UNITED STATES DEPARTMENT OF AGRICULTURE Bureau of Agricultural Economics Washington

FRUIM

STTIAT

- June 21, 1939

TFS-30

Larger crops of apples, peaches, apricots, pluns and cherries but smaller crops of pears, California grapes and dried prunes, and generally smaller crops of citrus than in 1938, were indicated by June 1 condition reports says the Bureau of Agricultural Economics.

Summary

Although some improvement in industrial activity and consumer incomes is in prospect for this summer and fall, the general business situation and demand for farm products probably will continue relatively stable throughout the year. The demand for fruits in general this season probably will be somewhat better than in 1938.

Early peaches, cherries, apricots and plums are already moving to market in considerable volume, and early apple shipments from the South have started. Marketings of new crop pears and grapes probably will begin in the next few weeks.

Production of California Valencia oranges from the bloom of 1938, marketings of which are just getting under way, is indicated to be somewhat smaller than the previous year's crop. Also, because of unfavorable growing conditions, a larger than usual proportion of this season's crop is indicated to be small sized fruit and of unmarketable quality. It is probable, therefore, that the supply of oranges for the summer and early fall months will be even smaller than the reduced production would indicate. Market prices in early June averaged substantially higher than those of a TFS-30

year earlier. Shipments of 1938 crop Texas citrus are about completed. Shipments from Florida are continuing in considerable volume and market prices in early June show only slight changes from early May.

Cold storage holdings of 1938 crop apples as of June 1 were smaller than a year earlier but larger than average holdings. Market prices of apples in early June were generally slightly lower than a month earlier.

DOMESTIC DEMAND

The following statement concerning demand conditions is from the Price and Demand Situation report of this Bureau, issued June 15, 1939.

"Developments during the past month have given further indications of moderate improvement this summer and fall in industrial activity and consumer incomes. No marked changes are expected, however, and the general business situation and demand for farm products probably will continue relatively stable throughout the year.

The Federal Reserve Index of industrial production declined to 92 in April. Consumer purchasing power also declined. Preliminary indications are that May industrial production was close to the April level. The June rate may be slightly higher, improvement in a number of lines having occurred in recent weeks.

It now appears probable that no very marked changes in business activity, such as occurred in opposite directions in 1936-37 and in 1937-38, will be repeated in 1939 and early 1940. It is true that business activity in the past generally has been characterized by wide fluctuations rather than by stability. There have been, nevertheless, some rather extended periods of relatively stable conditions and it is not at all improbable that changes in industrial activity during the next year or more will be less marked than those which have occurred in most years since 1929.

Production and consumption of consumers' goods in general have been sufficiently in line during recent months to call for no drastic balancing adjustments. The sobering influence of events since 1937 should prevent an early repetition of the sort of business psychology which resulted in the run-away period of inventory accumulation and consequent sharp stimulation of industrial production in 1936-37. Even if the expected summer and fall pick-up should result in a considerable improvement of business sentiment, it seens unlikely that any large volume of business spending for capital goods can get under way this year. Although the volume of such expenditures is affected by donestic and international conditions aside from the current novement of business activity, sustained improvement in the latter would seen to be a prerequisite for any considerable increase in tho volume of production of new capital goods. Thus, there is little basis for anticipating a rapid industrial expansion this year. On the other hand, the present - 3 -

situation with respect to the level of industrial production in relation to consumption, inventories, forward commitments, and business spending is not conducive of a sharp or sustained downswing, as evidenced by the resistance to unfavorable developments during the first part of this year."

CITRUS

Production of California Valencia oranges from the bloom of 1938 was revised as of June 1 to 23,870,000 boxes and is slightly less than indicated a month earlier and nearly 18 percent less than the crop produced from the bloom of 1937. A large portion of the 1938 crop is expected to be unmarketable because of frost injury and the preponderance of small sizes. Only small changes were indicated in production of oranges as of June 1 for other areas, and no change was indicated for other kinds of citrus.

The Texas orange and grapefruit marketing season for 1938-39 is completed, as is the season for California navel oranges. Although the marketing season for Florida oranges and grapefruit usually is nearly finished at this time of the year, shipments in recent weeks continue to be relatively large. Florida orange shipments totaled close to 1,400 cars during the week of June 10 compared with 550 cars during the corresponding week a year earlier. Grapefruit shipments from Florida totaled 536 cars compared with 240 a year earlier.

Market prices of citrus fruits have advanced slightly in recent weeks, a reflection of the reduced prospect for California Valencia oranges and the completion of the marketing season in several areas. Lemon prices in early June were sharply higher as a result of increased denand occasioned by the recent high temperatures in many eastern cities.

Although it is too early in the season to indicate production of citrus from the bloom of 1939, condition reports as of June 1 indicate less favorable prospects than a year earlier for California navel oranges and lemons and all grapefruit, but somewhat more favorable for California Valencia and Florida oranges.

PEACHES

The indicated production of early peaches as of June 1 is 16.1 million bushels, or slightly smaller than that of a month earlier, and is about the same as in 1938. It is about 1.6 million bushels greater than the 1928-37 average production. Shipments of early peaches were well under way in nid-June, and market prices in early June averaged considerably higher than during the corresponding period last year.

Production in the late-crop States, excluding California, is indicated to total 21.4 million bushels, or about 6 million more than in 1938 and 4 million more than the average crop for 1928-37. This prospect indicates a large supply of peaches available for market in late July, August and September. **TFS-30**

Peach production in California is also indicated to be large this year - totaling 24.4 million bushels - and exceeds that of 1938 by nearly 4 million bushels. Both clingstone and freestone varieties show increases over last year and indicate that there will be ample supplies for commercial canning and drying.

PEARS

The United States pear crop is indicated to total 30 million bushels this season compared with 32.5 million in 1938 and 25.4 million the 1928-37 average production. A decline of nearly 3 million bushels in the three Pacific Coast States more than offsets an increase of 483,000 bushels in all other States. Of the 19.6 million bushels indicated for the three Pacific Coast States, 13.6 million are Bartletts and 6.0 million are all other varieties. Early shipments of pears are expected to start about the first of July.

CHERRIES

June 1 condition indicated a cherry crop of 180,350 tons in 12 important commercial States, a new record high production. It is about 40,000 tons larger than the 1938 crop and is largely the result of sharply increased production in the States producing principally red sour varieties. Production in New York and the four North Central States combined is indicated to total 94,000 tons in 1939 compared with 50,630 tons in 1938. In contrast, production in the four Mountain States is indicated to total only 8,140 tons or about 4,500 less than in 1938 and in the three Pacific Coast States, where the crop is largely sweet varieties, 78,200 tons is indicated against 77,600 tons last year.

The supply situation this season indicates that there will be ample red sour varieties for canning and freezing. Stocks of red pitted cherries in canners hands as of June 1 totaled about 181,000 cases (24 #2's) compared with 388,000 cases a year earlier and indicate that the carry-over into the new marketing season (as of July 1) will be negligible. Shipments from canning factories for the period July 1, 1938 to June 1, 1939 totaled a little over 2 million cases (24 #2's) as compared with 2.4 million in the corresponding period a year earlier. By and large the present situation appears to be favorable from the standpoint of demand for red cherries for canning.

Cold storage holdings of cherries as of June 1 totaled 9.1 million pounds compared with 13.9 million a year earlier and 12.1 million pounds the seasonal low point as of July 1, 1938. On the basis of the decline in holdings from the seasonal peak, August 1 for quick freeze and September 1 for cold pack cherries, the out of storage movement for the 1938-39 season to June 1 totaled 23 million pounds and appears to be somewhat larger than in the previous season although strictly comparable data are not available. The relatively small stocks available this season indicate that the demand for cherries for freezing will be fairly favorable this season.

APPLES

The condition of the total apple crop as of June 1 averaged 69 percent of normal compared with 55 percent a year earlier and 64 percent the 10-year 1928-37 average for June 1. It would indicate a total crop for 1939 somewhat larger than the 1938 crop of 132 million bushels and slightly larger than the average crop of about 160 million bushels. Prospects were above average in the North Atlantic and North Central groups of States but below average in the South Central and Western groups. In the South Atlantic group condition is about average.

Cold storage holdings of 1938 crop apples totaled 1,665,000 bushels on June 1 compared with 1,969,000 bushels a year earlier and 1,551,000 the 10-year average holdings on June 1. Holdings this year in the Western States were slightly larger than a year earlier but in the Eastern States they were somewhat smaller.

Market prices of apples in early June were generally slightly lower than a month earlier but with few exceptions were well above those of a year earlier. Probably most of the decline in recent weeks was due to loss of quality since the end of the out of storage movement is near. A few shipments of early 1939 crop apples from Southern States have been reported and it is expected that the novement will increase rather rapidly in the next month.

Exports of apples from the United States from the beginning of the 1938 crop season to May 1 totaled 11.6 million bushels, as compared with 11 million bushels for the entire 1937-38 season and 13 million bushels, the average for the five seasons 1931 to 1935. The increased exports this season are a direct result of the relatively short fruit crops produced in Europe in 1938 occasioned by heavy spring frost. As a general rule exports from the United States vary with the size of the United States crop but the 1938-39 export season was unusual in that the United States produced a relatively snall crop. It is probable, therefore, that exports the past season would have been much larger if the United States crop had been relatively large.

Conditions in Europe as of May 1939 indicate fruit crops considerably larger than those harvested in 1938. Frost damage was less than in either of the last two seasons and fruit trees bloomed later than usual but heavily. Table 1 .- Citrus fruits: Production, average 1927-36, annual 1937-38

NOTE: Beginning April 1, 1939, warehousemen were asked to report their holdings of frozen fruits on the basis of small and large-size containers, instead of by the previous method of attempting to segregate the quickfrozen and cold-packed holdings. Indications are that most of the storage operators have shifted their reports to the new basis, but it may be several months before the container segregation can be considered productive of fully dependable results for the detailed classifications.
