CENSUS OF CANADA, 1591

## SPECIAL BULLETIN

on

## MECHANICAL AND MANUFAOTURING INDUSTRIES

Daparmant of Agmelliture, Ottawa, Ducember, 1894.
This bulletin relates to the mechanieal and manufacturing establishments of Cimalia.

Its ohject is to place the condition of thoso industrios beyond homest cavil, by examining the attacks which have been made upon the results obtained from the statisties grathered by the census enumemators in the census taken in 1891. Those statisties, when empared with the returns of 1881 , show the following results :-

|  | 1881. | 1891. | Jncrease. |
| :---: | :---: | :---: | :---: |
| Nunfer of extablishments | 49, 9 \% 2 | 75, 968 | 96,24i |
| Capital invested. | 8164, 057, 423 | S35-4, $1 \times 200750$ | \$189, 6 (63, 3,327 |
| Nimber of enaployees. | 25,4, 814 | 310, 370,256 | 115,3152 |
| Wages paid | 859,401,703 | \$100, (ib3, (2ĩ0 | \$11,2611,948 |
| Cust of maw matorial | S17 51423,193 |  | Sift, 18! , 84! |
| Vigine of proilucta. |  | S-176, 2is, 286 | \$106, 527,01! |

These figures differ both in 1881 and in 1891 somewhat from those whieh have been previously published. The explamation is that the above statement is the result of a carefnl examination of the returns of the censuses of 1881 and 1891 for the purpose of errouping the mechanical and industrial establishments according to the value of their output. In some cases errors in addition were diseovered; in other cases errors of omission were found. The close serutiny of cach of the 125,690 industrics was $a$ work involving great labour, as caeh industry required 12 columns or about $1,500,000$ entries in all. But it was deenmed advisable to undertake the work, 1st, as giving to the public such a grouping of onr industries as would enable them to see at once in what directions our industrial development was taking place, whether in the line of large industries or otherwise: 2nd, as giving to the public and on public men information which wond enable them to sec the defects, if any, of the system followed in Canada during three eensuses with respect to our industrial establishments, and 3rd, as givinga solution of the question how best to improve the returns so as to remove the doubts of their value which have been raised after each census.

$$
8 d-1 \frac{1}{2}
$$

In all eases the compilation has been made from the original sheets without reference to the results published in the 1881 report, or to the preliminary bulletins for 1891 .

The basit of the grouping is the yearly output of the several establishments, teing the value of the artieles produced in the mechanieal and manuffetmring establishments of the country, as reported to the census enumerators by those to whom they applied for the information.

The divisions made were five in number. This grouping was decided on because it was considered that fewer divisions would not bring out the faets with sufficient clearness, while a greater number of divisions would incrense unneessarily the work of compilation.

The definition of an industrial establishment whieh has guided the enumeratots in the three censuses taken under federal autlority is: "An industrial establishment is any place where one or steral persons are engaged in manafactming, altering, making up or changing from one shape into another, materinls for sale, use or consumption."

The olject in view in all three censuses was to procure full statistics of the small, as well as of the large, industrics of the country.

Whether, when the industries are very small, they should be ineluded in the compiled statement is a fair subject for disenssion. In the censuses of 1881 and 1891 they were included, if the value of the articles produced amounted to 850 in the year. Possibly the limit fixed in 1881 was too low, but as it was fixed at that figure it was not doemed advisuble, in the absence of any legishative ematment, to raise the limit in the compilation of the statisties gathered in the consus of 1891.

To meet the ohjection that might be, and has been, raised, that such very small industries, if taken, lewl to misconception and tend to swol! the number of industrial estahlishments without adding materially to the sum total of the output, the plan of grouping has been adopted.

The materiad is before ench investigator: If he thinks that these small industries should not be included he has but to drop them both for 1881 and 189 t and he has the four remaining groups to compare trgether.

No. 1 group inclules all mechanical and manafaturing establishments whese output of articles produced was in the census years under 82,$000 ;$ No. 2 , inelndes all whose yearly ouput wat from 82,000 to 212,$000 ; N_{1}, 3$, all from $\$ 12,000$ to $\$ 25,000$; No. 4, nll from 825,000 to $\$ 50,000$, and No . 5, all having an amual output from 50,000 and upwards.

## Br groups.

The results of the examination are given in the following summary :

| 9 |  |  | fiom <br> " $812,0 \tan$ ta $\$ 2 \pi, 004$. <br>  <br> " \& \&rambind over. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \% | 4 | 16 |  |  |  |  |
| 1 |  |  |  |  |  |  |
| ! | $\cdots$ | 4 |  |  |  |  |

## Census Industries.

A study of this table will show:
1st. That while group 1 , (which contains all the sumller industries) has increased ly 50 per cent in 1891 comprod with 1881, it has not increaser more mithidly in 1891 than it did in 1881 proportionately to the total output. In each census year group 1 formed 6.7 per cent of the total output.

If in order to swell the total the enumerators had "raked and scraped" together all the small industries, as they have been charged with doing, to a much greater extent than was done in the census of 1881 , the result would be that the group comprising the small industrios would have a larger proportion of the whole than it had in 1881. But the proportion is exactly the same. This is the best evidence possible that the enumerators of 1891 used equal diligenco with those of 1881 in looking after the small industries. They were bound to do that. Had they been over zoalous in the performance of their sworn duty in 1891, as compared with the enumerators of 1881, such ultra zeal would have revealed itself in the analysis by groups.

The results shown in group No. 1, of 1891, prove beyond a perad venture that the enumerators, taken as a body, did their duty honestly and did no more than their duty.

The analysis by groups confirms the general conclusion deduced from the totals. In tho census of 1891 the 75,968 mechanical and manufacturing establishments of the country aro reported as having an output of $\$ 476,258,886$, which is tuaverage of $\$ 6,262$ per estublishment. In the census of 1881 , the 49,722 establishments are reported is having an output of $\$ 309,731,867$ or $\$ 6,228$ per establishment.

If there lad been an ahormally large increase in the number of very small industries taken in 1891, that increase would have shown itself in the reduction of the average per establishatent for 1891 below the average of 1881 . On the contrary the werage is higher.

Ind. The grouping brings out the fact that the greatest absolute and relative increase was in group 5 . The increase in 1891 in this group was $\$ 107,027,419$ over the output of lN81 for the similar group. That incresse is $6 \|^{2} 2$ per cont of the whole.

If the lowest standard of an industrial establishment is to be considered an output of 850,000 a yeir, then judged by that standard the people of Canada in the year $1800-91$ provided themselves with manufactures to the value of $82(00,795,190$ against $8153,767,771$ in the yem $1880-81$. That is, that for every $\$ 100$ worth of neticles manufinctured in Canada in 1880 there was $\$ 169.70$ worth of articles manufactured in Cinada in 1890, the population only inereasing in the same period by 12 per eent.

If the stmudard of industrinl establishments is taken to he an nnnual output of 82,000 and over; then in the year $1890-91$ the poople of Canula were supplied from the manufactories of Canada with $\$ 444,003,694$ worth of home manufactured articles against $\$ 288,997,787$ worth of the same in $1880-81$. This is an increase of $8155,005,907$, or 53.7 per cent of an increase in the output of our manufactories in the slyee of 10 years.
a Thus it is shown conclusively that there has boen a very great increase in the capacity to supply ourselves with manufactured articles from our own Canadian workshops.

If, now, to groups 2, 3, 4 and 5 be added the output of group 1, which constitutes only me-fifteenth of the total output as given in the census returns, annlysis will show that the total output as given in the consus yoar 1890-91 was equal to $\$ 98.54$ per head of the population, an incronse of $\$ 26.91$ per head as the measure of the development of manufacturing in Canala after ten yous of effort in that direction. Take ofl the smaller industries, viz., group 1, and there remains an output of $\$ 91.87$ per head in 1890 and of $\$ 66.60$ per hoad in 1880 , showing an increase of $\$ 25.27$ per head. This is a difference of $\$ 1.64$ letween the per head output of all five groups in the census years $1890-91$ and $1880-81$ as compared with the per heud output of four groups, No. 1 group boing left out.

It is because of this $\$ 1.64$ in a total of $\$ 26.91$ that an outery has been raised against the results of the industrial census of 1891 . It is not worth fighting over. Drop it out altogether and the increase of $\$ 25.27$ per hend of the population is sufficient to prove that there hms been a great development of our manufacturing eapacity,

## 58 Victoria.

that the output of all elasses of neelanieal and manufacturing industries-lenving out for the purpuse of the argument the smaller ones of group 1-has been remarkable.

It is no part of the duty of the writer to account for that inerease or to sot forth the diflidultice encountered by those engaged in Canala in mechanical and manafacturing industries owing to their proximity to the more highly organized industries of the sume kind in the United States. It is his duty to present the facts with such fulness of detailed analysis as will establish them beyond all doubt, seeing that they have been averred not to be faets at all.

But to many persons a group containing a fair proportion of industries with an output close to $\$ 2,000$ a year would not be considered a group of small industries at all. That group contains the germ of future large mechanical and manufacturing industries. It is the most interesting of all the groups in that respect, and that there has beco an inerease so marked in this group is proof, Ist, that the lirge indnstries lave not ernshed out the small ones, and 2nd, that the netivity of the poople in tho manufatmang direstion is on the inerease ; in other words, that it pays a cunstantly ineremsing number of persons engaged in solving the problem of living to turn to mechanien and manufacturing oceupations.

These are growl signs of houlthy growth, and the diarnosis is eonfirmed by the fiuct that while in group 1, in 1881, the average output per establishment was 8646 a year, in 1891 it was $8633^{\circ}$, an upproximation so close as to show that nothing has oecurred during the ten years to prevent the development of these smaller industries.

## Group Five.

Taking up tho largest gromp, analysis gives the following results:
There were in 1891 in Cunala 708 establishments laving an anrund output of from $\$ 100,000$ to $\$ 500,000$ and in 1881, 460 . Of those with a yearly output from $\$ 500,000$ to $\$ 1,000,000$ there were 49 in 1891 and 24 in 1881 . Thase with an annual output of over $81,000,000$ numberel 19 in 1891 and 10 in 1881.

The following table gives the ammer and provinee, being analysis of group a:-

Further analysis has leen matle of eolumn 4, by subdividing it into establishments having an output from $\$ 100,000$ tor $\$ 200,000, \$ 200,000$ to $8: 00,000$, and so on wisk whe lislfnents laving in output of $\leqslant 1,000,000$ mad over.

The results eannot be publishal hy provinees owing to the foct inat in sevirna casos Where is in a provines lat, one extablishenent having the output within the dheignated range. To publish the fact in such ensts would be to reveal with more or less distinet-

## Consus Thclustrics.

ness tho identity of the oxtablishment. Tho resuls can, howewer, be given for Cunde. They are as under:

Establishments having an output of:

The increase in the number of these large establishments is 276 or 552 per cent against the increase of $22 \cdot 1$ per cent, which is the increase of all the establishments taken in the census of 1891 over the total mumber taken in the census of 1881.

## Analysis for Ontario.

An analysis of the province of Ontario shows that Eastern Ontario (ineluding in that designation Renfrew, Ottawia eity, Preseott, Glengary, Comvall and Stormont, Russoll, Carleton, Dundas, Grenville South, leeds, Sanark, Frontenate, Mroekville, Ad, liaghon, Prince Edwarl, Lamox, Hastings, Kingston, Peterbormgh and Northumberhand) had 37 cestablishments with mu output of frum $\$ 100,000$ to 8500,000 , and two with an output of 8500,000 to $\$ 1,000,000 \mathrm{in} 1881$. In 1891 the sathe conuties and cities had 70 establishments with : in output of $\$ 100,000$ to $\$ 500,000,10$ with an output from half a million to a million, and one with an output of over a million dollars.

In Central Ontario, comprising Nipissing, Muskoka, Victoria, Durham, Ontario, Simeoc, York, Cardwell, Toronto and Peel, there were 75 establishuents having an annual output of from $\$ 100,000$ to $\$ 500,000$ in 1881 , and 152 establishments having an output of the same rango in 1891. In 1881 there were four with an output of from half a million to one million dollars a year, and in 1891 the number was the same, 4 ; in 1881 there were no establishments having an output beyond the million dollar mark and in 1891 there were two.

In Western Ontario, comprising all the remainder of the province there were 128 es. tablishments in 1881 , and 170 in 1891 , with an output from $\$ 100,000$ to $\$ 500,000$; four in 1881, and 12 in 1891, with in output from half is million tọ une million; two in 1881 and two in 1891 went beyond the million dollar mark.

Of those which in the province of Ontario went beyond the one million dollar ontput, the nggregate was $\$ 2,200,000$ in 1881, and $\$ 6,175,000$ in 1891 .
${ }^{4}$ The number of establishments in the province of Ontario having an output of of from $\$ 100,000$ to $\$ 500,000$ inereased by 152 which is 62.5 per eent of an increase. The increase in the number of establishments having an output from half a million to one million was 160 per cent and of those beyond the million, nark, $\$ 150$ per cent.

## Analysis for Quibec.

In the province of Quebec, Montreal and Hochelaga are the great eentres of the large manufacturing establishments.

Tu 1881 there were in the whole province 171 establishments having an output of $\$ 100,000$ to $\$ 500,000: 13$ with an ontput from half a million to one million, thed six with an ontpht of one million and over:

In 1891 the 171 establishments had inereased to 219, the 13 to 16 and the six to 11.

In 1891, 92 of the extablishments with an output of $\$ 100,000$ to $\$ 500,000$ were ontside of Montreal and llochehagn. In 1881 there were 69 of these establishments
outside of these two elcetoral distriets: Thus $4 \therefore$ per cent of these establishments were outside of Montreal and Hochelagit in 1891, and 40 per eent in 1881. So that the outside districts have slightly gained on the manufacturing enatre in respect to these establishments. Of industrial cstablishments with an output of half i million to one million the outside districts had 31 per eent in 1891 against 39 per eent in 1881, and of industrial establishments with one million and over of an output Montreal and Hochelaga had them all in 1891, while in 1881 one out of the six was outside of the two distriets.

Taking the whole provinee the inerease in the number of establishments with an output from $\$ 100,000$ to $\$ 500,000$ was 28 per cent. The increase in the number of those with in output of half a million dollars to one million dollars was 23 per cent, and of those having an output of a million dollars and over, 83 per eent. The increase of these three elasses in Montreal and Hoehelaga was 24.5 per cent, 37 per eent ind 120 per eent respeetively.

Of the establishments in the province of Quebee which went beyond the one million dollar mark the aggregate in 1881 was $\$ 12,263,159$, and in 1891 the aggregate was $\$ 28,416,504$.

Of the 19 establishments in Canada having in 1891 over a million dollars of an output, 11 are in the provinee of Quebec and 5 in the province of Ontario.

Of the 9 establishments which in 1881 had an output of over one million dollars 6 were in the province of Quebec and 2 in the province of Ontario.

The total output of the 19 estrblishments in 1891 wns, $\$ 38,769,004$; the 9 establishments in 1881 had an output of $\$ 17,290,159$.

The proportion which the output of these establishments bore to the total output of all the industrial and meehamieal establishments was in 1891, $8 \cdot 1$ per cent, and in 1881, $5 \cdot 6$ per cent.

It has been calculated that the output of the farms of Canada, allowing an average of 25 cents a day as the eost of farm prorluets eonsumed by cach person in Canada plus the exports of the produce of the farm, is equal to $\$ 500,000,000$ a year. The output from the mechanieal and manufachuring establishment is what at $8: 176,260,000$.

The furmers numbered 40 s 73 s in 1891 and, theretore, the average former contributed to the state the sum of $\$ 1,223$ a year.

The number of establishments in 1891 was 75,008 . Thus the meehnoical and manufacturing establitmonts emb:ibuted to the Stata as thair share towards the nggregate profluct of the country the sum of $\$ 0,000$ a year.

The total number of hands employed in these mechanical and manufacturing establishments was 370,250 . So that the share of each employee in the aggregated products is $\$ 1,275$, or somewhat more than eaeh farmer's share, in the sum total of the argregate produets of the firm.

## Conclusion.

The eonelusions derived from the statistics are :

1. That all the groups show a very considerable increase in 1891 over 1881.
2. That all the provinees have partieipated in this development of industrial occupations.
3. That during the ten years there has been a great increase in the number and in the output of the large industrial ustablishments.
4. That the small industriat establishments have not been affeeted injuriously by the development of the large establishments.
5. That while the group eontaining the small industries increased their output as a group in 1891, yet that relatively to the whole this gromp weeupies oxactly the same position the similar group did in 1881.
6. That, therefore, the statement that the output for 1.891 was inordinately and abnormally inerensed by bringing into the census of manufacturing and mechanieal establishments is greater proportionate number of the very small establishments than were included in the census of 1881 lacks the essential elmment of trath.

GDOROR JOHNSON, Statistician.
d with a similar group in 1881 . This is shown by the shaded part of the columns of 1891. Thus 1 output of 56 per cent more than the output of group 1 of 1881 . The length shows the proportion of that census. The width in 1891 (shaded lines) shows the growth in each group compared with and is also wider. These facts mean that the large industries of the country had an output in and showed an increase of $69 \cdot 6$ per cent on group 5 of 1881 :-
