INTERNATIONAL EXHIBITIONS,

LONDON, 1851.

LONDON, 1862.

LONDON, 1873.

"For ingenuity of construction and excellence of manufacture of surgical and obstetric instruments."—Vide JURORS' REPORT.

27, CAREY STREET,  
LINCOLN'S INN FIELDS, LONDON.

Entered at Stationers' Hall.

LONDON :  
PRINTED BY WOODFALL AND KINDER,  
MILFORD LANE, STRAND, W.C.

MATTHEWS BROTHERS beg to submit their Catalogue to the profession, and trust that it will be found a useful book of reference ; with this end it has not been allowed to attain an unreasonable size, whilst great care has been taken to make the engravings accurate representations of the various instruments.

Strict attention is always paid to adhere to the correct patterns, and that the material and workmanship are of the highest class. MATTHEWS BROTHERS personally superintend the manufacturing department, and no instruments are supplied without having previously passed through their hands.

The prices have been regulated, with the view of being as moderate as possible without detriment to quality, it being always their object to supply none but perfectly reliable instruments.

Prize Medals have been awarded to them in the International Exhibition of 1851, 1862, and 1873, for "Ingenuity of Construction and Excellence of Manufacture."

• A map on page 8 shows the position of the new premises to which MATTHEWS BROTHERS have recently removed, nearly opposite their old ones (marked respectively N and O on the map), and next door to King's College Hospital. They are larger, and afford

increased accommodation for the business, especially for the truss and deformity branch of it, to which, of late years, special attention has been paid.

From new customers a remittance or a satisfactory reference in London is required, and foreign and colonial orders must be accompanied by a remittance. When orders are forwarded through an agent, MATTHEWS BROTHERS request that it be distinctly stated that the goods are to be obtained direct from them, as much confusion and disappointment have sometimes arisen in consequence of disregarding this precaution.

MATTHEWS BROTHERS also take this opportunity to thank their customers for their past support, and to solicit the favour of their future patronage.

## ARMY REGULATION CASE.

One Straight and one Curved Sharp-pointed Bistoury.

Curved Blunt-pointed Ditto.

Hernia Bistoury.

MATTHEWS'S Double-spring Tracheotomy Tube, silver.

Four Gum-elastic Catheters, Nos. 1, 4, 7, 9.

Three Silver Ditto, Nos. 3, 5, 8.

Steel Hernia Director.

Double Elevator.

LISTON'S Artery Forceps.

Bone Forceps.

Bullet Forceps.

Two DIFFENBACH'S Forceps.

Large Dissecting Forceps.

Bladder Trocar and Canula.

Three LISTON'S Amputating Knives.

LISTON'S Needle in handle.

Steel Aneurism Needle.

Six Half-curved Needles.

Gun-shot Probe.

Amputating Saw.

Saw with Shifting Back.

Three Scalpels.

One Ditto, with Tang.

Tenaculum.

Screw Tourniquet.

Medium size Trepine.

Hydrocele Trocar.

Half-ounce FERGUSSON'S Ligature Thread.

Extracting Probang.

Reel Ligature Silk.

The above in a Handsome Brass-bound Mahogany Case,  
lined with Silk Velvet, £12 12s.

Army Regulation Case, Large Size, £22.

## SET OF INSTRUMENTS

FOR A SURGEON IN THE ROYAL NAVY.

FAHRENHEIT'S Thermometer.  
 Two Amputating Knives.  
 Amputating Saw.  
 Metacarpal Saw with Two Blades.  
 Catlin.  
 Artery Forceps.  
 Twelve Curved Needles.  
 Two Tenacula.  
 Bone Nippers.  
 Two Tourniquets.  
 Two Trephines.  
 HEY'S Skull Saw.  
 Skull Forceps.  
 Brush.  
 Elevator.  
 Two Trocars.  
 Two Silver Catheters.  
 One Gum-elastic Ditto.  
 Six Scalpels.  
 One Tooth Key with Three Spare Claws.  
 Gum Lancet.  
 Two Tooth Forceps, Straight and Curved.  
 Tooth Punch.  
 Seton Needle in Scales.  
 Strong Probe Scissors.  
 Long Probe.  
 Bullet Forceps.  
 Probang.

**The above in a Handsome Brass-bound Oak or Mahogany Case, polished inside and out, and with the instruments blocked in the solid wood, £14 14s.**

This Case is recommended, as the fact of its not being lined with velvet renders the instruments less likely to get rusty, and the case itself is made very strong and screwed together, so as to stand a hot climate: vacant spaces are left in it for the instruments necessary to complete the outfit on promotion, which can be fitted up when required.

The following Instruments are also required:—

	£	s.	d.
Set of Pocket Instruments . . . . .	3	3	0
Twelve Lancets, in cases . . . . .	1	1	0
Six Pewter Syringes . . . . .	0	2	0

When a Surgeon is appointed to a ship not bearing a Staff Surgeon, he is to provide himself with the following articles in addition to the foregoing :—

£ s. d.

Six Bougies, in case . . . . .	0	10	0
Set of Splints . . . . .	0	3	6
Aneurism Needle . . . . .	0	3	6
Two Tracheotomy Tubes . . . . .	1	12	6

SET OF INSTRUMENTS

FOR A STAFF-SURGEON IN THE ROYAL NAVY.

A Staff-Surgeon in the Royal Navy requires, in addition to the foregoing :—

- One Amputating Knife.
- One Amputating Saw.
- One Catlin.
- Lenticular.
- Two Tracheotomy Tubes.
- Razor.
- One Probe-pointed Bistoury,
- Bullet Scoop.
- One Probang.
- One Aneurism Needle.
- Enema and Stomach-pump Apparatus.
- Set of Pocket Instruments.
- Six Lancets, in case.
- Cupping Apparatus.
- Two Dozen Bougies, in case.
- Six Pewter Urethra Syringes.
- Two Sets Lined Splints.
- Two Eighteen-tailed Bandages.
- Four Screw Tourniquets.
- Twenty Yards Tourniquet Webbing.
- Sixty Yards of Tape.
- Needles.
- Ligature Thread.

Complete Outfit of Instruments required by a Surgeon of the Royal Mail Steam Packet Company, £28.

## PENINSULAR AND ORIENTAL COMPANY'S REGULATIONS.

The following Instruments are to be provided and kept in good order by every Surgeon at his own expense; the same to be shown to the Company's Medical Inspector on appointment to the Service:—

1. A complete Case of Amputating Instruments.
2. Trepanning Instruments.
3. Cupping Instruments.
4. Tooth Instruments.
5. Dressing-case.
6. Case of Scalpels.
7. Three Male Silver Catheters of sizes, and one Female Catheter.
8. A Midwifery Forceps.
9. Metallic Bougies of sizes.
10. Scrotal Trocar and Canula, with Injecting Apparatus.
11. Bleeding Lancets.

*By Order of the Directors.*

**Set of Instruments as above, £23.**

### PRESENT LIST OF

## SURGICAL AND MIDWIFERY INSTRUMENTS

WHICH THE SURGEON OF A PASSENGER SHIP SHOULD POSSESS.

*Regulations of Emigration Commissioners.*

A Pocket Dressing-case, containing Scalpel, two Bistouries (blunt-pointed and sharp), Gum Lancet, Tenaculum, Forceps, Spatula, Scissors, two Probes, Silver Director, Caustic Case, Curved Needles of different sizes.

Lancet Case, with at least two lancets.

Case of Tooth Instruments.

Midwifery Forceps.

Set of Silver and Gum-elastic Catheters, including Female Catheter and some Bougies.

One Amputating Knife and Catlin; one Amputating Saw; one Hey's Saw; Tourniquet; LISTON'S Bone Nippers.

Silk of different sizes for Ligatures and Sutures.

### DESIRABLE ADDITIONS.

Cupping Apparatus.

Trocar and Canula.

Trephine and Elevator.

Craniotomy Forceps, Perforator, and Blunt Hook.

## AMPUTATING INSTRUMENTS.

## SET A.

A HANDSOME POLISHED OAK OR MAHOGANY CASE, Brass-bound, either polished inside or lined with the best Silk Velvet, containing :—

Best Amputating Saw.

Three Amputating Knives.

Catlin.

Sir WILLIAM FERGUSSON'S Strong Bistoury for CHOPART'S Operation, &c.

LISTON'S (straight) or FERGUSSON'S (angular) Bone Forceps.

Sir WILLIAM FERGUSSON'S Lion Forceps.

PETIT'S Tourniquet.

MATTHEWS'S Operating Forceps.

WILLCOX'S Ditto, for Flaps.

Spring-catch Artery Forceps.

Tenaculum.

Needles.

Sir WILLIAM FERGUSSON'S Hempen Ligature.

**The Case complete, £7 15s.**

## SET B.

A POLISHED OAK OR MAHOGANY CASE, polished inside or lined with Silk Velvet, containing :—

Best Amputating Saw.

Three Amputating Knives.

Sir WILLIAM FERGUSSON'S Strong Bistoury.

LISTON'S or FERGUSSON'S Bone Forceps.

PETIT'S Tourniquet.

MATTHEWS'S Operating Forceps.

Spring-catch Artery Forceps.

Tenaculum.

Needles.

Sir WILLIAM FERGUSSON'S Hempen Ligature.

**The Case complete, £5 10s.**

## SET C.

A MAHOGANY CASE lined with Velvet, containing :—

Amputating Saw.

Two Amputating Knives.

Sir WILLIAM FERGUSSON'S Strong Bistoury.

PETIT'S Tourniquet.

Operating Forceps.

FERGUSSON'S or LISTON'S Bone Forceps.

Tenaculum.

Needles.

Sir WILLIAM FERGUSSON'S Hempen Ligature.

**The Case complete, £4 5s.**

Testimonial from Professor CURNOW.

*Anatomical Department,  
 King's College, Oct. 7, 1873.*

GENTLEMEN,—I have much pleasure in informing you, that you may assure any of our Students that I am perfectly satisfied with your knives and dissecting instruments generally.

I have used them myself since my first dissection, and always recommend them when my opinion is asked.

Believe me to remain,

Very faithfully yours,

JOHN CURNOW.

MATTHEWS'S Sequestrum Forceps with Shark's Teeth (Fig. 15)	per pair, 8/6, 10/6 and	0	12	6
--	-------------------------	---	----	---

"The teeth of these forceps resemble those of a shark, inasmuch as they are directed backwards, and as a consequence of this peculiarity the hold of the instrument is so strong as to preclude the possibility of any tissue slipping from its grasp, when it has once been fairly seized. This principle, which is entirely the invention of Mr. Matthews, and for which he deserves great credit, is peculiarly applicable to the construction of Sequestrum forceps, as well as those employed for dissection, for the extraction of Polypi, and for all other purposes where great prehensile power is required." (*Surgical Instruments in the Exhibition of 1862.*)

		0	10	6

One size for ordinary and one for the larger arteries.

SIR,—I have been asked so often as to the form of forceps I recommend for the practice of Torsion, and instruments have been sold as mine which I have no wish to claim, that I send you the drawings of two pairs of forceps which Messrs. Matthews made for me some time back. The narrow-bladed pair is for arteries of moderate calibre; the broad pair for the femoral or brachial arteries. They answer admirably.

I am, Sir, yours faithfully,

THOMAS BRYANT.

Finsbury Square, Jan. 1871.

• From "THE LANCET," December 27th, 1873.

"The want of a small and effective lamp for heating the actual cautery is one which has long been felt. In operations such as Mr. Henry Smith's for the removal of hæmorrhoids, it has often been a cause of much inconvenience to heat the cautery by the ordinary bed-room fire, the bars of the grate being in many instances too high to allow the point of the instrument being inserted in the midst of a clear fire whilst the handle rests on the hearth; the alternative being to thrust the iron into the fire with the handle protruding horizontally, in which case it becomes heated in the stem as well as in the button, causing the handle to be dangerously 'warm' to the operator. It may also happen that the fire in the patient's room is not a bright one, the result being that the coal adheres to the iron, from which it is with difficulty removed.

"The ingenious arrangement invented for Mr. Henry Smith by Messrs. Matthews entirely removes all these inconveniences. The Septic Lamp is on the principle of the Russian blowpipe, by which a little methylated spirit is boiled in an upper reservoir furnished with a safety valve, and the spray of spirit vapour ignited by a little flame beneath the upper reservoir, which may be easily regulated and promptly extinguished. The jet of flame is protected by copper sides, on which the iron or irons are placed, and made hot at the button only in 'one or two minutes.'

"The whole affair folds in a very compact little japanned box, which is furnished with a tin compartment to hold a quantity of spirit; and the whole box (which may be made to carry the cauterics also) measures on the outside 8½ in. by 3½ in.

"We are extremely pleased with this ingenious arrangement, and have no doubt that in India and warm climates, where a fire is not readily

obtainable, the instrument will be extensively used, as it will doubtless be here, owing to its simplicity, handiness, and moderate price.

"The specimen lamp shown to us was fitted in a little bag, which contained, besides, Mr. Henry Smith's set of clamps, cauteries, &c., for hæmorrhoids."

FIG. 32.

WILLCOX'S Forceps, with slide catch (Fig. 32) . . . . . 0 12 6  
 (The slide and nut are so arranged as to hold any substance of tissue.)

### POCKET CASES.

HANDSOME RUSSIA or MOROCCO CASE, lined with Silk Velvet, or all Russia Leather, with Gilt or Silver Clasp. (CASE A.)

Elbow Scissors.

MATTHEWS'S Operating Forceps.

Exploring Trocar and Canula, in Ivory Case.

Polypus Forceps.

Chased Spatula (plated).

Clinical Thermometer in Slide Silver Case.

Male and Female Catheter (silver).

Silver Director.

Two Silver Probes.

Solid Silver Caustic Case with Palladium Quill, and Exploring Needle.

BRYANT'S Torsion Forceps.

Double Curved Bistoury, spring back.

Scalpel and Finger Knife, ditto.

PAGET and SYME'S Knife, ditto.

Eye Spud and Curved Needle, in Ivory Case.

Gilt Scoop and IMRAY'S Ear Scoop united.

Silk—Needles.

**The Case as above, £7 15s.**

---

HANDSOME RUSSIA or MOROCCO CASE, lined with Silk Velvet, or all Russia Leather, with Gilt or Silver Clasp. (CASE B.)

Elbow Scissors.  
 Straight Scissors.  
 MATTHEWS'S Operating Forceps.

TESTIMONIAL FROM DR. JOHN HUNTER.

"London, April 5th, 1874.

"While in medical charge of the *Thames* transport hospital ship, employed on the West Coast of Africa, during the Ashantee War, 1874, I made frequent use of the Clinical Thermometer in every one of the numerous cases of remittent fevers received on board. The thermometers which I used were supplied to me by Messrs. Matthews, and I had every reason to be very highly satisfied with their great sensitiveness and accuracy.

"JOHN M. HUNTER, M.D., Staff-Surgeon, R.N."

FIG. 101.

MATTHEWS'S Tracheotomy Tubes, with Double-spring Canula (silver) (Figs. 100, 101, and 102) 14/- 16/- and

o 18 o

This instrument is deficient above and below, and consists of two blades fixed to an ordinary guard plate, which are capable of being

£ s. d.

pressed together so as to form a wedge, the point of which is not thicker than the back of an ordinary scalpel. Compressed in this way, the canula is easily introduced (Fig. 100); the blades then spring apart and retain the tube *in situ*. The inner, a complete tube, is now introduced, and the instrument tied as usual. There is an opening on the inner aspect of the laryngeal tube, so that there is no obstacle to the respiration when it assumes its natural direction." (This Gag is made in three sizes, the smallest being for infants, and is always used by Sir Wm. Fergusson and

Professor Wood for operations for Cleft Palate, Excision of the Tongue, Tonsils, &c.)

"In cleft palate it is of the greatest assistance to the operator, as it presents no ridge or obstacle of any kind in the way of the instruments and sutures. It has been found impossible for the patient to dislodge it, and it can be adjusted in spite of any inequalities in the teeth."—

FIG. 125.

	£	s.	d.
Sir HENRY THOMPSON'S Lithotrite, with Crossbar or Wheel Handle (Fig. 121) . . . . .	5	15	0
Sir W. FERGUSSON'S (Rack and Pinion with Key) Lithotrite (Fig. 122) . . . . .	4	10	0
MATTHEWS'S Lithotrite (Fig. 123) . . . . .	5	10	0

" In this instrument, power, lightness, and the most delicate power of adjustment, are combined with a precision and celerity of movement not

£ s. d.

previously attained. It is the most handy, light, and efficacious of any."  
—"DRUITT'S VADE MECUM," page 601.

"It is constructed to possess the greatest possible lightness and handiness, compatible with strength. This firm, we are informed, were the first to make lithotrites of the size of a 4 to a 6 catheter—a feat which obviously illustrates the delicate workmanship and beautiful temper of the steel."—"BRITISH MEDICAL JOURNAL," Aug. 2, 1873.

Sir H. THOMPSON'S Lithotrite for Children . . . . .	3	0	0
CIVIALE'S Lithotrite . . . . .	3	10	0
Lithotrite for the Dead Subject . . . . .	2	0	0

(In this Lithotrite, the female blade is an ordinary tube, in which the male blade slides, whilst in all the others of our manufacture, the dovetailed groove of the female blade is *cut* out of the solid steel, thereby ensuring the greatest attainable strength.)

NOTE.—All these Lithotrites are made with either the ordinary crushing blades, or with the broad flat blades for fragments, &c., as depicted by the side of Fergusson's Lithotrite (Fig. 122).

Silver Catheter, with Large Eye and Gum-elastic Stylet for Extracting Débris . . . . .	£1	2s.	and	1	4	0
Double Channel Catheter (silver) (Fig. 126)	£1	10s.	and	1	15	0

of vision.)

FIG. 135.

FERGUSSON'S Double Scoops, two sizes (Fig 135) 8/6 and 0 10 6

FIG. 136.

	£	s.	d.
MATTHEWS'S Lithotomy Tube, with Brass Syringe, complete (Fig. 136) . . . . .	1	1	0

"A new lithotomy tube, invented by Messrs. Matthews for stopping hæmorrhage by the application of cold and pressure, is shown. It consists of an ordinary lithotomy tube, round which is fastened an india-rubber bag, to which a tube and stopcock are attached. The bag, before it is filled with water, hangs loosely round the tube, and offers no sort of impediment to its easy introduction. The bag is then filled with iced water by means of the brass syringe, the dilatation of the bag causing a great deal of pressure at the same time; while the urine passes through the centre as in the ordinary tube, which, we think, will be entirely superseded by this admirably simple contrivance."—"BRITISH MEDICAL JOURNAL," Aug. 2, 1873.

Ditto, ditto, without Syringe . . . . .	0	10	6
Lithotomy Tubes, mounted with Rings . . . . .	0	5	0

Dr. W. S. PLAYFAIR'S Probes for Intra-uterine Medication (soft metal, plated, with engine-turned ends) (Fig. 179) . . . . .	0	10	6
---	---	----	---

“For this purpose I have had constructed a series of uterine probes, made of a soft metallic extremity,  $2\frac{1}{2}$  inches in length, corresponding to the ordinary measurements of the uterine cavity. These are made as fine as possible, and they are considerably less bulky than an ordinary uterine sound, so that when wrapped with cotton wool they are sufficiently small to pass readily through the os uteri. They are attached to box-wood handles 9 inches in length, so that there is no difficulty in working with them through the speculum. The flexibility of the probes is of essential importance, as it enables us to bend them to the exact shape of the uterine cavity, just as we do to the uterine sound; and thus intra-uterine medication can easily be used even in cases which are accompanied by the most well-marked ante- or retro-flexions of the uterus, without the necessity of first replacing the flexion, as in other methods of treatment. The first step is to wrap the probes smoothly and evenly with cotton wool, and this requires some little practice to effect satisfactorily, the object being to surround the probe with a fine layer of wool so smoothly applied as to add but little to its bulk, and yet so firmly as to avoid all risk of its being detached when used. This is best done by taking a very small quantity of fine cotton wool, which is teased out and flattened between the hands until it forms a layer of uniform thickness. The probe is then dipped in water to cause the wool to adhere, and then is wrapped round by rotating the handle, while the metallic portion with the layer of wool is held between the finger and thumb of the left hand. These probes are manufactured by Matthews Brothers.”—“LANCET,” Feb. 15, 1873.

Extra Top to Ditto, for Hot-air Bath . . . . .	0	2	6

*Extract from the "LANCET," January 1st, 1870.*

**"NEW BATH LAMP FOR MERCURY AND STEAM.**

"This is a cheap and portable form of lamp-bath, by Matthews Brothers, of Portugal Street, W.C., which strikes us as decidedly superior to that now in general use. The apparatus is contained in a small collar-box, very convenient for travelling. The Mercurial vapour bath is a very well-known and popular method of obtaining the curative effects of the mineral. This little invention possesses all the advantages of the older form of lamp. It is of course used in the same way, the patient sitting on a cane-bottomed chair, with a blanket or cloak around him."

*Directions for Use.*—Place the three tin legs on the edge of the box (*see engraving*), put water in the circular trough surrounding the little metal pan (on which the mercury powder is placed), fill small lamp underneath with spirits of wine, light it, then place the apparatus under a cane-bottomed chair on which the patient sits, enveloped in a suitable cloak (which may be purchased with the lamp) or ordinary blanket.

MATTHEWS'S Hot-air Bath . . . . .	0	10	6
(This consists of the same lamp as preceding, but with wire-gauze top, <i>see</i> Fig. 204.)

FIG. 207.

MATTHEWS'S ENEMA SYRINGE AND VAGINAL DOUCHE, in Mahogany Case (Fig. 207) . . . . . I I 0

(The cut represents the syringe in action; the piston is held in the basin by means of a small circular weight,

and a continuous stream is produced by slightly shaking the barrel with one hand, leaving the other hand at liberty. It is much to be recommended for the patient's own use, on account of its extreme simplicity. As the piston is made of metal, without cotton or leather packing, it is not liable to get out of order, and is particularly suitable for a hot climate.)

"The subjoined drawings illustrate the advantages of an ingenious new form of 'McIntyre's Splint,' made by Matthews Brothers, Surgical Instrument Makers to King's College Hospital. When the instrument is in use, it is precisely the same as the old form of splint, the good qualities of which time and innovation have not yet superseded. When, however, the splint is not in use, by simply removing a screw, it folds up upon itself, as it were, occupying half the space required for the old-fashioned appliance, and will go readily into a drawer of moderate size. The sketch shows its compactness and portability, which, combined with the advantage of simplicity, will no doubt find much favour with the medical officers of the army and navy, where facilities of transport and stowage are of so much importance, as well as in private practice. Its presence also in an hospital will doubtless be much appreciated, as it will do much to render the splint-room more accessible and better arranged."—"*BRITISH MEDICAL JOURNAL*," Oct. 12, 1872.

Self-acting Clockwork Magnetic Machine . . . . .	6	6	0

FIG. 244.

Improved Induction Coil Battery, consisting of a Solution of Bichromate of Potash, with Zinc and Carbon Plates (Fig. 244)	£	s.	d.
		3	15 0

(By a simple mechanical arrangement, the zinc plate can be withdrawn from the solution, so that the battery can be shut up in its case and left for any time without wearing itself out. There are no fumes. This battery is strongly recommended, as the current is easily regulated and almost continuous, and is suitable for patients to use themselves. The solution will last a very long time, and can be easily renewed.)

BEST QUALITY ENGLISH ACHROMATIC OBJECT-GLASSES,\*

Reconstructed from the 1/2-inch upwards, on an improved principle of correction, which gives the clearest and most brilliant definition. The high powers from the 1/10th to the 1/40th now made, can be used dry, or with water between the front lens and cover of the object, by altering the adjustment to the mark "Wet," thus avoiding injury, the cost of extra fronts, and time lost in changing separate dry and immersion lenses. The screws are cut to the gauge of the Microscopical Society, but may be applied to any instrument not having the Society's screw by means of an adapter. Those marked \* have an adjustment for covered and uncovered objects.

FIG. 266.—For Single Truss.

Fig. 267.—For Double Truss.

WOOD'S TRUSSES, WITH STEEL CROSS STRAPS (FIGS. 266 AND 267).

(In some cases of rupture, it has been found that a slight strap of steel, connecting the tail of the truss with the pad, has possessed many advantages over the ordinary strap and stud. If a strap be fastened to a stud, the *tendency* is for the strap to pull the pad up out of its place. A rigid steel strap can be used, either to keep the spring open, or to pull it together, or, what is most important, a bend in this steel bar will apply pressure on the pad, from the reverse side, causing the spring to act on both sides alike. This truss requires most delicate adjustment at the hands of the mechanic.)

*Testimonial from Professor WOOD, F.R.S., Professor of Surgery and Surgeon to King's College Hospital.*

I am glad to be able to say that Messrs. Matthews have shown much skill and patience in carrying out my designs for truss pads, in accordance with the principles I have laid down in my work on Rupture. I have had a great number of cases fitted with trusses by Messrs. Matthews, many of these cases of a most aggravated character, which no other truss-maker has been able to do anything with, and with the most successful results.

JOHN WOOD.

68, Wimpole Street,  
Cavendish Square.

FIG. 268.

	£	s.	d.
Wood's Wire Ring Pad Truss for Irreducible Hernia (Fig. 268)	30/-	42/-	and 3 3 0

(A piece of leather is stretched, drum-like, across the wire ring to give support to the unreduced hernia, and to prevent its further protrusion. This truss is especially suitable in cases of old persons whose abdominal walls are thin, and who cannot bear the requisite pressure to retain a large hernia.)

Silk Elastic Bag Truss (Fig. 269)	63/- to	4	4	0
Ditto, ditto, extra fine silk		5	5	0

(The above consists of an elastic silk belt, the fibres of which stretch *vertically only*, to give a supporting pressure to the hernia, and is supplemented when required by an elastic strap to give additional support to the scrotum. It is usually worn over the shirt, and is recommended for old people and cases of long standing.

FIG. 269.

"The trusses devised by Mr. Wood have been employed with much success in curing small herniæ, as well as in keeping up and preventing the increase of a hernia, for which an operation for radical cure has not been deemed advisable. The trusses are of four kinds, viz., for *inguinal* rupture, *oblique* and *direct*; for *crural* and for *umbilical* hernia. They are all based on a distinct principle, that of applying flat and level pressure at the *sides* of the hernial opening instead of in the *axis*. Mr. Wood considered that the principle of a convex pad projecting into, and exerting its chief pressure in, the *centre* of the hernial aperture is erroneous, and calculated to increase the size of the hernia by invagination, the longer the truss is worn. The pad for oblique inguinal rupture is of the shape of an obliquely curved horseshoe, the outer limb (intended to press on Poupart's ligament) being shorter than the inner, which is laid over the inner pillar of the ring. The curve of the horseshoe is placed over the deep hernial opening, and the bearing of the side spring is exactly in the centre of the pad. When a radical cure is looked for, the pad is composed of a hard smooth substance.

"The hard surface may be covered by an India-rubber water bag, the shape of the pad. The pad for *direct* inguinal hernia is of the shape of an ovate ring, with a hole in the middle, opposite to the axis of the hernial opening. This exerts its chief pressure upon the margins, preventing their giving and enlarging under the pressure of the bowels.

"The double bearing of the horseshoe and ring pads enable them, under sufficient pressure of the side spring, to keep in place better than the convex pad, while the tension of the integuments across the opening prevents the rupture from emerging there. The spermatic cord and pubic spine escape the injurious pressure of the pad, by lying in the cleft or opening."—*Vide* "DRUITT'S VADE MECUM."

"We also notice the various patterns of Mr. Wood's well-known trusses, which have now been used for several years, in several thousand cases, with the best possible results; the great advantage being, that the edges of the ring are not weakened by dilatation, the tendency of the pressure being rather to strengthen them. In several cases in adults, the hernia has been cured by their employment; in one case in particular, a gentleman, aged 34, with an inguinal and a femoral rupture on the same side."—"BRITISH MEDICAL JOURNAL," Aug. 2, 1873.

FIG. 270.

*Measurements and Particulars required in Ordering a Truss.*

State whether the hernia or weakness is on the right, left, or on both sides.

Give some idea of the size of the protrusion, such as, large as a walnut, egg, &c.

State whether the opening through which the hernia escapes is large or small.

State description of hernia.

Measurement for inguinal hernia (state whether oblique or direct), the girth of body half-way between the iliac crests and great trochanter,—the tape meeting in front. In extremely bad cases of hernia, it is sometimes necessary to take a plaster of Paris cast of the pelvis.

*Memorandum for Complete Outfit of Trusses, suitable for Residence Abroad, &c.*

- One Truss.
- One Ditto (duplicate, in case of accident or repair).
- One Plated Bathing Truss.
- One Light Sleeping Truss.
- Twelve Sets Linen Covers for Truss and Pads.
- Screw Driver.
- Oval Solid Leather Case, with Patent Lock, or Japanned Tin Ditto, ditto.

MATTHEWS'S Reflex-action Pad for Umbilical Hernia, fitted to any of the above Belts (Figs. 274 and 275)	o	10	o
Ditto, ditto, with Stopcock and Inflating Pump . . . . .	o	15	o

"This ingenious invention, which has been registered by Messrs. Matthews Brothers, attached to a suitable belt, is intended for the relief of umbilical hernia. It consists of two distinct pads, the outer of which, in the shape of a ring, communicates with the inner. The outer pad, being both thicker and higher than the inner one, when *in situ*, reflects the action of the abdominal muscles on to the inner or middle pad by its compensating action; the principal pressure being applied, on Mr. Wood's principle, round the margin of the opening, and the centre part being only slightly in action during any movement of the abdominal walls. A glance at the illustration will at once illustrate the important feature of the pad, the great advantage of which is that it is perfectly self-acting. The invention has been in use some little time, and has been found perfectly effective in cases of obesity complicated with umbilical rupture, as well as in simple and infantile cases. The pads are filled with water or air."—"BRITISH MEDICAL JOURNAL," May 24, 1873.

*Measurements Required.*

For an Elastic Stocking.—Circumference of Leg at L, K, J, H, G, F, and E, and length from K to E.

For a Knee-cap.—Circumference at E and D, and also round Leg over Knee-cap.

For a Thigh Stocking.—Circumference at D, C, B, and A ; length from D to A.

For an Anklet.—Circumference at L, K, J, and H.

## MEASUREMENTS REQUIRED FOR ARTIFICIAL LIMBS.

The presence of the patient who requires an artificial limb is always to be desired. Should he not be able to come to us, a competent assistant can be sent to take the requisite casts and measurements, and in the event of his residing abroad, a plaster cast of the stump is required, together with the following particulars.

(The above note does not apply to the common bucket legs and arms, as they can be made to the measurements alone.)

*Artificial Leg for Amputations above Knee.*

State whether right or left ; state approximate height and weight ; send plaster cast of stump if possible ; tracing of sound foot and also boot ; length from perinæum to end of stump, and from end of stump to the ground ; circumference of end, middle, and top of thigh ; inside length from perinæum to middle of knee of the sound leg ; ditto from middle of knee to the ground ; height when sitting from top of knee to the ground.

*For Amputations below Knee.*

State whether right or left ; plaster cast if possible ; approximate height and weight ; length from perinæum to middle of knee ; length from middle of knee to the ground ; middle of knee to end of stump ; circumference of top of thigh ; middle of thigh ; above knee, below knee, middle of stump ; end of stump ; boot and tracing of sound foot ; length from end of stump to the ground.

*Artificial Arm for Amputations at or above Elbow.*

State whether right or left ; plaster cast if possible ; pair of gloves ; outline tracing of sound hand ; length of sound arm from axilla to elbow, from elbow to wrist, from axilla to tips of fingers ; length from axilla to end of stump ; circumference of end, middle, and top of stump.

*For Amputations below Elbow.*

State whether right or left ; plaster cast ; pair of gloves ; an outline tracing of sound hand ; length in sound arm from elbow to tips of fingers ; length from elbow to end of stump ; circumference above elbow ; circumference at end, middle, and top of stump.
