## CONTENTS

The total 1974 deciduous fruit crop is forecast at 10.9 million tons, about the same as last year's utilized output, but nearly three-tenths above the small 1972 crop. Supplies of fresh citrus will be smaller than a year earlier until the new season gets underway in October. Prices at all levels for most categories of fruit will remain high during the remainder of 1974.

Apricots, pears, sweet cherries, and dried prunes head the list of smaller crops this season. These reductions are offset by moderately larger supplies of fresh nectarines and plums, California clingstone peaches, and tart cherries. U.S. production forecasts of apples, grapes, peaches (excluding California clingstones) and strawberries are virtually the same as last season.

Shipping point f.o.b. prices for fresh noncitrus fruit this season were generally higher with the exception of California plums and nectarines which reflected their record crops. Prices for sweet cherries, peaches, grapes, pears, and apricots were moderately higher than a year ago. With the progress of harvest, f.o.b. prices for major fresh deciduous fruits have been declining seasonally and will probably continue to do so through fall, but are expected to average above year-earlier levels.

The prospective supply situations for a number of processed noncitrus items, particularly frozen and dried, have improved and will be adequate during the coming marketing season. For example, frozen fruit and berries (particularly strawberries, blueberries, peaches, and apples) and dried fruits (particularly prunes and raisins) should be in adequate supply. Apricot products appear to be in shortest supply. However, except for canned clingstone peaches and apple products, canned noncitrus fruit will be relatively short once again this season primarily because canners' stocks at the beginning of the pack year were at the lowest level in recent times.

Partly reflecting higher grower production costs, price agreements for most fruit utilized for processing are being negotiated moderately to substantially higher than a year ago.

Supplies of fresh citrus, mostly from California, will be smaller than a year earlier until the new season gets underway in October. Prices received by orange growers have been generally above year-

earlier levels while grapefruit prices have been below the relatively high levels a year ago. Prices for these two fruits will advance seasonally until the new crops move to market in volume. In response to a smaller crop, lemon prices have been substantially higher than a year ago and will remain high through early fall.

As a result of smaller citrus crops, total 1973/74 pack of processed citrus is expected to be less than last season. Demand for processed citrus products has been generally good in spite of higher retail prices. With substantially larger stocks at the beginning of the season, stocks of canned and frozen citrus items are now moderately to substantially above year-earlier levels. However, chilled citrus juice stocks currently are below a year ago.

Citrus trees this summer have been in generally good to excellent condition with fruit growth developing well.

Prices at all levels for most categories of fruit will remain high at least until the end of this calendar year. Consumer prices for fresh fruit will remain above year-earlier levels, re-

flecting lower remaining supplies of citrus fruit as well as strong demand and increased marketing costs. Prices for frozen and canned fruit will also remain above a year ago as processors pass sharply higher raw material, processing and marketing costs—tin cans, sugar, packing materials, and transportation—through to consumers.

Higher prices could meet with consumer resistance both at home and abroad, resulting in lower levels of domestic use, decreased export demand, or both, for fresh and processed U.S. fruit. Shipments and sales of some high-priced fruit products could lag if consumers substituted a relatively cheaper fruit and even some other food item in their purchasing patterns. The precise degree of substitutability among fruit products, and between fruit and other fruit items, has not been determined. With the likelihood of some switching, prices of some individual items may weaken as the season progresses. The real questions concern how much weakening and for which products. These are among the most pressing uncertainties facing fruit marketers during the 1974/75 season.

## RECENT DEVELOPMENTS AND OUTLOOK

### NONCITRUS FRUIT

#### Apples

#### 1974 Crop—Changes in the Pattern of Supplies

The August 1 forecast of this year's total U.S. apple production is nearly the same as last year's. The estimate at 6.2 billion pounds is 1 percent less than last year, but 5 percent more than the 1972 utilized crop. However, there has been some changes in the pattern of supplies this season with increases in the East and Central States nearly offsetting smaller crops in all Western States.

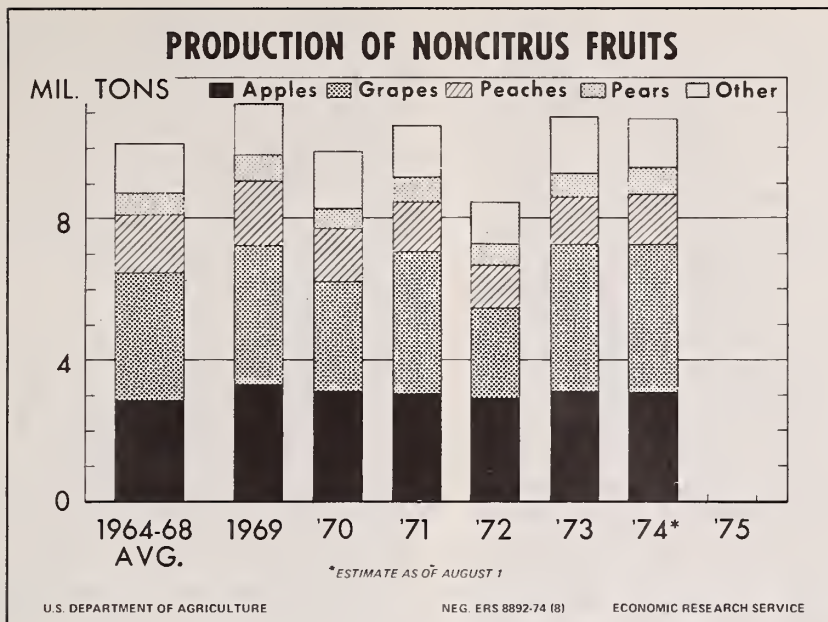

The East expects a crop of 2.6 billion pounds, 4 percent above last year with New York, North Carolina, and New England accounting for the increase and offsetting smaller crops in Pennsylvania, Virginia, West Virginia, and Maryland. In the Central States, production at 1.1 billion pounds is about one-third larger than the 1973 crop. Michigan's apple crop is expected to be 670 million pounds, about 52 percent above the short 1973 crop.

The Western States production is forecast at 2.4 billion pounds, 15 percent less than last year.

Table 1.—U.S. noncitrus fruit: Production, 1972, 1973, and indicated 1974

Crop	Utilized		1974
	1972	1973	
	1,000 tons	1,000 tons	1,000 tons
Apples .....	2,935	3,102	3,083
Apricots .....	127	158	94
Cherries, sweet .....	95	154	135
Cherries, tart .....	134	87	123
Cranberries .....	<sup>1</sup> 104	105	112
Grapes .....	2,570	4,218	4,209
Nectarines .....	86	87	100
Peaches .....	1,204	1,302	1,446
Pears .....	608	720	704
Prunes and plums .....	353	751	644
Strawberries .....	229	239	240
Total .....	8,445	10,923	10,890

<sup>1</sup> Includes cranberries put in set aside under the cranberry marketing orders.

**Table 2.—Apples: Regional production, 1972, 1973, and indicated 1974**

Area	Utilized		Indicated 1974
	1972	1973	
	<i>Billion pounds</i>	<i>Billion pounds</i>	<i>Billion pounds</i>
East . . . . .	2.53	2.49	2.59
Central States . . . . .	1.25	.85	1.14
West . . . . .	2.09	2.86	2.44
Total U.S. . .	5.87	6.20	6.17

Washington expects about a one-tenth smaller crop at 1.65 billion pounds. Production in all other Western States will also be lighter than in 1973 (table 5).

Production of the leading apple varieties, Delicious and Golden Delicious, is expected to register a decline this season. The forecast for Delicious at 2,058 million pounds, is down 5 percent from last year and accounts for 33 percent of 1974 production. The Golden Delicious estimate of 949 million pounds is 2 percent below a year ago, and represents 15 percent of this year's crop. Production decreases are also expected for Rome Beauty, off 13 percent; and York Imperial, 31 percent less. Significant increases are forecast for McIntosh, up 37 percent from last year; and R.I. Greening, up 79 percent (table 6).

#### Utilization of the 1973 Crop

The share of the total 1973 apple crop utilized for processing continued to be relatively stable,

accounting for 44 percent. Apples used for applesauce and other canning registered an increase and accounted for 20 percent of the 1973 crop, a 3 percentage point increase from 1972. The utilization of apples for frozen products took 4 percent for each of the past two seasons while dried products doubled their share to 4 percent. The only category to register a decline was apples utilized for juice which dropped from nearly 18 percent of the 1972 crop to about 14 percent.

The share of total apple crop used fresh had been relatively constant in recent years. Fresh use was about 56 percent of the 1973 crop.

#### Exports Increase

Fresh apple exports during the 1973/74 season (ending June 30) increased 19 percent to 178.3 million pounds. However, exports still represented less than 3 percent of total U.S. utilization. As usual, Canada took the largest share, over 50 percent this season, while the European markets took 10 percent—28.1 million pounds less than a year earlier.

Imports of fresh apples during the 1973/74 season were 16 percent lower than the year before, and totaled about 90.1 million pounds. Imports of apple juice during calendar 1973 at 20.6 million gallons, were nearly one-fifth less than in 1972 with South Africa and Australia the major suppliers. During the first half of 1974 imports of apple juice at 8.3 million gallons were down 10 percent from a year earlier. Supplies from France during this period increased substantially as imports from South Africa and Australia were off considerably.

## Prices

Season average prices received by apple growers for the 1973 crop were higher in all regions of the U.S. Most significant increases occurred in Eastern and Central States where production was off significantly last season. The U.S. average grower price for all sales was estimated at 8.8 cents per pound, 37 percent higher than for 1972. Growers received an average 10.8 cents per pound for U.S. apples used fresh, up from 8.92 cents for the 1972 crop. For processing apples, average grower prices doubled from \$62.80 to \$124.00 per ton for the 1973 crop reflecting the strength of processor demand.

Grower prices for apples early in the 1974 season may average slightly below last year's high levels with a larger fresh supply available from Eastern and Central States this year. In addition, processor demand is not expected to be as strong this season as it was during 1973/74. However, grower prices for fresh apples may average above year earlier levels during the coming winter and spring months since supplies from Washington State will be moderately lower this season.

## Grapes

The production situation for U.S. grapes this season at 4.2 million tons is virtually the same as last year's large crop. Like apples, some shifts in supply did occur this season. California's estimated crop of 3.8 million tons is down 3 percent from last year. California's raisin varieties at 1.95 million tons will be down 17 percent from last year, but anticipated increases of 22 percent in wine varieties and 12 percent in table varieties will be largely offsetting (table 8).

Production in New York, Michigan, Pennsylvania, Ohio, and Washington, major grape processing States, represents 9 percent of the U.S. total and is forecast to be 37 percent more than the short crop last year. New York's crop at 198,000 tons is 55 percent larger than in 1973 and nearly double the short 1972 crop. This year's prospect is in the range of the record 200,000-ton crop of 1971, primarily because of high yields and an increase in acreage. Michigan expects its grape crop to double to 47,000 tons from last year's short crop.

Most of the U.S. grape crop is crushed for wine—about 61 percent of last year's utilized production. In California, 96 percent of the wine varieties were crushed during the 1973/74 season with the remainder shipped fresh. In addition, more than half of California's raisin and table varieties were crushed for wine last season. Raisin production, the second most important outlet for grapes, utilized 23 percent of the 1973 U.S. grape output, compared with 17 percent in 1972. Fresh usage accounted for one-tenth of 1973 U.S. grape production while the remaining 6 percent was used for canning, juice, jam, jelly, etc.

Last season's U.S. average grape price received by producers was \$159 per ton, down about 4 percent from the previous season. As expected, prices varied greatly by producing area, variety of grape, and utilization. For example, last season's prices were \$455 per ton in Arizona (primarily fresh market) but averaged \$122 for raisin varieties (fresh equivalent of dried and not dried) in California.

The average price paid by raisin packers for the 1973 crop was \$700 per ton (dried basis), up 25 percent from 1972. Currently, the California raisin price for

the 1974 crop has not been established and no price offers have been reported. Since not all raisin grapes are dried, the price outlook depends largely on production and just how much the wine industry will absorb. Some industry observers indicate the 1974 raisin production will equal or slightly exceed that of 1973. Stocks of raisins as of August 1, were substantially larger than a year ago when stocks were small; thus if industry estimates of production are realized supplies will be large enough to cause some downward pressure on prices. However, foreign demand for raisins is expected to continue strong since Australia and South Africa report a cut in raisin production, and Turkey reports 25 percent of its Sultana vineyards damaged by an April freeze.

Fresh grape shipments from California through mid-August this season were running about 13 percent below year-earlier levels. In mid-August, shipping point prices for Ribier f.o.b. Kern District, Calif. were reported at \$7.20 per 23 pound lug, compared with \$6.38 quoted in mid-August 1973.

### Peaches

U.S. peach production is forecast at about 2.9 billion pounds, 11 percent more than utilized in 1973 and 20 percent above 1972. The August 1 forecast for California clingstone peaches was reduced 2 percent from July to 1.58 billion pounds but still 22 percent above 1973. Rains during the early part of July resulted in brown rot disease in the early varieties.

Excluding California clingstone, total peach production is about the same as last year at 1.3 billion pounds, with most of these peaches sold fresh. Supplies were down substantially in the Southeastern region, particularly South Carolina and Georgia. The California freestone crop was forecast 12 percent larger than a year earlier. Production in the Appalachian district of Maryland, Pennsylvania, Virginia, and West Virginia is expected to be one-third larger than the 1973 crop. Larger supplies were also forecast for New Jersey, New York, Michigan and Ohio.

With this pattern of production, early prices for fresh use were significantly higher than last season; but as shipments from more northern areas increased in volume, prices have declined to levels closer to those of last season. In June the average U.S. price received by growers for fresh use was 21.2 cents per pound, compared with 14.1 cents in June 1973. However, prices in July declined from June to 14.0 cents per pound, but still above the 13.2 cents in July 1973. In mid-August shipping point f.o.b. prices continued moderately to significantly above last season depending on variety, quality and location, and are expected to continue so the remainder of this season.

Last season, canners took 54 percent of the total U.S. crop, and California clinstones accounted for

nearly 90 percent of the total U.S. pack of canned peaches.

Canners' stocks of clingstone peaches at the beginning of the new pack year were at the lowest level in years—only 1.4 million cases (24-2½'s) compared to 1.6 million cases on June 1, 1973. However, should the 1974 pack fully reflect the 22 percent larger clingstone crop, the resulting total supply of approximately 27 to 27.5 million cases would be much larger than the 23.2 million cases available during 1973/74.

As reported in the *July Fruit Situation*, the canners agreed to pay members of the California Canning Peach Association a base grower price of \$132.50 per ton, up from \$97.50 last year. In addition, canners and the California Freestone Peach Association have agreed on the price of \$135 per ton, roadside, for the principal canning freestones the Fay Elberta variety. The price is based on a 5 percent variable tolerance, and a 2¼ inch minimum size. The agreement represents a 35 percent increase over last season's price. They also agreed on \$130 per ton for Regular Elbertas.

With the fresh market continuing to take considerably more California freestones than a year ago, the pack is likely to be smaller this season than last year's 2.9 million cases (24-2½'s).

Wholesale prices for canned peaches continued to advance sharply in recent months with the BLS price for July at \$4.95 per case (12-2½'s), up from \$4.36 in June 1974, and \$3.59 in July 1973.

Exports of canned clingstones in 1973/74 season amounted to 2.8 million cases (24-2½'s) compared to 2.6 million during the previous season.

USDA announced two purchases of canned peaches. On July 26, 114,800 cases (24-303 cans/case) were bought for distribution through the needy families programs. No such purchases were made last year. On August 8, 283,800 cases of canned peaches packed in 6-No. 10 cans per case were purchased for distribution through the child nutrition program. Last year under a similar program, 39,600 cases were purchased.

Processors of freezing type California freestone peaches settled with the California growers for \$135 per ton, roadside, for Rio Osos and other late varieties. A year ago freezers paid \$120 per ton for the Rio Osos and \$130 for other late varieties. Storage stocks of frozen peaches on August 1 were about 25.3 million pounds, substantially above the supplies on hand the same data last year.

### Pears

The 1974 pear crop is forecast at 703,600 tons, 2 percent less than last year's utilized crop, but nearly 16 percent higher than the 1972 crop.

Bartlett pear production in the 3 Pacific Coast States at 479,000 tons is 6 percent below last year.

Most of these pears are produced for canning with nearly three-fourths of last season's crop utilized in this manner. Small additional volumes of Hardy pears are also produced in California for the canning market.

Stocks of canned pears on June 1 were sharply below a year ago and lowest in recent times. With reduced pack prospects, this season's total supply will likely be moderately smaller than last season's 12.3 million cases (24-2½'s). Wholesale prices for canned pears have increased significantly during the past marketing season. During July BLS reported the average wholesale price at \$5.95 per case (12-No. 2½ cans per case) compared to \$4.89 per case for July 1973. Prices at all levels are expected to remain strong in view of the smaller supply and higher price of raw product. The California growers and canners have agreed on a field price of \$165 per ton for No. 1 grade Bartletts and \$163 for Hardies, roadside at the orchard, compared to \$115 and \$113, respectively, last season. Northwest processors and growers have agreed on a price of \$160 per ton for No. 1 grade Bartletts 2½ inch and larger; this is \$50 more than last year.

The production of fall and winter pears in Washington and Oregon is expected to total 172,000 tons or about 6 percent larger than in 1973. These pears are mostly destined for storage and delivery to the fresh market during the winter and spring.

Most of the remaining U.S. pear production is centered in Michigan and New York. Both States expect larger crops this season at 14,000 tons each, compared to 12,600 tons in New York and 9,500 tons in Michigan a year ago. These increases are somewhat offset by smaller crops in Utah, Idaho, Colorado, and Connecticut.

Fresh shipments of Bartlett pears from California through mid-August were considerably below a year earlier. Consequently, Sacramento Valley f.o.b. Bartlett prices were \$9.00 per standard box, wrapped pack, 90-150's, compared with generally \$7.50 per box last season. Shipping point prices for Bartlett pears at Yakima, Washington have also opened substantially above year earlier levels. Although production of winter pears in the Northwest is slightly higher, late-season pear prices are not likely to weaken significantly.

U.S. exports of fresh pears during the 1973/74 season increased to approximately 86 million pounds, 61 percent above a year earlier. Most of the increase was accounted for by Europe and Canada, the largest foreign buyer of U.S. fresh pears. During the same period U.S. imports of fresh pears declined sharply to 18.5 million pounds as domestic supplies during 1973 recovered from the short crop of 1972. Once again Australia was our major supplier.

## Cherries

### Smaller Supplies of Sweet Cherries

Supplies of sweet cherries were lighter this summer, with smaller crops in the important Western States. Total sweet cherry production at 135,000 tons was 12 percent lower than last year's production, but 42 percent higher than the extremely short 1972 crop. Output in the Western States at 110,150 tons was down 18 percent from a year ago, while production in the 3 Great Lake States was up substantially, nearly one-quarter above last year's utilized production.

Reduced production levels were reflected by reductions in fresh shipments. Sweet cherry shipments at the end of July were about a quarter below a year-earlier levels and fresh prices at major shipping points were higher.

Although the volume of the crop shipped fresh during the 1974 season is not known, fresh utilization accounted for 54 percent of last year's crop compared to 44 percent in 1972. Brining outlets accounted for 35 percent of the 1973 sweet cherry crop and about 46 percent in 1972.

### Larger Crop of Tart Cherries

Tart cherries are in more abundant supply this summer. The U.S. crop is placed at 123,450 tons, up 42 percent from last year's short crop. Total production for the Great Lakes States, which account for about 90 percent of the total U.S. crop, is 111,100 tons—up 50 percent from last year. In Michigan, the leading State, production is up nearly two-thirds from the 58,000 tons used in 1973. Most tart cherries are produced for freezing, which accounted for 65 percent of the crop in 1973 and 61 percent in 1972. Canning outlets took 27 percent of the 1973 utilization and 31 percent in 1972. The remaining small volumes were shipped fresh or used for juice, wine or were brined.

At the beginning of the current pack year July 1 inventories of both frozen and canned tart cherries were down substantially from a year ago. The carryin for frozen items was down 41 percent to 16.1 million pounds, while canners' stocks on July 1 were the lowest on record—only 4,506 cases (24-2½'s). However, with higher production prospects, supplies during this season will be substantially larger than during the 1973/74 season.

### Nectarines, Plums and Prunes

Output of both fresh plums and nectarines in California was significantly greater this year than a year ago. Nectarine production was estimated at 100,000 tons, up 15 percent from last year. California's fresh plum crop was 130,000 tons, about a third more than in 1973 and 1972. Fresh shipments of California plums and nectarines exceeded year-earlier levels throughout the season with prices

generally lower. Although recent shipping point prices (mid-August) have firmed, season average grower prices for California nectarines and plums are expected to average below a year earlier.

Production of prunes and plums in Michigan, Idaho, Washington, and Oregon is forecast at 64,000 tons, 2 percent less than last year's utilized crop, but 53 percent more than the light 1972 crop. Michigan, Oregon, and Idaho prospects are below last year while Washington expects its best crop since 1969. The fresh market and canning account for most of the prunes and plums produced in these 4 States. In 1973, about 43 percent of the crop was used fresh with most of the remainder used for canning.

Dried prune production in California is forecast at a sharply lower volume this season. The tonnage being estimated is 155,000 dried tons, nearly one-quarter below the 1973 level. August 1 carryover of dried prunes has been estimated at about 54,000 tons, considerably above last year's low level of 4,541 tons. Thus, despite the sharply smaller pack this season, total supply for the 1974/75 season will remain ample due to the large carryover. Because of anticipated prune supplies the Prune Administrative Committee in California has recommended, and USDA has

proposed, that 75 percent of the 1974 California dried prune crop be designed salable to meet expected carryover requirements. The remaining 25 percent—reserve pool—could be used to satisfy additional demand, develop new markets, or augment short supplies.

### **Cranberries**

The first forecast of the Nation's 1974 cranberry crop is about 2.2 million barrels, 6 percent more than last year's total crop and 8 percent above 1972. Increased production over last year in New Jersey, Washington and Wisconsin will more than offset smaller crops in Massachusetts and Oregon. Much of the increase in production will come from Wisconsin which expects 900,000 barrels, an increase of 19 percent and its largest crop of record.

Production utilized during each of the last 2 seasons was approximately 2.0 million barrels. During 1973, 1.5 million barrels were processed, down from 1.6 million processed in 1972. Fresh use increased from 0.3 million barrels in 1972 to 0.4 million barrels during 1973. The remainder is accounted for by shrinkage or cranberries lost due to dehydration and berry breakdown after delivery.

## **FRESH CITRUS**

### **Oranges**

#### **Remaining Supplies of California Valencias Nearly as Large as a Year Ago**

Most remaining supplies of 1973/74 crop oranges are California Valencias. They will provide the bulk of fresh market supplies until new crops mature this fall. In late July about 10 million boxes of California-Arizona Valencias remained for late-season marketing, only slightly less than the quantity available during the same period last summer even though the total crop was estimated almost 14 percent less than the 1972/73 season. Fresh use of California-Arizona Valencias so far this season has been almost the same as a year ago, while processing use has been only half of last year's volume. During 1972/73 a large proportion of the freeze-damaged Valencia crop from the Central District of California was diverted to processing outlets. Thus, with a small quantity of oranges available for the summer, fresh use will remain the principal outlet and processing uses are likely to remain substantially below last season.

#### **Fresh Orange Prices Above Year-Earlier Levels**

In response to a smaller California Valencia crop, f.o.b. prices for California Valencias for fresh shipment have been above year earlier levels since May. However, f.o.b. California Valencias packed

fresh declined from \$7.35 a box to \$6.85 from June to July, but still was 9 percent above a year ago. In view of light supplies remaining for the season, prices are expected to continue above last year until the new season gets underway in October. With high prices for California Valencias in prospect, retail prices for fresh oranges will continue to average above year-earlier levels. In July, BLS-reported retail prices for oranges averaged \$1.11 a dozen compared to \$1.02 last year.

#### **Foreign Trade Balance Improved**

U.S. exports of fresh oranges and tangerines during November 1973-July 1974 totaled 8.3 million boxes. This was about one-fifth above the same period last season. Canada, the principal purchaser of U.S. oranges, took substantially more than last year. Shipments to Europe and other countries also increases substantially. In contrast, imports of fresh oranges during the first 7 months of 1974 were down one-fourth from last year in spite of a smaller domestic orange crop. The principal suppliers sent us less: Mexico was down almost one-third; Israel, one-sixth.

### **Grapefruit**

#### **Summer Supplies Light**

Remaining supplies of fresh grapefruit, now mostly from southern California, will continue seasonally

light until harvest of new-crop Florida grapefruit in September. This season's California grapefruit crop was considerably smaller than a year ago. Since the volume of grapefruit used fresh has been almost the same as a year earlier and processing use has been substantially less so far this season, the remaining supplies as of late July were almost the same as a year earlier.

### Prices Stay Low

With the 1973/74 grapefruit harvest nearing completion, U.S. on-tree returns to growers for fresh market grapefruit have advanced seasonally in recent months, but have remained substantially below the high level of a year ago. In July, U.S. on-tree returns to growers for fresh market grapefruit were \$3.18 a box compared with \$3.74 a year ago. Demand for fresh grapefruit appears to be lagging moderately behind the pace of last season. Through mid-August this season, total fresh grapefruit unloads in 41 major markets were 7 percent less than a year earlier. However, because of increased marketing costs, retail prices of fresh grapefruit most months of this season have been slightly above the corresponding period a year ago. But BLS-reported retail prices for fresh grapefruit during July averaged 20.8 cents each or 7 percent below a year earlier. In view of the limited remaining supply, fresh grapefruit prices received by growers are expected to continue upward until the new season gets underway but probably will not reach the high levels recorded a year ago.

### Exports Strong

Fresh grapefruit exports during the 11 months ending July 1974 were 6.2 million boxes, up 22 percent from last season. The continued increase in exports to Japan was chiefly responsible. Shipments to Canada decreased substantially and accounted for nearly one-fourth of total exports compared with slightly more than 37 percent a year ago. The European

market took approximately one-tenth of total exports, down only slightly from last season. Exports to Japan increased 70 percent and accounted for two-thirds of total exports.

## Lemons

### Summer Supplies Up Slightly

The 1973/74 California-Arizona lemon crop is expected to be 17.4 million boxes, approximately one-fourth below last season's record crop. Harvest is still in progress in California but has been completed in Arizona. Through early August, shipments to processing outlets were substantially below a year earlier. This was primarily because the 1973/74 frost-damaged fruit resulted in a high elimination rate at the packinghouse. Movement of fresh markets was only down slightly and supplies remaining for marketing exceeded those of a year earlier.

### On-tree Returns Remained Substantially Higher

Fresh lemon prices continued to advance seasonally in July, but they were substantially below the high levels early in the season. In July, on-tree returns to growers for fresh lemons was \$6.30 per box, 39 percent above the relatively low levels of a year ago. As a result of the smaller crop, fresh lemon shipments were down substantially from a year earlier. The new shipping season started in very small volume. Grower prices for lemons are likely to remain high through early fall.

### Exports Down

U.S. exports of lemons have been deterred by smaller crops. Exports of lemons and limes from November 1973 through July 1974 totaled 4.3 million boxes, a decrease of 2 percent from the corresponding period a year ago. Decreased shipments were reported to all usual export areas with the largest decline taken place in the European markets, down 9 percent.

## PROCESSED CITRUS

### Output Down in 1973/74 Season

As a result of the smaller citrus crop, total U.S. 1973/74 pack of processed citrus is expected to be less than last season. The Florida citrus packing season finished earlier than last year. With the exception of canned and frozen grapefruit items, output of processed citrus items in Florida was slightly to moderately smaller than a year earlier. Less processing use of California-Arizona citrus has also been reported so far this season. The packing season in Texas finished earlier than a year ago. Texas packed nearly 9.6 million cases (24/303) of canned citrus products compared with 9.9 million last season.

Carryover of most canned and frozen citrus items in Florida will be above year-earlier levels, while chilled citrus juice on hand is likely to be below a year earlier.

### Frozen Concentrates

The 1973/74 pack of Florida frozen concentrated orange juice was about 171.8 million gallons as of August 10, slightly below a year earlier. However, with carryover stocks last fall of about 48 million gallons, packers' supplies including imports this season amounted to approximately 224 million gallons, 10 percent above 1972/73. Demand for frozen concentrate has been good. Movement to the trade so

far this season was about 7 percent higher than last season. Exports of frozen orange concentrate for the season through June have been nearly 8.2 million gallons, 14 percent more than last year. But with a carryin 73 percent larger than last season, Florida packers' stocks of FCOJ as of August 10 were 105 million gallons, 11 million gallons above the heavy stocks on hand a year earlier. The Florida citrus industry recently has conducted a merchandising program to stimulate sales. Recent weekly rates of movement from packers to the trade have been running substantially above year-earlier levels. So far this season, weekly rate of movement has averaged 3.33 million gallons compared with 3.12 million last season. However, it appears that carryover of FCOJ at the end of the current season is likely to be substantially above year-earlier levels.

Grower prices for Florida oranges used for frozen concentrate have averaged moderately above those of a year ago. In early August, spot prices for oranges for frozen concentrate were reported at \$2.81 per box, compared with \$2.42 for the comparable period a year earlier. However, because of larger stocks on hand, the price of Florida orange concentrate at processing plants has been steady at \$1.88 per dozen 6-ounce cans (unadvertised brands) with the exception of two promotional allowances. In early April, Florida citrus packers offered promotional allowances and discounts for frozen concentrates shipped through May 3 which resulted in an effective price of \$1.76 per dozen 6-ounce cans. The second promotional allowance and discount was effective for orders made by July 27 and shipments by August 10 which resulted in an effective price of \$1.63 per dozen 6-ounce cans. After the promotion the effective f.o.b. prices varied by processor from \$1.88-\$2.03, but prices have currently settled at \$1.88.

However, prices at retail since March have shown a gradual upward trend and in July were 25.6 cents a 6-ounce can, slightly higher than a year ago. But frozen orange concentrate is still one of the few food items that has not increased significantly in price in recent years. In view of the large stocks of frozen orange concentrate on hand, f.o.b. prices probably will remain relatively steady until the new crop estimates become available in October. Current citrus conditions in Florida is excellent with fruit growth developing well.

Excluding reprocessed gallonage, the 1973/74 pack of frozen concentrated grapefruit juice had reached almost 9 million gallons as of August 10, slightly more than the corresponding period a year ago. Thus, with movement slightly less than a year ago and a 26 percent larger carryin at the beginning of the season, there were 7.2 million gallons of grapefruit concentrate in inventory as of August 10, one-fifth above a year ago.

To facilitate orderly marketing of frozen concentrated orange juice, a State marketing order

has been proposed to establish a reserve pool for FCOJ beginning with the 1974/75 season for the Florida citrus industry. A referendum has been ordered by the Florida Citrus Commission, and growers and processors were casting their ballots until August 30. If the referendum is passed, the marketing order will go into effect on September 30, 1974.

### Chilled Products

Despite a smaller orange crop, Florida's 1973/74 output of chilled orange juice to August 10 totaled 127.9 million gallons, 7 percent above the corresponding period in 1972/73. The increases were recorded from both fresh fruits and reconstituted bulk frozen concentrate. Total pack for the 1973/74 season is expected to set another record as packers will continue to turn increasingly to frozen orange concentrate for processing into chilled juice for the remainder of the season.

In spite of higher prices, demand has been strong for chilled orange juice. Total domestic movement through August 10 was 113.2 million gallons, 8 percent above a year ago. For the first 10 months of the 1973/74 season (October 1973-July 1974), chilled orange juice prices at retail averaged 49.1 cents per quart compared with 47.8 cents during the corresponding period the previous season.

With a slightly larger Florida grapefruit crop, the current season's pack of chilled grapefruit juice in Florida (excluding single-strength reprocessed gallonage) had reached 16 million gallons as of August 10, 7 percent above year-earlier levels. Movement has been strong, up almost 1 million gallons from a year ago, leaving smaller stocks on hand as of August 10.

### Canned

The citrus packing season in Florida is virtually finished. Total pack of canned citrus products was

36.6 million cases (24-2's), slightly below a year earlier. The decrease was primarily attributed to a decrease of one-fifth in canned orange juice pack, while the canned grapefruit pack was more than last season. With the exception of canned grapefruit juice, movement of all canned citrus products has been slightly less than a year ago. In spite of the smaller pack, slow movement and a larger carryin at the beginning of the season have resulted in larger stocks of canned citrus products, approximately 7 percent above a year earlier as of August 10.

After the significant fluctuation in prices of Florida canned orange and grapefruit juice during the season, current list prices of canned single-strength orange juice (1 dozen of 46 ounces, f.o.b. Florida canneries) have currently stabilized at \$4.35 compared with \$4.00 last year. Likewise, canned single-strength grapefruit juice prices have leveled at \$4.50 (a dozen of 46 ounces, f.o.b. Florida canneries) compared with \$3.75 a year ago. If processing costs continue to increase, canned citrus prices may rise even higher than current prices.

## TREE NUTS

### Almonds

California almond production is forecast at a record 180,000 tons in-shell. This is a third more than the previous record crops of 134,000 tons in 1971 and 1973. The continued increase in almond production largely reflects a steady upward trend in bearing acreage. California almond bearing acreage has been trending upward from 89,259 acres in 1961 to an estimated 229,180 acres in 1974. However, yield per acre has stayed relatively stable since 1960. The historical trends for bearing acreage, production, and yield per acre for California almonds from 1960 to 1974 are shown in the following chart.

As of June 30, 1974, total movement of shelled almonds for this season amounted to 131 million pounds (includes reserve and salable shipped into export), almost one-tenth below year-earlier levels. This was due mainly to the slower movement in the domestic market, while U.S. exports of shelled almonds from August 1973 through June 1974 were one-fifth more than a year ago. Unshelled almond exports during the same period were also slightly

more than last year's 2,700 tons. However, the export market for this year does not look very bright. Foreign production (in Spain, Italy, Iran, Portugal, and Morocco) is forecast to be up almost 50 percent from last year's depressed crops.

Prices received by almond growers were sharply higher for the 1973 crop. The average grower price was \$1,440 per ton, compared with \$785 for the 1972 crop. However, with a larger inventory plus a substantially large crop in prospect and a weaker export demand, almond prices probably will not reach year-earlier levels. New crop openings are not expected until the end of August. The USDA has proposed that none of the 1974 crop will be set aside for reserve outlets, thus the entire crop will be salable.

### Walnuts

The 1974 walnut crop is forecast at 141,200 tons, 19 percent below last year's record crop. California production at 140,000 tons is down 19 percent from last year's record output of 173,000 tons, but is still 20

percent more than 1972's utilized production. The crop is developing well, but set varies from poor to good depending on variety and area. Harvest of early varieties will begin in early September. Oregon's crop is forecast at 1,200 tons, one-fifth more than last year's utilized crop. The crop in general looks good with some blight showing up.

According to the Walnut Control Board in California, in-shell walnut shipments to both domestic and foreign markets for the 1973/74 marketing year amounted to 90 million pounds, up 16 percent from last year. The increase was primarily

attributed to larger exports, up 28 percent, while shipments to the domestic market were up only 7 percent and its share declined to 56 percent from 60 percent a year earlier. Shipments of shelled walnuts during the same period increased 10 percent, but the bulk of the crop is utilized domestically.

Despite a larger crop, prices received by walnut growers were slightly higher for the 1973 crop. The average inshell price was \$580 per ton, compared with \$564 for the 1972 crop. New crop prices have not yet been established. However, good domestic and foreign demand is in prospect.

## PER CAPITA FRUIT CONSUMPTION

During 1973, civilian per capita consumption of fresh and processed fruit increased about 6 pounds to 199.2 pounds, 3 percent above 1972. This substantial increase more than offset a 4 pound drop during 1972.

Although per capita consumption of fresh fruit was off slightly to 75.6 pounds, the use of processed fruit rose about 6 percent to 123.6 pounds (fresh-weight equivalent). Almost all of the increase was in citrus products. On a fresh-weight equivalent basis, frozen citrus—mostly oranges used for frozen concentrated juice—showed the highest increase to 48.5 pounds, nearly one-fifth above 1972. Also, the steady increase in chilled orange and grapefruit juice consumption continued. In addition, more fresh oranges were eaten, increasing by nearly one-half pound to 15 pounds per person.

Noncitrus consumption, excluding apples, showed an increase of nearly 2 percent. Consumption of bananas, the major fresh fruit, increased from 18.1 pounds in 1972 to 18.4 during 1973. Canned noncitrus juice, excluding apple juice, increased nearly one-fifth, mostly due to greater consumption of pineapple juice. Canned noncitrus fruit were in tight supply because of the reduced carryin from the poor 1972

crop. Per capita consumption of apples and apple products (fresh equivalent) decreased about 3 pounds to 25 pounds. Consumption of fresh apples, the second major fresh fruit, decreased nearly one-fifth to 14.3 pounds, due largely to the abbreviated crop of 1972. Consumption of canned and frozen apples also declined, while apple juice and dried products advanced.

Detailed data regarding per capita consumption of fresh and processed fruit for the 1950 to 1973 period may be found in tables 22 through 28.

Based on preliminary estimates, another sharp advance is in prospect for total fruit consumption during 1974, and use may move to the highest level since the late 1950's. Processed citrus products will account for most of the gain, led as usual by a sharp rise in frozen orange juice concentrates. Though the 1973/74 citrus crop is estimated slightly below last year's record, inventories of products are currently high. The movement of frozen orange juice concentrate so far this season remained good.

Though supplies of citrus products remain ample, stocks of canned deciduous fruits on hand at the beginning of the pack season now starting represent the lowest per capita supplies on record.

<sup>1</sup> The crop year begins with bloom of the first year and ends with completion of harvest the following year. <sup>2</sup> Net content of box varies. Approximate averages are as follows: Oranges-California and Arizona, 75 lbs.; other States, 90 lbs.; Grapefruit-California, Desert Valleys, and Arizona, 64 lbs.; other California areas, 67 lbs.; Florida, 85 lbs. and Texas, 80 lbs.;

Lemons-76 lbs.; Limes-80 lbs.; Tangelos-90 lbs.; Tangerines-California and Arizona, 75 lbs.; Florida, 95 lbs.; and Temples-90 lbs. <sup>3</sup> Navel and miscellaneous varieties in California and Arizona. Early and Midseason varieties in Florida and Texas, including small quantities of tangerines in Texas.

<sup>1</sup> Excludes quantities consumed as baby food. Unless otherwise noted, data represent a calendar year (adjustments to a calendar year, when necessary, were made by combining proportional parts of each pack year involved). Civilian consumption only. Beginning 1960, includes Alaska and Hawaii. <sup>2</sup> Crop and pack year beginning October or November prior to year indicated. <sup>3</sup> 1955-59 average includes juice beginning 1955 and fruit beginning 1956. <sup>4</sup> Includes only apples grown in commercial areas. <sup>5</sup> Preliminary.

Note: See September 1970 (TFS-176) Fruit Situation for annual data prior to 1960.

## FRESH THOMPSON SEEDLESS GRAPES—PRICES, COSTS, AND MARGINS

by

Alfred J. Burns, Joseph C. Podany and N. A. Wynn, Jr.,  
Agricultural Economists  
Economic Research Service  
Commodity Economics Division

**ABSTRACT:** The retail value of Thompson Seedless grapes sold in Chicago and New York City increased an average of 73 cents per lug per year between 1964 and 1973. The wholesale and retail margin increased 40 cents per lug per year; rail transportation costs went up 3 cents; harvesting and packing costs rose 9 cents; and grower returns rose 21 cents. Transportation's share of the retail value decreased slightly. Other market shares, including the grower's share, changed little.

**KEY WORDS:** Grapes, retail price, costs, margins, grower returns.

Grapes, one of the principal fruits in the United States, ranked first among noncitrus fruits in farm value. Utilized grape production in 1973 had a farm value of \$671 million, 36 percent of the value of all noncitrus fruits.

Commercial grape production is reported for 13 States. California produces the most—around 90 percent of the U.S. crop each season (table 1). In 1973, of the 4.2 million tons of grapes produced, California accounted for 93 percent. California produced three

types of grapes—table, wine, and raisin. Some of each type are used in the fresh market.

Per capita consumption of fresh grapes has trended downward in recent years. The average person in the United States consumed an estimated 2.4 pounds of fresh grapes in 1973, compared with 3.5 pounds 10 years earlier.

Raisin-type grapes, of which Thompson Seedless are the most important, accounted for 60-68 percent of the California grape crop in each of the last 10

**Table 1.—Grapes: Production and fresh use, California and United States, 1964-73**

1973 .....	3,912	93	306	7	4,218	10	10	5

seasons. Most raisin-type grapes each season are either dried for raisins or crushed for wine. From 1964 to 1969, only 10-13 percent of the raisin grape crop each season was used fresh. Since then, increased demand for wine and raisins has sharply reduced the quantity of such grapes used fresh—to only 5 percent of the 1973 crop. Practically all raisin-type grapes sold fresh are Thompson Seedless.

This article discusses prices, marketing costs, margins, grower returns, and production costs for fresh Thompson Seedless grapes. Data used are from a continuing costs and margins project on fruit and vegetables.

### Procedures Explained

Thompson Seedless grapes were priced at two marketing levels—California shipping points and retail in Chicago and New York City. Retail prices were collected monthly by the Bureau of Labor Statistics in a sample of retail stores on Tuesday, Wednesday, and Thursday during the first week of the month containing a Tuesday. The shipping point price used is an average of daily prices for the week preceding the retail pricing week. Shipping point prices are reported by the Federal-State Market News Service. Monthly retail and shipping point prices are weighted by monthly carlot unloads of California grapes in Chicago and New York City to obtain the average price for the season (July-October).

The retail value of a lug of Thompson Seedless grapes is the return to the retailer for salable grapes (retail price minus 9 percent allowance for spoilage loss during the marketing process). Transportation costs are based on rail rates from Fresno, Calif., to Chicago and New York City. Harvesting and packing costs are reported by the California Agricultural Extension Service. Grower returns are derived from the shipping point price by deducting harvesting and packing costs. The wholesale and retail margin is derived by deducting the shipping point price plus transportation costs from the retail value. This margin represents payment for wholesaling (assembly and warehousing), intra-city transportation, and retailing. These functions may be performed by one of more firms. Production costs are based on sample costs reported by the California Agricultural Extension Service.

### Marketing Costs Up—Market Shares Unchanged

The retail price of Thompson Seedless grapes increased sharply between 1964 and 1973. The U.S. average retail price was 57.3 cents per pound in 1973, three-fourths more than 9 seasons earlier. Retail prices went up each season except in 1965, averaging slightly over 2 cents per pound more per year. Retail price increases usually occurred in response to declining supplies of raisin grapes used fresh.

However, in 1966, 1968, and 1971, increased supplies did not result in lower retail prices. Figure 1 shows the relationship of U.S. average retail price to the supply of raisin grapes used fresh.

Figure 1

The retail value of a 23-pound equivalent lug of Thompson Seedless grapes sold in Chicago and New York City averaged \$12.80 in 1973, 82 percent higher than in 1964 (Figure 2). The wholesale and retail margin averaged \$6.66 in 1973, more than double the amount in 1964. Rail transportation costs from California to Chicago and New York City, although unchanged from 1964 to 1967, went up 34 percent between 1967 and 1973. Harvesting and packing costs in California rose from \$0.94 to \$1.75 from 1964 to 1973, an 86 percent increase. Returns to California growers for grapes shipped to Chicago and New York City increased 41 percent, from \$2.53 to \$3.57 per lug. Grower returns fluctuated from \$1.72 in 1965 and 1969 to \$4.20 in 1972.

A simple trend line fitted to the data in Figure 2 indicates that the retail value of Thompson Seedless grapes sold in Chicago and New York City increased an average of 73 cents per lug per year since 1964. During the same period, the wholesale and retail margin increased 40 cents per lug per year; rail transportation costs rose 3 cents; harvesting and packing costs went up 9 cents; and grower returns went up 21 cents.

The market share of the retail value going for transportation costs decreased on the average about one-third of a percentage point per year during 1964-73. The percentage of the retail value going to other market factors and to growers did not show any significant trend over the period. For the 10 seasons, the wholesale and retail margin averaged 49 percent of the retail value, transportation costs 8 percent, harvesting and packing costs 14 percent, and grower returns 29 percent.

Figure 2

#### Retail Price Higher in New York City

Consumers in New York City paid a much higher average price for Thompson Seedless grapes each year than did Chicago consumers (tables 2 and 3). Price differences between the two cities ranged from 1.5 cents to 9.6 cents per pound. Rail transportation charges to the two cities were essentially the same. Higher retail prices were associated with a larger wholesale and retail margin in New York City each season. The margin was 25-35 percent larger in New York City than in Chicago in 7 of the 10 seasons.

A simple trend line fitted to the data in tables 2 and

3 indicates that both the retail value and the wholesale and retail margin increased faster on the average in New York City than in Chicago. The wholesaler's and retailer's share of the retail value was larger in New York City—by 2 to 12 percentage points. Growers received a smaller share of the retail value of grapes sold in New York City—1 to 8 percentage points less. For the 10 seasons, wholesalers's and retailer's share of the retail value averaged 44 percent in Chicago and 50 percent in New York City. The grower's share averaged 32 and 28 percent, respectively.

### California Production Costs Up

The cost of producing a 23-pound equivalent lug of Thompson Seedless grapes in California for table use averaged \$1.36 in 1972, 40 percent more than in 1964 (table 4). Labor, the largest single cost component, averaged 50 cents per lug, or more than one-third of total costs in 1972. The next largest component in 1972 was plant costs—primarily depreciation and interest on investment for vines, stakes, and trellis, amounting to 22 cents per lug. Costs of material other than plants were 20 cents per lug; herbicides and insecticides accounted for over 90 percent of this amount. Total equipment costs were about 26 cents per lug. Rent and overhead costs averaged 18 cents.

Relative labor costs declined slightly between 1964 and 1972, from 38 percent to 37 percent of total costs. Relative equipment costs declined also, from 21 percent to 19 percent. Total material costs, however, increased sharply during the period. Herbicides and insecticides, used to reduce labor and equipment costs and increase yields and quality, doubled in costs between 1964 and 1972, increasing their share of total costs from 10 percent to 14 percent. Fertilizer costs made up 1 percent of total costs in both 1964 and 1972.

### Prices and Costs to Continue Increasing

Costs of producing and marketing Thompson Seedless grapes are expected to continue rising for the next few years. Shortages of many inputs have resulted in rapidly increasing prices for them. Many materials used in production and marketing are derived from fossil fuels or made with energy produced from these fuels. Because of recent price increases in fossil fuels, prices are increasing for

**Table 4.—California Thompson Seedless grapes for table use: Perharvest cost of production, 1964, 1972<sup>1</sup>**

Cost item	1972		1964	
	Dollars per 23-lb. lug	Percent	Dollars per 23-lb. lug	Percent

Rent .....	.120	8.8	.103	10.6
Overhead <sup>4</sup> .....	.065	4.8	.046	4.7
Total Costs .....	1.359	100.0	.970	100.0

<sup>1</sup> Based on sample cost of producing California Thompson seedless grapes for table use reported by the California Agricultural Extension Service. <sup>2</sup> Includes social security and other benefit costs. <sup>3</sup> Depreciation and interest on investment for vines, stakes, and trellis. <sup>4</sup> 59 percent of total costs to cover supervision, interest on operating expenses, and other general expenses.

many materials used to produce and market Thompson Seedless grapes. For example, between the second quarter of 1973 and the second quarter of 1974, the index of prices for fuel, power, and light used

in marketing went from 135 to 200 (1967=100) and the index of prices of containers and packaging material increased from 123 to 145. Prices of these inputs and others—such as labor, rent, and taxes—are expected to continue rising.

Production and marketing cost increases will result in higher prices for Thompson Seedless grapes. If future price changes are similar to those of the last 10 years, the retail price of the grapes in Chicago and

New York City would reach 76 cents per pound, or nearly \$16 per lug, by 1978. This assumes conditions similar to those of the last 10 years. Higher retail prices will probably be passed back through the marketing system with higher prices at each level. Grower returns, although highly variable, would average \$4.60 per lug by 1978. The market shares of the retail value would be expected to show little change.
