Kensington station of the Metropolitan, where formerly stood Pelham Villas. This station was opened in the Christmas week of 1868. Of the railway we are happily, on the present occasion, independent, since its convenience is its sole recommendation, and the means of transit can hardly be said to compensate for numerous annoyances and high fares. In the underground railway carriages, every one quietly submits to sit in a thorough draught, which would be immediately resented in an omnibus. This is one of its dangers; but there are others resulting from the general busting and excitement, stopping in tunnels, chances of fire, &c., which appear to be quite as likely to occur as on other lines. No, let us keep above ground as long as we can, and when we cannot, there is the Brompton Cemetery (of which we shall have a word to say by-and-by) always open to us. This by the way. It was at the South Kensington station that the serious collision took place, in consequence of which that clever actress, Miss Bufton, obtained a verdict of 1,600*l.* damages, to which the railway company demurred as excessive, although they owned themselves entirely in fault; and 1,600*l.* is poor compensation for the possible wreck of an entire future.

Opposite to this station at the corner of Cromwell-lane still stands Brompton Hall, said to have been the residence of Lord Buteleigh, and visited by Queen Elizabeth on the occasion of her proceeding to Queen's Elm. A stone engio yet remains perched above the wall in solitary state, where once was the old gateway, which is now, alas! disfigured by an ugly hoarding. No. 7, Cromwell-place, is the residence of Mr. J. R.

* The following are the competitors who are to receive for the award 50*l.* each:—Messrs. T. R. Smith, R. F. Iers, Seddon, E. W. Godwin, Quilter, T. H. Watson, & Francis.

Millais, R.A. It is one of a fine row of houses leading into Cromwell-road. In Cromwell-lane are some quaint almshouses about 230 years old, built by Mr. Methwold, who lived in Hale House (afterwards Cromwell House). The inmates of these houses (one of whom is upwards of ninety years old, and has been there twenty-three years), seemed cheered by an occasional visitor, more especially if also a sympathetic inquirer; but they appear to be very carelessly treated, as the rooms are terribly out of repair. Sixteen acres of land, it would appear, were left to keep these old houses in perpetuity. This, like many another trust, owing to negligence, not to no a barster term, on the part of those on whom the responsibility devolved, has been lost to those for whose advantage it was intended, and has, we believe, in some curious manner, merged into a portion of the South Kensington estate. It may be suggested to the inhabitants of the neighbourhood, and the charitable generally, that a trifling amount would restore the houses to at least comparative comfort.

There used to be a square old wooden pump in the front garden not very long ago, and we remember constantly passing the houses when they were in a narrow lane: now they are almost the sole remnants hereabouts of a by-gone age; and we understand that they are purchased by the railway company, so that the chances are they will come down in these days of progress and desecration, unless some zealous archaeologist should interfere."

THE ASSESSMENT OF ST. THOMAS'S HOSPITAL.

THE proceedings at the general assessment sessions at Westminster last week on the appeal of the governors of St. Thomas's Hospital against the assessment made by the parish of Lambeth on the new structure, contain several features of interest as to the value and rateability of public buildings. The parish had rated the hospital at 20,722l. gross, and 17,580l. rateable value, whereas the hospital authorities contended that the extreme rateable value was 5,000l.; but the magistrates last week decided that the rateable value was 10,900l., which, although that sum is nearly 7,000l. less than the amount claimed by the parish, is, nevertheless, more than double the sum at which the hospital authorities contended the building ought to have been rated. The matter is not, however, yet settled, inasmuch as a case was granted, on an application by the counsel for the hospital, involving a point of law as to the liability of the hospital to be rated at all. A feeling of dissatisfaction seems to prevail at the decision arrived at by the magistrates, as it involves an annual contribution from the income of the charity of a sum approaching 3,000l. towards the rates of the parish of Lambeth, and it is urged that it is not just that a charity freely relieving and treating the sick and injured poor of a parish should be subject to such an impost.

The opposite views of the several valuers and others connected with building as to the annual value of the hospital was somewhat striking. Mr. E. Ryde, on behalf of the hospital authorities, stated that he had had great experience in London as a valuer, and the result of his valuation was that the gross value of the hospital should be 6,000l., and taking off one-sixth, the result would be 5,000l. as the rateable value. Mr. Carrey, the architect of the hospital, also believed that 5,000l. was the fair rateable value; and Mr. Clifton corroborated the two first-named gentlemen. On the other hand, Mr. C. Lee, who appeared on behalf of the parish of Lambeth, said for the building he allowed 360,000l., and 90,000l. for the land. That sum was less than the cost, for he had left out the decorations. It was worth 9d. per cubic foot, but he had calculated it upon 8d., or 450,000l. at 3½ per cent., making the gross value 19,350l., and the net 15,750l. Mr. Castle stated that the principle upon which the parish of Lambeth had assessed the hospital was a fair one, namely, its structural value. He put down the land at 90,000l., and the foundations at 48,000l., making 138,000l., and upon that he allowed 4 per cent., giving 5,520l. net. He estimated the buildings at 854,153l., and allowed 5 per cent. on them, making 17,770l., which altogether amounted to 23,227l. net. Adding one-fifth to that, the gross value would be 27,872l. Mr. Marsb Nelson fully agreed with Mr. Castle's principle, but he thought a fair basis would be 21,000l. gross, and 20,000l. net. Mr. Vigers gave similar testimony.

He had surveyed the premises, and put down the land at 90,000l. and the foundations at 48,000l., making 138,000l.; and the buildings be valued at 8d. per foot.

MORE THUNDERSTORMS.

A REPETITION—almost a continuation—of thunderstorms has been going on throughout the country since the date of our last notice. On Thursday night in last week the metropolitan display of silent lightning was curious; it seemed to be beyond a range of clouds in the north-east, and ten or a dozen times a minute lighted up the dark outlines of these with its gleams, attended occasionally with zig-zag displays, but otherwise like the aurora borealis than ordinary lightning. Double storms appear to have been frequent, the second recurring after a longer or shorter interval, as if the storms were circular, and returned upon their own track; and indeed they were accompanied in certain cases by a whirlwind, or a water-spout. The rain descended in deluges in many districts. A fearful storm burst over Hampshire on Thursday morning. Emsworth Station, on the London and Brighton Railway, was struck by the lightning, and speedily destroyed. The streets of Portsmouth were flooded. During a most violent storm at Burnley, Trinity Church was struck and the flag-staff was shattered to pieces. Berwick Light-houses has been struck, but the masonry is believed to be uninjured. Many persons, horses, cattle, &c., have, as before, been struck, but fewer persons killed than heretofore. One gentleman was killed in bed, and his brain was found to be dissolved into an oily substance. The heat or other oppressive influence of the atmosphere has also caused some deaths. In New York these continue; and a cooler sunshine does not seem to have caused the deaths to cease, or the lassitude and oppression of spirits to diminish.

COTTAGE DESIGNS: ROYAL AGRICULTURAL SOCIETY.

I AM told fifty-two designs for cottages were sent to the meeting of the Royal Agricultural Society held this year at Cardiff, but not one was found of sufficient merit to receive the seal of the Royal Society. How is this? Are architects too honest for them, and have not indulged in sufficient ornament to suit the judges? But surely out of fifty-two designs there must have been one found possessing a well-distributed plan.

Is it possible, sir, for an architect to send in competition an honest æsthetic design for a pair of cottages, containing each five rooms, with offices, for the sum of 220l. ? H. F. T. C.

SCHOOL BOARD FOR LONDON.

THE Board have selected a design by Mr. Frederick Roper, for their schools to be erected in Great Hunter-street, Southwark. Accommodation, 320 boys, 320 girls, and 400 infants. The estimated total cost is 7,000l.

THE BUILDERS' STRIKE.

ON Wednesday afternoon deputations from the carpenters, bricklayers, plasterers, painters, metal-workers, and labourers waited upon the sub-committee of the Master Builders' Association, with the object, if possible, of effecting a settlement of the existing dispute. The carpenters' deputation, which attended as an independent body, were first admitted to an interview, and on being asked by the chairman of the committee, Mr. Hannon, under what instructions they acted, Mr. Sadler, a member of the deputation, handed in the following resolution, adopted at a meeting of the carpenters' delegates on the previous evening:—

"That we instruct our deputation about to wait upon the masters' committee to offer the following terms,—viz.: fifty-one hours per week, to be worked regularly throughout the year, in shops and on jobs, at the wage of 8½d. per hour, up to the 1st of March, 1873, with a guarantee that on and after that date an increase of 3d. per hour be given; also, that a code of working rules be arbitrated upon, the men not to resume work until such code is finally agreed upon."

Mr. Sadler added that himself and colleagues were prepared to make a settlement upon the above terms.

Mr. Hannon said his committee had been invested with full powers to settle the dispute upon any terms they thought fit, and they could not treat with any deputation not possessing the same powers.

It appeared that the carpenters had found their deputation not to go outside a hard and fast line, and therefore it was of no use to prolong the interview. After a few remarks, the deputation retired.

The other deputations from the trades belonging to the amalgamated committee were then introduced, and stated they came to discuss a re-arrangement of the bours as accepted by the masons, and the necessity of a code of working rules.

The Chairman said it appeared to him that none of the deputations had come with full powers to settle, and therefore it was useless to prolong the interview. The hours must form the basis of any code of working rules, and as the different trades could not agree upon the hours it was useless to go into that question. The masters were prepared to consider a code of rules to regulate overtime, but they could not recognise any rule for the abolition of piece-work.

The deputation then retired, without having come to an agreement upon any single point.

BEECH.

SIR,—If "W." will try the experiment of filling up the ends of fresh-sawn beech with soft soap, and placing the beech crossways to season, he will find it to his advantage. I have seen beech so treated for the manufacture of joiners' bench planes. W. W.

THE IRONWORK AT BRADFORD COVERED MARKET.

SIR,—I have taken great interest in your description of the new covered market in Bradford (see p. 562), and wish you would add the names of the contractors for the ironwork. Having been myself connected with the firm, beg to state that the late Messrs. Ratcliffe Nuscheler (now Mr. A. Nuscheler, Hexthorpe Ironworks, Doncaster) have been the contractor for the ironwork. I can further state that the weight of plain castings has been about 30 tons, the ornamental castings about 40 tons, and the wrought-iron in the dome and roof principals about 13 tons. A special feature in this market is the elaborate half-circular windows in the openings, formed of cast-iron framing, and ornamented with cast-iron scrollwork of flowers.

H. NADHOLZ.

PORTLAND CEMENT STAIRS.

SIR,—If your correspondent, Mr. Britton, or other of your readers interested, will take the trouble to look into the wharf of Messrs. Bailey White, Brothers, cement manufacturer of Millbank-street, Westminster, they will there see a flight of steps up to their offices, done some eight years ago, and which has stood the wear and tear daily of a large number of carmen hob-nailed boots during that time, and are at present in as good a state of preservation as on the day when done, thus proving to ocular demonstration that Portland cement, well banded, an excellent material for that purpose.

WILLIAM PULHAM.

STOCKTON EXCHANGE COMPANY (LIMITED), COMPETITION.

SIR,—In this, as in kindred instances, it will probably be found that the promoters have erred from ignorance rather than intentionally. The conference committee on competitions will meet again until after the holidays; and I, hon. sec. of that committee, have as yet no authority for remonstrating *ex officio* with the authors of unfair conditions. In the meantime the "General Regulations for the Conduct of Architectural Competitions" are now in the press, and will shortly be issued; and architects having the good of the profession at heart will do well to provide themselves with copies, and send them for the guidance of such committee directors, and private promoters as they know are about to invite competition.

With regard to the Stockton Exchange competition, on seeing the letter on this subject in last week's *Builder*, I immediately wrote for it

particulars, but received the laconic answer, "List of competitors closed." Judging, however, from the conditions as advertised, your correspondent appears to have a bundant grounds for signing himself "Indiguans." The particulars by nothing about a professional assessor; the timber and scale of the drawings are not stated; employment is not promised to the author of the design; the aggregate amount of the premium is only 55*l*. instead of 1*l* per cent. on the proposed outlay; and finally we are told that the premium will merge in the commission. Unless these conditions are modified, I would paragon *Punch's* celebrated advice by saying, "To lose about to compete—DON'T."

ALFRED STRONG.

TO THIRSTY FOLKS.

MANY a weary and thirsty person could often get a good drink of water, if he would carry out with him, especially when he goes into the country, a short length of India-rubber tubing. By putting one end into the water, and the other into his mouth, he may frequently get draught of pure and clear water from very all springs and pools, where it would be impossible to get it in any other way.

J. R. EDMONDS.

WASTEFUL FIRING.

—Will you allow me to ask some of your readers in Scotland, if it would not be possible to retain and utilise the large amount of gas usually allowed to go to the chimney? I confess that I do not understand all the processes of gas-making, but it strikes me that the coal used in an ordinary kitchen ought to light the house; and if any one would produce a stove to accomplish that, I should think his fortune would be made.

FOR WHAT IT IS WORTH.

TREATMENT OF BUILDERS.

—On the 18th of June invitations were issued to five eminent builders in Hull and elsewhere to inspect the plans, &c., for the proposed alterations and restoration of the old castle in the East Riding of Yorkshire, prepared by a firm of Hull architects, with a note appended that the tenders must be delivered on Friday, the 23rd, at noon; and, in complying, all the tenders (one of which was delivered on the Friday, and, as a matter of course, the lowest was recommended to the proprietor for acceptance, and was actually accepted on the Saturday, in strange to say, the tender referred to (by a Scarborough) was forwarded on the Saturday, at 4 p.m., thus only seven hours behind the specified time, when, when found to be upwards of 1,000*l*. below the price stipulated at the appointed time, and was consequently accepted. Will any of your correspondents advise me the right way for architects to treat builders, or spending so much valuable time in taking out and weighing quantities?

A LOVER OF STRAIGHT DEALING.

THE REPAIR OF PAVEMENT OVER CELLARS.

THE VESTRY OF ST. GEORGE'S, HANOVER-SQUARE, W. COL. R. W. HAMILTON.

MR. POLAND (for the Vestry) explained, in opening the case, that he was instructed at the Westminster Police Court, that he was instructed to take out a summons against Col. Hamilton for the recovery of 8*l*. 13*s*. 4*d*. being for repairs executed by the parish in making good the pavement at 108, Eaton-square. He rested upon the 11th & 19th Vict., cap. 120, sec. 102, which said that all cellars, arches, and cellars were to be kept in proper order and repaired by the owner or occupier of the house. The question in question was really the roof of the cellar, being on its walls. When originally put down, the pavement was 5 in. thick, but it had now worn to 2*1*/₂ in. and Mr. Hamilton had repaired the landing, and called upon Mr. Hamilton to pay the expense; but he repudiated all liability, and hence the present proceedings. He (Mr. Poland) contended, however, that the defendant was bound to put down flagstones 11 ft. long to re-cover the roof of the vault, for as the rule the flagstones they put down as pavement were much smaller. The vestry had taken many others, and involved very considerable expense. Mr. Turner (for Col. Hamilton) supposed his learned friend had not disputed the facts, but the inference he drew therefrom. If the decision was adverse, he would ask for a case for a superior court. He wished to know, that Col. Hamilton's lease was granted in 1829; that Act on which Mr. Poland relied was passed in 1855, and steps had been taken till the present time. His learned friend had said the pavement was the roof of the vault. True, the under-surface was, but the roof of the cellar was also the pavement at Eaton-square. It was not, then, Eaton-square had no pavement. He submitted that this pavement was not a "covering" within the meaning of Michael Angelo Taylor's Act (57 Geo. III., c. 29), sec. 70, and moreover 7 Geo. IV., cap. 25, s. 68, this pavement was vested in the trustees of Lord Bunsford's property, and by the 18th & 19th Vict., c. 120, sec. 95, their powers and liabilities were transferred to the vestry of St. George's; so that the parish

was clearly bound to repair this pavement. Besides, there was already a decision of Chief Justice Erie (Robbs v. Jones, 13 C.B. N.S., p. 231), where an action was brought against the owner of a pavement, to recover damages in consequence of an accident through the pavement falling. It appeared that the pavement was in front of a house on the Surrey side of Waterloo Bridge, and a crowd having assembled, through a distress being put into the house, the pavement gave way, several persons were injured, and one was killed. The judge ruled that the plaintiff must be non-suited, and gave judgment for the defendant. He (Mr. Turner) contended that as the pavement in front of Col. Hamilton's house was worn out by public traffic, the vestry were bound to repair it. After some further remarks on both sides it was agreed that Mr. Poland should draw up a case for a superior court.

RE-ARRANGEMENT OF THE METROPOLITAN BOARD-ROOM.

SIR,—The public are largely interested in this matter; the question being, shall the public enjoy as much facility as they have hitherto enjoyed in hearing the debates of the Metropolitan Board of Works? Several classes of persons need accommodation in the public meeting-room of the Board:

1. The chairman and the officers.
2. The members of the Board.
3. Any deputation or other persons who may have been called upon to transact business with the Board.
4. The Press.
5. The public.
6. Those visitors who, by reason of their rank, &c., are privileged "to occupy seats on the bench" beside the chairman.

It is in the interests of Class 5—the common, vulgar, impertinent, inquisitive, awkward, rate-and-coal-tax-paying public—that I write. Hitherto, these intruders have been placed in a small gallery at one end of the room, and have been able to hear the debates and proceedings very well indeed; and they heard them because the reporters were also placed in the same gallery—these latter upon the front seat. Now the move is to place the reporters in the body of the room, and, I suppose, to leave to the public the whole of the gallery at the end of the room. Hitherto, the members of the public were obliged to speak in such a tone of voice that the public must hear, or (as the reporters were close to the public) the speeches could not be reported. The officers, also, in reading their reports, were obliged to speak up, or the reporters could not catch the drift of the debates on the reports. Let us hope that, in rearranging the public meeting-room of the Board, the seven members who constitute the committee to which the question is intrusted will remember that their duty is to arrange the room so that the public can hear the proceedings.

RATEPAYER.

ACCIDENTS.

A SHOCKING accident has taken place at Messrs. Culhite's building yard. A labourer employed in white-washing the premises got his clothes entangled in the machinery, and had every bone in his body literally crushed to pieces. He had sufficient consciousness and self-collectedness to state that he was taken round fourteen times by the wheel. He died shortly afterwards, and a verdict of accidental death has been returned.

A fatal accident has also occurred at the works of Messrs. Cooke & Swinerton, Grimesthorpe, which resulted in the death of two men and the more or less serious injury of three others. Messrs. Cooke & Swinerton have been adding to their works by the erection of a large forge and rolling-mills. The new buildings were commenced in March last, and it was expected they would have been completed in the course of a few weeks from the present time. One of the buildings is so far advanced as to permit it to be roofed, and at the time of the accident the workmen were engaged in putting up a portion of the roof of the second building. The framework of the roof consisted of a number of heavy iron principals, spanning the whole width of the building, and resting upon the walls on either side. Eight of these principals were up and fixed. Just as the men were about to raise the ninth, "something seemed to give way,"—as was described by an eye witness,—and seven of the principals came tumbling to the ground. Eight men were at work at the time, and only three of them escaped uninjured. Mr. Francis Taylor, the contractor for the roof, was in the building at the time of the accident, and he had a very narrow escape. As it was, he was knocked down, and one of his men fell upon him. The cause of the roof giving way is unknown, and at present the accident seems inexplicable.

CHURCH-BUILDING NEWS.

Cleator Moor.—The new church of St. John, at Cleator Moor, has been consecrated by the Bishop of Carlisle. The new edifice is an adaptation of the Norman style of architecture to the requirements of the present day. Externally, it is a plain, unpretending building, suited to the district in which it stands, where any external ornament would rapidly become disfigured with soot, and he out of harmony with the immediate

neighbourhood. The width of the walls—all 4 ft. thick—give a solidity, in look and reality, which is in their case necessary, as the whole church is covered with vaulting which rises to a height of 40 ft. over the nave. This vaulting supports the timbers of the roof. In the chancel, the groining ribs and the chancel arch are of wrought stone. All the other portion of the church is lined with brick, pointed, and a cavity between the outer wall and the inner one of brick is filled with asphalt, to keep the inner wall dry. The seats are of pitch pine. Stained glass windows (donations) adorn the east and west ends. The original estimate given by the architects (Messrs. Cory & Ferguson, of Carlisle) for the church, without the parsonage house and cemetery walls, was 3,300*l*., which sum is rather above the finished cost. Accommodation is afforded for 600, 450 being adults and 150 children.

Rickmansworth.—The church erected by public subscription at Croxley Green, has been consecrated by the Bishop of Rochester. The edifice has now been completed some months. It stands on a portion of the green immediately abutting the high road from Watford to Rickmansworth, and is built in the style which prevailed in the thirteenth century, or transition from the Early English to the Decorated. The exterior is cased with Bath stones, the quoins, windows, &c., being composed of a stone obtained from the quarries of Douling, in Somersetshire. The roof is covered with Staffordshire tiles, and the circular spire surmounting the tower with ornamental tiling of the same description. The entrance is on the south side, where there is a porch with a flight of steps. The tower, which is placed on the north side of the church, forms an entrance to the vestry. In the interior, the walls are cased with red bricks, diapered with blue bricks in ornamental patterns. The roof is of open timber, the chancel being vaulted with wood work. The flooring is for the most part of Godwin's plain tiles, but the chancel is laid with ornamental tiling. The seats are made of English oak, and the chancel is fitted with carved stalls. The reredos is composed of arcading in Caen stone, the centre panels being adorned with some wrought canopy work. The pulpit is composed of Douling stone. At the east end is a painted glass window. The building will be lighted by gas, by means of three coronas. The church, which has been erected at a cost of some 2,500*l*., is capable of seating about 250 people. The edifice has been built by Mr. Clark, of Bath, from designs by and under the superintendence of Mr. Norton, of London, architect. The ground surrounding the church has been laid out by Mr. Skidmore, of Rickmansworth.

Balderstone, Rochdale.—St. Mary's Church, which completes the group of buildings, comprising church, vicarage, and schools,—all erected by the liberality of the Messrs. Radcliffe,—has been consecrated by the Bishop of Manchester. The site is triangular in shape, bounded on the east by the main Oldham-road; on the west by the old road to Oldham; and on the north by a street passing close to the churchyard, and leading to the Greenfield Mills. The principal view of the church,—if, indeed, one be superior to another,—is the north-east, which is seen on approaching the church from the town. It takes in the east chancel gable, mainly occupied by a large five-light traceroed window. The stonework of the window is moulded, and on each side of it is a slender shaft, with a carved capital. This, like each of the main gables, is surmounted by a carved stone cross. The tracery of the windows is considerably varied, although there are some forty or fifty in the church, besides those of the heiry. On walking round the outside from the east towards the north, on the north side of the chancel is seen a two-light window, lighting the sanctuary; and farther on, under the eaves, a pair of clearstorial rose windows. The east gable of the organ-chamber, containing a three-light traceroed window, a little square quatrefoil on the north side of the organ-chamber, and a small window in the east of the transept, come next in order. In the north gable in this transept is a rose window, 10 ft. or more in diameter. Below it is a buttress, circular on plan, resting on an hexagonal base, and flanked on either side by a pair of narrow cusped windows. A carved head runs across this gable, above the large rose window. At the extreme north-west corner stands the steeple, with a tower and spire rising to a height of nearly 150 ft. The spire is a broached octagon, with canopied pinnacles rising from the brackets. The west gable contains a large four-light window; below it is a projection of some

feet, with a battlemented cornice. The south elevation generally resembles the north, except that the details are different. In the interior, the marbles, granite, and alabaster; the coloured mural decoration; and the colours of the stained glass, all contribute to enhance the general effect. The eastern end especially attracts the eye. The chancel fittings are of oak. The east wall of the chancel is almost entirely occupied by the rosettes and the east window. On each side of the chancel are large arches, opening into vestry and organ-chamber respectively. The east chancel-window is of five lights, and is filled with stained glass, in subjects, by Messrs. Heaton, Butler, & Bayne. The transept windows, and those at the west ends of the aisles, are also filled with stained glass by the same firm. The great west window,—which is a memorial one,—is filled with subjects all relating to the Resurrection. The rest of the glazing is in simple patterns in various shades. The church is lighted by brass gas standards, one in the centre of each of the nave arches. There are two gas coronas in the chancel, and supported against the wall by floriated brass brackets. The general contractor is Mr. Mark Foggett, who has carried out the work from the designs, and under the superintendence, of the architects, Messrs. Medland & Henry Taylor, of Manchester.

Little Lever.—The church of St. Mary the Virgin, in this parish, has been re-opened, after having undergone alterations, embellishment, and enlargement. The ancient fabric, which possessed several features of interest, has been completely renovated; the old eastern wall and window have been replaced by a chancel arch, and a new chancel has been added, thus considerably increasing the accommodation. The church is benched with new carved oak benches, choir stalls of the same material being substituted for the high-backed pews. The restoration has been in progress about twelve months, and has been carried out under the direction of Mr. J. Goldie Turner, of London, architect, the cost having been defrayed by the Rev. Richard Palmer, rector of Purley, Berks, the brother of the late rector, and as a tribute to his memory.

Middlesbrough.—The foundation-stone of St. Peter's Church, Lower Feversham-street, Middlesbrough, has been laid. The church is cruciform in plan, consisting of a nave, two transepts, and a chancel. The chancel has an apsidal end. The style of the architecture is Early Gothic, of a plain description. There will be sitting accommodation for about 315 persons on open benches. The roof will be open-timbered. Mr. Blessey, of Middlesbrough, is the architect. It is estimated that the cost of the church, which will be built of red-pressed brick, will be about 1,600l. Mr. H. W. F. Bolckow, M.P., gave the site.

Rotherhithe.—A new church at Rotherhithe, erected to a great extent at the expense of Field-Marshal Sir William Maynard Gomm, G.C.B., lord of the manor of Rotherhithe, has just been opened. The church, which is dedicated to St. Barnabas, is situated in Plough-road, on what was once an expanse of market-garden ground, extending from the Surrey Commercial Docks and the new Southwark-park, to the boundary of the parish of Deptford, where the counties of Surrey and Kent join, but which is now a populous neighbourhood, laid out in numerous streets. The architectural proportions of the church are striking, although the materials used are plain. A large portion of the interior fittings and other articles are presents from friends. A costly marble font is a present from Lady Gomm. The pulpit is given by Mr. Charles Churchill; the altar by the architect (Mr. Butterfield); the lectern by the Rev. H. Bailey; the font-ewer by Mrs. Bailey, and the organ by the rector (the Rev. J. E. Beck) and his private friends. The cost of the church, exclusive of the gifts named, is 6,000l. In connexion with the church a site has been given by Sir William Gomm for new schools, which are to be immediately erected.

Wetheral (Cumberland).—The restoration of the church here is commenced. The contract has been taken by Mr. Ormiston, of Warwick. It is intended to complete the chancel before proceeding to commence the nave and aisles. The dean and chapter of Carlisle undertake the chancel, the rest falling to the parish. Mr. Withers, of London, is the architect. The estimated cost is about 2,000l.

Southleigh.—The parish church has been re-opened, after having undergone a restoration. The bishop of the diocese separated the living

from that of Stanton Harcourt, and gave it to the present vicar, the Rev. G. Moultrie, and Mr. Sibthorp added considerably to the endowment of the church. A house for the clergyman to reside in being now very much needed, his present residence, which is a commodious one, and designed by Mr. John Gibbs, of Oxford, architect, was soon afterwards built by voluntary contributions and grants from different societies, at a cost of about 1,600l. Next came the new schoolrooms, which have been erected just below the village green. Mr. Sibthorp gave half an acre of land on which to erect them, and also a large sum of money towards the carrying out of the work. This gentleman has also been instrumental in the restoration of the church. The chancel has been newly roofed, and the floor laid with encaustic tiles. There is also a new oak altar, the front of which is carved and decorated. On the centre vesica is painted Our Lord in glory, and on the side panels are four figures symbolising the worship of heaven and the worship of earth. There are new oak stalls for the clergy and choir. The ends of the stalls are carved, and in the front part of the backs of the same is tracery work. The roof is of open deal, varnished. The whole of this part of the work was done by the Ecclesiastical Commissioners at a cost of about 300l., and the architect for the same was Mr. Christian, of London. A new stained-glass east window has been placed in the church, this being the gift of the family of the late Mr. S. Druce, of Eynsham. The subject is that of St. John the Baptist, who points to the Lamb of God in the distance, and in the top lights are angels holding instruments of the Passion. The wall paintings have been restored by Messrs. Burlinson & Grylls, of London. The subjects are "The Resurrection," "The Gates of Heaven," "The Weighing of Souls," "St. Clement of Rome," and "The Annunciation." The ancient oak pulpit in this church, in which John Wesley preached his first sermon in 1726, has been preserved. The base of it, however, has been rebuilt with Milton stone, inlaid with encaustic tiles. The chancel is divided from the nave by the old carved oak screen with tracery work, and surmounted by a cross. The old deal pews and other seats in the body of the church have been replaced by low-backed seats of pitch pine, varnished. The ends of these seats are also carved. The floor of the aisle and nave are laid with black and red tiles; and that under the seats is of wood. The church is heated with hot-water pipes, which run along the whole length of the building under the nave and aisle. The old altar has been removed to the side chapel, which is at the east end of the north aisle. The wall-paintings were restored at the expense of Mr. Sibthorp. An olive-wood cross has been presented to the church by Mr. Evans, to be placed on the altar; the wood grew on Mount Calvary. The porch at the south entrance to the church was in a very dilapidated state, and it was therefore taken down and rebuilt with local stone. The dressings are of Milton stone, as are also the cornices, springers, coping, apex, and cross above. The churchyard has, for the most part, been levelled, and new paths laid out. Mr. C. Rolfe, of Reading, was the architect, and Mr. Groves, of Milton, the contractor for the whole of the work. What has already been done has cost about 1,000l., and an outlay of upwards of 300l. more is required for re-roofing the body of the church. The wood-work of the tower and the bells are also in urgent need of restoration.

Hertford.—The alteration and extension of All Saints' Church have been long talked of, and at length the works have been begun. Mr. Norris is the contractor. The proposed alterations and extensions comprise an addition to the north transept, which will run parallel with and nearly to the end of the chancel, comprising within its walls a new organ-chamber and a vestry-room, and a number of additional sittings. The gallery, which now extends over the north transept, is to be shortened, to correspond with the opposite side, and the pulpit and reading-desk are to be new, and placed opposite to their present positions, and material improvements are to be made near the communion-table. The works are from the designs of Messrs. Wilds & Son. Delay has been caused by suggested alterations in the plans, and impediments of various kinds.

Donarh (Carringtonshire).—The church has just been re-opened, after extensive alterations. The nave and chancel were modern, and have been entirely remodelled, with new windows, roofs, and fittings, and the ancient tower

repaired. The expenditure has been about 900l. Mr. Withers, of London, was the architect, and Messrs. Jones & Sons, of Llywngog, were the builders.

SCHOOL-BUILDING NEWS.

Salterhebble.—A new infant school, to be connected with the national schools at All Saints, Salterhebble, is about to be commenced. The site is on the sloping ground in Chapel-lane, and the design is by Mr. Barber, architect. It will have a large room, 40 ft. by 19 ft., and a classroom, 17 ft. by 13 ft. Beneath the school-room is a covered playground, 30 ft. by 19 ft., opened by large arches into the playground. The building will be erected at the cost of C. Holdsworth.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Northfleet.—The school-church of SS. Mar and Francis has been opened by the celebration of Pontifical mass by the Bishop of Southwark. The building is of flint, with stone and brick dressings, and is the work of Mr. Thomas Blak from designs by Mr. James Multon, of Gravesend. It is in the Early English style, and measures 64 ft. outside 64 ft. by 24 ft. It has an open rosette on the outside, with ridged tiles at the centre, and surmounted by a bell-turret, and crosses at the extremities. The chancel can be screened off at pleasure by a serviceable covance.

Greenburn.—The new Roman Catholic Church about to be erected here, will be in the Early English style, and will consist of nave, semi-octagonal sanctuary and vestry, the accommodation being for 600 persons. The architect are Messrs. W. & R. Ingram, of Glasgow.

Wigan.—The chapel in Caroline-street, which formerly belonged to the Primitive Methodist Society, and used by them as a place of worship, a chapel has been considerably enlarged—has, in fact, been almost rebuilt,—and it has been formally opened as a church, dedicated to St. Joseph. The edifice is situated on the north side of Carlisle-street, and it consists of a wide nave and north aisle, wooden arches and columns separating the nave and aisle; a space is raised at the end of the nave for the purpose of a sanctuary. At the same end of the church, and the aisle side, the sacristy is situated. The chancel is constructed above the sacristy, and, consequently, its position is close to the sanctuary. From the end of the building opposite the altar may be seen the gallery, and under it in the south or street wall the porch, with a glass screen and folding-doors. On the north side, the foot of the gallery stairs, is an extra door, he used in cases of emergency. The plot of land which the erections occupy is nearly a square. On the north side there were the lights of the adjacent buildings to be studied; this circumstance accounts for the shape of the roof on the north side, and of the low aisle. The south Caroline-street elevation is lighted by a series of lancet windows, the jambs of which are worked in moulded bricks from St. Helen's. The entrance door is moulded with brickwork. Generally, the materials have been of the simple character, and the old work, where possible, has been used up again. The principal object of the design seems to have been to arrange the building to be comfortable, and adapt it to modern requirements, and at the same time out of plumb materials to obtain as much church-like effect as possible. The church will accommodate about 1,500 people, and the entire cost will be about 1,500l. Mr. Aspinall, of Wigan, was the builder employed, and the works have been carried out from the design of Mr. Edmund Kirby, architect, Liverpool.

Harrrogate.—Dr. Cornwailton, Roman Catholic Bishop of Beverley, has blessed the first stone of the high altar of a church now in course of erection at Harrrogate, and dedicated to St. Mary's. St. Robert. The altar stone was laid, of course with the rites and ceremonies of the Roman Catholic Church. The church is being built at the designs of Messrs. Goldie & Child, London; the contractor being Mr. Wood, builder, Leeds. It consists of nave and two aisles, divided by pillars. The cost of the building will be 3,100l. exclusive of the internal fittings, and there will be accommodation for 600 persons. The building is of red brick, with stone dressings, and an open timbered roof, and square tower of brick and stone.

FROM SCOTLAND.

Moffat.—The new Episcopal church at Moffat has been opened for divine service. The church, which is built on a deep-laid brick foundation, is situated in Milburnside, which has been recently much widened, and stands about 30 feet off the road, surrounded by gravel walks and shrubbery plots. The walls are of wood, coated with galvanised, corrugated iron, of a dull bluish tint. The sides are buttressed, and up these buttresses the gas pipes are led, concealed, and are taken thence into the interior. Along the ridge of the roof, ventilators are arranged, and these are topped with ecclesiastical ornaments. At the western end, over the porch (in which there are two entrances), there is a small heltry. The whole structure externally assumes the form of a cross, the chancel at the east forming the top, the transepts with the organ chamber and the vestry, the arms; and the nave, with the porch, the foot. The chancel is 14 feet by 15 feet, the vestry and the organ space each 9 feet square, the transepts are 21 feet by 8 feet, and the nave is 55 feet by 22 feet, with a passage 4 feet wide up the centre. The walls rise 14 feet inside, and the roof slopes up till the mid height rises to 26 feet. Over the sliding entrance-door there is a traced and painted trefoil window. In the side walls there are three long painted windows, and in each of the transepts there is a tripartite Gothic window. Above the altar there is a memorial window, in three divisions, executed by James Ballantine & Co., Edinburgh, to whose taste also the other interior ecclesiastical decorations are due. The central design of this window is a Crucifixion scene. On the right is the Holy Family in the stable at Bethlehem, while the wise men worship, and the star in the East shines overhead. On the left we have the angel at the sepulchre, with women around him. An organ (manufactured by Willis, London), occupies the space on the left. The church has been erected at the expense of Mr. J. Toulmin Laurence, of Liverpool, resident in Craigielurn House.

Peterhead.—The foundation-stone of a new public hall for Peterhead has been laid, with Masonic ceremonial.

The Caithness Railway.—The works on the Caithness Railway are being rapidly proceeded with, the contractors for the different sections being strong forces of men engaged. The comparatively level nature of the county renders railway-making an easy task. One of the heaviest cuttings in Caithness, about two to three miles from Wick, is from 18 feet to 20 feet deep, and its excavation is being vigorously prosecuted. The large bridge which will span the river in this cutting, has, it is understood, been contracted for by an Inverness gentleman. In the west end of the county the work is considerably further advanced than in the neighbourhood of Wick.

PROVINCIAL.

Appleby, Westmoreland.—Mr. John Alcock Clarke is just having completed the erection of a mansion (Carbridge House), on the east of Bonthe, near to which runs the Eden Valley, and the Settle and Carlisle Railways, parallel with each other. The style of the building is Early Domestic Gothic: Mr. Octavius Hansard, of London, is the architect. The ground-floor comprises drawing-room, morning-room, library, dining-room, smoking-room, entrance-hall, and a spacious staircase, and servants' offices. The first floor consists of six rooms, with dressing-rooms attached, together with bath-room, and a wardrobe, 29 feet by 18 feet, the latter being constructed with wagon ceiling, 15 feet high, and superior ventilation. The whole of these rooms are fitted with pitch-pine varnished, with the exception of the airing-room, which is of English oak. The ceiling is panelled with oak beam and pitch-pine panels, the floor of the same having a carpet of parquetry, 2 feet wide. The principal fireplaces are of pitch-pine, with twisted balustrades and ornaments with a variety of fretwork, the top being lighted with a ribbed dome-light, rising into a lead flat in the centre of the ceiling, the floor of which is all of parquetry. A private stair leads to servants' bedrooms, on second floor. There is a cistern in the roof capable of containing 1,200 gallons of water, which is pumped up, after being filtered, from a cistern outside, of 5,000 gallons, and underground, entirely depending on the rain that falls for supply. The elevations are of the height of the roof, with two bay windows, of large dimensions. There is also a large oriel window. The

entrance-porch, of rather large dimensions, gives the north front relief, from its carriage-drive. It is ceiled by a ribbed groined arch, and externally finished with a parapet. The masonry is of stone from Barwise Quarry, and is lined with 9-in. brick, leaving a 3-in. cavity between stone and brick. The offices not directly connected with the house are composed of the same material. The whole of the work has been carried out under the direction of the architect, by Mr. M. Little, of Penrith, contractor; Mr. Wm. Court, Carlisle, joiner; Johnston, Brothers, & Co., plasterers; Martindale & Jackson, Appleby, plumbers, painters, and glaziers; the slating by T. Dodger, of Appleby; hot water, Bailey & Son, London. The self-closing shutters, of which the whole of the principal or ground-floor are fitted, are by Clark & Co., of London. The clerk of the works is Mr. McDonald Taylor, of London.

VARIORUM.

"PROFESSIONAL PAPERS ON Indian Engineering: Second Series: edited by Captain A. M. Lang, R. E., Principal, Thomason C. E. College, Roorkee. No. IV. April, 1872. Roorkee: Thomason College Press." Two of the chief papers in this publication are on irrigation in India—the one titled, "Is Irrigation Necessary?" by Captain C. S. Thomason, R.E.; and the other, "A Report on certain Experiments in Irrigation," by E. C. Palmer, C.E., Exec. Engineer. It also contains reports, &c., on bridge foundations on Punjab State railway; a paper on the Toolsee Water Supply Project, by Rionzi G. Walton, C.E., acting executive municipal engineer, Bombay; and matter on the subject of the Delhi Iron Pillar, with a frontispiece.—"Papers on Subjects connected with the Duties of the Corps of Royal Engineers, contributed by Officers of the Royal Engineers. New series, vol. xx. Printed by Jackson & Sons, Woolwich. 1872." The leading paper in this series is an excellent memoir of Field Marshal Sir J. F. Burgoyne, bart., G.C.B., by the Right Hon. Sir Francis Head, bart. We have hitherto known too little of this great general, and it is to be hoped the present brief memoir will be extended. Most of the other matter in the volume is strictly professional, but includes notes on earthworks, demolition of bridges, huts in war, rails and turn-tables, tunnels, &c.—"Transactions of the Manchester Statistical Society, Session 1871-72. Manchester: Roberts, Printer, Chapel-street, Salford. 1872." The paper of chief interest to our readers in this volume is one on "Town Dwellings for the Working Classes," by G. T. Robinson, F.R.I.B.A. There is an inaugural address on the scope and method of statistical inquiry, and on some questions of the day, by John Miles, the president. A paper on "Certain Fallacies in Local Rates of Mortality," by Dr. Rumsey; one on some published results of the census of 1871, by Thos. A. Welton; one on the "Growth of the Commercial Centre of Manchester, Movement of Population, and Pressure of Habitation," by H. Baker.

From *Cassell's Technical Educator* for the new month we get some information as to the means of turning a cube in a Lathe:—

"To turn a perfect cube in the lathe would appear, at first sight, an impossibility; but in reality this is a most simple form to produce,—much more so than the sphere. The cube is a six-sided solid, and all its sides are plane surfaces. We already know that it is as easy to turn a plane surface in the lathe as to turn a cylinder; and to produce a cube, it is only necessary to turn six plane surfaces in certain positions, the one with the other. The turner would proceed as follows:—He would first take a piece of wood sufficiently large to enable him to turn a cylinder out of it, with a diameter equal to the diagonal of the square side of the cube. And this also he would do, cutting the cylinder off to a length equal to the side of a square. This would then show a short cylinder, with two flat ends, or a thick flat disc, and this disc would be placed in a chuck in a position at right angles to the position in which it was turned,—that is to say, the axis of the cylinder is placed parallel to the surface of the chuck, and the lathe being set in motion, a third surface is turned upon the article, which is then removed from the chuck, and replaced with the third flat surface bearing against the surface of the chuck. In this position a fourth flat surface can be turned upon the article; and if the settings have been carefully made, these two last surfaces revolve in right angles to the two, forming the ends of the cylinder. Two further similar settings of the work in the chuck will enable two other surfaces to be turned, and these will complete the cube."

Bursting of a Sewer.—The immense quantity of rain which fell during the thunderstorm in London on Tuesday evening in last week, caused a sewer just above King's-cross Station to burst. A large body of water flowed into the tunnel, in some parts to the depth of 5 ft.

Miscellanea.

The Brighton Meeting of the British Association.—The meeting will commence on Wednesday, August 14, and continue till Thursday, August 22, when it will close with the usual excursions for members and associates. The president-elect is Dr. W. B. Carpenter, F.R.S., &c., who will deliver his inaugural address on the evening of the 14th. On Thursday evening, the 15th, and on Tuesday evening, the 20th, soirées will be held. For these the northern block of the Pavilion property will be appropriated. The Brighton Natural History Society are arranging a complete flora of the south coast, both living and dried specimens; also a microscopical display to which the most eminent London makers and the leading metropolitan societies will contribute. On Friday evening, the 16th, and Monday evening, the 19th, lectures will be delivered by eminent scientific men. It is authoritatively announced that the information received from Dr. Livingstone will be communicated in the geographical section. Mr. Stanley and Dr. Livingstone's son will probably attend the meeting. The geological section will have especial importance by reason of the boring now being made on the estate of Mr. W. Mappin (of Regent-street) at Netherfield, near Battle. The problem is, what underlies the Wealden formation of Kent and Sussex; is there any coal there? Four "half-day" excursions are arranged for Saturday, August 17; and five "whole-day" excursions for Thursday, August 22. The new Brighton Aquarium will be opened and stocked for the meeting. The Brighton Railway Company will issue return tickets to members of the association, available on the 12th August and any following day, to return by any train and on any day to the 26th August.

Steam Whistles.—Mr. F. S. Powell has laid before Parliament, too late, it is said, to pass in this session, a Bill proposing to prohibit, under a penalty, the use of any steam whistle or steam trumpet for the purpose of summoning or dismissing workmen without the sanction of the sanitary authority. The Bill gives power to the sanitary authority to revoke such sanction, and power to the Local Government Board to revoke it on representation made to them by any person who is prejudicially affected by such sanction. The Bill has passed through committee in the House of Lords. It is nothing to be done, however, towards restricting railway stokers or engine men from amusing themselves, at the public expense, both night and day, with noises of the most hideous description, which, even on their own showing, are frequently most excessive and unnecessary, inasmuch as some of them habitually act with a little common sense and consideration for the public, while others as habitually do the contrary, and without the least restriction from the railway authorities; whose searchers, moreover, are obviously, in some cases, of tenfold too great strength, since others used under similar circumstances are far weaker and yet are kept in use, and must therefore be sufficient for the purpose? Such an infamous nuisance ought to be abated, and would very soon be abated if it were committed by the costermongers or other poor and defenceless persons.

Cottage Hospitals.—The new cottage hospital at Tewkesbury has been completed, from designs furnished by Mr. Middleton, of Cheltenham. Seven years ago a cottage hospital was established in Tewkesbury, two cottages having been taken for the purpose. The new building is near the temporary hospital, and not far from the railway station. The foundation stone of a new cottage hospital has been laid at Driffild. The site of the building is on the Nafferton road, in a pleasant and healthy position, and about a quarter of a mile from the town. The building will be a commodious one. The architect is Mr. Howe, of Beverley; and Mr. George Whiting is the contractor. During the five years the institution has been in operation, it has effected much good, and a great number of patients have been cured, and some remarkable surgical operations performed.—The village hospital at Ditchingham, Norfolk, is now being roofed in. It will provide about twenty beds for patients, besides all the necessary accommodation for sisters, nurses, and domestic arrangements. Mr. Botwright, of Bungay, is the builder, who also supplies all the bricks and tiles from his brickfield. The cost will be about 3,000. The architect is Mr. R. J. Withers, of London.

The late Fire at Hartshill Church, Stoke-upon-Trent.—A meeting of the pewholders and congregation of Holy Trinity Church, Hartshill, has been held to receive and consider Mr. Gilbert Scott's report of damage done by the late fire, and estimate of restoring the church. Mr. Scott, in his report said that the damage to the nave and chancel was not great but the tower had been considerably damaged, whilst the spire was also slightly injured. He made suggestions for restoring the church, the cost of which he estimated at 1,900l. Mr. Campbell, who produced the report, added that the cost of the recent decorations was about 300l. A new clock would cost 190l.; a new bell, about 100l.; and a new organ, such as they could manage with, at least 600l. Mr. Scott had made suggestions for the better lighting of the chancel, which would cost 400l. That would make about 3,500l. In addition, there would be the architect's commission and other costs. The alterations required for improving the chancel he (Mr. Campbell) would pay for, and he would give another 100l., making his contribution 500l. Beyond his contribution, they would have to raise over 2,800l. A committee was appointed for the purpose of raising subscriptions. The total amount promised in the room was about 620l.

Serious Risks on the Underground Railway.—During the thunderstorm that passed over London on Tuesday night before last a most exciting scene took place near York-road Station, which is situated in a deep cutting, and the fall of rain was so heavy that a large amount of water had accumulated. As soon, therefore, as the 6.18 train from Barnet, filled with passengers, emerged from the tunnel, the water had reached such a height that it put the engine fires out, and the train was brought to a standstill. The points would not work, the sleepers were afloat, and the wires of the telegraph could not be used. The express which runs on to Farringdon-street was at the time overdue. The majority of the passengers were unable to leave the carriages, owing to the depth of the water; women were fainting; and even the servants of the company seemed paralysed with fear. In the midst of the crisis the express did come up; but the same cause which had placed the Barnet train in its terrible position proved its salvation, for the water also put out the fires of the express engine, which drew up within about 5 ft. of the hindermost carriage of the former train!

The Worcester Model Dwellings Association.—The annual meeting of the members of this association has been held. Mr. G. W. Hastings presided, and there were also present Rev. T. L. Wheeler, Messrs. F. Parker, J. W. Isaac, and H. Aldrich (secretary). Mr. Aldrich read the report, which was unanimously adopted. It thus opened:—"In presenting their eighteenth annual report, your governors are sorry to observe that the causes which have for some long time militated against the well-doing of the model buildings still continue, and, indeed, with greater force. During the past year the two adverse influences, viz., reduced rentals and increased expenditure, have been more strenuously at work than before, to render the financial position of the association more unsatisfactory. . . . The proprietors may rely that if the anticipations are unfortunately not realised in the course of the next twelve months, they will then be called together to consider the best method of dealing with their property."

Tunbridge County Bridge.—A work of some importance to Tunbridge has just been commenced. It is that of pulling down the narrow, dangerous, and inconvenient structure known as the Little Bridge, and of widening the northern approach to it. The entire expense of re-construction has been undertaken by the county, at a cost of 1,471l., the contracts accepted being those of Mr. George Butchard, for the smith's and founder's work, at 995l., and Messrs. Lucy & Tockington for the remainder of the work, at 476l. The preparatory work of constructing rafts, driving in piles, &c., is already completed. The county surveyor (Mr. Martin Bulmer) has the superintendence of the work, and the surveyor to the Local Board (Mr. Hobbs), is to render assistance as the work progresses.

The Late Dr. Aldis.—We hear with very great regret of the death of Dr. C. J. Aldis, the earnest and painstaking medical officer of health for St. George's, Hanover-square. He threw himself heart and soul into all sanitary work: knew what to do, and did it.

Ancient Remains at Compton, Berks.—On the summit of "Cowdown," in the occupation of Mr. Mathews, is a large circular entrenchment called "Purhorough." It consists of a high bank, having a ditch or fosse without, and enclosing an area of about six acres. The vallum throughout its circuit exhibits unmistakable evidence of the action of fire. Here and there, large "Sarsen" stones, or drift boulders, have been met with, but always on the line of the earthwork, some of which are so large that the labourers have found it impossible to raise them, and so have sunk them beneath the reach of the plough. There are four large circular pits, or excavations, on the eastern slope within the enclosure; they are cut in the chalk. There is a Roman encampment visible at the "Slade," in the vicinity of Compton. This entrenchment at "Cowdown" was a stronghold of the Britons, which they must have endeavoured to hold against their more disciplined foe.

New "Constitutional Hall" for Dukinfield.—The foundation stone of a new Constitutional Hall at Dukinfield has been laid by Mr. W. Cunliffe Brooks, M.P. The St. John's District Constitutional Association was established four years ago, and since that time its members have met in premises located in Oxford-road, Dukinfield. The site of the new hall is in Hyde-street, one side of the building being in the Gothic style; the external dimensions being 60 ft. by 47 ft., and comprising one large room (60 ft. by 28 ft.), billiard-room, reading-room, library, and smoking-room. The usual conveniences for hot water, &c., will be in the basement. It is expected that the cost of the structure will amount to 850l., but in addition to this 200l. have been paid for the land. The architects are Messrs. J. Eaton & Son, of Ashton-under-Lyne; and the builder is Mr. J. Crabtree, also of Ashton.

The Steam Roller in Hackney.—A report on the use of a steam roller in the repair of roads, by Mr. James Lovgrove, C.E., chief surveyor to the Hackney District Board of Works, has been issued in a printed form, by order of the Board. It recommends the continued use of the roller, which "will do more good in three turns over the road than the horse-roller will do in twelve." It is more desirable, the reporter thinks, to hire than to purchase, at starting, with option of purchase. Its first cost is 550l.; and it can roll 700 to 800 yards per day. The horse-roller, at work in Hackney, costs 1l. 4s. a day, and the steam-roller belonging to the Islington district costs, in working, about 1l. 12s. a day. On hire, including watching and water, it cost 4l. 10s. 6d. as against 2l. 10s. a day with watching and water.

Presentation to an Employer.—On Tuesday evening last, the workmen in the employ of Mr. J. Dalby Holson, Wesleyan Chapel builder, of Duke-street, Adelphi, invited him to a supper at the St. Martin's, after which they presented him with a handsome alabaster time-piece, bearing a suitable inscription, engraved on an ornamental plate. The presentation was made on behalf of the subscribers by Mr. John H. Jones, the general manager, who, in his address, alluded to the good feeling which has always existed, and to the total absence of strikes in the firm. Mr. Holson, who has just completed some contracts at the Wesleyan Training Colleges at Battersea and Westminster; also chapels at Richmond, Putney, North Woolwich, and Hadley, was necessarily much gratified by the demonstration.

Unhealthy Houses.—The Artizans and Labourers' Dwellings Act, 1868, has been put in force by the St. Giles's District Board of Works for the removal of thirty of the most squalid houses in that district. The medical officer of health having certified that these houses were unfit for human habitation, the legal notices were issued for their demolition. In the case of two the property was in Chancery, and an appeal was lodged against the decision of the Board. The appeal was heard on Wednesday before the justices at Westminster Guildhall, when the Board's decision was confirmed.

In Japan considerable reforms were taking place when the last mail left. The Government had established a patent law. Women have been granted the same rights as men as regards visiting the temples, &c.; all indecent pictures and exhibitions are henceforth prohibited; gas will shortly be laid at Yokohama; a fine suspension bridge is being erected at Yedo; and the burnt-down part of that city is being laid out in streets, 90 ft., 60 ft., and 48 ft. wide.

Monumental.—The statue of the late Lou Stanley of Alderney, by Mr. George Nelson, has been placed on the altar-tomb in Alderley Church, Cheshire. The figure is life-size, in a recumbent position, and represents his lordship in the peer's robes. The likeness, which was obtained from a cast taken after death, is pronounced by Lady Stanley and the different members of the family to be very successful. Of the tomb we have already spoken.

Monument to King Robert the Bruce a Stirling.—A monument is to be erected in Stirling to King Robert the Bruce. Government have given permission to erect it on the esplanade of Stirling Castle.

Builders' Benevolent Institution.—In the report last week of the annual meeting of the charity, it was omitted to mention that while the accounts showed an increase in the amount paid to pensioners, the working expenses of the Institution had decreased.

New School Board Offices.—By an Act, Parliament just printed, the powers of the Elementary Education Act, 1870, are extended in regard to the borrowing of money to enable the School Board for London to purchase land required for the erection of offices for the Board.

Strike of Masons in Preston.—The stone masons in Preston are at present out on strike in consequence of the masters refusing to accede to their demand of an advance of wages of 6d. per day, and 6d. a day extra, as expenses, for every mile they are employed beyond the boundaries of Preston.

TENDERS

For alterations to the workhouse of the Westminster Union. Mr. E. R. Blatchley, architect:—

Warne & Son	£1,459 0 0
Harding	1,375 0 0

TO PAINTERS, &c. WANTED, a respectable and steady Man to act as a WORKING FOREMAN. Constant work. None need apply who have not been accustomed to the management of men. Apply, by letter, to Messrs. GARRARD & SMITH, 500, Edgware-road, London.

WANTED, a respectable YOUTH, aged 15 to 18, in a BUILDERS' OFFICE, who can write a good hand, and make himself generally useful. Write your own handwriting, to A. B. 10, Tavistock-street, Bedford-square, W.C.

WANTED, by a Builder, ten miles from London, an energetic YOUNG MAN, to assist him in his Office, &c. Must be thoroughly acquainted with building, books, and the general routine. If a plain draughtsman, would be an advantage. Address, stating references, salary required, &c. A. G. H. Post-office, Chigwell, E.

PAINTERS.—WANTED, a good WRITER and GRAINER. Constant work. Wages 7*l.* per hour. Apply to Messrs. W. H. & W. BOSKINS, Painters, &c. Darlington.

WANTED, to ARTICLE a well-educated and energetic Young Man, aged 17, to a CIVIL ENGINEER, having plenty of work in town and country. Thoroughly conversant with practical experience.—Address, E. ELLICE CLARK, Assistant Engineer, Town-hall, Banagata.

WANTED, EMPLOYMENT, by a first-class GRAINER and MARBLER, Fife-crook.—Address, A. G. 151, Carlton-road, Knights-town, N.W.

TO BUILDERS, &c. WANTED, by the Advertiser, a SITUATION as OUT-DOOR FOREMAN. Has had the management of first-class jobs, both in town and country. Thoroughly understands the preparing of jobs and other work. Carpenter and Joiner by trade. Age 42. Good references.—Address, B. E. 28, Olyn-street, Vauxhall-gardens, Lambeth.

WANTED, by a really good DRAUGHTSMAN, MAN, ENGRAYER, well versed in construction and perspective. Salary, 9*l.* per week.—Address, ALPHA, Post-office, Broadway, Deptford, S.E.

WANTED, a RE-ENGAGEMENT, as WORKING SHOP FOREMAN, or to take the Charge of a Job, Joiner by trade. Good references.—Address, A. B. 22, Great Suffolk-street, Borough, S.E.

WANTED, a RE-ENGAGEMENT, as WORKING FOREMAN of CARPENTERS and JOINERS. Wages required, 2*l.* 2*s.* per week. Age 32. Good reference.—Address, C. 2, Cambridge-terrace, Finsbury.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, by a competent and energetic ASSISTANT. Can prepare plans, draughtsmanship, and estimates, and is well versed in accounts. Age 25. Highest testimonials.—Address, No. 537, Office of "The Builder."

TO ARCHITECTS, SURVEYORS, &c. WANTED, a RE-ENGAGEMENT, by an ARCHITECTURAL ASSISTANT, of some years' experience. A permanency preferred.—Terms about 5*l.* 6*s.* per week.—Address, No. 509, Office of "The Builder."

TO BUILDERS, &c. WANTED, a RE-ENGAGEMENT, by a systematic FOREMAN of twelve years' experience, who directed a shop of seventy benches several years. Salary in keeping with the depressed state of the trade, and the country preferred.—Address, X. 3, Post-office, Roshall-terrace, London.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT as SHOP FOREMAN of JOINERS, GENERAL FOREMAN, or CHARGE of a JOB, by a practical man of good experience, good draughtsmanship and designer, well up in making and estimating drawings, &c. First class man of men, and setter out of working-risks. Good references and testimonials.—Address, 520, Office of "The Builder."

TO BUILDERS AND PLUMBERS. WANTED, a SITUATION, by a Youth, aged 17, as PLUMBER'S LABOURER. Has been used to the same three years.—Address, B. G. 4, Ladbroke-terrace, Bayswater, Histon.

WANTED, a SITUATION, by a practical BRICKLAYER, in all his branches, to work on an estate or for a good Jobbing Builder. Town or country. Seven years' character. Address, M. N. Post-office, Reading, Wiltshire.

TO BUILDERS. WANTED, a SITUATION, by a first-class Builder's Clerk of many years' experience. Can take rough estimates, estimate, and work specifications. Has good draughtsmanship. Can price out all accounts. Next book-keeper. Age 36. Salary, 1*l.* 1*s.* per week. References to Mr. C. H. & Sons, 14, Giltford-street, W.C. Mr. Robinson's, 36, Ouseley-street, North, Birmingham.

TO BUILDERS, CONTRACTORS, AND OTHERS. WANTED, a SITUATION, as STORE or GATE KEEPER. Has been seven years as above at a Builders'. Is well versed in all kinds of Builders' and Contractors' duties. Can have seven years' good character from last situation.—Address, W. J. No. 5, Seckford-street, Chesham.

WANTED, a SITUATION, by an experienced CARPENTER and JOINER, in scales and framing, box-work, shop-fronts, stairs, alterations, general repairs, or the general repair of an estate of houses, at very low wages. Age 50.—Address, W. 21, 3, Broad-street, Walthamstow.

WANTED, a SITUATION, as WORKING SHOP FOREMAN of JOINERS, Shop and General Foreman, or Foreman on a Job. A good general knowledge of the various branches. Thoroughly acquainted with either situation.—Address, BARBOLD, 43, Gilt-street, S.E.

TO BUILDERS, PLUMBERS, AND DECORATORS. WANTED, a SITUATION, by a first class PLUMBER, PAINTER, and GLAZIER. Thoroughly understood every branch in the business. Is willing to make himself generally useful. Can do writing and painting. Wages no object, if for a continuance.—Address, B. C. 4, Wellington-terrace, Paddington-green.

WANTED, by a young Man, a SITUATION as PLUMBER. Willing to fill up his time in painting and glazing, &c. Has a thorough knowledge of the trade.—Address, J. M. 20, 75, Cambridge-street, London.

WANTED, by an energetic, practical Man, a RE-ENGAGEMENT as JOINERS' FOREMAN or Foreman of a Job. First-class reference.—Address, ALPHA, care of Mr. Rolfe, 17, St. John's Wood-terrace, N.

TO BUILDERS AND CONTRACTORS. WANTED, by an experienced London FOREMAN, a RE-ENGAGEMENT as FOREMAN of BRICKLAYERS, Clerk of works, or to take Charge of a Job. Good reference.—Address, W. H. No. 4, Moor-lane, Lambeth-road, Lambeth.

TO MASTER BUILDERS AND DECORATORS. WANTED, by the Advertiser, a Constant BIRTH as PAINTER, GRAINER, and PAPERHANGER. Town or country. Age 34. Undeniable reference as to character and ability.—Address, W. B. 36, Noble-street, St. Luke's, E.

WANTED, by a first-class PLUMBER, a SITUATION. Understands hot-water apparatus. Can do plain zinc work. Fill up time painting and glazing.—Address, J. S. No. 12, John's-road, Beck-road, Kingland, N.

WANTED, by a good PLUMBER, an ENGAGEMENT, or Piece-work, in general Plumbers' Work and Gas Fittings. First-class testimonials.—Address, A. B. 3, Chippendale-terrace, Harrow-road.

TO BUILDERS AND BUILDERS. WANTED, by a thorough practical PLUMBER, a JOB or SITUATION of first-class references as to ability. Town or country.—Address, J. W. 33, Warmior-road, Wyndham-road, Camberwell.

WANTED, by a Young Man, a SITUATION as THREE-BLANCH HAND. Can do gas or plain zinc work. Good references if required.—Address, G. H. 1, 25, Glass-walk, Lambeth-road, London.

TO BUILDERS and OTHERS. WANTED, by a young Man, a PERMANENT SITUATION, in Town or country, as PAINTER and GLAZIER. Can do Jobbing plumbing, gaswork, plain zinc-work. Has been used to general house repairs. Has a good reference if required.—Address, J. B. New-street, Park-town, W.

TO LANDLORDS and OTHERS. WANTED, by a BRICKLAYER, constant EMPLOYMENT. Thoroughly competent to take entire charge of repairs to an estate.—Address, J. R. 89, Cumberland-street, Hackney.

TO IRONMONGERS and CONTRACTORS. WANTED, by a first-class BELLHANGER, a SITUATION. Can do undertake gas work if required. Highest references can be given as to character.—Address, A. Country engagement preferred.—Address, 511, Office of "The Builder."

WANTED, to TAKE PAINTING, GRAINING, &c. or to Take Charge of a Job, or Foreman of PAINTERS. Can be highly recommended. Age 30. Address, F. O. 3, Watford-terrace, Old Pancras-road, N.W.

TO BUILDERS. WANTED, by an experienced SHOP FOREMAN, a quantity of JOINERS' WORK to FINE PAPER. Labour and material, or labour only. A good reference, strictly will be given and required.—Address, W. A. 34, Park-street, Lambeth.

TO BUILDERS and PLUMBERS. WANTED, by an experienced Man, a SITUATION as PLUMBER and GASFITTER. Can do water, laths, pumps, and deep well work, plain zinc-work, &c. Town or country. Can have good references.—Address, G. R. 35, Sussex-street, St. Paul's, E.C.

TO ARCHITECTS, BUILDERS, AND OTHERS. WANTED, a permanent ENGAGEMENT as GENERAL CLERK and BOOKKEEPER. Age 23. Quick at figures, and has a fair knowledge of drawing, &c.—Address, A. B. Post-office, Eastingside, Hants.

TO CIVIL ENGINEERS, &c. WANTED, a permanent ENGAGEMENT as DRAUGHTSMAN. Has been trained at the best schools, 10 years on plans, &c. Large public gas, water, and drainage work and previously two years with an architect. Good references, &c.—Address, C. 24, Blandford-street, London, E.C.

TO BUILDERS and CONTRACTORS. AN experienced ESTIMATOR, MEASURER, &c. requires a SITUATION. Has had great experience in all the above branches. A young Man, desirous to get into general office work.—Address, X. Y. Deacon's News-room, Lead-hall-street, E.C.

AN experienced ARCHITECT'S ASSISTANT, desires an immediate RE-ENGAGEMENT at a moderate salary. Has been accustomed to working out contract drawings from rough sketches, and to the general routine work of an office. Age 23. Address, C. 20, Kingsway-street, Finsbury, London.

TO ARCHITECTS AND QUANTITY SURVEYORS. AN experienced ASSISTANT requires a RE-ENGAGEMENT. Age 24.—Address, C. B. 34, Oval-road, Kennington, S.W.

TO ARCHITECTS, SURVEYORS, AND ESTATE AGENTS. A JUNIOR ASSISTANT is desirous of an ENGAGEMENT. Next draughtsman and writer, all knowledge of perspective, and wishes, if possible, to have further practice in the art.—Address, M. A. G. 11, Hulse-road, South Hackney, N.E.

TO BUILDERS, CONTRACTORS, AND ESTATE AGENTS. A GENTLEMAN, of large experience, desirous of a permanent SITUATION, either as AGENT or MANAGER. Twelve years' experience in building and public works, and well up in quantities, plans, estimates, &c. per cent. levelling, &c.—Address, M. 3, Post-office, Finsbury, London.

TO ARCHITECTS and BUILDERS. A SITUATION, by an experienced CLERK of WORKS, or as BUILDER, to reside in Fife-shire. About 100*l.* per annum. Desires a large charge. First-class references and testimonials.—Address, C. F. care of Mrs. Hodgkiss, 12, Cross-court, Drury-lane, W.

TRAVELLER.—A Gentleman, well up in the Timber and Building trade, an active and of sound character, desirous of a permanent SITUATION, either as AGENT or MANAGER, to superintend a job or otherwise. Good references.—Address, B. H. 20, St. Vincent-terrace, Bucca-street, Histon, N.

TO ARCHITECTS AND DECORATORS. A DECORATOR, PAINTER, &c., &c. thoroughly good workman, desirous of a permanent SITUATION, in the management of first-class work, wishes for an immediate ENGAGEMENT, to superintend a job or otherwise. Good references.—Address, B. H. 20, St. Vincent-terrace, Bucca-street, Histon, N.

TO ARCHITECTS AND DECORATORS. A FIRST-CLASS Decorative ARTIST, wants EMPLOYMENT. Town or country.—Address, Office of "The Builder."

TO ARCHITECTS AND WRITING. A FIRST-CLASS GRAINER and WRITER, is open to a JOB.—Address, B. YOU'NG, 186, Vauxhall-brook-road, Finsbury, S.E.

A COMPETENT PLUMBER desires a SITUATION, or object to take all the work at a moderate wages, not to exceed six shillings as a continuance. Seven years' reference.—Address, W. ALLES, 113, Clifton-street, Finsbury, E.C.

TO BUILDERS AND DECORATORS. A GOOD CARPENTER and JOINER, wants EMPLOYMENT, at moderate wages, either at a shop or building, or in a Jobbing shop. Particulars drawings, set out work, or will undertake any kind of plain or fancy woodwork at home.—Address, A. Z. 6, York-terrace, High-street, Clapham.

TO SAW-MILL PROPRIETORS AND TIMBER MERCHANTS. THE Advertiser, who has been thirty years employed in an established saw-mills, with timber connected, is desirous of a SITUATION as CLERK, TOWN TRADER, or COLLECTOR.—Address, A. B. 31, Queen Margaret-street, Mile-end, E.

TO BRICK-MAKERS, STONWARE POTTERS, AND OTHERS. THE Advertiser is open to an ENGAGEMENT, is well up in all kinds of plans for the above. Seven years' experience. Particulars for Brick-making, &c. of all kind now in use. No objection to going abroad.—Address, J. WILLIAMS, 11, Mendell's Brick Works, Northampton, Yorkshire.

TO ENGINEERS AND OTHERS. THE Advertiser having had considerable practical experience in Building and other Works, and possessing a sound knowledge of mathematics, physics, and chemistry, desirous of an ENGAGEMENT. The highest references can be given.—Address, F. H. 1, Mackenzieburgh-street, Mackenzieburgh-square, W.

TO ORGAN-PIPE DECORATORS. A CONSTANT EMPLOYMENT to a good HAND.—FORREST AND SONS, Organ-Mechanics, High-street, London.

A SITUATION WANTED, as IMPROVED PLUMBER in a SHOP, by a respectable Man, had seven years' experience. Jobbing work objected to. Wages Address, 525, Office of "The Builder."

STAIRS.—A first-class STAIRCASE HAND is in WANT of a JOB, either in town or country, at a Shop or Out-door Working Foreman. Another in town or country. Address, B. I. Ingestre-place, Broad-street, W.

QUANTITY TAKER, MEASURER, &c. ESTIMATOR, of upwards of twenty years' experience, with practical knowledge of building, and well acquainted with London prices, offers TEMPORARY ASSISTANCE upon reasonable terms.—Address, SURVEYOR, 25, Thornion-street, Drury-lane, W.

QUANTITIES and MEASURING. A SITUATION of considerable experience in OFFICE MEASUREMENT, and in the use of the DIAGONAL. He is practically acquainted with Builders' accounts, having to do with the same.—Address, SURVEYOR, 7, Isaacson's Garden-road, S.W.

The Builder.

VOL. XXX.—No. 1540.

Wolverhampton Congress of the British Archaeological Association.

NOTWITHSTANDING indifferent weather, the British Archaeological Association have been spending a useful and satisfactory week in Wolverhampton and its neighbourhood. When it was first arranged to visit this part of England, the Black Country as it is called, it was said on all sides that there was nothing to be seen, while the fact of the matter is, that the difficulty has been to select what should be omitted from the programme. The approach to Wolverhampton by rail, from London, is not calculated to raise expectations: the scene is one of ruin,—all black and irregular: furnace chimneys, smoke, masses of *debris* from the foundries, are the prominent elements of the picture. No order, no regularity; heavy nowhere—all ruin. And yet from this ruin comes wealth: call Earl Dudley into court to prove it if necessary. Arrived at the town, it is found much brighter in parts than could have been anticipated. Of its ruins, it is not intended to speak now, but we all have something serious to say about these on another occasion. Every endeavour ought to be made in a town like Wolverhampton, to bring in art to its aid, and yet one of the speakers, on the first day, was found saying, and with truth:—"There were many things in Wolverhampton calculated to strike the eye of a stranger, and one matter which had struck his attention very particularly was the fact that in an important town like this, where art formed so great a feature in connexion with the chief manufactures of the town, although there was a school of art in the town, yet from the inquiries he had made, he found that it very much lacked support, and was in anything but a flourishing condition. He should be very glad if a few words like these addressed to the working men of the town, or to those who had the leading of them, would induce them to make an effort to alter this state of things. It was a matter of most respect that in Manchester, Rotherham, Sheffield, and many other towns, more attention was paid to the making of money than to the promotion of happiness. He did believe that the cultivation of art, through the mediums of schools of art, established in our large manufacturing towns, and thus adapting it to the various modes of spreading that which was beautiful, he believed that this would materially conduce not merely to the physical good, but to the happiness of the people."

The Mayor and Corporation received the Association with much apparent satisfaction. The Earl of Dartmouth, the president of the congress, delivered an inaugural address, which was listened to with much interest. Wolverhampton, the president said in the course of it, had long been distinguished and remarkable for its productions in metal-work. Those who had visited exhibitions of late years could not have failed to remark the admirable specimens of clock-work exhibited by the artisans of Wolver-

hampton. Besides that, going back rather more to archaeological times, passing over the period when shoe-buckles were worn, and when gentlemen walked about in full dress, with steel-hilted swords by their sides, which were the production of Wolverhampton, they might go back to the period of the civil wars, a period which he thought would, during the excursions of the week, be vividly brought to their recollection. In this town itself there was a very strong Royalist feeling in former days; he believed he was right in stating that the Goughs of the Old Hall were conspicuous as energetic supporters of Charles I. in those troublesome times. He had alluded to Dr. Plot, and perhaps he might say, by way of a parenthesis, that he very much regretted indeed, in looking over the magnificent engravings which adorned Dr. Plot's volume, that so many of the old Staffordshire houses had passed away, and been replaced by what some considered more tasteful, but what he thought perfectly atrocious buildings, considering what they replaced. So much was this the case that he was almost inclined to shut up the book in despair, and regret that a period of such Gothicism had intervened between the time of those old houses, as represented in the engravings, and the present. Passing on to another topic in connexion with the history of the county, his Lordship remarked that some of them who had read the London papers might have thought that the county gentlemen and magistrates of Staffordshire were extremely unworthy of books, that they had had a very magnificent library offered to them, and had done nothing towards availing themselves of the offer. He was happy to tell them, however, that all difficulties had passed away, and that the Salt Library was now the property of the county in every sense of the word. On the following day he believed a meeting of the committee would be held at Stafford for the purpose of appointing trustees of that valuable gift. He need not enter into the reasons for the delays that had taken place now that they were overcome, but he thought they, in Staffordshire, had reason to be exceedingly grateful to many gentlemen who had taken up the question, and he would particularly refer to Mr. Sneyd and Mr. G. Wrottesley, to say nothing of their excellent chief constable, Captain Congreve, who was half a Staffordshire man, and who had taken a very active part in bringing the matter to a successful issue. He hoped that if the British Archaeological Association ever visited Staffordshire again, the Salt Library would be ready for their inspection. He merely mentioned this to show that they were not so black as they had been painted, although they lived in a Black Country; but, on the contrary, they had a large appreciation of objects of art and antiquity. Referring to the programme for Tuesday he found that one of the places to be visited was Lichfield. He would say nothing about the cathedral, but when they saw the grand west front of that beautiful edifice disfigured, as he must call it, by stucco, they would, he thought, join with him in the hope that the day was not far distant when it might be replaced by solid, durable stone. In the cathedral itself they would find many old monuments well worthy of their attention. Then, again, they must remember that they would be in one of the most ancient cities in Great Britain, situated as it was so near to the great Watling-street, which was one of the most ancient roads in Britain.

Archdeacon Moore, when moving a vote of thanks to the Earl, said,—Earl Dartmouth had expressed a great desire to see the plaster upon the west front of Lichfield Cathedral replaced by stone. No one could more desire to see that done than he (the archdeacon) did. It could only be done at a vast expense; but he believed that if the dean and chapter were permitted to make an agreement, funds would be found for

commencing the work, and no doubt all persons in the county who took an interest in the work would assist in its completion. That front was a great warning against some sorts of hero worship in general, and against plastic worship in particular; but still it was the best specimen of plastic work to be seen. Yet it was plastic, and so far had; and he hoped that there would be no more such plastic work again; and he would be glad to see the noble front of that important edifice of the grand old Church of England which was so much and so seriously indented in these days to the Earl of Dartmouth, once more stone and no longer plaster. His lordship had said that there was little to be seen that was picturesque immediately around where they were assembled; but he (the archdeacon) thought that any one with an eye for the picturesque might there find much that would interest it. When he went out on what people facetiously termed his "steeples chases" (visiting and inspecting the churches), he could find even among the tall chimneys and the whirl of their machinery much that was picturesque, amid all their smoke.

A Vice-President of the Association, speaking to the same resolution, observed that it seemed to him that a visit from such an association to such a town was most appropriate. Here was a place which seemed so wholly of the present, yet was so largely connected with the past; and it seemed to him most important that all that recalled to them the past should be preserved, and that they should not permit their old landmarks to be swept away. Here they were executing works in iron and other metals, wherein much beauty was not always obvious; while the remains of old metal-work showed them a beauty of workmanship often wanting in the work of these days. Even then for the sake of their present work, it was well for them to preserve that which recalled the past. Some told them that such associations as that now visiting the town had done their work, but he thought that that association was more needful now even than twenty years ago; for every day time itself was sweeping away the remains of the past, and where man lent his hand to the spoiler's work there was little hope of preservation. By such visits as that now being paid to Wolverhampton, inhabitants of towns were led to look more closely and curiously at the remains of the past, and to conclude that that which was worth the visit of so many from so far was worth preserving.

At the ancient parish church, to which all then repaired, a paper by Mr. Parke was read, which gave an able sketch of the history of the structure, together with some extracts from a report by Mr. Ewan Christian, who restored the church some years ago, and rebuilt the chancel. The nave is of the Perpendicular period, and is remarkable for its dignity and majesty. It is disfigured by ugly galleries and inappropriate seating, the removal of which is contemplated. A carved stone pulpit, formed round one of the south pillars of the nave, is noticeable. It was built with the column, notwithstanding the opinion of the rector (the Rev. J. H. Iles) to the contrary; the courses run through. An interesting monument to Col. John Lane, who helped King Charles to escape after the disaster at Worcester, some of the old screen-work, and a bronze statue by Le Sueur of one of the Levisons, interested the visitors, and doubtless some of them noticed in the porch a marble tablet, dated 1732, the inscription on which commences thus oddly:—"Near this place lies Charles C. Phillips, whose absolute contempt of riches, and inimitable performances upon the violin, made him the admiration of all that knew him."

The Ancient Pillar.

The great point for discussion, however, was the pillar in the churchyard.

Mr. E. Levis, M.A., said it was believed to be a Danish column from the remains of what were supposed to be the figures of ravens sculptured upon it; ravens having been held in great veneration by the Danes as the companions of their god Odin, as eagles were believed to be those of Jupiter, the owl of Minerva, and the Dove of Venus, showing how the gods of our forefathers were believed by them to be gods of an ornithological tendency. The Danes had two emblematical ravens—one indicative of victory and the other of defeat; and the question was which of these two ravens seen by some on this pillar were. It was known that the Danes committed excessive ravages in Mercia, in 1385, and it was thought on the one hand that this pillar was put up to commemorate some victory of that date, as it was not usual for people to commemorate their defeats. The Saxons on the other hand, were quoted to show that the Danes suffered an enormous defeat in this part of Mercia; but that was the Saxon version, while there was no doubt that the Danes succeeded in firmly establishing themselves here. The cross, he thought, might have been erected to commemorate the same victory; but whether of the Danes or Saxons remained undecided.

Mr. G. M. Hills remarked that whether crosses were erected to commemorate victories he would not pretend to say, but it was well known that in ancient times crosses were erected merely as landmarks. Without any idea of a religious character, it was well known that the Romans raised crosses as landmarks; in fact, it was one of their rules, when surveying a country, that crosses should be erected at special points. It was very probable that a cross, occupying the position which this did, belonged to very ancient times, but its date depended very much upon what meaning they attached to the words "very ancient." He had no hesitation in saying that this cross was of great antiquity; but he failed to discover anything known of the Danes upon it, or to see anything of the ravens of the Danes about it. They would observe certain open spaces in the lower part, and then certain figures in the form of half a lozenge. Five of these could be traced half-way up, leaving five spaces below for a figure under a canopy. In one of these spaces there were distinct traces of a figure. The figures to be traced above those canopies showed that it could not be a Danish, but that it must be a Christian monument. He found in one the ox of St. Luke; in a second, the angel of St. Matthew; in a third, the lion of St. Mark; and in a fourth, the emblem of St. John; while the fifth was filled with scroll-work. This showed that the design was to give the symbols of the four Evangelists, and from this they could venture to hazard a notion of what filled the spaces below the canopies; and from the absence of symbol in the fifth canopy, they could venture to assume that in the fifth space the Crucifixion was represented. The enrichments above were merely scroll-work, with various animals,—griffins and others,—represented in grotesque form and of monstrous description. He thought the date of the cross was about the twelfth century,—the beautiful scrolls would be the work of that century. He had examined the top of the column, and found evidence of provision for the insertion and fixing of another stone, probably a cross. He had no doubt it was Norman work, and belonged to the Norman period, namely, the twelfth century.

At the public dinner afterwards (which was generally presided over by Lord Dartmouth, and passed off very satisfactorily),

Mr. Colwin, in the course of some observations, said he gave Mr. Gordon Hills very great praise for the admirable acuteness with which he described the old pillar in front of the Collegiate Church; still he (Mr. Godwin) was bound to say, as an old Saxon himself, that he could see no reason why the cross should not be of the Saxon period. It had the balustrade shape, which was generally understood to show the work of an earlier people than the Normans, and, without expressing any decided opinion as to the exact date, he must say that he could see no reason in the world why the cross should not be considered as of Saxon origin.

Mr. Edward Roberts, speaking at the same dinner, thought that although it might be true, as had been said, that the cross belonged to the twelfth century,—and he must say that he himself had not examined the details of it with any particular care,—still his impression was that it was Saxon; in other words, it might probably have been executed by Saxon workmen, and not by Normans, just before or after the period of

the Conquest. They all knew that between the Saxons and the Normans there was a very slight line of demarcation, and that what had been for centuries regarded as Saxon now turned out to be Norman, and things that had been regarded for centuries as Norman turned out to be Saxon. Therefore it was quite possible that this cross was executed by Saxon workmen just at the turn of the century where the terminaries of the mouldings showed the character of the age to which they belonged. They had certainly no desire to lessen antiquity, as was shown by their having put eighty years of age on to the central tower of the Collegiate Church.

The matter is so interesting that we shall return to it and give a view of the pillar hereafter.

The Etoctum of the Romans,

now called Wall, was amongst the places visited on the second day. We are not giving a full account, and shall merely touch on a few of the more interesting incidents of the week. Excavations had been specially made at the expense of Col. J. N. Bagnall. Mr. Molineux having collected the visitors around him on the rising ground, which is marked as the site of the old city, reminded them that Etoctum was one of two large Roman stations established in Staffordshire, and was at the junction of two Roman roads—Wattling-street and Icknield-street. By what means Etoctum became a hurried city he did not know. It did not appear to have been occupied by the Saxons; in the word "wall" they had, he considered, evidence of its early ruinous condition. He referred to the notices of the station by Camden and Dr. Plot, who spoke of coins of Nero and Domitian having been found there. Plot spoke of the city as being in a field called the Butts, by which name the field they were now standing in was known to that day. It was believed that the city or its walls extended to Chesterfield (a village visible between the trees). Shaw also described it as a Roman station of large magnitude, and as having been erected about A.D. 120. He exhibited some relics which had been excavated from the holes at their feet on the previous day—pieces of plaster, coloured outside, red, white, and yellow in hue; some nails and pieces of large tiles turned up at the side; patera, a brass stud, pieces of draining pipes, a fowl-bone, &c. These excavations had been made in anticipation of a visit from the British Archaeological Association. A few days since some excavations had been commenced in the Castle Croft, and a chamber had been laid open which it was difficult to identify. Whether it was a public bath, or what it might have been was an open question; but he thought there was no question that the whole of the district was filled with buildings. They found no coins, but some black Roman pottery, and some concrete made of Walsall lime and pebbles. They also laid bare a wall, and found it built of sandstone and concrete, and 3 ft. thick, running north and south. In the orchard below they had traced a wall for 120 yards in length, which was 9 ft. thick, and they hoped to follow both that and the west wall until they came to one of the gateways by which the town was entered. He had no doubt that Etoctum had originally a frontage of a mile to Chesterfield. They looked forward to the discovery of the cemetery with much interest, and it was intended to prosecute these excavations up to Chesterfield, and to show, as he believed they could, that they had at Wall as interesting and important a Roman station as the Shropshire people had in Uriconium.

Eiford Church, Eiford Lodge, a luncheon at Haselour Hall, and other incidents kept the members too long from Lichfield Cathedral, so that Mr. Gordon Hills was forced to condense overmuch his account and comments on that most interesting structure. To what he did say we may return.

Early Constructions.

At the first evening meeting, held in Wolverhampton Town-hall, Mr. J. S. Phené read a paper on Uniformity of Design in the earliest British and Continental Constructions, illustrated with a number of carefully prepared diagrams. He commenced by drawing attention to the uniformity which prevails in the remains of early British places of occupation, which, notwithstanding their rareness and wide separation, arising from removal for agricultural purposes, still retain features which make them so identical as to represent the work of a single people. He considered this by no means affected the question of another race having immigrated amongst them, or even been sparse pre-

occupants of Britain, and the very fact of the extreme distances between British remains of the same design and class, for the illustration of which he selected the most remote places,—from the Hebrides to Kent, and from Northumberland to Cornwall,—evidently formed a strong support to the idea; as it was not, he thought, probable that the same race could have occupied these various remote points without also occupying at least a large portion of the intermediate space. Their forts, dwellings, utensils, and ornaments, he said, had a common uniformity of design, not only with themselves respectively, but with each other; nor was this accidental, for he found articles of apparently common interest having a superior meaning attached to them. Thus the quern was, for some reason, an emblem of eternity, while the gold rivulet surmounting some of the Irish monoliths found in the peat morasses evidently had reference to solar worship. He then compared these remains with some bearing the same features in other countries, including very similar constructions on the Alps. He dwelt upon customs connected with the preservation of the human heart in Britain, and showed approximating religious customs in connexion with the heart as almost universal. He drew attention to certain parallel indications in the sculptures of Easter Island, Egypt, America, and Britain, at least so far as vastness of design is concerned to the sculptured solar altars of Nineveh, very similar emblems being found in this country, in Mexico, Easter Island, and elsewhere; and also to the remarkable incisions in the rocks of Northumberland, Ilkley, Scotland, New Grange, and Carnac, which were also to be traced along the Mediterranean route as far as Greece, and even had representatives in India and America.

The Chairman (Mr. Godwin) said whatever they might think of the theory of sun-worship he was sure they would unite in a feeling of gratification that Mr. Phené was applying himself to investigations upon a subject of so much interest. The uniformity of those early structures all over the globe was scarcely to be doubted, nor was their antiquity. But Mr. James Fergusson, whom they all held in the highest esteem, seemed in the most extraordinary way to have shut his eyes against indications and proofs of their great antiquity. Because he finds evidence that some such structures were of tolerably modern date, therefore he would have it inferred that they are all of modern date. He (the Chairman), however, was quite unable himself even to read the Bible without finding ample proof of the early existence of that exact description of structure of which he (Mr. Fergusson) spoke as modern; the monuments of unhewn stone, the setting up of single stones, the forming of a cairn, and so on. Mr. Phené had alluded to some singular structures, especially in Scotland. It was to be hoped that other gentlemen who had applied themselves to the same branches of antiquity, with the view of bringing their minds to bear upon this particular subject, would help in guiding them to a true solution.

Mr. Burgess read a paper on "Ancient British Remains in the Forest of Arden." He explained that the forest of Arden, to which his paper referred, was a wide district of England, with (according to Drayton) "one hand touching Trent, the other Severn side"; and his remarks applied to the remains of earthworks and British forts to be found in different localities and in lines within that area. He endorsed good deal of what had been advanced by Mr. Phené as to the uniformity of these works, and exhibited drawings of earthworks at Brinklow and Seckington. He believed these were not Saxon earthworks, but that they belonged to an earlier period.

Mr. E. Roberts observed on these papers that the more he saw and heard of this subject the more he was impressed with the similarity of the whole of the productions of the pre-historic period. He had gone over to see the Paris Exhibition almost for the purpose of studying the illustrations of the different periods of labour, and he was amazed at the precise similarity of all the tools exhibited there from all parts of the known world. He thought they could not come to any other conclusion than that there was a larger amount of intercourse between nations in the earlier days than they had been inclined to believe.

Here we must break off for the present.

Mahogany wood has been discovered in the Guinea region of Africa.

SOME HOUSES IN SEVEN DIALS.

CONSIDERABLE improvements have been made in Seven Dials and the rest of the parish of St. Giles-in-the-Fields, since we first commenced those explorations and illustrations of the Shadows of London and our large towns, which, not to speak in any degree arrogantly, have assisted in producing the present state of public opinion on the subject, and the increased attention now paid to sanitary reform. We could point to some dark pictures of portions of this neighbourhood, scattered through our earlier volumes, and afterwards gathered into little books, and then reproduced far and wide by a more or less sympathising daily press. Seven Dials, as our London readers know, is an open space in St. Giles's, whence radiate seven streets, and had its name from the circumstance that there was a Doric column in the centre of it, which bore on its upper part seven sun-dials, one of them facing each street. As we find in "Trivia,"—

"Where famed St. Giles's ancient limits spread,
An hour's ride column rears its lofty head;
Here to seven streets seven dials count the day,
And from each other catch the circling ray."

The column was removed a hundred years ago but the name remains: words are more lasting than things. Well, one of the seven rays from this central point is called Great St. Andrew-street, and here, notwithstanding the improvements we have alluded to, are still to be found dwelling-places in which there can be no healthy life;—places where virtue is difficult, and decency impossible. Nos. 40, 41, and 42 were of this class, and had gone on from bad to worse, until they were utterly unfit for human habitation, and past hope of any aid from the commercial principle; the basements were full of decomposing rubbish, the drains stopped, the floors and ceilings broken through, the roofs were guttermless, the walls in part saturated.

By a series of fortunate accidents, so to speak of a number of generous acts, the Society for Improving the Condition of the Labouring Classes, better known, perhaps, as Lord Shaftesbury's Society, came into funds at their last general meeting, applicable to such a purpose, and have descended on this neglected and terrible piece of property. Mr. Eborall, the builder, under Mr. Eytan, as architect, has been set to work to render the houses fit for human habitation. We do not know if it be intended to make any re-arrangement of the premises so as to fit them better for occupation by a number of families, or merely to repair them and introduce such sanitary requirements as may be practicable in their present form. We shall watch the work with interest, and report upon it hereafter. The Society has done good service in this same direction before, and it should not be forgotten in judging of its proceedings that it seeks to provide healthful and humane dwellings for the very poor, which in London can only be done by so great an expenditure, and accepting so moderate a rental, as put large dividends quite out of the question.

DIAMONDS, AND THE IDEA OF BEAUTY IN NATURE.

It would be a somewhat curious speculation to go into to theorise as to what sort of a being man would have been had he had no such faculty conferred upon him as the perception of beauty, and the desire to create it. How very different would the external world have looked and seemed to him. All the colours and forms of nature would have been to him as nothing. It would have mattered nought how things about him looked. Would he have been the happier for it, or no? For we are told in a very impressive way that "he who increaseth knowledge increaseth trouble;" and perhaps it is so. But, however this may be, there is no help for it, and the love of the Beautiful is, without doubt, an inherent faculty in human nature, and cannot be got rid of, and will in some way or other be gratified;—nay, so powerful is it in some minds, that no cost to themselves seems too great for its gratification, and they will turn the very world itself over to find some new beauty. It would be a difficult thing to say which is the most beautiful object in nature hitherto found. Some will declare for one thing, and some for another; but for a combination of rare and unique qualities, and for the comprehension of much in little, the diamond is perhaps the most beautiful object in existence. The subject is a most curious one, and will show, even in these few

thoughts on it, how much there is in nature and art yet to be theorised about, and to be inquired more deeply into. Most people are aware that the diamond is seen in rings and in other articles of jewelry, and as cut into certain regular forms, is not to be found so in nature. As dug up from the earth, or as found amid the sand of a river, it is hardly to be distinguished from a common smooth pebble, or a bit of glass with the rough corners worn off; there is little or nothing of the diamond to be detected in it. It is only after "cutting" into some regular geometrical form that the magnificent beauty of the stone is to be found. Those regular forms into which the diamond is by nature crystallised, the sharp edges of which are worn off, and which exist under the rough surface of the rounded pebble, are most commonly the octahedron, and the dodecahedron, and the multiples of these: as twenty-four, thirty-six, and forty-eight sided figures. Those who wish to understand the subject of diamond-cutting, we would mention in parenthesis, should make drawings of these figures. The pure octahedron form is not, it may be noticed, so advantageous a form as the others, the loss of weight and size in the cutting of the stone into the brilliant form being much greater than it is in the more numerous sided crystals. But all these regular forms are much better for the purposes of the jeweller than the more irregularly shaped stones, with jagged corners, or of forms nearer to the cylindrical or prismatic. It is also noteworthy that there is a form of crystallisation very frequently to be found in the South African diamond, known in mineralogy as the "Maacle crystal." It is triangular in form, and consists of two distinct crystals, welded together by nature. While speaking of African diamonds, about which there has been so much talk lately, it may be noticed, as a curious circumstance, that they are not quite white, or colourless, but of a very pale, and, to our thinking, beautiful straw colour, even adding to the beauty of the gem. The famous Golconda diamond is colourless. In the cutting of a diamond, without which the beauty of the stone is hidden away under a ragged coating, it may be generally calculated that about one-half, a little more or a little less, is lost, so that it is only at a great sacrifice that the beauty of the diamond is made to show itself.

It is a little difficult to explain without a number of diagrams, the curious nature and effect of this diamond cutting, and to hint at what would seem to be a shortcoming in it, if the production of pure beauty be the object sought. A "brilliant" diamond, to give an example, may be thus described. The top of it is an octagon, and on the size of this octagon, or "table," as it is termed, the value of the gem to a great extent depends. From each side of this octagon, at an angle of about 45 degrees, spring triangular facets; connecting these are square, or nearly square, ones, and between these again are double triangular planes. In all, therefore, there are thirty-two facets, or planes, at angles to each other, and which together make up the upper face or top of a "brilliant" diamond. It is from these facets or planes, round the central octagon or table, and which is flat, that the magnificent sparkle comes which makes the beauty of the diamond, and which is to be got from no other substance in nature hitherto discovered. It is produced, as many will recollect, by the great refractive power of the substance of the diamond, and the sight of which suggested to Newton that the diamond must be combustible. The diamond is pure carbon, or charcoal, like a bit of burnt wood, and nothing else; and perhaps in nature there is nothing more surprising than the fact that such a substance as charcoal, black and opaque, and dull as it is, should exist in so different and wonderful a form. Thus far the upper surface or top of a brilliant diamond. The under surface, or bottom of the diamond, mostly hidden in its setting, is equally noteworthy. It is the same as the top, with the exception of the table, which, instead of being as large as may be, is extremely small,—indeed, almost a point. Hold up a large diamond to the light, and the whole of it will appear almost black and impenetrable, with the exception of this small octagonal space; but through this the light comes, and objects may be seen as through a small window. It is not, therefore, by transmitted but by reflected light, and by the blending of the light that the beauty in the diamond is made to manifest itself. It is only by carefully examining a good stone, or by making a careful drawing of one, that these curious facts can be usefully tested. The knowledge

gained will amply repay the trouble it takes to do it. Nothing can possibly surpass the beauty of a clear, well and accurately cut diamond. You are never tired of looking at it; it is always changing, and never seems to look twice alike.

We cannot help thinking that something, and perhaps not a little, yet remains to be accomplished in the cutting of diamonds. A very large diamond, as the Kohinoor or the Regent, is a somewhat disappointing object to look at, after the sight of a smaller stone, finely cut; for the facets are too large, there is too much of the multiple mirror in them. It is in the intensity, and exceeding brightness of the infinitely divided and separated coloured sparks of fiery light, that the marvellous beauty of the diamond lies; and where these are too large, or too wide apart, a great deal of the real beauty and exquisite feeling of the gem is lost. Diamond-cutting is an art and mystery in itself, and there is a "regular way" of doing the work which it seems to be almost impossible to improve upon. So, indeed, you are told. It is, too, a very costly process, so that experimenting is hardly to be thought of. We have gone a little into this curious subject, and have come to the conclusion that the art and mystery of diamond-cutting is not among those things that are "progressing." It is, as it seems to us, something like fiddle-making; it is not a mere trade, it is a fine art, and takes the hand, and eye, and brain of an artist, and an artist-workman to do the work. A "Stradivarius" is the man that is needed; a fine and knowing workman, with hands as well as brains, and brains as well as hands,—both together, and together only, making the artist-workman.

It is not only the artistic beauty in a diamond that makes it remarkable, and worth some study; there is also the value of it; and it is this, indeed, that makes the subject so full of wonder, for in no other substance or thing in nature can you compress so much "value,"—commercial value, even, as in a fine diamond. Without taking into account the very large diamonds, such as the Kohinoor, the Regent, the great Russian diamond, and a few others which have an almost fabulous value, we may well pause to wonder at the value, in other goods and chattels, of a small stone, say of 500l. or 1,000l. in price. Why is this? It is among the mysteries of nature. The wonderful beauty enshrined in the stone responds to the wonderful sense or perception of beauty in the human mind, and actually compels the sacrifice. What would the "sustained splendour" of modernism do without the diamond? Gold itself could not make up for the loss of it! Diamonds are valued according to size; and it may interest the curious to know that the very latest quotations are 4l. per carat for rough diamonds weighing ½ a carat each; for 1 carat, 4l. 10s. to 5l.; for 10 carat stones, 26l. to 25l.; for 20 carat stones, 40l. to 42l. per carat, and so on to those fabulous amounts which the world now and then hears of. But whether the diamond be great or small the principle is the same: it is a price paid for the sight and possession of a thing of beauty and of rarity, and that only; for of the value of the diamond as a mere working tool to cut glass, and for other useful purposes, we need not here speak.

It is impossible to talk of the diamond without some thoughts of its "setting." Diamonds cannot be worn and can hardly be looked at without they are in some way or other "set" or fixed into some other substance, as gold, to make them wearable. Indeed, the art of the jeweller consists in the setting of gems, and the devising of forms to enhance, if possible, their beauty, and to bring them together. Unfortunately the art of the jeweller is little at present above a trade. The work done is all very neat, and highly polished, and carefully filed down, and finally smoothed; but as a fine art, and as dealing with the richest and rarest of substances in nature, it lacks almost everything it ought to have. Let any one who doubts this examine carefully, and minutely, the engraving or chasing of an ordinary finger-ring, or locket, or the back of a watch, no matter what the price: no one will deny it to have neatness, and care, and finish, but where are the drawing and sculpture in it to be found? We had almost said where is the designing power in it? Whole rows of watch-backs may be looked at on which certainly no expense would seem to have been spared, and it will be in vain to look for inventive drawing. Unfortunately it is a trade. Things like these are left to the mere workman. The designer and thinker will be found to be a man working out his ideas, such as they are, "on paper." Perhaps he would hardly condescend to write upon gold. He certainly never does so;

if he did we must see it. If the art of jewelry be a fine art, as we think it is, then most surely is it one of those things that are not "improving" in an artistic sense, though they may be in a *productive* one. More jewels may be made, and cheaper, and more diamonds and rubies may be cut and polished, and put into gold cases, to hang round pretty necks and fair arms, but most certain it is that they will not bear the looking into which the older and rougher work of bygone days will, when machinery was not, and tools were fewer, and human labour was not so divided; and when every workman was asked personally for his work, his own work; and when, too, he thought out his own work as well as executed it. If *buildings*, on a great scale, show, as they undoubtedly do, what the old workman was without machinery, to almost do his work for him, then also may the minute work of the jeweller and the diamond-cutter show what is done, and what is yet to be done, with gold and gems.

THE ROYAL ARCHÆOLOGICAL INSTITUTE AT SOUTHAMPTON.

The inaugural meeting was held at noon of Thursday in last week, in the Hartley Institution. The Bishop of Winchester, the president for the occasion, was unable to take the chair, having been unexpectedly subpoenaed to attend a trial for libel between two quarrelsome neighbours at Guildford. In his absence the permanent president, Lord Talbot de Malahide, F.S.A., temporarily occupied his place. The room was very well filled for an opening day. The mayor and corporation attended in state to welcome the officers of the Institute, and among the gentlemen present were the Marquis of Bristol, Lord Henry Scott, M.P., Sir Stafford Carey, Sir E. Smirke, A.M., and some other persons of note.

At three o'clock the party reassembled at the Bargate, in the centre of the town, and which formed a portion of its original defences. Here Mr. J. H. Parker pointed out the peculiarities of the building. After inspecting the interior, which presents little of interest to the antiquary, Mr. Parker conducted his party along the site of the walls, and pointed out an old water-gate. The inspection of other local objects of interest occupied the time till dinner-hour.

The *soirée* given by the Mayor of Southampton at the Hartley Institution in the evening of the opening day brought together a very pleasant party, the mayor and Mrs. Buchan having a surprise in store for many of their guests. Their entertainers had prepared a concert for their delectation. At the close of the musical performance, the Bishop of Winchester made a pleasant speech to the guests from the front of the orchestra, assuring them that he neither meant to sing a song nor play on the double-bass violinello, but to call upon them for three cheers in honour of the mayor's birthday, which the bishop led with hearty good will. The party was attended by a large number of the officers of the American fleet.

On Friday morning there was a meeting of sections at the Hartley Institution. The bishop presided for a short time, and introduced Lord Henry Scott, who read them an introductory address in the Historical Section, confining his remarks to a history of the county of his adoption. Lord Talbot de Malahide, in moving a vote of thanks to Lord H. Scott, which was carried by acclamation, endorsed his lordship's observations as to the want of a good county history and a good archaeological association, which latter he considered would greatly help to accomplish the former. Kent, Somerset, Sussex, and Wilts, and nearly all the counties in the south of England, had good archaeological associations, and it would be a proud remembrance on the part of this Institute if they should be in any way instrumental in giving an impetus to a similar action in Hampshire.

The reading of another and shorter paper brought the morning's proceedings to a close, and in the afternoon the archaeological pilgrims wended their way as far as Romsey and Porchester, and on the route some of them took the opportunity of inspecting Broadlands, which, by the courtesy of Mr. Cowper-Temple, M.P., they were enabled to do. Broadlands, formerly Lord Palmerston's seat, is situated on the top of a slope, commanding a good view of the Test. Within the house are some fine paintings of the old masters, and a monument by Flaxman to Viscount and Viscountess Palmerston. Porchester, the *Portus Magnus* of the Romans, is said to have been the lauding-place of Vespasian.

Since then the sea has much receded from it. The present quadrangular fortress is Norman, partly erected on the old Roman works, and exhibits in a portion of its walls specimens of Roman material applied in later construction. The keep has two massive Norman towers. The parish church of St. Mary is situated within the outer part of the castle area. The west front contains a Norman window, and much enriched doorway. At Romsey the vicar, the Rev. E. L. Berthon, gave a running discourse on the abbey, and exhibited the result of recent excavations. At Porchester, Mr. G. T. Clarke was the *cicerone* over the castle.

At a general meeting of the members of the Institute, Exeter was selected as the place of meeting in 1873.

Next day, there was an excursion through the New Forest to Christchurch, the party visiting objects of interest in the New Forest on their return homewards. They started from Southampton at nine o'clock, and on their arrival at Christchurch proceeded to examine the antiquities of this pleasant and ancient town, which is watered by the crystal Avon, so famous for its salmon. The chief object of attraction, of course, was the priory church, which is said to have been founded on the site of a Roman temple. In 1150 it was converted into a priory of Augustinian monks. The castle, a little to the north of the priory, has only two ruined walls of a small keep left standing. After spending some time in the examination of the church and the ruins of the castle, the party "refreshed" at the town-hall, and then returned by rail towards Southampton, stopping *en route* at Beaulieu-road station, and thence by turnpike road to Beaulieu. Here they were received by Lord Henry Scott, M.P., and the Rev. F. W. Baker, who conducted them over the remains of the abbey. The gatehouse of the latter is now the residence of Lord H. Scott, and is called "The Palace." This was an abbey of the Cistercian Order, founded by King John in 1209. Near the centre of the hospitalium was the access to the conventual buildings. There are relics of the sacristy and chapter-house, and a passage and portion of the monks' refectory. The ground-plan of the ancient convent church has been traced by the stones on the sites of its pillars. The parish church is the ancient refectory. There is great variety of sculpture in the intersections of the ribs of the roof representing the Montagu and Buceleuch arms, the Beaulieu arms, &c.

At a *conversatione* in the Ordnance Survey office, some interesting objects were shown. Among these were flint implements from the drift found near the Southampton Cemetery, 80 ft. above the level of the sea, and supposed to have been deposited there about the commencement of the glacial era; a model of Ben Nevis (4,066 ft. high, the highest mountain in the United Kingdom), and of the surrounding country; a model of Stonehenge, with drawings and photographs exhibited by the electric light, and of some cromlechs; plan of the ancient, the fortified station of the Romans at Bitterne Manor, Southampton; plan of the town of Southampton and of its ancient walls, and plan of Netley Abbey, with photographs; plan of Silchester; model and plan of Jerusalem, with photographs shown by the electric light; model of the great pyramid of Egypt to illustrate the use of its interior arrangements. Photozincographic *fac-similes* of Domesday Book, of the national MSS. of England, Scotland, and Ireland, with some very interesting originals of the latter, &c.

On Monday, after a morning sectional meeting, at which an address by Sir Edward Smirke, president of the Section of Antiquities, on the records of Southampton, was delivered to an audience not large, and followed by an illustrated address upon Silchester by the Rev. J. G. Jones, Winchester was visited, and the cathedral and other objects of interest in that ancient city inspected.

On Tuesday, the members of the Institute visited Silchester, which derives its name from the Saxon "Sil," great or best, and the Roman word "castrum," and has been described by us before now. It has the largest area of any of the Roman fortifications. The walls at present are about 13 ft. high and 8 ft. thick. The city had four gates,—north, south, east, and west,—and beyond the wall was a deep ditch, and beyond the ditch a vallum 15 ft. high. The amphitheatre is situated outside the city, 150 yards from the north-east corner of the wall. The members also visited the remains of the Chapel of the Holy Ghost at Basingstoke, and Basing House, formerly the abode of the Marquis

of Winchester, by whom it was gallantly defended against the Parliamentarians, and when stormed was utterly destroyed. In the evening the members returned to Southampton, and held an evening session for the reading of papers at the Hartley Hall.

THE BISHOP OF WINCHESTER ON ARCHÆOLOGY.

At the Southampton meeting of the Archaeological Institute, the Bishop of Winchester said he was sure they would all sympathise with him in his having to deliver an inaugural address in the middle of the meeting, which was like a stale egg. They all knew what a stale egg was, and he had to produce before them that day an egg which had evidently been "sat" upon; and he hoped they would not sit upon him for doing so, for then his only chance would be a long rope, whereas he had only the shortest possible "yarn" then allowed him. It was evident that what he should have to speak about then was the general purpose and idea of these gatherings and meetings, and the good that they and he might be able to deduce from that particular one. Many people, when an antiquary was coming to them, expected something amusing, and sometimes rather absurd, but there was a far deeper side to archaeology, upon which he should like them to rest. Perhaps it was stated almost as beautifully as language could do it by the great Lord Bacon, in his hook "Advancement of Learning." He said, "Antiquities are history diffused, or some remnants of history which have happily escaped the shipwreck of time"—a beautiful idea in itself; and then he went on to speak of what constituted the true antiquary and what he might do, and set a deep view of the whole of their pursuits before them. Returning to his old idea of the shipwreck of time, he spoke of antiquaries as persons who, "by an exact and scrupulous diligence and observation, out of monuments, names, words, proverbs, traditions, private records and evidences, fragments of stone, and the like, do save and recover something from the wreck and deluge of time." He (the Bishop) did not agree with him that it was history diffused. It was more especially the establishing of the remaining facts out of which history had to be formed; because history itself, as they commonly understood it, was far more a theory about facts than a mere relation of the facts themselves. Such a pursuit as they were engaged in was full of every advantage, especially to a people in a higher state of civilisation, and that, he thought, every reasonable man would see in a moment. There could be no future to a people about whom there had been no past: the future developed itself just as it did in life in the world around. The future carried it out of the past. Dead vegetable matter made the humus; into that the roots of the living tree were struck; and because there had been vegetation in the past there was vegetation in the future. And so it was with regard to the higher life of a nation. Unless there was a past to which it could refer, there could not be in it any high sense of its own mission in the world. New peoples were predatory—they came as the Goths of old, to plunder and overrun countries which had a past, and extinguish them, and as they acquired for themselves a past they began to develop a future out of the past, and so that which led them to love and venerate the past did, in fact, give them the best standing-point for helping in the present to make provision for the coming of the future. They did not want to bring the old times back again, but they would understand the present around them far better if they could trace the present back into the past, see what it arose out of, what it had been the development of, and what it contained to serve for the future before them. There was nothing which so tended to keep the mind of men from rash experiments, from those things which destroyed nations altogether by the sudden imagination crossing the mind that some very great result might be obtained by some entire subversion of everything. There was nothing on the one side that more guarded a people against that than by having a reversion for the past, and nothing more truly directed those shapings of the present, which every reasonable man knew he had to give way to, than the being able in the new shaping to have before him the old, out of which he was going to shape it, so that his shaping might only carry on more completely the purposes for which that he was now altering began

to exist. They might see all that he had ventured to suggest when they looked round the grand old cathedral they were to visit that day. With it grew up the life of England, out of the remains which were left at the Saxon invasion, which extinguished the earlier Christianity. Out of the restoration of the Saxon element as it became historic, developing itself through a series of great priests and princes, the wonderful building had been erected.

THE RESULTS OF ARCHÆOLOGICAL TEACHING.

An old correspondent from the Royal Archaeological Institute, writing from Southampton, says:—

I do not send you any notes on the present occasion, first, because this is such a trodden ground; secondly, because the newspapers have been so full of our proceedings; and, thirdly, because I have lost faith in archaeology. Twenty-six years have elapsed since the Institute visited this spot,—the Association has, I believe, been here since,—and yet there has not been a local society established, or anything done towards a county history, both of which things we are continually told are the beneficial objects and results of these gatherings. But the greatest outrage to one's feelings is on revisiting the locality to find that there is nothing to notice but two strange works: Lyndhurst Church, by Mr. White, and the colouring of St. Cross, by Mr. Butterfield. The latter is the greatest satire on taste ever perpetrated by a modern architect. The unmistakable sounds of reprobation which were uttered during Mr. Parker's address will, I hope, be communicated to the architect. The joke that passed about was, that after the present thirteen members who enjoy the charity of the founder are dead, they will be succeeded by thirteen clowns; hence the motley on the walls. If such monstrosities as these are all we can show for studies, papers, architectural institutes, and whatever other institutions exist for the development of art, the sooner such institutions be made to come to an end the better. The Bishop's address, which was very good, you may like to give. F. S. A.

THE NEW THEATRE AT THE ELEPHANT AND CASTLE.

The large new building near the Elephant and Castle, which was erected a few months ago for the purposes of a public hall for meetings, lectures, and musical entertainments, in connexion with swimming and private baths, but which has never been completed, is now in process of being converted into a theatre, the original owner having disposed of the building to new proprietors. The building, which occupies a very large area, being about 120 ft. in length, including the space for baths, from the New Kent-road frontage, to the extreme back, is now undergoing extensive structural alterations preparatory to the fitting up and completion of the interior. A considerable portion of the roof of that part of the building which is intended to be devoted to the auditorium department has been removed for the purpose of carrying the main walls to a greater height in order to admit of the construction of galleries and additional tiers of boxes beyond those contemplated in the original structure. The interior from the entrance in New Kent-road to its communication with the intended great hall, which consisted of about sixty private baths approached by stone staircases, and also leading to the upper part of the hall, is being entirely reconstructed. The walls and compartments forming the baths, together with the corridors, have been altogether removed, and the space which they occupied will be converted into a vestibule, with approaches and staircases leading into the various parts of the theatre. The interior arrangements will provide accommodation for an audience of upwards of 3,000, the two tiers of boxes, twelve of which will be private, seating 500, whilst the pit and stalls, which will be of large dimensions, owing to the great width of the building, will have sitting-space for an audience of 1,500, in addition to which there will be standing-room for 200. The amphitheatre and gallery will have accommodation for about 1,000 persons.

In addition to the audience department, there will be large refreshment saloons in the different parts of the building, communicating, through iron doors, with an ample promenade, attached to which will be smoking and refreshment.

rooms, together with lavatories and gentlemen's dressing-rooms. In connexion with this feature in the arrangements for visitors, the practice adopted in Continental theatres will be introduced by the ringing of the stage-manager's bell in the refreshment-saloons and promenade, announcing the commencement of the performances. The interior of the theatre is to be chiefly lighted from sun-lights in the ceiling. The erection of the stage, which will be very spacious, has been entrusted to Mr. Ellis, who has had a large experience in this department of theatrical construction. The principal entrance to the building, leading to the boxes and stalls, will be in the New Kent-road, the pit and gallery entrances being in the Walworth-road, nearly opposite to the Elephant and Castle.

The entire cost of the new theatre when completed is estimated at about 15,000*l.*—4,000*l.* having already been expended on the building before it came into the present proprietor's hands. The architects are Messrs. Dean, Son, & Co., of Mark-lane, City; and the contractor is Mr. Giles Bennett, of Vauxhall. The theatre is announced, by Mr. E. T. Smith, under whose management it will be conducted, to be opened in September next, and we understand that the contractor has undertaken to have it ready by that time.

THE WORK OF ENGLISH CARPENTERS.

Now that carpenters are prominently before the public, by virtue of the "strike," a glance at the work of their predecessors may have some interest.

The Middle Ages have left us nothing more characteristic of "Old England" than the work of the old carpenters,—old to us, but youthful and gallant enough to the dames and maidens who glanced up at them when they were deftly raising the great oak and chestnut beams that were to group into the glorious roofs we now gaze upon as masterpieces. The closer we look into their work the more we are impressed with its artistic comeliness, sturdiness, and grandeur.

In the fourteenth and fifteenth centuries English workmen seem to have looked upon the roof of a large building as a firmament. They treated it so literally; for they coloured the spaces between the rafters deep cerulean blue, and they set countless golden stars in it; and this firmament they filled, so far as they were able, with an angelic host. They carved angels on every corbel, and high above these they placed angels again. Sometimes they folded their great wings close, with soft, drooping curves; sometimes they spread them out into a bold, wide, glad sweep. Generally they placed a shield, or a book, or a musical instrument in their hands; always they made them expressing adoration, joy, or devotion.

The thoughts of these old workers could not have been sordid, nor even always homely. They overlaid their work, clearly, with captivating fancies, as lustrous, it may be, as the gold with which the Syrian workmen overlaid King Solomon's ivory throne, or they would not have given such surpassing names to details or parts of structures as they have done. They must have been thinking of more than shaping an oaken beam, for instance, when they called the stanch central-pieces of a roof the king-post, and the two smaller pieces that perform a corresponding central service, queen-posts. We are sure they felt that these were the crowning pieces of their framework, to which all the others were attached, for strength's sake, and that they gave them these names because they answered in their minds to the dignity of the service they rendered. We do not wonder that the slater was impressed with the thought, and that when he came to cover their roofs with slates he distinguished one size from another by an elaboration of the same association of idea, and that he called them duchesses, countesses, and ladies, according to their measurement.

Look at the roof of Westminster Hall. Note the bold span of the curved braces that form the mighty arches; note, too, the dignity and interest given by the winged figures, and the lightness of effect produced by the open cusped tracery. We can never cease to admire the graceful and sufficient contrivances to carry weights and resist strains. Six hundred years have sped since the bold fellows who reared it departed to the mercy of God; yet it has not been surpassed in any country in the world.

But the old carpenters did not reserve their skill for the halls of kings' palaces or other high places; for some of the ancient farm barns

present equally wonderful specimens of their constructive powers. Modern architects look up with awe into some of their stolid roofs over these humble huddings, raised there 400, perhaps 500, years ago, and yet surpassing the wide spaces with undiminished strength and beauty. The great beams stride from side to side of the high walls, stretch forth and jut out to meet others, rise up to support more, slant away towards the dim, shadowy apex, or slope downwards from it, forming an angle here and a curve there, with a labyrinthic effect that bewilders the unskilled eye; yet those who are the most competent to judge aver that there is not an inch of timber used but has its deep purpose and scientific use. Scorners have but to look upon the great, cumulous, hoary, mellow barn at Harmondsworth, Middlesex, or upon that at East Barsban, or upon another at Easby Abbey, to be convinced of the nobleness of old carpentry.

It is allowed that England has carried the science of carpentry to greater perfection than any other country. Its insular position, and consequent necessity for "wooden walls," caused naval architecture, in all times, to draw to itself the boldest and most original constructive geniuses; and, of course, it was easy to transfer to the land the cunning devices intended for the formation of floating homes. Moreover, some was always difficult to be procured in some localities, while on the other hand the sea to forest furnished timber in abundance down to Tudor times. The clever carpenters in the days of the Plantagenets sometimes built churches entirely of timber, as we may see at Greensted, in Essex. More frequently, however, they were content to span the walls of stone churches with open timber roofs; or to cap them with wooden turrets, or delicate spirelets covered with cleft oak shingles, or otherwise; or to shade them with timber cloisters; or to fill them with elaborate screens, stalls, pulpits, and pews. They made bridges, too, of timber: notably, the first bridge over the Thames. But far more freely they employed their skill in dwellings.

Half-timbered houses still abound in many of our ancient towns, such as Coventry, Canterbury, Chester, Shrewsbury, and Sandwich; though, as in the metropolises, fires, edicts, and frequent clearings to make way for improvements, have removed immense numbers of them. We are all familiar with the quaint, projecting stages; peaked, and sometimes hipped or slant, copped gables; grotesquely carved corbels; their charming bay windows and oriels; their coquettish dormers, diamond-paned lattices, and sun-baked, weather-beaten lines. We may see that the foundations were generally made of stone or brick. Upon this base were laid large timbers, the full length and depth of the first stage. Into these timbers, called wall-plates, the corner and other principal posts of the first stage of the superstructure were firmly fixed. Where there was a window or door to come, upright and horizontal pieces were placed to frame the opening. And between all these posts and beams were inserted curved braces, which linked the framework together and strengthened it. The joists to form the floor of the next stage overlapped the lower rooms considerably, and so caused the next chamber to project over them. They received the wall-plates, into which the main timbers of the upper chamber were to be tenoned, just as the foundations received those of the stage below. When there was a second or a third story the same process was repeated; and then, over all, rose the steep gables, deeply hooded in the verge-boards with which they were protected. A paper read by Mr. Street to the members of the Institute of British Architects, describes the construction of several examples of ancient roofs and dwellings.

Very proud some of the old carpenters were of their work. On the great window of the hall of Little Moreton Hall, Cheshire, there is this legend: "This windows whire made by William Moreton, in the yeare of our Lorde MDLIX.—Richard Dale, Carpéder, made this window by the grac' of God." Very austere, too, were some of them. On the beams of a roof at Crawley, one cut this admonition:—"Man in Weal beware: Beware before what cometh behind."

A carpenter cut upon a beam in the parlour of the old parsonage-house at Meppershall, which was upon the boundary of two counties, this little joke: "If you wish to go into Hertfordshire, hitch a little nearer the fire." But the usual tenour of their inscriptions is serious and devout.

There are many old writings extant in which mention is made of carpenters and joiners and

their work. The early archives of the City of London give many curious particulars of them. One entry in a venerable tome belonging to the Corporation, dated 1308, sets forth that Simon de Canterbury, carpenter, came before the mayor and aldermen on the Saturday after the feast of St. Martin, in that year, and declared he would undertake to make, for William de Harrington, peltreer, a hall and a room with a chimney in it, and a ladder between the two, and a sun-parlour with an oriel in it over them, and cellars and sewers below them, as well as a stable with a sun-parlour and garret over it, before the feast of Easter next ensuing; and that the said William de Harrington undertook to pay for the work aforesaid, the sum of 9l. 5s. 4d., half-a-hundred of eastern marten skins, fur for a woman's hood, value five shillings, and fur for a robe for him, the said Simon.

The churchwardens of the parish of St. Michael, Cornhill, as we mentioned in these columns, in our notice of Mr. Waterlow's volume, have a pale vellum volume, rich with clerly flourishes in faded ink, in which the parochial accounts were kept four hundred years ago. In this there are many entries relating to workmen. One line tells us that a carpenter received fourpence for half a day's work in "mendynge of a pew," in 1460; and others show that he was frequently employed in putting the men's pew, the women's pew, or the mayor's pew, in repair, at a similar rate of pay. Various small sums are put down in the accounts for "trashie" (trifles) for the joiner. "Paid for an hnge for Russes wyfes pew 1xd," wrote the churchwardens in 1457. The price of labour brought carpenters a shilling a day in Queen Elizabeth's reign. So when we read against the date 1565, in this same volume, "1tn. To Mr. Owghtinge, Carpenter, for mending the pulpitt in the churche yarde iijjs.," we know he was hammering, sawing, screwing, filing, wrenching, and planing, for four long days before he had earned his money.

The account-rolls of the priors of Holy Island, preserved by the Dean and Chapter of Durham, yield many similar references relating to the north. Among southern records we must particularise the expense-book of Prior Moore, preserved in the chapter-house of Worcester Cathedral, of which we gave some account in our notice of Mr. Noakes's works on Worcester Cathedral. This document throws light, too, upon the way in which the trade of a workman gave him a surname. From the evidence to be gathered from it we may be sure, for instance, of the original rank of one of the executors of Dick Whittington's will, John Carpenter, though we know he was a worthy citizen of renown when appointed to the trust. In a word, neither the quaint-cropped verbiage of the old English statutes, nor the tawny pages of Medieval manuscripts, nor the glitter of jewelled goblets, albeit, in the days of yore, they flashed upon the *dressoirs* of a dozen abbots in succession; nor, indeed, the sight of any relic we can name, affords us the vivid realisation of the old times that we obtain from an examination of ancient carpentry. It behoves us, therefore, to conserve every example of it reverently. We feel, too, as we gaze upon it, that if to execute work of a high rank, stately, great, and hold, is to be noble, then, truly, English carpenters have a noble ancestry. *Noblesse oblige.* Let their successors look to it.

KENSINGTON PALACE AND GARDENS.

So far back as 1631, Sir Henry Finch was proprietor of these grounds, and of the mansion, then called Nottingham House, on the descent of Notting-hill, and thus contra-distinguished, as the Ham or Vale. Sir Henry was recorder of London, an office of much greater importance in those days; and about the year 1690, William III. bought the estate, made sundry additions, and adopted it as a royal palace.

Sir Christopher Wren made several improvements, and built what was then called the south front; but if the east front was erected, as is recorded, in the reign of George I., then the present south and west elevations must certainly have been carried up at a later period.

John Evelyn records in his diary, that he visited King William III., A.D., 1690, at this palace, which was then "a packed and altered villa;" so it is clear that a great part of the original foundation, perhaps of 300 years' standing, is embodied in the existing amalgam of courts, corridors, entrances, chambers, and state rooms, both low and lofty.

As we now view it, the grand escalier, auditorium, and state apartments, although once highly ornate, and decked with gilt statuary, are divested of their splendour, unused, and going to decay; the rain and embellishment. Still portions of the wide palace are occupied, and in order. The Duchess of Inverness, the Prince and Princess Teck, and others, have their allotted portions, but the general aspect is one of waste, if not desolation.

The west front slopes upon the outer boundary wall line, under its tile roofs and dormers, but external to the quadrangle and in continuation we find four small ancient cottages or villas, as also a large stable, built in ordinary rural style, of the Cromwellian era, in fact, viewing its fine position, the whole is an incongruity, if not an absurdity, unsuited to the age.

Outside the palace, and external to Kensington Gardens, all along the west boundary, from Bayswater-road to Kensington High-street, there is a waste margin exceeding 100 yards in width, which ought to be added to the gardens, and bounded by an iron fence similar to the Park railing; this, together with the site of the antiquated palace, if it were removed, would add 40 acres or more to the extent of Kensington Gardens; and a new palace built upon the highest plateau of the Park, near the Round Pond, need not cover more than ten acres, or at most 15 acres; thus, 30 acres might be gained in Park range, besides the advantage of an extended circuit, and the attainment of a truly Royal palace, worthy of the country, and encircled by forest trees of mature growth.

In the reign of George I., Kent built the cupola, and made other additions, besides laying out the grounds, and as all the noble wide glades concentric at the point of the Round Pond, this would seem to be the position fixed for the erection of a suitable palace, commanding views on all sides through stately forest glades; on the east across Hyde Park, and extending a mile and a half to Park-lane, the position being elevated, open, and healthy, as well as easily accessible to the metropolis of fashion, no other site in London, nor indeed of any other European capital, can equal it.

Have we at present any metropolitan palace adapted for the occasions of Royalty? The convenience for drawing-rooms, levees, receptions, but, above all, the healthfulness of position, and adaptation for occasional residence; all these combined are to be found in the open, dry, and elevated site herein described, and alluded to in the *Builder* of the 13th July.

As to style of building, our national palaces,—and they are many,—have little to admire. Windsor Castle is a glorious old relic, but for modern usage has little to recommend it. Hampton Court, although William III., Queen Anne, George I., and George II. frequented it much, is now only used as an asylum for pensioners. St. James's is wholly antiquated, and yet it opens the portals for levees and drawing-rooms, notwithstanding its decrepitude. Buckingham Palace may be commodious, but its low position renders it very uninviting for any continuous abode, and the elevation, although solid and somewhat ornate, is anything but attractive.

The appearance and effect of the new Foreign Offices, viewing also the dignity of the interior, its solidity, convenience, and aptitude for the occasions, would seem to suggest that character of building for a new palace in Kensington Gardens; for here at least all that is commanding in architecture should bear evidence of a truly Royal palace.

The connexion of Hyde Park with Kensington Gardens, both being now free to the public, having intercommunicating walks, surrounded by a continuous fence, and forming one integral liberty, makes it essential to refer again in the *Builder* to the grievous nuisance of Knightsbridge Barracks, which is a foul blot and disgrace to the Ladies' Mile,—the most fashionable and ornate portion of the whole enclosure.

If old Kensington Palace be removed, surely some space might be found in the outer margin for a suitable Guards' harracks—that is, in case Government should not wish to build new quarters in Chelsea (near the Foot Guards), or in case the officers should decline to surrender their messroom, which overlooks the Drive.

It is clear that wherever the Household troops get new barracks, at least six or perhaps eight additional public-houses must be opened; therefore the writer takes the liberty of suggesting to head-quarters that an extensive caserne, with large reception and refreshment rooms, be

opened and licensed for the entertainment of the troops and the public, within short distance, but subject to such regulations as may assure free enjoyment with due decorum.

The old harrack, as it stands, is not only a blot upon the Park-whin, but it degrades and depreciates the value of the choicest spot on the Kensington line of road, while it also restricts the thoroughfare on the principal grand western route from Piccadilly to the royal town of Kensington. If the building were abated and the railing continued, but withdrawn where the harrack impinges full 24 ft. upon the road, the open view would give a seeming expansion to both road and Park; and were the beautiful floral border continued from Albert-gate, then Hyde Park would really become a delightful place of resort worthy of London, and a solace to that portion of its three millions who daily use the promenade.

Kensington, formerly a rural hamlet, is now a most important suburb, if not a royal town; therefore the enlargement of the main road; and Knightsbridge has become a necessity, and especially so if hereafter the palace become the abode of royalty. Our Queen Victoria was born there. After William III., Queen Anne resided there principally until her death in 1714; then George I. up to 1727; but George II. and Queen Caroline made this palace their treasured home and solace till 1760. Afterwards, during the reign of George III., Windsor and Claremont were more in use, and Kensington became the "retiro" for members of the Royal family or pensioners of the Court. Thus this splendid foundation, now in its decadence, awaits the revival of its hygone magnificence.

QUONDAM.

NEW RAILWAY FROM HUDDERSFIELD TO KEIGHLEY.

A NUMEROUS and influential meeting has been held at Halifax, as to a scheme for securing to the town better railway facilities and accommodation. The mayor (Mr. J. D. Hutchinson) presided, and was supported by Lieut.-Colonel Holdsworth, Mr. John Crossley, Mr. E. Crossley, and others. A committee reported that, having carefully examined the plans and considered the scheme submitted by Mr. Fulton, they adopted the following resolution:—

"That after mature consideration this committee recommend to the public meeting that the scheme of a new railway from Huddersfield to Keighley, as laid down by Mr. Fulton, be adopted. The committee are also of opinion that at least 20,000 shares, at 10s. each, should be subscribed before the proposed railway should be proceeded with; but it is distinctly understood and stipulated that no promoter shall be liable beyond the deposit of 10s. per share until the Act of Parliament is obtained, and that no future calls exceeding 3s. per share shall be made in any one year."

The adoption of the report was carried unanimously, and the committee were requested to continue their services, and to modify the plans as they might think necessary, but not to abandon a central passenger station and a high-level goods station in the town, and also to take every step to secure subscriptions for shares.

THE SEWAGE QUESTION.

Purification of the Thames.—For several years past, as our readers know, the local authorities of Kingston-on-Thames, Hampton Wick, Teddington, East Molesey, Richmond, Twickenham, Isleworth, Mortlake, and Brentford, have been under imperative orders from the Thames Conservators to divert the sewage of their respective towns from the River Thames. In consequence of the great diversity of opinion amongst scientific men as to the best means of dealing with town sewage—some recommending irrigation, others filtration, and a third class deodorisation—as well as owing to the difficulty of obtaining land for the utilisation of the sewage, no definite action has hitherto been taken, although the authorities of Kingston and Richmond have spent several hundreds of pounds in vainly endeavouring to procure eligible sites for irrigation fields. The Conservators, it appears, have decided to wait no longer for preliminary investigations and experiments, for the Twickenham Local Board have just been informed that unless they take immediate steps for the diversion of the town sewage from the river, the Conservators will proceed against them for penalties. The penalty for non-compliance with the order of the Conservators is 100l. per day.

The Birmingham Sewage Injunction.—Vice-Chancellor Bacon has given his decision respect-

ing an information filed at the instance of certain inhabitants of Gravely-hill, near Birmingham, to restrain the town council of that borough from committing a nuisance by carrying on a sewage-farm at Salbey. An injunction had already been granted, and a motion was now made for an order of sequestration against the council for disobedience of the injunction. The Vice-Chancellor said he could not but feel the great difficulty the corporation were in, in dealing with the enormous mass of sewage they were bound to get rid of; but it appeared, from their own evidence, that they were able, with their present powers, to do much to abate the nuisance; in fact, their very application for more time showed that they thought that to be the case. Little, however, had been done, even since the Bill was thrown out of Parliament. He found himself, therefore, bound to allow the writs to be issued; but, as a matter of indulgence, he would direct that they should not be issued till after the second motion day in Michaelmas Term next.

Visit to the Merthyr Sewage Farm.—Several of the members of the Council of the Royal Agricultural Society have visited the Merthyr Sewage Farm. The sewage lands belonging to the Local Board of Health are said to be one of the most successful speculations undertaken in the country for the utilisation of sewage. The Board was driven to find out some means for the disposal of the town sewage, the population being 50,000. There were constant fights with other local authorities for polluting the already polluted river Taŕ. Ultimately the Board was placed in Chancery, and the town was then put under the professional care of Mr. Bailey Denton, who, after due consideration, recommended that the new remedy suggested by Dr. E. Frankland should be tried at Merthyr. This new remedy, it is said, has been successful. The cost has been great, but the cure is said to be perfect. From the day when the filtering was first used in February of last year to the present time the sewage of Merthyr has been cleansed by the twenty acres laid out for filtration at Froedryth. This acreage was divided into four plots. Upon each of these plots a fourth part of each day's sewage has been distributed evenly, after being strained. The whole of the land thus divided has been drained nearly 7 ft. deep, and in such a way that no sewage can descend directly to the drains from the surface. Mr. Denton obtained, on the 10th of March last year, authority from the Local Board to prepare the surface of the filtering acres for the growth of crops, and to plant such vegetables as he considered were suitable under the circumstances. Accordingly, on the 14th of June following, the land being ridged up for the purpose, the planting of cabbages and sowing of mangolds commenced. On the 30th of August, seventy-seven days after the commencement of planting, part of the crop was offered for sale by auction, and realised 17l. 15s. an acre, while some portions withdrawn from the sale realised afterwards 20l. an acre. During this period of seventy-seven days, the sewage of the district was poured on to the filtering areas, thus affording conclusive proof of the capability of producing vegetables during the filtration of the maximum amount of sewage through the soil upon which they grew. Since the crops thus raised and sold have been cleared from the grounds, fresh ones have taken their place, and were inspected. Some portions of this year's crops have been already sold at 22l. 13s. 4d., 27l., and 32l. 13s. 4d. an acre respectively, yielding an average of 27l. 9s. an acre.

ARCHÆOLOGICAL EXCURSIONS.

The Kent Archaeological Society.—The annual meeting and excursion of this society took place at Faversham and its vicinity. The meeting was held in the large room of the Faversham Institute, under the presidency of Earl Amherst. The Rev. W. A. Scott Robertson read the report, which thus opened:—

"In this their fourteenth annual report, the council can give, as always, a satisfactory account of the progress of the society. Our members steadily increase, and are growing beyond the number of 1,000, about which we have hitherto for some years. Forty-two members have been elected in the year. Many more are awaiting election at your hands to-day. The balance at our bankers is payable 92l. 16s. 9d., but the greater half of this will be payable in a few days to our printers, engravers, &c., for the expenses of the eighth volume of 'Archæologia Cantiana.'"

The report was unanimously adopted. Mr. Beresford Hope, M.P., had given notice of a motion to alter the rule for the time of the general meeting, which at present must be held in July, August, or September, by providing that it may also be

held in October. Mr. Hope, however, was not present, and Earl Amherst called attention to the notice, and expressed a doubt whether it would be judicious to make the alteration. Ultimately Lord Fitzwalter said they would all agree with him that any proposition coming from Mr. Beresford Hope should meet with every attention; but as they could not, by reason of his absence, hear that gentleman's reasons for the proposal, he would move that they proceed with the orders of the day. The motion was agreed to. The ladies and gentlemen present then went to inspect the parish church. The Rev. C. E. Donne, the vicar, described the church. The Elizabethan Grammar-school was next visited, by permission of Mr. Crosswithe, the head master, and the site of the ruins of Faversham Abbey proved to be interesting, the few remains being pointed out by Mr. Bedo. Davington, a small village about a mile from Faversham, then became the centre of attraction. On leaving Davington, the company returned to the town, where dinner was served at the Institute, Lord Harris presiding, supported by Earl Amherst, Lord Fitzwalter, Sir Walter Stirling, &c., there being a considerable number of ladies present. At the evening meeting, which was held in the reading-room of the Institute, Mr. F. F. Giraud, town-clerk of Faversham, read a paper on the Ancient Charters of the Corporation. The Rev. C. E. Donne then read a paper on "The Tragic Story of Arden, of Faversham." Mr. Bedo read a paper on "Roman Remains discovered in Faversham," and this brought the evening meeting to an end. A local museum which was formed here, consisting of objects of antiquarian interest, contributed by members and friends of the society, and a collection of the ancient documents as well as the insignia of the town of Faversham, excited considerable attention during this and the morning of the following day. On Wednesday, an excursion took place, under the guidance of the Rev. W. A. Scott Robertson, to various places of interest in the neighbourhood of Faversham. Preston Church, which is in close proximity to the Faversham railway station, was first visited. From Preston Church the party, which numbered in all about 100 ladies and gentlemen, proceeded in carriages to Ovingde, where the remains of the Maison Dieu (which has almost entirely disappeared) and of a sort of hospital for lepers, of the date of the fourteenth century, were inspected. Thence the company passed on to Syndale Park, the seat of Mr. W. Hall, and anopposed to have been the site of a Roman camp (probably the Durolevum of Antoninus). The house as well as the grounds was thrown open to the company, and Mr. Hall entertained the numerous party to a cold collation. At Syndale Park, a paper on the Roman camp, prepared, we believe, by Mr. T. G. Godfrey Faussett, was read by the Rev. Scott Robertson. The company afterwards made progress to the ruined church of Stone, which is specially noticeable from the fact that it was of the Roman Britannic period, and is almost the only place of the kind in England where any part of the building is held to be undoubtedly of Roman origin. Eastling Church was visited, and from Eastling the party proceeded to Ovingde Church, which was shown to them by the vicar, the Rev. W. N. Griffin. From Eastling the party returned to Faversham, after a pleasant day's excursion, with fine weather, beautiful scenery, and objects of antiquarian interest to recommend it.

The Norfolk and Norwich Archaeological Society. The annual summer excursion of this Society has been held. The unfavourable character of the weather on the previous day, combined with other causes, rendered the attendance of members but small; still the day was an enjoyable one. The first place visited was Wroxham Church, and here the members were welcomed by Mr. R. Blake-Humfrey and his wife, and by the vicar. The parish church of Horning was next visited, and then that of Potter Heigham. At Ludham Church a brief paper, sent by Mr. Gann, was read by Mr. Fitch, the secretary. On their way from Ludham to the ruins of the Abbey of St. Bennet's at the Holm, the members visited Ludham Hall, the site of the Grange of the Abbey, and subsequently of the summer residence of the Bishop of Norwich. Dr. Beasley read on the spot a report of the fire, made by the Rev. A. Harrison, rector of Catfield. The members next proceeded down the marshes to the ruins of the Abbey Gate-house. A paper was here read by the Rev. C. R. Manning, from Taylor's "Index Monasticus," which summarised all that is known about the rise and fall of the

abbey. After the reading of the paper the site of the Abbey Church was pointed out by Mr. Powell. The visit of the Association to the abbey was one of the most pleasant features in the day's excursion, and ended the summer gathering, the members dispersing immediately on leaving the marshes.

The Essex Archaeological Society.—The annual meeting of this Society, took place at Maldon, from whence excursions were made to various places of historic interest in the neighbourhood. The programme, as has been the case for the last few years, was much too full for the few hours allotted to it. The proceedings were initiated by a general meeting in the large room of the Public Hall, which had been turned into a museum of antiquities. The audience consisted of about 100 persons, including thirty or forty ladies. The Bishop of Rochester, who was accompanied by the Hon. Mrs. Clanghton, presided. Mr. King presented the twentieth annual report of the Society, from which it appeared that there was a balance of 120l. at the bank, of which about 80l. were an "available working balance." The number of members was 173, showing, unfortunately, a loss of seventeen since the last revision of the list. The museum at Colchester has been greatly increased during the year by valuable gifts of coins, medals, and various objects of antiquity. In 1870 the number of visitors was 10,155; in 1871 it was 13,969, and during the past year it was 14,780. The meeting listened with interest to a speech from the Rev. E. R. Horwood, descriptive of the old church of All Saints, Maldon, and of the ancient history of the town itself. Mr. Nichols explained the stained glass. The bishop, in closing the meeting, deplored the fact that this interesting and useful society had only 173 members. In Kent an archaeological society had 1,000 members; in Sussex there were as many; and even the Surrey Society, which was quite a young one, had more members than this. The history of the most ancient inhabitants of our land was very much bound up with Essex, and it was a pity that the spirit of archæology should not be much more dominant in the county. The party then partook of luncheon, served at the Blue Bear Hotel. Afterwards, the churches in the town, Dr. Plame's Library, Beoligh Abbey, the site of Woodham Walter Hall, Daubury, Little Baddow, and the priory church of Hatfield Peverel were visited, a paper on the last being read by the Rev. T. Debary. Next year's meeting is to be at Dedham.

Sheffield Architectural and Archaeological Society.—The members of this society, to the number of about five-and-twenty, recently made an excursion to Hardwick and Bolsover, under the generalship of Mr. J. D. Webster, one of the honorary secretaries. At Hardwick Hall, the Rev. J. Stacey, president of the society, read a paper on the history of Hardwick, and the career of the famous builder of the Hall, Elizabeth, Countess of Shrewsbury. On the way to Bolsover, a short digression was made to see the curious old Norman church at Ault Hucknall. At Bolsover, the church was first visited, and then the castle. At the latter place, the party were received by Lady Frances Beaulieu. On reaching Chesterfield, tea was provided at the Angel, and the party then returned to Sheffield. The day was very fine, and the arrangements were satisfactory.

A WORKMEN'S CITY.

This was the term used by Lord Shaftesbury, on Saturday last, after laying the first stone on an estate at Wandswoth, called the Shaftesbury Park Estate, which has been acquired by the Artizans', Labourers', and General Dwellings Company (Limited), and is to comprise 1,200 dwellings. The company was formed in 1867, in consequence of the destruction of houses by railroads, and other improvements, for the purpose of enabling working men to erect dwellings combining fitness and economy with the latest sanitary improvements, and to become themselves the owners of these dwellings in the course of a stated number of years, by the payment of a small additional rent. On every estate purchased by the company a suitable space will be reserved as a recreation-ground, a co-operative store will be built for the special benefit of the tenants, and public-houses will be absolutely forbidden.

"We have founded this day," said his lordship, "a workmen's city, and we have founded it upon the very best principles. We have founded it upon the great

principle of self-help, and upon the great principle of independence. By independence, I mean without any other assistance than that which every man has a right to receive from his fellow-man,—sympathy and kind aid,—and that is what every man, either great or small, stands in need of from another. You have founded the workmen's city upon your own efforts, and by your own contributions, and for the great and wise purpose of advancing your social position and bodily health, as well as your intellect and general prosperity. And most heartily do I say for myself, and I also say it in the names of hundreds and thousands of your fellow-men,—that the blessing of Almighty God will rest upon the good work which you have inaugurated to-day. I like the principles you have laid down for your guidance. You have shown your wisdom, in a moral point of view, by excluding the public-house and the tap-room; and you have done with them as the people did of old by the lepers, you have put them outside the camp.

We are not quite certain that we desire to see workmen's cities established. We have no desire to segregate classes; but we shall doubtless have an opportunity before long to know more of the plan proposed. Lord Shaftesbury gave, as he always does, some excellent advice, and has doubtless satisfied himself of the wisdom of the scheme proposed to be carried out.

THE RAILWAY ARCHES QUESTION.

THE St. Saviour's Board of Works have followed the example of Lambeth, and determined to take proceedings against the Chatham and Dover Railway Company to compel them to remedy the nuisance caused by the percolation of water through their railway arches. The company are also to be further proceeded against with reference to the noise and alarm caused by the trains passing over the bridges, which has now become an intolerable nuisance, and a source of positive danger to invalids. It is contended that the loud noise could be materially abated, if not almost completely stopped, by the face of the girders being covered over and enclosed, instead of being exposed as at present, the rails being laid upon the top of the girders with only a thin sheet of iron between them. The bridge at Ludgate-hill, which is already enclosed and covered in, is pointed to as a proof that the nuisance complained of with respect to the several bridges in Lambeth and other railway bridges south of the Thames could be easily got rid of.

LONDON SCHOOL BOARD.

At a recent meeting of the Board, Mr. C. Reed, M.P., moved, in accordance with a previous recommendation of the Works Committee:—

"1. That Mr. E. R. Robson be, and he is hereby, appointed architect of the Board, at a salary of 1,000*l.* per annum, with a view, amongst his other duties, to his designing and building the schools of the Board; that Mr. Robson give his time to the Board, and that the Board provide the necessary staff and offices.

2. That it be referred back to the Works Committee to make arrangements by which Mr. Robson may be relieved of the duty of looking out for sites and negotiating for their acquisition."

He said, in consequence of the increased labour thrown upon the committee in reference to the acquisition of sites and arrangements for buildings, it had been found necessary to make a re-arrangement of the architect's department. At the present time, the Board had acquired fifty-four sites, and had appointed thirty-one architects to build schools, including seven who would be proposed at this meeting. In response to the appeal for competitive designs, about 180 architects had sent in their designs, with regard to the schools where the competition had been limited to six architects for each school; and in regard to one open competition, fourteen architects had sent in designs. Practically, therefore, the Board had arranged for buildings on thirty-two sites. As the Board proceeded with this work, they found a difficulty in getting superior architects to compete; the Board had not offered any fee for the preparation of the designs, but had given to the successful competitor the execution of the work. Under the circumstances the committee felt there might be a difficulty in future in getting a sufficient supply of competitive designs. Within the next eight months fifty or sixty more schools would have to be arranged for; and the question arose as to the best way of dealing with this moiety of the work to be fulfilled within the term of the present Board's existence.

Mr. Freeman said when the Board commenced their operations they gave an opportunity to the architects of London to compete and bring out anything good in the way of schools, but that had practically worked itself out, and it would be a serious thing to go on paying a commission of 5 per cent. for all schools, so that the payment

of 1,000*l.* a year to their own architect would really be a considerable saving to the rate-payers. Mr. Robson had given abundant evidence that he was thoroughly qualified for designing and building schools for the future.

The resolution was then agreed to.

The following were appointed architects for carrying out the schools to be erected on the undermentioned sites respectively:—(i.) Eelbrook-common, Chelsea, Mr. Basil Champneys. (ii.) York-road, Islington, Mr. F. W. Aldwinckle. (iii.) Cottenham-road, Finsbury, Mr. Lucy W. Ridg. (iv.) Wilmot-street, Bethnal-green, Messrs. J. Giles & Gough. (v.) Harper-street, New Kent-road, Mr. Robert W. Ellis. (vi.) West Ferry-road, Millwall, Mr. R. Phénix Spiers. (vii.) South-road, Brockley-road, Mr. H. Saxon Snell.

Since then the following appointments have been made:—New Winchester-street, Finsbury, Mr. Charles Barry; Bunnell-street, Islington, Mr. T. Roger Smith; Woodpecker-road, Newcross, Mr. Frederick Warren; Turin-street, Bethnal-green, Messrs. Bodley & Garner.

SCHOOL BOARDS.

Leeds.—A report recommending, among other measures, the acceptance of tenders for building three new schools, amounting in all to nearly 20,000*l.*, has been adopted, after some discussion, by this Board. The foundation-stone of the first school building to be erected by the Leeds School Board has been laid in Bowerley-street, Dowsbury-road, by Sir Andrew Fairbairn, the chairman.

Walsall.—The following tenders were presented for the erection of the Tantarra-street School:—Mr. D. Moore, Walsall, 3,005*l.*; Mr. J. Rowley, Walsall, 3,168*l.*; Messrs. Rowley, jun., & Lyneux, Walsall, 3,210*l.*; Mr. G. Heveingham, Wolverhampton, 3,387*l.* 4*s.* For the erection of the Bloxwich School:—Mr. D. Moore, 2,923*l.*; Mr. J. Rowley, 2,977*l.*; Messrs. Rowley, jun., & Lyneux, 3,280*l.*; Mr. G. Heveingham, 3,161*l.* 12*s.* The offer of Mr. Moore for the erection of the Tantarra-street school was accepted, and that of Mr. James Rowley for the erection of the Bloxwich School. The architect's estimate, it was stated, was in each instance 3,000*l.* It was stipulated that the first-named school should be completed within eight months from the 1st of August, and the other within eight months of the contractor receiving notice to begin the work. Payment of the undermentioned sums was ordered:—560*l.* to Mr. D. Moore on account of his contract for the erection of the Wisemore School; 610*l.* 3*s.* to Mr. T. Highway for the Wisemore site; 857*l.* 12*s.* 6*d.* to the Rev. J. Barrow for the Bloxwich site; and 150*l.* to Mr. S. Russell, for his interest in the Paddock site. The clerk produced a statement showing that, inclusive of these contracts, the Board had become liable for an aggregate sum of 10,700*l.*

Southampton.—The clerk read a communication from the Education Department, returning the plans for the erection of Board schools in Bevois-town, which they deemed satisfactory, and intimated that before tenders for the building were accepted an accompanying form should be filled in and sent up, in order that the Board might consider what amount of grant they could recommend towards the school. It was resolved that the form be referred to the general purposes committee, and that tenders be advertised for.

Hereafter.—On the question of the appointment of a clerk of works, Mr. Scott doubted the wisdom of going to the expense of appointing such an officer, knowing the integrity of the builders, and considering the fact that the architect resides near the works. Mr. T. R. Hill did not agree with Mr. Scott's views. No one could have greater faith in Messrs. Wood than he had, but where over 100 workmen were employed it was necessary some responsible person should be employed to see that the character of the material used and the quality of the work done were satisfactory. He mentioned that, in point of economy, this might be done without going to great expense in the election of an officer. Mr. Rowe, the architect of the prison buildings, had arranged for the supervision of the works by one of his clerks at a weekly payment of 1*l.* Mr. Day, the architect, who attended the meeting, stated that he could arrange for a similar supervision; and Mr. T. R. Hill moved:—

"That Mr. Day having said that such supervision of the works as would be requisite, in addition to his own, to enable him efficiently to protect the interests of the Board, would be obtained by the employment of one of his clerks, at a salary of 1*l.* per week, without the employment of a

clerk of works, resolved that the employment of Mr. Day's clerk on the terms named be sanctioned."

The Rev. Canon Wood seconded this resolution, which was carried unanimously.—The seal of the Board was affixed to the contract of Messrs. Wood for the building of the new schools.—The Board decided that the principal stone of the new school-buildings should be laid, with due ceremonial, on the 19th inst.

Huljao.—The clerk read the report of the Sites and Building Committee respecting the erection of the schools belonging to the Board and containing specifications as to their construction. The report was adopted, and it was resolved that the competition for designs should rest with the architects within the limits of the borough.

THE ARTIFICIAL DESICCATION OF WOOD FOR FUEL AND ENGINEERING PURPOSES.

THE methods hitherto employed to preserve the soundness of timber may be classed under one or another of the following heads:—

1. Applications to the surface of the wood, to prevent contact with the air.

2. Open-air immersion in some antiseptic liquid.

3. A process of suction or filtration, of which Boucherie's method is a type.

4. Injection with an antiseptic fluid with the aid of successive processes of exhaustion and atmospheric pressure.

5. Artificial desiccation in closed vessels, as a preliminary to some one of the above processes.

Several of the above-mentioned processes have formed the subject of valuable memoirs from the pen of the late M. Payen, in various scientific journals. In the paper now before us his observations are designed chiefly "to illustrate the advantages of stove-action, both in the simple desiccation of wood and in preparing it for the aforesaid treatment." Some preliminary remarks are made upon the advantages attendant on the uses of thoroughly-dried fuel in metallurgical operations and other industrial processes:—

"The presence of air and moisture in the pores of wood is one of the most active promoters of fermentative action in the organic tissues, and of the consequent changes which involve the ultimate destruction of the wood. These changes frequently carry off a notable proportion of heat-producing substances; in like manner, the water contained in the wood, in the process of evaporation, absorbs and carries off a portion of the heat generated by the heating of the surrounding ligneous matter, the heating power of which is reduced accordingly. To obtain a clear idea of the advantages secured by drying wood intended for use as fuel, we must compare the volume of heat generated by the combustion of a given weight of dry wood with that obtained from an equal weight of the same wood when wet or full of sap. The comparison may readily be made by taking the ordinary chemical composition of oak wood as a standard, and comparing the equivalent amounts of carbon which it represents in each state. Now, 100 parts of dry oak wood contain 59 parts of carbon, 6.20 hydrogen, and 43.80 oxygen. The heating power represented by the carbon must be augmented by the equivalent of the excess of hydrogen over and above that required to convert the oxygen present into water. In oak, this excess of hydrogen is about 0.630, which would be equivalent in heating power to 1.89 of carbon. The heating power of 100 parts of dry oak is therefore equal to 50 + 1.89, or, 51.89 parts of carbon, i.e. of pure charcoal. But to determine the amount of useful heat, we must reduce the above amount by the volume of heat absorbed by the hydrogen and oxygen which pass off in combination in the form of water. The water thus formed amounts to nearly 50 per cent. of the component elements of the wood, and the heat absorbed by it in the process of evaporation, at the temperature of combustion, is equivalent to five parts of carbon. Consequently, the amount of useful heat generated by the combustion of 100 parts by weight of dry oak wood is equal to 50 + 1.89 - 5 = 46.87, or very nearly that of 47 like parts of pure charcoal.

We can easily compare the useful heat obtainable from 100 parts of wet wood, by assuming

* From the French of the late M. Payen, Member of the Institute;—"Annales du Conservatoire des Arts et Métiers," vol. ix, 1871.

that oak-wood in this state will hold 45 per cent. of water; 100 parts by weight will thus consist of .45 of water and .55 of dry substances. As 100 parts of dry oak-wood are equivalent to 46.89 of carbon, 55 such parts will equal 25.79 of carbon. From this must be deducted the heat absorbed in the evaporation of the 45 parts of water, which will equal 4.50 parts of carbon. The useful heat obtainable from 100 parts of wet oak will therefore equal 25.79-4.50, or 21.29 parts of pure charcoal only. In other words, to generate a volume of heat equal to that supplied by 100 parts by weight of dry oak-wood, we require 225 parts of the same wood when it contains the proportion of moisture we have supposed above.

In addition to the loss thus occasioned directly, which in itself is serious enough, there are certain operations—such as glass-founding, the fusing and volatilisation of zinc, and the like—in which it would be impossible to secure the desired results with damp fuel; the heat developed would only balance the loss caused by draughts and radiation. Thus, it will be seen that the desiccation of fuel—always of essential service—is, in certain metallurgical processes, absolutely a necessity. The preliminary drying can be most advantageously performed when it is possible to effect it with the waste heat carried away by the gaseous products of combustion. In cases where the wood is to be injected under atmospheric pressure, the previous elimination of the moisture contained by it will be useful in many ways, and is, indeed, essential to the penetration of heavy antiseptic preparations, such as creosote, sulphate of copper, and the like.

Two methods are available for this purpose:—
1. Natural desiccation, by exposing the wood for a lengthened period to the air, sheltering it, of course, from rain.
2. Artificial desiccation, in stoves of various descriptions.

Again, it is obvious that the impregnation of the wood with antiseptic fluids, in closed vessels, can only be effectually performed when the wood is in a sufficiently dry state to admit of the exhaustion of the air from its pores, and the entrance therein of the injection. If damp, or newly-cut wood be subjected to the injecting process, the fluids contained in the tissues being confined on all sides, and virtually incompressible, cannot give place to the antiseptic fluid whatever may be the pressure exerted. Practically, therefore, injection in closed vessels is only feasible when the wood is sufficiently dry to admit of the exhaustion of the air or gases contained in its tissue and their replacement by the antiseptic fluid supplied by the pumps. This fact was recognised long ago. Hence the great number and variety of apparatus designed for the purpose. But in spite of the advantages which might fairly be expected to result from their employment, the latter have been very rarely in coming into general use; a fact which may, no doubt, be explained by their high price and imperfect construction, and the tediousness and costliness of the processes. It is only within the last few years past that the artificial desiccation of wood before its impregnation with an antiseptic preparation in closed vessels has been generally adopted in practice. Previously, it was customary to leave the wood—railway sleepers more especially—exposed to the air for a period of eight to twelve months, according to the season. This was very objectionable, not only on account of the loss of interest on the capital represented by the wood during this tedious process, but also by reason of the injury done to the wood by atmospheric influences, and the necessity for large and costly timber yards, and the concomitant expenditure in labour and transport, which were often ruinously great.

The first essays in the art of drying wood artificially carry us back to a period now tolerably remote. Wollaston and Fourcroy both recommended the drying of wood in ovens. Newmann, a German chemist, suggested another method, which has since been adopted in a somewhat different form, *i.e.*, steaming the wood. Newmann placed the wood to be dried in a large wooden chest, taking care to leave spaces between the pieces, and then turned on the steam on a boiler provided for the purpose. The condensed steam, charged with albuminous matter taken up from the wood, or rather from its surface, was run off from time to time, and the progress of the operation was judged by the colour of the water. When the latter was clear and colourless, the chest was opened, and the wood withdrawn for use, without further pre-

paration. The process would have been useful enough if superheated steam, which would have dried the wood by absorbing the moisture, could have been used, but the cost of the process would doubtless have been too high to permit of its practical application.

In 1837, M. de Mecquenem devised a method of desiccation in which the pieces of wood to be dried were placed in a closed chamber, and subjected to a current of hot air, heated for the purpose by a special apparatus, and driven by a blower. The air entered by apertures in the lower part of the chambers, and escaped at the top, laden with the moisture absorbed from the wood.

In 1839, M. Charpentier obtained a *brevet d'invention* for a process of drying wood in hermetically-closed chambers. The wood was subjected to the action of air heated by contact with metal plates covering the flue of a coke furnace. This air entered by conduits on the level of the floor of the chamber, and escaped at the top, through apertures leading into the chimney of the furnace. Between 1848 and 1853, Bethell, who had paid much attention to the subject, obtained several patents, both in England and France, for stoves for drying wood. In his English patent of 1848, and the subsequent French one of 1853, we find a description of a peculiar kind of stove on the following plan:—

It consisted of a rectangular chamber formed of three walls, and vaulted over; the whole in brickwork, with a certain thickness of slag in the centre, to prevent loss of heat. One extremity of the chamber was open to admit of the introduction of the wood by means of a truck running upon longitudinal iron rails. The opening was closed with a double door when the chamber was full. On the exterior of the opposite end of the chamber was a furnace to burn coal, coke, wood, or tar, according as it was desired to dry the wood simply, or, in the words of the inventor, to smoke it, *i.e.*, to impregnate it with the antiseptic gaseous matters evolved in the imperfect combustion of certain tarry substances. The heated air or smoke entered through a flue running along the floor and branching out at the end; and it escaped, or was pumped out at the top of the vaults. Bethell kept at a temperature of 110 Fahr., and that the duration of the process should be regulated by the condition of the wood. His experiments showed that this time varied from eight to twelve hours,—the rapidity being attained at the cost of a relatively large expenditure of fuel. In point of fact, the draught was too great to permit of the utilisation of the full amount of heat contained in the gaseous matter, which escaped at a temperature very little below that at which it entered. The heat produced by the fuel was badly utilised, and it is open to question whether, under any circumstances, large pieces of wood, such as sleepers, could be dried in so short a time as eight or twelve hours. The drying could only be effected by the use of a very high degree of temperature, tending to split the wood and weaken its strength. This view was confirmed by the results obtained in a long series of experiments made in 1852-3 by an English manufacturing company, known as the Desiccating Company. A low temperature, and long continuance of the drying process, appear to be the conditions essential to the success of artificial desiccation, particularly with wood intended for cabinet-making, turning, joinery, ornamental work, &c., in which it is desirable, as far as possible, to prevent splitting, warping, and other changes of structure in the material. These results, it would seem, were not secured, by the arrangements above described.

THE HORTON INFIRMARY, BANBURY.

EVERY week tells of the devotion of large sums of money by individuals for public purposes. The result of a recent instance we illustrate in our present number. The Horton Infirmary, which abuts on the Oxford turnpike-road, about a mile out of Banbury, and was formally opened a few weeks ago by the Bishop of Oxford, was commenced in June, 1869, by the late Miss Horton, of the Holt, Middleton-Cheney, and of a gift to the town of Banbury. Her death, shortly after, caused a stoppage of the works for some months; they were, however, resumed in May, 1870, by her great-nephew, Mr. J. H. Horton, who, being desirous of carrying out her wishes to the fullest extent, has spared no expense to

make the building as complete as possible for the purposes for which it is intended.

The infirmary stands in its own grounds, and is constructed in red brick with black bands and Box-ground stone dressings. The centre block contains the executive portion of the establishment, and the two wings the wards for patients. In the executive portion there is, on the ground-floor, an entrance-hall, 10 ft. by 16 ft., paved with encaustic tiles, leading into a corridor about 150 ft. long, varying in width from 9 ft. to 7 ft., by which access is obtained to all parts of the building. This corridor affords means of exercise to patients in wet or severe weather. On the right and left of the entrance-hall, and connected with it and the corridor, are the surgeon's, matron's, and porters' rooms; opening from the corridor is the operating-room, 20 ft. by 16 ft., with an open-timber roof, which is lighted by four large windows and a lantern-light. A gallery is provided for the students' use, under which are lavatories and sinks, with hot and cold water laid on, as also to the sinks for the use of the operating-room. There are waiting-rooms for men and women, and dispensing and consulting rooms; a room for convalescents, 16 ft. 6 in. by 14 ft., and rooms for hospital stores and comforts. The wings contain the wards for male and female patients respectively; they are each 48 ft. long by 24 ft. wide and 16 ft. high, with fire-places at each end, and lighted on both sides and at end. At one end of the wards, and having a direct ventilation from the external air, are lavatories, sinks, and bath-rooms, with an ample supply of hot and cold water laid on; and at the other end are ante-rooms, sculleries (with sinks), and nurses' rooms. The wards and rooms appertaining to them are plastered throughout with polished Parian cement; the dressings to doors and windows are executed in cement; and the floors are wainscot, waxed over. The floors of rooms adjoining are ventilated by means of openings in the ceilings, air-flues, &c. With the exception of the kitchen and the bedrooms for the surgeon and matron, the whole of this hospital is on the ground-floor, and the plan has been so arranged that the building can be readily added to should it be found necessary to extend the accommodation of the present building.

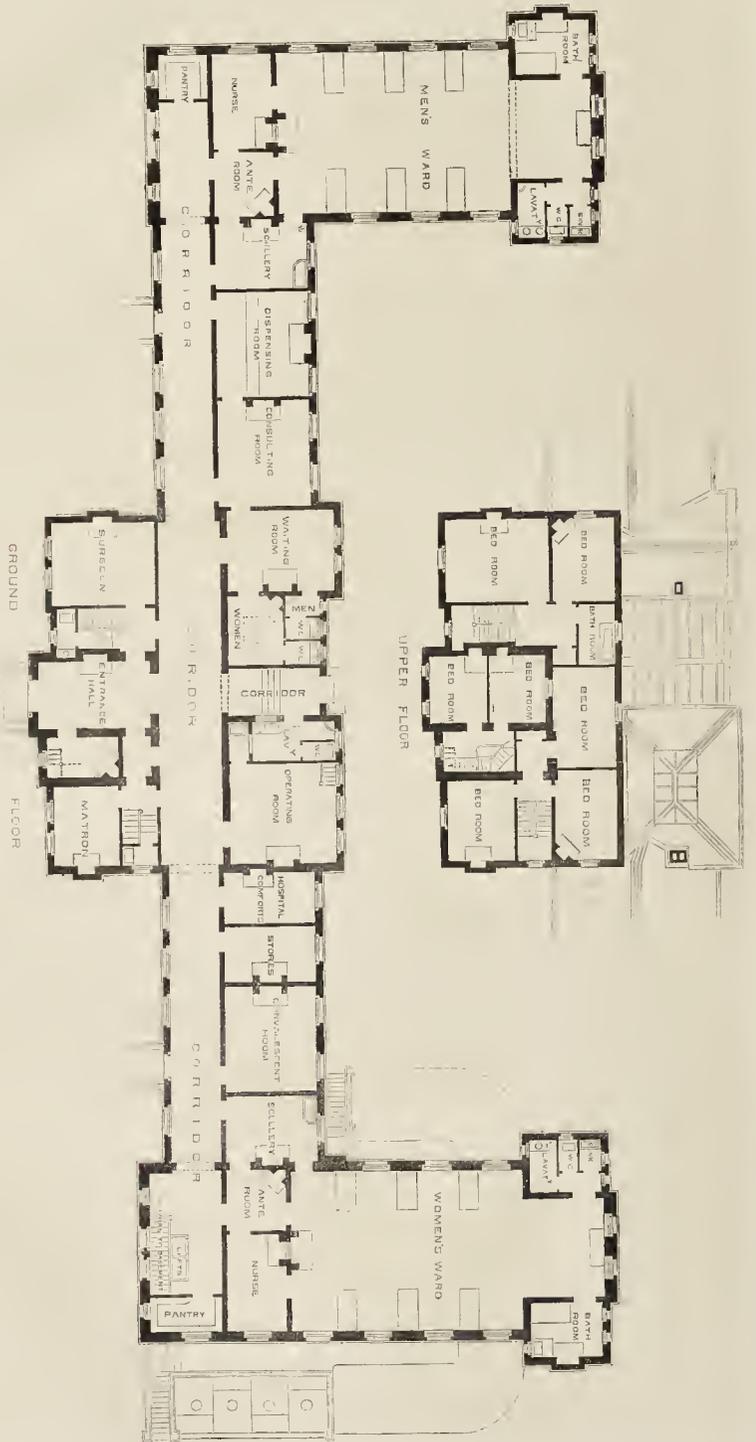

Taking advantage of the natural slope of the ground, a large kitchen is obtained under the women's ward, with scullery, pantries, wine, beer, and coal cellars, with a lift to the ground-floor.

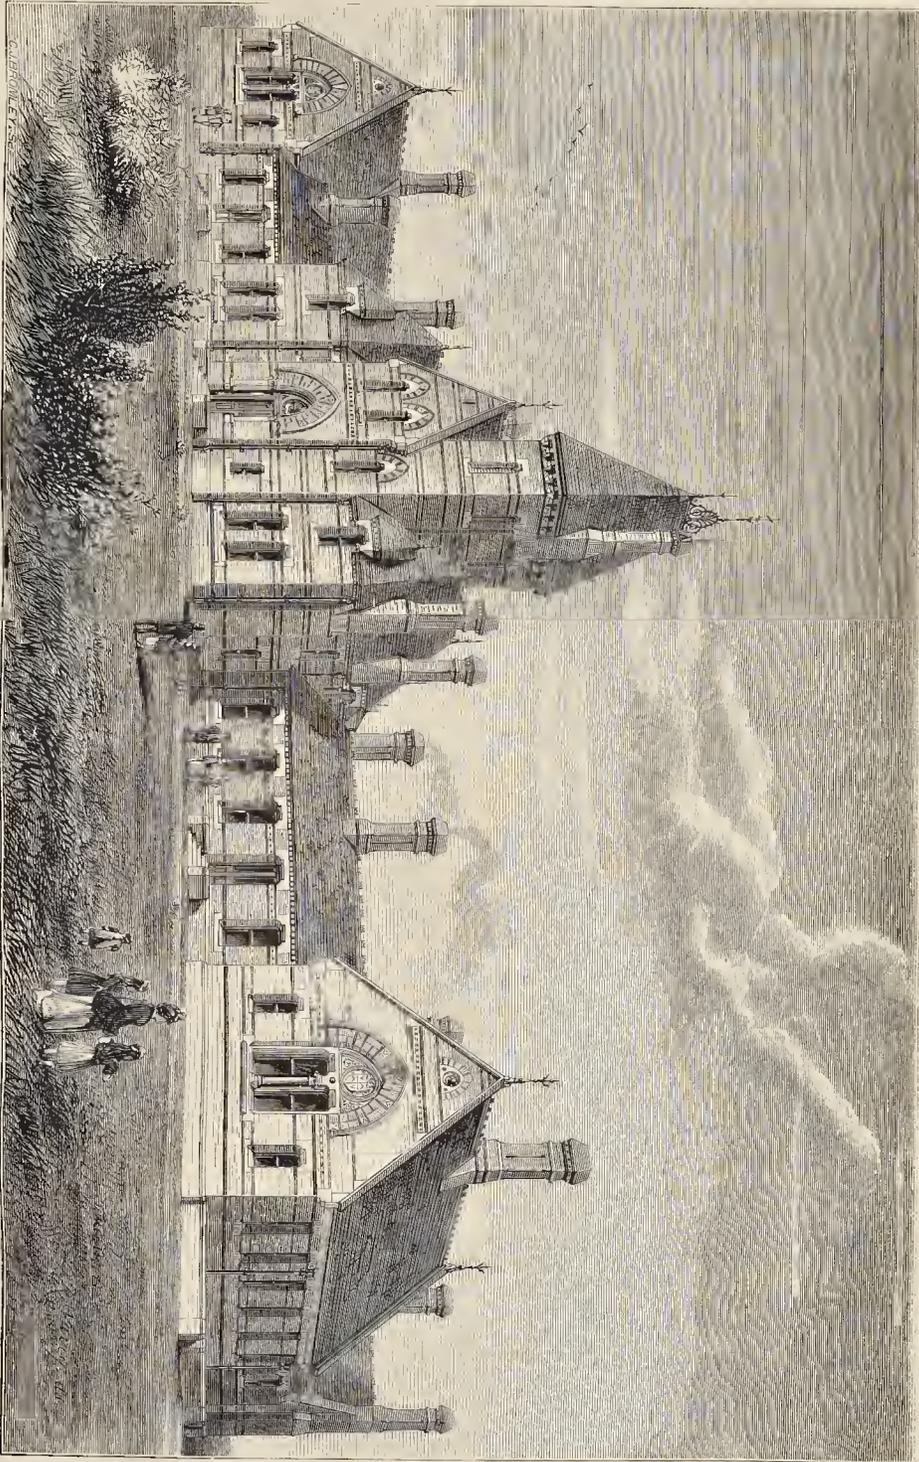

In the upper part of the centre block are bed-rooms for the surgeon, matron, porter, and servants. In the tympanum over the windows of the wards are carved the arms of the Horton family, and the monograms of the late Miss Horton and Mr. J. H. Horton combined. The grounds have been laid out as a garden for the use of the patients by Mr. P. J. Perry. A handsome railing and gates form the boundary of the hospital ground towards the end.

The whole of the works under the contracts have been carried out by the builders, Messrs. Franklin & Son, of Deddington, from the designs and under the personal superintendence of the architect, Mr. Charles H. Driver, of London.

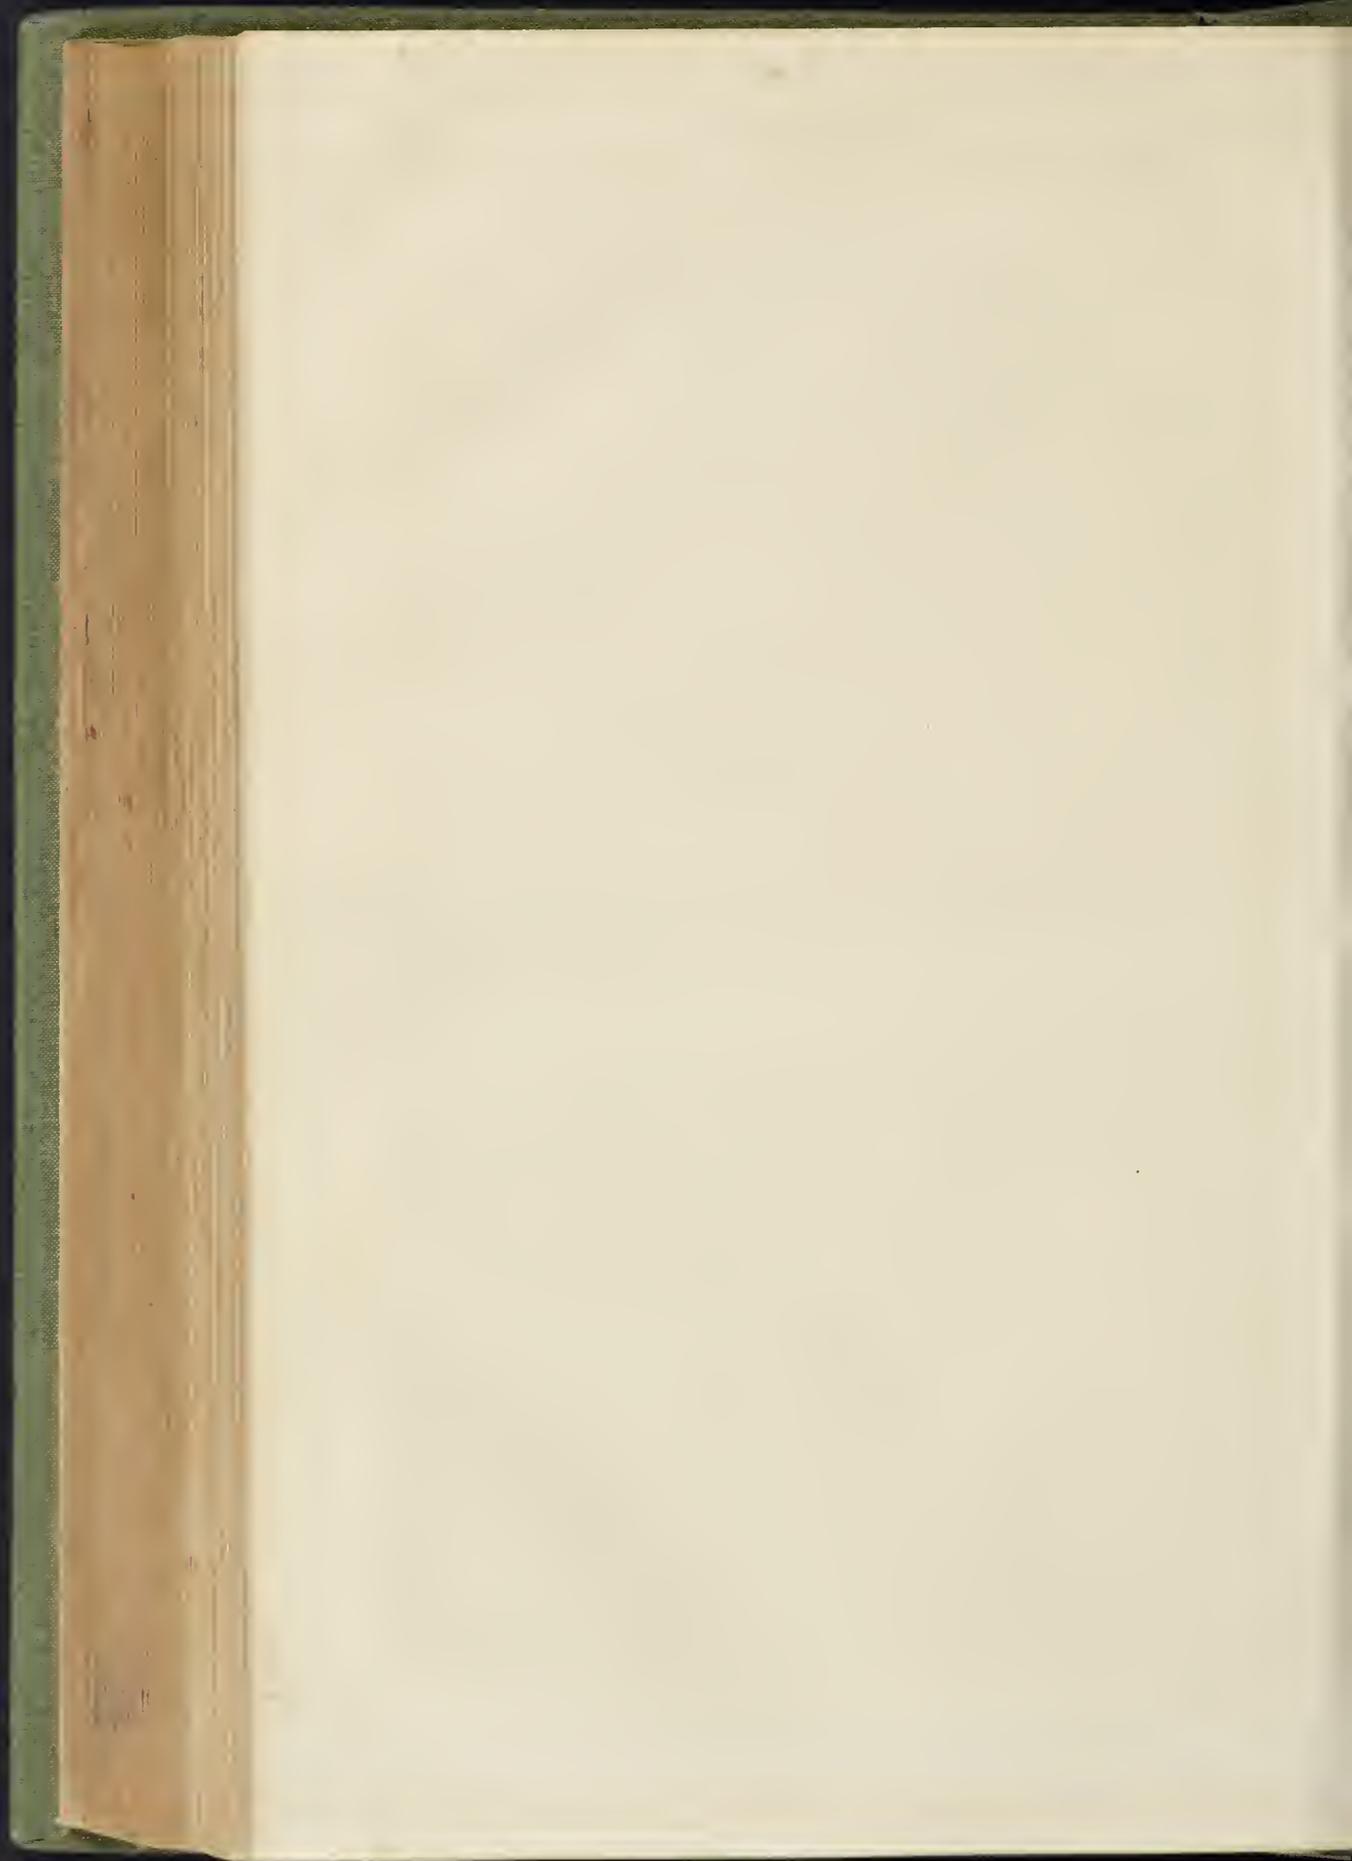

Together Mr. Horton and the late Miss Horton have given 10,000*l.*, including the value of the site, for the building and endowment of this institution. The erection of the infirmary cost 6,200*l.*, and the furniture about 900*l.*, and Mr. Horton has given 831*l.* 1*s.* 7*d.* towards its endowment, being the balance of the sum set apart by the donors for the purposes of the hospital. The total amount of donations towards its maintenance is now 3,500*l.* Mr. Hitchcock, of Leamington, has given 500*l.*, besides a promised subscription of 100*l.* a year. That donation was promised upon condition that 1,000*l.* were contributed by others towards the endowment fund, and it is gratifying to be able to state that that sum was not long in forthcoming. A portion of the land which was given for the site of the infirmary, and which is not at present required, is let at an annual rent of between 30*l.* and 40*l.* a year. This sum will go towards defraying the cost of the maintenance of the institution, which it is estimated will be about 600*l.* a year. The infirmary is intended for the use of the poor of Banbury and those residing within a radius of ten miles. In connexion with it is the Provident Dispensary, and a person can by a subscription of 1*d.* a week, or 3*d.* a week for himself and family, provided his children are not more than fourteen years of age, secure medical advice, medicine, and in case of serious illness, medical attendance at his own home.

THE HOITON INFIRMARY, BANBURY.—Plan.

THE HORTON INFIRMARY, EANBURY. — MR. CHARLES H. DRYDEN, ARCHITECT.

SEVERE THUNDERSTORMS.

We have a larger collection than ever of notes on all parts of the country as to the continuance of storms, and damages to life and property, but not occupy much of our space with their details, especially as the damages to buildings are mostly of a minor description, such as knocking down chimneys, and otherwise damaging houses, schools, tents, &c. Many persons have been struck by lightning, and more or less injured killed, but the deaths are few by comparison with the number struck; and often the results strange escapes from any injury at all to a person, while portions of the dress were torn away. Insensibility or blindness for a short interval has been frequent. Among those killed is again a person in bed. Fright has killed one, and a horse broke his neck with his owner from fright. Whole families have been struck, and yet none killed. At Derby, Mary's Roman Catholic Schools were struck, yet not one of 400 children in them was hurt. At Leicester a manufactory was on fire, and at Tewkesbury a circus-tent was burnt up. A gentleman whom we know taking shelter in the Holloway-road under a pavilion, when it was struck and shrivelled in a moment by fire. Thunder is even on Wednesday rolling in this same district; and we hear that St. Giles's, Cripplegate, has been rather severely injured, as also the Holy Trinity Church, Windsor. Stacks of hay and straw in various places have been burnt, and glass roofs broken. At Smithfield, hundred thousand pounds' worth of meat is tainted by the recent sultry heat of a single day. The heart of England has suffered severely again since last we recorded the occurrence of these extraordinary storms, and Ireland had its share of them. The accompanying winds in England have done much more damage in the lightning direct itself. At Douglas, in the Isle of Man, immense waves from the Atlantic have suddenly done much injury. These waves, and a peculiar vibrating motion of the sea, are supposed to have had something to do with the electric disturbances. An earthquake on the bed of the ocean might produce such shocks and vibrations. Violent thunderstorms swept over Germany and Switzerland. At Lux de Fonds the Festival-hall of the Swiss gymnasiasts was unroofed. Four persons lost their lives on the Zurich lake. Upsala (in Sweden) and its environs were visited by a terrible hailstorm on the 25th of July. The hail-stones, as big as pigeon's eggs, covered the road 11 in. deep; all the windows were smashed, trees broken, and the crops utterly ruined in the district. Together, these physical commotions have probably far exceeded those which in 1869 produced the great earthquake.

WHO GETS THE PROFIT?

Permit one who lives on Pit Bank to say a few words on the prevailing topic, and your remarks thereupon. In South Yorkshire, during the fall last year, the price of steam coal at the pit's mouth ranged from 3d. to 7s. per ton. Since then there have been four advances of 10d. per ton each, and an advance of 2s. 6d. per ton; so that now the price of coal is from 12s. 6d. to 13s. per ton. At the same time colliers' wages have advanced 1s. per ton only, while the cost of coal to the collier has advanced 6s. 6d. to 7s. per ton. Sixteen pence per ton will cover all the extra expenses added by increased wages to engine-drivers, fitters, &c., cost of coal, oil, fodder for horses, and a clear additional profit to the owner of 5s. to 6s. 6d. per ton, making, in all, some 10 per cent. Now, sir, it seems to me a very odd and pertinent question to ask what this collier does to deserve these enormous profits. The seventh of the additional profit has been taken from him by the workers, while he quietly sets the other six-sevenths, and is, I hear, Oliver, asking for more. A complaint, noticed by you, has been going round of the papers, that the colliers are getting their increased earnings in drink, and neglecting their work thereby. If this charge is true, it is, of course, much to be regretted, though my own observation does not bear it out. An increased cost of food and clothing alone would swallow up his increased earnings; so that if a collier drinks more, he must eat and dress less. But then colliers are, and have ever been, a very debased class, with no pleasures

or desires other than their belly and their "dawn"; and if the public wants cheap coal, let an afraid colliers must be kept ignorant, as now, knowing no fear and fearing no danger. Let the Education Act have force through a couple of generations, and I venture to doubt whether, in spite of any or all the securities against danger which the Legislature may be able to enforce, and human ingenuity devise, men will be found in sufficient numbers to raise as much coal as will be required to carry on manufactures alone in this country, even if our present ruinous export is stopped. No man of any education can be persuaded to hurry himself in the bowels of the earth ten hours or even eight hours per day, so long as he can earn a living in the sunshine.

I cannot pass by this question of reduced hours of working without protesting against the tone of the complaints made by the employers, who seem to assume that workmen have no right to workless, whatever their remuneration may be. I say it distinctly, that no one who works for wages likes long hours, but will do all he can to make them as short as possible. Fancy, going down into a mine in the early morning twilight, and working there in darkness all the time the sun shines above, and returning to the surface just in time to see his last rays. Who but a slave would submit to this?

The hours of labour will be much shorter in the future than they have been in the past; and justly so, or why should we invent and use labour-saving machines, and more economical modes of working? When there are no *draves* in the country, and every person earns his dinner by brain or hand before he eats it, it will be time enough to complain of short working-hours, should the production be insufficient for our wants. E. G.

A BOX-IRON.

Sir,—A new American box-iron for laundry purposes is advertised. It consists of a hollow box-iron, with a short bent flue at the top of the nose end, and a regulating draught-hole at the butt end, so as to form a small furnace, in which wood charcoal is burnt for the purpose of heating the iron. Will not the products of the combustion consist largely of carbonic acid gas, and is not the apparatus likely to be detrimental to the health of persons using these irons and breathing the gas thus thrown off? R. M.

THE ROYAL AGRICULTURAL SOCIETY.

Sir,—I can sympathise with your correspondent of last week as to the behaviour of the Royal Agricultural Society in the case of the competition for two cottages, as they behaved in a precisely similar manner to a number of competitors sending in designs for the "best mode of laying out a lot of land for cottages for the labouring classes in various degrees of accommodation and size."

I took an immense amount of pains, trouble, and expense to send in a set of plans, and the result was, "No design comes up to the mark of the Society's ideas," &c. This was at the Leeds show, about twelve years ago. J. NUNN.

OPENING OF THE NEW PIER AT HASTINGS.

The opening of this pier by Lord and Lady Granville, on the 5th inst., was an important event in the annals of Hastings and St. Leonards. The pier has been constructed after the model of the West Pier at Brighton, but the floor or deck of the pier is flush with the parade, from which it is approached, thus rendering steps unnecessary throughout its whole length, and at the sea end there is a pavilion or "palace on the sea," entirely closed in and capable, it is said, of holding about 2,000 people. The position of the pier is on the Hastings side of the dividing line between the two towns, being opposite the garden of the Sussex Infirmary. The deck, which is closely and smoothly laid like that of a vessel, is 45 ft. wide for half its length. At the shore end it gradually widens out to 190 ft., giving ample room for separate entrances on the east and west sides. At the south end or "head" there is an expansion until an extremity of 130 ft. is reached. As the entire length from the shore seaward is 910 ft., it will form a promenade for visitors seeking to enjoy the sea-breeze of the south coast. The pavilion,

or saloon, out in the sea, is in the Alhambra style. Its dimensions are 150 ft. long by 100 ft. broad, and 30 ft. in height. The possible strain, as well as the weight of this superstructure, have made it necessary to impart additional strength to the part of the pier on which it stands, and to that end the floor of the saloon is raised about 3 ft. above the general level of the deck, and the main girders beneath are arranged diagonally, so as to give greater stiffness. The columns supporting the saloon and the girders are so braced together that there is said to be no vibration even amid violent storms. A covered way, answering the purpose of a verandah is made all round the saloon on the outside, and beyond, at the head of the pier, is a wide open space, where a fine view of Hastings and St. Leonards is obtained, including the whole coast-line between Fairlight and Bex-hill. 300 cast-iron columns with screw-piles have been used in the structure. Towards the shore the piles have been forced into the solid rock 2 ft. deep, and the remainder have been driven to a considerable depth into the clay. The sides of the pier are occupied with a continuous line of seating to the extent of 2,600 lineal feet. For walking a total area of 75,000 superficial feet has been provided. The engineer and designer was Mr. Eugénus Birch, of London, and the contractors were Messrs. R. Laidlaw & Sons, of Glasgow, gentlemen who have held the same relative positions in the construction of the Brighton, Blackpool, and other piers. The amount of the Messrs. Laidlaw's tender was 23,250l.

A PROPOSED NEW CHURCH IN PIMLICO.

A New Mission Church is about to be erected in Pimlico, in connexion with St. Peter's, Eaton-square, which has for some time been so crowded that there is not accommodation for the constantly increasing congregation. A site has been secured on the waste land lying between the printing-office of the London, Chatham, and Dover Railway Company and Gillingham-street, and having a good frontage into Wilton-road. The part reserved for the church will give a ground-floor accommodation for about 700 persons, and leave a space to be used at any subsequent period for enlarging the church or erecting schoolrooms. All the seats are to be free, but it is proposed to adopt some plan to secure the rights of those living in the district over strangers, by keeping their seats until a certain time.

PITCH AS A PROTECTION AGAINST DAMP.

Sir,—I should feel much obliged if any of your numerous readers could give advice, or the result of their experience on the following matter. Some years ago, in the erection of a large country house in an exposed position, where the outer walls were of stone and lined with brick-work, instead of having the south and western walls battened, I had a coat of Stockholm pitch paid completely over the whole internal surface of these walls; and whilst in a soft state the pitch was roughly scored with a stick, so as to form a key for the plaster, which was subsequently applied in the usual manner, and with three coats. The result was perfectly satisfactory. No damp of any kind has since appeared. The rooms were papered within a very short period of their completion without any subsequent discoloration, and there has been no annoyance from smell. I have subsequently applied it on brick walls as satisfactory a result; but last year, in the erection of another large house, where the main walls were of flint, lined with brick, and covered with Portland cement on the outside, I had the inside walls rendered with pitch in the same manner as above described: the pitch seemed longer drying than usual, and the smell continued for a longer period. After the joiners' work was finished considerable annoyance was experienced from the smell of pitch, and some of it had to be taken down with a view to give air and vent to the smell. After leaving it exposed for two or three months, the annoyance seemed at an end; but now, on the return of the family from abroad and the occupation of the house, the smell seems to have returned, to the annoyance of every one. The builder declares that he used the best pitch, and that no tar was mixed with it.

Can any of your readers say why that which answered perfectly in former cases should prove

an annoyance in this case? And can they suggest any application which would counteract or remove the smell? As a protection against damp from the outside it answers perfectly.

T. H. W.

OPPOSITION TO THE PROPOSED NEW SOUTH LONDON CEMETERY.

The proposal to construct a new cemetery in the neighbourhood of Penge by the recently formed "South London Cemetery Company," is likely to encounter a considerable amount of opposition from several sources, on the ground that the site is unsuitable, the soil consisting of a dense clay, and unfitted for burials. The company propose that the cemetery shall occupy an area of 42 acres, and they have already secured the principal portion of the ground; an extension of 17 1/2 acres is, however, required to make up the required 42 acres; but before obtaining this for cemetery purposes, the sanction and licence of the Home Secretary are necessary, and for these they are applying. The inhabitants of South Norwood are adverse to the cemetery being formed in the locality, alleging that the formation of a cemetery in a district comprising upwards of 900,000 inhabitants, would have a depreciating effect on the surrounding property, and encourage the erection of an inferior class of buildings. A public meeting has just been held on the subject, at which it was decided to oppose the granting of the licence by the Home Secretary, and a committee was appointed to carry out the object of the meeting. The Lewisham District Board of Works are also opposing the project, and a petition against the granting of the licence for the additional 17 1/2 acres has been signed and presented to Mr. Bruce by the Board.

ORIGIN OF FIRES.

SIR,—Captain Shaw, the Chief Superintendent of the London Fire Brigade, has published, recently, a very useful work upon the nature of fire-risk, &c., which you have reviewed. A work, compiled by some competent person, upon the origin of fires in buildings, especially in ancient houses, would be useful, as scarcely a year passes without some old edifice being destroyed by fire in Britain. Neale's "Views of Seats," A.D. 1820, contains an engraving of Heythorpe House, near Chipping Norton, then a "stately residence," erected by Robert Archer for the Duke of Shrewsbury, A.D. 1705, and occupied by the Duke of Beaufort, A.D. 1820. Subsequently it was destroyed by fire, caused, I believe, by linen, which had been placed to dry, taking fire at night; and when I saw the place, in 1819, the walls alone remained. Frequently, a wooden beam or an over-heated flue causes the disaster. The fire may smoulder for several days, and break out at night unexpectedly. I believe that a plainly-written work, by some experienced architect competent for the purpose, showing the general reason of fires in edifices, especially in old buildings, with useful practical hints and suggestions, would be popular, and prevent some old houses from being destroyed before they might be without such information. If I were the owner of an old mansion, I would have it examined by a surveyor, at least annually. I think Longiton Hall, Essex, which I saw on fire in the winter of 1837, was burnt owing to a beam becoming ignited in a chimney.

CHR. COOKE.

PROTECTION OF IRON.

SIR,—Whilst admiring the construction of the scaffolding and the steam appliances thereon at the Town-hall, Manchester, yesterday (and, of course, the elegant structure within it), my attention was suddenly drawn to the rusty state of the railings inclosing the Albert Memorial, and the faded appearance of the heraldic painting and gilding; in fact, it appears to be too minute and delicate in character and detail for a work exposed to the elements.

How will the enormous quantity of gilding appear on the Rochdale Town-hall when it has weathered as many winters as the Memorial? Its renovation will be costly and dangerous.

I think it high time that some more permanent and inexpensive coating should be introduced for preserving iron from rust. Take, for instance, railings round tombs, first put up and neatly painted; families or friends of the departed leave the neighbourhood; a few years

pass, and paint gives place to rust. Galvanised iron answers to a certain extent, but would hardly serve in this case.

I feel certain there is a fortune to be made by any one who will invent the desired material.

H. J. P.

UTILISATION OF SEWAGE WORKS AT LEEDS.

TENDERS have been opened for the construction of a reservoir with twelve compartments, providing for a constant flow of sewage. The proposal of Messrs. Longley, Brothers, was accepted. The following is a list of the tenders:—

Table with 2 columns: Contractor Name and Amount. Includes Boothman & Broomhead, Helm & Co., Westley, Ryecroft, Abbey, Whitaker, Bros., Nichols, Longley, Bros., and Mr. Alfred M. Fowler.

Mr. Alfred M. Fowler, borough surveyor, Leeds, and Mr. W. W. Symington, Native Guano Company, London, are the engineers for the works.

THE COURTS OF JUSTICE.

In reply to statements by Mr. Cavendish Bentinck on Saturday last,—

Mr. Ayrton said his hon. friend had hardly done justice to his own view. Some time ago the hon. member for Whitehaven submitted for their consideration a motion which he then stated was four years too late, because he proposed that the whole question should be reconsidered; and he made some reflections on Mr. Street, as if he were incompetent to perform the duties for which he was appointed. The appointment of Mr. Street determined the style and character of the building to be erected, and that gentleman was singularly well qualified to carry out that style and to produce a building of as much beauty as any other architect that could be named. The hon. member had fallen into considerable confusion between the general plan which had been laid in the Library towards the close of last session and the more detailed drawings from time to time varied in minute ornamentation; but the general scope of Mr. Street's design had not been altered since it was exhibited in the Library. No benefit would result from commencing the House from time to time any change which Mr. Street might make in the ornamentation of the front of his building. In August last year the Treasury gave their sanction to the south front, and, according to contract, Mr. Street was bound to deliver the contract drawings which were necessary to enable the contractors to make tenders in February, this year; but he deemed it desirable to request much more time than he anticipated, and, so far as he could judge at the present moment, the Office of Works would not be in a position to receive tenders for the construction of the building for the next three or four months. His hon. friend wished to know what was to be done with the approaches to the Courts of Justice, and nothing was to be done with it. All the land would be required by the contractors for the enormous works undertaken, for the preparation of the stone, and shoring up the building.

Mr. Alderman Lawrence wanted to know whether the architect had entered into a contract under seal to carry out the works for a certain sum.

Mr. Ayrton replied that contract for the performance of the work for a certain sum had been signed, and the time necessary for the completion of building would be between six and seven years.

Mr. C. Bentinck said that, having learnt there was no probability that the work would be proceeded with this year, he would go no further.

"UNFAIR COMPETITIONS: BRIGHOUSE."

SIR,—Having been absent from home, I have only just seen the letter you published on the 27th ult. under the above heading. It is so absurdly mistaken, or so utterly malicious, that, as regards its author, it is unworthy of notice. In justice to your public position, however, it is necessary to advise you of the truth. With this view, I send you copies of The Brighouse News of July 18th and 20th respectively; the former containing a list of the tenders originally submitted for the chapels, lodge, &c., referred to in the letter in question, and the latter an account of the reductions effected.

You will see that the total of the lowest tenders was not 6,000l., but 2,931l. 5s., which sum included 275l. for boundary walling. On estimating, as made in the letter, in accordance with the requirements of the Board, was, without the boundary walling, 2,656l. The comparison, therefore, lies between 2,831l. 5s. less 275l., 2,556l. 5s., and 2,000l. showing a difference of 556l. 5s., instead of 4,000l. The real difference is sufficiently amazing, without any such exaggeration as has been placed upon it by your ingenious correspondent; but it is by no means peculiar to the case in question, as may be seen by recent reports of similar affairs in this district,* and probably also in other districts,—perhaps even in your correspondent's own practice, if he has any.

The second of the two cases herewith sent reports the value of the reductions proposed, namely, 19s. 7d., of which the Board, having been satisfied that the intended modifications could be effected without lessening the accommodation and without injuring the structural solidity of the buildings, adopted alterations which resulted in a saving of 18s. 11d., which left the amount of the lowest tenders 2,312l. 11s. 1d. Deducting

* Vide Bradford Observer, July 18.

from this amount the cost of the boundary walling, 275l., we have 2,037l. 11s. 1d. to compare with our original estimate of 2,000l.

I leave your readers to draw their own conclusions. The announcement referred to in the opening paragraph of the letter appears to have emanated from the same source, for it conveyed as much error as truth, and, practically speaking, failed in its gratuitous prophecy but it had the merit of correcting itself to some extent before it was absurdity.

From what point of view the competition in question can be classed as an unfair one it is difficult to see, unless it be from that of a disappointed rival. Our position was gained under motto, by the plainest style of drawing, and neither Mr. Gay nor myself had the honour of being acquainted with any gentleman at the Board or in the district, nor had we the slightest "influence," nor did we attempt to gain it.

When a gentleman, fired by public zeal, seizes his pen to meddle with the business of others, it is obviously his duty to make sure of his facts. In the absence of such approximation to accuracy, he exposes himself to certain natural suspicions, which belie your correspondent's statement and his professed motives. If, however, he acted in bona fides, he cannot fail to show his regard for truth and justice, by publishing a statement, signed with his own name, indicating the means by which he has been led to make such reckless and unfounded charges; and I would do well to win to remember that it is not necessarily a fraud to enter a competition; and that fair play does even to those who succeed.

F. BARTRAM PAYTON, who writes the letter in question sent us a new paper, in which the amount he named was given. He was probably misled by this.

THE FIRE AT ST. MARY'S, PADDINGTON.

SIR,—I feel sure that many of your readers, as well as mine, will be interested to know a little more as to the exact cause of the late fire at St. Mary Magdalen's Church, Paddington. The newspaper report states that a layer of pitch was spread over the roof of the steeple, and that the steeple, and thus ignited the whole roof. Is not pitch somewhat unusual substance to employ in such a situation? I have often described "pitched-incombustible roofing felt," and do hope that the latter is really what it professes to be. Would it be giving too much of Mr. Street (the architect of the church), to ask some slight explanation of the origin of the fire? EDWARD B. FERRIS.

"TREATMENT OF BUILDERS."

With reference to a letter in our last number which had we received a communication from a firm of solicitors in Hull, on the part of Messrs. Smith & Brodbeck, architects, stating, "1. That no acceptance of any tender made until that from the 'Scarboro' builder' had been received. 2. That the 'Scarboro' builder's' ten was forwarded by the 4.40 p.m. train from Scarborough Friday, and not on Saturday. 3. That his tender was 700l., and not 1,400l., below the lowest previously offered." We willingly insert this contradiction of statement in the letter referred to, and must request explanation from the writer of the letter.

MASTERS AND MEN.

SIR,—Will you allow a workman to say a few words on the question of wages? I think that the question of wages when looked upon as a mere question of political economy, as your correspondent "Brighton" says, it, "enlightens the mind," will always tend to promote antagonism between employer and employed. While, on the other hand, if the employer treats the workman as a man, he will be as well as himself, and not as a bale of cotton; and if any commodity that brings him in so much cash so doing he will create a reciprocal feeling on the part of the workman, making him feel that he is a kind of partner in the enterprise, and that wherever he is, it is a privilege to do his best for his employer. I am at this time only brought about by a better understanding both on the part of the employer and the man, and the Christian principles in the relations of every-day life. J. R. GOSLIN.

INJUNCTION AGAINST "INTERPOLATING" A HOUSE.

In the case of Bidgood v. Preston, heard in the E. Court, the plaintiff, who is owner of No. 21, Brunson terrace, Brighton, sought to restrain the defendant gentleman who had recently purchased the adjacent corner house, No. 20, from "interpolating" a house the rear of No. 20, between it and No. 27, Brunson square. The plaintiff relied on a covenant entered by the defendant's predecessor in title with the owner of the property. The defence was, that this similar covenants affecting the other houses in Brunson terrace were abrogated by a clause in a local Act passed in 1830, and that the covenant was still in existence; the plaintiff was precluded from enforcing it by acquiescence. The Master of the Rolls said the Act of 1830 had no operation to the covenant in question, and the acquiescence only came to this, that some owners houses in other parts of the terrace had not chosen to insist on their rights. A perpetual injunction restrained the defendant from erecting any building at the rear of No. 20, except appropriate domestic offices, was granted.

REIGATE AND ITS REQUIREMENTS.

CONSPICUOUS amongst the places that are left undone that they ought to have done stands Reigate—a town well known to Metropolitanians, being the same distance in point of time from the City that Notting-hill is. As has done her utmost to make Reigate one of the most delightful retreats for such of the high kind as are addicted to commotion; it is

ed from the Polar blasts of winter by the softness of the Surrey hills, and the heat of summer is tempered by an abundance of umbrageous trees. It would appear, however, that the more hountiful nature is, the more remiss are recipients of that bounty are. As soon as the South-Eastern Railway opened up this truly cadian district, paterfamilias, "habbling of green fields," was not slow to betake himself and progeny to a spot hitherto given up to nalaids and satyrs, and soon many of the most sylvan spots were bought and built upon by him, and a naturalist who may be dubious as to whether he is gregarious in his nature might have been misled by an opponent's argument, backed up by such a fact as this migration. In a single decade the population was doubled. Dives was fully represented by the migrants, and, as usual, he did his utmost to shut Lazarus out of his earthly Paradise; and, to a great extent, he was successful. The great unwashed came in train; but it dwelleth apart in rows of ill-lit, draughty tenements, that afford a striking contrast to the luxurious villas of the opulent. There was a time, long past now, when a householder's duties ceased at his garden-gate, and there are many who call it "the good old times," who would like them restored. "Every man for himself and the devil for us all," is their motto. The wise sanitary laws that our forefathers in their wisdom did not pass compel us all to look to ourselves collectively as well as individually. If we are not bound to administer to our neighbour's stomach, we must satisfy ourselves that his house is fit to be occupied by a nobler man than a pig. To the disgrace of Reigate, a part of the duties of the inhabitants has long been scandalously neglected, and the balmy has become fetid and pestiferous, fevers frequently recur, and the smallpox has paid the "n" visit, and left its mark behind; and the order is, that it did not depopulate whole parishes, for the sanitary arrangements and water-courses are more primitive than those of Moses. We expect to find such things in parts of Staffordshire, but to find them in a refined and Elysian suburban suburb takes our breath away, literally well as metaphorically. A few days ago, the lord mulcted a Reigateite for building a set of tea-chests: surely those nasty laundries that have not provided proper closets ought to be made to explain the reason why. Such a set of things ought not to be tolerated a single

any are asking how it is that for three or four years there has been no migration to Reigate, and that building operations have entirely ceased. Some attribute it to the heavy drainage that the new drainage will make necessary, but it is not because the town has been left drained until its fair reputation has been damaged? There are several tenanted villas, but have evidently been occupied; perhaps the late occupants have fled to a place less propitious to the difatory organs.

Amongst the other sins of omission that strike the visitor to Reigate are the absence of channels for many of the thoroughfares, the paucity of pavement, and the had street architecture. The Public Hall scarcely has a façade, and though it may be close upon it, he will have to "seek for it till he finds it;" but a hideous Georgian hall is conspicuous in the extreme, and is not possibly be overlooked. The former is a fine, but of the most insignificant type. The castle precincts, which are situated in the centre of the town, have been made into a public park, but more evergreens are wanted, and the protection for shade of a few more trees would say "the trustees" open that the charge of "patriotism." I could not learn that the band of volunteers play so often as twice a week, or twice a year. I should suggest to the trustees that the public would be drawn thither more than it is if 10s. or 1l. per week were put upon music, and more seats would be provided to make the gardens perfect.

GARGOYLE.

NEW SCHOOLS OF SCIENCE AND ART, AND MUSEUM, AT GLOUCESTER.

The new edifice, except a few minor portions, and some of the fittings, may be said to have been completed. A view and plan of the edifice will be found in our volume for last year, pp. 466-467. Messrs. Pulljames, Walter, & Son, of Gloucester, executed the plans; and Messrs. King and Edwin are the contractors. The style is a mixture of the thirteenth century. On the basement-floor rooms are provided for the curator,

hat and cloak rooms and lavatories for the male art-students, and cellars. The ground-floor consists of a general entrance, with carved work, an inclosed porch, hall, and staircase. Entered from the hall, on the left-hand side is the museum and library, a room 60 ft. long by 20 ft. wide, and 16 ft. high. Immediately facing the main entrance is the door leading to the lecture theatre, a room 28 ft. by 26 ft., and 17 ft. high. This is to be used in common by science and art students; it is fitted with benches, and has separate entrances for each department. The remainder of the accommodation on this floor is devoted exclusively to the uses of the science school, and comprises a class-room, 19 ft. 8 in. by 21 ft.; a master's and preparation room, and a lavatory, 24 ft. by 24 ft., with an open-timbered roof. There is also a separate entrance-porch, with cloak-room, lavatories, &c., appropriated exclusively to the use of the science students. The laboratory is a low building on the north side of the main block. It is placed as near as may be to the other rooms connected with the science school, while it is made a detached building, to admit of its being easily ventilated when scientific experiments of certain kinds are being conducted. By means of the staircase from the hall the rooms on the first floor are approached. The whole of these are devoted to the use of the school of art. They consist of an elementary room, 34 ft. 3 in. by 20 ft.; and a modelling-room, 18 ft. by 12 ft.; each 20 ft. high to the collar-beams of the roof; a large painting and advanced class-room, 60 ft. by 20 ft., and 22 ft. 6 in. high to the apex of the open roof; and a master's room, 20 ft. by 12 ft. There are also cloak-rooms, lavatories, &c., for the use of the lately students. The roof of the large painting-room was suggested by the architect in order to obtain a perfectly unimpeded light, free from wall-platts and other impediments which cast shadows. The building has been fitted with warming and ventilating apparatus by Messrs. Hayden, of Trowbridge. The building is erected of stone of the district, lined with brick, with Bath stone dressings. The roofs are covered with Broseley tiles, and the timbers on the inside, where visible, are stained and varnished. At the top of the staircase is the Munich glass window which Mr. J. D. T. Niblett intended to present to the cathedral, but which could not be placed therein because a contemplated change in the tracery was objected to by Mr. Gilbert Scott. It is intended as a memorial of the founders and providers of Sunday schools in this neighbourhood.—Mrs. Bosvey, of Flaxley, and the Rev. T. Stock and Mr. R. Raikes, of Gloucester; and was executed by Chevalier Max Ammiller, superintendent of the Royal Glass Works at Munich, under the direction of Mr. Niblett. It is partly heraldic, and also contains representations, in the centre, of Christ blessing two kneeling boys; on the left, a matron with infant in arms, directing her little daughter to Christ; and, on the right, two of the disciples rebuked. Over the central canopy is a hand in glory, and dove below.

CHURCH-BUILDING NEWS.

Waterford.—The small church which has been erected at Waterford, at the sole cost of Mr. Robert Smith, of Goldings, has been consecrated by the Bishop of Winchester (in commission for the Bishop of Rochester). The hamlet of Waterford is an outlying portion of the parish of Bengoe. The building now erected in the hamlet will be the chapel-of-ease for the mother church of the parish. The new church is dedicated to St. Michael and All Angels, and the architecture is Early Geometrical. Mr. H. Wooller, of Graffham, near Guildford, was the architect. The edifice is in plan a parallelogram consisting of chancel and nave, and will seat 150 persons. Attached to the north aisle of the church is a vestry and organ-chamber, having communications with both the chancel and nave. There is also a south porch to the nave, framed with open tracery, turned shafts, &c. The steeple, porch, and fittings are of English oak. The walls are built of concrete, with Kentish rag facings and brick linings. The windows, doors, and dressings generally are of Bath stone, and the roof is covered with Broseley tiles. At the west end of the church is a stangled branch or steeple seventy feet high, to contain the bells. This steeple is supported upon cambered tie-beams, walls, posts, and arched braces, starting from solid stone-wall shafts below. The pavements are from Messrs.

Minton's. The four west windows and the chancel windows have temporary glazing, the painted glass ordered for them not being completed. The other windows are filled with uniform panel-flowered quarries. The church will be lighted with coronas by Messrs. Hardman, of Birmingham. The organ, with an illuminated front, was built by Messrs. Walker & Sons, of London. In the winter time the church will be heated by means of hot-air apparatus. The churchyard is surrounded by a boundary wall of stone, and at the entrance there is a lych gate, and porch with gabled roof surmounted by a cross. The contractor was Mr. C. Chappell, of Tring, and Mr. Davidson was clerk of the works. All the oak for the sittings, floors, porches, and other portions was found by Mr. R. Smith, and the additional cost of the structure has been about 2,800l. Mr. Smith has also built close by three houses for poor widows, specially designed for the health and comfort of the inmates. They are built with porches, gables, and timbered beams in the walls, and look in keeping with the lych gate at the entrance to the churchyard. Two of the rooms in one of these cottages are to be devoted to the purposes of a mission room and village library. Mr. Smith has also erected here two model labourers' cottages. Mr. Sheffield, of Bengoe, was the builder.

Bromsgrove.—The corner stone of a new church has been laid at Bromsgrove. The site is at the upper end of the Birmingham road. The ground plan of the church provides accommodation for upwards of 600 people, exclusive of the choir benches. The church will comprise nave and side aisles, tower at north-west corner, porch on south side, chancel with apsidal termination, and an organ-chamber and vestries for clergy and choristers. A basement will be sunk to accommodate the heating apparatus. The east window bay of aisles is slightly projected, and gabled in the transeptal form, which gives the church exteriorly, according to the perspective view, a cruciform appearance. The style is transitional. A spire with tower, rises at the north-west corner, its altitude being about 175 ft., the upper part of the tower containing the belfry, with ornamented double lantern lights, with louvres for the passage of sound; but it is not contemplated to execute this upper portion of the tower and spire at present, owing to limited funds. The church is intended to be built with the local sandstone, the walls being lined inside with buff-coloured bricks, relieved with stone strings and handings, the dressings, arches, window facings, &c., being executed partly in Bath, and part in local grey sandstone. The amount of the contract, which is undertaken by Mr. Estcourt, of Gloucester, is 3,920l. towards which a sum of about 3,300l. has been collected. The foundation has been raised to the plinth, and the corner stone forms the base of one of the buttresses at the west end. It is of Portland stone, and bears, incised, a Latin cross, and the letters "A.D., 1872." Mr. J. R. Horton is the architect, and Mr. Estcourt, the contractor.

Whittlesey.—St. Andrew's Church, Whittlesey, has been restored and reopened. The cost of the portions already restored is about 1,500l., and further restoration is contemplated as funds become available. After obtaining the major portion of the requisite funds, Mr. R. R. Rowe, architect, was directed to prepare plans for a restoration of part of the fabric; tenders were invited; and Mr. W. Elworthy, of Upwell and Wisbech, became the contractor. The first work was to clear every particle of wood fittings from the interior. Upon removing the boarded and paved floor, the church proved to be a great mausoleum; it was literally honeycombed with coffins, upon which the floors rested; as the coffins from time to time decayed, the floors sank, and the atmosphere within the building produced nauses. All the vaults have since been arched over, and the whole area of the church covered with concrete; holes have been cut through the walls so as to ensure a thorough ventilation of all boarded floors; the soil in the churchyard for 80 ft. in width from the church has been lowered, so that persons now step up into the building instead of stepping down as formerly; a new oak roof has been put upon the north aisle of the nave, and covered with lead; the walls generally have not been over-dipped, and the mutilated stonework re-set and restored; new stone parapets, with coping and gable crosses, have been fixed where needed; cast-iron pipes have been provided for conveying rain-water from the roofs, and underground drains laid in. The interior presents a very changed appearance: two of Gidney's underground stoves have been fixed; the passages,

chancel, and sanctuary paved with tiles, many being in ornate patterns; new boarded floors have been laid under all the seats; the old chancel stalls are re-arranged, and the whole of the nave and aisles filled with open seats of one uniform pattern, in which provision for kneeling has been made. The windows having a north aspect, are glazed with ordinary white glass, in lead quarries and coloured margins, those on the sunny sides of the church are filled with thick obscured glass in two tints, so as to obviate the necessity for blinds. A stained-glass window has been given by the vicar, Dr. Burgess. It is placed at the east end of the chancel, immediately over the Communion-table; it is nearly the width of the chancel, and is in five lights, the subjects illustrated being the five principal events in the life of our Lord; the figures are nearly life-size; they comprise the Nativity, Baptism, Crucifixion, Resurrection, and Ascension. Below each figure is a medallion; above is canopy-work. This window has been painted and made by Mr. Constable, of Cambridge, from the design of the architect. Mr. G. W. Johnson, of Peterborough, has presented painted-glass figures of two saints for the centre light of the west window in the tower, and other contributions of stained glass will be thankfully accepted by the vicar and churchwardens.

London.—The foundation-stone of a new church for St. Mark's district, Victoria Park, has been laid by Lord George Hamilton, M.P. The church will be built by Messrs. Brown & Robinson, from the designs of Mr. Blomfield, and will be in the Early English style, cruciform in plan, and consist of nave, side aisles, transepts, and chancel. The roof will be open, and the building, when completed, will accommodate 700. The new church will cost 4,000l.—The church of All Saints, Blenheim-grove, Rye-lane, Peckham, has been consecrated. The building is fitted with all the modern appliances. The roof is of stained pine, as are also the pews. The general character of the building is Gothic. A school-house has been provided. The building is detached, at a slight distance from the church.—A new church, dedicated to St. Luke, and situate in Evelyn-street, Lower-road, Deptford, has been consecrated by the Bishop of Rochester.

Birkdale.—St. Peter's Church has been consecrated by the Bishop of Chester. The church is in the Decorated style of Gothic architecture, and consists of nave, 81 ft. 6 in. by 21 ft. 8 in.; north and south aisles, 81 ft. 5 in. by 11 ft. 4 in.; chancel, 22 ft. 4 in. by 18 ft.; with organ at south-east, opening into chancel and aisles, and a vestry at the north-east. There is a tower 15 ft. square (externally) and 53 ft. high. The building will accommodate 600 persons, of which 295 sittings are free. The external stonework of the whole is of Cefn stone, the facings being of Upholland stone parpoint in courses. The contractor for the whole was Mr. Hugh Yates, of Liverpool, and the works were carried out by Messrs. T. D. Barry, also of Liverpool.

Welton.—The foundation-stone of a new church at Welton has been laid by the wife of the Bishop of Carlisle. The edifice will be small and unpretending, in the style of the latter part of the thirteenth century, modified to the requirements of the nineteenth; and will consist of a nave and chancel of one height, with a gabled projection for the vestry and organ chamber. The outside length will be 61 ft. 6 in., and the width 22 ft. A bell-cote is inserted in the west end; not, as usual, at the apex of the gable where the tines are carried up, but at the lower part of it. The church, when completed, will accommodate about a hundred. The architects are Messrs. Cory & Ferguson, of Carlisle; and the contractors are, Mr. James Wilson, of Gaitsgill, for the mason work, and Mr. Pearson, of Wigton, for the joiner's work. The material used will be the red stone from Chalk quarries in the neighbourhood.

Barnsley.—The foundation-stone of a new church about to be erected at Worsborough Common has been laid by the Archbishop of York. The architects are Messrs. Heeley, of Bradford. The church, to be dedicated to St. Luke, will be of Early Decorated Gothic character, and will consist of a nave, 53 ft. by 23½ ft.; and chancel 23½ ft. by 18 ft., and an organ-chamber and vestry on the north. The church will accommodate 212 adults, and the cost, exclusive of boundary walls, will be 1,300l.

Barnard Castle.—A meeting of the parishioners, duly convened, has been held to consider the plan and estimate furnished by Mr. Fowler, architect, for the restoration of the church tower. At the outset, Mr. W. Watson, jun. (Starforth

Hall) inquired why Mr. Haswell, who had so successfully restored the church, had not been engaged in the restoration of the tower? Mr. Watson (Spring Lodge), and Mr. Richardson contended that Mr. Haswell, in his former proposition for rebuilding the tower, had advanced vague estimates, ranging from 500l. to 1,250l. His restoration of the chancel also had not given general satisfaction. Ultimately the meeting was adjourned until the return of Mr. Holmes, the vicar's churchwarden, who, it was agreed, ought to be consulted.

Ashton-upon-Mersey.—The foundation-stone of the new church of St. Mary Magdalen, Ashton-upon-Mersey, has been laid. It is being built from the designs of Messrs. W. Wilson & Oldham, of Manchester, in the Early Decorated style. Its whole cost, including organ, the laying out of the grounds, &c., is estimated at 6,500l. The nave is 83 ft. by 43 ft., and has north and south transepts. The organ-chamber is on the north side of the chancel, which is 13 ft. by 19 ft.; and the vestry is under the tower on the south side. The entrances will be from the south porch and at each transept. The church will seat 650 persons. Mr. Brooks, who gave the land, and four others, gave each 500l. towards the building fund.

Hutton, near Kendal.—The works are in progress for a new church at Hutton, near Kendal, dedicated to St. John the Baptist, the old church being entirely removed as dangerous and beyond repair. Originally, the church was one of the most ancient in the diocese, but rebuilt about 100 years since, when all vestiges of the old structure disappeared. The new church will consist of a nave, 54 ft. by 26 ft., without side-aisles, an apsidal chancel, porch, vestry, and organ-chamber, and a bellry-spire at the south-west corner, 55 ft. high. The style is the thirteenth century. Materials—the dark blue stone of the locality, and white freestone dressings, open-timbered stained roofs throughout, seats and church furniture of pitch-pine and oak; sittings for about 200. The architects are Messrs. Brade & Smales, of Kendal; Mr. John Pawcett, of Hutton, is the contractor.

Bodmin (Cornwall).—At last there appears some hope that the long-contemplated restoration of this fine old church will be commenced. Plans have been prepared by Mr. Withers, of London, and a faculty is now being obtained. The estimated expenditure is about 6,000l.

Bridgnorth.—The battlements around the summit of the new tower of St. Leonard's Church have been completed, and when the pinnacles, with their carved crockets and finials, now just commenced, are completed and fixed, the tower will have assumed its true and full altitude, 110 ft. The carvers have chiselled on the gargoyles at the four angles of the parapet. These are each 4 ft. long. They are designed to carry 4-in. lead spouts. Upon the upper cornice, as well as around the turret and upon the string-course, lower down, a number of other animals, principally grotesque, will be carved; whilst the pinnacles of the tower and those around the turret will be decorated with crockets and finials, with human and other heads at the base. The label moulds of the bellry windows will also be stopped by sculptured heads and foliated corbels. The niche on the southern side and immediately over the doorway will be carved; the upper labyrinth of pinnacles, and surmounted by a helmet beneath by an angel with extended wings. The jambs of the doorway and adjacent parts will be ornamented with carving, in tracery, and pinnacles. Inside, in the groining beneath the bellry, all the intersection will be enriched by carved bosses. The style of ornament to be used throughout will be fifteenth-century in character, according to the architecture of the tower.

Saltburn-by-the-Sea.—The Church of Emmanuel, Saltburn-by-the-Sea, which stands on the Marsko high-road and adjoining Windsor-street, has been consecrated by the Archbishop of York. The Earl of Zetland presented the site, and Messrs. J. P. Pritchett & Sons, of Darlington, are the architects. The building is Early Decorated, and comprises nave, north and south aisles (each 89 ft. by 55 ft.), north and south transepts (each 24 ft. by 12 ft.), chancel (30 ft. by 24 ft.), with vestry, organ-chamber, and porch; together with a tower, 100 ft. high. To have carried out the whole of the plan would have involved an outlay of 7,500l., or thereabouts, and provided accommodation for a few short of 1,000 persons. The committee, however, decided for the present only to proceed

with the nave, north aisle, and north transept, which are now completed, and afford accommodation for 598 persons. This portion of the scheme was perfected at a cost of a little over 4,000l.

Chislehurst.—Christ Church, Chislehurst, was consecrated on the 29th ult. by the Archbishop of Canterbury. The building is placed on the summit of a site presented by Mr. N. Strode, of Camden Park. The church is Early Decorated after designs supplied by Messrs. W. G. Habeshon & Peto, of London, architects. Accommodation is provided for 525 adults, and care has been taken to give every facility for egress. The church consists of nave, with clearstory, aisle north and south transepts, and chancel, with vestry at north-east angle. Externally it is built of Kentish rag stone in regular courses with dressings and ornamental parts executed in Bath stone, and roofed with Whitland Abbey green slates and purple Bangor in alternate courses. A lofty tower with spire is placed at the western extremity of the nave, and utilised on the ground floor as one of the principal entrances, and in the next stage as an organ-gallery, approached by a turret staircase. The interior has a nave arcade, with carved capitals, and the Bath stone has been relieved with red Mansfield for the smaller columns which carry the roof principals in nave and chancel. The roofs throughout are open timber boarded and felted. The chancel has an apsidal end, with two-light windows in each compartment, and the floor is laid with ornamental tiles. The pulpit and reading-desk have been placed in the most convenient positions for commanding view of the whole congregation. The aisles are paved entirely with red and black tiles laid diagonally, with black margins, and the windows are filled with cathedral glass. The internal dimensions of the church, exclusive of the chancel, are 72 ft. by 53 ft. The general work have been carried out by Mr. Carey, of Highgate, builder; the tile floors by Mr. Colla, Victoria; the gas-chandeliers by Mr. Berry, Pimlico; and the ornamental ironwork boundary fences by Messrs. Hart, Son, Peard, Co., of Wych-street.

Derby.—The new Church of St. Anne, Derby, has been consecrated. Mr. W. Mundy, of Mat-eaton Hall, made a grant of the land for the site. The dimensions of the ground upon which the church is erected are approximate to the following:—The ground on which the schools will be built, 105 ft. from east to west, and 66 ft. from north to south. In arranging a plan for a church to accommodate 600 people on so small a plot of ground, it was necessary to occupy nearly the whole of the area; and accordingly the east, west, and north walls are placed close to the boundaries, with a passage on the south side access to the east end of the church. The church consists of nave, with north and south aisles, and chancel, with a north aisle for children, and on the south side an organ-chamber and two vestries for choir and clergy. The general internal dimensions of the building are as follows:—The nave and chancel are of uniform width and height, and are 95 ft. long by 50 ft.; and 30 ft. high to the wall-plat; the open timber roof will make the total height 50 ft.; the width of the aisles is nearly 10 ft. The principal entrances are at the west end in the street, and others are provided east of both for the vestry and the children's aisle. The body of the church is fitted with open seats, the chancel with stalls. The church is built entirely of red bricks, those for the interior for the windows and doorways being the best pressed bricks. Stone is introduced only for the pillars of the arcades, and for the tracery of the clearstory windows. In design the church is very simple, and has to depend upon the proportion of the several parts for its effect; but any future time, when funds are forthcoming there will be ample opportunity for painting wall-decorations, as well as for stained glass—similar embellishments. The architect is Mr. F. W. Hunt, of London; the builder, Mr. Robert Bridgatt, of Derby; and the office of clerical works has been jointly performed by several members of the committee as an honorary pointment. A bell, weighing nearly 6 cwt., been supplied by Messrs. Moors & Stainback, London. The carving has been executed by Mr. Tinkler, of Derby. The heating and ironwork and gates for the chancel-screen have been executed by the Derwent Foundry, and have also in hand the pulpit, which will be entirely of metal-work. The font is the workmanship and gift of Mr. Bateman. The rector

likewise a gift. The alabaster and the cross, and filling in of the panels, is the gift of Mr. C. P. Cart. The workmanship of the alabaster and marble is that of Mr. S. Keeling, a working man, done entirely in his overtime. The builder's contract was 2,750*l.*, but other expenses raised the cost of the building to 3,200*l.* Temporary day and Sunday schools, capable of accommodating 300 children, have been erected, but it is intended to proceed with the erection of permanent schools at present.

Swine.—The Church of St. Mary, at Swine, has been re-opened by the Archbishop of York, after restoration. The roof was flat and plastered, which entirely shut out from view the scenery of the upper part of the window. The roof is now of open woodwork, being supported by the side walls by means of footings. Three of the old oak beams have been retained, and have been varnished. The altar is reached by four broad steps and foot-piece round the communion-table. The body of the church is divided on the aisles by four bays. The arches rest upon low Norman pillars, surmounted by capitals bearing engrailed carving. The ancient choir-stalls have been preserved, and supplied with new frontals of stained deal. The floor, formerly brick, now consists of Minton's tiles. The seats were high-backed ones, but they are now open benches of stained deal. The gallery on the west end has been taken down, and in its place are the seats for the school children. The work of restoration was done by Messrs. G. J. Dury & Son, Selby.

SCHOOL-BUILDING NEWS.

Wood Green (London).—The foundation stone of new schools, to accommodate 300 children, in connexion with St. Michael's Church, Wood Green, has been laid in the Colney Hatch-road, by Mrs. Pearson, of Nightingale Hall, who presented the site. The schools are being erected by Messrs. Jackson & Shaw, whose foreman, Mr. Hey, arranged the preliminaries for the ceremonial. The building will be in the old English large-school style.

Camberwell.—New school buildings have been erected in Camberwell New-road, in connexion with the new Church of St. John the Divine, which is being erected in the Vassall-road, and have been formally opened, with some ceremony, in the presence of a large body of the clergy and laity. These schools, with spacious playgrounds, and gifts of an anonymous donor. The building, the north-west angle, has a tower and spire about 20 ft. in height above the main building. The buildings contain a boys' and girls' school, class-rooms, in addition to a master's house, a committee and board rooms. It is intended to use the boys' school for Divine service on Sunday evenings, in addition to strictly school purposes.

Hertford.—A meeting of the subscribers and friends of the Cowper Testimonial and Abel Smith Memorial School has been held at the Town-hall, to consider the necessary steps to be taken for the purpose of erecting school-rooms for 120 girls and infants, in connexion with the Andrew's Schools, on a site in the Hertingfordbury-road, which has been given by the Marquis of Salisbury, and is approved by the Government. The chair was taken by the Rev. N. Williams, rector of St. Andrew's. A committee was appointed to collect subscriptions to carry out the work, with power to add to their number.

Newcastle.—The foundation stone of Roman Catholic School-buildings in connexion with the church dedicated to St. Dominic, in course of erection at the Red Barns, Newcastle, has been laid by the (R. C.) Bishop of Hexham and Newcastle (Dr. Chadwick). When completed, the buildings will consist of three separate schools for boys, girls, and infants, and will accommodate about 800. The schools for boys and girls will each be 67 ft. by 30 ft., and will be placed end and end, so that the whole may be thrown into one by raising the revolving shutters which form the division. This arrangement will provide a hall 134 ft. by 30 ft., for meetings and social gatherings. Each of these schools will have a classroom, 22 ft. by 17 ft. The infant school will be 40 ft. by 25 ft. There will be entrances for boys and girls and infants in separate streets. The church of which the schools are an adjunct, advancing fast towards completion. Both church and schools are being reared by the Dominican Fathers.

Burslem.—The chief stone of Primitive

Methodist new schools has been laid at Burslem. The schools will be two stories in height, and will be erected from the plans of Mr. James Watkin, by Mr. John Grosvenor, of Tunstall. The building contract, exclusive of the land, is 257*l.*

FROM SCOTLAND.

Galashiels.—Operations have been commenced towards the completion of St. Andrew's Roman Catholic Church, Galashiels. The church was partly built in 1856, in the Gothic buttressed style, but was not then finished, owing to the want of funds, and also to the fact that at that period there was a comparatively small settled population in the district belonging to the R.C. Church. The present work is from plans by Messrs. Goldie & Child, architects, London, and adds 40 ft. to the length of the building, with an ornamental frontage to the river. The front elevation, according to the design, is 72 ft. high and 56 ft. wide, flanked with octagonal buttressed towers of the same height as the centre elevation. The principal feature in the front elevation is a Gothic window, 22 ft. by 11 ft. 6 in., with four mullions in the centre.

Miscellaneous.

Liverpool Architectural Society's Excursion.—On Saturday, the members of the Liverpool Architectural and Archaeological Society held their annual excursion. A party of about thirty gentlemen and two ladies assembled at the Royal Institution, Colquitt-street, and started thence. Under a glorious summer's sky they proceeded, via Walton, to Kirkby. At Kirkby the party visited the new church dedicated to St. Chad, where they were met by the Rev. Canon Hornby, who explained the various points of interest about the church. At Aughton, near Ormskirk, a visit was made to a new church on the crest of a rising ground, about midway between Aughton and Ormskirk, where it forms a conspicuous object in the landscape. The church was designed by, and has been erected under the superintendence of, the Messrs. Hay, who are members of the society. Considerable time was spent in examining this church and its decorations, after which the party proceeded to Halsall, where they were met by the Rev. Mr. Bindell, the rector, who conducted them over the church, which is undergoing a restoring process. The rector also conducted the party to some ruins, which are supposed to have been part of the residence of monks or friars who attended from Burscough to minister in the church. The rector then invited the party to lunch. A rather long drive brought them to Rufford, where the Old Hall, the residence of Sir Thomas and Lady Hesketh, was visited, and some quaint old carved oakwork was inspected; after which a small church, erected by another of the members of the society, Mr. Davies, was examined. About seven o'clock in the evening dinner was served in the Hesketh Arms Hotel. The return journey was commenced shortly after nine o'clock, and, at a quarter past twelve the vehicle pulled up in Lime-street.

Girls' Public Day School Company.—A company is being formed to establish and maintain in such parts of London and the provinces as may from time to time be decided on, superior day-schools, at a moderate cost, for girls of all classes above those provided for by the Elementary Education Act, and on the general model of the North London Collegiate Camden-street Schools for Girls. There are some excellent names on the council, and many shares have already been taken. It is intended to open the first school as near as suitable premises can be obtained to the South Kensington Museum as soon as a number of shares shall have been taken up sufficient in the opinion of the council to guarantee the success of the undertaking. The school system will be specially adapted to meet and correct the defects pointed out in the Report of the Schools Inquiry Commission:—"Want of thoroughness and foundation; want of system; slovenliness and showy superficiality; inattention to rudiments; undue time given to accomplishments, and these not taught intelligently or in any scientific manner; want of organisation." Serious endeavours will be made to train the pupils for the practical business and duties of life.

Sanitary Precautions.—The following sensible suggestions have been issued by the Hackney District Board of Works:—Clean out the water-butts or cistern frequently; boil the water before drinking it, and filter it through a charcoal filter. Keep the house, especially the bedrooms, clean and well ventilated, and use carbolic or other disinfecting soap for scrubbing the rooms. Keep the body clean by daily baths or washing the body all over with tepid or cold water, according to the state of health. As far as possible avoid excessive exercise and exposure to the mid-day sun. Do not eat unripe or stale fruit, stale fish, or tainted meat, and be especially careful to keep infants' food sweet. Be very temperate as regards porter, ale, or other fermented liquors. Two or three times a week pour down the water-closet and all the drain-traps water containing two table-spoonfuls of chloralum or carbolic acid in half a gallon of water. Be very careful to keep the trap on the sink and other drain-openings. Throw a little carbolic acid or chloralum, or, better still, chloralum-powder, into the dust-bin. The pipe, if any, in the cistern should have a leaden "S" trap placed on the top thereof to prevent contamination of the water with sewer-gases. If there be not a separate cistern for the water used for drinking or cooking, the air-pipe of the water-closet should be carried through a wall into the open air, and not open in the cistern. It should be remembered that plenty of fresh air, pure water, good and simple food, daily ablutions, and exercise in the open air, are the first necessities for perfect health. Give notice at the Town-hall of defective drainage, choked drains, accumulations of house-refuse or other offensive matter, and of the existence of offensive smells. Burn all vegetable refuse, such as cabbage-leaves, and do not throw any into the dust-bin.

Concealment of Disease.—The case of Best against Stapp, recently decided in the Court of Queen's Bench, is one full of importance to the public, and one with the particulars of which it behoves them to be fully acquainted. It appears, according to *Food, Water, and Air*, that Mrs. Stapp took apartments of Mrs. Best, at Eastbourne, for herself and children, one of whom had recently had scarlet fever, but she did not make known the fact to the landlady. Soon afterwards another of Mrs. Stapp's children was taken ill, and died; while Mrs. Best was herself prostrated with the fever, and two of her children actually died of the malady. This was an action, therefore, by Mr. Best to recover damages for the illness of his wife, the death of his children, and for his being prevented from letting his lodgings. The trial, we are happy to state, resulted in a verdict for the plaintiff, with a handsome pecuniary award, but which, however, after all, was but a very inadequate recompense to Mr. Best for the death of his children. Had the case been reversed, and had Mr. Best let lodgings in which persons had recently resided afflicted with epidemic disease, he no doubt would have been equally mulcted in a heavy pecuniary penalty. Cases similar to the one now noticed are unfortunately of daily occurrence: the moral wrong and guilt of parties so acting have of course been long recognised, but we believe it is only of late that the law has been made powerful enough to grapple with such cases.

The Deepest Well in the World.—Twenty miles from Berlin is situated the village of Sprenberg. Owing to the presence of gypsum in the locality, it occurred to the Government authorities in charge of the mines to attempt to obtain a supply of rock salt. With this end in view the sinking of a shaft or well 16 ft. in diameter was commenced some five years ago, and at a depth of 280 ft. the salt was reached. The boring was continued to a further depth of 960 ft., the diameter of this bore being reduced to about 13 in. The operations were subsequently prosecuted by the aid of steam until a depth of 4,194 ft. was attained. At this point the boring was discontinued, the borer or bit being still in the salt deposit, which thus exhibits the enormous thickness of 3,907 ft. There were mechanical difficulties connected with the further prosecution of the operations.—*Mining Journal*.

Arrival from Ephesus.—A drum of a column from the Temple of Ephesus,—the most massive specimen of that famous edifice which has yet been received in this country,—has arrived at the British Museum. The case had to be drawn by ten horses.

A Great Gas Well.—The Newton Well, on the Nelson Farm, six miles north of Titusville, Pa., found forth such a volume of gas that it was impossible to pump it, as the valves would not work. The tubing was pulled, and the well was cased in order to let the gas blow off, so that it might be pumped. After the casing was put in, the sand-pump was lowered for the purpose of agitating the well, and the gas raised a column of water, throwing a solid stream into the air 100 ft. The noise was terrific, and could be heard for a distance of more than two miles: it was something like the loud roar of thunder; and when the column burst at the top, it threw the water each way for fifteen rods from the well. The water was exhausted in about twenty-five minutes, and then a column of gas followed, rising with tremendous force 50 ft., from the derrick. The outpouring of the gas makes a roaring noise that could be distinctly heard for two miles from the well. From descriptions of eye-witnesses, this is probably the greatest gas well ever struck in the oil region.

Coal-cutting by Machinery.—One of the most interesting and practical papers read at the Liverpool meeting of the Institution of Mechanical Engineers, which has just been held, was that by Mr. Robert Winstanley, of Manchester, communicated through Mr. George H. Daglish. It contained a description of a coal-cutting machine, with a rotary cutter, worked by compressed air, and employed at the Platt-lane Colliery. It was stated that the man who works the machine by contract earns three times as much per day as he did with the pick, while there was the signal advantage in favour of the machine over hand-labour, that it did not "strike" for wages. It was stated that the risk of clogging and jamming, teeth getting loose, &c., was with moderate care very small, indeed, almost nil. It could easily be reversed, and cut its way out. During the discussion, the merits of the machine were freely admitted with respect to hard beds of coal; but it was said that in soft beds no machinery would have a superior advantage over the hand-pick.

The Prince Consort's Model Cottages at Windsor.—Some few years back the Prince Consort, with a desire to improve the welfare of the humbler classes, caused a society to be formed at Windsor for the purpose of erecting a number of model cottages. Upwards of fifty dwellings, constructed upon the best models, furnished with all kinds of conveniences likely to promote the home comforts of the inhabitants, were accordingly erected on the south side of the royal borough, and let to tenants at moderate rentals ranging from 4s. 6d. to 6s. per week. Since then these model cottages have served as examples for the erection of workmen's dwellings elsewhere. The Royal Society have just sold the "Prince Consort's cottages" to Mr. R. Richardson-Gardner, who is now the possessor of upwards of 150 model cottages, besides other cottage property at Windsor.

Building Accident.—At Halifax, three corporation labourers were employed building a wall in the cellar of the newly-added portion of the inland bonded warehouse, as an additional support to the arched roof and floor above, which was already supported by iron beams and pillars, when one of the pillars gave way and fell on to the workmen, along with the iron archway and stone floor, burying the men alive. Two of the men were got out of the debris within two hours quite dead, but the third was not recovered until nearly three hours after the occurrence. He was alive, but in a very precarious condition. The corporation had ordered the wall to be built in the cellar, because they did not consider the original supports sufficient, and the workmen had only just commenced operations.

Paper from Wood.—A letter from Berlin in the *Elberfeld Gazette* represents Prince Bismarck in a new light—that of a paper-maker. The paper manufactory established by the Imperial Chancellor on his estate at Varzin has proved so successful, says the writer, that it is impossible to meet the large orders which come from England. This paper is made of chips of fir—that, at least, is the chief element.

The Winchester Surveyorship.—It has been recommended to the local council to advertise for candidates to succeed Mr. H. Newman, whose past services were eulogised, and who, it was hoped, would be presented with some mark of appreciation of his long and ably discharged duties.

Middlesbrough.—The new dock is being rapidly got on with, and in about three months it seems that some portion of it will be available for shipping. The original dock was made by Mr. Joseph Pease at a cost of 160,000l., and the present one will cost above 100,000l. It is being made by the North-Eastern Railway Company. In the erection of the dock, with Mr. Harrison, the engineer-in-chief of the North-Eastern Railway, has been associated Mr. Chadworth and Mr. A. H. Whigham, of the Darlington Section. The latter has been the resident engineer in carrying out the work.—A second Middlesbrough is starting into life in North Lincolnshire between Doncaster and Gainsborough, on the estate of Mr. R. Winn, M.P. In a short time there will be within less than the radius of a mile no less than nineteen blast furnaces in work.

London and County Bank.—At the meeting of the London and County Bank, Mr. W. C. Jones in the chair, the usual dividend of 6 per cent., with a bonus of 4 per cent., for the half-year, was declared, being at the rate of 20 per cent. per annum, and leaving 10,634l. to be carried forward. At the corresponding date of last year, the total distribution was 9 per cent., or at the rate of 18 per cent. per annum, and 4,400l. were carried forward. The paid-up capital and reserve remain respectively at 1,000,000l. and 500,000l., the deposits held are 16,874,466l., an increase of 2,309,158l., and the acceptances are 2,453,011l., a decrease of 187,127l.

The High Price of Building Materials.—An influential meeting of gentlemen interested in the building trade, convened by circular, has been held at Parker's Temperance Hotel, Leeds, to consider the present high price of building materials. After the subject had been discussed, it was unanimously resolved "That a company be formed at once with the object of laying down the necessary plant and machinery for the manufacture of bricks on an extensive scale, in order that the present dearth of bricks may as far as possible be obviated." The building trade, we are informed, was largely represented at the meeting.

Contract for Silver Coins.—Messrs. Heaton & Son, of the Mint in Birmingham, have entered into a contract with the Government for the supply of silver blanks to the extent of one million sterling in value. The number of florins represents 600,000l., shillings 300,000l., sixpences 85,000, and threepences 15,000l.—a total of 16,600,000 coins. The weight of this mass is 110 tons of silver. The coins will be perfected at the Royal Mint, London. By the terms of the contract 10,000l. of blanks are to be produced daily.

Fleet Ditch.—A deputation has waited upon the Metropolitan Board of Works, urging that body to proceed with the construction of a subsidiary sewer to relieve the Fleet Ditch from the overflows which periodically occur and inundate the cellars and basement premises of the inhabitants of King's-cross and its neighbourhood. The chairman stated that delay arose in prosecuting the works owing to the hullers' strike. The memorial was referred to the Works Committee.

St. Michael's, Chester-square.—A new vicarage-house is being built in Ebury-square, on a site given by the Marquis of Westminster, from the designs of Mr. Withers, architect, by Messrs. Adamsons, of Putney, at an expenditure of about 3,000l. It is of red brick, with Park Spring stone sparingly used, and will be covered with Pennoyle slates. Mr. Laidler is clerk of works.

The Builders' Strike.—The disruption in the London building trade is increasing, every day matters are becoming more and more complicated, and the prospects of an early settlement of the dispute arc extremely gloomy, while the most favourable season of the year for building operations is rapidly passing away. Surely the time has arrived for a properly arranged arbitration?

Guy Faux at the Government Offices.—Some gun-cotton experiments have been carried out in a garden attached to the official residence of the First Lord of the Treasury in Downing-street. The shock was so violent as to break into pieces some scores of panes of glass in the windows of the Colonial and Foreign Offices. A rumour was spread that an attempt had been made to blow up the Treasury.

Westbury.—On Wednesday in last week the memorial stone of the new schools and library institution about to be erected by Mr. Abraham Laverton for the benefit of the town, and as a free gift, was laid by Miss Laverton. The building will contain the usual accommodation for a boys' school, reading and class rooms, committee room, and a large assembly-room. The architect is Mr. Stent, of Warmminster.

Opening of the Grand Aquarium Brighton.—A distinguished company of visitors, including, probably, one or two members of the royal family, is expected to be present at the opening ceremony of this marine aquarium at Brighton, on (this) Saturday. There will be a promenade concert in the grounds of the Royal Pavilion during the afternoon.

The Iron Stone at Clifton.—The *Bristol Times* says that the iron-ore, discovered on the site of Clifton House, Regent-place is of a remarkably rich character, returning more than 70 per cent. metallic yield, and worth on the spot from 21s. to 23s. or 24s. a ton. It is believed that there are some thousands of tons there.

Utilisation of Slag.—A paper was recently read before the American Institute of Mining Engineers, "On the Uses of Blast-Furnace Slag," by Mr. T. Eggleston. He gives a process by which good bricks may be made of it, and he states that a cement equal to the best Portland is to be manufactured from this slag, at small cost.

Electro-telegraphic Progress.— "It is a fact," says Mr. Scudamore, "that a telegraph clerk in London who was engaged on a visit to Berlin formed an acquaintance with and an attachment for a female clerk who worked at the same wire in Berlin, that he made a proposal to her, that she accepted him without having seen him, and that they were married."

Art-Union of London.—The private view of the works of art purchased by the prizeholders of 1872 will take place on Monday next at the Gallery of the Institute of Painters in Water Colours. The exhibition will be open to the subscribers and their friends on the next and following days.

The Model of Holborn Viaduct.—We saw in our notice of this work that it had been executed for the Corporation of London. This is not quite correct. It was made for the engineer, Mr. W. Haywood, and will be deposited by him in the Guildhall Library.

The Haymarket Theatre is being entirely redecorated by Messrs. Harland & Fisher, Southampton-street, Strand, under the direction of Mr. G. Somers Clarke. The same firm decorated Windsor Theatre some time back, and under Mr. Clark's direction.

Pre-Historic Monuments.—Sir J. Lubbock has notified that next session of Parliament he will bring in a Bill for the better protection of pre-historic monuments.

The Public Health Act has been read a third time and passed in the House of Commons, and, after making rapid progress in the House of Lords, has been there also passed.

TENDERS

For the erection of St. Luke's Church, Redcliffe-square South Kensington, for the Rev. W. Fraser Hancock, Messrs. G. & H. Godwin, architects. Quantities supplied by Messrs. Gardner, Son, & Theobald.

	Spire and Upper Part of Tower omitted	Total
Hibbins & Co.	£15,489	£15,489
Perry	14,965	11,613
Ayers & Sons	14,729	11,738
Nightingale	14,650	11,849
Atis & Co.	14,590	11,673
Adamson & Sons	14,355	11,345
Manley & Rogers	14,125	11,889
Cowland	13,808	11,473
Hill, Keddell, & Waldram	13,794	11,363
Dove, Brothers	13,626	11,078
Henshaw	13,595	11,129
Hill & Sons	13,234	10,911

Two late.

For erecting two villa residences for Lieut. Babbage Bromley. Mr. G. G. Stanham, architect. Quantities supplied:—

Newman & Mann	£4,836	0	0
Payne & Baldwin	4,426	0	0
Waters	4,234	0	0
Stimpson & Co.	4,209	0	0
Adamson & Son	4,133	0	0
Temple & Forster	4,175	0	0
Emmett	3,637	0	0

For rebuilding No. 35, Maiden-lane, Covent-garden, for Mr. Benjamin Rule. Mr. Alfred Cross, architect.—
 Putnam & Rothamstead £2,223 0 0
 Perry & Sons 2,391 0 0
 Hart 2,396 0 0
 Cole & Sons 2,333 0 0
 Newman & Mann 2,325 0 0
 Wilson, Bros. 2,257 0 0
 Howard 2,148 0 0

For fish-cooking apparatus, to be supplied and fired at No. 3, Arthur-street East, London Bridge, for Messrs. Lightfoot, Brothers.—
 Deane & Co. £111 12 10
 Lewis, Bros. 96 0 0
 Brown & Green 83 0 0

For the erection of a Gothic villa, at Park-hill, Croydon, for Mr. W. White. Mr. H. A. Alexander, architect. Quantities by Mr. Henry Laxton.—
 Waller £3,445 0 0
 Smith 3,142 0 0
 Mansbridge 3,000 0 0

For four houses, near Rutland-gate, Hyde Park, for Colonel and Mrs. Spencer Clifford, Messrs. Walker & Mann, architects. Quantities supplied:—
 Hiscope £10,560 0 0
 Brass (too late) 9,882 0 0
 Stimpson & Co. 8,835 0 0
 Thorne & Co. 8,739 0 0
 Adamson & Son 8,463 0 0

For repairs and decorations at 84, Highbury New Park. Mr. W. P. Griffith, architect.—
 Devereux £327 10 0
 Bamford 312 0 0
 Bamford 298 15 0

For the erection of vicarage house, St. Michael and All Angels, London Fields, Hackney, E. Mr. W. Wignott, architect.—
 Hill, Keddell & Waldram £3,107 0 0
 Hill & Sons 3,033 0 0
 Killy 3,015 0 0
 Kitch 2,915 0 0
 Falkner 2,898 0 0
 Merritt & Ashby 2,851 0 0

For master's residence and boarding-house, for the Rev. G. R. Green, M.A., Eastbourne. Mr. H. Eulan Umbre, architect. First contract.—
 Feeless £5,500 0 0

For pair of semi-detached villas, at Birkenhead. Mr. Charles Aldridge, architect. Quantities supplied by R. L. C. Riddell.—
 Burroughs £3,358 0 0
 Nicholson & Ayr 3,247 0 0
 Forde (accepted) 3,063 0 0

For alterations and additions to All Saints' Church, Oxford, for the churchwardens, Messrs. W. Wilds & Co., architects. Quantities supplied:—
 Parkins £745 0 0
 R. & W. Andrews 710 0 0
 Norris (accepted) 150 0 0

For building five houses, in Warner's-road, Ware. Messrs. W. Wilds & Son, architects.—
 Additional Bedroom.
 Elkins (too late) £1,108 £1,223
 Castle 1,050 1,200

For a double system of drainage, to exclude the rain & storm water from the sewer, and two rain-water pipes, at the Union Workhouse, Ware, for the Board of Guardians, Messrs. W. Wilds & Son, surveyors. Schedule of prices for the works.—
 Hitch (accepted).

For building English Church, Spa, Belgium. (Wallington provided.) Messrs. Habershon & Pice, architects.—
 Blackmore & Morley (accepted) £5,565 0 0

For alterations to St. John's Lodge, North End, for G. Drew, Esq. Mr. R. A. Cane, architect.—
 Pitts £2,404 0 0
 Furrell (accepted) 329 0 0

For rebuilding 79 and 80, Baker-street, and 51, George-street, Portman-square, for Mr. William Robinson. Messrs. New & Cummings, architects. Quantities supplied:—
 Foster £5,830 0 0
 Simpson & Son 5,648 0 0
 Brown 5,570 0 0
 Ebb & Sons 5,322 0 0
 Harris & Sons 5,286 0 0
 Thompson & Smith 5,187 0 0

For new class-rooms and superintendent's house, at Wesleyan Chapel. Mr. H. J. Faulk, architect. Quantities by Messrs. Thompson & Smith.—
 Fry £1,144 11 4
 Read 1,086 0 0
 Spackman 878 0 0
 Crook (accepted) 800 0 0

Remises, Nutford-place, Messrs. Atchison & Walker to that tender, and not that of Mr. Wignott, has been accepted, and that they are doing the work.

Messrs. Stimpson & Co.'s tender (revised) was accepted. Southend Mill, Lewisham. Mr. W. C. Banks, architect.

TO CORRESPONDENTS.

H. R.—Mr. S.—G.—H.—A.—T.—H. W.—M.—T.—H.—N.—A.—H.—F. J.—E.—B.—P.—R.—T.—J.—S.—Q.—J.—D.—S.—T.—D.—D.—G.—W.—B.—&—M.—W.—S.—J.—B.—E.—F.—M.—K.—W.—W.—A.—W.—F.—J.—R.—C.—R.—Y.—C.—W.—A.—C.—G.—Inquiries from correspondents charges for taking out quantities vary according to circumstances, and are usually the subject of pre-arrangement.—G. T. (we cannot give addresses).—G. W. (to advise as to the mode of ventilating a public hall, it should be seen and examined). Call in a proper address on the spot.—H. M. (must look to our advertising columns).—G. J. D. (report on the accident referred to was not enclosed).—H. W. R. (nothing is yet settled).—Coal Question (in type).

Erratum.—We are asked to mention, with reference to the Asylum at Virginia Water, that the names of the authors of the paper marked "Messrs" in our column, should have been Messrs. Mathew & Quiller, instead of Mr. J. S. Quiller.

We are compelled to decline printing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

Not.—The responsibility of signed articles, and papers read at public meetings, rests of course with the authors.

NOTICE TO SUBSCRIBERS.

Advertisements cannot be received for the current week's issue later than THREE O'CLOCK P.M. on THURSDAY.

The Publisher cannot be responsible for ESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

Bath and other Building Stones of Best Quality.—RANDELL, SAUNDERS, & CO. Limited, Quarrymen and Stone Merchants. List of Prices at the Quarries and Depôts, also Cost of Transit to any part of the United Kingdom furnished on application to Bath Stone Office, Corsham, Wilts.—[Adv't.]

Ashton & Green, Slate, Iron, and Marble Merchants, and Quarry Agents, keep the largest and best selected Stocks of Bangor, Portmadoc, Green Roofing Slates, Slate Slabs, and every description of Slate Goods, Marble and Enamelled Slate Chimney-pieces, Stoves, Ranges, Rainwater Goods, and General Castings. A. & G.'s special Red Ridge Tiles. Drawings and prices upon application. Offices and Show-rooms, 14 and 15, Bury-street, St. Mary-Axe, London, E.C. Agents for sale of Whitland Abbey Green Slates in town and country.—[Adv't.]

Bills of Quantities, Specifications, &c., Lithographed by ROBT. J. COOK & HAMMOND, 29, Charing-cross, S.W. Accuracy is guaranteed; punctuality may with confidence be relied upon. Plans and Drawings Copied, Traced, or Lithographed.—[Adv't.]

PERFECTION IN BOOKKEEPING. Builders and others desiring a really good system, can have a SET OF MODELS FOR BOOKS, BY DOUBLE ENTRY to which was awarded the prize offered in "The Builder," No. 1,189, and which has been adopted by many large firms. Also a Modified Arrangement by Single Entry, suitable for small builders.—Address, R. A. & S. George, road, Regent's Park, London.

THE TIMBER MERCHANTS and BUILDERS COMPANIES' cutting Tables of the Bedwood Weight and Measurement of Deals and Battens of all uses; also the Red Pine that so size bears per Lineal Foot to any given price per Petersburg Standard Hundred, &c. By WILLIAM DOWLING, Timber Merchant Hall, London: LOCKWOOD & CO., 7, Stationers' Hall-court, E.C.

Second Edition, with 5 Plates. Royal 8vo. 5s. cloth (postage 3d.) THE STRAINS OF STRUCTURES OF IRON WORK, with Practical Remarks on Iron Construction. By F. W. SHIELDS, M. Inst. C.E. London: LOCKWOOD & CO., 7, Stationers' Hall-court, E.C.

NOTICE.—TO THE ARCHITECTS OF GREAT BRITAIN; also the CONTRACTORS. An Early in AUGUST A NEW WORK will be published, ENTITLED EXAMPLIES BY MODERN ARCHITECTS. Four Plates, Imp. 4to, with Four Pages of Letters and Weighty Remarks. Price to Subscribers, 5s. Non-Subscribers, 5s. 6d.

The First Number will contain a CHURCH, SCHOOL, MANSION, and a VILLA. The Architects have kindly consented to lend their drawings, and to become subscribers. All Architects wishing their insertion of their drawings, will please forward same, carriage paid, with a subscription order. The name and address of each Architect will be given, also the Contractor's estimate for erection, and each monthly number will be varied.

A New Work just published on SPECIFICATIONS, by F. ROGERS, Architect, after the MODEL of BARTHOLEMEWS. 8vo. lettered. Price London: R. A. SPRIG (Original Publisher of all Atchley & Co.'s Publications), 106, Great Russell-street, Bedford-square.

HEALTH and COMFORT in HOUSE BUILDING, or Ventilation with Warm Air by Self-acting Suction Power, with Experiments. By J. DRYSDALE, M.D. and J. W. HAYLAND, M.D. London: R. & P. N. STON, 48, Charing-cross.

LOCKED OUT. A STORY OF THE STRIKE. See No. 9 of THE ORIGINAL STORYTELLER. 12 large pages, well illustrated, price One Penny. London: SWEETING & CO., 87, Gray's-inn-road; and all Book-sellers.

A GENTLEMAN connected with the Building Trade, and having an office centrally situated in Birmingham, is open to undertake COMMISSIONS. Would not object to travelling for three weeks or so quarterly.—Apply, BETA, General Post-office, Birmingham.

PUPIL.—A CIVIL ENGINEER, having works of considerable magnitude in operation, has a VACANCY in his Office for a PUPIL. The district in which the works are being done of considerable extent and importance, affords unusual opportunities for the acquirement of engineering experience.—Address, A. B. 3, Gresham-street, E.C.

TO ORGAN-PIPE DECORATORS.—CONSTANT EMPLOYMENT to a good Hand.—FORSTER & ANDREWS, Organ Manufactory, Hull.

LEAD GLAZING.—EMPLOYMENT can be given to GLAZIERS accustomed to plain Church work.—PHILIP PALMER, 36 (late 118), St. Martin's-lane, W.C.

THE BOROUGH SURVEYOR OF BARNSELY, Yorkshire, has a VACANCY in his Office for a Young Gentleman as ARTICLED PUPIL.—For particulars and terms Barnsley, July, 1872.

INDIAN CIVIL ENGINEERING COLLEGE, COOPER'S-HILL, BOHAM.—THE APPOINTMENT OF INSTRUCTOR IN ARCHITECTURAL AND MECHANICAL DRAWING, now VACANT, will shortly be filled up. Salary 500l. with quarters. The holder must be unmarried.—Apply, with testimonials, to the President of the College.

WANTED, immediately, a thoroughly good and experienced ARCHITECTURAL DRAUGHTSMAN.—Address full particulars to ARCHELDECK, Salkin's Newspaper Office, No. 11, Duke-street, Adelphi, W.C.

WANTED, in Sheffield, an ASSISTANT, Duties: architectural work, &c. Must print and draw well. Salary about 1000.—Address, A. B. 7, West Bank-place, Sheffield.

TO ARCHITECTS ASSISTANTS. WANTED, a first-class ASSISTANT, in a provincial office. To a really good and experienced assistant a liberal salary would be given, and the appointment would be permanent.—Address, with all particulars, No. 53, Office of "The Builder."

WANTED, immediately, in a City Office, a thoroughly competent ARCHITECT'S ASSISTANT. Must be a good draughtsman and designer, and able to prepare specifications and detail drawings.—Apply by letter only, stating terms, age, experience, and references. G. B. & S. Birchall-lane, E.C.

WANTED, as CLERK, a Young Man, accustomed to Saw Mill accounts.—Apply by letter only, stating terms and all particulars, to B. N. W. 14, Guildford-street, W.C.

WANTED, a CLERK, who can WRITE SHORTHAND.—Apply at the Bristol North Somerset Railway Contract, Passford, near Bristol.

WANTED, an experienced CLERK, in a Builder and Decorator's Office, with a practical knowledge of the business. Must be able to superintend the trade generally. A thoroughly steady man indispensable. State, in own handwriting, age and previous experience, with terms.—Address, No. 560, Office of "The Builder."

WANTED, in a London Builder's Office, a YOUNG MAN, to keep Books, Take Out Quantities, and Assist with Estimates. One having a few years' experience preferred.—For further particulars, address No. 560, Office of "The Builder."

OUT-DOOR FOREMAN. WANTED, an experienced and energetic Man to TAKE CHARGE of a JOB, in London. Unexceptionable references required.—Address, stating wages and full particulars, to G. D. care of Messrs. Waterlow & Sons, London-wall, E.C.

WANTED, a FOREMAN, accustomed to MASON WORK in Church Restoration for work within a few miles of Leeds.—Apply, by letter, W. F. Free Press Office, Wakefield.

TO BATH STONE MASON. WANTED, a good STONE SETTLER.—Apply to H. H. DYER, miller, Buxbury, near Ilchester, or at the Works, Swindon.

WANTED, a thoroughly practical Man, to TAKE CHARGE of a JOB, in the country. Must be a Joiner by trade. State salary required, age, references, &c.—Address, No. 642, Office of "The Builder."

GLASS PAINTERS.—A HAND WANTED for Painting Canopies, &c.—Apply to F. H. LEACH, 2, Millbrook-place, Harrington-square.

TO CARPENTERS and JOINERS. GOOD WORKMEN as GENERAL HANDS WANTED. Country, estate, and mansion work.—Particulars as to age, family, and references, to ESTATE Office of "The Builder." No society men need apply.

WANTED, EMPLOYMENT, by a first-class GRAINER and MARBLER, Piecework.—Address, A. G. 131, Cannon-road, Kenilworth-tower, N.W.

WANTED, EMPLOYMENT, by a first-class GRAINER and MARBLER, a good French Hand. Has no objection to fill up with painting.—Address, A. W. P. 16, John-street, Bryanston-square, W.

WANTED, EMPLOYMENT, by a Young Man, aged 28, as PLUMBER, PAINTER, GLAZIER, and THIN SHEET-METAL, or as a General Hand, with under 10 years' general trade, and fill up time in supplying relief in the line of joining. Wages no object.—Address, S. H. 1, Little York-place, Maythorne-road, W.

TO MASTER PAINTERS. WANTED, CONSTANT EMPLOYMENT at Painting, Graining, or Paper-hanging. London preferred.—Address, G. H. 8, Tottenham-street, Tottenham-court-road, W.

WANTED, AN ENGAGEMENT, as FOREMAN OF PAINTERS. Just left a similar situation. Has had many years' experience in conducting first-class work and church decorations. Will take charge of a large Job. Town or country.—Address, 600, Office of "The Builder."

WANTED, AN ENGAGEMENT, as GENERAL ASSISTANT by a thorough BUILDER, CLERK, is a systematic accountant and good correspondent. Will set up in prices cost, estimating, and making up extras and minutes. Practically acquainted with the trade, labour prices, and measuring work. First-class references. Married. Aged 29.—Address, C. C. Post-office, Colindale-road, W. H. 2.

The Builder.

VOL. XXX.—No. 1541.

A Few Words to Wolverhampton.

OLVERHAMPTON is particularly interesting in the union which it presents of the past and the present,—ancient relics with evidence of modern progress. We have already said how important we believe it to be to such a town to preserve the landmarks of its early history. A very good feeling in this respect seems to prevail, we were glad to see; so that exhortation is scarcely necessary. The fine old church has been restored, and the ancient cross, or pillar, seems duly prized. Several creditable buildings have been lately erected. The Town-hall, Anglo-Italian in style, with Mansard roofs of the present period, is a handsome-enough building, and seems to meet the requirements, though the acoustic qualities of the council-chamber are diabolical, and should at once receive scientific attention, with a view to improvement. A good building has been put up for the purposes of the School of Art, though it is not made use of to the extent desired; and the streets display some excellent shops. The building trade is not particularly lively in the town: one of the leading builders discharged twenty of his joiners on the morning of our visit. The fact that recently there were 20,000 miners of the neighbourhood, and 30,000 hands dependent on coal, out of work, must necessarily affect expenditure. These violent disruptions in the course of labour necessarily damage everybody.

The suburbs of Wolverhampton show some very good houses in pleasant gardens, anything but black country,—the fringes of green of which Lord Dartmouth spoke at a recent meeting. The Agricultural Hall is worth looking at, and it is not an unsatisfactory indication to find one of the thoroughfares designated "Art-street." Thorneycroft's statue of the Prince Consort, like most of the bronze statues in this country, is in a filthy state: not merely covered with soot, black, and reflectionless, but with a number of white spots here and there of most disagreeable appearance. We sadly need some good preservative coating for metal. However, our present object is scarcely so much to describe the appearance of the town as to utter a protest against the system of arranging the streets which has been pursued there, and is apparently still acted on,—a system which results in the production of countless courts of the most unhealthy and objectionable character. In street after street, street after street, side by side with the house-doors, are seen narrow entrances to Court 1, Court 2, Court 3, and so on, which are filled with houses generally without any back-windows, low, ill-ventilated, and mostly overcrowded. Overcrowding, as we have often said before, means

dirt, degradation, disease, and death; and here proofs of the truth of the assertion may be easily found. We visited scores of these courts, and found them in the majority of cases with middens full, stinking, confined, and deadly. In Poel-street and its neighbourhood, behind Back-lane, and in what is called Carrice Island, the condition of things is frightful: if the latter were really the settlement of a tribe of wild Indians, it would be an object of wonder to the civilised upper classes of Wolverhampton. These are the places which fight against the general salubrity of the town, and out of which will one day come some frightful epidemic to dispel the secularity at present indulged in, and rouse to salutary action. These words are written with but one end in view,—the promotion of the general good,—and will, we trust, be received in the same spirit. If little else can be done, the authorities can at any rate make a resolute stand against any further extension of the abominable court system.

THE WOLVERHAMPTON CONGRESS.

THE archaeological crop of the week is more than we can gather or house. Any attempt to chronicle fully the proceedings of the British Archaeological Association, the Archaeological Institute, the Kent, Bedford, and Sussex Society (all which, to name no others, have been industriously at work), would fill our present Number. The Congress of the British Archaeological Association has been particularly satisfactory, and would give many points for notice. We must content ourselves with quotations from two or three of the papers read. We take the first from a memoir by Mr. J. C. Tildesley, on

The Early Industries of Staffordshire.

Locks.—The lock trade was a recognised industry in Wolverhampton and Willenhall at the commencement of the sixteenth century. During Elizabeth's reign, one Mark Scalliot is said to have constructed a lock "consisting of eleven pieces of iron, steel, and brass, all of which, with a piped key, weighed only two grains of gold." Early in the seventeenth century cranks were made in Wolverhampton for "brilles for brewing women." It is satisfactory to report that this branch of the lock trade is now entirely extinct. Dr. Plot, writing in 1686, says of Wolverhampton:—"The greatest excellency of the blacksmith profession lies in their making of locks, wherein the artizans of Wolverhampton seem to be preferred to all others. . . . These locks they make either with iron or brass boxes, so curiously polished, and with keys so finely wrought, that 'tis not reasonable to suppose they were ever exceeded except by Tubal Cain, the inspired artificer in brass and iron. . . . I was told of a very fine lock made in this town, sold for 20*l*., that had a set of chimies in it that could go at any hour the master should think fit." The object of chimies in a lock, unless it be to soften the heart of a hurglar, does not appear; but such music is certainly to be preferred to that of the lock on the wardrobe of fair Penelope, immortalised in Homer's *vers*o (*Odyssey* 21st). Pope thus translates the passage:—

"A brazen key she held, the handle turn'd,
With steel and polish'd ivory adorn'd;
The bolt, obedient to the silken string,
Forsakes the staple as she pulls the ring;
The words respondent to the key turn round,
The bars fly back, the flying valves resound;
Loud as a fall makes hill and valley ring,
So roar'd the lock when it released the spring."

Up to the end of the seventeenth century keys were usually ornamented by the insertion of a cross in the bow, and heads surrounded the shank.

Dr. Wilkes, of Willenhall, writing in 1750, pays a flattering tribute to the skill of the lock-smiths both in Wolverhampton and Willenhall. Referring to the latter town, he mentions that in the year 1776 one James Lees made a lock and key, the total weight of which did not exceed that of a silver twopence. The first of Chubb's well-known patents was obtained in the year 1818, a factory on a small scale having been established in Wolverhampton some years previously by the founder of the firm.

Wrought Nails.—Nail-making is mentioned as a thriving industry in Staffordshire, by Leland, in his "Itinerary" (A.D. 1538); and Dr. Plot,

in 1686, remarks that "for nail-making there are so prodigious numbers here, that in the parish of Sedgley there are thought to be no less than 2,000 of the trade, reckoning boys as well as men." Hutton, the Birmingham historian, riding on his gray nag through the nailing district, ingeniously records his surprise "at the number of female blacksmiths here about," until a buxom lass, leaning with bare arms over her smithy door, explained that they were nailers. Shaw says, that in 1798 nail-forging employed one-fourth of the population of Tipton. Until the introduction of steam machinery, nail-forging was a thriving industry, but since that era it has been gradually dropping under the weight of enormous competition, and its existence has only been prolonged at the cost of excessive labour on the part of men, women, and even children. It is most probable that the thousands of little nail smithies scattered throughout the district of which Dudley is the centre, will, in a few years, become the relics of a decayed and obsolete handicraft.

Iron Castings.—Ironfoundries were in operation in Staffordshire prior to the reign of Elizabeth, but the produce was on a small scale until after the close of the sixteenth century. Dud Dudley made "all sorts of cast-iron wares, as brewing cisterns, pots, mortars, &c.," and during the civil wars, cannon balls were cast at Foley's foundry, in Wolverhampton. Tipton, Bilston, Wednesbury, and West Bromwich were also among the earliest centres of the trade. The productions were, until the beginning of the present century, mostly confined to the heavier descriptions of castings, such as grates, boilers, pipes, and garden rolls. With the invention of cast hollowware in 1779, by Jonathan Taylor, a Birmingham artisan, ironfoundry in Staffordshire began to make strides of progress. The first hollowware foundry was established at West Bromwich in 1780, on a site which afforded ample water power. The manufacture was of the crudest and most primitive type until the present century had commenced. The annealing oven was invented in 1805, by Mr. Kendrick, of West Bromwich; and in 1839 Messrs. T. & C. Clark, of Wolverhampton, invented the process of enamelling hollowware now so generally employed.

Mr. Molyneux, F.G.S., in a paper on—

The Roman Roads of Staffordshire,

said, these are pretty well known to be three,—Walsing, Icknield, and Ryknield. The first entered the county from Shropshire, due east, at a place called Storyford. It passed near Stretton and Penkridge, leaving the latter place two miles to the north. It crossed Cannock-chase, and at Nuckley Manor diverged slightly to the south-east, and so on to the wall—Elocetum. Thence it again diverged, and left Staffordshire over the river Tame at Fazely, Icknield-street entered Staffordshire through Warwickshire, due north. It passed across Sutton Park, which was now in a state of nature. There it would be found to represent one of the most perfect portions of a Roman road to be found in this country. The author particularly noticed that in Sutton Park, on the north side, there was a footway, about 6 ft. wide, evidently intended for pedestrians, and that on the side of the hill, midway in the park there was a curious hollow excavation in the road, 12 ft. square, which was apparently intended as a place for watering the horses while the troops were on the march. From the ground of Little Aston Park Icknield likewise went on to Elocetum, and ultimately entered Derbyshire to the Dove, on Monk's Bridge. Ryknield entered Staffordshire across the Trent, in the parish of Burton, and was stated by Dr. Mason, in his history of Stoke-upon-Trent, to correspond to Chesterton, near Newcastle-under-Lyne, which the doctor identified as the *Mediolanum* of the Romans. There was some doubt whether this or another Roman road was the Roman street in question, because there were traces of a Roman road which crossed the Trent at Branston, the *Ad Trivonam* of the Romans, and that extended in the direction of Needwood Forest, where Roman remains had been found. After showing that the Roman roads were generally from 40 ft. to 60 ft. wide, and invariably ran across the country in a perfectly straight course, whatever might be the obstructions, the road-makers always using deposits of gravel wherever they could find them, and keeping ditches on both sides, for drainage purposes; Mr. Molyneux reminded his hearers that the Latin conquerors erected important stations

generally at twelve miles' distance, or a day's march.

Early Documents,

in the possession of Lord Wrottesley, were commented on by Mr. W. de Gray Birch, who spoke first of the great destruction of early documents that had occurred. He could tell how the beautiful miniatures and illuminations in the library at Durham Cathedral were cut from priceless manuscripts by a nursemaid of one of the members of the Chapter to amuse some fractious children;—how at Malmesbury Abbey, in Wiltshire, enough vellum MSS. were carted away from the library to serve the glovers of the town for ten years. But these, and innumerable instances, must be allowed to plead their eloquent tale to them and to posterity, and teach them to guard with jealous hand the little yet remaining, which must have been preserved by little short of miraculous intervention. One of the great values to be attached to ecclesiastical and religious deeds was, that they contained notices of national events not to be found in any other repository. Of this Lord Wrottesley's collection contained a very notable instance, where, in a roll which he had no hesitation in ascribing to the authorship of a literary member of the Abbey of Burton-on-Trent, in the county of Stafford, a statement of the settlement of Scottish affairs in the troubled times of Edward I. had been inserted by the scribe upon the back of what really was a synopsis of British history from the earliest period to the last decade of the thirteenth century. It was evident that the Wrottesley manuscripts were exceedingly valuable as containing much that would cast a new light upon the history, manners, and customs of England during a very extended period. The following were among some of the documents which Mr. Birch produced and explained:—1. A copy, made in the time of Henry VI. or thereabout, of a deed purporting to be dated in 1088, whereby Robert de Stafford, an ancient member of the House of Wrottesley, grants a certain land called "Wrotteslea and Lemintona" to the Abbey of Evesham, in frankalmoinage, or as a free almsgiving. In consideration of this he was probably admitted into the monastery as a monk, for the deed goes on to say, "I, Robert, having been made a monk in my infancy, in the same monastery, have confirmed this gift, by the sign of the cross with my own hands." Then follows his cross or mark, as well as those of his son Nicholas, and other witnesses. There were several points about this charter of donation which the author confessed he did not like, for it appeared to him to point to the fact that the venerable monks of Evesham, having persuaded the grantor to join their community when on his deathbed, as they thought, fabricated this deed in order to get possession of the estate. Mr. Birch based his opinion adverse to the strictly genuine nature of this document upon the defective grammatical structure of the sentences, and especially upon the fact that Peter, Bishop of Chester, who, it was stated in the document, ordered the deed to be drawn up, died three years before the date of the deed.

The reception at Patshall by the president, Lord Dartmouth, and the Countess,—a reception equally genial and elegant,—on which same day Mr. Planché and Mr. Harrison Ainsworth contributed valuable papers; the continuous labour of Mr. Gordon Hills and Mr. Edward Roberts, as officers of the society, in describing and commenting on buildings not illustrated by their natural protectors; the exertions of Mr. G. R. Wright in the arranging of excursions; and the brilliant conversation given in the town-hall by the Mayor of Wolverhampton as the wind-up of the week, all call for warmest acknowledgment in even the briefest record of the proceedings. We will add two superannumerary lines to give a word of hearty commendation to the Star and Garter Royal Hotel, which is kept by one bearing a name held in much esteem by archaeologists,—Britton.

What is an Inch of Rain.—An English acre consists of 6,272,640 square inches; and an inch deep of rain on an acre yields 6,272,640 cubic inches of water, which, at 277,274 cubic inches to the gallon, makes 22,622.5 gallons; and as a gallon of distilled water weighs 10 lb., the rainfall on an acre is 226,225 lb. avoirdupois. As 2,240 lb. are a ton, an inch deep of rain weighs 100,933 tons, or nearly 101 tons per acre. For every 100th of an inch a ton of water falls per acre.

REPORT OF THE JOINT COMMITTEE OF THE TWO HOUSES OF PARLIAMENT ON RAILWAY AMALGAMATION.

EARLY in the present session of Parliament a joint committee of peers and commoners was appointed to investigate the subject of railway amalgamation.

Joint committees, special committees, Royal commissions—such are our substitutes for the special discharge of scientific or political duties by trained men. The French revolutionary mode of sending a civilian deputy to control the operations of a military command, the sole qualification of the deputy being his republican virulence, is only one step beyond our own method. Professedly and habitually we subordinate all special studies—war, marine, everything but law—to non-professional control. We have another instance of the folly of this method of dealing with questions of national welfare, on the basis of party combination, in the history of our railway legislation. The Report before us at once shows how far we are fettered and cramped by the manner in which we have made laws about railways for some forty-four years, and contributes another stone to the pile of our embarrassment.

We are not to be understood as denying that much sound sense and patient inquiry are displayed by the framers of the Report, and that much valuable information is contained in its columns. As much as that may be predicated of many similar productions. But the mischief is, that most of the time of such commissions is occupied by the education of the commissioners. They collect a mass of facts, in the course of eliciting which they acquire, often for the first time, a second-hand acquaintance with the subject, such as to enable them to speak of it in Parliament or elsewhere, or to write upon it, in a manner that may seem creditable to persons less informed than themselves. But for the main points to be grasped and followed out—for time to be saved, irrelevant evidence checked or repressed, or any assurance to be obtained that a subject has been exhaustively treated, we must look to some other method of inquiry.

We shall see that this view is signally illustrated by the Report now under consideration. It has all the mixed character of that patchwork which invariably results from setting several men to do the work of one. With many of its conclusions we fully agree. Of the feebleness displayed in altogether blinking the main question, which a statesman, if such should arise among us, will one day have to face, we had better not express our opinion. But as to the actual omission of one of the main subjects of consideration, which, from the committees' own point of view, ought to have been brought into most prominent relief, we are sore of public assent to our condemnation, when the gap is once pointed out. This we will endeavour to do.

The upshot of all the work of the commission is contained in twenty-five paragraphs, the essence or gist of which is abstracted by the report. The committee acknowledge that they suggest nothing that will "have the effect of preventing the growth of railway monopoly"; the dangerous nature of which, however, they do not dispute. Nor do they offer any suggestion by way of benefiting the public, in the way of reduction of rates and fares, in the event of the increased prosperity of the great inland carrying corporations. They propose to give such support as is practicable (or as has occurred to them as practicable, which is a very different matter) to water-carriage, inland or seaborne, and to let the public know, more distinctly than at present, what they are charged, and why they are charged, while giving them improved means for getting unfair charges remedied. These two objects are real and important. But it is inconceivable how, in going even thus far, the committee should have entirely closed their eyes, or at least their mouths, as to one of the recent developments of a very old mechanical application, which promises to be of far more general application than any method of water-carriage. To hold railway companies in check by aiding the development of canals may be all very well. But have the committee never heard of such things as tramways? Have they no knowledge of light railways or narrow-gauge railways? If they know nothing of what is doing in these things, what is the character of their intelligence? If they know anything, and have not sought either to know more, or to tell their constituents what they do know, what are we to think of their judgment? It is clear that be-

tween the rigid horns of this dilemma the Report, so far from assuring the dignity of a State paper, sinks to a value but little above that of a schoolboy's theme,—a good theme, by a clever schoolboy,—but by one who has not borne in mind the axiom that the whole is equal to the sum of its parts.

As to the short-sighted character of the policy which has allowed our great canal property to fall to so great an extent into the power of the competing railway interest, no judicious mind can entertain any doubt. The history of civilization, so far as the means of internal communication are regarded, has witnessed the same sort of oscillation between the conduct of traffic by land and by water, that we are now watching between the predominance of the attack, or of the defence, in military and naval artillery and fortification.

At one period the chief centres of commerce are those that lie most seaward, and thence give the longest land, and the shortest water, transit. Such a port was Brundisium, at a time when the military roads of the Romans afforded a surer and better mode of military and commercial transit than did the marine of the period. Such a port is that Imperial harbour, under its present name of Brindisi, again becoming. We must say this, however, as a matter of faith rather than of fact, as far as the postal service is concerned, for letters landed at Brindisi by the Indian mails still take the greater part of a week to reach London. Thus, for example, we may cite the fact that the *Ponak* landed at Brindisi, on the evening of the 1st of August, the letters which were delivered at London on the 7th. That, however, is a question of the bad management of the Italian service, and the wilful delay which the French invariably oppose to anything that does not go by Marseilles. The fact of the possible superiority of the land route remains.

On the other hand, such a city as Bristol, and we may even add, London, owes the foundation of its prosperity to directly the opposite influence. In the choice of the sites of these cities, as of most of those of which we can trace the primitive foundation, the object was to allow the greatest amount of water-borne traffic to be carried for the furthest possible distance inland. As we trace this alternation in the main requisites of ports and of cities, so may we understand the causes of the change, from time to time, by studying the history of locomotion. Within times not very remote, in this country, we have witnessed the formation of macadamised roads, the introduction of an organised system of inland navigation, and the origin and rapid extension of the railway system.

As, in the early days of the Stephensons, the canal interests steadily opposed the passage of Railway Bills through Parliament; so have the railway companies, when they had established their own position, endeavoured to devour and cripple the canals. Out of nearly four thousand miles of inland water communication in Great Britain, we are told that more than a third is now under the control of railway companies. In some instances that control might have been wisely exerted, to the relief of the plethora of the choked lines, and to the increasing of the dividend of the proprietors, by facilitating the use of a cheap mode of transport for goods; in the transmission of which time was not an object of the first importance. Indeed, even as to time, we can remember that it is not so very long since, on the North-Western line, we were told that heavy goods could be sent to London from Birmingham more rapidly by canal than by railway. That of course was an entirely exceptional state of things, arising from the great pressure and block of business. But it was an instructive exception.

The mischief of allowing the water-carriage of the country to pass into the hands of the railway companies has been twofold. First, practically, it has led to the ruin of much of the canal property. We can point out, from personal knowledge, one great line, and we have no doubt that it is but one out of many, in which the works have been so neglected that the question, which cannot long be delayed, of repair or of demolition, will assume a very serious importance. We believe this policy to be as short-sighted for the railway interests as it is disastrous for those of the country. Instead of competing with the canal for the coal and other heavy traffic, which, in the instance to which we refer, could have been carried by water not only more cheaply, but with far greater public convenience, the managers of this line would have

acted far more wisely by keeping the heavy traffic in its old water-borne course, and using their line (when it was made) for passenger traffic alone. No doubt in this case it was judged more expedient to augment traffic returns than to keep an eye on the main issue of dividend. But similar political reasons are everywhere, more or less subterraneously, at work. The result is, the public are losers, the canal property is deteriorated, and ultimately the railway proprietors will find that an ugly amount has to be paid, as the result of a blind and aggressive policy.

The second evil which this artificial check upon water communication has produced has been, that it has diverted the attention of practical and scientific men from the improvement which is unquestionably possible in canal navigation. As it is, the present limit of speed is rather incidental than actual. It is not the difficulty of propulsion which keeps the barges to their slow pace, so much as the damage done to the banks of a canal by the wave caused by a rapid transit. We have travelled with the *ae plus ultra* of luxury of motion, and with a very reasonable rate of speed, on a canal, in a light boat drawn by a pony at a trot, or even at a gallop. Under these circumstances the boat rises from its usual immersion, and glides over the surface of the water. Boats may be constructed expressly for this purpose. The saving of traction that is effected by the increase of speed is one of those things which *no a priori* mechanical investigation has pointed out. But it is a known fact. It is analogous to those results which we are now obtaining, in fixed machinery, by driving a very light wire-rope at a very high speed. The limit at this moment, as we before hinted, is rather in the cost of maintenance than in the difficulty of traction. And this is one which it would not be impossible to confront, if a due share of traffic were encouraged on our inland navigations.

It is the part of wisdom never to run into extremes. On the one hand, we profess no sympathy with the engineer who saw in the rivers and streams of a country only possible feeders for canals. On the other hand we never heeded the prophecies in which the old canal worthies were wont to indulge, as to the impossibility of railways ultimately holding their own. Nor, in its turn, can we fail to condemn the murderous hug with which the latter have embraced their watery rivals. At a period which has witnessed one of the most famous triumphs of engineering skill that has been effected since the time of the Pharaohs—the canal by which French energy and perseverance has united the Red Sea and the Mediterranean—we are not among those who hold that canals are altogether the most ordinary consideration, that the possible effect of tramways and narrow-gauge railways, either as feeders of, or to some extent as competitors with, existing lines of railway, is a far more urgent and pressing question, even if not one of so much ultimate importance, than the development of water-borne carriage. We are not prejudging the question; we are not, for the moment, expressing a decided opinion on the advantages of what are called tramways. The subject is too important to be dismissed in one or two paragraphs. But we do say that a Report which only professes to palliate, and makes no attempt either to probe or to provide for future exigencies, is signally defective, in going into the question of canals, and ignoring that of tramways.

More may be said in defence of the failure of the committee to deal with the great national question of the ultimate proprietorship of the internal communications of the country. The members no doubt felt a just distrust of their own capacity for dealing with so important a subject. It is hardly one for amateur investigation: which is the form, to speak plainly, which almost all corporate or board inquiries naturally assume. Indeed, judging from the tone in which military and postal conveyance is spoken of, we think it is matter for congratulation that the committee did not contribute an additional quota of confusion to a subject which all European governments except our own have held to be one demanding the best attention of their statesmen. It is proposed that the fares to be paid by the War Office for the transport of troops should be reduced to such an amount as will give the companies a profit equal to that derived from either ordinary passenger, or excursion, traffic. This, we think, is not the light in which the subject should be viewed. It is a matter of good statesmanship to make the inci-

dence of all taxes as little onerous as possible. In all foreign States this maxim has been borne in mind as relates to the services which the railways render to the State. Great powers are entrusted to these corporations; to be used, primarily, for the pecuniary benefit of their members. The service of the public, or at least has been hitherto, a subordinate consideration. The rate of fares, the timing of trains, the condition of carriages, are matters on which a *laissez faire* policy has been to a great extent that of our legislation. No redress exists, in many cases, for extreme inconvenience inflicted on the public. The directors most respected are those who declare the best dividend. It is, therefore, but little to demand, in return, that railways should return to the State such a payment *in kind* as will best serve the latter at the least expense to the former. We do not see why the conveyance of troops should be regarded as a source of profit. At all events, we are disposed to maintain that, for State service, no railway company should receive more than the lowest rate of remuneration which, for its own ends, it voluntarily accepts. We may instance the coal traffic. The low rates at which minerals are borne, for competitive reasons, are notorious. To choke water carriage, coals and ore are taken at charges which differ immensely from those of passenger traffic. Now, allowance being made for the difference, if any, of the cost of the carrying stock, a ton of soldiers, which loads and unloads itself, ought to be carried by every railway company at least as cheaply as a ton of coals, which the company has to place in, and remove from, its premises or its wagons.

We have not space to go, item by item, through the joint Report. It will be seen from the above remarks how fragmentary and casual is its character; and how it entirely fails to look a great question in the face. Nor can we view with more favour its one substantive recommendation—the appointment of a special tribunal, entitled the Railway and Canal Commission, composed of one eminent lawyer, one member who should be thoroughly acquainted with the details and practice of railway management, and one who, as no special qualification is attributed to him, is, we suppose, to be of the fashionable political colour of the day. This attempt to create brand-new authorities is not an unnatural recommendation to a committee. Most things seek to perpetrate their own likeness; but judging from past experiences, we should only have a new obstacle thrown in the way of every really efficient improvement. That which all civilised nations, except ourselves, have done, has been to give the general control of public works, and the State supervision of all things of an engineering nature, to a minister holding equal rank with the secretaries of State for war, marine, commerce, law, and the other main branches of Government. With us, what the Government does with regard to these matters is intrusted to different functionaries, not of the highest rank, independent of one another, sometimes coming into mutual collision, and, as we have recently seen, more than sometimes coming into violent collision with all that we have that is most respectable either in science or in art. It is a misfortune to a Cabinet, no less than to the country, that such should be the case. We call attention to the fact that in the sanitary measures now in course of elaboration the head of the Local Government Office has to discharge some of the functions of a minister of public works. If such a ministry were permanently and efficiently organised, the gain to the country might be great; and so long as our present plan of giving the supreme command to a civilian unacquainted with the special requirements of his department is continued, the permanent staff of the ministry would form a sort of counsel to the temporary chief, so as to prevent him from making any very extraordinary blunders; or, at all events, so as to render him palpably inexcusable for so doing. If Government interferes at all with works, ports, harbours, river purification, river navigation, roads, railways, drainage, and sanitary engineering, it can only satisfactorily do so by a harmonious execution, and by systematic action. We must have done with referring everything to special Boards, whether of trade, of works, of sanitary measures, and of railways. What we do should be done seriously, and not by rule of thumb. The question of how far Government must, and must not, interfere with public engineering questions has yet to be stated, and to be settled. We have to commence, *ad oco*, a systematic study of the whole question; a study

such as Von Moltke made of the question of defence. With this leaf taken from a very instructive lesson-book, we shall find that public time and public money will be by and greatly economised. We should then not invite half a dozen gentlemen to quarrel for months, or even for years, on a question which the careful report of one eminent and responsible engineer would settle in the course of six, twelve, or eighteen months, but settle definitively and exhaustively. We should cease to render ourselves ridiculous by official reports, involving the extraction of coal at a temperature of 120° Fahrenheit, or the dealing with railway legislation without any reference to tramways.

LOADS AND DEFLECTIONS OF SOLID BEAMS.*

THE methods which have been in use for the last twenty years for calculating the strength of iron beams, have all been more or less based on the experiments and mathematical investigations made by the late Eaton Hodgkinson; and the author of the essay before us has not been able to discover anything more reliable than the recorded results obtained by that eminent experimenter; the chief novelty about his investigations consisting in the view he takes of those results in their bearing upon the strength of beams. He finds fault with the usual methods of calculation, because they give the breaking or ultimate strength instead of what is really wanted by the practical engineer, the proof strength or the utmost load that can be put upon a beam without permanently injuring its elasticity.

In cast-iron beams, Mr. Donaldson considers that experiments show that the modulus of elasticity, whether for tension or compression, can be taken as nearly the same, when the load is not sufficient to impair the elasticity of the material; but that in beams of wrought-iron the modulus for extension is to that for compression in the proportion of 14 to 11.

Mr. Donaldson's investigations differ therefore in this point from previous ones, in taking two moduli, one for compression, and another for extension, instead of an average modulus to include both strains. This is no doubt the correct method, but it involves more complicated formulas, and it may well be questioned whether such nicety is of much practical value in determining the strength of beams, since we seldom find that any two specimens have exactly the same modulus, and therefore after all only an average value can be taken.

There is one other important point in which our author differs from his predecessors, which consists in taking the ratio of tensile and compressive stresses as widely different when proof stress or ultimate stress is under consideration. The ultimate compressive strength of cast-iron, as determined by experiments on short cylinders, is about six times the ultimate tensile strength; and on this relation the form of section of what is called the Hodgkinson cast-iron beam is based, making the metal of the bottom flange, which suffers a tensile strain six times that of the upper one which is under compression. Mr. Donaldson, however, considers that this is a wrong conclusion to draw, and that the proof compressive strength being only three times the proof tensile strength, the form of the girder should be based on this principle, and not on the ultimate or breaking strength of the metal. He takes this view of the relations of proof and ultimate stress from a table of experiments given by Hodgkinson, in the Parliamentary Report for 1849, which were made on a number of cast-iron rods 10 ft. long and 1 in. square, in which it appears that a compressive force of 25,000 lb. was all that they would bear without injury, the tensile strain being 8,000 lb., without impairing the elasticity. If we refer, however, to the record of these experiments, we find it stated that the rods were enclosed in an iron frame, which prevented their getting out of a true form, which prevented their being broken in the right line; but, notwithstanding this precaution, some of the bars strained with 16 or 18 tons had become very perceptibly undulated. This might well be expected from their great length, as compared with the width, which would be of no consequence in tensile strain; but when a compressive force was applied, the resistance would vary according to

* New Formulas for the Loads and Deflections of Solid Beams and Girders. By W. Donaldson, M.A. London: Spott. 1872.

the ratio of breadth to length, the strength of very long pillars being shown by Hodgkinson's other experiments to be nearly inversely as the square of the length. It appears, therefore, to us that the experiments which Mr. Donaldson quotes are not of much value for the purpose of determining the resistance of the upper flange of loaded beams to compression, and that a proof stress for compression of one-fourth the ultimate strength is far too little to allow in beams of cast iron.

With regard to wrought iron, it is almost impossible to fix with any accuracy the average ultimate strength, whether compressive or tensile, since so very much depends on the quality and ductility of the metal, there being no exact point in good wrought iron at which crushing can be said to occur; while, on the other hand, it may generally be drawn out very considerably by a tensile force before fracture takes place. Mr. Donaldson takes as his authority some experiments of Hodgkinson's on bars 10 ft. long by 1 in. square, and from these he deduces the ratio of 3 to 2 as that of proof compressive to proof tensile stress in wrought iron. This, however, is an inference drawn from one set of experiments only, and very different results are shown by Hodgkinson in another set, on bars of larger diameter. In subjecting long bars of wrought iron to a compressive force in the direction of their length, although kept from bending by mechanical means, the same difficulty will arise as we mentioned in the case of those of cast iron, and they can only be considered as long pillars, whose strength depends on the ratio of diameter to length. For these reasons, we can hardly admit that Mr. Donaldson has proved the principle which he affirms, "that it would be wrong to use formulas with constants determined by ascertaining the experimental breaking-weights, to design beams intended to support proof and working loads."

But whatever difference of opinion there may be as to the conclusions to be drawn from experiments, there can be none as to those deduced by pure mathematical reasoning, in which Mr. Donaldson is certainly an adept, and has worked out, by means of the integral calculus, very exact formulas for finding the strength and deflection of beams in cast or wrought iron and timber. These formulas are quite independent of the results of experiments, and will be found of equal use whatever value of constants the engineer may deem it advisable to employ. It will only be those who have a good acquaintance with algebra that will be able to follow the author's arguments or to understand the application of the formulas deduced; but the following are some of the results obtained, and which will not be difficult of practical application.

In the case of solid rectangular beams of any material, let W be the load applied at the centre of the beam, w the weight per unit of length (l) of the beam itself, d the depth and b the breadth of the beam, f , f' the horizontal components of the stress per unit of area on the extreme bottom and top edges respectively actually exerted, E the modulus of elasticity in extension, E' the modulus in compression; then the relation between the applied forces and the resistances is expressed by the equations—

$$W + \frac{wl}{2} = \frac{4fd^2b}{3l \left(1 + \sqrt{\frac{E}{E'}}\right)}$$

or,

$$= \frac{4f'd^2b}{3l \left(1 + \sqrt{\frac{E'}{E}}\right)}$$

the upper or lower expression to be used according as E is less or greater than E' .

The deflection at the centre of a rectangular beam with a distributed load is,

$$\text{Deflection} = \frac{5f \left(1 + \sqrt{\frac{E}{E'}}\right)^2}{48E'd}$$

or,

$$= \frac{5f' \left(1 + \sqrt{\frac{E'}{E}}\right)^2}{48E'd}$$

The deflection produced by a central load is to that by a distributed one of equal amount in the proportion of 8 to 5.

In the case of flanged girders, let D be the

distance between the centres of gravity of the top and bottom flanges, A and A' their sectional areas; then we have the relation between the forces determined by the equations,

$$W + \frac{lw}{2} = 4fA.D$$

or,

$$= 4f'A'.D$$

If the areas of the flanges are proportioned so that

$$\frac{f}{f'} = \frac{E}{E'}$$

then the central deflection, with a central load, when f is constant, is,

$$\text{Deflection} = \frac{f l^2}{48E'd}$$

or,

$$= \frac{f l^2}{48E'd}$$

Mr. Donaldson has also devoted a few pages of his essay to the investigation of the ratio of depth to span in wrought-iron railway girders, for which a table is given with the ratios varying according to the spans.

SANITARY CONDITION OF PARTS OF BIRMINGHAM.

THREE or four years ago, on the occasion of the meeting of the Social Science Association in Birmingham, we received some abuse in return for the particulars we gave as to the evil condition of parts of that important town. Notwithstanding the time that has elapsed, similar statements have yet to be made. At the recent meeting of the British Medical Association in Birmingham, the president, Mr. A. Baker, said, in the course of his inaugural address—the area of the borough, 8,120 acres, when divided between 350,164 inhabitants (the estimate of the last census), gives upwards of 124 superficial square yards to each person,—an allowance that probably accounts for our freedom from typhus, as fully as the absence of marshes and bogs explains our immunity from ague. The distribution of this area, however, is not so equal as might be wished for sanitary purposes; the space per head varies in the different wards from 695 square yards in Edgbaston to 31 yards in St. Martin's Ward. Seven other wards yield a smaller superficial area than 100 square yards for each inhabitant. The density of population in the central and older parts of the town may be comprehended, but that districts which have been built since the importance of sanitary rules has been known, should have been allowed to exceed the limits of health in house accommodation, is only to be attributed to the anomalous position of a corporate body which, whilst endowed with powers to levy rates and govern the town, has no authority to curb the crude and ignorant designs of the building speculator, who, in order to secure a large immediate return for a small outlay, is at liberty to construct a court of scanty surface, approached by a narrow alley, with rows of sheds called houses, built back to back so as to support each other; defying through-ventilation, yielding scanty space for the admission of pure air, and as little for the escape of that which has been exhausted by respiration. From these courts, possessing not a single sanitary attribute, containing open middens of faulty construction, arise fetid exhalations that pollute such air as enters the still enclosure; the leakage from the ashpits through the soil into the wells from which water is drawn gives rise at times to an excessive mortality from scarlatina, typhoid, diptheria, diarrhoea, and other preventible diseases of a like type. Let contagion enter a space thus circumscribed, and the result may be safely predicted. For the tenants of these defective courts, the only airing-grounds are the streets, which fortunately present many open spaces in various parts. Well might Dr. Greenhow declare that "more than half our annual mortality results from diseases which prevail, with a very great range of difference, in proportion as the sanitary circumstances are had or good;" and that the mortality from preventible disease in certain districts "raises the death-rate of the whole country 33 per cent. above the death-rate of the healthiest part." The powers wanted to suppress this evil need not be vexatious. They are required only for the protection of the poor, embrace the simple questions of ventilation, space, and sewage, and might be safely dictated by a health-officer, aided by the borough surveyor.

On the subject of the sewage difficulty, Mr. Baker said,—

"Whilst sympathising with the Corporation in their efforts and their defeat on this question, there is one marked and culpable defect in the official appointments of this borough which demands severe animadversion. The imperfections that have been mentioned could not have existed unremedied had there been a well-qualified technical officer of health, possessing technical knowledge of hygienic rules; capable of guiding the deliberations of the Council on this subject, and of framing comprehensive plans for the prevention of disease and the promotion of health. Such an officer, rendered independent by an adequate salary, freed from the cares of medical practice, exclusively devoted to sanitary science, and armed with power to exact information and aid from all the executive officers of the borough, would secure to the inhabitants that skilled care which they have a right to expect, would represent faithfully the views of our profession, and would be competent to contribute to those discussions between the 'associated officers of health' which have materially advanced our knowledge of scientific hygiene. The cost of such a man would be more than compensated by a diminished rate of illness and pauperism, a more steady capacity for labour, and a smaller rate of crime."

OPENING OF THE PORTLAND BREAKWATER.

ON Saturday his Royal Highness the Prince of Wales laid the completion-stone of this great national structure. The Prince received a most enthusiastic reception. During the past two months preparations for the event had been in progress. An appeal made by the Mayor, Mr. James Robertson, had resulted in the townspeople subscribing some 700l. towards the fund for the decoration of the town alone. The little town was therefore bedecked in the most profuse manner. The Esplanade was rendered gay with flags, evergreens, and flowers, Venetian masts, with heraldic trophies, being fixed in this as also the other public thoroughfares.

The Portland Breakwater, now that it is finished, offers to the eye little more than a thin reef, stretching away almost till it fades. Its magnitude and strength are buried out of sight, but it is a vast Cyclopean wall, 100 ft. high and 100 yards thick at the base. It is heaped up by nearly 6,000,000 tons of stone, which, if built into a solid column 100 ft. in diameter, would overtop the highest Alp. The scaffolding, of which, of course, there now remains no trace, must be described as a wooden railway viaduct, of the most massive kind, built a mile and a half out from the shore, in from 50 ft. to 60 ft. of rough sea-water. Every timber had to be made waterproof and wormproof by the hydraulic forcing of creosote into the pores of the wood, and when this was done a huge pile was made of nine or ten timbers bolted together in one nightly spar of eight or nine tons, some 2 ft. or 3 ft. square. Tipped with an iron screw, this was lowered into the sea until it rested on the bottom, when it was worked round by a capstan till the screw had bitten 8 ft. into the clay. Three or four of these great piles were set at a time, and at once bolted together by many wrought-iron tie-rods and powerful cross-timbers and under-trusses, till the mass was strong enough to carry the trucks of stone for tipping-in. The top of the scaffolding was 30 ft. above the water, or 90 ft. above the ground.

In the construction of the North Fort, these piles were set in two great circles, of 112 ft. and 22 ft. in diameter, upon which, as on a huge dial, moved an immense wrought-iron radial "traveller" dragging the feeding-trains, each with from 60 tons to 80 tons of stone in tow, stopping them over the exact spot where more tipping was required, when, as by magic, the wagons rose on end, and poured their blocks into the sea. Thus,—and this shows the way in which the whole breakwater was built,—a mighty mound was heaped for the foundations of the North Fort, an island in the sea, of 140,000 tons of solid stone, and, with the fortifications, 100 ft. high, 400 ft. in diameter at the base, and 200 ft. at the summit. At every tide the divers went down to level, as well as they could, the masses tipped in, and to report that a little more stone was needed here or there, as the case might be.

This North Fort is in three stories,—one of magazines, two of casemated batteries; and the

ment will be sixty gins in all. The whole structure appears from above a ring, of granite, 100 ft. thick, enclosing a centre courtyard, into which look the officers' quarters and men's barrack-rooms.

Taking three fathoms' depth as the standard of low-water, Plymouth Breakwater encloses 741 acres, or 150 more than Portland.

CONCRETE AND THE METROPOLITAN BOARD OF WORKS.

At the last meeting of the Board it was agreed,—

"That the application of Mr. Philip Bramon, on behalf of Mr. J. R. Bell, for approval by the Board of a special mode of constructing monolithic concrete fire-proof buildings proposed to be erected on land near Edington-green, be granted, on condition that the concrete used in the construction be compounded according to the conditions in the form of licence now submitted; and further recommending that the said form of licence which has been prepared by the Superintending Architect, and is a modification of the form approved by the Board on the 14th of June, 1868 (No. 11), be approved by the Board, and issued to the applicant accordingly."

and that,—

"With reference to the two cases now before the committee, of the erection by Messrs. Hall & Co., of buildings in East-street, Bermondsey, and Overhill-road, Dulwich, with walls of Portland cement concrete, without having obtained the licence of the Board for the use of that material, Messrs. Hall & Co. be not permitted to accept of a licence for the buildings erected under their patent, and either recommending that a printed circular be forwarded to the district surveyors, informing them that the Board consider the buildings under this patent to be within the scope of the Building Act, and that they will be expected to take proceedings in the usual way in cases where the provisions of the Act are contravened."

A PAROCHIAL INSTITUTION.

A NEW parochial institution is being erected in George-street, Oxford-street, for the parish church of St. Mark's, North Audley-street, from designs by Mr. Withers, architect. It will comprise industrial and soup kitchens, workmen's club, mission-room, parish and committee rooms, model lodgings for parish officers, and school, &c. The front next George-street will be of red bricks, and will be six stories high. Messrs. M. Allen & Son have the contract, for 4,433l. Mr. Alder is clerk of works. The Marquis of Westminster gives the site.

RECONSTRUCTION OF THE HÔTEL-DE-VILLE, PARIS.

THE *Gazette des Architectes et du Bâtiment* No. 14, 1872, contains the conditions of the competition opened for the reconstruction of the Hôtel-de-Ville, Paris, together with a plan of the site and approaches. The jury of selection will consist of ten members, named by the Municipal Council, and taken from their own body: ten named by the Prefet, and taken from the Commission of Fine Arts and Historical Works, and named by the competitors. The designs will be publicly exhibited, and then the jury will select twenty, considered the best, which will be gain exhibited; and then from these the jury will name six. The author of No. 1 will be charged with the execution of the design; No. 2 will receive a premium of 600l.; No. 3, 450l.; No. 4, 400l.; No. 5, 320l.; and No. 6, 200l. The authors of the remainder of the twenty designs selected will each receive 100l.

THE BRIGHTON AQUARIUM.

The aquarium constructed at Brighton, and which promises to be a very interesting and instructive institution, was opened on Saturday last by Mr. J. Corly Burrows, the Mayor of Brighton. Mr. C. Soames, the chairman of the company, discharged the duties of president very efficiently at a dinner afterwards given under the well-known dragon chandelier in the pavilion, whereat were present the Lord Mayor of London, Sheriff Sir John Bennett, Sir James Duke, and other distinguished persons, including Mr. E. W. Cooke, R.A., R. G. A. Sala, Mr. Walter Thornbury, Mr. Carter, Mr. James Dredge, and others connected with art, literature, and journalism. The number, in the whole, of 200. Mr. Eugene Arch, the engineer, was complimented on his achievement, and Mr. H. Lee and Mr. Frank Auckland were thanked for good services. We propose presently to give some illustrations of

the establishment that may be useful, and reserve particulars, with such praise and blame as may seem due, till these appear. We wish the company the greatest possible success.

TAUNTON DRAINAGE WORKS.

A PUBLIC MEETING was held in Taunton on the 8th inst., convened by the Government Inspector, Mr. Arnold Taylor, to take into consideration the necessity and desirability of borrowing 4,000l. to complete the sewerage of the district. The scheme proposed consists of bringing the whole of the sewage to one outfall, in the Target field, about half a mile from the town, so that at some future time the sewage may be deodorised and utilised, a scheme for which is under the consideration of the Board.

The proposed arrangements will necessitate the bringing the sewage of the northern part of the town, under the river Tone, by means of an iron siphon, with a depression of about 3 ft. There will also be another iron siphon, under the mill-stream in Tangier, with a depression of 1 1/2 ft.

Also all the closets and drains that empty their filth into the river are to be destroyed. The plans of the joint schemes were prepared by, and the works are to be carried out under the superintendence of, Mr. James Henry Smith, the board's surveyor.

THE COAL QUESTION A SERIOUS SUBJECT.

SOME time ago we said, under the above head, "that there were many reasons to lead us to expect an immediate increase in the price of coal." How far this prediction has been carried out the readers of the *Builder* will be able to judge. It was also stated the quantity of coal on which we can with any prudence depend, must be far less than the 146,480 millions of tons which may be reasonably expected to be available for use. Since that time the demand for all kinds of fuel has greatly increased, and the means of meeting the demand are just now being considerably augmented, so that should the present state of trade exist for any great length of time, it cannot but be expected that the quantity of available coal will be consumed long before the time stated by Professor Jevons. It may, perhaps, be not uninteresting at the present time to notice the increased means which are being taken to keep pace with the request in which coal is held. Throughout the Yorkshire coal-field a large number of extensive collieries are being opened out; and in many cases old pits which have been abandoned for years are being turned to account in order that the neglected, and at that period valueless, fuel may be got. These results cannot be wondered at when it is stated that thousands of tons of pit slack were left in collieries in bygone times because it would not pay for the trouble of removing. A different state of things now exists, as what was worse than worthless then now sells readily at 8s. per ton at the pit mouth. But to return to the subject of the development of new collieries. At and near Pontefract, which a few years ago was only known as an agricultural district, a number of new pits have within the past few years been opened out, which may be said to be getting into fair working order; some of them producing from 500 to 600 tons per day. Last week experienced the winning of coal at one of the largest pits in this part of the district, viz., at the Prince of Wales Colliery, close to the Pontefract race-course. The sinking operations have been going on for over two years, having been commenced on the 21st June, 1870. The coal is known as the Haigh Moor seam, and was reached at a depth of 446 yards. It is the property of the trustees of the park, who leased it to Messrs. Rhodes & Dalby at 130l. per acre, for fifty years, at a minimum rent, for the first five years, of 300l. per annum from the acceptance of the offer, and 600l. per annum afterwards. A large quantity of the coal underlying the parish of Royston, between Barnsley and Wakefield, has just been secured by Messrs. Davy & Co., at 300l. per acre. The field, which is a very valuable one, belongs to a number of small holders, who are to receive 1l. per acre per year so long as their coal remains unworked;—this amount to be deducted from the sum stated. Sinking operations are to be commenced as early as possible; and as the royalty exceeds 1,000 acres, the colliery will be one of the largest in the district. Within a comparatively short space

of time the old Darley Main Colliery, where seventy-five lives were lost in 1819, has been re-started. In other parts of the district old pits have been, and are being, turned to account. Attention is also being paid to the winning of the thin coal seams which abound in the district, and which can be got at a comparatively trifling depth. Many large collieries which have been recently sunk are now getting into working order, and will shortly add to the output of coal to a considerable extent. Amongst others, the Queen's Colliery at Burton Bridge may be noticed. The pit is just being developed, and is now yielding a good quantity of coal. The same remarks will also apply to the New Oaks and the Manvers Main Collieries, which are doing a large stroke of business during the prosperous trade. The sinking operations at a large colliery at Aldam Junction, as well as those at Smithies, are being pushed forward with all speed. In the Durham Coalfield similar steps are being taken for adding to the output, and keeping pace with the large demand. The Bishop Middleham Colliery, which has been idle for several years, is now being put into working order, prior to being started again. What is known as the Old Cassop Royalty, once holding a conspicuous position in connexion with the Durham coalfield, is about to be turned to account. A new shaft is to be sunk between the villages of Cassop and Haugh Hall, at which point the royalty is still almost in its entirety. The Hutton seam, at the Coxhoe Colliery, is also to be worked, so that a great addition is likely to be made to the produce of that district. In Sutherlandshire, the Duke of Sutherland is said to be devoting his energy to the working of the coal measures, which, since the days of Queen Elizabeth, have been known to exist, and which, up to 1827, were regularly worked. It is reported that recent examinations of the Brora district have led to the discovery of an undeveloped coal basin, commencing at Helmsdale, and running parallel with the coast, in the direction of Inverness. Throughout the Derbyshire district, which now sends fully two-fifths of all the coal carried by railway to London, a number of new collieries are being opened out. In the Unstone district, where Messrs. J. Rhodes & Son have just sunk a large pit, the new shafts belonging to the Blackwell Colliery Company (Limited) have just been sunk down to the blackshale coal, which was met with at a depth of 300 yards. It will thus be seen that a large number of new collieries are being opened out in consequence of the brisk trade in coal; but whether they will all prove remunerative in times of quietness remains to be seen.

THE JOINERS' COMPANY AND TECHNICAL EDUCATION.

THE prizes awarded to the candidates in the competitions organised by the Joiners' Company were distributed at a court, held at Guildhall, on Thursday, the 1st inst. The master, Mr. J. Johnston, jun., presided; and the wardens present were Mr. Wrenker, jun., and Mr. H. L. Phillips. In presenting the first prize to Mr. W. Hodges, of the Spitalfields School of Art (for original design), the master said he had to express the gratitude of the court that such beautiful specimens had come before them. They had offered these prizes to induce those who were training for skilled trades to do all in their power, not simply to raise themselves to distinction in their own branch of art, but to raise the national character. The other prizes from this school were to Messrs. T. Russ and W. Shuter. The first prize, in building construction, was awarded to Mr. W. G. B. Lewis, student at the Charterhouse School of Art for two years and a half. These designs were sent by ten students. The other prize for this school was gained by Mr. F. Ansell. There were three prize-takers from the Birkbeck School of Art, Messrs. T. V. J. Bennett, W. H. Sweet, and E. C. Miller, the latter being for mouldings applicable to ceilings. The prizes consisted of books on architecture and cases of mathematical instruments.

The master addressed a few words of encouragement to the candidates on their leaving. He said it would be for them to show to all around that they were industrious and persevering, and would make the best of surrounding circumstances. Nothing good and nothing great could be achieved without these qualities. They should show they were determined not to "scamp" their work, but raise each one his branch of industry in the eyes of the world.

ORNAMENTAL TILES IN THE SOUTH OF HAMPSHIRE.

DURING the Southampton Congress of the Archaeological Institute, Mr. Greenfield read a paper on this subject. He said that pavements formed of encaustic tiles did not come into use until the end of the twelfth century, and although there appeared to be no natural or necessary connexion between this kind of pavement and Gothic architecture, yet, as a matter of fact, they came in together and went out together; he added this might be attributed to the reformation of religion, and the suppression of the monasteries. Then, alluding to the process of manufacturing inlaid tiles, he produced one found at Beaulieu which was precisely similar in pattern to a tile found at Winchester Cathedral, St. Cross, Christchurch, Romsey, and St. Deny's, but differed in the number of spots on it and in the borders. Ancient kilns for burning these tiles had been discovered in Worcestershire, Staffordshire, and other places. At present Beaulieu was renowned for the good quality of the brick earth or clay proper for making bricks and tiles, which was found in abundance in its neighbourhood. He was not aware that a monastic kiln for the burning of decorative tiles had been discovered in the southern part of this county. Most probably there were such at Beaulieu, and Quarve, in the Isle of Wight, if not at Netley and Romsey, and the neighbourhood of Winchester. But, in any case, from the similarity of the patterns of the tiles that were to be seen in the pavements of Winchester Cathedral, the Hospital of St. Cross, and the churches of Romsey and Christchurch, and of the tiles that had been discovered in the ruins of St. Deny's Priory, and Netley and Beaulieu Abbeys, more especially at the two latter, there was sufficient evidence to show that many of the tiles used at all these six places were made either from the same or precisely similar moulds. To illustrate this meaning he directed attention to specimens of tiles on the table before him, and drawing in fac-simile which his daughters had made from tracings they had taken of patterns still remaining at Netley, Beaulieu, Christchurch, Romsey, and Winchester, and likewise the set of fac-similes of patterns from Beaulieu, kindly lent him for the occasion by Lord Henry Scott, M.P., and the Rev. W. H. Lucas, vicar of Sopley. Of his own tracings of patterns from monasteries and churches in the south of this county, and from the Nunnery of Tarrant, in Dorsetshire, there were 105 fac-simile illustrations. Of these examples 43 were from Netley, 34 from Beaulieu, 39 from the Church of the Hospital of St. Cross, 57 from Winchester Cathedral, 33 from Romsey Abbey Church, 8 from the Priory Church of Christchurch, and 5 from Tarrant Nunnery. Besides these there were two examples from Netley in the plate which accompanied the Rev. E. Kell's excellent and exhaustive article on Netley Abbey, which formed part of the "Colledania Archaeologica," and four examples from Romsey and Winchester in Mr. Nicholl's series, which he had not taken. Mr. Greenfield then pointed out several examples and described their peculiarities at some length, including unique specimens from Netley, Beaulieu, Winchester, St. Deny's, St. Cross, Romsey, Sopley, and Tarrant (Dorset), pointing out their relationship, and, in many instances, great beauty. He spoke highly of the rare and excellent work of the Messrs. Skelton, of Southampton, of which only four copies were purchased, entitled "Patterns of Encaustic Tiles found at the Ruins of Priory to St. Dionisius, near Southampton," containing twenty different examples, admirably printed from blocks in the proper colours by the double process, one of which copies he was enabled to lay before them through the kindness of the Rev. E. Kell, and proceeded to say that he had made out that of the thirty-four different examples noted at Beaulieu twenty of the same identical patterns were found at Netley, and that out of the forty-three different examples noted at Netley only five were solitary, or without example elsewhere, while of the thirty-four at Beaulieu only four were solitary. There was enough to show that these two abbeys, as well as other monasteries in the neighbourhood, possessed decorated tiles of precisely the same pattern, if not made in the same moulds. It was not improbable that a closer connexion, and the interchange of kindly offices between the monks of Beaulieu and Netley, might have arisen from their being members of the same order, and governed by the same rules, and from the

fact that on completion of the foundation of Netley its first abbot and monks were chosen from Beaulieu. Both establishments were of the Cistercian order, which took its rise in about the year 1075, and was introduced into England in 1158, by William Giffard, bishop of Winchester, on his founding the Abbey of Waverley, in Surrey. Before the dissolution it had eighty-five houses in this country. Beaulieu Abbey was founded by King John in 1204, while Netley Abbey was said to have been founded by Henry III. in 1239, in fulfilment of the wishes of his former tutor, Peter de Rupibus, bishop of Winchester, who founded the Augustinian Priory of Selborne, in this county, in 1233, and who died in 1238, leaving a sufficiently large sum of money to found this abbey and another, and furnish them with whatever things were requisite. The Benedictine Nunnery and Monastery of Romsey were founded by King Edgar, A.D. 967; the Augustine Priory of St. Deny's, near Southampton, by Henry I., in 1124; and the Benedictine Monastery of Wherwell by Elfrida, queen of King Edgar, in 986. Attention was drawn to the heraldic insignia on a fragment of an encaustic tile found at Netley, now in the possession of the Rev. E. Kell, which there were grounds for believing was of Beaulieu design, and was made at that place. There was a remarkable similarity of design in the geometrical tracery and foliage to that on a tile in Warblington Church, at the south-east end of this county. But it was not from the same mould, and it differed essentially in the heraldic charges and emblems. Yet in both the armorial insignia related to the same family, though most probably not the same person.

THE TRADES MOVEMENT.

THE last monthly report of the Operative Carpenters' and Joiners' General Union of Great Britain and Ireland sums up its review of the position of affairs thus:—

"The Amalgamated Building Trades Committee are at a dead lock; but the deputations of the Central Council of the Carpenters and Joiners are systematically organising the whole kingdom, and funds are flowing in to such an extent that victory may safely be predicted. A general lock-out on the part of the masters is not feared, but rather courted, as it will test the earnestness of the men, who appear now to be united to a man."

On Saturday, the finance committee at the Brown Bear, presided over by Mr. Thomas Hall, the treasurer (Amalgamated Union of Carpenters and Joiners), and Mr. C. Matkin, the secretary (General Union of Carpenters and Joiners), stated that the dividend this week would certainly not be less, but most likely more than last week. According to the same report, there are sixty-six towns, including Liverpool, Manchester, Leeds, Sheffield, and Birmingham, where the employers and the men have agreed upon a code of working rules, one of the points for which the London men are now contending. It was also stated that last month, at Chorley, an agreement was come to with the masters to fix the week's working time at 49 hours, at 7d. per hour, with a code of working rules, while at Keighley the working time was reduced from 54 hours to 50½ hours, at the same rate of pay, with a code of rules, and that on and after the 1st of October next a similar regulation is to come into operation at Blackburn. Strikes are now on at Sheffield and Leicester, towards which the General Union has contributed, in the shape of strike pay, 308l. The General Union has seven branches in London. It was stated in the Central Committee of the Carpenters and Joiners, a few days since, that one of the interdicted employers was willing to set the example of conceding the nine hours pure and simple, at 8½d. the hour, with the understanding that he should a code of working rules be ultimately agreed to in any general settlement of the dispute it should be adopted in his shop. It was remarked, however, that the other masters might one by one follow suit, and in the end the code would come to be shelved. To keep up the dividend will require a good deal of pushing in the provinces, as the London levies are not all that could be wished. The distribution was made in round numbers to about 1,550 men, at the rate of 14s. 6d. per week to the men on strike from Jackson & Shaw's and Brass's, and 11s. 6d. to the rest, who, of course, constitute the vast majority of the whole. According to the latest inquiries, the masters, for the most part, have obtained sufficient hands to carry out all pressing contracts or orders. Neither the general committee nor the sub-committee of

their Central Association have any idea of holding a meeting until September, unless, in the meantime, the men express a desire to make terms. We do sincerely hope that this will be the case.

Newcastle and Gateshead.—The house carpenters and joiners have struck work for an advance of wages from 28s. to 30s. a week. A deputation from the Masters' Association and a deputation from the Workmen's Union have met, in order to try and bring about a settlement of the dispute. No definite result, however, was arrived at. The operative joiners have since accepted the terms of the masters, 7d. per hour, and have returned to work.

Halifax.—A meeting of the carpenters and joiners has been held on behalf of the London joiners now on strike. A deputation, consisting of Messrs. Sadler (chairman of the London delegates) and Wright, gave a full statement of the present position of the London men, and the history of the movement up to the present time, the determination to remain on strike being unanimous. A resolution was passed to "levy" the Halifax men at 6d. per week, in support of their London brethren.

Agitation in the Brick Trade.—At a well-attended meeting of the operative brick-makers of the Rowley, Old Hill, and Hales Owen Union, it was unanimously resolved that those men who had not obtained the reduction of hours should request their employers to reduce their working hours to fifty-four per week, and if not conceded, it was resolved to give fourteen days' notice.

Expected Lock-out of Engineers at Birkenhead.—An offer by the Liverpool and Birkenhead master engineers to their men having been declined, notice has been issued by the master engineers of a lock-out, to commence on the 22nd. Two crowded meetings of workmen have been held in Birkenhead, at which the masters' terms were unanimously rejected.

Strike and its Consequences.—The strike of the goods porters on the London and North-Western Railway has come to an end. The company having received a sufficient number of men from Scotland and the provinces, to take the places of those who had turned out, posted placards, "No more men wanted." Upon this many turnouts offered to go in unconditionally and a few of the most able were selected. The larger number, finding that all chance of regaining their employment was gone, tore the strike colours from their button-holes, and dispersed. At a meeting of the directors banks were voted to the clerks and men who had remained at their work, and double pay was ordered to be given them until the reorganisation of the stations was completed. It was also determined, that in filling vacancies in the higher classes, preference be given to the men who had remained faithful.

SMOKE PREVENTION.

Vicars's self-stoking apparatus has been fitted up to boilers employed in driving the machinery that prints the *North British Daily Mail*, in Glasgow. The most prominent external feature of the apparatus is a hopper for holding the fuel, and which may be of any size. At the bottom of this are two small receptacles, one at each side, which are made to contain a given charge of coal. These charges are forced into the furnace, one at a time, by two plungers or pushers, one of which is moved forward while the other is coming back. These plungers are worked by a shaft moved by a ratchet, so arranged that the rate of feed can be varied at pleasure, by causing the driving eccentric at each stroke to take a greater or lesser number of teeth. Once in the furnace, the fuel is carried onward by movable bars, which all move forward together about 3 in., and are brought back one by one. Movable furnace bars are not a novelty, but the mode of their application in Vicars's furnace is an important and original feature. Each bar is provided with a trough containing water, in which a centre rib cast on the bar is immersed, while the upper part of the bar forms a perfect cover to exclude cinders or ashes from the trough. By this device the burning of the fuel, or their getting blocked up, were constant causes of trouble, are said to be effectually avoided.

In Vicars's furnace a small and uniform amount of fuel, just what suffices to replace that consumed, is being constantly added to the fire, which is supplied with exactly as much air as is calculated to enable combustion to be carried on

in the most economical and effective manner. The result of this is, that not only is smoke prevented, but all waste of fuel is avoided, and an important saving in the quantity consumed is effected, in addition to which the finest dress can be burned with as much advantage as the coal of which it is the refuse. The apparatus can be applied to any kind of boiler, and to reverberatory furnaces of all descriptions. There are hundreds of these self-stokers at work throughout the midland and northern counties of England.

ST. CHAD'S COLLEGE, DENSTONE.

A MEETING has been held in the hall of St. Chad's College, or School, Denstone, of the friends of middle-class education. The gathering was summoned by the Rev. Canon Woodard, Provost of St. Nicholas's College, Lancing, in order that all interested in the education of the middle class should have an opportunity of seeing what has already been done in St. Chad's College, and what yet remains to be done, before the college can be opened. The company dined together at one o'clock in the great hall of the college, and afterwards, by the invitation of the Earl of Shrewsbury and Lady Shrewsbury, attended a garden party at Alton Towers. A view and plan of the school were given in the *Builder* of 29th June, and to the particulars therein given we may here refer. Denstone is in the very centre of the Midland districts of England. It is anticipated that this school at Denstone will before long be subordinate to some greater establishment, like Lancing, which will form a centre for the supply of the educational wants of the Midland counties. To this will be added a lower middle school, where boys will be boarded and educated for fourteen guineas a year. A middle school for girls must also be founded, similar to that at Bognor; and a large foundation has already been offered for each of these schools. These extended operations will entail colleges for the Midland counties in general relation with St. Nicholas's College, but otherwise independent of the Sussex schools. The works have been pushed on: the centre and one wing of the great quadrangle will soon be roofed in, and the head-master's house is in a forward state. It is hoped that in the course of another year such portions of the building will be complete as will enable the college to open with at least 200 boys.

The Bishop of Lincoln, in the course of a speech, announced that Sir T. Percival Heywood had subscribed 30,000*l.*, to found a chapel in Keble College, Oxford, and commended his example to other merchant princes in the district.

THE FATAL ACCIDENT AT HALIFAX.

THE INQUEST as to the cause of death in the accident, reported in our last, which occurred by the falling in of a portion of the flooring of the new part of the Bonding Warehouse in Gibbet-street, whereby two men were killed, and another severely injured, has been held.

After some evidence was heard, the jury retired to deliberate as to whether it was necessary to call further evidence, and after being in consultation for some time, the public were again admitted, when the foreman said the jury had decided not to call any scientific evidence as to the construction of the building; but there were one or two links in evidence that required clearing up. The first of these was when the deflection in the floor was first discovered; what means were taken to remedy it; and what precautions had been taken to protect those engaged in this remedy.

George Lister, employed at the bonding warehouse, said that when he was in the cellar on the 11th of July, there was no talk of there being any danger. He knew the foundation-stone was broken. The floor had been tested by the borough engineer, by placing heavy fine sets on it; and at that time the arch gave way. After that Mr. Henry and Mr. Thwaité ordered them not to place any goods upon that portion of the floor.

Mr. Peter Bovis, borough engineer, said that the testing by granite sets took place on the 11th of July. The weight of the test was about 25 tons, which was placed on the centre of one bay, between four columns, and over an area of 15 ft. by 9 ft. On the following morning one of the columns had sunk, and the floor had gone down in the centre. He saw no signs of any immediate further deflection. In the afternoon he saw one of the contractors, Mr. Denton (of the firm of Quarmbury & Denton), in whose hands the building was at that time. He pointed out to Mr. Denton the defective work found by the testing, and told them it arose from their defective workmanship. Denton replied that it was not the fault of the contractors at all, but that the stone at the base of the column was not big enough. Witness said that the contractors were responsible for the

damage that had arisen. Witness then waited a few days to see if the contractors intended to do anything. They did nothing, however, and on the 19th witness sent a man in with instructions to bare the top of the base of the column. This was done, and he found that the flange of the column was broken. He then gave instructions that the man should dig carefully down on each side of the stone, to see what was the matter with it. When this was done he found that the stone had split in two. Underneath the stone he found there was a space of 14 in. between the footings. That portion of the stone bearing the column was 2 in. lower than the other portion. He then wrote to Quarmbury & Denton, telling them of the state of matters, and requiring them as early as possible to remedy the defect of the foundation-stone, to build two brick pillars under the beam, and to relay the flagging over the arch. That letter was dated 30th of July, and to it he received a reply next day, in which they declined to do the work, as they considered the test excessive. On the 3rd of August, witness wrote again to Messrs. Denton & Quarmbury, informing them that, in accordance with their contract, he should employ other men to do the work, and deduct the amount from their account. Accordingly, he instructed his assistant, Mr. Richardson, to see Hancock about doing the work. Afterwards, in describing how the work was to be done, witness had ordered that the pillars should be erected before the foundation-stone was touched in any shape. In the way the work had been done it was absolutely necessary that the beam should be propped. He expected that those who undertook the work would have gone about it in a sensible and workmanlike manner. By the Jury: The reason why he tested the floors was because they were not done according to drawing or specifications. On the 16th of May, an interview took place between witness and the contractors, in consequence of the arches being built lower than the specification. The contractors said that arose from their joining having made a mistake in constructing the centres; and they agreed that the arches should stand a week, and then be tested, and that if they stood the test, the engineer should waive his right to have them rebuilt. Hence it was that the tests were applied.

Mr. Richardson, assistant borough engineer, corroborated this evidence. "The jury then retired, and after a deliberation of a little over half an hour they found as follows:—'We, the jurors, unanimously find that Samuel Thwaité and W. H. Halliday came to their deaths on the 6th day of August, by reason and in consequence of the fall, on the same day, of a portion of the floor of the Inland Bonding Warehouse, in Gibbet-street, in the township and borough of Halifax, which floor also formed underneath the arched roof cellar in the basement thereof; which floor and roof were supported by iron columns and girders; and we do unanimously find that the said floor and roof fell in consequence of the giving way of the foundation stone of one of the iron columns, and the fall of the same, and the iron girders resting thereon. That the immediate farther subsidence of the foundation stone was caused by the incursions digging on the westerly side of and removing the flag as an soil close to the said foundation, thereby giving it room to force itself and the column from their proper and erect position; and the jury is further unanimously of opinion that due precautions were not taken previously to the commencement of so important and dangerous an operation, by the proper supporting of the said roof and floor by means of props and timber, or otherwise.'"

The inquest, which commenced at ten in the morning, did not conclude until half-past nine at night.

SLAUGHTER-HOUSES IN THE METROPOLIS.

THE medical officer of health for Whitechapel, Mr. John Liddle, draws attention in his last report, just now issued, to the provisions of the Building Act of 1844, which makes it unlawful, after the lapse of thirty years from that date, to slaughter cattle in any building or vault, or in the open air, at a less distance than 40 ft. from a public way, or than 50 ft. from a domestic dwelling, and to the endeavor that was made to repeal this by the introduction of a Bill to amend that Act, so far as it relates to the slaughtering of cattle and sheep, and to render permissible the slaughtering of cattle in butchers' private slaughter-houses. The following reasons Mr. Liddle gives, why the provisions of the Act of 1844, relating to slaughter-houses, should be continued:—

1. Because slaughter-houses as now conducted are nuisances, and injurious to health, and although, theoretically, they may be kept as clean as any private wash-house, it would be found impracticable to do so; and it would be impossible to enact a law which should compel the owner of a slaughter-house to prevent offensive smells from issuing from his premises.
2. Because private slaughter-houses afford facilities for the slaughtering of diseased animals, and enable the owners of such diseased animals readily to dispose of the unwholesome meat. The improper use which is made of private slaughter-houses was pointed out in my quarterly report for December, 1869.
3. Because the driving of cattle through the crowded streets of London is not only a great annoyance to the inhabitants, but is a source of danger to life and limb.
4. Because the erection of a sufficient number of well-ventilated public slaughter-houses in suitable places, within reasonable distances from the centre of the metropolis, would be highly advantageous to the whole population, inasmuch as the animals intended for slaughter would be

inspected by qualified officers; and if found to be diseased, proper steps would be promptly taken to prevent the use of such meat for human food.

5. Because the flesh of the animals slaughtered in airy and well-ventilated public slaughter-houses, and under proper inspection, will keep longer in a fresh state than when animals are slaughtered in some of the ill-ventilated slaughter-houses in London.

If the City of Glasgow, with a population of 500,000, has thought it expedient, as a means of improving the public health, to prohibit the use of private slaughter-houses, and has erected three public slaughter-houses for the use of the butchers, it is surely quite possible, with the same object in view, for the local authorities in London to erect a sufficient number of public slaughter-houses for the slaughtering of all the cattle which are required for the use of the inhabitants of this vast city.

In the reign of Henry VII. a petition was presented to Parliament by the parishioners of the parish of St. Faith and St. Gregory, in London, setting forth that they had been greatly annoyed and distressed by the corrupt airs engendered in the said parishes by occasion of blood and other foul things by reason of the slaughter of beasts.

In consequence of this petition it was enacted, Anno Quarto Henrici VII. cap. iii. that no butcher or his servant should slay any beast within the walls of London. It was also enacted that half the penalty for committing the offence should go to the king, and the other half to every one of the king's lieges that would sue for the same by action of dcht."

SOFT FELTED FABRICS OF PAPER.

AMONGST the novelties of the International Exhibition at South Kensington, not the least remarkable are the new patent felted papers of Messrs. Pavy, Preto, & Co. All the windows and doors of the Exhibition are fitted up with curtains of this new material, into which a certain quantity of animal fibre has been felted, and which is said to give a remarkable toughness to the fabric, without any very great addition to the cost. Curtains, blinds, and bed-furniture, of various patterns, are produced at very low prices; and it is fully expected that the new material will replace leather in the covering of chairs, binding of books, &c. The feature to which special attention is drawn is its superiority over cotton and woollen materials for the curtains of sick-rooms. It is non-absorbent, easily brushed, and not likely to retain contagion.

Paper seems destined to vex the tailors and linendrapers, unless they take to it kindly themselves, and share the profits with the stationers. A paper suit of clothes for 2*s.* is the latest novelty, and it hails from New York. The tailors have not introduced it; but the drapers are selling the articles, which are of Japanese make. These paper dresses are said to be as tough as leather, and as pliant as linen. Rain will not reduce them to a pulp. Perhaps they will even wash.

SCHOOL BOARDS.

London.—It has finally been resolved by the Metropolitan Board of Works to lend the London School Board, 40,000*l.*, to be expended in the erection of permanent offices. In reference to the competition for the Board offices, the committee selected four architects to compete, and it was thought only fair that the unsuccessful competitors should be paid for preparing the plans to the extent of twenty-five guineas each, whilst the successful one would have charge of the building. As to the arrangement of the building the committee stated they would be glad of any suggestions by members before the specifications were sent out.

Ross.—The Educational Department will be ready to sanction schools for 120 boys, 120 girls, and 180 infants, arranged in accordance with instructions referred to. Mr. Pearson has been instructed to prepare plans and specifications for the erection of new schools; also of boundary walls, and the levelling of the Henry-street site. The building to be of native stone, and the proportions according to the letter received from the Education Department, and the resolution passed by the Board.

Batley.—The designs committee have drawn up a series of instructions to architects competing for the premiums offered for the best

designs for a school to be erected at Purlwell, to accommodate 700 children—300 boys, 250 girls, and 150 infants. One of the conditions is that the total cost, exclusive of boundary walls and internal fittings, is not to exceed 5,000l.

THE THUNDERSTORMS.

THESE storms have not yet ceased, but they seem to be on the wane. Their history during the last eight days resembles that of the week previous, but not quite to the same extent, although houses and persons, cattle, and so on, have been struck on many occasions. A curious mischance occurred at Forres, in the north of Scot. land. One of the chambers of the North of Scotland Chemical Works was struck by lightning, and destroyed. It was 8 ft. 6 in. in length, 16 ft. in width, and 16 ft. in height, and was built of thick sheet lead. It contained 70 tons of sulphuric acid, which, when the collapse took place, flooded the works and escaped. The loss is estimated at 1,000l.

In our last, we spoke of the storms of 1868 which preceded the great earthquake. It so happens that since our last a small earthquake has occurred in Scotland. The locality (Bridge of Allan) is one where a similar shock occurred in 1839, when the shock passed from Lisbon, through France and Great Britain, to the north-west of Scotland.

Now Lisbon, on the west coast of Europe, is where a great earthquake once occurred, and we know that in the case of the American coasts it is where great earthquakes have heretofore occurred that earthquakes seem to be liable to occur again, and that the great earthquake of 1868 happened. There has also been a recent earthquake in Algeria, near the Portuguese and Spanish peninsula; Antioch, not far off, has been half destroyed by earthquakes; and although there may be no greater earthquake anywhere this year than has already happened, the coincidence is curious; and, at all events, these physical and electrical commotions appear to be all connected in one way or another.

THE WORCESTER GUILDHALL QUESTION.

At a recent meeting of the Worcester Town Council, the report of the Survey, Building, and Property Committee, as to the Guildhall plans, was formally received.

Mr. Grainger said the question now occupying the attention of the council was one of the most important they had had to deal with for a long time. The plans signed *Fiat Justitia* and *Bahalun* appeared to be the best; but the council were left in the dark as to the cost of carrying out the buildings according to these plans. It might cost from 40,000l. to 50,000l. He thought the wisest course the council could take would be to defer the discussion of the subject for three months, and to instruct the committee either to advertise for further plans (no, no) or seek further information from those who had not afforded sufficient particulars respecting the plans sent in.

Mr. Smith said the estimate of cost of the building to which *Bahalun's* plans referred was 18,000l.; that of *Fiat Justitia*, 17,500l.

Mr. Lovey suggested that the question should be referred back to the committee for final settlement, and that they should have power to call in professional assistance if necessary. Supposing they took this course, and the committee found, when they had investigated the plans, that the expense of carrying them out would exceed the estimate of 18,000l., it would become a question whether the person sending in such a plan should receive the premium.

After some further discussion, Mr. F. Woodward submitted a proposition to the effect that the Survey Committee be instructed to employ a competent surveyor to assist them in their decision as to the best plan, and report thereon to the council. It was, however, ultimately moved by Mr. Lovey, seconded by Mr. Bozward, and carried, Mr. Woodward only dissenting, "that the plans be referred to the Survey, Buildings, and Property Committee, with instructions to select those they recommend to the council as entitled to the premiums offered by the instructions to architects."

At a subsequent period of the meeting, Mr. Airey presented a memorial from a public meeting held recently against the proposed rebuilding or reconstruction of the guildhall, and recommending the necessary repairs to be

effected. This memorial was received, and pursuant to notice, Mr. Airey then moved—

"That the memorial now read be received, and in complying with the prayer thereof, the Council instruct the Survey, Buildings, and Property Committee not to take any further steps at present for the re-building or reconstruction of the guildhall, but that they proceed to ascertain what repairs are necessary with a view to the same being executed with all convenient despatch, and report the result of such investigation to the next meeting of the Council."

At the close of another discussion, Mr. Airey replied on the whole question, and the vote was then taken, the names being recorded. There were against the amendment, 24; for, 5. The motion was therefore declared lost.

ARCHITECTURAL ASSOCIATION EXCURSIONS.

THE Northamptonshire excursion, under the guidance of Mr. Edmund Sharpe, will start from the 19th inst. to the 24th, on the former of which dates the party will leave the King's-cross Station, London, by the 7-50 train, and will arrive at Peterborough at 10.16; thence they will proceed by the Midland Railway, leaving Peterborough at 10.32, and arriving at Stamford at 10.52 a.m. The dinner will take place at the George Hotel, Stamford, where Mr. Sharpe will deliver an address. From eight to eleven buildings will be visited each day. The final dinner will take place at Northampton.

THE PRE-HISTORIC REMAINS ON ROMBALD'S MOOR.

THE members of the Leeds Naturalists' Field Club and Scientific Association have walked over Rombold's Moor* from Saltaire to Ilkley, under the guidance of Mr. John Holmes, of Methley, for the purpose of examining the rock markings and primitive structures discovered there.

On the top of the hill over Shipley Glen they found the first specimen, consisting of a circular elevation, along the inner and outer edge of which were placed, at intervals, slabs of grit-stone, set on edge. Between these two circles there was a sort of irregular pavement, made up of small fragments of the same kind of stone. Mr. Holmes pointed out the chief features of this circle, and called attention to many pieces of rock whose smoothly-planned surfaces indicated unmistakably the former presence of glaciers. The party passed through the village of Ilkley; and near the "Shooting-Box" a well-defined circular elevation, eleven or twelve yards in diameter, with a single row of stones, was come upon. Mr. Holmes explained that structures of the same kind had been found in Algeria, in Denmark, Sweden, and even in India; and Mr. Teesdale stated that he had often seen such circles in India, as well as in Palestine; but that there they were in a more perfect condition. Mr. Holmes further stated that they were supposed to have been erected by the Taramians, and exhibited a "flint flake," found in the circle under inspection, as confirmatory of such a supposition.

At that part of the moor which is immediately above Ilkley, circles of stones, more or less complete, were seen in abundance, many of them being of very large dimensions, and in some cases enclosing smaller ones. Other lines of stones there were in which curvature was scarcely, if at all, evident. Many of the circles contained a large boulder in the centre, and on the upper surface of this were ring and cup marks. In two or three instances some of the party cleared away the soil from the top of large boulders, and unearthed fine specimens. In some cases, as elsewhere, there was only a cup visible; in others, the cups were surrounded by one, two, or three rings. The abundance of these cup and ring marks was astonishing.

IRON AND THE IRONWORKS OF ROMAN BRITAIN.

FOR countless ages before iron came into the humblest use, mankind had passed through the toilsome periods of stone or flint cutlery; then of copper, pure, soft, and well-nigh useless, till, at a later time, hardened by tin, which the commercial enterprise of the Phœnicians transferred from Cornwall to Sinai.

* The western moorlands of Yorkshire are a part of that long range of mountains—the Pennine chain,—which stretch north from Stafford to Scotland.
† From a paper by Mr. Grover. Read at meeting of British Archaeological Association, at Wolverhampton.

In the comparatively civilised days when the Grecian chiefs wasted ten years in wrangling round the walls of Troy, bronze was the metal used for their offensive and defensive armour; and Pliny, in his *Natural History*, tells us that, by an express stipulation, the Roman people agreed with Porsenna that they should only use iron for implements of agriculture. This was about 400 years before the Christian era, and for nearly 300 years more they continued to use bronze weapons, with which they encountered Hannibal, in the second Punic war.

Yet we have allusion in the Scriptures to the somewhat extensive use of iron in the times of Moses; and we all remember that the great king of Basan, Og, boasted an iron bedstead, although we do not know what resemblance that article of furniture would have to the present Birmingham make.

Sisera, too, had 900 chariots of iron, which indicates an extensive iron rolling stock in his time, which was 1,300 years before the Christian era.

But as we pass further west, into the land of the Gauls and Britons, we find bronze weapons in almost universal use at the period of the Christian era.

From these dates we are enabled, in some measure, to note the high progress of civilisation which the nations of ancient Syria had attained at a very early period, as compared with that of the West of Europe. When Cæsar landed here, he found a limited use of native iron amongst the natives, as he states, in rings for money; but he must have been in some error here, for gold and silver coinage existed to a large extent in Britain before his arrival.

The tardy introduction of iron into the West can only be ascribed to the difficulties involved in generating the high heat required to smelt it.

The most productive method which appears to have been employed was to construct a small air "bloomery," or blast furnace, or chimney, of clay, in which alternate layers of ironstone and charcoal were placed, and through the bottom of which funnel-shaped holes entered from the side. This primeval structure stood on the top of high ground, and when the wind blew, a species of feeble blast was obtained, and the ore was sufficiently reduced to be capable of manipulation between heavy stones.

I need not state that this was a "cold blast" process, and I cannot find that the idea of a "hot blast" seems ever to have entered into the head of the primitive ironmaster. Yet we do find a rough conception of it in the furnaces of the ancient Persians for smelting silver, who employed furnaces such as those described, but with the addition of stone hearths outside the air-hole, on which burning charcoal was laid to heat the air before it entered the furnace: this is "hot blast."

The next improvement in the iron make, appears to have been the employment of bellows for creating an artificial blast: these seem to have originated in Central Asia, and consisted of goat-skins, worked by a woman or a boy, probably by the feet. This was a great step in the right direction. Those amongst us who take an interest in the iron trade, no doubt have read of a number of experiments conducted by Mr. Cramp-ton, of Woolwich Arsenal, on the proposed employment of coal-dust in reverberatory furnaces, yet we find that in India the charcoal used was frequently ground into dust, also the furnaces were charged from the top as the Staffordshire blast furnaces are now-a-days.

The iron masters of Roman Britain, appear to have worked on a very extensive scale, and seem to have made use of water-power for driving their blast or bellows; for the most extensive remains of cinder-heaps are generally found by the side of streams in Britain, and both in Sussex and in the Forest of Dean remains are found of ancient tanks in such situations as to point directly to their use as reservoirs of motive power. But the most remarkable invention for producing "blast" discovered in Roman Britain was found at Lanchester, the Ancient Epiacum, in Durlam, where extensive ironworks existed, and where, no doubt, the arms of the two legions on the wall were fabricated and repaired.

Dr. Bruce, describing the spot, says—"The method of producing the blast necessary to swell the metal was made apparent. Two tunnels had been formed in the side of a hill, they were wide at one extremity, but tapered off to a narrow bore at the other where they met in a point. The mouths of the channels, opened towards the west, from which quarter

a prevalent wind blows in this valley, and sometimes with great violence,—the blast received by them would, when the wind was high, be poured with considerable force and effect upon smelting furnaces at the extremity of the tunnels."

Now without venturing to approach technical ground too closely, I must ask you to follow me to its confines a little, while I endeavour to explain the leading changes which occurred in the iron make in consequence of the forms of the furnaces.

First, we have the "air bloomery," or air furnace of the high hill, driven by the wind, as it passed through little conical holes in the sides. This must have been a painful slow and fickle process, and the ore would become de-oxidised, and by long-continued low heat a "cementation" of the metal would take place. There would be no fusing, no melting of the ore, no cozing metal, or liquification as we get from our blast-furnaces, but the product would be a glowing mass of imperfectly malleable or wrought iron, mixed withinders, dirt, and un-reduced oxide. This lump would be drawn out of the top of the furnace, and put under heavy tilt-hammers, driven by water or animal power. At each successive blow the glowing mass would acquire purity as sparks flew from it. The Roman forgerman would keep on turning it round, and over and over, till at last a "bloom," or block of wrought iron would result.

The first great improvement in this process would be the addition of artificial blast in bellows. This was the furnace of Roman Britain, and would be called a "blast bloomery," in contradistinction to the air bloomery, which probably preceded the Roman times here.

The application of blast would offer great advantages—it would obviate the necessity of an elevated site, and render the whole process more equable and certain. Yet, although the method of reduction would remain the same, the result would be very different; for if the blast was strong enough the iron would be melted, and partial carbonisation taking place, a sort of Bessemer steel would result, totally useless to the Roman smith, as he could not forge it.

So it became necessary to invent another process—a primitive refining. The metal was sheathed with plenty of charcoal, and the bellows-pipe, being removed from the bottom of the furnace, would be put on the top, and direct the blast over the surface, charcoal being also at on from time to time till it was all burnt out, and the iron became tough and malleable. It is possible that the entire operation was conducted in the Catalan forge, in one heat or at one operation, and all conducted in one little furnace, i.e., the "blast bloomery."

I shall perhaps be travelling out of the subject if I give any more processes, for to this day only had the iron manufacture reached amongst the ironmasters of Roman Britain; yet the word on the subsequent great invention of cast-iron, which forms the staple of our modern industry, and which the Romans had not reached except perhaps incidentally.

The modern "blast furnace," such as we see in this Black Country, which turns out its many hundred tons of "cast-iron" or "pigs" a week, and sends flames and smoke to heaven, like some angry volcano in its wrath, is but the man full-grown from the child, the "blast bloomery."

As demand increased, the little bloomery raxed higher and higher, from the infantine 6 ft. or 4 ft. of the third and fourth century of Roman days, to (curious coincidence) 15 ft. or 16 ft. high in the sixteenth century. This is the sychod of the blast-furnace; but now we see it 40 ft. high, and even more, in his swarthy side of giant manhood.

His increased height, however, had caused a great change in his capabilities, and the result most surprising. As the ore descended from the top through a longer length, its contact with the charcoal would be prolonged, and a higher rate of carbonation ensuing, the product would be "cast iron."

This new era in Iron's story is supposed to date from the latter half of the sixteenth century. Mr. Mushet endeavours to fix the date of the first blast-furnace in the Forest of Dean at D. 1550, but he never saw a casting older than 20. The progress then became rapid; for in the seventeenth century iron was exported from England.

Mr. Grover next showed that, although the Romans had mineral coal at nearly all their stations, and it was not unfrequently met with

in their villas in Britain, yet only charcoal was used in smelting. In the Roman villas in Britain vast quantities of iron were used, much more than in an English modern house of similar dimensions. The number and variety of iron keys were truly surprising, and gave one an astonishing insight into the elaborate domestic economy and housekeeping arts of our early conquerors here. Chests, caskets, cupboards, pantries, sideboards, and dressers, though long perished, were indicated by their locks and keys, and must have been a goodly array. Besides, they found door-keys and locks, and bolts and hinges, and what was more curious, lifting-latch keys, such as were now used by late hacchlores in London houses. Then there were padlocks and cylindrical locks, and keys attached to rings to wear on the finger, though these were generally of bronze. Fire-dogs, of handsome make, in iron had been found, showing that fire-places had been partially in use in some of the apartments. In addition to the articles already named they found numerous hunting weapons, knives, scissors, and nails of all variety of sizes, not only for building purposes, but for the soles of the sandals of Roman farmers. At Ohedworth Villa, two large masses or blooms of iron were found, evidently brought to the villa to be worked up, and this was, perhaps, the explanation of the quantity of iron generally found. A resident smith was employed in the villa. He was always at it, and when the repairs of locks, keys, and farming implements did not keep him going, he no doubt employed his time in working out some of the little ingenious iron devices in rings and keys. The chief locations of the iron industry in Roman Britain were in Sussex, in the vast forests of Anderida, as the locality was then called, and the Forest of Dean. Pits from which the ore had been extracted were found in Sussex, together with great heaps of cinders, accompanied with Roman pottery and coins; but it was on the banks of the Wye that the most workings existed. Indeed, that district must have been the primeval "Black Country"—the dark, rich, centre of smoke, noise, and industry. For many miles together the ground was formed of a continuous bed of iron cinder. About Month and Ross must have been the Dudley and Birmingham of Roman Britain. The cinders contained of them 40 per cent of metal, and throughout the last 300 years numerous blast-furnaces in the Forest of Dean had been supplied solely with Roman scoria.

PRESTWICH UNION WORKHOUSE.

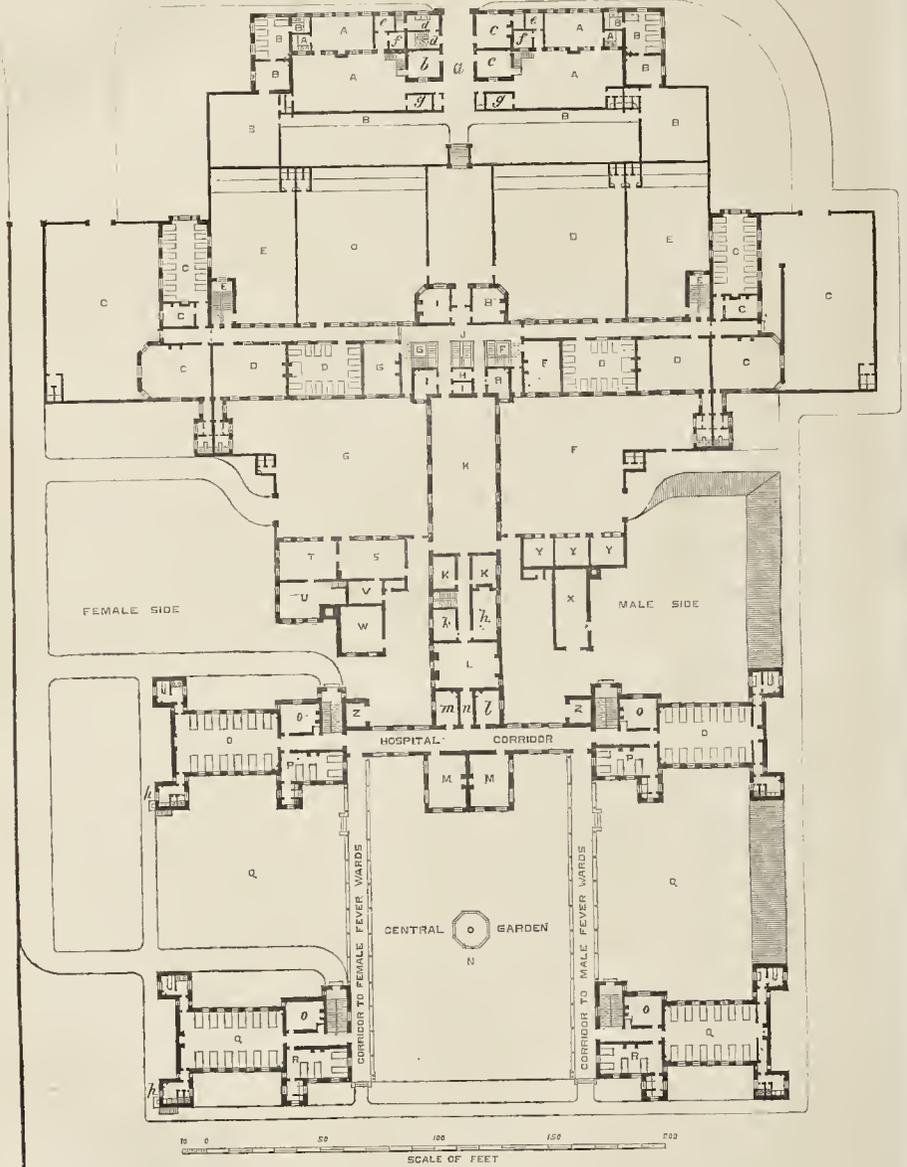

A NEW workhouse has recently been erected near Manchester for the guardians of the Prestwich Union. The site, which is approached by a road leading from Crumpsall-green to Blackley, forms a part of the Bongs estate, on another portion of which stands the new workhouse belonging to the township of Manchester, so that the property of the Prestwich Board of Guardians is immediately contiguous to that of the Manchester board, and separated by a boundary wall, erected at the joint expense of the two boards. The site of the proposed building being of a very irregular and uneven shape, has involved a great deal of levelling, and a portion of the ground being very hilly, there has necessarily been a considerable amount of excavation. Portions of the building are erected in a valley down to which the ground has been levelled. The approach road, passing through the grounds, sweeps up to the main entrance, passing on the right the farm belonging to the Manchester guardians. The main entrance is in the form of an arched gateway, on the right of which is the porter's lodge, and on the opposite side is his residence. On the first floor are committee and clerks' rooms, adjoining which is a reception-room for the accommodation of persons having business with the committee or clerk. Passages to the right and left lead to the probationers' ward, with fumigatories, clothing stores for male and female inmates, together with the usual lavatories, &c. Behind these are wards in which patients suffering from skin disease will be required to remain a certain time before being passed into the house. Passing up the central avenue, we come to a flight of steps leading to an elevated platform in front of the main building, which will serve as an airing-ground for the use of the aged and infirm of both sexes, as well as the harmless insane.

Entering the main building are the master's and matron's parlours, which occupy the central

front, the windows of their rooms commanding a view of the front part of the building and airing-ground. A central staircase, exclusively for the use of the officers, leads to the master's and matron's bedrooms, which are placed above their sitting-rooms. On the right and left of the central staircase are large stone staircases for the use of the male and female inmates, and adjoining these are wards for the able-bodied, whose sleeping-rooms occupy a corresponding position on the floor above. There are offices for the master and matron situated behind the main staircase, with projecting windows overlooking the rooms occupied by the able-bodied behind, and so arranged (by a small window looking into the dining-hall on each side) as to give the principal officers in charge a thorough inspection of the whole building. The able-bodied, in passing from the day-room to their separate wards, have to pass by the doors of these offices, thus again bringing them under the supervision of the master and matron. There is a door of separation right and left of the principal staircase for the aged and infirm, whose day-rooms and sleeping-rooms are placed side by side on the same level on each floor. The advantage of this arrangement is that probably more than half of this class who could not dine in the general dining-room may live entirely on the ground floor, whilst the more aged and infirm can live on the same level upstairs. The second door of separation at the further end of this passage leads to the wards appropriated to the epileptic inmates on the ground floor, and those for the harmless insane on the floor above. The room for the attendant is placed so that he can conveniently inspect from his window all the dormitories. Special care has been exercised in the arrangement of the water-closets, lavatories, &c., which are divided by a short ventilated passage from the ward itself, so as to admit of a thorough draught of air through the whole. Projecting behind the main building is the dining-hall, with the chapel above, the entrances to which are so arranged as to bring each person under the eye of the master or matron when passing into either of the above-named places. Provision is made for seating about 200 at meals, and this number might be increased if necessary. The kitchen, pantry, bread-store, and other necessary departments are placed behind, and are easy of access to the dining-hall, on the one hand, and to the hospital buildings on the other, the latter being situated in a group at the back. There is a workshop on the men's side, with boiler-house, stabling, cart-shed, and coal-shed. On the female side are washhouses, laundry, foul linen-shoot, butchery, coal-shed, &c. At the rear of the domestic offices is a cross corridor, separating the main building from the hospital buildings, which are so placed as to be completely detached from the general workhouse. The hospitals are built on the pavilion principle, there being four pavilions, containing male and female wards, easily accessible to the domestic offices and the surgery. Immediately in front of the kitchen and domestic offices is the convalescent day-room for inmates of both sexes. The wards are two stories high, and have each of them a small scullery, and sleeping-room for the nurse or ward attendant. Each hospital has a hoist, dust-shoot, water-closets, bath-rooms, and lavatories, arranged on a similar principle to those already referred to. Over each water-closet and bath-room is a tank for storing water.

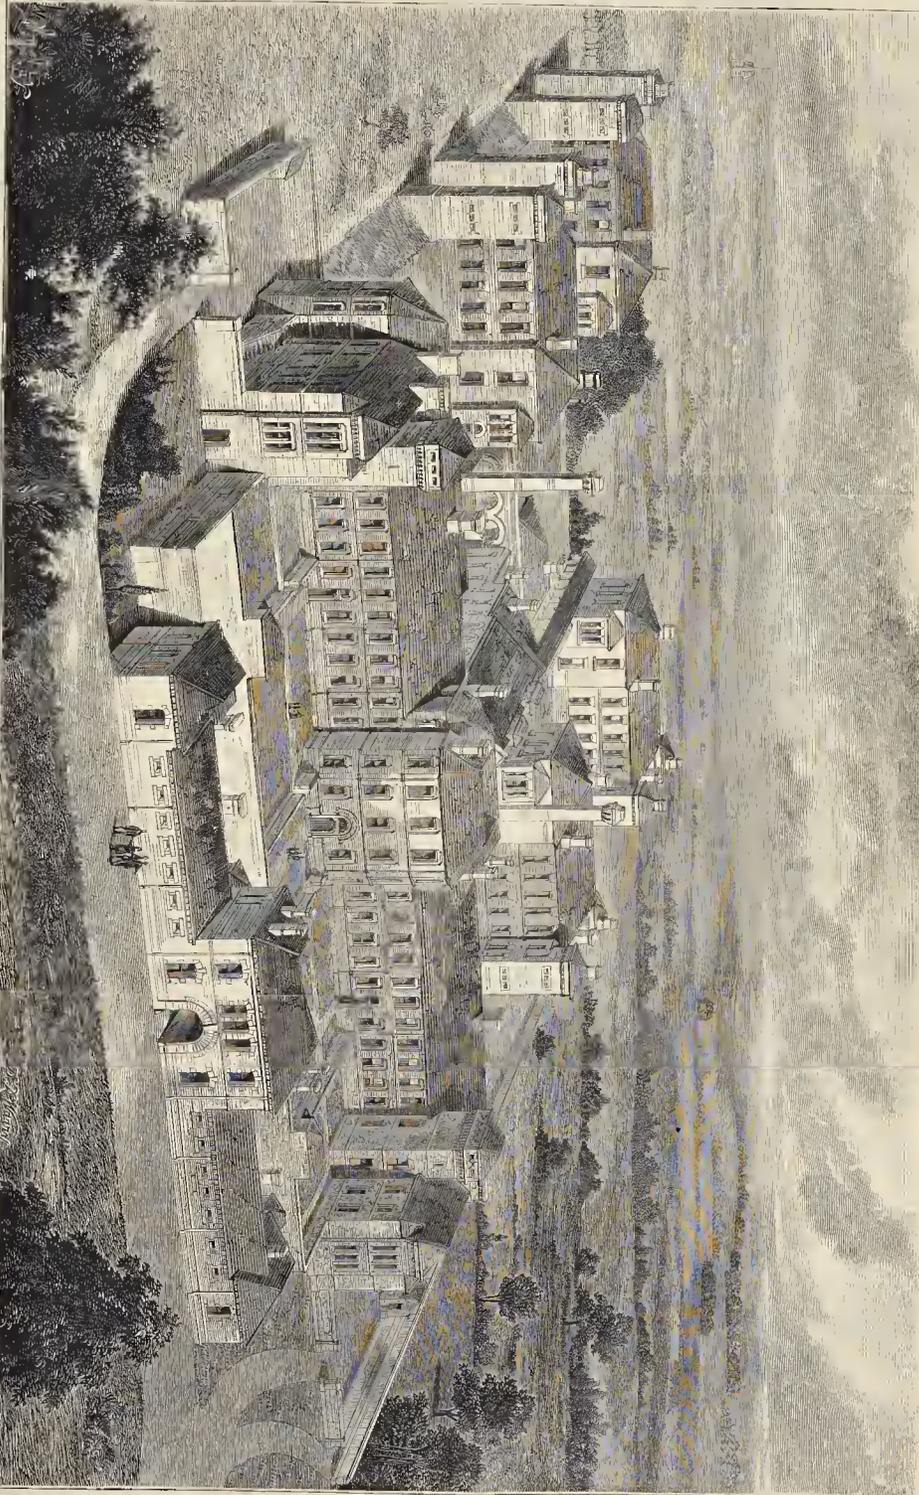

One great object of the architect has been to centralise the administrative department as far as practicable, so as to admit of distribution of food, and facility of supervision to those in charge. Another, and perhaps the principal object, has been to give a liberal allowance of cubical air-space, together with sufficient light and ventilation. As one means of accomplishing this, the pavilion principle has, to some extent, been carried out in the arrangements of the main building, or workhouse proper, in which the long, dark, and ill-ventilated passages usually found in such buildings have been substituted by light, airy corridors. Utility rather than appearance having been the aim of the guardians, the building is very simple in design.

The architect of the building was Mr. Thos. Worthington, of Manchester; and the general contract was let to Messrs. R. Neill & Sons, for 21,775l. The foundations formed a separate contract, for 3,250l.; and the cost of fittings, land and purchasing, commission to architect and surveyor, road-making, &c., increased the total amount to 37,775l.

PRESWICHE UNION WORKHOUSE, NEAR MANCHESTER.—MR. THOMAS WORTHINGTON, ARCHITECT.

ACCIDENTS.

St. Alban's Abbey.—An accident has occurred at St. Alban's Abbey, which is now in process of restoration, under the superintendence of Sir George Gilbert Scott. The great central tower has been shored up and strengthened, and the workmen are pointing the stonework of the exterior, for which several heights of scaffolding have been erected; and while the men were at work on the uppermost scaffolding a portion of it gave way, and four of them fell on to the roof of the nave of the abbey, between 40 ft. and 50 ft. One was severely injured in the pine, in addition to being much bruised. The other men were also much bruised and shaken.

The Wakefield and Barnsley Canal.—The commencement of this canal at Old Mill, near Barnsley, has given way, owing to the water getting through the bottom of the sides. The water flowed into the fields adjoining, and it had to be cut out for some distance, in order that the leakage might be repaired.

Dewsbury.—Some foot-passengers at Thornhill were observed a large crack in a new grocery establishment opened about a month since, and they gave the alarm. The family promptly left the place. They had hardly got into the street when the whole of the building came down. The lock-in-trade and the furniture were destroyed, and the building was rendered uninhabitable. It is supposed that the foundations had been badly constructed, and that an excavation made near caused the building to give way.

Oldham.—A fire has occurred at the mill of Messrs. Ogden, cotton manufacturers, near Oldham. The damage is estimated at 30,000*l.* Forty thousand spindles were destroyed. A weaving-shed and warehouse were saved by the women. The fire is supposed to have originated by the friction of the machinery.

CHURCH OF ST. JOHN THE BAPTIST, ISLINGTON.

This church, which stands at the meeting-point of Cleveland-road and Almorah-road, Bowham-road, was consecrated by the Lord Bishop of London on the 6th of August. The church consists of nave, aisles, chancel, chancel screen (comprising organ-chamber on the south side and vestry on the north), with bell-cotting above the chancel arch. There are three arches, one to the vestry, and one to each of the aisles. The style is Early Decorated, and the building is erected of brick, with stone dressings, and tracery. The interior is of brick, paneled with coloured work, with bands and ribs. The chancel is a semi-octagon, with north and south arcades to the vestry and organ-chamber. The nave is separated from the aisles by five bays, having stone shafts and capitals, and bays, and stone arches. The whole has been erected under the superintendence of the architect, Mr. Wm. Wigginton, save the temporary font, which was a gift. The whole cost, including fencing and lighting, will be under 6,000*l.*, and the accommodation is for between 600 and 800. Mr. Heath, of Hornsey-road, is the contractor. A bad foundation and an awkward site increased the architect's difficulties.

REIGATE.

Sir,—Permit me, as a Burgess of the borough of Reigate, and a resident there for more than thirty years, to thank you most heartily for your article in the *Builder* of the 10th inst. Several of your remarks are, they are but too well deserved. It is useless for any individual to call the attention of the authorities to the state of things; but I imagine, however much they may chafe under the strictures of the *Builder*, they will find they will be obliged to do "over on" now that your eye is upon them. I do not know, sir, of a more sickening punishment that I could give you than to make you out at the reports of the meetings of the Local Board for three or four years past. You are doubtless aware that Reigate is a rough that some time since was very properly franchised for its corruption, and those who are powerful under that régime still have great influence in the place, though time will bring in a better class of men, and after a while, I believe, greatly change matters. Unfortunately, present, few of those who are most fitted for serving in public offices will accept office. I am writing more particularly to the Western

Ward, not because they are insensible to their duties as citizens, but because of the strong personality which characterises the proceedings in all municipal matters.

The speculative builder has been allowed to do almost as he likes here, and the consequence is that in spite of stringent by-laws houses have been put up, both large and small, that are a disgrace to the place.

The purchase of a gold chain for the mayor, an address to the Prince of Wales, a squabble between two members of the council, bearding the mayor, or, indeed, any of "the little things that are only big to little men," get plenty of attention; but such a thing as a thoroughly satisfactory inspection of the sanitary arrangements of the houses in the place is out of the question, for who knows but that the first offender might be one of their own council? Heaven forbid that they who make the by-laws should be amenable to them. Under the Public Health Act I trust there will be a means of calling Government attention speedily to the shortcomings of local Boards.

I trust "Gargyle" will find an opportunity of visiting us again soon, and be able to report progress. I enclose my card.

SALUS POPULI.

THE DUBLIN TRAMWAYS COMPANY.

At the half-yearly meeting of this company on the 8th inst., a dividend was declared for the past six months at the rate of 10 per cent. per annum, a sum equal, with respect to the period during which the tramway had been opened, to a rate of upwards of 11 per cent. per annum. The report of the directors showed that the number of passengers carried from February to June inclusive reached 979,684, the receipts from which traffic amounted to 11,970*l.*, whilst unamortised accounts exhibited total receipts from all sources at 11,470*l.* working and other expenses leaving a balance of 4,571*l.* as net revenue available for division. The returns are the more satisfactory that up to June 7th only three miles were open, 2½ additional miles being at work from the 8th to the 30th of that month. That this extension will prove eminently profitable was shown by the increase of receipts from 2,681*l.* in May to 3,388*l.* in June. A statement made by the chairman disclosed a further progressive addition to income, the passengers carried in July increasing by 108,563, giving receipts of 1,874*l.* The shareholders seem to have every reason to be gratified with the prospect before them.

NEW MANSION AT THANCKES, IN CORNWALL.

For the last eighteen months or more workmen have been erecting a mansion for Lord Graves, and the works are now so far complete that the family have taken possession. The building has been erected close to where the old house stood, and is situated about half a mile from Torpoint. It is built in the Tudor style, and has been designed by Mr. A. Norman, J.P. The southern aspect commands a fine prospect. The sky-line of the building is broken up by three gables, each surmounted by quaintly-carved animals and birds, which stand out conspicuously against the sky. The carriage-porch is at the south-western end, and from it rises a high tower, which forms a main feature in the general grouping of the building. Upon one angle of this tower is a turret, and upon the one immediately overlooking the drive is carved a life-size figure of a soldier, in the costume of the Tudor period. The billiard-room is semi-attached to the rest of the building, and is situated at the north-west angle. In shape it is octagonal, each cant terminating with a gable, and each gable surmounted by carved figures of birds, squirrels, &c. Over the entrance-porch of the carriage-way are carved spandrels, in which the national emblems are introduced,—the rose, shamrock, and thistle, twisted and entwined together with the oak. The materials used in the building are all of a comparatively local character. The walls are built of native limestone, and the various dressings are in Portland stone, the stone having been selected at the quarries. The hall is wide and spacious, and the upper rooms are reached by a massive staircase, lighted by a large stained-glass window. The contract was taken by Mr. Trevena, of Plymouth, builder. Mr. W. Trevena, jun., has represented his father upon the spot throughout. The carving has been executed by

Mr. Harry Hems, of Exeter, and by artists from his atelier, under the immediate superintendence of the architect. Mr. Norman has been engaged in making extensive additions to Anthony House, which is situated about a mile from Thanckes. The style of the main building is Classical, and in the design for the extensions the architect has maintained the same character. Mr. John Pothick has carried out the contract.

THE BRIDGE IN ST. JAMES'S PARK.

Sir,—As there are at the present time a number of improvements on hand in the metropolis, perhaps it will not be out of place to notice a want that has long been felt in St. James's Park.

It is utterly impossible for rowers, with comfort, to go under the present bridge, and consequently stooping becomes necessary. Many severe knocks and bruises have been experienced by persons who select the water for an amusement, not a few of which the writer has witnessed.

Could not the bridge be raised at least a foot higher? The expense would not be great, and the gradient would not be so high as to interfere with much of the present surrounding paths.

This would be a great boon to many amateurs who patronise the water. A BUILDER.

PORTLAND CEMENT STAIRS.

Sir,—With regard to the suitability of Portland cement for stairs, the following fact may be interesting to the readers of the *Builder*. Several flights of stone stairs in the Central Station of this town (Newcastle-on-Tyne), by continual traffic, were worn quite hollow in the centre and the nose worn off, consequently each step was dangerously narrow. This was entirely rectified in the following manner:—The stone of each step was chipped over its face and Portland cement applied in the hollow part, running off to nothing at the ends of the stone, and a nose of cement moulded on; these were supported by a block of wood for a couple of days, then cleared away, and now each step is like a solid piece of stone. R.

HOMOEOPATHIC TREATMENT.

Sir,—Some years ago I wrote to the *Builder* to observe that a certain church tower was out of the perpendicular. The churchwardens thereupon, instead of rebuilding the tower, or having recourse to any expensive engineering process, to rectify the deformity, built two adjuncts, which served an economic purpose, and concealed the defect. Now, as the said tower is built on a site intercepted by numerous spires, one of these is probably the cause of its leaning, and I cannot see a cheaper or more certain remedy than to let down the side from which the tower leans to the level of the other side, and this by means of an artificial water-course under the side to be lowered. Suppose the tower to lean towards the west.—Bore some distance from the north and south ends of the east side to a depth lower than the foundation; connect the shafts by a narrow water-channel through the soil, without pipes; pour water in one shaft, and pump it out from the opposite shaft. A settlement will take place too gradually to cause any fear of danger. Of course the tower must be iron-bound during the process. When the tower has levelled itself, in case the water-course is not compressed, and to prevent further sinking, pour in fluid cement or asphaltic to fill it up. WALTER SCARLELL.

"UNFAIR COMPETITIONS: BRIGHOUSE."

Sir,—I was greatly surprised on perusing the letter published in the *Builder* of the 27th ult. as if Mr. Payton challenges me to publish my name, and the authority for my statements, which with pleasure I hasten to do, at the same time taking the opportunity of replying to his far from gentlemanly effusion.

The information I acted upon appeared in the *Halifax Courier* of the 28th ult., under the head "Brighouse," and I still fail to see how the statement can be anything but correct, as each lowest tender for the various artificers' works was given separately, and the total of the sums (nigh 6,000*l.*) collectively.

With regard to the rival statements in the *Courier* and the *Brighouse News* respectively, I will merely state that the *Courier* is edited by the mayor of Halifax, and is considered one of the best weekly newspapers in Yorkshire.

I still consider that Mr. P. has not at all freed the Brighouse competition from the stigma of unfairness. Even if the statement in the *Courier* (which I forwarded for your perusal) is not correct, which I by no means admit, the fact of the lowest tenders, as per Mr. P.'s letter, being almost one-half more than they ought to have been (as I will shortly prove), in my opinion stamps the competition as unfair.

What would Messrs. G. & P. have said had the lowest tender for the Bradford Town hall been 69,000*l.*, instead of 40,000*l.*, the amount given as the limit. But "comparisons are odious."

Now to prove that the cost is nearly one-half more than the sum stated as being the limit, I Mr. P. will reproduce the copy of the instructions issued by the Brighouse Local Board, he will find that the 2,000*l.* were to include the boundary-walls; so that Messrs. G. & P.'s estimate was "1,000*l.*" in accordance with the requirements of the Board." Of course, I take no cognizance of the reductions

afterwards effected, which must have affected the design as a premeditated one.

Your readers may form some idea of the cost of erecting Messrs. G. & P.'s design when I state that in addition to the ordinary cemetery chapels (with tower and spire) mortuary chapels were attached, which were almost as large as the others, and that the entrance-judge was, if I remember rightly, two stories in height and with bay windows; entrance-gates and 100 yards of boundary-walling were also included. For my own part, and, I may add, in the opinion of competent builders also, the 6,000 named in my first letter was about the sum that would be required to erect the premeditated design in its entirety.

I emphatically deny Mr. P.'s insinuations that we were competitors in the competition referred to, and with regard to the affronts Mr. P. pleases to heap upon me I will say nothing, trusting he will have the good sense to apologise for them. As before, "I leave your readers to draw their own conclusions."
J. LEECHING.
Habitax.

REMOVAL OF DUST AND TRADE REFUSE.

At Lambeth Police-court, Mr. Ellison has given his decision in the case of Messrs. Chubb, the locksmiths, against the Vestry of Camberwell parish as to the removal of ashes, &c., from their premises. Mr. Goddard was counsel for Messrs. Chubb, and Mr. E. Clarke for the Vestry. Counsel referred to the case of "Lindon v. Stanbridge" (20 *Law Journal*, Exchequer Reports). Mr. Ellison, after a discussion on some evidence, gave his opinion on the question raised. It was whether the substances were trade refuse, or such as the parish was bound to remove. Of course dust and ashes, the produce of domestic purposes, should be removed, and that which was produced by the forges, &c., used in manufacturing purposes, was to be considered "trade refuse," and the parties themselves to have them removed. The two substances should be kept distinct. He considered that the case in the *Law Journal* supported the view of the case he had arrived at. It was arranged that a special case should be submitted to the Superior Court for decision.

ROYAL AGRICULTURAL SOCIETY: CARDIFF MEETING.

It seems fifty-six sets of plans and detailed estimates were sent in competition for two prizes of 20*l.* and 10*l.* for the first and second best design for a pair of agricultural labourers' cottages, the cost not to exceed 220*l.*; and two similar prizes for the first and second best design for a pair of miners' cottages, to form part of a row, no single cottage in which was to cost more than 90*l.* The three land surveyors who were appointed judges pronounced them all devoid of merit, so no prize was awarded. As each set of plans was accompanied by an entrance-fee of 10*s.*, the society appears to have adopted a smart way of strengthening their funds. A SUBSCRIBER.

PROTECTION OF IRON.

Sir,—I am strongly urged by your correspondent "H. J. P." to make a trial of Astbury's oxide of iron paint for the protection of all kinds of ironwork. It lasts longer than any other composition, and has a good appearance for years. I trust these lines will be service to the manufacturers of the article in question. M. A.

THE BURSING OF TURNMILL-STREET SEWER.

CLERKENWELL VESTRY v. METROPOLITAN RAILWAY COMPANY.

The action brought by the Clerkenwell Vestry against the Metropolitan Railway Company to recover the sum of 1,854*l.* damages and costs already awarded by arbitration for injury done to the Turnmill-street sewer, by the company's works, came on for hearing before Baron Martin and a special jury, at Guildford, and the whole proceeding seems to have been gone into again as if no arbiters' award had ever been made.

Among the witnesses were Mr. S. Bevan, Chief Surveyor of the Vestry, and Mr. C. H. Gregory, C.E., who stated that in their opinion the formation of the railway works preceded the failure of the sewer. Mr. Moreton, C.E., under whose superintendence the railway works were done, maintained the contrary, or, at least, that the damage was not caused by the cutting of the railway; and Mr. B. Baker, Chief Assistant Engineer to Mr. Fowler, corroborated this view. Baron Martin, in summing up, said: The arbitrators were appointed in this case to ascertain to what extent the plaintiffs were injured, or whether they had been injured at all. As they did not agree, Mr. Clutton was appointed as umpire. I do not know him, but I have understood that he is one of the most eminent men in the kingdom, who has been employed in these things for many years. Mr. Clutton, in this document, after stating the appointment of arbitrators on either side, and stating that he had taken the oath before a Justice of the Peace, makes an award of 1,854*l.* as the amount to be paid by the Metropolitan Railway for injuriously affecting, by the execution of their works, the sewer of the plaintiffs. So that there is Mr. Clutton making this award, after having viewed the premises and seen all the witnesses. Therefore, it is as plain as the sun at noonday, notwithstanding all that the counsel says, that he decided that the Company had done the damage. I believe there was a mistake in this Act of Parliament, which meant that the money should be paid as a consequence of the award being given; but the lawyers found out that it was necessary to bring an action to get at the money, and they, therefore, come here to deny the very thing that Mr. Clutton has affirmed. They fling the whole of that away, and try the case over again, and tell you you are to listen to nothing but the evidence given to-day. In the first place the plaintiffs call the surveyor, who must of course be prejudiced, but who gave his evidence very well. Then, however, they call Mr. Gregory, an independent man, and one of the most eminent men in the kingdom, who tells you that the injury was caused by the works. Whom does the other counsel call? He calls all the servants of the company, who are bound to come here and swear it was their fault. Mr. Clutton heard it all, and decided against them. I have nothing more to add, except

that it is most extraordinary after the taxed costs are fixed at 250*l.* on one side, when they must be just as much on the other side, and when the costs altogether cannot be less than 500*l.*, that you should be called upon to try the thing over again, and enable this railway company to keep the money still longer from these people.

The jury at once returned a verdict for the plaintiff for the full amount.

Mr. Day handed in a bill of exceptions to the judge's ruling.

HINTS HOW TO USE A GRINDSTONE.

Mr. T. E. MITCHELL, in the *Journal of the Franklin Institute*, says,—

- 1st. Do not waste the stone by running it in water; but if so, do not allow it to stand in water when not in use, as this will cause a soft place.
- 2nd. Wet the stone by dropping water on it from a pot suspended above the stone, and stop off the water when not in use.
- 3rd. Do not allow the stone to get out of order, but keep it perfectly round by the use of gaspipe, or a hack.
- 4th. Clean off all greasy tools before sharpening, as grease or oil destroys the grit.
- 5th. Observe—when you get a stone that suits your purpose, send a sample of the grit to the dealer to select by: a half-ounce sample is enough.

CHURCH-BUILDING NEWS.

March.—The new church of St. John, in the town of March, and Isle of Ely, has been consecrated by the bishop of the diocese. The new church constitutes another, although, as yet, small,—landmark in the wide expanse of the Fen country, and at the same time adds a useful ornament to the town of "the avenue of elms." Until recent years, the township of March was comprised, for ecclesiastical purposes, within the rectory of Doddington. The Church of St. John consists of nave, small side aisles, and chancel,—provision being made at the chancel end for organ and vestry. The style belongs to the early part of the fourteenth century. It has not been thought necessary at present to build a tower, but there is a small turret surrounded by a flèche or bell-tower. The walls consist of Ancaster stone, with Bath stone dressings, and the roof is covered with Colly Weston slates. The building is erected on a tolerably good foundation for the district, although a good deal of concrete had to be employed under the walls. There are four arches on either side of the nave, supported by stout stone pillars, with carved capitals; the chancel-arch resting on short marble columns, and stone coriols. The roof is an open one, with timbers stained and varnished, and the seats which are open, are made of pine, also stained and varnished. The main entrance is the porch at the west end of the south aisle, but there is also a smaller doorway at the extreme west end of the north aisle. The chancel is paved with Maw's tiles, by Mr. Simpson, of London; and the aisles are laid with black and red Staffordshire tiles. The three-light window at the east end awaits stained glass, in memory of the late Sir Algernon Peyton, bart. The work is being executed by Messrs. Clayton & Bell. At the west end there are two two-light windows, which (in common with those in the aisles) are at present filled with cathedral glass. There are stalls in the chancel for the choir; and the pulpit is made of alabaster, with open arches. The chancel is raised three steps from the centre aisle, and that part within the communion-rail is raised a similar distance from the chancel-floor. The stone carving throughout has been executed by Mr. Sanson, of London. The heating apparatus was supplied by Mr. Haylen, of Newbridge. The church, which will accommodate 400 persons, will cost above 5,000*l.* The architect is Mr. T. H. Wyatt, of London, president of the Royal Institute of Architects. The work has been carried out by Messrs. Holland & Hannen, builders, under the supervision of Mr. Fowles, as clerk of the works.

Charlton.—This is a hamlet in Fladbury, and forms part of the living of Crophorne. Mr. Workman has purchased and considerably improved the Charlton Estate. Casting about him for a suitable site for a new church (now open), it occurred to him that a spacious hamlet on the estate, which, from its substantial character and style of building, seemed almost originally to have been intended for both purposes, would form the nucleus of a church such as the village required; and thereupon, acting on his own ideas, he proceeded, with the aid of Mr. Forsyth, of Worcester, to convert the

building into a church. The work of conversion commenced early in September, 1870, and has been steadily proceeded with up to the present time, the builders being guided by neither plan nor estimate. The large doorways of the barn, which gave room for the entrance of the grain crops off the estate, have been built up with masonry, and the building "rounded church-like" by the insertion of windows of the fourteenth-century style. There are eight of these windows, principally single-light; but in the east window something more elaborate has been attempted. This window has three lights, with tracery heads, and is filled in with stained glass, the principal subjects being "The Ascension," "The Good Shepherd," and "Christ Blessing the Children." Over this window is a quatrefoil light, geometrically traced, filled in with stained glass, bearing the sacred emblems of the four Evangelists. The side chancel windows are also filled in with stained glass, and bear the figures of the Evangelists. The eight single-light windows are filled in with plain glass, with coloured bordering and centres for relief. The roofing of the barn was found to be in such a state of repair that little was required to be done to it. On the gables, however, of the building, floriated crosses have been erected, and there is a bell-turret, with bell. The church consists of nave and chancel. Entrance to the building is obtained by a porch at the west end, which is an addition to the old building, and is built of the same material as the old walls, with Bath stone coping and dressings. The arch of the porch is wrought with coloured and Bath stone alternately, and there are carved capitals on each side of the doorway. The inner doorway is of Bath stone. The interior of the building has an open-timbered roof,—the original roof of the old structure, which has been rendered more in character with its new purpose by small spandrels having been brought down on each side to carved stone corbels on to the principals, and the whole being stained and varnished. These corbels are all alike, with the exception of the two showing the limit of the nave, which are carved figures representing angels. The others are conventional subjects. The chancel is decorated with a border of ornament and devices, on each side of the east window being a vine, the rest of the wall being decorated with a pattern of fleur-de-lys. The splay of the windows are filled in with devices of roses, lotuses, and other flowers. The stalls, altar-rails, and sedilia are of pitch-pine, with black columns for relief, with carved patterns and angles. The altar-rail has iron standards, picked out with gold and colour, and the floor of the sacrum is laid with encaustic tiles, supplied from the works of Mr. Godwin, at Lugwardine. The floor of the porch and part of the nave are laid with a plainer pattern of tile. The west gallery is constructed of pitch-pine, with carved capitals and dark columns, corresponding with the stonework of the porch. The pulpit is of Caen stone. The building will seat about 250.

York.—Mr. Street, the architect who has charge of the restoration of the Minster in this city, has visited York, and inspected the progress of the works. It was originally thought that the roof of the south transept would have to be bodily raised by hydraulic power, and towards this end the shoring of the lower roof was finished some time since. The outer roof is now being stripped of the large Westmoreland slates with which it has hitherto been covered, and it is found to be in good condition. The object of raising the roof would have been to have drawn it in; but it is found that the hulging outward has been slight, and that, as a consequence, there is little to do in this respect. As soon as the whole of the slates are off, boarding of the roof will commence, in readiness for covering it over with lead. The two turrets at each side of the south entrance will be taken down, and substituted by wooden ones, to try the effect, before rebuilding them.

Ashbocking.—All Saints' Church, Ashbocking, which in part of the present fabric is of the twelfth century, has been recently under repair at parish cost, to save the walls from falling in. A desire is strongly felt to complete the restoration on a very simple scale under Mr. E. C. Hals will, who has undertaken it. The stonework of the window, &c., which is of the thirteenth century, is much decayed. There are also other details much needing immediate care. The works are in the hands of Mr. H. Luff, builder Ipswich.

Boldon.—The ancient parish church of Boldon near Sunderland, having become very dilapidated

During the past few years, a movement has been getting set on foot to restore the interior. The old church is generally supposed to have been erected about the eleventh century. The edifices in the Early English style, though much of the beauty and simplicity has been defaced by the process of repairing and furnishing pursued by the church authorities of last century. It is intended to remove these deformities, and to this end it has been determined to clear away the recent galleries, and substitute open seats for the present square pews. To effect these and other improvements which it is proposed to make, it is estimated that a sum of 1,000l. or 2,000l. will be required.

Mortomley.—The Parkin Jeffcock Memorial church, at Mortomley, has been consecrated by the Archbishop of York, in the presence of a large assembly, including the principal families of the neighbourhood. With the circumstances attending the death of Mr. Parkin Jeffcock the public are familiar, and it need only be said that while heading a band of heroic men, after the explosion at the Oaks Colliery, in December, 1866, another explosion took place, and he and those who were with him perished. He had often desired the erection of a church at Mortomley, for the benefit, more particularly, of the miners, in whom he took a deep interest; and when a memorial to his memory was contemplated, it was decided to erect a church, according to his desire. A fund was opened, and in a short time over 2,000l. were raised. The Jeffcock family gave 1,000l., including the site, of the year 2000, and among the subscribers were the Earl of Fitzwilliam and Lord Wharfedale. The church, which is known as St. Saviour's, is situated close to Mortomley Hall, and is built in the style of architecture prevailing in the thirteenth century. The nave is 48 ft. by 20 ft., the chancel 25 ft. by 18 ft., and there is a north aisle, organ-chamber, and vestry. The roof is of open stained timber, and the height is 43 ft. The seats are open, and of stained wood. The church will accommodate 300 persons, and the total cost is about 1,900l. It will be heated by hot water. The pulpit is of polished marble, and that and the chancel-screen are the gift of Mrs. Jeffcock. The font is the gift of the Rev. G. Lewin, of Wortley. The very handsome altar is the work of Mrs. Gainsford. Miss Marriott, Mrs. Hutton, and Mrs. Burges have also contributed towards the decoration. At the north end of the church is a brass tablet, containing the following inscription:—

To the glory of God, and in pious remembrance of Miss Jeffcock, who lost her life with an exploring party on the 13th December, 1866, in the Oaks Colliery, near Ruseley, after the great explosion there on the previous day, this church, free to all, and dedicated in the name of St. Saviour of the world, is offered by his surviving parents, his brother, and many friends, on the 7th day of August, in the year of our Lord 1872.

The architect was Mr. James Brookes, and the contractors were Messrs. Longmire & Burgo. A part of the contract was carried out by Messrs. Deacon & Broadbent. Mr. Masters acted as clerk of the works.

Bromsgrove.—The architect of the new church is Mr. J. Cotton, of Birmingham. Mr. Barton, mentioned in our account last week as architect, is a member of the building committee only.

SENTING CHURCH-BUILDING NEWS.

Wellingborough.—The memorial-stone of a new Wesleyan chapel and school has been laid here. The total amount of subscriptions is nearly 1,000l. The site for the new chapel is on what is known as the Park Estate, and that part of the site is fast becoming one of the most important of the town. The proposed chapel is designed in the Italian style, freely treated. It will be entered from the front by an open arched porch, supported by columns with pedimented caps, and over the arches diaper-work will be introduced. On either side are two vestries, containing gallery staircases. The body of the chapel is divided by two wide aisles, and galleries are provided for 400 persons, and, with the seats in the galleries, makes a total of 700. A large rostrum will be used, and a recess in rear is placed to give room and effect. Behind the chapel are three vestries, two communicating, which can be made into one large room. The schoolroom is behind them, and is 26 ft. by 39 ft., well lighted and warmed, and has an open roof. To it is a kitchen, and in convenient position are lavatories. The architect is Mr. Daniel Bell, of London, under whose direction the building is being built by Messrs. Barton & Reach, of

Rothwell. Mr. Blunt, of Wellingborough, is clerk of the works. The estimated cost is a little over 1,800l., to which are to be added 500l. or thereabouts, for the purchase of the ground.

Lightcliffe.—A Congregational church has been erected here in the Geometrical Decorated style, from the designs of Messrs. Lockwood & Mawson, architects, Bradford. The cost has been 8,500l. The edifice stands on a gentle eminence at a short distance from the Lightcliffe Railway-station. The tower and spire, rising to a height of 150 ft. from the ground to the top of the spire, has just been completed. Sir Titus Salt has given the turret-clock and bells, which cost 750l.; Miss Salt has expended 130l. on the pulpit, communion-table, and choir-benches; and Mr. George Salt defrays the cost of the organ and case, 700l. The organ is to be built by Mr. Holt, of Wakefield, under the management of Mr. Samuel Smith, of Bradford, a musical amateur. Inclusive of the gifts of the Salt family, the amount expended on the church will exceed 10,000l.

Great Boughton, Chester.—The memorial-stone of a Congregational chapel has been laid here. The site is the corner of the new street between the Christleton and Tarvin roads, and near to the present chapel, which it is intended to utilise as a schoolroom. So soon as the amount given or promised towards the new chapel reached 1,000l. an architect, Mr. T. M. Lockwood, was appointed, and the contract of Mr. W. Andrews, another citizen, to build it for something less than 1,800l., was accepted. Probably with the cost of the land and extras, the total will be 2,300l., and it would have been at least 2,500l. had the first design, which included an open octagonal turret at the south-west corner, been adopted. The dimensions of the new chapel will be 68 ft. by 28 ft. 6 in. inside, and access will be had from the Christleton-road through a vestibule with inner porches 6 ft. in width. The height inside is 29 ft. to the ceiling, and to the ridge 42 ft., there being a triangular space left in the roof for ventilation. The roof is open for half its height, showing its construction internally. Accommodation is provided for 463 sittings, the seats being open, with sloping backs. The windows will be glazed with lead lights, filled in with tinted glass. The woodwork of the interior will be chiefly of pitch pine, the pulpit being placed on a raised dais under an arched recess. The general style of the building is Early English, the walls being of brick with stone dressings. The front is to have a large three-light window, with carved caps and columns, while below it will be the entrance to the building by means of two arched doorways, with carved capitals and granite shafts. In the upper part of the gable is a circular louvre, and the apex is surmounted by a bell-cot of simple design. The side windows consist of double lancet lights between the buttresses, finished internally with carved capitals and stone shafts. The heating will be effected by means of Porritt's patent hot-air apparatus, and ample provision is made for ventilation.

West Bromwich.—The opening services in connexion with the new Wesleyan Chapel, recently erected in the Beeches-road, have been performed. The new building is situated close to the Birmingham-road, and forms a conspicuous object in the most fashionable suburb of the town. The chapel is designed in the Grecian style of architecture. Exteriously it is faced with Kingswinford bricks, with Bath stone strings, quoins, cornices, pediments, &c., the stone being enriched with carving and incised decorations. The interior walls are relieved with ionic pilasters, and over each pilaster are acroteria ornaments, from which spring the moulded ribs dividing the coved ceiling panels. A gallery is provided at the entrance, and a rostrum and pulpit opposite. The arrangements for warming and ventilating are complete. The architect was Mr. Edward Pinches, of West Bromwich, and the builders were Messrs. Trow & Sons, of Wednesbury. The cost, including land, will be about 2,600l., of which 800l. remain to be raised.

Bensham, Gateshead.—The foundation-stone of a Wesleyan new chapel has been laid at Bensham. The site is near St. Edmund's Cemetery, Gateshead. The new chapel will immediately adjoin the schoolroom. The new edifice is situated on the west side of the road leading to the Redheugh Bridge. The dimensions of the building are as follows:—Length (including 20 ft. which will be set apart for the choir), 70 ft.; width, 46 ft.; and height, 32 ft. The new chapel will be built in the Italian style of architecture,

and will accommodate between 800 and 900 persons. The walls will be built of Low Law blocking and Prudham stone, and will, in the winter, be heated with hot water. The architect is Mr. F. R. N. Haswell, of North Shields, and the contractor is Mr. J. F. McMurtrie, of Gateshead. The site has been purchased from the Askew estate, and the total cost of the building is estimated at 6,000l.

Denton.—A new Wesleyan chapel has been opened here for divine service. The style of architecture is Gothic, and, together with the arrangement of the plan, is upon the model of another chapel recently erected from the designs of the architect (Mr. George B. Ford, of Burslem). The accommodation provided is for nearly 600 persons on the ground floor, and in the gallery across one end; and at the opposite end of the chapel is an orchestra, underneath which is a large class-room, and adjoining this is a minister's vestry and lavatory, with closet attached. In securing the site sufficient land was purchased for the erection of schools, which are to be built forthwith. The works have been carried out by Mr. Stringer, of Sandbach, from the designs and under the superintendence of Mr. Ford, the architect. The cost of the building and fittings is about 3,400l.

Wheelock.—The chief stones of a new Wesleyan chapel and school have been laid here. The site of the new chapel is in a central position, opposite the present chapel and school. The school will be underneath the chapel, which will seat 406 persons, the school and class-rooms affording accommodation for 500 scholars. The plan of the chapel is an oblong, with a gallery and orchestra, and the style of architecture is Gothic freely treated. Both the chapel and school will be well lighted and ventilated. The chapel roof will be in one span, to avoid obstructions to sight, and the floor of the chapel will be higher at the entrance than at the pulpit end, to prevent obstructions to sight when the congregation are seated, and this is obtained without steps. The vestibule will be laid with encaustic tiles, supplied by Messrs. Malkin, Edge, & Co., of Burslem, and the building is to be warmed with hot air. The contract for the buildings and fittings, which also includes railing, gates, and boundary-wall along the front of the site, but exclusive of warming, has been undertaken by Mr. William Martin, builder, Haslington, for 1,730l., and will be carried out under the superintendence of the architect, Mr. George B. Ford, of Burslem.

Hanley.—The memorial-stones of a new Wesleyan Chapel have been laid, with the customary formalities, at the corner of Rose-street and Keeling's-lane, opposite to the National Schools. Messrs. Serivener & Son, of Hanley, architects, prepared the plans. The design is Gothic, and the chapel, which will be 60 ft. long by 33 ft. broad, will accommodate 300 persons. There will be a school-room underneath of the same proportions. The building will be of blue and red brick, with stone dressings, and the roof will be of red and blue tiles, ornamentally arranged. The chapel will be seated throughout with open benching, stained and varnished. There will be an open timbered roof, and a gallery at one end. The windows will be filled with tinted glass. Two vestries and a porch-entrance will be provided. Mr. R. Hammersley, of Bucknall-road, has undertaken to erect the building for 1,355l., and towards this sum the committee had secured 938l. before the laying of the memorial-stones.

SCHOOL-BUILDING NEWS.

Charlton Kings.—Mr. Higgs having determined to build a school suitable to the growing requirements of this parish, the foundation-stone of a building capable of accommodating 200 children has just been laid. The site, which is given by Mr. Higgs, together with 1,000l. to the building-fund, is adjacent to the Church of the Holy Apostles, and the architectural character of the building will be in keeping with that structure. Messrs. Middleton & Goodman are the architects of the new building, and Mr. Daniel Hawkins is the builder.

Saltire Literary Institute.—We understand that this building, erected by Sir Titus Salt, bart., is closed, for the purpose of decoration. The style selected is Pompeian. The execution of the work is intrusted to Mr. Henry Briggs, of Bradford, from designs by Messrs. Lockwood & Mawson.

STAINED GLASS.

Doncaster Parish Church.—The west window of this church is to be filled with stained glass, by Sir Isaac Morley, of Beechfield, as a memorial of his late wife, Lady Morley. The execution of the work has been placed in the hands of Messrs. Ward & Hughes, but the design will be first submitted to Mr. Gilbert Scott.

Free Church, Sighthill, Glasgow.—A stained-glass window has been prepared for this newly-erected church. The window is a memorial of the late Mr. William Collins, the founder, in 1834, of the Glasgow Church Building Society. The leading incident in the life of the good centurion has been selected for illustration. The centurion said he was not worthy that Christ should come under his roof, but let Him speak the word and his servant would be healed; on which Christ said, "I have not found so great faith, no, not in Israel." The illustration occupies the three upright lights in the window. The dexter light contains three of the elders of the Jews accompanying Christ to see Him restore the sick servant to health; the centre lights represent Jesus met by two of the centurion's servants, and in the sinister light is seen the centurion tending his sick servant. Messrs. Ballantine, of Edinburgh, are the artists.

Stoke Fleming Church.—Painted glass has been placed in the east window of this church, to the memory of the late Mr. Samuel Juaniz-y-Echalarz Clark. The subject is the Ascension, a difficult one to treat successfully in so confined a space. The window has been made by Messrs. Ballantine, of Edinburgh.

Wellingborough Church.—The Decorated east window of this church has been filled in with stained glass.—"In commemoration of the thirty years' ministry of Canon Broughton as vicar, A.D. 1871." The window is one of five lights of varying width, with flowering tracery in the upper portion. The subject chosen for illustration is the "Crucifixion." The central light is filled with a life-size figure of the crucified Saviour, with the Virgin Mary and the Magdalen at the foot of the cross. The lights to the right and left of the central one are filled with pictures of the two thieves, the beloved disciple and others finding a place in the lower part of the design. In the extreme side lights, the centurion and soldiers with the Roman standard have been represented, some of the soldiers on horseback. The chief part of the tracery is filled with figures of angels. The window has been erected at the expense of the parishioners of Wellingborough, and is the work of Mr. A. Gibbs, of London.

Carlisle Cathedral.—A new window of stained glass has been inserted in the west end of the nave of this cathedral to the memory of the late Canon Harcourt. The style of the masonry is Gothic, and it consists of five lights. The subjects represented in the window are all Scriptural and religious, but so limited is the space that in only one case do they comprise more than two, or at most three figures, and in many instances they are simply portraits. This gives the design of the window some poverty of effect. The central and principal subject is a portrait of Jesus. The work has been executed by Messrs. Hardman, of Birmingham.

Bath Abbey Church.—Mr. Murch, says the local *Chronicle*, has every reason to congratulate himself on the success of his proposal for filling the east window of the Abbey in a manner worthy of the structure, the rest of the work of restoration, and the city. From a circular which he has just issued, we learn that in place of the fifty subscriptions of ten guineas each which he thought he might venture to ask, he has received besides a few larger and many smaller subscriptions no less than fifty-seven several sums of ten guineas, the entire amount promised to him up to this time being 930*l.* To carry out the plan of the committee with whom he is associated for the purpose a further sum of 220*l.* is required. Messrs. Clayton & Bell have the execution of the work, which it is intended shall represent, in a series of seventy-six pictures, the life of our Lord from the Annunciation to the Ascension. The arrangement has the sanction of Mr. G. G. Scott.

Bengeoerth New Church.—This church is progressing. The stained-glass east window, for which a special effort has been made, is being inserted. This window has been prepared by Mr. W. H. Constable, of Cambridge. It portrays Aaron, St. Paul, Christ, St. Peter, and Moses.

Minster Church, Thanet.—Two painted glass windows have recently been placed in the west-

lower end of this church, to the memory of the late Mr. William Rogers, of Sheriff's Court, in the parish of Minster. They have been executed from the design and under the superintendence of Mr. Seddon, of Westminster, the architect of Mrs. Tait's Orphanage and of St. Peter's Church, Thanet, by Mr. J. R. Thompson, of Southwark. They represent the figures of the Virgin Mary, with the infant Saviour and St. Joseph, standing under conventional canopy-work. The background of one of the windows is a ruby, and of the other a deep green, and the prevailing colours in the border are respectively counterchanged.

Halesworth Church.—A stained glass window has just been placed in the south aisle of this church, in memory of the late Mr. Patrick Stead, formerly a merchant of this town. His widow presents the memorial. Mr. H. Hughes was the artist. The principal figure is the Ascension of our Saviour.

St. James's, Gateshead.—A stained glass window has been erected in this church in memory of the late Colonel Henry C. Allhusen, of the 1st Newcastle Artillery Volunteers. The work was designed and executed by Mr. Henry M. Barnett, glass-stainer, Newcastle, and cost upwards of 160*l.* The window illustrates three Scriptural subjects. The centre and two southern lights are taken from Luke vii. 1—10, and the two lights in the north side are from the Acts of the Apostles x. 1—4. The upper rose of the window illustrates the Resurrection, and the two intervening roses the coats of arms of the family and the corps of which the deceased gentleman was the commanding officer.

PATENTS CONNECTED WITH BUILDING.

HASP OR LATCH.—*R. Dempster.* A communication. Dated 21st July, 1871.—This invention consists in constructing a hasp or latch, called "the safety hasp or latch," of a combination of three principal parts, first, a hasp or latch piece proper of the usual hook or other form; secondly, a bolt attached to that part of the hasp or latch which extends between the eye and the hook, or the equivalents of the eye and hook, or either of them; and, thirdly, a spiral or other spring, to act upon the above-mentioned bolt and keep it pushed out, but also allowing it, when pressure is applied, to recede. To facilitate the passing of the hook over the staple or fixed piece, the end of the bolt is formed with a curved lip.

WINDOW SASHES.—*S. Rogers.* Dated 22nd July, 1871.—Into the pulley stile is let a case containing a ratchet-wheel with a steel spring and a pawl working in the teeth of the said ratchet-wheel connected by a rod to a handle, around which rod is coiled a spiral spring, and projecting from the said ease and leading to the inside lining is an arm. Into the back of the sash is fixed a rod of iron or other material, with teeth thereon to correspond to the teeth of the ratchet-wheel. When the window is required to be opened, pull the said handle or knob, which releases the ratchet-wheel, and raises the sash upwards, the sash being stopped at any position by the handle or knob being let go. The sash is lowered by hand in the usual way.

PAVING OR FLOORING FOR THE STALLS OF STABLES.—*J. L. Norton.* Dated 22nd July, 1871.—According to this provisional specification metal frames are employed having cells in them to be filled up with asphalt, wood, moulded blocks, bricks, or tiles. Between the cells or through the blocks holes are formed for the passage of moisture or dirt.

LONGITUDINALLY CORRUGATED IRON BEAMS.—*R. Montgomery.* Dated 30th November.—This relates to improvements in the shape of the ingot to be used in the manufacture of longitudinally corrugated or folded beams. The invention consists in casting the ingot in a mould so fashioned as to form or produce longitudinal grooves in the ingot, corresponding in their number and relative position with those required in the finished beam or rail. To convert the ingot thus formed into a beam, bar, or rail, it is passed at a proper heat through a rolling-mill provided with a series of finishing grooves, the first of which correspond very nearly with those of the ingot. The invention also relates to the combination of bars of a peculiar shape in the formation of a "pile" for the production of a longitudinally corrugated beam or rail of iron, and consists in forming a "pile" having the same shape as the bar thereby produced, from which, with the same rolls and the same number of passes a perfect beam is manufactured.

Books Received.

"Work and Wages Practically Illustrated. By Thomas Brassey, M.P. Bell & Daldy." This interesting volume, which has a preface by Mr. Arthur Helps, and is dedicated to Mr. Thos. Hughes, M.P., will receive attention in due time.

"Specifications for Practical Architecture; a Guide to the Architect, Engineer, Surveyor, and Builder. With an Essay on Building, on the basis of the work by Alfred Bartholomew. Thoroughly revised, corrected, and greatly added to by F. Rogers. Sprigg, Atchley, & Co." We gladly welcome any republication of the late Alfred Bartholomew's Essay, now out of print in its original form, and hope this volume may in consequence be studied. But if we are called upon to express an opinion as to the way in which the present editor has done his work, it will not be very complimentary. Mr. Rogers claims in his preface to have adapted the book to modern science and requirements, and indicated the use of new materials. When we say that the specifications are described as for a "fourth-rate" house, a "third-rate" house, a "first-rate" house, a mode of description (belonging to an extinct Building Act), which is no longer recognised, and that the specifications do not contain a single word as to the use of Portland cement concrete, the extent of the trouble which has been taken to fit the book for the present day will be obvious to the meanest capacity.—We simply note, at all events for the present, the publication of "A Treatise on Mathematics, as applied to the Constructive Arts. By Francis Campin, C.E." (Sprigg); "Practical Plane Geometry, giving the simplest Modes of constructing Figures contained in One Plane. By J. F. Heather, M.A." (Lockwood & Co.); and "Perspective, or the Art of Drawing what one sees explained and adapted to the Use of those Sketching from Nature. By Lieut. W. H. Collins, R.E." (Longmans & Co.).

Railways or No Railways. By ROBERT F. FAIRLIE. London: Effingham Wilson. 1872.

The narrow-gauge Fairlie system is now well known both in Europe and in America; and the purpose of Mr. Fairlie's volume is, of course, to advocate that system as against the broader gauges. His narrow gauges, he maintains, combine economy with efficiency, while the broader gauges are both costly and extravagant. We have thus a revival of the old battle of the gauges under a new form; for what was formerly called the narrow gauge, which overcame the broad, is now ranked with the broad as against the still narrower Fairlie system. The British and other railways are like a tree which has not yet thrust forth its leaf-loading twigs; and what Mr. Fairlie wants, we presume, to do is to send the railway ramifications into every wealth-producing corner of the country to develop its multitudinous resources, and gather them all into the main branches and trunks of the railway system as already formed. And for such a purpose certainly narrow gauges and Fairlie engines and other vehicles seem better adapted than the present ponderous system, which is practically defective, and ever must be.

Miscellaneous.

Memorial Reredos in Dorrington Church.

This church has been improved by the addition of a reredos, executed in Caen stone, which extends across the east end of the chancel. The reredos, which is a memorial of Mr. T. H. Hope-Edwards, consists of a carved central subject, representing "The adoration of the Kings." On either side, in niches, are figures of St. Edward the Confessor and St. Andrew, in whose honour the churches of Dorrington and Conover are dedicated. Devonshire marble shafts, with carved capitals, also a carved cornice and diaper, help to further enrich the central part of the reredos, which is exactly the width of the east window—raised by the officers and rank and file of the 5th company Shropshire Rifle Volunteers, in memory of Mr. W. J. Hope-Edwards; the spaces north and south being filled up by arcades, having carved capitals, marble shafts, and carved panels. The sculptor was Mr. T. Earp, Lambeth, who executed the whole of the work. Mr. Edward Haycock was the architect.

Ferra-Cotta Works at Watcombe.—Having passed through the biscuit-oven the object is ready for the beautifully delicate colour which is given upon some of the ware: a result of the application, by hand, of glazes and enamel. Some of the figures, such as butterflies, are printed on copper-plates on thin paper, and applied in ordinary way to the object to be ornamented, which, being subjected to heat, the paper is destroyed, and the colour and markings remain, when the ornamentation is completed, the articles are again placed in the oven, with a heat sufficient to fix the glazes, and this perfects the details of operations necessary to the formation and embellishment of a Watcombe vase. Success so signal having been attained in the minor and utilitarian objects, attention is now chiefly directed to ornamental composition and detail; in respect to flower and foliage reproductions, nothing that has ever been produced is comparable with the really marvellous productions of Watcombe in this department. The *deux* of the manufacture, as yet, have been in baskets of flowers, and they claim this distinction as setting forth the infinite *finesse* with which the clay may be worked; results far surpassing anything, either ancient or modern, that has been attempted in this way. Each leaf is minutely modelled, and consigned to its place in an exactitude of form and precision of surface, strictly imitative of nature in its minutest details, and thus, with most perfect success, are called baskets of roses, passion-flowers, lilacs, &c., and indeed a variety embracing the entire of the picturesque Flora. Other remarkable works are statues of the Princess Louise, Marquis of Lorne, the late Charles Dickens, of which great numbers have been sold; conspicuously, a pair of vases, covered with glaze, and enriched with copies in gold of able sculptural works. We may also mention among the best reproductions of this establishment a bust of our Saviour by an eminent French sculptor.—*Art Journal.*

The People's Theatre, St. Peter's-square, Newport.—Some alterations have been made in this theatre. The whole of the work has been planned and executed by Mr. Peter Pierce. The ceiling and cornices were done by Mr. E. Es. One feature in the remodelling of the theatre is the lowering of the pit to the basement, by which the effect on the interior is similar to what would be produced by adding one story to the building. The proscenium is thus heightened. The semi-circular top of the opening is finished with mouldings to harmonise with the treatment of the walls generally. These will be contrasted with the spring of the front of the galleries, from which the gaseliers project. What was formerly a floor is now cut away, except a portion round all round, which will form a dress circle, of 400 chairs, terminating at the stage-end on one side and with private boxes. Instead of one gallery at the entrance-end, there will be one on each side, the whole of this portion now affording accommodation for 900 people. None of the Manchester theatres, it is said, have such wide passages, and there are three wide doors for the dress-rooms are provided for the managers under the stage and behind it, the latter itself being considerably larger than here.

Memorial.—The Cowper Memorial Committee of the Olney Mechanics' Institute, considering the present an appropriate time, have resolved, after securing the counsels and cooperation of the principal gentlemen of the town and neighbourhood, to proceed with the matter without further delay. It has been decided that the scheme shall include the purchase of a suitable site, the erection of a town-hall, with a library, a public library in Olney.—The monument in honour of Jahn, the founder of the societies for athletic exercises in Germany (the Verein) after the disasters in 1806-7, has been directed and unveiled on the Hohenstein, Berlin. A festive procession was formed, which passed through England, America, Austria, Hungary, and parts of Germany were represented by delegations, and the streets were gaily decorated with flags, and densely thronged. The Minister of Interior and the municipal authorities, in official robes, assisted at the ceremony.

George Gilbert Scott, R.A.—On the 9th inst., at Osborne, her Majesty conferred the honour of knighthood on our distinguished and esteemed colleague.

Bridges, Great Grimsby.—Two new bridges have been opened, connecting the new town with the old town, and both with the corporation land on the west side of the Old Dock. One of these is a foot-bridge, with a 6 ft. clear roadway, and a total length of 620 ft. It crosses the permanent way of the Manchester, Sheffield, and Lincolnshire Railway, and rests on thirty-two iron columns, each 16 ft. 6 in. long. It is approached by staircases rising from the foot-way at each end of the bridge, and it is the largest bridge yet constructed over any railway in this country. A swing bridge has been carried across the Old Dock, 283 ft. in length, with a roadway 16 ft. wide, and footpaths on each side, 4 ft. wide. It is in eight spans, one of which is movable, so as to allow vessels to pass to and fro in the dock and through a channel of 45 ft. clear width. It is formed of wrought-iron girders on cast-iron screw piles and cylinders. These bridges have cost about 12,000*l.* By the opening of the swing bridge over the dock, 240 acres of grass land, in close proximity to the town and docks, have been made available for a park, building, and other purposes. Excellent roads have been made through this land, and sites for above 200 new houses have already been bespoken.

Improved Dwellings for the Working Classes.—At the Mansion House, Alderman Sir Sydney Waterlow, the chairman, presided at the eighteenth half-yearly meeting of the Improved Industrial Dwellings Company. The report stated that the subscribed capital now amounted to 206,150*l.*, and the unallotted shares represented 43,850*l.* The loans from the Public Works Commissioners were to the amount of 81,000*l.* in all, of which 69,000*l.* had been received. The rents during the half-year had brought in 9,183*l.*, and the total expenditure was 5,291*l.*, leaving a profit of upwards of 4,000*l.* The directors recommended the payment of the usual dividend of 5 per cent., and that from the balance (5,332*l.*) a sum of 5,000*l.* should be placed to a reserve fund, and invested for the equalisation of dividends. The number of persons now occupying dwellings belonging to the company is 5,958,—viz., 2,675 above sixteen, and 2,281 children, while the number of different occupancies was no less than 337.

The Drainage of Barnes.—The pressure on the parish authorities by the Thames Conservators has induced the vestry to appoint a committee, who, after a careful consideration of all the circumstances, suggest the adoption by the vestry of the following resolutions, viz.:—
1. That the vestry of Barnes, recognising the necessity of providing, without further delay, for the proper and efficient drainage of the parish, adopts the system of sewers recommended by Messrs. Tress & Innes, subject to such modifications as may be found necessary when the position of the outfall is determined.
2. That the Special Drainage Committee be authorized to take such steps as may be necessary for obtaining the requisite permission from the Local Government Board for borrowing a sum not exceeding 8,000*l.* for the construction of the said system of sewers.
3. That the vestry are of opinion that it would not be desirable to establish local sewage works, and therefore request the Special Drainage Committee to take such steps as they may deem best in supporting and promoting a general scheme for providing an outfall for the sewage of the Thames Valley above the metropolitan district. These resolutions have since been adopted by the vestry.

Vienna Exhibition.—It is proposed to organise, during the period of the coming universal Exhibition at Vienna, but separate from it, a special exhibition illustrative of the history of the city of Vienna. According to the *Society of Arts Journal*, this collection is to be divided into two groups—the first to include plans and views of the city, and of its various quarters and most interesting edifices, prints recording the most remarkable events that have occurred there, portraits of notable persons, and engravings illustrative of the habits, customs, and fashions of various periods; the second division to include monuments and other objects in stone, wood, and metal, historical products of Viennese industry, and medals referring to historical facts and personages of interest in connexion with the Austrian capital.

The Salt Memorial at Stafford.—It has been decided by the committee to open out the front of St. Chad's Church, and restore this edifice as a memorial. The contemplated improvements will necessitate the pulling down of the premises occupied by Messrs. Deakin, as well as others. Sir Gilbert Scott has been, or is to be, requested to furnish designs for the work.

The Steam-Whistle.—By the new Act, to use a steam-whistle is forbidden, provided the purpose be to summon workmen to labour. A whistle may not be blown nor a trumpet sounded with this object under a less penalty than 5*l.*, and a further penalty of 40*s.* for every repetition of the offence. The nuisance on railway engines ought to have been dealt with also. It is a nuisance quite as unbearable as that for which Parliament has thought fit to legislate, and it is one which might be materially modified without Parliament's intervention. In the United States, the sound of railway whistles resembles the low note of a Chinese gong, and is neither unpleasant nor unmelodious. If our railway directors would only take a lesson from our American brethren in this matter they would merit the thanks of the community. If not, then the Act against fixed steam-whistles will be made to include movable ones also. The new law will be used as a precedent, and will furnish an argument of irresistible force.

A New Gas Igniter.—Various experiments of an effective and successful character, it is said, have been made in Preston, with the view of testing a new gas-igniter, discovered at the Royal Observatory of Gottingen, in Hanover, and adopted and successfully used in the principal street of that city since last Easter, and about to be applied to 10,000 street lamps in Berlin, by order of the Imperial Government. Mr. J. Billington Booth, of Preston, has patented the apparatus for England. The chief peculiarity of the invention is said to be this, that with the utmost ease, rapidity, and certainty it can (without the personal application of heat or flame) ignite gas simultaneously in any number of lamps, globes, or burners, at any distance or altitude, and simply by the gas-pressure laid on, and acting on a chemical material and apparatus easily applied beforehand to the burners.

The Science College for Birmingham.—The arrangements for carrying out Mr. Josiah Mason's munificent intention to found a science college in Birmingham, specially fitted to the wants of the town and of the district around it, are progressing. An excellent site for the college has been purchased by Mr. Mason, in Edmondestreet, at the back of the town-hall; and a provision has been made by way of endowment for the institution. Mr. Mason has now, we understand, completed the number of his trustees. The gentlemen upon whom this honour has been conferred are Dr. Blake and Mr. G. J. Johnson (the two trustees originally appointed), Mr. W. C. Aitkin and Mr. J. Thackeray Bunce (whose names were appended to the foundation deed as witnesses to Mr. Mason's signature), and Dr. Hicpol and Mr. George Shaw.

Carlisle Public Hall.—The prospectus of this new Public Hall Company (Limited), has appeared in the local *Journal*. The capital is 8,000*l.* in 1,600 shares of 5*l.* each. It is not purposed to expend the whole at once. The site is at the corner of Lowther-street and Chapel-street, and is 2,600 square yards in extent. The cost will be 10*s.* a yard. Steps will be taken towards the erection as soon as the conveyance is executed. The building will comprise a large public room, capable of seating from 1,500 to 2,000 people, a smaller room for sales and such like purposes, two shops, offices, outbuildings, custodian's room, &c. The committee estimate that if the hall be erected at a cost of 5,000*l.* or 6,000*l.*, it will realise a dividend of not less than 7½ per cent.

Instruction in Physics.—The Lords of the Committee of Council on Education have decided to transfer the instruction in physics, chemistry, and natural history from the Royal School of Mines in Jermyn-street, and the College of Chemistry in Oxford-street, to the new buildings in Exhibition-road, South Kensington. The following courses of lectures and practical laboratory instruction will be given at South Kensington:—Chemistry, by Professor Frankland; biology, by Professor Huxley; physics, by Professor Frederick Guthrie, with laboratory work.

Sussex Archeological Society's Meeting. The annual meeting of this society was held on Thursday last week, at Parham House, the residence of Lord Zouche. Notwithstanding the threatening appearance of the weather, there was a good attendance of members and their friends. The dinner took place in the society's marquee, in Parham Park.

Laying the Foundation-stone of a Leeds Board School.—The foundation-stone of the first of the Board schools to be erected by the Leeds School Board, under the Elementary Education Act, has been laid, on the site of the intended building, in Brewerley-street Dewsbury-road. Mr. G. Corson is the architect. The school will accommodate 854 children, allowing 10 superficial feet of floor space to each child. The cost of the main building will be 5,834*l.* 1*s.* 1*d.*; the covered playgrounds and fences, 2,693*l.* 1*s.* 6*d.*; and the contingent expenses,—such as architects' fees, &c., will amount to 457*l.*; making a total of 8,984*l.* 7*s.* 7*d.* The site has been purchased from Lord Houghton, at a cost, including the half of the streets, of 1,333*l.* 2*s.* 6*d.*

Bursting of the Lake, near Petersfield, Godalming.—During one of the recent extraordinary thunderstorms, it appears that a waterspout fell in the forest, and it rushed in an immense stream of 120 ft. to 150 ft. wide, and 6 ft. high, into the lake, making the water rebound over the embankment, and then away it went, from top to bottom, and one huge volume of water poured out, sweeping trees, stones, and everything before it. Independent of the waterspout, the rain has done incalculable damage, loads upon loads of earth having been washed out of the fields, and the roads being left like skeletons, earth and sand all gone, and only the bare stones left, large holes washed out, and banks thrown down. An express train had a very narrow escape.

The New Dock at North End, Liverpool.—A considerable addition has just been made to the Liverpool Dock Estate, by the construction of a new dock at Bootle, for steam purposes. It is situated immediately to the north of the Huskisson Branch Dock, and forms an integral portion of the Huskisson Dock. The new dock is 1,200 ft. in length by 300 ft. wide, and extends over 8 acres in area, having about 2,700 ft. of quay space. It will be seen from these dimensions that the Huskisson Branch Dock No. 2, which is its name, is peculiarly formed, being long and narrow, and therefore specially adapted for the use of steam vessels.

London Financial Association.—At the half-yearly meeting of shareholders in the London Financial Association, the chairman said one of the principal assets was the Muswell-hill property, and the directors had come to the conclusion that it would be useless to attempt to sell that palace and property to any company in an unfinished state, and therefore they had determined to complete it. Everything was now being pushed forward with vigour, and the board had determined to postpone the opening of the palace until next spring, by which time the short railway would be completed. Over this line would pass the whole of the traffic from the Metropolitan and other systems, and take visitors direct to the palace.

Offer of Paintings to Town Councils.—The Newport (Isle of Wight) Council have received a letter from Mr. Vivian Webber, of Ryde, offering to present the corporation with a painting,—a memorial picture, having reference to the recovery of the Prince of Wales. Mr. Webber has presented some pictures to the corporation of Ryde. The corporations have accepted with thanks his generous offer. The picture for Newport is 11 ft. by 7 ft., including the frame, and it is said to be a valuable artwork.

Masters and Workmen.—The Act to make further provision for arbitration between masters and servants (35 & 36 Vict., cap. 46) is issued. It recites the Act, 5 Gen. IV., cap. 96, in which provision was made for the arbitration, in a mode therein prescribed, of certain disputes between masters and workmen. Provisions are now made with reference to agreements under the Act. An agreement is to designate some Board, Council, or persons as arbitrators.

The Leeds Exchange and News Room.—Mr. Nussey, chairman of the Exchange and News Room Committee, has received a letter from Lieut. Colonel Sir Howard Elphinstone, stating that his Royal Highness Prince Arthur will have the pleasure of laying the foundation-stone on Friday, the 20th of September.

St. Peter's at Rome.—The *Fanfulla* states that the cupola of St. Peter's shows unmistakable signs of decay. A commission of Papal architects and engineers has, it is said, been appointed to examine it.

Proposed Testimonial.—A movement has been started for the purpose of presenting a testimonial to Mr. George Smith, of Coalville, near Leicester, who has laboured to ameliorate the condition of the women and children employed in brickfields. We were earlier in the (brick) field than even Mr. Smith, but, for all that, we shall be glad to hear of his receiving a testimonial, if he desires one.

Testimonial to Mr. H. G. Blagrove.—The printed record of subscriptions, &c., for behoof of Mr. Blagrove, the distinguished violinist, whose continued illness has disabled him from carrying on his profession, is a good example of what may be done in such a case. A sum of 1,500*l.* odd has been collected, and a Government annuity of 100*l.* thereby secured to Mr. Blagrove for life by an active committee of sympathisers.

Sunday Street Watering.—The Street Cleansing and Sanitary Committee of the Westminster District Board of Works have reported that they have directed the principal thoroughfares of the district to be watered on Sundays during the driest portion of the season, the contractor for the horse hire having agreed to supply horses at the contract price for such purpose.

The Camberwell New Vestry-hall.—The chief stone of this new edifice, a view and plan of which we gave on the 13th of April last, has at length been laid by the chairman of the vestry, Mr. Turney. The site chosen for the building is that formerly occupied by Havil House, at the corner of Havil-street, High-street, Peckham.

The Bristol City Surveyorship.—After a long discussion, the city council have at length resolved, by 32 to 17, to appoint a city surveyor and architect, but not to require him to give his whole services to the city; and the committee are to ascertain what terms can be made with Mr. Josiah Thomas.

Seats in Public Places.—Mr. W. H. Smith, M.P. for Westminster, has intimated to the Metropolitan Board of Works his willingness to be at the expense of placing twenty seats upon the Victoria Embankment for the public accommodation. It is to be hoped that this kindly act will be emulated by other generous persons.

Sherston, Wilts.—Messrs. J. Davenport & Co., of Derby, are about to erect a new silk factory, chimney-shaft, engine and boiler-house, &c., at Sherston, Wilts. It will be about 170 ft. long and about 70 ft. wide, and lighted by skylights. Mr. Charles Brown, of Tetbury, is the contractor.

Ventilation of Sewers.—The Limehouse Board of Works report the placing of twenty-six ventilating shafts in Poplar, and of thirteen in Limehouse and Ratcliff, in connexion also with apparatus for deodorising the effluvia from the sewers by means of sulphuric acid instead of charcoal.

New Theatre in Vienna.—A new theatre is to be built in Vienna for the Exhibition season of next year. There will be room for 5,000 spectators in the auditorium. The director is to be Baron Schwartz.

A New Theatre for Cardiff.—It is proposed to erect a theatre on the Circus site. The new edifice, drawings of which have been prepared, will also serve the purpose of a Philharmonic Hall.

The Wallace Fountains for Paris.—The first of the drinking-fountains due to the liberality of Sir Richard Wallace has just been erected on the Boulevard du Combat, at La Villette, near the Rue des Buttes Chaumont.

TENDERS

For taking down and rebuilding Nos. 43 and 44, Upper Berkeley-street, Portmans-square, for Mr. W. H. Hudson. Mr. Alfred Wright, architect. Quantities supplied:—

The Builder.

VOL. XXX.—No. 1542.

Designs for the Proposed New Cathedral in Edinburgh.

It may be necessary to remind readers that six architects were invited to submit designs for a new cathedral to be erected in Edinburgh, from funds left for that purpose by the late Miss Walker, of Drumsheugh. The site is in the centre of the west termination of Melville-street, is open on all sides, and is admirably adapted for the display of an important public building. The sum set apart by the trustees to cover all charges is 65,000*l.*, and the competing architects were required to adapt their designs so as to keep the cost within that amount. The designs are exhibited in the rooms of the Royal Scottish Academy, under motto, but

any one who has a knowledge of architecture and is acquainted with the works of the competitors can easily penetrate the *incognito*; indeed, the names of the authors of the respective designs are openly spoken of and printed, and it needs no apology on our part to follow suit; adopting the description of names already published, although we shall not be surprised to find two of them misplaced.

Each competitor has accompanied his design with an explanatory memorandum, and the course we propose to follow is to allow each architect to explain his own design, and make our comments upon it thereafter.

Taking the drawings in the order in which they presented themselves to us, we find the first series to the left, twelve in number, under the motto "Fidelitas," and which are assigned to Mr. Burgess. The author says:—

Site.—The site being exposed on all sides, and as the west elevation can be well seen from Grosvenor-crescent, the architect has thought it desirable to keep in view the orientation of the building, and has shown it lying due east and west, and on a line forming the axis of Grosvenor-crescent and Melville-street. Should the trustees deem it desirable to show the principal facade to Melville-street, it could be arranged with equal ease; but as a departure from the ancient practice, and on other grounds, it would not perhaps be advisable. A slip has been fixed on No. 8 drawing, to show how the building may be adapted to either arrangement. Assuming that the true orientation as observed, the western entrance would front Palmerston-place and Grosvenor-crescent, while that to the chapter-house and entrance for the clergy would be from Manor-street, and being Melville-street.

Level.—It is proposed to raise the floor of the nave 4 ft. above the level of Melville-street, and thus give a broad, massive base to the building, as well as dignity to the entrances by a flight of steps to the doorway.

Choirs House.—With this house the plan does not in any desired by the trustees; but it does not appear to present sufficient merit, either architecturally or otherwise, to render its existence of great importance; and the residences quite apart from the present old building.

Dimensions.—Length of nave, 130 ft.; long by 30 ft. wide; length of aisle, 110 ft. long by 15 ft. wide; length across transepts, 100 ft. long by 30 ft. wide; length across choir, 65 ft. long by 30 ft. wide; chevet or circumambient aisle, 15 ft. wide; extreme length over all, 265 ft.; width across west tower, 32 ft.; width across transept, 110 ft.; height of interior to groin, 75 ft.; height to ridge, 107 ft.; height of west towers, 220 ft.; height of central dome, 285 ft.

Plan.—In arranging the plan, the convenience and comfort of the congregation have been carefully studied, and the architect has endeavoured to provide for this by the introduction of a large narthex at the west end of the nave, entered through a triple porch, and by a roomy south porch into the south aisle (the necessity for subse-

quent inside wooden porches to prevent cold draughts being thus avoided). The font is placed on the left of the south porch on entering; the pulpit at the north-east pier of nave, as being the best position for sound as well as sight. It is proposed to seat the nave only with benches, the transepts being left clear for temporary seating by chairs or other seats.

Accommodation.—The accommodation is as follows:—Sittings in nave and aisles, 1,082; sittings in transepts, 336; sittings in choir, 64; sittings in stalls, 24; total, 1,506.

Daily Service.—As before mentioned, the transepts and space under the lantern being kept clear, the daily services would be provided for by chairs placed in this part of the building, and by which nearly 600 persons could be accommodated; or by seating the central crossing only, 150. The architect has adopted the chevet, or mode of carrying the aisles quite round the choir, thus giving free access from the vestries and chapter-house to all parts of the building without crossing the choir or chancel, and also providing a very suitable space for mural monuments and brasses, while at the same time it would immensely improve the architectural effect of the building,—a mode of treatment happily enforced and illustrated in Mr. Beresford Hope's work, "The English Cathedral" (chap. vi.). The chapter-house opens off the north side of this circumambient aisle, and is approached through a wide corridor, lighted on the east side by a rich screening, and hooded on the west by the vestries for the clergy. The chapter-house is in the form of a parallelogram, 53 ft. by 26 ft., and capable of accommodating 150 people. A grand organ might be placed in the left or the narthex at the west end.

Style of Design.—A severe and comparatively early style of French Gothic has been selected, so as to avoid excessive detail and carving, and its approaching more nearly to the best period of Scottish Gothic, which, in much of its massive, severe character, is more nearly allied to the Early French than any other, and many details may be found identical in both. The side-walls have been kept perfectly plain, with the view of giving value to the richness of the clearestory, where the principal decoration has been concentrated, as being a leading feature outside and inside the building. It is contemplated to groan the ceilings throughout with stone ribs, and chalk or concrete filling, the latter presenting many very commendable features, both as to strength, economy, and lightness.

This is undoubtedly a very fine design, possessing much grandeur, harmony of proportion, and exquisite detail, and it improves upon one by familiarity. The grouping of the three spires would form a marked feature in a part of the city deficient in outline, and would unmistakably point out the church as the cathedral. As seen nearer at hand, too, either from east or west, the composition is unexceptionable; but to secure the finest possible architectural effect we would be inclined to adopt the author's suggestion of reversing the usual arrangement and place, what is usually the western feature at the east, so that the more important facade would be seen along the whole length of Melville-street. Several precedents, ancient and modern, can be found for such an arrangement both here and on the Continent, but there was always a good cause for it, and it may be contended that the mere securing of a better architectural effect is not a sufficient reason for breaking through an almost universally recognised practice, and one which is wound up with old associations and ideas.

The interior is even finer than the exterior. The relative proportions of aisle, triforium, and clearestory, are charming, as is also the distribution of the light, which is mainly from above.

Looking, however, to the matter of cost, we have grave doubts as to the accuracy of the architect's calculations. Probably, were the "wealth of images," and the spires left to be added in the future, the sum at command might be sufficed. But upon this subject the committee will doubtless be guided by the opinion of the professional man whom they are, we understand, to call to their assistance.

We do not agree with the author as to the worthlessness of the old manor-house which adjoins the site, and would stand close to its northern elevation. It is a very quaint and characteristic example of Scottish homial architecture, and its retention would enhance rather than detract from the effect of the new edifice.

Next in order we have a series of eleven sheets bearing the motto "Non ignote civitatis muni- ceps." The general arrangement is almost identical with that of the recently-erected cathedral at Inverness by Mr. Ross, and is thus described:—

* The author of the design bearing the motto, "Non ignote civitatis muni- ceps," submits the following remarks regarding his design for the proposed Cathedral of St. Mary:—The whole of the internal area, clear of columns, and excluding the choir, amounts to 11,061 square feet. This, divided by 7 ft. for each person,—the usual amount allowed (including passages) by the London Incorporated Society for the Enlargement and Building

of Churches, gives accommodation for 1,713 persons. Out of this must be deducted sundry spaces not available, so that the area may fairly be taken to give the required accommodation. Chairs in a building of this description are much to be preferred to fixed benches. For ordinary occasions, a space might be enclosed by temporary wooden barriers, as in Continental churches. As it is well known that it is more advantageous and more economical to keep the warming apparatus always in gentle use, there will be no difficulty in securing a proper temperature for week-day services. On Sundays the apparatus will be worked to its maximum. It is proposed to place the large organ, divided into two parts, in the western gallery, while a smaller instrument, to lead the choir, is placed on the floor near the stalls. The whole of the roof, except the aisles, are intended to be boarded, which will preclude any difficulty as to the preacher's voice being distinctly heard. The clock and peal of bells may be placed in the north-western tower. It is generally agreed that a complete cathedral should consist of three great divisions, arcade, triforium, and clearestory, and its parts should be nave and aisles, choir and aisles, transepts, and one or more towers. In the present instance the sum of money to be spent utterly precludes any central tower, and the author has consequently elected to put two towers at the west end, where they not only help the western facade, but perform the useful office of making the western ends of the aisles. The spires will be of wood, covered with lead, and the timber at the intersection of the nave and transepts will also be of the same materials. In view of the comparative smallness of the sum proposed (65,000*l.*), in relation to the accommodation required, it naturally follows that the fittings must be of the most simple character. In order to reduce the expenditure still more, the author would suggest, in case of necessity, the substitution of a continuous wooden barrel-roof for the stone vaulting in the nave and choir aisles. It should also be noticed that the figure sculpture could not be included in the sum, but would be a possible future extra.

The exterior of the design is wanting in dignity. There is, however, considerable beauty in the west elevation, with its two towers and leaded spires, which are quaint yet elegant. Were this design adopted, the call to reverse the orientation would be more imperative than in the preceding instance, the eastern elevation being somewhat monotonous and undignified. The interior is more impressive than the exterior, and would be much better without the meretricious colouring proposed to be introduced. We cannot say we like the effect of the slender shaft which runs up from the ground along the face of the cylindrical columns of the nave to meet the hammer-beams of the roof; nor do we much affect the tie-beams, which appear to be a necessary part of the construction. There is nothing national in the style adopted, unless it be the tartan costumes of the worshippers. The architect has conscientiously endeavoured to keep within the mark as regards cost, and we have no doubt that the design could be carried out in its entirety for the sum indicated.

Nine drawings, bearing the device of a white cross upon a circle of blue, are allocated to Messrs. Peddie & Kinnear. In the memorandum it is said that,—

"In preparing the accompanying design, it has been considered essential, in the first place, that there should be a grand central tower. Situated in the middle of an open space, and surrounded with houses of a classic character of architecture, the cathedral will harmonise best with the situation and the surrounding buildings if its leading feature be placed in the centre. Moreover, as the chief views of the cathedral, and the principal approaches to it, will be from the east, and as that end of the building will therefore be in some respects the most important, it is thought that this treatment of the design will give it a much grander and more imposing effect than if its main features were to consist of large western towers. At the same time, in order to mark more distinctly the cathedral character of the building, it has been thought that there should be two smaller towers at the west end. The general style of the architecture is Gothic of the best period, with as much as possible of the Scottish variety. Scottish Gothic is quite distinct from English Gothic. There are noble examples of it in the cathedrals of Elgin and Dunblane, the abbey of Sweetheart, &c., buildings which owe their effect to the grandeur of their general design and the simplicity of their details, rather than to elaborate ornamentation and minute carving. It has been sought to make the cathedral, which, from its position and size, will be the cathedral of Scotland, thoroughly Scottish in character. The accommodation provided is for 1,557 sitters exclusive, and 1,677 sitters inclusive, of the end gallery. As nothing is said in the instructions as to having a gallery, the design has been made of such dimensions as to give the required accommodation without it; and, accordingly, the gallery has not been included in the estimate of cost. It has been represented on the drawing, however, in order, to show how the design is capable of affording additional accommodation should it be required. The design has also been arranged so as to be adopted for a still farther extension of the accommodation, by introducing fixed seats or chairs in the large space under the great tower, between the choir-screen and the front of the pews. With the sittings in the gallery, and those for which this space has been left under the tower, the total accommodation would be 1,731. With no such provision for any extension of accommodation, the design might, of course, be reduced in size by about one-eighth, with a very material reduction in cost. The ground plan shows how the sittings may be arranged in pews, but in the internal view the pews are omitted, in order that the effect of the architecture may be better seen. Fixed pews are always destructive to architectural effect, and it is suggested that in the present case movable benches or

boyant type, with a strong suspicion of a German, apiky, element at the east end. The great central tower is here again surmounted by the open crown of St. Giles's carried up to rather a disproportionate height. The window tracery is somewhat monotonous and heavy throughout. The interior is pervaded by a feeling of flatness, which is not relieved by the commonplace panelling which takes the place of a triforium.

To sum up our remarks, this competition has brought out clearly that the local architects invited to compete are no match for their southern brethren in the production of a design for an ecclesiastical edifice. We have no hesitation in saying that there are younger men who have been kept out in the cold who would have been nearer the mark. Be that as it may, the trustees have got from each competitor good value for the retaining fee of 100*l.*, and they have secured at least two designs either of which if executed would provide a church of which any city might be proud, and which will greatly excel any yet existing in Edinburgh.

ON CHARACTER IN ART.

The word character, in ordinary language, has a meaning somewhat different from its original signification. It is one of the many words, in the English tongue, which have gradually assumed a conventional importance that is not their etymological inheritance. The original meaning is, a mark or incision. The old English word "ear-mark" is a good parallel. Hence the term was applied to those incised marks which designated vocal sounds, or numeral values, and which we usually call letters or figures. It is probably from the use of such terms as Greek characters, or Hebrew characters, that we became accustomed to convey by the word in question the idea, first of the entire form of an object, and then, of something more than its form, of its essential distinctions; or of the physiognomy, or outward indication by which such distinctive idiosyncrasy is expressed.

The word character, when correctly used in reference to art, has two distinct meanings, which may be traced to the gradual development of the import of the word. There is the character of the artist, and there is the character proper to the material in which he works. These two species of character are intimately related to, and react on, one another, but none the less do they convey two distinct ideas. Thus the character of the paintings of Greuze differs intelligibly from that of the paintings of Michelangelo. And thus, in the other sense of the word, the character of a relief modelled in wax differs from that of a relief modelled in clay.

The character of an artist is rarely to be grasped from a single example of his work, or rather it may be said that none but judgment of the most accomplished order can so detect it. But if numerous works of the same artist are collected together, the character that is common to them all may be observed at a glance. Here lies the secret of the value of such collections as contain numerous examples by the same master. Their instructive power, as illustrating the artist by himself, is very great. A remarkable instance of this is to be noted in the Hertford Collection, of which we some little time since gave an account. The visitor to that exhibition passed through a phase of positive education with reference to several of the artists there represented. Every one, for instance, is more or less acquainted with Greuze. Most of us have formed such a judgment of his works as to be able to recognise them at a glance. As to their ordinary motive, their style of handling, and the various qualities, good and bad, which are evinced in almost every example, there might seem not to be much that is left unsaid. But Sir Richard Wallace hangs side by side no less than twenty-two works by Greuze. Some of them exhibit as wide a difference in motive as is probably to be found between any of the productions of the artist. And yet the similarity of idea and of treatment,—in fact, the identity of character,—that pervades these twenty-two paintings, is such as to give the observer a peep, not only into the studio, but into the very mind, of the artist. Certain points are invariably evident. You gain such an insight into the mode in which Greuze looked at nature, no less than into that by which he represented it, that you can at once fix upon a subject that he would have chosen, and feel that it is the want, not of conception, but of manipulative power alone, that

prevents you from being able to show exactly how he would have painted it. Again, from the Murillos in the same collection, an idea may be formed of the character of that great master, at which it would have taken much time and much travelling to enable a student to arrive in the absence of so favourable an opportunity. Eleven paintings by Murillo illustrate so forcibly the main features both of his earlier and of his later style, that what, perhaps, you knew from authority you instinctively feel from observation. One sees the rare power and great breadth and grasp of subject which Murillo attained in his portraiture of rustic life. One sees the manner in which his ideas condensed and crystallised when, in his later days, he devoted his pencil to religious, imaginative pictures. Seven or eight Madonnas are hut repetitions of the same rather heavy, but no doubt very worthy, model. She is so impressed on the memory by repetition that she would be recognised again at a glance, under all circumstances and in any costume.

In fact, a study of this nature, of painter by painter, confining the attention for the time to the works of a single artist, leads the judgment to the unexpected conclusion that the great portrait-painters are the most imaginative of their profession. The view must be taken with reason, and expressed with due limitation. For, in the first place, it must be confined to that extremely rare class, great portrait-painters. In ordinary limners nothing can be less obvious than the display of imaginative power. Photography has no imagination; and persons who think that an accurate reflection or delineation of features constitutes a portrait, form, as is but too evident, the majority of those with whom we are acquainted. Again, when we rise from the very poorest to the second-rate portrait-painters, we find the individual character of the artist to be for the most part reflected, with inflexible fidelity, from his canvas. One English portrait-painter, of high rank, if we judge by fashion and by price, can be recognised in a moment by the polish he gives to the boots of his sitters. He ought to have been salaried by Day & Martin, or by Warren, whose famous cat, swearing at her reflection in a polished boot, was once to be seen on the walls of every European capital. Again, if we take an artist of much higher rank,—Sir Thomas Lawrence,—it is impossible to mistake the character which is reflected from himself over his subjects. It is, no doubt, a courtly and agreeable personality, but it is one which is so universally present in every portrait from his easel, that we are sure it must have been that of the artist, and not of his sitters.

But with the very greatest of all, the painter so grasped his subject that he projected it upon his canvas, untinged by his own personality. By the admirable skill, the art which conceals art, you may recognise the master; or, again, you may refer the portrait to one or two possible authors, but you can detect no treacherous mannerism, either of conception or of execution. This is eminently the case with the works of Titian. A judge may come to the conclusion that a given portrait can be by no other painter, because he can think of none who would rival it, but he might fail to be able to point out any distinct trait of the great Venetian. Thus the portrait of Julius II., in our National Gallery, by Raffaele, a well-known picture, repeatedly reproduced by the artist, might have been thought to be a work of Titian, if the history of the case had admitted of such an illustration. It may, indeed, be the case with reference to the portrait of the Pope, that the fiery character of the man so dominated the ordinary temperament of the painter, as to lead to the production of a picture of a peculiar style. But, speaking from memory, there is a portrait of Paul III., painted by Titian, which was in Lord Northwick's collection, which might well pass for a pendant to that of his successor to which we have referred. With Vandeyck, again, there is a variety in his finest portraits far greater than that which can be found in his Holy Families, saints, or other ideal compositions.

It follows from this view of the case that the characteristic style by which a painter may be almost certainly detected, by an accomplished critic, is something which is rather a defect than a virtue, and results from the limitation of the range of his ideas, the variety of his models, and the mastership of the procedures of his art. It is impossible to compare a number of paintings by the same artist without admitting that such is, to a certain extent, the case. Even in cases

of very high, if not of the highest excellence, the poverty of the human imitator becomes evident when we compare it with the rich variety of nature. In landscape, indeed, it might be supposed that nature would so fill and dominate the artist, that he would cease to originate, and would be content to reproduce. And so, no doubt, he thinks to do. But in his reproduction are ever present the two invariable elements of his taste and his method, or, at least, the special bent of his skill, when he attempts different methods.

Thus, Constable, Crowe, Birket Foster, Vicat Cole, to go no further than our own galleries, would each so represent the same scene that we should readily recognise from which easel it was brought. If we extend our limits, and compare a landscape by Claude with one by Salvator Rosa, or one by Doré with one by Turner, it will at once become evident how powerfully the idiosyncrasy of the artist is reflected in his delineation of nature. It would be a study worthy of the best care of the critic to ascertain, and to define in one or two appropriate words, the chief element of personal character in works of art. Thus, the landscape of Holbein may be characterised by one word—limpidity. The knotted branches of the trees in his work not only curve and bend with all the wild grace of nature herself, but their delineation seems to have floated from the brush. At times the artist is to be known by the mastery over, or the passion for, certain branches of his art. Thus we recognise Correggio by his magic chiaroscuro, combined with a skill in draughtsmanship that delights in what is most difficult to represent. In Rembrandt we have a chiaroscuro that is no less masterly than that of Correggio, but a taste that revels in effects of altogether a different tone. The broad Dutch build of the models of this artist is ever conspicuous, and at times is such as to pass the limits of good drawing. Again, in the great Venetian artists we are most struck by their sense of colour. The more the tell-tale characteristic of an artist is of a lofty and ideal character, as in the case of Raffaele and of Leonardo da Vinci, the higher is the grade in art. The more it partakes of sameness of conception or of truth of manner, the lower is the merit. As in the maxim *Summa ars est colere artem*, so is the highest character of an artist that which it is most difficult to define, and most impossible to imitate.

In character, regarded as impressed on a work of art by the material in which it is executed, we have a different subject of inquiry, and one as to which it is important that every student should make himself at home. It is connected with what we may call the personal character of a production in this natural and direct mode. Every artist, almost, if not altogether without exception, has his favourite or special medium. He may be able, indeed, to work in several or in many, to paint and to sculpture, to mould or to draw; but there will almost always be one method of production in which he will be most excellent. In that case, the material, or medium, will harmonise in its behaviour under the brush or the chisel with the special mode in which the artist most freely works, and the result will thus be characterised by a sort of intensified, or doubled, personality.

We may refer to wood as an art material which, more than many others, prescribes to the artist the character of his work. The soft and yielding nature of wood requires a certain breadth and holdness of touch, in the absence of which we have, not wood-carving, but upholstery. Mechanical means give a unity and finish of surface to wood which is excellent in its own place, but which, if called in to cover the imperfections of the carver, is simply odious. A wainscot-board, or a door, fresh from the plane, has a beauty of its own, consisting in exactitude and mechanical finish. But if we would adorn, let us say, a chimney-piece with fruit, foliage, or arabesque, the plane, the file, and the sand-paper become very dangerous implements. The true tool for wood is the chisel, and the chisel not used as a knife, but struck by the hammer. Hammer-wrought wood-carving, even if rough, has a certain form and breadth of a very high artistic value. In the finer details of work, such as the veins and the serrature of leaves, or even the limbs and hair of children, the true wood-carver never loses the essentially sculptural touch. But the inferior workman, unable to carry out the idea of the work by a blow, or a series of blows, uses his chisel to pare, adds the service of the file, and smooths all the life out of his work. If the material be ivory instead of wood,

the method of execution is very different. The chisel can then only be used with extreme care; and that for the sake of saving time, and not, as in the case of wood, as the effective and proper tool. For the hard and elastic material readily shivers under a blow, and unsightly black cracks are thus originated—hardly perceptible when the work is finished, but steadily increasing, probably by the growth of microscopic fungi, and seaming the surface with destructive blemishes. Again, the grain of ivory, while much finer than that of wood, is more tyrannical. It compels a certain method of treatment, and a certain degree, not only of finish, but of finish which must be produced by strokes given in a certain direction. Ivory agrees with wood in having the effect of any work executed in it destroyed by mechanical finish. That is one main reason why the work, which is now executed by Penton and other carvers, has not taken a higher rank in art. Ivory has an extraordinary tendency to form facets under the chisel or the burin, and these facets must be removed. The readiest way to do this is by the use of simple mechanical means. True artistic finish, in this material, consumes so great an amount of time after the work is apparently finished or all but finished, as to be entirely out of the question when price is at all an object. For this reason one of the most exquisite materials which nature has placed at the disposal of art has scarcely ever been worthily employed. Pure in colour, of a texture equal to that of onyx, and superior to that of alabaster, a perfect work in ivory has but one weak point, its comparative perishability. It requires to be kept from damp, from dust, and from darkness. It is easier to find carvers in wood to rival Grinling Gibbons, than carvers in ivory to equal H. Flammings.

Still directing our attention to plastic art, as that in which the character of the material employed by the artist is at once most varied and most pronounced, let us glance at the difference between clay and wax, as affecting the work of the modeller. It is well known to any one who has ever made essay of the modelling tool, how very different is the effect which the same amount of labour will produce in these two materials. The student instinctively would select one for works of a large size, or of a bold character, and the other for those requiring miniature delicacy of finish. For a rugged head of Jupiter or of Hercules the first would be appropriate, the second for the grace of a Psyche. Now we are told by Winkelmann that the Greek sculptors modelled in wax; and, indeed, the name of the sculptor of Sisyon, who first employed clay, is recorded. In this there must be an error, arising from the want of practical acquaintance on the part of the critic with the work of the sculptor. We have to inquire for what purpose the model was required. If it was for a sketch, or first outline of a conception, whether on a reduced size, or on a full scale, there can be no doubt that clay would not only be the most cheap, ready, and effective material for the sculptor, but that, from the evidence of the early antiquity of the art of the potter, modelling in clay must long have preceded modelling in wax. But for a statue to be cast in bronze, the case is altogether different. For that purpose wax was by far the most manageable material for the artist. It could be melted by a moderate heat, and would leave the matrix ready for the metal. The use of a clay core or model for a metal casting implies a more advanced state of art than the employment of a readily fusible material for that purpose. Now it is certain that the exquisite modelling of some of the finest Greek statues, more especially the delicacy of a wax model. At times this lovely modelling is absent, as in the trunk of the Belvidere Apollo. It is possible that this magnificent but unequal statue is a copy of a nobler original. But the grandeur of the head is opposed to that view. Again, the breadth and freedom of the drapery are strongly suggestive of the use of the true sketching material of the sculptor. If the Apollo was executed from a clay model, while works of more tenderly accentuated surface, such as the torso of Cupid in the Vatican, were copied from bronze figures, or from wax models designed for the work of the metallurgist, these anomalies might be more readily explained. The proportions of the Apollo are too exact to allow us to suppose that the statue is a Roman copy of a Greek work. Roman copyists, so far as our experience goes, were never precise in their adoption of those

definite laws of proportional girth which a modern writer on symmetry has shown to have been scrupulously obeyed by the great Greek sculptors. If the original Apollo was not intended to be a bronze, but a marble, statue, and was therefore modelled, not in wax, but in clay, the discrepancy between the grandeur of the head and the breadth of the drapery, on the one hand, and the comparatively rude modelling of the trunk, and want of exact symmetry in the limbs, on the other, may be readily explained.

The Apollo is a happy instance of the double signification of the term "character." We can, for instance, pronounce with certainty that the statue in the Vatican is not the work of Praxiteles. But whether it be owing to the special bent of the genius of the sculptor, or to the impress given to his work by the material on which he wrought, that we form our opinion, it is now hard to say. Thus, when an artist confines his operation to the medium most akin to the bent of his mind, and to the natural breadth or delicacy of his work, we have the result which, in a double sense, may be truly called characteristic.

THE NORTHAMPTONSHIRE EXCURSION.

On Monday morning, the 19th, were gathered at the rambling, roomy, old-fashioned George Inn, at Stamford, a party of some forty architects, mostly of the "younger persuasion" (as Artemus Ward might have put it), prepared for a week's sketching scramble among the churches of Northamptonshire, under the pleasant and trustworthy guidance (as on former similar expeditions) of Mr. E. Sharpe. The first day was occupied in sight-seeing and taking notes in the town of Stamford itself. With nothing so strikingly picturesque and antique as can be seen in Chester, Shrewsbury, and some others of our old towns, there is, nevertheless, about the streets of Stamford a quiet unobtrusive character and variety which is marked enough; gables and dormers break the line and come out from between the adjoining buildings, some higher, some lower, in a manner which is refreshing to eyes accustomed to the long dull lines of brick and horizontal cornice in our more modern towns; indeed, the sight of the low tiled building with its squat dormers, opposite the yard entrance of the inn, is enough at once to assure us that we have got away from the security of modern life for a little. The old life in Stamford must have been much brisker, though, when the place was one of the great coaching stages; now, the railway passes by the old town in a careless anticipatory manner, making it of little account; and, except for market-days, it would be difficult to guess how the large inns managed to keep it up, as in a lazy, easy-going way they seem to do.

A visit to

"Burleigh House, by Stamford town,"

(so Tennyson spells it, but it is "Burghley" here) formed the commencement of our inspections, by way of teaching the Gothic students what to avoid, perhaps. It is so consoling to see the smoke carried high above the roof, through classical columns, acting as flues, each couple carrying a small piece of architrave,—refreshing to the Gothic sense, too, to find the chapel marked externally by a spire, or something like it, a tribute to the "religious" prestige of Gothic architecture, combining, oddly enough, with the features of the Stuart period. It must be said, however, that this is the only incongruous feature in Burghley House, the rest being all quite in keeping, and some of the interior ornamental detail in the chapel and ante-chapel is really worthy of study and attention, as showing in the plaster diaper and the flat interlaced wood-carving a unity of effect and suitability to the materials employed with great beauty of execution.

As to the pictorial decorations, the walls and ceilings—

"Where sprawl the saints of Verrio and Laguerre"

(for many of the rooms are painted by these two worthies),—they are fearful and wonderful indeed,—wonderful for the time and industry spent upon an art into which so little of mind went, and fearful from other causes. But Verrio ought to have been a good scene-painter. His power of making painted architectural features look real is not contemptible; and there must be conceded a certain boldness (or impudence?) of conception in his treatment of the great room, with Heaven (Verrio's Heaven, save the mark!) on

the ceiling, and divers angels and others dropping therefrom, flying headlong from the cornice, and through the columns at the sides of the apartment. Then, on the staircase is Stothard's largest work, "Anthony and Cleopatra" (or "Intemperance"), far superior to Verrio, certainly, in refinement of conception and treatment, but marred by the artist's carelessness or want of study in drawing the figure, whose reputation, once supposed to give him a title to be called "the English Raffaele," does continually fade and decrease as knowledge of these things extends,—a consideration not without its lesson to us all. Touching the paintings at Burghley, it is not here we are to speak. Some of them are valuable and well known; but the impression left by the decorative treatment is that one has seen legs and arms enough to satisfy one for a long time to come. The masses of trees in the park, heavy and dark in the strong sunlight, were a relief, indeed, to look at after all this display of tawdry pseudo-art.

Afternoon was occupied mainly about the Stamford churches, two of which, at least, are not to be despised,—St. Mary's and All Saints'; the tower of the first named being Early English, and a very fine specimen. The rest of the church is not remarkable, except for a fine richly-decorated canopied tomb of late date. All Saints' Church affords an instance of the advantage of designing in reference to site and approach, for both the effect of this church is certainly owing to the fine and effective manner in which the tower, from its position, forms the background and culminating point of the composition as seen from the open square to the south of the church. In other respects this is a fine tower, though not equal to St. Mary's; and a highly-characteristic and individual feature in the external design is furnished by the wall arcading of lofty proportion and Early English date, which runs along the south wall, and forms the basement of the whole composition. It is unusual in Gothic work to find blank arcading occupying so much of the lower part of the wall usually devoted to windows, and carried out so continuously; and the breadth and solidity of expression thus gained might form a valuable hint for novelty of treatment in future buildings, ecclesiastical or secular. One of the most interesting buildings visited was Brown's Hospital, an almshouse or refuge providing accommodation for twelve aged persons, founded by one W. Brown, of happy memory, in the reign of Edward IV. This has recently been restored, and, in great measure, rebuilt, with additions, by Mr. Fowler, of Louth; and Mr. Sharpe bestowed decided and well-merited praise on the manner in which this had been effected, and especially on the care taken by the architect to leave incorporated, even in the rebuilt portions, enough of the old work to show clearly what had existed, and leave the architectural history of the building as little impaired as possible. The Dean of Stamford furnished some archaeological particulars as to the history of the foundation, and Mr. Fowler, who accompanied the party, gave some further information on the architectural side of the question. The present dining-hall is on the space formerly occupied by the small cells of the inmates, with the ambulatory between, leading to the chapel, which retains its old situation, and is shut off from the dining-hall only by sliding doors and fine wooden screens. The lines of the tiling on the hall floor have been so arranged as to mark the places where the cell partitions once stood, so that the floor is thus made an indelible record of the former arrangement. The stone is of the neighbourhood, with Ancaster dressings, and the grey roofing tiles so common in the district; the combination of these, with the delicate warm buff tint of the stone, forms a singularly pleasant and quiet harmony of tint. Looking at the grassed sunlit quadrangle, with these homelike-looking buildings surrounding it, those who had seen the Royal Academy this year could hardly escape an association with that other "Harbour of Refuge," which attracted so much attention; and the architecture, one is bound to add, is better than that of Mr. Walker's painting. In the audit-room above the dining-room, are to be seen some of the most beautiful hits of old stained glass that we have ever come across. Especially was to be noticed the delicate and beautiful execution of the heads, the hair, and beards etched on in thin lines, with the utmost lightness and transparency of effect. In St. John's Church is the memorial brass of the founder of the almshouses; the church, though with very good points, is not otherwise

specially noticeable, except it be for some better wall colouring in the chancel, in the present haphazard accidental style. St. George's, a poor little church, claims a word for the singular shape of the tower, oblong on plan (the longer axis north and south), and battering in the upper stage; another word, too, in recognition of a monument to Sir R. Cust, by Bacon; a female figure, life-size, with elegant pose, and remarkably effective handling of the drapery, leaning against an urn; a very good example of the work of a sculptor, in his day rated above, and in ours below his real merits. The font here, too, is worth attention for an unusual design, both simple and suitable. A walk of half a mile out of the town, along the course of the Welland, with long masses of wood in Burgley Park crowning the opposite bank, brings us to St. Leonard's chapel, now half dismantled, the existing portion being divided into a stable, &c. And here it is that we find the finest piece of architecture seen throughout the day, the beautified west front, of the finest type of early transitional work, with its noble recessed central portal of four orders, executed in that grey oolitic stone which is found often hard and sharp in buildings of this date, while edifices in the more perishable sandstones three centuries later have decayed beyond recognition. The party were detained long before this beautiful specimen of ancient architecture, and so home to dinner, "with what appetite we may," which happened to be a very good one. After dinner came some remarks from Mr. Sharpe, specially intended mostly for the benefit of the younger members of his flock, the "students" *par excellence*, and those who were not present at previous excursions; not, however, without observations having a wider tendency and hearing. After this nothing better could be wished for than a stroll up the street, to see St. Mary's tower transfigured under a cloudless moon, with a grey lustre on the broad surface of stone and black impenetrable shadow in the recesses, unless it were to lean over the bridge where the river rippled quietly in the moonlight, and study the dark reflections of the buildings and poplars on each side of the water. By daylight, it should be remarked, the view from this bridge either way is most picturesque, in a quiet way, in the irregular arrangement of the buildings on its banks; and might well attract the notice of one or other of our water-colour artists.

On the morning of Tuesday, the 20th, we set off early in carriages, after the old fashion, to go round some of the churches near Stamford. Of those thus visited, Offington, with its most well-kept churchyard, full of trees and shrubs, was the first: a small church of early transitional period; in general style and design quite a model for a small country church. Though we are specially on a Gothic expedition, we must give one word, however, to the gates and gate-pieces of the churchyard, and the larger and more elaborate gates, in the same style, of the grounds of a mansion opposite. These are in the English Renaissance style—what may be called the Jones period (or the ironwork may be later), and as good and admirable in their way as anything in the church. Tallington, a very small church not originally in our programme, need not detain us longer than just to record the existence of some bits of Norman work of some interest, and a good little transitional piscina, the headstone of which is formed by the sink-stone or cill of a former piscina, the inverted hollow of the old basin being visible on looking into the recess. West Deeping is like Offington, a model village church, but in the Geometrical style, with a tower and spire of the Perpendicular period—short, but remarkably well-proportioned and pleasing in composition. Adjoining this is a large new parsonage, in the most violent contrast of "patent compressed" red and black brick, with tuck-pointed joints. A stronger lesson on the value of tone in building material, and especially of having the tone naturally belonging to the district, could hardly be given than by the contrast between this staring abortion and the cool subdued grey tone of the church opposite. And throughout this district it is to be noticed how pleasing to the eye is the stone mostly used for ordinary building, and how thoroughly the constructors of these buildings have known how to use it. So picturesque is the arrangement of the masonry, that even the stone fence-walls of the fields and farms, with their thin courses of masonry, and delicately shadowed joints, innocent of pointing, are a

source of pleasure to the eye; and our party saw few pieces of work better and more truly architectural in its way than the park wall at Burgley, and some of the farm walls we passed in our drives. The system of coping most prevalent in the more carefully constructed walls of the district is so picturesque and effective as to be worth mentioning. It consists, over the ordinary masonry, of three or four courses of tiles, or very thin stones, each one set a little back from the one under it, and the whole crowned by a coping of semicircular bricks. One is surprised, at first, at noticing that all the stone-built cottages have brick chimney-stacks; but the stone, of course, is mostly limestone, and will not stand heat. A little bit of ornamentation seen in many of the roadside cottages is singular enough: the small gabled dormers have, as a finish, just under the apex, a crown-glass bull's-eye imbedded in the plaster or mortar. Some of our modern Goths are fond of using bull's-eyes in windows: here is another hint for them. But we must get on to the two Deepings; whereof the first, Market Deeping, is not a very remarkable church, but containing in the nave very good arcades, of different dates. St. James Deeping, on the contrary, is a very remarkable church indeed, both for beauty and peculiarity. The original church was part of a priory, founded in the reign of Henry II., and was evidently a church of three aisles, on the ordinary plan, and of unusual character. In its present condition, it offers the remarkable and unusual appearance of a church of two broad aisles of equal width, with a grand arcade up the centre. This is the south arcade of the original nave, the north arcade of which is replaced by a wall and lofty windows of the Perpendicular period; though a portion of the two eastern bays of the arcade is visible, built up in the later work. This north wall has settled and fallen outwards at least 15 in. out of the perpendicular, and so remains. In the centre wall, above the main arcade, is a remarkably fine triforium gallery, of late transitional date, originally forming the clearstory of the former church, the places where the windows were pierced being visible; but, now built up, as the new north aisle, of the Perpendicular period, is the same height as the other. The imposts of the main arcade present a most extraordinary and puzzling appearance, having, as the crowning member, the circular abacus, square on section, characteristic of late Transitional work, while beneath this the capital is arranged on the rectangular projections belonging to earlier work, and which, in such cases, the abacus usually follows. The appearance is, at first, as if pieces of an older capital had been worked up; but the fact that the member immediately below the circular abacus is in each case rounded to fit the curve of the latter, seems to indicate that the two parts were designed for the situation they occupy. If, so, a more odd instance of the confusion of style and manner through which Gothic architecture passed, in its struggle through the experimental Transition period, probably does not exist. The chancel contains some beautiful purely Early English work, and the exterior treatment of the north wall, both as to windows and buttresses, is remarkably fine, and unusual in manner, for English work. Altogether, St. James Deeping is a church to afford much, both for pleasure and instruction in the higher forms of architectural expression. The village cross at this place also should not escape notice.

Norththorpe, the next on the route, is also a highly interesting church, not in its main structure, but in regard to the noble and massive architecture of the south chapel, added in the Decorated period, and as notable for its beauty as for its individuality of treatment. Still more interesting is the old house and outbuildings a little way from the church; the portion towards the road, with its fine archway, long roofs and dormers, and small millioned windows inserted in the most desirable of masonry, should really be looked after by Mr. Boyce, whose masterly works in the Society of Watercolours' Exhibition have shown such a genius for handling this class of subject: he could make a very fine thing of it. We go from hence to Elton; the fine tower and spire of which, and the admirable and interesting detail, showing the transition from the Early English to the Decorated period, have been amply illustrated in published works. Helpston is a church of considerable interest and individuality, having an octagonal west tower with a small stunted spirelet by way of a finish, of the Late Decorated period. This is in reality old work, but has all been taken down and rebuilt,

on account of failure of some portions, within the last three or four years, and so carefully and judiciously has this been done, under the superintendence of Mr. Browning, architect, of Stamford, that there is really nothing to show, externally at least, that the tower has ever been meddled with. There are some remains of very good ancient tiling in the chancel floor, and two very singular bench-ends of stone, carved with grotesques, but almost exactly resembling what we are accustomed to see executed in wood in such a position. In taking down the tower, it was discovered that a good many tombstones had been used in the masonry, or stones shaped as tombstones; whether they had actually fulfilled that office before being converted into building stone cannot be ascertained. Bainton is a small church in very bad repair, with an exceedingly good tower and spire, with the mullions of the lucarne broken away, so that an unseasonably amount of daylight is seen through the spire. The most notable thing in the interior is a very pleasing memorial bust-relief, a single figure, by Westmacott: curious enough to meet this highly-wrought little specimen of modern art in the midst of the piled-up masonry and grotesque carving of the Gothic period, and in so primitive a little village as Bainton,—it seems to belong to another world. There is a good font, Early English, in the church. We finish up our day's circuit with Barnack, where, indeed, some of us wished we had come in the morning and remained all day. The nature of the main interest attaching to this remarkable church is pretty well known, and the Saxon tower has been engraved a good many times; but we question whether those who only know it by such means have a correct notion of the scale and mass of this tower, most of the published engravings being small and paltry, and the style of the architecture being very misleading as to scale, on paper. We do not know whether attention has been so much directed to the remarkable proportions of the nave arcade, especially on the north side (early transitional), which is carried by circular columns, not short and massive as we are accustomed to find them, but with a tenuity of proportion more like that of late Perpendicular work, and carrying great circular arches of so wide a span that the nave, though no small one, is included in three bays. The south arcade is considerably later, with excellent specimens of the beautiful stiff foliated carving of the later transition: and singular it is to contemplate the three types of capital collected together at the west end of the church; on the north the early transitional, with the square abacus and projections on each face, and still retaining the impress of Norman work; on the south, the circular abacus with its elegant foliage; and between these the so-called Saxon arch carrying the tower, with its strange abnormal plougings and furrowings in the stone, scarcely to be called mouldings, and producing on the fancy much the same effect as the contumplation of the bones of some mishapen extinct animal existing in a pre-historic period. What were the lives, what the notions concerning beauty and ugliness, of the men who have left us this strange travesty of architecture? We cannot get hold of this: we have before us the very stones on which they worked their fancies, almost as sharp and uninjured as if they had been put there only last year; and as to the men who did it, we can come no nearer than a conjectural belief that they were either Saxons or Danes,—words which to most of us are more names in themselves. One thing, however, we are sure of, that the men who left us this memorial of themselves were not a very kindly or affable race; for no stories of harsh semi-savage life could seem much out of keeping with the expression of these silent records, so intimately are artistic feeling and moral and mental temper connected.

The Proposed New Park for Ashton.

The committee have awarded the first prize, of 20l., for the best plan for laying out the Highfield estate as a public park for Ashton-under-Lyne and neighbourhood, to Mr. Alfred Lindley. The second prize, 10l., has been adjudged to Mr. G. Gill, Stalybridge. Great preparations are being made to secure the success of the show about to be held on the grounds. There is every prospect of an early laying out of the ground. The sum already collected amounts to about 7,000l., and no doubt is entertained as to the promoters obtaining the additional 3,000l. necessary.

NAMING.

Of course no one will insist on our endorsing all the complaints in the following communication. Any one custom in such a matter, too uniformly insisted upon, would no doubt give less pleasure on the whole than results from the use of fresh judgment in each case, and even from caprice, often the outcome of every way admirable instinctive feeling,—a better guide in delicate matters of taste than the coolest judgment. We, however, admit Mr. Pictorvaco's letter, though somewhat exceeding the space usually at command for the exposition of personal views, as it may lead to a proper confidence on some occasions where it would be usefully shown, and as the writer expostulates so good-humouredly with "his tyrants."

Sir,—Physiognomists, phrenologists, recognised character readers, and other professors of human nature, treat in the ordinary way of their professional occupations, of the qualities of the vile bodies submitted to their masterly analysis. They cannot, of course, do without eagle glances and quickly-formed conclusions; and one does not grudge them any of the glory pertaining thereto: who ever does envy or even underestimate the acts of his confessed superior? To what good purpose do cynics suggest that every such Sidrophel does his task more cleverly, if the sufferers are first interviewed by a Ralpho who, in the way of duty,

"seeks out

"And pumps 'em what they come about?"

Some people may, indeed, account thus for occasional surprises to patients and their friends, or for a want of correspondence with previous notions about well-known things or persons. Happily few of us are of that mind; the most being rather disposed in such event to augment their reverence, if only the operator sticks firmly to his tale; for has he not in such cases expounded what was previously unknown, and might but for his prestige and confidence have ever remained so?

Similarly the activities of funambulists, fortune-tellers, conjurers, prestidigitators, improvisators, and other like ready-witted or lissomed-bodied products of more (or less) civilisation, shall never find in me a depreciator nor smirking critic. Yet notwithstanding all this reverence and open-mouthed admiration,—notwithstanding a healthy willingness to achieve distinction or even worthy notoriety,—I have attained self-knowledge enough to readily confess that I am not anxious to exchange lots and depend for life on the sudden exertion of many supple muscles of brain or body.

Consider such accidents as failure of memory, as unguile wit—not to speak of undisciplined ignorance! Why, then—confessedly liable to such ills of flesh—and I nonchalantly puzzled by painters and sculptors (and architects, too, I suppose are to blame), with mysteries more mysterious than mere ozokeritis and agnosty columns,—to riddles readable, if at all, like Noystradamian and other prophecies, only by ingenuity most astonishing even to the interpreter himself? Why am I (and I suppose my experiences are shared by other lookers at art works) tortured by problems as distressing as ever racked the brain of a possible schoolboy—unknown to Macaulay,—in the shape of artfully draped queries hiding wild beasts of quadratics, or Sisyphian labours in deducing the present longitude of the schooner *Hum* from meagre data as to the personal history and state of the razors of her captain?

Why, in thirty-six words,—so that the patient reader may not in despair cease to listen for my grievance,—why are not the anathemas commonly pronounced against books without pronounceable and happy titles, and against books without indexes,—pronounced also against medallions, busts, statues and groups, pictures and portraits, public buildings and monuments without NAMES?

The walls of my church have recently been decorated in temper, in the best and most workmanlike manner, with the counterfeit presentments of (for the most part) venerable gentlemen in costly raiment. Here, however, all cavil is put out of the question. We are not content with the illumination afforded to the happy initiated by the emblems thrust into some hands and held loosely; and, for the sake of variety and character, clung to desperately by others, in order to restore balance to their dislocated martyred frames. These are supplemented throughout by labels,—scrolls, we call them, as

they are elevational perspectives of donhied (not rolled) strips of paper. And these are all inscribed as legibly as a writing-master's flourished frontispiece, or the grand starting-word of a bit of black letter. Can any one be astonished that the memory of this makes me indignant, when completely floored by the terrible child to whom I am explaining some unticketed modern masterpieces in stained-glass,—his nuttored mind leading his eyes, not to the features, or the Tyrian purple robes, but to the wonderful saw which has strayed from a museum into the figure's left hand; and this because I had foolishly forgotten the elaborate iconographical chart constructed with so much care and pains, and condensed for portability into the size of a Murray's "London." Not thus unfairly were spectators treated by the mosaic workers at Monreale or St. Sophia. They, though regrettably ignorant of English, and using characters to be found in no well-printed newspaper, seem to have done their best to give fair verbal descriptions of their works; albeit, if we are to believe the Ahhd Gravina, Salzenburg, and Texier, they indulged in a too uniform imitation of the vertical and erratic fashions of advertising tailors.

Do not let me be misunderstood as hinting that all pictures should be legibly labelled. No one would wish, for instance, that, in the great galleries of show-houses, the interpreting functions of the housekeeper or her handmaids should be in anywise superseded; especially when carefully made hand-charts of the pictures, that were correct when made, are to be found in every room. And the most perverse person would willingly forgive the Royal Academy for declining so heroic a task; seeing that, in that case, the rates of admission would of course have to be raised. It might, indeed, be objected that catalogues, even then, might possibly find a sale; but one knows that, in practice, the purchasing ceremony would be perversely omitted in too many cases,—with the additional evil consequence that visitors would be deprived of such ample memorial as they added to their stores in the last ("La Reine," of Vandyck) old master's catalogue. On the other hand, it would obviously be good policy to make it penal for print-sellers to exhibit in their windows prints before letters, etchings, or old engravings, without explanatory notices; and photographers or photo-sellers should be liable, at least, to forfeitures to respectable persons (claiming in proper form) if they omit to name legibly the portraits of eminent persons exposed for public observation and purchase.

Sculptors, also, are often the most merciless of my tyrants.

"Under hanging mountains,
Beside the falls of fountains,"

seated in pleasant gardens, by laurel hedges, the subject of a marble group, seen against the trees of the autumn, may form a tolerable subject for fanciful conjecture. Even here one craves the conviction that by custom there shall be a concealed name-bearing medallion discoverable by the initiated; but in a gallery to detect the special nature of each of these white-robed divinities, with their uniform perfect calm of soul! . . . The good Egyptian channelled and blacked letters of a name,—with a "sculptor" or "fac." after it, as a condescension to high art sentiments,—evidence one healthy habit; and perhaps, in caudor, the present custom of accompanying the Latin or Greek testimony to departed merit or to the existence of moral sentiment by the English original, ought not to be without its share of commendation. . . .

I wish, indeed, that this habit of sculptors could be considered to justify an architect's name, medallion or panel,—say on the eye-line in every modern building; or, if in the absence of special precedent the innovation should be deemed all.

* We are forced, by considerations of space, to omit Mr. P.'s remarks on painters' signatures, false warranties, the identification of portraits, the Gainsborough and Reynolds portraits of unknown ladies (4 and 6 in the Bedford-green collection), pointing the moral also on enigmatical titles, the difficulties of nomenclature, illustrated by the experience of Nathaniel Hawthorne, in the matter of "transformation,"—omitted in order not to overrule the authenticity of the communication, having in mind the experience of Dr. Livingstone, &c. From other practical suggestions, the following may, however, be selected.—In the national collections of pictures (for instance, at South Kensington) the dates of the deaths of painters should be filled in to the spaces prepared for them. Perhaps it might be better to omit the "D" till the year can also be supplied; otherwise, an extreme longevity is in some cases suggested for artists, that must be dubious, even to people not possessed of the systematic incredulity of Mr. Thoms. If the date, or even the approximate date, of the execution of a painting could be supplied, it would very frequently be valuable; this has been done,—"painted about,"—on different occasions."

too-violent, the allegorical fashion of Batrachus (frog) and Saurus (lizard) might be regarded with favour, as it has the prestige of many centuries; or initials; or rebuses, after the punning fashion of I (or eye)-slip, Bolt-tun, Ram-ridge, Wheat-hampstead (*locus frumentarius*), or before it if wit or fate (which, after all, has some share in a name), will allow. . . .

An inspection of a large, new, City-of-London building, not yet manifested internally to the vulgar world, affords me some very pertinent instances of the sort of anonymity I am deprecating. It has a big central nave, from which the recessed side chapels for study open by goodly ranges of pier-arches, and in the spandrels between these arches are carved heads of poets, other writers, architects, sculptors, painters, and what (*pace* of Mr. Gladstone and Mr. Ayrton) will probably always be known as men of science. Of course, these have all been copied from the best authorities, carefully modelled, and skilfully carved. I did, it is true, fancy that Shakspeare showed, what I called to myself, the conventional ideal, instead of either the homely sagacity of the Stratford bust, or the poetic elevation of the Chandos portrait. Also (as, for instance, in his case, and Michelangelo's, and Wren's) I fancied,—as, in fact, I often do elsewhere,—that my diminutive stature (under 6 ft.) unfitted me for seeing the works so fairly as I should have done before they were hoisted aloft; but this latter objection would, of course, lose its validity when the contemplated increase of physical dimension,—corresponding with the future intellectual height,—has been attained; and, indeed, in that still atmosphere, full of the (much diluted, let us hope) fragrances of Russia and vellum, with rows of Grainger, Lodge, and their congeners, and bulbous portfolios, with loose engravings by the thousand, placidly awaiting observers. Amid such company it might well bring a blush of shame to the cheek of an ingenuous, able-bodied, strong-wristed frequenter, if compelled to confess that any one of these faces was wholly unfamiliar, or anything short of perfectly identified at a first glance. Nevertheless, a stranger or occasional visitor of the existing dwarf humanity,—a weak-limbed innocent, to whose pitiless arms heroic grappling with many folios would be a task,—a born forgetter of faces with his untraversable eye,—might not these and others have their possible existence recognised, or not ignored? Would it not seem, in fact, that the few days which an alphabet-cutter would need to bestow on simple initials of letters might be a pleasing economy of human labour in the long-run?

I must, indeed, forbear to say positively that there would be a similar obvious advantage in pointing out in a readable way the companies,—from which the rampant animals have strayed, that stand guard at higher levels in this building over the corbels, lending support to the roof-tree. "Such ugly monstrous shapes elsewhere may no man read." Some may imagine that this menageric consists in seriousness of poetic conceptions,—Spenser-like warnings of possible transformations due to extreme devotion to apocian frenzies, appropriate here, as this hall is to serve as vestibule to the grand temple of that cultus,—

"Rearing fiercely their upstaring crests.

Sad and . . .
And mournful need of joyes delitious"
(Book II., Canto 12.)

We may thus conclude that some allegories might usefully be left to the interpretation of individual wit; but the omission of all legend round the numerous shields hereabouts seems not so well justified on similar grounds. Between the savage mockery of Lord Macaulay and the continuous exulting pean of an amateur herald, there must be in the country at large many gradations of sentiment;—one is, in truth, sometimes inclined to think that, as in many other things, a good deal of the variation in sentiment is due to the variation in degrees of ignorance. Letting that be as it may, many people (not, of course, everybody) would still maintain that carefully devised and arranged and carved shields, and indeed heraldry generally, might gain (as well as the onlookers) if some distinct idea were necessarily associated with the more or less graceful forms. A notion of this sort seems times and again to have occurred to actual builders, and as a consequence names and dates have been put on the grounds of the panels occupied by shields. But why should these freaks of subtle genius be so rare? Why should not,—in consideration here also of

human frailty,—every arms-bearing shield (and perhaps, after that, they are better than the blank ones that years ago seemed likely to become fashionable) he accompanied, as a matter of course, by the name of the lord who bears it (as his seal)? On occasion, why should not the quarterings be explained, in all the commonplace of readily decipherable inscription, thus:—

James Jones,
Member of the Committee,
A.D. 1888.

[Consider also the woes of future heralds, and the prodigious dimensions of a comprehensive Gwillim Edmondson, Burke, or Robinson of the year 2000; unless it shall be agreed that named and single blazons should not imperatively demand book perpetuation by the photo-chromo-instantaneous-printing of that period.]

I begin at this stage to fear that I have written myself into something like good temper and amity; and appear, in consequence, to find my grounds of grievance shifting away under me. In digging over the soil, I have seemingly made it less solid. My main personal complaint seems merely to be that guide-books, catalogues, and books of reference generally are sometimes big, occasionally of an awkward shape to carry, occasionally inaccurate, and frequently incomplete: not always at hand on a casual look into an exhibition, or at a public building or monument. Perhaps at any time one may be justified in repeating also the general complaint of the evil fate which, even in a real library, so often hides a wanted detail, and only yields it up as the reward of diligent hunting. On reflection, however, it becomes pretty evident that any one may, if he will take the trouble, provide himself with appropriate antidotes against a poisoned peace from these; except, indeed, in the last case,—of the revenge harboured in the frame of things,—which is beyond the reach of medicine. These antidotes would be in no wise outlandish or difficult to procure.—Artificial memory, unlimited patience and industry, streams of shillings, pockets of great hook-carrying capacity, and a sturdy muscular frame;—some strict limitation of subjects of interest.

This feeling of comparative indifference is, it may be, rendered all the more victorious by a sort of consciousness that so almost entirely virtuous and so prominent an example in these matters as the Prince Consort Memorial is likely to set a lasting fashion, and shortly prevent us (unless, indeed, we are forced thereby to turn our coats) from grumbling in the least at any hut the works of an older time. Ideal groups and single figures all named; the portrait subjects also; sculptors' names holdly put;—in cases, indeed, with the extra attention of crows' feet and lines to indicate the limits of sculptural responsibility: "Queen Victoria and her people" have shown in all a fair fellow-feeling for the forgetful, imaginative ordinary person. With the exception of names to arms, of which the omission is less wicked in this instance than ordinary, as their significance can hardly be misapprehended; harring also the want of a date or two to the portraits to make clear the chronological series,—though even this is not here indispensable, so obvious is the drift (and we owe it to the man who would dare to date some of them with firmness); the name of the architect is also wanting above the recognisable low-relief profile, so inseparably connected with the monument. With these exceptions, the most vehement vindicator of the value of naming could not ask for a better specimen of the rational following out of his theories.

Not of course that one wants to convey the impression that the right thing has not been done elsewhere as well. Dulwich School, with its range of terra-cotta portrait medallions above the one-pair story, all answering to names on the hollows above them, is another happy case in point; notwithstanding that keen youthful eyes or an opera-glass may be almost necessary to read some of the inscriptions around, and discern some of the lineaments of these heads of world-famous story, their height above the lower world doubtless being a few feet too philosophical.

The London University building in Burlington Gardens.— But why indulge in a sort of catalogue?

Having thus shown that naming is important, and should be uniformly attended to, unless certain effective substitutes are obtainable, and that good judgment in some new instances will be sure to influence the future, it only remains for me to say that no professional jealousy actuates

these criticisms, and to show that my works are most obviously not obnoxious to the complaints I have made against those of others by subscribing myself, sir,

Your obedient servant,
JOHANNES PICTORVACCE,
Dairyman's Landscape and Animal Artist; Still-Life and Animal Painter for Public-house Signs; Herqueins for Oils and Colours; Mangles;—also Lettering to the same, in every style.

THE STRAINS IN TRUSSES.*

THE system of exhibiting by means of diagrams the relative strains to which the several parts of a piece of framework are subjected when the whole is loaded with a weight, was propounded some few years ago by Professor Clerk Maxwell, but has not been used by engineers and architects to the extent that it deserves. The work before us will greatly aid those who are still unacquainted with the method, in applying it to various kinds of structures, such as trussed roofs and bridges. The author has, however, omitted all mention of Professor Maxwell as the author of the system, and any one taking up the subject for the first time might suppose that Mr. Ranken was himself the inventor of it, although he really makes no claim to be so, but only "to set in a clear light the theory and method of computing by diagrams the strains in trusses bearing a constant load," so that "it may be found intelligible even by those who have no previous knowledge of statics." In order to do this, he commences his treatise with an explanation of the mode in which forces are considered in statics, the principle of resultants and components, together with the parallelogram of forces in which the diagonal represents the resultant of the two forces forming adjacent sides of the parallelogram. The triangle of forces is a simple deduction from the preceding, or rather "another way of stating it." If three forces keep a point at rest, three straight lines drawn parallel to their directions will form a triangle whose sides, taken in order, will be proportional to the magnitude of the said forces. By this principle, if the direction of three forces and the magnitude of one of them are known, that of the other two can be at once determined by the simple process of drawing a triangle. When there are more than three forces to be considered, we can first find the resultant of any two, and combine it with another of the forces, and so on for any number. We can thus extend the principle to that which is called the polygon of forces, and which is stated as follows:—If any number of forces acting in one plane keep a point at rest, then straight lines drawn parallel to the directions of those forces, taken in order, will form a polygon whose sides will be proportional to the magnitudes of the forces. The author has omitted to demonstrate the steps by which the principles above enunciated can be reduced to the system of stress diagrams for triangular or polygonal trusses; but the following is a brief explanation of their connexion:—Suppose A, B, C, to be the joints of a triangular frame acted on by a force at each of those joints, which keep it in equilibrium; then, by the "triangle of forces," the lines representing these three forces must meet at some one point, D,—and be proportional to the sides of another triangle,—E, Q, R,—which are respectively parallel to the lines A, D, B, D, C, D. Then the stresses in the sides of the frame,—B, C, &c.,—will be represented by lines drawn from P, Q, R, parallel to those sides, and meeting in a point,—X; the lines P, X, Q, X, R, X, representing proportionally the strains in B, C, C, A, A, B. If the figure A, B, C, represents the centre lines of the beams forming the truss or frame, it is called the frame diagram, and the figure P, Q, R, is the stress diagram.

After giving several examples of the balancing of three forces amongst themselves to familiarise the student with the method of forming diagrams, he proceeds with the application to the ordinary forms of roof trusses, beginning with the king-post truss, and proceeding with more elaborate combinations of framework. Taking 12 to represent the load sustained by each truss, he finds by means of the diagram what portion of that quantity is borne by each part, and whether the strain is tensile or compressive; he assumes, however, that if a continuous beam is loaded uniformly, and supported in the centre as well as at each end, the weight

borne by the middle prop is twice the weight supported by each of the abutments, and when there are two equidistant props that each has one-third of the load to carry, the two abutments carrying the other third between them, and so on. This is not, however, the mode of dividing the load which is adopted by the latest writers on the subject, the proportions which they give being for one, two, or three intermediate props as follows:—

In the examples given in the treatise the strain on the king or queen post from the weight of the tie-beam is omitted "for simplicity," but if there is a ceiling to be supported by the tie-beam this would produce one of the most important strains which the truss would have to bear, and ought not in any case to be neglected, the chief business of the king or queen post being to prevent the sagging of the tie-beam.

The effect of the wind is by far the most important of the strains which a roof-truss has to sustain, and this is taken by Mr. Ranken in all the examples as a dead weight acting equally on both sides of the roof at the same time; except, however, in roofs of very low pitch, this would lead to very inaccurate results, as the force of the wind is almost always sustained by one side much more than the other, so as to produce a racking strain upon the framework, to counteract which the timbers must be made much stronger than if they had only to sustain a uniform vertical weight acting on both sides alike. The stress diagrams ought, therefore, to be always drawn on the hypothesis of the wind being at right angles to one surface of the roof, and the figures will then have a very different appearance to those given by the author.

A considerable number of examples are fully worked out for the frameworks of girder-bridges as well as of roofs, by mastering which the student will find that he has acquired great facility in the application of the principle to practical purposes without having to trouble himself about algebraical or trigonometrical formulas; these latter, however, cannot be dispensed with in considering trusses exposed to the action of a travelling load, as in railway bridges, to which this system of diagrams is hardly applicable. In applying the method to practical uses, care should always be taken to ascertain the exact mode in which the strains to be supported are applied, as otherwise very erroneous results will be obtained, by which the system may get into disrepute, whereas the mode of using it is really in fault.

The system of computing strains in trusses by means of diagrams has hitherto been too little known or practised by English engineers, and the present work, although not so accurate as might have been desired, will do good service for the profession by showing how easy it is in application after a little practice. We therefore strongly recommend all students of architecture and engineering to work out carefully the examples given in this treatise, as well as others which may arise in the course of their practice. They will by this means become familiarised with the relative strains which the several parts of a truss sustain, and be able to detect at once any weak points in its design.

THE HARTLEPOOL EXCHANGE AND CLUB-HOUSE COMPETITION.

SOME three or four months since the directors of the projected exchange buildings at West Hartlepool invited twelve local architects to submit designs, and after deliberation the New Exchange Company have committed themselves to a definite scheme for the erection of a block to a definite scheme for "The Hartlepool Exchange." The selected design is that bearing the motto, "On 'Change," the author of which is Mr. C. G. Hoskins, of Darlington.

The building will have three principal frontages. The style is Italian Gothic, having a tower, with angle turrets breaking the line of the north façade. The materials proposed to be used are red pressed bricks, relieved with stone dressings.

The Post-office authorities have had copies of the plans submitted to them, and probably the same post-office buildings, much needed for West Hartlepool, will form a separate department. The North-Eastern Banking Company are also in treaty with the directors for suitable accommodation here, and most of the offices in the

* The Strains in Trusses computed by means of Diagrams. By F. A. Ranken, M.A. Longmans, London.

building are already secured, on promise, by private firms in the town.

The same architects also submitted designs for a club-house for the Exchange Company, to be erected on a site facing the Exchange, and in this case also Mr. Hoskins succeeded in carrying off the prize. The building is in the same style of architecture as the Exchange.

It is understood that the directors have assured themselves that both buildings can be carried out for the estimated cost, and operations are expected to commence without delay.

THE CONSTANT SERVICE OF WATER.

SIR,—During the past week very important regulations have been issued by the Board of Trade relative to the fittings required for a constant service of water under the provisions of the Metropolis Water Act, 1871, all of which are tolerably clear except the last (No. 33), which says:—"All existing fittings, which shall be sound and efficient, and are not required to be removed or altered under these regulations, shall be deemed to be prescribed fittings under the Metropolis Water Act, 1871." But, inasmuch as "these regulations" do not in any part require specifically any fittings to be removed or altered, I am at a loss to understand the meaning of the clause quoted. A careful perusal of the regulations, and a clear and succinct account of what is required of property owners under them, would repay a journal so largely devoted to sanitary science, and so widely read by property owners, more especially as in so complicated a matter the water companies will make every endeavour to stretch their powers to the utmost limit, and to withhold all possible information from the public.

BALL VALVE.

WASTE IN WARMING.

At the meeting of the British Association which has been held with remarkable success in Brighton, Mr. Bramwell, C.E., as president of the Mechanical Science Section, dilated on coal and the means of obtaining power without coal. After speaking of the amount of coal left buried in abandoned mines, the speaker said,—Next there came the question of the waste of coal when brought to the surface. This was of two kinds, the domestic and the manufacturing. The domestic waste was a highly important branch of the subject. It is believed, said Mr. Bramwell, that out of the total of 98 or 99 millions of tons of coal which in 1869 were retained for home use, 18½ millions of tons, about one-fifth of that quantity, were consumed for domestic purposes. We all of us know so intimately the way in which coals are burnt for domestic purposes that it will seem an idle waste of time to describe it. We put a grate immediately below and within a chimney, and, as this chimney is formed of brickwork, by no possibility can more than the most minute amount of heat be communicated from the chimney to the room. On this grate we make an open fire. Fire cannot burn without air, and we provide no means whatever for the air to come in to the fire. This is a provision that not one architect or builder in a thousand dreams of making. The consequence is that the unhappy fire has, as it were, to struggle for existence. In a well-built house especially has it to struggle, for the doors and windows shut tightly. The result is that the fire is always smoking, or is on the verge of smoking. We breathe the noxious gases, and we spoil our furniture and pictures; nevertheless, happily for us, the fire does succeed in getting supplies of air which, even although insufficient for the wants of the chimney draught, do renew the air of the room. If, to satisfy the demands of the chimney, and to stop its smoking, a window is left a little open or a door is set ajar, we complain of draughts and we complain of the unhomey look caused by sitting in a room with an open door, so that there we are, with an asphyxiated fire, our smoky rooms, and our draughty rooms. Moreover, the fire being immediately below the chimney, the main part of the conducted heat inevitably goes up it and is wasted, leaving the room to be warmed principally, if not entirely, by the radiated heat; and we do and suffer all this in order that we may see the fire, and be able to poke it. I must confess that if there were no cure for the evils I have described other than the close stoves of the Continent, with the invisible fire and with the want of circulation of air in the room, I would rather put up with the whole of our present domestic discomforts, and even with the loss of heat, than resort to the close stove as

a remedy. But there are modes by which freedom from smoke, freedom from draught, efficient ventilation, and utilisation of the heat may all be combined with the presence of the visible pokable fire. Some members of this Association may recollect the paper that was read before it at the Norwich meeting in 1868 by Captain Douglas Galton, in which he so clearly described his admirably simple invention of fire-grate. This consisted in putting a flue to the upper part of the fire-grate, which flue passed through a brick chamber formed in the ordinary chimney, which chamber was supplied with air from the exterior of the room by a proper channel, and then the air, after being heated in contact with the flue in the chamber, escaped into the room by openings near the ceiling, so that the room was supplied with a copious volume of warm fresh air, which did away with all tendency to draughts from the doors and windows, and, moreover, furnished an ample supply for the purposes of ventilation and combustion. These fireplaces, I regret to say, have been but little used in England, from a cause I shall have to advert to hereafter—a cause which, as I believe, stands in the way of adoption of improvement generally. The merits of these fireplaces were at once acknowledged by the French, who made the most careful and scientific investigation of their working; and they found that with such fireplaces three times the effect was obtained from a given weight of coal that could be got with those of the ordinary construction. No doubt there are many other plans by which the same end as that attained by Captain Galton may be arrived at, and yet we go on year after year building new houses, making no improvement, exposing ourselves to all the annoyances, and, worst of all, wasting the precious fuel. Assume that we were to set ourselves vigorously to work to cure this state of things, can it be doubted that in ten years' time we might halve the consumption per household, and do that not only without inflicting any discomfort, or depriving the household of any gratification, but with an absolute addition to warmth and an increase of cleanliness, a benefit to health, and a saving of expense? Moreover, it must be remembered that, with the imperfect combustion of domestic fires, large volumes of smoke are poured into the air. We know how much freer from smoke town atmosphere is in summer time than it is in winter time, and this simply on account of the smaller quantity of coal that is being burnt. Suppose that we could reduce the total consumption, both in summer and in winter, by 50 per cent., what an enormous boon that would be even in the one matter of a pure atmosphere.

THE DIMINUTION OF ORIGINAL RESEARCH.

At the British Association meeting already referred to, Dr. Hall Gladstone, F.R.S., as president of the Chemical Science Section, drew attention to the diminished activity of chemical discovery, and to the lamentable fewness of original papers communicated. This has been attributed chiefly to the "non-recognition of experimental research by our universities," and suggests that in the granting of science-degrees every candidate should be required, as in Germany, to prove his ability for original investigation. Concurring in this, I would remark that other causes have also been assigned, and other suggestions have been made. There is the small recognition of original research even by our learned societies—at least, such recognition as will come home to the understanding of the general public. It is true the fellowship of the Royal Society is awarded mainly for original discoveries, and there are two or three medals to be disposed of annually; but these distinctions fall to the lot of the seniors in science, often men who are beyond the need of encouragement; and though they doubtless are serviceable as incentives, there is many a beginner in the honourable contest of discovery who is too modest even to hope for the blue ribbon of science. While the Victoria Cross is awarded to few, every soldier who has borne part in a victory expects his clasp; and so might every man who has won victory over the secrets of nature, fairly look for some public recognition. It has been suggested, for instance, that the Royal Society, in addition to the F.R.S., might institute an Associateship, with the letters A.R.S., designed exclusively for those younger men who have shown zeal and ability in original research, but whose discoveries have not been

sufficient to entitle them already to the fellowship. It is suggested, too, that the Chemical Society might give some medal, or diploma, or some similar distinction to those who contribute papers of sufficient merit. But beyond this is the non-recognition of scientific research by society in general. We can scarcely expect the average enlightened Englishman to be anything but scared by a graphic formula, or a doubly sesquipedalian word containing two or three compound radicals; but he need not continue to talk of the four elements, or of acids being neutralised by sugar. But, indeed, the so-called educated classes in England are not only supremely ignorant of science, they have scarcely yet arrived at the first stage of improvement—the knowledge of their own ignorance. Then, again, there is the excessive preference of practical inventions over theoretical discoveries—or rather, perhaps, the inability to appreciate anything but tangible results. Thus, a new aniline compound is nothing unless it will dye a pretty colour; if we speak of the discovery of a new metal by the spectroscope, they simply ask, What is it useful for? and the rigorous determination of an atomic weight has for them no meaning, or interest, or beauty. The general appreciation of science must be of gradual growth; yet there are wealthy men who know its value, and who might well become the endowers of research. There are, indeed, at present, funds available for the purpose—such as the Government grant and the surplus funds of this association; but the money is given simply to cover actual outlay; and this, though very useful, scarcely meets the case of those young philosophers who have no balance at their bankers, and yet must live. Will not some of these wealthy men endow experimental scholarships, or professorships, in connexion with our colleges, institutions, or learned societies? As an instance of the good that may be effected in this way, may be cited the Fullerian professorships; and as a very recent example, worthy of all honour, may be mentioned the purpose of Mr. J. B. Lawes, not only to continue his elaborate experiments at Rothamstead throughout his lifetime, but to place his laboratory and experimental fields in trust, together with 100,000*l.*, so that investigations may be continued in the wider and more scientific questions which the progress of agriculture may suggest. The Government of our country, through the Science and Art Department, renders good assistance to the teaching of science; and if the recommendations of the Royal Commission on Scientific Instruction and the Advancement of Science be adopted, the introduction of practical examinations for the obtaining of certificates for a superior grade of science-master will certainly foster a spirit of research. I believe that this diminution of original research, which we deplore, is partly due to a cause in which we rejoice—the recent extension of science-teaching. The professorships of chemistry are scarcely more numerous now than they were twenty years ago, while the calls upon the professors' time in conducting classes or looking over examination-papers, have greatly augmented. Thus some of the most capable men have been drawn away from the investigation of nature; and in order to afford sufficient leisure for the purpose, means must be found to multiply the number of the professorships in our various colleges. While the rudiments of science are being infused into our primary education, now happily becoming national, while physical science is gradually gaining a footing in our secondary and our large public schools, and while it is winning for itself an honoured place at our universities, it is to be hoped that many new investigators will arise, and that British chemists will not fall behind in the upward march of discovery, but will continue hand in hand with their Continental brethren thus to serve their own and future generations.

OF THE ACTION OF SEWER GASES UPON LEAD.

At this season of the year nothing is so painfully persistent, so obnoxious, and so patent to our observation as the intolerable smells which proceed from defective water-closets. The nuisance needs no special medication from us, to any one who has given the least attention to the subject, or bestowed upon it the slightest scientific examination.

It is now generally allowed that much of the evil is due to defective soil-pipes; and on this topic we may say a few words explanatory.

Some time ago, as our readers will remember, Dr. Andrew Fergus drew attention to the very grave subject of the chemical action of sewer gases upon lead, and to the fatal consequences which often result from that somewhat recondite and unforeseen cause. It is hardly possible to overestimate its importance; and, indeed, we are rather surprised that the paper has provoked so little discussion hitherto. Of course this subject of the corroding and perforation of leaden soil-pipes through the chemical action of the sewer gases is, as our readers must know quite well, not new to us. We have long been aware of the evil; indeed, we have had painful experience of it in our professional practice. The disastrous circumstances attending a rotten soil-pipe are obvious; and we venture to assert that the evil is very much more widely distributed than most people are aware. Dr. Fergus deserves high commendation for his observations and researches; and we regard it as a most hopeful symptom of sanitary progress that intelligent physicians are every day becoming more alive to the evils which are wrought by defective construction.

The day is fast approaching when the physician will find it as necessary to examine, or, at least, cause to be examined, the house drains and the water-closet as regularly as he does his patient's pulse or the state of his tongue! What an important fact it must be, for example, to ascertain in a case of typhoid fever whether the soil-pipe communicates with a sewer or with a cesspool! How many cases of diarrhoea might be discovered to originate from the scandalous practice of connecting the waste-pipe of the cistern (having, of course, a close lid too) with the trap of the water-closet? We have known instances of a whole family of children being stricken down at one time with scarlatina in its very worst form in consequence of the nursery being placed in close contiguity to a foul and defective water-closet.

It may be alleged in such cases, with the highest probability, that the water-closet was imperfectly constructed, and it may easily be admitted that neither the water-closet itself nor the soil-pipe to which it was attached was made of good materials in the first instance, or properly fitted up in the second. Our whole building jurisprudence is unquestionably at fault in this matter, for it is absolutely left, as the law stands at present, at the option of any speculative proprietor, or any needy contractor, to do what seemeth just in his own eyes, in this most vital and important constructive detail.

The stoutest and best-made leaden soil-pipe in the world cannot long resist the action of sewer gas; and as supplementary to the statements already mentioned, we may briefly indicate how this curious yet dangerous consequence occurs. That which is popularly termed "sewer gas" consists in reality of a compound of different sorts of gases;—sulphuretted hydrogen, hydro-sulphuret of ammonia, carburetted hydrogen, carbonic acid of course, and minute traces of certain other gases, including arseniatted hydrogen, when the sewer becomes impregnated, as it often does underground, with coal gas. Of these highly noxious and dangerous gases, the two first mentioned constitute the greatest bulk of the compound; and of those two again, sulphuretted hydrogen chiefly predominates. Now this abominable gas, which the merest tyro in chemistry must be acquainted with from its disagreeable odour—that is simply of rotten eggs—has a well-known and specific action upon lead. Indeed, it is beyond all question the best analytical test for lead; a fact which signifies, in other words, the greatest chemical affinity. Although it occurs in nature associated with certain mineralogical groups, it is far more frequently produced by the decay and decomposition of organic substances, such as albumen, fibrine, caseine (e.g., as in eggs, flesh, or cheese), and in the rest of the so-called proximate principles of organic chemistry. Almost all decayed animal and vegetable matters evolve this gas. Indeed, it would seem to be a wise and salutary provision of nature to make the process of decomposition in all its phases offensive, and these decomposed principles our readers will be at no loss to account for, some of them at least, in the substances which (always speaking collectively) we term *sewage*. The residuum of sewage is that which goes to make up the contents of all soil-pipes, cesspools, and cesspits, of whatsoever description or denomination. Few people who are not well read in organic chemistry understand what a quantity of sulphur is necessary to the waste and reproduc-

tion of the tissues; and still fewer, we are afraid, that this sulphur, wholesome in the highest degree, and indispensable to our nutrition, when it occurs in our food, becomes by an inscrutable law of nature a deadly poison. The truth is, that this poisonous gas simply dissolves the metal (lead) and perforates the tube which constitutes the soil-pipe, and finally escapes itself, mixed with all its infernal death-producing congeners, into our bedrooms, our drawing-rooms, and even our very dining-rooms. It may be added that this is done continuously,—under certain circumstances irresistibly,—but, above all things, silently and unseen. The whole of these sewer gases are colorless and invisible; however dangerous, however poisonous, they may be, they are always unseen and insidious. It needs an acute and practical nostril, for the most part, to detect them; and, in point of fact, in many instances, where the house is properly and systematically ventilated (especially during the day), it is almost impracticable to detect them at all, even by their vile and noxious smell. When it is added to these remarks, that hardly such a thing as a perfectly sound and complete system of sewerage, far less of house drainage, exists in any of our large towns, it will at once be seen what a dangerous and wide-spread public enemy we have to contend with.

PROPOSED LUNATIC ASYLUM, ST. ANN'S HEATH, VIRGINIA WATER.

We have already spoken of Mr. Holloway's intention to erect a lunatic asylum for the unsuccessful of the middle classes, and to present it to the country, and of the designs for the building that had been submitted to him in competition, under certain conditions. We published a view of the design to which the second premium was given,* and we now illustrate, by view and plan, the design sent in by Messrs. Crossland, Salomons, & Jones, to which the first premium has been awarded. In this design the architects have avoided the ordinary gallery system, their experience being, they say, that it does not conduce to the comfort or general management of the building; and in this matter medical men and general managers of asylums consulted have confirmed them. The general form of the building is such that all day-rooms, dormitories, and single rooms have a south and south-western aspect, and the mode of communication is by corridors 7 ft. wide.

The patients are classified as follows, on the male side:—

There are four classes,—first-class patients, second-class patients, sick and feeble, and excited patients, in the following proportions. The female side similarly arranged:—First-class patients, 35; second-class, 30; third-class, 15; fourth-class, 20.

The proportion of single rooms to each class is as follows:—

First-class:	6	single rooms;	29	in dormitories.
Second-class:	5	"	25	"
Third-class:	6	"	9	"
Fourth-class:	8	"	12	"

All the feeble patients are to be on the ground and first floors. Provision is also made for fever or contagious cases on the upper floor, with separate stairs, with dormitories for five or more beds, spare rooms, separate kitchens, &c., for nurses, with cubical contents in dormitories of from 1,600 ft. to 2,000 ft. for each patient. The floors of these rooms are to be of oak, with fire-proof arching. The attendants are placed between the day-rooms and dormitories, with a glass window or doors of communication, and so arranged as to afford the means of overlooking the patients. There is also a bedroom for the night attendant in a quiet portion of the building, where he can sleep during the day. Extra rooms, both for attendants and patients, are provided on each side of the buildings. The associated bedrooms, as will be seen on the plans, are so constructed as not to contain less than four or more than ten, and all under the supervision of the several attendants.

All exuberance of ornament and expensive detail is avoided, and it is sought to obtain an effective building by a judicious arrangement of parts. The buildings are to be of red bricks, with stone arches and string-courses, small turrets carried up over the staircase, and made available for ventilation. A large tower carried up over the central staircase will contain a large tank for the supply of all the other cisterns, and

to be used by hydrant in case of fire. In the smaller towers are the cisterns for the supply of hot and cold water for the several baths, lavatories, and W.Cs. The arrangements will be understood on reference to the plans.

The buildings are approached from the south, with suitable lodge and gates. The general entrance to the building for patients, &c., to the porter's room, the committee-room, the visitor's room, the superintendent's office, the clerks' and steward's offices, storerooms, and other offices, is on the north side; there being one general entrance to all, with a road diverging to the stores.

The accommodation for the male and female patients is kept distinct on either side of the central entrance and grand hall. This central grand entrance and staircase is only used for visitors on state occasions, leading up to the entertainment hall. The building on each side is divided, as before mentioned, into wards, with four attendants to each ward.

The building consists of three stories; the upper story being exclusively devoted to sleeping accommodation.

There is provided in the basement, central on both sides, a series of rooms for a Turkish bath, hot-air and vapour bath.

The kitchen is placed central to the whole establishment, surrounded by the several stores. Attached to the kitchen is a large serving-room, with lifts to each floor.

On referring to the plan, it will be seen how convenient the arrangement is for the distribution of food to each department. Sleeping accommodation is provided for the servants over part of the stores, with separate stairs, and altogether distinct from the rest of the establishment.

A large hall is provided central to both sides, having service-rooms and lifts from the kitchen, so as to serve for public dinners if required; also cloak-rooms for ladies and gentlemen. The hall is fitted with a platform at the end, and a gallery is provided, which may be made available for an orchestra.

Provision is made for the following officers:—

Medical superintendent—Two sitting-rooms, library, five bedrooms, bath-room, kitchen, and necessary offices, and so arranged that the servants are barred from all communication with any part of the general buildings.

The assistant medical officer, the steward, and housekeeper have each one living-room, one bedroom, and bath-room; the chief attendant on each side, a bedroom, and separate room to be used as store or office. The steward's rooms and office are close to his stores, on the north side.

Wine, beer, and coal cellars in the basement. All coals are carried up to the several floors by lifts, and there is a shoot from each floor to the basement for ashes. Close to the kitchen on each side is a separate dining-room for the attendants.

Sleeping accommodation is provided for the domestic servants in the centre of the building, with a servants' hall and W.C. The day-rooms are so arranged as to have ready access to the airing-grounds; those for the aged and infirm are on the ground-floor. A billiard-room is provided on the third floor, close to the central tower.

On the ground floor on each side, near to the centre of the building, is a library for male, also separate one for female, patients.

The associated dormitories, for clean and healthy patients, have from 60 to 80 superficial feet for each. The separate sleeping-rooms for the first-class have 170 superficial feet; and second-class, 85 superficial feet. The water-closets in all parts of the establishment are to be arranged on the same system, each water-closet ventilated separately by a pipe passing to the outer air from below its trap, so that the sewer gas will pass away through it. This is extra to the special ventilation of the drains.

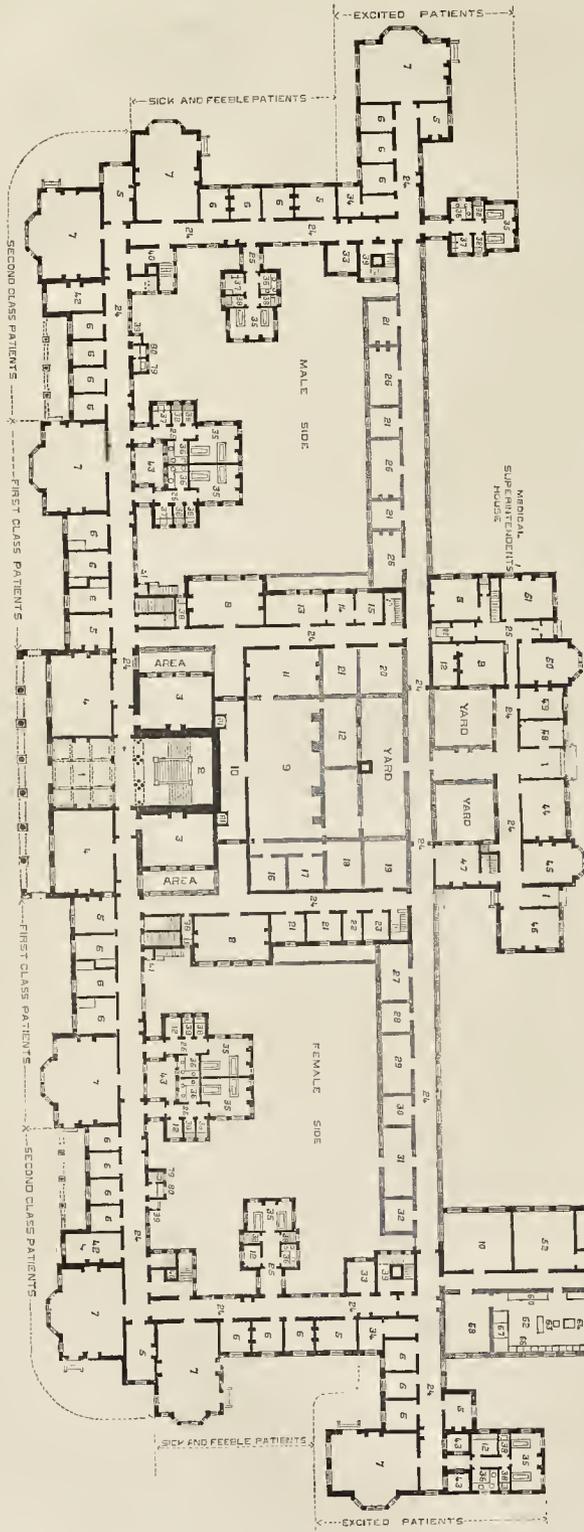

A special compartment is to be constructed in a large chimney to be used for extracting foul air from the drains.

The system of ventilation adopted is that used in other buildings of this class; foul-air flues from each of the single rooms and dormitories into a horizontal flue in the roof, leading into a ventilating shaft, and by means of rarefaction extracted. The fresh-air flues are from the basement, where the air is warmed. The ventilation of the dormitories is effected by gas-burners placed in the ceilings, and carried in flues in the walls. In the extracting or ventilating shaft in the towers, hot-water cisterns are placed, so as to rarify the air. All the flues are to be lined with glazed socket drain-pipes, and all the external walls are to be hollow, with 2 in. cavities.

PROPOSED LUNATIC ASYLUM, ST. ANN'S HEATH, VIRGINIA WATER, WINDSOR.—Design to which First Premium was awarded. Messrs. Crossland, Salomons, & Jones, Architects.

DR. CARPENTER ON NATURAL LAWS.

The address of Dr. Carpenter as president of the British Association must have taken a great many of his colleagues by surprise, and has opened up a fertile field for discussion. "I open," he says, "to satisfy you that those who set up their own conceptions of the orderly sequence which they discern in the phenomena of nature, as fixed and determinate laws, by which these phenomena not only are within all human experience, but always have been, and always must be, invariably governed, are really guilty of the intellectual arrogance they place in the systems of the ancients, and place themselves in diametrical antagonism to the real philosophers, by whose comprehensive grasp of penetrating insight that order has been so far disclosed."

The absolute infallibility of scientific deduction, accepted without careful comparison and analysis, has never been taught either by ancient or modern philosophy. That not an established fact in science which requires unshakable phenomena as natural law; it is her vocation not to create, but to discover; and the fallibility of man is shown by the practical application, and not by the revelation, of natural laws. Let us take, as an illustration, the principles upon which an iron girder or a bridge is constructed. I presume it will not be contended that the parabolic transmission of the strain can depart under any circumstances on the law of gravitation, and if a weak portion of such a girder exists, it is in the manufacture of the iron and not in the natural fibre of the material; or it arises from a formula misapplied, or an error of calculation, and consequently a false distribution of power. It has, therefore, in its creation, a conceivable element failure, which is a negative proof of the infallibility of natural laws, since the inferiority of a material or the insufficiency of sectional area is open to positive demonstration, either by the method of investigation of the formula, which was founded upon a series of practical experiments upon the tensile or compressive qualities of iron, occurring in that "orderly sequence" against the belief in which we have been warned by Dr. Carpenter. From the practical success that is the result of those formulas, may consider them to be "fixed and determinate laws."

The soundness of scientific inquiry is built on precedent by the faculty of deduction, which can only arrive at a faithful result by a series of comparisons: a multitude, as it were, converging lines to one common centre of elevation. This must establish the truth of any scientific inquiry before it can be tested by a practical trial. In speaking of the discoveries of Kepler, Dr. Carpenter says, "The first, that of the revolution of planets in elliptical orbits, was based on study of the observed places of Mars alone; night or might not be true of the other planets, so far as Kepler knew, there was no reason why the orbits of some of them might be the concentric circles which he had first proposed that of Mars to be." The contention by Dr. Carpenter is the answer to his objection: there was no reason in the absence of scientific evidence of "this application to other planets." Here was wanting that very crucial deduction without which no man of science would have been warranted in concluding that because a law was obviously governing the elements of one, it was equally controlling the elements of the planets. In my late articles on the Harmony and Application of Natural Laws, for which you were good enough to find space in your columns, I may, perhaps, have toned down some satisfaction (in agreeing in one respect where I have differed in many from some authority), that I dwell especially upon the necessity of the labour and patience of research, as the only means by which we could be liberated from the entanglements of falsehood and error; and, knowing the truth, by that knowledge to be made free.

In considering this question in its religious aspect, it cannot be said of the artist, of the philosopher, or the philosopher, that he is distinct from the others in his interpretation of nature; in the religious application and ethics of natural laws, the two former are distinct from the philosopher, as they are often the expounders of things which are unseen, and the basis of religious teaching is therefore that of faith. Science does not admit of anything like that which the artist knows to be sometimes essen-

tial, the accident of his picture, the shadow of a cloud which is not upon his canvas. She can raise no emotional feelings like the poet, from the source of ideality; she cannot draw from the beautiful well-spring of legendary lore. She must be true only to herself, or she will be false to the great principles she expounds. Her region is that of formula and fact; upon the former the latter must be built, and the deductions which are the result are the truths of science, and are in unison with natural laws. On one occasion I heard at a philosophical discussion this astounding statement from a clergyman of the Church of England, "that formula was only another name for going round about truth, and never arriving at it." Religion gains nothing by statements such as this, and she loses much,—she loses that tolerance which should exist between science and her own professors. It aggravates the antagonism already existing, and widens the breach which I believe it is within the province of science to surmount.

Science, by the application of natural laws, may not only achieve the purposes of the Creator, but it is fulfilling the very ordinance of religion by "the light which it causes to shine before men," but we cannot start with religion, and strive to reconcile the immutable laws of nature with every one's preconceived doctrine of theology, but must rather be led, by the comprehension of natural laws, from—

"Nature up to Nature's God."

BYNG GIRAUD.

LIGHTNING CONDUCTORS.

The electric peculiarities of this season have led to a discussion of the subject of lightning conductors in the Times. In a letter signed "E. B. Denison" the writer says,—

"When I was managing the fixing of the Westminster clock, I found that Sir W. Snow-Harris had actually embedded the conductors of the clock-tower,—flat copper bars,—in the walls, and he did much the same at Exeter Cathedral, and in the wooden masts of ships. In fact, glass collars are hardly less absurd than the glass flials which I remember an architect putting on a spire, with a view to keeping off the lightning, which repeated the insult by knocking over the spire in four years.

It must, however, add a warning in the opposite direction, as many people will be putting up conductors after all these thunderstorms. The conductors of spires should be fixed to the very bottom of the vane-rod, if there is one, and not above it, otherwise the electricity runs down to the end of the rod, and, finding no continuous metallic communication, leaps across to the spire, and either smashes it or sets it on fire. . . . The lead on a spire should be connected with the ground by a conductor, which may be a stout copper bar, or a conductor in another sense. The copper ropes are safer from damage inside the tower than outside.

As a cheap and efficient conductor for houses: Mr. Alfred Vandy recommends "gas barrel":—

"This can be bought at any ironmonger's in lengths varying from 1 ft. to 12 ft., each length being furnished with screws and sockets for connecting the barrel together. The gas-barrel has also the advantage of being stiff as well as cheap.

The first 12 ft. should be driven into the earth, and, where practicable, the barrel may be connected to the water-pipes.

The barrel should be led up the house, outside the walls in as straight a line as practicable, and attached to the house by iron staples driven into the walls, or by any other suitable way.

The top length, which should be carried to some height above the house,—say 15 ft. to 20 ft. (the higher the better),—may be terminated with a pointed copper rod attached to the interior of the top length of the barrel.

The retail price of gas-barrel is about 3d. per foot for 1/2-inch barrel, and about 6d. per foot for 3/4-inch barrel; to this must be added the cost of screwing the lengths together and attaching the pipe to the wall,—not an expensive operation."

In a compilation (for trade purposes) by Messrs. J. W. Gray & Son, whose system was patented under the cognizance of Sir W. Snow-Harris, and has been carried out in the Houses of Parliament, the Royal Navy, and many public buildings, the compilers remark that,—

"It is now well known that metallic substances have not in themselves any more attractive influence for the agency of lightning than any other kind of common matter; that, in short, all matter is equally indifferent to ordinary electricity in a free state, such as the electrical discharge. Lightning, in certain cases, only falls on metallic substance, rather than other substances, from the circumstance of these affording less resistance to its progress when occupying a certain position in space, aided, perhaps, by pointed terminations, which have a sort of mechanical action in further lessening the resistance in their immediate vicinity; but lightning will not so fall if less resisting path be open to it in any other direction, even though it may happen to be through worse conducting matter. If the metallic substance be not present, still lightning will strike on the next best conductor; hence it is found that, in a great variety of instances, lightning appears to avoid pointed or other metallic substances, passing them by altogether."

"We have to point out from experience that it is requisite to link into one great chain all parts of the building; the metallic bodies, chimney-stacks, &c., employed in the construction of the building; and provide, in connexion with these one or more continuous conducting channels between the highest points and the ground, regard being

had to the nature of the soil and the extent and disposition of the metallic bodies in the building, so that on any explosion of lightning falling on the general fabric, the electric matter could not move by disruptive discharge upon any circuit of which these main channels do not constitute a part."

The common methods of lightning-rods, they consider, are of too partial and precarious a character, and based upon principles too hypothetical, to be admissible as a complete (if any) security against the terrible agency of lightning. "It has been, for example, supposed that a common lightning-rod would influence the discharge of a cloud at a distance equal to two-thirds of the altitude of the rod, and would hence give protection to that extent, which is certainly not only an untrue assumption, but is contradicted by the positive facts, especially in the observed operation of lightning on ships of the Royal Navy, from the official journals of which a vast and most important series of observations relative to atmospheric electricity have been derived."

Mr. Latimer Clark thus describes a simple and inexpensive lightning conductor:—

"Take four similar lengths of ordinary galvanised No. 9 wire, which is the wire commonly used for telegraphic purposes, and is about an eighth of an inch in diameter. The four wires are, by means of a stout stick, to be twisted together into a rope of sufficient length to reach from the top of the highest chimney to the ground, and to extend 20 ft. or 30 ft. under-ground. This rope may project a few inches above the chimney, and the wires may spread out into forks and pointed, if several chimneys rise of the same height, the conductor should be slightly raised above them, so as to protect the whole. It may be fixed in any manner or direction, either within or without the house, as found most convenient, but if there be any leaden gutters or pipes near its path it is preferable that it should touch them. When the conductor reaches the ground a little more care is desirable. If it be buried for 10 ft. or 12 ft. in thoroughly wet ground, such as that afforded by a drain or well, it will be secure; or, if it be placed in full contact with any water-pipe or gas-pipe; but if damp earth be not obtainable, about 20 ft. or 30 ft. of its length should be buried in a straight or crooked direction, in the ordinary soil, at a depth of 2 ft. or more. The only remaining precaution is to take care that this conductor never becomes severed at the bottom either by decay or willful injury. For large or lofty buildings, and in all cases where expense is not an important consideration, and where great security and permanency are desired, it is better to resort to skilled advice and to the copper conductors. Most modern houses of good construction are unintentionally provided with efficient conductors; the eaves and ridges are covered with lead, and these communicate by metal spouts with each other and with the ground, and commonly also by cisterns and water-pipes with the iron mains of the town."

THE NEW GLOBE BRIDGE AT PECKHAM AND THE TRADESMEN.

FROM the statements made by a deputation of tradesmen and shopkeepers who waited on the Camberwell vestry, at their meeting last week, it would appear that serious injury is being inflicted by the delay now taking place in the construction of the new Globe Bridge at present in course of erection for the Camberwell vestry over the Surrey Canal in Commercial-road, Peckham. The vestry seem to have been singularly unfortunate as regards the contract for this undertaking. In the first instance, the original contractor, whose tender was remarkably low as compared with those of his competitors, was unable to complete his surties, the result of which was that the vestry had to advertise for fresh tenders, which was followed by the acceptance of the present contractor's tender. A few weeks ago, the latter intimated to the vestry that he could not go on with the contract unless certain relaxations in his favour were made, and he proposed throwing the contract over. A subsequent understanding, however, between the vestry and the contractor and his surties appeared to be a guarantee of the works being vigorously proceeded with, but there are still loud complaints of the delay in construction, and its injurious consequences to the tradesmen in the neighbourhood. They allege that after having had to endure, for an unreasonably long time, a stack of bricks deposited in front of their shops the construction of the bridge commenced, but that it proceeds so slowly as to give no promise of a termination, and that in the meantime their businesses are being ruined, one of the deputation stating that recently, on a day which he named, he only took 6d. in his shop during the whole of the day.

The statements of the deputation elicited considerable discussion, in the course of which several members of the vestry expressed much sympathy with them.

One vestryman stated that having paid a visit to the works, and finding they were not progressing satisfactorily, he had urged the committee to close with the contractor at once;

whereupon Mr. Dresser Rogers, the chairman of the committee, stated that steps to that effect had already been taken, the sureties having been called upon to perform the work.

Another member of the vestry suggested that the penalties should be rigidly imposed if the contractor did not complete the work within the stipulated time, and that the tradesmen who were suffering should be reimbursed out of those penalties.

It was ultimately decided to inform the contractor and sureties that the penalties will be enforced if the work is not completed within the specified period. The terms of the contract are that the contractor is to finish the work in six months from the 1st of April last, the penalties for non-fulfilment of the contract being 20% per week.

It is altogether improbable that the terms of the contract will be complied with. Nearly five months of the time have already expired, and the coffer-dams are still in the canal without any piers in sight.

OLD CHURCHES AND NEW.

If it were wished to adduce in a practical and familiar way any one subject which should carry conviction to the general public mind of the wide gulf of difference between the old system of putting a building together, and afterwards of "decorating" it, and the modern of to-day mode of doing such work, it would be to instance a good old-fashioned *unrestored* church of almost any date,—i.e., Middle-Age date. It may be useful at the present time to note some of these differences between the old and modern work, and to try to find out how to build a modern church that shall look like an old one, or, rather, so to build it as to follow the ancient method of design and work,—in short, to build artistically, like the men of past times. And, first, it is to be noted, if you visit an *unrestored* church, no matter of what date, it is truly surprising how little you find in it to specially talk about: the place seems almost empty: there is nothing in it or about it that one would naturally expect to find in a place which you are told is almost a museum of fine art. But go into a quite new modern church, of the ordinary type, built with but moderate funds; and there is almost no end of details. The floor is half-covered with smart and now encaustic tiles, sometimes not a little glaringly clean; the walls usually plastered, and thickly coated with drab-coloured wash, even if they be not painted with the usual coatings of common oil-colour. There is almost no end of *ornaments*, more or less elaborately filled in with tracery; so many on one side and so many on the other,—indeed, every bay between the buttresses has its window,—that is, where the doorways or porches do not come in. There is, of course, a large east window, and a large west window. If the church has aisles, there is the clearstory also, with its regularly-arranged series of lights. We know all this by heart: a new church of the usual Gothic type is as much a cut-and-dried affair as a ready-made coat, of which some thousands are cut out by a machine made expressly to do it. The roof-timbers may differ a little in actual disposal, but there they are, and the *dimensions* of them may be seen in any of the useful guide-books to church-building. And then there are the two porches, of course, and the tower and spire. What a curious thing is a modern church!

But as a contrast to all this regularity, and primness, and neatness, and ornament, it is not a little striking to examine a thoroughly neglected, *unrestored*, and almost disreputable old church, of almost any date and style of Gothic. The first thought about it is, how very plain and meagre it all looks and is. We well recollect seeing a church of this type in a somewhat out-of-the-way place, at some small distance from a town. The "side elevation" of this unpretending structure, fourteenth-century work, had but one solitary buttress in it, viz., the strut and merely constitutional one, put there not because a buttress is a Gothic feature of architecture, but for the sole purpose of resisting the thrust of the heavy chancel arch. It was long and it was broad, and without ornament of any kind, but it did its work well, and looked thoroughly useful. There were no side windows in the chancel, nothing but the plain rough stone walling. There were two very plain and simple-looking windows in the one side elevation of the church, and none in the other. No clearstory. The west window seemed to do all the lighting

of the church. A sombre place inside, shabby some might call it, dingy certainly; but in reality full of colour and light and shade of the true sort, something far of a picture of an old deserted church, and full of memories of the past. It would take too long to go into detail and to name every individual thing in the place, from the altar-table to the solitary four-light chandelier hanging from the dingy roof, but one or two things must be named to make our meaning and intention clear.

First, then, the floor: nothing but very rough and worn paving visible, except in the chancel, where there were some dozen or so of encaustic tiles, all of different patterns, much worn, and of no small interest, each tile quite a little study, full of drawing and colour in the true sense of that word. In the chancel window were a few fragments of painted glass, but few as they were, they had the effect of filling the eye with the pleasing sense of colour and even form, for the fragments were of great interest, and were enough in number to show what the window was when complete. Quite a picture in colour was seen. Amid the dimness of the dull chancel glass. This window, or rather fragment of it, quite satisfied the mind, and with the tiles filled the eye with the sense of colour, as we have said. Of the main body of the church itself it is almost needless to talk about in the art sense as now understood. There was not a single fragment of ornament anywhere to be found in it, not that it had been destroyed, but it never had any existence. The capitals of the nave columns supporting the nave wall and roof were composed of a few mouldings, hardly noticeable. The columns were round. We must not, however, forget the chancel arch, for although it had but one or two mouldings and no carving of any kind, its effect was singularly impressive from its mass, and depth, and look of solidity. We must repeat that the whole interior of this church did not contain, beyond the tiles and the glass fragments, one single bit of ornament; the whole effect was got out of solid architectural forms, useful construction, and real material. We do not propose to say anything on the fate of this particular church, if it passed through the same phase which all old churches have already passed through or are destined to pass through. There is as much ornament added to the ancient structure as would have served for the ornamenting of a dozen or two of such buildings in bygone times. Two things more unlike each other than a modern restoration church and one of them in a primitive state there cannot possibly be. It is the difference between art and art-manufacture. There is a gulf of difference between the two ideas.

But our main object in thus calling a passing attention to the almost extinct old church in its *bona fide* state is for the purpose of showing how independent to a great extent is architecture of sculpture and painting. These may come afterwards and decorate it, and make it more interesting and impressive, but architecture, *per se*, is a something. Here we have a building of excessive plainness, nay almost poverty, absent; but still as that word is now understood, absent; but still as we have said; but, it must be recollected, architecture with *individuality* stamped legibly on it. It was impossible to look on the walls even, *i.e.*, the bare walls, without interest; surely the men of past times, ignorant as they doubtless were of all that makes up modern science, were artistically more capable than we moderns. The mere wall builder must have been a thinking man, as well as a workman; for, if not, how is it that all old masonry, mere walling, is a something to look at. No ornament is necessary, the mere and simple wall is enough, and seems to invite the eye to look at it; you cannot help thinking that there must be something more in it than there really is, or well can be. Surely modern men have yet to do the walling of a church, as it ought to be done and has been done! There is another reason for our calling a moment's attention to these strange facts, interesting to a few minds certainly, and that is that having got architecture *per se*, *i.e.*, the useful building, and without as yet any ornament, even a fragment of it, it then becomes a task to add to the interest of such structure by the addition to it of sculpture and painting, or decoration, to use a word of somewhat wider meaning.

The problem arises, how to do this in the best and truest way, and sometimes in the cheapest?

Our answer would be, to call in the aid of the artist, or the artist-workman, to do a little, or a little at a time. Exclude altogether the system of art manufacture. Let us employ, if it be possible, the artist himself to do a little, a very little it may be, of decorative work. Suppose, for instance, the building be perfectly plain, like the church we have cited; let the artist come in and paint but one small panel as *bona fide* work: that is, real work, his own work. Will not this be of infinitely greater interest, little as it may be, than to have the whole building covered up and hidden away by the shop decorative system? Suppose it is sculpture that is wanted: a few heads or a few fragments of ornament, suppose it be only a row of ornament round the chancel arch done by artistic hands, and would not this be more impressive than the miles of "curlicue" we see everywhere, and but for which modern buildings would be entirely bare of "architecture," and would be called "buildings"? No subject can well be more suggestive than this at the present time, for it is impossible to deny that more money is expended on art nowadays than ever before. The picture which a few years back brought to its industrious painter some hundred pounds, now finds purchasers at the rate of three or four thousand. The cup and saucer painted by a clever artist-workman for a few shillings is now competed for, at our wonderful auction sales, with heavy bank-notes! What are our artists-workmen doing that they cannot bring their work, if not into the church or the palace, at least into the auction-room?

We must start *de novo*, and to build a new church, or new law courts, or to decorate a cathedral, or to really restore or add worthily to an old church, we must surely begin all over again,—not by expecting that such work can be accomplished by the hiring whole gangs of workmen to do the art-work "under superintendence," but by one man following another, as in the art manufacture of plates and dishes, but by the strict adherence to the one great principle on which all the old work was really done, *viz.*, by the employment of the human agency,—as human, *i.e.*, mind and hand, and not as in a machine, wherein each man, or agency, is as a wheel in such machine, and sometimes as a cog merely in each individual wheel. This is to weld the very soul out of a man, and to reduce him to the level of mere insensate matter, or little better; and it, of course, shows itself in the work he does. The real principle of work is not in truth for workman as well as for artist, same in truth for workman as an individual. The architect, the painter, the sculptor, the workman, are in reality as one, and their work is one, but it must be *bodily* as well as *mentally*, and mentally as well as *mentally*, and it is only in this way that nature has bestowed on man the power to create; but to do this he must not only create *mentally*, but he must realise manually. It is not either separately, but both together, that have produced the magnificent realities of the "old time before us."

"AN ECONOMICAL STOVE."

In answer to the appeal for an economical stove, allow me to draw your attention to a stove that has existed and been used with perfect success in Italy for some time. It involves the necessity of its being heated with charcoal instead of coal, which, in these times of dearth of coal, might prove a veritable boon.

I send you the description as advertised in the Italian papers, and will order the proprietor to communicate with the Council of the Society of Arts on the subject.

The use of this stove is extensively spread through France as well as Italy, and, when adopted by those studying economy, has proved of eminent service.

The apparatus is of iron; part is tinned, part galvanised; it weighs not more than 15 kilograms, or 33½ lb., and occupies about the space of a cube of half a metre. It requires a particular spot on which to be placed,—and either on the ground, in a chimney-place, on a table or chair, in the corner of a shop or room.

In addition to its moderate cost, it does away with all the expense of kitchen utensils, necessary recipients for the cooking of different dishes forming part of the apparatus itself.

The fire is made of charcoal, broken in small pieces, the size of a nut.

To cook a dinner for six or eight persons (in France and Italy), a half-penny worth of charcoal is sufficient. The receiver of the charcoal is placed in the midst of the water: this precludes danger. The water while boiling heats either *à bain-marie* or by steam the receivers, in which is placed the soup, meat, or vegetables. The receiver in which is placed the *roast* alone is in direct communication with the fire. Potatoes, or any other vegetable, by means of an especial receiver, can be cooked without water, and by steam only, thus preserving the taste in perfection. By means of an iron lid (like the country one) sweets and pastry are successfully cooked, lighted piece of charcoal being placed on the top of the lid; in fact, the charcoal once placed the receiver, the apparatus works itself without demanding any watching.

Left to itself, the fire will last five or six hours, the end of which the dinner is cooked, ready to be served.

There then remains in the apparatus the water the *bain-marie*, limpid and clear, to wash the tea, or for any other purpose.

It is very simple, without any complication, the mechanism lasts very long, is easy to arrange, brings no difficulties in the using to whom will, for the first two or three times only, attention to the minute and clear instructions which are sent with the stove.

The price of these stoves, ready packed for exportation, is 1l. 18s. 6d., at the present rate of exchange. Why cannot charcoal be more extensively utilised in the present coal panic? This domestic stove is manufactured at and exported from Turin. F. C.

OPENING OF THE CROSLAND MOOR WORKHOUSE, HUDDERSFIELD.

THE completion of the workhouse at Crosland Moor has been celebrated by a luncheon, to which the guardians and other gentlemen were invited. There are a few finishing strokes to be done to the building, and all the rooms are not furnished.

The buildings have been erected at a cost of £100,000, on an eminence which commands a fine view of beautiful scenery, and the situation is healthy and salubrious. The principal entrance is on the north side, abutting the highway. The building is 20 ft. wide, and on either side, to the extent of 150 yards, as far as the lodge gates, are to be planted, and thus the institution will be approached by an avenue. The facade of the building faces due east, and the premises are situated and designed as to admit of the sun, in every quarter, of the sun's beams. The building is erected of stone, procured from quarries in the locality, in the Domestic style of architecture, from designs prepared by Messrs. John Kirk & Sons, of Huddersfield and Dewsbury.

The centre building is 216 ft. long and 52 ft. high, and three stories high, arranged as follows, viz.:—In the centre is the principal entrance and staircase, and branching right and left is a corridor, 8 ft. wide on each floor, which is used for easy access to all the rooms, and ventilation. In the centre tower is placed a tank, containing 10,000 gallons of water, which supply all the closets, lavatories, baths, &c. Provision is also made to attach a plug and hose which landing in case of fire.

To the right of the principal entrance, on the ground floor, is the governor's office; on the left, the warden's room. Over the same is the visit-committee's room, the governor's private parlour, and bedrooms. On each side of the staircase is a room set apart for clothing-stores; also a room on each floor above for sundry stores. The remaining part of this building, on the right side, is divided into six day-rooms for the men; four airing-grounds; and, to the left, into six dormitories for the women, also with four staircases; making accommodation for 218 inmates. From the corridor under the principal staircase the dining-hall, 58 ft. long by 35 ft. wide, an open timber roof, and fitted up with tables and seats, and a reading desk, and will seat 200. To the left of the dining-hall is the paid staff's sitting-room, kitchen, scullery, and a cooking kitchen, fitted up with a steam boiler; also the bread-stores and general stores. The larders are under the bread-stores, and are arched over.

The bakehouse, coals, and out-offices for the

servants, with a closed yard, are all conveniently arranged: to the right of this is the refractory ward, and a large coal-store covered over with a slated roof; and to the left is the wash-house, drying-room, and laundry. The boiler-house is so placed as to be convenient both for cooking-kitchen and wash-house.

To the right of the main building is the hospital, a two-storied building, 131 ft. long, one half for males, and one half for females, each with separate entrances, staircases, and airing-grounds, and is divided into ten sick-rooms, two convalescent day-rooms, surgery, kitchen, scullery, and nurses' rooms, bath-rooms, and store-rooms. All the sick rooms are so arranged as to be well ventilated, having windows on three sides, all well supplied with water-closets, lavatories, with hot and cold water; and will accommodate 32 males and 43 females. The airing-grounds are large and open, being to the front, and will have a low wall and palisading. A little beyond this is the building for fever and infectious diseases, with similar arrangements to the large hospital, and will accommodate 10 males and 10 females.

To the left of the main building is the school, 140 ft. long, consisting of two day-rooms, two school-rooms, two class-rooms, and sitting-rooms for the teachers. The schools and class-rooms are fitted up with galleries. At the back are covered sheds, for the children to play under in bad weather. The dormitories are on the first floor. There are large playgrounds, with wall and palisading.

The total number provided for is as follows:—Main building, 218; hospital, 75; infectious ward, 20; children, 100—total, 413.

At the entrance is the porter's lodge, a two-storied building, with a weighing-machine. Attached behind the lodge are the receiving-wards for each sex, with day and night rooms, fitted up with bath-rooms. Near to the porter's lodge is the vagrant ward, the entrance being from Nah Croft-lane, and is so arranged in separate yards and day and night rooms that thirty males and fifteen females can have a night's lodging at the same time, each ward having bath-rooms, &c. Work-rooms are also provided.

The architects have confined the expenditure within the estimates. The contractors were:—Masons, Messrs. A. Graham & Sons; joiners, Messrs. W. Fawcett & Sons; plasterers, Messrs. T. Loughottom & Sons; plumber, Mr. H. Garton; painter, Mr. G. Brighouse; slaters, Messrs. W. Goodwin & Sons; and ironfounders, Messrs. T. A. Heaps & Co.

Mr. Kirk, in responding, at the luncheon, to the toast of "The Architects," said the entire measurement of the workhouse was 8,243 yards. The cost of erection was 2l. 15s. per yard, but it would be 3l. if they took in the boundary-walls and palisading. They could not build a cottage house for a less price than 2l. 10s. per yard, so that they had given the guardians a very cheap building. If they took the number of inmates at 450, 55l. per head would cover the whole cost.

BRISTOL CORN EXCHANGE.

This building was originally executed from the designs of Mr. Wood in 1745, and contained an inner quadrangle, surrounded by colonnades of the Corinthian order. In this quadrangle, one story in height, and open to the weather, the important business of the exchange has until now been carried on. Many complaints of the inconveniences of such an arrangement have, however, been made, and the corporation of Bristol at length determined that the quadrangle should be covered, and protected from the weather, by a roof of iron and glass. They accordingly consulted Mr. Edward M. Barry, R.A., and the work has been carried out from his designs, and has just been opened to the public. The quadrangle is 50 ft. square, within the columns of the colonnades, which latter are about 15 ft. wide and 16 ft. high. Over the colonnades, and below the springing of the roof, there has been constructed a story of offices, 10 ft. high, with semicircular arched windows, looking into the quadrangle, each office having also a direct opening to the external air for ventilation. Between the arched windows, and over each column, are carved figures, or caryatides, well executed by Mr. E. W. Wynn, sculptor. From these figures start the arched principals of the roof, which is of wrought-iron and glass, and rises to a height of 66 ft., in the centre, from the floor. A balcony or gallery runs all round the

building at the springing of the roof, to give access to the lower part of it, which is vertical, and made to open for ventilation. The central lantern at the apex of the roof is open for a similar reason. The main ribs and the purlins are arched in form, and are filled in with open ornamental tracery, arranged constructionally. The lower part of the roof forms a vertical story of iron and glass. Three arched openings occupy the space between each principal, and can be opened or closed as may be desired. The roof itself is pyramidal, and slightly curved in section. The work has been carried out in Bath stone by Mr. G. W. Booth, of Gosport, and the sub-contractor for the iron roof was Mr. Cornell, of Cheltenham. Mr. W. Long was the clerk of the works. The cost has been between 6,000l. and 7,000l.

The Corn Exchange Committee, in a report just made to the corporation, dwelt with satisfaction on the work, and state their opinion that the public of Bristol will share their sentiments. The completion of the building was celebrated by a public dinner of those interested in the corn trade, at Bristol, on the 15th inst., under the presidency of the mayor, Mr. W. Proctor Baker.

THE STREET IMPROVEMENTS AT ST. MARY-LE-STRAND.

THE improvement now going forward in the Strand, between Newcastle-street and Somerset House, consequent upon the absorption into the thoroughfare of a portion of St. Mary's Church-yard and boundary walls, which has already been briefly noticed in the *Builder*, is no doubt one that will be attended by a great public benefit, and an advantage to both pedestrians and carriage traffic. Within the last few days a numerous body of spectators have been attracted to the novel process of laying down the wooden pavement which has been completed during the present week. We have, however, heard one fault found with this otherwise valuable improvement, and the feeling in this particular seems to be general. It is well known that hitherto there has been no footpath whatever on that portion of the north side of the Strand, along St. Mary's Church, a defect in pedestrian locomotive agency which has not only been a source of inconvenience, but of danger. The demolition of the church-yard boundary-wall admitted of an opportunity for the construction of a footpath of reasonable width; this opportunity has not, however, been availed of in the work now in progress, but the improvement is being confined to the making of a passage for pedestrians under the church wall, of little more than 2 ft. in width, which will scarcely admit of two persons meeting and passing each other, thus rendering the new and contracted footpath almost valueless. It is suggested that the footpath might have been rendered far more useful by taking an additional foot or 18 in. from the carriage-way, without any appreciable difference being made in the latter, or causing the least inconvenience to vehicular traffic.

THE SOUTH LONDON WATER SUPPLY.

A SUPPLY of purer water than has ever yet been received from the Lambeth Company will now be poured into their cisterns. The company have spent in obtaining it about 50,000l., and they propose to expend 70,000l. more in completing the scheme. Anticipating Mr. Stansfeld's Act for the improvement of the metropolitan water-supply, the Lambeth Company resolved to move their intake higher up the river than the restricted ten miles from London. They selected a spot at Hampton Court, which had been pronounced by the Royal Commission of 1857 to furnish the purest Thames water. An intake was formed there, and three-and-a-half miles of conduit laid down to connect it with the existing reservoirs at Thames Ditton. The directors and officials of the company have just visited Hampton Court to witness the turning on of the new supply. The Lambeth district at present comprises an area of about fifty square miles, and contains 300 miles of piping. The consumption within that area averages 11 millions of gallons per day, its maximum being about 13 millions. The new intake will supply about double that quantity, Mr. Taylor, the engineer, estimating the maximum delivery of the conduit when full at 26 million gallons per day, and the average throughout the year at 20 millions. Between the new intake and the reservoirs at

Hampton Court there is a fall of about 6 ft., which gives the current a velocity of about two miles an hour. Ultimately the supply will be largely increased by forming reservoirs near the new intake, and converting those at Thames Ditton into filtering-beds.

THE LONDON BUILDING TRADES MOVEMENT.

THE central committee of the carpenters and joiners having determined to appoint a deputation with full power to arrange with the masters' committee, a communication to that effect was sent to the latter, requesting them to appoint a time for receiving the deputation of the men to treat for a settlement of the dispute. The secretary of the central committee has received a letter from the assistant secretary of the Masters' Association, stating that a special meeting will be held on Thursday (this day), after which the resolution of the delegates of the carpenters would be laid before it for consideration, and it was understood that at the general committee meeting of the masters a sub-committee would be appointed to meet the men's deputation and arrange the terms of settlement, and that it was possible that this meeting might take place on Friday, but that the probabilities were that it would not be held until Monday, as there were several preliminaries to arrange before the meeting could be called.

PORTLAND CEMENT STAIRS.

SIR.—Referring to the letters appearing in the *Builder*, I can fully endorse the experience of your correspondent respecting the suitability of Portland cement concrete for stairs.

I herewith have pleasure in handing you a photograph of a circular concrete staircase and landing at the Patent Concrete Building Works, Lawson-street, Great Dover-street, London. The materials used in the construction are four parts burnt clay, one part clean sharp sand, and one part Portland cement. Three weeks after the erection of this staircase and landing, it was tested by loading it with men, as shown in photograph. The traffic up and down the staircase for the last two years has been very considerable, yet no trace of wear is perceptible.

For further good examples of this class of stairs, two flights already finished, and one in progress, may be seen at the block of industrial dwellings now erecting for the Peabody trustees at East-lane, Bermondsey.

I may mention that the nosings are not run on, after the steps are finished, but moulded entire, with the treads and risers, giving the appearance of hand-worked Portland stone.

JOSEPH TALL.

EXCLUSION OF INSECTS.

A CORRESPONDENT writes from Florence:—Are you much plagued with flies? The best remedy I have seen is in the villa in which I am now staying. Every window is provided with sheets of wire gauze fixed in movable slight small window-frames. The gauze excludes neither the light nor air, is almost invisible, and the whole villa is free from flies, mosquitoes, or any similar nuisances.

There are many country houses in England where such an arrangement would conduce to comfort, especially in the wasp season.

"TREATMENT OF BUILDERS."

IN our issue of the 10th inst. we requested an explanation from the writer of the letter on this subject, inserted on the 3rd, and contradicted on the 10th. The explanation is as under:—

"TREATMENT OF BUILDERS.

I, the undersigned Charles Brown, of South Cave, in the county of York, having written a letter, and having procured the same to be inserted in the *Builder* of the 3rd instant, signed "A Lover of Straight Dealings," and having made statements therein reflecting upon the conduct of a firm of Hull architects, but which statements I have since discovered to be wholly unfounded, hereby, in consideration of their staying legal proceedings against me, express my sincere contrition and regret that such statements as appeared in the said letter should have been made.

Dated this twenty-first day of August, 1872.

CHARLES BROWN.

Witness, J. P. CRATHAM, Solicitor, Hull."

PITCH AS A PROTECTION AGAINST DAMP.

SIR,—I beg leave to offer the following suggestion regarding "T. H. W.'s" difficulty (*Builder*, p. 229):—On occasion of the unsatisfactory use of pitch inside the house, the outside was covered with Portland cement. May it not have been through the very impervious nature of the cement, that even the effluvia of the pitch was confined, while in the other instances it was absorbed by the damp of the walls, and then gradually perspired exteriorly?

NHIL.

ROMFORD SURVEYORSHIP.

"To Surveyors.—The Romford Local Board of Health will, at their meeting to be held on Monday, the 2nd day of September next, consider the applications of candidates desirous to be appointed Surveyor and Inspector of Nuisances for their district. Should a candidate be elected, he will be required to devote the whole of his time to the discharge of his duties, and must be prepared to enter into a bond, with two sufficient sureties, in a sum not exceeding 200*l.* Salary, 100*l.* per annum and house, the Board reserving the Board-room and Clerk's office. The Surveyor will have to provide gas and fuel for the use of the Board, and also for the use of the Romford Burial Board and the Romford School Board, and must attend to the Board-rooms and Clerk's office, for all which the yearly sum of 8*l.* will be allowed. Candidates are requested to send application to me, at my office, at Romford, on or before the 24th instant, stating age and qualifications, accompanied by testimonials.—By order of the Board, A. H. HUNT, Clerk.

Romford, 8th August, 1872."

SIR.—Seeing the above advertisement in the *Builder* of last week, a thought struck me that I should suit the situation admirably: I have therefore sent in an application, of which the following is a copy, and knowing the interest you take in these matters, I should like to hear what you think of my chance.

JOHN THOMAS.

[COPY.]

Al, Lowther Arcade, Strand, W.C.,

20th August, 1872.

The Chairman and Members of the Local Board of Health, Romford.

Gentlemen,—I have the honour to make application for the appointment of Surveyor and Inspector of Nuisances to your Board.

I am thoroughly acquainted with the duties of such an office, having been an office messenger to a London surveyor for a long period. I am quite prepared to give my whole time to the business of the office, and part of my bed-time in addition.

I am rather taken aback, I must confess, at having to supply gas to the three Boards enumerated. The fuel I could manage; but as to attending to the Board-room and clerk's office, I can do that first-rate; and should the gentlemen of the Board have an occasional quiet dinner or take tea in the building after some of their arduous duties, why I can wait at table very nicely.

I may add that I am married, without encumbrance; height, 5 ft. 11 in.; aged 35; of good appearance; wife a good washer and getter-up of fine linen.—I am, &c.,

JOHN THOMAS.

P.S.—Testimonials are not sent, as I have always found them looked upon with suspicion in gentlemen's families, personal character being always preferred. When I say that I am distantly related to the gentleman of the above article,—who is my wife's aunt's thirty-first cousin,—you will have no doubt about my giving you any number of personal references to noblemen and gentlemen.

EXPLOSION AND PREVENTION OF EXPLOSION BY MUSICAL TONES.

OBSERVATION that the gaslights in a drawing-room seemed to keep time with the music, showed that the vibrations excited by sound influenced the flame, which rises or sinks in proportion to the strokes it receives from the air. MM. Champion and Pellet have endeavoured to prove that heat alone would not be sufficient to cause an explosion, if it did not cause vibration. Starting from this proposition, they arrived at the conclusion that there must be some musical note able of itself to produce an explosion of certain explosive substances, without the assistance of heat. This deduction they have confirmed by fact. Iodide of nitrogen is a detonating substance, which may be handled freely so long as it is moist. The experimentalists put small portions of it in this state into little bags made of goldbeater's skin, which they hung to the strings of a bass-viol. When all was dry, the bow was applied to each chord in succession; and it was found that, while the low notes produced no effect whatever, the highest caused an explosion at the very outset. It was ascertained that at least sixty vibrations per second were necessary to lead to this result. Two parabolic mirrors being placed opposite to each other, at a distance of 8 ft., a drop of nitro-glycerine was put into one of the foci, and a bag of iodide in the other. The former being made to explode, the vibrations thus caused were reflected from one mirror to the other, and led to the explosion of the iodide. These curious facts may now help to explain the almost simultaneous explosions of sepa-

rated deposits or barrels of gunpowder in a magazine, when once a beginning of explosions takes place.

An interesting and useful application of the "musical flames" has been made by Dr. A. K. Irvine, and communicated to the Iron and Steel Institute, at Glasgow. This application takes the form of a minor's safety-lamp, indicating by sound the presence of explosive mixtures of gas and air, based on a new form of the singing flames. When a mixture of inflammable gas and air passes into the lamp, it is ignited on the surface of a disc of wire gauze, above which is placed a suitable chimney, in which is produced the musical sound, varying in pitch with the size of the flame and the dimensions of the chimney.

"PLACE AUX DAMES."

SIR,—I am aware that you have a leaning towards the support of authority, and that you have not joined in the crusade against Her Majesty's Chief Commissioner of Works so vigorously as some of us would like. You can scarcely, however, refuse to insert the following quotation from a leading article in the *Manchester Courier* of the 8th inst. After speaking of the dispute between Mr. Ayrton and Mr. E. M. Barry, as to the Houses of Parliament, the article proceeds,—

"But Mr. Ayrton had not done with Mr. Barry. He had to show him that a Chief Commissioner was not to be insulted with impunity, and that, above all things, he was never to be put in the wrong. As, however, Mr. Barry's relations with Mr. Ayrton were almost wholly at an end, it was difficult to see how the lesson was to be taught. But difficulty exists only for those who do not know how to take advantage of their opportunities, and this Mr. Ayrton most certainly does. The time soon came for revenge. Mr. Barry is carrying out certain rather extensive improvements at the National Gallery, but, contrary to ordinary custom, there has been no ceremony over the laying of the foundation-stone. The contractor for the work thought, however, that for his own gratification it would be pleasant to have a little entertainment on the occasion, and he therefore invited,—as is not uncommon under such circumstances,—the wife of the architect to officiate on the occasion. It will hardly be believed that a Minister of State could condescend to such a piece of petty and vulgar spite, but Mr. Ayrton actually interferred officially to prevent Mrs. Barry from taking the part in the proceedings to which she had been invited. After this, of course, all architects, market-gardeners, and other largely common people will understand their proper place and will refrain, when fate brings them into contact with an Ayrton, from doing or saying anything by which he could possibly be offended, lest in the abundance of his virtue he should make them suffer in the persons of their wives."

LOOKER-ON.

SCHOOL BOARDS.

Scarborough.—Tenders for executing the work required in erecting the proposed infant school at Falsgrave having been opened and examined, a sub-committee was appointed to examine and accept the tender most advantageous to the Board. The committee of the whole Board reported that they had inspected the designs, nineteen in number, submitted by competing architects for the proposed Central Board School, and expressed their opinion that the plans set in by the following architects were the best:—(1) Mr. Thomas Oliver, Newcastle-upon-Tyne, estimate, 5,500*l.*; (2) Messrs. Stewart & Bury, Scarborough, estimate, 3,850*l.*; (3) Mr. W. Watson, Wakefield and Doncaster, estimate, 4,650*l.* The design submitted by Messrs. Stewart & Bury was ultimately accepted, subject to the same being approved by the Education Department, and also subject to the condition that the tender from a respectable contractor for the execution of the works within 10 per cent. of the amount of the estimate accompanying the plans be obtained.

Loans.—By an Act of Parliament just printed the Public Works Loan Commissioners are authorised to make advances to School Boards in pursuance of the Elementary Education Act, 1870. Power is given to issue 1,000,000*l.* out of the Consolidated Fund for the purpose mentioned.

SAWING WOOD WITHOUT A SAW.

ELECTRICITY is by the present invention made to supersede a mechanical implement, threatens also to drive it into banishment; while the muscular and other forces which were largely expended in their use are replaced by the action of the galvanic battery in one of the most simple forms.

The invention, which is described by the *Scientific Review*, was patented in the United States on the 28th of last May, by Geo. Robinson, M.D., of New York.

tion, including the rebuilding of the chancel, will be about 3,000l.; but the expense of the new chancel and side chapels will be defrayed by Mr. Gere Langten, M.P., of Newton-parish, Bath, and Sir Greville Smyth. The work has been carried out from the design and under the superintendance of Mr. Ferrey, of London, who is engaged upon the work of restoration at Wells Cathedral. The builders are Messrs. Wall & Hook, of Brimscombe, near Stroud.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Camberwell.—A new church has been opened in Camberwell New-road, close to the London, Chatham, and Dover Railway-station. The church is in the Early English style, 98 ft. long and 47 ft. wide, and is intended to accommodate a congregation of 2,500, which is said to have grown up in this neighbourhood during the last ten years. The architect was Mr. C. A. Buckler, and the builder Mr. Panthorpe, of Notting-hill. The style of the structure, which is of white brick with stone corbels, is twelfth-century Gothic. The pillars dividing the centre from the side aisles are of Boxhill stone, and their caps are in process of being sculptured by Mr. Earp, of Kennington-road. The altar is of stone, and is carved. It is the gift of Mr. S. Knill, a gentleman residing at Blackheath. The sanctuary floor is laid with rich Minton tiles. That of the body of the church may be described as ordinary tessellated pavement. The organ is now being built by Mr. Richardson, of Camberwell, and will cost 500l. The entire cost of the edifice is 2,000l.

SCHOOL-BUILDING NEWS.

Kingston.—The foundation-stone of the new Church of England Schools at Kingston-on-Thames has been laid by the Princess Mary, in the presence of a large number of spectators. The committee paid 800l. for the site, and about 1,900l. had been raised towards the total cost; but at least 1,400l. more were required. Mr. C. J. Freake presented the mallet which is said to have been used by Sir Christopher Wren in laying the foundation-stone of St. Paul's Cathedral, June 21, 1673. The schools will accommodate, when completed, 264 boys and 262 girls, allowing, according to the Government standard, 8 ft. superficial for each child. The existing building will be repaired and made available for 200 infants.

Halifax.—The chief stone of St. Joseph's Roman Catholic Schools to be erected on a site near to Godley Bridge, in the field known as "Bloody Field," has been laid. The new buildings will occupy a situation close to the bridge by Godley cutting, and overlooking the town of Halifax. The ground plan is quadrangular, the style Gothic, and with two large school-rooms, class-rooms, and inclosed play-grounds, accommodation will be provided for 600 children. The total cost will exceed 2,000l.

York.—The foundation-stone of new national schools for the north-eastern district of York, has been laid in a street called Beidern. The area which the buildings will occupy is over 4,000 ft., and accommodation will be provided for more than 500 children. The schools will cost about 2,000l., and the works will be under the superintendance of Mr. Cane, architect, and clerk of the works at the Minster. The contractor for the works is Mr. Dennison, of Marygate.

Oxford.—The new boys' and girls' schools, which have recently been erected at the south end of Bridge-street, Osney, to meet the requirements of the rapidly-increasing population of this suburb of Oxford, have been opened by the bishop of the diocese. The schools are 72 ft. long, and 18 ft. wide. The ground-floor will be for boys, and the first story for girls, and out of each of these is a class-room, partitioned off, and measuring 20 ft. long by 18 ft. wide. The old building will, in future, be used as an infant school. The whole of the work has been done by subscription, and there is at present a debt of about 200l. remaining on the building, which was erected by Messrs. Honour & Castle.

Stockton Exchange Competition.—We have received complaints of want of information in this matter. The remedy is in the complainants' hands,—do not compete unless satisfied.

Books Received.

Patterns for Turning. By H. W. ELPHINSTONE. London: Murray, 1872.

This handsome volume is illustrated with seventy patterns, many of them elegant and curious elliptical and other figures cut on the lathe without the use of any ornamental chuck. All the patterns can be cut on a lathe furnished with a division plate, an ornamental slide rest, an eccentric cutting-frame, and an everhead motion. The reader is requested to peruse the volume by the side of his lathe as he performs the various operations indicated in the text, so as to obviate any serious difficulty in understanding the methods of cutting the patterns. Most of them can be cut by a person capable of performing simple addition or subtraction of numbers containing two figures, and the fractions $\frac{1}{2}$, $\frac{1}{3}$, and $\frac{2}{3}$. Some few require a knowledge of decimal fractions. Brief explanations of the geometry of the patterns have been inserted for behoof of mathematicians, and especially as to "envelope" patterns.

The Worshipful Company of Turners, we may here remark, is of practical service to the handicraft whose name it bears. The master, wardens, and court of assistants, in continuation of their good old custom of former years, propose to give, this year, their silver medal and the freedom of the company and of the City of London to any one workman or apprentice in England who may send in the best specimens of hand-turning. The material to be used will be varied in different years, so as to include wood, ivory, metals, stone, spar, &c. The competition for this year will be in turning in hardened and tempered steel. The subject of the competition will be horological turning, whether exhibited in the turning and finishing of pinions of chronometers and watches, or in any of the various escapements used in the same. Competitors will be at liberty to select their own subject for exhibition in turning and finishing, whether in wheel-work or the escapement; but the complete escapement or train of wheels planted in position, to show the truth and accuracy of the same, will be desirable. The successful candidate will be required to supply a satisfactory certificate of the work having been done by his hands only, and of its being done during the period of competition, and may be required to do, in the presence of the judges, a portion of work similar to the successful exhibit. In addition to this prize, the bronze medal of the company will be given to the competitor second in merit, and the company's certificate of merit to the third. The different objects must be delivered free at the Mansion House, London, during the week beginning Monday, October 21st, and ending Saturday, October 26th. Sir William George Armstrong, C.B., of Newcastle; Sir J. Brown, of Sheffield; Mr. John Jones, of the Strand, London; and Mr. S. Jackson, of Red Lion-street, Clerkenwell, are the judges for this year.

Miscellaneous.

Brighton Sewers Board.—At a special meeting of this body held last week for the purpose of accepting a tender for the completion of the unfinished sewer works, the General Purposes Committee reported that eleven had been sent in, namely, from Messrs. John Hall Clark, Warwick; John Aird & Sons, Belvidere-road, London; W. & J. Pickering, 21, New Bridge-street, Blackfriars; George Thomas Parnell, Gloucester Lodge, Dale-road, Kentish-town; H. A. Marshall, 68, Islingwood-road, Brighton; James Neave & Co., Edmonton, Middlesex; Matthew Jennings, 3, Adelaide-place, London Bridge; Thomas Pearson, Kennington-cross, Lambeth; A. W. Ritson, 4, Herne-hill-road, Camberwell; W. Webster, 8, St. Martin's-place, Trafalgar-square, London; and Crockett & Dickenson, King's-road, St. Pancras. Ultimately the tender of Messrs. Aird & Sons was accepted, for the sum of 58,472l., which was the lowest sent in.

Inigo Jones.—A correspondent of *Notes and Queries* asserts that Inigo Jones was baptised Ynyr, a common Welsh name, but corrupted into Inigo abroad; and that in Wales the architect was known as Inco, a name which still adheres to a house he is said to have built—"Tyddgn Inco," or Inigo's Farmhouse, near Bala.

Sir Christopher Wren's Mallet.—Some doubt is entertained as to whether the mallet which was used by her Royal Highness the Princess Mary in laying the foundation-stone of the Kingston Church Schools, was used by Sir Christopher Wren, as alleged, in laying the foundation-stone of St. Paul's Cathedral. *The Times* says, "The mallet itself bears the following inscription on a silver plate:—By order of the M. W. the Grand Master his Royal Highness the Duke of Sussex, &c., &c., and W. Master of the Lodge of Antiquity, and with the concurrence of the brethren of the Lodge, this plate has been engraved and affixed to this mallet, A.L. 5831, A.D. 1827, to commemorate that this being the same mallet with which His Majesty King Charles II. levelled the foundation-stone of St. Paul's Cathedral, 5677, A.D. 1673, was presented to the Old Lodge of St. Paul's, now the Lodge of Antiquity, acting by immemorial constitution, by Brother Sir Christopher Wren, R. W. D. G. M., Worshipful Master of this lodge, and architect of that Cathedral." It is not disputed that this is the identical mallet used on the occasion of laying the foundation-stone of St. Paul's, nor is it denied that it was subsequently in the possession of Sir Christopher Wren. The only question is whether the mallet was used by the architect himself, as stated by Dean Milman in his 'Annals of St. Paul's,' or whether the stone was laid of 'levelled' by Charles II., as alleged by the Lodge of Antiquity in the above-quoted inscription."

Sale of Land in Kent.—On the 13th inst. at Ashford, Mr. James Waterman, jun., conducted a large land and property sale, under an order of Vice-Chancellor Sir R. Malins in the cause of Whelan v. Whelan. The property, which is the outlying portion of the Herndon Hall Estate, comprised an area of 346 acres, and was put up in twenty-two lots. The room was crammed, and a spirited competition took place for some of the lots. Lot 1, farm known as "Hope Farm," having an extent of 14 a. 3 r. 7 p., realised 3,100l. Lot 3, a freehold estate of rich marsh and pasture land known as "Cote Farm," comprising 113 a. 2 r. 12 p., realised 11,400l. For lot 4, 1 a. 2 r. 12 p., of pasture land, 120l. were offered, not sold. Lot 6, realised more than 100 per acre; it was a piece of pasture fatting land containing 5 a. 0 r. 15 p. Lot 7, 27 a. 1 r. 34 p. of fresh marsh land, in Snargate and Brenzel in two pieces, sold for 2,880l., being over 100 per acre. Lot 8, 38 a. 3 r. 13 p. of pasture land situate in Shirley Moor, in the parish of Tenterden, fetched 3,100l. Lot 10, 2 a. 3 r. 35 p. pasture land, fetched 230l. Lots 11 to 18 were principally property situated in Tenterden Town, and they realised very fair prices. Lot 19, described as several parcels of accommodated pasture land, containing 16 a. 3 r. 18 p., fetched 1,390l. The seventeen lots sold realised close upon 25,000l.

Removing Slag from Blast Furnaces. The improvements of Mr. David Joy, of Middlesbrough, consist in receiving the slag as runs from the furnace into the recesses formed in the rim of a wheel or cylinder (either outside or inside or on the edge thereof), in which it is carried through a part of the revolution of the wheel or cylinder, and then discharged therefrom, the axis of revolution of such wheel or cylinder being either horizontal or inclined, suchwise that each part of the circumference shall alternately be raised and lowered during the revolution. And he makes the recesses such form, and places them in such position with regard to the centre of revolution, that the slag may be retained in them during a considerable part of the revolution of the wheel or cylinder. And if necessary he forms ridges in points at the bottoms of the recesses to mould the slag such form as to break easily in pieces.

The Adulteration Act.—The statute amend the law for the prevention of adulteration of food and drink, and of drugs, has just been issued. Every person who shall adulterate articles of food, or drink, or drugs shall, for first offence, pay a penalty not exceeding 5s. and for a second offence be guilty of a misdemeanour, and be liable to six months' imprisonment. The Pharmacy Act is to be incorporated with the present statute. The inspectors' nuisances may submit articles to be analysed. There is a provision that the purchasers of articles of food, &c., may require the same to be analysed. We may take the credit of blame amongst those who laboured to obtain legislation in this matter.

Asserted Poisoning by a Galvanised Iron Roof.—The *Benidry* Independent mentions that a man living in a hut with a galvanised iron roof, situated in close proximity to Koech's crushing-machine, in Long Gully, was on ill and removed to the hospital. He was re—the symptoms being slight, though the case appeared serious—treated tentatively, recovered sufficiently to be discharged, but had this been the case, when his mate was suffering from a precisely similar form of disease, was admitted into the same institution, and the coincidence at once attracted attention. An examination proved that the usual arsenical slow-poisoning was present,— writes him on the nail,—and Dr. Macgillivray Dr. Smart drove out to the hut, where they found, not only the roof coated with an arsenical powder, but an arsenical sediment in the tank water attached to the premises. The first signs again betrayed symptoms of poisoning, and examination proved, beyond doubt, that a slow poisoning had commenced. Under proper treatment both are out of danger.

Eccelesiastical Dilapidations.—An attempt of some importance has been made in the Act to amend the Eccelesiastical Dilapidations Act, 1871, with respect to fees to bishops' secretaries and others, on which complaints have been made. The Act alters the length of mortgage terms, and of the conditions of repayment to be advanced. It then provides that it shall be lawful for the Archbishop of Canterbury, the Chancellor, and the Archbishop of York, with the assistance of the two vicars-general of archbishops, with the consent of the Treasury, at any time during the year 1873, to revise the rates of the fees of the bishops' secretaries and registrars, and the rates of the fees of the surveyors for work done in pursuance of the Eccelesiastical Dilapidations Act, 1871, and establish thereof, one uniform table of fees and charges, to be binding throughout the whole of England and Wales, and that they shall have power from time to time to amend or alter such table of fees and charges.

The Atmospheric Disturbances.—Mr. J. Plant, writing at Birmingham to the local press, says,—“The remarkable frequency of storms this summer has been the subject of much surprise. Commencing with the 15th day, Birmingham and the district have had as many as thirteen distinct storms of terrific violence. . . . With nearly five months of the year unexpired, we have had upwards of 1 in. of rain already recorded, and which is at least 1 in. over our year's average value. It is also above the quantity which fell in the entire of 1870. This enormous depth of rain is, of course, quite unprecedented in my records, and is 13 in. above the average.”

Archaeological Congress at Brussels.—On Thursday the congress on pre-historic geology opens in Brussels, under the fitting presidency of one of the oldest savans in Europe, M. Omalius d'Halloy, who presides at the site of the congress, is in his 90th year. More than 600 names have been sent in to the committee of organisation. The Government, it is said, have given instructions for striking a medal commemorating of this meeting. Expenses will be undertaken to Namur, Spiez, and Fortoof. General Faidherbe, in a paper on the “Dolmens” of Algeria; a paper on the flint implements of Dutch Bourg; and M. Burmeister, director of the museum of Buenos Ayres, one on the pre-historic flints of La Plata.

Attershall Castle, Lincolnshire.—The designs by Mr. F. H. Reed illustrating this magnificent ruin of the fifteenth century, which was lately sent in for and obtained the silver medal, and 5l. 5s., offered by the Institute for red drawings, and an additional grant in consideration of the thoroughness of the illustration, will shortly be published. The original designs, fifteen in number, will be reproduced by photo-lithography.

Chelenge.—Sir John Lubbock writes to daily papers to communicate a fact which, as he says, will surprise and grieve archaeologists, and appears that the occupier of the farm near Chelenge is actually plunging up the well-known ‘curse.’ I have no means [he adds] of gaining here by whom this land is occupied, whom it belongs.” It is to be hoped this will put a stop to without loss of time.

The Paris Hotel de Ville.—If the Hotel-de-Ville of Paris does not rise speedily from its ruins, says *Galignani*, it will not be from a dearth of architects, as the number of those who have already inscribed their names to take part in the competition for the reconstruction of the building is 422.

The Price of Gas.—The rise in the price of coal is inducing the gas companies to increase the price of their gas. In some towns the advance has reached 1s. 8d. per 1,000 cubic feet.

TENDERS

For manufacturing premises, Bromley, Messrs. Hills & Fletcher, architects. Quantities supplied:—

Wages required, 2*l.* with house.—Address, 75*a*, Office of "The Builder."

THE Advertiser seeks an ENGAGEMENT as JUNIOR ASSISTANT.—Address, ALPHA, Post-office, Dorking.

THE Advertiser, aged 30, requires a SITUATION as ASSISTANT. Twelve years with a decorative firm. Has a knowledge of drawing.—Address, G. F. 1*a*, Acton-street, W.

THE Advertiser, with many years' experience in sanitary engineering works, and desirous to level, superintend, or take out quantities, &c. and to obtain EMPLOYMENT.—Address, E. 4*a*, Court-street, Hoxton, N.

TIMBER TRADE.—WANTED, by the Advertiser, a SITUATION as FOREMAN or SALESMAN, in a retail sawmill and timber yard. Quick accounts and willing to make himself useful. Has a thorough knowledge of the trade throughout. Good character as to honesty, &c.—Address, No. 67*a*, Office of "The Builder."

TO TIMBER MERCHANTS. SITUATION WANTED, in the Office of a Timber Merchant, as TRAVELLER or CLERK, by a Young Man, of active business habits; or in an Office where a knowledge of the building trade would be valuable. Particulars reference, Address, T. M. 23, Charterhouse-square, E.C.

SAW-MILLS and STEAM JOINERY WORKS.—An energetic practical FOREMAN, of many years' experience, in England and abroad, is DESIRED. Thoroughly versed in saw-mill accounts, measuring, and converting material, a systematic manager of machinery. (DISENAGED). Salary 2*l.* per week. Excellent references.—Address, SHEPHERD, 5, Exeter-place, London.

QUANTITIES and MEASURING.—A SURVEYOR of considerable experience in TAKING out QUANTITIES, MEASURING, WRITING SPECIFICATIONS, &c. and in ASSISTANCE to ARCHITECTS and BUILDERS. No objection to undertake the books and accounts of a Builder. Address, SURVEYOR 128, Stanhope-street, Hampstead-road, N.W.

QUANTITY TAKER, MEASURER, and ESTIMATOR, of upwards of twenty years' experience, in all the branches of his business, and well acquainted with prime cost, estimates, and all necessary house repairs. Offers TEMPORARY ASSISTANCE in town or province, or permanent references.—Address, 25, Theobald-street, Brixton-road, S.W.

CLERK of WORKS.—WANTED, a RE-ENGAGEMENT by a thoroughly practical and experienced Man. Just completed large mill in Nottingham, and is a first-class expert in all the branches of his business. Well acquainted with the building trade, and well acquainted with the building trade. Particulars reference, Address, THOMAS STAFFORD, Caroline-street, Tees Hill-road, Nottingham.

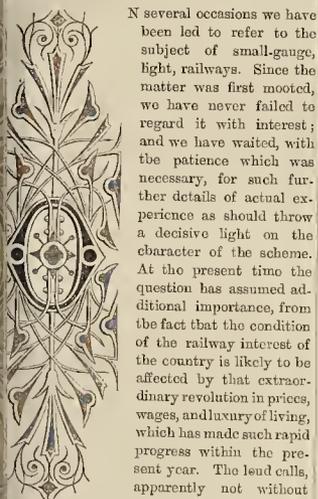

RELLHANGER.—first-class, is a good Gilder. Offers WAGES EMPLOYMENT. Good reference. Address, K. M. 5*a*, Arch-street, Clerkenwell, S.

DENT & CO. Manufacturers of TURKISH CLOCKS, Chiming, Ringing, &c. Bell Machinery, &c. Mr. Hojsey and J. R. H. Hojsey, "The Golden Well," 24, St. Paul's Church-yard, &c. GREAT CLOCK of the HOUSES of PARLIAMENT.—An 81, 34 and 32, Royal Exchange (joining Liverpool); and the Face 8*oc* 27-street, Strand, London.

The Builder.

VOL. XXX.—No. 1543.

The Effect of the Present Industrial Movement on the Value of Railway Property.

On several occasions we have been led to refer to the subject of small-gauge, light, railways. Since the matter was first mooted, we have never failed to regard it with interest; and we have waited, with the patience which was necessary, for such further details of actual experience as should throw a decisive light on the character of the scheme. At the present time the question has assumed additional importance, from the fact that the condition of the railway interest of the country is likely to be affected by that extraordinary revolution in prices, wages, and luxury of living, which has made such rapid progress within the present year. The lead calls, apparently not without success, for money for any possible and impossible purpose to which invested capital can be applied, are so numerous and repeated, that it is evident that it will not be from inability to collect capital that the want of any thoroughly good mode of investment is to be anticipated. It is, therefore, at a more appropriate time that we find ourselves in possession of further information as to what has been actually done, and as to what is the course of execution, for which we have more than once expressed a desire.

It is of considerable importance to the property of the country that the position of our railway interest, in face of the augmentation of prices and of the rate of wages, together with the general diminution in the hours of productive labour, should be steadily regarded. The total receipts of our railways, in 1869, were £41,595,661. Forty-seven and a half per cent. of this intake was absorbed in working expenses. For the sake of round numbers, we will assume the income of the year ending at summer last at forty-four millions sterling; of which, at the above-named rate of profit, something like twenty-one millions will have to be paid to pay working expenses, leaving twenty-three millions to remunerate the proprietors. The return thus made may be taken at an average of 3.6 per cent. (three and six-tenths) on the gross total outlay. Owing to the enforced increase of the capital accounts, and the steady decrease of traffic due to the commercial growth of the country, the actual income of the lines as a whole has reached a point beyond which its development is increasingly lucrative. The profit has begun to accrue, in the most tangible manner, to the holders of original stock, who have long been overweighed by the preferential guaranteed charges. Into this, however, we do not propose now to enter; our point being, that the broad general prospect was, but a little while ago, one of an unusually satisfactory character; a fact of which the public showed due appreciation by the sensitive barometer of the London Market.

In face of an increasing traffic which encouraged such brilliant anticipations, we have now to place the unprecedented movement in those items which form the main working expenses of railways. Coal, iron, and labour, as we have recently shown, are gaining upon gold. That is to say, a larger weight of gold has now to be given, than was the case a year or two ago, in order to purchase a given amount of either of these commodities. But it is exactly in these items of coal, iron, and labour that the main outlay of railway companies consists. We are not in possession of sufficient details to enable us to calculate with absolute precision the influence of this rise of price upon future dividend. Indeed, the calculations of one month may prove inapplicable in the next. But we may form some idea. To rate the extra cost of labour alone, arising, or likely to arise, from the short-time movement, and from the adjustment of wages in one employment to the advance obtained in others, at 10 per cent., will probably be far within the mark. To estimate the advance on the price of materials at 30 per cent. will also leave a margin. If, therefore, we roughly take the general augmentation of working expenses at 20 per cent., or one-fifth, of their recent amount, we shall find the division between the amount spent in earning and that applicable to dividend to be materially modified. We shall require twenty-five millions and a fifth to work our lines. We shall only have eighteen millions and four-fifths to distribute as interest and dividend. We thus find two-thirds per cent. struck off from the average rate of dividend at a blow; supposing, of course, that no great increase be effected in traffic returns.

There is not the slightest doubt that, by adopting such a wise system of mutual aid and forbearance as would be proper if all railway income made a common purse, very much might be done to counteract this probable deficiency. That we will not now discuss. Let us assume, if necessary, that such a union has taken place. The limits of the savings thus to be effected are definite. The limit of the rise in cost is indefinite. The obvious remedy will be the rise of fares. But rise of fares, so far as experience goes, means arrest of growth, and check to prosperity.

It is, therefore, only in such an extension of the railway system as shall direct fresh streams of traffic to the centre, as well as to the extremities, of our great network of iron, that we see a probable resource for the maintenance of our enormous railway property, in a state that shall combine the national advantages of the best service of the public, and the due payment of the proprietors of our 11,000 miles of railway. This development cannot take place by means of branches, such as we formerly attempted. A certain amount, not of prospective, but of actual, traffic must exist, in order to justify the construction of a branch. We have, long ago, exceeded the limits of a wise economy in the matter of branch lines; nor do we hold that delusive estimates of the great saving that can be effected, for example, by making the rails themselves lighter, can do anything but mischief. Looking at our normal gauge of 56½ in., we have long had materials for striking a balance between economy of construction and economy of working. Undue saving, in the first instance, is not economy. The very idea of a railway is, that by reducing friction and obviating all unnecessary work in the way of overcoming gravity, recurring cost may be proportionably reduced. We cut bills and embank valleys for the latter purpose; in fact, to save going up any hill that can be avoided, and thus lifting weight for no result; and we lay iron tracks for the former. We have found it worth while to lay out nearly 650 millions sterling for this end; and so far as lines of the ordinary gauge are concerned, those that we may make in future will probably cost

more per mile than those which we have already made.

On the other hand, no one can share in those distant excursions to which London has rushed, as if in one great exodus, on the close of the session; still less can reside for a few weeks in a village separated by only three or four miles of cross-country road from the nearest railway station; without seeing how commercial life is nipped and strangled by disconnection with the great network of traffic. The question of transshipment, or rather of change of vehicle, enters for something into this; but it is far from being the most important item. In our early "battles of the gauges," and in almost all disputes concerning railway extensions, canal development, and the like, we have attributed rather too much importance to this single item.

It is quite otherwise, however, with road-traffic. When we exchange the railway for the van of the carrier, or the cart of the farmer, we go into another order of things. Progress then has to be measured by yards, instead of by miles. Every hill is a separate difficulty, to be separately and painfully encountered. Instead of communication with the great circulation of the country by every train, intercourse is reduced to a daily, an alternate daily, or a twice-a-week, interchange. A moral effect is combined with that which is physical. It is more difficult to send, or to go, to the nearest station than to continue the course from that station to the market-town. In fact, on the railway-lines we have the England of the nineteenth century; of them, we have the England of the eighteenth.

The one assumption which lies at the base of this great national difficulty is, that a railway must have a track of 56½ in. in width between the rails. That granted, the *statu quo* must remain, or, at least, can only be gradually modified as the gradual growth of the country will warrant. But should that assumption be granted?

In the whole course of industrial art we may watch a sort of periodical oscillation between the two opposite (but not opposing) principles of strength and of lightness. They are the Jachin and Boaz of the mechanic, no less than of the mason. Our progress has been often alternate; as a man plants first one foot, and then the other, on the ground. But in the ultimate pattern of the engineer, the living organism, we find that these male and female principles are firmly wedded. From this union result the most astonishing mechanical triumphs of nature, — those displayed among the aerial tribes. In the megatherium or the deinosaur we may see a magnificent display of well-ordered strength, — a veritable broad-gauge animal. In the swift and in the dragon-fly we see that combination of material and of structural design which unites adequate strength with requisite lightness, and enables the animal to exert a velocity of movement that beats a firm and supporting path through the air itself.

Velocity, we learn from the phenomena of flight, as well as from some that are more within our present power of production, is an element of such importance that we are as yet far from having mastered the great subject of its relations. It is the feature which distinguishes dynamics from statics. The bicycle may be cited as an example of the manner in which a mechanical contrivance may be made to behave in a manner which was not anticipated, by the simple fact of being propelled at a given speed. Many things conduce to the conclusion that we are as yet only in the infancy of mechanics. If so, it is by the combination of strength with lightness, and by the rendering low power available for producing high velocity, that progress will be made. Ever since the steam-engine entered upon its Promethean existence, it has given indications of the direct

tion in which its development should be sought. Let any one compare one of the massive, stationary, heavily counter-balanced Cornish pumping-engines, with one of those handy and obedient little donkey-engines (far more tractable, as well as fifty times more strong, than their four-footed godfathers) which raised stones and pumped water for the service of the Thames Embankment; and he will form a very good idea of the kind of progress of which we speak.

Now if we look at the history of railway locomotion we shall find that the mechanical progress made, great as it has been, has been mainly in the opposite direction to that which we have thus indicated. Messrs. Braithwaite & Ericsson's "Novelty," which attained the highest speed in the famous competition of 1825 (though it did not obtain the prize, from want of duly distributed strength), weighed, with water and fuel in the tank, 3 tons 17 cwt. 14 lb. The "Rocket," of Messrs. George & Robert Stephenson, which did obtain the prize, weighed 4 tons 5 cwt., exclusive of a tender which, when filled, weighed 3 tons 4 cwt. In 1830 7-ton engines were considered heavy. In 1840 the weight had doubled. In 1850 we had 25-ton engines; in 1860 35-ton engines. There are goods engines now at work on the Continent that weigh, exclusive of tender, 45 tons; and a design by M. Meyer, which has been much commended, contemplates a weight of 60 tons, exclusive of tender. Now if we consider the velocity at which these enormous masses of iron are whirled along the rails, the blows struck by the revolution of the driving-wheel, the lateral stress caused by the conical tyre, and the rigid resistance which the whole surface of permanent way and substructure must present to the terrific force of impact, we shall find that a railway, according to M. Meyer, must be more than twelve times as strong as a railway, as it was contemplated by Captain Ericsson. We have made gigantic strides; but we have made them in a direction involving the most prodigious outlay. It is at least open to question whether we have not made them in a wrong direction.

One or two engineers think that we have. Not only so, but they have the courage of their opinions. They have not contented themselves with an abstract view of the subject. They have reduced their principle to practice; and they assert that the results of that practice justify their views. Thus far they have a *prima facie* case, they have been working in the direction indicated by the organic engineering of nature; while the gradually increasing weights piled upon the driving-wheels of the locomotive, from the time of Ericsson to our own, have been so many triumphs over reluctant and abhorrent nature. She has, perhaps, not been without her revenge.

From Portmadoc to Festiniog, in Merionethshire, there was constructed, about forty years ago, one of those small tramways, worked by horses, which are the lineal ancestors (we do not mean to pun) of the railways of Great Britain. We are told by Captain Tyler, formerly Government Inspector of Railways, that it was made by a gentleman, who ruined himself by the undertaking, to reclaim a large piece of waste land from the sea, and to carry down slates from the quarries in the Festiniog mountains for shipment in the latter port. The length of the main line is 12½ miles, and there is an additional mile of branch. The average rise to be overcome is 1 in 92, for 12½ miles. The steepest gradient over which passengers are carried is 1 in 80; but some portions of the lines, which radiate to the various quarries, are worked by locomotives over a gradient of 1 in 60. The country is exceedingly rough. Ravines are crossed by embankments of 60 ft. in height, with a breadth of 10 ft. at the top. One embankment, at Traeth-Mawr, is 900 yards long; the deepest cutting is 27 ft. The sharpest curve is one of 1¼ chain radius, and others vary from 2¼ to 8 chains in radius. The line is so sinuous that a moderately long train may lie on two or three curves at once. It was originally laid with rails of 16 lb. per yard, which were replaced by 30 lb. rails. These were in use for eighteen years, and were in their turn replaced by double-headed rails of 48 lb. to the yard. The joints are fished, and the cross sleepers, 3 ft. apart under centres, and 2 ft. under joints, are of larch, 4 ft. 6 in. by 9 in. by 4½ in.

The gauge of this little mountain line is, accurately measured, a little under 2 ft.; say 1 ft. 11¼ in. It is worked by specially-constructed locomotives, the speed having been limited by the Board of Trade to 12 miles per

hour. With the Fairlie engine, an experimental speed of 30 miles to 35 miles an hour is said, by Mr. Spooner, the engineer, to have been attained. The Festiniog line can hardly be considered as a fair criterion for a small gauge, as it was not originally constructed for locomotive power; and the capital account has been increased by the expenses of conversion and change of plant. Still the accounts given of its traffic show a limitation of working expenses to 35½ per cent. on the receipts, and a net profit of 12½ per cent., or more than three times the average net earnings of English railways.

The chief sources of information as yet at the disposal of the public, with reference to the important question of small-gauge railways, are the compilation by Mr. Spooner, of which we gave a notice some months since, and the little book by Mr. Fairlie, to which we referred in a recent number. The great literary defect of these books is, that they are argumentative rather than explanatory. The facts which they contain are so mixed up with the estimates of what is expected, that it is difficult for the ordinary reader, and all but impossible for the engineer, to get through the chaos of the ordinary reader, to winnow the chaff from the grain. Not that the chaff, as we call it, is by any means worthless. Arguments and estimates are both of a very sensible nature. But, after all, literary ability is a great desideratum, and the best cause may be stifled by advocacy which, while honest and intelligent, is not lucid and well arranged.

The opinions of foreign engineers of eminence are cited by Mr. Fairlie, and to some of them we attach great weight. M. Eugene Flachet, who must now be almost, if not quite, the *Doyen* of the profession in France, has reported on the small-gauge lines constructed up to 1867. Mr. Nordling, formerly chief engineer of the Orleans railway, and now one of the chief engineers of the Austrian railways, a gentleman of whom we had the opportunity of forming a high opinion when in his former post, has recently collected and published important information on the small-gauge railways at present being worked. These reports ought to be brought before the English public.

A line 14 miles in length is in operation in the Broelthal Valley which pays a dividend of 575 per cent., with a daily traffic of 40 tons per mile. A line of 8 miles long has been constructed from Tavauz to Ponsericourt, in France, at a cost per mile of 1,000l. for construction, and 1,920l. for rolling-stock. Between Antwerp and Ghent is a railway of 3 ft. 7 in. gauge, which pays between 7 and 8 per cent. on its capital. In Austria the Lambach-Gerundon Railway has been open for several years; the gauge is 3 ft. 6 in., but the stock is old-fashioned, and the speed slow. In Norway M. Carl Pihl has constructed lines on a 3 ft. 6 in. gauge, through very unfavourable country, at mileage cost of 5,300l. in one instance, of 4,600l. in a second, and of 3,142l. in a third; including rolling-stock, material, and workshops. A 3 ft. 6 in. gauge line has been constructed in Canada, under Sir Charles Fox & Sons as engineers, called the Toronto, Grey, and Bruce Railway, at a reduction of about 25 per cent. on the estimate for a 4 ft. 8½ in. line. From Denver, in Colorado, a line is now in course of construction to the city of Mexico, on a 3 ft. gauge, at a saving of 36 per cent. as compared with the Kansas Pacific Railway, of the ordinary gauge, which was constructed by the same engineers and the same contractors. Thus enough evidence is already in existence, if it were carefully collected and lucidly stated, to allow of the formation of a very definite judgment on the practical cost of small-gauge lines.

Assuming, however, that the contemplated economy of from 25 to 36 per cent. on cost of construction may be realised, this forms but one, and that by no means the most important, of the advantages claimed for the small-gauge system. For the mechanical reasons which we have above adduced, we are prepared to accept the statements of the great saving to be effected on the actual cost of carrying goods and passengers by light and well-designed rolling stock. The dead weight of the ordinary goods-trains, in proportion to the live, or paying weight (exclusive of mineral traffic), in the United Kingdom, was stated in a paper read before the British Association in 1870 at 7 to 1. In passengers it was actually 29 to 1. In France the proportion of dead to live weight is about 11 to 1 in goods, and 5 to 1 of passengers. Our French neighbours are noted for their tyranny over their passengers, whom they pack almost like sheep, and drive into pens with stern persecution. We see the economical result, as compared

to our own more independent habits. In the United States the average dead weight of passenger stock is to the paying weight as 8 to 1.

Now, on the Norwegian small-gauge lines, the dead weight, in passenger stock, is in one case 2½ to 1, and in another, 1.82 to 1. On the Norvord Railway it is as 2.7 to 1; on the Livny Railway as 2.5 to 1; on the Dunedin and Port Chalmers Railway, in New Zealand, as 1.75 to 1. In goods, on six separate lines on the small gauge, 3 tons of net weight are carried per ton of dead weight, or rolling stock. On the Montepone line 2½ tons, and on the Broelthal Valley 2 tons, of freight, are carried per ton of stock.

Thus, we find an economy which, if the figures stated are correct, is not one of estimate but of fact, of at least 4 to 1 in the carriage of passengers, and 3 to 1 in that of goods, is to be effected by the employment of the small gauge as compared with that in ordinary use. That this is not an advantage confined to very short lines may be inferred from the fact that the length of the line in construction from Denver to Mexico, above mentioned, is a thousand miles.

We call serious attention to the above statements. We make no pretence to the power of prophecy. Still, that the adequate investigation of a great industrial question may enable an engineer to estimate with some certitude the course of its proximate development, we think our recent articles on the coal question have demonstrated. We now think it pretty clear that an unfavourable change is at hand, unless some measures be taken to avert it, in the value of our railway property. And we invite those most deeply interested to investigate that method of turning seven years of death into seven years of plenty, which is offered by the development of the small gauge.

GLEANINGS AT THE BRIGHTON MEETING.

Storage and Sewer Gases.

In a paper on this subject,—
Mr. W. J. Cooper pointed out that the noxious exhalations rising from the drains of large cities are daily increasing in quantity, and that they threaten serious damage to the public health. Cases of drain-poisoning are not uncommon, and it is difficult to find a thoroughfare in the metropolis that is free from the foul and sickening odour which ascends through every grating communicating with the sewers. This is in spite of the millions that have been spent upon London drainage, and the sewer gases are still the greatest difficulty in the way of the sanitarian engineer. It has even been suggested that the only way to treat them is to provide for their free escape into the atmosphere; and a letter recently published in the *Times* gives advice that the sewer gas should simply be diluted with air in every direction, and that tall chimneys should be sent above the houses, so as to afford outlets for it in regions above the heads of the inhabitants. So desperate a remedy could scarcely have been proposed, except in recognition of a really imminent danger. At a time when strenuous efforts are being made to secure purity of atmosphere, when Smoke Acts, and others of a similar tendency, are being rigidly enforced, the idea of building tall chimneys to distribute sewer gases over our dwellings seems distinctly retrogressive. We should rather look to chemical agency for effectual and prompt assistance; and it is perfectly practicable to arrest the fermentation of sewage during its passage through the conduits and to prevent the formation of gas. While watering the roads and streets of towns during the last four years with a solution of mixed deliquescent chlorides the author had found that the waste solution running into the drains had exerted a marked effect in preventing the unpleasant smell formerly proceeding from them; and he had thereby led to insinuate experiments which had convinced him that the drains of London and other large towns could be kept perfectly free from gas at an annual cost of about 1s. per head of the population. He proposed to introduce chloride of calcium, either in powder or solution directly into the drains and sewers at times when they were nearly empty, and especially, times of drought. The effect of chloride of calcium upon carbonate of ammonia was to decompose it, and to form neutral chloride ammonium and carbonate of lime; but treating the sewers with a chloride of calcium preparation at proper times the generation

monia and its accompanying products of decomposition will be prevented. Anomonia is generated in sewers by the decomposition of organic matter in the presence of water. The progress of its decomposition consists in the fermentation of the organic matter, which produces a gas, called carbonic acid gas, and water, which is equivalent to carbonate of anomonia.

Mr. Longstaff, speaking on the paper just read, said the evil of sewage fermentation was very great, and it would be well to consider what remedies there were for them. He stated that he had factories in Yorkshire, and had sought a remedy for these evils in making such connexions between the sewers and large factories, that the gases passed through the furnaces and thus lost their noxious character. He believed that this plan had been effective, and thought that the same course should be adopted wherever there were high shafts in the neighbourhood of sewers. He regarded the object dealt with in the report as of twofold importance,—in its sanitary bearings and in its relation to the fertilisation question. He believed that the soil of England would bring forth threefold more wheat if the sewage were applied generally, but it was the misfortune of this country that the agricultural mind was slow to move from the habits of previous ages, and another thing, the country suffered from so much engaged in farming not possessing sufficient capital to carry on their business properly. He considered that in dealing practically with the question of the utilisation of sewage,—in giving what the country now greatly needed, he means whereby the sewage, now a nuisance to our towns, might be profitably employed by the agriculturists,—the committee had done nothing. Experiment after experiment had been carried on, but no practical results had been given such as would be of value to the country. He expressed a desire to know whether this want of practical information was attributable to any of the gentlemen whose names were on the committee not attending. Professor Williamson, in answer to Mr. Longstaff, said that practical value was to be in the fact of its having been ascertained in the use on a farm of 100 parts of common nitrogen, about 40 parts were found in the soil grown,—that was nearly one-half, and 10 per cent. went off in the effluent water, in the generally of nitrates, but in a small degree according to soil over which it passed. He believed 50 to be accounted for, and he believed 50 parts would be found in the soil, which is to that degree enriched. The 10 per cent. passed off in water was not sufficient to poison.

He also said the value of sewage in the growing of crops could be easily estimated from the report statement of facts. In Cheshire the sewage was made of 3 acres to keep each cow house—on some good farms 2 acres. Now, the use of sewage as a manure, he would think to grow sufficient rye-grass to keep cows to the 1 acre, and he could go to five to an acre. He could grow 80 tons of a rye-grass to the acre, and could go to 100 tons an acre.

Scott referred to the difficulties which had been created by refusing completion upon this subject, and pointed out Birmingham, by the vote on Sir Robert's objection to the utilisation of the sewage had been thrust out of existence in that town was ready to undertake. He said that the Public Loans Commissioners refused to grant loans to our towns, by their might undertake to work out the question of the sewage. He pointed, as another example of the difficulties of towns in this respect, to the case of East Ham, which stood upon two rivers—the Lea and the Thames, and the drainage of both which had refused to connect with the drainage to the waters under them. The Government proposed to have a sewage treatment works, who was appointed the local authorities the necessary permission to undertake this means of ridding the town of their sewage.

With regard to the proposed system, for the purposes of ventilation, of the chimneys shafts, reminded those who had said that some gases from sewers were evolved, and that explosions had actually occurred through such connexions. He added that he did not believe typhoid fever was caused by sewer gases, but he said he believed this disease was caused by the waste pipe in the cistern

being directly in connexion with the soil of the closet, and thus contamination of the domestic water ensued, leading to disease and death.

A Common Migration from the East, shown by Archaic Remains in America and Britain.

In a paper on this subject, Mr. Phené drew attention to a paper read by him last year at the meeting at Edinburgh, in which he had referred to some remarkable mounds in North Britain, which he considered were identical with the Serpent and Alligator mounds of America. He stated that since that meeting he had opened the most perfect of these British mounds, and with very satisfactory and interesting results; but as the investigation had been published, he should pass on to other matters. He pointed out various difficulties he had met with in coming to an accurate decision about the mound, but how, finally, he found, on reducing it to scale, and taking the various levels, that it agreed almost entirely with the Egyptian Ureus and the Phœnician serpent deity, each of which is represented in relics now extant as in the precise position of the form of the mound, and each with the solar disk at its head, which is found to correspond exactly with the cairn formerly described as the head, but which is now found to be in the position of resting upon it, assuming the figure was placed vertically, instead of horizontally. The author next proceeded to show that his observations on this point also explained the only ambiguity in the case of the Great American Serpent Mound at Ohio, which, he also argued, is surmounted by the solar orb, thereby agreeing with the Egyptian, Phœnician, and, as he claims, British representations also. He quoted a number of authorities to show that the words O B, meaning Serpent, and O N, meaning Sun, represented the Sun and Serpent deity, commonly worshipped in Egypt and Phœnicia; that the same word, with the addition of the letter I, is found in Africa, OBION and OBONI; both represented serpent and solar deities which were worshipped by some tribes in a visible and sensual manner, and by some in a spiritual sense. He showed how rare places with these component names are: one only in Europe; four or five in Asia, where the worship of the Sun and Serpent still continues; those already quoted in Africa; and one only in America directly: but he proceeded to show that some of the American names in the districts of the ancient mounds assimilated very nearly to these, making allowances for no greater variation than had taken place in the form of names in their transmission from Greece to Rome, and concluded his argument by claiming for Oban (the town near where the Argyleshire mound is) the name of "the place of the Serpent and Solar Deity"—ABON or OB-AN, which he quoted authorities to show were used indifferently, as EBOE and OBOE are in Africa, each having also that meaning.

The Moabite Expedition.

Dr. Tristram, in the course of his paper on this subject, spoke of the "Antonine Itinerary" as another centre for exploration, from which the most remarkable and important discovery was made. The ruins of a magnificent palace, far more perfect than anything yet found in Moab of so early a date, were discovered on the borders of the desert, east-south-east of Hesibon, and form a new problem for our antiquaries at home. A quadrangle of freestone encloses a palace of brick. The quadrangle is 170 yards on each side, and furnished with semicircular bastions. On either side of the only entrance is a facade of carved work, 180 ft. in length and 17 ft. in height. Animals, birds, flowers, fruit, and even men, are chiselled with great thoroughness and delicacy of touch. The whole is in a marvellous state of preservation. The vaulted roofs of eight chambers of the palace yet remain. The plan and details have led Mr. Fergusson to conjecture the Persian conqueror Chosroes to be its author. Sir Henry Rawlinson questions the soundness of this opinion, on the ground that a military invader who merely crossed this tract on his way to Egypt never had sufficient hold upon the country to attempt such a work. Be this as it may, A.D. 600 must be somewhere about its date. The Arabic name, Umm Shittah, gives no clue to the history of this remarkable place. West of the direct route referred to above, the gorge of the Kallirrhoe, with its hot baths, where Herod the Great tried for a cure, was most thoroughly explored, though not unknown before; but Makaur, which must surely from its modern name and its similarity of position to the descrip-

tion of Josephus, answer to Machœrus, was reached for the first time.

The Brighton Intercepting Sewer.

This was fully described by Mr. J. G. Gamble. He said,—“A portion of the Intercepting Sewer has now been in use for about a year, at Cliftonville: that is to say, the drainage of Cliftonville runs along it for a short distance. Although the gradients of the road at this end of Brighton are by no means steep, and the gully-traps are said to be good, yet the quantity of silt-like material and large flints that come in is quite incredible. This has to be removed by hand. At Hastings there is a very fair system of flushing by aid of the tide in operation, and the gullies are better constructed than usual, having a special catchpit beside the actual water-trap of the gully. Nevertheless, sand collects at every junction, and has to be taken out by hand. . . . But not only does the road-drift create an obstruction which collects other and more noxious materials, but it often sets hard like concrete, and has to be dug out with pickaxes, with no small damage to the brick lining. Whenever possible, road-gullies ought not to go into the sewers: in front of Brighton they might, and some do, go on to the beach. No objection could be taken to this being done, if a good system of scavenging for horse-droppings, like that in use in some parts of London, were in practice.” Upon the subject of ventilating shafts, which are to be placed at intervals of about 200 yards in the town, and 400 yards in the country, Mr. Gamble said,—“The position of the intercepting sewer precludes us from using what is, perhaps, the best way of ventilating sewers,—viz., by tall shafts taken up by the side of houses and above the levels of the roofs. . . . It has been suggested to move fans by aid of the current below, but, apart from the liability of any such arrangement to get choked, the worst smells are given off when there is least water.” “An objection has,” says Mr. Gamble, “been made to the intercepting sewer, that it is an elongated cesspool. But it is surely worse to have the sewers as they are at present than to have a cesspool long enough and so placed that the sewage will run right away out of the limits of the town. As pointed out, even if 300,000 cubic feet were backed up in the sewer at high water, it would not reach within a mile of Kemp Town, and all the gases would pass up the air-shafts on the Newhaven-road. The outfalls under the present system are equally blocked at high water, but the gases have nowhere to escape except back into the town.” In reply to questions, Mr. Gamble said he could not say what would be the cost of the sewer, as only about one-third was now finished. The engineer's estimate was 80,000*l.* The works were stopped at present, in consequence of a change of contractor; otherwise, Mr. Hawkshaw would have been happy to conduct members over them.

The Barrows of the Yorkshire Wolds.

The Rev. W. Greenwell read a description of the round barrows and their contents. In general form these barrows are either conical or bowl-shaped. It is probable that many had originally an encircling moat or a ditch, or both, at the base; but if such were the case, all traces of these enclosures have been destroyed. The barrows were commonly of earth than of chalk. They are usually associated in groups, but a single barrow is not uncommon. As a rule they have been erected on high ground. The bodies buried under the mounds occur at various levels, the centre burial being usually in a grave elevated in the chalk. Generally, there is nothing to protect the body from the pressure of the overlying soil, interments in cists being almost entirely unknown in the wolds. Rarely the body has been protected by a coffin formed of a hollowed tree-trunk. The remains of the body, when burned, are sometimes enclosed in an urn. Secondary interments are common, and the bodies previously buried have been thereby disturbed, and the bones scattered. In some instances the burials were by inhumation, in others after cremation, the former practice being far the more common in the wolds. In cases of burial by inhumation, the inhumed body is always found lying on the side in a contracted position, with the knees drawn up towards the head. This was evidently not due to the requirements of space, but must have originated in some settled principle, the meaning of which is not understood, but which appears to have been common

to all mankind at a certain stage of development. Perhaps it was in imitation of the natural posture assumed in sleep when the individual sought warmth. The direction of the body seems to follow no rule.

The barrows contain numerous weapons and implements of stone (including flint), of bronze, and rarely of bone or horn. The catalogue of stone implements includes almost all those which occur elsewhere, but the bronze articles are very limited. In 218 burials by inhumation and after cremation thirty-nine had articles of flint or other stone, ten of bronze, and three of horn. From the evidence afforded by the barrows it appears that the early inhabitants of the Yorkshire wolds must have lived in an organised state of society; that they possessed domesticated animals, and cultivated grain; that they manufactured woollen and perhaps linen fabrics; and that they had attained considerable skill in metallurgy, and were acquainted with the manufacture of pottery, though ignorant of the potter's wheel. It is believed that it was their custom to bury with the dead the wives and children of the deceased, and perhaps their slaves. The round barrows yield both dolichocephalic and brachycephalic skulls. The short-headed race were taller, more strongly built, and harsher in features than were the long-headed people. With regard to the age of the round barrows, the author feels safe in not attributing to them too high an antiquity by referring them to a period which centres more or less in B.C. 1000.

THE NORTHAMPTONSHIRE EXCURSION.*

AN early train from Stamford brought our party to Elton, on Wednesday, the 21st, to commence a round of churches in the district adjoining Oundle. Of these Fotheringay, the first visited, is a very fine example of a large spacious church entirely in the Perpendicular style, with a tower crowned by an octagon lantern of very stately character, and forming an exceedingly fine object as seen from the south-east and north-east. The large deep buttresses externally, and the peculiar thin flying buttresses to the clear-story, are well worth attention as a piece of good and effective building; and the west doorway is one of the best specimens of the style. The church has no chancel, an omission which gives a very peculiar character to the interior. The broad walk up the church, overshadowed by a complete continuous "pointed vault" of foliage, through which the sunlight made an intricate diaper on the path, was not the least pleasant feature in connexion with Fotheringay. The tower and spire of Warrington, our next halting-place, are well known as one of the finest specimens of the Early English period: the scale is small, however, and the proportion of the spire somewhat broader and shorter than most of the said illustrations would lead one to suppose. The inspection of this and some other well-known spires will confirm the opinion we have expressed on a previous occasion as to the inaccuracy, especially in regard to general proportion and outline, of Wickes's illustrations, from which many students have taken their idea of the structures they were unable to visit. The roof-shafts at Warrington (which carry a wooden vault of simple design) have remarkably beautiful carved capitals, which have not yet been illustrated. Tansor, with its short tower covered thickly with ivy, is a small unpromising-looking structure externally, possessing, however, no small interest, and comprising specimens of nearly every period of English architecture. The older part of the nave-arcades, towards the west is Early Transitional of a very good type; the church was remodelled in the Early English period, and the nave lengthened in that style. The most singular point in the church is the continuous rise of the floor from west to east, making a difference of nearly 2 ft. or thereabouts in the levels; the capitals of the nave arcade, though very irregular, diminish in height, in the main, in the same direction. Was this one of those odd attempts at artificial perspective, specimens of which are to be found here and there on the Continent? More likely it was accident, or carelessness. Proceedings were diversified here by some organ-playing by a member of the party, on a small but remarkably pleasing instrument by Walker, of London; winding up with a certain prelude and fugue of Bach, dear to musicians as "the little E minor" (as distinguished from the "big"

ditto). Cottesstock, to which we next find our way, is a small church, notable chiefly for a fine east window; also for a bit of flat *flieu-de-lis* cusping in one of the tower windows, unusual and very modern-looking in appearance, though evidently old. Here we lunch under an avenue evidently old. Here we lunch under an avenue of trees, assisted in our operations by the hospitality of a genial old farmer of the place, who insists upon bringing out to us mighty flagons of "home-brewed" from his own stores—such material as is not to be had from the degenerate taps of town inns, large or small. We give our hearty old friend three cheers, and drive off in a state of mind to do justice to the beauties of Polebrook. This small out-of-the-way church is one of the finest and most interesting of our series. The church is Transitional and Early English, of the finest types; it is nearly square on plan, being only three bays long, and having nave and aisles, and a north transept of considerable depth, the width of the eastern bay. The arcade of the north side is rich, but comparatively Early Transitional work; the south side later, approaching to the fully-developed Early English style (to which the tower and spire belong). The north transept contains one of the most beautiful and artistic specimens of an Early English wall arcade that could be seen. The beauty and variety of the nave capitals is also remarkable. No one coming to the neighbourhood should omit a visit to this church (about two miles eastward of Oundle), on account equally of its detail and general plan and arrangement, which are alike most suggestive. Barnewell St. Andrew, two miles farther south (for we are progressing down the eastern side of the county now), is a small church, the chancel at present under "restoration," which, in this case, nearly includes rebuilding; style, mostly Early English, remarkable for the profuse use of the "dog-tooth" ornament; also for a door in the west tower, calculated to puzzle archaeologists, and which was set down by some of the party, our leader included, as a seventeenth-century attempt to imitate "Decorated" work. Are we quite in a position, by the way, to say, whenever we had and clumsy piece of work is found, that it belongs to the modern period? There might have been clumsy masons even in the fourteenth century,—exceptions to the rule,—or perhaps amateur architects. From hence to our next rendezvous, Tichmarsh, is a beautiful drive of about four miles; and perhaps it would be difficult to find anything more pleasant or more thoroughly English in character than the main road at this point, with a wide border of turf on each side, lofty thickset hedges, and over them an almost unbroken row of fine tall trees overshadowing the road, and screening the sunlight just enough to make the effect perfect. The church at Tichmarsh is altogether modern internally, and good work, containing also an organ by Mr. Lewis, which, so far as it is finished, fully confirms the reputation which this rising builder is already establishing. Architecturally the point of interest is the tower, of late date, the lower portion of which, with its deep buttresses and rich profusion of quatrefoil panning, in excellent preservation, is a remarkably fine piece of work. Here we are entertained with tea and coffee, and the rectory lawn, under the shade of a great cedar-tree, celebrated for its size and beauty, and opposite to the garden front of the new rectory, a most pleasant bit of domestic building by Mr. Browning, of Stamford, whose good work and true feeling for his art we have had several times occasion to recognise in the course of our excursion. From hence we take train to Oundle, find our way over the long bridge which forms the approach to the town, and charge the Talbot Inn in great force. This is a picturesque old house, worth a note in itself, particularly the solid old staircase leading up to the dining-room, and lighted by mullioned windows, looking out into the courtyard, and the long, low room, with its two large, fine stone fireplaces, belonging, like the staircase, to the Jacobean Renaissance period; and it is only justice to add that the fare and the attendance were equally of the good old-fashioned kind, and that plenteousness and civility went together. After dinner arrangements were entered into for obtaining photographs of some of the places visited during the day, the objects to be photographed being put to the vote by a show of hands. Then came a turn-out to the church, obligingly lighted up for our inspection. More organ-playing here, to an extensive congregation, winding up with a general hymn-singing. As to the church, the interior has been well restored, but is not re-

markable, except for size. The upper stage of the tower is one of the finest bits to be found in the kingdom, very unusual in design, and was one of the objects almost unanimously selected for photographic illustration.

Half-past seven the next morning found us, by train, at Thorpe Station, five or six miles south of Oundle, whence (after first losing our way and being deposited in a *cul-de-sac* in the churchyard of Lilford-cum-Wigthorpe *) we found our way to Aldwinckle, of which the older church, St. Peter's, is well known, from illustrations, for its beautiful simple tower and spire of Late Decorated date. The later tower of All Saints, less known, deserves to be more so, as a remarkably good example of Early Perpendicular work, unusually artistic in design in the upper stage, and notable for a treatment of mouldings and details in which a good deal of the richness and well-rounded relief characteristic of the Decorated period is combined with the forms and general treatment of the later period. As a specimen of masonry this tower is admirable. In this village Dryden was born; tradition says, in the house now the Parsonage, but this, as the spectator said, "wants confirmation." The name of the author of "Absalom and Ahithophel" certainly suggests associations curiously at variance with the aspect of this quiet, retired country village. A drive of a mile brings us to Lowick, a church entirely in the Perpendicular style, and with a tower and lantern not without merit, but the whole thing is weak and unworthy. In the church are the chapel and some monuments of the Sackville (Lord Dorset) family, and a rather singular monument, having two recumbent effigies with canopies at their heads placed horizontally; the back of the canopies decorated with small and delicate panel-work. Islip also, is a late Perpendicular church, small, with a pretty spire, but not otherwise interesting; but our next stage, Woodford, is a somewhat notable church. There is here what may be termed a double chancel arch, one in the usual position and one three bays to the westward; both arches of the same date in regard to mouldings, &c., and apparently built together. At the point where the western arch occurs are two transverse arches across the aisles, balancing the thrust of the centre one; the south aisle has three such cross arches from pier to south wall. The chancel, even beyond the eastern arch, is a unusually long one. The north arcade of the nave is Transitional work, of unusual interest, the capitals mostly advanced to a tolerably high state of ornamental elaboration, but the arches, with having perfectly plain semicircular arches, with a square soffit. The south doorway is exceedingly rich in decoration, and contains in the arch-mould an under-cut stem-and-leaf ornament curling from one member to another over a deep hollow, the tenacity of the stem being seeming more like what would be suitable for ironwork; that it should have remained, since the fourteenth century, almost unbroken and perfect, shows that the stone must have been very carefully selected in the first instance. The whole, Woodford is a church which will repay study, both as to detail and general treatment. Ringstead is a church with a fine spire. Early English date, remarkable for its breadth and simplicity of treatment; there is a fine arcade of the same date, with the singular that the capitals (moulded only, without carving) are of different heights, some shallower than others. It is a small church with nave and north aisle only. But Ringstead is noticeable as the first church in our series, as we go southward in which we find the suggestion of a construction in polychromy, very largely used in many churches in the southern part of the county, by the introduction of hands of the dark reddish brown iron-stone which forms a large part of the geological formation of this large part of Northamptonshire. In the present instance the use of red stone is oddly partial and irregular; but there is a vaneer, or a band in the middle of a pier, in another place a whole pier composed of it, &c. But as we proceed, and come into the centre of the iron-stone district, we find the introduction of the iron-stone in contrast with the grey oolitic limestone, more and more common, and carried out with increasing regularity forming the keynote, too, of several modern restorations. One cannot help noticing, indeed when going rapidly in this way from one group of churches to another, the manner in which design of the buildings is coloured, so to speak, the nature of the formation on which they are built; a relation between circumstances and results of course much more pronounced

* See p. 660, ante.

times when transit was slow and difficult than in these railway days. Indeed, the remarkable range of fine churches which runs through Lincolnshire and Northamptonshire might almost be described as the outgrowth of the lias and great oolite deposits which are laid bare at this part of England, and furnish the main portion of the magnificent building stone which enabled the Medieval builders of this neighbourhood to construct such beautiful and enduring works. Where these formations crop out there are the best churches; where they disappear the churches, as a rule, decrease in interest. This connexion of works of art which are comparatively only the productions of to-day, with the formation of deposits of clay and minute shells countless ages ago, suggests matter for many reflections, which yet we will not follow out here, but go on to Denford Church, only noticeable for its picturesque situation, a pretty spire, and the existence of some of those pots built into the wall in the chancel, the discovery of which gave rise to much speculation some years ago, and which were said to have some acoustic object, a suggestion pretty generally given over to contempt by our party. Indeed, it is not easy to see what acoustic object they could fulfil; though it is credible that the Medieval builders may have had some unobtrusive fancy of that kind. We next proceed to Raunds, with its famous tower and spire, grandly situated at the crown of a steep field, from which an excellent view of it is obtained. This tower has been a good deal illustrated, but is mostly very inadequately, and must be seen to be properly appreciated. It is worth noting how fine is the contrast between the rich tating of the tower, with its multiplication of buttresses and set-offs, and the plain masonry and long lines of the spire, broken only by comparatively small lucarnes. The disproportion between the size of the church and its tower is remarkable even now, and must have been much more so before the present late clearstory was added, and when the church was comprised within the limits shown by the weather-mark visible on the east wall of the tower, within the church. Clearly utilitarian theories of building were not predominant when this tower was built. With this feature the interior of Raunds is tame and poor in design, and in wretched condition; dirty, dilapidated, fitted with wretched worm-eaten purlins, and in extent from the spreading of the roof: unless something is speedily done the building will be unsafe. The manners of the natives, who, in a dirty disorderly crowd, followed our party into the church, seemed to match only too well with the state of the village sanctuary. We do not pretend to say whose fault it is, or whether there is any fault in the matter, but certainly Raunds leaves a melancholy impression, or depression, on the spirits, as of a place morally and materially neglected. The little church of Staunwick, with its octagonal tower almost unique in design, is the last on our day's route. The situation of the church on the side of a descent, and surrounded with trees, is most picturesque, and would make an excellent subject for an artist; the only particularly noteworthy thing in the interior (which has one aisle only, on the south side) is the singular niche just within the chancel, behind the north front of the chancel arch, and facing to the east, the use or origin of which it is difficult to conjecture. A drive of six or seven miles brings us to Wellingborough, where we are to stay the night; a place soon to become, probably, the centre of an active ironworking district. We come here fairly on to the iron-stone formation; instead of the grey limestone road, we have a dark red dusty highway, unpleasant to the eye, and the inevitable disfigurement of the face of the country by excavations, furnaces, chimneys, and other such defilers of the landscape, has already made some progress. The strange point, indeed, is that the richness of this district in iron should not earlier have been noticed and turned to account; and that stone should have been used for building in the churches of the district nearly 500 years ago, with the iron seams actually cropping out from the worked face of the stone (as may be noticed in the external walls of many of the churches, in the south of the country), so that it can be fled off; and yet that it should only have occurred to people within a few years back that it might be put to a more remunerative use than building with it. Whether the "wealth" of a district, in every sense of the word, is promoted by this kind of tillage of the soil, may be questioned;

but the fat has gone forth, and the iron industry will, no doubt, be more and more actively cultivated in Wellingborough and the neighbourhood for some time to come. The town itself, never, we should fancy, a very interesting one, has already begun, in its newer portions, to put on that look of unutterable ugliness and grimness which appears the inevitable aspect to which towns come that take to iron manufacture,—an industry before which, under whatever form, beauty seems to fly from the face of the earth. It must have been of the ironfounders that the prophet said, "The land is as a Garden of Eden before them, and behind them a desolate wilderness." Let us hope there is solid good enough to compensate for these inevitable evils, but one is sometimes tempted to doubt it.

The church at Wellingborough, of which we saw the interior by gas-light only, is a fine, spacious building, mostly of late date, and well and carefully restored recently by Mr. Law, of Northampton. Some remarks on what was noticed in the churches in the immediate neighbourhood of Wellingborough and Northampton we defer.

THE VIENNA UNIVERSAL EXHIBITION AND THE WORKING ARTIST.

ACCORDING to all report, what has hitherto been done in the way of exhibitions will be far excelled by that which is to fill the world's eye in the forthcoming year. We, of course, refer to the "Vienna Universal Exhibition," now in active course of maturing itself, both here and everywhere else. A few words about it in time may, we think, be useful. We have before us the general and very comprehensive programme, almost a comfort to see; for so much has been thought of, and methodically put together and arranged. The whole idea is under the highest possible patronage,—that of his Imperial and Royal Apostolic Majesty, the Emperor Francis Joseph; its president is the Archduke Regnier; and its general manager, the Baron William de Schwarz-Seuborn. It would seem impossible for things to be more promising. The city of Vienna occupies a commanding, and in some respects a unique, position in Europe; and is, in itself, not a little remarkable in many ways. The building will be about four times the size of the Exhibition of 1851, and is situated in the "Prater," or Imperial Park, and close to the Prater or Northern Railway Station, and almost on the banks of the Danube, which runs through the city. Nothing can be better. It is impossible to speak of Vienna without noticing the singular way in which these modern days have added to the old Middle-age city which stands in the very centre of it. It is about three-quarters of a mile across, and in it is the Imperial palace, and the renowned church of St. Stephen. This inner town is entirely surrounded by a broad garden or park, in which no building has very properly been suffered to be built. It was the ancient moat of the city in its old and fortified state, so that you must cross this ancient moat site and present garden to pass from the new city into the old, or garden-surrounded city. Old Vienna is thus completely surrounded with a ring or circle of trees and flower-beds! The new or modern city has another or larger ring surrounding or encircling this. It is a singularly happy idea, though an accidental one, and says much for those who would not allow of its green spots being built on. A good deal more might be said about this city and its "improvements," for improvements are not confined to London or Westminster, but our present business is to hint at a thing or two concerning the artistic part of the coming Exhibition: as we take it, a not a little important part of it.

In the first place, it will be seen by referring to the programme, that the classification adopted for the objects to be exhibited are separated into twenty-six classes or groups, as mining, agriculture, chemicals, and so on, for raw produce. Then metal industry, wood industry, stone, earthenware, and glass, and so on; for manufactures and art-manufactures. There is also under this heading, art as applied to religion, i.e., works of fine art which are employed in public worship. There are also to be the arts of the past, and fine arts of the present. There is also "education," as a matter of course, and teaching and instruction, so that there is as it would seem really nothing left out. We say nothing of trials of machinery, history of industry, conversion of "waste into use," history of prices, and a perfect host of other things

sufficiently puzzling to the curious, however curious they may be; but one thing certainly has been left out of the programme, at least, which has always seemed to us to be all-important; and it is this—in a single phrase: artistic hand-work, as applied to common things. We do not here mean pictures, or even statuary, or expensive engraving, but simply that sort of work of which the old Etruscan, or the old Greek, has left us specimens in his wonderful vases and wine-cups, and of which old Rome and Pompeii have shown us examples in their wall paintings, and which the dark Middle Ages managed to accomplish without the aid of machinery or apparatus, in almost every fragment of wood carving, or stone-cutting, which time has spared to us. Do not let us be misunderstood. We are not at present complaining of art-manufactures, though it is a painful subject to contemplate, for we all know before hand who they are, and must be, who will carry off all the prizes of this great show; but we are simply again asking attention to the fact of the existence of those artistic hands which are, however things are done, destined to do the real and actual work. What we want and are pleading for then is, a small space, in this gigantic show, for the modern successors,—for some few, at any rate, actually do exist, though at present unknown,—of the old Etruscan, the fine Greek, and the workman, and the working artist, of the Middle Ages. We all know well what it is that we shall see: the huge and well-filled glass cases elaborately fitted, and lined, and labelled in full with the name and antecedents of the exhibiting firm, names and addresses, and all complete, triumphs of energy, and organisation, and capital! But of the very names of the men who, in some obscure corners, garrets, or cellars, who have painted, or even helped to paint, or to mould the costly tea-cup, or fruit-plate, or drinking-cup, or anything else you like to name, who is there who expects for a moment to see them either stuck on to the objects made or adorned, or anywhere else? On very many of the antique vases there is the name of the executive workman, or artist, and we almost seem to see the man as we look on his work. It is rude work enough, some of it, it must be confessed, but how expressive of the country in which it was done, of the race of men who so wrought, and, what is even more, of the individuality of the executive workman. It is something of this that we want to see in the Vienna Imperial Exhibition of next year. We want to see exhibited in it, not merely the cases full of goods, the produce of organisation, and capital, or miles of designs in artificial stone, but at least a corner of the great building filled with the works and names of individual artist-workmen. Each country from Scandinavia to Italy, and from Russia to France, having its representative workmen. We must repeat, do not let us be misunderstood. Of course, the workman or workmen must always be seen in some way or other, nothing comes into being of itself, and a modern painted and drawn and designed tea-cup, or cheese-plate, is the produce of some one set of men or machines. It is impossible to get entirely rid of the personality of the workman, and this, of course, a something; but as we have said, but must repeat, what we desire to see is,—the man, not as a mere workman, or even as an artist, and as producing a result with others, but as an individual artist-workman. It would be impossible to over-estimate the importance of this mode of exhibiting to the world the capacity and skill of the modern workman, no matter what may be the range and power of his artistic capacity and skill. If he have the very highest, as that of a painter, then we must see it, if it be only to wonder at it. If it be the lowest, it must possess the same interest as is always to be found in a man's handwriting, however rough that may be.

We have said there are twenty-six distinct groups of classified objects comprehending almost everything, might not there be yet another, an artist-workman's group, for the express purpose of exhibiting the artistic power of Europe as embodied in its individual workmen? Such a division would be of surpassing interest, not only to general visitors, but more than all to those who are given to think of the future of the workman; and certainly to all those who really care and know anything of the "education" of the working man: for the best and most productive of education must be that which adds to the mental and bodily powers and producing capacities of the workmen of the time. It is not surely as a mere show of novelties, and as a

The Lord Mayor requests us to correct the following paragraph, as being calculated to mislead the public:

"The Alexandra Palace.—Mr. Gilbert Redgrave, R.A., is moving in the matter of the Alexandra Palace, and the design is to make the building a science and art museum, similar to those at South Kensington and Bethnal Green, with the addition of a concert hall and theatre. The undertaking, to be successful, would require to have a constant succession of novelties; and it is feared that, if opened under the plan of the metropolitan authorities, as at present framed, such would not be provided."

"The movement recently inaugurated at the Mansion House," says his lordship, "has for its object the acquisition of the entire park of 500 acres and its preservation for ever for the people, as a fountain of health and a grand arena of wholesome recreation. If only 192 acres are reserved for the park, and the remaining 308 acres are covered with buildings, as is contemplated by the owners, these objects will be frustrated. The larger area of land would not only not detract from the efficiency of the Palace for amusements, but, on the contrary, would give greater facilities for the 'constant succession of novelties' which Mr. Redgrave is moved to declare as necessary for the success of the undertaking. . . . If the plans which have been placed before the Lord Mayor are carried out, they will be not only attractive, but will confer vast moral and physical benefits on the mass of the people,—a matter of infinitely more consequence than the provision of a 'constant succession of novelties.'"

THE HARTLEPOOLS EXCHANGE AND CLUB-HOUSE COMPETITION.

Str.—For the following two reasons your report and description of the successful design in this competition has caused us some surprise. Firstly, we have not received any official notice of the final decision of the directors; and, secondly, the directors to whom we have spoken upon the subject are not aware that a final decision has been arrived at.

Hoping you will in a future issue insert some further account of this competition,

ONE OF THE PREMIAED.

THE DESIGNS FOR THE WORCESTER GUILDHALL.

The Survey Committee of the Corporation, to whom it was referred to pronounce as to the award of premiums for the designs for rebuilding or reconstructing the Worcester Guildhall, have decided on recommending to the Council that the first premium of 100*l.* should be awarded to the design marked "Bakalum," subject to his giving a guarantee that he can carry out the work for the specified sum of 18,000*l.*, exclusive of the tower, sculpture, and carvings shown in the exterior perspective; the second, of 50*l.*, to the one marked "Fiat Justitia," subject to the architect's guarantee that the expenditure shall not exceed the aforesaid limit. There are only two plans for reconstruction, and the committee state that, having previously reported that "Convenience" had not complied with the stipulations as to outlay, they therefore presume that the premium of 60*l.* must be awarded to "Vindex." The second premium for reconstruction (30*l.*) remains unawarded.

ABOUT REIGATE.

A RESIDENT in Reigate sends us a reply to some statements as to the condition of Reigate made recently through our pages. The general correctness of "Gargoyls'" letter has been affirmed by several other correspondents, and we are not disposed to print mere assertions in denial. We print the greater part, however, of the resident's letter:—

"Where did 'Gargoyls' find 'the rows of ill-built, draughty tenements,' in which 'the great unwashed' dwell? There are very few rows of buildings in the place, except in the two main streets, and these are occupied chiefly as business premises. . . . Draughty, a number of the small houses may be, but not more so than usual, nor more so in comparison with the larger ones; neither do 'fevers frequently recur'; and though small-pox paid the town a visit in the early part of the year, I do not know what the mark is that it has left behind. It is the same here as everywhere else,—the lower class of people, the more they crowd together in the houses for economy of rent, and the more careless they are in sanitary matters. When typhoid fever and small-pox were prevalent in

London and other places, it made its appearance here, but it was chiefly confined to a few places where sanitary requirements were most likely to be neglected by the people; the other cases were suspected of being brought from thence to other parts of the place. The Local Board did not find a man for building a house of ten-chests (which would be rather *shaky* even for very speculative builders), but for erecting a store-shed without having given the required notice, or deposited plans for the same; and I believe the ten-chests merely supplied the weather-boarding, &c.; and even this was at Red Hill, and not at Reigate.

"Many are asking how it is that for three or four years there has been no migration to Reigate, and that building operations have entirely ceased. Some attribute it to the heavy rates that the new drainage will make necessary, but it is not because the town has been left undrained until its fair reputation has been damaged? There are several tenanted villas, which have evidently been occupied; perhaps their late occupants have fled to a place less obnoxious to the olfactory organs."

Had there been 'many asking,' it is very likely I should have heard of it, but I have not; and I think the stoppage of building operations (that is, other than for the owner's own occupation or investment, which still goes on) is rather due to the increase of the cost of labour and materials than to the reason assigned. There are other places around London where houses do not let readily, though the drainage and locality may be everything that could be wished for.

The Castle Grounds are a vast improvement on the old state of the place,—thanks to the liberality of the trustees,—and though 'Gargoyls' says more evergreens are wanted, perhaps if he waits until the present shrubs are grown up, he may see sufficient of them. There are plenty of seats, under large and shady trees and elsewhere, and although on one side more trees might be an improvement, these are not grown in a year. The trustees have spent more money than the subscriptions amounted to, and 'if the public would be drawn thither more than it is if 10*l.* or 1*l.* a week were spent in music,' I should think it is only fair that the 'public' should furnish the means by more of them becoming annual subscribers.

As to the letter of 'Salus Populi,' although some of its statements are unfortunately true, generally speaking it is apart from the subject. I believe there are fewer houses than usual in Reigate in which the 'speculating builder' has scamped his work to any great extent.

R. J. W."

The *Survey Advertiser* has taken up the cudgels for the authorities, and terms the statements of "Gargoyls" and "Salus Populi" "calumnies" and "utterly unfounded." Our usually well-conducted contemporary will better fulfil its mission by helping to obtain for the town the attention and improvements that are needed. Reigate has many attractions and capabilities, and deserves to be cared for.

BEDS AND BEDSTEADS.

WHEN the Hebrew writer wished to convey an idea of the might and prowess of Og, king of Bashan, the last of the giants, he said his bedstead was a bedstead of iron. In like manner, when Amos was inveighing against the wantonness of Israel, and desired to depict the height of slothful sumptuousness indulged in by those "who took their ease in Zion," he declared they lay upon beds of ivory. Again, nothing gave a better insight into the Spartan habits of the great Duke of Wellington than the small, uncarved iron bedstead in his bed-chamber, in Walmer Castle. Thus, it will be seen, a man's bed has often been closely associated with his character, as well as with his fortune, from the earliest times to our own. This piece of furniture has, moreover, further interest.

Judging from Egyptian, Greek, and Roman bas-reliefs, beds appear to have been always furnished with mattresses and pillows, sheets, and counterpanes; but they have differed exceedingly in form and materials. The form was probably first affected by the discontinuance of the custom of reclining on couches at meals, which took place towards the close of the fifth century. Among the materials used in their construction from the earliest times, have been bronze, silver, ivory, horn, and rare woods.

M. Viollet-le-Duc, in his recent work on Merovingian and Carolingian furniture, gives some interesting particulars concerning ancient French beds. Before the thirteenth century, there were so many cushions piled up at the heads of beds that persons sleeping in them

reposed almost in a sitting position. In the vignettes of manuscripts of this period, we may see that people undressed before lying down, and draped themselves only in the ample sheets. Over them, as they lay propped up with pillows, was thrown a heavy counterpane, probably of tapestry. Sometimes another piece of tapestry was placed under the mattress, and allowed to hang down on either side of the bedstead till it touched the floor. M. le Duc gives a fac-simile of a *vignette* in a manuscript in the Strasbourg library, in which this arrangement is represented. A king reclines in bed, conventionally crowned and robed. The bedstead is of metal. At the head of it are two standards, one on either side, which support bars extending from one to the other, upon which one end of the mattress is raised. Thus the number of pillows in this instance is reduced to one, which is very small, and covered with rich stuffs. A carpet, or piece of tapestry, is spread over the bedstead and hangs down to the floor; upon the mattress is another; and a third is thrown over the regal figure. Curtains are suspended from the ceiling, and exactly over the bed depends a lamp.

A night-lamp was an indispensable accompaniment of the bed of persons of rank and means, during the twelfth, thirteenth, and fourteenth centuries. It was, at first, swung from the ceiling, but when curtains came into use it was swung from a rod in the centre of the supports, and thus hung down over the middle of the bed. When everybody believed in evil spirits and supernatural visitations of all kinds, darkness was a season of terror not to be encountered if it could be avoided.

Before canopies came into use, curtains were suspended from beams, either in the ceiling or below it, or they were festooned from one ornamental hook, or bracket, in the wall, to another. The earliest canopies appear to have been fixed into the walls at the heads of beds at one end, and to have been supported at the other by rods descending from the ceiling. The four posts that now uphold them are, comparatively, late inventions. In the chamber of Isabelle de Bourbon, wife of Charles le Téméraire, there was a grand green damask canopy which extended over two beds and a wide passage between them. This lady, like all the French kings and queens, had a chamber of parade, as well as a bedchamber, in which there was also a handsome bed. Both are minutely described by Aliénor de Poitiers.

In their 'chambers of parade,' the French monarchs received those courtiers who were entitled to greater privileges than the rest of the court, or court officers, but yet were not on sufficiently intimate terms to be received in their bed-chambers. The distinction thus drawn constituted the difference between the *grand lever* and the *petit lever*.

Oriental canopies must have been of great magnificence in very early times. Holofernes, we are told, rested upon his bed under a canopy, which was woven with purple, and gold, and emeralds, and other precious stones. And when the beautiful Hebrew woman smote off his head, she pulled down this canopy from the pillars, and carried it to the elders of her own people. "Behold," she cried, "the head of Holofernes, the chief captain of the army of Assur, and behold the canopy wherein he did lie in his drunkenness; and the Lord hath smitten him by the hand of a woman."

The State beds at Holyrood Palace and Hampton Court are, it will be remembered, all four-posters. They are only of Tudor, or sixteenth century, antiquity.

In the fifteenth century there was a form of bedstead in use which is still ordinarily used in the cottages of the north-country peasantry. It was inclosed with panelling about 8 ft. high, on three sides, leaving the fourth open, or on four sides, except in the centre of one of them, where there was sufficient space left for the occupants to get in and out. A foot-stool, covered with tapestry, or other rich material, assisted the apparently difficult processes of entrance and exit. The panelling was elaborately carved, and it was finished off with a handsome open-work cresting. Within, there were curtains, pillows, and a counterpane of precious stuffs. Divested of all this ornamentation and colour, hard, indeed, into mere deal panelling, painted brown or drab, and rightly abhorred by sanitary reformers, this piece of furniture is now known as a "box bed."

But the rudest bed-place of which we have written account is that of the inhabitants of St. Kilda. Writing of these primitive people in 1764, and describing their abodes, the Rev.

Kenneth Macaulay observes:—"The walls of these habitations are made of a rough gritty kind of stones, huddled up together in haste, without either lime or mortar, from 8 ft. to 9 ft. high. In the heart of the walls are the beds, which are overlaid with flags, and large enough to contain three persons. In the side of every bed is an opening by way of door, which is much too narrow and low to answer that purpose. All their dwelling-houses are divided into two apartments by partition walls. In the division next the door, which is much the largest, they have their cattle stalled during the whole winter season: the other serves for kitchen, hall, and bedroom." Worse than this follows. So much manure is made in every house by spreading the ashes of the peat fires all over the floor and treading them into a compost, that the walls which are 8 ft. or 9 ft. high to begin with are reduced to 4 ft. or 5 ft. on the inside, when it is time to use it and sow the barley.

From this picture of discomfort it is pleasant to turn and remember that many beds were so stately as to be extremely valuable legacies, in the Middle Ages. Many were, of course, heirlooms. Shakespeare, we call to mind, wrote in his will, "I give unto my wife my second-best bed, with the furniture." Inventories also afford us many curious particulars concerning them; and they are incidentally mentioned in some of the early statutes.

Henry VII. enacted that no one should expose for sale in any fair or market in his realm any feather beds, bolsters, or pillows, stuffed with any other material than dry pulled feathers or clean down, or any quilts, mattresses, or cushions that were stuffed with anything but clean wool or clean docks. Scalded feathers, fen-down, moose-hair, neat's hair, and goats' hair were unlawful stuffing in the eyes of legislators in those days. Edward VI. endeavoured to meet a new contingency,—that of adulteration. He enacted that no one should offer for sale the articles above mentioned, though stuffed with dry pulled feathers and clean down, if these were mingled with scalded feathers, fen-down, thistle-down, sand, lime, and gravel.

Among celebrated beds, every one remembers the great bed of Ware. Mrs. Montagu's feather hangings, that Cowper admired so much, are also of world-wide reputation. Nextly every one is as familiar with his lines upon them as with Dame Dimmock's sheets, "washed with fairly-well water, and bleached on the honny white gowans;" but either of these curiosities would be dingy by the side of the Oriental magnificence indicated in King Solomon's word-picture,—"I have decked my bed with coverings of tapestry, with carved works, with fine linen of Egypt. I have perfumed my bed with myrrh, aloes, and cinnamon."

Now, ought we to be content that our characters should be judged by posterity by our lumbering and most unhealthy four-posters; or will our anatomical iron bedsteads properly represent us in time to come? Surely there is great room for improvement in these items in our household effects.

THE PROPOSED ALTERNATIVE PRISON SYSTEM.

At the International Prison Congress, the sittings of which were lately held in the Hall of the Middle Temple, a number of foreign gentlemen, some delegates from their Governments, took part in the deliberations under the auspices of the Council of the Social Science Association. Questions relating to criminal law, criminal procedure, preventive police, punishment, treatment of discharged prisoners, and penitentiary systems, were discussed for about a week and a half; and among the more prominent members may be mentioned Dr. Wines, Major Du Cane, M. Stevens, Dr. Eyre, Count Sokoluh, Count de Foresta, Mr. G. W. Hastings, Mrs. Howe, the Right Hon. Sir Walter Crofton, and the secretary, Mr. Edwin Pears.

The time allotted for the above questions, or rather the minutes that could be spared for questions under the above heads, were not many, and it cannot hence be said that one single question was exhausted or even thoroughly gone into. Nevertheless, the fact of the congress's sitting brought together from all parts of the world a considerable and valuable amount of information on the prevention and repression of crime, including penal and reformatory treatment. In connexion with this may be mentioned the system of occupying prisons by intermittent see-

tions proposed by M. Ed. Schmidt, of Petersburg, to which allusion has been made before in this paper, on the occasion of a lecture delivered in the meeting-room of the Social Science Association on the subject. With the aid of the annexed plans and diagrams, the reader will be able to follow the description and criticism here given.

It must be acknowledged at the outset that, whatever the merits or defects in M. Schmidt's scheme may prove to be, it is the only one which in a rounded and, to its details, finished form, has been presented to the public in general and to the members of the International Prison Congress in particular on the recent occasion. Its novel and principal feature is the constant use of all available space. Thus, instead of having a workshop and a sleeping-place, each capable of accommodating a number of prisoners used alternately,—say the workshop by day and the dormitory at night,—he uses the rooms constantly by bringing twice the number into them at the same time. That is, while one party fills the workshop he is unwilling that the space of the dormitory should remain unoccupied, and *vice versa*. Having mastered this principle, there appear to spring up at once objections sufficient to make one close one's eyes; one almost refuses, on the plea of common sense, to entertain the idea any further. But that is not fair to a man who has creditably devoted years of thought and labour to his scheme, and who pleads for it "economy," which, if it be based on a sound basis, demands attention, or at least a full hearing of the case.

There crops up, for instance, the question of the night-work. To have one set of prisoners work their sentence out in night labour while another set work by day, or, in fact, to have night-work at all, is considered unjust, inhumane, and killing. However that may be, there are some among us who nevertheless have to give many a night to our callings. Police, railway guards, the staff of newspapers, members of Parliament, and not a few besides, are compelled to yield their nights at times, and with them often their rest, leave alone the number of brewers and forgers who would fain turn night into day. But M. Schmidt has no such intentions. He does not propose to deprive the prisoner of his rest, nor that he shall work at night during the whole of his sentence, nor even, after the fashion of our hospital nurses, be on night duty for so many weeks and on day duty for so many. In almost imperceptible stages the prisoner works gradually later and later into the night, until at last he is gradually leaves the night work. Ten minutes, in fact, is to be the difference each day, so that a man who to-day turns to his work at midnight, to-morrow turns to it at ten minutes past twelve a.m., and after twenty-four days sleeps until four o'clock in the morning. In six times twenty-four the whole term is completed; that is, in 144 days each man begins again at the same moment at which he started. Out of this number of 144 he passes from ten minutes to four hours of his time between midnight and four a.m. in the workshop. Suppose one looked upon these hours as the critical night hours, it then becomes at once evident that of those he spends only 24 in 124, or one-sixth of his nights, and that only once for four full hours in the workshop. In the year consequently he has sixty nights of more or less disturbed sleep between midnight and four a.m., or a little more than the loss of one night per week. For those who consider the margin too small, and who consider eight hours of the night as necessary for repose, the figure is doubled, so that at the worst the prisoner would have to sacrifice two and one-third of a night per week. It may be added for those unacquainted with modern sentences that incarceration for life hardly exists anywhere now; that the longest sentences probably fall short of fifteen years on an average, and that ten years may be considered, on the whole, the longest term actually passed in a prison. The system of remission of sentence and pardons is extended to every deserving prisoner, and if he or she be detained longer than just indicated, it is not the fault of the authorities.

In the lower plan the dining-room is marked by the figure 1. The other rooms on that floor are kitchens, bath and wash-houses, offices, &c. In the upper plan the figure 3 indicates the class-room; 4, the dormitory; 5, the workshop. SS are special portions of these, for such prisoners as deserve a preference. The cells, C C, are disciplinary cells; V V, the ventilating shafts.

A complement of 300 persons would be divided into, say, ten sections of thirty persons each. There are consequently five sets of conjugate sections, each set sharing a dormitory and an atelier, and never in conflict. They always avoid each other. There can be no conflict either with any other set, because they, again, have their dormitory and workshop portions between themselves.

Before going into the points which are less clear than those hitherto explained, we will allude to a pamphlet published by Grunert, Bros., Berlin, on M. Schmidt's system. The author says that, having provided a wholesome and proper dwelling, suitable clothes, substantial food, time for rest, walking, and instruction, the country ought to reap the benefit derived from the prisoners' work. This might do more than cover the current expenses, if the waste space of prisons is utilised as above described. In ordinary goals of, say 300 prisoners, there are 300 cells, ateliers for 300, kitchens for 300, dining-halls for 300, &c. That, the author argues, is twice as much room as is required. Where sections follow one another in successive order into the dining-room, yard, and class-room common to all, only one kitchen is required, and one dining and class room for thirty persons each; and cells and workshops for 150, instead of for 300 persons. Each prisoner has eleven hours' labour, nine hours' rest, four hours for meals, dress, walking, and intellectual pursuits. Hence, each of the five ateliers will be occupied for twenty-two hours; the five dormitories, eighteen hours; the dining-room, twenty hours; the yard ten hours; and the class-room, ten hours.

The following are the advantages propounded:

- As regards economy:—

 1. A saving of 50 per cent. on the outlay in erecting and arranging the prisons.
 2. With a reduction to half the original number of buildings, the annual cost of repairs will be reduced in proportion.
 3. Similarly much waste of capital spent on sundry requisites, utensils, &c., would be avoided.
 4. The atelier system is productive, and capable of improved industry.

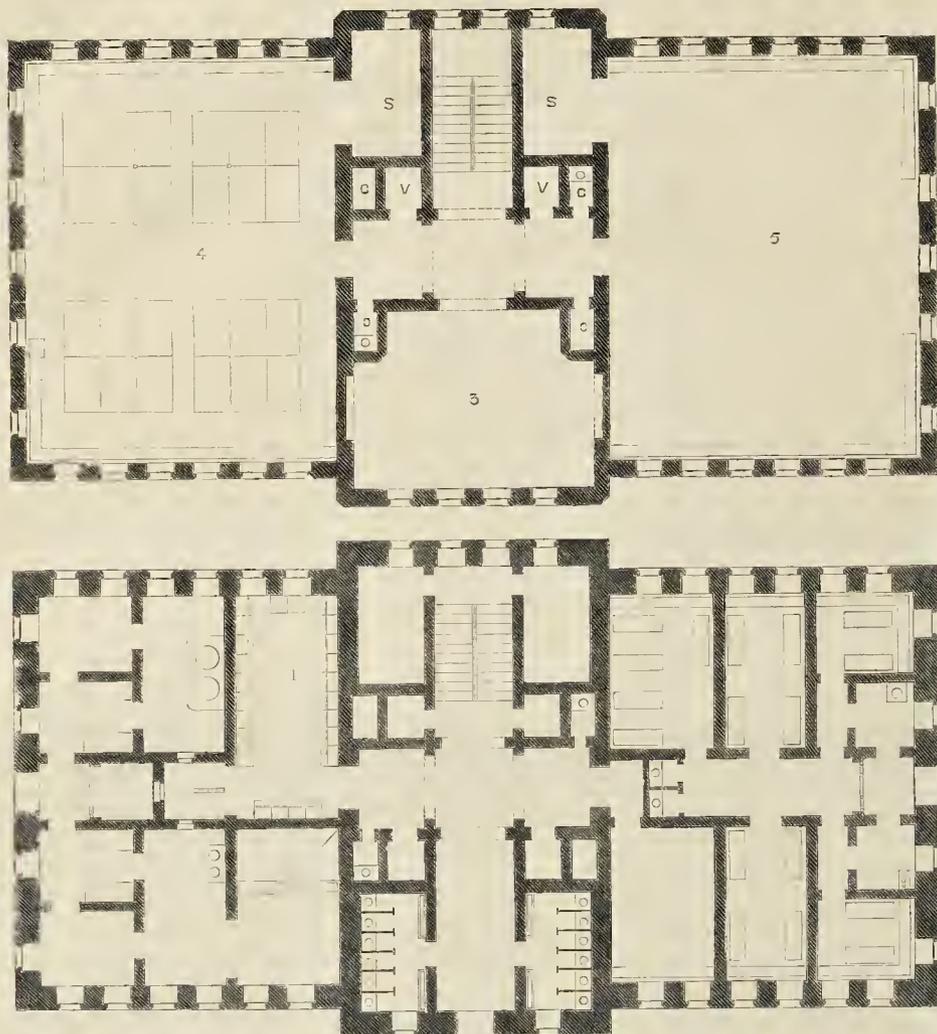

As regards the prisoner's reformation:—

1. The small number enables the sectional officers to exercise a direct influence on each individual prisoner.
2. The mechanism of the routine inculcates notions of order, obedience, and industry.
3. The remuneration of the prisoner on the value of his work would be a guide to an estimate of his reformation.
4. The erection of a prison on the proposed system, by way of experiment, can on no account be attended with any useless waste of funds; for, granting even the possibility of failure, there will always be room in a prison constructed on this principle to accommodate, instead of the two or three hundred prisoners, as here anticipated, half that number, thus performing anyhow as much as is ordinarily required.

There are some points of interest which might be overlooked, but which, nevertheless, deserve a careful scrutiny. The saving of 50 per cent., for instance, does not extend to the current expenses. It is impossible to have the same staff as in ordinary prisons. Take a manager or cook, for example. He cannot be supposed to go on for twenty-four hours; and besides this, it is doubtful if suitable persons could be found who would submit to join in the routine of the prisoners. It seems as if M. Schmidt intended superintendents of sections to stick by their flocks through day and night work for periods probably longer than any convict's sentence, before becoming entitled to a pension. To perambulate the dormitory, workshop, dining-room and yard, without feeling as much prisoners as those under their charge, would be a difficult matter to the officers.

We have once before touched upon the difficulty regarding Sunday. In countries where that day is kept as it is in this country, no work can be required at the hands of any prisoner. Supposing that the periods in the dormitories, yard, dining-room, and class-room remain the same, and that the workshops for the nonce are turned into places of worship, how shall the ten hours he passed in those workshops? M. Schmidt will be best able to answer these and similar questions, and he will have to do so satisfactorily before a practical trial would be contemplated by anybody, despite his explanations.

We afford him, as a foreigner, the opportunity to set forth his proposals, but we are not at present disposed to advocate them.

PLANS ILLUSTRATING THE PROPOSED ALTERNATIVE PRISON SYSTEM.

ST. PAUL'S COLLEGE, STONY STRATFORD.

THE chapel recently erected in connexion with the College of St. Paul, at Stony Stratford, promises to become an object of interest. The college itself, which has already 120 resident pupils, was founded about two years ago to provide for the sons of clergy and others of limited incomes a public school education upon the principles of the Church of England; and it is for the exclusive use of these pupils, with the masters and friends, that the chapel has been built.

The foundation stone of the edifice was laid in October, 1870. The plan of the building consists of an atrium, or enlarged porch, extending across the whole western gable of the chapel; a choir-proper for the members of the college; transepts, which combine organ-chamber, vestry, and accommodation for the servants of the college; and a deep sacristy terminating apsidally. The total length is 111 ft. by 35 ft. across the choir. The style adopted is a treatment of Pointed architecture, adapted to the peculiar local materials, a greenish sandstone for the walls with red brick dressings; a very sparing use of cut stone being made. The contrast of

colour between the local stone and brick, relieved by the lighter-tinted Bath stone, and carried out by the tiled roof, is harmonious and agreeable. In the interior, brickwork is used for architectural features with considerable success. Window tracery, cornices, wall shafts, piers, &c., are all carried out in this material. Stone, in the shape of sculptured corbels and capitals, and the introduction of some monolithic shafts of polished grey granite, add to the effect. The ceiling is arched and ribbed with tie-beams and shafted king-posts. The apse is unimpiered by windows, but has a high roof-light from a spirelet, which rises just over the centre of the sacristy, and which will afford light for the frescoes which are intended to adorn the walls, showing scenes from the life of St. Paul, the patron saint of the college. The floor all over is laid with tessellated patterns, the richer design being reserved for the sacristy. The choir is fitted up with panelled and carved seats in oak and pine, arranged choir-wise, with a projecting canopy over the upper seats, and canopied stalls for the warden and chaplains.

Later on it is intended to erect an altar of marble and alabaster combined; and also a pulpit and screen in keeping with the style of the chapel. Some designs for filling two of the

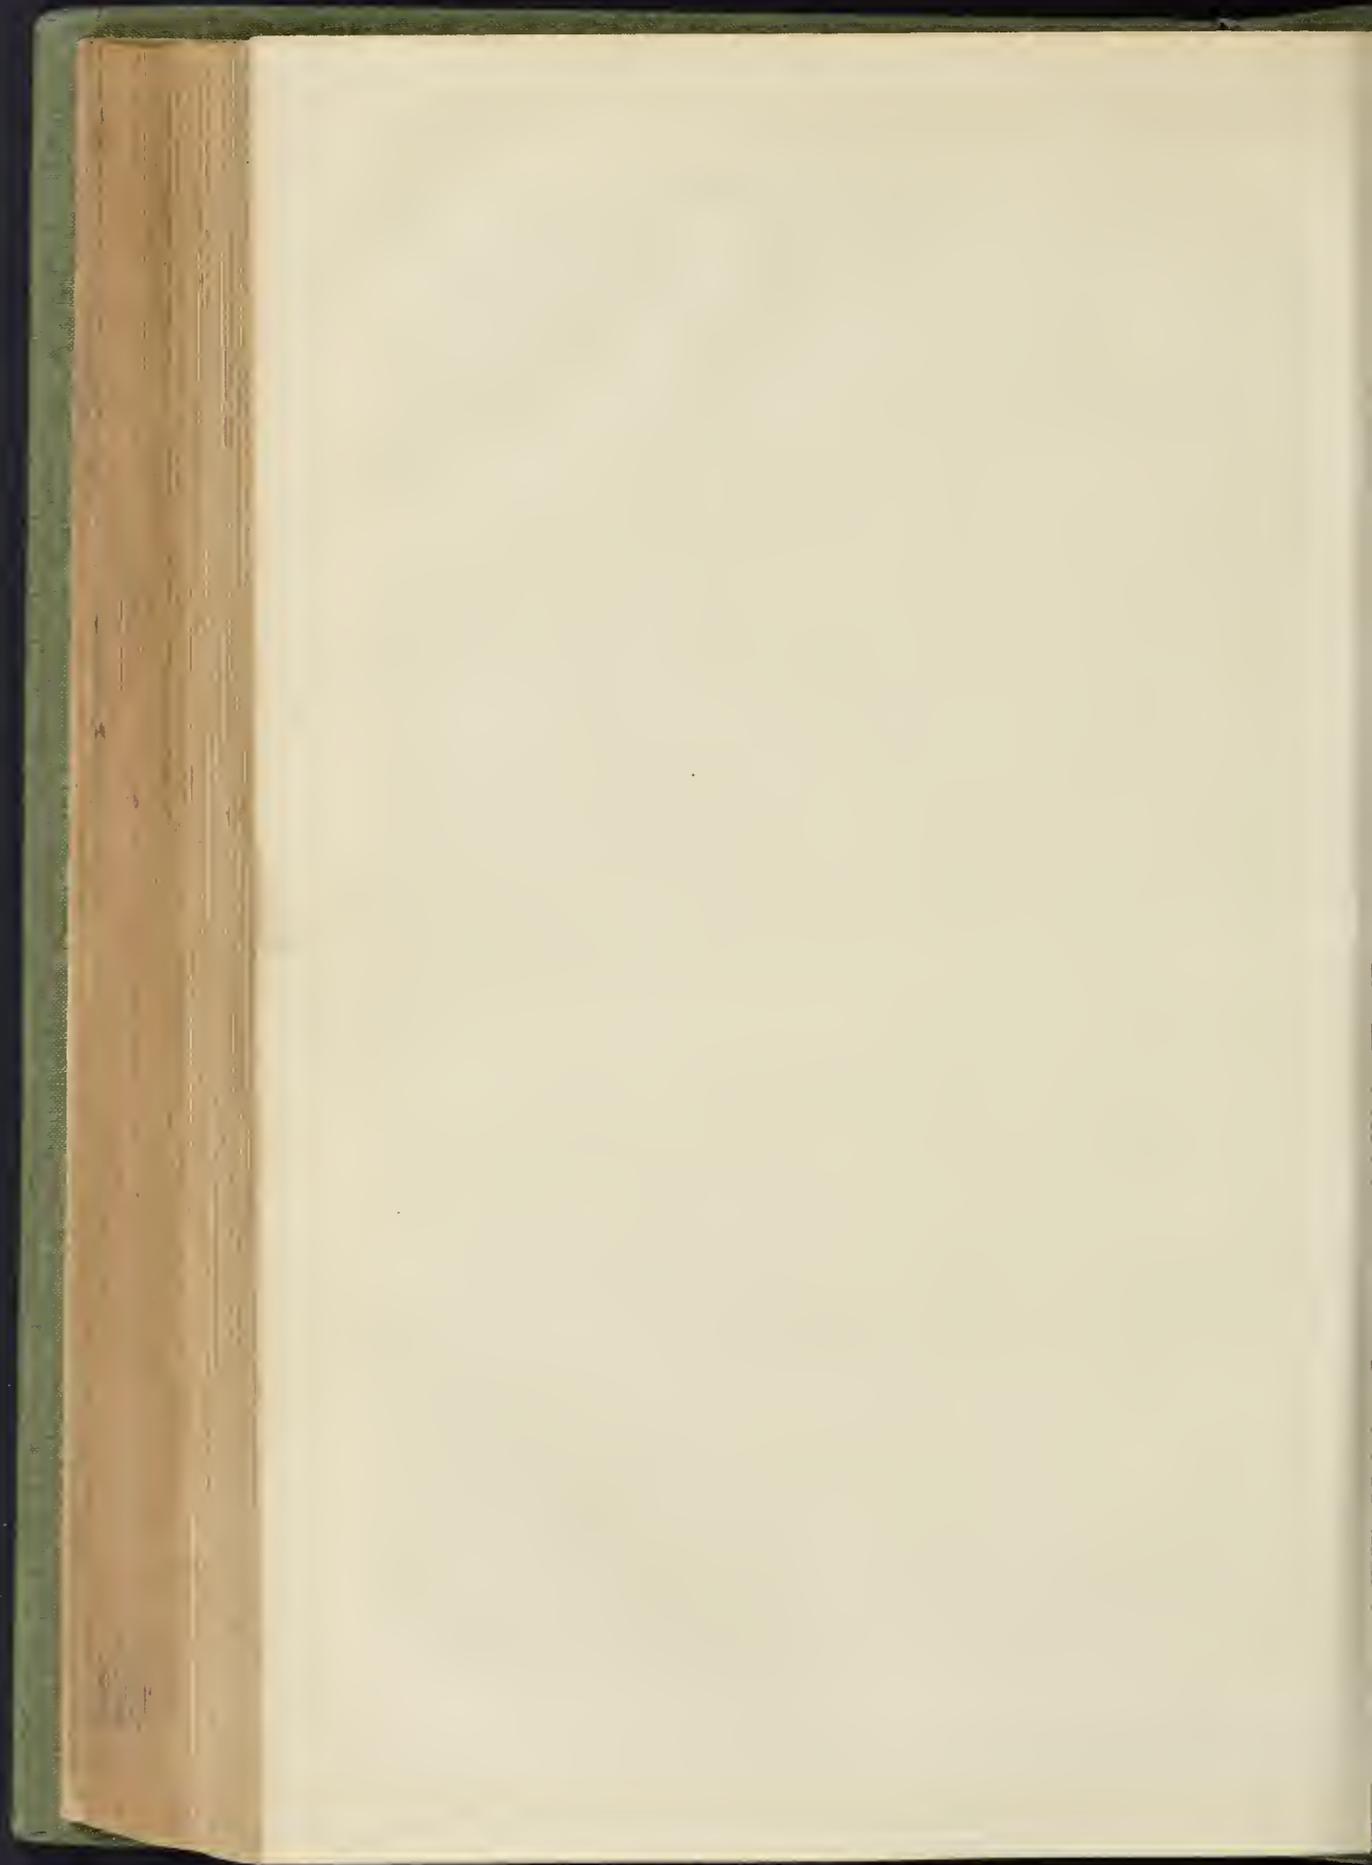

windows with stained glass will be carried out immediately; and it is hoped that early next spring the walls will admit of the intended decorations.

We have now only to add that Messrs. Goldie & Child were the architects under whose care the work was carried out. Mr. Frederick Aveline, of Stony Stratford, was the builder. The designs for the gas standards were executed by Messrs. Hart & Peard. Mr. Earp, the sculptor, of London; Messrs. Hargraves & Craven, who supplied the tiles; Mr. Hayball, of Sheffield, who executed the stalls, should also be named, as well as the clerk of the works, Mr. West. An eagle has just been executed for the chapel by Messrs. Margetts, of Oxford. The candlesticks and the wrought crucifix upon the altar are from the well-known atelier of M. Alexandre Chartier, of Paris.

The cost of the chapel is over 5,000l., but almost as much again seems still to be required to complete the design. This expense is defrayed entirely by the warden of the college, the Rev. Walter M. Hatch, who is one of the fellows of New College, Oxford. The chapel is licensed for the performance of divine service and the administration of the sacraments under the Private Chapels Act.

CHAPEL OF ST. PAUL'S COLLEGE, STONY STRATFORD.—MESSRS. GOLDIE & CHILDS, ARCHITECTS.

THE METROPOLITAN BUILDING TRADES MOVEMENT.

It is gratifying to be able to state before going to press this week that there is now every prospect of a speedy termination to the unfortunate misunderstanding between the employers and employed in the metropolitan building trades. A conference between the sub-committee of the Master Builders' Association and the deputation from the carpenters and joiners, for the purpose of arranging the points in dispute, was held on Tuesday, at the offices of the Association, No. 2, Westminster Chambers. The sub-committee of the masters consisted of Messrs. Hanmon, Brass, Shaw, Macey, Trollope, and Bird; and the deputation from the carpenters were Messrs. Greedy, Mitchley, Mortimer, Whaley, and Burgess. The following document has been furnished as the result of the proceedings, which lasted about four hours:—

"2, Westminster-chambers, Aug. 27.
The working hours to be 52 1/2 per week all the year round for joiners, 52 hours per week for 40 weeks in summer and 48 per week in winter for outdoor work, leaving off work at 1 o'clock on Saturday during winter.
Wages to be 8s. per hour all the year round, sometimes beyond the above hours, when worked at the request of the employer, to be paid for at the following rates:—For the first hour at 9s. per hour, and from the end of the first extra hour until 8 o'clock p.m. at the rate of 1s. 6d. per hour; after 8 o'clock at the rate of 1s. 3d. per hour. This scale not to apply to the case of men working over-time at their own request or to make up time lost by them during the week. Extra time on Saturday to be paid for at the rate of time and a quarter up to 8 o'clock, and after that time at the rate of time and a half.

Moved by Mr. Hanmon, seconded by Mr. Matkin, and carried unanimously:—
In the opinion of the sub-committee of the Masters' Association and the deputation of the carpenters and joiners now met together, it is desirable that an endeavour should be made to settle all future questions which may arise on trade matters by conference or by arbitration.

On Wednesday morning, the bricklayers' deputation met the same sub-committee of masters. The deputation consisted of six members. Very little discussion took place. The deputation stated that they had not come fully empowered to settle the dispute, but were willing to enter into a discussion as to the terms of a settlement. The masters declined to enter into any discussion in these circumstances, and the deputation then retired to report to their committee the result of their interview.

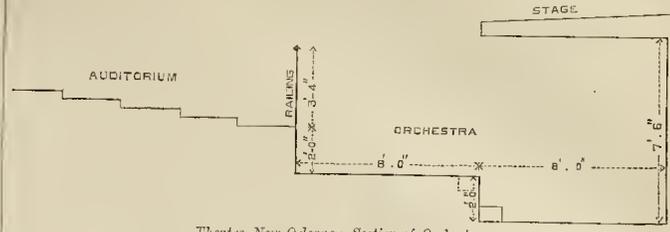

In the evening, a crowded meeting of the carpenters' and joiners' nine-hour delegation was held at the Brown Bear, Broad-street, Bloomsbury, to receive the report of the deputation who had waited upon the masters' committee. About 60 delegates were present, and the following resolution was carried:—

"That this meeting of delegates of the carpenters and joiners of London, having heard the report of their deputation elected to confer with the master builders' committee on the existing points of the dispute, hereby agree to commend that work be resumed upon the terms agreed on between the deputation and the committee of masters. In the same time, we further recommend the continuance of this organization, with the view of obtaining terms more satisfactory to the trade at the earliest opportunity, and also for the purpose of establishing the terms now agreed upon throughout the London trade."

It was understood that the great body of the men out on strike will forthwith resume work on the new terms.

SHOPS WITHOUT BUSINESS, AND SHARPING AGENTS.

SIR,—I often notice with sadness many retail shops opened for a few weeks, then up go the shutters. These shops are mines of wealth to the modern business agents, who combine other operations—loan office, debt collecting, and edit *Dupers' Gazette*, or *Sharpers' Advertiser*, at six per cent! They ruin all that "walk into parlour." These deluders pluck their victims like sheep. When broken down in heart and purse, they know they are powerless to sue them for false representations. To expose them individually is a libel. Let us throw these fellows their bread-crumbs by honest opposition. A few teetotal surveyors would for a small fee survey premises and locality before a venture. I recently bought a brush at a shop kept by a low left with five children. Tears came into my eyes as she told me of taking only sevenpence in two days, notwithstanding representations made to her by the agent. Genuine business shops seldom get into their hands; the other sort pays them best; for, as soon as one party is stamped out, they rig it up again. They believe in quick returns. They buy and sell all that rely on them. R. T.

Theatre, New Orleans: Section of Orchestra.

HERR WAGNER'S THEATRE.

SIR,—In your issue of June 15th, I notice a section of Wagner's proposed National German Theatre. In the accompanying remarks it is stated, that "the idea of an invisible orchestra will now, for the first time, be carried out."

Now, sir, I claim to have built a theatre in this city, which was opened on the 4th of December last, the orchestra of which was constructed in accordance with the enclosed section.

The orchestra it is intended to accommodate is only proportioned to dramatic performances, and composed, say, of fourteen or sixteen pieces. Still the principle involved is the same.

A carefully-constructed sounding-board encloses the space under the stage. By this arrangement the effect is in no degree impaired.

B. M. HARRD, Architect.
New Orleans, Louisiana, U.S.

It is to me surprising that for every species of good church-work it is not used. It has every possible advantage over oak, and in old cathedrals requiring new stall-work its rich brown colour would give it a great advantage over the pale brownish yellow hue of new oak,—which to my own taste is most offensive. After great experience, I know not one drawback to the use of black American walnut; and want of knowledge of its many excellent qualities has, I am sure, alone prevented its more general use.

SWIMMING FROM ENGLAND TO FRANCE.

Mr. J. B. JOHNSON, who imposed on the inhabitants of the metropolis some time ago by a pre-arranged act of *extempore* daring, seems to have been playing another trick of a similar kind. He started with much pomp and circumstance, and "for a large wager," to swim from Dover to Calais,—a work of at least twelve hours, as was calculated,—and before he had been in the water one hour it was found that the circulation was failing, and he was taken on board a steamer that had been hired by Mr. Strange to accompany him. If it was an honest affair he ought to be ashamed of himself for not having first assured himself that he could, at any rate, approximate success. But the whole thing looks like a well-greased advertisement-trap, into which all the newspapers seem to have slidden easily. In the interest of good-faith Mr. Johnson and his backers should be made to answer a few questions.

THE PREHISTORIC CONGRESS AT BRUSSELS.

THE Congress of Prehistoric Archaeology opened in the Ducal Palace, Brussels, on Thursday last week. At noon the members met in the Gothic Saloon of the Hôtel de Ville, where M. Orts, on behalf of the Bourgmestre, M. Ansapach, welcomed the Congress and thanked the distinguished *swains* who had come to throw light on the historic problems of obscure and distant periods. M. Hagemans replied on behalf of the Congress, and M. Worsae, the Danish archaeologist, in the name of the foreign members, returned thanks to the town of Brussels for the hospitality extended to them. A *déjeuner* was then served, and at two p.m. the Congress met in the Ducal Palace, M. d'Omalus d'Halloy presiding. The king honoured this first sitting with his presence; M. Delcours, Minister of the Interior, and General Guillaume, Minister of War, being in attendance on his Majesty.

On Saturday an excursion to the Valley of the Lesse took place. The excursionists went to Dinant by rail. All along its course the Lesse runs between ranges of high hills of varied shapes, presenting alternately huge mountain ribs of bare rock and of woods. Along the river banks are numerous caverns where the cave-men had their dwellings. Nearly all these caverns have been investigated by M. Dupont, the director of the Brussels Museum of Natural History, who acted as interpreter. His disquisitions were followed by lively discussions among the archaeologists and geologists present. He commenced with the *Trou Magritte*, where multifarious objects of the age of the Mammoth have been found, some of them showing beginnings of the art of sculpture. A long and steep mountain-path leads up to this cavern, where there are four superposed ossiferous layers. After this, however, troubles of the day commenced. Lesse has many windings and few bridges, and to carry out the programme it had to be forded four times. Cars sank in the water, and only after great trouble was the company brought to

AMERICAN BLACK WALNUT.

SIR,—Permit me, through the medium of your journal, to direct the attention of architects and cabinet-makers to the great value and beauty of black American walnut-wood. My attention was first directed to its use by an accident; and during now a period of seventeen years I have tested its durability and adaptability for almost every kind of woodwork. I have had it used for the largest and most costly kinds of furniture, with carvings of the most elaborate kind. I have had it used for doors exposed to the full action of the weather; for conservatory-doors, exposed to constant damp, and considerable changes of temperature; for a large and costly staircase, the whole of the walls being covered with the same wood, and the floors of the same; for internal doors and casement windows, of rather large and costly construction, and carved, and for every kind of smaller cabinet-work, exhibiting the highest taste and good workmanship; and for all these purposes I have found the wood answer most admirably. It appears to bear rough external wear quite as well as oak. It does not warp or crack like oak, and bears the greatest transition of heat and cold without any visible change. The colour of the wood, when eiled, is perfect,—that natural rich brown colour, which three centuries of wear will alone give to oak; it has a close grain, without much figure; is thoroughly well adapted for every kind of carving; and its cost now is not higher than oak.

the other side. One car, containing five ladies, was nearly upset. After luncheon on a romantic spot, the Lesse, to reach the Trou-de-la-Nailette and the Trou-de-Challeux, had to be crossed again. As the side of the mountain reaches down close to the opposite bank, the river was to be traversed in boats. Several hundreds crossed over, and the crowding in the boats was great. On the return from the caverns the boats were even more crowded, and one of them went down, and eighteen persons were thrown into the water, among whom were Mr. Franks, of the British Museum; Madame Royer, the interpreter of Darwin's theories in France; and M. d'Omalins d'Halloy, the president of the Congress. All got to the shore, however, and returned to Dinant without further accident. Shortly before midnight the party arrived at Brussels, after a day of useful research for many and enjoyment for all who had taken part in the excursion.

BORING IN THE WEALDEN.

We shall watch this important experiment with great interest, and trust there will be no lack of funds to carry it through successfully. The place where the boring has been commenced is known as Councillor's Wood, near Battle, on the estate of Mr. J. C. Mappin. Mr. Bosworth, who is conducting the boring, drives by steam a cutting tube, a sort of closed auger, at the end of an iron rod, weighted on the top, and fresh joints of rod are screwed on between the auger and the weight as they are required. The auger itself is about 2 ft. long; and it produces a perfect cone of the strata through which it has passed. Mr. Bosworth has elsewhere carried boring to a depth of 2,000 ft. When great depths are attained, the revolution of the rod at the top of the bore is not immediately communicated to the auger, but may be said to take time to reach it, so that the rod twists. Theoretically, each 20 ft. of rod make a three-quarter turn before communicating the rotation to the portion below; so that every 100 ft. require six complete revolutions at the top before the auger feels the movement. The workmen soon learn to tell, by the sensation communicated by the rod to the hand, whether the auger bites, and at a depth of 100 ft., if it did not bite on the completion of six, or at most seven or eight, revolutions, it would be pulled up, and a faulty joint of the rod looked for and removed. In theory, of course, the six turns would be distributed over the whole length of the rod; but the iron is not perfectly homogeneous, and so, in practice, it is the weakest or softest part of the rod that receives all, or nearly all, the twist, and that would break if the twist were carried too far. For the surface soil the auger is 9 in. in diameter, but in deep borings is replaced by one of 2 in., or of only 1 in., in diameter.

LINCOLN ARBORETUM.

This public park, designed by Mr. Milner, was on the 26th inst. opened with much ceremony. It covers 12 to 13 acres of the southern escarpment of the table-land on which the upper part of the city stands, has two entrances on the summit and two on the lower level, one of the latter being the lodge, which has a tea-room attached to accommodate 200 people.

The chief feature is a broad terrace running from east to west, approached by three wide flights of steps, and having trees along its edges; a glazed pavilion is placed in the centre, and at each end a fountain. Drinking-fountains are also fitted up; two retaining walls are built—one to support the embankment, the other forming the northern boundary, and surmounted by a neat iron fence.

The grounds are tastefully laid out and planted; a maze is constructed with briar bushes, and a miniature serpentine lake, with two bridges; a number of casts of statuary are dotted about the grounds, the most prominent being a lion mounted on a pedestal.

The work has been some two years and a half in hand, and having been done chiefly by day work, will cost with the approaches upwards of 8,000l.,—something like double the contemplated outlay. The land belonged to the freemen, who in consideration of a payment on their behalf of 200l. a year from the corporation, sanctioned the scheme, for which an Act of Parliament was obtained. A series of several acres along the summit was sold for villa sites, and the remainder appropriated for the arboretum.

RESULTS OF THE EXAMINATIONS OF SCIENCE SCHOOLS AND CLASSES.

The following is from the list of Queen's Medallists,—science examination, May, 1872:—

Subject 3: Building Construction.

Name.	Age.	Occupation.	School.	Teacher.	Medal.
Painter, Edwin T....	26	Clerk	Portsmouth School of Art	Carter, J. L.	Gold
Souhey, H. J.	29	Carpenter	Taunton School of Science and Art	Rowe, J.	Silver
Harper, Earen	18	Clerk	Birmingham, Bloomsbury Institute	Smith, A. F.	Bronze
Lewis, Wm. G. B....	19	Architect's Clerk	Charterhouse, St. Thomas's School	Mills, S. F.	Bronze

THE NEW INFIRMARY FOR CHELSEA.

On the day appointed by the Local Board of Guardians for opening the tenders, Mr. Gough, representing Mr. Giles, the architect, being present, the following tenders were received:—

Neave	£19,862	0	0
Heath	19,331	0	0
Fish	18,983	0	0
Stephenson	18,450	0	0
Elliott	17,967	0	0
Messrs. Leathby	17,655	0	0
Gough	17,609	0	0
Sawyer	16,885	0	0
Manley & Rogers	16,797	0	0
Thorne & Co.	15,740	0	0
Rankin	16,135	0	0
Turrell	15,857	0	0

Mr. Birch moved that the tender of Mr. Turrell be accepted, as it was the lowest.

Mr. Sydney, contending that it was a wrong time to embark in building speculations, moved the postponement of the question for six months, and after some discussion this was carried by a majority of 8 to 6.

NEW HOSPITAL FOR SOUTHAMPTON.

The Sanitary Committee of the town council at the last meeting of the council, reported that Mr. Lemon, the borough surveyor, had informed them that, having made an approximate estimate of the cost of the proposed hospital at West Quay, he found that it would much exceed the amount which he thought the town council were prepared to spend. As far as he was able to judge, without making an estimate in detail, the hospital would cost upwards of 7,000l. The surveyor also submitted detailed plans and drawings; after which the committee resolved that Mr. Lemon's report be submitted to the council, and they approved of the plans, and recommended the Local Board to adopt them, and carry out the works. At the same meeting Mr. Lemon submitted a reserved estimate for reclaiming the foreshore, building quay walls, and putting in foundations for the proposed hospital, amounting to 1,167l., and the following tenders were submitted for the work:—Messrs. J. Ball & Sons, 1,139l., and Mr. John Tate, 1,180l. The committee recommended the Board to accept the former.

The council appeared, from the ensuing discussion, to be taken by surprise at these calculations, and in the end an amendment on the motion for adopting the report, to the effect that its consideration be adjourned, was passed by a majority of 21 to 11.

SCHOOL BOARDS.

London.—The Works Committee have reported as follows:—

"On the 28th of June the committee were instructed by the Board to take the necessary steps to invite a competition of four architects for the Board offices to be erected on the Thames Embankment. They now beg to submit the conditions and particulars which have been drawn up for the guidance of the competing architects."

The conditions stated that the offices are to be erected on the Thames Embankment, near the Temple Station, the accommodation to include, besides the offices for the staff, a board-room for forty-eight members and accommodation for the Press, together with a public gallery for about 100, with separate entrance. The report was approved. On the recommendation of the Works Committee, it was resolved to appoint to the architect's department a chief draughtsman at 200l. a year, six efficient assistant draughtsmen at salaries not exceeding 120l. a year, and a "practical man," at a salary of 2l. 2s. a week, to take charge of the structural drawings and specifications.

Mr. F. W. Roper and Messrs. Leo Bros. & Pain were appointed architects respectively for schools to be erected in Hunter-street, New North-road, and Gloucester-street, Stepney. The tender of Mr. W. E. Nightingale, amounting to 5,578l., for the erection of a school on the site in Mary-street, Bromley, was accepted.

Leicester.—A report from the Architects' Com-

mittee as to the tenders for building the Syston-street schools, has been adopted by the Board. There were thirteen tenders, and that of Mr. T. Duxbury, for 4,913l., was recommended by the committee. The subject of sites for other schools has been engaging the attention of the Architects' Committee. Mr. Hollingworth inquired if it was not time for the Architects' Committee to take some steps for obtaining a clerk of works. As soon as the contracts were signed the work would be commenced, and they would want some one responsible to see to it. It was agreed to call the attention of the committee to this subject.

Rochester.—The clerk stated that the plan of the Board's new schools had been sent to the Educational Department. He further said it was considered necessary, that adjoining property should be purchased, in order to furnish proper ventilation, good drainage, and a playground for the boys. It was agreed that advertisements inviting tenders for the erection of the school should be issued. Mr. Walker, the architect for the new schools, said he had received communication as yet from the Education Department respecting the plans, but he believed they would be adopted. There would then be plenty of time to proceed with the work; the builders' strike being expected to terminate every day, while the price of iron was falling. Mr. Belsey said Mr. Barrell, the owner of the property adjoining the proposed new schools, had told him that he would not allow the Board to open any windows or doors at the new school near his premises. Mr. Hayward said no one could prevent the opening of doors or windows on a public road.

THE LATE HECTOR HOREAU, ARCHITECT.

We hear with regret of the death of M. Hector Horeau, of Paris, at the age of 71. He has received more medals than commissions, and was the author of plans which brought fame and fortune to other men of his profession. One of these medals was obtained in London, in 1856, for a plan for an Exhibition building in Hyde Park. M. Horeau believed to the end of his days that had he not been a Frenchman the Exhibition Committee would have preferred him to Sir Joseph Paxton. He was one of the earliest projectors of a submarine tunnel between England and France. During a short residence in England he designed and superintended the erection of an odd house in Avenue-road, Regent's Park, a view of which will be found in our early volumes. Years ago the writer, then a boy of his first tour, breakfasting with Hector Horeau in Paris, found him attired in a close-fitting red dress, à la Mephistophiles. He was a man of considerable ability, but his success was scarcely commensurate.

THE NEW GREEN-COAT SCHOOLS AT CAMBERWELL.

ABOUT twelve months ago the Bishop of Winchester laid the foundation stone of the above-named schools, facing Camberwell-green, which have just been completed and opened, with the exception of the infant school, which will be ready for occupation in the course of a few weeks. Some time ago it was determined to take down the old building and erect the larger and more convenient structure now finished. The style of architecture adopted is the Gothic, the material used being Kentish rag-stone, with Bath stone dressings. The main elevation, which consists of three stories, is 8½ ft. in length and 54 ft. in height, there being a handsome spirelet or bell-cot, at the south end, 24 ft. in height. The building extends 168 ft. backwards, and on a portion of this area stand the boys' and girls' schools and class-rooms, the remaining space being set apart as a playground. The central portion of the front block contains the masters' and teachers' residences, and at the

out-west corner is the board-room. The principal boys' school-room, which is on the ground-floor, in the rear of the building, is 70 ft. by 6 ft., and attached to it are two class-rooms, 18 ft. by 20 ft. each. On the first floor above here is also another boys' school-room, 38 ft. by 10 ft., with two class-rooms, 18 ft. square. The girls' schoolrooms are on the ground and first floors, and are T-shaped, their extreme length being 53 ft. by 20 ft., and their extreme width, 49 ft. by 20 ft., each school having two class-rooms 20 ft. square. There is also an infants' school of the same dimensions as those for the girls. The cost of the building is estimated at a little over 4,000l. Messrs. Payne & Clarke, of Buckingham-street, Strand, are the architects, the contractor being Mr. Crabb, of Kingsland-road.

CONCRETE AND THE METROPOLITAN BOARD OF WORKS.

Sir,—Surely some of your more able correspondents will not let the strange notice appearing under the above heads, in your last week's paper, pass without some comment. Am I to understand a concrete wall, built between Tall's stent panels, is according to the Act of Parliament, and that one built in the same way with the same kind of materials, between planks fitted together, does not come within the rules? I rely this cannot be fair to those who do not go to purchase an expensive apparatus. I have dealt with them extensively, and am doing so in King-street, Borough, but I also find it is equally good walls between planks. If it is considered to come within the rules of the Act, why not the other?

It has been several times summoned by the Metropolitan Board for this system of building contrary to the Act, and each time the complaint has been withdrawn or lushed up.

H. GOODWIN.

THE LONDON INTERNATIONAL EXHIBITION OF 1873.

Her Majesty's Commissioners for the Exhibition of 1873 announce the third of the series of annual International Exhibitions of selected works of art (including music), industrial art, and the most scientific inventions and discoveries. It will be opened at South Kensington, in April, 1873, and closed in October, 1873. The exhibition will take place in the permanent buildings erected for the purpose, adjoining the Royal Botanic Gardens. It will consist of three sections—Fine Arts, Manufactures, and the most Scientific Inventions and New Discoveries of all kinds. The productions of all nations will be admitted, subject to the decision of competent judges as to their being worthy of exhibition, and provided they have not been exhibited in the previous International Exhibitions of this series.

A RESERVOIR INJURED BY A WATERSPOUT.

On examination of the chief reservoir supplying the Fyde Water Works, in Grizedale, above Garstang, and an inquiry in the district constituting the "gathering-ground," it tended to reveal a state of things showing damage to the extent of many thousands of pounds has been done by a waterspout, and that works have been thrown completely out of repair. During the late heavy rains a waterspout burst upon the Fells of Bleasdale, above water works, and this was so tremendous it washed down vast quantities of peaty soil, lig, &c. into the reservoir. The rush of converging currents was terrific, the reservoir was swollen 2 ft. above the ordinary overflow, and it was feared by the man in charge of the whole place was going to be swept away. Luckily, the principal embankment, some time ago showed signs of weakness, was afterwards repaired, fully as the water pressure put upon it, else the valley below would have been inundated, and sad havoc would have been caused. The reservoir was, however, with all kinds of refuse; its water (many thousands of gallons) was totally spoiled; and it took about five months to clean it out. It is calculated that the work of emptying the reservoir, and of repairing it, will cost about 10,000l.; and that the total damage in loss of water, derangement of works, &c., may reach

20,000l. Fresh supply-pipes to feeders adjoining the reservoir will have to be laid, to partially provide for the extensive district hitherto using the water. The supply for the vessels at Fleet-wood, and for the streets of that town, and of Blackpool, &c., has been stopped, and it is thought that the general supply will have to be cut off every night, or at intervals during each day, till the work of reparation is accomplished.

A GERMAN BOARD OF HEALTH.

The Chancellor of the German Empire has proposed to the Federal Council, states the *German Correspondent*, to create a board of health for the empire, composed of ordinary and extraordinary members. The duties of the former, who must be resident in Berlin, would consist in aiding the Government to exercise a supervision over matters in the province of the medical and veterinary police, to take cognisance of all analogous institutions existing in the different Federal States, to prepare and submit legislative measures to the empire, to observe the practical working of laws enacted in the interest of the public health, and in particular cases to report on them to the State and local authorities, to follow the progress of medical legislation in foreign countries, and to organise a satisfactory system of medical statistics for Germany. The extraordinary members would have to be selected from persons who do not reside in Berlin, and from the municipal officers of the larger German towns, professors of medicine, Government medical officers, or practical chemists and architects. They would be required to express an opinion on certain questions when summoned to do so by the president; to watch everything likely to affect the public health in the neighbourhood of their respective residences, and to report on it to the president; and, finally, to take part in the general conferences to be held from time to time at Berlin. These proposals of the Chancellor will, in the first place, be laid before a committee for examination, and afterwards submitted to the Federal Council.

"SPECIFICATIONS."

Sir,—I have seen your critique on my edition of "Bartholomew's Specifications," and shall be much obliged if you will make public my reasons for the omissions you mention in the work.

I still preserved the old names of first, second, &c., class of houses, although after an obsolete Act, as it has always seemed to me the best way of describing a house. But you will find that this refers only to the first four specifications, and not at all in the new ones I have inserted.

With regard to my omission of concrete construction, I should like it to be known that it did not arise from ignorance or carelessness; I had even written a paper upon the subject, but omitted it because at present it is so much a matter of patent right that it seemed to me that I must advertise one or other of the companies now established, which is scarcely a proper thing to do in a work of reference. Besides which, any person wishing to build in any one of the patent systems need only obtain the full particulars which is scarcely a proper thing to do in a work of reference.

In studying the matter, I find that you were personally so early in the field in advocating this system of building that I am sure you cannot be pleased to find that some of the companies refuse to work under architects.

F. ROBERTS.

INTERNATIONAL PATENT SYSTEM.

A recent deputation, which included Mr. Macfie, M.P., Mr. Webster, Q.C., Mr. Johnston, M.P., Dr. Haselme, and Mr. Wise, C.E., have by invitation presented to the Government a written statement of their views on this subject.

It is suggested that negotiations should at once be initiated in accordance with the last resolution of the Select Committee of the House of Commons, who recommended

"an assimilation in the law and practice with respect to inventions among the various civilised countries of the world, and that Her Majesty's Government be requested to inquire of foreign and colonial Governments whether they are ready to concur in international arrangements in relation thereto."

Three modes of procedure are presented for consideration:—(1.) An international conference; (2.) Correspondence between the Ministries of the various States and colonies; (3.) Communications between heads of the different patent offices. Some of the desired objects, it is thought, may be obtained by an assimilation of the official rules, as the patent laws in many States are similar in principle, though legislation may be requisite to secure a substantial uniformity in the practice under the various systems.

The deputation are of opinion that the grant of Letters Patent should be confined, as recommended in the ninth resolution of the Select

Committee, to "original inventors, their assignees, or authorised agents;" and they regard the recognition of the rights of the authors of inventions as indispensable to an international system. They state that an organised practice of "pirating" inventions exists, whereby foreign inventors are often deprived of their rights by "first importers," who anticipate them in their applications for English patents. The deputation submit these suggestions, which accord, they state, with the recommendations of the Select Committee, and they respectfully ask that early action may be taken by the Government calculated to secure uniformity in the various systems of granting patents for new inventions.

EDINBURGH CATHEDRAL COMPETITION.

Sir,—Will you allow me to disclaim any connexion with the design marked "Fidelitas" in the Edinburgh competition?

W. BEZGOS.

UNFAIR COMPETITIONS: BRIGHOUSE.

Sir,—Your correspondent displays an amazing audacity in maintaining the mis-statements he propounded to your readers as to the amount of the original tender for the Brigbous Cemetery buildings; but no one will entertain a doubt as to where the better means of information lie. It might have been expected that he would have accepted my statement; but since he is pleased to doubt it, I hardly know whether I am justified in believing it myself. Since my authority is insufficient, and that of the *Brigbous News* also, the only newspaper represented at the meeting of the Board on the occasion of the opening of the tenders, let us turn to his own authority, the *Italy Courier*. This very highly-esteemed journal equally contradicts his statements, for although the total of the lowest tender is, probably by a misprint, stated to be 5,922. 6s., the separate items only add up to 2,928. 10s. On this error, which must have been patent to an unprejudiced eye, your correspondent has based his charges against us.

With regard to the *Instructions* I read (pages 16 and 17) that "the estimate of the cost of the building shall in no case exceed 2,000l." The document does not refer to the cost of the entrance-gates and boundary wall, of which the length is only given approximately, and of which the cost could not therefore be definitely estimated.

The board compared the working drawings with the competition drawings in lengths, widths, and height, and being satisfied that they remained substantially unaltered, they passed a resolution approving of them. So far as I know, your correspondent has not seen the working drawings at all, and I am sure that he has not compared them with the sketches. Where, then, are the grounds on which he has based his charge of unfairness? What is the value of his estimate?

With regard to the real discrepancy between our estimate and the tenders, it is, as I have already admitted, excessive; I have, also, fully accounted for it. The well-known rise of prices which has taken place since our estimate was made, exemplified as it is in the report which you publish (*ante*, p. 590) of a meeting of the Bradford School Board, must be familiar also to your correspondent if he knows anything of building, and will amply satisfy the judgment of your readers. Further, I endeavoured to fulfil the work internally in a superior manner.

E. BARHAM PARSONS.

NEW GLOBE BRIDGE, PECKHAM.

Sir,—I beg to draw your attention to an article in the *Builder* of the 24th inst., headed "The New Globe Bridge, at Peckham and the Tradesmen" (p. 689), the particulars of which are false and groundless, thereby seriously injurious to my character as a contractor. In the first place not a single brick, or materials of any kind, has ever been placed in front of any tradesman's premises, but upon the banks of the canal, and on my own service ground. With reference to the piers, or rather (technically speaking) the abutments, I am happy to say they can be plainly seen above the water line by those who wish to see them. The statement, too, referring to my surceits is so far groundless, that they have nothing whatever to do with the work beyond that which is usual with surceits.

The deputation mentioned was composed partly of speculators, semi-impooverished previous to the commencement of this work, who, like many others, are looking out for an opportunity to plunge their hands into their neighbour's pocket.

I must add that no bursting of the dam has ever taken place, although considerable trouble and expense have been occasioned, owing to entirely unforeseen difficulties in the location of the canal and the traffic thereon, no claim for which has ever been made upon the vestry, or certified by the engineer; therefore I must beg you to give this letter a place in your next issue, in order that the subject may appear fairly and truthfully before your readers.

S. S. PRACK.

THE DARLINGTON FEVER HOSPITAL.

In our paper of March 30th we inserted a letter under this head reflecting on the conduct of the Mayor of Darlington and other members of the Hospital Committee of the Darlington Town Council. The mayor having commenced an action against the publisher of this journal in respect of such letter, the statements therein made being denied, and having offered to stay proceedings on our giving up the name of the writer of the letter, and paying the costs incurred in the action, we express our regret that the letter was allowed to appear, and withdraw all imputations the letter may be supposed to reflect on the character of the Mayor of Darlington and other members of the Committee.

WHAT IS A SPONGE?*

THEN comes the question, What is a sponge? Down here, in this wet hollow, we are sure to find some; in dark places, where the water is of some depth, almost every fragment of seaweed has attached to it some living species of sponges, and they vary in size and structure, from mere specks to large and substantial masses. Now and then we may find them on the shells of oysters and crabs; and once, in our aquarium, a fine hermit came out of his shell to die, and was found to have a sponge as large as a hazel-nut attached to his soft body, just below the insertion of the last pair of legs.

Animal life may be said to begin or end in the sponges; they are the very lowest in the scale of animated nature; but it is quite certain they are not members of the vegetable kingdom. Take a piece of sponge, such as is commonly used on the toilet-table, and dip it into a thin solution of size, and you have a fair resemblance of the skeleton, the gelatinous coating is organised and animal; and the best proof of the fact is afforded by the microscope, which reveals ciliary motion, and there is an end of the difficulty as to what place it should occupy. The openings in the sponge are chambers, interlaced with silicated fibres, and, by the play of the cilia on the gelatinous surface, the water is made to circulate from chamber to chamber, so that the sponges obtain their food by the same process as a vorticella or rotifer—namely, by creating currents through the agency of cilia. The exterior film is the life of the sponge; the skeleton is a deposit. But the film must be understood as pervading the inner as well as the exterior chambers, so that the currents of water pass through the entire mass, and carry nourishment to all the mouths for which the cilia work so incessantly. A very dead sort of creatura is a living sponge. It has none of the organs of sense which distinguish terrestrial animals, and not even the irritability which makes a sea-anemone of so peevish or spasmodic a temper. But it has its history, however brief, like others of the great class of zoophytes. The sponges increase by gemmation. Little buds appear within the openings of the reticulated mass, and these at last detach themselves, and exhibit the same play of cilia as their parents.

CHURCH-BUILDING NEWS.

Holme-on-Spalding-Moor.—Bursca Chapel, which stands a little distance from the Market Weighton and Howden turnpike-road, has been opened for divine worship, without the usual ceremony of consecration. The Right Hon. Sotherton-Estcourt, Tetbury, Gloucestershire, presented to the promoters an eligible site, and, in addition, paid for the cost of building, as a memorial of the late Mrs. Estcourt. The architectural design is a modified form of the Early English, worked brick, with stone facings, and with bell-cote at the west end. Its dimensions are 54 ft. long by 18 ft. wide; to accommodate about 100, and with chair seatings. The architect was Mr. Wm. Butterfield, of London; and the contractors were Messrs. Castles, of Goole. There is no pulpit: a portable stand is placed along the side of the reading-desk, as a substitute, without the emblem of the eagle.

Chineley.—The chief corner stone of the new nave of the church, now being rebuilt, has been laid by Mrs. Robinson, the vicar's wife. Mr. J. West Huggall, of Oxford, F.R.I.B.A., is the architect directing the execution of the works; and Messrs. Wall & Hoek, builders, of Brimscomb, Gloucestershire, are the contractors, for the sum of 2,168*l.* The walls of the new building are already 8 ft. or 9 ft. above the soil, and there is every prospect of the new church being completed and ready for divine service before next Easter. The new church will consist of nave, north aisle, vestry, and south porch, the present chancel and tower remaining. The walls will be built of brick, faced with Bath stone dressing; the roof open-timbered, wrought, varnished, ceiled between the rafters, and covered with plain tiles from the neighbourhood. Godwin's encaustic tiles will be used for the aisles. The seats will be of deal, varnished, open and low, and the pulpit, with prayer-desk, &c., of oak. The organ will be placed at the entrance from the north aisle to vestry.

Darlington.—The parish church of Darlington, which, with the exception of the tower and spire, has been rebuilt as a memorial of the late vicar, the Rev. Mr. White, has been reopened. The style is Pointed Gothic, and the building comprises chancel, north and south transept, and nave, and north and south aisles, accommodation being provided for between 1,300 and 1,400 persons, allowing more space to each than was afforded in the old church, and the aisle seats are all free and unappropriated. The exterior walls are cased with Codsall stone, with Greenshill stone dressings, and the roof covered with Broseley tiles, the ridge being surmounted with red crests. For the present the tower remains unrestored. It is intended to open a doorway through the lower part, to form the principal or western entrance. The roof is open, the timber being of pitch pine, stained and varnished. The nave is separated from the aisles by pointed arches, carried by decorated cast-iron pillars, and the chancel aisle is supported by carved corbels and Purbeck marble columns, with carved capitals. Light is supplied by means of clerestory windows of circular shape, and gallery and nave windows, two-light, with canopied heads, surmounted by trefoils; while in the chancel is a four-light stained-glass window, produced by Messrs. Wailes, of Newcastle-upon-Tyne, and given by Mrs. Brevitt. The subject is the four Evangelists. In the nave is another stained-glass window, given by Miss Huggill. Another stained-glass window, the gift of the Rev. C. B. Walton, curate, is situate in the gable over the chancel arch. Artificial light will, when necessary, be afforded by means of coronas, supplied, as was all the ironwork, by Messrs. Broad & Dowling, of Birmingham. The pulpit is the gift of Miss Dorsett, of Edgbaston. It is octagonal in shape, the materials used being Painswick stone and Devonshire marble. The organ has been transferred from the north aisle of the chancel to the south transept, which also serves the purpose of a vestry. The old seats have been scraped and cleaned, and made to match the gallery front and other new work, all of which is stained and varnished. The floor is laid with Maw's encaustic tiles. The architect gives an oak reading-desk. The whole building is heated by means of a hot-water apparatus, supplied by Mr. Blakemore, of Wednesbury. Mr. A. P. Brevitt, Darlington, is the architect; Mr. Lovatt, of Wolverhampton, the builder. The erection of the edifice has been superintended by Mr. Taylor. The total cost will be about 3,800*l.*, including outlay upon fittings, heating apparatus, and all other appliances, but not taking into account the value of the gifts.

St. Peter-le-Bailey (Oxford).—The foundation stone of the new church, which is about to be erected in New Inn Hall-street, has been laid by the Bishop of Oxford. The present church is situated at the corner of Queen-street and the New-road, and is about to be taken down to allow of the widening of the street at this place. The new church is to be erected about two hundred yards distant from the old one, on the west side of New Inn Hall-street, and adjoining New Inn Hall. It will consist of nave, chancel, and two side aisles. The body of the church will be 70 ft. long and 55 ft. wide, and the chancel 30 ft. long and 20 ft. wide. The organ chamber will be on the north side of the chancel, and also some seats for children. A square tower, with octagon turret for stone staircase, will be erected on the south side of this portion of the edifice, and underneath it will be the warming apparatus. The tower will be 77 ft. high from the ground to the battlements. A vestry will also be erected on the south side of the chancel. The style is to be Decorated. The ashlar work will be of Bath stone, Box ground, intermixed with stone from the old church and tower, and the window dressings and tracery will also be of the same kind of material. The interior of the building will be plastered. There will be four arches on each side dividing the aisles from the nave, and two smaller ones dividing the organ chamber from the chancel. At the west end there will be a five-light window, with a tracery of the period of Henry III., and also a five-light window at the east end, and tracery windows on each side. The chancel will be paved with Milton tiles, and the seated portion of the body of the church will be a boarded floor. The remaining portion, however, will also be paved with tiles. The interior of the roof, which will be a high-pitched one, will be open timber, and covered with Stonesfield slates. The height of the roof from the floor to the ridge will be 52 ft., and that of the chancel, 45 ft. Mr. Basil

Champnes, of London, is the architect; and Messrs. Honour & Castle, of Oxford, are the builders.

Bradfield.—The restoration of Bradfield Church, which was commenced several months since, is making progress. The work comprises the cleansing and repairing of the stonework in the nave and tower, and removing the galleries; re-warming, and re-seating the nave and chancel. It has been undertaken by Mr. Sampson, of Bolsterstone, and Mr. A. Hayball, joiner, &c., of Sheffield. There was accommodation, including the galleries, for 456 adults, but owing to the arrangement of the pews only a much smaller number could see and hear the clergyman. By the new plan 980 adults and 135 children, or 450 adults without children, will be seated on the ground floor. The chancel has already undergone considerable alteration and improvement, by cleaning and repairing the walls and removing the temporary vestries, and by the erection of a memorial east window by the Wilson family, of Brincliffe Tower.

Knutton.—The foundation-stone of a new church has been laid at Knutton. The new church is intended to accommodate nearly 400. The site is near Knutton House. The edifice is to be built by Mr. Bennett, of Burslem, from the designs of Messrs. T. Lewis & Son, architects, Newcastle. The design is Early Decorated, and the plan consists of a nave, 64 ft. by 25 ft.; with north aisle, 51 ft. by 13 ft. 3 in.; chancel, 30 ft. by 20 ft.; organ-chamber and vestry, each 12 ft. by 10 ft.; the nave will be 23 ft. 6 in. high to the spring of the roof, and 42 ft. to the under side of the ridge, and with the chancel, aisles, &c. will have open-timbered roofs. The seats will be open benches of pitch pine, the walling will be of red Alton stone, and the roofs of tiles of ornamental patterns. Although at present only a north aisle will be built, provision is made so that a south aisle may be added at some future time should the requirements of the district necessitate the enlargement of the church which, as at present arranged, will accommodate 383 persons. The cost of the building will be about 4,000*l.*

Stroud.—The screen has been removed from before the reredos, with which the parish church has been enriched by the Stanton family. The reredos has been erected as a memorial to their father, the late Mr. William Stanton. It was designed by Sir Gilbert Scott, in the Southwestern style of Gothic architecture, and is in harmony with the general design of the church. It extends the whole length of the chancel. On both sides there are niches surmounted by canopies, intended to receive figures of the Evangelists or some other fitting subject. This is not yet decided, and the niches are at present blank. The reredos, as seen at present, consists of a canopied panel, in which are carved in relief scenes in our Lord's life. The group of the left represents the taking down of the bed of Jesus. The centre group appropriately represents the resurrection. The canopies are carved. The groups have been designed and executed by Mr. E. E. Gejowski, of London at Rome, to whom the contract for the work was given by the architect. The architectural carving has been carried out by Mr. Morr, Gejowski. It is estimated that when the work is completed the cost will be from 700*l.* to 800*l.*

Wolverhampton.—Considerable alterations are commenced at St. Paul's Church, a building erected about thirty-five years back, according to the then-prevailing type, having a chancel 4 ft. or 5 ft. deep, with a vestry at the back over which latter is placed the organ. It is intended to remove the organ and wall-screen below, thus increasing the depth of chancel, taking in the present vestry, and erecting a new one on the north side of the church. On the south side will be built a new organ-chamber with open archways towards the chancel aisle, the lower portion being filled in with wire screens. Amongst other alterations, the font and pulpit are to be removed from their present situations in front of the chancel, and the former raised at the west end of the nave. The present lath-and-plaster gallery front is to be taken down, and a lower one constructed in wood. The tender of Mr. P. Horsman, at 600*l.*, for the general works, is accepted by the committee. Mr. J. V. Veall is the architect.

Thornton.—The new church of St. James, Thornton, has been consecrated by the Bishop of Ripon. The chief stone was laid in October 1870, with Masonic honours, by the Marquis of Ripon, as grand master of the Freemasons of England. The site, which is by the side

* From the *Gardener's Magazine*.

the highway leading from Bradford, at the adford end of the village, was given by Mr. Foster, of Queensbury and Hornby Castle, the building has been erected from the designs of Messrs. T. H. & F. Healey, of Bradford, at a cost of 5,060*l.* The style of architecture is Early English. There is a chancel, nave, south aisle, and organ-cess. The roof of the church is an open-timbered one, and the roof of the chancel is circular. The nave is 85 ft. in length by 27 ft. 6 in. wide. The dimensions of the chancel are 33 ft. by 23 ft., and the aisle is 14 ft. long by 14 ft. wide. The height of the chancel is 51 ft. At the east end, over the altar, there is a three-light window, surmounted by a pediment, both of which have been filled in with stained glass by Mr. John Foster, jun., at a cost of upwards of 300*l.* The subject represented is the *Te Deum*. It is the work of Messrs. G. & J. G. G. of London. The west end of the building is lighted by a two-light window, the chancel is lighted by a lancet-shaped window on the north side, and above the latter are rose-shaped clearstory windows. There are in the aisle two-light lancet-shaped windows. The principal entrance to the church is by a porch, above which it is intended to build a tower and spire. This part of the building has already reached the tower-base, which is at a height of 24 ft. The interior affords accommodation for about 600 people. The seats are of oak and are of pitch-pine, and the choristers' seats in the chancel are of oak. There are three pendants, to light the church at night. These have been designed by Messrs. Brown & Downey, of London. Mr. Wallace, of Gillington, has been clerk of the works, and the following are the contractors:—For the masonry, Messrs. T. & Sons, Thornton; for the woodwork, Messrs. P. & Sons, Thornton; the plumbing, Mr. Jones, Thornton; painting, Mr. E. Barstow, Thornton; slating, Mr. Smithies, Thornton. When the work has been added, and it is hoped that before the building committee will be in a position to complete it, the total cost of the edifice will amount to 6,000*l.* Upwards of 4,000*l.* have already been obtained towards the outlay intended.

Gvernafield Church.—This church has been erected on the site of an ancient building, stood on the site of the present church, close to the village. The ecclesiastical district of Gvernafield is but a small area, and contains a population, according to the last census, of 975, the greater part of which are at Gvernafield, Pantymawn, and along the back of the limestone hills stretching from Rhydydd to the vicinity of the Loggerbed. It was better to pull down the old edifice altogether, and build a new one. The architect of the new church is Mr. D. Walker, of Liverpool, and it is built in the Gothic style, and consists of nave and chancel. The framing of the roof is of stained wood. The aisle runs through the centre, and there are seats in the body of the church for about 250. Several of the donations were gifts. The cost of the edifice is 5,000*l.*

St. Peter's Church, St. Alban's.—The foundation-stone of the new church, which is in course of erection in the parish of Morton, has been laid by Miss Leigh, of Sweeney Hall, near Oswestry. The new church, which is dedicated to St. Philip and St. James, stands in a convenient situation on the site of the old building, and immediately adjoins the turnpike-road leading to Oswestry. It will be in the Early Decorated style, and will consist of a nave and chancel, with north and south aisles, severally appropriated to the purposes of an organ-chamber and vestry-room.

The external elevation of the nave will be 42 ft. All the seats will be free and the building will be constructed to contain 300 persons, the internal dimensions of the nave being 54 ft. by 21 ft.; south aisle, 14 ft. by 12 ft.; chancel, 26 ft. by 18 ft.; transept, 12 ft. by 9 ft.; and vestry-room, 12 ft. by 10 ft. The principal entrance will be on the north side, facing the turnpike-road, and the building will be supplied from local sources, chiefly from Sweeney Mountain and the lake. The roof will be covered with blue tiles, and the terminals of the gables will be surmounted with small statues. The walls will be 2 ft. 9 in. to 3 ft. in thickness. There will be a bell gable at the west end, which will be filled in with a four-light window; a three-light window will be in the chancel, and light will also be supplied by two other windows of two and three lights each. The roof is to be a varnished

one, open, and with open principals, and all of the arcades and interior openings will be of dressed Shelvoke stone. In the chancel, which will be laid with Maw's encaustic tiles, will be placed the sedilia, credence, and other adjuncts. The pulpit, as at present proposed, will be a stone one. The nave and aisles are level throughout, the chancel being raised by two steps, and the sacrum by three. The warming apparatus of the old church,—a floor stove, by Dodwell, of Shrewsbury,—will be utilised for the purposes of the new structure. The works are being carried out from the designs of Mr. S. Pountney Smith, of Shrewsbury, architect, Messrs. Morris & Chaplin, of Oswestry, being the contractors. The outlay upon the work is estimated at between 1,600*l.* and 1,700*l.*, towards which nearly 1,500*l.* have been already subscribed or promised.

Sandford Rectory.—Having been enlarged, restored, renovated, re-fitted, and decorated, the parish church of St. Nicholas has been reopened. The whole of the church has undergone a restoration, and a new north aisle has been added. The chancel is of the fourteenth century, and has been preserved. Attention has been paid in preserving the ancient character of the external masonry. The new work is in the Perpendicular style. The paving of the chancel and manor aisle is of Maw's encaustic tiles. The roofs are of pitch pine, with curved ribs springing from picked pitch corbels. The seats are new, of the pulpit and reading-desk are carved and rest on Ham stone bases. Under the tower-arch is an old oak screen, of the Perpendicular period, which has been restored. The manor aisle contains two stained-glass windows by Messrs. Clayton & Bell. A new window by the same artists has been placed in the chancel. The warming apparatus is by Messrs. Hatien, of Trobridge. The organ, which cost 50*l.*, is a small instrument, inclosed in a pine-wood case, with pipes of "best spotted metal." It was built by Mr. Hallett, of Kington Magna, and is placed at the western end of the new aisle. The tower has five bells, which are chimed by a new and simple arrangement. The work has cost about 2,000*l.*, and has been executed under the superintendence of Mr. Henry Hall, of London, architect, by Mr. A. Reynolds, builder, of Milborne Port. The funds have been chiefly provided by the lord of the manor, Mr. Hubert Hatchings, and the rector, the Rev. Urquhart Cookworthy.

Clifton, Manchester.—The first stone of a new church at Clifton, near Manchester, has been laid by the Hon. Mrs. R. Cotton. The building will consist of nave and aisles, transepts, with a spacious chancel, and chancel aisles. The style is Gothic, of the fourteenth century, and the church will accommodate 500 persons. The work is being carried out at the expense of Mr. and Mrs. Cotton, who have also given the site. The architect is Mr. Edward M. Barry, R.A., and Mr. Booth, of Gosport and London, is the contractor.

Dorking.—The contractors for St. Martin's Church are Messrs. Goddard & Son; not "Goddard & Terry," as stated.

STAINED GLASS.

St. Peter's Church, St. Alban's.—The series of stained glass windows in this church has just been completed by the addition of two on the south side of the nave. The whole of the windows in the chancel are of coloured glass, that on the north side representing the Annunciation of the Virgin Mary, and the one on the south side the Ascension of Christ. The east window represents a series of Scriptural emblem worked in detail. The two new windows in the nave have been executed in Brussels, by Mr. J. B. Capronier. The subject of the one nearest the western porch is the Parable of the Sower; the centre figure representing Christ, with the sower on the right, and three of the disciples on the left. Underneath the centre figure is a cherub hearing a scroll, and above are two figures of angels. The subject of the other window is the Parable of the Vineyard, representing the hire of the labourers. There is also on this window a scroll. The subjects of the other three windows in the nave are the Good Samaritan, the Good Shepherd, and the Prodigal Son, the former of which is a memorial window, as well as that on the south side of the chancel. The stonework of the two new windows has been restored by Mr. Haselgrove, of St. Alban's. The

whole of the fourteenth-century glass on the north side of the nave has been collected and preserved. It is hoped that other stained windows, having for their subjects a continuation of the Parables, will eventually be placed in the church.

Great Berkhamstead Church.—The memorial window has been placed in this church by the high sheriff, Mr. Thomas Curtis, of the Hall, Berkhamstead. The window is by Messrs. Clayton & Bell, and cost upwards of 300*l.* Its subject is the Resurrection of the Blessed.

St. Mary's, Newmarket.—Stained glass has been placed in the east window of this church. The new glass, the cost of which has been defrayed by subscription amongst the parishioners, is the work of Messrs. Heaton, Butler, & Bayne, of Covent Garden. The three principal lights are filled with representations of the Nativity, the Crucifixion, and the Resurrection, and the smaller compartments in the heading of the window contain angels bearing shields, on which are represented emblems of our Lord's Passion,—the scourge, the hammer and nails, the reed and sponge, and the spear, &c.; the two uppermost shields display the crown of thorns, while two others, bearing a lantern and censer, typify Him who is the Light of the World and our Intercessor in heaven.

St. Matthew's, Rastrick.—Stained glass, by Messrs. Hardman & Co., Birmingham, has been placed in the first window on the south-east side of this church. The subject is Our Lord sitting at the feast in Levi's house. The work is the result of a subscription raised amongst the congregation of St. Matthew's Church, and in memory of the late Rev. Thomas Haines. The window is square, and is so treated as to occupy the entire space; and the architectural details are in accordance with the Palladian character of the church. Some one has been employed in the work of erection whose care has not been sufficient to prevent the breakage of one of the largest pieces of glass which the window contains, and it is difficult to see how such a breakage can be satisfactorily repaired.

Seale Church.—A further addition to the stained glass of this church has just been made by the rector and his brother, in remembrance of their parents. A window, of two lights, in the south wall of the nave, nearest the tower arch, has been furnished with full-length pedestal figures of Simeon and Anna. In harmony with the gospel narrative (St. Luke ii. 25-38). The general treatment of the subject is in the Perpendicular style, with some details in the borders, from the Fairfield windows. The artists were Messrs. Burbison & Grylls, who executed the stained-glass windows in the church of Hartley Wessell. The other windows in the church are mostly of the Decorated period, by Willenot, Wells, Clayton & Bell, Baillie, and Mayer.

Miscellaneous.

Subsidence of Land at Old Trafford.—Alarm has recently prevailed, owing to the condition of some house property situated near the toll-bar at Old Trafford. The back portions of the premises occupy a rather elevated position above the side of the bed of the old canal. Apparently in consequence of the soil not being sufficiently solid and firm, it yielded slightly, and appearances were presented in the way of cracks in some of the buildings, that gave rise to uneasiness, which increased on account of farther changes perceived. About six months ago the canal water was drawn off, and the subsequent effect of that seems to have been to take away the water from the surrounding soil, and cause the latter to sink. The Cheshire Railway Lines Committee, who own the bed of the old canal, have been constructing a 15-in. pipe drain below it, and the work is now progressing towards completion. It is found that four houses in Dalton-place are affected, and especially two of the buildings, where the cracks are more extensive, and the threatened consequences alarming. The inmates of the two houses have removed their furniture. The main parts of the line of buildings are built upon good foundations, and the danger is apprehended chiefly at the back.

The Great St. Gothard Tunnel.—The Swiss Federal Council has ratified the agreement with the contractor for the construction of this tunnel.

The Operative Bricklayers' Society have issued their second "London Strike Report," to be read at their various branch meetings. The number of men on strike during the four weeks ending the 10th of August was 119, of whom eighty-one belonged to the society, thirty of them being newly-enrolled members. In the fourth week the number was seventy-one, of whom only twelve were non-unionists. A sum of 98l. 11s. from the society funds was paid to eighty-four, including the above eighty-one, members on strike, being at the rate of 2s. per day per man, the time varying from one to eighteen days. The cost of administering this sum was 20l. 18s. 7d., of which the committee received 18l. 3s. In the seven preceding weeks ending the same date the total charge to the society for the strike amounted to 229l. 18s. 11d. During the three weeks ending the 5th of August, 111l. 8s. 4d. were collected in the way of subscriptions, and 47l. 13s. 7d. were obtained from trade levies, making together 159l. 1s. 11d., of which 142l. 8s. 4d. were distributed amongst the above 119 men, the cost of collecting and administration being 17l. 13s. 7d. Altogether, during a period of seven weeks, 264l. 13s. 3d. were contributed to this general fund, and on the 5th of August, 28l. 3s. 9d. remained in hand. For the last three of the four weeks covered by this report members of the society received strike pay at the rate of 1l. 3s., and non-members 11s., per week. The gross cost of the strike up to the 10th instant was 466l. 3s. 5d.

School Desks.—Mr. J. F. Moss, the clerk to the Sheffield School Board, has devised two new school-desks. The "Sheffield School Board Desk" is the title of one design; the other is to be distinguished as the "National School Board Desk," and both are arranged to seat the pupils in pairs. The latter can be constructed so as to have a separate locker for each boy or girl, and in this form it has, we believe, already been supplied by the makers (Messrs. Colman & Glendenning, of Norwich, and 23, Warwick-lane, London) to a large proprietary school just erected at Plymouth. A space of about 15 in. is left between each series of double desks in a group, but this space is more than counterbalanced by the saving effected in placing the desks closely one behind the other, and a very comfortable back is thus provided for each scholar. Additional writing-space is also afforded, the tops of the desks being wider than most of those hitherto used, and each pair of desks is provided with a footboard. The great advantage claimed for seating the children in pairs is that the teacher has more perfect and ready supervision of the members of his class, as he is enabled to reach any pupil in the least possible amount of time, instead of having to walk round the long desks, as under the old system. Some good opinions of these desks have been expressed. The question of space will probably arise.

A Proposed Livingstone Monument in New York.—The *New York Herald*, referring to the proposal to erect a statue of Dr. Livingstone in the Central Park, New York, makes the following remarks:—"We have a bust of Humboldt in the park and a statue of Morse, and it is eminently fitting that Livingstone, with whose history America is now so closely and pleasingly identified, should take his place by the side of the renowned naturalist and the famous electrician. The statue of Sir Walter Scott, by Steell, the well-known Scottish sculptor, from the original model which adorns the Scott monument in Edinburgh, will in a few months be placed in position, and the idea of the original projectors of the park, who desired that it should in time be a gallery of art as well as a place of natural beauty, is in a fair way of being realised. The statue of Dr. Livingstone is already made. It is the work of Mrs. Amelia R. Hill, the widow of D. O. Hill, member of the Royal Scottish Academy. It is to be erected in England in the honour of Livingstone as soon as he returns home. Why should we not have the same model erected here at once? The design is admirable. The commissioners should secure a model of this great work, and place it in the Central Park at once, so that it may be first seen here by Dr. Livingstone when, as we hope and expect, he visits New York before he returns to his native land."

Port of London Sanitary Authority.—A first meeting of this new corporation committee was held in the Guildhall, Mr. G. S. Pedler being unanimously elected chairman. Various matters were discussed, bearing on the new duties entrusted to the corporation.

The Combustibility of Iron.—Professor Magnus, of Berlin, has recently devised a beautiful experiment to demonstrate the combustibility of iron, says the *Mechanics' Magazine*. He takes a straight bar magnet of considerable power, and sprinkles iron filings on one of its poles. These filings, of course, arrange themselves in accordance with the lines of magnetic force; and since, however closely they may appear to be packed, no two of the metallic filaments are parallel, a certain portion of air is enclosed, as in a metallic sponge. The flame of a spirit-lamp or gas-burner readily ignites the finely-divided iron, and it continues to burn brilliantly for a considerable time. If the experimenter stands on a little elevation, and waves the magnet to and fro while burning, a magnificent rain of fire is produced. The experiment was first performed in Berlin before the Emperor of Germany and his court. The late Professor Faraday used very strikingly to show the extreme combustibility of iron under certain experimental circumstances.

The Cambrian Archeological Association.—The members of this association are holding their seventh annual meeting at Brecon, and, like their English brethren, they not only read papers, but make pleasant excursions to the national and historical objects of interest within easy distance of the place which forms their temporary head-quarters. The general programme has been arranged, and excursions have been fixed for Brynlllys, Aheredy, Cefn-y-bedd, Clawdd-y-gaer, Pytingwtijn, Digwyflla, Llan-de-failogfach, Maenmorwynion, Cwmab, Digwyflla, and Bettws. It is said that complaints of neglect have been addressed to the general committee from Llyynggffwddvaar, Marthacwm, Blan-Gwraeth, Llanvaircraeriion, Llanvairryryrn, and Lleechynvarwydvach. At the Pontypool police-court, a Welchman has just been charged with assaulting another on a disputed point in the spelling of Welsh names; and no wonder!

Richmond School of Design, Victoria.—Richmond, which is a suburb of Melbourne, with a population of about 18,000 people, maintains successfully a School of Design. At the second annual exhibition and distribution of prizes, held last evening, the hon. secretary, Mr. M. Egan, architect, stated in his report that the average attendance was fifty-two, with ninety names on the list. The report proceeded,

"A great deal has been said about the non-practical character of these schools. At first it was designed that our teaching might be of use to the students in their various callings, but we found that were we so severe in our teaching as to limit them to defined courses of instruction we would be unable to continue even in our present position. One school, in my opinion, has ceased to exist through following this course, and the fact is further illustrated by the most practical class we possess, namely, the architectural and mechanical, which, through our attempting to teach elementary principles, has fallen off from being the largest to the smallest. We can therefore only continue in our present course, and trust that the time will soon arrive when drawing shall be so valued that it shall be taught independently of the wishes of the learners."

Somersetshire Archeological Society.—The twenty-fourth annual meeting will be held at Taunton, on September 10th, 11th, and 12th, under the presidency of Mr. W. A. Sanford. After the president's address, Mr. G. T. Clark will read a paper on "Taunton Castle." The castle, the churches, and other objects of antiquarian and historical interest in Taunton, will then be visited; and in the evening there will be a meeting for papers. On the 11th there will be an excursion embracing Cheldon, Hestercombe, Kingston, Norton Church and Camp, Bishops Hill, Rams-leury Bridge, and Trull; and on the 12th the excursion will embrace Bathpool by the old Road, West Monkton, Creech, North Curry, Hatch Beachamp (if possible), Thornfalcon, and Ruishton. A third excursion is proposed to take place on Friday, embracing Orchard Portman, Thimbleer, Staple Fitzpaine, Curland, and the Camp of Castle Neroche.

The North Surrey District School.—Complaints have often been made as to the bad condition of the children in this school, and a committee of the Wandsworth and Clapham Guardians have now reported:—

"They were deeply impressed with the general air of discomfort prevailing in every part of the establishment, and regret to observe the want of proper arrangements, want of ventilation, want of sufficient accommodation for separate children in different stages of disease, want of cleanliness, imperfect drainage, and the utter failure in the carrying out of what they had understood to be the resolutions of the Board in its general management. The Visiting Guardians regret to have occasion to report their great dissatisfaction on the state and conduct of the infirmary in the North Surrey School."

A more rigorous inquiry seems to be necessary.

Statistical Congress at St. Petersburg. This is the era of congresses. On the 22nd inst. the labours of the Avant Congress having terminated, the Statistical Congress at St. Petersburg was formally opened by the Grand Duke Constantine. His imperial highness delivered an elaborate inaugural address, which was enthusiastically applauded. He concluded his address by bidding the congress welcome in the name of the Government and formally declaring the session open. The programme of the entertainments for the congress included an invitation from the Emperor to dine in the palace at Tsarkoé-Selo on the 26th, from the Yacht Club to a *fiête* on the 26th, and an excursion to Peterhof and Cronstadt on the 27th. The city of Moscow also sent an invitation to the members to visit the Polytechnic Exhibition and to accept the hospitality of the municipality.

A New London Park.—The Metropolitan Board of Works have now completed the improvements of Stepney-green, already alluded to in a previous number, and have thrown it open to the public. This is a valuable addition to the recreation grounds of the metropolis. For many years past the large open space known as Stepney-green, situate in one of the most crowded quarters of the east of London, has fallen into a neglected condition. At the instance of the local authorities, the Metropolitan Board have contributed the whole cost,—about 3,000l.,—of converting the waste fields into flower-garden and public recreation grounds. Stepney-green is the last remaining remnant of the famous Mile-end-green, the rendezvous of the rioters of Essex in the insurrection led by W. Tyler in 1381, and the trysting-place of the architects of the Tudors.

"Weighting" Paper and Cloth with Slate.—Protection has been obtained for an invention which consists in the employment of ordinary slate, or the mineral from which slate is quarried, in a state of fine dry powder or of fine wet pulp, and using it in both conditions as articles of commerce, either with or without the addition of any colouring matter. Slate of different colours is selected as desired, and ground to any degree of fineness in the dry or moist state, and this powder, or pulp, in natural colour is to be used for "stiffening a weighting" cotton or other cloth or paper, either used alone or in combination with china clay or other similar substance. The dry powder or moist pulp is also to be coloured to any tint required, and used in the manufacture of pigments or colours.

Gas Explosion.—At No. 1, Shrewsbury-villas, Plumstead, on Friday night, the occupant (a widow lady), being rendered uneasy by strong smell of gas, called in her next-door neighbour to their help. Seeing that there were lights burning in the drawing-room, he thought there could be no danger of an explosion, a getting upon a table, proceeded to search for a leak in the gas-pipe. For this purpose he struck a match, when the gas, which must have accumulated in the upper part of the room, exploded, with a very loud report, hurling through an open door into the next room, burning him severely about his face, neck, and hands. A young lady also had both her hair burnt, and the curtains and furniture in the room were ignited. The house itself was greatly damaged.

Decline of Cholera Symptoms.—In accordance with what we have more than once pointed out during this summer season as what might be expected in so open and thundery a year, not only in this country but over Europe, we now state that the cholera "has not in the last fortnight really advanced at all in its westerly direction" from Asia, and that "epidemic appears to be steadily declining," whatever may happen abroad, this is no choice year for England; and moreover, the autum and winter will probably be more than usually healthy otherwise, as is generally the case whenever the decaying, putrefying, organic wreck spring and summer.

Society of Engineers.—Arrangements have been made for a visit of the members and associates of this Society, on (this) Friday, the works of the Ransome Stone Company, East Greenwich. After leaving the visitors to proceed to the adjacent works of the Bessemer Steel and Ordnance Company, then to be inspected.

Opening of a new Drinking Fountain at Tunbridge Wells.—A new fountain has been opened at the junction of two roads at the town of Tunbridge Wells (the Grosvenor and St. John's) leading into the heart of the town. The Hon. F. G. Molyneux addressed a numerous assemblage on the occasion, as did also Mr. Veyland, a member of the Metropolitan Drinking Fountain Association. The fountain is composed of a pillar of polished granite, and bears a brass plate, on which are engraved some words of arms, &c., together with the following inscription:—"This fountain is erected by his widow, in memory of Lieut.-General Molyneux Williams, K.H., who died in May, 1871, respected and beloved by all who knew him. 'Blessed are the dead who die in the Lord.'—Rev. xiv. 13." The masonry was done by Mr. George Williams.

The People's Gardens, Willesden.—A series of Saturday *fetes*, to conclude the summer season of 1872, are being held at these gardens, which were opened last year in a somewhat unfinished state. The gardens have been purchased and laid out by "The People's Garden Company," with the object of affording to the shareholders and members a means of healthy and rational recreation, such as cricket, croquet, chery, boating, gymnastics, dancing, &c. The grounds comprise about fifty acres, and are well laid out. The gardens are open on Sunday mornings to members for promenade, when a band attends, and lectures and musical entertainments are provided on that day. The club now numbers 800 members, with the privilege of introducing friends.

Waste Materials at the Vienna Exhibition of 1873.—Among the supplemental exhibitions which will be formed in connexion with the Vienna Universal Exhibition is to be one showing what steps have been taken since 1851 (the date of the first London Exhibition) in the utilization of substances previously regarded as waste. On the one hand will be shown the waste products in all the industrial processes included in the forthcoming Exhibition; on the other hand, the useful products which have been obtained from such wastes since 1851. This is intended to serve as an incentive to further researches in the same important direction.

The Tower Subway.—The report of the directors states that the number of passengers passing through this subway during the last half-year has been 506,072, and the amount earned 1,054*l.* 6*s.* 4*d.*, or sufficient to pay all working expenses and interest at the rate of 5*1/2* per cent. per annum on the original shares. The traffic of the last half-year is 106*1/2* per cent. in excess of that of the previous half-year. It is proposed to declare a dividend on the preference shares at the rate of 5*1/2* per cent. per annum, and on the ordinary shares at the rate of 4*1/2* per cent., although there are not funds in hand to pay it immediately. The report has been adopted by the shareholders.

Destructive Fire at Leeds.—On Sunday morning in last week, a fire was discovered to be going on the extensive premises of the North-eastern Railway goods depot, Wellington-street, Leeds. The goods station is nearly a square, and on the eastern side is the grain warehouse, 40 ft. wide, and on the western extremity is the general goods warehouse, 127 ft. in length by 47 ft. in width. The general goods warehouse was only partly finished. The fire burned throughout the day, and the mischief done was very extensive. There are suspicions that the fire had been caused by an incendiary. The amount of damage done will, it is stated, exceed 50,000*l.* The buildings were insured.

Swimming Bath for Richmond.—A recent attempt to provide a swimming-bath at Richmond by means of a limited liability company having proved a failure, a public meeting has been held at the vestry-hall to consider the best means of providing one, under local direction and by local means. Colonel Burdett occupied the chair. It was unanimously resolved, "That it is meeting is of opinion that a public swimming-bath on the River Thames, in the immediate neighbourhood of Richmond and Twickenham, is urgently needed." A committee was appointed to carry out the object in view.

Tenacious Glue.—Dissolved in nitric ether, says Dr. J. M. Maisch, in the *American Journal of Pharmacy*, glue is about twice as tenacious as when it is dissolved in water.

The Liability of Tenants.—An owner of house property having inquired at Somerset House why the property tax should be charged in excess of the income, has received an official reply stating that the valuation list is accepted as conclusive evidence of the gross value of the property, and adding that the "tenant is only entitled to deduct the tax on the amount of rent actually payable by him, and that the difference should be borne by him unless he can obtain a reduction of the charge in the valuation list, for which purpose he should apply to the assessment committee of the parish, at the office of the vestry clerk. The question is thus really a tenant's and not a landlord's question."

A Breakwater for Jersey.—The local authorities of Jersey having resolved to construct a new harbour, with the view of affording better accommodation, and greater facilities for the arrival and departure of shipping at all states of the tide, the first stone of the breakwater which is to form the protecting arm of the harbour, was to be laid on Thursday by his Excellency Major-General P. M. N. Gay, C.B., Lieutenant-Governor, assisted by Sir John Coote, and the members of the Harbour Committee, in the presence of Mr. John Hammond, bailiff, the members of the States, and public bodies of Jersey.

Alms-houses, Wimbleton.—Mr. Henry W. Peck, member for Mid-Surrey, has founded five alms-houses, freehold tenements, at Wimbleton, and has endowed them with a view of their being occupied by deserving men within the district of Mid-Surrey. The almsmen will each have a cottage free of rent, taxes, and water-rate, and a pension of 36*l.* per annum. The first four pensioners will shortly be elected,—one by the founder himself, one by the mayor and corporation of Kingston-on-Thames, one by the mayor and corporation of Reigate, and the fourth by the magistrates of the county of Surrey.

A Forgotten Lighting Conductor.—A correspondent of the *Times*, reminding the public what an excellent conductor of electricity carbon is, gives the following advice:—"First: keep your chimneys clean. Second: in the language of the telegraphist, 'put your grates to earth,'—that is, connect each grate of your house with a solid and continuous piece of wire, like that used for telegraphic purposes, with a piece of metal buried in the earth, or with the system of iron pipes conveying gas and water through your town."

Fall of a Grand Stand.—The Manchester papers state that at the Robinson Lane well-dressing sports in connexion with the Ashton-under-Lyne wakes, the grand stand gave way, and between 300 and 400 persons were thrown to the ground. The stand was about twenty yards long, and there were on it many spectators. Just as one of the races was concluding the structure was observed by outsiders to shake, but before any warning could be given the timbers gave way. Several persons were severely shaken, and others were bruised, but no limbs were broken.

A Sea Pacifier.—Under this title Mr. Thos. Morris, architect, suggests a form of construction for ocean-shields, breakwaters, piers, lighthouses, and other marine objects. He proposes to form a platform on the tops of a series of vertical cylinders of great buoyancy, kept in their position by struts and braces, and held down to the proper level by weights or anchors. With the understanding that at a depth of 15 ft. the sea in British regions is perfectly still, Mr. Morris concludes that a platform at that distance below the surface would be undisturbed.

Illumination of Limehouse Church Clock. Mr. C. Harston has laid before the committee drawings and specifications explanatory of the proposed work, with details, as to the construction of the new dials. These are four in number, each over 13 ft. in diameter, and projecting 18 in. from the face of the clock. The plans have been approved, and the architect has been instructed to invite tenders for the work. The cost will be about 500*l.*, of which 295*l.* have been subscribed.

Tintern.—On the 14th of August the foundation-stone of a new day and Sunday school, with school-keeper's house, &c., was laid at Tintern, Monmouthshire, by Mr. Thomas Peibick, of Bristol, assisted by the ministers of the neighbourhood. The work is being carried out by Mr. W. Roberts, builder, of Chepstow, from drawings and under the supervision of Mr. E. A. Lansdowne, architect.

State Purchase of Irish Railways.—The chairman of the Dublin and Belfast Junction Railway Company, at their recent meeting, said he had no doubt whatever that the Government had serious intentions of purchasing the Irish lines. It was desirable, whatever determination the Government should come to, that no time should be lost, because it prevented the question of amalgamation going on between them and the Dublin and Drogheda and the Ulster lines.

Advance in the Price of Window Glass. The principal makers, says the *Birmingham Post*, have issued circulars stating that it is necessary, in consequence of the increase in the cost of fuel and other materials, to advance the price of window-glass. They state that for the present the net price for "fourths" crown will be 42*s.* per crate; and the quotation for "thirds," 15 oz. sheet, glazing quality, is 4*1/2**s.* per foot, less 25 per cent. discount.

Great Fire in Kentish-town Station of North London Railway.—Throughout Tuesday night a very destructive fire has ravaged the Kentish-town Station of the North London Railway. Captain Shaw's report shows that about 230 ft. of the arrival platform, four waiting-rooms, and a signal-box were destroyed, and many of the adjacent buildings were more or less damaged.

Fall of a Quay into the Tyne.—The quay frontage at Messrs. Sheldon, Nixon, & Co.'s chemical works, at Hebburn, has fallen into the river. The quay was 200 ft. in length, and had upon it a steam crane and boiler, a coke-oven, a cooper's shed, three or four manganese stills, and 20 tons of soda-ash, all of which were precipitated into the Tyne. Fortunately, no person sustained any injury.

Coal and Steam Superseded!—Mr. John Earl Clare, of Liverpool, has succeeded (it is said) in perfecting an engine to be worked by electro-magnetism, by which an up-and-down motion is obtained whence a power is developed that is applicable to our largest ships afloat, and also to stationary and locomotive use.

New Lighthouse for Ceylon.—Messrs. Shearer, Smith, & Co., of the Dalbeattie Granite Quarries, having lately completed the supply of worked granite for the Great Basses Lighthouse, have undertaken the supply of the worked material for the sister lighthouse about to be erected on the Little Basses Rocks.

South Kensington Museum and Bethnal-green Branch.—Visitors during the week ending 24th August, at Kensington, 19,221; average of corresponding week in former years, 15,540; at Bethnal-green, 40,956.

Opening of the Glasgow Tramways.—The system of tramway communication has been inaugurated in Glasgow, by the opening of the line extending from St. George's Cross to Eglinton Toll.

Hornsey.—According to the *Rock*, a new church will shortly be commenced at Hornsey, to be called Trinity Church. It will be opened under the auspices of the Free Church of England Council.

The New Public Hall in Holloway.—Progress is being made with the Holloway Hall, Holloway-road, and the building will shortly be opened for public meetings and other purposes. It has cost about 5,000*l.*

TENDERS

For rebuilding church at Etingshall, near Wolverhampton. Mr. W. D. Griffin, architect:—	
For Church and Fittings	
Stockton & Son	23,820 0 0
G. & F. Higham	3,082 0 0
Lovatt	2,950 0 0

The Builder.

VOL. XXX.—No. 1544.

Trevithick.

ICHARD TREVITHICK was a Cornish man, and an able engineer, plain, practical, and great, like Watt, Smeaton, and George Stephenson, — a man of genius.* He had the power and energy of any of them, but not the subtlety of Watt, the accomplishments and scientific knowledge of

Smeaton, or the quality of looking after his own interest as well as that of others that George Stephenson had. He was descended from an ancestry of Cornish Trevithicks, the last of whom before him married a lady whose forefathers came to Cornwall from Ireland. Trevithick was born in 1771. The first practical application of steam to pump water out of the Cornish mines was made by Newcomen in 1705, who combined the ideas of Savery and others with his own great mechanical genius, and applied the action of a piston moving in a cylinder to give motion to a beam overhead. Many of his engines were erected in Cornwall to pump water out of the mines. The cylinders of Newcomen's engines were open at the top, and the efficiency of the machine depended on the degree to which the steam underneath the piston could be condensed, after it had done its work of raising the piston to the top of the cylinder, and thus allowing the weight of the atmosphere to drive the piston down again. It was thus called the atmospheric engine. Keeping to the same principle, various improvements were made from time to time, until Trevithick's father, who was the manager of several mines in Cornwall, in or about the year 1778, substituted self-acting gear and valves for those which had previously been worked by personal attention after each stroke of the piston. Besides this improvement of the engine, he improved the form of the boiler, the top of which had been theretofore made flat; but as this form has but little power of resistance, Richard Trevithick, sen., made the top in an arched form, by which he brought directly into play the tensile strength of the material to resist the internal expansive force of the steam.

In 1777 Watt appeared in Cornwall, with his newly-invented method of using steam by condensing it in a separate vessel, whereas Newcomen had been used to condense it in the cylinder itself, and, as Trevithick's father adhered to Newcomen's method, he and Watt contended for the approval of their respective engines by the proprietors of the Cornish mines. He made also a great improvement in the system of mining; that, namely, of excavating the rock upwards instead of downwards, having first sunk the shaft to the lower level. In the old system,

the road over which the broken rock had to be conveyed was continually destroyed, and the drainage of the water away from the miners was prevented, whereas in the new system these difficulties were got rid of.

All these and other like things became gradually known to Trevithick. The actions of every man are necessarily governed to some extent by the condition in which he is born, and by the circumstances which happen within his apprehension during his youth. Trevithick was a man of great powers of body and intellect, and had no other, or but little, education than that of the things which transpired around him, and which his idiosyncrasy enabled him to observe and appreciate; those, namely, of mining operations. When he was eighteen years old he worked at the Stray Park mine. When he was twenty-one, he was employed by the shareholders in Tin Croft mine, to examine and report on the relative duties, or the work done with a certain quantity of coal, in the patent engine of Watt, and in that of the double-cylinder engine of Hornblower. "Thus," says the author, "at the early age of twenty-one, Trevithick was in public and professional contact with Watt, and from that period dates the competition of the great low-pressure engineer and his youthful and vigorous high-pressure rival."

In 1796, the year before his father's death, and when he was twenty-five years of age, he competed with Watt and with Bull in saving coal, by the various methods of using the force of steam to raise water, Trevithick's method being to improve Newcomen's beam-engine; Watt's (also with the use of the beam), to condense the steam in a separate vessel; and Bull's, to place the steam cylinder directly over the weight to be lifted, and therefore requiring no beam. It was useless, however, to try to compete with Watt so long as the steam was condensed in the cylinder, and Trevithick in some cases worked his engines at high-pressure, without any condensation, the waste steam being driven out into the atmosphere.

When water, admitted into a pump-barrel, is required to be raised to a greater height than about 30 ft., a solid tight-fitting piston is sometimes used, which, in the downward stroke, forces the water up the rising main; but as sand or other obstructive matter is usually drawn into the barrel with the water, the piston or the barrel soon wears out. Trevithick adopted a plunger, which works in the harrel of the pump without touching its sides, the effect being that it displaces just so much water each stroke as its cubical capacity measures, the only part subjected to wear being the gland at the top of the barrel, through which the plunger works.

It is probably not generally known that a steam road-locomotive ran through Oxford-street, Tottenham-court-road, and the New-road, in London, seventy years ago, at the rate of eight or nine miles an hour; but Trevithick, after constructing an engine of this kind at Camborne, in Cornwall, made another in Leather-lane, and drove it through the streets of London. Both came to grief by running off the road, the one into a ditch, the other into a garden. This tendency of his road-locomotive seems to have turned his attention to confining the wheels to iron tracks, and, in 1804, he constructed a locomotive which ran on a tramroad at Pen-y-darran ironworks, in South Wales, taking ten tons of iron and seventy men over a distance of 9½ miles. Soon after he sent a similar engine to Newcastle-on-Tyne for use on the railroad of the Wylam colliery. Here was a chance for the North-countrymen to learn something, and they were not long in doing it. Of course everybody went to see it:—"Mr. Wood and George Stephenson, with Mr. Wilson, the engineer, and Timothy Hackworth, then a blacksmith, afterwards engineer on the Stockton and Darlington Railway, and maker of the *Sanspareil* locomotive,

that, a quarter of a century later, competed on the Liverpool and Manchester Railway." Robert Hawthorne, also, the author thinks, was probably one of the lookers-on, for "a few years afterwards the two great engineering establishments in Newcastle, known as Hawthorne's and Stephenson's, began to grow into importance."

The blast-pipe is an all-important part of a locomotive engine, and both that sent to Newcastle and that in Wales, as well as one constructed at Coalbrook Dale, had it, although the invention was afterwards claimed by others. These are not unsupported statements. Authentic documents and letters are referred to showing their truth. It is, however, open to doubt whether Trevithick, with all his genius, used the blast-pipe for its main purpose in a locomotive,—that of creating a powerful draught of air through the fire, and so increasing the heat to a degree that could not otherwise be attained; or whether, as Mr. Smiles says, he only turned the waste steam into the chimney to get rid of it.

In 1808 Trevithick laid down a circular railway in a field adjoining the Euston-road, near or at the spot now forming the southern half of Euston-square, and placed upon it a locomotive engine; and Mr. John Isaacs Hawkins, a well-known civil engineer, said, in 1847, "On that railway I rode, with my watch in my hand, at the rate of twelve miles an hour."

The author says, and apparently very justly, "To Trevithick and his never-ceasing practical exertions, in Cornwall, London, Shropshire, South Wales, and in Newcastle-on-Tyne, are we indebted for the first practical and real evidences of steam locomotion."

He invented and set to work, on the river, at Blackwall, the first steam dredging-machine. He drove a driftway under the Thames about the same time, *i. e.*, 1808, from the southern shore almost to low-water mark on the northern shore. This was about two miles and a half below London Bridge. It was 5 ft. high in the clear of the timbering, 3 ft. wide at bottom, and 2½ ft. wide at the top, in the clear. He sank a shaft on the southern shore, at Rotherhithe, and drove his heading level for three-quarters of the distance across, being 30 ft. below the bed of the river. He then began to rise towards the north shore, with an inclination of 1 in 9, so as to come out at the surface; but after getting through 1,028 ft., the whole length being about 1,128 ft., he came to a quicksand, which broke into the driftway, and the work was abandoned.

He invented iron tanks for containing water for ships' use, instead of wooden casks, and for water ballast in the hold, and for other purposes on shipboard; a floating dock, made of wrought-iron plates riveted together, for docking a vessel of considerable size while riding at her moorings, by means of which the ship might be supported as in a common dock, and the water pumped out so as to leave the keel dry.

His specification for building ships of iron instead of wood sets forth that the sides and deck are to be of wrought-iron plates; that ships so constructed can be built so as to carry, bulk for bulk of ship, a much larger cargo; that they will be free from vermin, and extremely durable; and that if shot through the side there will be no splinters, as a shot would carry away no more of the ship's side than the diameter of the ball, and the hole could be plugged up at sea. It is stated that in 1812, he, having invented the screw-propeller for ships, offered it to the Navy Board, with a proposal to test its superiority to paddle-wheels.

Davies Giddy (afterwards Gilbert), a Fellow of the Royal Society and a Member of Parliament, was Trevithick's great friend, helping him with scientific explanations of his inventions, and with calculations which he himself,—although not at all an illiterate man,—could not work out, and standing by him with encouragement in all his troubles; but men like Trevithick, after the

* Life of Richard Trevithick, by Francis Trevithick, C.E. Vol. 1. E. & F. N. Spon, 1872.

time of their youth, can bear with but little interference. Had he had scientific knowledge to start with, it might have reduced his impetuosity, but would probably have enabled him to carry out his ideas with greater success, and to greater perfection. He appears to have been free from the vice of selfishness, and cared not who or how many benefited by what he did, showing his inventions to all comers; but, as in many other instances where generosity is unallied with either scientific knowledge or cunning, his great exertions brought him no personal wealth.

The difference between Trevithick's schemes and those of many other inventors is, that his were worked out in detail, as though he were describing something that had been done, rather than what was to be. Most of his ideas, so far as they are revealed in this first volume, have since been carried out by or with the help of mathematicians.

SANTARY SCIENCE AND SANTARY POLITICS.

THE important question of urban purity, so long and so often urged in our columns, has at last taken hold of the attention of the public. It may be said, indeed, that circumstances have compelled an unwilling attention. As to that we are not disposed to grumble; the great point being, that the subject, now that it has condescended assumed dimensions of imperial magnitude, shall not be disposed of by a side wind; but that all those manifold problems which are involved in the one general solution shall be adequately and correctly wrought out.

The facts before us, we have before pointed out, must be regarded not as isolated phenomena, but as a whole. To this whole must be added, year by year, and month by month, the new results of investigation, and the new conclusions of science. On the one hand we have to review the action of the Legislature, as resulting in the Public Health Bill, the details of which we examined at some length on the occasion of its introduction into Parliament. On the other hand we have the debates of the Parliament of Science; in the reports presented to the British Association during the late meeting. We must regard each of these contributions to the law and to the knowledge of the subject, in order to keep up to the level of advancing intelligence.

On one of the questions as to which, in our usual cumbersome and dilatory mode of procedure, we are slowly collecting the data for subsequent legislation, namely, the pollution of rivers, the opinions expressed by the Association were quite unhesitating. Major-general Sir James Alexander read a paper, expressed in very strong terms, as to the injury inflicted on the public, with reference both to the destruction of fish, and to the carriage of the germs of disease by the neglect of the Scottish rivers. He especially called attention to the case of the Forth. Professor Fawcett, the chairman of the section, intimated that it was now too late to raise the general question. The evil of the pollution of rivers was generally admitted. The practical question was, what remedy could be suggested. On this point, however, excepting so far as regarded the general view that "the Government ought to do something," the members of the section were generally mute. Sir John Bowring gave details of great interest as to the fish culture of the Chinese, and as to their culture of edible vegetables in water. Beyond, however, the expression of the opinion that the Government sanitary measure of the present year has only touched the fringe of the question, and that Government should seek the counsel of engineers as well as of chemists, the proceedings of Section F (Economic Science and Statistics), cannot be said to have had much practical bearing on the subject of riparian purity.

The fourth annual report of the Committee on the Treatment and Utilisation of Sewage was received by Section G (Mechanical Science). The division of two essential parts of the same subject between the Statistical and the Mechanical sections is not very happy. Again, the Chemical Section is called upon to discuss the same matters. So important is the subject, and so unfortunate is the result of its being thus frittered away in detail, that we suggest for consideration the formation of a separate sub-section for dealing with the national question of sanitary engineering; including in one view both the

mechanical and the chemical divisions of the subject, on the concurrent elucidation of both of which the economical results must depend. We are not yet in a condition to discuss either of these parts of the subject by itself; and in this fact lies the real source of the difficulty of a prompt and decided action with regard to the restoration of the purity of rivers.

Five distinct methods or examples of the treatment of sewage were reported on by the committee. These investigations have been arrested, for want of funds; but yet have produced some results of value.

The first process dealt with by the report is one which is in operation in the workhouse of Stoke-upon-Trent, an establishment containing about 750 inmates, and known by the name of *Wear's process*. It is unnecessary for us to enter into the details of the report. The principle involved is that of filtration through charcoal, which, at the close of the process, is employed as manure. The result of the process is stated by the committee in a few words. The suspended matter is absorbed by the charcoal. The quantity of ammonia, and that of organic nitrogen, is also much reduced by absorption. But no chemical action proper, or at all events no oxidation, occurs; and the effluent water is stated to be to all intents and purposes merely diluted sewage. As far, therefore, as the report of the committee carries weight, we must add *Wear's process* to the long list of failures; which it would be highly instructive to tabulate in a compendious form.

The second section of the report dealt with the process in use at Ealing; namely, upward filtration, and the method of General Scott. The committee declare upward filtration to be absolutely worthless. This is not the first time that this opinion has been formed. We are not in possession of facts to invalidate the judgment of the committee. At the same time we cannot but think that it must be held to apply to detail, rather than to principle. That, so far as matters suspended in a fluid are concerned, they can be more readily removed by calling in the aid of gravitation, opposing an obstacle to their ascent, than by merely mechanically straining them out from a descending column of water, seems, *prima facie*, apparent. Against this has to be set the greater facility afforded for cleansing the downward acting filters, by intermittent use and disuse. But we must confess some surprise, and some disappointment, that no method has yet been hit upon for enlisting the force of gravitation in the service of purification. We should like to see an upward filtration attempted through a porous artificial substance, which should be subjected, on alternate days, to the *washing* power of a head of water, in the reverse, or downward direction, for half an hour or an hour. The principle of upward filtration cannot be held to be disposed of without some such experiment as this. It is true that chemical precipitation is one of the great engines which we have to employ, but mechanical filtration may reduce the cost of the chemical agency.

Ealing has a population of 10,000, and the daily flow of sewage averages from 350,000 to 400,000 gallons. The precipitants used by General Scott are lime and clay. These are mixed together, and introduced into the main sewer, at the distance of about a mile from the works. This admixture is said to reduce the clinging, quasi-glutinous, character of the sewage, so that the sewer through which it runs does not become coated with deposit. The fluid is then made to ascend through a filter of sand and gravel. The precipitate thus arrested, or strained out, is removed and placed on a floor of hot plates or tiles, below which a fire is kindled. It is, in fact, a sort of drying-floor, in which the solid matters mechanically suspended in the water, and removed by filtration, are treated much like bricks in a brick-kiln. The sewage bricks, however, contain nearly 30 per cent. of organic matter, which is combustible. After the first drying they are burned in a kiln, the organised matter supplying so much combustible material that very little other fuel is required. The product of this combustion is crushed in a mill, and is said to form a good cement, selling at 30s. per ton. This is further said to yield a profit of 10s. per ton, or 50 per cent.; but the committee have not reported on the question of cost. The effluent matter is shown by analysis to contain rather more than two-thirds of the chlorine and of the dissolved nitrogen of the sewage, although the nitrogen appears to have undergone a change in its combination. The ammonia is reduced to one-

quarter of its original amount; but the organic nitrogen is nearly doubled. Results so anomalous show that we are as yet far from a thorough comprehension of the chemistry of the case. The process, if successful, will have a commercial value of much importance to the inventor. We have therefore little doubt that the practical ability of General Scott will not be diverted from the investigation, until we derive, at all events, a considerable increase in our knowledge of the chemistry of the question. We must never forget that it is within the province of chemistry that the real knot of the matter lies. Even in the best cases of disinfecting sewage by passage through the earth, the process is chemical, though conducted in the laboratory of nature. Why and how earth, under certain conditions, *does* disinfect, we have yet to learn. This is the great question which the curators of human health have now to put to the chemist. On the reply to that question will hinge the sewage arrangements of the future. At present it can only be said that, under certain circumstances, one of the great difficulties incurred in the treatment of sewage is alleviated by this process of combustion.

The third, fourth, and fifth sections of the report deal with experiments and observations on the utilisation of sewage, and purification of the effluent water, by irrigation and earth-filtering.

Under the pressure of injunctions from the Court of Chancery, the local board of Merthyr Tydfil have converted 20 acres of land into a filter, on a plan suggested by the Rivers Pollution Commission. The soil consists in a deep bed of gravel (probably the former bed of the river Taff), composed of rounded pebbles of the old red sandstone and coal-measure formations, with loam and sand interposed, forming a highly-porous subsoil, with a vegetable mould upon the surface. The land has been pipe-drained at a depth of 7 ft., the pipes converging into an open drain, which conveys the water into the Taft. The sewage is first passed through a bed of slag, which arrests the coarse matters. How this filter is dealt with when it requires cleansing is not stated. The area is divided into four portions, on each of which the sewage is turned, in rotation, for six hours at a time, being led on by surface carriers and drains. The surface of the land is cultivated to a depth of from 16 in. to 18 in. The average daily supply of sewage is about 300,000 gallons; but, owing to percolation from the river, the quantity of effluent water nearly doubles the amount. This water has been analysed at different sewers. It is stated that the suspended matters are removed, and that the ammonia and nitrogenous organic matters held in solution are almost entirely oxidised, so that they appear in the effluent water in the form of nitrates and nitrites. The Commission therefore report that the sewage is purified, but cannot be said to be utilised. It will be evident that here again are to be found elements of importance for the ultimate chemical analysis of the entire question. The oxidising of the nitrogenous matter by the gravel filter, as compared with the absence of this important process in other cases, is a matter of great importance for us plainly to understand.

In the farm at Romford the committee found by analysis that one-tenth only of the total nitrogen applied to the land was to be detected in the effluent water, and that not in an organic form. 40 per cent. was accounted for by the crops; and the remaining half of the original quantity was as yet unaccounted for. Analysis of the soil is expected to reveal its presence, but experiment on this point is reserved for next year.

In the Chemical Section, on the 20th August, Professor Corfield described the new process known as Whittbread's Patent, in which one equivalent of monocalcic phosphate (the commercial superphosphate) and two equivalents of di-calcic phosphate, are added to the sewage, followed by a little milk of lime. The precipitation is rapid and complete. The suspended matters are removed, and the organic nitrogen is almost entirely removed. The ammonia is increased in amount, and phosphoric acid remains in solution in the effluent water. The precipitate contains phosphate of lime, which is a valuable manure. It also contains 3 per cent. of ammonia, which considerably enhances its value. But the loss of the phosphoric acid in the effluent water is a drawback. The process is one which eminently demands further careful investigation.

The outcome of the debates of the different sections appears to be this. We are in a state of

doubt as to the true chemical solution of the question of utilisation. Fresh information is being daily attained, and the ultimate result, we trust, is not very distant. First, in efficiency, is the power of chemical agency of the earth itself, especially when aided by the organic chemistry of the plant. But the application direct of sewage to land is difficult, and not everywhere practicable. Then we have processes of mechanical filtration; and among these the discovery, by General Scott, of the combustible character of the organic matter is likely to play an important part. Thirdly, we have the method of chemical precipitation. Of the various methods suggested, that of Whittred comes to the fore as most worthy of investigation, in the present state of our information. The question of precipitation and oxidation of the nitrogen by reposition underlies the commercial value of the proposed methods of utilising our refuse.

It is now desirable to examine how far the Act of Parliament, 35 & 36 Vict., c. 73, entitled An Act to Amend the Law relating to Public Health, corresponds with the Bill brought into the House of Commons by Mr. Stansfeld, Mr. Secretary Bruce, and Mr. Hibbert, of which we gave an abstract in our numbers for the 23rd of March and 6th of April last.

With the exception of clause No. 3, postponing the operation of the Act for three months from the date of the Royal Assent, which is now omitted, the first eighty-one clauses of the Act are very nearly identical with those of the Bill. Certain obligations under which the former proposed to lay the local Government Board, as to obtaining a preliminary report of inspectors, are omitted, and the appointments of medical officers of health and inspectors of nuisances, first made after the passing of the Act, are limited to a period not exceeding five years. With regard to future organisation this provision may prove highly important.

The important clauses with reference to the prevention of nuisances are all omitted from the Act of Parliament. The prohibitions as to putting solid matter into streams; as to turning sewage into drains; the powers given to the sanitary authorities in this respect; the penalties as to smoke nuisances, as to neglect to cleanse, as to obstructing sewers, as to adulterating food; the clauses as to closing foul pumps and wells, and buildings unfit for human habitation; the regulations as to purity of water supply, as to gas supply, as to hospitals; as to analysts; as to false representations in case of infectious diseases; and the power to buy up water-mills; all have disappeared. Thus the Act may be broadly said to effect only one object,—the division, or rather the authorisation of the division, of England into sanitary districts, urban and rural, under local authorities, which are to appoint medical officers of health and other officers; and the further giving to the inspectors of the local Government Board similar powers, with reference to those local Boards, to those which the Poor-law inspectors have under the Acts relating to the Poor-law. A single clause, empowering sanitary authorities to destroy infected bedding, and another, inflicting a penalty not exceeding 50*l.*, for wilful obstruction of the rules of the local Government Board, are all that we find of positive sanitary enactment.

There is no doubt that deep and serious disappointment has been felt by the advocates of sanitary reform at the mutilated form in which a Bill that they considered to err, as it was, on the side of defect, has been passed through Parliament. Professor Fawcett called the measure a most imperfect one, and warned his hearers at the British Association not to be misled by any members of Parliament who would now be "running up and down the country singing the praises of the work done by Parliament." At the same time, we must remember, first, that no notion is entertained that this Act is to be final. Secondly, a project to consolidate the whole of the laws relating to the public health is one of such magnitude that it ought to be the principal, or one of the principal, objects of a session. During the last few months, the time of the House of Commons was so occupied by the long and repeated discussions of a political measure that may possibly affect the distribution of seats, and that in a very unexpected manner, that we could not expect the House of Commons to give a due amount of attention to matters that only affect the public health. If pestilence comes on us unprepared, no doubt it will be deplorable. But still, what is that to the question of maintaining a majority? Dreamers, like

ourselves, may hold that we should study national wants first, and political theories afterwards. But these are poor common-sense views, and by no means attain the dignity of Parliamentary importance. Let us be thankful, then, for what we have got, and only trust that some new enigma may not be started as a Parliamentary hare for the session of 1873.

But beyond this great question of the consolidation of the laws, the very magnitude and importance of which forbid any but the most maturely considered legislation, it is evident, from what we have previously stated, that we are not as yet fully ripe for one of the main enactments which the future welfare of the country will require. That our great rivers are foully polluted, and that a stop must be put to this outrage on common sense and public decency, we do not need a Royal Commission to inform us. So far as that, public opinion may be said to have been already formed. But we object to being made ridiculous by contradictory legislation. We object to have injunctions issued by the Lord Chancellor, obedience to which is rendered impossible by the House of Commons. No sanitary authority, no municipal body, no private individual, ought to be placed in so false a position as that now occupied, not of its own fault, by the town of Birmingham. In a word, while as nuisances as any one can be to prevent, first, the pollution of streams, and, secondly, the loss of crop-feeding material, we cannot admit the propriety of stopping up the end of a sewer without providing a proper mode of dealing with its contents. With certain matters, such as the offensive refuse of manufactories, we think that the law should at once, if necessary, be enlarged so as to deal. We doubt much whether it is not, at this moment, only awaiting appeal to its efficacy. But with the general and immediate arrest of the actual course of all our sewage are not in a position summarily to deal. We may do much—we may prepare for doing all. But we must have the chemistry of the matter made clear before we can impose immediate penalties. We are hard upon the traces of discovery. We can, by one process, purify effluent water. We can, by another, utilise sewage to a certain extent. In a third instance we see rich crops rise out of what was once barren land. But we cannot afford to leave every local board to its own devices. We must throw all the light that science can shed on this vital question. We must avoid the theorist, the speculator, and the airer of hobbies, no less carefully than we avoid the old stager who is for leaving everything alone. The great power now placed at the disposal of the head of the Local Government Board must be guided by adequate science. Full illumination, such as there is now for the first time an opportunity of summarily obtaining must be shed on the point. The time for Commissions of Inquiry must be considered past and gone. Such a patient, exhaustive, able, investigation of the great requirements of the country in the matter of sanitary engineering, as Prussia inaugurated in the matter of military organisation, must be taken in hand. Of such an organised attack on ignorance and on filth we cannot doubt the triumph. The one thing necessary is, that the difficulties be confronted as a whole, and dealt with as a serious matter of business. The natural configuration of the country must be one main element in the consideration. The treatment of the sewage of Norwich, and that of Oldham, or of Keswick, are problems in which nearly every element varies. They are very different cases of a rule, but cases which must yet come under one general rule. The country demands adequate legislation. But, still more imperatively does it demand that clear intelligence of the case by which alone legislation can become otherwise than mischievous. We look, with an anxiety that is shared by nearly all conversant with the subject, for indications of the action of the Government in two particulars. First, how will they give a guiding impulse to the local organisation of sanitary authorities provided for by the recent Act? Secondly, how are they confronting the great question of the general sanitary engineering of the country?—the preservation of its streams?—the restoration of its fisheries?—the water-supply of its population?—and the application, in each physically-defined district, of the best outcome of the present condition of chemical and mechanical science?

The Autumn Military Manœuvres.—A map of the district has been published by Mr. Wylde, of Charing-cross,—very useful just now.

THE NORTHAMPTONSHIRE EXCURSION.

STARTING early from Wellinborough on the fifth day of our wanderings (the 23rd ult.)* we made a delightful beginning of the day with Finedon Church, "the Heckington of Northamptonshire," well known by reputation as one of the noblest churches of Late Decorated style in the country. The tower, with its rich deeply-cut bands of trefoil and quatrefoil decoration, and the beautiful tints of the grey stone and lichens, diversified by bands of red stone, is as pleasant an object as the eye could desire to rest upon in the sunshine of a bright morning. The wide spacing of the arcade, the fine mouldings of the capitals and piers, and the deeply-recessed windows with their escocion arches, combine to give an aspect at once of solidity and spaciousness to the interior. The window tracery is nearly all of that reticulated form common in the period to which the church belongs, but entirely destitute of foliage; a peculiarity, but not one to be imitated or admired. The most remarkable thing in the church, in one sense, is certainly the stone straining arch, if we may call it so, built across the nave between the piers immediately west of the transept bay. The north and south aisles terminate eastward with arches carrying a solid wall above, dividing them from the transepts; but no such arch spans the centre aisle; the natural consequence of course would be the thrusting inward of the nave-piers at this point by the side arches abutting against them. That the original builders of the church should have overlooked so obvious a want of balance in the construction is as discreditable to them as the clever and picturesque manner in which they remedied the mistake is creditable. This is effected by throwing a segmental pointed arch across the nave between the two piers affected, met by an inverted segmental round arch from the wall above each pier; a kind of flying buttress being thus formed across the church, the spandrels filled in with tracery. The mouldings show this feature to be somewhat later than the main building, so that the necessity for such a constructive addition was not at once discovered. The architect who contrived it evidently obtained credit for his work, and was called on to repeat the same thing at Rusden, some five or six miles off. The church has been carefully and conservatively restored by Messrs. Slater & Carpenter. In the west gallery a Renaissance organ-case, of remarkable beauty and elaboration, suggests something out of the common way; and the following little bit of history in relation to this instrument, supplied in the report of Mr. Holdich, who recently repaired it (dated May 10th, of this year), will be of sufficient interest to many of our readers to excuse its insertion:—

"*Finedon Organ.*—This most interesting instrument was built by Christopher Schneider, son-in-law of the celebrated Father Schmidt. It was opened in the church 17th of May, 1717, by Dr. Croft. J. Kent, who wrote many beautiful anthems, was the first organist. Nothing had been done in the shape of modernising, excepting that the 'echo organ' was included in a box with a sliding front, to make an attempt at a swell. This was done, I believe, by the Rev. W. Jones, of Nayland, who wrote the beautiful tune 'St. Stephen's,' or 'Nayland,' so called. He was curate at Finedon."

In 1833 I was bold enough to add two octaves of Bourdon pedal-pipes and German pedals. In this state it has remained until the present time, when, from age and decay, the machinery would work no longer. I have now entirely rebuilt it, but used all the pipes I could, and retained the handsome case and curiously-dispersed pipes. I should doubt whether there is another organ in the kingdom that can show such an original exterior."

It would be wrong to leave Finedon without a word as to the effect exercised on the picturesque character of the neighbourhood by the good taste and liberal expenditure of Mr. Dolben, whose grounds, with their beautiful lime-tree avenue ("the cathedral of Finedon"), adjoin the churchyard. Some of the cottages and ledges erected by him in the district do equal credit to the owner's intentions and to the way in which they have been carried out by his architect, Mr. Law.

Our next church, Dillingborough, should be better known than it is, for its fine and almost unique tower, with solid square substructure and octagon upper story; quite unique in the manner in which it has been shored up by masses of masonry on the east side, to provide probably against the result of some failure of the foundations, that great hugarbear of the Middle Age builders. Architecturally excrescences, these buttresses yet add materially to the wily picturesque expression of this singular tower,

* See p. 689, ante.

standing quite apart to the westward of the church, which later in itself is nothing remarkable. Higham Ferrers, with its grand Early Decorated tower and spire, is too well known through illustration to call for much comment here; except a word as to the effect which the small flying buttresses at the base of the spire have exercised on the angle pinnacles, which are visibly pushed out of perpendicular. It is as well that young students of Gothic should recognise that Medieval architects really did make mistakes sometimes; and that features essentially constructive, when used where construction does not call for them, will sometimes revenge themselves on the architect for his mistake. The interior, with its fine double nave, has been restored and re-seated recently; the natural polychromy before referred to, obtained by bands of limestone and ironstone, has been largely used in this interior, but irregularly. The brasses in the chancel are of unusual size and elaboration, and in excellent preservation. It was in this church that, at one period, a perpetual service was kept up, day and night, by the zeal and devotion of the Ferrers family. Allusion to this is made, if we mistake not, both by George Herbert and De Quincy, in their respective fashions. Rushden, hardly a mile from Higham, is very similar in the general character of its tower and spire, though far less rich. The ironstone is largely used here in bands, and as quoins to the buttresses, in contrast with limestone. The effect of colour here is remarkable, for while the ironstone has retained its strong deep red on the west side, the returns to south and north, the former especially, are coated with a greyish vegetation, while the limestone has been weathered to a greenish tint. The effect is very rich and unusual, and would furnish good employment for the artist's brush. The font in the church should be noticed for some singularly bold and broadly-treated leafage ornament of the Transitional period, almost "classical" in its symmetrical arrangement. Our next church, Irchester, is also noticeable chiefly, if not entirely, for its tower and spire of Decorated date, singularly happy in proportion; and here we find the most deliberate and regular use of polychromy we have yet chanced upon, in the masonry of the tower, composed entirely of bands of red and grey stone of equal width. As harmonised by weather, the effect is very good, but must have been very "streaky" when new. The spire branches are remarkably low and equal in proportion; but the effect (the whole being on a small scale) is by no means bad. The Saxon tower at Bart's Barton, which we next inspect, is well known, occupying such an exposed site as it does, on high ground, one is surprised to find it, at this date, still in such fair preservation. The church is small, and not of special interest. A drive of seven miles brings us to Northampton, to find comfortable quarters and super-excellent fare at the "George," another of the houses which bring their traditions from the "good old" coaching days.

Every visitor to Northampton who knows what he is about will go, in the first place, to St. Peter's Church: it was matter of course, therefore, that we all went there first. This really is a Norman basilica in all but the apse. The eastern end is square, nor is any trace of an apse known to have existed. Apart from this, however, the long, low proportions of the church, the varied and highly-enriched capitals, some of them quite unique, others with a strange touch of Byzantine character about them, convey an impression curiously at variance with our ordinary associations in regard to English architecture. Externally, the long range of small round-arched windows forming the clearstory furnish another characteristic feature. There should be some history connected with the tower arch at the west end of the nave; from the adjustment, or want of adjustment, of the arch-moulds to the caps of the jamb-shafts, it would certainly appear as if the arch had not been always in its present position, or had been rebuilt. The next point of interest (forming the first rendezvous on our Saturday morning's round), is the Templar church of St. Sepulchre, grand in its internal perspective of octagon arcade and heavy pointed arches. The eastern portion, by Sir G. Scott, is a modification of the more florid Early English manner, with, perhaps, rather too much use of the band-work of red and grey stone suggested by the old churches of the district. A passing glance at St. John's Hospital, where there are some good bits of late Decorated work, affords opportunity

for some remarks from Mr. Sharpe relative to the employment of stained glass in light diapered patterns, with plenty of white, rather than in masses of strong colour. The east window of the chapel, however, is rather too fragmentary, in its re-arrangement of old bits of glass, to stand as the basis of a theory, however intrinsically correct. Then we drive out some five or six miles to eastward of the town, to Cogenhoe, noticing in our way through the suburbs a very good class of suburban houses, not without architectural merit, though, in the main, with considerable sameness of manner. As to Cogenhoe Church, there is not very much in it, excepting a very nice bit of Early English work on the south side of the chancel, where lancet windows are coupled under escutcheon arches, the shafts of which are carried down to the floor, past the sill of the actual window. Externally the best thing here is the beautiful wooded landscape seen from the platform on rising ground, which is occupied by the church and parsonage; and the old-fashioned looking parsonage-house, with its trim, well-kept garden. Whiston Church, a mile or two farther on, also most pleasantly situated in a high churchyard amid a circle of tall, dark trees, has a more architectural interest. The tower is one of those fine specimens (of which All Saints', Aldwinckle, is another example) built at the early part of the Perpendicular Period, when something of the feeling of the previous style still survived in the details, and before richness of elaboration had degenerated into weakness and wretchedness. And here there is the most picturesque and artistic use of the stone polychromy of the district which we have had occasion to notice. Instead of the red and grey stone (here a most delicate grey) being arranged in continual bands of mechanical regularity, we find them here in bands in the lower stage (giving somewhat the same effect as rustication); then an unbroken mass of grey for the next stage; then a broad band, 6 ft. or 8 ft. deep, of the red ironstone, below the heltry stage; then the banded arrangement recurring on the heltry stage, and a band of red, two or three courses deep above it; after which the tower is finished in the grey stone. The effect of this is most pleasing, and the angle pinnacles of the tower, with crocketed heads and gables, are treated with a peculiar breadth and richness which we have rarely seen equalled; and the whole appearance of this upper portion of Whiston town, the lighted portions shining with almost a white glare under the bright sun, and contrasted with the dark foliage adjoining, formed a bit of effect to be remembered for long after. Internally the church is an admirable specimen of the period, with very narrow piers, and a wide arcade, with traceted spandrels, and a low timber roof (which has probably been more or less renewed), most elaborately carved on the sides and soffits of the principals, and along the cornice. The arrangement of seats in this church affords a good hint for cases where a church has been provided, from any cause, too large for its congregation. Instead of crowding the whole area with seats half of which are not wanted, the seats have been arranged in small square blocks between the piers in each bay, leaving a wide aisle in the centre and an unusual amount of unobstructed floor space. The effect is exceedingly pleasing, and gives a spacious look to the church which it would not otherwise possess. A short and very pleasant drive brings us to Castle Ashby, the church of which is known as possessing a Norman doorway of excellent character and in good preservation; in other respects there is little or nothing of ancient interest left in the church, the interior of which is almost entirely modern work, by Mr. Street,—but not, we should probably conclude, very recent. A monument by Tenerani (Rome) is to the memory of the second Marquis of Northampton, which stands at the west end of the church, is known beyond the locality: it consists of a sitting figure, more than life size, of the angel of the Resurrection, waiting with upturned face for the signal to sound the trumpet which he holds. This has been immensely praised, and there is a great deal of beauty in the reverential countenance of the angel, but a certain want of power even here; and we submit that the introduction of the trumpet, a sculptured trumpet of ordinary aspect, is a dire mistake, at once giving a littleness, a trumpet (no pun intended) character, quite inconsistent with the grandeur of the idea intended to be conveyed. "The last trumpet" is, partly through association, an expression highly suggestive when vaguely used

as poetic imagery; but to translate it into realism in sculpture is as inconsistent with the feeling of the subject as is Handel's "Trumpet Solo" before the air in the "Messiah." A bas-relief monument by the same sculptor, in the north chancel aisle, is a very elegant composition, reminding one a little of Flaxman in feeling, and a monument to the Hon. Mrs. Leveson-Gower, in the wall of the north aisle, deserves notice. The portrait sculpture of the lady represents her in the last sleep on a flower-strewn couch, in a deep niche in the wall. At the back of this is a very low bas-relief of an angel, apparently flying past, and in the act of throwing a pall over the prostrate figure. There is a tenderness of feeling and refinement of execution in this figure such as have not always been associated with the works of Marochetti, by whom the figures were executed. The architectural details are by Mr. Gillott, a former pupil, we believe, of Sir G. Scott, but they are rather wanting in refinement. It was a pleasure, under such a bright sun as we had, to look at the Italian mansion adjoining, sparkling with its white stone and niches and statues, and well-known halustrade over the cornice, consisting of a Latin inscription (the big letters forming the balustrade), and at the terraced garden below with similar halustrades, and gorgeous groups of flowers laid out in the kaleidoscope patterns, which the modern gardener produces for the enjoyment of those

"Who in trim gardens take their pleasure."

And so we drive away down the long avenue, and back to Northampton to our final dinner, and to leave-taking speeches, and congratulations on the glorious weather we had enjoyed all the week; and the health of our accomplished and amiable conductor; and of our reverend friend who had accompanied us on every expedition hitherto; and of our Irish professional brethren, four of whom had crossed the Channel to join us (more power to them!); and of the veteran architect of Northampton (whose name we have had occasion to mention more than once), and who gave some opportune advice to the students to sketch detail carefully, and not to be one-sided, but study Classic equally with Gothic. Our attention to Northampton itself, exclusively of the old churches, was necessarily somewhat meagre; but the town-hall received due attention from a good many of the party. All Saints' Church, a great Renaissance church, Greek cross on plan (weakly attributed by the townsfolk to Wren), is a fine specimen of a really congregational plan, and might be a very fine interior if all the detail were very different from what it is. The grand organ here, with its four key-boards and magnificent body of tone, is one of the finest and largest church organs in the kingdom.

In concluding our notes of a very pleasant architectural tour, it ought to be explicitly said that, on the part of a good many of the party at least, this was no mere tour of inspection. Though much was necessarily hurried into a short space of time, a great deal of material was collected which may be more or less available for illustration of buildings or details not already published. Several of the younger members of the Association in particular arranged to obtain the measured details of the principal (nave) arcade in each church visited; and in this manner the materials were collected for accurately drawing out specimens of the arcades, including of course sections of moldings, &c., of no less than thirty-nine churches. This must be admitted to be a good week's work, and highly creditable to the character for industry and application of the members of the Architectural Association.

NOMENCLATURE OF GOTHIC ARCHITECTURE.

AFTER dinner on the first day of the Northamptonshire Excursion, Mr. Edmund Sharpe made an address to those present. We have already referred to it in our general notice of the proceedings (p. 660, ante), but may usefully print a portion of it *verbatim*—

It is obvious, said Mr. Sharpe, that along with finer perceptions as to characteristic treatment of different phases of Medieval art,—differences already referred to, which require only to be pointed out to be at once recognised and appreciated, and the knowledge and detection of which increases immensely the interest we take in its study,—it is clear that along with advanced knowledge of the true history of this admirable progress comes also the necessity for a minutest classifica-

tion of its different periods, and of fitting terms by which to distinguish them. And here, in fact, we touch on the greater difficulty that the architectural student has to contend with. Not only are the terms which we have employed for the description of our buildings, so long as we classed them by centuries, inadequate for our present purpose now that we have learned to divide them almost by decades; but there is at this moment the greatest want of unanimity, on the part of those who write and speak on this subject, in the terms that they employ; nor do they indeed always employ the same term when speaking of the same thing. I will give you two remarkable instances of this want of definiteness on two recent and prominent occasions.

On the recent visit of the members of the Architectural Conference to Westminster Abbey, Sir Gilbert Scott was good enough to give them a description of the building, and in the course of his description he made use of the following terms as applied to different portions of the works of the Abbey. After having noticed the Anglo-Saxon and Norman remains, he spoke of those belonging to the great Transition from Norman to Early English, or rather, he added, from Romanesque to Early Pointed. He next spoke of the transition from Early Pointed to Middle Pointed; but corrected himself further on by calling the latter the "pure Late Decorated style." He speaks also of "Henry III.'s style," and of the "transition from the Middle Pointed to the Perpendicular," and lastly of the "Tudor style," and of that development of it which he recognises as the "Pan-groining" style.

Now, if the "imaginary individual" to whom Sir Gilbert Scott professed to address himself on this occasion, and whom he supposed to be somewhat ignorant of the subject, were really present during the delivery of this address,—what remote notion could be possibly form of the nature of the architecture of Westminster Abbey from the terms in which it was thus described? And would not the ten or twelve terms which the learned Professor employed for this purpose be likely to confound and deter him from further approaching a study, the very threshold of which is encumbered with technical difficulties of so formidable a kind?

On the other hand, we have the president of the Northern Architectural Societies urging that the styles of Gothic architecture should be named "from the centuries, or, better still, from the king's reigns, because they possess many characteristics not covered by the old definitions."

Now, what the death of one king, or the coronation of another, can possibly have to do with the progress of architecture, it is difficult to conceive, nor yet why it should be perceptibly changed at the close of each century. Nevertheless, we find Mr. J. H. Parker realising this idea at the recent meeting of the Archaeological Institute at Southampton, by describing the Gothic remains of the neighbourhood as twelfth, thirteenth, fourteenth, or fifteenth century work, varying his descriptions by designating some of it as Edwardian, and as work of the Periods of Henry II., Henry III., Henry VII., &c.

Were this system to be adopted, we should have no less than fifteen periods, corresponding with so many kings, between the eleventh and sixteenth centuries.

The indefiniteness of the first of these terms,—twelfth-century work,—is obvious when we remember that that period covered the whole of the Norman work of Peterborough Cathedral, which was commenced 1117; the whole of the numerous and remarkable works of the Transitional Period; and the choir and eastern transcripts of Lincoln Cathedral, its lancet windows and clustered columns. What possible idea could this term then convey to Mr. Parker's hearers at Southampton? To me it seems infinitely more practical and sensible to accept the six great classes into which our national architecture, from the Conquest to the Reformation, naturally divides itself, and which every one in his descriptions has now more or less begun to recognise and to fix, by common and unanimous consent, on the terms by which we shall distinguish them.

This we have, I think, a right to demand. As regards the selection of these terms, I am, for my own part, quite indifferent. I have, as you know, proposed terms to apply to these six periods, but I have also, as you know, more than once offered to throw them over if better ones can be found, or others to which more universal assent can be obtained. Till these be offered, I

shall retain my own as answering the purpose sufficiently well. It is certainly preferable if possible to retain old terms than to adopt new ones; but there are objections to two of the terms already in use, as applied to the new division, which have always appeared to me insuperable.

It was in the middle of the twelfth century that the influence which Norman art had exercised for ninety years over architectural design in this country began to decline. The next half-century was signalised by that remarkable contest between two rival systems, the circular and the pointed, which ended, at the close of the twelfth century, in the supremacy of the pointed arch in all parts of the building. During the forty-five years of this great Transitional Period, more churches were erected in England than at any subsequent period within the same lapse of time; they show great fertility of invention, great vigour and nobility of design, and, in certain parts, great richness of ornamentation. That they were built by native artists there cannot be a doubt, for in the treatment of their details they are, with a single exception (the choir of Canterbury Cathedral), totally unlike the contemporaneous work of other countries, especially that of Normandy.

I claim, then, for the architecture of this period, the importance and originality of which is not even yet sufficiently recognised, the credit,—first, of its being the earliest English architecture, subsequent to that of the Saxons that we have; and, secondly, of its being the first Pointed architecture that this country ever saw: for the arches of constructions as a measure of utility, and subsequently used into the arches of decoration, prevailed throughout its entire duration. To call any other than this period, either Early English or First Pointed, is then impossible. And to limit the application of these terms to this Early Pointed period, after their long use in another sense, appears to be equally so.

What is absolutely certain is, that we cannot go on as we are at present, with four systems of nomenclature used by different writers, and two or three used indifferently, as we have seen, by the same writer. How soon we shall arrive at the unanimity in this respect that is so desirable, is difficult to say; meanwhile our course is a simple and an easy one.

You have already recognised the advantages which an intelligible classification, most simple and definite terminology, bring to the student; and the rapid and suggestive manner in which their use enables you to seize upon, and retain the characteristic features of a building, to be utilised hereafter in the same way that the old masters themselves used them; for, rely upon it, they were students in the same way that we are ourselves.

To learn the grammar of their art was as essential to them as it is to us; and there is no reason why you, if you become as thoroughly imbued with the spirit and feeling of the style in which you design as they were, should not be as independent and as original.

It is true that there are some to whom originality is impossible: such men are condemned to copy; they have simply mistaken their calling. They belong to the residuum of which Sir Gilbert Scott speaks in the otherwise excellent address to which I have already referred, and from which I will read an extract, that I venture to think is not inapplicable to the objects of our present meeting, and to those who have attended it and others in this and former years. It embodies, at all events, the sentiments which led to the establishment of these annual excursions:—

"One valuable means of perfecting our knowledge of architecture, is by measuring, sketching, and studying over and over again such buildings as those we have now around us, till we have mastered their principles, and have thoroughly imbedded our minds with the character of their details. If we do this with anything like system we shall do. We ought, at least, to attempt it. Some of us have done so with more or less success. Unhappily we cannot afford to be so polite as to shut our eyes to those who are a residuum of architects who pay no attention whatever to the cultivation of their artistic powers: who are architects only in name, and whose works are a disgrace to the architectural works of the nation."

"There is an admirable race of young architects coming up—men not much known, and very little patronised by the public, but men who are following up, heart and soul, the work which their predecessors have attempted—the revival of Gothic architecture in this country; and whether we are to go on to the natural end of our term, or whether we are to be sacrificed at the behest of newspapers and reviews, I hope it will be to the school of rising architects I have mentioned that our works will be committed, for then we shall have hope for the future."

DRAWING.

To be able to draw lines correctly on paper is as necessary as to be able to write, for all persons engaged in constructive works, and is an excellent idea of the publishers to put into the hands of workmen something from which they may learn what they ought to have learnt at school, but "Drawing for Bricklayers" * will not do that. It is an absurd hook, and the disappointment of the bricklayer who may have bought it, with the hope that from it he might learn to draw, may be imagined. A great portion of the hook has no reference at all to drawing, and the instructions conveyed are of the most meagre description. The other part consists of extracts from Peter Nicholson and from General Pasley, and of some original remarks, such as that "In England, the bricks, when burned, are rather less than 9 in. long, 4½ in. broad, and 2½ in. thick." The London stocks are of about that length and width, but thicker, while the red Suffolk and the Midland Counties bricks are both wider and much thicker. There could be no objection to the size of bricks or anything else being stated correctly, but why go out of one's way to convey wrong information? "The white Suffolk may be called a London brick, whilst the red clay in Cheshire yields the red bricks used to so great an extent in that district." But the colour of the clay has nothing to do with the colour of the brick when burnt, which depends upon the chemical properties of the clay, and not upon its colour. A very yellow clay will make a red brick when burnt. The various kinds of bricks are pretended to be mentioned, amongst which are "concave bricks made flat on one side, like an ordinary brick, and hollowed on the other, used for drains and water-courses." † while the ordinary culvert bricks which are used for drains are not mentioned at all; neither are the Staffordshire blue bricks. Lintels, it is said, have a hearing of 1 ft. or 18 in. at each end, and a drawing of a door or window-head is given, in which the lintel is shown as resting on pieces of wood 6 in. square placed across the wall.

The author gives a curious illustration of how our money was spent in laying a barrel-drain at the Ordnance Barracks at Chatham. "The bricks were ordered to be cut and ganged," so that the ordinary radiating or culvert bricks seem to have been as unknown to the Royal Engineers, as to the author of this book.

It would have been, one would have thought, an appropriate instruction in drawing for bricklayers to have given some examples of the arrangement of house walls, both of small and large houses. The only examples of this useful kind of work given in this hook is that of one villa, and in this the water-closet is placed as uncouth as can be in the centre of the building.

"Drawing for Cabinet-makers" ‡ is better, but it has one fault in common with the book more mentioned. They form two of a series, and the reader is frequently referred to some other hook of the series for the information necessary to complete the understanding of the subject. This may be very ingenious, but it is unjust to those persons to whom the books are specially addressed. The position taken is one that ought to be worthily filled, and if no better information can be given than is to be found here it were better to say nothing. If criticism is to be worth more than the paper on which it is written we must not hesitate to condemn such books as these.

"The Art of Drawing what One Sees" †† shows the rationale of perspective drawing. Here there is no writing for the sake of making a book, but every line tells its own story intelligently, building up the structure of the book line upon line without confusion of ideas, and genuinely putting before the reader what the author's views of the principles upon which perspective drawing depends, and reducing it to a science. Artists, or higgling their pardon, pseudo-artists, think they have nothing to do with science. In perspective drawing, however, they must proceed on scientific principles, and they will find them plainly stated in this book.

The manner in which the eye conveys to us the impression of the existence and relative positions of objects, the rays from which we receive into the eye, is wonderful. If studied

‡ The Art of Drawing what One Sees. By Lieut. W. H. Collins, R.E., F.R.A.S. Longman, Green, & Co. 1872.

more closely it is astounding. Bacon said that Nature reveals but little of her charms to the stranger, and reserves the greater part for those who come again; and whether we shall ever understand her is a mystery, but she makes no mystery of herself to those who will seek to know her with diligence and humility. The want we find we have is that of intelligence to understand what we do see. That very important part of the actions of Nature which enables us to see and appreciate the relative positions of objects and to represent them on paper is well set forth in this book.

A perspective picture of an object, says the author, is an enlargement of the picture thrown on the back of the eye through the pupil, and interpreted by the brain. The perception of the object or interpretation of the little picture within the eye is *sight*; and the image itself, or an enlargement of it, is the perspective view (from *perspicio*, I look at).

"It is thought by a beginner that correct drawing is the result only of a correct eye, and that, like the poet's art, the peculiar faculty must be born with one, and cannot be acquired; but it is astonishing how soon the novice is capable of bringing rigid rule to bear upon the production of his own drawing, and upon the criticism of his master's. Master and he have then become pupils of Nature."

MANUFACTURE OF STAINED GLASS.

DURING a recent course of Cantor Lectures at the Society of Arts, Professor Barff treated of the manufacture of stained glass. The lecturer said, coloured glass is made in the same way as ordinary glass, except that certain substances are added to colour it. It is often said that the mystery of stained-glass painting is lost,—that the art which was once known to our forefathers in the Middle Ages has been lost. But this is altogether a mistake; there is nothing which they did which we cannot do. It is true that, after the decay of Medieval art, up to about thirty years ago, the stained glass that was made was anything but like that which it was intended to imitate, viz., the glass which adorns the ancient cathedrals of this and other lands. You will understand this if you look at some windows in the Temple Church, which are extremely good for the time at which they were made. They were a decided advance in the right direction upon what had preceded them. I shall have to allude to them again, as well as to other windows, in the next lecture, when I speak of the styles of glass-painting. I cannot help referring to them now, for this reason. A gentleman, named Whinston, a barrister, was much interested in this subject of glass-painting, and studied it very carefully. He saw that there was something wrong in the treatment that was being adopted, and he desired to ascertain how it was that the old windows, which had been made so many years, were so different from these modern imitations of them. He, in conjunction with Messrs. Powell, of Whitefriars, to whom we owe entirely this revival of the ancient mode of making glass, set to work, and analysed the old glass, to see with what metallic oxides they were coloured, &c. They also examined carefully the method in which they imagined the old glass was made. Mr. Whinston examined old treatises on the subject. He read carefully a book by a writer of the Middle Ages, and a translation is given in the appendix to a work which he published. It is interesting to see how very similar the older methods were to those employed at the present time; yet there were differences. I will not go through a description of the various stages of their work; however, we owe them both a heavy debt of gratitude. Others may have taken up the same subject, and doubtless have; but they were first in the field, and the enterprise and intelligence which Messrs. Powell displayed in this matter are beyond all praise. They have furnished us with specimens of their coloured glass, and by means of these I hope to be able to illustrate to you the method of manufacturing glass suitable for church windows and decorative purposes of all kinds, and contrast it with that which is used for domestic purposes, and show you how it was that gradually stained-glass painting began to decline from about the end of the sixteenth century. If you look at this cylinder, which is a beautiful specimen of glass, sent by Messrs. Chance of Birmingham, you will see that it is most perfect in its manufacture, and all their glass in domestic uses is of this character, most carefully and beautifully

made. But it is because the glass which those who revived glass-painting employed was so perfect in its manufacture, and so fine in substance, that much of the effect of the ancient glass-painting was wanting in their works. Various means were employed by architects and others to remedy these defects by covering the glass in places with opaque enamel, so as to give it an antique appearance, and also to give it lustrous effects which they saw glistening forth in the windows of the old artists. The effect of this was to cause darkness, and to destroy utterly that brilliancy which they hoped to attain.

Now, here is a cylinder of glass which is made for church windows. I dare say that even at this distance you can see that it is very imperfect on its surface, and irregular in its substance. The cylinder is not particularly true in its form, it is not even in its thickness, and the glass has not been refined with the same care as that which I showed you just now. It is full of air-bubbles and streaks; and if you look at a person through it, his features will be distorted in all kinds of directions. In fact, you cannot see at all distinctly through it. Now this very defect in the manufacture of glass for stained windows is its beauty. If you allow the light to pass through a sheet of glass, like this fine specimen, it passes through it uninterruptedly; but if you allow it to pass through this coarser glass, it is refracted, and this gives it its beauty and brilliancy.

There, again, is another sheet of glass which will illustrate it better; it is full of striae and air-bubbles. It is interesting to watch the course which the change in the manufacture of glass has taken in the last thirty years. All sorts of what one may call tricks have been resorted to to produce the effect of old and partly disintegrated glass. It was found, on examining the old glass, that it was full of little spots, or minute holes. I think I told you the reason of this in a former lecture, that it is because the glass is not perfectly homogeneous; some silicate, more alkaline than the rest which composes it, has dissolved out, which, you will remember, it does readily when water acts upon it slowly, and there is no doubt whatever that to this disintegration of a great portion of the old glass its pearly lustre and extreme beauty are owing. These irregularities in thickness all refract light, and cause it to stream through the glass as through a number of prisms, and thus we get a more lustrous and beautiful effect than we do when light is allowed to pass through a perfectly homogeneous medium.

Here is a specimen of patent-rolled plate glass, which I allude to because I think it right to give all the credit to those who, by scientific means, have done anything to improve or advance this beautiful manufacture. This was invented by Mr. Hartley, of Sunderland, a glass-maker of great intelligence, who found out a very simple thing, that he could ladle out from a pot of glass a desired quantity, and throw it upon a table, and roll it. These marks which you see are from engraved lines in the iron table upon which it is rolled. This glass is very lustrous, and is often used in the manufacture of stained-glass windows. Mr. Hartley has also done much in the improvement of coloured glass. I will now describe how glass is coloured. Here is a piece of blue glass. It is what is termed pot metal; that is to say, the blue colour passes all through the substance of the glass. It is made blue in the pot. Here, again, is a piece of ruby glass, and in it you will see striae and irregularities in its colour which make it so valuable to the artist. This glass is not coloured throughout its substance, but is simply coated on the surface. There are certain other glasses which can be coated; for instance, blue glass can be coated, because oxide of cobalt when used in quantity imparts a very deep blue colour to the glass, so that you can have a thin film of it covering white glass, and producing a deep blue colour. Again, greens and purples also can be coated, and they are all of them, I believe, to be obtained coated either in this country or from abroad. But ruby is always a coated glass. If you look at this specimen, you will see that it is perfectly opaque. It does not look like glass, but like a piece of red sealing-wax; it is coloured with the sub-oxide of copper. When the workman is making a disc or cylinder of ruby glass, he gathers upon the end of his blow-pipe, first, a piece of ruby glass, which is like this opaque glass, and then on the outside he gathers a quantity of white glass. He knows how to take the two glasses in proper proportions, so as to have a proper thickness of white and of ruby. He

then blows and gets a globe, or cylinder, which is composed of white glass covered with a very thin film of ruby glass; and it is only when this ruby glass is seen spread out thin that you are able to see its ruby colour.

Here, again, is the material used in making another kind of ruby glass, which is very beautiful. This is ruby made with oxide of gold. Here, you see, is a mass of red glass, not particularly brilliant in colour, which is made in the glass-pot, and great care is required in its manufacture; for if it is heated too much the oxide of gold is destroyed, and is reduced to a regilded state, and metallic gold does not colour glass. A piece of this glass is attached to a blow-pipe, just in the same way as the other, and is coated in the same way with plain glass. I hope to have a small piece of this gold ruby here next week, that you may see its beautiful colour. I will proceed now to the subject of stained glass or glass-painting, and leave to my next lecture the colouring of glass in the mass, because next week we shall be able to make some coloured glass in small quantities; and, having the electric light, I shall be better able to show how the white glass is coloured than than I can do now. I could not commence the description of the method of staining or painting glass without first mentioning the way in which glass is coloured, because you will see, when we come to treat of the manufacture of stained glass windows, that there is, properly speaking, no staining whatever except in one instance; it is simply painting. It is called stained glass, but this is an incorrect name for it. This piece of glass is not stained: it is coated with coloured glass.

I have here a piece of yellow glass. It is stained with oxide of silver, and this is really the only stained glass which is used in windows. Other glasses are either coloured throughout their substance, or are coated. I shall this evening illustrate the method of staining yellow glass. This little furnace, which you see here, will be used for the purpose. I shall, I hope, be able to show you also a method by which a ruby stain can be obtained. Silver stain varies from a light straw-colour to a deep orange; but a ruby stain is, as its name implies, a true red. Here is a piece of glass which was coloured with a ruby-stain in this muffle, but as the heat was allowed to become too great, there has been a little metal reduced here, which spoils the colour in parts. It is very instructive to examine this, because it shows the importance of attending to temperature in all these operations. In making a stained window, the first thing to be done is to make the design. Here are some sketches of various designs for windows; these, as well as everything pertaining to stained-glass manufacture, have been lent us by Messrs. Lavers, Barrand, & Westlake, of Endell-street, artists who hold a very high position as glass-painters: it is, therefore, quite unnecessary for me to make any comments on the merit of their works. The first thing to be done is to make the design. After that the working drawings, or large cartoons, are drawn by the artist. You see here a series of them, which have been used in the manufacture of a stained-glass window, and here is the window which was executed from them.

The various black lines which you see are lead lines. When a cartoon is finished, tracings are taken from it, and thus you see how easy it would be for any one who has a talent for drawing to make first a small sketch, and afterwards to make the large cartoon. As to the taste required and the style to be adopted, I will not say anything, as I am now simply speaking of manipulation. There is nothing easier than for a person who can draw to enlarge the drawing afterwards. A tracing is made of the whole and of different parts of the windows, and it is from these tracings that the glass used in the window is cut. One tracing will serve both for cutting the pieces of glass required to make up the window and also for performing the operation of leading, of which you see a sample here. Here are the pieces of glass which were laid upon this tracing. It is very easy, when they are cut, for the workmen to lay them down in their places and join them together by means of these pieces of lead, in the way which I will presently show you. I now come to the most interesting and important of all the operations after the cartoon is drawn,—that is, the painting of the glass. Certain substances are used for the purpose of painting on glass. Here you see certain dark lines, indicating the shape of the design. If it were a rosette or a face, it would be outlined in

just the same manner. Mr. Yeoman, an artist from Messrs. Lavers, will illustrate the work before you. He will take a piece of glass, which he has got ready for the purpose, and will show you how the manipulation is performed. He will put upon it a colour, the composition of which I will describe, and afterwards I will put it into this muffle, and fire it before you. The material with which Mr. Yeoman is going to paint is opaque. It is quite clear that if much of that material were used, the transparency of the glass, the property for which we most prize it, would be destroyed. Therefore, an artist who knows his work is as sparing as he can be in the use of this material, provided he can produce the effect which is desired. The material is made of various oxides of iron which are infusible, which do not enter into chemical combination to any appreciable extent with the fluxes employed, but which are simply held in suspension by them, and which are fixed on the glass when the fluxes are fused. There are different ways of making fluxes, and in my supplemental lecture I shall have an opportunity of showing you new methods of making them, by which they can be easily produced, and rendered very fusible; and where the flux is required to be coloured so as to be transparent, it can be so composed as to insure this effect at the temperature which is at our command. The bases of most fluxes are borax and oxide of lead. Borax is a substance which renders the glass fusible, and so also is red oxide of lead. Many prefer to use the lead and the borax in chemical combination, and for this purpose they precipitate a solution of common borax by a solution of lead nitrate, and they then get a lead borate, which makes an exceedingly good flux; but there is always a drawback to the use of borax as a flux for painting stained-glass windows. I do not know whether you have ever noticed it, but if you look, you may notice on the outside of many modern church-windows a white milky appearance upon the dark brown colour with which the glass is painted. If the glass, by any accident, gets placed the wrong side outwards, and that sometimes does happen, when it is painted on the wrong side—the painted portion is exposed to the action of the weather; this and the moisture in the air cause the borax to dissolve slowly, so that the flux which fixes the colour upon the glass is to a great extent destroyed. I have seen many works of really distinguished artists in which some of the lines and shading of the faces have disappeared altogether, owing, no doubt, to the fluxes being made soft with too much borax.

WORCESTER GUILDHALL COMPETITION.

The town council met last week to receive the report of the Survey Committee, recommending as we have already mentioned,—

"That the set of plans for the re-building, sent in by the architect under the motto, 'Bakalum,' be awarded the first premium of 100*l.*, on the distinct understanding that the architect guarantee that the proposed building, exclusive of the tower, and of sculpture and enrichments shown in the exterior perspective, which, as the elevations show, are not necessary to the design, can be carried out for the estimate sent in; otherwise the premium to be withheld." "That the set of plans sent in by the architect under the motto, 'Fiat Justitia,' be awarded the second premium of 50*l.*, on the same conditions." It was resolved unanimously,— "That, there being only two sets of designs for the re-construction, and this committee having previously reported that 'Convenience' had not complied with the conditions, they therefore presume that the premium must be awarded to the architect signed 'Vincit Veritas.'"

Mr. T. R. Hill said the council should not commit themselves to the award of the premiums until they were satisfied that the requirements of the advertisement had been complied with in respect to time. He would ask the town clerk whether they would be acting strictly according to law in making the award until it had been ascertained that those terms had been complied with.

The Town Clerk said, I know as a fact that 'Bakalum' was amongst the first six. I cannot answer the question as to one of the others.

Mr. Airey was glad to hear that this design was one of the six delivered within the time stated in the advertisement, having been strongly of opinion that the council had committed a mistake in admitting the three received late to competition, and especially so after hearing the very decided opinion of the editor of the *Builder*. He hoped the second was also one of the six; and that care would be taken that they had a *bona fide* guarantee as to the cost.

The recommendations of the committee were

ultimately adopted. The letters giving the names of the authors of the plans were then opened, and it was found that the three designs were sent in as follows:—

Bakalum.—Mr. C. G. Wray, 44, Cannon-street, London.

Fiat Justitia.—Mr. E. C. Robins and Mr. G. F. Roper, 16, Southampton-street, Strand.

Vincit Veritas.—Mr. E. A. Day, Worcester.

SLAG AS A BUILDING MATERIAL.

EVERY visitor to the neighbourhood of iron-works is struck with the enormous accumulations of unavalaible product, and is almost sure to inquire, "Can nothing be done with it?" Numerous plans of utilising it have been proposed, many in our own pages, but still there lie the mountains of slag added to by every month's work. At the American Institution of Mining Engineers a paper on the subject was lately read by Mr. S. Egleston, a portion of which we reproduce.

The necessity of having building stone in certain countries of Europe, where it is very scarce, led to a long series of experiments, which, after a multitude of failures, resulted in the manufacture of a very useful product for certain kinds of constructions. These experiments began at a charcoal blast-furnace, the slag from which was taken out of the fore-hearth with a ladle compressed into a mould, and cooled slowly. In order to keep the slag in the hearth from becoming cool, it was covered over with charcoal. A small quantity of the powder of the charcoal became mixed with the slag, and effected a partial devitrification in the moulds. The attempt to apply this exceedingly simple process to a coke furnace failed entirely. The bricks became too porous from the evolution of gases resulting from the admixture of coal-dust. Sand and coke-dust were then substituted, but as the bricks were still fragile they are now annealed in furnaces. This process is applied in Konigsbatte, in Silesia, to the manufacture of building material, of which some of the important constructions of the works are built. The slag is run from the furnace into a hemispherical basin on wheels. The bottom of this basin is covered with sand or fine coke-dust, to the depth of about three centimetres. The wagon is then drawn to the point where the bricks are to be made. The slag and sand are mixed together with a curved iron tool until most of the gases have escaped, and the mass is about the consistency of dough. It is then drawn with the same tool into a mould with a hinged cover, and punctured several times to let out the gas. The cover, which fits into the mould, is then turned down, and the slag compressed. By the time three or four moulds have been filled, the first slag brick is sufficiently solid to be removed. This is done by raising a clamp, which allows the mould to separate. The red-hot brick is now drawn into a kiln, covered over with powdered coal, and left to anneal. Each kiln contains 1,000 bricks, and is from three to four days in cooling. Four men can make 600 of these bricks in five hours. The loss in the manufacture from the breakage is about 20 per cent. The cost of annealing is about two shillings per 1,000. These bricks are rough on their surfaces, but, on account of their larger size, do not require more mortar than ordinary bricks. They do not readily absorb moisture, and for that reason are extensively used in the construction of foundations. The pillars supporting the main wind-pipes at Konigsbatte are built of this material. In Silesia these bricks cost 25 per cent. less than ordinary brick.

A brick much inferior to this in every respect is made in the Hartz mountains out of the lead furnace slags, which are silicates of iron. These are moulded and compressed, and are used for buildings. As the bricks are very brittle, the constructions in which they are used are generally covered with a coat of mortar. The buildings of Clanshal are built of this material.

Mr. Sepulcre, a Belgian engineer, was one of the first who successfully transformed the slag into a stone which could be generally used. This he effected by causing the slag-channels to terminate in an excavation, the sides of which had an inclination of about 30°, and with a capacity varied from half to ten cubic metres. The very steep inclination of the sides causes the section of the pits to increase very rapidly, and this allows the solid crust, which forms on the surface of the liquid slag, to rise with it without becoming attached. The slag must flow con-

tinuously into the excavation; and if, from any cause, there is an interruption, the crust must be raised to allow of the liquid material flowing underneath. In this manner the whole mass of slag in the pit is sure to be all liquid, and will solidify from above and under pressure. After the excavation is full, it is left for five to ten days to cool, the only precaution required being to cover the top with ashes or sand to a sufficient depth to prevent the mass cooling too rapidly. The stone so produced grows hard on exposure to the air. When first made it can be easily broken into any required shape, but after exposure for a period more or less long, it becomes so much harder as to require double the number of tools to work it.

All kinds of slag are not suitable for this manufacture; those which contain too much lime fall to pieces on exposure. In general, it may be said that they should contain from 38 to 44 per cent. of silica, and that the furnace should be working well.

According to experiments made at the Conservatoire des Arts et Métiers, in Paris, this stone, when made from slag; while the furnace was running on white iron, never became fissured under a pressure of less than 212 kilogrammes the square centimetre, and was crushed at a pressure of 886 kilogrammes as a minimum. When made from gray iron, they do not crush under a pressure of less than 405 kilogrammes, but they have fissures at a pressure as low as 222 kilogrammes, or a little less than the white iron slags. This material is, therefore, stronger than the best marble.

One of the Belgian furnaces, which produces 2,500 tons of slag in thirty days, made from it 1,177 cubic metres of stone. The expense of manufacture was 820 dollars. The material sold for 1,600 dollars, making a profit of 780 dollars in thirty days; 70 per cent. of the slag produced was profitably used. In order to introduce it the price was put 25 per cent. lower than ordinary stone.

BLACKPOOL MARKET COMPETITION.

Forty-seven sets of designs were sent in, and these were referred by the Local Board to Mr. Jas. Green, architect, of Portsmouth, near Tordmorden. In his report, just now adopted by the Board, Mr. Green says:—

"Out of the remaining designs I shall notice six especially for your consideration, viz.—Nos. 5, 7, 17, 21, 29, and 36.

In considering the six designs I have no hesitation in recommending to your notice that of No. 7, bearing the motto 'Mercurius,' as worthy of the first premium, both on account of the arrangement of market, which is well lighted and ventilated, also shops and offices, and the excellent style of elevation it presents. I estimate the cost of carrying out this design in its integrity, including the handsome clock tower, would not exceed 7,500*l.* The tower would absorb about 300*l.* of this sum; but as it forms so great a feature in the design, and would be at once so useful and ornamental an acquisition to the town, I should strongly recommend the committee, if they decide to accept this design as the first, to carry out the whole as drawn.

For the second premium I select No. 17, bearing the motto 'Knowledge is Power.' This I name as having an excellent arrangement of plan, both of market and offices. The elevation I consider not so good, but the author has evidently considered the amount to be expended, and I think has not exceeded the amount in his design.

For the third premium I select No. 21, with the motto 'St. Swithin,' which has a much superior elevation to the last mentioned, but is not so good in plan, having less light and ventilation to the market, and not so convenient a board-room. I think the cost of this would not exceed 7,000*l.*

The premiums were accordingly awarded as follow:—

First, 30*l.*, No. 7, "Mercurius," Messrs. W. & J. Hay, Liverpool.

Second, 20*l.*, Mr. Charles O. Francis, Liverpool.

Third, 10*l.*, Messrs. Thomas Bird & Son, Manchester.

"LANDS THAT WANT HANDS."

STR.—If the statement be true that "men who eat and drink well ought to work well," the converse is also true, that "men who work well ought to eat and drink well." Experience teaches us, that unless men do eat and drink well they cannot work well. It is as vain to expect the contrary as that the steam-engine shall work without the burning of fuel. No matter whether the labour be mental or physical, brain labour or muscular exertion: it has been abundantly shown that men cannot perform it unless they live well. Now, living well involves a good supply of animal food,—meat. Unless men eat plenty of meat they cannot do plenty of work. It will not, then, be a matter of surprise

in these busy times, when great exertions are being made, and labour performed at railway speed, that there should be a great demand for meat; and also that, in consequence of that demand and the very natural wish of those who have meat to sell to share in the general prosperity, meat should be at a high price. It would be a matter of surprise if, under these circumstances, meat was cheap; but a very general impression has got abroad, especially in our cotton counties, that meat is much dearer than it need be, that cattle-breeders are getting more than their fair share of profit, and have by some underhand backstairs way induced the Government to protect them in their dealings by prohibiting the importation of foreign stock; ostensibly, it is true, on account of disease, but really to prevent competition. It would be well if this impression could be explained away. From a statement recently published it appears that our meat supply is derived mainly from our own soil, and that we import to the extent only of some 5 per cent. of the whole. If that be so, the cry recently raised requiring the Government to remove the restrictions against the importation of (diseased) cattle seems uncalled for. Let us have free trade in (healthy) cattle certainly, but let us not be deluded by the belief that other countries in Europe will have much to send us. Denmark used to be our great source of supply; but ever since the German hosts were launched into Schleswig Holstein, there to acquire that appetite for beef which has later swept the face of fair France of its cattle, and which appetite is not likely to be appeased, now that the splendid feeding-grounds of Denmark and France are "annexed," we shall, in all probability, get next to nothing from them. Spain, too,—sleepy Spain,—sends us a few cattle; but let the spirit of enterprise get abroad under a vigorous Government, and Spain will want all its cattle for its own use. We clearly cannot depend upon these. On whom, then, are we to depend for our meat-supply? Not on our colonies; for, in spite of the noise made with their tins of preserved meats, the bulk of the people will not be satisfied with them. "It no fill him belly," and no foreign country offers anything better. It is clear we must follow the old advice, "If you want a thing done, do it yourself." We must depend upon ourselves. Already a great stimulus is given to production by high-selling prices. Farmers will do their utmost to meet the demand, by growing root crops instead of corn, which can be well imported, and by hesitating to send their calves to the butcher. Government may do something in that direction also, by prohibiting the slaughter of calves and lambs under a certain age; for why should not these have a "close time," as game and wild-fowl have? These remedies to scarcity will do something, but they will scarcely do enough. We want more people to live in the country, following agricultural pursuits. If we want a peasant proprietary. Looking over the volume of the *Builder* for 1870, I have been much impressed with your remarks upon this subject. I can avouch that there are in this England of ours abundant "lands that want hands," for I have gone through a great portion of it on foot, and have observed the manner of its cultivation, and also of its waste; and, as a result of my observation, I may affirm that, leaving out the 30,000,000 of acres now uncultivated, if the remainder, said to be cultivated, were in good hands, and under the management of intelligent peasant proprietors, our country would produce for us in abundance everything,—except tropical productions,—of which we stood in need. Not only that, but there would be an immense improvement in the people themselves. Our town artisans, many of whom have been country bred, but who are mostly only one degree removed from starvation, would be infinitely better off as cultivators of their own land, although its extent be no more than that of Miss Martineau,—a farm of two acres. A man need not cease to be an artisan by such an acquisition. A good system of light railways throughout the country would keep him in sufficient connexion with his employers; and it will require no stretch of imagination to see that a man with his family so situated would be practically above the reach of want.

And now let me repeat your question, "Who will help us to such a position?" There are large numbers of us scattered about the country who mean to have it, either in our own or some other land,—men with large families, who would be welcomed in any country except our own. The United States are absorbing a large

number of our best workmen; and Canada, our own colony, is not only offering to us such inducements as the possession of good land gratis, but is also paying for us part of the cost of reaching it. In these countries men think themselves hardly used if they do not eat beef or mutton three times a day and every day. There every country family, and many town ones, possess cattle, so that they get a good supply of fresh dairy produce,—a luxury which we town-dwellers in England seldom or never obtain.

Will not some noble lord or honorable gentleman who is in possession of a portion of the surface of this land of ours put some of us with large families into possession of, say two to three acres each family, at an equitable rental and a long lease; the first three years at a peppercorn, gradually rising to the full rental at the end of ten years, or as may be determined by the merits of the case? We can pay a good rental; we can pay more per acre than any tenant-farmer in the country; and we shall produce more, take us altogether. We shall have no strikes and no starvation, and, consequently, no poor-rates and workhouses, and I am quite sure we shall want no lunatic asylums. But we shall want good, healthy homes, and large storehouses for cattle and crops, and good schoolhouses for our children. We shall want, and shall be able to have, many things of which we can only read and dream now.

Our cry, then, is "Back to the land; back to the land! Who will be the first to start a home colony on the 'Builder's plan' or any other?"

E. G.

SCHOOL BOARDS.

London.—On June 26th the Works Committee were instructed by the Board to take the necessary steps to invite a competition of four architects for the Board offices, to be erected on the Thames Embankment. They have submitted the conditions and particulars which have been drawn up for the guidance of the competing architects.

Conditions and Particulars.

The School Board for London invite competitive designs from the four selected architects for the offices to be erected on the Thames Embankment site, near the Temple Station, a lithographed plan of which is herewith sent. A schedule of the probable accommodation required is appended, but the competing architects are invited to submit suggestions.

An honorarium of twenty-five guineas will be paid to each of the four selected competitors. Each architect to give the cubic contents in feet of the whole building, measured from the bottom of the foundations to half-way up the roof; the available internal superficial area of each floor, as contained in the rooms; and an estimate of the cost, together with a general specification and description.

The Board reserve to themselves the right of rejecting the whole of the designs, should none of them be considered suitable. The plans, drawn to a scale of 8 ft. to an inch, to be delivered to me not later than 5 p.m. on Saturday, the 30th of November, 1872.

With reference to the appointment of officers for the architect's department, Mr. Tabrum explained that the altered arrangements as to the services of the architect would involve a saving during the first year of 25,000*l.*, and as the architect would have thirty sites placed at once in his hands, the committee thought it desirable that he should have a sufficient staff.

Brighton.—The Education Department have approved the designs of Messrs. B. Fletcher and J. S. Nightingale for the schools in Ivory-place.

SEWAGE WORKS AT BUCKHURST-HILL.

THESE works have been carried out under the direction of Mr. Grindle, of Hertford, and have been in successful operation for nearly twelve months. "The population of Buckhurst-hill," says the *Woodford Times*, "is about 2,000. The sewage is very strong, being nearly double the strength of ordinary London sewage. Originally an irrigation farm was thought of, in deference to the frequent visits of London excursionists, and the high price of land, the Sewer Authority decided on adopting a system of precipitation combined with intermittent filtration as recommended by Dr. Franklin. The raw sewage is taken to the subsiding tanks from the main sewer down the Queen's-road to the works which are situate about 300 yards below the railway station. On its way to the tanks it is treated with sulphate of alumina to assist subsidence; it is then received into a tank 30 ft. long, 12 ft. wide, and 5 ft. deep, in which the solids fall quickly to the bottom. These tanks

are frequently cleansed by means of valves and pipes in the bottom of the tanks, which convey the sewage mud to drying beds. This frequent cleansing is found necessary to prevent secondary decomposition taking place, and so further polluting the supernatant liquid. The surface of the liquid is always maintained at one level, so as not to allow any disturbance of the partially settled solids, the liquid being gradually delivered upon a sand-filter 20 ft. square, containing 1 ft. in depth of sand. From these sand-filters, the liquid, being deprived of all matter in suspension, is run upon one of four beds of calcined earth, 40 ft. square, and 6 ft. in depth. It is allowed to pass through one of these beds for eight hours, and so on the others alternately, thus giving each twenty-four hours' rest for the purpose of allowing the air to follow the sewage to oxidise any organic matter contained in solution. The effluent water runs direct into the River Rode, clear and sparkling. The works are in duplicate, so that no delay may take place during the cleansing of the several tanks and filters. The use of alum is to coagulate the albumenoid portion of the sewage, and to assist in its precipitation."

PAVEMENT IN PALL-MALL.

Stg.—I should like to draw your attention and that of the parishioners of St. James's, Westminster, to the relaying of the foot-pavement on the south side of Pall-mall by the authorities of the parish.

PEDESTRIAN.

CANTERBURY CATHEDRAL.

ONCE more a priceless treasure has been imperilled by the plumbers. All England has heard with a thrill that on Tuesday morning last the east end of Canterbury Cathedral was in flames, and that, but for great and judicious personal exertions, and the most fortunate circumstance that Canterbury has a high-pressure water-supply, the building could scarcely have escaped. As it is, the damage is mainly confined to the roof, and is merely a question of money. The circumstances of the fire, and the considerations that grow out of it, may be better treated of as a whole on another occasion.

KENILWORTH IN 1872.

Who but a wealthy English nobleman can indulge in the luxury of nursing the decrepitude of a shapeless ruin, and letting seven acres of land lie untilled? That some are to be found at the present time who are rendering this service to mouldering walls and mounds of earth is in itself, in the eyes of archaeologists, a sufficient justification of the perage. But the English public is not without its obligations to some noble squire; for were it not for them, how seldom would John Bull see with his bodily eyes the actual records of the great past of his country; and in all probability we should not be able to take our stand with quiet pleasure in the base-court of ruined Kenilworth. We owe our thanks, then, to the Earl of Clarendon for the very evident care that is constantly bestowed upon all that remains of Kenilworth Castle. We could wish that there were fewer printed notices posted on the walls to warn the climbers of them,—fewer spikes and rails at every turn and corner,—a less evident preparation for the reception of excursionists. But, above all, we wish away the disgusting additions of modern masonry, especially where they take an ornamental form, quite uncalled for and most unwelcome to the eye that dwells with interest upon the old stonework. The architectural value of the ruins is not great, and cannot for a moment be compared with their historic worth. There are to be found no such delicate and varied details as gem the broken walls of Tintern or Fountains Abbey. Of true detail there is little or none. The huge pile known as Caesar's Tower is austere in its plainness. The tottering wreck of what remains of Leicester's Buildings presents, indeed, towering rows of millioned windows in the walls and in projecting bays; but the details of these are coarse and scanty. Only in the ruins of the Great Hall, in its grand porch, in its windows and its beautiful oriel, is any approach to refined architectural detail to be discovered, and even here its distinctness is obliterated by long exposure and by reason of the soft nature of the reddish sandstone of which the hall is built. The architectural student will find, then, little here to fill

his sketch-book. The ruins are too essentially picturesque and shadowy to afford many determinate features for him to seize upon. The artist with his colours is the proper person here, and for him how many charming and affecting subjects are presented in the great circuit of what remains of Kenilworth. But detail apart, the architect may find much to instruct him, especially in the disposition of the various masses of building, and in the shapes and aspects of the different halls and chambers. The natural beauty of the site is great, but the old builders have made the most of it; and in spite of the thickness of the walls and the narrowness of many of the windows,—in spite of vaulted ceilings and turret stairs,—when the castle was entire there could hardly have been a corner of it that was not cheerful except the dungeons. Of how many modern houses, with all their lightness, can this be said? Two of the windows on the western side of the great hall are recessed, and look over towards Honily. Before Cromwell gave the castle up to be spoiled by his followers, these windows looked on to a vast lake, which stretched away from the base of the outer walls into the dim distance, the wooded neighbourhood of Honily. From day to day the idle courtier or the proud lord of the domain could command from these lofty trauced windows as fair a view as could be found in England. And when the Princely Pleasures were held at Kenilworth, the mighty Queen herself no doubt often rested upon the broad stone seats beneath them, while Leicester pointed out to her the various beauties of the lake and the encircling trees of the chase beyond it. Two more charming windows could scarcely be found. A ceaseless flood of daylight once poured through their glazed and jewelled traceries, and still continues to pour through their bare ruined openings. The summer breezes that blow through their opened casements must have been bewitching, for they are bewitching still. The entrance to the castle is now by the side of Leicester's Gatehouse. Before the Gatehouse was made into a dwelling by Hawkesworth, Cromwell's officer, the road passed through the centre of it under an arch 12 ft. wide. This building is well preserved, and is inhabited as a farmhouse. The path to the castle is on the west side of it. A gravel walk, with flower-borders on either hand, conducts you through a gate or two into the grassy base-court, which rises rapidly to the foot of Caesar's Tower on the right and Leicester's Buildings on the left. Passing through the broad opening (once covered with buildings) between these two masses of ruin, the great hall with its fine oriel immediately faces you, and all that remains of Leicester's Buildings is on your left hand. At the northern end of the great hall stands the famous strong tower, which Scott in the romance calls Mervin's, and makes it the retreat of the unfortunate Amye Robsart when she ventured to drag her wrongs and sorrows into the unsympathising presence of the princely pleasures. To take his seat in the midst of these ruins on a long summer's afternoon, on a day when there is no excursion to the castle, is productive of mingled sensations in the mind of the visitor—arising with the natural bias of his thought. Around him rise the symbols of a power which is no longer such, but very weakness, for the feudal age with its chivalry has passed away. Here are the stern remnants of walls as old as the Conqueror side by side with the tottering fragments of others that were brand new in Elizabeth's time. History for a season made her home here in the persons of mighty kings and of almost as powerful subjects. The flower of our race, and the leaders of our nation, assembled here, just about 300 years ago, to take part in one of the most glittering pageants of which there is any record, when, for many days in succession, a gorgeous throng filled every nook and cranny within the great circuit of the walls, and eddied with its sparkling waves about the person of the virgin queen. We look up at the windows where beauty once took her stand to gaze at the life and bustle of the great court-yard below, or to catch the breeze from the surrounding lake. The windows are dark now, mere voids, and the ivy clammers about their broken millions. We sigh over the departed life of our ancestors, even if we believe it to have been inferior to our own. But we cannot sympathise with it: we belong to another age; we are mere spectators here. The strength of stone and the tenacity of mortar have preserved these records of life in the sixteenth century for us to look upon, but we can do no more. The resistless current of change has borne us so far from

these ancient landmarks that we feel like strangers and aliens in their presence. What have the men of to-day, whose familiar are steam and lightning, and whose politics are veering on lawlessness, in common with the men who reared these walls?—whose powers, as compared with theirs, were as the quiet drying out of a summer's day in contrast with a storm in the tropics? Of what real value, then, is an hour spent at Kenilworth to the active worker in this present age, and primarily to the architectural worker? The good of such a visit is surely for his heart, and scarcely at all for his art. If rightly viewed, ruins such as these, with the reflections they give rise to, will teach him, amongst other things, how utterly his age is severed from that in which these mighty buildings were executed, and that he must look for the sources of the power and beauty he is fain his art should display elsewhere than in dried-up fountains.

S. D.

TASMANIAN WOODS.

TASMANIA has woods which might usefully be introduced to the English market. A discussion has been going on recently in Tasmanian papers on the subject. The *Launceston Examiner* says:—

"We have immense forests of both hard and soft wood, as solid and enduring as British oak, as soft and more lasting than American pine. Practical men pronounce Tasmanian blackwood to be quite equal to mahogany—some say it is even better: it is pleasant to work, after seasoning will not shrink or warp, is everlasting, and may be had in planks 3 ft. or 4 ft. wide. Our gums, especially the blue gum, are in no way inferior to oak, either for strength or durability; while our pines—the Hoop, celery-top, sassafras, and pencil—are equal to any in the world. Besides which we have fancy woods in great variety, most elegantly marked, and capable of receiving a very high polish. We should like to see some of the woods we have mentioned introduced into the English market. Manufacturers would hail them with delight if they could once be persuaded to give them a trial, and thus a trade would spring up that would be of mutual advantage to the old country and the colony. One of the principal objects of international exhibitions is to show the resources of different countries—what they have to sell, and, by inference, what they are likely to buy. We think it can scarcely be doubted that Tasmania has suffered through not being properly represented at the various exhibitions that have been held in Europe."

All bear testimony to the valuable character of some of the timbers, especially blackwood, for nearly all purposes for which timber can be used, from post and rail fencing to the veneering of the most delicate cabinet work. Blackwood (*Acacia melanoxylon*) is certainly a most beautiful and very useful description of timber. It is handsomely grained as mahogany, and takes a high polish, so that to the cabinet-maker it is an invaluable timber. Furniture of all sorts is now made from it, while it is also largely used for interior fittings, for window sashes, and carriage work. This timber should, if properly introduced, command a high price in the English market, and it is worth the attention of those in the trade.

THE LIGHTING OF SCHOOL-ROOMS.

A PAPER "On School Life in its Influence on Sight," read recently at a meeting of the College of Preceptors, by Mr. Liebreich, Ophthalmic Surgeon in St. Thomas's Hospital, deserves the attention of architects and school boards. We print a portion of it, in which the writer speaks of the position of windows in class-rooms:—"The Education Department in its rules to be observed in planning and fitting up schools, has made regulations for the lighting of class-rooms, and has chosen, of all the different kinds, the very worst. No. 15 of the rules is as follows:—"The windows should be so placed that a full light should fall upon the faces both of the teachers and of the children." Light coming from the right hand is not so good as that from the left, because the shadow of the hand falls upon that part of the paper at which we are looking. Light from behind is still worse, because the head and upper part of the body throw a shadow on the book; but the light that comes from the front, and falls on the face, is by far the worst of all. In the first place, it does not attain the object desired; and next, it is most hurtful to the eye. The object is to make the fully-illuminated faces more visible to the master; but the children, instinctively desirous of avoiding the unpleasantness of the full glare, assume all sorts of positions, which turn their faces from the master. In reading, they turn the head round the vertical axis, generally towards the right, in order to let the light fall on the book, which, when held straight before them, is completely in shadow; while, in writing, or in reading (the book being on the table), they bend their heads

as low as possible, in order to shade their eyes by the projection of the forehead. In this way the faces are much less visible to the master than if they were held upright and illuminated from the left side; and if, according to the regulations of the Committee of Council, the light also falls full upon the face of the master, he will be entirely prevented from seeing them. This method of lighting the room is very injurious to the eye, because, firstly, the retina becomes fatigued by the full glare upon it, and the diffused light renders the comparatively dark images of the printing and writing more difficult to be perceived. Secondly, the position assumed by the children, in order to avoid the disturbing influence of the light, places the axis of the eye in a very unfavourable direction, which, as I have already mentioned, and shall explain more fully by-and-by, induces short-sightedness, differences in the sight of the two eyes, and certain weaknesses of the muscles of the eye. The motives of this diversity in the lighting of rooms cannot easily be given, as they are different in almost every school. I will, however, mention a few of the more prevalent. Some of the principal schools are in buildings, two, three, and even four hundred years old. Here the windows are not in the most desirable positions; comparatively speaking, however, the lighting in the large class-rooms is very good. They have high Gothic windows, and the light falls through them more directly from above. The more directly the light falls from above, the less it feels any fault with regard to the side from which it comes. In small old buildings the lighting is frequently very bad. This would have been of little consequence where the old building serves merely as a nucleus for new ones, were it not that the unfortunate idea of building the new part in the old style has deprived the children of the favourable opportunity of obtaining several well-lighted rooms, in addition to a small number of badly-lighted ones. If we have to condemn this sacrifice of a most important object to architectural taste, what shall we say when one of the first architects in England builds, at an enormous cost, a perfectly new, large, splendid school on an extensive piece of ground, open on all sides, and lights every class-room from three sides at once by low broad windows; thus rendering it impossible to place the desks in any suitable position? Are trustees and architects aware of their responsibility, when they build a school without consulting the masters, and only for the ward show? Or have they no misgivings of the evil consequences resulting from such unpractical arrangements in a school? In the schools of the middle classes I have generally found better arrangements with regard to light, especially where limited means did not allow the architect to ornament the house in the Tudor style, in which the upper part of the window, i.e. the most important, is useless, but obliged him to build in a simpler manner. Buildings with rectilinear and rectangular ground plan, with high, rectangular modern windows, do not produce such a pretty effect in the landscape, and do not proclaim the genius of the architect to the superficial beholder; but this seems to me of small consequence in the case of institutions of such practical importance as our schools. In the schools for the poor, where the light depends essentially upon the situation and means of the school, and where the first is often unfavourable and the latter limited, no one can be blamed for the lighting, which is generally insufficient rather than ill-arranged."

CATHEDRAL OF ST. CANICE, KILKENNY.

THIS cathedral is the see of the Bishop of Ossory, a diocese which embraces nearly all the county of Kilkenny and portions of the Queen's and King's counties, in the province of Dublin. Originally seated at Seir-Kyran, in the King's county, the bishops of Ossory subsequently had their see at Aghaboe, in the Queen's county, but it was finally removed to Kilkenny at the beginning of the thirteenth century. Commenced early in that century, and finished about 1280, this cathedral is in style a pure Early English building, and is said to bear strong tokens of affinity to the South Wales school of that style. The plan is cruciform, with a tower at the intersection of the cross. There are aisles to the nave and to the western portion of the choir; the former having lean-to roofs, the latter being gabled. Besides the choir aisles which served as chapels (the piscina and credence still remain), there are two chapels opening eastward from the transepts; that to the north served as the parish

CATHEDRAL OF ST. CANICE.

church, and is plain and small: the southern chapel is much larger and more ornate. It has three closely contiguous three-light lancet windows to the south; the lancets being mullioned, and each triplet contained by shafted piers and a moulded internal arch. Its earlier window consists of three similar lights of two lancets each, the central light rising considerably above the side ones. It may safely be assumed that this chapel is later than the main structure, as, if the heads were pierced, the windows would be examples of plate tracery. The choir is lighted by lofty lancets grouped in threes in the east end and at each side, and separated by massive piers with moulded trefoiled heads (over round-headed windows) and jamb shafts; over the roofs of the side aisles five clearstory windows admit light also to the choir.

The original tower fell early in the fourteenth century, and has been rebuilt, with a curious, though not servile, adherence to the style of the previous century. The fan-tracery of the tower arch could not, however, have been erected until the fifteenth century. It is said to have been the work of Bishop Hacket, reputed to have designed the Abbey of Batalha, in Portugal, and is the only bit of Perpendicular work in the entire building.

The external aspect, as may be seen in our view, is plain, but pure Early English work. Notwithstanding the plainness of its style, and its comparatively small size, the cathedral, both

internally and externally, is not without a certain degree of massive grandeur. It was restored and roofed by the Dean and Chapter just previously to the disestablishment of the Irish Church, at an expense of about 15,000*l.*, of which the greater portion was borrowed on the credit of the Economy Estate, 3,000*l.* were advanced by the late Ecclesiastical Commissioners for Ireland, and 400*l.* subscribed by private persons. The architect was Mr. Thomas Newenham Deane, whose work is not very happy where he had not the ideas of the old architects to guide him; notably in the sheeted hammer-beam roof of the choir, and the bishop's throne and stalls. The adaptation of stone water-courses to the exigencies of modern work has not been successful, as they leak under the wall-plates, and have already caused the unavailing expenditure of several hundred pounds in the endeavour to make them water-tight.

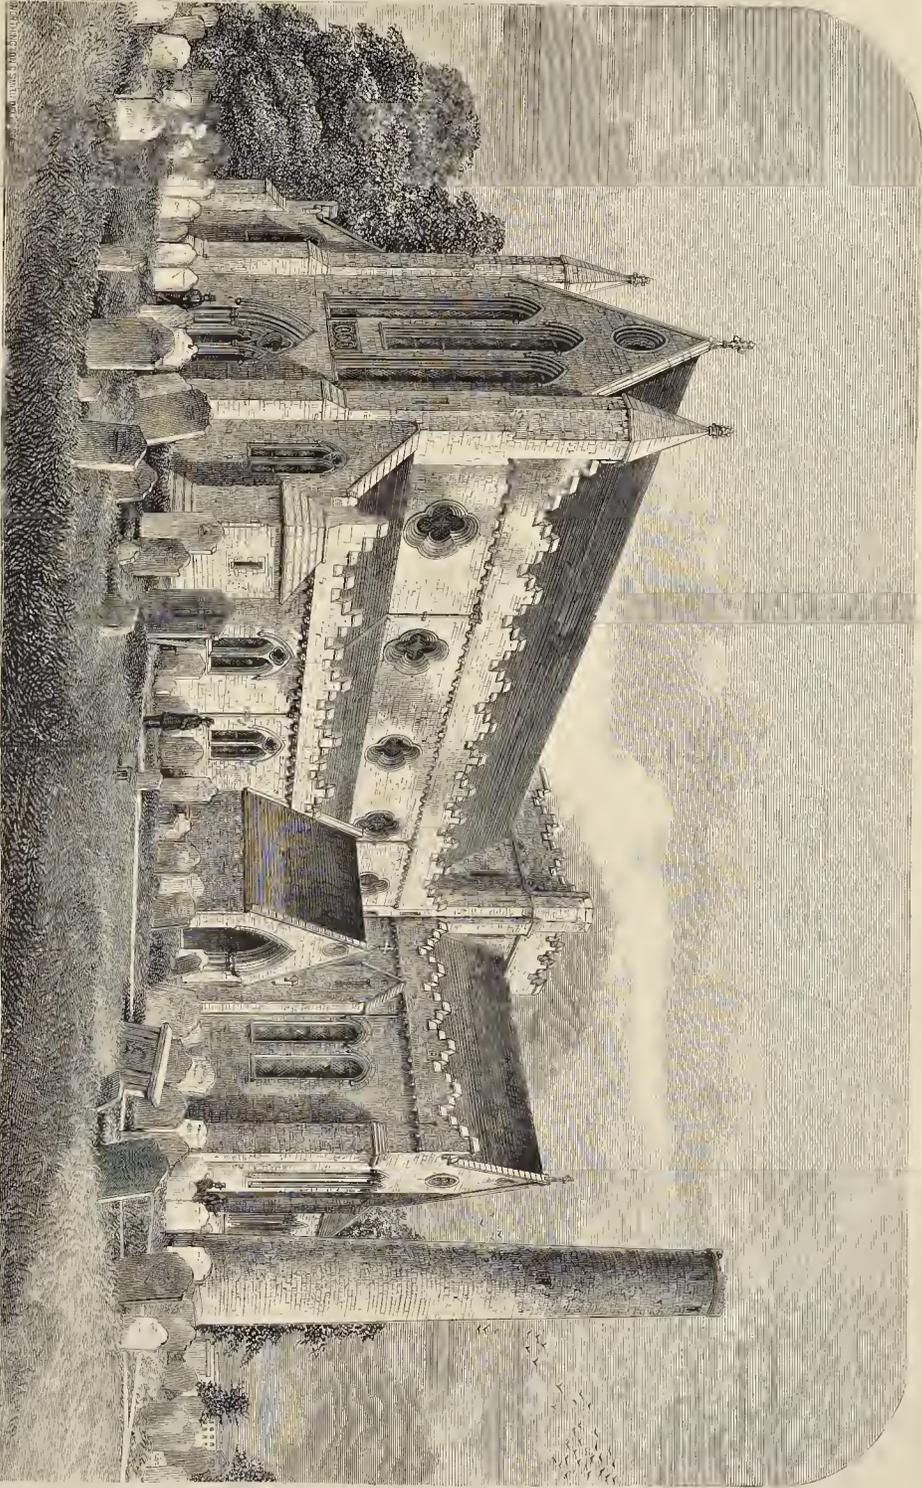

The church is plainly floored with Minton's tiles and Irish marble, and seated with movable open benches, the sittings being entirely free. It is lighted by a series of part-polished and part-painted large corona, suspended from wrought-iron ornamental tie-rods, and supplied by Messrs. Richardson, Slade, & Co., of Brownlow-street, Holborn: one of these corona pendants we have illustrated. The pulpit and most of the carving of the new work are by Harrison, of Dublin. There are four principal doors: a very fine double door to the west, of an ornate character; one with a porch, giving entrance to

the south side aisle of the nave; one in the north side aisle of the nave; and one in the north transept. The last-mentioned exhibits a round-headed entrance under a moulded pointed arch, and is considered the most curious feature in the church; unfortunately it suffered much from injudicious cleaning some years ago, as did also the finely-moulded arches of the nave arcades. The stone principally used in the dressed work is Kilkenny marble, or mountain limestone, of a dolomitic nature; a good deal of local sandstone was also introduced by the old builders; and the north transept door seems to be of Caen stone.

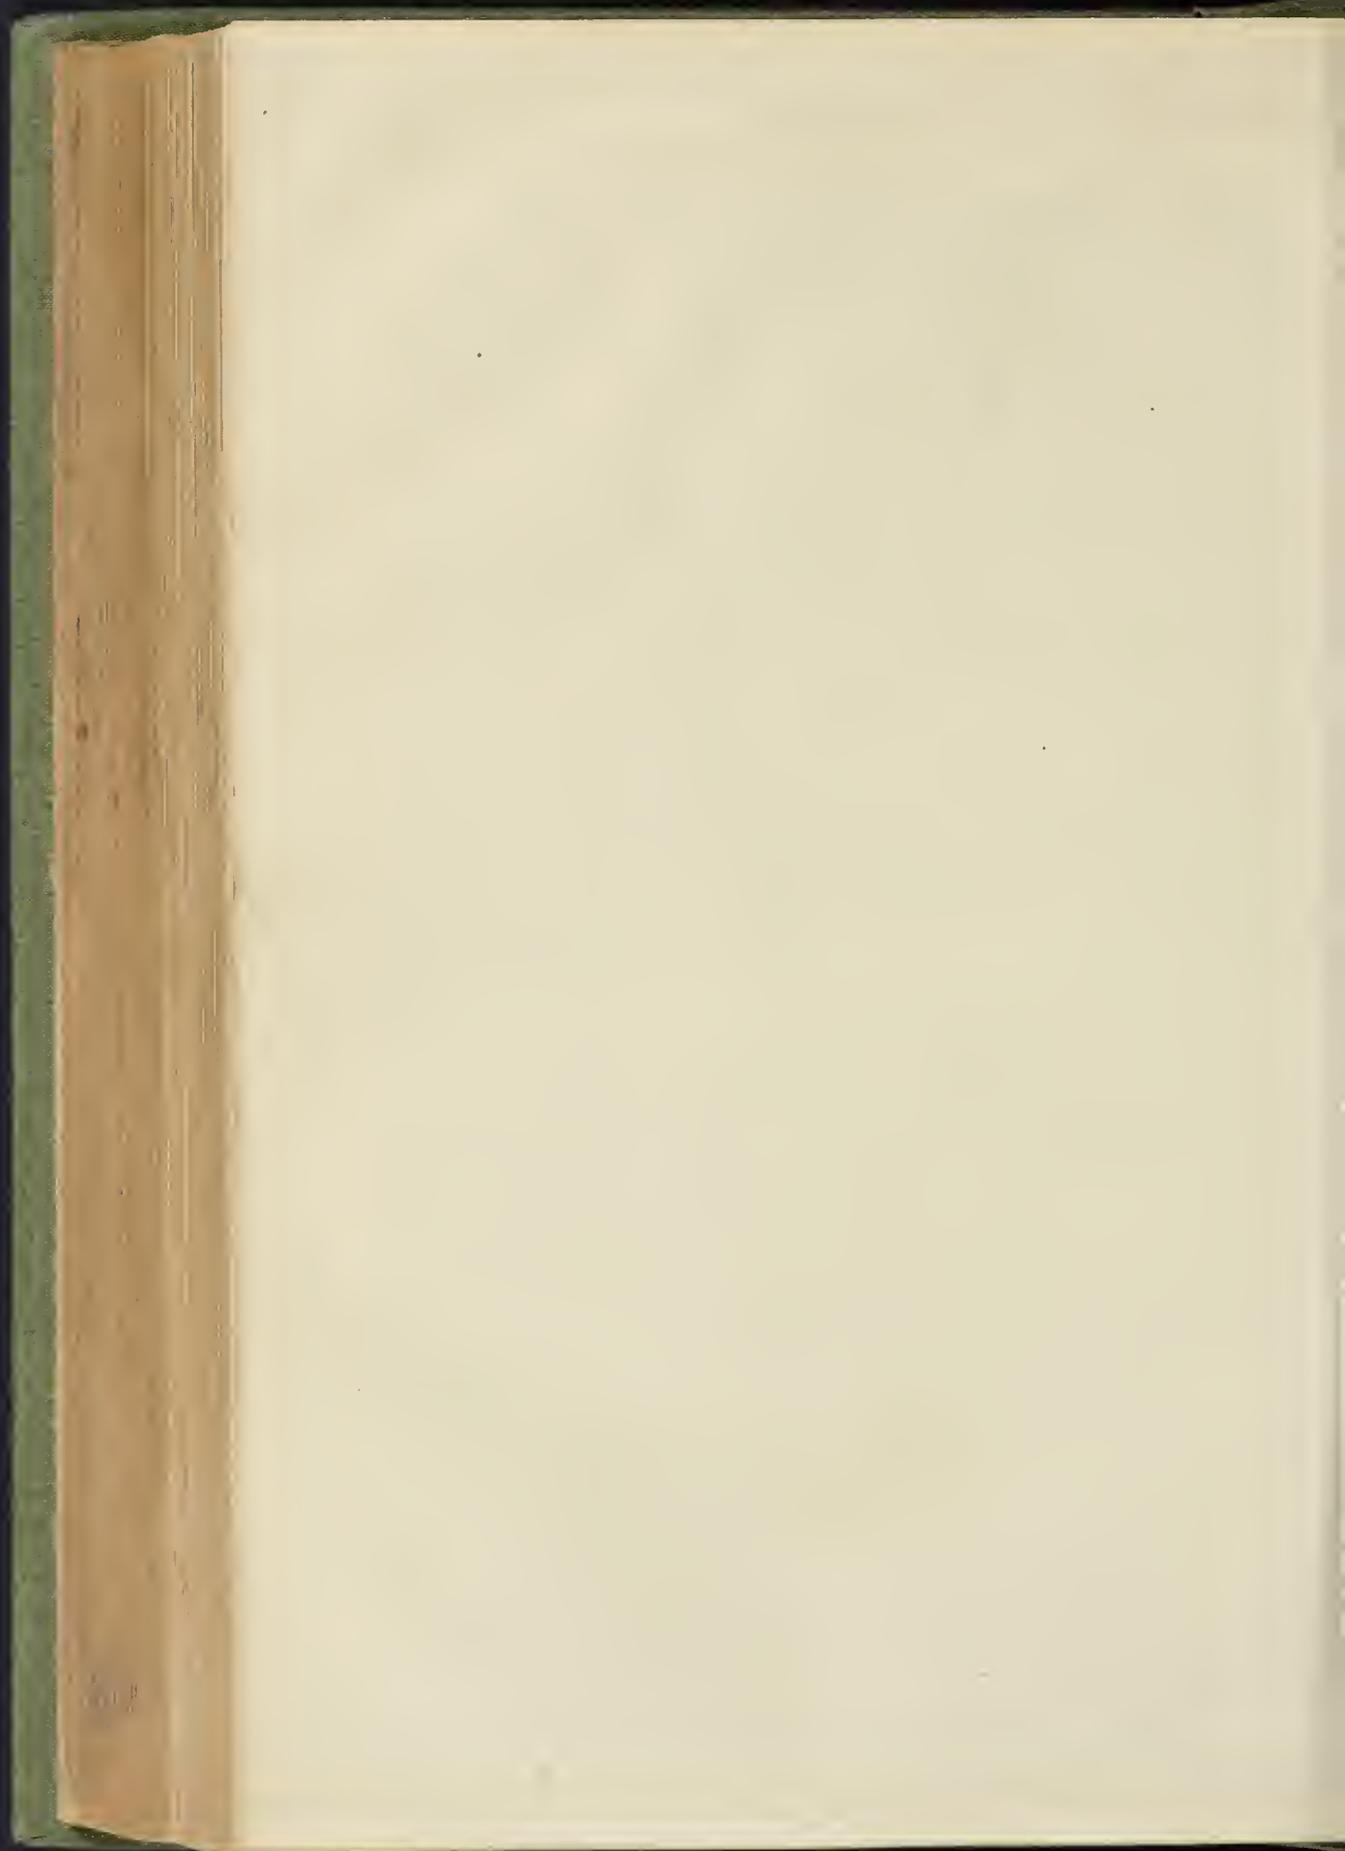

One of the ancient Irish Round Towers adjoins the south transept, and is well seen in our engraving. It is 100 ft. high.

The principal measurements of the cathedral, clear of the walls, are as follow:—Nave, 107 ft. by 28 ft. 3 in.; side aisles of ditto, 14 ft. 7 in.; north transept, 38 ft. 10 in. by 28 ft. 11 in.; south transept, 38 ft. 8 in. by 28 ft. 10 in.; choir, 73 ft. 10 in. by 28 ft. 8 in.; choir aisles, 48 ft. 6 in. by 15 ft. 10 in.; lady chapel, 28 ft. 7 in. by 20 ft. 8 in.; area of tower, 26 ft. Total length from east to west, 212 ft. 3 in.; total breadth across transepts, 117 ft.

* In the modern restoration work a very good fossil-coloured fine-grained sandstone from the lowland of Coolcullen, in the Castlecomer coalfield, has been successfully used; it is easily worked, and hardens on exposure to the air.

CATHEDRAL OF ST. CANICE, KILKENNY, IRELAND: AS RESTORED.

RANSOME STONE AND BESSEMER STEEL.

The Engineers' Society, as already announced in our columns, have paid a visit to the Patent Stone Works of the Ransome Company, and to the Bessemer Steel Works, both situated down the river-hank, at East Greenwich. The visitors, who were marshalled by Mr. Nursey, secretary of the society, included Messrs. H. Adams, the vice-president of the society, W. MacGeorge, C. J. Light, W. H. Le Fourre (past president), Baldwin Latham (ditto), J. Crowley, J. Cargill, A. Williams (hon. sec. and treasurer), and a number of visitors and friends of the society. The first visit was paid to the Ransome Works, where the whole process of artificial stone-making was exhibited and lucidly explained by Mr. Ransome, the managing director. The members of the society were marching in their examination and inquiries, and the sum of their opinions was that the Ransome patent stone (which has often been named of in our journal) is admirably adapted for building, and especially for ornamental purposes. The visitors then proceeded to the new factory, now in course of erection, for the manufacture of Bessemer steel, and of ordnance made of the material. Mr. Bessemer was in attendance, and explained his process. The reports shown in which the ore is fused until it comes a liquid; then the vessels into which it passes, and where, by the introduction of a powerful blast of oxygen, the silica is separated from the metal, and the latter is transformed to pure steel; and finally the finishing process, by means of which the material is turned to railway rails, guns, and various other articles. On the interesting conversation that arose, it was gathered that Bessemer's steel and Bessemer's gun have greater triumphs still in store than any that have as yet been achieved. We go to have a Bessemer steel gun, which will prove the problem that may be said to have solved the "Woolwich Infant,"—namely, that of charging a shot proportioned to its size without ultimately destroying the gun. By his method he expects to make the discharge of one or shall of five tons weight a matter of easy everyday occurrence. Another of Mr. Bessemer's novelties discussed during the visit was his works was the Channel packet-boat built by him, in conjunction with Mr. Fowler, Esq., in which an oscillating cabin, which a water-lift, is always to keep its level, and which is to form the voyage from Dover to Calais in sixty minutes.

"A BRIDGE OF EASE."

So Mr. H. W. Tison entitles the suspended trolley he proposes should be formed over the London railway. The rough sketch which he has submitted to the Commissioners of Rivers and other bodies shows his plan as applied to King William-street, London Bridge, and the South Eastern Railway Terminus. The proposed footway and its supports are to be constructed of iron, of a light construction. The estimated cost is about 40,000*l.* The idea, as our readers know perfectly well, is old one. The only novelty or usefulness could be about it would be in the mode of trying it out; but, as Mr. Tison evidently knows nothing whatever of engineering, the proposal, we are sorry to have it to say, is altogether valueless.

EXTENSION OF THE EDINBURGH GASWORKS.

The extension of the Edinburgh Gasworks on and cleared in Shoemakers' Close is proceeding apace. In a line with the chimney runs southwards towards the Canongate, a new gas-works is being erected. The stores are 200 ft. in length, consist of an iron roof pitched on iron piers supported by girders, leaving both sides open. The completed the stores will be capable of holding 14,000 tons of coal, and this will increase the storage room within the works to 25,000 tons. Eastward of this range of stores are being built a double row of ovens,—twenty-five on each side. These ovens are of fire-brick, and in a row there will be five retorts of the best and most improved description. The retorts will be covered by iron-roofed sheds of similar description to that of the stores, and will extend a length of 206 ft. When in full operation the 250 new retorts will enable the

company to manufacture 1,348,000 feet of gas per day, in addition to the 2,500,000 feet which are made by the existing works. The whole of the new works are expected to be finished before winter sets in. Messrs. J. & R. Park are the contractors for the building work, and Messrs. Tol, Leith-walk, for the ironwork.

The long range of old, tumble-down buildings called Shoemakers' Close, lying between the Canongate of the works and the Canongate, were acquired by the company some time in the beginning of this year. In their demolition some curious knowledge was gained of this part of old Edinburgh. The houses, which must have been between two and three hundred years old, were built on the site of an ancient tannery; and Shoemakers' Close was erected on forced earth. Cuttings laid bare the old tan-pits, and the wood with which they had been lined was quite fresh, although it must have been embedded in the earth for hundreds of years.

THE METROPOLITAN BUILDING TRADES MOVEMENT.

ALTHOUGH the dispute has terminated, it will be some days yet before matters go on smoothly. On Saturday last the central committee of carpenters were fully occupied in attending to numerous applications from small building firms unconnected with the Masters' Association, as to the terms upon which their men would be allowed to work in the future, and to deputations from the men in several other firms, who attended to report that, an application being made to their employers to ascertain whether they intended to work their shops under the terms of the new agreement, they were met with evasive replies in several cases, and in others by a distinct refusal, and wishing to know from the committee how they were to act. To the application from the masters the committee replied that an official printed copy of the agreement between the employers and workmen, with the interpretation of that agreement by the committee, would be forwarded to them through the post, and that they would be expected to comply with those terms. The reply given to the men was that the committee had no power to instruct them upon the matter, but that all firms declining to carry out the terms of settlement would be reported to the delegate meeting on Thursday evening, who would deal with each case upon its merits. They were also informed that it was highly probable the delegates would call out the men from those firms refusing to carry out the agreement. It was reported to the committee that several of the firms who had taken no part in the lock-out had notified to their workmen at pay-time on Saturday that they would commence working under the new arrangements upon Monday of this week.

The following is a copy of the printed document posted on Saturday evening by the central committee of carpenters to every building firm, large and small, throughout the metropolitan district:—

"2, Westminster Chambers, Aug 27.

The working-hours to be 52½ hours all the year round for joiners in shops, and 52½ hours per week for 40 weeks in summer, and 48 hours per week in winter, for out-door works, leaving at one o'clock on Saturday during the winter weeks. The wages to be 8*½*d. per hour all the year round. Overtime beyond the above hours, when worked at the request of the employer, to be paid for at the following rate: for the first hour at 9*½*d. per hour, and from the end of the first extra hour until eight o'clock p.m. at the rate of 10*½*d. per hour; after eight o'clock, at the rate of 1*½* 9*½*d. per hour. This scale not to apply in the case of men working overtime at their own request, or to make up time lost by them during the week. Extra time on Saturdays to be paid for at the rate of time and a quarter up to five o'clock, and after that time at the rate of time and a half. Moved by Mr. Hannen, seconded by Mr. Matkin, and carried unanimously.—That in the opinion of the sub-committee of the Master Builders' Association, and the deputation of the carpenters and joiners, now met together, it is desirable that an endeavour should be made to settle all future questions which may arise on trade matters by conference, or by arbitration.

On behalf of the employers,
BENJAMIN HANSEN, Chairman,
On behalf of the workmen,
C. MATKIN, Secretary."

As regards the bricklayers' deputation, they returned to the masters' committee with more power to settle the matter, and after several hours' talk, they accepted the terms concluded with the other branches, and succeeded in getting tacked on to them some additional provisions which custom had already sanctioned. The agreement or memorandum runs thus:—

"2, Westminster-chambers, 30th August, 1872.

At a conference between the Sub-Committee of the Master Builders' Association and a deputation from the

Operative Bricklayers' Society, the following arrangements have been agreed to:—

The working hours to be 52½ for forty weeks in summer, and 48 hours per week for twelve weeks in winter, leaving off at 1 o'clock on Saturday in the winter weeks. The wages to be 8*½*d. per hour all the year round. Overtime beyond the above hours when worked at the request of the employer, to be paid for at the following rates, viz.:—for the first hour one penny extra; from the end of the first extra hour up to 8 p.m., at the rate of two pence extra; after these hours to be paid for at the rate of time and a quarter up to 5 o'clock, and after that hour at the rate of time and a half. This scale not to apply to the case of men working overtime at their own request, or to make up for time lost by them during the week. Half an hour for breakfast and half an hour for dinner to be allowed during the winter weeks. Gauged work, when executed as day work, shall be paid for at the rate of a penny an hour extra. Bricklayers sent from London at the request of the employer to country jobs to receive London wages, with an additional allowance for lodgings, the railway fare to be paid to the job, and if discharged by the employer the fare back to London.—(Signed), B. Hannen, G. W. Jackson, J. M. Macey, W. Brass, Stanley G. Bird (hon. secretary), E. Coulson, J. Batchelor, H. Honor, W. Crawly, J. Paget, G. Knapp."

The Executive Council of the London General Labourers' Union have addressed the following notification to the huddlers' labourers of the metropolis:—

"Brothers,—We wish to inform you that our delegate, Mr. Kenny, got the following terms from the Master Builders' Association for all labourers (shops as well as jobs):—One halfpenny rise: those who had 4*½*d. will have 5*½*d.; those who had 5*½*d. will have 6*½*d.; those who had 6*½*d. will have 7*½*d. Overtime: First hour, one halfpenny extra; the following two hours, penny extra per hour; after eight o'clock at night, time and a half. If you work after twelve on Saturday, time and a quarter till five o'clock; after five, time and a half. In our memorial we ask for sixpence per hour, which is little enough for our labour. If you think so, unite at once with us; if you do not, we will have to take for your labour the buyer's price, and not your own. The above agreement, signed on behalf of the masters, comes into operation on September 2nd."

THREATENED INJURIES AT STIRLING.

SIR,—Should your attention not already have been called to the threatened destruction, or, at least, disfigurement, of the Castle Rocks at Stirling, will you kindly devote a corner of your valuable space to expose the iniquity and barbarism of the whole affair? It appears that the town council of that borough have actually disposed of a considerable portion of this beautiful and classic rock,—one of those rare, isolated, and igneous basaltic protrusions on which the royal Castles of Edinburgh, Stirling, and Dunbarton are so picturesquely perched,—for the base purpose of quarrying it for road-metal! Shade of King Robert the Bruce! where has our national sentiment of patriotism gone to? What would Sir Walter Scott have said on hearing of the destruction of his darling "Grey Bulwark of the North"? Here is what he did say on one memorable occasion respecting a similar act of vandalism (the destruction of the Cross in the High-street, of Edinburgh):—

"Oh, be his tomb like lead to lead
Upon its dull destroyer's head!
A minister's malice is said!"

May let us have a little anathema from the Builder.

ALPHA.

NOTES IN THE BROMPTON CEMETERY.

MR. DILTON CROKER, continuing his sketches in the *South London Press*, gives an interesting account of the West London Cemetery, which extends from the Fulham-road to the Richmond-road, and was consecrated in 1840. We condense some of his remarks. Some years ago, says Mr. Croker, it was proposed that the Government should become the owners of the various cemeteries around London, and a Bill was prepared for the purpose, no doubt being entertained but that it would pass through Parliament without opposition. An agreement was in the interim made with the West London and Westminster Company for purchase. The Bill, however, was thrown out, but the agreement was insisted upon by the company, and we are given to understand that this cemetery is now Government property.* Here T. P. Cooke and Walter Montgomery lie side by side, on the path right of the catacombs, close to one of the hell towers. We read on Mr. Cooke's monument that he served under Nelson, and was present in his Majesty's ship *Danger* at the battle of St. Vincent; then follows a fitting tribute to his able delineations of the character of the British seaman. About half way down on the right of the centre avenue is the handsome monument, 21 ft. high, erected by public subscription to the general

* Quite correct. It was valued for the Government by the late Mr. J. W. Higgins, Mr. Lockyer, and Mr. G. Godwin.—E.B.

and gifted Alfred Mellon (sometimes styled the English Costa), who died at the early age of forty-seven, mourned by all who knew his many endearing qualities.

Separated by one grave, we find that of Alfred Mellon's niece, Nelly Moore, who will be long remembered as a charming *ingenue*, whose death, when only twenty-four years of age, saddened the whole of the theatrical world, and a number of private friends, by whom she was dearly loved and respected for her gentle nature.

Immediately behind will be found the memorial cross which Mr. C. Millward caused to be erected at his own expense, "in affectionate remembrance," over the grave of Joseph Henry Irving, the comedian, whose performance of "Triah Heep" was so full of promise, and whose career ceased when he was only thirty years of age. Near these graves are those of the graceful and gentlemanly Leigh Murray, and J. H. Tully, the conductor of the orchestra at Drury Lane for many years. On the other side of the avenue we come upon the grave of the father of Albert Smith. Here are also buried Mr. and Mrs. Albert Smith, and Arthur, the brother of the former. Close to the hideous monument of John Jackson, the professor of sparring, will be discovered the grave of Charles Godfrey, hand-master of the Coldstream Guards, the father of the now celebrated Dan and Charles Godfrey.

In this direction is the resting-place of James Rogers, the comedian, who died on April 15, 1863, aged forty, and which has the following inscription:—

"You have heard—some know—the story of his life,
That brief existence with afflictions rife;
How to the last he struggled with the foe,
Whose shadow darker nightly seemed to grow,
Still smiling through his sufferings, and though wrung,
By quivering pain, a jest still on his tongue,
He had cause indeed to wish the play had power
To 'ease the anguish of the torturing hour.'
Shall it not aid, the man who bravely fought
Life's battle out, no noble lesson taught?
No! 'twas a hero's sermon for the age,
Preached from the player's pulpit of the stage,
Remembered by us."

Nearer the Fulham-road entrance are the graves, next to each other, of Robert Keeley and Frank Matthews; not far off is also that of Edward Wright. What agreeable memories do these three names recall! If one of the most pleasant of humanities be to laugh, well may we hold them in grateful remembrance. The tomb of Sir Roderick and Lady Murchison will be seen in the centre path, where a handsome but rather too pretentious marble mausoleum, with a figure of "Hope" at the top, has been recently erected by a Mr. Henry France, of Wardour-street, to the memory of his wife, which must have cost a very large sum indeed. The coffin is seen through the opening, and at the back is a window of stained glass. Amongst others may be mentioned the graves of H. F. Chorley, the acute musical critic; Sir S. Canard; Pettigrew; F. W. Fairholt; R. B. Peake, the dramatist; Mr. and Mrs. Tayleure, actors; Sotheby, the well-known auctioneer, author of several learned works, the most remarkable of which is his "Principia Typographica;" Captain Harrison, a distinguished member of one of the first yacht clubs; Robert Gunter; Francis Nicholson, the landscape-painter, one of the founders of the old Water-Colour Society, who died when at the patriarchal age of 91; and his son-in-law and daughter, Mr. and Mrs. Crofton Croker, whose deaths occurred within two months of each other,—the first on the 8th of August, and the second on the 6th of October, 1851. Here is also the grave of Sydney, Lady Morgan, upon which rests an effigy of an Irish harp, above which are two volumes, inscribed "Wild Irish Girl" and "France."

THE NEW CHURCH OF FATHER IGNATIUS'S MONASTERY, IN THE WILDS OF WALES.

THE foundation-stone of a new church has been laid by the Rev. Father Ignatius, at the Monastery of St. Mary and St. Dunstan, Llanthony. After leaving the ruins of the old priory, a drive of four miles along a rough and dangerous road brings the visitor to the monastery, at which the superior of the English order of Benedictine monks, with eight or ten of the brethren, have taken up their sequestered abode. The monastery is situated on the slope of a bleak and hoary mountain, commanding a view of the sequestered valley of the Ewias. In these solitudes Father Ignatius has reared the germ of what is intended to be developed into

an extensive monastic institution, one wing only of which is at present built. The structure, when completed, will bear an exact resemblance to the old Abbey of Llanthony, the length of which, from west to east, is 212 ft., and the breadth, including the aisles, 50 ft. The length of the transept from north to south is 100 ft. The new monastery was commenced about three years ago, by two brothers, who had previously been living in a hut on the mountain, subjecting themselves to great inconvenience, and even privation, in the winter. The land was given by a lady "associate." The choir and nave of the new church (the portions now commenced) will be erected at a cost of about 3,500*l.*, the whole sum being given by an English Churchman. The architect is Mr. C. Backridge, of London and Oxford. These are odd times in which we live!

ECONOMY IN FUEL:—THE "BUILDER" FIRE.

A CORRESPONDENT of the *Times* describes what has for so many years been well and widely known as "The *Builder* Fire," but whose paternity, like that of many other good things, has been lost in the lapse of years. With this correspondent's description of our celebrated fire we may refresh the memory of our old readers, and instruct the new at the present juncture:—

"The plan advised is the insertion of an iron plate 4 in. in thickness, closely fitted upon the bottom grating of the stove, leaving the space between it and the front bottom bar open as it is at present. The fire should be made by being well packed with small lumps of coal about half-way up. The wood should then be placed, and an upper layer of coal, and then lighted. By this means the upper layer of coal becomes speedily ignited, and a good fire is soon obtained; and as the air cannot pass upwards through the bottom, the fire will gradually burn downwards, not only taking a considerable time to do so, but effectually retaining every particle of fuel, which cannot fall through."

This fire will last for many hours without any fresh supply being required, and will give out a much larger volume of heat than an ordinary fire. By this means small coal, and even dust, may be as readily used as large, while the saving in consumption, as the *Times* correspondent says, he has long proved, is quite 50 per cent. in all stoves except the kitchen range, which is, no doubt, capable of considerable improvement; while, in addition to the saving of fuel, the result is greater cleanliness and comfort, more heat, and less necessity to attend and replenish the fire. The use of the poker is almost entirely superseded, it being only necessary once during the day to thoroughly press the fire together, and being replenished, it will burn till night. In very small grates this plan will not perhaps suffice. A small surface of fire will not obtain sufficient air through the front bars to support combustion; but in all of a moderate size it may be used with the advantages enumerated.

THE "NATIONAL SCHOOL-BOARD DESK."

SIR,—In noticing, in your last issue, a new desk, with the above title, by Mr. Moss, for seating children in pairs, which is certainly ingenious, you very rightly conclude that "the question of space will probably arise." There is, it appears to me, a practical objection to its general use in national schools which the inventor has not taken into consideration,—viz., its *inconvertibility* into the various uses for which school-desks are now generally called into play. Under the name of "convertible," a bench with desk, variable in length, is now pretty generally adopted, which, as well as doing duty for school purposes, can be used as a table for school teas and treats, or as a bench, with sloping back, arranged for lectures, concerts, &c. Mr. Moss's desk in pairs seems to offer none of these advantages. FREDK. R. WILSON.

THE SPEAKER AND HIS FARM LABOURING PARTNERS.

THE Right Hon. the Speaker has given his annual treat to the labourers on the Glynde estate, to celebrate the in-gathering of the harvest. He presided at the dinner, and in the course of his remarks said:—

"I will make a proposition to you, and to all in my employ. If you have got 5*l.*, we will say, in the savings-bank, and you would like to lend that to my farming business, I will engage to give you, as the savings-bank does, 2*l.* per cent. for the money. And I will do more than that. I will, supposing the profits of the farm amount to

more than 2*l.* per cent. for the money I have invested, give you rateably precisely the same interest upon the capital you lend me. That is to say, supposing I get 10 per cent. profit on the capital I have invested on the farm, you shall have 10 per cent. on your 5*l.* instead of 2*l.* So you will see, you will be in this position, that you will not get less than the 2*l.* per cent. you receive at present, if the farm yields more you shall have the benefit of it. Carriers, shepherds, &c., for instance, receive about one per cent. per week, and out of this seems to me to be by no means impossible that some may save 2*l.* a week, or the year, if you the 5*l.* if you desire it, plus 2 per cent., or whatever rate of interest arises from the year's farming operations. I am quite sure of this, that we shall never come to a satisfactory settlement of the relations between employer and employed until the latter, according to the amount of labour and capital he has invested, has an interest in good conduct of the concern."

His sole object, as he stated, was to give farm labourers a personal pecuniary interest in the conduct of the farm, and to endeavour raise them a little above the position they now occupied as labourers.

THE THAMES CONSERVATORS AND THE CHELSEA VESTRY.

AT the Chelsea Vestry, a letter was read from Payne referring to a statement in the *Builder* relative to the Thames Conservators and the conduct of the Vestry. In his letter, Mr. Payne said he considered the parish had been most unfairly treated by Thames Conservators and the Metropolitan Board, the mode of transit by the river from the parish had been hindered for years was taken away, and nothing given in return. The embankment had ruined the river from Swan at Chelsea to the old church. The river could be widened on the opposite side. This letter was considered by the Vestry. Mr. Marr's offer of accommodation at the jetty at Cremorne, but no action was taken.

ASPHALTE IN CHELSEA.

THE Chelsea Vestry having proposed to lay asphalt in the parish as an experiment, and either for the same at the end of twelve months, or require the asphalt company to take the asphalt up, the following companies and their terms in—Val De Travers 2 in. of asphalt on 6 in. Portland cement concrete 12*s.* per yard super, and remove it and re-lay the way at the end of twelve months, should the experiment fail. If it succeeds the company will receive 5 per cent. interest, provided the asphalt is in a good condition as when first laid down (this and reasonable expenses). The Limmer Asphalt Company offer to lay down 2 in. of asphalt on a concrete foundation, and keep it in repair for two years, at 12*s.* 6 per yard super. The vestry are to get the road ready for concrete, and to pay 60 per cent. of the charge by month after the completion of the work, 30 per cent. at the end of three months, and 10 per cent. at 12 months. The Barnett's Patent Asphalt Company offer to lay down 2 in. of asphalt on 6 in. of Portland cement concrete at 12*s.* the square yard.

The vestry, after some discussion, decided that as one of the companies had complied with the conditions of the vestry's proposal, they could not entertain their proposal, and that the companies be so informed.

BITUMINOUS BUILDING, PAVING, & GENERAL CONSTRUCTION.

A NEW company has been set on foot, with a capital of 100,000*l.* in shares of 5*l.* each, the prospectus of which, recently issued, extract the following particulars.

Mr. McCullagh Torrens, M.P., is the chairman. Mr. J. L. Norton, whose patents are to be appropriated, will be the managing director for five years; and the consulting architect is Edward Norton Clifton, of London. The primary offices are at No. 8, Old Jewry.

"The recent successful employment of bitumen in the formation of street pavement has been generally looked upon as the method in which asphalt can be rendered serviceable. That this notion, however erroneous, may be shown by reference to manifold uses to which asphalt was applied by the ancients: the existing ruins of buildings evidencing the important part which it occupied as a constructive material from the time of the Assyrians and Egyptians down to that of the Romans; this subject Mr. J. L. Norton, the well-known patentee of the tube-welding process in the Abyss expedition, has for some time past devoted attention, and has succeeded in inventing a perfecting system of employing bitumen, in the opinion of practical men, and as test experience, must lead to great change improvements in building and construction generally.

The various materials used in the past process have stood the test of years, and application and adaptation for the purposes intended may be gathered from the following summary:—

*Bricks.—These may be made in any locality, whether weathering, pugging, drying, or burning.

Moreover, of extraordinary durability, impervious to moisture, unaffected by frost or thaw, and ready for use within a few hours' time.

Building.—Resolutions and basement-floors are made of water and damp proof. Bricks can be laid at the rate of 3,000 to 4,000 daily per man, as compared with 700 to 800 under the present system. Ceilings and the inner side of walls can be prepared in a dry state. **Roofing.**—The rendered thoroughly water-tight, requires only half a number of slates as compared with the present system.

Roofing slating, woodwork, and other decorations can be carried out in a much more effective, expeditious, and less expensive manner than hitherto.

Paving.—Roadways will possess greater durability, and at the same time as clean and noiseless as the asphaltic always now in use; while horses will have as good a thing as on macadamised roads, both on levels and slopes, a desideratum not hitherto accomplished, and removing the great objection to asphaltic as at present. Tramways can be laid down at a reduced cost and increased facilities for construction and maintenance. Sides thus paved will save not only 80 to 70 per cent. of straw usually employed, but will greatly increase the use of the manure, as shown by the accompanying memoranda.

General Construction.—Reservoirs, tanks, basins, basent floors, embankments, sea-walls, &c., may be made at very large saving in cost of material, labour, and time, soundness and durability being unquestionable.

The operations of the company are intended to be carried on by the establishment of a manufactory in the neighbourhood of London for the preparation and sale of the patent construction material. The actual work of construction will be undertaken by the company to an extent sufficient to fully occupy its available capital; licences will be granted to builders, contractors, and others, to avail themselves of the patent processes.

A house built by Mr. Norton, on his patent system, may be seen at his private residence, Try Hill, Worplesdon, near Guildford; and various specimens of the paving are laid down the New Inn-yard, Old Bailey, where they have been subjected to most severe tests.

As regards the supply of bitumen, a contract has been entered into for the purchase of an estate of 60 acres of land in Sicily, containing various deposits of rich asphaltic rock.

Mr. Wyatt Papworth, architect, has reported favourably on Mr. Norton's systems of construction.

COVENT GARDEN THEATRE.

Admitting that Mr. Boucicault's magnificent production of the re-opening of Covent Garden as the National Theatre turns out to be a mistake, and that "Babil and Bijou" is after all but a fairy extravaganza, differing only in degree from many others, he has nevertheless placed, in conjunction with Mr. Planché, who contributed a number of most charming scenes, a very remarkable work of its kind, which some time to come will serve to delight the audiences the theatre has been fitted to give. The first two acts are a little tame, might be greatly improved if the whole of the actors were re-dressed, and Mr. Lionel Brough did exhibit a little more of his usual vivacity.

"The River of Life" is an excellent ballet; the ballet is beautiful (though the changes of scene might be more effectively managed), and the whole culminates in a spectacular display which leaves the spectators no wits for criticism. The composers have co-operated in the production of original music, two or three of which are being very charming, notably the boys' quartet to spring.

"Spring! Spring! gentle Spring!
Youngest season of the year!"

At night they take the horse by storm, and soon be sung in every part of the country as a vocal association exists. Wealth, skill, taste have been lavished, and the result is a success.

WEST HAM SEWERAGE.

Mr. Lewis Angell, the surveyor at West Ham, has represented to the public, through the Local Government Board, that great injury has been inflicted on the ratepayers by the refusal of the Local Government Board to sanction the proposed works of about 100l. per acre on upwards of 100 acres of land to be used for sewage disposal, with 50,000l. added for works, and put up in the open market, the ratepayers are to have had good ground for objecting to preliminary negotiations. Why Mr. Angell should have been angry because his arrangements were not approved he knows best.

The Local Government Board rejected the scheme on financial grounds, and not on the objection of sewage irrigation. The proposed works would have been ruinously costly to the

locality, and clarification of the sewage may serve at West Ham. The following has been forwarded to the Inspectors.

SANITARIAN.

August 27th, 1872.

Sir,—I am instructed by the Committee of the West Ham Ratepayers' Association to forward to you the following resolution, carried unanimously by them at their last meeting:—

That the best thanks of the Association are due, and are hereby tendered, to Mr. Rawlinson and Mr. Harrison, for their thorough and patient investigation into and hearing of the evidence respecting the West Ham Sewage Farm; also for their wise decision in relation to the same.

And to add,—
That in their opinion the wisdom of such decision is further strengthened from the fact that a portion of the said farm was sold, on the 26th of July last, for more than 30l. less per acre than the parish was about to give as the declared market value.—*Vide Essex Times of the 27th ult.*

(Signed) GEO. COOK.

Buxton-road."

THE DRAINAGE AT WINDSOR CASTLE.

The works now in progress for the drainage of Windsor Castle and Frogmore House are being pushed forward. The sewage, which is to be separated from the rainfall, will be conveyed from the Castle, the buildings in the Home Park, and Frogmore House, through earthenware pipes, 9 in., 12 in., and 15 in. in diameter, to a receptacle at the Royal Dairy, Frogmore; thence it will be taken through the main pipe, 18 in. in diameter, for about a mile across the Home Park and Manor Farm, in an easterly direction, to the pumping station, which has been built near the old wooden one over the navigation cut at Old Windsor. Owing to the large amount of water used at the castle the sewage upon reaching the pumping station will be in a very liquid condition. It will here be received in the straining chamber, which is 10 ft. by 7 ft., and then pumped through an iron pipe laid across the new bridge now in course of erection, and which will replace the old wooden structure, to the irrigation plot, a field of about fifteen acres, situated upon the Ham, at Old Windsor. The pumping apparatus will consist of a compressed-air engine of from 2 to 4 horse power, placed near the station; and it is expected that pumping for ten hours a day will dispose of twenty-hours' sewage from the Castle, Frogmore, and the Home Park, and pass it across the cut to the pipes on the Ham. These pipes will be furnished with openings about five yards apart for the purpose of irrigating the farm.

CHURCH-BUILDING NEWS.

Sheffield.—St. Marie's Church, Norfolk-row, has been re-opened, after being cleansed and painted by Mr. Robinson, of Broomhill, under the directions and superintendence of Messrs. M. E. Hadfield & Son, the architects. Advantage has been taken of the occasion to erect a reredos in St. Joseph's chapel, in memory of the late Miss Smilker, of Richmond, the entire expense of which has been defrayed by a friend of that lady. The reredos consists of canopied niches, carved, with arched at the sides, in Caen stone. The architecture is of the early part of the fourteenth century. It has been executed from the design of Mr. Charles Hadfield, by Mr. Earp, of London. The relieve and figures are from the studio of Mr. Pfyffer, who is a Belgian artist, though now residing in London. The centre niche, the only one at present filled, represents in relieve the death of St. Joseph; and in the sides are to be placed figures of angels holding musical instruments, and in the centre below a figure of St. Joseph. Above the reredos are two new stained windows, by Lavers, Barraud, & Westlake, of London.

Bristol.—The chief stone has been laid of a new church, to be called St. Andrew's the Less, upon the site of the old church in Dowry-square, Howells, which has been pulled down. As the plot of ground is in the line of a row of buildings, the sides of the church will not be visible. The principal frontage is in Dowry-square, and the back is in Green-street. The structure, the foundations of which have already been put in, is to be of Brandon-hill stone, with free-stone dressings. The style is of the thirteenth century. The church is to consist of a nave, aisles, and chancel. In consequence of the eastern and western ends being blocked with the walls of the adjoining houses, the only means of light to be obtained is from windows in the north and south sides. The church is divided into four bays, three of which will form the nave proper, and the fourth the chancel. The chancel opens into

a quasi-transept, built upon the old burial-ground, and that towards Dowry-square forms the vestry and organ-chamber. There is to be a tower at the south-west corner, with a slate spire, the total height of which will be between 90 ft. and 100 ft. At the side of the tower is a staircase leading to a gallery at the west end. The internal columns throughout the church are to be of blue Penman, with carved capitals. The church is to seat to be free. The sacristy and chancel are to be paved with Godwin's encaustic tiles, and the body of the church with Staffordshire tiles. The architect is Mr. J. C. Neale, and the builder Mr. R. J. Crocker, of Bexminster. The total cost of the building will be about 2,000l.

Ivinghoe.—The church of Ivinghoe, in the archdeaconry of Buckingham, has recently been opened, after a restoration by the diocesan architect, Mr. G. E. Street. The church stands at the foot of the Chiltern hills, a little eastwards of the London and North-Western line of railway between Cheddington and Tring. It is a cruciform building with central tower. The piers and arches of the tower and nave are of the thirteenth century, and the remains of the Early English building are also discoverable in the transepts and other parts of the edifice. The church was encumbered with high pews, and with a formidable western gallery, and the fabric generally greatly needed the hand of the restorer. The renovation, so far as it goes (the exterior still needing restoration), is what might be expected from the able architect.

Barton Moor Lane (near Manchester).—Emmanuel Church was re-opened by the Bishop of Manchester, on Saturday last, after undergoing alterations, comprising the addition of a chancel aisle and south transept, enlargement of vestry, erection of an entrance at the west end, and the entire removal of the south porch. The west gallery has been taken down, and the lower part of the tower, situated at the west end of the south aisle, and which formed the entrance to the gallery, is now converted into a baptistery. Stained glass has been put in the west window, by Hardman, of Birmingham. The inner vestibule is formed by a traçoered screen of pitch-pine, glazed with cathedral plate, in geometrical lead lights. A. The original accommodation was for about 500, which is now increased to 650, 280 of which are free. The church is in the Decorated style of architecture, and built as recently as 1858. Messrs. Horton & Bridgford, of Manchester, were the architects, and Mr. Cardwell, of Altrincham, was the contractor.

DISSENTING CHURCH-BUILDING NEWS.

Southsea (Hants).—The Congregational Church for the new district in the Dover-road has been completed, and dedicated. It is built in the Early Decorated period, and consists of nave, apse, east and west transepts, and aisles. The foundations are also put in for the tower in the north-west angle. The extreme length is 92 ft.; width, 62 ft.; height to ridge, 54 ft. The pewing is of pitch pine, and fitted to accommodate about 650 persons, with standing room for about 150 others. A school-room was first erected in the rear of the site, and worship has been conducted therein during the erection of the church. Mr. Stent, of Warminster, Wilts, was the architect; and Mr. Smith, Portsea, the builder. The heating was done by Messrs. Haden & Son, of Trowbridge; and Mr. Barnden was the clerk of the works to the whole.

London.—The foundation-stone of the new Welsh Congregational Chapel, to be erected on the site of the old one in Southwark Bridge-road, has been laid by Mr. Samuel Morley, M.P. The total cost of the chapel is to be about 5,000l., of which 3,000l. go to purchase the site; Mr. Thomas, of Swansea, is the architect; and Mr. Gough, of Chelsea, the builder.

Horsna (Yorkshire).—The foundation stone of a new Congregational Church has been laid here by Mr. E. Crossley, of Halifax. The plan shows the building to be entered by a porch and tower entrances, leading into a vestibule, from which access is obtained to the ground floor of the building, which consists of a nave and two shallow transepts, affording accommodation for 410 people; and with a small west gallery the building will contain sixty persons more. At the rear of the church, and opening from it, is placed the schoolroom, contiguous to which, and having an entrance into the church, is the minister's vestry. The church will be provided

with open seats having solid ends, and will be covered by an open-timbered roof, which (with all internal woodwork) will be lightly stained and varnished. The tower is to be placed on the south-west angle of the building, and to be surmounted by an octagonal spire in brickwork, to rise to a height of 91 ft. It is intended to place in the tower a clock and bell. The building is to be erected in bricks, and faced with white stocks, relieved by bands and arches of red stocks, and will have Yorkshire stone dressings to windows, &c. The glazing will be in cathedral glass in quarry pattern. The building will be in an early style of Gothic architecture, and erected by Messrs. Hulse & Stephenson, bricklayers; Messrs. H. & W. K. Barr, joiners; Mr. John Denton, mason; Mr. James Barr, plumber, glazier, gasfitter, and painter,—all of Hornsea; and Messrs. King & Co., and Dawber, of Hull, are contractors for the ironwork and slating respectively. The building is from the designs, and to be carried out under the superintendance, of Mr. Musgrave, of Hull.

Faversham.—The memorial stone of the new Baptist chapel now in course of erection at the bottom of St. Mary's-road has been laid by the Rev. C. H. Spurgeon. The building is to be 60 ft. by 37 ft., and is intended to afford accommodation for about 400 persons. The total cost will be about 1,800l.

Manchester.—The foundation stone of a new Congregational Church, to be erected in Broughton Park, has been laid. The site is near to Broughton Hall, and surrounded by three roads. The church will be in the Decorated style. It will consist of nave and side aisles, with transepts, the north aisle being terminated by a tower and spire, rising to the height of 175 ft. At the east end of the church there will be a lecture-room affording accommodation for 200 persons. There are to be vestries for ministers and deacons, with rooms appropriated for ladies. Accommodation will be provided in the church for 600. Separating the lecture-room from the church a Gothic screen, in the shape of an open Gothic window, is designed, and, as occasion may require, it can be so arranged as to convert the lecture-room into a part of the church proper during divine service. Ample provision has been made in connexion with the lecture-room for the requirements of social gatherings. Mr. S. W. Dankes, of London, is the architect. The arrangements for the building are not yet completed, no tender having been accepted, but it is expected that the cost will amount to about 12,000l.

Kenilworth.—The foundation-stone of a new Independent chapel, at Abbey-hill, Kenilworth, has been laid by Mr. Alfred Keep, of Edgharston, Birmingham. The chapel is to be built of brick, with Bath stone dressings and windows, from the designs of Messrs. G. & J. Steane, of Coventry, architects. The style is Gothic: the length about 70 ft., and width 31 ft. 6 in. The cost will be about 1,600l. The chapel is to hold 300 persons in the body, and 100 boys in the gallery. The builder is Mr. J. B. Stanley, of Leamington; and Mr. Jenkins, of Leamington, has the contract for fitting up with hot water.

Middleton-One-Rov.—According to the *Darlington Times*, the foundation-stone of a new chapel, for the use of all Christian denominations, has been laid at Middleton-One-Rov. The site faces the river, opposite the centre of the village, and has been placed at the disposal of the promoters of the new edifice by Mr. H. A. W. Cocks. The plans have been prepared by Mr. Robinson, of Darlington. From these it appears that the building will be 38 ft. in length by 24 ft. 6 in. in width, and will provide accommodation for about 168 persons. Utility has alone been considered, and not architectural beauty; the building will therefore be comparatively plain. It will be constructed of red brick, and faced with stone. The cost is estimated at between 400l. and 500l.

SCHOOL-BUILDING NEWS.

Widewater (near Rochdale).—The corner-stone of this school, which is to be used for day and Sunday purposes, has just been laid. The building will be of Parpout stone, with Yorkshire stone dressings. A method is adopted of utilising the whole of the class-rooms when required for public meeting purposes. The cost of the building will be about 2,200l. The architects are Messrs. Maxwell & Tuke, of Bury.

Wolverhampton.—St. John's Schools are now being enlarged by the addition of a room to

accommodate about 170 infants, with class-room attached. The building is one story high, of a plain description. The tender of Messrs. G. & F. Higham at 368l. including galleries, &c., was accepted, and the works are being carried out from the designs and under the superintendance of Mr. J. R. Veal, architect.

Halifax.—The foundation stone of the new Sunday School in connexion with the Harrison-road Congregational Chapel in this town has been laid by Mr. John Crossley, of Hopwood Hall. The site selected for the school is that portion of ground formerly known as Cadney's Croft, on the lower side of the chapel, and on which many circus proprietors have often pitched their tents on flying visits. But now the whole site is being filled up with dwelling-houses, and a considerable portion of it will be occupied by the new school. The contractors are—For the masonry, Mr. J. W. Wilson; joinery and carpentry, Mr. H. Dearden; slating and plastering, Messrs. Taylor & Firth; plumbing; Mr. Joseph Barker; hot-water apparatus, Mr. E. Lunby, all of Halifax.

Northampton.—New Roman Catholic poor schools for girls and infants, erected on the Lower Mounts, in connexion with the Convent of Notre Dame, Abington-street, have been opened here. The building is a two-storied one, its elevation from basement to ridge being nearly 40 ft. It is a plain red-brick erection, but is relieved with white brick and stone ornamentation for window arches and sills. The front entrance is also arched in stone, and it is intended to add a little further ornamentation at this point by placing a figure of the Virgin and Child under a canopy. The room on the ground floor is to be used for infants, and is fitted with a gallery; and that on the upper story for girls. Both schools have class-rooms adjoining; they are also provided with lavatories, and other requisite conveniences. The dimensions of the two principal rooms are:—On the surface floors, 49 ft. by 22 ft.; height of lower, 14 ft., and of upper, about 18 ft.; class-rooms (infants'), 22 ft. by 12 ft., and girls', 22 ft. by 19 ft. The rooms will afford accommodation for about 300 children. Mr. Hull was the architect; and Mr. Watkin, whose contract of 910l. was the accepted one, was the builder.

Stoke Prior.—New schools, erected by Mr. Corbett, of the large salt-manufactories, have been opened here. The building is to serve as schoolroom for the children of his workpeople, a place for holding divine worship on Sundays, and a lecture-room or hall for use when occasion requires. There is also attached a dispensary, in which a supply of medicines and appliances in case of accidents will be constantly kept, the whole to be maintained at the sole cost of Mr. Corbett. The edifice is built from designs by Mr. M. Bohill, and was erected by Mr. Corbett's own workpeople, on a site given by him in Shaw-lane, near to his works. It is of the Gothic order of architecture, and the lecture-room is 90 ft. by 36 ft.; class-room, 36 ft.; infants' school, 28 ft. by 21 ft.; height to the wall-plate, 16 ft.; the roof (an open one, stained and varnished), rising 21 ft. to the ridge, with an ornamental bell-tower in the centre, and a tower over the front porch. The large room can be divided, so as to form two school-rooms. The playground is 180 ft. by 150 ft., and the school will accommodate 500 children, attached to which is a residence for the schoolmaster and schoolmistress. The cost of the building amounts to about 3,500l.

Books Received.

Health and Comfort in House Building; or, Ventilation with Warm Air by Self-acting Suction Power. By J. DRYSDALE, M.D., and J. W. HAYWARD, M.D. London: Spon. 1872. In a previous volume we printed part of a paper by Dr. Hayward, read at a meeting of the Liverpool Architectural Society, descriptive of a house built by him, with special arrangements for warming and ventilating. The volume now before us is an elaboration of this paper, made in conjunction with Dr. Drysdale, who had previously erected a house in the suburbs of Liverpool, in which he had attempted to meet many of the defects of ordinary houses. The scheme worked on may be said to be, plenty of fresh air admitted to a heating chamber in the lower part of the house, and thence supplied to the various rooms through openings in the cornices,—the collection of the foul air from the various rooms,

into a foul-air chamber formed in the roof, whence it is taken down to the kitchen fire, and passed off to the air by an air flue formed and adjusted to the smoke flue. The due adjustment of the openings for admission and emission, and the prevention of accidental ventilation which would interfere with the results of the calculations, course comes into discussion as difficult points of the problem to be solved. All the flues, they are provided for a probable maximum attained only on extraordinary occasions, may be controllable by valves. The difficulty "squaring" all the antagonistic circumstances must be great; nevertheless the authors state the result of practical experience, that "in houses erected in accordance with these details the whole scheme works with an accuracy sufficient for all the requirements of practical utility." In an appendix the various methods of calculating draughts in hot-air flues are viewed, several formulae being given, and there is a record of some original experiments performed in one of the houses. The volume will be of value by those who know how to use it.

A Few Lines on the Hunter, the Charger, and the Roadster. By WOODMAN. London: Sampson, Low & Co.

The writer of this little book is evidently "horsey" man, in the best acceptance of the word: he is fully impressed with the importance of his subject, and dwells on the good point of a horse with all the affection of a young lover for his mistress. Many persons who drive work horses know nothing about them, and would be glad to get a little knowledge on the subject, but are deterred by the largeness of books in which it is treated of. To such would recommend Woodman's "Few Lines," which will be found a very good introduction.

VARIORUM.

AMONGST reprints of papers and lect. touching the sewage question, we have to notice a paper read before the Philosophical Society of Glasgow, "On the Drainage and Sewage of Towns," by John Phillips, C.E., the substance of two lectures read before the Literary and Philosophical Society of Nottingham, by M. O. Tarbotton, C.E., entitled, "Sanitary Legislation and Science, with especial regard to Sewage and Water-Supply," published by E. & F. N. Spon. Mr. Phillips before now set forth his views in our paper. Nevertheless, we give a *résumé* of the deductions he arrives at in the paper now published:—

1. That it is expedient that the subsoil of a town should be thoroughly graded and vented, and the houses erected thereon free from damp.
2. That it is expedient that the surface water should be collected into channels, with which the subsoil should be carefully excluded, so that the water conveyed thereby should be discharged into the water-courses or rivers in a practically innocuous dilution.
3. That the sewage drainage should be removed separate channels or pipes of dimensions not large as necessary for its passage, and should be conveyed outside the towns by gravitation or other means, and there clarified by chemicals in tanks, and afterwards distributed by irrigation over land made fit for its use by deep surface pulverisation and deep drainage, or similarly clarified before permitting to enter a stream or river.
4. That a system of sanitary police be established, duty it should be constantly to collect the horse droppings and surface refuse, which should be removed and deposited upon the land, and, further, to render the surfaces perfectly clean by continually sweeping the occasionally washing them.
5. That, with the view of reducing the volume of water for irrigation and filtration within manageable limits, so that the water-supply fittings, and the supply to closets, should be supervised, in order to prevent leakage and waste, and needless use of water, that the fittings in houses and factories should be purged by the rain and subsoil water into the streams and rivers.
6. That, with the view of more readily adopting a system of sewerage which I have advocated, if a system of sewage farms be obtained, upon which sewage should be discharged by irrigation after passing through the necessary preliminary stage of extraction of solid matters from it.
7. That, with the view of effectually preventing the escape of noxious gases into the houses, it should be incumbent upon the owners or occupiers to provide pipes from the sewage pipes, carried above the highest part of the houses, away from chimneys and attic windows.

—"The Hours of Labour" (Vickers, S) is the title of a paper read at the Century under the auspices of the Labour Representation League (Mr. Brassy, M.P., in the chair), George Eccarins. The object of the writer is to show that a general reduction of the hours of labour is necessary on social, economical, and moral grounds, and is demanded by the working classes all over the world. The w

are well and fairly stated, and the pamphlet deserves the attention of those who erect themselves in the question.—*The Utmost Magazine*.—New Series. September, 1872. In this issue of the *Utmost Magazine* there is an account of Page's revolving paddling-mill, with an illustration. The apparatus, which is interesting from its simplicity, is already in use in several British ironworks, though only produced by Mr. Page, the engineer, to the fish ironmasters, about three or four months ago. The belt admits of its adapting itself with to the great variety of positions requisite; the paddling-bar revolves 300 to 800 times a minute with white cast iron, and 800 to 900 for grey. Amongst the other papers is a brief one on Port Sanitary Authorities.—Prison Congress of London, July, 1872. Edited by the Howard Association for distribution at home and abroad. From this tractate we extract the "general conclusions of the Congress."

The general nature of the final recommendations of the Congress is thus summarised in the concluding report of the Executive Committee:—

"Recognising, as the fundamental fact, that the protection of society is the object for which penal codes exist, the committee believe that this protection is not only consistent with, but absolutely demands, the enunciation of a principle that the moral regeneration of the prisoner should be the primary aim of prison discipline. A progressive classification of prisoners should be effected in all prisons.

"The treatment of criminals all disciplinary punishment that inflicts unnecessary pain or humiliation should be abolished.

"Impel a prisoner to self-exertion should be the aim of prison discipline, which can never be achieved unless they succeed in gaining the will of the State.

"Work, education, and religion are the three great forces which prison administrators should rely on."

"The gathering may be considered to have been wholly successful, and will probably be followed up by another a few years hence.

Miscellaneous.

Ethics of "Tenders."—*The Globe* has a piece of sharp practice in connexion with "tenders for contracts," which, if true, is highly disgraceful. In one of the London parishes it was found necessary to contract for paving and watering the district. The number of firms in the metropolis capable of undertaking such a work is necessarily limited, and it is stated that their representatives, in consequence of the advertisement for tenders, gathered together, and decided among themselves to accept the lowest bid best suited to his interest; "the others sending in tenders as such that they must inevitably be refused. It is an effect, if the facts stated are correct, a combination to defeat the object of advertising tenders altogether, and to control the market. The contractor was not forthwith decided on, the contractors would withdraw their tenders, and, on excuse or other, make a much higher bid when further called upon. There was, consequently, in the face of this Sibylline prophecy, but one course to adopt,—to accept the lowest tender, and to submit to the enforced monopoly.

Disinfecting Dwelling-rooms.—Some experiments prove the defectiveness of the dry process of disinfecting dwelling-rooms, and infectious and contagious diseases, without a same time stripping of the paper and washing the walls and painted surfaces with soda. In Manchester nearly all the men employed in this duty have had fever or infectious disease, although the houses previously to their having been disinfected with chlorine, carbolic acid. It is believed that contagious matter is retained in the paper, particularly when a number of layers have accumulated on the walls. The coats of paper, they describe a fusty which of itself may possibly give rise to the recurrence of fever in the same house. In Manchester, it is said, has greatly increased since the introduction of this mode of cleansing.

Infirmary for the Parish of St. Paul.—At a meeting of the board of health, held on Wednesday last, the resolution passed at a previous meeting, postponing the commencement of the new building for a period of six months, was rescinded, and the order of Messrs. Thomas & Co. accepted. Orders are to proceed forthwith.

Fresh Works, Dover Harbour.—At the last meeting of the Dover Harbour Board, a decision was arrived at in reference to the improved scheme of Continental communication proposed to be effected by the adoption of the designs of Mr. Hawkshaw, whereby the harbour will be deepened so as to admit steamers of a draught of not less than the Holyhead class, and a certain other improvements effected, including a covered way extending from each of the railway stations to the landing wharf, so that passengers may embark and disembark with perfect comfort, whatever the condition of the weather. The plan extends the harbour beyond the present entrance, and will cost in round figures some 200,000*l.* The improvements will include the covered way and station as above referred to, which will be used in common by all the railways; the erection of a Custom-house, if necessary; and the provision of any other appliances requisite for the due accommodation of the public, and for averting the possibility of confusion and inconvenience which now sometimes arises.

Discovery of an Egyptian Papyrus 3,000 years old.—A papyrus has been found in a tomb, by Mr. Harris, editor of the *Hieroglyphical Standard*. As described, it forms a roll 134 ft. in length and 1 ft. 4 in. wide. It dates from the end of the reign of Rameses III. (the Ramses of Herodotus), and contains valuable information relative to the political and religious civilisation of Egypt at that distant period. It is written in hieratic characters,—a mixture of hieroglyphics and signs for letters and syllables. The text is an allusion to Rameses III., "to his people and all the men on earth." Rameses therein recounts how he re-established the ancient Egyptian worship, rebuilt the temples, and endowed them with munificence. The religious movement alluded to relates to the period of Moses, to the monotheistic worship founded or restored by him, and comprises all the events which terminated in the ruin of monotheism in Egypt and the exodus of the Jews. This papyrus is, consequently, held to be of the highest interest for the study of the Mosaic religion and legislation.

Science and Art Instruction in the North of Scotland.—Classes for instruction in science and drawing are now very general in many parts of England and Ireland; but these classes have not met with much success in Scotland, except in a few large towns. The long-expected Education Bill for Scotland, and the naturally cautious habit of the people in adopting new subjects and ideas in education, have operated somewhat unfavourably. The Educational Institute of Scotland has held two or three meetings of teachers, at which the subject has been very fully discussed, and favourably received. In the northern counties most of the parish teachers are Masters of Art, and can receive payments for science-teaching without further examination. This will probably lead to the establishment of several classes during the coming winter. The papers also report public meetings at Aberdeen, Dundee, Banff, Cullen, Inverary, Irvine, Coatbridge, and other places, which have been addressed by Mr. Buckmaster, with very encouraging results.

Memorial of Sir John Simeon, Bart.—This memorial will shortly be commenced upon the selected site, at Newport, Isle of Wight. The proposed memorial consists of a cross about 10 ft. in height, placed upon a rectangular basis about 5 ft. high, which, in turn, rests upon a large mass of stone and a step. The whole height above the ground-level will be not less than 18 ft. The cross itself has a plain, solid stem and arms, at the junction of which it bears a large quatrefoil of incised work, containing the well-known monogram of our Saviour, "I.H.S." The base upon which this cross descends is the most ornamental portion of the structure, being on each side formed into a gable, covering a decorated niche filled with floral carving. Pinnacles complete each angle of the base. Below this recommences the plainer work, which forms the substructure. The memorial is to be executed in hard white stone, probably Portland, under the superintendence of Mr. Thomas Woolner, A.R.A., sculptor.

Chapel of St. Paul's, Stony Stratford.—We are asked to add to the account we gave of this building in our last, that it is warmed by means of pipes placed in trenches and covered with trellis, Messrs. J. L. Bacon & Co. executing the work.

Steam Power on Canals in America.—Although the offer of a prize of 100,000 dollars for the best mode of propelling canal boats by other means than horse-power appears to have stimulated invention, it looks very much as if it were likely to prove a failure, for the present at least, in eliciting any practical plan of propulsion that will meet all the required conditions. The commission appointed to test the inventions and make the award assembled in Albany a few days ago. The commission, after arguments by the various competitors, decided to modify the original rules, and adjourned to meet in Syracuse on the 1st of October. The final award will not be made until the close of the year. Several models have been prepared, of which one presented by Mr. Chase, of Portland, Maine, appears to have been the most novel and effective. It consists in the application of air, by means of a 15-horse-power engine and a rotary blower, under the stern of the boat, which is made in the shape of an inclined plane. The air is liberated by pipes against the stern, which is thus propelled in one direction, and the water in another.

Another Gas Explosion.—Another explosion, somewhat like that lately described, but of a more serious nature, has occurred in the residence of Mr. T. Eastlake, situated in the Temperley-road, Balham-hill. It seems that three persons were sitting in the dining-room on the ground-floor front, when the gas must have escaped from some parts of the chandelier, and not being detected by any of the inmates, had accumulated along the ceiling until it reached the burners, when the vapour became ignited, and an explosion of a loud and fearful character followed, prostrating and burning the three unfortunate occupants of the room, and at the same time blowing into the roadway the windows and igniting the furniture, &c. The wall of the drawing-room on the first floor was split and thrown out of its perpendicular, and eight other rooms in the building were also severely damaged by the force of the explosion. Fire-engines soon extinguished the fire, but the damage done is very considerable.

Twickenham Drainage.—The liability of the local authorities of Twickenham to pay a fine of 100*l.* a day for neglect in regard to drainage began on Friday, the time allowed by the Conservancy Board having expired on Thursday. At a special meeting of the Twickenham Local Board of Health, held the previous evening, Mr. Donnithorne, J.P., in the chair, the board having been informed by their legal adviser that the members themselves were personally liable to the penalty, the following resolution was carried unanimously:—"That the plans prepared by their surveyor for the drainage of the parish, including the river-side embankment, be adopted, subject to the approval of Mr. Lawson (the engineer who had been consulted by the board), and that such approval being obtained, the necessary steps be taken to obtain the requisite power to borrow the funds required."

Sewage Utilisation.—The Leeds Town Council Sewerage Committee have reported that they had carefully considered the process of the Native Guano Company, and that a contract had been entered into, after taking the opinion of Mr. Hawksley, for the first section of the necessary works, comprising a reservoir 618 ft. in length, with twelve compartments, enabling the sewage to flow at the rate of 12,000,000 gallons per day. The cost will be 14,950*l.*, and the committee hope to have the whole in the contractor's hands in the course of a few weeks. The present works have been in full operation since October last, treating the sewage at the rate of 1,500,000 gallons per day of twenty-four hours, and the effluent water has been remarkably clear, it is said, and highly satisfactory to the committee.

The Air in Public and Private Buildings in Leicester.—Three instructive tables, with remarks by Mr. Richard Weaver, C.E., F.C.S., are given in the *Lancet*. The analyses given in the tables were undertaken during the past winter months, and test the condition of the air of manufactories representing the staple trades, and of places of public resort, schools, and private dwellings, in the busy town of Leicester; also the cubic space per individual, the number of persons present, and of gas-jets burning at the time of observation, with the internal and external temperatures, and the provision for the ventilation of rooms.

Statistics of Iron.—The total annual production of iron is estimated at about 11,125,000 tons for the whole world in 1863, and must have increased greatly in more recent years. At that time England produced over 5,000,000; the United States of North America over 1,500,000; France nearly 1,125,000; Prussia rather more than 1,000,000; Belgium not quite 500,000; the Austrian Empire a third of a million; Sweden and Norway nearly 400,000; Russia and the Zollverein nearly 500,000 tons between them, of which four-sevenths came from the former; Spain and Italy made up nearly 100,000 tons, two-fifths from the latter. The increase in the production of the United States in the five preceding years was nearly 64 per cent.; in Prussia, 36 per cent.; and in England, in six years, 26 per cent.—*Mechanics' Magazine.*

Wrought-iron Riband Columns.—The Riband Telegraph Post Company appear to be contributing their share towards the realisation of the principle in construction of a maximum of strength with a minimum of material. Their wrought-iron riband pillars are both economical and ornamental, and will no doubt come into use in other forms than that of telegraph-posts. For railway-stations, verandahs, conservatories, and shedding they seem to be well adapted. As to their relative strength, or the weight of roof they are capable of carrying, some particulars will be found in our advertisement columns. Compared with cast-iron pillars, the riband wrought-iron ones are said to be little more than one-third of the cost, as well as of the weight, while they are decidedly more ornamental.

The Liverpool School of Science.—The committee of this school have just issued the eleventh annual report, in which they say:—The number of students is much the same as in the previous session. Out of a rather smaller number of students, eighty-nine have passed the examinations in May, 1872, against 43 in the previous year, and of these the greatest proportional increase has been in the higher stages, namely, advanced and honours. The committee draw attention to the fact that three of the teachers were formerly pupils in the school, and two others have received instruction in similar institutions. The treasurer's report shows a considerable deficit this year, owing to the annual subscriptions falling far short of the required amount.

Proposed Improvements in Leeds.—There are several improvements contemplated by the Corporation of Leeds in their new Act of Parliament. Power has been taken to widen various streets. The powers of the Corporation for the compulsory purchase of lands for any of these improvements must be exercised within five years of the passing of the Act, and authority is given to borrow 100,000*l.* (in addition to the money borrowed under the Act of 1863) for the purposes of the improvements authorised by the new statute. It is to be hoped the Corporation will be well advised.

Farnham.—The work of building is proceeding extensively in this town, and considerable improvement is especially being manifested in South-street and the Borough. An Assembly room, contiguous to the Royal Deer, has just been commenced, of which Mr. H. Harding is the architect; while the Wesleyan and Congregational chapels in the same road are progressing. The extension of Mr. Ransome's establishment, at the corner of South-street and the Borough, will effect an improvement in the appearance of that locality. Mr. Harding is also the architect of this work.

Yorkshire Archæological Society.—This Society had its annual trip this year to Ripon, where it was received by the mayor. Fountains Abbey was visited, and its details explained by Mr. Edmund Sharpe, M.A. Ripon Cathedral was afterwards inspected; descriptive remarks and a plan of each being given on the programme of the day's proceedings. A special first-class train ran to accommodate the members and friends, and thanks to the active exertions of Mr. Fairless Barber, the secretary, all passed off pleasantly and with success.

"Notes and Queries."—Sir Charles Dilke has become the proprietor of our useful and amusing contemporary, *Notes and Queries*, and has confided the editorship to the able hands of Dr. Doran, F.S.A. Mr. W. J. Thoms, its erudite and estimable founder, after conducting it for twenty-three years, had come to desire relief from the continuous work of editorship.

Harbour for Jersey.—The foundation-stone of a new harbour for Jersey has been laid. The works comprise a breakwater on the west, and a landing-pier on the east of the present harbour, to enable the mail packets to land passengers at all states of the tide. The estimated cost of the undertaking is 254,000*l.*, and it is to be carried out under the direction of Sir John Coode, who was engaged on the Portland Breakwater.

Fall of a Railway Viaduct near Plymouth.—An accident has occurred upon the Cornwall Railway, near St. Germans, ten miles from Plymouth. The line crosses the river Nottor by two long viaducts, one of which gave way. The accident, however, involved no consequences more serious than several hours' detention of trains.

American Patents.—The Patent Office has had a most extraordinary development within the past five years. Up to 1850 the patents but once reached 1,000 per annum. From that period until 1860 no year showed 5,000 patents; while the average of five years past has been over 13,000 per year.

The Local Board of West Ham District have determined to erect the necessary appliances for testing on a large scale General Scott's lime and cement process for treating sewage. Their resolution is based on the recommendation of their surveyor, Mr. Lewis Angell.

Cannon's Gas Regulating Cocks.—These cocks give the means of satisfactory control over the gas supplied to various floors of a building. They are made so shapely, too, that they need not be hidden away, but can be placed in positions where they may be easily seen.

West Ham Park.—A movement has been started in Stratford in favour of converting West Ham Park into a place of public recreation. It is stated that the land can be purchased for 20,000*l.* A committee has been formed to raise a fund for the purpose.

Technical Museum in Russia.—Russian journals have announced the opening at no distant time of a special technical museum for children. This museum is intended to teach the young the processes of manufacturing the various objects used in daily life.

Copper.—The *Financier* states that the price of copper was on Tuesday officially reduced as follows:—Manufactured, 110*l.* per ton; tile and tough copper, 103*l.* per ton. This shows a fall of as much as 8*l.* per ton as compared with the last officially fixed prices.

Mathematical Instruments, Drawing and Surveying Instruments of every description of the best possible make, at the most direct prices. List post free. These goods can be had by direct sale.—Address, GREAT TERNACLE, BARNHURST, London.

J. & W. E. ARCHBUT, 201, Westminster Bridge-road, Lambeth, near Ashtley

Manufacturers of the Original Patent Gravel Dam, Perished List of Prices, 10 inch Dump, 12 inch, 14 inch, 16 inch, 18 inch, 20 inch, 22 inch, 24 inch, 26 inch, 28 inch, 30 inch, 32 inch, 34 inch, 36 inch, 38 inch, 40 inch, 42 inch, 44 inch, 46 inch, 48 inch, 50 inch, 52 inch, 54 inch, 56 inch, 58 inch, 60 inch, 62 inch, 64 inch, 66 inch, 68 inch, 70 inch, 72 inch, 74 inch, 76 inch, 78 inch, 80 inch, 82 inch, 84 inch, 86 inch, 88 inch, 90 inch, 92 inch, 94 inch, 96 inch, 98 inch, 100 inch.

W. & E. HERBERT, MODELLERS, 82, EASTON ROAD, N.W. Manufacturers of the late JOHN HERRING, Street, Dr. BONS of the Ceiling Flowers, Royal Arms, Street, Banners, Vases, Terrazines, Columns, Corinthian Capitals, and every description of Ornament for Internal and External Decoration in Plaster, Wood, Marble, Portland, and all kinds of Cast.

Gelatine Moulds made for the Trade. White Fine Plaster for Casting, 2s. 6d. per cwt. Buff Coloured ditto, 2s. 3d. per cwt.

Poloncau and Seys ASPHALTE. ESTABLISHED 1820. The covering of Flat Roofs, Pavings and Flooring of every description in places subject to damp and vermin. This is now extensively used. Has been shown above. For Estimates in detail, preventing the generation of ammonia. For Estimates in detail, preventing the generation of ammonia. For Estimates in detail, preventing the generation of ammonia.

HANCOCK'S INDIAN RUBBER PIPES for WATERING GARDENS, LAWNS, &c. Made in 60 feet lengths. Hose reels (iron or galvanized) for the hose. Orders promptly and illustrated. JAMES LYNE & Co. Vulcanised India-rubber Works, Goswell-mews, No. 26, Goswell-road, London, E.C.

WINDOW BLINDS. E. ADKINS, 132, HIGH STREET, ST. JOHN LEPENT'S PARK, LONDON. OUTSIDE SUN-SHUTTERS AND ROLLERS TO THE TRADE. Patent Self-adjusting Venetian Blinds, requiring no Fastening for a Minute. Illustrated List of Prices post. Export and Shipping Orders with attention.

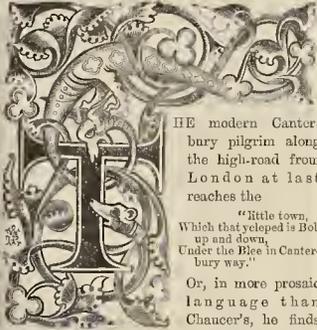

BELLMAN & IVEY, GENERAL AND ORNAMENTAL PLASTER SCAGLIOLA MARBLE and SUPERIOR PLASTER OF PARIS. This Plaster, made expressly for their own Business, is of quality, and its extreme lightness in weight insures a saving of 10 per cent. in use, from its covering one-third more superficial area than other Plaster.

PRIZE MEDALS. were awarded Messrs. Bellman & Ivey for their Work. Exhibition of 1861, and again in 1862. PLASTER WORK, 10 VINE STREET, LIQUORISTS. SHOW ROOMS and OFFICE, 4, BUCKINGHAM STREET, FITZROY SQUARE, LONDON.

The Builder.

VOL. XXX.—No. 1545.

Canterbury Cathedral: the Fire and its Effects.

THE modern Canterbury pilgrim along the high-road from London at last reaches the

"Little town, Which that yeloped is Bob up and down, Under the Bise in Canterbury way."

Or, in more prosaic language than Chaucer's, he finds at Harbledown the

last ascent and descent in the road that is to lead him into the city,—in the valley of the Stour. In the course of that descent he probably reflects that his predecessors, in the days of quaint dresses, caught sight on the very hill-brow of the huge temple now hidden therefrom by pleasant planting. When the great pyramidal mass is suddenly seen, outlined against the green downs in the distance,—the central tower relieved against, let us say, the transparent pearly clouds lighted through by the early morning sun,—the spectator is on the produced east and west axis;—the building, seen from the raised road, and as rigidly symmetrical as a soldier at drill, with its exact balance approaching an architect's elevation more nearly than anything else in nature. Thus, he does not from this historic road get in the distance any indication of the something strange that, in the shape of a large, intensely black gap, attracts the attention of another wayfarer approaching from Sandwich;—when imitating in the main Cour de Lion's (March, A.D. 1194) pedestrian method; but, in vagrancy of soul and freedom from traditional disciplinary poas, following the prospect-commanding footpath over the quiet sheep-haunted downs.

Passing eastwards along the broad gravel, skirting the trim grass sward round the south walls of the cathedral, the eastern arm is reached after going by the first transept, running north and south from the majestic Bell Harry Tower over the crossing. Five bays from the tower the second transept comes forward (about 10 ft. internally) beyond the well-pronounced western cross, and as tall and forcible as the choir itself. The cathedral, with these and other bold projecting masses, conveys on the outside the impression of immense internal area,—an impression hardly justified in the interior owing to the many differences of level; and, perhaps one may add, that the building rarely looks all its prodigious length, for which accidents of site and the comparative shortness of its western limb are of course also in part responsible. About in a line with the centre of the piers between the second and third bays, moving still eastwards from the south-eastern transept, the ridge of the steep-pitched, lead-covered roof which the eye has followed from the central tower, and down the transept and round to this point, suddenly ceases; and a ragged, raking line of leadwork, broken by some half-dozen blackened rafter-couples jutting out above

eventually meets the lead parapet about a bay and a half further to the east. A dark cavernous space shows itself when looked at from beyond the eastern wall of Becket's Crown. The two bays eastward of the south-eastern transept have their sides parallel to the axis of the building; then,—as all who have once caught sight of the inside of the choir will not fail to recollect,—the side walls begin to converge. As the chapels of St. Anselm and St. Andrew,—excellent chapels beyond the choir aisle of the (shorter) older church,—were not to be removed, they "would not allow the breadth of the choir to proceed in the direct line." These converging walls last for two bays, when the present screen, forming, what we will call, the east end of the choir, is reached,—for two bays further the walls are ruled by the axis. A creak outwards of 6 in. each side corrects the passage, and we reach into the semicircular apsidal end (divided into five sections) of the Trinity Chapel. Practically, it is from the beginning of the bold convergence of the walls that the east part of the choir is roofless; the vault (not a roof, but a ceiling) of course, however, remaining intact over both choir and Trinity Chapel. From the Green Court on the north,—looking over the ivy-covered ruins of the Priory, and consequently from a greater distance,—the details are seen to be similar; but the eye, guided by the imagination, is able to fill in among the lines of that less angular perspective the missing 80 ft. of straight ridge, and to trace in air the sloping line of the semi-cone as it stood aforesaid black against the morning sun.

Looking up inside the Trinity Chapel, the vaulting is seen to have absorbed some of the water profusely poured out above it. The *tas-de-charge* and the ribs are of Caen stone, the filling-in of clunch and Falaise tufa, whitened to a surface on the underside. The bosses, pierced with cradle-holes,—one in the cross arch at the spring of the apse, and another a bay and a half westward,—happened to be well placed for the passage of the liquid lead dripping on the back of the vault from the blazing roof. On the rough decayed surfaces of the Purbeck slabs that occupy the site of the Becket shrine, fragments of the lead remain; but on the patterned pavement, the "Opus Alexandrinum,"—covering the floor immediately to the east of the present choir-screen,—there are no traces of the several pounds of metal that streamed down there. Through the holes further westward water came, sufficient to float over the surfaces of the polished Purbeck floor, and the steps of the altar; and alarmed the well-intentioned assistants into removing the altar, tearing up the altar rails, unlining the pulpit and throne, and seeking out the readiest means of sawing the fixed seats from their cills. The reliques of the Black Prince attached to a beam (over his tomb), at the level of the tops of the caps of the piers on the south side of the Trinity Chapel, were all taken down, and placed away in safety. The shield, chapeau and helm, surcoat, laton gauntlets, and leather scabbard, with the buckle and fragment of belt attached, have all been replaced in the position they have so long occupied,—a concession to the feelings of the very numerous visitors brought here by the circumstances and the holiday season. It is to be hoped, however, that the suggestion of Mr. A. Hartshorne will shortly be acted on, and a strong glass case, in the aisle of the chapel, preserve from air and moisture the perishing crimson velvet, brown with age, and the other perishable materials, that in about five years' time will for five centuries have been among the treasures of this cathedral; and are now the most ancient and complete remains of the kind in existence.*

* It has been asserted several times recently that the reliques have clung to the beam undisturbed for centuries. This is, however, an error. The leopard (or lion) crest—of pasteboard, coated with plastic material, in which the

The eastern end is said to have been filled with steam from water rushing through with and falling on the molten lead on the floor; and in time by every opening wood-smoke reached the inside of the building, filling all down to the west of the nave with a blue haze. The stained-glass windows on the north side of the Trinity Chapel—brilliantly lighted up from the outside by the fierce light above—and streams of luminous metal, 10 ft. in length, rushing down at intervals;—the whole, viewed from the south-eastern transept, is said to have been a scene of weird awful beauty.

Mounting and passing along the roof of the south-eastern transept, all that will stand by itself is seen still in its place,—charred timbers, bending parapets, &c. Of the roof over 80 ft. in length, by widths of 50 ft. to 35 ft., the few beams and fragments here and there, a mass of charcoal on the green below, and black powder profusely scattered on every lower roof, are the remains. The back of the vaulting is being covered with a strong cement rendering, so that this small model of rounded chalk-downs may throw any rain-water well into the hollows of the vault pockets. These,—never more than 5 ft. 6 in. deep below the backs of the vault ridges,—have little windows to light them (3 ft. 8 in. by 11 in.); and through these, now deprived of glass, the water will run out on to the aisle roofs. As the liquid metal ran down the vault slopes into the pockets, and formed a level floor when it reached these window-cills, it enabled fresh melted metal to find its way out on to the water tables of the buttresses immediately below; and further down (in parts 4 in. thick) on to the flying arches conveying vault-thrust to the outside of the aisles. Dropping tears in shining metal, knotted interlaced tails, and many another eccentricity, are here to be found, where froth melted metal has run in among cooled and cooling streams. A solid east-lead table raised out of one of the pockets is seen by a moment's calculation to weigh 1½ to 1½ ton (in parts ½ in. thick). It must be slit up into lumps not much over 1 ft. super. before it can be with comfort (and safety) conveyed to the hoist at Becket's Crown. The walls show 3 ft. 7 in. wide to the splay of the cornice, situated about 9 in. out from the face of the wall below. On the outer edge the wooden^o lead-covered parapet stood,—from 3 ft. to 1 ft. 11 in. high where remaining on the north side, giving the awkward raking lines so judiciously replaced by the horizontal top in there constructed south-eastern transept roof. It was from the covering strips of the tops of these parapets that the stained glass windows ran their greatest risk. When the insides of the parapets were burnt, these long lead ribbons hung over and flapped to and fro. (Probably, however, not a score pieces of the glass have been knocked out by all the accidents.) When the parapets burnt through—the lead from the outer surfaces fell on window-cills, strings, hood-moulds, and aisle-roofs; bucketfuls of what looks like short lengths of the wire for silver filagree have been gathered from the lower levels. Inside the parapet two wall-plates carry heel-pieces (or sleepers) 7 in. by 6 in., projecting inwards 15 in. to 2 ft., according to position; inclined struts, 6 in. by 4 in., start upwards from their ends, forming "knees" at the bottom; rafters, 1 ft. 8 in. apart, are 7 in.

shaggy locks are moulded—fell off the chapeau about twenty years ago, and was carefully re-connected. Twenty years ago the jupon was taken down and lined with leather, in order to keep it from falling to pieces. About forty years ago, when the Duchess of Kent brought the Princess Victoria to the cathedral, all were taken down, and placed so that the heir to the throne of England might touch and see in detail some of the personal and other reliques of one of the most famous members of her family.

* A suggestion by Mr. E. B. Denison,—“It would not cost much gradually to replace all the wooden gutters of the cathedrals with stone, and then such accidents would be impossible,” is not without its practical value. Stone parapets have, however, not been contemplated in the roofs at Canterbury. The space from the front edge of the cornice of the choir (on the level of the top of the wall) to the starting of the roof-slope [12 in. above the cornice] is only 14 in.

by 5 in. x 4 in. by $\frac{3}{4}$ in. longitudinal battens, 3 in. apart, support the lead; collars and inclined braces complete the roof. The whole of the timber is oak and chestnut, and very dry.

Seeing thus the shape of the works, the story of the fire in its best authenticated forms, seems very simple. A plumber and man on Tuesday,* the 3rd of September, were at 10:30 a.m. at work in the south gutter, over the Trinity Chapel. The tool-bag must have stood over the fourth pier castwards from the transept, as the tools have been dug out of the lead in the pocket below. The fire began, however, somewhere between this point and the springing of the apse. The plumber, by the way, is stated on all hands to be a very steady, trustworthy man, seven or eight years in his present employ. A peculiar "whirring sound" inside the roof, led them to go inside, when they found three of "the knees," described above, on fire. The best conjecture seems to be that the dry twigs, straw, and similar debris, carried into the roofs by birds, and which it has been the custom to clear at intervals out of the vault-pockets, had caught fire from a spark that had in some way passed through the roof covering; perhaps under a sheet raised a little at the bottom by the wind;—the surface of the pocket at the spring of the apse was only 32 in. under the timber-knee. After efforts to extinguish with water, with additional water fetched up from the crypt, and to "rub out" the fire with sail cloth,—the authorities were informed; the bell tolled; military, citizens, and fire brigades assembled. The fire had then run up to the ridge, and was giving out smoke and flame (about 11 o'clock). Air to feed the fire came from the various openings under the gutters, from the doors into the western roofs, and through the lead laps; the roofs were, however, so filled with suffocating smoke, that endeavours to reach the fire from the transepts failed. Then followed the efforts to obtain water,—effected at last by junction to one of the hydrants in Burgage-street in a direct line south of the choir; and the hose, about 700 ft. long, was carried over a wall and through gardens, hung up by ropes, and carried aloft. Mr. Andrews, superintendent of the cathedral gasworks, reaching—by ladder from the roof of St. Anselm's Chapel, a dormer intended for access to the choir gutters from the inside of the roof, situated just by the west angle of the converging wall, entered with the hose (12 o'clock), and began to play on the most western portion of the flames, then licking along the upper part of the roof; and at once saw them yield to the water. Once the progress stopped, the beating back of the flame on the parts already alight followed. Another hose had played on the outer surfaces of the lead from the ground without any good result; but when carried (12:15) through one of the little windows mentioned above a useful additional stream was poured out. By half-past twelve the whole was seen to be extinguished. The south aisle roof was set on fire in two days, but put out after only trifling damage had been done. Buckets of water on the pockets—containing charred smouldering timber,—kept all so well at rest, that (about 2 o'clock) an enterprising photographer was allowing the sun to depict a group ranged across the vault under the part-burnt roof. At 4 o'clock the authorities held the evening service, so as not to break a continuity of custom extending over centuries; and, in the smoke-filled choir, the whole of the chapter in residence for the proper Psalm (xviii.) found expression for the sense of victory over a conquered enemy.

Cathedral authorities, fire brigades, soldiery, and townspeople seem to have pulled together with the oneness of purpose proper on such occasions. With the ready gallantry, and great personal risks in all quick movements at such high levels, it is a matter of congratulation that absolutely no important injuries are mentioned.†

* The fire that injured the choir finished by Prior Conrad (dedicated 1130), broke out 5th of September, 1174, a date that has been remarked upon by those who note odd coincidences of coincidence. To that fire we owe the work carried on in the next ten years,—the dignified and elegant designs of William of Sens, and William the Englishman, recently imperilled. Dean Stanley, "Memoirs," 4th edition, p. 295, does not pass without notice what Langton (1221) had not failed to point out,—the Tuesday in the past history of this Foundation. On Tuesday (the 26th December, 1170.—4th January new style), Becket was murdered; on Tuesday (the 7th July, 1250), the "Translation" of his relics from the crypt to the new shrine took place.

† Perhaps the soldiers showed some excess of zeal when they cut and pulled up the lead of the west valley where the roof of the north-east transept abuts; and more still when they used the axe on the sheets next to Bell Harry

Mr. Andrews, who appears to have shown a cool determination in every way admirable, and whose entrance inside the roofs was evidently the turning-point of the story, was in no way hurt,—though melted lead, striking on the timbers, now seen covered with little shining patches, spattered from time to time round him and burnt his clothes; and though the scorching heat and the flame were driven westward towards him continually by the wind. No doubt, the set of this wind (blowing gently but steadily from the east) had something to do with the rapid passage of flame along the ridge after the covering was once broken. Almost directly after the fire was got under a strong wind sprang up from the same quarter.

What might have Happened, and What should be Done.

It may not be out of place to conjecture all the possible results, if—as can be imagined—no large quantity of water had been obtainable at the requisite level; and the flames had maintained an uncontrollable supremacy in spite of the creation of considerable gaps in the roofs, and other efforts. A strong wind and night-time may be assumed in order to select the most unfavourable conditions. The whole of the roofs as far as the central tower would have been destroyed: comprising those of the Trinity Chapel, choir, two eastern transepts, probably also those of the aisles and adjacent chapels. It is difficult to imagine an extension of disaster that would have affected any roofs further to the westward. From falling timbers, by evil hap,—the stone vaults being fractured in their filling in (perhaps leading to the fall of some complete sections),—fire would be communicated to all internal fittings; injury done to much stonework by flame; and—possibly by falling masses of stone and timber and heated metal—monuments and stone screenwork mutilated (comparatively little injury has, it is true, been done to stonework by the recent fire);—wall and other painting would run, under such circumstances, great risk of entire ruin. That such destruction would seriously affect the stability of the building does not appear at all probable; and it is to be noted that some considerable portion of the irremediable injuries would only happen in case of a more or less complete failure of the vaulting. The behaviour of the vault in the present instance will incline every one to regard with some satisfaction these incombustible substitutes for wooden ceilings, notwithstanding that they want the constructive and complete fire-resisting qualities of the Roman dome and the Celtic stone vaults and roofs. From this consideration, however, of extreme not-impossible consequences, sufficiently saddening to think of, we see perhaps more distinctly the absolute necessity of the provision of many available resources,—that shall, in all fair probability, always avert such worst results; and also the advisability of doing away altogether with, or at least keeping under the strictest control (with the use of more than ordinary precaution), all the obvious sources of possible beginnings of destructive fires.

Under the influence of the sudden shock the manifestation of some eagerness to visit some person, or body, or system with blame, and call them responsible, was naturally to be expected. It must also be confessed that, through the press, and in other ways, the ordinary desire to render everything secure to the remotest future after one horse has been abduct, has been very fairly manifested. While proper reasonable provisions and precautions are in so many instances neglected, most of us who have to deal practically with the preservation of buildings are ordinarily content, to limit ourselves to urging apparently elementary caution and simplest preparation in case of possible casualty. Knowing so well the natural tendency to inertia when all is going on as usual, one would wish on principle to avoid the risk of what always suggests the hithermost irony of fate,—when elaborate contrivance is left to depend, in process of time, on not-always-intelligent routine. But this need not prevent any one from seizing an opportune

Tower, 150 ft. west of where the fire was stopped. It was proposed, just before the success of the water, to take out the 20 ft. of ridge east of the transepts, and the portions of the roof extending thence to the north-east and south-east valleys; and thus to leave the choir roof to burn itself out if need be. If one side had been stripped before the other, as the lead on each side approaches two tons in weight, this might have led to accident; and one bay or a part of a bay of the choir roof, now leaning well in that direction, would possibly have toppled over westward.

moment—to point out some of the sober, practical details that might well be lodged in the minds and in the practice, of those who have the care of important public monuments.

As no irremediable damage appears to have resulted from the recent fire, it is nearer sober truth than mere cynical endeavour to say, that the menace and the actual damage will have been of real service, if our public buildings throughout the country have the benefit of searching inquiries into their means of meeting similar calamity,—such inquiries being made with all the point and purpose that result from the still fresh teaching of the inexorable logic of facts. Deeming the thorough conservation of historical buildings an unmixed good, and no pains to secure it in reality too great, we (*mutatis mutandis*) regard the matter with something like the optimism of the insurance offices, which look for sure indemnification for any specially heavy losses in the more general contributions of the community to fire-funds, and an increased personal care.

It cannot be denied that if in any instance patching with solder might be excused, the old choir-roof at Canterbury was that instance. The framework,—judging by portions remaining,—in not too excellent condition, crippled in places and patched and strengthened,—the whole leaning westwards in a way needing no plumb-line for its detection;—the leadwork old beyond memory, and repaired with patches and seams of all sorts and sizes, and apparently of many dates;—it would seem that to deal with the weakest places, to limit the work to keeping out the weather by the simplest means, would not be a very unreasonable course. Necessarily the total replacement of such a covering as existed here (and exists on the north transept), would to any judgment be only a question of suitable time and sufficient funds. In the case of such an admirable roof-construction (as in the progress eastwards of rigid-construction) was put, not so long ago, over the south-east transept, with its handsome timbering and framing and bracing; its 10 lb. lead gutters,—the leadwork now in the grey uniformity of early oxidation;—it is really difficult to contemplate in one's own time the need of repair of any kind. And, indeed, on a roof in such condition mere temporary repair of any weak place would probably never be proposed; a new piece of metal would be put in, and the old removed for recasting.* Even at an expense (as it would commonly be found to be) of several times the $\frac{1}{2}$ d. per foot super. for labour and coals of a reported test experiment at Lincoln Cathedral, the gain in permanence alone would be sufficiently decisive,—where the aim was not to secure temporary serviceableness at the least cost, but the very best kind of maintenance.

But however desirable it may be that all leadwork should be thus replaced, it is to be feared that, even in the case of the most precious buildings, the custodians—in the exercise of their ordinary judgment—will rarely be able to dispense with the less thorough descriptions of patching. Most of us have times and again to do, not what we would, but what we can. But it can be a rule that unprotected fires and lights—open flame and fire of any kind—shall not be carried in any case into certain agreed-upon places; and such a rule should at once be made, and carried out on pain of instant dismissal of workmen infringing it. Not that workmen are the only people to whom the rule should apply! Must not most of us, who have poked into the holes and corners of buildings beyond count, cry *peccavimus* in our secret souls,—when we recall some of the incidents, say, of creeping in the night-time through belfry and passages, eventually to clamber out on to the starlit tower-top to view the sea's horizon, or the lights on the distant hills? Or, as we think of the roof-spaces, the hoarding underfoot littered over with dryest accumulations,—it may be of centuries,—all powdered with the dust from the decayed surfaces of the wooden beams above? A candle wrapped in paper for the hand, and guttering at each sharp cross-air-current, and notebook and measuring-rod in charge,—have we not on occa-

* In the old choir roof the sheets are prevented from slipping by bands (not unlike bow-door-handles) carried round the 4 in. by 3 in. battens (which are put 3 in. apart); the ends of the bands being doubled into the rolls. In the new transept roof, the sheets of lead are narrow and not lengthy,—clips at the bottom of the middle of each sheet hang over the battens, and straps soldered on each lead alternately of the back of the sheet at every 1 ft. 6 in. or 2 ft. of length are also carried over the battens, and nailed to them, inside the roof with copper nails. The rolls are of course not on woodwork, but formed only by the bending up and wrapping over of the edges of the thick metal.

sion reflected (after our return) that we should have readily submitted to carry a Davy-lamp if need be, if only it had been put into our hands? Especially would the complete banishment of the plumber's fire-pot, in its ordinary unprotected form, be no little gain to the community at large; and often it may be said,—though the woes of private persons do not form part of our present subject,—would such a banishment be no small comfort to a worthy householder or owner. Viewing the lamentable, all too frequent, miserable destruction wrought by this apparently simple and innocent implement,—it would not, in last week's state of public opinion, have been deemed outrageous for insurance companies to obtain powers to prosecute and recover heavy penalties from any tradesman causing them loss by permitting such an unshielded fire-basket to be used. A little ingenuity and determination on the part of the leading plumbers would, without difficulty, secure the necessary amendment. Certainly the most scrupulous pains—pains rarely possible if the performance of a reasonable quantity of work in a given time is at all to be considered—could only succeed in rendering accidents somewhat more rare,—from this spark and lighted wood shedding contrivance,—which, however carefully put under the shelter of a stone wall, must always have the control of its own conduct there, when meetings come round for the workmen. (The workmen at Canterbury have, it is stated, had for years past directions to put out all fires half an hour before leaving work for the day.)

We think a word or two may usefully be said in this place, as to assumed blameworthiness in this case at Canterbury. In the natural desire to select and if possible punish some one, which most of us share with Mr. Samuel Weller and other leaders of opinion, "the workman" was pitched upon at once, and credited, on convincing new evidence, with uniform culpable carelessness; this even, in some instances, improved into a mocking Mephistophelian satisfaction in the undoing of work already done. Like all class-characters depicted without bias tints, this happily is only a caricature; and seems to involve also a misconception of some of the conditions under which much hard mechanical work is carried on. The absence of keen anxiety,—one of the happy results of habit and hard work,—would, if with difficulty acquired, be regarded by any well-disposed critic of human nature as a thing that a man should earnestly seek for; and this,—quite compatible with proper care,—is often mistaken by unthinking observers for heedlessness; really quite a different thing, too prevalent, no doubt, but not anything like universal. Indeed, what risks—in building scaffolding, in shoring, in special dangers of most building trades, are avoided, as by a clear, through the steady nerves, and almost instinctive decision of ordinary workmen? Who could wish that anybody should pursue his daily tasks with an habitual view of all possible consequences of every act? Is it not sufficient to remember that there are arguments that have shown us the blessings of our ignorance of futurity? In this instance, as we have stated the case above, the plea of mere misadventure may surely be listened to;—and, indeed, many an accident, however calamitous, might be accounted for without suspicion of criminal neglect;—a suspicion that we like the less when it goes the length of imputations,—aimed beyond the individual at the moral status of a large part of our people,—who probably are imperfect, and happily are not more thin-skinned than other healthy-minded people, but are not habitually wanting in all the qualities in which we of the middle classes take some pride for ourselves,—such as, among others, far care in the performance of understood and undertaken duties, and a habit of considering at some stage or other that somebody or something has a right to be thought of besides ourselves.

On this head of prevention the question of the use of incombustible, fire-resisting construction should not be passed by without a word. It is probably not yet decided to renew the timber roof; and it will be worth argument at least, as to whether a construction suitable to the building could not be put up that should have fewer disadvantages than the wooden one. With the roof not incalculable spans, and the steep pitch, the special covering material, and some provision for force of wind, the construction cannot be a light one; no doubt a very costly matter in iron just now. Probably, by the way, a considerable weight in the roof is very advisable, if not abso-

lutely necessary, in order to supply (being cleverly arranged) direct downward pressure on the piers that sustain the vaulting. We shall note with interest the decision that is come to in this case, a decision that would be a precedent in other cases; complicated as it is with many considerations—not among the least the question of the probable endurance of iron. The failure of galvanisation, once regarded so hopefully,* and the cost and at the same time incompleteness of protection from the air by painting, instantly come into the mind.

Whether a suggestion that has frequently been made as to the coating of the inflammable surfaces of timber with fire-resisting solutions is practically feasible, awaits experiments and tests. No doubt much would be done with such solutions if justified by sufficient expectation of useful result.

The isolation of large buildings, and their division into distinct thoroughly separated sections are matters too much neglected. Why should there be even a possibility in any case that the burning of the inflammable roofs of a choir should affect, through a central tower, the inflammable roofs of the abutting transepts and nave, &c.?

The next consideration to prevention is—cure; in the case of ordinary medicine signifying the expulsion of disease; in the case of an ignited building the putting out of the fire—in other words, water-supply. In this Canterbury instance, it would be slaying the slain to insist at any length—on the mistake that the dean and chapter made in not obtaining the benefit of the high-pressure water supply immediately on the completion of the city waterworks. The cathedral precinct has long been supplied with water for culinary and other purposes from a special water-supply; derived from a spring on the hill behind the barracks, about a mile distant, and carried by lead pipes to a reservoir near the Green Court, up 25 ft. or 30 ft.† From this, pipes are led into the crypt of the cathedral, among other places, and it was from these that the buckets were carried up the stairs in the north transept, at a run the whole way, in the early stages of the fire. The waterworks for the supply of the city have been opened two or three years. The water is obtained from an artesian well, sunk in the valley, and forced up to the reservoirs on St. Thomas's Hill, not far from Mr. P. C. Hardwick's well-known Clergy Orphan Asylum, on the road to Blean. These works are, it is said, arranged so as to supply 150,000 gallons per day, with continuous service, at a pressure of 70 lb. to the square inch. This will account for the splendid volume of water obtained when once the hose was fitted; and for the fact that the streams directed inside the roof, against the flaming ridge, burst upwards in columns, 20 ft. above it, although that ridge was nearly 115 ft. above the grass in front of St. Anselm's Chapel below. Of course, when a fire occurred in Sunstreet, in the city, in November last, and was put out by means of this high-pressure service, the cathedral authorities noticed the matter at the December audit, and saw that the question of protecting the cathedral would deserve some consideration,—eventually giving instructions for hydrants round the buildings at the June audit.

As we leave Mercury-lane, on market-day, and enter the Precinct by Christ Church-gate, and walk on in the long shadows thrown by the westerly sun, and notice the black-robed peaceful visitants of the towers, decorously announcing their own approach in a gentle monotone, it is not over a mere two or three years that we seem to have slipped back as we entered this self-sufficient system with its central orb and planetary "homes of ancient peace." . . . And we cannot expect these privileges without paying some price or other, considerable or inconsiderable; let us be satisfied in that a complete water-supply of the most thorough kind is now here assured,—as well as in every such

* The galvanised iron covering to the roof of the chapter-house at Canterbury now shows, especially on the north side, red blotches of very considerable extent (put up a little over twenty years ago).

† Readers of Professor Willis's admirable "Conventual Buildings of Christ Church, Canterbury" (1869), will not need to be reminded that the subject of the waterworks for the supply of the Precinct,—from the earliest period to the present time,—has been considered and proved worthy of laborious investigation on the part of that distinguished writer. By some strange power in the author,—his reader is made to enter into the process of discovery and the unravelling of difficulties,—till every part of what at first sight looks like a collection of the dustiest and most commonplace of mechanical details,—is found to be possessed of all the interest of a mysterious contemporary cause célèbre.

building throughout the country where high-pressure service is to be had. Mains led to different points round the building; hydrants at selected spots; in each distinct section of the building a rising fire-main, with fire-cocks on every distinct story,—crypt, ground story, and triforium; all cocks and hydrants screwed to one gauge so as to be used with the hose of the neighbouring fire brigade, and provided as well with hose,—the greatest length of the section,—to be kept, with wrenches and keys, adjoining each fire-cock,—and special lengths for the hydrants:—these are among the cares that one looks at with satisfaction, once on a glance at, and times and again on a careful survey of, an important building. Sizeable cisterns always full, and an array of glossy leather buckets,—some filled for use,—are also pleasant to the eye. It is true, as we have observed above, that the inefficiency of an absolutely indispensable portion of a carefully and skillfully arranged system is the oddest of all practical satire. This has so struck our national imagination and sense of humour, that the horse and well-equipped vehicle and the forgotten or missing driving-rein have passed into a proverb. May the practice days of provincial fire-engine volunteers, and the case of a notable City of London building (the National Provincial Bank of England), supply illustrations of efficiency maintained by rehearsal. In the latter case, the architect has a special (and comprehensible) dislike to the accumulations of soot and mud that deface so many London buildings. There is a thorough system of fire-mains inside the building,—all sealed,—to be used only in case of fire (not for the purposes of ordinary supply). Once every three months the seal is broken, and in the early morning (or rather what we call late at night in ordinary thought and speech), the Portland stone front is played upon, till its old colour appears, and the grime has hastily accompanied the water-streams down the gutters. The water company officials seal once again all that they wish, and till the next time comes it is probable that hose is in its place and sound throughout, that cocks can be joined to hose, and that the old and any new officials will be able fairly to do their part in the routine,—if by chance a real performance should be necessary a couple of months after such a rehearsal. Such practice as this, if only with the effect of watering the turf, and washing a piece of the leaden roof of a cathedral, or making rainbows in its Green Court for the delectation of the lookers-on, would probably not be wasted time, water, and energy.

The provision of large cisterns, filled by special hoisting or forcing, and of bucket supplies, is of course all the more imperative in cases where a high level cannot be reached by the water-service; and perhaps it might here be suggested that in place of a Cathedral Dignitary presiding over the plumbers and carpenters, and keenly glancing at glue-pots and pans, in the course of repairs (or, as we should conclude, an Alderman in the case of works at an old Guild-hall)—it might be possible to keep attached to every large building a "water-supply man," who should be skilled in the extinction of fire, and on the alert, when he knows that fires and lights are being used, to secure conformity to rules.

The splendid service rendered by Mr. Andrews at Canterbury, due to his intimate knowledge of the building, is the best possible case to show the value of an intelligent, muscular officer of the kind in question.

Not, however, to weary out "good intentions" by other details that might deserve attention in a more lengthened exposition, we may confess that most of us would be in the main satisfied if only special hazards were superseded and an efficient water-supply maintained. And we will not deny ourselves the satisfaction of hoping that,—when all panic and, to all seeming, all remembrance of the lessons of the recent fire have passed from the general public,—on the two heads we have named "prevention" and "cure,"—the Capitular Bodies, the authorised custodians of some of the most valuable of our national memorials, will have left a fair but critical observer no room for cavil.

The Norfolk Fine Arts Exhibition.—The annual exhibition of the Norfolk and Norwich Fine Arts Association was opened on Monday, at the Crown Bank. The collection is quite up to the average of former exhibitions, and the local artists, and particularly the amateurs, show in strong force.

A NOTE AT EXETER.

THE restoration of the interior of the choir at Exeter Cathedral, now far advanced under the direction of Sir G. Scott, promises to be a very successful and conservative cathedral restoration. Those who only know the interior under its whitewashed condition will find a new beauty in it now, in the delicate and harmonious contrast of tone formed by the unpolished bluish-grey marble of the clustered piers, and the light cream-white tint of the stone forming the arches and the superstructure. Almost the only new features, the only features for which no precise original was found, appear to be the screens north and south of the choir, in the western bays of the arcade. These occupy the place where a brick wall had been built during the dark ages (of architecture). Most judiciously has the hand of the restorer been restrained from any superfluous application of colour on the vaulting; and while we had occasion to notice, some little time since, with regret, the unhappy effect of the blue and gold colouring applied (under the same direction) to the roof of Cloucestor choir, especially in reducing its apparent height, we here notice with proportionate pleasure the satisfactory and delicate effect of the simple lines of gilding with which the fillets of the vaulting-ribs are brought out, and which give just the requisite sparkle to the vault, lighting up its leading lines, and leaving the spandrels an expanse of pure untouched stone, illustrated only by shadow and air-tint. With the bright sunlight which illumined the interior on the day of our flying visit, it would be difficult to find anything more truly noble in effect than this interior as at present restored, with its large and grandly proportioned windows of the finest period of tracery, shedding a flood of light over the beautiful triforium and deeply moulded arcade. The remains of the old glass, in one of the north clearstory windows especially, show how light-toned and bright glass such as this, with no heavy masses of colour, assists the aerial perspective of such a building. A beautiful result might be obtained if the whole of the large clearstory windows could be filled with glass of the same type, and on the same light scale of colour; and it would be a righteous work also if the parts of the east window, which are now filled with tawdry modern glass of the worst period of the Revival, were restored by a skilful and artistic hand in a style in keeping with the older portions. A like sentence might well be passed against the west window, which not only disfigures the cathedral, but is a means for the propagation of bad taste in a small way, being habitually pointed out by the ignorant custodians of the building as "a fine window;" concerning which it is sufficient to say that the date thereof is about the end of the last century. What, in the course of the restoration, is to be done with the episcopal throne,—that noble specimen of Mediæval woodwork? Let us express a hope that when re-decorated, as it inevitably must be to some extent, the same counsels which have already guided the rest of the work may prevail; and that colour, if applied, may be applied delicately; gilding used with a wise and cautious discretion; and that there may be no violent eruptions of red, blue, and gold, in unnecessary deference to Middle Age precedent. The small and beautiful late chapel adjoining the south aisle of the choir stands as a warning in this respect. This has been "restored" in point of colour, of which we are informed sufficient remains were left to form an exact guide; and what is the result? A tawdry mass of strong blue, strong red, and gilding splashed on in true gin-palace decoration style. If the designers of the original chapel really coloured it in this way (which we take leave to question), all that is proved is that they did not know the value of their own work when they had produced it. Slightly decorated by gilding, perhaps, and with the elaborate and delicate stone carving left to tell its own tale, this little apartment would be quite a gem (allowing for the decadence of the style); treated as it has been, it becomes vulgarised into a mere piece of coarse tawdriness. If walls are to be covered with colour at all, there is surely something more refined to be invented than these perille efforts in two continually repeated colours and gilding. Why is a combination which even in a theatre, in the present state of decorative knowledge, would be accounted too strong and glaring to escape the charge of vulgarity, to be regarded as the normal scale of coloured decora-

tion for a church, with its soberer and more solemnising associations? Those of the public who are maintained by modern-mediævalising fancies perceive the incongruity, we imagine, very plainly.

One regret to find still retained at Exeter the system, now happily abolished in several at least of our cathedrals, which degrades these noble monuments into show-places, and leaves the visitor at the mercy of the half-educated official who insists on "showing him over," and telling him gratuitous architectural falsehoods—"gratuitous" only in one sense, he it understood. If the showmen at these places understood their own interests, instead of insisting that "nobody can go round without the verger," they would put up a tariff, "half-a-crown charged for attendance round the building, and five shillings for being let alone." They would get plenty of five-shilling "tips." But why do not deans and chapters put an end to this useless nuisance?

Except at the Cathedral, things architectural seem to be very quiescent at Exeter. The Church of St. Michael and All Angels, built three or four years ago from the designs of Mr. Hawkins, seems to be regarded as the point of attraction in modern architecture, of which the interior (arranged with narrow side aisles for passage only) is the best portion, and is solid and monumental enough in character, and satisfactory in the nature of the carved work (of French type); but the whole rather too like an imitation of the manner of a more eminent modern Gothic architect. The treatment of the nave buttresses externally is good, but the tower and spire cannot be called a success, being at the same time weak in general composition and deficient in refinement of detail; the latter remark applying, indeed, to the whole of the exterior treatment. It is almost necessary to say so much, because it appears that the church is shown and held up in the neighbourhood as a model of modern church architecture,—which it certainly cannot be said to be. The new Albert Museum, not far from the Cathedral, is a creditable building in French Gothic, containing among other things a very well-arranged collection and classification of the building stones of Devonshire and one or two of the adjoining counties. The collection of birds is worth looking at, on account of the cases of splendidly-mounted specimens of falcons and some other birds, lent by an amateur, in which the birds, instead of being stuck formally on pedestals, are represented with great spirit and fidelity in their natural actions and attitudes,—flying, fighting, &c.,—somewhat after the spirit in which Audubon used to make his drawings of birds. One group is an exact and very clever copy of the picture of two hawks fighting for a teal, painted some years ago under the title, "Just Out,—the Tail of a Teal;" the artist's name has escaped our memory.

The Exeter railway station is so commodious and roomy that the traveller along this line is tempted to inquire why the same qualities cannot be extended to the construction of the company's carriages; more particularly when he contrasts the price paid for his ticket with the discomfort of his conveyance. The rates of fare are exceptionally high on the Bristol and Exeter line; the carriages, the second class particularly, exceptionally (we had almost said disgracefully) cramped, mean, and uncomfortable. Persons living mostly in narrow-gauge regions are wont to associate ideas of excessive comfort with broad-gauge travelling. The fact is the reverse; what is given in breadth is saved in length in the latter carriages, where the seats and the space between them are so economically narrow that all comfort is out of the question. A "London and North-Western" carriage is a paradise by comparison. As we are on a railway grumble, let us ask once more, what we suppose every one going through Bristol asks,—Whether there is anywhere to be found an important central station so egregiously and ingeniously inconvenient, comfortless, shabby, and dirty, as that of Bristol;—where the stations of three different lines are combined at three different angles to one another, one of them only to be reached by a scramble across a network of rails at an oblique angle; where the booking offices are hidden away in the most unlikely corners, with no indication of their whereabouts; and where all printed announcement as to which station is which, seems to be thought quite superfluous, and strangers to the place may be very thankful if they find their way by accident to the right spot just in time to see their train off. If this is not an "architectural" subject, it

ought to be; for a place with such a meeting of railway traffic as at Bristol ought to have a new station, planned in an intelligible and reasonable manner.

BITUMEN, AND ITS PRACTICAL APPLICATIONS.

THE application of bitumen interests so many of our readers at this moment, that we have thought it desirable to translate some observations on the subject published in the *Bulletin de la Société d'Encouragement pour l'Industrie*, August, 1872:—

Bitumen has been known from a very remote antiquity. In ancient days, at Babylon, and elsewhere in the East, it took a place amongst building materials; but the mortars and cements, first skilfully elaborated by the Greeks and Romans, have found greater favour in modern times. After having been abandoned for ages, the application of bitumen to purposes of construction was revived about the year 1849. Bituminous cements were then tried in France for covering footways and roofing vaults and arches. The success which attended these experiments attracted public notice, and cements of this description came speedily into vogue.

The rage for bitumen, and the bituminous compounds, all and sundry, which made their appearance about this time; the impetus thus given to the trade, and its varying fortunes and descents, are within the personal recollections of many of us. Briefly, besides the cements formed of native asphalt from the mines of Scyssel, and of bitumen from Lobsann, there appeared a multitude of similar compounds, made with spurious bitumens obtained from the refuse of the gasworks, which were foisted upon the public as equal, or superior, to native asphalt. The failure of most of these substances bade fair to ruin the new industry; but time and perseverance have shown the utility of certain of them, and we have now natural and artificial bituminous cements, each having a recognised place and uses in construction. The success which attended the employment of asphalt as a covering for pavements and footways generally, naturally suggested its application to streets and roadways, and many unsuccessful attempts were made in this direction. Not until twenty years later was the difficulty practically solved by the formation of the roadways of "compressed asphalt," which now covers some five thousand running metres of the Paris streets, and which our neighbours across the Channel began about the same time to use as a substitute in the streets of London for "macadam," of which they, like ourselves, had experienced the inconvenience.

Bitumen, which would appear to be the result of a subterranean process of distillation of organic matter or of coal or lignite, is still involved in considerable obscurity as to its origin. Numerous theories have been broached to account for its formation, and impregnation with various matters found in combination with it. Moreover, chemically considered, it is a very complex substance, formed of various compounds of hydrogen and carbon. Just as fatty matters are made up of olefin and stearin, so bitumens consist of a highly carbonised solid substance, combined or amalgamated with certain essential oils of more or less volatile character. When exposed to the air, these oils evaporate slowly, giving rise to the varying states—solid, viscous, and liquid—under which bitumen is found in nature. Originally, the terms bitumen, mineral-pitch, mineral-tar, asphalt, and the like, were applied rather vaguely to denote the degree of consistency of the material. At present, in accordance with the system of nomenclature proposed by M. Milo, in 1861, the term *bitumen* is applied to the bituminous principle in all compounds of this class, whilst *asphalt* is restricted to those compounds of bitumen with calcareous matter, which form the basis of the cements in use for paving purposes, and the substance of the "compressed asphalt" now employed on our carriage-ways.

Bitumen is widely distributed in nature. It is met with in various states:—1. Free and unmixed. 2. In a state of admixture with quartzose sand or earthy matters. 3. Impregnating schists. 4. In a state of combination, or of more or less intimate admixture with calcareous rocks, in which state it constitutes the substance we know under the name of asphalt.

Springs of pure bitumen have been known from a very high antiquity; but those which would seem to have been formerly very abundant

are now much reduced, and their yield gets smaller year by year. Those of Judon, which furnished the bitumen employed at Babylon, give scarcely any yield; that of Gabian, in Heralut, which formerly gave 1,500 kilogrammes per annum (3,300 lb.), is now almost exhausted; and the famous "pitch fountain" at Clermont is well nigh dried up. It would appear, however, that in China the supply is still abundant. Near the Cape Verdes, the bitumen at times overflows the surface of the tide; and in certain places in the Holy Land it rises to the surface of the water in a sort of scum, which is drifted to shore by the wind. In the island of Trinidad, on the bed of an ancient lake-basin now dried up, are found masses of bitumen solidified by the evaporation of their essential oil or by the addition of foreign substances. Bitumen in a pure, unalloyed state, as it here occurs, forms, as we have said, the basis of all bituminous cements.

At Seyssel, at Bastennes, in Auvergne, and in numerous localities in France, Spain, and Switzerland, may be found beds of sand impregnated with bitumen. These *mollasses* are generally in the vicinity of deposits of asphalt, most frequently to be seen. The bitumen is extracted from the sand by being in water, during which process it rises to the surface like a scum. Lastly, bitumen, in a vaporous as well as a fluid state, appears to have made its way, under conditions at present unknown, into the marls, schists, and jurassic-limestone beds of the lacustrine epoch, in which it exists in a state of admixture, perhaps even of combination.

Bituminous schists are extremely plentiful in the coal-basins of Aatun (Saone-et-Loire), of Buxiere (Allier); and are also found in Provence, in Dauphine, and doubtless in many other localities. Calcareous bitumen appears to be of rarer occurrence as it also is of greater industrial utility. In France, we know at present but of four or five deposits susceptible of being advantageously worked. The oldest and best-known are at Seyssel, Seyssel-Volant, the Val de Travers, in Switzerland, and at Maestri, in Spain. Latterly some deposits have been opened in Haute-Savoie, and several beds near Alais, which, in the excellence of the yield, bid fair to rival that of Seyssel or the Val de Travers. Some trials have also been made in Auvergne, in the neighbourhood of Clermont, but the proportion of bituminous matter in the limestone is too variable and uncertain hitherto to admit of its being worked to profit.

Bituminous limestone, or asphalt properly so called, has the appearance of mortar. Its colour is chocolate, of a shade depending upon the proportion of bitumen contained in it. When broken, it shows a fracture of a lighter colour, such as a scratch with a knife leaves on the surface of chocolate in cake. The grain is fine, and a close inspection shows that each grain of limestone has a separate bituminous envelope; each grain is thus parted from its neighbours by a coating of varnish, which varnish binds the whole together firmly in mass. In hot weather this varnish becomes soft and sticky, and often times the weight of a block in itself is sufficient to cause rupture. In winter, on the contrary, the bitumen is dry, and the mass presents a remarkable degree of hardness and impenetrability. When heated on an iron plate to a temperature of 170° to 180° Cent. (335° to 350° Fahr.) asphalt decerpitates and falls to powder.

The proportion of bitumen in asphalt ranges from 15 down to 7 or 8 per cent. Generally speaking, those from the Val de Travers and Haute-Savoie give an average of 12 per cent. Seyssel asphalt yields 8 to 10 per cent only. In the works in the department of Gard, which are in a series of superposed beds, the proportion varies considerably, but the percentage is uniform throughout each individual bed. The richest yield 15 to 20 per cent, and the poorest 7 to 8 per cent. But the proportion of bitumen even in the richest beds is not sufficient to cause them to soften in hot weather. When after breaking the asphalt into 3 in. or 4 in. fragments, we heat it to a temperature of 130° to 140° Centigrade, it falls to powder, as we have before said; and if the temperature be raised still higher, the bitumen passes off in the form of a thick smoke. If, on the other hand, we cast the powdered asphalt into pure molten bitumen, it dissolves, so to speak, and as much as 90 per cent. may be added before the mass assumes a paste-like consistency. Upon this singular property is based the process of manufacture of bituminous cements.

Formerly, Bastennes, in the Landes, and Lob-

sam, in the Bas-Rhin, supplied a sufficiency of bitumen in a fluid, or, at any rate, in a viscous state, for this purpose; but now the springs appear to be nearly exhausted. Pure bitumen can only be obtained by boiling the *mollasses*, or bituminous shales, for a lengthened period,—say, ten or twelve hours. This is the mode of procedure at Seyssel; but it is costly and incomplete, and the bitumen thus procured always retains a certain proportion of sand. Even at Seyssel, where the shale is in close proximity to a rich deposit of asphalt, the process has been well-nigh abandoned; and there, as elsewhere, the native bitumen has been given up for dry bitumen from Trinidad, dissolved in mineral tar, obtained by a second distillation of certain bituminous shales found in considerable abundance in the department of Air.

To 800 kilog. (1,760 lb.) of Trinidad bitumen are added 250 kilog. (550 lb.) of mineral tar, and the whole is boiled, stirring well the while, for the space of ten hours. In this way we get what is called "refined bitumen," which now takes the place of that from Bastennes and Lobansam.

To form the bituminous cements used for paving, &c. we throw into the molten bitumen aforesaid, by degrees, and stirring well the while, the fragments of asphalt reduced to a powder, either by the action of heat or by mechanical pressure. The latter method is to be preferred, as it precludes the possibility of the bitumen getting burned. 100 kilog. (220 lb.) of refined Trinidad bitumen will thus take up 1,400 kilog. (3,080 lb.) of powdered asphalt. After six or seven hours' cooking, the compound assumes a paste-like consistency, and is then run off into moulds bearing the trademark of the manufacturer. In this way are obtained the blocks in which asphalt is offered for sale. Formerly it was the custom to melt these blocks on the spot, with the aid of a portable furnace, and the addition of six or seven parts by weight in the hundred of fine gravel. After melting, 60 to 70 per cent. of pure bitumen was stirred in, and the mixture laid on hot. But the smoke and the disagreeable smell thus emitted were productive of serious inconvenience in the Paris streets, and hither to the cement has been amalgamated with the sand or gravel at the contractor's works, and brought to the required spot in covered conveyances, provided with small coke furnaces, for keeping the contents at the requisite temperature. The latter are stirred from time to time by means of an "agitator," worked with a rotary handle. The success which attended the use of bituminous facings for footways naturally led, as we have already observed, to a desire to apply the material to carriageways equally, either in the form of concrete of small stones embedded in some bituminous cement, or by flagstones, cemented together with asphalt. But, in each case, the alternations of temperature and humidity destroyed the setting, and the essays proved unsuccessful. Numerous other attempts proved equally abortive, and it was only after many long years of experiment that it was found practicable to form roadways of compressed asphalt, such as now covers over 10,000 square metres of the Paris streets, and is rapidly coming into favour in England. It should be stated that, although the experiments at Paris were unsuccessful, at Seyssel and at the Val de Travers the roadways formed by the continuous droppings of fragments of asphalt have a smooth, homogeneous surface, very compact and very durable. This fact suggested the application of the material in its natural state, as in the roadways now laid with "compressed asphalt," as it is termed.

For this purpose the asphalt is reduced to a fine powder, and heated to a temperature of 130° to 140° Cent. (260° to 280° Fahr.). It is spread out in layers, of 2 in. in thickness, over a concrete flooring, and well compressed by ramm- ing, until cool. It forms a compact mass, as homogeneous in its powers of resistance as the rock itself in its natural state. At first, the asphalt was pulverised, by breaking it into 4 in. or 6 in. fragments, which were placed on strongly-heated iron plates. This method was only applicable to the richest asphalts, as that of the Val de Travers, and the bitumen often got burned in the process. Now-a-days it is pounded cold by a very ingenious mechanical arrangement, equally applicable to any sort of asphalt, so long as it contains 7 or 8 per cent. of bitumen. The powdered asphalt is placed within large horizontal drums of plate iron, revolving over portable furnaces, which, with the aid of a

system of rails and turntables, can be run under them as required. When the powdered asphalt has acquired a temperature of 150° Cent. (300° Fahr.), the portable furnaces are withdrawn, and in their place covered trucks, with double sides, to retain the heat, are run in under the drums, to receive their contents, and to wheel them off for immediate use. The loss of temperature in the trucks is small, and on arrival at its destination the powder is spread out and rolled with slightly-heated rollers into the requisite state of pulverisation.

The success of the operation depends much upon the state of the weather. In cold, and particularly in damp, weather, the powder cools too quickly; it then binds well at the surface only, and when the surface goes the road is destroyed.

Very many roads which have been made or repaired in unfavourable weather have lasted a very short time. Now, in Paris, operations of this description are no longer performed in winter,—all alterations and repairs are deferred until the summer, the stopping of holes and the like being done provisionally with boiling pitch, until the weather will admit of their execution in a proper manner.

Roads formed of "compressed asphalt" are cheaper in respect both of prime cost and of maintenance than ordinary macadamised roads. They produce less noise, less mud, and less dust. The resistance to traction upon them varies much according to circumstances. In winter it is less than over a flagged road; in summer-time, on the contrary, it is greater than on a paved road. Their greatest defect is that they become very slippery when covered with a thin coating of mud; they should therefore always be kept clean swept. Their greatest practical inconvenience is, as we said, that repairs can only be effected at particular seasons.

THE TEACHING OF PHYSICAL GEOGRAPHY.

At the recent Brighton Congress the Rev. Edward Hale, of Eton College, read a paper "On the Place of Geography, Political and Physical, in Education." The author gave it as the fruit of long experience as a teacher, that the rudiments of sound education should form two branches, viz., human and natural philosophy,—the one taught by literature and history, and the other by mathematics, physics, and science. Geography, physical and political, should form an essential part of rudimentary education. He considered geography, in its broad sense, to be one of those elementary studies absolutely necessary to the proper study of the history of man and nature. Having been for many years a teacher of modern history, he had found boys absolutely ignorant of the commonest geographical facts, and, therefore, unable to understand the political importance of treaties affecting the boundaries of countries or exchange of colonies. It was not so obvious that physical geography should be the groundwork of science-teaching. All parents are aware of the inquisitiveness of children, and must have observed also how, after school life begins, this inquisitiveness seems to vanish. The author's opinion was, that it is generally stifled by the evil geni of Latin and Greek grammar. Its disappearance did not prove that it was dead: with warmth and gentle rains it sprouts afresh, and this stimulating power is afforded by physical geography. As soon as the first principles begin to be taught, i.e., the phenomena of day and night, summer and winter, boys become interested at once,—the intellectual cravings of childhood revive and are being satisfied. At the end of the author's first lecture to his class on this subject, boys would remain behind, asking for further information, "Why is this?" or "Explain this again." Instruction in physical geography, in the author's own practice, begun with these astronomical relations of the globe. These lessons were followed by others on the first principles of heat, the effects of solar heat on the earth, the tides, winds, and currents, evaporation and rain, the first principles of geology, changes in the physical features of the earth, volcanoes, ice, rivers, the formation of chalk and coral, and the distribution of plants and animals. If, at first, the natural inquisitiveness of the boys is excited, at the end they feel their intellectual powers. They see how, from the knowledge of certain facts, the great laws of Nature are deduced; in short, the reasoning faculties are excited and strengthened. Boys who,

From some cause, are unable to appreciate the refinements of grammar, suddenly awakened, as it were, when first taught the principles governing the phenomena of Nature. A great moral good is effected in such boys. They are enabled to maintain that self-respect they were in danger of losing under the feeling of inferiority in other departments. An objection may be made against physical geography, that it is too discursive. The author admitted that a boy's training should be thorough, but this requirement was not injured by the study in question. The want of thoroughness is seen when boys are successively put through courses of astronomy, chemistry, mechanics, &c., anything like a thorough knowledge of which, within the time they are taught, being impossible. But the principles of such of the sciences as are necessary to the study of Nature may be thoroughly taught, and can be properly understood by a boy of fair intelligence. The author then described the method of teaching which he followed with his class at Eton, which consisted of about thirty boys. He gave them no text-book. Each boy has an atlas of physical geography; he himself drew his information from the works of Humboldt, Herschel, Tyndall, Murchison, Reclus, and, above all, the "Principles of Geology" of Lyell, to which he made his principal references. His apparatus consisted of wall-maps, photographs, and a microscope, to which he was preparing to add a small but good geological museum. He required each boy to bring a large note-book, with each page folded in the middle. Commencing his lecture by stating, first, its immediate subject, he dictated from his own notes an abstract of its first division, which each boy writes on one half of his folded page. He then enlarged on and illustrated his subject by facts, putting, at the same time, frequent questions to the boys. On the other half of their pages they make their notes, and, at the end of the lecture (lasting nearly three-quarters of an hour), he referred them to the authors and the chapters of their books which treat more fully of the subject. After every two lectures he requires each boy to bring an abstract of the lectures, and for this marks are given, with additional marks for good diagrams; and after every eight or ten lectures a prize is given to the boy whose aggregate marks are highest. He believed that some sort of field instruction would be a most valuable addition to his lectures, which should include the teaching of the use of instruments.

In the course of the discussion which followed, approval of Mr. Hale's views was strongly expressed by several speakers.

"DE LUNATICO INQUIRENDO."

MR. HOLLOWAY'S scheme for building and endowing a hospital near Windsor (of which illustrations of the first and second promoted designs have already appeared in our pages) will probably add a more than ordinary interest to Sir James Cox's speech at a recent meeting of the Medico-Psychological Association, held in the rooms of the Royal Society of Edinburgh. Sir James Cox (the president), it is well known, is a distinguished physician and a commissioner in lunacy for Scotland; he has also devoted the labours and researches of a long series of years to the important questions arising from the treatment of lunacy; and it is remarkable to find that his opinions are tending more and more in the direction that the results of asylum treatment, even in its highest phases, are not sufficient to cope with the portentous growth of insanity in our population. We have only room for one or two quotations, which, however, are deserving of attention, as coming from a practical authority:—

"After quoting a variety of statistics from the returns of lunacy in England and Wales, he said, on the whole, everything considered, I fear we must come to the conclusion that during the last twenty years medical science has not succeeded in effecting any increase in the proportion of recoveries, or any decrease in the rate of mortality among insane patients in asylums. What, then, is the object sought to be attained by the establishment and constant enlargement of asylums for the insane? The answer to this question involves the consideration of many important points. We have gradually become so accustomed to the extension of asylums whenever they are full, that few stop to inquire whether this is the proper course to pursue. But a little reflection will suffice to show that the institution of asylums is merely an expedient to counteract an evil which has its origin in remote and complicated causes. When the Lunacy Acts were passed, a belief was extensively prevalent that the establishment of asylums would powerfully contribute to check the growth of lunacy; chiefly by the numerous cures they would effect, and by the difficulties they would place in the way of the propa-

gation of the malady. We have seen that this hope has not been realised, but that, on the contrary, the number of lunatics has been greatly increased. It is not enough the more frequent occurrence of insanity, if we may so interpret the increase in the number of admissions, and partly through the predominance of admissions over discharges and deaths. Even if we accept the latter cause as sufficient in itself to account for the increase in the number of lunatics, and regard their accumulation as simply the result of life prolonged through improved treatment, it is difficult to see in this explanation any adequate reason for the constant extension of asylums. The question still remains,—What have they accomplished towards diminishing insanity, either by repressing its growth or by promoting recovery? Of course, it is impossible to call in question the fact that a large proportion of the patients admitted into asylums are restored to sanity. But this fact, nevertheless, leaves totally unaltered the problem how far recovery is due to any special influence of asylum treatment, or simply to the recuperative powers which nature displays whenever the circumstances which produced the malady are removed or neutralised, wherever that may occur."

Sir James proceeds to deal with the common argument in favour of asylum treatment, that recovery follows in a much higher ratio in the cases which are admitted in the earlier stages of the disease. "It cannot be denied," he says, "that such is the case." And it is not impossible that the plain deduction, that recovery was due to the removal of the patient to the asylum may also be correct. "But it will be observed," he adds, "that this is an assumption, in support of which it is very difficult to bring forward proof."

"Nobody can tell whether recovery would not equally have taken place had the patient not been sent to an asylum, and had simply those other circumstances which have been adopted which are resorted to in many other maladies—such as a judicious administration of purgatives, tonics, or other drugs, with proper regulation of diet, and change of scene and surroundings. On the other hand, when it is pointed out that recovery rarely follows the admission of chronic cases into asylums, it is impossible to doubt the fact. But when it is maintained that recovery would have followed had admission taken place at an earlier stage of the malady, we have here again an assumption which is beyond the power of proof. In admitting this assumption, we should be bound also to admit that all patients received into asylums in the early stages of insanity invariably recovered. But we know from experience that this is not the case. Even where there is no apparent organic disease, where the malady manifests itself as simple excitement or depression, or where there is merely delusion without either excitement or depression, we find the malady not infrequently requiring treatment at however early a stage the patient may have been brought to the asylum."

Sir James Cox does not, however, undervalue the usefulness of asylums:—

"Every one must admit that asylums, under the exigencies of modern social existence, are indispensable institutions. They meet a great want, and, moreover, they meet it, as a rule, in an admirable manner. Therefore, I beg it may not be supposed that I am arguing in any way against other asylums or their management. My purpose is to point out what I consider to be the proper application of these establishments, and to warn against their unreasonably use. I have often in visiting them been inclined to question the propriety of detaining certain patients. There was no doubt as to the existence of insanity, but there was, nevertheless, the doubt whether it was such an extent as to necessitate continued detention. From the superintendent being of opinion that such was the case, or from other difficulties in the way of discharge, the patient was left. At a future visit I have found him (the patient) much more confirmed in his delusions, or more liable to excitement, or, perhaps, incoherent. This result, looked at from one point of view, would seem to confirm the propriety of detention, but from another it may be regarded as bearing out the doubt that was felt. One thing, at all events, was clear; asylum treatment, whether successful or not, had failed; and, whatever the result, whether, of course, remain unknown; but it has always appeared to me very questionable reasoning to maintain the propriety of detention from its unsuccessful results. However, it is not uncommon to hear it asserted that even where asylums do not cure, they at all events improve and humanise. It cannot be denied that this is frequently the case; but, on the other hand, there is not wanting evidence to show that association with the insane has occasionally a degrading and deteriorating effect."

We should feel inclined to substitute the word "invariably" for "occasionally," in the last sentence, if Sir James means to signify that perfectly sane patients were compelled to associate with insane ones. But it is not clear that such is his meaning. Moreover, it is not asserted that such a deteriorating or degrading effect may or could arise from the contact of a couple of innocent lunatics. Under certain circumstances, indeed, we should fancy the association not only to be quite harmless, but actually beneficial! We remember hearing a story many years ago of a rencontre which happened between three crowned heads and a harmless lunatic, and which occurred during the occupation of Paris by the Allied troops in 1815. Three military gentlemen were walking one morning in the Jardin des Plantes, when its beauties were quite scientifically pointed out and described to them by an oddly-dressed and singular-looking personage, whom they supposed to be one of the under-gardeners. He dwelt with peculiar emphasis, it was remembered, on the beauties of the Indian trees,—the lotus, the palm, the banyan tree, &c.; and, after concluding his botanical survey, he turned to his audience and politely requested the strangers' names. "I am

the Emperor of Russia," said one of the party. "Indeed! ah! and this gentleman?" "He is the Emperor of Austria," was the answer. "Oh! Must I also understand," pursued the singular querist, "that this gentleman is an Emperor too?" "No," replied Wilhelm, smiling (who then saw Paris for the first time), "I am simply the King of Prussia. But," continued His Majesty (with a touch of that grave humour which is characteristic of his race), "will you be so good as to tell us in return the name of our distinguished *otomane* to whom we are at present so much indebted?" "*Monseigneur mon frère*," replied the eccentric botanist, drawing himself up and laying his hand on his heart, "*Messieurs mes frères, je suis le Grand Mogul!*" Alexander of Russia, who frequently told the story afterwards, used to add that the Great Mogul was probably the happiest monarch of the four.

There is more in Sir James Cox's valuable address deserving of study. Although leading strongly to the curative effects of home treatment, he nevertheless admits that "the great advantages of asylum treatment are its convenience and its economy." He is silent, as far as we observe, respecting the vital question of dangerous lunatics, and the method of their treatment; but the following observations are as valuable as they are just.

"There cannot be a doubt that the inspiration of genius, and the knowledge acquired from experience, will often point the way to successful treatment in specially difficult or obscure cases; but, as a rule, recovery from an insanity is due far more to an adherence to the broad rules of hygiene than to any peculiarity in the treatment. In supplying abundance of food and clothing in providing comfortable lodging and bed, in giving proper attention to cleanliness, and in affording ample means of varied occupation and exercise in the open air, lies the great secret of the successful treatment of insanity. Purgatives, hypnotics, narcotics, and tonics are useful as auxiliaries; but a comfortable meal is the best of sedatives, and abundance of exercise the best of hypnotics."

So that it would appear, in Sir James Cox's estimation, that the proper and most philosophical treatment of the insane,—like that of other helpless and dangerous increments of our population,—is more and more verging on the simple yet beneficent principles of public health.

SCHOOL BOARDS.

Erith.—The Erith School Board have appointed Mr. Herbert Ford, architect, for the erection of suitable buildings to accommodate 575 children, also residences for the master and mistress of same, at Erith, Kent.

Dromfield.—It was resolved, at the last meeting, that Messrs. Flockton & Abbott, architects to the Board, be requested to prepare the necessary plans and estimates for intended schools and master's house in Cross-lane, such estimates to include the requisite fittings and furniture for the school. It was also resolved that Messrs. May & Lucas be requested to examine the plans and estimates before they be submitted to the Board for approval.

Staplehurst.—This Board has held a special meeting, to consider in what way to deal with Mr. Bridge, whose tender for the erection of the schools, namely, £2,000, was accepted, out of six, although the Board were somewhat surprised to find the lowest tender exceed 4,000. The Board have recently received four new tenders; the estimates are not to be disclosed until next meeting. It was remarked that there was a superfluity in the ornamentation of the adopted plan, which rendered it costly, to which it was replied that it was desirable to erect a school of which they might not feel ashamed, either internally or externally. Eventually a resolution was carried unanimously, to the effect that no tenders be opened, and that Mr. Lewis (the architect) be requested to obtain from Mr. Bridge the amount to which his tender would be lowered by the reduction of the ornamentation. It would then be compared with the new tenders, and should his figures approximate to them within a reasonable sum, his offer would be accepted.

Reading.—Two reports of committee were read. Amongst the subjects referred to were the following:—Plans of the new school buildings in Silver-street had been pronounced "satisfactory" by the Education Department. The alterations to the temporary school in Silver-

street required by the Education Department would cost about 25*l.*, and therefore the committee did not think it advisable to incur this expense. With reference to the new school proposed to be built at Releigh, correspondence had taken place between the Board and the Education Department, and it was deemed advisable to postpone the whole question for the present. Twenty-two tenders had been received for the new school in Silver-street, and the following had been accepted:—Mr. Charles Waite, brick and slate work, &c., 926*l.*; Mr. A. Shepherd, carpenter's work, 392*l.* 15*s.*; Mr. Pecover, iron-work, 92*l.*; and Mr. Sumner, plumber's work, 18*l.* 10*s.*; total, 1,489*l.* 5*s.* The reports were adopted.

Southampton.—The Works Committee reported that after advertising for tenders for the erection of schools in Bevois Town, estimated to accommodate 700 children, the following had been received:—Messrs. Laver & Rowland, 3,595*l.*; Messrs. Bull & Sons, 3,627*l.*; Messrs. Reynolds & Eldridge (Brighton), 3,740*l.*; Mr. H. Sanders, 3,849*l.*; Mr. S. Stevens, 3,865*l.*; Mr. J. Nichols, 3,887*l.*; Mr. J. Crook, 3,920*l.*; Mr. Gambling, 3,950*l.*; Mr. Jas. Dyer, 4,045*l.* 10*s.*; Messrs. Martin & Son, 4,195*l.*; and Messrs. Dunkley & Son (Edgington), 5,200*l.* 10*s.* The committee recommended the Board to accept the lowest tender, viz. that of Messrs. Laver & Rowland. In respect to the site for a school in St. James's district, the committee instructed the Board's surveyor to bring up an estimate as to the cost of erecting suitable schools. Mr. W. C. Westlake moved the adoption of the report, and reminded the Board that the acceptance of the contract for the schools at Bevois Town would be subject to the approval of the Education Department. The amount was larger than they anticipated, but the rise in the price of material and labour had been recently very great, and accounted for a large portion of the increased cost. The proposition to accept the tender was then carried, subject to the surities offered proving satisfactory, and the matter was referred to the special works committee.

Worcester.—The foundation stone of the Board's schools at Hounds-lane has been laid by the chairman. The architect is Mr. E. A. Day.

GLASGOW: STOBECROSS DOCKS.

We understand that Mr. Taylor Shipley Hunter, of Edinburgh, has been accepted by the Clyde Trustees, after much consideration, as contractor for the first portion of the above docks. At first, eleven contractors gave in offers, and from that number four were chosen to give estimates for alternative designs, when Mr. Hunter's, being the lowest, were accepted. Mr. Hunter engages with a somewhat gigantic work, but his previous experience with similar undertakings gives every promise of the Stobecross Docks being constructed satisfactorily. In 1859 he built the eastern harbour at Granton, near Edinburgh; afterwards the Queensferry Railway and Harbour; and, latterly, has been engaged in the erection of the Chickens Light-house, Isle of Man. It is calculated that it will take nearly twenty years to complete the whole of the Stobecross Docks; but Mr. Hunter has undertaken to execute the first portion in two years, at a cost of 160,000*l.* The foundations for the dock-walls are to be of concrete cylinders, while the walls are to be freestone, from the Craigleith quarries, near Edinburgh, of which Mr. Hunter is lessee.

THE ART OF GLASS STAINING.

In one of the Cantor lectures, by Professor Barff, to which we referred in our last, the lecturer said,—I am about to speak to you on the subject of staining glass with metallic oxides. We notice a considerable difference in the ancient glass which adorns the old cathedrals of this and other lands, and the glass which was made some twenty or thirty years ago. We notice this difference in the blues and reds, but more particularly in the latter, and we ask frequently in what does this difference consist? I have already noticed this point, but it is now my business to go into it rather more fully. The texture of the ancient glass is very different from the texture of modern glass, and I shall give some experiments later on to show this, and you will need no further remarks, as the illustrations will speak for themselves. But when old ruby glass is examined, you find that there is a thicker

coating of the colouring matter upon it than there is upon modern ruby. The ground of colour is different, i.e., the white glass—that I have already shown—and to that is owing, in great measure, no doubt, the lustre of the ruby. But it appears as if the operation of dipping and coating had been repeated several times—as if the glass ruby had been taken and dipped into the pot, and coated with white and ruby glass more than once. It appears as if the coloured coating had been put on the outside and not on the inside, and that after the glass had been dipped into the ruby it was again dipped into the white, so that strata of white glass are formed between the thin films of ruby glass. That would very materially increase the brilliancy of the effect produced by transmitted light. All the old ruby glass is remarkably thick, and, no doubt, in former times, those who made windows took the greatest possible care in firing their ruby glass, and a great deal depends upon the firing. I have here a disc of ruby which was lent me to-day by Messrs. Powell, in which we have portions of it perfectly white; but if this white glass is fired carefully it becomes ruby, and if this ruby, which is perfectly red on this side, is overfired, it becomes almost opaque. Great care is therefore necessary in firing ruby glass. In some instances glass painters, if they are not careful in using a flux with their painting colours which is sufficiently soft to run down before the temperature rises so high as to affect the ruby glass, spoil their ruby. Glass painters know that, in spite of all their care, this does sometimes happen, and that ruby becomes so dark with the firing that they have to reject it, and paint fresh pieces. I mentioned, I think, that ruby glass is usually coloured with sub-oxide of copper; it is also coloured with oxide of gold. I have here two specimens, which have been lent me, of ruby glass, obtained from the heating of an almost colourless glass. I shall show you those presently by the aid of the electric lamp, and you will see that one piece is colourless, whilst that which has been heated has become of a beautiful ruby colour.

Before leaving the subject of ruby glass, I must say one word about splashed ruby. As many of you, no doubt, are aware, there are some pieces of old glass taken from French windows, I believe, in which there is clear, white glass with dashes of ruby upon it, just as if the maker had taken ruby glass in a liquid state, and dashed it on the white glass. This is called splashed ruby. The way that can be imitated, and no doubt, the way in which it was originally obtained is this. Portions of this copper ruby are broken up into small pieces and thrown upon the iron implement, which is called the *marbre* or *marver*, and which is used in the manufacture of flint glass. The workman then gathers white glass from the pot on the end of his blow-pipe, and rolls the hot glass on the *marver*; the small pieces of ruby adhere to it, and are softened by the heat. The mass is then exposed at the mouth of the glass-pot, and the pieces of ruby melt and become perfectly united with the white glass and spot over its surface. When the mass is in the proper state it is blown and made (as already described) into a disc or cylinder, and the spots by this operation become elongated, and produce the same sort of effect as would be obtained by throwing a red liquid obliquely on a sheet of white paper.

Another point to be noticed in connexion with ruby glass is that we do not always get a ruby colour with the oxide of copper. Sometimes the sub-oxide becomes oxidised into the higher oxide, and that higher oxide gives a green, not a ruby, colour; so that we get an intermixture of green and red sometimes, and also purplish and bluish tints. Specimens of these I shall show you by and by.

The blue glass which is considered by many to be so beautiful, this sort of purple blue, is stained with oxide of cobalt. I have arranged an experiment or two to-night, to show you how, by running down certain mixtures which we have here, the composition of which I will tell you of presently, we are enabled to obtain coloured glass. Of course, in so short a time we cannot obtain it in a state perfectly homogeneous; but, at all events, we shall be able to show you how blue glass is obtained. Green glass is coloured by various metallic oxides. For instance, even as I have already mentioned, in a certain state of oxidation, iron colours glass green, and the green colour of ordinary bottle glass is owing to the presence of protoxide of iron. Green is also obtained with other

oxides of metals. We have here a beautiful piece of green glass, which goes by the name of signal green, because it is used for railway signal-lamps. It is coloured by the higher oxide of copper, the protoxide, not the sub-oxide. Oxide of chromium also colours glass green, and it has a very powerful colouring effect. Opaque greens are made with it for enamels, and some transparent greens; for if this opaque green be coated upon white glass, we have a similar effect produced to that which we have when the ruby glass is coated upon white; a coated green is obtained. Then, with regard to yellow glass, there are different kinds, which I shall show you presently. Some cold yellows are obtained with sesquioxide of iron, the oxide containing more oxygen than the protoxide. Another yellow is got by silver stain. It is said that the ashes of certain woods colour glass yellow. It is the iron contained in the ashes which, in the state of sesquioxide, imparts the yellow colour to the glass.

Having spoken of the method of analysing colour, I must speak on the texture of glass, for this is a subject of immense importance. It is on the texture mainly, I think, that the richness and beauty of effect which we see in the old window glass depends. I shall have to show this by direct light, putting the various pieces of glass in front of the lantern, and you will see by direct light the difference of effect produced by the texture of the glass; and you will yourselves, I think, be able to see in an instant how very beautiful is that glass which is made according to the system which the ancients adopted in the manufacture of their glass. First, we begin with white. On putting a piece of common glass coloured the lantern, you see no change whatever in the light thrown on the screen; but now I will put a piece of Messrs. Powell's white glass, used for church windows, in front of the light, and you see how beautifully the light is refracted. And if you get this brilliant effect by passing the electric light through this medium, how very much more beautiful will it be when produced by the sun's rays passing through it. You notice these numerous luminous points all of which add to the brilliancy of the effect. Here is a piece of ordinary green glass, through which the light passes uninterruptedly. Here is another piece, on which I experimented just now, and you observe how brilliant it is. Now I will show you a piece of ruby glass, which will illustrate the point I mentioned before. You see there is a border to it, which is deep in colour, but the main portion of it is white, with small streaks of ruby in it. That is the disc which I mentioned had been fired more on one side than on the other, and I said that those parts of it which are now white would become ruby if they were cautiously fired. This is most interesting to me, because it supports the theory which I have held for some time past, in conjunction with many other chemists, namely, that it is not to the presence of the metal, as a metal in the regular state, that the colour of glass is owing, but to the presence of a metallic oxide. This is a subject which I will not go into this evening, because it would take us too far. Here is another specimen of ruby, which has also greenish, greyish, and bluish streaks in it. That is coloured with sub-oxide of copper, but, no doubt, some of the sub-oxide has become oxidised into the protoxide, which gives the green and blue colour. You remember the green I showed just now—bluish green, the signal green—it is coloured by the protoxide of copper, so that you can quite understand how there are streaks of blue there, and how you get streaks of greenish blue and grey mixed up with the ruby colour. I believe it is owing to the presence of these different tints that certain of these rubies which are sold ordinarily, and some of those which are manufactured for stained-glass purposes, when tested by the prism allow other rays, such as a green and blue, to pass through them. Here is another very interesting specimen. You see what beautiful colours and forms there are upon this piece of glass. You will be astonished to hear what they are, and how they are produced. It is a piece of glass which Mr. Powell was kind enough to lend me, and which had been for many years in his stable at Clapton. It is a pane of common crown glass, taken out of the stable-window. It is perfectly smooth on one side, and coloured, but on the other side it is rough and very iridescent indeed. It looks like some of the glass vessels which are taken out from Roman excavations, or from the bottom of rivers. Its surface looks like opal, and most beautiful colours are

seen on it as you move it about. These colours must have been produced by the action of certain substances on the glass, carried as spray in the air, which were in the stable, and which were deposited on this window from time to time, through a long course of years. The action of these substances is such as to destroy the texture of the glass, or at least the texture of that surface with which they came in contact, and having seen this you will not have much difficulty in understanding how it is that, through a lapse of years, certain effects are produced by atmospheric influences upon the church windows, of which we are so justly proud, as representing a state of high art and sentiment in the Middle Ages.

A DRINKING FOUNTAIN FOR PATNA.

A DRINKING fountain has been presented to the people of Patna, near Ayr, and was opened the other day with some rejoicings and speeches. The fountain consists of a basement of polished grey Aberdeen granite, with two basins, into which the water flows through two metal spouts issuing from lions' heads. Above is a moulded plinth of Yorkshire stone supporting the shaft of the fountain, which is of polished Aberdeen granite, having a moulded band across the middle, with a carved shield, and arms a lion rampant. Above the shaft is a carved Gothic capital, with played angles, surmounted by an open corona in Yorkshire stone, carrying a carved conventional fleur-de-lis. The total height of the fountain is 12 ft. from the basement to the top of the finial. Upon the shaft, in incised and gilt letters, is the following inscription:—"Presented by A. Barclay Walker, Esquire, to the inhabitants of Patna." The design was furnished by Mr. Henry H. Vale, architect, Liverpool.

CLACTON-ON-SEA.

THIS picturesque watering-place seems to be rising into importance, and offers a field for investment. A commodious hotel, erected by a limited liability company, has just been opened opposite the pier, and pleasure-grounds are being laid out facing the sea. The nearest railway station is about five miles off, but omnibuses run in connexion with the trains, while the London and Ipswich steamers call daily. A narrow-gauge railway or a tramway, to communicate with the main line, is needed.

A number of new houses and cottages are already occupied, and a London builder (Mr. Snelling) has bought several acres of freehold land adjoining the hotel, and seems at present to be doing the chief building here.

THE TRADES MOVEMENT.

London.—The Carpenters and Joiners' Central Committee have paid their final strike dividend at the rate of 2s. 6d. a day, or 15s. a week per man. During the last week upwards of 350 signed the strike-sheets; but that total does not represent the number actually idle for the whole six days, as by a resolution of the delegates a man could for the space of a month come on and off the sheets at pleasure in the intervals of his being out of work. The strike began the first week in June with very nearly the same number as that which shared in the last dividend. The first dividend paid was at the rate of 2s. a week per man, the second 2s., and the third 2s. Then came the "lock-out," and with it a fall in the fourth dividend to 7s. 6d.; the fifth was 8s.; the sixth, 9s. (lock-out withdrawn); the seventh, 10s.; the eighth, 12s.; the ninth, 11s.; the tenth, 11s. 6d.; the eleventh, 13s.; the twelfth, 6s. (week after the settlement); and the thirteenth, 15s. The highest, therefore, was at the rate of 4s. 6d. a day, and the lowest 1s. a day. The payment of the last, it is said, has pretty nearly exhausted the treasury. What has hitherto been called "The Short-time Movement" will henceforth become a "Uniformity of Time and Wages Movement," and the next business of the delegates will be to arrange for the machinery to extend the adoption of the agreement recently come to with the Central Association of Master Builders to employers outside that body. At last week's meeting three prominent firms in this category were brought under notice, viz., Messrs. Corbett & McClymont's, West Brompton; Adanson & Sou's, Turham-green; and Perry & Co's, Stratford. Deputations from the committee were appointed

to deal with the two first. Messrs. Davis, Benny, and Matkin (secretary) were delegated to move Messrs. Corbett & McClymont's, and they returned with the report that in order to avert a threatened strike the firm had unconditionally accepted the terms of the agreement entered into with the Masters' Association. The shop has accordingly commenced working under the code of rules issued by the Central Committee.—A mass open-air meeting of the builders' labourers of London was held in Trafalgar-square on Saturday evening last, to receive the report of their deputations to the Masters' Association relative to the late dispute in the trade. It was estimated that there were fully 1,500 of this class present, and the proceedings, which occupied about an hour and a half, were characterised by good temper and order from beginning to end. Mr. Halloran moved:—

"That, in the opinion of this meeting, the small addition granted to the wages of the builders' labourers is not sufficient to enable them to support themselves and families; and this meeting of labourers pledges itself to use its influence, and calls upon all concerned to do the same, to extend throughout the London district the Builders' Labourers' Union, so that by our united strength we may be able to command our 6d. per hour."

Mr. J. Leicester seconded the resolution, which was passed by acclamation.

Oxford.—The stonemasons struck for an increase of wages, but the builders having since conceded their demands,—30s. a week,—the men have resumed work.

Beeches.—A meeting of carpenters was recently held, to discuss a demand made of an increase of 2s. per week on wages. The meeting was summoned by the workmen, but the employers were invited to attend to talk the matter over. The only employers who attended were Messrs. Pells and Woodroffe. In the course of the conversation it was stated that the present wages were 20s. per week for ten hours a day; and the reason the men asked for an increase was the advance in price of all articles of diet and wearing apparel. Mr. Pells and Mr. Woodroffe said they had no objection to give the increase if other employers did the same. The meeting was adjourned, that other masters might be consulted.

Birmingham.—It seems by no means improbable that there will shortly be a strike of great magnitude in the Midland colliery district. The Coalmasters' Association have had a meeting at Birmingham to discuss the demand of the men for a further advance of 10 per cent., and have resolved, it is understood, not to grant it. In consequence of this decision the men afterwards met and determined to tender notice to leave work in a few days. Should no settlement be come to, therefore, another strike appears inevitable, and about 20,000 men and boys will thus become temporarily idle!

Labour and Capital.—At a meeting of the Executive Committee on Labour and Capital, in connexion with the Social Science Association, held on the 3rd inst., it was resolved:—

"1. That the committee desire to congratulate the master builders of London and their workmen on the termination of the late strike and lock-out in their trade, on the restoration of harmony, and on the passing of the joint resolution of masters and men, to the effect that, if any dispute should arise in future, they will at once resort to those means of friendly conference which have in this instance proved successful. 2. That it is very satisfactory to the committee that the advice which they ventured to offer, in reference to the late strike and lock-out, immediately elicited from one of the parties concerned an expression of a willingness to adopt it, was soon in part carried into effect, and has now been fully acted upon by both parties. 3. That in the hope that a similar result will follow the tender of the same advice in the case of the London bakers, the committee, again taking advantage of their neutral position, respectfully but strongly recommend both masters and men to appoint an equal number of representatives, with full powers to meet in friendly council and to settle all matters in dispute; or, failing to accomplish a settlement, to choose an umpire, whose decision shall be final."

OPENING OF THE "BLACK BURGH," BRIGHTON.

THE Dyke-road tumulus, or black barrow, about four miles from Brighton, has been opened. In the long account of the excavations, and their results given in the local *Herald*, it is stated that

"the pit itself was an oblong, 12 ft. long and 8 ft. wide, sunk about 2 ft. 3 in. in the chalk, and filled in with chalk rubble. The direction of the pit was N.W. and S.E. The first objects found in the chalk rubble were two bronze coins and some Romano-British pottery, about the level and top of the pit. The coins are, probably, Roman, and, together with the pottery, belong to the secondary interment. At 4 in. from the floor of the pit some Romano-British pottery, of similar character to that found before, was encountered, and on the floor of the pit, with its point to the east, lay a bronze knife-dagger. Slightly to the

south of the dagger, a small food-vessel, of far earlier type, a bronze pin, and about fifty well-made flat heads, about three-eighths of an inch in diameter, apparently made of jet, were found. And then, while clearing the floor of the pit, a skeleton, with its legs drawn up, and resting on its left side, with the face in an easterly direction and the arms crossed, with the fingers towards the face, was discovered. The whole was so crushed by the superincumbent mass that it was only 2 in. thick. It would appear that a pit was cut in the chalk, and that a dead chief was placed in a sitting position—his dagger, beads, and food-vessel placed by his feet; the earth was then put over him, and upon the surface of the filled-in grave a mighty funeral pyre was lighted; then the flint were daked over the charcoal, and the mound raised above the level of the surrounding country. At a subsequent period, the mound was opened to receive another man of mark."

One of the first things noticed at the opening was a cylindrical hole in the chalk, 1 ft. deep and 4½ in. in diameter; next, a similar but smaller hole, 6 in. deep; and then a leg-shaped hole, 1 ft. 7 in. deep,—all cut in the chalk. These were evidently artificial, and differed altogether from the pot-holes met with in the chalk. Nothing was found in them. Mr. Phené, who has written on the subject, Mr. Monks, considers that the leg-shaped hole is in some way connected with religious rites. That they are of common occurrence is proved by the fact that Canon Greenwell has found them in Norfolk, cut in the rock; and they are spoken of as generally associated with mound burials.

ALBERT MEMORIAL.

Sir,—While approving the several remarks of your earlier correspondents on the Albert Memorial, I would wish also to make a suggestion.

It appears to me almost an impossibility to examine carefully and with any amount of pleasure, the beautifully sculptured bas-relief round the podium of this magnificent monument on a fine day, the eye becoming extremely wearied with the glaring brightness of the marble. This I believe might be entirely counteracted by having evergreens and flowers placed in pots on the upper landing within the low railing, and just below the statuesque pavement and at its base.

The green colour of the plants would also relieve the present plain and severe lower part of the Memorial, and help to harmonise the same with the gorgeous upper portion.

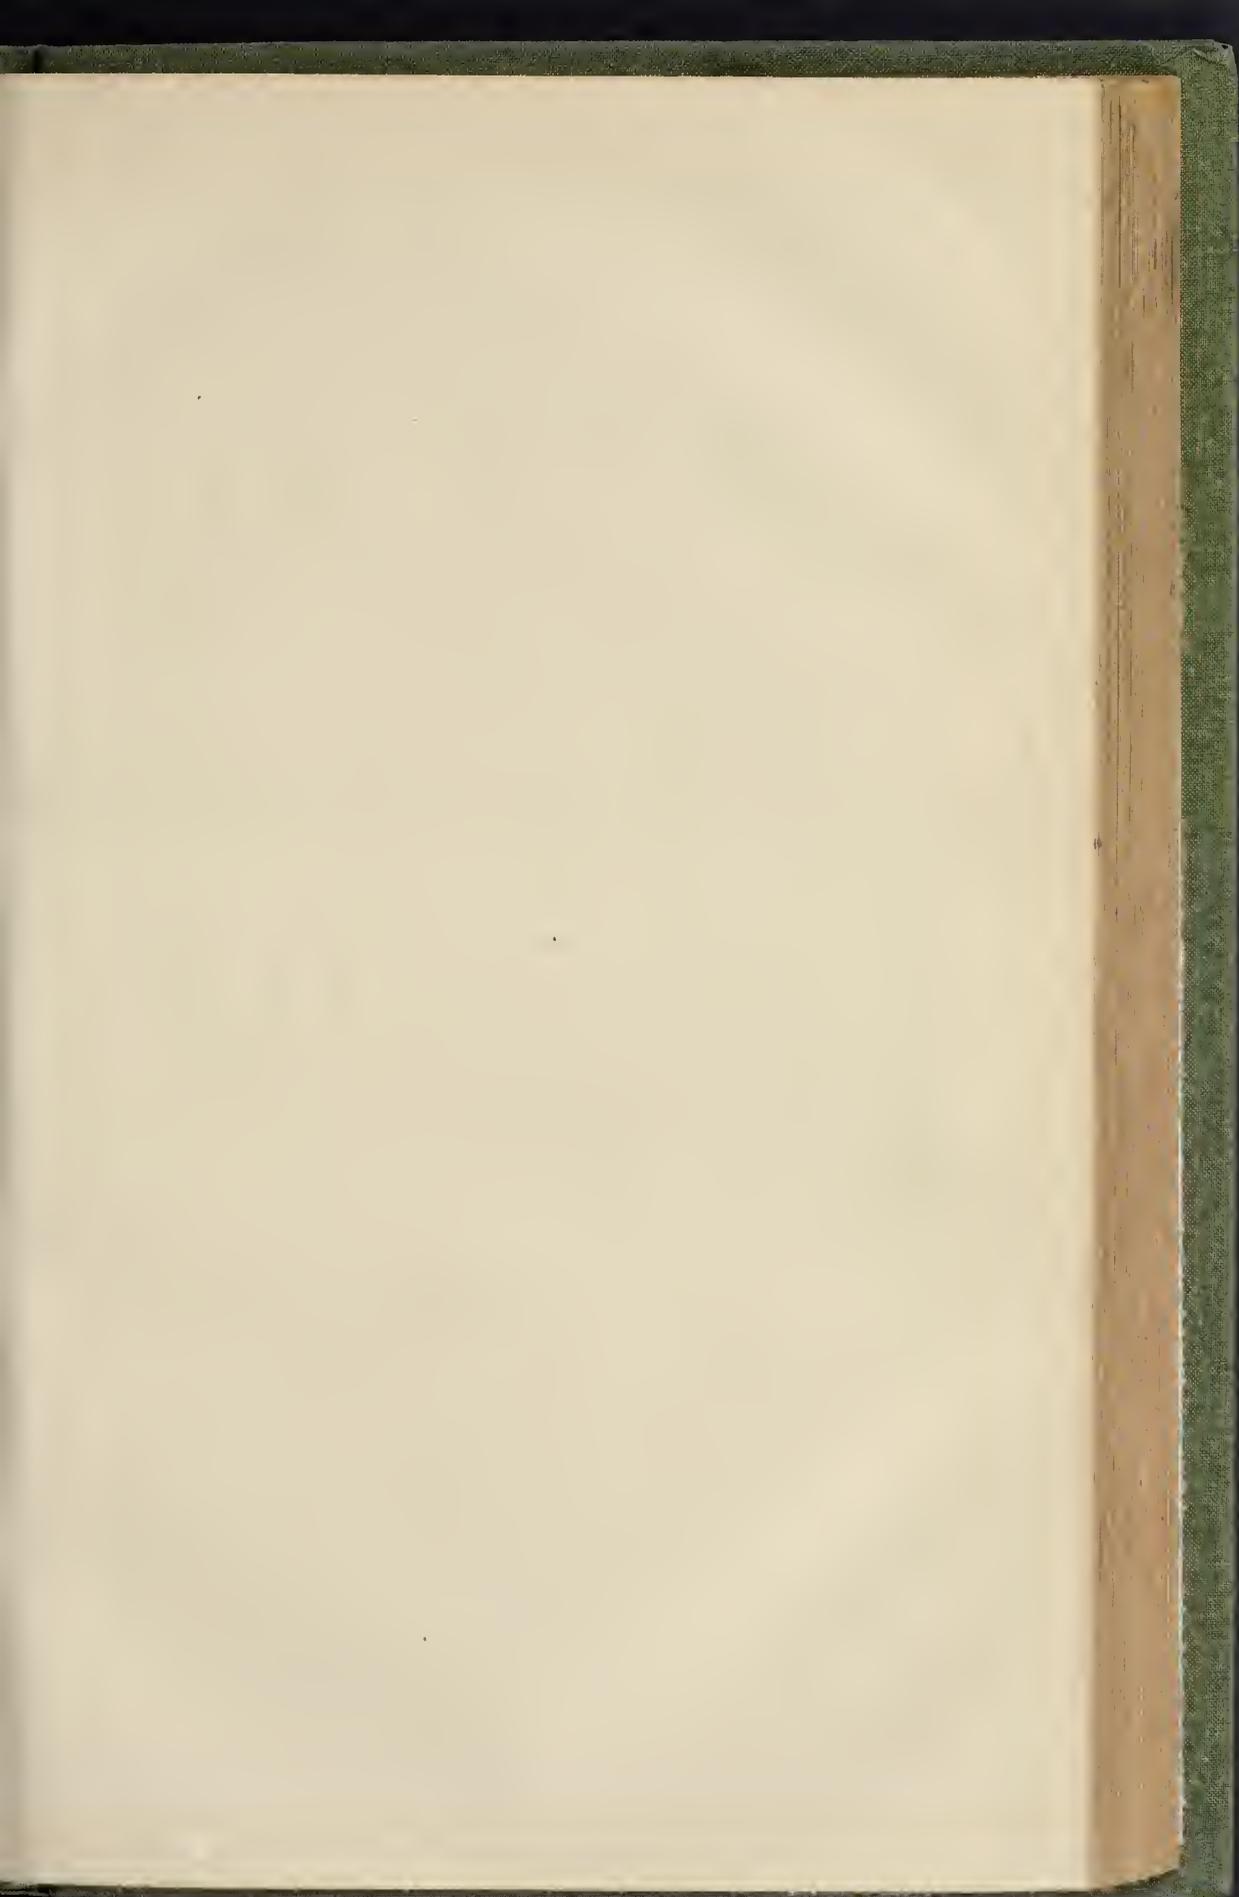

F. N. K.

THE SCIENTIFIC AND MECHANICAL SOCIETY, MANCHESTER.

SECTION I.—ENGINEERING.

At the last meeting of the above society, Mr. A. Hildebrandt moved a resolution,—"That a special committee be appointed to take into consideration the society's future programme, and to make the necessary arrangements of carrying out the same." This committee to draw up new rules, to organise additional sections of their own, representing the staple industries of the district in all its most important branches, similar to the well-known "Société Industrielle de Malhouse," to consider the advisability of taking immediate steps for the establishment of a "Technological Reference Library and Reading Room," and the publication of the society's proceedings. He thought they were now in an unsatisfactory position, and their future line of action required mature consideration, which would bring about a radical change; they had now men of all shades—as regards professional pursuits—in their midst, and they had found by experience that it was not exciting sufficient interest to let them all meet at one time, and join in one common discussion, except by their own desire. For the next session he hoped there would be a section of chemistry, another for spinning and manufacturing, &c. If they looked upon that eminently useful and authoritative body, the Société Industrielle de Malhouse, it was difficult to understand that a similar movement should not have been set on foot in such an important centre of industry as their own district, long ago. It was for them to decide now whether they should set themselves the task of exploring that field, clear as it was that there was ample scope and an urgent want for such an extension. He hoped that those gentlemen who wrote to the *Chemical News*, advocating a similar movement, would consider that they possessed the nucleus for it, and would co-operate with them.

A committee with full powers was then elected, consisting for the present of Messrs. Ziffer, Ross, Lynde, Spriggs, Tolhausen, Waterford, Driefuss, Hulenhansen, Hilton, and Hildebrandt, the hon. sec. of the society. This committee is to commence its labours at once, and the results are to be laid before and sanctioned by the next monthly meeting on the 2nd of October, so that everything may get in proper working order for the next session.

PORTION OF SCULPTURED COLUMN FROM THE TEMPLE OF DIANA AT EPHEBUS.

THE TEMPLE OF THE EPHESIAN
DIANA.

EARLY in the year we gave the public the first view they had had of the lowest frustum of a column, with its base-mouldings, as found by Mr. J. T. Wood on the site of the Temple of Diana in Ephesus, together with an elaborate essay on the probable form of the Temple, and a plan to illustrate it.* This large and interesting relic is now in the British Museum, open to all, together with a grand Ionic capital and other important remains, one of which we illustrate in our present issue. The width of the capital is about 8 ft. 8 in. on the face of the volutes. In the essay referred to, our classical readers were reminded of the account of the temple given by Pliny. He states (xxxvi. 11), that the height of the columns was 60 ft. and the weight of the

* See pp. 103 and 119, ante.

epistylia,—the architrave stones,—enormous; the number of columns he gives as 127, "made by as many kings," of which thirty-six were, he says, *celato* (sculptured in relief), one being by Scopas. Scopas, let us note in parenthesis, executed one side of the tomb of Mausolus. The temple which is now being exhumed, and with which we are concerned, was in process of completion, as we have before mentioned, when Alexander passed into Asia, B.C. 334, in succession to one that had been set on fire on the night of his birth, B.C. 356. Well here we now have a part of one of these columns sculptured in relief, as sent home from the site by Mr. Wood. It is the lowest portion of a column, of marble, about 7 ft. in diameter at bottom, and 6 ft. in height. Our engraving represents one side of it, and shows a female figure between Mercury and a winged Victory. Further round is another upright female figure, with the lower part of a

seated female. The drapery of all the figures admirably modelled.

It was a glorious find, and is of itself worth the money that has yet been expended on the work of excavation.*

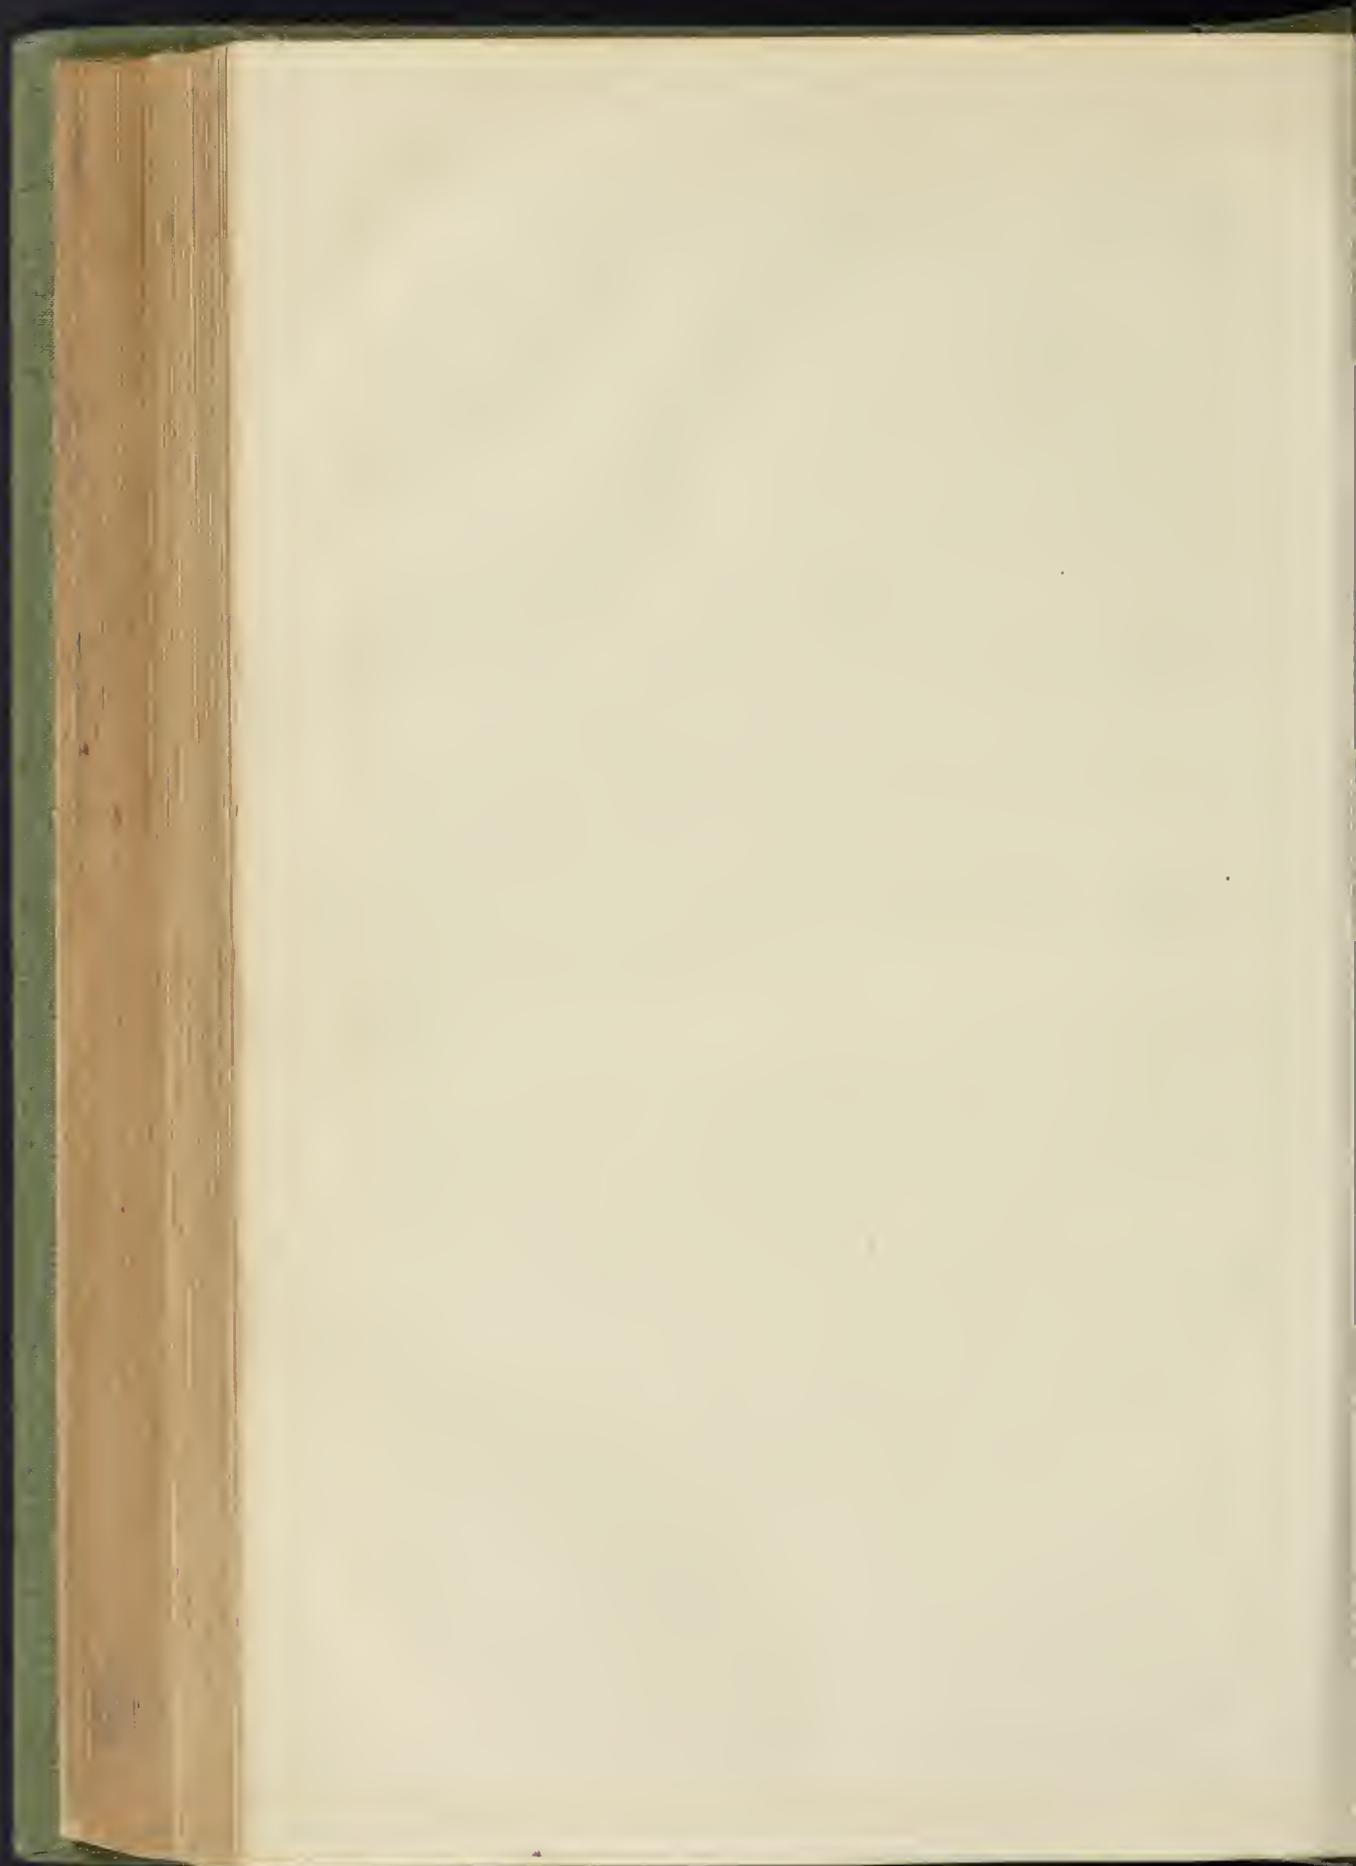

Amongst other remains now in the Museum are part of a pilaster, also sculptured, the subject being "Heracles [our old friend Hercules] struggling with a female figure;" and the lower part of two figures, one sitting, the other standing close behind.

We conclude that these important and deeply interesting relics will be all brought together due time. At present they are somewhat scattered. We must repeat the expression of hope that Mr. Wood will be liberally assisted in the further prosecution of his researches.

* Messrs. Mansell & Co. have published three excellent photographs of the sculptured drum of column, to which we gladly point attention.

THE BOSTON AND LOWELL PASSENGER STATION: BOSTON, U.S.—MESSRS. L. NEWCOMB & SON, ARCHITECTS.

THE BOSTON AND LOWELL PASSENGER STATION, BOSTON.

The railway station which is in course of erection in Causeway-street, Boston, U.S., has a frontage of 205 ft., and extends back 700 ft.; what is there called the Head-house having a depth of 120 ft. out of this. It is modern Franco-Italian in style, and was designed by Messrs. L. Newcomb & Son, architects, under whose superintendence the work is now going on.

The material will be of face-brick, with trimmings of Nova Scotia stone. The central portion projects 18 ft. 4 in. from the line of the front, and is 64 ft. 8 in. in width. This central projection is crowned by a "Louvre" dome, the summit of which is 115 ft. above the street-level. In front of the dome the stonework rises in four pillars, forming a window, above which is another conspicuous projection, containing a large clock. On either side of the window is an ornamental circular window, and a similar one is on each side of the dome. At each of the four corners of the head-house is a tower, 35 ft. by 30 ft. Three of these are uniform in height, while the fourth, at the corner of Causeway and Nashua streets, rises to an altitude of 165 ft., the brick and stone work rising two stories above the main structure, and above all is a mansard roof. The towers, dome, and roof are all surmounted with cast-iron crestwork. The first story is finished in rustic stonework, and the towers are bastioned, and have a considerable inward slope, giving them a strong and substantial appearance. In each side of the roof, between the towers and the dome, are circular windows, corresponding to those in the dome, and just above is a row of smaller ones. In both of the Causeway-street towers are arched entrances, 40 ft. wide, communicating with covered driveways, open on the side, supported by pillars, and extending back to the towers in the rear. The archway in the tower at the corner of Nashua-street is for inward, while that on the other is for the outward, passengers. The driveway is 20 ft. wide, and is to be paved with wood. The rest of the space is to be occupied by a tiled sidewalk, 12 ft. wide, next the main structure.

From the side-walk, roomy entrances will communicate with the great central court of the area, 92 ft. long by 52 ft. wide, with a height of 64 ft. 9 in., and celled with ornamental glass-work. The floor will be of tessellated marble, and in the centre will be a fountain, while all around will be comfortable seats for the accommodation of the traveller. Around the sides will be a double row of corridors, corresponding with each story, giving a view of the scene on the floor. In the arches of these corridors will be chandeliers, and at night the scene will be one of much beauty. The woodwork of the entire interior will be of brown ash, relieved by black walnut; and, in the great court, the prominent points will be brought out in variegated colours. On the west side of the court is the gentlemen's waiting-room, 39 ft. by 40 ft., with barber's shop and closets adjoining. Beyond is the telegraph office, and then comes the vestibule leading from the side-walk to the court.

This vestibule is 19 ft. wide and 40 ft. long. Here are the broad and easy stairways leading to the story above. On the opposite side of the building is a vestibule exactly similar in every respect. The outward and inward baggage-rooms are in the rear of the vestibules. To the east of the court is the ladies' room and a large ladies' waiting-hall. But the unique feature is the ladies' private reception-room, immediately in front of the court, and occupying the central projection. Its dimensions are 52 ft. by 34 ft. It will be fitted up in a luxurious manner. A handsome carpet will cover the floor, and the walls will be adorned with paintings. The windows will be hung with heavy drapery. This room communicates with the ladies' waiting-room, spoken of before, which will have a private restaurant attached.

In the second story on the left is to be a suite of rooms for the manager, including a public and private office; and in the rear will be rooms for the treasurer, with a large fire and burglar proof safe, 9 ft. 8 in. by 6 ft. inside. Directly over the ladies' private reception-room is a large room fitted up for the reception of gentlemen wishing to see the officers of the road on business. On the right are the superintendent's rooms, and in the rear is the attorney's office, with law library attached. All these rooms communicate with the corridor running around the rear court. This corridor is 12 ft. 8 in. wide,

In the third story is a similar corridor. In this story are the directors' room and three large banquet-halls, so connected by folding-doors that they can be thrown into one large apartment. The rest of this story is occupied by rooms for the various clerks of the road, and the civil engineers' room. In the Mansard-roof story is the kitchen, which is to be connected with the restaurant by a steam elevator. The basement will contain the steam-beating apparatus.

The great train-house is 580 ft. long, and has a span of 120 ft., but there being lean-tos 40 ft. wide on either side, the total width will be 200 ft. In the main part will be four tracks: two in the centre 12 ft. apart, and one within 6 ft. of each wall, giving large platforms 40 ft. wide between. Then in each lean-to will be a track close to the inner wall, and outside will be extensions of the drive-ways and side-walks from the front tower entrances. The side-walls are to be 16 in. thick, while the rear wall will have a thickness of 20 in. The rear elevation is of ornamental design, and contains three large rose windows. The great iron trusses supporting the roof spring from the ground 25 ft. apart, and describe a Tudor arch, rising to the height of 74 ft. A monitor ventilator, 22 ft. wide, runs the entire length of the roof. The roof, for 20 ft. each side of the elevation, is to be of heavy ribbed plate-glass, set in sashes of iron, to light the interior. The rest of the roof is of wood, covered with tin and again with corrugated iron. The roof will be painted in parti-colours; the woodwork of one colour, and the iron truss work in strong contrast.

THE HORNSEY DRAINAGE WORKS AND THE CONTRACTORS.

The Hornsey District Board of Works are making strong complaints against the contractors for the drainage works at present in progress, not going on with them as rapidly as is desirable.* At last week's meeting of the Board the chairman stated they had extended the time to complete the works four months beyond that originally specified, and if more activity were not shown they would be into the winter months and still the drainage incomplete. In answer to these complaints the contractors state that they are doing their best against many trials with which they have to contend, and in a letter to the clerk they observe "labour is very scarce; in fact, we cannot obtain more than 100 men up to the present time." It was ultimately resolved that a letter should be written by the clerk to Mr. Latham, the engineer, calling on him to insist upon the drainage works being more rapidly carried on.

THE MANCHESTER TOWN-HALL CONTRACTS.

The proceedings of the General Purposes Committee of the City Council (as reported in the City News), having been submitted for approval,—

Councillor Stewart moved an amendment that they be approved with the exception of the resolution under which it was proposed to give the whole of the contracts for finishing the new Townhall to Messrs. George Smith & Co., the general contractors, without offering the work for competition. He had looked carefully into the matter, and he could not see that sufficient reasons had been assigned by the architect for his recommending that course. In his report the architect spoke of the floors not being proceeded with until the roof was on, but it appeared that both of those departments of the work were in the hands of Messrs. Smith, and consequently could not interfere with the work of other contractors. He (Mr. Stewart) was informed that Messrs. Smith & Co. did not do all the work themselves, but sublet it to other contractors; and if so, that fact entirely disposed of the architect's remark that Messrs. Smith could not well make room for other contractors. Messrs. Smith recently tendered for an insurance company's building in Albert-square, the amount being 9,795*l.*, and the work was let to Messrs. Thomas Clay & Sons for 7,400*l.*, showing a difference of 2,395*l.* in a small contract of that sort. He thought it was fair to assume, then, that the schedule of prices to be sent in by Messrs. Smith for the remaining work to be done on the Townhall might amount to 40,000*l.* or 50,000*l.* more than the work could be

* These complaints forcibly illustrate the present state of the labour market, and the difficulties which contractors and others have to encounter in obtaining men.

done for by others. With regard to the delay which the architect said would occur if Messrs. Smith did not get these contracts, he had consulted several well-known builders, who assured him that no more delay need occur through other contractors being engaged than if Messrs. Smith did the work, because, if the work were let this week to somebody else, it would take nearly all the time between now and the completion of Messrs. Smith's present contract to get ready for going on with the other contracts.

The amendment having been seconded, Alderman Heywood (chairman of the New Town-hall sub-committee) said the keenest consideration had been given to this question, and the committee would not have come before this Council with this proposition if they had not felt convinced that, under all the circumstances, it was the right course to adopt. No doubt, as he had said on a former occasion, the course suggested by Mr. Harwood and other gentlemen was the popular course pursued in the erection of large buildings, but he maintained that in this case there were circumstances which took it out of the category of the ordinary condition of things. Mr. Stewart had given them the opinion of several builders as to what could be done, but he (Mr. Heywood) did not think the Council ought to take that expression of opinion against what they had heard from their architect. He thought it was a very unusual course of procedure for Mr. Stewart to make the comparison he did between the price of a certain work contracted for by Messrs. Clay & Sons and the amount asked for by Messrs. Smith. If Mr. Stewart would consider the position in which Messrs. Clay were placed by tendering for that work as compared with Messrs. Smith, he would see that, though it might appear an argument to his advantage, it was really no advantage at all. He thought he might fairly say what would have been the course adopted by the Council had Messrs. Clay & Sons' contract for the new Town-hall been very near that of Messrs. Smith: the Council would have felt that Messrs. Clay ought not to be removed from the foundations. If, then, there should be any feeling at all in this matter, he did not see why it should not be in favour of Messrs. Smith, who had laboured hard to fulfil the conditions of their contract, and to erect a building which, he believed, could not be excelled throughout the length and breadth of the country. It had not been argued that Manchester men were not to execute the work which had yet to be done, nor had it been said that they would not do it. It had been said that Messrs. Smith were foreigners, and were coming to take the work out of the Manchester contractors' hands; but such was not the case, nor likely to be.

A division was taken on the amendment, with the following result:—for the amendment, 30; against, 20; the amendment was therefore carried.

STOWMARKET CORN EXCHANGE.

The following tenders for rebuilding the Corn Exchange, Stowmarket, Mr. Frederick Barnes, Ipswich, architect, have been received:—

Andrews.....	£1,410 0 0
Gibbons.....	1,390 0 0
Saunders & Son.....	1,340 0 0
Smith.....	1,334 0 0
Cannold.....	1,237 0 0
Girling.....	1,229 0 0

The last was accepted. The internal dimensions of the hall will be 80 ft. by 37 ft., divided into seven bays in the length. The roof will be carried by six cast iron elliptic arches and columns bolted to the side walls. To avoid as much as possible obstruction to the neighbouring property, the height of the walls will be only 20 ft.; but a lantern in the form of a clearstory, lighted on each side, extends the length of the building, framed over the iron arches, thus obtaining a height of 32 ft. from floor to ceiling, the crown of the arches being 26 ft. from the floor. Each bay in the length will have a triple circular-headed window 10 ft. high on each side wall, thus obtaining ample light.

The interior of the walls will be faced with the white bricks and red strings and arches, pointed. The lighting and ventilation will be effected by sun-burners, as the building is designed for the purpose of concerts or balls, and public meetings of all kinds, as well as a corn market. The old Assembly-rooms being contiguous, advantage has been taken to open out one of the apartments to form a gallery for an orchestra at the end of the hall.

CONDITION OF REIGATE.

SIR,—I cannot expect you to allow me to trespass upon your space, to the exclusion of matter probably more generally interesting to your readers than a discussion upon the state of the sanitary arrangements in Reigate. Still, as the statements of "Gargoyles" and myself have been called in question, I hope you will try to find room for these few lines.

I have no idea who "Gargoyles" is, but I have no doubt he is prepared to substantiate all that he has written. I know that I am prepared to do so.

There is the Blue Book of the Reigate Election Inquiry; there are the reports of the council meetings as reported in the *Survey Standard*; and there is the place itself, which any one can inspect. What more is needed?

"R. J. W." states that some of my remarks are unfortunately true, but that I depart from the subject. Now it seems to me that there is a great connexion between the sanitary condition of any place and the authorities who have full power to improve it if they choose to do so.

I do not know the *Survey Advertiser*, and therefore have not seen the "honourable mention" made of "Gargoyles" and my statements, but "*il n'y a rien qui soit en soi une contradiction*;" and if spiced with a little vituperation, it is especially acceptable to some people. It is, however, sheer nonsense to speak of my remarks as "unfounded" and "calumnious."

Permit me to offer a word of advice to the authorities, although it may have no better effect than what others have given them before. Reigate is nothing without its private residents. It has no particular trade or manufacture to support it, but is almost entirely indebted for its prosperity to those who make it their private abode. Now the chief attraction for such a class is the natural beauty of the place, which is undeniably great; but that can be purchased too dearly, as many have found to their cost, through the defective drainage and the stench arising from open privies, drains, and cesspools. Let, then, those who have the means in their hands use them speedily and vigorously to make the place as sweet and clean as it can be made, and clear the reputation which is at present under a cloud. But to do this the matter must not be left to subordinates. Each member of the Council should not rest satisfied without a personal inspection of all open privies, drains, slaughter-houses, &c., and should particularly not be afraid to enter a place for that purpose because it may happen to belong to a fellow member of the Council or a personal friend. By doing this the Council will earn the thanks and goodwill of the large majority of the population, besides rendering the place still more attractive to a class who come into a neighbourhood and are the great supporters of the schools, hospitals, and other charitable institutions in it.

I hope ere long I may have the pleasure of offering a tribute of praise as heartily as I have now uttered my measure of blame.

SALUS POPULI.

CONCRETE BUILDING.

SIR,—I presume Mr. H. Goodwin, in his note appearing in your issue of the 31st ult., refers in some degree to the notice announcing the licence of the Metropolitan Board to use my Patent Monolithic Fire-proof system.

If you will kindly find a place for the following remarks, they may perhaps throw some light on the matter. From what transpired in the course of my applications to the Board as to my patent, it appeared to me they were exercising due caution in their opposition to the use of concrete, on the ground that hitherto concrete walling in this country has been often executed in so unsatisfactory a manner as to be very unreliable, and to have frequently failed. The defects have been increased by the unskillful employment of courses of bricks or stones, variously termed "packing" and "bond courses,"—as though concrete, correctly appreciated and properly wrought, were not itself the finest bonding material in use.

In one word, concrete in England is so erroneously treated as to be generally a weak, spongy mass, in comparison with the powerfully adhesive and impermeable substance it becomes under correct manipulation.

I showed that it was in conformity with this correct treatment operations on my system were conducted.

To show the veritableness of the distinction I have pointed out, it will be enough to say that I have put up a flat roof on my system, chiefly of grey lime and ballast, and another of Portland cement and ballast, but only 6 in. thick, and although exposed to the heavy rain of the last three months, has never exhibited the slightest sign of leakage. On the contrary, I read the following passage in the description of a cement bridge in a scientific periodical:—

"Nevertheless, the porous nature of even such good concrete as that used in this bridge is shown by the fact of rain passing through it in the course of a few hours."

PHILIP BRANNON.

CONCRETE AND THE METROPOLITAN BOARD OF WORKS.

SIR,—As Mr. H. Goodwin is unable to understand the explicit resolutions passed by the Metropolitan Board of Works, relative to the erection of concrete buildings, within the metropolitan area, I will endeavour, as far as I am able, to elucidate them.

It is quite true that I have been summoned twice, as also Tall & Co. (Limited), once, for this system of building, and in each case the complaint has been carried out and withdrawn, but not before the works in progress (including the Peabody buildings), have been carefully watched and minutely examined.

The result of these careful investigations has, no doubt, convinced the practical gentlemen engaged, that the system of building in concrete, as carried out by Tall & Company (Limited), is applicable to the present rules of the Building Act.

Mr. Goodwin appears to understand that it is the Patent Building Apparatus that has influenced the decision. I am of an opinion that the Metropolitan Board of Works have been simply convinced by the superiority of the buildings erected by myself and Tall & Co. (Limited); it cannot possibly be supposed that this company would erect concrete buildings unless they were carried out in the safest and most careful manner, knowing that a failure would be ruin to the company, who have not only a reputation to maintain, but a large capital at stake.

With the speculative builder, the question is very different: so long as he runs up his buildings quickly, and cheaply, obtaining advances as the work progresses, it is all he has to study. I am, however, in a position to prove that a builder cannot build cheaper between planks than with my patent apparatus.

Some works now being carried up at the present time, in London, between planks, are a disgrace to concrete; and I am also in a position to prove that the materials used in some cases are quite unfit for the walls, which are really dangerous.

As the last straw breaks the camel's back, so it is with concrete: it will not bear excessive abuse.

Your correspondent will justly see that it is this class of concrete building that requires a special licence and supervision, which, doubtless, the Metropolitan Board of Works will take care to have properly attended to.

JOSEPH TALL.

NOMENCLATURE.

SIR,—In your report of Mr. Edmund Sharpe's excellent address after the Northamptonshire excursion dinner, a quotation is given from the address of the President of the Northern Architectural Societies on the Nomenclature of Gothic Architecture. Now I do not object to be quoted, even adversely, in such company as Sir Gilbert Scott and Mr. J. H. Parker. I simply write to state that the address referred to was delivered by me as president of the Liverpool Architectural Society, and not the "Northern Architectural Societies." HY. H. VALE.

PROPOSED RECREATION GROUND FOR WARRINGTON.

SIR,—Unless the Local Government Board at Whitehall steps in to interfere, the mayor and corporation of Warrington are about to do a very foolish thing. Under the pretensions of a Public Recreation Ground, they propose to purchase, at the cost of £1,000, an acre, a space of ground in the centre of the borough, very valuable, it is true, for building ground, but, as its present owner states, in a condition of "perpetual eclipse" from the murky and corrosive atmosphere by which it is constantly enveloped. Moreover, this purchase and purpose are vehemently protested against by a large majority of the ratepayers; and, strongest point of all, by the four senior medical practitioners of Warrington, resident there respectively forty-seven, thirty-seven, thirty-six, and twenty-nine years. The folly would be less if the ground could be resold hereafter, but the purchase-money, having to be borrowed from Government under the Recreation Grounds Act, this costly and objectionable site must remain for ever devoted to this, and to no other purpose. Even of the limited space above-named (12½ acres), only 6½ acres are to be allotted for the free and unrestricted use of the ratepayers, where they may indulge in a fair foot-race, or enjoy an honest game at football, golf, or an ornamental garden (oh! such a garden), a cricket-ground, and a bowling-green, none of which can fairly be looked upon as a public recreation-ground.

As a still further addition to the cost, the deed of transfer of the land is to contain a clause binding the corporation to form a new street, of twenty yards wide, along one side of the recreation-ground, the cost of which is estimated at £2,000.

From such a needless waste of the ratepayers' money, it is to be hoped that the discretion vested in the Local Government Board may be powerful enough to deliver us.

M. D.

* * * We insert this in deference to the medical men of the town, and with a view to inquiry as to the fitness in position of the land. We must not be regarded as offering the slightest opposition to the provision of a Recreation Ground for Warrington; a step we would by all means aid.

WEST HAM SEWAGE AND IRRIGATION.

SIR,—To your correspondent who assumes the name of "Sanitarian" in last week's *Builder*, I have only to reply that the cost of land for irrigation when negotiated for by a public Board is a very different matter to its cost at a public auction. My Board were unable to obtain land by any other means than either private negotiation or the exercise of compulsory powers; our negotiations were carried on with one of the most respectable firms in the City (Messrs. Beadell), and my Board, looking to the financial results of the use of compulsory powers and arbitration in other like cases, considered themselves fortunate in securing, without litigation, 750 acres of fresh land, near London, with approaches by road and rail, and a Thames frontage, at an average cost of 96s. per acre. My communications to the *Builder* upon this subject had reference to the general question of irrigation, but as "Sanitarian" cannot rise above the local case and personal remarks, I must dismiss his letter without further comment. LEWIS ANSELL.

MONUMENTAL.

An Aberdeen polished granite cross, 123 ft. in height, has just been erected at Penrhy, in memory of the late Rev. C. Maybery, who had been rector of the parish for over forty years, and an active magistrate for the counties of Brecon and Glamorganshire during the greater part of that time. The red foliated cross stands upon a grey granite circular column with moulded cap and base, and this rests upon a square base of Forest of Dean stone, having small recessed red granite shafts at the corners, with sunk trefoils of similar material in the front of the four gables projecting from the apex of the cap. The inscription slab is of black marble, and is set into an arched recess on one of the sides of the base. Mr. T. D. Williams, of Aberdear, was the sculptor employed by the architect, Mr. E. H. Linget Barker, of Hereford.

THE DRAINAGE OF EVESHAM.

At a special meeting of the town council the sanitary committee stated that Mr. J. F. Fairbank, C.E., had, at the request of the council, made an inspection of the town, and advised the adoption of the irrigation system of drainage, but this, on account of the enormous outlay (40,000*l.*), as well as the difficulty of obtaining land for the purpose, was impracticable. Mr. Barry, of Liverpool, advised the adoption of the "filtration process." On account of the wide difference between the cost of the estimates of these two gentlemen (the latter being about 4,000*l.*) the committee were compelled to exercise the greatest possible caution in the matter, and reported their inability to recommend the adoption of any particular system of drainage, without further advice, and proposed that the Local Government Board be requested to send down an inspector to suggest remedial measures.

ARCHAEOLOGICAL SOCIETIES.

The Cumberland and Westmoreland.—The members of this society have held a meeting in the western division of the district. They assembled at the Holborn-hill Railway Station, whence they proceeded to Mill Church and Castle, several of the ladies and gentlemen taking a circuitous route for the purpose of examining the "Gallows Stone." The party examined the interior of the castle, and Mr. Simpson, who was appointed chairman of the meeting, proposed a vote of thanks given to Mr. Knowles for a paper he read; after which some of the party took conveyances for Kirkcubright and Lacro, and others proceeded to Lacro on foot. Lacro is an ancient cultivated estate on the summit of a hill, 500 ft. above the level of the sea. It is surrounded by a circular stone fence. The objects worthy of notice at Lacro are a kirk, or pill, called "Old Kirk," consisting of an irregular heap of ruins,—two stone inclosures, three artificial platforms or terraces, an inclosure dyke, and an extensively furrowed surface. The party next proceeded to Silcock Railway Station, where a paper on "The Ancient Remains of Lacro and Kirkcubright" was read by Mr. Eccleston. He said that

"The south of Cumberland, until the close of the 12th century, seems to have been specially rich in that class of ancient remains, commonly called 'Druidical.' More than ordinary facilities were offered for the formation of these rude structures by the numerous fragments of rock that bestrewed the district. At the breaking up of Eskdale and other West Cumberland glaciers, the 2,000 ft. of the foot of Black Combe, and for nearly 1,000 ft. up the sides, together with minor heights, were sprinkled with boulders of all sizes and from various quarters. The Esk and other stone structures are, in the south of the Esk, six stone circles, a giant's grave, a kirk, corded, namely, six stone circles, a giant's grave, a kirk

large cairn, and a city—that of Barisac. Of this latter the loss of nearly one half has to be deplored; three circles and the cairn have been wholly obliterated.

On reaching St. Bees, the party dined at the Royal Hotel. The meeting on Friday morning took place at St. Bees Church. An adjournment was then made to the lecture-hall of the college, where Mr. Jackson read a paper on the "Registers of St. Bees." The weather was exceedingly favourable. On reaching Egremont, or the Mount of Sorrow, the party at once proceeded to the castle ruins. At Calder Bridge luncheon was provided at the Stanley Arms, and a visit was paid to Calder Abbey. The members and friends then drove through one of the most beautiful districts in Cumberland to Gosforth Church, where they were kindly received by the Rev. A. B. Cheese, the rector. Here the meeting closed.

The Cambrian.—As we have already noted, a series of five days' excursions has taken place in the neighbourhood of Brecon, under the auspices of this Association. The weather was appropiately favourable, and the programme of meetings and excursions was carried out, on the whole, very effectually, the appointed routine of the out-door proceedings being generally adhered to. On Monday evening, the 26th ult., the inaugural address was delivered in the Town-hall, Brecon, to a large and distinguished party of ladies and gentlemen,—members and friends,—by Sir J. R. Bailey, bart., M.P., the newly-elected president. Professor Balington, of Cambridge, was present. Papers were read at each of the three evening meetings upon various subjects. 1. "On Wales and its Saints in the Sixth and Seventh Centuries," by Mr. M. J. Rhodes, of Tenbyre. 2. "Some Remarks upon Prince Llewelyn," by Mr. W. Rees, of Tonn, Llanidloery. "The Battle of Mortimer's Cross," by Mr. F. Edmunds. "Llanthw Church, and the Ruins adjoining which mark the Site of the Palace of Idris, vicar of Llanthw." 5. "Oldford Castle," by Mr. Wm. Rees, of Tonn, Llanidloery. 6. "Porchester during the great Rebellion," by Mr. Rowland Phillips, barrister-at-law. Trips were taken daily into the surrounding districts, and the chief churches, castles, venerable ruins, and descriptions, and Druidic remains, within the county of Brecon were visited by the party during the campaign.

Re SANITARY SCIENCE, &c.

Sir,—Your ably and sensibly written articles on the public health of our towns deserve to be much more generally known, not only in England but in America. For myself, I feel inclined to see this lovely river, flowing, as it does, through the most beautiful district of England (Maidstone), positively worse than any stagnant pool in Southern Africa.

I came down here last August, after an absence of forty-eight years; but quite unprepared to see almost on the first morning after arrival the whole atmosphere covered with smoke, more than in the neighbourhood of the Lambeth Chimneys,—I mean the village of Tovil. Some person, probably a friend of Lord Romney, has set up oil-cake mills; and, through my window in bedroom, I am almost suffocated with smoke. No one seems to take any notice. As for the river, which used to be pure when I was a boy, I now cannot and do not go within 10 yards of it if I can help it. Do send some one to see this polluted river.

R. HODGKIN.

A STEAM HAMMER FOR WOOLWICH.

PREPARATIONS are being made on the site selected for the new foundry of the Royal Gunpowder Mills at Woolwich Arsenal, for the erection of a 30-ton Nasmyth steam hammer, the largest ever made. It will strike a blow equal to the weight of about 800 tons, and the bed for the mill has therefore to be of great strength. A bed 15 ft. square and 20 ft. deep was first dug, and then piles of timber to the number of more than 100 were driven into the solid gravel more than 20 ft. below, the interstices being filled with concrete. On the foundation a block of 30 ft. broad and 11 in. thick, and weighing 120 tons, was laid, and upon this two layers of balks. Upon the timber was laid another plate, 10 in. thick and 27 ft. square, weighing 121 tons, and then followed more oak balks, being vertically and bound together by wrought-iron hands. Two more iron plates,

weighing 214 tons, have since been lowered upon the bed, and one heavier than any yet employed is to follow. Upon this will rest the anvil-block, which is shortly to be cast in the arsenal, and will weigh 102 tons, and upon this finally the anvil-face, which will be 12 ft. in diameter and weigh 60 tons. This will bring the anvil up to the level of the forge floor, and all the excavations round it will be rammed in with concrete into a solid mass. The erection of the factory walls has not yet commenced, but in several parts the timber-rafts on which it will stand has been excavated and the underground work completed.

"DISINFECTING DWELLING-HOUSES."

Sir,—After stripping off the paper and exposing the bare wall, I have found Mudie's Disinfectant (in solution) to be the best deodoriser. My men have never suffered had effects from infection, and I am sure the above is preferable to carbolic acid, or even caustic soda.

HOUSE PAINTER.

SCHOOL DESKS.

Sir,—Mr. Wilson's letter of last week appears to me to indicate considerable misapprehension as to the meaning of Mr. Moss's desk. The problem is to arrange children for efficient teaching in such a manner that they shall be able either to sit or to stand comfortably, and yet that the desks shall not be moved about. Seeing that the space suitable for sitting is much less than that necessary for a standing position, Canon Cromwell has met the difficulty by the provision of a hinged flap to the desk, which, at a given word, is let down, and the boys then rise. Mr. Moss, on the other hand, devotes his exclusive attention to the convenience of the sitting position, and enables his children to stand by arranging them in groups of two only, so that, at a given word, they stand out laterally into the gangways, one behind the other. Both of these arrangements are highly ingenious, but that by Mr. Moss secures the absence of anything movable and liable to create a noise in the school, while it gives great facility of access (and, therefore, of supervision) on the part of the teacher, and, above all, allows circulation of air by the gangways on one side, at least, of each child. As to actual space occupied by the two plans, there is little difference, but the proportion of the class-room becomes different.

"Convertibility" is the very thing which no one now wishes to see adopted. Hitherto (owing to the necessity of using schools for all kinds of purposes), the best shape and disposition of a school in reference to its educational use has been overlooked in favour of making the room available for school treats, Sunday school arrangements, &c. But School Boards will, no doubt, adopt those arrangements which are best calculated to promote efficient teaching. Only this week I have heard of a "convertible" desk crushing a child's finger.

Great George-street.

E. R. ROBSON.

THE RESTORATION OF THE WEST FRONT OF WELLS CATHEDRAL.

THE first portion of the works,—the centre compartment, reported by Sir Gilbert Scott and Mr. Ferrey to be necessary, having been completed, and the second portion,—the southwestern tower,—being on the eve of completion, a meeting of the general committee was held at Wells, when there were present the Lord Lieutenant the Earl of Cork, who presided, the bishop, the dean, and others, as also Mr. Ferrey, the architect. It appeared that the liabilities on the contract for the second portion of the work exceeded the amount of subscriptions available, and that further subscriptions were needed to meet these liabilities and to complete the third portion of the work,—the north-west tower,—not yet contracted for. It was decided to call a public meeting, to be held in the Chapter-house, on the 9th of October, to receive from the sub-committee a full report of the progress of the works, the work remaining to be executed, and the state of the funds, and to suspend in the interval the consideration of entering into a contract for the third portion of the work.

St. Pancras Surveyorship.—Mr. H. H. Bridgman has resigned the office of Assistant-Surveyor of St. Pancras, London.

CHURCH-BUILDING NEWS.

Wentworth (near Sheffield).—A new parish church is to be erected in this village, on a plot of ground very near to its predecessor, and on the opposite side of the existing carriage-road to Wentworth House. Mr. J. L. Pearson, of London, is the architect. The edifice will consist of a nave, two side aisles, north and south transepts, chancel, vestry, tower, and spire. The extreme length of the building, taking the outside measurement of the walls, but excluding the buttresses, will be 120 ft.; width across the nave, including the side aisles, 52 ft.; width across transepts, 68 ft.; length of chancel, including the chancel arch, 31½ ft.; width of chancel, 26 ft. The vestry will be on the north side of the chancel, and its dimensions will be 25 ft. by 14 ft. The total height of the tower and spire, including ironwork and vane at the summit, will be 180 ft., the tower itself being 87 ft. in height. Height of church from floor level to eaves of roof, 41½ ft.; and from floor to ridge of roof, 56 ft. The tower will stand in the centre of the transepts, or nearer to the east than the west end of the building. Entrance to the church will be gained by a porch on the north or village side, and it is intended that this shall be the sole means of ingress or egress for the parishioners. A small door on the same side will be used merely as a vestry entrance. Light will be imparted to the body of the church by four three-light windows in the clerestory of the nave. There will also be eight two-light windows in the south aisle, and seven windows of a similar description in the north aisle, the place of the eighth window being occupied by the porch. At the west end of the church will be a large six-light window, with tracery in the head. Each transept will be lighted by a large six-light window at the north and south ends, the heading of these also being filled in with tracery. The transepts will have side windows of four lights each. The chancel window will, of course, be the most elaborate. It will contain five lights, and the head will be enriched with tracery. Above the arch of this window, and in a gable, will be placed a circular window, with tracery of seven quatrefoils. The chancel will be further enlivened by two three-light windows on each side. The interior of the church will be stone-geined throughout with moulded and carved ribs and stone spandrels. There will be a triforium round the chancel, and also at the west end of the nave, access to which will be obtained by small towered spiral staircases. The chancel will have an arcade on the north and south sides, each arcade being divided into four panels under the bays of the windows, the heads being traced. The mouldings generally about the arches and the groining will be ornamented with dog-tooth tracery pattern. The tower will spring from, and be supported by, four stone pillars at the junctions of the transepts with the nave and chancel, each pillar having a moulded capital. The roof of the space beneath the tower will be geined as the rest of the roof of the church, and as this ceiling will be considerably higher than the groining of the nave, it has been found necessary to introduce windows on the north and south sides. The ringing-loft will be above the groining, and above this will be the bell-chamber, which will be lighted by two windows on each side of the tower. The nave will be separated from the side aisles by an arcade of four arches on each side. The whole of the nave and aisle passages, with the chancel, except that portion east of the communion-rails, the vestry, the porch, and all other parts of the church, will be paved with Staffordshire tiles, red and black, with black tile borders. The space inside the altar-rails will be paved with a richer kind of tile. The seats will be all open, of American oak, with English oak backs and ends. There will be very little carving or ornamentation about them, but they will be moulded, both at the ends and backs. Provision will be made for the organ in the north transept, and here also will be the seats for the choir. Under the vestry will be constructed a chamber to contain the heating apparatus. The lower, battlemented at the top, will contain a clock facing to the north, the spire springing from the inside of the battlements. Instead of running in a direct line to the point of the angle, the spire will slightly swell outwards. Access to the tower will be gained from outside by a spiral staircase at the south-east angle, formed by the junction of the chancel with the south transept. The church

proper will be entirely built of Danford Bridge rubble stone, laid in random courses. The internal face of the walls and all dressings will be of Darfield stone ashlar. The roof will be composed of Staffordshire tiles of a straw-berry colour, except the roof of the chancel, which will be covered with lead. A large space of ground around the church will be enclosed by a stone wall, and laid out neatly, but not used at present for internments. A carriage-road will run directly from the east end of the tower to Wantworth House, for family use. For the convenience of the villagers a road is intended to be formed in a direct line from the church porch to the principal street of the village. Mr. J. W. Booth, of London, is the contractor. The clerk of the works is Mr. Joseph White, of London.

Dunkirk.—The parish church has been reopened after restoration, alteration, and improvement. The edifice has been built only thirty-one years; but it appears that the foundations of the buttresses were found to be defective, and they have all been pulled down and rebuilt in cement. The old lead on the ridge of the roof has also been removed, and replaced with red ridge tiles. Internally, the organ and choir gallery at the west end have disappeared, and the organ is now placed in a new separate chamber, built out on the south side, forming a transept, with seats for thirty choristers. The chancel, which was quite plain, has been decorated by Messrs. Harland & Fisher, of London. The whole of the pews, which were previously stained, have been painted and varnished, and are now of a lighter colour to be more in harmony with the general character of the internal arrangements of the building. There is also a new lectern of oak on an illuminated pedestal, the gift of Mr. Henry Saddleton, of Whitstable. The restorations have been carried out by Messrs. Goode & Payn, under the supervision of Mr. Broadbridge, architect. The total cost of the works is estimated at 500l.

DISSENTING CHURCH-BUILDING NEWS.

Darlington.—A new Wesleyan chapel in North-road, Darlington, has been opened for public worship. The edifice will seat 1,500 persons. The site has been presented by Mr. W. Barningham. The cost of the structure amounts to 4,200l., of which sum about 3,200l. have been already subscribed or promised. The design was prepared by Mr. Pritchett. The interior is comparatively plain, but commodious. The acoustic properties of the building, however, are good. The building is in the Romanesque style, and of red bricks, with stone dressings. The front towards the North-road has in the lower stage of the centre a double doorway, the space over the doorway being occupied by a large four-light window. This central part is finished by a gable, surmounted by a finial. The sides of the front are occupied by staircases, having steeply pitched roofs, to break the monotony usual in chapel fronts. In the lower story of each staircase is a single doorway, over which are two-light windows. All the doors and windows of the front have recessed jambs, containing pillars with moulded bases and carved caps. The sides of the building are designed with pilasters of brick and round-headed windows, in red and white bricks. The internal dimensions are 100 ft. long by 50 ft. high. The space is divided into nave and aisles by two tiers of iron pillars, the lower tier of which support roomy galleries, and from the caps of the upper tier spring moulded arches forming arcades from the top of which rises a wagon-headed roof, having moulded braces and purlins, and ceiled to the spars and collars. The first bay is occupied on the ground floor by a vestibule in the centre, over which the gallery extends, and by stone staircases at the angles, which, being inclosed all the way up, form abutments, from which the arcades spring. The last bay in the rear is occupied by a large vestry in the centre, over which is the choir, and at each side are three stories of vestries, and a staircase leading up to them. The whole of the seats are low, with slanting backs, and provide accommodation for about 1,500 persons. About 400 of the seats are free and open, all the rest having low doors. The pulpit is of pitch-pine, varnished, and all the rest of the woodwork is painted. The warming and winter ventilation are effected by Lewis's patent warm-air apparatus. In summer fresh cold air can be admitted through the same channel, and also by a number of Sheringham's ventilators near the ceiling, and the foul air is extracted by gas furnaces in the roof, connected with various ventilators by sheet-

iron tubes. The lighting is by star-lights, dependent from the main and gallery ceilings. The site, which contains space for a minister's house, is surrounded on three sides by light low railings on dwarf walls, the back being inclosed by a plain brick wall. The works have been carried out by the following contractors:—Brick, mason's, and plasterer's work, Messrs. Ironsley; slating, Messrs. Atkinson; joiner's work, Mr. Armitage; painting, Mr. Wilson; ironfounder's work, Mr. Davison; plumbing, Mr. Lishman, all of Darlington; warming and ventilating, Mr. Lewis, Newcastle; gasfittings, Mr. Gilbody, Manchester; ornamental metal-work, Mr. Dovey, Manchester; carving, Messrs. Bustall & Taylor, Leeds.

Coniston.—The memorial-stone of a new chapel for the Primitive Methodists was laid last week at Coniston, about one mile from the village of Swine, in Holderness. The tender of Mr. Pickering, of Coniston, has been accepted, at 199l. The architect is Mr. Frank N. Pettingell, of Hull, who is also the architect for the new chapel now in course of erection in Williamson-street, Holderness-road.

Tettenhall Wood.—The memorial stone of a Congregational Chapel, intended to supersede the present inconveniently small and ill-adapted building, in which the Congregationalists of Tettenhall Wood now worship, has been laid by Mr. S. S. Mander, in the presence of a large assemblage from Wolverhampton, Sedgley, Bilston, and other places round the district. The building will be 58 ft. long by 33 ft. broad, and will accommodate, including north gallery, about 400 adults. The style is Geometric. The walling will be stone faced, the stone used being from the Codsall quarries. The north front will be a gable with central doorway, and a turret at the western angle, the turret to be 60 ft. high. The contract has been taken by Mr. Cockerill at 1,808l. The architect is Mr. Billake, of Wolverhampton.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Kensal New Town.—The new Roman Catholic schools and temporary church in Bosworth-road, Kensal New Town, were opened on Sunday, the 8th inst. The architect is Mr. S. J. Nicholl, and the contractor Mr. A. Stour.

SCHOOL-BUILDING NEWS.

Addingham, near Ilkley.—The memorial-stone of a new Sunday and day school, about to be erected by the Wesleyan Methodists at Addingham, has been laid, in the presence of a large gathering of spectators. The building has been designed in the Gothic style of architecture, by Mr. Geo. Smith, of Bradford, and on a scale that will give accommodation for about 200 children. It is to consist of one large schoolroom, 50 ft. by 30 ft.; and two class-rooms, each 17 ft. by 14 ft. Land has also been acquired for a playground. The cost of the school and land will be about 1,000l., but a further outlay of 250l. is contemplated in the erection of a teacher's residence. The contracts for the various works have been let to Mr. Geo. Smith, builder, Addingham; Messrs. J. & B. Emmott, joiners, Addingham; Mr. James Whitaker, plumber, Addingham; Mr. O. Lister, plasterer, Ilkley; and Mr. Samuel Thornton, slater, Bradley.

Great Wyrley.—New schools and master's residence have been commenced at Cheslyn Hay, Great Wyrley, Staffordshire. The site has been given by Lord Hatherton, and the cost of the buildings will be 800l. Mr. Grocensill, of Great Wyrley, is the builder; and Mr. Griffin, of Wolverhampton, the architect.

STAINED GLASS.

Cadoston Church, South Wales.—A stained-glass window, consisting of two lights and tracery, has been fixed in this church. The subjects are Abraham's sacrifice, Good Samaritan, and the Raising of Lazarus. Mr. S. Bourne was the artist.

Hamsingore Church, Wetherby.—A stained-glass window, by Messrs. Hardman, of Birmingham, has just been placed in this church. It is the gift of Mr. Wood, of Cattail, in memory of his grandparents. The window consists of three lights, representing St. John the Baptist preaching.

Hockerill Church, Bishop Stortford.—Six

stained-glass windows, by O'Connor, of London, have lately been placed in the south aisle of this church. In the eastern window of the aisle, which is a memorial window, the subject is the Female Saints of the Old Testament, arranged in chronological order. In the western window the subject is the High Priests of the Jewish Dispensation, also in chronological order. In three of the southern windows are the twelve Minor Prophets, in the order in which their writings are placed in the Old Testament, four figures being placed in each window. In the smaller window are the figures of Ezra and Nehemiah. Two of the windows representing the Minor Prophets are memorial windows to the Rev. Arthur Henry Blunt, one of them having been given by the superintendent, governesses, and schoolmistresses of the college together with all Mr. Blunt's former pupil during the eight years of his chaplaincy. The dedication of the church (All Saints) has been kept in view in arranging the subjects for the windows. In the west windows are four classes of Saints, Patriarchs, Prophets, Kings, and Martyrs. In the chancel, where the subjects are chosen entirely from the New Testament, are represented in the east window the twelve Apostles, and our Lord in Glory as the King of Saints; in the north window are three of the Saints and Evangelists mentioned in the Acts of the Apostles. One of the southern windows is for its subject the Female Saints of the New Testament. In the southern window are three Bishops, as another class or order of Saints: St. Timothy, St. Titus, and St. Clement.

Dunfermline Abbey.—A stained-glass window has been erected in the nave of this abbey to the memory of the late Mr. and Mrs. Hunt, of Perthshire. The window is situated at the north-west angle formed by the walls of the western tower, and is at once seen on entering from the north porch. Stone mullions divide it into three tall pointed lights, with three tracery openings above. The three upright compartments contain illustrations of incidents connected with the death, burial, and resurrection of our Lord. The first group is seen St. John leading his Mary, the mother of Christ. In the centre light is represented Jesus being laid in the sepulchre by St. John and Nicodemus, Mary Magdalen, and other women. In the third compartment, forming a completion to the series of subjects, is the scene of our Lord appearing to the women after his resurrection. In panels underneath these groups are angels seated upon shrined thrones, and bearing scrolls inscribed "I am the resurrection and the life. He that believeth in me, though he were dead, yet shall he live." Over the subjects are foliated canopies of early character, terminating in crosses of mosaic colouring. In the leading points of the tracery are stary crowns, and the emblem of the Trinity. The glass is entirely composed of thick crystalline colours. The whole has been designed and executed by Messrs. Ballantyne, Edinburgh.

FROM SCOTLAND.

Edinburgh.—After many years of delay Trinity College Church is now fast approaching completion, and can be well seen from Calton Hill, Regent's Arch, or North Bridge. The apex of the original church is being carried up at the same time in the shape of an arch behind the modern church. It is now so far advanced as to be ready for throwing over the stables of the roof, so that in a short time old groined ceiling, with its carved bosses, will again be in proper position after lying so long on the Calton Hill.—A public meeting has been held in the Freemasons' Hall, Blackfriars-street, says the *Weekly Scotsman*, for the purpose of memorialising the Town Council against the re-erection of the piazza at the corner of Blackfriars-street. The Rev. Mr. Gillespie was called to the chair, remarked that the piazza was not only unseemly in appearance, but dwarfed the other new buildings in the street, and hoped that it would not, after being taken down, be put up again. The meeting then agreed to memorialise the Town Council, with a view of having the piazza removed altogether. A committee was thereafter appointed to draw up the memorial, and present it to the Town Council.

Blairdrummond.—The large east window of Kincairdine Church has just been filled with stained glass in memory of the late Mr. and Mrs. Home Drummond, of Blairdrummond.

ndow is divided into four upright compartments, with top tracery. The church is in the peculiar style of architecture, and the walls of the glass are all in accordance with the structure. The subjects illustrated are Jesus weeping at the Grave of Lazarus, Christ's Agony in the Garden, "Christ using His Cross," and the "Angel at the quire announcing to the Marys 'He is risen.'" The subjects, we believe, were executed by Mrs. Drummond. In the central space in the top tracery is a group of angels (shipping). Over the illustrations are canopies, and the remainder of the lights are covered with a borderings and foliated grizaille ground-work. The window has been executed by Messrs. Ballantine, of Edinburgh. We understand that, in addition to the window just noted, the Messrs. Ballantine have been commissioned to put in other three stained-glass windows by parties who have a connexion with the parish of Kincardine.

VARIORUM.

JENKINSON'S Practical Guide to the English to District" (Stanford, Charing-cross), is arently the work of one who well knows the rick, and will be found very useful by tourists. The main point is the want of proper architectural descriptions of remaining structures. The book includes a number of useful maps, clearly noted.—"When Mother Died" (Kitto, Coppsgate-street), is the title of a little tale for children, by Marie B.—It is a very touching story, charmingly written: a little over-sad for children. We advise the writer to take a more lively theme for her next.—"The City Sanitary Organisation: its Aids and Obstacles. By James M. Macleod. Glasgow: Adshedd, 1872." This is a reprint from the *Law Magazine* for Scotland, of a paper read before the Social and Sanitary section of the Glasgow Philosophical Society. Mr. Macleod is Sanitary Inspector of the city of Glasgow. His purpose is rather to point out the duties of the various officers, the provisions and acts of the law, and obstacles to be encountered in carrying out the Public Health Act of 1867, the Police Act of 1866, than to treat of the sanitary state of the city, either before or since the Acts were passed.—In the new number of *Leisure Hour*, Mr. Timbs, continuing his own Recollections, gives appreciative and interesting notes of some who were contributors to the work with which he was early connected:—Charles Mackay, W. A. Chatto, "Alfred Quill," Peter Cunningham, Mr. Henry Cole, and several others.

Miscellaneous.

the Copenhagen Exhibition. — This northern Exhibition of Industry and Art is open. In the fine arts, Norway is especially represented by landscape. Adolph Tidemann occupies a prominent place. Professor Hans E. von Carlshule, has furnished many works of high standard quality, the best being "Morn-ing in a Norwegian Harbour." Ludwig Munthe, Düsseldorf, has supplied a winter landscape with light. Among historical paintings especially notable are "Valkyria" and "The early Ride of the Rulers of Man's Fate," by P. N. Arbo, of Paris. The former idealises the mysteries being called Valkyria, a female in Odin sent to choose from the fallen such as had won the bliss of Val-hall by a fight and a dauntless death. She rode air and water, surrounded by a ghastly army, the so-called corpse-lustre; and, wherever she was seen, was the harbinger of slaughter. The weird idea Mr. Arbo has endeavoured to embody in a handsome figure with a passionate greyish eye, riding intently on a horse exceedingly wild black steed. Of the various treatments in this Exhibition, there is none which commands such an amount of purely national interest as the department of domestic industry. In conception and design, this department is in some respects peculiarly original. The native industry of Norway bears such an unusual stamp that nothing in the world could be mistaken for it. What is exhibited in the same class from Denmark bears a widely different impress, and is so void of specially-marked nationality that it might as well be German.

A Few Words about Strikes.—Supposing the demand of our working men to be reasonable, and that their employers will not listen to their entreaties, is there no other mode by which they can obtain the object in view than by suddenly suspending work, and in a manner declaring war against both their work and their employers? Do they take into account the enormous loss resulting from such strikes to the whole country, the incalculable inconvenience to the parties concerned, the loss to the capitalists, and the still greater loss to themselves and their families? Let them not imagine that it is the same thing to get 11. or 21. a week for their stentation out of the common fund of their trade-union, and to receive an equal amount from their employers. In the former case the expenditure is unproductive, in the latter it is productive. And there is this additional important difference, that while any fund arising from former savings must soon come to an end, the fund arising from continuous productive labour is ever renewing itself. And are they sure that, were they to win and get the advance sought, they would fully recover all they are now losing? Dr. Watt, in a paper on strikes, and their effects on wages, profits, and accumulations, calculated that if a strike for 5 per cent. increase in the wages succeeds, after a given time, the loss of every human month's wages would require one year and three-fifths of work at the extra rate to make it up. But more than this, as money is worth 5 per cent. at interest, it follows that if a strike for 5 per cent. lasts twelve months and a half, and then succeeds, and maintains the interest for twenty years, the workman has lost in interest much more than he has gained in wages, and that therefore no part of the loss can ever be made up; for if he could have worked for the lower sum during the year of strike, and have invested instead of spending the money, the year's wages would have grown into three years' wages nearly by the time in which the gain of the strike would make up for the loss of a single year. How much should we think before we commit ourselves to a position from which we cannot retreat!—*Professor Leone Levi, in "Cas-sell's Magazine" for September.*

Sanitary Report on St. Marylebone.—The annual report on the health of the parish of St. Marylebone, 1871, by John Whitmore, M.D., medical officer of health for the parish, has been printed, by order of the vestry. From this report it appears that, under the Artisans and Labourers' Dwelling Act, eight houses in York-courthouse have been pulled down, which were certified as unfit for human habitation and incapable of structural repairs. All the houses in Stephencourt, five in number, and one in Crawford-place, have also been demolished for the same reasons; in addition to these, all the houses in Burn-place, twenty in number, have been shut up, the medical officer of health having declared them unfit for habitation, and many other houses, which had been condemned, but which were found capable of structural repairs, have since been put into good sanitary condition. A mortuary-house has been erected in the burial-ground adjoining Paddington-street; it is capable of holding twenty dead bodies, and is now in almost daily use for those who have died from contagious or infectious diseases. It is disinfected under the directions of the medical officer of health. A disinfecting apparatus has been erected in the parochial stone-yard. A remarkable feature in connexion with the population of St. Marylebone is the great preponderance of females over males. The census of 1871 shows an excess of the former over the latter amounting to upwards of 20,000, the number of females being 89,668, and the males 69,596. This excess exists in every district of the parish; it is greatest in St. John's, where it amounts to nearly 6,000, and least in All Souls, where it amounts to about 2,300. And if the relative birth and death rates of the two sexes during the past year were to continue undisturbed for some few years longer, the female population of St. Marylebone would more than double that of the male.

The Worcester Architectural Society.—An excursion to Stratford-upon-Avon has been made by this society. The Rev. Dr. Collis, vicar of Stratford, acted as *cicerone* to the churches and other objects of interest in the town and neighbourhood. The excursionists had charming weather. Of course, they visited all the places of interest, which we need not here particularise. The party dined at the Shakespeare Hotel.

Trial of a New Road-making Machine.—A lengthened trial of Messrs. Goro & Green's patent steam-road rammer has taken place at Boston, Lincolnshire. This machine resembles the steam road-roller which has been at work in London, but combines with it two massive rammers, each weighing 18 cwt., which are impelled by steam power forcibly against the ground. At each blow the loose materials of the road are firmly pressed together into a dense and solid mass, which the roller then passes over and smooths, but in no way disturbs. The result is said to be a much superior state of the surface than can be produced by the mere effect of rolling. The machine has been constructed by Messrs. Tuxford & Sons, of Boston. The experiments were conducted by Mr. C. B. King, C.E., of Dowgate-hill, London. It was seen that the rammers could be thrown out of gear at will, and the machine thus made to act as a roller only. The force of the blow also was shown to be completely under the control of the engineer, and prevented from acting injuriously by reaction against the machinery. Major-general Boleau, of the Royal Engineers, who has written a treatise on road formation, was present, and expressed his approval of the double principle of the machine.

Fatal Accident in a Well.—Dr. Diplock has held an inquest at the Lamb, Chiswick, upon the body of Richard Swansborough, who was killed while boring a well at Messrs. Sich's brewery. The deceased and another were engaged in digging out the earth at the bottom of the well, which is 5 ft. in diameter and 132 ft. deep—the stuff so loosened being thrown into buckets and drawn up the mouth of a well by a windlass worked by two men, who were superintended by a third. Deceased and his companion had been but a few minutes in the well, and had only sent up two buckets of earth, the latter of which the superintendent was horrified to see was swinging by its bale or handle upon the very point of the hook. He had barely time to call attention to the precarious position of the bucket, and none to remove it, before it fell the whole depth of the well, striking the unfortunate Swansborough, breaking almost every bone in his body, and killing him instantly. Verdict—Accidental death.

A New Industry in Glasgow.—A few months ago, a gentleman, named Colonel Fish, came over to this country from America, with the object of developing a patent he had just taken out, for the manufacture of asbestos, or, rather, for the application of that mineral to steam-packing purposes. He took steps, in Glasgow, for the formation of a company to work his patent. That company was soon formed, and works for the new manufacture were erected in St. James's-street. Colonel Fish has lately been carrying out a series of experiments at Glasgow, with the view of testing the adaptability of asbestos for the manufacture of cloth and paper. The demand for the steam-packing patented by Colonel Fish has increased so much that it is in contemplation to build other and more extensive works in Glasgow, capable of turning out from 200 to 300 tons per annum. Practical engineers are of opinion that many more useful applications are likely to be found for this mineral.

A Steam Faving Tool.—An apparatus of this kind has lately been tried in Paris, namely, a Steam Rammer. As used from time immemorial, the rammer is a heavy iron-shod implement which the workman raises about 1 ft. from the ground and allows to drop, as rapidly as he may, successively upon the boulders or blocks to be set. The object of the invention of M. Lignier is to save the labourer the severe physical exertion of raising the heavy tool, an exertion producing in time an injurious effect upon the lungs. In the apparatus of M. Lignier the heavy weight is lifted by a small Lenoir gas engine. To the fly-wheel of the engine is connected the rammer of steel, smaller but heavier than the ordinary instrument. The movement of the machine is controlled by the operator; and the rapidity of the operation, according to the inventor, more than counterbalances the greater first cost.

Stowmarket Church.—The quantity of stones that have fallen from the tower of this church during the last few days has been something alarming, and many fears are expressed by those who reside in the neighbourhood that the entire tower will shortly come down. Something ought to be done directly in the matter.

Sanitary Report on St. Mary's, Islington.
The annual report on the sanitary condition of the parish of St. Mary, Islington, during the year 1871, by William H. Corfield, M.D., Medical Officer of Health, has been printed by order of the vestry. In speaking of the sanitary work of the year, this report states that during the hottest part of the summer carbolic acid was used with the watering every Saturday in some of the closest streets; and once a week also McDougall's powder was freely thrown about many of the courts, yards, and dust-bins of smaller houses. The reporter thinks that "the whole system of dusting may, before long, have to be reconsidered, as it is a growing opinion that it would be a wise sanitary measure to abolish entirely all dust-bins, and substitute portable receptacles in their stead; the metropolitan vestries making provision for the daily removal of refuse from each house."

St. Margaret's Church, Ipswich.—During the progress of the restoration of this church, the workmen discovered the remains of a mural painting in the spandrel between the second and third arches reckoning from the west end on the south side of the nave arcade. The picture seems to be an attempt to combine the legends of St. Christopher and St. Anthony praying with the fishes. At the bottom is the kneeling figure of a man in the act of prayer. Just above him are fishes of various kinds, the pike in the act of swallowing a smaller fish, the eel, the plaice, &c., and the water is visible, in spite of the mutilation which the picture has suffered. Above the highest of the fishes, in the widest part of the spandrel, are traces of the figure of a man. The figure appears to be wading through the water.

The Employment of Children in Brick-yards.—At the Birmingham Police Court, Mr. John Bond, brick manufacturer, Garrison-lane, was summoned by Mr. W. H. Johnson, sub-inspector of factories, charging him with having employed in his brickyard four children, each under the age of thirteen years, for more than six hours and a half per day, and also with having employed a girl, under the age of sixteen years, contrary to the Workshops Regulation Act. Mr. Johnson said that not any of the children attended school, for which their parents were responsible. He would not press for a heavy fine, as he thought that the defendant would be careful not to infringe the law again. The magistrate imposed the mitigated penalty of 1s. and costs in each of the five cases, amounting altogether to 3l. 7s. 6d. The full penalty in each case is 3l.

Cambridge.—The guardians of the Cambridge Union are about to erect an infectious disease hospital on an isolated spot on the borders of the town, to consist of, on the ground-floor, for each sex, night and day convalescence wards, kitchen, and nurses' rooms, with offices. On the first floor will be two wards, each containing six beds, 20 ft. by 30 ft., and an occasional ward for two beds. All the wards will be ventilated by foul-air flues, worked in the walls, and a continual supply of fresh air will be admitted into the wards by small inlets, formed with iron boppers, covered with fly-wire, at the top of the sashes. A detached dead and wash house will be provided. The works are to be carried out from the drawings and specification prepared by Mr. Edwin Bays, architect, Cambridge.

Sculpture, Birlingham Church.—We recently mentioned the completion of the works here. We may add to what we said, that the interior includes some carved small figures, &c., executed by Mr. Purdy, of London. On the north side of the church, at the entrance to the chancel, is a carved angel, on a stand. The angel is represented as holding an open Bible, and is intended for the pulpit. On the opposite side is the lectern, representing an eagle on a rock. Both of these are the work of Mr. Pfyffers, sculptor, London, the material used being Corsham stone.

The New Lambeth Workhouse.—It appears from the proceedings which took place at the usual meeting of the Lambeth guardians last week, that the works of the new workhouse have so far progressed that it is now necessary to take measures for providing the fixtures and fittings, and the architect has submitted a set of drawings and specification for the same which, after some revision by the guardians, have been approved of, and tenders for the execution of the works ordered to be invited.

Proposed Children's Playgrounds for Salford.—At a meeting of the Salford Town Council, Councillor Mather moved,—“That it is desirable that three plots of land, respectively situated in Deal-street, Silk-street, and Spring-field-lane, be acquired, either at a yearly rental or by purchase, for the purpose of converting them into playgrounds for the children of the poor inhabitants of the respective districts, and that the General Health Committee be authorised to consider the subject and report thereon.” After some discussion, however, an amendment that the question of the formation of playgrounds for the children of the poorer inhabitants of the borough should be referred to the General Health Committee to consider and report to the Council, was adopted by a majority of twenty to six.

The Proposed New Dock at Maryport.—A crowded meeting of the ratepayers and ship-owners of Maryport has been held for the purpose of having laid before them by the trustees a statement relative to the proposed new dock and works, and the probable cost of completing the same, and to take their opinion as to whether the trustees should proceed with the works. After some discussion, during which it was stated that the dock would cost 120,000l., while the borrowing powers were only to the extent of 88,000l., the chairman took the sense of the meeting as to whether the dock scheme should be proceeded with or abandoned, and it was decided by a large majority that the scheme should be abandoned.

Coate Reservoir, Swindon.—The culvert which conveys the water of a spring underneath Coate reservoir burst, and the water was rushing out when Mr. Fox, the lessee, ran to the hatch and let it down, then to the other end of the reservoir, and arrived in time to see the repulsed water flow out into the meadow there, but by letting down the other hatch he stopped this also. The spot where the leak had occurred was indicated by a whirlpool, and the confined air in the culvert suddenly blew the water up above the surface of the reservoir, like the spout of a whale. It appeared to be a serious leak, caused probably by the brickwork of the culvert settling down, the foundation being upon a kind of bog or quicksand.

Howel Harris's Memorial Chapel, Brecon.—The site selected for this memorial is a piece of ground near the old College at Trevecca, on the north-east side, and in the immediate vicinity of the birthplace of the reformer, and the spot where he lived and died. The ceremony of laying the stone has taken place. A platform had been erected for the purpose of holding a meeting on the spot where the foundation of the chapel lies. The Rev. Edward Matthews, of Cardiff, presided. The chairman delivered an address in Welsh, and, on behalf of the committee, handed Mr. Davies a silver trowel and mallet. Mr. Davies, who is a ready subscriber to worthy objects in the Principality, took off his coat, called for a sledge-hammer, and performed his task in a workmanlike manner.

Covered Sheds or Ventilating Barns.—These buildings save trouble in the field (by the crop being carted earlier than if it were to be placed in the old-fashioned closed barn): they allow corn to dry better than if packed in a stack, and especially they save cost of thatch and thatching. The cost of some such buildings is, it appears, from 8d. to 1s., according to material used, for each cubic yard of contents. Thus, says a correspondent of the *Bedford Times*, if 30 cubic yards were taken as the bulk from one acre, a shed to accommodate the produce of 100 acres would cost between 100l. and 150l. A solid erection of brick pillars, 14 ft. high, and as many feet apart, with a slate roof double that span, and a floor of concrete, would now be not far short of the latter figure.

Bristol City Surveyorship.—The joint committee of the town council to which this question was referred, have decided to recommend the appointment of Mr. Josiah Thomas, as city surveyor, at a salary of 700l., with an allowance of 50l. in addition, for hire of horse and trap. Mr. Thomas will be permitted to retain his private practice, but must not undertake any work in which the interests of the parties concerned are antagonistic to the corporation. The staff required by Mr. Thomas will be appointed by the corporation, and not by that gentleman himself, as originally proposed.

Fall of a Party-wall in the New Cut.
An accident, which, had it occurred at any other part of the day than that during which it happened, would in all probability have been attended with loss of life, took place on Thursday week, in the New Cut, London. About one o'clock in the morning, the inhabitants residing in neighbourhood were disturbed by a rumb noise, and upon getting up to ascertain cause, they found that the party-wall inside premises of Mr. Priest, who keeps a coffee-dining room on the ground floor only, had fallen down, driving the shop-front into the street, destroying all the crockery and other material in the interior, a considerable portion of roof immediately over the shop falling in among the debris.

The Fountain Movement in Paris.
Three new fountains, provided for by the liberality of Sir Richard Wallace, have been opened at the Barrières de la Glacière, M. parnasse, and d'Enfer.

Edinburgh Cathedral Competition.—We understand that the designs have been referred by the trustees to Mr. Ewan Christian, in view of his reporting on them.

TENDERS

New lecture-room adjoining Red-hill Congregational Chapel. Mr. W. F. Poulton, architect:—
Russell £207 0 0
Asstford & Wainwright 325 0 0
Cook (accepted) 325 0 0

For alterations and additions to Balls-vue II Twickenham. Mr. W. G. Wallis, architect:—
Fish £2,065 0 0
Higgs 1,897 0 0
Messian & Wainwright 1,850 0 0
Asstford & Wainwright 1,911 0 0
Hiscoek 1,775 0 0

NOTICE.—To the ARCHITECTS of GREAT BRITAIN; also the CONTRACTORS.—An Early in AUGUST A NEW WORK will be published, ENTITLED, EXAMPLES by MODERN ARCHITECTS. Four Plates. Imp. 4to, with Four Pages of Letterpress and Wrapper Monthly. Price to Subscribers, 7s. 6d. Non-Subscribers, 10s. The First Number will contain a CHURCH, SCHOOL, MANSION, and a VILLA. The Architects have kindly consented to send their drawings, and to become subscribers. All Architects wishing the insertion of their drawings, will please forward same, enclosed with a subscription order. The name and address of each Architect will be given, also the Contractor's estimate for erection, and each monthly number will be varied. A New Work just published on SPECIFICATIONS, by F. ROGERS, Architect, after the MODEL of BARHOLLOMEO, Rev. J. Rogers, Co.'s Edition. E. A. SPEIGG (Original Publisher of All Architects & Co.'s Publications), 106, Great Russell-street, Bedford-square.

THE PRACTICAL CARPENTER and JOINER, illustrated by Card-board Models (new and original), showing the best practical methods for obtaining every conceivable cut requisite to constructive Carpentry, Joinery, and Boat Building (including Joinery, by ROBERT HODDLE). London: R. A. SPEIGG & CO. Ltd, Great Russell-street, Bedford-square, which is the only firm that work can be obtained from.

W. H. BARBER, Surveyor, 12, Buckingham-street, Strand, W.C. twenty years with Messrs Myers and Myers, Mansfield, has REMOVED his OFFICES to the above address. Quantities and Estimates prepared, and every kind of assistance rendered on moderate and mutual terms. DISPECTED AND LITIGIOUS ACCOUNTS SPECIALLY ATTENDED TO.

PERSPECTIVES, COMPETITION, or OTHER PLANS and DRAWINGS, artistically PREPARED and Etched or Coloured in the best Style. Terms strictly moderate. Also Occasional Assistance in or out of Office.—Address, T. H. 14, Appleton-street, W.C.

MR. ARCHIBALD D. DAWNEY, C.E. CONSULTING ENGINEER and SURVEYOR, 25, Walworth-road, LONDON.—CALCULATIONS, DESIGNING, and ESTIMATES prepared for IRON CONSTRUCTIONS, GASWORKS, &c. LEVELLING and SURVEYING. Professional assistance generally.

WANTED, in the principal towns, Persons, Builders, and Plasterers, to PROMOTE the introduction of the SCIENTIFIC MORTAR.—Address, Secretary of the Scientific Mortar Company, 5, White, St. Andrew-street, London, S.E.

TO MERCHANTS.—WANTED, by a Gentleman in business in South Wales, with an extensive connection throughout the whole of the principality, COMMISSIONS on GOODS connected with the Building Trade.—Address, BULLDOZER, Post-office, Newport, Monmouthshire.

PUPIL.—A CIVIL ENGINEER, having three years of considerable magistracy in operation, has a VACANCY in his Office for a PUPIL. The district in which the works are situated being one of considerable extent and importance, affords unusual opportunities for the acquisition of engineering experience.—Address, A. E. 71, Grosvenor-street, E.C.

TO PARENTS and GUARDIANS. CIVIL ENGINEER'S PUPIL.—A Civil Engineer, in extensive practice, principally as a Sanitary and Hydraulic Engineer, a Member of the Institution of Civil Engineers, is prepared to receive into his Office, at Westminster, a well-situated YOUTH who has a taste for Engineering Pursuits. Great advantages are offered for a thorough mastery of the profession, both practically and theoretically, and for future employment upon the completion of his articles. Premium required. References exchanged. ADDRESS ENGINEER, care of Messrs. E. & F. N. Spon, Stationers' Row, London, S.W.

A VACANCY for a PUPIL in a Builder and Contractor's Office. Frugal moderate.—For particulars, address, 21, Office of "The Builder."

TO PARENTS and GUARDIANS. A FIRM of ARCHITECTS are seeking a PUPIL. A premium required, and a salary given after the second year. To be young man of energy and education. Apply by letter, to ARCHITECT, care of Mr. E. W. Dale, Stationer, New Market-street, Bradford.

A GENTLEMAN, with some years' experience on London and country railways, is prepared to take charge of the duties of SUPERVISOR and LEVELLER, to take out quantities, or to make all classes of drawings or tracings, either at home or elsewhere.—Address, R. Y. Post-office, Millbank-street, S.W.

TO TIMBER MERCHANTS.—The Advertiser, having had large experience in the Timber Trade, is open to undertake the SALE of TIMBER on commission or otherwise, in Town or country.—Address, THOMAS, Post-office, London, E.C.

ENGINEER WANTED, by the Ferry Committee of the Wallace Loan Board, to Prepare Plans, Specifications, and Quantities, and to Take Charge of the whole Works for the contemplated Improvement of the Segoe and Egmont Ferries, on the River Mersey, consisting of Masonry, Landing-Stairs, and Bridges at Segoe; and a Pier, Landing-Stair, and Movable Stage at Egmont.

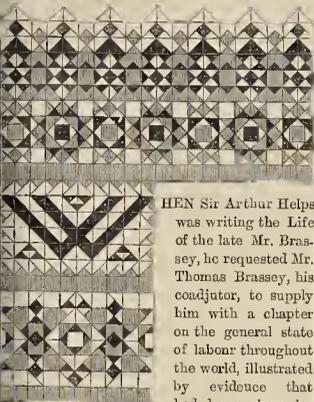

These subjects who have already had experience in such works will be preferred. Applications, accompanied by testimonials, addressed to "The Chairman of the Ferry Committee," to be sent to the Offices of the Wallace Loan Board (Clerk's Office), Church-street, Egmont, near Liverpool, not later than TWELVE o'clock at noon on FRIDAY, the 15th day of SEPTEMBER next.—By order.

T. ROBERT LEBER JONES, Clerk to the said Board. Public Offices, Egmont, 25th August, 1872.

The Builder.

VOL. XXX.—No. 1546.

"Work and Wages."

HEN Sir Arthur Helps was writing the Life of the late Mr. Brassey, he requested Mr. Thomas Brassey, his coadjutor, to supply him with a chapter on the general state of labour throughout the world, illustrated by evidence that had been given by skilled persons, in

reference to his father's career. The subject, however, was found to be so large, and Mr. Thomas Brassey's industry had wrought together such a mass of important facts bearing on the subject, that a separate volume was determined, and this is now before the public.* In it Mr. Brassey treats of strikes, trade unions, hours of labour, the commercial progress of other nations compared with that of our own, co-operation, piece work, and other "burning" questions in debate, with great impartiality and an evident desire to arrive at just conclusions. He urges rightly that clearer knowledge will bring charity and forbearance where jealousy and distrust now unhappily divide the master and the man. There is much truth in the observation of the recently-married Pere Jacquinthe,—"Toutes les fois que le voisin commet une faute, accusons-nous nous-mêmes, nous ne vivons pas assez édifiés." Mr. Brassey's hook is calculated to édifier many, and we trust it will be so used. We will condense some of his observations with such comments as may be necessary. We agree with him that English workmen but imperfectly realise the serious odds against which our industrial establishments have to contend, from the difference in the rate of wages here and on the Continent. It requires skill in the employer, and energy in the workmen, to compensate for the difference. Perhaps the most successful engineering establishment on the Continent is M. Krupp's, at Essen. Between 8,000 and 10,000 men are employed. Day workmen and helpers receive only 2½d. to 1s. 9½d. a day, while the wages of smiths, puddlers, carpenters, and masons, average 8s. to 6l. 15s. a month. These wages would not satisfy the English artisan; yet they are the highest which are paid in any part of Germany. His low rate of wages is to be explained partly by the cheapness of provisions; and it may here be remarked that the comparative cheapness of provisions in some districts of the Continent goes long way to compensate our foreign competitors for the higher price which they have to pay for coal and iron. Moreover, the mode of living adopted by the artisans in Germany is more frugal than English habits will permit. The writer points out that the working-classes in the

agricultural districts in France are, as a rule, more provident than the same class in England. When the works were first commenced on the Paris and Rouen Railway, the contractors endeavoured to introduce a system by which the workmen were to be paid once a fortnight instead of once a week, as had been the custom in England. But very soon after operations had been begun, the Frenchmen requested that the pay might take place only once a month, whereas the English navy generally desires to be paid on Saturday night—and, by the following Wednesday, often wants something on account of the week's work. It is the opinion of Mr. Lothian Bell, one of our highest authorities, that, after all the efforts of our iron-masters to contend with the difficulty of high-priced labour by the improvement of machinery, labour costs 15 per cent. more in England than on the Continent, and this disadvantage in his opinion entirely neutralises the advantages we derive from our great facilities in the proximity of our iron-mines to our coal-heds. Our workmen are not sufficiently alive to the necessity for the exercise of the utmost efforts of ingenuity, in order to enable capital invested in England to hold its own in the industrial campaign.

Speaking of the effect of supply and demand, as opposed to the action of trade-unions, Mr. Brassey says our operatives have but a faint conception of the rise of wages which has taken place abroad in countries where trade-unions did not exist, and where the improvement in the workman's condition was attributable solely to the increased demand for labour. From the tables given in the report prepared by Mr. Phipps, on the industrial classes in Wurtemberg, it appears that the average increase in the rate of wages, in eight branches of manufactures and industry, during the last thirty years, amounted to between sixty and seventy per cent. In the building trades the rise of eighty to ninety per cent. is to be explained solely by the unusual activity in the trades. As a general average, sixty-nine per cent. may be taken as the increase in the daily wages for the out-door labourers. In their class the increased demand for labour is peculiarly noticeable.

The advance in wages in the building trades in London has been considerable; but the writer maintains that it has been the necessary result of the altered relation between the supply of workmen and the demand for labour. Abundant evidence in support of this explanation of the cause of the rise of wages in all branches of trade is supplied by employers by no means friendly to the trade-unions. Mr. Trollope, for example, in his evidence before the Commissioners, says:—"Hitherto there has been such an enormous pressure for work, that almost every man who can handle a tool has been taken on at an unreasonable rate." Again, speaking of the advance in wages in the building trades in the provinces, Mr. Mackay, a member of Mr. Brassey's staff, observes:—"Wages have risen, during the last twenty years, from twenty to twenty-five per cent.; but by the force of circumstances they would have risen as much or more if trade-unions had never existed." We fully believe that the rate of wages cannot long continue so high as to deprive capital of its fair return; for if it did, capital would seek some other investment of a more satisfactory nature. Neither can the rate of wages long continue below the amount necessary to maintain the labourer and his family. The fluctuations in the rate of wages between the two limits depend entirely upon the varying demand for labour.

In the United States the wages of skilled workmen average from 9s. to 15s. a day, and those of unskilled workmen from 2s. 6d. to 7s. 6d. It cannot be supposed, says Mr. Brassey, that so great a difference between the reward of labour on the opposite shores of the Atlantic is due to the superior organisation of trade-unions in the

United States. In New England there are powerful combinations among the artisans, but none among the agricultural labourers; yet, as compared with the same class in England, the condition of the common labourer is, of all others, the most improved by emigration to America. And let it be observed that, as agriculture is the most flourishing, so it is the most important of all the industries of the United States. The value of the total annual production of the leading industries has been estimated by Mr. Wells at 1,365,000,000. To this total agriculture contributes 685,590,000. The demand for labour to bring under cultivation the vast tracts of land still unoccupied is such that it has never yet been satisfied. Hence a rise of wages in strict conformity with an economical law.

In one of his chapters, the author maintains what some would deem a paradox; namely, that daily wages are no criterion of the actual cost of executing works, or of carrying out manufacturing operations; and he does this to reassure those who fear that we may no longer be able to compete with foreigners. It is quite possible, of course, that work may be more cheaply executed by English workmen, notwithstanding that their wages have largely increased; but there must be no artificial restraints by trade-union by-laws if that is to be hoped for.

At the commencement of the construction of the North Devon Railway, the wages of the labourers were 2s. a day. During the progress of the work their wages were raised to 2s. 6d. and 3s. a day. Nevertheless, it was found that the work was executed more cheaply when the men were earning the higher rate of wage than when they were paid at the lower rate. Again, in London, in carrying out a part of the Metropolitan Drainage Works in Oxford-street, the wages of the bricklayers were gradually raised from 6s. to 10s. a day; yet it was found that the brickwork was constructed at a cheaper rate per cubic yard, after the wages of the workmen had been raised to 10s. than when they were paid at the rate of 6s. a day. Again, in Russia the nominal price of labour is lower than in any other country in Europe; yet the manufacture of iron is at least as costly in Russia as in England; and it is considered politic by the State to give an artificial encouragement to the iron manufacturers by paying a bounty of 4l. per ton on all rails made in the country.

The contract for the Paris and Rouen line included some difficult work. There were four bridges across the Seine, and four tunnels, one of them one mile and five-eighths in length, passing through hard limestone. The English were chiefly employed on the difficult work. The French labourers drew away the staff, or wound it up the shafts; but the mining was done by Englishmen. In the tunnels the skilled work was all done by them. At one time there were five hundred Englishmen living in the village of Rollebois, most of whom were employed in the adjacent tunnel. Although these English navvies earned 5s. a day while the Frenchmen employed received only 2s. 6d. a day yet it was found, on comparing the cost of two adjacent cuttings in precisely similar circumstances, that the excavation was made at a lower cost per cubic yard by the English navvies than by the French labourers. In the same quarry at Bonnières, in which Frenchmen, Irishmen, and Englishmen were employed side by side, the Frenchmen received three francs, the Irishmen four, and the Englishmen six francs a day. At those different rates, the Englishman was found to be the most advantageous workman of the three.

If our agricultural labourers were better paid and bred, we have very little doubt that they would do more work, and do it better too.

Mr. Brassey believes that it is equally true that the hours of labour (of course he means

* Work and Wages practically Illustrated. By Thomas Brassey, M.P. London: Bell & Daldy. 1872.

within certain limits) are no criterion of the quantity of work done. Using greater diligence an energetic man may do as much in nine hours as he formerly did in ten. When hours are shortened with the expressed intention of doing correspondingly less work in that time, it is necessary to remember that trades, which can only flourish by successful competition with the foreigner, must, to a certain extent, be regulated with reference to rules established abroad. The British workman must take care that he does not, by working shorter hours, so increase the cost of production, that competition with foreign industry becomes impossible.

Mr. Brassey is quite satisfied with the success that has attended British enterprise in competition with foreign industry, and has no gloomy forebodings. Summarising some statements by Professor Leone Levi, he says,—

"In 1763 the population probably was 10,000,000. In 1870 it was 31,000,000, showing an increase of 210 per cent. But if the population has increased three times, the imports have increased thirty times, namely, from 10,000,000, to 300,000,000, the exports nearly twenty times, namely, from 10,000,000, to 240,000,000; the navigation of ports from 1,500,000 tons, to 38,000,000 tons, and the shipping belonging to the kingdom fourteen times, namely, from 550,000 tons to 7,700,000 tons. The whole trade of the kingdom actually doubled itself during the last fifteen years, having grown from 290,000,000, in 1855, to 570,000,000, in 1870. The sum invested in railways in 1845 was 88,000,000. In 1870 the capital embarked amounted to 530,000,000. The increase most fully demonstrates the growth of capital, the vastness of our accumulations, and the extent of our industrial resources."

With a few words to note that Mr. Brassey, while he sees the difficulty of introducing the co-operative principle into the arrangements between masters and men, hopes yet to see it more largely introduced into British industry, we must end our notice. The introduction of this principle would teach workmen to appreciate the difficulties and hazards attending the investment of capital in business. We shall be glad to see a cheap edition of this volume extensively circulated.

STONEHENGE: THE AUTUMN CAMPAIGN.

The ring of arms and the roar of cannon, happily unshot, that have attracted so many eager spectators to the Wiltshire downs, cannot be expected to find a very distinct echo in our pages; and yet, while the attention of the country is riveted on that which is at once a test and a lesson of military skill, we may be pardoned for recalling, with no little pleasure, our own long advocacy of the importance of the engineering education of our troops. From the Italian war we drew the inference that a great change was setting in in the relative power of attack and defence,—a change that would tend greatly to modify the principles of military architecture, and thus, in the sequel, to alter many of the main features of our cities and towns. The lesson given as to land-fortifications by the siege of Gaeta was repeated, with reference to floating batteries, by after events and the various calamities that beset those gigantic iron-clad structures, in some of which the primary principles of naval architecture were altogether set at defiance. This series of costly lessons,—costly in far more than money,—in needlessly sacrificed life,—seemed to culminate in the loss of the *Captain*. With the short, sharp campaign that terminated in the decisive battle of Sadown, a fresh set of most instructive facts claimed our attention. The influence of arms of precision and of repetition in the decision of a critical battle was there proved to be of the utmost importance. In fact, it might almost have been said that a new arm was given to the soldier. At all events, infantry tactics had to be wrought out under new conditions. The shield to be opposed to the terrible efficacy of the rifle, we showed, was to be forged by the agency of the pick and the shovel; and we watched, with no small anxiety, the slow development of the new relations between the parade-ground and the spade.

With the slow deliberation with which one of our old sailing three-deckers might have got under weigh, the armed force of England has spread on its canvas to the breeze. A great change, from which we would gladly expect the results promised by its proposers, has been introduced into the entire system of our land forces. Purchase is no more; and the scientific corps have received a wise and liberal measure of justice, which it was deplorable to see any one who bore Her Majesty's commission attempt to prevent or to postpone.

To all this, on a scale increasing year after year, has been added an annual repetition of that practical education of the soldier which, under the old system, was deferred till he was in the presence of the enemy. Of the details of our home campaign it is not our purpose to speak. Their value is recognised by all competent judges. And the opinions which we so frequently advanced, as to the increasing importance of the labouring and enduring, as compared with the merely fighting, qualities of the soldiers, are now receiving, each year, fresh illustration.

It adds extraordinarily to the interest of the campaign of the present autumn that it has taken place on those wide and unbroken downs that preserve, in the midst of the busy civilisation of the nineteenth century, an aspect not very different from that which they may have borne in the time of Alfred, of Offa, or of Cæsar. Nay, in the time of Cæsar himself, so far as any evidence of change or of decay can be obtained from the memory of man, or the references of the earliest chronicles, they may have been dominated, as they are to-day, by the same solemn, mysterious watch-towers,—the abandoned home of a race whose very name has been obliterated. It cannot but strike the philosophical student of history with admiration that the latest outcome of a science which has been actively prosecuted since the time of Galileo,—we may say, since the time of Alexander,—appears to be a return to that circular plan which was common among that stone-building people who have raised so many monuments in our own and in other countries, that yet remain the very cradle of the archaeologist.

We are not about to enter into any argument as to the date, origin, or archaeology proper of Stonehenge. The subject has been not unfrequently raised in our columns. And yet, having witnessed the dotting of the Wiltshire downs with the trim tents of our troops, having seen the roads filled by regiment after regiment of a splendid cavalry, and choked by the long trains of the improvised means of transport; above all, having seen the grey trilithons of Stonehenge lighted up by the scarlet, and gold, and green of the uniforms of the foreign officers of distinction who have assisted at our manoeuvres, and contrasted the intelligent respect shown by the owners of names famous in European history with the vandalism and neglect which are now attacking these irreplaceable monuments with the chisel of the gravestone cutler,—we are anxious to offer our readers a few considerations that are, as we think, novel. We wish, for a moment, to regard Stonehenge, not so much from the archaeological point of view as from that which is offered by the higher motives of the architect. The evidence afforded by such features as choice of site, orientation, indication of religious rite or faith, and resemblance, or the reverse, to any known religious or civil structures, has never, we believe, been discussed or even fairly stated. We wish to avoid what is disputed, but to bring out more clearly than has yet been done what is certain, but what has been remarkably overlooked.

Few ruins in the world,—not one in England,—can so powerfully affect the imagination as Stonehenge. Its first view is never to be forgotten. No picture, no description exists, that in any way does justice to the grandeur of the scene. Leaving the picturesque street of Amesbury, the distance of which town from the nearest railway station has preserved to it much of the character of the England of five-and-twenty years ago; passing the fine old church, in which three of the seven lancets of the choir have been replaced by a fine Early Decorated window some 500 years since, the road crosses the Avon by a stone bridge, just below a broad weir and tumbling waterfall. The noble timber and stately grounds of Amesbury Park shadow the links of the river. Turning to the west, on leaving the town, the road diverges on passing one of those fast-vanishing features of pre-railway England, a turnpike; and runs over broadly-swelling undulations towards the open country. Clumps of well-grown timber, and the scarped chalk that bounds the park, crested with a dense zone of trees, are left to the right hand. To the left opens a wide range of down towards Salisbury Plain, on which groups of wizened and elfin-looking trees mock the expectation bent on the giant stones. At about a mile and a half from Amesbury the brow of a hill is surmounted by the road. The last dense clump of timber is passed. Before the view stretches a wide expanse of heathy down, on a gently-

rising plateau, in the middle of which, in solitary grandeur, is Stonehenge.

Very much has been written as to this unexplained relic of a hoary antiquity; very much too, that the visitor will do well to leave unread or to banish from his head, if he unfortunately have prepared himself for a visit by the unprofitable study. The word Druid must be unpronounced. The ingenious, half-crazy theories of Stukely, which, for fault of a better, dominate most of the literature of the subject should be named only as an instance of the audacity which may be attained by the writer who projects his facts out of his own brain. We must remember that almost all our ideas of Druidical rites are derived from Cæsar; and that the account given by that great general of his campaigns in Gaul and in Britain has a very close family likeness to the hulletins of Napoleon. Each was the account given by the general, who safe from fear of contradiction, of his own exploits, for the sake of producing a political effect. The Commentaries were framed for the *gobe-mouches* of Rome, as the hulletins were for those of Paris. In each it is often possible to read between the lines a story very different from that presented to the Forum and to the Bourse. In his two scrambling raids through Britain, the latter of which turned to actual flight (as is proved by the clumsy pretext ordering the hostages to be sent after him) Cæsar never looked at the walls of the centre of British power, the great city of Verulam; the widespread ruins of which bear a far more incontrovertible testimony to an ancient civilisation than do the scraps of gossip which Cæsar gives second-hand from Divitiacus. It is remarkable that people should have received a simple good faith an account involving such ridiculous marvels as some details of the natural history of Gaul, according to Cæsar. Taking then, what he says of the Druids for what it may be worth, there is not the slightest connexion to be traced between a priesthood who rites were of a forestal character, and the night-masons who wrought Stonehenge.

The first idea that impresses the intelligent (when fancy allows reason to commence its work), is that of the antiquity of this structure. Language fails to give us a such measure; human tradition, in its shadowy, yet most ineffaceable form, that of a name, is utterly lost. The names of heroes a country that their memorial is all but eternal. Those of the two builders who may most closely vie with the founder of Stonehenge, Solomon and Sulpis, are ineffaceably connected with the mighty wall that girds Mount Moriah, as with the vast bulk of the great Pyramid. In other cases, the name survives the meaning; its associations, as in Kit's Cotyhouse and, perhaps, Silbury Hill. But here the Saxon strangers gave only their own simple title of Hanging Stones to monument as mysterious to them as it is to us. If their British predecessors had any definite tradition, it has perished. In the associated instance of Avebury, a yet more ancient megalithic work has only a Saxon name. Hackpen, in the neighbourhood, has a British sound, but one that is mute as to its significance. No word lingers in human speech to tell of the origin of the mighty pile Stonehenge.

As regards the entire group of the megalithic remains of Wiltshire, Stonehenge is, there can be little doubt, the most modern. It shows undeniable traces of an elaborate masonry which is far less visible at Avebury. The great store of the impost preserve, in one or two cases, even a distinct arch. The mortises and trusses are apparent. The circle of stones immediately within the great line of the trilithons present indications leading to the conclusion that they were not only wrought, but polished. The geological character shows that they came from quarries different from those (alike unknown) that furnished the larger blocks. None came from any part of Wiltshire, or of the entire range of the chalk districts. Icebergs have been pressed into the service, as the carriers of the larger blocks from—no one has yet suggested what mountain. But icebergs would not be selected and brought from some other locality the smaller stones, of a character adapted to bear a good polish. In one on the left hand the principal part of the building, is yet evident a long vertical groove, as if made for the turn of a door. The very high state of art which masons of Stonehenge had attained, as well as the yet remaining sharpness of some of the (while less carefully selected stones have been

shapeless from the influence of weather), are reasons for concluding this Wiltshire marvel to have been one of the latest efforts of the megalithic art of England.

Tradition, then, is utterly silent as to Stonehenge. In the earliest notices we have of its existence, it appears vast, dim, and unknown, even as it is to-day. Language has failed to emblazon any reference to its origin. Geology has refused as yet to tell where its builders sought their well-selected and carefully-squared blocks. What can we know about it?

In the first place, we must remark on the compact and castellated form of the ruin. To this all the representations fail to do justice. As seen from the first point of view, on the Amesbury road, it might be thought to be yet habitable. That it was a complete and highly-finished building there can be no doubt. Whether the interstices of the gigantic coists and pillars were filled by wood or by smaller stonework, whether the roof was conical or of other form, we have little as yet to tell us. The nearest approach to a plan is found in the temples or churches of Abyssinia, which have one great conical roof covering their concentric rings and divisions.

The building was not an ordinary throned, such as the megalithic chambers of the Mediterranean islands will have been, even if the shade of giants. It must have been devoted to some especially solemn purpose, whether of state, of religion, or of the two combined. Whatever were the details now lost, a great central hall, with five graduated thrones or altars, is surrounded by an ambulatory, and dominates a sort of smaller interior theatre or place of audience.

It must be remembered that the relation between the vallum, or remains of a bank and ditch, that surrounds the outer wall of Stonehenge at a distance approximately equal to the diameter of the building, is obscure. There is nothing to make it an integral part of the monument.

Stones lie in one or two places near its existence, and a certain external fence, or hedge and ditch, but even this is uncertain. There is an essential and primary difference between the earth-building and the megalithic habitations of these regions, to which we shall presently refer, which is enough to warn us never to assume an identity of structure between a mound and a building which it may surround. The circular plan of structure, which possesses extreme advantage as a defensive characteristic, is common to most of the megalithic remains. At Stonehenge, while the external wall is circular, the plan of the central hall approaches the horseshoe form. No small amount of practical science is involved in the harmonious adaptation of these distinct elements of structural arrangement.

The central hall itself was not calculated to contain a large number of persons. If their number had been that of our own times, the building would have been inconveniently crowded with more than 600 persons. It would not seat more than 200 persons. About 200 might find room in the inner hall, the same number in the outer, and again the same number in the inner ambulatory. If the stature of the inhabitants were larger than our own, these numbers must be diminished. This, considering the costly nature of the building, points rather to the seat of the throne than to that of the altar. The worship of the spot must have been restricted to sacerdotal giants.

The site of the building has been determined what we may call truly architectural considerations. It is not placed in astronomical azimuth, as was the great Pyramid, and as were most of the Oriental temples. It occupies a commanding position, although it is in its turn commanded by a swelling eminence of the hill on which it stands, much as the site of the temple of Solomon was by that of the fortress which, under the third dynasty, was named Antonia. Its portals face the site where the direction of some of the roads of the ancient city is yet indicated on the soil. At twice the distance of the diameter, the straight central avenue was guarded by a vast flock of stone, probably bearing the insignia of the monarch, or some emblem of the venerable structure, and compelling those who entered to turn to the right or to the left, as a mark of respect on setting foot within a palace. The grave and stately habit of the people is indicated by the magnificence of the avenues, of which we have relics at Avebury and elsewhere, and by the great regularity often to be observed in the lines indicating the plan of their streets and cities.

Although not astrolatrical in its position, or

visibly connected with the observation or the veneration of the planetary bodies, Stonehenge was built by masons who were not without some knowledge of astronomy, at all events as matter of observation. A giant stone lies, 100 ft. from the circle, in a position over which an observer, on the summer solstices, may now (and many annually do) see the sun rise from the stone known as the altar. Thus, whether palace or temple, Stonehenge is a monumental calendar.

The worship, if such it were, of the builders of Stonehenge, appears to have been unlike that of any faith now existing on earth. In all Egyptian temples, and in those Syrian, Grecian, Roman, and Western sanctuaries which show marks of relationship to Egyptian knowledge and tradition, the *cella*, or holiest place, forms an essential part of the sacred building. We find this at Thebes, at Jerusalem, at Athens, at Paestum, at Baalbec; we find it in Rome, at Canterbury, at St. Alban's, at Westminster, and at York. We find it in every church of Latin or Anglican rite. It is replaced by the *kehlch* in the mosque. The form of the central hall is more approaching that of the basilica, or Roman tribunal, than any other which we know. But it differs from the basilica in possessing five principal thrones or canopies instead of one.

The numeric arrangement of the building is not one that is familiar to us. Five, three, and two are the normal numbers, used by the builders. The great trilithons are five. The council-table, or altar, is alone. The piers of the outer wall were thirty in number. The internal divisions of the plan, as far as discernible, were five, viz.,—the outer and inner ambulatories, the space between the trilithons and the inner circle, the main hall and the apse behind the altar stone. If we attempt to associate the number with that of the minor planets, the sun being indicated by the pointer, we still fail to note anything that can be associated with the moon. From the irregularity of the path of that planet, no architectural feature can be determined by astronomical reference to the moon. Sir Walter Scott, in his imaginative indication of the tomb of the Wizard by the cross of red thrown on it by the moon beam, has taken a poetic licence which no astronomer can condone. We rather find indications of a people who used a decimal notation, than any other inferences to be drawn from the numeric arrangement of Stonehenge, and of most cognate monuments.

To go further is only to guess. We stand at Stonehenge, in the presence of a monument of great antiquity and of lost tradition. It was reared by a race that had attained extreme mechanical skill, producing masons of ability. Its materials were brought from sources as yet undiscovered; but stone from different geological formations was selected for different objects. The building was not astrolatrical or astrolatrical in its purpose; although its builders have left proof of astronomical observation. It was disposed with a picturesque skill in choice of position and of orientation of which any architect might be proud.

It appears, from its dimensions, to be rather palatial than templar in its design. It evinces no relation to any existing form of worship, although it contains something that recalls the idea of an altar, or perhaps still more faithfully of a council-table. Everything about it is dignified, enduring, colossal,—approaching the superhuman. That the faith and worship of its founders were associated with the hope of immortality is a natural deduction from the fact that the megalithic builders had the habit of hurrying their dead, a custom by which they are ethnographically distinguished from the contemnerous tribes (whether contemporary or otherwise) of earth-building, harrow-rearing people, who hurried their dead. Nay, the megalithic cromlech builders hurried their chieftains not only in costly sepulchres, but in the very attitude of prayer. Further, as yet, we cannot go. We have called Stonehenge an unpenetrated mystery. In the age which has witnessed the invention and the application of the spectroscope we decline to use the word impenetrable.

Canterbury Cathedral.—It is estimated locally that to repair the damage an outlay of between 3,000l. and 4,000l. will be required. The work of clearing away the ruins has already begun, and the restoration will, it is understood, be carried out by Messrs. Gaskin & Godden, of Canterbury, builders, under the direction of Mr. H. Austen, the cathedral surveyor.

COLOURED GEMS, AND A FEW THOUGHTS ABOUT THEM.

In these days of rapid change and never-ceasing progress and unquiet, it is interesting, and may be salutary, to some of us, to go back in time and see what our forefathers did. They were quieter than we are, and went about in slower coaches, and took more time over things, and certainly, as a rule, thought over matters before coming to conclusions for a much longer time than we of this present day are able to do or do do. There may be some disadvantages in this slow method of work, but it has its advantages; for to give timely thought to a thing is almost always to do it better, and to save time in the end. We are going on at a most rapid pace, always by rail, and so no one can possibly say that we are standing still, and not moving on; but the real and vital question is, where are we going, and is the movement made really "progress" in the sense of everything being upon the whole better than it was? Say that railways are better than the old coaches and the pack-horses of past days; but who shall say that the *mental* or even *bodily* good to be got out of the travelling is an "improvement"? Musical instruments, again, are all improving, we are told on all hands; but are they indeed so? Old Stradivarius contrived to make violins which no one in these mechanical days pretends to be able to rival. We say nothing of sculpture and painting; but there is one subject, just now, of some interest which illustrates these remarks. What is to be the future of gems,—of diamonds and pearls,—as objects of beauty, and as human adornments? In old days no difficulty seems to have been felt. People knew well what use to put jewels to, and how and when to wear them. To have a gem was to utilise and to display it, without affectation and without ostentatious display. Large gems, as well as small ones, were equally well worn, and added not a little to the beauty of the dress which they were bought to adorn.

We have before spoken of the cutting of diamonds and of their singular value, and of the place they hold in Nature's great storehouse of the Beautiful. But there are other gems besides diamonds, and hardly less beautiful,—coloured stones of wonderful richness and power of touching the sense of the beautiful in man, as the ruby and emerald, and others, and it is to them that we would now call a moment's attention: to the cutting of them, and to the difference between them and the diamond itself, and a word also on the "poetic beauty" that some more imaginative people seem to have found in precious stones. It is in an artistic sense, and as how to best show forth the beauty of a gem, and as to the cutting and polishing of it, that we are mainly concerned; for it is a melancholy fact that, for the most part, and with but few exceptions, the modern and mechanical gem-cutter makes a mistake, and cuts away just where he ought not to, cut at all, and where he should cut, he goes wrong or does not cut enough.

Let us, by way of example, take the ruby, the next gem after the diamond itself and in which Nature seems to have impressed the idea of beauty. It is not a little remarkable, and we might philosophise for some time about it, that while the diamond is made up of pure carbon, or simple black and opaque charcoal, the ruby, the next in order in value and beauty, is nearly made up of pure alumina, or common clay,—98.5 per cent,—the colouring matter, iron, making up the rest of it; the mere trace of lime found in it being unappreciable.

Nothing, we may venture to say, in Nature's chemistry is more wonderful than this fact of the dull, colourless, and lifeless clay, becoming *metamorphosed*, by some hidden and almost miraculous way, into the transparently clear, red-coloured, and almost living gem! Imagination itself fails to find a theory to account for all this, and no progress in chemistry can invent a theory to fit it. It is a somewhat curious coincidence that the ruby, as well as the diamond, and other precious stones, are so often found associated with gold: where they are the gold is almost sure to be present. Nature produces these her riches together, and it afterwards is the province of *art* to keep them together, and to exhibit them as one object. How much remains to be done before this artistic feat is well performed; for, as things are, the beauty of the stone is as often as not spoiled in the cutting and fling. We are inclined to think that no coloured stone should be cut at all. Rubies, for instance, always look richer by the

being simply polished or cut *en cabochon*, or tallow-topped, as it is termed. It is the marvellous depth, and purity, and intensity, of colour, as seen in the ruby, the sapphire, the emerald, and such-like coloured stones that make up the beauty and value of them, and not, as in the colourless diamond, in the coloured sparks of light which are seen in it. The blue sapphire, it may be noticed, is simply a variety of ruby or corundum.

We live in practical and mechanical days, and in times of universal enlightenment, and general knowledge, and in a state of positive suspicion of things we cannot quite see into; so that all that is "dreamy" and mystical in the "stones of fire" has well nigh disappeared. But the time was when, in the possession of a precious stone of price, a man held in his hand, and carried about with him, a real poetic charm, almost a *material poem*. Is the world really improving? is a question that we cannot help repeating. In these days a gem is simply a pretty thing to be worn by the rich and fair, because it is pretty, and costs a good deal, and evidences at once the wealth and taste of the wearer; but the time was, as in the days of Jerome, when the sapphire and the ruby were a good deal, nay, infinitely, more than this. That great doctor himself thoroughly believed that the sapphire could procure not only the favour of princes, and could pacify enemies, but could also free from *enchantment*, and obtain a man freedom from captivity. It also prevented evil and impure thoughts, and was such an enemy to poison, that if put into a glass bottle with a venomous insect it would kill it. Strange fancies these, and how different the feelings of those who held them, and believed in them, to those of us whose only mystery concerning them is the present and future riddle of the diamond market! It must surely be a very ingenious man who could fairly argue the world into the belief that the getting above and superior to these harmless fancies added to the value and interest of these wonderful beauties of nature. Not, be it observed, that all the mystery of them is done away with, for no science, however advanced, has as yet been potent enough to divine a cause for them, or why they came into existence at all. Their origin truly is as mysterious as is that of the beginning of life itself. Nothing, indeed, can be fuller of artistic thought than is this curious subject of precious stones, and we could say much on it in many ways, and at some length, but it is impossible to cease wondering at the marvellous colour found in them in such small quantities, yet so vivid and full of intense beauty. In the emerald, for instance, is to be found the most intense green colour, surpassing any green herb or plant in colour; indeed, so vivid is the colour given forth from this splendid gem that it was anciently thought to give a green colour to the surrounding air, and to be capable of colouring the water it was dipped into. But if the intensity of the green colour to be found in the emerald is a wonder, no less a wonder is it,—beyond all chemistry it would seem,—as to what it is that causes it. Formerly it was thought that chrome in a most minute quantity coloured the emerald, but lately it has been found that the colouring matter is organic in its origin; indeed, that the green colour in the gem is of the same kind as that which colours the leaves of trees and the blades of grass. Where then does it come from, and what was that organic something which could exist when the dull inorganic clay passed into the clear emerald? The most subtle chemistry can tell us but little or nothing about such marvels. Hard words in plenty, but little else.

There is one other curious fact, or rather one among many others, connected with the colouring of gems, worth notice, for the fair for whom jewels are made might be yet fairer were but a little more thought about it in the "market." Colour in most things, as we all know, is found to add to the value of them. A picture is more valuable than a bare drawing. A coloured flower is more attractive than a colourless one, and things by daylight look the better as more full of colour than they do by candlelight. But the colourless diamond, perfectly pure, and without trace of colour, is in the "market" fully 50 per cent. above, or more valuable than the palely-coloured stone from the newly-discovered African diamond-producing district. In the lustre of a fine gem of either kind, there is little or no difference; but the difference lies in the fact of the African diamond being tinged with the faintest possible tint of straw or pale yellow

colour. To many this might seem to add to the beauty of the stone, and to give it warmth, and to harmonise it with its gold setting; but fashion rules all things, even the hard and intractable diamond. If the colouring matter in the emerald is a mystery, so is it in that of the coloured diamond, for so faint is the trace of it, and so infinitesimally small is the quantity of colouring matter added to the pure carbon of which the gem is composed, that the profoundest chemical analysis has failed to detect what it is with any certainty. We can but theorise, and perhaps some of us call upon the "imaginative faculty" to help us to solve the mystery; but even here we soon come to an end, and not even a Swedenborg, who "saw nature at work in the deep recess of her vast laboratory," could do more than dream!

CONSTRUCTIVE CARPENTRY, JOINERY, AND STAIR BUILDING.

We have before us a book that deserves the attention of architects, builders, and operatives and not alone of them, but of members of various other crafts, workers in metals as well as in wood and stone, to whom a practical knowledge of the rudiments, at least, of geometry is indispensable for an accurate designing or "setting out" of their workmanship.* To the carpenter, joiner, stonemason, and metal worker, this book will be specially valuable. In a word, the work contains the constructive science of carpentry and joinery simplified and epitomised, yet without comprehensive and plain for building operatives of the most ordinary capacity. Mr. Riddell's former works evidenced his ability as a workman and an instructor; the book under notice proves him to be a thinker, a worker, and a thorough technical teacher of his art. He has struck out an almost new path for illustrating the most difficult forms of constructive carpentry and joinery in the present volume, and by the aid of cardboard models, which at the same time form the plan and the elevation (for the stretched-out elevation can be at once lifted over the plan), he proves to a palpable demonstration the accuracy of his lines for producing a perfect execution in detail of the work required.

We may premise here that this new volume and condensation of Mr. Riddell's previous works is divided into three sections: the first treating of "Practical Geometry" as applied to the plans of construction laid down in the book. This section includes eight plates or cardboard models, some cut for illustrating the constructive development in elevation, others left uncut for the purpose of testing the learner's powers who may desire to copy them and construct cardboard models independently of those in the book. The second section of the work deals with the most important problems in carpentry and joinery, including the construction of difficult forms of framing, panel, or other work standing on a given slant, the way to obtain the cuts, bevells, and mitres. The "acting out" and construction of different forms of roofs on irregular plans and the methods of obtaining the bevells and cuts for the parlians, jack-rafters, and hip-rafters, &c. There are also methods and models given to find cuts and mitres of work standing on rake and level; the construction of niches whose ground-plan being a semi-ellipse and the elevation or front rib a semicircle; the construction of a niche standing in a circular wall; and the construction of niches on other plans. Similarly to these there are methods given to find a curve on leave-boards for circular, turret, cupola (dome), or other work; the construction of ribs for lath-and-plaster groin or vault in masonry; the construction of door-frames with semicircular heads, standing in a circular wall, with jambs radiating to a centre, and for those which stand in a circular wall, the pulley-stiles being square with chord-line of plan, with the development of a veneer for bending round the same.

Plates 9 to 24 inclusive, embracing some cardboard models, belong to the second section of the work; the cardboard models, 9, 10, 11, and 15, are well-selected examples of illustrations for showing the construction of splayed framing and panel-work, as also of a perfect model of a roof either in the flat as a plan or elevated as a

* The Practical Carpenter and Joiner; illustrated by Cardboard Models (new and original). By Robert Riddell, author of "Hand-Railing Simplified," "Practical Geometry," "The Carpenter," "New Elements of Hand-Railing," &c. London: printed by Virtue & Co., City-road.

model. The ordinary plates are equally well chosen, and may be utilised by the workman with nearly equal advantage as the others. The lines and methods given are applicable to a variety of other work in carpentry and joinery; for obtaining the bevells, lengths, and exact cut which may be wanted in its construction.

The third and most important section, as also the most ambitious, in the book is that devoted to "Lessons on Handrail Construction." The plates and cardboard models, cut and uncut in this section, are entitled to every commendation for their originality, clearness, accuracy, and the ingenuity displayed in their "setting out." Here is, indeed, handrail construction developed, simplified, and demonstrated. Here is every line almost, and every section, in the elevation work projected on the plate beyond the plan yet still attached to it, and the section being cut through to half the thickness of the cardboard, the model of the handrail and wreath, when lifted, is made to stand perpendicularly over the plan, winding round its cylinder, and both shanks of the wreath, or straight portions of the handrail, standing on their proper pitches. Nothing could be more exact or beautiful than the several illustrations given in the plates and cardboard models on handrailing.*

In our notice of Mr. Riddell's former work "New Elements of Handrailing" (vol. for 1870) we entered into detail on several matters connected with the use, progress, and practice of the art in the British islands, so it is unnecessary to go over the ground again on those matters. However, we desire specially on those matters to give to building workmen to draw the attention to the practical lessons given and illustrated so admirably by models in the present work. With very little study the workman who still adheres to the antiquated methods of working handrails by the aid of drums, cylinders, boxes, cradles, and other expedients, can entirely dispense with their use. Even the aid of falling-moulds (though useful to know their methods of construction) may also be entirely dispensed with. The construction of the face-mould for the wreath of a handrail is a very simple operation indeed: the curves of the template or mould are simply portions of semi-ellipse, or, in other words, the section of a cylinder cut obliquely; the circle, or its quarter, being the ground-plan, its elevation or pitch being the developed elliptic section, ranging or winding over that plan. It is immaterial whether the workman constructs the face-mould in its elliptic form by the aid of two pins or nails, with the aid of a string, or uses a trammel. The former is the go-ahead American fashion and is an expeditious method. The trammel, we think, the safest for the inexperienced. The prime essentials are the obtaining of the proper bevells and the application of the moulds obtained to the plank. On the correctness of the drawing or "setting out" depends the accuracy of the moulds and bevells belonging. Whether the stair be a platform one or one having under the ground-plan of each being semicircular, it is of the utmost importance to the learner in his first practical lesson to understand the part that tangents play in the formation of a handrail. Both the tangents and the bevells for the joints in the construction of the wreath are mutually dependent on each other, and may be said to be inseparable. A reference to the cardboard models in Mr. Riddell's work will prove this at glance.

In plates 25 to 32 inclusive, there is comprised all that is practically needed by those who have already some knowledge of stair-building and hand-railing. Methods are given and illustrated for obtaining the moulds for wreaths where the planks have to be thrown for wreaths where the practice may be said that these methods are applicable where the wreath has to wind over portions of two flights of unequal incline, owing either to a difference in the height of the risers, or cases where it is necessary that the handrail should rise a certain height in a given number of feet, to suit exigencies not uncommon in stair-building.

Although the use of scrolls was discontinued, and their methods of construction eliminated from Mr. Riddell's former work

* A word here may not be amiss to the workman or other student using Mr. Riddell's work. The plans should be carefully studied, and the cardboard models attached carefully handled. The models are not intended for rough and constant usage, but with a proper degree of care they will last for years. It would be far better, however, if the young workman to carefully copy the lines, and construct a series of similar models of cardboard, veneer, or the thicker seasoned material. The knowledge and the practice he will obtain by doing so will repay him well for the little trouble he may experience.

handrailing, he has considered it advisable, as we (and others) have differed with him, to include a plate treating on the construction of the scroll in the present book. Though American stair-builders have abandoned scrolls for the commencement of the hand-rail, and adopted panelled octagon and other forms of newels, scrolls are still extensively used throughout the three kingdoms. There is, indeed, some truth in the author's remark about the "very objectionable bundle of balusters standing on curtain step, forming a receptacle of dust, cobwebs, and other offensive matter." The dust and other offensive matter need not exist, nor is it necessary that the bundles of balusters should be retained, though the scroll may, and still receive a more ornamental support, from a line perpendicular to the joint on its shank to its eye or centre. The problem, plate 7, aient the construction of a pyramid, or a piece of framing or panelling of pyramidal shape, is worthy of extended notice. The cardboard model is simple and correct, but its construction, simple as it is, has puzzled thousands of carpenters and joiners in the obtaining of the different levels necessary, and their proper application afterwards. Out of this problem may be said to spring a variety of others applicable to the construction of framing standing on the slant, the hips of roofs, the preparing of columns in joinery, elevated soffits, and domical, conical, and other complex forms of framings and coverings.

THE SOCIAL SCIENCE ASSOCIATION AT PLYMOUTH AND DEVONPORT.

The inaugural address of Lord Napier and Ettrick on Wednesday was a very able one, but the work of the Congress might be said to have commenced on Thursday. An excellent address on Law Reform, by Sir John Coleridge, the Attorney-General, was admirably delivered, and the several sections met immediately afterwards. In the section of economy and trade, at the Royal Hotel, Mr. Thomas Beggs read a paper "On Arbitration in the Settlement of national Disputes," in course of which he said:—Were Berlin, or Vienna, or London in the extremity that Paris found herself in 1871, there are in each city crowds of men who would be ready to take advantage of that extremity, and try to desolate the homes, in the midst of which they had found a shelter. The ruffianism which has been generated by vice and neglect would be only too ready to commence the work of spoliation when the opportunity occurred, and the work of the incendiary huffles all military strategy. It is surely wise to rescue the industrial classes from such leadership as this. He then referred to the encouragements for hope that the time for international arbitration is at hand. These arise from the danger which had been pointed out, and from some hopeful indications that a nobler ambition will supervene in France, and stimulate higher aims. The best preparation for the great work that all good men desire to see—a friendship among nations, is to break down every barrier to free intercourse, close every custom-house, and abolish all duties upon exports and imports; in a word, establish perfect free trade. Science and commerce are the great civilisers. The greatest encouragement, however, is supplied to us by the result of the Congress at Geneva. All speculation as to its award is now at an end, and at length two powerful nations have submitted to arbitration a dispute that once assumed a threatening importance. A dispute which involved far greater considerations than any pecuniary compensation has been settled by peaceful means; the spirit of an aggrieved nation has been appeased, and without the aid of the sword. The result is valuable as a precedent, as showing what many people doubt, that arbitration is practicable; but it is scarcely less valuable in teaching us the importance of maturing a code of international law.

In the Health Section, Mr. H. W. Acland, M.D., F.R.S., presided. A paper by Mr. P. H. Holland was read by Mr. Michael, Q.C., on "What Steps should be taken to guard against Sewage Poisoning?" No collection of filth should, he said, be allowed anywhere under any circumstances. The only safe course would be the immediate removal of every disgusting subject, and to take care that none lodged by the way, as it was less from sewage than from its deposit from which danger and annoyance proceeded. As little foul air as possible should be allowed to form in the sewers, or, if it did, it should escape where it would do the least mis-

chief. He advocated the free ventilation of sewers outside the dwellings, and the absolute non-connexion of the sewers with the internal parts of the house. Mr. J. N. Stevens, M.R.C.S., in another paper, advocated drains being made of Portland cement; they should be of such angle as would allow the rapid flow of sewage to outfalls. The interiors should be smooth. The sewers should be oval. He objected to the use of pipes for carrying off the gases, believing the foul air would be carried in at the windows if they were used. The sewers should be disinfected with charcoal or chloralum. In the discussion Dr. Hearder pointed out the difficulty of carrying out the chemical means proposed, and said the bringing up pipes from the ground to the tops of the houses would be impracticable. He did not see why, in some places, large shafts should not be used for carrying them up. Dr. Hardwicke, medical officer of health for Paddington and Bayswater, objected to the ventilation by pipes, and believed the practical remedy against gases was flushing with a proper water supply. Dr. Nankivell thought the best plan was to have short pipes placed into sewers at no great distance from each other, which might intercept the foul air in its passage. Mr. Buttel, F.R.C.S., drew attention to the necessity of proper supervision in the laying of drains, pointing to cases where wells had been poisoned through carelessness in regard to this. Mr. E. Vivian was in favour of tall shafts, but would have them so constructed that the weather or lee scuppers should be opened according to certain winds. Mr. Michael pointed out that the great thing was to have no connexion between sewers and human habitations. Mr. T. Baker, barrister, read a paper on the prevention of disease. In the discussion that followed, Dr. Shrimpton said diseases were not contagious except under those conditions and in those places where they may be produced. Dr. Hardwicke expressed regret that under the late Government Bill no provision had been made for appointing properly-qualified veterinary surgeons, engineers, and it might be analytical chemists, to act in conjunction with the medical officer of health. Earl Fortescue entirely agreed that it would be most desirable that medical officers of health should have the assistance of veterinary and engineering skill at their disposal.

In other sections, namely, Licensing and Trade, Repression of Crime, Jurisprudence, and Education, a number of papers were read and discussed. One of the most important discussions took place in the thinly-attended section on the repression of crime. It was carried on between experts, and had the direct value which complete knowledge can give it. A paper was read by Mr. J. B. Baker strongly advocating the adoption of cumulative punishments for minor offences. The system is being adopted, and is said to work well. The difficulty is how to apply it. Miss Carpenter stated, as the result of her long experience, that the severity which was best for society was best for the criminal, and that the constant bringing up of incorrigible offenders, and the repetition of the same incidental sentence, inflicted great injury on society. Colonel Radcliffe, of Birmingham, testified to the immense diminution of drunkenness which had been caused by the enforcement of the new Licensing Act in that borough, the cumulative penalties of which he regarded as a most valuable step in legislation.

The mayor of Plymouth gave a grand reception at the Royal Hotel, which was very full. The Association had this time double municipal patronage, in the two corporations of Plymouth and Devonport, the first one of the oldest, and the latter one of the youngest, in England. The two towns shared the visit of the Association, and both did all they could to make their visitors feel that the long journey to this far western seaport, with all its natural beauty, its historic interest, and its present importance, was well worth the trouble and the cost.

On Friday the Health Section was but thinly attended, but the gentlemen present were nearly all practical men. Mr. W. H. Michael read a paper on the principles which should characterise a new Sanitary Bill. There seemed to be a feeling that Mr. Stansfeld's Bill of this year was unsatisfactory; that in making new sanitary machinery before passing a new sanitary law we have put the cart before the horse. This opinion may, however, be regarded as that of sanitary authorities who want to lay down an entirely new system. Mr. Michael proposed strong measures. He was for superseding existing authorities, and appointing a Minister of Health, with a council,

which, under the check of his responsibility, should have very large powers. The paper was so generally approved by the section that a special resolution was passed asking the council to print it, not merely in the Transactions, but for circulation.

A lively discussion took place in the section presided over by Sir John Coleridge. The room of the Athenæum, which is Greek in form, arrangement, and ornamentation, was crowded. The Rev. John Stock, LL.D., of Devonport, read a paper in which he set forth the arguments for establishment of an international tribunal to settle all disputes between nations, and cited examples from ancient history and modern experience to prove its possibility. Mr. R. N. Fowler, M.P., said that he could see no possible practical result which would ensue from it; that England had emphatically shown her disposition for the peaceful settlement of international disputes; and it was in France, Germany, and Russia that the peace agitation needed to be carried on.

In the Education section, Mr. T. Chatfield Clarke, of London, read a paper, in which he strongly advocated the plan he has urged on the School Board of London—that of the establishment of a national training college, in which the students should board with their parents, or in lodgings, and in which the teaching and training should be common to persons of all denominations; the Government merely to provide the building, and a grant to Queen's scholars to be spent partly in education, partly in maintenance. Mr. G. W. Hastings delivered an address on Education, in the course of which he said he attached great importance to the teaching of science in all schools. By scientific teaching, he meant the development of the powers of observation and the training of the understanding, and not merely the accumulation of a number of scientific results. It produced habits of careful thought which were invaluable, and by cultivating a spirit of inquiry, they taught the child to examine for himself, and thus educate himself. They were incentives to adult education and prolonged activity.

Questions as to taxation, evidence, &c., were discussed in other sections; and in the evening a working men's meeting was held in the Albert Hall, Lord Napier and Ettrick in the chair. It was well attended, and addresses were delivered by Sir John D. Coleridge, Sir John Bowring, Dr. Acland, Mr. Morrison, M.P.; Mr. Hastings, and others.

The Mayor of Plymouth (Mr. I. Latimer), received the members of the Association in the evening, at the ball-room, Royal Hotel, which was decorated for the occasion. The company was very numerous, and the visitors were hospitably entertained by the mayor and mayoress.

Saturday was not quite an "off" day at the meetings, but it was a kind of half-day. The sections met in the morning, and in the afternoon the members generally made some pleasant excursion. There was rather more sight-seeing than business. Some of the sections were prematurely deserted; for there was a trip to Mount Edgumbe at two o'clock, and the Mayor of Plymouth had asked those who wished to see the Town-hall and Assize Courts to meet him and the architect there at half-past twelve. The visitors noted the grouping of the new municipal buildings, which are rising in the centre of the town. The new buildings have been arranged in two blocks, with a wide space between them, so that they form a kind of quadrangle, of which St. Andrew's Church and tower form one end. The new buildings form each a side, and the remaining side is an open street. The buildings are in the Early Pointed style, and are constructed of granite and Devonian limestone, with Portland stone facings. On one side are the municipal buildings, with council-chamber and municipal offices for town business; on the other side is the great hall, to seat 2,500 persons, and two smaller halls, for assize business, with all the usual appliances of police and assize courts. These buildings, it appears, will be paid for out of the profits of the water-supply, which is in the hands of the corporation, and from other sources of existing revenue, and will not add a farthing to the borough rates.

The visit to Mount Edgumbe, in the afternoon, wanted nothing but fine weather to make it one of the most delightful excursions the Association enjoyed.

A good deal of business, however, had been done in the morning, before the pleasure. In the Municipal Law Section, an important paper

"On the Transfer of Land," of which we give a separate abstract, was read by Sir R. Torrens, M.P. The address of the day, in the Representation of Crime Section, by the president of that section, Mr. Kennaway, M.P., was a careful review of the position of the criminal question as it was left by the Prison Congress which lately met in London. Mr. Kennaway anticipated nothing but good from a congress in which the representatives of some four-and-twenty nations or governments were assembled, and which enabled them to compare criminal systems through the agency of the very men who administer them; but he strongly dissented from some of its conclusions. It thought only of the criminal, and overlooked society. Mr. Kennaway maintained, amid the apparent sympathy of his audience, that we have not only to consider the reformatory effect of punishment on the 30 per cent. of the perpetrators of crime who are discovered and punished, but must also look to its deterrent effect on the 70 per cent. who are never found out at all. He also pleaded for the employment by Government of the convicts in such work as that carried on at the Pimlico factory, and feared that now Portland Break-water was finished, and the works at Cbatham were drawing towards completion, there would be difficulty in finding work to keep the convict establishments going.

Mr. George Smith, of Coalville, near Leicester, of whose efforts on behalf of children employed in brickfields we have before spoken, read a paper in one of the sub-sections on Economy and Trade, on the imperfect protection which is still given to such children. He declares that owing to insufficient provision for inspection the Act of 1871 is nearly a dead letter. Children at and under eight years of age are very extensively employed in the manufacture of tiles, which is actually worse in its laborious character and its unhealthy nature and its demoralising associations than brickmaking itself, and the evasion of the law is practically unpunished. The Act allows the Home Secretary to make exceptions, and Mr. Smith states that such exceptions are made without regard to the interests of the children and on the representations of manufacturers. One of his statements gives a curious example of evasion. Before 1871 the tile manufactories were regulated by the Act of 1861. That Act applied to "ornamental tiles," and the makers of such tiles escaped by calling them plain tiles. The Act of 1871 has put plain tile factories under more severe restrictions than the others, and they have, therefore, changed their definition, and obtained leave from the Home Office to be regarded as ornamental tile manufactories. It is, however, not the tiles that have changed—only the name.

Mr. Henry Dunant, of Switzerland, founder of the "Red Cross" and of the Convention of Geneva, read a paper in one of the sections in which he made a proposal for introducing among the civilised Powers a High Court of International Arbitration with a view to avoid war.

In the Health Department a paper was read by Mr. Christopher Bulteel, F.R.C.S., "On Some of the Provisions of the Public Health Act of 1872, with special reference to Plymouth, Stonehouse, and Devonport;" and Mr. Symington read one "On the Method of Dealing with Sewage proposed by Mr. Strong, of Glasgow." The principal feature of the system consisted in the interception of each kind of sewage in detail at its source, by means of an apparatus designed for the purpose, which retained for separate removal all the polluting matter, and allowed only the water in a harmless condition to pass into the sewers. The system had been practically tested, and had been found to work satisfactorily. It secured the entire exclusion of all noxious matters from house drains and sewers. One of the chief recommendations of the plan was its extreme simplicity, and the facility with which it could be applied to existing arrangements.

In the Economy and Trade section, Mr. Jeremiah Head read a paper on the subject of "Retail and Co-operative Supply Associations." He said he considered that the gentlemen who recently waited on the Chancellor of the Exchequer to complain of civil servants carrying on co-operative stores were protectionists. They afforded an example of the way in which men lost faith in a true principle if for a time it seemed to operate to their disadvantage. Consumers encouraged the multiplication of shops, from a mistaken notion that competition would reduce prices. Notwithstanding the multitude of retailers, the cost of distribution was seldom less than 20 per cent. on the wholesale prices,

whilst the co-operative associations were able to distribute for less than 5 per cent. He believed that if three-fourths of the existing shops were abolished, the remainder could do the whole retail trade of the country at a proportionately cheaper rate. The remedy for the existing waste of capital and energy was the extension of the co-operative system. The importation of sentimentality into any economic question was as mischievous as indiscriminate charity had been found to be. There was no public obligation to support more distributors than were necessary, especially when there was an outcry for more producers.

Dr. Littleton, late assistant-surgeon R.N., read a paper on "A New Method of Constructing Ships, with a self-regulating power as to their specific gravity, so as to enable them to secure the advantages enjoyed by fish." The numerous and disastrous accidents, he said, which had recently happened to several of our iron-clad fleet must have occasioned great anxiety to every patriotic Englishman, and it became a question of the deepest interest to discover whether means could not be devised to avert such calamities. Dr. Littleton then spoke of the difficulties to be overcome, and explained the manner in which he hoped he had met most of those difficulties, referring to a model of his new ship, which was placed on the table. The specific gravity of the whole hull of a ship and her cargo was diminished by the temporary inflation of collapsible air-cylinders fitted on the outside, so as to enable the ship to float in a less draught of water, and thus enter a harbor or disengage herself when aground, or prevent her sinking after springing a leak. There might also be air-cylinders within,—incompressible air-tubes,—and compressible tubes.

On Monday the Congress adjourned to Devonport, and there seems to have been no falling off in the number of persons attending it. The arrangements at Devonport were, in most respects, as convenient as those at Plymouth.

The event of the day was the address of Dr. Acland as president of the Health Department. A crowded audience assembled to hear it, and Dr. Acland held their attention for more than an hour and a half. The address was extempore, and perhaps the most important part of it was the eloquent vindication of the sanitary legislation of last session. Dr. Acland began by illustrating the nature of international sanitary inquiries, and showed how elaborate investigation in diseases in one part of the world benefited the whole human race. After showing how intimately the physical health of a nation affected its mental wholeness and vigor, Dr. Acland came to the question of sanitary administration. He had made a list of twenty-nine departments of such an administration, and in answer to Mr. Vernon Harcourt's joke that if experts had their way they would regulate the cut of an old woman's flannel nightcap, said that the duty of Government was to do whatever was needful to health which a poor man could not do himself, and to leave to the people's own care whatever was within their own power. Pure air, pure water, pure food, means of recreation and rest, hospitals, and, more than all, education, were to be looked after by Government. Dr. Acland would not have these things centralised. Looking at the inevitable course of affairs in this country, health administration ought to be conducted by the people themselves. Local government had made England what it is, and Mr. Gladstone had done right in committing the England of the future to the same bodies and the same organization which had in the past made it what it now is. He rejoiced that Mr. Stansfeld had, with rare modesty and sagacity, created a real administration of the public health, and he believed that, in spite of all that had been said, there was under the Bill of last session ample power to appoint experts as referees in all needful cases. These experts should not be men who had failed in their professions, and who wished to have the care of a Government salary; but the highest men in each branch, paid, not by salaries, but by the piece, by fees for each particular reference. So far from the Health Bill being a mutilated Bill, Dr. Acland thought it was sufficient for present needs. "I earnestly desire," he said, "that there should be no Public Health Bill next session. Sanitary machinery we have, but sanitary law we shall only get as the working of that machinery all over the country shows us what provisions are needful, and what are incapable of enforcement."

The Health Department was otherwise occupied with sewage. Mr. Hope read a long paper

on sewage irrigation, in which he insisted that engineers huddled in laying out sewage-farms like water-meadows, and insisted that not a drop of sewage should run off the ground, but all be made to percolate through it. Mr. Siller described the successful operation of what is called the A B C process, as carried on by the "Native Guano Company."

A large meeting of the National Association for Promoting Social Progress in India was held after the business of the day, and the Mayor of Devonport, in the evening, gave a splendid reception to a large number of members of the Congress.

At the meeting in the Devonport Mechanics' Institute, on Tuesday, the address of Sir John Bowring, the President of the Economy and Trade Department, opened the proceedings. In it the present position of the agricultural labourer formed one of the principal topics of observation.

The Health Section had an interesting discussion on the present position of the town of Birmingham. Mr. Hope read a paper on the rejection by the House of Commons of the Birmingham Sewage Bill on the third reading. Birmingham has hitherto thrown part of its sewage into its river, but received some time ago notice that it must cease to do so. Thereupon the corporation undertook a long and expensive inquiry into the best mode of dealing with it, and adopted a double system, by which a great part of the sewage is kept out of the sewers, and taken away in carts. The part which could not be thus dealt with, was by the Bill to be made use of on a large sewage farm in the neighbourhood. The Bill empowered the purchase of this farm, and it was opposed by Sir R. Peel and Sir C. Adley, on the ground that it would be a nuisance to them. Their opposition failed before the Select Committee; but the House itself yielded to them, and threw out the Bill. The corporation are under a Chancery injunction not to put their sewage in the river, and Parliament forbids them to put it on the land. They cannot obey the injunction, and Mr. Hope says that the Court has issued a sequestration of the corporation revenues; that in November next a receiver will be appointed; and that local self-government in Birmingham will cease. It is a dead-lock, and all that the section could do was to suggest to the council that a copy of Mr. Hope's paper should be sent to the proper department of the Government.

To the Tuesday's proceedings in the other sections we have no space to refer.

In the Economy and Trade Section, Mr. G. J. Holyoake read a paper "On the Abuse of Industrial Partnerships."

On Wednesday, the concluding general meeting of members and associates was held at the Mechanics' Institute, Devonport. The chair was occupied by Lord Napier and Ettrick.

Several excursions took place in the afternoon. The Gun-wharf, Keyham Steamyard, and the Devonport Dockyard, were open, by permission of Admiral Hall, to members and associates, and at the latter hour steamers conveyed the excursionists to the Breakwater, the River Yealm, and Port Eliot.

On Thursday a party, limited to fifty, by invitation of the Duke of Bedford, were to visit Endsleigh, his grace's seat. There was also to be an excursion to the Eddystone Lighthouse.

The Council have accepted an invitation to meet next year at Norwich, and recommend Glasgow as the place of assembly in 1874.

THE IMPROVEMENTS AT LINCOLN'S INN.

EXTENSION OF THE LIBRARY.

THE enlargement of the Library at Lincoln's Inn, which has for some time been in progress, under the superintendence of Sir Gilbert Scott, the architect, is now nearly completed. The building has been extended a considerable distance eastward, which admits of a largely-increased space in the Library as well as the dining-room of the Hall. In carrying out the extension, the architectural features of the original building have been adhered to, the added portion not only resembling the old in every main feature, but, so far as was possible, the materials, including the brick and stone work of the east end of the building, were carefully preserved, and have again been used in the enlarged structure. This particularly applies to the stonework of the large eastern window, the whole of which, after being removed, has been replaced in the extended building, and now pre-

ments precisely the same appearance as it did before its removal. Carved arms, escutcheons, and armorial bearings, in stone, uniform with those in the original building, are displayed outside the structure in the spaces between the lower and upper windows of the added portion. A distinct and additional architectural feature has been imparted to the building by the erection of an octagonal tower at the south-east angle. The materials used in the construction of this tower, up to the eaves and parapet wall of the main building, are uniform with the main building itself, being of red brick, with stone facings. From this point the tower is carried up, entirely in stone, to an additional height of about 15 ft., the stonework being carved. The extreme height of the tower is surmounted by a spire, from 12 ft. to 15 ft. high, terminating in a vane. The spire, which has been finished during the present week, completes the external features of the enlarged building.

In connexion with the enlargement of the library, it may not be out of place to notice the memorial gates which have recently been erected at the south end of the gardens of the hall in memory of the late Colonel Brewster, formerly Colonel of the Inns of Court Rifle Volunteers. The fabric of these gates, which was designed in Belgium, is exceedingly light and ornamental. They consist of a large central gate, and two smaller side gates, and are formed mainly of screen work representing memorial flowers. On the top of the central gate are the deceased Colonel's arms, together with his name and date of his death, whilst on each of the other gates is the monogram of the Inns of Court Volunteers.

Considerable alterations and building improvements are about to take place in Lincoln's Inn immediately opposite to the east end of the library of the Hall. It is intended to take down the whole of the buildings on each side of the square, known as the Old Buildings-square, and erect upon their site new chambers of an architectural character. New chambers of a similar character are also about to be erected on the western portion of the square itself, having its frontage to Lincoln's Inn Hall, and within the last fortnight these have been commenced. When the new chambers now in course of erection in the square are completed, the old buildings adjoining will be taken down, and new chambers erected on their site.

THE GAS QUESTION IN LONDON AND THE PATENT GAS COMPANY.

UNDER the auspices of the London Gas Consumers' Association, a series of public meetings is being held in various parts of the metropolis, the objects of the meetings being, *inter alia*, to secure gas of improved quality at a reduction in price of from 3s. 9d. to 2s. 9d. per 1,000 cubic feet; and to take steps to place the gas-lighting of London in the hands of the parochial authorities, so that the profits may be applied to the reduction of taxation upon the plan adopted in Manchester, Glasgow, Leeds, Dundee, Rochdale, Bury, Aberdeen, and numerous other cities and towns. In connexion with this series of meetings a second lecture was delivered by Mr. G. Pittell, C.E., in Exeter Hall, on Tuesday evening last. The lecturer stated that the annual cost of gas in the metropolis last year exceeded 2,200,000*l.*, being 165,000*l.* more than in the previous year, showing that the consumption was increasing at the rate of doubling itself in about ten years. In Manchester the corporation applied canal gas at 3*s.*, and on a rental of 212,615*l.* applied 65,343*l.* to public improvements and the reduction of local taxation. If the lighting of London could be vested in the local authorities they would have a profit of at least 750,000*l.* per annum to dispose of for the advantage of the public. The London consumers had a right to demand gas of a much more pure and of higher illuminating power than that supplied to them, and at a price not exceeding 2s. 9d. per 1,000 ft. Eighteen-candle gas could be sold in London at a profit at 2s. 6d. per 1,000. The London gas was not only very bad in quality, but it was 40 per cent. dearer than in most of the other large cities and towns in the United Kingdom. That better gas could be supplied at a profit at a much lower price, was easily demonstrable. At Walsall, eighteen-candle gas was supplied at from 2s. 2d. to 2s. 6d. per 1,000, and this left a profit sufficient to light the street-lamps without charge to the public. The South Metropolitan Gas Company sold gas of excellent quality at 3*s.* per

1,000, in a thinly-populated district; but the Ratcliffe Gas Company, that lighted a densely-crowded part of London, charged 4*s.* 3d. per 1,000. The consumers had no redress, as the "distrieting" system had destroyed competition. They must take such gas as the company that had the supply of the district provided, and must pay for it what the company demanded, or go without. It was vain to seek legal redress as the companies could apply, without stint, the ample funds they had from violation of the Acts of Parliament that should bind them but did not. It was the interest of the local authorities acting on behalf of the ratepayers to apply to Parliament at once for an Act to enable them to buy up the existing companies at their fair market value. The directors would oppose this, as, in addition to their dividends, they paid themselves from 4*d.* to 8*d.* for every 1,000 ft. supplied to consumers. The directors of the 8*s.* gas company had 5*d.* on each 1,000 ft. supplied, and divided 10 per cent., which showed that gas could be sent out in London at 2*s.* 6*d.* per 1,000 ft. Important improvements had been effected in gas-making, and the public had a right to demand that the gas companies should adopt them, and give their customers the benefit. It was grossly unjust that the public should have to pay for inefficiency in their business, and profligate extravagance, that did not belong to and would not be suffered to exist in connexion with any other kind of business or manufacture. He thought the directors of the London gas companies should be sent to East Barnet to learn their business. He had been himself asked to go there, which he did with a mind prejudiced against the process of the Patent Gas Company. He found, however, that it was a great success, and that the invention of the company was one of immense value. He felt certain, that whether adopted or not by the London companies, the system would speedily find its way into the provinces and abroad. With the same quantity of the ordinary gas coal from which the companies made, by the common process, ten and twelve candle gas, the Patent Company made the same quantity of gas of eighteen-candle illuminating power. The adoption of the process would be an immense boon to consumers. The South Metropolitan Company, it appeared, from the *Journal of Gaslighting*, was about to give the Barnet system a trial on a working scale, having first made experiments, with which they were satisfied. The value of the process was readily apparent by a simple proportion calculation. If 9,000 ft. of twelve-candle gas, made from a ton of common gas-coal, is worth, say 3*s.* 9d., or 3*d.* per 1,000 ft. per candle, what is 9,000 ft. of eighteen-candle gas worth? The answer is, 5*s.* 7*d.* The extra cost of manufacture by the patent process was 3*d.* per 1,000 ft., and supposing the company were to charge, say 1*d.* per 1,000 ft. for the right to work the patent, this would make the net increased value per 1,000 ft. by the patent process 1*s.* 9d., or an increased value upon the production of gas from a ton of coal of 15*s.* 9d. But this was not all,—the gas companies making by the ordinary process are obliged to use from 10 to 12½ per cent. of canal gas, at 30*s.* per ton, to bring their gas up to even the low standard of twelve candles. This is equal to an addition of 3*s.* per ton on their coals all round, or a difference in favour of the Patent Company's process of 18*s.* 9d. in the value of the gas made from a ton of coal. This saving upon the consumption in the metropolis would amount, according to the lecturer, to no less than 735,000*l.* per annum.

BUILDING ON THE MILKWOOD ESTATE.

THE activity in building which has been going forward within the last few months on the estate which is known by the above name, and which is situated between Denmark-hill and Herne-hill, and bounded on the south-east by the Chatham and Dover Railway, is a striking instance of the new suburban neighbourhoods rising up in succession in different places around the metropolis. About the present time last year the greatest portion of the land forming the estate was occupied as market gardens, but the entire area has now been laid out in wide and spacious streets, all drained and paved, and provided with ample footpaths, and upwards of two hundred private houses and shops have already been erected and occupied, whilst a large number of new dwellings are at present in course of erection. The principal street on the estate, which has been named Milkwood-street, is a spacious thorough-

fare of about one mile in length, running parallel with the railway direct to Herne-hill, and having an outlet close to the railway station there. This street is intended to be the main business thoroughfare of the locality, and a large number of houses and shops have been built and occupied by tradesmen in different branches of business, whilst several other blocks are in course of erection.

When entirely built upon, it is estimated that the number of houses and shops on the estate will be about 800, with a population of not less than 4,000. The streets have been laid out by Messrs. Habershon & Pite, architects, of Bloomsbury, and the premises erected on the estate are subject to their approval.

THE LATE MR. THOMAS RIDER.

MANY of our readers will learn with regret of the decease of Mr. Thomas Rider, of the firm of Messrs. Rider & Son, builders, Union-street, Southwark, which occurred on Saturday last, the 14th instant, after a brief illness, we believe in his seventy-first year. Mr. Rider was the son of a builder of the same name, who by his industry and integrity raised himself from a humble position to one of credit and independence. His son was, as was usual in those days, apprenticed to his father, and served his time at the bench: he thus acquired a knowledge of the details of his business which was of the greatest importance to him in after-life. He had an extensive business, chiefly in the City of London, and was employed by many leading architects, by whom he was deservedly respected, from his scrupulous integrity, and the attention and practical knowledge he brought to bear upon business intrusted to him. Among the more recent buildings erected by Mr. Rider are the Freemasons' Hall and Tavern, Great Queen-street, under Mr. F. P. Cockrell's superintendence; and the premises of the British and Foreign Bible Society, from the designs of Mr. P. Anson.

REPORTED NEW COAL-FIELDS IN WEST LANCASHIRE.

IN the present dearth of the coal-supply, and the almost unprecedented high price of that commodity, any facts leading to a belief in the prospect of new sources of supply must be received with unmixt satisfaction. It is now stated that Mr. Edward Young, a mining engineer and geologist of Oughtifield, near Sheffield, says he has convinced himself of the existence of coal-fields in West Lancashire to the extent of from 400 to 500 square miles. Mr. Young's conviction is that the coal measures commence in the neighbourhood of Southport, and extend to Liverpool on the one side, and from Southport to Preston and Lancaster on the other. These districts, it must be borne in mind, embrace nearly the whole of south-west and north-west Lancashire, where coal has never hitherto been found, the existing Lancashire coal-fields having been mainly confined to the eastern portions of the county. It is also to be noted that the distance between the respective points in which it is now alleged coal is to be found is very considerable, the distance between Southport and Liverpool being upwards of 20 miles on the one hand, whilst between Southport and Preston and Lancaster, on the other hand, it is no less than 40 miles, thus giving some idea of the large area in which it is now asserted that coal is to be found. We learn that a number of persons interested in coal discoveries share Mr. Young's opinion that there is coal in abundance in the districts named; and it is stated that a meeting of landowners in West Lancashire is shortly to be held in Preston, at which Mr. Young will attend, and explain the reasons which have led him to the opinions he has formed. It is further said that several landowners have already announced their intention of contributing towards the large expense which boring operations will involve. A new railway, called the West Lancashire Railway, is about to be constructed from Southport to Preston; and in the event of coal being discovered in the locality, it must materially add to the prospects of the undertaking.

Mr. T. Mellard Read, of Liverpool, writes to the same effect, suggesting that it is worth consideration whether or not Liverpool people should try the experiment of sinking for coal under their feet. His letter goes into many particulars, which are interesting

to geologists, and essential for the substantiation of his argument. If coal is to be bored for by the Liverpool people in the neighbourhood, it should be on a spot where the lower red sandstone is thrown up to the surface. This being done, the depth to which they would probably have to bore before reaching coal would be 400 ft. or 500 ft. This would be in the upper members of the coal measures. Twelve hundred feet lower would bring them to workable coal, in the beginning of the middle measures; and such a depth as this is very slight compared with those which have been canvassed in estimates of the increased difficulty and costliness of meeting the industrial demand for fuel. The trial would not be a very perilous or extravagantly costly one. There have been previous attempts made, but they were on wrong spots, and bored wrong *strata*. Mr. Reade is for making the trial through the soft red sandstone by sinking a shaft near a fault.

THE VIENNA UNIVERSAL EXHIBITION, IN 1873.

THERE are many reasons why the United Kingdom should make an effort to be well represented in this approaching Exhibition, and we shall willingly do what we can to assist in bringing about such a state of public opinion as may lead to this. Other nations co-operated cordially with us in our Exhibitions of 1851 and 1862, to which we owe much; and it is but right that we in our turn should respond to their calls. Apart, however, from this, selfish motives point the same way. Foreign countries, we may even say all industrial states of the world, evince the greatest interest in this forthcoming Exhibition. In the East, as well as in the West, extraordinary preparations are being made to be well represented there. The East, more particularly, is desirous of sending its productions lavishly, and will make every exertion to compete successfully with the West. It is, therefore, highly desirable, and the wish of her Majesty as expressed in the Royal Commission, that England and her colonies should be well represented in art, science, and manufactures. The importance of the approaching Exhibition at Vienna can scarcely be over-rated, considering the essentially civilising influence of these gatherings. Hitherto these exhibitions have occurred only in the great centres of civilisation in the west of Europe, whereas the present Exhibition will take place on its extreme eastern borders. To the east of Austria there is a population of some twenty-four millions of semi-civilised peoples of European Turkey, including the Danubian Principalities, who in view of the considerable extension of railways in progress into those distant parts through Hungary and Transylvania, will have an opportunity not before known of largely benefiting by a more immediate contact with the Western civilisation in arts and sciences, in commerce, social habits, and customs. Besides that the great ends of national economy, of industrial and commercial speculation, will be greatly furthered by this enterprise, there is also a political importance attached to this Exhibition.

Looking back upon the results that have accrued to Great Britain and France from the Exhibitions of 1851, 1855, 1862, and 1867; the immense influx of strangers from far and near, the widened sympathies, the assimilation of new ideas and of foreign languages which resulted, it will be easy to conceive that the effects on the East of an Industrial Exhibition in the Austrian capital can hardly fail to be much greater even than those realised in England and France. Hitherto the sympathies with this Exhibition have been rather lacking, it would seem, in England, and yet British interests are deeply involved. There is a vast market to be opened in European Turkey for agricultural implements, machinery of all kinds, cheap cloths, hardware, and many other British manufactures, and enterprising capitalists would do well to direct their attention to the almost countless mineral treasures yet unexplored in Transylvania.

The situation of the Exhibition Palace is admirable lying in the heart of a park unpassed for beauty by any in Europe,—the Prater. The area apportioned to the Exhibition will embrace from four to five English square miles. The covered space available for the Exhibition will be about 1,150,000 square feet, being considerably more than that occupied by the Paris Exhibition of 1867. The Exhibition building will be 905 metres long by 205 metres

wide. We give a plan of the site and a view of the central building. There will be a main gallery or nave intersecting the whole edifice. This gallery has cross galleries or transepts on each side, which are so placed as not to obstruct the view from either end. Between the transepts and the nave lie the garden-courts, which will also be available for exhibition purposes, and each country will have one or more of these transepts allotted to it, together with the portion of the nave and the garden-court adjoining. A rotunda, shown in our view, will rise from the centre of the building, and divide the main gallery in the middle. This rotunda, when finished, will be the largest canopy-shaped edifice without supports which has ever been erected. It has a diameter of 102 metres, and its height is 79 metres. The whole is being constructed of iron, after a design by Mr. Scott Russell.

The main gallery will be 25 metres wide, and each of the transepts 15 metres wide and 75 metres long. The latter are separated by courts, which are designed for such objects as can be exposed in uncovered places. The number of square metres within the Exhibition building will amount to 103,000. East of the Prater Rondo, facing the main gallery, the Art Exhibition building will be erected, covering an area of 6,995 metres. Buildings of a permanent character, sufficiently protected, will be provided for the exhibition of works of fine art.

From the chief building covered galleries lead to a large conservatory, and to smaller pavilions which are intended for the exhibition of horticultural productions, aquariums, &c. A separate hall will be erected for machinery in motion, 800 metres in length, and 28 metres in width. In this hall will also be found hydraulic machines, diving apparatus, &c.

The Imperial Villa and the ball in which the jury will deliberate and make their awards will also be erected in the grounds, which will be laid out under the direction of a landscape gardener of great reputation.

Amongst other attractions, the council of the Exhibition have decided on having a permanent aquarium of considerable magnitude erected in their city, and plans have been submitted to them for their approval. Their choice of an architect has fallen upon Mr. Charles H. Driver, who planned and erected the aquarium at the Crystal Palace last year, and the works will be forthwith commenced.

Machinery, we need scarcely say, will form an important feature of the Exhibition, and we would call the attention of English manufacturers to the opportunity afforded to exhibit either fixed steam-boilers, fixed steam-engines, or portable engines, and also steam-engines and steam generators for service in the machinery hall. Machinery and apparatus specially adapted to the requirements of the Exhibition may also be supplied by exhibitors; and exhibitors supplying such machines and apparatus intended for special service during the Exhibition will enjoy special privileges, to be arranged between them and the director-general. If British makers lend cranes, hoists, boilers, and engines for use of British exhibitors, no fees will be levied by the Imperial Austrian Commission for the use of the same by British exhibitors; but if British exhibitors lend such machinery for the use of foreign exhibitors, arrangements will be made by the Austrian director-general to indemnify British exhibitors for the use of their machinery. The power required to set machinery and main shafting for driving machinery in motion will be supplied by the Austrian Commission, and exhibitors will in no case be charged for motive power supplied by the main driving-shafts in the machinery-hall.

Coals from the best Austrian and Prussian coal-mines, and feeding-water for boilers, &c., supplying steam-engines driving machinery in the machinery-hall, will be supplied by the Austrian Commission free of expense. Stockers will also be provided for the steam-boilers lent for service in the Exhibition; or, if the exhibitor should prefer to employ his own people, the wages of the latter will be paid by the Austrian Commission according to a fixed tariff.

The whole Exhibition-ground will be drained by a system of drainage-pipes, carrying water and liquids to the Danube, and every measure has been taken to have a sufficient supply of water in all parts of the Exhibition. Gas will be furnished by the Imperial Continental Gas Company, at the usual pressure.

There will be some work of importance to be done by steam road-rollers, and, in case of any

work performed for the installation by traction-engines or road-rollers, all expenses will be paid by the Austrian Commission. There will be competitive trials with steam fire-engines, and the jury and exhibitors are invited to send special engines for this purpose; such engines will be considered as objects of exhibition, and, if lent for use, fuel and care will be at the charge of the Imperial Austrian Commission. There will likewise be special trials held with agricultural machinery and implements, in fields in the neighbourhood of Vienna, or in such places as can be easily reached by the Exhibition railway. Agricultural machines will not be exhibited in the machinery-hall, but in a pavilion specially built for that purpose.

All machines intended for the Exhibition, will be admitted to the machinery-hall, from the 1st of February till the 15th of April, 1873, inclusive, and must be set up by the 25th of April. Machines and apparatus arriving in pieces, and consisting of heavy and bulky parts, must be set up by the 15th of April.

Slates is particularly desired to be sent to the Exhibition: the slate will stand a chance of being sold with advantage at the close of the Exhibition, the Austrian slate being only fit for roofing.

It is also desired by the Director-General that fittings, show-cases, cloth for the covering of walls, window-glass, &c., should be sent from England to Vienna: these would be considered as Exhibition objects, and sold at the close of the Exhibition.

Some time ago her Majesty, in pursuance of an invitation received from the Austrian Government, appointed a Royal Commission for the purpose of representing the British and Colonial exhibitors; and these commissioners have already held several meetings, and established their offices at 41, Parliament-street, where Mr. Philip Cunliffe Owen, the secretary, will receive applications for space, and give every information as to the forwarding, exhibiting, and returning of the objects of the Exhibition, in accordance with the regulations laid down. The Exhibition will be opened on the 1st of May, 1873, and closed on the 31st of October of the same year.

British exhibitors can communicate with the Austrian Commission solely through the Commission appointed for Great Britain and the Colonies.

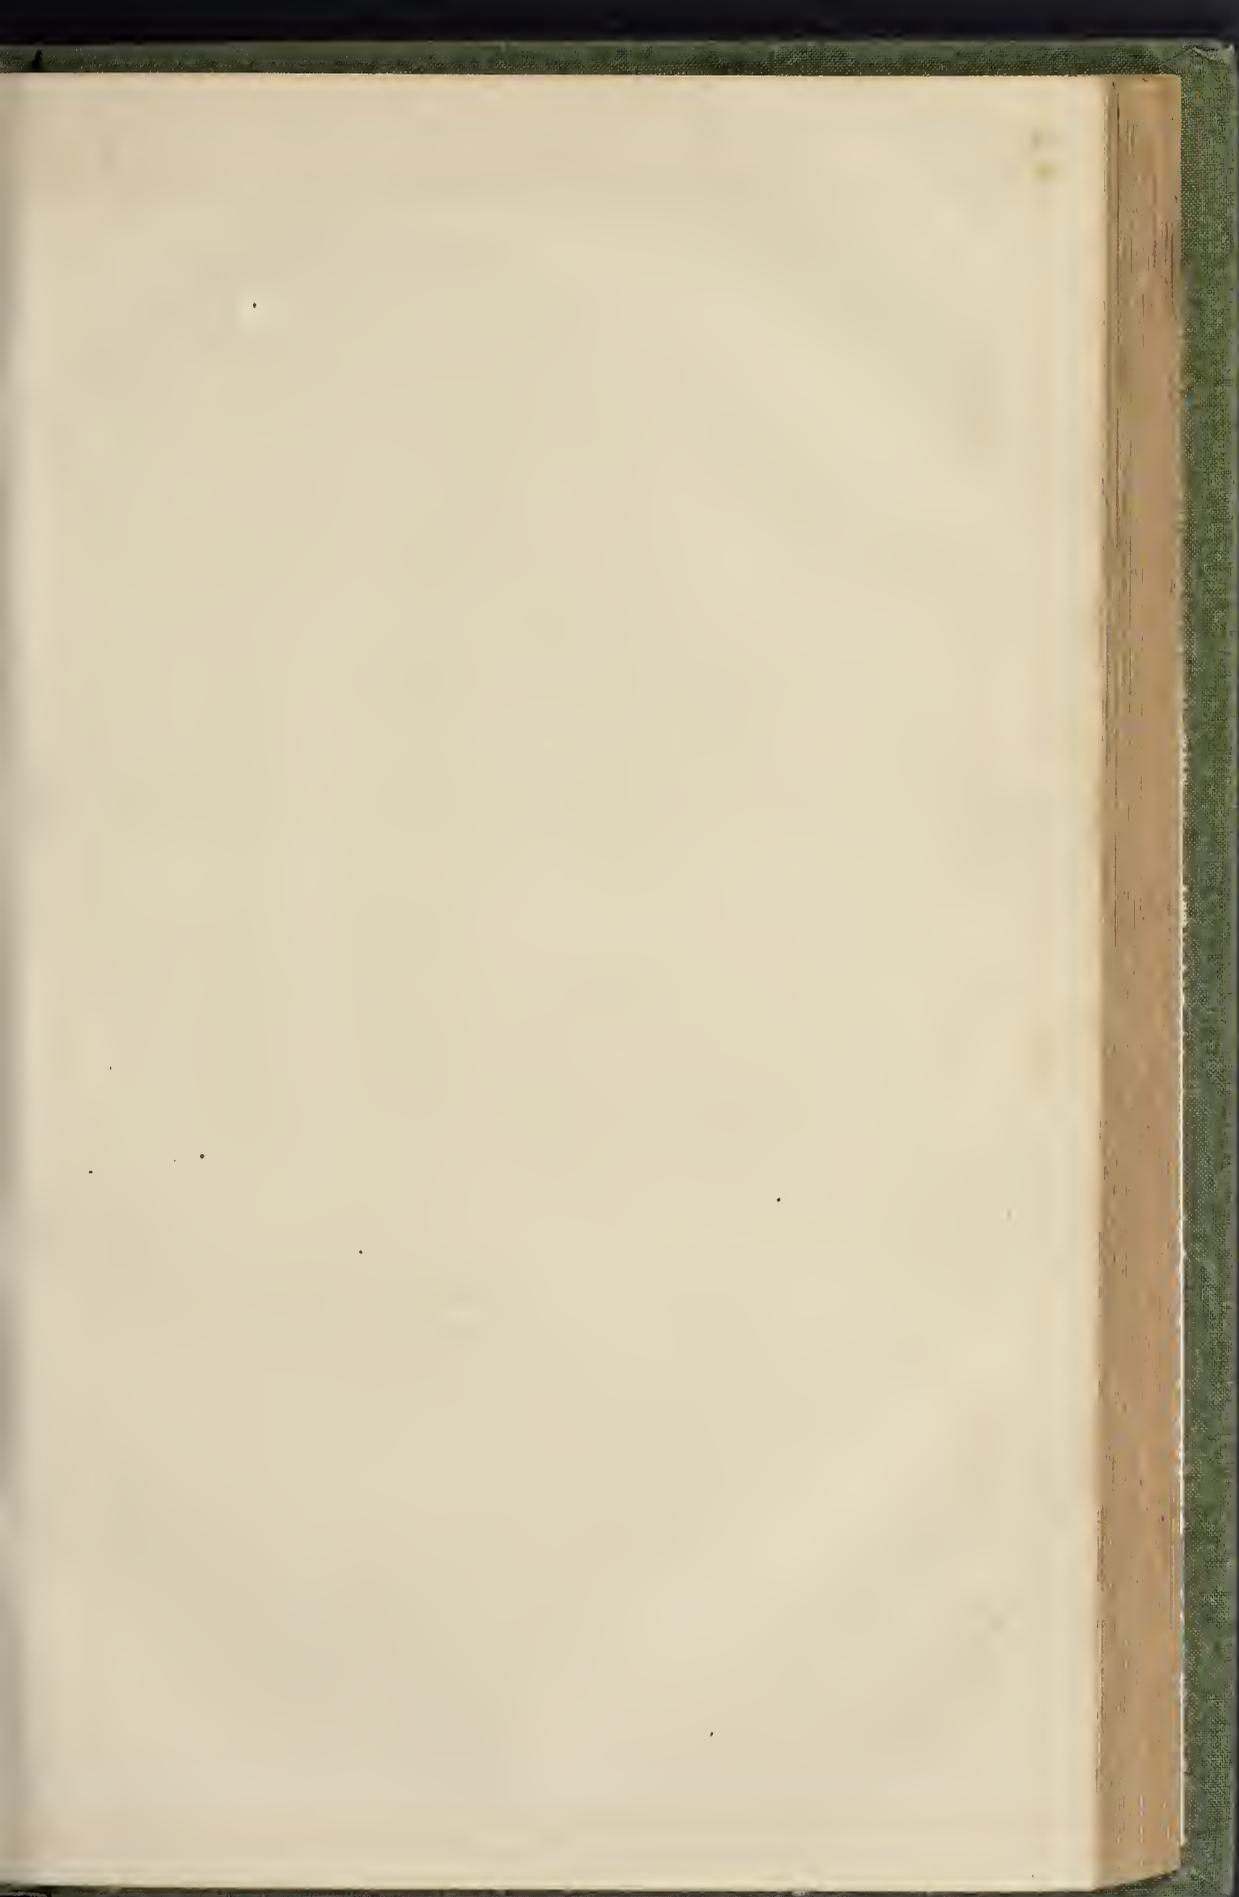

Lists of the intended exhibitors of the United Kingdom and the Colonies, as well as detailed plans, showing the space allotted, and of each single object to be exhibited, must be sent by the Royal Commission to the Director-General, Baron Schwarz, before the 1st of January, 1873, at the latest, so that the exigencies of the respective countries may be taken into account in organising the interior arrangements of the Exhibition buildings. As the total demand for space must depend upon the number of individual applications received, it is desirable that applications should be forwarded without delay to 41, Parliament-street.

The Director-General has entered into negotiations with the different railway and steam navigation companies of Austria and Hungary, and procured a considerable reduction of rates for the conveyance of objects for the Exhibition, and several of the English railway companies have already agreed with a praiseworthy spirit to offer the exhibitors from the United Kingdom similar facilities: other companies have the matter under consideration.

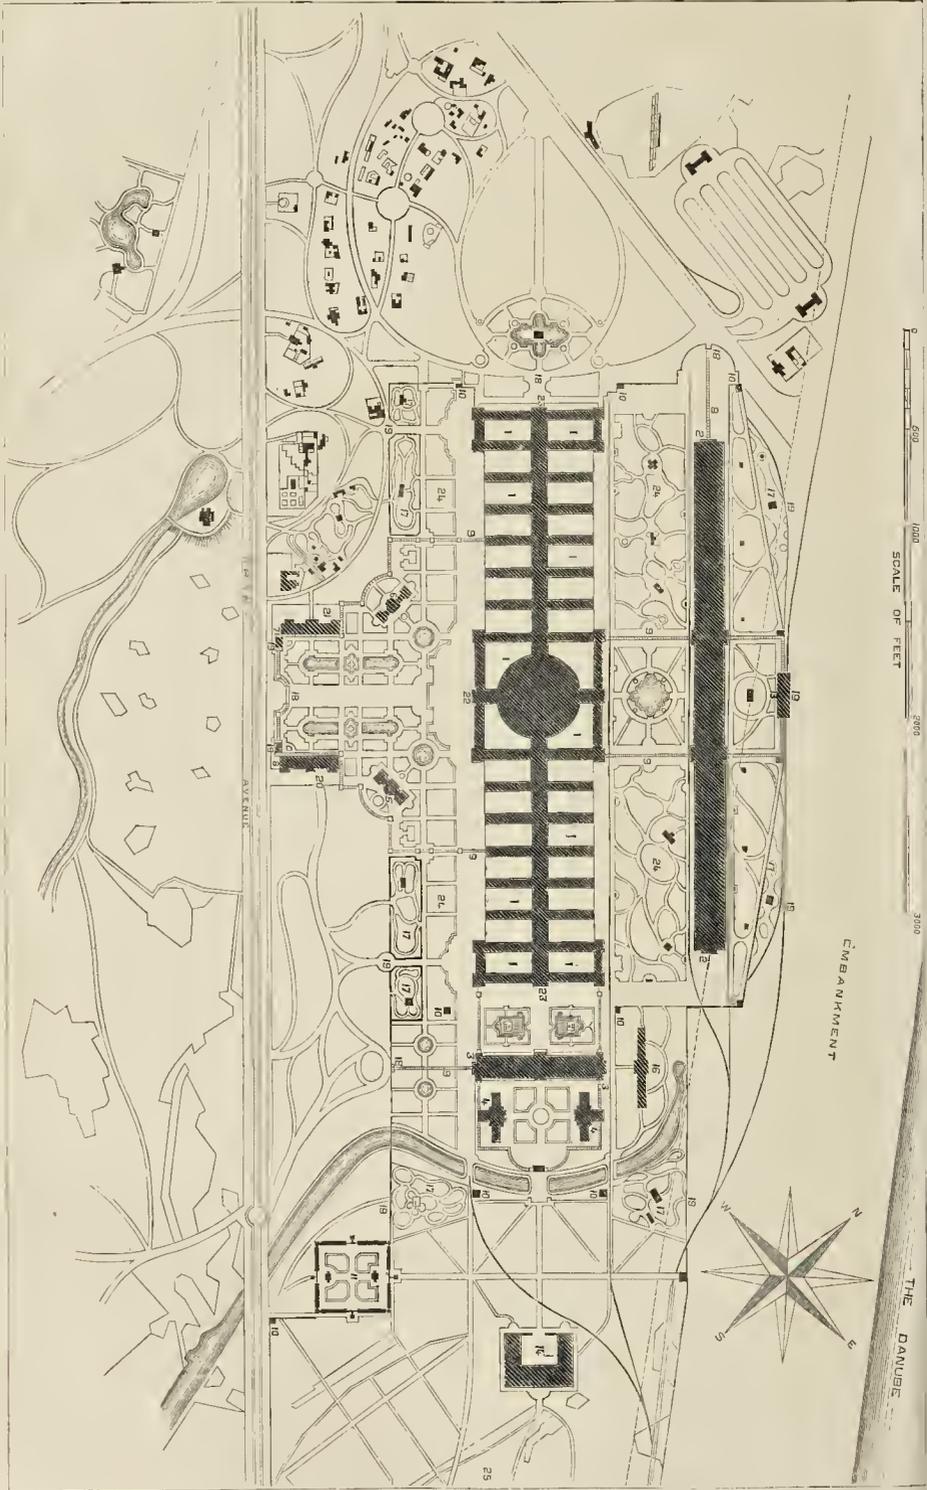

We will simply add, that the exhibitors of works of fine art are exempted from any charge for space.

VIENNA UNIVERSAL EXHIBITION: VIEW OF THE CENTRAL ROTUNDA.

THE TRANSFER OF LAND.

SIR R. TORRENS, M.P., read a paper on the "Transfer of Land," in the Municipal Land Section of the Social Science Congress, at Plymouth, from which the following is abstracted:—

"The question of applying to estates and interests in land the principle of conveyancing by registration of title has frequently been discussed. I have undertaken to bring it again under review, with the additional light thrown upon the subject through the labours of the Royal Commission on the Land Transfer Act of 1862 (Lord Westbury's), and more recently by the Parliamentary returns, exhibiting the working of the corresponding Act in Ireland (Record of Titles Act, Ireland, 28 and 29 Vict.), and by the Blue Book, containing the reports of the governors of the Australian colonies, testifying the complete success of the same principle there, applied under a different method. I will commence by endeavouring to explain the radical distinction between 'conveyancing by deed,' and 'conveyancing by registration of title.' Title by deed can never be demonstrated as an ascertained fact; it can only be presented as an inference more or less probable, deducible from the documentary and other evidence accessible at the time being. This condition involves the employment of highly skilled, and therefore costly professional assistance. Secondly, an element of uncertainty through the admitted possibility of a wrong inference being drawn from the evidence given by the most skillful conveyancer (2), and from the difficulty of ascertaining beyond doubt that all the evidence is fully and clearly before him. Thirdly, this examination involves delay, sometimes such delay as entirely to frustrate the object of the party dealing; and, lastly it has the disadvantage of being cumbersome from the mass of documents that have to be preserved. In contrast to this, 'title by registration,' is a tangible ascertained fact. The entry in the record is conclusive. There is nothing to deduce or infer, or, in the conduct of ordinary dealings, to necessitate professional assistance. The time occupied in such dealings need not exceed that required for transacting the like dealings with railway scrip, or with property in shipping, and the instrument evidencing title would rarely exceed the size of a sheet of letter-paper. In contrast to this I would refer to the results of 'conveyancing by registration of titles' of which we have a perfect example in this country, and in this great commercial port. You need not, but walk down to the Custom-house, and there you may see an ordinary mercantile clerk, without any difficulty, and with perfect security, conducting transfers and mortgages of property in shipping, and the time occupied in this dealing with a vast property, such as that of the Great Eastern, would not exceed half an hour. A few weeks back a friend of mine expressed surprise at meeting a gentleman, whose arrival from Australia was not expected for some months. 'Yes,' said this gentleman, 'it is all owing to that admirable act of your friend Torrens that I am here so soon. Only two days before the packet sailed, I had an offer for my estate. The intending purchaser went with me to the Lands Title-office, and in less than an hour the business was transacted. I got a cheque for the purchase money, and he got an indefeasible title to the land, and so we did the business ourselves, the cost was only 3l. or 4l.' Again, a gentleman residing at Launceston, Tasmania, writes to me as follows:—'Your Act has proved a great blessing to us here. Recently I purchased a sheep station for my son, and being 5,000l. short of the purchase-money, I mortgaged some land for the amount. The transaction was completed in less than half an hour, and as I did the business myself, the whole expense was only 15s., which, under the old law, would have been 20l. or 30l., and I should have considered myself lucky if I got it done under a month or two.' Official duties connected with the transfer of property in shipping suggested to me, in 1850, the feasibility of applying the same method to dealings with land, though it was not until 1856 that, falling in my endeavours to induce any of my professional friends to take the matter in hand, I essayed what, to a mere layman, was a very formidable task, and brought out my scheme in the form of a bill—I confess a very defective one, as I too timidly followed the language as well as the forms of my model, the Shipping Act. This Bill, in an amended shape, was introduced into the Legislature of South

Australia in 1857, and became law. In May, 1857, the Royal Commission on Registration of Title made their report, and two years later Lord Cairns, being then Solicitor-General, introduced into the House of Commons Bills to give effect to the recommendations of that report, which Bills, unfortunately interrupted in their course by a dissolution, never passed into law. As no portion of the method which I have herein instrumental in establishing in the Australian colonies has worked with greater facility, or been productive of so great advantage to the community as that which relates to charges on land, I will here, as briefly as possible, describe that method. The old fiction of transferring the legal estate is abolished, and the object is accomplished by a direct instead of by a circuitous course. In the language of the Act, 'mortgage and encumbrance shall have effect as security, but shall not operate as a transfer of the land thereby charged, and in case default be made in the payment of the principal sum, interest, annuity, or rent charge thereby secured, or in the observance of any covenant, and such default be continued for the space of one calendar month, or for such other period of time as may therein for that purpose be expressly limited, the mortgagee or encumbrancer may give to the mortgagor or encumbrancer notice in writing to pay the money then due or owing on such memorandum of mortgage or of encumbrance, or to observe the covenants therein expressed, and that sale will be effected unless such default be remedied.' In such case the registered proprietor of the charge may proceed to sale, and should the sum bid be inadequate to cover the amount secured, he may foreclose without further expense or delay, by producing to the registrar evidence that the requirements of the law have been complied with. In either event, the registrar is required to register the proprietor of the charge, or his purchaser, as owner of the land. The Act further enables the proprietor of the charge, in such case, to distrain or enter into receipt of rents and profits. Charges are released by memorial entered on the appropriate folium of the register, and upon the certificate or other instrument evidencing title, which memorial the registrar is required to make upon production of receipt for the sum of money, annuity, or rent charge; or upon production of evidence of the decease of the annuitant; or that the circumstances or conditions upon the occurrence of which the charge was contingent, have ceased to be possible. These charges on land are transferable by endorsement in a simple form, printed on the back of the instrument, evidencing the charge, and as the title is indefeasible, the pass as freely as Exchange bills between parties acquainted with the value of the property to which they attach. The expense attendant on creating a charge is but 10s., the cost of transfer 5s., and of release 6s. Equitable mortgages for the purpose of securing cash credit, and advances, for fluctuating amounts, and also when parties desire secrecy, are created under this system with a degree of security and facility for realising unattainable under the English law of conveyancing, because the title is indefeasible; and so long as the banker retains the certificate of registration of that title no dealing therewith can take place without his consent. Should the banker desire further to secure facilities for realising on the contingency of the death or insolvency of his creditor, he may require 'contract for charge' duly executed on a prescribed printed form, to be deposited with the certificate, either specifying a fixed amount, or as is more usual, for such sum as may prove due on balancing accounts at some future date, and on the occurrence of either of the events above referred to, he can, by presenting these instruments at the registry-office, convert his equitable lien into a registered mortgage. The amendments really necessary in order to render this Act of 1862 a true embodiment of the system of conveyancing by registration of title, so as to put that system fairly on its trial, may be compressed in a very few words. I will enumerate them in the order of their importance. First, abandoning the attempted compromise between registration of title and registration of assurances, to repeal Clause 63, which makes property in land to pass upon execution of a deed or instrument, and substitute for it the corresponding provision of the Australian Act, which declares that estates and interests in land shall pass or be affected by entry in the register; and instruments, when executed, shall have effect only as authority to the officer to make such entry, and as contract between the parties.

Secondly, in order to facilitate the first placing of land upon the register, a relaxation of the stringency of the requirement of Section 5, so as to allow the recording officer to accept for registration "good holding titles," in the event of non-claim after service of notices and due advertisement. Thirdly, repeal of Section 14, in order to substitute the simple and effectual method of recording by one register-book, with instruments evidencing title to each separate estate or interest, upon the model of the Shipping Act, and as in operation in Australia; for the method by three register-books, with land certificates and special land certificates, as condemned by Colonel Leach and other witnesses, and admitted by Mr. Spencer Follet to be unsuitable for the conduct of business on such scale as would render it of sufficient public advantage. Fourthly, the abandonment of Section 32, so far as to exclude uses and trusts from being disclosed on the register.

Before concluding, the reader of the paper drew attention to a Blue Book, recently presented to Parliament, giving replies from the governors of the Australian colonies to a circular despatch of her Majesty's Secretary of State, calling for reports on the working and progress of the system of conveyancing by registration of title there in operation. The advantages derived from this system by the inhabitants of the colonies, he said, may be thus summed up. The procedure is so simple and ready of accomplishment that parties dealing for the most part transact their own business. A saving of 19s. in the pound sterling has been effected in the cost of conveyancing. The wealth of the community has been increased by restoring to its intrinsic value, as building sites, land, which, deprived of that special character by imperfect evidence and technical defects in title, lay waste and unprofitable. The value of land as a basis of credit has been raised by the extraordinary facility and security with which equitable mortgages and registered charges are effected, and the ease and rapidity with which the title may be transferred from hand to hand. Through the simplification of titles, so that each freeholder stands in the same position as a grantee direct from the Crown, the risks of Chancery suits have been reduced to a minimum, and a ready and inexpensive procedure in foreclosure and ejectment has been obtained. He earnestly desired to see those benefits participated in by the landowners of this country.

SCHOOLS OF ART AND SCIENCE.

Selby School of Art.—The first annual meeting of this school has been held in the Public Room, Selby, under the presidency of Sir G. Gilbert Scott, B.A. About a year ago an art class in connexion with the Science and Art Department, South Kensington, was established in this town, and has been so successful that the committee decided to commemorate the first anniversary by combining a *soirée* and an exhibition of prize and other drawings. They obtained the consent of Sir G. Gilbert Scott, to preside on the occasion; and contributions of works of art were so liberally offered, that a notable display was offered. So valuable a collection has never before been exhibited to a Selby public, and would itself be amply sufficient to form an instructive exhibition. In addition to this, the committee have been intrusted, by private owners, with some valuable paintings, which add greatly to the attractiveness of the exhibition.

Brighton and Sussex School of Art and Science. The fourteenth annual distribution of prizes to the successful students in connexion with this school has taken place in the Music Room at the Royal Pavilion. The Mayor, Mr. J. Cordy Burrows, presided. There was a very good attendance of the parents and friends of the pupils. In presenting the first annual report in which the Committee have had to record any proceeding in connexion with the Science branch, the Committee

"congratulate the subscribers to the institution and the public of Brighton on the great extension of their operations during the past year. It would be unjust (continues the report) if they did not state that this result is to be ascribed entirely to the capacity and energy of the headmaster, Mr. Alexander Fisher. . . . While there has been a moderate increase in the numbers, the improvement in results is much more marked. The Committee regret exceedingly to state that the insufficiency of the accommodation afforded by the room in which the school is at present carried on has caused the number attending the classes to have been very much less than they would otherwise have been. The Artizan Class would probably nearly double its present numbers if there were sufficient space. The Committee will use their utmost exertions during the ensuing year to obtain improved

accommodation. To attain success in this object, the co-operation of the public, of the local authorities, and of the Government is necessary. That of the latter is certain, conditionally on the two former being afforded: and when it is generally known that, notwithstanding the high rank the town now takes, both in reference to population and as the residence of the wealthy and influential classes, it possesses no School of Science at all, and a School of Art most meagre in its appointments, and probably more circumscribed in its capabilities than any in England; that at a time when the need of education, and especially of technical education, is being so fully recognised, numbers in Brighton, anxious to acquire this education, are actually driven away from the doors of the school for want of sufficient accommodation—it is confidently hoped that the efforts of the Committee to establish a Science and Art Educational Institution worthy of the largest and most important town in the south-eastern counties, will be so far seconded by the help of the municipality and the pecuniary support of the public as to meet with full success at an early date.

¶ *Maidstone School of Art.*—An exhibition of drawings and paintings executed during the past year by students of this school has been held, the works being arranged in the corridor leading to the concert-hall of the Corn Exchange. On the whole, both drawings and paintings seem to have been carefully and conscientiously executed, and several displayed signs of talent. The lady students hear off a fair share of the honours of the year, and they were particularly successful in carrying away the local prizes. The distribution of prizes took place at the Concert-hall. Mr. W. Hart Dyke, M.P., presided. The report says, "The committee, in presenting their fourth report, would call to mind that it is fast approaching five years since these art-classes were first commenced in Maidstone; and while they have to regret that the middle and upper classes do not continue to support the effort as they might, by sending their sons and daughters for instruction, they rejoice to say the artisans have shown their appreciation of the great advantages offered by well maintaining their numbers."

The Southampton School of Art and its Head Master.—There has for some time been an unfortunate misunderstanding between the council of the Hartley Institution and the head-master of the art-school, Mr. Baker, which has eventuated in a public meeting, at which Mr. Baker explained the causes of difference, and resolutions were unanimously passed, urging an inquiry into the present position of the Hartley Institution, and how far, as at present conducted, it meets the requirements of the town in respect to its foundation; thanking members of its council for their efforts; and pledging the meeting to use every exertion to establish a new school of art under Mr. Baker, in connexion with South Kensington.

LONDON SCHOOL BOARD.

In the architects' department the following appointments have been determined on:—One chief draughtsman at 200l. per annum, two senior draughtsmen at 140l., one senior draughtsman at 120l., four junior draughtsmen at 80l., and one writing clerk at 50l. per annum. The annual cost of this staff would be less than that previously recommended, by 26l. The committee obtained the necessary power to carry out their recommendation.
