In order to secure a systematic and regular procedure in the management of a forest property, it is above all things necessary to find out what its annual yield is or can be made, its normal sustained increment, its capability. This depends of course, in the first place, upon the soil and climatic conditions, next upon the kinds of trees composing the forest, and finally upon the condition of the forest and its management. These matters being ascertained by a forest survey, forest regulation then proceeds, depending upon a thorough knowledge of the laws of accretion or annual growth, involving a study, not only of the mass and form development of the single tree under varying conditions, but also that of the forest growth as a whole, its mass increment, and the distribution of the same through various ages. Besides the mass accretion, there is also to be determined a quality increment, and dependent upon both a value increment. It then is possible to determine how much wood may be harvested from time to time, and how much must be left as normal stock, upon which the normal increment can take place. It is then also determined with what rotation the forest is to be cut, i. e. how long a time may elapse until a full crop can be most profitably cut, also the system of sylviculture, whether coppice or timber forest is more advantageous. As further basis for such regulation, it is desirable to determine by the methods of forest valuation the money value of the property, in order to ascertain whether the capital represented in the soil and in the growth does yield or promise to yield a satisfactory interest, and what kind of management might be most advantageous. Closely connected with these financial problems is the consideration of expenditures for administration. All these problems, to be sure, are of greater importance in a large and complicated forest economy, such as the various government administrations represent, and become of less and less importance, and are less complicated as the area of the forest to be placed under systematic management decreases.

In a well-conducted forest administration the forest is divided not only into districts, sub-districts, ranges, etc., which serve as units of organization each under a competent manager, but each of these divisions is divided again into blocks, compartments, groups, and age-classes, which serve as units of management. The management is carried on upon a carefully prepared working plan, revised from time to time, which indicates for years to come, perhaps a century and more, the operations to be performed in each compartment or group, the annual or periodical cut, which is kept as nearly equal as possible in area or mass, and the methods of regeneration, etc.

Under the name of *sylviculture* may be comprised all the manipulations in the field which have for their object the best development of the crop, and which may readily be considered in three divisions, namely: those concerned with the improvement and cultivation of the crop; those insuring properties against fire, insects, and other damage; and, lastly, those which have reference to a well-regulated method of harvesting or exploitation, such method determining in part the system of reproduction or regeneration. Artificial forestation or forest-planting is practiced either where the original forest has been cut away without regard to natural reproduction or where there was no forest, as in the treeless plains.

The considerations which require attention in forest-planting are the selection of plant material adapted to soil and climate, and with reference to the value of the product; the manner of disposing it on the ground: the method of planting it. All operations must be considered from the sylvicultural standpoint as well as with regard to the financial result. Whether, therefore, to sow the seed or to plant seedlings grown in a nursery, whether to plow and thoroughly prepare the ground or only to open trenches in which to plant, or to use the dibble, as well as the selection of plant material, are questions both of sylviculture and finance which can only be discussed with reference to given local conditions and special cases. Only the leading principles in forest-planting may be stated here. Mixed growths are preferable to those of single species (by themselves), because they may be made to yield larger returns, and offer better soil protection and greater resistance to damage by winds, fire, and insects. In the selection of species for mixed planting, besides their adaptability to soil and climate—those native in a region deserve first consideration—and the value and rapid development of their product, their behavior to each other, and their relative development must be considered, which are predicated by their relative dependence for development on light and shade, their relative rate of height growth, and their relative capacity for preserving and increasing favorable forest conditions. Out of these considerations the following rules to be observed in mixed planting arise:

1. The main growth—i. e. the one that occupies the larger part of the ground—must be of a kind that improves soil conditions, namely, a densely foliaged, shade-enduring kind, which does not lose its shading capacity with age. 2. Densely foliaged kinds may be grouped together, if the slow grower will endure the shade of the rapid grower, or can be protected against its supremacy by being planted in larger specimens, or in advance of the former, or in larger numbers, or if its gradual killing out after it has served its function of soil cover is not objected to. 3. Thinly foliaged kinds should never be grouped together where soil humidity is to be preserved, unless no shady tree can be found to fit the locality. 4. In grouping light-needing with shade-enduring kinds, the former must be more rapid growers, or must otherwise be given an advantage. A mixture of deciduous trees with conifers, where the latter are otherwise adapted to soil and climate, gives ideal conditions, the conifers furnishing more continuous cover, developing best with the deciduous trees as neighbors, and yielding most valuable material. Since the first object to be attained is to create as quickly as possible a soil cover, dense planting is the rule, 6,000 to 8,000 plants per acre, and even 10,000 where, as in the prairie, evaporation is rapid and the need of a soil cover greater. This dense planting obviates after-cultivation. For nursery practice and general practice in handling plant material, see NURSERY, and the various plants under their respective heads.

While it is mostly cheaper to sow the seed in the first place where it is to grow, sowings are apt to come up unevenly, require more aftercare, and the loss in time and development often makes planting of seedlings more profitable in the end. Young, well-rooted seedlings, two to three years old, are preferable to older plants, because cheaper and more successfully handled. Cuttings of various kinds, like cottonwoods and willows, can also be utilized, but this kind of plant material is not advisable where long-lived timber trees are wanted. Only sufficient preparation of the soil to give the plants a successful start the first year is needed, since it is impossible to keep up cultivation, and the labor expended at the first soon loses its effects. In sandy soils planting with dibbles of various shapes is practiced in Germany, one man setting 1,200 plants in a day. Various methods of planting, adapted to different soil conditions, are practiced in Europe—bunch-planting (several plants in one hole), top or mound planting (setting plants on top of ground in wet localities), sod-planting (taking up and setting plants with ball of earth), notching with hatchet or spade, furrow-planting, etc. Various planting-tools are also in use. An ingenious mechanical planter, which prepares the soil and plants the seedlings in trenches in one motion at the rate of 20,000 per day, has been patented in the U. S. On the prairies thorough cultivation and sometimes several years' cropping of the soil before planting has been practiced, with cultivation between the widely set rows of trees afterward. It is questionable whether this is necessary or even desirable. Cultivation may be avoided by dense planting. To establish forest conditions must be the first aim of the forest-planter.

Forest conditions, as found in the natural forest, consist in dense growth, mixed growth, undergrowth. By so much as any one of these conditions is deficient or lacking, by so much is the forest short of the ideal. Reduced evaporation is forest condition. Shade reduces evaporation. Dense growth furnishes not only straight clear timber, but shade. Mixed growth alone can preserve a continuous shade for a long time. Undergrowth assists in keeping the ground shaded.

Natural regeneration or reproduction is practiced where natural growth of desirable kinds exists, either by a new growth of sprouts or shoots from the stump or stool or from the seeds sown by the old trees. The former method, reproduction by shoots, is called the *coppice* system (German *Niederwald*; Fr. *taillis*). It is applicable only to such kinds as have the capacity of readily sprouting; the conifers are therefore excepted. Some broad-leaved trees also do not sprout readily enough to admit of their management in the coppice system. Shoots, while growing more rapidly than seedlings at first, relax sooner and remain comparatively short. This system, therefore, is fit for the production of firewood, ties, posts, hoop-poles, and wood of small dimensions only; also for tan-bark purposes or for mere soil cover. The coppice should not be allowed to grow longer than thirty or at the longest forty years, since with longer rotation the stocks or stools lose their reproductive power too soon; deep rich soil and a mild climate are most favorable to the maintenance of reproductive power. Cutting is best done in spring before buds start, should never be done during heavy frost; the cut should be smooth and as low as possible in order to reduce liability to injuries and induce formation of new independent roots from the shoots. If, when cutting the coppice at the age of from ten to twenty years, some trees are left to grow to larger size—standards—thus combining the coppice with the timber forest, a system results which the Germans call *Mittelwald* (Fr. *taillis sous futaie*), and which may be translated *standard coppice*, a system which offers many advantages where inferior firewood can be disposed of, and especially for smaller forest areas where more special attention can be given to the treatment of the standards, to avoid their unwelcome branching. The coppice growth must be made up of deciduous, shade-enduring kinds with considerable reproductive power; the standards should be of less shady kinds, that produce desirable material. The coppice is cut several times before the standards are ready for use. The *timber forest* or seedling forest (German *Hochwald*; Fr. *futaie*), in which it is proposed to grow trees to full maturity for lumber, is reproduced entirely by seed from mother trees, or planting after the old growth has been cut. The latter method, which appears the simplest, had become of very general practice in Europe, in many cases with rather unsatisfactory results in the end, through desiccation of the soil and enormous increase of insect pests on large sun-warmed clearings. Hence a return to the natural regeneration systems from seed trees has begun, so that the following statement can be given as a guiding rule:

Forestry in a wooded country means harvesting the wood crop in such a manner that the forest will reproduce itself in the same if not in superior composition of kinds. Reproduction, then, is the aim of the forest manager, and the difference between the work of the lumberman and that of the forester consists mainly in this: that the forester cuts his trees with a view of securing valuable reproduction, while the lumberman cuts without this view, or at least without the knowledge as to how this reproduction can be secured and directed at will. The efficient forest manager requires no other tool than the ax and saw—the planting tools being needed only to correct his mistakes—but he uses them differently from the lumberman.

There are two systems of natural regeneration by seed possible, namely, the system of echelons (German *Randbesamung*, *Coulissenschlag*; Fr. *coupe par bandes alternes*), in which strips are cleared and a neighboring growth of seed trees left to supply the seed for reproduction, and the system of regeneration under nurses or shelter-woods, leaving a certain number of seed trees scattered over the area on which the timber is to be regenerated, gradually removing them as the young growth requires more light. This is the manner in which the primeval forest regenerates itself if left alone, old trees falling and young growths starting in the breach. Man merely brings method into this process of regeneration. In the latter system various methods are practiced, which are distinguished as the "method of selection" (German *Fehmelbetrieb*, *Planterwald*; Fr. *jardinage*), or the "group method" (German *Loecherhieb*), when the mature trees over the entire forest area are taken out irregularly in single individuals or groups, the gradual regeneration also taking place irregularly and in small patches, when the forest contains always trees of all ages; and the "compartment method" (German *Fehmelschlag*; Fr. *mode des éclaircies*), when the process of regeneration is concentrated upon a given portion of the forest area, a compartment, so that in a few years the old growth is replaced altogether by an even-aged young crop. In both these methods the consideration of the relative need of light or shade by the different species at different stages of development is the guiding principle in the manipulations, so that forest management may be said to be a management of light conditions. It is also necessary to keep in mind that most or many of our most valuable trees do not bear seed every year, at least not plentifully, and hence the cutting must be done with reference to the seed years.

The method of echelons is applicable for species with light or winged seeds, which the winds can easily scatter over the clearing, and for light-needing species, which can dispense with the protection that the mother trees give to the young growth. The method of compartment regeneration is used with species which either can endure or require in their early stages of development the cover of the mother trees. Three stages, occupying longer or shorter time according to soil, climate, species, and other conditions, appear in this manipulation of cutting for reproduction, and together are called the regeneration period.

First, "preparatory cuttings" occupy several years before the expected seed year. These consist in taking out undesirable species which are not to be reproduced, and thinning the mother trees to an even stand, allowing light and air to penetrate to the soil sufficiently to fully decompose the raw humus and form a good seed bed.

When the seed year appears, an even crown cover must have been secured, having left about 0·4 of the normal number of trees per acre evenly distributed over the area to be regenerated. A failure of the seed crop sometimes requires waiting for another seed year. When the seedlings have appeared the third stage begins, that of "cutting for light," with a gradual removal of the mother trees, as the seedlings require more light, the whole period of regeneration occupying from five to ten or even twenty years. Various modifications of this as well as of the next method are practiced. Where the natural sowing fails, the fail-places must be planted by hand. The group method differs only in the smaller extent of the area brought under regeneration. The method of selection is the most natural and most conservative, as well as the oldest; almost entirely abandoned for a time on account of its many drawbacks, it has recently come again into more general practice. It is the method which the lumberman unconsciously practices as he culls out the desirable material, only that he fails to consider the needs of the aftergrowth. Requiring considerable individual attention in all parts of the forest, it is perhaps more applicable to smaller areas, while the more schematic compartment method deserves first place in forests of greater extent.

Besides these typical methods there are in use more or less developed modifications and combination methods, such as the so-called double rotation timber forest, where a greater or smaller number of trees are held over for a second rotation to make large-sized timber; the method of "undergrowing for light accretion" (*Lichtungsbetrieb mit Unterbau*) to secure heavier dimensions where the forest of forty or sixty years of age is severely thinned, and to maintain favorable soil conditions an undergrowth of shady kinds is established underneath the older timber; the combination of coppice with agricultural crops, known as *Hackwald* in Germany, and practiced largely in France under the name of *sartage*, when the soil is given up to field crops for a few years after cutting.

Improvement Cuttings, and Thinnings.—After the young growth is established it becomes desirable to aid its most advantageous development. This is done by a judicious thinning out, so as to preserve a proper density of the crop, two principles being the guides, namely, not to expose the soil to sun and wind too much at any time, and to give sufficient light for rapid and vigorous development of the trees without permitting the formation of undesirable low branching. Prevention of the latter is preferable to cure by pruning. This is rather expensive, and the results are not always satisfactory. The first thinning may be done when the trees are fit for hoop-poles, removing the less desirable growth; afterward the golden rule is to return often and not to thin too severely.

Forest protection is especially needed against fire and insects. Running fires destroy the vegetable mould and underbrush; top fires lay low the trees. To reduce this danger not only great care in the use of fire is required, but in order to confine and control any that has started the forest, especially in the pineries, is divided into blocks and compartments by cleared rides or roads regularly laid out and crossing each other, kept clear of underbrush, proceeding from which the fire may be fought. Running fires are beaten out with brush, checked by ditching or by counter-fires; top fires are stopped by felling strips of timber, and thus preventing further spreading.

Caterpillars destroy the foliage of healthy trees, the larvæ of beetles destroy the wood and the buds of young trees, and injure the roots of young growths. Many methods of defense are practiced, the annual outlay for which by the Prussian Government forests averages $60,000 per year. Prevention again is better than cure. It consists in growing mixed forests, and keeping them as shady as possible.

Exploitation consists in the proper felling and most economical adaptation of the various woods and dimensions to their most profitable use, providing means of transportation, etc. A good road system well laid out and well kept, supplemented by other means of transportation, is the keynote of profitable forestry, for only where all material can be readily marketed does the cost of production and the desired interest on the capital result. The harvesting of by-products, which sometimes, as in the case of tan-bark in the tan-oak coppice, becomes the main product, also requires special attention.

History and Statistics.—The history of the forest has been the same in all parts of the world, progressing according to the cultural development of the people. First it was valued as the harbor of game; then it appeared as an impediment to agricultural development, and relentless war was waged against it; then the value of its stores made it an object of greedy exploitation, and only in a highly civilized nation does the idea of the relation of forests to the present and future welfare of the community lead to a rational treatment of the forest cover and the application of the principles embodied in the science of forestry. Modern forestry, such as is more or less practiced now by all European people, is of modern and mainly Teutonic origin. There existed some knowledge as to the nature of forest growth and the advantages of its systematic use among the *Romans* and *Greeks*. The consecration of forests to the gods may be considered as a means to prevent their devastation. Ancus Martius, the fourth King of Rome (about 64 B. C.), claimed the forests as a public domain, and placed them under special officers; later, under the republic, they were in special charge of the consuls. Subsequent wars, however, seem to have wiped out not only the administrative features, but most of the forests themselves.

To *Germany* in the first and France in the second place belongs the palm for the beginning as well as for the scientific development of rational forestry systems. The first attempts in this direction seem to antedate even Charlemagne's time. At the end of the eighth century the "ban forests" (*foresta*) had been established—i. e. woods in which the king had the right reserved to exercise the chase. (Afforesting and disafforesting are terms having reference to the establishment and discontinuance of such forests.) After a time favored vassals, ecclesiastics, and others had such rights reserved for them, and gradually the "forest" included not only woods but fields and other open territory, and under the plea of guarding the chase regulations in the use of the wood were enforced. But long before this those communistic villagers, aggregated in the "Mark," had themselves regulated the methods of using the communal forest. These regulations, originating among a crude people six or seven centuries ago, were indeed wise and rational when compared with the irrational methods pursued at the present time in the U. S. The amount of wood to be harvested was determined beforehand, the better kind of timber being more economically cut. For firewood the dry and inferior timber was assigned. Charring, boxing for resin, etc., were carried on under precautions. The number of swine to be allowed in the oak or beech forests was determined according to the mast. The damage by sheep and goats was recognized, and their pasturing in the woods prohibited as early as 1158. Even an arbor day was anticipated in some parts, each man having to plant under supervision of the appointed forester a number of trees proportionate to his consumption; in 1368 the city of Nuremberg began reforestation on a larger scale with conifers, which was imitated by other communities; and in 1491 a regular artificial reforestation by annual sowings of oak was undertaken by the community of Seligenstadt. The end of the fifteenth century also witnessed quite a systematic regulation of the annual cuttings by the communal authorities, the cities and villages having increased their holdings by large forest properties given by or bought from the kings and princes, and also fully organized administrations of the forests belonging to the latter were instituted. The law punished with heavy penalties trespasses of all kinds. The Thirty Years' war, which extirpated many of the villages and cities, and other causes increased the holdings of the princes and nobility, and gradually the communal forest was to a large extent supplanted by the royal and lordly forest, or (by partition) by private forest of the farmers. These, however, remained encumbered with servitudes—i. e. right of adjoiners to certain use of the forest and its products—for which use counterservice was demanded, such as aid in extinguishing fires, dropping and hauling of wood, or other assistance in forest culture. Fires devastated large areas in the seventeenth and eighteenth centuries, and a period of neglect and bad management reduced the forest area to poor conditions, upon which the many regulations and orders of the princes against devastation had little effect. Under these circumstances the development of the technical part of forestry was naturally slow. Yet many methods of forestry practice still existing in modified forms date from the beginning of the eighteenth century, while in the latter part of the same century the foundation for the present system of management and policy was laid, and forestry science in all directions built up with remarkable activity, becoming one of the branches taught at several universities, besides a number of special forestry schools. Yet the forest conditions in the beginning of the nineteenth century were deplorable, and the same reformatory movement now beginning in the U. S. was necessary to bring about the improvement of modern times. Among the most active writers of that time and as fathers of modern forestry may be named G. L. Hartig, whose treatise on sylviculture, the first forestry book on a scientific basis, is still authority in many directions, H. von Cotta, F. W. L. Pfeil, Hundeshagen, König, and Carl Heyer.

At the beginning of the nineteenth century forest property comprised three classes: first, the forests, formerly princely, which have become state property; second, those remaining the private property of royalty, private individuals, or institutions; and, third, the communal forests, belonging to cities, towns, villages, or merely associations. The first, representing about 35 per cent. of the total forest area, are entirely under the jurisdiction and management of the state, with special forest departments; the communal forests (about 15 per cent. of the forest area) are under more or less strict supervision of the state authorities, with a view to preventing devastation; but the private forests, containing nearly 50 per cent. of the total forest area, are almost entirely without such supervision, yet from prudential reasons are generally managed systematically according to conservative principles. Lately, however, the fuller recognition of the protective character of forest cover has created the tendency to restrict private owners from such use of their property as may endanger adjoining interests, and at the present writing (1893) a law is under discussion to further extend such restrictions.

With well-established forest administration of Government forests, with forestry schools or chairs of forestry at universities, and twenty periodicals devoted to forestry alone, Germany is the exponent of the most advanced ideas in this branch of economic science and art.

The policy of the Government is to increase its forest area by the acquisition and replanting of waste lands, and turning over to agricultural use such tracts of forest land as are profitably so employed, so that finally the land occupied by forest growth shall in the main represent such as is not useful except for timber crops. In this direction there were spent during 1883–93 over $3,000,000, increasing the holding of the state by over 200,000 acres, besides exchanging some 30,000 acres. During the same time the Government spent in subventions to private enterprises in reclaiming waste lands the sum of about $30,000 per annum.

The following figures, from official sources of the Prussian forest administration for the year 1890, will serve to give an idea of the financial results of a well-ordered forestry system:

TABLE SHOWING FINANCIAL RESULTS OF PRUSSIAN FOREST ADMINISTRATION, 1890.

Area: 6,685,768 acres, including 687,982 acres not woodland.

Expenditures for the year.

Administration:		
Direction, 122 officers	$154,350	
District managers, 681	588,276	
Under-foresters, 3,753	1,162,867	
Financial agents, 114	73,141	
Rangers, temporary	12,332	
Other *personnel* expenses	1,061,255	
		$3,052,221
Or 46 cents per acre.		
Management:		
Harvesting	$2,266,030	
Building account	599,834	
Roads and waterways	410,102	
Planting and cultures	1,230,882	
Surveys	110,226	
Protection against insects	60,454	
Sundries	280,973	
		$4,958,501
Or 74 cents per acre.		
Various:		
Forestry schools and experiments	$48,131	
Purchase of waste lands	304,156	
Sundries	434,682	
		$786,969
Or 12 cents per acre.		
Total expenditure		$8,797,691
Or $1.32 per acre.		

Revenues for the year.

Wood:	
962,300,000 feet B. M. saw-timber at $10.32 average.	$9,931,000
2,074,830 cords of wood at $3.70 average	6,224,497
17,930 cords tan-bark at $3	66,341
	$16,222,738
By-products	1,036,773
Game	84,056
Sundries	289,243
Total	$17,632,810
Or $2.63 per acre.	
Net revenue	$8,835,119
Or $1.31 per acre.	

Saw-timber represents 45·6 per cent. of total wood product, and 61·6 per cent. of total money yield, the total wood production (annual accretion) being round 280,000,000 cubic feet, or about 46 cubic feet per acre of woodland, worth 5·8 cents per cubic foot.

In *France*, in early times, the same communal conditions and usages existed as in Germany, and the progress in the development of forestry is similar. After various ordinances issued by the kings from time to time, regulating the use of forests, among which, that of Philip August in 1219, a definite "administration of forests and waters" was instituted in 1346 by Philip VI., and a tribunal for forestry cases established in the *Table de Marbre*, which was much abused for extortions, especially under Henry II. Under Charles IX. control over private forest property was considerably extended. Henry IV. (1589) strove in vain to bring order into the management; forest devastation remained the rule until the famous ordinance of Colbert in 1669, under which France was divided into forest districts, and with a reorganization of the administration in a severe manner the cutting on private as well as public forest lands was regulated. This organization lasted until 1790. During the eighteenth century forestry matters were discussed by such well-known scientists as Réaumur, Duhamel, Buffon, who about 1774 first advocated the advantages of thinning. The Revolution opened wide its doors to the destructive element, and the damages which France is now working to repair date largely from those times. Napoleon revived the forest administration in 1801, but the present system came into practice only with the forest code of 1827 as an outcome of Lorentz's studies in Germany. The establishment of a forest school at Nancy in 1824 must also be credited to the exertions of this man. Later laws (1860–82) establish the cases in which the state may interfere with private forest property, and have reference especially to reforestation of mountains.

The territory directly injured by the torrents resulting from forest devastation comprised about 8,000,000 acres of tillable land. Some $10,000,000 have been spent so far to reforest and resod the denuded mountain sides, while nearly $40,000,000 more are estimated necessary to put in proper condition the 800,000 acres needing reforestation.

Austria and *Switzerland* stand next to Germany and France in the development of a well-established forest policy. *Italy* has a forestry school at Vallombrosa, and Government forest administration. An excellent law compelling reforestation of denuded mountain-slopes was passed in 1890. *Spain* and *Greece* have less developed forestry systems. In *England*, although with William the Conqueror the idea of the forest as a territory reserved for the king's chase was imported, forestry proper has received but little attention. There was, however, instituted during the years 1847 to 1864 a forestry service for India, and a forest school in Cooper's Hill, England, in 1885, and lately more activity in forestry matters appears. The forests of the crown are indifferently managed, but private owners, especially in Scotland, apply better methods to their holdings. The British colonies in Australia and lately in Africa have organized forest administrations. *Norway* and *Sweden* have but imperfectly developed forestry practice. In *Russia* a Government forest administration and several schools exist. Even *China*, *Japan*, and *Korea* have developed forestry systems, and at Tokio University forestry is one of the branches taught.

COMPARATIVE AREAS OF FARM, FOREST, AND OTHER LAND IN THE UNITED STATES AND IN EUROPE.

COUNTRIES.	Areas.	Agricultural soil in actual use (in U. S. 300,000,000 acres).	Forest (in U. S. 500,000,000 acres).	Waste or unoccupied, but capable of production (in U. S. 800,000,000 acres).	Roads, water, and land incapable of production.		Agricultural soil per capita.	Forest per capita.

* The most recent returns reduce the percentage of forest in Sweden and Norway to 24 and 25 per cent. respectively.

The figures given in the above table, so far as they relate to other countries, are taken from European statistical tables, based upon the state of things existing in 1880. No such exact figures can be given for the U. S. In the estimates and approximations, given in round numbers, neither Alaska, the Indian Territory, nor Indian reservations are included, the forest condition of these not having been ascertained. The forest area is taken from an estimate made by the forestry division of the U. S. Department of Agriculture in 1885. For the amount of farm land under cultivation, as well as for unoccupied and waste land, whether capable of profitable use or otherwise, reliance has been placed upon the census returns. The per capita estimates are made upon the basis of population in 1880, viz., 50,000,000.

Reliable statistics for the U. S. are absent, but the situation may be briefly summarized as follows: The estimated area of woodlands comprises in round numbers 500,000,000 acres, or 25 per cent. of the total land area: the annual consumption of wood of all description is in the neighborhood of 22,000,000,000 cubic feet, of which the larger part, over 80 per cent., is firewood; the value of all forest products increased from $500,000,000 in 1860 to over $1,000,000,000 in 1900. The exportations of forest products and manufactures of wood in 1900 amounted to $50,598,416, with importations to the amount of $20,591,908. Forest fires destroy annually thousands of square miles of standing timber, or destroy the forest cover. The U. S. Government retains about 50,000,000 acres of woodlands, mostly situated in the Western mountain-ranges, and without administration, excepting some regulations by the land-office.

Apparently the forest policy of the Government has been to get rid of the land and that of the people to get rid of the timber. The first forest reservations from the public domain, for forest purposes in part, were made in 1891. No administration of these is as yet provided. In the Department of Agriculture, however, there exists a bureau of research and advice without administrative functions called the division of forestry. The only State attempting a management of its public woodlands is New York with a forestry commission exercising control over the Adirondack forest, some 700,000 acres in extent, an area which is to be extended. Forestry commissions exist in various States, but mostly of an advisory character. No real forest management by private owners seems to exist. Rapid, wasteful, and unsystematic exploitation is the rule. Forest-planting on a small scale and with only partial success has been practiced mainly in the treeless plains, the Government until lately encouraging such by the granting of proportionate areas of land, in fee simple, under the so-called Timber Culture Act, now repealed.

Other means of encouraging a more rational use of the forest resources consist in the establishment of arbor days, now celebrated in almost every State, the formation of societies, among which the American and the Pennsylvania Forestry Associations are most active in trying to change the forest policy in the U. S. and to introduce more rational systems. Instruction on forestry matters is being given at various agricultural colleges. B. E. FERNOW.

Forey, fō̆rā', ÉLIE FRÉDÉRIC: general; b. in Paris, France, Jan. 10, 1804. He was educated at the military school of St. Cyr; distinguished himself in Algiers; became general in 1848, and took an active part in the *coup d'état* of Dec. 2, 1851. In the Russian and Italian wars he held important commands. In Aug., 1859, he was made senator, and in July, 1862, was placed in command of 30,000 men destined for the invasion of Mexico. Landing at Vera Cruz, Sept. 27, he issued a conciliatory proclamation, but shortly after ordered the sequestration of goods of those who opposed the French. Puebla surrendered after a severe siege, May 17, 1863, and he occupied Mexico city soon after, forming a provisional government. On July 2 he was made marshal of France. In Oct., 1863, he turned over the command to Bazaine, and after a short diplomatic visit to the U. S. returned to France. D. in Paris, June 20, 1872.

HERBERT H. SMITH.

Forfait, fō̆r'fā', PIERRE ALEXANDRE LAURENT: engineer; b. at Rouen, France, in 1752; studied mathematics and hydrography, in which departments he won several prizes offered by the academy of his native city; and in 1783 obtained an appointment as engineer in the navy by the influence of the Duc de Penthièvre. He distinguished himself before Cadiz and at Brest, published several scientific treatises (*Sur les vers marins, Sur une machine propre à curer et creuser les canaux, rivières et ports, etc.*), and was charged with the construction of large transport-vessels destined to run regularly between France and her colonies. Elected a member of the Legislative Assembly in 1791, he had a seat in the committee on naval affairs and exercised great influence on its proceedings. But he had little sympathy with the Revolution; he was not re-elected, and he was even imprisoned for a short time as suspected. The Directory, however, again employed him, and charged him with the construction of the so-called Seine boat. (See his *Rélations des expériences faites sur la navigation de la Seine* in the *Transactions* of the Institute, 1798.) With Napoleon he was for a long time a great favorite, and he was at the head of the preparations for an invasion of England; but after the Peace of Amiens he resigned his position in the navy, and shortly after he retired into private life. Besides the above-mentioned treatises, he published a great number of papers on military and civil engineering in various scientific periodicals. D. at Rouen, Nov. 8, 1807.

Forfar, Forfarshire, or **Angus**: a maritime county of Scotland; bounded by the German Ocean, the Frith of Tay, Kincardine, Aberdeenshire, and Perthshire. Area, 880 sq. miles. Its surface is very varied, ranges of hills, the Sidlaw and the Oatlaw, alternating with valleys, the Vale of Strathmore, and the plain along the Tay, and its soil is fertile and well-watered by the Tay, the North and South Esk, and the Isla. The climate is mild and favorable to agricultural pursuits. The manufacture of coarse linen is a very important industry in which many thousands find employment. Pop. (1891) 277,788; (1901) 283,729.

Forfar: town; capital of Forfarshire, Scotland; situated in the Vale of Strathmore; 14 miles N. N. E. of Dundee (see map of Scotland, ref. 9–I). It has important manufactures of heavy shoes and coarse linens, and is connected with Aberdeen by the Scottish Midland Junction Railway. It has fine public buildings. Pop. (1891) 12,844.

Forfeiture [from O. Fr. *forfeture, forfaiture* < Low Lat. *forisfactu'ra*, deriv. of *forisfa'cere*, act beyond, transgress; *fo'ris*, out of doors + *fa'cere*, do, act]: a loss of property to the state or an individual as a penalty for the commission of some offense. Forfeiture is either civil or criminal. In civil forfeiture the property passes into the possession of some individual who has been injured by the violation of his rights through some neglect or transgression of duty on the part of the property-owner. There are several classes of cases in which this penalty might be incurred at common law, and in some of them it is still retained. Thus in former times if an owner of a limited interest in real property, as a tenant for life or for years, attempted to convey a larger estate than he himself possessed by making a feoffment in fee simple, not only did the grantee receive nothing, but the grantor's entire interest was forfeited to the reversioner or remainderman. But at the present day this rule has no application, and an excessive grant is operative as a valid transfer of the grantor's actual interest, and of nothing more. In like manner, a tenant might forfeit his estate by disclaiming the title of him under whom he held, or the commission of waste might entail a like result as the effect of a judgment in an action of waste. The effect of disclaiming the title would be to enable the landlord to treat the tenant as a disseizor, and thus to forfeit his estate. In the U. S. the action of waste has been discarded in a number of the States, and even in those which still retain it an action to recover merely the damages sustained is more usually brought than one for forfeiture. One very important case of civil forfeiture is that which occurs when the breach of the condition in a grant has been committed. The grantor may re-enter upon the premises and recover them as his own property. (See CONDITION.) This form of forfeiture depends upon the stipulations of the parties, while other forms are referable to rules of law applying irrespective of any agreement.

Criminal forfeiture, under English law, was the general penalty inflicted for acts of felony and treason, the offender's lands, chattels, or both, being confiscated by the crown. (See FELONY.) The same penalty has been retained until the present, but with considerable relaxation of its former severity. Attainder for felony entails the entire loss of goods and chattels, but, except in the case of murder, the forfeiture of the criminal's interest in lands in such cases only extends to the profits accruing during his life, and afterward restoration of the land is made to relatives. When murder is committed the right of retaining and enjoying the profits of the land continues in the estate a year and a day after the wrong-doer's death, with power to commit waste. The only offense which now results in a complete confiscation of the offender's property, to be forever vested in the crown, is that of treason. There are a few minor offenses to which this kind of punishment is also attached. For instance, striking a person in the superior courts at Westminster, or drawing a weapon upon a judge there presiding, causes a forfeiture of the profits of the offender's land during his life. Forfeiture, in all cases after conviction and attainder, has a retrospective operation, so as to nullify all transfers or incumbrances that may have been effected since the commission of the offense.

In the U. S., forfeiture, as a general mode of punishment for crime, has never existed. There is a provision in the Constitution that "no attainder of treason shall work corruption of blood or forfeiture, except during the life of the person attainted." This restriction appears to have been copied in substance from the English statutes of 7 Anne, c. 21, and 17 Geo. II., c. 29. The language of the first of these acts is "that no attainder for treason shall extend to the disinheriting of any heir, nor to the prejudice of the right or title of any person or persons other than the right or title of the offender or offenders during his, her, or their natural lives only; and that it shall be lawful to every person to whom the right or interest of any lands, etc., after the death of any such offender should or might have appertained if no such attainder had been, to enter into the same" (sec. 10). Though this phraseology is much more explicit, it is altogether probable that the framers of the Constitution intended to accomplish the same result by a brief form of expression, and to save to the widow of a traitor her dower, and to the heir his estates. Of course it must be understood that this section of the Constitution applies to the result of judicial proceedings, and does not prevent Congress in the case of civil war from treating rebellious subjects as enemies under the law of nations, and seizing their property in that character. This limited authority to declare forfeiture for treason was never exercised until after the breaking out of the civil war in 1861. A previous law of Congress, passed in 1790, had expressly waived the right to impose such a punishment by providing that "no conviction or judgment for any capital or other offense shall work corruption of blood or any forfeiture of estate." The crisis of the civil war was thought to demand more stringent coercive and punitory measures, and in 1862 an act was passed providing for the confiscation of the property of certain classes of persons, but containing the restriction that no punishment or proceedings should be construed to work a forfeiture of the real estate of the offender longer than his natural life.

There are certain specific classes of offenses in regard to which particular statutes have been enacted by Congress exacting the forfeiture of property employed as a means of committing the wrongful act or used in an unlawful transaction; but forfeiture in such cases applies only to the particular property designated, and not generally to chattels or lands, as in the other instances which have been mentioned. Thus laws have been passed from time to time providing that smuggling or importation of goods under fraudulent invoices shall cause a forfeiture either of the entire invoice or of the property wrongfully imported. Acts of piracy entail a forfeiture of the piratical craft and its appurtenances. The same was formerly true of vessels engaged in the slave-trade.

The constitutions of many of the States of the Union, or the laws which they have enacted, contain substantially the same provisions, prohibiting the general forfeiture of a criminal's property, as the laws enacted by Congress.

Revised by T. W. Dwight.

Forfic'ula [Lat. *forficula*, small scissors]: See Entomology.

Forficu'lidæ: a family of insects the members of which have received in Great Britain the common name "earwigs." The scientific position which these insects should occupy is rather uncertain. Some authors place them in the order *Orthoptera*, along with the cockroaches, grasshoppers, etc., while others make a distinct order—*Dermaptera* or *Euplexoptera*—for them. See Entomology. J. S. K.

Forge [from O. Fr. *forge* < Lat. *fa'brica*, workshop, deriv. of *fa'ber*, smith]: a workshop and plant for the working by the hammer, or the hammer and rolling-mill combined, of wrought iron, steel, copper, etc., at a red or white heat. The Bloomary (*q. v.*) is often called a forge. The different forms of forge are very numerous, according to the kind of work to be turned out. The aid of steam is often called in, not only to furnish the air-blast, but to move powerful hammers, to hoist and turn masses of iron, and the like. The rolling-mill, a comparatively recent invention has for some purposes superseded the forge.

Forgery [from Fr. *forgerie*, deriv. of *forger*, make, form, devise < Lat. *fabrica're*, make, manufacture]: the wrongful making or alteration of a writing with intent to deceive and defraud by its fictitious appearance of genuineness. The essential criminality of the offense lies in its tendency to prejudice the rights and interests of innocent third persons, by giving to an instrument an apparent legal efficacy which it would not otherwise have possessed; and the application of this test as a criterion determines both the kind of writings of which forgery may be committed, and how great a degree of change is necessary to be effected in their form and appearance in order to constitute the crime. Thus the writing must be of such a nature that, whether fictitiously fabricated as a whole or only in part, its use and circulation would be calculated to occasion pecuniary loss or some infringement upon or injury to legal privileges, or the creation of a liability to which the person injuriously affected ought not to be subjected. The instrument must be legally capable of effecting a fraud. Hence if its only tendency would be to injure some person's feelings, violate his confidence, or convey false information, without otherwise affecting his interests, no forgery would be committed. But whenever the writing might be made the foundation of a legal liability, as if one should wrongfully make or alter a note or a bill of exchange, or wherever it might cause a wrongful disposition of property or occasion the loss of a situation of pecuniary benefit—in these and similar cases the unwarrantable falsification is sufficient to constitute the offense of forgery. Instruments which are manifestly of a pecuniary nature, by directly entitling their possessor to the receipt of money, may be forged, and a letter of recommendation to a servant or a schoolmaster by which he might obtain a lucrative position, or a representation as to the financial credit and standing of a merchant by reason of which those trusting him might be deceived, would come within the same category. The same is true of instruments which unwarrantably prejudice any legal right by effecting a fraud, as a deposition to be used on the trial of a cause in court or a copy of a writing to be used in evidence. If a writing be invalid on its face, it can not be the subject of forgery, since its power to prove deceptive would be nullified by its own contents. But the invalidity must be readily apparent, for if only discoverable upon examination—though but slight examination would be required—the criminal nature of the instrument is in no way diminished.

The degree of fabrication or alteration of an instrument need be only sufficient to render a fraudulent deception possible. Consequently, the entire contents need not be fictitious, but a very slight change, either by insertion, alteration, erasure, or other material modification of the terms of any writing, which would be effectual in giving it a seeming validity or varying its tenor, would be enough to constitute forgery. This may consist either in the addition of a false signature to a true instrument, or a real signature to a false one, in the insertion of paragraphs or clauses, or the change of words, or even of letters, if the legal effect of the instrument be thereby altered. Appending the signature of a fictitious person or of one no longer living to an instrument is as fraudulent an alteration as imitating the name of a person still living and generally known. A printed or engraved document, as a railroad-ticket or pass, may be forged, as well as one that is in writing; but when the thing in which the alteration is effected is one which does not consist, in its essential nature, of some form of language, no change of words used in connection with it will be sufficient to constitute a forgery. Therefore the change of an artist's name in the corner of a painting, in order to deceive the public, and fraudulently induce a purchase for more than its value, is not forgery.

As in other criminal offenses, an evil intent is a necessary element in the offense of forgery. But this principle does not require that there should have been a definite purpose to injure a particular person, but only that the instrument forged shall be intended to be used as if it were genuine. Consequently, if the wrong-doer in using the fictitious paper faithfully designs to take such subsequent measures as shall avert all possibility of injury, he is nevertheless guilty of the crime. By so employing the instrument that others may be defrauded he is conclusively presumed in law to have been actuated by criminal motives. But if a person, believing himself with good reason duly authorized to act as agent in the use of another's signature, does employ it, and has in fact no justification, he is not chargeable with forgery, because his wrongful act was induced by no fraudulent purpose. Generally, wherever an actual forgery is committed, intent is presumed from the mere circumstance that the act was committed.

It is not necessary that any actual injury should result from the offense. It is sufficient, at common law, that the writing has such a deceptive character that if once put into circulation it will, according to natural and reasonable anticipation, entrap and mislead those to whose hands it comes, to the injury of their lawful interests. Whether the person whose writing is imitated or whose name is assumed be immediately affected by the forgery, or loss is occasioned to third persons, is entirely immaterial. The offense is complete without regard to the persons affected.

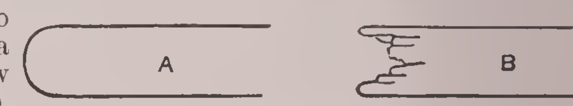
Besides forgery prejudicial to the rights of individuals, there exist, both at common law and by statute, varieties of this offense more immediately affecting the public. Of this nature are frauds and fraudulent alterations of any matter of record or of any authentic matter of a public nature, as a parish register, etc. Various statutes in Great Britain have specified numerous other instances in which fabrication or alteration of public documents is made punishable.

In the U. S., Congress and the State Legislatures severally have enacted special laws against forgery. This crime against the general Government can be punished only under the acts of Congress; but, as a general rule, it is held that the State statutes, unless inconsistent with the common law, do not supersede the principles of the common law, so that an offender may be prosecuted either under the statute or not, as may be thought desirable. Some States, however, have discarded the common-law procedure entirely.

The offense of uttering forged instruments—i. e. of attempting to effect a fraudulent deceit by making actual use of them—was not a necessary ingredient in the crime of forgery at common law, but was specifically provided for by statutory regulations. In some of the States uttering has been made an essential element in this offense, while in others it is still considered a distinct crime. (The statutes of the separate States must be consulted.) The word, as used in extradition treaties between the U. S. and foreign nations, would have a signification confined to that in which the word was employed in the general jurisprudence of the respective nations. It would not include the special statutory definition of forgery in one of the States. See EXTRADITION. Revised by T. W. DWIGHT.

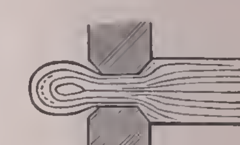
Forget-me-not: the *Myosotis palustris* of Europe, a plant of the Borage family, sparingly naturalized in the U. S., and prized by people of many nations as the emblem of constancy in friendship and love. The U. S. has a number of forget-me-nots, mostly common to the two hemispheres. They generally have brilliant blue flowers. Many varieties appear in cultivation; one of the most brilliant is the dark-blue forget-me-not of the Azores (*M. azoricura*), now widely cultivated in hothouses.

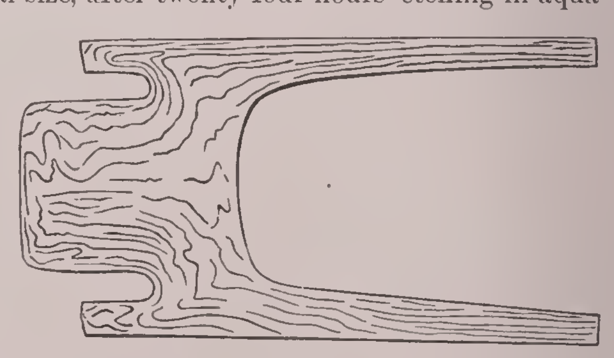
Forging: the reduction of iron or steel at a high temperature to any desired shape by means of blows of a hammer or the like. Originally all forging was done by hand, but now most kinds of work is done by the steam-hammer, and finished by hand in some cases. The rolling-mill has also superseded the forge to some extent, doing its work much more rapidly, and generally quite as well. In *hydraulic forging* the powerful and continuous pressure of a hydraulic press is substituted for the repeated blows of a hammer in shaping the iron or steel. A swedge, or mold, of the desired object is necessary, and under the proper conditions of temperature the metal may be forced into every angle and recess as perfectly as if made fluid by fusion and cast; but objects so made are very much stronger than castings, and are claimed to be even superior to forgings made in the ordinary way. The process has been carried to great perfection, after years of patient experimenting, by Mr. Haswell at the machine-shops of the Imperial State Railway Company of Austria, in Vienna. It is used there chiefly for forming such parts of locomotives as cross-heads, link-bars, axle-box frames, and for car-wheels and various other intricately formed parts of railway rolling-stock, where superior strength and lightness are important. It is also used instead of heavy steam-hammers for drawing down large ingots of Bessemer steel. The results appear to justify the conclusion that ingots so treated give stronger and more homogeneous bars than are obtained by hammering. At Vienna two large hydraulic presses were in use—one with a piston 24 inches in diameter, giving 1,200 tons pressure, and one with an 18-inch piston, working up to 600 tons pressure. The pressure in the pumps is 600 atmospheres. A press of more recent construction, made in France, exerts a pressure of 1,800 to 2,000 tons, and can be run at a speed of 30 squeezes a minute. A double press on the same plan, built at the Krupp works, and giving a maximum pressure of 6,000 tons, is used there for forging armor plates. The action is vertical; the piston descends upon the work, and for forging ingots has a hammer-like head opposed to an anvil of the usual form below. In drawing down an ingot, say of one ton weight, of soft Bessemer steel, the work begins at one end, and after each squeeze by the descending piston the mass is pushed along until the first half of the length of the ingot has been acted on, when it is turned end for end. It is then turned over and back and forth, as is usual under a hammer, until the whole has been drawn down to the required size. In this operation there is no noise or jar. The piston descends slowly, but irresistibly, and forces the hot metal each way as if it were a mass of soft putty. The work is effectively performed, and it requires less time than ordinary forging or rolling. The pressure affects the very center of the mass of the ingot. Its action is by no means superficial, and it is far more effectual in modifying the structural condition of the bar than blows on the surface can be. There is no distribution of the force of the blow through the anvil to the foundation, as there is in the violent impact of a steam-hammer. The ingot yields gradually to the pressure, and bulges out at the sides and end as in Fig. A, and is not drawn over more at the surface than at the center, so as to give a ragged hollow end (Fig. B),



such as is usually formed under hammers and rollers.

Before the forging of an ingot is completed a distinct structural arrangement of the steel is developed, and is seen most distinctly when the hot steel sinks down under the pressure. As the piston-head descends into the mass, and squeezes it upon the anvil, the lines of structure visible in the sides of the ingot bend downward, and are compressed as shown in the annexed cut, the movement extending to the very center of the mass. This structure or "fiber" is doubtless the result of a difference in chemical constitution in planes approximately parallel to the squeezing surfaces, and, so regarded, the process may be considered to be more favorable to the development of structure or "grain" than ordinary forging. But, from whatever cause it originates, this grain is an important factor of strength in pressed forgings, and characterizes them in a remarkable manner, as was beautifully exhibited at Vienna in a series of forged objects which had been sawn asunder and etched so as to show the grain. These structural peculiarities are most distinct in the pressed forgings made from piled iron masses, and are beautifully shown in etched sections of irregular angular objects like cross-heads, as in the figure, a section of a cross-head, about one-eighth natural size, after twenty-four hours' etching in aqua regia:





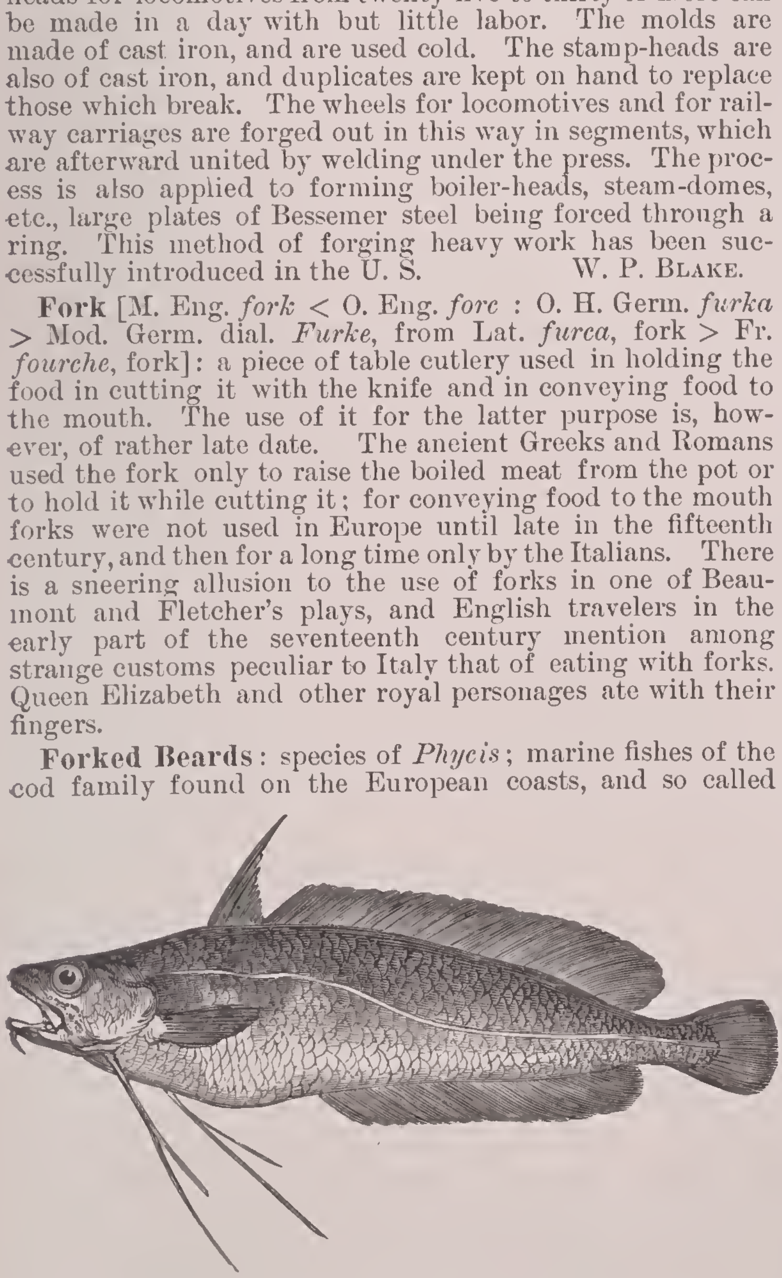
The lines of the grain, it will be seen, conform in a remarkable degree to the form of the mass, winding in and out around the curves and angles in such a manner as to give the greatest strength where it is most needed. These lines show in a very interesting way the flow or movement of the viscid metal when under pressure. Experience has taught that very sharp angles in some parts of molds interfere with the proper flow of the metal. This difficulty is avoided by rounding off the angles, or by building them out so as to give more space for the metal to move in. The superfluous metal is cut away, leaving the internal curves of the grain in the best shape for the strength of the object.

In forging such objects as the parts of machines weighing from 50 to 150 lb. or more, a mass or ball of metal is cut as nearly as possible of the required weight from the end of an ingot, and is heated nearly white hot preparatory to being thrown into the mold. The molds are made of iron or steel, in several parts if necessary, and these parts are securely held together by bands of wrought iron. They are left open at the top for the reception of the metal and for the descent of the plunger or follower, which is attached to the piston-head of the hydraulic press. The shape of this follower, called by the workmen the "stamp," determines the shape of the inside of the object to be formed. The mold is placed directly under the piston-head. All the parts being properly adjusted, and the inside of the mold and the surface of the plunger being smeared with thick oil or grease, a mass of hot steel is thrown into the open top of the mold; the plunger is brought slowly down, and pushes the hot metal before it into every part and recess of the mold. The excess of metal, if any, after the mold is filled, rises on each side of the plunger and protrudes. This leaves a wing or "burr," which is afterward easily cut off with chisels; but a little practice enables the workmen to cut off masses so near the required weight that there is but little excess to be trimmed off. When the stamp has reached the required depth the pressure is removed; the key which attaches the stamp-head to the piston is knocked out; the piston is raised out of the way, and the mold and contents are removed from the bed of the press. A few blows of a sledge-hammer detach the fastenings of the mold and liberate the forging, which is thrown aside to cool. If the work has been well done, all the angles of the object are full and solid. All pieces pressed in the same mold are alike in dimensions, and there is no great excess of metal in any part to be cut away.

The rapidity with which intricate forgings are made is one of the greatest advantages of the method. It is especially adapted to heavy work, where there are many angles and interior surfaces to be shaped. Of such objects as cross-heads for locomotives from twenty-five to thirty or more can be made in a day with but little labor. The molds are made of cast iron, and are used cold. The stamp-heads are also of cast iron, and duplicates are kept on hand to replace those which break. The wheels for locomotives and for railway carriages are forged out in this way in segments, which are afterward united by welding under the press. The process is also applied to forming boiler-heads, steam-domes, etc., large plates of Bessemer steel being forced through a ring. This method of forging heavy work has been successfully introduced in the U. S. W. P. Blake.

Fork [M. Eng. *fork* < O. Eng. *forc* : O. H. Germ. *furka* > Mod. Germ. dial. *Furke*, from Lat. *furca*, fork > Fr. *fourche*, fork]: a piece of table cutlery used in holding the food in cutting it with the knife and in conveying food to the mouth. The use of it for the latter purpose is, however, of rather late date. The ancient Greeks and Romans used the fork only to raise the boiled meat from the pot or to hold it while cutting it; for conveying food to the mouth forks were not used in Europe until late in the fifteenth century, and then for a long time only by the Italians. There is a sneering allusion to the use of forks in one of Beaumont and Fletcher's plays, and English travelers in the early part of the seventeenth century mention among strange customs peculiar to Italy that of eating with forks. Queen Elizabeth and other royal personages ate with their fingers.

Forked Beards: species of *Phycis*; marine fishes of the cod family found on the European coasts, and so called



Great forked beard.

from their forked ventral fins, the rays of which are very slender, like barbels. The forked beards of the U. S. waters (*Phycis chuss* and *tenuis*) are called hake, but are much superior in quality to the true hake.

Forkel, Johann Nikolaus: German musical composer and author; b. at Meeder, near Coburg, Feb. 22, 1749; studied at Göttingen 1769–79; was director of music to the university in 1779; member of the academy of Stockholm 1804. Published *General History of Music* (2 vols., 1788–1801, unfinished); *Life of Sebastian Bach* (1803; new ed. by Peters, 1855); and other works. D. at Göttingen, Mar. 17, 1818.

Forlì, fōr-lē′: province of Italy; on the Adriatic; area, 719 sq. miles. Its coast region is low and unhealthful, but very productive. Sulphur is mined, and the manufacturing interests are important. Pop. (1890) 274,042.

Forlì (anc. *Forum Livii*): town of Italy; capital of the province of Forlì; beautifully situated between the rivers Ronco and Montone; at the foot of the Apennines; in the center of a fertile and well-cultivated plain; 40 miles S. E. of Bologna (see map of Italy, ref. 4–D). It is handsomely built, and contains a number of interesting monuments—the cathedral, with the beautiful chapel of the Madonna del Fuoco, where is found the masterpiece of Carlo Liguani, the Church of S. Girolamo, with frescoes by Melozzo da Forlì, and a *Conception* by Guido Reni, etc. It has also many excellent educational and charitable institutions, and manufactures of silk ribbons, oil-cloth, matches, and tiles. It was founded in the third century before Christ. After the fall of the West-Roman empire it became a republic with an oligarchic form of government, generally with some great family at its head, but in 1503 Julius II. conquered it, and from then till 1860 it was incorporated with the Papal States. Pop. (1895) 45,200.

Forlì, Melozzo, da: painter; b. in Italy in 1440; generally supposed to be a pupil of Piero della Francesca. Although of wealthy parentage, he apprenticed himself as workman to a great master in order to learn his art. Little is known about his life, although he contributed greatly to the progress of art. One of his best works, in the chapel of the SS. Apostoli at Rome, in which he represents our Savior's ascension, was executed in 1472. Besides many works in Rome he painted at Forlì, his native place; Ferrara also possesses exquisite fragments of his painting. D. in 1492. W. J. S.

Form [M. Eng. *forme*: Germ. *Forme*, *form*, from O. Fr. *forme* < Lat. *forma*, shape, form]: in philosophy, the essence of a thing; that which makes a thing what it is, and is permanent. The history of this as a philosophical term begins with the doctrine of Pythagoras respecting numbers. In them is to be found the first dawn of the thought of a principle of form, which was developed by Socrates and Plato into the famous doctrine of ideas (= forms, εἴδη ἰδέαι). To these, in opposition to Heraclitus's theory of universal flux, Plato assigned an independent and eternal existence (Aristotle, *Metaph.*, bk i., cap. vi.), and made them the archetypes of which individual things are the more or less imperfect copies, existing through participation. Aristotle severely criticised the Platonic doctrine, denying the independent existence of archetypal *forms*, and making *form* one of the four αἰτίαι, or grounds of existence. He, however, uses the term in a narrower and in a wider sense. In the former it is the second of the αἰτίαι, constituting, as the inner principle of realization (distinguished from μορφή, or external form), the substance of things. In its wider signification it includes formal, efficient, and final causes, and thus stands opposed to the material principle as actuality to potentiality. In this sense the spiritual is pure form, and the soul the "form of forms." (See Biese, *Philosophie des Aristoteles*, vol. i., p. 439; Trendelenburg, *Aristotelis de Anima lib iii.*, pp. 301, *seq.*; Bonitz, *Aristotelis Metaphysica*, p. 325, *et passim*; Von Hertling, *Materie und Form*, pp. 48, *seq.*; Ueberweg, *Hist. of Philosophy* (Eng. trans.), vol. i., p. 162; Grote, *Aristotle*, vol. i., p. 354; vol. ii., p. 354, *et al.*; Lewes, *Aristotle*, p. 117.) The term underwent little change of meaning until the time of the Neoplatonists, who tried to fuse the teachings of Plato and Aristotle. In Plotinus, *form*, instead of being conceived as an αἰτία, is placed in the category of substance, constituting, along with matter (ὕλη) which is not regarded as its substratum merely, substance. (Plotin., *Enneads*, ii., bk. iv.; Kirchner, *Die Philosophie des Plotin.*, pp. 106, *seq.*; Richter, *Plotin's Lehre vom Sein*, pp. 96, *seq.*) The Scholastics were mostly guided by the authority of the ill-understood philosophy of the ancients, especially of Aristotle.

Robert Greathead, for example, who wrote commentaries on Aristotle, distinguished three kinds of forms—form immanent in matter, abstract form, and immaterial form. Albertus Magnus held that form existed potentially in matter; and Thomas Aquinas recognized a *forma substantialis*, or objective universal, and *formæ accidentales*, or subjective abstractions. With him, as with Aristotle, God is pure form—immaterial, as being entirely actual, without potentiality.

Bacon, the most successful of the opponents of Scholasticism, flattered himself that he had broken with antiquity more than he really did. He identified form with law or mode, and even maintained that, as far as thought is concerned, the form of a thing is the very thing itself. (*Nov. Org.*, ii., 13.) The philosophy of Bacon and Locke came to a standstill with Berkeley and Hume, and the reaction called forth on one hand the Scotch or common-sense philosophy—on the other, the Kantian or critical philosophy. In the latter the word *form* has a purely transcendental meaning—that is, the forms, whether of intuition or of thought, are regarded as native to the mind and prior to experience. The *forms* of intuition are space and time. The *forms* of thought are (*Proleg.*, pt. ii., § 20):

1. QUANTITY.	2. QUALITY.	3. RELATION.	4. MODALITY.
Unity,	Reality,	Substance,	Possibility,
Plurality,	Negation,	Cause,	Existence,
Totality.	Limitation.	Reciprocity.	Necessity.

These categories of the understanding stand opposed to the transcendental object or *Ding an sich* (thing in itself), which corresponds to the Aristotelian ὕλη, but is treated less philosophically. Since Kant, this has been the meaning of *form* in German philosophy, except that since Hegel *form* has been conceived as objective as well as subjective, pure knowing being identical with its object. In the Scotch and modern materialistic and cosmic schools the word has no true philosophic meaning. Thomson calls *form* "the means of viewing objects presented to the mind." *Outline of Laws of Thought*, 2d (English) ed., p. 34. THOMAS DAVIDSON.

Formal Cause: in philosophy (Aristotle, *Metaphys.*, v., 2), the form, archetype, idea, or pattern of anything. Thus the intention or design (idea) of the artist is a formal cause of the statue. The formal cause is the *quidditas* of the Schoolmen.

Formates: salts of formic acid.

Formation: in geology. See BED and GEOLOGY.

For'mes, KARL: singer; b. at Mülheim-on-the-Rhine, Aug. 7, 1810; made his first appearance on the stage Jan. 6, 1842, at Cologne as Sarastro in *The Magic Flute*. He sang with great success in Vienna, London, and other European capitals. In 1857 he went to the U. S. and led a wandering life, dying in San Francisco, Dec. 15, 1889. His voice was a deep and powerful bass of high culture and great flexibility. D. E. HERVEY.

For'miæ: a city of ancient Italy, on the site of the town now called *Formia*. Its origin is unknown. It was on the Appian Way and on the Sinus Caietanus, and has always been famed for its beautiful situation. Cicero and many other Romans had villas here, and at Formiæ the great orator was murdered. A structure called the tomb of Cicero is still shown.

Formic Acid [*formic* is from Fr. *formique*, deriv. of *fourmi*, ant (but subjected anew to the influence of its original), Lat. *formi'ca*, ant]: $HCHO_2$, the simplest member of the fatty series of acids, derives its name from the ant (*formica*), from which it was first prepared. It occurs in the juice of the stinging nettle and in other plants; in the ant, especially the red ant, and is projected by it as a means of defense; in some caterpillars; in human blood, urine, flesh-juice, and perspiration; in some waters. It is formed by a great variety of chemical reactions. Potassic hydrate heated in carbon monoxide is changed to potassic formate—$CO + KHO = KCHO_2$. Potassium spread on the inner surface of a jar of carbon dioxide over water is converted into a mixture of potassic formate and acid carbonate—$CO_2 + K_2 + H_2O = KCHO_2 + KHCO_3$. Wood-spirit (wood-naphtha or methylic alcohol) is oxidized in presence of platinum black into formic acid—$CH_4O + O_2 = HCHO_2 + H_2O$. It is prepared (1) by distilling red ants, previously mashed; (2) by distilling 10 parts of tartaric acid, 14 parts of manganese dioxide, and 35 parts of water; (3) by distilling 1 part of starch with 4 parts of water, 4 parts of manganese dioxide, and 4 parts of sulphuric acid, added in small quantities; (4) by gently heating 10 parts of oxalic acid, with 10 of glycerin and 2 of water, to about 212° F. for twelve or fifteen hours, then adding 5 parts of water and distilling. The addition of water and distillation are repeated till 60 parts of the dilute acid have been distilled off. The pure concentrated acid is prepared by saturating the impure dilute acid with plumbic carbonate, crystallizing the plumbic formate, and heating it in a current of sulphuretted hydrogen. The formic acid distills over, and may be freed from sulphuretted hydrogen by a current of carbon dioxide. The concentrated acid is a thin, transparent, colorless liquid, sp. gr. 1·22, boiling at about 212° F. It fumes in the air, and is very corrosive, a single drop placed on the skin causing intolerable pain and producing a painful ulcer. It (or its salts) reduces the oxides and many of the salts of mercury, silver, and gold, forming metallic precipitates.

Formication [from Lat. *formica'tio*, deriv. of *formica're*, crawl like ants, deriv. of *formi'ca*, ant]: one of a group of unnatural sensations felt in the skin to which the general term *paræsthesia* is applied. Formication is so called from the resemblance of the sensation to that produced by the crawling of ants. It is frequently experienced as a result of pressure on the nerves of the leg or arm, the foot or hand being said to be "asleep." It may also be present as a temporary symptom in poisoning by aconite. As a more permanent symptom formication, together with other forms of paræsthesia, such as burning sensation, feeling of water running over the skin, etc., occurs in various forms of spinal disease. All of these symptoms may or may not be associated with *anæsthesia*, the loss of sensation in the skin.
WILLIAM PEPPER.

Formo'sa, or **Bermejo**: a territory of Argentina; created in 1884 from the northern part of the old territory of Chaco; bounded N. E. and E. by the rivers Pilcomayo and Paraguay, separating it from Paraguay S. W. by the river Bermejo, separating it from Chaco, W. by Salta, and N. by Bolivia. Area, 73,000 sq. miles. Physically it is entirely comprehended in the great plain of the GRAN CHACO (*q. v.*), and the interior is very imperfectly known. Pop. (1895) 4,829, exclusive of wild Indians. Villa Formosa, the capital and only civilized town, on the Paraguay, has 1,000 inhabitants, and is the center of an agricultural colony. H. H. S.

Formosa: a large and important island which belonged to China until 1895, when it was ceded to Japan by the Treaty of Shimonoseki. It lies about 90 miles E. of the Chinese province of Fuhkien, of which it was a foo or department until 1886, when, with the Pescadores and other adjoining islands, it was erected into a separate province. Among the Chinese it is called *Taiwan*, or "Terrace Bay," the name *Formosa*, "the beautiful," by which it is known to foreigners, having been given to it by the Portuguese, the first Europeans to visit it, near the close of the sixteenth century. See TAIWAN.

Area, Topography, etc.—The island stretches in a general N. E. and S. W. direction from 25° 19' to 21° 54' N. lat. It is 237 miles in length, has an average breadth of 70 miles, and an estimated area of about 15,000 sq. miles. The southern half lies within the tropics. It has two well-marked physical divisions: (1) a plain about 20 miles in breadth, extending along the west coast for nearly the whole length of the island, and (2) a great forest-covered mountain-system which occupies the rest of the island. Through the center of this region runs a chain of lofty peaks, of which Mt. Sylvia (11,500 feet) and Mt. Morrison (12,850 feet) are the chief. The east coast is bold and precipitous, the mountains in some places rising sheer out of the water to a height of 6,000 to 7,000 feet. The water off shore is consequently very deep, while on the west coast it is remarkably shallow. There are no harbors and few good anchorages on either of these coasts.

Tamsui and Kelung in the north, at the mouths of the Tamsui and Kelung rivers respectively, afford the best harbors.

Geology.—Little is known of the geology of the island. The mineral products include coal, sulphur, and petroleum; and iron ore, gold, and silver are also found. The coal, which is a soft bituminous, is abundant and of good quality. Since 1877 it has been extensively mined near Kelung by the Chinese Government, under foreign superintendence. The petroleum wells, also found in the north, are still undeveloped.

Soil and Productions.—The soil is rich and very productive, and vegetation is exceedingly luxuriant. Bamboos of great size abound, and the mountains are covered with forests of gigantic camphor-trees (*Laurus camphora*) and other valuable timber-trees. The principal agricultural products are rice (two crops yearly), wheat, barley, millet, maize, pulse, yams, peanuts, etc. Among the other products are tea, sugar, tobacco, indigo, jute, hemp, ramie or China-grass, etc. The tea, which is grown in the north, is superior to that of Japan, but inferior to that grown on the mainland. The U. S. take most of it. The sugar is of two kinds, and goes mostly to Japan. Much camphor-wood is exported, and the trade in camphor is considerable. The product in 1890 amounted to 100,833 piculs. Until Feb. 9, 1891, the camphor-trade was a Government monopoly. A license is necessary, and a garrison tax is levied by the Government to defray the expense of maintaining troops in the interior to protect the stills and workmen from attack and injury by the aborigines.

Climate.—Though partly within the tropics, the heat is never excessive. At Taiwan-fu (see TAINAN), the present capital, the atmosphere is clear and bracing, and the cold is never as great as at Hongkong, which lies farther S. In the north, and especially about Tamsui, the rainfall is great, and the rainy season lasts from the end of November to the beginning of May. The temperature is higher than in the same latitude on the mainland, but the dampness of the air makes it unpleasantly cold.

Population and Races.—The population of the island, usually estimated at 3,000,000, is composed (1) of settlers from the mainland of China, chiefly from Fuh-kien and Kwang-tung, and (2) native or aboriginal tribes of distinctly Malay type, who now occupy the mountainous regions and the east coast. The Chinese settlers occupy the plain which borders the west coast and the regions of the north, while between them and the uncivilized aborigines are found HAKKAS (*q. v.*) and Hoklos, also immigrants from China, who live in towns and villages of their own, as well as the semi-civilized aborigines, with whom they, as well as the Chinese, frequently intermarry. The independent tribes who do not recognize Chinese authority are usually known as *Sŭng-fan* (locally *Chi-hwan*), "raw" or untamed foreigners; while those who have been brought under civilizing influences are known as *Suh-fan* (locally *Sek-hwan*), "cooked" or tamed foreigners, or as *Pepo-hwan*, "foreigners of the plain." The aborigines (who now number about 60,000) are divided into numerous clans, and speak several distinct dialects. They are tall and active, and have given much trouble to the Chinese settlers. Tattooing is in vogue among them.

Trade and Commerce.—Four towns were opened by the Chinese to foreign trade and Japan continues the arrangement, viz.: TAIWAN-FU (*q. v.*); TAKOW (*q. v.*), 22 miles farther S.; TAMSUI (*q. v.*), on the northwest coast; and KELUNG (*q. v.*), on the north. The net foreign imports, cottons, woolens, lead (for tea-chests), matches, kerosene, etc., amounted in 1892 to 3,745,158 haikwan taels, and the exports, comprising coal, tea, rice, sugar, camphor, gold-dust, beans, hemp, etc., to 4,459,829 haikwan taels. See FORMOSA in the Appendix.

History.—Formosa seems to have been known to the Chinese as early at least as the Sui dynasty (581–618), an expedition having been sent to it in 603. It was not until 1683, however, that Chinese authority was established there. Attempts seem to have been made by the Spanish to establish settlements in the north. During the period Wan-leih (1571–1619) of the Ming dynasty the Japanese took possession and held part of the island, but were driven out by the Dutch, who had gained a footing on the Pescadores, in 1621, and later on the main island, where, in 1624, they built a fort called *Zealandia*, and another named *Providentia*, at the principal harbor on the west coast (now called Taiwan). After many conflicts with the aborigines on the one hand, and on the other with the Chinese settlers who flocked to Formosa from Fuh-kien during the troubles connected with the overthrow of the Ming dynasty by the Manchus, and especially with KOXINGA (*q. v.*), a famous pirate chieftain, the Dutch were forced to withdraw in 1662, and Koxinga proclaimed himself king. During the K'ang-hi period the title of king was abolished and a governor was appointed, but it was not until 1683 that the island passed into the full control of the Chinese Government, by the surrender by the grandson of Koxinga of all claim to it.

Formosa was again opened to foreign trade and residence by the treaty of Tientsin (1860). Roman Catholic missions were first established there in 1859, and Protestant missions in 1865, and their success has been very great. Traces are still found of the Christian work carried on by the Dutch. In 1874 the Japanese sent an expedition to Formosa to punish the natives for the massacre of the crew of a Japanese vessel that had been wrecked on the coast in 1872, and a war with Japan was averted only by the Chinese agreeing to pay half a million taels to the friends of the murdered men, and by purchasing the buildings the Japanese had erected during their occupancy of the coast. In 1885, when the French captured Kelung and endeavored to take possession of the island, the governor removed his capital to Tai-pak-fu, which is practically a part of the important city of Twatutia, 10 miles from Tamsui and 30 by rail from Kelung. From Twatutia the railway runs S. as far as Sin-chu (about 35 miles), and is being pushed farther S. still. In Nov., 1895, Taiwan-fu (see TAINAN) again became the capital. The telegraph has been introduced, and a cable connects the island with Fuh-chow. See Appendix. R. LILLEY.

Formo'sus: Bishop of Porto; became pope in 891; d. May 23, 896. His election caused much controversy during and after his pontificate, as the canons at that time forbade a transfer of bishops from one see to another; and Pope Stephen VI. caused his body to be dug up and cast into the Tiber as an intruder, but a council, presided over by John IX., declared the pontificate of Formosus valid and confirmed his acts as pope.

Forms of Address: the titles to be used in addressing written communications to individuals. In European countries and in all countries where rank and title prevail the forms of address to be followed are a matter of much complexity. In the U. S. these forms are less varied and numerous, and an adherence to them is not so absolute. Common usage has sanctioned the employment of the following forms: The President of the U. S., Governors of States, and ministers to foreign countries are addressed as "His Excellency the President of the United States," etc. This custom is now sanctioned by law. Vice-President, heads of executive departments at Washington, chief justice of the U. S., Lieutenant-Governors of States, and mayors of cities, "The Honorable the Vice-President of the United States," etc., or "The Hon. —— ——, Vice-President of the United States," etc. Senators and Representatives of the U. S., or of the several States, judges, and consuls, "The Hon. —— ——," to which may be added their official designation.

Ex-Presidents and other ex-officials are addressed simply as "The Hon. —— ——."

Usage differs as to the title "Honorable" in different parts of the U. S. In New England the title is limited quite strictly to State officers, members of Congress, judges, State Senators, and mayors of cities, and is not usually given to members of the lower house.

Cardinals: "His Eminence —— ——, Cardinal Priest (or Cardinal Deacon, as the case may be) of the Holy Roman Church."

Archbishops: "The Most Rev. —— ——, D. D."

Bishops in the Roman Catholic and Episcopal Churches: "The Right Rev. —— ——, D. D."; in the Methodist Church: "The Rev. Bishop —— ——, D. D."

Ministers of the gospel: "The Rev. —— ——," or "Rev. —— ——."

Physicians and surgeons: "Dr. —— ——," or "—— ——, M. D."

Lawyers or private gentlemen: "—— ——, Esq.," although in the case of unprofessional gentlemen a plain "Mr. —— ——" is quite usual. The latter form is always used in invitations, and is gaining in favor in common addresses. In addressing both husband and wife the accepted forms are: "His Excellency and Mrs. U. S. Grant"; "Governor and Mrs. John A. Andrew"; "The Hon. and Mrs. Thomas H. Benton"; "The Rev. and Mrs. John Brown," etc. Widows write their names "Mrs. Ellen Smith," not "Mrs. John Smith." For some account of British usage, see COURTESY TITLES.

Forney, JOHN WEISS: politician and journalist; b. at Lancaster, Pa., Sept. 30, 1817; apprenticed in the office of the Lancaster *Journal* in 1833, and in 1837 was editor and joint proprietor of the Lancaster *Intelligencer*; in 1840 he united the two papers. In 1845, in Philadelphia and thereafter, he edited *The Pennsylvanian*, Democratic journal. In 1851–55 was clerk of the U. S. House of Representatives, editing the Washington (D. C.) *Union*, Democratic. Aug. 1, 1857, began *The Press*, Democratic daily, at Philadelphia, supporting Stephen A. Douglas and opposing President Buchanan. He was subsequently clerk of the Thirty-sixth

Congress. At the opening of the civil war in 1861 he urged the vigorous prosecution of the contest by the Northern States, and acted with the Republican party until the nomination of Mr. Greeley, whose election he advocated. From 1861–68 he was secretary of the U. S. Senate and corresponding editor of the *Press*; started during this time the Washington (D. C.) *Chronicle*, weekly, which became a daily in Oct., 1862; visited Europe in 1868, publishing his letters to the *Press* and *Chronicle* as *Letters from Europe* (1869). Sold his property in the *Chronicle* in 1870, but was connected with the *Press*, and later established *Progress*, a weekly journal. D. in Philadelphia, Dec. 9, 1881.

Fornication [from Lat. *fornica'tio*, deriv. of *fornix*, vault, brothel]: unlawful carnal knowledge by an unmarried person of another, whether the latter be married or unmarried. It is usually a misdemeanor, punishable by fine or imprisonment or both.

Forrest, Edwin: actor; b. in Philadelphia, Pa., Mar. 9, 1806. When a mere boy, not twelve years old, he performed as an amateur, taking female and juvenile parts, Young Norval in Home's play of *Douglas* being particularly remembered. His first appearance on the public stage was at the Walnut Street theater, in the *rôle* of Douglas, on Nov. 27, 1820. A long professional tour in the Western cities, during which he undertook characters in Shakspeare, gave him experience and reputation; so that, after filling engagements in Albany and Philadelphia, he presented himself before the New York public at the Park theater in the character of Othello. This was in 1826. His success was signal, owing both to his natural genius and to his superb form and noble presence. At the Bowery he was a special favorite. There and at the Park he played long engagements, but, not satisfied with local fame, visited all the principal cities of the U. S. His chief characters were Othello, Macbeth, Hamlet, Richard III., varied by parts like Metamora and Spartacus, which his fine physique and immense energy made effective and kept popular. In 1835 Mr. Forrest made a professional visit to England and the Continent, finding warm friends, conspicuous among whom was Mr. Macready, to whom he was indebted for much kindness. In 1837, on the occasion of a second visit, he married Catharine Sinclair, daughter of the popular ballad-singer. After 1845 two years more were spent in England. During this visit his friendly relations with Mr. Macready were broken. His partisans entered zealously into the quarrel, which broke out in the bloody riot of May 10, 1849, when Macready was playing at the Astor Place theater in New York. Mr. Forrest announced his retirement from the stage in 1858, but played at intervals till 1871, when compelled by ill-health to desist. After this he appeared as a public reader of Shakspeare. He was a man of fine literary taste and accumulated a large library rich in Shakspeariana. He died in Philadelphia, Dec. 12, 1872. A large part of his great fortune was left by him to establish an asylum for aged and indigent actors. His library, with its best treasures, was destroyed by fire Jan. 15, 1873. See the *Life* by W. R. Alger (1875), and the biography by Lawrence Barrett in the American Actor Series (Boston, 1883).

Forrest, French: naval officer; b. in Maryland in 1796; became a midshipman 1811; lieutenant Mar. 5, 1817; commander Feb. 9, 1837; captain Mar. 30, 1844; and was dismissed Apr. 19, 1861. He distinguished himself in the war of 1812 on Lake Erie, and in the fight between the Hornet and the Peacock Feb. 24, 1813. In the Mexican war was adjutant-general of the land and naval forces. Followed the State of Virginia when she seceded from the Union, and was acting assistant secretary of the Confederate navy. D. at Georgetown, D. C., Dec. 22, 1866.

Forrest, James: secretary of the Institution of Civil Engineers of Great Britain; b. in London, Nov. 30, 1825. He received an ordinary school education, and at the age of sixteen was articled to Messrs. Edward and John Manby, civil engineers, and when their office was removed to Paris he was transferred to that of Mr. Charles Manby, at that time secretary of the Institution of Civil Engineers. From 1845 to 1848 Forrest was engaged upon the Leeds and Dewsbury, the Leeds and Thirsk Railways, the East and West Yorkshire lines and others, under Mr. Thomas Grainger. In 1848 he returned to Mr. Manby, assisting him in the work of the institution. In 1858 he was made assistant secretary of the Society of Arts; in 1856 succeeded Mr. Manby as secretary of the institution. He has been intrusted with the most responsible and confidential work, and has brought into the institution many improvements. During his incumbency the membership has risen from 835 to 6,339, and the income from £3,000 to £25,000. It had been the policy of the older members to limit membership to those engaged in the constructive branch of engineering, excluding, for instance, men who were occupied in the design and construction of machinery. This exclusiveness was resented and led to the formation of the Institution of Mechanical Engineers. Mr. Forrest set himself to induce the council to take the broader view, so that the institution might become the representative of the whole engineering profession, a result which was not fully accomplished until 1886. He is also the actual treasurer, librarian of the extensive library, and personal editor of the *Proceedings*.

W. R. Hutton.

Forrest, Nathan Bedford: soldier; b. in Bedford co., Tenn., July 13, 1821. In 1834 his father removed to Mississippi, and in 1837 died, leaving a large family dependent upon Nathan, who devoted himself to farming. He engaged in business at Hernando, Miss., in 1842; in 1852 became a real-estate broker and dealer in slaves; in 1859 purchased extensive plantations in Coahoma co., Miss., and became a cotton-grower, and acquired a large fortune. Though opposed to disunion, he was an ardent States rights man in politics, and when war became inevitable he espoused the Southern cause with his usual energy. In June, 1861, he joined the Tennessee Mounted Rifles as a private, but in July, at the request of Gov. Harris, of Tennessee, raised a regiment of cavalry, equipping them largely from his own private means. On the organization of the regiment in October he was chosen lieutenant-colonel. At Fort Donelson Forrest bore a conspicuous part, and on the final determination to surrender he remonstrated, and was allowed to attempt an escape with his men before a flag of truce was sent. In this he was successful, reaching Nashville with the main part of his force Feb. 18. On Mar. 10 his regiment reassembled at Huntsville, and a few days later marched to Iuka, Miss. His force was now increased to ten companies, of which he was chosen colonel. Engaged at the battle of Shiloh (Pittsburg Landing) Apr. 6–7, 1862; wounded in combat Apr. 8. In the following June he was assigned to the command of cavalry at Chattanooga, and participated in the attack on Murfreesboro July 13; appointed brigadier-general July 21, 1862, and placed in command at Murfreesboro Sept., 1862; in command of brigade Dec. 4, 1862, and engaged in the action of Parker's Cross-roads Dec. 31, 1862, and battle of Chickamauga Sept. 19–20, 1863. Transferred to North Mississippi in Nov., 1863, he was appointed a major-general the following month, and assigned to the command of Forrest's cavalry department; in command of forces at the capture of Fort Pillow Apr., 1864; promoted to be lieutenant-general Feb., 1865; surrendered at Gainesville May 9, 1865; was subsequently president of Selma, Marion and Memphis Railroad Company until 1874. D. at Memphis, Tenn., Oct. 29, 1877.

Forrest City: town and railway junction; capital of St. Francis co., Ark. (for location of county, see map of Arkansas, ref. 3–E); 45 miles W. by S. of Memphis, Tenn. It has 6 churches, 2 free schools (one for blacks), and a canning-factory. Principal industries, agriculture and stock-raising. Pop. (1880) 903; (1890) 1,021; (1900) 1,361.

Editor of "Times."

Forrester, Alfred Henry (*Alfred Crowquill*): artist and comic writer; b. in London, England, in 1805; educated at Islington; was a notary in the Royal Exchange, but retired about 1839; began contributing to periodicals at the age of sixteen, and afterward drew, modeled, and engraved on steel and wood to illustrate his own writings. *Leaves from my Memorandum-book* (1826) was followed by *Eccentric Tales* (same year.) In 1828 he contributed to the *Humorist* in *Colburn's Magazine*, with Theodore Hook, Disraeli, and others; then to *Bentley's Miscellany*, *Punch*, *The Illustrated London News*, etc. He exhibited large pen-and-ink drawings at the Royal Academy, and gained some repute as a designer and modeler. *Wanderings of a Pen and Pencil*, *The Comic Arithmetic*, *Phantasmagoria of Fun*, etc., are among his works. D. in London, May 26, 1872.

Forreston: village (founded in 1854); Ogle co., Ill. (for location of county, see map of Illinois, ref. 2–E); 107 miles W. of Chicago. It is the terminus of the Ch. and Ia. Branch of the Ch., B. and Q. Railroad, and the junction of the Ch., Mil. and St. P. and the Ill. Cent. Railroads. It has seven churches, a public school with an attendance of 300 pupils, and a creamery. Principal business, farming. The village was incorporated Sept. 21, 1867; under special charter May 11, 1868; under general law Aug. 2, 1888. Pop. (1880) 1,108; (1890) 1,118; (1900) 1,047.

EDITOR OF "HERALD."

Forshey, Col. CALEB GOLDSMITH, A. M.: engineer; b. in Somerset co., Pa., July 18, 1812; educated at Kenyon College, O., and at the U. S. Military Academy at West Point; was Professor of Mathematics and Civil Engineering at Jefferson College, Miss., 1836–38; was thenceforth engaged for many years in important engineering works in the South. Though opposed to secession, he served in the Confederate army during the civil war as lieutenant-colonel of engineers. After the war he was engaged in railway construction in Texas 1865–71, on the improvements at the mouth of the Mississippi, and in the U. S. engineer service on the Red river and in Galveston Bay 1874–75. Prof. Forshay was one of the founders of the New Orleans Academy of Sciences 1853, and was its first vice-president. He was one of the authors of *The Physics of the Mississippi River* (Washington, 1861; 2d ed. 1876). D. at Carrollton, La., July 25, 1881.

Förster, ERNST JOACHIM: painter and writer on the history of art; b. at Münchengosserstadt, Germany, Apr. 8, 1800. His early studies were in theology, philosophy, and philology in the universities of Berlin and Jena, but at the age of twenty-three he devoted himself to painting, under the teaching of Cornelius, one of the founders of the school of which Kaulbach was the most distinguished pupil. Förster's hand is seen in frescoes in the Aula at Rome, in the Glyptothek and Arcade at Munich, and in the chapel of San Georgio at Padua, whose frescoes he restored. But his chief labor was literary. He wrote a large number of works, including a *History of German Art* (3 vols., 1851); *History of Italian Art* (1869); *Studies Relating to the History of Modern Art* (1835); *Letters on Painting* (1838); *Monuments of German Architecture, Sculpture, and Painting* (1855); *History of Modern German Art* (1863); *Life of Raphael* (1867–69); *German Art in Picture and Story* (1879); and guide-books to Munich, Italy, and Germany of great merit. He also wrote a *Life* of Jean Paul Richter, and edited several of his works. Förster was the discoverer of several ancient pictures in Italy, notably of the old frescoes of Avanzo in Padua, which he restored. D. at Munich, Apr. 29, 1885.

Forster, JOHANN GEORG ADAM: traveler and author; b. near Dantzic, Germany, Nov. 26, 1754; accompanied his father, JOHANN REINHOLD FORSTER (*q. v.*), around the world in 1772–75; was Professor of Natural History at Wilna in 1784, and librarian to the Elector of Mentz in 1788; envoy to Paris in 1792. Published *History and Description of the Breadfruit* (1784); *Views of the Lower Rhine, Brabant, Flanders, etc.* (3 vols., 1791), etc. A collection of his letters was published by his widow (2 vols., 1829), and a complete edition of his works was published in 1843. He made a translation of the *Sakuntâlâ* into German, was the tutor of Humboldt, and one of the fathers of modern German literature. D. in Paris, Jan. 11, 1794.

Forster, JOHANN REINHOLD: traveler and naturalist; b. at Dirschau, Germany, Oct. 22, 1729; studied theology at Halle and Dantzic; became pastor at Rassenhuben, near Dantzic, devoting his leisure time to scientific studies. In 1766 he went to England, and for two years was teacher of natural history at Warrington, in Lancashire; in 1772 accompanied Cook on his second voyage, as naturalist, and on his return published *Observations made During a Voyage Round the World* (London, 1778). In 1775 the University of Oxford conferred upon him the degree of LL. D. In 1780 he was appointed Professor of Natural History at Halle. Other works were *Introduction into Mineralogy* (London, 1768); *Flora Americæ septentrionalis* (London, 1771); *Zoölogiæ Rarioris specilegium* (Halle, 1781); with his son Johann Georg and Sprengel, *Treatise on Ethnology and Geography* (Leipzig, 1781–83). D. at Halle, Dec. 9, 1798.

Forster, JOHN: author, editor, and critic; b. at Newcastle, England, Apr. 2, 1812; educated for the bar, but devoted himself to literature, contributing to the London *Examiner*, of which he was editor for ten years; to the *Edinburgh* and *Quarterly Reviews, The Foreign Quarterly Review*, of which he was editor, etc. He also edited the London *Daily News* for a year. From 1855 to 1861 was secretary to the lunacy commission, and from 1861 to 1872 a commissioner in lunacy. His works were *Statesmen of the Commonwealth of England* (1831–34); *Life of Oliver Goldsmith* (1848); *Biographical and Historical Essays* (1859); *Arrest of the Five Members by Charles I.*, and *Debate on the Grand Remonstrance* (1860); *Sir John Eliot, a Biography* (1864); *Walter Savage Landor, a Biography* (2 vols., 1868); *Life of Charles Dickens* (vol. i. in 1871; vol. iii. in 1874); *Life of Dean Swift* (vol. i., 1876). D. in London, Feb. 1, 1876.

Forster, WILLIAM: philanthropist; b. at Tottenham, near London, England, Mar. 23, 1784; became a minister of the Society of Friends in 1803; married Anna, sister of Thomas Fowell Buxton, in 1816. In 1820 visited the U. S.; in 1838 settled as a preacher near Norwich, England; in 1844–45 labored as such in France; in 1846 traveled in Ireland to relieve the distresses there caused by famine. Commissioned in 1849, by the London Yearly Meeting, to present an address on slavery and the slave-trade to rulers in Christendom, he had interviews with European monarchs, and in 1853 with the President of the U. S. and several Governors of Southern States. D. on the Holston river, Blount co., Tenn., Jan. 27, 1854.

Forster, Rt. Hon. WILLIAM EDWARD: English Liberal statesman and orator; b. at Bradpole, Dorset, July 11, 1819; educated at the Friends' School, Tottenham, and was a worsted manufacturer at Bradford. As a Liberal he unsuccessfully contested Leeds in 1859, but was returned to the House of Commons Feb., 1861, for Bradford, and was member of Parliament till his death. Was Under-Secretary for the Colonies in Lord John Russell's administration from Nov., 1865, until July, 1866, and vice-president of the committee of council on education in 1868. Mr. Forster was magistrate and deputy lieutenant for the West Riding of Yorkshire. He had much to do with passing through the House of Commons the Education Bill in 1870 and the Ballot Bill in 1871, and was a strong supporter of the imperial federation scheme. Mr. Forster was a son-in-law of Dr. Arnold of Rugby. In 1874 he visited the U. S. In 1875 he was elected lord rector of Aberdeen University. He was Chief Secretary for Ireland 1880–82. D. in London, Apr. 5, 1886. See *Life* by Wemyss Reid (1888).

Forsyth, JOHN: statesman; b. at Fredericksburg, Va., Oct. 22, 1780; graduated at Princeton in 1799. His father, a Revolutionary soldier of English birth, removed to South Carolina, and thence to Augusta, Ga. John became a distinguished lawyer; was attorney-general of Georgia in 1808; was in Congress 1813–18 and in 1823–27; U. S. Senator 1818–19 and 1829–37; Governor of Georgia 1827–29. U. S. minister to Spain 1819–22; U. S. Secretary of State 1835–41. Forsyth made an able Secretary of State, but his attitude toward Mexico in the complications resulting from the Texan war of independence and his known sympathy with the project of annexing Texas gave rise to much adverse criticism, especially among anti-slavery writers. D. at Washington, D. C., Oct. 21, 1841.

Forsyth, WILLIAM, Q. C., LL. D.: barrister; b. at Greenock, Scotland, in 1812; educated at Trinity College, Cambridge (B. A. 1834, M. A. 1837); called to the bar at the Inner Temple in 1839, and became in 1857 queen's counsel, and bencher of the Inner Temple in 1859. He was standing counsel to the Secretary of State in council for India 1859–74, and M. P. for Marylebone 1874–80. Among his works are *On the Law of Composition with Creditors* (1841); *Hortensius, or the Duty and Office of an Advocate* (1849); *On the Law Relating to the Custody of Infants* (1850); *The History of Trial by Jury* (1852); *Napoleon at St. Helena, and Sir Hudson Lowe* (1853); *Life of Cicero* (1864); *Cases and Opinions in Constitutional Law* (1869); *The Novels and Novelists of the Eighteenth Century* (1871); *Hannibal in Italy, an Historical Drama* (1872); *Essays, Critical and Narrative* (1874); *The Slavonic Provinces South of the Danube* (1876).

Forsythia, fōr-sī'thi-a [named in honor of William Forsyth (1737–1804), a Scotch gardener and pomologist]: a genus of shrubs of the order *Oleaceæ*. The *F. viridissima* and *F. suspensa*, small Chinese shrubs, very common in cultivation, are very hardy, and conspicuous for their yellow flowers which appear in early spring before the leaves.

Fort: a fortification, usually inclosed and provided with flanking arrangements and accessory means of defense, which generally are lacking in the smaller works known as REDOUBTS (*q. v.*). In the U. S. the military posts of the interior are known as forts, although generally without fortifications of any kind. For further information as to FORTIFICATIONS, see that title. JAMES MERCUR.

Fort Adams: a fortification constructed on Brenton's Point, entrance to Newport harbor, R. I. This work, planned and built 1828–38 by Gen. Joseph G. Totten, subsequently chief engineer U. S. army, is one of the few works of the system of seacoast defense in the U. S. designed to sustain a regular siege. Its land fronts are elaborately arranged according to the principles of the art as then received.

Fortaleza, fōr-tāā-lā'zāā (often, but incorrectly called CEARÁ): a city of Northeastern Brazil; capital of the state of Ceará; on the Atlantic Ocean, in lat. 3° 42′ S. (see map of South America, ref. 3–H). The coast at this point forms a slight bay, but the shores are exposed to heavy surf, and vessels anchor 2 miles out in an open roadstead; passengers and freight to and from the land are generally carried on *jangadas* or sailing-rafts. The town, built on a low bluff, is regularly laid out, and the principal streets are lined by substantial buildings, but with little architectural display. The heat is modified by sea-breezes, especially during the dry season, and the town is generally healthy, though it has been visited by several severe epidemics of yellow fever and smallpox. The country immediately back is a barren waste of sand and scrub; a railroad, extending inland to Baturité, connects the port with the rich grazing and agricultural districts of the interior. Fortaleza is the principal port of Ceará, and has a large trade, exporting sugar, hides, rubber, etc. The name, meaning a fortress, is derived from the old fort of Amparo, built here in 1611. Pop. (1893) about 20,000. HERBERT H. SMITH.

Fort Atkinson: city; Jefferson co., Wis. (for location of county, see map of Wisconsin, ref. 7–E); on railway and on Rock river, near Lake Koshkonong; 24 miles N. N. E. of Janesville. It contains a large manufactory of furniture, wagons, buggies, and cutters, two foundries, an extensive manufactory of dairy, creamery, and cheese-factory apparatus, and manufactures of harrows, brooms, and wheelbarrows, and has a national bank with $60,000 capital. Pop. (1880) 1,969; (1890) 2,283; (1900) 3,043.
EDITOR OF "JEFFERSON COUNTY UNION."

Fort Barrancas: a small work in Florida, on the north side of Pensacola Bay. In 1861 this fort was garrisoned by a small body of artillery under command of Maj. Adam Slemmer. When, in Jan., 1861, Com. Armstrong of the navy surrendered the navy-yard to the Confederates, Maj. Slemmer abandoned this work and transferred his command to the more important work, Fort Pickens, on Santa Rosa island, opposite. Barrancas was held by the Confederates until the evacuation by them of Pensacola.

Fort Bowyer: See FORT MORGAN.

Fort Brady: a military post (occupied by two companies) at Sault Ste. Marie, Mich. It is an important military position, commanding the St. Mary's river and canal. See also ST. MARY'S RIVER.

Fort Brown: a military post at Brownsville, Cameron co., Texas; half a mile from the site of the old Texan Fort Brown (for location of county, see map of Texas, ref. 8–H). It has quarters for a regiment, but, the place being unhealthful, the garrison is usually small. On the other side of the Rio Grande is the Mexican town of Matamoras.

Fort Canby: one of the defenses of the mouth of the Columbia river; situated on Cape Hancock or Disappointment, Pacific co., Washington (for location of county, see map of Washington, ref. 4–A). The fortifications are on a bluff about 200 feet high, the quarters near the water.

Fort Chipewayan: See the Appendix.

Fort Churchill: See the Appendix.

Fort Collins: town and railway junction; capital of Larimer co., Col. (for location of county, see map of Colorado, ref. 1–D); on the Cache la Poudre river; 70 miles N. of Denver. It has excellent water-power and some manufactures, and is the site of the Colorado Agricultural College. Principal business, agriculture, dairying, and stock-raising. Pop. (1890) 2,011; (1900) 3,054.

Fort Covington: village; Franklin co., N. Y. (for location of county, see map of New York, ref. 1–I); 15 miles N. W. of Malone; on railway and the navigable Salmon river, 5 miles from its mouth and a mile from the Canada line. It has an academy; dairying and farming are the leading interests. Fort Covington is memorable for the sufferings which the U. S. army endured at this point during the winter of 1813–14. Pop. (1890) 870; (1900) 822.

Fort de France (Fr. pron. fōr'de-fraañs'), formerly FORT ROYAL: capital of Martinique, French West Indies; on low, flat land bordering Port Royal Bay, near the southern end of the island (see map of West Indies, ref. 7–M). It was formerly the principal port, but has been supplanted by St. Pierre. The bay is defended by Fort St. Louis, an important post during the French and English wars. The city is regularly laid out, with substantial houses, generally of wood, and the surroundings are exceedingly picturesque. There is a small park containing a monument to the Empress Josephine, who was born near the place. Pop. (1892) about 15,000. HERBERT H. SMITH.

Fort Dodge: city; capital of Webster co., Ia. (for location, see map of Iowa, ref. 4–F); situated on Des Moines river, the Chi., R. I. and Pac., Ill. Cent., Mason City and Fort D., and Minn. and St. Louis R. Rs.; 90 miles N. of Des Moines. It has a college, a large graded school with excellent ward schools, a Catholic seminary, fine quarries of building-stone, large deposits of gypsum, coal, fire-clay, potter's clay, and water-lime, various manufactures, one of the largest oat-meal-mills in the State, gas-works, electric lights, and water-works. Pop. (1880) 3,586; (1890) 4,871; (1900) 12,162.
PUBLISHERS OF "CHRONICLE."

Fort Donelson: See FORT HENRY AND FORT DONELSON.

Fort Duquesne: See PITTSBURG.

Fort Edward: village; Washington co., N. Y. (for location of county, see map of New York, ref. 4–K); on railway and on the east bank of Hudson river; 28 miles N. of Troy. A dam 900 feet long and 27 feet high crosses the Hudson, and affords great water-power. The village is finely situated, has a seminary and collegiate institute, and extensive manufactures, including iron, lumber, machinery, and stoneware. The first fortification here was built in 1709; another and larger one called Fort Lyman was built in 1755, but the present name was soon substituted in honor of Edward, Duke of York. Some remnants of the fort still remain. Fort Edward was a point of importance during the old French and Indian wars, and during the Revolution was occupied in turn by British and Americans. Pop. (1880) 2,988; (1900) not separately returned.

Fort Erie: post-village of Welland co., Ontario, Canada (for location of county, see map of Ontario, ref. 5–E); on two railways and on Lake Erie, at the head of the Niagara river opposite Buffalo, N. Y., with which it is connected by a railway bridge. Pop. 1,000.

Fort Ethan Allen: a military post established in Mar., 1893; situated near Essex Junction, Vt., about 5 miles E. of Burlington (for location, see map of Vermont, ref. 4–B). It is designed for the accommodation of a large garrison, and to form one of the cordon of posts along the northern frontier of the U. S. JAMES MERCUR.

For'tescue, CHICHESTER SAMUEL PARKINSON: See PARKINSON-FORTESCUE, CHICHESTER SAMUEL.

Fortescue, Rt. Hon. HUGH, Earl: English statesman and author; b. Apr. 4, 1818; educated at Harrow and Trinity College, Cambridge; entered Parliament in 1841; in Dec., 1854, was chosen for Marylebone; resigned and was called to the upper house for his father's barony of Fortescue Dec. 5, 1859, succeeding as third earl Sept. 14, 1861. In 1846–47 was a Lord of the Treasury, secretary of the poor law board 1847–51, besides being chairman of several successive metropolitan commissions of sewers. Retired from Parliament after 1858 in consequence of ophthalmia, contracted in visiting a hospital with a view to his successful parliamentary motion for sanitary reform. He has written *The Health of Towns* (1844); *Official Salaries* (1852); *Representative Self-government for the Metropolis* (1854); *Parliamentary Reform* (1859); *Public Schools for the Middle Classes* (1864).

Fortescue, Sir JOHN: English chief justice of the king's bench; b. probably about 1395; became sergeant-at-law 1429; one of the king's sergeants in Easter 1441; chief justice Jan. 25, 1442, to Easter 1460; escaped with Henry VI. into Scotland at the end of Mar., 1461; was attainted of high treason 1463; escaped with Queen Margaret to the Continent; was pardoned by Edward IV. Oct., 1473, and was living in Feb., 1476. Wrote *On the Praises of the British Laws*, in Latin, between 1461 and 1470, a masterly exposition of English law, and *The Governance of England*, otherwise called *The Difference between an Absolute and Lim-*

ited Monarchy, as it more particularly regards the English Constitution (1714; new ed., Clarendon Press, 1886).

Fort Fisher: a strong earthwork on Federal Point, N. C., between the ocean and the Cape Fear river; erected by the Confederates during the civil war to guard the mouth of the river. It consisted of two faces. The general direction of the land face, running N. W. and S. E., was nearly perpendicular to the beach and the shore of the river, separated at this point about half a mile. It was between 500 and 600 yards long, and was designed to resist an attack by a force landing on the beach to the north and marching against it. The sea face, nearly perpendicular to the land face, was about 1,400 to 1,500 yards long. It ran N. E. and S. W., parallel to the beach, and terminated at its southwestern extremity in a battery 60 feet high, mounting two heavy guns, called the "mound battery." The land face mounted 20 heavy guns and 3 mortars, with 3 Napoleon guns for guarding the gate near its center and the road bridge at the left flank of the work. To protect the guns from enfilade and reverse fire from the fleet, they were placed singly between long, thick, and high traverses, except at the left flank, where a change in the direction of the parapet allowed one traverse to cover two guns. The ground in front of this face was also defended by land torpedoes electrically connected with the fort. A strong palisade extended along the foot of the parapet to and around the salient of the work. On the sea face were mounted twenty-four heavy guns, also well protected with traverses and provided with bomb-proof magazines and shelters for the men. All the guns of the fort were mounted *en barbette.* Near the extremity of Federal Point was a wharf for deep-draught vessels, and not far from this Fort Buchanan, an elliptical fort mounting four guns covering the inlet and sweeping the land approaches. The blockade-runners entering the Cape Fear river finally became almost the only source from which supplies not manufactured in the Confederacy could be obtained, and to cut off these supplies it was necessary to capture Fort Fisher. A combined land and naval attack was therefore planned and carried out on Dec. 23, 24, and 25, with Gen. B. F. Butler in command of the land forces and Admiral Porter in command of the fleet, but they were obliged to retire without effecting serious damage upon the fort. An attempt to blow up the fort by the explosion of a powder-boat was made without effect. Gen. Grant determined to renew the attempt to capture the fort, and, Jan. 4 and 5, 1865, embarked a force of about 8,000 men at Bermuda Hundred, under command of Gen. Terry, making Beaufort the rendezvous as before, and reached this place on Jan. 8. On the evening of the 12th the fleet and transports were again before Fort Fisher, and on the morning of the 13th the debarkation commenced, while the bombardment of the fort was begun by the ironclads. The troops having all landed in the afternoon, the whole fleet joined in the bombardment, which was mainly directed upon the land face. The firing during the night of the 13th was kept up by the ironclads, and during the night and day of the 14th was continued with a view to keeping down the fire of the fort and dismounting the guns on the land face. Meanwhile the land forces had thrown up a line of works across the peninsula to guard against an attack from any relieving force, and arrangements were made for a simultaneous assault at 3 P. M. of the 15th by the army and a column of marines and sailors from the fleet. In the morning fire was opened by the entire fleet, and continued until the assault was made. At about noon the sailors and marines began to land, and at 3 P. M., upon signal, they and the land forces made the assault, the sailors attacking the salient and the army the left flank of the land front. The naval attack was repulsed with great loss. The army captured the extremity of the line, and fighting its way from traverse to traverse, assisted by the fire of the ships when it could be so directed as not to injure the Union troops, by 10 P. M. had occupied the entire work and received the surrender of the garrison. The effective strength of the army in the attack of the 15th was about 8,000 men. The losses in killed, wounded, and missing were about 1,000. The naval assaulting column contained about 2,000 men and lost about 300. The total Confederate force was from 2,000 to 2,500 men, of whom about 500 were killed or wounded and the remainder captured. On the morning of the 16th an explosion of the main reserve powder magazine occurred, killing and wounding about 100 Union troops and a number of Confederates. This explosion seems to have been accidental, although at the time it was supposed that the Confederates fired the magazine by electricity from the other side of the river. JAMES MERCUR.

Fort Foote: an inclosed barbette work with exterior batteries; situated on the Potomac river, 6 miles below Washington; on a commanding bluff of the Maryland shore, 100 feet above the river. It was constructed during the civil war, and forms the inner line of defense of the channel of approach by water to Alexandria and Washington.

Fort Gaines: town; capital of Clay co., Ga. (for location of county, see map of Georgia, ref. 6–F); on railway, and on the navigable Chattahoochee river. It has a commanding position, and a good trade in cotton. There are numerous ancient artificial mounds in the vicinity. Pop. (1880) 867; (1890) 1,097; (1900) 1,305.

Fort George: a fortification in Inverness-shire, Scotland; on a spit of land jutting out into the Firth of Moray. It was built in 1748 to keep the Highlanders in subjection.

Fort Gratiot, -grăsh'i-ot: city; St. Clair co., Mich. (for location of county, see map of Michigan, ref. 7–K); now part of Port Huron; at the outlet of Lake Huron; opposite Point Edward, Ontario, Canada. It has railway machine-shops. Pop. (1880) 1,280; (1890) 2,832.

Fort Griswold: See NEW LONDON, Conn.

Forth: a river of Scotland; rises in two branches, the Avendhu and the Duchray, which unite at Aberfoyle. It then passes, with many windings, through the most picturesque and romantic part of Scotland, by Stirling, and a little above Alloa it empties into the Firth of Forth. It is navigable for vessels of 100 tons to Stirling, and to Alloa for vessels of 300 tons. It communicates with the Clyde by a canal 38 miles long. The depth increases between Grangemouth and North Queensferry in the first mile from 10 to 15 feet; in the second, to 25; in the third, to 53; and the remaining part of the distance has a general depth of 60 feet at low water. The tides are felt 4½ miles above Stirling, and at Stirling harbor the spring tide rises 7 ft. 9 in. At Leith and Kinghorn the average height of the tide is 17½ feet. The bed of the river consists, to a great extent, of mud, the depth of the deposit being in some places more than 200 feet, and there are extensive alluvial formations along the lower course of the river and in the upper parts of the estuary. The fisheries of herring, whitefish, and salmon are very important. In 1889 a great railway bridge, one of the most remarkable in the world, was erected across the Forth at Queensferry. See BRIDGES.

Fort Hamilton: a fort on the eastern shore of the Narrows, the principal entrance to New York harbor.

Fort Hancock: one of the strongest forts in the U. S.; on Sandy Hook, N. J. (see map of New Jersey, ref. 3–E); designed to control the entrance to the lower New York Bay. Attached to the fort are grounds used in testing guns, armor, projectiles, etc.

Fort Henry and Fort Donelson: two works erected by the Confederates during the civil war in the U. S.; the former on the right bank of the Tennessee river, the latter on the left bank of the Cumberland river, about 40 miles from where these rivers empty into the Ohio; distant from each other about 12 miles, and connected by a direct road. A combined land and naval attack for the reduction of these works having been determined upon, the naval force was intrusted to Com. Andrew H. Foote, and the land force, numbering about 15,000, assigned to Brig.-Gen. U. S. Grant. On Feb. 2, 1862, the naval fleet left Cairo, followed by the troops in transports, arriving on the 4th off Fort Henry, where it had been resolved to make the first attempt. This fort was defended by 17 guns and about 3,000 men, under the command of Brig.-Gen. Tilghman. After landing the troops and making reconnoissances, the morning of Feb. 6 was settled upon for the combined attack, which was accordingly commenced at noon by the navy, the army having started an hour earlier with the expectation of cutting off the retreat should the fire of the navy compel the enemy to abandon the position; but Com. Foote attacked with such vigor as to compel the surrender of the work in but little more than one hour, while the army, being delayed by the condition of the roads, did not arrive till some time later; the Confederate garrison meanwhile escaping to Fort Donelson, with the exception of about sixty or seventy men, besides Gen. Tilghman and his staff, who surrendered with the work. After waiting a sufficient time to repair the damage sustained by the gunboats, Gen. Grant on the 12th moved with his army toward Fort Donelson, arriving before that work the same afternoon. In the meantime the garrison at Fort Donelson, consisting mainly of those who had escaped from Fort Henry, had been re-enforced on the 9th by the command of Gen. Pillow, and on the 12th by that of Gen. Buckner from Bowling Green, and on the following day by the brigade of Gen. John B. Floyd, who, being the senior officer, assumed command of the entire force of about 16,000 men. This work, while it commanded well the river-front, was in the rear commanded by high ground, which was, however, secured and fortified before the arrival of the Union forces. Gen. Grant at once proceeded to invest the Confederate lines, and early on the morning of the 13th opened a vigorous cannonade, followed in the afternoon by an assault by a part of McClernand's force, which was, however, repulsed with considerable loss. On the 14th re-enforcements to the number of 10,000 reached Grant, bringing his land forces up to about 27,000 men, together with the fleet of Com. Foote, and a combined attack was determined upon. Being unable to get the new troops in position, the fleet opened the attack alone in the afternoon, but after an hour and a half, during which time every gunboat was disabled and 54 men killed and wounded, the fleet was compelled to retire. Gen. Grant now proceeded to complete his line of investment and await the re-enforcement of his army. The Confederate commanders, however, realizing their danger, had agreed upon a vigorous attack, by which it was hoped to secure an avenue of retreat to Nashville, which, intended as a surprise, was commenced at 5 A. M. on the 15th, but was met by a fire from the Federal force, and a battle ensued with varying success until about 3 P. M., when a final advance was ordered by Gen. Grant along the whole line, which drove the Confederates back to their own lines, while on the left a position was gained within the Confederate works. The loss on each side during this day's conflict was, in killed and wounded, nearly 2,000. Gen. Grant now made his preparations for a general attack the next morning, which, however, was not executed, for during the night the Confederate commanders, finding the Union line of investment completely restored, had determined upon a surrender. Pillow refused to consent to a capitulation, while Floyd acknowledged that "personal reasons" prevented him from acceding to such a decision, thus devolving the surrender upon Buckner. During the night Floyd managed to escape by steamers with some 1,500 of his own command, as did Pillow and his staff, also Gen. Forrest with 300 or 400 men, by the river-road. At dawn of the 16th Buckner addressed a communication to Gen. Grant, asking the appointment of commissioners to settle upon terms of capitulation and an armistice until noon, to which Grant sent his famous reply: "No terms except unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner, having no alternative, accepted these terms. No exact statement of the captures can be given; the most reliable estimates place them at 65 cannon, about 17,000 small-arms, and about 14,000 prisoners, many of whom were wounded. The total Union loss in killed, wounded, and missing was 2,832.

Revised by JAMES MERCUR.

Fort Howard: city and railway center; Brown co., Wis. (for location of county, see map of Wisconsin, ref. 5–F); on the west side of Fox river, near its mouth, opposite the city of Green Bay; 114 miles N. of Milwaukee. It has 9 churches, 5 brick school-buildings (including a large high school), numerous and extensive lumber-manufactories, the G. B., W. and St. P., and the Ch., M. and St. P. Railway machine-shops, sash, door, and blind factories, canning-factories, brick-yards, machine-shops and boiler-works, electric lights, sewers, water-works, etc., a fine harbor, and an extensive trade. Pop. (1880) 3,083; (1890) 4,754. Now a part of Green Bay.

EDITORS OF "REVIEW."

Fortification [from Fr. *fortification* : Ital. *fortificazione* < Low Lat. *fortifica'tio*, deriv. of Lat. *fortifica're*, make strong, fortify; *for'tis*, strong + *fa'cere*, make]: the art of rendering a military position defensible against the attacks of superior numbers; also the work or works erected for this purpose. The art of fortification is usually divided into two branches—permanent fortification and field or temporary fortification. Permanent fortifications are constructed to defend a position of permanent importance, and are made of durable materials. Field fortifications are intended to serve a temporary purpose, and the materials employed are those found most ready at hand. The principles of the art are essentially the same in both. Permanent fortifications being the more elaborate, it will be convenient, in a brief exposition of the subject, to consider that branch first. It will be necessary to assume that the reader is acquainted with the elementary terms employed.

I. PERMANENT FORTIFICATION.

General Definitions.—A modern fortress usually consists of an inclosure of earth and masonry, called the enceinte, or body of the place, secured by a citadel within, and strengthened by works on the exterior, called outworks.

The mass of earth employed to cover the bodies of the defenders while in action from the enemy's projectiles is called the parapet. It is raised upon another mass of earth called the rampart, R (Fig. 1).

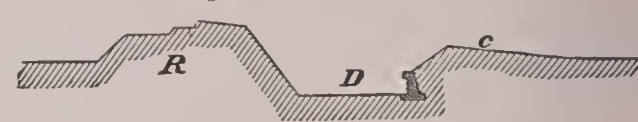


FIG. 1.

Outside the rampart is the ditch, *D*, which is made deep and wide enough to offer a serious obstacle to the enemy; and beyond the ditch the glacis, *c*.

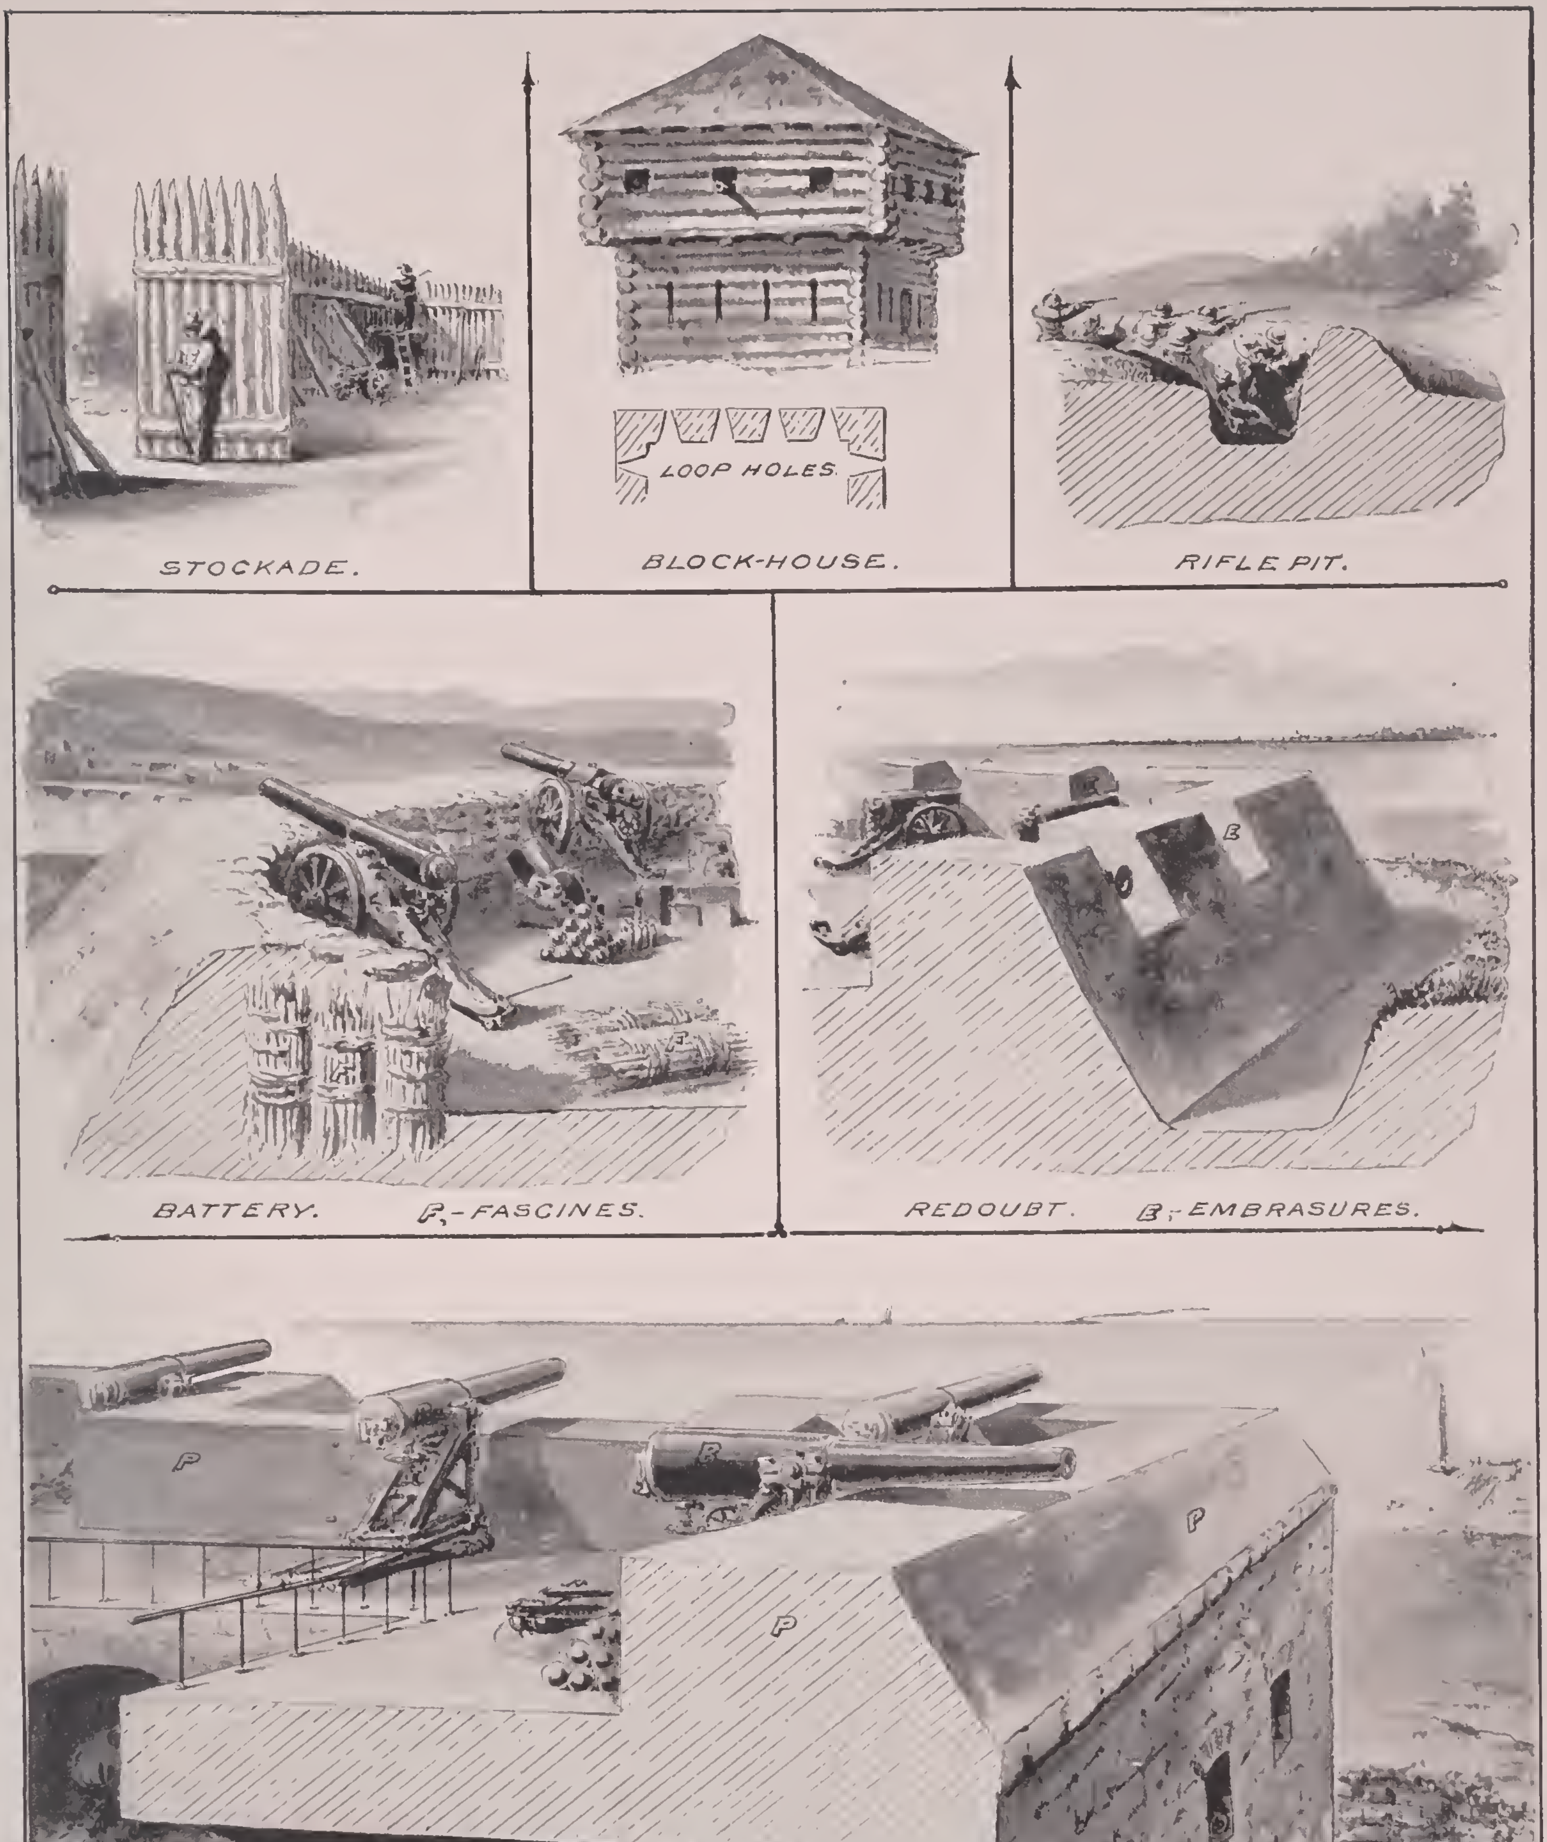
If the plan, or trace, of the enceinte should have the form of a simple polygon with only salient angles, the ditch would not be under the fire of the work, and an enemy having reached it would there find shelter. The arrangements by which the exterior slope and bottom of the ditch are brought under fire are called flanking arrangements. In general terms, they consist in arranging the sides of the polygon so as to make both re-entrant and salient angles. In small works, having only salients, galleries are sometimes built behind the counterscarp, having a fire upon the ditch. When the flanking arrangements are imperfect, the space left unexposed to the fire of the work is called a dead space.

Systems of Fortification.—The main points to be attained in any fortification are—1, to offer an obstacle to the advance of the enemy to a hand-to-hand conflict; 2, to cover the defenders from his projectiles; and 3, to thoroughly sweep with its fire all the ground within range on the exterior, including its own ditches. A vast number of different methods of securing the above ends have been proposed. There are three principal systems, however, which these methods approach more or less closely, and which will alone be noticed. These are the tenailled (Fig. 2), the bastioned (Fig. 3), and the polygonal systems (Fig. 4). The figures represent the systems on a perfectly horizontal site, where there is nothing to cause irregularity. To avoid unnecessarily complicating the figures, only the magistrals, interior crests, rear lines of terrepleins, and foot of rampart slopes are shown. The heavy black lines are the interior crests; the stippled portions are the bottoms of the ditches. In Fig. 2 only the magistral and interior crest of the enceinte are shown.

It will be observed that the lines are straight in all of them. To make them curved would either scatter their fire or concentrate it upon a single point, since the direction of the line of fire is always assumed to be perpendicular to the interior crest, this being the most natural direction for the soldier to fire in, and the one which he will always employ at night. Moreover, if the lines were curved, it would not be possible to flank them, since the path of the projectile is a straight line.

Before describing these systems it should be noticed that the mere inclosing a given space by a rampart of the usual height will not necessarily of itself afford the required cover to the defenders. If the direction given to the lines is such that the enemy can place himself upon the prolongation of them, he can land his projectiles at one end of the terreplein and sweep it to the other; fire striking a line in such a direction is called enfilade fire. Should the enemy be able to take up a position from which he can fire over one portion of the inclosure, and strike in rear the parapet beyond, the latter is said to be exposed to reverse fire. Lines placed so as to be exposed to enfilade or reverse fires are faulty; and though it is not always possible to avoid so placing them, on account of the necessity of giving their fire a suitable direction, it is evident in comparing the different systems that the one which will least often require this fault will, so far, be the best.

Tenailled System.—The tenailled trace is shown in



FORTIFICATIONS.

Fig. 2. This trace is simple, adapts itself well to irregular ground, and provides a cross-fire upon the approaches. At first glance it seems to be well flanked, but that is not the case. The greatest angle of depression at which artillery is fired is about 1 upon 6. Supposing the height of the gun

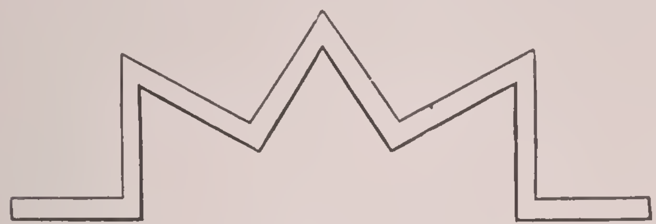


Fig. 2.—Tenailled system.

to be 40 feet above the bottom of the ditch, it can not strike this bottom at a distance less than 240 feet. Hence there is a considerable dead space at each of the re-entrant angles. For the same length of parapet this trace incloses less space than either of the other traces. The great number and the sharpness of its salients render its faces peculiarly liable to enfilade and reverse fires.

Bastioned System.—Fig. 3 shows the bastioned trace. It will be observed that the great distance between the flanks and the opposite glacis will expose the masonry scarp of the former to the curved fire of the enemy. To partially remedy this defect, and to cover the masonry of the curtain, the tenaille, *T*, was introduced. It is a low outwork, so constructed as not to interfere with the fire of the flanks upon the ditch in front of the bastion faces, and is armed with musketry. It creates, however, a considerable dead space.

In the attack of this enceinte the enemy would make his approaches along the capital of the bastion, and the greater portion of the fire which can be brought to bear in this di-

Fig. 3.—Bastioned system.

rection is comparatively distant, since it comes from the adjacent bastions. This weak point is strengthened by the construction of the demilune, *D*. Two adjacent demilunes throw the bastion between them into a strong re-entrant, and add enormously to the strength of the front. The demilune serves also to mask the shoulder angles of the bastion and to cover the communications under the curtain.

In the employment of the bastioned system it would be very difficult to so place all of the lines that none would be exposed to enfilade and reverse fires. The connection be-

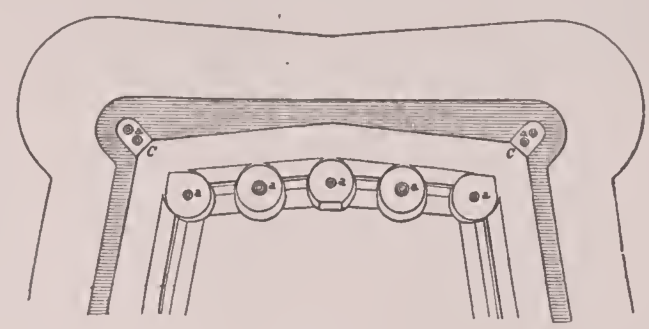

Fig. 4.

tween its parts is so rigid that it is best adapted to a flat country, such as Holland, where, in a modified form it was largely used at the close of the seventeenth century; in very rough sites it is entirely inapplicable. The flanks being situated at a considerable distance from the faces to be flanked, a portion of the range of their guns is lost. The height of the parapet is limited by its length of front.

Polygonal System.—In this system the faces are but little exposed to enfilade or reverse fires, since the enemy in placing himself upon the prolongation of one of them, will place himself within short range of the adjacent ones; and it is easy to cover these prolongations by adjacent outworks. For the same length of parapet more ground is inclosed than in either of the other systems. The length of a front —or what amounts to the same thing, of the lines of defense —may be greater than in the bastioned, since the full range of the flanking guns is made available. This system adapts itself better to irregular sites.

Each of these systems has had its partisans. The contest between those of the bastioned and those of the polygonal has been especially sharp, and has resulted in the adoption of the polygonal system by all great nations. The other systems are mainly of interest on account of existing fortifications, built prior to the modern development of firearms, though they may find occasional application in places not greatly exposed, as in the gorge of an inclosed work.

Principles of Fortification.—The more important fundamental principles in all systems are—

1. They must have good flanking arrangements.

2. The lines of defense must be as long as possible, supposing the dimensions of the fortress to permit it, in order to avoid short fronts and a multitude of flanks. Their length is limited by the range of the weapons used for flanking; and these weapons must be such as will throw a large number of projectiles heavy enough to disable men. Rifled artillery is not suitable; machine-guns and howitzers are generally used. The how-

itzer is used for occasionally throwing shells to destroy any temporary cover the enemy may erect.

3. The enceinte must have a considerable command over the surrounding country and over the outworks. The height of the interior crest is limited by the necessity of thoroughly sweeping the ground on the exterior, and of not offering too great an object to the direct fire of the enemy. It is rarely more than 25 or 30 feet above the natural surface of the ground.

4. Masonry is not to be exposed to the fire of the enemy. In seacoast fortification it is frequently necessary to concentrate a large number of guns upon a confined space, and they are placed in tiers of casemates, one over the other. These works being subject only to fire from ships, the masonry was exposed with comparative impunity, since this fire is so unsteady as not readily to strike the same spot many times in succession. But a single shot from the powerful artillery now in use will do as much execution as a series of the old ones. Hence it becomes necessary to substitute iron or steel for masonry where earth can not be employed. When practicable the guns are placed in cupolas, with roof of spherical form (a, a, a, Fig. 4). or mounted on disappearing carriages. A cupola is a hollow revolving structure of steel or iron, containing one or two guns, buried in a mass of concrete, which in turn is buried in the parapet.

5. The nearer the general direction of the fronts fortified shall be to a straight line the better, since thus a large amount of fire can be concentrated upon the approaches.

6. The arrangement of the works must be such that, as far as possible, the prolongations of the parapets shall not be attainable by the enemy, and the terrepleins be covered against vertical fire. The first is secured by a proper placing of the lines, and the second by casemates and bombproofs.

7. The outworks must be so arranged that their capture must necessarily be successive, thus introducing the element of time into the defense. If two outworks can be attacked simultaneously, their capture may require more material, but not more time, than if there were only one.

8. All parts of a fortification should be equally strong. Hence if one part is the stronger by nature, the others will demand more from art. This sometimes leads to the multiplication of works upon one or more of the fronts.

Accessory Defenses.—The advance of an enemy is very seriously retarded by a judicious use of countermines. In addition to the works exterior to the enceinte, works are sometimes constructed within it, called the reduit, the object of which is to defend the breach when made, and to furnish the garrison a point of retreat whence the defense may be prolonged.

When the face of a work is exposed to enfilade fire, the destructive effects of the latter may be much diminished by raising masses of earth at intervals along the terreplein. These masses are called traverses (y, y, y, Fig. 3); they extend across the terreplein in a direction nearly perpendicular to the interior crest. When a parapet is exposed to reverse fire, a mass of earth is thrown up behind it and its defenders; this mass is called a parados. Both the parados and traverse may be utilized for the purpose of bombproofs, magazines, and cupolas. They are both essential to limit the action of the modern explosive projectile.

It is of great importance to remove all obstacles which could afford cover to the enemy anywhere within range of the guns. Forests and buildings are cleared away, and inequalities of the ground graded off.

Economy of Fortification.—In determining upon the amount of money that can be assigned to the construction of fortifications, the latter should be regarded as so much insurance, and insurance not only against pecuniary loss, but also against national dishonor. Their extent at any given point must therefore depend upon the importance of the point and the risk of its capture. Among a warlike people the risk of capture will be less when the population is dense and re-enforcements in materials and men can readily be procured. Hence an isolated point, with but a sparse population in its vicinity, will require the maximum percentage of its value for fortification, supposing always that the facilities for attack are the same, and that the site offers no great natural advantages to the defense. The points of greatest value with a nation having powerful neighbors are the great strategic pivots, the occupation of which by an enemy would endanger the life of the nation; such are, in Europe, the capital and great commercial centers. A very small percentage of their value will give very large sums for their defense, and European nations expend these sums without hesitation.

The size of the works is not always an indication of their strength, nor is their cost always proportionate to the value of the point defended, though their strength must be. Everything varies with the locality.

Permanent Fortifications in the U. S.—The frontiers which are exposed to attack being principally maritime, the fortifications of the U. S. consist almost entirely of batteries of heavy guns adapted to a contest with ships. To secure these batteries from a land attack, they are inclosed in rear by a land-front, traced according to the principles above laid down, and made strong enough to hold an enemy in check until re-enforcements can arrive. These land-fronts are seldom designed* to resist a regular siege for a great length of time, it being assumed that the vast resources in men and material that are available, and the system of railroad and water communication, will enable a superior force to be brought to meet an enemy at any point, provided time is allowed to assemble them; it is to gain this time that the land-fronts are constructed.

The essential feature of these works is the sea-front. Where space is available the guns are spread out in a single tier.

Where the space is contracted it has been usual to mount guns in masonry casemates built tier over tier. Some of the works in the U. S. built prior to 1860 have three tiers of casemates, and a barbette battery on top. This method of building was recognized throughout the world, and was the one generally adopted in the U. S., up to the date of modern developments in the construction of guns and ships, by which the caliber, range, and power of the first were immensely increased, and almost impenetrable ironclad vessels superseded wooden ones. The method is now discarded, and the question of adapting casemates to seacoast batteries has not come to a practical solution.

The majority of the present fortifications in the U. S. belong to what is known as the third system, the first comprising those built after the breaking out of the French Revolution in 1789, and the second those built just before the war of 1812. The works of the first and second systems were small and weak. The third alone was systematically planned after a comprehensive study of the coast and northern frontier; a board of engineer and naval officers was convened for the purpose, of which the celebrated French engineer Gen. Simon Bernard and Gen. Joseph G. Totten were prominent members. It was commenced in 1816, and notwithstanding the vast extent of the coast it was until about 1865 in a very fair state of defense. This third system, founded upon broad general principles which are perennial, is now much behind the demands of the times as regards methods of construction. A new one has been planned by a mixed board of army and navy officers and civilians, presided over by Hon. William C. Endicott, Secretary of War. The report of the board was made in 1886. It proposed the use of turrets, armored casemates, barbette batteries, mortar batteries, floating batteries, and submarine mines. The estimated cost of fortifying the entire seacoast and lake frontier was $126,377,800, or less than $2 per head of population, truly an insignificant burden. The execution of this project has made a fair beginning. Good progress has been made in the preparations for manufacturing guns, securing sites, and at some of the more important points in the construction of batteries.

The scheme of defense, of which fortifications constitute one element, comprises a navy, fortifications, interior communications by land and water, and a regular army and well-organized militia. In the language of Gen. Joseph G. Totten, for many years chief of the engineer corps of the U. S. army, "The navy must be provided with suitable establishments for construction and repair, stations, harbors of rendezvous, and ports of refuge. All these must be covered by fortifications having garrisons of regular troops and militia, and be supplied with men and materials through the lines of interior communication. Not being required to remain in the harbor for their defense, the navy, pre-eminent as an offensive arm, will be prepared to transfer the war to distant oceans and to the shores of the enemy, and to act the great part which its early achievements have foretold, and to which its high destiny will lead.

* The few works—e. g. Fort Adams, Fort Monroe, etc.—which form the exception were designed and built before the year 1850, before the resources and means of inland communication of the U. S. had been developed.

"Fortifications should—1, close all important harbors against an enemy, and secure them to our military and commercial marine; 2, should deprive an enemy of all strong positions where, protected by naval superiority, he might maintain himself during the war, keeping the whole frontier in constant alarm; 3, must cover the great naval establishments from attack; 4, must protect the great cities; 5, must prevent, as far as possible, the great avenues of interior navigation from being blockaded at their entrance to the ocean; 6, must cover the coastwise and interior navigation, by closing the harbors and the several inlets which intersect the lines of interior communication, thereby further aiding the navy in protecting the navigation of the country; and 7, must shelter the smaller towns along the coast, and also all their commercial and manufacturing establishments which are of a nature to invite the enterprise or cupidity of an enemy.

"Interior communications will conduct, with certainty, the necessary supplies of all sorts to the stations, harbors of rendezvous and refuge, and the establishments of construction and repair for the use both of the fortifications and of the navy; will greatly facilitate and expedite the concentration of military force, and the transfer of troops from one point to another; will insure to these troops supplies of every description; and will preserve, unimpaired, the interchange of domestic commerce, even during periods of the most active external warfare.

"The army and militia, together with the *personnel* of the marine, constitute the vital principle of the system.

"It is important to notice the reciprocal relation of these elements of national defense: one element is scarcely more dependent on another than the whole system is to each one. Withdraw the navy, and the defense becomes merely passive; we expose ourselves the more to suffer the evils of war at the time that we deprive ourselves of all means of inflicting them. Withdraw interior communication, and the navy will often be greatly embarrassed for want of supplies, while the fortifications will be unable to offer full resistance for want of timely re-enforcements. Withdraw fortifications, and the interior communications are broken up, and the navy is left entirely without collateral aid."

It must be borne in mind that the foregoing was written when the population of the U. S. was small and the modern system of intercommunication by railroads and canals not in existence. The practical application of the principles laid down has been somewhat modified by these physical developments, but it is not the less interesting and important to understand this masterly exposition of the principles which govern the seacoast fortification of the U. S., as distinct from land fortification, which alone forms the subject of most treatises on the art.

Although it is now the settled policy of the U. S. Government to employ permanent fortifications upon the seaboard, this policy has been attacked by men in high station. A full statement of the arguments for and against it may be found in vol. iv. *Reports of Committees Second Session 37th Congress*, 1861–62.

The application of steam to vessels of war brought with it the employment of submarine mines or other obstacles as a necessary complement to seacoast fortifications. The introduction of iron plating can not impair the relative efficiency of guns in forts to those in ships, since this improvement is applicable to both, while the weight or thickness is in the fort unlimited. One of the most important applications of permanent fortifications in Europe is to intrenched camps. See INTRENCHED CAMPS.

II. FIELD FORTIFICATION.

Modification of Foregoing Principles and Rules.—In field fortifications, which are constructed during the exigencies of war, the practical application of some of the foregoing principles is somewhat modified. The parapet, instead of being raised upon a rampart, is placed upon the natural surface of the ground (Fig. 5). The ditch is no great obstacle to the advance of an enemy, and is not intended as such. It is excavated to procure earth for the parapet, and is made of the width and depth most convenient for that purpose, the scarp and counterscarp not being revetted. Some obstacle, however, is essential, as before announced, and in field works it consists of a line of obstructions placed about 50 yards in front of the ditch, *a* (Fig. 5). If possible, a second line should be established 50 yards farther to the front. The following are some of the obstacles most commonly employed: *Abatis,* formed of stout limbs of trees about 15 feet long, with the small branches cut off and the large ones pointed, laid as close together as possible, branches toward the enemy; *palisades*, or rows of stout stakes, about 10 feet long and 6 inches in diameter, planted about 3 feet

FIG. 5.

deep in the ground, about 4 inches apart, their tops being pointed and inclined to the front; *trous-de-loup*, or excavations in the form of an inverted cone, with pointed stakes at the bottom; they must be either so shallow as not to afford cover to skirmishers, or so deep that when a man has fallen into one he shall not be able to use it as a rifle-pit; *wire entanglement*, made by driving stout stakes into the ground about 7 feet apart, in three or more rows, arranged checkerwise, and connecting their tops by strong wires crossing diagonally about a foot or 18 inches above the ground; *torpedoes*. See TORPEDOES.

Inundations are sometimes made by damming back a watercourse: if the overflow is fordable, it may be rendered impracticable by digging trous-de-loup, or irregular trenches, and by scattering about harrows, boards with nails in them, or crows'-feet.

The parapet being intended primarily as a cover, and not as an obstacle, no portion of it is revetted except the interior slope, which must be made steep to enable the defenders the more conveniently to fire over it. This is effected by the use of gabions, fascines, or sods, sometimes by logs, posts, barrels, sandbags, or any conveniently improvised means.

Outworks are seldom employed in field fortification, since, even if time permitted their construction, they would obstruct the fire of the enceinte on account of its low relief.

The application of the principle that the works must have good flanking arrangements is modified in the case of field works by the fact of their low relief, which removes to a certain extent the dead spaces in front of them; and further, by the situation of the point where the enemy's advance is checked. In the case of permanent works the enemy meets his most serious obstacle when he reaches the ditch, whereas in the case of field works an enemy having once reached the ditch will, in most cases, not delay to enter the works, and the real obstacles to his advance are found 50 yards from the ditch. Hence, while it is undoubtedly desirable to have good flanking arrangements, a field work may be in an excellent state of defense without them; whereas the want of them in a permanent work would be a vital defect. Indeed, in the case of a small field work it would be injurious to the defense to break up the lines into a series of small ones, scattering the fire in several directions, and rendering it insufficient in all.

Fortifications extending over the front of the position of an army are called intrenchments or lines. Continuous lines are those which extend continuously from one end of the position to the other. Lines with intervals are those in which only the most important points are occupied by detached works, the intervals being left open.

The great development of the front occupied by an army rendered it impracticable, until a recent date, to give to all parts of a continuous line the strength necessary to resist the attacks of very superior numbers; and an enemy forcing his way through at a single point could turn the whole line. Hence in a strictly defensive position engineers preferred the line with intervals, concentrating all their means upon the detached works, and controlling the intervals by the fire of these works. The recent great improvements in the musket, particularly in loading, by means of which a thin line of troops can deliver a steady stream of fire, have changed the circumstances of the case. It has been definitely shown by many bloody experiments in the civil war in the U. S., and in the Franco-German war (1870–71), that a well-intrenched line, properly manned, can not be carried by an open assault in front. (See *Professional Papers Corps of Engineers*, No. 20, Appendix F.) The experience of these wars has also shown that troops can not be exposed for even a few moments without some cover, and that the ordinary inclosed field work of earlier days, unprovided with traverses or bomb-proofs, is of little use against the accurate and distant fire of modern weapons, while it will probably attract a concentrated fire from them. Hence result several important modifications in the application of field fortifications—viz.: 1, the employment of continuous lines of low command and easy construction for the defense of an army's front; 2, the constant use of intrenchments on the battle-field, thrown up in a few moments whenever the troops halt; and 3, the greater care in the planning and construction of inclosed works when such are employed.

The works alluded to under the first heading are called rifle-trenches, popularly known in the U. S. during the civil war as rifle-pits, which term is technically applied to another work. (See SIEGE.) Those under the second heading are used by armies something as the individual formerly employed the buckler and cuirass, and are called shelter-trenches. Rifle-trenches and shelter-trenches receive the generic name hasty intrenchments. Those under the third heading have received the appropriate name semi-permanent works.

Hasty Intrenchments.—In modern warfare the first duty of the troops upon halting after a march, when near the enemy, is to intrench themselves. During the varying tides of battle a point gained is at once intrenched. Cover for infantry is most rapidly obtained by excavating a trench about 1¼ feet deep, and throwing the earth to the front to form a parapet. This can be widened in a few minutes, so as to afford cover to men lying down (Fig. 6).

FIG. 6.

There should be ready means of getting in and out of these trenches, both to the front and rear; the troops should be able to march straight over them when necessary. At intervals of about 100 yards ramps should be formed or breaks be left in the lines, which may here overlap, to enable artillery and cavalry to pass. The trace given to these trenches is evidently the same that would be occupied by a line of battle. No attention is paid to flanking arrangements, properly so called. Should the position be long occupied, the most important points are sometimes secured by inclosed works. Should the ground be occupied for a prolonged period, the trenches are deepened and widened until they become rifle-trenches. A trench 3 feet deep and a parapet 4½ feet high, giving a total cover of 7½ feet, is the greatest vertical dimension generally given them. The natural surface of the ground forms the banquette, the parapet being thrown forward sufficiently far for that purpose. In wooded regions a revetment of the interior slope is frequently formed of logs laid one over the other. Further strength is given to the line by some of the obstacles previously described, placed about 50 yards in front.

It is natural for men lying behind breastworks exposed to fire to crouch low, and thus to raise the muzzles of their muskets while they lower the butts, and fire too high. It is therefore important to provide loopholes along the parapet, to cover the heads of those firing. A log about a foot in diameter is sometimes laid on top of the parapet, notches being cut on the lower side about 6 feet apart. Loopholes may also be made of boards or of sandbags. A screen of any kind, even if not bullet-proof, is valuable; branches of trees are therefore sometimes employed.

At suitable points the artillery is posted, the terreplein being widened and embrasures cut for the purpose. If a position can be secured where the artillery could enfilade an attacking line, it would of course be occupied, as in posting troops for battle. This is not strictly a flanking arrangement, as the term is employed in fortification.

Woods in front of the works are cleared away and ditches filled up, these clearings being extended by degrees to the full range of artillery, should the position be long enough occupied. Ditches and similar obstacles running perpendicularly to the general direction of the defenses may be left, as they will obstruct the circulation of the enemy's troops from one part of his line to the other. In long lines of rifle-trenches branches should be run back, at intervals of 500 or 600 yards, in a direction nearly perpendicular to the main line, to shut off the enemy in case of his forcing his way through, and prevent him from turning the whole line by his advantage at a single point.

The employment of inclosed works upon these hasty intrenchments is exceptional, since the labor and materials required to construct them in accordance with the demands of modern war can not usually be provided.

Semi-permanent Works.—At the breaking out of the civil war the strategic points of the U. S. were entirely unprovided with land defenses. It became necessary to construct strong fortifications, with some durability, for large cities, in a short time. These circumstances gave rise to a new kind of fortification, combining certain of the arrangements of permanent with those of field works, and called by U. S. engineers semi-permanent works. It is in this form that inclosed field works will generally be employed in the future; and these must always be employed for the land defenses of cities in the U. S. The most remarkable example of their application was in the fortification of Washington at the outbreak of the civil war. (See *Prof. Paper C. E.*, No. 20.) This city was very much exposed, was of vital importance to the Union cause, and was loosely scattered over a wide area. It was necessary not only to keep out the enemy, but to keep out his artillery projectiles, which had a range of 3 or 4 miles. The first defenses constructed were of the old field-work type, with thin parapets and steep scarps, and unprovided with bomb-proofs. They were located at the points most immediately requiring them. As some of them were laid out by the eye, the distances being measured by pacing, their weakness was recognized. As time and experience were gained, a system of great strength was developed, the defenses at the close of the war consisting of 68 inclosed forts and batteries, having an aggregate perimeter of 22,800 yards (13 miles), and emplacements for 1,120 guns, 807 of which and 98 mortars were actually mounted; of 93 unarmed batteries for field-guns, having 401 emplacements; and of 35,711 yards (20 miles) of rifle-trenches, and 3 block-houses. The permanent garrison was about 18,000, though it was expected that this would be greatly re-enforced in case of a persistent attack. The length of the line occupied was about 37 miles. "Every prominent point, at intervals of 800 or 1,000 yards, was occupied by an inclosed work; every important approach or depression of ground unseen from the forts swept by a battery of field-guns, and the whole connected by rifle-trenches." These inclosed works were the semi-permanent works; they were located upon the principles of lines with intervals, the intervals being afterward closed, as an additional precaution, by lines of rifle-trenches.

In these detached works bomb-proofs were provided for the men and material, embrasures for the guns, and well ventilated magazines, lined in a substantial manner with heavy timber, for the ammunition, space being allowed for 100 rounds per gun. The depth of the ditches was usually 6 feet, their width being regulated by the amount of earth required for the parapets. Glacis were thrown up to bring the ground in front under the musketry-fire from the parapets. Traverses were erected wherever a line was exposed to enfilade or oblique fire. Great care was taken to provide each of the larger works with flanking arrangements. When this could not be otherwise secured, counterscarp galleries were employed. In many cases advanced works, in the shape of rifle-trenches connected with the main works, were constructed. Wells were dug to supply the garrisons with water. Instead of a steep scarp, liable to erosion, the exterior slope of the parapet was continued to the bottom of the ditch.

But the most remarkable improvement upon the old methods was in the structures within the works. In addition to the substantial and roomy magazines already referred to, the larger works were provided with filling-rooms, implement-rooms, service magazines, and guard-rooms, either in the traverses or in separate structures, while nearly all contained capacious bomb-proofs. The latter were generally arranged to serve the purpose of a parados, or traverse, or interior retrenchment, in addition to their primary object, and were provided with a banquette along the rear, from which musketry-fire could be delivered upon an assaulting party which had succeeded in mounting the front parapet. See Gen. J. G. Barnard's *Defenses of Washington*, published as *Professional Paper Corps of Engineers U. S. Army, No. 20*, in 1871.

Block-houses.—The case frequently arises where it is necessary for a point of considerable importance to be guarded by a small detachment of men, and where circumstances do not permit the construction of a semi-permanent work. Such would be a bridge upon a line of communications passing through the enemy's country which it is necessary to guard against cavalry raids. In this case, instead of the redoubt often employed, engineers sometimes use the block-house. This is a building of which the sides are composed of heavy timbers placed vertical in juxtaposition, loopholed, and sometimes provided with embrasures for artillery. Earth is heaped up on the exterior to the height of the loopholes or embrasures, and a V-shaped ditch excavated to prevent the enemy using these against the defenders.

Historical Sketch of Fortification.—The origin of fortification is coeval with that of society. The character of the works has conformed to that of the weapons employed in the various ages of mankind. Thus among the wild tribes of the infant world, armed with clubs and weapons of stone, a wooden barricade or a bank of earth surmounted by a hedge was an efficient defensive work. The introduction of cutting tools of metal rendered these an easy prey to the attack, and a wall of masonry became necessary. As nations grew in power the height and thickness of these walls increased; some are said to have been 100 feet high. The greater their height, the more difficult they were to scale, and the more efficient were the missiles thrown from them; while the greater the thickness, the more space was provided upon them for the engines of war. To procure great thickness two walls were often built parallel to each other, the interval between them being filled with earth. The walls of Babylon are said to have been 70 feet thick, and are supposed to have been built in this way. To cover the men and material on top of this rampart, a thin wall was built up at the front part of it to the height of a man, and furnished with embrasures, through which stones and arrows were discharged at the enemy. To obtain a fire upon the foot of the wall, brackets were built out, and upon them were placed parapet-walls with embrasures. The next improvement was to build towers projecting from the general face of the wall, and providing a fire parallel to it. The distance between these towers was about the range of an arrow. It is doubtful when the ditch was introduced, but it was probably at an early date. During the Middle Ages the art of fortification, like the other arts and sciences, rather retrograded than improved.

The invention of gunpowder caused a radical change in all the methods previously employed. The high walls presented a marked and vulnerable object to projectiles of cannon; they had to be very much lowered. The top of an ordinary wall did not afford room for the guns; space was procured by throwing up a bank of earth on the interior. The towers had to be very much enlarged to receive the guns; they thus expanded into bastions. The walls, though lowered, were still exposed to being breached from a distance; outworks were therefore thrown up in front of them.

The Italians being in advance of the rest of Europe in all the arts, it was with them that the first great changes originated—Verona was surrounded by a bastioned enceinte in 1527—though the first modern writer was the celebrated German painter, sculptor, and architect, Albert Dürer, whose book is dated 1527. His ideas showed great originality and sagacity. He provided casemates, and flanked the faces of his polygon by enlarged towers, which he called bastions, though they rather resembled the caponnière than the modern bastion. The second great name in the modern art is that of Daniel Speckle, also a German, b. in 1536 at Strassburg, which city he fortified. He enunciated the principles that masonry must not be exposed to the distant view of the enemy, and that the nearer the general direction of the line fortified shall be to a straight line, the better. The first prominent French writer was Errard de Bar-le-Duc, whose book is dated 1594. He enunciated the principles that the minimum salient angle shall be 60°, and that the outworks must be seen into and commanded by the works in rear. His work was followed by that of De Ville in 1629, who made some improvements in details. Following Errard and De Ville, the next master was the Count de Pagan, whose work is dated 1645. He greatly increased the size of the demilune, and regulated the dimensions of the bastions and the distance between them, and improved the direction of the flanks and other details.

Vauban was born in 1633. Taking the method of Pagan, he enlarged the demilune, and provided it with an interior redoubt, invented the tenaille, enlarged the re-entrant places of arms, and constructed traverses along the covered way. Vauban restored 300 old fortresses, built 35 new ones, and besieged 53. He displayed extraordinary talent in adapting his works to the site, and he brought the bastioned system to a high degree of perfection. Coehorn was a contemporary of Vauban's, and adapted the system in a peculiar manner to the low lands of Holland. Vauban was followed by Cormontaingne, b. in 1696, who enlarged the demilune still further, introduced redoubts in the re-entrant places of arms, and made other improvements, leaving the system substantially as it is to-day.

The bastioned system was considered the only proper manner of fortifying until the latter part of the eighteenth century, when Montalembert, a French general of cavalry, produced his bold and original work. This "most intrepid of writers on fortification," as he has been styled, abandoned the bastioned trace, made large use of casemates, and used caponnières for flanking purposes, thus developing the ideas produced 250 years before by Dürer. He also advocated the tenailled system. It is upon the ideas of Dürer and Montalembert that the modern polygonal system is based, which has received such general employment throughout Europe. For seacoast fortification the casemates of Montalembert had a singular applicability. He is the first engineer who invented special designs for works "for the defense of ports," and he should be regarded as the originator of the casemated batteries subsequently so extensively employed by all nations.

The literature of fortification is very large. For a technical study of the subject, the reader is referred particularly to Zastrow's *History of Permanent Fortification*, originally published in German, but translated into French and published at Paris in 1856; Fallott's *Cours d'Art Militaire* (Paris, 1857); and the following works by Maj.-Gen. A. Brialmont, of the Belgian staff: *Études sur la Défense des États et sur la Fortification* (Paris, 1863); *Traité de Fortification Polygonale* (Paris, 1869); *Fortifications à Fossées Secs* (Brussels, 1872); *Fortification du Temps Présent* (Brussels, 1885); and *Influence du Tir Plongeant* (Brussels, 1888). For attack and defense of fortifications, see SIEGE.

O. H. ERNST.

Fortin, fōr'tăn', PIERRE: Canadian official; b. in Verchères, Quebec, in Dec., 1823, and graduated M. D. at McGill College in 1845. He served as surgeon at Grosse island 1847–48; in 1852 was appointed stipendiary magistrate for the lower river and Gulf of St. Lawrence, and organized the service for the protection of the sea and river fisheries in that district. In 1858 he was commissioned by the Canadian Government to visit the French colonies of St. Pierre, Miquelon, and Long Lake, and report conditions under which the French fisheries were carried on. In 1859 he established on all coasts and rivers of the Province of Quebec a system of licenses for salmon-fishing, and in 1862 began his series of descriptions of marine animals, fishes, etc., of the lower river and Gulf of St. Lawrence, which were printed in some of his annual reports to the Government. He had a seat in the Dominion Parliament 1867–74 and 1878–87; was commissioner of crown lands, Province of Quebec 1873–74, and Speaker of the Legislative Assembly 1875–76. While Speaker he founded the Marine Library of the province. He was one of the founders of the Geographical Society of Quebec, and its first president.

NEIL MACDONALD.

Fort Independence: a casemated, pentagonal, bastioned work located on Castle island, Boston harbor, Mass., begun 1832. It forms one of the defenses of the inner harbor of that port, being distant about 3 miles from the city. It is on the site of the old fortress called Castle William before and during the Revolution.

Fort Jackson: a pentagonal, bastioned, and casemated brick work, with glacis and wet ditch, on the Mississippi river, 78 miles below New Orleans, at what is known as the Plaquemine Bend. The designing of such a work on this soil was bold but successful; the considerable "settlement" has done no serious injury. In conjunction with Fort St. Philip it defends New Orleans against attack from the river. It was built mainly from 1824 to 1832, though extensively repaired, enlarged, and modified since 1841. The forcing of the passage of these works and their capture by the fleet of Farragut constituted the first great naval exploit of that commander. See FARRAGUT, DAVID GLASGOW.

Fort Leavenworth: a post-village of Leavenworth co., Kan.; on the Missouri river; 2 miles above Leavenworth (for location, see map of Kansas, ref. 5–J). It is situated on a bluff 150 feet high. Here in 1827 was established a U. S. military prison, which is now, however, under the jurisdiction of the Department of Justice. The U. S. reservation is 6 miles long and a mile wide, and is well laid out. The infantry and cavalry school is located here.

Fort Lee: post-village of Bergen co., N. J. (for location of county, see map of New Jersey, ref. 2–E); on the Palisades of the Hudson river, opposite 160th Street, New York city. It was once a military station, and fell Nov. 18, 1776, into the hands of Gen. Cornwallis, who here captured large amounts of military stores. Pop. (1895) 1,617.

Fort McHenry: an inclosed bastioned pentagon, with exterior batteries, on the west side of the Patapsco river, forming one of the defenses of the channel of approach to Baltimore, Md. It is an old work (second system), built prior to 1812; an attack during the war of 1812–15 furnished the theme for the well-known words of *The Star-spangled Banner*, by F. S. Key.

Fort Madison: city; capital of Lee co., Ia. (for location, see map of Iowa, ref. 7–K); situated on Mississippi river, 23 miles below Burlington, and on the Atch., Top. and S. Fé, Burl. Route, and Ch., Fort Mad. and Des Moines R. Rs.; 237 miles S. W. of Chicago; connected with Illinois by one of the finest wagon and railway bridges on the river. It has numerous churches and schools, a business college, a public library, three parks, a State penitentiary, shops of the A., T. and S. F. Railway, foundries, tanneries, large packing-houses, and manufactures of agricultural implements, machinery, railway-car wheels, boots and shoes, flour, brick, lumber, sash, doors, blinds, and furniture. The city is the site of a fort built in 1808, and captured by the Indians in 1818. Pop. (1880) 4,679; (1890) 7,901; (1900) 9,278. EDITOR OF "PLAIN DEALER."

Fort Marion: an inclosed work at St. Augustine, Fla., begun by the Spaniards about 1650 and completed in 1756. It is the oldest fort in possession of the U. S. Government, and is from its antiquity an object of attraction to strangers visiting ST. AUGUSTINE (*q. v.*). It is not of much value, but is carefully preserved as an object of historic interest.

Fort Mifflin: one of the inner line of defenses of the port of Philadelphia, Pa.; on Mud island, Delaware river, below the mouth of the Schuylkill. It is one of the older (or second) system of works. It was attacked by a British man-of-war Oct. 23, 1777, and after a spirited resistance was taken on Nov. 16. The fort has been modified and repaired.

Fort Monroe: a fortification located on Old Point Comfort, Va., for the defense of Hampton Roads and the water-approach to Norfolk and the Gosport navy-yard. It stands on the north side of the channel, Fort Wool (formerly Fort Calhoun) being on the south side, about a mile distant. Fort Monroe might properly be called a fortress or fortified place, as it incloses a large area, and contains within it a number of detached buildings, such as officers' quarters, offices, barracks for soldiers, storehouses, a portion of the workshops of an arsenal, the artillery school of the service, a chapel, etc. It was commenced in 1817, and was originally designed to mount 371 guns in casemates and *en barbette*, inclusive of mortars, field-pieces, and flanking howitzers. In plan it is an irregular hexagon, on two sides of which, comprising the three channel fronts, the armament is arranged in two tiers, one in casemates and one in barbette. On the other four sides, each being one front, the ramparts are solid, with the exception of some of the flanks, which are casemated. The work is bastioned, although unaccompanied by the usual outworks of the regular bastioned system. It is surrounded by a tide-water ditch, 8 feet deep at high water, exterior to which there is a casemated battery on the channel front to the left of the casemates of the main work, and a quadrilateral redoubt on the north side, commanding the approach down the peninsula. This redoubt, like the main work, is surrounded by a wet ditch. The scarp-wall of the main work rises to the height of 17 feet above high water. The entire fort covers an area of 80 acres, and the distance around it, exterior to the ditches of main work and redoubt, is $1\frac{6}{10}$ miles. In its construction there was expended $2,818,000. This fort is (1893) being modified to fit it to the requirements of modern defense, an efficient armament of modern steel rifled cannon and mortars properly protected being provided, supplemented by a system of submarine mines. Inasmuch as the exceptional magnitude of Fort Monroe, as compared with other works of coast and channel defense in the U. S., has been the subject of frequent, and perhaps not unjust, criticism, it may be said, in explanation, that this work was designed under the inspiration of Gen. Simon Bernard, a foreign engineer of eminence, called into the service of the U. S. soon after the close of the war of 1812–14, with all the exaggerated ideas of warfare which the close proximity of belligerent nations in Europe had produced and rendered orthodox. There is no other work at all like it in the U. S. in any essential particular, and the error in this instance relates solely to magnitude, not to strength.

Revised by JAMES MERCUR.

Fort Morgan: an inclosed casemated and bastioned pentagon of brick, with exterior batteries; located on the west end of Mobile Point, Ala., at the entrance to anchorage in Mobile Bay; begun in 1819 on the site of old Fort Bowyer. An historic interest attaches to the latter work as having borne an important part in the war of 1812–15. It then consisted of only a small redoubt. In pursuance of the plan adopted by the British, "to destroy and lay waste all towns and districts of the U. S.," the Indian war was renewed on the southern frontier, and on Sept. 15, 1814, a combined naval and land attack was made upon Fort Bowyer, then but a small redoubt mounting 20 guns, and with a garrison of 120 men, officers included. The British force comprised 4 armed vessels, 590 men, and 90 guns, and a land force exceeding 700 men, of which 600 were Indians. The British lost a ship and 232 men. The work was taken by the British Jan. 11, 1815. It was captured from the Confederates by Admiral Farragut Aug. 22, 1864.

Fort Moultrie, mōl'trē: a fortification on Sullivan's island, entrance to Charleston harbor, S. C. A rude work of palmetto logs and earth, mounting 26 guns, was unsuccessfully attacked in 1776 by the British fleet of nine vessels (270 guns), under Sir Peter Parker, and thenceforth bore the name of the commander, Col. William Moultrie. It was subsequently rebuilt in masonry with an imperfectly bastioned tracé, and described in official reports as a "work of some strength, but with scarp-wall so low as to oppose no serious obstacle to escalade." And such it was, essentially, at the time when (Dec. 26, 1860), abandoned by Major Anderson, it fell into Confederate hands, and together with the batteries on Morris island fired the first guns of the civil war upon the Star of the West, Jan. 9, 1861. (See FORT SUMTER.) In Confederate hands the work was re-enforced by earthen batteries extending the whole length of Sullivan's island. Since the civil war it has been very much modified to adapt it to receive modern heavy guns, protected by earthern traverses and parados. The Seminole warrior Osceola is buried just outside the walls of the fort.

Fort Niagara: an inclosed work in Niagara co., N. Y., at the mouth of Niagara river, the entrance to which it commands. The old work of this name bore a prominent part in the war with Great Britain in 1812–15, and was the scene of stirring events, being surprised and captured in 1813, when most of its garrison were slain.

Fort Ontario: See OSWEGO.

Fort Payne: city; capital of De Kalb co., Ala. (for location of county, see map of Alabama, ref. 2–E); on railway; 50 miles S. S. W. of Chattanooga, Tenn.; in a coal and iron mining region. It has rolling-mills, an iron-furnace, fire-clay works, and sawmills. Pop. (1890) 2,698; (1900) 1,037.

Fort Pickens: an inclosed casemated and bastioned pentagonal brick work, on Santa Rosa island, Pensacola harbor, Fla., which harbor and the U. S. navy-yard at Warrington it is intended to defend. In Jan., 1861, Maj. Adam Slemmer abandoned the small work, Fort Barrancas, opposite, and transferred his command to Fort Pickens, which he succeeded in holding until re-enforced.

Fort Plain: village (settled about 1715; incorporated in 1832); Montgomery co., N. Y. (for location of county, see map of New York, ref. 4–I); situated on the Mohawk river, on the Erie Canal, and on the N. Y. C. and H. R. and West Shore Railways; 58 miles W. of Albany. It has six churches, the Clinton Liberal Institute (Universalist), one of the largest spring and axle works in the U. S., a very large furniture-factory, knitting-mill, silk-mill, wood-working establishment, etc., and is the center of an important hop-raising and dairying section. A strong fort was erected here in 1778, and a block-house in 1780. Pop. (1880) 2,443; (1890) 2,864; (1900) 2,444.

EDITOR OF "REGISTER."

Fort Pulas'ki: a fortification constructed on Cockspur island, Ga., for the defense of Tybee Roads and the Savannah river approach to the city of Savannah; begun in 1829, and finished at the beginning of the civil war in the U. S. at a cost of nearly a million dollars. Upon the secession of Georgia from the Union her military took possession of the fort, but on Nov. 29, 1861, Gen. Quincy A. Gillmore, chief engineer to the expeditionary corps commanded by Gen.

W. T. Sherman, made a reconnoissance of the works and pronounced the reduction of the work practicable by means of batteries of mortars and rifled guns established on Big Tybee island. From December till spring the preparations went on. The island was occupied by Union troops, and batteries were placed at adjacent points, the material for their construction, as well as the ordnance and ordnance-stores, being carried with infinite difficulty over the swampy soil. The positions selected for the most advanced batteries were screened from view from the fort by brushwood and bushes, and concealment was maintained until the work was far advanced. The batteries opened fire on Apr. 10, 1862, and though but few of the Union shells burst within the inclosure, the balls from the rifled guns chipped and tore away the masonry to such an extent as to threaten the fort with complete demolition, and on the afternoon of the following day its garrison surrendered. The credit for this victory, which was gained at a trifling sacrifice of life on either side, is due to Gen. Q. A. Gillmore. See his *Report on the Siege and Reduction of Fort Pulaski* in *Professional Paper No. 8 of the Corps of Engineers.* See also BOMBARDMENT.

Fortress: a place made strong and defensible, so that a small number of men may hold it against a larger force. This is the general term, not used in any exact or technical sense; it implies usually a place of considerable size and a permanent work, rather than an intrenched camp or the like. Ancient fortresses differ radically from modern ones in this respect, that the attack and defense of the works were *vertical* before the introduction of guns throwing heavy balls horizontally, a change dating not earlier than 1500 A. D., while since that time the attack and defense have been *horizontal.* The modern fortress is low, and not to be seen from afar; its grassy slopes are lost in the landscape. The ancient fortresses, from the time of the early empire in Egypt, as at El Kab or Abydos, to Pierrefonds, N. E. of Paris, finished in 1400 A. D., were lofty and imposing structures, crowning a height or isolated in a lake, lifting their battlemented towers high above all surrounding objects.

The manner of attack upon a fortress must always determine the character of the defensive works. During all the ages before the introduction of breeching guns there were but four methods of attack: by escalade, by forcing or surprising gateways, by mining underneath the walls, so as to throw them down, and by battering-rams, the pickax, or other such methods of breaching the wall above ground. To resist escalade the walls were made high; to resist breaching they were made thick; to make the gates defensible elaborate and ingenious combinations were devised; while mining could be prevented only by the rocky nature of the soil, or by position upon high scarped cliffs, or by water, and could be opposed only by countermines, or by sorties of the garrison. Missile weapons were secondary in importance. Arrows and bolts were used to drive the defenders from the walls at the moment of assault, and to repel the assailants, and heavy stones and darts as large as iron-shod rafters were used to destroy battlements and wooden defenses of all sorts; burning missives were used also to set fire to the stockades, palisades, and wooden galleries. The largest *pierrières* of the Middle Ages could throw a 300-pound stone perhaps 600 feet; but not many of these in an hour, and with not very exact aim; moreover, such a machine contained an enormous amount of solid timber, occupied a space of perhaps 800 sq. feet, and took many days to set up and adjust for use. It will be seen, then, that the main walls and towers of a city or castle had nothing to fear from missiles. The assailants had to crowd close under the walls to scale them or to breach them, and the defense consisted of a steady shower of darts, arrows, stones, and unslaked lime, with fire-arrows aimed at the wooden mantlets and scaling-towers of the attacking party. The higher the wall the heavier the blow struck by a rounded stone falling from its top, the harder to reach it by ladders, and the harder to match it with movable towers. Accordingly, the defenders of Pierrefonds stood upon a solid pavement not less than 80 feet above their assailants, while aid came to them from fellow defenders in towers rising on either side from 40 to 60 feet higher still; the donjon of Coucy had 180 feet of sheer unbroken wall before the galleries of defense began; and the pope's palace at Avignon has walls generally from 80 to 120 feet in clear vertical height above the pavements of the streets throughout its perimeter of nearly a third of a mile, with towers rising much higher. Then to resist the ram and the pick a thickness of from 10 to 16 feet was given to the walls, and often the whole basement of a tower, as of the great donjon of Châteaudun, was of solid masonry without any open space inside. Moreover, it was very common to arrange the location and the levels of a fortified place, even on tolerably even natural ground, so that the level without would be from 10 to 30 feet lower than that within, and so that the outer surface of the stone wall might be a mere facing, the true foundation being above on an artificially leveled table of rock, out of reach of the mines and galleries of sappers.

Next in importance after the strength of the walls and towers was the protection of the persons of those who manned the wall. The simplest and most obvious means of protecting them against missive weapons was the *battlement*, a device used by the Egyptians 4000 years B. C., by the Greeks, the Persians, the Romans, and the Europeans of the Middle Ages alike, as their monuments show. Piers of masonry, from 6 to 8 feet wide and 6 feet high above the top of the wall, alternate with spaces where the parapet is only about 4 feet high. The soldier shoots over the low parapet and shrinks back behind the *merlon.* Sometimes the merlon is pierced by a long slit for discharging arrows. In the defenses of Pompeii each merlon has a bit of wall carried back like a buttress, so as to protect the left side of the soldier using it, who, of course, shoots from his own right shoulder. In the thirteenth-century fortresses the row of battlements was carried out beyond the face of the wall on corbels, so as at once to widen the *chemin-de-ronde* or broad walk on the top of the wall, and to leave open spaces between the corbels, through which heavy stones could be dropped upon the assailants at the very foot of the wall, and that without exposing the defenders in the least. But there grew up in the thirteenth and fourteenth centuries an elaborate system of temporary wooden defenses put upon the walls when a siege was expected. These projected far beyond the face of the wall, and gave excellent "command" of the base of wall as well as perfect cover for the archers and cross-bowmen. It was therefore the first aim of the besiegers to destroy these by heavy stones or by burning barrels of combustibles thrown by a *trébuchet* or *mangonel.*

Much the most important ancient fortress remaining nearly complete to modern times is Rome, whose walls built by Aurelian and Honorius have been preserved nearly intact for the greater part of their extent. The battlements have been many times restored, no doubt, but these can be compared with the almost intact example of Pompeii. Generally, while the plan and distribution of an ancient fortress can be made out with but slight excavation and removing of obstacles, the details of the defensive appliances at top are lost. Bas-reliefs. as on the columns of Trajan and Antonius at Rome, and on the wall of the Temenos at Gjölbasschi, and wall-paintings, as in Egypt, help us to restore these in imagination. Of the fortresses of the Middle Ages many remain in excellent condition for study; several in Syria, built by the crusaders, being almost intact; the great inclosed place at Villeneuve, opposite Avignon, retaining all its defensibility except for a breach or two in the walls; and the tower of Philip the Fair near by, and the walls of the city of Avignon itself, having needed and received but slight repairs, and so with many instances. As with other ruins, the near neighborhood of a large population brings swift destruction to the lighter and more easily removed stone work; a lonely and removed situation is the best safeguard until government protection is given.

RUSSELL STURGIS.

Fort Royal (Martinique): See FORT DE FRANCE.

Fort St. Philip: a fortification nearly opposite FORT JACKSON (*q. v.*), on the Mississippi river. The old river-front, with low brick scarp and wet ditch, was built by the Spaniards. The Plaquemine Bend offers the lowest favorable locality for defending the river, though it is 15 miles above the mouth and 30 above the Head of the Passes. The work was wholly inclosed by the U. S. authorities during the war of 1812–15, but, like nearly all works of that and earlier date, it is of rude design both in trace and in relief. Since 1841 it has undergone extensive repairs and modifications. At the outbreak of the civil war in 1861 it fell into the hands of the Confederates, but was, with Fort Jackson, captured by Farragut's fleet Apr., 1862.

Fort Schuyler, skī'ler: See NEW YORK (city).

Fort Schuyler: the name given in 1776 to the old Fort Stanwix which stood on the site of the present city of Rome, N. Y. It was unsuccessfully besieged by St. Leger's Tories and Indians in 1777, and was destroyed by fire and freshet in 1781. Fort Stanwix was built in 1758, and cost the British Government £60,000.

Fort Scott: city and railway center; capital of Bourbon co., Kan. (for location of county, see map of Kansas, ref. 7–K); situated on the Marmaton river; 300 miles W. of St. Louis and 98 miles S. of Kansas City, Mo. It is the seat of a normal college, and has an iron-foundry and machine-works, grain elevator, large flour-mills, woolen-mills, paint and cement works, window-glass works, and a large sorghum-sugar factory. Coal and flag paving-stone are found in the vicinity, and large quantities are shipped from the city. Hydraulic cement and mineral paints, umbers, yellow ochers, Spanish brown, Indian red, etc., are found in large quantities. Pop. (1880) 5,372; (1890) 11,946; (1900) 10,322.
EDITOR OF "TRIBUNE."

Fort Smith: city and railway center; one of the capitals of Sebastian co., Ark. (for location of county, see map of Arkansas, ref. 2–A); situated at the confluence of Arkansas and Poteau rivers; 158 miles W. by N. of Little Rock. It has sawmills, planing-mills, furniture-factories, cotton compress and oil-seed mills, ice-factory, etc., and an important trade in coal, cotton, grain, lumber, hides, and furs. Pop. (1880) 3,099; (1890) 11,311; (1900) 11,587; besides a suburban population of about 2,000. EDITOR OF "TIMES."

Fort Snelling: village; Hennepin co., Minn. (for location of county, see map of Minnesota, ref. 9–E); on the Ch., M. and St. P. Railway, at the junction of the Minnesota and Mississippi rivers, opposite Mendota, and 2 miles below the Minnehaha falls. It was founded in 1820, is an old U. S. military post, and the oldest settlement in what is now Minnesota. Pop. (1890) 550; not returned separately in 1900.

Fort Sumter: Charleston, S. C.; noted for being the place where the U. S. civil war was begun, Apr. 12, 1861, and as the scene of several severe military and naval conflicts during that war. The work, begun in 1829, is located upon a shoal on the south side of the entrance to the inner harbor, distant about a statute mile S. W. from Fort Moultrie, and $3\frac{1}{3}$ miles from Charleston city. The land nearest the work is Cummings Point, on the north end of Morris island, about three-quarters of a mile distant, in a southerly direction. The fort was built of brick on a rip-rap foundation, the exterior wall being 38 feet high and $7\frac{1}{2}$ feet thick, and was designed to mount 136 guns arranged in three tiers, two in embrasure and one *en barbette*. It never received its entire armament, as none of the embrasures of the second tier were finished when the civil war broke out. The openings left for them were therefore walled up with brick, in order to render the work as strong as possible to resist the threatened attack of the Confederates. Up to that time a little more than $1,000,000 had been expended upon it, and its armament comprised 6 24-pounders, 41 32-pounders, 10 8-inch Rodman guns, 10 42-pounders, 3 10-inch columbiads, and 8 8-inch seacoast howitzers.

View of Fort Sumter from Morris island, Aug. 16, 1863.

South Carolina formally seceded Dec. 20, 1860, in the midst of the wildest rejoicing and exultation throughout the South. The entire force of U. S. troops in Charleston harbor at the time consisted of two companies of the First U. S. Artillery and nine musicians, a total of seventy-five enlisted men, under the command of Maj. Robert Anderson. This handful of men, which had hitherto occupied Fort Moultrie in consequence of the unfinished condition of Fort Sumter, was quietly transferred to the last-named work during the night of Dec. 26—an event at once followed by the seizure, by the State authorities, of all the other forts in the harbor, and the U. S. arsenal, post-office, and custom-house in Charleston city. The construction of batteries on Morris island was begun, the coast and harbor lights were extinguished, and the buoys removed from the channel to prevent the sending of re-enforcements and supplies to Fort Sumter. On Jan. 9, 1861, the steamer Star of the West arrived in the harbor with provisions and 250 Federal soldiers. In attempting to reach Fort Sumter she was fired into and struck from batteries on Sullivan's and Morris islands, and abandoned the enterprise. As Maj. Anderson's provisions would be exhausted on Apr. 15, official notice was conveyed to Gov. Pickens, of South Carolina, on the 8th that supplies would be conveyed to the fort at all hazards. Its surrender was demanded by Confederate General Beauregard at 2 P. M. on the 11th, and refused. To another communication of the same date, Maj. Anderson replied that the work would be evacuated on the 15th unless "controling instructions" or "additional supplies" were received by that time. This response not being deemed satisfactory, Maj. Anderson was notified at 3.20 A. M. on the 12th that fire would be opened on the fort in one hour, and the cannonading began at the appointed time. At noon on the same day a fleet of vessels from New York, with provisions for the garrison, appeared off the harbor and exchanged signals with the fort, but made no attempt to land any supplies, without which the contest must necessarily be of brief duration. On the afternoon of the 13th terms were arranged, under which the garrison marched out on the 14th with the honors of war, saluting the U. S. flag with fifty guns.

The brick buildings erected inside the fort for quarters and barracks were burned down during the action by hot shot from the Confederate batteries, but the work itself had received no material injury. Contemporaneous opinion, outside a somewhat restricted military circle, very generally conceded the difficulty, if not the impracticability of throwing re-enforcements and supplies into the fort during the attack, but in the light of subsequent events such an enterprise loses most of the elements of extreme hazard. The lower embrasures, forty-one in number, and each nearly 2 feet wide and 3 feet high, were only 4 feet, in many places not over 3 feet, above the enrockment at the foot of the outer wall, and not more than 10 feet distant from the water, which encircled the fort on every side. If thirty or forty small boats carrying rations and soldiers, and manned by such men as a call for volunteers would bring out in any fleet of U. S. merchantmen, had attempted to make a landing simultaneously on all sides of the work during the night of the 12th, a large proportion of them would doubtless have succeeded. The opposition, if any, would have come from boat-parties similarly organized, which, at the worst, would only place the combatants on a footing of theoretic equality, in which the best men and the best weapons would win.

The Confederates, upon getting possession of Fort Sumter, at once proceeded to augment its offensive and defensive strength. Rifle-guns were added to the armament; many of the casemates were filled up with sand; sand traverses were constructed between the barbette guns, and the magazine walls were strengthened. They held undisturbed possession for a period of two years.

On Apr. 7, 1863, a gallant attack was made upon the fort by a U. S. naval force of nine ironclads, carrying twenty-three guns, under command of Rear-Admiral Samuel F. Dupont. The vessels engaged were the Weehawken, Passaic, Montauk, Patapsco, New Ironsides, Catskill, Nantucket, Nahant, and Keokuk. The combat lasted one hour and forty minutes, when the fleet withdrew, at 4 P. M., with the intention of renewing the engagement the next morning. The monitors had received so much injury, however, that the project was abandoned. The Keokuk, a thin-armored, double-turreted monitor, sunk the next day from the injuries received in her hull, although she had been under fire only thirty minutes. She had been struck ninety times, and nineteen shots pierced her through at and below the water-line. In this engagement the ranges varied from 550 to 2,100 yards. The fleet, armed almost exclusively with 11-inch and 15-inch smooth-bores, with a few 150-pounder rifles, fired only 139 times. Of these, 54 15-inch shells, 43 11-inch shells, 22 11-inch solid shot, and 5 150-pounder rifle projectiles were fired at Fort Sumter, and the rest at Forts Wagner and Moultrie. Fort Sumter was subsequently bombarded, its batteries destroyed, and the walls upon two of its faces demolished, from batteries established by the Union land forces on Morris island. The first fire from the breaching batteries opened Aug. 17, 1863. At 12 P. M. on the night of Sept. 8 the fort was assaulted by a naval column of 500 men in small boats, which was repulsed with heavy loss. A preliminary summons for its surrender had been made by Admiral Dahlgren.

A prominent historian of the war asserts, on the alleged authority of the naval commander, that co-operation from the army was expected in this assault, in accordance with previous arrangement. Such is not the case. On the contrary, although an assault had been ordered by the commander of the land forces the same night, the admiral was informed that the column could not start from the creek W. of Morris island until midnight, in consequence of low tide. The naval column left the fleet at 10 P. M., and by midnight had been repulsed and withdrawn. The only arrangement between the navy and army commanders consisted in the adoption of a watchword to prevent unpleasant collisions on the water between the two forces. Each enterprise was organized with ample strength to act alone, and was intended to be entirely independent of the other, and no reference whatever to any expected co-operation from the army was made by the admiral or by any of his subordinates in their official reports of the action.

The Fort Sumter garrison subsequently constructed additional shelters, galleries, and quarters within and under the ruins, and maintained possession until the final evacuation of Charleston and all its defenses Feb. 18, 1865.

The work has been rebuilt on a modified plan, and mounts large guns *en barbette* and guns in casemate. For demolition of Fort Sumter, see Gen. Gillmore's *Report on Engineer and Artillery Operations against Charleston*; also article BOMBARDMENT.

Fort Tompkins: a fortification on the west side of the Narrows, entrance to New York harbor; lat. 40° 36′ 1″ N., lon. 74° 2′ 58·2″ W. See NEW YORK (city).

Fortuna [= Lat. *Fortuna*, equiv. to Gr. Τύχη]: the goddess of good luck, worshiped at many places of Italy, Greece, and Asia Minor. She is most often represented holding in one hand a rudder, in the other the horn of plenty; sometimes also with a ball or wheel at or under her feet. She was especially honored at Rome, where she had several temples and bore many surnames. G. L. H.

Fortunate Islands [transl. of Lat. *Fortunatæ Insulæ*, transl. of Gr. Μακάρων Νῆσοι, Islands of the Blessed]: an ancient name for a group of supposed islands of the ocean stream, whose genial climate is celebrated by Homer. The geographers identified them with what are now called the Canary islands, but the term in a wide sense seems to have included the Azores, Madeira, and the Cape Verde group. The delightful climate of all but the most southerly group of these islands justifies the name.

Fortunatia'nus, ATILIUS: a Roman grammarian of the fourth century; author of a treatise on meters, and especially on the meters employed by Horace. The work is compiled from previous writers for the use of a young Roman of senatorial rank, to whom the author recommends the careful study of Horace. In order to explain for him the meters of the poet, Fortunatianus gives first a summary of the different kinds of feet and the principal meters, with some of the leading rules of prosody. He then takes up and analyzes the Horatian measures. The work is given in Gaisford's *Script. Lat. Rei metricæ* (Oxford, 1837), and in vol. vi. of Keil's ed. of the Latin grammarians.

Revised by M. WARREN.

Fortuna'tus: the hero of an old romance, the first known edition of which appeared in German at Frankfort in 1509, the second in 1530. Fortunatus, after great sufferings, receives an inexhaustible purse and a wishing-cap, which finally proves the ruin of him and his sons. Another popular character, Fortunio, is believed to have been at first identical with him. The story of Fortunatus was dramatized by Hans Sachs, *Der Fortunatus mit dem Wunschseckel* (1553), and by Dekker, *Pleasant Comedie of Old Fortunatus* (1600). The principal European languages have the tale in various forms. Its authorship is not known, but some of its materials are very old. The "inexhaustible purse" of Fortunatus forms one of the prominent features of the strange tale of *Peter Schlemihl* (by Chamisso), who for it sold his shadow.

Fortunatus, VENANTIUS HONORIUS CLEMENTIANUS: Bishop of Poitiers; a Latin poet of the transition period, who wrote on a great variety of subjects: he owes his reputation mainly to three or four beautiful Latin hymns. He was born in Northern Italy, in the neighborhood of Ceneda and Treviso, about 530 A. D., but received his education at Ravenna, where he studied grammar, rhetoric, and jurisprudence, devoting considerable attention also to eloquence and poetry. About 564 he left Italy for France, where he spent the rest of his life. He was favorably received at the court of Siegbert, King of Austrasia, in honor of whose marriage with Brunhilda he composed an epithalamium in the manner of Claudian, and resided there for some time as a sort of court-poet. After visiting Tours in fulfillment of a vow to St. Martin, he repaired to Poitiers, where he met Radegunde, the queen of Clothaire I., who was living in a cloister which she had founded in the vicinity, and attracted her attention and regard. He here took orders, became a presbyter, and almoner and chaplain of the queen, and under her patronage devoted himself to ecclesiastical studies and literary production. On the death of the Bishop of Poitiers, Fortunatus succeeded to the episcopate (not earlier than 592), which office he retained till his death, about 600. His works are very numerous in prose and verse, consisting of lives of distinguished men, bishops, confessors, and others; explanation of the Lord's Prayer and of the Creed; an epic poem in four books on the life of St. Martin, chiefly copied from the narrative of Sulpicius Severus; and nearly 300 poems, collected in eleven books, on a great variety of subjects and in different meters. Fortunatus stands on the border-line, as it were, of the old classical poetry and the mediæval accentual (of which he was one of the first writers), adopting in his poems both varieties, and showing no great regard for Latin quantities. The best edition of his works is by Leo and Krusch (2 vols., Berlin, 1881 and 1885, vol. i. containing his poetical, vol. ii. his prose works). His beautiful hymn, *Vexilla regis prodeunt*, was adopted by the Church, and has been translated into several modern languages (into English by J. M. Neale in *Mediæval Hymns*, and by Mrs. Charles in *Christian Life in Song*). It, with several others, appears in the greater collections, but is made generally accessible in Trench's *Sacred Latin Poetry* (London, 1874, 3d ed.) and in March's *Latin Hymns* (New York, 1874). See Manitius, *Geschichte der Christ. Lateinischen Poesie* (Stuttgart, 1891, pp. 438–70); Guizot, *History of Civilization*, 18th lecture; Ebert, *Gesch. d. Christlich-Lateinischen Literatur* (Leipzig, 1889, pp. 518–542.)

Revised by M. WARREN.

Fortune, ROBERT: author and botanist; b. in Berwickshire, England, in 1813; educated at a village school in the Merse; selected horticulture as his occupation, and was employed in the botanical gardens of the Scotch capital, then in those of Chiswick; later in life he was for a few years director of the botanical garden at Chelsea. In 1842 was made collector of plants for the Botanical Society of London in Northern China; in 1847 published *Three Years' Wanderings in Northern China*. Visiting China in 1848 to make investigations concerning the tea-plant for the East India Company, he published, after an absence from England of three years, his *Two Visits to the Tea Countries of China*. He again visited China in 1853, and spent three years, publishing in 1857 *Residence among the Chinese Islands*. He in 1859 collected in China, for the U. S. Government, the seeds of the tea-shrub and other plants, and in 1863 published *Yedo and Peking*. D. Apr. 16, 1880.

Fortuny y Carbó, fōr-too′nē̆e-ee-kaar-bō′, MARIANO: genre-painter; b. at Rëus, Catalonia, Spain, June 11, 1838. Pupil of Palan, Claudio Lorenzalez, and of the Barcelona Academy; Prix de Rome, Barcelona Academy, 1856; went to Morocco in 1859 to paint pictures of Gen. Prim's campaign; went to Paris in 1866, but spent almost the whole of his life in Rome. His pictures are notable for brilliant qualities of color and extreme cleverness of manipulation. They sold for high prices during his lifetime, and are much sought for by collectors in Europe and the U. S., where many of his principal works are owned. *Camels at Rest* is in the Wolfe collection, Metropolitan Museum, New York; *Arab Fantasia* and *Court Jester* in the collection of Mrs. W. H. Vanderbilt, New York. D. in Rome, Nov. 21, 1874.

Fort Valley: town and railway junction; Houston co., Ga. (for location of county, see map of Georgia, ref. 5-H); 29 miles S. W. of Macon. It has a large trade in fruit, cotton, and other agricultural products. The surrounding region is of the very first rank in the production of peaches and pears. Pop. (1880) 1,277; (1890) 1,752; (1900) 2,022.

Fort Wadsworth: a casemated stone fort at the entrance to New York upper harbor. See NEW YORK (city).

Fort Washington: a former suburban village of New York, now in the city limits; on Hudson river; in the north part of Manhattan island. The fort, of which some remains still exist, stood between what are now 181st and 186th Streets, on the highest land upon the island, and during the Revolution it was an important point. It was taken, with 2,600 prisoners, by the British Nov. 16, 1776, after a gallant defense. It was attacked at once by Gen. Knyphausen with six German regiments moving up from the flats along the rough hills nearest the Hudson; by Lord Percy with a division of English and German troops on the southern side; and by Gen. Matthews with the guard and Col. Sterling with a body of Highlanders, crossing the Harlem river at two different points. See E. P. Delancey, *On Fort Washington* (1878).

Fort Wayne: city and important railway center; capital of Allen co., Ind. (for location of county, see map of Indiana, ref. 3-G); on the Ft. W., Cin., and Lv., Findlay, Ft. W., and W., Grand Rapids and Ind., L. S. and M. S., N. Y., Chi., and St. L., Penn. Co., and Wabash Rys., at the confluence of St. Mary's and St. Joseph rivers, which here form the Maumee; 94 miles W. S. W. of Toledo, O. The city is regularly laid out in well-paved streets, and covers an area of nearly 6 sq. miles. It is the seat of Concordia College (Lutheran) and Fort Wayne College of Medicine, and has 47 churches, 35 public and parochial schools, 2 well-appointed libraries, 2 hospitals, 2 orphans' homes, and 7 public parks. The handsome Government building cost $200,000. There are also a new county court-house, erected at a cost of $1,000,000, a $125,000 manual-training and high-school building, and a $75,000 public library, the latter the gift of Mr. Andrew Carnegie; and 1 private and 4 national banks represent a capital of $2,500,000.

Manufactures, etc.—There are extensive railway-shops, foundries, machine-shops, flouring-mills, and manufactures of baking-powder, wagons, and lumber; a general electric-light plant employing 900 men, two knitting-mills employing 450 men, etc. The city has over 32 miles of street-railways, an excellent system of sewerage, and electric lights.

The town originated in a fort built by Gen. Anthony Wayne in 1794. The first city charter was granted in 1839. The place is surrounded by a fine agricultural community, and is the leading city of Northern Indiana. Pop. (1840) 1,200; (1880) 26,880; (1890) 35,393; (1900) 45,115.

Fort William: an important railway and shipping point on Thunder Bay, north shore of Lake Superior, in Western Ontario (see map of Canada, ref. 9-J). It has the elevators and terminal shops of the Canadian Pacific Railway, and is a favorite summer resort. Pop. 2,800. M. W. H.

Fort William Henry: a fortress in Warren co., N. Y., near the head of Lake George; erected in 1755 by the British forces under Sir William Johnson. It became an important strategic point in the last French war in the colonies, and was captured by about 9,000 French and Indians under Montcalm in 1757. The fort was garrisoned by about 3,000 English troops under Col. Munro, and at only 15 miles' distance stood Gen. Webb with 4,000 men. Munro applied for aid from Webb, but as none was furnished he was finally compelled to surrender. The fort was then destroyed.

Fort Worth: city and important railway center; capital of Tarrant co., Tex. (for location of county, see map of Texas, ref. 2-H); situated on Trinity river, 32 miles W. of Dallas and 210 miles N. of Austin. It has 39 churches, Fort Worth University, Polytechnic Institute, St. Ignatius Academy, Fort Worth Medical College, Academy of Music, 2 business colleges, high school, 12 public schools, 8 private schools, and a fine board of trade building. Among its chief industrial establishments are 4 grain elevators, 4 flouring-mills, a cracker-factory, 2 iron foundries, a cotton-oil mill, excelsior-factory, car-works, shops of the Fort Worth and Denver, the Texas and Pacific, and the Rio Grande Railways, large stock-yards, and one of the largest packing-houses in the Western U. S.

The U. S. census for 1890 shows 311 industrial establishments, with a capital of $3,184,872, giving employment to 2,649 persons, at an annual wage of $1,882,116. The cost of materials used was $3,379,519, and the value of products $6,691,621. The city has 200 private artesian wells for drinking water, besides city water-works for drinking, sewerage, and fire purposes. It has 60 miles of macadamized streets, 60 miles of sewers, 20 miles of electric railways, and a complete system of electric lights owned by the city, 7 national banks, and 2 daily newspapers. Pop. (1880) 6,663; (1890) 23,076; (1900) 26,688. EDITOR OF "MAIL-TELEGRAM."

Fo′rum [of uncertain etymology, perhaps connected with *foris* (*fores*), Gr. θύρα]: seems originally to have been applied to any open space in front of buildings or surrounded by them, and so, for example, to the area in front of a sepulcher, as appears from a fragment of the laws of the Twelve Tables. The term was usually applied to an open place in Rome, like the Greek ἀγορά, for the assembly of the citizens for business, for legal transactions, for the administration of justice, and for the sale and purchase of goods. With the growth of the city the necessities of the people required more than a single forum, and convenience separated them into those devoted to public affairs and those which were more strictly markets or bazaars. The most celebrated and the most important of the *fora* of the former class was the Forum Romanum, sometimes called Magnum, and from its pre-eminence simply Forum. This was the earliest, and for a time the only one, and was situated in the valley between the Capitoline and Palatine hills, and with it is associated very much of the interest of the public and private life of early Rome. It was the very heart of the city, the center of all its life and activity, and in it were gathered daily those whom business summoned, the orators and public men of the day with their bands of clients, as well as the idlers who sought only to be amused, with trains of quacks and mountebanks, so pleasantly described by Horace. (For the buildings in and around the Forum, see ROMAN ARCHÆOLOGY.) Immediately adjoining this a new forum was erected at great expense by Julius Cæsar, which was called from him Forum Julium. It contained a temple of Venus Genitrix (in allusion to his descent from the goddess), which was vowed by Cæsar after the victory at Pharsalus, and was dedicated in 46 B. C. This still failing to accommodate the increasing pressure of the business of the courts, Augustus constructed still another, which received from him the name Forum Augusti. It contained within it a temple of Mars Ultor, which Augustus had vowed to erect on avenging the death of his adoptive father. This forum was more contracted than Augustus had designed on account of the refusal of some owners of houses to part with their property. Still other fora were erected by the later emperors, partly to facilitate business, but chiefly to adorn the city. Among these may be named the Forum Nervæ or Forum Transitorium (so called because it was an important thoroughfare from the Carinæ and the Subura to the Forum Romanum), begun by Domitian and completed by Nerva; and, the most magnificent of all, the Forum Trajani, immediately adjoining the Forum Julium and Forum Augusti, and having connected with it the Basilica Ulpia and the famous Columna Trajani, still standing. The second class of fora was devoted to market transactions, and they derived their names from the articles sold in them—e. g. *forum olitorium*, the vegetable-market; *forum piscarium*, the fish-market; *forum boarium* (cattle), *forum suarium* (swine), etc. The word forum was applied (in the latter sense of a market, and also of a place at which the prætor held his circuit, administering justice) to villages or stations in the provinces of Italy (like the use of the term "court-house" in Virginia, from which grew up in time even flourishing towns; such were, among others less important, Forum Appii in Latium on the Appian Way; Forum Aurelii or Aurelium in Etruria; Forum Cornelii in Cispadane Gaul, now Imola; Forum Gallorum in Cisalpine Gaul, now Castel Franco; Forum Julii or Julium in Gallia Narbonensis, now Fréjus. See Jordan, *Topographie der Stadt Rom* (vol. i., part 2, p. 155 ff.), and Middleton, *Remains of Ancient Rome* (vol. i., p. 231 ff., and vol. ii. init.). Revised by G. L. HENDRICKSON.

Forum: in law, a court or judicial tribunal; a place where a remedy is sought. The Roman Forum was the place where the courts were held, and the name was, from this circumstance, introduced into the English law to denote a place of trial, and has been retained as a convenient designation in certain phrases until the present time. Thus the phrase *lex fori*, in which the term is most generally employed, means the law of a place or court where an action is instituted. (See LEX FORI.) *Forum contractus* is the court of the place where a contract is made. *Forum domicilii* is used to denote the court or place of a person's domicile; *forum rei sitæ*, the tribunal where the property in litigation is situated. There are various other important phrases in which the term is used, in all of which it has the same general meaning.

Forward, WALTER: lawyer and Congressman; b. in Connecticut in 1786, removed to Pittsburg, Pa., in 1803, and studied law, beginning its practice in 1806; began to edit *The Tree of Liberty*, a Democratic newspaper, at Pittsburg in 1805. He was M. C. from Pennsylvania in 1821–25. In 1824–28 he supported John Quincy Adams, and was thence identified with the Whig party. He was active in the convention of 1837 to revise the constitution of Pennsylvania; in Mar., 1841, was appointed first comptroller of the U. S. Treasury; was Secretary of the U. S. Treasury in 1841–43; in 1849–52 U. S. *chargé d'affaires* to Denmark, and then presiding judge of the district court of Allegheny co., Pa. D. at Pittsburg, Pa., Nov. 24, 1852.

Foscarari, fos-kaa-raa'ree, EGIDIO: ecclesiastic; b. at Bologna, Jan. 27, 1512; became a Dominican; in 1544 was made a prior and inquisitor at Bologna, and later Bishop of Modena. He was frugal, modest, and austere, and devoted much time and money to the poor and to the reclamation of the vicious classes. Paul V. imprisoned him for heresy, but Pius IV. vindicated him, and in 1561 he entered the Council of Trent, in which he assisted Forerius and Leonardo Marini in preparing the catechism and correcting the missal and breviary. D. at Rome, Dec. 23, 1564.

Foscari, fos'kaa-ree, FRANCESCO: Doge of Venice 1423–57; b. 1372; warred with the Duke of Milan in 1426 (peace concluded Apr. 26, 1433), 1438 (peace again Nov. 20, 1441), and 1452 (peace Apr. 9, 1454). The Venetians obtained possession of Cremona, Bergamo, and Brescia, but Foscari was deposed by the Council of Ten Oct. 23, 1457, and died Nov. 1, 1457. His sufferings and those of his son, banished as a traitor in 1445, are the subject of Byron's *Two Foscari*.

Foss, ARCHIBALD CAMPBELL: Methodist divine; b. at Phillipstown, Putnam co., N. Y., Mar. 6, 1830; graduated at Wesleyan University in 1852 with the highest honors of his class, and at once joined the New York Conference. He served several important churches, and in 1858 became associate pastor with Dr. John McClintock at St. Paul's, New York city. In 1860–62 he occupied the chair of Latin and Hebrew in his alma mater; from 1863 to 1866 was presiding elder of the Poughkeepsie district; in 1867 was offered, but declined, the professorship of Biblical Exegesis in the Drew Theological Seminary. In 1868, while preaching at Sing Sing, his health failed, and he traveled in Italy and Switzerland. D. at Clarens, Switzerland, Mar. 30, 1870.

Foss, CYRUS DAVID, D. D., LL. D.: b. at Kingston, N. Y., Jan. 17, 1834; a brother of Archibald C. Foss; graduated at Wesleyan University in 1854; taught mathematics in Amenia Seminary, N. Y., 1854–55, and was its principal 1856; entered the Methodist Episcopal ministry, and has held important pastorates, chiefly in New York and Brooklyn, 1859–74; was a delegate to the General Conference of his Church in 1872; became president of Wesleyan University, Middletown, Conn., 1875; elected bishop in Methodist Episcopal Church, May 12, 1880. He resides in Philadelphia.

Fos'sa Maria'na [Lat. *fossa*, ditch, canal, deriv. of *fo'dere*, dig + *Maria'na*, pertaining to *Marius*]: a canal about 16 miles in length, cut by the Roman general Marius from the river Rhône to the Gulf of Stomalenine, where it terminated at a port called Fossæ Marianæ, near the modern village of Foz. The work was done in 102 B. C., and traces of it existed in the fourth century. The entrance to the Rhône through the delta mouths being difficult and dangerous, Marius while encamped near by caused the canal to be dug by his army, thus diverting a large part of the river to a commodious entrance.

Revised by MANSFIELD MERRIMAN.

Fossil [from Lat. *fos'silis*, dug up, deriv. of *fo'dere*, *fos'sum*, dig]: the body or any known part or trace of an animal or plant buried by natural causes in the earth. The molds of shells, the impressions left by the feet of animals in walking, implements of stone or metal and other works of human art which have been accumulated naturally into rubbish-heaps, are thus strictly fossils. Perhaps the marks of rain, wind, waves, and shrinkage through heat should be included. Early writers believed fossils the result of certain laws of nature, and never animated; others suggested they might be relics of the Noachian deluge; but it is now generally conceded that they indicate the nature of the life of numerous successive periods in the earth's history from the *Eozoic*, or the *dawn* of life, to the latest vessel sunk in the chalky depths of the ocean. A few fossils have been preserved entire, like the elephants and rhinoceroses found encased in frozen mud and sand in Siberia. The relics are usually *petrified*, or rendered stony through the infiltration of mineral matter. The organic particles are slowly replaced through chemical forces by mineral atoms, but arranged in the same manner, so that the characteristic structure of the plant or animal is preserved. Microscopic sections show unmistakably the peculiar internal features of the pine, oak, or palm, though the substance is changed to flint. Fossils indicate the former existence of organic races now entirely extinct; that, as a whole, each successive period contained more highly organized structures than its predecessor; that tropical forms once flourished in the polar regions; that each epoch was characterized by peculiar groups. Hence formations are identified in new countries by means of fossils.

Fossil Botany: See PLANTS, FOSSIL.

Fossil Fishes: See VERTEBRATES, FOSSIL.

Fossil Footprints (*Ichnites*): impressions left by extinct animals in walking over mud and sand which has since hardened into stone. These may be made by various invertebrates or vertebrates, such as crustaceans, insects, batrachians, and reptiles, or even mammals. Few of this latter class are known, but among them may be mentioned those found at Carson City, Nev., probably made by some of the great ground-sloths (see MEGATHERIUM), but acquiring some notoriety through newspaper articles ascribing them to man. While tracks in stone must have been observed at an early date, the first scientific notice concerning them appears to have been by Dr. Duncan in the *Transactions* of the Royal Society, Edinburgh, in 1828. Trails, probably made by trilobites, and described under the name of *Climachtichnites*, are not uncommon in the middle Cambrian of New York, Wisconsin, and Canada; similar tracks appear in the Cambrian of Great Britain. Footprints of labyrinthodonts were described from the Trias of Germany under the name of *Cheirotherium barthii*, and very similar prints have been found in the Carboniferous of Pennsylvania and Kansas, the latter associated with tracks of reptiles. Prof. Marsh has described the footprint of an amphibian from the Devonian of Western Pennsylvania which is of special importance as being the sole indication of the existence of an air-breathing vertebrate at so early a date. By far the most important locality for fossil footprints is the valley of the Connecticut, where large numbers, representing a variety of species, have been found in the red Triassic sandstone so extensively quarried for building purposes. These were first noticed by Pliny Moody in 1800, and were described at length in 1836 by Prof. Edward Hitchcock, who based 153 species on these impressions, including birds, reptiles, batrachians, fishes, insects, and lower invertebrates. It is not probable that any of these tracks were made by birds, since no birds are known below the Jurassic, the so-called bird-tracks having been made by Dinosaurs. The Hitchcock Ichnological Museum of Amherst College, Massachusetts, contains more than 20,000 Ichnites, while the museum of Yale University has a still larger collection. F. A. LUCAS.

Fossil Forests: a popular name for collections of petrified tree-trunks. Few of these "forests" really deserve the name, as they generally consist of trees which have been carried far from their place of growth, buried in earth, there silicified, and subsequently exposed by the washing away of the material which once surrounded them. Among celebrated fossil forests there are those of Egypt near Cairo, of Nubia, of Silesia, and of the island of Antigua in the West Indies. Other accumulations of silicified wood occur in the interior of Chili, in New Zealand, and in Abyssinia, while in the U. S. there are as great and remarkable collections of silicified tree-trunks as any found in other parts of the world. On the banks of the Little Colorado, in Arizona, are silicified tree-trunks of all sizes up to 6 feet in diameter, perfectly and beautifully preserved, but none in positions or places occupied in life. Sometimes they are simply replaced by white silica, which shows the woody structure as distinctly as it could have been seen in the living tree; in other cases the trunks are masses of solid jasper, looking like huge sticks of red sealing-wax; in other cases still, the wood is opalized or agatized, or filled with chalcedony or crystallized quartz, stained with the most brilliant colors. In this region the history of the vast accumulation of silicified tree-trunks is easily read, and probably it will serve to explain many similar cases. The banks of the Little Colorado are formed of Triassic marls, here more than 1,000 feet in thickness. As the marls are very soft, they have been extensively eroded, leaving the silicified wood either on the surface—where trees 40 to 60 feet in length may often be seen, with all their parts in contact—or accumulated at the bottom of the slopes bordering the valleys from which the marls have been removed. Hot water has much greater power than cold to dissolve silica; and it is probable that thermal waters have had much to do with the silification of the tree-trunks in the localities where they are found in great numbers. In the U. S. volcanic phenomena have been displayed on a grand scale throughout all the region where fossil wood is found, and it is also a district in which thermal springs carrying large quantities of silica are numerous, and are still displaying their petrifying powers. There is reason to believe that in the later geological ages hot springs were even more abundant, and probably they were more potent than they now are. What is known of the geology of the island of Antigua is confirmatory of the view that thermal waters have played an important part in the silification of the fossil wood found there. In the Bad Lands of the Little Missouri thousands of silicified tree-trunks are scattered over the surface, where they have been exposed by the washing away of the sandstones and shales of the Laramie group, in which they were formerly buried.

A remarkable group of silicified trees, some of which are 12 feet in diameter, was discovered in Napa co., Cal., and is described by Prof. Marsh in the *Am. Jour. Sci.* (1871, p. 266); and a veritable fossil forest, in which the trees are standing erect, surrounded by volcanic *débris*, in large numbers and at several levels, is described by W. H. Holmes in his report on the geology of Yellowstone Park (Hayden's *Report* for 1878, p. 48).

In the drift deposits of Southern Ohio is found an old soil in many places thickly strewed with interlaced prostrate trunks of trees which grew upon it; and in a few cases these are found buried erect. This old forest was plainly submerged by the sinking of a land-surface or the elevation of the water-level over it, resulting in its burial beneath many feet of gravel and sand. The trees here are not mineralized, and have the appearance of partially decayed wood; but if the subsidence had been occasioned by volcanic action, and hot water had been poured out freely, undoubtedly the trunks would have been silicified, as they are at the Cascades of the Columbia river, where a volcanic outburst at a much later date buried quantities of trees and changed them to masses of silica. See PLANTS, FOSSIL. J. S. NEWBERRY.

Fossil Invertebrates: the remains of invertebrate animals found in stratified rocks, including the species of *Protozoa, Cœlenterata, Echinodermata, Vermes, Molluscoidea, Mollusca, Arthropoda*, and *Tunicata*. The fossil invertebrates already described and named reach a total of about 40,000 species. There are also probably 5,000 species of fossil plants, and of fossil vertebrates nearly 5,000 species. Upon fossil invertebrates therefore the science of paleontology is largely founded. The fossil invertebrates are also of great importance from a geological standpoint, because the majority of all the stratified rocks, upon which historical and formational geology are founded, were formed under the surface of the ocean, and the fossil remains preserved in them are mainly the remains of the invertebrates that lived along the shores in the ocean.

Some invertebrate remains, on account of their great abundance, constitute the basis of rock formations—e. g. limestones from corals and from crinoids, called therefore coral and crinoidal, or encrinital limestones. *Protozoa*, as in the case of the *Fusulina* of the Carboniferous, and the *Nummulites* of the Tertiary, form the main part of thick deposits; in the latter case reaching a thickness of several thousand feet; and the white chalk, so conspicuous on the two coasts of the English Channel, is composed of comminuted shells of other animals, but chiefly of the minute shells of Foraminifera. The abundance of fossils of one kind and another has suggested the names of Lingula flags, Graptolite shales, Pentamerus limestone, Productus, Coral Encrinital, Crinoidal, Cephalopod or Brachiopod limestone, and many others for the rocks containing them.

Invertebrate fossils are chiefly composed of the hard parts secreted when living by the animals which they represent. In the case of Gastropods, Cephalopods, Pteropods, and Lamellibranchs, they were the outer calcareous shells which protected the soft animal which secreted them. In the case of corals the secretion is also calcareous, but was made under, and at the base supporting the polyp, and lifting it from the bottom to which the coral was attached; the reef-forming corals continued to grow upward till large masses of the calcareous secretions were formed. Crinoids, Cystoids, Blastoids, and Echinoids are represented by calcareous coatings made up of polygonal plates inclosing in a cup or chest like body the more active soft organs of the animal. The breaking up, in part, and burying of the unbroken calcareous fossils of these kinds furnished the material of the limestones which in the aggregate reach a thickness of many thousand feet. The fossils of Brachiopods are both calcareous and chitinous, and were very perfectly preserved, often revealing the microscopic structure and the delicate internal supports for the brachia, after being fossilized for millions of years. The hard parts of Crustacea and Trilobites are the outside chitinous coverings of the animals, which, on account of their jointed nature and frailty after the animal is dead, are often broken and fragmentary.

On account of the presence of these fossils in the stratified rocks of the whole series from the base of the Cambrian upward, the paleontological history of organisms is read more fully respecting the invertebrates than respecting plants or vertebrates, the remains of which were preserved only rarely and under exceptional circumstances. The general discussion of fossil invertebrates, in their relations to the laws of organic history and as indicative of the characteristic life of the various geological ages, will therefore be found under PALEONTOLOGY. Remark is also made of some of the more interesting groups of fossil invertebrates under their generic, family, or ordinal names.

HENRY S. WILLIAMS.

Fossil Plants: plants or vegetable impressions preserved in the earth by natural agencies, such as inhumation, petrifaction, carbonization, or incrustation. See PLANTS, FOSSIL.

Fossil Vertebrates: See VERTEBRATES, FOSSIL.

Foster, BIRKET: landscape and genre painter; b. at North Shields, England, Feb. 4, 1825. Pupil of E. Landells, an engraver; member British Water-color Society. He painted principally in water-colors, and many of his pictures have been engraved. His work is very popular in Great Britain. He drew a great deal for illustration of books and periodicals. D. Mar. 27, 1899.

Foster, CHARLES: merchant and banker; b. near Tiffin, O., Apr. 12, 1828; received his education in the public schools, in the academy of Norwalk, Ohio, and under private tutors in what is now Fostoria, to which his father had removed; was engaged continuously for fifty-six years in mercantile and banking business: on the outbreak of the civil war was appointed colonel of the 101st Ohio Regiment, but was unable to accept; was elected to the 42d, 43d, 44th, and 45th Congresses; was a member of the committee and chairman of the sub-committee appointed in 1875 to inquire into political affairs in Louisiana; was elected Governor of his State in 1879, and re-elected in 1881; was appointed by President Harrison, in May, 1889, chairman of a commission to negotiate a treaty with Sioux Indians; received the votes of the Republican members of the Ohio Legislature in 1890 for U. S. Senator; was appointed Secretary of the Treasury by President Harrison, Feb. 7, 1891. C. H. THURBER.

Foster, Frank Hugh, Ph. D.: Congregationalist; b. at Springfield, Mass., June 18, 1851; graduated at Harvard College 1873; was Professor of Mathematics (1873–74) in the Naval Academy at Annapolis, Md.: pastor at North Reading, Mass., 1877–79; Professor of Philosophy at Middlebury College 1882–84, and was made Professor of Church History at Oberlin Theological Seminary in 1884. In 1893 he became Professor of Theology in the Pacific Theological Seminary, Oakland, Cal. He has published a translation of Grotius on the *Satisfaction of Christ.* He is one of the editors of *The Bibliotheca Sacra.* George P. Fisher.

Foster, George Eulas, D. C. L.: Canadian statesman; b. in Carlton County, New Brunswick, Sept. 3, 1847; graduated at the University of New Brunswick in 1868; studied at Edinburgh University and University of Heidelberg 1872–73; was principal of Victoria County Grammar School 1868–69; of Classical and Mathematical Baptist Academy, Fredericton, 1871; of Ladies' High School, same city, 1872: and was Professor of Classics and History in University of New Brunswick 1872–79. He was elected to the Canadian Parliament in 1882, and re-elected in 1887 and 1891. He was Minister of Marine and Fisheries 1885–88, and became Minister of Finance in 1888, a portfolio which he now (1893) holds. While Minister of Marine and Fisheries he discharged important departmental and diplomatic duties in relation to the Bering Sea and the Atlantic fisheries disputes with the U. S. In 1888 he attended the commission at Washington which resulted in the Bayard-Chamberlain treaty; in 1891 was one of the Canadian commissioners who visited Washington to confer with Mr. Blaine relative to improved trade relations between Canada and the U. S. Neil Macdonald.

Foster, Jedediah: judge; b. at Andover, Mass., Oct. 10, 1726; graduated at Harvard University 1744; practiced law at Brookfield, Mass.; was in the Worcester County convention Aug., 1774, and delegate to the Provincial Congress 1774–75; he was negatived as a counselor by the British general Gage in 1774, but re-elected in 1775; was judge of the superior court in 1776, then judge of probate, and a justice of the court of common pleas of Worcester co., Mass.; also a member of the convention which formed the constitution of Massachusetts. D. at Brookfield, Mass., Oct. 17, 1779.

Foster, John Gray: soldier and engineer; b. in Whitefield, Coos co., N. H., May 27, 1823; graduated at West Point July 1, 1846, and entered the U. S. army as second lieutenant of engineers. In the war with Mexico he served with a company of sappers and miners; engaged in construction of fortifications and on coast survey 1848–54; assistant Professor of Engineering at West Point 1855–57; as engineer in construction of Forts Sumter and Moultrie, South Carolina, and works in North Carolina 1857–61; chief engineer of fortifications of Charleston harbor, strengthening them to resist attack; in defense of Fort Sumter Dec., 1860, to Apr. 14, 1861; appointed brigadier-general of volunteers Oct., 1861, and commanded brigade on Gen. Burnside's expedition to North Carolina; appointed major-general of volunteers July, 1862, and assigned to command of department of North Carolina (Eighteenth Army-corps); conducted various expeditions; mustered out of volunteer service Sept., 1866; brevet brigadier and major general U. S. army Mar., 1865. Returning to duty with his corps he was placed in charge of works for the preservation and improvement of Boston harbor, and construction of defenses of Portsmouth harbor, N. H., and many other works of construction and repair; on location of West Shore Railroad at West Point, on Sutro Tunnel, Louisville and Portland Canal. Author of *Notes on Submarine Blasting in Boston Harbor.* D. Sept. 2, 1874. Revised by James Mercur.

Foster, John Watson: cabinet officer; b. in Pike co., Ind., Mar. 2, 1836; graduated at the State University of Indiana 1855; studied at Harvard Law School 1855–56; admitted to bar 1857; practiced law at Evansville till July, 1861, when he entered the Union army as major of the Twenty-fifth Indiana Volunteers; participated in the battles of Fort Donelson, Shiloh, Knoxville, and others; commanded cavalry brigade and division of Twenty-third Army-corps in East Tennessee campaign; appointed minister to Mexico by President Grant 1873; minister to Russia by President Hayes 1880; minister to Spain by President Arthur 1883; appointed on special mission to Spain by President Cleveland 1885; commissioned by President Harrison, 1891, to negotiate treaties of reciprocity with Spain, Germany, San Domingo, and other countries; appointed agent of the U. S. in the Bering Sea arbitration with Great Britain, June 1, 1892; appointed Secretary of State to succeed Mr. Blaine, June 29, 1892; in 1893 and 1897 visited Europe to represent the U. S. in the Bering Sea question; was adviser to Li Hung-chang in treating with the Japanese in 1895.

Foster, Judith Ellen: temperance advocate; b. at Lowell, Mass., Nov. 3, 1840; daughter of Jotham Horton; educated in Boston common schools, and Genesee Wesleyan Seminary, Lima, N. Y.; married E. C. Foster in 1869; studied law because her husband was a lawyer; admitted to the bar 1873; superintendent department legislation N. W. C. T. U. 1870–84; president Iowa W. C. T. U. 1886–91; president Nonpartisan W. C. T. U. of D. C. 1889–93; president Woman's Republican Association of the U. S. 1888. Author of *The Crime against Ireland*; *Amendment Manual* (Prohibition); *The American Renaissance*; *Republican Contentions and Supreme Court Decisions*; and transient articles on current reform and political questions.
C. H. Thurber.

Foster, Lafayette Sabine, LL. D.: statesman; b. at Franklin, Conn., Nov. 22, 1806. He was educated at Brown University, and graduated there in 1828 with the highest honors; studied law with the Hon. Calvin Goddard, of Norwich, and was admitted to the bar in 1831. Repeatedly elected to the General Assembly of Connecticut from Norwich, he served as Speaker in 1847, 1848, and 1854; mayor of Norwich in 1851 and in 1852, receiving on his last election every vote cast. He was U. S. Senator from Connecticut 1855–67, serving on various committees, and acting as chairman of committee on foreign relations during part of the civil war. In Mar., 1865, he was elected president *pro tem.* of the Senate. When Mr. Johnson, the Vice-President, became President by the death of Mr. Lincoln on Apr. 14, 1865, Mr. Foster became acting Vice-President of the U. S., and held that position for two years. In 1870 he was again member and Speaker of the Connecticut Assembly; judge of the Supreme Court of Connecticut 1870–76. D. at Norwich, Conn., Sept. 19, 1880.

Foster, Michael, M. A., M. D., F. R. S.: physiologist; b. at Huntingdon, England, Mar. 8, 1836; educated at University College, London; became Professor of Physiology there, and later prælector of physiology at Trinity College, Cambridge. He is now (1901) Professor of Physiology in the University of Cambridge and secretary of the Royal Society. His text-book of physiology (1876) has run through several editions.

Foster, Robert Verrell, D. D.: instructor and writer; b. near Lebanon, Tenn., Aug. 12, 1845; educated in the Cumberland University and Union Theological Seminary. He was for several years Professor of Mathematics in Mississippi, and in Waynesburg College, Pennsylvania. In 1877 he became Professor of Hebrew and Biblical Theology in the Theological Seminary at Lebanon, Tenn., combining with this, for several years, editorial work in the Cumberland Presbyterian publishing-house, and the work of Professor in the college for ladies in Lebanon. He has published *Introduction to the Study of Theology* (Chicago and New York, 1889); *Old Testament Studies, an Outline of Old Testament Theology* (Chicago and New York, 1890); *A Commentary on the Epistle to the Romans* (Nashvile, 1891).
Willis J. Beecher.

Foster, Stephen Collins: song composer; b. at Pittsburg, Pa., July 4, 1826; educated at Athens Academy and Jefferson College, Pennsylvania; taught himself music, French and German, and the elements of painting. His first published song was *Open thy Lattice, Love* (1842), and his last was *Beautiful Dreamer* (1864). Between these two he wrote nearly two hundred songs, in most instances both words and music, and many became exceedingly popular. Among them were *Nelly was a Lady*, *Old Dog Tray*, *Old Folks at Home*, (for which he received $15,000), and the serenade *Come where my Love lies Dreaming.* Foster's gift of melody was remarkable, and had he had a thorough musical education he might have become a second Schubert. D. in New York, Jan. 13, 1864.

Foster, Randolph Sinks, D. D.: Methodist bishop; b. at Williamsburg, O., Feb. 22, 1820; studied at Augusta College, Kentucky, and in 1837 entered the Methodist Episcopal ministry; held important stations in the Western States; was transferred in 1850 to the New York Conference; chosen in 1856 president of Northwestern University; in 1858 became a professor in Drew Theological Seminary; and in 1872 was elected a bishop; retired May, 1896. Author of *Objections to Calvinism as it is* (1849); *Christian Purity* (1851); etc.

Foster, Mrs. THEODOSIA TOLL, better known as **Faye Huntington**: a writer of books for children and older people; b. in Oneida Castle, N. Y., 1838; graduated at the Oneida Seminary (1860); engaged in teaching; principal of the Home School for Girls, Verona, N. Y. She has published the following volumes: *In Earnest* (1867); *Kittie Farnham's Letters* (1868); *Through Patience* (1869); *Allan Phillips* (1872); *Those Boys* (1874); *Mr. McKenzie's Answer* (1875); *Louise's Mistake* (1875); *Fred Robert's Start in Life* (1875); *Mrs. Deane's Way* (1875); *Ripley Parsonage* (1877); *Echoing and Re-echoing* (1878); *Susie's Opinions* (1883); *Millerton People* (1884); *Competitive Workmen* (1884); *Transformed* (1885); *St. Paul's Problem* (1889); *What Fide Remembers* (1887); *A Modern Exodus* (1891); *A Baker's Dozen* (1892). WILLIS J. BEECHER.

Fosto'ria: city and railway center; Seneca co., O. (for location of county, see map of Ohio, ref. 2–E); situated 35 miles S. by E. of Toledo. It has one of the largest flouring-mills in Ohio, glass-works, and numerous other manufacturing establishments, and is supplied with natural gas. Pop. (1880) 3,569; (1890) 7,070; (1900) 7,730. EDITOR OF "REVIEW."

Foucault, foo'kō', JEAN BERNARD LÉON: natural philosopher; b. in Paris, France, Sept. 18, 1819. In 1844 he invented an apparatus by which electric light is used in optical experiments, microscopic researches, etc.; in 1845 he became scientific editor of the *Journal des Débats*. He demonstrated the earth's rotary motion on its axis by the pendulum and gyroscope in 1851, was physicist to the Imperial Observatory (1854), and a member of the French Institute. In 1855 obtained the Copley medal of the Royal Society for measuring the velocity of light. D. in Paris, Feb. 11, 1868.

Foucault Currents (or *eddy currents*): in electricity, are currents named from FOUCAULT (*q. v.*), the French physicist. They are electric currents in the iron or other metallic parts of a dynamo, motor, or other machine, induced by the movement of the parts in question through a magnetic field, or by fluctuations in the field (as in the transformer, etc.). Within the masses of metal, closed circuits of low resistance are afforded, so that the currents generated are frequently of considerable magnitude. The energy thus produced being converted into thermal form is apt to result in injurious heating, to say nothing of the serious losses of work involved. Loss of energy through Foucault currents is prevented by lamination of the parts subjected to induction; layers of metal lying at right angles to the path of the induced currents being used, with insulating strips between them. See DYNAMO-ELECTRIC MACHINE, ELECTRICITY, INDUCTION, MAGNETISM, TRANSFORMER, etc.
E. L. NICHOLS.

Fouché, foo'shā', JOSEPH, Duke of Otranto: politician; b. May 29, 1763, in Nantes, France; member of the convention 1792, and voted for the death of Louis XVI.; infamous for his share with Collot d'Herbois in the butcheries at Lyons; Minister of Police 1799; dismissed by Napoleon, but recalled 1804; created Duke of Otranto 1806; again dismissed by Napoleon 1810; made by him governor of Illyria 1813, and Minister of Police for the third time on his return from Elba; head of the provisional government after second abdication of Napoleon; again made Minister of Police by Louis XVIII.; ambassador to Dresden 1815; exiled and deprived of office by the decree of Jan., 1816, against regicides. D. at Trieste, Dec. 25, 1820. His *Memoirs* (1828–29, 4 vols.) are spurious.

Fougères, foo'zhār': town of France; department of Ille-et-Vilaine, at the junction of the Nançon and the Coucsnon; 23 miles by rail N. of Vitré (see map of France, ref. 4–C). It is famous for its dyeing, especially of scarlet, whose delicate tints are due to certain qualities of the waters of the Nançon. It has also tanneries, granite quarries, and manufactures of sailcloth and shoemakers' supplies. Pop. (1896) 20,735.

Fou'la, fow'la: a solitary island in the Atlantic, belonging to the Shetland group; lat. 60° 9' N., lon. 2° 6' W. It is a granite block rising 1,369 feet above the sea, and inhabited by 250 persons, who carry on some fishing, farming, and hunting of wild fowls. It is supposed to be the ancient *Ultima Thule*.

Foulard, Fr. pron. foo'laar' [Fr. *foulard*; origin obscure]: a light fabric of silk, sometimes containing cotton, and used principally for ladies' dresses. It is chiefly of French manufacture, but a similar class of goods is largely made in Japan, India, etc.

Fould, foo, ACHILLE: statesman; b. in Paris, France, Oct. 31, 1800; of Hebrew parents; was in the Chamber of Deputies in 1842 and 1846, in the Constituent Assembly in 1848, and in July, 1849, was a member of the legislative body. Prince-President Louis Napoleon made him Minister of Finance Oct. 31, 1849, but he retired in Oct., 1851, filling the position, however, for a second period from Dec. 2, 1851, to Jan. 25, 1852; then made senator, Minister of State and of the House of the Emperor in 1852; commander of the Legion of Honor Dec. 8, 1852; then a third time Finance Minister from Nov. 12, 1861, to Jan. 1, 1867. D. near Tarbes, Oct. 5, 1867.

Foul in the Foot: a contagious disease of sheep, characterized by ulcers and granulations between the toes. Caustic and stimulant applications, such as oil of turpentine, followed by tarry applications, are generally curative. The cause and nature of this disease are not well understood.

Foulis, fowlz, ROBERT and ANDREW: printers; b. in Glasgow, Scotland—Robert, Apr. 30, 1707; Andrew, Nov. 23, 1712; Robert was a barber by profession and Andrew intended to enter the ministry, but in 1740 the former established a printing-press; three years later became printer to the University of Glasgow, and in 1743 the brothers entered into partnership. Andrew died Sept. 18, 1775, and Robert in 1776. They made fortunes by printing, and lost them in founding an academy of painting and sculpture in Glasgow, the paintings being sold by auction in 1776. Their editions of Greek and Latin classics, especially those of Homer and Horace, were noted for accuracy and elegance.

Foulke Fiord: See the Appendix.

Foulweather, Cape: See CAPE FOULWEATHER.

Foundation [from O. Fr. *fondation* : Ital. *fondazione* < Lat. *funda'tio*, deriv. of *funda're*, found, deriv. of *fundus*, bottom]: in law, in its most enlarged legal signification, the establishment of a corporation of any kind, and in which sense the sovereign or state is said to be the founder of all corporations, since their original creation is due to royal charter or legislative grant, express or implied. In its narrower, yet more usual and important, meaning, *foundation* refers to the establishment of eleemosynary or charitable corporations or institutions by private endowment; and it is sometimes, though less commonly, by a natural transfer of application, used to indicate the endowment itself. A large variety of charitable institutions have owed their origin and maintenance entirely to private munificence. There is vested at common law in the creator of such institutions the right to exercise a power of supervision over the management of the corporate revenues and the methods of corporate action and government. This is called "a power of visitation." Charitable purposes may also be accomplished without any corporate authority, through the medium of trustees appointed by the founder either by deed or will. These trusts are under the supervision of the courts of chancery. The same remark is applicable to the funds of charitable corporations, which may be called to account for a breach of trust. See the articles CORPORATION and TRUSTS.

Foundation: the substructure of a building; the lower courses upon which the whole superstructure rests. Its object is to furnish an unyielding base which shall preserve the building from unequal settling and consequent cracks and dislocations or ultimate collapse. The science of foundations is one of the most important branches of civil and architectural engineering, and presents many problems of great interest and frequently of great difficulty. The principles are simple, and may be briefly stated; their application has to be made under such varied conditions as to require in general a new solution for each problem. It is only possible in a short survey of the subject to state these general principles with some of their more common typical applications, explaining the methods and processes employed, and illustrating them by actual examples from buildings of several different kinds.

The construction of a foundation comprises the preparation of the *bed*—that is, of the bottom of the excavation; the laying of the *footings*, as the foundations proper or lower courses of the structure are called; and the building up of the *foundation walls* from the footings up to, or nearly to, the level of the ground, where the apparent or visible structure begins (sometimes called "neatwork" by engineers).

The general principle underlying these operations is that of securing a firm and incompressible surface or area on which to begin the construction of the building; and whenever the bed is of a yielding nature, or incapable of sustaining a heavy pressure, to so enlarge the base of the structure as to reduce the pressure per square foot well within the safe limit for the soil of the bed in question. It is consequently of the utmost importance to ascertain as thoroughly as possible beforehand the nature of the strata upon which the building is to rest, and for all heavy structures, such as chimneys and towers, bridge-piers and tall buildings, to determine the bearing-power of the stratum selected for the bed. It is far wiser, and often more economical, to spend a fair sum in borings and tests, and thereby to be enabled to proceed on a basis of definite knowledge, than to dispense with these and proceed upon assumptions which may prove costly mistakes in the end. In many cases, of course, the experience of adjacent buildings supplies the required information; in buildings of little height and light construction such precautions may be unnecessary, but it is certain that the cost of retrieving a single expensive blunder resulting from unexpected weaknesses in the foundation-bed or an unexpected depth to the surface of the rock would counterbalance the cost of experimental borings many times over.

Foundations may be divided into two general classes, those on incompressible soil and those on yielding or compressible soil. The latter class may be subdivided according to the nature of the soil, or according to the means employed to distribute the weight over the required increase of area. But it is not always easy to classify the soil by its common name. Hard rock is absolutely unyielding; so for most purposes is hard gravel, and so is sand when confined. But some rocks, partly disintegrated, are more yielding than hard clay; and sand, although incompressible when properly confined, is a most treacherous material when unconfined, especially when saturated with running water from springs or underground streams.

Foundations on Rock.—These require only that the rock-surface be dressed to roughly approximated planes normal to the line of pressure—i. e. horizontal for all vertical walls. A very gentle slope only requires roughening to prevent any sliding of the foundations upon it. Ordinary slopes should be cut into rough steps. But great differences in the depth of different parts of a foundation are to be avoided as far as possible, because of the greater settling in the masonry of the deeper foundations. The latter should be built up with cement-mortar and with careful masonry as close-jointed as possible; or concrete may be employed to make up the difference in height, since concrete, when once fairly "set," is incompressible, like the rock itself. Care should be taken to fill up all crevices and fissures in the rock-bed with cement or concrete, or to arch over such as are very deep and wide. The bed should also be carefully drained to prevent injury to the foundations themselves from surface-water or adjacent springs, and all disintegrated and soft rock removed. Upon a rock-bed so prepared the masonry may be built up without any great "spread" or increase of breadth at the base. The footings are usually, though not always, composed of large stones, and the chief precaution requisite in the foundation-walls is to see that they are thoroughly bonded by the use of "headers," and that they are laid up with a good quality of mortar, preferably cement-mortar. When the rock "gives out" under a building site, the builder has a very difficult problem to face. It becomes necessary to found a part of the edifice on a more or less compressible soil, and some settling is almost sure to occur over those portions of the foundation in spite of every precaution. Sometimes, however, an apparent failure of the rock indicates merely a more or less sudden dip or falling away of the ledge, which may be reached again by simply digging deeper. In such cases the difference in the depth of the excavation should be made up, as already indicated, by solid concrete, or by closely built masonry laid up in cement, or by concrete "piles" or "wells," as described farther on.

Foundations on Hard Gravel.—Hard gravel is an excellent material for a foundation-bed, and may safely be relied upon to bear a pressure of 5,000 lb. per square foot. Where it overlies rock, and is not liable to scour from running water, it will often safely sustain a greater load than this, Rankine's allowance of 1 to 1·5 tons (long) being undoubtedly much too low. The chief precautions to observe in founding on gravel, after it has been excavated to below the frost-line (2 to 6 feet, according to climate), are to drain the trenches thoroughly, and to secure as nearly equal a bearing as possible upon all parts of the trench. The footings are usually of concrete or of large stones, as nearly flat as possible, presenting a wide bearing-surface and a deep bond into the wall. Sometimes the bottom of the trench is covered with a layer a few inches thick of broken stone, on which the footing-stones are laid. The footings are sometimes laid up "dry"—i. e. without mortar—in such cases they should be laid with extra care, and thoroughly wedged to prevent movement under the superimposed weight. If laid in mortar, strong cement should be used. Concrete footings are made in layers 9 to 18 inches thick at a time, thoroughly rammed, and allowed to "set" before the addition of the next layer. It is customary to "spread" the footings, making them 50 per cent. wider than the walls to be built upon them (Fig. 1). It is important to confine the concrete, either by temporary walls or molds of planking, or, better still, by filling with it the whole width of the trench, until it has thoroughly set. Otherwise it is apt to spread and disintegrate under its own weight while soft, and to set in a less compact and solid mass than when so confined. The figure shows the trench filled with concrete on which are the stepped or spreading footings.

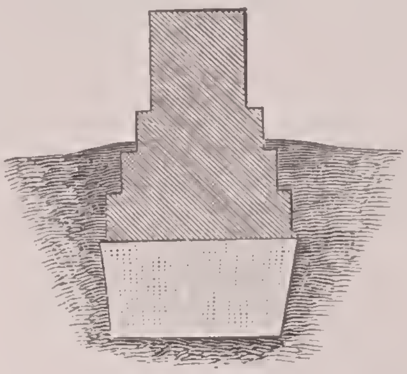

FIG. 1.—Section of concrete footings, etc.

Foundations on Sand.—Sharp sand, constantly dry or wet, is practically incompressible when properly confined so as to prevent lateral movement. When foundations are to be laid in sand it is necessary to excavate below the frost-line, ordinarily from 4 to 6 feet, and to drain the trenches thoroughly when there is any danger from springs or infiltration of water. Light buildings may be erected upon footings of large stones, preferably flat, laid dry in the trenches; sometimes a layer of broken stone 6 or 8 inches thick is first spread over the bottom of the trench, though the utility of this practice is questionable except as a drain under the masonry. The footings should be carefully laid, with a spread of 50 per cent. over the thickness of the walls, and should cover as nearly as possible the whole bottom of the trench, cut to the requisite width with this end in view. The chief danger is that the more heavily weighted parts of the masonry may settle by forcing up the sand under other less heavily loaded portions. It is consequently important to secure an approximately equal distribution of the pressure over the whole bed by the use of a platform or continuous footing of timber or concrete. Such platforms of timber, called "grillages" when used on a large scale, will be described later. Concrete footings are laid as already described for foundations on gravel. For heavy structures, however, the danger of lateral yielding of the sand requires to be guarded against, especially on sloping sites and under retaining-walls. This is accomplished sometimes by the use of parallel brick walls

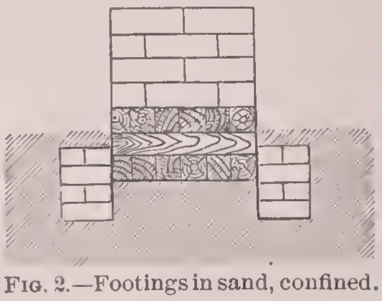

FIG. 2.—Footings in sand, confined.

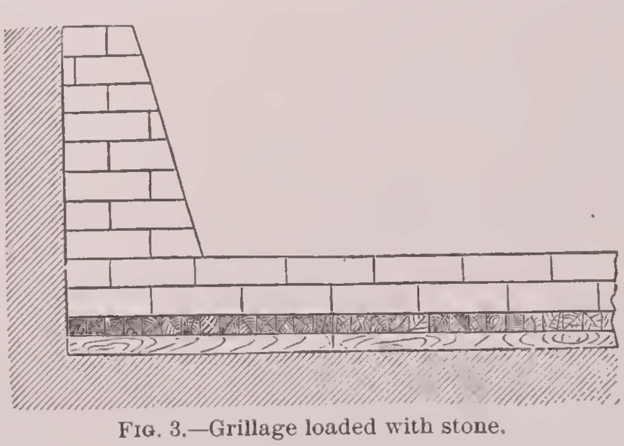

FIG. 3.—Grillage loaded with stone.

on either side of the trench, penetrating 2 or 3 feet below its bottom (Fig. 2), and laid up in cement. Quite as efficient and less expensive is the employment of *sheet piling*. This consists of planks driven vertically close together, edge to edge, into the ground to the desired depth, and spiked at the top to string-pieces of timber. To resist the upheaval of sandy soils outside of retaining-walls, as in the case of fortifications, a timber platform or "grillage" may be extended some distance beyond the wall and loaded with masonry (Fig. 3), or an inverted arch may be constructed abutting externally beneath another wall or other load, as shown in Fig. 4.

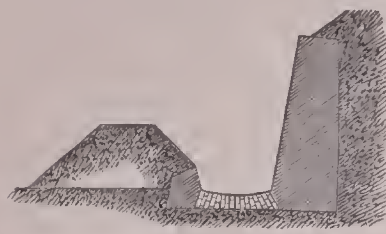

Fig. 4.—Inverted arch in trench.

Foundations on Quicksand.—The most treacherous of all beds, however, is quicksand, or sand permeated by moving water. Though belonging properly in the category of compressible soils it will be treated here for the sake of convenience. The whole site of the building should be surrounded by sheet piling, and the structure erected on a platform of concrete extending under its whole area. Sometimes a grillage of heavy timbers—i. e. a platform of logs or squared timbers laid in successive courses crossing at right angles and bolted together—is first laid over the area excavated, and the voids filled up with concrete. In either case the water must be carefully excluded while the concrete is setting, lest it wash out and disintegrate the concrete before it has had a chance to harden. To this end the water is drained into a trench or well, and pumped out continually until the concrete is firm and solid. The footings and foundation-walls must in such cases be laid up in strong hydraulic cement, and be protected externally against the percolation of the water by a liberal coating of asphalt or tar. Unless this precaution be taken infiltration is sure to take place. Subterraneous springs in the foundation-bed have been known to break through concrete 2 feet thick, and if confined or plugged at one point, to burst through at some other point. In building the foundations of the great dry dock in the Brooklyn navy-yard this difficulty was met with, and the engineer, J. W. McAlpine, finally overcame it only by driving two tiers of piles, one over the other, in a space of 1,000 sq. feet around the spring, and laying upon these a heavy floor of brick and cement, with vent holes to allow the escape of the troublesome spring (1841–51). The foundation of a water-works pumping-station at Clear Stream, near Jamaica, L. I., designed by the writer, consisted of an "area" or platform of concrete 2 feet thick under the whole building, with another independent platform for the chimney. The whole region overlies a subterranean stream of fresh water flowing through the sand 18 inches below the surface, and the excavation was fairly honeycombed with springs. These were drained into a trench, and pumped into a neighboring brook; but the flow of water through the sand underlying the platform carried with it so much sand that before the masonry of the walls was fairly begun the whole platform had settled from 2 inches at the end farthest from the pump to 5 inches at the end nearest to it. "Flowing" sand must be treated precisely as though it were water, and indeed in many cases the simplest and safest solution of the problem it presents is to excavate through it to solid bottom or to use piles reaching to a firm soil beneath it.

Foundations on Compressible Soils.—The means employed to prepare foundations on compressible soils divide themselves into two general classes—*pile foundations* which provide support by means of a multitude of rigid piers or posts penetrating through the soft stratum, and *platform foundations* which distribute the superincumbent load over an area sufficient to reduce the pressure per square foot within the safe limit for the soil in question. This safe limit or bearing-power can only be accurately determined by actual tests, and these should always be resorted to in the case of all important and heavy structures. The tables given by Rankine and other authorities can only be treated as rough approximations, not to be relied on in special cases, owing to the wide range of strength in soils apparently of the same class.

Pile foundations are of two principal kinds, "sand piles" and rigid piles made of wood or iron. To these may be added a species of pile sometimes used under special conditions and termed "concrete piling." These will be taken up in the above order.

Sand Piles.—In soft or boggy soils where the moisture is not sufficient to cause the sand to work into the surrounding earth, sand piling may be advantageously used. Holes are bored in the bottom of the trench, 6 or 8 inches in diameter, and 6 feet deep or thereabout, and filled with damp sand well rammed. The sand distributes the vertical pressure of the load equally in every direction, laterally as well as vertically, instead of downward only, as is the case with wooden piles. It is not therefore necessary to penetrate to a solid bearing, the important element being the amount of lateral surface presented by the piles. These should be spaced farther apart than wooden piles, and care be taken to prevent upheaval of the soil between them. This may be done by laying a solid platform of wood or concrete over the whole bottom of the trench.

Timber Piling.—The principle involved in wooden piling is entirely different from the above. The function of a wooden pile is either (*a*) to transfer the downward pressure of its load directly to a stratum capable of bearing it, by penetrating through the softer overlying strata, or (*b*) to support its load by the friction of its lateral surface against the soil. It is commonly considered that a friction pile will safely bear one-fifth the safe load of a pile driven to a solid bearing. Yet the experience of certain railway engineers in the U. S. tends to show that this is much too low an estimate of the relative supporting power of friction piles, as will be shown later. Piles are usually round, from 8 to 18 inches in diameter, and 20 to 35 or 40 feet long, or even longer. They should be of straight timber, free from knots and flaws, and should be driven with the bark on when used in tide-water or wet soils. Pine is the material most commonly used in the U. S., white pine in the North, and the long-leaved yellow pine in the South. Oak is also used in some localities, though it can not be obtained in such lengths of straight timber as can pine. Cypress, spruce, chestnut, and other woods are also sometimes employed. The piles are driven with the small end downward; this end should be tapered for 2 or 3 feet to a diameter of 5 or 6 inches and cut off square, as it is then less likely to be deflected by bowlders or other obstacles. When it is required to penetrate very stiff clay or marl, the small end may be shod with an iron "shoe" (Fig. 5) to prevent splitting or "brooming." The upper end or "butt" should also be cut off square and bound with a heavy wrought-iron ring. For heavy work all these preparations should be executed with particular care. Piles are driven in rows by the use of a "pile-driver," having vertical guides in which slides a hammer or weight of iron, weighing from 1,000 to 3,000 or 4,000 lb., hoisted by a cable and winding-engine, and released at any convenient height either automatically or by hand, the whole pile-driver and engine being moved along on rollers or floated over the water to the position of each successive pile. The spacing of the rows of piles and of the piles in each row is regulated by the width and weight of the superstructure. Thus if each pile is to be allowed a weight of 15 tons, two rows 3 feet apart, with piles spaced $2\frac{1}{2}$ feet in each row, would be required to support a wall 3 feet thick at the base, and weighing, with its share of the floors and roof fully loaded, 12 tons to the running foot. When the piles have been driven to the requisite depth, they are cut off to a level, and the footing-stones laid directly upon them (as is done for light and ordinary work), or upon heavy stringers bolted to the head or butt of each pile. Sometimes a solid platform of heavy timbers or planking is built upon the piles, on which the masonry is set; in some cases also a filling of concrete between the heads of the piles takes the place of the platform.

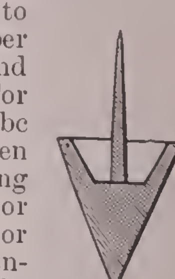

Fig. 5.—Iron shoe for pile.

Fig. 6 illustrates the construction of the sea-wall adopted and in part carried out along the North river front of New York city, showing the use of piles where the rock bottom is too deep to allow of excavating to it. The piles are driven to a solid bearing and cut off 15 feet below low water, and upon them is laid a timber platform which carries the masonry of granite facing and concrete backing.

Various formulas have been devised for determining the loads to be safely borne by piles under different conditions. For piles driven to a solid bearing, Rankine allows 1,000 lb. per square inch of head-surface. This would give somewhat over 108,000 lb. for a 12-inch pile, and 243,000 for an

18-inch pile. Patton says (*Practical Treatise on Foundations*, New York, 1893), "In sand and gravel piles will carry to the full extent of the crushing strength of the timber, provided the depth in the material is sufficiently great to prevent vibrations" (as from passing trains in the case of a bridge) "from reaching the point of a pile." If this be true of piles driven in sand and gravel, it must be true *a fortiori* of piles driven to a solid bearing, and Rankine's allowance may be safely exceeded. But this supposes the material penetrated to be sufficiently compact to prevent rocking or tipping of the piles. The partial collapse of the bridge at Tours, France, built in the eighteenth century, is to be attributed to the tipping of the piles driven down to rock-bottom, as shown in Fig. 7. This bridge of fifteen arches, each of 75 feet span, is a splendid example of French bridge-building in every respect, except the insufficient stability of its pile foundations, which required to be underpinned and, in some cases, filled in or "injected" with concrete.

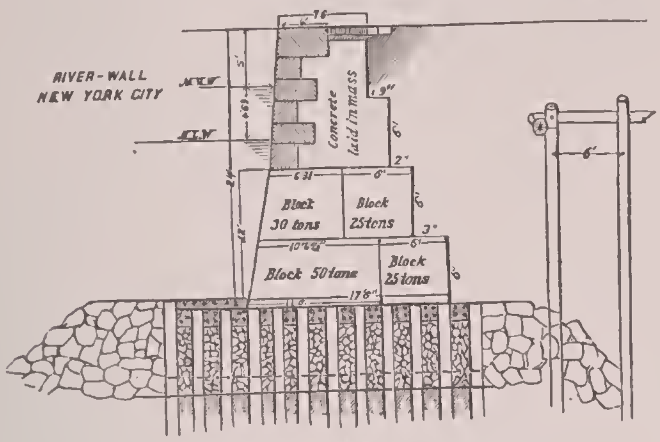

Fig. 6.—Foundations of sea-wall, New York.

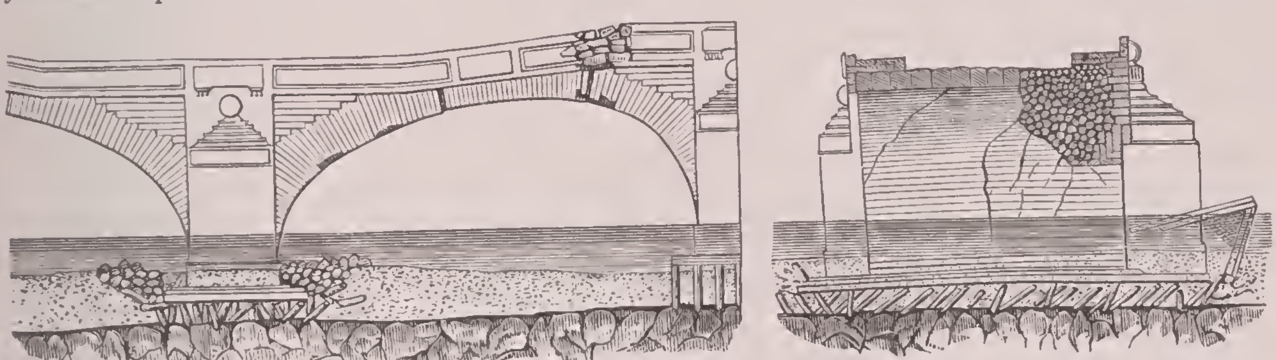

Fig. 7.—Bridge at Tours.

The formulas in use for the safe load on piles driven through more or less yielding strata are based upon the amount of penetration of the pile under a given impact, as of a hammer of given weight dropped from a given height. Rankine's formula, far too complicated for practical use, is

$$P = \sqrt{\frac{4ESWh}{l} + \frac{4E^2S^2x^2}{l^2}} - \frac{2ESx}{l}, \qquad (1)$$

in which $P=$ extreme load on pile in tons; E a constant modulus of elasticity $= 108{,}000$ feet per square foot; $S=$ sectional area of pile in inches; $W=$ weight of hammer, h its height of fall in feet; x the penetration of the pile at last blow; and l its length in feet. The same notation will be employed for the other formulas.

Sanders's formula is

$$P = \frac{Wh}{8x}, \qquad (2)$$

the height of the fall being in this case taken in inches, and P being the *safe* load in *pounds* instead of the extreme load in tons on the pile.

Trautwine gives the following:

$$P = \frac{\sqrt[3]{h} \times W \times 0{\cdot}0268}{1+x}, \text{ or, in simpler form,}$$

$$P = \frac{0{\cdot}0268\, W \sqrt[3]{h}}{1+x}, \qquad (3)$$

in which P is the extreme load in tons, which should be divided by a factor of safety of from 2 to 4; and h is taken in feet, not inches. McAlpine's rule is

$$P = \frac{80}{3}\left(W + 0{\cdot}0228\sqrt{\frac{h}{12}} - 1\right), \qquad (4)$$

h being in this case measured in inches. Assuming a pile to sink half an inch under a 1,000-lb. hammer falling 8 feet, Sander's formula allows 24,000 lb. as the safe load on the pile; Trautwine's rule, 30,600 lb. with a factor of safety of 2, or 20,400 lb. with a factor of 3; and McAlpine's rule, based on experiments in laying the foundations of the Brooklyn dry dock already mentioned, 26,640 lb.

The above formulas, proceeding upon the theory that the penetration of a pile under a given impact measures precisely the resistance of the soil reached at the given blow, determine the safe load to be allowed each pile without regard to its being driven "home" or to an absolute or approximate stoppage. But as no one can tell into what sort of stratum the next blow might drive the pile, and as piles often enter a treacherous soil after penetrating a more solid one, there have arisen various rules for determining when a pile has been driven "home." Thus the French engineers are accustomed to regard a pile as fully driven when it sinks one-fifth of an inch under thirty blows of an 800-lb. hammer falling 5 feet. Another rule commonly given is to consider the driving completed when the pile sinks one-quarter of an inch under a single blow of a 2,500-lb. hammer falling 30 feet. For ordinary work, however, where the pile is to be loaded much under the safe limit allowed by the formula used, considerably more sinking than the above may be permitted. Indeed, the value of all these rules and formulas is seriously questioned by some eminent practitioners. Prof. Patton (*op. cit.*, pp. 210–222) demonstrates from a wide experience in railroad bridge-building the superiority of actual tests over all formulas, and the unreliability of many of the data on which these formulas are based. Thus apparent "sinkage at the last blow" may be due solely to the crushing and brooming of the butt of the pile; often a pile allowed to "rest" a while is found to offer a resistance to sinkage many times greater than when last struck; and piles which are very far from being driven "home" will support by frictional resistance a load much greater than the rules will allow. In swampy and alluvial lands this comforting fact is of great practical value, and conduces to a great saving of expense.

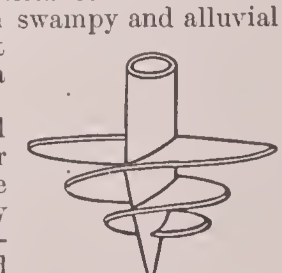

Fig. 8.—Screw pile.

Screw piles (Fig. 8) have been used in many cases to secure a broader bearing in soft strata. They are made of metal and driven by turning. They have proved especially useful in maritime works, as for lighthouses and wharves. Disk piles, having broad flanges at the base (Fig. 9), have also been used successfully in India especially for bridge-work. For a description of a screw-pile bridge across the Mobile river, see Patton's *Practical Treatise on Foundations*, article lii.

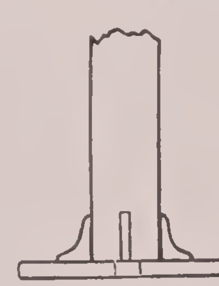

Fig. 9.—Disk pile.

Piles completely buried in sand or in water may last for centuries. The cities of Venice and Amsterdam are conspicuous examples of the durability of pile foundations. The Back Bay region of Boston, Mass., built upon made land—i. e. land artificially filled in—rests wholly upon pile foundations. The chief danger of decay results from exposure alternately to water and air, as in the case of tide-water wharves. In soils saturated by the fluctuating tide the piles should be cut off below the low-water level.

Concrete Piling.—In soft soils overlying rock or hard gravel, which may be reached at no great depth, foundations are sometimes constructed, especially in France and Germany, by boring holes from 28 to 36 inches in diameter to the solid substratum, and filling these with concrete. In this way there are formed isolated piers, spaced 6 to 12 feet on centers, and connected by arches of masonry, or by metal girders, upon which the walls are built up. Such concrete piles or "wells" require particular care in the compounding of the concrete, and in its being thoroughly rammed in layers not over 18 inches to 2 feet thick. The wide spacing of the piers subjects each one to a heavy load, with no help from its neighbors in case of failure or settling from any cause. Such piers should rest on a solid stratum, as the proportion of frictional area to load is so small (in comparison with wooden piles) as to offer little resistance to sinkage. A conspicuous example of this sort of foundation is the great votive Church of the Sacred Heart at Montmartre, Paris, which stands on a treacherous soil of clay and sand of varying depth, over the substratum of gypsum which underlies the whole city. See *Architectural Record*, vol. iii., No. 1.

PLATFORM FOUNDATIONS.—The function of the platform, whether of timber, concrete, or other material, is to distribute the pressure over a wider area than that of the foundation walls themselves, and at the same time as far as possible to prevent any one portion of the building from settling more than another part. Platforms are of four principal kinds: those of concrete, of masonry, of timber, and of iron and concrete; these will be considered in this order.

Concrete Platforms.—Concrete, already so frequently alluded to, is an artificial material consisting of broken or crushed stone or coarse gravel, consolidated by a mortar of hydraulic cement mixed with sand and water in definite proportions, varying with the requirements of each case. A common rule is to use one barrel of Portland cement to three of damp, loose sand and five of broken stone; or where greater strength is required these proportions may be made one, two, and four respectively. Great care is required in supervising the measuring, mixing, and depositing of the concrete, but a full discussion of the subject is out of place here. (For details, consult Gen. Q. A. Gillmore's *Limes, Hydraulic Cements, and Mortars* (New York, 1872); Patton's *Practical Treatise on Foundations*, pp. 9–23; also articles CONCRETE and MASONRY.) To establish a concrete platform the excavation is made over the required area and to the necessary depth, always below the frost-line, and the bottom brought to a level. The concrete, mixed close to the place of its using, is dumped from the barrows where required, spread evenly in layers of from 9 to 12 or 18 inches thickness, and thoroughly rammed. Each layer is allowed to set, and its surface is then picked to afford a "key" for the next stratum of concrete to hold by, and thoroughly sprinkled before the next layer is applied.

Concrete platforms or "areas" are used under structures of limited area but considerable height and weight, such as towers, chimneys, and bridge-piers, and under large buildings having many piers, the spread of whose footings leaves comparatively narrow spaces between them. Such a platform consolidates the whole structure into a unit, and settlement of one portion of it apart from the rest becomes impossible except by the breaking or crushing of the concrete itself. Concrete platforms are also useful where buildings are to be erected on quick or springy sands, and on wet soils where it is necessary to exclude water from the basement or cellar of the building, as already illustrated in the case of the pumping-station near Jamaica, L. I., already alluded to.

Masonry Platforms.—The only way in which masonry of brick or stone can be employed for platform foundations is by the use of inverted arches. When in a building subjected to heavy loads isolated piers are substituted for continuous walls, as is practically the case in the modern American system of "post-and-girder" construction, even when the exterior walls are apparently continuous, two methods of providing a foundation are available. One is the method of "isolated foundations," to be described later; the other is that of the continuous platform, of which the concrete platform just described is but a special case. In such buildings the turning of a series of inverted arches between the several piers secures a continuous pressure upon the continuous footing under each line of piers. By turning inverted barrel-vaults between each line of inverted arches, the various loads are distributed over the whole area of the building, as by a concrete platform or grillage (Fig. 10). All the arches and vaults should be calculated precisely as if they were ordinary upright arches with a distributed load equal to that on the piers they connect, since the total reaction upward against the arch is equal to the total load, and is equally distributed over all its surface. Such arches should be of segmental curvature, and laid in cement mortar with even greater care than if they were visible parts of the superstructure.

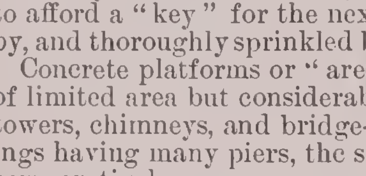

FIG. 10.—Inverted arches.

Inverted arches are, however, oftener used to distribute the weight of rows of piers over the longitudinal footings than to form actual platforms over a whole area.

Timber Platforms.—Another method of establishing a wide bearing-area on which to construct the masonry of the superstructure is by the use of what is commonly called a grillage, composed of timber, either squared or in the log. When laid in a constantly wet soil, or completely buried in sand, the timber is practically indestructible. A ship of the Viking period (tenth or eleventh century), excavated in Norway in 1875, was found to be perfectly sound after its burial of over eight centuries. When employed under isolated walls the pieces of timber, in the form of 3-inch planks or of 4 by 6 inch stuff, are laid across the trench in close order, and longitudinal stringpieces spiked to them. Where considerable spread is required under heavy structures, as in the case of a chimney or bridge-pier, or of a grillage under a whole building, the timber is laid in several successive layers, the pieces of each layer crossing the one below at right angles, and the whole securely bolted through together. When laid with interstices between the pieces of each layer, it becomes necessary to lay over the topmost timbers a heavy planking on which the footings are begun; the hollow spaces being also filled up, as the construction of the grillage progresses, with sand, or, still better, with concrete. The whole platform should be completely buried after the completion of the foundation walls. The successive layers above the two or three lowest are often diminished in size up to the footings of piers or walls.

Timber grillages have been frequently used for foundations both of bridge-piers and of tall buildings. The New Orleans custom-house (built 1848–1860) stands upon a timber grillage laid on a plank flooring 7 feet below the street-level. The soil is exceedingly soft and treacherous—a sandy clay saturated with water—and firm bottom can not be reached except at an excessive depth, so that even piling is not to be trusted. The grillage consists of logs 12 inches in diameter laid in close contact, and crossed by a second layer of similar logs 3 feet apart. The interstices are filled with concrete, and the whole grillage covered with a 12-inch layer of the same material. The building settled gradually during its construction, some 2 feet in all, the settlement diminishing from year to year, but the settlement was unequal in different parts of the building. The Auditorium Building of Chicago, a ten-story building covering over 60,000 square feet, with a tower 240 feet high, rests upon a grillage 24 inches thick, over which is a concrete platform 5 feet thick, in which are imbedded three layers of steel rails, one layer of 15-inch V-beams, and one of 12-inch I-beams, securing a perfect distribution of the load over the whole platform.

Platforms of Iron and Concrete.—A system of foundations somewhat similar to the above has come into quite general use in the U. S., having been employed with success in Chicago, where the soil is soft and treacherous, a wet clay overlying quicksand (as is generally supposed), with no solid bearing short of 50 or 60 feet deep. This great depth has generally forbidden the use of piles, although there are engineers who, distrusting the results of test-borings, claim that the soft soil covers a heavy bed of compact clay over hard gravel, which should carry heavily loaded piles with safety. By the Chicago system the bearings are spread by means of platforms, either of grillage or of concrete, to an area which reduces the pressure to between 3,000 and 4,500 lb. per square foot. Upon the concrete base are piled two or three layers of steel rails (70 to 75 lb. to the yard) laid close together, the layers crossing each other at right angles, and topped off with 15-inch (up to 20-inch) I-beams, on which the masonry or the iron column rests. The whole is buried in concrete, and the sides plastered heavily with cement to protect the ends of the beams. Such foundations, although somewhat more expensive to construct than if built up in dimension-stone from the concrete base or footing, are more economical in the end. Figs. 11 and 12 give sectional views of the two systems for comparison. It will be seen that the dimension-stone footings in Fig. 12 occupy much valuable space above the cellar-floor unless the excavation be made much deeper than that shown in Fig. 11, where the whole foundation lies beneath this level. There is, furthermore, a considerable saving of weight in the foundations themselves. The weight of the masonry footings in Fig. 12 is nearly twice that of the steel and concrete in Fig. 11. This saving would allow the addition of another story without exceeding the load on the bed in Fig. 11.

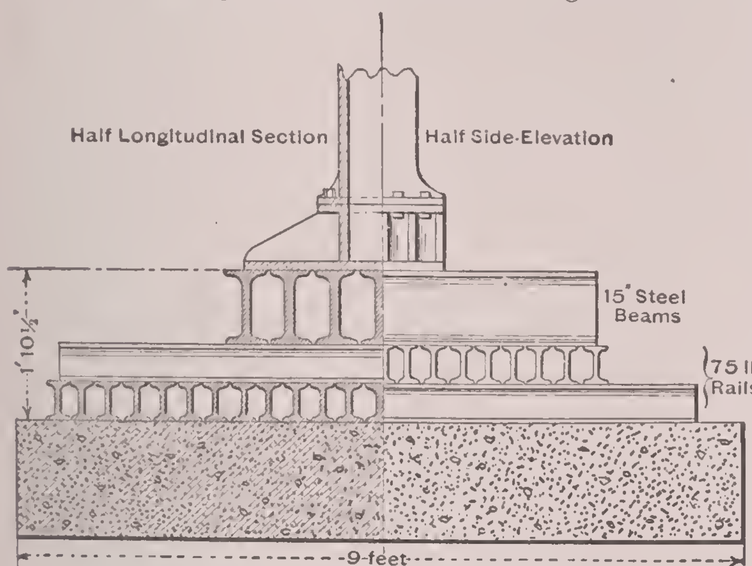

FIG. 11.—Iron-rail footings in concrete.

Such foundations as these may be laid either on a continuous platform or "area" of concrete or on a grillage, or they may be set on independent platforms, each specially proportioned to the particular load it bears. This last is the common practice in Chicago, where the problem of foundations for high buildings in cities has received particular attention. There is nothing essentially novel in the system itself, which in an elementary form is asserted to have been employed by the Byzantine engineer and architect Anthemius as early as 532 A. D. in building the Church of the Divine Wisdom, now the mosque of Santa Sophia, so called. To the Chicago builders belongs, however, much

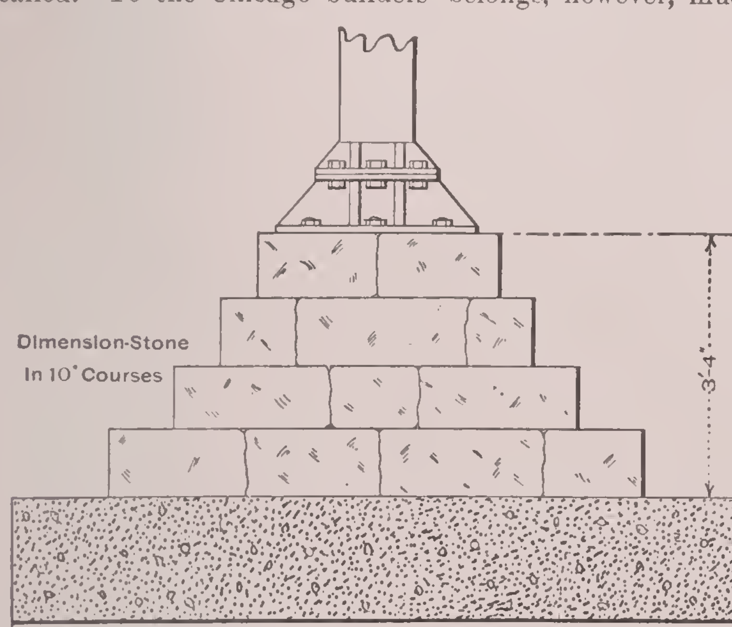

FIG. 12.—Masonry footings in concrete.

of the credit for the reduction of the principles involved to a scientific basis, and for the special methods adopted, especially the use of metal rails and beams with concrete as above explained. See Patton's *Practical Treatise*, pp. 343–347; also *Engineering News* for Aug. 8, 1891; article by C. T. Purdy, C. E.

In all these various platform systems the basis of computation of the required area is of course the bearing-power of the soil of the foundation-bed. This bearing-power is best determined by actual experiment, and it is obviously important that the safe load allowed be kept well below the extreme limit derived from the experiments. It does, indeed, not infrequently happen that as the building progresses, the increased weight, although causing the foundation to settle somewhat, by compressing the soil gradually increases its bearing-power until an equilibrium is reached and the settling ceases. This is especially likely to happen when the soil under the foundations is confined by sheet piling; but it should not be relied upon for sustaining loads in excess of the observed bearing-power of the soil except as the result of careful experimental tests. It is always a wise precaution, moreover, to load the foundation, when built on soft and compressible soils, with a load equivalent to that which it must ultimately bear, removing the load in proportion as the work advances. This hastens the total settling of the foundations and the final reaching of a stable equilibrium before the walls are built up, so that when once completed there is less likelihood of deformation of string-courses and twisting of floors. This precaution was successfully applied in building the Auditorium tower in Chicago.

Rankine gives in *Rules and Tables* the following safe loads on different soils:

Moderately hard rock...........	9 tons per sq. foot;
Rock of the strength of good concrete........................	3 " " "
Soft rock........................	1·8 " " "
Firm earth, dry gravel, hard clay, confined sharp sand.........	1 to 1·5 tons per sq. foot,

the ton being taken at 2,240 lb. The progress of engineering experience has, however, shown these figures to be, in general, too low, although the great variation in the strength of different soils of the same kind under varying conditions may sometimes reduce the safe allowance to Rankine's limits. Moreover, the terms "soft rock," "firm earth," and the like are somewhat too vague for precise calculations. A few cases from actual experience will prove instructive. The towers of the suspension bridge over the Ohio at Cincinnati are 242 feet high above the foundation. The tower on the Cincinnati side rests on a bed of compact gravel, which has successfully borne the pressure of over 10,000 lb. per square foot exerted by the tower—from three to four and a half times Rankine's allowance. The Roquefavour aqueduct in France stands upon hard rock, which carries a load of 26,800 lb. per square foot. The foundation-bed of the Gorai bridge in India is composed of close sand, and supports 16,000 to 18,000 lb. per square foot. On the other hand, in the bridge at Nantes, France, some settlement has already taken place with a pressure of 15,200 lb. per square foot on sand, and there are plenty of cases on record of settlements and dislocations of a serious character occurring in buildings founded on soils nominally and apparently of the same class with others in which much heavier loads have been borne without yielding. Much depends upon the underlying strata, on the presence or absence of "scour" from springs or running water, upon the weathering of the denuded rock, and much upon the workmanship of the foundations themselves. Hence the danger of hasty generalizations and the necessity of careful tests and experiments wherever the conditions are not absolutely known. A few further examples of weights actually borne may be not out of place here: At Coney Island a stick 12 inches square bore without sinking perceptibly in the micaceous sand a load of 10 tons. Under certain parts of the East river bridge (New York and Brooklyn) the sand carries a load of $6\frac{3}{4}$ tons. The Washington Monument, the tallest existing structure of masonry, exerts a pressure of 10,000 lb. per square foot on a bed of mixed clay and sand; it is estimated that this pressure is sometimes doubled on the leeward side in high winds. The new bridge across the Firth of Forth, Scotland, loads its foundation-bed of silty sand up to $3\frac{1}{2}$ tons per square foot. During its construction the foundations were loaded with extra weights up to $5\frac{1}{2}$ tons, with a resultant settling of $1\frac{1}{4}$ to $1\frac{3}{4}$ inches. The load on the foundations of the Eiffel Tower, Paris, was about 3 tons per square foot.

FOUNDATIONS UNDER WATER.—These constitute a wholly distinct class of problems from those hitherto considered, and involve in general much more elaborate preliminary operations, on account of the difficulty of excluding the water while the bed is being prepared and the foundations built. Three chief systems are in vogue for works of this kind—the "coffer-dam," the "open crib," and the "pneumatic caisson."

Coffer-dams.—The coffer-dam is a temporary water-tight wall or dam built around the site to be excavated, enabling the latter to be pumped dry and kept dry while the foundations are building. The walls of the dam are composed of two parallel walls or rows of sheet piling, with the intervening space filled with a "puddling" of clay or clay and sand (Figs. 13 and 14). In constructing a coffer-dam a row of ordinary piles is first driven just outside of the proposed exterior line of sheet piles, and their heads bolted or framed to heavy stringers, and sometimes also to subordinate stringpieces, *i i*. They are thoroughly braced by cross-pieces, *e*, to resist the water-pressure after the dammed area is pumped out. The outer row of sheet piles is then driven firmly into the bottom soil and spiked to the stringpieces framing the pile-heads. A second row of piles is then driven inside the proposed inner row of sheet piling; or strong posts, *b*, are set in their place, framed to string-pieces secured by the cross-pieces *e*, and to wales *n n*, against which are driven the interior series of sheet piles. The intervening space, A, is then filled with the puddling material, rammed as thoroughly as may be in the water, and the water in the interior inclosed space, B, is then pumped out. As its level descends strong struts, *o o*, are fitted across from wall to wall of the dam to prevent its bulging inward from the external water-pressure. As the masonry rises they are removed, and short struts inserted between the masonry and the dam in their places. There is always considerable leakage, especially where the area is excavated to a considerable depth below

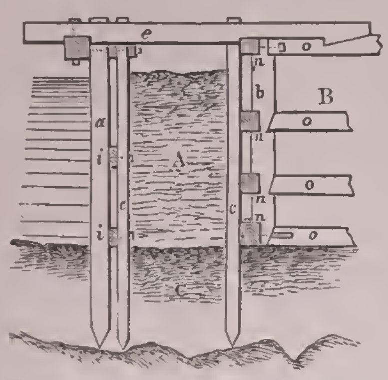

FIG. 13.—Section of coffer-dam: *a*, main exterior piles; *b*, strong square beams, corresponding to *a*, on which the wales *n n* are notched and bolted; *c*, sheeting-piles; *e*, cross-pieces; *o o*, horizontal shores buttressing opposite sides of dam; A, puddling; B, interior space; C, mud, etc.

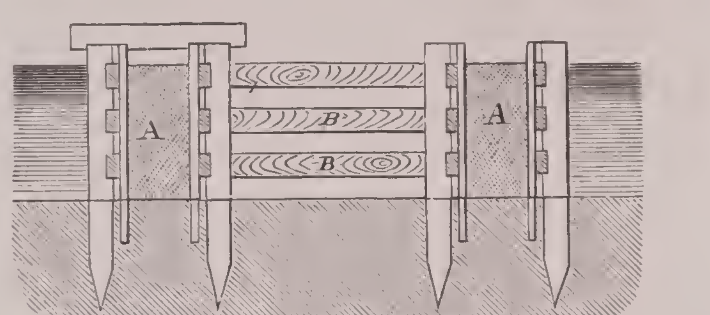

FIG. 14.—Coffer-dam, showing detail.

the natural bottom; and the pumps must be kept in constant operation, with renewal of the puddling when this is little by little washed out into the inclosure by the leakage. It is economical to make the interior area from 6 to 10 feet wider each way than the proposed structure, as this allows sufficient room for the workmen and for repairs on the dam.

The Open Crib, or Caisson.—Coffer-dams are practicable only in water of moderate depth, and on sites requiring but little excavation to prepare the bed. Where these conditions do not exist, and especially in the case of bridge-piers in rivers of considerable depth, the "open crib" or "open caisson" is frequently employed. This is an open box-like structure of timber or iron, provided with a partial flooring or shelf, upon which is loaded a sufficient weight to sink it when it has been floated to the proper position, the height of the crib being sufficient to reach above the water when so sunk. The bottom of the area it incloses is then dredged out, and the crib sinks gradually down into the excavation, successive sections being added to its height as it descends so as to reach constantly above water. In this way a species of coffer-dam may be finally established from which the water may be pumped, and the bed prepared for the foundations in the usual manner. More often, however, the excavation having been carried down to rock or to a firm bearing, the crib is filled with concrete, and the piers built up on this material without pumping out the water. Iron cribs have been frequently employed for structures of this kind, remaining as a permanent part of the foundation up to the water-line, from which level the pier or other construction is carried up in masonry. The crib is usually built on shore and launched and floated into position, though sometimes begun on shore and completed after launching: it has double walls, and if of large size the open area is divided into compartments by double-walled longitudinal or transverse partitions. These double walls are made to converge to a cutting edge at the bottom, and this converging portion is built up solid if the crib be of timber. Usually the lower part of the crib is given a certain spread or "batter"; the utility of this has been questioned by some engineers. The Poughkeepsie bridge over the Hudson river, New York, rests on four piers founded on cribs of hemlock, with white-oak cutting edges; they measure 60 by 100 feet, and are 104 feet high. The double walls, of 12 by 12 inch hemlock, are about 10 feet thick; the total depth reached is about 135 feet below low-water level, the crib finally resting on a layer of hard gravel after passing through silt, clay, and sand. Another remarkable example of crib foundations is the railroad bridge at Hawkesbury, New South Wales, in which the cribs are of iron, 52 by 24 feet at the bottom, 48 by 20 feet at the top, and were sunk to various depths up to 118 feet below the river-bed. Each crib was divided into three compartments, in each of which was an iron well 8 feet in diameter with a flaring bottom. The cribs were sunk by filling with concrete the open spaces or corners around these wells, which were also filled with concrete after the sinking of the crib, and served as foundations for masonry piers built up to 42 feet above low-water. For the Victoria tubular bridge at Montreal open caissons, shaped as in Fig. 15, were employed; when

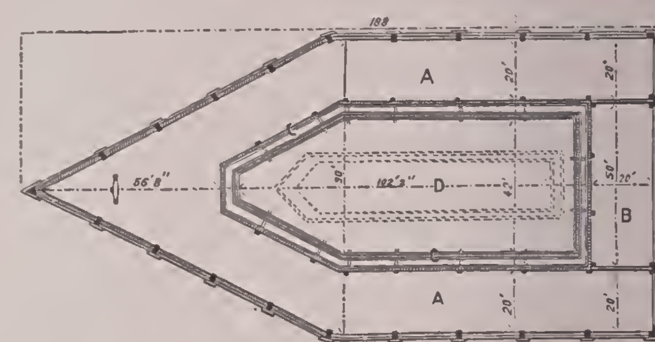

FIG. 15.

brought into position and sunk they were anchored to the bottom by iron pins in the corner posts; the space C (Fig. 16) was filled with puddling, forming a coffer-dam; the space D was then pumped out and the pier built up within it. Fig. 17 shows a variety of open crib sometimes used in small work in shallow water where the natural bottom is firm and level; it is merely an open box sunk into position by the weight of the masonry built up within it. This is primitive and elementary; a more scientific form is that in which such a box-crib is combined with a pneumatic caisson, as will be later described.

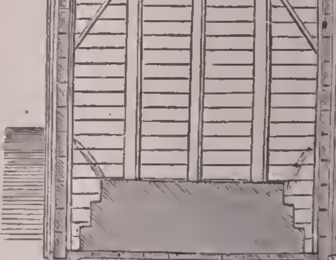

FIG. 17.—Open crib.

The Pneumatic Caisson.—This is the device most commonly employed for sinking foundations in water, sand, etc., to depths varying from 30 to 100 feet. It is used in many forms, in all of which the principle of the diving-bell is made use of to expel the water from beneath a species of crib or caisson, and thus permit of excavation by hand. An air-tight caisson or inverted box, constructed with strong walls, usually double, and having a cutting edge at the bottom, is floated over the destined site, and sunk either by loading with stone and gravel or concrete, or by the weight of the masonry built up upon it, its walls being constantly added to, as in the open crib, so as to extend above water and allow the mason-work to be executed at any level. The caisson forms a diving-bell, and serves as a working-chamber, in which the labor of excavating beneath the cutting edges may be carried on by hand. A constantly increasing pressure of air is supplied by "compressors," or air-pumps, as the structure sinks into the excavated bottom; this effectually excludes the water at all times. In case of any defect or error making the raising of the caisson desirable, this may be effected by an increase in the pressure under the chamber; and, on the other hand, the sinking may be accelerated by reducing the pressure, or withdrawing it altogether. Uneven sinkage may be in part controlled by allowing the air to escape under the edge or through openings in the side where the sinking is too slow; the escaping air scours out the sand whose friction impedes the descent of that side of the caisson, and thus releases it. Bowlders are removed by a jet of water under them, or, if of great size, by blasting. Workmen and material are admitted to and withdrawn from the working-chamber by means of "air-locks." When a final level and solid bearing is reached, the interior of the working-chamber is filled with concrete, and forms a solid and permanent base for the masonry already completed above the water-level. It is obvious that the pressure of air in the working-chamber must increase with the depth of sinkage, in order to exclude the water; a depth of 100 feet below the water-level would require a pressure of three atmospheres, or 45 lb. per square inch in addition to the normal atmospheric pressure of 15 lb. Many difficulties result from this pressure. It offers a strong resistance to sinkage, which must be overcome by extra loading. It requires the greatest care in constructing and operating the caisson, which must be substantially air-tight and provided with abundance of air-compressors to guard against accident. The heavy pressure in the chamber is not only painful, but often injurious to the health of the workmen, whose "shifts" must be reduced in length as the pressure increases. This pressure also raises the temperature of the air in the chamber, and retards the setting of concrete used within it, unless compounded with dry porous brick instead of stone, or ventilated by sections of gas-pipe admitting the air into the body of the concrete as it is being laid. Difficulty is often encountered in securing a perfectly vertical settlement of the structure; in some cases it has been necessary to correct final errors in the settlement by deviating the superstructure from a true verticality for a greater or less distance.

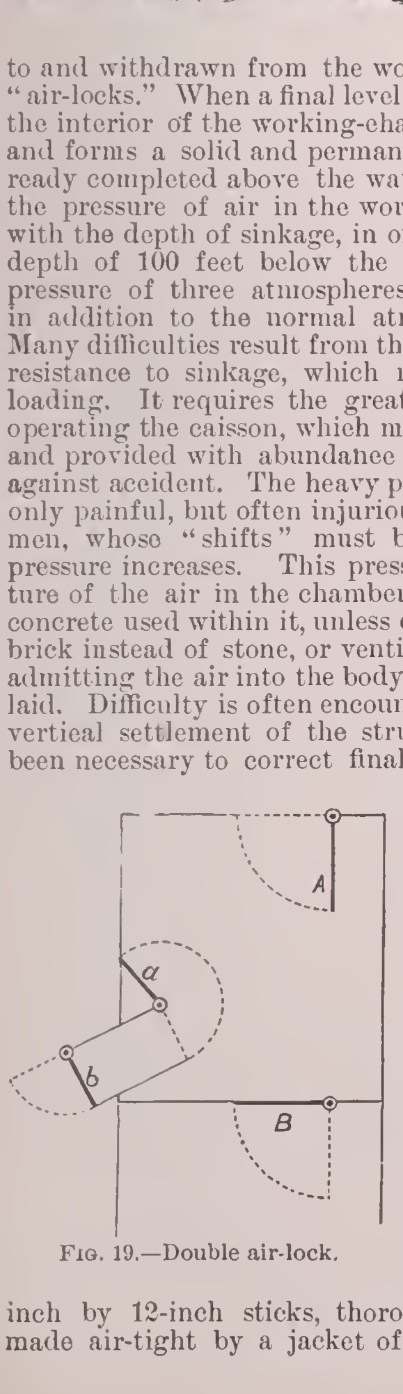

Fig. 19.—Double air-lock.

Fig. 18 shows a section of the caisson foundation for one of the two piers of the New York and Brooklyn (East river) bridge, designed by J. A. Roebling, and completed by J. A. Roebling, Jr. (See article Brooklyn.) The caissons are 168 by 102 feet, and 172 by 102 feet in size, and about 26 feet high, constructed of timber with battered sides and cutting edges, 9 feet thick at the top and 10 feet high. The material is yellow pine in 12-inch by 12-inch sticks, thoroughly bolted together, and made air-tight by a jacket of tin between the third and fourth courses, or layers of timber in the solid ceiling, and extending down the sides. Each caisson had two wells of boiler iron extending below the bottom of the caisson, the water remaining in them at the normal level. Dredges were operated through these wells to remove the excavated material from pits into which it was thrown by the workmen. Each pier consists of two arches, carried by three piers of masonry; in the openings between these were two open cribs extending above the water-level, and containing the air-locks and supply-shafts. The New York caisson was sunk to firm bottom 78 feet below the water-level; the Brooklyn caisson to a depth of 50 feet.

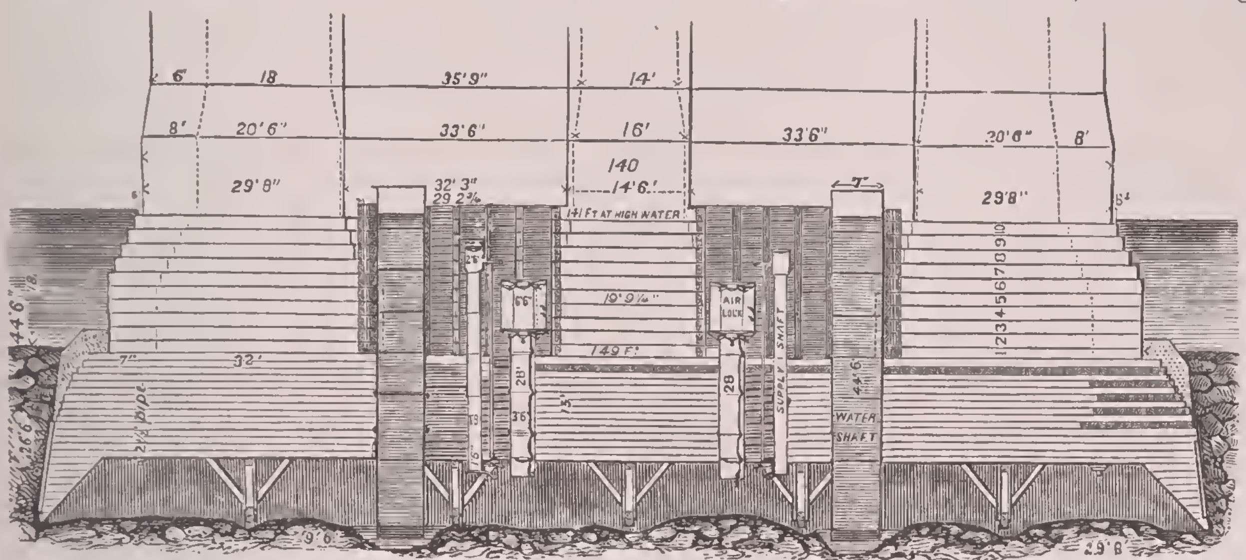

Fig. 18.—Caisson, Brooklyn bridge.

The "air-lock," by which access is had to the working-chamber, is a small air-tight chamber, usually of boiler iron and circular in form, surmounting a shaft leading to the working-chamber. A valve or door admits to its upper end, and another, in the bottom, to the shaft; both are hinged to open downward. The workmen having entered by the upper door, this is closed, and the lower door opened, admitting the compressed air until the pressure in the lock and chamber is equal, when the workmen descend into the chamber. In quitting the caisson the process is reversed, and the operation is the same in introducing supplies or extracting material as in admitting or withdrawing the men. A lockful of compressed air is of course wasted at each "locking"; to reduce this loss in the discharge of material a smaller sup-

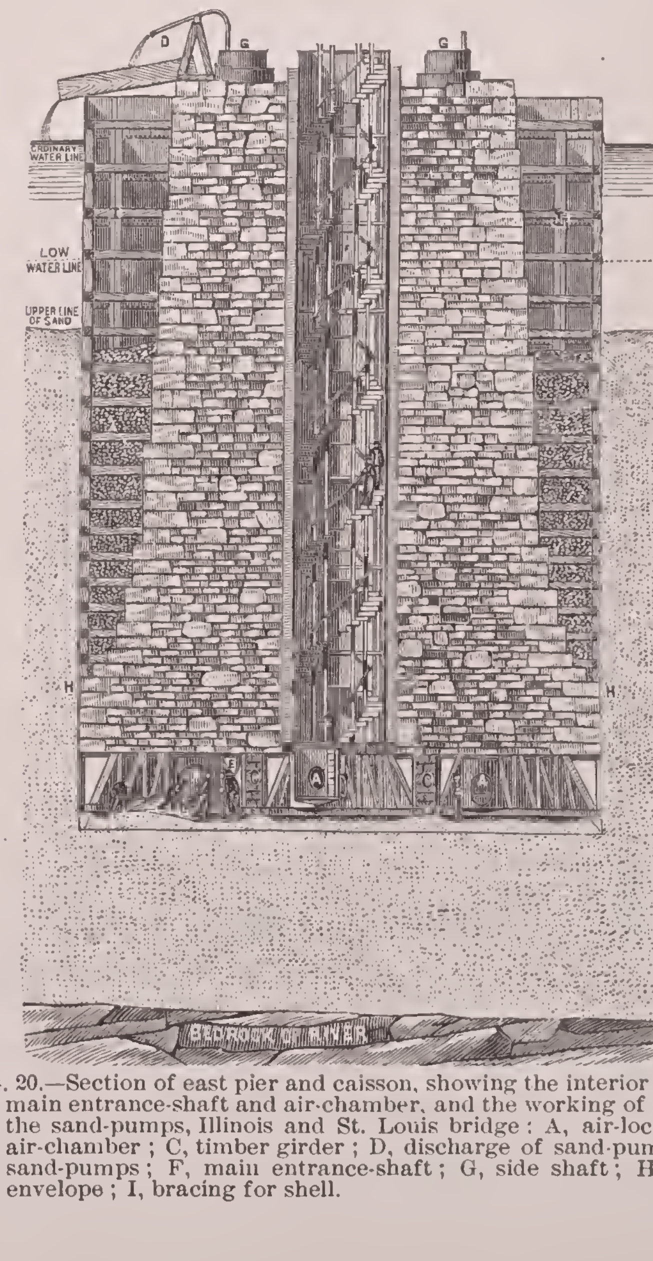

Fig. 20.—Section of east pier and caisson, showing the interior of the main entrance-shaft and air-chamber, and the working of one of the sand-pumps, Illinois and St. Louis bridge: A, air-locks; B, air-chamber; C, timber girder; D, discharge of sand-pump; E, sand-pumps; F, main entrance-shaft; G, side shaft; H, iron envelope; I, bracing for shell.

plementary lock is sometimes connected with the main lock. It is shown in Fig. 19. The rubbish is placed in the inclined spout-like supplementary lock through the door *a*, which is then closed, and *b* opened, allowing the rubbish to slide out into the water.

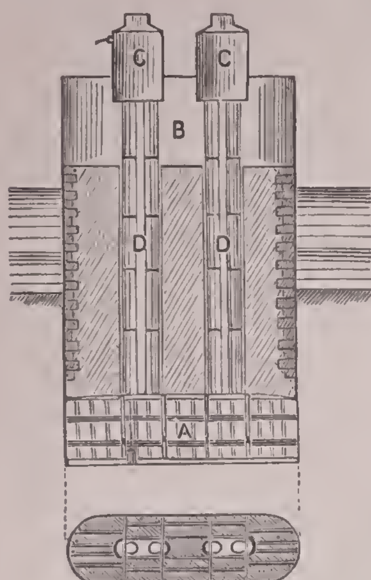

Fig. 21.—Pneumatic pier.

There are many variations of detail in the pneumatic caissons employed in bridge and lighthouse building, most of which combine the essential features of the crib and caisson. The walls of the caisson continued upward, form an open crib above the working chamber; this excludes the water, permits the masonry to be built irrespective of the rate of sinkage, and allows the air-lock to be placed close to the roof of the caisson. Fig. 20 illustrates the caisson and crib of the east pier of the St. Louis bridge, designed by James B. Eads. It shows the air-locks at *A*, and the open well in the center. This foundation is sunk to a depth of 110 feet below the water-level, through clear sand, which was excavated by sand-pumps, operating by the pressure of the compressed air, and discharging, as shown, at D. In this case the crib walls were removed above low-water level when the pier was completed. In many cases the crib is a permanent circular structure of boiler iron, which is lined or filled solid with masonry, or, when of small diameter (as 8 feet or under) with concrete. The air-locks are often in such cases placed at the top of the tube or crib, and removed alternately from one crib to the other as the cribs are extended upward. Such tubes are sometimes called pneumatic piles, and are illustrated by Figs. 21 and 22. The latter represents the piers of the first Tay bridge across the Firth of Tay, Scotland. Each pier was composed of two iron columns or cylinders of iron $9\frac{1}{2}$ feet in diameter, built up in sections about 4 feet high, rising above a single working-chamber, $22\frac{1}{2}$ feet long, $10\frac{1}{2}$ feet wide, and about 8 feet high. The whole of both columns opened into this chamber, forming together a single caisson. Each was surmounted by an air-lock, and the whole pier was sunk by lining the cylinders with masonry $2\frac{1}{2}$ feet thick, supported on a sort of shelf on the interior near the base, and leaving a well in the center of each and opening up to the air-lock. Fig. 23 is a transverse section of the shore-pier at the French end of the Kehl bridge over the Rhine, showing the dredging well in the center and the two compressed air-shafts leading to the air-locks at the top. These air-shafts were used alternately, one being lengthened while the other was in use. The caissons were quadruple, giving four wells and eight air-shafts for each pier, the masonry being built around the shafts as fast as they were sunk. This bridge dates from 1859. Fig. 24 is a section of one of the cylindrical pneumatic piles or caissons of the Szegedin bridge over the Theiss, Hungary. Each pier consists of two columns or piles, which were filled with concrete when the final bearing was reached.

These examples sufficiently illustrate the general form and applications of the pneumatic caisson to bridge-building. It was for the first time applied to the foundations of an office-building, that of the Manhattan Life Insurance Company in New York city. Fifteen caissons were used, of boiler steel, eleven of these being rectangular in plan and four circular, the sizes varying from 15 by 25 feet to 26 by 26 feet for the former, and from 10 to 16 feet diameter for the latter. The fifteen caissons were put into position at the same time and sunk to bed-rock, 50 feet below the street-grade and 25 feet below the proposed cellar-floor. Upon them were built footings of hard brick in cement, capped with several courses of granite, on which rest the bed-plates of the metallic columns of the building, some of which sustain a load of 1,500 tons.

Many details of the science of pneumatic foundations have been necessarily omitted, as these will be more properly looked for in the standard works on engineering and bridge-building. So also must be passed by, with only brief mention, some of the more special and unusual processes for sinking shafts for foundations in quicksand. One of these is the Poetsch freezing process, which freezes the quicksand so that it can be cut, dug, or excavated like any solid. Pipes 6 or 8 inches in diameter are driven down to the necessary depth in a circle around the proposed excavation, and brine, cooled by an ammonia freezing-machine, is circulated through them, freezing the quicksand gradually for several feet in every direction. Another very ingenious process employed with success is that invented by Robert L. Harris, of the American Society of Civil Engineers. Pipes are driven at short distances apart to the required depth, and a current of water forced through the alternate pipes, scouring a passage out from each to the nearest adjacent pipe, through which it escapes, carrying the sand with it. In this way channels are cut from pipe to pipe, and eventually a species of chamber is formed, after which liquid cement is introduced through the pipes into the channels or chambers, in which it mingles with the sand and solidifies, forming ultimately a wall or a floor of concrete, according to the way the pipes are distributed and manipulated. By this process a sewer-channel 4,000 feet long and 16 wide has been excavated 25 feet deep through very fluid quicksand, and great claims are made for its practicability in all similar cases.

It is beyond the scope of an article like this to enter further into the practical and scientific details of foundation-building; for these the reader should consult the professional text-books on engineering. A few historical observations are proper in conclusion.

The Egyptians appear to have taken small pains with their foundations. The compact soil, the dry climate, and the

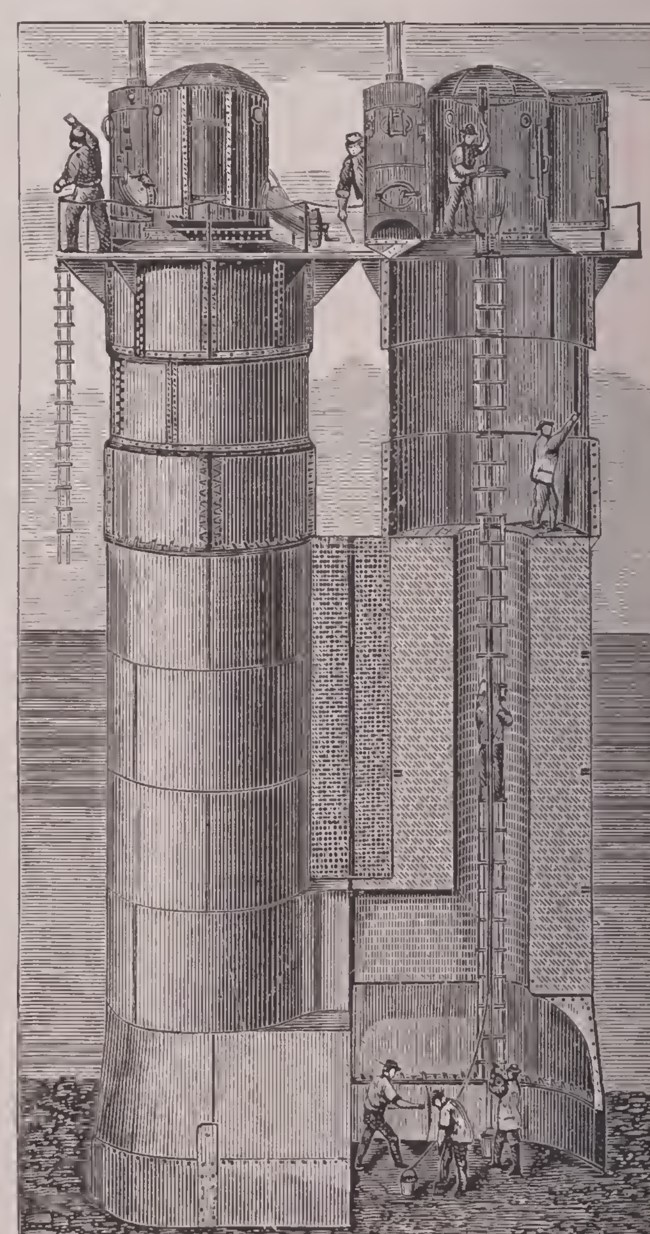

Fig. 22.—Tay bridge pier: Sinking the caissons.

absence of frost made deep excavations unnecessary. The massive, but ordinarily not very lofty, masonry of their temple-walls rests in most cases on a species of platform or wide footing composed usually of stone, but sometimes of sun-dried bricks, and laid in trenches excavated but 5 or 6 feet. Maspero testifies that in all cases under his observation these crude foundations had not failed, but other writers ascribe the ruin of the great temples largely to the failure

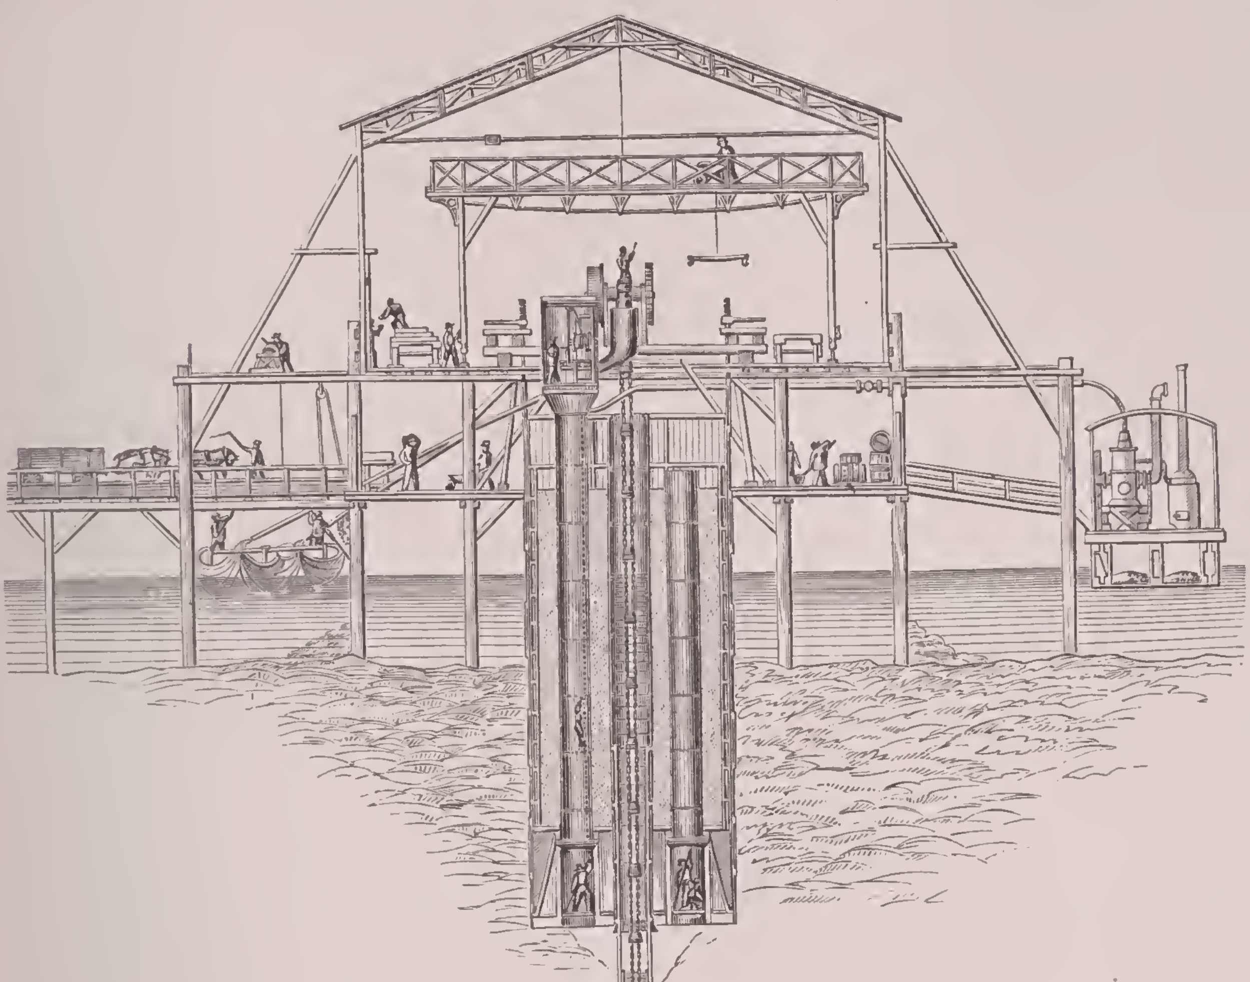

Fig. 23.—Cross-section: shore pier of Kehl bridge (French side).

of their foundations, due in many cases to the infiltration of the Nile overflow. The Greeks took greater pains with their foundations, excavating to a considerable depth and in some cases covering the area thus laid bare with a layer of charcoal or ashes several inches thick, upon which were built the footing courses of hard stone, carefully cut and laid dry. The excellence of the mason-work of the superstructure, laid up without mortar and doweled, with close joints and deep bearings, doubtless contributed to the stability of the foundations by the absence of unequal settlings throwing unequal strains upon them. The Romans appear to have been the pioneers in the scientific engineering of foundations, for which they excavated in most cases to the rock, spreading the footings to a wide bearing and laying them up in cut masonry carefully fitted and cemented. They made free use of concrete and hydraulic cement made with *pozzuolana* or hydraulic lime and pounded brick, and the foundations of isolated piers were frequently consolidated by means of inverted arches. They also made use of piles and employed coffer-dams in subaqueous constructions, in which they displayed great skill. According to Choisy (*L'art de bâtir chez les Byzantins*) the principle of isolated or independent foundations in an elementary form was applied in preparing the substructure of the Church of the Divine Wisdom, 532 A. D. These foundations cost over $1,000,000, but having for 1,300 years carried the massively vaulted edifice without failure, in spite of severe shocks of earthquake, they have demonstrated the wisdom of this heavy expenditure. Among foundations of mediæval buildings those of the leaning tower and cathedral at Pisa have perhaps excited the most controversy and discussion, one side claiming that the inclination of the tower and of certain lines of masonry in the cathedral walls was purely accidental, and due to sinkage of the foundations, the other that these deviations were a part of the design. It is generally admitted, however, that the piles under one side of the tower sank under the imposed load, either gradually or, more probably, quite suddenly, when several stages of the tower were finished, perhaps by breaking through a more solid into a softer stratum, and that the diminished inclination of the upper stages was an effort to correct in part the consequent leaning without too abrupt a break in the lines. With regard to the cathedral there is more apparent evidence for intentional irregularity, though it is far from conclusive. Most of the mediæval buildings, both ecclesiastical and secular, were vaulted structures, and consequently very heavy, requiring extremely well-built foundations. The majority of those whose foundations have been examined are built on widely spreading footing courses, "drawing in" to the base courses of the walls somewhat gradually, and laid up in regular courses of carefully fitted masonry from a bed on solid rock or compact gravel in most cases. The presence or absence of a firm substratum would in many cases determine the adoption or abandonment of a given site for a cathedral or church. Many spires, vaults, and walls undoubtedly fell during the Middle Ages, of which mishaps the record is lost or forgotten, some collapsing from inherent vices of construction, some from insufficient foundations. The walls and piers of Peterborough Cathedral, England, have long been seamed and cracked by the failure of the foundations, and Salisbury Cathedral was saved from the ruin which menaced it, owing to the sinking of its foundations in the moist soil, only by their being encased and in some cases underpinned with concrete, thereby increasing their area and excluding the moisture from the mortar in their joints. Modern engineers have revolutionized the building of foundations by the application of the open-crib and pneumatic caisson; the development of the manufacture and use of concrete and hydraulic cement; the invention of the screw pile and sand-pump; and the reduction to definite statistics and formulas of an ever-increasing experience in the building of bridges—especially for railroads — and lofty structures in cities. For further particulars, the reader is referred to the files of the various engineering journals, to standard works of reference and text-

books, such as the engineering and architectural handbooks of Trautwine, Haswell, and Kidder; Rankine's *Civil Engineering*; Patton's *Practical Treatise on Foundations*, and Baker's *Masonry*; also to the articles BRIDGES and LIGHTHOUSE in this work. A. D. F. HAMLIN.

Founder [deriv. of *founder*, go lame < M. Eng. *foundren*, from O. Fr. *fondrer* in *effondrer*, fall in, sink, founder, deriv. of *fonder*, fall, deriv. of *fond*, bottom < Lat. *fundus*, bottom]: an inflammation primarily attacking the laminæ of the horse's foot (*Laminitis*). This disease may follow overdriving, exposure to cold when perspiring, overfeeding, or giving food or drink too soon after hard work; long-continued driving on pavements or on frozen ground and bad shoeing are fruitful causes. The fore feet are usually affected alone, but the fore legs and chest-muscles sometimes share in the disease, and these muscles undergo a sort of atrophy (chest-founder) in consequence of its long continuance. The disease resembles rheumatism in many respects. Like that, its acute form is attended by great fever and pain. Bleeding is admissible in a young strong horse suddenly foundered. The shoes should be taken off, the hoof covered with a hot poultice, the stall littered heavily, and in severe cases the horse slung up from the floor. After the acute stage is over the horse should be put to pasture if possible, and allowed to run as long as he can be spared, except in severe weather, when he should be housed. A foundered horse can be detected by his mincing gait, by his resting his fore foot upon the toe, by a hot or contracted hoof, and by delicate signs recognized with difficulty by any except practiced observers. For an established founder there is no possible cure. See FARRIERY.

Foundling Hospitals: institutions for the reception and support of infants and children that have been abandoned by their parents or guardians. Such institutions are maintained by government appropriations or by private or sectarian associations. Children found abandoned are known as foundlings, and the cause of their desertion is in most cases illegitimate birth, though not a few are born in wedlock and are abandoned by parents unable to provide for them. The necessity of providing for such children, and restraining infanticide, led to the establishment of foundling institutions by most civilized nations.

As early as the sixth century a species of foundling hospital existed at Treves, where a marble basin was located in front of the cathedral, in which parents could deposit children they wished to abandon, the care of such foundlings being given by the bishop to members of the church. In Rome also, in the sixth century, public institutions existed for the reception of foundlings, called by Justinian *brephotrophia*, and in the seventh century similar ones existed at Anjou in France. One was established at Milan in 787 by an arch-priest named Datheus, for the object of preventing infanticide. In 1070 a foundling hospital was established at Montpellier, and a second one in 1180, known as the Hospital of the Holy Ghost. In 1200 one was established at Eisenbeck, and in 1212 one in Rome. In Florence a magnificent one, the Spedale degli Innocenti, was established in 1317. Similar institutions were founded in Nuremberg in 1331, in Paris in 1362, and in Vienna in 1380. The Hôtel Dieu of Lyons, founded in 1523, was one of the first in France where foundlings were not only received, but were educated, and in 1536 a similar one was established by Francis I. In Paris in 1563 a foundling hospital was established by the Church, and managed by an association of priests. In this children received a careful education, many of the boys being trained for the priesthood. Recognizing the necessity of providing for abandoned infants, St. Vincent de Paul collected funds sufficient to establish a new foundling hospital in 1640. In 1670 this hospital was converted into a public one by Louis XIV., and subsequently it was enlarged. After 1789 the French republic assumed the charge of foundlings, and in 1793 the terrorists declared them all to be *enfants de la patrie*. An imperial degree in 1811 continued the arrangement by which foundling hospitals had become Government institutions and the foundlings children of the state. It further ordered the establishment of such hospitals in each arrondissement of France, the children to be kept in them until six years of age, when they were to be intrusted to respectable persons, who received a stipend for their support and education. This stipend is yearly reduced until the children attain the age of twelve, when the able-bodied boys are placed at the disposal of the Minister of the Marine, while delicate ones are provided with suitable work. Prior to 1811 the reception of foundlings was public, but by the decree of that year each hospital was provided with a turning-box in which the child could secretly be deposited. In most of the Roman Catholic countries of Europe the same system as that in force in France was adopted, and in many of them it still prevails. In Belgium and France the turning-boxes have been abolished since 1834, and the secret reception of foundlings has been declared illegal in the latter country. Since 1886 children are admitted to the foundling hospital at Paris under a system which amounts to indiscriminate admission, it being possible to leave an infant without giving any particulars relating to it. The same institution admits incorrigible children, who are called *moralement abandonnés*, in distinction from *enfant assistés*, as those of all other classes are designated. In 1784 a large foundling hospital was established in Vienna by Joseph II. In 1762 a foundling hospital was founded in Moscow by Catharine II., being afterward greatly enlarged, so as to include a lying-in department and schools. The Vospitatelnoi Dom in St. Petersburg was founded in 1772, also by Catharine II., as a branch of the one in Moscow, and like it has since been greatly enlarged, and has a lying-in department and a school. According to the laws of Russia, all foundlings are the property of the Government, and the army and navy are largely recruited from this class. Owing to the prevalence of the crime of infanticide in China, a foundling hospital was established about 1856 in Canton. In the city of Mexico there has long been a *cuna* or foundling hospital maintained by private means, and receiving the supervision of certain ladies. The infants are kept in the institution one month, and are then sent to the country or villages in charge of a nurse, who is responsible to somebody in the neighborhood. These children after a certain age are generally adopted by respectable persons. In the foundling hospital in Rio de Janeiro all the male children are apprenticed at maturity to trades, and the girls are educated to make able and useful wives. The great hospital of Santo Spirito in Rome has a foundling department capable of holding 3,000 children, and farms out the most of its infants. At Naples the foundlings receive more attention than in any other Italian city. The Dei Trovatelliale Annunziata, which was founded in the thirteenth century, has a costly educational establishment also. Every foundling received has a number fastened around its neck to aid in future recognition. Two infants are given in charge of one out-door wet-nurse, and on attaining the age of eighteen months are intrusted to the nuns for further care. Every infant received in the foundling hospital of Florence is farmed out, the wet-nurses receiving ten francs a month, and a further gratuity if they retain the foundlings until their eighteenth year. The girls on being married receive 235 francs. In the Madrid hospitals the infants are also farmed out until seven years of age, when they are transferred to the college of the "Forsaken" (*Desamparados*) to be educated. In Portugal the Santa Casa de Misericordia in Lisbon contains an immense foundling department, conducted in a manner similar to those in Spain. The foundling hospitals in Vienna and Lower Austria receive infants on the following conditions: Declaration of the community to which the infant or mother belongs, of her religion, and proof of its illegitimacy in case it is to be received permanently. Admission is free to infants born in hospitals. Admission is granted to illegitimate children on payment of a stipend by the relatives or townships of the mothers. The institutions provide for the children until their tenth year, after which their support must be assumed by their native village or town. In the Prague foundling hospital the children are only kept a short time, and are then farmed out in the country, only those being kept in the institution who are feeble, and for whom nurses can not be found outside. Those given in charge to outside parties are claimed by the institution, and at their sixth year receive a free schooling. At the age of ten years the institution relinquishes all claim to the child, when the village or town of the mother must provide for its support, or its own mother may reclaim it on proving her ability to provide for it. In Munich the following rules for the care of illegitimate children are strictly enforced: It is a misdemeanor to take charge of such children under eight years of age without approval of the police authorities, and such permission is refused unless the character, circumstances, and locality of the petitioner are satisfactory. The infants given in charge of nurses are first examined by medical men, and no women are allowed to receive foundlings to the neglect of their own children. The management of the London Foundling Hospital, which was founded in 1739 by Capt. Thomas Coram and is not strictly speaking a foundling hospital at all, is as follows: The governors meet once a week to receive petitions for the admission of children. A child can be received only upon personal application of the mother, who is obliged to state the circumstances requiring her to abandon her child, and to give her name, residence, age, date of child's birth, sex, father's name and occupation. Shortly after admission the infants are sent into the country, where they remain until their fifth year, when they are returned to the institution, where they are educated. At the age of fourteen the girls are apprenticed out as domestic servants until the age of twenty. The boys at the age of sixteen are apprenticed as mechanics until they attain the age of twenty-one years. In both cases those to whom they are apprenticed are held to a strict accountability for their physical and moral wellbeing. After the termination of the period of apprenticeship, the institution ceases to exercise any control over the foundlings. In Great Britain the boarding-out system for foundlings has met with great approval, but in the U. S. it has been the occasion of much cruelty, leading to criminal prosecutions. The advantages claimed for this method are that the children are removed from pauperizing tendencies, and are put upon an equal footing with other children. It is claimed that foundlings thus brought up have in most instances become good men and women. In Scotland the boarding-out system has been widely adopted, and from its marked success has won universal approval. In the U. S. the care of foundlings in institutions is the universal system, and most of the larger cities have their foundling hospitals, either under control of and supported by private and sectarian associations, or the State and municipal government. The turning-boxes or cribs have been abolished almost wholly. In 1893 the general Government, through the census office, made the first attempt to gather statistics relating to foundling hospitals throughout the U. S. Revised by F. STURGES ALLEN.

Foundry [also *foundery*, from Fr. *fonderie*, deriv. of *fondre*, pour, found, cast < Lat. *fun'dere*, melt, pour]: an establishment for shaping metallic figures by pouring the molten material into molds in which it cools and is solidified. The operation is called casting or founding. Metal casting was successfully practiced in ancient Assyria, Babylonia, Phœnicia, and Greece, and the Chinese and Japanese have long excelled in casting both iron and bronze. In modern times in more highly civilized lands casting has attained great perfection. Iron-founding, brass, bronze, and type founding are special forms of the art. Of especial importance is the formation of the mold, within which, if the casting be hollow, a *core* is placed. The mold is in general formed of loam, molding-sand, plaster, or even, for some articles, of metal. For small and nice objects pounce, or powdered cuttle-bone, is sometimes used for making the mold. The core is always of some material which will yield during the contraction of the metal. Type-foundries employ steel molds. (See PRINTING.) In the iron-foundry the metal is generally melted in a furnace of the form called *cupola*; coke, charcoal, and in the U. S. anthracite, are employed in melting the iron. For many forms of nice casting, requiring clean edges and well-defined lines, bog iron, which is often heavily charged with phosphorus, is preferred, since it is more perfectly liquid when in a molten condition than most other kinds of iron. The variety of articles now manufactured in a foundry is very great. The principle employed in all kinds of casting is very obvious and simple, but the practical details are very numerous, and can be properly learned only by experience. See METALLURGY and MOULDING.

Fountain [M. Eng. *fountayne*, from O. Fr. *funtaine*, *fontaine* < Low Lat. *fontana*, deriv. of Lat. *fons*, *fontis*, spring, fount]: an outbursting stream or jet of water, especially one artificially produced, either for use or decoration; though the name is still applied to historic natural springs, as of Egeria, Bandusia, or Vaucluse. Decorative fountains, probably first used by the Romans, were designed in great numbers by Italian architects of the Renaissance, and have ever since been important features in the adornment of parks and squares. In some the architectural or sculptural treatment of the basins is most prominent, in others the arrangement of the jets and masses of water. The Fountain of Trevi and the Acqua Paola at Rome, the Cascade at Caserta, the Grandes Eaux at Versailles, the fountains S. Michel and des Innocents at Paris, and the Triumph of the Republic at Chicago (1893) are conspicuous examples of such works. *Drinking-fountains* are provided for public use in modern cities by public enterprise or private munificence; in Oriental lands their erection is deemed an act especially to be rewarded in paradise. A. D. F. HAMLIN.

Fountain of Youth: a mythical spring which, according to Indian stories of the sixteenth century, existed in a country sometimes called Bimini; the waters, it was said, had the power of healing the sick, restoring the aged to youth, and conferring immortality. The story was current in the West Indies and parts of Central America, and Bimini was described as a beautiful island or region toward the north. The Spaniards at first supposed it to be one of the Bahamas, and later Florida, a region near the Mississippi, or even Mexico. Ponce de Leon sought for the fountain in Florida, 1512 and 1521, and it was one of the incentives which led to the later expeditions of Narvaez and Soto. Similar myths have been recorded in the Old World. H. H. SMITH.

Fouqué, foo'kā', FRIEDRICH HEINRICH KARL, Baron de la Motte: poet and novelist; b. at Brandenburg, Germany, Feb. 12, 1777. His family was French, but had emigrated to Prussia after the Revocation of the Edict of Nantes. His father was a major-general in the Prussian army, and he himself served in the campaigns of 1792 and 1813, but retired from the army, on account of ill-health, with the rank of major, and resided at Paris, at Halle, and on his estate of Nennhausen. He was a very prolific writer. In 1801 he published, under the pen-name *Pellegrin*, *Dramatische Werke*. *Sigurd* followed in 1808; *Undine* was written in 1811; *Corona*, poem, in 1814; *Der Zauberring* (The Magic Ring) in 1816; *Eginhard und Emma*, drama, and *Bertrand du Guesclin*, epic poem, in 1821; a collection of his poems, containing most of his lyrics and all his dramas, appeared in five volumes 1816–27. A posthumous romance, *Abfall und Basse*, was published in 1844, some *Geistliche Gedichte* in 1858, and *Christlicher Liederschatz* in 1862. He belonged to the Romantic school, and was at one time extremely popular in Germany. D. in Berlin, Jan. 23, 1843.

Fouqué, HENRI AUGUSTE, Baron de la Motte: Prussian general; b. at The Hague, 1698; served in the Prussian army against Charles XII. of Sweden 1715; acquired the friendship of the Prussian prince-royal, afterward Frederick the Great, and received a command from him in 1740; rose to the rank of a general (1759) in the wars of Frederick; was wounded and taken prisoner at the battle of Landschut in 1760; and died at Brandenburg, May 3, 1774. His memoirs were published in German (1788).

Fouquet, or **Foucquet**, NICOLAS, Viscount of Melun and Vaux, Marquis of Belle Isle: minister to Louis XIV.; b. in Paris, 1615; educated for the civil service; rose rapidly in the favor of the court, and at the age of thirty-five was made procureur-general to the Parliament of Paris. Enjoying the favor of Cardinal Mazarin and of Anne of Austria, the queen-mother, he was three years later appointed superintendent of the finances. The treasury was then in a bad condition, owing to mismanagement, official extravagance, and the greed of courtiers, and Fouquet is said to have advanced money from his private estate and made loans on his own credit to supplement the revenues. But as he grew in power he became indiscreet, made an enemy of Mazarin, who thenceforth determined on his destruction, offended the king by his lavish display, and above all angered him by his advances to the royal mistress, La Vallière. When, on the death of Mazarin, Louis determined to be his own Prime Minister, Fouquet, wishing to retain his influence, exaggerated the financial distress of the Government; but the king, carrying the report to Colbert, who coveted the ministry of Finance, was made aware of the falsity of the figures. Nothing was done, however, to show Fouquet that he was in disfavor, for it was the king's wish that the arrest should be postponed till Fouquet had given up the office of procureur-general, which would give him the privilege of a trial by the Parliament. He was accordingly induced to sell his office. In the meanwhile he had bought the port of Belle Isle, which he fortified at great expense, and he had built a palace at Vaux which anticipated the royal magnificence of Versailles. In Aug., 1661, the king attended a *fête* at Vaux, which had been prepared at an enormous expense. But for the intercession of Anne of Austria Louis would have arrested his host in the midst of the festivities. Hardly three weeks passed, however, before he was arrested at Nantes. Charged with malversation in office and rebellion, the alleged evidence of which was procured mainly from papers found in his palace, he was finally sent to the Bastile. He showed fortitude in his imprisonment, and replied with spirit to his accusers, but the verdict was against him, and he was sentenced to perpetual banishment and confiscation, a sentence which the king commuted to imprisonment for life. He was confined at the fortress of Pignerol under the care of Saint-Mars, afterward the jailer of the Man with the Iron Mask, with whom Fouquet is sometimes wrongly identified. He wrote a number of devotional works during his imprisonment, and died at Pignerol, Mar. 23, 1680.

F. M. COLBY.

Fouquier-Tinville, -tăn'veel', ANTOINE QUENTIN: revolutionist; b. at Hérouel, France, 1747; studied law in Paris, where he became *procureur* (attorney) to the Châtelet, an office which the ruin resulting from spendthrift and licentious habits forced him to sell; was reduced to the extremes of want, but secured a humble position in the bureau of police as a reward, it is said, for some flattering and commonplace verses addressed to the king. At the outbreak of the Revolution he joined the violent faction, was conspicuous on the day of the storming of the Bastile, and was soon afterward made *commissaire* of his district (St.-Merry). Danton, Robespierre, and other prominent radicals became his friends, and in the spring of 1793 he was appointed a juror to the revolutionary tribunal, where his effectiveness in carrying out the will of the committee of public safety caused his advancement to the position of director of the jury and then of public prosecutor. Regarding himself as an instrument of the Terror, "the axe of the convention," as he afterward said, he was absolutely pitiless in the administration of his office, condemning his friends and patrons with the rest and heeding neither bribes nor entreaties. He condemned both Hébert and Danton, but did not long survive Robespierre. By order of the convention he was imprisoned Aug. 1, 1794, charged with having caused the death of a great number of persons without regard to the principles or even the forms of justice. Judgment had been passed on sixty or eighty persons in the course of three or four hours without observing the legal forms, and many were sent to the guillotine against whom no deposition had been made. Fouquier replied that he was but the instrument of the convention, which, accordingly, was responsible for his acts. He was guillotined May 7, 1795. F. M. COLBY.

Fourcroy, foor'krwaa', ANTOINE FRANÇOIS, Comte de: chemist and politician; b. in Paris, France, June 15, 1755; became M. D. in 1780; Professor of Chemistry at the Jardin du Roi 1784–1809; admitted to the Academy of Sciences 1785; member of the National Convention 1792, and of the Committee of Public Safety 1794; of the Council of Ancients 1795; appointed Minister of Public Instruction Sept. 15, 1802. D. in Paris, Dec. 16, 1809. *System of Chemistry* (11 vols. 8vo) was issued in 1801, *The Philosophy of Chemistry* in 1792.

Foureau, FERDINAND: See the Appendix.

Fourier, foo'ri-ā', FRANÇOIS MARIE CHARLES: the founder of the social system called Fourierism; b. in Besançon, France, Apr. 9, 1772, and educated in the college of his native city. He had both talent and inclination for studies, especially for mathematics, music, geography, and natural history, but when he was eighteen years old his father put him into the office of a merchant in Lyons as a clerk, and commerce became his business in life, very much against his will. In 1793 he inherited a fortune from his father, but lost it the same year on account of the revolutionary disorders in Lyons, in which he became entangled. He was imprisoned first in Lyons, then in Besançon, and he escaped only by becoming a dragoon in the Revolutionary army. Having been discharged from the military service in 1795 on account of ill-health, he returned to his commercial pursuits. He led a very retired life, held always inferior positions, and had only miserable salaries. In his few leisure hours he wrote his books, and with his scanty spare money he published them. They made no sensation; they hardly attracted any attention, and yet every single day of his life, on returning home from his office, he expected to find some enthusiastic millionaire waiting for him, ready to invest his millions in a social experiment according to the new theory. His first book, *Théorie des quatre mouvements et des destinées générales*, was published in 1808; his second and most important, *Traité de l'association domestique agricole*, in 1822; and a sort of compendium of both, *Nouveau monde industriel et sociétaire*, in 1829; but they found only very few readers. It was not till 1831, when the social schemes of Saint-Simon and of Robert Owen were much discussed, that Fourier attracted any attention for his own ideas by his savage attacks on these two reformers, *Pièges et Charlatanisme des Deux Sectes Saint-Simon et Owen, promettants l'Association et Progrès.* From that time several talented disciples gathered around him—Madame Clarisse Vigoreaux, Victor Considérant, Cantagrel, Hennequin, and Mennier. A monthly paper, *La Phalange*, was issued, and later on even a weekly, *La démocratie pacifique.* In England and the U. S. Fourierism found warm adherents in Hugh Doherty and Albert Brisbane, and practical experiments which had but short life were made both in France and America, the community of BROOK FARM (*q. v.*) being the most noted of these attempts in the U. S. from the eminence of many of its members and advocates. This, like most of such experiments, proved a failure. Fourier died in Paris, Oct. 10, 1837.

The negative side of Fourier's writings, his criticism, is very brilliant. It is bitter, but it is acute, often strikingly true, and always full of noble suggestions. But the positive side of his system is theoretically a failure, and where it also has proved a failure practically the reason is hardly that the experiments have been made with insufficient means, but that the fundamental idea is incompatible with human nature and human destiny. Fourier considers civilization in its present form as the root of all vices and the cause of all miseries; and his views and arguments on this point carry a kind of conviction with them in all their critical details. But the remedy he prescribes, his ideal of a new civilization, his social system, is fantastic, and, what is worse, no remedy at all. Its speculative part, the foundation of the system in the nature of the universe and the human soul, is awkward and insufficient, and its practical part, the phalanstery, where 1,800 people live, work, and enjoy together in one building, is a dream which perhaps would do away with much vice and misery, but which certainly would also do away with much virtue and all heroism. In order to gain freedom in a comfortable but narrow sense of the word, Fourier cuts it off in its large and dangerous but inspiring sense. In order to secure to each individual a certain amount of enjoyment, he cuts off from mankind the prospect of an infinite degree of happiness. In order to get rid of the errors, crimes, and horrors in which human destiny is involved, he lowers this destiny to an eating, drinking, dancing, and sleeping mediocrity. He is not at war with morals and religion, but he has no use for them. He acknowledges property as a reward to labor and talent, but does not understand it as a necessary compliment to the human personality. His phalanstery is the monastery of the Middle Ages revived. To some people it means an asylum, but to others an iron cage. As a critical ferment, however, the value of the works of Fourier and his disciples is considerable. See his complete works (6 vols., 1840–46; new ed. 1870); also Victor Considérant, *Destinée Sociale* (1835); Pellarin, *Charles Fourier, sa vie et sa Théorie* (5th ed. 1871). Revised by F. M. COLBY.

Fourier, JEAN BAPTISTE JOSEPH, Baron: mathematician and natural philosopher; b. at Auxerre, France, Mar. 21, 1768; was a moderate friend of the popular cause in the Revolution, but was twice imprisoned by the ruling party. He was subprofessor in the Polytechnic School 1794–98; accompanied Bonaparte to Egypt as savant in 1798; was prefect of Isère at Grenoble Jan., 1802–15; in 1816 was admitted to the Institute, in 1817 to the Academy of Sciences, and to the Académie Française in 1827. The same year he was president of the council of the Polytechnic School. D. at Paris May 16, 1830. His *Théorie Analytique de la Chaleur* was published in 1822, and he left an *Analysis of Determinate Equations*, published in 1831.

Fourier, PIERRE, known as THE BLESSED PETER FOURIER: b. at Mirecourt, in Lorraine, Nov. 30, 1565; became a Premonstratensian monk, and in 1595 parish priest of Martaincourt, where he founded the congregation of Notre Dame (see NOTRE DAME, CONGREGATION OF), or "Ladies of the Congregation"; and soon after instituted a reform in the Premonstratensian order. D. at Gray, Dec. 9, 1640, and was beatified 1730.

Four Lakes: a chain of lakes in Dane co., Wis., discharging their waters into Catfish river. They are situated in a beautiful and fertile region. First Lake is 3 miles long and 2 miles wide. Second Lake, the next above, is rather longer. Third Lake (Lake Monona) is 6½ miles long and 2 broad. Fourth Lake (Lake Mendota) is the highest; it is 6 miles long and 4 broad. Between the last two lakes stands

Madison, the capital of the State. These lakes are deep, clear, and cold, and are fed largely by springs.

Fournet, foor'nā', VICTOR; scientist; b. at Paris, May 15, 1801. Was educated at the French School of Mines: graduated doctor of science, and rendered great services to dynamical geology, metallurgy, and mineralogy; demonstrated *Fournet's law*, establishing the exact order of the metals as regards their "sulphurability"; was an industrious meteorologist and observer of physical phenomena; introduced great improvements in the treatment of lead ores; was a member of many learned societies, and author of scientific papers of value. D. at Lyons, Jan. 8, 1869.

Fournier, PAUL EUGENE LOUIS: See the Appendix.

Fournier, TÉLESPHORE: Canadian jurist; b. at St. François Rivière-du-Sud, Montmagny, P. Q., in 1823, and educated at Nicolet College. He was admitted to the bar in 1846, appointed queen's counsel in 1863, and has been president of the general council of the bar of Province of Quebec. He was one of the editors of *Le National* newspaper, Quebec, 1856–58, and entering politics was Minister of Inland Revenue 1873–74, Minister of Justice 1874–75, and the latter year became Puisne Judge of the Supreme Court of Canada. He sat in the Quebec Assembly 1871–73, and in the Parliament of Canada for a few years preceding his elevation to the bench. D. May 10, 1896. NEIL MACDONALD.

Fourth: in music, an interval comprising four degrees of the scale, or the distance, e. g., from C to F, D to G, etc. Fourths vary in quality or compass according to their place on the scale, numbering from four to six semitones. They are regarded as threefold—viz., the perfect containing two whole tones and one semitone; the diminished or imperfect, one whole tone and two semitones; and the augmented three whole tones; thus:

In harmony, the fourth is regarded as a consonance when it occurs as the complement of the perfect fifth, as in the second inversion of the triad. In other cases it is treated as an imperfect dissonance. See INTERVAL.

Revised by DUDLEY BUCK.

Fourth Dimension: See GEOMETRY.

Fourth Estate: a term first bestowed in Germany (*vierter Stand*) upon the people standing politically and socially below the THIRD ESTATE (*q. v.*), or citizen class. From the fourteenth century to the end of the eighteenth the representative assemblies in France were made up of three estates: first, the clergy; second, the nobility; and third, the burghers or citizens. In the time of the French Revolution of 1789 a class below that of citizens came forward into great prominence; and early in the nineteenth century it became evident that henceforth it must be counted upon as a political power. Louis Philippe, the "Citizen King," was regarded as the personification of the third estate, and his overthrow was very largely brought about by the stratum of society still lower. Louis Napoleon, by means of universal suffrage, established his power mainly on the basis of the fourth estate. Since the Revolution of 1848 the class so denominated has everywhere received more or less political power mainly through the general extension of the suffrage and in every modern government it has become an element of growing importance. The fourth estate has strong feelings in regard to great questions involving the good of humanity; and, though incapable of nice discriminations, it often turns the political scale by the earnestness of its conviction and the energy of its action. To direct and enlighten its opinion and action in regard to great subjects is one of the most important functions of the scholar and the statesman. To direct its action in regard to matters of medium or subordinate importance is the favorite function of the political demagogue. C. K. ADAMS.

Fourton, MARIE F. O., de: See the Appendix.

Fouvent-le-bas, foo'vaăn'le-baa': a hamlet of France; department of Haute-Saône. In 1800 Cuvier discovered in the vicinity a great number of fossil bones of quadrupeds, and in 1827 Thirria determined some of these bones as remains of the rhinoceros, elephant, hyæna, and lion.

Fowl [M. Eng. *foul, fuhel, fugel* < O. Eng. *fugol*: O. H. Germ. *fogal* > Mod. Germ. *Vogel*: Goth. *fugls* < Teuton. **fuglos*]: a word which, in its original meaning as a synonym of *bird*, is antiquated and nearly obsolete, except as used to designate domesticated birds of the sub-class Cursores and order *Gallinæ*. This order contains, besides the common domestic fowl (*Gallus domesticus*), the peacock, guinea-fowl, turkey, etc., all of which are noticed under the proper heads. There is reason to believe that the domestic fowl is the descendant of more than one recognized species of the genus *Gallus*, all, however, of Asiatic origin. Among these are the *Gallus giganteus*, or Kulm fowl, a large bird of India and the Eastern Archipelago; *Gallus sonneratii*, a spirited fowl of Hindustan; *Gallus æneus, furcatus*, and *bankiva* of the Archipelago, and others; but there is very good reason to believe that they are all of one stock, since the domestic fowl, like the pigeon, has a remarkable tendency to develop strongly marked varieties in breeding.

The domestic fowl was well known to the Greeks; to the Romans, who regarded it as sacred to Mars; to the Egyptians, as their wall-paintings show; to the Etruscans; and, as Cæsar says, to the ancient Britons also. There are innumerable breeds and varieties, among which may be mentioned the Dorking, the game-fowl, the black Spanish, the tall Chinese breeds, the Polish, the Crèvecœur, the Houdan, the little Bantams, the Leghorn, etc. They are valued for the number and excellence of their eggs, and for their flesh, which is excelled by that of no domestic bird except the turkey. The breeds differ much in color, disposition, hardiness, size, and fattening and laying qualities.

The cock is said to have been the emblem of the ancient Gauls, though the tradition does not rest on authority, and is supposed to have been a mere play of words between the Latin *gallus*, a cock, and Gallus, a Gaul; the cock was placed, after the Revolution, on the ensigns of France. It is introduced by artists among the emblems of our Lord's passion, in allusion to St. Peter's sin, and for the same reason it is St. Peter's emblem as the lion is the emblem of St. Mark. Among the early Christians it was represented on tombs as an emblem of the resurrection—the herald of light after the night of death; also as a symbol of vigilance. See GALLINÆ and POULTRY.

Fowler, CHARLES HENRY, D. D., LL. D.: clergyman; b. in Burford, Canada, Aug. 11, 1837; removed with his parents to the U. S. in 1840; graduated at Genesee College, New York, in 1859, and studied at Garrett Biblical Institute, Evanston, Ill. In 1861 he entered the Methodist ministry, preaching in Chicago, Ill., until 1872, when he was chosen president of the Northwestern University at Evanston, Ill. Editor of *Christian Advocate*, New York, 1876–80; appointed secretary of the mission society June, 1880; elected bishop 1884.

Fowler, HENRY HARTLEY, M. P., P. C.: financier and public man; b. at Sunderland, in the county of Durham, England, in 1830; son of the Rev. Joseph Fowler, a prominent Wesleyan minister; educated at Woodhouse Grove School and St. Saviour's School, Southwark; mayor of Wolverhampton 1863, which borough he represented in Parliament 1880–85; Under-Secretary for the Home Department 1884; financial secretary of the Treasury in Mr. Gladstone's ministry of 1886; created privy councilor 1886; president of the local government board in Mr. Gladstone's cabinet 1892. Mr. Fowler has attained his chief distinction as a financier.

Fowler, Sir JOHN, Bart., LL. D., K. C. M. G.: past president of the Institute of Civil Engineers; b. at Wadsley Hall, Sheffield, England, in 1817. After completing his school course he became a pupil of Mr. J. Towlerton Leather, a well-known hydraulic engineer, and was first employed upon the Sheffield water-works. Upon leaving Mr. Leather he was assistant upon several lines of railway, among them the London and Brighton Railway. He was then made resident engineer of the Stockton and Hartlepool Railway, and after its completion remained for two years as general manager and locomotive superintendent. In 1844, at the age of twenty-seven, he became chief engineer of the Manchester, Sheffield, and Lincolnshire lines, embracing very heavy work of every description. He then removed to London, and was continuously employed on important works in Great Britain and elsewhere. Mr. Fowler's principal works are the Metropolitan underground railways of London and their connections. He built a great number of important railway systems, docks, river and harbor works, and reclamation works. He was for eight years consulting engineer to the Government of Egypt, visiting that country every year. With his younger associate, Sir Benjamin Baker, he completed in 1890 the Forth bridge, the largest work of the kind yet constructed, upon the completion of which he was made a baronet. In 1855 he was made a commander of the order of SS. Michael and George "for important services to Her Majesty's Government in Egypt." He became a member of the Institution of Civil Engineers in 1844, and was president in 1866. D. in London, Nov. 21, 1898. WM. R. HUTTON.

Fowler, LYTTLETON: a minister of the Methodist Episcopal Church South; b. in Smith City, Tenn., Sept. 12, 1802; was licensed to preach in Kentucky Sept. 30, 1826. After filling responsible stations in Kentucky, Tennessee, and Alabama, he went in 1833 as missionary to Texas, and in 1838 was made superintendent of the Texas mission, which extended all over the republic. He was a delegate to the General Conference which met in New York in 1844, and was a member of the Louisville convention in 1845, at which the M. E. Church South was organized. D. in Texas, Jan. 19, 1846. He was an eloquent and a successful preacher.
Revised by S. M. JACKSON.

Fowler, ORIN: Congregational minister; b. at Lebanon, Conn., July 29, 1791; graduated at Yale 1815; entered the Congregational ministry; became a missionary in the West; settled in 1819 as pastor at Plainfield, Conn.; in 1831 at Fall River, Mass.; often in the State Legislature; resigned his pastoral charge in 1848, and was in Congress 1848–1852; distinguished as a temperance and anti-slavery orator; author of a treatise on *Baptism* (1835); *Historical Sketch of Fall River* (1841; 2d ed. Fall River, 1862). D. in Washington, D. C., Sept. 3, 1852.

Fowler, ORSON SQUIRE: phrenologist; b. at Cohocton, Steuben co., N. Y., Oct. 11, 1809; graduated in 1834 at Amherst College, and with his brother, L. N. Fowler (b. June 23, 1811; d. Sept. 2, 1896), became widely known as a lecturer, and as writer, editor, and publisher of books and periodicals upon phrenology, health, self-culture, education, and social reform; retired in 1863 from his business in New York; removed to Boston, Mass., and continued to write and lecture; was the author of numerous well-known works upon the subjects indicated above. D. near Sharon Station, Conn., Aug. 18, 1887.

Fowler, SAMUEL, M. D.: b. near Newburg, N. Y., Oct. 30, 1799; studied medicine at Penn Medical College of Philadelphia; was licensed in 1800, and began to practice at Hamburg, N. J.; after a few years removed to Franklin, N. J. He took an active part in politics, representing his county in the upper branch of the State Legislature, and afterward his State in the 24th and 25th Congresses, during the administration of Gen. Jackson, of whom he was a warm supporter and one of the earliest friends in New Jersey. As a mineralogist and geologist he was regarded by men of science as among the first in the country; was made a member of the Geological Society of Pennsylvania and of the New York Lyceum of Natural History; an honorary member of the Literary and Philosophical Society of New Jersey, and corresponding member of the Academy of Natural Sciences of Philadelphia; was also an honorary member of the scientific societies of London and Dublin, and others. In 1825 he published in *Silliman's Journal of Science*, vol. ix., *An Account of some New and Extraordinary Minerals Discovered in Warwick, Orange co., N. Y.*; in 1832, in the same journal, vol. xxi., *An Account of the Sapphire and other Minerals in Newton Township, Sussex co., N. J.*; contributed to Gordon's *Gazetteer and History of New Jersey* an article on *The Franklinite, Red Oxide of Zinc, and other Minerals found in the Valley at the Foot of the Hamburg Mountains*; also a notice of the geology and mineralogy of the same region, for Cleaveland's *Mineralogy*. The rare mineral fowlerite was discovered by and named for him, and the iron and zinc ore franklinite is supposed to have been so called by him; he made it known to eminent naturalists in Europe, and awakened an interest in it which resulted in its successful development and manufacture. D. at Franklin, N. J., Feb. 20, 1844.

Fowler, WILLIAM CHAUNCEY: educator and author; b. in Clinton, Conn., Sept. 1, 1793; graduated at Yale in 1816; was tutor 1819–23; pastor of a Congregational church at Greenfield, Mass., 1825–27; Professor of Chemistry and Natural History in Middlebury College, Vermont, 1827–38; Professor of Rhetoric and Oratory in Amherst College 1838–43; a son-in-law of Noah Webster, and editor of the University edition of Webster's *Dictionary* (New York, 1845); author of a treatise on *The English Language* (1850); of two English grammars; of *The Sectional Controversy* (1863); *Chauncey Memorial* (1856); *History of Durham, Conn.* (Hartford, Conn., 1866), etc. Resided in Durham, Conn., after 1858, and there died Jan. 15, 1881.

Fowlerite: crystallized rhodonite from Franklin, N. J.

Fowler's Solution [named from Dr. Thomas Fowler, of Stafford, England (1736–1801), its inventor]: a solution of arsenite of potash in water, flavored and colored with compound tincture of lavender. Each fluid drachm contains the equivalent of half a grain of arsenious acid. The dose is five or ten drops once, twice, or thrice daily. It is used in many diseases, especially skin diseases and malarial fevers and their sequelæ, and is sometimes very useful in epilepsy and neuralgia. It is a powerful tonic, and should be used only under the eye of a competent physician.

Fox [M. Eng. *fox* < O. Eng. *fox*: Mod. Germ. *Fuchs*]: any one of those members of the family *Canidæ* which are externally distinguished by a slender muzzle, vertical pupil, and an elongated bushy tail. Several distinct genera are thus confounded which differ from each other in some remarkable characters. Of these forms one genus (*Vulpes*) is common to the entire northern hemisphere, and has also numerous representatives in Asia and Africa. The most familiar species is the common or red fox of Europe and North America, and embraces several varieties, of which the most characteristic is the prairie or long-tailed fox of the Southwestern U. S. Another related species, of smaller size, is the swift or kit fox (*Vulpes velox*) of the Western prairies. A third congeneric species with strongly marked characters is a native of the Arctic circle, and has hairy feet, whence it is called *Vulpes lagopus*. The genus *Vulpes* is very closely related to *Canis*. Another genus (*Urocyon*) has much external similarity to *Vulpes*, but is distinguished from it by several very important anatomical characters. It is peculiar to North America, and embraces a single well-determined species (*Urocyon virginianus*); but there is an insular and tropical race which is much smaller, and has been considered as a distinct species, and named *Urocyon littoralis*.
Revised by F. A. LUCAS.

Fox, Sir CHARLES: civil engineer; b. at Derby, England, in 1810; urged by friends to follow the medical profession, but studied engineering, and was first employed by Ericsson. At the beginning of the construction of the London and Birmingham Railway Company's line he was appointed its assistant engineer by Robert Stephenson, and remained with the company five years. He drew the plans for the building called the Crystal Palace, in Hyde Park, in which the great industrial exhibition was held in 1851. Constructed the Sydenham Crystal Palace and many extensive railway and engineering works. D. June 17, 1874.

Fox, Rt. Hon. CHARLES JAMES: English statesman; the second son of Henry, Lord Holland, by Georgiana Carolina, daughter of the Duke of Richmond, a descendant of Charles II.; b. in London, Jan. 24, 1749, and educated at Eton and at Hertford College, Oxford. His father, the first Lord Holland, cherished an almost idolatrous fondness for his second son, and he early initiated him into many of the vices of the time, from some of which it afterward proved impossible for Charles James to emancipate himself. His studies were often interrupted. He did not graduate, but traveled 1766–68 upon the Continent, where he acquired a lifelong fondness for Italian literature. In 1768 he took a seat in Parliament for Midhurst, from which borough he was elected before he came of age. In 1770 he became a Junior Lord of the Admiralty, and in 1773 a Lord of the Treasury, whence he was dismissed in 1774 by Lord North on account of his independent spirit. From this time he stood by the side of Burke and the Liberals, and assailed with the most brilliant and effective eloquence the administration of Lord North, foretelling the eventual defeat of the British arms in North America. In 1780 he was chosen to represent Westminster in Parliament. In 1782 he was Secretary of State for Foreign Affairs under the Marquis of Rockingham, and in 1783 was Secretary of State in the Portland ministry. In 1783 he introduced his India bill for the relief of the inhabitants of British India, but the East India Company, the king, and the House of Lords combined to defeat him, and he resigned. He stood again for Westminster, and was elected, but was unseated through the influence of the ministry. He entered Parliament for a Scottish burgh, and punished the offending magistrates of Westminster by a successful suit at law. He now became the prime leader of the Liberal party, from which Burke was so soon to secede; joined heartily in the prosecution of Warren Hastings; opposed with all his powers the policy of Pitt in his interference in continental affairs; supported Wilberforce in his efforts for the abolition of the slave-trade; and hailed from the first the French Revolution as the harbinger of a new era of freedom. Between Napoleon and Mr. Fox there was a mutual respect which amounted almost to a personal friendship. From 1797 to 1802 he absented himself from Parliament completely. In 1806 he entered the ministry as Secretary for Foreign Affairs, and in a personal note addressed to Napoleon offered peace, but did not live to see it effected. D. at Chiswick, Sept. 13, 1806. Though his life was one of great irregularities, his nature was generous, and he endeared himself to all those with whom he was intimately associated. To the consummate excellence of his oratory Burke, Mackintosh, Parr, Franklin, and all the best critics of his time bear the amplest testimony. His political views were always liberal and progressive, always far in advance of his time. His incomplete *History of the Reign of James II.* was published in 1808, and some minor works, besides six volumes of his speeches appeared in 1815. See Adams's *British Orations*, vol. ii. (1884).

Revised by C. K. ADAMS.

Fox, GEORGE: founder of the Society of Friends; b. at Drayton-in-the-Clay (now Fenny Drayton), Leicestershire, England, in July, 1624; the son of pious Christopher Fox, weaver, called among his neighbors "Righteous Christer." His parents were both members of the Church of England. Fox was early bound apprentice to a shoemaker and glazier, but in 1643 abandoned this occupation, and in 1647–48 began itinerant preaching. For this he was repeatedly arrested and imprisoned from 1649 to 1666, but submitted as one ready to lay down his life for his faith. In 1652 he formed congregations in Lancashire. In 1669 he married Margaret, widow of the Welsh judge Thomas Fell, and in 1671 visited America. At Barbados, on this journey, he drew up a paper setting forth the belief of the Friends as to the fundamental doctrines of Christianity. In Mar., 1673, he embarked for England. He was soon imprisoned again in Worcester jail, remained in confinement a year, and was freed through the influence of Sir Matthew Hale. In 1677 and 1681 he visited the Friends in Holland, and established monthly, quarterly, and yearly meetings there. He returned to England, and died in London, Jan. 13, 1690, having continued his public addresses to within a few days of his death. His writings were published in three vols. folio—viz.: 1, *Journal of his Life, Travels*, etc. (1694); 2, *Collections of many Select and Christian Epistles, Letters, and Testimonies written by George Fox* (1698); 3, *Gospel Truth Demonstrated in a Collection of Doctrinal Books given forth by George Fox, containing Principles Essential to Christianity and Salvation held among the People called Quakers* (1706). Consult Sewell's *History of the Quakers*; the *Life* by Marsh (1848), by Janney (1853), and by Watson (1860); C. H. Spurgeon's *George Fox*, an address to the Society of Friends, London (1866); Tallack's *George Fox, the Friends and the Early Baptists* (London, 1868); and Biekley's *George Fox and the Early Quakers* (London, 1884); and for a full account of Fox's writings and publications, Joseph Smith's *Catalogue of Friends' Books*, Barclay's *Apology* (London, 1678); and T. Evans's *Exposition of the Faith of the Religious Society of Friends* (Philadelphia, 1828), for the doctrinal views of Fox and the early Quakers.

Fox, GEORGE L.: actor; b. in Boston, Mass., July 3, 1825. He first appeared at the Tremont theater, Boston, as one of the children in the *Hunter of the Alps*, for the benefit of Charles Kean. When twenty-five years old he played in the *Demon of the Desert* at the National theater in New York. He entered the Union army at the outbreak of the civil war, and served as a lieutenant in the Eighth New York Infantry at the battle of Bull Run. In July, 1861, he left the army, and soon afterward became manager of the Old Bowery theater, New York. In 1867–68 he made an immediate success in New York as the clown in the pantomime *Humpty Dumpty*. He continued to appear in this part until 1876, when he was stricken with paralysis while playing at Booth's theater, New York. D. at Cambridge, Mass., Oct. 24, 1877.

B. B. VALLENTINE.

Fox, GUSTAVUS VASA: naval officer; b. at Saugus, Mass., June 13, 1821; served in the navy 1838–56; entered business; was summoned to Washington Feb., 1861, and sent by President Lincoln in command of an expedition to relieve Fort Sumter, which, crippled in advance by the withdrawal of the Powhatan, was able only to bring off Maj. Anderson's command after the surrender. Made assistant Secretary of the Navy, he discharged the duties of that position throughout the war with great skill, tact, and unselfishness. He planned the capture of New Orleans and the opening of the Mississippi. At the close of the war he was sent on a special mission to Russia. He afterward was in business in Boston. D. at New York, Oct. 29, 1883.

Fox, LUKE: an English navigator who in 1631 commanded an expedition in search of a northwest passage. He discovered Cumberland island and other important points of Arctic America. In 1635 he published an account of his discoveries.

Fox, WILLIAM JOHNSON: orator and political writer; b. at Uggeshall Farm, near Wrentham, England, in 1786. His father was a weaver. The boy gave early evidence of remarkable ability, and was sent to Homerton College, Hackney, then under the care of Dr. Pye Smith, to be educated for the Christian ministry among the Independents. But his opinions led him away from that connection; he became a preacher of Unitarianism, till, departing still further from the accepted belief, he separated from all denominations, and took an isolated position as a rationalist preacher in South Chapel, Finsbury, London. Here he attracted attention by the speculative boldness of his views, his innovations on the ordinary customs of worship, and the secular tone of his discourses. His audiences, though never very numerous, were composed of people remarkable for intelligence and influence on the world of mind. He was a powerful teacher, with a strong infusion of the social agitator. His interest in politics made him a leader among the Liberals. No abler speaker addressed the meetings of the Anti-Corn-Law League; no abler writer took up the pen for the most extreme measures of the "party of progress." His *Letters of a Norwich Weaver Boy*, which were printed in the newspapers, did powerful service. His *Lectures to the Working-classes* were widely read, and did much to prepare the way for present movements. In 1847 Fox was elected to Parliament from Oldham, was defeated in 1852, and re-elected the same year to fill a vacancy caused by death. At the general election in 1857 he was again defeated. D. in London, June 3, 1864. The writings of Fox are comprehensive and vigorous. Three volumes of sermons show what he was as a pulpit-orator; a book on *The Religious Ideas* shows the cast of his philosophic thought. In religious belief he resembled the Transcendental Unitarians. He was a theist and an idealist. The two points of his creed were "the perfection of divinity—the immortality of humanity." See the memorial edition of his works (12 vols., 1865–68).

Foxborough: town; Norfolk co., Mass. (for location of county, see map of Massachusetts, ref. 5-I); on the Old Colony R. R.; 21 miles S. W. of Boston. It has a public library and public buildings worth $90,000, a large straw-hat and bonnet manufactory, a granite quarry, manufactures of packing-boxes, boots and shoes, and machinery, and several minor industries. Principal business, manufacturing. Pop. of township (1880) 2,950; (1890) 2,933; (1900) 3,266.

Fox(e), or **Fox**, JOHN: b. at Boston, Lincolnshire, England, in 1516; entered Oxford about 1532; chosen a fellow of Magdalen College in 1538; became a Protestant, and in 1545 quietly resigned his fellowship; was tutor to the children of Sir Thomas Lucy, and later (1547–53) to those of the Earl of Surrey; was ordained deacon by Ridley 1550; fearing persecution under Queen Mary, he fled to the Continent in 1534, and lived in deep poverty in Basel; returned in 1559; became a prebendary of Sarum 1563; and died in London, Apr. 18, 1587. He is chiefly remembered as author of the *Acts and Monuments* (London, 1563), known as Fox's *Book of Martyrs*; best modern ed. by John Stoughton (8 vols., London, 1877).

Foxglove: See DIGITALIS.

Foxhound: a variety of the dog, bred principally in Great Britain and Ireland, and by its keenness of scent, speed, and powers of endurance, adapted to the national sport of fox-hunting. The foxhound is from 20 to 22 inches high, close-haired, straight-limbed, with large thin ears and preferably white clouded with black and tan. It is said to have been produced by crosses between the bloodhound, greyhound, and bulldog, but however this may be the breed is now well established.

Fox-hunting: one of the national sports of Great Britain; engaged in to some extent in the U. S. The fox is followed by a pack of from 40 to 120 dogs, and by a large number of gentlemen and ladies on horseback. As they ride in the chase the party are under the charge of a master, the hounds being in the care of a huntsman and "whippers-in" or whips. The bolder members of the hunt leap their horses over fences, gates, and hedgerows, and all feel at liberty, when necessary, to rush headlong through fields of grain and other growing crops. The fox is not shot, but when caught by the dogs the huntsman cuts off his brush (tail), pads (feet), and mask (face), which are given as trophies to those who may be present, or "in at the death," as it is called. The flesh is cut up and given to the dogs, to be devoured on the spot.

Fox Indians: See ALGONQUIAN INDIANS.

Fox Islands: Pacific Ocean. See ALEUTIAN ISLANDS.

Fox River: a stream rising in Green Lake co., Wis. Taking a S. and S. W. direction, it approaches to within $1\frac{1}{2}$ miles of the Wisconsin river, with which it is connected at Portage City by a canal. It then flows by a circuitous course N. and N. E. to Green Bay, Wis., into which it falls at the town of that name. The navigation of this river has been improved by jetties, and a canal between it and the Wisconsin forms the connecting link of the great water-route which leads from the Mississippi by way of Wisconsin river, the Upper Fox, Lake Winnebago, and Lower Fox river to Green Bay, and thence by way of the Great Lakes to the Atlantic Ocean.

Fox River: a stream which rises in Waukesha co., Wis., and flows S. and S. W., emptying into the Illinois river at Ottawa, Ill. It furnishes abundant and well improved water-power.

Fox Shark, or **Thresher**: the *Alopias vulpes*, a shark of the Atlantic and Pacific; 12 to 18 feet long, the tail

Fox shark.

about as long as the body. Its food consists of small fishes, and while it has been reputed to attack and thresh the whale with its tail, such reports are erroneous.

Foy, MAXIMILIEN SÉBASTIEN: general; b. at Ham, France, Feb. 3, 1775; entered the army in 1791; served with distinction in the republican wars; was in Massena's and Moreau's Swiss and German campaigns, but his known coldness toward Napoleon tended to check his promotion. He was made a general of division; served at Waterloo; represented the department of Aisne in the Chamber of Deputies 1819, where he appeared in a new *rôle*, that of a liberal orator. D. at Paris, Nov. 28, 1825. The people subscribed freely for his children, whom he left poor. He left *Speeches* (2 vols., 1826) and *History of the Peninsular War* (unfinished, 4 vols., 1827). C. H. THURBER.

Foyers, fi'erz, or **Fyers**: a river of Scotland; rises in the Monadleadh Mountains in Inverness-shire, and after running 12 miles N. falls into Loch Ness. It forms two falls—an upper one of 30 feet, and a lower one of 90 feet. The latter is one of the finest in Great Britain.

Foyle: a river of Ireland; formed at Lifford by the junction of the Finn and the Mourne; after a course of 70 miles it falls into Lough Foyle, an inlet of the Atlantic on the northern coast of Ireland. It is famous for its salmon-fisheries, and is navigable for vessels of 600 tons to Londonderry, 4 miles from the Lough.

Fra Angelico: See FIESOLE, FRA GIOVANNI.

Fractions [from O. Fr. *fraction* < Lat. *frac'tio*, breaking, deriv. of *fran'gere*, *frac'tum*, break]: in arithmetic, a fraction is one or more of a number of equal parts into which a unit or whole number is divided; also, the expression indicating one or more such parts. When the unit or whole is divided into two equal parts, each is a *half*; when into three equal parts, each is a *third*; and so on. Thus *one-half*, *two-thirds*, *four-ninths*, etc., are fractions; they may be written $\frac{1}{2}$, $\frac{2}{3}$, $\frac{4}{9}$, etc. A fraction consists of a *denominator*, which shows how great the parts are, and a numerator which indicates the number of these parts. In the fraction $\frac{5}{6}$ (read *five-sixths*) 6 is the denominator and 5 is the numerator.

Fractions are divided into two classes—*vulgar* or *common fractions* and *decimals*. Vulgar fractions are those in which the denominator is expressed; decimals are those in which the denominator is simply indicated. The denominator of a common fraction may be any quantity whatever; the denominator of a decimal is always some power of 10. The denominator of a decimal may be written out in full, in which case it is a decimal fraction, which differs in no respect from a common fraction. See DECIMAL and DECIMAL FRACTION.

VULGAR FRACTIONS.—Vulgar fractions are expressed by writing the numerator over the denominator, with a line between them, as $\frac{7}{8}$. This is one of the methods of indicating division; a fraction is, in fact, equivalent to the quotient of the numerator by the denominator.

The two parts of a fraction are called *terms*, and according to their relative values the fraction is said to be *proper* or *improper*; if the numerator is less than the denominator, the fraction is *proper*; if the numerator is greater than the denominator, the fraction is *improper*. A proper fraction is always less than 1, and an improper fraction is always greater than 1. It may happen that the terms of a fraction are equal; in this case the expression is equal to 1, and is fractional only in *form*.

Fractions are *similar* when they have a common denominator—that is, when they have the same unit; they are *dissimilar* when they have different units. Thus $\frac{3}{7}$ and $\frac{5}{7}$ are similar—$\frac{3}{7}$ and $\frac{4}{5}$ are dissimilar. Dissimilar fractions can be made similar as follows: find the least common multiple of the denominators for a common denominator of the required fraction; divide this by the denominator of each fraction, and multiply the quotient by the corresponding numerators for the numerators of the required fraction. This transformation, as well as many others, depends on the general principle that we may perform the same operation on both terms without changing the value of the fraction.

Fractional expressions are those that contain a fraction in any form. They may be mixed, complex, or compound. A mixed fraction, or mixed number, is composed of an integral and a fractional part, as $3\frac{1}{8}$, $5\frac{2}{7}$. A complex fraction is one in which at least one of the terms is fractional, as $\frac{3\frac{1}{2}}{5}$, $\frac{2\frac{1}{4}}{3\frac{1}{5}}$, $\frac{3}{5\frac{1}{7}}$. A compound fraction is a fractional part of a fraction or mixed number, as $\frac{1}{2}$ of $\frac{2}{5}$, $\frac{1}{3}$ of $5\frac{1}{4}$. Any one of these may be reduced to the form of a simple fraction—that is, to a form in which both terms are entire—by means of the general principle already given.

ALGEBRAIC FRACTIONS.—In algebra a fraction is any indicated quotient of two quantities; also, the expression by which the quotient is indicated. A rational fraction is a function of a variable x, which may be reduced to the form

$$\frac{Nx^m + N'x^{m-1} + \ldots + K}{A'x^n + Bx^{n-1} + \ldots + K'}.$$

If m is not less than n the fraction may be reduced by division to the form

$$X + \frac{A''x^{n-1} + B''x^{n-2} + \ldots + K''}{A'x^n + B'x^{n-1} + \ldots + K'},$$

in which the entire part is either a rational function of x, or a constant. The fractional part can be resolved into *partial* fractions—that is, fractions whose denominators are either binomial factors of the first degree with respect to x, or some integral power of such factors—whenever the denominator can be resolved into such factors. This resolution is of much use in the integral calculus. The following are the methods of resolving fractions of this kind into partial fractions:

1. *When the Binomial Factors of the Denominator are Real.*—Write the given fraction equal to the sum of as many partial fractions as there are units in the highest exponent of the variable in the denominator, whose numerators are constants to be determined, and whose denominators are the different powers of the factors of the first degree, from the m^{th} to the 1st inclusive, m being the number of times that any factor enters; then clear the equation of denominators, and equate the coefficients of the like powers of the variable in both members; from these equations find the values of the constants, and substitute them in the assumed partial fractions: the resulting fractions will be the

partial fractions required. Thus let it be required to separate the fraction

$$\frac{x^3 + x^2 + 2}{x^5 - 2x^3 + x}$$

into partial fractions. The factors of the denominator are $x(x+1)^2$ and $(x-1)^2$. Hence by the rule

$$\frac{x^3 + x^2 + 2}{x^5 - 2x^3 + x} = \frac{A}{x} + \frac{B}{(x+1)^2} + \frac{C}{x+1} + \frac{D}{(x-1)^2} + \frac{E}{x-1}.$$

Clearing of denominators, and equating the coefficients of like powers of x, we obtain a set of equations from which we find $A = 2$, $B = -\frac{1}{2}$, $C = -\frac{1}{2}$, $D = 1$, and $E = -\frac{3}{4}$. Hence

$$\frac{x^3 + x^2 + 2}{x^5 + 2x^3 + x} = \frac{2}{x} - \frac{1}{2(x+1)^2} - \frac{1}{2(x+1)} + \frac{1}{(x-1)^2} - \frac{3}{4(x-1}.$$

2. *When the Factors of the Denominators are all Imaginary.*—In this case we suppose the denominator to be resolved into factors of the second degree, each of which, when placed equal to 0, will give two imaginary roots. We then write the given fraction equal to the sum of as many partial fractions as there are single factors of the second degree in the denominator, their numerators being of the form $Mx + N$ (M and N being constants to be determined), and their denominators being the different powers of the factors of the second degree from the m^{th} to the 1st inclusive, m being the number of times any factor is taken. We then proceed as before.

VANISHING FRACTIONS.—A vanishing fraction is a fraction that reduces to $\frac{0}{0}$ for a particular value of the arbitrary quantity that enters it. Thus

$$\frac{x^2 - a^2}{x^3 - a^3} = \frac{(x-a)(x+a)}{(x-a)(x^2 + ax + a^2)}$$

is a vanishing fraction, which reduces to $\frac{0}{0}$ when $x = a$; the common factor which produces this result is $x - a$. If we strike out this factor, and then make $x = a$, we find for the true value of the fraction,

$$\frac{a + a}{a^2 + a^2 + a^2} = \frac{2a}{3a^2} = \frac{2}{3a}.$$

Revised by S. NEWCOMB.

Fracture [from O. Fr. *fracture* < Lat. *fractu'ra*, deriv. of *fran'gere, frac'tum*, break]: (1) In mineralogy, the appearance of the fresh surface when a mineral breaks, disclosing its texture, and furnishing a characteristic by which it may be identified. Thus the fracture is said to be *even* when it forms a face or plane of some extent; *uneven*, when the surface is rough and unequal; *conchoidal*, or shell-like, when concave on one side and convex on the other; *splintery*, when the surface presents the appearance of numerous thin-edged scales; and *hackly*, when covered with numerous fine sharp points or inequalities. (2) In surgery, the term fracture is used to indicate a break, or solution of continuity, occurring in osseous tissue, or in rare cases in cartilaginous tissue partly ossified. The separation, in early life, of two portions of the same bone, held together by cartilaginous tissue, is not strictly accounted a fracture, but is known as epiphyseal separation. Fractures may be *simple, compound, complicated* or *comminuted*; *complete* or *incomplete*; *oblique, transverse, spiral*, or *longitudinal*. By *simple* fracture is meant one in which no wound exists admitting air to the seat of fracture. A *compound* fracture is one in which such a wound does exist. A *complicated* fracture is one in which some other serious injury is inflicted, at or near the site of the fracture, other than the rupture of the osseous tissue, or in which, from the situation of the rupture, the healing process can not progress as favorably as is usual; as when a large blood-vessel or nerve-trunk is torn by the broken bone, or when the fracture extends into a joint-cavity. A *comminuted* fracture is one in which the bone is broken into several small pieces at the point of rupture, and is rarely produced except by direct violence, as by a blow or crushing force. A *complete* fracture is one in which the rupture extends through the whole thickness of the bone, while if only a portion of the fibers is broken, as sometimes happens in children, the fracture is called *incomplete*, or the "green-stick fracture" of some writers, from its resemblance to the fracture produced by bending a stick of green wood until some of the fibers give way. The terms *transverse, oblique, spiral*, and *longitudinal* refer to the direction of the rupture in relation to the long axis of the bone, the great majority of the fractures of the long bones belonging to the second class. The term *stellate* is applied to a series of fractures radiating from a center, as seen sometimes in fracture of the skull from a wound produced by a pointed instrument. When the line of fracture extends into a joint it is spoken of as *intra-articular*; when its limits are quite within those of a joint-cavity it is *intra-capsular*.

Causes of Fracture.—These may be *external*, from violence adequate to break a normal bone, or *internal*, the bone being too fragile to resist ordinary forces. External causes embrace *direct violence*, where the rupturing force is applied opposite the point where the bone breaks (as a blow or crushing force which fractures the bone at the point of contact); and *indirect* violence, where the bone is bent beyond the power of its elasticity to restore itself, and gives way, usually at some distance from the point of application of the fracturing force (as when a fall upon the shoulder fractures the collar-bone). The skull and pelvis are sometimes broken at points more or less opposite to that at which violence has been applied; this is known to surgeons as fracture by *contre-coup* (counter stroke). *Muscular* force is generally acknowledged as a cause of fractures, especially in particular situations—e. g. fracture of the point of the elbow or of the knee-pan. The *internal* or predisposing cause is a brittleness of the bones called "fragilitas ossium," which occurs sometimes in early or middle life as a result of disease (although it may occur in those otherwise healthy), and almost universally in advanced life from the preponderance of earthy and deficiency of elastic matter; this condition is also now well known to obtain among the insane.

The signs of fracture are *pain, swelling*, and *tenderness* (loss of function) at the point of fracture, *change in shape* of the limb, *unnatural mobility, false point of motion*, and *crepitation*, and the fact that when the parts are restored to their proper position they fail to remain there unless supported, though any, or even all, of these signs may be absent. The pain comes from laceration of some nerve-filaments and pressure upon others by the broken bone, or by the blood escaping from torn vessels, which gives rise to the swelling that occurs at first, the subsequent swelling being due to products of inflammation or of the reparative process. The change in shape is due partly to this swelling, and partly to displacement of the broken bones, either by muscular action or by movements of the patient. The unnatural mobility and false point of motion comes of course from the want of continuity of the bone, and the crepitation is a fine grating elicited when the ends of the broken bone are gently rubbed together, and which may be appreciated by the ear or touch. If the fracture be *impacted*—that is, if the broken ends are firmly driven together, as sometimes happens—none of these signs may be present in a marked degree, and some of them, such as crepitation and false motion, not at all.

Fractures generally unite by the deposition of bony material between and around the broken ends of the bone, forming an exception to the rule that prevails for most other structures, that union after rupture is effected by means of fibrous or connective tissue; and the reason is apparent, since fibrous tissue does not form a sufficiently rigid bond of union to enable the bone to perform its functions, as is seen in cases of so-called "ununited fracture," when the union is of a fibrous nature. The union of a simple fracture consists of two processes—one to accomplish a temporary purpose, the other for the permanent union; the former to support and bind together the fragments, while the latter consolidates them. A few days after the fracture the bone, its periosteum (membrane surrounding the bone), and the neighboring tissues pour out a quantity of plastic material around and between the broken ends, which, with the remains of the blood at first effused, gradually hardens, and at the end of the fourth to the eighth week consolidates the fragments. This is called the "provisional callus," and the hardening process continues until it is converted into bony tissue. The plastic material effused *between* the fragments is much slower in ossifying than that which is internal or external to it; and this, which is destined to form the permanent bond of union, is called the "definitive callus." While the definitive callus is forming the provisional callus is gradually being absorbed; and finally, many months after the fracture, the provisional callus entirely disappears, and the fragments are united by the definitive callus alone, which is true bone; and the site of the fracture may be indicated only by a slight enlargement at that point. The union of *compound* fractures is entirely different. In these the provisional callus is almost or quite absent, and the definitive callus is formed by a process of granulation from the ends of the fragments, the granulations being gradually converted into bony tissue. It is a process requiring several months, or sometimes years, and is attended with a greatly increased amount of danger from exhaustion through long-continued suppuration and absorption of purulent material should such occur. The difference in the mode of union seems to be due to the irritation produced by the sources of infection (*germs*) conveyed by the air to the wound.

The *treatment* of fractures consists essentially in restoring the fragments to their original position, and holding them there by some form of rigid apparatus which shall not cause discomfort or injury to the patient. Of course general treatment is to be employed also if the circumstances require; but simple fracture in a healthy individual requires no special medication or system of dieting, as the old modes of practice were wont to inculcate. The rigid apparatus used to retain the fragments in their proper position is called a splint, which consists of two kinds—padded and molded. If the splints are made of straight, inflexible material, they can not be adapted to the irregularities of the limb without more or less padding at certain points; while if made of material which at the time of its application is soft and pliable, it may be molded to the shape of the limb, and, becoming hard and rigid, will serve to support and retain the fragments. Splints of the first variety are made of wood, sheet iron, tin, zinc, etc., while metal, gutta-percha, felt, sole leather, starch, soluble glass, or plaster-of-Paris are used for the second class. Fractures sometimes fail to unite, and are called *ununited* fractures. This may be the consequence of faulty position of the fragments, or of something interposed between the broken ends, impeding union, but it more frequently arises from some constitutional defect. The location of the fracture may prevent union, especially if either fragment be poorly supplied with blood, as in certain fractures of the neck of the thigh-bone, which frequently unite only by fibrous tissue. Ununited fractures may often be made to unite by irritating the parts at the site of fracture, as by rubbing the bones together, drilling them by means of a long needle, or by wiring the bones together. Compound fractures need to be treated according to the strictest tenets of modern aseptic surgery, whose underlying principle is surgical cleanliness. Their successful treatment depends in the main upon due appreciation of the fact that the principal danger to which they are subject is that from blood-poisoning (septicæmia, pyæmia), and that these are due to germs of putrefaction and disease (bacteria) which infest the air, the skin, common dressings, the clothing, and all the surroundings. Scrupulous disinfection of everything in or about the wound, including the skin, the surgeon's hands and instruments, the dressings, and everything which may come in contact with the parts, is the *sine qua non* of success. Under such methods the whole former treatment of these injuries, and the results obtained, have been simply revolutionized.

Revised by Roswell Park.

Fra Diavolo, fraa' dē-aa'vō-lō [Ital., liter., brother devil; *fra*, brother < Lat. *frater* + *diavolo*, devil < Lat. *dia'bolus*]: the Italian sobriquet of Michele Pezza, a Calabrian goatherd; b. at Itri in 1760. He became successively a stocking-weaver, a soldier, a monk (with the name of Fra Angelo), and the leader of a band of atrocious robbers. He took service in 1799 against the French, and held a colonel's commission; was captured by the French and hanged in 1806 as a robber, notwithstanding his pardon and commission from the King of Naples. The Fra Diavolo of Auber's opera has little or nothing in common with the historical character.

Fraga, fraa'gaā: town of Spain; province of Huesca, on the Cinca, 55 miles S. E. of Huesca, in the center of a fertile and well-cultivated plain (see map of Spain, ref. 13–I). It was formerly a fortress, and in 1134 witnessed a victory of the Moors over Alfonso I. of Aragon. Pop. (1887) 7,158.

Fragonard, fraā'gō'naar', Alexander Evariste: historical painter; son of Jean Honoré Fragonard; b. at Grasse, France, Oct., 1780. Pupil of David; Legion of Honor 1819. Was one of the chief "classicists of 1830," and a sculptor as well as a painter. Frescoes in the Louvre, Luxembourg Palace, and Versailles Museum; works in museums at Orleans and Blois. D. in Paris, Nov. 10, 1850.

W. A. C.

Fragonard, Jean Honoré: genre and portrait painter and engraver; b. at Grasse, France, Apr. 5, 1732. Pupil of Chardin and Boucher; Grand Prix de Rome 1752; his work forms a sort of connecting link in the transition from the painting of the eighteenth century to the classicism of the early part of the nineteenth. His pictures are in the museums at Rouen, Nantes, Versailles, Lille, Amiens, Nancy, Marseilles, St. Petersburg, and Madrid, and in the Louvre. His pictures resemble those of Boucher in subject, and his portraits are freely and cleverly painted. D. in Paris, Aug. 22, 1806. W. A. C.

Framingham: a township of Middlesex co., Mass., containing three thriving villages—Framingham Center, South Framingham (*q. v.*), and Saxonville (see map of Massachusetts, ref. 3–H). Framingham Center has the oldest normal school in North America, a soldiers' memorial library building, etc. Pop. of township (1880) 6,235; (1890) 9,239; (1900) 11,302.

Fra Moreale, fraa'mō-rā-aa'lā [Ital., Brother Montreal, so called because he was once a brother in the order of St. John in Jerusalem; but afterward he left it in disgrace]: the title of Montreal d'Albano, a gentleman of Provence who distinguished himself as a condottiere in the service of Louis I., King of Hungary, in his Neapolitan wars (1347–51). After the close of the wars Montreal remained in Naples at the head of a body of brigands, and entered on a course of wholesale brigandage. Being finally driven from Naples, he raised a large company of freebooters, with which he marched against one and another of the petty rulers of Italy. All booty was divided among his followers according to a fixed system. He became the terror of Italy, and the soldiery flocked from every quarter to his service. Bulwer's picture of him in *Rienzi* is not exaggerated. Sienna was forced to give him provisions and free transit, Florence to pay him 28,000 florins, and Pisa 16,000. Montreal contemplated the establishment of a permanent dominion, perhaps with Rome itself for his capital. With a small force he went to Rome, where he was arrested by command of Cola di Rienzi, and beheaded Aug. 29, 1354.

Revised by C. H. Thurber.

Franc [(adapted in spelling to Fr. *franc*) < M. Eng. *frank*, from O. Fr. *franc*, deriv. of Lat. *Francus*, a Frank, the coin at first bearing the Lat. inscription *Francorum rex*, king of the Franks. See Franks]: the unit of account in the monetary system of France, adopted under the republic in 1795; also the silver coin representing the same unit. In the general reform of French metrology which took place in the year above mentioned, the following were the governing principles: (1) to derive the units of measure, weight, and value, mediately or immediately, from the linear unit called the meter, which is the base on which the whole system rests; (2) to derive the higher and lower denominations in each series from the corresponding unit by decimal multiplication and division. The unit of capacity was derived immediately from the basic unit of length; the unit of weight from the unit of capacity; and the unit of value, the *franc*, from the unit of weight. (See Metric System.) The franc is divided into 10 *decimes* and 100 *centimes*; the denomination *decime* has fallen into disuse, but the old division into twenty *sous* of five centimes each is still in common use. The copper coins which represent this value are stamped "*Dix centimes.*" The coinage in silver consists of single francs, pieces of five and two francs, and of fifty and twenty centimes. The gold coins are pieces of five francs, ten francs, twenty, fifty, and a hundred francs. The twenty francs are commonly, but not legally, called napoleons. The copper coins are of ten centimes, five centimes, and a very pretty but rather useless little piece of one centime. The one-centime pieces are hardly seen except at the post-offices.

The monetary system of France was adopted by Switzerland May 7, 1850, and on Dec. 23, 1865, a quadripartite treaty was entered into between France, Belgium, Switzerland, and Italy known as the Latin Union (*q. v.*), which made this system common to all those countries. Austria has assimilated her system to that of France by making her ten-florin piece equal to twenty-five francs. Roumania, Spain, Servia, Bulgaria, and Greece have adopted the equivalent of the franc, though they call it by other names. The weight of the silver franc is five grammes = $77\frac{1}{6}$ grains troy, its value being about nineteen cents U. S. money and $9\frac{1}{2}d$. English money.

The name *franc* did not originate with the monetary system of 1795. It has been in use since the fourteenth century, and applied to coins of very different values both gold and silver, at different times. The legal monetary unit in France before the introduction of the franc was the *livre Tournois* (of Tours). It was slightly less in value than the coin by which it was superseded, eighty-one livres being equal to eighty francs.

Français, Cap: See CAPE HAYTIEN.

Français, fraañ'sā, FRANÇOIS LOUIS: landscape-painter; b. at Plombières, Vosges, France, Nov. 17, 1814. Pupil of Gigoux and Corot; first-class medals, Salon, 1848, Paris Expositions, 1855 and 1867; medals of honor, Paris Exposition, 1878, and Salon, 1890; member of the Institute 1890; officer Legion of Honor 1867. His pictures are notable for fine composition and are truthful in effect. Four works are in the Luxembourg Gallery, Paris. Studio in Paris.

W. A. C.

France: I. A republic of Western Europe, extending over a space of 12° 20' lon.; and from lat. 42° 20' to 51° 5' N. It is bounded N. by the North Sea, the Strait of Dover, and the English Channel, which separates it from England; W. by the Atlantic Ocean; S. by the Pyrenees, which separate it from Spain; S. E. by the Mediterranean; and E. by the Alps. The greatest extension of the country from N. to S. is 600·6 miles, from E. to W. 550 miles; the greatest diagonal, from Finistère to Mentone, is 668 miles. Its area is 204,092 sq. miles (Corsica included), or about $\frac{1}{18}$th part of Europe and $\frac{1}{250}$th part of the land-surface of the earth.

Annexed to France are Corsica and Algeria, the latter comprising a large territory S. of the Mediterranean, with an area of 257,450 sq. miles, of which about 166,000 are actually occupied. The colonies of France are increasing rapidly. France possesses in Africa, besides Algeria, the protectorate of Tunis (about 45,000 sq. miles), Senegal, with the French Sudan, French Guinea or Rivières du Sud, with the protectorate of Futa-Djallon, the Ivory Coast (Grand Bassam, Assinie, etc.), with the protectorate over the Kong country, the settlements on the Slave Coast (Whydah, Kotonou, Porto Novo), with the protectorate of Dahomey, French Congo, Madagascar (with its islands), which was made a colony in the year 1896, as well as Mayotte and the Comoro Isles, Réunion, and Obok at the entrance to the Red Sea; in Asia, the five cities of Mahé, Karikal, Pondicherry, Yanaon, and Chandernagore in Hindustan; in Indo-China, Cochin-China, Tonquin, with the protectorate of Annam and Cambodia; in Oceanica, New Caledonia and dependencies, the Marquesas, the Society islands (under French protection), etc.; in South America, French Guiana; and in the West Indies, Martinique and Guadeloupe, to which must be added two small islands, St. Pierre and Miquelon, situated S. of Newfoundland. The total area of the territories belonging to and protected by France is 2,814,988 sq. miles, with 30,520,293 inhabitants.

II. PHYSICAL GEOGRAPHY. 1. *The Surface.*—The surface of France, considered in general, presents a plane, gently inclined from S. W. to N. W.; that is, from the Alps and the Pyrenees to the Atlantic Ocean. To the E. this plane is cut by the valley of the Rhône, on whose western side rise the Cévennes, from which the waters of the three great basins of France flow in an almost parallel direction. Thus the orographic system of the country is composed of—1, an outer belt of chains, comprising the Vosges, Jura, Alps, and Pyrenees; 2, an inner belt, comprising the Cévennes and their continuations; and 3, the ramifications issuing from the Cévennes, and comprising the group or central plateau separating the basins of the rivers which flow to the Atlantic.

The *Vosges* stretch from N. to S., parallel with the Rhine, for a length of 161 miles. Their summits are rounded and generally covered with turf; now and then the rock juts through. Their sides are clad with magnificent forests of beech and fir. The southern part of the Vosges is the highest; its average elevation is 3,280 feet; the highest peaks are the Ballon de Guebwiller (4,680 feet) and the Ballon d'Alsace (4,100 feet). The northern part, from the neck of Saverne to the group of the Palatinate, rises hardly more than 1,968 feet; the principal passes of this chain are those of Saverne, Ste.-Marie-aux-Mines, Bussang, and the picturesque Schlucht. The Vosges are separated from the Jura Mountains by the pass of Belfort, which forms one of the principal thoroughfares across the French frontier.

The *Jura Mountains* are principally composed of limestone, called Jurassic. Instead of rounded summits there are long, parallel ridges, which support three galleries of plateaus. The general direction of these ridges is a curve concentric with the general curve of the Alps, and on the line of this curve are found the depressions of the lakes of Leman, Neuchâtel, and Bienne. The Jura group rises from France toward Switzerland; its highest peaks are the Crêt de la Neige (5,656 feet), the Reculet (5,630 feet), Mont Tendre (5,518 feet), and the Dôle (5,514 feet); its length, from the Rhône to the Rhine, is 186 miles.

The *Alps*, which form the great arc of a circle, surround Northern Italy on three sides. The French part has a length of about 279 miles, and consists of the Pennine, Graian, Cottian, and Maritime Alps. The Pennine Alps extend from St. Gothard to Mont Blanc, whose highest peak, white with snow, rises 15,776 feet, and surpasses all other mountains in Europe, not only in height, but also in beauty. The Graian Alps contain the Little St. Bernard and terminate at the road of Mont Cenis, which formerly was the principal passage across the Alps, but which has been superseded by the tunnel through Mont Cenis. The Cottian Alps extend to the pyramid of Mont Viso (12,585 feet), and form an acute angle, at whose head stands Mont Thabor (10,535 feet). The Maritime Alps terminate at Col di Tenda, after describing a large arc, with the concavity toward Italy.

Toward Italy the slopes of the Alps are abrupt. In France they project long and powerful arms toward the Rhône—namely, the Alps of Valais, whose nucleus is formed by the Buet; the Alps of Faucigny and Chablais; the Alps of Savoy, with the beautiful group of the Great Chartreuse; the Alps of Dauphiné, which communicate with the Pelvoux and its immense glaciers, whose highest peak is called, quite poetically, La Barre-des-Écrins (13,457 feet), and with Devoluy, a dull and gloomy group; the Alps of La Maurienne; and finally the Alps of Provence, which contain Mont Ventoux in the N., the mountains of Les Maures, with their pine-covered summits, and those of L'Estérel.

The *Pyrenees* are inferior to the Alps in height, extent, and aspect. They extend from W. to E., and to the N. a regular series of buttresses and vales project. The principal peaks are, in the eastern Pyrenees, Canigou (9,137 feet) and the Pigne d'Estats (10,302 feet); in the central Pyrenees, Pic de Carlitte (10,203 feet), Cylindre du Marboré (9,861 feet), Néthou (11,168 feet), the highest peak in the whole chain, Mont Perdu (10,995 feet), and the Pic du Midi de Bigorre (9,436 feet); and in the western Pyrenees, Vignemale (10,820 feet) and Pic du Midi d'Ossau (9,734 feet). The principal passes from E. to W. are the Perthus, the Col du Pla' de Beret, and the Somport.

The main body of the Pyrenees, composed of granite, schist, and limestone, extends over a length of 217 miles, and has a breadth of 62 miles in the center, and of 31 miles at the extremities. From the center proceed the long ranges of hills which separate the valleys of the Gaves. From the Pic de Carlitte issue two secondary chains, the Corbières, of which the southern is high, pointed, and granitic, and the northern flat and calcareous. This chain is continued by the Cévennes, which begin at the neck of Naurouze and extend over a length of 295 miles. They are divided into the southern Cévennes, which are rocky and granitic chains whose principal peak is L'Aigoual (5,139 feet); the central Cévennes, which comprise the mountains of Gévaudan and Vivarais, and whose most remarkable peaks are the Gerbier de Jonc (5,121 feet), the Mézenc (5,820 feet), and the Lozère (5,584 feet); and finally the northern Cévennes, which again are subdivided into the mountains of Lyonnais, Beaujolais, and Charolais, which fall to an average of 1,804 feet.

To the N. the Cévennes are continued by the Côte-d'Or, which produces the finest wine in France, the plateau of Langres, and the Faucilles Mountains, which communicate with the Vosges. N. of the Faucilles Mountains extend the plateaus of Lorraine, L'Argonne, with its famous defiles, and the Ardennes, covered with forests and deeply cut by the streams which traverse them. Between the Ardennes and the sea stretch the plains of Flanders and the fertile and well-cultivated plains of Artois and Picardy, which are continued to the sea by the plains of Caux.

To the W. of Côte-d'Or, whose average height is 1,640 feet, is found a small granitic group, from 2,624 to 2,952 feet high, called Morvan; on account of its strategical position it is considered the citadel of France. Still more westerly, and N. of the Loire, stretches the immense plain of the Beauce, the vast granary of France. Between the Beauce and Finistère are the heights of Perche and Maine, about 1,312 feet high, from which a double granitic range traverses Brittany from E. to W. N. of Maine are the graceful and fertile hills of Lower Normandy, and finally the peninsula of Cotentin, terminating in Cape de la Hague and the high hills inclosing Cherbourg.

Between the Loire and the Garonne are the remarkable summits of the central group which in remote ages separated the gulf of the Seine from that of the Garonne. This group comprises very different chains; the granitic mass of the Margeride, from 3,608 to 5,248 feet high; the mountains of Auvergne, whose highest peak is the Plomb du Cantal (6,094 feet), an old volcano, and in the center the groups of Cézallier and Mont Dore, which contain the Puy de Sancy (6,186 feet), the highest peak in Central and Northern France, and which project toward the N. W., a granitic spur, the mountains of Lower Auvergne, and toward the N. the chain of the Puys, a curious line of old, extinct volcanoes, now covered with verdure, but whose craters are still distinguishable, as are also the immense streams of lava, which in the country itself are called *chéires*. Puy de Dôme (4,805 feet) and Puy de Pariou are the most remarkable of these volcanoes—the one on account of its height, the other on account of its form. With the mountains of Lower Auvergne connect the granitic mountains of Limousin, which attain their greatest height in Mont de Meymac (3,207 feet) and Mont Odouze (3,129 feet), and which from that point slope down through the sterile plateau of Millevaches to Mont Jargeau (3,116 feet). The central group contains several secondary ridges; to the N., a chain whose elevation seldom surpasses 3,280 feet, though in a few points it reaches 5,248 feet. It is divided into the mountains of Velay (basaltic), Forez (granitic), and Madeleine (porphyritic), and runs off from the mountains of Vivarais, forming a high barrier between the Loire and the Allier. To the N. W. the granitic mountains of La Marche communicate with Mont Odouze. To the S., and detaching itself from the chain at Mont Lozère, stretches the vast region of the Causses, high calcareous plateaus deeply cut by the valleys of the Tarn, Lot, and Aveyron. These plateaus comprise nearly the whole of the old province of Rouergue. To the S., finally, are the mountains of Aubrac, a granitic group slightly connected with the mountains of Margeride.

Corsica is traversed from N. to S. by a chain of high mountains whose most elevated summit is Monte Cinto (8,888 feet).

2. *Hydrography.*—The flowing waters form in France seven principal basins—namely, those of the Seine, Loire, Garonne, Rhine, Maas, Scheldt, and Rhône. In the first three basins the water runs toward the N. W., to the English Channel and the Bay of Biscay; in the next three it runs northward to the North Sea, and in the basin of the Rhône it runs S.

France possesses more than 200 streams fit for navigation. Their length, as far as utilized, is 6,200 miles, of which 5,500 are used for navigation. The principal rivers in the *basin of the Seine* are the Seine, which waters Paris, Rouen, and Havre, where it forms a vast estuary, and its affluents—to the right, the Aube, Marne, and Oise, with its feeder the Aisne; and to the left, the Yonne and the Eure. Among the secondary basins belonging to that of the Seine are those of the Somme and the Orne. *In the basin of the Loire* flow the Loire, which passes by Nevers, Orleans, Blois, Tours, Nantes, and St.-Nazaire, and its affluents—from the right, the Maine: and from the left, the Allier, Cher, Indre, and Vienne. The Vilaine forms a secondary basin, and becomes navigable at Rennes. *In the basin of the Garonne* the Garonne, after its junction with its principal affluent, the Dordogne, forms the Gironde, on which stands Bordeaux. Its principal tributaries, the Tarn, Lot, and Dordogne, join it on the right. To this basin belong the Charente and the Adour, the latter passing by Tarbes and Bayonne. *In the basin of the Scheldt* are the Scheldt and its affluent, the Scarpe. *In the basin of the Maas*, the Maas, which in France is called the Meuse, receives at Namur, from the left, the Sambre. *In the basin of the Rhine*, the Rhine is navigable from Basel to the sea, and runs through Strassburg, Mainz, Coblentz, and Cologne. Its principal affluent, the Moselle, waters Metz, and receives the Meurthe, which passes through Nancy. *In the basin of the Rhône*, the Rhône traverses Lake Leman and waters Geneva and Lyons; receives from the right the Saône; and then proceeds toward the Mediterranean, where it forms its vast marshy delta. S. of Lyons its principal affluents are the Isère, Drôme, and Durance, which carry to it nearly all the water flowing into France from the Alps. To the same system belong the basins of the Var and the Aude.

The coast of the North Sea is low, partly marshy, and, down to the mouth of the Somme, bordered with a line of dunes, broken only by Cape Gris-Nez, which forms the nearest approach to England. Along the English Channel the coast of Normandy is bordered by cliffs which, cut and beaten in every direction by the sea, rise to the height of 820 feet, and extend to Cape de la Hève, W. of which the coast opens to the estuary and bay of the Seine. Then follows a line of low and dangerous rocks and the sandy and marshy estuary of Carentan, which touches the peninsula of Cotentin. This peninsula, flat in its southern part, rises to the N. between the points of Barfleur and La Hague, where its coast attains a height of 492 feet. In the angle formed by the peninsula and the northern coast of Finistère lies the bay of Mt. St. Michel, remarkable for the exceptional height of its tides (49 feet), and defended on the N. by the Channel Islands. The passage between these islands and the coast is very dangerous to navigate. The whole northern coast of Finistère is strewn with dangerous reefs extending to Point St. Mathieu, which forms the extremity of Brittany. At this point the coast suddenly retreats, and forms the vast roadstead at the head of which stands the naval port of Brest. From Brest to Lorient, also a naval port, the coast is lower, but still hilly. Along the coast from Finistère to the Charente are situated the islands of Ushant, Groix, Belle Île, Noirmoutiers, Yeu, Ré, and Oléron. From the Gironde to Spain the coast is traced as a straight line bordered by vast dunes, which are broken only to the right of the basin of Arcachon and at the mouth of the Adour.

Along the Mediterranean the western coast is low, and its gracefully rounded heads conceal a series of marshes, of which the most important are those of Than and Mauguio, but especially that of Berre, which separates Marseilles from the mouth of the Rhône. At Marseilles the coast rises, and thence to the Italian frontier presents a picturesque and much-indented line of headlands and bays.

The western coast of Corsica is steep and abrupt, the eastern low and marshy.

Climate.—The mean temperature is 12½° C., or 55° F. To the W. the isothermal lines are raised northward by the heating influence of the southwesterly winds and the Gulf Stream; to the E. they are lowered when removed from these influences. Rain is frequent and more abundant on the western coasts and in the mountainous regions (33 inches on the Atlantic coast; 23 inches in Paris; 39 inches in Morvan; 40 to 45 inches on the slopes of the Alps and Pyrenees). Although the climate is generally temperate and mild, it nevertheless presents five different types—the Sequanian (from the *Seine*), Vosgian, Rhodanian, Mediterranean, and Girondin. The Sequanian climate is N. of the Loire; its mean temperature is 52° F.—in winter 38° F., in summer 66° F. The prevailing winds are W., S. W., and S.; the first two are rain-bearing. The Vosgian climate is more extreme; its mean temperature is 49° F.; rain is less frequent. The mean temperature of the climate of the valley of the Rhône is 52° F., but the hot and dry southern winds, alternating with the cold northern, produce sudden changes in the temperature. Rain is abundant in the Alps. The Mediterranean climate is warmer, its mean temperature being 57° F. The summer is hot and dry; the autumn is rainy, and disagreeable on account of the cold and impetuous N. E. wind called the mistral. The climate in general is milder in the winter and hotter in summer than the Sequanian. N. W. and S. W. winds alternate, and produce rapid changes in the atmosphere.

III. AGRICULTURE.—France presents four agricultural belts which traverse it from S. W. to N. W.—namely, the olive, bounded by a line which connects the foot of the Corbières with the Alps of Dauphiné; the maize, whose northern boundary runs from the island of Oléron to the middle of the Vosges; the vine, which ceases at a line drawn from the mouth of the Loire to the source of the Oise; and N. of this line the apple-tree belt.

Fruits are largely exported—apples and pears from the north, oranges, lemons, and pomegranates from the south; excellent peaches, strawberries, and currants are grown near Paris; apricots in the central part; cherries near Paris and the coasts of the Channel. Dried fruits—pears, apples, prunes, figs, almonds, and nuts—come from the central and southern regions. The principal trees are the walnut, olive,

chestnut, white oak, mulberry, oak, elm, ash, hornbeam, beech, alder, poplar, aspen, willow, birch, fir, larch, and pine.

Of the total land surface about 37,000,000 acres are under cereal crops, 21,000,000 in forests, more than 12,000,000 in meadow and grazing land, 5,730,000 in vineyards, and less than 17,000,000 are unproductive. The productive farm lands are valued at 91,500,000,000 francs ($18,300,000,000), and their annual products at 19,000,000,000 francs ($3,800,-000,000). According to *Bulletin No. 6*, 1891, of the Ministry of Agriculture, the areas and productions of the cereal crops were as follows: Wheat, 17,449,557 acres, 331,748,810 bush.; maize, 1,350,641 acres, 23,815,177 bush.; rye, 3,925,-510 acres, 68,583,274 bush.; barley, 2,168,369 acres, 48,683,-754 bush.; and oats, 9,342,176 acres, 265,690,158 bush. Other products were: potatoes, 3,619,415 acres, 405,639,026 bush.; tobacco, 38,172 acres, 49,052,350 lb.; and maslin, 733,768 acres, 13,523,675 bush. Since 1874 France has fallen from first to second wheat-producing country. The area in vineyards was largely reduced after 1875 on account of the ravages of the phylloxera, but in 1888 it showed an encouraging increase, and there has been a steady improvement since. The production of wine in 1888 was 662,247,000 gal. Of dairy products there were exported, according to the above *Bulletin*, 87,579,946 lb. of butter, valued at $21,188,-081; 15,082,460 lb. of margarine, value $1,188,344; and 12,232,137 lb. of cheese, value $1,682,962. The farm animals in 1891 comprised 2,883,460 horses, 13,661,533 cattle, 21,791,909 sheep; 6,096,232 swine, and 1,480,229 goats.

IV. INDUSTRY.—*Mining*.—Granite occurs in Cotentin, the Chausey islands, and several points of Brittany, in the Vendée, Limousin, the Alps, and the Vosges. Among volcanic products are the basalt of Auvergne and the porphyry of Corsica, Var, and Épinal. Excellent slate quarries are found in the vicinity of Angers. Bayonne gives feldspar and asphaltum from the clay-schist of Ain. The most remarkable marble quarries are at Boulogne, Maubeuge, and Givet in the north; at Le Mans and Sablé (Sarthe) in the west; at Chomerac (Ardèche), La Droix (Côte-d'Or), Châtillon (Loiret), and several other places in the central part of the country; at Campan, St.-Béat (white marble), Castéra-Verduzan (yellow marble), and Caunes in the Pyrenees, at Grenoble in the Alps, at Laveline in the Vosges, and at Corte in Corsica. Different kinds of freestone abound. Chalk is found at Rouen, Meudon (in the vicinity of Paris), Troyes, and in Touraine, etc. Of siliceous materials, excellent millstones are obtained from La Ferté-sous-Jouarre, and from Lesigny (Creuse), Bergerac (Dordogne), etc. The best plaster is that from the vicinity of Paris; the best cement comes from Boulogne, Vassy (Yonne), Pouilly (Côte-d'Or), and Grenoble. Calcium phosphate is found in the departments of Pas-de-Calais, Somme, Meuse, Vosges, Côte-d'Or, Gard, and Lot. Besides the common potter's clay, found everywhere, a finer sort is found at Gien and Limoges, from which a celebrated *faïence* is made. Porcelain clay is found at St.-Yrieix. Rock-salt is found near Nancy, and in the Jura, at Salins and at Lons-le-Saunier; sea-salt is produced from salt-marshes on the Atlantic from the mouth of the Loire to the Gironde, and on the Mediterranean coast.

Of mineral and thermal springs there are four groups: 1, the Vosges; 2, the Jura and the Alps; 3, the center; and 4, the Pyrenees. Besides these groups there are the sulphur springs of Enghien, near Paris, and of Bagnoles (Orne), the chalybeate springs of Forges-les-Eaux (Seine-Inférieure), and the famous springs of St.-Amand.

France is poor in metals, with the exception of iron. Argentiferous lead is found at Pontgibaud (Puy-de-Dôme), Vialas (Lozère), etc.; copper in the Alps and Corsica; zinc in small quantities in Gard and the Pyrenees; manganese at Romanèche (Saône-et-Loire); antimony in Haute-Loire, Cantal, and Corsica; nickel in small quantities in Isère (Les Chalanches); tin in Limousin and Bretagne; gold-dust in the sand of the Rhône; and iron pyrites for sulphuric acid in Gard, Ardèche, Rhône, and Vosges. In 1900 there were mined 33,270,385 tons of coal and in 1898 4,731,000 tons of iron ore. Anthracite is mined in Hautes-Alpes and Fréjus in Var; lignite in Aisne, Manosque, and Aix in Provence; and peat in the Pas-de-Calais, Somme, Aisne, Oise, Seine-et-Oise, Vosges, and Jura. Iron ore is found in the Jurassic regions—Le Creusot, Franche-Comté, Isère, Ardèche, Aveyron; and as bog ore in Ardennes, Champagne, Bourgogne, Franche-Comté, Berri, Poitou, Périgord, and Landes. The principal deposits are those of Vassy (Haute-Marne); Châtillonnais, which form a belt stretching through three departments; Franche-Comté, which are situated between Langres, Vesoul, Besançon, and Dijon; and the department of Cher, which are the richest in France and yield one-fifth of the whole production.

Manufacturing.—Agricultural machines are made in Paris, Liancourt (Oise), Nancy, Meaux, Orleans, and Bourges; spinning and weaving machines—for cotton, in Paris, Rouen, and St.-Quentin; for flax, in Lille; for wool, in Roubaix, Elbeuf, Louviers, and Sedan; for silk, in Lyons and St.-Chamond; for hosiery, in Nîmes; sewing-machines in Paris and Lyons; machine-tools in Paris, St.-Denis, Rouen, Le Creusot, etc.; tools for naval woodwork, in Havre; metallic wares in Paris, Villedieu (Manche), and Guise (Aisne); hardware for tools in Paris and St.-Étienne; for buildings, in Charleville (Ardennes), Laigle (Orne), Rugles (Eure); for the household, in Paris and Lille; and firearms at Paris, Châtellerault, St.-Étienne, Charleville, Tulle, etc. There are about 112 iron-foundries with 168 blast furnaces, and 200 iron-works with 1,000 furnaces. In 1900 the productions were 2,699,494 tons of pig iron, 745,-312 tons of finished iron, and 1,264,737 tons of steel.

Alcohol is made from wine at Hérault and in the Charentes, and from beet-root in Flanders; chemicals are manufactured in Paris, Lille, St.-Gobain, Chauny, Rouen, Cherbourg, Lyons, Montpellier, Marseilles, Bordeaux, etc.; oils are made from olives in Provence, Roussillon, and Southern Languedoc; from nuts, in Charente and Dordogne; from colza and flax-seed, in Flanders; from rape-seed, at Caen and in Franche-Comté. Candles and other chandlery products are made at Paris, Lyons, Montpellier, Marseilles, and Lille; soaps, at Marseilles, Nantes, Havre, Amiens, Rouen, Elbeuf, Reims, and Lyons; toilet soaps, at Paris; hair-dressing articles, at Givet, Paris, Château-Renault, and Grenoble; glue, in Flanders, Paris, and Givet.

Cheese-making is much developed. The most famous kinds are the Maroilles, Brie, Camembert, Neufchâtel, Livarot, Pont-l'Évêque, and Isigny; those of Jura resemble the gruyère of Switzerland; the Septmoncel and Mont d'Or cheeses are made of goat's milk; the well-known Roquefort cheese and the Cantal are made of sheep's milk. The manufacture of beet-root sugar is carried on especially in the northwest (Paris, Lille, Valenciennes, Douai, Arras, Péronne). In 1896 there were 356 sugar-works of all kinds, employing nearly 48,794 operatives. Liqueurs are distilled at Paris, Grande Chartreuse, and Cette. In the Vosges excellent cherry brandy (*Kirschwasser*) is made. Chocolate is manufactured in Paris, Noisiel, Bayonne, and the Nord. Vinegar is made in Charente and Orleans; mustard is prepared extensively in Paris, Bordeaux, and Dijon; drugs mainly in Paris.

The manufacture of cotton stuffs employs 5,000,000 spindles and nearly 70,000 looms, producing annually 600,000,000 francs' ($120,000,000) worth of fabrics. The manufacture of printed calicoes is confined to Paris and Rouen.

Of textile plants, hemp and flax are indigenous in France. The manufacture of linen employs more than 610,000 spindles, 178,000 power-looms, and 22,800 hand-looms, and has an annual product value of more than 500,000,000 francs ($100,000,000). This industry is principally located in the north.

Silks are manufactured principally in the valley of the Rhône. Besides the indigenous produce there is imported annually raw silk worth over 280,000,000 francs ($56,000,-000). The manufacture employs 94,800 looms and 110,300 hands, and the product is valued at 630,000,000 francs ($126,000,000).

V. TRADE AND COMMERCE.—The first railway was constructed in 1828 from Andrezieux to St.-Étienne and Lyons; horses were used until 1832, when the first locomotive was employed. The next was that from St.-Germain to Paris. The present railway system was begun in 1847; its actual length in 1898 was 23,324 miles. The railways cost $3,133,-509,360, and are worked by companies which have leases for ninety-nine years, when they become the property of the state. There are six great companies—namely, the West, the North, the East, the Paris Lyons and Mediterranean, the Orleans, and the South; and more than fifty small ones. The traffic on the railways amounted in 1898 to 385,873,000 passengers and 114,437,000 tons of merchandise. The receipts in 1898 amounted to $268,024,146, of which one-third was for passengers. The merchandise conveyed on the waterways is about three-tenths that of the railways.

Imports and Exports.—In 1899 the general commerce aggregated 5,848,000,000 francs ($1,128,664,000) in imports and

5,533,500,000 francs ($1,067,965,500) in exports, and the special commerce in 1900 4,408,500,000 francs ($850,840,500) in imports and 4,078,000,000 francs ($787,054,000) in exports.

The principal imports of raw material are silk, cotton, wool, flax, hemp, jute, hides, skins, sugar, coffee, tobacco, cocoa, spices, dyewood, etc.; also copper, lead, zinc, tin, iron, sulphur, coal, petroleum, building-timber, animals, etc. The importation of salt fish, butter and cheese, horses, fruit, rice, and other cereals reaches large proportions. That of manufactured articles comprises woven fabrics, flax and hemp, cotton, silk, hair, yarn, mattings and plaitwork, straw hats, machines and tools, and watches.

The exports consist chiefly of woven fabrics (silk, woolen, cotton, flax and hemp), yarn, linen, articles of toilet (furnishing goods, modes and perfumery), chemicals, madder and indigo, drugs, soap, stearin and candles, sugar, toys, haberdashery, etc., skins, tools, machines and arms, jewelry, watches, paper, pottery and glassware, and musical instruments. Of other products are exported wine and brandy, textile fibers (silk, cotton, wool, and hair), cereals, cheese and butter, eggs, dried vegetables, fruit, olive oil, salt-water fish, salted meat, horses and cattle, seed corn, hides, oleaginous seeds, wood, and copper.

The merchant marine is not prosperous. The number of vessels has remained stationary for about thirty years, though the tonnage has doubled. On Jan. 1, 1900, there were 14,262 sailing vessels of 450,636 tons and 1,227 steam vessels of 507,120 tons, with crews aggregating 81,732. During 1899 the number of vessels of all kinds that entered French ports was 101,370, of 24,911,506 tons.

The post and telegraph services are regulated by the state. On Jan. 1, 1899, there were 9,776 post-offices in France and Algeria, which handled 2,462,295,000 articles of all kinds. The telegraph service in 1899 had 79,396 miles of lines, 400.341 miles of wire, and 12,328 offices, and handled 43,963,811 messages. The receipts of the joint services 1898–99 were 250,442,320 francs ($48,335,368) and expenditures 184,721,465 francs ($35,551,243).

Measures, Weights, and Money.—The system of weights and measures used in France and its dependencies is the METRIC SYSTEM (*q. v.*).

The money basis is the FRANC (*q. v.*). Besides the various coins and the ordinary commercial paper, used principally in the great financial and banking establishments, France employs bills on the Banque de France, whose credit is equal to that of the state. The coinage in 1900 amounted to 36,619,537 francs, of which 30,048,830 francs was gold. From 1795 till 1899 the total coinage of gold was 9,565,473,070 francs, and of silver 5,613,719,125 francs. It was estimated that 14,731,803,108 francs in coin were in circulation, of which two-thirds were gold. See FRANCE in the Appendix.

VI. POPULATION.—The population by census of 1891 was 38,343,192, an increase of 671,144 from 1881. The census of 1896 showed the legal population (that is, both present and absent), to be 38,517,975, including 1,027,491 foreigners. Vital statistics for 1894 showed 286,662 marriages, 855,388 births, and 815,620 deaths. The majority of the population (24,500,000) is settled in the country; about 18,500,000 live by agriculture. There are about 4,000,000 in business. Building and the manufacture of textile fabrics, clothing, and toilet articles employ about 1,000,000 persons each. The ten departments which owe their prosperity especially to manufactures or commerce are Seine, Bouches-du-Rhône, Rhône, Loire, Nord, Loire-Inférieure, Gironde, Var, Vendée, and Corsica. In 1896 the population of the principal cities was as follows:

Paris	2,536,834	Tourcoing	73,353
Lyons	466,028	Rennes	69,937
Marseilles	442,239	Dijon	67,736
Bordeaux	256,906	Orleans	66,619
Lille	216,276	Grenoble	64,002
Toulouse	149,963	Tours	63.267
St.-Étienne	136,030	Le Mans	60,075
Roubaix	124,661	Besançon	57,556
Nantes	123,902	Calais	56,940
Havre	119.470	Versailles	54,874
Rouen	113,219	St.-Denis	54.432
Reims	107,963	Troyes	52.998
Nancy	96,306	Clermont-Ferrand	50,870
Toulon	95,276	St.-Quentin	48.868
Nice	93,760	Béziers	48,012
Amiens	88,731	Levallois-Perret	47,315
Limoges	77,703	Boulogne	46,807
Angers	77,164	Caen	45,380
Nîmes	74,601	Avignon	45,107
Brest	74,538	Bourges	43,587
Montpellier	73,931	Lorient	41,894

VII. GOVERNMENT.—Since the revolution of Sept. 4, 1870, France has been ruled by a republican government, and by the law of Feb. 25, 1875, the National Assembly decided on the definitive form of government and constitution. The executive, administrative, and judiciary powers are vested in the President. The legislative power is exercised by the National Assembly. The President is elected by the National Assembly for a period of seven years. He exercises the executive power, chooses and dismisses the ministers, who are responsible, however, not only to him, but also to the National Assembly, which consists of the Chamber of Deputies (584 members) and the senate (300 members; 75 were elected for life under the law of 1875). Each arrondissement elects one deputy, and if it has more than 100,000 population, two. Senators are elected for nine years, one-third retiring every three years. Vacancies occurring among life senators are filled by the election of ordinary nine-year senators. The National Assembly holds annual sessions of at least five months. Senators receive 15,000 ($3,000) and deputies 9,000 ($1,800) francs per annum. The National Assembly represents the nation, by which it is elected and in whose name it exercises the sovereign power. With the consent of the senate the President can dissolve the Chamber of Deputies. The ministers, of whom the one chosen by the chief magistrate as chief of the cabinet is president of the council, are ten—1, Minister of Justice and of Religion; 2, Minister of the Interior, under whom are the whole general departmental and communal administrations of France; 3, Minister of Foreign Affairs; 4, Minister of Finance and of Posts and Telegraphs; 5, Minister of War; 6, Minister of Marine and the Colonies; 7, Minister of Public Instruction and the Fine Arts; 8, Minister of Agriculture; 9, Minister of Commerce and Industry; 10, Minister of Public Works.

Communal and Departmental Administrations.—The commune represents the elementary unit of the territorial division and of the administrative organization. It is a part of the territory comprising either a town or one or more villages, with their annexes and fields. It is governed by a *maire*, *adjoints* (deputies), and a municipal council. The mayor is appointed by the municipal council from its own number. He is assisted by one or more deputies, who are appointed in the same manner, and who take his place in case of absence. The municipal council, of which the mayor is the president, and which is composed of from 10 to 36 members elected by the inhabitants of the commune, exercise within the very narrow limits of the law a deliberative power in all communal affairs, issuing either decisions or deliberations or simple advice. It holds annually four sessions, generally of ten days each. Paris has a special administration; its municipal council of 80 members elects its president and vice-president.

The canton generally consists of twelve communes. It is not, properly speaking, an administrative division, but it serves as a basis for the election to the general council and to the council of the arrondissement. It is specially a judiciary circumscription. Recruiting for the army takes place at the principal town of the canton.

The arrondissement consists, generally, of eight cantons. It is governed by an under-prefect, who ranks next to the prefect of the department. The arrondissement, however, in which the capital of the department is situated is governed by the prefect himself. The under-prefect is appointed by the chief of the state. He is assisted by a council of the arrondissement, which consists of as many members as there are cantons. It assembles on the call of the prefect, deliberates on public works, and assesses the direct contributions upon the commune.

The department consists generally of four arrondissements, and is the only division of any great consequence in an administrative point of view. The prefect, who governs it, is appointed by the President of the republic on the nomination of the Minister of the Interior. He represents the Government, brings the laws and the ministerial orders into execution, superintends and maintains public order, and exercises a sort of police inspection over the towns. He introduces all affairs concerning the department, and executes the decisions of the general council and of the departmental committee within the limits of the law. The deliberative power pertains to the general council, composed of as many members as there are cantons, though not more than thirty, who are elected for nine years and renewed by thirds. It deliberates and votes on all departmental affairs; in the interval between its sessions it assigns its power to a departmental committee, which superintends the administration of the commune. Besides these two powers there is a third administrative power, exercised by the council of the prefecture, which decides on all demands for reductions in contributions, etc. Relief to the poor and the sick must be provided for by the commune; the communal hospitals are governed by a committee of five members, appointed by the prefect and presided over by the mayor. The arrondissements have generally hygienic committees, physicians for the poor, committees for inspecting drug-shops, etc. Every department must have an asylum for lunatics.

VIII. Constitution and Administration. *Administrative Divisions.*—In 1891 there were 36 old provinces, forming 87 departments, 362 arrondissements, 2,881 cantons, and 36,144 communes. In the early part of 1893 13 new cantons were formed in the department of the Seine. The following table shows the provinces, the departments, and the capitals of the latter:

1. Northwest.

Provinces.	Departments.	Capitals.
Flanders	Nord	Lille.
Artois	Pas-de-Calais	Arras.
Picardy	Somme	Amiens.
Normandy	Seine-Inférieure	Rouen.
	Eure	Evreux.
	Calvados	Caen.
	Orne	Alençon.
	Manche	St.-Lô.
Brittany	Ille-et-Vilaine	Rennes.
	Côtes-du-Nord	St.-Brieuc.
	Finistère	Quimper.
	Morbihan	Vannes.
	Loire-Inférieure	Nantes.
Anjou	Maine-et-Loire	Angers.
Maine	Mayenne	Laval.
	Sarthe	Le Mans.
Île de France	Seine-et-Oise	Versailles.
	Seine	Paris.
	Seine-et-Marne	Melun.
	Oise	Beauvais.
	Aisne	Laon.

2. Northeast.

Champagne	Ardennes	Mézières.
	Marne	Châlons.
	Aube	Troyes.
	Haute-Marne	Chaumont.
Lorraine	Meuse	Bar-le-Duc.
	Meurthe-et-Moselle	Nancy.
	Vosges	Épinal.
Alsace	Belfort	Belfort.
Franche-Comté	Haute-Saône	Vesoul.
	Doubs	Besançon.
	Jura	Lons-le-Saunier.
Burgundy	Ain	Bourg.
	Saône-et-Loire	Mâcon.
	Côte-d'Or	Dijon.
	Yonne	Auxerre.

3. Southeast.

Lyonnais	Loire	St.-Étienne.
	Rhône	Lyons.
Dauphiné	Isère	Grenoble.
	Drôme	Valence.
	Hautes-Alpes	Gap.
Savoy	Savoie	Chambéry.
	Haute-Savoie	Annecy.
Comtat Venaissin	Vaucluse	Avignon.
Provence	Bouches-du-Rhône	Marseilles.
	Var	Draguignan.
	Basses-Alpes	Digne.
Nice	Alpes Maritimes	Nice.
Corsica	Corsica	Ajaccio.
Languedoc	Haute-Loire	Le Puy.
	Ardèche	Privas.
	Lozère	Mende.
	Hérault	Montpellier.
	Aude	Carcassonne.
	Tarn	Albi.
	Haute-Garonne	Toulouse.
	Gard	Nîmes.
Roussillon	Pyrénées-Orientales	Perpignan.
Foix	Ariège	Foix.

4. Southwest.

Guyenne and	Hautes-Pyrénées	Tarbes.
Gascony	Gers	Auch.
	Tarn-et-Garonne	Montauban.
	Aveyron	Rodez.
	Lot	Cahors.
	Dordogne	Périgueux.
	Lot-et-Garonne	Agen.
	Gironde	Bordeaux.
	Landes	Mont-de-Marsan.

Army.—The army consists of volunteers or re-enlisted men, who form about one-tenth of the annual contingent, and young men twenty years of age and fit for military service, whom the recruiting laws summon annually to form what is called "the contingent." These young men serve three years in the active army, ten years in the reserve of the active army, then six years in the territorial army, and at last six years in the reserve of the territorial army. All privileges of exemption were abolished in 1887. According to the budget for 1901 the strength of the army on a peace footing was 29,990 officers and 568,775 men, total 598,765, with 143,667 horses, and the war effective was estimated at 2,500,000 officers and men.

Navy.—Exclusive of transports, sailing vessels, school-ships, etc., the French fleet consists (1901) of 299 vessels, of which 26 are battle-ships, 18 port-defense vessels, 68 cruisers of different classes, and 187 torpedo-craft, besides 27 vessels of different kinds in course of construction. The *personnel* consists of 1,733 executive officers (including 15 vice-admirals and 30 rear-admirals), 225 principal engineer officers, and 40,589 men, recruited either by voluntary enlistments or from a portion of the army contingent, or by drafting those men from the seaboard whose names are entered on the naval registers. The total number enrolled is 150,000. The maritime territory is divided into five arrondissements, commanded by a maritime prefect, who has the rank of vice-admiral. Their capitals are Cherbourg, Brest, Lorient, Rochefort, and Toulon. The naval expenditure of France, which in 1880 was 186,000,000 francs, was increased in 1899 to 304,078,400 francs. See Naval Academies and Ships of War.

Finances.—The budget of the commune is prepared by the mayor, voted by the municipal council, and approved by the prefect or by the chief of the staff if the revenue exceeds 3,000,000 francs ($600,000). The departmental budget is prepared by the prefect, submitted to the departmental commission, and discussed and voted by the general council. The budget of the state is prepared by the ministers, presented by the President of the republic, and discussed by the National Assembly one year in advance. The expenses of the state for 1901 are estimated as follows:

	Francs.
Finance (public debt and dotations)	1,278,105,141
Justice and worship	78,417,486
Foreign affairs	16,554,210
Interior	79,567,158
War	693,614,531
Marine and colonies	432,804,299
Public instruction and fine arts	221,351,398
Commerce and industry	36,660,891
Agriculture	44,908,845
Public works	669,298,419
Total	3,551,292,378

The receipts of the general budget come from the following sources:

	Francs.
Direct taxes	522,596,614
Indirect taxes and revenues	2,117,391,250
Proceeds from the public domain	52,710,300
Proceeds of monopolies and industrial enterprises of the state	728,651,830
Sundry receipts of the budget	69,596,418
Recettes d'ordre	60,624,085
Total	3,551,570,497

The following are some details of the different receipts: In the direct taxes the land tax amounts to 196,700,000 francs ($39,340,000); personal tax, 88,200,000 ($17,640,000); tax on doors and windows, 57,200,000 ($11,440,000); tax on patents, 122,600,000 ($24,520,000). Of indirect taxes the most important are:

	Francs.
Registration	553,112,000
Stamps	181,532,400
Customs	453,049,800
Indirect contributions (beverages, salt, etc.)	649,022,550
Sugar	199,500,000
Tobacco	413,261,000
Post-office and telegraph	255,028,400

On Jan. 1, 1900, the public debt amounted to 30,055,398,-100 francs ($5,800,691,833).

Justice.—Justice is administered in the name of the chief of the state. There are three different jurisdictions: (1) The civil jurisdiction, which takes cognizance of all personal or real relations of the citizens. It is exercised by justices of the peace, of whom there is one in each canton, who conciliates, if possible, or decides cases of minor importance. Above them are the civil tribunals, or tribunals of first instance, which pronounce annually on about 140,000 cases. There are 138 *conseils de prudhommes*, of whose members half are elected by the employers and half by the employees, and who in the manufacturing towns act as justices of the peace in cases between employer and employed; they consider annually 40,000 cases, of which more than two-thirds are conciliated. In the manufacturing and commercial cities there are 222 tribunals of commerce, whose members are elected, and which pronounce in first instance on about 250,000 cases annually, of which one-fourth are conciliated and two-thirds closed by definitive judgment. Above the civil tribunals and the tribunals of commerce there are twenty-six courts of appeal, which judge about 12,000 cases annually. (2) The criminal jurisdiction. The simple misdemeanors come before the tribunals of police. The justices of peace exercise this jurisdiction in 385,000 cases annually. Offenses are brought before the tribunals of correction, which form a particular branch of the civil tribunals, and which can administer from six days' to five years' imprisonment. Grave crimes are brought before the courts of assize (3,100 to 3,700 cases a year), of which there is one in each department. They are composed of three magistrate-judges and a jury. The jury is composed of twelve citizens, who must be over thirty years old, and are selected by a special committee in each canton, and subject to approval and rejection by a district committee. The jury decides the point of fact, the judges apply the law. Besides the magistrature which judges there is a magistrature which performs the duty of public prosecution. To each court of appeal a general procurator is attached, assisted by several advocates or deputies. To each civil tribunal, and under the authority of the general procurator, is attached a procurator of the republic, assisted by one or several substitutes. At the police tribunals the office of public prosecutor is performed by the mayor or the commissioner of police. The public prosecutor interferes only exceptionally in civil cases. In criminal cases, on the contrary, he acts a principal part. He orders the investigation of the offense or crime, has the accused person arrested, superintends the trial, prosecutes before the judges, and proceeds with the execution of the verdict given. Above all the other tribunals is the court of cassation, which secures the exact application of the law, and any verdict given by any tribunal may be brought before it. By its decrees it confirms or reverses the verdict given, and in case of cassation the suit is recommenced before another tribunal instituted by the court of cassation. The convicts receive their punishment, according to the gravity of their offense, in the police prisons, in the departmental prisons, which also serve as jails (381 jails, with room for 25,000 inmates), in the penitentiary colonies for young convicts, in the central prisons for those sentenced to compulsory labor, in the houses of detention for local crimes, and in the penal colonies of Guiana and New Caledonia. With the administration of justice are furthermore connected the notaries, who receive acts and contracts and give them the character of authority; the attorneys, who represent the parties before the tribunal; and the sheriffs, who carry the summons, serve the judgment, and regulate its execution.

Public Education.—The school system was founded by the National Convention in 1792, and is administered by the commune and the department under the general control of the Minister of Public Instruction and Fine Arts, and a national council. Primary instruction is gratuitous and obligatory; it is given in the communal schools, which are under the direction of lay teachers appointed by the prefects. Each commune of 500 inhabitants is obliged to have a school for boys and one for girls. There were more than 5,600,000 pupils distributed in 67,359 public schools and 14,498 free schools in 1890; and besides these there are about 9,053 educational institutions of a higher grade, *cours d'adultes*, and a number of infant schools which prepare children under seven years of age for the primary schools. The teachers are educated in 90 primary normal schools for males, with 5,445 master pupils, and 82 normal schools for females, with 3,564 pupils, about one for each department. There are, besides, two higher normal schools, one for each sex. The secondary, classical, or industrial instruction is given by the state in the lyceums, by the communes in the communal colleges, and by the clergy or by laymen in the seminaries. There were in 1891 107 lyceums, which were generally situated in the capitals of the departments, and contained more than 51,000 pupils; 246 colleges, with 34,000 pupils; and 650 free establishments, with nearly 68,000 pupils. For girls there were 24 lyceums, with 4,000 pupils, and 27 colleges, with 3,000 pupils. The classical schools give diplomas of *bachelier de l'enseignement secondaire classique* and *bachelier de l'enseignement moderne*, the latter course substituting the study of modern for that of the dead languages. In order to educate professors the state has established for the classical branch the high normal school, and for the industrial branch the special normal school at Cluny. (See Common Schools.) The higher instruction is given by the universities (*facultés*), of which there are 15 for literature and science, 12 for law, 7 for theology, and 4 for medicine. The universities confer diplomas of *bachelier*, *licencié*, and *docteur*. The Collège de France and the Museum of Natural History, both in Paris, represent the independent studies; the Conservatoire des Arts and Métiers (for arts and trades), in Paris, is a sort of industrial university.

The principal schools preparatory for the civil service are: (1) in Paris, l'École Polytechnique, for officers and state engineers; the Central School of Arts and Manufactures, for civil engineers; the School of Fine Arts, for painters, sculptors, and architects; the Conservatory of Music and Declamation, for musicians and actors; the school for living Oriental languages. (2) Outside of Paris there are three schools of the arts and trades, several schools of fine arts (Dijon, Toulouse, etc.), 3 schools of agriculture, 1 of horticulture, 3 for veterinary surgeons, 1 for miners at St.-Étienne, and 1 for mining engineering; to which may be added several communal and private institutions, such as schools for drawing, Central School in Lyons, the school for watchmaking in Besançon, etc. (3) In foreign countries the French school in Rome for a limited number of artists, painters, sculptors, architects, and musicians, chosen by competition; and the schools of Rome and Athens for the study of ancient literature, to which the pupils are chosen from among the pupils of the high normal school. The administration of each of the sixteen academies, or territorial circumscriptions of public instruction, is confided to a rector assisted by an academical council. The rector has under his orders an inspector of the academy and several inspectors of the primary instruction. Algeria has a separate academy. The instruction is facilitated by libraries, which exist in most of the towns, and which are being founded in the communes, in the primary schools, in the regimental schools, and at the museums. There are learned societies in most all the departments, and some of them have a high reputation. In Paris there are, among others, the Association Française pour l'Avancement des Sciences, Société de Géographie, de Géologie, d'Anthropologie, Association Polytechnique, Société d'Agriculture, etc., besides several great public institutions, such as the Observatory, the Bureau des Longitudes, the Medical Academy, and l'Institut de France, composed of five académies (Académie Française, des Inscriptions et Belles-Lettres, des Sciences, des Beaux-Arts, des Sciences Morales et Politiques), each of which contains 40 members (Académie des Sciences 66) chosen by the members themselves.

The military schools are l'École spéciale militaire, of St.-Cyr, for the infantry and the cavalry; l'École d'application de l'artillerie et du génie, at Fontainebleau; l'École d'application de cavalerie, at Saumur, for officers and for under-officers proposed for the rank of officers; l'École de médicine et pharmacie militaire, at Val-de-Grâce, at Paris; l'École d'application des poudres et saltpêtres; l'École militaire d'infantrie, of St.-Maixent, and l'École militaire d'artillerie et du génie, at Versailles, both intended for under-officers proposed, on examination, for the rank of officers. There are also numerous technical schools, such as l'École d'administration, at Vincennes; l'École normale de gymnastique, l'Écoles regionales de tir, l'Écoles régimentaires de l'artillerie et du génie, etc.; above all these schools, l'École supérieure de guerre, at Paris, which trains officers, captains, sub-lieutenants, for the brevet d'état-major. Le Prytanée militaire de la Flèche, a kind of military lyceum, receives the sons of indigent officers and of sub-officers killed in battle. The marine receives most of its officers from the naval school at Brest. There are also 19 écoles d'hydrographie, and 3 écoles de médecine navale at Toulon, Brest, and Rochefort; l'École du génie maritime (for naval construction) in Paris; l'École de torpilles of Toulon, l'École des mousses and l'École de maistrance of Brest, etc. La Maison d'Éducation of the Legion of Honor at St.-Denis receives without charge the daughters of officers and sub-officers of the Legion of Honor.

WORSHIP.—There are in France three forms of *worship* recognized by the state and maintained at its expense—the Roman Catholic, the Protestant, and the Jewish; and in Algeria, in addition, the Mussulman. Any sect in France with 100,000 adherents is entitled to an annual state grant.

The Roman Catholic Church.—The parish is the elementary unit, and there is a parish or more in each commune. Of the parishes, some are *curacies*, others *succursals*. The former number 45,000; the priest is irremovable, appointed by the bishop, and approved by the state. The priests of the latter parishes are appointed by the bishop, and may be removed by him. Above the priest is placed the bishop. According to the concordat of 1801 there are 84 dioceses, 67 bishoprics, and 17 archbishoprics in France, nearly one in each department; the see of the bishop is generally at the capital of the department. In 1890 the secular clergy numbered 50,420, besides 4,376 teachers and 9,526 students in seminaries. Above the bishops stand the archbishops, who administer their own dioceses and exercise authority over ecclesiastical provinces or archbishoprics consisting of several dioceses or bishoprics. There are 17 archbishoprics, corresponding nearly to the old provinces from the Roman period—namely, Paris, Rouen, Tours, Cambray, Rennes, Reims, Besançon, Lyons, Chambéry, Avignon, Aix, Toulouse, Bordeaux, Auch, Alby, Bourges, and Sens. Above the archbishops are five cardinals. The budget grant for 1897 for this Church was 41,266,023 francs ($8,253,204).

The Protestant Church.—This comprises two denominations recognized by the state—the Calvinistic and the Lutheran. In both of them the parish has its minister and presbyterial council, which administer under the authority of the consistory. In the Calvinistic Church the ministers are chosen by the consistory, and the superior authority is exercised by the synod, consisting of five consistorial churches, and by the central council of the Reformed Church. At Montauban is a theological university. In the Lutheran Church the ministers are chosen by a directory which acts under the authority of the consistory. The grant for this Church was 1,495,100 francs ($299,020).

The Jewish Church.—A communal rabbi presides at each synagogue, assisted by officials who are under the authority of a departmental consistory, which again ranks under the central consistory of Paris, presided over by the grand rabbi. The grant for this Church was 206,530 francs ($41,306).

Algeria forms one archbishopric (Algiers) and two bishoprics (Oran and Constantine). It has two Protestant consistorial churches and three Jewish consistories. The grant for Algeria in 1893 was 1,238,596 francs ($247,719).

F. PRUDENT. Revised by R. LILLEY.

France, History of: begins in the fifth century with the conquest of the Roman province of Gallia Transalpina by the Franks, a Gotho-Germanic tribe who settled in the country and gave it its name. Ancient Gaul (Gallia Transalpina) was originally inhabited by three different nations —the Belgians, in the north and east; the Celts, in the west and center; and the Aquitanians, in the south. Along the Mediterranean coast several Greek colonies were situated, the chief of which was Massilia. These nations, subdivided into many different tribes, the Batavi, Helvetii, Ædui, *et al.*, were subdued by Cæsar between 58 and 52 B. C., and the whole country reduced to a province of the Roman empire. Roman institutions, language, civilization, and religion gradually took root among the people, and the country flourished; but in the fifth century A. D. the Roman empire had become too much expanded to defend its frontier at all points. Representatives of the Teutonic tribes had gradually entered Roman territory and worked themselves into various industrial vocations. Even the Roman army came largely to be made up of German recruits and allies. When the general movement of the barbaric tribes from the north and east took place, the Romans were in no condition to withstand the attacks along the frontier. The army in Britain was recalled, but even the re-enforcement thus afforded was not sufficient to prevent the barbarians from overrunning Gaul. The Visigoths settled in the southern part, and connected it with Northern Spain; the Burgundians established an independent kingdom in the east; and in 486 Khlodwig or Clovis, chief of the Salian Franks, a grandson of Merovæus and founder of the *Merovingian* dynasty, defeated the Roman governor at Soissons, and took possession of the whole northern part of the country to the Loire. In 507 he also defeated the Visigoths at Vouillie, and added their possessions N. of the Pyrenees to his dominions, thus forming a kingdom which comprised nearly the same area as modern France, with the exception of the eastern districts between the Rhine, the Saône, and the Rhône, which were occupied by the Burgundians. He embraced Christianity 496, and by this step succeeded in reconciling the clergy, and, through them, the Gallo-Romanic population, to his rule; so that at his death in 511 a Frankish empire was actually consolidated in Gaul. (See FRANKS.) The further development of this new kingdom was seriously impeded, however, by civil wars between the eastern Franks (Austrasia) and the western (Neustria), brought on by the dangerous custom, common to all Gotho-Germanic nations, of dividing the kingdom at the death of the king between his sons. But fortunately, during the last kings of the Merovingian dynasty, who were men of weak characters and with no talents as rulers, a new family rose into power, capable of keeping the empire united in spite of the tendencies to separation which it contained, and capable of defending it against the most formidable enemies from without. Pepin of Héristal, *major domus* to Clovis II., established the authority of Austrasia firmly in the dominions of Neustria, and his son Charles Martel, succeeding him in his position as *major domus*, a sort of viceroyship, routed the Saracens at Tours in 732. Charles Martel's son, Pepin the Short, confined, with the consent of the clergy and the pope, the last king of the Merovingian dynasty, Childeric III., in a monastery, and ascended the throne himself in 752, thus founding the *Carlovingian* dynasty. The Merovingian kings had established a Gotho-Germanic empire on Roman soil; during the reign of the Carlovingian dynasty this Gotho-Germanic empire became French. The formation of a new kingdom was followed by the formation of a new nation. Pepin the Short ruled with great vigor, and made one very valuable addition to his dominions—namely the coast regions along the Mediterranean, which hitherto the Arabs had held. His son, Carl or CHARLES THE GREAT (*q. v.*), defeated his enemies with masterly ability and consolidated the government, from 768 to 814. Although at this time the different tribes of the Gotho-Germanic race had formed several nationalities, and in several places commenced the development of individual forms of civilization, still the settlement was not yet final. By transforming the chiefs of the tribes into feudal lords, vassals with power, but also with responsibility, and by introducing Christianity and the institutions of the Roman Catholic Church throughout his realm, Charles secured the first rudiments of order.

The name "France" occurs for the first time in history in the middle of the ninth century. After the death of Louis le Débonnaire, a son of Charles, the empire was divided between his three sons by the treaty of Verdun in 843. Louis the German received that part which lay E. of the Rhine, and which was called Deutschland (Germany); Charles the Bald received that part which lay W. of the Scheldt, Meuse, Saône, and Rhône, and which was called France; the long strip of land stretching between these two boundary-lines from the North Sea to the Mediterranean was given to Lothair, together with Italy and the title of emperor. As soon as the treaty was concluded wars broke out between the contracting parties, and these wars did not cease until a new dynasty, which had grown up on French soil, and which entertained no general Gotho-Germanic (but simply French) ambition, ascended the throne of France. It was, however, not so much their imperial ambition as their utter inability which cost the Carlovingian kings their crowns. There were forty hereditary (i. e. independent) vassals in the territory of France. One of them was the Duke of Normandy, formerly the chief of the Norse pirates, to whom Charles the Simple had given in 912 the beautiful province W. of the Lower Seine, in order to stop the invasions. Another was the Count of Paris, one of whose family, Count Odo, was chosen king in 887, and vindicated himself till his death, in 898, against Charles the Simple. A third was the Duke of Lorraine, who offered his allegiance to the King of France or to the Emperor of Germany, just as he liked. To a man who had no other purpose than to govern these forty vassals the task might prove difficult enough, and it became fatal to any one who besides had Gotho-Germanic ambitions. When, at the death of Louis V. in 987, the vassals passed by the proper heir, Charles of Lorraine, because he had given his allegiance to the German emperor, and chose for king Hugh Capet, Count of Paris, Duke of France, and founder of the *Capetian* dynasty, there was a French nation, but there was hardly a French kingdom in existence.

The consolidation of the royal power and the establishment of the feudal monarchy are the leading ideas in the history of France under the two following dynasties—the house of *Capet*, from 987 to 1328, and its collateral branch, the house of *Valois*, from 1328 to 1589. Not that they are the sole motives in all the various events which crowd its pages during this period, but they are the common result of them all. The crusades acted chiefly as a vent for the romantic ambition of the feudal lords, and as a means of rallying them around the person of the king. The Church was usually an ally of the crown, and for the time from 1309 to 1377, while the pope resided at Avignon and two œcumenical councils were held here in 1326 and 1377, even a very submissive ally. The Reformation was actually used as a means of curbing and destroying the heads of the nobility, and the very moment it became a party against the absolute power of the king it was crushed. The wars with England and Austria were thoroughly dynastical, and could not help attaching a particular importance to the representative of the dynasty. The development of the cities was furthered and privileges were granted to the burghers, so far as to enable the third estate to form an effective opposition to the nobility, but not so far as to make it capable of checking the royal power. And even the nobility itself was made a monarchical instrument. It lost its power, but not its splendor. It was transformed from a feudal aristocracy into a court nobility. And it is this transition from the feudal to the absolute monarchy, together with the consequences following therefrom, which gives the history of France its paramount importance in the history of Europe. How early a powerful national feeling was developed in France was shown under Louis VI. (1108–37). In the long wars which he waged against Henry I. of England about Normandy, which by the Norman conquest of England threatened to become lost to the French crown, Henry succeeded in establishing a formidable alliance with the German emperor. But, although the relations between the French king and the French vassals—the Counts of Flanders, Champagne, Lyons, Provence, Toulouse, etc.—were very loose, in this emergency an army of 200,000 men was immediately formed for the defense of France. Louis VI. was a sagacious ruler. He abolished serfdom in his own territories, and formed his cities with their adjacent districts into corporations. But by his example he compelled his neighbors to do the same, and thus he sowed a very fertile seed of opposition to the feudal lords among their own subjects. Philip Augustus (1180–1223) took the first steps toward centralization, and took them successfully. He formed a chamber of peers, a sort of council of state, consisting of six secular and six ecclesiastical members, which tended to secure uniformity in the actions of the king and his vassals; and he established the right of appeal from the decision of the feudal lord to the royal court; which measure, in the course of time, seriously impaired the influence of the lord. Meanwhile the crown grew richer. Philip Augustus conquered Normandy, Maine, Touraine, and Poitou from the English after the battle of Bouvines in 1214; Philip III. (1270–85) acquired Toulouse and Venaissin by negotiation; and Philip IV. (1285–1314) received Navarre, Champagne, and Brie by marriage. This latter prince could afford to treat the order of the Templars in the most arbitrary and despotic manner, and on one occasion, when the nobles pressed him too hard, he baffled all their exertions by convoking for the first time (Mar. 28, 1302) that important assembly which came to be known in French history as the *States General*, which was made up of representatives of the three estates: the first the clergy, the second the nobility, and the third the free cities. On the accession to the French throne of the house of Valois, in 1328, with Philip VI., nephew of Philip IV., the terrible wars with England began, the English king, Edward III., claiming the crown of France as a grandson of Philip IV. These wars are known as "the Hundred Years' war." But when at last the Maid of Orleans succeeded in rousing the national feeling to an unconquerable pitch, and carried, in 1429, Charles VII. to Reims to be crowned, all the enthusiasm of the people was concentrated on the person of the king. In spite of all the incapacity and corruption which royalty had exhibited in France during these hundred years, it had become very dear to the French people; and although persons like Louis XI. (1461–83) and Catharine de Medici, who actually governed France during the reign of her three sons, Francis II. (1559–60), Charles IX. (1560–74), and Henry III. (1574–89), were not fit to make royalty charming to the minds of the people, they were eminently fit to make it respected and feared. Charles IX. had the principal leaders of the Protestant party murdered at the massacre of St. Bartholomew in 1572; Henry III. had the principal leaders of the Roman Catholic party murdered one after the other. When (in 1589) Henry IV. ascended the throne and founded the *Bourbon* dynasty, he was obliged to devote the principal energies of the state to the difficult task of establishing harmony between the Roman Catholics and the Protestants. It was to this end that the EDICT OF NANTES (*q. v.*) was promulgated in 1598. Immediately after the death of Henry IV. in 1610, however, troubles broke out anew. The king, Louis XIII., was but a boy, and was ruled by his mother, Marie de Medicis. But about 1622 a great master of statecraft began to attract the attention of the country. CARDINAL RICHELIEU (*q. v.*), dominated by three great political ideas, controlled France until 1642. All his energies were directed toward subduing the political power of the nobles, breaking the predominant power of Austria, and destroying the political power of the Protestants. These three purposes will be found to furnish the key to all his acts. While he was successful he laid the foundation for the authority of Louis XIV.

During the first years of the reign of Louis XIV. (1643–1715) France was eminently prosperous, and held the most prominent place not only in European politics, but in European civilization. Louvois and Colbert were excellent ministers; the treasury was full; commerce and industry flourished; the army and navy were in an effective state; Turenne, Condé, and Luxembourg achieved great victories, and new provinces were added to the kingdom. The king was exceedingly prodigal, but his prodigality was accompanied by an elegance and taste which spread a magnificent and even blinding radiance around him; all other kings tried to imitate him. Corneille, Racine, Molière, Boileau, Bossuet, and Fénelon had the ear of the world, and dictated the taste in all other literatures. But after some years the true character of the absolute monarchy became apparent. In 1685 the king revoked the Edict of Nantes. Thereby the guaranty of religious freedom which was given to the Protestants by Henry IV. in 1598 was destroyed, and persecutions immediately began. Thousands of the most industrious and intelligent citizens of France were exiled. Some of the most prosperous branches of French industry stopped; the revenues decreased, and an uneasy feeling crept into the hearts of the people. The king's prodigality, however, did not decrease with his diminished revenues; on the contrary, his passion for stupendous buildings and gorgeous court magnificence grew stronger as he grew older. His second war (from 1689 to 1697) was not successful, and in his last (from 1700 to 1713) failure followed failure. Both were begun for reasons of mere vanity, but, although his armies were defeated time after time, his arrogance did not abate. In many districts of France food began to become scarce, but the king heeded it not. When he died he left a debt of 3,500,000,000 livres, a country utterly exhausted, a court more demoralized and more expensive than any other institution that modern civilization had ever seen, and a people deeply discontented, though perhaps as yet unconscious of the reasons of its discontent. Under his successors, Louis XV. (1715–74) and Louis XVI. (1774–93), the consciousness came, and with it the crisis.

The French court was the government of France. There was no constitution, and such fragments of a constitution as existed were either out of working order on account of disuse—the States General had not been summoned since 1614, the assembly of the notables not since the first year of Louis XIII., the Parliament of Paris had not met with full authority under Louis XIV.—or if capable of working, they worked against each other, and produced only confusion. The only valid authority was the king; he could interfere even with the courts of justice by his *lettres de cachet*. He governed France by the court and a great retinue of officials; 250,000 were employed to gather the land and income tax alone. There were about 4,000 offices which conferred nobility on their incumbents—that is, exemption from taxation and from military service. These offices were sold, and the sale was not a fraud on the administration, but a financial operation of the government. This people under this government consisted of three classes—the nobility, the clergy, and the third estate. The nobility comprised a long scale of different degrees of rank, from the forty-four peers of the realm to the swarms of parvenus who had received their nobility from an office; and this scale was expressed by an intricate system of etiquette. But all nobles —and their proportion to the whole population was as one to 250—were exempted from land tax, from military service, from contributions to the maintenance of roads, etc.; they paid only an insignificant class tax; and on such conditions the nobility held more than one-half of the soil of France, enjoying the right of hunting, exercising police superintendence, administering justice, etc. The Church owned a little over one-sixth of the soil, from which it derived an income of 160,000,000 livres a year, and on which it paid no regular taxes. Of these 160,000,000, 40,000,000 were received by the active servants of the Church, the curates, the priests; the rest was swallowed by the appanages of the prelates or spent in benefices which the king bestowed on the younger members of the noble families, and which enjoined no kind of service on the beneficiaries. The third estate had to bear the whole burden of the defense of the country, the whole burden of the defrayment of the public expense, and the whole burden of productive labor.

Between this people and this government stood a numerous class of writers—Voltaire, Rousseau, d'Alembert, Montesquieu, Diderot, and many more—whose glory has faded very much since it became evident that their positive ideas were wrong, but who conferred a great benefit not only on France but on Europe by their criticism of the actual state of affairs. With matchless eloquence, with irresistible wit, they showed that faults and demoralization on the one hand were the true causes of the misery and degradation on the other, and they taught men not to take the world as it was, but to try to make it what it ought to be. This was the situation to which the absolute monarchy in France came: a corrupt government, falling short of means by which to gratify its vicious appetites, a hard-toiling people, pinched by hunger and almost driven to despair; and between them a literature which told the starving man who it was that stole his food. The result could be nothing else than the *Revolution.*

Money was wanting; the state was on the verge of bankruptcy. The king first tried different ministers of finance: Necker, but he only revealed the state of affairs to the public, and informed the people that His Majesty had used 860,000,000 livres for his own person; Calonne, but he only increased the debt by his chimerical speculations, which destroyed much private capital and the last remnant of public confidence; Brienne, but he could do nothing when the nobility and the clergy absolutely refused to be taxed. The king then recalled Necker, and convoked the States General to meet at Versailles, May 25, 1789. In this assembly the votes were cast not by poll, but by class, and thus the third estate was completely overruled by the two privileged estates. The third estate protested against such an order of conducting business, and demanded a vote by poll. The two other estates refused. On June 17 the third estate constituted itself the National Assembly, and invited the two other estates to participate in its debates; on the 20th the Assembly pledged itself by oath not to separate until a constitution was made; and on the 23d it declared its membership inviolable. To this the king answered by dismissing Necker and ordering the concentration of a body of troops at Versailles; but in the meanwhile the nobility and clergy had given way at the king's request, and joined the third estate. On July 12 the first insurrection took place in Paris; on the 13th a national guard and revolutionary municipal boards were formed; on the 14th the Bastile was stormed; and on Aug. 4 the National Assembly—or, as it it was generally called, the Constituent Assembly—abolished all feudal and manorial rights. The royal princes fled, the emigration began. On Oct. 5 the mob of Paris, followed by the national guard, rushed to Versailles, and, after massacring the royal guard, carried the king and queen back to Paris, whither also the Constituent Assembly removed. July 14, 1790, the constitution was ready, the king took his oath on it, and those of the nobility and clergy who refused to do so were thrown into prison. Still the excitement and disorder in Paris increased every day, and on the frontier the royal princes organized corps of *émigrés*, while Austria, Prussia, Saxony, Great Britain, and Spain formed an alliance and offered the king their help against his subjects. June 20, 1791, he and the queen tried to flee, but were stopped at Varennes, brought back to Paris, and confined in the Tuileries. On Sept. 14 he had to take oath on a new constitution, and then the Constituent Assembly considered its work as done, dissolved, and gave place for the Legislative Assembly.

This Assembly met Oct. 1, 1791. Meanwhile the protests of the foreign courts against the constitution, the royalist insurrections in Calvados and Vendée, and the movements of the emigrants on the frontier caused terrible excitement in Paris. War was declared against Austria and Prussia, and when reports came of the defeat of the French armies, and when, moreover, the king, in confidence of help from the approaching Austrians, assumed a more decided attitude toward the Legislative Assembly, the excitement grew into wild fury. Armed bands broke into the Tuileries June 20, July 5, and Aug. 10. On the last occasion the Swiss guard was horribly massacred, and the king and the royal family were compelled to seek refuge in the Legislative Assembly, from which they were brought to the Temple as prisoners. Robespierre, Marat, and Danton swayed the Parisian populace through the club of the Jacobins and through Marat's paper. On the news of the Prussian invasion of Champagne and the fall of Verdun a tribunal of national defense was formed, the constitution abolished, the Legislative Assembly dissolved, and a National Convention convoked.

The National Convention, which met Sept. 21, 1792, consisted of two parties—the Jacobins, generally called the "Mountain," and comprising the most radical democrats—men without any definite ideas, but determined to carry the passion of the hour to its last consequences; and the Girondists, the representatives of law and order under the form of a constitutional monarchy, who were men of probity and talent. The Jacobins were in the majority, and on Sept. 22, France entered on the "First Day of Year I. of the Republic." Their power was still more strengthened by the success of the war. The Prussians were driven back, Dumouriez conquered Belgium, Custine crossed the Rhine, and Montesquiou entered Savoy. They felt that they were irresistible, and they pushed forward, trampling down everything which opposed them. The king was brought to trial Dec. 11, and executed Jan. 21, 1793. The Girondist leaders were arrested June 2, 1793, and executed Oct. 31. A committee of public safety was formed and invested with absolute power. The Convention passed a decree against all who were "suspected," and Barère declared that "terror" was the order of the day. Terror was indeed the weapon the Jacobins employed. In Bordeaux, Marseilles, and Lyons counter-revolutions took place, but they were put down with a cruelty and violence which the world had not seen since the days of the Roman emperors. The government was a perfectly unlimited despotism, exercised not by one, but by many. He whom the Parisian mob lifted on their shoulders became a despot for the hour, and he could do with lives and property as he liked. No institution could withstand these shocks. The Christian religion was formally abolished, and the worship of "Reason," represented on the occasion by a danseuse from the Opera, was introduced.

At this moment, however, a reaction began to set in. Not that the Reign of Terror ceased and the cruelties stopped. But the revolutionary frenzy had reached its culmination. The movement could go no further. In the excesses of Hébert and his party, especially in the abolition of religion, there was something which actually offended and disgusted Robespierre. He was thoroughly in earnest. He wanted a perfect democracy, with "liberty and equality," and he was willing to go through the terror of anarchy in order to break down the old social order and produce the new. But anarchy itself was not his ideal. Hébert and twenty of his party, the *Enragés*, were arraigned as vicious men and traitors to their country, and brought to the guillotine on Mar. 24, 1794. A worship of the Supreme Being was substituted for that of Reason. But the reaction, once begun, could not be stayed. Hébert was followed by Danton (Apr. 5), and Danton by Robespierre himself (July 28). The Jacobins were now without leaders, and on Nov. 11 their club was closed. During the first half of the year 1795 the Convention debated and adopted a new constitution, which placed the executive power in the hands of a Directory of five, and the insurrection against this new constitution, brought about by the intrigues of the radical democrats and the royalists, was successfully put down by the young general Bonaparte; the mob of Paris was disarmed Oct. 5.

The situation of the Directory was, nevertheless, by no means easy. From without it was attacked by Great Britain, Austria, and Russia. But it offered a vigorous and successful resistance to its enemies in the field. By regular conscription it brought 200,000 men into the field. The war was everywhere carried on in the enemy's territory, and the armies of the young republic seemed to be unconquerable. Foreign countries were subdued, and French ideas were impressed on Europe, not by mere eloquence, but by the aid of arms. In dealing with its domestic foes, however, the government of the Directory was much less successful. La Vendée was still in uproar, and when more peaceful and conciliatory measures were adopted the royalists returned and began their intrigues. At the election of 1797 they gained the majority in the representation, and the Government had to use very harsh—not to say terroristic—means in order to save itself. The Tuileries was surrounded with troops and cannons, and the royalist members were arrested. Their election was declared illegal, and they were banished from the country. Also the financial difficulties proved too great for the Government. In spite of the enormous sums which it drew from Belgium, Germany, and Italy, the Directory was unable to pay the public debt. It had to declare the state bankrupt and repudiate two-thirds of its obligations. Under these circumstances there arose a general feeling of the necessity of concentrating the Government in one single individual, and when (Nov. 9, 1799) Gen. Bonaparte overthrew the government of the Directory by military force and grasped the reins himself, most people in France approved of the measure. From the overthrow of the Directory to the defeat at Waterloo, June 18, 1815, Napoleon was the absolute ruler of France—first as consul (Dec. 27, 1799), then as emperor (Dec. 2, 1804). His reign was the most brilliant period of French history. An uninterrupted series of great victories—Marengo, Austerlitz, Jena, Wagram—made France the undisputed arbiter in European politics, removed her frontiers to the Elbe and the Adriatic Sea, and turned a stream of gold and treasure into her lap. This changed, of course, after the catastrophe in Russia (1812), the battle of Leipzig (Oct. 19, 1813), and the abdication (Apr. 4, 1814). (See NAPOLEON I.) Nevertheless, in spite of the humiliations and the exhaustion which those years brought along with them, France was not simply recovering, but actually developing during the period from the restoration of the Bourbons, in 1815, to their final expulsion, in 1830—that is, in the reigns of Louis XVIII. and Charles X. But the Bourbons had learnt nothing and forgotten nothing during their exile of more than twenty years; and when, under their hands, the reaction gradually assumed the character of arbitrariness and despotism, the revolution broke out, July 25, 1830. It ended with a mere change of dynasty, but Louis Philippe also proved unsuccessful in quieting the restless spirit of the French people. His so-called policy of resistance provoked another revolution, Feb. 5, 1848, and he had to flee. It was evident that the spirit of revolution was still a very powerful force in the French nation. It was the presence of this spirit which gave the rich and comfortable middle class of the French people a dread of the future, and enabled Napoleon III. to trample down the republic (Dec. 2, 1851) and establish a new monarchy (Dec. 2, 1852). It should also be noticed that one of the most effective means which the new ruler employed to keep down the political aspirations of the people and support his own despotism was just this very dread for what seemed to be the last consequences of liberalism. Seldom, however, has a political undertaking of any magnitude ended in so shameful a manner as the reign of Napoleon III. After the Prussian victory of Sedan (see FRANCO-GERMAN WAR) it became more and more apparent that his whole foreign policy had been a senseless casting about for the mere purpose of producing or sustaining an illusion. The humiliation of Sedan was followed by the paroxysm of the Commune. The republic established in 1870 after the deposition of Napoleon III. has lasted longer than any former attempt at establishing a republic in France. Under the presidencies of Thiers and MacMahon events were often stormy enough. Royalist plots, legitimists, Orleanists, and Bonapartists were much spoken of. Under the presidency of Grévy the times were calmer. Under that of CARNOT (*q. v.*) great financial scandals connected with the Panama Canal scheme were brought to light, and at times the Government seemed to be in peril. Carnot was succeeded by CASIMIR-PÉRIER (*q. v.*), who, however, resigned Jan. 15, 1895. Two days later FÉLIX FAURE (*q. v.*) was chosen to succeed him. During this period the foreign policy of France has limited itself to colonization and to development of military resources with a view to possible recovery of the provinces lost in the Franco-German war. See FRANCE, HISTORY OF, in the Appendix.

AUTHORITIES.—Of the works narrating nearly or quite the entire history of France the most important are Martin, *Histoire de France* (16 vols., 1855–60); Michelet, *Histoire de France* (17 vols., 1833–66); and Guizot, *Histoire de France* (6 vols., 1870). Of Martin and Michelet parts only have been translated and published in English. Guizot appeared in English simultaneously with the French edition. Of works on special periods Guizot's *Histoire de Civilisation en France* (also in English) is of the first importance for the period of the Middle Ages. For the same period Coulanges's *Histoire des Institutions politiques en France* is also very important. For the period of the Reformation the works of Mignet, Baird, Poole, White, Freer, Segretain, Poirson, Robson, and Chéruel are important. For the period of the Revolution the number of works is too great for enumeration. Of the first importance, however, are the writings of Lanfrey, Tocqueville, Thiers, Blanc, Taine, von Sybel, Mignet, Alison, Carlyle, and Jung. For the post-revolutionary period the most useful works are Viel-Castel, *Histoire de la Restauration*; Blanc, *Histoire de Dix Ans*; Hillebrand, *Geschichte Frankreichs von der Thronhesteigung Louis Philippes bis zum Falle Napoleon III.*; Guizot's and Tocqueville's *Memoirs*; Delord, *Histoire du Second Empire*; Jerrold, *Life of Napoleon III.*; Van Laun's *The French Revolutionary Epoch*; and Adams's *Democracy and Monarchy in France.* For a fuller bibliography, see Adams's *Manual of Historical Literature.*

Revised by C. K. ADAMS.

Francesca, fraan-ches'kaa, PIETRO, della: painter; b. at Borgo San Sepolcro, in Italy, in 1398. He was also called Pietro Borghese after his father. He first painted several small pictures for the Duke of Urbino, which excited great admiration. He then went to Pesaro, Ancona, and Ferrara, where he decorated many rooms in the old palace, now destroyed. At Ferrara there are only the frescoes of the chapel of St. Augustine still remaining, and they are spoiled by the damp. Nicholas V. invited him, together with Bramante, to work in the Vatican, and here his work was also destroyed, as Raphael painted over the frescoes. After executing his commission in Rome Francesca returned to Borgo San Sepolcro, where he produced exquisite work, as also at Arezzo and at Loreto, with Domenico Veneziano. This great painter lost his eyesight at the age of sixty, and gave himself up to the study of mathematics. He was the first to lay down the principles of perspective and to imitate in painting different effects of light, to note intelligently the muscles in the nude figure, to prepare models in clay to paint the figures from, and to study drapery on them by putting it on wet. D. in 1484. W. J. STILLMAN.

Franche-Comté, fraansh'kōn'tā': one of the old provinces of Eastern France; now divided into the three departments of Doubs, Haute-Saône, and Jura.

Franchise [from O. Fr. *franchise*, freedom, privilege; deriv. of *franc, franche*, free, whence Eng. *frank*]: in law, a particular privilege conferred by government on individuals or corporations which does not belong to the citizens of a country generally by common right. In Great Britain the varieties of franchise are very numerous, and include such rights as these: to have wrecks, estrays, treasure-trove, or forfeitures; to hold fairs or markets; to establish and maintain ferries; to have a forest, chase, park, warren, or fishery, etc. In the U. S. the classes of these special privileges are greatly reduced in number, and they are, almost without exception, vested in corporations. The most usual and important are the privileges of maintaining ferries, bridges, turnpikes, railways, telegraph and telephone lines, and the right to be a corporation for any purpose.

Nature of a Franchise.—A franchise is created either by express legislative grant or by prescription, which presupposes a grant, and hence is of the nature of an agreement or contract between the State and the grantee or possessor of the franchise, and the latter thereby assumes certain obligations as a consideration for the rights which the former confers upon him. The rights accruing under this contract are generally included in law among incorporeal hereditaments. But as it is usually conferred upon a corporation, which is regarded as having a perpetual existence, it can scarcely ever be said to pass as an inheritance. It has, however, this quality of inheritance when vested in an individual, and it clearly indicates the nature of a franchise as a right of property, an incorporeal hereditament being regarded as real estate.

Duties or Obligations Imposed upon the Grantee.—The duties which are imposed upon, or the obligations assumed by, the grantee of a franchise depend upon the nature of the franchise bestowed. He must in any case use his privileges only in the way and to the extent contemplated in the grant, and in the exercise of these is governed by the law of the land. In the case of grants which bestow privileges, the exercise of which consists in rendering some service to the public for a consideration, the obligations assumed are to serve the public in the way and to the extent which he may reasonably be supposed to have agreed to do in accepting the franchise. Thus if the privilege be to construct and maintain a common highway or provide any means of public transportation, there is annexed to the grant a power of taking tolls from those who enjoy the superior facilities afforded, as a means of remuneration; and the owner of the franchise must in return provide proper accommodations for the public, take all reasonable measures to promote the safety and comfort of travelers, and be ready at all proper time to give them passage. For any violation or neglect of these duties he may be made to respond in damages, or he may even be deprived entirely of the power with which he had been intrusted.

Rights of the Grantee.—The rights of the grantee of a franchise are the same as those which he would have in the case of any other property, subject, of course, to the limitations imposed by the act bestowing it, and those arising from the nature of the particular franchise. As is said above, the franchise is in the nature of a contract, and the rights of the grantee are such as arise from the terms of the contract, and may be protected and enforced in the same way and to the same extent as any other rights of a like nature. Thus a corporation having a franchise to maintain a public ferry may obtain damages from any one illegally interfering with their full enjoyment of the franchise, and enjoin any further acts of interference. On the other hand, as an example of the limitations upon the rights of the grantee arising from the nature of a franchise, may be mentioned the principle, established by the weight of authority, that a corporation can not mortgage, sell, or transfer its franchises unless expressly authorized thereto by the Legislature, although on this point the cases are not all agreed. It is fair, however, to assume that in granting a franchise to be a corporation the State has regard to the character of the grantee, and it is not unreasonable to hold that as a due performance of the corporate duties is the consideration of the grant of a franchise, any contract which disables or prevents the corporation from discharging its functions, by undertaking without the consent of the State to transfer to another the rights and powers conferred by the charter, and to relieve the grantee of the burden which the charter imposes, is void as against public policy.

For the same reason it is held that at common law the franchises of a corporation can not be seized and sold on execution. Creditors can not so enforce their claims as to render the corporation incapable of performing its public duties. The common law, however, has been changed by statutes, so that, generally, on the foreclosure of a railroad mortgage the purchaser acquires the right to operate the railroad; and many charters, and the general laws of many of the States, expressly authorize corporations to mortgage or alienate their franchises. When a mortgage or transfer of corporation franchises is made without the authorization of the State, it may be ratified by subsequent legislation.

Rights of the State or Government against the Grantee.—So long as the grantee of a franchise performs the obligations assumed under the franchise, the State is subject to the same limitations and restrictions as respects depriving him of it, or destroying it, that exist with respect to any other species of property. In the U. S. the Dartmouth College case established the principle that the grant of a franchise in the charter of a corporation creates a contract the obligation of which is protected by that clause of the Constitution of the U. S. which declares against impairing the obligation of contracts by subsequent legislation. But in many charters, or acts of incorporation, there are various provisions which are regarded as matters of law and not of contract, and which are therefore subject to modification or repeal; and there are certain rights of the State or Government subject to which it is held that all franchises are granted, even though expressly excepted from their operation by the terms of the grant.

One of these is the right of *eminent domain*, in the exercise of which a State may always destroy or take away a franchise for the creation of other franchises or public works, upon making adequate compensation. (See EMINENT DOMAIN.) An interesting question has frequently arisen in the courts as to whether the Government in creating other franchises which would not directly destroy or divest any previously existing right of the same kind, but would seriously interfere with its exercise and diminish its value, as by establishing a new ferry or bridge in the immediate neighborhood of another, is infringing upon the franchise first granted in such a manner as to entitle the grantee to compensation. It has been asserted by some jurists that at common law any such infringement upon franchises was a nuisance, which might be prevented by injunction or be made the subject of an action for damages. But the U. S. courts have decided that there is in such cases no violation of proprietary rights, and that the State is under no obligation to make recompense. Public grants are to be construed strictly, and no implications of the kind under consideration are to be annexed to them. In some instances express terms are inserted excluding all interference within a specified distance, and a protecting stipulation is thus made expressly a part of the contract, which the State can not violate without making compensation.

Another right of this nature is that of exercising the *police power*, subject to which franchises are always granted. The courts have settled it that the police power of States can not be bargained away.

A third is the right to *alter legal remedies*. Every franchise is held subject to legislation affecting remedies; yet the State must give some remedy, and one which is substantially equivalent to that which was provided by law when the franchise was granted. Any law which under the pretense of changing the remedy really would deprive the grantee of some right for which he contracted in accepting the franchise would be unconstitutional, as being an impairment of the obligation of contracts.

The right to amend or repeal a charter bestowing a franchise is now, however, reserved in nearly all cases by the State. But even where this is the case the reserved power to amend or repeal has its limits. The power to alter or modify a charter is not an arbitrary power, but is restrained to the powers and franchises granted by the charter. The courts hold that the alterations must be reasonable, and that they must be made in good faith and be consistent with the scope and object of the act of incorporation. It does not reserve the right to change the object of the incorporation, or to substitute another for it. An alteration or modification is necessarily of the grant or thing to be altered or modified, and can not be done by substituting a different thing.

Remedies.—There are three remedies available for the enforcement of the public duties of a corporation: *mandamus*, *quo warranto*, and indictment. A corporation may be compelled by *mandamus* to perform duties specifically and plainly imposed upon it. *Quo warranto* is a proper remedy in cases of usurpation or illegal uses of franchises.

In political law the word "franchise" is used as an equivalent to the right to vote for candidates at a public election. The right of citizens of the U. S. to vote is now, to a certain extent, guarded by the U. S. Constitution, which provides (Fifteenth Amendment) that it shall not be denied or abridged by the U. S., or by any State, on account of race, color, or previous condition of servitude, and that Congress shall have power to carry this provision into effect by appropriate legislation. See VOTE.

Franchise Tax: See FINANCE.

Francia, fraan'chaa, FRANCESCO: painter; b. at Bologna in 1450; his family name was Raibolini. Of artisan extraction, he was placed with a goldsmith, and learned the art in all its branches to perfection. He was especially successful with coins and medals, was made director of the Bolognese mint, and designed all its coins during the government of the Bentivogli and of Julius II. Having made the acquaintance of Mantegna, he became anxious to paint, and in 1490 he produced his first picture for the Misericordia, a

Madonna in oil-color. Giovanni Bentivoglio, admiring this picture, made him paint him another Madonna for one of his chapels, and invited him, together with other Ferrarese masters, to paint in his palace. He soon became a famous and very popular painter, and received commissions from Lombardy and Tuscany, while his works in his own country are very numerous. His Madonna pictures were especially famous. He died in 1517.—His son GIACOMO, born at the end of the fifteenth century, was his father's pupil, and his works are sometimes taken for Francesco's. W. J. STILLMAN.

Francia, fraan'sē-ăā or (Span. pron.) fraan'thē-ăā, JOSÉ GASPAR RODRIGUEZ, called Dr. Francia: dictator; b. in Asuncion, Paraguay, in 1761. His father was a Brazilian named França, who had settled near Asuncion. José Gaspar graduated in canon law at the University of Cordova, and became an advocate in his native town, holding some minor public offices; he acquired a reputation for great learning among the ignorant people, but attained no real distinction before his fiftieth year. When Paraguay revolted against its Spanish governor (May 15, 1811), Francia was made a member of the governmental junta; he quickly became the leader, and from that time was virtually ruler of Paraguay. The country formally separated from Buenos Ayres Oct. 12, 1811, and Francia and Fulgencio Yegros were chosen consuls. Yegros, from the first, was a cipher in the government. In 1814 Francia was made dictator for three years, and in 1817 dictator for life. He ruled as an absolute despot, without ministers, and with no other law than his own will. Business and agriculture were managed as he directed, and in fact the whole country was treated as a private domain and the people as serfs. His policy was to cut off Paraguay from intercourse with the outside world, and to make it self-supporting; to this end foreign commerce was almost prohibited; Paraguayans were not allowed to leave the country, and the few foreigners who entered it were kept there for years. Several real or imagined conspiracies against him were put down by the imprisonment and execution without trial of scores of persons. His own friends were persecuted. D. in Asuncion, Sept. 20, 1840. HERBERT H. SMITH.

Franciabigio, fraan-chăā-bee'jō, properly **Francesco di Cristofano**: a Florentine painter; b. 1482; a pupil of Albertinelli. He afterward became an imitator of Andrea del Sarto, and in a friendly way often tried to compete with him. In the cloister of the Annunziata he painted a *Marriage of Our Lady* beside certain works of Andrea, which compared well with them, though it was never finished, for the monks angered him by uncovering it before the right time, and he injured it with a hammer and left it unfinished. At Scalzo and Poggia a Caiano his work was again executed beside that of Andrea, and although he does not equal him, no one can deny his having great gifts. D. in 1524. W. J. STILLMAN.

Fran'cillon, ROBERT EDWARD: novelist; b. in Gloucester, England, in 1841. He was graduated at Trinity Hall, Cambridge, in 1862, and admitted to the bar in 1864. Of his numerous novels the best known is *Under Slieve-ban* (1881).

Francis I.: King of France; b. at Cognac, Sept. 12, 1494; son of Charles, Count of Angoulême; succeeded his cousin and father-in-law, Louis XII., Jan. 1, 1515. In the following July he set out for the conquest of the Milanese territory. He won the great battle of Marignano, the "battle of the giants" (Sept. 14–15), and was knighted on the field by Bayard. In 1519 began his rivalry with Charles V. in the contest for the imperial crown and the control of Italy. In June, 1520, he met Henry VIII. of England on "the field of the cloth of gold," between Guisnes and Ardres. In 1522 he began the war against the emperor, the pope, and England, most unwisely attacking at once Navarre and the Netherlands. Prosper Colonna, at the head of the Italian troops, rapidly dispossessed Francis of his Italian possessions, except Cremona; the French were routed in Navarre; and on the eastern frontier the only advantage was the check given to Charles at Mézières. Meanwhile, the English invaded the north; the constable Bourbon went over to the enemy; Bonnivet was driven out of Italy; Bayard was slain, Provence overrun by the Germans, and the queen died. Francis, however, rapidly cleared Provence of his enemies, and followed them into Piedmont, but was defeated and captured at the great battle of Pavia, in 1525. He was kept a close prisoner at Madrid for one year; but England, Venice, Rome, and Genoa demanding his release, the emperor liberated him, after exacting the most humiliating conditions. The war was at once renewed in Italy; Rome was sacked by the constable Bourbon, the pope imprisoned, but the French army under Lautrec was destroyed before Naples by a loathsome disease hitherto unknown in Europe. In May, 1529, both parties were exhausted, and the Peace of Cambray ensued, though the war broke out afresh in 1534 and 1542, each time with apparent but not permanent advantage to France. The latter part of the king's reign was marked by terrible persecutions of the Protestants, in which many thousands of his subjects were either slain or banished. Francis died at Rambouillet, Mar. 31, 1547.

Francis II.: of France; b. at Fontainebleau, Jan. 19, 1543; the son and successor of Henry II.; in 1558 married Mary Queen of Scots, the niece of the Guises, who when he came to the throne in 1559 swayed completely the policy of the court, and renewed the persecution of the Huguenots, especially after the discovery of the conspiracy of Amboise. The reign is taken up with court intrigues, in which the queen-mother, Catharine de Medici, and the Guises struggled for the mastery, which the former finally secured at the time of the king's fatal illness. Francis died at Orleans, Dec. 5, 1560.

Francis I.: Emperor of Germany; b. Dec. 8, 1708; succeeded his father, Leopold, as Duke of Lorraine in 1729, and in 1735 received Tuscany in exchange for Lorraine. In 1736 he married the Archduchess Maria Theresa. In 1741 he was declared co-regent with his wife, and in 1745 was chosen emperor. Most of his attention was given to Tuscany, and Maria Theresa was the true sovereign in Germany. D. at Innspruck, Aug. 18, 1765.

Francis II. of Germany and **I.** of Austria: son of Leopold II. and grandson of Francis I.; b. at Florence, Feb. 12, 1768; succeeded his father in 1792, in which year war was declared against him by France at the beginning of the Revolution. Napoleon's brilliant operations in Northern Italy followed, and the Treaty of Campo Formio (1797) robbed him of Belgium, the Milanese, and part of the Rhine provinces. In 1799–1800 he joined Russia and Great Britain in another war, but Moreau in Germany and Napoleon in Italy (Marengo, June 14) brought this war to a termination favorable to France in 1801. In 1804 Francis took the title of Emperor of Austria, joined the third coalition of 1805, and was compelled by the calamities of Ulm and Austerlitz to renounce his title of Emperor of Germany (1806), together with his claim to Venice and the Tyrol. This was the end of the Holy Roman Empire. In 1810 his daughter, Maria Louisa, was given by him in marriage to Napoleon. He joined the allies, and took part in the battle of Leipzig and the occupation of France in 1813. Napoleon's final overthrow left Francis stronger than ever before. He became a leading figure in the Holy Alliance, and Austria's name was for years after the symbol of despotism and reaction against liberal politics. D. at Vienna, Mar. 2, 1835.

Francis I.: King of the Two Sicilies; b. at Naples, Aug. 19, 1777; became Duke of Calabria in 1799; succeeded his father, Ferdinand I., in 1825, having previously been associated with the constitutionalist and revolutionary party, and attempted constitutional government in Sicily. Nevertheless, his reign was one of cruel tyranny and corruption. D. at Naples, Dec. 8, 1830.

Francis II.: of the Two Sicilies (FRANCESCO D'ASSISI MARIA LEOPOLD); b. at Naples, Jan. 31, 1836; succeeded his father, Ferdinand II. (Bomba), in 1859, and adopted his father's reactionary policy. His realm was invaded and quickly overrun by Garibaldi's forces in 1860, and when Gaeta, his last stronghold, was surrendered (1861), Francis escaped to Rome and later to France, where he lived in retirement, though for a time he organized fruitless expeditions against the new kingdom of Italy. D. Dec. 27, 1894.

Francis Borgia, SAINT: general of the order of Jesuits and Duke of Gandia; b. at Gandia, Spain, in 1510: early showed an inclination for the monastic life, but his father, thinking to divert him from that career, placed him in the court of the Emperor Charles V., whom he accompanied on his African expedition. The emperor made him Viceroy of Catalonia, but Borgia entered into correspondence with Loyola, and in 1546 resolved to join the order of Jesuits, of which he became general in 1565. His zeal as a preacher and worker on behalf of the order caused him to be styled its "second founder." D. in 1572 and was canonized by Pope Clement X. in 1671.

Francis Ferdinand: heir to the Austrian throne; son of the Archduke Charles Louis by his second wife, Princess

Marie Annonciata, daughter of Ferdinand II., King of the Two Sicilies; b. at Gratz, 1863. By the suicide of the Crown Prince Rudolph, Jan. 28, 1889, Charles Louis became heir to the throne, but renounced his rights of succession in favor of his son.

Francis, James Bicheno: hydraulic engineer; b. at Southleigh, England, May 18, 1815. He went to New York in 1833 and soon after was engaged on railroad surveys in New England. In 1834 he was associated with George W. Whistler in the hydraulic improvements near the city of Lowell, Mass., and in 1837 he was appointed chief engineer for the proprietors of the locks and canals on Merrimack river. He held this position until 1884, and later was consulting engineer on the same work. He made many important experiments on turbine wheels, on weirs, and on the flow of water in tubes, which have been of great value to the engineering profession. The results of these are mostly given in *Lowell Hydraulic Experiments* (1855; republished with additional data in 1868 and 1883). He was also the author of many papers in technical journals, and of a work on *The Strength of Cast-iron Columns* (1865). During 1881 he was the president of the American Society of Civil Engineers. D. Sept. 18, 1892.

Francis, John M.: journalist and diplomatist; b. in Prattsburg, Steuben co., N. Y., Mar. 6, 1823. After receiving a common-school education he was at the age of fourteen put as apprentice to the printing business. In 1843 he was employed as editor of the *Wayne Sentinel* at Palmyra, N. Y. After studying law for some months he became in 1845 leading editorial writer of the Rochester *Advertiser*, and in 1846 performed a similar service for the Troy *Budget*, of which he was afterward editor and associate proprietor. After serving on the Troy *Post* and the Troy *Whig*, he established the Troy *Times* in 1851, and was afterward controlling proprietor of that journal. In 1871 he was appointed by President Grant U. S. minister to Greece, which position he resigned Nov. 17, 1873. Became U. S. minister to Portugal, July 7, 1882, and was minister to Austria-Hungary 1884–85. D. at Troy, N. Y., June 18, 1897.

Francis, John Wakefield, M. D., LL. D.: b. in New York, Nov. 17, 1789; graduated at Columbia College in 1809; in 1811 received his medical degree at the New York College of Physicians and Surgeons; published with Dr. Hosack (1810–14) the *American Medical and Philosophical Register*; in 1813 became Professor of Materia Medica in Columbia College and lecturer in the College of Physicians and Surgeons; went to Europe and studied under Abernethy; returned to New York, and held in the last-named school successively the chairs of the Institutes of Medicine, of Medical Jurisprudence, and of Obstetrics; was Professor of Obstetrics in the Rutgers Medical College 1826–30. D. in New York, Feb. 8, 1861.

Francis Joseph: Emperor of Austria and King of Bohemia, Hungary, etc.; b. Aug. 18, 1830; son of the Archduke Francis Charles and nephew of Ferdinand I., whom he succeeded in 1848. The Franco-Italian war of 1859 and the Prusso-Italian war of 1866 despoiled him of his Italian possessions, but the Treaty of Berlin, 1878, allowed him to annex Bosnia and Herzegovina. In July, 1890, his daughter, the Archduchess Valérie, was married to the Archduke Francis Salvator. The emperor's only son, the Crown Prince Rudolph, having committed suicide on Jan. 28, 1889, the emperor's brother, the Archduke Charles Louis, became heir, but he relinquished his right of succession in favor of his son, the Archduke Francis Ferdinand, who therefore is heir-apparent. See Francis Ferdinand.

Francis (Saint) **of Assisi**, as-see'see: founder of the orders of Franciscans in the Roman Catholic Church; was b. in 1182 at Assisi, and named Giovanni Bernardone, but called Francesco by his father Pietro, a rich merchant who traded much with France, because of the child's proficiency in the use of the French language. He was a thoughtless, gay youth, and served as a soldier against the troops of Perugia, but was taken prisoner and confined for a year, 1201–02. This imprisonment, and a consequent sickness, led him to make a vow to renounce the world—a vow which he soon forgot. But warned, as he conceived, by a voice from heaven, he took a final vow of poverty, and formally refused all inheritance in his father's property, 1205. He now begged money for the repair of the churches, washed the feet of beggars and lepers, and kissed their sores, clothed himself in a robe of serge sewed with packthread and tied about the waist with a rope; ate the meanest food, and covered it with ashes, and wept and fasted almost continuously; slept on the ground, and used a stone for a pillow. In 1209, having a few personal followers, he drew up a monastic rule for them, which was in 1210 approved by Innocent III., and in the same year Francis was made a deacon, the highest clerical position he would receive. In 1212 he was joined by St. Clara and her two sisters, the original Clarisses or Poor Clares of the Order of St. Francis. In 1219 he joined the crusaders at Damietta; in 1221 he founded the Tertiary Order. On Sept. 17, 1224, as is asserted, he had a vision of Christ, and received upon his hands, feet, and sides the *stigmata*, or marks resembling the wounds of Christ. (See Stigmatization.) Among his numerous reputed miracles was the healing of the infant Bonaventura, afterward a distinguished saint. St. Francis died in Assisi, Oct. 4, 1226, and was canonized in 1228. See his *Life* by Mrs. Oliphant (London and New York, 1871; n. e. 1877). His *Works* appeared in English translation (London, 1882).

Francis, Sir Philip, K. B.: politician; b. in Dublin, Oct. 22, 1740; was the son of Philip Francis (1700–73), an Anglican clergyman and translator of Demosthenes and Horace. Young Philip entered public life in 1756, under the patronage of Henry Fox (see Holland, Lord), as a placeman in the state department, and held afterward various places in the civil service at home and abroad until 1772. He was a member of the council for Bengal 1774–80, and the constant opponent of Hastings, by whom he was badly wounded in a duel. He entered Parliament in 1784, and finally left it in 1807. At present he is chiefly remembered as perhaps the author of the *Junius* letters. (See Junius.) D. in London, Dec. 22, 1818. None of his acknowledged writings are now important.

Francis'cans [from Mediæv. Lat. *Franciscus*, Franciscan, deriv. of *Franciscus*, Francis, liter. Frankish, deriv. of *Francus*, a Frank], **Minorites** [deriv. of Lat. *minor*, less] (*Fratres Minores*), **Gray Friars** (in England and Ireland), sometimes called also **Seraphic Brethren**: one of the great mendicant orders of the Roman Catholic Church; dates from 1209, when Francis of Assisi (*q. v.*), its founder, was joined by two companions at the Church of Sta. Maria degli Angeli, which was afterward called by him "Portiuncula," "little inheritance." In that same year the order was provisionally sanctioned by Innocent III., commended to the favor of the fifth Lateran Council in 1215, and finally established by Honorius III. in 1223. The rule was given in 1210. The female order of Clarisses (Poor Clares), which took its rule from him in 1224, dates from 1212. His Tertiaries date from 1221. And so he is called the founder of *three* orders. Mediæval Europe owes much to the Franciscans. They went everywhere, and were like flames of fire wherever they went. First of all, they roused the masses. Poor men, wearing nothing but brown frocks girded about the waist by bits of rope, brought the gospel home to the poor. By and by they made themselves felt in every walk of life. Assisi became the acknowledged capital of Christian art. Thomas de Celano, author of *Dies Iræ*, and Jacopone da Todi, author of *Stabat Mater*, were both of them Franciscans; pontiffs like Nicholas IV., Alexander V., and Sixtus V. were Franciscans; but, above all, some of the greatest and best of the schoolmen, such as Roger Bacon, Duns Scotus, Bonaventura, Alexander of Hales, and Ockham, belonged to the same order. The war between Thomists and Scotists was still more a war between Dominicans and Franciscans. Even in the lifetime of St. Francis strife arose in regard to the strictness of the rule. The extreme asceticism which originally inspired the order has repeatedly reacted against its declining discipline. Hence such temporary offshoots as the Cæsarines (1236–56), the Celestines (1294–1307), and the Clarenines (1302–1506). The Capuchins (dating from 1525) are still in existence. Hence also, especially, the great schism of 1368, which established the two branches of milder Conventuals and more rigorous Observants. The numerical strength of the order was greatest about fifty years after its foundation, when it had between 7,000 and 8,000 convents and nearly 200,000 monks. In the fifteenth century it declined, and was again greatly weakened near the close of the eighteenth century. At present the number of monks is nearly 100,000, and they are found in almost every part of the world.

The literature of the subject is voluminous. See Léon, *L'auréole séraphique, vie des saints et bienheureux des trois* *ordres de St. François* (Paris, 1883, 4 vols.). Cf. the history of the order, called the *Annales Minorum*, by Luke Wadding (2d ed. Naples, 1731–1860, 24 vols.).

Revised by S. M. Jackson.

Francis de Paul, Saint: b. at Paola, in Calabria, in 1416; became a Franciscan in youth, but assumed the life of a hermit near his native town. He soon acquired a wide fame by the terrible austerities of his life, and his reputed miracles brought to him many followers. In 1436 he established the order of Hermits of St. Francis, afterward called Friars Minims, Bon Hommes, and Fathers of Victory, which has now only a few members. In 1482 he visited Louis XI. of France, who hoped in vain to be cured by him of his long and at last fatal illness. He remained in the service of Charles VIII. and Louis XII. of France, and died at Plessis-les-Tours, Apr. 2, 1507. He was canonized in 1519.

Francis de Sales (Fr. pron. -saal'), Saint: b. at the Château de Sales, near Annecy, Savoy, Aug. 21, 1567, of noble parentage; was educated at Paris and Padua, and in the latter university became a doctor of theology and of laws; practiced law reluctantly, and at last won his father's consent to his entrance upon the clerical life, and as deacon and provost of the cathedral of Geneva won fame as an eloquent preacher; became a priest in 1593; went on a mission to Savoy, whence in 1598 he procured the expulsion of certain Protestant ministers. He was then sent by the pope to convert Beza, to whom he offered a cardinalate, but all in vain. In 1599 he became coadjutor, and in 1602 Bishop of Geneva. In 1610 he founded, with Madame de Chantal, the order of the Visitation, with the mother-house at Annecy. D. at Lyons, Nov. 28, 1622. He was distinguished for zeal, charity, purity, eloquence, and personal excellence. He was canonized in 1665, and made œcumenical (the eighth Latin) doctor of the Church in 1877. His complete works appeared in six volumes, Paris, 1868: in Eng. trans. London, 1883, *sqq.* (vol. iv., 1889); his *Introduction to the Devout Life* is one of the most famous devotional treatises, and has been translated into all literary languages, e. g. Eng. trans. New York, 1885. See his *Life* by J. P. Camus (n. e. London, 1880).

Francis Xavier, zăv'i-*er*, Saint Francisco de Xavier: Jesuit missionary; b. of a noble family at the castle of Xavier, in Navarre, Apr. 7, 1506; was educated at the Collège Sainte-Barbe, Paris; taught philosophy with applause in the College of Beauvais, and received the doctorate in philosophy from the Sorbonne (1530). In 1534 he joined the new society proposed by his fellow-student and compatriot Loyola, and in 1537 they, with a few others, the germ of the future Society of Jesus, went to Rome and received the papal benediction upon their new enterprise. He now toiled with zeal in the Italian prisons and hospitals, and in 1541 was sent by Loyola to Goa, India. During ten years in India, Ceylon, Japan, and Malacca he baptized, it is said, more than 1,000,000 persons, and planted the faith in fifty-two kingdoms. He died of fever, in the island of Hiang-Shan, near Macao, China, Dec. 2, 1552, and was canonized in 1622. Many miracles are ascribed to him by Roman Catholic writers. See the *Life* of this saint by D. Bartoli (1666; Eng. trans. London, 1858); by the Protestant H. Venn (London, 1862); and by the Roman Catholic H. J. Coleridge, with his *Letters* (1872–73, 2 vols.).

Franck, fraank, or (as he styled himself) **Franck von Wörd**, Sebastian: mystic and historian of the Reformation era; b. at Donauwörth, 1499; embraced the Reformation but not any of its sects, although inclined to the Anabaptists. He pursued a checkered literary career in Nuremberg, Strassburg, Ulm, and Basel, and died in the last-named city, 1543. His best-known writings are his *Chronica* (Strassburg, 1531) and *Sprichwörter* (Frankfort, 1541). See his *Life* by O. Haggenmacher (Zürich, 1886).

Francke, fraan'k*e*, August Hermann: German Lutheran divine and philanthropist, and one of the principal propagators of the Pietist movement in Germany; b. in Lübeck, Mar. 22, 1663; commenced his studies at Erfurt 1679, continued at Kiel, and finished them at Leipzig in Hebrew, Greek, and theology. He delivered theological lectures in Leipzig 1689–90, was *diakonus* in Erfurt 1690–91, but was summarily dismissed in consequence of his criticisms upon the "orthodox" clergy; in 1692 was called to the new University of Halle as Professor of the Greek and Oriental Languages, and as pastor of the suburban town of Glaucha. Breithaupt and Lange were his associates in the faculty and in the spirit of practical energy in which he followed up the work of Spener (*q. v.*). In 1715 he became pastor of the Church of St. Ulrich in Halle. He was founder of the greatest orphan-house of Protestant Europe, of a free school, a free table for students, and of a seminary for teachers. In 1698 these institutions were brought together in one great edifice in the city of Halle. The whole was sustained by private beneficence or by the judicious labor connected with the orphan-house. Among its useful appendages was a publishing establishment, from which were issued many valuable books, especially the cheap Bibles of the Canstein Institute. After his death, in Halle, June 8, 1727, the work was carried on by his son and by Frelinghausen, his son-in-law; but he can by no means be held responsible for the separatistic tendencies which then became visible. The best biographies of Francke are by H. E. F. Guericke, Halle, 1827 (translated into English, London, 1837); and G. Kramer (Halle, 1880–82, 2 vols.).

Franco-German War: the conflict between France and Germany which occurred in 1870–71. Under the statesmanlike leadership of Bismarck, Prussia wholly gave up, in 1866, its modest and somewhat ambiguous attitude of former days, and on the basis of the very decided impression which its victory over Austria produced it took the hegemony in Germany. But thereby the old enmity between France and Prussia was immediately rekindled. The government of Napoleon III. could not but feel depressed by reason of the astonishing success of Prussia. It was itself based on the success of its foreign policy. Its important reforms in the field of political economy had found only a cold reception, and Napoleon understood that it would be very difficult for him to maintain himself as Emperor of France when he could not maintain the French empire as leader of Europe. Perpetually stirred up and irritated by the opposition, the national feeling of France began to rise against a ruler who suppressed her freedom without increasing her fame and power. The French people felt its pride offended, and the cry was heard, "Revenge for Sadowa!" Thus after 1866 the imperial government tried its utmost to put the French army with the greatest possible rapidity on a footing which would enable it to declare war against Prussia, while at the same time it endeavored by diplomatic means to gain such concessions from Prussia as might look like compensations for the aggrandizement of that power. It failed, however, in both plans. The introduction of the Chassepot guns was carried through with great rapidity; at the end of 1869 the entire body of infantry was provided with this weapon. But the reorganization of the army met, in general, with so much opposition from the side of the representatives of the people that, especially after the death of the energetic Marshal Niel, only a few reforms of any consequence could be effected. By the army law of Feb. 1, 1868, presented and carried by Niel, the time of military service was fixed at five years in the active army and four years in the reserve, and an active national guard was formed, in which all those who bought themselves off from military service, or who remained after the annual conscription (100,000 men) was filled, were compelled to serve. On paper the active army and the reserve amounted, according to this law, to 900,000 men, and the national guard, which was to be used for the defense of the frontier, to 550,000. But how small a part of this immense army was actually mobilized and fit for battle the year 1870 showed.

The attempts at inducing Prussia to yield and surrender territory were entirely frustrated by the proud but prudent stubbornness of Bismarck, who after 1866 began to show himself not as a Prussian minister, but as the Chancellor of the North German Confederation and a German patriot. In Aug., 1866, he declined an offensive and defensive alliance offered through Benedetti, which stipulated that Prussia should consent to the annexation of Luxembourg and Belgium to France, and France recognize the appropriations which Prussia had made and the intimate connection with Southern Germany which she wished to accomplish. During the following years he several times refused similar propositions which were made to him under different forms, and in the spring of 1867 he took so decidedly a national position in the Luxembourg question that France, not yet ready for war, was compelled to stop short of her demands. Napoleon having, May, 1867, appointed Gramont Minister of Foreign Affairs in the cabinet of Ollivier, from that moment the French policy assumed a more warlike course, especially influenced by the Empress Eugénie, who was entirely under the control of the Jesuits.

Soon after the question of the Spanish crown furnished the issue. On July 3, 1870, Marshal Prim, the president of the Spanish ministry, communicated to the court in Paris that Prince Leopold of Hohenzollern had declared himself willing to accept the royal crown of Spain, and the imperial government could not tolerate such a success of Bismarck's policy. On July 4 the French *chargé d'affaires*, Le Lourd, who represented the French Government at Berlin during the absence of the ambassador, Benedetti, appeared in the office of the foreign ministry of the North German Confederation and set forth the painful impression which the candidature of Prince Leopold had made in Paris. The Under-Secretary of State, Von Thiele, answered that the question did not at all concern the Prussian Government. The next day the Duke de Gramont declared in the Corps Législatif that no foreign power would be allowed to disturb the balance of the political system of Europe, and slight the interests and the honor of France, by placing one of its princes on the throne of Charles V. This declaration—which, however, was severely attacked by the opposition, especially by Emanuel Arago, Crémieux, Picard, and Jules Favre—produced great excitement in the whole nation, and attracted serious attention from all other powers. In Germany both the press and the people in general remained perfectly calm, partly because they confided fully in their own power and the wisdom of the Prussian Government, partly because they did not believe that the French really desired a war. The French Government, however, persevered in the course it had assumed. On July 9, Count Benedetti appeared before King William, who was at Ems, and proposed, in his peculiarly insinuating manner, that the king as chief of the house of Hohenzollern should command the prince to withdraw his acceptation of the Spanish crown. But King William, although unguided by his ministers, felt immediately the consequence of this seemingly unimportant question, and gave an answer which conformed to his dignity without offending France. He emphasized that he had given his consent to the prince's acceptance of the crown, not as King of Prussia, but as chief of the family, and he declined to recall the consent. On July 11 the French ambassador repeated his demand in a more impressive manner, even threatening Prussia with war, but he received the same answer from the king. Once more he returned to the same topic (July 13, in the morning), and when the king told him that the prince had renounced the Spanish crown on the previous day of his own free will, the ambassador asked him to declare publicly that he approved of the renunciation, and would not permit any resumption in the future of the candidature of the prince. Such a declaration—given, for instance, in the form of a letter to the Emperor Napoleon—would be necessary in order to still the excitement of the French people. This demand the king refused, and dispatched to Bismarck an account of what had been done. Bismarck, seeing it would be the best moment for wholly repudiating the French pretensions and beginning the war he held to be inevitable, published the facts, which roused the nation to a high pitch of excitement. Gramont, the French minister, laid a distorted representation of the previous negotiations before the Representative Assembly (July 15), alleging a gross affront offered to the French ambassador; and, although vehemently opposed by some members, especially by Thiers, the Assembly voted, nearly unanimously, 500,000,000 francs for the war. This was the actual declaration of war; the formal followed July 19.

Meanwhile the Government of the North German Confederation had taken the possibility of war under consideration. On July 11 a council of ministers was held at Berlin, presided over by the Minister of War. The question of taking some preparatory steps was debated, but, in full confidence of the perfect working capacity of the army organization, it was decided not to give any pretext for war by preliminary arming. The council knew that even if the South German states did not participate in the war, the North German Confederation could send to the frontier within two weeks an army of 511,826 men, with a reserve of 265,082 men in garrison and 180,672 men of the second call; thus placing a force of 975,256 men, including the staff, against the French army. Count Bismarck, who was on his estate at Varzin, repaired to Berlin on July 12, and the same day Gen. von Moltke arrived from Schweidnitz. On the 15th the king left Ems for Berlin, and on arriving at the Brandenburger station, where he was received by the Crown Prince, Bismarck, Moltke, and Roon, he heard of the vote of the Representative Assembly in Paris. He gave immediate orders for the mobilization of the whole army of the North German Confederation. The next day the Federal Council assembled, and the Parliament was called for July 19. In Southern Germany the French challenge produced, contrary to French expectations, the same outburst of patriotic enthusiasm as in the North. Louis II. of Bavaria took the lead in this national movement, and ordered the mobilization of his army (July 16). Baden, Hesse, and Würtemberg followed the example. The question hardly came up whether or not a *casus fœderis* existed; the South German states joined the North German Confederation by the force of a natural instinct.

The rash challenge of France had made the European nations believe that her army and navy were ready to strike a blow at the very first moment, yet France was slow and Germany quick. Moreover, the diplomatic actions of Bismarck contributed to a general neutrality and to sympathy with Germany. He made known to the world, through a notice in the London *Times* (July 25), and through a communication of July 28 to the German ambassador in London (Count Bernstorff), the proposition of common land-robbery which the French Government had made to him from time to time, and the denials of Benedetti and Gramont he disproved (Aug. 10) by communicating a letter of Aug. 6, 1866, from the former, containing a project of re-establishing the frontiers of France as they existed in 1814.

If Napoleon had ever had a plan of operations, he was soon compelled to give it up on account of the state of his army and the attitude of Southern Germany. It can not be doubted that even before the first battles were fought a complete lack of plan and decision reigned at the French headquarters. On July 14 the reserve was called in, but while the greatest exertions were made to collect a strong force on the German frontier, the bad organization of the army and the defective system of its mobilization caused an indescribable confusion in all military branches and on all the railways and at the stores of supplies. The whole force on the French side was ranged in the front line—that is, all the corps which were ready for battle at the end of July and in the beginning of August—numbered hardly more than 250,000 men. And this force, moreover, was dispersed in the following manner: First Corps, 37,440 men and 120 guns, under MacMahon, was at Strassburg; next to it was the Fifth Corps, 28,080 men and 90 guns, under De Failly, at Bitsch; to the left, opposite Saarbrücke, was the Second Corps, 28,080 men and 90 guns, under Frossard; the Third Corps, forming the reserve of the Second, 37,440 men and 120 guns, was at Metz, under Bazaine; and to the left of this, at Diedenhof (Thionville), was the Fourth, 28,080 men and 90 guns, under L'Admirault. The Sixth Corps, 37,440 men and 120 guns, under Canrobert, was concentrated at Châlons; the guard, 17,280 men and 72 guns, under Bourbaki, at Nancy; and the Seventh Corps, 27,360 men and 90 guns, under Douay, at Belfort. Napoleon later on asserted that this arrangement was based on the idea of forming a strong army at Strassburg to push rapidly forward toward the Main. Be this as it may, it is certain that the corps stood too far apart when the fight began to give each other sufficient support.

In Germany the state of affairs showed quite another aspect. Even the mobilization of the army exhibited a superiority which later on became evident also in its strategic and tactical management. It was decided, although an early French invasion was not anticipated, that all the different army-corps should be put in complete war-trim in their garrisons, while small bodies of troops should try, by clever operations on the frontier, to produce an impression of their being strong corps. The plan succeeded completely. The French were deceived with respect to the strength of the German garrisons along the frontier, and in the last week of July three powerful armies were formed, undisturbed, at Coblentz, Mentz, and Mannheim. The first army, under Gen. von Steinmetz, numbered 61,000 men and 180 guns. It formed the right wing, with Coblentz for its headquarters. The second army, under Prince Frederick Charles of Prussia, numbered 206,000 men with 534 guns. It formed the center, with its headquarters in Mentz. The third army, under the Crown Prince of Prussia, numbered 180,000 men with 480 guns, and formed the left wing. Thus the force of the first line amounted to 447,000 men and 1,194 guns. The commander-in-chief was King William of Prussia, and his chief of staff was Gen. von Moltke. In his suite were the chancellor, Count Bismarck, the Minister of War, Von Roon, and the quartermaster-general, Von Podbielski. The commander-in-chief of the French army was Napoleon III.

On July 30 the strategical evolution of the German army on the Rhine was finished, and the march toward the French frontier, which as yet the French had not crossed, began.

The firing between the French outposts and the German vanguard began Aug. 4 at Weissenburg, on the left wing, army of the Crown Prince, and the French were defeated, Gen. Douay himself being killed. As soon as the news of this defeat reached Marshal MacMahon he determined to throw immediately all disposable troops against the German, and he chose a position at Wörth, with 50,000 men. But on Aug. 6 the Crown Prince attacked and defeated him. The French lost 9,000 prisoners, 2 eagles, 6 mitrailleuses, and 35 guns, besides 6,000 wounded and dead.

The news that the flower of the French army, the African troops, under the best general, had been completely vanquished, filled all Germany with proud confidence, and destroyed every hope of alliance which Napoleon still might entertain. And the French were defeated on the same day not only on the right, but also on the left wing, at Saarbrück.

The defeat in the field caused an immense reaction politically. The empress issued a proclamation in which the defeat was acknowledged, and firmness and order were urgently entreated. The acting Minister of War presented a decree which asked for the enrollment of all active citizens between thirty and forty years of age in the stationary national guard, the employment of the national guard of Paris in the defense of the capital, and the enlistment of all citizens under thirty years of age into the active national guard. The official journal of the 8th gave a picture of the reigning despair; it besought all the peoples of Europe to stand by France. All unmarried men between twenty-five and thirty-five years of age, who before had been legally free of military service, and widowers without children, were now called in, unless already enrolled in the national guard. Companies of volunteers were also to be formed. The regency considered necessary even the measure of expelling all Germans living in France.

Meanwhile, the German armies streamed over the frontier into France, pursuing the advantages already gained. Wheeling around to the right, the first army proceeded very slowly, the third very rapidly. On Aug. 13 the royal headquarters were in the castle of Herny, 15 miles from Metz. It was believed that the French Rhine army would give battle at Metz on the 15th.

On the French side the greatest confusion prevailed. Bazaine became commander-in-chief instead of the emperor, Garras took the place of Le Bœuf as chief of staff. A council of war was held on the 13th, and determined that the army, which was encamped entirely on the right bank of the Moselle, and under the protection of the guns of Metz, should retreat on the next day to Verdun. Early on the 14th the retreat began. But as soon as the commander of the German outpost, Maj.-Gen. von Goltz, observed the enemy's movements in the afternoon, he advanced his brigade immediately and made an attack. A real battle developed—the battle at Courcelles. It was very bloody; the French lost about 4,000 men, the Germans about 5,000; but the latter were victorious, and pursued the enemy to the glacis of the fortress.

The next day gave the German army time to approach the enemy's line of retreat. Only the First Army-corps remained to watch Metz from the E.; the Seventh and Eighth were pushed near to the Moselle, S. of Metz, and the whole Second Army was to try to reach as rapidly as possible the road from Metz to Verdun. This operation was effected by Prince Frederick Charles. Bazaine had ordered that the retreat should begin on the morning of the 16th, and take place along both the roads leading to Verdun, and in the meanwhile Napoleon had left Metz under a strong escort. At 9.30 A. M. the French outposts noticed the approach of the enemy, and almost immediately after the German regiments of cavalry fell on the bivouacs of the French cavalry. A great battle developed—the battle of Vionville or Mars-la-Tour. It was the most bloody in the whole war. On the French side 120,000 men, on the German 60,000, were under fire. The loss on each side comprised about 16,000 men, dead and wounded. But it frustrated the intended retreat to Verdun, and compelled Bazaine to remain at Metz. On the 17th he went back and took up a defensive position. After ascertaining that the French had left their positions, the King of Prussia ordered a new attack on Aug. 18. It was intended that the right wing should engage the enemy first, then the center should attack, and at last the left wing was to strike a decisive blow by its pressure on the right flank of the French army. The decisive point of this battle (battle of Gravelotte or St.-Privat) was St.-Privat. Here the circuit of the Saxons forced the French to yield at 7 P. M. On the French left wing the battle lasted still longer; the victory was gained here by the arrival of the Second German Army-corps. The losses were very heavy. The French, numbering about 140,000 men, lost 609 officers and 11,605 men; the Germans, numbering 211,000 men, lost 904 officers and 19,658 men. The result of the battle was that the French army was shut up in the fortress of Metz. The German commander-in-chief ordered the investment of Metz, and disposed of the First and Second Army, under the command of Prince Frederick Charles, for this purpose. From this force, however, the Fourth and Twelfth Corps, the Guards, and the Fifth and Sixth Cavalry divisions were separated and formed into a Fourth Army, under the command of the Crown Prince of Saxony, who was now to push forward toward Paris, together with the Crown Prince of Prussia and the Third Army. On the French side the first plan was that the army of Châlons should retreat to Paris, but the regency feared that the return of Napoleon, who accompanied this army, would occasion a revolution in Paris; and it also hoped that MacMahon would be able to relieve Bazaine at Metz. For these reasons Count Palikao, now Minister of War, ordered Marshal MacMahon to break up at Châlons with his army, now numbering 140,000 men, and move northward in a circuit around the German army toward Metz. MacMahon broke camp at Reims on the 23d. On the 27th the outposts fell in with the vanguard of the German army, and a cavalry encounter ensued at Buzancy. On the 25th the movements of MacMahon were noticed by the Germans, and the Third and Fourth Armies, which were pushing forward to Paris, and then in the neighborhood of Châlons and Vitry-le-François, were immediately ordered to march to the right. On the 26th both armies wheeled around to the N., and followed MacMahon in forced marches in order to place themselves between him and Metz. They marched rapidly, while the French army had made only 60 miles in six days. On the 29th MacMahon removed his headquarters to Raucourt, and the army began to cross the Meuse at Mouzon.

Meanwhile, the two German armies, which were drawn nearer together, and already had adopted the plan of pressing MacMahon toward Belgium, came in contact with the right flank and front of the French, and by the encounters at Nouart and Beaumont on the 30th threw parts of the French vanguard back in confusion on the main body. On the 31st they advanced near to the army encamping around Sedan. The plan was to contract the curve still closer to the French army on Sept. 1, and to attack on the 2d. It was observed, however, that the French were in a wavering and uncertain condition, so that their crossing the Belgian frontier seemed by no means improbable; and for this reason the king ordered the attack on the army of MacMahon, which was very densely concentrated around Sedan, on the next morning. At the dawn of Sept. 1 the German army commenced its attack (Sedan), and soon it grappled the French army, which was concentrated on a narrow space, in shape like a pair of tongs. The battle began at Bazeilles, and drew E. of Sedan farther and farther to the N.; in the beginning of the battle the French army had lost its commander-in-chief. MacMahon, severely wounded by a splint from a shell, gave up the command to Gen. Ducrot, from whom Wimpffen reclaimed it as the senior officer. Thus the command and the plan changed several times. It was the idea to break through the German lines somewhere, in order to afford an escape for the emperor, and he himself sought for a long time on the battlefield for such an opportunity; but the undertaking was evidently hopeless, and the army, as well as its leader, had to submit to its frightful fate. Shortly after 3 P. M. offers to conclude a capitulation were made from the French side. Napoleon sent the following letter to the king: "As I have not fallen at the head of my soldiers, I surrender my sword to Your Majesty." When this letter was brought to the king by Gen. Reille, adjutant-general to the emperor, the king demanded the capitulation of the French army as the first condition, and declared that he then would accept the imperial sword, and charged the chancellor and his chief of staff with the necessary diplomatic and military negotiations.

In the forenoon of Sept. 22 Gen. Wimpffen concluded the capitulation of Sedan, by which 84,433 men, 39 generals, 230 officers of the staff, and 2,095 subaltern officers were surrendered into German captivity. After the conclusion of the capitulation the king and the captive emperor had a conversation of a quarter of an hour at the palace of Bellevue. Napoleon went through Belgium to the palace of Wilhelmshöhe at Cassel, which was designated as a residence for him, and the French army was sent to Coblentz, Mentz, and other German fortresses.

The news of the catastrophe, which arrived at Paris on Sept. 4, caused an immense commotion. Jules Favre and his friends assailed the regency in the Corps Législatif, and demanded the deposition of the emperor. The turbulent elements of Paris filled the streets with tumult and thronged into the hall of the Corps Législatif, which assembly they dispersed. The members of the opposition then assembled at the Hôtel de Ville and formed a provisional government of national defense. Gen. Trochu, who had been governor of Paris since Aug. 17, was elected president; Jules Favre, vice-president; Ferry, secretary. This government determined immediately on the abolition of the senate and the Corps Législatif. At 1 P. M. the empress left the Tuileries and fled to England.

Considering the capture of Paris as the most important task of the war, immediately after the capitulation of Sedan the victorious armies began to move toward the capital, and on Sept. 19 the investment of the city was complete. But the strength of the besieging army was only 122,000 infantry and 24,000 cavalry, with 622 cannon, while the army in Paris had a strength of about 400,000 men including the national guard; moreover, Paris had sixteen strong forts.

The war continued at many points—in the Vosges, at Strassburg, at Besançon, at Metz, on the Loire. Strassburg fell Sept. 27 into German hands; Metz capitulated Oct. 27 with an army of 180,000 men, who were conducted as prisoners to Germany. On the Loire Gen. d'Aurelle de Paladines with 70,000 men moved toward Paris for help, but encountered at Orleans a German army under Prince Frederick Charles, and was repulsed in November. In vain Gen. Trochu with the army of Paris made vigorous rallies in November and December; he could not break the German war-chain. In December Prince Frederick Charles defeated completely the Loire army, now under Gen. Chanzy. But in the north a French army had been created, under command of Gen. Faidherbe, and was directed to the support of besieged Paris. Gen. von Manteuffel marched against that force with 40,000 men, and defeated it on Nov. 27 at Quesnel and Mézières, again in December at St.-Quentin, and on the river Hallue, and took Rouen and Amiens. German troops reached the coast of the Atlantic. A German army under Gen. von Werder defeated the French finally on the river Lisaine, and at the same time Prince Frederick Charles defeated the last French forces in the east at Le Mans.

Now, finally, all French armies in the provinces having been defeated, the fate of Paris was soon decided. The negotiations concerning an armistice took place between Count Bismarck and Minister Favre, and Jan. 28, 1871, the armistice was concluded. An agreement was arrived at that hostilities should cease and the provisioning of Paris immediately begin. Indeed, there was great danger that a part of the population might be starved to death. A convention was concluded containing an armistice of twenty-one days and the capitulation of Paris. The armistice was considered as preliminary to peace; its purpose was the convocation of a French national assembly.

The National Assembly met at Bordeaux Feb. 12, 1871. It had to decide whether peace should be concluded or whether the war should be continued. Further resistance, however, seemed a complete impossibility. France was utterly exhausted and completely defeated; her long and desperate resistance, possible only on account of the heroism of the population, had increased her loss; 400,000 French soldiers, among whom were 11,860 officers, were in captivity; about 100,000 men were disarmed in Switzerland, and the army of Paris would, according to the convention, also have to go to Germany as prisoners of war if hostilities were recommenced. Furthermore, the active troops were in a miserable state. Not only all the officers, but also all the trained soldiers, had either become prisoners by the great capitulations of Sedan and Metz, or they were wounded or dead. The active troops consisted of recruits led by a few generals. Not only in quality, but also in number, they were inferior to their adversaries. On Mar. 1, 1871, the Germans had on French soil 569,875 infantry and 63,465 cavalry, with 1,742 guns, and in Germany was an army of 250,000 men under arms. The eight French corps numbered not more than 250,000 men. An immense quantity of war-material had fallen into German hands—1,835 field-pieces, 5,373 heavy guns, and over 600,000 small-arms. Furthermore, all important strategical points were in the possession of the German army, and it held Paris in its hands. Under such circumstances all parties in the National Assembly, with very few exceptions, agreed that peace was necessary. On Feb. 13 the provisional government of national defense transferred its power to the Assembly; and on Feb. 17 the chief of the executive power of the French republic, the former minister of Louis Philippe, Adolphe Thiers, was sent to the German headquarters at Versailles, where King William of Prussia, who had been crowned Emperor of Germany, had resided since Jan. 18, to negotiate for peace. On Feb. 21 Thiers arrived, accompanied by a diplomatic committee. The armistice was prolonged to Feb. 26. The demands of the German Government were very heavy; the cession of Alsace and Lorraine, with Metz, Strassburg, and Belfort, and the payment of six milliards, were demanded. By their stubborn perseverance and by the support of the British Government the French negotiators succeeded in securing Belfort as a French possession and in getting the war expenses decreased by one milliard. On Feb. 26 the preliminary peace of Versailles was signed; Alsace and the largest part of Lorraine were ceded; five milliards were to be paid as war expenses; and German garrisons were to remain on French soil until full payment was made. Concerning the payment and the occupation, it was specially stipulated that one milliard should be paid in the course of the year 1871, and the rest in three years. The German troops should evacuate the city of Paris and the forts on the left bank of the Seine immediately after the ratification of the preliminary peace, and as soon as possible the departments Calvados, Orne, Sarthe, Eure-et-Loir, Loiret, Loir-et-Cher, Indre-et-Loire, and Yonne completely, and the departments Seine-Inférieure, Eure, Seine-et-Oise, Seine-et-Marne, Aube, and Côte-d'Or to the left bank of the Seine. After the ratification of the definitive peace and the payment of half a milliard the departments between the right bank of the Seine and the eastern frontier should be evacuated, and after the payment of two milliards only the departments Marne, Ardennes, Haute-Marne, Meuse, Vosges, Meurthe, and the fortress of Belfort, with its surroundings, should be occupied. An interest of 5 per cent. should be paid on the three milliards whose definitive payment was postponed. The preliminary peace also contained stipulations concerning the delivery of the prisoners of war and the government of the occupied French districts. This agreement was laid before the National Assembly by Thiers on Feb. 28, 1871, and accepted by 546 votes against 107 on Mar. 1. On the same day a part of Paris was occupied by 30,000 German troops. On Mar. 3 the ratifications of the preliminary peace were exchanged at Versailles, Paris was evacuated, and the removal of the German army to the right bank of the Seine was ordered. Mar. 13 the German emperor left Versailles for Berlin. May 10, 1871, the definitive treaty of peace was concluded at Frankfort-on-the-Main, and on account of the rapid payment of the war expenses the last German soldier left French soil in July, 1873. Revised by C. K. Adams.

Francolin [Fr.: Ital. *francolino*: Span. *francolin*, from Portug. *francolim*, apparently a Latinized diminutive of Portug. *frango*, cock]: a partridge-like bird of the genus *Francolinus*, or some allied genus. The francolins have rather long bills and tails, and generally a rich, variegated plumage. Thirty or more species are known, all confined to the Old World and most abundant in Africa. They are good game birds, lying well to dogs and flying swiftly and steadily. The common francolin (*Francolinus vulgaris*), once common in Southern Europe, is now extinct there, although common in Cyprus, Asia Minor, and other parts of Asia. F. A. LUCAS.

Franco'nia [Mod. Lat. from Germ. *Franken*, Franconia]: an old independent territory situated along the Rhine, the Neckar, and the Main, from whose dukes the German empire more than once elected its rulers. It underwent many changes and modifications until, at the dissolution of the German empire in 1806, it was divided between Bavaria, Saxony, Hesse, and Baden.

Franconia Mountains: the western cluster of the White Mountain group; in Grafton co., N. H.; separated from the main group by the Notch. The Franconia Mountains are not as high as the others, but the presence of little lakes adds a charm to the scenery. Mt. La Fayette, or the Great Haystack, is 5,296 feet high. Echo Lake, Eagle Cliff, the Profile Rock, Profile Lake, Bald Mountain, Walker's Falls, the Basin, the Flume, the Pool, and Georgiana Falls are attractive points. The mountains have deposits of iron ore.

Francs Tireurs, fraañk'tēē'rėr' [Fr., free marksmen; *francs*, plur. of *franc*, free + *tireurs*, plur. of *tireur*, deriv. of *tirer*, draw, shoot, fire]: a name applied during the Franco-German war to the members of the French guerrilla parties who carried on an annoying partisan warfare against the Germans.

Franeker, fraa'ne-ker: town of the Netherlands; province of Friesland; 9 miles by rail W. of Leeuwarden (see map of Holland and Belgium, ref. 2–G). Its university was founded in 1585, abolished by Napoleon in 1811, and in 1816 transformed into an athenæum. It was a very celebrated institution in the days of Vitringa, Hemsterhuis, and Valckenaer. The town possesses the planetarium made by Eise Eisinga, one of its citizens, in the years 1773–80. Pop. (1890) 7,198.

Frangipani, fraan-jee-paa'nēē: a once illustrious family of Rome, having also allied lines of the same name in Naples and Croatia. The family is traced as far back as the seventh century, and even claims to date from pagan Rome. During the eleventh, twelfth, and thirteenth centuries the name, already illustrious, became one of the most splendid in Italian annals, but rapidly declined thereafter. The name, it is claimed, signifies the "bread-breakers," from the charities of its founders.—Among its prominent members were CENCIO, a Ghibelline of the twelfth century; GIOVANNI, in the thirteenth century, a soldier and founder of the Neapolitan line; CORNELIO (d. 581), a great Friulian advocate, living at Venice; CLAUDIO CORNELIO, his son (1533–1630); NICCOLÒ, a Venetian painter of the sixteenth century; FRANZ CHRISTOPH, a Croatian conspirator (1630–71).

Frank, FRANZ HERMANN REINHOLD, D. D.: Lutheran theologian; b. in Altenburg, Germany, Mar. 25, 1827; studied at Leipzig; became professor at Erlangen 1857. Author of *Die Theologie der Konkordienformel* (4 vols., Erlangen, 1858–65); *System der christlichen Gewissheit* (3 vols., 1870–73, a treatise on apologetics, making regeneration the condition of certainty; translated into English, *System of Christian Certainty*, Edinburgh, 1886); *System der christlichen Wahrheit* (2 vols., 1878–80; 2d ed. 1885–86; a treatise on dogmatics, defending conservative Lutheranism according to modern philosophical methods); *System der christlichen Sittlichkeit* (1884–87, 2 parts; a treatise on ethics); *Vademecum für Angehende Theologen* (Leipzig, 1892). Among other numerous writings is a minute examination of the theology of Ritschl (1888; 3d ed. 1891).

Frank, JACOB, properly *Jankiew Lebowicz*: Jewish adventurer; b. in Southern Galicia, Poland, 1712. His father was a rabbi; he himself joined the sect of the Cabbalists, but started a movement of his own, proclaiming himself the promised Messiah, and attracted many followers. In 1756 the sect came under the ban of the synagogue for alleged immoralities. He then professed Christianity, and with 1,000 followers was baptized. Reviving his old pretensions he made his headquarters in Warsaw, gave himself out as Christ, and chose twelve apostles. This conduct brought him into trouble, and he was imprisoned from 1760 to 1763. His followers remained faithful, and he removed to Brünn, in Moravia, where he lived in princely style until 1786, when he was driven out. He then went to Offenbach, in Hesse, kept up the same mode of life, and there died Dec. 10, 1791. See H. Grätz, *Frank und die Frankisten* (Breslau, 1868).

Frankalmoign, frăngk-ăl-moin' [from Anglo-Fr. *franc almoigne* (= O. Fr. *franc almosne*), free alms]: in English law, the tenure, chiefly of lands, by spiritual service, as where a sole or aggregate corporation holds an estate of some private person, who gives it to God as free and perpetual alms. Tenures by frankalmoign were forbidden to be created after the eighteenth year of Edward I., but there are in England many examples dating from before that time, now chiefly ecclesiastical foundations or parish glebes. Frankalmoign implied no fealty or service, as did some other similar tenures.

Frankenthal, fraan'ken-taal: town of Bavaria; in the Palatinate; 7 miles by rail S. W. of Worms (see map of German Empire, ref. 6–D). A canal 60 feet wide and 3½ miles long puts it in communication with the Rhine. It has a bell-foundry, machine-shops, important sugar-refineries, and a large trade in lumber, iron, and wine. Frankenthal appears in the eighth century as the village of Franconodal. It suffered in the Thirty Years' war, and in 1688 was captured by the French, who burned it Sept. 13, 1689. Pop. (1890) 13,008.

Frankford: a former borough, now part of Philadelphia, Pa., in the northeast part of the city; separated from the main portion of the city by Tacony Creek. It has a celebrated asylum for the insane and important manufactures. See PHILADELPHIA.

Frankfort: city and railway center; capital of Clinton co., Ind. (for location of county, see map of Indiana, ref. 5–D); 46 miles N. W. of Indianapolis; in a fertile agricultural region. It has railway car-shops and is supplied with natural gas. Pop. (1880) 2,803; (1890) 5,919; (1900) 7,100.

Frankfort: city; Marshall co., Kan. (for location of county, see map of Kansas, ref. 4–H); on Mo. Pac. R. R., and on Vermilion river; 78 miles W. of Atchison. It is situated in a grain-producing region and has good water-power. Pop. (1890) 1,053; (1900) 1,167.

Frankfort: city; capital of Kentucky and of Franklin County (for location of county, see map of Kentucky, ref. 3–H); situated in a group of hills on both sides of the Kentucky river, and on the Louisville and Nashville and the Kentucky Midland Railways; 65 miles by rail E. of Louisville. It

State Capitol, Frankfort, Ky.

is noted for the picturesqueness of its scenery and the fine drives in the vicinity. It contains a fine public-school building, a high school, a seminary for young ladies, an institution for the training of feeble-minded children, gas and water works, manufactures of lumber, carriages, furniture, and twine, a cotton-mill, a barrel-manufactory, a pottery, flouring-mills, several distilleries, and the State prison. The Capital Hotel, of stone, was erected at a cost of $120,000. The Frankfort Cemetery is very beautiful, and in it repose the remains of many of Kentucky's great and gallant men. Nearly all the various benevolent orders have lodges in the city, and the Odd Fellows own a handsome temple. Pop. (1880) 6,958; (1890) 7,892; (1900) 9,487.

Frankfort: village; Benzie co., Mich. (for location of county, see map of Michigan, ref. 5–H); on the east shore of Lake Michigan; 40 miles N. of Manistee. It is a terminus of the T., A. A. and N. M. Railway, which connects with the G. B., W. and St. P. Railroad at Kewaunee, Wis., by a commodious car-ferry. The village is situated in a great fruit-growing district, and has 3 churches, a fine school, 2 foundries, a planing-mill, 3 sawmills, a shingle-mill, mineral springs, and one of the finest harbors on Lake Michigan. Pop. (1880) 782; (1890) 1,175; (1900) 1,465.

EDITOR OF "EXPRESS."

Frankfort, Council of: a synod noted in church history for its condemnation of Adoptianism, the heresy which asserted that Christ was the Son of God as to his human nature only by *adoption* (see ADOPTIAN CONTROVERSY); and its decided action against the worship of images. It was called by Charlemagne A. D. 794, and, according to Dupin (*Eccles. Hist.*, cent. viii.), was attended by 300 bishops, who came from Germany, Gaul, Spain, Italy, and England, besides two delegates from the pope. See Hefele, *Conciliengeschichte*, iii., 635, *seq.*; Landon, *Manual of Councils*, s. v.; and J. I. Mombert, *Charles the Great*, pp. 327–334.

Frankfort-on-the-Main [Germ. *Frankfurt-am-Main. Frankfurt* is from Germ. *Franke*, Frank + *furt*, ford]: city of Prussia; province of Hesse-Nassau; situated on the right bank of the Main, and connected with the suburb Sachsenhausen, on the opposite bank, by seven bridges, the oldest of which, a stone bridge of fourteen arches, was built in 1340 (see map of German Empire, ref. 5–D). The city proper is as beautiful as it is interesting. It is entered by seven large gates, two of which, the Gallus Thor and the Eschenheimer Thor, have been preserved in their old form; the other five are buildings of modern style. But the walls and the ditches which formerly stretched between these gates have been transformed into charming promenades, where splendid villas and resorts of amusement alternate with almost rural surroundings. Among its public squares are the Rossmarkt, with the monument of Gutenberg, designed by Launitz, and the Götheplatz, with the statue of Goethe by Schwanthaler. Among its public buildings the most remarkable are the Römer, or town-hall, an old building, in whose *Wahlzimmer* the electors met, and in whose *Kaisersaal* the elected emperor gave his first banquet; and the Cathedral of St. Bartholomew, a Gothic structure begun in 1238 and finished in the sixteenth century, in which the coronation of the German emperors took place. The city is well provided with educational and charitable institutions, contains a fine zoölogical garden, and has manufactures of sewing-machines, perfumery, chemicals, straw hats, etc., extensive banking-houses, and important commercial interests. Leipzig has superseded it in the book-trade, but as a moneyed center it still occupies the principal place. It is the richest city of its size in the world and the banking-house of Germany.

On account of its geographical position, Frankfort early attracted attention. It was a favorite residence of Charlemagne. In 1257 it was made a free city. After the days of Frederic Barbarossa it became the place for the election of the German emperors, and by the "Golden Bull" (in 1356) Charles IV. transformed this custom into a right. Napoleon made it the capital of a great principality. In 1848 and 1849 the German Parliament sat here; but the city sided with Austria in the war of 1866, and consequently lost her autonomy in that year. Pop. (1900) 288,489.

Frankfort-on-the-Oder: city of Prussia; province of Brandenburg; on the Oder; 50 miles E. by S. of Berlin (see map of German Empire, ref. 4–H). It has extensive tanneries, machine-shops, foundries, manufactures of organs, sugar, starch, tobacco, cigars, paper, wooden-ware, and chemicals, and an extensive trade. Its three annual fairs have more than 10,000 visitors, especially dealers from Poland. Its university, which was founded in 1506 by the elector Joachim I., was moved to Breslau in 1811. The city was a flourishing member of the Hanseatic League; it has several times suffered severely in war. Pop. (1895) 59,161.

Frank'incense [M. Eng. *frankincens*, *franc encens*, from O. Fr. *franc encens*, free or pure incense]: any one of various fragrant gums and resins. It anciently designated the substance now known in commerce as OLIBANUM (*q. v.*), the product of a couple of African and East Indian species of *Boswellia*, small trees of the family *Burseraceæ*. The frankincense of Sierra Leone is from the *Daniella thurifera* (family *Leguminosæ*), a large mountain-tree of that region. In the United Kingdom the frankincense of the shops is nothing but common turpentine, such as is exported from the Southern U. S.

Franking Privilege [deriv. of *frank*, free; Fr. *franc*]: the right of sending letters or packages free by mail. The post-office having been originally established solely for governmental purposes, the carriage of official correspondence remained for a long time its only business. The grant to the University of Paris and the well-known concessions of the German princes to the Counts of Thurn and Taxis having placed the post in the position of a carrier for hire, free correspondence between officers of the Government and other favored persons came gradually to be regarded in the modern light of a privilege. In England the right was claimed by the House of Commons in 1660, and privately allowed to members by the crown, which had hitherto enjoyed it in connection with the entire control and revenues of the post-office. In 1839 the privilege was abolished in Great Britain by the passage of Rowland Hill's act.

In the U. S. the first appearance of the franking privilege after the assumption of the post-office by the Continental Congress was in Jan., 1776, when it was granted to all private soldiers actually in service for letters written by and to themselves. Every few years since then Congress has modified the laws governing the privilege as the increase of public business or the prevention of the improper use of the privilege required. Ordinances conferred the privilege on specified officers while in public service; others restricted or extended the privilege; public documents from every department of the Government were made subject to free carriage; newspapers were allowed free exchange with each other; the privilege was extended by special acts to ex-Presidents and their widows during life; and then these general provisions were more or less modified, and some of them abolished. The act of Mar. 3, 1845, limited the privilege to the President, Vice-President, members and delegates in Congress, the third assistant Postmaster-General, and postmasters; other officers being directed to keep quarterly accounts of postage, and to pay it from their respective contingent funds. This act was soon amended, the provision requiring accounts to be kept of official postage was repealed, and an appropriation of $200,000 for official postage made, and subsequently increased to $500,000. The free exchange of newspapers was re-established in 1851.

By the act of Mar. 3, 1863, the privilege was conferred upon and limited to the following persons and articles: the President and his private secretary; the Vice-President; chiefs of executive departments; such heads of bureaus and chief clerks as might be designated by the Postmaster-General, for official letters only; Senators and Representatives in Congress for all correspondence, documents printed by authority of Congress, speeches and proceedings therein, and printed matter addressed to them, said privilege to commence with their term of office and to continue until the first Monday in December after its close; to all Government officers for letters indorsed official and addressed to the heads of their respective departments; to postmasters for indorsed official correspondence with each other, a penalty of $300 being provided for false indorsement; to publishers of newspapers for their exchanges; and to senders of petitions to either branch of Congress. The weight of the above-named articles, excepting petitions and public documents, was limited to 4 oz. Members of Congress were also authorized to frank "seeds, roots, cuttings, and scions," the weight to be fixed by the Postmaster-General. With very slight modification this law remained in force until Jan. 31, 1873, when an act was passed abolishing the franking privilege, and declaring that thenceforth all official correspondence should be chargeable with the legal rates of postage. At the same session all laws for the transmission of free matter were repealed, and an appropriation of $1,865,900 was made for the purchase of special stamps for the use of the chief executive, heads of departments, secretary of the Senate, and the clerk and sergeant-at-arms of the House.

By act of June 23, 1874, public documents, certified as such by the signature of any member of Congress or head of department, were allowed to go through the mails at a postage of ten cents, and the *Congressional Record* for one cent; and by act of Mar. 3, 1875, the franking privilege was restored to members of the existing Congress for such documents then printed or ordered to be printed, for the *Congressional Record* or parts thereof, and for seeds from and reports of the Agricultural Department, which latter were also authorized to be sent free by the Commissioner of Agriculture. By the act of Feb. 27, 1877, special stamps or stamped envelopes for official letters were required to be prepared by the Postmaster-General and sold to the executive departments. The act of Mar. 3, 1877, abolished the use of official stamps, and provided official envelopes for the departments, with a penalty of $300 on their use for private matter, and authorized all public documents to be transmitted free by Senators and Representatives, the secretary of the Senate, and the clerk of the House. The use of the "penalty-envelopes" was by act of Mar. 3, 1879, extended to all officers of the Government except pension-agents, and to the Smithsonian

Institution. Official postage-stamps were again introduced for the State, War, Navy, Treasury, and Interior Departments and for the Attorney-General by acts of Mar. 3, 1881, Aug. 5, 1882, and Mar. 3, 1883. The latter act directs the departments to inclose penalty-envelopes in official communications to members of Congress requiring to be answered or forwarded. By act of Dec. 20, 1881, the franking privilege was granted to the widow of President Garfield. The act of Congress approved Mar. 3, 1891, extended the franking privilege by providing that "the members and members-elect of Congress shall have the privilege of sending free through the mails, and under their frank, letters to any officer of the Government, when addressed officially."

Frankish Language: See DUTCH LANGUAGE.

Franklin: city and railway junction; capital of Johnson co., Ind. (for location of county, see map of Indiana (ref. 7–E); in an agricultural district, 27 miles E. of Martinsville. It has a college, a high school with a $55,000 school-building, gas-works, planing-mills, flouring-mills, and sawmills. Pop. (1880) 3,116; (1890) 3,781; (1900) 4,005.

Franklin: town; capital of Simpson co., Ky. (for location of county, see map of Kentucky, ref. 5–F); on the L. and N. Railroad; 134 miles S. of Louisville, Ky., and 51 N. of Nashville, Tenn. It has two colleges (for males and females respectively), a woolen-factory, and two flour-mills. Pop. (1880) 1,686; (1890) 2,324; (1900) 2,166.

Franklin: town; capital of St. Mary parish, La. (for location of parish, see map of Louisiana, ref. 11–D); on railway and on Bayou Têche; 30 miles W. of Morgan City: in a region devoted to raising sugar-cane. Pop. (1880) 1,702; (1890) 2,127; (1900) 2,692.

Franklin: town and railway junction; Norfolk co., Mass. (for location, see map of Massachusetts, ref. 5–I); on New Eng. R. R., 27 miles S. W. of Boston. It is the seat of Dean Academy, and has six churches, a public library, manufactures of pianos, and straw, woolen, and cotton goods, an iron foundry, canning factory, etc. Pop. of township (1880) 4,051; (1890) 4,831; (1900) 5,017.

EDITOR OF "SENTINEL."

Franklin: city; on railway; Merrimack co., N. H. (for location of county, see map of New Hampshire, ref. 8–F); at the junction of the Pemigewasset and Winnipiseogee rivers, which form the Merrimack; 18 miles N. by W. of Concord. Franklin Falls is another village in the same township, on the Winnipiseogee river, E. of Franklin proper. The two together have six churches, large paper and pulp mills, machine-shops, wood-working shops, manufactures of hosiery and knitting-machines, several woolen-mills, and one of the largest needle-factories in the world. The New Hampshire Orphans' Home is in the township, 3 miles S. of Franklin, on the farm once owned by Daniel Webster. Pop. of township (1880) 3,265; (1890) 4,085; (1900) 5,846.

EDITOR OF "MERRIMACK JOURNAL."

Franklin: village (founded by Gen. William Schenck in 1796); Warren co., O. (for location of county, see map of Ohio, ref. 6–C); on two railways; on the Great Miami river and on the Miami and Erie Canal; 40 miles by rail N. N. E. of Cincinnati. It has 6 churches, 2 schools (one a high school), a large paper-stock assorting establishment, 5 paper-mills (with nine machines), 2 wood-pulp mills, and 3 large tobacco warehouses. Pop. (1880) 2,385; (1890) 2,729; (1900) 2,724.

EDITORS OF "CHRONICLE."

Franklin: city and railway center (incorporated in 1868); capital of Venango co., Pa. (for location of county, see map of Pennsylvania, ref. 3–B); on the Allegheny river at the mouth of French creek. It contains flouring-mills, machine-shops, planing-mills, carriage-factories, lubricating-oil refineries, illuminating-oil refineries, etc.; and its streets are provided with sewers and paved with brick. Pop. (1880) 5,010; (1890) 6,221; (1900) 7,317.

EDITOR OF "CITIZEN-PRESS."

Franklin: town; capital of Williamson co., Tenn. (for location of county, see map of Tennessee, ref. 6–E); on railway and on Harpeth river; 18 miles S. of Nashville. It has a Masonic temple, flouring-mills, a furniture-factory and planing-mill, steam cotton-gins, carriage-manufactories, etc. It is the seat of Tennessee Female College, a prosperous institution, of Harpeth Male Academy, and of other schools, some of them free. Here Gen. Van Dorn was repulsed by Gen. Granger, Apr. 10, 1863, and here, Nov. 30, 1864, a bloody battle was fought between the forces of Gen. Hood and those of Gen. Schofield. (See FRANKLIN, BATTLE OF.) Pop. (1880) 1,632; (1890) 2,250; (1900) 2,180.

Franklin, Battle of: a battle of the U. S. civil war between the Confederates under Gen. Hood and the Union forces under Gen. Schofield. After the fall of Atlanta (Sept. 2, 1864), the Confederate authorities, aware of the necessity of drawing or forcing Sherman from Georgia, determined upon an invasion of Tennessee, and on Oct. 1 Hood crossed the Chattahoochee with 40,000 men to destroy Sherman's communications. Sherman, becoming aware of this intention, severed his communications and proceeded on his famous "march to the sea." After Sherman's departure Gen. Hood continued his movement toward Nashville, frequently engaging the Union troops, under Schofield, who continued to fall back before Hood's advance, until, arriving at Franklin, Tenn. (Nov. 30), Hood followed in such close pursuit that Schofield was compelled to give battle there. Gen. Schofield's object was to get his trains across the river and away to Nashville; Hood's object was to attack before he could do so. Schofield disposed his cavalry along the north bank above and below the town to guard the fords; on the heights of this bank a part of his artillery was also placed, and one division of infantry, to cover the crossing and support the cavalry and artillery. His army numbered about 27,000 men. Four divisions were posted on the south side of the river, Wagner with two brigades occupying an advanced position. Hastily constructed breastworks were thrown up along the main line, reaching from river to river, behind which artillery was well posted. At 4 P. M. Hood attacked Wagner in his advanced position; the latter, maintaining the defense too long, was driven back in confusion, with a loss of 1,000 men, into and through the center of the main lines. Continuing the attack Hood's men penetrated within the broken Union lines, capturing eight guns. At this critical moment Col. E. Opdycke (125th Ohio), commanding the brigade of Wagner's division which had been left within the main lines without waiting for instructions led his brigade into the gap, forcing back the Confederates and recapturing the guns. Of this exploit, Gen. Thomas reported that "it saved the army from destructive defeat." Continued assaults were made by the Confederates, the battle lasting till a late hour, but each time they were repulsed with great loss. At midnight Schofield withdrew his troops and train to Nashville, suffering little molestation. The total Confederate force engaged was about 55,000 men; their losses in killed, wounded, and missing, about 7,000, including 12 general officers. The Union losses, in killed, wounded, and missing, were about 3,000, of which 1,000 were in Wagner's division.

Revised by JAMES MERCUR.

Franklin, BENJAMIN, LL. D., F. R. S.: statesman and philosopher; b. in Boston, Mass., Jan. 17, 1706. His father, Josiah Franklin, was a tallow-chandler, and was of English birth, belonging to a Northamptonshire family; his mother, the daughter of Peter Folger of Nantucket. Benjamin was the fifteenth of seventeen children. To keep him from going to sea, he was apprenticed to his brother James, a printer, and by much reading, careful and assiduous writing (as much as possible after the style of the *Spectator*), together with the unassisted study of mathematics, he acquired such knowledge and facility in writing that he ventured to print his thoughts upon public affairs in his brother's newspaper, the *New England Courant*. His papers were well received by the public, but the discovery of their authorship led to a quarrel between the brothers. The newspaper was for a time published in Benjamin's name during an imprisonment of James, to which he was subjected for political reasons. In 1723 the young apprentice, wearying of the tyranny he experienced, broke his indentures and ran away, first to New York and thence to Philadelphia, where he found employment as a journeyman printer. He was in England 1725–26, having been sent by Sir William Keith, the Governor, who promised to set him up in business as the public printer of Philadelphia, but failed to keep his promise. After his return to Philadelphia he married (1730), established the *Pennsylvania Gazette*, and soon found himself a person of the first consideration, not only in Philadelphia, but throughout the provinces, for his talents as a writer and his sound judgment in public and business affairs. He established the Philadelphia Library in 1742, and the American Philosophical Society in 1744; was prominent in founding a college which in 1753 became the University of Pennsylvania; carried on his famous investigations into the nature of lightning 1746–52, and still later resumed them; and for his papers on the subject he received the Copley gold medal and was elected F. R. S. in 1775. In 1753 he was made Postmaster-General for the colonies, and several times served efficiently as commissioner to the mother-country and to the various colonies. From St. Andrews, Oxford, and Edinburgh in 1764 he received the degree of LL. D. In 1754 he proposed a plan for uniting the thirteen colonies under a central government, under which each colony might preserve its local independence. He did his best to prevent the Revolutionary war by trying to avert the injustice which caused it; procured the repeal of the Stamp Act 1766; and ever warmly sustained the colonial rights, though by a considerable party his patriotism was somewhat later sharply questioned. In 1775 he was chosen to the Congress, and in 1776 he was one of the signers of the Declaration of Independence, having been also one of the committee to draft that instrument. He was (1776–85) employed in the diplomatic service of the U. S., chiefly at Paris, where his influence in behalf of his country was powerful and serviceable in the highest degree, and where his simplicity, dignity, and wisdom made him highly popular. He was president of the Pennsylvania supreme council (in effect Governor of the State) 1785–88. In 1787 he was one of the delegates to the convention which drew up the U. S. Constitution. D. at Philadelphia, Apr. 17, 1790.

Of the writings of Franklin, the *Busybody*, a series of admirable papers somewhat after the manner of the *Spectator*, but far more readable, and the incomplete *Autobiography*, are the best known, but his political, anti-slavery, financial, economic, and scientific papers are all noteworthy. He published the famous *Poor Richard's Almanac* (1732–57), which was extensively reprinted in Great Britain. In youth he was an avowed skeptic in religious matters, and of somewhat loose morals, but his practical good sense enabled him to correct his way of living, and he in later life treated the Christian religion with reverence, though never avowing his faith in any religious system. His wife bore him two children: a son who died in his youth, and a daughter who became Mrs. Bache.—His son WILLIAM (1729–1813) was illegitimate; was royal Governor of New Jersey (1762–76; but became a royalist, went to England, and died there.—His grandson WILLIAM TEMPLE FRANKLIN (1760–1823) was his grandfather's secretary in Paris and the editor of his writings. See Lord Jeffrey's articles, *Edinburgh Review*, July, 1806; Aug., 1817; Bancroft's *History of the United States*, vol. ix., ch. xxix.; A. Norton's article in *The North American Review*, vol. vii.; Condorcet, *Éloge de Franklin* (1790); Mignet, *Vie de Franklin*; Bauer, *Washington und Franklin* (Berlin, 1803–06); C. Schmaltz, *Leben Benj. Franklins* (1840). In 1868 a corrected edition of Franklin's *Autobiography* was published by John Bigelow, from MSS. found in Paris. See also Brougham's *Statesmen of the Time of George III.*, vol. ii.; Parton's *Life and Times of B. Franklin* (1864); Hale's *Franklin in France* (1887): Theodore Parker's *Historic Americans* (1870); and *Franklin's Works*, edited by John Bigelow (10 vols.). Revised by C. K. ADAMS.

Franklin, Sir JOHN, D. C. L., F. R. S.: rear-admiral; b. at Spilsby, Lincolnshire, England, Apr. 16, 1786; went to sea in childhood; entered the navy; served at Copenhagen, Trafalgar, and New Orleans (1815), and was wounded in the gunboat fight on the latter occasion; led Arctic expeditions 1818, 1819, and 1825; became post-captain and F. R. S. 1823; was knighted in 1829 and received the honorary degree of D. C. L. from Oxford; was governor of Tasmania 1836–43, where he was greatly beloved. In 1845 he set out on his last polar expedition in command of the Erebus and Terror. Many expeditions were sent out in search of the Franklin expedition, and from time to time various relics of it were found; and in 1859 Capt. F. L. McClintock found at Point Victory in the Arctic region conclusive documentary evidence that Franklin died near Lancaster Sound, June 11, 1847, and there is no doubt that all his men also perished, though some long survived.—Franklin's first wife, Eleanor Ann Porden (1795–1825), was a poet; his second wife, Lady Jane, *née* Griffin, was famed for philanthropy and her labor for the recovery of her lost husband. D. July 18, 1875.

Franklin, SAMUEL R.: See the Appendix.

Franklin, THOMAS LEVERING, D. D.: b. at Philadelphia, Apr. 10, 1820; graduated at the Philadelphia Classical Institute 1837; at Trinity College, Hartford, Conn., 1841; and at the Theological Seminary of Virginia 1844; entered the ministry of the Protestant Episcopal Church; was on the missionary committee of the diocese of New York 1853; and of Western New York 1869–70; founded the Jane Grey School, Mt. Morris, N. Y., 1866; was its rector 1866–70; has been active in the work of building churches and rectories, and has occupied various important pastoral charges in his Church. He is the author of a valuable work on *The Creed*, and of several important tractates on *Divorce*, in the treatment of which his canonical learning has been widely recognized. Revised by W. S. PERRY.

Franklin, WILLIAM BUEL: soldier; b. in York, Pa., Feb. 27, 1823; entered the Military Academy at West Point, June 1839; graduated June, 1843, and was assigned to the corps of topographical engineers; served with honor in the war with Mexico. In the civil war he commanded a brigade in Heintzelman's division at the battle of Bull Run July 21, 1861; commanded at the battle of West Point May 6, 1862; at the affair of Golding's Farm June 27, 1862, and at the battle of White Oak Swamp June 30, 1862; was appointed major-general July 4, 1862; commanded the left at the battle of South Mountain, Md., Sept. 14, 1862, capturing Crampton's Gap; present at the battle of Antietam Sept. 17, 1862, in command of the Sixth Corps, relieving Gen. Sumner's command after 12 o'clock; assigned to the command of the left grand division Army of the Potomac Nov., 1862, consisting of the First and Sixth Corps; commanded left wing at the battle of Fredericksburg Dec. 12 and 13, 1862; relieved from duty in the Army of the Potomac Jan. 25, 1863; assigned to duty in the department of the Gulf July, 1863; in command of expedition against Sabine Pass Sept., 1863, which was repulsed; in command of troops occupying Northern Louisiana 1863–64; in command of the Nineteenth Corps and troops of the department of the Gulf, forming the Red river expedition, in Mar. and Apr., 1864, until joined by Gen. Banks on the evening of Apr. 6; in the battle of Sabine Cross-roads, as second in command, on Apr. 7, and in the battle of Pleasant Hill on Apr. 8; conducted retreat to Alexandria; on sick leave on account of wound from June to Nov., 1864; captured on a train from Baltimore to Philadelphia July, 1864, escaping during the next night; president of a board for retiring disabled officers from Nov., 1864, to Nov., 1865; resigned as major-general of volunteers Nov. 9, 1865, and as colonel of the Twelfth Infantry Mar. 15, 1866. He was president of commission for laying out Long Island City 1871–72; president of board of commissioners for building new State-house at Hartford, Conn., 1872–73; consulting engineer of same 1874; was appointed U. S. commissioner-general for Paris Exposition of 1889. Grand officer French Legion of Honor Oct. 20, 1889.

Revised by JAMES MERCUR.

Franklin Falls, N. H.: See FRANKLIN, N. H.

Franklin Island: an island off the coast of Knox co., Me.; on the west side of the entrance to the river St. George. It has a brick lighthouse with a flashing light, standing at the north point of the island; lat. 43° 53′ 31″ N., lon. 69° 22′ 10″ W.

Franklinite [deriv. of *Franklin*, in honor of Benjamin Franklin]: a mineral found associated with red oxide of zinc, found both amorphous and crystalline, chiefly at the Mine Hill and Stirling zinc mines in Sussex co., N. J., and also found at Altenburg, near Aix-la-Chapelle, Germany. It contains from 66 to 69 parts of peroxide of iron, with from 10 to 22 parts of oxide of zinc, and about the same proportion of oxide of manganese. Franklinite is worked for making zinc paint, and the residue, itself called franklinite, is used as a raw material to manufacture *Spiegeleisen* in two works in New Jersey and one in Eastern Pennsylvania.

Franklin Lake: a body of water in Elko co., Nev., E. of the lofty East Humboldt Mountains. It is nearly fresh, very shallow, and is fed by springs doubtless derived from the mountain-snows. The *tulé* (*Scirpus validus*) grows abundantly in the lake, which has no outlet.

Franklinville: village; Cattaraugus co., N. Y. (for location of county, see map of New York, ref. 6–C); on the W. N. Y. and Pa. Railroad; 50 miles S. of Buffalo. It is the center of an important dairying section, and has 2 public schools, 6 churches, casket and canning factories, saw and grist mills, creamery, etc. Its water system is owned by the village, and it has an electric-lighting plant. Pop. (1880) 672; (1890) 1,021; (1900) 1,360.

EDITOR OF "CHRONICLE."

Frank Marriage: a peculiar species of entailed estate formerly in use under the English law (and, subject to statutory modifications, still possible to exist), consisting in a gift of land by a father or kinsman to a daughter or cousin and her husband at the time of her marriage, upon the implied condition that the land was to descend to the issue of the marriage. On birth of issue the condition was regarded as performed, and the estate became alienable. But the passage of the statute *De donis conditionalibus* caused such estates, like others held in tail, to be controlled by the terms of the gift, and to be reserved exclusively for the issue for whom they were originally intended. Such estates were afterward subjected to the same changes as all entailed estates. See ENTAIL. Revised by F. STURGES ALLEN.

Franko, SAM and NATHAN: See the Appendix.

Frankowitz, MATTHIAS FLACH: See FLACIUS.

Frank Pledge: in Old English law, the pledge of one freeman for the good behavior and obedience to law of another; the system by which each freeman of an ancient English tithing (a subdivision of a county, consisting of ten freeholders with their families) was held responsible for the conduct of their fellow-freeholders. Upon the commission of an offense by any one of them, the others were obliged to have him forthcoming to answer the requisition of the law, or, in case of his escape, to bear the burden of any penalty that might be imposed. Revised by F. STURGES ALLEN.

Frank Pledge, Courts of: formerly in England, courts held once in the year in every hundred, lordship, or manor, for the purpose of presenting by jury all crimes committed within their jurisdiction, punishing all trivial misdemeanors, administering the oath of allegiance to every freeholder attaining the age of discretion, etc. All freeholders resident in the jurisdiction, with the exception of prelates, peers, clergymen, women, and minors, had to attend. The business of these courts is now performed by justices of the peace.

Franks, Sir AUGUSTUS W.: See the Appendix.

Franks, The [the O. H. Germ. *Franchun*, Mod. Germ. *die Franken*, is a deriv. from a word for lance, **francho*; cf. O. Eng. *franca*]: a group of Teutonic tribes that in the fifth century A. D. left their homes in the low countries N. of modern France, overthrew the Roman power in Transalpine Gaul, and laid the foundation of the Frankish empire.

1. *The Name and Peoples Embraced thereunder.*—The name is of later origin than the first historical appearance of the different peoples designated thereby. The tribes embraced two and a half centuries later under this name had already, during the reign of Augustus (27 B. C.–14 A. D.), appeared upon the Rhine and in their contact with the Roman civilization been drawn into historic notice. The Bructeri, Chamavi, Amsivarii, Catti, Chassuarii, and especially the Sygambri, mentioned by the Latin historians of this period, were the tribes which formed the nucleus of the later confederation of the "Franci." They had already at that time, in small pioneer groups, pushed across to the *left* bank of the Lower Rhine, while they occupied the territory on the right from the mouth of the Ems to the Sieg and Werra. After the middle of the fourth century appear the two groups of this Frankish confederation under the names Salian and Ripuarian—the former inhabiting the districts of the Lower Rhine, Meuse, and Scheldt, and deriving its name probably from the river Sala (present Yssel); the latter inhabiting the territory of the Middle Rhine in and about the present city of Cologne, and named from its riparian situation.

2. *Their Place in Teutonic History.*—Their problem in the civilization of Europe was the mediation of the Roman-Christian civilization with the Germanic; or, better, it was theirs to receive the inheritance of the Roman-Christian culture—to form, reform, develop, and supplement it by and with the freshness and vigor of the Germanic nature, and at the same time be formed, reformed, developed, and modified by it. The sinking Roman world delivered to the Franks the world-historic inheritance which it had itself received, increased, and stamped with the forms and characteristics of its own nature; theirs it now became to take up this world-civilization, and by the developments and modifications to which they subjected it, and it them, to present it as their form of the world-civilization, and be presented by it as its first expression through the Germanic man, and so furnish the connecting link between the antique classic world, with its speculative and ritualistic religiosity, and the scientific political world of the new time, with its ethically religious views.

3. *The Characteristics and Conditions which made the Franks the First World-historic People of Germanic Nationality.*—*a. Their Geographical Position and Agricultural Nature.*—We find them as early as the middle of the fourth century separated into the two branches of Salian and Ripuarian, and occupying the fertile plains on the lower course of the Scheldt, Meuse, and Rhine. While thus the other German tribes, during the great "wandering of the peoples," separated themselves entirely from their original homes, and, spreading themselves like a thin lamina over other nationalities, were soon absorbed by and disappeared in the same, the Franks, on the other hand, maintained their geographical connection with the old Germanic home, from which they continued to draw new freshness and vigor by which to oppose the deteriorating and disorganizing influences of the decaying Roman world. Sustained thus from behind, they pushed gradually and peacefully (as compared with the warlike convulsions which the great immigration was elsewhere producing) forward, never forgetting in their new acquisitions the worth and importance of the old; settling their lands as they gained them, and reducing them to cultivation; uprooting and destroying the scanty remnants of the Celtic, and at first of the Roman-Christian, civilization; in a word, thoroughly "Germanizing" as they pressed forward.

b. Their Attitude toward the Roman State.—While the other German tribes and peoples, for the most part, waged an open and unceasing warfare with the Romans for supremacy and existence, the Franks, on the other hand, after the first brushes of conflict with the Roman commander Aetius in Gaul, who, in 428 A. D., and again in 431 A. D., checked their southwestward movement, acknowledged the political supremacy of the Roman state, occupied peacefully the land as far as the Somme by consent of the Roman commander, and tolerated the Roman rites and religion, while their king Clovis received distinguished Romans at his court; in a word, they gradually and almost unconsciously, both to themselves and their national opponents, secured to themselves the substance of power, leaving to the Romans only the outward show. And not until the Roman governor, Syagrius of Soissons, had separated himself by his own usurpatory act from the source of his authority in Ravenna or Constantinople, and thus lost in the eyes of his Roman-Gallic subjects his show of legitimacy, did the Frankish king Clovis abolish these scanty remnants of Roman supremacy, and, while extending his dominions to the Loire, joined to the substance of the power which he already possessed the outward form of sovereignty (486 A. D.). Under such circumstances neither the Roman emperor at Constantinople nor the Roman-Gallic subjects took any offense at this procedure. On the contrary, after Clovis's victory over the Visigoths (507 A. D.) the Emperor Anastasius bestowed upon him the dignity and title of a Roman patrician, and appointed him Roman proconsul in Gaul; and though the Frank owed his supremacy, for the most part, to his own good sword, yet he was by no means blind to the advantage of the legitimation of his title in the eyes of his Roman-Gallic subjects by the legitimate Roman emperor. He received the dignity with reverence, caused the ceremony of coronation to be performed upon himself, and was greeted by his subjects as consul and Augustus, thus settling all dispute between Frank and Roman in regard to the right of his sovereignty.

c. Their Attitude toward the Orthodox Romish Church.—It has already been said that the Franks in their earliest appearance on the Scheldt began to root out and destroy the scanty remnants of the Roman-Christian as well as of the Celtic culture, but that, as they proceeded toward the S. W., and occupied the lands to the Somme under the recognition of the political supremacy of the Roman governor at Soissons, this opposition to the Christian culture was changed to tolerance, which of itself gave to the Franks a very great advantage in their relation to the Roman-Gallic population as compared with the other German tribes upon Gallic soil, since these, for the most part, were Arian Christians, and unceasing in their persecution of the orthodox branch of the Church, to which the Roman-Gallic inhabitants for the most part adhered. If mere tolerance therefore produced such advantage, what if the Franks should become the outspoken defenders of Romish-Christian orthodoxy? Yea, what if they should become orthodox Christians themselves? But here was a difficulty, or rather a great series of seemingly insurmountable difficulties. In the nature and history of the Franks every presupposition and condition for such a conversion seemed to fail. First of all, the readiness to break with the past, the despair of coming to anything upon the old lines of activity, the repentance and consciousness of imperfection necessary to a change of religion, were entirely wanting—yea, inconceivable—to the young, fresh, hopeful, active Germanic nature, all glowing with the recollection of its heroes of the past, and striving to imitate them. Then, again, the Christian religion was the religion of the Romans, their national enemy. The Christian God, according to their way of thinking, gave to the Romans their victories and brought to the Germans their defeats. To become a Christian was therefore to become a Roman in sympathy—in other words, a traitor. Then, again, the principles of Christianity emphasized at that time found but little sympathy in the nature of the German. The lowly, patient, and humble Jesus was anything but his idea of a perfect manhood. A proud, vigorous, belligerent, and successful individuality was to him the only example worthy of imitation. And when one turns to the speculative and moral sides it was no better. The preliminary philosophical study and development of language necessary to convey and receive such ideas—as, for instance, the doctrine of the Trinity—were entirely wanting, while the principle of blood-revenge for injury to one's self or family was the German-heathen correspondent in morals to that of brotherly love in Christianity. Many years of contact with the Romans had perhaps, in some features, softened the bluntness of the opposition; still the Franks remained entirely true to their heathenism, and the only perceivable effect of this contact was an indifferent toleration for Christianity as one of the Roman institutions. All natural conditions were thus lacking, and nothing short of a course of events miraculous in their nature to the minds of the Franks could secure their conversion; and such a conversion must and did establish peculiar, and in some respects dangerous, relationships to the ecclesiastical power. About 493 A. D. the Frankish king Clovis took for his consort an orthodox Christian, Clotilda, daughter of King Chilperic of Burgundy, who shortly before the marriage of his daughter had been murdered by his own brother Gundobald, also king in Burgundy, and an Arian by profession. The orthodox Christians of Gaul believed that difference of creed was the cause of the murder, and it fired their souls with hatred against Gundobald. Clovis inherited by his marriage with Clotilda, according to the German law of blood-revenge, the duty of revenging the blood of his father-in-law. Here, at least, was one point of sympathy between him and the orthodox inhabitants of all Gaul. Clotilda lost no time in attempting by her persuasions to extend this sympathy on the part of her consort, but in vain. Clovis gave way only so far as to allow his first-born son to receive the Christian baptism. A few days afterward the babe sickened and died. A second was born to him, and likewise, through the persuasions of Clotilda, subjected to the Christian rite. In five days this child sickened and came near unto death. It is difficult for men of our day and way of thinking to represent to themselves the thoughts and emotions of Clovis at this critical juncture. In allowing these acts he had been a traitor to the gods of his fatherland—those gods who had rewarded with victory and success his devotion to them, and who now punished his treason. It was therefore a matter of no small moment that this child recovered, and that the Christian God thus vindicated himself (so to speak) and his power in the eyes of Clovis. Thus aroused, disturbed, and excited in spirit, the Frank neared the decisive instant. The Alemanni, a warlike German tribe occupying both sides of the Rhine from Mayence to Basel, pressed hard against the Ripuarian Franks, whose king, Sigebert, with the aid of Clovis the Salian, prepared to meet them in battle. The conflict took place in the neighborhood of the present city of Zülpich (496 A. D.). The Franks fell by thousands; complete destruction threatened them. In this moment of despair, and doubt in the power and inclination of the gods of his own worship to save him, Clovis lifted his eyes to heaven and pledged himself by an oath to receive the Christian God, the God of his Clotilda, if that God would only prove his power and favor by securing to him the victory. Then, inspired by the sublime loftiness of this wager of his faith, he plunged once more into the heat of the battle, and won. The God of the Christians had by this miracle vindicated his right and claim to the faith, the devotion, and the sword of the Frank; and the conversion was complete. Clovis and 3,000 of his followers received immediately the Christian baptism from the hand of the Bishop Rhemigius of Reims, and vowed their allegiance to the orthodox Church. The manner of this conversion was the undoubting reception by the Franks of the Romish-Christian Church in its totality as the infallible organ of the invincible God. Neither the reasonableness of the orthodox doctrine nor the examples of its votaries had produced this change in the Frankish mind, but the Christian God had proved himself the superior God of the universe in the miracle of the victory over the Alemanni, and had also manifested therein his favor for the Franks. And that was enough for him. Under his favor and by his power the Frank now felt himself invincible and called upon to subdue the world to his scepter. But the Frank knew nothing of this God save as presented by this Church through its priesthood. This Church was to him a prehistoric institution. He knew nothing of its origin or development into its then existing ecclesiastical form. The command of the priest was to him the command of the Christian God, and service to the Church was service to that God. In a word, the manner of the conversion of the Franks to the Romish-Church Christianity forestalled all distinction between that Church and Christianity, and bound the hopes of the Frank for victory and success together with faith in the invincible divine power of that Church.

Enabled thus, by their geographical position, to draw continually fresh vigor from the old Germanic home, legitimized politically by the Roman emperor in the eyes of the Roman-Gallic subjects, drawn into most intimate sympathy with the same through the bonds of a common religion, and inspired with the idea of being the favored people of the invincible God, the Franks rapidly overcame all opposition on the part of other tribes and peoples, and at the death of Clovis (511 A. D.) had extended their kingdom and sovereignty from the Garonne and the borders of Septimania to the mouth of the Scheldt, and from the Atlantic on the west to Thuringia on the east.

4. *The Merovingian Government.*—Through the long years of constant warfare and motion during the immigration of the Teutonic peoples the chief command in war and in immigration had gradually become hereditary, chiefly because, in the absence of other educational means, the father would most naturally train up his own son to the duties of the chief command. The assumption of a state of peace at the close of the "great wandering" was gradual, and the ruler in the half-nomadic war continued the ruler in peace, the military leader became the king, the *Herzog* became the *König*. The first Frankish king of whom there is any mention was Clodio, while the second, Merovius, founded the dynasty which Clovis fixed firmly in power. The government was thus, by the nature of its origin, a monarchy —not a constitutional or absolute or feudal monarchy, nor yet a military monarchy in the modern sense of that term, but the patriarchal monarchy in its most warlike type. The king's court was the central point of the government. No distinction was made between the king's private property and the state treasury. The officers of his household were *ex officio* the highest officers of the state, the majordomo at their head. The government was administered through the agents of the king—viz., counts and bishops—and these officials, as well as all servants and favorites of the monarch, were paid or rewarded by grants of land, the only species of property at hand in sufficient quantity for the purpose at that stage of Teutonic civilization. The lands thus granted were already inhabited and cultivated by a Romish-Gallic peasantry; and, since no distinction had as yet arisen between public and private functions, the king's grant of land transferred the people dwelling thereon to the political jurisdiction of the grantee—that is, exempted the inhabitants of these grants from the immediate power of the king. Of course, such an economy of the treasury must, sooner or later, result in the exemption of the entire territory of the Frankish crown from the immediate power of the king, and raise up a powerful and defiant nobility which he could not control. This cause, taken together with the conflicts engendered by the absence of any fixed law of succession within the royal family itself, and the degeneration of the Merovingian dynasty through contact with the decaying Roman world, brought the Frankish state, after an existence of more than two and a half centuries, near to its dissolution.

5. *The Carlovingian Reform.*—The Carlovingian dynasty was in its origin the ducal house of the Ripuarian Franks. This branch of the Frankish folk had remained upon the soil of the fatherland, and, though united with the Salians in the confederacy of the Franci, had preserved the Germanic freshness and vigor, while the closer contact of the

latter (the Salians) with the decaying Roman world upon Gallic soil had produced weakness and decline. As at the close of the seventh century and the beginning of the eighth the dissolution of the Frankish state became imminent, three mighty dukes of the Carlovingian house, Pepin von Landen, Pepin von Heristal, and Charles Martel, gradually and successively gathered into their own hands all political power—first in Austrasia, the more German half of the kingdom, sometimes wearing the title of major-domo, to lend the show of legitimacy, sometimes not; and then in Neustria, the more Romanic half, where, having no ducal authority, the office of the major-domo was always assumed for the sake of legalizing their sovereignty over their West Frankish subjects. By the influx of this fresh and vigorous German element the process of dissolution was checked and the unity of the Frankish state restored. The Carlovingian dukes broke the independent power of the defiant nobility; brought the royal domain back to the ownership of the crown; established the principle that the grant of crown-lands meant only the grant of the use of the same, and that only upon condition of service to the state; extended the boundaries of the kingdom; planted the Church in new places; lent their aid to Boniface in the conversion of the Thuringians, Frisians, and part of the Saxons; and successfully defended the European-Christian civilization against the terrible Moslem invasion. Not until they had virtually ruled the Frankish state for more than fifty years, and had grounded their power through these mighty achievements, did they move for the possession of the crown in their own name and right. It was Pepin le Bref who submitted this question first to an assembly of the magnates of the kingdom, and then, after receiving their approval of his design, took one more step in the legitimation of his title, which, at the same time that it accomplished most thoroughly its aim, laid also the foundation for ideas, conceptions, and claims which from that day to this have filled the centuries with intellectual contest, and oft with bloody warfare; this step was the appeal to the Roman pontiff for the recognition of his authority as King of the Franks. Upon the reception of the affirmative reply of Pope Zacharias, Pepin was crowned and anointed by the presiding bishop at Soissons in May of 752 A. D. From this time forward the unity of Church and state in the Frankish kingdom became closer and closer. The bishops exercised more and more of the functions of political officers over the inhabitants of the bishoprics. The extension of the kingdom by Pepin and Charlemagne was at the same time a missionary movement for the planting of new churches, the establishment of new dioceses, and the conversion of new peoples. At length, after the mighty Charlemagne had reduced to the sway of his scepter all the territory of Europe, from the Ebro to the Eider, and from the Frisian coast to Dalmatia and the southern shores of Italy, Pope Leo III. set the crown of the Roman emperor upon his head in the Church of St. Peter's at the grave of the apostles, and the Roman people greeted him as emperor and Augustus (Christmas Day of the year 800). With this it was said that the Roman-Christian empire of Constantine had been restored—restored as the feudal grant of the Roman pontiff to Charlemagne. It is not probable that Charlemagne himself so considered it. He undoubtedly thought that it was the Romans' way of acknowledging that which already existed independent of them. This is clearly seen in the fact that Charlemagne crowned with his own hands his son Louis the Pious as his imperial successor, without any regard to the pope. Still the manner of the origin of the imperial title gave a color and a moment to the papal assumption of the power to grant and confiscate thrones which the entire Middle Ages did not shake off. During the reign of Charlemagne (768–814) the Frankish state stood at the summit of its power and glory. But the strength and endurance of personal government always depend upon the capacity of the ruler, and when the mighty personality which created the great empire was no more, and his only surviving son, Louis the Pious—a character to wear a cowl, but not a crown—succeeded to the sovereignty, the dissolution began. The wealth of the crown and the powers of the state were squandered upon the clergy, and the latter half of the weak monarch's reign was a constant scene of conflict between his sons in regard to the succession. At length it came, after the father's death (840 A. D.), to the compact of Verdun between them (Aug., 843 A. D.), according to which the eldest, Lothair, received Italy, which he ruled already, and the district called after his name Lothairingia or Lorraine, reaching past the Rhône and Rhine to the North Sea. Louis the German received the more German portion of the empire, E. of Lothair's kingdom, and Charles the Bald, the Romano-Gallic portion W. of the same. This compact of Verdun may therefore be looked upon as the birth-moment of the three great nationalities—German, French, and Italian—whose friendships and hostilities, workings and interworkings, influences and reflex influences upon each other have formed the substantial part of European continental history for the last thousand years. The peoples out of whom these three great nationalities were to be developed had been bound together in this mighty political structure of the Frankish state. By the power of this unity, whose chief and fundamental bond was a common religion and a common Church, they had succeeded to the inheritance of all that was destined to be of world-historic value in the civilization of the Roman world. Amid all the wreck and ruin of the centuries of the "great wandering" the Church alone, of all institutions, had stood firm, and now, as the established religion of the Frankish empire, it transmitted to all the peoples of this great state-unity the culture of the Roman world, which it had accumulated and preserved. In this the Frankish state had accomplished its work in the world-historic plan. The peoples brought together to participate in a common civilization by it now separate, each to go its own way—each to develop, supplement, and work up in its own way that which it had received—each to make its own valid at the expense of the rest. The elements clash against each other; sharpen, purify, and develop, thereby, themselves and each other; fall into false connections; become again dissolved, until at last the proper affinities, positions, and relations are found, and the active, intelligent, and reflected harmony of the new time begins to appear.

Franqueville, Comte de: See the Appendix.

Franz, fraants, ROBERT: song composer; b. in Halle, Germany, June 28, 1815; received a university education, and only after long opposition secured the consent of his parents to study music; studied under the best masters, and made a special study of the works of Bach, Beethoven, and Schubert. In 1843 he published his first set of songs, which attracted the notice of Schumann, and later that of Mendelssohn and Liszt. He ranked as one of the greatest song composers Germany has ever produced, and during his lifetime he published 257 songs for a single voice with pianoforte accompaniment. During the later years of his life he gave much attention to editing the works of Bach and Händel, and his additional accompaniments to the *Messiah* occasioned much controversy in the musical world. They are elaborate, scholarly, and certainly do much toward modifying the archaic character of that work. D. in Berlin, Oct. 24, 1892. D. E. HERVEY.

Franzensbad, fraants'ens-baat: town of Bohemia; county of Eger; on railway; 3 miles N. W. of Eger (see map of Austria-Hungary, ref. 3-C). It is a celebrated bathing-place. The waters of its nine mineral springs are very efficacious in scrofulous diseases; 500,000 bottles are annually exported. Pop. (1890) 1,944.

Franz Josef Land: See the Appendix.

Frascati, fraas-kaa'tee: a town of Central Italy; 12 miles S. E. of Rome; on the slope of the Alban hills, and celebrated as a summer resort (see map of Italy, ref. 6-E). It was built, after the destruction of ancient Tusculum in 1191, on the ruins of a villa overgrown with underwood (*frasche*), whence its name. It is the seat of a bishopric and has two cathedrals, one dedicated to San Rocco, dating from the fourteenth century, and one dedicated to San Pietro, dating from the seventeenth century. Pop. 7,134. The town is now interesting chiefly on account of its palatial villas. The Villa Falconieri is the oldest of them; it was built in 1550 by Cardinal Ruffini. The Villa Mandragone is the largest; it was built in the sixteenth century by Cardinal Altemps, belongs to the Borghese family, and is partly occupied by a Jesuit school. The Villa Ruffinella, or Tusculona, also dates from the sixteenth century; it was the residence of Lucien Bonaparte, but was afterward bought by Victor Emmanuel. In the chapel are the tombs of Lucien Bonaparte, his wife, his father, and his son Joseph. The Villa Conti, formerly called Villa Ludovisi, belongs to the Torlonia family. In the Villa Piccolomini, Baronius wrote parts of his *Annales*. But the most beautiful of all the villas is the Villa Aldobrandini, belonging to the Borghese family. It contains frescoes by Arpino.

Fraser, frā'zer, Alexander Campbell, LL. D.: philosophical writer; b. at Ardchattan, Argyleshire, Scotland, Sept., 1819; educated at the University of Edinburgh; in 1846 appointed lecturer on Mental Philosophy in the New College, Edinburgh. From 1850 to 1857 was editor of the *North British Review*, succeeding Sir William Hamilton in the latter year as Professor of Logic and Metaphysics in the University of Edinburgh. Besides many valuable contributions to the *North British Review* and other periodicals, he is the author of *Essays in Philosophy* (1856), *Rational Philosophy* (1858); in 1871 he published a collected edition of the *Works* of Bishop Berkeley, with dissertations and annotations: also the *Life and Letters of Bishop Berkeley, with an Account of his Philosophy*, and in 1890 a volume on *Locke*.

Fraser, Charles: painter; born in Charleston, S. C., Aug. 20, 1782; studied law, was admitted to the bar, and practiced with such success that his art studies were suspended. In 1818 he renounced the profession of the law and devoted himself to painting. In the department of miniature he chiefly excelled, though historical subjects and landscape tempted him. His popularity in his native city was great. At an exhibition of his works held there in 1857 there were 313 miniatures and 139 paintings in oil of other styles. Mr. Fraser was a man of letters, as well as an artist. D. in Charleston, Oct. 5, 1860.

Fraser, Christopher Finlay: Canadian politician; b. at Brockville, Ontario, in 1839; studied law, and was admitted to the bar in 1865. He was elected to the Legislative Assembly of the Province of Ontario in 1872, and re-elected at each successive election up to and including that of 1890. He was provincial secretary and registrar 1873–74, and the latter year appointed commissioner of public works. He was one of the originators of the Ontario Catholic League. D. at Toronto, Ontario, Aug. 24, 1894. Neil Macdonald.

Fraser, Donald, D. D.: Presbyterian minister; b. in Inverness, Scotland, Jan. 15, 1826; graduated M. A. at University of Aberdeen 1842; studied theology at Knox College, Toronto, and New College, Edinburgh; pastor in Montreal, Canada, 1851–59; Inverness, Scotland, 1859–70; Marylebone Presbyterian church, London, 1870–92. He published *Synoptical Lectures on the Books of Holy Scripture* (3 vols., London, 1871–76; 4th ed. 2 vols., 1886; the lectures on the New Testament in Italian, Florence, 1878); *The Church of God and the Apostasy* (London); *Life of Thomas Chalmers, D. D.* (London and New York, 1881); *The Speeches of the Holy Apostles* (1st and 2d eds. London, 1882); *Seven Promises Expounded* (London); *Metaphors in the Gospels* (London, 1885); *Mary Jane, Lady Kinnaird* (London); *Sound Doctrine* (London, 1892). D. in London, Feb. 12, 1892.

Willis J. Beecher.

Fraser, Simon: See Lovat, Lord.

Fraser, Thomas Richard, M. D., F. R. S.: author and teacher; b. in Calcutta, Feb. 5, 1841; graduated at University of Edinburgh 1862; became Professor of Materia Medica there 1877; Professor of Clinical Medicine 1878; dean of the faculty of medicine 1880; and has devoted his attention chiefly to the determination of the physiological effects of drugs. He is member of several distinguished societies, and is author of *Characters, Actions, and Therapeutic Uses of Physostigma Venenosum* (1863); *The Physiological Action of Physostigma* (1866–67); *On the Connection between Chemical Constitution and Physiological Action* (conjointly with Prof. Crum Brown, 1868–69); *An Experimental Research on the Antagonism between the Actions of Physostigma and Atropia* (1870–71); *The Dyspnœa of Asthma and Bronchitis, etc.* (1887); *Strophanthus hispidus: Its Natural History, Chemistry, and Pharmacology* (1889); and many others.

Fraser River: a river of British Columbia. Next to the Columbia and the Yukon, it is the largest American river falling into the Pacific. It rises by two forks, one of which flows S. E. from near 54° N. lat. and 125° W. lon. for 250 miles, while the other flows from the Rocky Mountains (in lat 53° 25′ N., lon. 118° 40′ W.), and reaches the junction after a N. W. course of 200 miles. The union is near Fort George (about 53° 25′ N. lat., 122° 40′ W. lon.). The course of the main stream is southward for 800 miles. Large steamers ascend it for 150 miles from its mouth to Fort Hope, and at high water they can go up 12 miles farther. Large sea-going vessels mostly stop at New Westminster, 75 miles from the Gulf of Georgia. The Fraser river is chiefly important for the rich gold mines along its banks, and for its salmon-fisheries, which are of the first importance. The river flows throughout a great part of its course in deep cañons, with a rapid current. Its mouth is near the U. S. line, on the Gulf of Georgia. Fraser river affords five species of salmon, and in the spring its estuary contains millions of the *oulachon*, or candle-fish, a fine smelt (*Thaleichthys pacificus*), which is very valuable for food and oil. Along its banks there are good timber and fur regions and some fine grazing-lands. The lower Fraser valley is densely timbered.

Fraserville, Canada: See Rivière du Loup.

Fraternal Insurance Societies: associations having for their object the insurance of the lives of their members and the rendering of pecuniary aid in case of sickness, injury to person or property, and in other exigencies of life. Strictly speaking, the lodge feature is a necessary characteristic of such societies, but since the general principles underlying all organizations known as assessment or co-operative insurance societies are identical, the present article includes a brief treatment of those which lack the fraternal elements of lodge system and ritual. In Great Britain associations similar to the fraternal insurance societies of the U. S. are called Friendly Societies (*q. v.*). All assessment insurance societies, whether strictly fraternal or not, meet death-claims by levies after a death upon the members of the associations, and have the legal power to increase or lower this levy as it may seem best. *Business assessment societies*, as those which lack the lodge system are commonly called, employ agents on salary or commission to transact their business, while the strictly fraternal societies do not employ such agents except in the preliminary organization of local branches.

Nature of Assessment Insurance Societies.

"It is probable that not one person in a hundred," writes one of the Massachusetts insurance commissioners, "takes his insurance with an intelligent appreciation of the relative merits of the companies or the plans they present. The uninitiated are overwhelmed by the volubility of the agent and his audacious prophecies." There is no business involving such large financial interests as life-insurance upon which there is such general ignorance. Yet the underlying principles are very simple. Let us start with that which is easiest to understand, though not first in point of time, assessment insurance, such as prevails in fraternal associations. A considerable number of people, the greater the better in order to avoid violent fluctuations of death-rate, form an association, and agree to assess themselves sufficiently to pay the heirs of each one on death $1,000, and to pay the expenses of management. The latter may vary from $1 to $4 a year for each $1,000 of insurance carried. The assessments for death-losses or mortality cost on this plan will evidently vary with the number of deaths. In a new association, where all the members are in the prime of life and have had to pass a thorough medical examination before becoming members, the mortality may not and often does not for a few years exceed eight in a thousand. If in an association of 5,000 persons 40 die yearly and $1,000 is paid to the heirs of each, $40,000 must be paid by the 5,000, or $8 each. As some of the 40 in this illustration would die early in the year and escape assessment, the 4,960 would have to pay a trifle over $8 each, but it may be said roughly that the cost per $1,000 insurance carried, aside from costs of management, will be the same as the mortality per thousand lives. As the association grows older the rate of deaths and assessments tends to rise to over sixteen in the thousand, unless the association can gain young, vigorous recruits much faster than the general growth of population.

As a result of the experience of several hundred thousand lives, the so-called Combined Experience Mortality Table has been prepared. Though some think it puts the death-rate too high, it has been accepted as the standard by

New York and Massachusetts law. According to this table, of 100,000 persons living at the age of 20 there will die that year 729. Of 100,000 at 25 the number will be 777; at 30 it will be 842; at 35 it will be 929; at 40 the mortality is 1,036; at 45 it is 1,221; at 50 it is 1,506; at 55 it is 2,166; at 60 it is 3,034; at 65 it is 4,408, and at 70 it is 6,493.

For people of all ages to pay the same rate of assessment at the death of a member has seemed to most associations unjust to the younger members, and assessments have been, with a few exceptions, graded according to age at entrance. Many of the business assessment companies proceed one step further and assess during the youth of the association and also of the insured more than is necessary for current needs. This surplus is put into a reserve fund to be used in later years, or at least the interest on the fund, to save the need of increasing assessments. Yet full power is reserved to levy all assessments needful.

Old Line or Level Premium Insurance Companies.

Quite different is the plan of the so-called *old line* or level premium companies, against which fraternal associations were formed as a protest in the seventies. The level premium company has no right of assessment, but is legally bound to collect from every one such an equal yearly sum as will, when improved at 4 per cent. compound interest, suffice to pay the death-claims of all, as they die, after living out on the average their normal expectation of life. Given an interest and mortality table and it is a simple matter to fix the equal annual premium. Any profits earned in excess of the legal rate serve in mutual companies, and even to some extent in stock companies, to give dividends to policy-holders that will lighten their annual premiums more and more until the maturity of the policy.

The ratios of expenses of management to mean amount insured in the five largest level premium companies have been as follows on each $1,000:

COMPANIES.	1872.	1879.	1885.	1892.
The Equitable (New York)	$8 40	$7 90	$8 70	$8 50
The Mutual (New York)	4 70	5 80	6 90	10 30
The Mutual Benefit (Newark, N. J.)	5 10	4 70	5 80	7 10
The New York Life (New York)	7 80	8 10	10 80	10 50
The Northwestern Mutual (Milwaukee)	7 90	7 20	8 10	8 30

The average cost of all the old line companies doing business in Massachusetts was $8 in 1880, $9 in 1887, and $9.30 in 1892.

To fraternal societies doing business on the lodge system the expenses of management bear a much smaller ratio to the mean amount insured, averaging, in addition to between $2 and $3 per $1,000 to cover lodge dues and local medical fees, no more than 48·04 cents on the $1,000 in 15 of such associations, and 72 cents in 10 others. This disparity is due to the saving in expenses to the fraternal orders on account of the management of their own interests by the insurers through the lodge system.

Origin and Growth of Assessment Insurance Societies.

Fraternal sick and funeral benefit associations, paying usually from $50 to $100 funeral benefit and $5 a week in case of sickness, had existed and in some measure flourished in the U. S. even before the civil war. Two such now doing business in Connecticut were organized in 1821, and eleven others between 1831 and 1857. Associations on the assessment plan, however, that emphasize the life-insurance side only, date in the U. S. from 1866. At about the same time appeared the three kinds of assessment associations, business assessment companies, secret fraternal life-insurance societies with branches or lodges, and other secret fraternal life-insurance societies sometimes called fraternal orders, that were without lodges or branches, but worked entirely through a central staff of officers, as do the business assessment companies, but, unlike the latter, were confined to some class or occupation or secret fraternity, and did not employ paid agents, at least on any extensive scale, to increase membership. On Nov. 12, 1866, some members of the Masonic fraternity at Newark, N. J., organized what the historian of the movement, Mr. George D. Eldredge, considers the first assessment life-insurance company in the U. S. Many other societies of Masons and Odd Fellows immediately took up the idea.

In 1879, of 136 assessment associations investigated by the congress of assessment associations, 64 were Masonic, with 69,844 members and $120,202,588 insurance; 37 were Odd Fellows', with 36,439 members and $44,427,544 insurance; 8 were Jewish, with 22,625 members and $23,909,000 insurance. Nearly all of these associations transacted insurance business through a central office only, without branches or lodges, though the members independent of insurance belonged in most cases to fraternal lodges. For convenience we will henceforth class all such life-insurance societies as *fraternal orders without branches.* Fraternal societies transacting their business through the lodge system may for convenience be designated as *fraternal lodge life-insurance societies.* These, together with *business assessment societies,* numbered 27 in 1879, contained 120,510 members, and carried $239,346,475 insurance. These three classes of assessment insurance societies will be treated in order.

I. Fraternal Life-insurance Orders without Branches.—As the fullest investigation and comparison of fraternal orders, both with and without branches, has been made in Connecticut, and published in the report for 1891 of the Bureau of Labor Statistics of that State, Connecticut may be regarded as typical of the whole country. The *Masonic Mutual Benefit Association of Connecticut,* a fraternal order without branches, was established at Hartford in 1867 to insure the lives of Freemasons. A board of twenty-eight directors elected at the annual meeting chooses the officers. The board holds monthly meetings, calls the assessments, and conducts all the business. Any Freemason in good health is eligible to membership without a medical examination. In Class A, which pays $200 at death, the admission fees are graded from $3 under 25 years of age to from $15 to $60 at the age of 60 or over, as the directors may determine. The assessment is $1.10 on the death of a member, of which 10 cents is devoted to expenses. Class B, which pays $1,000, can be entered by members of Class A on paying an admission fee of $3 and an advance assessment of $5.50. There are graded yearly dues, according to age in this class, from $1 at 35 to $7 at 57. A reserve fund of $8,000 has already been accumulated toward the $18,000 estimated as necessary to pay the last man. The membership in 1892 was 442. The *Odd Fellows' Mutual Aid Association of Connecticut,* another typical association of this character, contained 2,858 members Dec. 31, 1891. Organized in New Haven, Nov. 16, 1867, its government resembles that of the society just described. The initiation fees are graded from nothing between 21 and 35 years of age to $10 between 46 and 50. Medical examinations and age limits were introduced a few years ago. The younger members being dissatisfied with the equal assessment of $1.15 at all ages, assessments were graded in Oct., 1887, from 60 cents on $1,500 between 21 and 24 years of age to $1.50 between 45 and 50 years inclusive.

A statistical comparison of the fraternal orders without branches and the fraternal lodge societies in Connecticut reveals the following facts: The membership of the former throughout the entire State increased but 4 per cent. from Jan. 1, 1887, to Dec. 31, 1891, while of the latter the membership increased nearly 94 per cent. during the same period. In 1891 the average size of the policy in the former was $1,351; in the latter, $1,626; and the payments for death-claims in the lodge societies were less than half those of the orders without branches, this difference being partly due to the greater age and stationary size of the latter societies, and partly to their less care, especially in their early history, in the selection of young and healthy members. While the societies with branches spent 53 cents per $1,000 insurance in 1891 on sick and funeral benefits, there are no returns under this head in the orders without branches, and probably these orders provide very little in this direction, for many of them insure only those who through membership in social secret fraternities get, in that way, such benefits. As a very partial offset to the greater expenses for death-claims of the fraternities without branches, their expenses for management in 1891 were only 95 cents, as contrasted with $1.93 on each $1,000 insurance in the orders with lodges. The difference was doubtless due to lodge expenses directly connected with insurance. The average income from initiation fees and dues per $1,000 was $3 in the fraternal societies with branches and $2.18 in the others. The receipts from death assessments were $9.79 in the former, part of which seems to have gone into the small reserve fund maintained by many of the lodge orders. The assessments for death in the other orders amounted to $14.50. The remaining $1.10 of payments under this head must have come from reserve funds or interest on such. The proportion of various occupations in the fraternal associations with and without branches is given in the following table:

OCCUPATION.	Societies with branches.	Societies without branches.
In business	21·16	40·29
In the professions	5·33	14·74
Well-paid mechanics	38·65	27·37
Lower paid mechanics	20·28	6·35
Clerks	11·20	11·25
Farmers	0·66	.....
Housewives	2·72	.....
Total per cent	100·00	100·00

It will be observed that the societies without branches have a smaller proportion than the others of business and professional men, and the same percentage of mechanics, and that they alone include farmers and housewives. The mortality in 1891 among the orders with branches was 7·9, and among the other orders 14·5. The reserve funds were $4.64 per member with the former and $10.72 in the case of the 8,751 members among the orders without lodges that made returns.

II. Fraternal Lodge Life-insurance Societies.—The *Ancient Order of United Workmen* was organized Oct. 27, 1868, at Meadville, Crawford co., Pa. Its founder was John Jordan Upchurch, a machinist, who was at that time in the employ of the Atlantic and Great Western Railroad. The order was not primarily intended as an insurance or benefit-paying organization, its more prominent feature being to provide for the adjustment of the differences arising between capital and labor. This feature of its organization, however, was soon eliminated, and the beneficiary and protective element became paramount. The society consists of subordinate lodges, grand lodges, and a supreme lodge. The subordinate lodges are under the direct supervision of the grand lodge, which is formed by representatives elected by members of the subordinate lodges. The supreme lodge, organized Feb. 11, 1873, consists of representatives elected by members of the grand lodge. The supreme lodge exercises general control and supervision over the entire order, making general laws and rulings for its government. Grand lodges enact laws and regulations governing the subordinate lodges, which must not be in conflict with the general laws and regulations of the supreme lodge. This order was the first in the U. S. to introduce through a lodge system the payment of a stipulated sum on the death of a member. In fact, it is mainly through its influence and success that assessment insurance has been established and the system demonstrated to be feasible.

The Ancient Order of United Workmen, Jan. 1, 1893, consisted of 4,618 subordinate lodges, 31 grand lodges, and the supreme lodge. Its membership at that date numbered 308,575 members in good standing. It paid to the beneficiaries of deceased members during the year 1892 $6,015,020.60, and since its organization has paid the total amount of $44,570,948.89. Its total expenses for conducting its business for the year 1892 amounted to $462,514.89. As all its policies are for $2,000 each it had at risk on Jan. 1, 1893, $617,150,000. The order levies the same assessment on all its members.

Such a burdening of the younger members can be made tolerable only by their staying in the association until they reach old age—i. e. until the young in turn pay for part of the deaths of those formerly young members, but now old. Most actuaries hold that this must tend to deter the young from joining or lead to early withdrawal, and thus the association would be abandoned to the old with a high resulting death-rate. Yet these results do not seem to have followed in the case of the Ancient Order of United Workmen, except to some extent in Ohio, Kentucky, Tennessee, California, New York, and Pennsylvania.

The average mortality rate was 11·11 for 1879 to 1883 inclusive. It was 13·79 for 1884 to 1888 inclusive, but 16·77 for 1889 to 1892 inclusive.

The average mortality rate for the whole order increased much more slowly, to wit: From 8·34, in 1879 to 1883 inclusive, to 8·93 in 1884 to 1888 inclusive, and to 9·84 in 1889 to 1892 inclusive.

The lower mortality of the order as a whole is doubtless closely connected with the fact that its membership grew 77 per cent. during 1878 to 1883 inclusive, 67·3 per cent. during the next five years, and 42·7 per cent. during 1889 to 1892 inclusive; but in the six States above referred to the growth in these three periods was respectively 88 per cent., 8·7 per cent., and 6·1 per cent.

The *Knights of Honor*, with headquarters at St. Louis, was founded in 1873, and is the second in age of the large fraternal orders. On Jan. 1, 1893, it had 127,073 members in 2,627 lodges, or 48 members in a lodge. Starting out with the admission of all healthy white males between 18 and 55 years of age, it reduced the limit to 50 in 1882, but continued to charge an equal assessment of 50 cents per $1,000 insurance at all ages up to 45 years of age at entry, and then graded it for each year, so that it was 75 cents at 49 years. But the young continued to withdraw, the membership to remain stationary or decline, and the mortality to rise, so at the supreme lodge session in June, 1892, the assessments were further graded so as to be 40 cents for those entering from 18 to 30, and then increasing for each year's age at entry until it reaches 50 cents at 34; 75 cents at 44; and $1 at 49. It was further ordered that new members should pay but one assessment a month the first six months and two a month for the next eighteen, or an average of twenty-one assessments a year for the first two years. The assessments on the other members had never exceeded twenty until 1892, when they were twenty-three. The adoption of these changes almost entirely stopped accessions from July to Nov., 1892, but during the next six months for which returns are accessible the membership had begun to grow again. There are 2,023 social non-beneficiary members, but no more such are to be admitted. The insurance policies are for $2,000, $1,000, and $500. Sick benefits are optional with the lodges. With a stationary membership since 1883 it is interesting to note how high the mortality may run. The rate has been as follows in the Knights of Honor:

Year.	Mortality.	Year.	Mortality.
1884	11·1	1889	12·7
1885	11·7	1890	14·3
1886	12·0	1891	15·5
1887	12·9	1892	16·3
1888	13·5		

The expenses of management, exclusive of lodge dues of $1.50 to $3 per $1,000, were 29·7 cents per $1,000 in 1892, and the total cost of insurance aside from lodge dues was $17.62. The cost has gradually increased to this from $13.10 in 1887.

The *Knights of Pythias, Endowment Rank*, organized in 1877 with headquarters at Chicago, had a membership Dec. 31, 1892, of 30,225, who were insured for from $1,000 to $5,000. The supreme lodge of the Knights of Pythias elects the board of control of the Endowment Rank, and allows only Knights of Pythias under 50 and over 21 years of age to join this insurance department. The assessments, payable monthly, are graded according to age at entry, and increase from 70 cents at 21 to $1 at 36 and $1.60 at 50 for each $1,000 insurance. The change to this plan from an equal assessment at all ages was made in 1884. Those who were members prior to the change are kept in a separate class on the books. In this class, which has received no new members since 1884, the mortality rose from 14·81 in 1886 to 24·18 in 1891. The mortality of the entire Endowment Rank has been remarkably constant, as appears from the following table:

Year.	Mortality.	Year.	Mortality.
1884	13·2	1889	12·10
1885	13·8	1890	12·60
1886	14·4	1891	14·40
1887	13·6	1892	13·90
1888	13·9		
Average	13·8	Average	13·25

The death-rate for the last four years has been less than for the previous five. As the insured belong to the local lodge anyway, the extra dues on account of insurance are small payments to maintain a local organization called a "section," which handles the insurance features. Members must pay monthly assessments without notice between the first and tenth of each month. The expenses, aside from small section dues, were only 42·7 cents per $1,000 insurance in 1892, and the total cost was $15. In 1888 the cost was nearly as much—$14.40.

The *Royal Arcanum*, founded in Boston in 1877, grew from 86,935 members, Dec. 31, 1888, to 137,189 members, Dec. 31, 1892, with $401,083,500 insurance in force, policies reading for either $3,000 or $1,500. The expenses of the central office in 1892 were only 23 cents per $1,000, and the entire disbursements, save local lodge dues, were $9.95. In 1887 they were $8.90. The mortality-rate, due in part to rapid growth in membership, has remained low.

ROYAL ARCANUM RATE OF MORTALITY.

Year.	Mortality.	Year.	Mortality.
1884	7·34	1889	8·1
1885	7·34	1890	9·0
1886	7·88	1891	9·0
1887	8·48	1892	8·9
1888	8·50		
Average	7·91	Average	8·75

It has risen from an average of 7·91 per 1,000 during 1884–88 to 8·75 during 1889–92. In 1883 the age limit was reduced to 55. The assessments are graded from $1 at entrance at the age of 21 to $1.38 at 30, $2.06 at 40, $3.26 at 50, and $4 at 54. No insurance lodges are allowed in the Gulf States, South Carolina, portions of Southeastern Georgia, and Western Kentucky and Tennessee. In this, as in many other fraternal orders, the lodges may pay the assessments on sick members and directly help in other ways the sick and disabled.

The *American Legion of Honor*, organized at Boston in 1878, grades its assessments on $1,000 from 40 cents for those entering under 30 to 84 cents at 50, the maximum age-limit. Policies which formerly ranged from $500 to $5,000 were reduced for new members to an extreme limit of $3,000 by the Supreme Council in Aug., 1893, to take effect Jan. 1, 1894. Weekly sick and disability benefits range from $2 on a $500 certificate to $12 on $3,000, and are limited to five weeks in a year and 20 per cent. of the certificate in a lifetime. There is an emergency fund of $500,000. Local council dues average $4 a member and $1.46 per $1,000 insurance, as the members carry an average of $2,726 insurance. The expenses of the central office in 1892 were 56 cents per $1,000, making the total local and central expenses $2.02, and the total costs were $19.40, aside from the local dues of $1.46, or, including said dues, $20.86. The mortality-rate has been as follows:

Year.	Mortality.	Year.	Mortality.
1884	9·3	1889	12·5
1885	10·8	1890	13·1
1886	10·0	1891	15·6
1887	11·8	1892	16·4
1888	13·1		
Average	11·0	Average	14·4

The membership was 57,005 at the close of 1884, 62,276 in 1888, and 60,554 at the end of 1892.

The *Knights and Ladies of Honor*, organized in 1878, with headquarters at Indianapolis, grew from 47,793 on Dec. 31, 1888, to 64,661 at the close of 1892, its mortality-rate meantime rising from 11·3 to 12·8. In 1890 there were 27,465 males and 29,201 females. The mortality was 13·14 for the males and 12·39 for the females. For all the years of the order ending with 1890 the death-rate for the males has been 11·71 and for the females 9·76. There are about one-sixth as many social as beneficiary or insurance members. Assessment rates vary according to age at entry from 30 cents for those 18 to 25 to 75 cents for those 49 to 50, 50 being the maximum limit since 1885, when it was 55. Like the United Friends and some others, this order levies its assessments only once a month. The entire cost, save from $1.50 to $2.50 per $1,000 for lodge dues, was $12.70 in 1890, $14 in 1891, and $13.60 in 1892.

The *Equitable Aid Union*, organized in 1879, having its headquarters at Columbus, Pa., and four-fifths of its membership in New York and Pennsylvania, grew from 14,182, on Dec. 31, 1884, to 37,460 at the close of 1892. It insures for any sum from $200 to $3,000, but is peculiar in that it grades the insurance to be paid. Thus the payment of a dollar at each assessment gives one who enters between 15 and 21 years of age $3,000, from 30 to 31 $2,500, from 40 to 41 $2,000, from 50 to 51 $1,500, from 60 to 61 $1,000, and 64 to 65 $800, other ages having corresponding ratios. The mortality was between 9 and 10·2 from 1884 to 1888. In 1889 it was 11·7; in 1890, 16; in 1891, 13·8; in 1892, 15·4. The entire cost per $1,000, save local lodge dues, was $16.10 in 1892.

The *National Union*, with headquarters at Toledo, O., is the only fraternal order that has adopted the so-called step-rate plan—i. e. that assesses the members according to age when assessed and not according to age at entry. Organized in 1881, it grew from 17,002 on Dec. 31, 1888, to 40,566 on Dec. 31, 1892. The cost of joining is from $5 to $7 for the charter members of a new council or lodge and from $8.50 to $12 for others. The average local council dues, which, with the initiation fees, provide for disability and the required aid to sick members, are from $1.15 to $2 per $1,000 of insurance. The national management expenses in 1892 were 35.6 cents per $1,000, and the entire cost, save council dues, was only $6.90. The mortality-rate has risen from 5·1 in 1888 to 6·9 in 1892. Insurance is given for from $1,000 to $5,000. For $1,000 the assessment rises from 20 cents at 20 years of age to 30 cents at 30, 40 cents at 40, 60 cents at 50, and 72 cents at 54, the upper age limit, which at first was 65. There was $101,168,000 insurance in force Dec. 31, 1892, and the average insurance per member was $3,152.11.

The *Catholic Benevolent Legion*, founded in 1881 with headquarters at Brooklyn, N. Y., and a present membership of 29,530, is like the *Catholic Mutual Benevolent Association*, with its 38,341 members at the close of 1892, and the *Catholic Knights of America*, with its 22,682 members, in that it confines its membership to Catholics. In the last-named society the members "must receive Holy Communion at least once a year, at Easter or thereabouts, under pain of forfeiture of all benefits." The mortality in all three of these Catholic orders was from 14·20 to 14·80 in 1892.

The *Modern Woodmen of America*, organized at Fulton, Ill., in 1883, and having on Dec. 31, 1892, 72,644 members, is somewhat different from any of the above. It not only confines its insurance to those between 18 and 45 and living in Michigan, Illinois, Iowa, Kansas, Wisconsin, Minnesota, the Dakotas, and Nebraska, but it refuses to insure in Chicago and Milwaukee, although two-thirds of the 9,000 members of the Royal League, organized also in 1883 and with a mortality in 1892 of only 5·4, live in Chicago.

The rate of assessment in the Modern Woodmen varies from 40 cents to 55 cents. Insurance for $1,000, $2,000, or $3,000 may be had by those under 41, and only $1,000 or $2,000 by those over 41. The death-rate of the order was 5 in 1891 and 7·8 in 1892. The expenses of management in 1892, aside from local dues, were $1.95, and the total cost, aside from local dues, was $7.30.

Space forbids a description of several other large fraternal orders like the *Knights of the Maccabees*, *Order of United Friends*, the *Independent Order of Foresters*, the *United Order of the Golden Cross*, and many others.

III. BUSINESS ASSESSMENT SOCIETIES.—These associations accumulate a much larger reserve fund than the fraternal societies, and, as has been remarked, use paid agents instead of fraternal lodges. The available assets exceeded the liabilities in 208 business assessment companies reported in the *Spectator Handbook* for 1893 by an amount equal to $11.90 on each $1,000 in force Jan. 1, 1893. In the case of 72 fraternal associations based on the lodge system the reserve amounted to 98 cents per $1,000. The reserve in the 25 old line companies reporting on this head to the Massachusetts Insurance Department was $269.57 per $1,000.

Some of the business assessment companies like the *Hartford Life and Annuity Insurance Company*, of Hartford, Conn., founded in 1880, provide only a limited reserve fund, not to exceed $10 on $1,000 insurance, or $1,000,000 in all, and guarantee maximum annual assessments for the first seven years of a policy. These assessments for the age of 30 at entrance would not exceed $27.42 the first year, $14.42 the third, and so gradually diminishing to $12.42 the seventh. For the age of 40 at entrance the maximum assessments for the first three years are respectively $29.98, $16.98, and $14.98, and at 50, $38.10, $25.10, and $23.10. After the seventh year assessments rise with advancing age according to mortality cost. The number of certificates in force rose from 24,357 at the close of 1888 to 38,390 four years later, while the total cost per $1,000 rose from $15 to $17.40. Of this, $4 went to expenses of management. The mortality-rate was 11·2 in 1888 and in 1892.

Another type of business assessment companies is the *Mutual Reserve Fund Life of New York*, organized in 1881. It assesses during the first years of a policy one-third more than the normal mortality cost for that age at entry, and thus provides a reserve fund which is used to reduce assessments in old age. Cash surrender values are also provided. The net assets on Jan. 1, 1893, amounted to $12.89 for each $1,000. The total cost of insurance rose from $13.70 in 1888 to $16.80 per $1,000 in 1892. Of this, $4.90 went to expenses. The membership grew from 47,693 on Dec. 31, 1888, to 72,342 four years later. The mortality was 9·61 per 1,000 policies in force in 1888 and 11·93 in 1892.

A third type of these assessment companies is represented by the *Fidelity Mutual Life Association*, of Philadelphia, founded in 1879. The probable annual costs are equated to level or equal annual rates, but, unlike an old line company, this assessment company has the legal right to increase the rates, if necessary. The expected rates for $1,000 and a surrender disability benefit of $500 at end of probable life are $15.06 at 25, $18.96 at 35, $25.88 at 45, and $40.71 at 55. The cost of all policies per $1,000 in 1892 was $17.60, of which $7.70 was expenses of management. In 1888 the total cost was $15.30. The mortality-rate was 6·93 in 1888 and 10·4 in 1892 in this association of 17,510 members.

Of the large business assessment associations the *Northwestern Masonic Aid*, of Chicago, started in 1874, furnished a sort of connecting link with fraternal associations, in that no one could be a member unless a Mason or be recommended by two Masons. On June 4, 1896, this restriction as to membership was abolished, the company reorganized, and an entirely new name adopted. On Dec. 31, 1892, 49,417 certificates were in force; its mortality-rate was 11·7 for every 1,000 certificates in force during the year; the entire cost per $1,000 was only $13.80, and the expenses of management $2.10. Aside from the *Knights Templars* and *Masons' Life Indemnity Association*, of Chicago, founded in 1884, it was the only large business association known to the writer that increased the rate of assessments with every few years' advance in age of the insured.

Another of the older assessment associations is the *Covenant Mutual Benefit Association*, of Galesburg Ill., founded in 1877, whose total cost of insurance was $15.10 per $1,000 in 1892. It had a membership of 42,317 Dec. 31, 1892, and a mortality that year of 11·2. In 1888 the mortality was 9·2.

The *Massachusetts Benefit Association*, which began business in Boston in 1879 and had 34,343 members at the close of 1892, had a total cost of $20.10 per $1,000 that year, of which $4.80 was expense of management. Its mortality-rate grew from 12·4 in 1888 to 16·6 in 1892.

If there be included in the insurance costs of the fraternal societies the lodge dues, initiation fees, and local medical examiner's fees, and the latter two items have been generally omitted in this article in case of that class of associations for lack of data, no great difference will be found in total costs of insurance between the best business assessment and fraternal orders. A slight superiority seems to lie with the best fraternal orders, while their members in some cases secure sick benefits in addition to insurance, and whatever mutual aid and pleasure there may be in the fraternal features.

Although the fraternal orders do not have a large reserve fund, they are wonderfully strengthened by the lodge feature, and boast that no fraternal life-insurance company based on the lodge system has ever failed, as have very many other systems. The cost per $1,000, after all allowance is made for local expenses, is from $9 to $21 in the several fraternal orders. In 13 of the 24 largest especially examined by the writer the cost in 1892, after full allowance for all local expenses, did not exceed $15 per $1,000 of mean insuranee. In 7 others it was between $15 and $18, and in 4 others between $18 and $21. The average expenditure per $1,000 for death-elaims and expenses of management in the 19 business assessment associations reporting to the Massachusetts insurance department for 1892 was $16.39. The disbursements in the 27 old line companies reporting at the same time, after deducting dividends to policy-holders, the net increase of surplus, this latter item being $3.67, and the amount spent to pay endowments and surrendered policies, the last two items amounting to $6.09, was $22.76 for each $1,000 of life and endowment policies. If we include in the insurance cost the amount spent for endowments and surrendered policies, the cost would be $28.85.

The friends of fraternal insurance point to the lower cost to the insured revealed in the above figures of the different insurance organizations as demonstrative of the economic superiority of the fraternal method. Their opponents, however, urge that the saving incident to self-management, which is the sole cause of that lower cost, is offset by the inadequacy of that management as compared with the direction of the business by trained officials employed solely to attend to the interests of the company. Losses incident to bad investments are said by the representatives of the old line companies to be an unavoidable element of danger in the self-managed associations, which, moreover, make no provision for the insured in the case of surrendered policies. To part of this it is replied that investments are an insignificant feature of fraternal associations, and a small one of other assessment companies, as shown above, and therefore high-salaried officials are not so necessary as in the old line companies. It is not the purpose of this article to pronounce upon the relative merits of these institutions, but merely to point out their inherent differences.

Assessment life-insurance societies should not be confounded with the assessment endowment orders. The fact that rapid growth keeps down the mortality and costs of insurance in assessment companies does not render them analogous to these endowment orders. In an assessment company, if there has been care in the selection of risks and such grading of assessments at different ages as to apportion equitably the cost of insurance or prove popular with the younger members, then the securing of as many new members as there are deaths from year to year ought to keep the average mortality as low at least as that of those over 20 years of age in the community at large. This in most sections of the country is under 15 per 1,000 lives. See LIFE-INSURANCE.

Fraternities [from O. Fr. *fraternite* < Lat. *frater'nitas*, brotherhood, liter., brotherliness, deriv. of *fraternus*, brotherly, fraternal, deriv. of *frater*, brother]: voluntary associations of men for mutual benefit, benevolence, or pleasure. Such are the numerous secret and benevolent societies, and in a large sense the term may include the orders of the Church and the monastic and sacerdotal congregations, and even the orders of knighthood; also guilds, trades-unions, and the like. Among the laity of the Roman Catholic Church there are associations called fraternities, sodalities, confraternities, arch-confraternities, etc., designed for benevolent or devotional purposes. Some of these are very extensive and have many branches. See MASONRY, ODD FELLOWS, DRUIDS, GUILDS, COLLEGE FRATERNITIES, CLUBS, etc.

Fra'tres Arva'les, or **Arval Brethren**: a college of twelve priests said to have been established in ancient Rome by Romulus in honor of his nurse Acca Laurentia. The story is that Acca Laurentia having lost one of her twelve sons, Romulus, to console her, offered to take his place, and gave himself and his associates the title of Fratres Arvales. The term of office of the members of this order was for life, and office was not lost even by exile or imprisonment. Their duties consisted in celebrating an annual festival in honor of the gods who preside over the fields. They are said to have worn a crown made of ears of wheat and a white woolen wreath around their temples. See ARVAL BRETHREN.

Fratricel'li [partially Latinized form of Ital. *fratricelli*, liter., little brothers; plur. of *fraticello*, dimin. of *frate*, brother < Lat. *fra'ter*, brother]: (1) a name given to certain zealots of the thirteenth, fourteenth, and fifteenth centuries, who originally, influenced by the ideas on poverty of the Franciscans, adopted extravagantly ascetic habits, then later immoral practices and opposition to the papacy, going so far in these directions as to have community of wives and a pope of their own. They were condemned by Honorius IV. (1280), Nicholas IV. (1290), and Boniface VIII. (1296), and proceeded against by the Inquisition, which finally in the fifteenth century uprooted them. (2) The name is also given to the "Spirituals," a party among the Franciscans, who in the fourteenth century struggled for reform. They accepted the prophetical works of Joachim of Flore as inspired. Most of them after a time quietly returned to the order of St. Francis. (3) The name of the schismatics under Michael of Cesena, the general of the Franciscan order, who was joined by Lewis the Bavarian in their opposition to Pope John XXII. on account of his refusal to go their length in praise of poverty. Michael died unreconciled with the Church.

S. M. JACKSON.

Fraud [O. Fr. *fraude* : Ital. *fraude* < Lat. *fraus, fraudis*, fraud, deception]: in law, an act of intentional deception resulting in injury to another. Fraud of which the law takes cognizance has the effect to render voidable every transaction into which it enters as a constituent material element. But, as the essential qualification contained in this statement implies, it is not every perpetration of fraud that warrants legal interposition. In the sphere of morals all deceptive artifices for the purpose of misleading, every form of crafty imposition with the design of taking advantage of a person's confidence or credulity, are reprehensible as violations of the law of moral duty. But the enforcement of ethical obligations, simply on account of their rightful binding force upon the conscience, is, and must necessarily be for obvious reasons, altogether impracticable in courts of justice. Those forms of fraudulent practices, therefore, which legal methods are competent to examine and punish must be considered as included within the category of acts fraudulent in a moral sense, but not coextensive with it. And yet the precise line of demarkation can not be definitely drawn, though certain general principles may be stated upon which the distinction essentially depends. The first of these, and the most important, is that no dependence is to be placed upon the inherent quality of actions without regard to their natural or necessary consequences. The law considers the *results*, either actual or to be reasonably presumed, of every act concerning which question may arise as to its fraudulent character, and exerts its remedial agency only when injury to individuals or to the public welfare has, in fact, been occasioned or is to be naturally expected, and then only in behalf of the party whose interests may be prejudiced. Moreover, the injury must consist in an interference with some legal right or violation of some legal duty resulting in actual or probable pecuniary loss on the part of the person against whom the deception is practiced, or serious public detriment. It follows, therefore, as a deduction from this rule, that the same act, though done with intent to deceive, may sometimes be deemed fraudulent in law, and at other times not fraudulent, while in a moral aspect it would be fraudulent in all such cases. The distinction drawn in ordinary language between *deceive* and *defraud* serves to illustrate, in some degree, the difference between moral and legal fraud. Any adequate definition of fraud in law which will distinguish the character of actions considered simply in themselves is an impossibility. This fact has been so generally recognized by the courts that the attempt to frame such a definition has been pronounced contrary to the policy of the law. It is none the less true, however, that there are numerous classes of actions whose tendency to impair legal rights is so uniform and natural that they may be generally pronounced fraudulent when considered simply in themselves. But these can be more advantageously enumerated than defined. Another characteristic of acts deemed fraudulent in law is an intent, either actual or presumed, to occasion harm or damage to another. The principle is the same as in morals—that a wrongful purpose is necessary to render a deceptive act culpable. In a large class of cases, however, a fraudulent intent is presumed from the nature of the transaction. Hence arises the doctrine of constructive fraud, to be hereafter noticed. Actual fraud, on the contrary, consists in intentional deception, artifice, or concealment, with the view or expectation that a person will be misled, and the actual misleading him to his injury. Both actual fraud and constructive fraud are, with but few exceptions, within the cognizance of courts either of law or courts of equity under the division of jurisdiction which exists in the English and American systems of jurisprudence. (See COMMON LAW, EQUITY.) The chief exception to equity jurisdiction in questions of fraud is in relation to wills. Wills of personal estate are considered in probate or surrogate courts—those of real property in the common-law tribunals. But the general jurisdiction of equity over the subject of fraud is very comprehensive, and cases of constructive fraud particularly are much more commonly considered in equity than at law. The legal remedy consists merely of an award of damages to the injured party, while the modes of equitable relief, which admit the setting aside of a fraudulent transaction or the enforcement of the specific performance of an agreement, are oftentimes much more beneficial and desirable. It has been said that equity would presume the existence of fraud upon slighter evidence than would be required in courts of law, but this assertion is hardly sustainable. The more extensive jurisdiction of equity in cases of fraud is to be attributed especially to the superiority of its remedial processes. It will therefore be most expedient in the further consideration of this subject to state only the body of principles which have been established in equity, since they not only include those maintained at law, but are still more extensive in scope.

I. *Actual Fraud.*—Cases of this kind may be divided into two principal classes. The first class includes those forms of fraud which occur between parties who are under no legal incapacity, and who are in no mutual, confidential, or fiduciary relations with each other. The second class of frauds embraces those whose origin is chiefly attributable to the mental infirmity or legal disability of the persons injured, by reason of which imposition and deception may be more readily practiced than is usually possible.

1. In the first class of cases it is only necessary to have regard to the conduct of those committing the fraud and the nature of the transaction in which it occurs, without reference to the peculiar condition of those injured. The fraud perpetrated may be either, as it is termed in Latin phrase, *suggestio falsi*, the statement of an untruth, an open misrepresentation, or *suppressio veri*, concealment or suppression of the truth.

(*a*) *Suggestio Falsi.*—There are various elements necessary in an actual misrepresentation in order that it may furnish a ground of action. (1) The falsity of the statement must be known to the party making it, or else he must be justly chargeable with the possession of such knowledge. If he is perfectly honest in his belief of the truth of his representation, and is guilty of no imprudence or negligence in making the statement, he is not answerable for any injurious consequences that may result on the theory of fraud, though the transaction may perhaps be set aside on the ground of mistake. (See MISTAKE.) If his conviction was formed upon evidence sufficient to satisfy a reasonable mind, he would be justified in asserting as a fact what he properly deemed to be such. But if, while aware that his opinion is founded upon mere rumor, conjecture, or trivial testimony, he states it as matter of positive knowledge on his part, in order to induce others to act upon the faith of it, or with good reason to suppose that they will so act, he is deemed as culpable in law as if he actually knew that he was giving erroneous information. The statement, under such circumstances, of what one does not know to be true is said to be as unjustifiable as the statement of what one actually knows to be false. In like manner, if the means of information are peculiarly accessible to the person making the representation, and he is aware that his assertion will be acted upon, his failure to acquire the necessary information may constitute a fraud. (2) The statement must be made with intent to influence some person's action, or upon the understanding or reasonable belief that such a result is likely to ensue. In cases of this latter kind the nature of the concomitant circumstances would be sufficient evidence of fraudulent intent. If erroneous assertions be simply made in casual conversation as matter of gossip or common interest, or if they be stated merely as opinions, or if no transactions are contemplated or known which could be affected by confidence in the statements, any resulting deception and loss constitutes no legal injury. (3) The misrepresentation must be as to some *material* fact constituting an inducement to the act or omission of the other party. The test of materiality is whether, if the party had known the truth, he would have engaged in the transaction by which loss was sustained. (4) The person to whom the misrepresentation was made must rely upon it as a motive to his action, and must be justified in such reliance upon grounds of ordinary prudence and caution. If, notwithstanding the false statements, the person to whom they are made relies entirely upon his own judgment and sagacity, he will not be permitted to maintain an action on the ground that he was deceived, and sustained injury in consequence. When persons deal at "arms' length," as it is termed, there is no room for one to allege deceit against the other. Moreover, if reliance upon the false representations were an act of folly, such as no sensible man would have been guilty of, the courts will afford no relief. If the fact which is misstated is plainly within observation, and one acts upon faith in the falsehood, rejecting the evidence of his own senses, his injury is the result of his own wrong, and not of another's. But if some examination be necessary to detect the error, and the party to whom the representation is made acts with ordinary prudence, confidence in the representation will not be unreasonable, and the deceiver will be responsible. Moreover, if mere belief be stated as belief, opinion as opinion, or supposition as supposition, no person is justified in acting upon it as if it were an expression of actual truth, and if he does must suffer the consequences. So if a person knows a representation made to him to be false, such knowledge will prevent any allegation on his part of fraudulent deception. (5) The party deceived must have sustained an injury. Wrong without loss no more gives a cause of action than loss without wrong. Fraud and damage must coexist as cause and effect. This rule is, however, more formal than substantial, as injury may be presumed so far at least as to entitle one to nominal damages.

(b) *Suppressio Veri.*—A concealment of the truth, by reason of which injury is occasioned, is not to be deemed fraudulent under all circumstances, but only where a person is bound in conscience and duty to make disclosure in order to prevent undue advantage being taken of another. If a vendor knows that there are latent defects in his goods, of which the buyer is not aware, and that the consummation of the intended purchase would not be effected were it not for such a misunderstanding, and the buyer can not discover the defects by ordinary observation, a failure to remove the delusion is equivalent to an express misrepresentation; but if no confidence is reposed in the person making the concealment, the other party preferring to trust to his own judgment, no wrong is done by a failure to reveal a secret source of mistake. And if a defect be patent and readily discoverable upon examination, the maxim of *caveat emptor* will apply, and a seller will be under no obligation to protect a purchaser who by his own imprudence fails to profit by opportunities of discovery within his reach. There are, moreover, cases in which a delicate sense of moral duty would prompt to disclosure, while no similar obligation would be imposed in law. If, for instance, a man knowing of the existence of a valuable mine upon another's land, of which the latter was ignorant, should buy the property without mentioning this important fact, his action would be deemed justifiable. The same view would be taken in many forms of speculation where persons enjoying peculiar facilities for acquiring information about the value of property buy or sell without communicating knowledge which would materially modify the terms of the negotiation. In contracts of certain kinds, however, the fullest information and good faith is requisite, or the contract will be invalid. This is true in cases of suretyship and insurance. Dealings between parties between whom fiduciary relations subsist must also be marked by the most complete confidence and frankness. For fraudulent warranties, see WARRANTY.

2. The second class of cases of actual fraud includes deceptions rendered possible by mental infirmity or want of ordinary discretion on the part of those injured. Persons under such disability are incapable of giving that free and rational consent which is necessary to render their acts valid. The mental aberration may be so complete as entirely to prevent a legal transaction, as in cases of lunacy, idiocy, or dementia, or there may be only such a degree of weakness of intellect that undue influence may be more or less readily exercised by designing persons. In instances of this latter kind dealings which can be proved to have been conducted with entire fairness will be sustained, but they will be subjected to a careful scrutiny, and the burden of proof may be cast upon the person profiting by the transaction to show its fairness. For similar reasons, if there be such a degree of drunkenness as to utterly deprive a person of his reason and understanding, dealings with him to his disadvantage will be deemed fraudulent unless there is clear evidence to the contrary. Acts of infants and their contracts, except for necessaries, are judged voidable on account of their lack of reasonable discernment and discretion. Similar protection is afforded to persons under duress or in such extreme necessity that undue advantage is taken of them.

II. *Constructive Fraud.*—The peculiarity of this is that no intent to defraud necessarily exists, but is presumed as an inference of law. Cases under this head may be divided into three classes. The first includes contracts which are deemed fraudulent as contrary to public policy; the second, injurious acts which arise from some peculiar confidential or fiduciary relation between the parties; while the third embraces transactions which operate substantially as frauds upon the rights of third persons.

1. The principal varieties of contracts invalid, as in contravention of public policy, are—(1) Marriage-brokage contracts, by which a person agrees to give another a reward if he will negotiate a marriage for him. Money paid on such a contract may be recovered. (2) Rewards promised for influencing another person to make a will in a particular manner. (3) Contracts in general restraint of marriage, because they are detrimental to the general welfare of society, which is promoted by suitable marriages. The restraint is "general" when a person is bound not to marry at all, or to marry nobody except a particular person who is under no corresponding obligation. (4) Contracts in general restraint of trade, as tending to promote monopolies and discourage business industry and enterprise. (5) Various other contracts founded upon violations of public trust and confidence, as e. g. agreements to procure the passage of legislative acts by unjustifiable means, contracts for the buying and selling of public offices, agreements for the composition of a felony, wager contracts, usurious contracts, etc. In like manner, contracts founded upon corrupt considerations or moral turpitude are void. Of this sort are all agreements given to procure the commission of a public crime, or the omission of a public duty, or an offense against chastity.

2. In cases of constructive fraud arising from some confidential or fiduciary relation between the parties the peculiar nature of the wrong lies in its being an abuse of confidence lawfully reposed. Oftentimes there is some actual deceit or imposition practiced, but this is not necessary in order that the transaction may be invalidated. A wrongful intent may be presumed from the want of that perfect openness and fairness which the relation demands. The relations of the parties may be of various kinds: (1) *Parent and Child.*—Conveyances by children to parents are subjected to careful scrutiny on account of the danger that they may have been procured by an undue exercise of parental authority. Even after a child has attained his majority, the presumption is that parental influence continues for at least some short period, and mutual dealings to the child's detriment must be proved to have been attended with the utmost good faith or they will not be sustained. (2) *Guardian and Ward.*—A guardian will not be permitted to reap any advantage from dealings with his ward until the influence which his position of authority gives him has entirely ceased. A settlement or contract favorable to the guardian immediately after the ward reaches his majority is looked upon with great distrust. (See GUARDIAN.) (3) *Attorney and Client.*—In any transactions to which this relation gives rise it is a general rule that the attorney shall not gain any advantage to himself at the expense of his client beyond the amount of his just and fair professional compensation. (4) *Physician and Patient.*—Similar principles prevail in reference to this special relation. (5) *Trustee and Cestui que trust.*—A trustee is bound not to place himself in any position antagonistic to the fulfillment of the duties of his trust, and can derive no personal benefit to himself in the discharge of such duties. A purchase by a trustee from his *cestui que trust*, even though it can not be proved to be unfair, may be set aside at the latter's desire. It is thought wise to *disable* him from dealing with the beneficiary in order that he may be under no temptation to profit by a breach of trust. (6) Other fiduciary relations, as between principal and agent, partners, creditor and surety, etc., are governed by similar principles.

3. Transactions deemed fraudulent because they unwarrantably compromit the rights and interests of third parties afford ground for equitable relief on account of their pernicious tendency, although the persons immediately concerned may have acted freely and willingly. But the third persons who are injured must stand in some peculiar relation with one of the immediate parties to the transaction, and the injury must be dependent upon this relation. There are several classes of cases to which this doctrine is applicable. (1) Relief will be granted in what are called catching bargains with heirs or expectants during the life of their parents or other ancestors. By bargains of this kind are meant agreements to purchase the expected interest for a present sum, and by such transactions, of which the ancestor is ignorant, he is deceived into leaving his property to other persons than those to whom he believed it would pass. Sales of expectancies are, in general, only made by those who are improvident and necessitous, and will never be sustained unless the purchaser can establish that there was no fraud, but that a fair and adequate consideration was given. Upon the same principle, *post-obit* bonds given by heirs and expectants are set aside. These are securities promising, for a present loan, to pay a larger sum, exceeding the legal rate of interest, upon the death of the person from whom the expectancy is to be received. (2) Conveyances to defraud a party to a marriage are constructive frauds, as if either party to a marriage contract should enter into an agreement with a third person by which the other party would be defrauded of reasonable expectations. (3) Conveyances to de-

fraud creditors and purchasers are of the same character. These are considered under the head of FRAUDULENT CONVEYANCE.

Only an enumeration of the more important classes of fraudulent devices can be attempted. Frauds, as has been said, are infinitely various. But this general *résumé* of the leading principles appertaining to the subject shows that the jurisdiction of the courts in cases of this nature is very comprehensive and very salutary. The advanced and enlightened doctrines of equity are in furtherance of the highest practicable standard of morality which human tribunals can be deemed capable of adequately enforcing.

T. W. DWIGHT.

Frauds, Statute of: a celebrated statute, originally enacted in England in the reign of Charles II. (1677), for the prevention of frauds and perjuries, requiring the use of written instruments in many classes of contracts and in the various modes of transfer of different interests in property. The imperfection and danger of oral testimony as an adequate means of proof of the nature of past transactions, especially when valuable interests are at stake, renders this statute one of the most salutary measures of legislation in English jurisprudence, and its importance has been so fully recognized in the U. S. that it has been substantially re-enacted in nearly every State, and in some of them its provisions have been made still more comprehensive and stringent. The difficulty of ascertaining the exact nature of certain agreements into which parties have entered, if dependence were to be placed chiefly or entirely upon the vague and unsatisfactory remembrance of witnesses, would prove a very serious interference with the proper administration of justice, and would afford an opportunity and a powerful temptation to unprincipled men to fabricate evidence in the furtherance of fraudulent designs. The chances of detection would be too meager to be of any practical value. Where discrepancies in testimony can be attributed to a natural forgetfulness, rather than to any wrongful intent, discrimination between honest and dishonest claims becomes well-nigh impossible. Moreover, a very slight change in the terms of a stipulation has oftentimes a serious influence upon the interests of those whose rights are in controversy, and witnesses with every intention to be accurate would unavoidably differ in their accounts of the same occurrence. Writing exhibits the precise nature of an agreement, unaffected by the contrariety of testimony, or by the mental reservations of the parties concerned. Written documents, moreover, remain as a perpetual memorial of the events which they record, while the removal of witnesses by death would not unfrequently render it impossible to secure the requisite oral testimony if this alone were necessary to be introduced. The adequate protection of private rights, therefore, and the furtherance of the remedial operations of the courts render the requirement of written evidence in many cases a necessity.

The scope of the statute is very comprehensive. It includes within its provisions the subject-matter of a variety of contracts, and also transfers of land by way of devise. Certain sections require writing in the creation, assignment, or surrender of leases; others apply to devises; others to declarations and assignments of trusts (but these will be considered more conveniently under the specific topics LEASE, WILL, and TRUSTS, to which reference may be made). The sections which it will be most desirable to examine in this connection are those which most particularly affect the law of ordinary contracts. These are the fourth and the seventeenth of the original English statute. By the fourth section it is provided that "no action shall be brought (1) whereby to charge any executor or administrator upon any special promise to answer damages out of his own estate; (2) or whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person; (3) or to charge any person upon any agreement made upon consideration of marriage; (4) or upon any contract for the sale of lands, tenements, or hereditaments, or any interest in or concerning them; (5) or upon any agreement that is not to be performed within the space of one year from the making thereof; unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized." The requirement of signing which the statute imposes is sufficiently complied with if the name be written in any part of the instrument for the purpose of authenticating it. In some of the American States, however, the language of the statute is not "signed," but "subscribed"; and this renders it necessary that the signature be at the end of the writing. The form of the instrument is immaterial. The object is to secure correct and adequate documentary evidence of the intent and agreement of the parties; and it is therefore sufficient if the stipulations which are concurred in are embodied in separate letters or in distinct instruments, provided the contents of each have so intimate a connection with, and so evident a reference to, the matter contained in the others that the entire contract is manifestly ascertainable only from a comparison of all the writings. But the whole agreement must be deducible from the connected instruments, without its being necessary to supplement them by parol declarations.

The statement of the consideration of the contract is required in England and some of the States, but in others the consideration may be proved by extraneous evidence. The statute, it will be noticed, provides that the signature of a properly authorized agent will be equally valid with that of the party actually interested. Such authority may be given either orally or by writing, provided the act to be done does not require the execution of a deed or other conveyance. Where the conveyance must be under seal, so must the authority be. A single person may act as agent for both parties to the contract, as, for instance, an auctioneer, or broker, whose signature will be binding upon either vendor or purchaser. The signature to the instrument may be written either in ink or in pencil, or will be sufficient if printed, if this mode of authentication is usually adopted by the person to be charged or is sufficiently authorized by him.

Under the first clause of the section it has been decided that if an executor or administrator give bonds for the faithful discharge of his duty, a subsequent promise to pay a debt of the testator will be construed as charging the assets derived from the testator's estate, and not the representative's own property, so that no writing will be necessary. A promise made by an administrator before letters of administration are issued to him from which he derives his authority is also not within the requirement of the statute. The second clause, applying to promises "to answer for the debt, default, or miscarriage of another," necessitates the use of writing in all contracts of guaranty. (For the rules upon this subject see GUARANTY.) The third clause, referring to "promises made in consideration of marriage," is held to apply to promises of settlement, advancement, or other provision in anticipation of marriage, but not to promises to marry, which may therefore be made orally, unless they fall within the fifth clause, referred to below. The written promise, to be enforceable, must be effectually operative in inducing the claimant under it to enter into the marriage contract. Hence when a father made a written promise of advancement to his daughter in case she was married to a particular person, but the intended husband did not know of the promise, nor act upon the faith of it in marrying her, he was not allowed to enforce the promise. The fourth clause, concerning contracts for the sale of real estate or any interest therein, does not require writing in the sale of crops or annual industrial products. If, however, the sale is of standing trees or products not the result of annual cultivation, the better opinion is that the case falls within the statute. When both land and its products are sold to the same individual, the entire contract must be in writing. A mere license to use land does not create any legal interest in the property, and need not be written to be valid, though in such case it is in general revocable at will. The fifth clause relates to "agreements that are not to be performed within the space of one year from the making thereof." Under this provision it is not necessary that an oral agreement be actually fulfilled within the limits of a year from the time when it was made in order to be sustainable, but only that it be capable of fulfillment within that period in the contemplation of the parties when they enter into the stipulations. The actual result may show that the anticipations were unrealized, but the validity of the engagement, though it be unwritten, is in nowise impaired.

The other section of the statute which especially relates to ordinary contracts—viz., the seventeenth—provides that "no contracts for the sale of any goods, wares, or merchandise for the price of £10 sterling or upward, shall be allowed to be good except the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain or in part payment, or that some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract, or their agents thereunto lawfully authorized." In the statutes of the American States the principal alteration made in these terms is by the specification of a different sum of money. The sum generally established is fifty dollars, but in some of the States it is thirty dollars or forty dollars. This section is distinguished from any others contained in the statute by authorizing various modes of giving validity to contracts besides the single method of writing. This diversity is established on account of the comparatively greater frequency with which contracts for the sale of goods are made, and on account of the great inconvenience that would ensue if formal and precise agreements were always necessary to be prepared to effectuate such ordinary transfers. There is, however, this disadvantage—that by dispensing with the requirement of writing in every case the difficulty of proving the terms of many contracts is much increased; but the greater facility with which business operations may be conducted is deemed amply compensatory for this defect. The first mode mentioned by which the sale may be rendered valid is by delivery and acceptance of the goods. Both these prerequisites are absolutely essential in the absence of writing or part payment. A mere expression of final agreement to the terms of the sale of specific chattels is not, as in ordinary transactions of the kind, sufficient to impose a liability upon the purchaser. The delivery may be either actual or constructive. Constructive delivery occurs when means of readily taking possession of the goods are given to the purchaser, which he may exercise in exclusion of the vendor's claim. Thus the delivery of a key giving access to a warehouse in which the merchandise is deposited is equivalent to a complete transfer of possession. The same purpose is accomplished by giving an order upon a bailee of the goods, which the bailee accepts. The delivery of an integral part of the articles sold is virtually a delivery of the whole. Acceptance on the part of the buyer must be manifested by a suitable act. It is thought by some that there are two acceptances—one, to satisfy the statute of frauds; the other, to preclude the purchaser from objecting that the goods did not correspond with the statute. Accordingly, the former acceptance might have been made, while the purchaser might be still able to return the goods, on the special ground that they did not comply with the contract. As a second method of binding the bargain, earnest may be given. Earnest is a token or pledge passing between the parties by way of evidence or ratification of the sale. The article given must have some appreciable value, even though this be quite insignificant. A chip or pebble would be inadequate, while a cent or a ring would suffice. The effect of earnest is to impose upon the seller an obligation to retain the goods subject to the demand of the purchaser; but the latter must pay the purchase-money upon obtaining delivery. The giving of earnest was a common practice in the early history of English law, but it has now fallen into general desuetude. Thirdly, part payment may be made. This has the same effect as the giving of earnest. There must be an actual transfer of a portion of the price agreed upon, since the liquidation of a former debt as a part of the consideration for the sale will not be sufficient. Fourthly, the agreement or some note or memorandum thereof must be in writing. The principles applying when this mode of authenticating the contract is adopted have been already considered.

It has been much questioned whether executory contracts for the sale of goods which were not in existence in the form contemplated by the parties at the time when the agreement was made are within the statute of frauds. It is now, however, generally settled, contrary to the rule formerly prevailing, that such contracts, if they have reference substantially to a sale of chattels, even though these must necessarily be fabricated out of certain materials before delivery can be made, are within the statute, and must consequently be in writing. But if the contract is essentially for the performance of work and labor about certain chattels, the requirements of the statute have no application.

Courts of equity, as well as courts of law, are bound to comply with and enforce the provisions of the statute of frauds. But where strict compliance would produce hardship and injustice, as sometimes proves to be the case, courts of equity have power to grant special relief, even though the precise letter of the law be violated. Thus if a contract which ought to have been in writing is fully set forth in the bill of the plaintiff in equity, and is confessed by the answer of the defendant, it will be enforced, since there can be no danger of the commission of fraud, and the defendant may be deemed to have waived his right of defense under the statute by failing to urge it. If, however, he adduces and maintains such a defense, it will be effectual to protect him against the plaintiff's claim. In like manner, specific performance of an oral contract will be decreed if it has been partly carried into execution. This principle is established because a different rule would enable fraudulent designs to be consummated, which it was the design of the statute to prohibit. But the part performance must be something more than the part payment of the price. Moreover, the act must be done solely with a view to the performance of the agreement. An illustration of such a part performance would be the act of making improvements upon land by a purchaser in pursuance of an oral contract for its purchase. A still further exception to the statute is where an agreement is intended by the parties to be reduced to writing in the appropriate manner, but this is prevented by the fraud or cunning shrewdness of one of the parties. Equity follows the spirit of the statute by preventing the commission of fraud wherever it is possible. See SPECIFIC PERFORMANCE. T. W. DWIGHT.

Fraudulent Conveyance: a conveyance the object, tendency, or effect of which is to defraud another not a party to such conveyance, or the intent of which is to avoid some debt or duty due by or incumbent on the party making it. Such conveyances are declared invalid by two famous English statutes, which have been re-enacted throughout the U. S. with substantially the same provisions. By one of these, passed in the thirteenth year of the reign of Queen Elizabeth (1571), and commonly referred to as the statute 13 Eliz., ch. 5, all fraudulent conveyances, gifts, or alienations of lands or goods whereby *creditors* might be in any wise disturbed, hindered, delayed, or defrauded of their just rights, are rendered utterly void; but the act does not extend to any estate or interest in lands *on good consideration*, and *bona fide* conveyed to any person not having notice of such fraud.

The points deserving particular attention in the provisions of this act are that it applies to chattels as well as to lands; that it protects only the interests of defrauded *creditors*; and that the exception refers only to *lands* conveyed upon "good consideration" *and* to a "*bona fide*" grantee. Both these latter characteristics are necessary to the conveyance to render it not fraudulent, and if there were only a "good consideration" *or* a "bona fide" transfer, the privilege of the exception would not be available, and creditors might impeach and overthrow the conveyance. By a good consideration, as the phrase is here used, is intended every kind of consideration known to the law, whether it belong to the class more specifically termed "good" or meritorious considerations, by which is meant motives of natural affection founded on relationship, or to the class known as valuable considerations, which include every mode of pecuniary return for a promise or grant. If, therefore, there be an actual fraudulent intent in making a conveyance, and this be known to the grantee, so that he becomes a participant in the wrong committed, it is immaterial, as regards the validity of the conveyance, that there was an adequate consideration, even of a pecuniary nature. The fraud would be fatal. But if the purchaser for a valuable consideration acted innocently, under the influence of an honest belief that the conveyance was unobjectionable, his right to the property would be superior to the claims of creditors. But questions of most importance and difficulty have arisen under the statute in regard to the effect of voluntary conveyances, by which is meant, in a legal sense, those which are intended as mere gifts or are made merely upon meritorious considerations of natural love and affection. The principle is maintained in law, as well as in the sphere of morals, that "a man must be just before he is generous"; and if one under a burden of indebtedness disposes of the property, which ought to be used in satisfying the claims of his creditors, in gratuities to his relatives or friends, a fraudulent intent is imputed to him as a necessary presumption, without the need of positive proof. But if the property transferred were in no way essential to the maintenance of the debtor's full solvency, the conveyance would, according to the prevailing opinion, be sustained. A person, for instance, might possess ample means to discharge all his obligations after bestowing a portion of his property in gifts upon others, and the conveyance would then be deemed valid, as involving no reasonable implication of dishonest intention. To impose any prohibition upon those whose debts bear but a small proportion to their actual resources, preventing them from disposing of at least a part of the surplus in voluntary conveyances if they so desired, would be manifestly unjust, since the rights of creditors would receive, without such a rule, full and adequate protection, to which alone they are entitled. It has been decided in England that a voluntary conveyance is not fraudulent unless it transfers property which might be taken in execution for the payment of debts, since otherwise creditors receive no injury. This doctrine has been somewhat controverted in the U. S., though it has nevertheless been generally sustained. However, if the law of the State permits property which can not be taken on an *execution* to be seized by some other process for the payment of debts, it would be a fraud upon creditors to withdraw it from their reach. When the gratuitous disposition of property is injurious to subsequent rather than antecedent creditors, the presumption of a fraudulent purpose is not so readily entertained. If it were proved that such an act formed a part of a preconceived scheme to incur indebtedness after the means of payment had been bestowed upon others, the conveyance would justly be invalidated. But in the absence of such evidence no conclusion could be fairly drawn, from the mere circumstance of a gift to a wife, child, or friend which was not at the time prejudicial to the interests of any other persons, that the transfer was made in the prosecution of a fraudulent purpose.

The second statute against fraudulent conveyances is known as the statute 27 Eliz., ch. 4, enacted in 1585. It enacts that the conveyance of any interest in lands for the intent and purpose to defraud and deceive subsequent *bona fide purchasers* of the lands for a good consideration shall be utterly void. This act differs from the previous one in applying simply to lands, and in protecting the interests of purchasers instead of creditors; but it contains similar provisions declaring the validity of any previous conveyance if it be upon valuable consideration and to a *bona fide* purchaser. It has been adjudged in England, in the interpretation of this statute, that if the previous conveyance be voluntary, it is void as to a subsequent purchaser, even though he had notice before he received his deed that such a conveyance had been made. This doctrine has been generally rejected in the courts of the U. S. as inequitable, and the principle adopted that the receipt of notice gives a person intending to purchase ample opportunity to protect his own interests, and if he is guilty of imprudence in accepting the conveyance he ought to receive no assistance from the courts. This seems the better doctrine. Under both statutes voluntary conveyances are never set aside as between the immediate parties, but only in favor of creditors or purchasers.

T. W. DWIGHT.

Frauenburg, frow'en-boorkh: a town of Prussia; province of East Prussia; on the Frische Haff; 42 miles S. W. of Königsberg (see map of German Empire, ref. 1–J). It is the seat of the Roman Catholic Bishop of Ermeland, and has a curious cathedral with six towers, which in former times served at once as a fortress and as a water-work. The machinery intended for the latter purpose and contained in one of the towers is said to have been constructed by Copernicus, who was a native of Frauenburg. Pop. (1890) 2,458.

Fraunhofer, frown'hō-fer, JOSEPH, von: mathematician; b. at Straubing, Bavaria, Mar. 6, 1787; was brought up to his father's trade as a glass-worker, but studied optics, astronomy, and mathematics, and in 1806 became a director of the mathematical institute of Munich. In 1815 he observed, measured, and described with admirable fidelity the dark lines of the solar spectrum, called Fraunhofer's lines, first noticed by Wollaston in 1802 (see SPECTROSCOPE), and in 1817 was admitted to the Academy of Sciences, Munich. He was a partner in the manufactory of optical apparatus at Benedict-Beuren, which in 1819 was removed to Munich. He made many improvements in fine glass-making, in dioptric instruments, and in the machinery for the manufacture and finishing of lenses; made the noble refracting telescope of the Dorpat Observatory; in 1823 became professor and director of the Cabinet of Physics, Munich. D. at Munich, June 7, 1826.

Fraxin, or **Paviin**, pā'vi-in: a fluorescent glucoside ($C_{16}H_{18}O_{10}$) found in the bark of the common ash-tree (*Fraxinus excelsior*), in the horse-chestnut with æsculin, and in some other barks. It is sparingly soluble in cold water. Its very dilute solution exhibits by daylight a beautiful blue-green fluorescence. Dilute sulphuric acid converts it into fraxetin and glucose.

Fraxinel'la: the *Dictamnus albus*, an aromatic European herb sometimes raised in gardens. It abounds in volatile oil to such an extent that in warm, still weather the air becomes charged with an inflammable vapor. This phenomenon is best shown by inclosing the plant in a box or Wardian case. The plant belongs to the family *Rutaceæ*.

Frayssinous, frā'sēē'noo', DENIS ANTOINE LUC, Count de: prelate and author; b. of humble parentage in the department of Aveyron, France, May 9, 1765; d. there Dec. 12, 1841. He was educated in the seminaries of Rodez and St.-Sulpice, Paris, and was ordained a priest in 1789. From 1804 his "conferences" in the Church of St.-Sulpice began to attract general attention, but on account of his open opposition to the ecclesiastical policy of Napoleon his lectures were prohibited in 1810, and next year he retired from Paris. He returned with the restoration, was made almoner to Louis XVIII., a count and peer of France, and under Charles X. he became Minister of Ecclesiastical Affairs. After the Revolution he retired to his native place. He published, in 1818, *Vrais principes de l'Église Gallicane* and *Sur l'indifference en matière religieuse.* His "conferences" were collected and published in 1825 under the title *Défense du Christianisme.* See Henrion's *Vie de Mgr. Frayssinous* (Paris, 1842).

Frazee', JOHN: sculptor; b. in Rahway, N. J., July 18, 1790; commenced business as a stone-cutter in New Brunswick 1814; later opened a marble-yard on Broadway, New York. From 1819 till 1823 his work was chiefly in mantelpieces and monuments. His first bust, a head of John Wells, was executed in 1824. He subsequently made busts of Chief Justice Marshall, Dr. Bowditch, Daniel Webster, Gen. Jackson, John Jay, Judges Story and Prescott. The marble building in New York, originally the custom-house but used as the U. S. sub-treasury since 1862, bears his name inscribed as the architect. D. at New Bedford, Mass., Mar. 3, 1852.

Fraziers (Frayzers) Farm, Battle of, known also as the battle of Glendale, Newmarket Road, Nelson's Farm, and Charles City Cross-roads: an engagement of the civil war in the U. S. June 30, 1862. After the battle of GAINES MILL (*q. v.*) McClellan gave up his position along the Chickahominy and fell back to the James river. Magruder, who commanded the troops in front of Richmond and S. of the Chickahominy, moved forward and made the attacks at ALLEN'S FARM and SAVAGE'S STATION (*qq. v.*) June 29, where he was held in check by Sumner and Franklin, and the Union army crossed White Oak Swamp and destroyed White Oak Bridge. Gens. Richardson and W. F. Smith took a position on the south side of the stream to defend the crossing, and the divisions of Slocum, Kearny, McCall, and Hooker, in the order named from right to left with Sedgwick in reserve, formed a line facing nearly west, near Charles City Cross-road, the line being an irregular one with a re-entrant between Hooker and McCall and a salient at Kearny. Porter and Sykes marched on and occupied Malvern Hill. Gen. Jackson, crossing the Chickahominy at Grapevine Bridge, followed the Union troops, and at about 11 A. M., June 30, attempted to force a crossing at White Oak Bridge, but was held back during the rest of the day, principally by artillery. Longstreet and A. P. Hill crossed the Chickahominy at New Bridge early in the morning of the 29th, and marching by the west of White Oak Swamp took the Darbytown Road to strike the flank of McClellan's column near the junction of the Charles City and Quaker Roads. Halting within 2 miles of this point in the evening of the 29th, they advanced again in the morning of the 30th, and took up a position with a view to attacking simultaneously with Jackson and Huger, the latter of whom had come down the Charles City Road. An artillery action at about 2.30 P. M. between Huger and Slocum led Longstreet to make his attack, which he did with his own division, holding Hill's in reserve to pursue the Union troops after the column was cut in two and beaten. Longstreet's attack struck McCall's left and drove it back, but, new troops coming up, the line was re-established. Desperate fighting took place here and in front of Kearny; the

Confederates gained some ground, but no material advantage, and after putting in Hill's division were held in check until night. They were foiled in all their plans. During the day the reserve artillery, the wagon train of about 4,000 wagons, marched on to Malvern Hill, with the loss of only about fifty wagons destroyed by the bombardment at White Oak Bridge, and were followed by the troops during the night, and the army was in position for the battle of MALVERN HILL (*q. v.*) the next day. See *Battles and Leaders of the Civil War*; Webb, *The Peninsula*; and the *Official Record.* JAMES MERCUR.

Frechette, frä'shet', LOUIS HONORÉ, LL. D.: Canadian author; b. at Levis, Province of Quebec, Nov. 16, 1839, and educated at Nicolet College. He was admitted to the bar in 1864, and had a seat in the Dominion Parliament from 1874 till 1879. He edited *Le Journal de Quebec* (1861–62); *Le Journal de Levis* (1864–65); *L'Amérique* (Chicago, 1868–70); and *La Patrie* (Montreal, 1884–85). He is now (1899) clerk of the legislative council of the Province of Quebec; is a knight of the Legion of Honor, officer of the Academy of France, late president of the Royal Society of Canada, and is regarded as the national poet of the French-Canadians. Two volumes of his poems, *Les fleurs boréales* and *Les Oiseaux de neige*, were crowned by the French Academy in 1880. Among other works in verse are *La Voix d'un Exile* (1869); *Pêle-Mêle* (1877); *La Légende d'un Peuple* (1887); *Les Feuilles Volantes* (1892). His prose works are *Lettres à Basile* (1871); *Histoire Critique des Rois de France* (1883); *Lettres sur l'Éducation* (1893); *Vieux Cartons* (3 vols., 1893). NEIL MACDONALD.

Freckles [connected with the verb *freak*, to variegate, to streak, O. Eng. *freken*]: discolorations of the skin taking the form of dark round spots, and found usually on the face or parts of the body exposed to the sun. With the exception of certain individuals known as "albinos," persons of every race and climate have colored skins, which differ only as to tint and degree of pigmentation. The color of the skin is due to a deposit of fine pigment granules in its outer layer which is known as the epidermis or cuticle. When this layer is removed—e. g. by a blister—the underlying skin is found to be white, whether the individual is a Negro or a Caucasian. Various portions of the skin are normally of deeper hue than surrounding parts, and exposure to the summer sun tends to increase the amount of pigmentation in most individuals. When the darkening of the skin is diffused and temporary in character it is called *tan.* When the discoloration appears in the form of small round spots and tends to be more permanent, we then have *freckles.* These spots usually appear on the face and backs of the hands, and fade or completely disappear in the winter. A few are sometimes found upon portions of the body not exposed to the sun, and persist indefinitely. Freckles are most apt to affect those of fair complexion and reddish hair, but even dark-skinned individuals, and especially mulattoes, are by no means exempt. The spots may be readily removed by any agent which will destroy the epidermis or superficial layer of the skin in which the pigment is deposited.
GEORGE HENRY FOX.

Fredegar (or **Fredega'rius**), SCHOLAS'TICUS: the name of a chronicler of the Franks, who, in conjunction with two or more other writers, wrote the *Historia Francorum*, which is a most important source for the early history of France. Its Latinity is very corrupt. Best edition by B. Krusch, *Fredegarii et aliorum chronica* (Hanover, 1888). M. W.

Frederic, HAROLD: See the Appendix.

Fredericia, fred-*e*-rish'i-a: town and fortress of Denmark; in Jutland, at the entrance of the Little Belt. On July 6, 1849, it was the scene of a victory of the Danes over the troops of Schleswig-Holstein. Pop. (1890) 10,044.

Frederick: city; capital of Frederick co., Md. (for location of county, see map of Maryland, ref. 2–D); situated on the B. and O. and the Pa. Railways, 60 miles W. by N. of Baltimore. It has numerous churches, a nunnery, 2 colleges, 2 female seminaries, a fine city-hall, several foundries, 2 large canning-factories, planing-mills, tanneries, coach-factories, flour-mills, spoke-factory, a large hosiery knitting-mill, a shoe-factory, etc. Frederick lies within 3 miles of the Monocacy battle-field, and 12 miles from the battle-field of South Mountain. The Confederate army, under Gen. Robert E. Lee, occupied Frederick for six days from Sept. 6, 1862, and on the 12th of the same month the Union army, under Gen. McClellan, entered and occupied the city. On July 9, 1864, it was again occupied by the Confederate army, under Gen. Jubal Early, who demanded and received as a ransom from her citizens $200,000. The remains of Francis S. Key, a native of Frederick County, and the author of *The Star-spangled Banner*, are buried in Mt. Olivet Cemetery adjoining the city, and the body of Roger B. Taney, chief justice of the Supreme Court of the U. S. (1836–64), is interred in the old graveyard belonging to the Roman Catholic church of Frederick. Barbara Frietchie, the good old dame who has been immortalized by Whittier, is buried in the old cemetery of the Reformed church. Pop. (1880) 8,659; (1890) 8,193; (1900) 9,296.
EDITOR OF "NEWS."

Frederick I., Emperor of Germany; also known as *Frederick Barbarossa.* After Henry IV., Emperor of the Holy Roman Empire, had been thoroughly humiliated by Pope Gregory VII. in the celebrated snow-covered courtyard of Canossa, he determined upon surrounding himself with a new and reliable set of followers. In pursuance of this policy he created Count Frederick von Büren Duke of Suabia, and at the same time bestowed upon him the hand of his daughter Agnes. Von Büren shortly after removed his castle to the summit of a mountain named Hohen Stauffen, and was thenceforth always called by that name, though his family was also known by the name of Weiblingen, from the castle Weibling—a name which was changed subsequently by the Italians into Ghibelline. When Henry IV. died, Frederick served Henry V. with the same fidelity. Upon the death of the latter emperor Frederick was an applicant for the crown, but his haughty manner set the electors against him, and Lothair of Saxony was elected. Upon Lothair's death, which followed soon after his election, Conrad von Hohenstauffen, Duke of Franconia and brother of Frederick, was elected King of Germany, but he was never crowned emperor by the pope. In 1147, when Bernard of Clairvaux started the second great crusade, Conrad was, after a long resistance, induced to join it, and took with him his nephew Frederick (b. 1121), son of Frederick of Suabia, whose merits made themselves so apparent to Conrad that after his return from the crusade, and when he felt his end approaching, he recommended his nephew to the German electors as his successor. Frederick Barbarossa (so named on account of his red beard) was thirty-one years old when the German princes elected him their king. He at once restored the Guelphic duke, Henry the Lion, to his dukedom of Bavaria, of which Conrad had dispossessed him, and having brought order into all the political affairs of Germany, went to his Lombardian possessions, where the larger cities had raised various disturbances. Frederick speedily restored order, and, having proceeded to Rome, was there crowned Emperor of the Holy Roman Empire in 1155 by Pope Adrian IV. He was in the zenith of his glory when he returned to Germany from his first expedition. Literature, art, and sciences now began to flourish in Germany, under Frederick's fostering care, as they had never flourished before. The cities of Lombardy, however, did not leave him long rest, and even the destruction of Milan by Frederick on his second expedition did not succeed in suppressing the spirit of revolt. Supported by the pope, Alexander III., three more insurrections took place; and when Frederick for the fifth time entered Italy to subdue his refractory subjects, he was terribly beaten at the battle of Legnano (1176). He then made peace with the pope, whose influence was supreme with the people of Lombardy, and hastened back to Germany to punish Henry the Lion, who had, forgetful of all Frederick's past generosity, refused to go with him on that fifth expedition, and had thus virtually brought about its disastrous end. This was the beginning of the endless conflicts between the Ghibellines (Frederick's party) and the Guelphs (the party of Duke Henry). Henry was dispossessed of all his lands, and retired to the court of his father-in-law, Henry II. of England. His two dukedoms, Bavaria and Saxony, were divided into smaller parcels among the emperor's friends, and thus Frederick put an end to the overbearing rule of the great German dukes and made the imperial rule supreme in Germany. He now went once more to Italy, but this time in peace, and was everywhere received in triumph. Upon his return Frederick organized the great crusade, in which Richard Cœur de Lion also took such prominent part. The unhappy conclusion of that crusade he was fortunately spared witnessing. While advancing in triumph at the head of his troops, after having stormed and taken the capital of the Sultan of

Credi, he was drowned in attempting to cross the Calycadnus June 10, 1190, or, as some say, died of a fever.

Revised by C. K. Adams.

Frederick II.: Emperor of Germany; b. at Jesi, in the March of Ancona, Dec. 26, 1194. He was the son of Henry VI., and, though elected King of the Romans in 1196 and King of Naples and Sicily in 1209, and though Duke of Suabia by inheritance, he did not succeed to the imperial crown until 1215, when, by the aid of the Ghibellines and Innocent III., his guardian, he successfully asserted his claim against Otho IV., promising the pope to go at once upon a crusade; but his long delay caused him much trouble with the popes, and the failure of his first two expeditions caused him to be twice excommunicated; and though at last he spent fifteen years in the Holy Land in successful warfare, taking Jerusalem (1229) and crowning himself king, he was never forgiven, and after his return was twice more excommunicated, and was involved in lifelong wars incited by the popes. D. at Fiorenzuola, Dec. 13, 1250.

Frederick III. of Germany: This title is sometimes given to the Duke of Austria, elected emperor in 1314, who reigned as joint emperor with Louis IV. from 1325 to his death, Jan. 11, 1330. By others he is reckoned as a King of Germany, but not an emperor. The Frederick III. of history was a son of Ernst, Duke of Styria and Carinthia, b. at Innspruck Dec. 21, 1415; in 1440 was elected emperor. He reigned fifty-three years, the longest German reign, but this period was one of almost continual civil wars. The emperor was a man of virtue, fond of learning and quiet, and in spite of the confusions of his reign managed to strengthen greatly his own family, which for almost 400 years retained the imperial dignity, and which still bears sway in Austria. D. at Linz, Aug. 19, 1493.

Frederick I.: the first King of Prussia; b. in Königsberg, July 11, 1657; succeeded his father, Frederick William the Great, as Elector of Prussia, with the title of Frederick III., in 1688. Deformed and feeble from infancy, his training was slighted, but on coming to power he declared null the will of his father, by which his half-brothers received a part of his inheritance, and thereafter by skillful diplomacy greatly strengthened his influence in foreign parts, at the same time enriching his treasury with foreign gold, obtained by the lending of troops, and from time to time enlarging his boundaries at the expense of small neighboring states. In 1701, with the consent of the emperor, he took the title of king. He maintained a splendid court, and was personally popular, though his excessive taxation was a grievous burden to the people. D. at Berlin, Feb. 25, 1713.

Frederick II.: third King of Prussia, commonly known as Frederick the Great; son of Frederick William I.; was b. Jan. 24, 1712. His early education was one of extreme rigor in consequence of the eccentric severity of his father, who determined to make him a hardy soldier and give him an education of an extremely practical nature. He was forbidden the study of Latin, but his tutors gave him great facilities for acquiring a knowledge of French and for the thorough study of history, especially the history of Germany. Notwithstanding the father's injunctions, his teachers connived at his disobedience, and he acquired a rudimentary knowledge of the Roman tongue. Frederick William was extremely passionate in his nature, and resorted to violent corporal punishment on very trifling provocation. In consequence of the restless and disobedient disposition of his son, the king gradually acquired for him a strange and almost passionate dislike. So harsh was the father's treatment that the son often thought of running away. At last, on a journey with his father in the south of Germany, in 1730, he determined to carry such a project into execution. His confidential advisers were two lieutenants in the army by the name of Katte and Keith. But the scheme was detected and both Katte and the prince were arrested. Keith made good his escape. Katte was condemned to imprisonment for two months, but the king insisted upon his execution, and he paid the penalty of his friendship and fidelity with his life. Under Prussian law the punishment of a military officer for desertion was death, and as Frederick held the rank of lieutenant-colonel his life would doubtless have been subject to forfeit if he had carried out his plan of actual desertion. The king chose to act as he would have done in case the desertion had been accomplished. Frederick was condemned to death, and it was only after numerous petitions had been received from the crowned heads of Europe that a reluctant pardon was finally granted. During the next ten years Frederick showed no spirit of disobedience. At the king's suggestion he even married with apparent cheerfulness Elizabeth Christina of Brunswick-Bovern, a princess for whom he had no fondness whatever. His studies in French resulted in a correspondence with Voltaire, and the establishment of a friendship that was in many ways to influence his subsequent life. During this period he developed marked abilities as a student and writer; and two of his works published before he ascended the throne are still entitled to consideration. In the *Anti-Machiavel* and the *Considérations sur l'État présent du corps politique de l'Europe* he called attention to the growing importance of France and Austria, and the necessity of some third power that should be strong enough to neutralize their influence.

On the death of his father Frederick ascended the throne in 1740. It was evident from the first that his methods would be far more tolerant than those of his predecessor. He proclaimed freedom of religion, greatly advanced the freedom of the press, established the impartial administration of justice, and granted the absolute right of petition to all those who had any grievance. But it was in foreign matters that his discrimination and force of character made themselves most conspicuously seen. On the year of his ascension the Emperor Charles VI. died, leaving his inheritance to his daughter Maria Theresa. Frederick at once began the most active preparations for war. Though he had subscribed to the Pragmatic Sanction by which Maria Theresa was confirmed in her inheritance of her father's rights, Frederick held that such confirmation did not extend to any territory not rightfully held by her father. The right of Austria to Silesia Frederick disputed on the ground of an old compact the conditions of which had not been fulfilled by Austria. For setting up a claim to Silesia Frederick has been subjected to a vast amount of unwarranted criticism; for it is difficult to investigate the grounds of the claim without recognizing the fact that the terms on which Silesia had been given to Austria had not been carried out. Whether Frederick can be justified in resorting to war to establish his claim is another question; but at least it must be judged in the light of the customs of the eighteenth century.

After some preliminary negotiations at Vienna, Frederick invaded Silesia with an army of 30,000 men. His forces gained the first victory at Mollwitz Apr. 10, 1741; the second at Chotusitz May 17, 1742. As Maria Theresa was at war with France she consented to the Peace of Breslau June 11, 1742, which ceded to Prussia Upper and Lower Silesia as far as the river Oppa. But Frederick was convinced that Austria would not allow this treaty to be permanent. He therefore not only strengthened his army, but he also made alliances with France and Bavaria, and pledged himself to respect the imperial rights of Charles VII. Convinced that a war was impending and was inevitable, he invaded Bohemia and took possession of Prague in 1744. In 1745 he fought and gained the brilliant battles of Hohenfriedberg, Sohr, Hennersdorf, and Kesselsdorf. The Peace of Dresden, Dec. 25, 1745, confirmed his possession of Silesia.

The next eleven years were years of peace for Frederick, and he used them industriously and successfully for the development of his realm. He restored the Academy of Sciences; made canals between the Oder and Elbe; and developed the country by improving the methods of justice and administration. Though he habitually wrote and spoke French, and affected to despise German as the language of boors, he predicted for his mother-tongue a great future. Voltaire and Maupertuis became the center of literary activity at Berlin.

Maria Theresa had never abandoned hope of recovering Silesia. Prussia was now becoming so strong that the queen had no difficulty in arraying a very powerful combination against Frederick. One after another, Russia, Saxony, and France formed an alliance with Austria. In Jan., 1756, a convention was signed between Prussia and England which proved to be of incalculable advantage to both countries. Through the treachery of a Saxon clerk Frederick learned what was awaiting him. In Aug., 1756, realizing the advantage of striking the first decisive blow, he crossed the frontier of Saxony, and after a short but brilliant campaign defeated the Austrians at Lowositz, and compelled the Saxon army to surrender. This campaign proved to be the beginning of the memorable Seven Years' war, in which Prussia, supported though not very actively assisted by England, was assailed by Austria, Russia, France, Saxony, and Sweden.

Practically all Europe was turned against the little kingdom, which had hitherto been regarded as of scarcely more than insignificant importance. But the Prussians were led by a great commander who infused his own spirit into his armies, and seldom in history has military genius accomplished greater results. At the moment when Frederick seemed on the point of being ruined he succeeded in separating his enemies and overwhelming them, one after another. In Nov., 1757, he crushed the French in a remarkable battle at Rossbach, and a month later at Leuthen he defeated the Austrians and drove them out of Silesia. In 1758 he overthrew the Russians at Zorndorf, and in 1760 gained important victories at Liegnitz and Torgau. But notwithstanding these successes there were periods in the war of great danger. On Aug. 12, 1759, he was disastrously defeated in the battle of Kunersdorf, and nothing but a combination of fortunate circumstances prevented the loss of his cause. For a short time even Frederick believed that all was lost, and gave orders accordingly. But his enemies were slow in pressing their advantage. Most fortunate of all, on the death of the Czarina Elizabeth, Russia not only withdrew from the cause of Austria, but even became an ally of Prussia. All Europe was tired of the war, and the Peace of Hubertsberg, signed in 1763, confirmed Prussia in her claims.

It would be difficult to exaggerate the effect upon Europe of the Seven Years' war. It not only made Prussia one of the foremost powers of the Continent, but put the nation by the side of Austria in the contest for German supremacy. Not less important, it occupied France at a time when that nation was contending with Great Britain for the mastery in America and in India. With France fully occupied in Europe, Great Britain had a much easier task in gaining supremacy in other quarters of the world. But all this was purchased at a fearful price. The resources of Prussia at the close of the war were very nearly exhausted. The genius of Frederick, however, was no less marked in peace than it had been in war. Gradually the signs of disaster were effaced by his statesmanship, and long before the death of the great king Prussia had become for the first time what may be called a modern nation. In the course of his career Frederick had shown a constant inclination to literary activity. His collected writings, published by the Academy (1846–57), are comprised in thirty magnificent volumes. His death occurred Aug. 17, 1786.

AUTHORITIES.—Carlyle, *History of Frederick II. of Prussia* (6 vols.); Droysen, *Friedrich der Grosse* (2 vols.); Förster, *Friederich der Grosse*; Rigollot, *Frédéric II.* (1875); Schröder, *Friedrich der Grosse* (3 vols., 1876).

C. K. ADAMS.

Frederick III.: the second German emperor and eighth King of Prussia; b. near Potsdam, Prussia, Oct. 18, 1831; son of the German emperor William I.; was carefully educated under the direction of Prof. Ernst Curtius and the Rev. W. Godet; studied at the University at Bonn in 1849–50; traveled extensively in different parts of Europe; learned the art of war under Moltke; married in 1858 the eldest daughter of Queen Victoria; entered the military service in early life; bore an important part in the Austro-Prussian war of 1866, in which he commanded the Second Army, numbering some 125,000. During the Franco-German war he led the Third Army, which consisted of about 200,000 men and 500 guns; won the victories of Weissenburg and Wörth, and bore a distinguished part in the succeeding events of that war. (See FRANCO-GERMAN WAR.) He was general field-marshal and general inspector in the German army. On the death of his father, Mar. 9, 1888, he became German emperor and King of Prussia. Even before his accession a malignant affection of the throat had rendered tracheotomy necessary, and it was evident that his life was in danger. In the course of the three months of his reign he bore his suffering with the greatest fortitude, and did much to liberalize the institutions of his people. D. June 15, 1888.

Frederick Charles Nicholas, FIELD-MARSHAL PRINCE: b. in Berlin, Mar. 20, 1828; a nephew of the Emperor William of Germany; was educated at Bonn: entered the army in youth; served with distinction in Schleswig (1864); had an important share in the victory of Sadowa (1866), where he displayed great energy and skill; commanded the Second German Army (consisting of six army-corps, with some 260,000 men and 500 guns) in the Franco-German war; had command in the siege-operations against Metz; after the surrender was made a field-marshal, and afterward dispersed the army of the Loire in six weeks. D. June 15, 1885.

Frederick William, THE GREAT ELECTOR: eleventh Elector of Brandenburg; b. Feb. 6, 1620; succeeded his father, George William, in 1640, and found his dominions in a deplorable state of ruin, caused by the ravages of the Thirty Years' war and by the misrule of his predecessors; made an advantageous peace with Sweden (1648); reorganized the army; joined Sweden against the Poles in 1655, and freed Brandenburg from the Polish sovereignty, and was himself recognized as sovereign of Prussia (1663); took a leading part (1672–73) in the war with Louis XIV.; routed the French at Fehrbellin (June 18, 1675), and by 1679 had expelled them from Prussia and Pomerania. In 1685 he greatly enriched his provinces by offering an asylum to the French Protestants. The last years of his reign were devoted to the development of the material prosperity of his territories. Though not himself proclaimed king, he prepared the way for his successor, Frederick I., who was raised to that rank in 1701. D. at Potsdam, Apr. 29, 1688.

Frederick William I.: King of Prussia; b. in Berlin, Aug. 15, 1688; succeeded his father, Frederick I., in 1713. He maintained a standing army and collected a full treasury; forced the surrender of a large part of Swedish Pomerania to his sway; abolished feudal tenures (1717); was often cruel and unjust, as in the treatment of his son, the future Frederick the Great; had a whimsical passion for forming a guard of giant soldiers, for whom he found giant wives. His character was unamiable and full of apparent contradictions, and the ruling purpose of his life was the assurance of the future greatness of Prussia, through the economical rule of his own family. D. at Potsdam, May 31, 1740.

Frederick William II.: King of Prussia; b. Sept. 25, 1744; succeeded his uncle, Frederick the Great, in 1786, and by a natural reaction from the enforced severity of his previous life entered upon a course of immoderate luxury. He lost the trans-Rhenish provinces to the French republic in 1795, but his share in the second and third partitions of Poland (1793–95) largely extended his sway. His extravagance and tyranny were partially offset by legal reforms and the encouragement of Prussian industries. D. Nov. 16, 1797.

Frederick William III. of Prussia: b. Aug. 3, 1770; succeeded his father, Frederick William II., in 1797; undertook at once the reform of the abuses of his father's reign, and by treaties increased his dominions. During the early part of his reign he preserved neutrality with Napoleon, but the policy of the French emperor so exasperated the Prussians that they forced the king to declare war against the French in 1806. The battles of Jena, Auerstadt, Eylau, and Friedland, followed by the Peace of Tilsit (1807), were most disastrous to Prussia, and reduced it to half its former extent; but through political reforms, the abolition of serfdom, the sale of royal domains and church property, and the reorganization of the army, the king, inspired by Queen Louise and directed by the great Minister Stein, went far toward making the calamity of Prussia a great blessing. In 1813 the War of Liberation from the French was inaugurated; the battles of Lützen, Bautzen, Leipzig, and Brienne, and the occupation of Paris by the allies, followed, and Prussia became more powerful than ever before, chiefly at the expense of Saxony. At Waterloo the Prussian army also performed a most important part. In the closing years of his reign a conservative policy was adopted. D. June 7, 1840.

Frederick William IV. of Prussia: b. Oct. 15, 1795; was carefully educated; served in the wars against Napoleon, and was exceedingly popular in early life. In 1840 he succeeded his father, Frederick William III., and by his reactionary policy disappointed the high hopes which had been indulged regarding him. The affairs of the Zollverein (established 1819) were so managed as to increase Prussian influence, and internal improvements were pushed forward, but in 1841 the king refused the request of the estates for a constitution, and repeatedly declared that the estates should be convened only at his own will, and then only as an advisory body, with no legislative power. The revolution of 1848 followed, but the victories of the army gave the king confidence, and in place of the constitutions proposed by the revolutionists he promulgated one of his own and dissolved the popular assembly. In 1849 he declined the imperial crown tendered him by the Frankfort Diet. In 1857 he was seized with temporary fits of insanity, and yielded the crown to his brother, William I., who acted as regent until Jan. 2, 1861, when, on the death of his father, he succeeded to the throne.

Frederick III., The Pious: Elector of the Palatinate 1559–76; was educated at the court of Charles V., but married a Lutheran princess in 1537, and openly embraced Lutheranism in 1549. In the Palatinate the Reformation had been introduced in its Lutheran form, but just as Frederick III. ascended the throne the violent controversy concerning the Lord's Supper broke out between the Lutheran and the Reformed theologians. The teachings of Melanchthon seemed to lead in the direction of Zwingli and Calvin, the disputation at Heidelberg gave the victory to the Reformed theologians, and, as the population seemed to lean toward Calvinism, the festivals of Mary and the saints were abolished, the altars, organs, images, baptismal fonts, etc., were removed, the Church government was vested in a council board consisting of three ecclesiastical and three lay members, Reformed teachers and preachers were appointed instead of Lutherans; in short, the Lutheran Church was supplanted by the Reformed. The Lutheran princes of the empire even threatened the elector with deposition, but he proved steadfast; and the Palatinate became the principal home and chief support of Calvinism in Germany.

Frederick Henry Island: an island claimed by the Dutch; situated in lat. 8° S., lon. 138° 30′ E.; area about 400 sq. miles. It is separated from the mainland of New Guinea, of which it forms the southwest part, by the narrow Strait of Dourga, or Marianne. Arafura Sea separates it from Australia on the S.

Fredericksburg: town; capital of Gillespie co., Tex. (for location of county, see map of Texas, ref. 5–G); 80 miles W. of Austin. It has five churches, a good graded school, an ice-factory, cotton-gins, flouring-mills, and a lively trade in wheat, corn, and merchandise. The situation is elevated and healthful. Fredericksburg was settled in 1846 by a German colony. Pop. (1880) 1,085; (1890) 1,532; not returned separately in 1900.

Fredericksburg; city and railway junction; Spottsylvania co., Va. (for location of county, see map of Virginia, ref. 5–H); on the south bank of the Rappahannock river, 92 miles from its mouth, at the head of tide-water; 60 miles S. of Washington, and 61 miles N. of Richmond. The river is navigable for steamers and sailing vessels. The city has very great water-power supplied by a dam constructed across the Rappahannock just above the city, 900 feet long, and 18 feet high, giving a fall of 48 ft. 2 in., and affording some 6,000 horse-power. Fredericksburg has numerous churches, 7 schools, a public library, 3 large flouring-mills, a tannery, 2 sumac-mills, 2 large iron-foundries, a shoe-factory, an extensive woolen-mill, a silk-mill, an ice-factory, 2 cigar-factories, a carriage-factory, a planing-mill, a large sawmill, water-works, gas-works, electric lights, and two fine iron bridges across the Rappahannock. During the civil war it was the scene of several bloody contests. Pop. (1880) 5,010; (1890) 4,528; (1900) 5,068.

Editor of "Lance."

Fredericksburg, Battle of: Dec. 13, 1862, the first great battle of the U. S. civil war after Antietam; was fought by the Union forces under Gen. Burnside and the Confederates under Gen. Lee. Early in Nov., 1862, half of Lee's army under Longstreet was at Culpeper, Va., and the remainder under Jackson in the Shenandoah valley. On Nov. 7 McClellan, who was in command of the Army of the Potomac, was superseded by Burnside, who organized the army into three "grand divisions" of two corps each, under Gens. Sumner, Hooker, and Franklin, and concentrated it at Falmouth, opposite Fredericksburg, Va. Lee, to meet Burnside's movement, sent Longstreet to Fredericksburg, where he arrived Nov. 19, Jackson coming up a day or two later. The Confederates took up a position on the heights back of the city. Between these heights and the river lay open cultivated fields sloping gently to the river-banks, which were bluff. During the three weeks that the Confederates occupied this position before they were attacked, they availed themselves of the opportunity to become familiar with the ground and to fortify points which seemed weak. The Union army occupied Stafford Heights on the east (left) bank of the river, which were higher than the hills occupied by the Confederates on the west (right) bank, but were distant from them from 1¼ to 2 miles. The Union reserve artillery was massed upon these heights to sweep the plateau on the other side of the river. On the morning of Dec. 11 the construction of the bridges for crossing was begun. Two points were selected: one opposite the upper end of the city, the other a mile and a half farther down the stream. Franklin began crossing at the latter point at about 4 P. M., but withdrew most of his forces to await the completion of the other bridges. At the upper bridges the Confederate sharpshooters in the brick houses along the bank at first prevented all attempts to build the bridges, in spite of a most vigorous cannonading; but at about 4.30 P. M. were finally driven out by troops ferried over in pontoons, and the bridges were then built. The army commenced crossing that evening and occupied the town. The rest of Sumner's division and part of Hooker's crossed on the 12th. The remainder of Franklin's division also crossed after Sumner's bridges were finished. During the night of the 12th and under cover of a fog on the morning of the 13th the army was formed for attack. Between 9 and 10 A. M. the fog lifted and the battle began with the attack of Franklin's division upon the Confederate right at Hamilton's Crossing, held by Jackson with 30,000 men. This attack penetrated the Confederate front line and drove it back upon its reserves, until such strength was developed that the Union line was finally checked and driven back nearly to its original position. Desultory fighting continued upon this flank during the day with no material advantage to either side. On the Union right wing Sumner's and part of Hooker's troops, which had been concealed in the streets of Fredericksburg, moved out at about noon, formed and advanced to the attack of Marye's Heights. In making this attack they were exposed to a concentrated cross-fire of artillery and, upon a near approach to the Confederate position, to a most deadly infantry fire from the troops in a sunken road, which constituted the Confederate line of defense, and from those upon the hill above them. The attacking lines were cut down and destroyed by this fire, but fresh troops were again and again sent against the position until nightfall. During the night Burnside, becoming convinced through the representations of his subordinates, that the position could not be carried, gave up the idea of renewing the attack. The armies lay facing each other until the night of Dec. 15, when Burnside recrossed the river without molestation. The total Union force was about 116,000 men; the losses, 1,284 killed, 9,600 wounded, and 1,769 missing; total, 12,653. The total Confederate force was about 78,000; the losses, 608 killed, 4,116 wounded, and 653 missing; total, 5,377. See *Official Record*, articles in *Battles and Leaders of the Civil War*, and Scribner's War Series.

James Mercur.

Fred′ericton: a beautiful city and a railway center (incorporated in 1849); capital of New Brunswick and of York County (for location, see map of Quebec, etc., ref. 5–G); situated on the right bank of the river St. John, 84 miles from its mouth, in a fertile and well-cultivated plain bounded on the one side by the river and encircled on the other by a range of low wooded hills. It is finely laid out and has many handsome buildings. Among the public buildings of importance are the government-house, the province building, Victoria Hospital (erected 1887), court-house, city-hall, barracks, the exhibition building, the custom-house, jail, etc. Fredericton is the seat of an Anglican bishopric, of the University of New Brunswick, and of the Provincial Normal School, and has eight churches, Christ Church Cathedral (Anglican), a Baptist seminary, and several libraries. The city is engaged chiefly in commerce and the trade in lumber. The river is navigable to this point by large steamers; above small steamers ply during high water, proceeding as far as Grand Falls. A steam-ferry connects it with St. Mary's, on the opposite bank of the river. Fredericton was founded by Villebon in 1692 as a fort; was unsuccessfully attacked in 1696 by New Englanders; under the name of St. Ann's Point was temporarily made the capital of New Brunswick in 1701; and the government was permanently established there by Sir Guy Carleton in 1786. Pop. (1881) 6,218; (1891) 6,502; (1893) about 8,000.

Fred′erik: the name of seven kings of Denmark belonging to the Oldenburg dynasty. Under the reign of Frederik III. (1648–70) the constitution of the country was changed from an elective monarchy, in which the power of the crown was circumscribed within very narrow limits by the privileges of the nobility, to an hereditary monarchy, in which the crown was invested with an absolute and unlimited power (Nov. 14, 1660). Under Frederik VII. (1848–63) this constitution was again changed, and the present constitution established (June 5, 1849), according to which the executive power rests with the king and his responsible ministry; the legislative power, with the *Thing*, consisting of an upper and a lower house, elected indirectly and directly by the people; and the judicial power, with courts, in which the judges are appointed by the king, but for life. At the death of Frederik VII. (Nov. 15, 1863) the Oldenburg dynasty became extinct, and was succeeded in Denmark by the house of Sonderburg-Glücksburg.

Frederikshald, fred'er-iks-haald: town of Norway; in the stift of Aggershuus; 50 miles S. S. E. of Christiania (see map of Norway and Sweden, ref. 11–D). To the S. E. is a strong castle, Frederiksten, standing on a perpendicular rock 350 feet high, overhanging the sea, and considered impregnable. Here, Dec. 11, 1718, at the siege of this fortress, Charles XII. of Sweden was killed. The town has a fine harbor and considerable trade in iron and lumber. Pop. (1891) 11,183.

Frederikstad, -staad: a seaport of Norway; at the mouth of the Glommen; 50 miles S. E. of Christiania (see map of Norway and Sweden, ref. 11–D). It has a spacious harbor, a good trade, thriving manufactures of hardware, pottery, agricultural implements, brandy, etc., and carries on a considerable shipping trade, besides its lumber business. A mile and a half from the town is the fall of the Glommen, called Sarpen. The town was formerly strongly fortified, and in 1716 Charles XII. of Sweden in vain attempted to capture it. Pop. (1891) 12,307.

Fredo'nia: city; capital of Wilson co., Kan. (for location, see map of Kansas, ref. 7–I); on Fall river, and on the A., T. and S. F., the Missouri Pacific and the St. L. and S. F. Railways; 85 miles E. by S. of Wichita; in a fine farming region. Pop. (1880) 923; (1890) 1,515; (1900) 1,650.

Fredonia: village; Chautauqua co., N. Y. (for location of county, see map of New York, ref. 6–B); situated on the D., A. V. and P. Railroad; 40 miles S. W. of Buffalo and 3 miles from Lake Erie. It is the seat of a State normal school, built by the village at a cost of $100,000. The raising of garden-seeds, grapes, grape-vine roots and other nursery-stock is extensively carried on. The village has large carriage-factories, felt-pad works, etc., sewers, water-works owned by the village, electric lights, and an electric street railway connecting it with Dunkirk. Since 1824 it has been provided with natural gas, obtained by boring into the bituminous shale. Here was organized the first grange of the Patrons of Husbandry. The first academy in Western New York was established here in 1824; its library of some 2,000 volumes has been transferred to the normal school building. Pop. (1880) 2,692; (1890) 3,399; (1900) 4,127.

Free Bench: in English law, an estate in many respects resembling dower, which by the custom of most manors the widow has in the copyhold estates of which her husband was a tenant. In some manors the husband's estate in the copyholds of which his wife was a tenant is also called free bench, but this interest is usually termed his courtesy, and free bench applied only to the widow's interest.

This is a customary right, and as such is not governed by any general law, as in the case of dower, but is dependent upon the local custom for the quantity, character, and duration of the estate which the widow takes.

Unlike a dower right it may be defeated by any alienation of the husband, either by deed or by will, but is paramount to his debts. The former remedy for enforcing the right of free bench was by a plaint in the manor court, but the remedy is now by writ of summons and notice after a form of procedure prescribed by the Common Law Procedure Act of 1860.

F. STURGES ALLEN.

Free Church of Scotland: That branch of the Presbyterian Church in Scotland which separated from the Established Church in 1843. The movement in the Church of Scotland which terminated in the formation of this is closely connected with controversies which have lasted for more than 300 years. (For the earlier history of these controversies, see the article SCOTLAND, CHURCH OF.) In 1647 an act of the Assembly of the Scottish Kirk was passed, adopting the Westminster Confession with two modifications—the one in favor of the system of presbytery, which is omitted from the Confession, and the other affirming the right of the Church to meet in synods and assemblies without the consent of the magistrate.* On Mar. 9, 1649, the Scottish Parliament passed an act abolishing patronage in the Kirk, as being unlawful and unwarrantable by the word of God and contrary to the doctrines and liberties of the Church. The General Assembly in June of the same year passed an act entitled "The Directory for the Election of Ministers," in which it was declared that the kirk session, or board of elders elected by the congregation, should elect the minister, and intimate their election to the congregation for their approbation; if the majority dissented, another election was to take place. No minister was to be settled but "upon the suit and calling of the congregation." The session elected but the congregation must mark their consent by an orderly call before the settlement could take place. This Assembly completed what is usually spoken of as the Second Reformation of the Kirk, in which the great principles of her Presbyterian constitution and her inherent right of spiritual jurisdiction were vindicated.†

After the restoration of Charles II. patronage was restored in connection with the introduction of the episcopal form of church government.

We pass on to the union of the two kingdoms of England and Scotland and the merging of the two legislatures in one Parliament. This was preceded by a succession of legislative acts which were intended to secure to the Scottish nation, by the most solemn guarantees, the maintenance of the doctrines, principles, and government of the Kirk. In 1705 the act for securing the Protestant religion and Presbyterian church government was passed by the Scottish Parliament, and was afterward incorporated into both the Scottish and English acts for ratifying and approving the union. This act received the royal sanction in 1707, when the union was consummated, and has been regarded by Scotchmen not as a simple legislative statute, but as a fundamental and essential condition of the treaty of union.‡ This important act not only confirms the act of 1690, ratifying the Confession of Faith and settling the Presbyterian church government, but also the other acts which followed that, abolishing the royal supremacy, and substituting the election of the session and the call of the congregation for the presentation by lay patrons. But in 1711 the famous act of Queen Anne for the restoration of patronage was passed, and on this act the present practice of patronage in the Church of Scotland rests. All parties in the Kirk united in resisting the restoration of patronage; the General Assembly, while yielding to it, continued for many years to protest against it. Lord Macaulay thus speaks of the serious consequences of this alleged breach of the constitution of the Church of Scotland: "The British legislature violated the articles of union and made a change in the constitution of the Church of Scotland. From that change has flowed almost all the dissent now existing in Scotland. Year after year the General Assembly protested against the violation, but in vain, and from the act of 1711 undoubtedly flowed every secession and schism that has taken place in the Church of Scotland."§

The question here arises as to whether the terms of the Revolution settlement, subsequently ratified by the treaty of union between England and Scotland, are legally so stringent that they could not be altered by subsequent legislation without a breach of the covenant. It must be noticed that it has proved to be impossible for one generation to bind all those who succeed it in any department of human interest, and least of all in the sphere of religion. The acts that were embodied in the treaty of union required all university professors to sign the Confession of Faith and submit to the government and discipline of the Kirk. This was, equally with the abolition of patronage, a fundamental condition of the union; but in 1853 a Universities (Scotland) Act was passed by the Parliament which limited this subscription to theological professors. In the present condition of parties in Scotland the right of the legislature to make this change will scarcely be questioned. The subject in its purely legal aspect is not without difficulties, but it can not be maintained that the legislature of to-day is bound to perpetuate what it regards as inexpedient or even wrong because it was a condition of the treaty of union 200 years ago.

It must, however, be borne in mind that the act of Queen Anne which abolished patronage was in direct opposition to the declared principles of the Church of Scotland and to various solemn acts both of the General Assembly and of

Parliament. No change in the opinions of the Scottish Church or nation had taken place to warrant such a breach upon the constitution of the Kirk, and the measure was passed in spite of the earnest remonstrance and protest of the Church and nation. Apart, therefore, from the grave question in reference to the irrevocableness of any statute, the act itself was unwarranted, and its consequences were as serious as Lord Macaulay has represented them to be.

The history of the Church of Scotland from 1711 to 1834 is marked by many instances of the intrusion of ministers into parishes against the will of the people. In 1736 the Assembly passed an act against the intrusion of ministers into vacant parishes, and up to 1784 the Assembly continued from year to year to remonstrate against the law of patronage and instructed each succeeding commission * to make application to the king and Parliament for redress of the grievance. A case of disputed settlement under the patronage act led to the first Secession, in 1733, and another case of the same kind led to the formation of the Relief Church in 1752.

A full statement of the facts of these Secessions belongs properly to the history of the United Presbyterian Church in Scotland. From the time of the second Secession the dominant party in the Church continued to enforce the law of patronage for many years, but a minority within the Church continued to protest against the intrusion of ministers and to contend for the doctrine of spiritual independence. About the beginning of this century the party opposed to patronage, now known as the "Evangelical party," was greatly increased. The settlement of Dr. Andrew Thomson as minister of St. George's church, Edinburgh, in 1810, and the subsequent publication of the *Christian Instructor* under his management as editor, gave a great impulse to the Evangelicals.† In this work of rousing the energies of the Scottish people to seek ecclesiastical reform he was joined by Dr. Thomas McCrie, the historian, and shortly afterward, in 1815, Dr. Thomas Chalmers was removed from the country parish of Kilmany to the Tron church of Glasgow, and threw all his talents and energies into the same great work. These three ministers were of those men who stamp the impress of their own characters upon the age in which they live, and were influenced by the same strong lofty views of the independence of the Church, and by the same ardent love for the principles which they regarded as fundamental to the constitution of the Reformed Church of Scotland. In 1825 an anti-patronage society was formed, the most active member of which was Dr. Andrew Thomson, but the majority of the Evangelical party declined to unite with it, and continued to seek the regulation and control of the law without contemplating its total abolition. In 1832 overtures from three synods and eight presbyteries were laid on the table of the General Assembly, representing that the call had been reduced to a mere formality, and praying that measures be adopted to restore it to its constitutional and salutary efficiency. A motion declaring it to be inexpedient to take any action was carried by a majority of forty-two. At the Assembly in 1833 no less than forty-five overtures asking for the restoration of the call to its proper place in the constitution of the Church were presented. Dr. Chalmers moved that the dissent of a majority of the parishioners be conclusive against the settlement of a minister, provided the objections were not founded on malice or caprice. A motion, in effect continuing the practice then in use, was carried by a majority of twelve. The agitation of the subject was continued, and at the General Assembly of the following year (1834) a great number of overtures brought up the discussion of the call, and a motion made by Lord Moncrieff to the same purport as that made by Dr. Chalmers in the preceding year was carried by a majority of forty-six. The act on calls, generally known as the "veto act," was only a half measure. Instead of giving any direct efficacy to the call of the people, which was what the constitutional principles of the Church warranted, it simply rendered the dissent of the people conclusive against the presentee; but the passage of this act marks the beginning of the "ten years' conflict" between the ecclesiastical and the civil power in Scotland. The first case that arose under this new act will serve as an illustration of the conflict which was carried on between the co-ordinate courts.

* The commission of Assembly is a kind of committee of the whole, which has power to meet at any time of the year in reference to any matters which may affect the interests of the Church.

† The terms *Evangelicals* and *Moderates* are used to save circumlocution.

The church and parish of Auchterarder having become vacant in Aug., 1834, on Sept. 16 thereafter the Earl of Kinnoul, as patron, issued a presentation in favor of Robert Young, a licentiate of the Church. The call was laid before the presbytery on Oct. 14, and in terms of the veto act and its relative regulations the matter was brought before the parishioners. The call was signed by the Earl of Kinnoul's factor, not a resident in the parish, and by two heads of families. On the other hand, 287 heads of families, being communicants, subscribed a dissent from the call. In consequence of this the presbytery rejected Mr. Young as presentee to the parish. Mr. Young appealed first to the synod and afterward to the Assembly, but both of these courts reaffirmed the decision of the presbytery by large majorities. Thereupon the Earl of Kinnoul and Mr. Young instituted a process in the court of session,* contending that the rejection of Mr. Young as presentee was *ultra vires* of the presbytery, in violation of the statutes, and to the serious injury of their patrimonial rights as patrons and presentee. The presbytery of Auchterarder asked advice of the commission of Assembly which met Nov., 1835, and the commission instructed their procurator, or legal agent, to conduct the defense at the expense of the Church. On Mar. 8, 1838, the court gave its decision by a majority of three—the numbers being eight and five—to the effect that the presbytery had acted to the hurt and prejudice of the patron and presentee, illegally and in violation of their duty, and contrary to the provisions of the statute of Queen Anne for the restoration of the rights of patrons. At the next meeting of the presbytery of Auchterarder the whole matter was referred to the synod, and from thence sent up to the General Assembly, which met in May, 1838. The Assembly authorized the procurator of the Church to appeal the case to the House of Lords, and on May 3, 1839, the judgment of the House of Lords was given to the effect that the appeal be dismissed and the decision of the court of session affirmed. Thus the highest legal judicatory in the kingdom declared the veto act to be illegal, and that the law recognizes neither the call nor the objections of the people in the appointment and ordination of a minister to a parish, and that, if they interfere with the patron in the exercise of his right, they must be put down. A crisis had now arrived, and the General Assembly of 1839 met prepared to deliberate on the course to be taken. Dr. Cook, as leader of what was called the Moderate party, moved, in effect, that as the veto act had been pronounced illegal by the supreme civil tribunals of the country, the General Assembly should instruct all presbyteries to proceed in the settlement of parishes according to the practice which prevailed previously to the passing of that act. Dr. Chalmers, as leader of the Nonintrusion party, moved a resolution affirming the readiness of the Church to give obedience to the civil courts so far as the civil rights and emoluments of the Church were concerned, but at the same time declaring the principle of nonintrusion to be an integral part of the constitution of the Reformed Kirk of Scotland, and that the principle could not be abandoned; therefore no presentee should be forced upon any parish contrary to the will of the congregation. This resolution further provided for the appointment of a committee, with instructions to confer with the Government of the country with a view to the restoration of harmony between Church and state. This motion was carried in the Assembly by a majority of forty-nine. It declared in effect that the civil courts might do what they chose with the emoluments of the parish of Auchterarder, but that the Church courts could not proceed at the dictation of these courts to the ordination and settlement of Mr. Young. Thus terminated for a time the Auchterarder case, but the collision between the Kirk and the civil courts continued.

The position of the Church was becoming more and more difficult and complicated. The Nonintrusionists were willing to abandon the temporalities of the benefices, and claimed for the Church only spiritual and pastoral rights; but this was met, on the part of the civil courts, by the principle that ministers of the national Church were statutory functionaries, bound to perform their duties as fixed by the supreme courts, and that they could not evade these duties by merely abandoning the emoluments. Meanwhile some attempts were made to afford relief from this conflict of jurisdiction by means of legislation. In May, 1846, the

* The court of session is the supreme civil court in Scotland, having jurisdiction in all civil cases of whatever nature. It was instituted in 1532. The number of judges is thirteen—the lord president, the lord justice's clerk, and eleven ordinary lords.

Earl of Aberdeen brought forward a bill on the Church question, but it failed to meet the difficulties, inasmuch as it acknowledged the validity neither of the veto nor of the direct call, and left the proceedings of the Church courts subject to the review of the court of session. After a second reading it was withdrawn. The General Assembly of 1842 transmitted to the crown "the claim, declaration, and protest anent the encroachments of the court of session." "The Claim of Rights," as it was called, is a most valuable historical document, gathering up the principles of the majority in the Assembly, and giving a comprehensive statement of the scriptural, constitutional, and legal grounds on which these principles rested, of the wrongs which the Church had sustained from the civil courts, and of the claim for protection which she put forth. It closed with a solemn declaration that at all hazards the Church was prepared to defend and maintain her inalienable rights. Toward the close of the year 1842 a convocation was called to take into consideration the position of the Church in relation to the civil courts. This meeting was opened on Nov. 17, and about 450 ministers were present. A memorial to Government was subscribed by nearly all the ministers present, by which they committed themselves to the relinquishment of the Church temporalities if they could no longer hold them in consistency with the free and full exercise of their spiritual functions. Mr. Maule introduced a motion into the House of Commons, Mar. 7, 1843, to the effect that the house should resolve itself into a committee to take into consideration the grievances of which the Church of Scotland complained; 76 voted for this motion and 241 against it, but the Scottish members voted in the proportion of 2 to 1 in its favor. It was felt in Scotland as a grievance that in a purely Scottish question the voice of Scotland, as expressed by her representatives, was overborne by the votes of English and Irish members. With this decision the negotiations for relief from the conflict of opposing jurisdictions by means of legislation came to an end.

The Assembly met on May 18, 1843. That day witnessed a transaction which profoundly agitated the Scottish nation; a thrill of enthusiasm passed from heart to heart such as had not been felt for centuries. After the usual preliminary services, the Rev. Dr. Welsh, as moderator, impressively declared that it was impossible to constitute a free Assembly under the conditions of establishment as now fixed by the civil authorities, and then read the protest. The protest having been laid on the table, he rose and left the chair, and proceeded up the aisle to the door; he was speedily joined by Dr. Thomas Chalmers, and they were followed by over 400 ministers and a still larger number of elders. They were received by the people outside the church with prolonged cheers, and as the crowd fell back on either side to allow them to pass out, they spontaneously, though without any previous arrangement, fell into a line three abreast, and thus made their way to the large hall at Cannonmills which had been prepared for their reception. Dr. Chalmers was elected the first moderator of the Free Assembly, and the Secession was completed by the subscription of the act of separation and disruption. Four hundred and seventy ministers thus abandoned the Church of Scotland as by law established, renouncing all rights and emoluments in that Church. A yearly revenue of more than £100,000 sterling was voluntarily relinquished. We can quite understand how the fire of a holy enthusiasm would glitter in many an eye as they witnessed this example of the supremacy of conscience amid many temptations to compromise with the civil authorities. One great service which the disruption rendered to the common cause of Christianity was the testimony that it bore to the existence and power of a self-sacrificing attachment to the cause of Christian truth. Here was a company of nearly 500 ministers who, rather than do what they believed would be hurtful to religion, resigned their secure emoluments and threw themselves and their families upon the providence of God. The deed took many by surprise, and closed many a lip that had sneeringly proclaimed that the ministers would cling to their manses and stipends. It filled every generous mind, every lover of the noble and heroic in every land, with a glow of admiration. Whatever opinion men held of the merits of the previous controversy, the disruption itself made a deep and broad impression that the sacrifice it involved was made at the shrine of conscience. Nor was it done in the heat of a momentary impulse. It was reached by slow and well-measured steps after much public and private debate, and the truest honor is due to the men who thus rose at the call of duty above all personal, all earthly considerations.

It is necessary to notice that the Free Church thus constituted held strongly to the principle of a religious establishment. The testimony of the Church of Scotland has always been that Christ is not only Head over the Church, but also Head over nations and states as such; and it was held by the leaders of the Free Church movement, and especially by Dr. Chalmers and Hugh Miller (who as editor of the Edinburgh *Witness* did much to prepare the people for the disruption), that this doctrine of Christ's headship involved the duty of the civil magistrate to support the Church of Christ in the land over which he rules.

The distinctive principles of the Free Church may be summed up under two heads: (1) The right of those who are members of the Church, and in full communion with her, to have the uncontrolled power of choosing their own pastors. At the beginning of the conflict it was simply asked that no pastor should be intruded by a patron or by a church court upon an unwilling people, but as the battle went steadily on this claim was intensified, and the abolition of patronage was demanded as a right. The right of a call in some form or other has always been claimed by the Church of Scotland for the people. It is not necessary to review the facts on this subject; the only question is as to whether an Established Church, having no power but what the state has conferred on it, is not bound to acquiesce in the legislation of the state and the decisions of the civil courts. The Claim of Rights maintains that the restoration of patronage by the act of Queen Anne was a breach of contract as ratified in the treaty of union; but it was held, on the other hand, that the Establishment is not founded on contract at all, inasmuch as the legislature of one period can not be bound by the acts of their predecessors. That the constitution of the Church of Scotland involves the right of congregations to elect their ministers can not be doubted, and we find that after the dust of the conflict had cleared away the Church of Scotland once more, under the leadership of such men as the late Dr. McLeod and Dr. Caird, continued to claim for the people this right of electing their ministers. (2) The second great principle asserted by the Free Church was the right of the Church through its courts and under Christ, and in accordance with the word of God, to regulate all purely spiritual and ecclesiastical affairs. The Evangelical party in the Church of Scotland maintained that in matters so purely spiritual as the exercise of discipline over their own members and office-bearers they could not be interfered with by the civil courts. They were quite willing that the civil courts should assume the direction of the civil or pecuniary interests of their members, but when the court of session reviewed and reversed, declared null and void, the ordinations, suspensions, and depositions which the church courts had pronounced and ratified—when it prohibited ministers whom the church courts had appointed to preach in certain districts from exercising within these districts any function of their ministry—it was felt that the Church was stripped of her independence, and the doctrine of Christ's headship over the Church thrust aside. The appeal to the British Parliament to sustain the Church's claim to a separate and exclusive jurisdiction in things spiritual and ecclesiastical was rejected; and now it was left for those who contended for the Church's freedom and independence either to surrender the liberties and privileges which they regarded as in harmony with all the principles and statutes upon which the Kirk of Scotland was established; or to disobey the law as now declared and to submit to whatever penalties might be inflicted; or to quit the Establishment, and so relieve themselves from legal obligations which they could not conscientiously discharge. At once they chose the latter as the only open and honorable course for them to take, and rather than sacrifice the spiritual independence of the Church they paid the forfeit of their livings.

When the Free Church was thus constituted a great work was before it. Churches had to be created, provision made for the support of the ministry, a college to be organized and sustained, and missionary operations to be carried on. So much energy and zeal were put forth that within three years and a half after the disruption over $2,000,000 had been expended on churches and manses, and $350,000 had been obtained for educational purposes. In its subsequent history the Free Church has afforded the noblest demonstration of the power of a Christian Church to maintain an educated ministry, and at the same time to prosecute missionary and other benevolent enterprises with increasing liberality. The Free Church annually raises over $3,000,000 for religious purposes. Through its sustentation fund the ministers in the poorest parishes receive adequate support. Nearly all the foreign missionaries connected with the Established Church took part with the Free Church, and on this Church, even amid its own early struggles, the support of these missions devolved. It has missions in India, in Eastern Europe, in Asia Minor, Syria, and Arabia, and in Africa; it has contributed largely to the evangelization of the colonies, especially Canada and Australia; and it makes grants from year to year to evangelical societies on the continent of Europe. Free Church schools have been established through Scotland, and there are three theological colleges sustained with efficiency. Whatever may be said of the principles maintained by the Free Church, there can be only one estimate of the character and worth of the outgoing ministers, and of the zeal and liberality and success with which that Church has so far prosecuted its work. To the Alliance of the Reformed Churches, in 1892, it reported 74 presbyteries, 1,092 congregations, 1,142 ministers, and 338,978 communicants. For later and fuller statistics, and for an account of the voluminous literature of the subject, see the article PRESBYTERIAN CHURCH.

Free Cities: See FREE IMPERIAL CITIES.

Free Coinage: See COINAGE, CURRENCY, FINANCE, and SILVER COINAGE.

Free Congregations (transl. of Germ. *Freie Gemeinde*): the name of those formed in Germany as a rationalist reaction against the revival of positive Christianity under King Frederick William IV. of Prussia. In 1841 a number of pastors of the old rationalistic school assembled at Gnadau and Halle, under the presidency of Lebrecht Uhlich, pastor of Pömmelte, near Magdeburg, and adopted a platform of nine strongly pronounced rationalistic propositions, at the same time assuming the name "Friends of Light," or "Protestant Friends." In 1844 another meeting was held, at Coethen, where 133 theologians and about 500 laymen were present; and Uhlich delivered a lecture in which he rejected the doctrines of hereditary sin, atonement, the Trinity, the divinity of Christ, etc. At first the leaders of the movement professed to be Christians; but when afterward they openly rejected all the fundamental doctrines on which the Christian Church is built, identified themselves with the young Hegelian school, and affiliated with atheists and materialists, the Government began to interfere, and they were compelled to separate from the Church and form "Free Congregations." The movement, nevertheless, received a new and strong impetus from the political disturbances of 1848. The leaders entered Parliament, and found an opportunity of representing themselves as the leaders of the nation. The connection with politics, however, proved fatal to the movement. When the enthusiasm was spent and the heavy reaction set in, the Government began to deal in a rather peremptory way with the Free Congregations. Still in 1891 there were in Germany fifty-five of them, with 18,771 members. See F. Kampe, *Geschichte der religiösen Bewegung der neueren Zeit* (4 vols., Leipzig, 1852–60), and the annual *Freireligiöser Kalendar* (Gotha, 1871, *sqq.*).

Freedman [*freed*, perf. partic. of *free* + *man*; used often as a transl. of Lat. *libertus*, *libertinus*, freedman, derivs. of *liber*, free]: in ancient Rome, a free man who had been a slave. Slaves liberated by certain forms, or owned with certain conditions before liberation, or over thirty years old at the time of acquiring freedom, became not only freedmen, but Roman citizens; others belonged to the class Latini; still others (*dedititii*) had no recognized political existence. The descendants of freedmen were free, but even when citizens they did not have the rights of the gens.

Freedmen's Bureau: a bureau of the War Department of the U. S. Government established Mar. 3, 1865, for the supervision of lands abandoned during the civil war, and for the control of all subjects relating to refugees and freedmen from any part of the territory within the operations of the army. The bureau was under the control of a commissioner appointed by the President and confirmed by the Senate. The establishing act also contained a clause authorizing a detail of officers of the army for service under the commissioner. A supplementary act enlarged the functions of the bureau so as to include "the supervision and care of all loyal refugees and freedmen, so far as the same shall be necessary to enable them, as speedily as practicable, to become self-supporting citizens of the U. S., and to aid them in making the freedom conferred by proclamation of the commander-in-chief, by emancipation under the laws of States, and by constitutional amendment available and beneficial to the public."

The work thus assigned to this bureau was nothing less than the organization into the methods of civil government of two and a half millions of people who had been driven from their former homes by the sharp vicissitudes of war. Gen. O. O. Howard, of the U. S. army, was appointed commissioner, and he at once put in motion a vast machinery for the accomplishment of the work by installing a large number of assistant commissioners in various parts of the country. These were organized into divisions as the "quartermaster's division," the "land and claim division," the "medical division," the "transportation division," the "school division," the "bounty division," and the "financial division." The scope of the work undertaken was thus defined in the report of the investigating committee of 1870: 1, taking possession, on behalf of the U. S., of all real estate abandoned by its owners; 2, taking possession of all real estate forfeited to the U. S. to be sold for taxes, whether bought in by order of the President of the U. S. or sold to settlers and others; 3, taking possession of all lands confiscated to the U. S.; 4, taking possession of all personal property of the enemy derelict, abandoned, or captured, except prizes at sea; 5, taking care of, and making provision for, all persons now freed or hereafter to be freed under any laws of the U. S. or proclamations of the President or acts of manumission; 6, taking care of all colored men in the rebellious districts who were free before the war, and of all fugitives thereto from loyal States; 7, all legal proceedings for the confiscation of property in the courts, the U. S. attorneys or special attorney to act under orders of the new department so far as respects these proceedings; 8, the administration of all laws, rules, and regulations relating to the migration of colored people; 9, and of laws relating to the compensation, if any, which the Government may hereafter give to aid loyal States in emancipating slaves; 10, all other matters relating to the emancipation and its processes, its rules and regulations, etc., and the protection of the interests of the colored men as well as of the U. S.

Within five years from the time of the organization of the bureau the school division reported the establishment of 2,118 schools with 250,000 pupils; the transportation division reported 6,352 freedmen transported to places where there was employment and assured support; the financial division reported that the receipts and expenditures for the work of the bureau proper were about $8,000,000, and that including the bounty and prize-money secured through the bureau the total amount exceeded $21,000,000. The work of the bureau was intended to be only temporary. Gradually the schools, banks, and other institutions founded for the purpose of aiding in the passage over a rough period were turned over to the common system of government in the country. The best authorities on the subject are the various reports of Gen. Howard and of the congressional committees between 1865 and 1871.

C. K. ADAMS.

Freedom of the Will: See FREE WILL and WILL.

Freehold: an estate of inheritance or for life in real property. It was in ancient times termed a frank-tenement (a word having the same meaning as "freehold"), and denoted an estate held by a freeman independently of the mere will of the feudal lord. It includes those estates to which the mode of conveyance by feoffment with livery of seizin was, in the early common law, exclusively appropriate, and this characteristic was once used as a means of defining its extent of application; but since the abolition of feoffment such a mode of description is no longer possible. (See FEOFFMENT.) But though the ceremony of livery of seizin no longer exists, the term "seizin" has still been retained as applicable to freehold interests alone, while all inferior estates are said to exist only in "possession." An estate of freehold may be either corporeal, as in land, or incorporeal, as in rents or franchises. Freeholds of inheritance are fees simple (see FEE) and fees tail. (See ENTAIL.) Freeholds not of inheritance are life estates, and may be either *conventional* (that is, such as are created by contract between the parties) or *legal* (that is, such as are created by operation of law). Those which are conventional may be either (1) for one's own life, (2) for the life of another, or (3) for some indefinite period, which may possibly last during the period of one's life. Legal life estates are (1) curtesy, (2) dower, and (3) jointure. See ESTATE, DOWER, and JOINTURE.

Revised by F. STURGES ALLEN.

Freehold: town; capital of Monmouth co., N. J. (for location, see map of New Jersey, ref. 4–E); on Cent. R. R. of N. J. and Penn. R. R.; 24 miles E. of Trenton and 16 miles W. of Long Branch. It has 6 churches, good public and private schools, a manufactory of underwear employing over 400 persons, a large iron-foundry, machine-shops, a large file-factory, a planing-mill, about 150 business places, mechanics' shops, etc., gas and electric lights, a system of sewers, and water-works supplied from artesian wells. In the town is located a handsome monument commemorating the battle of Monmouth, fought here June 28, 1778. Pop. (1880) 2,432; (1890) 2,932; (1900) 2,934.

EDITOR OF "MONMOUTH DEMOCRAT."

Free Imperial Cities: the expression generally used to translate the German phrase *freie Reichs-städte*—that is, towns which govern themselves by elected magistrates and form independent communities subject only to the emperor. They were the natural result of the unsettled state in which society found itself in the early Middle Ages, and which made it necessary for the most peaceful industry and commerce to wear helmet and sword and protect themselves by walls and towers against the robberies of the knights. As they acquired the power of defending themselves they gradually obtained political influence, and the emperor was often willing to grant them great privileges on account of the support they were capable of giving him in his quarrels with the nobility and the clergy. They first appear fully developed in their distinct character as independent members of the empire in the reign of Henry VII., 1308–13. At the Diet of Augsburg, 1474, they for the first time divided themselves into two benches—the Rhenish and the Suabian; and by the Peace of Westphalia, 1648, they were formally recognized as forming the third *collegium* of the imperial diet. Their number was always somewhat fluctuating; they seem to have lost their privileges still more easily than they gained them, and their history was generally full of violent turns. At the outbreak of the French Revolution they numbered fifty-one, the Rhenish bench comprising fourteen—Cologne, Aix-la-Chapelle (*Aachen*), Lübeck, Worms, Spires, Frankfort-on-the-Main, Goslar, Bremen, Hamburg, Mühlhausen, Nordhausen, Dortmund, Friedberg, and Wetzlar; and the Suabian, comprising thirty-seven—Ratisbon (*Regensburg*), Augsburg, Nuremberg, Ulm, Esslingen, Reutlingen, Nördlingen, Rothenburg on the Tauber, Schwäbersch-Hall, Rothmeil, Ueberlingen, Heilbronn, Gmünd, Memmingen, Lindau, Dinkelsbühl, Biberach, Ravensburg, Schweinfurt, Kempten, Windstein, Kaufbenern, Weil, Wangen, Isny, Pfullendorf, Oppenburg, Leutkerchen, Wimpfen, Weissenburg in the Nordgau, Giengen, Gengenbach, Zell on the Hammerbach, Buchhorn, Ahlen, Buchau, and Bopfingen. In 1803 there were but six—Hamburg, Lübeck, Bremen, Frankfort-on-the-Main, Augsburg, and Nuremberg, and Augsburg and Nuremberg were incorporated with Bavaria in 1806, and Frankfort-on-the-Main with Prussia in 1866. The only free cities remaining are Hamburg, Lübeck, and Bremen, which since 1861 have been sovereign members of the German empire.

Freeland: borough; Luzerne co., Pa. (for location of county, see map of Pennsylvania, ref. 3–I); on the Lehigh Valley Railroad; 39 miles by rail S. of Wilkesbarre. It has excellent schools, a planing-mill, foundry, machine-shops, etc., electric lights, water-works, and an ample supply of coal, and is the business center of the surrounding agricultural district and mining towns. Pop. (1880) 624; (1890) 1,730; (1900) 5,254.

EDITOR OF "PROGRESS."

Freeman: a man who is not a slave, or, in a narrower sense, a citizen or burgess who has certain specified rights. In ancient Rome freeman (*liberi*) were of two classes—*ingenui*, or free-born, and *liberti* or *libertini*, freedmen, who had been slaves. The two classes had a distinct legal status, but the sons of freedmen were *ingenui*, though without tribal privileges.

Freeman, EDWARD AUGUSTUS, D. C. L., LL. D.: b. at Harborne, Staffordshire, England, Aug. 2, 1823; chosen a scholar of Trinity College, Oxford, 1841; a fellow in 1845; examiner in Law and Modern History at Oxford 1857–58, 1863–64, and in the School of Modern History in 1873; became Regius Professor of Modern History and fellow of Oriel 1884. He was created honorary D. C. L. by the University of Oxford at the installation of the Marquis of Salisbury in 1870, and honorary LL. D. by the University of Cambridge in 1874; honorary member of the Imperial University of St. Petersburg 1877; honorary LL. D. of the University of Edinburgh 1884. Author of *Church Restoration* (1846); a *History of Architecture* (1849); *Architectural Antiquities of Gower* (1850); *Window-tracery in England* (1850); *Llandaff Cathedral* (1851); *Poems* (with G. W. Cox, 1850); *History of the Saracens* (1856); *History of Federal Government* (1863); *History of the Norman Conquest* (4 vols., 1867–72); *Old English History* (1869); *History of Wells Cathedral* (1869); *Historical Essays* (1871–73); *Growth of the English Constitution* (1873); *Comparative Politics* (1873); *The Ottoman Power in Europe, its Nature, its Growth, and its Decline* (1877); *The Reign of William Rufus and the Accession of Henry I.* (2 vols., 1882); *General Sketch of European History* (1872); *Disestablishment and Disendowment, what are they?* (1874); *Historical and Architectural Sketches, chiefly Italian* (1876); *Sketches from the Subject and Neighboring Lands of Venice*; *The Historical Geography of Europe* (2 vols., 1881); *English Towns and Districts*; *Lectures to American Audiences* (1883); *Chief Periods of European History* (1886); *Methods of Historical Study* (1885); *Greater Greece and Greater Britain*; *George Washington* (1888); *William the Conqueror* (1888); *The History of Sicily from the Earliest Times* (vols. i. and ii. published 1891, vol. iii. 1892); *Historical Essays* (4th series, 1892); and *Sicily* (in the *Story of the Nation* Series, 1892). D. in Alicante, Spain, Mar. 16, 1892.

Freeman, JAMES, D. D.: a Unitarian clergyman, the first in the U. S. to call himself so. By his means the "King's chapel" in Boston, the oldest Episcopal church in New England, became the first Unitarian church in New England, and consequently in America. He was born in Charlestown, Mass., Apr. 22, 1759; was graduated from Harvard College in 1777; was chosen lay-reader of King's chapel in 1782; became Unitarian; carried his people with him; induced them to alter the Prayer-book in accordance with the new theology; and in 1787 was ordained pastor of the church by the wardens and people. The connection remained unbroken till his death in Newton, Mass., Nov. 14, 1835.

Freeman, JAMES MIDWINTER, D. D.: minister and author; b. in New York city, Jan. 29, 1827; studied in the public schools and in Wesleyan University, from which he received the degree of M. A. in 1866; became a pastor in the Methodist Episcopal Church, and in 1872 editor and secretary of the Sunday-school Union and Tract Society of that Church. Between 1865 and 1870 he was the author of thirty-five books for children (under the name of *Robin Ranger*). Besides these he wrote *Use of Illustration in Sunday-school Teaching* (New York, 1867); *Handbook of Bible Manners and Customs* (1874); and *A Short History of the English Bible* (1879).

Freemasonry: a comparatively modern popular name for an ancient institution existing among all the civilized peoples of the globe, called by its votaries "Masonry," and so styled in its rituals, constitutions, and records. None but *free men* are eligible to admission (much stress has always been laid upon this fact), and its members have styled themselves "Free and accepted Masons." Hence they came to be known to profanes as Freemasons, and their society as "Freemasonry." But inasmuch as "Masonry" is the name originally adopted and still used by those professing it, it is deemed proper to treat it under that head. See MASONRY.

JOSIAH H. DRUMMOND.

Free Methodists: a small sect found chiefly in Western New York, Illinois, and Michigan. They reported in 1900 in the U. S. 870 churches, 870 ministers, and 27,629 members. See METHODISM.

Free Port: a harbor where ships of all nations may enter and leave, load and unload, without paying any duty, properly speaking; only a small toll is levied. On paying the duty stipulated the goods stored in such a place may be introduced into the country for home consumption. But the free port has its principal importance for the transit trade. See FREE PORTS in the Appendix.

Freeport: city and railway center; capital of Stephenson co., Ill. (for location of county, see map of Illinois, ref. 1–D); 121 miles W. of Chicago. It has good water-power, wheel-factories, manufactures of carriages, bicycles, vinegar,

windmills, coffee-mills, foundries, and shops of the Illinois Central Railroad. Pop. (1880) 8,516; (1890) 10,189; (1900) 13,258.
EDITOR OF "BULLETIN."

Freeport: borough; Armstrong co., Pa., (for location of county, see map of Pennsylvania, ref. 4-B); on railway and the north bank of the Allegheny river; 28 miles N. E. of Pittsburg. It has 9 churches, 8 schools, a good academy, large grist-mills, a tannery, planing-mills, sawmills, 3 very large distilleries producing 200 barrels of whisky per day, and gas-works. Pop. (1880) 1,614; (1890) 1,637; (1900) 1,754.
EDITOR OF "JOURNAL."

Free-soil Party: a former political party of the U. S.; was composed of the Liberty party of 1846, the Barnburner Democrats of New York, and of a considerable number of Northern Whigs who favored the Wilmot proviso, a proposal to prohibit slavery in the territories acquired from Mexico. In 1846 David Wilmot, a Democratic member from Pennsylvania, offered an amendment—the so-called "Wilmot Proviso"—to a bill submitted to Congress and appropriating money for the negotiation of peace with Mexico. The amendment read as follows: "Provided that there shall be neither slavery nor involuntary servitude in any territory on the continent of America which shall hereafter be acquired by or annexed to the U. S. by virtue of this appropriation, or in any other manner, except for crime, etc." It was carried in the House, but failed in the Senate; and in the next session it was defeated in both divisions of Congress. Both in the Democratic and in the Whig conventions of 1846 resolutions of the same import were offered, but in both they were rejected; and the consequence of the rejection was that a great number of prominent men, especially from Massachusetts, New York, and Ohio, seceded from both parties and formed a new party—the Free-soil Party, or the Free-soilers. In 1848, at Buffalo, they nominated Martin Van Buren and Charles Francis Adams for President and Vice-President. The ticket did not receive any electoral votes, and only 291,000 popular votes. In 1852, at Pittsburg, they nominated John P. Hale and George W. Julian, who received 157,000 popular votes. In 1856 the Free-soil party was merged into the new Republican organization.

Free Spirit, Brethren and Sisters of the: See BRETHREN AND SISTERS OF THE FREE SPIRIT.

Freethinker: a name given to the deistical writers of England in the seventeenth and eighteenth centuries. It was bestowed on John Toland, who in 1697 was called, in a letter to Locke, "a candid freethinker." In 1709 Lord Shaftesbury spoke of "our modern free writers." The title of Anthony Collins's work, written in 1713, *A Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called Freethinkers*, proves that the name was then in use with a somewhat definite application. However originating, by whomsoever bestowed, it was accepted by the rationalists as descriptive of their position as men who thought freely—that is, outside of the usual lines on ecclesiastical and theological subjects. The reproach that became associated with the term in the common mind was due to the prejudice against the unbridled exercise of reason on the Christian Scriptures and Creed, whatever the special opinions professed might be. The chief names among the English freethinkers are Hobbes, Hume, Shaftesbury, Bolingbroke, Herbert of Cherbury, Tindal, Toland, Chubb, Woolston, and Collins. These names represent widely different phases of opinion, from simple deism to theism of a pure quality, and widely different intellectual attitudes, from philosophical skepticism to the blunt criticism of common sense. The freethinkers were not, strictly speaking, a sect; they entered into no league; they started no propaganda; they established no school; they put forth no creed —not even a creed of negation; they held nothing in common but a belief in the validity of reason in the sphere of faith. They were simply individual scholars, writers, talkers, who freely, with various measure of ability, uttered their doubts in regard to the system of "revealed religion." Their temper differed as widely as their genius or culture. Some were trained scholars, polished writers, wits, men of fashion, citizens of the world, men of letters, political and social philosophers; others were poor, uneducated, unrefined. Some were masters of *persiflage*; others employed none but the homeliest speech. Their deism was of every shade. For the most part they held very positive religious ideas; they stood by the broad facts of human consciousness, maintained the existence and unity of a personal God, affirmed the perfect order of the universe, and prophesied the future welfare of all mankind. There was not an avowed atheist among them, not a professed materialist, unless it were Coward. They were unanimous in their desire—apparently an earnest one—to elevate religion to a spiritual sphere, and to emancipate it from dogmatism and formalism. Lord Herbert of Cherbury, who had perhaps more influence than any other in shaping the freethinking mind of England, an elder brother of George Herbert the poet, believed the true religion to be universal, commended by its intrinsic evidence to the human mind, and attested by the intuitions of the soul. His five points of belief were the existence of one supreme God; the duty of worship; piety and virtue as the means thereof; the efficacy of repentance; the existence of rewards and punishments here and hereafter. If any, like Bolingbroke, doubted the immortality of the soul, they were actuated in part by the thoroughness of their faith in an active law of retribution, which needed no after-life for its vindication. Coward, who wrote in the spirit of a materialist, affirmed immortality as a divine gift to man, while denying that it was a natural inheritance.

Freethinking in England was colored by French infidelity, but always preserved a character of its own. The term "freethinker" is misapplied to the Frenchman of the eighteenth century, the contemporaries of Voltaire, the *esprits forts* who were the precursors of the French Revolution. These men, forced into antagonism to a despotic system in Church and state, bent all their efforts to overthrow it. Hence their vehemence of thought and speech; hence their acridity of temper; hence the audacity of their speculations, the severity of their denials, and the philosophical rigidity of their speculation. They were less freethinkers than aggressive thinkers. To them the name *doctrinaire* applies. They did aim at propagandism; they did attempt to form a school; they constituted an aristocracy of intellect, a clique of philosophers. They had little sympathy with the common mind, and little faith in the intuitions of the common heart. For English common sense they substituted Parisian wit, and for English seriousness Gallic levity. The English freethinker pushed his inquiries into the wide field of religious speculation; the French *esprit fort* took up an ultimate position outside of all religious confessions, and defended it. Both the Englishman and the Frenchman were by their principles compelled to be champions of human rights. The former expressed the spirit of sturdy self-reliance that characterizes the British mind; the latter, in contending against oppression in Church and state, advocated principles that afterward bore fruit in the Revolution that laid Church and state prostrate. Still the spirit of the Englishman was more democratic.

The term "freethinker" is even less applicable to men like Strauss, Paulus, Baur, and the German rationalists than to Diderot, d'Holbach, d'Alembert, and Voltaire. For these men, though professing in some respects the same opinions with the Englishmen, arrived at them by different methods, and held them in a different spirit. Closet-students, scholars, and philosophers by profession, they published the result of their labors in a calmly scientific temper, as if unaware of opposing powers. They did not plume themselves on their freedom: they were not apostles of liberty; they made no war on institutions. The Englishman is the only genuine freethinker. The Frenchman is a *philosopher*—the German is a *rationalist*. Both are in advance of the freethinker in clearness of thought and statement, nicety of discernment, and adequacy of learning. The freethinker belongs to the last generation. The scientific thinker, the true thinker, is taking his place. For the history of freethinking, see Lechner, *Geschichte d. Deismus*, and Adam Storey Farrar, *Critical History of Free Thought*.

Freetown: a town of Western Africa, in lat. 8° 29′ N., lon. 13° 9′ W.; capital of the British colony of Sierra Leone; on the southern shore of the estuary of the Sierra Leone river, in a low, hot, but extremely fertile and beautiful plain, and surrounded by an amphitheater of lofty, forest-clad mountains (see map of Africa, ref. 5-A). The great amount of decomposed or half-decomposed vegetable matter which the river carries down to the sea, and which the tide drives back toward the city, makes the place unhealthful and unsuitable for European residents. The city is well built, though most of its houses are of wood. As each house or hut has its garden, or at least its courtyard, the city occupies a large area in comparison with the number of its inhabitants. Pop. 30,000.

Free Trade: literally, trade or commercial intercourse free from artificial interference or restriction. As generally used, however, the term has a wider and more complex meaning, and may be regarded as the expression of a principle of political economy which holds that the prosperity of a state or nation can best be promoted by freeing the exchange of all commodities and services between its own people, and between its own people and the people of other nations and countries, to the greatest extent possible, from all interferences and obstructions; but more especially from interferences and obstructions of an arbitrary, artificial character, resulting from legislation or prejudice. Free trade, as an economic principle or politico-commercial system, moreover, is the direct opposite to the so-called principle or system of *protection*, which maintains, on the contrary, that a state or nation can most surely and rapidly attain a high degree of material prosperity by "protecting" or shielding its domestic industries from the competitive sale or exchange of the products of all similar foreign industries; the same to be effected either by direct legislative prohibition of foreign commerce, or by the imposition of such discriminating taxes on imports as shall, through a consequent enhancement of prices, interfere to a greater or less extent with their introduction, free exchange, and consumption. An explanation of either of these terms, therefore, involves a presentation of the arguments, based on theory or experience, which may be adduced in support of the respective economic systems for which they are the expressions, and a review of the premises of the one almost necessarily requires a conjoint statement of the claims of the other.

It is also essential to appreciate clearly, at the outset of any explanation, the relation which "free trade" and "protection," regarded as economic systems, sustain to the subject of taxation and revenue—a matter about which there is no little of popular misconception. The nature of this relation may be stated as follows: The command of revenue being absolutely essential to the existence of organized government, the power to compel contributions, or, as it is termed, "to tax," is inherent in every sovereignty, and rests upon necessity, and upon no other rational basis. And if this premise is correct, the conclusion is warranted that the righteousness of any specific tax, or interference on the part of the state with individual rights of property, may be tested by the question "is it necessary" for fulfilling the rightful purposes of the state, not is it convenient, nor is it suitable. If it is necessary, the power of taxation may be justifiably exercised to any extent. But if the interference transcends such necessity, if it takes a dollar of a citizen's property beyond the requirements of the necessity, the act of taking loses at once its sole justification—i. e. that of necessity—and becomes tyrannical. Further, if the state, even to promote its necessary and legitimate objects, takes the amount of property to which it is entitled in such an unequal and inequitable manner that one citizen pays more than his just share of the requisite amount—whether it be great or small—it takes that to which it has no right, or does that which if done by a citizen in defiance of law is called robbery. Again, let the true ends of civil government be what they may, the acquirement of wealth is not one of them. Government, however, needs money, not in the ordinary sense of riches, but as the indispensable and practically the only means of defraying its expenditures; and taxation is the process of obtaining it from the citizen, who in turn obtains it in exchange for some product of his work, or for some direct personal service. The obligations of the government of any civilized state can not be discharged by the tender of ordinary merchandise, or by the mere framing of a statute or the wording of a law. The only instrumentality by which these results can be accomplished is money, and the raising of money is one thing and the distribution or use of it after it has been raised is another and entirely different thing. That the state, through its legislative department, and with a view of promoting what it considers to be a public purpose or for general good, "may interfere with the laws of trade, repress one form of industry and stimulate another, discourage even to the extent of prohibition the indulgence of certain tastes and practices which it may judge detrimental to itself or its citizens, and expend the money raised by taxation in furtherance of such objects," may not be denied. But at the same time, if it is sought to make taxation, which is a fit contrivance only for raising money, an instrument for effecting some ulterior purpose, be it never so just and desirable—as, for example, the regulation of trade and industry, the enforcement of morality, or for punitive purposes—is to distort an agency from its sole fit object to one that is less fit, and lose sight in so doing of the fundamental principles of every free government. The phrase "taxation for revenue only" has a broader and deeper meaning, therefore, than is generally recognized by those who use it in political discussion, and is really in the nature of an axiom in political economy and civil polity, subject to such limitations as the recognition of this axiom involves and requires. The question as to what forms taxation had best assume becomes a mere question of experience and expediency, preference being always given to those forms which involve the least waste, cost, and personal annoyance in collection, which are most productive in revenue, and which interpose the minimum of interference and restriction on the interexchange of commodities and services. Free trade as an economic principle is not therefore, as is often assumed and supposed, antagonistic to the imposition of equitable duties on imports, provided the end sought to be attained is simply revenue, and the circumstances of the state render such form of taxation expedient. Protection, on the other hand, on the ground of advantages accruing directly or incidentally, advocates and defends the exercise of the power of taxation for purposes other than revenue, or the procurement of money for defraying the necessary expenditures of the State; and indeed for purposes which avowedly contemplate, and can only be successfully attained by the restriction or entire prevention of revenue. Protection, in fact, to the exact extent to which it attains its main object—i. e. the taxation of imports—is obviously always and necessarily antagonistic to revenue, inasmuch as revenue is received only on those commodities which *come in*, while protection is secured only when the importation of commodities is restricted or made impossible. The adjustment of a tariff for revenue in such a way as to afford what is termed "incidental protection"—an idea much favored by politicians in the U. S.—is based on the supposition that by arranging a scale of duties so moderate as only to restrict and not prevent importations, it is possible to secure a sufficiency of revenue for the state, and at the same time stimulate domestic manufactures by increasing the price of competitive foreign products. That the double object thus aimed at is capable of attainment can not be doubted, but that the project is also one of the most costly of all methods of raising revenue will appear evident if it is remembered that, while revenue to the state accrues only from the tax levied on what is imported, the tax arising from the increase of price is paid equally by the nation upon all that is sold and consumed in competition with the foreign article. A tariff for revenue so adjusted as to afford incidental protection is therefore a system which requires the consumers, that is, the people, to pay much in order that the state may receive little.

With these preliminary statements the essential points of the argument in favor of free trade as contradistinguished from protection may be stated as follows:

1. The highest right of property is the right to exchange it for other property. In the absence of all freedom of exchange between man and man civilization would obviously be impossible; and it would also seem to stand to reason that to the degree in which we impede or obstruct the freedom of exchange—or, what is the same thing, commercial intercourse—to that same degree we oppose the development of civilization.

2. Any system of law which denies to an individual the right freely to exchange the products of his labor, by declaring, as is generally the custom, that A, a citizen, may trade on equal terms with B, another citizen, but shall not under equally favorable circumstances trade with C, who lives in another country, reaffirms in effect the principle of slavery, for both slavery and the artificial restriction or prohibition of exchanges deny to the individual the right to use the products of his labor according to his own pleasure, or what may seem to him the best advantage; or, in other words, the practical working of both the system of human slavery and the system of protection is to deprive the individual of a portion of the fruits of his labor without making in return any direct compensation. The argument that is generally put forth by the advocates of protection in justification of legislation restricting freedom of exchange, or

in defense of the pithily expressed proposition "that it is better to compel an individual to buy a hat for five dollars, rather than to allow him to purchase it for three," is that any *present* loss or injury resulting from such restriction to the individual will be more than compensated to him *indirectly* as a member of society or citizen of the state. But this plea is the same in character, and just as legitimate, as that which was formerly put forth in defense of the system of Negro slavery—namely, that the system was really for the good of the persons enslaved, and that any suffering or deprivation endured by the slave for the good of society—meaning thereby the masters—would be fully compensated to him, through moral discipline, in the world to come. It is also to be noted that this same species of argument—i. e. indirect or future individual or society benefit as a justification for present personal restriction or injury—has always been made use of in past ages as a vindication and in warrant for persecution on the part of the state for heresy or unbelief, and also for the establishment of state religions and enforced conformity thereto.

3. The general result for which all men labor is to increase the abundance or diminish the scarcity of those things which are essential to their subsistence, comfort, and happiness. Different individuals have different aptitudes, or are endowed with different natural capacities for making the various forces of nature and varieties of matter available for production. One man is naturally fitted to excel as a farmer, another as a mechanic, the third as a navigator, the fourth as a miner, engineer, builder, or organizer and director of society, and the like. The different countries of the earth likewise exhibit great diversity as respects soil, climate, natural products, and opportunity. It would seem clear, therefore, in order that there may be the greatest material abundance, that each individual shall follow that line of production for which he is best fitted by natural capacity or circumstances; and that, for the determination of what that line must be, the promptings of individual self-interest and experience are a far better guide than any enactments of legislatures and rulers possibly can be; and, finally, that the greatest possible facility be afforded to producers for the interchange of their several products and services. So true, indeed, are these propositions that mankind in their progress from the rudest and most incipient social organizations to higher degrees of civilization invariably act in accordance with them, and, as it were, instinctively. It is important at this point to recognize clearly the meaning of the term *industry*, which in its "domestic" form is claimed to be the special object of protection to protect, and which the advocates of the protection theory seem to very imperfectly appreciate. Thus industry consists of two factors, or there are two elements in it. One is production (Lat. *pro*, forward, and *ducere*, to lead), in the sense of drawing out materials or products from natural sources, and the other is exchanging or selling the things produced; and industry can not get along without both any more than a man can get along with only one leg. If a farmer grows 10,000 bushels of corn, and needs only 1,000 bushels for himself, family, and animals, and can not exchange or sell the other 9,000, he might as well have not raised it. He can eat corn, burn it for fuel, and make whisky of it, but he can not clothe himself with corn husks, plow with a corn stalk, wear corn shoes, and the like. To get these other things he must sell or exchange his surplus 9,000 bushels; and he must be of a simple mind who does not at once see that the greater facilities afforded to him for exchange, such as good roads, bridges, horses and wagons, cheap and swift railways and steamships, low tolls, freights and taxes, the greater will be the opportunity for exchange and trade to advantage. On the other hand, poor roads, unbridged streams, few or no railways or steamships, and high tolls, freights, and taxes, all tend to restrict or destroy trade and the opportunity to sell his 9,000 bushels of corn to advantage. In short, there has never been a case in all human experience when the removal of restrictions—natural or legislative—on trade did not result in the extension of trade to the mutual advantage of the great majority of the people concerned; and, on the other hand, there has never been a case where trade has been restricted by mountains, seas, bad roads, or tolls, or tariff taxes, in which trade has not decreased, or not developed, to the great disadvantage of the great majority. The man who can get a law passed that will enable him to tax trade or exchange always sees an advantage to himself in the restricted trade that will result. So also does the man who sits behind a bush on the road, with a gun, and tells the farmer who has sold his surplus 9,000 bushels of corn, "You can not pass unless you give me a big part of what you received for it in exchange." Carry out logically and to their fullest extent the accepted and popular views about protection, we would have every man trying to produce as much and sell as little as possible. Free exchange between man and man—or, what is the same thing, free trade—is therefore action in accordance with the teachings of nature. Protection, on the other hand, is an attempt to make things better than nature made them. Free trade, or the interchange of commodities and services with the minimum of obstruction, by rendering commodities cheap, tends to promote abundance. Protection, by interference or placing obstructions in the way of exchanges, tends to increase the cost of commodities to the consumer, and thereby promotes scarcity.

All the people of the U. S. instinctively rejoice at the announcement of every new discovery in the construction or propulsion of vessels, whereby the time and cost of transporting commodities across the Atlantic from Liverpool to New York, or across the Pacific from China and Japan to San Francisco, are diminished; and yet they do not revolt at the inconsistency of imposing taxes, for purposes other than to meet the necessities of the state, on the landing of the commodities thus transported; which are precisely equivalent in effect, as regards the consumer, to substituting slow-sailing vessels of small tonnage in the place of ocean steamers, or of so widening the expanse of ocean to be traversed that the time employed in transportation (and the consequent increased cost of freight and risk) shall be expressed by months rather than by days. A few illustrations derived from the actual experience of the U. S. are here pertinent to the argument.

Upon the coast of Nova Scotia, within a short distance of the U. S., there are coal mines of great value, as respects quantity and quality, which, unlike any others in the whole world, are located so advantageously in respect to ocean navigation that almost by the action of gravity alone the coal may be delivered from the mouth of the pit upon the deck of the vessel. For many years the Government of the U. S. imposed a tax of $1.50 per ton on the landing of this coal within its territory. Now, if we assume that coal upon a well-managed railroad can be transported for one cent per ton per mile, the effect of this tax upon the people of New York and New England is precisely equivalent to a removal of these coal mines of Nova Scotia from a point on the seaboard to a location 150 miles inland. But it would also seem to stand to reason that if the removal of these mines 150 miles into the interior was a benefit to the people of the U. S., a further augmentation of their distance from the seaboard to 500 or 1,000 miles would be a still greater blessing, and that their absolute annihilation would be the most superlative good of all.

Again, about 1850 a British engineer, Bessemer, devised a new process for the manufacture of steel. He did not claim to make anything new; he did not claim to make steel of a quality superior to what was made before; but he did succeed in showing mankind how to make an indispensable article in the work of production *cheap* which was before *dear*. Immediately on the assured success of the invention the advocates of protection in the U. S. asked Congress to impose such a duty on the import of this steel as would, through a consequent increase of its price to American consumers, almost completely neutralize the only benefit accruing from the knowledge and use of the new process—namely, its *cheapness*—and succeeded in obtaining a duty that in a great degree accomplished such a result.

From the above propositions and examples it would seem evident that the direct effect of a protective duty, when it is really operative, is to compel, on the part of the community employing such an agency, a resort to more difficult and costly conditions of production for the protected article; and also that when a state or community adopts the protective policy it also commits itself to the indorsement of the principle that the development and multiplication of obstacles is equivalent to, or the surest method of, developing or multiplying riches—a policy and a principle which, if logically and practically carried out, would lead to disuse of all labor-saving machinery.

The advocate of protection, however, meets this averment, as well as the argument embodied in the coal and Bessemer-steel illustrations above given, by saying that by prohibiting or restricting the importation and use of foreign coal and steel a demand will be created for a corresponding additional quantity of similar products of the U. S. The immediate result of this will be that an additional opportunity will in consequence be afforded to citizens of the U. S. desirous of following the occupations of coal-miners or transporters or steel-makers; and, the results of their labor and expenditure remaining in the country, the national wealth will be thereby augmented, whereas if the same amount of labor and expenditure is diverted to, and takes place in, a foreign country, the results will be exactly opposite.

In answer to this it may be said: (1) That the amount of consumption in the two instances, and consequently the results of consumption, will not be the same; for whatever increases the price of a useful commodity diminishes its consumption, and, *vice versa*, whatever diminishes the price increases consumption. (2) To admit the desirability of creating an opportunity of employing labor through the agency of a tax on all consumers of coal and steel to do work that would yield to the same consumers a greater product of the same articles if performed elsewhere, or an equal product at less cost, is to admit that the natural resources of a country are so far exhausted that there is no opportunity for the truly productive employment of labor—an argument which, however effective in overpopulated countries, can have no possible application in a comparatively new country like the U. S., whose natural resources, so far from being exhausted, are yet, as it were, unappropriated and unexplored. Again, a tax levied in pursuance of legislative enactment for the maintenance of such labor is clearly in the nature of a forced charity, while the petitioners for its enactment answer in every particular to the definition of the term "pauper"—namely, one who publicly confesses that he can not earn a living by his own exertions, and therefore asks the community to tax themselves or diminish their abundance for his support. (3) The only true test of the increase of national wealth is the possession of an increased quantity of useful things in the aggregate, and not in the amount of labor performed or the number of laborers employed, irrespective of results. A tariff from its very nature can not create anything; it only affects the distribution of what already exists. If the imposition of restrictions by means of taxes on imports enables a producer to employ a larger number of workmen and give to them better wages than before, it can be accomplished only at the expense of the domestic consumers who pay increased prices. Capital thus transferred is no more increased than is money by transference from one pocket to another, but on the contrary is diminished to just the extent that it is diverted from employing labor that is naturally profitable to that which is naturally unprofitable. And herein is exposed the fallacy of the averment that duties levied on the import of foreign commodities protect home industry. It may be conceded that certain industries, as the result of such duties, may be temporarily stimulated, and the producers obtain large profits by a consequent increase in the price of their products; but then it is at the expense of those who pay the increased price, who are always the domestic consumers.

To further make clear this position, the following illustration, drawn from actual experience, is submitted: For a number of years subsequent to 1865 the Government of the U. S., with a view of protecting the U. S. producer, imposed such a duty on foreign salt as greatly to restrict its importation and at least double the price of the article, whether of foreign or domestic production, to the consumer. The result was, taking the average price of No. 1 spring wheat for the same period in Chicago, that a farmer of the West desirous of buying salt in that market would have been obliged to give 2 bushels of wheat for a barrel of salt, which without the tariff he would have readily obtained for a bushel. If, now, the tax had been imposed solely with a view to obtaining revenue, and the farmer had bought imported salt, the extra bushel given by him would have accrued to the benefit of the state; and if the circumstances of the Government required the tax, and its imposition was expedient and equitable, the act was not one to which any advocate of free trade could object. But in the case in question the tax was not imposed primarily for revenue, as was shown by the circumstance that imports and revenue greatly decreased under its influence, and the salt purchased by the farmer in Chicago was domestic salt, which had paid no direct or corresponding tax to the Government. The extra bushel of wheat, therefore, which the farmer was compelled to give for his salt accrued wholly to the benefit of the domestic salt-boiler, and the act was justified on the ground that domestic industry, as exemplified in salt-making, was protected. And yet it must be clear to every mind that if the farmer had not given the extra bushel of wheat to the salt-boiler he would have had it to use for some other purpose advantageous to himself—to give to the shoemaker, for example, in exchange for a pair of brogans. By so much, therefore, as the industry of the salt-boiler was encouraged that of the farmer and the shoemaker was discouraged; and, putting the whole matter in the form of a commercial statement, we have the following result: Under the so-called "protective system" we have a barrel of salt and 2 bushels of wheat passed to the credit of what is called "home industry," while under a free system we have a barrel of salt, 2 bushels of wheat, and a pair of shoes. Protection, therefore, seeks to promote industry at the expense of the products of industry; and its favorite proposition, that though under a system of restriction a higher price may be given for an article, yet all that is paid by one is given to some other person in increased employment and wages, has this fallacy—namely, that it conceals the fact that the price paid by the consumer would have been equally expended upon something and somebody if the consumer had been allowed to buy the cheap article instead of the dear one; and consequently the loss to the consumer is balanced by no advantage in the aggregate to any one. "When a highwayman takes a purse from a traveler he expends it, it may be, at a drinking-saloon, and the traveler would have expended it somewhere else. But in this there is no loss in the aggregate; the vice of the transaction is that the enjoyment goes to the wrong man. But if the same money is taken from the traveler by forcing him to pay for a dear article instead of a cheap one, he is not only despoiled of his just enjoyment as before, but there is a destructive process besides, in the same manner as if the loss had been caused by making him work with a blunt ax instead of a sharp one. Whenever, therefore, anything is taken from one man and given to another under the pretense of protection to trade, an equal amount is virtually thrown into the sea, in addition to the robbery of the individual."

To render the illustration derived from the transaction in salt, above given, more complete, attention is asked to the following additional historical circumstances: In the valley of Kanawha, West Virginia, there are salt-springs which furnish brine in abundance and of great strength and purity. The same springs also furnish conjointly an inflammable gas, which flows with such force and quantity that it is used both to lift the salt-water into tanks at considerable elevation and to subsequently evaporate the brine by ignition under the furnaces, without the necessity of resorting to the use of any other fuel whatever. Salt at this point can therefore be produced at a nominal cost, and with advantage even over solar evaporation, inasmuch as all expense of pumping the salt-water into vats in the first instance is entirely obviated. During the civil war, in order to deprive the army and the people of the Southern Confederacy of a supply of salt, the springs in question at Kanawha were temporarily destroyed by the Federal forces; and an important natural supply of salt to the country being thus cut off, the manufacturers of salt in Ohio, from springs less advantageously productive, obtained for a time a larger market and higher prices for their more costly competitive products. With the close of the war and the reopening of the Kanawha salt-works, the advantages thus gained at the expense of the salt-consumers bid fair to be put an end to; but in order to perpetuate them the Ohio salt-manufacturers united, and, having at a large annual expense leased the Virginia springs, abandoned and absolutely forbade their utilization.

4. As has been already shown, any increase in the price of domestic products consequent on the imposition of taxes on the importation of corresponding products of foreign origin is paid by the domestic consumer. Hence a result alike deducible from theory and proved by all experience—that not only does protection to a special industry not result in any benefit to the general industry of a country, but also that its beneficial influence on the special industry itself is not permanent, but temporary. Thus all taxes tend to diffuse themselves, and, if levied permanently and with any degree of uniformity, do diffuse themselves almost with infallibility. The price of no article can be permanently advanced by artificial agencies or otherwise without an effort on the part of every person directly or indirectly concerned in its consumption to protect and compensate himself by advanc-

ing the price of the labor or products he gives in exchange. If sufficient time is afforded, and local exchanges are not unduly restricted, this effort of compensation is always successful. Hence from the very necessity of the case no protective duty can be permanently effective; hence, also, it is that protected manufacturers in every country always proclaim, and no doubt honestly feel, that the abandonment of protection, or even its abatement, would be ruinous. Of this the experience of the U. S. affords a most curious and convincing illustration. Thus in 1862–63, in order to meet the expenses of a great war, the Government imposed excise or internal taxes on every variety of domestic manufactures, and, in accordance with the principles of equity, imposed what were claimed to be corresponding taxes on the importation of all competing foreign products. Soon after the close of the war, however, when the cessation of hostilities diminished the necessity of so large revenues, the internal taxes were all repealed, but in no one instance was there a protected manufacturer found who took any other position than that a repeal of the corresponding tariff would be most disastrous to his business. The tariff, as originally raised to compensate for the new internal taxes, was therefore left in a great degree unchanged. That the principle here laid down, of want of permanency in protective agencies, is furthermore admitted by the protected manufacturers themselves as a result of their own experience, is also proved by the following striking testimony forced out under oath before a Government commission from one of the foremost of their number in 1868—the late Oakes Ames, of Massachusetts:

Question.—What, according to your experience, was the effect of the increase of the tariff in 1864 on the industries with which you are specially acquainted? *Ans.*—The first effect was to stimulate nearly every branch—to give an impulse and activity to business; but in a few months the increased cost of production and the advance in the price of labor and the products of labor were greater than the increase of the tariff, so that the business of production was no better, even if in so good a condition, as it was previous to the advance of the tariff referred to.

The result of the fourteen revisions or modifications of the tariff of the U. S. that were made between 1861 (when through the necessities of war a comparatively liberal commercial policy was abandoned) and 1891 (an era of peace and great debt reduction) was as follows: The average *ad valorem* rates on the import of dutiable commodities were progressively and largely advanced, and mainly, after the termination of the war in 1865, on the plea that the domestic industries of the country required additional protection. For example, from an average of 18·84 per cent. in 1860 to 36·69 per cent. in 1864, 40·69 per cent. in 1875, and 46·28 per cent. in 1890–91. Henry C. Carey, in an essay *On Wealth*, published in 1838, thus clearly and cogently expressed himself on this question: "The moment," he says, "we admit that taxation in *any case* tends to promote industry, it is impossible to say where we shall stop. If taxation be a stimulus the advantage must increase with its extent, as taking 2*s.* per week must do more good than taking 1*s.* If taxation be good, so is the lash; both will make people work, but neither will make them work well."

5. Upon no one argument have the advocates of protection relied more in support of their system than that contained in the assumption already referred to—that if there were no restrictions on trade the opportunity to labor created by protection, and the results of the expenditure of the earnings of such labor, would be diverted to other countries to their benefit, and to the corresponding detriment of that country which, needing protection by reason of a necessity for paying higher wages or other industrial inequalities, abandons it; or, to speak more specifically, it is assumed that if the U. S. were to adopt a policy of free trade, England would supply us with cotton and metal fabrications; Germany, with woolen goods; Nova Scotia, with coal; the West Indies, exclusively with sugar; Russia, with hemp and tallow; Canada, with lumber; and Australia, with wool—that thereby opportunity to our own people to labor would be greatly restricted, and the wages of labor reduced to a level of the wages of foreigners. Specious as is this argument, there could not be a greater error of fact or a worse sophism of reason. None of the commodities mentioned will be given by the producers resident in foreign countries for nothing. *Product for product* is the invariable law of exchange, and we can not buy a single article in any market except with or by a product of our own, or for money which has been obtained by the exchange of some product for it. Nothing, therefore, can or will be imported unless that in which it is paid for can be produced at home with greater final advantage. Hence also it is in the nature of a truism to assert that it is for the interest of every community that its industry should be directed to the production of such articles as are attended with greater final advantage, in preference to those which are attended with less; as inevitably would be the result if the business of production and exchange were not obstructed by legislative enactments, but left to the guidance of individual self-interest.

From these premises we are warranted in regarding the following deductions as in the light of economic axioms: 1. A nation or community can attain the greatest prosperity, and secure to its people the greatest degree of material abundance, only when it utilizes its natural resources and labor to the best advantage and with the least waste and loss, whatever may be the nominal rate of wages paid to its laborers. The realization of such a result is hastened or retarded by whatever removes or creates obstructions or interferences in the way of production and exchanges. 2. The exports on the whole of any country must and always do balance its imports, which is equivalent to saying that if we do not buy we can not sell, while neither buying nor selling will take place unless there is a real or supposed advantage to both parties to the transaction. 3. As a nation exports only those things for which it possesses decided advantages relatively to other nations in producing, it follows that what a nation purchases by its exports it purchases by its most efficient labor, and consequently at the cheapest possible rate to itself. Hence the price paid for every foreign manufactured article, instead of being so much given for the encouragement of foreign labor to the prejudice of our own, is as truly the product of our own labor as though we had directly manufactured it ourselves. Free trade, therefore, can by no possibility discourage home labor or diminish the real wages of laborers.

The favorite protectionist argument, that if trade is unrestricted, and the people of a country, under the inducement of greater cheapness, are allowed to supply themselves with foreign commodities, the opportunities for the employment of domestic labor will be correspondingly diminished, is an argument identical in character with that which has in past times often led individuals and whole communities to oppose the invention and introduction of labor-saving or "labor-dispensing" machinery. To sift thoroughly this sophism, it is sufficient to remember that labor is exerted not for the sake of labor, but for what labor brings, and that human wants expand just in proportion to the multiplication of the means and opportunity of gratifying human desires. If the wages of a day's labor would purchase in the market one hundred times as much as at present, can any one doubt that the demand for the necessaries and luxuries of life would be increased a hundredfold? If the people of the U. S. could obtain the products of the labor of other countries for nothing, could the labor of the whole world supply the quantity of things we should want? In short, the demand for the results of labor can never be satisfied, and is never limited except by its ability to buy; and the cheaper things are the more people will purchase and consume. Nothing, therefore, can be more irrational than the supposition that increased cheapness, or increased ability to buy and consume, diminishes or restricts the opportunity to labor. If by the invention of machinery or the discovery of cheaper sources of supply the labor of a certain number of individuals in a department of industry becomes superfluous or unnecessary, such labor must take a new direction, and it is not to be denied that in the process of readjustment temporary individual inconvenience, and perhaps suffering, may result. But any temporary loss thus sustained by individuals is more than made up to society, regarded from the standpoint of either producers or consumers, by the increased demand consequent on increased cheapness through greater material abundance, and therefore greater comfort and happiness. About the time of the invention and introduction of the sewing-machine into Europe the benevolent people of a city in Germany where the industry of needlewomen was a marked specialty formed an organization to lessen in a degree the injury which it was believed would inevitably accrue from the supplementation of a great opportunity to labor by the poor which was threatened. After the lapse of a few years, however, when society, as represented by the whole people of the city, obeying their natural instincts, had determined to have, and had obtained, a cheaper source of supply for their needle-products than before, the organization referred to instituted an investigation, the result of which showed that by reason of a greater consumption of sewed goods, consequent on their cheaper supply, the number of persons engaged in the operating of sewing-machines was greater than what had formerly found employment by the needle, and that wages had increased rather than diminished.

6. The averment that prohibition or restriction of foreign imports encourages diversity of domestic industry is answered by saying that when any trade can be introduced or undertaken for fiscal or public advantage private enterprise is competent to its accomplishment. "To ask for more is only to ask to have a finger in the public purse." It may be possible to conceive of specific cases in which it might be politic for a government to give an advantage for a limited time and for a definite object. But protection, as an economic system, can not rightfully claim any support from such an admission, inasmuch as its demand is that the public shall be obliged to support all manufacturing enterprises upon no other ground but that they can not support themselves.

Furthermore, whenever governments have attempted to establish or stimulate industries by the payment of bounties, the general and ultimate result has been found to be that the industry is prosecuted mainly for the bounties, and that the bounty has been a stimulus to extensive fraudulent practices.

7. Protection, it is alleged, has a tendency to make what are termed manufactured products cheaper. A very fit and cogent answer which has been made to this assertion of the opponents of free trade is that if protection is to be recommended because it leads ultimately to cheapness, it were best to begin with cheapness. Another answer is to be found in the circumstance that not a single instance can be adduced to show that any reduction has ever taken place in the cost of production under a system of protection, through the agencies of new inventions, discoveries, and economies, which would not have taken place equally soon under a system of free trade; while, on the contrary, many instances can be referred to which prove that protection, by removing the dread of foreign competition, has not only retarded invention, but also the application and use of improvements and inventions elsewhere devised and introduced. Thus, referring to the experience of the U. S., where the system of protection has in general prevailed for many years, it is a well-known fact that the department of industry which has been distinguished more than any other by the invention and application of labor-saving machinery is that of agriculture, which has never been protected to any extent; and for the reason that the country which raises a surplus of nearly all its agricultural products for sale in foreign countries never can be. On the other hand, in that department of industry engaged in the primary manufacture of iron, which has always been especially shielded by high restrictive duties, not only from foreign competition, but also from the necessity of the exercise of economy and skill, the progress in the direction of improvement has been so slow that according to the report of the geological survey of Ohio for 1872–73 there was at that time hardly a furnace in that great iron-producing State that could be compared with the best European furnaces, in construction, management, or product, many Ohio furnaces unnecessarily wasting one-fourth of the metal in the ore in the process of smelting.

It is also pertinent to this department of the subject to notice the idea adopted by a school of U. S. economists or politicians that it is for the advantage of a country to endeavor to effect a reduction of prices by the creation, through legislation or otherwise, of an excessive or artificial stimulus to production. That the creation of an artificial stimulus to domestic production—such as is almost always temporarily afforded by an increase of the tariff or by war, which necessitates extraordinary supplies—does have the effect in the first instance to quicken certain branches of production, and subsequently reduce prices through the competition engendered, can not be doubted; but experience shows that in almost every such instance the reduction of prices is effected at the expense or waste of capital, and that the general result, in place of being a gain, is one of the worst events that can happen to a community. Thus the first effect of creating an extraordinary domestic demand is to increase prices, which in turn affords large profits to those in possession of stock on hand or of the machinery of production ready for immediate service. The prospect of the realization of large profits next immediately tempts others to engage in the same branch of production—in many cases with insufficient capital, and without that practical knowledge of the details of the undertaking essential to secure success. As production goes on, supply gradually becomes equal to, and finally in excess of, demand. The producers working on insufficient capital or with insufficient skill are soon obliged, in order to meet impending obligations or dispose of inferior products, to force sales through a reduction of prices, and the others, in order to retain their markets and customers, are soon compelled to follow their example. This in turn is followed by new concessions alternately by both parties, which are accompanied by the usual resort of turning out articles or products of inferior quality, but with an external good appearance—slate being substituted in the place of coal; cinder in the place of iron; shoddy in the place of wool; starch and sizing in the place of cotton; pasteboard in the manufacture of boots and shoes in the place of leather; and clay in the manufacture of paper in the place of fiber. And so the work of production goes on, until gradually the whole industry becomes depressed and demoralized, and the weaker producers succumb, with a greater or less destruction of capital and waste of product. Affairs having now reached their minimum of depression, recovery slowly commences. The increase of the country causes consumption to gain gradually on production, and finally the community suddenly becomes aware of the fact that supply has all at once become unequal to the demand. Then those of the producers who have been able to maintain their existence enter upon another period of business prosperity; others again rush into the business, and the old experience is again and again repeated. Such has been the history of the industry of the U. S. under the attempt to restrict the freedom of trade by high duties on imports, frequently modified; and such also was the effect of the war from 1861–65. To use a familiar expression, it has always been either "high water" or "low water" in the manufacturing industry of the country—no middle course, no stability. What the people have gained at one time as consumers from low prices they have more than compensated at another by the recurrence of extra rates, and as producers by periodical suspensions of industry, spasmodic reduction of wages, and depression of business.

Meantime the loss to the country from the destruction of capital and the waste and misapplication of labor has been something which no man can estimate. One of the most striking illustrations of this experience, selected from many examples afforded by the U. S., is the following: In 1864–65 it was found that the supply of paper of domestic manufacture was insufficient to meet the consumption of the country, and that the supply from abroad was greatly impeded by an unusually heavy duty imposed in time of war on its import. The price of paper in the country accordingly rose with great rapidity, and the profits of the paper-manufacturers who were then in possession of the machinery of production became something extraordinary. The usual effect followed. A host of new men rushed into the business and old manufactories were enlarged, so that during the years 1864–66 it was estimated that more paper-mills were built in the U. S. than during the whole of the twelve years previous. As a matter of course, the market became overstocked with paper, prices fell with great rapidity, many abandoned the business through inclination or necessity, and many mills and much machinery were sold for less than the cost of construction; while in the spring of 1869 the paper-makers met in convention to consider the desirability of decreasing the production of paper—or, what is the same thing, of allowing their capital and their labor to remain unemployed—on account of the unprofitableness of the business. In October of the same year a storm of great violence swept over the northern portion of the country, and in the flood which followed many mills engaged in the manufacture of paper were so injured as to temporarily render them incapable of working. A leading journal in one of the paper-manufacturing districts, devoted to the advocacy of protection, in commenting on the effects of the storm, used this language: "There seems to have been unusual fatality among paper-mills, but this disaster will work to the advantage of those who escaped the flood, and we doubt not that those that did stand will do a better business in consequence of the lessened supply"; or, in other words, the condition of this particular industry had become so bad through the influence of a fiscal policy based on the theory of protection that the occurrence of a great public calamity, with a vast attendant destruction of property, had come to be regarded in the light of a public blessing.

One notable result of intense competition among producers, more especially of manufactured products, has been the evolution of what is popularly known as the "trust," by which is to be understood a combination of the domestic producers of certain commodities to control production and advance prices. Now while the claim may not be warranted that such combinations are necessarily the result of the protective tariff policy, the experience of the U. S. is absolutely conclusive to the effect that the great majority of trusts existing in that country never would have been formed, and could not continue to exist, were it not for the imposition and continuance of its high protective duties on imports. That this must be so will be manifest if it is called to mind that no trust of the character referred to, operating on articles for which there is a possible competitive supply from other countries, could be maintained in the U. S. for a single month except under one of two conditions. Either all the competitive producers throughout the world must be brought into the trust, or, what is the same thing, the product of the whole world must be controlled; or the product of all foreign producers must be shut out from the markets of this country. The first result is not attainable. It would be obviously impracticable to induce all the manufacturers of starch, for example, in all the different countries of Europe to unite and put the control of their business in hands of trustees residing in the U. S. The *second* is made not only possible, but effective in the highest degree, by the imposition of tariffs, or duties on the importation of the articles in which the trusts are specially interested, so high as to completely bar them out of the U. S. market. These duties the existing tariff act (1893) provides. It thus becomes the creator and preserver of trusts and monopolies, the like of which can not and do not exist under the tariff system of Great Britain, as the starch trust, plate and window glass trust, nail trust, linseed-oil trust, lead trust, cotton-bagging trust, borax trust, ax, saw, and scythe trust, and many others; all of which, freed in a great degree from foreign competition, have advanced prices to American consumers to an extent that will afford them far greater profits than can be fairly considered as legitimate, but in which profits their employees do not participate.

8. It is clear that one of the essential attributes of a just law is that it bears equally upon all subjected to its influence, and that an unjust law must necessarily be also injurious. A system of law imposing protective duties must, in order to be effective, be partial and discriminating, and therefore unequal and unjust; for if a law could be devised which would afford equal protection to all the industrial interests of a nation, it would benefit in fact no interest by leaving everything relatively as before; or, in other words, the attempt to protect everything would result in protecting nothing.

Any system of laws founded on injustice and inequality can not, furthermore, be permanent. The possibility that it can be further changed to meet the further demands of special interests, and the instinctive revolt of human nature against legal wrong and partiality, continually threaten its stability. Hence a system of industry built upon laws establishing protection through discriminating taxes can never have stability of condition; and without such stability there can be no continued industrial prosperity. Apart from these considerations, in a free government, also, where the people enjoy the right to choose and to change their lawmakers at comparatively short intervals, the opinions of the masses will change according to the light they receive; and as their opinion changes, so must necessarily the policy of the government. Tariffs framed to regulate and direct industries can therefore never be permanent under governments that admit the right of the people to vote and to think. Nothing less than a despotism, and an ignorant despotism at that, can maintain a protective tariff at any given standard for any lengthened period. On the other hand, one of the strongest arguments in behalf of freedom of trade is that it makes every branch of industry independent of legislation, and emancipates it from all conditions affecting its stability other than what are natural, and which can in a great degree be anticipated and provided against; and it is undoubtedly from the stability in trade and commerce that a free-trade policy insures that no small part of the commercial and financial supremacy of Great Britain is to be attributed.

9. "A tariff on imports," it is sometimes alleged by the advocates of protection, "obliges a foreigner to pay a part of our taxes." To this it may be replied that if there were any plan or device by which one nation could thus throw off its burden of taxation in any degree upon another nation, it would long ago have been universally found out and recognized, and would have been adopted by all nations to at least the extent of making the burden of taxation thus transferred in all cases reciprocal. If the principle involved in the proposition in question, therefore, could possibly be true, no possible advantage could accrue from its application. But the point itself involves an absurdity. Taxes on imports are paid by the persons who consume them; and these are not foreigners, but residents of the country into which the commodities are imported. A duty on imports may injure foreigners by depriving them of an opportunity of exchanging their products for the products of the country imposing the duty, but no import-taxes will for any length of time compel foreigners to sell their products at a loss, or to accept less than the average rate of profit on their transactions; for no business can permanently maintain itself under such conditions. Where a nation possesses a complete monopoly of an article, as is the case of Peru in respect to guano, and to a great extent (as it has been) with China in the case of tea, the monopoly always obtains the highest practicable price for its commodities, and the persons who find their use indispensable are obliged to pay the prescribed prices. The imposition of a tax on the import of such commodities into a country may compel the monopoly, for the sake of retaining a market, to reduce its prices proportionally; and in such cases the nation imposing the impost may to a degree share the profit of the monopoly. But the price to the consumers is not diminished by reason of the import-duty, and the cases in which any interest has such a complete control over the supply of a product as to enable it to arbitrarily dictate prices are so rare as hardly to render them worthy of serious consideration in an economic argument.

10. Another powerful argument in favor of free trade between nations is that of all agencies it is the one most conducive to the maintenance of international peace and to the prevention of wars. The restriction of commercial intercourse among nations tends to make men strangers to each other, and prevents the formation of that union of material interests which creates and encourages in men a disposition to adjust their differences by peaceful methods rather than by physical force. On the other hand, it requires no argument to prove that free trade in its fullest development tends to make men friends rather than strangers, for the more they exchange commodities and services the more they become acquainted with and assimilated to each other; whereby a feeling of interdependence and mutuality of interest springs up, which, it may be safely assumed, does more to maintain amicable relations between them than all the ships of war that ever were built, or all the armies that ever were organized. Of the truth of this the experience of Great Britain and the U. S. in respect to the "Alabama claims" is a striking example. The moral and religious sentiments of the people of the two countries undoubtedly contributed much to restrain the belligerent feelings that existed previous to the reference of these claims to arbitration; but a stronger restraining element than all, and one underlying and supporting the moral and religious influences, was a feeling among the great body of the people of the two nations that war, as a mere business transaction, "would not pay"; and that the commerce and trade of the U. S. and Great Britain are so interlinked and interwoven that a resort to arms would result in commercial ruin and permanent and incalculable impoverishment to both countries.

11. The question here naturally arises if the above propositions in favor of free trade are correct, and if the doctrine of protection is as false and injurious as it is represented to be, how happens it that free trade does not at once meet with universal acceptance? and how is the adherence of many men of clear intellect and practical experience to the opposite doctrine to be accounted for? One of the best answers to these questions was given by the celebrated French economist Bastiat, in an article written many years ago, entitled *That which is Seen, and That which is Not Seen*, in which he showed that protection is maintained mainly by a view of what the producer gains and a con-

cealment of what the consumer loses; and that if the losses of the million were as patent and palpable as the profits of the few, no nation would tolerate the system for a single day. Protection accumulates upon a single point the good which it effects, while the evil which it inflicts is infused throughout the community as a whole. The first result strikes the eye at once; the latter requires some investigation to become clearly perceptible. The doctrine of protection is also an inheritance of the past, and has all the support which custom, dogma, and prescription can give it. Mankind also divide themselves into two classes—producers and consumers, buyers and sellers. The interest of producers and sellers is that prices shall be high, or that there shall be scarcity; the interest of consumers and buyers is that prices shall be low, or that there shall be abundance. But every person will at once admit that it is for the general interest that there shall be abundance rather than scarcity. But in the case of individuals controlling large agencies for production, their interests as producers and sellers of large quantities of commodities may be made greater than their interests as consumers, if by the aid of legislation the price of what they produce can be raised by discriminating laws, disproportionately over what they consume, or to the cost of production. Men of this class are generally rich beyond the average of the community, and therefore influential in controlling legislation and in determining fiscal policies; and it is but natural that in so doing they should consult their own interests rather than the interests of the masses.

12. It only remains to notice briefly the testimony of history in respect to the influence of free trade as an economic principle upon the development of nations and the progress of civilization.

In the earlier ages in Europe the principle that trade or commerce is mutually advantageous, and that after every fair mercantile transaction both parties are richer than before, was not understood. On the contrary, the generally accepted theory among both nations and individuals in respect to trade was pithily embodied in the old proverb, "What is one man's gain must be another man's loss." Commerce, therefore, it was assumed, could benefit one country only as it injured some other. In accordance, therefore, with this principle, every state in Christendom, in place of rendering trade and commerce free, exerted itself to impose the most harassing restrictions on commercial intercourse, not only as between different countries, but also as between districts of the same country, and even as between man and man. Country was accordingly separated from country and town from town as if seas ran between them. If a man of Liège came to Ghent with his wares, he was obliged first to pay tolls at the city's gates; then when within the city he was encumbered at every step with what were termed "the privileges of companies"; and if the citizen of Ghent desired to trade at Liège, he encountered the same difficulties, which were effectual to prevent either from trading to the best advantage. The revenues of most cities were also in great part derived from the fines and forfeitures of trades, almost all of which were established on the principle that if one trade became too industrious or too clever it would be the ruin of another trade. Every trade was accordingly fenced round with secrets, and the commonest trade was termed, in the language of the indentures of apprentices, "an art or mystery." If one nation saw profit in any one manufacture, all her efforts were at once directed to frustrate the attempts of other nations to engage in the same industry. She must encourage the importation of all the raw materials that entered into its production, and adopt an opposite rule as respected the finished article. At the close of the sixteenth century England undertook the woolen manufacture. By the act of the 8th of Elizabeth the exporter of sheep was for the first offense to forfeit his goods for ever, to suffer a year's imprisonment, and then have his left hand cut off in a market-town on market-day, there to be nailed up to the pillory. For the second offense he should be adjudged a felon and suffer death. At a later period, in the reign of Charles II., it was enacted that no person within 15 miles of the sea must buy wool without the permission of the king; nor could it be loaded in any vehicle, or carried, except between sunrising and sunsetting, within 5 miles of the sea, on pain of forfeiture. It ought to be most instructive to note also that under such restrictions on the trade and commercial movement of wool the price of wool in England exhibited the same phenomena as has followed in latter days similar restrictions in the U. S., namely, continued depression in the price of domestic wool, which in the former country (1576) finally touched a figure less than it had commanded in the time of Edward III.—200 years before. To remedy this state of things, and by creating a better market for wool through a new and enforced use of it, Parliament in 1578 enacted "that every corpse should be buried in a woolen shroud." Gen. Garfield, in a lecture on the *Mercantile System*, which he gave about 1870, after quoting and specially referring to this shroud enactment, added to it the following comment, as full of meaning now as then: "And in such shrouds they were burying, not the bodies of Englishmen alone, but the spirit of English liberty and industry." In 1672 the Lord Chancellor of England announced the necessity of going to war with the Dutch and destroying their commerce, because it was surpassing that of Great Britain; and even as late as 1743 one of the greatest of British statesmen (Somers) declared in the House of Lords that "if our wealth is diminishing, it is time to ruin the commerce of that nation which has driven us from the markets of the Continent by sweeping the seas of their ships and blockading their ports." By the treaty of Utrecht, which concluded the great war of Great Britain and Spain against Louis XIV. and his allies, Great Britain, being able to dictate the terms, secured the adoption of a section by which the citizens of Antwerp were forbidden to use the deep water that flowed close by their walls; and it was further expressly stipulated that the capacious harbor of Dunkirk, in the north of France, should be filled up and for ever ruined, so that French commerce might not become too successful.

There was, however, one notable exception to the all but universal acceptation in Europe during the fifteenth, sixteenth, seventeenth, and eighteenth centuries of the doctrine that the commercial and industrial prosperity of nations was dependent on monopolies and interferences with trade-production and exchanges, and that exception was found in the case of Holland. In a remarkable pamphlet entitled *The True Interest and Political Maxims of the Republic of Holland*, published by Cornelius de Witt, and translated into English in 1746, this great statesman of the Netherlands shows "that the Dutch, though not producing a bushel of wheat, ate the whitest bread in Europe; and though not producing a sheaf of hemp, a single plank, or any iron, had the best fleet which then sailed the sea; because Holland had wealth to pay for these commodities; and possessed this wealth because its trade and all exchanges were left unfettered, unimpeded, unlegislated upon; and that by this free trade the Netherlands became both the most peopled and the richest country on the earth, and loans could be effected there for a lower interest than anywhere else."

With the progress of civilization, and the consequent diffusion of information, the extreme restrictions on trade above noticed, which were formerly so common in Europe, have almost entirely disappeared, and men now wonder that any benefit could ever have been supposed to have accrued from such absurd and monstrous regulations. But the change to a more liberal state of things, though constant, has been slow, and the policy of the Middle Ages, in the process of modification and extinction, gave place to the so-called and more modern policy of "protection," which, while clearly recognizing the impolicy of interfering with domestic exchanges, regards foreign trade as something different from any other trade, which it is for the interest of the state to interfere with and regulate. But under the same influences of a progressive civilization this system too, in like manner, is disappearing.

In this work of progress Great Britain took the lead in 1841; not from a change in popular sentiment due to better acquaintance with theoretical principles, but from a realization on the part of all classes of the people of the results which the recognition and practice of the policy of protection during a period of many years had entailed upon the country. These results Noble, in his work *Fiscal Legislation of Great Britain*, thus describes: "It is utterly impossible," he says, "to convey by mere statistics of our exports any adequate picture of the condition of the nation when Sir Robert Peel took office in 1841. Every interest in the country was alike depressed; in the manufacturing districts mills and workshops were closed and property depreciated in value; in the seaports shipping was laid up useless in the harbor; agricultural laborers were eking out a miserable existence upon starvation wages and parochial relief; the revenue was insufficient to meet the national expenditure; the country was brought to the verge of national and universal bankruptcy." Great Britain, therefore, as it were, under compulsion, and with very grave doubts on the part of many of her ablest financiers and economists, under the lead of Sir Robert Peel abandoned protection as the national policy, and gradually adopted the opposite principle of free trade with all the world. The same author above referred to, writing in 1865, draws the following picture of the results of the change of policy referred to, based on the experience of near a quarter of a century: "It has rendered agriculture prosperous, largely augmented rent, vastly extended manufactures and employment, increased the wages of labor, and, while securing the collection of an increased revenue, has by improving the value of property lessened the burden of taxation. It has been shown, also, that each successive development of this beneficent legislation has extended these results."

In the U. S. the principles of the protective system have since 1860 been reapplied, and are still (1893) maintained, with a degree of rigidity and on a scale of magnitude which have no precedents in recent commercial history. The advocates of the protective policy claim that this policy has been in the highest degree beneficial, and they adduce in support of their claim the continued and remarkable prosperity of the country, its rapid recuperation from the effects of a long war, its increase in population, production, wealth, diversity of products, and marked reduction in cost of many of the great staple articles of popular consumption. That such striking results have been attained can not be questioned; but neither can it be seriously questioned that they are due to the great natural resources of the country, to the energy and intelligence of its people in utilizing them, to the entire absence of all legal restrictions on the movement of persons, or the exchange of their products over an area of territory continental in its proportions, to unrivaled facilities for quick and cheap transportation, a high standard of popular education and free and representative form of government; and that to attribute such results to the adoption and continuance of a national fiscal policy which has for its primary and main objects the imposition of high and unnecessary taxes and the restriction of trade is wholly unwarranted and irrational. An examination of the results of special experiences is also strikingly confirmatory of such conclusions. Thus while the claim is always preferred in the U. S. in behalf of the protective policy that it stimulates manufacturing industries by enlarging the market for their products and emancipating them from foreign competition, the exports of the country continue to be year after year mainly agricultural products, which can not as a rule be protected, while the percentage ratio of the exports of manufactured products to the total exports is comparatively small and increases very slowly, or not at all. Thus for the year 1891 agricultural products—mainly cotton, breadstuffs, animals, provisions, and tobacco—constituted 73·69 per cent. of the total exports of domestic merchandise of the country, and manufactured products only 19·37 per cent., as compared with 19·45 per cent. five years previously, or in 1887. Of manufactures of cotton, for the production of which the U. S. might naturally be supposed to have advantages, the value of the total exports for 1891 was $13,604,000, as compared with $14,105,000 in 1881. Statistics of comparative prices of iron and steel, published in 1888 under the auspices of the American Iron and Steel Association, show that the excess of cost of iron and steel in the ten years from 1878 to 1887 to the consumers of the U. S. by reason of the protective duties imposed on the import of these articles by the latter country was at least $560,000,000, or at an average of $56,000,000 per annum, above that paid in Great Britain during the same period; an aggregate in excess of the entire capital invested in the iron industry of the country, including iron and coal mines and the manufacture of coke, returned by the census in 1880, namely $341,000,000. And all this burden of cost to the people of the U. S., through tariff taxation, in order to sustain a branch of domestic industry which could not have been displaced or destroyed by any possible foreign competition. The inability (as shown by experience) to increase the export of the products of skilled labor has naturally and practically limited the growth of the so-called manufacturing industries of the U. S. to the demand for domestic consumption, and forbidden any enlargement of them consequent upon the increasing ability and desire of other nations to consume, and the increased facilities for effecting international exchanges. As a further legitimate sequence, the commercial marine of the U. S. has been all but annihilated, as is shown by the fact that while in 1860 71 per cent. of the total foreign trade of the U. S. was carried in U. S. bottoms, in 1891 the proportion was only 12·86 per cent. One of the most striking illustrations that could possibly be presented of the evil effect of commercial restrictions in limiting trade and industry, and consequently national development, is to be found in the history of the commercial relations between the U. S. and the British North American provinces. Thus in 1852–53, in the absence of anything like commercial freedom, the aggregate exchanges between the two countries amounted to only $20,691,000. The subsequent year a treaty of reciprocity went into effect, whereby the people of the two countries were enabled to trade and exchange their products with little or no obstruction in the form of import-duties. The result was that the aggregate of exchanges rose the very first year of the operation of the treaty from $20,-691,000 to $33,494,000, which subsequently increased, year by year, until it reached the figure of $55,000,000 in 1862–63, and $84,000,000 in 1865–66. In this latter year the treaty of reciprocity was repealed, and restrictive duties again became operative. The result was that the annual aggregate of exchanges immediately fell to $57,000,000, and in 1881, fourteen full years after the expiration of the treaty, when both nations had largely increased in wealth and population, the decrease of trade consequent on the abrogation of the treaty had not been made good.

It is also curious to note that the people of the U. S. are so well satisfied with the principles of free trade when applied to domestic transactions that, throughout the whole of the broad territory they inhabit, they will not allow the formation or maintenance of the slightest artificial obstruction to the freest exchange of products or to the freest commercial or personal movements, and that, too, notwithstanding the different States and Territories into which the country is divided differ among themselves in respect to wages of labor, prices of commodities, climate, soil, and other natural conditions, as widely as the U. S. as a whole differs from any other foreign country with which it is engaged in extensive commercial intercourse. And it is a striking and anomalous circumstance that a very large number—perhaps a majority—of the people of the U. S. regard trade with foreign nations as something very different from trade among themselves, and as such, therefore, to be subjected to entirely different laws and conditions. But a slight examination ought, it would seem, to satisfy that foreign trade presents no element peculiar to itself, but only the same elements which domestic trade presents, and that, consequently, the same laws and conditions that are applicable to domestic exchanges are equally applicable to foreign exchanges. Men, moreover, do not engage in any trade, foreign or domestic, for mere enjoyment or pleasure, but for the material gain which accrues to both parties. They desist from it also so soon as the mutual advantage ceases. The relation, then, which government ought to sustain to the whole question of exchanges is well expressed in the answer which the merchants of France gave to Colbert more than a century and a half ago, when he asked their advice and opinion "how he could best promote commerce" —*Laissez-nous faire* (Let us alone).

DAVID A. WELLS.

Free Will, or **Freedom of the Will**: a question at once of general philosophical, special psychological, and specific theological import, and so intricate and obscure that diametrically opposite answers have been given and maintained. Freedom, with reference to the will, has been variously defined, the definition as a rule being the result of a theory, not a preliminary to it. The conflict has been in part on the question whether the will is free, one extreme party making it wholly unrelated, separating it even from the control of the agent willing, and another placing it under the rule of an external necessity. (See FATE and NECESSITY.) But more generally it has turned upon the question, What *is* the freedom of the will? Each party here asserts its freedom, but not in the sense claimed by the other. The point of division is this: Does the will decide under the influence of determining motives, or is its ultimate decision an unconditioned, undetermined act? The objection ordinarily made to the first view is that it reduces the will to a necessity which destroys accountability. The objection to the latter view is that it subjects the willing agent to the will, and destroys the possibility of voluntary expression on the part of the agent; he no longer possesses a will, but is possessed by a will. Consciousness is appealed to on both sides: consciousness of freedom and accountability on the one, consciousness of rational and motived choice on the other. See WILL.

For the *psychological* question, see Baldwin, *Handbook of Psychology*, ii., *Feeling and Will*, pp. 280, *seq.*, especially pp. 369, *seq.*, and the literature given on pp. 381–82, especially the following: James, *Principles of Psychology*, ii., xxvi.; Höffding, *Outlines of Psychology*, vii.; Schneider, *Menschliche Wille*, ch. xiii.; Fouillée, *La Liberté et le Déterminisme*; Edwards, *Inquiry into the Will*. Prof. Baldwin states the matter thus: "Freedom is a fact, if by it we mean the expression of one's self as conditioned by past choices and present environment. It is not a fact, in any sense which denies that volition is thus conditioned, first, upon the actual content of consciousness as it swings down the tide of the present life and presses outward for motive expression; and, second, upon the environing circumstances which draw the motive consciousness out" (*l. c.*, p. 373).

In *theology* the question of free will is associated with the doctrines of GRACE, PREDESTINATION, and ORIGINAL SIN (*qq. v.*). In the history of the doctrine the names of Augustine and Pelagius are specially representative. Pelagius, in the interests of conduct, as he thought, taught a doctrine of ability of will which divorced the will from precedent character and, indeed, also from any effect on subsequent character; his doctrine of the will was practically identical with that of the indeterminists or accidentalists. In opposition to him Augustine taught a doctrine of will practically identical with that of the immanent determinists, holding that the will is determined in its activities by the state of the soul, or the character. (See for the contrasted doctrines, Warfield in the prolegomena to Augustine's *Anti-Pelagian Treatises*, in vol. v. of the *Nicene and Post-Nicene Fathers*, published under the editorship of Dr. Schaff.) On these lines theological opinion has ever since been divided into Augustinian and Pelagian or Semi-Pelagian. Prior to the outbreak of this controversy the Greek Church had a leaning to a doctrine similar to what was afterward known as Semi-Pelagianism; the Latin Fathers tended to the views which came into full expression in Augustine. The mediæval theology prevailingly leaned to Semi-Pelagianism. It praised Augustine, but followed Pelagius. In the Reformation both the Lutheran and Calvinistic Churches took strong ground against the entire Pelagian tendency. The theory of SYNERGISM (*q. v.*), given vogue in the Lutheran churches through the influence of Melanchthon, was an attempt at harmonizing the two views. The Arminian doctrine of the will is Semi-Pelagian; and the same general conception has become very influential among the Congregationalists of the U. S., under the "improved" New England theology. Modern German theology is largely synergistic, and its widespread influence is carrying synergistic conceptions into every Protestant land. The following works may be consulted on the theological aspects of the question: Augustine, *Anti-Pelagian Treatises*, E. T., in Schaff's *Nicene and Post-Nicene Fathers*, vol. v.; Anselm, *De Libertate Arbitrii*; Luther, *On the Bondage of the Will*; Edwards, *The Will*; Shedd, *Theological Essays*; H. B. Smith, *Faith and Philosophy*; C. Hodge, *Systematic Theology*, ii., pp. 278–309; Scholten, *Der freie Wille*, on the Augustinian side; and on the opposite side especially Whedon, *The Freedom of the Will*; Luthardt, *Die Lehre des freien Willens*. See also Girardeau, *The Will in its Theological Aspects*.

Revised by B. B. WARFIELD.

Free-will (or **Free**) **Baptists**: a body of Baptist people who reject the tenet of predestination, advocate freedom of the will to refuse or accept Christ, and urge the possibility of salvation to all men through a general atonement. This is the principal point of difference between them and the main body of Baptists, who it is well known adhere to Calvinistic views. (See BAPTISTS.) Another point of difference relates to communion at the Lord's table, the Free-will Baptists advocating open communion, while the others, at least in the U. S., are in the practice of restricted communion.

The Free-will Baptists are not of General but of Separate Baptist extraction. The Separate Baptists were one of the results of Whitefield's activity. Numbers of people in different portions of New England, who belonged to the Standing Order, received the preaching of Whitefield with unusual favor, and preferred his methods above those of the Established Church. Their zeal for religion was carried so far that their former church home shortly became distasteful to them. In many communities there was produced an amount of friction that sooner or later resulted in separation from the Established churches. The new churches thus organized were commonly in sympathy with the doctrines of the Standing Order, but, being no longer in organic union with it, were designated as Separate churches or Separates. The sharp conflicts that arose between the Separates and the Standing Order supplied an opportunity which the Baptists were not slow to embrace; in a few years numbers of the Separate churches accepted Baptist tenets, and henceforth were known as Separate Baptist churches. Possibly three-fourths of all the existing Baptist churches of the U. S. could trace their descent from the Separate Baptist movement. The influence of Whitefield upon the fortunes of Baptists in the U. S. can scarcely be overestimated; it has rarely been estimated as highly as it deserves to be.

The Separate Baptists having been suddenly set loose from their former moorings in the Established Church, it was natural that they should make large use of their new-found freedom. They started the watchword, then first heard among Baptist people, of "No creed except the Bible." Standing upon this broad platform and rejecting all the doctrinal standards hitherto accepted by Baptists, it was to be expected that wide diversity of opinion and practice should be displayed; in fact, it is matter of surprise that the differences were not many times greater than they subsequently proved to be. There were extreme Calvinists, moderate Calvinists, and low Calvinists among the Separate Baptists. Of course it was to be anticipated that now and then some would cross the line entirely and fall into Arminian sentiments. The Free-will Baptists took that course.

Their founder was Benjamin Randall, a man of admirable character, excellent abilities, and apostolic zeal. Born at Portsmouth, N. H., Feb. 7, 1749, he embraced religion in 1770, and was for some years connected with the Standing Order, but joined the Baptists in 1775. A seemingly accidental collision with a minister of decidedly Calvinistic views drove him in 1779 to the opposite extreme, and in 1780 he set about the task of organizing the new Church with great energy and success. New Hampshire and Maine were the scene of his early labors, but churches were soon established in most of the New England States, Canada, and in several of the Middle and Western States.

Apparently no effort was made by the Free-will Baptists to comprehend the General or Arminian Baptists of New England, who had now dwindled from their former glory to a feeble handful under the designation of Six Principle Baptists. On the contrary, the Six Principle Baptists appear to have exercised an important influence upon the development of the Free-will party; the outward organization of the new Church was fashioned after the model that had long prevailed among the Six Principle brethren, there being quarterly meetings, yearly meetings, and possibly other institutions borrowed from that source. In 1827 a correspondence was opened with the original Free-will Baptists of North Carolina, a very interesting and pathetic relic of the period of General Baptist ascendency in the U. S. A union was effected with these, which, however, was destroyed in a few years by the rising tide of opposition to slavery. More or less of intercourse has been cultivated with the much more influential General Baptists of Indiana, Kentucky, and other Western States, who sprang from the ancient community in North Carolina, but as yet no organic union has been accomplished. Also in 1827 the Free-will Baptists were brought into fraternal relations with the English General Baptists of the New Connection, and by this means were soon induced to engage in the work of foreign missions in India. It does not appear that they have ever attempted to form any alliance with the original and more ancient General Baptists of England. When the Separate Baptists in 1787 formed a union with the Regular Baptists it chanced that now and again members of the Separate Baptist fraternity for one or other reason would oppose this consummation. Not a few of these Separate Baptists entered the communion of the Free Baptists, thereby giving them representatives in nearly every Southern State.

The only party with which it has been possible for them to form an organic union are the Free Communion Baptists of New York and other Northern States. Originally this latter party laid emphasis upon open communion, but were moderate Calvinists. The Free-will party rejected Calvinism with decision, but laid no stress upon free communion. Nevertheless in 1821 overtures were made looking toward a union of the two organizations. The enterprise was delayed until 1841, when it was duly accomplished. By this union the Free-will community gained 51 churches and 2,470 members. The two parties have maintained reasonable harmony in the united Church, a circumstance that may be due to the fact that both sides were of Separate Baptist extraction; Benajah Corp, who established the Free Communion Baptists, had been a communicant of a Separate Baptist Church in Rhode Island before his removal to New York. The Free Communion Baptists were sometimes designated as Free Baptists, and since their union with the Free-will brethren that title has often been applied to the entire Church.

Their Church constitution is of the representative pattern, the local churches sending delegates to the quarterly meetings, and these in turn sending delegates to the yearly meetings. In 1827 their ecclesiastical machinery was completed by a general conference, composed of representatives from the yearly meetings. They reported in 1900 1,312 ministers, 1,517 churches, and 85,242 communicants. They are represented in thirty-three States, but are strongest in New England. They have more than 12,000 members in the Southern States. Their schools are numerous and respectable. Bates College, Lewiston, Me., stands at the head of the list, a wealthy and progressive institution, with which is connected the Cobb Divinity School. Hillsdale College, Hillsdale, Mich., and Ridgeville College, Ridgeville, Ind., are institutions of much merit and celebrity.

Freezing [deriv. of *freeze* < M. Eng. *fresen*, *freosen* < O. Eng. *freósan* : O. H. Germ. *friosan* > Mod. Germ. *friesen* < Teuton. *friusan*, deriv. of *frius-*, cold (> Goth. *frius*, cold); cf. Sanskr. *pruṣvā*, ice: Lat. *prui'na*, frost]: the change from a liquid to a solid state, resulting from the abstraction of heat. The zero of the centigrade thermometer, equivalent to 32° F., is the freezing-point of water under ordinary conditions. It has been shown by Dr. James Thomson and his brother Lord Kelvin that the increase of pressure upon water, and upon all substances which expand in freezing, will lower the freezing-point. Under a pressure of 13,000 atmospheres water will not freeze at Fahrenheit's zero. On the other hand, such substances as paraffin, which contracts in freezing, have the freezing-point raised by pressure. Artificial freezing can be best induced by the liquefaction of solids or the evaporation of liquids. These processes absorb heat—that is to say, they render it *latent*—and by abstracting it from the surrounding substances freeze the latter. In most cream-freezers the liquefaction of a mixture of pounded ice and salt is the means employed. In artificial ice-making machines the evaporation of ammonia or of the most volatile ethers is the essential element.

ARTIFICIAL FREEZING has been performed, as a mere laboratory experiment, ever since the middle of the seventeenth century. In 1665 Robert Boyle, fellow of the Royal Society, published his success in the repeated freezing of water and other liquids by various chemical mixtures. He attempted mercury, but remarks, "we could not at all freeze this extravagant liquor, though we tried it more than once." Leslie's freezing of water by sulphuric acid in a vacuum in 1810, and Faraday's long-subsequent achievement of solidifying water by sulphurous acid evaporating in a red-hot crucible, are only two of the many well-known varieties of this class of experiments. In what follows reference will be briefly made to four natural principles or methods by which the freezing of water has long been attempted on a considerable scale, and with more or less success for economic purposes.

1. *The Intermixing of Various Chemical Substances.*—Thus a solution of nitrate of ammonia in water depresses temperature 46° F. The nitrate may be recovered by evaporation, and employed again. (For other and considerably more frigorific combinations, see FREEZING-MIXTURES.) They all depend upon producing a solution the specific heat of which is greater than that of the components that enter into the solution. But the superior efficacy of the ordinary mixture of common salt with comminuted ice is mainly due to the consequent liquefying of the ice, by which an absorption of 142·2 British thermal units per pound is necessary for the latent heat of liquefaction.

2. By far a more powerful and a more manageable principle is the absorption of heat into vapor expanding and escaping from a volatile liquid. The vapor of water is supereminent in requiring 966 B. T. U. per pound for the latent heat at atmospheric pressure, while ammoniacal vapor requires 596 B. T. U., and sulphuric ether about 164 B. T. U. Yet another facility afforded by the more highly volatile liquids is the low temperature at which volatilization or ebullition takes place under the ordinary atmospheric pressure. Thus sulphuric ether boils at 95° F. (35° C.). Faraday published in 1825 his observation that certain of the hydrocarbons boil at or near the freezing-point of water. Pure ammonia boils at — 36° F. (— 38·5° C.).

3. The re-expansion of compressed air, as well as of other gases, is powerfully refrigerative. The heat developed by compression is first to be absorbed by cold water. Then the re-expansion against pressure produces cooling in the gas sufficient, if abstracted from its own weight of water, to depress the latter in temperature at the rate of one degree for each unit of energy expended in expansion, or for the amount of work necessary to raise the same weight 778 feet against gravity.

4. A frigorific agency, not dependent like the foregoing upon either mechanical force or chemical reactions, is afforded, under favoring circumstances, by radiation into the cosmical spaces. Robert Boyle quotes from "the diligent Olearius," more than two centuries ago, a statement that ice was ordinarily produced in the hot climate of Ispahan, the capital of Persia, in layers a finger thick, by pouring water at successive intervals in the night "upon a shelving pavement of freestone or marble." It has, moreover, long been known that in Bengal and other provinces in India ice is obtained for domestic use by exposing at night shallow earthen vessels resting upon a flooring of dry stalks and leaves in pits 2 feet deep. It has been said that a similar practice exists in Eastern China. In these instances merchantable cakes are produced by superimposing the thin layers one upon another, to unite by simple regelation. This method has been attempted both in Great Britain and in France with success as a mere experiment, but not to the extent of economic value. It is a study for philosophers to explain how it could succeed, even as an experiment, in a warm or temperate atmosphere.

To the utilization of chemical affinities for frigorific purposes the only requisites are a simple commixture or solution of the substances employed, and a flow of the cold mixtures upon or along metallic sheets or surfaces containing the substances to be cooled. Non-conductors of heat are employed for protection externally against radiation and the atmospheric warmth. In the employment of volatile liquids the evaporation is effected by drawing off or exhausting the vapor from the cooling vessel as fast as it is formed, either by a gas-pump or by the affinity of a liquid or other substance which will absorb the vapor with great avidity. Such, for example, is the affinity of water or of chloride of silver for ammoniacal gas, or of sulphuric acid or anhydrous chloride of calcium for watery vapor. Another mode of disposing of the vapor might be, in certain instances, to condense it upon a cold surface present in the evaporating vessel or in communication with it. A familiar illustration of this last expedient is the philosophical apparatus known as the "cryophorus"; another is the common laboratory paradox of making water boil in a flask by affusion of cold water on the outside. See the articles FREEZING-MIXTURES, GAS, ICE, ICE-MAKING, and REFRIGERATING PROCESSES. Revised by R. H. THURSTON.

Freezing-mixtures: combinations of substances whose fusion or interaction causes a reduction of temperature. When solids are liquefied (fused or dissolved) they absorb a certain quantity of heat, which is thus rendered latent—is no longer indicated by the thermometer. This heat is called *latent heat of fusion* or *fluidity*. If we mix equal weights of water at 0° C. (32° F.) and water at 79° C. (172·4° F.), the temperature of the mixture will be the mean of the two temperatures, or 39·5° C. (103·1° F.). But if we repeat the experiment with snow or pounded ice at 0° C. and water at 79° C., the temperature of the whole will be only 0°, *but the ice will have been melted*. A quantity of heat, represented by 79° C. (174·2° F.), will have been apparently lost in melting the ice. If we place in a warm room two vessels, one containing a kilogramme of water at 0° C., the other a kilogramme of snow at 0° C., we shall find when the snow is melted that its temperature is only 0°, while the temperature of the water in the other vessel has risen to 79° C. (174·2° F.). This principle is true of all solids: they absorb in melting a certain quantity of heat, without indicating by the thermometer any increase in temperature. The following table exhibits the latent heats of fluidity of a few solids, expressed in heat-units:

LATENT HEAT ABSORBED BY ONE KILOGRAMME IN MELTING.

Ice	79	units.
Sulphur	80·5	"
Spermaceti	82·22	"
Lead	90	"
Beeswax	97·22	"
Zinc	274	"
Tin	277·77	"
Bismuth	305·55	"

The solution of most salts in water is attended with absorption of heat as the salt is liquefied. The following table contains a few illustrations of this principle:

MIXTURES.		Thermometer sinks—	Cold produced.
Nitrate of ammonia Water	1 part 1 "	From +50° F. to + 4° F. " +10° C. to −15·55° C.	46° F. 25·55° C.
Chloride of ammonium Nitrate of potassa Water	5 parts 5 " 16 "	From +50° F. to +10° F. " +10° C. to −12·22° C.	40° F. 22·22° C.
Chloride of ammonium Nitrate of potassa Sulphate of soda Water	5 parts 5 " 8 " 16 "	From +50° F. to + 4° F. " +10° C. to −15·55° C.	46° F. 25·55° C.
Nitrate of ammonia Carbonate of soda Water	1 part 1 " 1 "	From +50° F. to − 7° F. " +10° C. to −21·67° C.	57° F. 31·74° C.

The most remarkable salt in this respect is the sulphocyanide of ammonium. Phipson (*Chem. News*, xviii., 109) states that on dissolving this salt in an equal weight of hot water at 96° C. (204·8° F.) he was surprised to see the outside of the vessel covered with hoar-frost, and on introducing a thermometer into the solution he found its temperature to be two to three degrees centigrade below zero (28·4°–26·6° F.); ninety-eight to ninety-nine degrees centigrade of heat (176·4°–178·2° F.) had been required to liquefy the salt. By employing acids instead of water still greater reduction of temperature results:

MIXTURES.		Thermometer sinks—	Cold produced.
Sulphate of soda Nitric acid, dilute	3 parts 2 "	From +50° F. to − 3° " +10° C. to −19·44°	53° F. 29·44° C.
Phosphate of soda Nitric acid, dilute	9 parts 4 "	From +50° F. to −12° " +10° C. to −24·44°	62° F. 34·44° C.
Sulphate of soda Hydrochloric acid	8 parts 5 "	From +50° F. to − 0° " +10° C. to −17·78°	50° F. 27·77° C.
Sulphate of soda Sulphuric acid, dilute	5 parts 4 "	From +50° F. to + 3° " +10° C. to −16·11°	47° F. 26·11° C.
Sulphate of soda Nitrate of ammonia Nitric acid, dilute	6 parts 5 " 4 "	From +50° F. to −14° " +10° C. to −25·55°	64° F. 35·55° C.

In a suitable apparatus a mixture of 6 parts sulphate of soda (Glauber's salt) and 5 parts hydrochloric acid will freeze 5 parts of water. The best results are obtained when considerable quantities are employed. The lowest temperatures are produced by mixing snow or pounded ice with the salt employed. The salt causes the snow to melt, with the absorption of its heat of fusion, and the water produced dissolves at the same time the salt, which in turn absorbs its latent heat. Such mixtures are used for freezing ice-cream and water-ices, champagne, etc., and for condensing very volatile vapors. The temperature of ice-cream is often 15° F. or lower; 2 parts of pounded ice and 1 of salt are used for ice-cream; 3 parts of crystallized chloride of calcium (cooled to 0° C. = 32° F.) and 2 of snow will freeze mercury, producing a temperature of − 45° C. = − 49° F.

The following are mixtures which may be used for freezing:

MIXTURES.		Thermometer sinks—	Cold produced.
Snow or pounded ice Common salt	2 parts 1 "	To − 5° F. " −20·55° C.	
Snow or pounded ice Common salt Sal-ammoniac	5 parts 2 " 1 "	To −12° F. " −24·44° C.	
Snow or pounded ice Common salt Sal-ammoniac Niter	24 parts 10 " 5 " 5 "	To −18° F. " −27·78° C.	
Snow or pounded ice Common salt Nitrate of ammonia	12 parts 5 " 5 "	To −25° F. " −31·67° C.	
Snow Sulphuric acid, dilute	3 parts 2 "	From +32° F. to −23° " + 0° C. to −30·55°	55° F. 30·55° C.
Snow Hydrochloric acid	8 parts 5 "	From +32° F. to −27° " + 0° C. to −32·78°	59° F. 32·77° C.
Snow Nitric acid, dilute	7 parts 4 "	From +33° F. to −30° " + 0° C. to −34·44°	62° F. 34·44° C.
Snow Chloride of calcium, cryst	2 parts 3 "	From +32° F. to −50° " + 0° C. to −45·5°	82° F. 45·55° C.
Snow Potash	3 parts 4 "	From +32° F. to −51° " + 0° C. to −46·1°	83° F. 46·11° C.

For further information on this subject, see ICE, ICE-MAKING, and REFRIGERATING PROCESSES, and consult Cooke's *Chem. Physics*; Ganot's *Physics*; Ure's *Dictionary*, Freezing; and Watt's *Dictionary*, Heat.

Fregel'læ: an ancient Volscian town, colonized by Rome in 328 B. C. It stood on the right bank of the Liris, probably nearly opposite Ceprano, and commanded the passage of the river. It was large, opulent, and faithfully devoted to the interests of Rome, but in 125 B. C. it was utterly destroyed by L. Opimius, in consequence of an insurrection. Its ruins doubtless afforded materials for building Fabrateria and other towns near by.

Freiberg, frī'bărch: town of Saxony (founded in 1175); on railway, at the foot of the Erzgebirge; 20 miles S. W. of Dresden (see map of German Empire, ref. 5–G). It is situated in one of the richest mining-regions of Europe, no less than 1,500 mines of silver, copper, and lead being worked in the neighborhood, and is the center of administration for the Saxon mines. Its mining school, having thirteen professors, a library of 18,000 volumes, a most excellent collection of minerals bequeathed to it by Werner, is a very celebrated institution, and visited by students from all European countries. The town has some manufactures of machinery, gold and silver ware, and leather, and an excellent system of water-works. Pop. (1895) 29,282.

Freiburg, frī'boor*k*h: town of the grand duchy of Baden, Germany; on the western slope of the Black Forest; 35 miles S. of Strassburg (see map of German Empire, ref. 7–D). Its cathedral, commenced in 1122 and finished in 1514, with a tower 367 feet high, is one of the finest specimens of Gothic architecture in Germany. Freiburg is the seat of an archbishopric and has a well-frequented university, founded in 1455, and manufactures of sewing silk, beads, buttons, paper, etc. Freiburg was founded in 1091, became a town in 1115, and after changing masters several times finally fell to Baden in 1806. Pop. (1895) 53,109.

Freiburg: canton of Switzerland, between Berne, Vaud, and the Lake of Neuchâtel; area, 644 sq. miles. The southern part is mountainous, though none of the peaks reach the snow-line; the northern part is more level. The whole canton abounds in excellent pastures, and although it has some manufactures of straw-plait, leather, and tobacco, cattle-breeding and dairy husbandry are the main business of the inhabitants. The cheese from this canton is said to be the best produced in Switzerland. Eighty-four per cent. of the inhabitants are Roman Catholics, and more than three-fourths are of French descent and speak French, which is the official language. Pop. (1888) 119,529; (1894) 122,058.

Freiburg: a quaint but picturesque old town of Switzerland; capital of the canton of Freiburg; on the Saane, over which is built a suspension bridge 906 feet long, 28 feet wide, and 175 feet above the water (see map of Switzerland, ref. 5–D). Its cathedral is a fine building, with a famous organ having 7,800 pipes. It is the seat of a Roman Catholic university and a bishopric. Pop. (1888) 12,244.

Freight [Late M. Eng. *freight*, *freyt*, due to influence of two words, both originally from the same source, (1) M. Eng. *fraught* (> Eng. *fraught*, freight), from Dutch *vracht* (whence Germ. *Fracht*): O. H. Germ. *frēht*, gain, reward); (2) Fr. *fret*, freight, from O. H. Germ. *frēht*]: (1) goods or cargoes transported from one place to another by carriers; (2) the price to be paid for such transportation. The term is also used sometimes to denote the compensation paid for any use of vessels, including the carriage of passengers. Only the second meaning of the term will be here considered. The nature of the obligation to pay freight, its amount, and the time of payment may be varied to a great extent by the stipulations in the contract of affreightment, evidenced by the charter-party or the bill of lading. Thus the shipper of goods may hire the entire capacity of a vessel or some specific portion for a gross sum agreed upon or at certain rate per ton, and he will then be bound to pay for the entire space engaged, even though it be not used, the amount paid for the space not occupied being termed "dead freight." Or the agreement may be to pay only according to the quantity of goods actually shipped, and the sum due might then be varied at the option of the shipper. If no definite stipulations were made in regard to the freight, a contract for its payment would still be implied by law, and its amount would be determined by the usage of trade and the circumstances of the particular case. The general principles governing the contract of affreightment, and not often modified by particular agreement, are—that the shipowner after receiving a cargo on board has a right to retain it until the completion of the entire voyage of transportation; that his right to claim freight does not exist until the final destination is reached; and that he has then a lien upon the goods for the satisfaction of his proper charges. A partial completion of the voyage only will not give the shipowner or master a right to insist upon the payment of any freight whatever. The consigner may demand an entire fulfillment of the contract and delivery of the cargo at its destination, and if compliance be refused he may retake his goods and is discharged from all obligation. The lien of the carrier differs from most liens of a maritime nature, in that it depends upon the possession of the goods, and if delivery be made he has only a personal claim against the consignee or consigner. But if there is only a partial delivery of the cargo, the lien on the remainder is not destroyed, but subsists as a security for the entire claim. A carrier's lien is generally enforced in a court of admiralty. The amount of freight-money payable is sometimes diminished by the arrival of the goods at their destination in a deteriorated condition or diminished in quantity. If the injury is occasioned by the negligent stowage or packing of the cargo, or by any default on the part of the master, the damages sustained may be deducted from the freight. But if the deterioration occurred by reason of natural causes, and could not have been prevented by reasonable care, as if the loss should be occasioned by natural waste, decay, or evaporation, or by unavoidable perils of the sea, the carrier is not answerable for the accident, and no diminution from the entire freight is allowed. If articles arrive in substantially the same form as when shipped, even though there may have been a change in their quality affecting their value, it is a general rule that full freight has been earned. Under no circumstances can a cargo which has arrived be abandoned to the shipmaster because its value has been so much diminished as to be less than the sum demanded for transportation. If the carrier is responsible for the loss, a counterclaim may be set up against him to neutralize his demand, or, as in Great Britain, a separate action may be instituted. If the carrier is not in fault, the goods must be received and the entire freight liquidated.

An apportionment of freight sometimes results as the consequence of a disaster upon the voyage, by which a vessel is compelled to put in at an intermediate port for repairs. The carrier has a right in such cases to retain the goods if he desires, complete his repairs with reasonable expedition, and proceed to his destination, or he may send them forward by some other vessel and thus earn full freight. In such a case the carrier may demand freight for the entire voyage, if the owner refuses to allow him to take or forward the goods to their destination. If the carrier refuses to so take or forward them he is entitled to no compensation. If he delivers the goods to the owner at the owner's request, he may claim a *pro rata* freight.

It is a general principle of the marine law that the earning of freight is a necessary prerequisite to the payment of the seaman's wages, or, as the terse legal maxim expresses it, "freight is the mother of wages." The reason of this rule is based upon the policy of stimulating the sailors to a careful performance of their duties and to the exertion of every effort to prevent disaster to ship or cargo, that the voyage may be successfully completed. But the application of the rule is not extended further than this reason for its adoption would justify. For if the loss of freight be attributable to the wrongful act of the shipmaster or the owner of the cargo, it would be grossly unjust to deprive the seamen of their just compensation; and though the vessel should be wrecked and abandonment become necessary, yet if the sailors used all practicable measures to insure her safety and reach port, their claims for wages would be enforced. The rule that wages shall depend upon the earning of freight has been abolished in Great Britain by statute, but the same result is practically obtained by the provision that a failure on the part of a seaman to exert himself to the utmost to save the ship and cargo shall defeat his claim. In the U. S. the common-law doctrine has not been altered. See SHIPPING. T. W. DWIGHT.

Freiligrath, frī'lich-raat, FERDINAND: poet; b. at Detmold, Germany, June 17, 1810; entered upon a mercantile life, performing also literary work which attracted much attention. His first volume of poems (*Gedichte*, 1838; 20th ed. 1862; 31st, 1874) won him a pension, which he renounced in his *Glaubensbekenntniss* (1844), a work so full of republicanism that he was prosecuted, and fled to London. He returned and took part in the revolution of 1848; was imprisoned and tried for the political opinions expressed in his poems, and, though acquitted (in the first jury-trial ever held in Prussia), was compelled to leave the country; returned to London 1851, and in 1868 removed to Stuttgart. Among his works are *Ça Ira* (1846); *Die Revolution* (1848); *Neuere politische Gedichte* (1849), a masterly translation of Victor Hugo's poems; translations of Burns, of Longfellow's *Hiawatha*, and many English poems. His more recent songs, such as *Hurrah, Germania*, and *Die Trompete von Gravelotte*, are, like all his works, highly popular. D. Mar. 18, 1876.

Freind, frend, JOHN, M. A., M. D., F. R. S.: physician; b. at Croton, North Hants, England, 1675; was trained at Christ Church, Oxford, where he became lecturer on Chemistry in 1704; attained great distinction as a physician of London; now chiefly remembered for his valuable *History of Physic* (1725–26). D. July 26, 1728.—His brother, ROBERT FREIND, D. D. (1667–1751), was a celebrated Latin scholar; and WILLIAM FREIND, D. D., Robert's son, was a dean of Canterbury and a prominent preacher.

Freinsheim, frīns'hīm, JOHANN (*Freinshemius*): classical commentator; b. at Ulm, Nov. 16, 1608; studied at Marburg and Giessen; went to Strassburg, where he found a patron in Bernegger, rector of the college; published an edition of Florus, with useful notes, in 1632; was made Professor of Eloquence in the University of Upsala, and after five years' service (1647) became librarian and historiographer to Queen Christina. Compelled by ill-health to leave Sweden, he was appointed in 1656 honorary professor at Heidelberg, where he died Aug. 31, 1660. His labors were devoted mainly to the elucidation of the Latin historians. Besides Florus, he edited Quintus Curtius (Strassburg, 1640, 2 vols. 8vo), in which the missing books were supplied by himself; he supplied also in a continuous narrative, from scattered hints in other writers, the missing books of Livy, first published together by Doujat in the Delphin edition (1679–82). These justly celebrated *Supplements* have been reprinted in some of the later editions of this author; for instance in Drakenborch's *Livy* (17 vols., 1820). Revised by ALFRED GUDEMAN.

Freire, Ramon: general and politician; b. in Santiago, Chili, Nov. 29, 1787. He joined the patriot army in 1811; after the defeats of 1814 fled to Buenos Ayres; was engaged with Brown in a naval expedition, and in 1816 and 1817 served under San Martin in the recovery of Chili. Later he held independent commands in the south, and on Nov. 27, 1820, defeated Vicente Benevides at Concepcion. As chief of the liberal party he opposed the dictatorship of O'Higgins, and on the deposition of that leader was elected supreme director, or virtually dictator (1823). Early in 1826 he drove the Spaniards from Chiloé, thus putting an end to their rule in Chili. Re-elected supreme director in 1827, he resigned soon after. In 1830 he headed an insurrection against the conservatives, who had come into power. After several months' fighting he was defeated at the battle of Lircai (Apr. 17, 1831), captured, and banished to Peru. In 1836 he made an unsuccessful descent on Chiloé. He was allowed to return in 1842, and thereafter lived in retirement until his death at Santiago, Dec. 9, 1851. Herbert H. Smith.

Freire de Andrada, Gomes: administrator; grandfather of Ramon Freire; b. in Coimbra, Portugal, 1684. After important military services in Portugal, he was appointed (May 8, 1733) governor and captain-general of Rio de Janeiro, and interim governor of São Paulo and Minas. As then constituted these captaincies embraced all Southern Brazil, and for a time the new captaincies of Goyaz and Cuyabá were added to his government, comprehending Central and Western Brazil. The administration of Gomes Freire lasted nearly thirty years, being the longest and most prosperous in the colonial history of the country. Colonization was pushed southward to Santa Catharina; the rich gold mines of the interior attained their greatest development; and the first attempts were made to establish a definite boundary between the Portuguese and Spanish possessions in America. Gomes Freire was created Count of Bobadilla, Oct. 8, 1758. D. at Rio de Janeiro, Jan. 3, 1763.

Herbert H. Smith.

Fréjus, frā'zhüs' [Fr. < Lat. *Forum Julii*, liter., the market-place of Julius]: an ancient town of France; department of Var; on the Mediterranean, and on the railway to Nice; 45 miles N. E. of Toulon (see map of France, ref. 9-I). It is a bishop's see, and has some Roman remains. Its harbor, once a Roman naval station of importance, is almost entirely filled by silt from the river Argens. Here Napoleon I. took ship for Elba Apr. 27, 1814. Pop. (1896) 3,510.

Fréjus, Col de: a depression in the crest of the Cottian Alps, lying about 16 miles S. W. from the summit of the Mont Cenis pass, and rising to the height of about 9,500 feet above the sea. Here a tunnel was excavated by the governments of Italy and France between the years 1857 and 1871. For a long time this great work has been known as the Mont Cenis tunnel, but its proper designation is the tunnel of the Col de Fréjus, or Mont Fréjus. See Tunnels and Tunneling.

Frelinghuysen, free'ling-hī-zen, Frederick: soldier and politician; b. in Somerset co., N. J., Apr. 13, 1753; graduated at Princeton 1770; was in Congress in 1775, in 1778-79, and in 1782-83; served with much distinction in the Revolutionary war, rising from the grade of captain to that of colonel; and after the war served as major-general on the Western frontier against the Indians; was a U. S. Senator from New Jersey 1793-96; was an able lawyer, and held various public offices. D. Apr. 13, 1804.

Frelinghuysen, Frederick Theodore: lawyer; b. at Millstone, N. J., Aug. 4, 1817; a nephew of Theodore Frelinghuysen, who adopted him as a son; graduated at Rutgers College 1836; was called to the bar in 1839; was appointed attorney-general of New Jersey 1861 and 1866; U. S. Senator 1866-69, and re-elected in 1871 for the full term. He took a prominent position in the Republican party in the proceedings to impeach President Johnson, and was chosen to reply to the last annual message sent by the latter to Congress. In July, 1870, President Grant appointed him minister to England, but he declined the position. After the close of his senatorial term he took comparatively little part in public affairs until he was appointed Secretary of State, Dec. 12. 1881, by President Arthur. D. in Newark, N. J., May 20, 1885.

Frelinghuysen, Theodore, LL. D.: son of Gen. Frederick Frelinghuysen; b. at Millstone, N. J., Mar. 28, 1787; graduated at Princeton 1804; was admitted to the bar 1808; was a captain of volunteers 1812-15; was attorney-general of New Jersey 1817-29; U. S. Senator 1829-35; mayor of Newark 1837 and 1838: removed to New York 1838; chancellor of the University of New York 1839-50; president of Rutgers College, New Brunswick, N. J., from 1850 till his death, in New Brunswick, Apr. 12, 1861. In 1844 Mr. Frelinghuysen was Whig candidate for Vice-President on the Clay ticket. In public life his acts were ever regulated by exalted moral and religious principles. He favored all measures which might tend to alleviate human misery or misfortune, and was a leader in many charitable and religious enterprises; was for years president of the American Tract, Temperance, and Bible societies and the American Board and other missionary societies. His qualities as a lawyer and statesman were of a high order. See his biography by T. W. Chambers (New York, 1863).

Frelinghuysen, Theodorus Jacobus: b. at Lingen, West Friesland (now in Prussia), about 1691; was ordained to the Reformed ministry in 1717, and was pastor at Embden, Holland, till 1719; went in 1720 to America, and became the Dutch pastor at Raritan (now New Brunswick), N. J., and preached in that region with great zeal and success till his death, probably in 1747. His five sons, Theodore, John, Jacobus, Ferdinandus, and Henricus, were all ministers of the Reformed Church.

Frémiet, frā'mi-ā', Emmanuel: sculptor; b. in Paris in 1824; received his first art instruction in the studio of his uncle, François Rude; was for many years connected with the medical school as anatomical draughtsman; made his *début* in the Salon of 1843 with his *Gazelle*, a figure in plaster-of-Paris, and was in 1875 appointed Professor of Drawing in the Museum of Natural History. Among the most celebrated of his works are *Le Chien courant blessé*, in the Museum of Luxembourg, 1849; *Le Cheval à Montfaucon*, bought by the state, 1853; an equestrian statue of *Napoleon I.*, erected at Grenoble; an equestrian statue of *Louis Duke of Orleans*, in the courtyard of the Castle of Pierrefonds (*q. v.*); an equestrian statue of *Jeanne d'Arc* at Paris, in the Place des Pyrenées; the colossal elephant which decorates one of the four corners of the fountain at the Trocadéro, in Paris; an equestrian statue of the great *Prince of Condé*; a *Mounted Torch-bearer of the Fifteenth Century*; a bronze statue in the Paris Hôtel de Ville; a *She Bear Defending its Young from a Man of the Stone Age*, exhibited in 1885. He is an officer of the Legion of Honor since 1878.

Fremont': village; Newaygo co., Mich. (for location of county, see map of Michigan, ref. 6-H); on Ch. and West M. Ry.; 10 miles N. E. of Newaygo; in a fertile agricultural region. It has a foundry, a tannery, a furniture-factory, and water-works. Fremont Lake, just S. of the town, is a pleasant summer resort. Pop. (1880) 902; (1890) 1,097; (1900) 1,331.

Fremont: city and railway junction; capital of Dodge co., Neb. (for location of county, see map of Nebraska, ref. 10-G): situated near Platte river, 47 miles N. W. of Omaha. It has numerous churches and schools, a normal and business college, stockyards, pork-packing houses, a manufactory of creamery supplies, machine-shops, creamery, harness-factory, flouring-mills, planing-mills, water-works, sewers, gas and electric lights, street railways, and a telephone system. It is a great market for horses, cattle, hogs, and sheep. Pop. (1880) 3,013; (1890) 6,747; (1900) 7,241.

Editor of "Herald."

Fremont: city and railway center; capital of Sandusky co., O. (for location of county, see map of Ohio, ref. 2-E); situated on Sandusky river, 30 miles E. of Toledo. It has excellent schools and manufactures of carbons, engines, boilers, shears, cutlery, spikes, sash, doors, blinds, tubs, staves and barrels, etc. It has also several gas-wells, and is the center of the Gibsonburg oil and gas field. Sardis Birchard, foster-father of President Hayes, gave two valuable tracts of land to the city for parks, and presented $50,000 for a public library. The city has purchased the Fort Stephenson property, the scene of Croghan's victory, for a public park. Pop. (1880) 8,446; (1890) 7,141; (1900) 8,439.

Editor of "News."

Frémont', John Charles: soldier and politician; b. in Savannah, Ga., Jan. 21, 1813. His father was a French immigrant. He received a good education, though left an orphan when four years old, and when seventeen years old graduated at Charleston College, South Carolina; taught mathematics; turned his attention to engineering, and was recommended to the Government to be employed in the Mississippi survey. He afterward served at Washington in constructing maps of that region. Having received the commission of a lieutenant of engineers July 7, 1838, he proposed to the War Department to penetrate the Rocky Mountain region. His plan was approved, and in 1842 he explored the South Pass. Soon after he planned a new expedition to Oregon. He approached the mountains by a new route, examined the region S. of the South Pass, turned aside to the Great Salt Lake, and connected his exploration with that of Wilkes's expedition. Frémont conducted another party, which discovered new and grand features in Alta California, the great basin called by his name, the Sierra Nevada, the San Joaquin and Sacramento valleys, and determined much of the geography of the far Western regions. In 1845 he was again on the road to the Pacific to examine in detail the Pacific slope—a journey which resulted in giving many new facts of importance to the world, and indeed gave California to the U. S. It was rumored not only that the Mexicans were negotiating with Great Britain for the sale of California, but also that the Mexican governor, Gen. de Castro, intended to destroy the settlements on the Sacramento river; and when Frémont reached California, he actually found De Castro on the march against the settlements. The settlers flew to arms and joined Frémont's camp. On June 15, 1846, he captured a Mexican post at Sonoma Pass, with 9 cannons and 250 muskets; and on July 5 De Castro and his force were completely routed. The settlers declared themselves independent, and elected Frémont governor of the province. He immediately proceeded to join the U. S. naval forces at Monterey, under Commodore Stockton, who had lately arrived with authority from Washington to conquer California. After the conquest of Upper California, in which he thus bore a conspicuous part, he was involved in a quarrel between two other officers, and was deprived of his commission by sentence of a court martial. The President offered to reinstate him, but he declined. He retrieved his honor by the survey of a route for a great road from the Mississippi to San Francisco; pierced the hitherto unknown country of the Apaches; defeated or terrified the hostile savages; and in 100 days after leaving Santa Fé reached the Sacramento; was sent as one of the first U. S. Senators from California, serving 1849–51. He was in 1856 the first Republican candidate for President, in opposition to Mr. Buchanan, the Democratic candidate, and though he received a large vote (114 electoral votes to 174 for Buchanan and 8 for Fillmore) he was defeated. Appointed major-general of volunteers May 14, 1861, he served in Missouri and in the Shenandoah valley. Resigned June 4, 1864. Major-general retired Apr. 28, 1890, by act of Apr. 19, 1890. D. July 13, 1890. See *Memoirs of my Life* (1886).

Frémont, frā'mōṅ', JULES JOSEPH TASCHEREAU, D. C. L.: legal writer; b. in Quebec, Canada, Dec. 20, 1855; and educated at St. Mary's College, Montreal, and Laval University. He was admitted to the bar in 1878, and elected to the Dominion Parliament in 1891. In 1893 he was Professor of Civil Law in Laval University, and mayor of the city of Quebec. He is author of *Le Divorce et la Séparation de Corps* and *Compendium of the Dominion Laws of Canada*. NEIL MACDONALD.

Frémy, frā'mee', EDMOND: chemist; b. in Versailles, France, Feb. 28, 1814; professor in the Museum of Natural History, Paris, and at the École Polytechnique. Author of *Traité de Chimie* and *Encyclopédie Chimique* (10 vols., 1881 ff.). D. in Paris, Feb. 3, 1894.

French, DANIEL CHESTER: See the Appendix.

French, GEORGE FRANKLIN: See the Appendix.

French, JOHN: physician; b. about 1616 at Broughton, near Oxford, England; educated at Oxford, studied medicine, and served in the Parliamentary army. D. in Boulogne in 1657. He published a *Treatise of the Choicest Spagyrical Preparations, Experiments, and Curiosities Performed by Way of Distillation* (1651), and *The Yorkshire Spaw; or, A Treatise of Four Famous Medicinal Wells* (1652).

French, JOHN RAYMOND: See the Appendix.

French, JOHN WILLIAM, D. D.: clergyman, author, and teacher; b. at New Haven, Conn., Nov. 9, 1809; graduated at Trinity College, Hartford, Conn., 1832; and subsequently studied at the Episcopal Seminary, New York. Ordained in 1835 and became Professor of Rhetoric and librarian at Bristol College, Pennsylvania, 1836, but the institution failing, he was rector of St. Paul's church, Portland, Me., 1836–39; chaplain to Congress 1841; rector of the Church of the Epiphany, Washington, D. C., 1842–56; Professor of Ethics, U. S. Military Academy at West Point, N. Y., 1856–71; and died there July 8, 1871. Author of a text-book of *Practical Ethics* (New York, 1864) and an admirable work on English grammar (1863). JAMES MERCUR.

French, NICHOLAS: bishop; b. at Wexford, Ireland, in 1604; d. in Ghent, Aug. 23, 1678. He studied and took holy orders at Louvain; became a Roman Catholic priest in his native town, and was appointed Bishop of Ferns in 1646. Having taken a very active part in the political disturbances of his time, he retired to the Continent in 1651 and was about 1670 appointed coadjutor-archbishop of Ghent. His *Unkind Deserter, Bleeding Iphigenia, Sale and Settlement of Ireland*, and other polemical and political pamphlets, were published in London (1846) under the title of *Historical Works of Bishop French* (2 vols.).

French, WILLIAM HENRY: soldier; b. at Baltimore, Md., Jan. 13, 1815; graduated at West Point July 1, 1837; entered the army as second lieutenant of artillery; served in the Seminole war, and on the Canada border during the disturbances 1837–38. During the war with Mexico he served at the siege of Vera Cruz, the battles of Contreras and Churubusco, and the capture of Mexico; served against the Seminoles 1850–52, and on garrison and frontier duty till 1861. Appointed a brigadier-general in Sept., 1861, and major-general in Nov., 1862, he fought at Yorktown, the battles of Fair Oaks, Gaines's Mill, Peach Orchard, Savage Station, Malvern Hill, Antietam, Fredericksburg, and Chancellorsville. In May, 1864, he was mustered out of the volunteer service. From 1865 to 1872 he was in command of the Second Artillery. He passed through the successive grades to that of colonel, and retired at his own request July 1, 1880. D. May 20, 1881.

French Berries: the name given by dyers to the dried berries of various species of *Rhamnus* or buckthorn, which are brought from the Mediterranean countries, and produce a very bright but not very permanent yellow dye. The yellow-berried buckthorn is a very spreading procumbent shrub, growing wild in rough rocky places in the countries near the Mediterranean. The berries are also called Persian and Avignon berries.

French Broad River: a river of the U. S.; rises in Henderson co., N. C., near the Blue Ridge, flows N. W. into Tennessee, receives the Nolichucky, turns S. W., and joins the Holston (now called Tennessee) 3 miles above Knoxville. There is delightful scenery along its banks. It is navigable 30 miles to Danbridge by steamboats, and is some 200 miles in length.

French Congo: See GABOON-CONGO.

French Horn: a metallic wind instrument, consisting of a tube which is usually convoluted, so as to make it more portable. It increases in diameter from the mouth-piece to the bell or flaring open extremity. It is provided with several longer or shorter mouth-pieces, by means of which the key is varied, and the whole is provided with valves and keys.

French Indo-China: See INDO-CHINA.

French Language [O. Eng. *frencisc* : Low Lat. *franciscus* : Ital. *francesco* : O. Fr. *franceis, françois* > Mod. Fr. *français*; orig. deriv. from the German tribal name, O. H. Germ. *franchun*, the Franks, spearmen, deriv. of a word meaning spear; cf. O. Eng. *franca*, lance]: that one of the Romance languages which is in most general use in France, though not the only tongue spoken in that country. The modern literary French has as its main source the Old French dialect of Paris and the surrounding territory, about what was later called Île de France, or, roughly speaking, the old duchy of France. The vocabulary has also been affected by other dialects—by Provençal words from the southern part of France, by borrowings from Italian, Spanish, English, and also from Latin, Greek, and some other languages. As the influence of Central French increased, the importance of the other dialects diminished, and they have long since sunk to the rank of *patois*, and are often mistakenly considered as mere corruptions of "good French" in the mouths of the ignorant. From the philological point of view they have much interest (a *Société des parlers de France* has been constituted), and in Old French they were extensively employed in literature. The political supremacy of Paris caused French to become the established literary language also in Southern France in place of Provençal, though the latter is still used in literature to some extent, and also to supplant in the same way the dialects sometimes called Franco-Provençal or Middle-Rhonish. In Western Brittany a Celtic dialect, the Breton, is spoken, closely related to Welsh; this is the result of an early immigration from Cornwall. In the southwestern corner of France Basque is spoken, Catalan in the extreme south, and Flemish in the extreme north. Corsica is linguistically Italian, and there are three small Genoese settlements in Southeastern France. On the other hand, French, as the spoken language, including Franco-Provençal dialects, reaches beyond the political limits of France, particularly into Western Switzerland and slightly over the northwestern border of Italy, Southern Belgium, also to some extent into the territory under German rule, though not reaching the Rhine, and the Channel islands belong linguistically to France. French is further spoken, more or less, outside of Europe in present or former colonies of France, as in Algeria, a large part of Canada (whence there has been a considerable immigration of French-Canadians into the U. S.) and Louisiana, to say nothing of Haiti, Guiana, Mauritius, and the extensions of French power in Africa and Asia. The various dialects spoken in consequence have considerable linguistic interest; for some idea of those of Canada and Louisiana, see articles in *The American Journal of Philology* and the publications of the Modern Language Association of America and of the American Dialect Society by Elliott, Fortier, Harrison, Chamberlain, and the undersigned.

The total number of those who speak French or some French dialect as their mother-tongue can not be given exactly. Suchier gives, in Gröber's *Grundriss der romanischen Philologie* (1888), 38,471,519 as the result of a careful computation; but this is for Europe only and includes speakers of Provençal dialects, and the census figures he uses are of somewhat different dates. Making allowances accordingly we may estimate the number at present as over 30,000,000. The language, in a form for the most part probably not very different from the Parisian French of the time (cf. Behrens in *Französische Studien*, v., and in Paul's *Grundriss der germanischen Philologie*, i.; also Suchier, *Altfranzösische Grammatik*, Halle, 1893), was brought into extensive use in England by the Norman conquest, and greatly affected English, so that a large number of the words in common use in English are from French. Besides this early Norman-French influence, English afterward borrowed much from the literary language of France. French has indeed exerted an influence on all the chief languages of Europe, through its literature and through the repute in which it has long stood as being the most polite and refined of the modern languages, and as possessing in a high degree the characteristics of precision and perspicuity, while the former political predominance of France on the continent of Europe assisted in giving its language a similar pre-eminence. These considerations explain also its extensive use in diplomacy.

The sounds of the modern standard language are as follows (a few which are of secondary importance or not universally recognized, though sometimes actually heard, are here omitted, and lack of a convenient and readily intelligible phonetic notation prevents minute exactness): There are twelve oral vowels: *i* (close, about as in English *machine*, never as in *hit*), close *e* (about as *a* in English *fate*, written *é*, also *e* without accent and *ai*), open *e* (as in English *pet*, *there*, written *è*, *e*, *ai*, *ei*), two varieties of *a*, one intermediate between English *a* in *fat* and *a* in *father*, the other more nearly like English *a* in *father*; close *o* (about as English *o* in *note*, written *o*, *ô*, *au*, *eau*), open *o* (somewhat like English *o* in *nor*, usually written *o*); *u* (close, about as in English *rule*, never as in *bull*, written *ou*), a vowel (written *u*) similar to German *ü*, but always close, to be obtained by pronouncing *i* with the lips rounded as for *u*, two vowels similar to German *ö*, and somewhat like English *u* in *burn*, one close, obtained by pronouncing close *e* with the lips rounded as for close *o*, the other open, being a similar combination of open *e* and open *o* (both usually written *eu*, but *œu* and *ue* also occur, as in *cœur*, *cueillir*), and a sound resembling English *e* in *battery*, the so-called "mute *e*," when really pronounced at all, always very short (written *e*). There are also four nasal vowels, nasalized forms of very open *e* (written *in*, *im*, *ain*, *ein*, *en*), of the second variety of *a* (written *an*, *en*, *am*, *em*), of an open *o* (written *on*, *om*), and of the open oral vowel commonly indicated by *eu* (written *un*, *um*). There are not less than twenty consonants: *p*, *b*, *f*, *v*, *w* (a consonantal *u*, written *ou*, *u*, *o*), a consonantal use of the vowel written *u* (as in *conduire*), *m*, *t*, *d*, *l*, *n*, *s*, *z* (the last six more dental than in English), sibilants like English *sh* in *shut* and *z* in *azure* (the former written *ch*, the latter *j*, *g*), a palatal *n* much resembling the sound of English *ni* in *union* (written *gn*), *y* (written *y*, *i*, *il*, *ill*), *k*, *g* (these two also with palatal forms as in English *key*, *gild*, compared with *cool*, *good*) and *r* (the uvular variety, but the older form trilled with the tip of the tongue is also permissible and is preferred by many). The sound of *h* as in English is given by some to the so-called "aspirated *h*"; this is its older sound, preserved in some dialects, but not generally recognized for standard French, where the only effect remaining of the former aspirations is to cause the preceding word to be pronounced as if followed by one beginning with a real consonant (*les hauts* with no *s* pronounced in *les*, compare *les autres* where the same *s* is sounded as *z*, *le haut*, *la haute* as contrasted with *l'autre*, where *l'* may represent either *le* or *la*). The accent, which is much weaker than in English, is on the last syllable of the word unless the vowel of this syllable is the "mute *e*," when it is on the preceding syllable. Unaccented vowels are not so slurred as in English. As appears from the various methods (incompletely given above) of writing the sounds, the usual spelling of French very imperfectly represents the language itself. The main cause of this is that the changes in the language since it began to be written have to a great extent not been recognized in its spelling, and even the early French spelling had to represent sounds not known in classical Latin by single letters or combinations of letters of the Latin alphabet. Thus *ai*, *ei*, *oi*, *au*, *eu*, *ou* once represented diphthongs with the stress on the first element, so that *ai*, for example, was sounded about as English *i* in *bite*, *au* somewhat as English *ou* in *loud*, *oi* (of which there were two varieties according to the quality of *o*) somewhat as in English *boil*, while the modern value of *oi* might be better expressed by *wa*. The sounds now written *eu* are of secondary development, though by no means only modern. The groups *il*, *ill*, in cases where they now mean *y*, formerly expressed a palatalized *l*, resembling *lli* in English *million*, and in those combinations of a vowel with a following *n* or *m* which now indicate nasal vowels the *n* or *m* was once fully pronounced, while the vowel had a nasal quality not always the same as in the French of to-day. Some sounds once existing have now disappeared; thus the oldest French had the consonant sounds written *th* and *ng* in English *thin*, *this*, *sing*, *l* followed by a consonant early changed into *u* in such words as *autre* (older *altre*), *chevaux*, plural of *cheval*, *s* before a consonant has been lost in such words as *été* (older *esté*), and final consonants have to a great extent become silent. Moreover, the older French spelling has in many cases been altered so as to agree more nearly with original Latin forms, or on account of the influence of other words from the same stem but with a different spelling. The usual Old French form from Latin *corpus* is *cors*, but an unpronounced *p* has been inserted from the Latin in modern French *corps*. The modern language has the written form *bœufs* as plural of *bœuf*, but the regular corresponding forms in Old French were *bues*, *buef*, the *f* regularly disappearing before the final *s*. In modern *grand* (compare Latin *grandis* and the French verb *grandir*) no *d* is ever pronounced, though *t* is sometimes heard instead before a word beginning with a vowel. The regular Old French spelling was *grant* (a feminine form *grande* also occurs), original *d* changing to *t* when final, and final *t* has since been lost regularly except when close connection with a following vowel in the next word has preserved it. This retention of an older final consonant sound only before a word beginning with a vowel is what is known as the *liaison* or linking. So final *s* has now regularly become silent, but in cases of *liaison* it usually stood between vowels, in which position *s* in French became *z* (in sound), hence the rule that *s* links with the sound of *z*. Similarly *g* (for older written *c* = *k*) links with the sound of *k*. The so-called "mute *e*" is now really mute in most cases, though still written at the end of words. Of course the changes in the language were gradual and were not all accomplished at the same time, some, as the loss of the sounds of English *th*, being hundreds of years older than others. The usual written form of French often disguises or conceals the inflexional history of the language by presenting old forms as actually still in use. This is particularly true for final letters, such as *e*, *s*, *t*, which play a large part in the inflexions of the language as written. Final *e* is common as a sign of the feminine gender, *s* is the usual sign of the plural in nouns, adjectives, and pronouns, and is frequent in verbs, as in the second person singular and elsewhere; but in the language as spoken the feminine is sometimes like the masculine, or differs from it by ending in a consonant which is lacking in the masculine, the plural is often like the singular, or differs from it by adding *z* before the next word, and verbal forms which differ in spelling are not always distinguished in speech or are distinguished by the accompanying subjects, especially pronouns; compare the written *grec, grecque, vrai, vraie, petit, petite, long, longue, longs, grand, grands hommes, tu as, il a, j'avais, tu avais, il avait, ils avaient, je viens, tu viens, il vient* with the spoken forms of the same words. But the spoken language is far from having lost entirely such distinctions as those made in writing, though they are not always made in the same way. Many changes in inflexions were also caused by analogy, the divergence from Old French not being brought about entirely by such regular changes in pronunciation as those mentioned, and it should also be remembered that some disagreement between the spoken and written forms of a literary language always exists. This disagreement is excessive and hence a serious defect in the case of French, though it is perhaps no worse than in English. One of the misfortunes resulting in great part from the loss of "mute *e*" is that French verse has acquired a somewhat artificial character, this *e* being still generally counted as the vowel of a separate syllable, while the number of syllables in the verse is a matter of great importance.

In the summer of 1893 a step was taken in the French Academy toward a moderate reform in orthography, proposals which permit a more consistent spelling of a considerable number of words being adopted by a small majority. The following examples will illustrate some of the most important changes in spelling proposed: *seur* for *sœur*, *sistème* for *système*, *filosofie* for *philosophie*, *rétorique* for *rhétorique*, *astme* for *asthme*, *cronologie* for *chronologie*, *honeur* for *honneur* (cf. *honorer*), (*il*) *appèle* for *appelle*, *genous* for *genoux*, *chevaus* for *chevaux*, (*je*) *veus* for *veux*. Among other things, further, the use of hyphens is much restricted and that of accents somewhat changed. It is to be hoped that these reforms will find general acceptance.

In its inflexional system French has the grammatical gender, nouns, adjectives, and pronouns being masculine or feminine, but the neuter gender has been practically abandoned. In the personal pronouns some true case forms are found, while nouns have wholly lost the distinction of cases. The so-called disjunctive (accented or emphatic) and conjunctive (unaccented) forms of pronouns are also a feature of the language; compare in English *tell 'im* (unemphatic) with *tell him* (emphatic). The infinitive endings, according to which verbs are classified into conjugations, are written *-er, -ir, -re, -oir*, but only verbs of the first two classes belong to still really living conjugational types, according to which newly formed verbs may be inflected. The simple tenses, not formed by the aid of separate auxiliary words, are the present, imperfect, past ("parfait défini" or aorist, as it might be called, which has almost wholly disappeared from use in conversation, its place being taken by the compound present; *j'ai fait* = "I have done" and "I did"), and future of the indicative mood, a present of the so-called conditional mood, corresponding to English "should" or "would," a present and a past of the subjunctive, and a simple imperative. There is a present active participle and a past participle (passive in transitive verbs). Tenses for which there are no simple forms are supplied by using auxiliary verbs (*avoir*, "have," or *être*, "be") with the past participle, and the passive voice is formed by *être* and the past participle. But the passive is less used than in English, reflexive forms or active forms with the indefinite subject *on* (*on dit*, "they say," "it is said") being largely used instead. The use of all these forms is determined for the written language by grammatical rules, some of which, particularly those for the inflexion of the past participle, are complicated and somewhat artificial. The method of negation is peculiar, two words being generally required, the old simple negative *ne*, "not," being in most cases accompanied by an additional adverb or pronominal word after the verb; *ne . . . pas* = "not," *ne . . . aucun* = "not any," "no," *ne . . . personne* = "not anybody," "nobody," but this accompanying word (originally negative in some cases, positive in others) is sometimes used as a negative by itself, when the verb is omitted, without which the *ne* can not be used. The language abounds in idiomatic uses of *ne* and various other words, having many phrases whose precise meaning is not at once obvious from the meanings of the individual words employed. Of the studies on special points of French syntax the best are to be found in Tobler's *Vermischte Beiträge zur französischen Grammatik* (Leipzig, 1886), and in his later papers with the same title in the *Zeitschrift für romanische Philologie*. French forms compound words less freely than either German or English, but is by no means so poor in compound nouns as is sometimes supposed.

The history of the French language begins with popular Latin, which, as spoken in Gaul, gradually assumes a form distinct enough to be called no longer Latin. For convenience, according to documents preserved, the Old French period may be considered as beginning in the ninth century (the Strassburg oaths, 842) and as extending into the fourteenth. The convenient characteristic for this period is the declension of nouns with two cases, a subject and an object. For the study of this period, see, for example, G. Paris, *Extraits de la Chanson de Roland* (4th ed. Paris, 1893); Suchier, *Altfranzösische Grammatik* (Halle, 1893, ff.); Godefroy, *Dictionnaire de l'ancienne langue française*, etc. (Paris, 1881, ff.); Gröber's *Grundriss der romanischen Philologie*, and other works mentioned in the article on the Romance languages. The period following this and preceding modern French (which may be said to begin after the sixteenth century) is a transitional one, though the language was of course not free from change during the Old French period. For the sixteenth century should be consulted Darmesteter et Hatzfeld, *Le seizième siècle en France* (Paris, 1878), and Thurot, *De la prononciation française depuis le commencement du XVI^e siècle* (Paris, 1881). It was not until the sixteenth century (1539) that the use of French was made obligatory in public documents in place of Latin, and the grammatical treatment of the language in this and the following century was under the influence of the Latin grammar, the historical continuity with Old French being ignored, and the early stages of French being neither understood nor studied by grammarians and critical writers in general. Moreover the conscious efforts of those who aimed at ennobling and refining the language were not without some influence. In 1635 the French Academy was established, following the example of the Accademia della Crusca in Italy, and its decisions in matters of spelling and usage were to be authoritative. The first edition of the *Dictionnaire de l'Académie* appeared in 1694, the seventh in 1878.

For some account of the relations of French to the other Romance languages and to Latin, see ROMANCE LANGUAGES. The following list of works on the language, in addition to those already mentioned, must also be supplemented by reference to the same article, for the modern language can not be fully understood without a knowledge of its history.

DICTIONARIES.—Littré, *Dictionnaire de la langue française* (Paris, 1863–72), and *Supplément* (1877); Darmesteter, Hatzfeld and Thomas, *Dictionnaire général de la langue française* (Paris, in course of publication): Larive and Fleury, *Dictionnaire français illustré des mots et des choses* (Paris, 1891); and older works in France, as Poitevin, *Dictionnaire universel* (1856–60); Bescherelle, *Dictionnaire national* (1843–46), and others: Sachs, *Encyclopädisches Wörterbuch der französischen und deutschen Sprache* (Berlin, 1869); French-English dictionaries such as those of Smith, Legros and Hamilton, Gasc, and others, notably the wonderfully condensed and yet for its size very full dictionary for the pocket (of both languages) of John Bellows; Godefroy, *Lexique comparé de la langue de Corneille*, etc. (1862); Génin, *Lexique de Molière* (Paris, 1846): Lafaye, *Dictionnaire des synonymes de la langue française* (Paris, 1858); the etymological dictionaries of Scheler (1st ed. 1862) and Brachet (1st ed. 1870). Grammar, including pronunciation and formation of words (in French): Ayer, *Grammaire comparée de la langue française* (4th ed. 1885); Benoist, *De la syntaxe française entre Palsgrave et Vaugelas* (Paris, 1877); the recent grammars of Brachet (*Nouvelle grammaire française*; his *Grammaire historique* is antiquated), Chassang (*Nouvelle grammaire française, cours supérieur*), Clédat (*Nouvelle grammaire historique du français*); *id.*, *Précis d'orthographe et de grammaire phonétiques* (Paris, 1890); A. Darmesteter, *Traité de la formation des mots composés dans la langue française* (Paris, 1875); *id.*, *De la création actuelle de mots nouveaux dans la langue française* (Paris, 1877); *id.*, *Reliques scientifiques recueillies par son frère* (Paris, 1890); A. F. Didot, *Observations sur l'orthographe française* (Paris, 1867); Koschwitz, *Les parlers parisiens* (Paris, 1893); Lesaint, *Traité complet de la prononciation française* (2d ed. Hamburg, 1871); Livet, *La grammaire française et les grammairiens du XVI^e siècle* (Paris, 1859); Mende, *Étude sur la prononciation de l'e muet à Paris* (London, 1880); Mercier, *Histoire des participes français*

(Paris, 1879); P. Passy, *Les sons du français* (3d ed. Paris, 1892); see also his and other articles in the *Phonetische Studien*; (in German or English) Beyer, *Französische Phonetik* (Cöthen, 1888); Beyer und Passy, *Elementarbuch des gesprochenen Französisch* (Cöthen, 1893, with an *Ergänzungsheft*); Breymann, *A French Grammar Based on Philological Principles* (London, 1874); Koschwitz, *Neufranzösische Formenlehre nach ihrem Lautstande dargestellt* (Oppeln and Leipzig, 1888); Lücking, *Französische Grammatik für den Schulgebrauch* (Berlin, 1883); Mätzner, *Syntax der neufranzösischen Sprache* (Berlin, 1843); *id.*, *Französische Grammatik* (2d ed. Berlin, 1877); Niemer, *Die orthographischen Reformversuche der französischen Phonetiker des XIX. Jahrhunderts* (Greifswald, 1882); Stengel, *Chronologisches Verzeichniss französischer Grammatiken vom Ende des 14. bis zum Ausgange des 18. Jahrhunderts* (Oppeln, 1890); Whitney, *A Practical French Grammar* (New York, 1886), etc.; see also the works mentioned in Gröber's *Grundriss der romanischen Philologie*, and many articles in periodicals. Versification: L. Becq de Fouquières, *Traité général de versification française* (Paris, 1879); Lubarsch, *Französische Verslehre mit neuen Entwickelungen für die theoretische Begründung französischer Rhythmik* (Berlin, 1879); C. Tisseur, *Modestes observations sur l'art de versifier* (Lyons, 1893); Tobler, *Vom französischen Versbau alter und neuer Zeit* (2d ed. Leipzig, 1883; French translation, 1885), etc. Dialects, etc.: Gilliéron and Rousselot, *Revue des patois gallo-romans*; Clédat, *Revue de Philologie française et provençale* (originally *Revue des patois*); and many special studies by Gilliéron, Joret, Horning, and others; see Gröber's *Grundriss* and periodicals. E. S. SHELDON.

French Literature: French literature may be divided for the sake of convenience into six periods—the first, from the earliest beginning to the second third of the fourteenth century, or the accession of the house of Valois—a period chiefly devoted to the expression of feudal and knightly society; the second, to the end of the fifteenth century (the boundary commonly assigned to the Middle Ages), reflecting more particularly the life and ideas of the bourgeoisie; the third, including the sixteenth century, i. e. the period of the Renaissance; the fourth, the period of French classicism, coinciding roughly with the seventeenth century; the fifth, sometimes called the Age of the Philosophers, comprising the eighteenth century down to the Revolution; and the last, the period of realism, extending from the Revolution.

French literature began as soon as national consciousness was awakened in the population of Northern Gaul after the Germanic invasions of the fifth and sixth centuries A. D., or, in other words, when the various elements that had been brought together there had so far been fused as to produce a community of sentiment and of culture in general. First of all these elements was the Celtic blood of the great mass of the Gallic population; though the vague but important contribution of a certain mental and moral temperament was about all the original Celtic inhabitants of Gaul made to the national inheritance of their descendants. Their institutions, religious and civil, and their language were replaced by those of Rome. Their civilization, in a word, was Latinized; and this Latin culture was the second ingredient of the forthcoming nationality. A third, coming in the train of Roman conquest, and partly mastering, partly neutralizing, Latin culture was Christianity, with its conceptions of man and the world, and its positive institutions of a visible church. The fourth ingredient of the compound was furnished by the ideas, institutions, and spirit which the Teutonic invaders brought into contact with the Christianized Gallo-Roman population they had conquered.

As it was a Germanic people that gave the new nation its name of France, so it was this youngest element of the French nationality that was the starting-point of the most vigorous and flourishing part of its first poetic production—the heroic poems or *chansons de geste*. The fruitful germs of the rich literature of *chansons de geste* lie in the memories of the exploits of the royal houses of the Franks, from the time of Clovis downward, and of those military successes or reverses through which, under the Frankish kings, the national spirit became conscious of itself. The original productiveness of this epic impulse ceased with the beginning of the eleventh century, when feudalism appeared fully constituted, but the materials which it had created continued to be worked over for a long time, and all the extant poems of this period owe their present form to later hands.

Two groups of the *chansons de geste* are distinguished. Those of the earlier came from a society in which the dominant sentiment was that of national unity, and their august central figure is Charlemagne, about whom memories of various older and later times have gathered. One of the earliest, and certainly the most famous, of all *chansons de geste*, the *Chanson de Roland*, composed in the second half of the eleventh century and contained in a manuscript a century younger, belongs to this group. The later group reflects a society in which feudalism, with its impatience of royal control, was the inspiring force (*Renaud de Montauban*, *Girard de Roussillon*).

The *chansons de geste* are mainly anonymous. They were composed to be sung or recited to a musical accompaniment, as the public to which they were addressed could not read. Their form, admirably suited for this method of publication, consists of groups of from five to several hundred lines of equal length, in the *Roland* of ten syllables, bound together by assonance of the final vowels.

Of considerably later inspiration and generally of somewhat later composition, addressing also a special class of patrons in those who were beginning to make a polite and courtly society at the castles of those rich nobles whose taste began to turn from war to display, luxury, or the cultivation of the forms of intercourse, and especially influenced by the part of women in this society and the ideals to which that gave rise, were the courtly poems celebrating chivalry and adventure. These expressed the ideals of courtly society; their heroes are not so much warriors as early types of the modern gentleman. They flourished particularly in the hundred years following the middle of the twelfth century, when the works of the most popular and brilliant author of poems of this kind, Chrétien de Troies (*Tristan*, *Erec*, *Cligès*, *La Charrette*, *Ivain*, *Perceval*, between 1160 and 1175), did much to establish their vogue. Their subjects were taken from various sources: The literature or traditions of antiquity (*Alexandre*, by Lambert le Tort and Alexandre de Bernai, whence the name of the line that became the basis of the verse-form of classic French tragedy; *Troie*, by Benoit de Sainte-More; *Enéas*), from floating Oriental tales (*Sept Sages de Rome*, *Aucassin et Nicolette*), and especially from Celtic tradition (*Tristan*, *Erec*, *Ivain*, etc.), which furnished King Arthur and the knights of his Round Table. These heroes of Celtic origin became enormously popular, and in them particularly the age of chivalry embodied its conceptions of polite life. The ordinary form was rhyming couplets, and the short line of eight syllables was particularly favored.

As was the case with the *chansons de geste*, the courtly poem continued to be cultivated after the ideas which gave it birth had ceased to have creative power. While its subjects were still popular, continuations of incredible lengths (60,000 lines) were added to the adventures of favorite heroes. As interest waned the poems were abridged. They were among the first compositions to pass into the prose form, rendering thus a real service to prose style, and were the forerunners of the modern novel.

With the *fableaux* one passes rather to the region of lower and common life and the horizon of the bourgeoisie. The *fableaux* are short tales in verse, usually extremely coarse in subject and frank in treatment, but redeemed sometimes by their shrewd observation of men or by a thrust of genuine wit. The society which they picture is that of the common people; the peasants and clergy are oftenest the target of their ridicule, and woman plays in them a very different *rôle* from that given her in the heroic or courtly poetry.

From the same region of society, and having the same main interest of incident with a very prominent satirical intent, were the stories of animals brought together in the twelfth and thirteenth centuries under the name of the *Roman de Renard*. In these stories the well-known adventures of *Renard*, the fox, *Isengrim*, the wolf, *Chanticler*, the cock, and the rest are told with a clearer and clearer reference in the later versions to human society.

The growing allegorical tendency thus seen in the stories of animals was very characteristic of the latter part of this period of the Middle Ages. The mediæval mind was inclined to regard things as mysterious symbols to be interpreted in the light of its already formed conception of the world, and to draw from everything a moral or spiritual meaning which was its real explanation. A large portion of the didactic literature of this period, which mainly, it is true, started from the clergy, but was composed in view of the people at large, was essentially allegorical. The sermons of the time are noticeable for their *exemples*, or parables, of homely sort, by which the instruction was made more vivid. Of the same allegorical nature were the *débats* and the personifications in which the religious literature of the thirteenth and fourteenth centuries abounds. Even works intended for scientific instruction used the same method. The stone-books (*lapidaires*), enumerating the peculiar properties attributed to precious stones, and the beast-books (*bestiaires*), which do the same thing for animals, add often the allegorical interpretation in moral terms of these properties. Indeed, science in the Middle Ages consisted largely in a half-allegorical interpretation of natural objects and phenomena. The profound curiosity to know the meaning of them as symbols was perhaps a reason why they were not observed more exactly as facts.

The work which represents the greatest achievement of the allegorizing spirit and whose instant and amazing success is a sign of its harmony with the taste of the time is the *Roman de la Rose* (begun by Guillaume de Lorris about 1237, finished by Jean de Meun about 1277). The subject of the poem is the attempts of Lover to pluck the Rose in the garden of Love, favored or hindered by Welcome, Danger, Slander, Shame, Fear, and others of the allegorical train. In the wake of the popularity of this work the allegorizing spirit went far beyond the boundaries of France and of this period, and signalized its strength in the next by its conquest of the drama.

The drama, which had its birth in the Church in the dramatic illustration, at first very meager, given the service on the great feast-days of Christmas and Easter, hardly outgrew during this period its dependence upon the service, though the scenes enacted from Old Testament and New Testament history had proven their charm upon the people, and began to be brought together in large groups (mysteries). The drama of purely profane subject did not arise till later. Adam de la Halle (b. about 1240) left two noticeable plays dealing with common life (*Jean de la Feuillée*, *Robin et Marion*), and from a very early date the religious plays were not without scenes where a comic or satiric spirit introduced pictures of contemporary life. And probably aside from these recorded examples the comic spirit of the age never ceased to deal dramatically with life, for some of the earliest farces that have come down from a later period do not seem to be creations in a new and unpracticed field.

French lyric poetry of this period was mainly dominated by Provençal influence. A few examples remain of an older lyric apparently native to Northern France, characterized by great simplicity and grace in form and content. But with the twelfth century the lyric poets of renown (Gui de Coucy, Chrétien de Troies, Blondel de Nesle, Tibaud de Champagne, etc.) all cultivated the forms and subjects of the troubadours; societies of artisans and tradesmen (*puis*) also applied themselves to the lyric art, and gave great elaborateness to the form and great monotony to the contents, though occasionally there was among them a man of real genius (Adam de la Halle, 1240–70, Rustebœuf, 1255–85).

Prose in this period hardly held the conspicuous place in French literature that it has since held. It was employed in translation from the Latin, which did not easily surrender its title as the only vehicle of really serious knowledge, and was successfully cultivated also by the writers of the prose romances of chivalry. But already the long series of great monuments of French prose had been opened by Villehardouin in his chronicle of the fourth crusade (1198–1207), and it was worthily continued by Joinville in his history of St. Louis (1300–09). But to the end of this period verse was still mainly preferred for all historical works in French (Gaimar, *Histoire des Anglais*, 1147–51; Wace, *Geste des Bretons*, 1155; *Roman de Rou*, 1160–74).

With the fourteenth century and the Hundred Years' war the middle portion of society comes definitely to the foreground in literature. The subjects and sentiments that had inspired the rich growth of *chansons de geste* and poems of chivalry had ceased to interest. Literary activity in these fields spent itself in attempts to rejuvenate the form of older poems and adapt their matter to the changed taste. Prose asserted its supremacy, and the old heroic songs, shorn of the epic formulas that had proved burdensome to them, regained in the shorter prose a considerable portion of public favor, which they still retained when the art of printing came to attest their popularity by sending some of the prose romances of chivalry forth among the first products of the press.

The field of lyric poetry was not so barren. After the lyric had been reduced to a mere matter of formal technique, and its productivity seemed exhausted, Guillaume de Machault opened up new possibilities for it, and a new series of forms was created, many of which, as the *ballade*, *rondeau*, *rondel*, *triolet*, etc., have been restored to new life and favor in our day. But some of these lyric poets were noticeable for more than technical excellence of form. François Villon (middle of the fifteenth century) particularly seems to cut loose from the Middle Ages by emerging from the conventional round of ideas that lyric poetry had expressed, and by asserting passionately and with poignant directness his own personal view and sense of things.

To the biblical and legendary drama (mystery, miracle) the bourgeoisie gave in this second period a great expansion, and it became the medium of whatever public relation with literature there was. The *puis* (see above) in all the considerable cities undertook the presentation at stated intervals of mysteries and miracles, which came to be of great length, and these were occasions of great public importance in the community. Allegory, that had so invaded literature in other directions, took possession of the drama also: and the morality, which is merely an allegory dramatized, became immensely popular. In them the native humor of the people and the *esprit gaulois* found vent, as in the farces to which they gave place, some of which are written with great comic vigor and considerable skill (*L'Avocat Pathelin*, fifteenth century). The spirit of satire and ridicule, which found abundant material in the decadent institutions and society of feudalism, ran riotous course in the *sotties*. At Paris, which here as often elsewhere resumes the intellectual life of France, these three kinds of dramatic representation were the especial care of three societies—the Confrêres de la Passion, the Basochiens, and the Enfants sans souci.

A somewhat kindred spirit of criticism distinguishes the historical work of the end of this period, the *Memoirs* of Philippe de Comines, from the *Chronicles* of Froissart which relate its beginning. Froissart is the vivid anecdotist, accepting completely the forms of that life which he pictured with such detail and color without questioning their authority. Comines, though an unmethodical chronicler, brings men and events to the test of a more reasonable order to be established.

The great movements of the sixteenth century in France, as in Europe generally, were the Renaissance and the Reformation. The Reformation agitated France profoundly, and contributed directly to literature in the fields of lyric poetry (songs of the Huguenots) and of vigorous argumentative prose (Calvin, 1509–64). But failing to penetrate the masses of the people, it succumbed to the strong impulse toward national unity, and did not deeply and permanently inform literature as in Germany and England. But the Renaissance produced a very complete transformation. Not only was the mind, somewhat baffled in its search of fruitful developments of the mediæval way of looking at life, fascinated with the new conceptions that contact with the antique world gave it, but it was charmed by the forms and art of the literatures which revealed them. Compared with them the native language and literature seemed uncouth and barbarous. Men looked upon Greek and Latin as the great models, and addressed themselves ardently to the task of reforming their own in their semblance. Their efforts, more zealous than well considered, are visible in all directions, and give to the productions of the century, with all their vigor and vitality, an appearance of confusion that is sometimes almost grotesque.

The great representatives of the century on the side of its ideas were François Rabelais (1483–1553) and Michel de Montaigne (1533–92). Rabelais's famous works, *Gargantua* and *Pantagruel*, in which the whole decaying mediæval world appears in fantastic and grotesque combinations with ideas and scraps of knowledge of all kinds crammed together from all sources, is, as it were, the boisterous laughter of the old spirit of the *fableaux* and the *sotties* standing at the outer threshold of the Middle Ages and tipsy with the wine of new learning. Montaigne's *Essays* belong more pronouncedly to the new age. They are the reflections, thrown together in agreeable disorder, of a man who views the world seriously, but amiably despairs of finding it intelligible as a whole, and whose essential skepticism allies him with the minds of the eighteenth century, who were the first to make him popular.

On the formal side the characteristics of the period were most noticeable in lyric and dramatic poetry. In the drama, though in Paris the representation of mysteries was forbidden because of the license which had invaded them, the old popular theater survived and even preserved a certain vitality. But a flood of translations and imitations of works of classical antiquity was invading the schools, drawing their inspiration from the Latin rather than the Greek authors; and the first forerunners of Corneille (Jodelle, 1532–73; Garnier, 1545–1590) were beginning the tradition of classical French tragedy. In lyric poetry Clement Marot (1495–1544) forms a connecting link with the foregoing period, and both in the strong old words of his language and in the forms of his verse continued the tradition of the fifteenth century. Pierre de Ronsard (1524–85), on the other hand, with his coterie, self-styled the *Pléiade* (foremost in which was Joachim du Bellay (1524–60), whose *Défense et Illustration de la langue française* expresses the aims of the group), led the movement to renew the language and literature; and his works—odes, sonnets, and imitations of Vergil—are stuffed with bold adaptations of Greek and Latin words and idioms. The result was enrichment of the language and literature, but almost their suffocation also. A critical process of selection and ordering was necessary, and a standard to regulate and check the excesses of individual zeal. These were inaugurated by Malherbe (1555–1628). Without original genius, he yet became the dominant force in French letters because he answered most fully the needs of the moment for definite standards and rules by which order and measure might be attained. Thus in harmony with the impulse of his time he largely impressed upon the dawning seventeenth century that character of repression, severe regularity, conformity to standard, which the classical period wears.

This character, favored by the great movement toward a central authority which came to all currents of French life with the final victory of the monarchy and the prestige of a brilliant court, felt more and more since Francis I. as the center of national life, gave to the literary productions of the seventeenth century a singular unity, which French society and institutions of the time also reveal. The French mind for the time exalted authority and the value of unity and order. In literature the authority of the ancients was easily and naturally accepted, and Aristotle became supreme arbiter in all questions about which he could be forced to give an opinion. In the drama, which, since the establishment of a regular dramatic company (about 1600), was preserving the prominence it had won in its older forms, not only the inferior talents (Hardy, 1570–1631; Mairet, 1604–86; Rotrou, 1609–50), but Corneille (1606–84) as well, whose masterpiece, *Le Cid* (1636), followed within a few years by *Horace*, *Cinna*, and *Polyeucte*, captivated the public and decided the formula of French tragedy, wished to apply those rules of dramatic composition which they supposed the ancients had followed. Racine (1639–99) moved with more freedom and ease in the form thus fixed, not because he expanded it in any wise, but because he naturally felt its limitations less, choosing, mainly from classical sources (*Alexandre*, *Andromaque*, *Britannicus*, *Mithridate*, *Iphigénie*, *Phèdre*), subjects which may be successfully developed within the narrow limits of time and place which the formula allowed. Comedy, which also owed to Corneille its first successful cultivation (*Le Menteur*, 1644) according to the taste of the time, developed more freely in the hands of the greatest literary genius of the century, Molière (1622–73), who, actor himself and theatrical manager, worked out his comic style, not without influence from the Latins directly or through translations, but in immediate touch with the feeling of the society about him, and taking as his point of departure the free comedy of situation and intrigue which was the special property of Italian troupes. By enlarging the part of observation he laid the great interest of his most serious works (*Le Misanthrope*, *Tartuffe*, *L'Avare*, *Les Femmes savantes*) in the lifelike presentation of well contrasted characters, and established the tradition of the comedy of character, which held its supremacy long after his time, and in which his most brilliant follower was Regnard (1655–1709).

Other poetry than dramatic did not greatly flourish in the age of Louis XIV. Epic breadth and elevation and lyric intensity and fervor were alike wanting. Only where these qualities are not of prime importance was work of distinction achieved, as in the fable and short story in verse in which La Fontaine (1621–95, *Fables* and *Contes*) produced masterpieces marked by brilliant perfection of versification and great alertness and grace of style.

The same craving for authoritative standards that fastened the rules upon classical tragedy dictated those grammatical and lexicographical works, beginning with the dictionary of Vaugelas (1585–1650), which had for their aim the precise definition of good usage and the consequent purification of speech, and presided also over the foundation of the French Academy (1635), which has since continued to guard so jealously the purity and dignity of the language. The house of Rambouillet, though leading to an extreme affectation, was but another expression of the same tendency. The qualities that the seventeenth century thus came to prize most highly are nowhere better set forth than by Boileau (1636–1711), who in his *Art poétique* formulated the critical canons of the age, the central demand of which was for lucidity, moderation, and common sense.

The application of such a standard was far more favorable to prose than to poetry, and the conversation in the salons of the day, as well as the letters of professed cultivators of prose style like Balzac (1597–1654) and Voiture (1598–1648), the pastoral romances brought into vogue by d'Urfé (1568–1625; *Astrée*) and the nominally historical novels of Mlle. de Scudéry were both developing its resources, giving it polish and fixing its forms. At the same time Descartes (1596–1650), whose philosophy supplied the basis of that spiritualistic conception of man which the classical literature mainly applied, and especially Pascal (1623–62), whose *Lettres provinciales* in defense of the suspected Jansenists of Port Royal were, by the admiration they excited and the circulation they received, particularly influential, were giving French prose the firm lucidity and precision which have continued to distinguish it. The letters of Madame de Sévigné (1626–96) show with what charm and force the language was habitually used by one who was not a professional writer. An ornate and impressive rhetoric was cultivated in the pulpit by Bossuet (1627–1704) in his celebrated funeral orations, Bourdaloue (1632–1704), Fléchier (1632–1710), and Massillon (1663–1742). Bossuet, furthermore, a man of really comprehensive mind, made himself the great apologist of the Catholic system by interpreting according to its ideas history (*Discours sur l'histoire universelle*), philosophy (*De la connaissance de Dieu*), and politics (*Politique tirée de l'Écriture Sainte*). The moralists La Rochefoucauld (1613–80; *Les Maximes*) and La Bruyère (1645–96; *Les Caractères*) enlarged the capacity of prose for delicate discrimination and condensed epigrammatic statement; and Fénelon (1651–1715) gave it in his political romance *Télémaque* a new harmony and rhythm.

The unity which is the conspicuous outward mark of the seventeenth century was not unbroken. There were not wanting voices, drowned for the time under the overwhelming chorus of assent, that appealed from the generally accepted standard, in state, in Church, and in taste. Against the authority of the ancients the equal or greater value of modern example was upheld. In the eighteenth century the dissenters gained more and more in numbers, but still without visibly weakening the established tradition. Voltaire (1694–1778) and Crébillon (1674–1762) continued to write tragedies in the manner of Corneille and Racine, and Destouches (1680–1754), Marivaux (1688–1763), Piron (1689–1773), and Lesage (1668–1747) followed, with such deviations as their talents imposed, the footsteps of Molière. Narrative poetry remained unproductive, not even the literary dexterity of Voltaire being sufficient to give real vitality to his serious (*Henriade*) and burlesque (*Pucelle*) attempts in this direction. In the lyric field J. B. Rousseau (1670–1741) composed odes of some technical finish and elegance, but without lyric impulse. The wholly rational drift of the century, with the stress it laid on logic and reason, was not calculated to lessen the respect paid to the qualities of proportion, lucidity, and good sense extolled by Boileau, and on the whole defended the old rules against attack. La Harpe (1739–1803), who is said to have created literary criticism in France, rigorously upheld the undiminished validity of the literary doctrines of the seventeenth century.

But the great movement of the century toward enlightenment, impelled by the feverish intellectual curiosity which characterized it, and of which the great *Encyclopédie* of Diderot (1713–84) and d'Alembert (1717–83) is the typical expression, was all the while bringing forth ideas completely subversive of that spiritualistic and aristocratic conception of life upon which the literary practice of the seventeenth century had been based, and forcing upon attention subjects that had lain quite without the circle of its sympathy and interest. The Cartesian philosophy was abandoned for the English sensationalism, and the *Esprit* of

Helvetius (1715–71), the *Système de la Nature* of d'Holbach (1723–89), and the writings of the other Encyclopédistes asserted a pronounced materialism. This entire shifting of the point of view, laying stress on the outer world rather than on the mind, lent a great impulse to the study of the natural sciences, and Buffon (1707–88) was but the most illustrious of a great number who applied themselves eagerly to the observation of nature. The comparative study of political institutions, as Montesquieu (1689–1755) conducted it, robbed the institution of royalty of its special authority. The society which afterward became the Société des Inscriptions et Belles-Lettres began to renew acquaintance with that national past upon which French literature had turned its back since the Renaissance, and to find there a various and multiform life of which the great century had been unconscious or disdainful. Foreign literatures also began to open to view other canons of taste than the ones that had ruled classicism. Of especial influence were the works of Shakspeare and the poems of Ossian, both translated within twenty years of the Revolution by Letourneur. At the same time, the complete ascendency of logic, lucidity, and common sense, with which, as has been said, the drift of the time was in full accord, was threatened by the sentimentalism of Jean Jacques Rousseau (1712–78), who, in discussions of politics (*Contrat social*) and of education (*Émile*), in fiction (*La Nouvelle Héloïse*) and in autobiography (*Confessions*), exalted the voice of feeling to an authority at least equal to that of reason.

These elements of a new conception of life became effective for literature but slowly. Rousseau exerted the most profound direct influence by the fascinating and brilliant style by which he dazzled not only his own but subsequent generations; and Bernardin de Saint-Pierre (1737–1814) was the first of a long line of disciples who combined, like their master, sentiment and nature (*Paul et Virginie*). The emotional element appeared again, in combination this time with the more democratic conception of society, in the sentimental comedy of common life inaugurated, under English influence, by de la Chaussée in the middle of the century, and defended in theory and practice by Diderot. The influence of the same democratic conception of society may be detected in the realistic tendency of Le Sage's most vital work, *Gil Blas*.

It was not till after the great breaking up of all the old forms of life in the Revolution that conscious and noticeable attempts were made to deduce the literary consequences of the new order of ideas; or, what is the same thing, to create a literature that should adequately reproduce and interpret life from these changed standpoints, and as affected by these new elements that were seen to enter into it. To do this was the task of the romantic school, whose inspiring principle was to bring literature closer to the reality of man and nature—seeing in nature a capacity to influence man emotionally, and regarding man in the concrete as the infinitely various spirit that history shows, and in the abstract as that absolute being assumed by the Revolution, created free and equal, from whose capacities the limitations of unnatural institutions were forever done away by the return to liberty. Chateaubriand (1768–1848) sought in history (*Génie du christianisme*) inspiring examples of the reality and power of those forces of life which classicism had largely ignored; and in the figures created imaginatively out of his own experiences (*René*, *Atala*) he reproduced the boundless aspirations, the unfettered license of desire, thought, and will, which belong to this revolutionary conception of man. Madame de Staël (1766–1817) drew from her own experience somewhat similar figures (*Corinne*, *Delphine*), and performed furthermore the signal service of opening to the French public of letters the strange and stimulating world of German poetry and philosophy. In Lamartine (1790–1869) was opened a fountain of pure poetic feeling of essentially lyric and elegiac quality that had long been sealed in France. But Victor Hugo (1802–85) first successfully formulated the principles of the new movement, declared the total inadequacy of the classical forms, and consciously founded a school. The early volumes of lyrics and dramas (*Odes et Ballades*, 1826; *Orientales*, 1828; *Cromwell*, 1827), in which he strove to render the variety, color, and striking contrasts that he found everywhere in life, he accompanied with prefaces theoretically defending his practice. He met with violent opposition—a sign of the tenacious persistence of the classical tradition—but was supported by an enthusiastic band of devoted followers. The performance of *Hernani* in 1830 has been regarded as the critical moment of the battle of romanticism; and from that time it was dominant. Victor Hugo continued throughout his long life to be true to the general conceptions of life and art that he defended in the prefaces of his first volumes. Of the group of his ardent supporters of 1830, however, most were more loyal to the spirit of the romantic movement than to Hugo's own formulation of it, and soon turned away from a style of representing life that seemed to sin against reality by emphasis and exaggeration. So Alfred de Musset (1810–57), whose impulse came wholly from romanticism, took after 1830 a somewhat reserved attitude toward the school of Hugo. His fervid lyrics are peculiarly his own, the expression of that capacity for passionate and emotional experience which was his great gift. Gautier (1811–72) alone of the better talents of the first enthusiasm remained devoted to Hugo, though he inaugurated a further development of the poetic creed by a special emphasis on form, and became thus the master of a new generation of poets of the second empire, the *Parnassiens*.

In prose the romantic spirit, which had drawn so much of its inspiration from history, signalized itself by creating a brilliant school of historians, Raynouard (1761–1836), Guizot (1787–1874), Augustin Thierry (1795–1856), Mignet (1796–1884), Michelet (1798–1874), and many less illustrious. It also showed kinship with history by compelling almost all fiction for the moment into the historical form, and thus starting the novel on a new phase of development which it has since mainly followed. Of those novelists who had conspicuous success in the years about 1830, Victor Hugo, Alfred de Vigny (1797–1863), Alexandre Dumas (1803–70), Honoré de Balzac (1799–1850), and George Sand (1804–76), only the last, who was consumed by her passionate revolt against society, and absorbed in her attempt to apply the conceptions of revolutionary man to contemporary institutions, failed at least to serve an apprenticeship in the historical novel.

Since 1850 both poetry and prose, in harmony with the growth of the democratic idea and the changed conceptions which the conquests of the physical sciences have produced, have ascribed an increasing value to commonplace persons and events, and to material things. The doctrine of "art for art's sake" of the *Parnassiens* involves the supremacy of the external, material form, and the realistic tendency in the novel, which has continued the movement of romanticism, has more and more sought its criteria of reality in extreme democratic and materialistic conceptions. The novelists who represent the successive phases of the realistic novel, de Balzac, Flaubert, de Goncourt, and Zola, show plainly how literature in the latter half of the century has drawn its interpretation of life more and more from the physical sciences. The method of impassive observation and tabulation of phenomena, which has been such a formidable weapon in the hands of these sciences, is demanded for literature also. Its employment in the fields of historical and literary criticism by Renan and Taine, with more or less rigor according to the temperament of each, has produced the most conspicuous examples of later French criticism.

Since 1885 a tendency is perceptible to demand of poetry again a greater emotional and ideal content, and to insist more strenuously upon the reality and value of the moral and spiritual forces of life. Of this the various confused groups of *décadents* and *symbolistes*, and the more coherent movement, sometimes called "Neo-Christian," are expressions. It seems doubtful whether in most cases this tendency rests upon an intellectual conviction of the truth of the conceptions of life sought, or on a patriotic belief that, were they present, they would be favorable to the perpetuity of the national vigor.

French Lick: post-township of Orange co., Ind. (for location of county, see map of Indiana, ref. 10–D). French Lick Springs, saline and sulphur waters, are some twelve in number, and are situated in a delightful valley, 9 miles from Georgia station on the Ohio and Mississippi Railway. Pop. (1880) 1,701; (1890) 1,869; (1900) 3,237; town (1900) 260.

Frenchman's Bay: an arm of the Atlantic extending 30 miles into Hancock co., Me., with a general width of some 10 miles. Mt. Desert island lies on the west side of its entrance, and Schoodic Point on the east.

French Polish: a solution of 1½ lb. of shell-lac in 1 gal. of alcohol, or 12 oz. of shell-lac, 2 oz. of elemi, 3 oz. of copal in 1 gal. of alcohol.

French Prophets: Protestant enthusiasts, who arose in France, principally after the unfortunate termination of the religious wars in the Cévennes. (See CAMISARDS.) They were originally Huguenots, and were for the most part honest, but the sufferings they had endured under persecution had exalted their minds until they believed themselves directly inspired of God. The earliest traces to be found of such enthusiasts are in Dauphiny and Vivarais as far back as 1688, but they were few in number until the opening of the eighteenth century, when they amounted to many thousands of both sexes. They believed themselves under the immediate influence of the Holy Ghost, went into trances, saw visions, and were by the populace generally treated with superstitious awe and veneration. About 1706 some of their prophets went over into England and Scotland, and rapidly gained converts on British soil. They were even joined by people of some influence. They predicted the speedy establishment of the Messiah's kingdom, and pretended to possess the gift of tongues and the power of working miracles. Their pretensions, however, brought on their overthrow. They had persisted that Dr. Eames, one of their number who had died, could be raised from the dead, and failing in this they speedily declined in influence and numbers. Their actions, however, left a stigma upon all Protestant refugees in Great Britain. See Hughson, *A Copious Account of the French and English Prophets, etc.* (London, 1814); Smedley, *Hist. Ref. Rel. in France*, iii., 253, *seq.*

French Purple: a beautiful dye obtained from lichens. See ARCHIL.

French River: the outlet of Lake Nipissing; in Ontario, Canada; flows into Georgian Bay, Lake Huron; latitude of mouth, 45° 53' N., lon. 81° 5' W. Length, 55 miles. It is a swift stream, the lower course of which looks as if it were cut artificially through the rocky walls. There are many rapids, but the stream is the channel of a considerable fur-trade, forming part of the route by which such as prefer the Ottawa to the St. Lawrence may pass from Montreal to the Red River of the North.—Another French river flows into James's Bay through the estuary of the Abbitibbe river.

French Shore: the western shore of Newfoundland, on which the French have the right to land and cure fish. This right was given by the Treaty of Utrecht (1713), and has discouraged settlements on this coast.

French Spoliation Claims: claims arising from the damages done to American ships and cargoes by the French prior to the convention between the U. S. and France, ratified July 31, 1801. When the U. S. urged these claims, which it then estimated at $20,000,000, France retorted with a counterclaim many times as great for damages resulting from the failure of the U. S. to keep its treaty obligations to that power. The convention of 1801 was a mutual surrender of these claims, the U. S. thus becoming responsible to its citizens for their indemnification. The matter came up repeatedly in Congress, and engaged the attention of some of the ablest statesmen and lawyers, but nothing was done till Jan. 14, 1885, when the House of Representatives passed a measure authorizing claimants to apply by petition to the court of claims, which was to examine and determine the amount and validity of claims thus presented and report the facts found by it to Congress for final action. The bill was approved by President Cleveland Jan. 20, 1885.

French Sudan: See SUDAN.

Frenchtown: borough; on Penn. R. R.; Hunterdon co., N. J. (for location of county, see map of New Jersey, ref. 3–C); beautifully situated on the Delaware river; 32 miles N. W. of Trenton. It has 4 churches, a sash and blind factory, 2 chair-factories, a sawmill, a manufactory of regalia, and a flouring-mill. The principal manufacture, however, is that of spokes and wheels. Pop. (1880) 1,039; (1890) 1,023; (1900) 1,020. EDITOR OF "HUNTERDON INDEPENDENT."

French War IN NORTH AMERICA, known also as the **French and Indian War** and the **Old French War**: the conflict between the English and the French in North America 1755–63. Through the able management of the Marquis of Montcalm the influence of the French was constantly extending its sphere until their line of forts in the Ohio valley, on the Mississippi, on Lake Champlain, and in the region of the Great Lakes threatened to confine the Anglo-American colonists to the strip along the Atlantic coast. The Ohio valley was claimed by both English and French, neither of whom, however, had planted any settlements there, though a few English settlers had penetrated into the valley of the Monongahela. In the latter region occurred the first important engagement. Here Gen. Braddock, in command of a body of English and colonial troops, was defeated and killed in 1755 by a combined force of French and Indians, the latter having been won to the French side in the war by Montcalm's shrewd policy. In the following year England definitely ranged herself with the enemies of France by her alliance with Prussia, and then followed the SEVEN YEARS' WAR (*q. v.*), of which the war in America became a part. In 1756 and 1757 Montcalm was successful, gaining possession of many important strategic points, but with the accession to power of the elder Pitt in England the character of the war changed. Fort Duquesne fell into the hands of the English, who destroyed Fort Frontenac, on Lake Ontario, and possessed themselves of Fort Niagara, Crown Point, and Ticonderoga, driving the French into Canada. The conquest of Canada was next attempted. MAJ.-GEN. WOLFE (*q. v.*) commanded the expedition against Quebec, which resulted in the surrender of the city in 1759, and in the following year the English were in full possession of Canada, which was formally ceded to England by the Peace of Paris in 1763. France, having sold Louisiana to Spain in 1762, ceased to have a share in the colonial interests of North America.
F. M. COLBY.

Freneau, frĕĕ'nō', PHILIP: poet; b. of Huguenot ancestry in New York, Jan. 2, 1752; graduated at Princeton, N. J., in 1771, and while there was the associate of James Madison. He went upon several mercantile voyages to the West Indies, in one of which he was taken prisoner by the British, and suffered much during his consequent imprisonment, as related in his poem *The British Prison-ship* (1781). During the Revolution he produced much prose and verse, chiefly of a burlesque character, which afforded a very effective support to the patriotic cause. He was editor of the *Daily Advertiser*, New York, 1791, and of the *National Gazette* of Philadelphia, 1791–93, and translating clerk for Mr. Jefferson, then Secretary of State. Freneau was a violent Anti-Federalist; edited in 1795 the *Jersey Chronicle*, and in 1797 the *Time Piece*, New York, after which he again became a shipmaster. He published four volumes of poetry and several collections of letters and miscellanies. D. near Freehold, N. J., Dec. 18, 1832. Some of his poems have very considerable merit. Revised by H. A. BEERS.

Frenta'ni: an ancient race of Central Italy, Samnite in blood, but not in name, for they were the allies of Rome in the Samnite wars; lived in a fertile hilly region bounded E. by the Adriatic and S. by the river Tifernus. Long the allies of Rome, they joined (B. C. 90) in the Social war, and probably were enfranchised with the other Italians.

Frère, frār, CHARLES THÉODORE: genre and landscape painter; b. in Paris, June 24, 1815. Pupil of J. Cogniet and Roqueplan; brother of P. Édouard Frère; second-class medal, Salon, 1848, and medal, Salon, 1865. His pictures generally depict Oriental subjects. *Arab Caravansary Resting*. Nancy Museum. W. A. C.

Frere, freer, Sir HENRY BARTLE EDWARD, K. C. B., G. C. S. I., D. C. L.: diplomatist; b. Mar. 29, 1815: educated at the India College, Haileybury; entered the Bengal civil service 1833; became British resident in Scinde 1856; served with distinction during the Indian mutiny; was governor of Bombay 1862–67; sworn a member of the privy council 1873; president of the Royal Geographical Society 1873–74; negotiated the treaty of 1873 with Zanzibar; governor of Cape Colony 1877–80, during Kaffir and Zulu wars. D. at Wimbledon, May 29, 1884.

Frere, JOHN HOOKHAM: diplomatist and author; b. in London, May 21, 1769; educated at Eton and Caius College, Cambridge, where he took his master's degree in 1795; at once entered the Foreign Office; was in Parliament 1796–1802; Under-Secretary of State for Foreign Affairs 1799; became envoy to Portugal 1800; envoy to Spain 1802–04; privy councilor 1804; minister to Spain 1808–09; married the Countess of Erroll 1812; removed to Malta 1821. D. at the Pietà, Malta, Jan. 7, 1846. He was a poet of much merit, and one of the founders of the *Quarterly Review*; author of *King Arthur and his Round Table* (1817, under the pseudonym of "Whistlecraft"); published *Translations of Several Plays of Aristophanes* (1840), one of the best translations of a classical author in the English language; *Theognis Restitutus* (1842); and other writings. See his *Works*, with memoir (1874). Revised by A. GUDEMAN.

Frère, frār, PIERRE ÉDOUARD: genre-painter; b. in Paris, Jan. 10, 1819. Pupil of Paul Delaroche; third-class medals, Salon, 1852, and Paris Exposition, 1855; second-class, Salon, 1852; Legion of Honor 1855. His pictures are somewhat anecdotal in sentiment, but are well painted. He had many pupils and followers at his home in Écouen, and his works are popular on both sides of the Atlantic. Three pictures are in the collection of W. T. Walters, Baltimore; *Exercise* is in the collection of J. J. Astor, New York city. D. at Écouen, France, May 28, 1886. W. A. C.

Frère-Orban, -ōr'bāān', HUBERT JOSEPH WALTHER: Belgian statesman; b. in Liège, Apr. 24, 1812; admitted to the bar 1832. He was a liberal member of the lower house 1847; Minister of Public Works 1847, and in the same year Minister of Finance; began the reform of the corn-laws in Belgium before Sir Robert Peel completed that reform in England; was for the second time Minister of Finance 1848–52, and again 1861–68; head of the cabinet, with the portfolio of Foreign Affairs, 1878–84. His administrations were noted for the increase of state income, the erection of great public buildings, reform of the school system, etc. He was a leader of the liberals. D. in Brussels, Jan. 2, 1896.

Frerichs, frā'richs, FRIEDRICH THEODOR, M. D.: physician; b. at Aurich, Hanover, Mar. 24, 1819; graduated at Göttingen and studied at the leading European capitals; became an exceedingly popular medical lecturer at Göttingen; went in 1851 to Kiel and assumed charge of the hospital; became in 1852 Professor of Pathology and Therapeutics at Breslau and director of the School of Clinical Medicine. He afterward removed to Berlin. His most valuable work is a *Practical Treatise on Diseases of the Liver*, which has been translated into English and French. D. Mar. 14, 1885.

Fréron, frā'rōn', ÉLIE CATHERINE: author; b. at Quimper, France, in 1718; was educated at the Collège Louis-le-Grand, Paris; left the Jesuits, among whom he was a professor, in 1739, for some unknown cause, but still wore the garb of a cleric. Disappointed of a benefice, he entered upon the life of a journalist. His periodical, *Lettres de Mme. la Comtesse de* ——— (1746–49), was suppressed, and soon reappeared as *Lettres sur quelques écrits du temps* (1749–54). His *Année Littéraire* (1754–76) was finally suppressed by his enemies, and he died of chagrin Mar. 10, 1776. He is remembered for his lifelong hostility to Voltaire and the Encyclopédistes, who fully returned his hatred; for his zealous championship of ecclesiastical and monarchical ideas; and as one of the founders of journalistic criticism. His works are mostly criticisms, poems, translations, and papers on subjects of no permanent interest; author of *Histoire de Marie Stuart* (1742) and *Histoire de l'empire d'Allemagne* (1771).—His son, LOUIS STANISLAS (1765–1802), is remembered as a bloodthirsty Jacobin, who became an equally cruel reactionist. He published in 1796 *Mémoires historiques sur la réaction royale et sur les malheurs du Midi*.

Fresco, or **Fresco-painting** [*fresco* is from Ital. *fresco*, adj., fresh, cool, from O. H. Germ. **fresc*, *frisc* (> Mod. Germ. *frisch*, fresh): O. Eng. *fersc*, *fresc* > Eng. *fresh*]: a term somewhat vaguely applied to different methods of mural decoration in colors or in *chiaroscuro*, but which, strictly speaking, belongs only to paintings executed on fresh or moistened plaster. In the so-called *buon fresco*, or true *fresco*, mineral colors, mixed with water or lime-water, are applied directly to the smooth wet face of good lime mortar—the last very thin layer, called the *intonaco*, being of a particularly fine quality—in which case a new chemical combination takes place, and a crystalline surface almost impervious to moisture is formed. The practice of staining walls with colors in this way may be traced even to Egypt and Greece, but it is somewhat doubtful whether it was ever applied to works of high art till toward the end of the fourteenth century. The earliest specimens of *buon fresco* are probably those of Pietro d'Orvieto (continued by Benozzo Gozzoli) in the Campo Santo at Pisa, although Förster credits the evidence that Altichiero and Avanzo had employed this process earlier at Padua. Albert Ilg, in the notes to his translation of Cennini, declares that *buon fresco* was practiced even in the Roman period, and has been practiced occasionally ever since; that it was known in Byzantium; and that the art has been handed down traditionally in the convents of Mt. Athos. However this may be, the works of Giotto and his contemporaries, though always spoken of as frescoes, were not executed in this way. The usual method of painting on plastered walls, in his time, was to allow the plaster to dry thoroughly and then to rewet such portions of it as the artist could cover with color at a single sitting. This is called by later Italians *fresco secco*, or dry fresco. Many suppose that the old Roman frescoes were generally executed in this way, but there is much difference of opinion on the subject. Some of them are certainly in *tempera*, and others in *encaustic*. (For further information as to the methods employed in producing the frescoes of Pompeii and Herculaneum, and for interesting chemical experiments upon these frescoes, see Overbeck's *Pompeii* (second revised ed., 1866), vol. i., ch. iii.) After the beginning of the fifteenth century *buon fresco*, or painting on undried plaster, became the favorite art of the greatest Italian masters, and Masaccio, Mantegna, Demonias, Ghirlandajo, Francia, Perugino, Luini, Fra Bartolommeo, Raphael, Michaelangelo, and Correggio all gloried in it and became glorious through it. The swiftness of execution required by the rapid drying of the mortar, the impossibility of correcting a mistake without removing a portion of the plaster, the vast spaces to be filled, at once demanded and permitted the exercise of the highest artistic faculties; and Michaelangelo went so far as to declare oil-painting to be work for only women and children. One obvious advantage of fresco over oil painting is that from the absence of all gloss of surface the picture may be seen equally well from every point of view; another is its greater durability under the same exposure. The subject to be represented on the wall was first drawn and shaded on paper backed with cloth; this cartoon, as it was called, or a tracing from a portion of it, was then applied to the wall, the outlines were carefully pricked through into the wet plaster and a fine black powder being blown or sifted into the perforated lines, a distinct drawing was left behind. Old cartoons pierced in this way are still extant, and the black dots can be detected in the outlines of many a beautiful old fresco. Careful inspection will also frequently show where the work of one day is joined to that of another, for the mason was obliged to lay the plaster from day to day as the artist covered it. A large proportion of the finest pictures in Italy are frescoes. Those of Giotto may perhaps be best studied at Assisi and Padua—those of Fra Angelico at Florence and Orvieto. The SS. Annunziata at Florence possesses some of Andrea del Sarto's best frescoes—the exquisite Madonna del Sacco and a series of scenes from the life of Philippo Benizzi. The Camera of San Paolo at Parma contains surpassingly beautiful frescoes by Correggio, not to speak of the domes of San Giovanni and of the cathedral, once miracles of this art by the same hand, but now well-nigh ruined by rain and dampness. The Sistine Chapel at Rome is considered by many as Michaelangelo's crowning work, and the Stanze of Raphael, also in the Vatican, are counted among the noblest efforts of that splendid genius.

The objection against frescoes, that they are not movable, is a serious one, but where time can be allowed for the tedious process they may be transferred from the wall to cloth, much in the same way as oil-pictures are removed from wood or from one canvas to another. Small frescoes in exposed places are frequently sawed out of the wall with a sufficient thickness of the plaster to keep them from falling in pieces, and so preserved. This art, though so eminently suited to brilliant architectural decoration, declined after the age of the great masters, and the only modern Italian painters who have acquired even a moderate reputation for fresco are Benvenuti, Appiani, and Cammuccini. (See Kugler's *Handbook of Painting.*) In Germany, however, *fresco secco* has been revived in a novel form through the invention, by Prof. von Fuchs, of a solution of silica called water-glass. Repeated applications of this solution are made to the surface of the best well-dried common mortar, after which it is again allowed to dry thoroughly. The whole surface is then rubbed and polished; after this it is twice rewashed with the water-glass, and once more left to dry completely. Mineral colors, prepared in water, are then applied for the decoration, and the artist can correct or change as freely as if working in oils and on canvas. When the whole is finished the entire surface is carefully sprinkled over with the solution, after which the painting is believed to be secure against atmospheric influences. This kind of fresco is called *stereochrome*, and may be seen in its highest perfection in Munich and Berlin, where Kaulbach, Overbeck, Cornelius, Schnorr, and other great German artists have exerted their best powers. Attempts at fresco-painting in Great Britain and the U. S. (as, for example, in the Parliament House in London and the Capitol at Washington) have been less successful; the same must be said of recent mural painting in France. See Overbeck's *Pompeii* (Leipzig, 1866); also translations by Albert Ilg, of *Cennino Cennini* and *Heraclius*, Nos. 1 and 4 in the series; *Quellenschriften für Kunstgeschichte* (Vienna, 1871–73); also Frederic Crowninshield, *Mural Painting* (Boston, 1887).

Fresenius, frā-zā'ni-oos, Karl Remigius: chemist; b. at Frankfort-on-the-Main, Dec. 28, 1818; studied at Bonn and Giessen, and became Liebig's assistant; entered in 1845 upon a chemical professorship at Wiesbaden; founded the *Zeitschrift für analytische Chemie* in 1862 at Brunswick; author of *Anleitung zur qualitativen Analyse* (1841) and *Anleitung zur quantitaven Analyse* (1846), both works of great value, besides treatises on the various German mineral waters, etc. His principal works are translated into many European languages, and have gone through many editions in Germany. D. in Wiesbaden, June 11. 1897.

Fresnel, frā'nel', Augustin Jean, F. R. S.: physicist and inventor; b. at Broglie, Eure, France, May 10, 1788; was educated at Caen and at the École Polytechnique and the École des Ponts et Chaussées, Paris. He was a Government engineer for eight years in the Vendée, and as a pronounced royalist was placed, during the Hundred Days, under the surveillance of the police. He returned in 1815 to Paris, and his researches on the aberration, diffraction, and polarization of light at once placed him in the front rank of physicists. In 1819 he was appointed, with Arago and Mathieu, as one of the lighthouse commissioners of France; in the same year he gained the prize of the Academy of Sciences for a memoir on the diffraction of light—a work which was crowned in 1819. In 1823 he was unanimously chosen to the Academy. In 1824 he was made secretary of the lighthouse commission, and in the same year his health, always feeble, gave way and he never again was able to work. D. at Ville d'Avray, near Paris, July 14, 1827, and on his deathbed received the Rumford medal of the Royal Society, London.

Fresnel's great life-work was compressed into five years (1819–24). That work, for which commerce, and indeed the whole human race, owes him a debt of gratitude, was the perfecting of the dioptric system of illumination for lighthouses. His system has received comparatively few improvements, and is almost universally employed in lighthouses. See *Lighthouse Illumination* under Lighthouse.

Fresnillo: a city of the state of Zacatecas, Mexico; on the Mexican Central Railroad; 36 miles N. N. W. of Zacatecas city (see map of Mexico, ref. 5–F). It is in a valley surrounded by rugged hills, in which are located some of the richest silver mines of Mexico. The city is well laid out and substantially built, but with little attempt at architectural display. Fresnillo owes its existence to the mines, which were discovered by Francisco Ibarra in 1554. Pop. (1889) 15,000. H. H. S.

Fres'no: city; capital of Fresno co., Cal. (for location of county, see map of California, ref. 9–E); situated on the Southern Pacific Railway; 206 miles S. E. of San Francisco. It is the center of an agricultural district chiefly engaged in sheep-raising, fruit-growing, and the production of wine and raisins. It ships large quantities of wheat and raisins, and has a street railway, gas and electric lights, and an excellent system of water-works and sewers. Pop. (1880) 1,112; (1890) 10,818; (1900) 12,470. Editor of "Expositor."

Freund, froint, Hermann Ernst: Danish sculptor; b. near Bremen, Oct. 15, 1786. In 1793 he was sent to a relative in Copenhagen to continue his apprenticeship as a blacksmith. In the meantime he gave his attention to drawing and modeling, and in 1805 he entered the Art Academy, where he won four medals, and with the large gold medal he also received the usual allowance for a several years' residence abroad. Before starting for Rome in 1817 he exhibited a life-size statue of *Eurydice*. In Rome, where he enjoyed the friendship of Thorwaldsen, he produced a statue of the evangelist *Luke* and a *Mercury*. In 1821 a literary society in Copenhagen published an appeal to Danish sculptors requesting them to render Scandinavian subjects, and rewards were offered for the best productions. Freund exhibited a relief of *Mimer and Balder Consulting the Norns* and some drawings of an *Odin*, and took the premiums. From that time he devoted himself with all his energy to Scandinavian mythology, and in 1827 he produced the celebrated Ragnarok frieze for the Christiansborg Palace. This frieze was partially destroyed by the great fire of 1884, but has since been restored by the Norwegian sculptor Stefan Sinding. D. June 30, 1840. There is a splendid illustrated biography of Freund, written by his son Victor, and edited by H. B. Baumann (Copenhagen, 1883).—Freund's nephew, Georg Christian Freund, b. in Altona, Feb. 7, 1821, is a Danish sculptor of rank, possessing a special talent for representing women and children. His *Little Girl Feeding a Cat* has often been reproduced, and is deservedly popular. Rasmus B. Anderson.

Freund, Wilhelm, Ph. D.: lexicographer; b. of Jewish parents at Kempen, Prussia, Jan. 27, 1806; studied at Breslau and Berlin; has been an instructor in Breslau, Berlin, Hirschberg, London, and Gleiwitz; author of *Wörterbuch der lateinischen Sprache* (4 vols., 1834–45), the basis of Andrews's, William Smith's, and Harpers's Latin dictionaries and of the larger work of Riddle and White; also author of two smaller Latin dictionaries; issued, under the title *Freund's Schüler-Bibliothek*, a series of annotations to the Greek and Latin authors usually read in the German gymnasia.

Frey, frī, or **Freyr**, frīr: in Scandinavian mythology, the brother of Freya and the son of Njörd. He is beloved of all gods and men, and is himself the god of pleasure and fruitfulness. To him Loki gave the ship Skidbladnir, which always had a fair wind, and which, though capacious enough for all the gods, could be folded up and carried in the pocket. He also gave him the swift, golden-bristled boar Gullinbursti, which could traverse air, sea, or land. He is the husband of Gerda, the beautiful daughter of the giant Gymir, for whose love he forfeited his good sword, which the gods sorely needed for their defense. He was especially worshiped in ancient Sweden. See Scandinavian Mythology.

Freya, frī'a, or **Frey'ja** (the beloved): the Scandinavian Venus, called also Vanadis, daughter of Njörd, the air-god, and wife of the god Odur, for whom she perpetually weeps tears of gold. Half the heroes who die in battle belong to her, doubtless because of old the passion of love was so fruitful a cause of wars. Friday (*dies Veneris*) is Freya's day, or, as others say, Frigga's day. See Frigg.

Freycinet, frā'sē'nā', Charles Louis de Saulces, de: civil engineer, inspector-general of mines, member of the Institute, Minister of War of France; b. at Foix, France, Nov. 14, 1828; educated at the Polytechnic School and the

School of Mines; in 1852 engineer of mines of Mont-de-Marsan, at Chartres in 1854, Bordeaux in 1855. In the latter year he was made general manager of the Southern system of railways. He held this position five years, during which time he gave to the service an organization which was imitated by all the other railways of France. From 1862 to 1870 he was sent on several scientific missions, and presented many memoirs to the Academy, including one upon the labor of women and children in factories in Great Britain. In 1870 he was member of the council of Tarn-et-Garonne, and later chief of the military cabinet of Gambetta at Tours. In 1876 elected senator, and in 1877 made Minister of Public Works. This position he retained until 1879, and then became Minister of Foreign Affairs and president of the council, a position which he resigned in 1880. Two years later he was again Minister of Foreign Affairs and president of the council, and has been in the cabinet almost continuously since that time. He was made chief engineer of mines in 1875, and inspector-general in 1883. Officer of the Legion of Honor since 1870. He was made member *libre* of the Academy of Sciences in 1882. Upon the death of Bussy he was invited to become a candidate for the vacancy in the Institute. Nearly all the other candidates withdrew, and he was elected in 1890 and received in 1891. He has written *La Guerre en Province pendant la Siège de Paris* (Paris, 1871), *Principes de l'assainissement des Villes* (1870), etc. W. R. H.

Freytag, frī'ta*k*h, Gustav, Ph. D.: author; b. at Kreuzberg, Prussian Silesia, July 13, 1816; studied at Berlin and Breslau; produced successful plays, tales, and poems; was editor of the Leipzig *Grenzboten* (1848–70); held for some years a court position at Gotha; and from 1879 lived in Wiesbaden. D. there April 30, 1895. Of his numerous works, the best known in the U. S. are *Die Journalisten* (1853); *Soll und Haben* (Debit and Credit; 1855, 37th ed. 1891), of which there are several English translations; *Bilder aus der deutschen Vergangenheit* (1859–67, 18th ed. 1891); and *Die Verlorene Handschrift* (1864, 20th ed. 1891), translated by Mrs. Malcolm under the title *The Lost Manuscript* (3 vols., London, 1865): *Die Ahnen* (1872–80, 6 vols.); *Gesammelte Werke* (1886–88, 22 vols.).

Friar [earlier *frier* < M. Eng. *frere*, from O. Fr. *frere* > Fr. *frère* < Lat. *frater*, brother]: a member of a monastic brotherhood, especially one who belongs to one of the mendicant orders—the Franciscans, Augustinians, Carmelites, and Dominicans. The Dominicans were called *Black* Friars, from their garments, and also *Preaching* Friars. The Franciscans were *Gray* Friars; the Carmelites at one time were called *Barred* Friars, from their striped robes, but in later times they were called *White* Friars. Monks not priests are called friars in Ireland, of whatever order; but after taking priests' orders they lose this distinctive name. The Franciscans are called *Friars Minor*, and there is a small order called *Friars Minims*. (See Minims.) *Crutched* Friars were canons regular of the Holy Cross.

Friar-bird: a local name given to an Australian bird (*Tropidorhynchus corniculatus*) on account of its bare head and neck. Known also as the monk, leather-head, poor soldier, and four o'clock. F. A. L.

Frias, Tomás: statesman; b. in Potosí, Bolivia, Jan. 14, 1805. He entered political life in 1828, held various important diplomatic positions, and was Secretary of State under Velasco (1840). José Ballivian (1841–46), Linares (1858–60), and Morales (1871). After the assassination of Morales (Nov. 25, 1872) he was president *ad interim* until the accession of Adolfo Ballivian in May, 1873, when he was made vice-president. By the death of Ballivian, Feb. 14, 1874, Frias became president, holding the office until 1877. His administration was peaceful and progressive. In 1879 he was minister to France. Frias was one of the greatest statesmen his country has produced, and he has been called the Bolivian Washington. D. in La Paz, Aug., 1884.
Herbert H. Smith.

Frich, frich, Joachim Gyldenkrantz: Norwegian painter; b. in Bergen, July 24, 1810. In 1850 he produced six paintings for Oscarshal in Christiania, and at the National Gallery he is represented by several Norwegian landscapes. He was a pupil of the Norwegian Dahl and the German Rottmann. D. in Christiania, Jan. 29, 1858. R. B. A.

Fricke, Gustav Adolf, D. D.: Lutheran theologian; b. at Leipzig, Aug. 23, 1822; became extraordinary Professor of Theology there 1849; ordinary professor at Kiel 1851, at Leipzig 1867.

Friction [viâ Fr. from Lat. *fric'tio*, rubbing, deriv. of *frica're, fric'tum*, rub]: that force, always acting as a resistance, which is experienced when it is attempted to move one body upon another which is pressed into close contact with it.* Friction is generally supposed to be due to the interlocking of the asperities of the two surfaces, and to abrasion by tearing them off. Friction is of two kinds—sliding friction, which is encountered when one body is forced to slide upon another; and rolling friction, which is that resistance which is met with when it is attempted to cause one body to roll upon another. The friction of a sled upon the ground or of a sleigh upon snow illustrates the first kind. The resistance of a carriage or of a railroad train consists principally of the rolling friction of the wheels upon the road or upon the track, and of the sliding friction of the wheels with their axles. When two bodies are at rest and in contact it requires more force to get up relative motion than to overcome friction after that motion has commenced. The "friction of rest" or "friction of quiescence" is greater than the "friction of motion." This difference is most marked with comparatively soft materials and with great pressures. A slight jar will usually reduce the friction of quiescence of hard smooth surfaces to that of motion.

In order to determine the real expenditure of power in doing work, and to ascertain the efficiency of machines, it is necessary to learn the amount of frictional resistance to be encountered, and to estimate the quantity of work which may be expected to be absorbed by it in each case. It is this force which has most effect in reducing the efficiency of mechanical combinations, and the losses from this cause alone are frequently very serious, amounting to 25 or even 50 per cent.†

The investigation of the laws of friction and the determination of the "coefficient of friction" have employed many of the most distinguished philosophers and engineers. The earliest extended researches were those of Coulomb, made during the latter half of the eighteenth century, and published in 1785.‡ They are given in full in his *Théorie des Machines simples, etc.*, 1821. The investigations of George Rennie, as published in the *Philosophical Transactions of the Royal Society*, in 1829, and those of Gen. Morin, recorded in the *Mémoires de l'Institut* for 1833, were more extended. The latter, which were made under the direction of the French Government, were long accepted as standard. Valuable and still later experiments have been made by Hirn,# by Bochet,‖ by Woodbury and Tower, and some work has been done by the writer.**

In determining the amount of frictional resistance the apparatus used is often, for slight pressures and low speeds, very simple. Fig. 1 represents one of these instruments. A plane, A B, is placed horizontally, and loaded with a weight, W. The plane is then raised at the end A until the weight begins to move.

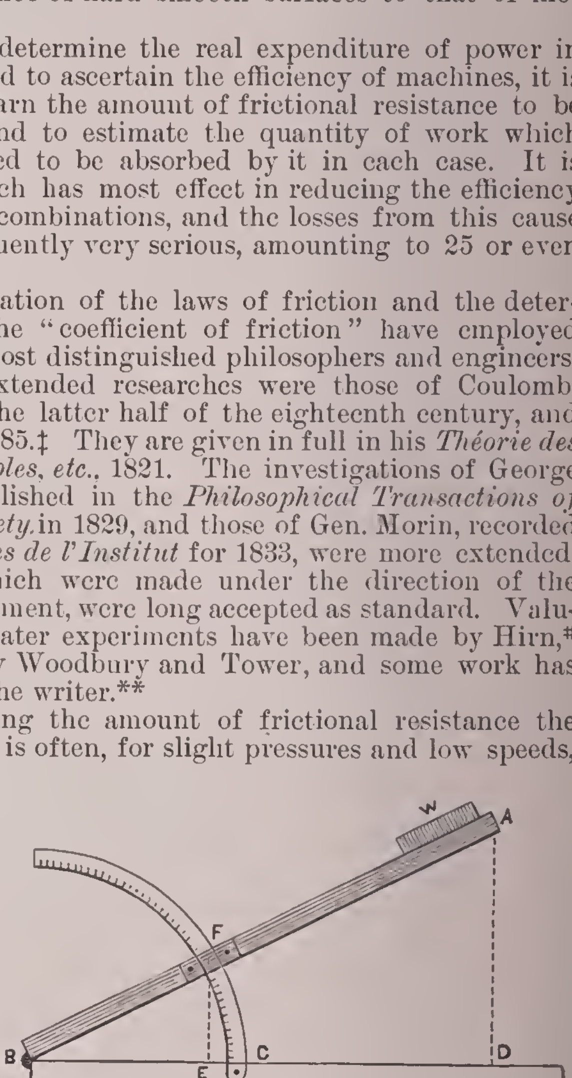

Fig. 1.

The force of friction of rest has then a ratio to that component of the force of gravity producing pressure, which is equal to the ratio of the perpendiculars A D and F E to the bases B D and B E—i. e. the "coefficient" of friction of quiescence is measured by $\frac{W \sin i}{W \cos i} = \frac{F}{P} = \tan i = f$. The angle $FBE = i$ is the "limiting angle of resistance." Similarly the "coefficient of friction of motion" is determined by noting at what angle motion will just commence, and will continue with uniform velocity after having been started by a slight jar.

The "tribometer" of Coulomb is shown in Fig. 2. A

horizontal table, A B, is fitted at one end with a pulley, C. A block, E, slides on this table, and carries a weight, W, of any desired magnitude. The block is drawn along the surface by a suspended weight, D, which is adjusted until just

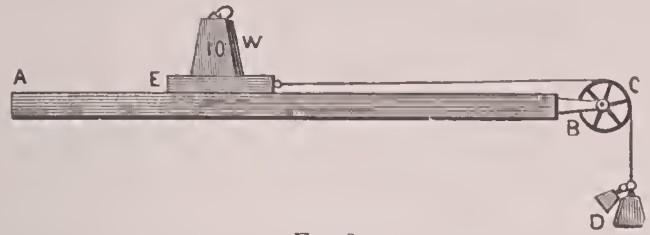

FIG. 2.

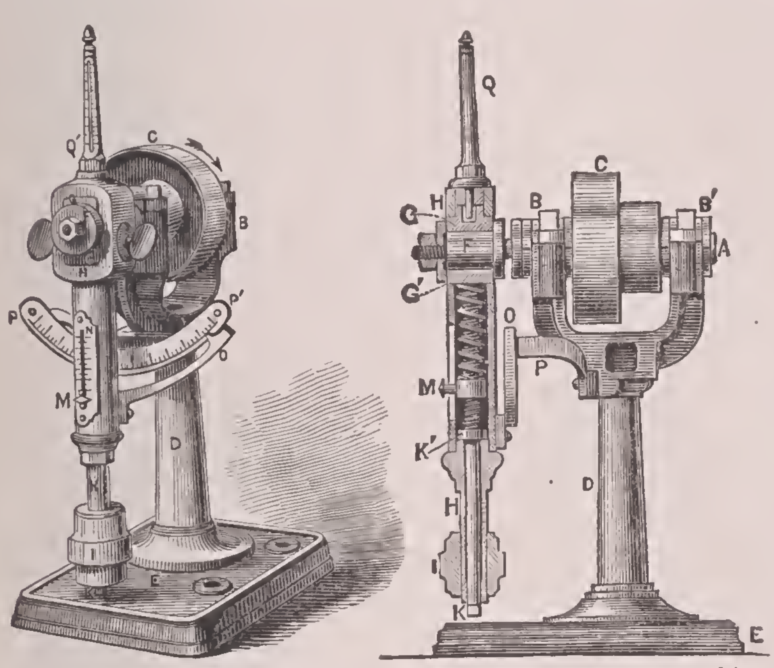
sufficient to produce or to continue motion. The nature of the rubbing surfaces and the amount of pressure upon them are readily changed, and the results obtained are quite reliable for such conditions as here obtain.

In experimental determination of rolling friction, cylinders, or rollers, of various sizes and weights are used in place of, or are placed under, the sliding block.

In ascertaining the friction of axles and of shafts revolving in their journals a shaft capable of being loaded to any required extent and driven at any required speed is used. A thermometer has sometimes been attached to indicate changes of temperature of the lubricant, or any warming of the journal due to the development of heat, into which form of energy the work done in friction is always converted. The first experiments of this character were made at the Brooklyn navy-yard by Messrs. King, Stivers, and Price, a board of U. S. naval engineers.*

A later and more complete apparatus for similar experiments is Thurston's apparatus for testing lubricants, which is shown in Figs. 3 and 4.† A shaft, A, is carried by a pair



FIGS. 3, 4.—Sectional and perspective views of Thurston's machine for testing lubricants.

of journals, B B, and is driven by a pulley, C. At the outer extremity is a third journal, F, grasped by a pair of "brasses," G G, which are caused to exert any required pressure by means of a helical spring, compressed by a screw, K K, working in the supporting nut. The degree of pressure is shown by a pointer, M, traversing the scale, N N. The arm, H, which carries this portion of the instrument is suspended so as to swing about the journal, F, and is loaded by a fixed weight, I. A pointer, O, traversing a graduated arc, P P, indicates the deviation of this loaded arm from the perpendicular, and the resulting moment equal to that exerted by the friction of the shaft in its bearing, F G. The scale, N N, bears two graduations, one of which, as just stated, indicates the pressure on the journal, while the other set of figures have such values that when the reading on the arc, P P, during any experiment is divided by the number on N N opposite that which indicates the pressure on the journal, *the quotient will be the coefficient of friction.* A thermometer, Q Q, the bulb of which is inserted in a cavity in the upper "brass" G, serves to indicate the temperature of the bearing at every instant. Thus coefficients of friction are readily determined for any kind of rubbing surfaces and for any kind of lubricant. The durability of any unguent, its capacity for resisting high temperatures or great pressures, and its general behavior under any conditions of use, may be learned. The relative values of several lubricants are ascertained with facility, testing them under the precise conditions as to pressure, velocity of rubbing, and character of surface to which it is proposed to subject them, and the kind of work to which any one of them is best adapted is indicated by the results of a series of tests under varying conditions.

By experiments made as indicated the following law has been found to exist, but only within certain limits: Frictional resistance is proportional to the force with which the rubbing surfaces are pressed together, and is independent of the extent of those surfaces and of the velocity of rubbing. The law is departed from whenever the surfaces are subjected to such intensity of pressure as to become abraded or otherwise deformed. It is also inaccurate where the surfaces are separated by an unguent, and especially when they are of such great area that the resistance due to viscosity of the lubricant becomes considerable as compared with the resistance of true friction. In this case the resistance varies approximately in proportion to the area of the surfaces in contact. This latter case occurs less frequently than the preceding. Great variations of velocity also cause a modification of the law, the friction becoming slightly less with high speeds.

The resistance due to friction is obtained by multiplying the pressure borne by the surfaces in a direction perpendicular to their planes by the coefficient of friction f. The following are values of f for the most frequently occurring cases, as given by Morin:

No.	Surfaces.	Unguent.	Angle i.	$f = \tan i$.
1	Wood on wood.........	None......	14° to 26½°	0·25 to 0·50
2	" " "	Soap... ..	2° to 11½°	0·04 to 0·20
3	Metal " "	None......	26½° to 31½°	0·50 to 0·60
4	" " "	Water.....	15° to 20°	0·25 to 0·35
5	" " "	Soap......	11½°	0·20
6	Leather on metal......	None......	29½°	0·56
7	" " "	Greased...	13°	0·23
8	" " "	Water.....	20°	0·36
9	" " "	Oil........	8½°	0·15
10	Smoothest and best lubricated surfaces....	....	1¾° to 2°	0·03 to 0·036

The value of f for earth varies from 0·25 for wet clay to 1·10 for gravelly soil; a usual value is 0·50. The coefficient of quiescence very commonly exceeds that of motion about 40 per cent.

The maximum pressure which the more frequently used unguents will bear varies with the speed of the rubbing surfaces, the liability to heat being measured by the product of pressure into velocity—i. e. by the quantity of energy expended in a given time. At a uniform speed of 200 feet per minute, the maximum per square inch, as determined by experiments on new iron shafts, running in loaded bearings, is as follows, when the elevation of temperature of bearing is not above 50° F.:

Winter sperm oil...........	65 lb.	Best mineral oil............	65 lb.
Summer " "	75 "	Light " "	55 "
Winter lard................	55 "	Lightest " "	30 "

At lower speeds and with very hard and smooth surfaces much higher pressures may be allowed. Steel crank-pins for steam-engines are sometimes subjected to a pressure of 1,200 lb. or more per square inch, with a velocity of rubbing of about 50 feet per minute; but this should be regarded as a maximum pressure, and should not be approached when possible to avoid it. Sperm oil, lard oil, and lard or tallow are the best lubricants for use on heavy machinery, either by themselves or dissolved in mineral oils. Lubricants having less "body" are more suitable for light machinery. All of the fixed animal, mineral, and vegetable oils are frequently employed, and plumbago and soapstone are sometimes used.

The temperature at which oils lose their fluidity has some influence upon their value in special cases. Winter lard oil begins to thicken at 40° F., and congeals at 25°. Winter sperm thickens at 48°, and becomes solid at 36°. Summer sperm oil thickens at 66°, and freezes at 56°. Heavy mineral oil thickens at 43°, and solidifies at 20°. Light petroleum thickens at 34°, and freezes at 18°. Very light mineral oil thickens at 18°, but remains liquid at 0° F.

Since both pressure and velocity of motion have an influ-

* *Friction and Lost Work in Machinery and Millwork.*
† *Ibidem.*

ence in determining the value of a lubricant, that which is best adapted for any special case should always be selected after trial under the precise conditions of actual use, both of speed and pressure, whenever possible.

Work lost in overcoming friction gives rise to heat to the amount of one British thermal unit for each 772 or 778 foot-pounds so expended. Where this evolution of heat does not produce overheating of the bearing surface or burning of the unguent, it does no harm. The amount of pressure thrown upon the surfaces exposed to friction should always be carefully kept far below the limit at which heating is liable to occur at the proposed velocity of rubbing.

The diameter of the journal of a revolving shaft is fixed by the consideration of the stress which it has to bear; its length is determined by the magnitude of frictional resistances and the limit of pressure admissible. The following formula was first proposed by the writer in 1862, from observation of and experiment upon the crank-shafts of naval steamers:

$$P=\frac{60{,}000ld}{V},\ \text{or}\ l=\frac{PV}{60{,}000d}. \qquad (1)$$

Rankine in 1865 published the following, as derived from locomotive practice:

$$p=\frac{44{,}800}{60\,V+20}. \qquad (2)$$

In these formulas l represents the minimum length of bearing in inches; d is its diameter, V the velocity of rubbing in feet per minute; p the maximum pressure per square inch of longitudinal section of the bearing, and P the maximum total load on the journal in pounds. Mr. J. D. Van Buren published in 1869 the formula deducible from (1):

$$l=\frac{PN}{350{,}000}, \qquad (3)$$

where P is the total working load on the bearing of a crank-pin in pounds, and N the number of revolutions per minute. Mr. T. Skeel in 1873 gave the following:

$$l=\frac{IHP}{130s}\ \text{to}\ \frac{IHP}{150s} \qquad (4)$$

in which IHP represents the "indicated horse-power" transmitted by the crank-pin, and s is the stroke of piston in inches. All of these formulas will be found useful for plane as well as cylindrical surfaces. These several formulas give different results, but those giving smallest journals represent a limit of safe working; those giving largest bearing surfaces exhibit proportions for safe and conservative practice.

Good practice is generally considered to dictate a limit of pressure as low as 800 lb. per square inch for other metals than steel. With thorough lubrication, which should always be carefully provided, and pressures below the maximum, the kind of metal of which the bearing surfaces are composed does not usually affect, in any appreciable degree, the amount of frictional resistance.

In general, to reduce the amount of power lost in friction, parts should be made as light as possible consistently with proper strength; rubbing surfaces should be given as great an area as possible; the velocity of rubbing and distances moved over should be kept well below the maximum due the pressure; and lubricants should be carefully chosen, and should be supplied to the journals, if practicable, in streams, and collected and filtered for use over and over again. A free supply is the only secret of the remarkably low friction sometimes observed. A common length of journal for shafting, as made by the best builders, is five times the diameter. With ample surface and effective lubrication, wear becomes imperceptible. Heavy weights are often carried on rollers, and wagons and carriages are mounted on wheels, rolling friction being thus substituted for the more serious form of sliding friction. "Friction-wheels" supporting the shafts of grindstones, or as applied in the "Atwood machine," also illustrate this case.

Although, in the operation of machinery and in many other instances, friction is an annoyance and the cause of even very serious losses, it is also frequently very useful. The friction of the driving-wheels of the locomotive upon the track is essential to the useful application of its power. "Friction-gearing," driving by the friction produced by contact and mutual pressures of smooth peripheries, has now many important applications. Nails, screws, and wedges would have no value except for the frictional resistance which retains them in place when once "driven home." The checking of the recoil of ordnance and of the motion of railroad trains is accomplished by "friction-brakes." Even the act of walking becomes impossible when, as upon smooth ice, the foot finds no frictional resistance to its movements.

Rolling friction has been found to be governed by a law which is expressed with approximate accuracy by the formula given by Coulomb,

$$F=f\frac{R}{r}, \qquad (5)$$

in which F represents the resistance, or the required force of traction to overcome it, when R is the load expressed in similar units of force, and r is the radius of the roller on which the load is carried. The coefficient of friction as determined by experiment is represented by f. The experiments of Gen. Morin confirm the deductions of Coulomb, while those of Dupuit and those of Poirée and Sauvage give results in which F varies nearly as the square root of r. The formula above given is generally adopted. Coulomb found the value of f for rollers of elm to be 0·032; Weisbach and De Pambour found the value for railroad car-wheels to be very closely 0·02. The total resistance of railroad trains on level grades and under favorable conditions is usually from 8 to 10 lb. per ton weight of train at all ordinary speeds. For vehicles mounted on wheels the tractive force is $2F$, since the impelling force is applied at the axis and its lever-arm has but one-half the length assumed in the formula. The value of f is subject to great modifications with different surfaces, and by the effect of the load in altering the form of the wheel or the roller, and in indenting and compressing the surface on which it moves.

The frictional resistance of *pulleys* arises in a great degree from the rigidity of their cordage. This was found by Coulomb to be proportional to the tension, to increase nearly as the square root of the cube of the diameter of the rope, and to be inversely proportional to the diameter of the sheaves over which the rope passes or of the cylinder around which the rope winds. Weisbach has shown that this rigidity is due principally to the lateral friction resisting the slipping of the fibers among each other, and that it is less with greased or tarred ropes than with dry cordage; and also that wire ropes offer less of this kind of resistance than ropes of hemp.* Where a rope is wound several times around a cylinder, the resistance increases in a geometrical ratio. It is for this reason that the strongest rope may be broken by the friction produced by a few turns taken about a post, as is sometimes seen in the common practice of seamen "rendering" a line around the "bitts" in checking the motion of a vessel at the wharf.

Fluid friction, so called, is a resistance due to viscosity of the fluid, and to the resistance of the inertia of those particles which are subjected to change of motion. The resistance of well-formed vessels is caused almost entirely by "fluid-friction." The amount of this resistance is given by Rankine † at "1 lb. per square foot of surface moving ten knots" (nautical miles) "per hour." By Isherwood ‡ it is stated to be "0·45 lb. per square foot of surface moving with a velocity of 10 feet per second." This resistance varies directly as the area of surface and nearly as the square of the velocity. R. H. THURSTON.

Friday [M. Eng. *Friday* < O. Eng. *frīgedæg*, *frīgu*, love + *dæg*, day, the personified Frigu being identified with Lat. Venus. Hence *frīgedæg* is trans. of Lat. *Veneris dies* > Fr. *vendredi*, Friday]: the sixth day of the week, following Thursday and preceding Saturday. In the Eastern, Latin, and Anglican Churches all Fridays, except when Christmas falls on a Friday, are days of abstinence, in memory of the passion of our Lord, which is especially commemorated on GOOD FRIDAY (*q. v.*). In the folk-lore of many nations Friday is considered an unlucky day, doubtless on account of the religious associations connected with it.

Friedland: town of Prussia; 27 miles E. of Königsberg (see map of German Empire, ref. 1–K.) Here the allied Russians and Prussians under Bennigsen were defeated by the French under Napoleon, June 14, 1807. This reverse caused the retreat of the Russian general upon Tilsit, where the treaty known as the Treaty of Tilsit was drawn up. Pop. 2,609.

Friedland: town of Bohemia; 68 miles N. of Prague (see map of Austria-Hungary, ref. 3–D). Wallenstein,

* *Zeitschrift für Ingenieur-wesen*, vol. i., 1848; also *Friction and Lost Work in Machinery and Millwork*, chap. ii.

† *Shipbuilding*, p. 81.

‡ *Engineering Precedents*, vol. i., p. 13; see also Thurston's *Manual of the Steam-engine*, vol. ii., chap. i., art. 28.

whose castle is close by, took his title of duke from this town. Pop. (1890) 5,282.

Friedland, Valentin, surnamed Trotzendorf, from his birthplace in Upper Lusatia, Germany: educator; b. Feb. 14, 1490; studied at Leipzig, where he learned the Greek language, and in 1515 became a teacher at Görlitz. His sympathy with Luther drew him to Wittenberg in 1518, and thenceforth he enjoyed the friendship of both Luther and Melanchthon. In 1523 he was called as rector to the gymnasium at Goldberg where he remained for four years. After two years of teaching at Liegnitz and a second visit to Wittenberg, he returned in 1531 to Goldberg, where his enthusiasm and ability gave to the gymnasium a European fame. The students, who at times exceeded a thousand, were admirably drilled and organized on the model of the Roman republic into consuls, senate, censors, etc., with Friedland as the *Dictator perpetuus*. See Pinzger, *Valentin Friedland, genannt Trotzendorf* (1825), and Löschke, *Valentin Trotzendorf* (1856).

Friedländer, freet'len-der, David: Jewish scholar; b. at Königsberg, Prussia, Dec. 6, 1750; became the leader of the Jews in educational and social reforms, and proposed a union of the Jewish with the Christian Church without the Jews acknowledging the Messiah. The ecclesiastical authorities of Prussia rejected the proposal, but the literature occasioned by it is quite extensive. D. in Berlin, Dec. 25, 1834. See Jost, *Geschichte des Judenthums*, etc., iii., 316, *seq.*

Friedrich, Johannes: See the Appendix.

Friend: village; Saline co., Neb. (for location of county, see map of Nebraska, ref. 11–G); on the main line of the Bur. and Mo. Railroad; 38 miles S. W. of Lincoln; in one of the finest agricultural districts in the State. It has 5 churches, a graded high school, 2 large grain elevators, and a very fine creamery. Pop. (1880) 555; (1890) 1,347; (1900) 1,200. Editor of "Telegraph."

Friendly (or **Ton'ga) Islands**: a group of over 150 islands, forming an independent kingdom; situated in the Pacific Ocean between lat. 13° and 25° S. and lon. 172° and 177° W. The smaller ones generally are of coral formation, while the larger ones are of volcanic origin. They have few native animals, but plenty of yams, sweet potatoes, and breadfruits. Collective area, 385 sq. miles. Pop. (1890) 21,750 natives and 250 foreigners. The largest island is Tongatabu (128 sq. miles). Mariner's *Account of the Natives of the Tonga Islands* is a classic.

Friendly Societies: associations which provide for their members relief in sickness and old age, and a small sum at death. The term originally included societies for good fellowship and conviviality, and many existing societies retain traces of the purpose which their name primarily indicates. In one shape or other they have existed from very ancient times; the Chinese have had their burial clubs from time immemorial; they were known to the Greeks under the name of ἔρανοι; and one of the prominent features of the Roman trade-guilds was the provision at the cost of the whole body of members of the customary ceremonial observances at the death of one of them. On certain appointed days in each year its members met to commemorate their departed brethren.

In this simple form of burial clubs, friendly societies respond to a sentiment that has prevailed among all peoples, savage and civilized, in all times. By a kind of instinct mankind has surrounded the disposal of the dead body with an apparatus of ceremony and of lavish expenditure which is frequently in strong contrast with the circumstances in which the life of the deceased was spent. This is thought to be grateful to the feelings of the defunct, and a sort of passport to the spirit-world. These costly obsequies are frequently beyond the means of the surviving relatives, and hence the help of neighbors comes to be offered. The step of making that help a matter of definite contribution is an easy and natural one.

The English race all over the world has developed more than any other the faculty and the practice of free association. These guilds carried on the tradition of mutual assistance for many centuries. They applied it not merely to provision for burial, but to brotherly aid in many other exigencies of life. Twenty such purposes have been enumerated (Walford, p. 7). viz.: relief in poverty, sickness, old age; on loss of sight, of limb, of cattle; on fall of a house; making pilgrimages; in case of loss by fire, floods, robbery, shipwreck; in imprisonment; defending legal action; in deafness, dumbness, leprosy; providing dowries on marriage of females, or on their entering a house of religion; aid in temporary pecuniary difficulties; in obtaining work; and the repair of roads and bridges. By such means the old guilds made provision for almost all the emergencies of life; and they did it after a fashion which is still popular among trades-unions, as well as with many friendly societies, viz., by means of levies. They did not take into account any question of extra risk arising from difference of age, or seek so to apportion their contributions as to create a reserve fund, but met each demand as it arose. They succeeded, however, in accumulating, in one way or other, considerable funds and landed estates. This wealth pointed them out as an easy prey to the spoiler, and long before the Reformation the state had looked greedily on their funds. The religious or superstitious element in their observances gave the pretext for their final extinction. That extinction was virtually so complete that the line of descent from the old guild to the modern friendly society, if it exists, is not easily to be traced. The probability is that the modern friendly society is a new birth. Though it has many features in common with the old guilds, it seems likely that, speaking generally, it grew out of the needs of the people, and owed little or nothing to its predecessors. They had left hardly a tradition behind them.

Here and there are traces of societies which existed during the seventeenth century; but the substantial revival of friendly societies seems to be due in a great degree to the worthy men whom the Revocation of the Edict of Nantes drove to seek refuge in England, and who afforded priceless examples of industry, of frugality, and of providence. Like their religious societies, several of their friendly societies have survived. Some of these are commemorative of the particular place from which the refugees had to flee, as the society of Lintot, which was originally exclusively for those who had been inhabitants of that town; others were formed among the refugees generally, but all have had long and useful careers.

By these and other means the growth of friendly societies had become by 1793 sufficiently obvious to attract the attention of the British legislature, and in that year Sir George Rose succeeded in passing an act for their encouragement and protection. When this statute is looked at in the light of the strange anomalies of the legislation of that day, it will be seen how large and real were the benefits it conferred upon societies. It enabled their trustees fully to protect their funds: it exempted them from all fees to barristers and officers of the courts when they had occasion to seek legal redress; it relieved them of the heavy burden of the stamp duties; it swept away every legal formality that oppressed them. The great number of societies that availed themselves of its provisions shows how wide-spread the movement had already become, and how much the benefits of the new legislation were appreciated. In Middlesex alone nearly 1,000 societies enrolled their rules, and the proportion in other counties was almost as great. The rules adopted were simple in their construction, usually provided for an annual feast, for monthly meetings, for uniform contributions for all members, for levies on the death of a member or member's wife, and for fines and expulsion in case of misbehavior. The justices by whose authority they were enrolled appear to have thought any close scrutiny of their provisions unnecessary, and no scientific adjustment of contributions to benefits was attempted.

The cry very soon arose, that has been taken up and repeated over and over again, and is even now constantly heard, that these societies, which were to put an end to pauperism and enable the workingman to provide for his own old age, were failing to do so, and making things worse instead of better. By 1817 this cry had acquired sufficient volume to call for the appointment of a select committee and upon the report of this committee was drawn up the second organic act relating to friendly societies. It recited the evils which had been found to exist and the necessity of seeing that the contribution of members should be adequate to provide for the risk to be insured. The modern profession of an actuary had but recently been developed, and the framers of the statute relied upon the certificates of two professional actuaries or persons skilled in calculation to insure the result they desired. The justices were to be satisfied as to the qualification of the persons certifying before enrolling a society. Some few societies obtained certificates from the Morgans, the Rainbows, and other great actuaries of that early day, but the majority were launched by local calculators. In one case the justices rejected a certificate for want of qualification in the givers of it; but in general they were not strict. The village schoolmaster was a favorite certifier, as indeed he had the right to be.

Somehow this system broke down; it discouraged the enrollment of friendly societies, and at the same time did not insure the solvency of those which were enrolled, and by the year 1828 the time had arrived for a further inquiry and for a new departure. The act of the tenth year of George IV. omits all reference to the persons skilled in calculation, and allows of a legal constitution being given to friendly societies whether they can satisfy the justices that their schemes are sound or not. It substitutes for the justices as examiners of rules a barrister to be appointed for the purpose, and gives him no discretion in the matter of rates of contribution. The barrister so appointed was Mr. John Tidd Pratt, who held office for forty years, and was a man of great energy and force of character. The part taken by him in the development of friendly societies was important. He was strongly impressed with the necessity of their being established on sound principles, and with this view he circulated many thousands of copies of model rules and rates prepared by actuaries. He was ready to help all who came to him with new ideas, and fertile in suggestions for carrying them into effect. He set his face against the wastefulness of the collecting societies, which he exposed in his periodical reports to Parliament. His views had great weight with the numerous parliamentary committees appointed on the subject.

In the year 1846 his official relation to societies was altered from that of the barrister certifying their rules to that of registrar, having the custody of the rules themselves and of other legal documents relating to the societies. By subsequent legislation the powers of the registrar have been from time to time increased. The act of 1846 contemplated the requirement from every society of a valuation once in every five years of its assets and liabilities; but before a single term of five years had elapsed the act was repealed, and this very necessary requirement was not again made until 1875. It is difficult to measure the loss which the hasty repeal of the excellent enactment of 1846 has inflicted on members of societies.

The requirement of a periodical valuation marks the final stage in the evolution of the modern scientific friendly society out of the old semi-charitable guild or club. If the society is to give to each its due, to be the organ of self-respecting insurance, and not the almoner of a more or less humiliating system of charity; still more, if it is to be worked on such principles of equity that its benefits are not all to be exhausted by the earlier claimants, to the prejudice of those whose claims happen to be longer deferred, it must not only enter upon contracts that are just and equitable in their terms, but it must exercise constant watchfulness over its affairs during the currency of those contracts. What the rates of contribution are that would be just and equitable to assure a given benefit is a question not easy to answer. Large bodies of statistics have been collected and published by the Manchester Unity of Odd Fellows, the Ancient Order of Foresters, the Independent Order of Rechabites, and other bodies, and a still larger collection of facts is being digested by the actuary to the registry office, but no society can be assured beforehand that its experience will in fact correspond with that shown by any of them. The liability to sickness varies with the locality and the occupation of the members, and the claims for sick pay vary still more with the amount of vigilance exercised by the society over the claimants.

The only test by which a society can ascertain whether it is charging just and equitable rates to its members is that of the periodical valuation. Once every five years the position of the society will be measured by the standard of the rates of sickness and mortality assumed in its tables, or, better still, by that afforded by its own experience, and it will be ascertained whether it is losing ground, and to what extent, or whether it has been so fortunate or so well managed and supervised as to have accumulated a surplus. In the one case a levy should be made, or the rates of contribution increased, or the rates of benefit diminished; in the other case the benefits may be increased. Such was the intention of the act of 1846. If it had been fulfilled, societies generally would have become awake to the necessity of more careful management, and much disappointment and loss to individuals would have been averted. In another respect the act of 1846 sought to apply a remedy to a growing evil in friendly societies—that of the insurance of the lives of young children. It forbade any insurance to be effected on the life of a child under six years of age. This prohibition also was removed by the act of 1850. Probably regulation would have been better than absolute prohibition, but the free trade in children's insurance which was permitted by the act of 1850 has certainly been productive of evil.

The act of 1846 is also noteworthy as having included the frugal investment of savings among the objects for which a friendly society might be formed, and thus given occasion for the establishment of what are now known as co-operation societies, for which further special provision was made in 1852. The act of 1850, which repealed that of 1846, and omitted to re-enact some of its more important provisions, is to be remembered as having for the first time recognized the bodies now known as the affiliated orders. They had existed for many years, and had been doing good work; but the mistrust which the legislation of that time felt for societies in correspondence with one another had caused them to be treated as unlawful.

They were indeed obnoxious to two cruel penal acts which are still on the statute book, the Corresponding Societies Act and the Unlawful Assemblies Act; and this had given them the color of secret societies. Their secrets have doubtless always been as harmless as those of Freemasonry, from which indeed they seem to have been derived, but the Freemasons were specially exempted from the operation of these acts. The act of 1850 exempted friendly societies with branches from it also, and enabled them to be registered. The Ancient Order of Foresters was the first to avail itself of the benefits of registry, and was soon followed by the Manchester Unity of Odd Fellows, the Nottingham Ancient Imperial Order of Odd Fellows, and others of the leading affiliated orders.

The act of 1855 enabled the branches of these orders also to become registered as separate bodies, but it was the custom for them to set forth in their rules their relations to and dependence upon the central body of the order. The circumstance of their having a separate existence, however, raised difficult questions between them, and resulted in frequent secessions. The act of 1875 effected a great improvement in this respect. It provided for the recognition of branches as portions of the order under the control of its central body, but recognized a qualified independence by making it an essential characteristic of a branch that it should have a fund or funds administered by itself in addition to the central funds of the order.

To quote a description which has been acknowledged to be correct: "In the most highly organized orders there are three stages: the lodge, by whatever name it may be called; the district, which is an aggregation of lodges; and the order, which unites the whole. The usual arrangement was that the lodges insured sick pay, the districts death money, and the order itself insured nothing." The act of 1875, however, required that every branch should contribute to a central fund administered by the central body of the order, and submit to the control of that body. This has led to the raising, in several of the orders, of a fund for the relief of distressed lodges and districts, so as to avoid their breaking up. The progress of these affiliated orders illustrates how powerless the legislature is to restrain large numbers of the people from entering into contracts that they have learned to regard as to their own advantage. Even the highly penal laws against corresponding societies had become dead letters, so far as regards these perfectly innocent bodies, long before they were in fact repealed. Each successive act of the legislature has been a step further in the direction of recognizing the real relation between these bodies and their branches, while the judicature has emphatically laid down that the contract embodied in their rules is one that must be faithfully adhered to. Societies the very existence of which was considered contrary to the public welfare are now fully recognized.

Taking the most recent and comprehensive information that can be obtained about these bodies, there are in England and Wales belonging to the affiliated orders 16,400 registered branches, having 1,727,809 members and £12,-121,202 funds. Their annual income and expenditure have been estimated as follows: Contributions, £3,024,000; interest and other receipts, £531,000; total, £3,555,000: benefits, £2,681,000; expenses, £449,000; saved on the year, £425,000; total, £3,555,000, as before. Of these registered branches, 11,242 had made returns of their quinquennial valuations, showing in 2,281 cases an aggregate surplus of

£874,679, and in 8,961 cases an aggregate deficiency of £6,716,838. With regard to the independent societies, that is, societies not in connection with any orders, and societies which, though really in connection with some orders, have chosen to retain their separate registry under the act of 1855, and not to become fully registered branches under that of 1875, the following particulars may be given: Number of societies, 10,426; members, 2,133,710; funds, £9,289,361. Annual estimated income and expenditure: Contributions, £1,707,000; interest and other receipts, £410,000; total, £2,117,000: benefits, £1,596,000; expenses, £195,000; saved in the year, £326,000; total, £2,117,000, as before. Of these societies, 3,717 had furnished returns of their valuations, showing in 827 cases a surplus of £658,252, and in 2,890 cases a deficiency of £3,901,435.

While the successive acts from 1793 onward have extended privileges to registered societies, it has never been the policy of the legislature to prohibit the formation of societies outside of the registry acts. There is not and ought not to be anything criminal in a number of persons having a common interest assembling together and endeavoring to aid each other in making provision for the ills of life in their own way. Accordingly, many registered societies exist; how many can not be ascertained, but it was thought by friendly societies commissioners in 1874 that the field of unregistered societies was at least as large as that of the registered. Impatience with the restrictions of the friendly societies acts is a frequent cause of this.

Unwillingness to incur the expenses of valuation is another cause. This is shown by the circumstance that since 1875 the proportion of societies registered under conditions in which the valuation would be dispensed with has been much greater than it was previously. Juvenile societies and societies making a periodical division of funds, from which, as not involving any accumulation of capital to meet future risks, a valuation would not be required, form a considerable proportion of the societies applying for registry.

Other societies which are deterred from registry are those which are established in large industrial works by arrangement between employer and employed, in which the belonging to the society is made a condition of employment, and the contributions are therefore not voluntary, as the act requires. If it were safe to assume that the members of unregistered societies are equal in number to those of the registered societies, the estimate of the extent to which the British workingman has made provision for his future would be amazing. It is estimated that the number of adult male persons of the working class somewhat exceeds 7,000,000. The number of members of registered friendly societies is 3,861,519, besides a further 3,318,942 belonging to the collecting societies, presently to be referred to. Omitting these latter, as largely consisting of women and children, and as being almost exclusively for the assurance of burial money only, and striking off the odd 861,519 as representing the infant and female membership of the ordinary societies as well as the cases in which a member belongs to more than one society, the number of adult male members of registered friendly societies left is 3,000,000.

If to these be added nearly a million members of trades-unions, the majority of whom are assured for friendly society benefits, the practice of making provision for sickness and funeral expenses is spread over an area almost equal to that of the male working class population, and one would almost be justified in asserting that those who do not make such provision are a mere residuum, consisting mainly of persons not in regular employment. The man in steady employment is, it would seem, almost invariably insured to some extent in some society of one class or another.

If the provision made by friendly societies were as comprehensive as that of the old guilds before mentioned, it might be supposed that the workingman was effectually protected against every contingency of life; but that is not so. Few societies make any definite provision against inability to work through old age; but many are prevailed upon by excellent motives of sympathy with their older members to continue sick pay during the whole of life, and thus provide them with what amounts to an old age pension. This well-meant liberality is the most usual cause of the insolvency of societies; for the contributions of the members are rarely more than sufficient to provide for such casual sickness as may arise during their working lives, and the funds rapidly become exhausted when the society attempts to do more than this. On the other hand, there can be few things more deplorable than to see a man who has been an honest and thrifty workman during the active years of his life reduced to seek the workhouse as an asylum in his last days. Probably this does not happen with anything like the frequency that has been asserted, but that it should happen at all is a thing to be prevented. The minds of statesmen and philanthropists in Great Britain have been much directed to the means of preventing it. Numerous schemes of compulsory insurance, of state aid, and of free pensions have been promulgated, and a royal commission of high authority has been appointed to discuss the position of the aged poor, and devise the best means of ameliorating it.

The provident method seems to be the only one by which the problem can be solved; but not the cast-iron system of fixed annuities commencing at a given age. The question should be approached from the side of the worker's real wants, not from that of the theorist. Encourage him to lay by for old age as much as he can spare, after having met the more urgent claims of the present day; commute his savings into a pension when inability to work through old age comes upon him, whether it be early or late; impose upon him no conditions of forfeiture. At present he pays one or one and a half weeks' income to his friendly society; get him to lay aside two weeks' income, and the uncertain provision for old age which he now assures might be placed beyond doubt.

It is urged in favor of some schemes of state aid, or state provision for the aged, that the incomes received by many agricultural and other laborers are insufficient to allow of their making further provision for old age than they do at present; but those who thus argue overlook that, if it be so, state aid would be a gift to the employer and not to the workman. The only form in which state aid could, perhaps, be useful is in the safe keeping of the funds. To subsidize them in any way out of the general taxation would probably be a mischief; but the least harmful form of subsidy would be the grant of a fixed rate of interest, even if it exceeded to a slight extent the current rate paid to the public creditor. This would be a return to the legislation of 1828.

A class of friendly societies remains to be mentioned which differs widely from the others in many respects, viz., the collecting burial societies. Of these there are 39, having 3,318,942 members, an average of 85,101 to each society, the larger number being infants. Their accumulated funds were £2,289,858, or £58,714 for each society, but only 13*s.* 9*d.* per member. Their valuations, however, are favorable: 14 societies had a surplus of £248,388, and 15 societies a deficiency of £116,242. The complaints against these societies are not that they incur the risk of insolvency by charging too little, but that they are conducted on too wasteful a system, that for every shilling that goes to benefit the member another shilling is spent in management. These complaints are to a certain extent met by the observation that the contributions of the members are payable by small weekly installments, and have to be collected from them by an army of officials. These collectors have to be remunerated for their services, and the remuneration must necessarily be large in proportion to the small contributions. If the members could be induced to dispense with their services, the management of these societies would be much more economical; but the members can not be persuaded to act for themselves, or to take any real interest in the working of these societies, and it is thus that the mischief arises. In contrast to the British system, that which prevails in France may be briefly commented on. Friendly societies in France are of three classes: 1. Societies recognized as establishments of public utility; 2, approved societies; 3, authorized societies. The first two classes have many privileges. They are provided by the commune with gratuitous meeting-rooms and books of account, and are exempt from stamp duty. They are allowed 4½ per cent. interest on their funds; receive subventions from the state; and there is a triennial distribution of honors among their most deserving managers. Their members exceed 1,000,000; those of the merely authorized societies exceed 300,000. The income of the three classes of societies together for the year 1890 was £1,170,000; their capital, £6,938,000.

In like manner, in Germany, legislation having for object the universal extension of accident insurance, sickness insurance, and old age insurance, has brought the friendly societies into closer relation with the state than exists in Great Britain, or than the modes of thought of the British people are accustomed to, or disposed to tolerate. In the British colonies of Australasia, New Zealand, Ceylon, and elsewhere, as well as in the Dominion of Canada, friendly societies flourish, and are regulated by legislation based upon that of the mother-country. In these young communities the form of society which has found most favor, and has indeed been almost universally adopted, is that of the affiliated order. As embodiments of thrift and self-reliance, and training-schools in the art of self-government, the development and extension of the friendly society system among English-speaking communities is full of bright promise for the future.

Authorities.—*Friendly Societies and Guilds*, by C. Walford (reprints from his *Insurance Cyclopædia*, 1878); Hardwick's *Manual of Friendly Societies*; Pratt's *Law of Friendly Societies* (11th ed. 1888); *The Friendly Society Movement*, by Rev. J. F. Wilkinson (1886); *Mutual Thrift*, by the same (1891); *Quarterly Review* (April, 1888); *Odd Fellows' Magazine* (*passim*); *Foresters' Miscellany* (*passim*); reports on sickness and mortality in the *Manchester Unity*, by Ratcliffe, and in the *Ancient Order of Foresters* and *Independent Order of Rechabites*, by Neison; reports of chief registrar of friendly societies (1855, *et seq.*); reports of royal commission on friendly societies (1872–74); reports of parliamentary committees (1817, *et seq.*); article, *Friendly Societies*, in *Encyclopædia Britannica* (9th edition); Ansell on friendly societies; Scratchley on friendly societies; account of some remarkable friendly societies, by H. Tompkins.

E. W. Brabrook.

Friendship: village; Allegany co., N. Y. (for location of county, see map of New York, ref. 6–D); on railway; 22 miles N. E. of Olean. It is the seat of Baxter's Musical University, and has five churches, an academy and union school, a foundry, a sash and blind factory, and a cheese-box factory. Principal business, farming and cheese-making. Pop. (1880) 1,134; (1890) 1,369; (1900) 1,214.

Editor of "Register."

Friends of God: a body of religious persons in the fourteenth century who constituted an unorganized brotherhood. Some were laymen, like Nicholas of Basel, their greatest leader; others were monks, like Tauler, the great Dominican mystic. The Friends of God adhered to the Church, but attempted great reforms within it. They were mystics, but intent upon realizing in practical life their ideas of holiness. "He is a perfect man," says John of Chur, "who has become one with God, wanting nothing else but what God will." They were very strict in attending church service, but they gave novel and often fantastic explanations of the religious symbols; and they were unsparing in their denunciations of ecclesiastical abuses. They formed no sect, but attempts were now and then made at organizing local brotherhoods. Thus John of Chur (d. in 1380) retired from the bustle of his native city, built a chapel near the Castle of Rüttberg, in the canton of St. Gall, and was for many years the center of a wide circle of adherents. They also maintained personal and epistolary communication with one another, especially within the same locality. But something vague and obscure always remained hovering about them, their doctrines, and their relations. See Jundt, *Les Amis de Dieu au quatorzième siècle* (Paris, 1879).

Friends, Society of, commonly called **Quakers**: a sect of Christians, distinguished by their belief in the "Light Within," or the immanence of the Holy Spirit, and by a number of "testimonies" springing from that belief.

Foundation.—The revolt from authority and tradition which characterized English religious thought in the seventeenth century is primarily responsible for the rise of a sect whose members called themselves at first the Friends of Truth, and later the Society of Friends. The term Quaker has been erroneously explained on the basis of physical excitement during worship; but Fox says it was Justice Bennett at Derby in 1650 "who was the first that called us Quakers, because I bade him tremble at the word of the Lord." While, as Bancroft says, the rise of this sect "marks the moment when intellectual freedom was claimed unconditionally by the people as an inalienable birthright," and while the historian Lecky has spoken of Quaker doctrine as "that strange form of distorted rationalism," nevertheless the origin of Friends must be connected with the life and teaching of George Fox. His biography is the history of early Quakerism, yet it should be remembered that he did not seek to organize a new sect; he sought simply to proclaim a purification of the Church at large, and a revival of Christianity in its original simplicity and freedom. George Fox was born in Leicestershire, England, 1624, the son of a weaver—"righteous Christopher"—who left him a small property, sufficient for his simple needs during a life of sixty-five years. In his famous journal he has described the stormy time of his early religious experiences, and the steps by which he was led into a mission of peace to his fellows; despite the sneers of Macaulay this book is now regarded as the sincere and eloquent utterance of a profoundly spiritual nature. Humility and power of will have seldom been so remarkably united as in George Fox. A certain dignity and force of character, preserved through manifold imprisonments and persecutions, led the civil authorities to regard him with respect; he was not free from the hysteric and extravagant taint which we meet in nearly all the religious men of his day, but integrity, simplicity of life and conversation, great executive and organizing power, and a certain readiness in all emergencies—"I never saw him," says Penn, "not a match for every service or occasion"—combined to make him a trusted leader of men. The central point of his doctrine is the direct responsibility of each soul to God, without mediation of priest or form, because of the presence of the Holy Spirit in the heart of every human being. "The Lord God opened to me," he says, "by his invisible power how every man was enlightened by the divine light of Christ: I saw it shine through all, and that they who believed in it came out of condemnation into the light of life, and became children of the light; but that they that hated it and did not believe it were condemned by it, though they made a profession of Christ . . ." From this central article of belief radiate the distinguishing doctrines of the society. Because all men share in this light, the Quaker insisted upon tolerance, a virtue then almost unknown, except among the Baptists, and upon the equality of all members of the state, a position which involved the stand against slavery. For the same reason, but in a humbler sphere of "testimonies," he refused to doff his hat to men of rank or place, or to address them with the plural pronoun "you," when, as was the custom, servants and common folk were addressed with "thou" and "thee." To justify this innovation, Fox published in 1660, with the aid of Stubbs and Furley, who provided the necessary scholarship, a book called *The Battledoor*; it showed from the pronouns of a long list of foreign tongues that "thou" and "thee" are the only correct forms for the second person singular. As a specimen of Quaker controversy this rare book is noteworthy enough. For the same reason—immanence of the Divine Spirit—the Quaker avoided forms and written creeds, rejected music and all other aids which art extends to religion, and, since God dwells in the heart and not in wood or stone, built the meeting-house as simply as was possible. A good example of earliest Quaker architecture is the building at Ulverstone, still known as Fox's chapel. For the same reason, moreover, the Quaker proclaimed a baptism of repentance and conviction, instead of baptism by water, and the communion of the spirit rather than the breaking of bread. No intellectual preparation can insure spiritual gifts; Oxford and Cambridge, ran George Fox's quaint saying, could not make a minister; and hence the Quaker's testimony against paid preachers. On the other hand, he created an ecclesiastical democracy, gave women equal rights with men, not only in the ministry, but in the conduct of business, and allowed any member to lift up voice in the meetings for worship, provided that the speaker was truly "moved" by the Spirit. Not the least logical outcome of this central doctrine of the immanence of the Divine Spirit was the silent meeting, "frost of the mouth and thaw of the mind"; in a quiet broken by no human voice each heart could commune with God.

Whatever might be the emphasis which Quakers laid upon this central fact of spiritual guidance, it is quite untrue that they rejected the authority of Scripture. Fox contended not that the Bible was without binding authority, but that it should be read invariably by the light of the Spirit. "I saw," he tells us, "that Christ died for all—was a propitiation for all, and that the manifestation of the spirit of God was given to every man to profit withal. These things I did not see by the help of man, nor by the letter of Scripture; but I saw them in the light of the Lord Jesus Christ and by his immediate spirit and power, as did the holy men of God by whom the Holy Scriptures were written; yet the Holy Scriptures were very precious to me, for I was in that spirit by which they were given forth." Indeed it was the teaching of the Bible which led Fox and his followers to put a literal interpretation upon the command of Christ, "Swear not at all"; and although this refusal to take oaths led them into their chief difficulties with the state, bringing upon them persecutions of the most cruel character, they refused to bate a jot of their testimony, and have been the pioneers of the modern custom of affirmation. Another command—"Thou shalt not kill"—was regarded as putting an absolute ban upon all military service; when Fox was asked to be a captain in the Puritan army, he replied that he was "in love with all men, and could not fight against any." Simplicity was the keynote of Friends' ordinary conduct, plainness of speech, plainness of dress and behavior; the guidance of the Holy Spirit was to lead the Quaker through the minutest details of his life, and would stamp his walk and conversation, so he believed, with the mark of primitive Christianity. In the last resort he must always consult the monitor within. When a convert of gentle rank came to Fox and asked whether he should continue to wear his sword, the founder answered, "Wear it as long as thou canst."

The famous *Apology* of Robert Barclay contains a logical exposition of the doctrines of Friends; but George Fox himself put forth a declaration of belief in a letter addressed in 1671 to the governor of Barbados, which was intended to convince the authorities that the new sect was at one with the Church in regard to fundamental beliefs of Christianity, and had nothing in its doctrines which could prove harmful to the state. This letter, together with the *Apology* and the doctrinal writings of William Penn and others of his time, gives us clear insight into the belief of the founder and his adherents. These early converts or fellows of Fox were drawn from all classes of society; the time was full of religious disintegration, and gentle souls of every sect and standing gathered about the preacher of tolerance, simplicity, and the life of the spirit. Gentlemen, officers in the army, clergymen, shepherds, household servants, tradesmen, all sorts and conditions of men, were allied with Fox. Twice he visited the Continent; spent some time in Scotland, where he converted Col. David Barclay ("Barclay of Ury") and his famous son Robert; and twice journeyed to America, passing two years in what was then almost a wilderness. His early ministrations, which began in 1647, were full of persecution and privation of every sort. He was beaten by a mob and left for dead; abuse of every sort, imprisonment in the loathsome jails of that time, exposure, lack of decent food—all failed to touch his indomitable spirit. That time of persecution was rich in converts. In churches—laymen, as we know, often preached from the pulpits of Puritan England—at market-crosses, up and down the land, George Fox called men of all sects to a life in the spirit and in the simplicity of truth. His preaching was powerful, his fervor intense: "Take thine eyes off me," cried one who disputed with him, "they pierce me so"; and William Penn has borne testimony to the founder's power in supplication: "The most awful living reverent frame I ever felt or beheld was his in prayer." Fox was most successful in the northern counties of England, and soon saw a little army of preachers at his side. Persecution only fed the flame. By 1662 there were over 4,000 Friends in prison at one time; in twenty years 243 are said to have died from cruel treatment. There were other trials. The profligacy of certain Dissenters, the insane and extravagant acts of others—in a few cases, it must be admitted, of Friends themselves—involved in undeserved condemnation a sect which insisted from the start upon simplicity of conduct, rigid morals, and complete obedience to the civil authorities. At one time the lack of coherence in the society combined in such a degree with the persecution from without that there was danger of total destruction. It was here that the dignity, the persuasive power, and the organizing genius of Fox brought order and discipline among his followers, and laid the abiding foundation of the society. To this organization there was considerable resistance, led by Wilkinson, Rogers, Story, and others, who objected to any outward restraint upon the freedom of each soul and its peculiar spiritual guidance. However, the establishment of order took its course. The society had been held together by the sympathy of common aims and common suffering, by the ministers who journeyed from one assembly to another, and by stated general meetings, held four times in the year, where several conventions came together. As early as 1666 Fox established that unit of ecclesiastical order among Friends, the monthly meeting. Regular houses for worship were provided, not without a harmless legal artifice involving tenants and household furniture. In 1672 a yearly meeting was held in London; and in 1675 articles of discipline were communicated to the quarterly meetings. In 1688 violent persecution came to an end, and the society could perfect its organization undisturbed; two years later George Fox died, and Quakerism entered upon its second period of development.

Later History.—The society was not confined to the limits of Great Britain. In 1660 a general epistle mentions "the great work and service of the Lord beyond the seas," in Germany, Italy, Rome, Turkey, Norway, Barbados, and America, where "Friends have passed in the service of the Lord." Nearly £500 was appropriated at this time for such missionary work. A woman Friend was admitted to audience by the "Great Turk," and found courteous treatment; while two others of the same sex met a very different reception at the hands of the Inquisition in Malta. Permanent branches of the society were established in Germany, France, and Norway, where they still exist, although in diminished numbers. Prominent among the Dutch members was Sewel, historian of early Quakerism. In Scotland the body of Friends has never been large, but their numbers in Ireland are still respectable. A small settlement has been made in Australia. But it was North America that became the most important colony of Quakerism. Here, in the New World as in the Old, the history of the society begins with a period of persecution. As early as 1656 two Quaker women came to Boston, were searched for signs of witchcraft, imprisoned, and banished with strict injunctions never to return. Others coming into the colony, laws were passed against this Quaker heresy, with mutilation for offenders, and death for the obstinate. In a few cases zeal carried the Quakers to deplorable lengths of fanaticism; but the cruelty of their persecutors is not to be defended, and the courage of men and women who returned to stripes, to mutilations, and to death is not to be denied. Three men and one woman were hanged; but further severities were checked by a mandate of Charles II., obtained by the influence of English Friends. Many of these, meanwhile, began to seek homes in New York, Rhode Island, and other parts of America. In 1674 Quakers bought Lord Berkeley's interest in the Jerseys; in 1677 they founded the town of Burlington, and soon published the democratic and liberal laws of New Jersey. Their first colonial assembly met in 1681, a body made up for the most part of Quakers; and in the same year Penn obtained from Charles II. the grant of his famous colony. The history of this "Holy Experiment," its successes and failures, must be read elsewhere; enough to note that the influence of Quakerism in the foundation and development of Pennsylvania was distinctly for good.

The first zeal of Quakerism, the power to make converts and extend its borders, ceased with the death of its founder. The absence of persecution may have contributed to this state of affairs. Testimonies hardened into tradition and almost into a ritual. The rigid morals and prevailing integrity of Friends engendered public confidence in their dealings, and since their scruples about an oath excluded them, especially in England, from the universities and from the professions, it was only natural that they should be found chiefly in trade and manufactures. Simplicity and economy in private life enabled many of them to accumulate large fortunes; and the same necessity of restricted household expenditures encouraged them to liberal benefactions. It must be remembered, however, that his simplicity of life and limited outlay of money won for the Quaker another reputation, and often made him play in public esteem the part of a niggard and a worshiper of money. The Quaker in Fielding's *Tom Jones* is an instance, and a later writer than Fielding alludes to the

> . . . broad-brim'd hawker of holy things,
> Whose ear is stuff'd with his cotton, and rings
> Even in dreams to the chink of his pence.

Against these not too generous hints may be placed the undoubted facts of Quaker philanthropy. George Fox indicated many needed reforms. He protested against capital punishment for such offenses as larceny, and heralded the general protest of the society against a death-penalty for crime. He spoke distinctly against the keeping of slaves. In America, Friends began and maintained protest against slavery. In 1688 the Germantown meeting published such a protest. Franklin, in a letter to John Wright, of London, dated Nov. 4, 1787, recalls several occasions where Friends took similar action, notably a meeting held at Philadelphia in 1693; and he mentions books against slavery which he himself printed for the society. John Woolman worked nobly in the cause; by 1776, although a colony like New Jersey counted over 12,000 slaves, in the neighboring meeting of New York to own slaves meant loss of membership. Whittier, himself foremost in the cause, has given an admirable account of this whole matter in the introduction to his edition of John Woolman's *Journal*. Again, in the substitution of arbitration for war Friends have been distinctly prominent; Franklin approved their efforts in this direction (see a speech of his in Bigelow's *Life of Franklin*, iii., 393). Among other Quakers who have been active pioneers in reforms of different kinds are Lancaster in education, Elizabeth Fry among the prisoners, John Bright and W. E. Forster in politics, and Tuke in treatment of the insane. In science there are names like Dalton and Young, while the records of trade and industry would show a long and honorable list of Friends. It may be claimed that the society has influenced public life more than any other religious body of its size.

Schism.—The testimonies of a "peculiar people," the absence of all forms in worship, the principle of birthright membership, and the strict precautions against marriage with those beyond the pale, contributed to stop the growth of the sect. As long as the milder but vexatious phases of social persecution continued Friends were welded into comparative unity; but with prosperity came division and discord. The great division of 1827, which had its center in Philadelphia yearly meeting, worked havoc in the meetings of New York and Baltimore as well, and brought about a permanent separation of Friends in the U. S. The controversy was bitter; it caused disputes about property, broke up old friendships, and led to many social and legal complications, but eventually an excellent feeling between the two branches was created, and some attempts have been made at a permanent reconciliation. It is, however, improbable that a satisfactory basis can be found for corporate union.

The causes of this division are evident. In its very foundation Quakerism had two distinct tendencies. One affirmed independence of the letter of Scripture, and emphasized the right of each soul to follow the guidance of the Spirit. The other tendency—shown in George Fox's letter to the governor of Barbados—was fain to square the belief of Quakerism with the creeds of evangelical Christianity. The separation of 1827–28 was upon these lines. One party, the so-called "Hicksites," protested against unwarranted interference with the liberty of individual belief. The other party, known as "Orthodox," protested against those ministers, notably Elias Hicks, who threw doubt upon the absolute divinity of Christ and the full meaning of the atonement. A total separation ensued, so far as the U. S. were concerned, in the society at large, the Hicksites taking a majority of Friends in the Middle States. In England, where the yearly meeting sided with the "Orthodox" branch of American Quakers, no separation of the sort took place. Another division, however, was made in the U. S. In 1837, J. J. Gurney, an English Friend, was engaged in religious work in New England; John Wilbur, a native preacher, who charged Gurney with unsound, i. e. ultra-evangelical, doctrine, was disowned for his proceedings, and took with him a minority of the yearly meeting, who are now known as "Wilburites."

Organization.—Friends distinguish between meetings for worship and meetings for discipline. In the latter only members of the society may take part. True to the central doctrine of the society, they do not record decisions of a deliberative body by the ordinary course of a majority vote; but the clerk of the meeting, on whom rests the chief responsibility and who is accordingly one of the foremost members, is authorized to take "the sense of the meeting," after opinions have been expressed by individual members. In other words, the meeting is held under the guidance of the Holy Spirit. When unity of sentiment is wanting the question is either deferred or dismissed. In the same way Friends do not undertake to appoint their ministers. A meeting of ministers and elders records its approval of a certain person's "gift" in the ministry, and the person in question is thenceforth a recommended minister. It is customary for meetings to give a minute of unity to such ministers of their body as desire to travel in the service of the gospel. Women have their business meeting separate from that of the men, but with a similar organization and nearly equal jurisdiction. In addition to the clerk of the meeting and the ministers whom it recognizes, there are officers known as elders and overseers. The elders "watch over the spiritual interests of the congregation." The overseers deal with matters of discipline, and special committees are appointed for the management of property. These things touch the society as a whole. Regarding the conduct of individuals, in addition to the duties of the elders to admonish the wayward, the so-called *Queries* deserve notice. These are read at meetings for business, and are answered from the smaller to the larger body, until the yearly meeting gathers the general results. These queries touch the various ways in which Friends' testimonies are maintained. Finally a code, made up of rules adopted from time to time, is printed for the use of meetings generally, and is known as the *Discipline*.

The monthly meeting is the real source of power. A certain amount of business is prepared for it at a meeting of each particular congregation, the preparative meeting. But the monthly meeting controls membership in the society, admits or disowns, regulates marriage, raises money for the needs of the Church, educates orphans and destitute children, cares for the poor, grants certificates to ministers traveling abroad, and deals with all cases involving the morals or business affairs of its members. The quarterly meeting, held four times in the year, embraces several monthly meetings, and is a body of appeal from them. It has a wider supervision, and recommends changes for the action of the yearly meeting. The yearly meeting covers a large district with its various quarterly meetings, and is a body of final appeal. In the U. S. the Orthodox branch has thirteen of these; the Hicksites have seven. The yearly meetings maintain correspondence with one another, but are mutually independent. Each of them appoints a standing committee, the official representation of the yearly meeting itself, to carry the doctrine of Friends into active public service; this is known as the representative meeting, except in Philadelphia, where it goes under the name of the Meeting for Sufferings, since it once found its chief business in attending to the wants of members who were exposed to persecution, to distraint upon property on account of refusal to bear arms, or to the perils of Indian incursions. These needs no longer existing, the meeting now issues publications in regard to temperance, peace, and the like; or else appeals to the Government for the suppression of vice or abuses. It may be called one of the aggressive phases of Quakerism left in an organized form.

Statistics.—By the census of 1890 there were in the U. S. 80,655 members of the Orthodox branch of the society; only one-sixth of these belonged to the older yearly meetings of Philadelphia, New York, New England, and Baltimore. Indiana yearly meeting alone had 22,105 members. In the so-called Hicksite branch there were 21,992. Of minor divisions the so-called Wilburites counted 4,329 and the Primitive Friends 232. The statistical returns of the Society of Friends for 1898, published in Jan., 1899, show that the number connected with it throughout the world was 113,877: in the U. S. 93,699, and in Great Britain and its colonies and on the continent of Europe 20,178. The society included 14 yearly meetings in America, 2 in Great Britain, 5 on the continent of Europe, and 6 in Australasia, with mission stations in every quarter of the globe. The total number of recognized ministers was 1,648. The tables for 1899 gave the total number of Friends at 113,580. The American yearly meetings returned 93,699 members and 1,279 ministers; the yearly meetings of Great Britain 17,153 members. In some meetings there is a paid "pastor," and singing, even instrumental music, has been introduced in public worship.

The society counts a respectable number of periodicals. The Orthodox branch publishes in England *The Friend*, *The British Friend*, and *The Friends' Quarterly Examiner*; in the U. S. *The Friend*, *The Friends' Review*, and *The Christian Worker*. The Hicksite branch publishes in Philadelphia *The Friends' Intelligencer*. Education has received due attention. Ackworth School and the Flounders Institute, an institution for training teachers, are in England. In the U. S. Westtown Boarding-school counts nearly a century of valuable work, while the Friends' School at Providence was founded in 1819. Each is under the care of its yearly meeting. Haverford College, near Philadelphia, was founded by members of the Orthodox branch as early as 1833, and Swarthmore College by the Hicksites in 1870. The latter is for both sexes, Haverford for young men; but Bryn Mawr College, for women, was founded by Dr. Joseph W. Taylor, an Orthodox Friend, and is managed by trustees, who must be members of that body. Wilmington, Earlham, and Penn are Orthodox colleges in the Western States; Guilford College, of the same branch, is in North Carolina.

Bibliography.—The literature of the society is very extensive, particularly for the early days of controversy. A *Catalogue of Friends' Books* was published by John Whiting in 1708; and when this was long out of print, Joseph Smith, of London, prepared *A Descriptive Catalogue of Friends' Books* (2 vols., London, 1867). A supplement was issued in 1893. The list is of books *written by members of the society*; but many works are catalogued which were written against Quakerism, and the bulky work is invaluable to every student of Quaker history. Among the more important books are the *Journal of George Fox* (London, 1694, and often reprinted); *History of the Life of Thomas Ellwood* (1714); Robert Barclay's *Apology for the True Christian Divinity as the Same is held forth and Preached by the People called in scorn Quakers* (in Latin, Amsterdam, 1676; English edition, London, 1678), the standard doctrinal work of Quakerism; William Sewel (of Amsterdam), *History of the Rise, Increase, and Progress of the Christian People called Quakers* (London, 1722); James Bowden, *History of the Society of Friends in America* (London, 2 vols., 1850–54); the various writings of William Penn for older phases, and for modern, those of J. J. Gurney; for the separation in America, Thomas Evans, *Exposition of the Faith of the Society of Friends* (Philadelphia, 1827; the Orthodox view); and *History of the Society of Friends*, by Samuel M. Janney (4 vols., 1859–67): vol. iv. gives an account of the separation, from the Hicksite point of view. Recent popular works are *Quaker Strongholds*, by Caroline Stephen; *The Quakers*, by F. Storrs Turner; and *The Friends*, by William Beck. FRANCIS B. GUMMERE.

Fries, frees, ELIAS MAGNUS: botanist; b. in Sweden, Aug. 15, 1794; became adjunct Professor of Botany at Lund 1819; professor there 1828; received the professorship of Economy at Upsala in 1834, and that of Botany also in 1851; became rector of the university in 1853. He was chiefly distinguished as a student of the mosses, seaweeds, lichens, etc.; author of *Systema Orbis Vegetabilium* (1825); *Corpus Florarum Provincialium Sueciæ* (1835); *Summa Vegetabilium Scandinaviæ* (1846–48), etc. D. Feb. 8, 1878.—His son THEODORE is Professor of Botany at Upsala, and conducted a botanical expedition to Spitzbergen.—Another son, M. E. P. FRIES, is a distinguished student of cryptogamic botany.

Fries, JACOB FRIEDRICH: philosopher; b. at Barby, near Magdeburg, Aug. 23, 1773; was trained in the Moravian seminary of his native place, and then studied at the Universities of Leipzig and Jena; began in 1801 to lecture at Jena, and in 1805, after having traveled in Germany, Switzerland, France, and Italy, was made Professor of Philosophy and Elementary Mathematics at Heidelberg; in 1816 returned to Jena as Professor of Theoretical Philosophy, and, though deposed for political reasons (from 1819–24), he remained there until his death, Aug. 10, 1843. In philosophy he followed the doctrines of Kant, but he believed that his master's method needed perfecting, because it confounded psychological ideas with philosophy properly so called, and does not strictly distinguish the aids that psychology furnishes to metaphysics from metaphysics themselves. By a blending of Jacobian conceptions with the philosophy of Kant, Fries developed the doctrine that the sensible is the object of knowledge, the suprasensible the object of faith (rational faith), and the manifestation or revelation of the suprasensible in the sensible the object of presentiment. He called his system "philosophical anthropology," since he made all further knowledge dependent on man's self-knowledge. Dr. Edwards thus comments upon it: "The philosophy of Fries commends itself in this, that it preserved the formal logical reflection of Kant without sharing in the metaphysical insipidity—yea, emptiness—of the contents of that philosophy." (*Bibliotheca Sacra*, 1850, p. 780.) His most important work is *Neue Kritik der Vernunft* (Heidelberg, 1807; 2d ed. 1828–31). See Henke, *Jakob Friedrich Fries, aus seinem handschriftlichen Nachlasse dargestellt* (Leipzig, 1867, 8vo); Ueberweg, *History of Philosophy* (New York, 1873, ii., 195, 201–203).

Friesen, free'zen, RICHARD, Baron, von: statesman; b. at Thürnesdorf, near Königstein, Saxony, Aug. 9, 1808. He was educated in the royal school of Meissen, the mining-school at Freiberg, and the Universities of Göttingen and Leipzig; entered the services of the Government in 1834. In May, 1849, when the revolution broke out in Dresden, he distinguished himself by his coolness and his firm adherence to the Government, in the midst of the general confusion, taking charge of the Ministry of the Interior; differences between him and the Minister of State, von Beust, caused him to retire in 1852, but in 1859 he was recalled and appointed Minister of Finance; member of the committee which governed the country during the war and the absence of the king 1866; after the war he took charge also of the Ministry of Foreign Affairs; deputy from Saxony to the council of the North German Confederation 1867. In 1870 he favored the formation of the German empire; represented Saxony in the Imperial Diet; president of the Saxon ministry 1871–76. D. Feb. 25, 1884. Author of *Erinnerungen aus meinem Leben* (2 vols., 2d ed. 1881).
Revised by C. H. THURBER.

Friesland, freez'land: province of Holland; bounded N. and W. by the North Sea and the Zuyder Zee and E. and S. by Groningen and Overyssel; area about 1,280 sq. miles; pop. (1895) 338,911. The country is low and level, intersected by canals, and has excellent pastures. Butter and cheese are the main exports; flax and hemp are grown in large quantities. The principal town is Leeuwarden. East Friesland is now the district of Aurich in Hanover.

Frieze [M. Eng. *fryse*: O. Fr. *frise* > Fr. *frise*, from Mediæv. Lat. *frisius* or *pannus frisius*, perhaps liter. Frisian cloth]; a coarse woolen cloth having a shaggy nap upon one side, and once much employed for making cloaks and jackets for laboring men. The Low Countries were a principal seat of the frieze manufacture, and hand-woven friezes of good quality are still manufactured in Ireland.

Frieze [from O. Fr. *frise* > Fr. *frise*: Ital. *fregio* (older *frigio*) < Mediæv. Lat. *phrygium*, *frigium*, *frisium*, appar. liter. Phrygian work. Or the word may be from the same source as *frieze*, a kind of cloth]: in architecture, generally a decorated horizontal band or belt. It is used in a more specific and technical sense to designate the band or member between the architrave and cornice of an entablature of the classic type, whether plain or ornamented. In ancient Greek architecture the frieze was frequently decorated with sculpture and called the *zoöphoros*; the Romans more often adorned it with conventional carved ornaments or grotesque and symbolic forms. The Doric order, as used by both these peoples, had a frieze of alternate metopes and triglyphs; the other orders had no distinguishing type of frieze (see ARCHITECTURE and DORIC ORDER). The metopes were frequently decorated with sculpture in high relief, as in the Parthenon, or with painted ornaments, as is supposed to have been the case on the lateral friezes of the Theseum at Athens. The most celebrated of ancient friezes is, however, the one which, forming no part of an entablature, once surrounded the upper part of the Parthenon cella-wall, immediately under the ceiling of the colonnade, and of which the greater part is now in the British Museum. It represents a religious festival procession in two uninterrupted compositions, 500 feet in total length and about 4 feet wide. One procession seems to move along the south front, the other along the west and north fronts, to the point where they both meet in the east front and where the high ceremony takes place. The figures of deities, priests, worshipers, and horses are treated in low relief with consummate skill, and the whole work is considered one of the masterpieces of the school of Phidias (440 B. C.).

In the Middle Ages decorative friezes were rarely produced, the requirements of Gothic architecture demanding emphasis of vertical rather than of horizontal lines. The Renaissance, however, revived the practices of Roman design, and the decoration of horizontal bands and friezes with carved ornament of the most sumptuous kind, employing classic symbols, arabesques, and acanthus-leaved scrolls or *rinceaux*, was executed with consummate skill.

In interior design the upper part of a wall, more richly decorated than the portion below and separated from it by a molding or architrave, is called the frieze, and in some modern buildings is treated with painted processions or other figure compositions of an allegorical or commemorative character. A. D. F. HAMLIN.

Frieze, HENRY SIMMONS, LL. D.: educator; b. in Boston, Mass., Sept. 15, 1817; graduated at Brown University 1841; instructor there 1841–45, and then at the grammar school of the university till 1854, when he became Professor of the Latin Language and Literature at the University of Michigan. He was an able and popular teacher and an excellent manager of the interests of the university, which were twice intrusted to his care as acting president, 1869–71 and 1880–

81. He caused the privileges of the university to be extended to women, obtained a valuable library of political science, and secured from the Legislature an appropriation of $75,000 for the university. The official connection between the university and the high schools of the State is also due largely to his efforts. D. at Ann Arbor, Mich., Dec. 7, 1889. Besides his valuable annual reports to the board of regents and occasional addresses, he published an edition of Vergil's *Æneid* (1860) and of Quintilian (1867), and wrote *The Story of Giovanni Dupré* (London, 1886).

Frigate Bird, or **Man-of-war Bird**: a bird of the family *Fregatidæ*, order *Steganopodes*, related to the pelicans. They are distinguished by a long, deeply forked tail, narrow, elongate wings, a small pouch under the bill, and a rather stout, straight bill, hooked at the tip. The body is small, the spread of wings 7 to 8 feet, the tarsus relatively the shortest among birds. These birds are remarkable for their powers of flight, and are said to catch flying-fish on the wing. They are most audacious robbers, lying in wait for gannets, fish-hawks, and other birds, and forcing them to drop or disgorge their food, which is seized before it can fall to the water. There are two species, *Fregata aquila*, found throughout tropical waters and common on the coast of Florida, and *F. minor*, confined to portions of the Indian and Pacific Oceans. F. A. LUCAS.

Frigg, or **Frig'ga**: in the Scandinavian mythology, the wife of Odin and the most venerable of goddesses. She dwelt at Fensalir, and was the goddess of marriage and of fruitfulness. Some say that *Friday* was "Frigga's day"; others say that "Freya's day" is intended. See FREYA.

Frigid Zone [*frigid* is from Lat. *fri'gidus*, cold (> Fr. *froid*, cold), deriv. of *frige're*, be cold, deriv. of *frigus*, cold : Gr. *ῥῖγος*, cold]: in geography, the arctic and antarctic regions; the portions of the earth's surface which lie respectively N. of the arctic and S. of the antarctic circle. The north and south frigid zones have each an area of very nearly 8,229,748 sq. miles, and within these zones the sun does not rise and set every day of twenty-four hours. See EARTH.

Frilled Lizard: See CHLAMYDOSAURUS.

Fringe-tree, or **Old Man's Beard**: a beautiful ornamental shrub of the U. S., growing as far N. as Pennsylvania and southward to Florida. It is the *Chionanthus virginica* of the family *Oleaceæ*. Its petals are white and curiously fringed, whence the name. It has an oval purple fruit, and leaves which are extremely variable in shape. Other species are found in Australia and the tropical regions of both hemispheres. A distinct plant, the *Rhus cotinus* of the Old World, is sometimes called fringe-tree, but it is more properly known as smoke-tree or Venetian sumac, and it is also known as wig-tree. Revised by L. H. BAILEY.

Fringil'lidæ [from Mod. Lat. *Fringilla*, one of the genera]: a family of small oscinine birds, characterized by a conical beak, whose cutting edges are bent downward at an angle near the base of the bill. The nostrils are well up in the basal portion of the beak, the primaries are nine, the tail-feathers twelve in number. While the beak is always conical, it varies from the comparatively slight form found in the snow-bunting to the massive bill of the grosbeak and the curious crossed mandibles of the crossbills. The family is one of the most extensive among birds, numbering over 500 species, and including those known as sparrows, finches, buntings, and grosbeaks. The distribution is somewhat peculiar, for the family is not found in the Australian region, although represented elsewhere over the greater portion of the globe. F. A. LUCAS.

Frische Haff, frish'e-haaf' [Low Germ., fresh-water sea]: a lagoon on the coast of Prussia with an area of 318 sq. miles. In ancient days it formed a lake receiving the waters of the Pregel, Frisching, Passarge, and Vistula, and separated from the Baltic by a very narrow band of land, the Frische Nehrung. But in 1510 the Baltic broke through the Nehrung and formed a permanent passage from 10 to 15 feet deep, called the Gatt. Frische Haff is so shallow that all large vessels have to load and unload at Pillau, situated at the Gatt, from which the cargoes are transported over the Haff on lighters.

Frisi, free'sĕe, PAOLO, F. R. S.: scientist; b. at Milan, Italy, Apr. 13, 1728; became a Barnabite monk; held professorships of Philosophy at Casale and the Barnabite College, Milan; became in 1755 Professor of Morals and Metaphysics at Padua; in 1756 Professor of Mathematics in Pisa; and in 1764 took the mathematical professorship at the University of Milan, where he died Nov. 22, 1787. He was profoundly versed in mathematics and physics, and his dogmatic temper involved him in perpetual controversies. His works include a *Disquisitio Mathematica* (1751) upon the physical cause of the earth's figure and motion; *De Atmosphæra cœlestium corporum* (1758); *De Inæqualitate motus planetarum* (1760); *Del modo di regulare i Fiumi e i Torrenti* (1762); and many others.

Frisian (friz'i-an) **Language and Literature** [*Frisian* is deriv. of *Friese*, native of Friesland < O. Eng. *Frisa*, *Fresa*, from O. Fries. *Frise*, *Fresa*]: that branch of the Teutonic group of languages which was formerly spoken in Northwestern Germany—along the coast of the North Sea. Although at present confined to a few small and mostly isolated districts, Frisian may claim to be for a student of English philology one of the most important languages in forming a connecting link between Old English and the Low German dialects.

In earlier times almost the whole of the coast and the islands along the North Sea between the southern boundary of Jutland and the Zwin or Sincfal in West Flanders was occupied by Frisians. At only one point within these limits was the Frisian territory from the very earliest times intersected by a population of non-Frisian origin, the coast at both sides of the mouth of the Elbe having been at an early date occupied by tribes belonging to the Low Saxon group. Curiously enough it is this part of Germany, or more exactly part of this district (viz., Western Holsatia, between Elbe and Eider), from which the main body of the Teutonic conquerors of Britain is said to have come. As far back as Frisian can be traced its geographical area and the number of the Frisian-speaking population have been constantly diminishing, and compared with the original extent the present area is a very small one. But the scantiness of extent and number is in some degree offset both by the considerable difference existing among the modern Frisian dialects and by the evidences left of some of the earlier varieties.

Modern Frisian is to be divided into four groups, viz., Insular Frisian, North Frisian, East Frisian, and West Frisian. There is every reason to believe that the same division existed in the period from which the earliest literary documents date, although Insular Frisian and North Frisian are represented only by recent sources.

INSULAR FRISIAN is limited to the four islands Sylt, Föhr, Amrum, and Heligoland. Formerly the dialects of these islands were considered as forming part of North Frisian—an opinion which holds good so far as Insular Frisian shares with North Frisian certain peculiarities which are not found in either East or West Frisian. But as there are striking similarities between Insular Frisian—in distinction from the other Frisian dialects—and Old English, and as the relationship of Insular Frisian to Old English is apparently of an earlier date than the features which it has in common with North Frisian, it seems advisable (with Möller) to separate Insular from North Frisian in admitting a special insular branch of the Early Frisian or Anglo-Frisian language. This separation is furthermore recommended by the fact that the inhabitants of the four islands and of the Schleswig coast find difficulty in making themselves understood by each other in their own dialect, Low German being preferred for the sake of mutual communication. Insular Frisian is in itself by no means a uniform language. In fact each one of the four islands has its particular dialect, there being, moreover, a marked difference between the eastern and the western part of Föhr, so that five varieties of Insular Frisian may be distinguished. Three of these—viz., the "Amring" and the two "Föhring" dialects—have several points in common with each other and partly also with North Frisian, in which the two others disagree. The differences between "Sildring" and the "Amring-Föhring" dialects are so considerable that both parties have some difficulty in understanding each other, while the idiom of Heligoland takes a kind of an intermediate position between those of Sylt and of Amrum-Föhr. Heligoland has, to a larger extent than the language of the three other islands, submitted to the influence of Low German, its dialect being at present a mixture of Frisian and Low German. Low German has furthermore invaded the eastern part of Föhr, the borough of Wyk, and the villages Nieblum, Boldixum, and Wrixum, being at present entirely or almost entirely Low German. All of the literary sources for Insular Frisian are of a recent date, the earliest document being a translation of the Lord's Prayer into "Amring" printed in 1748. They consist of numerous poems (folk-songs, wedding songs, religious poems, etc.). sayings, anecdotes, fairy tales, brief translations from Modern German, vocabularies, etc. Part of these exist only in manuscript, the MS. collections left by the Amrum minister Mechlenburg and preserved in the municipal library of Hamburg being especially valuable.

North Frisian is spoken along the western coast of Schleswig from the Widau (near Tondern) southward as far as Husum. North Frisian is furthermore found on most of the so-called "Halligen" islands—viz., Hooge, Northmarsh-Langeness, Oland, Groede, Hamburgish Hallig, and Northstrandish Moor. As several of the latter islands are situated as near or even nearer to Amrum and Föhr than to the Schleswig coast, it may seem strange that their dialect agrees with North Frisian instead of Insular Frisian. But this is accounted for by the fact that the "Halligen" formerly belonged to the continent, from which they were detached by floods during the seventeenth century. There are (according to Siebs) seven varieties of North Frisian—viz., the dialects of (1) Hattstedt, (2) Brecklum, (3) the Halligen islands, (4) Ockholm, (5) Karrharde, (6) Moringen, (7) Wiedingharde. This is counting only the chief varieties, minor differences being found in almost each community. The literary sources of North Frisian, resembling in character those of Insular Frisian, are not numerous, and mostly of recent date. With the exception of a short inscription of a baptismal font at Büsum in Holsatia,* dating from the fourteenth or fifteenth century, and several poems from the "Hallige" Northstrand in a MS. from the year 1661, they belong to the second half of the eighteenth century and to the nineteenth century, the earliest print being a wedding song from Bendixen (in the Wiedingharde dialect) from 1749.

East Frisian is at present confined to two small districts in the grand duchy of Oldenburg—viz., to the island of Wangeroog (near the mouth of the Weser) and to the "Saterland," consisting of three parishes in the marshy land (about midway between the Weser and the Ems). Its area, however, was much larger in former times. In the thirteenth century East Frisian extended from the Lauwers (in the Dutch province of Groningen) to the Weser, including the islands opposite the coast, and beyond the Weser the district of Wursten. Fortunately several important literary documents dating from this earlier period are preserved, which enable one to form an adequate idea of the former condition of the East Frisian dialect, and to trace the outlines of its development from the Middle Ages down to the present time. The history of East Frisian, then, is to be divided into two periods, as follows:

(*a*) *Old East Frisian* (down to the end of the fifteenth century).—The oldest manuscript—dating at least from the thirteenth, but more probably from the twelfth or even the eleventh, century—is a small strip of parchment containing a few fragments of an interlinear version of the Psalms. Its dialect is distinctly East Frisian, but does not exactly coincide with that of any other Old East Frisian monument. The rest and by far the more important part of the sources consists of eleven manuscripts from the thirteenth, fourteenth, and fifteenth centuries, containing various collections (or fragments of collections) of Frisian laws. All of these MSS. but one (whose dialect has not yet been identified) have been traced to one of the five following districts: (1) Rüstringer Land, (2) Brokmer Land, (3) Hunsigo, (4) Emsigo, (5) Fivelgo, each of which had its own particular dialect. The language of the Old East Frisian law-books represents the earliest accessible stage in the development not only of East Frisian but of the whole Frisian group, and accordingly is often simply called "Old Frisian." In view of its grammatical condition, it is fully entitled to a name which places it on the same line with "Old High German" and "Old Saxon," although its documents do not precede in date those of Middle High German and Middle Low German. The political isolation of the Frisians and their conservative spirit, especially in regard to their legal institutions, seem to account for the archaic character of the language in which their ancient laws were handed down and codified during the Middle Ages.

(*b*) *Modern East Frisian* (from about 1500 to the present time).—From the end of the fifteenth century East Frisian in literary and oral use has been gradually superseded by Low German. The language which at present usually goes under the name of East Frisian (viz., the idiom of the Prussian province of East Friesland) is not a Frisian, but a Low German (Saxon) dialect. Frisian yielded to Low German in different districts at different times—e. g. in the district of Jever earlier than in that of Wursten, where Frisian did not die out before about the middle of the eighteenth century. Frisian was still alive in the district of Wursten, in 1688, when Luderus Westing, minister at Wremen, made a list of about 780 High German words, with their interpretation in Frisian. A similar vocabulary, and partly based on the same list of German words as that used by Westing, was filled out in 1691 by the minister Johann Cadovius-Müller at Stedesdorf in the Harlinger Land, who in an appendix added some specimens of Frisian texts, and called his collections *Memoriale linguæ Frisicæ*. Both of these lists furnish valuable materials for the more recent history of the East Frisian language. The former is especially important, as the Wursten dialect appears to be an immediate descendant of the same variety of Frisian which is found in the Old Frisian laws of Rüstringer Land. The dialect of the Harlinger Land, as recorded by Cadovius-Müller, is closely related to the Modern Frisian dialect of the island of Wangeroog. The latter, as well as the dialects of Wursten and Rüstringer Land, belongs to the *Weser* division of East Frisian, while the remnants of Frisian found in the Saterland—which probably descended from the Old Frisian dialect of the Emsigo—belong to the *Ems* division. Both varieties are at present gradually dying out, the remnants of East Frisian in Wangeroog and in the Saterland becoming more and more displaced by Low German.

West Frisian was originally found along the whole coast of the Netherlands and Belgium between the Lauwers (in the province of Groningen) and the Sincfal (in West Flanders). Part of their territory, however, was at an early date occupied by the neighboring Low German dialects. Low Saxon advancing from the east and Low Frankish from the south and west. At the time of the earliest literary sources pure Frisian was confined to the district between the Lauwers and the Flie, and at present it is preserved only in the Dutch province of Friesland and on the islands Schiermonnikoog and Terschelling. (See Dutch Language, where the boundaries between Frisian, Frankish, and Saxon are indicated.) Its literary documents admit of a division of the history of West Frisian into two periods.

(*a*) *Early West Frisian* (the West Frisian language of the fifteenth and sixteenth centuries).—The chief sources of the earlier West Frisian dialect consist of law-books, similar to those in East Frisian, but of a more recent date. They are contained in two manuscripts (the so-called *Jus municipale Frisonum*, from the year 1464, and the *Manuscriptum Roorda*, from the end of the fifteenth century), and in an early print, which is supposed to have been published either at Cologne or at Aanjum between the years 1460 and 1488. Another source of Early West Frisian consists of charters, deeds, and contracts from the fifteenth century and the first half of the sixteenth (the latest being from the year 1541). The language of these legal documents was in the fifteenth century already encroached upon by Low Frankish (i. e. Dutch) and Low Saxon, Frisian becoming during the sixteenth century more and more confined to private documents, and being entirely dropped in legal use after the middle of the sixteenth century.

(*b*) *Modern West Frisian* (from the beginning of the seventeenth century).—There are four distinct varieties of modern West Frisian spoken, viz.: 1. The dialect of Hindeloopen in the southwest corner of Friesland, where Frisian is preserved in an earlier form than in the other districts. 2. The dialects of the other districts of the province of Friesland, which constitute the main body of modern West Frisian. It is these dialects that generally are comprehended under the name of "Peasant-Frisian" (*Boerefriesch*), or "Country-Frisian" (*Landfriesch*). Several local varieties of continental West Frisian are found, but the differences are on the whole very slight. 3. The dialect of the island of Schiermonnikoog, preserved in the eastern and the western part of the island, while in the central part (in the village of Midsland) Dutch is spoken. 4. The dialect of the island of Terschelling. As to the dialects of the towns Leeuwarden, Bolsward, Sneek, Harlingen, Franeker, Dokkum, and of "Het Bildt" (the district along the northwestern coast of the province of Friesland), the

* The inscription—a survival of the former Frisian dialect of the "Hallige" Pellworm—is: *Disse hirren döpe de have wi thön ewigen ohntoncken mage lete, da shöllen össe berrne in kressent warde* (i. e. This brazen basin we have caused to be made for an eternal memory; therein our children shall be baptized).

name of "Platt-Frisian" (i. e. "Plattdeutsch"-Frisian, Low German Frisian), or "Town-Frisian" (*Sladfriesch*), is generally assigned; it ought to be said that the "Town-Frisian" is not to be counted among Frisian, the idiom of the towns in question being a Low Saxon dialect, which replaced the former Frisian language and kept only a comparatively small number of Frisian words and peculiarities. Similar to the idiom of the Frisian towns is that of the island of Ameland, where Frisian was still found in the year 1786. Modern West Frisian has been used and is being used for literary purposes to a greater extent than any other living Frisian dialect, the literary documents of Modern West Frisian commencing with the beginning of the seventeenth century, and the literary production being carried on both in poetry and in prose. Among the better known of the earlier works belong the *Friesche rijmlerije*, by the great Frisian poet Gijsbert Japicx (1668), and the story *It libben fen Aagtje Ijsbrants, of dy frieske boerinne*, by Eelke Meinderts (1779). Of favorite authors of modern times there should at least be mentioned the brothers J. H. and E. Halbertsma (the ardent and successful advocates of Frisian language and nationality), Waling Dijkstra (the most prolific and popular Frisian author), T. G. van der Meulen, and P. J. Troelstra. The interest taken among the West Frisians in the study of earlier and in the conservation of modern Frisian is also manifested by the foundation in 1829 of the *Friesch Genootschap* (i. e. Frisian Association), and in 1844 of the *Selskip for Fryske tael-en skriftenkennisse* (i. e. Society for the Study of Frisian Language and Literature).

References.—On Frisian and its dialects in general, see Johan Winkler, *Over de taal en de tongvallen der Friesen* (Leeuwarden, 1868); the same author's *Algemeen Nederduitsch en Friesch dialeclicon* (2 vols., The Hague, 1874; with specimens of the modern Frisian dialects); Hewett, *The Frisian Language and Literature* (Ithaca, 1879); Siebs, *Zur Geschichte der Englisch-Friesischen Sprache I.* (Halle, 1889; with a full bibliographical list of books for the study of Frisian and of Frisian texts); and the same author's *Geschichte der Friesischen Sprache* in Paul's *Grundriss der german. Philologie*, vol. i., p. 723, *sqq.* (Strassburg, 1891). Specimens of Frisian dialects are also found in Firmenich's *Germanien's Völkerstimmen* (Berlin, 1843–68); and Leopold's *Van de Schelde tot de Weichsel* (Groningen, 1882). A comparative Frisian grammar was long ago proposed by Prof. H. Möller, of Copenhagen, who, however, has since been engaged upon other work. Siebs's *Englisch-Friesische Sprache* attempts to combine a comparative treatment of the Frisian dialects with the reconstruction of the Anglo-Frisian language; its first volume contains, besides an introduction and a bibliography, only the vowels of the stem-syllables. A chapter of especial interest for Anglo-Saxon grammar, viz., that of the Frisian palatal consonants, was studied by Möller, *Die Palatalreihe der indogerm. Grundsprache im Germanischen* (Leipzig, 1875), and Siebs, *Die Assibilierung der Friesischen Palatalen* (Tübingen, 1887). On Frisian literature in general, see especially Th. Siebs in Paul's *Grundriss* (vol. ii., pt. 1, p. 494, *sqq.*, 1893).

Insular Frisian and North Frisian.—As regards the separation of Insular from the North Frisian, the theory of Möller's, referred to in the text, is found in his book *Das Altenglische Volksepos* (Kiel, 1883, p. 85). Compare the valuable essay by Bremer, *Einleitung zu einer Amringisch-Föhringischen Sprachlehre*, in the *Jahrbuch* of the Low German Dialect Society, vol. xiii. (Norden and Leipzig, 1887, p. 1, *sqq.*). On single dialects, see Johansen, *Die Nordfriesische Sprache, nach der Föhringer und Amrumer Mundart* (Kiel, 1862), and Bendsen, *Die Nordfriesische Sprache nach der Moringer Mundart* (Leyden, 1860).

East Frisian. (*a*) *Old East Frisian.*—The fragments of the Old Frisian translation of the Psalms were published by J. H. Gallée in the *Zeitschrift für deutsches Altertum*, vol. xxxii. (1888, p. 417). The best collection of the Old Frisian law-books is that by von Richthofen, *Friesische Rechtsquellen* (Berlin, 1840), to which von Richthofen added a complete dictionary (*Altfriesisches Wörterbuch*, Göttingen, 1840). Von Richthofen's works created a reliable foundation for the study of the Old Frisian language, and rendered the former Old Frisian grammars by J. Grimm (in his *Deutsche Grammatik*) and by Rask (Copenhagen, 1825) rather antiquated. A brief sketch of Old Frisian phonology and inflexion was then given by M. Heyne in his *Kurze Laut- und Flexionslehre der altgerm. Dialekte* (Paderborn, 1862; 4th ed. 1881). A recent and exhaustive treatment of the same subject is Van Helten's admirable *Allostfriesische Grammatik* (Leeuwarden, 1890). Compare also, especially for the Rüstringer dialect, Siebs's *Geschichte der Fries. Sprache* (mentioned above).

(*b*) *Modern East Frisian.*—Cadovius-Müller's *Memoriale linguæ Frisicæ* was edited by Kükelhan (Leer, 1875), and Westing's *Vocabulary*, by Bremer, in Paul and Braune's *Beiträge*, vol. xiii. (Halle, 1888, p. 530, *sqq.*). For the present East Frisian dialect, see especially the essays by Ehrentraut and Minssen in the former's *Friesisches Archiv* (vols. i., ii., Oldenburg, 1847–54).

West Frisian. (*a*) *Early West Frisian.*—Some of the West Frisian law-books are printed in von Richthofen's *Altfries. Rechtsquellen* (quoted above under East Frisian) and in M. de Haan Hettema's *Jurisprudentia Frisica* (Leeuwarden, 1834–35). For charters and deeds, see E. Epkema's *Verzameling van vroegere charters, meest in den oudfrieschen longval*, in Visser and Amersfoordt's *Archief* (3 vols., Leeuwarden, 1824–28). Compare M. de Haan Hettema's *Idioticum Frisicum* (Leeuwarden, 1874).

(*b*) *Modern West Frisian.*—Selections from Frisian works of the seventeenth, eighteenth, and the nineteenth centuries are found in the second and third volumes of F. Buitenrust Hettema's *Bloemlezing uit oud-, middel-, en nieuwfriesche geschriften* (Leyden, 1887–90). Reprints of Gijsbert Japicx's *Friesche rijmlerije* were published by E. Epkema (Leeuwarden, 1821–24, with a comprehensive dictionary) and by W. Dijkstra (Franeker, 1853). The latter also reprinted the *Libben fen Aagtje Ijsbrants* (Leeuwarden, 1861). For the works of the two Halbertsma, W. Dijkstra, Van der Meulen, and other modern Frisian authors, see the bibliography in Siebs's *Englisch-Friesische Sprache* (p. 368, *sqq.*), and the same author's sketch of the history of Frisian literature in Paul's *Grundriss* (vol. ii., pt. 1). Compare G. Colmjon's *Beknopte friesche spraakkunst voor den tegenwoordigen tijd* (Leeuwarden, 1863; 2d ed. by van Blom, 1889); J. H. Halbertsma, *Over de uitspraak van het landfriesch* (in Taalgids, vol. ix., p. 1, *sqq.*); and the books on Dutch dialects quoted in the article Dutch Language.

Hermann Collitz.

Frisians: the race that inhabits a territory lying along the German Ocean between the Scheldt and Weser, which includes the modern divisions of Friesland in Holland and Aurich in Hanover. Their history goes back to very early times. Between 28 and 57 A. D. they came in conflict with the Romans, but were only nominally subjugated. They probably aided their neighbors, the Angles and Saxons, in the conquest of England and Scotland. Wilfrid of York established the first successful mission among them in 677–78. Charlemagne absorbed their territory in his empire. The three divisions of the country, Western, Middle, and Eastern Frisia, passed through many political vicissitudes, but in the last a confederate form of independent republican government was long maintained. In modern times the people have not asserted themselves politically, but have been peacefully united with adjoining nationalities. C. H. T.

Frith, William Powell: genre-painter; b. in Studley, near Ripon, England, in 1819; pupil of Royal Academy, London; Royal Academician 1853; second-class medal, Paris Exposition, 1855; Legion of Honor 1878; member of Vienna, Antwerp, Swedish, and Belgian academies. *Derby Day* (1858), *Railway Station* (1862), and *Marriage of the Prince of Wales* (1865) are among his most important works. They are crowded with figures, and detail is carefully painted, but his compositions lack harmony of color, and his figures are not very well drawn. His works are very popular, and many of them have been engraved. Studio in London. W. A. C.

Frit'illary [from Mod. Lat. *fritilla'ria*, fritillary, deriv. of Lat. *fritil'lus*, dice-box, so called from the dice-like marks on the petals]: the *Fritillaria maleagris* of Europe, a liliaceous plant common in cultivation. The flower is spotted with purple, red, and yellow; hence it is often called checkered lily. Many varieties are grown in gardens. The crown imperial (*Fritillaria imperialis*) is a fine showy flower of Persian origin. There are some twenty species.

Fritsch, Johann: neurologist; b. at Tepl, Bohemia, Feb. 10, 1849; graduated at the gymnasium at Eger; studied medicine at the University of Vienna, and became Privatdocent of Psychiatry there. He is Landesgerichts Artzt in Vienna, editor of *Das Jahrbuch für Psychiatrie*, and has written *Ueber die primäre Verrücktheit* (1879); *Ueber die*

Verwirrtheit (1880); *Für Differentialdiagnose der Melancholie* (1879); *Erfahrungen über Simulation geistiger Störung* (1890), etc.

Fritschel, frit'shel, Gottfried. D. D.: Lutheran theologian; b. in Nuremberg, Germany, Dec. 19, 1836. Studied at Neuendettelsau and Erlangen; was Professor of Theology, St. Sebald, Iowa, and Mendota, Ill., from 1857 to his death, July 13, 1889. Published in German a history of missions among the North American Indians, a volume of Passion sermons, and was a prolific writer of review articles, bearing especially on the predestinarian and other controversies in the Lutheran Church of America.

Fritschel, Sigismund, D. D.: Lutheran theologian: b. in Nuremberg, Germany, Dec. 2, 1833; studied at Neuendettelsau; professor in Theological Seminary of German Synod of Iowa since its foundation in 1854. He is eminent as a debater and a writer of review articles. Editor, with his brother, for many years of the *Kirchliche Zeitschrift.*

Fritz, Samuel: Jesuit missionary; b. in Bohemia, 1653 He was sent to Peru, entered the Mainas missions of the upper Amazon in 1686, and in 1689 descended the river to Pará, where he was imprisoned by the Portuguese governor for two years; he then returned to Lima, and in 1693 resumed his labors on the Amazon. The Omaguas missions were founded by him, and he established thirty-nine Christian villages. Father Fritz explored the whole of the Amazon and many of its tributaries, and made the first reasonably good map of the river-system; this was first published at Quito in 1707, and was long the authority for this region. Died at the Jeberos mission, near Laguna, Peru, Mar. 20, 1728.

Herbert H. Smith.

Fritzsche, frit'she, Christian Friedrich: theologian; b. at Nauendorf, Germany, Aug. 17, 1776; was educated at Francke's orphan asylum and at Leipzig; became a Lutheran divine, and in 1830 Professor of Theology at Halle. In his latter years he was rationalistical. Author of *Vorlesungen über den Abendmahl*; *De anamartesia Jesu Christi* (1835–37); *De Revelationis Notione* (1828); was one of the authors of the *Fritzschiorum opuscula academica* (1838); and *Nova opuscula* (1846). D. at Zurich, Oct. 19, 1850.—His sons, Franz Volkmar (see below), Karl Friedrich August (1801–46), Otto Fridolin (b. 1812), and Adolf Theodor Hermann (1818–78), are or were all university professors and authors of learned works, mostly upon topics connected with Latin and Greek literature or the writings of the early Christian period.

Fritzsche, Franz Volkmar: Greek philologist and editor: son of the learned theologian C. F. Fritzsche; b. at Steinbach, in Saxony, Jan. 26, 1806; studied philology at the University of Leipzig under Beck and Hermann; held the position of assistant teacher (collaborator) for some years in the Thomas school in Leipzig, and was called thence to the professorship of Eloquence and Poetry in Rostock 1828. His earliest literary labors were connected with the style and writings of Lucian (Leipzig, 1826, 1828), some of whose dialogues he edited (*Dialogi Deorum*, Leipzig, 1829). He subsequently devoted his attention to the Greek theater and the Greek dramatists, especially the comedians. Besides the *Quæstiones Aristophaneæ* (Leipzig, 1835) and *De Dætalensibus atque de Babyloniis* (Leipzig, 1831), he edited, with a copious commentary, the *Thesmophoriazusæ* of Aristophanes (Leipzig, 1838), and the *Ranæ* (Zurich, 1845). In defense of his old teacher, Hermann, against Otfried Müller, Fritzsche published a *Recension des Buches Æschylos Eumeniden von K. O. Müller* (Leipzig, 1834), to which was added a second part, 1835. Revised by Alfred Gudeman.

Friuli, frē-oo'lē [Ital. (whence the Germ. name *Friaul*) < Lat. *Forum Julii*, liter. market-place of Julius]: the name of a territory along the northern and northeastern Adriatic, which in the Middle Ages formed an independent duchy, but which is now divided into the province of Udine, belonging to Italy, and the district of Görz-Gradiska, belonging to Austria. The Friulians speak a Roman dialect (the Friulian) containing Celtic elements. The country is beautiful, exceedingly fertile, and favored with a mild and healthful climate.

Frizell, Joseph Palmer: civil engineer; b. Mar. 13, 1832, at Barford, Quebec; prepared himself for the profession of civil engineering; engaged in the construction of fortifications on the Gulf coast in the civil war in the U. S.; since employed in the public service, the improvement of rivers and harbors, especially in charge of the system of reservoirs on the head waters of the Mississippi; chief engineer of the board of public works of Austin, Texas, 1890; member of the American Society of Civil Engineers since 1883.

Fro'ben, Johann (*Frobenius*): a learned printer; b. at Hammelburg, in Franconia, in 1460. He received his education at the University of Basel, then served as corrector under Amerbach and Petri until 1491, when he established his own printing-office in Basel. His first publication was a Latin Bible, and he is said to have been the first, or among the first, to introduce into Germany the use of Roman letters. Froben was a warm friend of Erasmus, and the publisher of many of his works (issued collectively by Jerome Froben, 1540, 8 vols. folio). The advantages offered by the press of Froben and the correctness of his publications, among which was a splendid edition of the *Adagia*, were among the inducements that drew Erasmus from England to settle at Basel 1515. (Drummond's *Life of Erasmus*, vol. i., p. 244.) In this year Froben put to press the first published edition of the Greek text of the New Testament, edited by Erasmus. (*Tregelles on the Printed Text of the Greek Testament*, p. 19.) He undertook, also, under the supervision of Erasmus, the publication of the more important Latin Fathers—e. g. Jerome, on whom Erasmus had bestowed much careful study and labor (1516); Cyprian and Rufinus (1520); Tertullian (1521); Ambrose (1527); Augustine (completed 1528–29). He had intended to supplement these by a similar edition of the Greek Fathers, but he died in Basel before his plans matured (Oct., 1527). His design was, however, carried out by his sons, Jerome and John, and his son-in-law, Nicolas Bischop (Nicolaus Episcopius). Froben's publications, mostly in folio, are noted for their general correctness. The character of the old printer is presented in a pleasing light by Erasmus in one of his letters (*Ep.* dccccxxii.). See Drummond's *Life of Erasmus* (London, 1873, vol. ii., p. 273, *seq.*).

Revised by Alfred Gudeman.

Fro'bisher, Sir Martin: navigator; b. at Doncaster, Yorkshire, about 1535; the first Englishman to sail in search of a northwest passage. After an unsuccessful endeavor for fifteen years to obtain the necessary assistance, he was finally aided in his enterprise by Dudley, Earl of Warwick, and others, and sailed from Deptford in June, 1576, with three vessels of small size. On July 28 Frobisher reached that part of Greenland which he named Meta Incognita, and Aug. 11 passed through the strait to which he gave his name. Among the minerals brought back by him, gold was discovered, and in consequence a second expedition was fitted out, which sailed from Harwich, May 31, 1577; the result of this expedition caused a third to be made in 1578, which, however, arrived so late in the season as to be compelled to return at once. This was the last of Frobisher's voyages. In 1585 he accompanied Sir Francis Drake to the West Indies, and for his services against the Spanish Armada was knighted in 1588. In 1594 he was sent to aid Henry IV. against the Spaniards and Leaguers, and in an attack upon them at Croyzon, near Brest, was mortally wounded, and died at Plymouth, Nov. 7, 1594, soon after having brought back his fleet in safety.

Frobisher Strait: an arm of the sea; in British North America, between Hudson Strait and Northumberland Inlet, extending westerly from the Atlantic Ocean at the entrance of Davis Strait. It is 240 miles long, and has a mean width of 30 miles.

Froebel, frö'bel, Friedrich: educational reformer; b. Apr. 21, 1782, at Oberweissbach, in Thuringia, where his father was the laborious pastor of seven villages. His mother died before his remembrance, and his half orphanage had a prevailing influence on his destiny, giving him a very sad childhood, that quickened his sensibility and stimulated him to reflection, which he manifested by asking strange questions concerning human discords. An affectionate elder brother, to divert his mind from such subjects, undertook to teach him the sexual system of botany, and show him how, by the union of opposites, harmony and beauty gradually grow out of differences. Not long after, being put to school by a maternal uncle, in the first hour of it he heard a discourse by the teacher on the text, "Seek ye first the kingdom of God and his righteousness, and all these things shall be added unto you"; this gave to him the joyful conviction of there being a law which, gradually discovered and intelligently obeyed, would bring peace and harmony into the human universe; and when, in 1792, he heard a rumor rife among the peasantry that the world was coming to an end, he says he did not believe it, because the will of God had not been brought about—a wonderful thought for a child ten years old. At thirteen he was apprenticed to a forester, who taught him wood-lore and mathematics, in which he made great attainments. He studied for a time at Jena and Berlin, where he showed great interest in pedagogical methods. Twice he visited Pestalozzi, and in 1816, in connection with a friend by the name of Middendorf, opened a school at Keilhau. One who was a pupil describes it as a paradise of children, but says that during his stay (from 1816 to 1826) it was in a chronic state of bankruptcy. The plan was to educate the children by putting them at work, and making nature itself, and what they produced artistically by horticulture and their own hands, *their books.* It was while here that Froebel married his first wife and former pupil in mineralogy. They never had children of their own, but she made his school a happy family for the twenty years that she lived with him. But they did not confine themselves to Keilhau, where Middendorf only remained steadily and after the death of Froebel. They had schools in Switzerland at Watersee, Burgdorf, and Willisau. Some time during this interval Froebel went to Göttingen University and studied comparative philology, making himself thoroughly acquainted with Latin, Greek, and Sanskrit, and all to complete his own education for his duties. In 1839 he lost his faithful wife, and it was not till 1840 that he founded his first kindergarten at Brandenburg. Twenty-three years before he had published his first work, *Menschenerziehung* (Human Education), in which may be discerned the seeds of the kindergarten. He there gives the process of human development in the child. But at that time it was his idea that the child until he was seven years old should be exclusively educated by the mother. Later he saw that it was simply impossible for mothers with several children and other family duties to devote themselves to the development, mental as well as moral and physical, of each child, but that from the time children were three years old till seven, it was a relief for both parties to have them gather into companies, to be taken care of for several hours of every day by a kindergartner, thoroughly instructed in the process of development and the method of the kindergarten. (See KINDERGARTEN.) For the next twelve years he devoted himself to the education of kindergartners and the establishment of kindergartens. The last attempt was at Hamburg, where he was invited in 1850. He elaborated the method, and has left it a gospel to childhood, for its principle is that free creativeness is at once the means and end of human education, and begins in spontaneous play, so guarded and guided as to coincide with God's creativeness. He married one of the kindergartners whom he educated, and she kept a kindergarten in Hamburg for twenty years after his death, which took place June 21, 1852, at Rudolstadt, where he had a school for training kindergartners. It was in the course of these last twelve years that he published another most characteristic work, *Die Mütter- und Kose-Lieder* (Mother's Cosseting Songs), illustrated by plates and notes addressed to the mother, interpreting to her her instincts, and giving her hints for her motherly prattle with her little children. The reform of education begun by Rousseau, and carried on by Fichte, Pestalozzi, and Diesterweg, finally culminated in Froebel's discovery of the method, as well as principle, of educating the human being in its first years purely by means of its own spontaneous activities. See *Autobiography* (London, 1886); Joseph Payne's *Lectures on the History of Education* (new ed. 1892); Williams's *History of Education* (1892); Marenholz-Bülow, *Reminiscences of Frederick Froebel*, translated by Mrs. Horace Mann; *The Education of Man*, by Friedrich Froebel, International Education Series; H. Courthope Bowen, *Froebel and Education by Self-activity* (1893).

ELIZABETH P. PEABODY.

Froebel, JULIUS: German publicist; nephew of Friedrich; b. in Griesheim, Germany, July 16, 1805; studied at Jena and Berlin; held professorships of mineralogy and other sciences at the University of Zurich 1833–44; edited a radical political paper; removed to Prussia, but was obliged to go to Dresden for political reasons, and his pamphlets on public affairs were suppressed; took part in the revolution of 1848, and entered the Frankfort Parliament; was arrested and tried for a political offense at Vienna, but escaped conviction; removed to Switzerland, and thence to the U. S.; was editor, newspaper correspondent, lecturer, and merchant in New York, Nicaragua, Northern Mexico, and California; in 1857 went to Germany, and became again involved with the authorities; removed to London; became in 1862 an editor in Vienna; and in 1867 founded a journal in Munich; German consul at Smyrna 1873–76, and in Algiers 1876–91. Author of *Grundzüge eines Systems der Krystallologie* (1843); *System der Sozialen Politik* (2 vols., 1847); 2 vols. of American travels (1857–58); *Theorie der Politik* (2 vols., 1861–64); *Die Wirthschaft des Menschengeschlechts* (3 vols., 1870–76), and other works. D. in Zurich, Nov. 7, 1893.

Frog [M. Eng. *Frogge* < O. Eng. *frogga*. Connection with O. Eng. *frox*, *frosc, frog : O. H. Germ. *frosc* > Mod. Germ. *Frosch* : Icel. *froskr*, and with O. Eng. *frocca*, frog : Icel. *fraukr* is not understood]: any one of many leaping tailless Batrachians. The frogs are the typical representatives at once of a class (the Batrachians or Amphibians) and an order (the *Anura* or *Salientia*), and are divisible into several distinct families and numerous genera and species. As representatives of the family *Ranidæ*, the true frogs are distinguished by a peculiar sternal apparatus, the manubrium being a robust bony style, the xiphisternum generally similar, and the arciform cartilages wanting; the skull has no fronto-parietal fontanel; there are no teeth on the lower jaw; the tongue has a broad free margin, is attached in front and free behind, and is more or less deeply notched behind; the ear is perfectly developed, the tympanum, cavum tympani, and Eustachian tubes being present; there are no parotoid glands. The family is represented by a number of genera, the largest of which is that of the typical frogs (*Rana*), of which there are about forty species, found in almost all portions of the world except Australasia and South America.* (For metamorphoses of frog, see cut in article BATRACHIA; see also EVOLUTION.) Nearly a dozen are found in the U. S.: the best known are—1, the common bull-frog (*Rana catesbiana*); 2, the shad-frog (*Rana virescens*); 3, the wood-frog (*Rana sylvatica*); 4, the marsh-frog (*Rana palustris*); and 5, the spring-frog (*Rana clamata*). (1) Much the

The common European frog (*Rana temporaria*).

largest of these, and only rivaled in size by a species (*Rana tigrina*) of the East Indies, is the bull-frog. This, like its fellows, feeds upon worms, mollusks, and insects, and it is said that to those in the Zoölogical Gardens of London are sometimes given sparrows, which they greedily devour; its color is green, bronzed with olive, and with dusky blotches. (2) The shad-frog is recognizable by its eye-like spots, which are dark brown bordered with yellow, and in allusion to which it is also called leopard-frog; the name shad-frog has been derived from its appearing in spring nearly at the same time as the shad. (3) The wood-frog may be known by its reddish-brown color, and by a dark bridle-like stripe passing from the snout and through the eye backward; it is most abundant in woods, and is very closely related to or identical with the *Rana temporaria* of Europe. (4) The marsh-frog has about four to six rows of quadrate dark spots on the back and sides, and is also called the tiger or pickerel frog. (5) The spring-frog, or green frog, is of a bright green

* A single species of *Rana* only is found in South America.

color, with a yellow throat and with a very large tympanum; it is one of the most common species, and one of the most esteemed as a delicacy for the table. Although not universally popular, there is an increased tendency to the appreciation of the frog as a delicacy for the table in the U. S., as there has long been in France; and in most of the large cities frogs can be obtained in proper season. The abhorrence which is sometimes expressed respecting the use of frogs' flesh for the table is due only to irrational prejudices, for it certainly is a most tender and delicate morsel. In France, as is well known, as well as in Southern Europe, it is generally a favorite article of diet, and forms the object of an extended industry. Froggeries abound in which the animals are raised and kept. In the materia medica frogs' flesh was at one time quite popular among European physicians as an antiscorbutic. The common frogs have long been favorite subjects for experimentation among physiologists from the fact that the great vitality of their tissues renders them favorable objects for investigation. They are also celebrated in connection with the history of galvanism, Galvani having been led to his discovery by the consideration of the phenomena exhibited by them when experimenting with the common European species. THEODORE GILL.

Frog: the device used on a railway track where one rail crosses another, so named from its resemblance to the "frog" in a horse's hoof. Frogs were formerly made of cast iron, but now steel rails suitably connected together are generally used. The "plate-frog" has the rails riveted to an iron plate placed beneath them. The "bolted frog" is one in which the rails are connected by bolts passing through the webs, the spaces between the rails being filled by cast-iron fillers. The "keyed frog," shown in the illustration, has the rails held together by clamps, which can be tightened by keys or wedges. The "number of a frog" is the ratio of the length of the pointed part to the width of its base, and for general use on turnouts Nos. 6, 8, and 10 are used. A "spring frog" has the point held against the wing of the main track rail by a spring, thus preventing the jolt caused by the wheel in striking it; when a train passes on to the turnout the flanges of the wheels crowd the point aside, and then the spring restores it to its normal position. A spring frog is usually more durable than a stiff one, and produces less wear on the wheels. "Crossing-frogs" are used where the tracks cross each other, and where the angle is large it is usual to have an inner rail running around the quadrilateral to serve as a guard-rail and give extra stiffness. See Parson's *Track*, 1886.

MANSFIELD MERRIMAN.

Frog: a part of a horse's hoof. See FARRIERY.

Frogfish: See ANGLER.

Frog-spawn: properly the name of the gelatinous mass inclosing the ova of frogs; but the name is extended in rural districts to some of the large green fresh-water Algæ, which form slimy masses in streams and ditches—notably to those of the family *Batrachospermaceæ*, of which *Batrachospermum moniliforme* is a very common species both in Europe and the U. S.

Frog-spittle, **Cuckoo-spit**, or **Toad-spit**: a frothy substance often seen on grasses, weeds, and even trees, closely resembling human saliva in appearance. On examination it will be found to contain one or more grubs, the larvæ of various leaf-hoppers—insects of various families of the *Hemiptera*. In Europe the larvæ of *Cicada spumosa* is a very common cause. In the U. S. the genera *Heleochara* and *Aphrophora* are among the froth-producers. This froth consists of the sap of the plant. These insects are great pests to vegetation, and very numerous in species.

Froissart, frwaă'saar', JEAN: author; b. at Valenciennes, France, in 1337; was destined by his father for the Church, and took holy orders; went to England; was (1361–66) secretary and chapel-clerk to Queen Philippa, wife of Edward III., a liberal patroness. He traveled at her suggestion, that he might collect materials for chronicles, much in Flanders, France, Scotland, Italy, and other countries; became canon of Chimay 1390. The time of his death is not known, but probably was prior to 1419; the place was probably Chimay, in Belgium. He compiled for the Duke of Brabant a collection of ballads and songs called *Meliador*, but is chiefly memorable for his immortal *Chronicles*, the most important written historical monument of the Middle Ages in existence. Froissart's *Chronicles* are of great value, but are not so much an accurate history as a faithful picture of his times, and of their places, customs, and people. They range over all Western Europe, for Froissart, a churchman and scholar, living in unsettled times before the feeling of nationality had been well developed, is quite destitute of patriotic feeling. The favorite English version of this fine old author is that of Thomas Johnes (1803–10, 5 vols. 4to, often reprinted—e. g. 1884, 2 vols. 8vo), but the old translation by J. Bourchier, Lord Berners (1523–25, 2 vols. fol.), is correct and much more spirited. Buchon's edition (1824–26, 15 vols.) is the best of the original French text. The best edition of the original text of the *Chronicles* is by Luce (Paris, 1869–88, 8 vols.).

Frölich, frö'lich, LORENTZ: a Danish figure-painter; b. in Copenhagen, Oct. 25, 1820. His etchings *Amor and Psyche* and his *Lord's Prayer* are popular throughout Europe, and have appeared in many editions in London and Paris. His numerous illustrated books for children have also given him a European reputation. He illustrated Hans Christian Andersen's works, and has made an extensive series of etchings illustrating Scandinavian mythology.

R. B. ANDERSON.

Frome: town of Somersetshire, England; on the Frome; 12 miles S. of Bath (see map of England, ref. 12–G). It has considerable manufactures of broadcloth and cassimeres. Pop. (1891) 9,613.

Fromentin, frō'maań'tăń', EUGÈNE: painter of genre and Oriental scenes; b. in La Rochelle, France, Oct. 24, 1820. Pupil of Remond and Cabat; first-class medal, Salon, 1859; officer Legion of Honor 1869. His pictures are remarkably fine in color, and his drawing of horses is excellent. He wrote charmingly and with the most admirable critical knowledge on art subjects. His *Les Maîtres d'Autrefois* is a book on painting which can not be too highly praised, and his *Un Été dans le Sahara* is a delightful book of travels. *Algerian Falconer* (1873) and *Arab Encampment* (his last work and unfinished) are in the Louvre. Many of his best works are in the U. S.: *Crossing the Ford* and *Arabs Watering Horses*, collection of Mrs. William H. Vanderbilt, New York; *Encampment in Atlas Mountains*, collection of W. T. Walters, Baltimore. D. at St.-Maurice (near La Rochelle), Aug. 27, 1876. WILLIAM A. COFFIN.

Fronde [Fr., liter., a sling (the name being applied as a reproach, in allusion to the use of the sling by the street-boys of Paris) < Lat. *funda*, sling]: a faction of French nobles who opposed Cardinal Mazarin during a part of the minority of Louis XIV. The breaking up of the feudal system by Richelieu had finally led to a centralized despotism, against which the Parliament of Paris was the first to rise, offering a determined opposition. It refused to register the royal edicts; and when compelled by the king to register, the populace rose in its defense, Aug. 27, 1648—*la journée des barricades*. In the October following the popular demands were acceded to, but the malcontent nobles seized the opportunity of trying to overthrow Mazarin and to regain their old power—the Princes of Condé and Conti, the Dukes of Longueville, Beaufort, Orleans, Bouillon, Vendôme, Nemours, etc. The struggle lasted from 1649 until 1652, and as far as military results were concerned was favorable to the nobles, who had the grandest opportunities for making a great constitutional reform; but as they had no strong leadership, no fixed principles, and no definite object except self-aggrandizement, Mazarin in 1653 snatched from his mutually jealous and strangely frivolous enemies the fruits of their victory. The war of the Fronde was one of the most ridiculous and useless contests in history. See *Les Mazarinades*, a large collection of lampoons on the court; Saint-Aulaire, *Hist. de la Fronde* (1841); the histories of Barante and Fitzpatrick; Cousin, *La Fronde en Paris.*

Frontal Bone [*frontal* is from Mod. Lat. *fronta'lis*, deriv. of Lat. *frons*, *frontis*, forehead]: in the vertebrate skeleton, one of the most important bones of the skull. It is regarded as representing the neural spine of the second cephalic vertebra. In man it has two parts, a vertical and an orbito-nasal portion, the former the bony portion of the forehead, the latter forming part of the roof of the orbits of the eyes. It is developed from two centers, and at birth is divided vertically into two lateral halves by the frontal suture, which sometimes persists through adult life. The vertical part consists of an outer and inner hard layer, separated to some extent by a diploë, a soft cancelous tissue furnished with large veins. Just above the eyes the diploë is wanting, and its place is occupied by the frontal sinus, a cavity in two parts, each of which communicates with the nasal passages.

Frontenac, frōn'te-naăk', LOUIS DE BUADE, Comte de: soldier and governor of the province of New France; b. in 1620 in France; served in the army in Italy, Flanders, Germany, and received many wounds; in 1672 was appointed Governor-General of Canada by Louis XIV., having already won a wide renown for valor. He was a relative of Madame Maintenon and the husband of a court beauty who used her influence against him. His first governorship of New France (1672–82) was marked by the building of Fort Frontenac (now Kingston, Ontario) and the expeditions of La Salle, Marquette, and Joliet; but Frontenac, a man of great abilities, was hampered by the action of his intendant and of Laval, Bishop of Quebec, so long the virtual ruler of Canada. He was accordingly recalled, but in 1689, Canada being almost ruined under his successors, he was sent out again. He now punished the Iroquois, destroyed, through his lieutenants, the English fleet in Hudson's Bay, ravaged Newfoundland, terrified all the English-speaking coast-towns as far south as New Jersey, captured Pemaquid, Casco, Salmon Falls, Schenectady, and in 1690 repulsed the forces of Phips before Quebec—an event which Louis XIV. commemorated with a medal. His courage and his activity were marvelous, and he actually succeeded in restoring for a time the fallen fortunes of France in America. This able soldier died at Quebec, Nov. 28, 1698. See Parkman, *Count Frontenac and New France under Louis XIV.* (Boston, 1877).

Frontier: in general, the boundary that separates contiguous states; in a more restricted sense, employed especially in the U. S., the term indicates those outlying regions which at different stages of the country's development have been but imperfectly settled, and have constituted the meeting-ground of savagery and civilization.

The consideration of frontiers in the former and more common acceptation of the term has given rise to important questions of political science which have been answered in various ways at different periods of the world's history, and in Europe, where densely populated states abut on each other, the subject of boundaries has always been one of special significance. Publicists have discussed the questions whether there are "natural frontiers" within which a nation should restrain its activity; how the lines are to be drawn along rivers, lakes, straits, and mountains marking the frontiers; how changes of these natural boundaries affect the respective states; and whether frontiers should correspond rather with race boundaries than with "natural frontiers." The growth of the spirit of nationality, the distinguishing feature of modern political history, has tended to lessen somewhat the importance of physical lines of demarkation as compared with racial boundaries, thus sacrificing in many instances the geographic unity of a state to its ethnic unity. The same spirit, moreover, has striven steadily against the attempts of the powers to mark the frontiers in accordance with dynastic interests to the disregard of the racial unity of their subjects or citizens. Even the Congress of Vienna in 1814–15, with its excessive respect for the theory of legitimacy, reveals in many of its territorial arrangements the strength of the principle of nationality in determining the proper frontiers; and subsequent readjustments of the map of Europe have proved that this principle has been steadily gaining ground. The modification of means of intercourse and of the arts of war has diminished the importance of former natural frontiers from the point of view of offense and defense; and the enunciation of the doctrine that the state should coincide with racial rather than with topographic boundaries has afforded at least a pretext for ignoring old-time division-lines. But in any case it is desirable to have a definitely marked physiographic frontier instead of an artificial boundary-line. As a general principle it may be said that wherever a given population have an essential unity of interests, whether arising from topographic facts, race identity, or social and economic considerations, there is a strong tendency to political unity; therefore the "natural frontier" is that which bounds a people of fundamentally identical interests.

Writers on international law have laid down the principle that when the frontier of a state is formed by a natural water-barrier, not marked by a definite line along this barrier, the gradual accretions from fluvial deposit accrue to the state along whose boundary they form. But when a river or lake suddenly transfers its channel entirely within the territory of one of the states bounded by it, the boundary remains along the former river-bed. Publicists have also declared that where a boundary follows mountains or hills the water-divide constitutes the frontier. Where it follows a river, the boundary is determined by a line running through the middle or along the center of the deepest channel of navigable streams, provided there is no positive proof that the entire river-bed belongs to either of the contiguous states. The same principle applies to lakes. See Hall, *International Law*, §§ 37–38.

In the U. S. the frontier is not a fortified boundary-line separating populous States, but by common usage implies the outskirts of civilization, the regions but partially reclaimed from savagery by the pioneer. In the reports of the U. S. census the frontier-line has been defined as the inland line limiting the area which has an average, county by county, of two or more inhabitants to the square mile. This area is called the settled area. Between this census frontier-line and the Indian country the belt of territory sparsely occupied by Indian traders, hunters, miners, ranchmen, backwoodsmen, and adventurers of all sorts, constitutes the traditional frontier. In the course of American history the frontier has been advanced steadily westward, and in its advance settlement has also widened out N. and S. along its flanks. The continuity of the settlement has been broken by passing over certain regions which have remained to be occupied later; thus the less desirable regions of the Appalachian Mountains and of the Rocky Mountains were left isolated, and regions occupied by Indians, as well as the Great Plains, were left behind the general advance. In this advance of the frontier successive waves of industrial life have crossed the continent, and these waves have corresponded to the stages of the economic progress of society. The Indian traders and hunters, exploiting the fur-bearing animals, worked their way from the Atlantic coast along the rivers and lakes, until as early as 1830 they were traversing the passes of the Rocky Mountains, while the farmers were still near the mouth of the Missouri. The hunter life was followed by the pastoral life of the cattle-raiser, or in the mountainous regions by the miner's activity. The pioneer farmers (whose earliest representatives merged with the previously mentioned classes) came next and cleared the land and used up the virgin soil of the prairies with unrotated crops and careless farming.

Statistics for determining the settled area in the colonial period are lacking, but at the date of the first census in 1790 the settled area was bounded by a line which ran near the coast of Maine and included New England, except a portion of Vermont and New Hampshire, New York along the Hudson and up the Mohawk for some distance, Eastern and Southern Pennsylvania, Virginia, well across the Great Valley, and the Carolinas and Eastern Georgia.

By the census of 1820 the settled area included Ohio, Southern Indiana and Illinois, Southeastern Missouri, and about half of Louisiana. The continuity of this area was interrupted by Indian tribes, the management of which now came to be an important question. The frontier region of the time lay along the Great Lakes, where Astor's company operated in the Indian trade, and beyond the Mississippi, where the Indian trade extended to the Rocky Mountains, and in the Florida country. The Mississippi was the scene of typical frontier settlements. By the middle of the century the Indian region proper lay along the eastern boundary of what is now the Indian Territory, Nebraska, and Kansas. Minnesota was still a region of frontier conditions; but for the most typical frontier conditions at this period one must look to the settlements of California, where the gold discoveries had sent a sudden tide of adventurous miners to the Oregon territory and to the Mormon settlements in Utah. As the advance of the frontiersman beyond the Alleghanies had caused the rise of important questions of transportation and internal improvement, so now the settlements beyond the Rocky Mountains needed means of communication with the East. Accompanying the creation of these arose the settlement of the region of the Great Plains and the development of still another kind of frontier life. Railroads fostered by land grants sent an increasing tide of immigrants into the far West, the U. S. army fought a series of decisive Indian wars in Minnesota, Dakota, and the Indian Territory. By 1880 the settled area had been pushed into Northern Michigan, Wisconsin, and Minnesota, along Dakota rivers and in the Black Hills region, and up the rivers of Kansas and Nebraska. The development of mines in Colorado had sent isolated frontier settlements into that region, and Montana and Idaho as well were being settled. The superintendent of the census for 1890 reports that the settlements of the West lie so scattered throughout the entire region that there can no longer be said to be a frontier-line.

The hardships of frontier life conduced to an energetic and self-reliant spirit among the pioneers which has had a great influence upon the national life and character. In spite of the lawlessness that has marked these border communities, the necessary result of the rude conditions surrounding them, this influence has had no small share in developing the practical ability and inventiveness of the people. F. J. TURNER.

Fronti'nus, SEXTUS JULIUS: a Roman writer, distinguished also in civil and military affairs; was b. about 40 A. D., though the exact year is not known. His first appearance in public life was as *prætor urbanus* in A. D. 70, under Vespasian. Tacitus, in his *Life of Agricola*, tells us that he was appointed to the chief command in Britain (76–78), and that he conducted himself with ability, subduing the warlike tribe of the Silures. He was succeeded by Agricola, and on his return to Rome escaped the suspicions and jealousy of Domitian by living a retired and studious life. He was twice honored with the office of consul, and in A. D. 97 was appointed by Nerva *curator aquarum* (superintendent of aqueducts), to which appointment no doubt we owe his most valuable publication. He died probably in 103. Frontinus has left a work on military tactics, presented in the form of a series of anecdotes of distinguished kings and commanders, entitled *Strategematon libri III.* To each of the three books a brief preface is prefixed, detailing the chief subject of the book. A fourth book was added later by some unknown writer. More important than this is the other extant work of Frontinus, *De Aquis urbis Romæ liber*, in which he describes the construction and maintenance of those vast and expensive structures which made Rome enviable among ancient cities for its ample water-supply. Besides these, several treatises on land-measurement are ascribed to Frontinus, fragments of which are contained in the collection of Agrimensores, or *Rei Agrariæ Auctores*, by Goesius (Amsterdam, 1674, 4to), and in *Gromatici Scriptores*, by Lachmann and Rudorff (2 vols., Berlin, 1840–52). The best editions of the *Strategemata* are those of Oudendorp (Leyden, 1731, and again 1779); G. Gundermann (Leipzig, 1888); of the *De Aquæ ductibus*, those of Polenus (Padua, 1722, 4to); Dederich, with German translation (Wesel, 1841); and of F. Buecheler (Leipzig, 1858). See also R. Lanciani, *Topografia di Roma antica, i commentari di frontino intorno le acque, etc., silloge epigrafica aquaria* (Rome, 1881); a new recension of the text of both works by Dederich (Leipzig, 1855). Revised by M. WARREN.

Frontlet: See PHYLACTERIES.

Fron'to, MARCUS CORNELIUS: public speaker and rhetorician; b. at Cirta, Africa, about 100 A. D. Having removed to Rome, he soon attained high distinction as a teacher of eloquence, and won the special favor of the Emperor Hadrian, and Antoninus Pius, by whom he was intrusted with the education of the imperial princes, M. Aurelius and L. Verus. In 143 he held for a short time the office of consul, but he declined, on the plea of ill-health, the charge of a proconsular province. He was held in high honor by his contemporaries, and ranked among the most distinguished orators. He even had a body of followers, who took him as their model, and were called after him, *Frontoniani*. The date of his death is uncertain. It must have been as late as 175. Until 1815 no remains of Fronto were known to exist, except a doubtful treatise, *De nominum verborumque differentiis*. But in that year Mai discovered in the Ambrosian Library at Milan a palimpsest MS. which contained a number of the letters of Fronto, which he published. Subsequently, being transferred to the Vatican in Rome, Mai discovered there more than a hundred additional letters, a portion of the correspondence of Fronto with the Emperor Antoninus Pius and with his former pupils, Marcus Aurelius and Lucius Verus. He issued a new edition of his work, in which these were incorporated (Rome, 1823; reprinted 1846). A complete edition of the correspondence of Fronto, founded on a new recension of the MSS., was published by S. A. Naber (Leipzig, 1867). Revised by M. WARREN.

Froschweiler: See WÖRTH.

Frossard, frō'saar', CHARLES AUGUSTE: French general; b. Apr. 26, 1807; educated at the École Polytechnique in Paris, and at the school of artillery and engineering in Metz; entered the army Oct. 1, 1827; distinguished himself in Algeria; took part in the siege of Rome in 1849; in Jan., 1855, received the command of the Second Engineer-corps of the Crimean army; conducted the engineering operations for reducing the Malakoff; received, after the fall of Sebastopol, the cross of a commander of the Legion of Honor. In the Italian war in 1859 he was chief of the whole engineering department, and after the war he received the grand cross of the Legion of Honor. After this active and successful career Frossard had the misfortune in the war against Germany (1870–71), as commander of the Second Army-corps, first to arrange the attack on Saarbrücken (Aug. 2, 1870), and then to be thoroughly beaten out of the place on Aug. 6. He led his corps back to Metz, and participated in the battles of Vionville and Gravelotte (Aug. 16 and 18, 1870). On the capitulation of Metz (Oct. 27, 1870) he fell into German captivity. Author of *Rapport sur les opérations du deuxième corps de l'armée du Rhin dans la campagne de 1870* (Paris, 1871). D. Sept. 3, 1875.
Revised by C. K. ADAMS.

Frost [M. Eng. *frost, forst* < O. Eng. *forst, frost*: Icel. *frost*: O. H. Germ. *frost* < Mod. Germ. *Frost* < Teuton. **frustas*, deriv. of *frius-, fraus-, frus-*, freeze. See FREEZING]: properly, frozen dew, rime, or hoar-frost, often called *white frost*, to distinguish it from *black frost*, which is the effect produced upon herbs and leaves by the freezing of their juices. The freezing of soil-moisture is popularly called frost also. Hoar-frost is a deposit of minute ice-crystals in the place of dew. The conditions for the formation of white frost are precisely those requisite for the formation of dew (see DEW), except that those conditions (radiation of heat, etc.) act at lower temperatures. The presence of considerable bodies of water diminishes frost powerfully, because water by day absorbs and by night radiates much heat. Thus Western Michigan is rendered a good peach-region by the west winds, tempered by the influence of Lake Michigan. Thick clouds, or a dense smoke, will act as a blanket over the earth, and diminish or prevent the deposit of frost, and even a thin layer of smoke may be effective. The fact that low lands are usually visited by frost much earlier in the autumn and later in the spring than the neighboring hill lands is due to the fact that the colder air settles down upon the low grounds, and the hills are more exposed to the winds, which tend to prevent the stagnation of the air. The hygienic effect of frost is generally salutary. Malarial fevers are favorably modified by it, and the spread of cholera and of yellow fever is usually checked at once. Some forms of milk-sickness in cows are, however, attributed to feeding upon forage which has been touched by black frost. Frosts are successfully predicted by the weather bureau, to the great advantage of the growers of delicate crops. Revised by M. W. HARRINGTON.

Frost-bite and Freezing: conditions caused by the action of cold upon the animal economy. Frost-bite is local and partial—freezing is general and more or less complete. Severe frost-bite may lead to gangrene, but the milder forms often result in nothing worse than chilblains, which are very annoying, but not often dangerous. General freezing, if rapid, may result in speedy death; but more frequently the vital functions pass for a time into a state of abeyance, which may last, it is said, for some days, and then be terminated by death. In recovering frozen and unconscious persons it is held that a very slow restoration of the normal temperature is safest, apparently because sudden warmth arouses those dormant energies which demand immediate aëration of the blood, which failing, death at once ensues. It is, however, suggested that very rapid warming might, in many cases, secure all the advantages of slow restoration of temperature, and experiments on some of the lower animals seem to favor this idea. The belief that alcoholic drinks taken before exposure protect against cold is entirely erroneous, since by producing activity of circulation and dilatation of the blood-vessels of the skin, they favor rapid loss of heat, and therefore hasten freezing.
Revised by WILLIAM PEPPER.

Frostburg: town; on railway; Allegany co., Md. (for location of county, see map of Maryland, ref. 1–B); situated on a plateau between Savage and Dan's mountains, 1,255 feet above Cumberland and 1,792 feet above tide, immediately over the great coal-basin of Western Maryland; 17

miles W. of Cumberland. It has foundries and a fire-brick manufactory. Pop. (1890) 3,804 ; (1900) 5,274.

Froth Fly: See FROG-SPITTLE.

Frothingham, froth'ing-am, ELLEN: translator; daughter of Nathaniel Langdon Frothingham; b. in Boston, Mar. 25, 1835; devoted herself to the study of the German literature and language. She has inherited her father's literary taste and talent, and has distinguished herself by remarkably fine translations of three difficult masterpieces—Lessing's *Nathan der Weise* (1868), Goethe's *Hermann und Dorothea* (1870), in verse, and Lessing's *Laokoon* (1874).

Frothingham, NATHANIEL LANGDON: clergyman and author; b. in Boston, Mass., July 23, 1793; graduated at Harvard in 1812; in 1812 received the appointment of teacher of rhetoric and oratory at Harvard; prepared for the ministry, and from 1815 to 1850 was pastor of the First church in Boston. He published *Sermons in the Order of a Twelvemonth* (1852); two volumes of *Metrical Pieces* (1855–70); and contributed to literature poetical translations from the Greek, Latin, Italian, and German. He was one of the earliest students of German in the U. S. D. in Boston, Apr. 4, 1870.

Frothingham, OCTAVIUS BROOKS: author; third son of Nathaniel L. Frothingham; b. in Boston, Nov. 26, 1822; educated at the Latin School; graduated at Harvard in 1843; studied theology at Cambridge; was settled in Salem, Mass., Mar. 10, 1847; removed to Jersey City, N. J., in Apr., 1855; in 1859 went to New York and established the Third Unitarian Society, of which he was many years pastor. Mr Frothingham belonged to the extreme left or radical wing of the Unitarians for a time, but finally assumed the attitude of an independent preacher and drew to himself the largest congregation in New York. For several years from its beginning he was president of the Free Religious Association, of which he was one of the founders in 1867. Mr. Frothingham is the author of many valuable books, including *Stories from the Lips of the Teacher* (1863); *Stories of the Patriarchs* (1864); *A Child's Book of Religion* (1866); *The Religion of Humanity* (1873); *The Life of Theodore Parker* (1874); *Transcendentalism in New England* (1876); *Gerrit Smith, a Biography* (1878); *The Cradle of the Christ* (1877); *Beliefs of the Unbelievers*; *The Safest Creed*, a volume of discourses (1874); *George Ripley*, in American Men of Letters (1882); *Memoir of William Henry Channing* (1886); *Boston Unitarianism*, including a memoir of his father, Dr. N. L. Frothingham (1890); *Recollections and Impressions* (1891). In 1889 he published a *Memoir* of Rev. David A. Wasson, with selections from his sermons. For a year he was art-critic for the New York *Tribune*; for several years a regular contributor to *The Index*, an organ of free religion printed in Boston. In 1879 he was obliged by failing health to give up preaching. D. in Boston, Nov. 27, 1895. J. W. CHADWICK.

Froude, frood, JAMES ANTHONY, LL. D.: historian; b. at Dartington, England, Apr. 23, 1818; educated at Westminster and Oriel College, Oxford, where he graduated with honor; became a fellow of Exeter College 1842; was ordained a deacon in 1845; published *Shadows of the Clouds*, tales (1847), and *Nemesis of Faith* (1848), which were condemned by the authorities of the university, and he, as a consequence, lost an appointment as teacher in Tasmania. In 1850 he began to write for *Fraser's Magazine*, the *Westminster Review*, and other periodicals. His greatest work, *The History of England from the Fall of Wolsey to the Defeat of the Spanish Armada* (12 vols., 1856–70), is remarkable for the brilliancy of its style, for the novel views taken of many of the leading characters who figured during the time of which it treats, and for the abundance of fresh material introduced. In 1869 he was installed rector of the University of St. Andrews. In 1871 he resigned the editorship of *Fraser's Magazine*, and in 1872–73 lectured in the U. S. He has also written *Short Studies on Great Subjects* (1867); a little book on *Calvinism* (St. Andrews, 1871); *The English in Ireland in the Eighteenth Century* (3 vols., 1871–74); *Cæsar, a Sketch* (1879); *Reminiscences of the High Church Revival* (1881); *Reminiscences of Thomas Carlyle* (2 vols., 1881); *Thomas Carlyle: a History of the First Forty Years of his Life* (1882); *Reminiscences of his Irish Journey in 1849* (1882); *Oceana, or England and her Colonies* (1886); *The English in the West Indies, or the Bow of Ulysses* (1888). In 1889 he published *The Two Chiefs of Dunboy*, an Irish romance of the eighteenth century; in 1890, a *Life of Lord Beaconsfield*; in 1891, *The Divorce of Catherine of Aragon*; in 1892, *The Spanish Story of the Armada, and Other Essays*. On the death of Prof. Edward A. Freeman, Mar. 16, 1892, Mr. Froude succeeded him as Regius Professor of History in the University of Oxford. D. at Salcombe, Devonshire, Oct. 20, 1894.

Fructidor [= Fr. *Fructidor*, fruit-month, deriv. of Lat. *fruc'tus*, fruit]: in the French republican calendar of 1792–1806, the twelfth and last month in the year, extending from Aug. 18 to Sept. 16. In the year 5 (1796–97) occurred the "*coup d'état* of the 18th Fructidor" (Sept. 4, 1797), in which Augereau, acting for the majority of the Directory, removed the minority from that body.

Fruits [M. Eng. *fruit*, *frut*, from O. Fr. *fruit* < Lat. *fruc'tus*, proceeds, fruit, liter. enjoying, enjoyment, deriv. of *frui*, *fructus*, enjoy < Indo-Eur. *bhrug-* > Teuton. *bruk-* > Germ. *brauchen*, use; cf. Eng. *brook*, endure]: in a wide sense, are the perfected ovaries of a flowering plant, with proper envelopes. Some fruits, like the strawberry, result from the blending of many ovaries with a fleshy receptacle. In others, as the fig, the fleshy receptacle is hollow, and the whole inflorescence, including many pericarps, is blended in the fruit. Strictly speaking a fruit consists of the seed and its surrounding pericarp, and fruits receive various general names according to the nature of the pericarp; for instance, the achenium, the samara, the drupe, the pome, the berry, the sorosis, the pepo, and many other forms, of which the more important are noticed in this work under their alphabetical heads. For the use of fruits as food, see FOOD.

Fruit-culture: See POMOLOGY, NURSERY, and the articles dealing with the different fruits.

Frumen'tius, SAINT: a Christian missionary of the fourth century; b. in Phœnicia. Rufinus, his biographer, says that he was captured by the Abyssinians while traveling in their country in company with his kinsman, a Tyrian philosopher, who was murdered by them. Frumentius was taken to the court, where he ultimately became tutor to the young prince, on whose succession he returned home. Consecrated bishop by Athanasius at Alexandria, he again went to Abyssinia, where he became the recognized founder and apostle of the Abyssinian Church.

Fry, Sir EDWARD: See the Appendix.

Fry, ELIZABETH: philanthropist; daughter of John Gurney, and wife of Joseph Fry, of London; b. at Erlham, Norfolk, England, May 21, 1780; was brought up a Friend, and under the ministrations of William Savery, an American Quaker, in 1798 became awakened to a new religious life; was married in 1800, and then resumed her former habit of visiting the poor and sick, afterward extending her attention to seamen, prisoners, outcasts, and the vicious classes, not only in London, but in all parts of Great Britain and Ireland, and later even in many continental countries. In 1809 she became an occasional preacher, and notwithstanding the great extent, importance, and success of her benevolent labors, she found time to train with care and thoroughness a large family of her own. It is in connection with her prison work that she is chiefly remembered. Her reading the Scriptures in the woman's prison at Newgate, London, is the scene of a familiar painting. She died at Ramsgate, Oct. 12, 1845. See her *Memoirs*, by Thomas Timpson (London, 1846); by her daughters (1847); by Susanna Corder (1853).

Fry, JAMES B.: U. S. military officer; b. in Carrollton, Greene co., Ill., Feb. 22, 1827; graduated at the U. S. Military Academy 1847; was commissioned as brevet second lieutenant in the Third U. S. Artillery, and joined it in the city of Mexico during the Mexican war; served as assistant instructor of artillery at the Military Academy in 1847, and again in 1853–54, and as adjutant of the Military Academy 1854–59; appointed assistant adjutant-general 1861; chief of staff to Brig.-Gen. McDowell during his campaign of 1861, taking part in the first battle of Bull Run; as chief of staff to Maj.-Gen. Buell in 1861–62, took part in the battle of Shiloh, the advance upon and siege of Corinth, the operations in Northern Alabama, and the battle of Perryville; provost marshal-general of the U. S. (brigadier-general) from 1863 to 1866 under the Enrollment Act of 1863, passed to enforce military service after the system of voluntary enlistment had proved inadequate. As provost marshal-general he put into the army by conscription, substitution, and voluntary enlistment 1,120,621 men; arrested and returned to the army 76,562 deserters; made an exact enrollment of the national forces, showing that there remained in the U. S. liable to conscription, but not called out, 2,254,063 men; and collected, under a money-commutation clause of the Enrollment Act, $26,366,316.78. His *Final Report of the Operations of the Bureau of the Provost Marshal-General of the United States, from the commencement of the business, Mar. 17, 1863, until the Bureau terminated by law, Aug. 28, 1866*, is published as a congressional document. Promoted through various grades to lieutenant-colonel in the adjutant-general's department and brevet major-general U. S. army; served from 1866 as adjutant-general of the military divisions of the Pacific, the South, and the Atlantic. He was retired in 1881. Author of *The History of Brevets, The Army under Buell*, and of various pamphlets on military subjects. D. in Newport, R. I., July 11, 1894.

Fry, William Henry: composer and journalist; b. in Philadelphia, Aug. 10, 1815. Studied music entirely under local teachers and began composing in early life. In 1845 he produced his opera *Leonora* in Philadelphia and afterward, on Mar. 29, 1858, in New York at the Academy of Music. His second opera, *Notre Dame*, libretto by his brother, J. R. Fry, was produced at Philadelphia a few months before his death, which occurred in Santa Cruz, West Indies, Dec. 21, 1864. He also composed two other operas, several symphonies, which were performed by Jullien's orchestra in New York, several cantatas, and a *Stabat Mater*. For several years he was the music critic on the New York *Tribune*, and he wrote many political, economical, and literary articles for the press.

Frye, William Pierce, LL. D.: U. S. Senator; b. in Lewiston, Me., Sept. 2, 1831; graduated at Bowdoin College in 1850; became a lawyer; was member of Maine Legislature 1861–62 and 1867; mayor of Lewiston 1866–67; attorney-general of Maine 1867–69; elected member of national Republican executive committee in 1872; re-elected 1876 and 1880; was presidential elector in 1864; delegate to national Republican conventions 1872, 1876, and 1880; became chairman of Republican State committee of Maine in 1881; representative in 42d, 43d, 44th, 45th, 46th, and 47th Congresses; was elected U. S. Senator from Maine 1881; re-elected 1883, and again in 1888 and 1895; member of the peace commission 1898.

Fryken, frü'ken: a series of lakes in Sweden extending in a north and south direction over a distance of about 15 miles, and emptying into the Lake of Wenner. They have the appearance of a broad river, and the valley which incloses them presents some of the finest scenery in Sweden; it has been called the Swedish Switzerland.

Fryxell, früks'el, Anders: a celebrated Swedish historian; b. at Hesselskog, Dalecarlia, Feb. 7, 1795, and studied philosophy and theology at the University of Upsala. From 1822 to 1836 he was director of one of the most prominent educational institutions of Stockholm, and in 1824 he wrote a grammar of the Swedish language which is used in all the higher schools of the country. In 1830 he took the prize of the Academy of Stockholm for a dissertation on the history of Sweden from 1592 to 1600. In 1836 he was appointed provost of North Wermland, a position in the Lutheran Church intermediate between minister and bishop, but in 1847 he resigned this office in order to devote himself entirely to historical studies. Fryxell's chief work is *Berättelser ur Svenska Historien* (34 vols.). In the Scandinavian countries this book is much read and highly esteemed, and parts of it have been translated into German and French. Its style is fluent and lively, its narrative brisk and graphic, and as the author has made very extensive studies of archives not only in Sweden, but in Poland, Prussia, and Denmark, his work is exceedingly rich in details at once new and authentic. In his leading views he forms an opposition to Geijer, who may be considered as the historian of the democratic party. The attacks upon the aristocracy by the historians of the democratic school occasioned Fryxell to write his book *Dur aristokrat-fordömandet in Svenska historien* (4 vols., 1845–50), in which he defends the Swedish aristocracy, without defending the crimes it may have committed or the general injustice of its political preponderance. The book gave rise, nevertheless, to a very fierce contest between the two historical schools, which spread from science into politics. D. at Stockholm, Mar. 20, 1881.

Fuad Pasha, foo'ăad-paă-shaa': Turkish statesman; a son of the poet Izzet Molla Kischedji-Zadek; b. at Constantinople in 1814. In 1840 he was secretary to the embassy in London; in 1843 was appointed interpreter in the ministry, and soon afterward sent to the court of Spain on an errand of diplomatic courtesy. In 1848 he was named commissioner-general in the principalities of the Danube. In 1849 he became Minister of the Interior, and from Aug., 1852, to Mar., 1853, from May, 1855, to July, 1857, and in Jan., 1858, he occupied the position of Minister of Foreign Affairs. He participated as a plenipotentiary in the conference at Paris. In 1860 he punished the Druses and Mohammedans for their persecution of the Christians, and in Nov., 1861, was appointed grand vizier. In Feb., 1862, he took charge of the finances, and in Feb., 1867, was appointed Minister of Foreign Affairs for the fourth time, while his friend, Aali Pasha, was appointed grand vizier. Fuad Pasha was a man of French education and tendencies, a great admirer of France and Napoleon III., and the chief support of the reform party in the Turkish empire. D. in Nice, France, Feb. 3, 1869. He wrote a grammar of the Turkish language, which has been translated into several languages.

Fuca, foo'kaă, Juan, de: a Greek navigator whose real name was Apostolos Valerianos, a native of Cephalonia; was many years in the Spanish service, and in 1592 discovered the channel known as the Strait of Juan de Fuca. This he professed to consider a passage joining the Atlantic and Pacific. D. in Zante in 1602.

Fuca'ceæ: See Fucoids and Vegetable Kingdom.

Fu-chow-foo: same as Fuh-chow-foo.

Fuchs, fook*h*s, Ernest, M. D.: ophthalmologist; b. in Vienna, June 14, 1851; educated at University of Vienna; assistant, Vienna Eye Clinic, 1876–81; Professor of Ophthalmology, University of Liège, 1881–86; *id.*, University of Vienna since 1885; author of *Das Sarcom des Uvealtractus* (1882); *Die Ursachen und die Verhütung der Blindheit* (English, French, and Italian translations); *Lehrbuch der Augenheilkunde* (English and French translations).

Fuchsia, fyu'shi-a [= Mod. Lat. *fuch'sia*, deriv. of *Fuchs*, a German botanist (1501–1566)]: a genus of dicotyledonous plants, belonging to the natural family *Onagraceæ*. The popular name of the genus is "ear-drop," from the appearance of the pendulous flowers. These are very showy, and of a red, violet, or rose color in their native state. They sport and cross easily, and hence result the numerous varieties known in floriculture. Those with white or cream-colored tints are the most highly prized. The tube of the calyx is showy in appearance, like the corolla, and is extended much beyond the ovary. It is bell-shaped or tubular, with four spreading lobes. The petals are also four in number, and the stamens eight. The style is long and thread-shaped, and surmounted by a club-shaped stigma. The flowers are on axillary peduncles. The plants are mostly smooth, with opposite or whorled leaves. They are either tender shrubs, climbers, or trees, natives of South America as far as Terra del Fuego, and also of the southern parts of North America; and New Zealand has some native species. Their best-known habitat is the Andes of Chili and Peru. The species in cultivation have been so much changed by art that it is often difficult to determine the line of their descent. They may be divided into short and long-flowered and panicled fuchsias. The plant forms a berry which is sweet or only pleasantly acid, and which is eaten in the countries where it is native. A black dye is said to be formed from the wood in Chili. Fuchsias are easily propagated by cuttings. They thrive in a light rich soil. They grow well in the open air in the summer time, but in the northern U. S. have to be housed in winter. There appears to be no limit to the curious freaks of color which they may be made to assume. They bloom best in a rather low temperature, such as is required for roses.

Revised by L. H. Bailey.

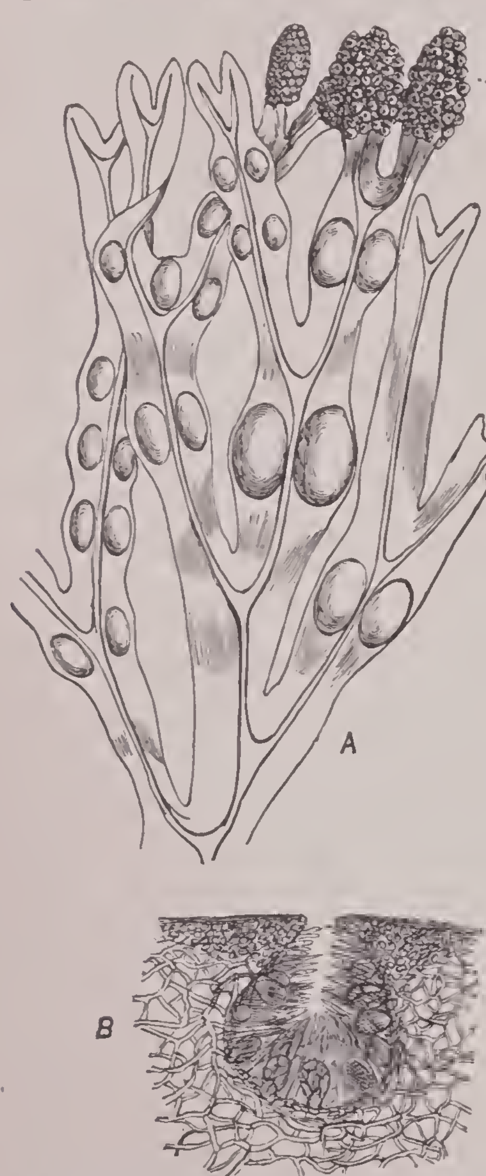
Fucino, foo-chee'nō, or **Celano**, chā-laa'nō (in Lat. *Fucinus*) **Lake and Tunnel of**: This lake lies about 50 miles eastward of Rome, at the height of 2,200 feet above the sea, in a mountain-basin in the Apennines having no known natural outlet. The ancient and mediæval accounts of the dimensions of Lake Fucino and of the fluctuations of its level are conflicting; but though its waters were undoubtedly partially carried off through natural conduits or fissures or porous strata in the subjacent rock, its depth and superficial extent have at all times been subject to great variation arising chiefly from the varying humidity or dryness of the seasons. In 1810 it covered 42,000 acres, with a maximum depth of $75\frac{1}{2}$ feet; in 1835 its area was but 33,000 acres, its greatest depth 34 feet. The occupation and cultivation of the debatable zone, of about 9,000 acres, between these extremes was of course attended with risk of loss, and at low water the freshly bared soil sent up miasmatic exhalations prejudicial to the healthfulness of the adjacent country. To obviate such evils, and to gain an addition of fertile soil for agricultural purposes by permanently reducing the lowest known level of the lake, Julius Cæsar contemplated the excavation of a tunnel under the mountain-ridge on the western side of the basin to discharge the superfluous water into the river Liris, now called the Garigliano, the bed of which is 62 feet lower than the bottom of the lake. This work was actually commenced by Claudius, and substantially completed after eleven years of labor. The length of the Claudian tunnel was 18,506 feet, or rather more than $3\frac{1}{2}$ miles, with an inclination of about $\frac{1}{1000}$, and a cross-section measuring 102 sq. feet, admitting a delivery of 424 cubic feet to the second. The tunnel was admirably engineered, but poorly constructed, and soon fell into total decay. At various subsequent periods attempts were made to restore the tunnel, but it does not satisfactorily appear that anything was effected until 1852–62, when, by the enterprise and liberality of Prince Alessandro Torlonia, of Rome, the entire line was rebuilt at a cost of more than $6,000,000, and on a far grander scale than that of the ancient imperial work. The new tunnel, which drained the entire lake by 1875, follows the original course, and, though at a somewhat lower level, includes the entire ancient channel, every vestige of the Roman tunnel having been necessarily removed in excavating the new. It is constructed with the utmost solidity, being everywhere lined with a thick revetment of cut stone; its cross-section measures 215 sq. feet, allowing a discharge of 2,400 cubic feet to the second; and, as its axis is lower than that of the Claudian emissary, and the bottom of the lake has been considerably raised in later ages by wash from the shores, the new tunnel is longer than the old by 2,200 feet. Hence its total length falls little short of 4 miles. From the entrance of the emissary a canal 8 miles long and 62 feet wide at bottom, requiring 4,000,000 cubic yards of cutting, was excavated to the deepest part of the lake. See Kramer, *Der Fuciner-See* (4to, Berlin, 1839); Leon de Rotron, *Proscingamento ad Lago Fucino* (8vo, Vienna, 1871)

G. P. MARSH.



A, a branch of *Fucus vesiculosus* (natural size), the fruiting parts at *f*. B, cross-section (enlarged) of a conceptacle.

Fucoids, fyu′-koidz, the *Fucoideæ*, an order of brown seaweeds commonly represented on the coasts of the U. S. by the rockweeds (Fig. A). They are plants of considerable size, ranging from a few inches to several feet in extent, and often show a differentiation into stems and leaves. Their outer tissues are composed of small and closely crowded cells, forming in some cases a hard mass, while the interior cells are loosely arranged, leaving large intercellular spaces.

They reproduce by sexual means only. In the ends of certain branches (see illustration, A, *f*) may be found nearly closed cavities ("conceptacles"), which are lined with hairs, some of which are antherids (producing motile antherozoids), while others produce egg-cells (see illustration, B). The latter when mature are set free by the rupture of the cells containing them, when they float out, where they meet the antherozoids; the latter unite with the egg-cells, and thus transform them into spores, which quickly germinate, and eventually give rise to a new plant.

There are about twenty genera, all of which are included in the single family *Fucaceæ*. The common rockweeds of the coast are species of Fucus and Ascophyllum. The closely related Gulf weed which floats abundantly in the ocean, especially in the Sargasso Sea, is *Sargassum bacciferum*.

The fucoids are all of a brownish or smoky-green color, resembling the KELPS (*q. v.*), which have often been included with them under the same name. Many fossil remains bear the name of "fucoids," although it is often very doubtful whether they were at all related to the plants under consideration.

CHARLES E. BESSEY.

Fucus: See FUCOIDS.

Fuel [M. Eng. *fuel, fowayle*, from O. Fr. *fouailles* < Low Lat. *foca′lium, foca′le*, fuel, deriv. of *focus*, fire = Lat. *focus*, hearth]: any substance which may be used for the generation of heat by its combustion in air. Many chemical reactions evolve heat from factors which are in no proper sense fuels; e. g. lime slaking with water, sulphuric acid mingled with water, quicklime drenched with sulphuric acid, and other like cases, evolve much heat although these substances are wholly incombustible. Properly speaking, only carbon and hydrogen, and the compounds of these two elements with each other, and with oxygen, nitrogen, etc., are fuels. This classification includes all the forms of coal, coke, charcoal, wood, turf, oils of every kind, and combustible gases, such, for example, as escape from artesian borings in oil-bearing and saliferous strata. It excludes sulphur, whether free or evolved from the roasting of ores, although this element is practically utilized as a source of heat in some chemical and metallurgical processes, as in refining sulphur.

Fuels differ very greatly in the amount of volatile matters they contain or which are produced from them in the process of combustion. Thus wood and turf contain a large percentage of free water, which is driven out or evaporated during combustion, while, in common with bituminous coals and lignites, they evolve also a large volume of combustible gases, tar, and other pyrogenic products. Such fuels burn with abundant flame, often with smoke, from imperfect combustion, and are well adapted to the generation of steam, the production of illuminating gas, and are preferred in many metallurgical processes. On the other hand, anthracite coal—of the harder variety—coke, natural or artificial, and charcoal from wood, burn with but little flame and no smoke, evolve little or no watery vapor, and from their firmness under the weight of a load and the high temperature they evolve are specially adapted to smelting iron and other metals, and to the production of a steady, intense, and long-continued heat for any purpose. Fuels also differ much in the amount of ash left by their combustion. In a few cases the ash is less than 1 per cent. of the weight of the fuel (e. g. albertite). The best coal yields 5 per cent. of ash or thereabouts, while many more contain 10 or even 20 and more per cent. of incombustible mineral matter. The presence of foreign matter of an incombustible nature in fuel is a loss of useful effect, not only by reducing the actual amount of carbon, etc., but in that it requires a certain amount of fuel to fuse the ash into a slag, which then encumbers the fire by clinkers. Water is another foreign element which greatly reduces the value of fuels. The common experience of the superior excellence of well-seasoned wood over green or recently cut wood is a familiar example. Water not only impedes combustion by reducing its temperature, but a large amount of heat is removed and rendered useless in converting the water into vapor. Furnaces have been constructed, however, for the purpose of consuming wet fuel, such as tan-bark, bagasse of sugar-cane, etc., in which, by an ingenious arrangement of parts, a high temperature and intense combustion are maintained, even when very wet fuel is used. One of these will be noticed hereafter. Even coal contains some moisture, and the varieties of lignite a much larger amount, while even well-dried wood retains 20 per cent. of water. Fuels containing oxygen also produce water in the act of burning, thus consuming a further quantity of heat. Even the hydrocarbon gases distilled in the combustion of coal are produced at the expense of a certain number of units of heat. It has therefore been asserted—and is often assumed to be true—that the total economical or useful effect of a fuel may be calculated from the known quantity of fixed or non-volatile carbon which it contains. It is, however, demonstrable that this statement, however theoretically correct, is not supported by experiment.

The value of the Pennsylvania anthracite (see ANTHRACITE) over all other coals as an agent for the production of high heats, especially in the high furnace and in the reduction and smelting of metals, is generally admitted. The superior evaporative power of anthracite was first demonstrated by the researches of Prof. Walter R. Johnson in 1844, by an elaborate series of experiments undertaken for the U. S. navy, and published in a *Report to the Navy Department of the United States on the Evaporative Power and other Properties of American Coals* (28th Cong., 1st sess., Senate Doc., pp. 607, 860, Washington, 1844). These researches were not confined to anthracite coals, but were extended also to natural coke, artificial coke, mixtures of anthracite and bituminous coals (Class I.); to free-burning bituminous coals of Maryland and Pennsylvania (Class II.); bituminous coking coals from Eastern coal-field of Virginia, in the neighborhood of Richmond (Class III.); and to foreign bituminous coals and those of similar constitution west of the Alleghany Mountains, and dry pine wood (Class IV.).

The highest evaporative power, as in the production of steam, is not, however, found in anthracite, but in the semi-bituminous coals, like those of Broadtop and the Cumberland region, and the coal of the Cruzot Basin, in which the proportion of hydrogen or volatile hydrocarbon is not greater than can be perfectly consumed in the furnace and flues of steam-boilers. This fact was first demonstrated by the researches of Johnson, and has since been confirmed by those of Sir Henry de la Beche and Dr. Playfair in their report on the coals suited to the steam navy of Great Britain (1848). The latest researches on this subject are those of Messrs. Scheurer-Kestner and Meunier on the coals of Rhenish Prussia and Belgium (abstracted in *Comptes Rendus*, tom. 66–69, and *in extenso* in the *Bulletins de la Société Industrielle de Mulhouse*). The calculations of Mendenhall on the heating powers of some Ohio coals (*Geological Survey of Ohio*, 1870) point in the same direction, as also those of Raymond on the lignites of the West.

BITUMINOUS COAL.—This coal contains a variable quantity of volatile matter, expelled as combustible gases when heated in close vessels, and leaves behind coke of variable strength, according as the coal is treated, and varying also with the amount of volatile matter expelled, and its physical and chemical constitution. Heated at lower temperatures, many of the coals of this class produce hydrocarbon oils, while coal-tar is a product of their destructive distillation at all temperatures, whence the name *bituminous*. When these coals agglutinate to form a hollow fire, they are called caking coals or fat coals. The mass softens and becomes pasty under heat and semi-viscid. This softening takes place below redness at the stage of incipient decomposition, and is attended with the escape of gas, which often blows bubbles, leaving the mass porous, and escapes in jets of smoke and yellow, smoky flame. With a higher heat in close vessels (gas-retorts) the escape of gas ceases gradually, and finally leaves a porous brittle mass of gray-black color and submetallic luster which is coke. The gas expelled in this way from bituminous (gas) coals varies from 25 per cent. to 50 per cent., and in the cannel coals rises even to 60 per cent.; the more common average being about 35 per cent. for gas-coals. The semi-bituminous coals of Pennsylvania and Maryland yield only from 12 to 20 per cent. of volatile matter. The *non-caking* or *free-burning* bituminous coals are like the caking coals in appearance, and often closely resemble them in ultimate composition, but they leave no proper coke. This is the character of the *lignites*, so called, of Colorado and Wyoming, mention of which is made beyond.

CANNEL COAL (*q. v.*) is a fuel of inconstant properties, owing its character, apparently, to local peculiarities of origin. *Torbanite*, *albertite*, *wollongongite*, and *grahamite* are bituminous minerals of exceptional richness in volatile hydrocarbon. The *torbanite*, or "bog-head" cannel, seems like a clay saturated with bituminous matter. It yields over 68 per cent. of gas and nearly 23 per cent. of ash, and only 8·8 of fixed carbon. *Albertite*, on the contrary, leaves only 0·10 per cent. of ash, and is regarded by Dana as an asphaltum, although commercially sold as an enriching coal.

BROWN COAL.—This variety of coal differs from bituminous coal chiefly in containing a larger amount of constitutional oxygen, more combined water, and in being generally more friable. Its powder is distinctly brown and not black, whence its name; but it is sometimes of a pitchy-black color and fine luster. It is found in more recent geological horizons than the coals before named. The deposits of this variety of coal opened in Colorado, Wyoming, and Utah are remarkable for extent, thickness, and uniformity, affording an inexhaustible supply of excellent fuel in a region for the most part destitute of forests and remote from all other sources of fuel-supply. Similar beds are found also in California and elsewhere on the Pacific coast. The brown coals are not caking coals, but are free-burning coals, yielding much gas, and are good steam coals, but not well adapted to carry the burden of the high furnaces for iron, although perfectly well adapted to general metallurgical use and to the Siemens gas furnace.

CHARCOAL AND COKE.—Charcoal prepared from hard woods at a high temperature is the purest form of carbon available as a fuel, being entirely free of sulphur and yielding only a little alkaline ash, with a small amount of silica. Burning to carbonic acid by oxygen, it forms the standard of comparison for the heat evolved by other less pure forms of fuel. By the experiments of Favre and Silbermann it gave per pound of fuel 8,080 calories (C.), equal to 14,544 calories F. Coke is less efficient than charcoal, just in proportion to the amount of ash it leaves, and this is usually about 15 per cent. But owing to its much greater strength under the crushing weight of the high furnace, as well also as its greater cheapness, it is the preferred fuel for the high iron furnace. The sulphur it retains from the pyrites found in the crude coal may be almost completely removed by proper mechanical treatment of the coal before coking. For this purpose the coal is crushed and washed in an apparatus similar to that used in the concentration of metallic ores, by which the pyrites is removed by virtue of its greater density, and the coke prepared from coal so treated is found to yield iron of a very superior quality, owing to its almost complete freedom from sulphur. In the process of coking the fine coal unites into compact prismatic masses, of a submetallic luster, sonorous when struck, like cast iron.

LIQUID FUELS.—The hydrocarbon oils found so abundantly in Pennsylvania and elsewhere, and produced artificially by the distillation of bituminous schists, offer a valuable resource for fuel in certain situations where their abundance enables them to compete with solid fuel. For example, the light naphtha forming from 20 to 25 per cent. of the first product of the distillation of Pennsylvania petroleum is extensively employed in the oil-regions as a steam fuel and for the distillation of the crude oil in its first stages of treatment. For this purpose the naphtha in vapor is burned from jets in wrought-iron pipes arranged beneath large boilers and pierced with numerous fine holes, the supply of air being regulated to secure a complete combustion. The exact value of light naphtha thus used as a source of heat has not apparently been practically determined in comparison with other liquid fuels. But a series of experiments are cited in the *Report of the Commission appointed to Inquire into the Several Matters relating to Coal in the United Kingdom* (1871), in which the materials employed were crude petroleum, crude paraffin oil, dead oil or creosote, and their calorific power and evaporative efficacy, determined by trials in the large way under steam-boilers, as compared with coal, under the direction of Prof. W. J. Macquorn Rankine. The results are as follows:

FOR ONE POUND OF—	Total quantity of heat generated.	Quantity of heat available for producing steam.	Quantity of water heated from 60° to 212° F., and converted into steam at 212° F.	Temperature of the fire or flame.
	Heat-units.	Heat-units.	Lb.	F.
Crude petroleum	20,000	16,847	15	4,646°
Crude paraffin oil	20,000	16,847	15	4,646°
Heavy oil—oil from either slate or coal	20,000	16,847	15	4,646°
Dead oil, or creosote	16,626	14.567	13	4,495°
Coal ... from	13,890	10,001	8·95	2,500°
Coal ... to	14,833	10,817	9·67	2,500°

The use of the vapor of the liquid hydrocarbons used under boilers, and even under the iron stills employed in the distillation of coal-tar of gas-works, as well as of petroleum products, has given most satisfactory results, reducing the time required for distilling a given charge fully one-half, and acting almost without injury to the stills, which are rapidly injured by the use of coal-fires. This difference is probably in great measure due to the much smaller amount of air required to feed the vapor-flame than is used for a coal-fire; 300 cubic feet of air (24 lb.) to the pound of coal being required, while not over half that amount is required to burn the hydrocarbon vapor supplied by a blast of its own production in place of the draft of a high chimney required for air-burning coal. The oxidation of the iron surface is thus largely saved, and the injury from sulphur in coal completely saved by the use of the hydrocarbon vapor. The conclusions reached by the commission referred to are that the evaporative efficacy of liquid fuel for generating steam is much greater than that of coal; and that on board ships there is an important saving of space for storage, as well as in labor of stoking, removing ashes, etc., with a proportional reduction of running expenses; while steam could be raised much quicker by the use of liquid fuel, and save the cost of banking up fires, and the immersion of the vessel more evenly maintained by tanks between the outer and the inner skins of the vessel, to be filled with water as the oil is removed. On the other hand certain obvious dangers attend the storing and use of volatile hydrocarbons, while the odor of the heavy or dead oils would be very annoying, however carefully stored on board ship. These objections do not appear to have been overcome, while for various purposes on land they have little force. Thus in iron-works dead oil has been use with advantage in the furnaces for heating iron plates, etc. It has been found possible to produce a higher, steadier, and more even heat with liquid fuel than with coal, while 8 cwt. are said to have replaced a ton of coal, and the time occupied in heating the iron is said to have amounted to only one-fourth or even one-fifth that required with coal. So that there was a manifest economy in the number of furnaces required to do a given amount of work. Thus, for instance, while the heating of a half-inch plate sufficient for bending would require from fifteen to twenty minutes with coal, it would require only four or five minutes with the liquid fuel; and a 4-inch armor plate requiring three hours to heat with coal required only thirty-eight minutes with the liquid fuel. The "scale" of magnetic oxide of iron formed in the process of heating is much less when liquid fuel is used than with coal, for the reason that there is less free oxygen from the air present, while the vapor of the hydrocarbon affords a reducing flame. In fact, the use of liquid fuel when burnt with a blast affords the same advantages as the gas furnace introduced by Mr. Siemens, which is mentioned further on. The unprecedented increase in the production of petroleum, not only in Pennsylvania, but in other parts of the world also, and which seems far from having reached its limits, renders the use of liquid fuel a subject at the present time of considerable importance. It is largely a question of relative cost, and it is obvious that it must needs be a very low cost indeed which will enable any description of liquid fuel to compete with coal.

Gas.—Natural gas, chiefly marsh-gas, was early observed in the salines of the Kanawha, and has been successfully used as fuel to heat the kettles of certain salt-works. In the city of Erie, Pa., gas obtained from artesian borings has also been used under steam-boilers to produce steam; and the marsh-gas from an artesian well near Rochester has been conveyed into that city for economical purposes. In the oil-regions of Pennsylvania the use of the gas escaping from the artesian wells is frequent for producing steam. The village of Fredonia in New York was as early as 1830 lighted by a natural flow of marsh-gas. Since 1883 natural gas has come into great prominence, both as a heat-producer and as an illuminant. The composition of the gas varies between the limits here stated: 60–80 CH_4, 5–20 H, 1–12 N, 1–8 C_2H_6, 0–2 C_2H_4, 0·3–2 CO_2. For the purpose of generating steam, 1,000 cubic feet of natural gas is equal to 80 to 133 lb. of coal.

Water-gas is of great value as a fuel. It consists of a mixture of carbon-monoxide and hydrogen, which is made by passing steam over highly heated anthracite coal. The heat of a water-gas flame is very high, and this gas is used to advantage for the production of high temperatures.

"The regenerative gas furnace" has worked a revolution in the methods of producing, applying, and economizing heat. The burning of a pound of carbon in pure oxygen to carbonic acid, as before stated, evolves 8,080 calories or units of heat (= 14.544 English units). As each unit of heat is convertible into 774 units of force or mechanical energy, it follows that 1 lb. of carbon represents really $14{,}544 \times 744 = 10{,}820{,}736$ units of potential energy. The mechanical power set free in the combustion of 1 lb. of pure carbon is as much, therefore, as would be required to raise nearly 11,000,000 lb. weight 1 foot high. This would sustain the work called a horse-power for about five and a half hours. This is a result quite unattainable in practice, of course, since, if for no other reason, the two elements of combustion can never be employed in a state of purity, and the oxygen is unavoidably mixed with about four times its own volume of inert nitrogen.

To realize how wide the margin for improvement was in the application of heat for smelting and metallurgical purposes prior to the invention of the regenerative gas furnace, and what this invention has done to economize fuel, it is only necessary to consider a few simple facts. The heat needed to smelt a ton of iron or steel, or to raise the temperature of a like quantity of iron bars to the welding point of malleable iron, is obviously very much more in excess of the amount theoretically required for these purposes than is required in the production of steam, because it is unavoidable that the products of combustion in the ordinary form of heating furnaces should leave the furnace at the temperature of combustion, while only the small excess stored up in the heated iron could be utilized. The remainder escaped unutilized into the chimney, and was lost. Taking the specific heat of iron at ·114 and the welding heat at 2,900° F., it would require $\cdot114 \times 2900 = 331$ units of heat to heat up 1 lb. of iron. Assuming that a pound of common coal develops 12,000 heat-units, one ton of coal should heat up to the welding point 36 tons of iron. But the ordinary reheating furnace heats only about $1\frac{3}{4}$ tons of iron, and therefore produces only about one part in twenty-one of the maximum theoretical effect. In melting steel in pots, in the ordinary Sheffield furnace for that purpose, $2\frac{1}{2}$ tons of coke are consumed to one ton of steel melted. Assuming the melting-point of steel at 3,600° F., and its specific heat at ·119, it takes $\cdot119 \times 3600 = 428$ heat-units to melt a pound of steel; while with 12,000 units at the heat-producing point of common coke, one ton of such coke should theoretically melt 28 tons of steel. In other words, the Sheffield pot furnace utilizes in the melting of steel only $\frac{1}{70}$th part of the theoretical heat of combustion. Here there was obviously a wide margin for securing an important portion of this great loss, and the regenerative gas furnace is the means which in the hands of Messrs. C. W. and Frederick Siemens has solved the problem, in part at least. See Furnace.

In the Siemens furnace the objects to be heated are sustained on a solid support in an atmosphere of burning gas, the oxygen of the atmosphere arriving by one inlet and the combustible gases by another, and the two uniting in a true Hare's blowpipe flame to do their work. The accessory contrivances, so essential in the economy of fuel, for the alternation of the flow of gas and air through the regenerative cellular flues of fire-brick are evidences of a high degree of inventive skill applied to the solution of a problem which, in its essential features, was clearly set forth by Robert Hare in 1802.

It is evident from these facts, which could be greatly extended did space permit, that for many purposes gas is the best form in which fuel can be applied for producing the highest temperature with the least loss of heat, and that the invention of the gas regenerative furnace of Siemens is the most important one yet made in the generation and application of heat.

Wood.—The value of wood as fuel depends mainly on its density in the dry state. Wood is composed of carbon, hydrogen, and oxygen, with a small proportion of nitrogen, and the mineral matter derived from the soil, constituting, when burned, its ash. Fresh or green wood contains from one-fifth to one-half its weight of water, which diminishes its value as fuel more than its proportion by weight, since a certain amount of heat is absorbed in converting this water into steam. Exposed to dry air, wood gradually loses a portion of its water, but being, by its porous nature, peculiarly liable to absorb moisture, it will take up a portion of water from damp air, so that, however well "seasoned" wood may be, it is never free from hygroscopic moisture, and is always in a condition of unstable equilibrium in this respect. Hence furniture and the woodwork in houses in a climate subject to such extremes of temperature and moisture as that of the U. S. is ever liable to change its dimensions between summer and winter. Air-dried wood may be deprived by artificial heat of a further portion of its moisture (kiln-drying). Rumford, who heated various kinds of air-dried wood at the temperature of 240° F. until they ceased to lose weight, obtained the following results:

100 parts of		100 parts of	
Oak wood lost	16·64	Fir wood lost	17·83
Elm " "	18·20	Birch " "	19·38
Beech " "	18·56	Lime " "	18·79
Maple " "	18·63	Poplar "	19·55

Rumford determined the amount of water absorbed by dry wood in the different seasons of the year in France, with the following results:

SPECIES OF WOOD.	100 PARTS IN WEIGHT OF DRY WOOD CUT INTO THIN SHAVINGS AND EXPOSED TO THE AIR, CONTAINED WATER—		
	In summer, at a temp. of 62° F.	In autumn, at a temp. of 52° F.	In winter, at a temp. of 45° F.
	Parts.	Parts.	Parts.
Poplar	6·25	11·35	19·55
Lime	7·78	11·74	17·50
Oak	8·97	12·46	16·64
Elm	8·86	11·12	17·20

From a comparison of these results it appears that woods when exposed to the air at a temperature of 45° F. contain twice the quantity of water they do when the temperature of the air is at 60° F. Rumford found that a sound oak beam which had been in a dry place for over 150 years still contained over 10 per cent. of water, and that a cubic inch of such wood contains more than half a cubic inch of air.

The elementary composition of wood of different sorts presents a very close resemblance. Thirteen different woods offer the following mean result: Carbon, 49·22; hydrogen, 6·25; oxygen, 44·02; nitrogen, 0·90. The differences are within 1 per cent. for the extremes; oak contains about 2 per cent. of nitrogen. The *ash* of wood varies from 8 per cent. in fir to 2½ per cent. in oak. It contains potash, with a little soda as distinguishing constituents (hence *potashes*), much lime and magnesia, with variable but small proportions of iron, manganese, phosphoric acid, chlorine, copper, etc.

PEAT AND TURF.—In many northern countries the vegetation of mosses, ferns, sedges, confervæ, rushes, reeds, and numerous small plants accumulates in swamps, morasses, and low places, each winter adding its quota to the mass of decomposing vegetable matter, in its turn the soil of a new vegetation the ensuing spring. Thus considerable accumulations are formed in process of time, the lower portions of which are black, unctuous, and somewhat dense, and are called *peat*, while the upper layers are spongy, fibrous, and less perfectly decomposed, and are called *turf*. In Holland, North Germany, Ireland, Scotland, and some parts of North America this material is rather extensively used as fuel. Air-dried peat contains from 15 to 20 per cent. of water, and its ash varies from 4 or 5 to 25 per cent., or more, averaging in the denser varieties about 15 per cent. The ash is very poor in potassa and soda, abounds in lime and free sand, while it is remarkable for containing notable quantities of phosphoric acid and sulphuric acid, and sometimes it contains iron pyrites in quantity sufficient to permit its use for the manufacture of green vitriol. (*Karsten.*) No means have yet been devised by which peat can be economically manipulated to compete with coal as fuel.

The calorific power of a fuel is the total amount of heat that can be obtained by its combustion. This is determined by burning a known weight of the particular kind of fuel under investigation, and allowing all the heat generated to act upon a known weight of water. By determining the temperature of the water before and after the combustion the quantity of heat given off can be deduced. The apparatus used for this purpose is called a calorimeter. (See HEAT.) The calorific power can also be determined on the large scale by estimating the amount of water converted into steam in a steam-boiler. Sometimes the calorific power is calculated thus: The fuel consists of carbon, hydrogen, and oxygen. It is assumed that the oxygen is in combination with hydrogen as water, and that the carbon and that part of the hydrogen which is not in combination with oxygen unite completely with oxygen in the process of combustion. As the calorific power of carbon and of hydrogen is known, the calculation can easily be made. Calculations of this kind, as might easily be imagined, give only roughly approximate results. The calorific powers of some fuels have been determined as follows:

	Calories.
Air-dried wood with 20 per cent. H_2O	2,800
Charred wood	3,600
Wood charcoal with 20 per cent. H_2O	6,000
Dry charcoal	7,050
Peat with 20 per cent. H_2O	3,600
Dried peat	4,800
Peat charcoal	5,800
Average bituminous coal	7,500
Good coke	7,050
Coke with 15 per cent. ash	6,000
Air-dried lignite	4,360–5,410
Hydrogen	34,462
Carbon burnt to CO	2,473
Carbon burnt to CO_2	8,080
CO burnt to CO_2	2,403
Marsh-gas	13,063
Olefiant gas	11,858

The value of a fuel is estimated by determining the amount of moisture contained in it, the volatile matter, the fixed carbon, and the sulphur. The chemist can comparatively easily make these determinations, and by the aid of these and of the determination of the calorific power a fairly reliable conclusion can be drawn as to the value of the fuel; but it is also important to note how it burns and other similar points which require the experience of one long accustomed to dealing with such matters.

Formerly fuel was interesting to mankind chiefly as the means of producing artificial heat in cold climates and for its use in the culinary art, which distinguishes civilized man from the savage. But the wonderful advance in modern times in chemical and metallurgical arts, and, above all, the universal introduction of steam as a motor and a vehicle for the transportation of heat, has given to fuel a value before unknown, leading not only to the development of all its available sources of supply, but to the study of its economical application with a view to obtaining from it the greatest useful effect and benefit possible. The phenomena and laws of combustion, and the methods of calculation of calories, are more fully discussed under HEAT; here chiefly the considerations which concern the economic value of fuel.

For a fuller discussion of this subject, consult Percy's *Metallurgy*, vol. i., and the French edition of the same, 1864 (*Traité complet de Métallurgie*); Knapp, *Chemical Technology* by Ronalds and Richardson (vol. i., pp. 8–99); Peclet, *Traité de la Chaleur* (3d ed. 1861, 3 vols.); W. R. Johnson, *Experiments on the Evaporative Power and Other Properties of American Coals* (1843), Cong. Doc., 28th Cong., 1st sess. (Senate, 386); *Dictionary of Applied Chemistry* (Thorpe), vol. ii., art. *Fuel*: Ad. Wurtz, *Dictionnaire de Chimie, Houille*: Marcus Bull, *Experiments to Determine the Comparative Quantities of Heat Evolved in the Combustion of the Principal Varieties of Wood and Coal used in the United States for Fuel*, etc., *Trans. Amer. Phil. Soc.*, (Philadelphia, iii., pp. 1–63, read Apr., 1826); Count Rumford (Benjamin Thompson): Rumford's most important papers on fuel and its use will be found in vols. ii. and iii. of *The Works of Rumford*, published by the American Academy of Arts and Sciences, Boston, 1870–73; in vol. iii. are his well-known papers *Of the Management of Fire and Economy of Fuel*, pp. 1–167, and his Essay X., *On the Construction of Kitchen Fireplaces and Kitchen Utensils*, etc.; De la Beche and Lyon Playfair, *First Report on the Coals suited to the Steam Navy* (Jan. 5, 1848), and *Appendix* by Prof. J. Wilson; *Experiments on the Evaporative Power of the Coals*, by Prof. Wilson and Mr. W. J. Kingsbury; *Experiments for Determining the Coefficient and Evaporative Power of Wood*, etc., by J. Arthur Phillips; *Chemical Analyses of Coals*, by F. C. Wrightson; *Ultimate Analyses of Coals*, by Mr. H. How; and lastly, *Calorific Value of Coals*, by J. A. Phillips, all in *Memoirs of the Geological Survey of Great Britain*, ii., pp. 539–630 (1848); *Report of the Commissioners appointed to Inquire into the several Matters relating to Coal in the United Kingdom*, 1871. *Blue Book C.*, 435, 3 vols. For an important memoir *On the Combustion of Coal*, quoted in the text, see M. A. Scheurer Kestner et Meunier (*Bull. Soc. industr. de Mulhouse*, 1869), cited in *Comptes Rendus de l'Acad. des Sci.*, t. 66, 67, 68, and 69, 1866–69; Kerl's *Metallurgy*, by Crookes and Röhring, in 3 vols.: vol. iii. *Steel—Fuel—Supplement* (New York, 1870). The second chapter of this treatise offers a full and satisfactory discussion, with the important advantage of references to all the more important sources of original information. See Phillips, *Metallurgy* (1874), art. *Fuel*; Bell, *Chemical Phenomena of Iron-smelting* (London, 1872); Box, *Practical Treatise on Heat* (London, 1868); Schinz, *Researches on the Action of the Blast Furnace*, translated by Maw and Müller (London, 1870, etc.); Wagner's *Chemical Technology*, translated by William Crookes (London, 1892); Ost, *Lehrbuch der Technischen Chemie* (Berlin, 1890). See also ANTHRACITE, COAL, CHARCOAL, COKE, CANNEL COAL, LIGNITE; also the articles GAS-LIGHTING, FURNACE, HEAT, FLAME, METALLURGY, NATURAL GAS; while the fuels suitable for various special uses are noted in the different articles on industrial processes and appliances.

Revised by IRA REMSEN.

Fuero, fwā'rō [Span., jurisdiction, judicial code, (formerly) court, seat of justice < Lat. *forum*, market-place, court-town]: the Spanish name for the old local codes of certain towns and districts, chiefly in the north of Spain. The fueros are very ancient, and are regarded with jealous affection by the places that possess them. They are mostly of Basque and Gothic origin.

Fuerteventura, fwer'tā-ven-too'ra': a mountainous and volcanic island, second in size of the Canary islands, and the most thinly populated of the group. It is but little cultivated. Area, 665 sq. miles. Pop. (1887) 10,041. Chief town, Puerto de Cabras.

Fugger, foo'ger: a celebrated German family, now represented by two lines of princes and several lines of counts and "most illustrious counts."—JOHANN FUGGER, a weaver of Graven, near Augsburg, was the founder of the family, which, however, acquired more influence from the success of his eldest son, JOHANN, who became a citizen of Augsburg 1370, and died 1409, leaving a fortune of 3,000 florins.—ANDREW FUGGER, the eldest son of the second Johann, founded the noble line of Fugger vom Reh, which died out in 1583. The descendants of the younger line became leading bankers, miners, and merchants, and the family was ennobled in 1504 by the Emperor Maximilian, who borrowed largely from them. Charles V. was also a borrower from the house of Fugger, whose famous representatives in his day were ANTONY and RAIMUND, who received the county of Kirchberg and Weissenheim, were given the title of counts, and awarded princely privileges. They were stanch Roman Catholics, and used their money freely in opposing the progress of the Reformation. Several were distinguished soldiers and statesmen, and many were liberal patrons of art.

Fughetta, foo-get'tā̆ [Ital., dimin. of *fuga*, by form of *foga*: Fr. *fugue* < Lat. *fuga*, flight. See FUGUE]: in music, a composition in fugue style, but usually shorter, less elaborate, and with more freedom of movement and structure than the regular fugue.

Fugitive-slave Laws: two acts of the U. S. Congress passed (under the provision of Art. IV., Sect. II., Clause 3, of the Constitution) to enable slave-owners to recover fugitive slaves escaping into other States. See SLAVERY.

Fugue, fyug [from Fr. *fugue*: Ital. *fuga*, *foga*, liter., flight < Lat. *fuga*, flight: Gr. φυγή, flight < Indo-Eur. *bhug-*, *bheug-*, *bhoug-*, yield > Sanskr. *bhuj-*, bend: Gr. φυγεῖν, flee]: a form of musical composition in which a certain theme or subject (consisting of a short melodious phrase) is first given out by one of the parts, and then taken up successively by the other parts, elaborately treated in various keys and with various harmonies, with the view of developing its beauty or interest by presenting it in a diversity of aspects and relations. "The designation of *fugue*," says Albrechtsberger, "doubtless originated from one part apparently *flying* before another, while the pursuing part, or answer, imitates the intervals of the first subject, generally precisely on the fifth above or fourth below, or on the octave above or below." Fugues are written for two, three, four, or more voices or parts, each of which in turn takes up the leading theme, and afterward continues its course as tributary to the general harmony. Besides the *simple* (i. e. a fugue with only one theme or subject) there are also *double* fugues, with two or more subjects. Fugues are also distinguished as *strict* or *free*; fugues in double counterpoint of the octave, tenth, or twelfth, etc.; and others in which the *motion* of the theme is changed into the *reverse* or the *retrograde*. A *choral* fugue is one in the course of which a plain choral song or chant is introduced as a new element, standing out in bold and stately form amid the interworking of the other parts, and giving an air of grandeur and sublimity to the whole composition.

The principal or leading theme of a simple fugue is called the "subject." The fugue commences with this, either in the bass or some other part, at the pleasure of the composer. The subject thus given out by the leading part is taken up by one of the other parts and in another key (or grade of the scale), usually by the dominant in answer to the tonic, or by the tonic in answer to the dominant. This is called the "answer." Meanwhile the first part proceeds in notes forming an accompaniment to the answer. A full and accurate knowledge of this form of composition requires much study with a master, and can not be neglected by any would-be composer, because of its intrinsic educational value. Modern music, with its greatly intensified harmonic and emotional effects, makes but comparatively small use of this form, *per se*, but it emphatically does of its spirit. Both the technical and æsthetic sides of this form of composition find their loftiest exposition in the works of Bach and Händel. Treatises on the subject may be found in the works of Cherubini, Albrechtsberger, Richter, Bridges, Prout, etc., but self-instruction is worth but little in conquering this art-form.

DUDLEY BUCK.

Fuh-chow, or **Foo-chow** [locally pronounced **Hok-chiu**, and sometimes spelled FOO-CHOO, FU-CHOW, and FUH-CHAU]: a walled city and treaty-port of China, capital of the province of Fuh-kien, and the residence of the viceroy of the united provinces of Cheh-Min, i. e. of Cheh-kiang and Fuh-kien. It is beautifully situated in a plain bordered by high, well-wooded hills, about 2 miles N. of the northern branch of the river Min, and 34 miles from its mouth; lat. 26° 5' N. and lon. 119° 20' E. (see map of China, ref. 7–K). Its walls have a circuit of 6½ miles, are about 25 feet high, and are pierced by seven gates surmounted by high watch-towers. From the number of mock-banian trees found in the temple-gardens and in the inclosures in which stand the yamuns or official quarters of the numerous provincial officers stationed here, the city has received the name of Yung Ch'ing, or "Banian City." The streets are narrow and dirty, and the shops poor, though well filled with goods. The eastern part of the inclosure contains the Tartar town, where a Manchu garrison has been maintained since the Manchu conquest of Fuh-kien in the latter half of the seventeenth century. On one of the three hills (about 300 feet in height) within the city stands the British consulate, though the consular offices and the residence of the consul are in the foreign settlement, on the northern slope of Nantai, the long narrow island (about 17 miles in length) which here divides the Min in two. The most important suburb is that which stretches from the south gate to the river-bank, where a stone bridge, the Bridge of Ten Thousand Ages, 1,350 feet in length, connects it with Chung-chow (Middle Island), from which another and similarly constructed bridge (less than 300 feet in length) stretches to the island of Nantai. The river here swarms with junks and boats, large numbers of which are used by the natives as dwellings. Sea-going junks anchor below this bridge, while foreign ships discharge their cargoes into lighters 10 miles lower down off an island called Lo Sing by the Chinese and Pagoda Island by foreigners, from a small pagoda on the island. Here on the left bank of the river is the Fuh-chow arsenal (founded in 1867), the most important naval establishment in the empire. It includes a school of navigation and extensive shops and ship-building yards (all under foreign superintendence), from which many war-vessels have been launched. Owing chiefly to its situation, Fuh-chow was never molested by the Taipings. In 1884, however, during the French hostilities in China, a short unequal engagement was fought, in which a Chinese fleet was destroyed and much injury done to the arsenal and the fortifications on the Min. The Chinese loss was estimated at 1,000 killed and 3,000 wounded, while the French loss was only seven killed.

Fuh-chow is one of the five cities opened to foreign trade by the treaty signed at Nanking in 1842. The total foreign imports in 1892 amounted to 4,396,217 haikwan or customhouse taels, and exports to foreign countries to 6,704,372 taels; the gross value of the trade of the port (foreign import and export, as well as native products carried by vessels engaged in the coasting trade) amounted to 12,622,150 haikwan taels. The principal articles of export were tea (5,671,703 taels), wood, including poles, coffins, etc. (251,052 taels), and paper (265,059 taels). In the six years ending 1892 the export of tea had decreased 50 per cent. The principal articles of import are cotton and woolen goods, opium, metals, clocks, kerosene oil, rice, and munitions of war.

Fuh-chow is now connected by telegraph with Canton, Shanghai, Peking, and the principal cities of the empire, as well as by cable with Formosa, Hongkong, and Europe. Pop. (1893) 636,000, including city proper, suburbs, and foreign settlement. R. LILLEY.

Fuh-kien, or **Fokien** (literally, happily established): a maritime province of China, corresponding nearly to the ancient kingdom of Min; bounded on the N. by Cheh-kiang, on the N. W. and W. by Kiangsi, on the S. by Kwangtung, and on the E. by the Formosa Channel. With the exception of some comparatively small tracts along the courses and near the mouths of its two rivers, the Min and the Lung-kiang, its entire area of 38,400 sq. miles is covered with hills, some of them, especially in the N. and N. W., of considerable altitude. Ku-shan, or "Drum Mountain," 6 miles below Fuh-chow, the capital, is 3,000 feet high, and is noted for its great Buddhist monastery, Yuen-fu, perched on its side at a height of 2,000 feet. Tea is extensively grown in this province, the brand known as Bohea taking its name from two ranges of hills known as Wu-yi (in the local dialect *boo-he*). The first tea imported into England in 1666 was grown on the Wu-yi hills in this province. From *te* (pronounced *tay*), the Fuh-kien pronunciation of *cha*, the Chinese word for tea, comes the French *thé*, Italian *tè*, Spanish *té*, German and Dutch *thee*, and the English *tea*. The other products of the province include grains of various kinds, but not sufficient for home consumption, oranges, bamboos, lichis, plantains, and sugar, besides gold, silver, iron, lead, and salt, paper, and cloth. Cotton-mills have been established at Fuh-chow by a native company, which has received special concessions from the government. Fuh-kien has two treaty-ports, FUH-CHOW and AMOY (*qq. v.*). It was among the last of the southern provinces to submit to Manchu rule when the native Ming dynasty was overturned in 1643, and many Fuh-kienese took refuge in Formosa rather than submit. In 1886 FORMOSA (*q. v.*) was detached and made into a separate province, since ceded to Japan. Pop. of Fuh-kien probably about 23,000,000. R. LILLEY.

Fuji-san, foo'jē-saan, or **Fuji-no-yama**: Mt. Fuji, the highest mountain of Japan, frequently but incorrectly called *Fusiyama*. It is a dormant volcano, said to have arisen in one night in the year 285 B. C., while at the same moment the earth near Kioto sank, and Lake Biwa was formed. The last eruption of Fuji took place Nov. 24, 1707, and continued until Jan. 22, 1708. It stands between the provinces of Suruga and Kai, about 60 miles W. of Tokio and the same distance from Yokohama, from both of which places it can be seen towering above the intervening mountains. It is an almost perfect cone, 12,365 feet in height, rising freely from the plain, and presenting the same appearance from whatever side it may be viewed. Hence its name, the *yama* or mountain (in Chinese *san* or *shan*), of one aspect or appearance, *fu-ji* being the Japanese pronunciation of the Chinese *puh-urh*, not two, the word *hing* (in Japanese *kei*), meaning outlines or aspects, being understood. The only deviation from the form of a true cone is a hump called Ho-yei-zan, on the upper slope of the south side of the mountain, and said to have been formed on the occasion of the last eruption. The summit, which is about 2½ miles in circuit, may be reached by four different paths. Fuji is one of the sacred mountains of Japan, and is visited annually by about 20,000 pilgrims. It forms a common but very prominent feature in Japanese decorative art. R. LILLEY.

Fulas: See FELLATAS.

Ful'co, or **Foulques** (Anglicized *Fulk*) **de Neuilly**, fook'-de-nö'yee': one of the greatest pulpit orators of the Middle Ages, and the chief preacher of the fifth crusade; flourished in the second half of the twelfth century. In the first years of his priestly office he led a life of miserable slackness, if not of gross vice, but in seeking to supplement his imperfect ministerial education by attending the lectures of Peter the Chanter, a theologian distinguished for his piety, Fulco's heart was touched, and he tried to atone for his past life by the severest asceticism. In a coarse cowl and girt with leather he journeyed as a preacher of repentance, and fearlessly condemned the vices of learned and unlearned, high and low. His words wrought such compunction that people scourged themselves, threw themselves on the ground, confessed their sins, and declared themselves ready to reform their lives and redress the wrongs they had done. "Many," says Jacob of Vitry, "inflamed with the fire of love and incited by his example, began to teach and to preach, and to lead not a few to repentance." Such a man was eminently qualified to advance the interest of the crusade movement which was just then being preached by Pope Innocent III. Peter the Chanter had been looked to as the great preacher of the fifth crusade, but his sudden death at the very inauguration of the movement led Innocent to select Fulco, and he was asked not only to preach repentance, but to request men to give proof of penitence by hastening to the land of promise. Fulco promptly complied with the papal commission, and of all "orators who blew the sacred trumpet" he was the most successful. He did not, however, live to see the results of the crusade. He died of fever at Neuilly, while the crusaders were still at Venice, in 1202. See Villehardouin, *Histoire de la Conquête de Constantinople* (trans. by T. Smith, London, 1829, 8vo); Milman, *Hist. Latin Christianity*, bk. ix., ch. vii.; Cox, *The Crusades* (New York, 1874).

Fulda, fool'daa: town of Germany; in the electorate of Hesse-Cassel, on railway and on the Fulda; 67 miles by rail N. E. of Frankfort-on-the-Main (see map of German Empire, ref. 5-E). Its cathedral, built in the style of St. Peter's church in Rome, is a beautiful and interesting building. There are excellent schools and considerable manufactures. Fulda was the capital of a former principality of the same name. It was the site of a famous mediæval monastery and abbey, and possessed a university from 1734 to 1803. Pop. (1890) 13,125.

Fulford, fool'furd, Rt. Rev. FRANCIS, D. D.: b. at Sidmouth, England, June 3, 1803; was educated at Exeter College, Oxford, where in 1824 he received a fellowship. He afterward held prominent positions in the Church of England, and in 1850 became Lord-Bishop of Montreal and Metropolitan of Canada. D. at Montreal, Sept. 9, 1868. He was an accomplished scholar, an eloquent preacher, and published *Sermons, The Progress of the Reformation in England* (London, 1841), etc.

Fulgen'tius, FABIUS CLAUDIUS GORDIANUS, Saint: Bishop of Ruspe in Numidia, "the Augustine of the sixth century"; b. at Telepte, in the province of Byzacene, in Africa, 468 A. D.; was intended for civil life, attaining the position of fiscal procurator of the province, but became disgusted with the world and retired to a monastery at Byzacene, and later lived at Sicca Venena. About 500 he visited Rome. On his return to Africa he founded a monastery, and became greatly distinguished for learning and devotion. In 508 he was made Bishop of Ruspe, or Ruspæ, and became one of the ablest apologists of Catholic Christianity. The Arian Vandals predominating, he often provoked their hostility, and was twice banished to Sardinia. In 523 a favorable change in the government brought about a recall of Fulgentius and all other expelled bishops, and thenceforward he enjoyed the possession of his see till A. D. 533, when he died. He was renowned for piety, learning, and every virtue. He is commemorated in the Church of Rome on Jan. 1. His writings are mostly against Arianism and Pelagianism. His most important work is *De veritate prædestinationis et gratia Dei*, directed against the Pelagianism of Faustus of Rhegium. Fulgentius explained "the system of Augustine with consistency, but carefully avoided the harsh points of the Predestinarian view." (Neander, *Ch. Hist.*, ii., 650; Clark's trans., iv., 417 ff; Shedd, *History of Christian Doctrine*, ii., 104 ff; cf. Hagenbach, *Hist. Doctr.*, § 114.) Yet even Fulgentius held in this very work that all unbaptized children, even such as die in the womb, are consigned to damnation—"*æternis et ignibus deputatus.*" Wiggers, *Darstellung des Semipelagianismus* (Hamburg, 1833), ii., 356. Editions of his writings: Basel, 1556, 1566, 1587; Antwerp, 1574; Cologne, 1618; Lyons, 1633, 1652, 1671; best, that of Paris, 1684, 4to, by Saint-Desprez; Venice, 1742, fol., and in Migne, *Patrologia Latina*, tome lviii. See also Schroeckh, *Kirchengeschichte*, xvii., xviii., 108 ff.

Revised by W. S. PERRY.

Fulgentius, FABIUS PLANCIADES: a Latin grammarian of whose life nothing certain is known. He is supposed, from his writings, to have been born or to have lived in Africa about the beginning of the sixth century A. D. Under his name three works have survived, which, though written in a slovenly and diffuse style and full of inaccuracies, still have a value in preserving certain details elsewhere omitted. The first of these works is entitled *Mythologicon* or *Mythologiarum libri III.*, of considerable service in the study of ancient mythology, but full of strange explanations. The second is *Expositio Sermonum Antiquorum*, or, more correctly, *De abstrusis Sermonibus*, a brief list of rare or obsolete expressions, with explanations, most of which have no value. The third is *De Expositione Virgilianæ Continentiæ* (contents, subject-matter), or *De allegoria librorum Virgilii*, an allegorical explanation of Vergil's *Æneid*, as representing human life. Fulgentius appears further, from some expressions, to have been a Christian, and is sometimes confounded with Fulgentius, Bishop of Ruspe, whose theological writings are extant. Another work has come down in part which is ascribed by Teuffel (in his *Hist. Rom. Lit.*) to this Fulgentius, though the name of the author is given as Fabius Claudius Gordianus Fulgentius, and he is generally considered to be neither the grammarian nor the bishop. The title of the work was *Liber absque litteris de ætatibus mundi et hominis*, in as many books as the letters of the alphabet, with the trivial intent, apparently, of enabling him to omit in each book one letter. Of the twenty-three, only fourteen have been preserved; edited by J. Hommey (Paris, 1696). The works of the grammarian Fulgentius are best edited in the *Auctores Mythographi Latini*, by Van Staveren (Leyden, 1742). See *Fulgentius de abstrusis Sermonibus*, by Dr. L. Lersch (Bonn, 1844); Zink, *Der Mytholog. Fulgentius* (Würzburg, 1867); Jungmann, in *Ritschl's Act. Soc. Philol. Lips.*, vol. i. (Leipzig, 1870). Revised by M. Warren.

Ful′gurites [from Lat. *fulguri′tus*, perf. partic. of *fulguri′re*, strike with lightning, deriv. of *fulgur*, lightning, deriv. of *ful′geo*, lighten. See Fulminates]: tubes of vitrified sand found in sandbanks and sandy soils. They are produced by the intense heat of electrical discharges, which fuses the sand together.

Fulham, fo͝ol′am: a western suburb of London, England; situated on the Thames opposite Putney (see map of England, ref. 12–J). It contains the palace of the Bishops of London. Pop. (1901) 137,289.

Fuller, Andrew: theologian; b. at Wicken, Cambridgeshire, England, Feb. 5, 1754; became the Baptist pastor of Soham in 1775, and in 1782 removed to Kettering; bore a prominent part in the propagation of Calvinistic doctrines of a less extreme type than generally prevailed at that time in his denomination, and was one of the leaders in the revival of the foreign mission-work among the English Protestants. Author of *The Gospel Worthy of all Acceptation* (London, 1784); *Dialogues and Letters* (1806); *Calvinistic and Socinian Systems Compared* (1793); *The Gospel its own Witness* (1800); and of many other treatises. His complete *Works* (8 vols., 1824) have been often reprinted. He received the honorary degree of doctor of divinity from the College of New Jersey (1798) and also from Yale College (1805), but he never used it. D. at Kettering, North Hants, May 7, 1815. Fuller's writings are all characterized by intense devotion to "evangelical" Christianity, by vigorous common sense, and by a subtle insight into men and things. He has been styled "the Franklin of theology." See his *Life* by John Ryland (London, 1816); by T. E. Fuller (1863); and by A. G. Fuller (1882).

Fuller, George: figure and portrait painter; b. in Deerfield, Mass., in 1822; studied in Boston, New York, London, and on the Continent; associate National Academy, New York, 1857; member Society of American Artists 1880. He returned to the U. S. in 1860 from his studies abroad and engaged in farming at Deerfield. He did not exhibit his work again until 1876, when he showed fourteen canvases in Boston. In 1879 he exhibited in New York his *Romany Girl* and *And She was a Witch*; in 1880 the *Quadroon* and *Winifred Dysart*; in 1882, *Psyche*; in 1883, *Fedalma*; in 1884, *Arethusa*; and besides the above many portraits. He died in Boston, Mar. 21, 1884. Fuller has been given a high reputation by some writers on art. Soon after his death a memorial exhibition of his works was held in the galleries of the Museum of Fine Arts in Boston. Most of his pictures are owned in Boston; the study for the *Romany Girl* is in the collection of T. B. Clarke, New York.

William A. Coffin.

Fuller, Margaret: See Ossoli.

Fuller, Melville Weston, LL. D.: jurist; b. in Augusta, Me., Feb. 11, 1833; graduated at Bowdoin College 1853; studied law with his uncle, George M. Weston, at Bangor, Me., and attended lectures at law department of Harvard University; commenced practice of law in Augusta, Me., in 1855, but devoted himself chiefly to editorial duties on the *Age*. In 1856 he was president of the common council, and also city solicitor, but resigned both offices and removed to Chicago, Ill., where in 1888 he had practiced law thirty-two years with great honor and success. He was delegate to the State constitutional convention 1861, and to the Democratic national conventions of 1864, 1872, 1876, 1880; member of State Legislature 1863. He is an old-school Democrat, and was nominated by President Cleveland for chief justice of the U. S. Supreme Court Apr. 30, 1888; confirmed July 20, and took the oath of office and his seat Oct. 8.

Fuller, Thomas, D. D.: clergyman and author; b. at Aldwincle, England, June, 1608; graduated B. A. at Queen's College, Cambridge, with the highest honors 1625; M. A. 1628; entered holy orders 1630 as perpetual curate of St. Benet's, Cambridge; became prebendary of Sarum 1631; resigned St. Benet's 1633 and became rector of Broadwindsor, Dorsetshire, 1634; was a member of the convocation 1640; resigned his prebend 1641 and settled in London; later he openly espoused the royal side, and led an unsettled life during the troublous times of the Commonwealth; was made chaplain to Charles II. in 1660 and was created D. D. Author of *David's Hainous Sinne* (a poem, 1631); *History of the Holy War* (1639); *Good Thoughts in Bad Times* (1645; 2d "century" of the same, 1646); *Good Thoughts in Worse Times* (1646); *Mixed Contemplations in Better Times* (1660); *Pisgah-sight of Palestine* (1650); *Holy and Profane State* (1642); *Church History of Britain* (1655); *Worthies of England* (1662); and a few less important works. His writings are remarkable for quaintness of style, for wit, sagacity, learning, and moral elevation; and the *Good Thoughts*, *Worthies*, *Church History*, and *Holy and Profane State* are English classics. D. in London, Aug. 15, 1661. The best biography is by J. E. Bailey (London, 1874).

Revised by S. M. Jackson.

Fuller's Earth: a greenish-white oölitic clay, chiefly found in Bedfordshire, Kent, and Surrey in England, and at many points on the Continent. From one-fourth to one-fifth of the mass is alumina, the rest chiefly silica and water, with some lime and other ingredients. It was formerly much used by cloth-dressers for cleansing the oil from woolen fabrics. Though in part superseded by soap, it is still used to a considerable extent by European manufacturers because it is much cheaper than soap, and if of good quality is scarcely less effective. Cimolian earth and various argillaceous substances share this detergent property. The annual consumption of fuller's earth in Great Britain is said to have amounted at one time to 6,000 tons.

Fullerton, Lady Georgiana Charlotte (*Gower*): English author; daughter of Lord Granville Leveson Gower; b. at Tixall Hall, Staffordshire, Sept. 23, 1812. She was married to an Irish gentleman, Alexander George Fullerton, in 1833, and in 1846 followed her husband into the Roman Catholic Church. She was distinguished for her works of benevolence and philanthropy, and her books, some thirty in number, and including several novels, are of a strongly religious and Catholic temper. Among them are *Constance Sherwood* (1865); *Mrs. Gerald's Niece* (1869); *The Gold Digger and other Verses* (1871); besides numerous lives of saints, memoirs of Catholic worthies, and translations from the French and the Italian. See *The Life of Lady Georgiana Fullerton*, translated from the French of Madame Augustus Craven by Rev. Henry James Coleridge (London, 1888). D. Jan. 19, 1885. H. A. Beers.

Fulling [deriv. of *full*, whiten < M. Eng. *fullen*, from O. Fr. *fouler* (but prob. under influence of *fuller* < O. Eng. *fullere*, from Lat. *fullo*, fuller) < Low Lat. *fullare*, full, deriv. of *fullo*, fuller]: an operation by which fabrics made of carded wool are shrunk, thickened, and partially felted. The woven goods are scoured and boiled (to remove knots and lumps), then soaped very thoroughly, and finally either beaten in the fulling-stocks or passed through great rollers. This operation is much like the previous scouring, except that fuller's earth, hog's dung, and urine are used in the scouring, while soap and hot steam are used in the fulling proper. The fulling process lasts from forty-eight to sixty-five hours. When complete, the threads of the cloth are scarcely perceptible, the tendency to unravel is overcome, and the cloth shrinks often nearly one-fourth in length and sometimes about one-half in breadth. The shrinkage is much less when dyed wool has been used.

Fulmar, fŭl'määr: any one of several sea-birds of the genus *Fulmarus*, web-footed birds that feed upon fish, dead whales, cirripeds, mollusks, etc. The best known is the *Fulmarus glacialis*, fulmar or fulmar petrel of the North Atlantic. This bird is much sought for by the fowlers upon the cliffs of St. Kilda, who gather its eggs (which are highly prized), its feathers and down, and the fish-oil in its stomach, which is commercially valuable. Another species is the *Fulmarus giganteus* of the Pacific, a bird as large as a goose. See Petrel.

Fulminates [deriv. of *fulmin-*, compounding form of *fulminic acid*, i. e. explosive acid, *fulminic* being deriv. of Lat. *fulmen*, **fulgmen*, lightning, deriv. of *fulgeo*, lighten. See Fulgurites]: salts of fulminic acid, which is not known in the free state. It forms salts with a great number of bases, but only a few of them are of importance.

Fulminating mercury is highly explosive, and its action is so sudden that it may be said to detonate. It explodes when heated to 186° C. or if exposed to a strong blow, and its force is somewhat greater than that of gunpowder; but, while it is more violent, its sphere of action is very limited. It is therefore of no practical value as an explosive agent in blasting or gunnery, but the readiness with which it may be fired makes it of great importance as a means of causing the explosion of other substances. In percussion-caps, primers, and friction-primers fulminating mercury is rarely used pure, but is mixed with saltpeter, mealed powder, or other bodies. See Explosives.

Fulton: city and railway center; Whiteside co., Ill. (for location of county, see map of Illinois, ref. 2–D); on the Mississippi river, and on the Chicago and Northwestern Railway; 135 miles W. of Chicago. It is the southern terminus of a line of steamers which, during the season, bring down millions of bushels of grain from Wisconsin, Minnesota, and Northwestern Illinois, and on their return trip take up great quantities of merchandise, agricultural implements, etc. Fulton has a large elevator, pipe-factories, a stoneware-factory, and carriage-factories, and its lumber interests are very important. The Northern Illinois College is situated here. Pop. (1880) 1,733; (1890) 2,099; (1900) 2,685.

Fulton: town; Fulton co., Ky. (for location of county, see map of Kentucky, ref. 5–B); junction of the Illinois Central and the Newport News and Mississippi Valley Railroads; in a fine agricultural region. It has two colleges, a foundry, spoke-factories, planing-mills, and manufactures of wagons, tobacco, flour, lumber, etc. Cotton-ginning and wool-carding are also carried on. Pop. (1880) 826; (1890) 1,818; (1900) 2,860. Editor of "Fultonian."

Fulton: city; capital of Callaway co., Mo. (for location of county, see map of Missouri, ref. 4–H); on the Chicago and Alton Railroad; 25 miles N. E. of Jefferson City and 25 miles S. of Mexico. It has 6 churches, fine public schools, and many other educational and benevolent institutions, among them a Presbyterian college, 2 schools for females, a State orphan school for girls (Christian), and the State asylums for deaf-mutes and for the insane. Coal and fire-clay are in abundance, and the city has a fine pottery and an excellent system of water-works supplied from sources 900 feet below the surface. Principal business, farming and stock-raising. Pop. (1880) 2,409; (1890) 4,314; (1900) 4,883. Editor of "Gazette."

Fulton: village; Oswego co., N. Y. (for location of county, see map of New York, ref. 3–G); on Oswego river and Oswego Canal and the N. Y. Cent. and Hudson R. Railroad; 24 miles N. of Syracuse and 12 miles S. of Oswego. It has 8 churches, an academy, ample water-power, 5 flour-mills, 2 buckwheat-mills, 2 edge-tool works, 3 paper-mills, 3 pulp-mills, a large manufactory of firearms, a woolen-mill, and manufactures of paper-mill machinery, pulleys, cider-mills, etc. It is an important cheese-market. Pop. (1880) 3,941; (1890) 4,214; (1900) 5,281.

Editor of "Patriot and Gazette."

Fulton, Robert: inventor; b. at Little Britain, Lancaster co., Pa., in 1765, of Scotch-Irish stock; went to Philadelphia when seventeen years old, and practiced the art of miniature-painting there and in New York with such pecuniary success that he was soon able to purchase a farm for his mother's support, whereupon he went to London and became a pupil of West; and throughout life he retained his early fondness for art, in which he from time to time made attempts which indicate very considerable power and capacity as an artist. In Great Britain he met with the Duke of Bridgewater, the father of the British canal system; with Lord Stanhope, an enthusiastic mechanician; and with Watt, the inventor of the steam-engine; and by their direct or indirect influence his attention was turned strongly to mechanical invention, his true field of labor. His machines for marble-sawing, rope-making, flax-spinning, and removing earth from excavations soon after appeared. His *Treatise on the Improvement of Canal Navigation* (1796) and a series of essays on canals were followed by a British patent for canal improvements, consisting chiefly in the substitution of inclined planes for locks. He resided in Paris 1797–1806, and there brought forward a submarine torpedo-boat for maritime defense, which was successively rejected by the French, the British (1805), and the U. S. Governments (1810). In 1803 he undertook the construction of a steamboat on the Seine, having in 1793 addressed a letter upon the subject to Lord Stanhope, himself an experimenter in steam-navigation. Fulton (in 1803), in company with Henry Bell, the first successful British steam-navigator, visited the Clyde, where Symington's Charlotte Douglas, a steam canal tow-boat, was then plying. But Fulton's Seine experiment was but partly successful. Aided, however, by Chancellor Livingston, then U. S. minister in France, he purchased (1806) a Boulton and Watt engine and shipped it to New York, where, after careful study of the defects and merits of previous attempts in the same direction, he built and launched (in 1807) the Clermont, his first successful steamboat, which, however, attained a speed of only 5 miles an hour when going up the North river. His first U. S. patents (1809 and 1811) covered only some points regarding the attachment of the paddle-wheels to the axle of the crank, and throughout life Fulton was involved in lawsuits with parties infringing upon his claims. He constructed many steamboats, ferryboats, etc., among the most remarkable of which was the U. S. steamer "Demologos," afterward called *Fulton the First* (built 1814–15), the first war-steamer ever constructed. She never attained much speed, and in 1829 was blown up by accident. Fulton died in New York, Feb. 24, 1815. See Colden's *Life of Fulton* (1817); Preble's *History of Steam Navigation* (1883); and Knox's *Fulton and Steam Navigation* (1886).

Fultonville: village; Montgomery co., N. Y. (for location of county, see map of New York, ref. 4–I); on the Erie Canal and Mohawk river, and on the West Shore Railroad: 44 miles W. of Albany; in a rich farming district; connected with Fonda, the county-seat, and the Central Railway dépôt by an iron bridge costing $50,000. It has three churches, a union free school, a public library, a silk-mill, broom-factory, foundry, steam lumber-mill, steam flour-mill, and grain elevator. Pop. (1880) 881; (1890) 1,122; (1900) 977.

Editor of "Montgomery County Republican."

Ful'via: a Roman lady; daughter of M. Fulvius Bambalio; was the wife of P. Clodius, by whom she had a daughter, Clodia, afterward wife of Augustus. After the murder of Clodius, she married C. Scribonius Curio, and her third husband was Mark Antony, whom she loved sincerely, and for whose sake she abandoned the dissolute habits of her earlier life, entering heartily into his ambitious plans, and behaving with great cruelty to his enemies. When her husband was dallying with Cleopatra she created an insurrection for the purpose of recalling him, but was driven from Italy. At Athens she met her husband, who treated her with great harshness, whereupon she retired to Sicyon, and soon after died of chagrin (b. c. 40). The triumvirs were then reconciled, and Antony married Octavia, sister of Augustus. Fulvia left two sons by Antony.

Fumigation [deriv. of *fumigate*, from Lat. *fumiga're*, *fumiga'tum*, fumigate; *fu'mus*, smoke + *a'gere* + drive]: the application of smoke, gases, or vapors for various purposes, as to produce or destroy odors: to bleach in certain manufacturing processes—to destroy infection; to act as a local application in diseases of the air-passages, and to form a part of the ritual in certain religious ceremonies. For the use of fumigation by sulphurous acid or chlorine, see Disinfection. The fumes of burning sulphur are employed for bleaching straw. For medicinal purposes the fumes of stramonium, tobacco, nascent muriate of ammonia, oxide of mercury, and of various gum resins are sometimes employed. J. S. Billings.

Fu'mitory [altered by analogy with words ending in *-ory* from M. Eng. *fumetere*, from O. Fr. *fume-terre*, from Low

Lat. *fumus-terræ*; *fumus*, smoke + *terræ*, of the ground, gen. of *terra*, ground]: the *Fumaria officinalis*; a weed of Europe, now naturalized in the U. S.; belonging to the family *Fumariaceæ*. It is a rather handsome herb, with a strong, disagreeable taste. Its sap abounds in saline matter and a principle called fumarin. Fumaric acid is also reported to be found. This herb is in parts of Europe valued as a tonic, diaphoretic, and aperient, and is esteemed for the treatment of skin diseases. The climbing fumitory of the U. S., called also mountain-fringe, is a delicate biennial, the *Adlumia cirrosa* of the same family, which is very fine in cultivation when trained in a shady place upon latticework. Revised by CHARLES E. BESSEY.

Funchal, foon-shaal′ [Portug., liter. (place) of fennel, deriv. of *funcho*, fennel < Lat. *feni′culum*, whence Eng. *fennel*]: the capital of the island of Madeira; situated on its southern coast; lat. 32° 37′ N., lon. 16° 54·5′ W. It is a handsome place, with a good harbor, and the center of the wine-trade of the island, and is a bishop's see. The climate is salubrious, and the place has a hospital for consumptives. Pop. 20,000.

Funck, foonk, or **Func′cius**, JOHN NICHOLAS: Latin scholar; b. at Marburg, Mar. 29, 1693; appointed in 1730 Professor of Eloquence and librarian in the academy at Rinteln, at which place he died Dec. 17, 1777. His chief contribution to classical learning is a history of the Latin language, which he divides into periods corresponding to the different periods of man's life, to each of which a separate treatise is devoted. The titles and dates of publication are *De Origine Latinæ linguæ tractatus* (Giessen, 1720; 2d ed. Marburg, 1735); *De Pueritia Latinæ linguæ* (Marburg, 1720); *De Adolescentia ling. Latinæ* (*ib.*, 1723); *De Virili Ætate ling. Latinæ*, in 2 parts (*ib.*, 1727–30); *De imminenti linguæ Latinæ Senectute* (*ib.*, 1736); *De Vegeta ling. Lat. Senectute* (*ib.*, 1744); *De inertia et decrepita ling. Lat. Senectute* (Lemgo, 1750). Besides these, Funck published the fragments of the *Laws of the XII. Tables* (Rinteln, 1744), and several minor works. H. DRISLER.

Funcke, OTTO: See the Appendix.

Function [from O. Fr. *function* > Fr. *fonction* < Lat. *func′tio*, performance, execution, deriv. of *fun′gi*, *func′tus sum*, perform]: in mathematics, a quantity which is conceived to depend upon, or be produced by, some other quantity to which values can be assigned at pleasure. The latter quantity is called an *independent variable*. We then conceive that for every value we choose to assign to the independent variable a certain value of the function will result. A simple illustration is afforded by the relation between the time required for a train to pass over a certain distance and the velocity of the train. The distance from New York to Washington being 225 miles, a train running at a mean speed of 45 miles per hour will make the distance in five hours; at a speed of $37\frac{1}{2}$ miles an hour, it will make it in six hours. If we assign any value we please to the speed, we can compute a corresponding value of the time by simple division. The mathematician would then say that the *time* is a function of the *speed*. Conversely, we may say that the speed is a function of the time; that is, assign any time we please as that within which the train is required to run, and we can compute a corresponding speed at which the train must run.

In mathematics a function is commonly expressed as equal to a certain algebraic expression containing an independent variable. It is then called an explicit function. It follows from this that there may be as many kinds of explicit functions as we can form algebraic expressions, and they are therefore classified according to the nature of the expression which represents them. Entire functions are so called because they are of the nature of an integer, or entire number. They are those the formation of which involves no operation except addition, subtraction, and multiplication. Thus $ax + by$ is an entire function of the quantities which enter into it. So also is $a + bx + cx^2 + dx^3 +$ etc. This expression is called an entire function of x, because it may be formed by multiplying x by itself, thus forming its powers; then multiplying these powers by the factors a, b, c, d, etc., and then adding them, thus requiring no operations except those we have named.

A rational function is one which involves only the operations of addition, subtraction, multiplication, and division upon the quantities which enter into it. Such a function is

$$\frac{ax + by}{mx + ny}.$$

An irrational function is one which requires the extraction of a root and which can not be represented by a rational quantity. Thus the cube root of a^3 is not irrational, because it is equal to a simply; but the cube root of a^2 is irrational.

The three classes of functions just defined are sometimes called algebraic, and all others transcendental.

An implicit function is one which is expressed as the unknown quantity or root of an equation. Such a root depends for its value upon the coefficients of the unknown quantity, and is therefore considered as a function of those coefficients. If the equation by which the roots are defined does not exceed the fourth degree, the root may be represented as an irrational function of the coefficients (see EQUATION); but if the equation is general in its form, and is of the fifth or any higher degree, no such representation is possible. S. NEWCOMB.

Function (mental): See PSYCHOLOGY.

Fundamental Bass: in music, the lowest term of a chord when that chord is in its original or natural form—the root or tonic as contradistinguished from the bass of *inverted* chords.

Fundamental Chord: (1) a chord in its original or normal form, not inverted; (2) a chord not accidental, anomalous, derived, etc., but essential and indispensable; as, e. g., the major and minor triads and the chord of the seventh.

Fundamentals, or **Fundamental Articles of Faith** [*fundamental* is from Low Lat. *fundamenta′lis*, pertaining to a foundation, concerning the foundation; deriv. of *fundamen′tum*, foundation; deriv. of *funda′re*, found; deriv. of *fundus*, bottom]: those doctrines which lie at the basis of a system or are involved in the right of a system to exist—its foundation. It is a relative term, and when a doctrine is asserted to be fundamental a necessary question always is, To *what?* It is also expressive of degrees of necessity, and allows of the question In what respect? It is therefore never a defining word till it has been defined. There may be a perfect agreement on the general sense of the word, and a total diversity as to the propriety of its application. Fundamentals are more or less generic as that to which they are related has more or less of the generic in it. If a doctrine be conceded to be fundamental to Christianity, it must be held by every one entitled to the name of Christian. But each Christian body has doctrines fundamental to its system which are not held by the entire Christian Church. Fundamentals have been divided into—(1) primary, or those doctrines the explicit knowledge of which is necessary to salvation; and (2) secondary, or those doctrines which are implied in the primary, and the denial of which logically involves the denial of the primary fundamentals. They have also been divided into (1) constituent and (2) conservative, or those doctrines which enter into a system as constituent parts in the sense that the system can not be stated without explicitly stating them, and those doctrines which are only logically involved in a system, in the sense that the denial of them logically involves the denial of the system in some of its constituent parts. They have still further been divided into (1) formative and (2) distinctive, or those doctrines which so lie at the basis of the system as that the system is but the unfolding of their contents, and those which differentiate and discriminate a system from some other system or from all other systems. These distinctions obviously cover largely the same ground. Involuntary ignorance of the secondary fundamentals does not remove the foundation of salvation, but denial of them does. And in like manner ignorance or neglect of the conservative or distinctive fundamentals does not invalidate a system, but denial of them does. The doctrine of fundamentals has been most agitated in the efforts to unite the Lutherans and the Reformed; but it necessarily forms a part of all controversy between parties in all communions. Revised by B. B. WARFIELD.

Funds and **Funding** [*fund* is from O. Fr. *fond*, bottom, foundation, capital > Fr. *fond* < Lat. *fundus*, for **fudnus* < Indo-Eur. *bhudhnos* > Sanskr. *budhna*: Gr. πυθμήν: Ir. *bonn*, sole of foot: Teuton. *budma* > Germ. *Boden*, floor: Eng. *bottom*]: money or other form of wealth accumulated and devoted to, or available for, some special purpose or enterprise. In Great Britain the securities issued for the national debt are known as the *public funds*, or simply as the *funds*. The process of funding a debt consists in dividing it into parts or shares (bonds) with stated times of payment of interest and principal, the latter usually at a remote date. The substitution of bonds of lower rate for those of higher rate

is often called *refunding*; provision, made by agreement, from year to year for the payment of the principal is known as a sinking fund. Funded debt is opposed to *floating* debt, which consists of notes and overdue bills; and to current debt, which consists of bills and other adverse balances already incurred but not yet overdue. See FINANCE and DEBT, PUBLIC. A. T. HADLEY.

Fundy, Bay of [earlier **Fundy Bay**, from Fr. *fond de la baie*, head of the bay]; an arm of the Atlantic extending N. E. between New Brunswick on the N. W. and Nova Scotia on the S. E. Its northeast extremity divides into two parts—Chignecto Channel, the northwesternmost, itself dividing into Shepody Bay and the Cumberland Basin, the latter reaching to within 13 miles of Northumberland Strait; the northeast arm of the bay is composed of Minas Channel and Basin and Cobequid Bay. Spring tides, in parts of the Bay of Fundy, have been known to rise over 70 feet, and come pouring in like an immense *bore*. The funnel-shaped and rapidly narrowing entrance to the bay enables a disproportionately long tidal wave to enter, and as it becomes narrower and shallower the height is necessarily increased. The remarkable tidal peculiarities render navigation dangerous except to those who are familiar with it. The fisheries are of great importance. See *Baie Verte Canal*, in the article SHIP-RAILWAYS.

Fü'nen, or **Fuhnen** (Dan. *Eyen*): next to Seeland, the largest of the Danish islands; separated from Seeland by the Great Belt and from Jutland by the Little Belt. Area, 1,123 sq. miles. It is low, but hilly, partly covered with forests, and very fertile. The principal towns are Odense, Svendborg, and Nyborg. Pop. 206,528.

Fu'neral, Funeral Rites [Lat. *funus, funeris*, a dead body]: The disposal of the bodies of the departed has in all ages and in nearly all countries excited a profound interest in the living. The two principal modes which are and have been observed are *burial* in the earth or sea, and *cremation*, incineration or burning. (See CREMATION.) Burial has been practiced from remote prehistoric times, as is shown not only by the most ancient existing records, but by the examination of cairns and sepulchral mounds in many countries. Burials are either in graves, in which the body (usually either inclosed in a coffin or cist, or among ruder peoples simply wrapped in grave-clothes) is covered directly with the earth, or it is placed in a subterraneous chamber called a vault, tomb, or sepulcher. The *embalming* of dead bodies (see EMBALMING and MUMMY) is a process anciently very prevalent in Egypt and some other countries preparatory to burial. Burial in the sea takes place from ships which are too far from the land to permit interment to take place. The body, placed in a suitable canvas sack, is (very commonly after the reading of the short and impressive burial-service of the Anglican Church) committed to the sea, shot or other suitable weights being attached to the feet. Burial in the earth is usually accompanied by ceremonies prompted at once by affection and by the religious faith and sentiments of the friends of the deceased. Masses and requiems are prescribed in the rituals of some Christian churches; eulogies, elaborate *oraisons funèbres*, or formal sermons are pronounced at or soon after the funerals of distinguished persons; but more commonly in Protestant communities a simple liturgical service, or a still less formal scriptural reading, followed by a few words of sympathy and religious counsel, with a prayer for the living friends, completes the service. Music is not universal at funerals; when used it is either in a minor key and expressive of grief, or of a kind intended to inspire hope and religious faith. A simple bier, or, in the case of public characters of distinction, a more or less imposing catafalque or hearse, is employed for the support of the coffin; and funeral cars (also called hearses) are almost uniformly employed in carrying the dead to the grave. The custom of having hired mourners to bewail the dead is at present prevalent chiefly in the East. The *hearse*, in strict language, is the candle-frame used in Roman Catholic services for the support of burning tapers. The dead are almost always buried in the supine position, very commonly with the head toward the E.—a custom which may have a religious significance, but which prevailed to some extent among the aborigines of North America. Some of these peoples, however, like the Kaffirs, buried the dead in a sitting posture—a custom which was once common in the south of Britain, as is shown by the examination of sepulchral mounds referred somewhat doubtfully to a prehistoric age. Graves have been discovered in North Carolina in which the dead were placed very near the surface of the ground, and covered with soft clay, which was afterward hardened by fire. Many Western aboriginal tribes suspended their dead in trees or placed them upon raised platforms—a practice which may have been designed to keep them from ravenous beasts. Some Indian tribes carry the bones of the dead with them on their migrations; others have the greatest horror of ever speaking of the dead; while among some tribes there prevails a system of ancestral worship which recalls that so prevalent in China, and a solemn dance is held yearly at the burial-place. The Parsees expose their dead until the kites and vultures have removed the soft tissues, when the bones are placed in an ossuary. A very similar practice obtains among some wild South American tribes. In many European monasteries there are ossuaries for the bones of the deceased brothers. Burial is believed to have prevailed quite as extensively in ancient Greece as burning did; and it was undoubtedly far more prevalent in Rome than burning until a comparatively late period of the republic.

Funes, GREGORIO: Argentine historian; b. at Cordoba, 1749. He graduated in theology and canon law at the University of Cordoba; was rector of a college at Loreto; and later rector of his own university and dean of the Cathedral of Cordoba. During the events which led to the independence of the Platine states he was active in politics. Dean Funes was an eminent pulpit orator and theologian. His most important historical work is *Ensayo de la historia civil del Paraguay, Buenos Ayres y Tucuman* (3 vols. 8vo, 1816). D. in Buenos Ayres, 1830. H. H. S.

Fünfkirchen, fünf'kirch-en [Germ., liter., Five-churches, Slavic *Pecs*, liter., Five]: town of Hungary; capital of the county of Baranya; 139 miles S. by W. of Budapest (see map of Austria-Hungary, ref. 7–G). Its cathedral is the largest and handsomest church building in Hungary. It has a college and other important educational institutions, and is a bishop's see, established in 1009. Its trade is very active, and it has coal mines, marble quarries, tanneries, and manufactures of woolens, flannels, brandy, and majolica-ware. There are interesting remains of the Roman and Turkish periods, for the Turks held this town 1543–1686. Pop. (1891) 33,780.

Fungi [plural of Lat. *fungus*, a mushroom]: those lower plants which are parasitic or saprophytic, and which as a consequence are destitute of chlorophyll; in systematic botany, such plants as an order or class, a usage which is obsolescent. In a natural system of classification the fungi are distributed among a number of classes of lower plants, with which their affinities have been pretty clearly made out. (See VEGETABLE KINGDOM.) Although the name Fungi must be abandoned as the designation of a natural group of plants, it may well be used as a general term for all the chlorophyll-less plants below the Mossworts, and in this sense it will be used throughout this article. In recent years, for no very good reason, the bacteria have been pretty generally excluded from the fungi, and it is now pretty evident that the Slime Moulds (*Myxogastres* or *Myxomycetes*) are more at home in the animal kingdom. The latter accordingly deserve no further notice in this article, and as the former have been fully discussed under BACTERIA, they will require only brief mention here. For fossil fungi, see PLANTS, FOSSIL, and for those fungi that are active agents in the process of fermentation, see FERMENTATION.

Systematic.—The lowest fungi are the Bacteria (*Bacteriaceæ*), which are to be regarded as degraded Water Slimes (*Schizophyceæ*). See BACTERIA.

The Green Slimes (order *Protococcaceæ*) have given rise to one or two small families of one-celled or few-celled parasites, the *Synchytriaceæ* and *Chytridiaceæ*, which infest aquatic plants and animals (Fig. 1).

The Pond Scums (order *Conjugatæ*) appear to have given us two families of fungi, the Black Moulds (*Mucoraceæ*), which are mostly saprophytic, and the Insect Fungi (*Entomophthoraceæ*), all parasites, and well represented by the common FLY FUNGUS (*q. v.*). See also MUCORACEÆ.

From the Green Felts (order *Siphoneæ*) have come, by degradation through parasitism, the Water Moulds (*Saprolegniaceæ*) and the Downy Mildews and White Rusts (*Peronosporaceæ*). See MOULDS, MILDEWS, and RUSTS.

By far the greater number of fungi have apparently sprung from the simpler Red Seaweeds, or more probably from Coleochæte-like plants. From this beginning two great diverging and branching classes have sprung, viz., the Sac-Fungi (*Ascomycetes*) and the Higher Fungi (*Basidio-*

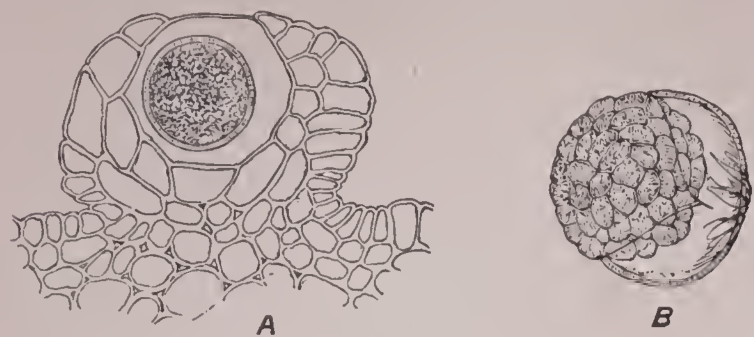

FIG. 1.—A, resting state of *Synchytrium mercurialis*, in a wart upon the leaf of Mercurialis ; B, the same germinating.

mycetes), differing mainly in the fact that in the first certain end-cells form spores by internal cell-division (endosporous, Fig. 2, A), while in the second they are formed by the enlargement of external protrusions (exosporous, Fig. 2, B).

A cell of the type A in the figure is a sac or *ascus* (pl. *asci*), and its spores are sac-spores or ascospores. A cell of the type B is a *basidium* (pl. *basidia*), and its spores are basidiospores.

Under the Sac-Fungi, which include more than 16,000 known species, may be distinguished six or seven pretty plainly marked orders as follows :

The Simple Sac-Fungi (*Perisporiaceæ*) consist of slender branching threads (cell-rows), which form a vegetative mould-like mass (the *mycelium*) of greater or less extent. From this certain branches grow up vertically, and by simple abstriction of the end-cells form asexual spores (summer-spores or conidia), whose function is rapid propagation while conditions are favorable (Fig. 3). Somewhat later the little dark-colored sexually formed fruits (*perithecia*) are formed. These are mostly globular structures containing a number of spore-sacs. It is now thought that in many cases the sexual organs are abortive through degeneration, and that the fruits develop without an actual fertilization. Many of the species (especially in the Powdery Mildews—*Erysipheæ*) are surface parasites upon the leaves and stems of the higher plants. See MILDEW.

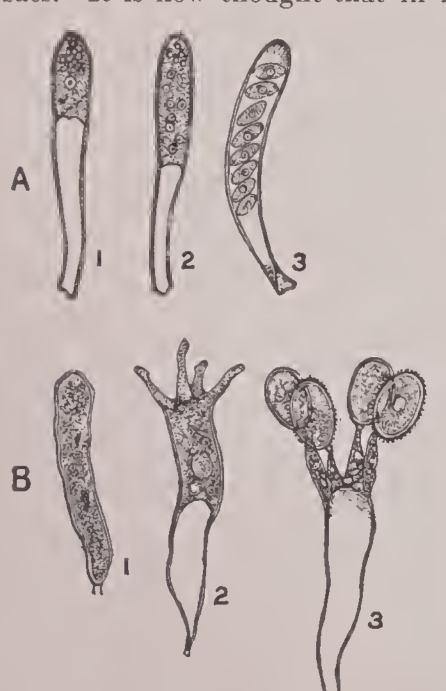

FIG. 2.—A, cells with spores formed internally ; B, spores formed externally.

The Subterranean Sac-Fungi (*Tuberoideæ*) resemble the foregoing, but have compound fleshy fruits. They are saprophytic, living upon decaying organic matter in the soil. The Truffles (family *Tuberaceæ*) are familiar examples of this order.

The BLACK FUNGI (*q.v.*) (*Pyrenomyceteæ*) include a great number of mostly parasitic or semi-parasitic species, referable to six or seven families, and pretty largely characterized by a sooty or blackish color. The simpler forms (Fig. 4, A, B, C) are scarcely to be separated from the Perisporiaceæ, but in the greater number of species the compound fruits are characteristic (Fig. 4, D, E, F). Many of the most injurious fungi are to be found in this order, which contains about 10,000 known species. See ERGOT and PLUM KNOT.

The Lichens (*Lichenes*) include a number of families of fungi, which are peculiar in being parasitic upon very small green plants (algæ) of the lower families, e. g. *Chroococcaceæ*, *Nostocaceæ*, *Palmellaceæ*, *Chroolepediaceæ*. These fungi are very closely related to the Black fungi and Cup fungi, from which they are scarcely to be separated. See LICHENS.

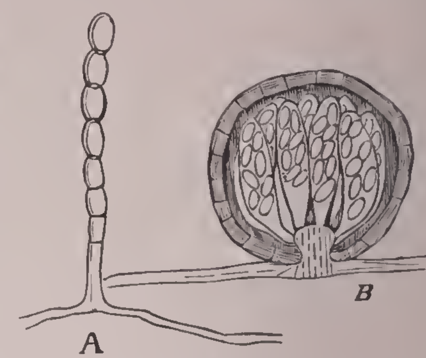

FIG. 3.—A, formation of conidia of Rose Mildew (*Sphærotheca pannosa* ; B, ideal section of a fruit of a Powdery Mildew.

The Cup fungi (*Discomyceteæ*) are pretty generally fleshy and more or less disk-like or cup-shaped in the fruiting stage. They are mostly saprophytic, although a good many species are parasites. In the saprophytic species the slender white threads of the plant creep through the decaying organic matter, and finally form sexual organs, a flask-shaped carpogone (the female organ) and a club-shaped antherid, the male organ (Fig. 5, A). After fertilization many threads grow upward and form a disk or cup shaped structure, in the substance of which spore-sacs develop (Fig. 5, B, C). In the common Morel (*Morchella esculenta*, Fig. 6) the spore-bearing tissue is everted, pitted, and folded, so as to give it the appearance of a compound cup-fungus raised upon a common stalk.

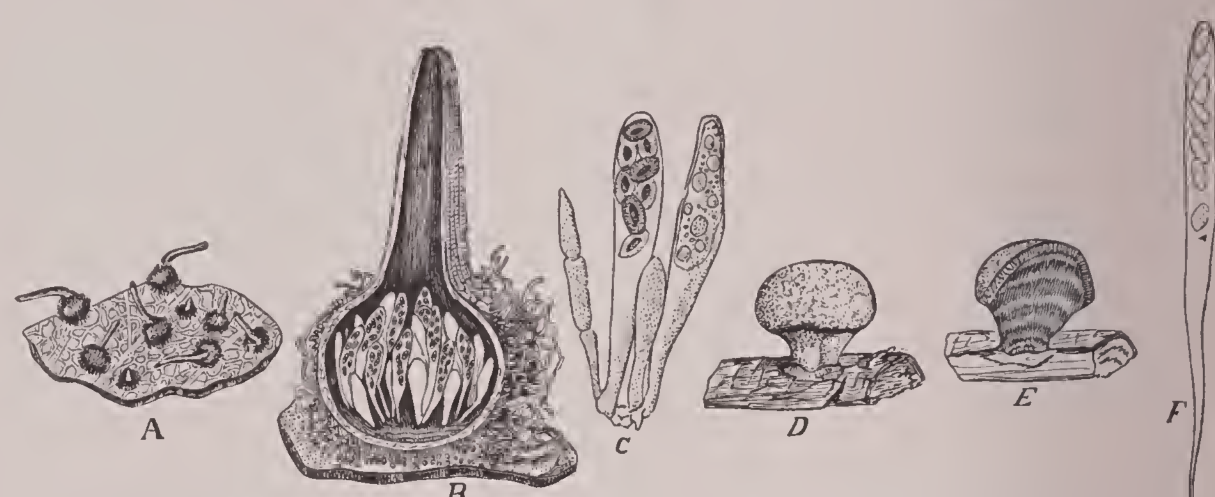

FIG. 4.—A, fruits of *Melanospora chionea* on a leaf-fragment ; B, a fruit cut vertically ; C, spore-sacs ; D, *Daldinia concentrica* on a twig ; E, section of same ; F, spore-sac.

In addition to many interesting genera—*Peziza*, *Ascobolus*, *Helvella*, *Phacidium*—there are a number of excessively reduced forms, as the parasitic Leaf Curl and Plum Pockets (Exoascus, Fig. 7, A), and other similar fungi of the genera *Taphrina*, *Eremascus*, *Gymnoascus*, etc. The plants are here reduced to little more than spore-sacs, the vegetative organs having nearly disappeared. This degradation is carried a step further in the yeast-fungi (*Saccha-*

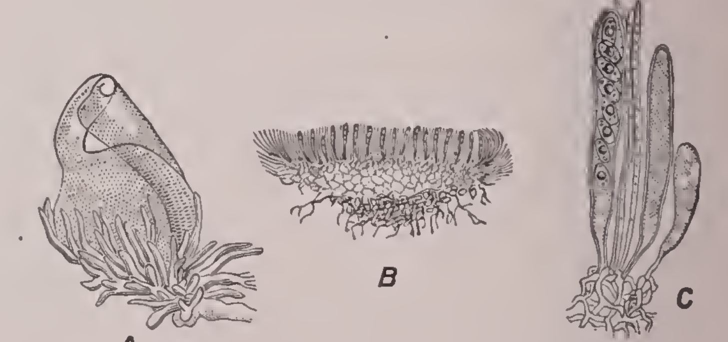

FIG. 5.—A, sexual organs of a cup-fungus ; B, section of mature fruit ; C, spore-sacs.

romycetaceæ), now considered to be greatly degraded members of this order (Fig. 7, B).

The Rusts (*Uredineæ*) may be regarded as greatly degraded parasitic sac-fungi, in which the spores at maturity entirely fill the spore-sacs (the "teleutospores" of descriptive botany). The plant is much reduced, and consists of branching threads which penetrate the tissues of its host, eventually producing summer-spores ("uredospores," or red-rust) and later the spore-sacs ("teleutospores," or black-rust). In many species there is still another spore-bearing stage preceding the red-rust, viz., the "cluster-cup" stage, which is probably to be regarded as strictly the original summer-spore stage. See RUSTS.

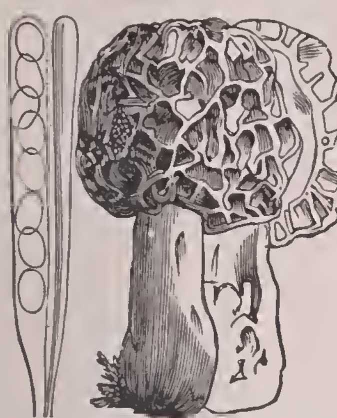

FIG. 6.—Common Morel (*Morchella esculenta*), with spore-sac at side.

The Smuts (*Ustilagineæ*) are parasites in which the structural degradation has proceeded still further than in the rusts, so that their true relationship is seen with the greatest difficulty. However, they may be regarded as sac-fungi whose spore-sacs are much distorted, or in many cases are so reduced as to form but a single spore. See SMUTS.

The so-called "Imperfect Fungi" are probably to be considered as members of the class of sac-fungi, although their method of spore formation is known only for the conidia (asexual spores). No less than 11,500 species are temporarily placed here awaiting full investigation. At present they are arranged under three orders, viz.: (1) *Sphæropsideæ*, in which there is a perithecium (but no spore-sacs), in which the spores are produced on the ends of threads (Fig. 9, A, B). Here are placed many of the most harmful parasites on cultivated plants, e. g. many species of *Phyllosticta* and *Septoria*, which produce diseased spots on foliage, stems, and fruits. (2) *Melanconieæ*, in which there is no perithecium, but the spores are produced subeu-

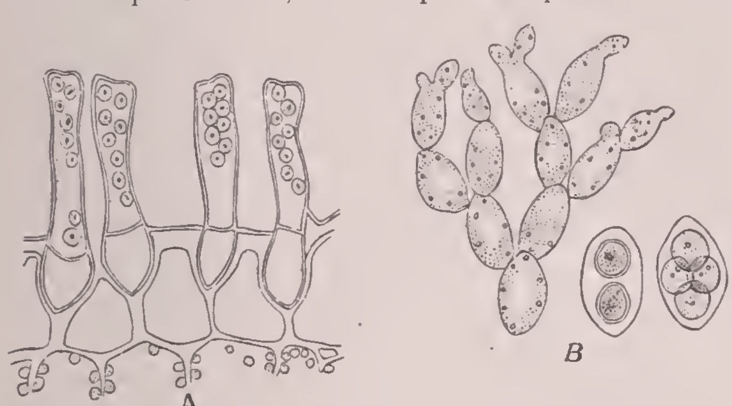

FIG. 7.—A, Exoascus of the Alder ; B, yeast-fungi, two cells with ascospores (highly magnified).

taneously on the ends of threads (Fig. 10). The genus *Glœosporium* contains many harmful species. (3) *Hyphomyceteæ*, in which there is no perithecium, but the spores are borne free upon superficial or sub-superficial threads (Fig. 11). Species of *Ovularia*, *Ramularia*, *Fusicladium*, *Cercospora*, etc., are quite injurious to many cultivated plants.

The Higher Fungi (*Basidiomycetes*) include somewhat more than 10,000 described species, many of which attain a considerable size. In all cases the plant is a mass of delicate threads (*mycelium*) ramifying through the organic matter (mostly dead) on which it feeds, and later producing large "fruits" (commonly supposed to be the plants themselves) in which are borne the spores. The numerous families are grouped into two pretty well-marked orders, viz.:

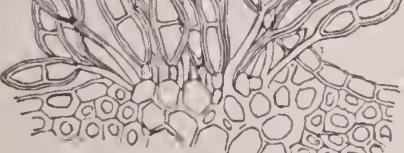

FIG. 8.—Spore-sacs ("teleutospores") of a rust, each containing two ascospores.

The Puff-balls (*Gasteromyceteæ*). Here the spore-bearing threads (basidia) are always internal, and the "fruits" (at maturity filled with dusty spores) are usually more or less globular. See PUFF-BALLS.

The Toadstools (*Hymenomyceteæ*). In these the spore-bearing threads are from the first external or soon become so. In the typical forms the "fruits" are more or less umbrella-shaped, and the spores are borne on the surfaces of radiating gills or vertical tubes. The common edible mushroom (*Agaricus campester*) and the ink toadstools (*Coprinus sp.*, Fig. 12) are familiar examples of the fruiting plants of this order.

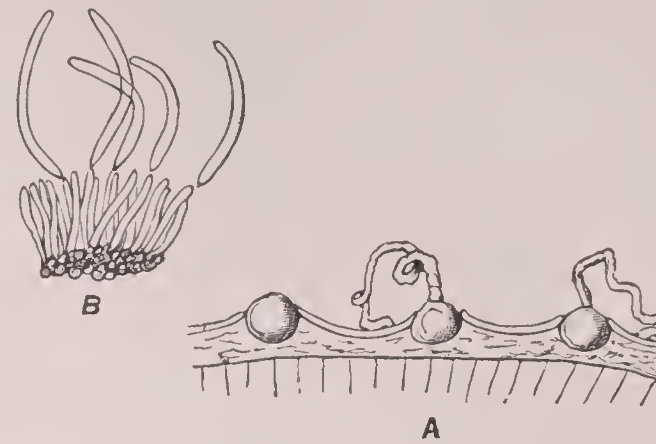

FIG. 9.—A, three perithecia of *Septoria* extruding masses of spores ; B, spores from interior of perithecium.

M. C. Cooké, the author of *British Edible Fungi*, speaks of the uses of fungi as follows: "In European countries the common mushroom (*Agaricus campester*) enjoys the widest popularity as an esculent, especially the cultivated varieties. The meadow mushroom (*Agaricus arvensis*) is scarcely inferior, though stronger in flavor, and is preferred by many to the cultivated species. In France the champignon (*Marasmius oreades*) is largely eaten, and in Austria *Collybia extuberans*, which has no admirers in England, finds a constant place in the markets during the summer. Truffles (*Tuber æstivum*, etc.) and morels (*Morchella esculenta*) are

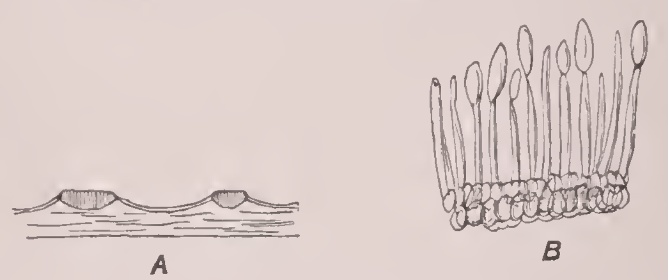

FIG. 10.—A, section through two spore-bearing spots of *Glœosporium* ; B, spores from the same.

favorites not only in Europe, but also in the vales of Kashmir, where two or three species of morels are dried for consumption throughout the year. The great puff-ball (*Calvatia maxima*) is increasing in reputation as a breakfast delicacy in Great Britain, while *Lactarius deliciosus*, the chantarelle (*Cantharellus cibarius*), and the hedgehog fungus (*Hydnum repandum*) have each their circle of admirers. Numerous other species are also eaten by mycophagists, although they are never found in the public markets. *Boletus edulis* cut in slices and dried may be purchased throughout the year in most of the continental cities. In Tahiti the Jew's-ear (*Hirneola auricula-judæ*) is dried in large quantities and exported to China, while a species of agaric (*Pleurotus subocreatus*) comes into the markets of Singapore, and another dried agaric (*Pleurotus fossulatus*) is sent from the Cabul hills into the plains of Northwestern India. Several species of Cyttaria are eaten in the southern parts of South America, and in Australia the *Mylitta australis* is a favorite article of food. In fact, a very long catalogue might be made of the species which are more or less consumed in different parts of the world; but we must rest content with suggesting some of the most important or interesting, referring the reader to more special treatises for further information. The cultivation of fungi for esculent purposes has not hitherto been successful with any other species than the ordinary mushroom. Attempts were made

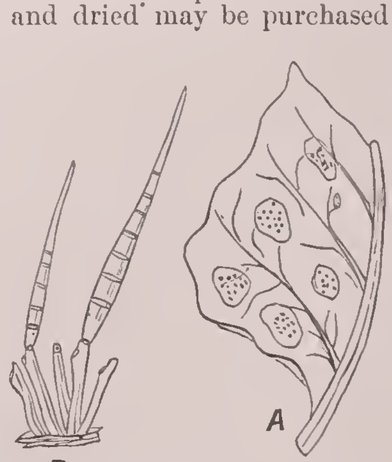

FIG. 11.—A, fragment of beet-leaf with spots of *Cercospora* ; B, spores of same (magnified).

in France for the cultivation of truffles, at first apparently with considerable promise, but ultimately without much satisfaction. There is no good reason to suppose it impossible or improbable that many species might be cultivated if proper care, time, and attention could be devoted to experiments in that direction. Fungi useful to man in medicine or the arts are by no means numerous or of importance. Some species of Polyporus have been employed as styptics, or beaten till soft and used as amadou. One species in Burma has a good reputation as an anthelmintic. Some species of Polysaccum and Geaster are employed medicinally in China. Species of Elaphomyces were at one time supposed to possess great virtues, now deemed apocryphal. Ergot still maintains its position in the pharmacopœia, but is almost the only fungus now employed (and that sparingly) by the legitimate medical practitioner."

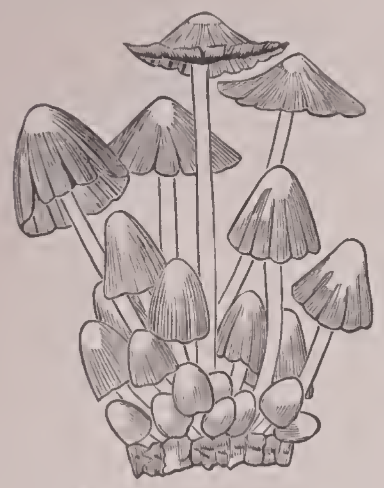

Fig. 12.—Fruiting plants of *Coprinus micaceus*, one of the ink toad-stools.

It is impossible within the limits of this article to enumerate the fungi which are injurious to cultivated plants, many of which are attacked by a great number of species. Thus wheat is the host of no less than 14 fungi, Indian corn of 67, the apple of 79. In economic mycology the injurious fungi are commonly referred to under the diseases which they produce, and will be so treated here. Accordingly the reader is referred to the following articles: Blight (on apple, pea, quince, strawberry, tomato, potato, and grape), Ergot, Leaf-spot (on cherry, plum, strawberry, etc.), Oïdium (on many leaves), Mildew (downy, on grape, lettuce, potato, etc.; powdery, on apple, cherry, grape, hop, pea, etc.), Peach Yellows, Peach Curl, Plum Knot, Plum Pockets, Rot (bitter-rot of apples and grapes, black-rot of apples and grapes, brown-rot of grapes, bird's-eye-rot of grapes, dry-rot of timber, plum-rot, potato-rot, root-rot of grapes, tomato-rot, white-rot of grapes, wet-rot of timber), Rusts (of apple, blackberry, Indian corn, raspberry, wheat, etc.), Scab (on apples, pears, etc.), Smut (on barley, Indian corn, oats, sugar-cane, wheat, etc.).

Aside from the bacteria, there are few fungi which are productive of diseases in animals. Quite a number are actively poisonous when eaten; in fact many which so closely resemble the edible species as to be frequently mistaken for them have been found to be fatally poisonous. Great care must always be exercised in the collection of wild species for eating.

Literature.—From the enormous mass of literature relating to the fungi, the following works are suggested to the student: Cooke's *British Edible Fungi* (1891); Cooke's *Microscopic Fungi* (1871); DeBary's *Morphology and Biology of the Fungi, Mycetozoa, and Bacteria* (1887); Ellis and Everhart's *North American Pyrenomycetes* (1892); Luerssen's *Handbuch der Systematischen Botanik*, vol. i. (1879); Saccardo's *Sylloge Fungorum*, 10 vols. (1882 to 1892); Scribner's *Fungus Diseases of the Grape and Other Plants* (1890); Smith's *Diseases of Field and Garden Crops* (1884); Ward's *Timber and some of Its Diseases* (1889); Zopf's *Die Pilze* (1890); also the volumes of *Grevillea* (London, England); *Hedwigia* (Dresden); *Journal of Mycology* (Washington, U. S.); *Revue Mycologique* (Paris)—periodicals devoted mainly to the fungi. Charles E. Bessey.

Fungicide: a preparation which is fatal to fungi, and which may be used for combating fungous diseases of plants and animals. Most fungicides contain copper or sulphur in some form. The most popular fungicides, especially for plant diseases, for which fungicides are mostly used, are those which are applied in water, either in solution or in suspension. Since the knowledge of fungous diseases of plants has so greatly increased, fungicides have come to be one of the chief instruments in agriculture. They are of particular use in all branches of horticulture. Various pumps have been devised for the application of fungicidal and insecticidal sprays. The best spraying-machine is the one which throws the finest spray to the greatest distance. If the material can be applied in a voluminous cloud-like mist the best results are to be expected. The value of any fungicide depends to a considerable extent upon the time and method of its application. Timeliness, thoroughness, and persistence are the essentials of success. The disease must be dispatched before it has become thoroughly established, or, better, it must be prevented from obtaining a foothold. For such common diseases as grape-mildew, apple-scab, pear-scab, and the like, the first application should usually be made before the leaves appear, and the material should be applied at intervals thereafter, as recommended for the various plants under their respective heads. The two most important fungicides at the present time are Bordeaux mixture and ammoniacal carbonate of copper. The former is more adhesive, but it is difficult to apply to tall trees unless much diluted. The latter is cheaper and more easily applied. The Bordeaux mixture can be added to such insecticides as Paris green and London purple, and insects and fungi may be combated at the same time. The following are the leading fungicides:

Ammoniacal Carbonate of Copper.—1. Into a vessel having a capacity of 2 quarts or more pour 1 quart of ammonia (strength 22° Baumé), add 3 oz. carbonate of copper. Stir rapidly for a moment, and the carbonate of copper will dissolve in the ammonia, forming a very clear liquid. The concentrated liquid thus prepared may be kept indefinitely. For use, dilute to 25 gal.

2. Carbonate of copper, 5 oz.; ammonia (26°), 3 pints; water, 45 gal. This is probably the better method.

It is better to wet the carbonate before dissolving it. For grape-rot and mildew, apple-scab, and many other diseases.

Ammoniated Copper Sulphate (mixture No. 5 of Department of Agriculture).—Equal parts of ammoniated copper sulphate and ammonia carbonate. Put 1 lb. of the material in 25 gal. of water when desired for use. For the same uses as ammoniacal carbonate of copper.

Bordeaux Mixture (copper mixture of Gironde).—1. Dissolve 6 lb. of sulphate of copper in 16 gal. of water. In another vessel slake 4 lb. of fresh lime in 6 gal. of water. When the latter mixture has cooled, it is slowly poured into the copper solution, care being taken to mix the fluids thoroughly by constant stirring. Prepare some days before use. Stir before applying. Stronger mixtures were at first recommended, but are not now used. Mixtures about half the strength of the above have been used with good reults.

2. Powdered sulphate of copper, 12 lb. in 15–20 gal. of water; lime, 8 lb. in 10–12 gal. of water. When the materials are thoroughly incorporated with the water, add the two mixtures.

For downy mildew and black-rot of the grape, blight and rot of the tomato and potato, blights of fruits, and many other diseases.

Sometimes the mixture is not washed off the grapes by the rains. In this case add 1 quart of strong cider vinegar to 5 gal. of water, and dip the grapes, allowing them to remain a few minutes, then rinse once or twice. Dip the grapes by placing them in a wire basket.

Eau Celeste.—1. (Audoynaud process.) Dissolve 1 lb. of sulphate of copper in 2 gal. of hot water. When completely dissolved and the water has cooled, add 1½ pints of commercial ammonia (strength, 22° Baumé). When ready to use, dilute to 25 gal. For treatment of downy mildew and black-rot of the grape, anthracnose, and blight and rot of the tomato and potato, and many other diseases.

2. Dissolve 1 lb. of sulphate of copper in 2 gal. of water. In another vessel dissolve 1 lb. of carbonate of soda. Mix the two solutions. When chemical reaction has ceased, add 1½ pints of ammonia, then dilute to 25 gal. For the same purpose as No. 1, and probably better.

Sulphate of Copper.—1. Dissolve ½ lb. of pure sulphate of copper in 5–12 gal. of water. For treatment of downy mildew and black-rot of grape and apple-scab in winter, or in spring before the buds swell.

2. Dissolve 5–8 lb. in 10 gal. of water. For soaking grains previous to sowing to destroy spores of smuts. The Germans use a ½-per-cent. solution, and soak the grains for about 16 hours.

Sulphide or Sulphuret of Potassium (liver of sulphur).—Simple solution in water of ¼ to 1 oz. to the gallon. For mildew in greenhouses, mildew on roses, gooseberry-mildew, orange-leaf scab, celery-leaf blight, pear and apple scab, and various rots.

Sulphide of Soda Wash (Hilgard's).—Dissolve 30 lb. of whale-oil soap in 60 gal. of water, by heating the two together thoroughly. Then boil 3 lb. of concentrated lye (American) with 6 lb. of sulphur and 2 gal. of water. When thoroughly dissolved, it is a dark-brown liquid, chemically sulphide of soda. Mix the two—soap and sulphur—boil for half an hour, add 90 gal. of water, and the mixture is ready for use. Apply warm with a pump For scab diseases.

Sulphur.—In its dry and pulverized state, sulphur, known as flowers of sulphur, is often a valuable fungicide, particularly for surface mildew. In the greenhouse it may also be used in fumes. Evaporate it over a steady heat, as an oil-stove, until the house is filled with the vapor. It should never be heated to the burning point, as burning sulphur quickly destroys most plants. It may also be used in water, in the proportion of an ounce of sulphur to 5 gal. of water. See also INSECTICIDE. L. H. BAILEY.

Fŭng-shui, or **Fêng-shui**, fŭng-shwee (Chinese, literally, wind and water): a kind of geomancy in universal use in China (1) for determining the luckiness or unluckiness of particular spots, and hence much in vogue in selecting suitable sites for cities, houses, temples, graves, etc.; and (2) in overcoming inauspicious conditions as regards aspect or the conformation of the ground in the neighborhood when the site is otherwise auspicious. The term is also used to designate the geomantic conditions themselves, as when it is said that the fung-shui of a place is bad, i. e. is such as will involve misfortune or death unless improved by such remedial measures as raising a mound or building a pagoda, planting trees, or in some other way altering the conformation or mutual relations of the surrounding hills, valleys, etc., which are but the outward manifestations of nature's breath as it pulsates in its twofold male and female forms through the earth, now expanding and now reverting, according to the fixed order of nature. A southern aspect is the best, for all good influences come from the south, and all evil influences from the north. Whatever tends to bar the way against these good influences, or to open the way to these evil influences, must be avoided. Hence the opposition hitherto shown by the Chinese to the introduction of railways and telegraphs, and to the opening of mines, which might endanger the "aspects" of countless graves and dwellings. Straight lines, especially when pointing to a proposed site, pointed gables, abrupt or rugged elevations with sharp peaks, and the like, are unfavorable; while a gradual slope, gentle curves, and crooked lines are auspicious. Uniformity of conformation or of façade must be avoided. To build on a hill resembling a basket, a plowshare, a turtle, the eye of a horse, or the like is very dangerous. Premature and violent death awaits the sons and grandsons of the man who builds on a hill which resembles a couch, while his daughters will always be ill, and his sons will spend their days in prison, if he build on an elevation which resembles a boat turned bottom up, and childlessness will be the lot of all connected with him if he build on a hill having the general outlines of a bell, surmounted by the outlines which correspond to the planet Venus. The most auspicious spot for a grave is where the Yang and Yin, or male and female principles of nature, meet, forming a kind of horseshoe with the "Azure Dragon," or male principle, on the east or left (according to the Chinese the magnetic needle points to the south), and the "White Tiger," or female principle, on the right or west. A side-hill is a desirable location, but an open plain or the top of a mountain is not. A burial-place judiciously chosen with reference to these and numerous other points, which the professional geomancer has to consider, will insure wealth, honor, distinction, and long life to the posterity of the person buried there. Interment is often postponed for many months while search is made for the lucky spot.

Little has been written on the subject by foreigners, but there is a considerable native literature, beginning with the *Tseh-king* or Dwelling Canon, dating from the first century of our era. See Doolittle's *Social Life of the Chinese* (vol. ii., p. 337, New York, 1865); *Notes and Queries on China and Japan* (vol. i., pp. 7, 9, and 19, and vol. ii., p. 69); *The Chinese Recorder* (vol. i., p. 39, Fuh-chow, 1867); Eitel's *Feng-shui: or the Rudiments of Natural Science in China* (London, 1873); and Edkins's *Chinese Buddhism*, pp. 327–352 (London, 1880). R. LILLEY.

Funk, FRANZ XAVER, von: See the Appendix.

Funk, ISAAC KAUFMANN: See the Appendix.

Fur [*fur* < M. Eng. *furre*, from O. Fr. *fuerre*, sheath, case, from Teuton.; cf. O. H. Germ. *fuotar*, lining, case (> Mod. Germ. *Futter*, lining): Goth. *fodr*, scabbard < Teuton. *fodr-* < Indo-Eur. *pātr-* > Sanskr. *pātra*, dish]: the short fine soft coat or covering of some animals, as the beaver, ermine, otter, seal, etc. What is called fur is in general shorter, finer, and softer than hair, but there is no definite line of distinction. The use of the skins of wool-bearing and fur-bearing animals as convenient and readily adapted clothing goes back, according to the sacred records, to the time of the expulsion of the first pair from Eden. This costume is used among all savage and half-civilized nations in cold climates, and some of those in semi-tropical regions. But apart from the use of these skins of animals as clothing, there grew up at a very early date a demand for the finer and more beautiful furs for purposes of ornament and luxury. They were used for the decoration of the tabernacle in the wilderness. Costly furs formed a part of the luxurious coverings of couches in the palace of Sardanapalus. Herodotus tells us that the inhabitants of the shores of the Caspian Sea were clad in the rich fur of the seal, and Ælianus and Plutarch both speak of the Pontic mouse (generally supposed to have been the ermine), whose rich fur made warm and beautiful robes, and was used as the covering of couches in the palace of Pharnabazus. The Chinese and Japanese have used furs as articles of luxury for at least 2,500 years (the Chinese probably more than 3,000), and the robes of ermine, sable, and fiery-fox furs worn by the nobles of both nations are remarkable for their beauty. The choicest and finest furs were very generally worn as articles of luxury by the Roman aristocracy in the decline of the Roman empire. The tribes of Goths, Huns, and Ostrogoths which migrated in hosts from the north carried with them the choice furs of the Arctic regions, and during the Middle Ages they became articles of luxury throughout Southern and Central Europe. In the wars with the Saracens the Christian princes imitated their foes in their habits of luxury, and costly furs from the East were used to such an extent that they well-nigh ruined the nations of Europe. Sumptuary decrees were issued about A. D. 1200 by Richard I. of England and Philip II. of France, prohibiting the wearing of these costly furs either by princes or people, but before the close of that century Louis IX. of France appeared in public with a surcoat lined with the skins of 746 ermines. Not long after this the privilege of wearing particular kinds of choice furs was granted to certain noble families in Germany, France, and Italy, but each one was restricted to a single kind of fur, and was permitted to put a figure of the animal producing it in his armorial bearings. Thus the ermine, the sable, the Hungarian squirrel, the Podolian or fiery fox, and possibly also the beaver and the wolf, came to find a place in the coats-of-arms of some of the highest aristocracy of continental Europe.

The furs principally worn are those of the Alaska seal or sea-otter; the fur-seal, of which not over 300,000 are taken annually; the sable, usually called the Russian sable, though the finest specimens come from Northeastern Siberia or Kamchatka. The fur of this animal is distinguished from all other furs by the hairs turning and lying equally smooth in either direction; this may be tested by blowing it. It is of a rich dark brown, approaching black. A fine set of these furs ranges from $800 to $1,800. The kolinski or Japanese sable is more plentiful, but is almost wholly taken up in the European, and especially in the British, market. The pine marten or Hudson Bay sable is still more abundant; its color is a lustrous brown, and it is sometimes colored and passed off as the Russian sable. The stone marten is of inferior quality, and of yellowish-brown color. It is often colored in Europe where it is much used. The fisher marten is a scarce and valuable fur, and is sold mostly in Europe. The mink is a favorite fur in the U. S. The best specimens are a dark chestnut brown, approaching to black, and resemble the Russian sable in color and fineness. The greater part are somewhat lighter in color, and the poorest are of a yellowish-brown hue. The ermine, called in Great Britain the stoat, is very abundant in the northern portions of America, Europe, and Asia. It is pure white in winter, except the tip of its tail, which is jet black; in summer it is yellowish brown. Its fur was once only allowed to be worn by the highest nobility and on the official robes of judges and magistrates. The fur of the skunk is fine, and that portion of it which is black is very beautiful. These are the principal furs sold in the form of collar, boa, and muffs: the sealskin and sea-otter are also made up in ladies' jackets, gloves, and caps, and in gentlemen's caps, collars, and gloves. These also are the only furs which are dyed successfully and retain both their color and gloss. Cheaper fur sets are made of Siberian squirrel, a very pretty slate-colored fur, muskrat, French rabbit or coney, common rabbit, wild-cat, house-cat, and occasionally of badger, Virginia opossum, or raccoon. The greater part of these skins are, however, exported to Germany and Poland, where they are largely used for trimming overcoats. The muskrat fur is mostly employed in the hat manufacture. A cheap imitation of sealskin is made from this fur by dyeing. The choicer grades of fox furs are used to some extent for trimming, but very rarely, if at all, for muffs, collars, or tippets. The color of the white fox is only white in winter; in summer he is brown, gray, or bluish, and is then called a cross or pied fox. The choicest of all the Arctic varieties of fox is the silver fox. Its color when in prime fur is a deep, glossy bluish black, with a silvery grizzle on the forehead and flanks. One of these skins has been sold for $500 in London. The skins of the different species of bears, wolves, Canada lynxes, badgers, panthers, and wild-cats, as well as those of the buffalo, are made up into carriage robes, and are in great demand.

When brought to the manufacturers, the pelts have been usually merely stretched and dried by the captors, or possibly a solution of alum has been applied to the flesh side. If not to be manufactured immediately, they are strewn with camphor, protected from dampness, and every few weeks carefully beaten with a stick. When they are to be dressed for making up into muffs, collars, etc., they are placed in tubs with a quantity of rancid butter and then trampled by the bare feet of men until the pelt is softened and partially tanned. They are next scraped on the flesh side with a strip of iron to remove portions of the flesh or cellular tissue which have adhered to the skin, and the grease is removed by trampling them again very thoroughly with fine sawdust of mahogany, lignum-vitæ, or some other hard wood. They are next beaten many times and the fur combed out. They are then ready for cutting out and making up into the various patterns of collars, boas, muffs, jackets, caps, gloves, etc.

Fürbringer, für'bring-*er*, Max, M. D., Ph. D.: anatomist; b. at Wittenberg, Saxony, Jan. 30, 1846; educated at the Latin School (gymnasium) of Gera, and at the Universities of Jena and Berlin. He devoted himself particularly to the study of zoölogy and anatomy under Haeckel, Peters, W. Müller, and Gegenbaur. He was successively assistant in anatomy under Gegenbaur, prosector, and later on Professor Extraordinarius of Anatomy at Heidelberg. From 1879 to 1888 he was Professor of Descriptive and Comparative Anatomy and Embryology and director of the Anatomical Institute of Amsterdam, and since 1888 he has held the same positions in Jena. Among the many important papers by Prof. Fürbinger may be mentioned *Knocken und Muskeln der Extremitäten bei den schlangenähnlichen Saurien* (Leipzig, 1870); *Zur vergleichenden Anatomie der Schultermuskeln* (Leipzig and Jena, 1873–75); and *Zur Lehre von den Umbildungen der Nervenplexus* (Leipzig, 1879). His chief work, however, is *Untersuchungen zur Morphologie und Systematik der Vogel* (published in two folio volumes at Amsterdam in 1888). This exhaustive treatise on the morphology and systematic classification of birds is the most important work on the subject that has yet appeared, and, full as it is of anatomical information, it must ever remain a monument to the knowledge and untiring industry of its author, and an indispensable aid to the student of avian anatomy.
F. A. Lucas.

Furetière, Antoine: lexicographer and satirist; b. in Paris, 1620; studied canon law and became Abbé of Chalivoy; wrote some successful satires, and in 1662 was admitted to the Academy, where his sharp tongue made him enemies. For many years the Academy had been collecting materials for a dictionary of the French language, and Furetière was accused of stealing from these stores for the similar work which he had in preparation. He was expelled from the Academy in Jan., 1685, on the charge of plagiarism, and mercilessly attacked by Charpentier, one of the Academicians. Furetière avenged himself on the Academy by his satire *Couches de l'Académie*, and retorted to Charpentier in *Factums*, which ran through four editions. He did not spare his former friend La Fontaine, whom he treated with injustice. But, on the whole, the public and the court sympathized with the satirist in his controversy with the Academy. D. May 14, 1688. His chief work was his *Dictionnaire Universel de la Langue Française*, published two years after his death. He claimed to have spent forty years of labor on this book. Among his other works *Le Roman Bourgeois* (1666) is valuable for the knowledge that it affords of the everyday life of his contemporaries. He also wrote *Poésies*; *Fables Morales et Nouvelles* (1666); and *Voyage de Mercure* (1673). F. M. Colby.

Furies, or **Fu'riæ**: See Eumenides.

Fu'rius: the name of many Roman historical characters, mostly of the old patrician gens Furia; but some plebeians bore the name also. The gens was very old. Of its origin nothing is known; the name is common on inscriptions of Tusculum, from which it has been inferred that the gens came to Rome from that place. The most famous of all was L. Furius, a prætor who overthrew the Gauls in the great battle of Cremona (200 b. c.) and received a triumph.
Revised by George L. Hendrickson.

Furius, Aulus, frequently called **Furius Antias**: a Latin epic poet who flourished about 100 b. c. A few short fragments are given by Bährens in his *Frag. Poetarum Romanorum* (Leipzig, 1886). See also R. Büttner, *Porcius dicinus und der litterarischer Kreis der 2. Lutatius Catulus* (Leipzig, 1893, p. 180). M. W.

Furius, Marcus Furius Bibaculus: a Latin poet of some eminence, who was b. in Cremona about 103 b. c., and lived as late as 24 b. c. He wrote lampoons, hendecasyllables in the manner of Catullus, and one or more epics. Horace (*Sat.* i., 10, 36, and ii., 5, 40) appears to have ridiculed his inflated style. See Bährens, *Frag. Poet. Rom.* (pp. 317–319). M. W.

Furlanetto, foor-lăa-net'tō, Giuseppe: successor in Latin lexicography to Facciolati and Forcellini; b. in Padua, Aug. 30, 1775; was educated at the seminary in Padua; became corrector of the seminary press; professor in the College of Sta. Justina; teacher of church history in the seminary; Professor of Hermeneutics in the university; and finally director of the seminary. In 1816 he published two fasciculi of additions to the lexicon of Forcellini, and then undertook a thorough revision of the whole work, which was published in 4 vols. (4to, Padua, 1823–31). D. Nov. 2, 1848. Revised by Alfred Gudeman.

Furlong [M. Eng. *furlong*, *furlang* < O. Eng. *furlang*, *furlung*, liter., a furrow long; *furh*, furrow + *lang*, long]: 40 rods in linear measure; the eighth of an English or U. S. statute mile, corresponding to the *stadium*, which was the eighth of a Roman mile. There are also several local furlongs, and the word is sometimes used for the name of a square or land measure.

Furnace [M. Eng. *fornais*, from O. Fr. *fornaise* > Fr. *fornaise* < Lat. *for'nax*, deriv. of *fur'nus*, **for'nus*, oven, deriv. of the root of *for'mus*, warm: Sanskr. *dharmá*: Gr. θερμός: Eng. *warm*]: in general, any structure or inclosed place in which heat is generated by the combustion of fuel for a particular purpose; specifically, a structure of iron or brick lined with some refractory substance, as fire-brick, for the generation of intense heat for use in some process of the industrial arts, especially in the treatment and utilization of metals and minerals. While special varieties of heating apparatus will be described or referred to in articles on manufactures wherein such apparatus is employed, the general principles of furnaces, and their classification according to the methods of utilizing fuel, are subjects of sufficient individuality and magnitude to warrant a separate essay; and as nearly all important types of furnaces are employed in the iron and steel manufacture, the illustrations will be drawn from this source. Furnaces may be classified as follows: I. According to the methods of applying heat. (1) *Open fires*, in which the material under treatment is heated in the fuel-chamber either in contact with the fuel or with the heat radiated directly from it, or with both. Iron-smelting or blast furnaces are of this class, but as complex chemical processes other than those generating heat takes place in them, they are better referred to in a separate article. The different kinds of furnace used for heating steam-boilers are of this variety. (See the article Steam-boiler.) The metallurgical furnaces of this class are the cupola for melting iron for castings, etc.; the smith's "fire" in all its forms; the pot furnace for melting steel in crucibles; also the usual forms of cementing furnaces. In pot and cementing furnaces the vessel that holds the metal, rather than the metal itself, is in direct contact with the fire. All forms of apparatus for heating air for domestic, metallurgical, or manufacturing purposes, by means of conducting walls placed between the heat-imparting medium and the air to be heated, are properly classified as "stoves," and are treated in various articles referring to the warming of buildings, also under the head Blast Furnace. The Bessemer converter and the "sponge" or ore-reducing furnace are of this class, and will be treated under STEEL. (2) *Reverberatory furnaces*, in which the material under treatment is heated in a chamber separate from and adjoining the fuel-chamber by means of the hot gaseous products of combustion and by radiation from the heated walls of the chamber. Most of the furnaces used in the wrought-iron and steel manufacture are of this class. The principal varieties are the puddling furnace, the "heating" furnace, the open-hearth or Siemens-Martin steel furnace, and the "air" furnace, which is a reverberatory melting furnace.

II. Furnaces are further classified according to the method of utilizing the fuel: (1) *Coal furnaces*, in which the heat utilized is the *direct* product of the combustion of solid fuel. (2) *Gas furnaces*, in which the fuel enters the furnace in the form of a gas; in metallurgical furnaces this is chiefly carbonic oxide; if bituminous coal, wood, or peat is employed, some hydrocarbons are present. To say that in the coal furnace fuel is used where it is burned, and that in the gas furnace fuel is made into gas in one place and used in another, would not accurately distinguish between the two varieties, because the gas-producer may be a part of the furnace where the heat is utilized, and yet the combustion which produces the carbonic oxide gas may be a distinct chemical process from the combustion which generates the utilized heat. The blast furnace and the cupola are necessarily coal furnaces; the other furnaces enumerated, whether the heat is applied in the chamber where combustion takes place or in an adjoining chamber, may be either coal or gas furnaces.

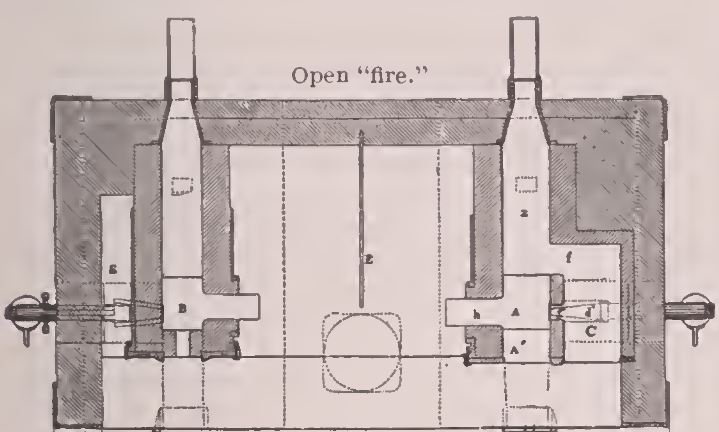

FIG. 1.—Horizontal section

Description of Furnaces.—Of the *open fires*, the smith's fire or forge is the oldest and the most common. It consists, in its simplest form, merely of a pile of coal from 1 to 2 feet in diameter, beneath which a blast is forced through a tuyere leading from a hand-bellows. Iron or steel bars inserted in the fire may receive a welding heat. In large smith-shops, such as those connected with extensive machine-shops, these fires, sometimes fifty or more in number, are arranged in a suitable building, each with its blast-pipe from a common power blowing-machine, and its water-bosh, anvil, and other appurtenances, and its chimney or a flue leading to a common chimney. The fire is usually placed on a cast-iron table, or rather a shallow tank on legs, at a

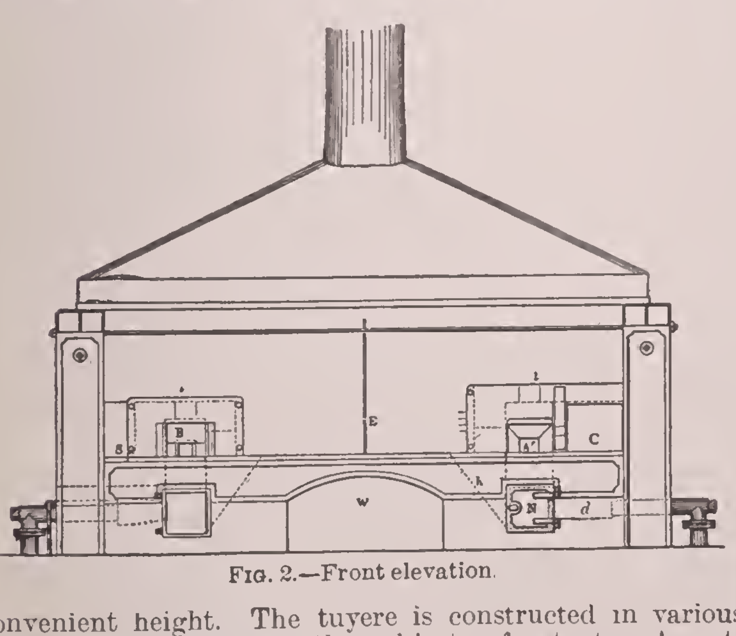

FIG. 2.—Front elevation.

convenient height. The tuyere is constructed in various ways, many of which are the subjects of patents. A portable smith's forge is usually a light iron stand holding the platform for the fire, and also some form of hand blowing-machine and a water-bosh. The portable forge is chiefly used for heating rivets for ship and boiler work. A more elaborate form of open fire is shown in horizontal section by Fig. 1, and in front elevation by Fig. 2. It is largely employed in crucible steel works for heating small ingots and bars. The "cold" or cogging fire consists of a pit, A, 14 by 16 inches in plan and 2 feet deep, without grate-bars, in which the fire is urged by a blast entering the tuyere, *d*. The ashes are withdrawn at N, and the ingots are inserted at A′, having been previously warmed in the "smoke-hole" C, into which flame enters at *f f*. Coal is fed down the incline *h* into the pit A. The extension Z is for the accommodation of long bars. The gaseous products of combustion pass, partly and in a regulated degree, into the general chimney through the holes *l l*, and partly through the mouths and feed-holes of the fires. The water-bosh is placed under the arch W, and the coke and coal for use lie on the platform above it, being divided by the partition E. The "hot" or welding fire, B, is a pit 16 by 12 inches in plan, and otherwise similar to the cogging fire. Its tuyere is protected by a water-casing. The fuel is coke. S is an iron tray containing welding sand. The fire-pits are built of fire-brick, the most refractory kind being required in the welding fire, where the most exposed parts last but a month. The two fires consume about 15 bush. of coal and 15 bush. of coke in nine hours to heat and reheat 45 cwt. of steel. Casting the ingot in an iron mold chills its surface, so that sudden heating would "burn" it. It is therefore warmed slowly in the smoke-hole, then heated in the cogging fire, and partially drawn under a power-hammer; then it is reheated as often as required in the welding fire.

The earliest smelting furnaces were open fires, not much larger than smiths' forges, and the same crude apparatus is still employed where fuel is plentiful both for smelting ore and for decarburizing crude cast iron.

The *reverberatory heating furnace* for solid fuel, as employed for heating iron and steel masses of 300 to 5,000 lb. weight, is shown in vertical section by Fig. 3. The fire on

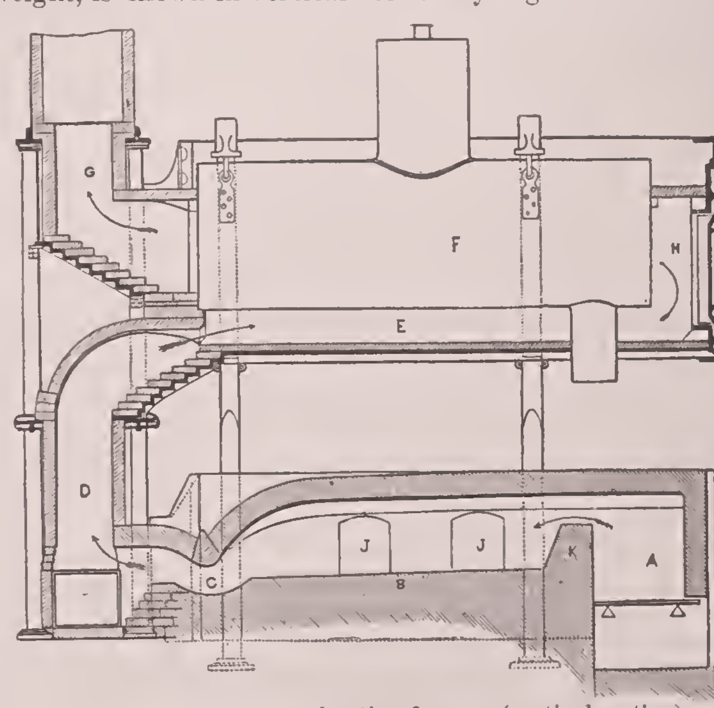

FIG. 3.—Reverberatory heating furnace (vertical section).

the grate A is urged by the draught of a high chimney, or usually by a power-fan. The masses to be heated are inserted and withdrawn through the doors J by hand, or by machinery if they are very heavy. The bottom of the furnace is a bed of sand, which is compacted by partial fusion. The metal is separated from the fuel and shielded from the direct impact of the flame by the bridge K. The flame, passing along under the roof of the furnace, heats the metal below, partly by contact and partly by radiation. The flame-current is "reverberated" by the roof and sides, so as to roll down upon and over the metal. The contracted throat C tends to check the expansion, and hence to maintain the temperature of the burning gases at this point, although the furnace "works" hotter at the bridge than at the throat. The shape of the roof, the size of the throat, and the height of the bridge are the subjects of endless modifications to suit the nature of the work and also the caprices of the workmen.

Cinder that forms from the oxidizing metal and the melting sand-bottom when high heats are employed accumulates and is tapped off at C. The furnace is a strongly bound iron shell lined with fire-brick. Upon a bed 10 to 12 feet long, six 7 by 7-inch iron rail piles can be heated to welding in $1\frac{1}{2}$ hours with about 1,000 lb. of coal per ton of iron. The engraving also shows one of the various arrangements of boilers for utilizing the waste heat of the furnace. The boiler F and its brick casing are placed over the furnace (to save room), and upheld by iron columns. The hot products of combustion pass up the flue D, under the boiler at E, and through the boiler flues into the chimney G. The tubes are accessible for cleaning through the doors H. In mills for rolling iron rails all the steam for driving the engines may be generated by the waste heat from the furnaces. Steel-heating furnaces are worked at a lower temperature, and the boilers over them do not furnish all the required steam.

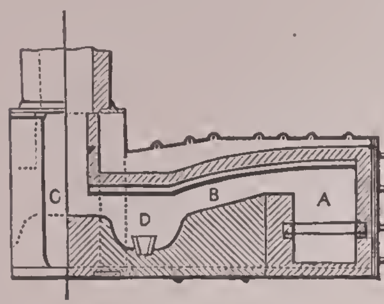

Fig. 4.

The reverberatory melting furnace, or "air" furnace for solid fuel, is of similar construction. In the older form (Fig. 4) the flame and any free air it may contain are drawn from the fire-box A along the roof of the furnace, and do not come in direct contact with the metal lying on the bed B. In the later form (Fig. 5) the flame from A is thrown by the roof directly upon the iron lying at B. This furnace therefore melts faster, but it oxidizes the metal more rapidly. The average air-furnace melts 2 tons of pig iron with a ton of coal. In European practice reverberatory melting and heating furnace fires are maintained by the draught of large and high chimneys. The same is true of the reverberatory furnaces almost universally employed in the U. S. for melting iron for cannon and rolls. But in the later foundry and rolling-mill practice fires are maintained more uniformly and with less expense by blast from power blowing-machines, usually rotatory high-speed fans. Iron melted in an air-furnace, as compared with that melted by direct contact of fuel in a cupola, escapes contamination by the sulphur in the fuel, and its carbon and silicon may be oxidized to any extent required for castings in the air-furnace, thus increasing its strength. The practice of melting 5 to 20 per cent. of soft steel scrap, as required, with cast iron in the cupola is found to make castings equally strong for many purposes.

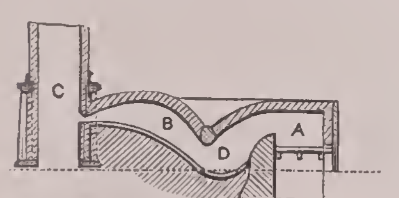

Fig. 5.

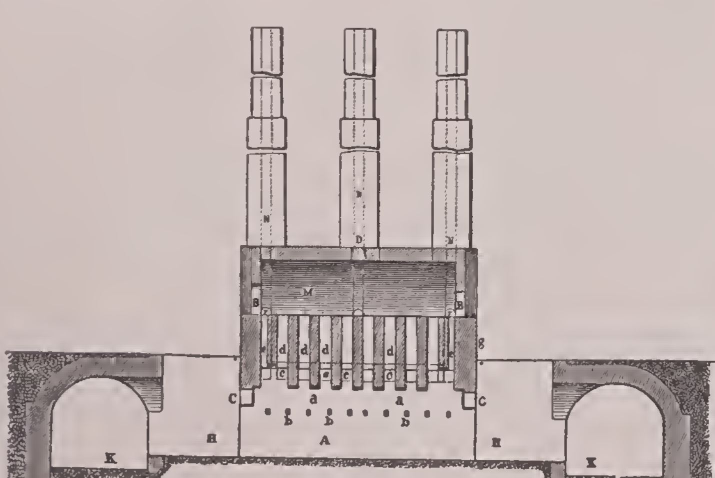

Fig. 6.—Cementing furnace (vertical section).

The cementing furnace is shown in vertical section by Fig. 6, and in horizontal section by Fig. 7. It is employed for heating wrought iron in contact with carbon to make carburized iron, called "blister steel," which is then rolled into marketable shapes or broken up and melted in crucibles to make cast steel. The same general type of furnace is suitable for annealing metals and for reversing the operation of cementing—viz., heating bars or castings in contact with oxide of iron to withdraw carbon. The furnace consists of two pots or troughs of refractory material (defined in Fig. 7 by the letter G at the four corners of each pot), each about 13 by 4 feet in plan and 4 feet deep, capable of

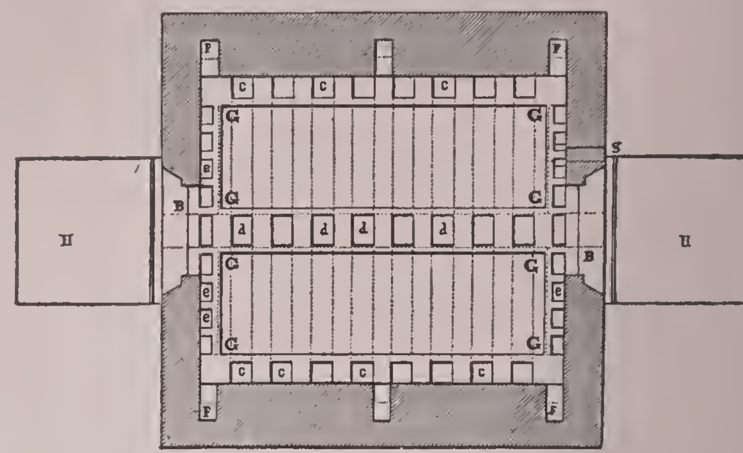

Fig. 7.—Cementing furnace (horizontal section).

holding 15 tons of iron bars. The pots are surrounded and heated by means of numerous flues, *c*, which pass under the bottom and up the sides, and flues *d e*, all of which convey flame from the common fire A to the chamber *m*, whence it is discharged by the chimneys N. The fire-grates lie on the bearing bars *a* (Fig. 6), and form a fireplace about 16 inches wide and 18 feet long. The large doors B B give access to the pots. H H are pits at each end of the furnace for working the fires, and K K are tunnels connecting the pits of a series of furnaces through which fuel is brought and ashes are removed. Layers of charcoal about one-fourth of an inch thick and layers of iron bars are laid alternately in the pots (in such manner that no bars shall touch each other) until the pots are full. Then sand and a cover of fire-clay is tightly rammed upon each pot, and the doors B B are closed with brick walls, except a sight-hole in each. A fire is then built upon the grate at *a*, and a yellow to white heat is maintained on the pots for six to ten days, according to the degree of carburization required. Test bars are from time to time withdrawn at the hole *g* to ascertain the progress of the cementation, and when it is completed the ash-pit doors are closed and the fire is allowed to smolder and go out. The pots are then opened and the bars are removed. Furnaces for heating-retorts in the production of illuminating gas are simpler forms of the above-described apparatus.

The cupola furnace, in a form commonly used for melting iron in foundries, is shown in vertical section by Fig. 8. It consists of a plate-iron shell lined with fire-brick. The internal diameter is ordinarily from 3 to 6 feet. The engravings show a Mackenzie cupola, which is elliptical in cross-section in order to shorten the travel of the blast from the tuyere B to the center of the cupola. The tuyere is a slit 1 inch to $1\frac{1}{2}$ inches high, and extending entirely around the furnace. Air is supplied through the wind-boxes D from a high-speed fan or a piston blowing-machine at a pressure of $\frac{3}{8}$ lb. to 1 lb., according to the amount and duration of the work. The furnace is narrowed at the melting zone by the boshes C. Iron (either pig or cast scrap) and anthracite coal or coke are charged in alternate layers, and the melted metal accumulates in the hearth below the tuyeres, and is tapped off at A. Bituminous coal, being compacted by the heat and the pressure of superincumbent charges, will not permit free passage of the blast, and is hence an unsuitable fuel for cupolas. From 5 to 15 lb. of iron are melted with a pound of coal, according to the kind and size of furnace. When the day's melting is over the bottom doors are opened and the sand bottom and the slag and any remaining iron are dropped into the pit below.

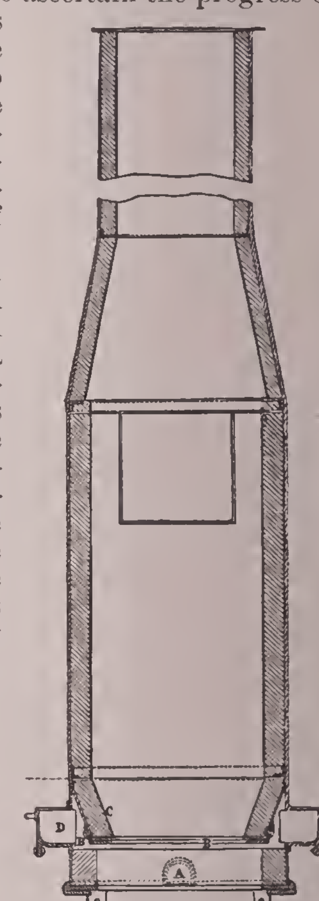

Fig. 8. — Cupola furnace (vertical section).

For delivering regular quantities of melted iron for many consecutive hours—for instance, 6 tons an hour for a day and a night in the Bessemer steel-works—modifications of the cupola are required, as shown in the vertical section Fig. 9 and the cross-section Fig. 10. In the foundry cupola (Fig. 8) the hearth is shallow, so that the bed-charge of coal (which must reach above the tuyeres) may be light; and since the furnace is run but a few hours at a time, this hearth is large enough to contain the slag. If a great quantity of iron is required, large cupolas or a number of cupolas are employed. But when the furnace must melt continuously for many hours, the hearth H (Fig. 9) is enlarged to accommodate a considerable quantity of melted metal and slag, and the tap-holes U V are provided to discharge the slag as it accumulates; otherwise it would rise and clog the tuyeres and form "scaffolds," which are masses of slag and coal that chill upon the walls. The tuyeres O are cast-iron tubes, generally six in number, with a 5 by 8-inch hole in each, and are so arranged that they can be cleared while in operation by inserting a bar through doors in the wind-boxes P. In a cupola of 5 feet internal diameter the bed-charge of coal, to reach above the tuyeres, is about $2\frac{1}{2}$ tons. Upon this are placed $3\frac{1}{2}$ tons of pig iron and 100 lb. of limestone (to make the cinder fluid); then 600 to 700 lb. of coal, $3\frac{1}{2}$ tons of iron, and 100 lb. of limestone, followed by coal, iron, and limestone in the last-named proportions. The fire is maintained by draught through the holes J K L till the bed-charge is thoroughly alight; these holes are then closed and blast is applied through the tuyeres O. When some 15 tons of iron have been melted and tapped out at L, the slag-hole U is opened. As the hearth fills again with iron the slag floating upon it runs out; and when the iron has risen to U, it is again tapped off at L. The slag-hole now remains open, and the cupola is worked continuously as last described.

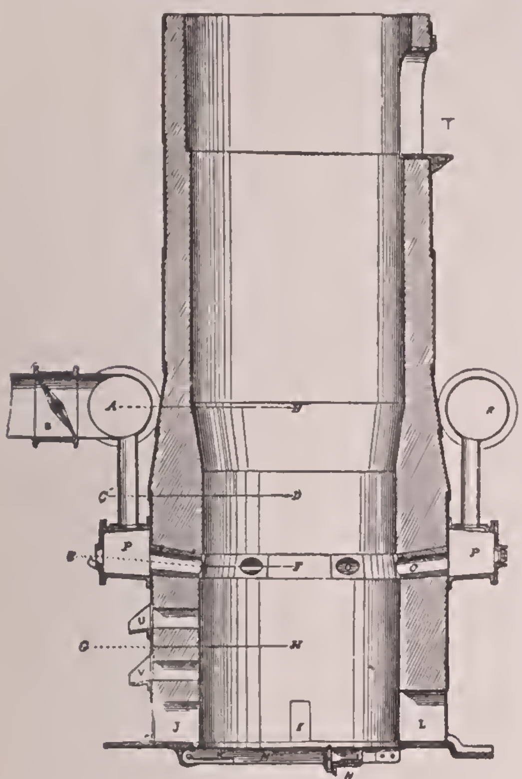

Fig. 9.—Vertical section.

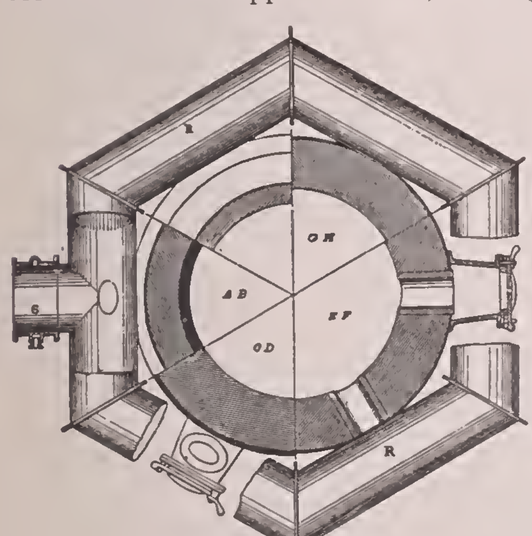

Fig. 10.—Cross-section.

The Gas-furnace.—The mere mingling of combustible gas and air is but one element in the production of the great and manageable heats obtained in a gas-furnace. The regenerative principle—i. e. utilizing the otherwise waste escaping heat to raise the temperature of the entering air and gas—is the subject of those modern improvements which are bringing the gas-furnace into almost universal use. There are two systems of regeneration: 1, the one by means of which Messrs. C. W. and F. Siemens, of London, developed the highly perfected and generally used Siemens furnace. This consists in passing the heated products of combustion, as they leave the furnace, over vast surfaces of brick, upon which they deposit their heat. The entering air and gas are then passed over these hot brick surfaces, and, so to speak, wash off the heat from them and

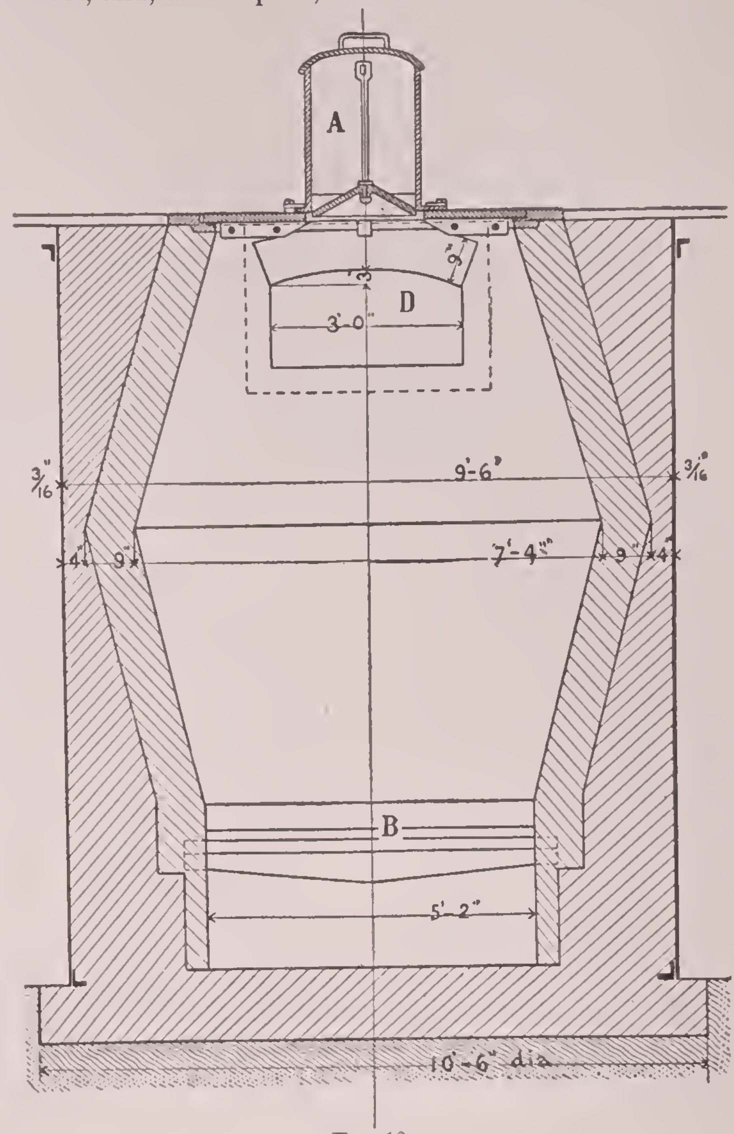

Fig. 10A.

take it up themselves. Meanwhile, the escaping products of composition are heating other brick surfaces, which

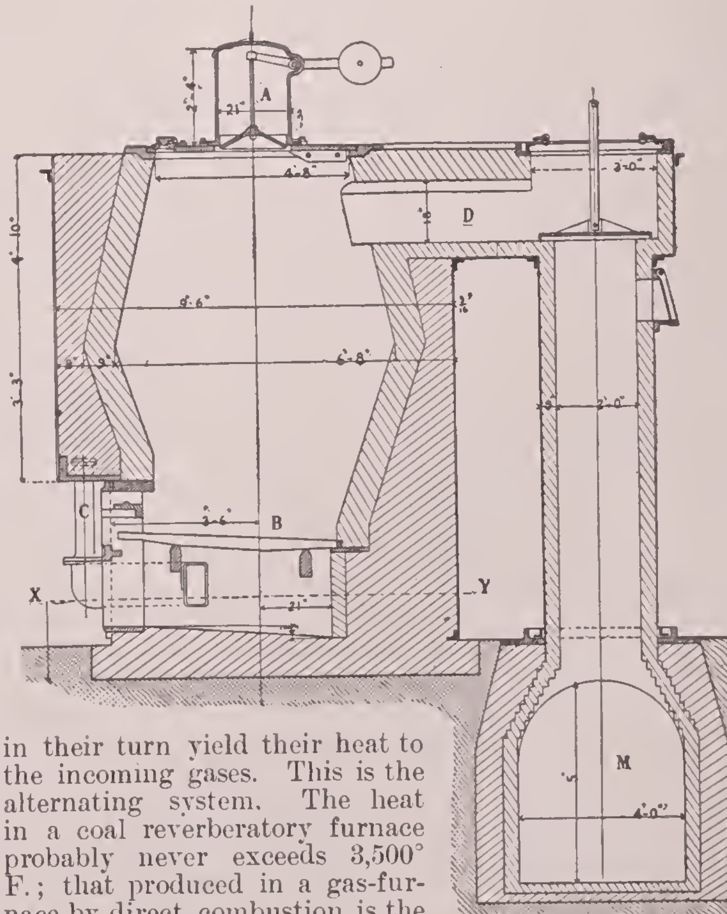

Fig. 10B.

in their turn yield their heat to the incoming gases. This is the alternating system. The heat in a coal reverberatory furnace probably never exceeds 3,500° F.; that produced in a gas-furnace by direct combustion is the same, plus the heat returned by the regenerators, and may reach 4,500° F., which is the heat at which dissociation commences, and is therefore the maximum attainable by the combustion of the gases employed. 2. The other form of regenerator is, properly speaking, a stove, in which the outgoing gases pass on one side of thin conducting partitions, while the incoming gases flow along the opposite side, the heat being continuously transmitted through the partitions. This continuous system of regeneration, although employed in a limited or an imperfect manner long prior to Siemens's experiments, and considerably improved by Gorman in the English furnace bearing his name, has again fallen into disuse. The gas-producer has also been the subject of many modifications to suit different fuels. The one illustrated in longitudinal section by Fig. 10A, and in cross-section by Fig. 10B, is the form designed by Wellman for bituminous coal. It is a strongly bound fire-brick chamber, from 7 to 8 feet square in its largest dimensions and 7 to 10 feet deep. Coal charged through the gas-tight hopper A is slowly burned on the grate B. The fire is stirred by a bar inserted at the hole C. By means of the flue D the gas enters the flue E to the main underground flue M, which is also the outlet of other producers arranged in line with it. Thence the gas is conducted to the furnaces, which may adjoin the producers or be hundreds of feet away. Air for combustion was formerly drawn into the grate by means of the furnace chimney, but blast is now generally introduced under the grates in order to control the rate of combustion better. Some 2 tons of coal are burned in 24 hours in each producer. The anthracite producer is usually larger and has more grate surface, and jets of steam are employed, chiefly to soften the clinker. The use of water as a means of furnishing combustible gases has not proved advantageous, because their combustion produces no more heat than that abstracted in decomposing the water into these gases. Bituminous coal having been lighted in the producer, the volatile constituents, chiefly hydrocarbons and water, are first evolved. Of the remaining 60 or 70 per cent. of solid carbon, that next the grate is burned to carbonic acid, which, by rising through 2 or 3 feet thickness of incandescent carbon, is changed to carbonic oxide. The gases passing to the furnace consist chiefly of carbonic oxide, 25 per cent.; hydrocarbons, 10 per cent.; and nitrogen, 60 per cent. The producer and gas-flue should contain a slight excess of pressure over the atmosphere to prevent the inflow of air through crevices, and the consequent combustion and waste of gas. Placing the gas-producers below the furnace, or supplying them with air by a fan rather than by the furnace chimney draught, best accomplishes this purpose. The modifications of the Siemens producer, now generally preferred in American metallurgical practice, are those of S. T. Wellman, of Thurlow, Pa., and J. W. Taylor, of High Bridge, N. J.

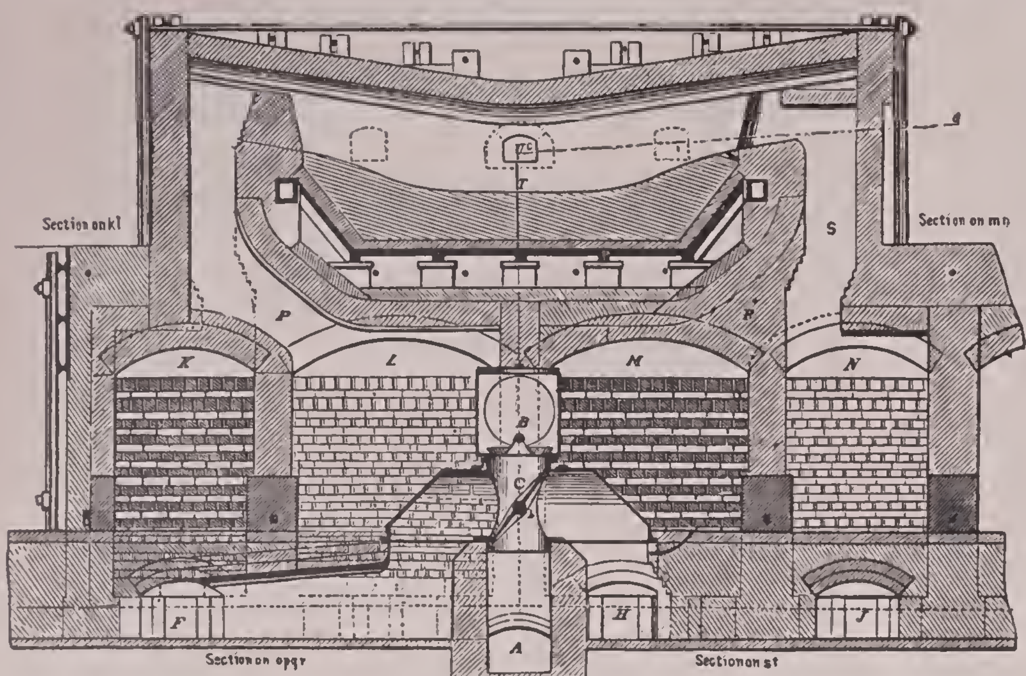

FIG. 11.—Siemens gas-furnace.

The Siemens Gas-furnace.—The general structure and details of this furnace, for both melting and heating, are illustrated by Figs. 11 to 14, which represent a 5-ton open-hearth furnace for the manufacture of Martin steel out of cast and wrought iron, as built by S. T. Wellman for the Otis Iron and Steel Company, Cleveland, O. Although the design is now antiquated, the drawings well serve the purpose of illustrating the principles of construction and operation. A furnace of modern design, in which natural gas is used as the fuel, is shown in the article STEEL. Above the floor-line W (Fig. 13) the furnace is a rectangular iron box about 22 by 10 feet in plan, strengthened with buckstaves, roofed and lined with fire-brick, and furnished with charging doors, U, like the ordinary reverberating furnace. The sand-bed or hearth, T, upon which the materials are melted rests in a heavy cast-iron basin, beneath which there is free circulation of air to preserve the parts from excessive heat. By means of the spout V the steel is conducted to the casting ladle. Fig. 14 is an exterior view of the charging side of the furnace and of the regenerator below. The regenerator consists of four fire-brick chambers, K L M N (Fig. 11; shown in horizontal section at Fig. 12, and in cross-section at Fig. 13), which are filled with a checkerwork of fire-bricks stacked loosely together, so as to present the largest amount of surface to any gas entering the chamber. From each of the end chambers, K N, two gas-ports, S, lead up into the furnace (as shown on the right of Fig. 11, and in plan on the right of Fig. 12). From each chamber, L N, three air-ports, P (Fig. 11) and R (Figs. 11 and 12), lead up alongside the gas-ports to a higher point in the furnace, in order to promote a more thorough mixture of air and gas.

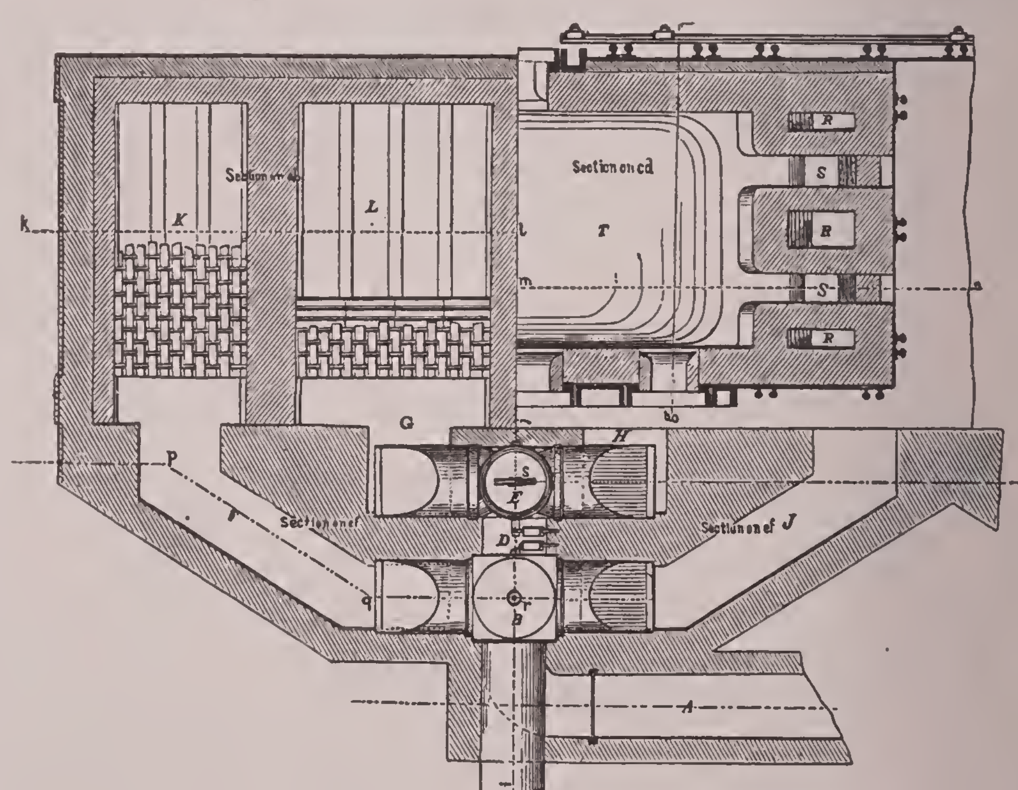

FIG. 12.—Siemens gas-furnace (horizontal section).

The ports thus form a sort of vast argand burner at each end of the furnace. The gas, air, and reversing valves and flues are shown in cross-section at Fig. 13, in plan (laid over a horizontal section of the flues) at Fig. 12, and in longitudinal section (laid over a longitudinal section of the regenerators) at Fig. 11. The operation is as follows: Gas from the producers, regulated by the puppet-valve B, passes down through the reversing valve, C (Fig. 11), which is so set as to throw it into the flue, F, and the regenerator, K, where it percolates through the mass of red to yellow hot brickwork, and thence passes at an equally high temperature into the furnace. Meanwhile air, regulated by the valve, E, is drawn by the furnace chimney into the reversing valve, C′ (Fig. 13), which, being set similarly to C, guides the air through the flue G into the regenerator, L, where it is also heated red hot, and in this condition it passes up the port, P, and meets the red-hot gas at the mouth of the furnace. The combustion is instantaneous, and intense enough, if the gas is not carefully regulated, to melt down the roof of the furnace. The flame is thrown down by the roof upon the bath of metal in the hearth, T; thence it passes down the ports, R S (Fig. 12) into the two regenerators, M N (Fig. 11), which absorb its heat; and thence it escapes through the flues, J H, under the two reversing valves, C C′, and into the chimney-flue, A A′. After twenty or thirty minutes, the two left-

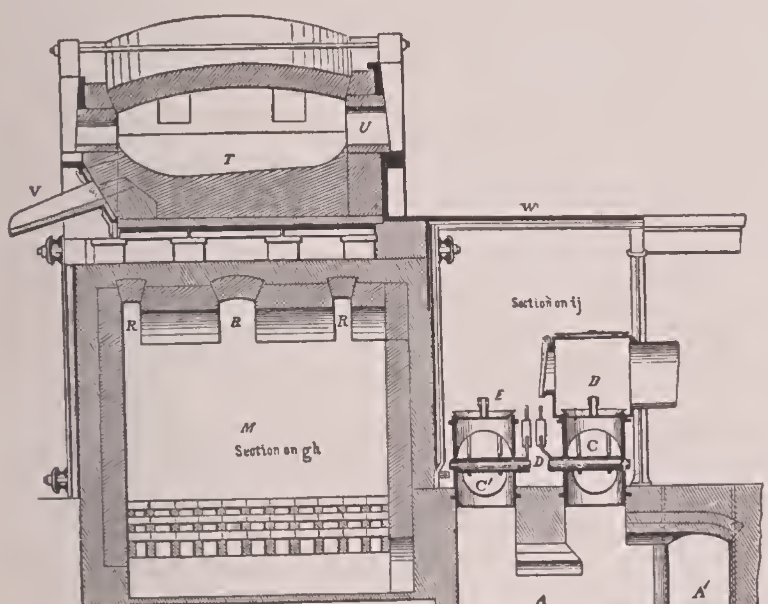

Fig. 13.—Siemens gas-furnace (cross-section).

hand regenerators having been somewhat cooled by the ingoing air and gas, and the two right-hand regenerators having been highly heated by the outgoing products of combustion, the valves, C C′, are reversed by means of the handles, D, when immediately the currents begin to move in the opposite direction; the gases pass into the furnace at R S and out through the regenerators, K L. The chief advantages of the gas furnace over the coal furnace are—1. Less than half the coal is required for a given heat; but since the escaping heat of the gas furnace is expended in regenerating gas rather than in raising steam, additional

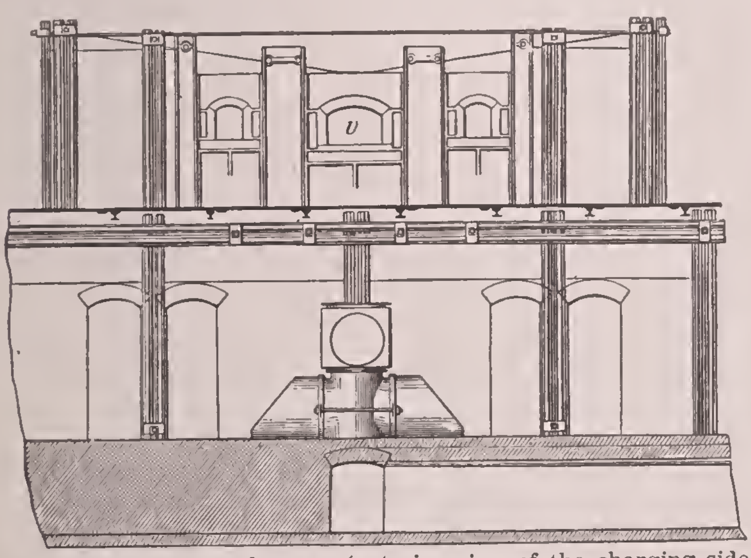

Fig. 14.—Siemens gas-furnace (exterior view of the charging side, and of the regenerator below).

coal must be burned under the boilers, so that the fuel-saving is reduced in rolling-mills to about 25 per cent. 2. The saving in the oxidation of the iron heated is about 3 per cent.—a greater economy than that in fuel—and is due to the complete command of the chemical character of the flame. The prevention of smoke, the saving of space and labor, and the cleanliness of works are also considerable advantages. It will be observed, by comparing the open hearth with the pot furnace and the puddling furnace hereinafter described, that the use of gas and of regeneration may be adapted to any required shape of furnace and to all varieties of work. In the glass manufacture, for example, they are largely employed. In the gas *heating* furnace the bed is usually made much larger than in the coal reverberatory (Fig. 3), because uniformity of temperature can be much better maintained. The largest practicable coal furnace will heat, for instance, 6 or 7 three-rail steel ingots weighing a ton each; a perfectly manageable gas-furnace, 20 by 12 feet on the bed, will hold 15 or 18 such ingots. The continuous regenerator will be described in a following paragraph.

The Pot Furnace.—This is a small furnace, worked at a very high temperature, for heating fire-clay or plumbago

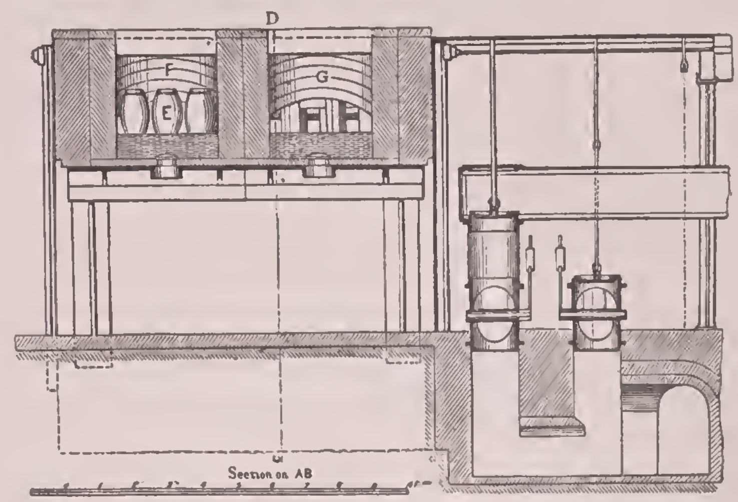

Fig. 15.—Siemens gas-pot furnace (longitudinal section).

crucibles or pots in which steel, brass, and other metals are melted. In the manufacture of crucible steel the pots containing the ingredients (chiefly wrought iron or cemented steel, and a little carbon and manganese) are about 15 inches high by 10 inches in diameter. From two to six of them are placed in a "melting-hole," which is a fire-brick furnace just large enough to hold them and the fire in which they are partially buried. The top of the furnace opens, by means of a lid, on the general floor of the building; a grate beneath communicates with a subterranean ash-pit and gangway. The fire in a coal furnace is urged by a powerful blast, and the escaping heat from a long row of melting-holes passes under a common steam-boiler. When the metal is ready to cast, the lid of the furnace is drawn to one side, the pot is lifted out, the cover of the pot is removed, and the metal is poured into a mold. Figs. 15 and 16 are respectively a longitudinal and cross-section of a Siemens gas-pot furnace. The general structure of a melting-hole and the situation of the pots E, whether coal or gas fuel is used, is shown at F G. The structure and operation of the regenerative apparatus will be understood by referring to the foregoing description of the open hearth. Gas and air, entering the hot regenerators I H respectively, mingle and burn as they enter the melting-hole G; thence they pass into and heat the regenerators J K. By means of the reversing valves the currents are changed from time

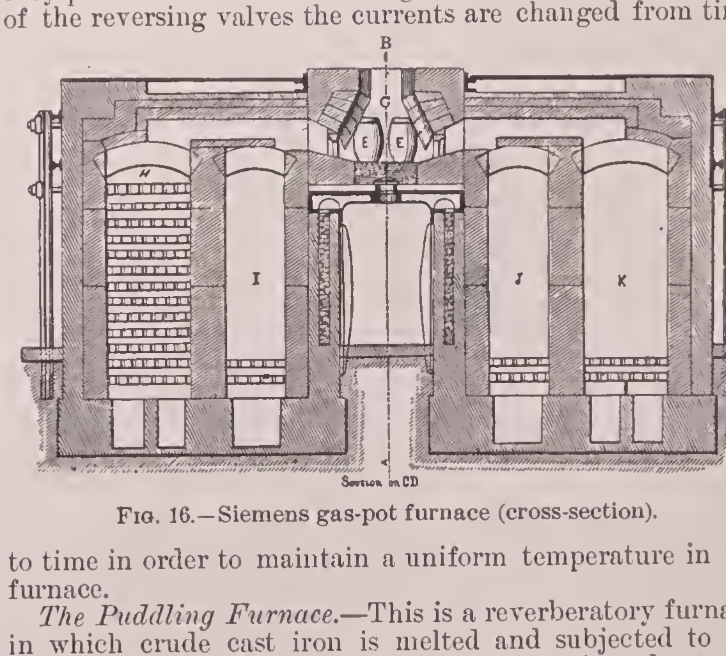

Fig. 16.—Siemens gas-pot furnace (cross-section).

to time in order to maintain a uniform temperature in the furnace.

The Puddling Furnace.—This is a reverberatory furnace, in which crude cast iron is melted and subjected to the oxidizing action of air and of oxide of iron, in order to remove its carbon and silicon, and thus convert it into a pasty mass of malleable iron. Its general construction is like that of the heating furnace (Fig. 3), except that its hearth is formed like that of the open-hearth furnace (Figs. 11 to 14). When gas fuel is employed the regenerative system is substantially that shown in the last-named engravings. The single puddling furnace has a door at one side of the hearth by which the iron is inserted and the "ball" is removed. Through a notch in the door the workman inserts the "rabble" or hooked iron bar by which he stirs the bath and forms the iron into balls. A double furnace has doors on both sides, through which two men work in the same bath. The product of a double furnace is about 2 tons in ten hours. Many attempts have been made to increase the product of the puddling furnace and to relieve the severe manual labor of stirring the charge by mechanical appliances, chiefly by means of the revolving furnace. These contrivances have all been abandoned.

The use of rotary furnaces is now confined in American metallurgical practice to the different modifications of the Brueckner cylinder, employed in the roasting (expulsion of sulphur) of copper ores. These rotary furnaces are simple large brick-lined iron shells, resting on rollers and driven by power, having at one end the fire-box in which the fuel is burned and at the other end the flue from which the gases of combustion and of roasting escape.

Conclusion.—A treatise on furnaces without descriptions of the different smelting furnaces, and of numerous standard forms of apparatus for applying heat in the various arts, is obviously incomplete. They are all, however, special applications, and as such are described in the treatises on these arts, and they are all modifications of the typical forms herein described. In those arts where fuel is used on the largest scale, such as the manufacture of wrought iron, steel, and glass, and where the highest temperatures are required, the grand improvement of the period, already becoming general, is the use of gaseous fuel, and its regeneration by means of the escaping heat of the furnace. One, at least, of the most important modern manufactures—that of open-hearth steel—is the direct result of the regenerative gas furnace. Heat of sufficient intensity and of suitable chemical character was unattainable by any other known means. The temperature of dissociation having been attained, further improvements would appear to lie in the direction—first, of economy—less than one-tenth of the theoretical value of fuel is utilized in the best furnaces; second, of more enduring refractory materials—fire-bricks are melted at easily attainable heats, and all refractory compounds are soon destroyed by chemical reaction with the ingredients under treatment.

Furnes, fürn [from Flemish *Veurne*, Furnes]: town of Belgium; province of West Flanders; at the junction of three canals; 13 miles E. by N. of Dunkirk, France (see map of Holland and Belgium, ref. 9–A). It has manufactures of linen and leather, and a large trade in grain, butter, cheese, and linen. Noticeable among its public buildings are the Church of Walpurgis, erected in the ninth century, and the city-hall, erected in the thirteenth century. Pop. (1891) 5,465.

Fur'ness, Horace Howard, LL.D. (Harvard, 1894): Shakspearean scholar; b. in Philadelphia, Nov. 2, 1833; graduated at Harvard College 1854; studied law; was admitted to practice 1859; furnished chapters in Troubat and Haly's *Practice* on *Ejectment, Domestic*, and *Foreign Attachment*, etc.; has published eight volumes of a New Variorum ed. of Shakspeare's plays—viz., *Romeo and Juliet* (1871); *Macbeth* (1873); *Hamlet* (2 vols., 1877); *King Lear* (1880); *Othello* (1886); *The Merchant of Venice* (1888); *As You Like It* (1890); and *The Tempest* (1892).

Furness, William Henry, D.D., LL.D.: clergyman; b. in Boston, Mass., Apr. 20, 1802; a graduate of the Boston Latin School and of Harvard College 1820; studied theology at Cambridge, and was ordained pastor of the First Congregational Unitarian church in Philadelphia in 1825; resigned in 1875. D. Jan. 30, 1896. Dr. Furness was widely known as an author; he published a volume of prayers (1850), a volume of sermons (1855); wrote devotional poetry of tender feeling; made numerous translations from the German poets, and published a volume of prose tales from the German (1856). He printed many sermons in pamphlet, contributed articles to the *Christian Examiner*, mostly on his favorite subject, the New Testament Gospels, and was for three years editor of *The Diadem*, an annual published in Philadelphia. But his name will be chiefly remembered in connection with the anti-slavery movement, in which he took an intense interest, and on which he frequently and earnestly preached; and with the attempt to recover the character of Jesus by a fresh study of his biographers. His chief literary works are on this theme, the successive volumes being simply attempts at more complete and convincing statement. The first, *Remarks on the Four Gospels*, appeared in 1836; *Jesus and his Biographers*, in 1838; a *History of Jesus*, in 1850; *Thoughts on the Life and Character of Jesus of Nazareth*, in 1859; *The Veil Partly Lifted*, 1864; and *Jesus*, in 1871. These volumes he has followed up with many minor studies of the same general theme. He translated from the German, with notes and comments, Dr. Daniel Schenkel's *Characterbild Jesu*, an elaborate essay written as a reply to Renan's work (2 vols., Boston, 1866). For an estimate of his view of Jesus, see *The North American Review* for Oct., 1850. In 1886 he published *Verses and Translations from the German Poets*; in 1893, *Pastoral Offices*. Dr. Furness never took part in sectarian controversies, nor was he interested in the extension of the Unitarian faith as a peculiarity, preferring to stand outside of organizations.

Furness, William Henry, Jr.: artist; b. in Philadelphia, Pa., May 21, 1828; d. in Cambridge, Mass., Mar. 4, 1867. On leaving school at the age of sixteen, he went into a counting-room, but was there only one year, his passion being for art. His skill in crayon portraits gained him reputation and money; he went to Brooklyn, N. Y., thence soon after to Boston, where a residence of two or three years enabled him to accumulate sufficient means by his pencil to spend more than two years abroad, studying art in Düsseldorf, Munich, Dresden, and Venice. On his return he established himself as a portrait-painter in Philadelphia, married, removed his studio to Boston, and lived in Cambridge. His improvement as an artist was rapid, and at the time of his death he stood in the front rank of his profession. His best work is marked by firmness of drawing, truth of color, fidelity to characteristic traits of feature, and fine feeling of expression. His genius was delicate, his spirit gentle, his taste refined; but earnest study saved him from weakness, and his simple love of truth imparted to his portraits a living charm. He was fortunate in his subjects. Charles Sumner, Lucretia Mott, Dr. Furness, John W. Field, Hamilton Wilde the painter, J. P. Lesley, the daughter of R. W. Emerson, with many persons besides of intellect and character, sat to him.

Furniture [from Fr. *fourniture*, furnishing, supplying, deriv. of *fournir*, furnish < O. Fr. *fornir*, from Teuton.; cf. O. H. Germ. *frummjan*, deriv. of *fruma*, use, advantage; cf. Mod. Germ. *fromm*, advantageous, useful, good, execute, do]: that with which anything is furnished; hence that which is needed to help anything discharge its functions, or to help any person do his or her work. Thus the locks and hinges in a house are a part of the furniture, as called for in the contract for building, and we speak of horse-furniture as including saddles and bridles and all their minor parts; so table-furniture includes all necessary and ornamental dishes and other vessels, knives and forks and spoons, table-cloths and other such accessories. But the word used absolutely means, generally, the tables and chairs, bedsteads and chests of drawers, which are used in a dwelling-house, the writing-desks, book-cases, etc., of a library or office, or in a fuller sense the above together with the bed-linen, carpets, curtains, and the like. It is not customary to include in *furniture* the pictures on the walls or the vases on the mantel-shelves, nor other articles of art and ornament having no utility.

Something of convenient height to sit on has always been found necessary for comfortable life, except among the Japanese of the so-called feudal period which ended in 1868, who were wholly independent of such convenience. A frame upon which to lay the cushions, rugs, or mattresses, which constitute the bed has also been found necessary, probably because it raises the sleeper out of the draughts of air which sweep along the floor, and out of reach of many insects and creeping things. Here again the Japanese have been an exception, needing no bedstead at all. Persons seated on chairs or reclining on beds or couches need tables upon which to lay small objects in use, and especially the dishes and other table-furniture at meal-time; and the Japanese, seated on their floor-mats, also require tables, though very low ones. Finally, shelves of some sort are needed upon which to lay, out of the way of harm, objects not immediately in use; and drawers, which are merely a modification of boxes resting on shelves, are an equally obvious device; the union of such shelves with drawers, or inclosed boxes of any sort, makes up the cupboard, sideboard, cabinet, chest of drawers, or wardrobe. Necessary furniture consists of these few types, the seat, the couch, the table, the cupboard. The Egyptians, at the time of their early wall-paintings, many centuries before the Christian era, had chairs of wood, with cane seats woven very much as modern ones are woven; others with seats of interwoven leather strips, and others with cushions; and also large and easy armchairs, with cushioned seats, arms, and backs. Wooden frames of some of these have been found in tombs in perfect preservation. Wooden bedsteads and "day-beds," or couches, they had also, and some of these were splendidly decorated. There was a very general custom of ornamenting these beds and couches with the heads, legs, and tails of lions, oxen, and other beasts, and this was carried so far sometimes that the whole piece of furniture appeared to be modeled after the creature chosen as its subject. A religious or traditional feeling had to do with this custom, no doubt. The larger armchairs, or thrones, as they may well be called, are represented as even more elaborately carved with heads and hoofs and paws of animals. Some of these were certainly made of metal, the wall-paintings make that clear; they were probably of bronze, and gilded. The discovery of one superb throne in excellent preservation, now in England, has proved that sixteen hundred years B. C. the Egyptians knew how to combine hard and fine grained wood, richly carved, with solid silver and gold and the same metals in thin plates, into one rich and really noble design. The Egyptians were great masters of metal work, and their gold and silver plate must have been splendid, to judge from the wall-paintings and to reason from the analogy of the jewelry found in mummy-cases; the plate itself has perished, except in a few cases, its intrinsic value insuring its reduction to ingots or coin at any change in the political world; the few pieces which have been found in the tombs are of spirited design, but a very great number of large and very minute representations of vases, cups, dishes, etc., has been collected by M. Prisse d'Avennes from the wall-paintings, and their variety, richness, and beauty are astonishing. (See METAL-WORK.) Spoons, ladles, and dishes of hard wood are found most richly carved in the semblance of human figures, as slaves carrying burdens, children, lute-players, females in the attitude of swimming and supporting the bowl of the spoon between their hands, as if they were trying to keep it afloat and before them. Some of these are painted in elaborate variety of color, others are left of the natural tint of the wood, and inlaid with glass, other woods, ivory, etc. Toilet articles also of painted wood exist in the collections, some of them worked into fanciful bouquets, the large flowers of which unscrew, revealing small boxes and trays. Egyptian physical civilization seems to have been as carefully organized for comfort and display as that of modern Europe, and this civilization the people of the Nile knew how to maintain for a space of time which dwarfs by comparison all the epochs of Europe.

Fig. 1.—Throne or armchair, from an ancient Egyptian wall-painting.

The Assyrians are shown in their bas-reliefs seated on couches and thrones, with bedside tables and stools, vases and dishes of varied form. The tables are lower than the couches, as would be more convenient. We know that the ancient Persians and the peoples of Asia Minor had rich and splendid furniture. The people of India have been makers of splendid articles of mingled use and beauty from time immemorial. The great empire of China will give the archæologists, whenever they may choose to improve it, the best chance they are ever likely to have of studying the history of decoration and furniture, combined with custom, tradition, and strong family and ancestral feeling, prolonged through untold centuries. From Greek and Roman antiquity, strangely enough, there is little to be learned. We know something of the furniture of display and convention, the marble tables and lamp-stands, and we know the bronze articles of utility which Pompeii has preserved for modern times, but little else has been learned with any certainty. We know that small tables were brought to the distinguished guests in Homeric times, one for each guest. We find that the custom of removing the tables with all on them and bringing others, was a later Greek practice as well. So, too, in the Roman *triclinia* or dining-rooms we read of how the whole table was removable at one time, and how, at a later time, the leg or upright of the table was made permanent, and only the top movable, and intended to be changed with the changing services; and we read of the "fad" there was for the use of splendid veined and knotted wood for these table-tops, and of the enormous prices paid for some of them. So we learn from allusions in contemporary writers that table-cloths came in with the Emperor Tiberius. But what the tables looked like and how they were built we can hardly guess, except from one or two paintings in Pompeii—hasty scrawls of feeble execution. What tables either Greeks or Romans used in the work-rooms, the open air sitting-rooms, or for writing, we do not know. About their couches and chairs we are a little better informed. Elaborate frames of bronze of both chairs and couches have been found at Pompeii, and wooden frames of the dining-room beds, richly adorned with bronze ornaments. We learn from allusions in Roman books and from vase-paintings, mosaics, coins, and bas-reliefs, that chairs were of different materials, some even of wicker-work, though probably not of rattan; we learn that there were chairs with backs and arms, and those without either; chairs with four straight legs and those with crossing supports like camp-stools, sometimes really folding up at pleasure, and sometimes having that form only, a traditional form of some importance, for of these were the famous curule chairs of the Roman magistrates. As for the stately armchairs with high backs, thrones in the proper sense (see THRONE), we find more of them in Greek art than in Roman art and narrative combined; for the vase-paintings present a great number of them and a variety of types. It is very doubtful, however, whether these were often used in the household, even in that of a prince; they are essentially articles of ceremony, and especially of the ceremony of worship.

Pompeii has kept safe for us a great number of bronze articles now in the Naples Museum of a kind unfamiliar to modern life. Thus the lamp-stands (candelabra) are of many sorts. One kind is composed of a straight, upright slender column, supported by a three-footed stand, and carrying a spreading top; the whole as delicate and light as practicable, the decoration partly in mere fluting and beading, partly in the animal and half-human forms used at the top and in the stand. These were to carry only one lamp each. Sometimes the slender upright was adjustable in height, a rod sliding in a sheath, and held at any point by a pin fitting in a hole. Other candelabra are two-branched or three-branched, and these have often a spirited figure as of a satyr or sphinx serving as the main stem, or affixed to it. Others again are made to hang several lamps from by chains, and still another sort is for the table, the stand being not more than 6 inches high, like the carved wood *socle* of a Chinese vase. The lamps themselves also were often beautifully worked in bronze; and there is something strangely foreign to our modern ideas in the combination of costly and very artistic appliances for the production of a light as feeble and uncertain as that of olive oil with a wick floating in it. Other curious bronzes are the little portable kitchens in which, on a stand a foot square, or but little larger, a fire-hearth, a boiler for water, and other apparatus for simple cooking are brought together. The utility of these is incontestable; like the modern chafing-dish, they allow of a great deal of delicate and skillful preparation of simple food.

The impression made upon the student of the existing monuments is that the Greeks certainly, and the Romans probably, asked for much less elaborate and less carefully adjusted furniture than the moderns require. They adapted their needs to the simple although often rich and stately table of stone or marble, seat of bronze or massive wood, bookcase or cupboard recessed in the wall. They wrote, as modern women write, on the knees, while the table beside them held their scrolls and inkstand. They kept their books in covered boxes, labeled on the outside. The presence in all well-to-do households of many slaves, often of quick-witted race and of some education, made elaborateness of furnishing and all labor-saving devices less necessary. And their life was more generally that of the agora and the forum, of out-of-door intercourse, business and politics, than we can well imagine.

Our knowledge of the furniture of the Middle Ages is derived from allusions in literature, from representations or suggestions in architectural and decorative sculpture, from paintings in manuscript books, from tapestries, and from the objects themselves which remain to us. It is obvious that from all these sources alike the amount of our information is very slight for the most ancient period, and grows rapidly more abundant as we pass the twelfth century and approach modern times. What Charlemagne had about his private rooms, or what his nobles or their retainers, or the townspeople, or the rustics of his time owned and used, we can only guess by inference from later times. Of the epoch two centuries later we can gather some few facts, but only a few. Fortunately it is not very misleading to reason backward from a time we know more about. Thus that the walls were very rarely covered with hangings of any sort in Europe, before the fourteenth century, follows from the low state of the textile industry of the time, and is also known from the miniatures which show us walls rudely marked off with lines and simple patterns in two or three colors, probably done with water color on the stone. So it is easy to see that the seats of the ninth or of the eleventh century would not differ widely from those of the thirteenth; that they would naturally be first, and chiefly, the chests which were ranged along the walls, and which contained clothing, table-linen, bed-linen, and, on occasion and in rare cases, pieces of rich stuff brought from the East and serving for decoration; secondly, the state chair which each high-placed family kept for its head and representative on frequently recurring days of ceremony; thirdly, benches and stools, large and small, a survival of which one finds to-day about the choirs and sacristies of Italian churches. About the bedsteads we know less; that is to say, very little. Concerning cabinets and cupboards we need only reason that they were very few, even fewer than the bedsteads probably were, for there was little to keep in high *armoires* and *bahuts*, which low and simple chests, useful also to sit on and to sleep on, would not hold as well, while skillful woodworkers were not numerous. There were no books. There were no pieces of decorative art. There was no fine china and no glassware at all. And as for mere adornment of the apartment, the nobles thought little of indoor life, and had but one private room to serve for sleeping, and for such affairs of society, eating or business, as were not to be carried on in the great hall amid vassals and followers, while all below the highest ranks would find such pieces of furniture wholly unattainable.

These remarks apply to the whole epoch from the disappearance of the last remains in Western Europe of the customs of the Romanized provincial nobility to the time when our sources of information became more frequent and more trustworthy. It is a tendency of recent archæological writing to claim a more advanced state of physical civilization for the early Middle Ages, on the strength of special discoveries of documents and monuments of the time, but these point only to exceptional and very rare instances of lingering tradition, or of enlarged ideas brought from over seas. The Byzantine empire was the center of art and of material civilization until the ill-omened second crusade, and undoubtedly a traveler brought home ideas of comfort and articles of luxury now and again from the great capital of the East. In the south of Italy and in Sicily something of Græco-Roman suavity of manners and ease of life had been retained, even to the iron time of the tenth and eleventh centuries. But generally the world of Europe of those days can best be judged, so far as its physical state of well-being goes, by means of a study of the peasants' houses in out-of-the-way parts of France or South Germany, or perhaps, as indeed travelers tell us, in Bulgaria and Servia, and in like regions of traditional and slowly changing customs. The bedstead is built permanently into the structure of the house, and forms part of it; it is rather pretty, with its paneling in hard wood and its bit of carving here and there; there is only one such, and that is in the living-room, for the younger members of the family sleep no matter where, in the garret on some sacks, or in the hay-loft, or rolled up in a blanket in front of the living-room fire. The coffers or chests are handsomely worked and tastefully though slightly decorated with carving, or a bit of inlay in wood, and even ivory, or shell on the sea-board; and they have each a splendid wrought-iron lock with a powerful bolt and a key as heavy as a horse-pistol, and quite beautiful in its *naïf* and barbaric ornament, but there are not more than one, or at most two, of them in one house. The table is massive but not very showy. Besides the chests there are no seats but stools, either three-legged, made by fixing round bars into a piece of plank, or made with two plank uprights, each cut out at bottom to form two feet with a graceful enough sweep between them, and two shorter and thinner pieces nailed across between the uprights to stiffen the whole. The chimney gleams with bright copper vessels which are the mistress's pride and joy, and which are of all dates from five centuries ago to yesterday. All this would be found much in the same condition in the house of a well-to-do family of the Middle Ages, if we could visit one to-day, and with it would be found a display of coats-of-mail, head-pieces and serviceable weapons, hung upon the wall. The noble family would have, in addition, the chimney-piece adorned with the armorial bearings of its chief, and the chair of state in the lord's chamber, which chamber itself would be more of a separate and a dignified apartment than any piece except the living-room in the modern house we have been considering. See House.

With the fourteenth century there came a very marked increase in the standard of comfort, both among the nobles and among the more well-to-do townspeople. The nobles sought in their castles something of the space and convenience of a country residence, combined with the defensible fortress which they could not yet spare. The townsmen built much larger houses than before, with separate rooms for the several needs of life, and with a good deal of care taken to provide large windows, pleasant places to sit by the window and by the fireside, and out-of-door *loggias* and porches.

With all this came a great increase in the number, and also in the richness, of the pieces of furniture employed. But the variety was not largely increased; the bedstead, the table, the chest, and the unbacked stool or bench, still made up the greater part of any man's furniture. Cushions were more numerous, as we may suppose; at least they were not few in the fourteenth century, for the miniatures show them in use in chairs, on benches, on chests—soft ones like pillows, firm and square-shaped ones like those of our old-fashioned wooden-seated armchairs. Hangings, door-curtains, window-curtains, table-cloths are common in the richer houses, and are not unknown in the others, at least of the towns. And in one respect the pieces of furniture of wood were different from those of the twelfth century and before, namely, in the much freer use of sculpture in their adornment. The earlier pieces had been decorated with inlaying, more or less, but especially with color applied by the paint-brush; they were massive and rather grotesquely ponderous, with huge square sticks and thick planks for their framework, and color for their chief adornment. But with the fourteenth century came the influence upon all woodwork and all minor ornamentation of the wonderful system of Gothic architectural sculpture. The end of every arm of a chair or bench was carved into a dog or a strange, semi-heraldic lion or a dragon, or at least a dragon's head; the wood of it, wherever unnecessarily thick was cut away for lightness, but a little of this was left behind in a delicate and rich group of leafage and small animal forms, helping by the general mass of the sculpture the main lines of the piece; even the chests received their share, though a less liberal one, but the bedstead and the chair of state received the richest sculpture, while the *settle* of the fireside, the state chair's domestic and popular enlargement, now growing common, had a share. The carving in oak of Northwestern Europe, and especially of France, from 1350 to 1400 is marvelous in beauty. But little of it remains, but enough to show it to be the early maturity of that splendid art which reached its culmination in the stalls of Amiens cathedral of about 1510, which kept its place, though with diminished importance, through the three following centuries, undestroyed even by the pomposities of the Louis XIV. period, and which lingers on even at the close of the nineteenth century in the traditions of the workshops in the towns of France. Besides the settle, the *cupboard* or *dresser* makes its appearance in the fourteenth century—a combination of shelves upon which to show off pieces of plate, with perhaps a locker or shut-up place beneath, and worked into a showy piece of furniture. Perhaps the distinction should be made between the cupboard or dresser which was of great stateliness, with even some limit as to the number of its shelves for each rank of life, and the simpler *crédence*. But either was as handsome as the owner's means admitted, and either was an almost immovable piece of furniture, a wall-piece, like a modern bookcase. It is noticeable, indeed, how all the furniture of decorative character tends to be fixed and immovable in character throughout the Middle Ages. The seats are throne-like chairs with footstools, high backs, and even canopies; the settles are high and heavy, and often raised, with a permanent platform-like footstool in front, inclosed at both ends, veritable islands in the stone-paved halls. The tables are sometimes less permanent, for the lord and his guest sat under their canopy on their raised seat, while a table was brought by the servant and set before them; but these tables were plain, hidden by cloths and draperies when served; and the decorative table was apt to be a ponderous thing, sometimes combined with shelves or cupboards below, for the two or three books of the scholar's library, sometimes having a revolving reading-desk above. In fact, the chief pieces of furniture were heavy and bulky things throughout the Middle Ages, like our grand pianos and bookcases, modifying in a serious fashion the rooms they were put in, unless those rooms were the huge and lofty halls of general resort. Light and dainty furniture is of a much later time.

With the fifteenth century, and the time of Louis XI. and his rival Charles the Rash and the English wars of the Roses, came the Renaissance in the North. This was not,

Fig. 2.—Crédence, late fifteenth century.

at first, in architecture and in furniture, a matter of classical gravity and simplicity of line—rather was the Gothic style more ornate and its decoration more florid before its final disappearance; but the forms were more light, the sculpture more delicate, the ironwork hammered and chased as finely as bronze; the pieces of furniture more numerous, more varied, and serving more numerous and varied requirements. Most of all, painting had almost disappeared from furniture. The richer the carving the less elaborate the painting of course; that had long been the rule; but now the use of painting had almost wholly disappeared from elegant furniture. The cabinet of two bodies now becomes common; not the mediæval *armoire* with one pair of doors from top to bottom; not the *crédence* in any form, but the decorative piece composed of a large lower chest and a smaller upper one. This *double press* or *bahut à deux corps* was not wholly novel in the sixteenth century, but the earliest specimens that remain to us are of that time, and the form seems to have been rare previously. It allowed of great novelty of design, for the natural and obvious treatment of it was much more architectural than would have befitted the old wardrobe or the dresser. At first the two parts were mas-

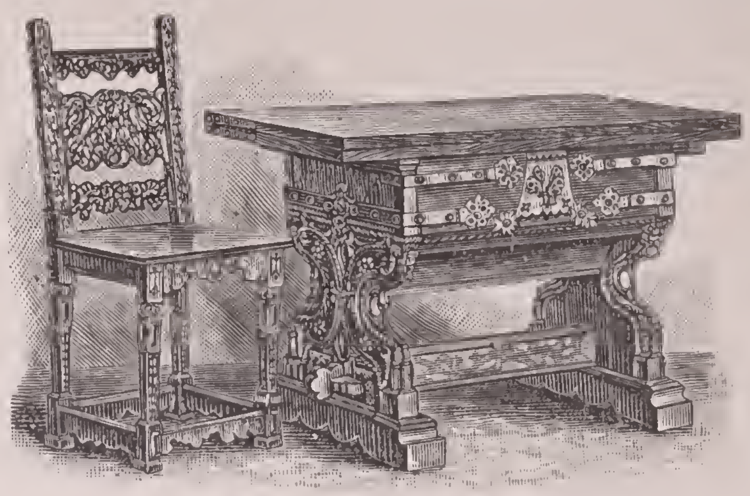

Fig. 3.—Table with locker which is opened by revolving the top; the top itself is in two folds; wrought-iron straps and lock plate; seventeenth century. Chair, same period.

sive oaken boxes simply adorned with shallow carving and with richly wrought-iron hinges and fastenings; but soon the introduction of the classical pilaster and entablature into architecture suggested the uncalled-for and wholly inappropriate ornamentation of wooden furniture by means of the same architectural members.

For the two centuries beginning with the year 1500 the furniture is like that of the Middle Ages, in being massive, of plain solid wood, without upholstery in our modern sense except in rare cases, consisting mainly of the old fixed or "standing" bedstead, the huge and heavy wardrobe or cabinet, the massive settle, bench, or form, and lighter pieces much more simple in design. But it was very unlike the Gothic furniture in its details, and less reasonable, less natural; tending to strange bosses and vase-shaped enlargements in the table-legs and bed-posts, and as whimsical as possible in its carving when made anywhere away from the great centers of art. Still it has great character, almost all of it. Houses have many more rooms requiring to be furnished than of old, and therefore small tables, small chairs with backs, presses and cupboards of more moderate dimensions than when one only was needed for a household, become common. The great change appears with the introduction of upholstered furniture. Generally, throughout the Middle Ages as in antiquity, the cushion was laid upon the seat or set up against the back of the chair or settle, and if any piece of stuff was nailed fast to the wooden frame it was commonly a mere decorative piece of splendid material hung over the back. But there is record of stuffing as well as of covering with a textile fabric or leather as early as the four-

Fig. 4.—Chair made of planks carved and pierced, sixteenth century.

teenth century. It may also be inferred that when a piece of velvet was nailed fast to the back with gilt-headed nails, the doing of the same to the seat as well, and the stuffing with wool beneath each of the pieces of velvet, would follow. Still there was not much upholstered furniture before the beginning of the seventeenth century. Then all at once, in the times of Louis XIII. of France, James I. of England, and their contemporaries, the seats of armchairs and of chairs appear as covered with leather or brocade, sufficiently stuffed and ornamented with rows of nails and fringes. The backs of these pieces of furniture are more commonly covered with a single thickness of the material, and not stuffed at all. The evidence for all this is mainly in the pictures of indoor life, far more numerous in the seventeenth century than before, but the wooden frames of many chairs of the time exist, and the seats are often made with a recess for the stuffing, the sides rising above the flat part of the seat, while nail-holes show all along the edges. Some few pieces exist, also, in what appears to be their original state. Later, and under Louis XIV., the seats made for elegant rooms put on the air familiar to us in the nineteenth century; the seats, backs, and arms are all stuffed and covered alike; pieces of tapestry or silk damask are woven for the purpose, and fit the wooden frames accurately; the forms of the wooden frame, previously square and firm, become yielding and as it were pliant in the curves they affect; the sofa takes the place of the settle; pieces of furniture are made in sets, the two sofas, two armchairs, and four or six chairs being covered with the same pattern of tapestry, as well as alike in the woodwork. This movement is of course contemporary with a very great advance in luxury and comfort, and even the simpler homes of the citizens had their varied seats of handsome fashions made in sets to match. Strange modifications of chair and sofa came into being, some of which the nineteenth century seems to have lost, to its disadvantage; there was the *chaise-longue*, originally a sofa without back but with a high arm at each end; or, as it might also be called, a union of two chairs by their front

Fig. 5.—Armchair or fauteuil, eighteenth century, reign of Louis XV.

edges, the two backs rising at the outer or opposite edges. There was a modification of that, by which one larger chair, or armchair, could be combined in a moment with a smaller one and an ottoman, the ottoman coming in the middle, and the three pieces of furniture forming a very luxurious sofa to lie upon. There was the sofa with settees, in which a long and large sofa had its two ends cut off, and separated from the rest by "arms," these two end-pieces being very often rounded away toward the back, so that each became a quarter-circle corner seat. In all these an extraordinary amount of fancy was employed, and great power of graceful design within certain very well marked limits. Indeed, all the decorative design of the years from 1675 to 1725, especially in France, however it might lack in dignity, was full of appropriateness and a kind of refined luxury. The snuff-boxes, watches, *étuis*, etc., of the time are marvels of delicate fancy. The bad tendency of the time, as to decoration, was toward excessive curvature in scrolls and borderings, and toward a treatment of the solid parts of house-fittings and furniture as if they were metal instead of wood. Indeed, they were made of metal, more or less. Quantities of furniture were made of silver for the service of Louis XIV., all or most of which was sent to the melting-pot during the national misfortunes of the closing years of his reign. Silver tables and frames for chairs exist in the United Kingdom, most of them dating from this epoch. Drawings and prints of furniture of the time exist, as to which it is impossible to be certain whether a metal or a wooden piece is intended.

A reaction came during the reign of Louis XVI., when there was a return toward more natural forms. Straight legs and straight horizontal pieces became the fashion. These wholesome changes were accompanied by extreme lightness of parts. The workmanship of the time was exquisite, and there was a very full use of small *plaques* of

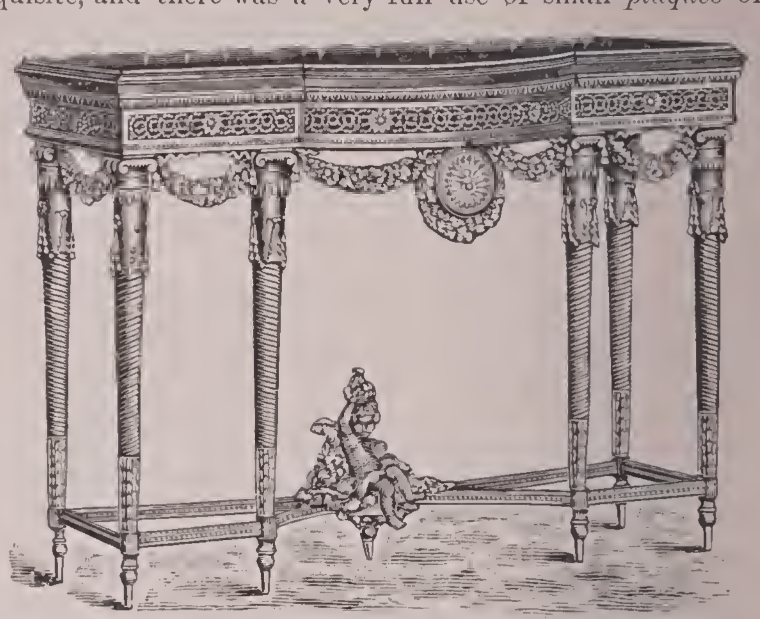

Fig. 6.—Wall-table or gueridon, late eighteenth century, reign of Louis XV. of France.

porcelain, delicate corner-pieces and mountings of gilded bronze, and similar accessories; moreover, the use of colored veneers and inlays of metal, shell, and similar material made great progress during the years from 1675 to the Revolution. (See Marquetry.) So that the most dainty and charming furniture known to us is undoubtedly that of France and of the years 1750–80.

The furniture of the nineteenth century lacks character, as does decorative art of other kinds. Since 1850 there has been a very marked increase in the splendor and cost of interior fittings and furniture, not only in the private houses of the very wealthy, but in hotels, public offices, business offices, and the dwellings of the people of moderate means; and with this has come a certain limited supply of rather spirited designing. In the great cities of Europe and the U. S. fashionable cabinet-makers turn out furniture very perfect in make and finish, and sometimes good in design There is a marked difference between the aim of the designers in different countries. In France it would seem the fixed purpose of nearly all the designers of furniture to adhere closely to some one of the accepted styles of not ancient dates, as Renaissance, by which is meant either the style of Francis I or that of Henry II., accordingly as it is early or late Renaissance, Henry IV. (for the intermediate reigns with their religious wars and confusion hardly count), Louis XIII., Louis XIV., Regency, Louis XV., Louis XVI. or Empire. In one or the other of these styles the draughtsmen are taught to compose and the workmen to execute. The result is exquisite in completeness, finish, tranquillity, the finest pieces seem as near perfection as one can hope to obtain; the old processes are revived, the old manners of work imitated, and an artist of one of the periods named might think his great efforts surpassed by his modern copyists. But they are copyists; and there is but little attempt to do anything, no matter how trivial, that was not done a century or more ago. On the other hand, the English makers are continually in search of novelties of form and composition. The most artistic designers have been trying ever since 1850, at least, to work out each design according to the purpose and make of the piece; this had its origin, perhaps, in the Gothic revival which affected all the decorative art of Great Britain, but it has been accepted as a general principle of composition. When the Parisian composes a cabinet in perfect Louis XIII. style, the whole forming a structure which might be of bronze or of stone for all it shows of the construction, the Londoner works his piece into true constructional truthfulness of design, every bit of wood telling the story of its insertion into the framework, and its utility there. The French work is immeasurably more graceful and more dignified, and it is adorned with exquisite carving. The British, far inferior in these respects, is designed on the right principle, and may, under more favorable conditions, develop into a real style of decorative work. Fine furniture in the U. S. partakes of both of these qualities and is evidently influenced by many contradictory suggestions from Europe.

Furnivall, FREDERICK JAMES, M. A., Ph. D.: philologist; b. at Egham, Surrey, England, Feb. 4, 1825; studied at University College, London, and Trinity Hall, Cambridge, where he received the degree of B. A. in 1846 and that of M. A. in 1849. A lawyer by profession, he taught for ten years in the Workingmen's College, of which he was a founder. Later he devoted himself with enthusiasm to the study of philology, and organized numerous societies for the publication of English texts. Since 1854 he has been honorary secretary of the Philological Society, and on his sixtieth birthday he received the honorary degree of Ph. D. from the University of Berlin. He has published some thirty editions of classical English texts, the best known of which is his admirable edition of the *Canterbury Tales*.

Furruckabad: same as FARRAKHABAD (*q. v.*).

Fursch-Madi, EMMA: See the Appendix.

Fur Seal: a name given in common to those species of the family *Otariidæ*, or eared seals, which possess an abundant and dense undercoat of fine fur. Several species, representing two genera, belong to this group, and are all, to a greater or less extent, the objects of eager search. The species of the Alaskan seas is the *Callorhinus ursinus*; the southern species have not been identified with complete certainty, but three species at least are generally recognized—viz., *Arctocephalus falklandicus*, *A. cinereus*, and *A. antarcticus*. See OTARIIDÆ.

Fürst, JULIUS: Jewish scholar; b. at Zerkowo, Prussian Poland, May 12, 1805, where his father, a learned Israelite, was reader of the synagogue; was intended for the rabbinate, and when only twelve years old he was already versed in the Old Testament Scriptures, Jewish tradition, and Hebrew literature. He first learned the German language at the age of thirteen, and three years later he stood at the gates of a gymnasium in Berlin asking for admission to the *secunda* (or second highest class), and in 1825 was ready for the university. For a while he studied at the high school of that place, but, induced by the probability of securing a very prominent position among the people of his native province, he took up the study of Jewish theology at Posen. During his stay there he became alienated from Jewish orthodoxy, and in 1829 finally determined to give up the theological field. He went to Breslau to pursue Oriental and antiquarian studies, and in 1831 to Halle. In 1833 he went to Leipzig to become a journalist, few positions of literary eminence being then open to Jews. But his learning secured him an appointment as lecturer at the university, in which school he labored with great distinction. In 1864 he was made a professor, and enjoyed the same advantages as his Christian colleagues possessed. D. in Leipzig, Feb. 9, 1873. His historical, critical, and lexicographical works are numerous, and yet everything he wrote found favor, and all his publications are widely circulated. Particular mention deserve his *Concordantiæ librorum Sacrorum veteris Testamenti Hebraicæ et Chaldaicæ* (Leipzig, 1837–40); *Bibliotheca Judaica* (1849–63, 3 parts 8vo); *Hebräisches und Chaldäisches Handwörterbuch* (1851–61, 2 vols., 3d ed. by v. Ryssel, 1876; Eng. trans. by Samuel Davidson, 1865–66; 4th ed. 1871); *Geschichte des Karäerthums* (1862–65, 2 vols. 8vo). He also edited *Der Orient* 1840–51. S. M. JACKSON.

Furst, WILLIAM: See the Appendix.

Fürth, fürt: town of Bavaria (since 1806); at the junction of the Rednitz and the Pegnitz (see map of German Empire, ref. 6–E). It is a flourishing manufacturing town; its mirrors and articles of brass, bronze, horn, and bone are celebrated. The first railway in Germany ran from Fürth to Nuremberg, a distance of 5 miles. The town has twice been burned—in 1634 and in 1680. Pop. (1895) 46,592.

Furze, or **Gorse** [*furze* is from M. Eng. *firs*, *fyrs* < O. Eng. *fyrs*, furze; *gorse* is from M. Eng. *gorst* < O. Eng. *gorst*, perh. for **grost*, deriv. of *growan*, grow]: the *Ulex europæus*, an interesting Old World shrub of the family *Leguminosæ*, having numerous solitary golden-yellow flowers of much beauty. It has several varieties, some of which are cultivated in gardens. Furze is grown as a cover to foxes and as sheep-pasture. In Belgium the waste sandy lands yield large crops of furze, which is gathered when green, cut fine in a mill, and fed out to live-stock as a forage-plant.

Furzechat: See WHINCHAT.

Fusan, or **Pusan** [Chinese, literally, kettle mountain]: one of the three open ports of Korea: on the southeastern coast of the peninsula, and about 10 miles from the Naktong river (see map of China, ref. 4–M). It is locally called Kan (the post), the Japanese having maintained a military station there almost continuously since 1592. In 1876, on conclusion of a treaty between Korea and Japan, a settlement was made by the Japanese, who now control the trade of the port, which was opened to general foreign trade Nov. 26, 1883. Kan is neatly built, in the Japanese style, and contains, besides the consulate and the warehouses of the trading companies, a chamber of commerce, a bank, and a hospital. The harbor is landlocked, large, and deep. Vessels entered (1892), 735; cleared, 754. The principal imports are goods of British manufacture, Japanese wares, and salt; the principal exports are rice, beans, and hides. Total value of imports (1892), $1,388,130 (Mexican); of exports, $1,738,-323. Steamers ply regularly between the port and Gensan, Chemulpo, Vladivostok, Shanghai, and Nagasaki, and there is telegraphic communication with Seoul, the capital, and with Japan. Pop. (1891) 5,329, including 176 foreigners not Japanese. About 3 miles from Kan, on the north side of the harbor, is Fusan proper, consisting of an old and a new city, the former walled. Both are poorly built. A hill back of the city, bearing a fancied resemblance to an inverted kettle, gives Fusan its name.

Fusang: a country said to have been visited in the fifth century by a Buddhist monk named HWEI-SHIN (*q. v.*), and so called from a tree, supposed to have been the Mexican aloe, found growing there. Fusang has been identified by Charles G. Leland and others with Mexico or some part of the North American continent bordering on the Pacific, and by Klaproth and many others with Japan. R. L.

Fuse: See FUZE.

Fusee′ [from O. Fr. *fusee*, a thread > Fr. *fusée*, spindleful < Low Lat. *fusata*, spindleful of yarn, deriv. of *fusa're*, use the spindle, deriv. of Lat. *fusus*, spindle]: in the machinery of watches and chronometers, a cone spirally grooved, connected with a chain which may be wound upon the grooved cone. One end of this chain is attached to the base of the fusee, the other to the barrel or box containing the mainspring. The barrel, when the watch is wound up, rotates, being moved by the uncoiling of the mainspring. As the spring uncoils it loses its elastic force, but as a compensation the chain acts upon a longer lever, since, as the fusee rotates, the *point d'appui* of the chain continually approaches the base of the fusee. In this manner the uniform rate of driving force is maintained.

Fu'seli, Henry, or **Fuessli**, Heinrich: historical painter; b. in Zurich, Switzerland, Feb. 7, 1741; son of Johann Caspar Fuessli, portrait-painter (1707–81). After graduating at the University of Zurich in 1761 he entered the Church. He left the ministry, however, after two years, and, visiting England 1765–67, began the study of painting. Studied in Italy 1770–79, and returning to London attracted public notice by the exhibition of a picture, *The Nightmare*, in 1782. He was elected a Royal Academician in 1790, and a professor in the academy in 1799. He lectured on art and wrote eloquently on art subjects, but his pictures are very deficient in technical qualities and confused in composition. D. in London, Apr. 16, 1825. William A. Coffin.

Fusel Oil [Germ. *Fusel*, poor liquor, perh. from Lat. *fusilis*, liquid]: a collective name for a variety of alcohols and compound ethers which are produced during vinous fermentation, and which pass over with the alcohol when fermented liquors are distilled. It is, in fact, to the fusel oil that the different kinds of spirits owe their distinguishing qualities, as when the fusel oil is completely removed from them pure alcohol, more or less dilute, alone remains. Fusel oil varies with the material from which the spirits are prepared: that from the potato consists chiefly of amylic alcohol, with some propylic and butylic alcohol, etc.; that from Indian corn is chiefly amylic alcohol, with compound ethers consisting of the acetate, caprylate, formate, caproate, and œnanthylate of ethyl and amyl. Fusel oil from beet-molasses contains butylic and amylic alcohols, and compound ethers of valerianic, caproic, œnanthylic, caprylic, and pelargonic acids, with ethyl, amyl, etc. The fusel oil from marc brandy contains considerable propylic alcohol, with methylic, ethylic, butylic, amylic, and caproic alcohol. Ethylic or common alcohol is contained in all fusel oil. The following table exhibits the alcohols found in fusel oil, with their boiling-points and specific gravities:

NAME.	Formula.	Sp. gravity.	Boiling-point.
Methyl alcohol....	CH_3OH.	0·798	66·6° C. = 152° F.
Ethyl "	C_2H_5OH.	0·794	78·4° C. = 173° F.
Propyl "	C_3H_7OH.	0·820	96° C. = 204·8° F.
Butyl "	C_4H_9OH.	0·803	110° C. = 230° F.
Amyl "	$C_5H_{11}OH$.	0·811	132° C. = 275·6° F.
Hexyl "	$C_6H_{13}OH$.	.....	....

The following acids have been observed in fusel oils, either free or forming compound ethers with the alcohol radicals methyl, ethyl, etc.:

Formic..............	$HCHO_2$.	Caproic............	$HC_6H_{11}O_2$.
Acetic..............	$HC_2H_3O_2$.	Œnanthylic.........	$HC_7H_{13}O_2$.
Propionic...........	$HC_3H_5O_2$.	Caprylic...........	$HC_8H_{15}O_2$.
Butyric.............	$HC_4H_7O_2$.	Pelargonic.........	$HC_9H_{17}O_2$.
Valerianic..........	$HC_5H_9O_2$.	Capric or rutic......	$HC_{10}H_{19}O_2$.

Amyl alcohol, being in most cases the predominating constituent, is often called fusel oil, even when freed entirely from the other alcohols, etc. It is a colorless liquid, having a peculiar sickening odor which causes coughing. It has a burning taste. Sp. gr. 0·811 at 19° C.; boils at 132° C.; burns with a white smoky flame; freezes at —22° C.; is soluble in alcohol and in ether; nearly insoluble in water. The ordinary amyl alcohol consists of two liquids having the same composition and vapor density, but differing in optical properties—one rotating the plane of polarized light to the left, while the other is inactive. Some of the compound ethers of amyl derived from this alcohol, as the acetate, butyrate, valerianate, etc., constitute the fruit essences strawberry, pineapple, banana, apple, pear, etc., now so generally used for flavoring confectionery, sirups, etc.

Defuselation of Alcohol.—As the fusel oil has a higher boiling-point than common alcohol, it distills over with the last portions which come from the still, and in the column still, when the more condensable vapors are liquefied and flow back to the still, the greater part of the fusel oil remains behind. Thus alcohol nearly free from fusel oil can be obtained. To remove it completely other means must be resorted to. Filtration over fresh wood-charcoal is the process most generally employed. Sometimes the vapor of the alcohol is passed through a chamber filled with charcoal. The following substances have also been recommended: binoxide of manganese for filtration; slaked lime, soda lye, chloride of lime, manganate of soda, milk, olive oil, and soap. The process of aging or keeping really results in a partial defuselation of spirits; by oxidation the fusel oil is gradually changed, probably to compound ethers, and the flavor and *bouquet* of the spirits are greatly improved. Spirits are not considered suitable for medicinal use till they are two or three years old.

Detection of Fusel Oil.—On distilling whisky and other spirits, and diluting the distillate with water, it is often rendered milky by the fusel oil which separates. By allowing spirits to evaporate slowly from the hand, or from a glass which has been rinsed out with it, the peculiar smell of the fusel oil comes out after the ethylic alcohol has evaporated. By mixing ether with the spirits, and then adding water, which causes a layer of ether to separate, the oil may be extracted. On evaporating some of the ethereal layer on a watch-glass the fusel oil is left behind. Nitrate of silver is not a very reliable test, as it is blackened by a great variety of substances. See Fermentation and Whisky.

Revised by Ira Remsen.

Fusibility [deriv. of *fusible* < M. Eng. *fusible*, from O. Fr. *fusible* < Lat. **fusibilis*, deriv. of *fun'dere*, *fusum*, melt, pour. See Foundry]: the property by which solids become fluid when heated. Most solids are fusible; some, however, undergo decomposition without fusing. The temperature at which solids melt (the melting-point) differs greatly for different substances, but it is always constant for the same substance. The temperature remains constant during the entire period of melting. (See Freezing-mixtures.) Many bodies are usually liquid (melted), because the temperature of the air is much above their melting-points. Most solids when heated to their melting-points pass from solids to perfect liquids, but some pass through an intermediate pasty condition (*vitreous fusion*) before they become fluid. This property in glass enables workmen to blow and press it into form, and the forging and welding properties of wrought iron and platinum are due to the same circumstance. The *freezing-point* is the temperature at which the melted body solidifies; it is generally identical with the melting-point. We can, however, often cool a liquid below its melting-point without its solidifying. We may cool water, if we keep it perfectly still, to — 15° C. (+ 5° F.) without its freezing, but if we drop in a grain of sand or agitate it, it at once rises to 0° C. (32° F.) and freezes. A *change of volume* occurs at the moment of melting, usually an expansion, but in the case of water and a few metals it is condensation. The melting-points of bodies are slightly affected by pressure—that of ice being lowered, that of wax being raised. Substances which expand on liquefying have their melting-points raised—those which contract have their melting-points lowered. Mixtures, as of fatty acids, alkaline chlorides, or alkaline carbonates, or of metals (see Fusible Metals), often fuse at temperatures below the melting-points of the simple bodies. Fluxes (see Flux), partly by their chemical action in reducing compounds to the metallic state, and partly by presenting a readily fusible medium, promote the fusion of metals. The following table of melting-points is taken from Pouillet:

SUBSTANCES.	Centigrade.	Fahrenheit.
Mercury..........................	—39°	—38·2°
Ice..............................	0	+32
Phosphorus.......................	+43	109·4
Spermaceti.......................	49	120·2
Stearin..........................	49–43	120·2–109·4
Potassium........................	58	136·4
White wax........................	68	154·4
Stearic acid.....................	70	158
Sodium...........................	90	194
Iodine...........................	107	224·6
Sulphur..........................	114	237·2
Tin..............................	230	446
Bismuth..........................	202	395·6
Lead.............................	320	608
Zinc.............................	360	680
Antimony.........................	432	809·6
Silver...........................	1,000	1,832
Gold.............................	1,250	2,282
White cast iron..................	1,050–1,200	1,922–2,192
Gray " "	1,100–1,200	2,012–2,192
Steel............................	1,300–1,400	2,372–2,552
Wrought iron.....................	1,500–1,600	2,732–2,912

C. F. Chandler.

Fusible Calculus: See Calculus.

Fusible Metals: alloys which melt at comparatively low temperatures. It is a curious fact that alloys often melt at temperatures far below the melting-points of their constituents. Bismuth, fusing at 202° C. (395·6° F.), tin, at 230° C. (446° F.), and lead, at 320° C. (608° F.), form alloys which melt in boiling water. Cadmium lowers the melting-point still further. An alloy of 1 bismuth, 2 tin, 1 lead is used as a soft solder. The following table gives the name and composition of the principal fusible alloys, all of which can easily be made by simply melting the constituents together in the proper proportions:

NAME.	Bismuth.	Lead.	Tin.	Cadmium.	Mercury.	Melting-point.
Newton's	50	31·25	18·75	....	....	94·5° C. = 202° F.
Rose's	50	28·10	24·1	....	....	95° C. = 203° F.
d'Arcet's	50	25·0	25·0	....	....	94° C. = 201° F.
d'Arcet's with mercury	50	25·0	25·0	....	250·0	45° C. = 113° F.
Wood's	50	25·0	12·5	12·5	....	65° C. = 149° F.
Lipowitz's	50	26·9	12·78	10·4	...	65° C. = 149° F.
Guthrie's Eutectic	50	20·55	21·10	14·03	....	Stated to have the lowest melting-point.

D'Arcet's alloy is a most remarkable one; when it cools from fusion it expands while still soft, and when used for taking impressions of dies reproduces the finest lines with the greatest accuracy. One of the alloys containing cadmium has been used by dentists for filling teeth, being applied in the melted state with little tools like soldering-irons. Plugs of fusible metal, mixed to fuse at certain definite temperatures, have been suggested as safety-valves for steam-boilers. They are found, however, to undergo changes in use which modify their fusibility, making them entirely unreliable. Revised by IRA REMSEN.

Fusiyama: See FUJI-SAN.

Fustian [M. Eng. *fustian, fustan*, from O. Fr. *fustaine*, Ital. *fustagno* < Lat. *fusta'neum*, deriv. of Arab. *Fustāt*, a suburb of Cairo, whence it first came]: a cotton fabric resembling velvet. In addition to the usual warp and weft there is an additional weft, which is brought above the surface in loops. When these are cut the ends rising above the surface produce a short fur, which entirely hides the tissue beneath. This is smoothed by shearing, singeing, and brushing.

Fustic [from Fr. *fustoc*, from Low Lat. *fustis*, tree (= Lat. *fustis*, stick). Another form with equivalent meaning is *fustet*, from Fr. *fustet* < Low Lat. *fustetus*, fustet, fustic, deriv. of *fustis*, tree]: a name applied to several yellow dyewoods. (1) True fustic, tree-fustic, yellow Brazil-wood, old fustic, etc., is the wood of *Morus* (*Broussonetia* or *Maclura*) *tinctoria*, a fine large tree of the order *Moraceæ* growing in the West Indies and South and Central America. It affords a very permanent and valuable yellow dye, and is largely exported to Europe and the U. S. (2) Bastard fustic, which is believed to be a smaller variety of the same wood, but is inferior in quality. (3) Young fustic, fustet, or Venetian sumach, called also Hungarian or Zante fustic, is the wood of *Rhus cotinus*, a sumach-tree of the Levant, whence it is exported. It makes a brighter yellow than old fustic, but one which is not so permanent. No kind of fustic is of much practical value except when compounded with other dyestuffs. Mixed with other appropriate dyes, fustic is of great value in obtaining green, yellow, orange, brown and drab tints, and even blacks and reds; but it is necessarily excluded from blues, violets, purples, and kindred shades. The fustics are employed for cottons, woolens, and silks.

Fust, JOHANN: See FAUST.

Futa Jallon, foo'ta-jăl-lon': the southern part of French Senegambia; the highest of that portion of Western Africa in which the rivers Senegal, Gambia, and Grande have their sources. Its elevation may not average much above 2,000 feet, but some peaks are so high that they are said to be occasionally covered with snow during the rainy season. The mountains are rugged and abrupt, and clad as they are with dense forests, they present most striking and beautiful scenery. Timbo, the capital, is situated in lat. 10° 25' N. and lon. 10° 40' W.

Futtehpoor: same as FATHIPUR (*q. v.*).

Future Estate: in law, an estate which is to commence in possession at a future day; an estate in expectancy. Under this general designation are included estates in remainder, reversions, contingent, shifting, and springing uses, and executory devises. In New York an important change has been made by statute in the common-law system of estates, and the term "future estate" has been adopted as a specific technical name for all estates in expectancy except reversions, the various separate titles previously in use having been discarded. A "future estate" is there defined as "an estate limited to commence in possession at a future day, either without the intervention of a precedent estate, or on the determination, by lapse of time or otherwise, of a precedent estate created at the same time." Such future estates are declared to be vested or contingent. "They are vested when there is a person in being who would have an immediate right to the possession of the lands upon the ceasing of the intermediate or precedent estate. They are contingent while the person to whom, or the event upon which, they are limited to take effect remains uncertain." An exposition of the law relative to future estates will be found under the separate titles REMAINDER, USES, etc.

Future Life: See FUTURE STATE and IMMORTALITY.

Future State: the state of man after death.

I. ROMAN CATHOLIC DOCTRINE.—The Catholic Church teaches that the soul of each man, immediately after death, is judged and assigned to one of three states—heaven, hell, or purgatory. Heaven consists of the eternal beatific vision of God, to which those are admitted who pass from earth without stain, either because their life has been sinless or because their transgressions have been fully expiated. Hell is likewise everlasting, and is the infliction of a twofold punishment. Those who die in original sin only are there deprived of the beatific vision—*pœna damni*; those who die in grievous actual sin are subjected, moreover, to unending torment—*pœna sensus*. Purgatory is a temporary middle state in which those who depart this life in the grace of God are detained to expiate, by suffering, the slighter offenses not forgiven before death, or to complete the expiation of grievous sins which had been forgiven. Heaven is the destiny of these souls, who, after their works have been revealed, "shall be saved, yet so as by fire" (1 Cor. iii. 12–15). Their sufferings are alleviated by the prayers and good works of the faithful, inspired by the "holy and wholesome thought to pray for the dead that they may be loosed from sins" (2 Mach. xii. 46). Concerning the location of purgatory, its duration for each soul, and the precise quality of its sufferings, various opinions are held by theologians, but nothing is defined by the Church as matter of faith. At the final and general judgment, the Church teaches that soul and body shall be reunited, and that the risen body shall share for eternity the existence of the soul—the glory of heaven or the torments of hell. JOHN J. KEANE.

II. ORTHODOX PROTESTANT DOCTRINE.—The subjects discussed in this article are (1) the *intermediate state*; (2) the *resurrection*; (3) the *last judgment*; (4) the *blessedness of the redeemed*; and (5) the *punishment of the lost*.

The doctrine of the *intermediate state* has been somewhat fluctuating in its form, owing to the paucity of the Scripture data. The representation in the parable of Lazarus and Dives has furnished the basis of the general statement that the believer is happy and the unbeliever is wretched between death and the final judgment; yet the resurrection of the body adds somewhat to both the happiness of the believer and the misery of the lost. The majority of the ancient Fathers, in the opinion of Hagenbach, believed that men do not receive their full recompense of either reward or penalty until after the resurrection of the body. The Protestant affirms that at death the soul of a believer is made perfect in holiness. What precisely is the difference between the condition of a believer as disembodied and as re-embodied he does not affirm. He is content with denying purgatorial pains and purification, as well as an unconscious sleep of the soul between death and the resurrection.

The doctrine of the *resurrection* of the body was from the beginning a cardinal and striking tenet of Christianity. Perhaps no article of the new faith made greater impression at first view upon the pagan. When the philosophers of Athens "heard of the resurrection of the dead, some mocked, and others said, We will hear thee again of this matter" (Acts xvii. 32). All the early Fathers maintain this dogma with great earnestness and unanimity against the objections of skeptics, of whom Celsus was acute and scoffing in his attack. Most of them believed in the resuscitation of the very same body materially. Justin Martyr says that cripples will rise as cripples, but at the instant of resurrection, if believers, will be made physically perfect. The Alexandrine school alone adopted a spiritual theory of the resurrection. Origen went so far in this direction as to assert that a belief in the resurrection of the body is not absolutely essential to the profession of Christianity, provided the immortality of the soul were maintained. But these idealizing views were generally combated with great earnestness, and in some instances evoked an extremely gross and carnal view in opposition. The patristic theory of the resurrection passed into the Middle Ages with little variation. The poetry of Dante and the painting of Angelo powerfully exhibit it. In the Protestant Church the existence of a real body, and of a body that preserves the personal identity, is affirmed; but the materialism of the papal, and to some degree of the patristic, Church is avoided by a careful attention to St. Paul's dictum: "There is a natural body (σῶμα ψυχικόν), and there is a spiritual body (σῶμα πνευματικόν)."

The doctrine of the *last judgment* was, from the first, immediately connected with that of the resurrection of the body. Mankind "must all appear before the judgment-seat of Christ, that every one may receive the things done in his body" (2 Cor. v. 10). The Fathers founded their views of the day of doom upon the representations and imagery of Scripture. They believed that a general conflagration will accompany the last judgment which will destroy the world, though some ascribed a purifying agency to it. Some of them, like Tertullian and the more rhetorical of the Greek Fathers, enter into minute details, while others, like Augustine, endeavor to define dogmatically the facts couched in the figurative language of the Bible. In the Middle Ages representations varied with the bent of the individual theologian. One popular opinion was that the judgment will be held in the valley of Jehoshaphat. Aquinas maintained that the last judgment will take place *mentaliter*, because the oral trial of each individual would require too much time. In the modern Church the course of thought upon this doctrine has been similar to that in the ancient and mediæval. The symbols of the different Protestant communions explicitly affirm a day of judgment at the end of the world, but enter into no description. Individual speculations, as of old, vibrate between the extremes of materialism and idealism.

That the *blessedness* of the redeemed is endless has been the uniform faith of the Church. Representations concerning the nature of this happiness vary with the culture and intellectual spirit of the age and the individual. Justin Martyr regards the blessedness of heaven as consisting mainly in the continuation and increase of the happiness of the millennial reign. Origen holds that the blessed dwell in the aërial regions, and pass from one heaven to another as they advance in holiness: at the same time he condemns those who expect merely sensuous enjoyment. The Greek theologians Gregory of Nazianzus and Gregory of Nyssa follow Origen. Augustine believed that the heavenly happiness consists in the enjoyment of peace which passes knowledge and the beatific vision of God. One important element in it consists in deliverance from all hazard of apostasy—the *non posse peccare et mori*. The Schoolmen held the patristic theories, but with an endeavor to systematize. They divided heaven into three parts—the visible heaven, or the firmament; the spiritual heaven, where saints and angels dwell; and the intellectual heaven, where the beatific vision of the Trinity is enjoyed. The modern Church maintains the doctrine of everlasting blessedness in substantially the same form with the ancient and mediæval. The tendency to materialize or to spiritualize it varies with the grade of culture and modes of thinking.

The *punishment* inflicted upon the lost was regarded by the ancient Church as endless. The principal exception appears in the Alexandrine school, represented by Clement and Origen. But Clement is careful to say that the doctrine of endless perdition must be preached, in order to deter men from sin, although the hope of the final restoration of all is permitted to the thinker. Some faint traces of a belief in the remission of penalty in the future life are visible in the writings of Didymus of Alexandria. Gregory of Nyssa speaks more distinctly, pointing out the corrective design of punishment inflicted upon the wicked. The annihilation of the wicked was broached by Arnobius. The mediæval Church was likewise a unit in holding to the endlessness of punishment. The modern Church has also received the historical faith upon the subject, though a tendency appears in individuals and parties to the doctrine of a second probation and the final restoration of all mankind. The argument most relied upon is derived from the general nature of the Divine benevolence, rather than from the testimony of Scripture. It is generally allowed, even by opponents, that the Bible, taken as a whole, apparently teaches the doctrine of endless punishment, and especially that the descriptions which Christ gives of the transactions and decisions of the day of judgment preclude the idea of a second probation. W. G. T. SHEDD.

III. NON-ORTHODOX THEORIES.—Two theories respecting the future state of those who die impenitent, which differ radically from one another and equally from the Church theory, have found many adherents. 1. The theory of *conditional immortality*, i. e. that the human soul is not naturally immortal; also and perhaps more commonly called *annihilationism*. It asserts that immortality or eternal life is given only to those who have faith in Christ. Those destitute of such faith do at death pass into an estate of punishment, and are finally destroyed. The advocates of the theory appeal to the biblical assertions that the wicked are destroyed, and to the passages which set forth eternal life as the gift of God, and that those only truly live who are in Christ. The theory has been accepted as satisfactory by a large number of English Congregationalists, and by many in other communions at home and abroad. The classic work on the subject is by an English Congregationalist, Rev. Edward White (*Life in Christ*, London, 1875).

2. The theory of *restorationism*, or technically of *Apokatastasis*, i. e. that the time will come when the impenitent will repent, and then be restored to the favor of God. The term comes from Acts iii. 21, and the theory is defended on biblical and philosophical grounds, both in connection with the doctrine of the atonement and entirely independent of it. Such passages as Rom. v. 18, xi. 32, 1 Cor. xv. 22 are appealed to, and much use is made of the idea that the object of punishment in the future life is remedial and reformatory. The theory seeks to do away with the supposed dualism of the Church theory. It has been a favorite with speculative minds from Origen to to-day, and is predominant in the present Universalist Church in Great Britain and America, and held by very many in orthodox churches. Thus recently it has been ably defended by Rev. Thomas Allin (*Universalism Asserted*, London, 1888), of the Established Church of England, and by the late Rev. Dr. Samuel Cox (*Salvator Mundi*, 1877, and *The Larger Hope*, its sequel, 1883), of the General Baptist Church.

LITERATURE.—On the entire article, besides the appropriate sections in the systematic theologies, see W. R. Alger, *Doctrine of a Future Life* (with Ezra Abbot's well-nigh exhaustive bibliography; 10th ed. Boston, 1878); *Dorner on the Future State* (trans. and edited by Newman Smyth, New York, 1883); A. Hovey, *Biblical Eschatology* (Philadelphia, 1888); James Fyfe, *The Hereafter* (London, 1889); James Strong, *The Doctrine of a Future Life* (New York, 1891). For the discussion whether there will be a return of Christ to the earth prior to the final judgment of all mankind, see SECOND ADVENT; for fuller statement in regard to HEAVEN and HELL, see those articles. S. M. JACKSON.

Fuze [abbrev. of *fuzee*, *fusee*, *fusil*, from Fr. *fusil*, flint, gun < Low Lat. *focile*, hearth flint, deriv. of *focus*, fire (= Lat. *focus*, hearth)]: a device whereby an explosion may be effected at a safe distance from its destructive action. The charge may be in motion or be stationary, and a short, or a long, or an indefinite time may be desirable between the act of the operator and its effect. Hence numerous and widely different contrivances are employed.

For projectiles, including shells, shrapnel, carcasses, explosive bullets, and grenades, fuzes are now classified as time, percussion, and combination; a class "concussion" was formerly added, but it gave rise to confusion, and has been dropped. In modern practice both point and base fuzes are used.

Time-fuzes consist of cases of paper, wood, or metal containing the ingredients of gunpowder, varied to suit the required rate of burning. Being selected or cut to the proper length, they are inserted in the fuze-hole of the projectile, where, being ignited by the flame of discharge or by a match, they communicate fire to the inclosed bursting charge at the desired point of the trajectory. To this class belong most fuzes used with smooth-bore ammunition, such as the Bormann and its numerous modifications, the mortar, and the seacoast fuze. With rifled guns the length of the projectile, and in many varieties the rotating device, cut off the flame of discharge from a time-fuze, and thus prevent its ignition. In such guns the shock in the bore of the piece is utilized to ignite a time fuze of proper length for the range required. A primitive type of igniter was the "McEvoy attachment," consisting of a hollow wooden cylinder fitted to the projecting end of an ordinary time-fuze; within was a gun-primer loaded with lead, which, ignited by inertia at the discharge, fired the fuze. A better application of the same idea was displayed in the Sawyer fuze. Many other inventions, some mechanical and some depending on the use of fulminates, have appeared. Some utilize the shock of translation, and others that of rotation, to set off the igniter. Moreover, the greater time of flight due to the increase in range of modern guns has aggravated the old difficulty of obtaining a uniform rate of burning in the time-fuze composition, and researches in this direction are not yet ended. It may be desirable—as, for instance, in shelling a working-party with a view to interrupting its labor—to have mortar-shells fall in its vicinity liable to explode at any time within an hour. The McEvoy-Beardslee fuze was designed to meet this case. A small vial of sulphuric acid is placed in a plug containing chlorate of potassa and sugar, but separated from it by several thicknesses of slowly absorbing paper. The shock breaks the vial, and, after a time, depending upon the number of thicknesses of paper, the acid soaks through to the powder, detonates it by contact, and thus ignites the bursting charge.

Percussion-fuzes induce a desired explosion only after the projectile strikes the object. As this is difficult to effect unless a particular point is brought into contact, the class is practically restricted to use with rifled arms, or with grenades, like Ketchum's, provided with some guiding device. One of the simplest forms consists of an ordinary percussion-cap upon a gun-cone, placed within a plug at the point of the projectile; a small priming communicates the explosion to the interior. The cone may be fixed, or, as in the Parrott, Schenkl, and Absterdam fuze, be attached to a movable plunger. In the former case a thin exterior covering is crushed by the impact, and the cap is thus exploded; in the latter case the same result follows from the inertia of the plunger, which, when the projectile is suddenly stopped, brings the cap into violent contact with the thick exterior cover. For incendiary shells the Tice fuze belonging to this class was found to be serviceable in the civil war in the U. S. It contained a small vial of fulminate, which the shock of discharge left, by an ingenious contrivance, unprotected among some loose shot. They caused an explosion at the first impact, however slight. If the percussion-cap is made to ignite a time-fuze, or if other simple devices are employed, the explosion may readily be delayed; but it is hardly possible in any way to render the action so instantaneous as to prevent the projectile from burying itself before the fragments can be scattered by the bursting charge. Experiment has shown that a projectile fitted with an ordinary percussion-fuze imbeds itself in an old earthen parapet fully three-fourths of its maximum penetration before explosion. In breaching a masonry wall or penetrating an iron-plated ship this delay is advantageous, since it adds the force of the explosion to the original impact, and thus shatters and enlarges the crater, or carries destructive fragments of the plate and backing into the vessel. Indeed, it has been found well in the latter case to dispense with fuzes entirely, and to place the bursting-charge in a flannel bag, in order to retard the explosion which is produced by the sudden shock. For use against troops, however, the unavoidable delay is for obvious reasons objectionable.

The combination fuze consists of a time-fuze, with some additional device by which explosion results when the projectile strikes, if not before. One of the simplest fuzes of this class is the old Splingard, which consists of a time-fuze containing in its axis a long hollow cone of plaster-of-Paris open at the bottom. Weakened by the burning away of the supporting composition, this cone breaks and admits the flame at once to the interior at any impact occurring before the expiration of the time for which it was prepared. To the combination class belong the Schenkl fuze used in the U. S. during the civil war, the most elaborate form of the British Armstrong fuze, and many others of more recent date. Although both complex and costly, combination fuzes are in demand, owing to the enormous cost of modern projectiles, which forbids wasteful use. A good pattern has been developed experimentally at Frankford arsenal, largely through the efforts of Brig.-Gen. Flagler, ordnance department. The Hotchkiss point and Hotchkiss base percussion-fuzes are now regarded with favor; and a new type, the Merriam base percussion-fuze with delay action, has had favorable trials at Sandy Hook. Neither in the U. S. nor in Europe can it be claimed that perfection has been reached, although many fairly good shell-fuzes exist.

When the explosive is stationary, as in economic or ordinary military mining—including torpedoes planted for the defense of channels—quite different fuzes are necessary; which may be classed as time, contact, or electrical. The first class ordinarily consists of trains of quick-match, ignited by slow-match cut to a sufficient length to allow the operator to escape to a safe distance before the explosion. Various kinds of match are employed. Thus the Bickford fuze (gunpowder priming) burns from $2\frac{4}{10}$ to 4 feet per minute, the Ord fuze (guncotton priming) about 15 feet per second, and the Gomez fuse (fulminate priming) about 300 feet per second. The old powder-hose burned very rapidly, and was therefore usually ignited by a piece of port-fire which consumed at a rate of about an inch per minute. For military purposes, except in cases of necessity, these trains have been quite superseded by electricity; but the Gomez fuze, which is violently explosive, may sometimes be advantageously employed to spread combustion rapidly through large masses of gunpowder, such, for example, as the load of a fireship set adrift against a bridge or fleet. The primary ignition may be effected by clockwork so arranged as to release a trigger after the desired lapse of time. Contact fuzes for the torpedo service are analogous to percussion-fuzes for the artillery, and many devices are employed. A projecting lever may be so arranged that upon contact with a vessel it shall set free a trigger, and thus explode a common gun-cap. A similar plan has been used with drifting torpedoes designed to float freely with the current, coupled in twos by a rope. When the latter is fouled upon the anchor-chains the torpedoes are brought alongside, and held there by the tide, which is thus enabled to act upon a wheel armed with vanes like a windmill. The revolutions, transmitted to a screw axle, soon release a trigger, and thus cause a blow to be delivered upon a pin resting on a gun-cap. A sensitive fulminating priming, protected by a thin copper or lead cap so placed as to be crushed by the blow of the ship, is another form of this fuze. Still another consists of a bottle of sulphuric acid imbedded in a mixture of chlorate of potassa and sugar; the ship, by striking a projecting pin, breaks the bottle and thus ignites the torpedo. Ordinary cannon-primers may be so arranged as to explode the torpedo in a similar manner. Many of these devices are equally applicable to small mines buried in the ground in front of fortifications, to be fired by men or horses charging over them. The great objection to the whole class is that they debar a route to friends as well as to foes. Electrical fuzes, being perfectly under the control of the operator, obviate this difficulty. Many varieties, adapted to the different forms of electrical action, have been invented. The oldest contrivance, and that still most employed, is based upon the property possessed by a voltaic current of heating any poor conductor introduced into its circuit. A very thin wire of platinum, German silver, or iron, from a quarter to half an inch in length, is soldered so as to form a bridge between two stout parallel copper wires imbedded in a plug of wood, gutta-percha, india-rubber, or other non-conducting material. The free ends of these wires being attached to the leading wires from a powerful voltaic or magneto-electric battery, the passage of the current reddens the bridge and thus explodes a priming packed around it. The chief advantage possessed by these over other electrical fuzes is that they admit of easy and accurate testing by the passage of a current through them too feeble to heat the bridge dangerously. As the electrical resistance of the latter is usually less than an ohm, giving a current-strength requisite for ignition of from one-half to 3 ampères, this condition is easily fulfilled. For special purposes platinum fuzes, having a resistance of about 50 ohms, and requiring for ignition a current rather less than 0·02 ampères, are practicable. Various primings, such as gunpowder, guncotton, fulminating mercury, compounds of chlorate of potassa, etc., may be employed around the bridge. To intensify the shock, a metallic capsule charged with mercuric fulminate, either pure or mixed with chlorate of potassa, is added. These capsules are called "detonators," and are made with charges ranging from 0·3 to 2·0 grammes, according to the nature of the high explosive to be fired. Great caution is needful in handling detonators, for accidents with them are serious; but their use is imperative in economical blasting with most modern explosives. The old Beardslee fuze was adapted to an alternating magneto-electric current possessing a comparatively high electromotive force, although less than that from a frictional machine. The stout wires were connected by a very short plumbago line drawn with a soft lead-pencil upon the end of the wooden plug. The priming was good rifle powder. The electrical resistance of these fuzes was variable, ranging between 500 and 5,000 ohms, and their testing, although possible was not satisfactory. The von Ebner fuze, used in the Austrian torpedo service, is adapted to the extra current from a large primary coil, which, with an electromotive force rather less than that of most magneto-electric machines, may be made to possess enormous quantity. The fuze-bridge at first consisted of a plumbago line primed with fulminating mercury and a mixture of sulphuret of antimony and chlorate of potassa, but at present only the latter mixture is employed. To fire any considerable number of such fuzes as the foregoing it is necessary to make use of a derived circuit, and hence the explosion, although nearly, is not absolutely simultaneous. For a long time this was regarded as a serious objection with detonating compounds. To overcome it fuzes adapted to electricity of high tension, such as condensed frictional or secondary currents, have been prepared. They were made by replacing the bridge with a layer of some chemical compound which is so strongly polarized by the passage of the spark as to induce explosion. Such primings are the following, some of which, however, are sufficiently conducting to allow the use of magneto-electric, and even voltaic, currents. The Statham compound is subsulphide of copper; that of Abel is 45 parts of subsulphide of copper, 10 parts of subphosphide of copper, and 15 parts of chlorate of potassa; that of Dowse is fulminating copper; that of other parties (including Abel in his submarine fuzes) is fulminating mercury, with a greater or less proportion of some conducting substance, like graphite or powdered metal, added for conductivity. Of all this class, the fulminating copper priming makes the most sensitive fuze. It may easily be so prepared as to explode in a dry atmosphere when the exposed ends of the wires are brushed with a feather, or when an ebonite comb is passed through the hair of a person grasping one wire terminal, the other being insulated in the air. One hundred blast-holes may be fired simultaneously with such fuzes, connected in straight circuit, when a good ebonite frictional machine with a suitable condenser is employed; but it is needless to add that their use is criminally dangerous. Fuzes of the platinum wire type are now used to the practical exclusion of all others of the electric class. By suitably adjusting the battery power and the grouping of the fuzes, all requirements even for the largest blasts can be met—as, for example, at Hallet's Point, New York harbor, in 1876, when 3,640 fuzes were simultaneously fired without accident. They are exclusively used in the submarine mining service, and very largely in modern cannon. Even small-arms adapted to employ them are in the market. H. L. Abbot.

Fyens, fī'enz, or **Fienus**, fī-ee'nŭs, Thomas: physician; b. at Antwerp, in the Low Countries, Mar. 28, 1567; studied medicine with great success at Leyden and in Italy, whose schools then abounded with famous instructors; became in 1593 Professor of Medicine at Louvain, and soon had a European reputation for skill; was for a time court-physician to the Duke of Bavaria, and afterward first physician to the Archduke Albert at Brussels. Author of some very curious medical works, of which *De Cauteriis* (1598) and *De præcipuis artis chirurgicæ controversiis* (1649) are the most noteworthy. His works have only an historic value. D. Mar. 15, 1631.—His father, John Fienus (d. 1584), was a famous physician, author of a singular work, *De Flatibus.*

Fyke-nets: See Fisheries.

Fyrouz (fē̆e-rooz') **I.**: an Arsacide King of Persia (the name is also spelled Feroze and Firouze), usually identified with the Pacorus of the Greek and Latin writers, called also Arsaces XXIV. as King of Parthia; reigned 83–103 a. d. The name *Fyrouz* signifies "victorious."

Fyrouz II.: the seventeenth Sassanide monarch of Persia (the Perozes of Byzantine writers), reigned 459–483 a. d. He succeeded his younger brother, Hormuz, whom he overthrew by the aid of the White Huns and put to death. A dreadful famine marked the first part of his reign, and the king became involved in wars with the White Huns, who finally defeated him with great slaughter, Fyrouz and twenty-nine of his sons being among the slain. The accounts of historians regarding many points of his reign conflict.

Fyrouz III.: titular King of Persia; son of Yezdejerd III., the twenty-eighth and last Sassanide monarch, whose kingdom was overthrown by the Arabs in 641 a. d. Expelled by the Mohammedans from Persia, he fled to the domains of the Chinese emperor Kao-Tsung (Taï-tsung), by whom he was recognized, and who by fruitless negotiations strove to restore him to the throne. He is the *Pilouse* of Chinese historians, and seems to have been a Chinese viceroy in Bokhara. D. 679.

Fyrouz (or **Feroze**) **Shah I.** (Rokn-ed-Deen, the support of the Faith): a Mohammedan King of Delhi who succeeded his father, Altamsh, in 1236, having previously been governor of Lahore. He was a vicious prince, and was deposed by the Sultana Rezia, his sister, in 1236.—Fyrouz Shah II. (Jelal-ed-Deen, glory of the Faith) reigned at Delhi 1289–96; was an Afghan usurper who succeeded the last Gouride sovereign, and who is chiefly memorable for his cruelties; was murdered by his nephew and successor, Allah-ed-Deen, in 1296.—Fyrouz Shah III.: King of Delhi; b. 1296; succeeded Mohammed III. in 1351; abdicated 1386, and died 1388. His reign was memorable for its tranquillity and the material prosperity of the kingdom. He founded in 1354 a city now called Firozpur (*q. v.*), formerly Fyrouzabad, and began the construction of the great canal system now known by his name.

Fyzabad: See Faizabad.

APPENDIX.

Eimeo, ī'mē-ō: one of the Society islands; in the Pacific Ocean; about 30 miles N. W. of Tahiti. Taloo Harbor is in lat. 17° 30′ S., lon. 149° 47′ W. Eimeo is 9 miles long and 5 miles wide. The surface is diversified by valleys and hills, which produce excellent timber. There is a missionary station connected with the London Missionary Society. Pop. 1,500.

Einbeck, īn'bek: town of Hanover, Germany; on the river Ilme; about 40 miles S. S. E. of the city of Hanover (see map of German Empire, ref. 3–E). It has three churches; also manufactures of cotton and woolen goods and chemical products. A city of considerable importance in the fifteenth century and a Hanse town, it has since declined. It suffered severely in the Thirty Years' war, and its walls were razed by the French in 1761. Pop. (1890) 7,676.

Eisenerz, ī'zen-ārts (i. e. iron ore); also called **Innerberg**: a town of Styria, Austria; at the north base of the Erzberg; 20 miles W. N. W. of Bruck (see map of Austria-Hungary, ref. 6–E). The Erzberg, which is 5,000 feet high, is a solid mass of iron ore of rich quality. Mines have been worked here for 1,000 years. Eisenerz has twelve smelting-furnaces. Pop. (1890) 2,433.

Eisenstadt, ī'zen-staat (Hun. *Kis Márton*): market-town of Hungary; near the west bank of Lake Neusiedl; 12 miles N. N. W. of Oedenburg (see map of Austria-Hungary, ref. 6–F). Here is the Esterhazy palace, having 200 chambers for guests, a hall in which 1,000 persons can dine at a time, a library containing an invaluable collection of church music, etc. Connected with this palace are a zoölogical garden, an orangery, and a conservatory containing 70,000 exotic plants. Pop. 2,845.

Electro-ballistics: *ballistics*, derived from a Greek word meaning *I throw*, is the science which treats of the motion of bodies projected into space. As generally used, however, the meaning of the term is restricted to the motion of projectiles of regular form fired from cannon or small-arms.

To the military student three distinct branches of the subject are presented: 1. *Interior ballistics*, which treats of the motion of the projectile within the bore of the gun. 2. *Exterior ballistics*, which considers all the circumstances of the motion from the time the projectile leaves the muzzle of the gun until it strikes the target. 3. *Ballistics of penetration*, treating of the effects of the projectile upon the object struck.

In all phenomena pertaining to projectile motion the time-interval is the all-important one. The velocities are so enormous, varying as they do from 600 feet per second in the case of spherical shot fired from seacoast mortars to nearly 3,000 feet per second for projectiles from high-power built-up rifles, that the time consumed in passing over any limited portion of the trajectory, or path, is exceedingly small. The first essential, therefore, in the study of ballistics is some means of measuring accurately a very small fraction of a second of time.

The limits of this article will not permit of a discussion of the many theoretical and practical problems involved, but it is instructive to follow the various successive changes and improvements in ballistic apparatus, which have contributed so largely to the perfection of modern ordnance construction. All instruments of this kind now in use are controlled and operated by electricity, and the term *electro-ballistics* is generally employed to designate all the various means, methods, and instruments relating to ballistic investigation.

A great number and variety of instruments have been invented to determine the velocity of projectiles. The more important of these may be grouped under three heads: 1. *Gun pendulums*; 2. *Ballistic pendulums*; 3. *Electro-ballistic chronographs* or *chronoscopes*.

In instruments of the first class the velocity of the projectile is determined by suspending the gun itself as a pendulum and measuring the recoil imparted to it by the discharge. The mathematical expression for the velocity is deduced by considering the energy of recoil of the gun to be equal to that imparted to the projectile, the powder-charge, and the air.

Apparatus of the second class consist of a pendulum of sufficient size, thickness, and weight to receive the impact of the projectile without complete penetration, and the expression for the velocity is deduced from the fact that the energy of the projectile at the moment of impact is approximately equal to that of the pendulum and the projectile after impact, as shown by the amplitude of the vibration.

The results obtained from both classes of pendulum machines are only approximately correct, and their operation involves much complicated mathematical data. They are no longer in practical use on the proving-ground.

The employment of electro-magnetism to determine the velocity of projectiles was first suggested by Wheatstone in 1840. The velocity of the electric current through a conducting wire is so great that for all practical purposes its transmission may be considered instantaneous. In like manner the demagnetization of a soft-iron magnet-core may be considered to follow instantaneously upon the interruption of the electric current. The peculiar adaptability of electro-mechanism to instruments of this class was, therefore, soon appreciated and taken advantage of by ordnance experts.

Instruments of the third class are generally called *chronographs*, or *chronoscopes*, and sometimes *velocimeters*. They vary so much in the principles of construction and operation that it will be necessary to describe briefly at least one of each distinctive type. Before doing so, however, the general method of finding the velocity of a projectile will be explained.

Two wooden target-frames are set up a short distance apart in front of the gun, as shown at A and B, Fig. 1.

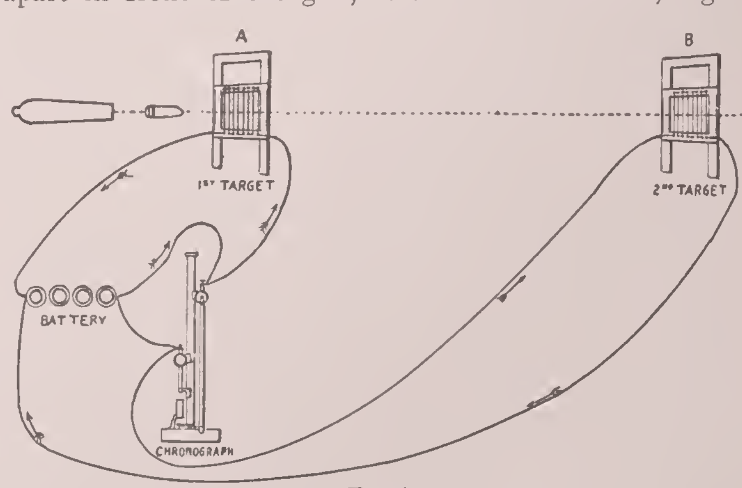

Fig. 1.

Over each frame is stretched a continuous bare copper wire, which is passed back and forth across the face of the frame in parallel strands. The strands are so close together that the projectile can not pass through the frame without breaking the wire at some point, and thus interrupting the electric current. Each target-wire forms part of an independent circuit from the battery, which also includes one of the electro-magnets of the chronograph. The chronograph and battery are usually installed at some considerable distance from the gun, in order that the shock of discharge may not disturb the more or less delicate adjustments. The projectile in passing through the first target breaks the circuit through the starting magnet and operates the chronograph; when it reaches the second target the circuit through the registering magnet is broken, and the exact time-interval between the two events is recorded.

The velocity of the projectile is found by measuring the time taken to pass over the distance between the two targets. As thus found, it must of necessity be an average or mean velocity for the distance. Since the actual velocity is a rapidly decreasing function of the time, it is important to have the distance or space-interval between the targets as short as possible, in order that the mean velocity may the more closely approximate the true velocity.

One of the earliest electro-ballistic machines of this class was that devised by the late Col. J. G. Benton, Ordnance Department, U. S. army, for the use of the cadets at the U. S. Military Academy. It is known as Benton's *chronometer* or *velocimeter*, and was the standard instrument of its kind in the U. S. for many years. Fig. 2 will explain its construction and operation. A graduated arc (*b*) is supported by a bed-plate of metal (*a*) and provided with spirit-levels and leveling-screws. The arc is divided into degrees and fifths of a degree, commencing at the lowest point of the arc and ending at ninety degrees on each side.

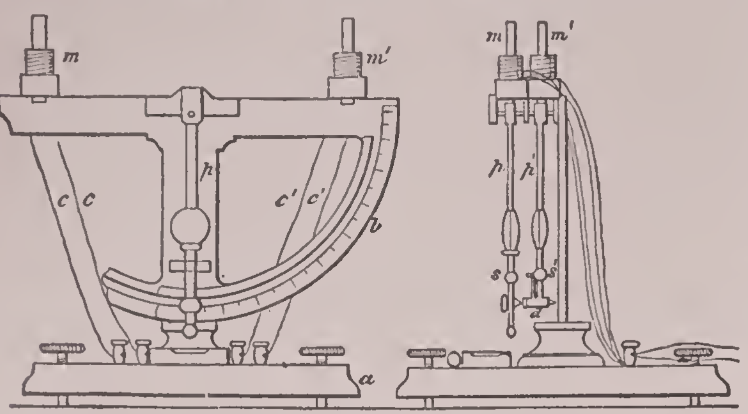

FIG. 2.

The two pendulums (p and p') have a common axis of motion passing through the center perpendicularly to the plane of the arc. The bob of pendulum p' is fixed, while that of p is adjustable so as to make the times of vibration of the two pendulums exactly equal. Two electro-magnets (m and m') are attached to the horizontal limb of the arc to hold up the pendulums when they are deflected through angles of ninety degrees. Soft-iron extensions of the pendulums (s and s') on coming in contact with the poles of the energized magnets hold the pendulums in the deflected positions. A contact device (d) registers on the scale of the arc the exact point at which the pendulums pass each other when released by interrupting the current around the magnets. This device is attached to the extremity of the suspension rod p', and consists of a small pointed pencil and spring inclosed in a tube. The point of the pencil is held near the surface of the arc, while the outer end is cut off obliquely to the surface.

As the pendulums pass each other a small projecting stud near the extremity of p strikes against the oblique end surface of the pencil, and thus leaves a distinct dot on the prepared surface of the arc. The position of the dot on the scale of the arc measures the interval of time that has elapsed between the two breaks in the electric circuits that release the pendulums in succession. The accuracy of the instrument is verified, and its adjustment tested, by breaking both circuits simultaneously and then regulating the length of pendulum p until the point at which they pass is exactly at the lowest, or zero, point of the arc. When the machine is in good condition and properly adjusted the position of the point of meeting seldom varies as much as one-tenth of one degree, an error which corresponds to only 0·000154 of a second of time.

The velocity of the electric current being so great, and the demagnetization of the magnets being considered simultaneous with the rupture of the circuits, it follows that the first pendulum begins to move the instant the projectile has cut the first target-wire and the second the moment the second target is reached, and the interval of time is measured by the difference in the arcs described by the two pendulums up to the time of meeting. From the known properties of these arcs tables are prepared which give at once the time-interval in fractions of a second for any given position of the point of meeting.

Boulengé Chronograph.—In Col. Benton's instrument, just described, the accuracy of the measurement of the time-interval was affected by the pivot friction of the swinging pendulums. The motion being constrained, the arcs as measured by the pencil-point differed slightly from the computed arcs, and thus introduced a varying error which was difficult to detect, and still more difficult to eliminate.

To overcome this defect, Capt. Le Boulengé, of the Belgian artillery, just after the close of the civil war in the U. S., devised an instrument in which the time between the two events is ascertained by the *free* fall of a heavy body during the interval, the beginning and end of which is made to accord with the occurrence of the events by means of an electric current.

This chronograph has been more generally used than any other of its kind, and although many changes in the electrical and mechanical details of its construction have been made by the inventor and others, it is still the same in principle, and is to-day considered to be the standard ballistic instrument of the world.

Figs. 3 and 4 show a side and front view of the chronograph installed upon a masonry or cement column ready for use. A and B are the two electro-magnets, in circuit with the targets. C is a long cylindrical rod of soft iron or low steel, held in suspension by the attraction of the core of magnet A. It is called the *chronometer*, and is provided throughout the greater portion of its length with a soft encasing cylinder of zinc. D is a short cylindrical rod of soft iron suspended from the core of magnet B, and is called the *registrar*. E is a substantial brass column which forms the support for the magnets. In the masonry foundation is a well, F, of a depth equal to the length of the rod C. G is a short brass cylinder which forms a pocket for the rod D to drop into. Supporting the cylinder G is a metal casing which contains a knife and spring with trigger attachment.

The practical operation is as follows: When the projectile breaks the circuit at the first target, the core of magnet A is demagnetized and the rod C drops. At the second target the circuit through B is broken, and the rod D, the registrar, is released. In falling into its pocket this rod trips the trigger of the knife and causes it to spring horizontally forward against the zinc casing of the falling chronometer-rod C. The cut thus made records the time. To eliminate as far as practicable from the results the various errors of time due to retained magnetism in the magnet-cores, the falling of the registrar into its pocket, and the time necessarily consumed in the mechanical operation of the knife-and-trigger mechanism, the operator before taking a record first locates the origin, or zero-point, of the chronometer-scale by suspending rod C from its proper magnet-pole, with the knife cocked. The knife trigger is then mechanically released, and the cut made on the casing of the suspended rod marks the origin. The rod D is then suspended from its magnet-pole, and the knife again cocked.

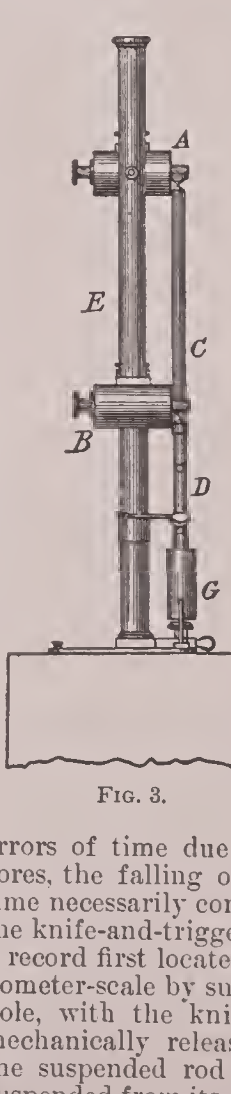

FIG. 3.

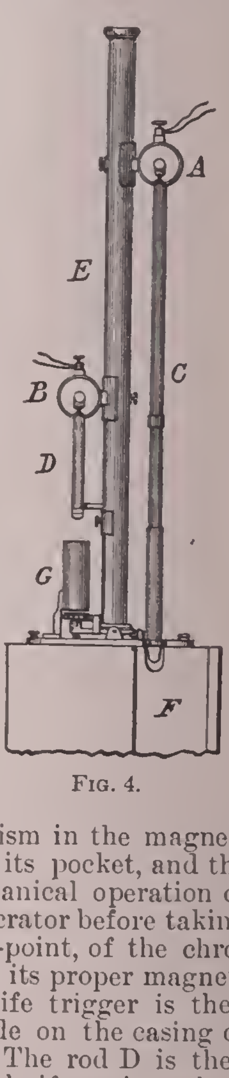

FIG. 4.

Now, if the circuit *through both magnets be simultaneously broken*, the cut made on the falling chronometer-rod will accurately measure the *sum of all instrumental errors.* The total instrumental error of the particular instrument used, being thus easily and quickly determined, is always subtracted from the actual chronometer record made in finding the velocity of the projectile. The certainty and ease with which this error can be found constitutes one of the most valuable features of the Boulengé chronograph.

The law of falling bodies is expressed by the equation

$$T=\sqrt{\frac{2h}{g}},$$

in which T is the time in seconds, h is the distance through which the body has fallen in the time T, and g represents the acceleration due to the force of gravity, or 32·2 feet. In the equation h corresponds to the distance measured from the origin of the chronometer-rod scale to the indentation made by the knife as the projectile passes through the second target. The correct values of T for all the different values of h used in practice are carefully computed by the formula given, and engraved upon a measuring-rule which is also provided with a convenient sliding vernier.

To take the record, the zero-point of the rule is inserted in the original indentation on the rod, and the vernier moved along until its knife-edge is brought against the inner edge of the indentation last made. The time in seconds is then read off directly from the scale. From the time thus found is subtracted the amount of correction due to instrumental errors (technically called the *disjunctor reading*), as already explained, and the remainder is the time consumed by the projectile in passing over the distance between the targets.

A reasonable amount of care is necessary in installing and adjusting the chronograph. The foundation should be a substantial one, and means must be provided for leveling the instrument. The current strength of each magnet should be just sufficient to support its rod, and no more, in order to obtain the greatest delicacy of measurement. The battery provided must therefore be of a voltage proportional to the total resistance of the circuit.

As already mentioned, the Boulengé chronograph is still the chief instrument in use for obtaining velocities. It has, however, undergone various modifications since its first introduction, particularly at the hands of Capt. Bréger, of the French artillery, and Capt. Holden, R. A.

The Schultz Chronoscope.—In the investigation of *interior ballistics* it is frequently necessary to determine the velocity of the same projectile at different points along the bore of the gun. It is also desirable, in determining the laws of the resistance of air to the motion of the projectile, to find the velocity at a number of different points along its path. For this particular work instruments of the Boulengé type are not well adapted, since they are primarily intended to measure but a single time-interval. The *Schultz chronoscope*, which was especially designed for the service indicated, and is the best known instrument of its type, will now be briefly described.

The cylinder a in Fig. 5 revolves by means of clockwork at a uniform speed of rotation, and at the same time is given a motion of translation by means of a threaded nut-bearing. The point b is attached to one branch of a tuning-fork c, and is either made to press lightly against the prepared blackened surface of the cylinder or it may be withdrawn from contact with it. The magnets d d are used to start the fork vibrating, to keep up this vibration during the experiment, and to equalize the amplitude of the vibration. Before using, the surface of the cylinder is coated with lampblack. As the cylinder revolves the point b traces a sinusoidal curve on its surface, and since the number of the vibrations of the fork per second are known there results an accurate scale of time. The record is made by a number of small electro-magnets, e e, placed in front of the cylinder, above the tuning-fork. Each magnet is provided

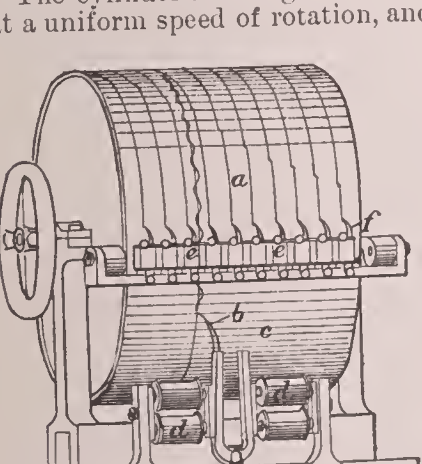

Fig. 5.

with a very light-pointed armature, f, which is held in its normal position and gently pressed against the surface of the cylinder by a small spiral spring.

When the current at a particular target is broken, the corresponding armature f is drawn quickly aside, and its point records the movement on the cylinder. The number of fork-vibrations between any two consecutive breaks is then counted, and this number divided by the number of vibrations per second gives the time-interval in seconds. To assist in counting the vibrations, the point b is first allowed to trace a simple helix on the surface of the cylinder before the fork is set to vibrating.

If the targets are such a distance apart that the current broken at one point can be restored before the next is reached, one register and one circuit is sufficient to record all the events; but, as this is seldom the case in practice, there are usually as many circuits and registers as there are events to be recorded. When determining bore velocities of the projectile, instead of the usual target-frames, a series of insulated electric circuits are arranged so as to be broken in succession as the projectile advances along the bore of the gun. The accuracy of the Schultz chronoscope is fully as great as that obtained with Boulengé's instrument, but it is so much more complicated, more expensive, and more inconvenient in every way, that it is used only in the special investigations indicated above.

Dunn's Chronoscope.—In 1890 Capt. B. W. Dunn, of the U. S. Ordnance Department, began a series of practical investigations and experiments, which has since led to the production of an instrument of the Schultz chronoscope type, and which is remarkable for its extreme accuracy and for its peculiar adaptability to the more technical refinements of ballistic study. Capt. Dunn's improvement consists essentially of a rotating photographic cylinder to receive the record, and the use of a massless beam of light, in conjunction with an induction or spark coil to make the record. The surface of the rotating cylinder is covered with sensitized paper. Instead of a tracing point, the tuning-fork carries a small perforated screen, which admits a single ray of light to the prepared surface, and as the fork vibrates a waving line is traced on the cylinder by the action of the ray. A second recording apparatus is provided which is adapted to act upon the same receiver. It consists of an induction coil, the primary circuit of which is broken by the projectile in its flight, and the terminals of the secondary coil are so arranged that the spark caused by the break in the primary leaves a mark on the paper at the side of, and close to, the waving line. The whole apparatus is operated in a dark room, there being means provided for admitting a single ray of light to the screen. The photographic record thus made is easily removed from the cylinder, and may be dated and filed for future reference.

While this instrument is not well adapted to the rougher practical experiments conducted on the firing-range, and would seldom be used in the ordinary determinations of powder-pressures and projectile-velocities in the service tests of new ordnance, it will prove of great value in the various manufacturing arsenals as a reliable aid to laboratory investigation.

The Crehore-Squier Polarizing Photochronograph.—A most ingenious modification of the Dunn chronograph has recently been produced in a complete instrument installed at the U. S. proving-ground at Sandy Hook, N. J., by the collaboration of Prof. A. C. Crehore, of Dartmouth College, and Lieut. George O. Squier, Third U. S. Artillery. It is probably the most expensive and elaborate, as well as one of the most novel, ballistic machines ever used. While the principles of operation are similar to those of the Dunn chronograph, the mechanical and electrical details of construction are radically different. The photographic receiver is inclosed in a dark box, and secured to a flat circular plate-holder, which is made to revolve rapidly at a practically uniform speed about a horizontal axis passing through its center by means of a small electric motor direct coupled to the shaft. A beam or pencil of polarized light is used, and, instead of the ordinary perforated screen, an ingenious massless shutter is provided by taking advantage of the well-known power of certain substances, when placed in a magnetic field, of rotating the plane of polarization. Such a shutter is not only without weight, but it has the further advantage of operating without mechanical movement, and thus avoids one of the most common and annoying sources of error. A Nicol prism is used to polarize the light, and a second similar prism, placed at right angles to the first, is employed as an analyzer. A beam of light falling upon the first prism is polarized, and the plane of the face of the second prism being perpendicular to that of the first, under ordinary conditions no portion of the polarized beam will pass through the analyzer, thus forming a shutter. If, however, liquid carbon bisulphide be placed in the path of the polarized beam between the two prisms, and then surrounded by a magnetic field of force, it will act to rotate the plane of polarization so that a portion of the beam will pass through the analyzer. As soon as the electric circuit that produces the magnetic field is broken the beam is again stopped.

The accompanying photograph shows the Crehore-Squier chronograph installed ready for work with the exception of the dark-box front and photographic plate. M is a small arc-light and projector which throws its beam upon the focusing lenses L L. P is the polarizer, T a glass tube filled with liquid carbon bisulphide, surrounded by the necessary magnetizing coils as shown. A is the analyzer, F a tuning-fork, the vibrations of which interrupt the emergent beam. W is a heavy wheel which carries the revolving plate-holder. A one-sixth horse-power dynamo, *m*, is coupled directly to the wheel-axle. In front of W is a thin metal cover which completely obscures the light from the sensitized plate except that admitted through a very narrow radial slit. A special shutter or cover is provided for this slit, which opens only when the instrument is ready for use, and remains open during one revolution only of the plate-holder.

The operation is as follows: The light from the projector passes through the polarizer P and traverses the liquid in tube T as a polarized beam until it reaches the analyzer A. Here the beam is completely stopped, provided no current is flowing in the coils surrounding the tube T. If, however, the electric current is flowing in these coils, the plane of polarization of the beam will be rotated to a greater or less extent according to the strength of the magnetic field, a portion of the beam will pass the analyzer A, and, after passing through a small perforated screen carried by a tine of the tuning-fork F, will enter the radial slit in the front of the dark box and fall upon the rotating photographic plate. As the projectile passes through the successive targets the current interruptions in the coils of T are thus accurately recorded upon the developed photograph. While this description is necessarily brief, it will suffice to explain the general operation. There are many details to be looked after, and experiments conducted with this instrument must be made with great care. The results are extremely accurate.

The Schmidt Chronograph.—A very compact and simple field chronograph has recently been brought out in France, and is now in use at the ordnance proving-ground at Sandy Hook. It is known as the *Schmidt chronograph*, and deserves mention here on account of the extreme simplicity of its construction and operation and the promise it gives of future usefulness in the every-day practical work of the proving-ground. It is, in reality, an electrically operated stop-watch especially designed for recording very small fractions of a second of time. It is portable, resembling an ordinary chronometer in size and appearance, and, as its adjustments are not appreciably affected by the shock of discharge, it can be set up near the guns, using its own battery-boxes as a supporting stand.

Fig. 7 shows a top view, and Fig. 8 a bottom view, of the instrument, together with the battery and wiring connections. The balanced wheel A is provided with jeweled pivot-bearings, and is actuated by a spring coiled about its axis, the spring being of sufficient length and tension to impart a practically uniform velocity of rotation to the wheel A for one complete revolution. The wheel A is made of non-magnetic material, with the exception of the large balanced spoke *c*, which is of soft iron. B is the starting magnet, the projecting core of which, through its attraction for the spoke *c*, retains the wheel in its initial position so long as the electric current is maintained around it. This magnet is in the first target-circuit. The stopping magnet C is in circuit with the second target. Its poles act upon the armatures *d d′*, which are fixed to the ends of the pivoted levers K K′, and so long as the current is unbroken the force of attraction holds these armatures in contact with the poles against the pull of the spiral spring L, which serves to bind the other ends of these levers together. When the current through C is interrupted the force of the spring is exerted to press these levers against the circumference of the wheel A, thus acting as an effective and quickly applied brake to arrest its motion. The axis of wheel A carries a pointer, I, which moves over an empirically graduated scale. The stop *g* is attached to a circular disk, and is moved by the thumb-piece *s*. A small adjustable reading-glass and vernier is provided to facilitate the reading of the fractional divisions of the scale. Inclosed in the same case are the usual electrical switches, resistances, and connections. Sufficient battery power is carried in two

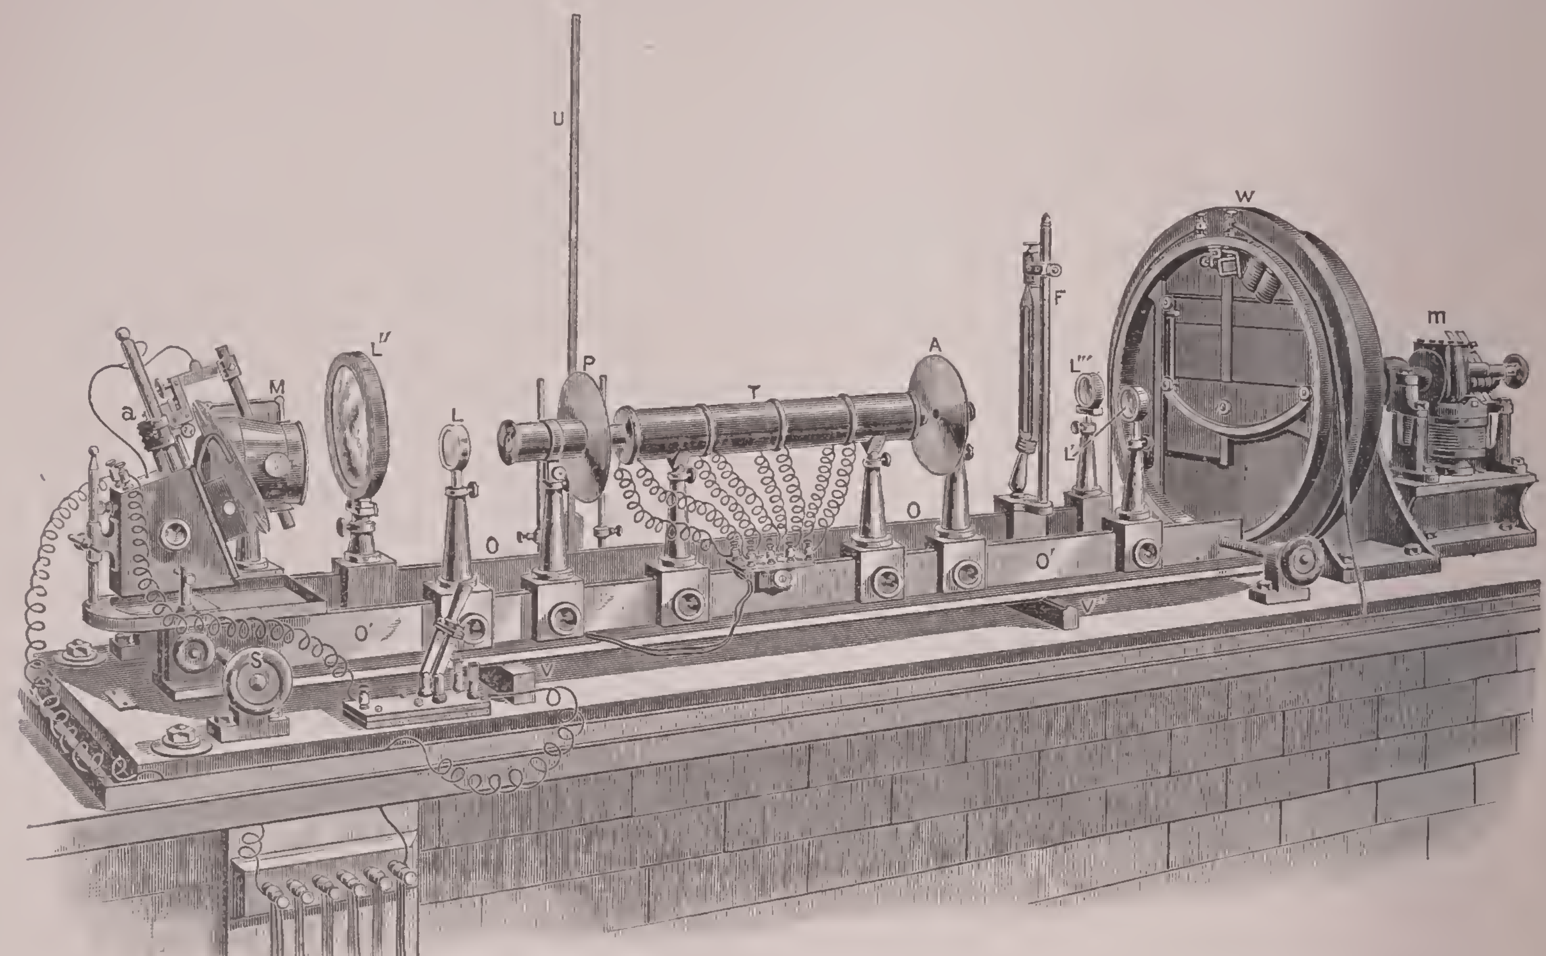

FIG. 6.—The polarizing photochronograph.

small battery-boxes, each containing a number of standard cells.

The operation of this chronograph is very simple. By moving the thumb-piece *s*, the setting disk and the stop *g* carry the pointer around to zero, when the armature spoke

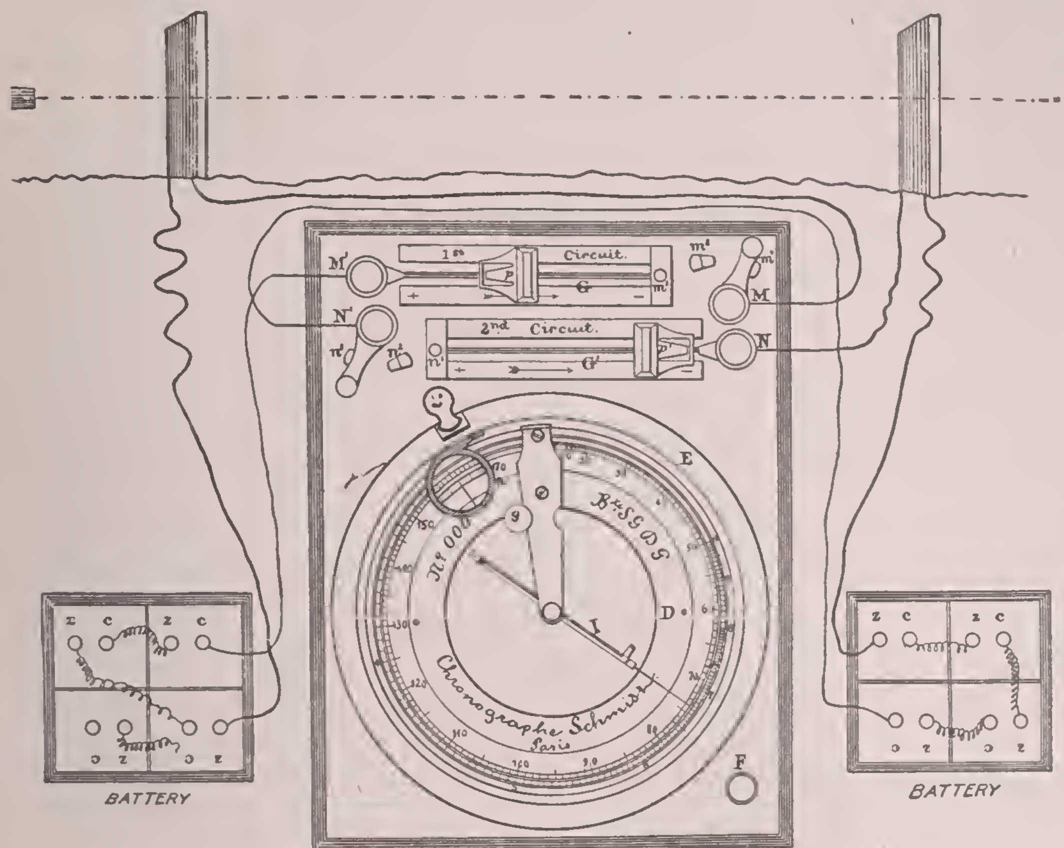

FIG. 7.—Schmidt chronograph, top view.

c of the balanced wheel A will be securely held, provided the current has first been established in the magnet B. The thumb-piece is returned to its original position as soon as the pointer is set at zero.

Now suppose both target-circuits to be established and the pointer at zero. The gun is then fired. As the projectile passes through the first target the circuit through magnet B is broken and the wheel A instantly freed. The

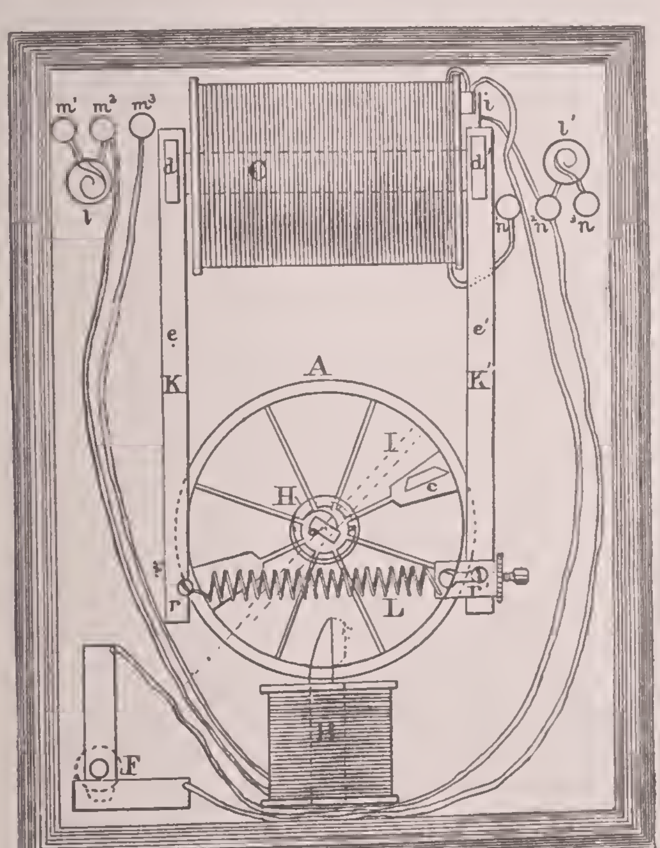

FIG. 8.—Schmidt chronograph, bottom view.

pointer flies around the scale until the second target is reached, when the magnetic brake is instantly applied by the interruption of the current in magnet C. The time-interval in thousandths of a second is then read directly from the scale. A second scale graduation gives directly the velocity of the projectile in feet per second. The targets used with this instrument should be placed at a given fixed distance apart, since the distance is assumed to be known in empirically graduating the scales, and it is made not too large (usually not more than 150 feet), since the movement of the pointer is limited to a little less than one complete revolution. I. N. LEWIS.

Elements, New Chemical: With the discovery of the chemical element argon as a new constituent in the atmosphere by Lord Rayleigh and Prof. William Ramsay interest in the study of the atmosphere and its constituents increased among chemists. The chief and most successful investigator in this domain of chemistry has been Prof. Ramsay, and at the meeting of the British Association in Toronto in 1897, in the address before the chemical section, he predicted the discovery of other elements besides argon and helium in the atmosphere. His more recent investigations have confirmed this view, and he has announced in succession the discovery of *krypton*, *xenon*, *neon*, and *metargon*. It does not necessarily follow that these bodies are all elements; still each has presented certain characteristics not hitherto recognized as belonging to other elements. Moreover, it must be remembered that these bodies exist only in very minute quantities in the atmosphere, they are exceedingly difficult of isolation, and their properties, as of all similar bodies, largely merge one into the other. A similar condition of affairs prevailed subsequent to the application of the spectroscope to the vapors of various compounds, which resulted in the discovery of a number of hitherto unknown elements in minute quantities; for instance, the discovery of cesium and rubidium in mineral waters by Bunsen. This method of investigation still continues a favored one, and has resulted in recent years in the announcement of *coronium* by Nasini, and of *monium* by Sir William Crookes. The discovery of the Röntgen rays has not been without its influence upon chemistry in the way of the announcement of new elements, and in Paris the radio-activity of certain compounds has been studied, notably that of the mineral pitchblende, which is of uncommonly complex composition. This has resulted in the announcement of the discovery of *polonium* and *radium*, possessing remarkable properties unlike any previously known among elementary bodies. For detailed information concerning the discovery and properties of these new bodies, see the names of those mentioned, in their alphabetical place. MARCUS BENJAMIN.

Elgon, Mt.: a mountain of East Africa, about 40 miles north of Victoria Nyanza. The meridian of 5° E. passes through its eastern foothills. Its height is 13,100 feet above sea-level. It was first visited on Dec. 30, 1883, by Joseph Thomson, the Scottish explorer, who found in the compact volcanic agglomerate of which the mountain is composed a considerable number of caves inhabited by natives, some of the caves being so large that they were occupied by whole villages with their cattle. In his opinion these caves were artificial, and were excavated in the rock in some past age by people superior to their present inhabitants. He saw only the caves near or at the base of the mountain, but six years later Messrs. Jackson and Gedge found inhabited caves at an elevation of 7,500 feet, one of which contained thirty large huts, and there were other cave villages farther down the mountain as well as at its base. Thomson's conclusion that the caves are artificial was combated by the later observers, who saw nothing to suggest that they might possibly be the work of man. They found evidence that many years ago the natives lived on the plain in ordinary villages, using the caves at times as a place of refuge from their enemies, until finally they made them their permanent abode. C. C. ADAMS.

Elk Lake: a small body of water south of Lake Itasca, Minn., and connected with it by Elk creek. It appeared on

Nicollet's map of 1836 as an estuary of Itasca, but later the outlet of Itasca was deepened by the current and that lake receded to a lower level, and a short creek now connects the two lakes. A traveler who visited Elk Lake in 1881 gave it his own name and announced it as the ultimate source of the Mississippi, and it so appeared in a geographical text-book used in the Minnesota public schools. By order of the Legislature, the lake under its new name was blotted on the school maps with red ink. The lake continues to be known as Elk Lake, which is the translation of its Indian name. It is not the ultimate source of the Mississippi, as several creeks tributary to Itasca spring from sources farther removed from that reservoir than Elk Lake. C. C. A.

Elliot, Arthur Ralph Douglas: British lawyer and author; b. Dec. 17, 1846; second son of the third Earl of Minto; was educated at Edinburgh University and Trinity College, Cambridge University, and called to the bar in 1880, practicing on the northern circuit; became a student and writer on political subjects; member of Parliament for Roxburghshire 1880–92, and for the city of Durham 1898; was made editor of the *Edinburgh Review* in 1895, which position he still holds. His publications include *Criminal Procedure in England and Scotland*; *The State and the Church* (1881); and other books and essays. F. S. A.

Ellis, Edward Sylvester, A. M.: author and educator; b. in Geneva, O., Apr. 11, 1840. He received education at the State Normal School, Trenton, N. J.; was a member of the faculty of the State Normal School of New Jersey 1857; vice-principal of the grammar school, Paterson, N. J., 1857–58; principal of the Trenton high school 1863–73; edited the Trenton *Public Opinion* (1874); was trustee and superintendent of the Trenton public schools 1875–85; edited *Golden Days*, Philadelphia, 1880–81. Besides numerous books for boys, such as the "Young Pioneer" series, the "Log Cabin" series, and the "Deerfoot" series (1874–99), he has published *An Eclectic Primary History of the United States* (1885); *The Standard Primary and Complete Arithmetic* (1886); *The Youths' History of the United States* (1887); *The People's Standard History of the United States* (1898); *A School History of the State of New York* (1899); and *A History of the World* (1899).

Ellis, Henry Havelock, L. S. A.: criminologist and author; b. in Croydon, Surrey, England, Feb. 2, 1859; was educated at private schools and at St. Thomas Hospital, England; taught in New South Wales 1875–79; returned to England and entered upon the practice of medicine, having qualified as a physician; gave up his practice for scientific and literary work, taking up his residence in Lelant, Cornwall. He edited the *Mermaid Series of Old Dramatists*, and his published writings include *The New Spirit* (1890); *The Criminal* (1890); *Man and Woman: a Study of Human Secondary Sexual Characters* (1894); *Sexual Inversion*, vol. i. of *Studies in the Psychology of Sex* (1897); *Affirmations* (1897); and other literary and scientific papers. He is a fellow of the Medico-legal Society of New York and of the Anthropological Society of Berlin; an honorary fellow of the Chicago Academy of Medicine; has been general editor of the *Contemporary Science Series* since 1889. F. Sturges Allen.

Elson, Louis C.: musical journalist; b. in Boston, Apr. 17, 1848, of German parents, and studied music there, beginning at the age of seven under his mother and continuing under the best of local teachers. He began his journalistic career as editor of the *Vox Humana*, and next joined the staff of the Boston *Musical Herald*. Subsequently he became music critic of the Boston *Courier*, and later of the Boston *Advertiser*. In addition to his journalistic work he has written several books which have become standard in their subjects. Among these are *The Curiosities of Music*; *History of German Song*; *The Theory of Music*; *The Realm of Music*; *European Reminiscences*, etc. He has delivered numerous lectures on musical subjects, and has been for many years Professor of Musical Theory, and lectures on musical history and criticism at the New England Conservatory of Music. He has directed several musical festivals in New England, and has composed and arranged a number of works. D. E. Hervey.

Elton, Charles Isaac: lawyer; b. in England in 1839; took his degree at Baliol College, Oxford University; became a fellow of Trinity College, Oxford, and a barrister in 1865; was appointed queen's counsel in 1885, and a bencher of Lincoln's Inn in 1887; is justice of the peace at Somerset, his country seat; member of Parliament for West Somerset 1884–85, 1886–92. Among his published works are *Tenures of Kent* (1867); *Commons and Waste Lands* (1868); *Copyholds and Customary Tenures* (2d ed. 1893); *Custom and Tenant Right* (1882); *Origins of English History* (2d ed. 1890); joint editor of *The Great Book Collectors* (1893): *Robinson on Gavelkind* (1897); and other books of a literary character. F. Sturges Allen.

Emery, Stephen A.: pianist and composer; b. in Paris, Me., Oct. 4, 1841. He studied at home first, and in 1862 went to Leipzig, remaining there for two years. Thence he went to Dresden, and finally returned home, settling in Portland, Me.; but in 1866 he went to Boston, where he remained for the rest of his life, teaching, composing, and writing theoretical books. His *Elements of Harmony* has become standard and is widely used. His compositions are very numerous, including many pianoforte pieces, solos and duets, studies, songs, and part songs. He died in the Massachusetts General Hospital, Boston, Apr. 15, 1891. D. E. Hervey.

Emotional Expression: Under "emotional expression" are included all the organic changes which accompany emotion and are said to express it. The term "facial expression" is used for the muscular changes of the face which show emotion, but the bodily accompaniments are much more widely extended. The heart is especially sensitive to changes of emotion: the breathing takes on altered rhythm, according as this or that emotion is dominant; the vasomotor system responds to these changes with compression or relaxation of the vessels, showing itself in blushing, flushing, paleness, etc.

Besides these general effects, there are certain well-marked sets of muscular contractions which go regularly with this emotion or that. The fact that they are regularly significant of certain emotions to the onlooker accounts for their being known as expressions, and they were considered literally as implanted means of expressing emotion until the rise of the evolution theory. A new construction of these muscular and physiological changes was suggested by Darwin in his famous work on *Emotional Expression in Animals and Man*. Darwin propounded the theory that the expressions have arisen as attitudes and actions which were of direct use to the animal in the struggles and rivalries, self-defenses and offenses, which the accompanying emotion at the time reflected and revealed. The expression of anger is, on this theory, a survival in the organism of the attitudes and actions, with their physiological counterparts, which the animal had to perform for safety and defense against other animals; that of fear, the attitudes of flight; those of affection, the attitudes of love-making, etc. This theory then says that emotional expressions are, in the first place, and in the majority of instances, "utility reactions" in the various storm and stress conditions into which the environment of things and other animals forced the creature's ancestors. The principle thus formulated Darwin called that of "serviceable associated habits."

This principle, now almost universally accepted, is associated, however, with certain others less widely applicable, but still necessary. Darwin formulated another law called that of "antithesis." There are certain emotional seizures which issue in expressions just the opposite of those which are accounted for by the law of serviceable associated habit or utility, expressions which seem to have no utility in themselves, and yet to be a sort of rebound and reversal of those which have utility. The emotions, also, in these cases, are the opposite of those which go with the useful expressions. Darwin accordingly held that such an expression is what it is because the emotion is just the opposite of that for which the antithetic expression has been useful. This is true as a matter of fact; but as Darwin left it, it is not an adequate explanation of the antithetic expressions. It assumes so-called muscular antagonism—the actual arrangement of the muscles in pairs—for the carrying out of the reversed expressions. But the theory of evolution has to account for just the fact of muscular antagonism. It has been pointed out, also, that the antithesis of movements in the organism goes much further back, being found in primitive organisms which have no developed muscular systems, and which react with approaching or withdrawing movements upon different classes of stimulating conditions in the environment. These contrasted attitudes are found in all life, and it has been suggested by later writers that it probably indicates some consciousness in the creatures, with variations in pleasure and pain; the reactions outward, toward stimulations, indicating pleasure, and those of withdrawal and inhibition, indicating pain. The law of antithesis, therefore, on this hypothesis, becomes that of "hedonic expression," the hedonic or pleasure-pain state being the real indication of what the actual attitude is to be.

A third principle, also intimated but not developed by Darwin, is that of "analogous feeling stimuli"—covering the fact that we take the same attitudes, expressive in character, toward things which feel alike, when the expression is appropriate, from the point of view of utility to one only of the similar stimuli. Let us say that a certain expression has arisen because of its utility for a certain sort of stimulation; then by this principle the same reaction or attitude is likely to be aroused by a stimulation which feels like the first, whether the expression be actually useful in the second case or not.

Finally, Darwin pointed out that many expressions are practically lawless, seem to be due to what he called "direct discharge" in the nervous system, without exhibiting any regular principle or purpose. This is especially true of intense emotions. When the regular well-recognized expressions have exhausted themselves, the system is thrown into a diffused convulsive contraction which is the reverse of useful. Thus the palpitation of the heart, the trembling of the knees, violent flushing, cold shivers, hot waves of sensation which sweep over us. These effects are probably due to the mechanical stimulation of the nervous system under conditions in which the ordinary pathways of discharge have not been adequate to carry off the agitation into which the organism is thrown.

The most general phenomenon of emotional expression—especially of the emotions which attach to personal situations and relationships—is the blush. This was also fully discussed by Darwin, who came to the conclusion that it is due to the direction of the attention to the person, and is hence confined to the parts which are visible to the eye of the observer—mainly to the face and neck. Mosso and others have found, however, that the blush extends more widely over the body; although the observations differ for different emotions, and the more widely extended flush is probably due to a general diffused vasomotor reaction of dilatation of the blood-vessels under excitement of the heart. This form of expression is referred to further under the heading MODESTY AND BASHFULNESS.

It is a growing opinion—based upon the so-called "James-Lange" theory of emotion—that, instead of being expressions of emotion, the bodily attitudes are really what is felt in consciousness as emotion; that, for the coarser emotions at any rate, the feeling is a revival or reverberation of earlier expressions of the utility type, established in the organism.

Enneking, JOHN JOSEPH: artist; b. in Minster, O., Oct. 4, 1841. He was educated at Mount St. Mary's College; studied art in Europe 1873–76; returning to America, settled in Boston. Among his more noted paintings are *November Twilight* (two different scenes); *Winter Twilight*; *Summer Twilight*; *Cloudy Day in Summer*; *The Coming Storm*; *Indian Summer*; and *Springtime.*

Ephebe [from Gr. ἔφηβος; ἐπί, upon + ἥβη, youth]: a youth, or cadet, in ancient Greece. After the period of school training was passed, the youths about the age of eighteen entered the class of *epheboi*, in which they were trained for their duties in the defense of the state. In Sparta this period lasted for twelve years. The first two years were devoted to learning the use of arms and light skirmishing. At the end of that period they became *eirnes*, and entered upon a course of study closely resembling actual warfare. At Athens the service of the cadets lasted for two years, the first year being spent in the neighborhood of Athens and the second on the frontiers, where they became acquainted with the topography of the country and served as a sort of rural police. The facts in regard to the organization of the *epheboi* are known almost entirely from inscriptions. Some of the most important points on which there is reasonable certainty are the following: It was a state institution; it was altogether of a military character; at Athens it comprised both foot soldiers and horsemen; it was an aristocratic institution, not all the citizens passing through this discipline, but only the young people belonging to the three higher classes. At a later period foreigners were admitted to this band. The institution changed greatly, so that any description given would apply accurately only to a limited period. For example, in the fifth century B. C. it was obligatory and lasted for two years, but beginning with the third century it is no longer obligatory and lasts only one year. This special period of training between youth and manhood is one of the most interesting and striking features of Greek education. See Davidson, *Aristotle and the Ancient Educational Ideals*; Grassberger, *Erziehung und Unterricht im Klassischen Altertum*; and Girard, *L'Éducation Athénienne.* C. H. THURBER.

Epistemol'ogy [from Gr. ἐπιστήμη, knowledge + λογία, deriv. of λόγος, discourse] (or *Gnosiology*, or *Theory of Knowledge*, or *Rational Psychology*): the science of knowledge; that department of metaphysics which treats of the origin and process of knowledge, having as specific problems validity of knowledge, the nature of the soul, and its connection with the body. The problem of knowledge whose solution gives a "theory of knowledge" is resolved into two: (*a*) the process of knowledge and (*b*) the origin of knowledge.

Process of Knowledge.—Three general theories have been held as to the method of connection of the mind and its object—that is, as to the true analysis of the subjective and objective factors: (1) Representative theories, (2) formal theories, (3) immediate theories.

1. *Representative Theories.*—This problem is a late one in philosophy. Before men began to speculate they were undeveloped realists, and after the Greek intellect seized upon the general problem of existence they did not question the truth of things around them. The early Greeks had no theory of knowledge. But it became necessary as soon as the postulation of a metaphysical principle conflicted in any way with the reports of the senses. So Parmenides must criticise the senses in saying that change is not, and Heraclitus in saying that being is not. So "the senses deceive" is the first attempt at a theory of perception. This led at once to various attempts to reconstruct or deduce perception on the basis of mediateness. These attempts may be classified broadly on the bases of the mediatizing agent as twofold: (*a*) *The medium is material.* So in the Greek view. It rests on the principle "*similia similibus percipiuntur,*" the mind is conceived as different from matter, so some medium must be interposed. The difficulty seems less when, by refinement, the material *objectum quo* becomes intangible and vague—more like the mind which is in its essence warmth, air, atom, or some other invisible form—so the eidola of Democritus and the effigies of Lucretius, affluences, etc. Of course this is no longer held—if mind be matter, matter the *objectum quo* can act on it; if not matter, the *objectum quo* can not act on it. The principle of "like on like," however, does not hold. Like may, for all we know, and because of what we know, act on unlike, unless there be some hidden aspect of likeness between matter and mind. So viewed, however, it is true that there is a material medium, namely, our bodies, unless the mind be throughout the body. As far, then, as extra-organic objects are concerned, knowledge is mediate. When we push the question to the connection between mind and body, however, by the nature of the case no material intervention can help us. (*b*) *The medium is ideal.* Here the great problem of idealism confronts us. The idealistic view of things finds its justification in the process of knowledge. Disregarding for the present formal idealism, as concerned with the origin of knowledge as well as its process (for if the mind imposes forms, to this extent the content of knowledge is modified), we may say that the historic forms of idealistic thought rest upon the following positions: (1) The entire presentational *continuum*, considered as the sum of presentations, is ideal. Each germ of knowledge is necessarily subjective. The very fact that it is in knowledge clothes it with knowledge form. The subjective is an affection of self—an intensive state. Ideas, then, are what we know, and without its idea we know nothing. To Locke knowledge is the perception of the agreement or disagreement between ideas. (2) All relations of comparison, similarity, etc., arrived at in knowledge are relations between ideas,

whether there be things beyond them or not. (3) We can know no objective counterpart. If one exists we could never reach it, and it is more philosophical to say the ideas are the real objects of perception. (Locke had to assume substance; he confessed he could not reach it.) So for all idealism. Admitting the first two points, we may say of the third that it overlooks the possibility of an actual world to which the ideal world is true. Granting this, each point of the three may be supplemented by the consideration that sensation and ideation are themselves the immediate reports of this external world which is given to us intuitively. It is possible that a field-glass distorts, but it is also possible that it does not—that it is a perfect glass in all respects. But since the glass can never be removed from the eye, we can never know what is the truth. One conception is, on its face, as reasonable as the other. And all idealistic developments have a broad expanse exposed to this annihilating possibility. For this reason the first ground of idealism can never be proved nor disproved. This is Hume's position, and as far as empirical perception, both external and internal, is concerned, his arguments have never been answered.

More special forms, various modifications of this basis, are found. Hume and the Mills could go no further, because mind disappeared as matter did. If mind be reinstated, however, through the doctrine of immediate consciousness of self as acting and the validity given it which is denied to matter, we reach subjective idealism. Matter is no longer left unexplained; its efficient cause is mind. The difficulties of subjective idealism are: (*a*) The difficulty in passing from individual to universal mind. Berkeley was driven on the ground of his *esse est percepi* to the all-perceiving existence of God; but in so doing he gave up his justification of subjective idealism, since the immediate knowledge of self on which it rests is individual knowledge. Consistency in this position would lead to the individual construction of the world, and we should have as many worlds as minds, and no assurance of their sameness without external tests. So Fichte also, in his universal I. (*b*) This permanence and unity of the external afford a positive refutation of subjective idealism. The only way out is to hold the dependence of both mind and matter on another something which guarantees oneness in the manifoldness of microcosmic representation, and then this other is the real and not individual minds. (*c*) The negative criticism urged against all idealism holds here—viz., that even though we admit, as we do, immediate knowledge of mind as energy, the possibility remains that external energy is equally real though mediate. Here the same parallel may hold, as Spinoza would have it, between thought and extension, even though we admit the necessary phenomenal eminence of mind as necessary to the perception of either. If extension is real, in order to be known as real it must be interpreted as ideal; but this construction as ideal is used to destroy its reality. (*d*) On the basis of subjective idealism there is no possibility of the differentiation of objects in the external world. If there be nothing in objects of more than mental validity, whence this permanent and characteristic differentiation? Mental forms are constant, the matter of perception is varied, and hence mental form can not be the whole of the object; its matter can not come from mind. By these criticisms logically the idealist is driven to some form or other of absolute idealism. If mind be the efficient cause of the phenomenal world, and if unity and connection be the characteristic features of this phenomenal world, unity must be postulated in the mental world—viz., a universal mind which is at once the cause and ground of phenomenal mind and matter. This ground may be mind or matter, or we may not know whether mind or matter. Only the first alternative is idealism—a form of identity philosophy which is monism of mind. So the Hegelians and, in modified form, Lotze. This is logical and the necessary outcome of a representative theory of knowledge. Hamilton said there is no middle ground between natural realism and pantheism; so there is not if in pantheism we include all forms of immanentism (which is not correct), and if the great alternative of parallelism is overlooked with Kant and Hamilton. Absolute idealism, as idealism, fails in its theory of perception.

On the other hand, admitting the postulate of parallelism, we reach through a representative, but dualistic, theory of knowledge a theory of ultimate monism as satisfying to the demand of reason and more in accord with experience. The problem is to justify dualism from a representative theory of knowledge. All theories which hold a something back of the idea which gives it possibility, this something being the true, real, but unapproachable essence of things, are cosmothetic idealism or representative realism.

(2) *Formal.*—The opposition between the critical or formal theory of knowledge and the representative is seen in the fact that it arose historically as a refutation of sensational idealism. Kant's fundamental question, How is knowledge *a priori* possible? was the affirmative statement of the very inquiry that Hume has answered negatively. Though leading to idealism as thorough as any representative view, it is an altogether different conception at the first. The representative theories suppose something intervening between mind and matter, this something to represent either one or the other in the way of a mediator to their interaction. The formal theory, on the other hand, makes no such supposition. In its view the phenomenal world is a compound or synthesis of subjective and objective elements, and its problem is to analyze this compound and assign to its factors their respective worth. The beginnings of this view are to be found in Descartes's doctrine of innate ideas (see quotation in Lewes's *Problems*, 3d ser., p. 14), though it and subsequent similar views (Shaftesbury and German thinkers) had no direct reference to sense-perception. If looked at as forms at all, these ideas could only be considered regulative principles of knowledge—those subjective rules by which knowledge proceeds. They would not modify the content of higher knowledge nor endanger in any way its external validity. Indeed, the Anselmian proof, and the ontological proof based on the idea, is direct evidence that these ideas were considered to give peculiar assurance of the real validity of their content. With Kant a new turn was given to the doctrine of innate ideas.

Positive Element in Kant's Theory.—Against Hume Kant seeks to vindicate by a profound analysis of experience the existence of certain *a priori* rational elements not deducible from sense. These are original conditions of knowledge. They are present both in sense-perception and in the higher mental operations. In sense-perception they are space and time, the conditions of the perception of external things. In the higher operations they are the categories. These categories are the rational element in knowledge, supplied from the very constitution of reason. Their criteria are necessity and universality. These form a valid necessary basis for knowledge. But against Wolff, who held the absolute external dogmatic value of innate principles, Kant is just as positive. He holds that the judgments of reason are valid only when employed on a content, this content being necessarily matters of sense. Reason is only one factor of knowledge—the form; sense must give the matter, and these are inseparable in any valid sense. Outside the sphere of sense the categories are mere ideas or concepts, from which the existence of corresponding objects can not be deduced. In short, the categories are valid for knowledge when the senses co-operate; otherwise they are empty.

Negative Elements in Kant's Theory.—Thus Kant vindicates the presence and necessity of rational as well as sensible elements in knowledge, but he undoes his own work largely by the conception of their relation to the senses. The rational elements exist in the mind prior to experience as conceptual forms, which the mind imposes upon the matter of the senses, and thus largely constructs its own object. In the division of labor the world furnishes impressions, and the mind builds them into things. There is then a distinction between things as they are and things as we known them. Things as they are are things as we know them minus the contribution of mind, minus active construction in the categories. For example, we can not assert that things as they are are causes. So with all the categories (substance, etc.) in sense-perception, space, and time.

Content and Limits of Knowledge.—The result is an antithesis against knowing and being. The content is the constructed phenomenon: the real thing is unknowable. We know a real world exists, for a phenomenal world presupposes an intelligible world. The appearance implies the reality. The limit of knowledge is then exactly where Hume, or more truly Locke, assigned it. Knowledge is limited to the phenomena of cognition. It embraces positive (natural) science and formal (mathematical). This limit excludes from knowledge (1) the realities of the noumenal world, and (2) the objects of metaphysics—God, the soul, and the ultimate principle of the world. This inside these limits is pure agnostic or sceptical idealism, if made to apply to knowledge of self as well. Consciousness and intellectual forms are media.

These are the general features. As a theory of the process of knowledge it is open to these criticisms: (*a*) It can never be proved that while the content of knowledge appears in subjective form it is modified by that form; it is just as reasonable to suppose it is not; (*b*) the criticisms urged against subjective idealism hold here. (1) It leads to an individual construction of the world and can not reach universality—How do I know that you see things in the form of space and time? (2) If you go over to universal forms properly, the things in themselves are modified before they reach any perception, or we do not know whether it modifies them at all, and if not, things are what we see; (*c*) there is a great deal of empirical evidence for the derivation of space and time by a mental reaction on given physical data, which themselves carry specific differences as arising at localities. (*d*) If the categories are subjective only, no noumenon can be postulated, and we reach subjective idealism or sceptical idealism. (*e*) The status of the noumenal self is more direct than that of noumenal matter. The forms are forms of knowledge. If mind can contribute primary qualities nothing is left. Noumenon is well named as thought. (*f*) Parallelism can be supposed, as in all idealism, and as Kant does in practical reason (so Zeller). It would apply to higher truth as well as to sensation, and thus free the categories from dependence on sense-perception, giving validity to intuitions of mind apart from the special applications. (*g*) The presumption of empty and illusory processes is contrary to the general principle of adaptation in a reasonable universe. So here, as in subjective idealism, logical development leads to absolute idealism, as in Fichte's I and Schopenhauer's Will. So three distinct lines from Kant: (1) Insist on *limit*, reach phenomena only—sceptical idealism; (2) insist on noumenal—absolute idealism; (3) insist on forms—subjective idealism.

(3) *Immediate Theories: the Realistic View of the World.*—Realism takes two great forms: (1) natural realism (Scottish), and (2) transfigured realism (Spencer). (1) *Natural realism* was founded by Thomas Reid as a sure answer to Hume's sensational idealism. He reasserts the authority of common consciousness at the two points denied by Hume—(*a*) objective validity of sense-perception, and (*b*) objective validity of the higher judgments, causality, substance, identity, etc. In perception the idea of an object which arises from sensation is accompanied by an irresistible belief in the existence of the object. Reid does not teach that the mind directly cognizes objects, but that it has a spontaneous and irresistible belief in their existence, and this is equivalent to such cognition. In the higher sphere he holds that there are certain original beliefs or principles of common sense, carrying their own assurance of the existence of these objects. Common consent attests the validity of the principles Hume disputed in both spheres. Validity is assured by catholicity. Reid's theory containing the germ of natural realism was developed by Stewart and Hamilton. Hamilton completed the theory, maintaining that we perceive things directly, and removing Hume's subjective difficulty by distinguishing between the primary (objective) and secondary (subjective) qualities of matter. This could not meet Kant's formalism, for extension to him was subjective. Hamilton does not admit the validity of supersensuous things through common sense. His theory of the relativity of knowledge confines him to sensible realities. Mind can not conceive the infinite, etc. The most complete statement and defense of natural realism is found in writings of James McCosh. He improves Hamilton's theory of perception. He also insists on validity of higher intuitions, dividing them into cognitions, beliefs, and judgments, and making their tests primarily self-evidence, and secondarily necessity and universality.

Defects of Natural Realism.—(*a*) It rests upon a supposition—a dogma—viz., parallelism, which is only hypothetical and needs much criticism, i. e. of belief, reality, etc. If idealism were true the facts would be the same. (*b*) It is untrue in any sense which denies the intervention of the nervous system. (*c*) It denies the necessity of the subjective reconstruction of space and time. Subjective states are purely intensive and can in themselves have no extensive quality. Hence local signs or other spatial and temporal indications are in the last resort only representative symbols by which space and time are reconstructed, even though we claim parallelism. This is Reid's form against Hamilton's. So also with physical energy, which is manifested only in terms of motion or space. Allowing the validity of external causation, still external resistance and power are only by a true inference arrived at. This inference we may hold is as valid as intuition and is as truly realism. (*d*) The principle of common sense as resting on universality is extremely precarious. The study of infant psychology and evolution is deriving principles before considered universal. And the simple fact that the unreasoning intellect accepts a position as true is faint ground that it is true. For example, the doctrine that intuition is inherited nervous habit is held by Spencer.

Excellences of Natural Realism.—(*a*) It affords a consistent doctrine of the lower (sense) knowledge and the higher knowledge together. Immediate perception of the world with perception of higher truth as immediate makes a consistent theory. We can not divorce the two with Hamilton. So Kant's formalism is carried throughout the mental life. It is best also for empirical psychology and psychological science. (*b*) It dispenses with any unknown and occult substratum of matter, beyond what is at once present to the senses—this is the merit of Berkeley and is held by McCosh, who defines substance to being, permanence, and power. (*c*) It allows a like simplification of the concept of soul. The soul is what we know—conscious unity with varied activities—this is for knowledge the whole of soul-substance. Why assume in either case a thing-in-itself when we have sufficient data for a rational theory? We can say with Hume and Schopenhauer "perception is a closed relation," and no things can be reached outside it—but we need not say with them consequently we know no things. We know two things within this closed relation, mind and matter, both of which answer the conditions of permanent existence. What they called agnosticism (of the absolute) we may call dualism (of the conditioned), leaving the problem of the ultimate ground of the relation for the present unanswered. (*d*) It admits supplementing in the line of the subjective reconstruction of space—which is the mode of perception of space—and an immediate inference from the categories. (*e*) It may dispense with the support of common sense, which is adventitious and only of secondary importance.

(2) *Transfigured Realism* (Spencer).—Mr. Spencer has given his theory the name of transfigured realism to distinguish it from the realism of common sense on the one hand and from idealism on the other. It is a complex theory, and its understanding requires knowledge of its historical antecedents. The main sources are three in number: (*a*) From Hume and the association school it derives its psychological features and general view of experience. (*b*) From the evolutionists it takes the principle of development, and by its means is enabled to substitute for the idea of individual experience that of race experience. (*c*) From Kant and his British followers (Mansel, Hamilton) it obtains its transcendental element, i. e. association of an unknowable reality as the basis of knowable phenomena.

Two Fundamental Elements of the Theory.—The two corner-stones are his sensational psychology and his transcendental ontology, giving two phases of the theory—psychological and ontological.

Psychological Phase.—Mr. Spencer applies the principle of evolution to mental phenomena. After tracing the development of the physical basis of mind, and showing its relation to biology, Mr. Spencer, in the beginning of his *Principles of Psychology*, seeks to show in detail that the mental life develops in correspondence with the nervous system and is its function. The mind with its powers gradually arises out of physical conditions. This, however, is preliminary to psychology proper, which treats of mental and not of nervous phenomena—the fact of consciousness intervening. In treating of the development of the intellect in man, he begins with the elements of Hume (*Data of Philosphy*, in *First Principles*)—impressions and ideas—changing the names to vivid and faint states of consciousness. These elements arrange themselves into two series of states, which agree in some respects and differ in others, but never intermix. Of these two series the vivid one becomes objective and stands for the external world, while the faint one becomes subjective and stands for the internal world. The first step in development, therefore, is the differentiation of subject and object in consciousness. The process then continues as unfolded in detail in the *Principles of Psychology*. The mental powers—memory, imagination, reason, and will—arise out of the same elements. And, lastly, the judgments of reason which affirm the "philosophical relations" of Hume arise as judgments of association among states of consciousness. The result is not reached in the limits of the individual life, but is the accumulated result of the experience of the race. The psychological phase is therefore sensational, for it contains the fundamental assumption that reason is developed sense, yet it admits the validity of *a priori* judgments in the individual as given by heredity. It is open to the development toward the subjectivity of phenomenal or sensational idealism.

Ontological Phase.—Logically, phenomenalism seems to be the only ontological theory consistent with Mr. Spencer's psychology. But, in fact, he is a Kantian in his ontological views. He agrees with Hume, as Kant did, as to the limits of knowledge. But he differs from Hume and the positivists, and agrees with Kant in affirming the existence of a noumenal being at the basis of phenomena. This doctrine came from Kant through Hamilton and Mansel. So his ontology is transcendental. He reaffirms Kant's and Hume's limitations of knowledge to the phenomena of positive science. In this respect there is harmony among the three theories (sensational idealism, formal idealism, and transfigured realism). Kant's doctrine of a world of realities outside and behind the world of phenomena is reaffirmed, and this is, with Kant, unknowable.

Connection Between Psychology and Ontology.—On what grounds can he reconcile the two and ground assertion of unknowable real world? On the doctrine of causality, as usual. The existence of the phenomenal in consciousness involves existence of the objective outside of consciousness. This principle is stated in three ways: (*a*) Phenomenon implies ground; (*b*) relative implies an absolute; (*c*) effect implies cause. To be organic, on the ground of necessity of thought, the world can not stand of itself simply as phenomenal, but its reason must be found in something deeper. Experience can not give this deeper element, but reason demands the postulate to make experience itself intelligible.

General View.—Spencer defends realism against idealism and scepticism. Realism is superior to all other theories because of its priority, simplicity, and distinctness. The idealist, of whom he takes Berkeley as type, not only complicates knowledge by introducing a *tertium quid* between knower and object, but he must fall back on realism to get any subjective basis for his idealism. The sceptic (Hume as type) has no basis for a theory of things, for he must use reason to deny reason's authority, which is suicidal. In denying Hume's subjective conclusion that knowledge is limited to mental states he is true to facts, if not as true to logic. Consciousness knows nothing of subjective states, he says; it objectifies everything. It affirms both the external world and itself as objects. Hume denounces consciousness as mendacious, and points out such cases. Spencer recognizes the authority of consciousness, and while denying that we cognize objects directly *in se*, holds that our cognition is valid for us and reaches objective truths by an irresistible belief. It is impossible not to believe in such things as time, space, substance, energy, personality.

The validity of this theory can not be proved directly, but can by the *reductio ad absurdum* of all the other theories. So the realistic feature rests not on direct cognition, but on belief, which in turn rests on the rational principle of proceeding from relative to absolute, phenomenon to noumenon, cause to effect. We cognize phenomena; we have a rational belief in a reality under phenomena; but we can not characterize this reality. This view is similar to that of Reid, except that it is more ontological and representative. Reid's belief was in the identity of the phenomenal and real; Spencer's belief is in the real as underlying the phenomenal. Both postulate this belief as a mental necessity.

Criticism of Transfigured Realism.—(*a*) The principle of race experience does not help sensationalism; it is practically giving the case to intuitionalism because the problem is not our fathers' process of knowledge, but our own. If our *a priori* knowledge came from their experience it is still *a priori* to us. And if constant individual experience gives practical certainty (Mill), race experience gives moral certainty, even though we recognize nervous habit as its genetic basis. (*b*) It does no good to assert an unknowable. It is just as reasonable to see in phenomena the real which is knowable (parallelism). Spencer has not Kant's justification here, for he has no mental forms or activities by which the object is to be constructed. By pure sensationalism no contribution can be made to the object by mind.

Data for True Theory.—From the preceding history and criticisms the following principles seem to emerge: (1) If the external world is known at all it is known in knowledge form. (2) There is something outside the individual consciousness. (3) There is a consistent uniformity and differentiation in the phenomena of the external world. (4) There is a universal tendency of mind to believe in a substantial reality—outside. (5) The nervous system intervenes between mind and its object in sense-perception. (6) A single principle explains higher and lower knowledge. (7) Knowledge is possible.

Now some kind of a doctrine of parallelism alone can answer these conditions. The subjective side of the parallelism is represented in (1) and (5), the objective side in (2) and (3), and the fact that these are parallel is intimated in (4), (6), and (7). It can not be called inferential or representative, because in higher knowledge there is no inference nor representation. It can be called immediate only on condition that in the knowledge form things are absolutely true; that is, that there is no other reality than knowledge reality. It is certainly not a form of natural realism. It involves a subjective reconstruction of space. Some form of immanental monism is required by these presuppositions.

Origin of Knowledge.—The second problem concerns itself with the origin of knowledge. This is intimately connected with the problem of the process of knowledge. Admitting the possibility of valid knowledge, we find again three general classes of theories: (*a*) Empiricism, (*b*) sensationalism, and (*c*) intuitionalism. (*a*) Empiricism of origin corresponds at once with empirical idealism of process. The criticisms already advanced against the latter disprove the former. There is a tendency of mind to pass to an ultimate basis of knowledge somewhere, and complete scepticism is only the denial of this impulse. We hold also that mind as real is given immediately in consciousness. It is not to be denied, however, that the empirical view is sufficient for natural science, and has rendered valuable service in its insistence upon an analysis of the higher notions. Whatever notions are derived from experience let us give to experience. Yet its advocates admit that it can not give us certain knowledge, and just for that reason it is insufficient. Its latest form is "associationism" with the "units of composition" theory. Here Mill and Spencer, after Locke and Hume. (*b*) Sensationalism. Here the case is worse. We can not stop to examine it at length; its weakness is apparent enough in its history. It is fundamental contradiction, since the denial of inner experience is the denial of external experience. What is a sensation as such? A fine example of its futility is seen in Candillac's famous "statue." It leads over to materialism in philosophy, morals, and life. (*c*) INTUITIONALISM (*q. v.*). In general this is a theory that some truth is known by mind independently of experience, though not antecedently to it.

J. MARK BALDWIN.

Erben, HENRY: naval officer; b. in New York in 1832. He entered the Naval Academy in 1848, became passed midshipman in 1855, master in 1855, lieutenant in 1856, and in 1856–57 was employed in bringing camels from Egypt to Texas for the War Department; engaged in deep-sea sounding for the Atlantic cable; served in the China station 1857–59, and in the Gulf station 1860; in 1861 was instrumental in rendering Fort McRae useless to Confederates by spiking guns and destroying ammunition; was on blockading duty on the Gulf coast in 1861, and in the same year was in fights at Ship island and off Mobile with Confederate gunboats; took part in the bombardment of Fort Pillow in 1872, commanding the ironclad St. Louis; at the siege of Vicksburg commanded the Sumter, passing the batteries with Farragut; was in the battle of Baton Rouge, and in the engagement in which the Confederate ram Arkansas was destroyed in 1862; advanced to lieutenant, and became executive officer of the Patapsco in 1862; was in engagements at Fort McAllister and the forts below Charleston, S. C., in 1863; served with the Gulf squadron in 1864, capturing under the batteries at Matagorda, Tex., the armed schooner Dale and the boats of the torpedo station; was on duty at the New York navy-yard and in the South Atlantic station 1866–69; was promoted to commander in 1868; again on duty in New York, and commanded the school-ship St. Mary's 1871–82; advanced to captain in 1879; commanded the Pensacola in a cruise around the world 1883–84; after serving at the Portsmouth navy-yard, on special duty in New York, as a member of the board of inspection and survey, as commandant of the New York navy-yard, and as commander of the European station, 1885–93, and having been made commodore in 1892, he was retired as a rear-admiral in 1894. He commanded the patrol fleet in New York harbor during the war with Spain in 1898.

Errani, Achille: vocal teacher and tenor singer; b. in Milan, Italy, about 1824, receiving a thorough musical education, and singing tenor rôles in various Italian operahouses; went to the U. S. in 1860 and sang in opera under Max Maretzek's direction. In that year he married Miss Charlotte McWalters, and soon retired from the stage and devoted himself to teaching. D. Jan. 6, 1897. D. E. H.

Essipoff, Annette: pianist; b. in St. Petersburg, Russia, Feb. 1, 1850, and educated first at the conservatory there and subsequently a pupil of Theodore Leschetizky, who fell in love with her and divorced his wife in order to marry her in 1880. She made her first concert tour in 1874, after having made a favorable reputation in Russia. In 1876 she went to New York and played at many concerts and recitals. Since her marriage she has lived in Vienna with her husband. D. E. Hervey.

Etherion: a probable elementary gas discovered in the atmosphere by Dr. Charles F. Brush, of Cleveland, Ohio. Its chief characteristic is enormous heat-conductivity at low pressure, which experimentally has been found to be one hundred times that of hydrogen, the best gaseous conductor hitherto known. The new gas was obtained by partial separation from the air by diffusion. If its heat-conductivity is placed at one hundred times that of hydrogen, its mean molecular velocity at freezing temperature may be assumed to be more than one hundred miles a second, and its density only a thousandth part of that of hydrogen, while its specific heat will be six thousand times greater than that of hydrogen. A gas having properties like those mentioned could not possibly be confined to the earth's atmosphere; hence it probably extends indefinitely into space and forms a constituent of interstellar atmosphere. It was in recognition of this probability that it was named etherion, meaning "high in the heavens," by its discoverer, who suggested that perhaps it is the ether of the physicist, to which such remarkable properties have been ascribed. It is proper to add that Sir William Crookes in reviewing the announcement of the discovery of this new gas considers it more probable "that etherion is a water-vapor than that it is a new elementary gas." Marcus Benjamin.

Europe: The population of Europe at the close of 1887 was 343 millions, and at the end of 1897 it was 379·7 millions; an increase of 36·7 millions in the decade, or 1·03 per cent. increase for each year. In 1887 an average of 35 persons lived in each square kilometer, and 39 persons in 1897, or an increase in density of population in ten years of 4 persons to the square kilometer. The most densely peopled countries are Belgium, 200 to the square kilometer; the Netherlands, 133; Great Britain, 118; Italy, 104; Germany, 87; France, 72; and Switzerland, 71. Russia made the largest increase in the decade, 17·4 per cent., with 103·6 millions of inhabitants in her European domain. Russia, Norway, Finland, and Sweden are the states of lowest density of population.

The views of geographers with regard to the boundary between Europe and Asia have conflicted from the earliest times, and are not yet in accord. *Bevölkerung der Erde* gives various estimates for the area of Europe, according as one or another boundary line is accepted. Some map-makers give the Ural and the Caucasus Mountains as the boundary, while others follow the political divisions Russia has chosen to make, extending the European province of Perm to the east of the Ural Mountains, and including the whole of Caucasia, both north and south of the Caucasus Mountains, in her European domain. Geographers generally agree that the natural boundary of Europe in the east and southeast does not consist of mountains, but of the wide zone of depression extending from the Sea of Azov eastward to the north of the Caspian as far as the Ob basin and down the Ob valley to the Arctic Ocean, which was once covered by an arm of the sea that connected the Mediterranean with the Arctic Ocean. While, however, the true line of separation is in dispute, it is agreed that the decided contrasts between Asia and Europe fully justified scientific men in dividing them into two continents. C. C. Adams.

Eustis, James Biddle: statesman; b. in New Orleans, Aug. 27, 1834; received a classical education; graduated at Harvard Law School in 1854, was admitted to the bar in 1856, and practiced in New Orleans until the beginning of the war, when he entered the Confederate army; served a year as judge-advocate on the staff of Gen. Magruder and later on Gen. Joseph E. Johnston's staff until the close of the war, and then resumed the practice of law in New Orleans; was elected a member of the Legislature before the passage of the Reconstruction Acts, and went to Washington as one of a committee to confer with President Johnson on affairs in Louisiana; was a member of the State House of Representatives in 1872, and State Senator 1875–78; U. S. Senator 1877–79; Professor of Civil Law in the University of Louisiana 1879–85; U. S. Senator 1885–91, and again thereafter practiced law in New Orleans; appointed minister to France in Mar., 1893, afterward becoming ambassador extraordinary and minister plenipotentiary, and held the latter office until Mar., 1897.

Evans, Arthur John, M. A.: b. in Nash Mills, Hertfordshire, England, in 1851; graduated at Oxford in 1874, and afterward studied history at Göttingen University; traveled through some of the least-known European regions, making antiquarian and ethnological research, twice exploring the Finnish and Lapp countries between the Arctic and the Baltic Sea, investigating the survival of heathen rites there; traveled in southeastern Europe in 1875, and wrote letters to the *Manchester Guardian*, partly republished under the title *Illyrian Letters*; later published *Antiquarian Researches in Illyricum*, and accounts of new discoveries of Illyrian coins in the *Numismatic Chronicle* and other periodicals; in 1882 was expelled from Austrian dominions, after a short imprisonment in Ragusa under the charge of complicity with insurgents; in 1883 became university lecturer at Oxford, and in 1884 keeper of the Ashmolean Museum; in 1889 published *The Horsemen of Tarentum*, a monograph on the coinage of that city, in 1892 *Syracusan Medallions and their Engravers*, and in 1893–94 edited and supplemented the fourth volume of Edward A. Freeman's *History of Sicily*.

Evans, De Scott: artist; b. in Boston, Ind., Mar. 28, 1847. He received education at Miami University 1863–65; studied art without instruction; opened a studio in Cleveland in 1874, giving special attention to portrait-painting; studied under Bouguereau in Paris in 1877–78; returned to Cleveland and became instructor and co-director in the Academy of Fine Arts there; was noted for skill in representing draperies. His pictures include *The First Snowfall*; *Grandma's Visitors*; *Day Before the Wedding*; *The Flirtation*; *Morning*; *Wading in the Brook*; *After the Pose*; and *Christmas Morning*. He painted *Winter Evening at Lawnfield*, a picture of the Garfield family, for the reception-room of the Garfield monument in Cleveland.

Evans, Sir John, D. C. L., LL. D.: scientist; b. in England in 1823; educated by his father, the Rev. A. B. Evans, D. D., head master of Market Bosworth Grammar School, Leicestershire. He has been prominent for many years in connection with archæological, geological, numismatic, and other scientific investigation. In 1864 he published *The Coins of the Ancient Britons*, for which he received a prize from the French Academy, and in 1872 *The Ancient Stone Implements, Weapons, and Ornaments of Great Britain and Ireland*. Among his other writings are *Flint Implements in the Drift*, published in the *Archæologia*, and many papers in the *Numismatic Chronicle*. He was president of the Geological Society 1875–76; of the Anthropological Institute 1878–79; and of the Society of Antiquaries 1885–91; has been president of the Numismatic Society since 1875, and was president of the British Association for the Advancement of Science in 1897. He is a trustee of the British Museum, correspondent of the Académie des Inscriptions, and honorary member of many foreign societies.

Evans, Robley Dunglison: naval officer; b. in Virginia, Aug. 18, 1846; educated at Gonzaga College, Washington, D. C., and the Naval Academy, Annapolis. In the civil war he took part in both attacks on Fort Fisher, and was so seriously wounded that he was retired from active service. After his recovery he was restored to the service at his own request. He was stationed at the Philadelphia navy-yard in 1866, receiving his commission of lieutenant July 25 of that year; was on ordnance duty at the Washington navy-yard the following year; and was assigned to the Piscataqua, flagship of the Asiatic squadron, in 1869, having been commissioned lieutenant-commander Mar. 12, 1868. He was stationed at the Washington navy-yard in 1870; at the Naval Academy in 1871; and was ordered to the Mediterranean as navigator of the Shenandoah in 1873. In the following year he became executive officer of the Congress and returned to the Mediterranean, remaining there till the Congress was ordered to Philadelphia for the Centennial in 1876. He was in command of the training-ship Saratoga 1877–80, being commissioned commander July 12, 1878. He was stationed at the Washington navy-yard in 1880; served as lighthouse inspector 1882–86, and as chief inspector of steel for new cruisers 1886–87. For the following two years he served as secretary of the lighthouse board, and was granted leave of absence from Oct., 1889, to July, 1891. During the Chilian imbroglio of 1891 he commanded the Yorktown; from 1892 to 1894 was secretary of the lighthouse board, receiving his commission of captain June 27, 1893, and in 1894 was ordered to the command of the New York. In 1896 he was put in command of the Indiana; in 1897 became a member of the lighthouse board; and in 1898 was put in command of the Iowa, which was assigned to blockade duty off the coast of Cuba during the war with Spain, and which took a prominent part in the battle of July 3 near Santiago. In Oct., 1898, he was appointed a member of the board of inspection and survey. He published *A Sailor's Log* in 1901.

Ewing, Thomas: lawyer and soldier; b. in Lancaster, O., Aug. 7, 1829; served at the age of nineteen as secretary of the commission to settle the question of the boundary between Virginia and Ohio, and later was one of the secretaries of President Taylor; graduated at Brown University in 1854; studied law at the Cincinnati Law School, and in 1856 began the practice of law in Leavenworth, Kan. He rose rapidly in his profession, represented Kansas in the peace conference assembled in Washington in 1860, and at the age of twenty-nine was elected first chief justice of the Supreme Court of Kansas; was active in the struggle to make Kansas a free State; was colonel of the Ninth Regiment of the Kansas Volunteer Infantry, recruited and organized by him in 1862; for gallant conduct was made brigadier-general Mar. 11, 1863. He was severely criticised for his order No. 11, issued while in command of the "District of the Border," from June, 1863, to Feb., 1864, in which he directed the inhabitants of a large portion of the three border counties of Southern Missouri to remove to the military posts or out of the border. After the war he was active in political affairs until 1880 in Ohio; was a member of the Ohio Constitutional Convention 1873–74; member of the 45th and 46th Congresses; in 1879 unsuccessful Democratic candidate for Governor of Ohio; from 1882 devoted himself to the practice of law in New York city, where he was one of the founders of the Ohio Society of that city, and for three years its president. D. Jan. 21, 1896.

Expert Testimony: in law, the testimony of expert witnesses, or, as they are commonly called, experts. The function of an expert witness is to examine a real or supposed case of facts and interpret them. They are called to give their testimony because, by reason of their special knowledge or skill in the matter in question, they are able to interpret or give accurate opinions concerning them where other men would not be qualified so to do. Their function is to give their opinions or judgments merely as witnesses of a matter of fact, actual or supposititious, presented to them, to aid the final judges of fact (the court or jury, as the case may be), but not to bind them. Notwithstanding the opinion either one way or the other of the expert witness employed to testify in any matter or proceeding at law, the final judgment as to the actual facts of the case, which shall be binding upon the parties to the litigation or proceeding, is for the jury, judge, or referee, as the case may be. The expert witness judges of the relation of the phenomena which he sees or perceives by his senses to the general rules of the science or art in which he is skilled or learned; but he has no part in the judgment as to the relation of the facts involved in the case to legal rules. He usually states what in his opinion would be a fact upon the supposition that certain other facts are true. It has been asserted frequently that on the Continent of Europe the opinion of the expert is binding on the court, but this is not properly so. Although the opinion of the expert has rather more weight and influence than in the American and English law, and his position is one of more responsibility and trustworthiness, still he does not exercise any control over the final decision of the case by the court or other final judge of the fact or law.

Expert witnesses are called in legal proceedings to give opinions for the assistance of the court or jury in determining the conclusions to be drawn in matters which require special skill or training to understand and properly interpret. The most important of such matters are: identification of handwritings; valuations of property, especially real property or works of art or *vertu*; matters involving chemical analysis or other questions of scientific knowledge or research, especially the science of medicine; matters involving special knowledge of some trade or art; and, in short, any matter of such a nature as to require an extended previous study or association or acquaintance in order to give an exact knowledge of it.

The History of the Introduction of Expert Testimony.—The practice of introducing experts as witnesses in the trial of actions or proceedings at law for the better determination of the matters involved by those having the decision of them dates back as far as the time of the Roman Empire, and to all intents and purposes is probably as ancient as the history of man. Thus among the ancient Jews, in a trial of any matter at issue between parties litigant, all the spectators present at the trial of a case or question were required to give their testimony as to the matters involved so far as they were known to them, and this undoubtedly involved the statement of opinions as to anything on which a person present might be specially qualified to testify. Under the Roman law, however, we find that the judge (*judex*) had the discretionary right to summon expert witnesses (*artis experti*) to give him information as to certain physical ailments and other matters. In England there is a decision as early as 1553 A. D., by Saunders, J., in which it is said: "If matters arise in our law which concern other sciences or faculties we commonly apply for the aid of that science or faculty which it concerns, which is an honorable and notable thing in our law, for thereby it appears that we do not despise all other sciences but our own, but we approve of them and encourage them as things worthy of commendation." The testimony of medical experts seems to have been first recognized in the German Empire in the reign of Charles V., and was incorporated in the "Caroline Diet" of 1532. It is now recognized under the writ *de lunatico inquirendo* (freely rendered, concerning the inquiry as to lunacy), and is considerably used both in civil and criminal cases in which are involved the cause or manner of injuries and death, the determination of the existence of sanity or insanity, the effects of given operations or substances on the health, and many other matters concerning which a knowledge of the laws and practice of medicine is necessary to an intelligent opinion.

The Province of the Expert Witness.—The province of the ordinary witness is to testify as to actual facts observed; in the case of the expert witness a state of facts is supposed to exist, and, assuming that state of facts actually to have existed, the expert witness is called upon to state his opinion of the result or proper interpretation of such a state of facts. Generally speaking, also, the expert witness must base his opinion on facts which he has heard proved during the trial of the question in issue.

No strict division or specialization can be made as to when any one person may testify as an expert witness. He is qualified to testify when it is proved that he has received such a practical education or experience in the matter involved as to enable him to render an intelligent and probably accurate opinion of it in accordance with the rules of the art, profession, or trade to which it pertains. The court passes on the fitness or unfitness of an expert, the decision being subject to the right of the parties to appeal.

The opinion of an expert witness is inadmissible when the subject of inquiry does not require any peculiar preparation or study to understand it, and where persons of ordinary intelligence and education may form a judgment as to the matter involved, or where the witness can not and does not know more about the subject-matter than the jury, and must make his inferences from facts already in the possession of the jury.

The two most important fields for expert testimony are the identification of handwriting and questions of medical fact.

Experts for the Identification of Handwriting.—The determination of the identity of handwritings is one of the most important subjects of expert testimony known in the modern law—not only because facilities for producing forgeries have increased with the growth of the arts and sciences, and especially the introduction of typewritten and printed documents, but also because of the enormous multiplication of the use of written documents. The forgery of wills and notes has greatly increased within recent years, and also the forgery of testimonials, stock certificates, and other evidences of debts or obligations. But with this increase of facility and frequency in the forgery of written documents there has been a corresponding increase in the facility and means of detecting forgeries, so that the expert witnesses as to identification of written documents, or of the times of the writing of different parts of written documents, all parts of which purport to have been written at the same time, have correspondingly increased in number.

It is well settled that each individual develops a certain characteristic habit of writing due to the complexity of his mental activities and capacities, with certain typical variations due to one cause or another—such as the practice of various systems of penmanship, etc. For the identification of handwritings no positive rule can be formulated, because no parallelisms are apparent in the writings of different persons, owing to the complexity of the causes which give to each person his individuality; but in determining peculiarities certain elements are usually considered—such as the dominating use of the hand or forearm in writing, the pen-pressure, the effect upon the lines of excitement, fatigue, disease, or old age; variance of signature from the ordinary handwriting; the effect of instruction, etc.

In the Roman law the comparison of handwritings and the making of comparisons was assigned to experts. Under the common law the general rule is to exclude any writing made especially for a comparison; and in the U. S. this rule substantially prevails in the New England States, in Mississippi, Ohio, Kansas, Iowa, Texas, New Jersey, and New York, the jury being the judge as to whether the writing used as a standard is genuine or not. In some States genuine writings which are already properly in evidence in the case may be used for comparison by the jury, and such comparisons in a number of States may be made by experts. The cases where handwritings made for the purpose of the comparison are admissible are technical and governed by special rules, legal decisions, or statutes. Photographic copies are generally admissible.

The determination of the contemporaneousness of the production of parts of the same document, or papers purporting to constitute one document, frequently involves the analysis of the ink employed in the writing, the appearance of freshness or antiquity of the writing, the identity in manufacture of the paper used, the shape of the letters if typewritten or printed, the character of the impression, the words and peculiar meaning of words and idiomatic expression involved, etc.

Medical Expert Testimony.—Medicine is the most frequent, as well as the most important, branch of science in which expert testimony is required in courts of law, and most frequently affects the physical and personal welfare of those who are suspected in the matters at issue, involving, as it does, the questions of poisoning and insanity. In order to qualify a physician or other person to be an expert witness in matters of medicine, it is not necessary that he should be a follower of any particular school of medicine, but merely that, as already stated, he should be possessed of such knowledge as will, in the judgment of the court, qualify him to give an intelligent opinion on a statement of facts, actual or assumed.

Where the medical expert testimony involves the physical sciences—such as analysis of the blood, measurement of the body, the analysis of the remains of the body for poisons, conclusions as to the form of death in certain cases (as, for instance, whether death was from strangling or from a sudden blow or contusion)—the opinions of expert witnesses are especially valuable. But in those cases involving theories of disease—theories as to the operation of certain substances upon the body where the conditions of administration, amounts administered, etc., can not be definitely fixed—the opinion of an expert witness is less valuable. This is especially true in cases involving the decision of the questions of insanity. Here the opinion of the witness is based upon the actions of the subject, as interpreted by him at a time when he is in personal contact with the subject. The question as to what constitutes insanity is still unsettled; the inclusiveness of the term is continually widening, and the theories of the various schools of medicine, medical experts, and experts in criminality are widely different. See INSANITY.

In testifying as to the insanity of a person, experts ordinarily give their opinions as to the cause of mental unsoundness and its general effects. It is usual to furnish the witness, as basis upon which to form an opinion as to the existence of sanity or insanity, with more or less actual personal contact with the subject, and also with facts relating to his past habits of life as stated by witnesses acquainted with him. Generally speaking, in a majority of the States laymen (not physicians) may state their opinions as to the sanity or insanity of a person as a result of their personal observation of the person in question, they first stating what facts they have observed. In the State of New York, however, a layman can not express such an opinion unless he be a subscribing witness, in which case he may state whether the acts to which he testifies were in his opinion rational or irrational. In Massachusetts the restrictions on the testimony of laymen as to sanity or insanity are still more strict.

Fees of Expert Witnesses.—The right of the expert witness to special fees is not yet well settled. In general, especially in the U. S., it may be said that where the case is one involving the public safety, and to that end requiring the testimony of an expert, he may be subpœnaed to testify in the same manner as any witness; but that otherwise he may demand such reward as he sees fit, as a condition of giving his testimony. But when an expert has testified as a witness in favor of one side or the other, he can not refuse to be cross-examined on the matters concerning which he has testified.

The Value of Expert Testimony.—Expert testimony is indispensable to the administration of justice in the courts. But the uncertainty of many of the rules governing such testimony, as in the identification of handwriting, and the uncertain state of knowledge as to many other matters of investigation, such as the question of insanity, coupled with the unlimited fees that may be demanded by and paid to expert witnesses, combine to throw great discredit upon expert testimony in many cases. In actual practice a case seldom occurs where expert witnesses of the highest character, both for learning and uprightness, can not be obtained to testify so as to support both sides of the question in issue. As a case in point on the question of identity of handwriting, reference need only be made to the Dreyfus case in France; and on the question of insanity, to the case of Guiteau in the U. S. See Greenleaf's *Treatise on the Law of Evidence*; Thayer's *Evidence at the Common Law* (1898); Lewis's *The Law of Expert Testimony* (1894); Clemens Herschel's *Experts in Judicial Inquiries* (1886); Head *v.* Hargrave, 105 U. S. 45; Bonnier, *Preuves*, s. 119 (5th ed.); *Value of Expert Testimony*, by Nathaniel C. Moak; vol. i. of Wharton's *Treatise on the Law of Evidence in Criminal Issues*; Hagan's *Disputed Handwriting* (1894); Stephens's *Digest of Law of Evidence*; Rogers's *The Law of Expert Testimony.* F. STURGES ALLEN.

Expert Witnesses: in law, persons who by reason of their knowledge or skill of some art or science are qualified and admitted to examine, estimate, and ascertain certain things or matters in question, and testify of their opinions respecting the same. They are sharply distinguished from ordinary witnesses, who can testify only as to actual facts personally known to them. See EXPERT TESTIMONY.

F. STURGES ALLEN.

Exposition, Cotton-States and International: an exposition held in Atlanta, Ga., Sept. 18 to Dec. 31, 1895.

Origin.—Owing to the fact that certain Southern Legislatures were prohibited by their State Constitutions from making full exhibits at the World's Fair held in Chicago in 1893, a feeling arose in the South, after the close of the Columbian Exposition, that its great agricultural, mineral, and manufacturing resources had not been adequately presented to the world. The agitation of this fact, together with the desire to foster the trade relations already existing between the Southern States and the republics of Mexico and Central and South America, led Col. W. A. Hemphill, the business manager of the *Atlanta Constitution*, to decide that Atlanta, Ga., was the proper place to hold an exposition that should have for its chief purpose the exhibition of the products of the Southern States. The manager of the *Atlanta Evening Journal* was taken into consultation, and promptly through the medium of these journals the idea was presented to the public. The proposition was favorably received by the citizens of Atlanta. An exposition company was organized, and a directory consisting of fifty of the most enterprising and influential business men was formed. A popular subscription of $225,000 was raised among the citizens of Atlanta; the City Council of Atlanta appropriated $75,000; and Fulton County promised convict labor to the amount of $50,000. The U. S. Government appropriated $200,000 for a Government building and authorized an exhibit.

Officers of the Fair.—President and director-general, Charles A. Collier; first vice-president, W. A. Hemphill; second vice-president, H. H. Cabiniss; third vice-president, W. D. Grant; assistant to the president, Edmund A. Felder; treasurer, A. L. Kontz; secretary, J. R. Lewis; chief of publicity and promotion, W. G. Cooper; chief of construction, Grant Wilkins; chief of admissions and concessions, Edmund A. Felder; chief of art department, Horace Bradley; chief of educational department, W. J. Northen; chief of machinery department, J. H. Allen; chief of electricity department, H. M. Atkinson; chief of jury of rewards, Daniel C. Gilman; chief of public comfort, Alexander W. Smith; chief of transportation, E. L. Tyler; auditor, E. McCandless; general counsel, J. J. Spalding.

Location.—The site chosen for the exposition was Piedmont Park, which is about two miles from the center of the city. The natural picturesque features of the landscape were developed, and more than $300,000 was expended on that work. Large inland lakes were constructed, thus affording a water-frontage to many of the buildings.

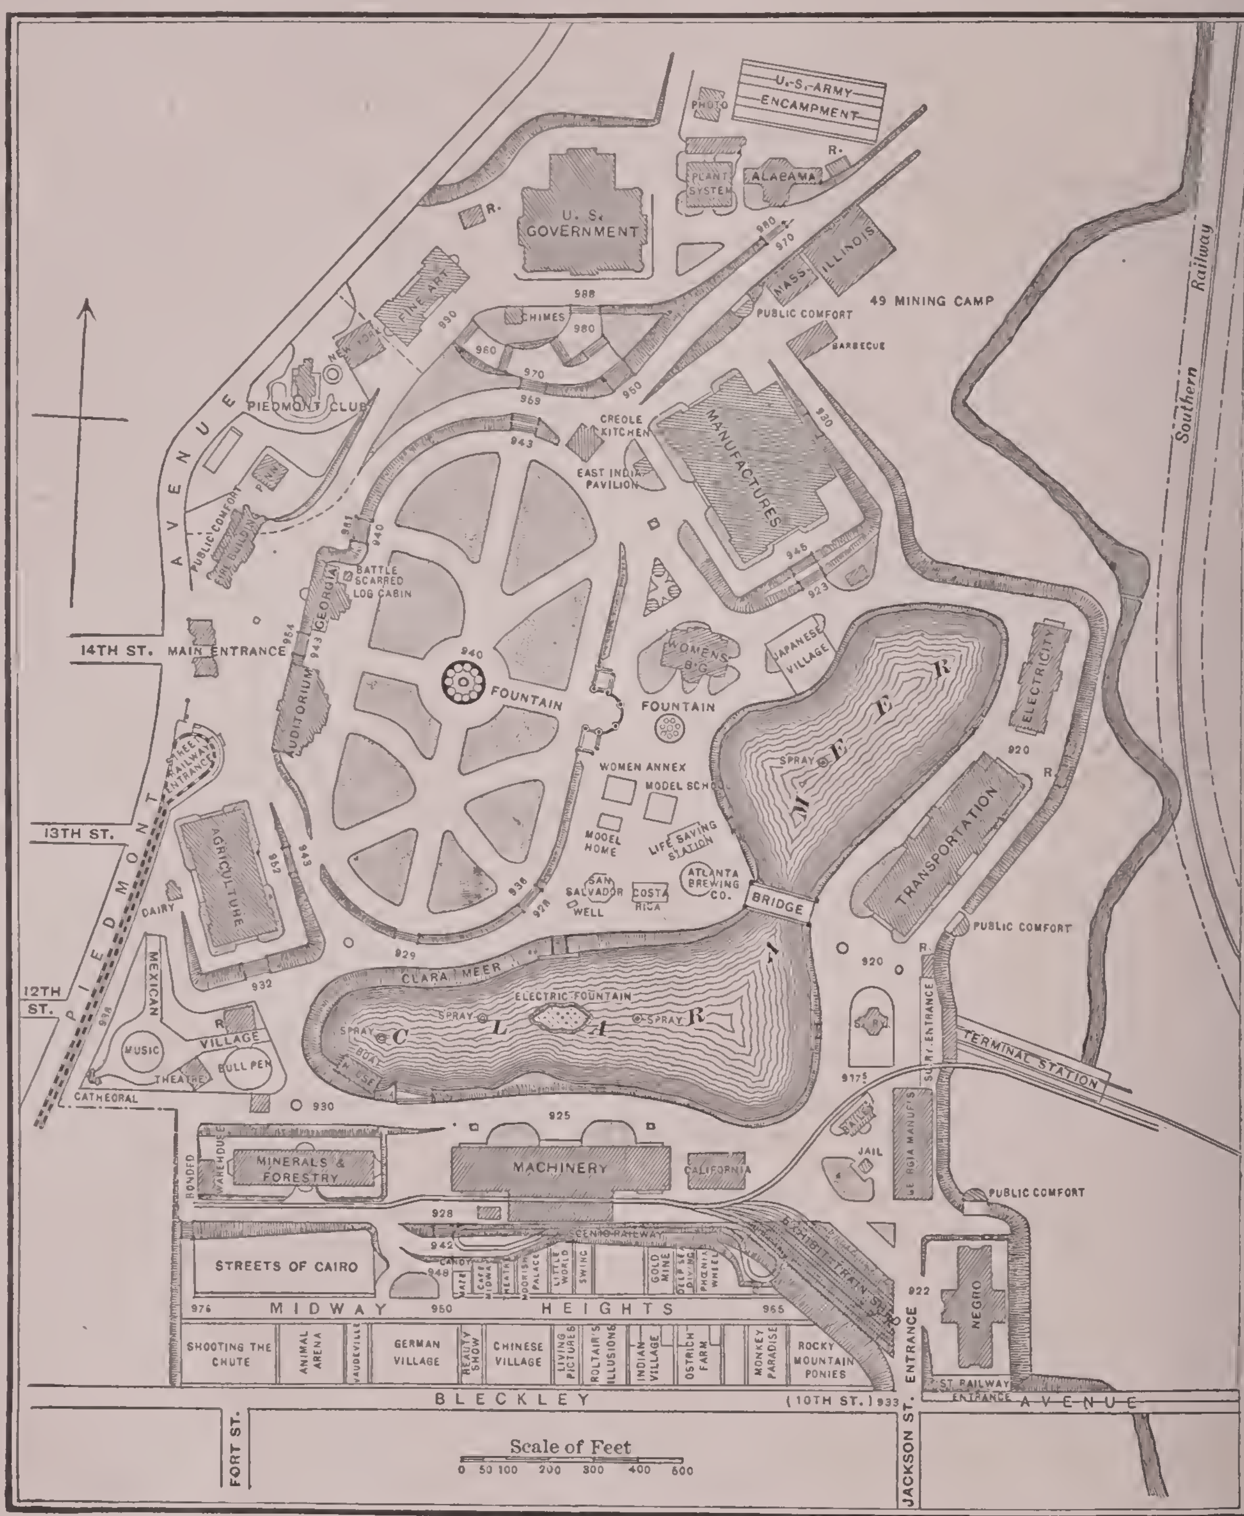
Buildings.—Thirty structures were erected on the grounds, most of them under the direction of Bradford L. Gilbert, of New York, and the prevalent type of architecture was the Romanesque. Among the most important were the following:

Administration Building.—The design for this building was a composite of the old baronial castles. The principal entrance was reached under a portcullis, and guarded, as in the days of the warlike barons, by the teeth of a huge iron-spiked gateway. The main tower suggested Rheinstein, an old Prussian stronghold on the Rhine. The entrance archway, frowning down with its deeply imbedded windows and loopholes, was entered by a circular doorway hewn from rough stones, and was a model of the old door of the Bloody Tower, part of the famous Tower of London.

Agricultural Building.—This structure was 300 feet long and 150 feet wide, and was one of the largest on the grounds. It covered an area of 44,000 feet, and the height of the central dome was more than 100 feet. The fullest possible display of the products of the Southern fields was shown within its walls.

Auditorium Building.—This occupied a lofty point on the grounds, and had a seating capacity of more than 3,000. Its acoustic properties were scientifically accurate, and the building was large, commodious, and airy. The music platform stood at the east end of the building, and along the sides cafés opened into the main hall so arranged that persons at the tables had a full view of the musicians.

Electricity Building.—Covering an area of 19,500 sq. feet, and 250 feet long by 91 feet broad, this building was on a commanding site. Its exterior was designed with particular reference to the effects to be gained by the use of numerous electric lights. The general outlines of all the buildings on festival nights were illuminated with incandescent lights of various colors.



Plan of the Exposition grounds.

MANUFACTURES BUILDING.

ADMINISTRATION BUILDING.

GENERAL VIEW OF THE EXPOSITION.

Fine Arts Building.—This structure was designed by Walter T. Downing, of Atlanta, and was 245 feet long by 100 feet wide. The central part of the front façade was 50 feet high, and the two side wings 26 feet high. Ample wall-space was given to the handsome collection of paintings, and many of the historic mansions and public buildings of the South loaned their treasures.

Manufacturers and Liberal Arts Building.—This was the largest and most important of all the buildings. It covered 103,000 sq. feet, and was 370 feet long and 216 feet wide. The main building was carried to a height of 90 feet, and was flanked on each corner by a tower nearly 60 feet square. One of the towers was carried higher than the rest and contained a magnificent chime of bells. Operating plants of every industry even remotely affecting the development of the South and its commerce were displayed within its walls.

Machinery Building.—This structure was 500 feet long and 100 feet wide, and covered an area of 96,500 sq. feet. Its entire basement was devoted to the placing of shafts and undershafts. It contained the latest and best inventions pertaining to the entire industrial field, including foreign as well as American products.

Minerals and Forestry Building.—This building was 220 feet long and 80 feet wide, was of natural woods, and included all varieties of foliage found in the South. The interior was festooned at the ceiling-line with Southern moss and evergreens. The spaces between the principal posts and braces covered an area of 26,000 sq. feet. A roof garden of the same area was provided, the sides of which were of palms and palmettos.

Negro Building.—The length of this building was 300 feet and it was 100 feet wide. For the first time in the history of the African race in the U. S. an opportunity was afforded it of exhibiting its progress under circumstances of enlightenment and freedom. The exhibit contrasted the condition of the race in Africa and the advancement of the Southern Negro.

Transportation Building.—An area of 55,000 sq. feet, included within the dimensions of a structure 413 feet long by 126 feet wide, constituted the space devoted to transportation. The war engines of the Western and Atlanta Railroad, every one of which had a history, formed a unique part of the exhibit. The progress within the last twenty-five years in the South was clearly shown.

U. S. Government Building.—An appropriation of $200,000 made by the general Government resulted in a structure covering 14,000 sq. feet, in which the Government exhibits were finely displayed. Exhibits from the Agricultural Department, the Interior Department, the Navy Department, the Smithsonian Institution, the War Department, and the State Department were shown.

Woman's Building.—This beautiful building, designed by Miss Elise Mercur, housed the exhibits that were peculiarly feminine, women being allowed to compete with men in all the general departments. It contained a nursery, cooking-school, resting-rooms, art-rooms, needlework-rooms, etc., and the offices of the Women's Board. An interesting exhibit was made by the women's patriotic societies.

Amusement Features.—The terraces between Piedmont Avenue and Jackson Street were devoted to amusement features. A street curved along the slope with a continuous succession of picturesque structures, the adobe houses and bamboo huts of the Mexican and Guatemalan villages and the wigwams of the Indians being in striking contrast with the antique designs of the Oriental village and the quaint or curious architecture of the Japanese, the Eskimo, the German, and Chinese villages. Other structures included Hagenbeck's arena of trained wild animals and his monkey-house. The Vaudeville theater, the Palace of Illusion, the Mystic Maze, and the Scenic Railway afforded much amusement, as did also Buffalo Bill's Wild West show. The villages were among the best features, and were occupied by real people of the countries typified. In the Mexican village some interesting archæological remains from the ruins of Palenque were exhibited.

Opening Exercises.—The formal opening of the exposition occurred on Sept. 18. A procession consisting of twenty-five military companies with five bands entered the grounds and marched to the Auditorium, where a programme was given that included a "Salute to Atlanta," composed for the occasion by Victor Herbert and rendered by his band; a prayer by Bishop Cleveland K. Nelson; an ode written by Frank L. Stanton and read by Col. Albert Howell; an opening address by Charles A. Collier, the president of the exposition; an address by Mrs. John Thompson, representing the Woman's Department; an address by Booker T. Washington, representing the Negro Department; and an address by Mayor Porter King, representing the city of Atlanta. On the conclusion of these exercises the engine in Machinery Hall was set in motion by an electric button that was pressed by President Cleveland in his cottage in Gray Gables, Mass.

Exhibits.—Special State exhibits were made by Alabama, Arkansas, California, Connecticut, Florida, Georgia, Illinois, Louisiana, Massachusetts, Mississippi, New York, North Carolina, Pennsylvania, South Carolina, Tennessee, and the District of Columbia, and special buildings were erected by Alabama, California, Georgia, Illinois, Massachusetts, New York, and Pennsylvania. Exhibits were sent also by the Governments of Austria, Belgium, Germany, Great Britain, Italy, Mexico, and Russia, and by several of the South American and Central American republics.

Expenses and Results.—According to the report of the auditor the total cost of the exposition was $960,930.20, distributed as follows: Administration, $63,562.64; grounds and buildings, $442,789.11; publicity and promotion, $41,004.20; woman, $3,280.77; privileges and concessions, $25,827.60; foreign, $5,696.81; machinery and electricity, $215,334.38; mines, $4,670.67; forestry, $3,078.87; fine arts, $13,814.80; Negro, $6,130.82; public comfort, $5,908.15; public comfort bonus, $20,090; exhibit, $18,244.48; admission, $27,259.58; and amusements, $64,236.69. Of these amounts it is estimated that 10 per cent. was expended for promotion, 60 per cent. for construction, and 30 per cent. for operation. The total number of exhibits was 3,619, which came from 37 States and 14 foreign countries. The receipts from the floor-space amounted to $79,000; from concessions, $125,230.58; from admissions, nearly $500,000. The total attendance was 1,179,889. MARCUS BENJAMIN.

Exposition, Pan-American: From May 1 to Nov. 1, 1901, an exposition was held at Buffalo, N. Y., to celebrate the achievements of the western hemisphere during one hundred years, and to promote trade between American countries. The site occupied 350 acres, there were twenty large buildings, and the cost of preparation was about $10,000,000, of which $500,000 was appropriated by the U. S. Government.

Expositions, Permanent: Within the last decade a number of museums have been opened in various countries whose special purpose is to promote commercial interests. The Philadelphia commercial museum, supported by the city and by fees from subscribers, who receive its regular or special reports, is perhaps the best developed of this class of permanent exhibitions, and a brief description of it will show the means they employ to further commercial education. Its spacious quarters are filled with exhibits arranged by countries showing the foreign goods exported to lands where U. S. goods meet them in competition. For instance, the products of Mexico are shown, and also the goods that are made in Europe and sold in Mexico. If a Connecticut cutlery-maker wishes to extend his trade to Australia, he may learn at the museum the quality, shape, and prices of the sheep-shears and all other varieties of cutlery that are sold in the Australian markets. It is also a function of the museum to supply the latest information as to the nature of commodities, tariffs, and local demands and conditions in all countries. This museum is in correspondence with more than 30,000 business houses in the U. S., and with about 20,000 in foreign countries. The commercial museum at Brussels contains only manufactured articles made in other lands, and brought together so that home manufacturers, by studying them, may compete more intelligently in foreign markets. The museum was so successful that others were started in other cities of Belgium. It is a part of the duty of Belgian consular agents throughout the world to send for distribution among these museums specimens of every article imported or manufactured and on successful sale in the countries where they are serving. Stimulated by the success of the Belgian museums, France has established fifteen of these institutions in her principal manufacturing and commercial centers, and they are regarded as most successful. Other commercial museums, some of them supported by private enterprise, and others, to a greater or less extent, by governments, have been established in Vienna, Berlin, Stuttgart, Berne, Milan, and Rome. The Japanese Government, also, has opened a commercial museum at Osaka to afford a central place for the exhibition of native and foreign products. In order to familiarize other countries with U. S. products, the National Association of Manufacturers has undertaken to establish what it calls American sample warehouses at various foreign centers. The first sample warehouse was opened at Caracas, Venezuela, on Apr. 18, 1898, with a great variety of exhibits representing sixty-one U. S. manufacturing industries. and the association has been investigating the conditions at Buenos Ayres, Hamburg, and Kobe, Japan, with a view to establishing sample warehouses at those places. C. C. ADAMS.

Ezekiel, MOSES JACOB: sculptor; b. in Richmond, Va., Oct. 28, 1844. After service in the Confederate army, he graduated at the Virginia Military Institute in 1866; studied anatomy in the Medical College of Virginia; removed to Cincinnati in 1868; visited Berlin, Germany, in 1869, where he was admitted into the Society of Artists on the merits of his colossal bust of Washington, and where he was the first foreigner to win the Michael Beer prize. The Jewish order of the Sons of the Covenant commissioned him, in 1874, to execute a group representing *Religious Liberty*, for the Centennial exhibition; the work was unveiled in Fairmount Park, where it remains. He made statues for the outside niches of the Corcoran Art Gallery in Washington. After 1886 his work became chiefly ideal. Among his productions are busts of Liszt and Cardinal Hohenlohe; *Industry*, a statuette; reliefs of Schiller and Goethe; bas-relief portraits of Farragut and Robert E. Lee; *Pan and Amor*; *The Fountain of Neptune*; and *Art and Nature*. He also made a bronze medallion of W. W. Corcoran for the gallery in Washington.

Fairlamb, JAMES REMINGTON: musician; b. in Philadelphia, Jan. 23, 1837; studied at home, and was organist of several churches before he was twenty years old. In 1858 he went to Europe for study, returning in 1860, but in 1861 was appointed U. S. consul at Zurich. He returned again in 1865, and was successively organist of several churches in Washington, Philadelphia, and New York. His compositions include much church music, many songs, and two operas, *Valerie* and *Leonello*. D. E. HERVEY.

Fajardo, fāā-chaar'dō: a port on the E. coast of Puerto Rico, about a mile from the fine bay which gives it importance. Founded in 1774. Muscovado-sugar making is the chief industry of the district, and sugar, molasses, and tortoise-shell are the chief exports. Imports from the U. S. are mostly lumber, provisions, and hickory barrel-hoops. The town is connected with the interior by excellent roads. Pop. (1887) 8,779. C. C. A.

Falconer, JOHN M.: artist; b. in Edinburgh, Scotland, May 22, 1820. He removed to the U. S. at the age of sixteen; studied art in the National Academy of Design, with the Society of Painters in Water-colors in New York city, in the Graham Art School and with the Art Association of Brooklyn, and in the Louvre in Paris. The first exhibition of engravings in the U. S., held in Brooklyn in 1864, was proposed by him; he organized the first chronological exhibition of American art, held in Brooklyn in 1872, and the first exhibition of water-colors by the Artists' Fund Society of New York, the parent of the existing American Water-color Society. He painted in oil *Kenilworth Castle*, *The House where the Declaration of Independence was Written*, and numerous other subjects; in water-colors he produced many historic houses. He wrote a *Sketch of the History of Water-color Painting*, and compiled the *Catalogue Raisonnée of the Chronological Exhibition of American Art*.

Fanciulli, FRANCESCO: bandmaster; b. in Port St. Stephen, Tuscany, in 1853, and educated in Florence, where he afterward conducted grand opera. Settling in the U. S. in 1876, he occupied himself as teacher and organist, composing much all the time. He succeeded Sousa as conductor of the Marine Band at Washington, D. C., but left that position to take charge, on Jan. 1, 1898, of the band of the Seventy-first Regiment, New York State Militia, succeeding Felix Erben. D. E. HERVEY.

Fanning Islands: In the Pacific Ocean, on both sides of the equator, a considerable number of small islands are strewn between 150° and 180° W. lon., and from 11° N. to 5° S. lat. A number of them have been guano-producing islands, and as the trade was carried on chiefly by Americans they were for some time known as the America islands, but have since been better known as the eastern part of the Central Polynesian group, or the Fanning islands, from the name of one of the largest among them. They are mostly coral reefs, with or without lagoons, flat and low, and the existence of some of them is still in doubt, as is shown by the mark (?) placed after their names on many maps. The two most important of the Fanning islands are Christmas and Fanning islands. Christmas island is far the larger of the two, and the reef incloses a lagoon of unusual size in that part of the Pacific. The island has been the occasion of a number of shipwrecks, vessels running unawares upon the low-lying reef. No fresh water is obtainable, and Fanning island, with its fruitful soil, rich vegetation, many palms, and potable water, is far more attractive. The two islands, together with Malden and Starbuck islands, have been British possessions since 1888, and the area of all the Fanning islands, including their lagoons, is estimated at 260 sq. miles. For a long time the output of guano from the Fanning and other islands of the Central Polynesian group was about $250,000 a year, but the supply is now practically exhausted. C. C. ADAMS.

Farm Laws, or **Agricultural Laws**: a general term used in law to include agricultural customs and all those laws affecting landlords and tenants of farms, many of the homestead laws, and laws affecting the interests of those engaged in the cultivation of the soil. When spoken of in general, a *farm* is understood to mean any considerable tract of land set apart for cultivation by a single occupant or under single control, whether by the owner or by the tenant; and the term is also frequently used to include several separate tracts cultivated together by one person or under one control. The laws of chief interest as relating to farms and farming are those affecting the rights of tenant and landlord, or those affecting the owners of interests for life or for a term of years in farms. The most important of these are the rights as to agricultural erections or buildings, fences, crops or emblements, manure, fruits, irrigation, mines and minerals, game, overhanging trees, repairs, stock or domestic animals.

In England it has been held that the existence of the mere relation of landlord and tenant is a sufficient consideration for an implied or an express promise on the tenant's part to manage the farm in a good and husbandlike manner, and not to carry away any straw, dung, etc.; but in the absence of custom or special agreement a tenant may carry away straw or hay from the premises. A change in the course of husbandry, or the pulling down of houses, or the opening of new mines or pits, would constitute waste.

Agricultural Erections.—The tenant of a farm has a right to take wood from the land for agricultural erections, including fences and necessary improvements; but in so doing he may not destroy ornamental trees or fruit-trees belonging to an orchard or a garden. He may also cut firewood, but not to sell, provided there is not sufficient dead wood on the premises for his consumption. These rights as to the cutting of wood are broadly governed—not only by the local custom, but by general rules varying in application with the circumstances of each case.

Crops.—The tenant's right to crops at the time of his incoming or outgoing is governed by the law of emblements, he not being entitled to the crops left by the tenant preceding him, and being entitled to those which he leaves at his outgoing. See EMBLEMENTS.

Manure.—The ownership of the manure made upon a farm in the ordinary manner from the consumption of the products of the farm is, in the U. S., generally held to belong to the owner of the farm, and passes with the farm if the latter be sold, upon the general theory that it is for the interest of good husbandry and of agriculture that the manure produced on a farm should be consumed on it. In Great Britain manure made on a farm is assignable by the tenant, but by assigning it the tenant becomes subject to an action for bad husbandry. In England there is also a usage for a landlord to pay a certain sum in compensation to the outgoing tenant, as well for the labor and expense bestowed by him for tilling the fallow land as for manuring the meadow-land, according to the course of good husbandry, the advantage of which manuring the tenant could not otherwise reap. Such a custom is a mere usage of the neighborhood, and is not a custom strictly speaking, and need not be immemorial. The owner of the farm may treat the manure so as to make it personalty, so that it will not pass with the farm if sold, as by heaping it up, or in some other distinct manner showing its separation from the farm.

Fruit.—The fruit growing on a farm belongs to the realty until it has been actually gathered, thus being distinguished from the emblements or crops raised only by cultivation—such as corn, wheat, potatoes, etc. The picking by an outgoing tenant of fruit which shall not have become sufficiently ripe to be suitable for gathering before the expiration of his occupancy constitutes waste. See WASTE.

Irrigation.—The right of an owner of a farm to the irrigation of his land so as to draw water from streams running through the land of others besides his own, or so as to discharge water over the land of another, is regulated by the rights of riparian owners and the right of drainage. In general, the tenant or owner of a farm the land of which borders on a natural stream of water has the right to use the water for any reasonable purpose not inconsistent with the similar rights of owners of the land above or below or opposite to his land; but where the use of the water of such a stream for the purpose of irrigation would so diminish the supply of water as to deprive the different proprietors living along the stream of their proper use of the water none of the owners adjoining on the stream may use it for irrigation. For domestic purposes, however, and for watering stock, any one of them would be justified in consuming all the water flowing through his premises. Where the irrigation of the premises involves the discharge of waters on the surface of another's land the tenant has the right to irrigate, provided the discharge does not create a new channel or watercourse over the land of the owners above or below him, and does not overflow the land of the adjacent owners beyond the natural limit of the water flowing over the land. Where two fields or farms are adjacent, and one is lower than the other, the owner of them has the general right to have the water that falls or flows upon his land flow off from the same upon the land below by the natural system of drainage. For such purposes the water is roughly distinguished into surface water and that which is not surface water, surface water being that which falls upon the surface of the land, but is not gathered into streams or ponds or lakes. The owner of a farm has no right to alter the natural flow of the water upon another's land; nor may he make any excavations or trenches by which the water is diverted from its natural channel, or direct it in a new channel made over his neighbor's land. He may not unite waters flowing in several channels so as to discharge them in an unnatural amount in a single channel upon the lower lands of his adjacent owners. The owner of a farm may make such excavations for wells on his own land as he sees fit, provided he does not encroach upon the territory of his neighbors, even though the result of the use of his wells should be to draw the subterranean water from his neighbors' wells and dry them up.

The right of irrigation by the tenant or owner of a farm is subject to similar rights of other riparian proprietors; and a non-user of similar rights by others, whether above or below, will not raise the presumption of a grant, or divest such owner of his right to the use of the stream for similar purposes. In irrigation the entire body of water may be diverted from its channel, provided it be again restored before leaving the premises of the tenant or owner. Where, however, there is an undue detention of water, it is not necessary to show actual damage, but the law will infer damage and remedy the wrong.

Mines and Minerals.—The tenant may continue the working of pits or mines which are open before the tenant enters into possession, in the absence of an express agreement, and dig or use them for his own benefit without incurring waste. The opening of new mines or pits, in the absence of an agreement permitting it, would constitute waste. See WASTE.

Game.—The matter of the killing and taking of game is generally regulated by the game laws. The ownership of game, however, vests absolutely in the owner of the premises on whose land they are found, being thus distinguished from domestic animals. See FERÆ NATURÆ.

Overhanging Trees.—Trees growing near a boundary line so that the roots extend and grow into the land of the adjacent owner and derive nourishment from it remain the sole property of the owner of the land on whose premises the trunk remains, even though some of its branches overhang the land of his neighbor, and the owner of the tree is entitled to all of its fruits. For the purpose of gathering the fruits he may reach over and pick them, and he has an action for assault if he is prevented from so doing by others. If, however, the fruit falls upon the neighbor's land, the question of the ownership is not settled. The owner of the adjacent premises over whose land the branches of the tree hang may, however, cut off the overhanging branches or the roots growing into his premises, but may not keep them or use them for his own purposes without being liable for their value.

Where a tree stands on the boundary line so that the trunk of the tree extends into the land of the owners of each of two adjacent fields, the tree and the fruit are owned in common, and neither may cut away the tree or any part of it so as to injure the common property. If the overhanging tree be poisonous, however, and poison or injure the cattle of the owner of the premises overhung by its branches, the owner of the tree is responsible for damages; but he is not responsible if the cattle break through to the poisonous tree which is reasonably removed from the boundary line. The having of poisonous trees on the premises, or allowing them to grow there, is regulated by the same general law of negligence which governs the placing of dangerous traps or pitfalls where they are likely to injure another.

Repairs.—In the absence of an express agreement between the landlord and tenant, the tenant is under obligation to make tenantable repairs—such as keeping the house tight against wind and water, repairing doors and windows broken by him, etc.; but he is not under obligation to make lasting or substantial repairs. That is, he is not obliged to repair the buildings damaged or injured by the natural wear and tear arising from reasonable use and the action of the elements.

The occupant of the premises is also bound to keep the fences in repair, and is entitled to such use and occupation of the premises of adjoining owners as is necessary to carry out his duty. The tenant is not under obligation, however, to repair the outbuildings and other erections on the farm, except when bound so to do by special agreement. The liability of the tenant for his rent is not affected by the property becoming untenantable for want of repairs, or by its destruction from any cause in the absence of an express provision, excepting damage from fire, storm, or unavoidable contingency; and the tenant can not compel the landlord to expend insurance money in rebuilding burned or destroyed buildings.

If the fences are allowed by the tenant to become out of repair to the damage or injury of another, in general, at the common law, the tenant or occupier is responsible alone in an action for damages. The tenant of a farm is not obliged, at the common law, to erect fences between the land occupied by him and that of an adjoining owner to prevent trespass upon his own land of cattle or domestic animals of any kind from the land of the adjoining owners, but must erect and keep fences to prevent trespass by his own cattle and domestic animals. See FENCES and TRESPASS.

Domestic Animals.—Domestic animals, as distinguished from wild animals, or *feræ naturæ*, constitute property, and are the subject of ownership. The owner of them is bound to use reasonable diligence in the care and guarding of them, and is liable for such trespass or damage done by them when not rightfully in the place where they may be. In general, the owner of ordinary domestic animals which are not likely to do mischief—such as sheep, oxen, horses, etc.—is not liable for injuries done by them to a person or property of another if they are lawfully in the place where the injury is done, unless it is shown that the particular animal was accustomed or inclined to do mischief, to the knowledge of the owner. But when the owner keeps an animal which is accustomed to bite mankind, or is accustomed to do other injury to the person or property of others, with knowledge that it is so accustomed, he is *prima facie* liable for damages to the person injured by the animal for negligence in the care of the animal. See DOMESTIC ANIMALS, FERÆ NATURÆ, and NEGLIGENCE.

F. STURGES ALLEN.

Fâsher, El: the capital of Darfur, a province of the Egyptian Sudan, lying near the foot of the Djebel Wanda at a height of 2,400 feet. It is the meeting-place of caravan routes from all points, and before the Mahdist revolt was the center of the considerable trade in gums, ivory, hides, ostrich-feathers, coffee, glassware, cotton cloth, guns, etc., passing between the states of the Central Sudan, Khartum, and Egypt. A wady descending from the hills to the northwest supplies the water required, and this and the consequent verdure of the surroundings and the little lake on which the town fronts are the chief advantages of the site. The town

is poorly built of clay and thatched straw huts, and is supposed to have a population of about 3,000. Kobeh, about 30 miles to the N. W., is a larger place, contains some stone buildings owned by traders, and is the starting-point of the desert caravan route N. E. to Assiut, forty days' journey.
C. C. ADAMS.

Fashoda: a town on the White Nile, in the country of the large Shilluk tribe, about 400 miles S. of Omdurman. It was founded by the Egyptian Government in 1867 and for a number of years was the southern limit of its territories in the Sudan, and was the base from which the Shilluk country was subjected to Egyptian rule. A fort was built at this strategic point, and Fashoda was long a place of imprisonment for Egyptian prisoners condemned to perpetual exile. It occupies a low-lying, unhealthful site, and is the southern limit of wheat cultivation in the Egyptian Sudan. When Omdurman fell into the hands of the Anglo-Egyptian forces, in Sept., 1898, Fashoda was held by a French force under command of Capt. Marchand, who had descended the Nile, and claimed Fashoda and the country S. of it as a French possession. After some months of negotiations, France consented to evacuate Fashoda and to relinquish all claims to territory on the Upper Nile. An arrangement was reached in Mar., 1899, by which Great Britain, on her part, agreed to concede to France ample commercial facilities on the Upper Nile, and the extension of the French sphere of influence in the Central Sudan several hundred miles farther N., so as to include the whole of Wadai and its vassal states, Baghirmi and Kanem, and the populated and mountainous districts of Tibesti, Borku, and contiguous oases in the desert of Sahara. This act practically completed the partition of the continent, excepting the independent African states and the Libyan Desert, among the European powers. The railroad up the Nile to Omdurman, which was completed in 1899, is to be extended to Fashoda.
C. C. ADAMS.

Fassett, CORNELIA ADÈLE (*Strong*): artist; b. in Owasco, N. Y., Nov. 9, 1831. She studied in New York city, in Paris, and in Rome; painted portraits in Chicago, and in 1875 removed to Washington city, where, besides executing portraits of many noted statesmen, including Chief Justice Waite, Justices Miller and Field, President Garfield, and John A. Logan, she painted *The Electoral Commission in Open Session*, containing portraits of about 200 persons. D. in Washington, D. C., Jan. 4, 1898.

Fastnet Rock Light: a light at the entrance to Long Island Bay, on the southwest coast of Ireland; the first light sighted on the Irish coast by vessels crossing the Atlantic from New York to Liverpool. The light is 148 feet above sea-level and is visible for 18 miles. The arrival of many east-bound steamships across the Atlantic is first reported from Fastnet.

Fauque de Jonquières, fōk'de-zhōn'kĕe-ār', JEAN PHILIPPE ERNEST, de: admiral and mathematician; b. at Carpentras, in the department of Vaucluse, France, July 3, 1820; entered the navy in 1835, and became a captain in 1858, and an admiral in 1874; grand officer of the Legion of Honor 1881. He was elected member of the Academy of Sciences Mar. 24, 1884. He held important commands in Cochin China (1864) and as maritime prefect of Rochefort, and published several valuable mathematical treatises, including *Mélanges de géométrie pure* (1856); *Théorèmes fondamentaux* (1865); *Système de courbes et surfaces algébriques d'ordre quelconque* (1866).

Faure, JEAN BAPTISTE: singer and composer; b. in Moulins, France, Jan. 15, 1830, and studied at the conservatory in Paris; won first prize for singing in 1852, and also for opera comique. He made his début at the Opera Comique, Oct. 20, 1852, and subsequently sang in London and Berlin, taking the leading barytone rôles in many operas. He was also, for a time, in 1857, Professor of Singing in the Paris Conservatory, and in 1874 in Brussels. He has composed much for the voice, and also for the piano. His most famous songs are *Les Rameaux* (The Palms) and *Crucifix*.
D. E. HERVEY.

Fausset, ANDREW ROBERT, D. D.: clergyman; b. in Silverhill, County Fermanagh, Ireland, Oct. 13, 1821; graduated B. A. at Trinity College, Dublin, 1843; has been since 1859 rector of St. Cuthbert's, York, England. He is a prolific author of scholarly religious literature, and among his works may be mentioned his part in the well-known Jamieson, Fausset, and Brown's *Critical, Experimental, and Practical Commentary* (Glasgow, 1868), and independently *Horæ Psalmicæ* (London, 1877, 3d ed. 1885); *The Englishman's Bible Cyclopædia* (1879, 4th ed. 1893).
S. M. J.

Fay, AMY: pianist and teacher; b. in Bayou Goula, La., May 21, 1844. Showing decided musical talent in early years, she was sent to Europe for further study. She remained there several years, studying under well-known teachers. She has written a book entitled *Music Study in Germany*, giving her experiences while studying. She has devoted her life to playing the piano and teaching, giving musical lectures and *conversaziones*, and is much identified with women's musical clubs and the advancement of women in music generally. Her brother, Norman Fay, is an officer of a bank in Chicago, and her younger sister, Rose, is the wife of Theodore Thomas. Their father was the Rev. Dr. Charles Fay, an Episcopal clergyman, who died Nov. 6, 1888, and her mother was the daughter of Bishop John Henry Hopkins, of Vermont.
D. E. HERVEY.

Fay, THEODORE SEDGWICK: author; b. in New York city, Feb. 10, 1807. After studying law, he became associate editor of the New York *Mirror*, with George P. Morris and Nathaniel P. Willis, for which paper he wrote a series of letters of European travel; was secretary of the American legation in Berlin 1837–53; was minister resident in Berne, Switzerland, 1853–61, after which he lived in retirement in Berlin. His published works comprise *Dreams and Reveries of a Quiet Man* (1832); *The Minute-book* (1833); *Norman Leslie* (1835); *Sydney Clifton* (1839); *Countess Ida* (1840); *Hoboken, a Romance* (1843); *Robert Rueful* (1844); *Ulric, or the Voices*, poems (1851); *Views of Christianity* (1856); *History of Switzerland* (1860); *Great Outlines of Geography* (1867); *History of Germany* (1888); *and Forty Dollars and the Boots, or Shall we not Abolish our Apostles' Creed?* (1897). D. Nov. 17, 1898.

Febiger, JOHN CARSON: naval officer; b. in Pittsburg, Pa., Feb. 14, 1821; entered the navy as a midshipman Sept. 14, 1838; became a passed midshipman in 1844, lieutenant in 1853, commander in 1862, and captain in 1868. From 1861 to 1863 he commanded various vessels of the Western Gulf and Mississippi squadrons, and in 1864–65 commanded the Mattabeset (North Atlantic blockading squadron), in which vessel he participated in the desperate fight between the little squadron of wooden vessels under the command of Capt. Melanchthon Smith and the ram Albemarle, which took place in Albemarle Sound, N. C., on May 5, 1864, and resulted in the defeat of the ram and the capture of her tender, the Bombshell. For his gallantry and skill on this occasion Febiger was warmly commended by Capt. Smith and Rear-Admiral Samuel Phillips Lee. He was inspector of naval reserve lands 1869–72, was made commodore Aug. 9, 1874, was a member of the board of examiners 1874–76, and commandant of the Washington navy-yard 1876–80. He was made rear-admiral Feb. 4, 1882, and retired July 1, 1882. D. in Londonderry, Md., Oct. 10, 1898.

Fee: in general, any reward or compensation for services; but mainly used in law for (*a*) the remuneration fixed by law for the services of public officers, or (*b*) the reward received or due for professional services, as by a lawyer. In Scotland the term is also commonly used as the equivalent of wages, especially the wages of servants.

Fees are in general distinguished from *salaries* by being remuneration for specific services rendered by a special or general agent; salaries being wages received by persons in the general employ of another at a rate or amount agreed upon per day, week, or otherwise. Formerly most government officers whose duties were ministerial and related to the active administration of the machinery of government, such as officers of court, customs officers, etc., received their remuneration for services given by fees, the amount being fixed by law at a percentage or at a given amount for each particular act or service rendered; and this system of remuneration, in many cases, was applied even to the judges of the lower courts, especially justices of the peace. This method of fixing the remuneration of public officers by fees is gradually giving way to that of employing officers to perform their duties at a fixed salary, based partially on the value of the services rendered, and often partially on the fees received in the office held by the incumbent, it having been found in many cases that the income received by the incumbent in office from fees was greatly out of proportion to the value of the services rendered, and also that the existence of the right of demanding fees was productive of extortion in office.

Fees of Public Officers.—For the specific fees paid to officers in any jurisdiction or government, municipal, State, or federal, in the U. S., or under any other government, the statutes regulating the same must be consulted ; or when they are regulated by custom, the decisions of courts or local records or treatises thereon.

Fees of Lawyers.—The laws affecting the payment of fees for professional services in the U. S. differ very widely in many respects from those in Great Britain. In the U. S. the fees of attorneys and counselors at law are, almost without exception, left to be settled by mutual agreement between the parties ; or, if this can not be done, are fixed by awarding to the attorney such amount as is adjudged to be a reasonable payment for the services rendered. In deciding what is such an amount the questions of the degree of responsibility assumed by the attorney and of the amount involved in the transaction concerning which the services took place frequently play a very important part, and it often happens that for services otherwise the same widely different sums are paid and recognized as being proper. The attorney does not need to stipulate what his fee shall be, but on rendering the services he may present a bill for such amount as in his judgment seems proper, which may or may not be paid voluntarily, as the case may be. The amount of his fee may be fixed by mutual agreement at any time at any sum which the parties see fit, and may be, generally speaking, a gross sum or a percentage of the amount involved in the transaction, the amount recovered in the judgment, or the like ; and in respect to fees, no distinction is made between services rendered in litigated actions, drawing of papers, conveyancing, etc.

In Great Britain the fees of solicitors, conveyancers, etc., are regulated by statute, prescribing the amount that may be charged for each specific act in the preparation of actions, filing of papers, writing of laws, drafting of copies, settlement of estates, abstract of title, attending references, drawing of leases, etc. The Supreme Court Judicature Act of 1873, and the additional rules of 1875 and subsequent years, made minute regulations governing these fees, but the act of 1881, commonly known as Solicitor's Remuneration Act (44–45 Vict., c. 44), was the first act that attempted in a definite way to place the charges of solicitors on an *ad valorem* basis. This act does not extend to Scotland, but the fees of the corresponding attorneys (there generally called *law agents*) were also regulated by statute (A. S. July 15, 1876, A. S. Dec. 4, 1878, and acts amendatory thereof).

The fees of counsel in Great Britain are upon an entirely different basis from that obtaining in the U. S. A counselor is not at liberty to decline, except in very special instances, to act for any party who applies to him for his advice and aid in litigation, but is bound in any case that comes into court to take the retainer of the party who first applies to him, whatever be the amount of the retainer offered. He can not demand or recover by action any reward for his services, but receives pay for them entirely in what is voluntarily given him by his client (the *honorarium* of the civil law), he, on the other hand, not being liable for negligence in the conduct of the case, and being free to act unrestricted even by the express instructions of his client. The *fees* of counsel in Great Britain are very carefully and rigidly distinguished from *gifts*, counsel not being allowed to receive gifts from his client during the continuance of the relationship of clientage. The same rule is generally applied in the U. S., but not so strictly, the theory being that gifts made during the continuance of such a relationship are subject to suspicion of undue influence.

The British system of fees according to unvarying tariff of prices fixed by law has met with much criticism and opposition from the attorney and solicitor, because it enables the unscholarly and ignorant to demand and receive for services the same prices as those paid to scholarly and learned men for services nominally the same, but actually much more valuable ; and from solicitor and client alike, because the system places a premium on circumlocution, and the conducting and performance of a number of technical acts and proceedings by the distinguished practitioner for the sake of increasing the fees which can be charged a client in any particular action.

Fees of Witnesses.—These are fixed by statute or local custom, and are usually a reasonable mileage fee, and a remuneration in addition that is nominal, or nearly so, especially in criminal actions. Expert witnesses, except in public cases, usually receive such fees as they see fit to ask, as a condition of testifying. See EXPERT TESTIMONY. See local statutes and treatises, and Morris's *Solicitors' Fees and Court Fees* (London, 1876); Evans's *Solicitors' Remuneration Act* (London, 1883); *Observations on the Remuneration of Attorneys and Solicitors*, a pamphlet by Reginald A. Parker (London, 1853).

Physicians' Fees.—In Great Britain a physician can not recover his fees by an action at law, except for his attendance at the death-bed sickness, it being generally understood there that the fees of a physician, like those of a counsel at law, are honorary, and not demandable of right; and, except for the death-bed sickness, they are presumed to have been paid, unless otherwise expressly stated. In the U. S. a physician's fees may be sued for and recovered on a *quantum meruit*, as in the case of services rendered by any other person.

F. STURGES ALLEN.

Fences: In general legal usage the term *fence* is applied to any kind of structure making an inclosure or division, such as a hedge, ditch, bank, wall, or structure of rails; it is distinguished from a *boundary*, in that the latter word is particularly applied to the line of division between the contiguous estates of different owners, while a fence is any structure used in the separation of such estates or of the parts of one estate.

The nature of the fence which an owner is required to construct in order to throw the liability for trespass upon the other party is discretionary, so long as the fence be calculated under ordinary conditions to be reasonably efficient as a protection against trespass by domestic animals.

The law does not require fencing against such small animals as would pass through or under an ordinary fence, nor against such wild animals as would break through. Where the statutory law prescribes the height of the fence, no damage can be recovered for injury or trespass by animals without showing that the fence was of the required statutory height.

Who Must Maintain Fences.—At the common law, a person who keeps cattle or other domestic animals is responsible for damages done by their trespassing upon the land of another unless they are properly confined by a fence. This rule obtains in many of the States of the U. S., including Delaware, Indiana, Maryland, Massachusetts, Michigan, Minnesota, New Hampshire, New York, New Jersey, Vermont, Rhode Island, and Wisconsin, and also in the Dominion of Canada. In other States it is held that in the absence of statutory regulation the owner of cattle or other domestic animals is not obliged to confine them in an inclosure in order to avoid liability for their trespass upon land of another. This rule obtains in the States of Arkansas, California, Colorado, Florida, Georgia, Iowa, Kentucky, Mississippi, Missouri, North Carolina, Ohio, Oregon, Pennsylvania, South Carolina, Texas, Virginia, West Virginia, Montana, Washington, and some others.

Statutory Regulations.—The subject of the duty of building and maintaining fences is generally regulated by local laws. These generally provide that the owners of adjacent premises are required to bear equally the expense of the construction of the fence required by law, which may be constructed on the land of both as a partition fence. The fence is presumed to be the common property of both owners, and either of them may repair it, compelling the other to bear his portion of the expense, if necessary. Where the construction of the fence is not required by law either party erecting the fence must bear the entire expense of it, and construct it entirely on his own premises; but for the purposes of repairing it he has the privilege of going upon the adjacent land of the other owner, so far as is reasonably necessary for the purposes of repair.

Fences constructed in such a manner, or of such materials, as to be calculated to injure the cattle or other domestic animals of another generally render the person constructing the fence liable for damages so created.

A general distinction is made between the construction of *outside fences*, or those boundaries bordering upon public lands such as highways, and *division fences*, or those between the lands of adjacent owners. As to outside fences, the landowner may fence his property or not, as he chooses; but so long as he fails to inclose the land he can not recover damages for trespass of the domestic animals of others upon his property; but as to division fences he must bear his share of the expense and burden of construction and repair. The statutes regulating the subject of partition fences generally provide for the appointment of fenceviewers, town trustees, or other officers, who assign to each owner the portion of fence which he is to build and maintain, and, when necessary, appraise the value of fences erected or of repairs made. The rights of adjoining owners conferred by such statutes may be waived by them by agreeing upon something different; but such an agreement may be terminated by notice from either unless the agreement be such as to estop its termination.

Fences are Real Property.—A fence, in general, is a fixture and a part of the realty, and can not be replevied or levied upon as personal property. So, when the fence is built by one person on the land of another, but without any agreement between them, it becomes the property of the landowner, who may remove it and dispose of it at his pleasure. See FIXTURES.

Railroad Fences.—At the common law, a railroad company is governed by the same rules as any natural person; but statutes have been passed in Great Britain and in many of the States of the U. S. requiring railroad companies to fence their tracks, and holding them liable for all injuries caused by their failure to comply with the statutes, regardless of whether the company has been guilty of negligence or not. Such statutes are held to be constitutional and valid as part of the police power of the State. At those points where the tracks of a railroad company pass a public highway the cattle-guard takes the place of the fence; but, in the absence of statutes, there is no more obligation on the part of the railroad company to maintain these than to maintain fences along the division lines.

A railroad company which passes through and divides the property of a landowner with its line can not so inclose or fence its tracks as to shut off the passage from one piece or parcel of land to the other by the owner, but must provide a suitable gate, bars, or other means of access from one piece to the other. See Hunt's *The Law of Boundaries and Fences* (London, 1896); Thornton's *Railroad Fences and Private Crossings* (Indianapolis, 1892); *American and English Encyclopedia of Law*, vol. vii.; and local statutes and municipal laws. F. STURGES ALLEN.

Fen Country: the lowest-lying part of England, tributary to the large and shallow bay known as the Wash, and embracing an area of about 1,200 sq. miles, fronting on the middle east coast in the neighborhood of that bay. It is called the "Holland of England," and with propriety, for, though it lies above sea-level, the surface is so low and flat that much of the sea-front requires protection by walls. The natural drainage agencies are the Witham, Welland, Nen, and Ouse rivers, which are almost stagnant, with rather indefinite courses and changeable mouths, and meander through a region that once was neither good land nor open water. By extensive canalization and drainage much of the land has been reclaimed, and the river-courses have been regulated by embankments. Fishing is an important industry along the coast. C. C. ADAMS.

Ferghana: a province of Russian Central Asia, occupying the basin of the upper Syr-Daria (*Yaxartes* of the ancients), embracing 39,500 sq. miles, of which about 13 per cent. is capable of cultivation. It lies between 39° and 43° N. lat. and 70° and 75° E. lon. "Blooming Ferghana" (formerly *Khokand*) is one of the richest and most promising parts of Russian Central Asia. The cultivable land is in the valley of the Syr-Daria, and the rest is steppe or mountain land, for the most part treeless and desolate, and in many places useless even for grazing. The climate passes through all stages, from tropical in the valley of the Syr-Daria to Arctic cold on the heights of the Trans-Alai. The cultivated soil is loess and requires artificial irrigation, and where this is available agriculture flourishes. Wheat, rice, barley, vines, cotton, vegetables, and all the best fruits of Southern Europe thrive. American cotton has been planted with great success and is one of the most profitable crops. Industries are quite diversified and are constantly developing, and the population, about 1,000,000 in number, mostly Mohammedans, are persevering, work their fields in a model manner, build irrigation works, and develop vineyards and fruit and garden industries. Russian immigration is increasing. The most important towns are Khokand, 60,000 inhabitants; Andijan, 40,000; and Marghelan, 35,000. At present the transportation of freight from Ferghana to Samarcand is two and a half times as costly as from Samarcand to the Caspian, but it is proposed to extend the Transcaspian Railway to Marghelan, which will greatly promote the prosperity of the country. C. C. ADAMS.

Fernald, JAMES CHAMPLIN: clergyman and author; b. in Portland, Me., Aug. 18, 1838; graduated at Harvard College in 1860, and at Newton Theological Seminary in 1863; held Baptist pastorates in Rutland, Vt., Waterville, Me., and Granville, Springfield, and other places in Ohio 1864–89; was on the staff of the *Standard Dictionary*, and editor of the *Students' Standard Dictionary* and of the *Standard Intermediate Dictionary*. He has published *The Economics of Prohibition* (1889): *The New Womanhood* (1891); *Synonyms and Antonyms of the English Language* (1895); *The Spaniard in History* (1898); *Home Training of Children* (1899); and *The Imperial Republic* (1899).

Ferrand, JOSEPH: French jurist; b. in Limoge, in 1827; under the imperial administration he was prefect of the Upper Savoy in the department of l'Ainse until Sept. 4, 1870; took up the public service again in 1871 as prefect of Galvados, which position he retained until 1874; was made an officer of the Legion of Honor in 1866, and was elected as correspondent of the Academy of Sciences in 1888. His publications include *De la Propriété communale en France et de sa mise en valeur* (1859); *Les Institutions administratives en France et à l'étranger* (1879); *La Réforme municipale en France et en Italie* (1881); *Les Pays libres, leur organization et leur éducation d'après la législation comparée* (1884); *L'Organisation municipale de Paris* (1887). F. STURGES ALLEN.

Ferraris, GALILEO: physicist and electrical engineer; b. in Livorno-Vercellese, Italy, Oct. 31, 1847; educated as a civil engineer at the polytechnic school of Turin, and received the degree of doctor of mathematics in 1872. In 1879 he became Professor of Physics in the military school of that city, curator of the physical cabinet and director of the physical laboratory of the Royal Industrial Museum. Ferraris was chiefly known for his researches in applied electricity. He was probably the first to suggest the application of the rotary field to electric motors, and it is to investigations such as his that our system for the transmission of power by means of polyphase currents owes its origin. He was likewise the author of a well-known treatise on *The Theory of Optical Instruments* (1887), which has been translated into German, and of numerous memoirs on technical and scientific subjects. Ferraris was justly recognized as the foremost of Italian electrical engineers. He was one of the official delegates of that government at the Electrical Congress in Paris (1881) and at the Vienna exhibition in 1883. He was one of the chief organizers of the electrical exhibition in Turin in 1884, and in 1886 he organized the Electro-technical School for Engineers in that city. This was the first school in electrical engineering established in Italy. At the electrical exhibition in Frankfort in 1891 Ferraris's method for the polyphase transmission of power had its first practical illustration in the transmission of one hundred electrical horse-power from the waterfalls at Lauffen to the exhibition grounds in Frankfort, a distance of more than 100 miles. At the World's Congress of Electricians in Chicago in 1893 he was a member of the chamber of delegates. Ferraris was a man of affairs as well as a man of science, and almost to the very hour of his sudden death by pneumonia, in Turin, Feb. 7, 1897, he labored for the industrial advancement of Turin and of his country. During the last year of his life he represented Piedmont in the Italian Senate. E. L. NICHOLS.

Fewkes, JESSE WALTER: anthropologist; b. in Newton, Mass., Nov. 14, 1850; graduated at Harvard University in 1875, and for postgraduate work in science received the degrees of M. A. and Ph. D. from that institution in 1877; subsequently for two years he studied zoölogy in the University of Leipzig under Rudolph Leuckart. From 1881 to 1889 he was assistant in the Museum of Comparative Zoölogy in Cambridge with charge of the radiates, and for three years of this time was secretary of the Boston Society of Natural History. He was a student under Louis Agassiz at the Penikese Island School, and for ten summers was associated with Alexander Agassiz in the Marine Laboratory at Newport, R. I. In 1889 Dr. Fewkes became interested in the study of American anthropology, and for four years thereafter visited the Southwest each summer as a member of the Hemenway Archæological Expedition, also participating in the Columbian Historical Exposition held in Madrid in 1892–'93, with charge of the Hemenway exhibits. Since 1895 he has been connected with the Smithsonian Institution, and has visited the West nearly every year, making large collections of archæological material in Arizona. He is now engaged in anthropological studies of the Moki Indians for the Bureau of American Ethnology. Dr. Fewkes holds the rank of Honorary Collaborator of the Smithsonian Institution. He has received the decoration of Isabella la Católica for his work in connection with the Madrid Exposition, and he has also received the gold medal "Litteris et Artibus" from the King of Sweden for his anthropological researches. Dr. Fewkes is a member of a number of scientific societies both in the U. S. and abroad, and is the author of many papers, most of which have been contributed to the *Proceedings* of the scientific societies of which he is a member. His early papers are for the most part on marine zoölogy, with special reference to the medusæ. More recently his published articles have been on his archæological investigations, and on the Moki ceremonies, of which the best known is the *Snake Ceremonies at Wolpi*. He was editor of the four volumes of the *Journal of American Ethnology and Archæology* (Boston, 1891–94).

MARCUS BENJAMIN.

Field, JOHN: pianist; b. in Dublin in 1782; called the "Russian Field." He was the inventor or the introducer of the popular form called the nocturne. He was a pupil of his grandfather, then of Clementi, whom he accompanied to St. Petersburg, which place he afterward left for Moscow. He made many tours through Europe. He was one of the greatest pianists of his time, and left many beautiful compositions, including seven concertos and eighteen nocturnes. D. in Moscow, Jan. 11, 1837. D. E. HERVEY.

Figig: an oasis on the northern edge of the Sahara, 30 miles W. of the boundary between Morocco and Algeria. It is connected by caravan route with the railroad to Oran, has an important trade with Algeria, grows many dates, and with 15,000 inhabitants is one of the most populous oases in the northwest Sahara. At an elevation of about 2,400 feet it stands on the dividing line between the Moroccan and desert vegetation. Caravan routes between Algeria, Morocco, and Tuat converge at Figig, which has also derived importance from the fact that it has often been made a place of refuge for deserters and criminals from Algeria.

Fiji Islands: The white population numbers about 2,000, one-third of whom live in the two principal seaports—Suva, the capital, and Levuka. The whites depend largely for food upon the importation of wheat flour, dairy products, and vegetables from New Zealand and the other Australasian colonies. They have a good local supply of meats (though mutton is mostly imported), poultry and fish, and tropical fruits. The natives adapt themselves readily to a European diet, and when they have money they spend it freely on soft bread, navy crackers, and preserved meats. There are two banks in Suva and one in Levuka. Proximity to Australasia and cheaper rates of freight give that region an advantage in commercial relations with the islands. In Polynesia the external trade of Fiji is second only to that of the Hawaiian islands. The imports in 1896 were $1,178,500 and the exports $2,105,700, and of the total trade Australasia had all but $256,100. There were no exports to the U. S., but kerosene, flour, dried fruit, and shoes were imported to the amount of $11,100. The islands are rapidly rising in commercial prosperity, which depends chiefly upon the development of the rich agricultural resources of the colony. Considerable British capital is invested in the sugar industry, and about 10,000 Indian immigrants have been introduced to work on the plantations. Although lying within the tropics, the islands are exceptionally healthful. For eight months in the year the tropical heat is greatly modified by the southeast trade winds. From November to April wet stormy weather prevails, and between December and March hurricanes sometimes sweep over the islands, doing great damage to the crops. Epidemics are rare and malarial fevers are unknown, but the tropical climate does not seem to be favorable to the health of white women for prolonged periods. C. C. ADAMS.

Finck, HENRY THEOPHILUS: journalist; b. in Bethel, Mo., Sept. 22, 1854, of German parents. In 1862 the family went to Oregon, where Henry and his elder brother Edward both learned the rudiments of music. Henry learned to play both the piano and the violoncello. In 1872 he entered Harvard University, devoting himself chiefly to the classics and philosophy, taking also the music course under Prof. J. K. PAINE (*q. v.*). After graduating in 1876 he went to Europe and wrote accounts of the Bayreuth Festival for the New York *World* and the *Atlantic Monthly*. In 1877 he returned to Cambridge and received a Harvard fellowship, which enabled him to study three years in Berlin, Heidelberg, and Vienna. During this period he wrote many articles for English and American magazines, together with letters to the *Nation*, New York, which resulted in his appointment as one of the staff of that paper, and he has since held the position of music critic and book reviewer on the *Nation* and *Evening Post*. Books written by him are *Romantic Love and Personal Beauty*; *The Pacific Coast Scenic Tour*; *Spain and Morocco*; *Chopin and other Musical Essays*; *Wagner and his Works*; *Songs and Song-writers*, and he is now engaged on a work describing the gradual evolution of romantic love from the Australian savages to civilized Europeans. D. E. HERVEY.

Finisterre Mountains: the central of the three ranges of high mountains, the Coast, Finisterre, and Bismarck chains, parallel with one another and the coast in German New Guinea between 46° and 47° 30′ E. lon., with 6° S. lat. as the northern boundary. Of the highest peaks of Finisterre, Kant rises to a height of 11,400 and Schopenhauer to 11,000 feet, and the steep high range of volcanic rock is in sharp contrast with the coral formation of the coast, only 35 miles distant. The range was explored in 1888 by Zöller, who saw the still higher Bismarck range about 50 miles farther inland, of which Mt. Wilhelm, about 16,000 feet high, is supposed to be the highest point of German New Guinea.

Finland: The population of Finland in 1897 was 2,527,801, and of Helsingfors 66,000. Only 10 per cent. of the people are settled in towns and about 80 per cent. are engaged in agriculture. Thirty-eight per cent. of the cultivated land and all the forests are the property of the state, the Church owns about 2 per cent., and the remainder is distributed in very small portions among private individuals. The woods cover 64 per cent. of the whole area. Only 8 per cent. of the entire surface is cultivated. The beautiful lakes and the abundant fishing and shooting in the moors and wastes are drawing tourists to the country to some extent. Shooting is now prohibited during most of the shooting season, but spotted trout and salmon are taken in great abundance. Finnish is spoken by about 85 per cent. of the people, Swedish by 14 per cent., the Russian-speaking inhabitants number about 5,000, not including the Russian garrisons, while the Lapps number only about 1,000, and other nationalities about 3,000. The exports in 1896 were valued at $1,698,313, of which more than half was timber; the imports were $8,201,529, of which the largest items were iron, steel rails, corn, flour, coffee, sugar, and manufactures. A line of weekly steamers from New York and Boston to Hull connects at that port with steamers plying weekly to Helsingfors. C. C. ADAMS.

Finley, JOHN HUSTON, A. M.: educator; b. in Grand Ridge, Ill., Oct. 19, 1863; prepared for college in Ottawa, Ill., high school; A. B., Knox College, 1887, and A. M. 1890; student in Johns Hopkins University 1887–89; secretary of State Charities Aid Association, New York, 1889–92; president of Knox College 1892–99; associated with R. T. Ely in the authorship of *Taxation in American States and Cities*; editor of *Charities Review* 1891–96; contributor to magazines, reviews, etc. C. H. THURBER.

Finsch Haven: the first capital of German New Guinea, a little N. of Huon Gulf, in 6° 30′ S. lat., 147° 51′ E. lon. It was named in honor of the German explorer Finsch, who first surveyed this part of the coast and described the land and people. In this harbor vessels may ride at anchor in 60 to 70 feet of water, wholly protected from winds. The capital was finally transferred to the more centrally situated Friedrich Wilhelms Haven, another excellent harbor N. of Astrolabe Bay, in 5° 15′ S. lat., 145° 45′ E. lon.

Fiore, PASQUALE: jurist; b. in Terlizzi, Italy, Apr. 8, 1837; studied law at the University of Naples, and in 1861 was made Professor of Philosophy at the Lyceum in Cremona, in 1863 Professor of International Law at the University of Urbino, and two years later Professor of International Law at the University of Pisa, whence after ten years he went to Turin and afterward to Naples. He has published a number of important judicial works, including *Droit international privé*, (1874); *Traité de droit penal international et de l'extradition* (1880); *Nouveau Droit international public* (2d ed. 1885). F. STURGES ALLEN.

Fisher, FRANCES C. (*Christian Reid*, Mrs. Tiernan): author; b. in Salisbury, N. C. *Valerie Aylmer* (1870), which was uncommonly successful, was followed by *Morton House*, a story of Southern life, which appeared serially in *Appletons' Journal*. Other books of hers are *Mabel Lee* (1871); *Ebb Tide* (1872); *Nina's Atonement* (1873); *A Daughter of Bohemia* (1873); *Carmen's Inheritance* (1873); *A Gentle Belle* (1875); *Hearts and Hands* (1875); *A Question of Honor* (1875); *The Land of the Sky* (1875); *After Many Days* (1877); *Bonny Kate* (1878); *A Summer Idyl* (1878); *Hearts of Steel* (1882); *Armine* (1884); *Roslyn's Fortune* (1885); *Miss Churchill* (1887).

Fitch, John Lee: artist; b. in Hartford, Conn., June 26, 1836. He studied in Munich and Milan, his professional life being spent in Hartford and New York city; is an associate of the National Academy of Design, and was for twelve years chairman of the art committee of the Century Association, declining re-election. Among his paintings are *In the Woods*, a large canvas exhibited in Philadelphia in 1876; *On Gill Brook*; *A Mountain Brook*; *The Outlet*; *In the Cañon*; *Waiting for a Bite*; *A Stray Sunbeam*; *Twilight on John's Brook*; *Cliff Side*; and *Willows on the Croton*.

Fitzpatrick, Charles: lawyer and politician; b. in Quebec, Canada, Dec. 19, 1853; graduated at Laval University in 1873; admitted to the bar in 1876. He was counsel in 1885 for Louis Riel, who was executed for high treason. In 1892 he defended ex-Premier Mercier in the prosecutions which followed his administration. In 1897 he represented the Dominion Government in the fisheries case before the privy council, England. He was a member of the Quebec Assembly 1890–96, and then became a member of the House of Commons, and was appointed in July, 1896, solicitor-general under Sir Wilfrid Laurier.

Flagg, George Whiting: artist; b. in New Haven, Conn., June 26, 1816. His early years were passed in Charleston, S. C., where he studied art with Washington Allston, his uncle, at which period he painted a portrait of Bishop England, *A Boy Listening to a Ghost-story*, *A Young Greek*, and *Jacob and Rachel at the Well*. His *Murder of the Princes* attracted the attention of a gentleman through whose aid he spent several years in Europe, living for some time in London; returned to New Haven, and afterward to New York; became a member of the National Academy of Design in 1851. Among his best-known works are *Landing of the Pilgrims*; *Washington Receiving his Mother's Blessing*; *The Good Samaritan*; *Columbus and the Egg*; and *The Scarlet Letter*. D. in Nantucket, Mass., Jan. 5, 1897.

Flagler, Isaac V.: organist; b. in Albany, N. Y., May 15, 1842, and became a church organist when twelve years old. He then went to Paris and studied under Batiste. He has played the organ in several churches, including Plymouth church, Chicago, for seven years. He has composed many organ pieces, his *Variations on an American Air* being a great favorite. He also composed a comic opera. He has given many organ recitals and lectures, and was for several years organist and musical lecturer at Chautauqua. He is organist of the First Presbyterian church, Auburn, N. Y. D. E. Hervey.

Flagstaff: a town in Coconino co., Northern Arizona, on the Atlantic and Pacific R. R., 6,864 feet above sea-level. On every side of the town pine lands spread for miles away, while outside this verdant area stretches the desert country. Flagstaff has a population of 1,500, and its sawmills and cattle and sheep interests are the sources of its growth and prosperity. To the north of the town are the San Francisco Mountains, through whose instrumentality this region derives its economic importance. These mountain peaks arrest and precipitate the clouds which would otherwise pass over the plateau and find no cause for precipitation over the eastern desert. The result is that a part of the desert has been turned into pineries and grass-lands. These mountains are the only elevation in Arizona on which snows accumulate, and melting in the spring they furnish supplies for many brooks, washes, and at least one perennial stream, Oak creek. Pop. (1890) 963; (1900) 1,271.

Fleming, John Ambrose, D. Sc.: physicist; b. in Lancaster, England, Nov. 29, 1849; educated at St. John's College, Cambridge. In 1871 he was science master at Rossall College; in 1873 demonstrator at the Royal College of Chemistry in London. In 1874 he was appointed teacher of physics at Cheltenham College, which position he resigned in 1880 to become demonstrator in applied mechanics at the University of Cambridge. In 1879 Mr. Fleming received the degree of doctor of science from the University of London and soon afterward was elected to the chair of Mathematics and Physics in the new University College at Nottingham. He resigned this professorship for the chair of Electrical Engineering in London. In 1883 he was elected a fellow of St. John's College, and in 1885 was appointed to the chair of Electrical Technology in University College, London. Fleming is the author of numerous papers on applied electricity, of a volume entitled *Short Lectures to Electrical Artisans*, and of a treatise in two volumes on *The Alternating Current Transformer*. E. L. N.

Floeberg Beach: the most northern point ever reached by a ship in the American Arctic; on the shore of the Arctic Ocean, at the northeast extremity of Grant Land. 82° 25′ N. lat., 62° W. lon. Captain George Nares in the fall of 1875 pushed his ship, the Alert, northward along the west shores of Kennedy and Robeson channels to Floeberg Beach, where he spent the coldest winter that Arctic explorers had experienced up to that time. From this point a sledge expedition under Markham advanced northward to 83° 20′, the farthest north attained up to that date; and another under Lieut. Aldrich traced 220 miles of new coast along the west and northwest shores of Grant Land.

Florence, University of: The city of Florence early took an interest in education, in 1320 engaged and paid some individual teachers, and in 1331 began to take steps for founding a *studium generale*. Not until 1349, however, on the earnest insistence of the authorities, did it receive from the pope the charter for the institution, which did not have altogether a brilliant existence, though law and theology were diligently pursued. Studies were suspended from 1354 to 1357. From 1373 to 1375 Boccaccio lectured in the university on Dante. From 1378 to 1383 studies were again interrupted; on Feb. 14, 1488, the high school received its own statutes. In 1396 Florence had the honor of taking one of the most important steps in the revival of learning, "for in the spring of this year the *studium* at Florence addressed an invitation to Manuel Chrysoloras at Constantinople to accept the chair of Greek Letters as first professor of the Greek tongue in the West. From this invitation, couched in words of great dignity worthy of the men who sent it, date the beginnings of Greek learning in Italy." In 1472 the university was transferred to Pisa. The present institution was not founded until June 30, 1872, under the direction of the royal Government in Italy. There are at present about 500 students. At the time of the revival of the study of antiquity Florence played an important part, the names of Boccaccio, Salutati, and Niccoli being specially associated with the movement. See *Minerva*; Woodward, *Vittorino Da Feltre and other Humanist Educators*. C. H. Thurber.

Florida: In Feb., 1899, a cold wave invaded Florida, greatly damaging her orange and other fruit industries. At least five disastrous freezes have occurred in Florida in this century. It is believed that the cold wave of 1835 was the most severe of the series. Fifty-one years elapsed before Florida, in Jan., 1886, was again visited by severe frost. In Dec., 1894, and Feb., 1895, there were cold waves that killed about three-fourths of the orange-trees down to the roots. In 1898 fruit from the trees that sprang from the old roots came into the market, and the crop was about half as large as that of the year before the 1894 disaster. It was thought in 1898 that the Florida orange crop would reach its former proportions in about ten years, but the industry received another setback by the cold wave of 1899, and increased the tendency in Florida to substitute other crops for oranges. Many orange-growers since 1894 have turned their attention to other products and have prospered. They are growing tobacco, are giving more attention to vegetables for Northern markets, and not a few have gone into stock-raising.

Flynn, Edmund James: lawyer and law professor; b. in Percé, Province of Quebec, Nov. 16, 1847; graduated at Laval University in 1873, in which year he was called to the bar; practiced his profession in the city of Quebec, and since 1874 has been Professor of Roman Law at Laval University. He has always been active in political affairs, and in 1878–79 was a member of the Provincial Legislature; was appointed Commissioner of Crown Lands in 1879, retaining this office until 1882; Commissioner of Railways and Solicitor-General 1884–87; was again Commissioner of Crown Lands 1892–96, in which last year he became Premier of the province with the office of Commissioner of Public Works. Retired from office May 22, 1897, on the defeat of his party at the polls. F. STURGES ALLEN.

Foreign Corporations: in law, corporations organized and existing under and by virtue of the laws of a foreign state. A corporation is not a person in the sense that a natural person is, although for most purposes of legal administration it is considered and treated as a person. A corporation existing under the laws of one State in the U. S. is held to be a foreign corporation in all other States, it being settled that a corporation is not a citizen within the meaning of the constitutional provision entitling "the citizens of each State to all privileges and immunities of the citizens in the several States." It follows, therefore, that, as well among the several States of the U. S. as between other independent sovereignties, corporations have no recognized legal existence as such outside of the State under and by virtue of whose laws they exist. The corporation legally exists only in the jurisdiction where the laws under which it is incorporated exist and are obligatory.

The Status and Powers of Foreign Corporations.—In the U. S. the status and powers of foreign corporations are a matter of special importance, because of the rapidly increasing number of corporations organized under the laws of one State for the purpose of doing business in other States. It is a common practice to organize a corporation under the laws of any particular State which for any reason may offer the most favorable conditions for the transaction of the business contemplated for the corporation. How far the powers granted or permitted by these States to corporations organized under their laws shall be recognized by other States in which they are authorized by their charters to do business becomes a matter of very great importance, both to the incorporators and to subsequent stockholders, as well as to the citizens of the State in which the corporation is transacting its business.

In foreign nations, such as Great Britain, France, and the U. S., etc., a corporation organized under the laws of one nation has no existence or powers legally except such as may be granted to it by the law of comity. But under the laws of the U. S., where all of the States, although considered independent sovereignties, are still subject to the Constitution of the U. S. and the laws passed in pursuance of it, the status and powers of the corporations organized in one State and doing business in other States are somewhat modified. It is settled, however, that a corporation is not a natural person in the sense that it is entitled to the privileges and immunities accorded to the citizens in the several States. The tendency at present of the Federal courts seems to be to enlarge the powers and immunities of corporations; but, notwithstanding this, it is still held that a corporation can have no powers and enter into no contracts in another State except by the permission, express or implied, of the foreign State in which it is attempting to do business. Comity, however, usually affords to foreign corporations, in the absence of express statutory restriction, the authority to do and perform those acts and contracts which are generally allowable for domestic corporations, so far as they are within the powers conferred by its own charter or certificate of incorporation.

In the U. S., in general, a corporation created in one State may establish agencies for the transaction of its business in another State, may make and receive contracts which a natural person there may make or receive, may maintain actions for the enforcement of contracts, and set up a defense against actions brought against it, and, in general, have the same benefits of its contracts and remedies at law as a natural person would have in such State. This is true in the absence of express statutory restrictions; but such restrictions are now becoming general in the separate States. These restrictions in general provide that a corporation shall not bring or maintain an action at law or in equity, or be allowed to appear or defend in an action at law or in equity, unless it has complied with certain provisions regulating the transaction of its business, and obtained a certificate from the proper officer (usually the Secretary of State) authorizing it to do business in that State; and in case of the existence of such a statute the corporation can not bring or defend an action upon any event or cause of action arising subsequent to the passage of the statute without compliance with it. Such statutes are generally passed for the purpose of enforcing the payment of taxes on personal property situated within the foreign jurisdiction, and for the purpose of compelling corporations engaged in banking, in the issuing of insurance, or in other business affecting public interests more or less directly, to submit to the rules of the insurance, banking, or other department existing in that jurisdiction. Under such statutes a State may place a prohibitive tax upon a foreign corporation if it sees fit to do so.

It is held that the Federal Government has jurisdiction over the business of corporations engaged in interstate commerce, and that the power of the separate States to regulate and tax foreign corporations is restrained so far as it relates to business coming within the jurisdiction of the interstate commerce laws, such commerce receiving the same protection when carried on by corporations as when carried on by individuals.

Restrictive statutes are usually expressed as applying to foreign corporations "doing business" in that State; and it has been generally held that isolated transactions performed by a corporation of one State in another State do not constitute "doing business" within the foreign State, but that the foreign corporation must do a substantial part of its business within the foreign State—such as by maintaining a sales agency, or maintaining part of its manufacturing plant there, or the like. A corporation, therefore, is commonly not restricted from conducting the ordinary operations of commerce by such a statute.

Contracts made in violation of such restrictive statutes by corporations which have not complied with the provisions of these statutes are generally held to be voidable at the election of the other party to the contract, or the remedy is suspended until the statute is complied with; but the corporation can not set up its own non-compliance with the statute as a defense to an action to compel it to perform its contract or for damages for non-performance of it. In some States it is held that contracts made as above are void only when the statute expressly so provides; in others, that they are not void when the statute merely provides a penalty.

The Power of a Foreign Corporation to Hold Land.—No general rule can be stated as to the power of a corporation to take, hold, and transmit title to land in a foreign State; but reference must be had in each particular case to the decisions and statutes of the State in question. In many of the States, as in New York, enabling statutes have been passed, either authorizing corporations to hold land in general or under certain special restrictions; and it has been decided in some cases that in the absence of prohibitory statutes the corporation of one State may hold land in another State if authorized so to do by its charter or certificate of incorporation, unless forbidden either by public policy or by statute. In all cases where the right of a foreign corporation to hold land is in question the law of the State where the land is situated governs.

Corporations generally, like other non-residents, are required to give bonds for costs in civil actions in the courts of a foreign State.

Service of Papers upon a Foreign Corporation.—The service of papers in an action upon foreign corporations is generally regulated by statutes, and they are ordinarily required to designate some person or corporation to act as an agent upon whom papers may be served, to the same effect as if upon the corporation. In general, jurisdiction can not be acquired by service upon an officer within the State for purposes not connected with the business of the corporation; but where service is made upon an officer of the corporation engaged in its business, or representing the company there in its business, such service is held to be good and to confer jurisdiction.

For the purposes of Federal jurisdiction in actions in the U. S. a corporation is a person, and when sued in a State foreign to the State of its domicile it may remove the cause to a Federal court, in the same manner as a natural person might. This is true, even though the corporation may be doing business in the foreign State under a certificate authorizing it to do so, obtained from the proper officer; but where the corporation has received corporate privileges in the foreign State it then becomes a citizen of that State for the purposes of jurisdiction as well as of the State under which it was first created. See Murfee's *Law of Foreign Corporations*; Reno's *Non-residents and Foreign Corporations*; Thompson's *Commentaries on the Law of Private Corporations* (vol. vi.); Beach's *Commentaries on the Law of Private Corporations.* F. STURGES ALLEN.

Forel, FRANÇOIS ALPHONSE: b. Feb. 2, 1841, at Morges, Canton Waadt, Switzerland; studied medicine and natural history in Geneva, Montpellier, Paris, and Würzburg, and

is Professor of Anatomy and Physiology at the University of Lausanne. He has given very large attention to the study of the physical conditions of the Swiss lakes, and has made most important contributions to the comparatively new branch of research known as limnology, or the study of lakes. The methods of pursuing these researches are largely based upon those he originated. Among his many monographs and books are *Introduction à l'étude de la faune profonde du lac Léman* (1869); *Températures lacustres* (1880); *Die pelagische Fauna der Süsswasserseen* (1882); *La thermique de la Méditerranée* (1891); and his exhaustive study *Le Léman: Monographie limnologique* (1892).
C. C. ADAMS.

Formosa: The U. S. had a larger share of the trade of Formosa in 1897 than any other country except China. The total foreign trade of the island, excluding China, was $5,500,000, of which about three-fifths fell to the U. S. The principal imports from the U. S. are petroleum, flour, and ginseng. Tea is the largest export. A drawback to commerce is the fact that the rivers are navigable only to a very limited extent. With the exception of the small inlets at Sao-o and Black Rock Bay, into which junks may run, the entire east coast offers no protection for vessels. Kelung, on the north coast, has a good depth of water and is open at all tides, but the inlet is narrow and much exposed during the winter monsoons. The harbor of the leading port, Tamsui, on the northwest coast, is merely the estuary of an insignificant river, with a shifting bar, which ocean vessels of any size do not attempt to cross. The lagoon at Takao, on the southwest coast, offers complete shelter and good holding ground, and is likely to become an important center of foreign trade. The Japanese cabinet has approved the recommendation of the Formosan Government for an appropriation of $20,000,000 in gold to improve Kelung harbor and extend the railroad now running from that port to Teekcham, 60 miles, to Takao, 175 miles farther S. Formosa is one of the largest sources of the supply of camphor, and more than 4,000,000 lb. of it was exported in 1894. Inasmuch as the tree is destroyed to obtain the gum, a more stringent enforcement of the law requiring that a tree be planted for each one destroyed will be required to prevent a diminution of the supply.

Fort Chipewayan: a Hudson Bay post near the southwest end of Lake Athabasca, Northwest Territory, Canada. It is at the mouth of the Athabasca river. It has been necessary to shift the position of the station several times on account of the changes in the alluvial delta. Missionaries have long maintained an orphanage here with 60 to 100 inmates, making the place the most populous white station in the Mackenzie river basin between Lake Athabasca and the Arctic Ocean.

Fort Churchill: a Hudson Bay post at the mouth of the Churchill river, west coast of Hudson Bay, Keewatin District, Canada. The west coast of Hudson Bay is low, with shallow water, and the only harbor available for large vessels at all stages of the tide is at Fort Churchill, where there is perfect shelter, an easy entrance, and 6 to 8 fathoms of water.

Foulke Fiord: one of the indentations on the northwest coast of Greenland, in 78° 18′ N. lat., 73° W. lon. The early explorers of the Smith Sound region found in the fiord the Eskimo village of Etah, which is supposed to be the most northern place of human abode in recent times, though the remains of Eskimo huts have been found farther N. on the coast of Grinnell Land. In the fall of 1860 Dr. I. I. Hayes, from Foulke Fiord, traversed the inland ice for 40 miles, the most successful attempt up to that time to penetrate the interior of Greenland. He spent that winter in the fiord with his exploring schooner, United States.

Foureau, foo'rō', FERDINAND: an African explorer. He completed in 1898 his ninth expedition among the sand wastes and oases S. of the Sahara, which he had been prosecuting, chiefly at the expense of scientific societies and private citizens of France, for about ten years. His routes cross one another in all directions from the southern limits of Algeria across the Erg wastes and into the country of the Tuaregs, and maps of that large region are now chiefly based upon his surveys, which include the determination of many heights and the position of a large number of places. In the course of this work he corrected many errors of the earlier maps. The information he collected stimulated the extension of French influence to the S. and the establishment of advanced military posts. Early in 1899 Foureau arrived with a large expedition at Agades, in the southern part of the Sahara, on his way to explore, under Government auspices, the parts of the Sudan that are in the French sphere of influence. Besides a number of reports and maps printed chiefly by the Paris Geographical Society, he has published these books: *Une Mission au Tademayt, territoire d'Insalah en 1890* (Paris, 1891); *Ma Mission chez les Touareg Azdjer* (Paris, 1894); *Mission chez les Touareg: Mes deux itinéraires Sahariens, Octobre, 1894, à May, 1895* (Paris, 1895).
C. C. ADAMS.

Fournier, PAUL EUGENE LOUIS: French jurist; b. in Calais, Nov. 26, 1853; studied at the School of Records, and received a diploma as paleographer of archives in 1879; received his doctor's degree in law, was appointed Professor of Roman Law at Grenoble, and afterward president of the academy of that village. He is well known for his historical studies of the Middle Ages and of ecclesiastical tribunals. He has published *La Question agraire en Irlande* (1882); *La Question des fausses décrétales* (1887); *Notice sur la bibliothèque de la Grande Chartreuse au moyen âge, suivie d'un catalogue de cette bibliothèque au XVe. siècle* (1888); *Le Royaume d'Arles et de Vienne, 1138–1378* (1891). F. S. A.

Fourtou, foor'too', MARIE FRANÇOIS OSCAR, de: statesman; b. in Ribérac, department of Dordogne, France, Jan. 3, 1836. He was mayor of Ribérac under the empire. In 1871 he was elected to the National Assembly, and took his place in the Right Center. In 1872 he was Minister of Public Works for a few weeks, retiring with Jules Simon. In 1873 he was for five days Minister of Worship in the last cabinet formed by Thiers. On Nov. 26, 1873, he became Minister of Public Instruction, Worship, and Fine Arts, and was Minister of the Interior in 1874, and again in 1877. M. de Fourtou became a Senator in 1880, and in 1889 he returned to the Chamber of Deputies. D. in Paris, Dec. 6, 1897.

France: The census of Mar., 1896, showed a total population of 38,517,975, an increase of only 174,783 in five years. The increase in population in the period 1886–91 was only 124,289, while in the period 1881–86 the augmentation was about 545,000. On the whole, the rate of increase in the population has considerably diminished in the last fifteen years. As a rule the towns are growing at the expense of the country, showing the growth of industrial and a small decline of agricultural interests. The birth-rate is below that of most civilized countries. The small increase in population is attributed in large part to the fact that a standing army of more than 500,000 men prevents many from marrying, and that enforced military service makes it impossible for many to marry till late in life, for, after leaving the army, they must first find positions that will enable them to support families.

France continues to be the largest wheat-growing country in Europe, and, next to the U. S., the largest in the world. Wheat is raised in all parts of the country, but particularly N. of the Seine. The average crop for the five years ending 1898 was 330,189,873 bush. Since the advent of phylloxera and other maladies of the vine France has given more and more attention to the production of her own food-supply. Oats are raised extensively in the north and northeast, buckwheat in the northeast, and rye in the central regions, while maize is grown in the Rhône valley and in the southwest. The culture of cereals occupies a little more than a quarter of the total surface, more than one-half of the cultivable area, and wheat occupies nearly one-half of the land devoted to cereals. Still France for a number of years has imported more cereals than have been exported. An increase in wheat imports from the U. S. is attributable to the prevailing opinion that a mixture of the American with the softer French wheat makes the best flour that can be produced. It is said that the inhabitants of Southern France consume more bread *per capita* than any other people. Meat is expensive and to the poor a luxury, and bread and cheap wine are the food and drink of most of the people. About half the flour imported at Marseilles comes from Algeria, and about half the wheat from Russia. In 1900 the wine product was 1,779,264,201 gal., and the cider product, which is an important industry in the north, was 776,897,553 gal. The wool product has been diminishing for many years. In 1840 the number of sheep was 32,151,430; in 1882, 23,809,433; in 1900, 21,357,660. Formerly the end sought in sheep-raising was to produce breeds equal to the merino type, but, owing to the low price of wool, in recent years sheep-farmers have sought to breed animals giving the best market value in meat. Wool has, therefore, diminished in quantity, and the quality has not improved. The best wool, fine and firm, is produced in Champagne, Soissonnais, Vexin, and Île-de-France.

In 1895 there were 55,458 industrial establishments in France. The enterprises devoted to textiles and clothing numbered 6,471; metals, 4,791; mines and quarries, 3,031; foods, 8,782; building arts, 6,602; agriculture (sugar-making, flour, etc.), 14,813; chemical and tanning, 3,117; paper, printing, furniture, etc., 3,421; state services, 430. The total horse-power employed was 1,163,005. In the quantity of its industrial products France comes after the U. S., Great Britain, and Germany, but it holds the first place in the workmanship and quality of many articles. The principal centers of manufactures are Paris, the north, and the southeast, though these industries are distributed over most of the country. Textile production (woolens, silks, cottons, linens, etc.) takes the first rank, with a value of about $700,000,000 a year and employing 600,000 workmen. Woolen goods come first in the value of the product, which is about $250,000,000, with an export of about $70,000,000. As the country does not produce sufficient wool, about three-fourths of the amount consumed is imported, a large part of it coming from Argentina and Uruguay. The export of silk manufactures amounts to about $50,000,000, and as silkworm-breeding in the Rhône valley does not supply sufficient material, a large amount of the raw silk used comes from Italy and China. Cotton manufactures have recently made considerable advance, and are using about a third more raw material than in 1890. The linen industry has for some years been in an unfavorable condition, while jute manufactures have been growing, as new uses for this material are being found. In the metal industry France is far behind Germany, but has improved within a few years, as the imports of iron and steel manufactures are diminishing, while the exports tend to increase. The production of leather and leather goods has somewhat declined, and also the exports of underwear and paper goods.

The exports in 1897 were $719,600,000, of which about one-third went to Great Britain, one-seventh to Belgium, one-twelfth to Germany, one-thirteenth to the U. S., and nearly as much to Algeria. The imports were $791,200,000, of which about one-eighth came from Great Britain, one-eighth from the U. S., one-ninth from Germany, one-fifteenth from Belgium, and nearly the same amount from Algeria. In 1899 the general exports were valued at $1,067,965,500 and the imports at $1,128,664,000. More than half of the exports were manufactured articles, about one-quarter were manufacturing supplies, and about one-sixth food-supplies. More than half the imports were manufacturing supplies, about one-seventh manufactured articles, and more than two-sevenths food-supplies. The notable increase in imports was largely due to heavy receipts of wheat, and there was a decrease in exports. Colonial imports foot up about $70,000,000 a year and the exports to about the same figure.

The French Government is protectionist to an extreme degree, and extends remarkable support not only to its commerce, but also to its merchant marine. A bonus is paid to all ship-builders on the basis of the tonnage they produce, and also to all ships, steam or sail, based on mileage. Technical education probably receives more attention in France than in any other country, except Germany. It exists in Paris in all classes of industry where skilled labor is required, and in all cities known for a particular product there are usually one or more technical schools, many of which receive substantial aid from the Government. Although the existing U. S. tariff is a cause of much complaint from the French, their tariff on many American products is prohibitive, and any increase in the U. S. tariff on articles exported from France is at once met by an increased rate on some product of the U. S.

The merchant marine in 1900 numbered 15,489 vessels, of which 14,262 were sailing. The chief ship-building yards in France are those of the Messageries Maritimes, which produce only their own ships; the Compagnie Générale Transatlantique; the shipyards of the Gironde at Bordeaux, which produce a considerable number of war-ships; at Nancy, where sailing vessels of a maximum of 3,000 tons and small steamships are built; at Rouen, the shipyards of Normandie; the Forge shipyards of the Mediterranean, and the shops and yards of the Loire, each enterprise owning two important ship-building plants.

The recent completion of the large scheme of harbor and dock improvements at Calais has added much to its importance as a seaport. Extensive improvements have also been made in the harbor of Rouen, and the increase in its shipping trade has been greater than that of any other port of France. The ports of Boulogne-sur-Mer, Dieppe, and Dunkirk have all been favorably affected by the improvements of recent years.

An agreement between England and France settling their dispute as to their respective spheres of action in the Sudan was reached in Mar., 1899. From the northern frontier of the Belgian Congo to the fifteenth degree of latitude the delimitation of the boundary will be carried out by a mixed commission, it being understood, in principle, that Great Britain retains the Bahr-el-Ghazal and Darfur, while France includes in her sphere Wadai and Bagirmi, likewise Kanem, and, generally speaking, the territories to the E. and N. of Lake Chad. N. of the fifteenth degree of latitude, Great Britain recognizes that the French sphere extends S. of the tropic of Cancer as far as the line which, broadly speaking, coincides with the western limit of the Libyan Desert. From the Nile to Lake Chad, and between the 5th and 15th parallels, the two powers mutually concede equality of treatment in commercial matters. This clause will thus permit France to have commercial establishments on the Nile and its affluents. Finally, the two powers mutually undertake to refrain from exercising political or territorial rights outside of the frontiers fixed by the arrangement.

C. C. Adams.

France, History of: The history of the Third Republic is, on the surface, one of rapid ministerial changes. Into the details of these changes it would be profitless to enter. The responsibility of a whole ministry is not as clearly defined as in England, while the French system of political groups is in striking contrast to the lines of demarcation between the two dominant British parties. As premier swiftly succeeded premier, observers might naturally doubt the stability of the republic. Yet it has lasted twenty-eight years. The Legitimists and Orleanists coalesced, and this united Monarchical Right has dwindled to a small minority. The Bonapartists, or Imperialists, have little parliamentary strength. On the other hand, the Republicans have steadily grown. They are split, however, into various groups, "Rallied" ex-Monarchists, Opportunists, Radicals, Socialists, etc.

Our survey may begin with Boulangism. Gen. Boulanger as officer and Minister of War gained wide popularity with the army and the public. His moderate abilities were supplemented by certain military reforms and an attractive personality in the eyes of the masses. He had come to Paris at the time of the governmental crisis in 1887, but he hesitated to strike a blow. He championed the cause of revision of the constitution, and was elected deputy in 1888. His popularity, somewhat impaired by a duel with Floquet, was regained; he was supported by very diverse elements—Monarchists, Bonapartists, anarchists, and many Republicans. Chosen deputy for the department of Seine in 1889, he could not resolve to execute a *coup d'état*. His programme was abolition of the parliamentary republic by a constituent assembly. The Government acted firmly. It suppressed the so-called League of Patriots, and decided to try Boulanger. He fled to Brussels, and was in his absence condemned to imprisonment on charges of conspiracy, treason, and misappropriation of funds. With his death in exile, two years later, Boulangism collapsed.

Carnot was then president. He was assassinated by an anarchist in 1894, and was succeeded by Casimir-Périer; the latter resigned early in 1895, on the ground that he was "irresponsible, and unable to answer attacks." M. Faure was his successor. Faure died in office in 1899, and was followed by M. Loubet. Besides the presidents, the statesmen of the last ten years include Freycinet, Ferry, Clémenceau, Ribot, Tirard, Méline, Dupuy, Rouvier, Hanotaux, Goblet, Constans, Brisson, and Floquet.

The act of an anarchist has been mentioned. Anarchism and strikes have been subjects demanding the attention of Government. The tariff was materially raised in 1891. After weathering Boulangism the republic was exposed to the Panama scandal. The great name and achievements of De Lesseps had involved the French deeply in the Panama Canal project. The collapse of the enterprise dragged down the reputations of various politicians, ministers, and journalists. A parliamentary investigation in 1893 resulted in the imprisonment of Charles de Lesseps and the trial for corruption of several senators, deputies, and officials.

Meanwhile the Franco-Russian *entente* was progressing. The chief steps that mark the formation of the Dual Alliance as a counterpoise to the Triple Alliance may be thus summarized: The visit of a French fleet to Cronstadt in 1891; the return visit of a Russian fleet to Toulon in 1893; the journey of the czar to France in 1896; and the tour of President Faure to Russia in 1897. On the last occasion the executives made use of the term "friendly and allied nations," thus formally indicating the fact of an understanding. Other recent important events were the constitutional crisis, in 1896, regarding the power of the senate; the adverse criticism on the mismanagement in Madagascar; the increased attention to the navy; and, in 1898–99, the Fashoda question, relating to the upper Nile region, a matter which nearly embroiled France with Great Britain.

All these things have been overshadowed by the "Dreyfus case." Capt. Dreyfus, an officer in the army, of Jewish descent, was apprehended in 1894 and sent by military court order to Devil's island, off the tropical coast of South America. Much mystery marked the occurrence, but it was understood that he was charged with betraying military secrets to a foreign power. Several attempts were made to reopen the case, notably by the novelist Zola in 1898. Anti-Semitism and the necessity of standing by the army were invoked. The matter was finally referred to the court of cassation, and he was brought back and tried and again pronounced guilty; but he was immediately pardoned and left the country.

This unfortunate incident, with the sudden death of President Faure, led to an ominous increase of activity on the part of the Bonapartist and Orleanist claimants, and caused skeptics to renew their doubts about the life of the Third Republic. Doubters may well offset against turbulent demonstrations in Paris the stability of the provinces, and against the staggering load of debt they may set the marvelous recuperative power displayed by France at many critical occasions. EDMUND K. ALDEN.

Franklin, SAMUEL RHOADS: naval officer; b. in York, Pa., Aug. 25, 1825. He was appointed midshipman in 1841; was in the action at Monterey, in the Mexican war, and was made passed midshipman 1847; served in the Coast Survey 1853–55; was commissioned master and lieutenant 1855; after service in the North Atlantic and the Brazilian squadrons and on the Atlantic coast, from 1855 to 1862, he became executive officer of the Roanoke, on board of which vessel he had been in her action with the Merrimac, when the Cumberland and the Congress were destroyed; he was commissioned lieutenant-commander in 1862, was with the Gulf blockading squadron in 1863, and on special duty at New Orleans 1864; in 1865 he participated in operations in Mobile Bay, being on the staff of Acting Rear-Admiral Thatcher, and was the naval representative in the demand for the surrender of Mobile; was made commander in 1866, and advanced to captain in 1872, being subsequently transferred to duty as hydrographer to the Bureau of Navigation at Washington; he was promoted to commodore in 1880, was placed on special duty in the Bureau of Equipment, and became president of the board of examiners 1883; was made rear-admiral in 1885, and was assigned to duty as superintendent of the Naval Observatory; he became commandant of the European station in 1886, and was retired in 1887.

Franko: the patronymic of a talented musical family, consisting of the brothers SAM and NAHAN and the sister, JEANNE, all violinists and pianists. They were all born in New Orleans, La., the children of a wealthy Jewish merchant there. Nahan was born July 23, 1862, and began the study of the violin very early. He made his first appearance in Steinway Hall, New York, Sept. 17, 1869, with the Carlotta Patti Concert Company. The next year he went to Europe and studied under famous teachers for seven years. He played at many concerts, and has been also quite successful as a conductor. Since his return from Europe he has always resided in the vicinity of New York. The sister, Jeanne, was also educated in Europe, and she too has made New York her artistic home. She is a good pianist, but a better violinist. The brother Sam is also a good performer, but less known than Nahan and Jeanne.

D. E. HERVEY.

Franks, Sir AUGUSTUS WOLLASTON: archæologist; b. in Geneva, Switzerland, in 1826; educated at Eton and Cambridge, England, and received the degree of M. A. in 1852. His first book, *Ornamental Glazing Quarries*, was published in 1849. He was considered one of the greatest authorities on the arts of the Renaissance and Oriental keramics. He was for many years keeper of the department of British and mediæval antiquities in the British Museum, and presented to the museum a collection of Chinese and Japanese porcelain and pottery and examples of Italian majolica and other wares. He was knighted in 1888. He wrote *Recent Excavations and Discoveries on the Site of Ancient Carthage* (1860); *Guide to the Christy Collection of Prehistoric Antiquities and Ethnography* (1868); *Catalogue of a Collection of Oriental Porcelain and Pottery* (1876); and edited *Horæ Ferales* (1863) and *Japanese Pottery* (1880). He was a fellow of the Society of Antiquaries, and was its president from 1892 till his death, May 22, 1897.

Franqueville, AMABLE-CHARLES FRANQUET, Comte de: French jurist and politician; b. in Paris in 1840; studied law and was admitted to the bar in Paris, and afterward, under the empire, was an auditor in the Council of State; in 1888 was made a member of the Academy of Sciences; was made an officer of the Legion of Honor May 17, 1873. His most important works are analytical studies of English institutions, including *Étude sur les sociétés de secours mutuels d'Angleterre* (1863); *Les Institutions politiques, judiciaires, et administratives de l'Angleterre* (1864); *Du Régime des travaux publics en Angleterre* (1875); *De la Personnalité civile du diocèse* (1875); *Le Gouvernement et le Parlement britanniques* (1887). F. STURGES ALLEN.

Franz Josef Land: an Arctic archipelago lying mostly N. of the eightieth parallel and bisected by the meridian of 60° E. lon. It consists of islands whose number and size are still undetermined, though most of them are small, and there is reason to believe that none compares in size with the main islands of the Spitzbergen group, which they resemble in geological structure and in their general aspect, though, being farther N., their climatic conditions are more severe. There are no mountain-chains, but there are many conical or table-topped mountains, isolated and in groups, with a mean altitude of 2,000 to 3,000 feet. The rocks are largely of igneous origin, though sandstone and old marine beds strewn with shells are found. The vegetation is not rich, and no reindeer have been met, but other Arctic land-animals and birds and sea-animals abound. The group was discovered by the Austro-Hungarian expedition commanded by Carl Weyprecht and Julius Payer, in the ship Tegetthof, on Aug. 30, 1873. They were borne to the islands by the ice-pack, their vessel drifting more than ten months before they saw these new lands. Payer's sledge journey in the spring of 1874 extended to Cape Fligely, 82° 5′ N. and 58° E., and resulted in a map of the archipelago, which has since been greatly changed by the explorations of Leigh Smith in 1880 and 1881, who extended the limits of the archipelago to the N. W., and by the Jackson-Harmsworth expedition, which spent about three years among the islands from Sept. 7, 1894. The main geographical result of the last expedition was the proof that the islands do not extend far to the N., and therefore do not afford, as was conjectured, a convenient land base for sledging toward or to the pole. C. C. ADAMS.

Frederic, HAROLD: journalist and novelist; b. in Utica, N. Y., Aug. 19, 1856; graduated at Hamilton College in his twentieth year; in 1874 became a proof-reader in the office of the Utica *Herald*, and during the next six years was rapidly advanced on the staff of that paper, and became chief editor of the Utica *Observer*; in 1882 assumed charge of the Albany *Evening Journal*, and edited it for two years; in 1884 was sent to London as regular correspondent of the New York *Times*, and remained at that post until his death. Aside from his pronounced success as a journalist, he achieved distinction as a writer of fiction. His first novel, *Seth's Brother's Wife* (1887), won for him creditable position; this was followed by *In the Valley* (1889); *The Lawton Girl* (1890); *The Return of the O'Mahony* (1892); *The Copperhead* (1894); *Marsena* (1895); *The Damnation of Theron Ware* (1896); and *March Hares* (1896). *Gloria Mundi* was running serially at the time of his death. It was his aim to illustrate in his fiction the peculiar features of American life. *The Damnation of Theron Ware* is generally regarded as his most truthful and powerful work, *March Hares* coming next. D. in London, England, Oct. 19, 1898.

Free Ports: A certain area in a number of important ports of Europe, specially reserved, is called the "free port," and within its limits all goods may be landed or stored without paying duty. The whole area, with all trading and manufacturing establishments in it, is considered as "foreign territory," not subject to customs duties or regulations until goods stored or manufactured within the free port are actually sold to persons in the same country, when the goods are treated as other imported wares. Thus at Hamburg, Bremen, and Copenhagen, the three chief free ports, commodities may be brought from any part of the world into the area set apart as the free port and then sent to foreign markets, paying duty only when taken into the country in which the free port is situated. The advantages of the free port to commerce are similar in many respects to those of bonded warehouses in the U. S. Lumber may be shipped to the free port of Copenhagen, stored there at low rates, and then distributed to the various ports of the Baltic according to the demands of trade without paying customs duty unless sold for use in Denmark. The tendency of the free port is to enhance the importance of the port by making it a central emporium for commodities brought from afar to be finally distributed in other countries. Imports stored in the free ports of Hamburg and Bremen are distributed to all parts of the world. C. C. Adams.

French, Daniel Chester: sculptor; b. in Exeter, N. H., Apr. 20, 1850. He studied art in Boston and in Florence, Italy; opened a studio in Washington, D. C., in 1876, and there executed *The Owl in Love* and *Dick Swiveller and the Marchioness*; returned to Florence in 1878, and afterward resided there. His sculptures include *The Minuteman of Concord* (unveiled in Concord 1875); *The May Queen*; *Elsie Venner*; *Peace and War* (in the St. Louis custom-house); *The Waking of Endymion*; and a life-size statue of Gen. Lewis Cass (for the National Memorial Gallery, Washington).

French, George Franklin: physician; b. in Dover, N. H., Oct. 30, 1837; graduated at Harvard College in 1859, and at its medical school in 1862; served on the staff of Gen. Grant and organized field hospitals for Gen. Sherman's army in the civil war; was surgeon-in-chief under Gen. Sherman during the march to the sea, and resigned in June, 1865. He settled in Portland, Me., was one of the original staff of the Marine General Hospital, and in 1875 became instructor in physiology and lecturer on dermatology in Portland Medical School. He went to Minneapolis in 1879, was lecturer on obstetrics in the St. Paul Medical College in 1881 and in the Minneapolis Hospital College 1882–85, and in 1886 became Professor of Gynæcology in the last-named college. He was president of the State examination board in 1887, and president of the Minnesota Academy of Medicine in 1890. D. in Minneapolis, July 13, 1897.

French, John Raymond, LL. D.: educator; b. in Pulaski, Oswego co., N. Y., April 21, 1825: graduated at Union College in 1849, soon afterward becoming Professor of Mathematics in Falley Seminary, Fulton, N. Y., of which he was subsequently principal; in 1855–59 was principal of Mexico Academy; during this time he studied law, in 1859 was admitted to the bar, and practiced until 1864, when he became Professor of Mathematics at Genesee College. When Genesee College became Syracuse University, in 1871, Dr. French was made dean of the College of Liberal Arts and retained the chair of Mathematics; at the time of his death, Apr. 26, 1897, he had been for nearly three years vice-chancellor of the university. He received the degree of LL. D. from Allegheny College in 1870.

Friedheim, Arthur: pianist; b. in St. Petersburg, of German parents, Oct. 26, 1859; studied there, and made his first appearance in his ninth year. Then, with his mother, he went to Weimar, where he became a pupil of Liszt. Next he went to Dresden and conducted opera there for several years, but afterward returned to Weimar, where he took up his abode with Liszt, accompanying that great master to Rome and Naples. He made several concert tours, with great success, through Cairo, Alexandria, Vienna, Northern Germany, Paris, and London. In 1891 he came to New York. Among his compositions is a concerto for piano in B flat, which he first brought out in Carlsruhe, Nov. 30, 1891, and again in New York, in Mar., 1894. D. E. Hervey.

Friedrich, Johannes, D. D.: Old Catholic theologian; b. in Poxdorf, Bavaria, not far from Bayreuth, May 5, 1836; studied at the Universities of Bamberg and Munich; was ordained to the Roman Catholic priesthood in 1859, and became chaplain in Marktscheinfeld, Bavaria. His academic activity began in 1862, when he became privat docent in the University of Munich; in 1865 he was made Professor Extraordinary of Theology. In 1869–70 he attended the Vatican Council as "theologian" to Cardinal Prince Hohenlohe-Schillingsfurst, and made himself very obnoxious to the majority by joining his colleague Döllinger in opposing the passage of the papal infallibility dogma. When, in 1871, Archbishop Scherr, of Munich-Freising, demanded acceptance of this dogma from all members of the Munich theological faculty, he, with Döllinger, refused and was excommunicated. Nevertheless, he was promoted to the ordinary professorship of Doctrinal History, Symbolics, Patrology, and Ecclesiastical Archæology and Literature in 1872. In 1882 the feelings of the strict Catholics were respected, and he was transferred to the philosophical faculty as Ordinary Professor of History. He took a prominent part in organizing the Old Catholic Church, opened the Old Catholic theological faculty at Bern in 1874, and lectured there two semesters on church history; yet when the Old Catholic synod voted, in 1878, to allow its priesthood to marry, he consistently withdrew from its leadership. He has been a prolific author. Of especial interest are his writings on the Vatican Council, *Tagebuch während des vaticanischen Concils geführt* (Nördlingen, 1871; 2d ed. 1873); *Zur Vertheidigung meines Tagebuch* (1872); *Geschichte des Vaticanischen Concils* (Bonn, 1877–87, 3 vols.); and his biography of Döllinger (Munich, 1st vol. 1899). S. M. J.

Fry, Sir Edward, P. C., B. A., D. C. L., LL. D., F. R. S., F. S. A., F. L. S.: jurist; b. in Bristol, England, Nov. 4, 1827; educated at Bristol College and at University College, London, and is a fellow of University College and of Baliol College, Oxford University; was called to the bar in 1854 and made queen's counsel and bencher of Lincoln's Inn in 1869, and was appointed treasurer of Lincoln's Inn in 1892. He has held many positions of trust, including the governorship of the Charterhouse and of Clifton College, trusteeship of the Hunterian Museum, College of Surgeons, etc.: presided over the royal commission on the Irish Land Acts 1897–98; was knighted in 1877, in which year he was made judge of the High Court, Chancery Division, which office he held until 1883, when he was appointed a lord justice of appeal, from which latter office he retired in 1893. He has published *Essays on the Accordance of Christianity with the Nature of Man* (1857) and *A Treatise on the Specific Performance of Contracts* (3d ed. 1892). He is an enthusiastic student of bryology, and has published a book on *British Mosses* (1892). F. Sturges Allen.

Funcke, Otto: German Protestant popular preacher; b. in Wülfrath, Germany, Mar. 9, 1836. He studied at Halle, Tübingen, and Bonn, and since 1868 has been pastor of the Friedenskirche in Bremen. His religious writings are very popular. Several of them have been translated: *The School of Life: Life Pictures from the Book of Jonah* (London and New York, 1885; 2d ed. 1886); *Self-will and God's Will, or How to Discern what is God's Will in the Perplexing Questions of Life* (1887); *The World of Faith and the Every-day World, as displayed in the Footsteps of Abraham* (1891); *How to be Happy and to Make Others Happy* (1896). S. M. J.

Funk, Franz Xaver, von, D. D.: Roman Catholic theologian; b. in Abts-Gmünd, Würtemberg, Oct. 12, 1840; studied at Tübingen and in the priests' seminary at Rottenburg; became Professor Extraordinary of Theology at Tübingen 1870; Ordinary 1875; was ennobled 1890. Of his learned works may be mentioned *Geschichte des kirchlichen Zinsverbotes* (Tübingen, 1876); *Lehrbuch des Kirchengeschichte* (Rottenburg, 1886; 3d ed. 1898); *Die apostolichen Constitutionen* (1891); *Kirchengeschichtliche Abhandlungen und Untersuchungen* (Paderborn, vol. i., 1897). He edited the fifth edition of Hefele's *Opera patrum apostolicorum* (1878–81, 2 vols.; 2d ed., vol. i., 1887). S. M. J.

Funk, Isaac Kaufmann, D. D., LL. D.: b. in Clifton, O., Sept. 10, 1839: graduated at Wittenberg College, O.; held pastorates near Moreshill, Ind., at Carey, O., and in Brooklyn, N. Y., 1860–65; traveled in the Holy Land, Egypt, and Europe in 1872, and on his return engaged in the publishing business; founded and edited the *Metropolitan Pulpit* (now the *Homiletic Review*) in 1876. The firm of which he is the head founded *The Voice*, a Prohibition paper, in 1884, and *The Literary Digest* in 1890; it has also published a number of important reference books, its principal publication being the *Standard Dictionary* (1890–94), of which he was editor-in-chief. He is an aggressive Prohibitionist, and is prominent in other social reforms.

Fursch-Madi, Emma: singer; b. in Bayonne, France, about 1847, and was educated at the Paris Conservatory. Her first public appearance was at a symphony concert conducted by Pasdeloup. Next she appeared as Marguerite, in *Faust*. Verdi selected her to create the part of Aïda in French at the Théâtre de la Monnaie, Brussels. Her first visit to the U. S. was in 1874, with the New Orleans French Opera Company. Returning to Europe, she sang for three seasons in Covent Garden, London, with such success that Mapleson engaged her for the New York season in 1884 at the Academy of Music. She was engaged by Henry E. Abbey for the opening season of the Metropolitan Opera-house. She sang frequently in opera and concert, until, taken ill, she bought a farm in Warrenville, Somerset co., N. J., and retired to it, where she died, Sept. 19, 1894. She was married three times—first to M. Madier de Montjau, next to M. Henri Verle, and finally to Mr. Wurtz, a painter. She left a son by her first husband and a daughter by her second. Her last public appearance was as Ortrud, in *Lohengrin*, at the Metropolitan Opera-house, in Feb. 1894.
D. E. Hervey.

Furst, William: composer and conductor; b. in Baltimore, Md., Mar. 25, 1852, and studied music there. At the age of fourteen he was a church organist. In 1878 he produced his comic opera *Electric Light*, and then conducted an opera company for five seasons. In 1884 he went to San Francisco, and became musical director of the Tivoli theater. There his opera *She* was brought out and ran for nine weeks. It was also given in New York, at Niblo's, Dec., 1887, and performed two seasons. In 1888 his grand opera *Theodora* ran for four weeks in San Francisco. Other works are *The Isle of Champagne* (1891); *Honeymooners* (1893); *Princess Nicotine* (1893); *The Little Trooper* (1894); *Ghismonda*, incidental music (1894); *The Merry World* (1895).
D. E. Hervey.
