## AMERICAN AGRICULTURIST

FOR THE

## Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN,"-WASHINGTON,

ORANGE JUDD & CO., PUBLISHERS AND PROPRIETORS. Office, 245 BROADWAY.

### ESTABLISHED IN 1842,

Published also in German at \$1.50 a Year.

\$1.50 PER ANNUM, IN ADVANCE, SINGLE NUMBER, 15 CENTS. 4Copies for \$5; 10 for \$12; 20 or more, \$1 each.

Entered according to Act of Congress, in December, 1870, by OBANGE JUDD & Co., at the Office of the Librarian of Congress, at Washington.

VOLUME XXX.-No. 1.

NEW YORK, JANUARY, 1871.

NEW SERIES-No. 288.

[COPYRIGHT SECURED.]

THE FAITHFUL GUARD .- Drawn and Engraved for the American Agriculturist.

It is exceedingly interesting to study the development of intelligence in the dumb animals, and though it is not difficult to cultivate it to a moderate degree, it requires the exercise of the greatest patience and persevering effort on the part of the trainer to develop it extraordinarily. The germs of intellectual and moral faculties certainly exist, and this fact is brought out in the engraving we use this month as a frontispiece. The natural instincts of the Skye Terrier would make short work with the trout and rabbit. The natural instinct of the Setter leads

him to watch live game intently, and very gradually to approach it until it starts, when he follows it. Training has made him willing to sit upon the point, for hours, sometimes. The dog in the picture knows he should not touch the game, and he would resolutely defend it against all comers. We see similar traits in all well trained dogs. The knowledge of "mine and thine,"—that is, of what is his own and what belongs to some other dog, or cat even, is almost instinctive. The recognition of his own master's property is generally very easily taught.

The sense of importance when a trust is imposed is frequently ludierous; and that of shame for failing to resist temptation, or in fulfilling the trust, is often painful to witness. This satisfaction and sorrow which are clearly exhibited in the dog, are, so far as we can judge, entirely distinct from either fear of punishment or hope of reward. However important threats and coaxing, whipping and rewarding by petting or bits of food may have been in the training, love of commendation from the master is the most powerful motive to control the dog.

Unauswered Letters.—Just at this season an immense number of letters are arriving along with subscription lists. Those on business will, of course, be promptly attended to, but many on personal matters, soliciting donations, etc., etc., will necessarily wait until we have a little more leisure, after the holidays. It is simply impossible to respond promptly to all, just now.

### AMERICAN AGRICULTURIST.

NEW YORK, JANUARY, 1871.

We all enter the New Year cheerfully and hopefully. It is an excellent thing that once a year at least, we bury our disappointments, and gloomy feelings, wipe out the old scores and begin afresh with a clean slate, and confidence in the future.

Farmers as business men should employ the beginning of the year in making settlements of a business kind. Pay every debt that is on your books, collect every one that is due, or settle it in some way as soon after the first of January as possible. It is a great deal better to come to a direct understanding about these things, than for both debtor and creditor to grow cool and half unfriendly because one owes the other a few dollars, or a few hundred dollars, and cannot pay. There is no friendship lost by coming to a direct and clear understanding about debts, and it will oftener than not happen that things may be turned in some way to lessen the account, or gradually to cancel it. A man who has a practical, common sense turn of mind, and has had a little mercantile training, having been a few years in a country store or in business in the city, or in some manufacturing establishment, will almost invariably prove a more successful farmer than one who has been trained solely upon the farm. We ought to regard farming more as a business than as a trade, more as work for the head than for the hands and teams only.

People have so much to do usually in autumn and early winter in preparing for Christmas, getting the pigs and poultry killed and marketed, and do ing other fall work, that that time is not favorable for neighborhood gatherings, for forming farmers' social clubs and libraries, but after the new year begins we have more leisure, and it is not difficult to accomplish such organizations. They are very useful, and at a very small expense to individual members, great enjoyment may be had, and many useful and entertaining books obtained for general circulation. Every farmer's family should have besides a regular newspaper, a sound agricultural jour-At the club reading-room, if it should be established, a dozen of the better class of the agricultural periodicals of the country ought to be taken, that a just comparison of views and teachings may be made. An efficient Secretary, well sustained,

will make such a club a source of great pleasure and improvement in any tolerably settled district.

### Hints about Work.

Building, etc.—January is a very good time to work in the wood lot, to haul timber to the saw-mill, to prepare for building, to plan and get out frames, etc. The men who can swing an ax with skill and vigor, are becoming hard to find, at least in the Eastern States, and it is well to look out ahead to secure such labor, and when engaged, to see that there is no lack of work.

Frost.—Our cold weather held off so long that doubtless when the cold map came, many were unprepared. The winter is the more likely to be intensely cold for beginning so mild, heuce it is important to see that stables, cellars, root pits, and water pipes, are very moroughly protected.

ley Paths.—The constant danger to man and beast from icy paths about the house and barn, must not be overlooked, sawdust, tan-bark, coal asbes, etc., offer easy but temporary means of security. Salt, if used upon steps or any where, should be cleaned away, as it is bad for animals to step in the brine and then into the snow, as a temperature of nearly zero is produced upon the foot.

Feed for Live-stock .- Many barns will be low in fodder before the end of this mouth. Buy cornmeal or corn, and feed that rather than hay at the high prices. Corn-meal is cheaper at \$2 a hundred than hay at \$30 a ton. Bran, middlings, and other forms of feed, usually bear relatively high or low prices, so that we can have our choice between them and vary the feed occasionally. For pigs, slightly damaged flour or other feed, may be fed without harm, and very economically. It should be mixed with mashed boiled potatoes and water, and allowed to ferment before teeding. It is a poor plan to feed fattening liogs upon too liquid food. As a rule, the drier the better, provided it is so that they can eat it easily. For other stock all kinds of grain feed should be sound. The best way to use the finer kinds of feed is on cut hay or straw.

Horses.—Keep all work and road horses sharp shod, or if there is no ice, keep them upon strong caulks, which may be sharpened at short notice. Sharp caulks wear dull very soon on bare ground, and become dangerously smooth. Spavins, splints, besides sprains and bruises, capped hocks and knees, etc., frequently come from slipping on the ice.

Cows in Milk should have succulent food as well as oil-meal, bran, or corn-meal, to give quantity as well as richness to their milk. There is little danger of a milch cow becoming too fat no matter how much she is fed, and it pays to feed well. The dribblets of poor milk which most farmers get from cows which have nothing but poor hay, and not half enough of that, do not pay for keeping the cows even on the poor fare they get. Well fed, they would pay in milk, and besides the calves would be larger and finer, and the milk much more abundant when the cows come in.

Dry Coms should be well fed, and allowed to get into good beef condition. Every pound of flesh and fat laid on extra will come back in cream.

Calves.—Keep young cattle, especially calves, growing all the time. They should not be exposed in bleak yards, but in warm stables, and be fed more or less meal daily. Their growth and thrift will be surprising and effect their whole lives.

Vermin on Cattle.—A few warm days in January will bring the lice to sight, if they are present. A strong solution of carbolic soap will check, if not destroy them. The use of mercurial ointment ("unguentum") is not to be recommended, although more certain in its effects than any thing else. When applied it should be used only in small quantities. Say for an ox a mass as big as a hazle nut, mixed with a tablespoonful of lard, and rubbed in well upon the neck and spine. If animals thus treated are exposed to cold and storms, they are very apt to be seriously and sometimes fatally affected. Lice and poor feed are hardly less

Sheep ought to have open yards of good size or

the range of farm lanes or small pasture lots besides roomy, well-littered sheds into which they should be shut at night. Ewes should have some grain daily, and be constantly improving in condition until yearing time. Fattening sheep should be kept in closer quarters, and as quiet as possible. See that all get their just portion of the feed. There is more danger of overfeeding in giving corn-meal, than oil-cake.

Swine must be kept dry and warm to do well in winter. Brood sows need to be kept nearly fat enough to kill; the brood will thrive for it. Store pigs need more feed in proportion than brood sows even, for they grow rapidly and require some exercise to keep them healthy. They will eat a good deal of hay—clover hay—4f it is fed to them. We give it when they begin to be impatient for feeding time to come, and find a few small locks will keep them busy and contented.

Fowls. — Good feeding and warm quarters will produce eggs. Keep the houses clean and dry. Use kerosene upon the roosts to kill lice, and some disinfectant if the fowls look dumpish and have colds; giving some tincture of irou in the water and Cayenne pepper with the food.

Manures.—Work up all the litter, leaves, muck, sawdust, and every thing that can decay, in liberal quantities into the manure. The heaps should be worked over and mixed, so as to give the mass the greatest uniformily, nuless indeed it is desirable to keep different kinds of manure for especial purposes. The careful saving of poultry-house manure mixed with a little, say twice its bulk of earth, or with sawdust and plaster, well rammed into old barrels, will afford a fair quantity of excellent guano, equal to that of the Pernvian Islands. Allowing fowls and turkeys to roost on trees and under out-buildings and sheds, which are in constant use for other purposes, involves a total loss of this.

Ice.—In gathering ice, be sure there is a deep bed of straw to place the first layer upon. Wheat chaff is sald to be excellent. The object being to bed the ice upon a non-conductor of heat, which will let the water pass off freely. Cut the cakes as even as possible, so that little space will be wasted by chinks; brush the cracks full of ice chips and dust, free from dirt, especially round the sides. The more solidly ice is packed upon the sides, which are exposed to thawing, the better.

Tools.—Send for Catalogues of tools and implements. If possible, visit large establishments with a view to see improvements and whatever there is that is new, whether you buy or not. Pursue the same plan in regard to

Seeds.—Get seedsmen's Catalogues, and in some particular every year improve, or endeavor to improve, the crops you raise by introducing superior kinds. With painstaking, one's own stock may be constantly improving, but this requires much care. Keep seeds in bags, nets, or baskets, hanging up so as to be out of the way of mice. Stone jars, tin or any close boxes are very bad for seeds, as they gather moisture and therein become spoiled.

The Markets.—The close of the war can hardly have any other effect upon our grain and produce markets than to send prices up. Those who are likely to need meal or bran would do well to buy; while we can but think that it will pay those who want to sell to hold a while for higher prices.

Draining may be done in many places during almost the entire winter. Springy ground never freezes deep, and this crust is soou thawed by the warm water underneath. In ditching, begin at the outlet and work up, carrying the drain half its depth or less at first, thus drawing off a good part of the water, after which it will be easier to deepen it.

Surface Rocks, or those which have been dug under and exposed, may be broken to pieces very well by blasting in any but the coldest weather. The drilling will create so much heat that water will not freeze in the boles, even when it will upon the surface.

Cutting off Bogs.—When the surface is only partly stiffened, swampy land may be entered and conveniently worked upon, either in grubbing out

roots or in cutting off bogs, leaving the surface smooth and level; and, if properly drained, a slight top-dressing of sandy loam with a very light seeding of red-top and timothy in the spring will insure good pasturage after it has half a year's start.

### Work in the Horticultural Department.

Our notes upon work and the hints we throw out from month to month, of course vary with the season in their applicability to different latitudes. and of course always some part of them is applicable to the conditions of some part of the country; but, as a whole, they will prove fresh and valuable reading to all interested in garden work in its many branches. They are intended to point out the things necessary to be done, and give suggestions as to the way of doing them. Even the most experienced need a reminder of this kind, especially when there are many details to be looked after. One of our largest gardeners has a record made of each day's doings at his establishment; and with all his extensive experience he finds it necessary to refer frequently to this diary as a guide. In making up these notes we are obliged to have several distinct classes of readers in mind; those who cultivate entirely for profit, and those who grow plants for the love of it, and without regard to gain; those who are familiar with the ordinary operations of horticulture and only need to be reminded of the season in which to do them, and those who essay the simplest operation for the first time. Besides the routine directions, it will be found that each month we incorporate much that is new under the different divisions, and answer in general terms many letters of inquiry. Horticulturists have always been in advance of farmers in availing themselves of the recorded experience of others; and we now have, not only general treatises, but many excellent works upon special subjects, iu which the various processes are treated more in detail than they can be by general writers. Every intelligent gardener will have some standard work upon the subjects in which he is specially interested. A glance at our book list will show that there are a plenty of such works. He is a poor gardener who does not do better this year than he did last. whether his operations extend over acres or are confined to the narrow limits of his dooryard.

### Orchard and Nursery.

The setting of a tree or plant of any kind involves a promise to take care of it. Unless these conditions are accepted, plant no more trees.

Young Trees, from the beginning, need constant supervision. Were the trees properly planted, no stakes will be needed; but if from careless planting or accident, any tree has been thrown out of the perpendicular, straighten it up and tie it to a stake, or tie the tree between two strong ones.

Order Trees early; if one lives near a nursery it will sometimes pay him to give an extra price for the privilege of digging his own trees.

Rabbits are troublesome, especially when the snow is on the ground. Among the various preventives blood has been found the easiest of application, and as efficacions as any. One sprinkling will last all winter. If blood cannot be obtained readily, rub the trunks of the trees with liver or bloody meat, but this is more troublesome.

Mice work under cover; keep all rubbish away from the trees, and tramp down light snows. When there are not many trees it will pay to clasp the base of the trunks with a girdle of old tin, or sheet iron.

Horses or Cattle often do much damage in young plantations, and must be kept out; indeed, hogs are the only animals ever to be allowed in the orchard. There are some annoying wild animals.

Insects can now be successfully headed off. The eggs of the tent-caterpillar seem to be especially arranged with a view to their ready removal. If a swelling is seen near the end of a twig, it should be looked to, as it is likely that there is a deposit

of eggs glued in a band around it. These clusters are readily seen while the trees are leafless, and may be removed by the aid of a step-ladder, on trees of moderate size; and on larger ones a pair of shears may be arranged at the end of a pole to work by a string. Any time and labor required to remove these eggs will be profitably expended.

Nurseries.—The young stock is to be headed back and brought into shape. Never let two limbs start so near together as to form a crotch. Make every preparation for the spring trade, and have all packing material and labels ready for use.

Manure may be carted out while the ground is frozen, and be ready to spread in spring.

Labels on trees received from the nursery are, for safety, bound on tightly. In this time of leisure go over the orchard and see that no strangulation can result from tight wires.

Cions sre to be cut at any time in winter when the trees are not frozen. Be careful to tie the sorts in bundles and to label every parcel.

Root Graft at any time during winter, and set the grafted roots in boxes of sand or earth.

### Fruit Garden.

Whoever contents himself with a single variety of strawberry, currant, or other fruit, gets only half the satisfaction his garden is capable of affording, or, if he cultivates for market, only a portion of the profit he might otherwise receive.

Grape-vines that were not pruned in autumn, do now in mild spells, and do the same with

Currants and Gooseberries.—Keep the bush open and shorten in the new growth. Cuttings may be made of the prunings by dipping the lower ends in mud and setting them in a cool cellar. See that the

Winter Covering of strawberry and other plants is not blown or washed off. If leaves are used, they may require a little soil to be thrown over them.

General Work, such as protecting trees, removing the eggs of insects, is hinted at under Orchard.

### Kitchen Garden.

The amount of out-of-door work will be governed by the season and the locality; wherever any thing can be done to facilitate next spring's operations, it should be attended to while work is not pressing. At least the one important article of

Manure—the key to success—can be accumulated and hauled to where it is to be used. Fresh manure for hot-beds, and composted manure to apply to the ground, need different treatment. Well decomposed manure may be taken to the spot where it will be needed, and left in small heaps, while that for hot-beds should not be in so small heaps that it will be chilled through, but it should be kept in a state of fermentation. As soon as a heap shows signs of heating, it should be turned over, and each turning will much improve its quality. Plants which are growing in

Cold Frames will need attention. If the weather is very cold and the plants are frozen, it is not necessary to remove the snow from the frames, but a light fall of snow, followed by mild weather, must be immediately removed. Give air abundantly, as it is the object to keep the plants as bardy as possible.

Hot-beds for raising seedlings are to be started about six weeks before the time at which it will be safe to set out the plants. Sashes should be got ready; paint, if need be, and replace broken lights.

Straw Mats are of great use in covering hot-beds and frames at night. There are several ways of making them; they should be a foot longer than the sash and of its width and a half wider, so that two mats may cover three sashes.

Covering of celery and roots in pits, do now. At the time we write, the middle of December, it seems as if this might be delayed for some time.

Lettuce, where there is a demand for early plants, may be forced in a hot-bed. The bed should be excavated at least 2½ feet deep, and this be filled with fermenting manure and covered with Foil.

Gardening at the South .- In the Southern States, whenever the condition of the soil will allow it, the hardy, early vegetables are sown in succession from January to April. The hardy vegetables include beet, carrot, parsnip, parsley, radish, turnip, onion, leek, lettuce, eress, cauliflower, cabbage, spinach, etc. Tender vegetables, such as encumbers, melous, beans, tomatoes, etc., can only be sown with safety in the open ground, at corn planting time, or when the peach is in full bloom. These rules answer for any latitude.

Seeds,-Their quality and integrity are of the greatest importance. It is better to be at any trouble and expense to get good seed, true to its kind, than to take that which is doubtful for nothing. Purchase early of reliable dealers only. Seeds go by mail at the rate of two cents for four oz.; if in doubt about the quality offered by home dealers, send to those of known reputation.

Tools are to be overhauled and repaired, and those needed made or purchased. A home-made roller, marker, reel for a garden-line and the like, are great helps, even in a small garden.

### Flower Garden and Lawn.

But little can be done out of doors. Where improvements are contemplated, a plan should be drawn to a scale, and sufficiently large to serve as a guide in working.

Everyreens are now appreciated, and the present is the season to discover where they may be introduced into the grounds to the best advantage. Many are injured by

Snow, there are many close growing decidnous shrubs injured by this. Shake it out before it becomes icy. Drifts around low-branching evergreens are apt to break off the lower branches as they settle, and should be shovelled away.

Hedges may have their winter pruning in mild weather and in southern localities.

Rhododendrons, Hollies, and other of the broadleaved evergreens may be made to contribute largely to the electful winter aspect of the grounds, and some of them, such as the Kalmias and Rhododendrons, serve the double purpose of making them gay with their flowers in spring and summer.

Pits, need air in mild weather. Water only when they seem to actually need it. Keep mice from pits. Seedling Percunials in their first winter will do all the better for protection, no matter how hardy the old plants may be. A mulch over the bed will prevent the roots from injury. Leaves may be used.

Trellises, Stakes, and all the little appliances that will be needed in spring, should be made and repaired while there is leisure.

### Greenhouse and Window Plants.

Temperature with house plants is less readily adapted to their wants than in the green-house. It is not well to let any collection reach a temperature much below 40°. Plants cannot, as a general thing, be expected to flower at much below 60°. For stove plants proper, more heat is needed, according to their tropical character.

Air is to be given in the green-house whenever the ventilators can be opened with safety. Window plants need a change of air, and should have it whenever it can be given without chilling them.

Violets and other half-hardy plants in cold frames, need plenty of air when the outside temperature

Bedding Stock of searce kinds may be multiplied by starting the stock plants into growth and taking enttings, which, after they are rooted, will in turn furnish cuttings for later propagation.

Insects are easily kept under by fumigating.

Dust .- Arrange some kind of a shield of cloth or paper to put over house plants while sweeping.

Bulbs, that were potted last autumn and kept cool, may be brought to the warmer atmosphere of the green-house or dwelling, and will soon flower.

Camellias need an even temperature, one rather low with a moist atmosphere. If necessary, thin the buds. Keep the foliage clear by use of syringe. Cactuses should, generally, have rest and dryness.

### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Dec. 15, 1870, and for the corresponding month last year.

TRANSACTIONS AT THE NEW-YORK MARKETS. Recripts. Flour. Wheat. Corn. Rye. Barley. Oats. 26 days this m<sup>\*</sup> th.535,000 3,184,000 1,540,000 76,000 1,212,000 1,936,000 26 days tast m<sup>\*</sup> th.511,000 3,196,000 1,574,000 89,000 874,000 1,716,000

### CURRENT WHOLESALE PRICES.

Gold fluctuated slightly since our last, the extremes of the price having been 1101/2@1111/2, and the closing quotation on Dec. 15, 111.... There has been a fairly active business reported in Bresdstuffs. The dealings in Wheat and Flour have been most extensive, largely for shipment, at improved prices. There has also been considerable speculative inquiry for shipping grades of Flour, and for red and amber, winter, and prime new crop spring Wheat. At the close, the market for both Flour and Wheat was tame, but steady. Corn has been offered much more freely at reduced figures, and has been in good request, chiefly for home use, though to a limited extent for export at the lower rates. There has been a

fair demand noted for Oats within our revised range Barley has been very quiet and much depressed. Ryc has been scarce and wanted at our quotations. available supply of wheat in store and affoat at this port is given at a little over four million bushels .... Provisions have been much less sought after, and have been quoted lower, particularly hog products, which have been pressed for sale. The husiness in Bacon and Lard has been mainly for forward delivery.....Cotton has been in less request at easier rates.....Wool has been held with comparative firmness, but has been quiet....Clover seed has been purchased with unusual freedom, mainly for shipment, at firmer prices...... Hay has been salable at our quotations....Hops have been depressed and quoted cheaper, but have been without activity....A very modtrade has been reported in Tobacco at irregular figures.....The closing of canal navigation has had the usual effect of greatly diminishing the receipts of produce at this point.

Beef Cattle .- After the heavy run of late cattle reported last month, receipts naturally fell off. When cattle are put upon winter feed farmers prefer to keep them a month or two, the first few weeks not telling upon their condition. In addition to this reason of the lighter supply now, is the fact that on December 5th the freights were nearly doubled-\$1.00 per cwt. from Chicago, instead of 60c .- and this at once shut down on much of the thin stock. Instead of 2,500 Texans received one week previous to the advanced tariff, we had barely 377 of the wild breed last week. New Yorkers may thank the railroads for better beef. Choice Christmas cattle begin to arrive, and are selling at 18c.@19c. per 1b., net weight of the beef. One pair went at 20c., weighed. to make 64 bs. per cwt., live weight. In the absence of very poor quality the prices obtained show quite an improvement. There has been a real advance of about 1/2c. per B. during the month, with an upward tendency at the close. Below we give the range of prices, average price, and figures at which large lots were sold:

Nov. 14th, ranged 7 @16 c. Av. 13 c. Large sales 11 do. 21st, do. 7 @16 c. do. 13 c. do. do. 11 do. 25th, do. 74@16 c. do. 13 c. do. do. 11 lec. 5th, do. 74@16 c. do. 13 c. do. do. 1) lec. 5th, do. 8½@16 c. do. 13 c. do. do. 11 do. 17th, do. 10 @16½c. do. 13½c. do. do. 0. 11

Mileli Cows .- There is a gradual tendency towards n removal of the fresh cow trade from the city, as the large swill stables-those mills which grind cows up in about one year-are broken up. More country, and less city, produced milk is now used. The few good fresh cows sent in bring better prices, an advance in beef adding to the market value of cows. Very poor cows are selling at \$45@\$55, fair to good at \$70@\$85, and prime to extras \$90@\$110......Calves.—Fell off to 11c, for the best, with heavy receipts of dressed, and bad weather forcing them to a quick sale. Now, prime 125tb.@ 160 b. milk calves are worth 12c., with ordinary to fair at 8c.@11c. Grass, or hay eslves of large size, sell at 4½c.@ 61/2c., or \$10@\$15 each ..... Sheep .- The few lambs now sent in are generally weighed with, and sold at the same price as the sheep. In fact there is little call for lambs alone. The demand runs upon extra holiday sheep, and some lots of 150th.@160th. long-wool Caunda sheep are selling at 8½c.@9c. per lb., live weight. One lot of 125 head, averaging 157½ lbs., went at 9c. Poor sheep are neglected; a car very thin, 61 lbs., selling at 4c. Most sales are from 5c.@61/2c., and the market is very good ..... Swine,-These run down soon after last report, live selling at 7c.@71/2c., but with lighter receipts just now, and cold weather, they vary from 7%c.@7%c. The weights are too heavy to suit the fresh trade. are unusually fat this season. The bulk are still sold after killing, and range from 84c. for 200 hs. 91/2c. for 1807bs., and 91/2c.@10c. for 1207b.@1607b. pigs.

The New Jersey Agricultural Soclety Record has been received through the Secre-It contains a list of all the prizes awarded at the tsry. It contains a list of all the prizes awarded at the last (12th) Annual Exhibition, together with the address of Hon, Orestes Cleveland and a list of the officers,

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, its 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Bound Copies of this Volume will be ready this moath. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the previous thirteen volumes (16 to 29) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bonnd in our regular style, at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clabs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus: a person having sent 10 subscribers and \$12, may afterwards send 10 more subscribers with only \$8; making a club at \$20; and so of the other club rates.

FREE.-The very Best Table Cutlery-Silver-plated Table Articles - Gold Pens - Children's Toys -Flower and Garden Seeds-Nursery Stock-Sewing and Washing Machines and Wringers-Melodeons-Pianos-American Watches-Shooting Irous-Tool Chests-Drawing Instruments - Barometers - Astral Oil - Hay Mowers - Horse-Forks and Hoes-Pumps-Family Weighing Scales-Cyclopedias-Dictionaries - Books - Grape-Vines - Toy Steam Engines - etc., etc., etc., are among the things that we are distributing very largely all over the country to our friends who send in clubs of Subscribers. Some report getting as many as fifty Subscribers a day. Others get one, two, three, or more as opportunity serves. Some make this their sole business, and sell their premiums received, and thus get large wages. There is no humbug, or clap-trap about this. At least Eleven Thousand persons have received these premiums with great pleasure, and still, not one in ten of those who ought to read the American Agriculturist and Hearth and Home for their own pleasure and profit, are yet supplied with it. So there is abundant room for thousands of others to obtain these valuable premiums. This work can go on all winter. Full particulars will be found in the Advertising Columns, pages 33, 34, and 35.

It Will Pay to supply yourself, your sons, and your workmen, with good papers and books. \$10 to \$20, or more, expended it this way, will come back every year. Your sons will be kept from idleness and mischievous company; they will understand and respect their work more; they will gain new ideas and learn to think and reason better; they will learn to make their

heads help their haods; they will labor more intelligently and be happier because their minds will be developed, and they will have something to think about while at work. Better sell an acre of land than not to have these mind cultivators. Any intelligent man will make more off from 9 acres than the unintelligent one will from 10 acres. Think of this in planning and providing for your sons in the future. Store their growing minds with useful ideas, or the devil will fill the vacancies with very undestrable tenants (ideas). (The premium list on page 33 will afford to many an opportunity to get some books free of expense; and plenty of good books, to be delivered by mail or otherwise, will be found in the advertising pages.)

Reliable Advertisements.—It is a atanding rule to admit no advertiser into the columns of this paper to whom we would not be willing to send cash in advance orders if wanting his goods at the price asked; also to exclude advertisements of a deceptive character, and of wares believed to be injurious. We believe our readers may more confidently patronize us a whole those whose advertisements are admitted into this paper, than it would be safe to do in any other paper published.

Beware of Silver-Plating Peddiers .- Last month a man pretending to be an English silver-plater called at our neighbor's, and claimed that he had brought over with him a valuable plating powder. The exhibited some work, and plated a copper penny io half a minute. The lady of the house paid him for replating a lot of spoons, and allowed him to polish up some pure silver ones. He directed her to wrap them in paper and let them lie four days for the plating to harden well. When the four days expired, and he was at a safe distance, she examined the articles and found them entirely blackened, and the silver spoons ruined. We suppose he and others are on their travels elsewhere. They should be arrested as swindlers. We often see venders of similar powders and liquids on the city street corners, brightening the boys' pennics, and selling their vile materials, which consist of a little cheap mercury, mixed or held io solution with clay or other substance. cury or quicksilver is deposited on the surface of the metals, and when fresh it rubs up as bright as a mirror; hut it quickly tarnishes, and when applied to silver, gold, and some other metals, it eats into them and destroys their texture. Applied to door koobs or any other articles plated with silver or gold, it ruins the plating in a day. Mercury (often called quicksilver) dissolves gold, silver, tin, lead, zine and bismuth the same as water dissolves salt or sugar. It is largely used by miners who crush the gold and ailver bearing rocks, and mix them with the mercury, which dissolves out the precious metals. The mercury is then evaporated by heat, leaving the gold or silver behind. The mercurial vapor is cooled, and caught in a condenser, and used again and again. This is called the "amalgamation process."

Cheap Advertising.—Every Advertisement in the American Agriculturist, we have good reason to believe, is read by at least 300,000 people. To print 300,000 cheap circulars, and mail them to the same number of persous, would at least cost for printing \$300; envelopes, \$400; addressing, \$300; Post-office stamps, \$600. Total, \$1,600. A whole page in the American Agriculturist, at \$666, would certainly be a better investment, not only as costing less, but as being in a form to insure preservation and frequent reference.

One of the Grand Enterprises of the age is the Northern Pacific Railway, which is not only to open a second Pathway across the Continent, but into occupation and cultivation a region of fertile country capable of supporting an enterprising population exceeding that of many single European Nations. The entire people of Norway and Sweden might well come in a body and possess this region, with a manifest gain in climate and soil-nod there would still be room for another Nation or two. Our attention was spec-Inlly called to this by the announcement on our last page of a New 7-30 Loan, now being negotiated by Messrs. Jay Cooke & Co. Few will forget the immense benefit conferred upon our Nation by this same firm, in securing for our government the first really large sum raised during the war-which was then, we believe, the largest single amount ever borrowed by any people in the world. The New Loan is in very convenient form for any amount, from \$100 upwards, pays a large interest, and the security would seem to be ample. It will be worth while to read the advertisement, and to send for the descriptive maps and pamphlets.

Drive Him Out.—In our humbug column last month, we mildly alluded to one calling himself Dr. Jesse Wright, as a disgrace to the good people of Salem, Ohio. On further examination of his circulars, and read-

ing some letters from correspondents, we are convinced that it is the duty of the people there to take some measures to expel from their midst this yillainous being who is coining money through private circulars which propose to diminish the increase of population, and which allure the young ou to vice. He ostensibly addresses only married people, and tells a semi-plausible story, but addresses his private circulars to "all." Such a man is more dangerous to a community than forty thieves and burglars. We have too high an opinion of the people of Salem, and all that region, to believe they will tolerate any such trafficker in the souls of men. A villain, calling himself Mrs. M. Wood, recently hailing from Williamsburg, now from a N. Y. P. O. Box, is in the same line of "business."

SUNDRY HUMBUGS.-The newspapers just now contain, under displayed head-lines, quite sensational reports of the overhauling and conviction of two of the pretended money swindlers. Passing over the fact that some of these same newspapers are particeps criminis, having opened their advertising columns to all the bogus operators who would pay for space, does it not show an unworthy timidity to keep silent over these swindles until the fellows are safely in jail? It looks like locking the stable door after the horse is stolen. In one prominent New-York Journal that "pitches in" to these swindlers, we counted the advertisements of ten different humbugs. If one-fourth of the newspapers of our country had followed the outspoken course of the American Agriculturist for a dozen or more years past, the whole people would have been so thoroughly informed that there would have been no verdant victims left to be preyed upon by thieves in disguise. We venture to say that very little of the vast sums that have gone into the pockets of these operators has come from anylof the million readers of this journal; and we do not mean any thing shall be obtained from them, in this way, if a persistent continuation of our notes and exposures will secure the end .... An alphabetical list of the humbugs discussed in these columns during the year just closed, contains no less than 217 references! The letters nod circulars received from all parts of the country would fill many large baskets. We can not of course acknowledge beyond a small portion of these, by pen or in type, but they have served a very nseful purpose. As soon as one of these new schemes or new names comes to hand, the delivery of letters to parties is stopped at the Post-Office, and tens of thousands of dollars have been returned to the unwise or over trusting senders ... . We are happy to report that two of the photographic money, saw-dustparcel swindlers have come to a little grief; they are sent to prison on Blackwell's Island for six months, They ought to have had at least sixty years in state-We refer to Dailey and Waters, who operated under the names of William Howard and William H. Jackson, alias "Logan & Co.," alias "Owen Brothers," alias "Howard & Co.," alias "Fisher & Co.," alias "Williams & Co.," alias "Joseph R. Lee," alias "Holt," "Kane," "Allison," and twenty or thirty other aliases. There are two other prominent operators, under a great variety of assumed names, whom we hope to see brought up. An examination of the "shop" of Dailey and Waters (Logan & Co.) brought some curious revela-tions to light. Their memoranda showed they had taken in as much as \$7,000 in a single day! Many letters, sending for counterfeit money, were found, several of them from persons in different parts of the country, who, while keeping up a hypocritical show of honesty at home, were none too good to slyly engage in circulating the 'queer." We have a list of names of such persons, which, if published, would create a commotion in many a neighhorhood. We will withhold them for the time being, hoping that the parties will reform in manners and morals. Perhaps it may yet be deemed best for the people at large to print the names of a few hundred of those whose letters are proof positive of their wish to palm off had money upon laborers, upon "freedmen," and upon their neighbors generally.....As we predicted, the California Library Lottery has helped to start up sundry other aimilar enterprises.....J. C. Derby is bring-lng reproach upon the publishing fraternity; we are sorry to see some newspapers puffing his "Gift Enterprise" on the ground of his connection with the press. We fail to see how his "Aiken Land Scheme" differs from a "Havana" or "Kentucky Lottery." True, he offers a picture to each subscriber of \$5. Suppose, for argument, the picture to be worth \$4. In that case the investor pays \$1 for the chance in the lot, or lottery, distribution of land. The Havana Lottery would accomplish the same thing by reducing the price of their tickets. Mr. Derhy asks us to "see what \$5 will do." We can tell him, that however much he may give for each \$5 sent to him, every \$5 invested will do something towards creating a taste for lotteries. The good sense of the conntry has long since put a ban upon lottery dealing, and justly so..... We have hundreds of letters received within

a few days, exposing attempted swiadles, many of which have already been referred to. We wish our new readera could see our last dozen articles. We can not well go over the old ground again ..... A widely circulated advertisement offers to "give \$5,000 to any respectable person who will adopt a fine healthy child five months old," as a temptation to ever so many thousands of unwary, childless, or impecunious persons to send 25 cents each for a photograph of the said child-an ingenious humbug, The Brooklyn Postmaster, under instructions surely! from the P. O. Department, now sends all their letters to the Dead Letter Office ..... A May-fair man in Brooklyn confesses the sins of his youth, in a plausible story told to get \$2 from various people for his medicines. Bah!... An unknown villair, who gives his address as "Box 356, Jersey City, N. J.," is baiting boys and young men on to rain by his private circulars, offering them villainous books, pictures, etc. Parents, watch what your children get through the Post of this sort. "short-hand writing" professor is scattering his circulars widely, and earnestly pleading for farmers, merchants, clergymen, etc. etc., to invest \$2 in his sys-We doubt its value to farmers or merchants, no matter how perfect it may be. As the professor gives no location, except a Post-Office box, and as-after inquiries of leading short-hand reporters-no one appears to know him, we can give no opinion of his work; but it is nonsense for any man to expect to become an expert or even a proficient in short-hand in one month. Shorthand writing or reporting is an art, to be acquired only after long and patient practice; and it is not worth while for any one to undertake it, except as a business pursuit requiring much time and practice.....Getting Names of People.—Many persons wonder how the Swindlers have obtained their names. Very often some one thinks his name could only have come from our subscription books. Never! We carefully guard against this. These swindlers send out circulars to Postmasters and others asking for the names of different classes of persons to be inserted in a pretended "Basiness Directory," and offering 5 to 10 cents for each name-which is seldom, if ever, paid. Again, numerous dealers, advertising doctors, and patent medicine men, by offering free circulars, etc. get hundreds of thousands of letters, and these they sell by the thousand. One made a fortune by offering a wonderful book to any one sending him two 3-cent postage stamps for postage on it. He pocketed the stamps and sold them, making no reply to the letters. He then sold the letters to swindlers at 5 to 8 cents each, thus clearing about \$12 on every hundred names, or \$36,000 on 300,000, out of which he paid \$6,000 for advertising-leaving him a net profit of \$30,000! In the above and other ways, the names and address of a large proportion of all the people throughout the country have been secured by the swindlers. One operator boasted of having distributed 1,200,000 circulars of a single kind ... . A dealer in patent medicines is "coming the pious dodge" by sending a very confidential circular TO THE PREACHER," and addressing him as "Dear Brother," etc. He has a great deal to say about the piety of the inventor-all of which should lead the "Dear Brother" to look out for the wolf's claws under the sheep's skin, before he sends any money, or orders any C.O.D. packages, or advises any body else to do so, notwithstanding the tempting offer of ever so many handreds and thousands of dollars a year commission or profits . RECIPES.—A large pile of letters before us contain very plansible propositions to people to buy recipes for making soap at 2 or 3 cents a pound; honey ditto; vinegar at a trifling cost, etc. etc. If the half that is stated in these circulars be true, there are a thousand persons in every county in the country making immense fortunes by selling these recipes. In every case the swindlers require a certain sum of money in advance. Every person sending a dime to a single one of these recipe operators, dees so foolishly. Their circulars and printed sheets in newspaper form are very plausible, but as a rule they are a fraud...We can't spare Mr. Gayler from hereabouts, though Cincinnati needs him badly. The awindlers by mail are getting thick ont there. Lotteries, alias Gift Enterprises, are widely and largely advertised in the newspapers, and by circulars. A. B. W. Taylor, L. D. Sine, Lewis A. Boll, etc., fairly rival the "Royal Havana" and "Covington, Ky." lotteries, in the gorgconsness of their prize-lists, and in what they promise to do. They operate in Cincionati, but have their drawings in St. Louis. Only very foolish people will invest. are far more in danger of being struck by lightning than you are of drawing one of the \$2,000 or \$5,000 or other valuable prizes, or an Aiken farm; so if you have any spare change, better invest it in a lightning-rod....

\*\*C.O.D.\*\* — A great many swindlers gain confidence by offering to send packages by express C.O.D.—that is, money not to be paid until the articles are delivered. But it must be paid for before the Express will deliver the parcels, and allow them to be opened and examined; and so, how is one better off than if he had forwarded his money direct to the swindler at first?....Wisa ladies

will buy their articles of known responsible dealers, instead of risking money forwarded to "Garland & Co., Brooklyn, E. D., or anywhere else, especially where the circular issuers fail to give street and number. (We expect a new subscriber from Hamlet, N. Y.! and she will prehably get more particulars about certain parties who are under investigation. If she don't find that \$25 badly invested, we hope she will let us know it.)....Oroide Watches .- There is so much swindling in articles under this name, that we advise letting them alone entirely, unless you choose to try something bought and warranted by a well-known, reliable, and responsible dealer always within your reach.....James T. Barton, 599 Broadway, N. Y., seems to be running a "Spanish Lottery ' right here in New York. None but consummate fools will send a dime to his address..... "Alumianm Watches" at \$3, or \$5 each, are humbugs..... Ditto every \$5 sewing machine ..... S. D. Benson, 77 Nassau street, N. Y., is trying to humbng "Dear Lady" and other people into the idea that for a dollar or two he can send them a snre prize ticket in an Havana Lettery . . . . The Empire Watch Company is a fraud; and the use of the names of Bradstreet & Co., Rowell & Co., Pettengill & Co. as references, entirely unwarranted. These parties know no such company.....A gentleman in Louisville, Ky., writes us complaining bitterly, and justly, of Harper's Weekly for admitting an advertisement of Brooks & Co,'s Music-hexes. Relying upon the character of the publishers, and not dreaming that they would admit a swindle even into their advertising columns, he sent \$5 for a box to play 24 tunes, and received a 10-cent harmonicum. To say nothing about any conscience in the matter, if these and other publishers will shut out humbugs from their columns, they will soon gain more in subscriptions than they will lose in advertising money.....
We have taken an unusual amount of space on this subject, but have not nearly exhansted the mass of letters and material before us. To sum up part of the balance, we add, avoid: "Journal of Beauty;" Hill & Co.; Cheap Bourhon Whiskey Distillers; unknown, and not well-known advertising agents; all advertising Doctors; and the following money swindlers (concerning whom we have over 300 letters just at hand): Bell & Son, Thos. W. Pierce, Owen Brothers, Jas. Fisher & Co., Wm. J. Fergusen, Williams & Co., B. B. Walker & Co., John B. Forrest, John F. Hamilton, Jas. R. Lee, S. B. Parks, H. Colter & Co., Rufus Stocktoo, Charles Humble, Horace Madden, P. Mayhorn & Co., Ed. F. Dickinson, Jas. P. Barker & Co., Henry E. Merton, King & Co., etc. . . . . P.S.—A professedly benevolent individual calling himself " Mary C. Leggett," hailing from the "National College of Health, N. Y." (where's that?), offers a free recipe for deafness, catarrh, and scrofula, which she (he) does send, but no mortal can find the materials, and of course must send the dollars to her (him) for the medicines, if foolish enough to have any faith in them. This is of the (Rev.) Edward Wilson class.... Gift Book enterprises are not quite out of date, because the foels are not all dead. .... The "\$1,000 a Week," of Rood & Co., is undoubtedly the counterfeit money swindle referred to above.... Certain "Family Association" circulars, ostensibly to look after family estates in England, have come to hand, which have a "Fishy" look, but we have not time to investigate. In each of these, some one man's bread is to be "buttered" on both sides, certainly. We never heard of anything but expense to come from such efforts. ....C. C. Corey & Co.'s ticket enterprise is an ontright swindle. Money comes in but nothing goes out.

Water-tight Cellar Floors:-When floors are not subjected to a great pressure of water, a good hydraulic cement or water-lime will form a tight cellar bottom and sides; but when the whole soil is full, and the cellar is like a basin in it, as in a case proposed to us, the pressure of the water upward will surely find crevices where it will ooze up. The cure for this state of things is to get drainage, if possible, and if this cannot be had and repeated patching will not stop the leaks, in a very dry time take up the top of the floor, and after covering the whole with a layer of gravel, pour into it melt-ed asphaltum, which should be rolled and pounded down while warm, and one or two more layers applied, topping with sand. If the gravel can be hot also, it will make a much better floor; but if it can not be, some coal tar may be mingled with the asphaltum, and the gravel coated slightly with it before the hot asphaltum is applied.

Secret Manure Recipes.—We see continually in the agricultural papers very attractive advertisements of secret recipes, for sale for \$i\$ to \$5, for compounds which will restore fertility to worn out land, bring orchards into bearing, drive away insects, save labor, produce great crops, and do wonders generally for the farmer. We are often pressed to advertise these things and always refuse. Not because the venders of the secrets are not or may not be lionest, and not because the recipea are worthless, but because the real in-

formation is readily obtained from other sources at a much lower price, and because the effects are always overstated. A judicious mixture of lime and salt, with ashes, and bone-dust, will do wonders almost any where, if properly applied. The admixture of hen dung, or other highly nitrogenous manure will greatly increase the effects. Any of our careful readers ought, we think, to be able to make a compost for grass, petatoes, corn, or roots, out of the above ingredients which would be worth more than any one of these 5-dollar recipes.

Fowls Poisoned by Lead.—D. S. Hartman, of Winfield, West Va., suggests that the fewls of "G. K. T.," mentioned on page 405, (Nov.) are poisoned by lead. He says: "I have lost several in this way, and in every instance I have found a shot or piece of lead in the crop. As yet I have found no cure."—Fowls pick up many insaintrions things, like lead, putty, glass, etc. When this is surmised, and several fowls are ailing, it would probably be worth while to open the crop (an operation which may be easily done), the contents taken out and examined, and the crop sewed up again, after being washed out. Crop-bound chickens are frequently cured in this way.

L. B. Green writes: "In your last issue of the Agriculturist I notice an advertisement of swivel plows for level laud and side-hill, leaving 'no dead furrows, etc.' I think such a plow is just what we need on farms where machinery of various kinds is used, and many of my neighbors are thinking the same thing. We would venture to purchase if we were sure that they were all right."—The plows referred to are indéed "all right," even for level land. The writer considers them almost indispensable on his own farm.

Whimlefree Yoke.—R. K. Fowle. We have considerable confidence in the principle involved in this harness for horses; but there seems to be lack of energy in the parties who own the patent, or something defective in the construction, or it would have been before this put npon the market.

Training Bird Dogs.—" Subscriber of 1871."—A good pointer or setter must not only have good blood, but be well trained. Sufficient training will make an inferior dog tolerably good—but the time wasted upon him would train two or three good ones! A good trainer will tell within a few days what a dog's capacities are, and it will never pay to train a stupid one if another can be got. A professional trainer will train a dog much better than any one else; and it will always pay to employ one, or to buy a well-trained dog.

When to Dry a Fleifer.—"W. R," Maine. It is generally conceded nowadays that to raise a cow which will give the most milk in preportion to the amount of feed she gets, the heifer should come in at 2 years old, or earlier; that for months previous to her calving, her udder should be frequently manipulated, so as to cause a tendency of blood to it, and its larger development; that she should calve fat; that after calving, she should be milked three times a day, as near eight hours apart as possible; that this should be kept up as long as her udder fills, and after this twice a day; that she should be milked close up to her second calving, which should take place at the end of a year. All this is to develop to as high a degree as possible the milk producing tendency. Of course the growing, young bearing, and milk producing animal should be fed with nutritious feod in abundance, and be warmly stabled in winter.

Grade Essex Pigs .- A farmer at Troy, Ohio, writes that he thinks the advice given in "Harris on the Pig," to select large, common sews, and breed them to a refined, small-boned, thorough-bred boar, is correct. He bonght an Essex boar, but the farmers in the vicinity did not think much of him. They thought him small, and were prejudiced against the color. Since they have seen his stock, and observed how rapidly he improved (at a year old he weighed nearly 400 lbs.), many of them began to change their minds. All the strong, healthy sows that were brought to him had fine litters of pigs, some of them jet black, and all more or less colored, showing that he strongly impresses his characteristics upon his offspring, as all thorough-bred male animals do when crossed with common stock. Crossed with a Berkshire sow, mere or less pure, he got pigs that "have grown faster than any pigs he ever saw." The hegs mostly raised to his neighborhood are of the large Magie breed. At the County Fair, last full, he exhibited his Essex boar, and it attracted much attention, being something new to most present. Knowing that his boar would he considered small, he put a tape-line in his pocket. "There was the best show of hogs ever had in the

county," he says, "but all belonged to the large breed. My hog, helng quite a curiosity, was well discussed, but was most always dismissed with the remark that he was too short or too fine. Says I, 'gentlemen, here is a tapeline, get in and measure him, and then measure any of these large pigs.' They did so, and he was only from 1 to 2½ inches shorter than the large breeds, and about the same in circumference around the heart. It opened their eyes. He was decidedly the hest proportioned hog on the grounds."

High Wages, Light Crops, and Low Prices have made the past year a very unprofitable one to many of our readers. Let us keep up our spirits as best we can. "It is a long lane that has no turning." Wages will probably be lower, prices are almost certain to advance, and we shall have better crops if we use the proper means. It should be noderstood that, no matter where we live, whether land is cheap or dear, or whether we adopt high farming or slow farming, we cannot hope to make much profit unless we raise large crops per acre. This is the central truth of American agriculture, and it is our aim to have it thoroughly understood by all our readers.

Clover for Hog Pasture.—Wm.T.Strickland, of Indiana, writes: "Say to your 'Kentucky farmer', who wants to know how to start 'a hog pasture,' that he may sow red clover seed on his wheat field—say from February 1st to May 1st, owing to the season—with the prospect of having a pasture ready for use by the 1st of the May next following. The better time to sow clover seed, as a general rule, is in March. There are not usually a sufficiently number of successively warm days in February, to sprout the seed, but in some seasons there are, and when the germ has sprouted, it requires very little cold to kill it. It matters but little about the condition of the ground, only that it should be free from weeds. It is the better plan not to pasture clover until it is 13 or 14 months old. It is very frequently large enough to make fine pasture in the fall, after having been sown the spring previous; but fall pasturing not unfrequently assists the following winter to destroy your next spring's crop."

Oil-calke for Figs.—"A. S.," Iowa, asks "If it will pay to feed fattening hogs oil-cake at \$3 per cwt, when corn can be bought for 30 cents per bushel, and hogs are worth 10 cents per lb., dressed."—Most certainly not. When oil-cake costs no more per ton than corn-meal, we should use oil-cake in preference, not because the oil-cake is any more fattening, but because the nanner from it is much more valuable. We are ourselves at this time paying \$5 per ton more for oil-cake than we can get corn-meal for, partly for the above reason and partly hecause a little of it helps to regulate the bowels and keep the animals in better health. Fattening hogs should not have much oil-cake, or it will render the pork soft, and soit is said, gives it a disagreeable flavor. Young pigs may be fed one-third oil-cake and two-thirds corneal, with decided advantage to the pigs. But it cannot pay to use it when it costs much more than corn.

Mink Breeding .- "J. B. S." A great deal has been written, rather indefinitely, however, about the breeding of mink. So far as we can learn, the facts are, briefly, that minks will do well and breed in confinement, provided they have plenty of water and enough to eat. During the breeding season they are kept in pairs, and in families after the young are brought forth, until they are nearly grown. Adult minks are almost antamable, but young ones readily submit to handling, and are easily domesticated. The time to secure young minks is in May and June, when they begin to ran with their dams. The streams must be quietly watched for mink trails, and these tracked to the nest. When they leave the hole the old one may be shot, and the young ones secured, or, they may be dug out. Those who own a breeding stock of minks ask high prices for but trappers represent to us that it is an easy matter, with a little patience, to get the wild young ones.

Pin-Worms in Horses.—"A. C.," of Hicksville, L. l., asks: "Can you give me a certain remedy for a kind of worms in horses, which are about one inch in length, of a white color, with glassy-looking heads and pointed tails? At times they come from the animal in his manne. I have tried every remedy that persons have suggested to me, including the one in the 'Hints to llorsekeepers,' but not one of them seemed to avail any thing. The horse is about fifteen years old, has had the worms a long time, and is at present in a very poor condition. He is an excellent work horse, and I want to get him in good order."—The hest remedy for pin-worms we know of is the following given us by Dr. Liantard, of the New-York College of Veterinary Sur-

geons: Give drachm doses of tartar emetic twice a day for three or four days, and follow with a mild purgative, say five drachms of aloes. Precisely the same remedy is good to bring away the long white worm.

Ask the advice of a veterinary surgeon or of a physician. It is probably caused by bad treatment, such as poorly ventilated stables, irregular feeding, letting the horses stand out of doors in cold storms without a blanket when heated; and then when you bring them home at night blanketing them in the stable instead of rubbing them dry. If you feed your horses much corn, work them hard, and do not groom them, you must expect them to become blind. Give the horse half a peck of bran or carrots twice a day; groom him thoroughly, and otherwise improve his general health, and his eye will probably get well.

Gydsum.-"C. D. O.." Hampton, N. Y.. writes: "In the December Number of the American Agriculturist, under the head of 'How much Gypsam per Acre,' you seem to convey the idea that two hushels would be as beneficial and for us long a time, as four bushels. Is it true that two bushels applied to an acre is as good as four if no more be put on for a number of years? Is gypsum in the soil different from other manures?"—Yes. Gypsum is very different from all those manures which, like bone-dust, saperphosphate, ashes, etc., exert their chief action in contributing directly to the nutrition of the plant. They are good because they are plant food. Gypsum is good because, to a considerable extent, it either enables the plants to take more of other food, or because it supplies or retains in the soil for the use of the plant, ammonia, moisture, or something else. There is no subject upon which there is more disagreement or uncertainty in the teachings of agricultural writers of anthority than upon the action of gypsum. Experiments have proved that the maximum beneficial amonut is soon reached on most soils.

Caponizing Fowls.—This is not a difficult operation to one who is accustomed to it, but the beginner will have difficulty unless he practises upon dead fowls until quite familiar with the mode of operating. If possible, a few lessons should be had of an old caponizer. Instructions accompany boxes of implements, which are worth \$6 or \$7.

Poultry Raising on a large Scale.

—We are in receipt of a number of letters asking advice on this subject. Poultry is cheap this year for some reason—probably because corn is not dear, grasshoppers more abundant; the season was dry, and the weather holds warm. It is therefore easier to buy 1,000 choice pullets than usual; but if any body tries it he will find it a task to do that—if we may judge by the experience of a neighbor. We have no doubt it is profitable to keep fowls by the 1,000; and the experiment in almost every case, where care is constantly exercised, will be successful for the winter and part of the spring, but when we have moist, cool spring weather, damp within and without, colds, roup, and death will surely come to an extent to reduce the profits essentially, noless experience and vigilance, with the closest attention to the wants of the fowls and their sanitary surroundings, ward them off. We advise no one to undertake wintering 1,000 hens, but

are glad if discreet people try the experiment.

be no rarity.

learning more about chicken ailments, preventives, and

enres; and the time is coming when flocks of 5,000 will

Minerals and Fossils.—It is very desirable for all who are interested in studying the structure of the earth's surface and its geological history, to know some one to whom they may apply for characteristic specimens of minerals and fossils. To such we are happy to recommend our old laboratory friend and associate, Mr. Louis Stadtmiller, of New-Haven, whose advertisement has been for some months in our columns. The study of mineralogy in those sections of the country where it can be pursued among the rocks, quarries, and mines, is interesting and improving. And all who collect minerals in one locality need to be in communication with other collectors, or some dealer with whom they can exchange, or from whom they can purchase specimens.

Pickles.—Mrs. W. A. B., Windham Co., Ct., contributes the following: "Cacambers should be cut from the vines, a part of the atem left on; observe care not to mar them, if brnised they will decay. Select such as are of suitable size and of good quality, and cover them with boiling water, let them remain until the water is cool; if for vinegar pickles, add a small quantity of salt before scalding. When cold, drain thoroughly, and cover with boiling vinegar with an addition of spice if preferred. If for brine, put a layer of dry salt in the bot-

tom of a barrel, and after thoroughly draining the pickles, put them in with dry salt amongst them. Add no water. Put a weight upon them, they will furnish moisture for brine, and will keep better, besides being more criap and brittle for having had the gum soaked from them by the bolling water."

Delaware State Poultry Society.—
"A. R. Tatnall," of Wilmington, the Corresponding Secretary, writes: "I wish to inform you of the organization of the 'Delaware State Poultry Society,' which will hold its first annual exhibition in this city from the 9th to 14th of Janaary, 1871. Premium lists, etc., will soon be issued. The officers of the society are as follows: President, Th. H. Churchman; Vice-President, R. M. Griffith; Corresponding Secretary, A. R. Tatnall; Recording Secretary, W. D. Bush; Treasarer, N. R. Benson. The Executive Committee includes all the above officers, with H. Morrison, Thomas Macfree, J. Bowers, and S. D. Jensison. Although our members are few, we have promise of a good exhibition."

Black-kmot.—L. A. Ide, Claremont, N. H., sends us a specimen of a black-knot with a grab in it. We have frequently seen the same thing. We have also seen apples with grubs in them, but never supposed that the grab was the cause of the apple. It is as well ascertained as any one point can be that black-knot is the result of a fungus, and that no insacts have any agency whatever in producing it.

The Glades of the Alleghanies.—C. W. Broad writes: "I have 500 acres of land in what is known as the "Glades of the Alleghany Mountains." The soil is a light, rich, sandy loam; there are hundreds of cattle grazed in this district and do remarkably well. Where the Glades (or open lands) are, there is plenty of natural wild grass, of which cattle are very food. Do you think I could make a better pasture for stock by plowing up und sowing tame grass, or to sow tame grass on the land as it is, merely harrowing it in? I wish to make a fine permanent pasture, suitable for all kinds of stock."

—Let the sod alone; the grass we believe to be Blae Grass, yielding to Red-top on wet spots. If you sow anything, try guano and plaster, and tell us the result.

Squash Seeds.—"S. G. B. G.," Galesburg, Ill., finds it difficult to free aquash and pumpkin seeds from pulp. The best way is to put the squashes and pumpkins from which it is desired to save seeds in a room where there is an even temperature, and let them remain until they show signs of decay. In this treatment the seeds receive all the nourishment that they can from the fruit. In any case place the seeds and pulp in a vessel with water enough to cover them, in a warm room and as soon as fermentation sets in the seeds can be easily washed from the pulp.

Large Squash.—C. J. Mills, Gloverville, N. Y., reports a squash which weighed 205 lbs., and was within an inch or so of 9 feet in circumference. We cannot tell what such a squash would be worth, as such monsters have no regular price.

Fields, Osgood & Co, have just published a charming book, by Mr. Chas. D. Warner, of Hartford. There are ever so many funny things in every man's experience of the world, if we can only see just "where the laugh comes in," and how to get the fun out of them. Mr. Warner sees very clearly, and kindly lends us his spectacles. It is not meant for a practically useful book, strictly, nor to make you laugh; but it blends so pleasantly useful hints, dry wit, racy fun, and observations of and upon nature and the rest of the world, that when taken up it fascinates one to the very end. Henry Ward Beecher writes a sprightly, chatty, introductory letter for it, and the little book pleases everybody, we believe.

Trees on the Prairies.—A Correspondent thus writes from Holt Co., Mo.: "Cau you not devise, or help devise some plan by which our Government may be induced to plant forest trees on these vast plains west of ns? If it be true that trees cause rain, to longer neglect it is criminal; for all these treeless regions of almost conutless millions of acrea are subject to droughts, and once during many years (say twenty) to such a drought as to be frightful in its consequences. Indeed, I tremble to think that the time will come when these prairies, being densely peopled, a whole year may pass without rain. It matters little now owing to the sparse population, though in 1859, during such a time, hundreds of people died in Kansas in consequence. Years of comparative regularity pass and people are deceived, hence the country becomes densely settled; but unless some means be found to secure to us rain, (and a very little

suffices), there must be awful suffering. It is said that it now rains in Egypt regularly, owing to the forest trees planted by a former governor. Now, there is no country in the world where trees grow faster than in these prairies of Kansus and Nebraska; and he will be honorably immortalized who puts in operation some plan by which the object may be accomplished; and I implore you to use your influence towards it. The people of the West, owing to their position, are wholly occupied with the things of to-day, grossly material, and not one man in a hundred thousand ever thinks of these matters, Imagine a repetition of the experience of 1859, with three millions of people in Kansas and Nebraska: the whole world would stand aghast."

Fun Ahead-The Patching Exhibition.—We are as impatient as any one else can be, at the necessary postponement of the Patching and Daraing Exhibition, noted elsewhere, for in addition to the great amount of good to come, and that already done to the contributors themselves, we anticipate no little amusement, when on Jaouary 9th and 10th we commence to open and prepare the numberless articles of all sorts, sizes, and fabrics, that have already come to hand. Wonder if any two will be alike-coming as they do from hundreds of families, in all parts of the country? For a week past the various express messengers have several times a day come in with both arms piled high up with parcels, and with a broad grin upon their countenances, as if conscious of doing a good deed. Won't it be a pleasant as well as amusing sight to go around to the Five Points Missions, the Howard Mission, the Children's Aid Society, etc., about the middle of January and after, and see the regiments of poor clothed in the these hundreds of parcels? All the parcels are still packed as they came, and will remain so until after Jan. 7th; but a few dozen letters from the contributors, that have come by mail, have given us a foretaste of what these packages will reveal on the day of exhibition. A fine show is already assured, but our grand building, with its 25x114 feet, first or office floor, and the tweaty new rooms on the five floors above, now being all newly fitted up, but not yet occupied-all splendidly lighted by newly devised skylights, will permit ample room for a supply of clothing for several regiments of the poor. So we invite unlimited further contributions of articles for competition, and for distribution, up to January 7th, when the opening and arranging will begin.

Where the Advertisement was seen.—Dealers are always pleased to know where the advertisement was published, which brought them a customer. It is also a gratification to us to have our wide-awake readers name the American Agriculturist, when ordering from those advertising in it, or writing to them for circulars or otherwise. There is also this advantage, viz.: that as our advertisers know our strict rules, and their danger of exclusion, if not of being shown, if they do not act on the square, they will be all the more careful and will take special pains to give satisfaction, if possible, to those whom they know to have come to them through this paper.

November Number a correspondent in Ottawa County gave a discouraging view of the prospects of the crops, especially of corn, in that State. From a great number of reports in reply, it is evident that "F. P." formed his opiniou from too limited an area—colored, perhaps, by his own individual experience. All of these letters from different counties speak in the highest terms of the condition and prospects of the various crops, especially of corn, and of the present prosperity and high hopes of farmers.

A Funeral a Day - Dangerous Light .- It was stated at a Coroner's inquest, Dec. 15th that 9914 per cent of the petroleum oils used in this city words, that only one gallon in every two hundred, is safe! This is a startling announcement, but it was based on a careful scientific examination of a very large number of samples gathered at random from the various dealers. And this city is no worse off than the rest of the country. From an observation of a large number of newspapers (of which about 4,000 are regularly received at this office) we estimate that there is an average of at least one death a day resulting from the use of poor petroleum oil or "kerosene," There is no need of this. Good, properly rectified oils do not explode, or even take fire at ordinary temperatures. A few manufacturers remove the cheap napthas, and sell only the heavier, non-explosive oils. Of course this requires the charging of higher prices, and the mass of people will continue to purchase those mixtures which cost a few cents less per gallon, and just here lies the whole difficulty. People will buy low-priced ganpowder, whiskey, and petroleum, unless the strong arm of Government is interposed and the sale of dangerous articles is prohibited by severe penalties. The ignorant masses are not proper judges, and competent inspectors should be appointed as much for petroleum oil, as for steamengines. We commend this subject to the earnest attention of the various legislatures usually assembling this month. A word more. These low-priced oils are not really cheap. The better oils give about as much more light as their price is higher.

Livermore, Broome Co.—The amount of salt in batter varies from none at all to 2 ounces to the pound. Such is the difference in tastes. That which we prefer for our own table, and which is most agreeable to our friends, has one ounce to the pound, worked in at the close of the first working. Of course a small portion of the salt is worked out—more or less according to the amount of butternilk left in the butter, which varies with the way in which the butter comes—soft or hard, granular or waxy, at the second and final working.

No Pumpkin Seeds for Cows.—
"Mrs. N. L. C." The medical action of pumpkin seeds is perhaps not thoroughly understood. They are regarded as almost a specific cure for tape-worn in man. The worn is killed and passes away. They certaioly have a strong diuretic action upon man and animals. This alone would account for the decrease of milk. If the blood is used up in the kidneys, the lactral glaads will be left with a short supply.

Mechanical Engineering in Vale College.—We have received the Inaugural Address of Professor Wm. P. Trowbridge, on taking the chair of Mechanical Engineering in the Yale Scientific School. Mr. Trowbridge is a graduate of West Point, and served with distinction upon the U. S. Coast Survey, and has more recently been connected with the Novelty Iron Works in New York. The address is upon Mechanical or Dynamical Engineering in its relations to civilization. It is issued by the Governing Board of the Scientific School.

"Pheasants and Poultry," is the attractive title of a book sent us with the compliments of H. C. Dear, of Eagland. An article by "Path-Finder," a writer in the London Field, cut up into very brief chapters and printed in coarse type, makes a dozen small pages, to which is added hardly any end of notices, recommendations of Dear's food for poultry, cattle food, etc. The price of the book is 2s. 6d. sterling, about 75 cents—which strikes us as rather dear for an advertising document. We do not and never have believed in the free use of any of these stimulating articles of diet; excellent as medicine they may be, but not as "food."

How to Head Off Peddlers .- The peddler nuisance is becoming almost unendurable. Venders of all manner of notions crowd the cars, steam and ferry boats, and over-run stores and offices, to the great annoyance of everyhody. The Internal Revenue law stipulates that every one of these pedestrian peddlers shall take out a ten dollar license; a failure to do so makes them amenable to a fine of not less than ten or more than five hundred dollars, in addition to paying the back tax. Any Internal Revenue officer has a right to ask any such peddler to show the receipt for payment of the tax. In case the latter refuses, the officer may seize his wares and convey him to the assessor of the district, who, in turn, may direct a forfeiture and sale. yourself therefore of these illegal peddlers, who, like bad pennics, are always returning, one has but to complain or threaten to complain to the nearest Internal Revenue of-A few threats of this character, especially if carried out, would serve to make the whole of them scarce.

Present to the Yale Scientific School.—The Managing Board of this School acknowledge in a recent publication the receipt from the Novelty Iron Works of New York of a collection of drawings numbering several thousands, "exhibiting entire and in detail multiform mechanical structures."

The Report of the Commissioner of Agriculture has been for some weeks upon our table, but we have not had time to give it that close serutiny which its table of contents calls for. We see, however, several subjects which are of great importance and interest at this time, and appear to be well treated and valuable contributions to our knowledge. Besides the reports of the Statistician, Entomologist, Chemist, and Superintendent of Gardens; we have a long and valuable report by Prof. Posy, on Agricultural Meteorology, which is endorsed in a note by Prof. Henry, "as an elab-

orate exposition of the latest facts and speculations on the subject." The "Report of the Editor includes not less than 30 distinct articles, all appearing as if they were original, that is, first given to the public in this Every clue to the source whence the information was collected by the editor, with a single exception or two that we notice, is carefully excluded. The information is not original, for some of it has appeared in slightly different form in other publications, if not in precisely the same language, to our certain knowledge. The mere statement that "Mr. So and So reports," means, if it means anything, that he reports to the Agricultural Department, instead of which the editor has probably found the statement in some agricultural paper and appropriated it. This would be in character for the editor of one of our agricultural or stock papers, which is run in the interest of some stock farm, or seed establishment, but beneath the digoity of a national publication of the character of the Agricultural Report. Editors are too apt to forget that persons interested in the most valuable information always want to trace it to its source. and that statistics, tables of results, and ecientific statements, lose their value if their source is not clearly stated.

Edityman's Convention. — The 6th Yearly Convention of Dairymen under the auspices of the Am. Dairymen's Assoc'n is called to meet at Utica, N. Y., January 10th to 15th. Donald G. Mitchell, Prof. Caldwell of Cornell. Joseph Harris who "Walks and Talks," are aunounced to make set speeches; besides a number of other gentlemen and dairy farmers have agreed to be present and speak on certain important topics. The Secretary, Mr. G. B. Wecks, of Syracuse, or the President, Ilon. Horatio Scymour, will give further information.

Professor Agassiz Wants Carcasses of all sorts of pure-bred domestic animals and poultry. He proposes to preserve the skeletons, and, if practicable, the skins(not stuffed), in the Museum of Comparative Zoology, at Cambridge, Mass. Professor Heary A. Ward, of Rochester, N. Y., is co-operating with Prof. Agassiz in this exceedingly important work, and receives the specimens, which are to be prepared under his direction. The accompanying letter from Prof. A. to Prof. W. explains the whole matter. Geattemen who lose by accident, or are obliged to kill valuable animals or fowls of the pure breeds only, and who wish to co-operate in this work, will ship them boxed or otherwise expeditionsly to Prof. Ward. Prof. Agassiz's letter, somewhat abbreviated, is as follows:

CAMBRIDGE, Dec. 13, 1870.

Dear Sir.—I propose to put up in the Museum of Comparative Zoology a perfect skeleton of a male, a female, a half-grown and a young of each breed, of all the different kinds of domesticated cattle raised not only in this country but in every part of the world, as a monument to the progress of civilization in that direction. I shall, at the outset, limit myself to the pure breeds..... Now that you understand my plan, and are ready with your skilled workmen to undertake the preparation of the skeletons, I can hope to proceed with its execution as rapidly as the misfortune of accidental or natural death may deprive the stock-grower of any of his pure stock. I suppose I am not mistaken in assuming that the man who has lost a valuable animal would prefer to see it put up handsomely in a museum, with a label commemorating the pedigree and history of the same, than to bury it and allow it to be entirely lost. I would therefore make an appeal to the farmers of the country to send to you the specimens of pure blooded breeds, known to be such, which they may lose, and to forward them to you by railroad, giving you at the same time, by letter, the necessary information concerning the history of the specimeus that I may record the whole in our catalogues. would be desirable, where convenient, to have them forwarded with the skin, \* \* \* but to lessen the chances \* but to lessen the chances of decomposition, the intestines should be removed. Beginning at home I would first call for specimens of all the breeds of cows, horses, sheep, swine, dogs, goats, rabbits, guinea pigs, etc., fowls, turkeys, ducks, ge fancy birds. As fast as the skeletons can be mounted they will be put up in a special room in the Museum at Cambridge, to remain accessible to every body at all times, all the year round, so that this collection may shortly afford the best means of studying the anatomy of our domesticated animals as far as their skeletons are concerned. Yours very truly, L. AGASSIZ.

Prof. H. A. WARD, Rochester, N. Y.

Feeding Turnips in Kansus.—
"E. D. L." When Turnips are worth but a few cents a bushel, it seems a waste of time to spend time to cut them up, but it is important. There is danger of them choking the cattle or horses. We need a cheap root-cutter that will work fast. Chopping with a spade is slow work.

### Special Premiums.

FOR A RENEWAL AND ONE NEW SUBSCRIBER TO AMERICAN AGRICULTURIST, OR ONE SUBSCRIBER TO HEARTH AND HOME.

Trophy Tomato has proved so far superior to others that we desire to have it widely distributed, and we have made such arrangements with Col. Waring as to enable us to affer pure seed from headquarters, with his trade mark guaranty of gennineness.

Japan Lilies.—We offer from the gardens of A. S. Fuller, Esq., several of the beautiful Japan Lilies, some of which have been sold by seedsmen within the last two years as high as \$5 each. Any one of these is an ornament to any garden, and they can be had free as premiums.

Eumelan Grape-Vines.—Hasbrouck & Bushnell, proprietors of the original stock, will supply us with vines of this most excellent variety, and we wish all of our subscribers would try at least one.

I.—To every old subscriber to American Agriculturist who after this date renews, and sends one new subscriber, with \$1.50 for each, and 5 cents for postage on the premium, we will send any one of the following eight articles that may be chosen:

1 Package (200 Seeds) of Trophy Tomato Seeds.

Or:-1 Bulb Red Japan Lily, Lilium speciosum rubrum.

Or :- I Bulb White Japan Lily, Lilium speciosum album.

Or:-1 Bulb Golden-banded Lily, Lilium auratum.

Or:-1 Bulb Long-flowered Lily, Lilium longiflorum.

Or:-1 Bulb Gladiolus, or Sword Lily, named varieties.

 ${\tt Or:-2~Bulbs}\,\textit{Tigridia}, {\tt or~Mexican~Tiger~Lily,} \\ {\tt differ't~kinds}$ 

Or:-1 Eumelan Grape-Vinc No. 1.

II.—For one subscriber, received after this date to REARTH AND HOME, for one year, at \$3, with 5 cents for postage on the article, we will send any desired one of the above premiums. Subscriptions taking these special premiums will not be counted in other premium lists.

### IMPORTANT!

### Patching Exhibition Postponed\*.

TO DE HELD JANUARY 11TH, 12TH, AND 13TH.

We regret the absolute necessity of changing the time of the "Patching and Darniog Exhibition" until January 11th, for the following reasons: The American Agriculturist Buildings are undergoing extensive alterations and improvements, at a cost of about \$30,000, all of which, by the terms of the contract, are to be mainly completed before Christmas; but owing to various entirely nulooked-for delays, it now appears probable that we are likely to be kept in a "muss" until after the time first set for the Exhibition, and, of course, it will be impossible to display the garnents properly in the midst of scaffolding, new paint, etc. As people are too much engaged to visit such an Exhibition during the first week of the new year, it seems best to wait until the second week; and it has therefore been decided to hold the Exhibition on JANUARY 11th, 12th, and 13th.

We exceedingly regret this delay, because to "postpone" is not a custom of ours; but perhaps it will be just as well for all concerned. The contributions to the poor will be none the less acceptable in midwinter, when previous supplies are exhausted.

The numerous parcels already sent In, and others as they come, will be carefully stored in a room set apart for the purpose until January 7th, up to which time further garments for competition or distribution may still be sent in.

Poultry Show in New York .- The New York State Poultry Society is holding its Third Annual Show as the Agriculturist goes to press. It is a great success. The quality of the poultry of the United States is increasing in excellence every year, and this year the Society has on its list of exhibitors some of the first English and Irish breeders. The Show is strongest in games and Asiatics, both of which are superb. French fowls are in good numbers and very good; Bantams never beaten at any show in America. Dorkings fair in numhers and very superior in size and markings. Hamburghs, beautiful and large-of course criticizable, but the best we have ever seen. The American Agriculturist Prizes have drawn many entries; and the same is true of the Rural New-Yorker Prize, for native breeds. foreign exhibitors for President Kingsland's prizes are Henry Beldoo, of Bingley, Yorkshire; J. H. Cryer, of Southport, England; and J. C. Cooper, of Limerick, Ireland. The show of Turkeys is grand; so of water fowls of all kinds, Toulouse Geese and Aylesbury Ducks

\* See HEARTH AND HOME, No. 49, page 778, and American Agriculturist, December Number, page 443.

being especially noticeable. Besides, the Pheasants, and Ornamental fowls, the Conics, Rabbits, Egg-hatching Apparatus of two kinds, and sundry Poultry House and Yard appliances, all add greatly to the attractiveness and instructiveness of the Show.

Working Land on Shares in Virginia.—A correspondent in Clarke Co., Va., writes us that he is working 110 acres of poor, cleared land on shares, paying one-third of all the grain and hay raised as rent, and, we presume, the same proportion of animal products. He keeps four horses, twenty sheep, and proposes to keep eight or ten cattle, and as many pigs as will make bacon for his own use. The soil is a mixture of clay, limestone, and gravel, slightly sandy; it is entirely free from wet or marshy land, and just sufficiently rolling to prevent any stagnant pools. "My wheat," he says, brings me in debt two out of three years. The soil runs readily into blue or sward grass. Butter brings on the average about 25 cents per pound. I have no money to belo me I have the farm in five lots, besides a fiveacre lot designed for mowing. If you can advise me as the best rotation of crops or general management please do so."---Working land on shares is a poor system. There is always a temptation to do as little work as possible on the land. We doubt whether a man can find his own teams, stock, implements, seed, etc., and afford to pay one-third of all his produce, and at the same time keep up the fertility of the land and make the necessary repairs. Perhaps this farm is worth \$3,000. To work it properly would require the labor of two men the year round, and additional help in summer equal to a for half a year-say two-and-a-half men, worth, if first-class men, at least \$1,000. Then the keep of the four horses would cost at least \$300 more. Wear and tear of implements, harness, etc., would be at least \$100 more Seed, \$100 more, or say \$1,500 in all. And you give onethird of this sum, or \$500, for the use of a farm worth only \$3,000. It cannot be done-and in fact is not done. Persons who rent farms on shares do not, and cannot farm them properly. Usually the crops which pay the best are those which require most labor; but out of every three days' labor the landlord gets one, and the tenant is at all times tempted to spend as little for labor as possible. The more labor he expends, and the more manure he uses, the more rent he has to pay, and the better the land will be when he leaves it. Our correspondent loses money on wheat; and, if so, we do not see how he can expect to make a profit on any other cultivated crop. On corn or potatoes he must expend more labor than on wheat, barley or oats. If two-thirds of a wheat crop will not pay him, two-thirds of a corn crop, as a general rule, certainly will not. The same remarks will apply to butter and cheese making. One-third of all the labor of making the butter goes to the land-owner. Better convert thegrass into beef than into butter. It requires less labor. Better keep sheep for the same reason. In fact, as you get the house and firewood for nothing, with two-thirds of the fruit for merely picking the whole, better let the land bring forth what it will spontaneously and go and work for some one else! Our object in making these remarks is simply to show the tendency of the system of working land on shares. The tenant has many inducements to impoverish the soil, and few, if any, to improve it. As Arthur Young once said, with characteristic exaggeration, "Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him the nine-years' lease of a garden, and he will convert it into a desert."

### Foot and Mouth Disease in Dutchess Co.

This disease, which, though not usually directly fatal, often produces death by secondary nction or its influence on other morbid symptoms, has caused very great trouble, and loss of property in Great Britain and on the Continent of Europe. It has made its appearance in Dutchess County, N. Y., and the Secretary of the N. Y. State Agricultural Society makes the following statement:

Farmers in all parts of the country, particularly upon the lines of through cattle traffic, should be on their guard, and upon the first indication of disease showing any of the symptoms stated below, should give immediate notice to the State Commissioner nearest them. The State Cattle Commissioners are Lewis F. Allen, (address Buffalo, N. Y...) M. R. Patrick, Manlius, Onondaga County, and Dr. Moreau Morris, No. 301 Mott street, New York.

The disease is the epizotic aphtha, commonly known as the foot and month disease, which is at this time prevailing to a very annoying extent in Great Britain. It is highly contagious, not only by contact with diseased animals, but also by contact with the discharges from the sores, and the contagion may be conveyed by the matter adhering to the clothes (especially the shoes) of persons

attending diseased mnimals, and also by the matter in the dang and litter of animals, on which account there is special danger from the manure or dirt thrown out of cattle cars at stations or in motion. The disease is also readily and frequently (perhaps most frequently) communicated by the discharges dropped upon the highways hy sick cattle driven over them, and for this reason the first precaution to be taken is to prevent the moving of cattle dattacked by the disease. The disease sometimes affects the udders of cows, and during its course (whether symptoms of its affecting the udder part or not) the milk should not be used as human food or given to any animals

The Dutchess County infected district has been visited by Prof. Low, of Cornell University, consulting veterinarian to the State Agricultural Society, who sends the following brief statement of the symptoms of the disease, viz: First-From one to two days dullness, loss of appetite, (and of milk in cows,) hot dry mouth, with a tendency to grind the teeth and to slaver, heat and tenderness of the udder and teats and of the feet, with frequent shaking of the feet, as if to get rid of some irritating matter. Second—On the second day, abundant frothing at the month, loud smacking of the lips and tongue, lameness and the formation of blisters of various sizes, up to an inch across, on the mouth, udder and teats and between the hoofs. Third-In one or two days more these blisters burst, leaving raw sores and shreds of loose skin inside the upper lip, on the roof of the mouth and the tongue, on the teats and between the hoofs. discharge an irritating fluid for some time, then scab over and heal up, in favorable cases, in from ten to fifteen days. It should be added that the milk should be drawn by tubes or syphous in case the udder or teats become so sore that the cow cannot be milked as usual, and that the sick beasts should be well nursed and nonrished with soft mashes and gruels. Cooling but not purgative medicines should be given, and the sores washed mild carbolic acid preparation, or with a weak solution of sulphate of zinc (white vitriol).

## Two Important Habits to Cultivate in Your Sons.

It is a generally observed fact that, in this country, a very large proportion of the successful men are either the sons of poor parents, or orphans-or half orphans; and that comparatively few sons of rich men amount to much in any business or profession, notwithstanding the superior advantages they have of education, position, and an inherited capital to start with. The exceptions are usually, of course not always, the oldest children of those who have gradually grown up to wealth—those who received their bent while the parents were themselves too thoroughly occupied to carry their children, and too economical themselves to allow spendthrift habits in their children. Another thing we have observed is, that, other things being equal, successful men come from large rather than from small families. Three-fourths or more of the rich men, and the influential men of this city to-day, have risen to their present positions from very indigent circumstances in early life. Why is this so? it necessarily so? Must the well-to-do parent feel that, after all his efforts to acquire for himself and his family the position that wealth gives, there is some compensating decree of Providence which ordains that his sons must enter upon a descending scale?

Our observation has led us to the conclusion that two of the strongest elements of success are, courageons selfreliance, and economy. The boy left a poor orphan has to fight his own battles. No rich father furuishes him a carriage to ride, and so he must walk-and he learns to No one reaches out a friendly hand to lead him, and he learns to go alone. With a scanty supply of pocket money, he is compelled to habits of economy that ever after cling to him. "The boy is father to the man" is a trite saying. The poor boy comes up to manhood, and instead of leaning upon some one to aid him, or of waiting for some one to come to his help, he strikes out with a feeling! that, to use a vulgarism, he must "root, hog or die,"—and he roots away. Look where you will, and you will find that ninety-nine out of every hundred successful men are inspired with just this self-reliant feeling. It is at the very foundation of the go-ahead and get-ahead-yourself spirit that animates them. The man who was helped by father when a boy, whose school expeoses were paid by father instead of having to earn them himself, whose expenses in preparing for his profession, or whose capital in starting business, came from some paternal bank, begins life with a dependent feeling, and it is next to impossible for him to strike out into the world with the feeling that whatever I am I must make myself; whatever I get I must get for myself. The only son, petted and aided as he could not be if he were only "one of several," lacks this element of self-reliance. Even in his "sums" and his other school lessons, he is

helped out by mother or sister, or perhaps by father, or a subserviant teacher. It is a very strong objection to private or home schools and tutors, that with few pupils, the teacher helps the children too much, and they also lack the stimulated of competition. In large families of children they have each to fight his own way along among compeers, and thus a healthful self-reliant spirit is acquired.

We have sald enough to illustrate our idea. parent consider the subject well, and see what he can do to cultivate this self-reliant spirit in his children. Let the tmining begin in very early life. Every time we see a mother sit down to work out the boy's "sums" for him, and help him dig out his other lessons, we feel that she is by so much teaching him to lean upon others, and lessening his manly independence. If he is over-tasked to absolute despair, let the task be lessened an-other time, but in every case let him "paddle his own Kindly encourage him to do it, but do not do it for him. While still very young, give him full charge of some work that he must accomplish entirely without aid from others. We think it well to give every boy on a farm at least a small plot of ground, in the care and direction of which he is to be absolute sovereign, suffering its losses and enjoying its profits. In its management let him have little of your aid or even advice. He will thus both learn self-reliance, and be led to plan and study for himself. Though there be a score of servants in the house, the child should not harbor the idea that he can run to them for every thing wanted. In short, whatever the station, let the children have a considerable number of duties and cares that they must attend to

without leaning upon any one.
With this courageons self-reliance secured, a habit of economy-not a mean or miserly parsimony-will go far to ensure a man's success. We believe every boy should have a money purse, and always have something in it. If you can only spare him three cents a month, let him learn to spend but two of them, and to keep an account of the expenditures. It is as important for him to do this, for the habit it hegets, as for the millionaire to enter a sale of a hundred thousand. A business man of our acquaintance, possessed of large wealth, came to this city almost penoiless, and engaged to work at a very small salary. Himself and wife took apartments which allowed them to save \$200 a year. While his fellow clerks took a three shilling noon lunch, he contented himself with one costing half that sum, but quite as The money saved by these two economies was just what he needed when a little business enterprise opened to him, that laid the fonadation of his present Getting rich depends not so much upon what a man receives, as upon what he saves. The sons of the rich seldom acquire these habits of economy, but commencing where their fathers leave off, they retrace his steps and they leave off where he began-at the small end of the horn.

## Put Water on the Stove Now. A BIT OF PRACTICAL SCIENCE.

If everybody knew the amount of comfort and health to be derived from it, there would not be a fire lighted this winter without having an open vessel of some kind containing water, upon every stove and in every heating furnace in actual use. Let the reader look a little into the practical science of the matter, for it is not diffi-cult to be understood. If you warm a portion of air it ap-pears to have the property of combining with water, and, so to speak, hiding it. If you cool the air again, it lets go its hold of the water. On a warm day, we say, a pitcher or tumbler of cold water "sweats," for we see maisture on the ontside. The truth is, no water passes through the sides, but it cools the warm air, and then this air lets go its concealed water, and it settles on the outside of the cooled vessel. When the air above us by any means become cooled, it gives up its moisture; the hidden vapor or particles of water unite in great numbers notil each little mass becomes too large and heavy to float longer, and it falls as a rain drop. Millions of these drops make a rain shower.

A room 10 feet square and 10 feet high contains 1,000 cubic feet of air. When this amount of air is just ice cold, (32° F.,) it will hold 2,350 grains of water—that is, 51<sub>3</sub> onnees, or one-third of a pint. [A pound or pint of water weighs 7,000 grains.] Set 10 pounds or pints of water in a dish on the floor, and it will stay there; the air will not take any of it, because it is already just full of watery vapor.

Now warm the air a little—say 8°, or to 40° of the Fahrenheit thermometer, and after a while you will find that the dish has lost 1,300 grains of water, which the air has picked up. Let the air be cooled down again to 32° by cold upon the ontside of the windows, and this 1,300 grains of water (nearly 2 gills) wil. be thrown out by the

air and will settle on the window glass. You can write your name on the damp, foggy film of water ... Now heat the air up to 70°-a moderate summer warmth—and after a while your dish of water will have lost 5,540 grains of water, or about four-fifths of a pint, though the air appears no damper than before, because it has hid away this extra water, or made it insensible. If you now cool it again as before, there will be nearly a pint of water on the window glass. . If you heat the air to 100°, it will pick up and hide more than a quart (16,770 grains) of extra water. Here is a table showing how many grains weight of water air will take up and hide, at several temperatures:

mperatures:
1000 feet of air at 0°, contains 180 grains of water,
1000 feet of air at 3°, contains 230 grains of water,
1000 feet of air at 40°, contains 300 grains of water,
1000 feet of air at 50°, contains 420 grains of water,
1000 feet of air at 69°, contains 520 grains of water,
1000 feet of air at 70°, contains 700 grains of water,
1000 feet of air at 80°, contains 1070 grains of water,
1000 feet of air at 100°, contains 1130 grains of water,
1000 feet of air at 100°, contains 1130 grains of water,

The air is always very eager to get just what moisture is natural to it at the different temperatures, and if you don't furnish a supply in an open dislawhere it can readily pick up the watery particles, it will gather it from the walls and furniture, and from your skin, and dive down into your lungs, and gather it there, and you will feel dry and parched outside and inside. The lungs, and the voice itself will become dry and husky—and you will feel nocomfortable.

We hardly need now to explain the necessity of keeping a supply of evaporating water on a stove which is constantly heating the air first in the room, and the cooler air that comes in to supply the place of that which has risen and escaped over the doors, through cracks, and through the ceiling. The old-fashioned open chimneys took out so much air, and brought in so much fresh air that we did not feel the lack of moisture. But now, with closed rooms and stoves, there should always he plenty of water evaporating from vessels with wide tops like hasins, so that the air can get at the water rapidly.-We consider warm air furnaces very healthy, because they constantly bring in large volumes of fresh, pure air from the supply pipe coming from out of doors. air is warmed as it passes through the furnace chamber; it is not de-exidized, if the furnace irons be not red but on their onter surface, as they seldom are; so we get a beautiful volume of warmed, pure air coming up through the registers. But to be healthful, and comfortable, there must be a broad-top pan or two of water in the furnace chamber, to give the air its natural supply of water as it is warmed, or it will rob our skin and our lungs of their natural moisture, and it will dry out and shrink our doors. and our furniture, causing it to get loose in the joints.

## "Shall I Send my Farmer Boy to College?"

Thus asks one of our Ohio readers. He further informs us that he has a good farm, large enough for all three of his sons, and that they intend to follow this business, but that one of them wants first to go through College; that he has the means to send him, but doubts if it will pay. We answer, yes, it will pay, even if the grown lad intends to live only to "make money." The thorough hard study required to master the mathematics and languages of a college course, is to the mind what the discipline of breaking-io a colt is to the true, welltrained horse. Let the sindent sit down to dig out a hard Latin sentence in Virgil or Livy, or a Greek one in Homer or Sophucles, or let him try to solve a problem in the bigher mathematics. It will require close applica-tion, steady thought, and the strong exercise of his rea-soning powers. At first the mind will fly off like the frisky colt, but the set task is to be accomplished, and the student brings his mind back into the thinking traces again and again-again and again-day after day, week after week, and month after month, in one severe study after another, until he acquires control over ituntil he is able to readily concentrate his whole thoughts npon the subject in hand. This is educating the mind. To use another illustration, this hard study discipline undergone by the apprentice blacksmith. He begins to strike with feeble and ill-directed blows at first; but he keeps on striking month after month and year after year until the exercise developes powerful muscles in his arms and shoulders, and he learns to direct the blows exactly to the right spot, and what powerfal effective blows be can then deal out! So the blows of the mind upon the mathematical studies and the languages, develope the mind's muscles, so to speak, and increases one's ability to concentrate the reasoning faculties upon any particular topic.

We might here add, parenthetically, that the studies so long maintained in most colleges—the higher mathematics and the Greek and Latin languages—are just the ones best fitted to develope this mind power, aside from any other advantages they possess, and we greatly fear the effect of the present inclination to modify this long-tried course of stody, and allow students to choose other studies that suit their whims or caprices. The fact that a child or student does not like, or has not a natural aptitude for, any line of study, clearly shows that certain faculties of his mind are weak, and there is all the more reason why it should be drilled in the very studies he dislikes, if you would give him a well-balanced mind. And for a like reason, we would give the greatest attention to the education of the naturally weaker-minded child of a family—and make up by discipline and enlitvation what is not bestowed by nature. It is injustice, may cruelty, to bestow our educational efforts upon the "smart" sons and daughters, and neglect the weaker once because they are weak. Exactly an opposite course should be pursued.

To return, does any one doubt that the young man who thus comes forth from college with educated, trained, strengthened mental powers, will not be a stronger and more effective man for it, even in the basiness of farming? If the whole business of farming consisted in turning over so many feet of ground, sowing or planting so many seeds, reaping or thrashing so many acres, and nothing more, the case would then be a little altered. But farming is now becoming a science. To judge of the capabilities of the soil; of the adaptability of crops; of the effect of season and weather; of the relative values of various products in the home and foreign markets; of the probable prospective supply and demand generally for the different products, grain, roots, meats, dairy, wool, fruits, etc.; of the effects upon the markets of political changes and national disturbances; how and where to market—for after his own food is sapplied, a man's success depends quite as much upon profitable marketing as apon good crops-these and a thousand other questions can be best grappled with by that man whose mind is most thoroughly trained to right reasoning, and whose mental powers are the most expanded and strengthened. A man does not go to college solely for what he learns there-he could fill in more mere knowledge by staying at home and constantly stuffing from books-but he goes for the discipline he gets. A collegiate may, on leaving college, forget every word he has learned, and yet have a strong mind-one able to grapple with the facts and

There has been an idea—until recently almost universal—that because a man was educated, he must of course go into some one of the learned professions, so-called. It is coming to be understood that he is to be educated hecause it will make him a better and stronger business man, whatever his calling. We are now finding college educated men in the various business callings, farming included, and of fifty we could name, five-and-forty are doing well.

The loss of time is, with many young oren, and their parents, a strong objection to devoting four, five or six years to college training. Let us see. Suppose that, at the age of 18,a man has an average probability of living, say thirty years. If he spend five or seven of these years in preparation, will not the remaining twenty-five years he far more valuable to himself and to others, than thirty years spent without this training? We are sure it will.

### Bee Notes,-By M. Quinby.

Apiary for January.—Bees crowd closely in cold weather to keep warm, and grow more dense as the weather grows colder, occupying that part of the combs where there is no scaled honey, and many empty cells. Small swarms often freeze to death this month. Where there are bees enough to generate moisture, it gathers on the sides of the hive and on the combs. This sometimes freezes, so that no honey outside the cluster of bees can be reached by them. When they have consumed all the honey within reach they must starve, unless warm weather supervene, or they be taken to a warm room for a time sufficient to melt the frost and enable the bees to reach their stores. The snn, if allowed to strike the hive fairly, will often dissolve the most of this frost. Care should be taken that the water thus produced does not run to the bottom of the hive, there to freeze again and stop the air-passages with ice.

Raise the hives occasionally and sweep out the dead bees and dirt. The presence of mice may be known by the nibblings. Exclude them by covering all passages, except a space just large enough for a bee to pass, with wire-cloth. Sweep the snow from the alighting board lest it choke the entrance, except when the whole hive is covered, when it will effectually protect it from the cold

In my non-patented lives, the space allowed for surplus boxes in summer should be filled with straw in winter, making them warm and safe on the top, except, perhaps, from mice. Bees properly honsed will need looking to, only to prevent the ravages of rats and mice.

### Ogden Farm Papers-No. 13.

Mr. C. D. Avery, of Syracuse, N. Y., asks for a more explicit account of the manner in which my 28-acre neighbor manages his farm. This I would gladly give had I the details at my own command; but one of my neighbor's peculiarities is an undue modesty, and my relations with him are not such that I could properly ask him to open his agricultural bosom to my inspection. I have frequent occasion to drive past his place, and I sometimes that with him. I can very well imagine the conversation I should probably have with him. Supposing I asked what he considers the secret of his success? He would answer, "Well, I use a good deal of manure," and so he does. He rakes the beach for sea-weed; he charters a slaughter-house hogpen; he crams his cattle with all the food they will eat, and then crams the manure into his land. No stone is left unturned that has under it the one great object of his agricultural lifemanure. Other farmers work for ready cash. He works for manure, knowing that that will bring him eash and interest too. Of course he is a good business man, and understands his market. He finds out what he can sell to the best advantage, and then sets at work to raise it in the best way, always giving preference to such crops as will either take the least from his land, or as will give money enough for the purchase of manure after a fair profit has been realized. Aside from this, I know of nothing in his practice that is exceptional. His success depends on little things rather than on great ones. His place is small and snug, and every rod does its share of the work. There are no wide stretches of pasture, that would support a slicep and a half to the acre, but one splendid grass field, which is heavily top-dressed every spring, and carries two cows to the acre throughout the season. He has capital enough to work in the best way; help enough to keep beforehand with his work, and sense enough to know that the best way is the practical way in every thing that he does. At the same time, I have no doubt that he considers himself an oldfashioned farmer, in contradistinction to the term "book farmer." He is not apt to experiment, and probably knows no more of the chemical constituents of a ton of hay than his grandfather did. He probably regards me, as all of my farming neighbors do, as an infatuated creature, determined to fly in the face of the experience of the whole island, when really we only follow different roads that lead to the same goal. If my success, in the end, equals his, I shall be quite satisfied, and he will, I am sure, be ready to confess that I have attained it in a sensible way.

Mr. Avery, while he is kind enough to compliment my reports, speaks of my "experimental" farm. Whatever Ogden Farm may be, it certainly is not an experimental farm. The trying of experiments is no part of the object with which either Mr. Tyler or myself undertook its improvement. We are acting on our faith that an over wet clay soil, skinned by yearly tenants, could not have had all the virtue sucked out of it; that underdraining, by drawing out the water and letting in the air, would develop new sources of fertility; that the breeding of thorough-bred Jersey stock for sale to the more enterprising butter farmers of the country, would prove profitable; that the manure of a large herd, applied year after year to naturally good and thoroughly cultivated land, will make it so rich that, in time, we can fully support fifty milking cows on our sixty acres; and that when this end is accomplished, we shall be in a position to make money. At the end of three years' trial, I see no reason to doubt that our position is well taken.

Incidentally, as I happen to be one of the writers of the Agriculturist, I detail my experiences for the benefit or entertainment of its readers. I never try experiments for the sake of proving or disproving my own theories or those of others. On the contrary, I undertake nothing that does not commend itself, on the most careful consideration, as being the most profitable course.

Some failures are of course made, and my readers derive advantage from my experience; but I am not such a philanthrophist as to try experiments for the public good. If the public learns any thing from my ten years' undertaking with this land, it will be by learning the good or bad result of my efforts to attain a certain end by a certain means. Whether I succeed or not in my enterprise, I trust that I shall have so faithfully recorded the details of my work that they, having learned what to follow and what to avoid, will be better off for what is being done at Ogden Farm. Of this I shall of course be very glad; but I cannot claim the credit of having undertaken the enterprise pro bono publico. If I get no more tangible reward than the thanks of those who may use me as a beacon light to keep them off the shoals, I shall consider my failure as complete as it well could be; for-to harp again on the old stringthere can be no success in farming that does not, sooner or later, develop itself in the form of dollars and cents.

I have just been counting noses in the stables, and the result surprises me. I find that I have 79 head of horned cattle-old and young; 15 horses, mules and colts; 24 sheep, and 16 swine. Of course this stock cousumes forage at a fearful rate,-and much of it is purchased from other farmers in the neighborhood and from a grain dealer in New York, calling for a large outlay, Will it pay? That is the question ;and a very serious onc. It is a firmly established idea in the minds of nearly all farmers that no one can afford to keep stock on purchased food. If that is true, no one can afford to keep stock at all. A barn full of hay is worth a certain sum-no matter where it came from nor where it goes to. If I can't afford to feed out hay that I buy, I can't afford to feed out hay that I raise. The hay in the barn is worth (as property) just as much in one case as in the other, and it is just as wasteful to feed it out in one case as in the other. Nothing is worth (necessarily) what it has cost, but what it will bring. If I pay more for it than it will bring, I make a bad bargain-otherwise not. Having the hay, my position with regard to it is the same whether I bought it or raised it. If I ought not to sell what I raise, I ought not to sell what I buy. If I can raise hay for eight dollars a ton, and can only buy at sixteen, I lose the profit on the raising of it; but if I can't afford to feed it when it costs me sixteen dollars, I can't when it costs me eight dollars,-for I could sell it for sixteen dollars. "Ali! but you ought not to sell hay off from the farm, it will run it down!" Precisely. Then I ought to buy hay and bring it on to the farm .it will run it up. The manure I gain in buying hay is worth just as much as the manure I save in feeding my own crop. If it is worth while to keep land from running down, it is worth while to improve it.

Therefore: Manure must be taken into the

account in deciding whether it pays to keep stock or not. According to Professor Lawes' tables the manure made from the consumption of a ton of meadow hay is worth \$6.43 (gold) per ton. I am satisfied to call it \$6 (green backs) and I would contract to buy it-delivered on the farm -at that price. My hav costs me \$16 per ton. Deducting for manure, as above, it costs \$10. Allowing \$3 for hauling and handling, it costs, in the mangers, \$13 per ton-or six and a half mills per pound. An average cow, carefully fed, will do well if she cat 20 lbs. in a day-receiving no other food. This brings the cost of her keep to thirteen cents per day. If this wont pay, the cow is not worth feeding,-and, furthermore, the difference of profit between feeding home grown hay and purchased hay will neither make nor break me. If the cow produces 13 cents per day and pays the cost of her food and feeding, I am entirely satisfied with the manure as my profit. If she can't do that, the sooner I find it out and quit farming and turn wood-sawyer the better. In proportion as grain is added to the feed the amount of hay required is lessened, and the value of the product, whether of milk, flesh or manure, is increased. If by cutting and steaming I lessen the cost of feeding, and I do, I increase my profit.

In England, where the average price of beef rarely reaches 12 cents, farmers holding their farms only as yearly tenants, subject to six months' notice to quit, buy store cattle or cows or sheep, and then buy corn or linseed cake from America to feed them on. Surely if they can afford this, we (who have a higher market for animal products) can afford to buy grain for the same purpose, before it has had the cost of transportation to English farms added to it. The Englishman feeds for the sake of the manure. If we will attach equal value to this product of our herds, we shall, I think, come to the conclusion that it does pay to feed stock, and that the more stock we feed the better it will pay. It takes no more machinery to cut and cook for my 134 animals than it would for half the number; and it costs no more for superintendence. If there is any profit at all, the more animals the more profit.

### Riding on Horseback.-No. 1.

The interest in the subject of teaching farmers' boys to ride on horseback that has been awakened by the last two of our Horse Paper series for 1870, indicates the propriety of giving the boys the benefit of a series of articles devoted especially to this art.

In a little book, called "Man and Horse," recently published in England, the author, Mr. March Phillipps, gives the most sensible directions for learning to ride that we have yet seen. Most books on the subject are of such a professional character as to be nearly useless to an ordinary reader who wants to learn about riding in a common sense way.

Mr. Phillipps says: "You want to learn how

Mr. Phillipps says: "You want to learn how to sit a horse. Very good; then put aside for the present all anxiety about managing and guiding him. Your present business is, whereever he may go or whatever he may do, to continue steady upon his back. Therefore leave it to some one else to take care that he goes where he ought and does nothing which he ought not. You are at present in the situation of a landsman going to sea, and must not think of steering until you have got your sea legs."

This injunction suggests the fundamental principle of the whole art of learning to ride, which is to learn one thing at a time and to learn that thing well, before attempting any thing else. As there can be no good riding without a good seat, the learner's whole attention should be devoted for days or weeks or months, as may be necessary, to acquiring it, giving no thought to any thing else. Never mind the management of the horse, that will come in due

Fig- 1 .-- AN INSECURE SEAT.

time. Learn to be as perfectly at home in a constantly moving saddle as in a stationary arm-chair,-so that, whether the horse walks, trots or canters, shies or jumps, you will either remain immovably in the saddle or get back to your proper position when disturbed from it, without effort or loss of time. Bear in mind too, that in acquiring a seat, it is just as easy to acquire a good one as a bad one, while only the good seat (and there is but one good seat) will enable you under all circumstances to ride safely and well. Without a good seat, no amount of skill in the management of a horse will be of much use. So begin at the beginning and devote your whole attention to acquiring an easy and secure position under all circumstances. Do not even trouble yourself about the manner of mounting and dismounting.

The proper seat on horseback is one in which the crotch and the hips are as firmly attached to the saddle as it is possible for them to be; the legs below the knees as free and independent as possible; and the body, from the waist upward, perfectly supple and pliable. Whatever movement the horse makes, the hips must conform to it, moving to the right or the left or tipping backward or forward as the case may be. But while they follow the changing position of the saddle, the legs, from the knees downward, must be free to move in obedience to the rider's will; and the upper part of the trunk, keeping its perfect balance, must move easily on a flexible spine and accommodate itself instinctively to every movement.

If a man's body were cut off at the lower part of the waist, the natural pressure of the thighs against the saddle would easily hold the hips in a firm position. If a whalebone rose out of the severed trunk, supporting a heavy weight two feet above it, the hips would still be free to move with the saddle; but if for the whalebone we were to substitute a stiff rod, the movement of the hips would communicate a movement to the weight which in its turn being at the long

end of a lever, would wrench them from their position.

The spine of the rider represents the whalebone or the rod, as the case may be, and the chest, head, and arms represent the weight. If the lower spine be kept flexible, the upper part of the body will not, from a sudden motion of the horse,

be started from its position by the movement of the hips; but if it be rigid, it will communicate the movement to the heavy mass above, and this movement once started, will be continued, acting on the spine as a lever to remove the hips from their place. This effeet can be fully illustrated by standing erect and throwing the weight, first on one leg and then on the other, holding the lower spine, first supple and then rigid I have dwelt thus long on this point, which is probably never thought of by one poor horseman out of five thousand, because it is the foundation of good riding. Until the ability to preserve a supple loiu under all circumstances is acquired, the rider is in danger of a fall at any moment; and it will always be impossible for him to ride gracefully or with comfort. But

while the supple loin is of the first importance, an erect position of the body is hardly less so. The position on horseback should resemble the position when sitting on a high stool, rather than on a low chair. On the chair, the weight is supported on the seat, behind the hips, and the spine has a tendency to curve outward and the shoulders and chest to droop forward. On the stool, the legs hanging down, the

weight is supported more directly under the hips, the spine is curved inward and the head and chest are more easily thrown backward. This is the position assumed by a good horseman; the weight of the upper part of the body being supported on an inward-curving and flexible spine. And it is the position to which the learner must so accustom himself that it becomes almost a second nature to assume it whenever in the saddle. As many of our readers are not familiar with the wonderful comic pictures of John Leach, in which the good and bad seat on horseback are

better shown than anywhere else, we reproduce here two that will answer our purpose.

Figure 1 shows the stiff and awkward bearing of an unaccustomed rider who has hired a livery stable horse for a holiday. Fig.

2 the upright, lithe position of a good herseman And now, how to get this seat. Saddle your horse, unbuckle the stirrups and take them out; let the reins lie on his neck and eall in the services of a friend to hold and lead him. Divest yourself, in this way, of all responsibility as to his conduct; get into the saddle in any way you please (the manner of mounting is a secondary consideration, and it may be learned later). Turn your toes inward, press your knees against the saddle, but not your calves, and open the back part of the thighs as far as possible. This will bring the flat of the thighs against the saddle and give the largest possible contact with it. Curve the spine inward and throw the shoulders back. This, being an unaccustomed position for you, will seem awkward and will look awkward, and you can at first only maintain it at an expense of a considerable rigidity of the spine. Let your arms hang listlessly by your sides. Holding fast mainly by the knees, shift your seat from side to side with as little swaying as possible to the upper part of the hody. Vary the exercise by swinging the body itself from side to side and from front to rear, while the seat is firm. Continue this exercise, no matter how long it takes, until your trunk is pivoted in your hips so that you can move it in any direction while keeping the spine curved inward. Do not at any time hug the horse's sides with the calves of the legs, but let the lower legs hang loosely. The thighs should neither hang too straight up and down nor be raised too high at the knee, but should take that position which gives the firmest hold on the saddle. Having become perfectly at home while the horse is quiet, let him be led at a walk (increasing the speed after a time) and finally let him be galloped with a long bridle rein, until, under all his motions, you feel comfortable and easy and have learned to depend only on your thighs and the flexibility or your body to maintain your position. Boys will learn this in

Fig. 2.-A SECURE SEAT.

less time than men, and some boys in less time than others; but all must make up their minds to learn it, however long it takes, before they can become thoroughly good horsemen and can really enjoy riding at all paces.

### Primitive Agriculture.

The fairs have been held, and probably there are few of our readers who have not attended one or more of them. They have seen all the new implements exhibited by enterprising manufacturers, and quite understand their mer-

its. Mowers, reapers, straw and fodder cutters, thrashing machines, and even farm steam-engines have been inspected, and each one, in the reader's mind, has been brought down to the inexorable—"Will it pay?" Now, while all these modern agricultural appliances are fresh in mind, may it not be well to look back and see how things were done 3,000 years ago? If we would study the agriculture of ancient Egypt, we have only to study that of the Egypt of to-day, for except in the culture of sugar-cane

and some other products, where the government has interfered by introducing new processes, the ordinary operations of agriculture have not changed from the times of the Pharaohs. The two engravings which we give upon this page are copies from pictures by the celebrated Gerome. We cannot give in the black and white of an engraving the peculiar oriental atmosphere so characteristic of Gerome's pictures. Gerome has the great merit of painting every thing just as he sees it, and all the minutest details are given. Take the subject of figure 1, which shows

the primitive thrashing machine. The straw is laid in a circle, and the blinded oxen, held by the Egyptian, pass around and around, and thus tread out the grain. This is the way in which wheat was thrashed thousands of years ago, and the way in which it is done today. The picture is instructive as a matter of history, but it is also interesting for its details. Look at the costume of the man, the bearing of the animals, and sec if it is not a real picture of to-day, as the artist saw it. The second picture is called "The Straw

Cutter." It seems to be a ponderous sledge, furnished with knives, for cutting straw, probably to make brick. We only know that the original by Gerome is called the "Hache Paille," which means the "straw cutter;" and that the original is, like other pictures by this artist, a faithful

representation of what he saw of Egyptian agriculture. The plows, as well as the few other implements used by the Egyptians, are equally rude in design and make. It is hardly possible to conceive of a wide-awake American using just such an implement or machine as his grandfather did. He would improve them.

the understand their mer- his grandfather did. He would improve them, and mules that are in daily

Fig. 1.—TREADING OUT GRAIN IN EGYPT.

### Wintering Breeding Stock.

"There is nothing like the lee of a stockyard to make them hardy" says the old school farmer. And he practises upon his theory, feeding out at least a third more hay than would be necessary in the barn. His eattle shiver, and grow thin at the stock-yard, but then they are hardy, for every one of them survives the cold. They eat enormously, but who cares? They eat hay and straw that the farmer did not pay for in money. "There is nothing est weather. Here his cattle stand from November to April, with very little exercise or sunshine. It is true that they grow fat on much less food than would support them at the stockyard. But is it, on the whole, the best system for animals that are breeding? Horses, oxen and mules that are in daily use thrive on it. A

large part of the farm stock, in the dairy regions at least, is made up of breeding animals. The cows are usually with calf, and the best of the heifers are to be raised to supply the waste of the herd. and for sale. want in these animals stamina, as well as flesh; and they must have plenty of fresh air and daily exercise to keep up that high physical condition, which is so necessary in a breeding animal. Barns, no doubt, may be so constructed as to give perfect ventilation; but they cannot give sunlight

and exercise, and with or without barns, these must be provided, to have the best breeding condition. If the model barn is used, there is great danger of sacrificing stamina to flesh and fat. Some tell us that milking cows can be kept confined the year round, without injury. We do not believe this statement. It is not the natural condition of the bovine race. The flow of milk can be kept up for a long time in confinement, we have no doubt, but we should not want calves, bred under this system. We have tried the wintering of young cattle and cows under

hovels, and, on the whole, prefer it to any other shelter for a herd, kept mainly for breeding purposes. A good deal depends, of course, upon the thorough construction of the hovel, or shed, and its exposure. For location, then, we want the south side of a hill; and if the hill is covered with wood, and the wood is evergreen, all the hetter. Make the hovels as tight as may be upon three sides, and partly enclose the fourth, which looks toward the south. The roof may be of boards or of poles, covered with sea-weed or

straw. The only essential thing is that it shed rain. In the rear build cheap racks, to which the cattle may be tied. Any farmer can make this kind of shelter for his cattle at a small cost. It is a good plan for saving manure; and for keeping up the health of breeding animals.

Fig. 2.—AN EGYPTIAN STRAW CUTTER.

like pine boards for shelter," says the rural improver, who used to be a merchant on Broadway, but now has a country-seat. He makes his barn proof against rats, water, and the winds. There is hardly a crack in it from cellar to roof. It is so warm that it hardly freezes in the cold-

### Walks and Talks on the Farm-No. 85.

We have heard people complain of our long and severe winters. In fact there are some people who complain about every thing-about the spring, snmmer, autumn and winter; about the frost, the snow, the rain, the sunshine, the wind, the fog; of the evening and the morning, of long days and short days; the clouds cast a gloom over their spirits and the sunshine brings no joy. They are constitutional grumblers. To "feel grumble" is not very bad. Such a disposition is often associated with great energy and when rightly directed brings about great things. The other day I noticed a locomotive, with steam all up waiting to take the Express train to Buffalo. The steam was escaping through the safety-valve; the fireman with a kind of "shut your mouth" gesture lifted a cover that pressed the valve down again and stopped the escaping steam. In a minute or two, however, the pressure lifted the valve and out came the steam again with a hissing, grumbling noise. This was repeated again and again; the damper was closed, but as long as the engine remained stationary on the track, it kept on screaking. By and by a little bell sounded, the conductor called "all abroad," the engineer opened the throttle-valve and turned the steam on to the piston. The wheels began to move and then the steam came with a grand, heavy puff through the smoke-pipe; it had lost all its complaining, snarling sound, and came out with a kind of good-natured grumble that springs from honest effort. As it settled down fairly to the work the puffs came thicker and faster and soon lost all trace of even the shadow of a grumble.

Discontent that escapes in idle grumbling is wholly bad; discontent that leads to honest efforts to improve our condition is good. To grumble at the weather is simply silly; but discontent with muddy roads, if it leads a man to take a hoe and let off the water, is worthy of all honor. If such a man should ever be nominated for Congress I would vote for him, whether he was a Democrat or Republican, black or white. I never knew but one road master that did it. After every rain he and his man took a horse and buggy and wherever they found a hole with water standing in it they let it off. We had then six miles of as good a gravel road as one could desire. But the poor man died; and his fate, and the character of his successors in office remind me of an epitaph I once saw on an English tombstone:

"God takes the Good,
Too good on Earth to stay,
And leaves the Bad,
Too bad to take away."

For my part I like our long winters. I like to feed stock, like to see them eat; and do not object to hear the wind howl about the barn when the animals inside are warm and comfortable. It is the pleasantest part of farm life. The days are short and we must work lively; and all who have tried it know that there is a great pleasure in intense activity-and the rest, afterwards, is equally enjoyable. It is said that farm occupations are dull and monotonous. Certainly this is not necessarily so, though it must be confessed that some farmers and many farm men are rather slow in their motions. There is no excuse for this in winter. The atmosphere is cold and bracing and six or seven hours of energetic. systematic labor will usually accomplish all that there is to do. If any one doubts it, let him take a card and write down every thing that he has done to-day. If he has the same work to do

to-morrow, let him think it all over and see what is the best order of doing the work, and how he can do it with the fewest steps and in the shortest time and with the least labor. Write it down, and the next morning, card in hand, go to work with energy. Run a little if need be; carry two pails instead of one; do not lose a moment; and if you do not do all the work in half the time, and do it better than you did the day before, you are in the habit of working to much better advantage than two-thirds of my farmer friends, and better than ninety-nine-hundreds of ordinary farmer men.

I have had a man of more than average intelligence who would, month after month, come empty-handed from the barn up to the house to get the milk-pails, and then after he had brought in the milk, walk empty-handed back to the barns to get his swill-pails, to carry the slop to the pigs. It never occurred to him that by bringing the swill-pails when he came up for the milk-pails he might have saved just half the time. The same man would carry hay from the cow-barn past the stack of corn-stalks to feed sheep, and then after he was through feeding the sheep would go an equal number of journeys to get stalks and carry them back to the barn for the cows. And this want of forethought and system characterized the entire day's work. He was an industrious, faithful man, but when a gate sagged he "had not time"—as he honestly thought-to straighten up the post or put a nail in a loose board. No time to sweep out the tool-shop nor sharpen the tools and keep them in their proper place; no time to tighten a hoop on a barrel nor wedge a fork that was loose in the socket; no time to pick up a piece of board that he walked past a dozen times a day; and so with a hundred little things that make all the difference between profit or loss in farming.

As a rule, no excuse is so utterly without foundation as the common one of "want of time." A man may have more work than he can do, but the reason is not a want of time but a want of physical or mental strength and nervous energy. We think too much, perhaps, of economizing time, and too little of economizing strength. What we do we should do with our might—and then rest. And we can rest by using other muscles or faculties, as a tailor that has been sitting on the board all day, takes rest by walking or standing. After writing sharply for three or four hours, nothing rests me more than an hour's tinkering in the barn or tool-shop.

One of the pleasant things to me about the winter season is the increased number of interesting letters I get from farmers in different parts of the country. Here is one from a gentleman in Maryland: "One of your correspondents in the October 'Walks and Talks,'" he writes, "asks for information with regard to the use of straw. There is now in view from the window at which I am writing a wonderful evidence of its efficacy as a top-dressing on grass. We endeavor to work all the straw through the barn-yard, ricking it so as to aid in sheltering the cattle, and to give them something to pick at between feeding times. One rick was only partially consumed and was hauled out in August and spread on an old sod. The effect was striking. The grass has grown with rapidity and vigor, and although the rest of the field is fertile, the green line can be seen as far as the field is visible."

I suppose the effect is due to the efficacy of straw as a *mulch*, rather than to its supplying available plant-food.

In reference to my remarks about fall-fallow-

ing, Mr. J. A. Clark of Jefferson Co., Wis., writes: "In this section fall-fallowing is as old as spring grain. We calculate to do all our plowing as soon as may be after harvest, and we can see a difference of every month's delay on the following crop; and if by bad luck a piece is left over until spring before plowing, we get, only two-thirds of a crop of wheat. With oats and barley is does not make so great a difference, but is nevertheless of considerable advantage to them."

"My wheat," he adds, "does not do well after clover, and such is the experience of others in this section. Last year I raised a crop of the big or pea vine clover for seed. It did not fill well and I got only half a bushel of seed per acre—thus not running the land any—and yet this year I got only half a crop of wheat after it."

This is not improbable. The land was in elover only one year, and the whole growth was cut and carried off the land. Had it been plowed under, or eaten off by sheep on the land, the result would probably have been very different. My plan would be to let the field lie in clover two years. Cut it for hay the first year, and then pasture it the remainder of the season until the next July or first of August. Then break it up and "fall-fallow," and sow it to wheat or barley the next spring. So much is said about clover enriching the land that many farmers have got, what I regard, a wrong impression respecting it. Mr. Clark evidently supposed that his field would be richer after it had grown a crop of clover than it was before; while, what we mean is, that the farm becomes richer through the practice of growing and feeding out clover-not necessarily and immediately the actual field on which the clover grew. I know Dr. Voeleker has advanced the idea that the actual growth of clover, even when it is cut for hay, and the second crop for seed, leaves the land richer in nitrogen than it was before, and he gives experiments that he thinks comfirms this view; but, while I regard Dr. Voelcker as one of the ablest agricultural chemists of the age, I must be allowed to say that these experiments prove altogether too muchand consequently prove nothing.

Mr. C. adds: "We can raise here nearly as many bushels of barley per acre as we can of oats; and if, as some say, barley is worth 11/2 to 2 times as much as oats for feeding horses, had we not better raise barley?" I think 100 lbs, of good heavy oats contain as much nutriment as 100 lbs. of barley. But good barley usually sells for more than oats, weight for weight, and is supposed not to impoverish the soil so much, and is a better crop to seed with. A considerable quantity of Canadian barley is sent to Chicago and Milwaukee for malting purposes. I suppose the fact is that Western farmers do not take as much pains to produce barley of the best quality as the Canadian farmers, and consequently cannot get nearly as good prices. In proportion to the labor, a good crop of barley usually pays us here as well as any other crop we raise.

A farmer in Holt Co., Missouri, favors me with a description of his piggery and his mode of feeding hogs. He is young in the business, but seems to have embarked in it with much spirit and energy. He says: "In 1860, I bought and tried to fatten 300 hogs. Gave them all the corn they would eat, board wallowing pool, and free access to clear water. I sold them at  $5^{1}$ |4c. per lb., net. I bought them too fat. The corn fed to them netted me

17 cents per bushel, while I sold the balance of my corn at the crib for 50 cents per bushel. This 'salted' me from hog feeding until October, 1869." Without knowing the fact, I should suppose the trouble was not in buying them too fat, but in paying too much per 1b. for them. "In October, 1869," he continues, "I went into the business again. I bought 20 sows, and 60 pigs and shoats. During the winter, 60 pigs were born. In the spring I had not 80 left, all told! In March and April 60 more were dropped, of which 30 remain—balance dead. Have had 80 pigs within six weeks—20 dead, and dying daily. I intend to try further. Will have 40 sows to drop their pigs next spring."

This seems bad luck, but I am glad he is not discouraged. When I first commenced to turn my attention to pigs, I had, though on a much smaller scale, quite as "bad luck." I had 3 sows that dropped their litters one night in the yard, and lost nearly every pig-as I deserved to do. I have now some 50 pigs, and by giving them careful attention, plenty of appropriate food, with warm, dry and clean pens, I anticipate no trouble. The last three sows produced 30 pigs, and I saved every one. I know that it is a general impression that you cannot keep a large number of breeding sows on one farm; but I cannot see why, provided each sow gets as good treatment as she would if she was the only pig on the farm. If this cannot be done, then do not attempt to keep them, for, as a rule, farmers who keep only one or two sows, do not treat them any too well.

There is one thing that is very important: We should know exactly when we are to expect the little ones, and make provision for their comfort beforehand. Pigs are remarkably sensitive to cold winds. They must have warm, dry, well-ventilated quarters; and my rule is to have the pens cleaned out every day, just as regularly as we clean out the horse stable. Why should they not be? "It is too much trouble, and will not pay." This is a great mistake. In the first place, if done every day, it takes only a few minutes' time to remove the soiled litter and shake up the bed; and if it pays at all to raise pigs with the present average rate of mortality, it will certainly pay if we can succeed in saving the entire litter. I am inclined to think that, taking the country through, from one-third to one-half of the pigs die-and this through sheer neglect and mismanagement. One of my neighbors, who is a very good farmer, and takes capital care of his cows, keeps his pigs in a pen covered at one end with some straw, thrown on rails. This is very well. Though open in front, it does afford some shelter. But the pen is built on the side of a building, and all the rain from the roof comes pouring into the pen. He "did not believe it paid to feed pigs any way," he said, and I presume he spoke from experience.

There are some lucky men in this world. Here is a letter from one at Troy, Ohio. "I have," he writes, "ten acres of land that I design planting with corn. I can get all the manure I want for nothing, except drawing it a quarter of a mile. I intend to put on a heavy coating of mauure; and then I thought of taking two parts of ashes, three of earth, and one of heu manure, mixing well, and putting a little to each hill after it comes up. Now, what I want to ask is, whether you think this will be giving the corn too much? and whether I can continue to grow corn every year, for ten years, without any other crop?"

If I could get all the manure I wanted for nothing, I do not think I should spend much time in making a compost of ashes, earth, and hen dung. If any one would make the compost and put it on for me I would let them. I have no doubt it would do good. Everybody says so that is in the habit of using it.

I would draw out the manure-say 600 twohorse loads-during the winter and pile it in the field. Turn it once or twice, and try to get it thoroughly rotted. It takes about three loads of ordinary stable manure to make one load of well-rotted manure. The 600 loads, therefore, would be reduced to 200, or 20 loads per acre. If the manure is good, this is a fair dressing, and will do to commence with. I would plow from half to two-thirds of the manure under, and apply the remainder to the surface, and work it in with a harrow. With plenty of manure, corn can be grown on the land every year almost indefinitely. But why grow corn? Where a farmer has access to all the manure he wants at a mere nominal expense, he should make his land as rich as possible, and then grow crops that require a large amount of labor per acre, such as onions, carrots, parsnips, beets, cabbages, etc. Or he might grow garden seeds or nursery stock. It requires no more seed, and no more labor in sowing, weeding and hoeing an acre of onions, that yields from 1,000 to 1,200 bushels, than one so poor as to yield only 200 bushels, and those of inferior quality.

Sometime ago I told you that we had drawn out our manure upon a wheat stubble that was seeded down, but on which the clover had partially or almost entirely failed to catch. I said my object in doing so was three-fold. First, if it should prove that there was sufficient clover the manure would help it; second, if it proved to have failed almost entirely I could plow under the manure and what glover there was in the spring, and plant corn; and third, that I could not plow under this manure last fall and sow wheat, because I was afraid that the manure contained the seeds of weeds. I thought by spreading the manure on the land in August and harrowing it repeatedly, so as to break all the lumps, the rains would wash it into the soil and also cause the weed seeds to germinate, and if the land was plowed in the spring, and afterwards thoroughly cultivated with corn, the weeds would all be destroyed; and if on the other hand the land was kept in pasture next year, or mown early for clover hay, the weeds would also be prevented from seeding, and be ultimately killed. My good friend, John Johnston, wrote me at once as follows: "I cannot resist writing to tell you that I don't believe you can kill the weeds in manure by putting it on the land in autumn, and pasturing next summer. I never saw stock that would cat weeds if they could get anything elsc. They won't even eat quack grass as long as they can help it. I once knew a farmer that killed a field of quack by pasturing it with sheep, and planting corn the following season, but no sensible man would have received the sheep as a gift when taken from the quack. The true way to kill the foul seeds in manure is to get out the manure in September, and spread and pulverize as fine as possible, and plow the land the next spring before the 10th of May [and I suppose plant corn]. In that way only did I succeed in killing bad weeds. You will exerse the liberty I have taken, but I have a wish to keep you right, if I am right!"

That is the spirit in which to write. This

noble old farmer, one of the most experienced and successful in the State, knows that I try a good many experiments and am never afraid to report the result whether a failure or a success. To use a slang phrase, "he has been through the mill." Like every farmer from Jethro Tull to the latest graduate of one of our own agricultural colleges, who deviates from the beaten track, he had to endure the sneers and unfavorable prognostications of his neighbors. They asserted so freely and so frequently that he was a fool, that at times, he says, he almost suspected that they were right, and he used to hide his head in one of the underdrains he was cutting as these wise men passed by.

It is always unpleasant, and for the time being, generally unprofitable, to fly in the face of general opinion. A wise man will listen to all the reasons which can be given against any plan he proposes to adopt. He will think the matter over carefully in his own mind, looking at it on all sides, and if he is satisfied that his plan promises the best results, in the circumstances, he must carry it out as best he may-and let his neighbors talk. If he can give a good reason for his faith and practice, let him not be discouraged at their remarks, for as a rule, all the reason they can offer is: "We don't think so," or "You will never make farmers believe it." They have told me this a hundred times, and I cannot help feeling and, I fear, sometimes saying, "who cares whether they believe it or not?"

I believe I was the first writer who contended, on chemical reasons, that with manure properly treated, there was little loss of ammonia from spreading it out and letting it lie on the surface of the land. John Johnston was the first writer who claimed the same thing as the result of practical experience and observation. Mr. Johnston's plan is to "pile" his manure in the spring and draw it on to the grass land he intends to break up for corn in the spring. The most general practice in this section is to draw out the fresh manure from the yards in spring and plow it under for corn at once. For my part I do not know which is the better plan, so far as the ultimate effect of the manure is concerned. We save a year's time, and the trouble of "piling," and avoid all possible risk of loss from leaching and fermentation. On the other hand the fresh manure will not act as quickly as when fermented in the piles; and if it contains the seeds of weeds there is no opportunity of destroying them until the land is planted to corn four or five years hence. The bulk of the manure, too, can be reduced about two-thirds with little or no loss of any valuable ingredient. It is less labor to draw it out and spread it; and when it lies on the surface six or eight months the rains wash the soluble salts into the land, and the manure is thoroughly mixed with the soil-a point undoubtedly of great importance. Whenever I am asked my opinion as to the best time of applying manure, I always say "when most convenient." The truth is, a farmer must decide all such questions for himself. It depends so much on circumstances that what is hest for John Johnston may not be best for me, and what is best for me may not be best for you. I draw out considerable manure in the winter, simply because it is a leisure season for men and horses—and horses are so terribly expensive, not only in first cost, but in keeping, shoeing, attendance, wear and tear, etc., that I aim to keep them employed as regularly as possible. I believe few farmers realize what it costs them to keep horses or they would not let them lie idle so frequently. I know farmers

who are kept poor by keeping a lot of poor horses and keeping them so poorly that when wanted, though they lie idle one-third the time, they cannot do more than half a good day's work, thus doubling the wages of the man that drives them, and otherwise entailing great loss by causing the farmer to get behindhand with his work. Good horses, well kept, thoroughly groomed, and worked steadily, would save millions of dollars to the farmers of the United States.

Fig. 1.-WATER FOUNTAIN.

### Poultry-Yard Conveniences.

This season is one of more or less leisure, and we may employ ourselves profitably in getting up convenient arrangements for our stables and poultry yards. Poultry yards are apt to lack good watering fixtures. Open troughs are scratched full of gravel and otherwise defiled. Small basins will not hold water long, and require frequent refilling. We give an engraving, (figure 1,) of a large jug, which is filled with water and inverted, the mouth being placed in a basin, which should be also previously filled. The jug is supported by a stool, having a hole in it, into which the jug will fit, while it cannot go through. It is most convenient to have the basin so small that it will go through the hole. Besides, the smaller the basin, the less liable it is to get dirty, and the less is the evaporation. Any potter can make such a "jug fountain" as is shown in figure 2, and similar ones may be bought at agricultural stores. When the jug is first shaped, a hole is made at the bottom, and a little basin formed and attached upon the outside surrounding it. With a tight stopper, this

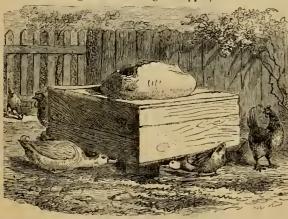

Fig. 4.—FEED BOX FOR DUCKS.

holds the water until the fowls drink it all up. There is almost always some difficulty in keeping fowls supplied with water in cold weather. We have had no trouble since adopting the following expedient. A barrel is sawed into two tubs, and an earthen jug placed in one of the tubs, the bottom of the jug and that of the tub being in contact, or nearly so, and the mouth of the jug close to the rim of the tub. The jug may be fixed in position by a few sticks, nailed across the tub inside. The tub is then stuffed full of horse litter and manure, and strips nailed across the top to keep it in. When this is done we fill the jug with water, put in a cork, and invert tub and all. (See figure 3.) Then the cork is withdrawn at the same time that a small pan is slipped under. The pan remains full during the day, and, if set in the sun, will not freeze so much as a film of ice upon the surface, even out of doors, except on the severest days. At night the pan should be withdrawn, and the water allowed to flow out.

A simple contrivance for feeding ducks and not allowing chickens to share their food, was shown us the other day at the yard of a subscriber, and we have had it engraved (fig. 4). The food was placed in a square, flat pan, in which a few bricks were laid, filling the middle of the pan, to prevent the food being shoved beyond the reach of the ducks. Then a box was turned over the pan and contents, and supported upon a brick at each corner. After a little experience the ducks learned to run their flexible necks under and fill themselves, while the disconsolate hens could get nothing. Ducks will increase rapidly in weight if they have all the soft food they can eat. The best place for them to pass the nights in winter is upon a fresh manure heap, under cover.

If one wishes to feed chickens and not ducks,

Fig. 3.—WINTER WATER FOUNTAIN.

a convenient way is to lay a board or two, to put the feed on, upon two barrels or wooden horses. A neat contrivance is shown in figure 5, for feeding fowls or chickens after they can fly. A hopper is placed within a box, two or more sides of which are of upright slats. The mouth

of the hopper being very low, so that but little grain can flow out at a time. This is covered by a movable roof, and the whole is placed upon a table, the legs of which, if surrounded with tin for eight or ten inches, or other support, will secure the hopper and its contents from the depredations of rats and mice.

In figure 6 (upon the next page) we have represented a rustic, barkroofed duck coop, which might be used either to confine an old duck and her brood at night, provided the slat-work was so close as to prevent the entrance of rats or weasles, or to confine a hen with a brood of ducklings, in which case

the openings would need to be larger, and the coop would have to be shut up at night by a close front. There is more danger to young ducks from rats, than from any other cause.

### Mules for Farm Work,

There is a growing interest among farmers in the Northern States in the subject of substituting mules for horses, for the ordinary work of the farm and road. It seems to be universally conceded that they are much less subjected to disease and better able to withstand the extremes of heat and cold than horses are. Their feet and legs are especially tough, and a lame

Fig. 2.—WATER FOUNTAIN.

mule is a rarity. Another idea in common about them, but which is erroneous, is that they require only seant rations of poor food and that they need but little care. It is true that they will keep alive on wonderfully little food; and that grooming is less important for them than for the nobler animals; but not even a mule can make bricks without straw. With them as with horses, muscular action involves a destruction of muscular tissue, and the loss must be supplied by the products of digestion. We have known a mule to eat a spoke out of the wheel of an army wagon and to make up for the want of forage by a diet of fence rails; but he did'nt grow fat on it and was very likely, after a few days of such regimen, to find his last restingplace in a ditch beside the road.

If any farmer thinks to circumvent the laws of nature by getting a mule to do hard work on a diet of bulrushes and rye straw, he will miss his calculation. But if, on the contrary, he will deal out corn with a liberal hand, he can get an astonishing amount of hard work done six days in the week, fifty-two weeks in the year, for more years than he is likely to follow farm-

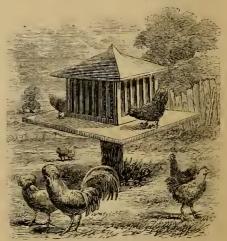

Fig. 5. - FEEDING HOPPER FOR CHICKENS.

ing; and a vigorous and frequent application of the curry-comb and brush will produce the good result that a clean skin and a brisk circulation of the blood effect in all domestic animals.

There is a wide-spread belief that mines are stubborn and vicious, and our agricultural friend, Josh Billings, has almost immortalized every bad quality that a mule can have. Probably these long-eared friends have rather more capacity in the direction of "mulishness" and viciousness than have most of our other domestic animals; but it is a capacity only, and these bad qualities are in all cases the result of brutal and ignorant treatment. The writer has had to do with hundreds of mules, and is convinced that they are naturally more intelligent, more affectionate and more docile than horses. But their

Fig. 6.—DUCK HOUSE.

docility will not withstand abuse; their affection is by no means bestowed on those who abuse them; and their intelligence is often chiefly exercised in devising means for worrying those who worry them. Well fed, well groomed, and gently treated, a mule is a perfect farm laborer; but starved, neglected and beaten, he has about as much badness and worthlessness as it is possible for his four legs to carry.

### Soiling Cattle in Illinois.

H. K. Smith, a young farmer of Putnam Co., Ill., writes to us for advice. He says: "I see the once rich farms about me are fast running ont by the incessant cropping practised here. Now, I have eighty acres of deep, black prairie soil, almost new, which will give me sixty-five bushels of corn per acre, and propose to keep it so by stocking it with-say eight or ten cows, keeping their calves until four years old, and fat, which will give the farm, after a little, an equivalent of-say twenty-five or thirty head of grown cattle. These I propose to feed in winter by steamed feed, in the most approved way, stabling most of the time, and soiling them in a summer house during June, July, August and September, saving and composting the manure. Now, I want your opinion of soiling in Illinois, bearing in mind that our soil will bring enormous quantities of clover, corn, etc., but is not first-class grazing land. Can cattle be kept in better order if fed by the soiling process, away from flies, etc., the heat and sun, and allowed the run of-say an hour in the early morningupon a good pasture? Land here is worth \$50 per acre."

REMARKS.—A partial system of soiling cattle on land that will produce sixty-five bushels of corn per acre, and an abundant growth of clover, but is not first-class grazing land, can hardly fail of being profitable. But we would advise our correspondent to "feel his way,"—

to practise it at first on a small scale on a few acres of the richest land. Soiling requires high farming. It will not do to mow a light crop of clover or coru fodder and cart it green to the stables for the cattle. You want the heaviest crop that the climate is capable of producing. The clover should be top-dressed in the fall or early winter, so as to give it an early start and a large growth in the spring. The corn for fodder should be drilled in rows, 3½ feet apart (not sown broadcast), at the rate of four bushels per acre, and thoroughly cultivated as long as the horse can get through the rows. The land

should be made as rich and mellow as possible. The nearer it is to the stables the more convenient will it be to feed out. But a still more important point is to sow at least a portion of it on the drycst, warmest, best and richest land you have. This is the great secret of success in raising corn for soiling. Too many farmers, when they sow corn for fodder, select a piece of land that is too wet to plant with corn, and when they are through their regular planting they turn over a tough sod, sow some corn on it broadcast, and in nine cases out of ten get a crop that costs more to cut and draw to the barn than it is worth. Two years ago, we drilled in two acres of corn on a piece of rich, warm land, while a neighbor sowed the same quantity broadcast on a piece of rich, wet land. He never

harvested any of his, while, from the 1st of July, we fed seven cows all they would eat while in the yard at night, and had more than half of the piece left to cure for fodder. No piece of land on the farm paid us better.

To get the full benefit of soiling, you must not only have rich land, but you should have well-bred cattle, and feed them more or less grain. The great advantage of the system is in providing a liberal allowance of food at all times, keeping the animals comfortable, and pushing them forward rapidly to maturity. Shorthorns and their grades, so fed, should be ready for the butcher at two and a half or three years old, instead of four years, as our correspondent proposes.

We have more faith in soiling in summer than in steaming in winter. Unless you have every convenience, the saving of fodder by steaming will scarcely pay for fuel and labor—at least not in the new sections of country where cattle food is comparatively cheap. We should be glad to hear from our Western readers who have had experience in soiling.—Eds.

### A New Cattle Shed at Ogden Farm.

It having been found desirable to have more stable accommodation at Ogden Farm, so as to take full advantage of the existing appliances for economical feeding, whenever the feeding of beef cattle promises a profit in the shape of free manure, a shed 12 feet wide, and 200 feet long, has been built as an addition to the barn.

The barn is 100 feet long from east to west. The new shed starts at the south-west corner, and runs 100 feet to the west, being a continuation of the south front of the barn; then it forms a right angle, and continues 100 feet towards the south. By this arrangement the barn-yard is perfectly protected for a length of 200 feet on the north and 100 feet on the west, which is, of itself, an immense advantage.

The shed has stables for cattle and sheep, and loose boxes for horses on the ground level; and on a floor above these a continuation of the railway track that carries the fodder car from the steaming chamber. This floor also affords

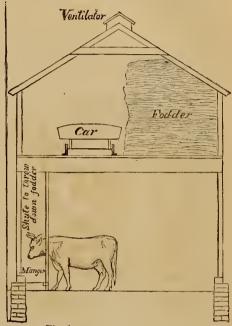

Fig. 1.—PLAN OF CATTLE SHED.

considerable storage room for grain, forage, etc., and has an open space at the side of the track for throwing down fodder. The ground plan of the new building is shown in figure 2. It contains five large compartments and four smaller ones, with doors and windows opening into the barn-yard, and with mangers on the opposite side. The compartment nearest to the barn, (as the ground is higher at this point, and the ceiling lower in consequence,) is appropriated to sheep; the next, which is still lower, to yearling heifers; the next, to cows, and the next two, which are more than 7 feet in the

> clear, to beef cattle. The four hox stalls are each large enough for a mare and foal, or for two colts.

Figure 1 shows a section of the building which is only 12 feet wide. The cattle stand upon the ground, which is covered with sand to keep it dry, and each one has a "headhole" into the manger, which is continuous in each compartment, so that it can be swept clean from end to end. The railroad track, which is an extension of the track on the eattle floor of the barn, runs at the side of the floor next to the manger, and leaves about 6 feet of the floor available for storage purposes. There are four ventilators at the peak, and six windows in the front slopes of the roof. Ample light is

given to the lower story by windows on the front. There is no opening of any kind on the north or west side of the building. The railroad does not run over the horse boxes, because it was necessary to raise the floor 2 feet higher at this point, to give more head room below. The feeding is very easily done, as the car is loaded

Old Barn

at the door of the steaming chamber, and each animal's rations are thrown directly from it into the manger.

## An Important Device in Tile Draining. BY GEORGE E. WARING, JR., OF OGDEN FARM.

I cannot quite say with the old drainer in Talpa, "I've been a-draining this forty year and more; I ought to know summat about it;" but I have been at it long enough to be half ashamed to own that I have only now learned how to protect the joints of drains that are laid without collars. I shall by no means abandon the use of collars, for they have a power to make a drainer sleep comfortably, that nothing else can quite equal. If the tiles are well laid, with well-fitting collars, the most nervous proprietor may rid himself of all uneasiness about them. They are as nearly a certain thing as any human work can be.

In many cases, however, collars cannot be procured, or, the farmer desires to avoid their cost, and some substitute is sought. I have at last found it. After trying tin, shavings, grass ropes, straw, etc., etc., I have made the apparently trifling, but really most important discovery, that simply a piece of newspaper laid over the tile, and held in place by a little loose earth at each side, is better than any of them. It fits closely, allowing the earth to pack down well upon the tiles, it is inexpensive and convenient, and when it decays, it yields nothing that can get into the tiles and obstruct them.

All that is needed is that the loose earth used in filling the ditch be prevented from entering the joints. This the paper accomplishes in the most perfect manner.

### The Influence of the Moon on the Weather.

There is no "notion" more firmly fixed in the popular mind than that of the influence of the moon on the fall of rain, the violence of the wind, etc. Scientific men, acting on the theory that "where there is so much smoke, there must be some tire," have given much attention to the subject, and have hinted at certain theories as being possibly correct. Unfortunately, the results of different series of experiments have failed to agree, and we are as far as ever from any reliable confirmation of the popular belief, except in the single point of the dissipation of clouds by the full moon, Sir John Herschel believes that "clouds have a tendency to disappear under the full moon," and that "a slight preponderance in respect to quantity of rain near the new moon over that which falls near the full, would be a natural consequence of a preponderance of a cloudless sky about the full."

Arago, who concurs in this opinion, refers to a common expression among French country people, that "the moon eats up the clonds." It has been observed by the writer that a large moon has a tendency to dissipate clouds in dry weather, but has little or no such effect when rain is falling. Beyond this trifling fact, there has thus far been found, even by the closest examination of the relation between the state of the weather and the condition of the moon during a period of six years, not the least ground for the popular belief.

Not only is this belief unworthy of intelligent beings, but it is subject to the oddest contradictions. For instance, in New England, a "wet moon" is one which is so much inclined that it "wont hold water," or on which "you can't hang a powder-horn." At the South, a

"wet moon" is one which "lies on its back." It is supposed to be "full of water," and as its center fills up, the water is forced over the edge, and it rains. When we consider that the moon is a sphere, and that its apparent shape depends only on the manner in which we see the sun's light upon it, it becomes even more incomprehensible that any connection should have been imagined between its appearance and the amount of the rain fall. What we call the "changes" of the moon are purely arbitrary. It changes constantly, and as much at one time as at another, and there is no reason for supposing that it will rain more or less at that particular part of its change that the almanac makers have, for convenience, selected to indicate its "quarters." We often hear it said that we may expect rain (or fair weather) pretty soon, "because the moon changes to-night;" does; but it changed just as much last night, and is changing constantly, day and night, from one end of the century to the other; it always makes the full change, from new to old, once in every lunar month.

### Weeds as a Green Crop.

We shall always have weeds. It is impossible to conceive of an agriculture so perfect that they will no louger exist. They may be killed in their earliest infancy, but still they will come again. Nature abhors a naked surface and is fast to clothe our fields with verdure, even though we may neglect to plant. If it ever becomes possible for farmers to do every thing that is necessary at the exact moment when it ought to be done, they may find in this spontaneous growth a really valuable source of manure. It is proverbial that nothing grows so luxuriantly as weeds; and as no vegetation growing upon the land can be plowed into it without increasing its fertility, weeds might be turned to a good account if we could make sure to plow them well under before they form their seeds. Of course such weeds as propagate themselves by their roots must be rigorously excluded; but all other sorts, and especially the well-known Ragweed (Ambrosia) which grows luxuriantly and does not ripen its seeds early, might be depended on for material help.

It is not unlikely that an important part of the benefit of summer-fallowing is that at each plowing, vegetable matter is mixed with soil, and it may even be well, if there are no earlyseeding weeds on the field, to allow the crop to attain considerable hight before turning it under. We are not, of course, advocating the careless neglect of weeds, which are the source of more agricultural woe than almost all else besides, but merely hinting at a means by which a indicious and free-handed man may avail himself of the wonderful benefits of green manuring without the cost of time and money that the raising of clover and buckwheat demand; and we desire above all things not to have our suggestion distorted into an excuse for slovenly farming by men who are too lazy or too incompetent to keep their land in proper order. It may be well to remark that we have not been able to think of any way in which the tangle of weeds and briers, that ornament so many farmers' headlands and fence-rows, can be turned to use.

### Spreading Manure from the Cart.

Most farmers make their manure in the yards, cellars, and stables. The practice differs materially in transferring the manure from the barn to the field. Some eart it out twice a year,

some only once, and others cart it out at all seasons of the year, as suits their convenience, making a thorough cleaning only when the last spring crops are sown. Some heap up the manure in the yard, and let it ferment a month or more before hauling, and others take it in the raw state and transfer it immediately to the fields where it is to be used. Some make large compost heaps on the fields that are to be planted the next season, and others spread every thing directly from the cart-tail. This latter practice is good if the compost is already made. It saves a great deal of labor. The manure is taken from the cart, a shovelful at a time, and spread evenly over the whole surface as the team moves along. It is left just right to be plowed in, or to remain for a top-dressing upon the meadow. If left in large heaps, it must be put into the cart again to be distributed. If left in small heaps, you must stoop with the shovel to get at your work, and here is a loss of labor. But, unless the compost is well made in the yard, there is a loss of mannre in spreading it green from the stables. We mean by this that the farmer loses the opportunity to make the best use of his green manures. He wants to mix this green manure with three or four times its bulk of loam, muck or peat, either in the yard or in the field. Oftentimes it can be done to the best advantage upon the field. There is a deposit of muck close by, and it will save a mile of carting to make the compost heap upon the field where it is to be used in the spring. It is much cheaper to bring the green manure to the muck than to hanl the muck to the barn, and after six months or a year, haul it back again. The process of fermentation will go on quite as well in one place as in another. To be sure it costs more to handle the manure, but the labor is more than paid for in the increased value of the manure. In spreading green manure upon the surface, and letting it remain, there is a very appreciable loss in the summer, and some waste even in winter. If we take fresh stable manure or hog dung from the sties and compost it with three times its bulk of muck or loam, the whole mass is made into a good fertilizer by spring, for most soils, and quite as valuable, load for load, as the fresh dung. It will not show its effects as quick, perhaps, but it lasts longer, and the labor spent in working over these compost heaps in winter is sure of its reward, and that is what all good farmers want. Some are deterred from this kind of winter work by the apprehension that the heaps will not ferment. It is true the heating is not so rapid as in summer, but it will be found, if a stick or crow-bar is thrust into one of these heaps, it soon becomes warm to the touch. They will "smoke" in the coldest weather, showing that fermentation is going on.

### Management of Barn-yard Manure.

A farmer in Pennsylvania asks "How we manage our manure?" It depends on circumstances. Some of us manage it in one way and some in another. Probably no two of the Agriculturist Editors manage it precisely alike. A good deal depends on whether we have much or little straw; whether we have access to a good bed of swamp muck; and also whether we are going to use the manure as a top-dressing on grass, or to plow it under for corn, or for root crops. For the latter, we must always have it well rotted, while for corn, if necessary, we can plow it under in a comparatively fresh

state. Our correspondent says: "The universal plan here in this section of Pennsylvania is to throw out all the manure from the stable in front of the barn, and let it lie there through the summer. We then haul it out on to an oatstubble (generally), and plow it under for winter wheat. Now, would it be a better plan to keep it under cover? Our barns are not suitable for manure cellars, being all built in a bank, in Pennsylvania style. To make a cellar under one of our old barns would cost as much as to build a new barn. Would piling the manure in open sheds be a better plan? Would such manure as is thrown out of our stables, which is more than half straw, rot under cover?"

If piled early in the spring, while the manure is saturated with water or snow, it will undoubtedly rot under cover. But if the manure be dry when piled, and if it contain a large proportion of straw, it will be likely to fire-fang. In this case it would be best to pile it where it would be wet with the rains, or, better still, where liquid manure could be pumped on to it.

In the ease of our correspondent, who, we presume, has abundance of straw that he desires to work up into manure, the great point is to convey all the water away from his barn-yard before it comes in contact with the manure. If the barn-yard is not unnecessarily large, the rain and snow that actually fall on it will be no more during the year than the manure needs for proper fermentation. But it may be necessary to have a water-tight basin or tank, to hold any excess of water arising from rain and melting snow in the spring; and if so, this water should be saturated with plaster, and pumped or soaked back on the manure heap when it becomes dry. Manure will not ferment if kept in a hole or basin full of water.

Instead of allowing the manure to remain in the heaps as thrown out from the different stables, it should be all wheeled or carted to one large central heap, in or on the side of the basin. If this is done every day, or once a week, the heap would be large enough to keep out the frost, and the manure would slowly ferment all winter. If the manure is wanted for winter wheat next fall, it may remain in this heap all summer, receiving from time to time any additional manure that is obtained from the stables. If it has been properly treated, it will be thoroughly rotted, and in excellent condition for applying to the wheat without turning or piling. And if none of the liquid has been allowed to leach away, the manure will be just as good as if it had been kept under cover.

Where sheep are largely kept, it is usual to " pile" the manure in the spring, the dry manure from the sheds being mixed with the wet manure from the open yards. If it contained much straw, it will be necessary to turn the piles once or twice, at intervals of a month or six weeks, to accelerate fermentation. If the sheep manure can be conveniently carted to the same heap containing the manure from the horse and eow stables, and from the pig pens and poultryhouse, and the whole turned over and mixed together in one large heap, it would be much the best plan. As manure heaps are usually managed, this would be a rather formidable undertaking. We have some unpleasant recollections of handling a mismanaged manure heap, with undecomposed corn-stalks running through it in all directions but the right one. But, where the manure has been spread evenly, in horizontal layers, every day, as wheeled on to the heap, it can be cut with a hay-knife into sections, four or five feet wide, and turned with less labor than many would suppose.

The points in managing manure in this way are:
1st. To pick out all loose stones, sticks,
boards, etc., from the barn-yard, and see that
nothing gets into the heap that will break the
forks, dull mowing machine knives, nor add to
the labor of handling the manure.

2d. A good wheelbarrow should be provided, and also some planks, for wheeling the manure from the stables to the heap.

3d. The manure should not be scattered over a large area, but should be placed in as compact a heap as possible; the deeper it is, and the more there is of it, the better will it ferment.

4th. The manure should be spread as wheeled out, and not left in barrowfuls on the heap. In doing this, the manure should be worked over as much as possible, and corn-stalks, especially, which should be cut into foot lengths, should be placed in layers. Manure heaps, during the winter should certainly have this daily attention.

5th. Straw, or the manure from straw-fed animals, ferments slowly. A little bone-dust, fish guano or other animal matter, or the droppings from the poultry-house mixed with such manure in the heap, would induce fermentation, and add much to its value. Pea and bean straw, the straw from clover seed, the manure from animals fed on clover hay, peas, beans, bran and oil-cake, will ferment rapidly, and make a manure of great value. Pains should be taken to mix such with that of poor quality.

6th. If the heap ferments unevenly, and the heat concentrates so as to form a kind of chimney, throw some of the cold manure from the outside on to the top of this chimney where the steam is escaping, and endeavor to distribute the heat evenly through the heap; or pull the heap to pieces, and get out a few harrowfuls of this hot manure and place it where you desire to start a new fermentation, in the cold portion of the heap. With skill, judgment, and without working over, the heap may be put in condition for drawing out for winter wheat, or as a top-dressing for grass land in August or September.

7th. Recourse may always be had to water, which, if pumped on, will check fermentation; but it must be used with care in winter.

### Common Sense in Wheat Culture.

The enthusiasm of "new converts" is proverbial and most natural. When a man who has been convinced, against his will or not, experiences the advantage of drilling, in opposition to sowing grain broadcast, he almost always thinks the variety of grain he sows has a good deal to do with his success, but he does not give up the drilling. We have advocated grain drills for years-and the editors and writers for the Agriculturist have fairly grown gray in their use. After all there are extensive regions through which one might travel days without seeing a drill-sowed field, and where to hire a drill for \$1 an acre would be as impossible as to hire a balloon for an evening airing. There is a great difference in varieties—that we all admit-but we agree fully with Mr. Harris, who in his article on Wheat Culture in Western New York, contained in the Agricultural Annual for 1868, says: "I have little faith in improved varieties of wheat unaccompanied by improved farming.—The two must go together"-and again: "The poorer the farmer the oftener he changes his seed. He sees others raising better crops than he does, and hopes by getting seed from them to be equally successful." The Boughton is included by Mr. H. among the best varieties, and one highly approved by the millers on account of its whiteness. It passes under several names, among which "Early May" and "Oregon," are perhaps, best known. These remarks are suggested by the excellent common-sense letter from Mr. S. D. Comfort, of Knox Co., Ohio, which follows:

MR. EDITOR:—The farmers of this vicinity have been learning a lesson in wheat culture in the dear school of experience. Many of them during the past few years have lived, a part of the time at least, on flour made from Iowa spring wheat. The careless modes of culture, which forty years ago were sufficient to produce large crops, are still employed by multitudes of farmers. The manure in huge piles against the barn, burns up and wastes its ammonia on the air, instead of being mingled with the soil. Instead of sowing on an inverted clover sod, the corn ground is hastily seeded to wheat. This is sown broadcast instead of being drilled, and put in so late as not to give the plant sufficient time before freezing weather to establish its roots firmly in the soil. The consequence is that the weakly, half-developed plant, is lifted out of the ground by the frost: and I believe it safe to say that half the seed committed to our clay soils in this section is lost. Broadcast seeding and covering with the harrow leaves much of the seed on the surface, and much more, covered so shallow that the first rain washes it bare. It germinates on or near the surface, and is easily destroyed by winter and spring frosts. The farmer who does not own a good wheat drill can make it profitable to rent one at one dollar per acre. Our eareless culture has run down the yield per acre so low as to be a standing disgrace; and it ought to shame every farmer who has helped contribute to the result. I venture the opinion that there is an obligation resting on the agricultural press to use all its influence with farmers to induce them to adopt improved modes of culture and improved seed. Our agricultural societies continue to give premiums to the old, red bearded varieties, on the ground that they have been tried and are sure for half a crop. My attention was recently called to a erop of thirty-three dozen and seven large sheaves raised from one bushel of seed of Boughton wheat. The heads are large, many of them contain sixty large, plump, white grains; it has a smooth head, a short, stiff straw, and it is believed by those who have grown it that there is no land rich enough to lodge it. It has ripened earlier than any other variety by several days. The Commissioner of Agriculture sent one pound of it into this section three years ago, and it has multiplied to hundreds of bushels; and I think every grain ought to be sowed. The earliest wheat will generally escape the weevil and rust, two of the most destructive enemies of the crop.

Bear-Grass-Yucca.-In September last we published some notes from Mr. J. T. Worthington, of Chillicothe, O., on the uses of the leaves of the Bear-grass, Yueca filamentosa, as a tying material, and at the same time gave an engraving of the plant as we have it in cultivation. Mr. W. afterwards wrote us that the engraving did not represent the plant he grows and uses, and sent us specimens of the leaves of his. It proves to be that form of Y. filamentosa, known in the nurseries as Y. flaccida, but which is regarded by botanists as only a variety of the first named. As the variety has much longer and less rigid leaves than the other, it is much better to use as a tying material; those who wish to cultivate it for this purpose can procure it at the nurseries by ordering Yueca flaccida.

[COPYRIGHT SECURED.]

### T II E SAILING OF AN EMIGRANT SHIP.—Drawn and Engraved for the American Agriculturist.

There is a sadness in leaving home by sea that those who have not experienced cannot understand. Those of us who depart, expecting to return soon, watch with the deepest interest for the last glimpse of land. But with those who leave home forever, how inexpressibly sad is the fading away of their native land! The picture above is full of sentiment, and will recall to many a reader the most touching memories. The old country, the fatherland, endeared by so many ties, where so many loves and hopes lie buried; why should not these parting emigrants look lovingly back upon it?

In a few days their faces will be turned with equal earnestness, but with different emotions, to eatch the first sight of the new land where they are to make new homes. Speed on, good ship! bear them safely to our shores. We have work enough and room enough for all who will work. There is abundant land which the industrious may possess, and upon which they can make homes that will in time be dearer to them than those they left behind, for they will be their own, and no laudlord can dispossess them.

Peruvian Guano as a Lasting Manure.

Much has been said of the injury that has been done by the use of Peruvian guano. The wheat lands of Delaware are a striking instance of such injury. Before the use of guano, the produce was small but sure. The early crops from the use of guano were very large. They soon dwindled to a very low point, and finally not even liberal manuring with guano would enable these lands to produce so much as they had done before guano was known. Had the guano exhausted the land? By no means; the wheat had done the mischief. The guano had enabled the crop to take more mineral matter from the soil than, without the guano, would have been possible; and the demand of the increased crop for mineral food was much in excess of the quantity contained in the manure. This excess was taken from the soil, deposited in the grain, and sold away. When the large crops had completely exhausted the available food in the soil, the guano produced only so much crop as its own mineral matters supplied,—not enough to pay the cost of cultivation. The land was exhausted, and guano greatly aided its exhaustion,—but only as it enabled the farmer to convert its most valuable parts into a salable form. If the crop had been allowed to fall and rot on the ground, the soil would have been improved in quality, and the guano would have been a benefit instead of an injury. It is not the production of the crop that does harm, but its removal. The heavier the growth, the better, if the whole of it is retained on the farm.

On a dairy farm, where the only thing sold is butter, Peruvian guano is the best manure that can be used,—and it is, so far as the condition of the farm is concerned, a very lasting manure.

Suppose a grass field of ten acres to be manured with two tons of Peruvian guano, and to produce, in consequence, fifteen tons of hay more than it would have produced without manure; whether it is benefited or injured will depend on the disposition that is made of this hay. If it is removed permanently from the land, it will leave it much poorer than before the guano was used. If, on the other hand, it is

1871.]

fed to cows whose manure is all reapplied to the same land, it will be improved. The manure made by the consumption of the fifteen tons of hay, in connection with the extra growth of roots in the soil, will be worth more than the two tons of guano, and it will still more

more likely to become a general favorite than this. The variegations of the leaves are well defined, the light portion being of a clear, creamy white. The past summer has put plants with variegated leaves to a severe test. They are regarded, and probably justly, as constitution-

ally weaker; and many of them lose their foliage in a long coutinued drouth, or their markings disappear under our July and August heats. The Variegated Rose of Sharon, however, stood it bravely, and was bright and cheering to the end. The plant makes such a show with its foliage that we hardly need flowers in addition; but it produces dark purple flowers which are remarkably double, and furnishes one of several instances of exceptions to the statement that plants with variegated foliage do not bear double flowers. The leaves are represented in the engraving of the natural size, while the flower given there is smaller much than usual, on account of the dry

The

weather.

### Job's Tears.—(Coiv Lachryma.)

It is pleasant to see old and almost forgotten plants turn up occasionally, and when a gentleman brought for a name a specimen of Job's Tears, we were gratified to meet a very old garden friend. There can scarcely be any thing more curious in the way of a grass-for it is a grass that bears this lachrymose name. The engraving will show the singular character of its flowers. A small, egg-shaped involuere encioses the female or perfect flower, and from this proceeds a weak spike, bearing several staminate or male flowers. There is something about the arrangement that reminds one of Indian corn. The involucre, or roundish body, which incloses the perfect flowers, in ripening, becomes very hard and bony, with a smooth, polished surface, and of a gray color. These seeds, if we may call them so, have received numerous funciful names, of which Job's Tears seems to have become the most firmly attached. When perforated the Tears are strung as beads, and used to make rosaries. The plant is a native of Southern Europe, and in our warm summers it usually perfects its curious fruit, though it would be much safer to give the seeds a start under glass.

### Potato Grafting.

BY JOHN WARCUP.

[The publication of Darwin's "Animals and Plants under Domestication" brought into prominence the fact that hybrids could be pro-

JOB'S TEARS .- (Coix Lachryma.)

duced other than through the medium of the seed. Several instances of graft-hybrids were cited, among the most striking of which was the successful blending of the characters of two varieties of potato by means of grafting. This statement at once set English experimenters at work, and for a while the journals contained numerous accounts of more or less promising results. During the past season, one of the most careful of these experimenters made the announcement, that he had done with potatografting as promising no useful results whatever. The following, from our Canadian correspondent, John Warcup, gives the manner in which the grafting is done, and the results he obtained in his experiments last season.-ED.]

I grafted, last spring, an Early Rose on a Garnet Chili, and also a Garnet Chili on an Early Rose, in like manner. I took a Chili and scooped out every eye, then cut from an Early Rose a slice in shape somewhat like a shield, containing a fine germ, or bud. This shield was inserted in a bed prepared for it in the Chili, stuck on with two pins, and bound fast with bass. The bed and shield were made to fit as exactly as possible, and the grafted specimen immediately planted in the usual manner. The two sorts operated upon are both reds—the Chili a little the darker, and round in shape, the Rose paler rod, and oblong. All the specimens came up and grew well. They were dug

VARIEGATED ROSE OF SHARON.

benefit the land, causing it to produce still more largely the next year. This crop being made into more manure, and returned to the same field, will again increase its yield, and there is searcely a limit to the extent to which its fertility may be increased,—all by the judicious reinvesting of the original five tons of guano (principal and interest). Of course, the usual requirements of good husbandry (such as rotation and seeding) must not be neglected; but under a good system of farming, with Peruvian guano to start with, the productive power of a farm may be vastly increased. In careless farming guano will be found an expensive manure.

### The Variegated Rose of Sharon.

In quite a large collection of ornamental shrubs none has given us greater satisfaction than the Variegated Rose of Sharon. The ordinary form with green leaves is one of the commonest shrubs in cultivation, and is commonly called in the catalogues, Althwa frutex, though it is not properly an Althea, but Hibiscus Syriacus. Its late appearing, single and double hollyhoek-like flowers, and its hardiness make it a popular favorite. The variegated one to which we refer was, if we mistake not, introduced by Robt. Buist, who, though he has brought out many fine plants, has sent out none

August 24. The Rose grafted upon the Chili gave a fair crop-about one-half of the Rose type and color, and the other half of the Chili type, but pure white. As to the Chili grafted into the Rose, the vines were extremely large, and, when dug, gave a large yield of beautiful potatoes, but all of them with clear white skins, except one or two to each plant, which were red; both colors were of the Chili type, and no apparent sign of the Early Rose among them. This shows a considerable change is effected by this grafting operation, in that it is capable of so modifying the color as to give a white progeny from red parents; but that it will fulfil all that its advocates claim requires more proof. Their theory is, that by thus bringing together two tubers of different qualities, a race may be obtained partaking in some degree of the properties of both. They think this method a quick and sure way of getting new varieties.

### Semething for our Inventors to Consider.

In looking over the advertisements of an English horticultural journal an American is struck with the great number of horticultural buildings, or green-houses, that are offered, and usually with the recommendation that they are "portable and easily fixed;" and accompanying them are equally numerous advertisers of hotwater apparatus for heating such structures, each maker vaunting the simplicity, effectiveness and cheapness of his wares. The buildings comprise all styles, from the small, simple leanto to the elegant span-roof, with transept. "Portable houses for the People," as advertised by one maker, shows not only how generally diffused is a taste for horticulture in that country, but also how readily one having such tastes can procure a glass-house in which to includge them. It is claimed that tenants can readily take these houses down and move them along with their furniture. In this country how very different. One must get masons, carpenters, glaziers and other mechanics, the chance being that neither of them ever worked upon a greenhouse before. When the house is built, then comes the great problem of how to heat it. If hot water be used the apparatus costs about as much as the whole establishment complete should cost. There are hundreds of people all over the country who, if they could procure a small house at a moderate cost and without more trouble and fuss than the whole thing is worth, would be glad to put up a glass structure for plants. There is a good chance here for some one to enter an unoccupied field, and we doubt not it would be found a profitable one.

VEGETABLES AND FRUITS.—One of the ever recurring questions met with in looking over our correspondence is: "What articles of food may properly be called vegetables, and what fruits?" -There is no trouble in defining what a fruit is according to the botanist's view-it is a ripened pistil with whatever may be permanently attached to it, whether pulpy and edible or not. Strictly speaking, a poppy-head is as much a fruit as is a pear. But when we come to popular usage it is not so easy to decide which among the fruits shall be called vegetables. We once suggested that those eaten without preparation should be called fruits, and those that are used cooked or dressed should be called vegetables. This very nearly covers the ground, but not completely. In this case the tomato cooked or as salad would be a vegetable, but if eaten, as some prefer it, raw and plain, it then is a fruit. If any one can suggest a better place to draw the line we should be glad to hear from them.

### Congress and Horticulture.

A copy of a proposed bill "To encourage the production of new and valuable Fruits and Plants" has been sent to us, together with a form of petition to be presented to Congress asking them to make a law similar in its effect to that proposed by the bill. The bill proposes to give any originator or discoverer of any new variety of "fruit, grain, herb, root, tree, wood, or flower, the sole right of propagating and selling such plant for the term of twenty-eight years." That is the "nut" of the thing, and all the rest of this proposed bill is subordinate and accessory thereto. Congress has done many foolish things in the eighty odd years it has existed, but never any thing so absolutely stupid as to pass such a bill as this. There are many objections to this "bill," but the greatest of these is it cannot be enforced. If we sell apple cions to another, how is it to be proved that they are cions of the "patented" variety until they fruit some years afterwards? and when they do fruit, who could prove that they were the cions sold? Then again, who can swear to the identity of two fruits grown in widely different soils and situations? There is bother enough now in identifying varieties; but what a lovely time it would be if our pomologists were obliged to testify under oath. Suppose that we had patented the Triomphe de Gand strawberry and Romeyn should sell his scedling, what a time we could make by prosecuting Mr. Romeyn for selling our plant. The case would last longer than the celebrated India-rubber case. We do not find the name of any one well known in horticulture concerned in this movement. We are curious to see how many of those who are known as pomologists, florists, and horticulturists generally, will be found to petition for this most absurd-because impracticable and useless law. The second section of this petition states the following: "That most of the varieties formerly cultivated, and which yielded for many years fruits and products of excellent quality, have recently failed in every section; and that very few of the new varieties recently produced have proved equal in quality to those that have been abandoned as unsuited to our soil and climate."-That is, most of the old plants have gone to the bad, and as the new ones are poorer than the old ones, we wish Congress to allow us the exclusive privilege of selling the new ones for twenty-eight years. There is a cat in this meal-tub somewhere. Let horticulturists consider the whole matter carefully before they sign this petition.

### Pruning the Grape-vine.

The question, "When and how shall I prune my grape-vines?", which so frequently comes to us each autumn, is one that cannot be readily nor satisfactorily answered, at least that portion of it which asks us to tell how. As to the time of pruning, there is every reason for doing it before spring, and the earlier it is done after the fall of the leaf the better. There are often mild days in January when it can be properly done. In order to prune a vine understandingly one should be familiar with its structure, and the manner in which it grows. The requirements of no two vines being exactly alike, no set rules can be given which can be safely followed. The operator

must exercise his judgment and give each individual vine the treatment it requires. The works of Fuller, Husmaun, Mohr, and others, give the principles upon which all pruning depends, and in the volume for 1868, we gave a series of ten articles discussing the subject in great detail. We cannot repeat articles like these from year to year; and those who would understand the matter fully should refer to that volume or some of the standard works. The general trouble, with vines pruned without regard to any particular system, is that too much wood is left. The operator should understand that the whole growth of next year will be produced from the buds now upon the vines, and that the fruit will not be borne upon the wood he now sees, but upon new green shoots that will start from these buds. If every cane of the present season's growth be cut back so as to leave but two buds, the probability is that even then there will be many more shoots produced next spring than are needed. It will be seen that one must have an eye to future effects, and in imagination see a shoot in place of every bud now before him. An old and entangled vine, that has been neglected for years is a very unsatisfactory subject to handle. Yet, as such vines are often as much valued for their shade as for their fruit, it is worth while to bestow some labor upon them. Young vines that were set out last spring should be cut back to three buds, and have some earth drawn up around them. One or two of these buds, according to the strength of the vine, will be allowed to grow next year. In pruning, cut an inch or two above a bud, to guard against injury to the upper bud during winter.

## House Plants.

At this season of the year a painful wail comes from our correspondents-especially the ladies-concerning their house plants. It is all summed up in the words "bad luck." We believe in bad luck. If a lady makes a cake according to an approved rule and puts it in a cold oven, she will have bad luck. If she undertakes to can fruit without putting on the covers properly, her fruit will spoil, and she will have bad luck. So long as bad luck is taken to express the fact that a thing is not properly done, we accept it for want of a better name. Getting plants and potting them is one thing-properly caring for them is another. The demands of a plant are few; but these being disregarded, failure is sure to follow. In the first place as to watering. Plants must have water; and many thinking that you cannot have too much of a good thing, water all the time, keeping the roots in liquid mud-about as sure a way to kill a plant as can be desired. If a plant gets too dry, it can usually be restored; but we know of no way in which to restore a sodden mass of water-soaked roots. Decay sets in, and the job is done. We lost a fine window-box of plants from telling the house-maid to soak it once thoroughly. She kept it soaked. We thought the earth was a long time in drying out, and upon inquiry found that she had faithfully added water each day to keep it soaked. The consequence was a loss of a lot of nice plants. Plants in open ground are treated to alternations of wetness and dryness. Every one must have noticed how much better plants stand a drouth than a long continued rain. With house plants we must keep up this alternation and allow the earth in the pots to be so far exhausted of moisture that air can penetrate the earth. No plant, unless it be a thorough aquat-

ie, can flourish in sodden earth. The rule should be to water just before the plant begins to need it. A watchful eye will notice the proper time.

Air is another requirement of house plants. We ourselves contrive to survive with an impure atmosphere, but the plants cannot be deceived. They must have proper air or they will perish. In old-fashioned houses heated by wood fires, where there is abundant ventilation, there is no difficulty in growing house plants. In our modern houses, success with plants is the exception. Open the windows whenever there is no danger of freezing the plants.

Dust is the housekeeper's annoyance, and it is also that of the plant. Cover the plants with papers or a cloth while sweeping is going on, and as often as practicable set the pots in a sink or bath-tub and give them a fine showering from a

Heat .- This must be governed by the requirements of the family. When it can be regulated, the temperature for plants at night should be from 10 to 15 degrees less than they have with sunlight. Here is one great trouble with house plants. We keep the temperature of our rooms as high or higher at night than we do in the daytime.

Fertilizers .- Much is written by amateur newspaper writers about the use of ammonia, and this and that specific for making plants flourish. We have raised a great many house plants, and have had about as good success as the average, without recourse to any of this fancy treatment. The plants are put into good, rich, light soil at the outset, and they do not need any thing from the apothecary's shop. Some who write about plants seem to delight in throwing a mystery about their cultivation and ascribe their success to certain fertilizers. Proper watering, judicious airing, and a low night temperature, will do all that can be done for their welfare.

### Notes from the Pines.

There was never any thing finer than the frost work the other morning upon the edges of the celery! Each leaf was fringed with a border of pure white crystals which, in contrast with the dark green of the leaf, made a filigree work so beautiful that it seemed a pity that the rising sun should destroy it all. Winter has its beauties as well as spring-time and summer.

Condon Peach-Trees.-I have taken a great deal of pleasure in a dozen Cordon peach-trees trained against the chicken house. A trellis was made a foot from the house, the trees planted four feet apart. Each was ent back to within a foot of the root, and only a single stem allowed to grow. How that stem did grow! I watched it morning and evening as it kept on growing and growing. Then it put out side shoots, and when they had made eight leaves they were pinched back to four. Here was occupation and amusement, this watching and pinching. Of the pinched shoots, some of them pushed again, and they were treated just as the original shoots were. Now that the leaves are off, I have my trees, nearly all, eight feet high, and for the greater part of their hight, furnished with short branches, which I shall cut in somewhat. Some people see these trees and ask what is the use. Such do not know the pleasures of horticulture. Setting out an acre or ten aeres of trees for the profit thereof is one thing. Planting a dozen trees to guide and mould under one's own hands, is another. If I

never get a peach I shall have been amply repaid in the enjoyment I have had in pinching and pruning. But if one can prognosticate, I shall get peaches; for my cordon trees are all furnished with blossom buds, and if a frost comes at blossoming time I can protect them with mats, or with newspapers for that matter. One peach so raised will be worth a basket of Delawares, because it will be mine. Now this is just the feeling that we lack in this countrythe growing of a thing for the sake of growing it. In true horticulture, dollars and cents do not come into the account.

SPINACH .- Was there ever such a provoking thing. I had a patch sown in September. It came up and staved up. I am thankful that it did not go back into the ground again; but it would not grow and give me thinnings for the table. Now in these December days it has taken a start and is growing famously, and gives promise of an excellent crop for spring.

Scolymus.-I don't know any other name for it unless it be the French, Scolyme d'Espagne, and that can only be translated into Spanish Scolymus. Well, Scolymus is as good a name as Salsify, and the plant is a great deal better than the one that bears that name. It is one of the new things I have tried this year, and I like it. It bears great thistle-like tufts of leaves -and its root goes down and down; but when you get it up you have got something. It is a long, large, white root, that does not, like Salsify, turn black upon the slightest exposure. It has much the oyster flavor of Salsify, and, upon the whole, I am much pleased with it. A part of the crop has been dug, and the rest left to see how it will winter over. From one season's experience, I am inclined to commend the Scolymus.

WEEDS,-It is not usual to talk about weeds in December; but just go into your garden, that you thought was left clean at the clearing up, and see the little green tufts, not bigger than an old-fashioned sixpence, but they are there, and, with the first warm sun in March, they will "blossom and bourgeon" in a way that will surprise you. Botanically, I love weeds, horticulturally, I detest them; and so astonish my man by directing him to do a bit of hocing in December, when the ground and the weeds are just right.

### About Commission Merchants.

Whoever raises a crop, whether it be fruits or early vegetables, poultry or what not, wishes to get the best possible price for it. He thinks, if within reaching distance, he can do best in the New-York market, and as a matter of course sends to the American Agriculturist to know who is a "reliable commission merchant." We have done with recommending commission merchants, for this reason: The nature of the business is such that with the best intentions on both sides, consignee and consignor, there is likely to be a misunderstanding. Some of the best men we ever knew in the business have been stigmatized as rascals, and some of the worst ones have been able to show, in certain cases, a clear record. Under the circumstances we do not youch for the standing of any commission merchant. We know of some with whom we would trust any thing, but others living far away might send them produce and feel that they had not been fairly dealt with. When our friends send to us asking us to recommend a commission

merchant, the best we can do is to send the cards of two or three whom we believe to be honest, and there our responsibility ends.

### The Edible Polymnia.-Novelties.

In April last, under the head of "A Proposed New Vegetable," we gave an account of the Edible Polymnia (Polymnia edulis), and at the same time presented an engraving of the root, which had been sent us by a Prussian seedsman. We stated that we had the seeds, and proposed to try the plant and give a report of it. The seeds, which were carefully sown in a hot-bed, did not come up, and we procured a second lot, but met with no better success. A friend, who is always on the lookout for novelties, sent to Europe for some seeds, which he received by post, but he did not succeed in raising a plant. Thus far we have heard of no Edible Polympia in this country. Now comes the Illustration Horticole with a record of the experience with the plant in Belgium. An account is given of its history and botanical characters, but its value is summed up in the concluding paragraphs, which we translate:

"After all this fine enthusiasm, and after a serious examination, it remains thus: the Polymnia contains 60 0 of sugar, and no starch at all: it is below mediocrity as an alimentary plant, and should only be planted, like the Jerusalem Artichoke, in poor soils, where its tubers and foliage may be harvested for cattle.

"This is its true position. It has, however, another to fill, and it is this which makes us write to-day upon a plant too much praised and too much defamed: it is that of a plant of ornamental flowers and foliage, for parks and large gardens." Then follows a notice of its usefulness for decorative purposes. We have devoted this much of space to the matter to show the difficulties that surround the introduction of new plants. Our seedsmen, ever on the alert for novelties, import and sell them with the foreign descriptions. A person who buys an untested novelty must not blame our dealers if it turn out perfectly worthless. There is a great pleasure in experimenting with new things, and in watching the development of a plant that we have never before known. Disappointment is the rule; but when satisfaction does attend the trial, we forget the ninety-nine blanks in our joy over one prize. We would not discourage the trial of novelties, for without this, gardening would lose half its charms, but caution our readers to remember that they are novelties. If one cannot afford to risk a little money for the pleasure of seeing how they will come out, he had better purchase only well-tested varieties, that can be relied upon.

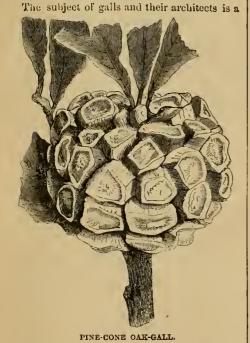

Onions.-Many complain that onions do not keep. The trouble is in keeping them too warm. The onion is a bulb, a plant at rest, and the least warmth starts it into activity. It is much better that onious should remain frozen through the winter, provided they can thaw gradually, than to put them in a cellar or other warm place where their vegetative powers will be aroused. If put in large heaps onions will be sure to spoil; but if spread in thin layers and covered with hay and straw, so that if frozen the thawing may be gradual, they will keep well through the winter. It is the custom with onion growers to get their crop to market as soon as possible. If they were to provide proper storage, they would realize much more for them, when sent to market later in the season.

### The Pine-cone Oak-Gall.

The accompanying illustration represents a very singular growth, found by Mr. C. J. Sidell on a white oak twig. It is a gall made by a large gall-fly, described by Baron Osten Sacken, of New York, from a gall found on Quercus Prinus, (White Swamp Oak,) as Cynips quereus Strobilana, in the Proceedings of the Entomological Society of Phila., Vol. III., p. 690. This is what entomologists call a polythalamous gall, i. e,, one having many cells; for each of the cunciform bodies composing it contains a hard cell, wherein lies a fat, whitish, footless grub. In the course of the winter this grub gradually assumes the pupa state, the legs, feelers, wings, etc., of the future fly appearing by a sort of budding process. By spring the fly will have matured, when it will eat its way out of the gall through a round, smooth hole, and commence to found new galls. The gall is doubtless produced by the sting of the insect on the leaves of a bud, each leaf growing into

The "gall-nut" from which ink is made is produced by the punctures of a closely allied fly (Cynips gallæ-tinctoriæ) on the leaves of a species of oak (Quercus infectoria), which grows commonly throughout Asia Minor. How few persons ever reflect that they owe so much to a tiny fly, and, to use the words of Kirby, "How infinitely are we indebted to this little creature, which at once enables us to converse with our absent friends and connections, be their distance from us ever so great, and supplies the means by which, to use the poet's language, we can --- 'give to airy nothing a local habitation and a name,' enabling the poet, the philosopher, the politician, the moralist and the divine to embody their thoughts for the amusement, instruction, direction and reformation of mankind."

the shape represented in our illustration.

most interesting and fascinating one, and we never cease to wonder at the great diversity of form and structure, and at the apparent blending of the animal and vegetable organisms which our different galls exhibit; for there is

not one of them that could be produced either by the vegetable alone or by the insect alone, and each particular gall is as invariably found on its particular plant, as are the flowers and fruit.

LILAC-FLOWERED FUCHSIA.

### The Lilac-flowered Fuchsia.

There are some forty or more species of the Fuchsia in cultivation; the varieties produced by hybridization and sporting are almost innumerable. Not many years ago a Fuchsia was a rarity, to be found only in choice collections of plants. Now they are multiplied so rapidly that they are the commonest things sold by the street venders of flowers. Each year brings its collection of new varieties, as it does of geraniums and verbenas. Most of those in our collections are so mixed and blended that it is difficult to trace their origin to the original species. The best known varieties are those with pendulous flowers, with the ealyx and corolla having their colors in marked contrast. The Fuchsia of which we present an engraving, is so unlike the common type that, at first sight, it would hardly be taken for a Fuelisia. It is called Lilac-flowered; not on account of the color, but from the resemblance to a Lilac in bearing a cluster of small flowers. The blossoms, which are produced abundantly, are of a violet-pink color. It is one of the Fuchsias which bloom well during the winter. The florists usually have it as Fuchsia syringæflora, but it is properly a variety of F. arborescens. It is a native of Mexico and Guatemala.

RHUBARB FORCING.—In October last Mr. Henderson described the manner of forcing Rhubarb on the large scale, with a lint how it could be done in a small way. Those who have

not prepared for a supply of Rhubarb by taking up the roots last fall, can probably do so during some mild spell, such as we frequently have this mouth. Place the roots close together in a

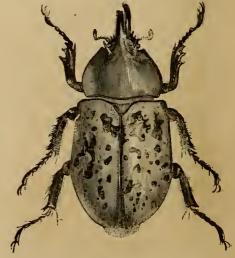

barrel, fill the spaces between with earth and set the barrel near the kitchen stove or near the furnace in the cellar, taking care it does not become too dry. Last winter we partly filled a cask with horse manure and placed the roots upon it and added earth to fill in between them. This was set in the barn and afforded an early supply. The cask or barrel may be closely covered, as light is not needed.

### The Gigantic Rhinoceros Beetle.

Mr. J. A. Forney, Brittain, N. C., sent us, some time ago, a large insect for a name, remarking, "They show a great fondness for the light after night. We have found several in the house when a window is left open." The immense brown beetle enclosed is a female of the Gigantic Rhinoceros Beetle (Dynastes tityus Linn.), and that our readers may recognize it we present herewith a portrait of the male. The female differs from him in being generally a little smaller, in lacking the horns on the thorax, and in having but a small tubercle on the head. Both sexes are very variable in the ground color, some specimens being glaucous-green, with brown spots, some brown, with glaucous spots, and others again entirely green, or entirely of a deep chestnut-brown, like the one sent. The spots also vary much in size.

This beetle is the largest N. A. species, and though tolerably common at the South, is very rare in the more Northern States. It breeds in the decaying roots of several trees, and Say informs us that a number of them were once found near Philadelphia in the cavity of an old

cherry-tree that was blown down by a violent wind. Its larva bears a general resemblance to the common White Grub of our meadows. The specimen sent by Mr. Forney was packed in a paper box, and, for a wonder, came through

GIGANTIC RHINOCEROS BEETLE.

the mail without being crushed. We would ask our friends who send insects for determination, to enclose them in small wooden or tin boxes, or pack them in such a way that they will reach us safely. Three-fourths of those sent us arrive in unrecognizable fragments. A quill, plugged with paper, does for small insects.

### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

### What is a Warrener?

BY AN OLD FOGY.

"Was this cooked in the Warrener?" asked the Colouel, as he was carving a piece of meat that looked neither roasted nor boiled, but thoroughly well done and juicy. The good lady replied that it was, and I was "stumped." I thought I knew every cook-in-ahle thing from the old-fashioned bake-kettle to the latest patent Yankee hroiler. "Warrener" was too much to keep silenee under, and the matter had to be investigated. I have since seen it described in an English work as "Captain

Fig. 1.-A WARRENER.

Warren's Everybody's Cooking Pot," and I don't wonder that the name has been shortened into Warrener. The invention seems to be a capital one. as it allows of cooking by steam, and without either steam or water coming in contact with the meat. The general appearance is shown in figure 1. It is much like a large glue-pot, with the modification shown in figure 2, which gives a section; A, is the outer vessel which contains water; B, the inner vessel, in which the meat is put; this vessel does not touch the bottom of the outer one, but fits closely enough to it at the rim to prevent the escape of steam. The cover C, is double; a tube, D, passes from the outside of the inner vessel and projects upwards to meet a tube in the cover; these tubes fit together closely. The cover is also shown, separately, in figure 3. Water is put into

Fig. 2.—section of warrener.

the outer pot, A, until it reaches the bottom of the inner one, B; the meat is placed in B, without any water. The cover, C, is then put on with its tube connecting with D, and the apparatus placed on the fire. The water in the outer vessel soon boils, and steam is formed which completely envelops

the one containing the meat, passes through the tube into the cover, where it condenses and trickles back again into the boiler. The meat is thoroughly cooked in its own juices, without danger ef scorching, and is so acceptable that in the family above referred to the Warrener is in frequent use. When the water once reaches the hoiling point it requires very little heat to keep it there continuously, as none is lost by evaporation. It would seem al-

Fig. 3.—cover of warrener.

most impossible that a dinner placed in this could be spoiled by the most stupid "help." An intermediate vessel is provided, which may be placed between B and the cover, in which vegetables may be cooked at the same time with the meat. I do not know if the Warrener is for sale in this country, but if not it ought to be, as it appears to be an economical and excellent household contrivance.

### Bridal Gifts.

[There is much to be said on both sides of the custom of giving wedding presents. One of our clerical friends puts his side of the case in strong language in the following article. Still, to our view, he does not touch the point of the fashionable wedding where "tickets" are sent to those who are supposed to give liberally on such occasions, and where, after marriage, friends are estimated by the articles they presented to the bride.—ED.]

Shall we bestow them? They are quite the fashion; and it is almost as much the fashion to decry the usage as a bad thing in itself. Hear one, a woman, on this topic. "The modern fashion of displaying at weddings the bridal gifts, has caused more evils, in divers ways, than its ostentatious originator ever dreamed of; indeed, ostentation is the least of these. Could that wide-spread table, groaning under its costly burden, speak and tell the private history of its precious things, the admiring crowd around it would soon be hushed by its humiliating confessions. It might even tell of sleepless nights; of days passed in contriving how to bring a fit offering there; of screwing and pinching; of cheating some creditor of his due, or poverty out of the contents of the household poorbox, and what is worse, the soul of that blessing which the God of the poor had ready 'for the cheerful giver,' now turned into a purloiner of God's money! Or, of selfish ambition to excel in giving, and be foremost in the praises of spectators; of pride, envy, jealousy, petty strife, extravagance, penuriousness in secret, for hard-carned public commendation."-All this is very eloquent, but not very just. The custom is no doubt liable to abuse, as is every good thing that God has given us. have attended many weddings among the rich and the poor, where the gifts were very numerous and eostly, and where there were none at all: and have had an intimate personal acquaintance with many of the circles that brought their offerings on these occasions. We have yet to learn of the first one that gave beyond his means, or of one that was seriously inconvenienced, or of one whose bad blood was stirred by the sympathy and love of friends and kindred, shown to the bride. There is probably as little danger of giving from wrong notions on these occasions as there is in bestowing our religious charities in church. If we were in the insurance business we would take risks on this kind of peril at very low rates. But shall we abolish missions, ragged schools, and soup houses, because some ostentations Pharisee gives a thousand dollars for these objects, to see his name in print, and to help his chances at the next election? Shall we tighten our purse strings because Bullion, sitting in the next slip, puts a big roll of greenbacks on to the plate, to astonish the natives? We approve of soup houses, and missions, and shall keep giving, and leave Bullion and other ostentatious

people to square their own accounts with their Maker. We approve the custom of making bridal gifts, and shall continue to make them, where personal friends need them. There is a good deal of twaddle and more hypoerisy in the criticism made upon this custom. The real points in the indictment against the usage, are not those named in the communication we have quoted. These are only the apology for stinginess, which, in most cases, is the only objection to remembering the bride. The men and women who make the strongest objections to the eustom, are those who have abundant means, and do not love to give to any thing. They love accumulation, and give with as much reluctance to the poor as they do to brides. They have the same opinion of soup houses that they have of weddings; they are conspiracies to rob them of their hard-earned money. We do not expect any thing but croaking and criticism, from such people. Their professed regard for the evils wrought by this custom is a convenient cloak for their own meanness, and should be estimated accordingly. Giving to the bride! When can there be a fitter occasion for giving? She is going out from the home of her youth to a new home, to make new friends and acquaintances. Should not the old ones show their tender regard, and give their keepsakes with their blessing? Should they not crown her queen of the festive hour, and bring offerings that will abide, when the orange blossoms have faded? Those gifts will be prized from their associations, rather than from their intrinsic value. So they be fitting and worthy of the giver, they will be cherished,-not as trophies, but as the tokens of affection, carrying along the precious memories of girlhood into the cares and trials of her new life. A little sentiment still, if you please, O close-fisted critics, on wedding occasions! a bride differ a little from a heifer that is sold for the shambles!

### System in Housekeeping.

It is easy to see that considerable daily planning may be saved by systematizing the regular work of the week. For instance, devote Monday to washing, Tuesday to baking, Wednesday to ironing, Thursday to odd jobs that require considerable time, Friday to a general brushing and cleansing of the house, Saturday to baking again. Then if you can systematize the daily meals so much the better. I once heard a man laugh because a lady friend of ours had dismissed her boarders, giving as a reason that it "tired her to death" to plan three meals a day for fastidious people. If she had only the planning to do, he thought she had an easy time. But this endless planning and contriving are really pretty bard for a woman of delicate health, whose tastes lic mainly in another direction. The woman I speak of was an excellent housekeeper, but a better teacher or writer. Some people seem to think it unnatural and rather disgraceful for a woman to feel a distaste for housekeeping. Why is it more so than for a man to feel no relish for farming? Women who do all their own work are unable to carry out a weekly system as strictly as those who employ domestics, they have so many interruptions from company, siekness, and other causes. you have once arranged a good system for the week, be determined to let no small causes break in upon it. Your "help" will snon learn to depend upon it greatly, and will be considerably put out by any great deviation. In the arrangement of a system for meals, it is well to leave considerable margin for extra dishes, but some of the main items may be definitely decided. Some housekeepers always bake beans for a part of the dinner on Monday when the wash-boiler occupies the stove.

### The Use of Apples.

BY A WESTCHESTER CO., N. Y., HOUSEKEEPER.

When the apple first becomes fit for use, it is not quite so easy to spoil it, for its juiciness, tenderness and acidity, trimmph over bad cooking. Even then, however, it can be made much better by ju-

dicious preparation. But it is when apples are getting old and withered, and are losing their flavor, that they need special care. The most common errors in making sauce are using too much water, which renders the apples flavoriess, cooking them so slowly that they become discolored and tough, and removing them from the stove before they are thoroughly cooked, thus leaving them hard and lumpy. I amex a few recipes which are well tried and proved, and always liked.

Apple Sance, No. 1.—Pare, core, and cut tart apples, put them in a basin with just water enough to keep them from burning, cover closely and cook quickly. When perfectly tender, stir them down, sweeten and turn out into a dish to cool.

Apple Sauce, No. 2.—Wash, core, and ent out all imperfect places in the apples, but do not peel them. Proceed as above. When cooked, turn into a sieve, and when cool enough for your hand, rub them through. Sweeten and let cool. When apples are fresh and green, apple sauce needs no flavoring; but late in winter and during the spring, a few drops of lemon juice added to any preparation of apples, quite successfully counterfeits the natural acid of the fruit.

Baked Sour Apples.—Greenings are the best. Put them into a deep baking-pan, sprinkle sugar over and around them, fill the pan half full of water and bake quickly.

Baked Sweet Apples.—These require a slow fire. A little water in the pan is an improvement, and a little sugar, also, though they are very good without either.

Preserved Apples.—Peel, core, and halve acid apples. Make a syrup of seven onnees of sugar to each pound of apples. Boil the apples slowly until tender, remove them from the syrup; add to the syrup one lemon cut in slices, for each two pounds of apples, let it boil for twenty minutes. Return the apples to the syrup, let them cook for two or three minutes, and put them up in air-tight cans to be used at pleasure.

Apple Dumpling. — Make a crust of 1 quart of flour, 2 teaspoonfuls of cream of tartar, 1 teaspoonful of soda, 1 tablespoonful of butter or lard, a little salt, and milk enough to make a dough that can be rolled out. Cut this dough in eight pieces, roll them out thin, put slices of sour apple upon them, fold them up tight and steam or bake. Baking will require thirty minutes, steaming an hour. Either hard or liquid sauce may be used. The following is an excellent recipe for

Liquid Sauce.—1 cup of sugar and  $\frac{1}{2}$  cup of butter, rubbed to a cream. Then stir in the well-beaten white of 1 egg. Flavor with nutmeg or lemon. Just before bringing to the table add  $\frac{1}{2}$  cup of boiling water.

Apple Pies to be good, should not be more than two days old, and to be in perfection, should be eaten when eool, the day they are made. The contents of an apple pie may be ever so good, but if enclosed in a tough envelope of ernst, the result will be a poor pie. The making of good crust appears to me as simple an operation as any in the culinary department.

Pie Crust.—A good rule is % of a teacupful of lard, well pressed down, to every 2 teacupfuls of flour; a little salt, and only water enough to hold the ingredients together. This makes enough crust for one medium sized pie. Mix quickly and earelessly, not kneading at all.—For minee pies, from ¾ of a cup to a whole cup of lard, is uccessary for every 2 cups of flour. This rule never fails to make good, crisp pie crust for me.

Apple Pie, No. 1.—Slice peeled apples upon a pie plate, and cover with a crust. Do not press it down at the edge, but trim it off neatly. Bake quickly and thoroughly. Remove the ernst, turn its upper side down upon another pie plate. Mash the apple, sweeten it to the taste, flavor with nutmeg, add a piece of butter the size of a hickory nut, and spread the mixture upon the crust. A little sweetened eream poured upon this when eaten, is delicious; or the pie may be made very

nice by spreading the well-beaten and sweetened whites of 3 eggs over the top. In the latter case, the apple should be made very sweet.

Apple Pie. No. 2.—Proceed as in No. 1, but make an upper and an under crust. In this case remove the upper crust when baked, season and sweeten the apple, and cover again.

Apple Pudding. No. 1.—1 pint of stewed and sifted apple, 3 eggs, sugar to make it very sweet, ½ pint each of cream and milk, a little salt, nutmeg, and raisins. Bake with an under crust.

Apple Pudding. No. 2.—1 pint of cream and milk, half and half, 1 pint of sifted flour, a half dozen large apples, four eggs, a little salt. Peel the apples and take out the cores without breaking the apples; steam them until tender, then put them into the pudding dish and pour the batter over them, and bake about 45 minutes. Eat with the liquid sauce, the recipe for which is given above.

### Modern Cooking.-Brown Bread.

BY A MODERN HOUSEKEEPER.

I have much sympathy for the "old-fogy," who, in the Agriculturist for last September, repeats the merited praises of the "bake-kettle." That he tells nothing but the truth, my father can well attest, for I have often heard him describe both the kettle and his mother's "brown bread." Still, even if I had a genuine bake-kettle, I could never hope to get the good, sound, hickory wood, which our grandmothers used in such abundance to obtain living coals for their cooking and baking. So I faney we must keep watching for the next best thing, and for two years past I have been using a "steamer," (at least, this is the only name I know for the artiele). Brown bread of any kind, cooked in a steamer, and finished with twenty minutes of browning in a modern oven, is not to be despised; indeed, it is a luxury that I seldom see away from home. It has the merit of "long-continued cooking," at an even temperature, "with juices and flavors retained." and the same applies to a large variety of the articles used for our table. Stuffed meats, vegetables of all kinds, apple dumplings, and even rice, may be cooked by steam, and need only to be carefully tested to be appreciated. In making brown bread, I have combined the best elements of different recipes, and have had excellent success. So many have asked "How do you make this bread?" that I have thought some of your readers may like to try the same.

For Graham Bread, I boil apint of milk, and thicken with wheat meal (Graham flour), then add cold milk enough to make the whole as thin as light batter. As soon as cool enough not to seald, add half a teacupful of hop yeast, and set in a warm place to rise. When light, I put in a little salt, and halfa teacupful of syrup (or rather sweeten to taste), and as much wheat meal (Graham flour) as I can stir in with a spoon. Then I sprinkle a little fine flour on the dough-board, and mould my brown bread until it works clear from my board and hands, but still careful not to get it too stiff and dry, then put it into a round basin (that will fit nicely in my steamer) and return to the warm place to rise. When light enough to bake, I put it into the steamer over boiling water, and let it cook an hour, then bake twenty minutes in the oven. By a little practice and good judgment, a housekeeper can alter the size of the loaf and learn the proper stiffness, observing carefully not to open the steamer while the bread is cooking, or the bread will be heavy.

For Corn Bread, I make the sponge the same way, with scalded Indian meal, add salt and syrup, but thicken with fine wheat flour altogether. Let it rise, and steam and bake as above described. Indeed, I learned to make corn bread in this way from my mother, before we thought of using Graham bread. Perhaps some of your readers may not know that the quickest and best way to boil milk is to put it into a tin dish and set that into a kettle of boiling water. Thus scorching is avoided.

## Domestic Recipes. BY AUNT HATTIE.

To Make Stewed Oysters Tender. -Turn the oysters with the liquor into a convenient dish. With a fork remove each oyster to another dish, passing it as you do so through the oyster liquor, in order to wash off any bits of shell, etc. When all have been removed, strain the liquor through a fine sieve, which will retain the bits and yellow erabs. Some people cat these little crabs, but I reject them from an oyster stew as they suggest earelessness. Put the strained liquor into the kettle with the quantity of water or milk you think proper, and set to boil. Add rolled eracker and salt. A little mace (only a little) is a great addition, as it brings out the oyster flavor; I do not put in pepper as some guests do not like it, and the color of the soup is not so good. Each person can suit his own taste by using either the black or Cayenne. The clearer and whiter a soup appears, the better it will be relished. I omit eracker in a dinner soup; each guest must be supplied, however, at the table. Keep out the oysters until all the ingredients of the soup are added, and until it thoroughly boils. Now add the oysters. As soon as it comes to a good boil, the soup is ready to serve. If you have a very rich stew, a great many oysters and little soup-it may be well to put only a part of the oysters in at a time, waiting until the first lot bave had a good scald before adding the remainder. The idea is to give each ovster a good scald on the outside surface; it cooks them sufficiently and avoids the toughness that comes from overcooking. Treated according to these directions the oysters in a stew will be as tender as raw ones. It is very easy to spoil oysters by overdoing them.

**Reast Goose.**—It should be very fat; remove every pinfeather. Then pass a lighted paper over the outside surface to remove the fine hairs. Make a forcemeat, either as for turkey, of fine bread erumbs seasoned with summer savory, salt and pepper, or, with sage and two onions chopped fine, with pepper and salt. Roast until a fine brown all over. If a nice brown around the legs and wings, you may be pretty sure it is done. Remove every particle of the fat from the pan. It is not fit to cat. Keep it however, for a Intricating oil, and other useful purposes. Make a gravy of the brown sediment remaining in the pan. Apple sauce and onion sauce with potatoes, peeled and boiled whole, are the usual accompaniments.

Roast Diele.—The fatter the better, as it will then be juiey and tender. The feet, neek, gizzard, and liver, must be stewed until tender. See that every pinfeather is removed, and singe off the hairs. Be very careful to remove the two oil sacs from the back, as they will impart a very disagreeable flavor if allowed to remain. Forcement the same as for goose, Roast until brown. Remove all the fat from the gravy. Serve with potatoes, apple sauce, onion sauce, and green peas.

How to Skin and Stew a Rabbit. -Make a small incision in the lower part of the belly, being careful not to cut deeper than the skin. Put down the kuife and gently tear the skin upwards about three inches. Now take hold of one hind leg and force the hip joint up along the side of the body under the skin. Take hold of the bare joint and pull the leg out of the skin. Do the other the same. Now take hold of the two skinned legs with one hand and grasp the loose skin with the other hand. Use your strength firmly but gently, and separate the remaining skin, including the head and fore feet. The feet joints with a half of the ears must be separated under the skin with a knife, and remain with the skin, as they cannot be skinned. After removing the entrails, soak un til white and free from blood. Double the feet under, and secure the head firmly to the back. Tie the body firmly with a nice white string, and stew gently until very tender. I use, to accompany the rabbit, a nice onion sauce, but bread sauce or a mushroom stew may be served, as preferred.

### BOYS & GURLS' COLUMNS.

#### A New Year's Greeting.

What shall a New Year's greeting be to all our boys and girls but to wish them a "Happy New Year?" Now, it seems not very long ago that we did the very same thing. Bless us! how the years do fly! To you, young people, it seems a very long while from Christmas to Christmas, and from New Years to New Years. When the holidays are over, and you have enjoyed your visits, your presents, your vacation, and all the pleasant things that holiday time brings, and after school has commenced again, and you have talked it all over with your school-mates, then some of you no doubt say, "Oh, dear! it is so long before Christmas and New Years will come again!" It is not so with us older people; we find the years come around fast enough-too fast, indeed, for all the work there is to do in them. You, too, will find it so when you are no longer boys and girls. A "Happy New Year!" How often at the beginning of the year do we speak that wish to our friends! A pleasant wish it is; but if it is mere empty words, it does n't make any one happy. We must follow up our words by deeds if we would have our wish "come to pass." We wished you a "Happy New Year," and we shall try, in our way, to contribute to your happiness. We do n't see each other but once a month, but we will try to have a jolly time when we do meet, and to make it all the merrier, we have persuaded "Aunt Sue" to come along with us. You don't know who Annt Sue is; but those who were boys and girls ten years ago will tell you that she is—as Capt. Cuttle would say—"the chock-fulledest" of puzzles of any one you ever saw. Just look at her Puzzle Box for this month, and see what a lot of nice things she has prepared, and she means to keep doing so. Then we shall try to make you happy with a nice lot of pictures; some shall be funny, to make you laugh, and some serious, to make you think. Then the Doctor will have some of his talks—well, just you see it we do n't have a pretty good time once a month. Now, what are you going to do to make it a "Happy New Year?" If you know of any thing better than to try to make some one else happy, we wish you would tell us what it is. You need not go outside of the family to find opportunities. There are mother, father, sister and brother, and you can do so many thiogs to make them happy; or, what is much the same thing, you can avoid doing so many things that will make them unhappy that every boy and girl can, if they will, to show that they are really in earnest when they wish others a "Happy New Year,"

#### About Walking.

How many boys and girls like to walk for the sake of walking? They think that they would like to have dumb-bells, Iodian clubs and house gymnasiums, with which to take exercise to improve their health; and forget that they possess the means by which to take the most healthful kind of exercise—walking. Those who live in towns will enter an omnibus or horse-car to go a mile or so, when, if they would allow a few minutes more, and walk the distance, they would feel much better at the end of their journey. So with those who live in the country. They will spend time in harnessing a horse, and in getting ready to go a short distance, instead of starting off vigorously on foot. There is, somehow, a notion among our people that it is not dignified to walk. The English think differently, and they are much better walkers than we are. Dickens used to take a regular daily walk—eight miles, we think it was—as a rest from his daily mental labor. Perhaps it is to these walks that you are indebted for the delightful Christmas carols, for Little Nell, Oliver Twist, and Paul Dombey. The writer early accustomed himself to long walks, tramps of a whole day; and this practice was useful to him, when, in a desert country, the horses gave out, and he was obliged to make twenty and thirty miles, day after day, on foot. Never mind if there are horses in the stable doing nothing; they can afford to do nothing better than you can. If you have not a fatiguing distance to go, take it on foot; and if either is to suffer for want of exercise, let it be the horses.

#### What I Saw from the City of York.

The Agriculturist has correspondents all over the world. We are always glad to hear from them, but never more so than when they write a word to our Boys and Girls.
"B. B.," writing from Hurrongate, Eng., says: "I think the young readers of the American Agriculturist would like to hear something about what the writer saw from the top of the highest tower of the York (England) Cathedral, which measures in hight, 213 feet. Now this is an immense size, is it not?—Well, we entered a little door inside the church, and after ascending a vast number of steps, we reached the roof, but only the roof,-not the top of the tower by any means, yet, for we had been going up one of the smaller towers, and were only part way up it even. Well; we crossed the roof, and started to go up the center tower; and after ascending a long, spiral flight of stairs, we reached the top of the tower, having overcome 270 steps ! There, the wind blew very hard indeed. But only think of the view; all around us on each side, for the distance, we should say, of at least 40 miles! It was not a very clear day, but we got a very good view, so what must the sight be on a fine, clear day! Close beneath us were the streets of York, with men about the size of tin soldiers, and horses like those in toy farm-yards! The cars in the distance puffing along, and the houses roofed with tiles, stretching far and wide. It was great fun, and I think you all would like to have seen it. And now, when we go home to New York, we hope to see something that must be still grander: namely, New York from Trinity spire."

#### An Icicle.

The Doctor wishes to ask if any of the boys have ever watched an icicle. He is sure that they have all seen icicles hanging from the roof of the house, but he would like to know if any boy has watched the formation of one. There is a great deal to be learned from so common a thing as an icicle, and the watching of its growth has often afforded him much amusement and instruction. Now, the Doctor will send to the boy who sends the best account of how an icicle grows-like a cow's tail, downwards-one of the steam-engines offered as prizes, and the Agriculturist for one year; and to the second best, the paper for one year. Come on, boys; here is a chance.

#### Aunt Suc's Puzzle Box.

Boys and girls, I propose to have a lively time through 1871, with every good thing in the enigmatical department that we can get together. I want Father and Mother, Uncle John and Aunt Mary to join in and help the little ones; Grandfather will, of course. Send in your puzzles, and I will do myself the pleasure of scasoning and dishing them up to suit all parties. Perhaps you think pleasing all parties is n't the easiest thing in the world to do; but I'm going to try it, and at the end of the year I will let you know how I succeed. Now for the good things.

Address all communications intended for the PUZZLE BOX, to AUNT SUE, BOX 111, Brooklyn, N. Y.

QUESTIONS, ENIGMAS, CHARADES, ETC.

#### RIDDLE,

Though I'm often bound for the most of my life, And serve my master well.

Yet I feel as free as the rustling leaves, Which oft of my presence tell.

And whether obscure or widely known,

At home, or a worthless rover, Among the titled I'm ever found, With my faults all under cover,

COUNTIES IN TEXAS ENIGMATICALLY EXPRESSED.

- A cake,
   A stone,
   A queen,
   A berry,
   A pursuit,
   A planet,

### NUMERICAL ENIGMA.

I am composed of 18 letters;

My 14, 17, 5, 13, 15, was the wife of one of the patriarchs.

My 1, 4, 5, 10, 16, was one of Sanl's daughters. My 2, 1, 8, 6, 10, was second cousin to Joab.

My 7, 8, 18, 13, 4, 9, was a servant sent to Elisha by a sick king to inquire if he would recover.

My 1, 2, 12, 11, 17, 3, was one of the daughters of Ze-

My whole is a scripture name, used to signify to the Jews that "the riches of Damascus and the spoils of Samaria" were to be quickly taken by the Assyrians.

#### H. G. D. TRANSPOSITIONS.

- 1. Transpose a rent into a thicket.
- 2. Transpose part of a book into an insect. 3. Transpose an animal into a plant.
- 4. Transpose a river into a string,
- Transpose a finit into a fish.
- 6. Transpose a mineral into a valley,

#### ENIGMATICAL LIST OF CAPES

- 1. A biped, an exclamation, and an enclosure.
- 2. A trade and an animal.
- 3. A caution.
- 4. A color.

#### PUZZLE.

If to a vehicle you will but add The period of time which each one lives You'll something see, oft on the table laid, To many an epicure it pleasure gives.

SQUARE WORD,

#### Square the word SEVEN.

(As this will require some patience and perseverance, I propose to give a set of anagram letters—to be drawn'by lot from the names of all those sending correct solutions-for an answer composed of fair English words in common use, Proper names not allowed.)

#### CHARADE.

To the animal kingdom my first doth belong, My second belongs to the fruit;
My whole you will probably have to obey, If it is proper, and happens to suit.

#### COMBINATIONS.

- 1. Join together a verb, an adverb, and an article, and make a flower.
- 2. Combine equality, an article, and a situation, and make a contemptible creature.
- 3. Combine a frame of mind, a preposition, and a vowel, and make a desirable quality.

398. Illustrated Rebus.-The name of an Indian tribe.

Illustrated Rebus.-You will know more about this after you have made it out.

ANSWERS TO REBUSES IN THE OCTOBER AND NOVEMBER NUMBERS,

- 393. "Who drives fat oxen should himself be fat.
- 394. Straws show how the wind blows.
- 395. Govern your conduct according to circumstances
- 396. If sinners cutice thee, consent thou not."

[COPYRIGHT SECURED.]

T H E  $\,$  F I R S T  $\,$  S M O K E .— Drawn and Engraved for the American Agriculturist.

Boys frequently think that it is somehow a mark of manliness to smoke. These boys in the picture think they have done a great thing. They have bought cigars, pipes and tobacco at the grocery store, and feel that they are now as big as any one. Look at the little fellow at the right and observe what airs he puts on. Poor fellows I they will pay dearly for their first lesson. Indeed, the center boy does not look as if he enjoyed his pipe. The others, seem disposed to laugh at him, but they too will soon feel like doing any thing except to laugh. Probably the oldest smoker has not forgotten his early attempts to acquire the habit of smoking. But few escape the penalty being paid by the boy in the picture. Who can forget the terrible nausea, the deathly paleness, the trem-bling limbs, and, worse than all, the smell of tohacco in the breath and npon the clothes, which told the tale when he went home. Then, which was worse than all the sickness—the shame at having dispheyed the commands or known wishes of his parents. But some boy will say that his father, his uncle, or some other very good man smokes, who would not do it if it were not right and proper. Let this boy ask the best man he knows, who is a smoker, if he would advise him to smoke; and the answer will most certainly be, "No." And he would probably add, "I would give a great deal if I could shake off the habit." Now, smoking cannot be a very nice thing if fathers will not advise their children to do it. Perhaps some boy will be tempted to try to see if it is so very bad. Let him look at the sick boy in the picture and hesitate. The sickness is but a very small part of the matter, however. The worst thiog about smoking is giving up to a habit which controls us and makes us a slave to it for life.

### Winter in the Country.

Many, if not most of our boys and girls, live in the country. They have heard their city consins say, "Ob, the country is very pleasant in summer, but I should not like to live here in the wieter." Now, is winter in the country all desolate and dreary? We, who write for you boys and girls, live in the country both summer and winter. In front of the house runs a river, with a wooded bank, and at the rear of the "plantation" is a wooded hill. Now, we have a daily pleasure between these two. How pleasant it is to watch the Ice King stop the flow of the river! and it is just as pleasant to see how the river gets the better of the Ice King, when the great blocks of ice come floating down and crush one another against the banks, and pile themselves against the roots of the great hemlock tree, that is half in the water and half out of it. Then the trees upon the river bank, and the trees in the woods-what varied tints they present! sure the old pines are always green, but the willows have their colors, and the birches theirs. Then what pleasure it is to go up into the woods, when the snow is not too deep, and see all the preparations made for next spring! Just lift up the leaves, nature's own blanket, and see how ready, and waiting, the lovely woodland plants are for spring. Then, upon these mild winter days, how the mosses enjoy it, and what fine tufts we can find to bring home, which, by keeping them cool and moist, we can preserve with all their bright verdure for weeks, perhaps months. Then there are the lichens, those grey, queer things that grow, sometimes upon the bark of trees, and sometimes without any apparent attachment, and which people mistakenly call mosses—they, in these

mild, sunny days, seem to flourish more than ever before. Then, when in the woods, look at the buds of the different trees. All summer these bads have been getting ready for next spring's opening. See how different the bud of the beech is from that of the hickory. Buds, what wonderful things they are! It needs only a few days of spring to set them agoing. It is as if all summer had been spent in winding them up, and they were all ready to go off at command. Then observe the dif-ferent colors of the young twigs of trees and shrnbs. When the leaves are out we are not apt to notice this, yet every tree and shrub has in its young twigs a characteristic color. The writer once went through a Western forest with a young man who knew every tree by its bark, but could not distinguish it by its leaves and twigs; while the writer knew every tree hy its leaves and twigs, and could tell but very few by the bark. This goes to show that we do not half observe the common objects around us. Every boy and girl ought to know the name of every tree and shrub upon the place, and know it so well as to be able to recognize it in its winter nakedness or summer clothing. There is much to be learned in the country in winter, besides what can be obtained from books. Books and papers are most useful sources of information, but we must not rely entirely upon them, but learn to use our own ears and eyes, and to read from the book which the Great Teacher has spread open to us all. He must be hard to amuse who can find no beauty in the wondrous changes that each day presents. With so many interesting things to look at and examine, it would seem impossible that winter should ever be dull in the country, or that time should ever hang heavily.

HARVEY FISK,

Bankers and Dealers in Government Securities.
No 5 Nassau-st., New-York, Dec. 10, 1870.
Funding Five-Twenty Bonds.—Within the past three months a very large amount of Five-Twenty Bonds have been funded through our office into the First Mortgage BONDS of the CENTRAL PACIFIC RAILROAD COMPANY, besides large sales of the same scenrities for new invest-

We deal in Central Pacific Bonds the same as in Government Scenrities, and regard them as affording the dereduction of interest and with unimpaired security.

They are well known, and have a ready market in alt the money centers of this country and Europe, are daily

quoted at the Stock Exchange, and can be sold at current market price as readily as the Bonds of the Government. Earnings from Jan. 1 to Dec. 1, 1870......\$7,417.317

Earnings from Jan. 1 to Dec. 1, 1869..... 5,260,882

Increase in 1870......\$2,156,435

We keep a supply of these securities on hand, and furnish them at current market price.

The advantage of exchanging Governments into these

The advantage of exchanging costs.

Bonds is about as follows:

Proceeds of \$1,000 5-20 bond of 1867, at 110....\$1,100.00

Cost of \$1,000 Central Pacific bond, at 92...... 920.00 Difference realized.....

We continue, as heretofore, to buy and sell Government Bonds, make Collections, receive Deposits, subject to check at sight without notice, and allow interest on balances, and do a general Banking business.

FISK & HATCH.

Morace Greeley's Essays, "What I know of Farming," which have been published in The Tri-BUNE every week during 1870, are to be printed in book form, and a copy will be sent, post-paid, to each subscriber who sends \$10 for The Dally, \$1 for the Semi-Weekly, or \$2 for The Weekly Tribune, and requests the book at the time of subscribing. This will enable old subscribers to secure the Essays for preservation, on renewing their subscriptions, and new subscribers will, of course, be glad to obtain them, free of cost.

Facts for Housekeepers.-Dory has made our washing days all sunshine. A little nine-year-old lassic took hold of the wash and put it through, much to our admiration and astonishment, so simple is its arrangement and successful its execution.-Rev. Joseph M. Wilson, Philadelphia, Pa.

# Newspaper Advertising.

A Book of 125 pages, contains a list of the best American Advertising Mediums, giving the names, circulations, and full particulars concerning the leading Daily and Weekly Political and Family Newspapers, together with all those having large circulations, published in the interest of Religion, Agriculture, contemplates becoming such, will find this hook of great value, Mailed free to any address on receint of fifteen cents. GEO. P. ROWELL & CO., Publishers, 49 Pauk Row, New York.

The Pittsburgh (Pa.) Leader, in its issue of May 29, 1870, says: "The firm which issues this interesting and valuable book, is the largest and best Advertising Arency in the United States, and we can cheerfully recommend it to the attention of those who desire to advertise their lunsiness scientifically and systematically in such a way: that is, so to secure the largest amount of publicity for the least expenditure of money."

#### WANTED!

To purchase and improve 1,700,000 Acres of Choice 10WA LANDS, FOR SALE at \$3 per acre and upwards, for Cash or on Credit, by the IOWA RAILROAD LAND COMPANY. Railroads already built through the Lands, and on all sides of them. Credit Substantials of the Cast of Cast Substantials of Cast Substantials of Cast Substantials. of them, Great inducements to settlers. Send for our Pamphlet, It gives prices, terms, location—tells who should come West, what they should bring, what it will cost—gives plans and cost of different styles of ready-made houses. Maps sent if desired.

Address

W. W. WALKER, Vice-President, Cedar Rapids, Iowa.

### MAGIC DIAMOND.

Send One Dollar to MILLERS FALLS M'F'G CO., 87 Beckman Street, and we will send you by mail a revolving steel-pointed implement, which cuts glass perfectly and is durable. If not satisfactory, return it, and we will return you all the money, except the postage. The Publishers of this paper knew that we are responsible.

MOORES

### EARLY CONCORD CORN.

EARLY CONCORD CORN.

Read extract from report of the Vegetable Committee of the Massachusetts Horticultural Society:

The past year has not been so prolific of novelties in the way of vegetables, as some of its predecessors. In this age of progress, when so many are engaged in striving to improve our garden vegetables, it would seem strange, indeed, if among them all, some real gain is not annually secured, such a gain your committee feel confident the public will seeme in "Moore's new Sweet Corn," which, after another season's trial, proves a decided acquisition.

To Capt. J. B. Moore, of the well-known Horticulturist, of Concord, Massa, belongs the honor of originating this splendid variety. It is a cross between Crosby's Early and Barr's Improved, the former the most popular early, and the latter the best late variety we have, Alter several years of great care and labor, Mr. Moore has at last succeeded in bringing it to its present perfection. It was first crossed in 1955, and again in 1857. Stalks strong, stocky and vigorous, growing from seven to seven and a half feet high. Ears set rather low on the stalk, and having from twelve to sixteen usually, and occasionally twenty rows on the ear. Color, when lit or the table, very white and handsome. Onality superior, not surprissed by any other variety. Size of ears, large, considerably larger than the Crosby, and superior to any other variety, either for the market or family use, and very productive. It also matures earlier than any other variety of equal size, which will make it a very desirable variety for the market gardener.

Mr. Moore exhibited specimens of this corn, planted in the open ground, well filled and fit for the table, on the same day (July 234) as the Darling an eight-rowed variety of small size, herefore considered the earliest sect corn we have; the latter variety having been forwarded by starting in pots, in a greenhouse or frame, hefore planting out in the open ground. It was also shown by Mr. Moore every Saturday during the senson from Jul

r committee.

CHARLES N. BRACKETT, Chairman.

GEO. HILL, G. W. PIERCE, J. FILLEBROWN,
W. RUSSELL, E. A. STORY, J. B. MOORE.

Having made arrangements with Capt. Moore for sale of his corn, which we shall offer in packets sufficient for fity nills—one pkt. 50c.; 5 pkts. 82, or one selected ear for \$1, post-paid. Prices to the trade on application. For further description, and two beautiful colored lithographs, one of the corn, and one of the flowers, see Amateur Cultivator's Gulde, which will be sent Iree to applicants on receipt of two stamps.

WASHBURN & CO.

The experience of a large number of farmers in every State who have tested the Sanford Corn the past season, confirms all that has been said in its favor, establishing the fact that

It is not a "Humbug,"

In a decided improvement over all other varieties. In Michigan, Wisconsin and Minnesota, it has ripeaed in less than ninety days from time of planting, and with same culture, yielding one-third more than other corn.

Farmers, remember that an increase in yield of one bushled per acre will pay the cost of seed. Remember that a change of seed from the "old, worn out," even where no speriority is claimed, is often a great advantage.

Remember that large quantities were sold last season which were not genuine; therefore beware of the spurions. I often none but selected stock; the small end of every car rejected.

I offer none but selected stock; the small can be rejected.
Send stamp for Circular, giving full description, mode of culture, also the testimony (neither bought nor bogue) of reliable farmers, having no "ax to grind," only to give the truth of its great success at the Eust, West North and South. One quart by mail, post-paid, 60c, two quarts, \$1; four quarts, \$2; one peck, by Express, \$2; half bushel, \$3; one bushel, \$5. Address S. B. FANNING, Jamesport, N. Y.

### SANFORD CORN. HUGH'S CORN.

#### NORWAY OATS.

I have a fine stock of the above, and wishing to get reports from my patrons, I have offered premiums for the largest yield from 4 lbs. of seed, in '71. I believe the Hugh's Corn will yield more sound corn to the acre than any variety I have ever seen. My Catalogue describes them, and gives conditions to those competing for premiums; also prices by the peek and bushel.

4 lbs. of any one of the above, by mail, \$1, or the three to one address, \$2,50.

WALDO F. BROWN,

Box 75, Oxford, Butler Co., Ohio,

### To Farmers & Gardeners.

If the Garden Seeds you use have proved fresh and true to name, stick to the man who sells them to you; he is worth encouraging. If you have not found them fresh and true, I shall be happy to add your name to those of the fifty thousand farmers and market gardeners scattered throughout the United States and Canadas, whom I annually supply with my warranted garden seeds. My large vegetable and flower seed Catalogue, abounding with elegant engrayings, the forest on all

ment free to nll.

JAMES J. H. GREGORY, Marbichead, Mass.

AMMOTH DENT CORN.—600 bushels raised IVE last year from 1 hushel planting; 20 to 40 rows to eac ear. Price by mail, 4 lbs., \$1; by express, 1 bushel, \$3.50, Address S. R. BAILEY, Lina, O.

### B. K. BLISS & SONS,

and Flower Seeds, Horticultural Implements and Garden Requisites,

Would inform their friends and the public that the Scren-teetth Annual Edition of their Illustrated Seed Cat-alogue and Guide to the Plower and Kitchen Garden, is now in press and will be ready for distribution about January 1st.

Gairlen, is now in press and will be ready for distribution about January 1st.

No pains or expense has been spared in preparing this edition to make it the most complete work of the kind ever published in this country.

It will contain 120 pages of closely printed matter; spwards of Two Hundred Choice Engravings of Favorite Florers and Vegetables, and two beautibility colored Lithographs; and a descriptive list of upwards of Two Thomsond species and varieties of Florer and Regetable Seed, including all the novelties of the past season, with directions for their culture; also, a list of upwards of One Hundred varieties of Choice Guadiolus, with many other Sumer-Flowering Tubes, and much useful information from the subject of gardening generally. Seeds and Bub's mailed prepaid to any part of the country at Catalogue prices. Address EB, EA, EBLESS & SONS.

B. K. BLISS & SONS. AddressP. O. Box No. 5712, New York.

## Gregory's Annual logue of Garden and

Flower Seeds.

Ilaving In former years introduced to the public my Hubbard Squash, American Turban Squash, Marblehead Manmoth Cabbage, Mexican Sweet Corn. Plinney's Water-melon, Brown's New Dwarf Marrowfat Pea, Boston Carled Lettace, and other new and valuable Vegetables, with the return of another season I am again prepared to supply the public with Vegetable and Flower Seeds of the purest quality. My Annual Catalogne is now ready and will be sent free to all. My enstomers of last year will receive it without writing for it. It abounds in fine engravings, many of which were taken from photographs of the vegetables themselves. It has not only all novelties, but all the standard vegetables of the farm and garden, (over one hundred of which are of my own growing.) and a carefully selected his of flower seeds. All of my seed is sold under three warrants: 1st. That all money sent shall reach me. 2d. That all seed ordered shall reach the purchaser. 3d. That my seed shall be fresh and true to name. I invite all to send for Catalogues, both for themselves and their friends.

JAMES J. H. GREGORY, Marblechad, Mass.

### SUGAR TROUGH GOURD.

I have raised this year on ½ of an acre 50 of these gourds, that will average 5 gallons each, and 100 of the largest will hold from 7 to 11 gallons cach. I believe one may be grown to hold 15 gallons; and in my Catalogue have offered a premium of \$10 for the largest, and \$5 for the second, grown in 71. I have used them in the Sugar Camp and for Lard Chas for several years, and they are not only the cheapest, but best vessels for these purposes; are valuable for a variety of household purposes.

My stock of seed was exhausted last year, and I returned the money to nearly one thousand of my customers, but I can supply all demands this year. My catalogue for 71 gives full directions for their growth and management, and the prices and description of 200 varieties of Field, Garden, and Flower Seeds, including 9 varieties of Field, Garden, and Flower Seeds, including 9 varieties of Beans, 9 of Reeis, 10 of Cabbage, Cheumber, 7, Corn, 9, Gonrd, 5, McIon, 9, Feas, 8, and nearly every thing any family wants to plant; also 100 choice varieties of Flowers. Send for the Catalogue.

THE PRACTICAL

### POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE

### MANAGEMENT OF POULTRY.

FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrafed.

BY L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poulterer who must make the business pay, and the chicken funcier whose taste is for gay plumage, and strange, bright birds. The most valuable portion is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed his aim. The middle parts of Mr. Wright's Manual are taken up with minute directions for making show fowls for Fairs, a nice discussion of the good and bad points of the dif-ferent breeds, and a brief sketch of such fancy stock as peafowl, pheasants, and water-fowl. Then follows a section on artificial hatching, and another, worth special attention, on large poultry yards...A study of Mr. Wright's book will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutmegs merely, but the family supplies of sugar, New York Tribune. shoes, and cloth.

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fawls. Farmers' Cabinet.

This is a reprint, with numerous wood engravings, of an English book, the object of which is to convey in plain language a great deal of practical information about the breeding and management of poultry, whether for demestic use, the markets, or exhibition.... The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry.

Philadelphia Press.

It is a handsome volume, brought out in the best style, and earliched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business.

\*\*United Presbyterian.\*\*

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is em-bellished with numerous illustrative engravings.

The author has called to bis aid all who were experi enced in the subject whereof he writes, and the consequence is a volume of more than ordinary thoroughnesa and exhaustiveness. Rachester Democrat.

The book is a complete and standard guide to the management of poultry for domestic use, the market, and for exhibition. Watchman and Reflector. for exhibition,

PRICE, POST-PAID, \$2.00.

ORANGÉ JUDD & CO., 245 Broadway, New York.

### WARING'S

### BOOKS FOR FARMERS.

### DRAINING FOR PROFIT

### DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,

Engineer of the Drainage of Central Park, New York.

CONTENTS.

LAND TO BE DRAINED; How DRAINS ACT; How TO MAKE DRAINS; HOW TO TAKE CARE OF DRAINS; WHAT DRAINING COSTS; WILL IT PAY? HOW TO MAKE TILES; RECLAIMING SALT MARSHES; HOUSE AND TOWN DRAINAGE.

EXTRACTS FROM NOTICES BY THE PRESS.

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health. [Portland (Me.) Press.

Nowhere does this book merit a wider circulation than Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it.

[Chicago (III.) Republican.

A Book that ought to be in the hands of every Farmer. SENT POST-PAID. - - - PRICE, \$1.50.

By GEO. E. WARING, Jn.,

Formerly Agricultural Engineer of the Central Park, in New York,

CAREFULLY REVISED.

CONTENTS.

THE PLANT; THE SOIL; MANURES; MECHANICAL CUL-TIVATION; ANALYSIS.

The foregoing subjects are all discussed in plain and

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful practical farmer, and is full of information, good advice, and sound doctrine. HORACE GREELEY says of it: "Though dealing with facts unfamiliar to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, once negot work he word in the source of the second state. open pages may be read in the course of two evenings and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally noderstand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."

SENT POST-PAID,

# The Eumelan Grape

### TROPHY TOMATO.

THE EUNELAN GRAPE is the best grape in cultivation for general culture. It is as hardy and vigorous as Concord; ripens before the Hartford Prolific, and equals Delaware and Iona in quality.

T. O. Paine, East Bridgewater, Mass., in Farmers' Club report, says: "I consider the greatest fault of the Eumelan Grape is disposition to bear too abundant crops, which will be considered an excellent failing."

The Troury Tomato stands first in value for both garden and market culture, being among the carliest to ripen, and more than usually productive of the floest tomatoes we have ever seen.

We purchased a large number of seed from "Headquarters stock" at what seemed to ms an enormous price, viz., 25 cents for each seed, but we were more than doubly rewarded by the nbundant product of the vines of large, smooth tomators, almost solid in fisely, and of finest flavor. Many specimens weighed over one pound each, and the largest nearly two pounds. From the most prefect specimens of the fruit we saved the seed, and will send packages of 100 seed, post-paid to any address upon receipt of 25 cents.

AGENTS and CANVASSERS will receive most liberal terms for the in roduction and sale of our vines and seeds in all parts of the country.

Our stock comprises all the leading varieties of Vines, also Raspherries, Blackberries, Strawberries, Currants and other small fruits.

Circulars sent free to any address.

LIASBROUCK & BUSHNELL,

Iona, near Peckskill, New York.

### GARDENING FOR PROFIT"

"Practical Floriculture."

The former, detailing the system of Market Gardening, the latter, descriptive of the modes of Commercial Floriculture as practised in the vicinity of New York.

Mailed, post-paid for \$1.50 each.

Our Annual Descriptive Catalogue of Vegetable and Flower Seeds,

containing two new and beautiful colored plates, is now ready. Also

Catalogue of New and Rare Plants,

illustrated with colored plates and engravings. Both will be mailed on recript of twenty-five cents, or sent with either of the above hooks free of charge.

### eenderson & Flerenc,

SEED MERCHANTS AND GROWERS,

No. 67 Nassau St., New York.

### SMALL FRUITS, FLOWERS, Etc.

Our stock of VINES, PLANTS, FLOWERS, SHRUBS, Etc., is very large and fine, which we are offering at remarkably low prices.

Scnd 15 cents for CATALOGUE and PRICE-LIST OF SMALL FRUITS, and 5 cents for Catalogue (No. 2) of

Flowers.
R. CUMMING & CO., Successors to J. Knox,
Pittshurg Pittsburg, Pa.

MARTHA (WHITE CONCORD)

Our stock of vines of this most valuable variety being ninch the largest and best in the country, having been grown under the direct supervision of Rev. J. Knox, who, it is well known, secured the entire original stock, we are prepared to furnish Nurserymen and Dealers at rates below those of other establishments.

ACENTS WANTED.

R. CUMMING & CO., Successors to J. Knox, Pittsburg, Pa.

### Eumelan Grape Wood.

We will furnish a limited quantity of first class Enmelan Grape Wood for propagation and for grafting old vines, at low rates per thousand.

Whole vineyards of interior sorts can be changed to the Enmelan by grafting, at slight cost, and thus made very valuable.

HASBROUCK & BUSHNELL, Iona, ncar Peekskill, New York.

### Joseph Gilloy's STEEL PENS.

For sale to the Trade at the NEW YORK branch of the House, 91 John Street.

JOSEPH GILLOTT & SONS,

HENRY OWEN, Agent.

D. PUTNAM & CO., Produce Commission Merchants, No. 68 Pearl-st., New York, "Quick sales and prompt returns." See Send for our weekly Price-current and Marking Plate.

Tent and Marking Plate. 20

EUSBANDS, WIVES, SONS AND DAUGHTLIERS, should read The Photograph Phenological,
Journal for 1871. It is one of the best Family Magazinea
now published. Only \$3 a year. Send to
S. R. WELLS, 389 Broadway, New York.

HEARTH AND HOME: \$3 a year for less than four copies: Fonr to nine copies, \$2.75 each; Ten to nineteen copies, \$2.50 each; and twenty or more copies, \$2.25 each.

# THINGS

That are Good, That are Desirable. That are very Cheap, AND

### That can be Obtained WITHOUT MONEY.

A Better Opportunity was never Offered to Secure Splendid Premiums, in Articles of Great Value and Usefulness, and better than Money, yet Without Money.

January is a First-rate Month for making up Premium Clubs easily. Over Eleven Thousand other people have done this with great satisfaction, and You may easily do the same.

POSTMASTERS, Cultivators, Mechanics, Ministers, Merchants. Teachers, Lawyers, Children, Ladies,

here is an excellent chance to do a capital thing for yourselves, and for others also ..... We publish two first-rate Journals-beautiful, valuable, full of good, useful, interesting reading matter, in which we shall also give at least \$35,000 in fine Engravings this year. These Journals are: American Agriculturist, mouthly, with 44 pages in each number, and Hearth and Home, weekly, with 20 large pages in each number ..... They will each Please and Henefit anybody who reads them, many times more than their cost ..... But we cannot go all over the country to show them-uor can we afford to send traveling agents everywhere, while we furnish the papers so cheaply...... But we have procured an abundant supply of firstrate articles-desirable either for one's own use, or for sale. They are all of the best quality. By large wholesale cash purchases, and the special favor of the manufacturers, we get these articles so that we can offer them free to all our friends who will take the little trouble required to show the journals, explain their merits, and collect and forward the subscriptions. (See "Explanatory Notes" below.) It is easy to do this. Eleven Thousand Persons have already received these premiums with great satisfaction. One or two subscribers a day, for a month, will secure the free receipt of a very large and valuable premium, or several smaller but valuable ones.....

Many persons canvass all the time, as a business, and sell the premium articles received, and thus make large wages. Some Ladies, now canvassing, have each cleared from \$500 to \$3,000 a year. Many others have cleared \$50 to \$300, by devoting but little time to it. Many Clergymen have collected names among their parishioners, and secured the Cyclopedia, Melodeons, Sewing Machines, etc., etc., in a brief time. Many Boys and Girls have secured the Great Dictionary, etc., etc. .....This has all been done with only one paper. As we now include both papers in the list, the eanvasser can use both.

One or more premium clubs can be raised at EVERY POST-OFFICE. There are plenty of people who ought to take these papers, and will take them, if some one will show them and explain their value...... YOU. READER, may just as well attend to this at your post-office, as any one else, and get the premium. Try it. A little perseverance will accomplish it.

#### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But....(b) Tell us with each name or list of names sent, that it is for a premium....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from one to five months, to fill up your list....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit money in Checks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

(In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50.]

N. B.-In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 8 to 11, 21 to 24, 27, 28, 19. 47. 48, 63, 64, and 66 to 100 inclusive, will each be delirered FREE of all charges, by mail or express (at the Post-affice or express office nearest recipient), to any place in the United States or Territorics.—The other articles cost the recipient only the freight after learning the states of the recipient of the freight after learning the states. ing the manufactory of each, by any conveyance that may be excepted.
(Steam Engine mailed for 86 cents extra.) [See Next Page.]

### Full Descriptions

of all the Premiums, are given in our October number, which will be mailed *free* to all applicants. Read over the descriptions, and you will find many desirable articles—indeed all are desirable. We have room in this paper only for the following DESCRIPTIVE NOTES:

Table Cuttery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the hest foreign goods. Messrs. Patterson Bros., 27 Park Row, who supply us with these articles, are also importers of Euglish goods. They recommend these Knives, manufactured by the Meriden Cutlery Co., as equal to any Cutlery in the market, and their recommendation is a guaranty, wherever they are known. We offer four kinds of Knives, and three sizes of each kind. No. 1 have Rubber Handles, which are actually boiling water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$14... For 23 subscribers at \$1.50, or 78 at \$1. we will give either the medium size or the table size, sold at \$15.50. No. 2 have twory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$15.50. No. 2 have twory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$15.50. For 34 at \$1.50, or 112 at \$1, we will send the Table size, sold at \$20.50. For 34 at \$25.0. No. 3 are made of Solid Steel and are triple-plated all over with pure silver, which will wear for a long time, while the Knife is actually indestructible hy ordinary use. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have silver. For 45 subscribers at \$1.50, or 143 at \$1, we will give the Table size, sold at \$30.50. The Forks, which accompan

No. 7.—French Cook's Marife, Fork, and Steel,—This is a long (10 in.) thin Knife, with Pat. Rubber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by The Meriden Cutlery Co.

Nos. 8, 9, 10, 11—Pocket Knives.

—RERE'S FOR THE BOYS AND GIRIS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl, too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are made by Messeys. Smith & Clark, Brouxville, N. Y., whose work is equal to any done in this country or Europe. No. 8 is a neat, substantial Knife, with three blades and buck-horn handle. No. 9 is a still finer article, with four blades and buck-horn bandle. No. 10 is an elegant Knife, with four blades and shell handle. No. 11 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 12.—A Tea Set.—This premium has given the greatest satisfaction, for the last four years. There are six pieces; viz. A Coffee-Pot, two Teapots, a Creamer, Suyar and Stop Bovet—all of beautiful, uniform pattern, new style, with raised and embossed figure work. They are not the common silver-washed articles, but the nest triple plate, the foundation being white metal, so as not to show, even when the beavy silver coating may chance to be worn off in any spot by long, hard usage.—These sets are made by the Luclus Hart Manufacturing Co., of Nos. 1 and 6 Burling Sllp, New York City, and are warranted by them to be of the best triple plate; and each piece bears their stamp. Mr. Hart, "the veteran Sunday-school man," has been in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and take pleasure in commending and guaranteeing its value to be as represented. The amount of silver inpon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good-looking plated ware for less than half the money.

No. 13.—Casters and Fruit or Cake Basket Combined.—This is a new pattern, both novel and beantiful. It can be used as large, showy Casters, with six cut-glass bottles, or be instantly changed into complete Casters, with Call-Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers as No. 12, of same metal, plating, etc.

No. 14. - Cake Basket.—A new pattern, came shaped, hicelyschased and very taking. It is from the same makers and of equally good quality as the two preceding premiums; is a beautiful table emament.

No. 15.—Revolving Butter Cooler.

-This is a really good and useful article. It is so arranged that a very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same honse as No. 12.

No. 16.—Ree or Wieler Pitcher.—A large and ornamental article. It is of the same metal, plating, etc., and by the same makers as No. 12. For 35 subscribers at \$1.50 cach, we will include a round Salver of pattern to correspond (value \$6); or, for 47 subscribers, a large 16-inch oval Salver (value \$14), large enough for two goblets with the Pitcher: and for 53 subscribers, the Pitcher, large Salver, and a pair of beautiful Goblets, silver-plated without, and gilded within (value \$38). This complete set is exceedingly desirable, though the Pitcher alone, or that and the smaller Tray, or Salver, will answer a good purpose, both for use and ornament.

No. 17.—One Bozen Teaspoons.— No. 18.—One Bozen Table-Spoons.— These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 12. They are far *cheaper* than any thing we have found at half the price, and well worth working for.

No. 19.—One Bozem Table-Forks.

—The same description and remarks apply to these as to No. 18. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 20.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the outside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life keep-sake.

Nos. 21, 22, 23.— Avoid Pens: with everpointed Pencils, in extension, coin-silver cases.— Premium
No. 21 contains the best No. 4 Gold Pen; and No. 22 the
best No. 6 Gold Pen, which is the same style, but larger,
No. 23 contains No. 7 Gold Pen, in Gold-tipped Ebony
Holder. Each pen will be sent in a neat leather case by
mail, post-paid. These pens are made by Gco. F.
Hawkes, No. 64 Nassau St., and have obtained
a wide and good reputation. We have known the maker
and his goods for many years, and can recommend them.

No. 24.—3. Addies Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same makers as above.

No. 25.—Lozo Pendulum Board.—
A very pleasing article for Boys and Girls (and we have seen not a few "grown up" folks playing with it). It is a neat Walmut Table Case, with rings, balls, hooks, etc., etc. Seven different games can be played on this board. It is easily adjusted upon a table, chairs, piazza, etc., and readily closed and set away when not in use. Pictures and descriptions of it can be obtained by addressing "Novelty Game Company, Providence, R. I." As it requires only 18 subscribers at \$1.50 each, or 58 at \$1 each, to get this \$10 Prize, a great many of our young readers can quickly get up a club, and secure a Holiday present for themselves.

entertainment for both young and old people. Our observation is, that the increase of entertaining home games is already doing much to keep not only the boys but their fathers away from drinking and gambling rooms, and other places of evening resort not conducive to good morals. Premium No. 25 is specially adapted to children. This one, the "Amnsette," as it is called, will afford interest to the older as well as the younger members of the family, male and female. It only needs a smooth table of any kind covered with a cloth. The play with the balls will develop much of ingenuity and skill, and give a capital study of the laws of motion, force, etc." The price has been reduced from \$10 to \$6, and our recluing will place it in the power of yery many to secure this additional source of home amneements. The

Amusette is supplied by E. I. Horsman, 100 William Street, N. Y., who will send any desired circulars giving information. It packs in small space and can be safely sent anywhere by express at small cost.

No. 27.— Garden Seeds.—A valuable selection of 40 varieties of the best seeds for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next are put up for us by Messrs. B. K. Billss & Sons, Seed & Horticultural Warehouse, 23 Park Place and 20 Murray St., whose seed establishment is well known as one of the best in the country. This premium will be of great value and convenience to many, as we send the seeds post-patel.

No. 28.—Flower Seeds.—Like No. 27 this is a valuable premium. It consists of 100 different kinds of beautiful flower seeds, all in separate papers, and includes the finer common varieties, and many of the newer and rarer kinds that are costly. Sent post-paid.

Nos. 32, 33, 34.—Sewing Machine lightens the labor and promotes the health and happiness of those at home." We offer a choice of three of the best of the leading machines, all of which have been thoroughly tested in our own families, and give entire satisfaction. While all are valuable, each has some excellence peculiar to itself. The Grover & Baker Machine is remarkable for the elasticity of its stitch, which is at the same time very firm and durable. The structure of the seam is such that, though it be ent or broken at intervals of only a few-stitches, it will neither open, run, nor ravel. It sews directly from two spools, without rewinding.... The Florence Machine makes different stitches, each being alike on both sides of the fabric. One of its special advantages is that it has the reversible feed motion, which enables the operator, by simply turning a thumb-screw, to have the work run either to the right or left, to stay any part of the seam, or fasten the ends of seams without turning the fabric. The Willcox & Gibbs Machine excels in the exceeding simplicity of its construction. Very little instruction and ingomity are required, to understand the f-w parts of which it is composed, and their use; and there is no excuse for getting it out of order, until the parts are fairly worn out. One of its stroagest recommendations is the ease with which it is worked, taxing the strength of the operator less than other machines. All these machines have constantly increasing sales, showing the public estimate of their value. Either of them will prove a great treasure in any household; worth more than \$500. The \$500, at 7 per cent interest, would yield, less taxes, about \$32. Most fainfiles require at least four months of steady hand-sewing a year, costing, if all hired, not less than \$24 a mouth, board included, or \$96 a year. With a Sewing Machine, a woman can sew more in one month than in four months by hand. Here is a clear saving of \$72. But far above this—the everlasting "Stitch, stitch," the bending over the work

No. 35.—Washing Machines.—For a long time we have annually tried many new Washing Machines, and "Doty's Paragon," which we have now used nearly five years, is the only one the "help" will use voluntarily. Send for full Descriptive Circulars to R. C. Browning, 32 Cortlandt St., N. Y., or to Metropolitan Washing Machine Co., Middlefield Conn.—It goes cheaply by freight or express.

No.36—Clothes Wringing Machine.

—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is bard upon the bands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which prees the water out better than band wringing, and as fast as one can pick up the articles. We have given thousands of these premiums, with almost universal satisfaction. They are made by the Metropolitan Washing Machine Co., Middlefield, Ct.

Nos. 37, 38.— Melodeoms.— These are excellent and desirable instruments, for the Home Circle, for small Churches, for Sunday-schools, for Day Schools, Academies, etc. Instrumental and Vocal Music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer the Melodeons made by Messrs. Geo. A. Prince

& Co., Buffalo, N. Y., for we know them to be good. A large one in our own Sunday-school room has been in use for eleven years, and is to-day just as good as when first purchased, though used from time to time by a large number of persons.—Several clergymen have obtained this premium for themselves, their Churches, or Sunday-school rooms. The clubs of subscribers were quickly raised among the members of their parishes.—Many others can get a Melodeon for their home use. Send a postage stamp to the makers and get their illustrated descriptive circular. These Melodeons will be shipped direct from the manufactory at Buffalo. They can go safely by freight or by express. If an Organ should be wanted instead of a Melodeon, we can supply it for an increased number of subscribers in proportion to the value. We have given these instruments for several years, and we believe they have invariably been greatly esteemed.

No. 40.—A Good Watch.—The Watches made by the American Watch Co., Waltham, Mass., have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor, with machinery perfect and ample, enables them to offer watches at lower rates than any other manufacturers. Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of over 400,000 Waltham Watches in the pockets of the people is the best proof of the public approval. We offer a Silver watch, jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, and in pure coin-silver "hunting" case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "American Agriculturists. Made by the American Watch Co., Waltham, Mass."

No. 41.—Ladies' Fine Gold Watch. This elegant Premiam will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 40 above) includes these heautiful gold watches. They are full jewelled, in 18-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time Keeper. Upon the movement of each Premium Watch will be engraved "AM. Agriculturist. Made by the AM. Watch Co., Walthau, Mass."

No. 42.—Frank Wesson's Breech-loading Rifle.—This is a capital little rifle, weighing 6½ lbs., 40 inches long including the breech, and an accurate and powerful shooter, to which our attention was recently called by our "great gun" friends, Messrs, Cooper, Harris & Hodgkins, of 177 Broadway. At our first trial, of ten shots, eight were put within an inch of the center of a target 60 yards off, and the other two were within 1½ inches. We stopped then because the bull'seye was destroyed, and tried twelve shots at 100 yards. Seven of these were within 1 inch of center, and the other five within 2½ inches. The above 22 shots were fired as fast as the marker could plug the holes and get out of the way. (Plain open sights were used. For very accurate shooting with any gua, the globe sight is necessary.) A few trials proved the gun to have great penetration and accuracy at the distance of 400 to 800 yards. With the ready fixed ammunition, (copper cartridges, containing powder, ball, and percussion), the loading is exceedingly simple and rapid. Pulling one trigger throws up the barrel, and ejects the used copper shell, a new one is inserted in an instant, the barrel is pushed down, the cook set—all done in a few seconds—and you are ready to fire again. One has only to carry the cartridges in his pocket, the light rifle, and his game bag.—The usual length of barrel is 24 inches. Longer barrels can be had at an expense of 50c, an inch if wanted by any one.—Send for descriptive Circulars, etc., to the Agout, M. W. Robinson, 79 Chambers St., New York. Our premium will be the 24-inch steel-harrel rifle, including 100 cartridges. The recipient will please choose whether the caliber be 32-100, or 38-100, or 44-100. The last named is suitable for heavy game, the first for smaller, and the 33-100 for a medium. The first is bardly large enough for bears, buffalo, or deer, but is ample for anything smaller.

No. 43.—Bireccla-loading Focket Rifle.—This remarkable little fire-arm weighs only eleven onnees, yet shoots with great accuracy and power from 30 to 100 yards, or more, and can be loaded and fired five times a minute. It can be carried in a side pocket, and is accompanied by an extension breech, so that it may be used either as a pistofor file. It is put up in a neat makegany case, with 250 rounds of am-

munition. The manufacturers are Messrs. J. Stevens & Co., Chloopee Falls, Mass., and the rifles are sold at retail by Messns. Coopea, Harris & Hodgkins, No. 177 Broadway. This Premium gave great satisfaction last season. 25 Without the mahogany case, we will give the weapon, all complete, with 100 case, ridges, packed in a pasteboard box, on receipt of 18 subscribers, at \$1.50 each. For a full description see American Agriculturist for Jan. 1869, page \$2.

No. 42.—Mayrerd's Combination Gun—A Breech-loading Itisc and Shot-Gun, or Two Guns in One!—This is a capital gun for those who want a weapon to use either as a rifle or shot-gun. Either barrel can be slipped into the same stock in a moment. The ammunition is poculiar. The strong brass cartridges are loaded at leisure, costing nothing but for the powder and lead, and may be used over and over again for any number of times. One can carry cartridges in his pocket, loaded with different sizes of shot, and slip in and fire any size wanted for large or small game. At our first trial with the rifle barrel, we twice over put 12 successive balls within an inch of the cooter of the mark, at the distance of 60 yards, and within 1½ inches of the conter at the distance of 100 yards, and did nearly as well at still greater distances. We want nothing better for accuracy and penetration. The shot barrel carried admirably. Our Premium consists of a complete outfit, including an extra fine Stock, a 26-luch rifle-barrel, 51-100 bore, with clevating Peep Sight, Cartridge Retractor, Double Bullet Mold and Neck Cutter, Loader, Rod, Brush, Cone Wrench, Extra Cone, Rag-holder, and 50 Cartridge-cases, Platin Bushing, Front-shaded Bead Sight; Shot Barrel, with 50 Shot Cartridge-cases, Rod and Brush, Wad-entter, and Shot-loader, Powder-Plask, and extra Charger. For further particulars send for a Circular to the Massachusetts Arms Company, Chico-pee Falls, Mass.

No. 45. — Double Barrel Gun; or Fowline Prece.—These guns are the genuine London "Twist" harrel, Patent Breech, Bar Lock, chony ramrod, and in all respects desirable. Their calibre and length of harrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this premium by Messrs, Cooper, Harris & Hodgelins, 177 Broadway, well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in faucy carving and plating for show, but in the gun itself. This premium includes Gan, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 46.—Chest of Good Tools.—We continue through the special favor of Messrs. Patterson Brothers, of 27 Park Row, the offer of chests of the very first quality of tools, of kinds and prices named below. Similar tools could be purchased for half the money, but these are all A. No. 1, for practical use, and worth a dozen common articles. For this we have the guarantee of Messrs. Patterson, which is amply sufficient for us, and for all who know them. Any of these tools may be ordered of them. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and but few additions would be required for a Journeyman Carpenter. The assortment we offer is as follows: 1 Teol Chest, \$8; 1 Jack Plane, \$1.75; 1 Sonooth Plane, \$1.50; 1 Fore Plane, \$2.25; 1 Hardsaw, 22 in., \$1.75; 1 Compass Saw, 10 in., 50c.; Compass, 6 in., \$7c.; 1 Adze-cye Hammer, No. 4, \$1.25; 1 Hatched, No. 2, 90c.; 1 Draw Knife, 7 in., \$1.12; 1 Try Square, 6 in., 70c.; 1 Bevel, 8 in., 75c.; 1 Chalk Line and Spool, 30c.; 1 Mallet, 20c.; 1 Pair of Pliers (steel), 5 in., 60c.; 1 Pair of Calipers, 4 in., 36c.; 1 Brace, No. 2, \$2.25; 1 Auger bit; ea. ½ in. 30c.; ½ in. 32c.; ½ in. 45c.; 1 in. 60c.; 1 Center bit, ea. ½ in., 30c.; ½ in., 23c.; 1 in., 25c.; 1 Flat Conntersink, 25c.; Rose, do., 25c.; Snail, do., 25c.; 1 Octagon Reamer, 30c.; 1 Taper bit, 30c.; 1 Screw-driver bit, 25c.; 1 Flat Conntersink, 25c.; Rose, do., 25c.; Snail, do., 25c.; 1 Octagon Reamer, 30c.; 1 Taper bit, 30c.; 1 Screw-driver in Handle, ea. 3 in., 50c.; 1 Taper bit, 30c.; 1 Screw-driver in Handle, ea. 3 in., 50c.; 1 fin., 70c.; 1 Chisel in Handle, ea., ½ in., 50c.; 1 in., 60c.; 1 in., 50c.; 1 in., 5

Nos. 50, 52.—Mercarrial Biaromer ters.—Woodruff's Patent, made by Chas. Wilder, Peterboro, N. H. These are the most convenient and portable Mercurial Barometers made. (Send to Mr. Wilder for a circular.) The peculiar form of Mercury enpinvented by Mr. Woodruff renders these Barometers so portable that Mr. Wilder guarantees their safe delivery, if not to be sent beyond the Rocky Mountains. The instruments are about 3 feet long, differing mainly in the style of case, both being supplied with Thermometer and Vernier. A Barometer is to firmers, or others or land, what it is to saflors at see—an indicator of the weather

to be looked for. To us this instrument is of more real value, in a business way, than the interest on several hundred dollars. It more than pays its cost every year!

No. 59. — Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequaled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc., etc. This is one of the most successful toys ever invented. Twenty-five thousand dollars' worth were sold last year by Orange Judd & Co., Sok Agents.

No. 62.—The Great Edictionary.—
Worcester's Large, Pictorial, Unabridged Edition, containing 1,854 three-column pages, with a multitude of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopædia. The Dictionary can be called for at our Office, or be sent by express or otherwise, to any part of the country. It should be in every family. It is published by Brewer & Theston, Roston.

Nos. 66 to 76.—Volumes of the American Agriculturist (Uubound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid.—They are profusely Illustrated, the cogravings used in them having alone cost at least \$60,000. Those obtaining premiums for less than thirteen volumes can select any volumes desired, from XVI. to XXIX, inclasive. For ordinary use, the sets of numbers unbound will answer quite well.

Nos. 77 to 87.—Bound Volumes of the Agriculturist.—These are the same as Nos. 66 to 76 above, but are neatly bound in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. SS to 99.—Good Libraries.—
In these premiums, we offer a choice of Books for the Farm, Garden, and Mousehold. The person entitled to any one of the premiums SS to 99 may select any books desired from the list of our books published monthly in the American Agriculturist, to the amount of the premiums, and the books will be forwarded, Post or Express paid. \$25 or \$50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. The Let the Farmers of a neighborhood unite their efforts and through these premiums get an agricultural Library for general use.

No. 100.—General Book Premium.

—Any one sending 25 or more names may select Books from our list to the amount of 10 cents for each sabscriber sent at \$1; or 30 cents for each name sent at \$1.20; or 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

No. 101—Steam-Engine.—This is a veritable steam-engine; one that will GO; and a capital, inteosely interesting, and instructive article for boys, and grown-up people too. [See description and Illustration in our December Number, and in Hearth and Home for November 26.] Our eleven-year old boy has rno his engine an average of an hour or more n day for five weeks past; has exhibited it in motion to many of his playmates; has hitched on the toy machinery, and it appears to go just as well as when first started. It is given to any one sending two subscribers to Hearth and Home, at \$3 a year; or three subscribers to American Agriculturist, at \$1.50 a year. It will be sent anywhere in the United States or Territories free if 36 cents-are supplied to prepay postage.

#### Small Truck Farm, near New York City.

For Sale, a valuable Farm of 31 Acres of the best quality of land for raising Garden Truck for the N. Y. City markets, for which it has been in part devoted. It is on Long Island, less than 9 miles by the best of roads from the N. Y. City Ferries, and in the midst of the celebrated Long Island Truck farms, many of which are valued at \$400 to \$1,00 per acre. It has beat, comfortable, New Buildings, and will be sold on easy terms of payment, say one-third to one-half cash, and the balance on Bond and Mortgage. Price \$10,000. Address S. F. GOODING.

Care of American Agriculturist Office, New York.

#### Wallace's American Stud-Book.

Volume one. Being a compilation of the Pedigrees of American and Imported Blood Horses, from the earliest records, with an APPENDIX of all named ani-

mals without extended Pedigrees prior to the year 1840. And a Supplement, containg a history of all Horses and Mares that have trotted in public from the earliest trotting-races till the close of 1866. By J. H. Wallace. Royal 8vo. of over 1,000 pages, elegantly bound in extra cloth, heveled boards and splendidly illustrated. Price, post-paid, Ten Dollars.

The American Stud-Book will be found COMPLETE IN ITSELF, as no book outside of it is necessary to trace the pedigree of any given animal through all its various ramifications, until you reach its utmost bounds or the British Stud-Book. From the admirable system upon which the book is constructed, this completeness becomes an inevitable fact.

"Welcomed as a standard authority on the genealogy of the equestrian peerage of the United States."—New-York Tribune.

Horse Portraiture. Breeding, Rearing, and Training Trotters. Prepa-

rations for Races; Management in the Stable; on the Track; Horse Life, etc., etc. By Joseph Cairn Simpson. Post octavo. Post-paid, \$2.50.
"The most valuable work on the breeding, rearing, and training of Trotters ever presented to the American public."—Turf, Field and Farm.

A Splendid Quarto Volume.

BEAUTIFULLY ILLUSTRATED

With numerous fine Wood Engravings, and with

### 17 FULL PAGE and 7 DOUBLE PAGE COLORED LITHOGRAPHS

OF PLACES ALREADY IMPROVED.

### Make Home Beautiful.

NOTICES BY THE PRESS.

A home! A home in the country! And a home made henutiful by taste! Here are three ideas which invest with a triple charm the subject of this exquisite volume. We know of nothing which indicates a more healthy progress among our countrymen than the growing taste for such homes. The American people are quick to follow a fashion, and it is getting to he the fashion to have a place in the country, and to beautify it; and this is at ouce fed and guided by such books as this, which lay down the just principles of landscape gardening, and teach all how to use the means at their disposal. This book is prepared with careful judgment. It includes many plans, and furnishes minute instruction for the laying out of grounds and the planting of trees. We have found very great pleasure in a first inspection, and doubt not that when another summer returns, we shall find the book as practically useful as it is heantiful to the eye and exciting to the imagination.— N. Y. Evangelist.

Orange Jadd & Co. have just issued a book that hundreds, perhaps thousands, of our readers will be glad to have. It is a quarto volume, devoted to views and plans of grounds around and about rural residences, homes in the country; actual pictures of lawns laid out, with walks, and fountains, and trees, each particular tree and bush being on the spot where it stands in the grounds; for all these are actual sketches of places owned and laid out by persons whose names are given with them, so that the places themselves may be visited by anybody who wishes to see them. It will be good economy for any one who wishes to go into the luxury of rural residence to huy this book—it will cost only fifteen dollars—and will save fifteen hundred, perhaps as many thousands, by opening one's eyes to see what is to be done, and what it will cost to do it .- N. Y. Observer.

We have from Orange Judd & Co. a magnificent manual, entitled Beaulifying Country Homes; a Hand-Book of Landscape Gurdening. It is a brief treatise on landscape gardening and architecture, explaining the principles of beauty which apply to it, and making just those practical suggestions of which every builder and owner of a little land, who desires to make the most of owner of a little land, who desires to make the most of it in the way of convenience and taste, stands in need; in regard to lawns, drainage, roads, drives, walks, grad-ing, fences, hedges, trees—their selection and their grouping, flowers, water, ornamentation, rock-work, tools, and general improvements. The chapter on "im-proving new places economically" would be worth much more than the cost of the book ten times over to many persons. The whole is Illustrated not only by little sketches, but by a series of full-page lithographs of places which have been actually treated in accordance with the principles laid down, with lists of trees and shrubs, and other useful suggestions. We have never met with any thing—and we have given a good deal of attention to the subject, and bought a great many books upon it—which seemed to us so helpful and, in general, so trustworthy as this treatise, which we heartily commend. We omitted to say that it has been done by Mr. J. Weidenmann, Snperintendent of the City Park, and of Cedar Hill Cemetery, Hartford, Coun.—Congregationalist, (Boston).

Price, Prepaid, \$15.00. ORANGE JUDD AND COMPANY, 245 BROADWAY, NEW YORK.

### DAIRYMEN

### Iron-Clad Milk Can.

The above cut represents the Cover, which is one of the best improvements in the manufactore of Factory Cans. It is pressed out of one piece, rim and all; therefore it does away with all seams, which makes it

#### DURABLE AND EASY TO OLEANSE.

They will not only last much longer, but will pay for themselves in the saving of milk, fitting so much closer than the old-style made by hand. For sale by all Tinners. Stock and Trimmings for sale hy the IRON-CLAD CAN CO., 42 and 44 Murray Street, New York. 200 Kandoiph Street, Chicago, Ili. P.S.—The Handle will be illustrated and described in next month's issue of this paper. See Bottom in Dec. No.

ARIOULE'S AGRICULTURAL STEAMER
AND CALDRON.—By the nace of Steamed Food, Dairymen admit the increase of one-third in me admit the waste of fodder. A Western me admit the whave Lessenser for me meonic using a No.2 Printile Steamer for me meonic using a No.2 Printile Steamer for me meonic using a lip shuff from the mill during who in the mill during who is the me have fattened fifty hogs more rapidly than any hogs we have ever fed, with less than half the cost."

The "Prindle Steamer" can be had from the subscribers or from any responsible dealer in the United States. It is always successful when it has a good draft, sets near the work to be done, and has pleuty of water at hand to wet the food. Its safety even in unskilled hands is beyond a donht. One hundred have hately been sold to a house in San Francisco.

Prize Essays (a book of 61 pages), giving full information in the subject of cooked and cooking food for stock, are forwarded post-paid on receipt of 10 cents.

QUESTION,—What GRAPE shall I plant? Answer.—The EUMELAN; whether for table use, market, Answer.—The EUMELAN; whether for table use, market, or for wine.

Question.—Where can the Eumelan vines be obtained?

\* Answer.—Of Messrs. HASBROUCK & BUSHNELL, Ions, near Peckskill, Westchester Co., N. Y.

WIVES, HUSBANDS, DAUGHTERS AND SONS, find The Phrenological Journal one of the best Family Magazines ever published. Only \$3 a year, with choice premiums. Address S. R. WELLS, 389 Broadway, New York.

EDUCATION for FARMERS.—For information apply to W. S. CLARK, President Massacousetts Agricultural College, Amherst, Mass.

### A BEAUTIFUL GIFT.

A Picture for the Home Circle.

# "DANDELION TIME."

By MRS. LILLY M. SPENCER.

The Publishers of the American Agriculturist have purchased of the artist this beautiful painting, and have issued it as a Chromo, designing thus to enable very many to secure it as an ornament and source of pleasure in their homes. Mrs. Lilly M. Spencer has already won an honorable name in art. Though of a poetic imagination, and the author of many paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. Her works of this class have been reproduced in colored lithographs and other forms, and through these her name has become a familiar one throughout the country. Finding that pictures of a domestic character with something of the humorons in them were more popular than those to which her natural tastes inclined her, Mrs. S. for some years painted such subjects almost exclusively. Her "Shake Hands," "Jolly Washerwoman," "The Gossips," and others, are known to all lovers of pictures. They are full of life I meaning, and at the same time finished with an acy and detail that few artists nttempt. Among est productions are "War Times at Home," "The of the Red, White, and Blue," " The Starrauty to the Brave," etc. In the beautiful ered, called

### "DANDELI 'N TIME."

three children, of whom the is a plump, rosy babe, and a huge Newfor your g which they have decked with a dandel reath, are play upon the green gradient This Circles who se work equals any concles, who thing of the kind done in this country. The scene is full of happy life and conner mil to delight both old and vonng.

The picture would prove an ornament in any home, and be a most heautiful and acceptable present to make to a friend. It is 13×18 inches in size, and mounted on linen, will be sent by mail, in a tube, with all materials and directions for stretching.

### PRICE, POST-PAID, \$6:00.

preferred, the picture will be sent by express, mounted on artists' board, all ready for framing, on receipt of the price, \$6.00, the purchaser to pay express charges. If ordered in a frame, it will be sent by express, carefully boxed, on receipt of prices, as follows:

In a neat Black-Walnut Frame, gilt band ..... \$ 9.00. " wider gilt band., 10.00. " carved edged 66 " ...•11.00. " beautiful gilt " best quality..... 15.00.

If taken with a frame at the store, 245 Broadway, the charge for boxing, which is 75 cents, will be deducted from these prices. In all cases where sent by express, the purchaser will pay express charges.

A LIBERAL DISCOUNT MADE TO THE TRADE.

### WHITE AND PARTRIDGE COCHINS AT THE N. Y. STATE POULTRY FAIR .- Drawn and Engraved for the American Agriculturist.

The display of Cochins was remarkably fine at the late show of the "N. Y. S. P. S.," and in no class was there closer competition than in Partridge Cochins. The magnificent trio which received the first prize, a pair of which is shown above, belong to Mr. Geo. F. Champney, of Taunton, Mass. The White ones won their honors with less competition, but there was a worthy show. We think we recognize the winning trio above represented as having been exhibited last year, when they lost the award they have now won, on account of exhibiting, in a sprinkling of pale buff feathers, traces

of their origin from, or remote crossing with, the Buffs. Those feathers probably disappeared in the last moult, and their owner, Mr. J. J. Berry, of Hackensack, N. J., has a magnificent-looking trio of fowls. The Cochins, as a class, deserve as they receive, the assiduous attention of Fanciers. We hardly value them as highly as the Brahmas for useful qualities, yet so nearly are the two breeds matched in this regard, that the highest authorities differ in their opinions of their relative merits. They are unsurpassed as winter layers, their great cushions of fluffy plumage protecting them

from the cold. They are excellent mothers. The young grow rapidly, and early attain marketable and large size, though early maturity can hardly be asserted of them. They grow to the very largest size ever attained by fowls, and present a variety and beauty of plumage which make them attractive as fanciers' breeds. We have the Buff, which is probably the parent breed, the Partridge, the Grouse, like the Partridge, but of less beautifully or distinctly marked plumage, the White and the Black; the last being the least interesting, and usually not breeding very true to color and points.

Estimate Escef in New York. — We have been for some time receiving buffalo hams, mostly from old bulls, sent by express from Kansas; but just as we go to press we have had the pleasure of seeing a carboad of 126 hind-quarters of young cows, and 7 carcasses of buffalo yeal, all plump and fat, full of kidney fat and in good order, though having been 13 days on the way, brought on by T. L. Runkin, of Lyndon, Osage Co., Kansas. They were shot near the Colorado line on the Kansas Pacific Railroad, and brought on in a patent car of Mr. Rankin. This meat is hardly well enough known in our market to bring a remnnerative price, for this lot might have been soid west of the Alleghanies for a much higher price than 11 brings here. It ought to bring as much as the very best beef. It comes in the hides,

### AMERICAN AGRICULTURIST.

NEW YORK, FEBRUARY, 1871.

It is hard to realize that so very soon after this number of the Agriculturist is Intrusted to Uncle Sam's mail bags, it will be read by thousands of families who may read it sitting with open doors and windows and watch the mellow soil turned by the plow, or enjoy the fragrance of blooming fruit trees and jasmines, while we shiver, with the thermometer below zero, perhaps, and face day by day the blasts of winter. Yet it is even so. The fields of the South are green with white clover and spring grasses, and spring work is heginning in earnest. The market gardens about Norfolk and Beaufort are busy enough, and their early crops perhaps already shipped to our hungry North. Clueking mothers lead forth their downy broods, which will make our choice broilers in May and June at a dollar to a dollar and a half apiece. In another direction mail trains and stages will be delayed by drifted snow, and neighbors with their ox teams and snow shovels will be opening roads and helping the stage-sleigh with its load of half-frozen passengers through to their journey's end.

As the sun rises higher at noon, and waxes hotter, the sap will start in the sugar bush, and there will be pleasant seenes on many a hill-side, where the fires of the sugar-eamps burn night and day.

We still have comparative leisure for reviewing the past year's work, and laying plans for the coming months, when so much hard labor will be demanded that the mind will not give itself readily to continuous thought. Whatever plans are made, on this very account, if for no other reason, should be put upon paper, so that when the time comes for their prompt executiou, they shall not be forgotten. The season of field work, when it does come, will be likely to come all at once, and then you will feel as if every moment were gold. Therefore, use all leisure time to get ready for spring work.

#### Hints about Work.

If the snow is off the fields, the opportunity is a good one to pick up stones. Cart them off from the mowing and grain fields in the mornings, while the ground is frozen. The grass fields may be gone over with a sharp hoe or weeding "spud," and multitudes of weeds cut just below the surface.

Winter Grain, which does not look well, and has been thrown by the frost, will be benefited by a light, even dressing of fine, well-mixed muck compost, or simply fine muck or soil.

Grass and Clover Steds.—These may be sown toward the end of the month, if the frost is pretty well out of the ground. The sowing is easiest done on a light snow, when the seed may be seen, and an even east secured. To this end, it is often well to sow in two directions across the field, and sometimes even three, as In sowing grass seed upon a lawn. Suitable weather for this frequently does not come until March. Avoid sowing where melted snows will wash the soil away, or move the seed.

Buildings.—Clear roofs from too heavy snow, stop leaks, keep eaves-troughs free, paint where needed, fasten loose boards, keep manure away from sills, oil rusty hinges, see that fastenings are in good order, and all repairs promptly made. Get out timber for sheds sufficient to shelter all stock. Study economy and convenience in plans.

Ice.—Secure a full supply, if not already done. In good weather, an ice-house may be made and filled within a week. One will pay ou a dairy farm, and be convenient everywhere.

Manure.—Mix plenty of muok, especially with that from the horse stable, to prevent firefanging; or, in absence of this, fork over the pile to prevent too great heat. All deposits now made in readiness for use in spring, will respond to drafts to be made for good crops next fall. Keep a heavy balance in your favor to draw upon.

Wood-Ashes should not be emptied into wooden smoke-houses before they are sifted, to be sure no live coals are in them. A few smouldering sparks may be sufficient to fire the structure, destroy its contents, and cause great loss; at least the lower part should be brick or stone.

Crates, Bags, Barrels, Baskets, etc., used for marketing, or kept at home, should be plainly marked with the owner's name and residence. A branding-lron or marking-plate and brush will save many losses. Improve leisure'by putting all in repair.

Bird-Houses.—Prepare neat houses for martins, bluebirds, and wrens, to be put up about the house, fruityard, and farm. The occupants will pay good rent by destroying insects.

Farmers' Clubs.—The meetings may be made interesting by committees appointed to investigate and report on subjects, such as new crops, new implements, the condition of farms in the vicinity, etc.; by correspondence with other similar associations, and occasional joint meetings of the clubs of different townships. New facts and experience, worthy of general notice, should be put in terse language, and communicated to the Agriculturist.

Advertisements are profitable reading. They usually indicate what progress the world is making. To farmers they are invaluable. Notes on tools, seeds, stock, trees, plants, etc., should be made, and further information gained by sending for circulars of trustworthy parties. The algriculturist aims to admit no other class.

Horses.—A few earrots with their grain will ald digestion and appetite, and improve their coats. Exercise daily. Train colts so that no breaking will be needed, and that none of spirit or of harness result. Keep working and carriage horses sharp shod, well groomed, and blanketed when standing out, or in cold stables after exercise. Ventilate stables, and abolish high feeding racks.

Cows.—Dry off four to six weeks before calving. Give generous feed of hay and roots, but not much grain. Cut hay or straw, steamed, and a little bran or meal added, is profitable. Keep the skin healthy by frequent carding and brushing. Those about to calve should be turned loose late separate, roomy stalls. Watch their time, to give assistance, if needed, but do not interfere, unless absolutely necessary, and then use gentle means. Allow the ealf to have the milk for four or five days. The effect of the first milk is medicinal and essential to the health of the young animal. After calving, let the cow alone; she will lie down awhile, and then get up and begin to eat. Then offer her a warm bran

mash, made with sealding water, but allowed to cool to about blood heat. Keep her upon her usual feed, with the addition of roots, to promote the flow of milk.

Sheep ought to have free, open yards or a more extensive range, for exercise and fresh air are essential to their health. Shelters must be well ventilated, not crowded, and the sheep turned out daily, except in severe storms. Pregnaut ewes should have little grain, but roots with hay. Those yeaning early will need separate, clean, not overlittered apartments, and careful attention, that the lambs be not fatally chilled.

Swine.—Allow breeding sows, near farrowing, potatoes or other succellent food, with bran or bolled corn-meal. Give them clean, well-littered stles, but not straw enough to endauger the young by covering them so that the sow will lie upon them. Poles, ten inches above the floor, and about eight inches out from the sides, all around the pen, will prove a great safeguard.

Implements.—Have all in repair and readiness for spring work. In the end, huying is cheaper than borrowing. Consult advertisements, send for catalogues and circulars for information about new implements, and always get the best.

### Work in the Horticultural Department.

Now is the time to prepare for any emergency that msy occur in the busy season. An extra spade or whiffletree, and a reserve supply of seed to replant in case of failure, are often of the greatest Importance. Next month, active operations will be crowding, and even now, at the South, out-ofdoor work is going on. Trees should be ordered at once. Stock of some kinds may be very scarce, and it may be necessary to apply to more than one dealer, in order to procure the desired varieties. The assortment of seeds is at its best this month. and it is well to secure them now. The same with implements; purchase the best, and have extra ones or duplicates of parts that are liable to be broken. Test seeds, as far as possible, to be assured from your own knowledge that they are good. It is a great advantage to the purchaser and a convenience to the vender, to order trees, seeds, and such things, well in advance. Seedsmen now have their catalogues ready and their stock in store.

#### Orchard and Nursery.

Washing and Scraping are of great benefit to neglected trees; and washing, at least, may be done with advantage on all fruit trees. It destroys the young and almost invisible growth of mosses and lichens, kills dormant insects that have bidden in crevices, and improves the tree generally. Various tree washes have been recommended, but there is probably nothing better than good, home-made soft soap, thinned with water to work conveniently with a brush. Remove the loose scales of bark by means of a blunt scraper before washing.

Insects are to be fought at all seasons. Remove the eggs of the tent-caterpillar before they hatch. They are to be found near the end of the small twigs, glued around in a neat band. The wingless females of the canker-worm begin to ascend the tree as soon as the ground thaws. There are many protectors, all of which agree in principle—that of Interposing a barrier over which the insect cannot crawl.

Cions may still be cut. Pack them in fresh sawdust; or, if put in a tight tin box, and kept in a cool place, they will keep in good condition until it is time to set them.

Grafting should be done only when the swelling of the buds shows that vegetation is starting. Cions may be cut and preserved in moss or sawdust.

Pruning is to be done before growth begins. In pruning neglected trees, the object should be to get an open and well-halanced head. Take care that a bad wound is not made by the falling of the limb when partly sawed off. Pare wounds smooth, and cover them with melted grafting wax or brown paint, which may be tinted, to be less conspicuous.

Planting.—The time for setting trees will be governed by the locality. In the Southern States, planting will be done this month, but at the North nothing is gained by planting too early. Cold, drying winds are very injurious.

Varieties.—For family use, the selection should comprise varieties from the earliest to the latest. For marketing, there should be but few varieties, and in making a selection, local experience is the only safe guide. Do not buy from the extravagantly colored pictures shown by traveling agents. If unfamiliar with the sorts, go about among those who grow fruit, and learn.

Injured Trees.—Such as are broken by the wind should be pruned as the ease may require; and the stumps, when limbs are removed, should be painted over with hot grafting wax, to prevent the sap flowing out and "scalding" the bark, as the farmers call it. When trees are gnawed by mice and rabbits, if the injury does not amount to girdling, or nearly to that, pare the torn edges of the bark, and paint this also with grafting wax; make a plaster of earth and cowdung and apply this, binding it on with a cloth. If girdled, the bark above and below should be united by means of twigs of the size of one's finger inserted in each side and bound on, the ends being sharpened and fitting corresponding notehes.

#### Fruit Garden.

Dwarf Trees will need pruning, washing with soap or lye, protection against insects, etc., and such other care as has already been suggested for trees in the orehard.

Pruning of small limbs may be done with the knife wherever necessary, to bring trees into shape.

Grape-Vines not attended to last autumn should be pruned in the first mild spell that occurs.

Strawberries may be set as soon as plants can be procured, and the frost is fairly out of the ground.

Trellises will be needed for grapes, and posts should be got out. Where durable timber is scarce, set a short locust post in the ground, and spike to it an upright of other wood.

Blackberries and Raspberries should be set as early as the condition of the soil will allow. The underground shoots, which will form the canes of next season, start very early, and are likely to be injured if the setting is left until late.

#### Kitchen Garden.

Every man, woman, and child in the country, or who lives where the backyard is not all flagged, except a square rod to dry clothes upon, or who lives, and does not board, is, or should be, practically interested in the kitchen garden; the countless daily blessings which come to the board every month in the year-yes, every day in the year -are blessings-God's blessings-received from the garden. Good food brings health; fruit and vegetables are man's first and most natural food. According to Moses, man was first permitted to eat meat after the flood. The crisp salads and spiuach of the early spring are followed by the long list of delicious things until the store of various roots, cabbages, and celery, parsley, etc., fills our cellars and keeps us well supplied until spring comes again with its delicacies.

Manure, the one thing needful for success in gardening anywhere, North or South, whether to be spread for the crops or to be used for hot-beds, must not be allowed to get overheated. Turn it over, and water it if too dry.

At the South hardy vegetables may now be sown—turnips, carrots, lettuce, cabbages, radishes, onions, leeks, spinach, parsley, etc., also plant potatoes, peas and rhubarb, asparagus and other roots. The time for planting tender vegetables, such as okra, beans, cucumbers, etc., must be governed by that at which it is safe to plant Indian corn. Corn is so generally planted all over the country, and the time at which it is safe to put in the crop is so well established in each locality, that it is always a safe guide for the inexperienced.

Cold Frames.—Plants in these will need more care, must have plenty of air, and exposure by removing the sashes whenever the weather will allow.

Hot-beds, unless very early vegetables are wanted, need not be made, at the North, until next month. In Southern gardens they may be prepared, and tomatoes, peppers, egg plants, cabhages, etc., sown in them. Shelter from prevailing winds should be looked out for, and If necessary to make the bed in an exposed place, it will pay to put up a temporary fence to shut off prevailing winds.

Brush and Poles for peas and beans should be out while there is leisure, trimmed and sharpened, and stacked near the place where they will be used.

Root Crops that were left in the ground all winter—salsify, parenips and horseradish—may be dug for sale or use whenever the ground is thawed.

Rhubarb may be forced, by taking up the roots and setting them in boxes of earth in a greenhouse; or, a few roots in the bed may be forced by covering with boxes or harrels around which is heaped a good supply of fermenting manure.

Potatoes.—Plant some early sort, such as Early Rose, as soon as the frost will allow.

Straw Mats to cover the sash, to protect plants from frost or too much sun, are very important. They should be 7 feet long, and 4½ feet wide, so that two will cover three sashes. One of the simplest ways to make them is to stretch five strands of strong twine or "marlin," of the proper length, to form the mat, then lay on straw, with the but ends towards the edges of the mats, and about an inch in thickness; then put five other strings over the straw, and directly above the first ones, and take a large needle and twine and sew through the straw, taking care that the loop of the stitch catches both the upper and lower strings.

#### Flower Garden and Lawn.

It is pleasant to have in the flower garden, and to a less extent upon the lawn, a constant variation year after year, in the kind of flowers, and in their succession upon the same ground. A little thought and planning will secure this, and add much to the interest of ornamental and pleasure grounds.

Ornamental Trees should have the same care as fruit trees. Most of them will repay manuring; and they need pruning whenever a branch disfigures the proper shape.

Shrubs may be pruned and thluned. Those that bloom on the new wood may be cut back, but those which have their flower-buds already formed need only to be thinned when the growth is crowded.

Plants in Pits must have air on warm days, or they will get drawn up by the increasing heat of the sun. Give water only when the soil in the pots is dry

Dahlias, Cannas, etc., stored in cellars, ought not to be too damp. If there are signs of mould or rot, remove them to a dry room.

Rustic Work should have a coat of oil, and such trellises and frames as need it should be painted during the very early spring.

Lawns may be rolled as soon as the frost is out of the ground, and if they did not have a top-dressing last autumn, give one now of good compost.

At the South.—Make walks, prepare borders, and set edging. Transplanting of trees, shrubs and herbaceous perennials, may be done, and the hardier annuals sown.

#### Greenhouse and Window Plants.

During mild weather more care will be required with the fires, as sudden changes are apt to occur. Maintain a uniform temperature, which should be 10° to 15° lower by night than by day.

Camellias that have done flowering must be pruned, and if the pots are full of roots, repot.

Azaleas coming luto flower should have more water, and when in bloom, be shaded from the sun.

Dust should be removed from the leaves of window plants by washing or showering.

Bulbs should have the flower-stalk cut away as soon as out of flower. If in pots or boxes, the

leaves may be kept growing until they can be turned out in the open ground. Bulbs that have flowered in glasses are not worth saying.

Plants in Bloom will need shading during the middle of the day. Bring those about to flower near the glass.

Propagation.—Cuttings of Verbenas, Geraniums, Heliotropes, and such plants as are often needed in large quantities, may be started, and by beginning early, the stock may be multiplied extensively. The temperature of the air of the house should always be lower than that of the cutting bench.

innuals, for summer blooming, may be sown in shallow boxes, and the seedlings, when large enough to handle, may be pricked out into other boxes. Many herbaceous perennials, started early, will bloom the first year.

#### TWO MISTAKES-Read About Them.

First, we think every one of our readers makes a Mistake, who does not secure the reading of HEARTH AND HOME. As that and American Agri-\* culturist are supplied together for \$4 a year, Hearth and Home really easts the reader of this Journal only \$2.50 a year, or less than 5 cents a week, which is less than the price of one fair eigar, and less than the produce of one hen would sell for. Aside from, or if you prefer, in addition to any profit from the circulation of Hearth and Home, we really desire all our old readers to have it, because we believe it will both please and benefit them. It is really a very fine paper, and full of good things, and we not only know we can, but know we shall make it a first-rate Journal for every body. Its Engravings are very beautiful, pleasing, and instructive withal. These illustrations are not cheap ink blots, but are of the first class, and excellently printed.

Its 20 pages are nearly double the size of American Agriculturist, and, in addition to the engravings, there are two of these large pages of editorials on live topics; a page or more on Agriculture, and one on Horticulture and Gardening, etc., prepared by the best practical men in the country; three pages on a variety of topies, answers to queries, etc.; a page or more of the very best practical information on Household work; two pages of miscellany-art, science, literature, including a couple of columns of choice humor, such as will rest the tired man or woman, helping him to "laugh and grow fat;" and then come two pages of the most charming children's reading that we find anywhere. Finally, we have four pages giving, in a condensed but clear form, the news of a week, brought up to within an hour of mailing. In these pages one will find a record of every thing of general interest going on in the world, in such a form that busy men and women, and those not supplied with a large stock of newspapers, can find a ready prepared digest of what is transpiring, without wading through a mass of printed matter. The latest financial, commercial, produce, live-stock, and other market reports are also given. Such is Hearth and Home, and we mean to make it so valnable that no one can afford to be without it, and we want to have all our readers enjoy it. Please give it a trial. A specimen copy will be sent to any one desiring it.

The second Mistake referred to above, is an idea, which we hear is entertained by some, that Hearth and Home and American Agriculturist are alike. They are entirely different in engravings and reading matter—as much so as if published a thousand miles apart, though the combination of

the business interests saves in rent, in printing, and other machinery, in business elerk hire, in mailing, and engravings, news, etc. etc., so that we can really give more in each paper for the same money than we could if separate business establishments were required for each Journal.

With these facilities, and with a combined circulation reaching over 200,000 families, which divides the cost so as to make it comparatively small to each, we are able to present to every reader of the two Journals, at the small cost of only 8 cents a week, copies of engravings worth \$35,000 to \$40,000 each year, and an amount of reading matter equivalent to what is given in 122 good Books of the size usually sold at \$1 each!

Both Journals are Electrotyped, so that Numbers from the beginning of the Volumes can at any time be supplied as called for.

#### Commercial Matters-Market Prices.

Gold has been without remarkable change since our last, the extremes of the price having been 1101/2@1111/2, and the closing quotation on Jan. 17, 1101/2, against 111 .There has been more than an average on Dec. 15... trade in the leading kinds of Breadstuffs since our last, and the general tendency of prices has been upward. The export demand has been fair for Flour and Wheat, and moderate for Corn, at the advancing figures. The available supply of prime qualities has been much reduced, and holders have shown increased confidence. There has been renewed activity in Provisions, especially in hog products, which close decidedly dearer ... Cotton movement has been fairly active, but at variable prices, closing heavily... ... There has been more call for Hay, Tobacco, and Wool, at rather steadier rates.....The dealings in Hops have been unimportant and prices have been much depressed, on liberal offerings, particularly of undesirable qualities.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Jan. 17, 1871, and for the corresponding month last year also for the year ending December 31, 1870.

Beef Cattle.-The lighter supply during the five weeks just ended fails to add anything to the price. In fact, prices have steadily declined, with the exception of holiday week, when large quantities of fancy cattle were sent in for sale,-more than ever before, and more than could be sold at the rates such animals usually reach. A few of the first choice ran up to 20c.@21c. per 10., net weight, but nearly as good hullocks went at 17c.@18c. before all were closed out. The course of trade has been such as to inflict serious loss upon speculators and drovers who had previously contracted for stock. Some of the old dealers have been compelled to retire, and othera will be forced to follow, unless something more favorable turns up. Cattle have been costing nearly as much at the West as they would sell for here. The causes are a continued large supply, and markets never before so filled with poultry and game. Buffalo from the prairies, eattle dressed in Chicago, deer brought down in the western wilds, with innumerable quail, grouse, and rabbits, all detract from the trade in live-stock. A whole car load of 15,000 lbs. buffalo saddles has just arrived from Colorado and Kansas. The meat is offering below the price of beef. Late arrivals of cattle show a better quality, with very few Texans among them. During the year 1870, there were 39,652 Texan cattle, that State standing second in source of supply. The present trade closes in a very unsatisfactorily for dealers. Orders have gone West to hold back the stock until there is an improvement here.

Below we give the range of prices, average price, and figures at which large lots were sold:

Dec. 19th, ranged 10 @21 c. Av. 14 c. Large sales 13 @18 do. 26th, do 10 @17 c. do. 13½c. do. do. 12½@15 Jan. 2d, do. 8½@16½c. do. 13½c. do. do. 12½@15 do 9th, do. 8½@16 c. do 13½c. do. do. 11 @14 do. 16th, do. 8 @15 c. do. 13 c. do. do. do. 11 @14

Milch Cows.-The fresh cow trade seldom amounts to much during the winter. Milkmen supply themselves io the fall, and towards spring begin to purchase again. Trade has been very dull for a month past, poor cows selling low. Some sent in to be palmed off as fresh cows, when they were really "stepmothers," were sold at \$25@\$30 each. Very poor, but fresh cows are selling at \$45@\$55, fair to good at \$70@\$85, and prime to extras \$90@\$100... Calves. These have fallen off in numbers, but remain steady, so far as prices are concerned. During the winter season, large quantities are sent in ready dressed, with skins on, which do not appear in the receipts. Such calves sell at 12c.@16c. for thin to prime milk yeals and 6c.@10c. for fed calves. Live are worth 10c.@12c. per To., if fair to fat, and 4c.@8c. for grass or hay fed up to thin, milk veals ..... Sheep .- There was a good supply of extra fat sheep sent in for the holidays, weighing from 120 to 200 lbs, alive. Such animals sold at 8c.@10c., with an occasional sheep still higher. Since then the markets have been tame, with a surplus of stock usually on hand. Butchers now complain of the many ewes sent to market heavy with lamb. Wethers sell much the quickest. Prices range from 41/2c. @51/2c. per To., live weight, for thin to fair sheep, and 6c.@7c. good to extra.....Swine.-In addition to the 102,450 live hogs during the last five weeks, we have had 36,779 Western dressed, most of them during the past fortnight. Arrivals of dressed, at the present time, equal those sent in alive. Dealers in hogs have had a rough season so far, prices declining between the time the hogs were hought West and sold here. They are now about 1/2c, lower than one month ago, and nearly 2c, below the prices of this time last year. We quote live at 71/3c.@7%c., with city dressed at 8%c.@9%c., and Western dressed at 814c.@814c. Light pigs, when selected out, sell for more money.

#### Special Premiums.

Fon a renewal and one new subscriber to American Agriculturist, or one subscriber to Hearth and Home.

Trophy Tomato has proved so far superior to others that we desire to have it widely distributed, and we have made such arrangements with Col. Waring as to enable us to offer pure seed from headquarters, with his trade-mark guaranty of genuineness.

Japan Lilles.—We offer from the gardens of A. S. Fuller, Esq., several of the beautiful Japan Lilies, some of which have been sold by seedsmen within the last two years as high as \$5 each. Any one of these is no ornament to any garden, and they can be had free as premiums.

Eumeian Grape-Vines.—Hasbrouck & Bushnell, proprietors of the original stock, will supply us with vines of this most excellent variety, and we wish all of our subscribers would try at least one.

I.—To every old subscriber to American Agriculturist who after this date renews, and sends one new subscriber, with \$1.50 for each, and 5 cents for postage on the premium, we will send any one of the following eight articles that may be chosen:

1 Package (200 Seeds) of Trophy Tomato Seeds.

Or:-1 Bulb Red Japan Lily, Lilium speciosum rubrum.

Or:-1 Bulb White Japan Lily, Lilium speciosum album.

Or:-1 Bulh Golden-handed Lily, Lilium auratum.

Or:-1 Bulb Long-flowered Lily, Lilium longiflorum.

Or:-1 Bulb Gladiolus, or Sword Lily, named varieties.

Or:—2 Bulbs Tigridia, or Mexican Tiger Lily, differ't kinds. Or:—1 Eumelan Grape Vine No. 1.

II.—For one subscriber, received after this date to HEARTH AND HOME, for one year, at \$3, with 5 cents for postage on the article, we will send any desired one of the above premiums. Subscriptions taking these spe-

Serviceable Pump for Deep Wells.

"T. B. R., Broad Run, Va., writes: "I have found difficulty in obtaining a good, durable pump for a deep well. Do you know a pump which is desirable for wells 70 to 75 feet deep, in localities not convenient to cities?

Durability, and non-liability to get out of order are prime necessities with us."—We do know just such a pump,

and believing it to be one of the best if not the very best

pump in the world, we offer it as a prize for subscribers to the Agriculturist. See our Preminm List on page 73.

Containing a send which of the includes

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Bound Copies of Volume 29 are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the previous thirteen volumes (16 to 28) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol., (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus: a person having sent 10 subscribers and \$12, may afterwards send 10 more subscribers with only \$8; making a club at \$20; and so of the other club rates.

There is No Mistake in the assertion that Many Thousands of our readers may this month secure, free of cost, one or more of the valuable articles described on pages 73, 74, and 75, (see also page 44,) and that, too, without interfering with their regular business. A subscriber or two a day for either journal, will soon count up enough for a large and valuable premium. Few persons, if properly enlightened as to the practical value of such journals, will fail to subscribe. They will decide to save, if necessary, a few cents per week from some needless luxury, to secure so large an amount of useful reading, and so many hundreds of fine engravings. They only need an invitation with a few explanations from some one who knows the journals.

spring will soon be Along, and those who contemplated setting out fruit trees, shrubs, etc., will do well to look out early for their supplies. It is best to begin in time, and send now for catalogues of seeds, trees, and plants, and make up orders. If dealers have their orders early, they can be all ready to supply them at the proper time, far better than if they "come all in a heap" just at the digging season, and the earliest orders generally fare the best. Our own advertising columns furnish a fair directory to good dealers—we aim to admit none others—none that we would not buy of ourselves if occasion required. As our advertisers know our strict rules, and their danger of exclusion, if nothing worse, if any member of our family of readers is not well dealt by, it is always best in writing, on sending for circular, etc., to note the fact when advertisements responded to were seen in this journal.

That Little Steam-Engine, which was described in December, is worthy of all we said of it. Our own boys find it a perpetual source of interest; and the first one obtained, which has been very frequently run during more than two months, seems rather to improve with age and use. Fifty-five of our Sunday school-hoys each received one of these as a Christmas token from their teachers, and we know of nothing else that could have given a hundredth part so much pleasure as these have. Several have added various toy attachments, which are worked by steam, and are quite interesting. It is not only a pleasing but a rational toy for boys, and there are

a good many grown-up boys that enjoy them. They are perfect, reciprocating engines that eo. Our first 2,000, bought for premiums, are fast going to those who have secured them, but we have made arrangements for a supply, for a month more at least, and will contione to furnish one of these for three subscribers to American Agriculturist at \$1.50 each, or for two subscribers for Hearth and Home at \$3 cach a year. They will be mailed safely to any part of the United States or Territories, if 36 cents be supplied for prepaying posting on the engine and box. For two subscribers to each paper at the above prices, we will send an engine post-paid.

Sundry Humbugs.-It is lamentable that Journals, otherwise respectable, continue to adver-tise almost any swindler that will pay them for the space. To issue good papers, with such advertisements where they will meet the eyes of the unwary, is equivalent to selling sugar-coated poison under a false name. Many of the things advertised contain poison to mind and morala ten times worse in the end than strychnine itself, which indeed kills the body, but not the soul also. A letter before us from a gentleman who writes like one of fair intelligence, tells us how he was swindled by responding to an advertisement which was so constantly before him in Harper's Weekly, and in other leading journals, (including several "Religious" papers.) that he supposed it must be all right. This is only one case in hundreds that are constantly coming to our knowledge. Covert advertisements of vicious books and appliances, are continually placed before the young. Every publisher should promote the pecuniary and moral interests of his readers; he has no right to print any advertisement that he has not good reason to believe is of a nseful character, and from an upright, reliable, and responsible advertiser. If his Editors-who are supposed from their very position to have facilities for information superior to those enjoyed by the readers-cannot determine as to the character of advertisementa, they should be dismissed, and better men put in their places. Unfortunately, they are not usually consulted, but office boys or clerks, who are expected to get in all the money they can, are left to judge of advertisements, or left without discretion; and so we often find in one column "Sunday reading," moral precepts, warnings against vice, exhortations to honesty, etc., and in the next column or two, on the same page, advertisements of a directly opposite tendency, and of the meanest swindlers. "Frethren, these things ought not so to be.".....We have another large batch of letters and circulars concerning the yeatended counterfeit money operators, mostly from parties already reported. We will simply give a list of their assumed names, old and new, as a sort of guide or directory to this class of swindlers: Jas. P. Baker & Co.: 11. Colter & Co.; Bell & Son; King & Co.; Owen Brothers; Jas. Fisher & Co.; Williams & Co. (the above 7 names all used by one man); Wm. J. Ferguson; H. Hicks & Co.; Rufus Stockton; Thos. W. Pierce; Wm. B. Logan; Robt. H. Holland; Jos. R. Lee; B. B. Walker & Co.; Juo. F. Hamilton; Jas. B. Sherman, etc. And as new names, assumed by this class of swindlers, we have C. E. Benson & Co., 176 Broadway; W. H. Wood & Co., 208 Broadway; J. C. Walter and Batey & Co. (alias Thos. Pierce), 599 Broadway; E. Conway & Co., 102 Nassan-st., etc. A double thief, calling himself H. Colter & Co., 195 Broadway, but who will not receive any letters there, wants money by express, and not only seeks to steal other people's money, but he either has stolen or counterfeited the printed envelopes of Messrs. R. H. Allen & Co., proprietors of the well-known Agricultural Warehouse, and nses these to give character to his swindling circulars enclosed in them. Several other reputable firms have been similarly imposed upon..... A letter from Lock-port, Ohio, says the writer's boy was so worked upon by a circular sent out from Canton, O., that he stole \$10 and forwarded it, and received about \$100 in counterfeit 50c., 25c., and 10c. carrency. The name given we withhold, as we have no such name on our list of pretended counterfeit dealers, and furthermore none of these men actually send any counterfeit money; they only pretend to, and then pocket the money of their dishonest dupes. If any one has received such circulars from Canton, Ohio, please send us a copy....." Jeffries' Grand Gift and Musical Jubilee" of Council Bluffs, Iowa, though variously sugarcoated, is in principle and in fact, nothing more nor better than a "Havana Lottery." We should prefer the latter, if disposed to invest at all in any such thing, for all the prizes awarded in the Havana Lotteries, where any are received, are in gold, good anywhere, and not what-will-you-do-with-them city lots, which would be sold regularly for cash, if they could be readily sold for any thing like what they are put down at as "prizes." We suppose some people will be foolish enough to invest and similar "Gift Enterprises," but we hope not one of our readers will do so..... A gentleman in Maryland, who chanced to receive a copy of our paper from Washington, as a wrapper, gives us

quite a list of swindles practised upon himself and neigh-Had he read the Agriculturist for past years, ha bors. would have seen all those humbugs he speaks of, and many hundreds of others, shown up in their true colors. His account could be repeated in almost every neighborhood in the cotire country where this journal has not been read for years past by a sufficient number of persons to act as centers of information to the community generally ..... H. H., of Baltimore Co., Md., and a good many others, are "definitely" informed that not only the "Spanish Policy" a 599 Broadway affair, but every other case is a positive swindle, where parties profess that a "\$200" watch or any other prize has been drawn which can be had by the payment of 5 or 10 per cent on the valuation. There have been very many operations of this kind, mainly by parties claiming to be "receivers" for some exploded gift enterprise. We have had many \$5 and \$10 bills sent us to pay such assessments, which have of course been returned. Multitudes have caught at the plausible bait; their money has never been heard of afterwards. In some instances operators have sent a cheap pinchbeck or gilded or silvered watch, costing \$2 or \$3 to get up, instead of the "\$100," or "\$165," or "\$200" watch, said to have been drawn. The professed "Spanish is an ontrageous swindle ..... Most of the professed "agents" of "Havana lotteries," now operating in this country, are swindlers, using counterfeit tickets; nothing is ever heard of the money sent to them; and the cases are so rare where one gets any thing from the genuine tickets, that none but very ignorant people or lunatics, will ever invest a dollar in them..... The Pocket Time-keeper for \$1 is an absolute fraud—no better than a chip of wood with a string tied to it. seller may well say "it can never go wrong," for the reason that it never goes at all. Rocks may just as well be said to be "never out of time"—" never too fast nor too slow." The soller gives his business place as "Broadway, N. Y." Said street is some six or seven milea long, and has over 1,500 numbered buildings, with five to fifty rooms in each; so the defrauded one would have a long search to find this man. And, by the way, the reader may always consider any man a swindler who falls to give his street number in any city or village large enough to have the buildings numbered. But the giving of the number is no certain indication of reliability. A private dodge is to give a pleture of some large building, with the operator's name on the froot. You go there and hunt through 30 or 40 rooms without finding the name you are looking for; or if found, it is in small letters on a door, which is kept closed except to the letter-carrier or some green dupe, whose character is studied through a small invisible aperture before the door is opened. Perhaps more frequently a boy or clerk is found, while the chief operator is behind a screen, and the said clerk answers that the Proprietor is or is not in. according to a secret signal from the hidden boss, who judges from his retreat whether or not he has a goose to be picked..... Neven buy professedly cheap jewelry, of any kind, except from a well-known, skilful, and reliable dealer, or npon his judgment. These cheap diamonds, "equalling in brilliancy real diamonds," are poor glass affairs, worth nothing except to make the wearer appear ridiculous in the eyes of people who know any thing of genuine articles. Many thousands of glass things, costing a few cents to make, fitted into a galvanized setting, are sold at \$5 to \$10 each, and represented to the buyer as "equal to diamonds valued at \$100 to \$600. "All this cheap jewelry business is sheer humbug, as every one will find who touches it, "C.O.D." or otherwise ..... An Old Subscriber in Chyahoga Co., O., writes as to caution the farmers of that State against the operations of a so-called Cleveland Roofing Company. He says they go into a place, select their man, offer to put on his roof free, as an advertisement, get his signature to an order for the material, and then use this in concocting a forged note, which is sold to confederates, after which, threats of law are used to frighten farmers into paying black-We know nothing further than is gleaned from the latter before us, but it will be well for farmers to look out for any such swindles. We remember in old times of having a new patent fanning mill left for a few days as a sample to be seen by the neighbors—rather against the protest of the farmer. The next thing was a bill for it of \$30, and then a suit-but the result was, they paid \$6 storage and took their mill away.....Once agaio, we earnestly caution our readers against heeding the circulars or letters of any advertising Doctor, or his medi-cines. Listen to no advertising eye or car or lnng doctor. But our space is full, and we must leave over, to the next paper, several humbugs now in hand.

Burning Corn-Stalks.—"R. T. P.," who has a river-bottom farm in Ohio, writes: "I do not cut up my corn fodder, but in the spring I hitch a horse to each end of a railroad iron rail, and drag down the corn fodder and plow it under. In cultivating the land afterwards this fodder is sometimes pulled up. What

benefit are the stalks to the soil when turned under, and would it be considered wasteful if they were raked up into piles and burned?"—With us, we should consider the stalks worth from \$2 to \$3 per ton for manure. On rich, botton land, abounding in organic matter, they may be of little value; and in such a case, if they can be burned with little labor, we should not regard the practice as altogether reprehensible.

Another Good Advertising Medium.—The circulation of Hearth and Home has been increased more than twenty per cent since its publication from this office, while its advertising rates remain (for the present) the same as formerly. The same rule as to character of advertisements is observed as in the American Agriculturist. It is read by a buying class, and at the rates charged (40 cents per line), is one of the cheapest mediums in the country.

House and Barn from Designs in the Agriculturist.—Mr. Alex. Kinmoot, Defiance Co., Ohio, in renewing his subscription to the American Agriculturist, writes: "I have taken it for several years, and find it a very valuable paper. I have followed hints from it in building my barn and house, and an well pleased with the result. The barn is a bank barn on the level with bridge. It is very satisfactory. My honse is a one-story house, from plans in the American Agriculturist for January, 1867. It is all I cau desire for ease and comfort."

How to Get Rid of Rats and Mice.—A gentleman of large experience, and fully as humane as most of us, says he gets rid of rats by putting polash in their holes and runs. The poor wretches get it on their feet, and over their fur, then they lick it, and don't like the taste of it; it burns them somewhat, and the more they see of it, the less they like it: so they clear out almost as soon as the application is made. To get rid of mice, the same person uses tartar-emetic, mingled with any favorite food; they take it, take sick, and take their leave.

Preserving Eggs.—This subject has been so thoroughly discussed at different times in our pages, that many persons must have made careful trials, and be able to report their success or failure in the use of different recipes. It is much easier to preserve eggs in autumn, to keep until February, than to preserve spring and summer eggs to last through moulting time.

Unloading Potatoes or Corn—A Good Idea.—R. W. Twitchell, of Kent, Ohio, writes: "In unloading corn in the ear or potatoes, when you wish to shovel them out of the wagon box, it is generally a vexations job to pick out two or three bushels by haod before there is room to begin to shovel. Now, by taking a rather wide board, about three feet long, and placing one end on the bottom and the other on the endboard, you have a chance to begin shoveling at once. The board should be somewhat wider than the shovel, and of course must be put in before loading.

### "What is the Best Subsoil Plow?"

—We cannot tell. There are several patterns that answer a good purpose. Let us hear from those who have used them, especially in regard to ease of draft and effectiveness of work, as well as those udapted to light work on sandy subsoils, and those suited to heavy clay subsoils, with more or less stone to strike against.

Scours in Sucking Pigs.—"Farmer" writes from Goldsboro, N. C.: "I frequently lose young pigs by accours before they are old ecough to eat. Can you not give your readers a simple and efficient remedy?" It would be guess work to prescribe without a knowledge of the cause. This probably lies in the food of the sow, but very likely in the treatment of both dam and farrow. Is the sty warm, dry, and well littered? and does the sow have, both before and after farrowing, wholesome, cooked food consisting largely of roots?

Cotton-Seed Meal.—"G. R. A.," of Biddeford, Me.—This is used quite extensively in this section of the country for milch cows, and for nothing else. When used in connection with meal or shorts, it is considered superior to all meal or any other grain feed.

Use of Ashes with Bones, etc.— Wm. Eppinger, of Morgan Co., W. Va., asks: "Will it pay to buy bones at one cent per pound and ashes at twelve cents per bushel, to dissolve the bones with?"— Ans.—\$30 a ton is dear for bones; they dissolve slowly in either manure or ashes, but the ashes will probably be worth 12c, per bushel. That is enough to offer for good hard-wood ashes, such as soap boilers would use. "Will the ashes set the ammonia free?"—Ans:—Yes, nnless the heap is carefully manipulated, and kept covered with a layer of earth or peat. "Is it good to mix ashes with hen manure, to be applied to corn in the hill?"—Ans.—No; much better mix dried earth with it, and work it over thoroughly once or twice.

Large Hen Establishments.—G. L. Hurst, Chicago. We know of none successfully carried on where more than one or two hundred fowls are wintered. There may be such. On Mr. Warren Leland's farm some thousands are kept, but these are seattered, and have the range of twenty-acres. There is no doubt about the profit in it, provided the stock remains healthy.

Hiring Men by the Mouth.—Tho same writer asks: "If a man employed by the month for a certain number of months lose time, can he be required to make it up?"—We think not. If he was bired for \$26 per month, and either from sickness, or with the consent of the employer, lost three days' time, \$3.00 might be deducted from his wages, but he could not be compelled to work three days longer than the time he was hired for; neither could he, in such a case, compel the employer to let him "work out his lost time." This is not a legal opinion, but we think it is common sense, and the law is supposed to be based on justice and common sense.

Plaster in Manure Heaps.—A correspondent asks: "If plaster is put ioto a manure heap, and the manure is spread on the land next spring, will the plaster do as much good as if put on separately, or does it lose its power by being put in the manure heap?"—If any portion of the plaster is converted into sulphate of ammonia, the ammonia will do more good than the plaster. And the plaster not acted upon, will not be injured. It is plaster still.

Rabbits and Young Trees.—"S.," Georgetowo, Ohio, succeeds in keeping rabbits from injuring bis trees, by rubbing the trunks with hog's liver, as high up as the rabbits can reach. It seems that animal matter is repulsive to the rabbit. Many Western orchardists sprinkle their trees with blood. Some shoot a rabbit, split it open, and rub the tree with the raw flesh.

Is Ditching Farm Work?—A correspondent writes: "If a farmer employs a man by the month to work on a farm, can be require him to ditch a part or all of the time as farm work?"—If he bired him simply to do farm work, and said nothing about requiring him to dig ditches, it is somewhat doubtfal whether he could compel him to ditch most or all of the time. The question would turn on the common enstom. Digging ditches is certainly ordinary farm work, but it would be unfair to keep a man at it all of the time.

What Kind of Stock?—Wm. Webb, Huntington Co., Ind., writes: "Our farms in this vieinity are on river bottoms, especially adapted to corn, grass or roots. What kind of stock should I raise to make the most of a given amount of labor—whether horses, eattle, swine, or sheep?"—Ans.: Grass, corn, and roots indicate clearly beef or mutton, or both We should say stock with eattle first at any rate, and feed for beef either raising Shorthorn steers to turn off at 3 years old, or bnying stock to fatten up for market. After a while you can go into mutton sheep, raising both green fodder crops and roots for them, and increasing the size of the flock as they prove profitable. Of course long wools of some kind would be the class to select.

Seed Corn for Soiling Crops.-The result of our experiments last year with Soiliog Corn, indicates that what is known in the New-York trade as "Western mixed" (a small grained corn of mixed color), is the best. Sweet corn we found hard to bny, and the variety we used had a very small growth of stalks. Probably the "Dexter" and the "Stowell" would have done better, but we could not huy these for less than \$3 per bushel. "Southern White," which produces an enormous growth of stalk and leaf, seems—at least when grown at the North—to be deficient in sugar and other nutritive matter. The "Western mixed" grew to a very good size, about 7 or 8 feet high, and the rows, which were 3 feet apart, interlaced thickly at the top. In quality we could not perceive (judging from the condition of the stock and the produce of the dairy) that it was inferior to sweet corn. How much allowance is to be made for the very dry and hot weather of last summer we cannot say, but while we shall experiment again this year with the Southern variety (sweet is out of the question on account of the difficulty of getting seed), we shall plant nearly our whole crop with the Western, using 5 bushels of seed per acre, in 3-foot drills.

Roup or Swelled Head—Catarrh in Fowls.—"J. P. H.'s" hens have clearly the Roup. They swell around the eyes, and after a while go hlind in one eye, or in both, and it is catching. No common fowl is worth bothering with after the eyes swell badly; before that they may be cured with tolerable ease. The month, throat, eyes, and nostrils should be washed ont clean, and sponged with strong chloride of line-water, or what is better Labaraque's solution, chloricated soda, and the whole flock, but the ailing ones particularly, should have the heartiest diet—iron in their water, bread and ale, soft feed well peppered, and meat of some kind.

A Good Jersey Grade Heifer.—M. Abraham Peckham, of Middletown, R. I., has a seveneighths Jersey helfer that came in last spring at two years old. She gave, all through the season of good feed, fourteen quarts of milk a day. She is to calve again early in March, and when we saw Mr. Peckham, about the middle of January, he told us she was giving four quarts a day. This is the sort of animal that butter farmers must raise if they hope to have the best results, only the more nearly thorough-bred they are, the better, This heifer will not weigh more than 650 lbs., and she has given, between her first and second calving, not less than 2,500 quarts of the richest milk. A big Shorthorn cow, weighing twice as much, and consuming twice as much, would have done well if she gave 4,000 quarts. She would have cost more to raise, more to keep, and would not probably come in until a year later. probability is, though this we cannot positively assert, that her 4,000 quarts of milk would hardly have made more butter than the 2.500 quarts of the little Jersey, and its quality would certainly not have been so good. If every farmer who makes butter as a leading branch of his business would scenre the services of a thorough-bred Jersey bull, of well-known butter-making stock, butter making would be much more profitable, and the country would be much better supplied ten years hence than is possible with the hap-hazard, scrub bull-hreeding that now prevails.

The Air-Line Railroad, from New York to Boston, will be one of the most important routes in the Eastern section of the country. that five distinct railroad and steam-boat routes have for years past connected these two important cities, with a profitable patronage upon all of them, indicates the immense amount of daily travel. It needs little figuring to estimate the advantage of a direct, through railroad that shall save 20 to 25 miles of distance, and an hour's time to each one of vast multitudes that annually traverse this Reckoning a thousand for each week day, the annual saving in distance would be six and a quarter million miles, or two hundred and fifty times around the globe, and a hundred years in time, estimating the saving in distance at 20 miles and in time at one hour. The new ronte passes through many localities which will afford much local traffle. We are glad to learn that under the energetic presidency of our old friend. David Lyman. the last link in this route (between Middletown and Willimantic, Conn.) is rapidly approaching completion. (This portion of the Air-line route is termed the New Haven, Middletown, and Willimantic Railroad. Messrs. Hatch and Foote offer some first mortgage bonds, which must certainly he a safe and profitable investment for any one having \$500 or upwards to put out on interest. An examination of the documents, which the advertisers furnish free to all applicants, will be interesting evon to those not specially desiring to invest.)

A farmer at Horseheads, N. J., asks our opioion as to the relative merits of these two harrows. We have not used the Nishwitz harrow on our own farm, but from what we saw of it at the Trial at Utica and other places, deem it a useful implement. Shares' harrow we have used for some years and can recommend it, especially when having steel teeth. We should think it less liable to get out of order, especially on stony land, than the Nishwitz. Neither of these implements, however, is properly a harrow. They are a cross between a harrow, a cultivator, an old-fashioned English rib-roller, and a gang plow. They can the ground and turn it over in small, shallow furrows. We are inclined to think the Nishwitz would be the most effective in proportion to draft, and much the most durable.

Windmills.—W. Haskell, Bucksport, Me., writes: "I see in the Agriculturist an allusion to a windmill for raising water. Perhaps others of your readers as well as myself would like a little information as to their cost, efficiency, and best mode of construction; and whether they could be used as a motive power for other purposes as well as for raising water." The writer has used a windmill for nearly three years to raise water up an elevation of nearly 50 feet, and over a horizontal distance of 800 feet. The original cost of the

machine was \$150, and it cost about \$50 to set it up. Its operation has been perfectly satisfactory. It ran for two years and a half without being injured in any way, although we had during that time the severest gale that has been known for fifty years. A few months ago one of the clamping irons having been so much worn away as to give too much play to the machine, it got rocking in a heavy wind and was badly broken, so that it cost about \$40 to repair it. It now seems to be about as good as new. There are two or three requisites that seem to be very essential in the construction of windmills. The must be constructed on the principle of window blinds, so that there must be no single piece exposed to the wind that will offer much surface for its action : there must be some system of governors that will cause it to feather its sails when running at too great a velocity; and the sails must be held up to the wind by a weight or weighted lever, that will yield and allow them to feather before too great a strain comes upon them. A properly constructed windmill is perfectly adapted to the driving of any farm machinery, with the single exception that it cannot be depended upon at all times, being available only when the wind blows.

The American Journal of Science to be Published Monthly .- The scientific world will greet with pleasure the appearance of this ancient and honored journal as a monthly. It was begun by Professor Silliman in 1813, and is now continued in the proprietorship as well as editorship of Professor B. Silliman, his son, and Professor Jas. D. Dana, assisted by Prof. Gray, the hotanist, Prof. Gibbs, the chemist, both of Harvard College, and by Prof. Newton, the astronomer, Prof. Johnson, the agriculturist, Prof. Brush, the mineralogist, and Prof. Verrill, the naturalist, all of Yale College-a galaxy of scientific lights, such as no similar journal can boast. The publication forms two annual volumes, of course indexed, and a complete index is furnished every ten years besides, giving great additional value to the volumes. The subjects discussed bear upon pure natural science, not overlooking its applications. The Journal contains records of important discoveries and of new views, and is distinguished throughout the world for conscientions devotion to scientific truth. It is published by Silliman & Dana, at New Haven, Conn.

To Make Cows Give Milk in Winter.—"J. B.," Elizabeth, Pa., asks: "Will you please give me the best method of making cows give a liberal quantity of milk in the winter?"—Give them "a liberal quantity" of feed of the proper kind. Feed them enough to make them grow fat, and dry off when within 5 or 6 weeks of calving. Send for the Agricultural Annual for 1870, and read 8. M. & D. Wells' article therein. Rye or wheat bran, linseed or cotton-seed oil-cake meal, carrots, beets, mangels, parsnips, and ruta-bagas, are excellent milk-producing food. The last named, as well as soft tarnips, will frequently give some taste to the milk.

# Cheap Money—Money wanted at the West, at a High Interest.

Constant inquiries for money, come from farmers and others in the Western States, especially from Illinois and the States and Territories west of the Mississippi. Here is a specianen: ".... I see money constantly, or often, quoted in Wall Street as 'abundant,' and 'ensy' at 4,5, or 6 per cent. Now, why can you not get some for me on land security worth five times the amount I wish to borrow? I can afford to pay 10 per cent to the leader and pay you a good round commission to obtain it for me. My rich, virgin soil yields large returns for little labor, and it will bear this interest, and yield me a good profit. I only want means to stock it, and extend my other similar letters, we answer:

1st. We live in the country, come daily to the city to attend to our own business, and go home to work with pen, etc. So we have little to do with city money matters, and can not undertake to act as funnial agents.

2d. If we could attend to it, it would be difficult to get money to invest at a distance, no matter how good the security, or how high the rate of interest—though we should say it would pay many men having money to invest, to go West with it, personally examine the property, and loan it there. A brief advertisement would call out plenty of good applicants for the money. We believe it would be a good thing for borrowers as well as lenders, and hope the hint will be acted upon, but we have not time to act as agents for either party.

3d. To our distant country readers, we will explain that this cheap money is only loaned "strictly on call"—that is, the borrower must deposit as seemity, not mortgages, but U. S. Boods, or Railroad or other Stocks or Bonds, that one sold at once for each at the Stock Board, if

the money is not returned on any day and on the day it is called for. A great deal of money used mainly for Stock speculations is loaned thus from day to day when not in actual use, and this is the cheap 4, 5, and 6 per cent money quoted. Commercial paper, "gilt edged, is, notes of parties of the highest credit, and well endorsed at that, is seldom quoted as low as 7 per cent, unless having a very short time to run, and in a dull time of speculation. Ten to fifteen per cent are more frequent quotations for pretty good notes, having only 2 months to run. Right here, at the money center, there are usually good first mortgages that can be bought at rates that will yield 9 to 12 or more per cent per annum; and second mortgages, almost as good as first ones, that will yield 15 to 20 per cent. There is a considerable class of persons whose sole business is to buy up such mort-They thus make quite as large a percentage as men in regular business, with quite as little risk.

Some of the city newspapers have constant advertisements such as this: "\$100,000 to Loan on City (or County) Property, etc." But go to one of these advertisers, and you will usually have to pay a "commission" and "searching title" expenses, that will cost a heavy percentage. The Savings Banks and Insurance Companies lend money at 7 per ceut, but they are restricted by their charters, or by custom, or by bye-laws, to particular kinds of property, and in specific locations,—usually within the city, or county where they are located, or at least in the State.—We hope the hints above may prompt some capitalists among our readers, to look into the feasibility of taking their capital to the West, where they can make a legal interest, on safe invostments, much higher than East, and aid others also.

# The Scarcity of Water.—Look out for Mice on Fruit Trees Now.

Mice breed rapidly, and it may not be generally known that an immense number of them are usually ed, in autumn, by the filling of the ground with water and its freezing. This is one of Nature's modes of of checking the multiplication of these pests to a degree that would make them worse than the frees in Egypt, But the past autumn and winter, thus far, have been in many parts of the country unprecedentedly dry. We hear from some sections of so great a lack of water in cisterns and wells, that much anxiety is felt for the result. In some cities the fountains are so completely dried up that large extra fire patrols are organized to watch against conflagrations. With the above facts in mind, it will be well for all having fruit and other trees to look out that they are not girdled by the redundant mice that still barrow in the dry soil. We well remember that, some twelve or fifteen years ago, after such a dry autumn, there were hundreds of thousands of fruit trees girdled and destroyed soon after the first heavy fall of snow. In many cases large orchards were rained. Mice seldom, if ever, gnaw a bare tree, or one around which the snow is firmly trampled. The simplest protection, therefore, against their ravages, is to either keep the snow cleared away from any tree or shruh in danger, or to trample it firmly down around the trank as soon as it falls. To leave a light snow around a tree for a day or night will furnish a fine cover for the depredators to work under, Tarred paper put around a tree, and extending up 10 or more inches from the ground, and held by a string, is a further eafeguard worth providing for all valuable fruit The roofing felt, saturated with coal-tar, can be trees. bought 30 inches wide for 5 to 7 cents a yard, in large quantities, and each yard will cut so as to make six pieces for trees not more than 51/2 inches in diameter, or twelve pieces for trees less than three inches in diametor.

Hungarian Grass and Corn Fodder.—Geo. Burr, of Medina Co., O., writes: "I have just come into possession of a large farm, and about 100 acres of it have not been plowed for fifteen years. The old meadow is bottom land, needs draining, and is all run ont to wild grass, and very light at that. There is no piece that I can mow for hay next snumer. I have 6 cows, 12 young cattle, and 3 horses that I wish to keep over. What do you think of Hungarian grass for hay? The soil is light, sandy loam, and is nearly all pasture. Ans .- You have a good many animals from which, with dilligence in the use of means, you can make a big heap of excellent compost where with to manure corn in drills for fodder. You will be able to make at least one good load of manure from each head of stock per month; you will have four months, and will thus have 70 to 80 loads of manure. Sow all the corn fodder you can, manure well, and make up with Hangarian grass any deficiency that may occur, sowing the latter so that it will not ripen faster than you can take care of it, for to be wholesome, it must be cut green. Ripe Hungarian hay injures stock.

# The Great "Patching and Darning" Exhibition.—Editors' Notes.

Though a few days only were allowed for preparation. the contributions were nnexpectedly large. Four Hundred and Fifty-three Ladies, from Twenty-nine States and Territories, sent in 718 parcels, numbering 1311 pieces, of which most were quite serviceable garments Among them were 278 pairs of Pantaloons (162 for Men. and 116 for Boys); 119 Coats (49 for Men, and 70 Boys' coats and jackets); 52 Vests; 28 Sacques; 31 Dresses; 18 Skirts; 47 Shirts and Chemises; 29 pairs of Drawers; 312 pairs of Socks and Stockings, etc., etc.; nearly all of woollen fabric. The contributors numbered by ly all of woollen fabric. The contributors numbered by States as follows; from Maine, 4; N. H., 5; Vt., 7; Mass., 29; R. I., 9; Conn., 34; N. Y., 124; N. J., 35; Pa., 47; Ohio, 36; Ind., 21; Ill., 17; Mich., 18; Wis., 5; Iowa, 9; Nebraska, 5; Kansas, 7; Va., 7; W. Va., 2; Md., 10; Del., 7; N. C., 3; Georgia, 3; Mo., 5; Cal., 2; Wyoming Ter., 1; D. C., 2.——Specimens were sent by girls of 8 and 10 years, by Ladies of 80 to 90, and by those of all ages intervening. The Exhibition was visited by a throng of people and was kept open on the fourth day, in response to the request of many gentlemen who drop-ped in on Friday, and were so astonished and pleased, that they earnestly desired an opportunity to bring their wives and daughters on Saturday. Nearly all the city papers noticed the exhibition with great commendation several of them giving it marked attention as a highly useful as well as entertaining affair.

Below we print, just as they were written and sent to us, the very pleasant notes and reflections of a ladyone of the most gifted writers of the day-who visited the Exhibition, and looked over a portion of the letters accompanying the articles. We will add, here, that the Publishers were more than satisfied with the good results, though it cost them some \$300 for prizes, expressage, etc., besides a serious interruption to their regular husiness for several days .- The beneficial results were two-fold. First, more than a thousand useful garments, exactly what is greatly needed at this season, were placed in the hands of the good, noble-hearted Ladies who devote much time and care and labor to hanting up and feeding and clothing those suffering from destitution. For convenience, the boxes, bales and parcels were first taken to a spacions room at the "Old Brewery," or Five Points Mission, and seven ladies devoted two days to opening, assorting, labeling, numbering, and arranging the articles. To have heard their many exclamations of gratitude to the donors as they opened garment after garment, and talked over what they would do with each of them, would have amply repaid every contributor a hundred-fold. We know these ladies will make every article do good service to the unfortunate children of extreme poverty. Every contributor may feel assured that each piece of clothing she sent will be worn out by some poor mortal who will thus be made more comfortable. Every person who does a good act of this kind is not only happier, but is really made better in heart by the deed. It is "more blessed to give than to receive," and it is always blessed to give. The non-prize takers are therefore scarcely less rewarded than the successful ones.

But a still greater good has been accomplished by this remarkable exhibition. Besides the Four Handred and Fifty-three Ladies who sent their own handiwork, There were thousands of others, who did not contribute, but whose attention was called to the subject, and who set about testing and improving their skill in the very useful and needful "accomplishments" of patching and darning well—accomplishments far more useful to nineteentwentieths of the great mass of wives and daughters than embroidery and crocheting.

There were hundreds of specimens which showed very plainly how a torn or worn garment can be made almost as good as new, and this, too, when leaving hardly a visible trace of the repairing. An intelligent proprietor of one of our largest clothing and tailoring establishments in New York, as he looked over garment after garment, remarked frequently, "I could afford to give high wages to the woman who can use the needle like that; such women are very scarce."

Some nseful hints afforded by this exhibition with extracts from letters, etc., will be discussed in our paper hereafter. We have now only room left to speak of the prizes. The articles were all labeled with cards giving the number and class, leaving the judges in the dark as to the real contributors. Sixteen ladies, chosen for their intelligence and good judgment, were requested to act as a Committee of Award.\* They met on Thursday morning, divided themselves into Sub-Committees, on the six Classes, and devoted the day to a careful examination of every article, and not selecting the most meritorious ones, counseled together in making the final awards. The different qualities of the materials, the character of the work, its utility, etc., were all taken in-

to account. We have not room now for the separate reports and remarks of the Class Committee. The Publishers will award some other prizes to specially meritorious articles, and in our next a list of these and of a considerable number of others which the Committee thought should receive special HONORABLE MENTION. The following are the Committee's

#### Awards of Prizes:

C	CLASS APATCHING-Girls not over 16:*	
1st Prize:	CARRIE M. C. TOWERS, Tottenville, N. Y	\$15
2d Prize:	EUNICE CASE, Goshen, N. Y	\$10
3d Prize:	ELIZA W. TUTTLE, Cheshire, Conn	. \$5
4th Prize:	NELLIE E. HALLOCK, Jamestown, N. YH.	& H.
5th Prize:	MARY E. Sisson, South Portsmouth, R. I	A, $A$ ,
	CLASS BPATCHING-Ladies over 16:	

1st	Prize:	MRS. M. C. PARKER, Washington, Iowa\$15
2d	Prize:	MISS CLARA M. BLODGETT, Philadelphia, Pa .\$10
3đ	Prize:	Mrs. G. M. Woodward, Columbia, Conn \$5
4th	Prize:	MSS. ELIZAB'TA BERKER, No. Bergen, N.Y.H.& H.
5th	Prize:	MRS, J. H. READ, New York City
	CLASS	CDarning Garments-Girls not over 16:

ist	Prize:	Maggie Shaw, Noblestown, Pa	\$	15
2d	Prize:	LOUISA G. DREER, West Philadelphia, Pa	\$	10
3d	Prize:	FLORA SORTORE, Belmout, N. Y	:	₹5
4th	Prize:	LIZZIE CLARK, Chester, N. Y	de	H.
Selv	Prizo.	Lor Hope Doror Dol	4	4

	CLAS	s D.—Darning Garments—Ladies over 16:
ist	Prize:	Mas. Jean Marc, Plainfield, N. J
54	Prize:	MISS MAGGIE NEWELL, White Plains, N. Y \$10
3d	Prize:	MISS M. E. TRUMP, Rossville, Md \$5
ith	Prize:	MISS MARGARET COOK, Sherwood, N. Y H. & H.
5th	Prize:	Mrs. A. C. Macy, Jr., Hudson, N. Y

ORANGE JUDD, MISS ADA F. GOODING.

### The Exhibition of Patching and Darning.

BY A VISITOR.

The san, going his basy rounds on the 12th day of Japaary, and looking brightly down on Broadway, as is his wont, of a clear winter morning, saw, perhaps, no more unexpected sight than that which stared him in the face at the office of the American Agriculturist. On all other days of the year he had beheld a well-regulated publishing Counters loaded down with wise books; shelves bristling with array of things which Agriculture knows all about, but which are mysterions and awful to the common mind; distracted looking clerks, shut up in little pens, as if they were too dangerous to be at large. and engaged in hand-to-hand encounters with whole columns of appalling figures that, like poor Dora's, "won't add up:" baskets of prize potatoes and incom-parable seeds, of queer bulbons deformities, warranted to turn out beautiful flowers, and of such pleasant jokes of Mother Nature as strawberries in December, and blossoms in snow-time; all the agricultural wisdom of the country as incarnate in members of the Farmers' Club, the Ogden Farmer, and other Solous of the sod. coming and going from morning until night;-these are the every day properties of the office of the Agriculturist and Hearth and Home, and this is its usual aspect.

But, on this extraordinary Thursday, that respectable and bookish sanctum seemed to have gone out of its mind. The floor was crowded with boxes, bundles, bags, bales of old clothes. The counters were heaped with aged and infirm garments. The shelves were buttressed and palisaded with double walls of faded woollen. Nay, ancient pantaloons and venerable socks fairly bestrode the walls of the Publishers' private office, and flaunted from the sacred precincts of the Editor-in-Chief. The Jew-shops of Chatham Street had never half so extensive a stock in trade, nor half so critical inspectors, for that matter. For this congregation of old clo' was the reply to the appeal of Messrs. Orange Judd & Company for fine specimens of patching and darning, and the busy ladies flitting hither and yon were the Committee of Examination.

And well might they he busy, and well might they

pause perplexed over every third specimen. For the good, industrious, frugal, and determined women who read the appeal had responded with more than Thirteen Hundred articles of clothing, and some of the darning was so fine that the Committee believed that the good housewife had coaxed a family of spiders (by a promise of undisturbed housekeeping through an unlimited future) to weave the frayed edges together; and some of the patching was so exact and dainty that the Committee was persuaded that the loom which wove the original fabric was a clumsy contrivance compared with the deft fingers which repaired its "looped and windowed raggedness. Plenty of darns there were which the youngest eyes of that grave Examining Board could not have found but for the guiding white thread, like Ariadne's clue. Many a patch joined itself to the parent stock as a graft to an old tree, seeming to improve the quality of the original. And again and again, and yet again, did a veritable garment appear which must have suggested the problem of the jack-knife, which, being borrowed by Tommy from Johnny, and supplied by said Tommy with a new blade, and in its turn embellished by said Tommy with a new handle, demanded of our puzzled infancy to know whether said Johnny had any right to reclaim the reconstructed article. So had new patch become old material, in its turn patched upon with newer,

And oh, the "web of life of mingled yarn, good and ill together," which all these pieces joined to make, and which they so innocently revealed, that he who ran might read. It gives one a sharp twinge of remorse for shillings idly spent in candy and tinsel, to think of the patient poverty which has put one handred darns into this old stocking and its fellow, before it felt that it could afford to give them to a poorer poverty than itself. There is a sound prick of external conscience for the careless, in the needle which has carefully repaired two hundred moth-holes in a single garment, because it was the only garment its owner could afford to give away. There is an nnconscious pathos in the cheery words of the Kansas honsewife far out on the border, who sends her package of stont clothing (mended and mended till no vestige of the first fashion thereof appears, and almost past mending now), with the wish that there were more articles, and better; "but the truth is, we are all so poor out herc. that husband and boys have to wear their clothes till they fall apart, which is perhaps a good thing, for the scarecrows look so exactly like the men, that the birds can't tell them from each other, and so leave the crops alone. It would be a blessing to have the paper for a year; library for the honsehold and fine arts for the walls; but my mending has to be done with one hand on the churn or the wash-tub, and I can't expect to take a prize."-And you are more disappointed than the sender can be if these old stockings are not worthy of a prize, for she who sends them says: "We had to give up the papers when my husband died, for there were many months to feed, and only I to fill them. But I think I see a chance now to get them again, and I send the only pair of stockings we can spare, with the darns of two years in them. If I don't get the paper, two cold little feet will get the stockings, which is better.

Well, well, this garment might have been worn all his life by Old Parr, and the old lady of ninety who sends it certifies in the smallest of hands, in the most exact of spelling, that she is not a tailoress, that she set her patch and wove her darn unaided, that she is very poor, and would like the paper to brighten her lonely evenings, and so sends her bit of work for competition. Dear old lady! her patient eyes are not so quick as once they were, and the stitches are not so fine. But the good heart, that hopes the poor patched clothes may help somebody who needs them more than she, will one day take the prize that only the Highest Court of Inquiry offers.—And the very next garment comes from a little girl eight years old, a tiny Dame Durden of a creature, who observes with philosophy, "i snpose i cannot so well enough to take this prize but i thought i would try, and then you see, Mr. Judd, if you should offer another prize when i am bigger, i might be able to take that."—And the next, why surely this comes all the way from Nebraska! Pinned to the tidy patch is a letter written on fair paper with a pretty initial letter W, at the top. And what do yon suppose that letter says. Curly-heads? It says, as plain as print, "Mr. Judd,—I thought I would try if I could get the prize. I have mended these pants all myself. I'm a little Indian girl and I'm only fourteen years old.

int,
e prize. I have mended the
title Indian girl and I'm only fourteen years on.

From your friend H— W
Genoa
Pawnee Reservation
Platte Co.
Nebraska,

[The Agriculturist wants to whisper in your ear, bright little H. W., (and It hopes that the two or three hundred other persons, mostly "grown-ups." who have made the same mistake may overhear it, and take heed to their ways.) that there is no such word as "pauts" in the English language. "Pantaloons" or "trousera" is the name of the garment which you send and which your

small fingers have done their best to mend. While we are school-girls suppose we learn to speak the language as well as we can, and then we shall not be mortified, when we are old enough to teach children ourselves, (or, possibly, even wise enough to serve on a Committee on Patching and Daralng,) by having some shocking blunder of speech bonnee out of our mouths in a way to make us wish ourselves deaf and dumb!]

A tidy bundle of clean, warm, well-mended clothing comes from a Boy of twelve, who says:

" \* \* \* And I have washed and ironed each article that is in mother's bundle and in mine. I have always wanted the Agriculturist ever since I first saw it. If you can send it this year for what I have done I will subscribe next year. I picked hops enough to pay for Hearth and Home last year and this year, and I think I can pick enough more to pay for the Agriculturist after this year. These are my outgrown clothes. I wish I had something nicer and better to send yon, but I have not.

Yours Respectfully, N. G. L. (The Agriculturist has a word to whisper in N—'s ear, too. And it is to tell him that one of the greatest scholars America has produced, picked huckleberries enough to buy his first hook, a dictionary, and made himself master of twenty-eight languages before he died, earning every dollar which his education cost him.)

What have we here? Surely a pair of Sionx Indian leggins! And who shall send them but a dear old lady living away out on the Pawnee Reservation, where a Sionx, in his war-paint and leggins, not infrequently makes an inwilling legacy of both to the Pawnee who is always in wait for them. The children make all manner of fun of her for sending her homely work to the grand show, she says, but though she must work too hard to do fancy mending she doubts whether any other exhibitor can show more thoroughly mended garments than she. One can fancy the frontier cabin and the great stretch of prairie, and the loneliness of this white winter solitude. One can see the busy honse-mother, in-door-hand and field-hand indifferently, when need calls, driven and harried with the endless work of a settler's wife, but finding time, thank Heaven, to laugh with the children, for all that. -And here is an old garment patched by a motherless girl of afteen, who keeps house for her father and brother and goes to school. And here is an envelope out of which a great broad ray of sunshine seemed to fall, as the slip came ont. The slip deposeth and saith that the writer did patch and mend a certain pair of tronsers, (namely, the wedding breeches of her brother-in-law) with the sleeve of her mother's old broadcloth cloak; and furthermore, that "I did it entirely by myself, sitting with my back to my mother, who was on the opposite side of the room, lest the patches should feel her influence and go on right of themselves." Honest Louise!

But O, see this little cloak! It was made by "just n poor man's wife," from four old pairs of pantaloons, one old vest, and two old coat linings! "There are sixty-eight pieces in it," says the label, "and I made it in two days. It has been worn three years to public school, and I hope it may keep some other darling warm for three years more." All the way from the prairies came that garment, too, shining with cleanliness, and sweet with the brooding mother-love, stitched into frayed edges and thread-bare scams, that look fairer than broidered liems.

From twenty-nine States and Territories this harvest of old clothes has been reaped. Four hundred and fiftythree contributors are registered. Thirteen hundred and eleven garments are to be distributed to the poor. And now that the veracious scribe has discharged his office it only remains for the gentle moralist to fulfil his. And it seems to him that the actual gain to the poor in this extensive wardrobe, and the actual gain to the donors in the improvement of their handiwork, excellent as these advantages are, are perhaps the least gain of this odd and whimsical undertaking. The real things of life are the invisible; are those which are reckuned in emotion and thought. And who shall measure the cheerful zeal, the genial emulation, the patient exactness, the generous impulses to bestow, which this Exhibition has developed? What a bright excitement it has made in frontier villages, and quiet country places of which the great city never heard! What breathless interest in five hundred homes will wait on the rendering of the vordict! With what glow of kindly human feeling are all these strangers brought close to one another and seated, as it were, side by side, before this Old Cio' pageant! The darkest and narrowest and poorest home from which the meanest of these garments came, will be a little the brighter and broader and richer, both for having given a gift, and for forgetting the old burdens for a little while to wonder about a life ontside its conditions. Nay, in the very glow of honest vanity over her excellent handiwork shall the weary worker find a cordial and compensation.

"Yes, indeed," says the gentle moralist to himself, samming up the spiritual results of this queer "go." "Any scheme which brings people nearer each other in kindly human interest; which makes them work in the

same wise direction; which appeals to the best impulses in them; which exchanges their troubled thoughts for bright ones; and teaches charity and carefulness, liberality and prudence, all in a breath;—any scheme which does this is an admirable one, even if it seem to violate the implied injunction not to put new cloth in old garments. Surely, setting new cloth of better impulses in our old garments of selfishness is a wise kind of patching and darning. And whoever," concludes the moralist, "offers a text for my prosing, is a benefactor to his kind! Therefore, blessed be the kindly heart that devised this Charity, and blessed be the kindly hearts that responded in works. And so, as Tiny Tim observes, 'God bless us every one!'"

### Maple-Sugar Making.

BY W. J. CHAMBERLAIN, OF HUDSON, OHIO.

In the February and March numbers of the Agriculturist for 1870, I described the apparatus used in making maple sugar, "by the best sugar-makers of Northern Ohio," and also their methods of making it.

Those articles brought me many circulars and letters on the subject. Most of them came from Vermont, and from them I learn that the Vermont sugar-makers are in advance of us in some respects, and we ahead of them in others.

Last year I recommended a wooden san spout, not because I considered it a perfect thing, but because it was, on the whole, better than any metallic one I had then seen. I find four or five different kinds are used in Vermont, but only one appears to me, on the whole, preferable to the wooden one (beach or maple, turned, bored, and notched in three places, to give a choice, so that the bucket may be hung level), which is in general use here. That one is Post's "Eureka" sap spout, improved (1870). See fig. 1. It is made of east iron, galvanized so that it will not rust, and will last a generation. Since it is metallic, it is not liable to sour, as wood is. It is held into the tree, by three thin "flanges," entering about half an inch, while a hemispherical surface "bugs" against the outer edge of the hole. The "flanges" are about as thick as the back of an ordinary table-knife, and so stop very few pores, while the hemisphere stops none at all. The old "elder quill," as it was commonly sharpened, stopped all the pores for the first halfinch, and these are the very ones that yield the most sap. These features of the Eureka (the flanges and the hemisphere) are patented, and are well worthy of a patent. Then, too, the hole in the Eureka by which the sap leaves the tree is at the very bottom of the spout, and almost at the bottom of the auger-hole. But all other spouts, wooden and metallic, which enter the auger-hole in the tree at. all, have their holes in their centers, and as the spout is usually inclined downward, and driven in nearly an inch, this hole is brought above the middle of the auger-hole. This dams up a little sap and leaves it there, constantly to freeze or to sour. The shape of the Eureka externally, ordinarily prevents the sap freezing up, or if it does freeze, the amount is so small that it thaws in a few moments on the open metallic surface.

But the spout in use here often freezes solid the whole length of the bore; and as this ice is surrounded by wood, a bad conductor of heat, it often does not thaw so that the sap can run until two or three hours after it would otherwise have begun to flow. The Eureka I consider a perfect spout, with one exception. The very shape of the flanges, the three edges being parallel, and made exactly to fit a half-inch hole, prevents our using the same spout after the hole is reamed or retapped. But it is claimed that as no sap is left in the hole to sour

and gum up the pores, the holes will not need reaning as when the wooden spout is used; and that as no pores are stopped by the spout

Fig. 1.-EUREKA SAP-SPOUT-IMPROVED.

itself, you will get more sap with this spout without reaming than with the wooden one with. And I must say that my experience for one year leads me to think this is true. They cost a good deal, \$4 per hundred, but they are the thing. They last a lifetime, and, on the whole, they are the cheapest spouts made. Good things always cost. Last year I used a hundred; this year I have ordered a thousand. They are manufactured and sold by the inventor, C. C. Post, Burlington, Vt. In the improved Eureka of 1870, the bucket hangs by two points (see figure), so that it cannot swing like a pendulum, and in two narrow notches, so that it cannot twist nor wabble.

There is another metallic spout. It is simply a frustum of a cone, made of heavy tin, with a galvanized pin to hold the bucket on the spout. I used a hundred and fifty of them last year, and at first thought I should like them. But when there came a high wind, I found the pails twisted and swung and wabbled, until about ten out of a hundred pulled the spout out entirely, and sixty more were tipped, and had lost their covers.

After the sugar season began last year, I was induced to take a 15-foot evaporator on trial. My arch had to be rebuilt, and the sap got quite a start. The weather held good, too, and in four days and one night I had boiled and put up, ready for stipment, \$200 worth of syrnp. With my old pans, 13 feet long in all, it would have taken four days and four nights, and then I should have had thin syrup, which must be reboiled and clarified at the bouse. And this I consider the chief merit of the evaporator—that it takes all the work out of the house, and away from the women of the family, while it lessens the work in the camp for the men. I speak within

Fig. 2.—EUREKA SAP-SPOUT OF 1869.

bounds, and from an experience of many seasons with good pans, and of the greater part of one season with an evaporator, when I say that it saves half of the time, labor, and fuel, and makes better sugar and syrup.

The evaporator is made of heavy galvanized sheet iron, with pine sides. The bottom is divided into spaces, six inches wide, by partitions, hollow from beneath, to admit the flame, and alternately touching one side and leaving a space of six inches at the other, to permit the sap to pass through. There are also two gates. The pan is set on the arch, so as to project three inches each side. This protects the pine sides from the fire, and secures a partially cool place for the scam to stand until it can be conveniently skimmed off - The sap enters from the vat by a rubber tube, through the regulator. The latter is tin, with a tin float, which works a lever. This works a pair of jaws, through which the rubber tube passes. As the sap rises in the pan, the float closes the jaws, the jaws gradually bite the tube, which finally stops the flow of sap. But as the sap boils lower the jaws open again and the sap flows. The regulator can be set to give any required depth in the pan. It is, in some respects, preferable to the one described in my February article, last year. As soon as there is half an inch of sap in the pan a brisk fire may be started, and the regulator set at 1 , inches. After boiling half an hour, a few pailfuls should be drawn from the syrup faucet, at intervals of five minutes, and turned back into the pan by the side of the regulator. In half an hour more there will be thick syrup here, which may be run off constantly in a small stream, as long as

[Mr. C. specifies the advantages of his sorghum evaporater as follows, not claiming the same excellence for all.]

1st. A greater surface is exposed directly to the fire by the hollow partitions. For every horizontal space of 6 inches there is a space nearly vertical of twice 1'14 inches. This would add nearly half to the boiling capacity, provided the partitions ran clear across the pan, and provided the heat was as great in them as on the flat surface of the pan. As it is, I estimate the gain here as about one-fifth. It is on the principle of the tubular boiler—viz., increasing the exposed surface.

2d. The heat required to boil the sap or syrup at any given point is graduated to the heat actually found there. This depends on the curious fact, that the sweeter the sap or syrup is, the more easily does it boil. Now, the greatest heat is of course over the fire, and in burning four-foot wood, eleven of the fifteen feet must be heated by flame alone. The heat gradually decreases from the door of the arch to the chimney. Now, the cold sap enters at the hottest place (or nearly the hottest). By the time it has passed two of the thirty times across the pan, it begins to boil. As it passes on, it grows sweeter and sweeter until it is syrup. With a good fire it boils alike the whole length of the pan, though the heat is unequal at all points. With the ordinary pans this advantage cannot be secured; for in all parts of an eight-foot pan, without ledges, the syrup is alike, and you will often see it boiling furiously in one part and scareely at all in another.

3d. There is no loss of time in syruping off. With a constant fire, a constant stream of sap, about <sup>1</sup>|<sub>2</sub> inch in diameter for a fifteen-foot evaporator, runs in, and a constant stream of syrup, as large as a small slate-pencil, runs out. With the ordinary pans the fire must be greatly slackened every two or three hours, that the pan of syrup may be taken off and emptied, and filled with new sap.

4th. The furnace doors and grates accompanying the evaporator utilize more of the heat, because they hold the wood nearer the pan and consume it perfectly. With the simple crossbars, described last year, a vast bed of coals and brands accumulates in the arch and their heat is wasted. This grate burns the wood to fine ashes, and uses all the heat.

5th. We get better syrup and sugar, because the sap is not kept so long over the fire.

Let any one boil in sap all day without syruping off, and he will find he has very dark-colored syrup. The best sngar-makers who use the old pans, syrup off every three hours. But any given pail of sap is not more than thirty minutes in the evaporator before it comes out a half-pint of syrup, as clear and white as honey.

6th. The pan boils violently in the middle, and throws the seum to the cool edges. Here it will not boil in again as in the old pan, but stand and wait for the tender to remove it with the skimmer. Then, too, the gates are in the middle of the pan, and so no seum passes through them.

So far as I can learn from correspondence, circulars, and printed letters, as well as from the form of spouts found there, the cover has not been used at all; in Vermont, certainly to no considerable extent. For example, one letter speaks of last season as "a bad one to make good sugar, on account of the unusual amount of snow and rain which necessarily got mired with the sap." No more necessary than that rain should get "mixed" with hay. A barn roof will keep it from "mixing," and a cover, costing less than two cents, will keep it from "mixing" with the sap. I cannot emphasize too strongly the advantages of using covers. I have seen a soft, damp snow, falling when the wind blew, plaster itself up and down the south side of the trees while the sap was flowing briskly; and then, as it thawed more and gathered thicker, suddenly slide for twenty feet above the bucket, carrying dirt and bits of bark with it, and fill the uncovered buckets full of slush. And I have known some of my neighbors, whose buckets were uncovered, throw away barrels of such stuff-snow, dirt, and sap-or boil it with more than its worth of fuel, to get a black inferior syrup, while those who had the covers, gathered as nice a lot of sap as any in the season. Or if it is a rainstorm, the rain trickles down the trees, carrying with it dirt and stain into the sap. Syrup or sugar of the first quality can never be made from sap and rain-water. It is easier to keep out the dirt, insects, and rain, than to get them out. Then, too, a wooden cover counteracts the bad effects of heat and cold. The sap is not so liable to sour during warm days, nor to freeze solid in very cold nights.

I consider hanging the bucket on the spout by a hole beneath its wire rim, and then covering it, as the greatest single invention in sugar-making. Much as I prize my new evaporator, I would rather give it up and go back to the pans than give up the covers and go back to boiling sap and water! And the covers cost so little too. A square foot of  ${}^3|_4$ -inch pine, white-wood or poplar planed on one side is all that is needed; though it may be planed on both sides and all edges, and painted.

### Ogden Farm Papers .- No. 14.

It is curious to see how one thing leads to another when any departure is made from the old routine of common farming. It is a principle with ordinary farmers not to keep more stock than they can raise food to support. The first thing that "high-farming" does is to set aside this principle; and the high-farmer keeps all the stock he can properly shelter, and for which he can get money to buy food. We started out at Ogden Farm on this plan. Then, having a large stock to feed, it seemed indispensable to resort to steaming, in order that the utmost good could be got from the food bought. Having to make steam for cooking, it was found cheaper to discard the horse-power and put in a steam-engine. Having a steam-engine, which does its work in a small part of the time during which steam is up-for we can cut enough in 5 hours to last a week, while we must have steam

up about 15 hours in the week-it became a question how we should make full use of the apparatus during the odd times when there was no immediate demand for the steam. Another point is, that the cost of raising steam is much greater than the cost of keeping it up after it is raised; and that when the full pressure point is reached, it costs comparatively little to keep the engine at work. We found that one of the worst leaks was in the matter of grinding grain. Twenty bushels of corn are to be ground, we will suppose. A horse must be hitched up, and a man must leave his work and go half a mile to the windmill; a few days later he must hitch up again and make another trip, possibly to find that the grist is not ground, and that he must go again the next day. Then we get back, not the 1,120 lbs. we sent, but about 1,000 lbs., -supposing we get our dues, and have no " waste of the mill" to stand. Now, it costs at least \$1 (to say nothing of the interruption to other work) to send a grist to the mill and get it back; and on an average \$2.50 for toll and waste, or 171/2 cents a bushel on the corn. We feed about 40 bushels of corn a week, which cost \$7 to have ground at the mill, and have concluded to put up a portable mill (costing, with fittings, about \$200) that will do the work in about six hours. Having the mill, we can get work from our neighbors that will probably pay profit enough to balance the cost of interest, wear and tear, and repairs-reducing the cost of our own grinding to a trifle. The engineer can run the mill, so there will be no extra charge for attendance. I believe that this will complete the eircle, and that there will be no need for further investments in machinery.

I fancy I hear some old farmer saying, "How about folks that haint got no engineer?" And the idea seems to be general, that if a farmer have an engine he must keep a man at a cost of \$2.50 a day to run it. My engineer is a farm apprentice, who was 15 years old when he took charge of the machinery. He costs no more than any ordinary farm boy; and he goes to school, milks, does chores, works in the field, and makes himself generally useful, like any other hand on the place. The engine employs about one-third of his time in winter. All he knows about the engine is what I have taught him myself, and what he has learned by experience-what any boy with brains enough to work a mowing machine (which is more intricate than a steam-engine) can easily learn in a short time. As to the danger of running a farm engine without an experienced engineer, I don't see it. It is an important point with a mowing machine for the driver not to step down in front of the cutter bar when in operation, lest it cut his foot off. It is equally important for an engine driver not to let the water get too low in his boiler lest it blow his head off. One of these " accidents " is necessarily as much to be feared as the other; and any boy or man who is fit to be trusted with any responsible work, is fit to be trusted with a simple farm engine. In these days no one need go far to find a regular engineer who will tell him and show him in half an hour all he needs to know about guarding against dangers. The only real occasion for professional assistance is to have the boiler inspected once a year. If this fact were more generally recognized, I think there would he a good many more engines in use on American farms.

Bearing upon the point suggested at the commencement of this article as distinguishing high-farming from the good old way, I have gathered a bit of information from my English agricultural paper. Mrs. Millington, to whom was awarded last year the Royal Agricultural Society's prize for the best managed farm, (profit of the business being a chief test in the competition,) spends \$6,000 a year for cattle foodmost of it linseed cake from America—the consumption of which on her farm secures an abundant supply of good manure, by which she raises large and profitable crops from a poor, light soil. How about "overstocking" in this case? And how long before American farmers will learn that they too can make money by securing in this way a large addition (in quality as well as quantity) to their stock of manure?

As I drive along the road, I daily meet ablebodied men crawling along beside snail-like oxteams with loads of stained straw from the private stables in which the summer residents of Newport keep their horses "up to their knees" in litter. The eart holds about a cord of the stuff, (128 cubic feet,) for which \$5 or more have been paid in town, and to get which, occupies the best part of a day's labor of man and team. If these same men would take their money out of the Savings Bank and invest it in well-purchased beef cattle or wether sheep, and in rich food, they would make manure at home which would cost them nothing, and of which one cord would be worth more than five cords of the dirty straw they haul from town. Of course it pays them to buy and haul the town manure, or they would not do it; but this only proves that it would pay them five times as well to make manure at home. Some of them understand this; and I have several neighbors who feed out from 500 to 1,000 bushels of purchased corn every winter. I remarked to one of them, "That makes manure." He replied, "It makes land, I am getting my farm so that it will grow a good crop of any thing I seed it to."

I received a letter a short time ago from Iowa, suggesting that I give less attention to the question of manure and more to the processes of farming. Bless your soul, my good man, I am not writing for you, but for your children, and for the very large class farther East, whose fathers thought as you do-men who now have to pay for the paternal squandering. The time is not very far distant when the question of manure will be the important question in Iowa itself. If you do n't believe it, just read the agricultural history of the whole world to the eastward of you, until you come to the great wall of China. Read the census reports of our own Western Country itself, or look at your local agricultural papers, and see what complaints are made of weevil and other grain-destroying insects. Weevil is another name for weak plants, and weak plants mean a weak soil. You are coming to it faster than you imagine, and if you live to be a hale, old man you will see that I am right.

The farmers of the East begin to see it now, and many a man is straining every nerve to replace the fertility that his ancestors have allowed to go to waste; many a man is, and many a one is not; for I see in my own immediate neighborhood piles of manure accumulating under the caves of barns, sending their most valuable parts to the nearest brook with the drenehing water of every rain; and so long as this lasts you must excuse a much younger farmer than yourself if he takes frequent occasion to remind you that "you can't have your cake and eat it too." If you squander the heart-blood of your

rich soil, it will be a poor soil before you know it. It is infinitely easier to keep land rich than to make it rich, and infinitely cheaper too.

As Winter comes again, there comes with it the perennial question of coloring butter. I thought I had, last winter, hit upon the best plan, in the use of annotoine, or an extract of annotto, from which the cruder parts are excluded. It certainly did work very well, and the color was rich and good. Still, on comparing it with some grass butter, laid down in June, it became evident that though a good color in itself, it was not a good color for butter; and I have made a new series of experiments, and have now much the best result, both in color and in flavor, that I have yet attained. The new system is by no means new to many dairies. It consists simply in grating a few perfeetly clean, deep-colored earrots, the Orange carrot will not do nearly so well as the Altringham or the French horn, and squeezing the juice into the churn with the cream before the churning commences. We use for each churning (of about 20 lbs.) a dozen medium-sized carrots; and it makes color enough for winter, not the rich gold tint of summer, but still a gold-like color that is much more attractive than the reddish-yellow hue annotoine gave. So far as color and flavor are concerned, I judge that a bushel of carrots used in this way has as much effect as 50 bushels fed to the cows. However, they have no effect on the appetite and the condition of the animals, and are not allowed to supersede the feeding of roots, which is, in our case, regularly carried on. We give from a peck to a half-bushel daily to each milking animal. Just now, we are using earrots; they will be followed by ruta-baga turnips, and these, later in the season, by mangels. Both of the last-named roots are often objected to as affecting the taste of the milk and butter-the turnips being much the worse of the two. All difficulty on this score may be avoided by feeding only at milking time, or immediately thereafter. What becomes of the taste I do not know, but the fact is obvious that turnips fed in the morning will not be tasted in the evening's milk, while if fed at noon they will be. Even when fed, as directed, too much must not be given at once, (say not more than a peck at each milking time,) and even then their use must be occasionally abandoned for a few days, so that their flavor may not accumulate in the animal's system, (if this is the true explanation.) My observation is, that it is best to leave them off for three days about twice a month.

I hear much complaint this year of the failure of cows to get with ealf; and I have suffered somewhat in this way myself, especially in the case of a very fine imported Jersey cow, which has recently come in heat for the fourth time since May. Some writers have ascribed the difficulty to the extreme heat of the summer. If this is the case the remedy must now be provided, for at this writing it is as cold as though it never meant to be warm again.

Mr. J. Preston Thomas, in a communication to the Country Gentleman, expresses surprise at my statement in the November Agriculturist "that corn raising would not pay on Ogden Farm." He thinks my trouble was that I did not have a good sward to turn under. My precise statement was, "I do not think the corn crop pays so well as other things would, and every thing cannot be grown by a farmer who

has only a limited supply of labor;" and this was followed by a computation of the comparative profit of ruta-bagas and mangels or hay. I did not say that corn would not pay—only that I thought other things would pay better. Most of my cornfield did have a very fine sward, and there was a very heavy growth of grass turned under in the spring.

Mr. Thomas says they are, in Chester Co., Pa., most sure of a crop of from 80 to 100 bushels to the acre for the whole field. He would probably be satisfied to have the money return of the crop set down at \$100. This is more than it costs, and is profitable. Now, let us see: On such a soil as that of Chester County-where shall we look for better?-roots can be raised easily and enormously. The manuring recommended for the corn crop is 16 3-horse loads of well-rotted manure, 60 bushels of lime, 3 years for them to act in producing a good sward, and a compost of hen manure, ashes, and scrapings in the bill. With this manuring an aere of Chester County land would produce 1,200 bushels (or more) of mangels, worth at least a Yankee shilling (1621, cents) per bushel to feed out on the farm (or more to sell). This would give \$200, and if the crop is raised by transplanting, the whole cost, including harvesting, would not be \$25 more than the cost of the corn crop. This leaves a difference of \$75 in favor of the mangels, which is what I meant when I used the expression "pays so well." As an additional advantage, a good crop of mangels leaves the land absolutely elean-more free from weeds than the best kept erop of corn can possibly do. I am aware that the suggestion will be made that "Beets draw the land." So they do, but what of that? I would as soon have a pound of potash in my root cellar (on duty) as in my soil (inactive), for it will get back to the soil in time for the next erop, if I feed my roots; if I sell them, they will enable me to buy manure. If any plan could be devised by which we could each year exhaust (in our crops) every ounce of fertilizing matter from our soils, farming would be a simpler business than it now is; for we could apply it all every year in our manure, just when we want it, where we want it, and as we want itand what crops we would grow! We would have the full benefit of the "nimble sixpence." If any man were to make a business of raising mangels, selling them off the farm, and investing the money in bank-stocks, he would be on the straight road to the poor-house-and serve him right. But if he fed them on the placeor if sold, brought back their manurial equivalent-he would not fail to prosper, so far as prosperity can be compassed by good cropping.

A correspondent in Monmouth County, N. J., asks whether the same benefit can be obtained from transplanting in the case of carrots and parsnips, as with ruta-bagas and mangels-his land being very weedy. Probably not. I have never known it to be done; and although there may be some way to make a carrot or a parsnip grow when transplanted, I have never succeeded in doing it, and judge it to be nearly or quite impossible. Land may be well cleaned and prepared for these roots by growing and plowing in three successive crops of buckwheat the previous season-which is, in my opinion, much the best kind of summer fallowing-unless the soil naturally produces a good growth of ragweed, which is probably as good as buckwheat. If the buckwheat has been preceded by a heavy and well-manured clover lea, the preparation for a good crop of roots will be nearly perfect.

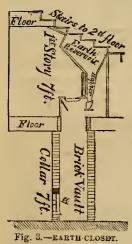

### A Cottage without a Cesspool.

The object of this article is to show that a complete modern house may be so arranged that those two great abominations of the age—the cesspool and the sewer—may be entirely dispensed with. The house in question is in the City of Newport, R. I. To show the character of the establishment, we give upon the next page a sketch of the house itself; but our business is more directly with the diagrams, that show how the wastes of the family are disposed of.

In figure 1 the dotted lines show the plan of the house and buildings—the heavy lines show the drainage, etc. 2 is a bath-tub, on the ground floor, connected by its waste-pipe with drain, A. 5 is a slop-hopper, on the second

floor, from which all of the slop of the sleeping rooms are carried by a waste-pipe to the same drain. 3 is the kitchen sink, with a waste-pipe conducting to the same. These three points (2, 5 and 3,) are supplied with hot and water. The drain, A, runs-not to a cesspool, as is customary-but to a small, cemented cistern, 3 feet in diameter, and 5 feet deep, which serves the same purpose as a silt-basin in land drainage (see fig.2). The position of this cis-

tern is shown at 6, in fig. 1. It is covered with a flag-stone, cemented down. Its outlet is on the same level with its inlet, but is furnished with one of Boynton's curved pipes, reaching about 10 inches below the surface of the water. Any solid particles that may come from the house are allowed to settle in the still water of the cistern, and once in four or five years it may be necessary to clear them out. The grease and "scum" will float on top of the water, and cannot possibly get into the outlet pipe, which takes its supply so far below the surface; consequently, only purely liquid matter will flow out. The outlet pipe from 6 to 8 (a 3-inch drain pipe) is cemented at the joints, so that all the liquid will flow to 8, which is a basin of cemented brick, 20 inches deep from the surface of the ground, and also covered with a stone. The drain spoken of enters it 12 inches below

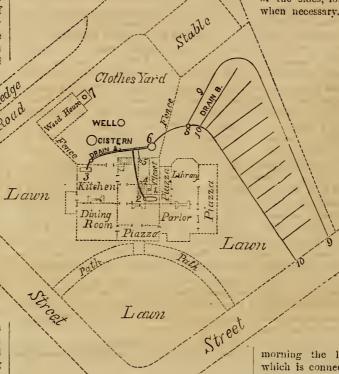

drains, B, are common land tiles, laid 12 inches deep, connected at their joints with collars, but not cemented. The main drain, 10, 10, is of 2-inch tiles, and its laterals of 11/2-inch tiles. The laterals are connected with the main by Boynton's branches. The drain, 9,9, starts from the box at a slightly higher level than 10, 10 .- Now, when water is pour-

the surface. The

waste-pipes, it flows to the cistern, 6, and displaces an equal amount, which flows out through the curved pipe, and passes to the box,

8 (which stops any sediment that may have escaped from 6), and flows into 10, 10, and its laterals. It leaks through their uncemented joints and soaks into the ground, within the reach of the roots of the grass. If, from any

Cow Yard

Fig. 1.—PLAN OF GROUNDS AND HOUSE.

cause, the drain, 10, 10, becomes obstructed, the liquid will rise in 8 until it reaches the drain, 9, 9, and will flow out to the gutter in the street. The appearance of water at this point is a sure indication that some of the pipes 10, are out of order, and need examination.

This provides for all the liquid wastes of the house, in such a manner as to preclude the possibility of their either breaking through into the drinking-water well, or giving out offensive or dangerous exhalations. They percolate slowly into the soil at a shallow depth, when the access of air and the action of roots will render them innoxious,—where they will perform only the le-

gitimate office of

all feculent matter.

of the family are

provided for

The solid wastes

Fig. 2.—SILT CISTERN. serves as a dirt receptacle, securing every thing subject to decom-

position that is of no useas swill, or otherwise.

On the main floor of the house, under the main stair-case, and adjoining the bath-room (at 1), there is an ordinary "pull-up" Moule's earth-closet. Its construction is shown in fig. 3. The house is an old one, altered over, and there was formerly a water-closet in this place. As it was not possible to change the location, it

had to be made to answer the purpose. The earth-reservoir—large enough to hold two months' supply of dry earth—was built under the stair-case, and the receptacle—large enough to hold the accumulations of a year or more, was made in the cellar, immediately under the seat. It is simply a brick shaft, about  $2^{1}|_{2}$  feet square, reaching from the cellar bottom to the under side of the main floor of the house, the bottom being cemented to prevent leakage. An opening at a, 1 foot square, was left in one of the sides, for removing the accumulations when necessary. This opening is closed with

bricks, laid in mortar, but set on edge, so that they may be knocked out without disturbing the main wall. It would be difficult to conceive of a more simple carth-closet, and no water-eloset could be more satisfactory in every respect. On the second floor, over the point marked 4, in fig. 1, is another earth-closet, opening out of a passage-way from the back stair-case, and easily accessible from the chambers. This closet is arranged as shown in figure 4. Under the seat there is a stationary pail, of galvanized iron, a, which has a hinged bottom, held in its place by a weight, c. In other respects, its mechanism is the same as in the closet below. Every

morning the house-maid raises the handle which is connected with the weight, c, opens the bottom of the pail, and allows its contents to fall through a galvanized iron pipe (12 inches in diameter, and with soldered joints) into a vault in the cellar, similar to the one described above. While the bottom is open, she throws one charge of earth from the hopper, which dusts the pipe and the top of the deposit in the vault; she then lets the weight down (closing the bottom of the pail), throws one charge of

earth into it, and leaves it ready for another day's use.

Both of the closets described are without direct ventilation—only because it was impossible to provide it—and they are both quite in the heart of the house. We are unable to conceive of any plan by which the inestimable convenience of indoor closets could have been more satisfactorily arranged.

The closet at 7, opening out of the wood-house, is of the simple "cottage" pattern, over a brick vault, also comented at the bottom. This closet is for the use of the servants.—The foregoing description will make the various arrangements for the "earth sewage" of a modern house clear to our readers, and we commend them to their careful consideration the following advantages:—

1. The luxury and comfort of in-door-closets, to which delicate women and invalids can have

access without exposure to the public gaze, or to the inclemency of the weather.

2. The absolute prevention of the contamination of the atmosphere of the house with the ling bright contrasts; the white spots running of twigs, on which is laid a quantity of mud,

foul exhalation so common with water-closets.

3. Avoidance of the poisoning of the drinking-water wells by the infiltration of fæcal matters from cesspools and privy vaults; an almost invariable source of typhoid fever, dysentery, and other diseases.

4. The saving of all the valuable manure produced by the family.

5. Absolute cleanliness and purity by the aid of means that the place itself affords, without dependence on public water-works, with taxation, and the heavy bills of the plumber.

### American Magpie.

We are so familiar with Magpies, and Jackdaws, Rooks and Ravens in English and European literature, that it seems almost a serious lack in our American fauna that we have none—and must make our garrulous and omniverous crow

stand as a representative of the genus, supported by the Crow black bird and the Bluejay. The Crow black bird is very much like the Jackdaw, and there is a larger bird, close akin, common at the South, which bears a closer resemblance. At the West, we have an American Magpie, if it be not the real European one itself. This matter of identity is a

question for the savans. Our artist has given us a very pretty picture of this famous chatterbox, taken from living specimens procured at the far West. The birds are not uncommon in the interior of Texas, Western Louisiana and northward and westward to the Pacific coast; and this might indeed indicate a common origin with the magpie of the Old World. Chas. Bonaparte gave it the name of Pica Hudsonica, from its being common in the Hudson Bay Company's possessions.

Other naturalists call it Pica melanoleuca, which is the name given to the European one.

The engraving gives a good general idea of the bird. The males are 18 to 23 inches in total length, the females smaller. The general color is black, with brilliant green and steel-blue iridescent reflections; the shoulders, under parts of the body, and flight feathers are white, making bright contrasts; the white spots running

COTTAGE AT NEWPORT, R. I.

together, and into grayish-white upon the back.

Magpies mute for life, "for better, for worse,"
remain in pairs all the year, rear their
families, and keep them with them until well
able to shift for themselves. Their habits are
much like the crows, as is also their food, and
manner of hopping about upon the ground.
When pressed by hunger they are very bold,

British birds: "It is a large, and therefore generally a very conspicuous fabric, of a spheroidal or eliptical form, composed first of a layer of twigs, on which is laid a quantity of mud.

then a dome of twigs, loosely but securely interlaced, while the bottom of the interior is lined with fibrous roots, and there is left in the side an aperture barely sufficient to admit the bird. The eggs are from three to six, and differ considerably in form and coloring. Frequently they are pale green, speckled all over with umber-brown and light purple, and sometimes pale blue, bluishwhite or greenish-white, with smaller spots of the same dark colors. The notes of the magpie are a harsh call, like pay, pay, and a lively chatter when several are together. It is rather remarkable that, abundant as these birds are in the Rocky Mountain region, they are unknown in the older States. Were they to be introduced, we should find them eating field mice, snails, grubs and worms of many kinds, birds'

eggs, young birds, even chickens, sometimes, besides carrion, and occasionally grain and fruits, like the crow. It is a shy bird, easily alarmed, and only bold when sorely pressed for want of food. Wilson and Audubon, in their descriptions of the Magpie, both quote the experience of Lieut.-Col. Pike when on the Red River, in Louisiana, many years ago. He said "our horses were

obliged to scrape the snow away to obtain their miserable pittance; and, to increase their misfortune, the poor animals were attacked by the magpies, which, attracted by the scent of their sore backs, alighted on them, and, in defiance of their wincing and kicking, picked many places quite raw. The difficulty of procuring food, rendering these birds so bold, as to alight on our men's arms and eat meat out of their hands." Nuttall says, in speaking of the magpies met with on

speaking of the magpies met with on Snake River, "The old birds were shy, but the young birds were so familiar and greedy, approaching our encampment in quest of food, as to be easily taken by the Indian boys, when they soon became reconciled to savage domesticity."

AMERICAN MAGPIE.

being easily captured, and are then domesticated with facility. The magpie builds its nest in high trees when it can do so, but takes a more humble position if necessary. The structure is thus described by Macgillivray, in his history of

### Walks and Talks on the Farm-No. 86.

It is curious what notions even intelligent men have in regard to making manure. The Deacon thinks corn-stalks are worth a great deal more for manure than straw-simply, I imagine, because they do not rot so soon and make a larger heap of manure in the spring. But the most popular error-and one that is constantly cropping out at all Farmers' Clubs, and in the columns of our agricultural papers-is the idea that the animal "makes" the manure. There is a sense, of course, in which this is true. A stove makes ashes, and a still makes whiskey; and to the same extent it is true that an animal makes manure. But, in fact, it is the wood that makes the ashes, and the eorn that produces the whiskey, and the food that makes the manure. The amount and value of the ashes will be regulated by the quantity and quality of the wood consumed, and this is equally true of the manure. Its value depends on the food. The animal adds nothing to it.

The editor of one of our agricultural papers was here a short time ago, and has given some account of my farming. He says: "All the manure made on the farm is carefully saved, as far as ean be done, without expensive appliances and arrangements for housing. The pigpens, barns, and stables surround a dishing yard three or four feet deeper in the centre than on the sides. Into this the manure from the pigpens and stables is wheeled, and underdrains from the same [to earry off the liquid from the animals] empty into it. [There are separate underdrains for earrying all the water from the buildings and conducting it off without letting it come in contact with the manure.] Nothing that will make manure is sold from the farm, but large quantities of provender, meal, spoutfeed, bran, and oil-cake are purchased, and find their way after being steamed with one of Prindle's agricultural steamers, through the stock and farm reservoir on to the farm. Fet stock enough to do much in this way toward 'high farming' is not kept."

Here is the old idea that it is the stock that makes the manure. Now the truth is, that if I kept three times as much stock as I now keep, I should not make, unless I bought more food, one particle more manure than I now makewith this exception: If I bought animals in good condition and kept them until they got thin, the amount of flesh lost might be food in the manure; or if any of the animals died I might get an increase of manure from their carcass. But this is rather an expensive method of getting manure, though I am sorry to say not a very uncommon one. In England, where the farms are nearly all rented to tenants, the landlords sometimes insert a clause in the lease prohibiting the taking of two grain crops in succession from the same field, and others compel the farmer to raise a certain number of aeres every year of turnips and feed them out; others will not allow the tenant to break up old pasture land or permanent meadows. Mr. Lawes, who has studied the matter very thoroughly, proposes that all such restrictions should be done away with; and in order to prevent the tenant from impoverishing the farm from over eropping, that he should be compelled to produce on the farm every year a certain amount of flesh meat. If he does this he may crop the land as he pleases, and sell what he pleases, and it will be utterly impossible for him to impoverish the farm. The test of good farming is not the amount of stock you keep, but the amount of beef, mutton, wool, pork, poultry, eggs, butter, and cheese you produce in a year. You may make manure without making meat, but you cannot make meat without making manure.

If I feed out everything raised on the farm, except wheat, barley, and clover seed, which is my rule, and spend more money in buying bran, oil-eake, and corn than I get from the grain and seed sold, I am at a loss to know how keeping more stock, unless I bought more food, would enable me to make more manure. It is the quantity and quality of the food fed out that determines the quantity and value of the manure and not the number of animals. I keep about 40,000 lbs. of live-stock on the farm; and an animal will eat about 3 lbs. of hay per day, or its equivalent for each 100 lbs, of live weight. According to this my stock eats 219 tons of hay per annum, or its equivalent in grass, grain, straw, or stalks. Leaving ont wood and waste land, I have only about 220 acres actually in grass or under cultivation, so that I am feeding out at the rate of about one ton of hay per acre. " How is that for high?"

But it is true that I told my friend the editor that I was adopting the slow system of farming instead of the "high" or fast system. The truth is, I am adopting the one in hopes of sooner or later being able to adopt the other; and I have been flattering myself that I have already got nearly half way towards high farming.

There can be no really profitable farming in this country, when labor is so high, without raising large crops per acre. There can be no exception to this rule. It is as true at the West as at the East, at the South as at the North. No matter whether land is worth five or five hundred dollars per aere, you must grow large erops, or the cost of cultivation will eat out all the profits. But the system of farming most profitable will depend a great deal on the price of land. Where land is high you must adopt high farming-that is, you must raise large erops every year, or two or three large crops in a year. And this can only be done by using large quantities of manure. But when land is cheap, and where, it may be, the mere earling out of the manure would cost double the feesimple of the land, we must raise large crops with little or no manure. If we cannot get maximum crops every year, we must get them every other year, or every three years, or every four years. Large crops we must have, or we cannot pay high wages, or realize any profit from our own labor and capital. And this is what I mean by slow farming. In high farming, as Liebig once said, before he adopted the socalled mineral manure theory, "Ammonia is Time"-in slow farming Time is Ammonia. If, as on Mr. Lawes' experimental wheat-field, the atmosphere, rain, dews, and the decomposition of organic matter in the soil will give us ammonia sufficient every year to produce 15 bushels of wheat per acre, we must so contrive to husband this ammonia as to grow a crop of wheat every three years of 45 bushels per acre. I will not say that this can actually be done in all eases. But at any rate it is what we should It is the essential idea of slow aim at. farming.

Here is a letter, this moment received, since the above was written, that refers to a branch of this subject. It is from that clear-headed, true-hearted, noble-minded veteran of the agricultural and horticultural press, J. J. Thomas:

"Dear Friend,—There are some questions in

connection with that of obtaining the best market for farm grain, that I would like to see fully treated in the 'Walks and Talks on the Farm.' The simplest and least economical mode is, I suppose, to sell the threshed grain at its eash price per bushel in market. But the more approved mode is to convert it into flesh, and sell that. We get our pay in two shapes—manure for the land, and eash for the meat. This is well understood by many. But which of the three animals do the best work for us—eattle, sheep, or swine?

"We plow in green crops, because it saves us the labor of harvesting, drawing, feeding, and drawing out and spreading. The question is, do we gain or lose most in this way? We gain in labor, but lose in the cash for the flesh, which a part of the feed will manufacture. The circumstances of prices of labor, distance, and cost of drawing, etc., will vary the results; but I would like much to see a fair average of these reduced to accurate figures.

"In using animals to make manure, the hardeating and thin-fleshed breeds will pass through more and assimilate less of the rough material, and will consequently make the most manure; but this manure will be costly, as a part of it is what would otherwise be more valuable flesh. It is like plowing in the green crop, without the advantages of saving, drawing, etc., just mentioned. This brings me to the question I wish to ask—Which of the three animals mentioned, cattle, sheep, or swine, are the most profitable manufacturers of flesh, and the best marketers of grain, taking into consideration that some of them must have their food in finer condition than others?

"One more question—What is the best breed, or mixture of breeds of swine, for ordinary farmers in Western New York, taking into consideration such as are common and accessible? If a small farmer wishes to raise 6 to 10 animals, or thereabouts, how can be best secure a yearly supply for pork? Keep both sow and boar?

"Please excuse me for these questions, and answer in the Agriculturist such as may be convenient only."

To answer the questions as they deserve to be answered, would require a volume. They take hold of the fundamental principles of good farming.

As to whether it is best to sell grain or feed it to animals on the farm depends on the price of the grain, the price of the meat, butter, cheese, or wool, and the value of the manure on that particular farm, and on what it would cost to buy it. Take pigs, for instance. Seven bushels of corn, fed properly to good pigs, will give us on the average 100 lbs, increase in live weight. The manure from this seven bushels of corn (420 lbs.) is worth \$1.40, or 20 cents per bushel. I know farmers who have sold their corn this season at 70 cents per bushel. Deducting the value of the manure, this would be 50 cents net; so that the actual cost of the pork (live weight) would be 31/2 cents per lb. We are now grumbling, (and I think justly!) because ordinary fat pigs are only worth 7 cents per lb. live weight. Still, even at this rate, it is clear enough that we had better feed our corn to pigs than sell it at 70 cents per bushel.

I am inclined to think that we can feed grain to cattle and sheep with more profit than to swine at the present price of pork. And yet it is true that neither eattle nor sheep will gain as fast in proportion to the food consumed as a well-bred pig. But cattle and sheep have much

larger stomachs than pigs, and can digest a less elaborated food, such as straw, stalks, hay, and grass. I cannot find any experiments that show the exact "maintenance ration" of well-bred cattle, sheep, and swine-I mean how much food they require to keep them alive and healthy without gaining or losing weight; in other words, how much food is required to sustain the vital functions. If this point was determined it would not be so difficult to answer Mr. Thomas' question. I see no reason to doubt that a well-bred Shorthorn, or a well-bred Cotswold or Leicester sheep, having a quiet disposition and a minimum amount of offal would, for the grain consumed over and above the amount required to sustain the vital functions, gain as rapidly as a well-bred pig. And it is certain that, unless in a case where a pig lives on food that would otherwise be wasted, the food required to sustain the vital functions is far less costly in the case of cattle and sheep than in the case of pigs. In other words, hay, straw, and stalks cost far less to produce them, in proportion to the nutriment they contain, than grain. We can often, as at the present time, buy grain at a cheaper rate, in proportion to nutriment, than hay or straw. But we cannot grow it nearly as cheaply.

The point Mr. Thomas wants to get at is this: When cattle, slicep, and pigs have the requisite amount of food necessary to sustain the vital functions, how many pounds of corn will it take to produce a pound of beef, mutton, and pork? I cannot answer this question for the reason above given. And it cannot be answered until we know the amount of food required to sustain the vital functions.

In Dr. Miles' experiments on Pigs at the Michigan Agricultural College, six pigs of the same litter were put into two pens—three in a pen—and in both pens the pigs were allowed all the corn-meal they could eat. One of the pigs in Pen B met with an accident and was killed. When 30 weeks old the pigs weighed as follows:

Pen A—Pig 1, 59 lbs.; pig 2, 69 lbs.; pig 3, 133 lbs.

Pen B-Pig 4, 156 lbs; pig 5, 142 lbs.

The pigs in Pen B ate 61 per cent more food than those in Pen A, and gained over 92 per cent more. This result was owing to pigs 1 and 2, though perfectly healthy, gaining so little. At this time, Dr. Miles put the three pigs of Pen A into three separate pens, and the reason of their gaining so little was at once apparent. During the first week pig 1 ate 11 lbs. meal; pig 2, ate  $12^{1}$  lbs. meal; pig 3, ate  $25^{1}$  lbs. meal.

During the month the pigs ate and gained as follows: Pig 1 ate 48<sup>1</sup>[2] lbs. meal and lost 1 lb.; pig 2, ate 51<sup>2</sup>[2] lbs. meal and gained 4 lbs.; pig 3, ate 100 lbs. meal and gained 19<sup>1</sup>[2] lbs.

In this case it required nearly 50 lbs, of corn per month to sustain the vital functions, and 50 lbs, of corn over and above this amount gave 19<sup>1</sup>|<sub>2</sub> lbs, of increase, or 100 lbs, of corn produced 39 lbs, of increase. In other words, it took a little over 2<sup>4</sup>|<sub>2</sub> lbs, of corn to produce a pound of increase. It is capable, chemically, of producing a larger increase than this—that is to say, 2<sup>4</sup>|<sub>2</sub> lbs, of corn contain more carbonaceous, nitrogenous, and mineral matter than the 1 lb. of increase of animal.

A farmer would be very likely to say that it took 100 lbs, of corn to produce the 19<sup>4</sup>|<sub>2</sub> lbs, of pork. But in point of fact it took 50 lbs, to "run the machine" and 50 lbs, to do the work of producing pork.

Now, as I have said, in the case of well-bred cattle and sheep, we can "run the machine"

with a cheaper article of food than corn, and we can also use this cheaper food to some extent in producing growth; but there comes a point beyond which we cannot go in the production of growth with this cheap food. Then, when this point is attained, and when the animal has digestive and assimilative power still unused, if we feed corn, I do not see why the ox, the cow, or the sheep is not as capable of extracting as much material of growth out of it as the pig; in other words, why 21/2 lbs. of corn will not give us 1 lb. of pork.

Corn is seldom so high in this State, or meat, butter, and cheese so low, that it may not be much more profitably fed out on the farm than sold in the market. But it must be fed with judgment, and to the right kind of animals. There are tons of corn fed out that, uside from the value of the manure, does not bring 10 cents a bushel. One of my neighbors has a red, rawboned cow that is farrow. She gives a little milk, and he asked me the other day if I did not think it would pay him to dry her off and fatten her. He would "have some corn ground, and give her two quarts of meal and two quarts of millfeed a day." I told him it would not pay. She was not the right kind of animal to fatten in the winter. I would feed the meal and bran, and keep on milking her. She would convert the meal into butter, and that would pay better than converting it into fat, "But the meal," he said, "will dry her up." "It will not," I replied; "but if it should, then she will fatten." I have two farrow cows that I am fattening in this way. We give them-and in fact all the cows-from three to four quarts of cooked corn-meal each perday. We commenced feeding them about the 1st of November. Our pastures had been poor, and the cows had not done very well the past summer, and there was talk in the house that we should "have to buy butter before spring." I said nothing about giving them the meal; but in two or three weeks I was informed that we were "making more butter a week than we did in summer "and yellower, firmer, sweeter, and better butter I do not wish. And instead of buying, we soon had a five-gallon crock to sell; and the cows are getting fat into the bargain.

I doubt if there is any better way of selling corn than in the form of winter butter-fattening the cows, if need be, at the same time. But nearly every thing turns on the skill and judgment of the feeder, and on the breed and qualities of the animals. One of the commonest mistakes is to let animals take care of themselves pretty much all summer and fall, and then just as winter sets in to spasmodically attempt to fatten them by giving grain. Thousands of farmers do this with their hogs, and not a few treat their cows in the same way. Steady, persistent feeding, day after day, week after week, and month after month, is what pays. We must never let the digestive powers of the animal run to waste, and never overtask them. There is no profit in keeping an animal that is not either gaining in flesh or giving milk all the time. A good cow that is well fed in winter, will not only give us a good strong calf, but next summer all the fat she has stored up we get back in the form of butter. If our dairy cows are not receiving as much food in winter as they can digest, better far to give them corn-meal than to sell it.

I feel that I am not answering Mr. 'Thomas' questions, and will leave the subject for others to discuss

In regard to plowing under clover for manure, instead of making it into hay, feeding it out to

animals, and drawing back the manure, it may be remarked that the animal does not remove, on the average, more than 5 per cent of the ingredients of most value as manure. From 90 to 95 lbs. of hay plowed under would be worth no more than the liquid and solid droppings of an animal eating 100 lbs. of hay; in fact not as much, as the latter would decompose quicker and be more readily assimilated by the plants.

The manure from a ton of clover bay, according to Mr Lawes' estimate, is worth \$9.64. The clover hay itself, plowed under, would be worth, say \$10.24, or 60 cents more. I suppose a crop of clover hay can be put in the baru for \$2 per ton, and the manure from it drawn back again and spread for 40 cents; so that the actual cost of the food in the hay to the farmer would be \$3.00 per ton-that is the cost as compared with plowing it under. I will not say whether it is or is not worth this to feed to stock. But I do not think if I wanted Mr. Geddes, or any other advocate for plowing under clover, to winter a horse for me on clover hay, he would ask less than \$1.00 per week. And if the horse eats 200 lbs. a week, this would be \$10 per ton for the food in the clover; in other words, he makes \$7.00 per ton by converting the clover into hay instead of plowing it under.

In regard to swine, Mr. Thomas puts his question-purposely no doubt-in the most difficult form for me to answer. Read it again. It seems a simple question; but it is full of limitations and difficulties. It is certain that especially in pigs, we should never use any thing but a thorough-bred male. Now, I am fully persuaded in my own mind that a thorough-bred Essex is the best boar to use with our common sows. But the question limits me to such as are "common and accessible." The right kind of sows for the cross can be found in any neighborhood; but there is not one district in a thousand where an Essex boar, or any other thoroughly established breed, can be found. In the case supposed the farmer wants to keep only one sow, and Mr. Thomas asks, "Must he keep a boar also?" And herein lies the real difficulty of the question. Some years ago a gentleman in this town, who kept three or four cows, wanted to improve his stock, and he gave Mr. Sheldon \$300 for a good Shorthorn bull. If he had had forty or fifty cows of his own, nothing could have paid him better. But as it was, he put up the price to \$300 per cow, which was from three to six times more than the usual charge, and scarcely a farmer in the neighborhood availed himself of this splendid opportunity of improving his stock. And it will be just so with the farmer who gets an Essex or a Berkshire boar. And the better he is the more fault they will find with him, because the greater will be the contrast with their own stock. He will be too small, too delicate, too fine-boned, and too quiet. And if he answers all these objections, they will say, "We should like him first-rate if he was only white."

Where this prejudice against black pigs exists, a farmer who depends on the patronage of his neighbors must select a white breed. For my own part, in such a case, I should prefer to get a thorough-bred Suffolk or small Yorkshire, but most farmers in the vicinity would probably prefer a larger hog. In this case I should get a large Yorkshire, or a Jefferson County pig. The Chester Whites, such as I have seen, are altogether too coarse.

If Mr. Thomas had asked me this question: A farmer has a good common sow; he is a good feeder, and likes to have good stock, and takes good care of them. He wants to raise and fat a few pigs to sell and to cat. There is in his neighborhood thorough-bred Essex, Berkshire, Suffolk, Small Yorkshires, Large Yorkshires, Chester Whites, Jefferson Co., and Magie pigs, which shall he use? I should have no hesitation in replying, Essex.

I do not claim great size for the Essex. They belong to the class of "small breeds." They are the largest of the small breeds. They are larger than the small Berkshires, larger than the Suffolks or the small Yorkshires. What I claim for them is high quality of meat, a large proportion of flesh to fat, and lard remarkably white and firm. They are the most gentle of all pigs; good breeders, careful mothers, and good sucklers. They have a minimum proportion of offal, are good graziers, and will grow rapidly in proportion to the food consumed, and are fit for the butcher at all times-can be sold at three to four months old, and afford the most delicious of fresh pork, or can be kept till fourteen months, and then dress over 400 lbs. And last and best of all, our American bred Essex, imported from the late Fisher Hobbs, by such men as Morris and Thorne, and bred by them and others who know the value of pedigree, are of unquestioned purity of blood, and will stamp their form and characteristics on their offspring, even from common sows, with the strength of a steel die.

I am fattening a pen of five cross-bred Essex and Berkshires. There may be larger pigs of their age, but I have never seen handsomer. I had two of them weighed to-day (December 23). They are spring pigs, not quite nine months old. One of them, a sow, weighed 370 lbs., and the other, a barrow, 374 lbs. The man also weighed one of the young thorough-hred Essex sows, six months and eleven days old, and designed for breeding purposes. She turned the scales at 171 lbs. A young sow, four months and one week old, weighed 110 lbs. I think these figures speak well for their early maturity. There is not one of these pigs, unless it is the young sow, that would not dress 85 per cent on this live weight, and there is no better test than this of good breeding. I should also state that though the Essex are entirely black, they dress. all but the hoofs, perfectly white, and the lard and fat is whiter than those from any white pig I have ever seen killed.

### Dyking Swamp Land.

Mr. Chas. Bradley, of New Haven, has 5 acres of meadow land which is more or less overflowed by tide-water at times, but is hard and smooth enough to be mown with a machine without clogs on the horses feet. It has been dyked, but has been supposed to run down, owing to the persistent ravages of muskrats. He asks whether he shall undertake its improvement, either by rebuilding the old dyke, or by making a new one. There is a dyke on the river below which keeps off ordinary summer tide, but is only an insufficient protection to the 200 acres of meadow lying above it. He asks what is the best material to build the dyke of, stone being too costly, and musk-rats burrowing through earth, loose stones, shells, and every material that has been tried, except stone laid in mortar. He suggests the following plan: Dig a ditch 21/2 feet by 3 feet, and then set at tight, hemlock fence close to the wall of the ditch, on the meadow side, 2 feet above the level of the meadow, which will be out of the way of tide-water; the fence above the meadow to be banked with earth, to make it tight. He thinks the musk-rats might go under the fence at the bottom of the ditch, and so they might.

We know of but one way to protect a dyke against the ravages of musk-rats, and that we believe to be effectual. It is to have it some distance, say at least from 6 to 10 feet away from the ditch, and to have a ditch only on one side of it. If Mr. Bradley will dig a ditch 3 feet wide at the top and 3 feet deep, wheeling the earth 10 feet from it toward the water side, and will then make a dyke 3 feet high, covering it as soon as possible with a good turf, he will probably find the job satisfactory. Musk-rats will only burrow into a dyke when they can crack it from below the surface of the water, and they will not intentionally burrow through it; if they want to get to the other side they will go over the top. The mischief is generally caused by two different colonies burrowing from opposite sides and meeting within, or from accidentally making their holes so near to the outside of the dyke as to enable the water to force a way through. The plan here recommended will be much cheaper, and we think better, than to use boards, as proposed.

### Poultry Yard Appliances.

Under the term of "Poultry Appliances," we notice that poultry fanciers and premium lists include all those little conveniences which make up the furniture of a good poultry house and

yard. It is certainly more correct than "fix-tures," for many of them are movable, and it is more comprehensive than "fittings" or "fnrniture," so it

Fig. 1.—NEST-BOX.

is probably best to adopt it as applied. The late show of the N. Y. State Poultry Society brought out a number of new affairs of this kind, some of which, we think, it may be of use to our readers to know something about.

Galvanized Iron Nest-box—(Figure 1.)—This consists of a plain box, twelve inches wide by fourteen inches in length, with an alighting step in front, having its edge rolled over a wire, to give a secure footing. It affords no harbor for lice, is inaccessible to rats, if hung up, and is easily shifted into the sitting apartment whenever it is desired to set a hen.

Suspended Feed-hopper—(Figure 2.)—This is also of galvanized iron, and is made of various sizes. It is adapted to feeding dry grain of any kind, and may be hung against a post or parti-

of rats and mice. It is, besides, light, easily cleaned out and refilled when necessary. Suspended. fountain - (Fig. 3.) -This article is made of the same material, galvanized iron, and of such size only as may be dipped in an ordinary water-bucket, for filling. It is adapted to hang against a partition of a small house or of a coop,

tion out of the reach

Fig. 2.-FEEDING HOPPER. thus occupying no room upon the floor, and not being liable to be much dirtied by any thing thrown into it by the scratching of the fowls, like open troughs.

Folding Coop.—Figure 4 represents an excellent folding coop for exhibiting poultry or for other uses. It is made of clear pine, larch, or

other wood not liable to split, and capable of being worked smooth. The top, two open sides, ends, and bottom, are each one piece, and the six pieces are hinged together, so that they can be quickly and compactly folded up, as shown in figure 5, and in this state stored or shipped. When set up, the bottom is level with the frame of the lids in front and rear, hence is easily cleaned ont. It is firm and substantial, and lighted from above,

Fig. 3. — WATER-FOUN

and took the first prize at the show above named.
All the above-named articles were exhibited by their inventor, Mr. A. M. Halsted, of Rye, who, although expecting to profit by their manufacture and sale, places no restrictions upon those who wish to make them for their own use.

Feed and Water Trough for Show Coops .-The most convenient arrangement we have seen for providing feed and water to fowls confined during several days in show coops, is shown in figure 6. It consists of a tin or galvanized iron box, or trough of such a size, that it will slip through between the bars of the coop if desired, and provided with a socket, soldered on, which will slide over an iron pin in the frame of the coop or cage, and thus suspend the trough within or without the coop at pleasure. The trough may be divided by a tight partition, and feed placed in one side and water in the other, if desired; but it is preferable to use two troughs, and always best in exhibition coops, except in the case of very wild fowls of some sorts, to hang both feed and water vessels upon the outside of the coops. With water-fowls this is imperative, as ducks and geese make a great dripping and splashing of

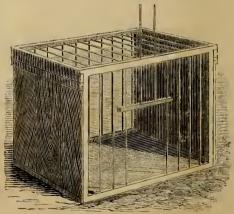

Fig. 4.-FOLDING COOP.

water if they have the opportunity to do so. When coops are made with wire netting, through which large-combed fowls cannot get their heads, of course some other plan should be followed—Mr. Halsted's, for instance, as shown in figures 2 and 3, just described.

Cleeton's Sectional Coop has been lately introduced, and ought to be mentioned in this connection. It is chiefly excellent, because its low price brings it within the reach of all, being quite as cheap as an equally good coop could be made to order. It can be packed in very

small compass, is easily set up, and, though hardly substantial enough to bear rough usage upon a journey, may be made quite strong by

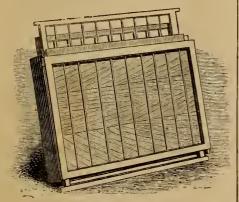

Fig. 5.-FOLDED COOP.

a few brads and large carpet tacks. Several hundred were used at the recent exhibitions of the Connecticut and New-York Poultry Societies, and gave good satisfaction.

#### Peat for Fuel.

The money that has been sunk in the peat enterprise has been mainly for buildings and machinery for pressing and drying. When coal was selling for twice the present prices, it was calculated that peat could be sent into the cities and sold at a large profit. Machines were invented for pressing it into the smallest compass, to prepare it for transportation. When coal receded to the old prices, all these calculations were upset, and most of the peat factories were sold for old lumber. The question of the economy of using peat for fuel, as it comes from the bog cut with the spade, dried in the sun, and stored in sheds, has never been tried on a large scale in this country. There are a few localities, like Block Island, where the forests have all been cut off, that have used peat successfully for a good many years. Island the wood was gone before coal had come into common use, and the people were forced to buy wood from the main land at high prices, or resort to the peat bogs, which were numerous, and of good quality. It is quite possible there are other localities where the high price of fuel will make the use of peat economical. It is estimated that two tons of sun-dried peat will supply as much heat as one ton of anthracite coal. If peat can be put into the cellar or shed at half the price of coal, ton for ton, it

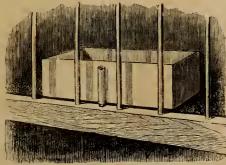

Fig. 6.—FEED TROUGH FOR SHOW COOPS.

will do to use it; if it cost less, there is economy in using it. A ton of sun-dried peat is worth about as much as a cord of oak wood. On some farms, where the wood is short, and coal is inaccessible or very high, it will probably pay now to open the peat bogs for fuel. Peat is very widely diffused, and the farmer who has it upon his premises can test its value without any great outlay for tools or fixtures.

The only tool needed is a good, long-handled spade. Most Irish laborers are familiar with the whole process of entting and curing peat. It is cut in square blocks, about a foot long, and just large enough to be conveniently handled with the spade. After lying upon the bank, exposed to the sun and wind for a few days, it is turned bottom side up. As the drying process advances, the blocks are piled loosely in heaps, that give free circulation to the air. When sufficiently dried, the heaps of peat are carted to a rail pen, covered with boards, or to an open shed for storage, where it may be kept indefinitely, without much danger of damage or loss. An expert workman would average, in a good bog, two tons of dried peat in a day. The cost of preparing it is less than that of wood. In most communities it costs a dollar a cord to cut and pile four-foot wood. It costs about two dollars a cord to work this up fine enough for a cooking-stove. If the wood and peat are considered of no value, or of equal value, before they are touched, it would seem to be cheaper to get peat whenever the cost of cartage is equal. There are always difficulties in introducing a new kind of fuel. Coal came very slowly into favor. Many a man sweated over the kindling of his first coal fire, and thought the man a fool who first mined coal. It did not burn well upon the open hearth, like wood. Even when lifted upon sticks of wood, for a grate, it burned slowly, and did not look cheerful. Iron grates, coal stoves and furnaces were needed to help combustion, and popularize the new fuel. It is one great step toward the use of peat for fuel that we have these inventions, for peat will generally burn well where coal does. Larger space will generally be needed for the fuel, for it is not so compact as coal. In some cooking-stoves, made for the use of wood. peat burns freely. As soon as it is found out that peat is available for the farmer and the villager, there will be inventors enough to give us the best apparatus for burning it. We have no doubt that in many of the older parts of the country, where wood and coal are dear, and peat bogs are plenty, the time has already come to try peat.

#### Cotton-Seed Meal.

The large crop of cotton, approaching very nearly to the largest crop ever raised before the war, very properly turns the attention of farmers to cotton-seed meal as an article of provender. It was coming into favor ten years ago, and mills were established in several places in the North to decorticate the seed, express the oil, and grind the cake into meal. The war stopped these mills, and for several years very little was heard of cotton-seed oil and cake. Attention is now turned to these articles with new interest, and both are likely to be mannfactured much more largely at the South than at the North. We are glad to hear of cotton-seed oil mills in the great center of the cotton trade. There are three at Vicksburg, which made, last year, 160,000 gallons of oil and 4,000 tons of cake. In New Orleans there are five mills, using up 28,000 tons of seed. There are also mills at Memphis and Mobile. Formerly, the planters dumped this seed into the nearest creek to get rid of it. In later years they turned it to use for manure, dropping it in the hill for corn and cotton, after a slight fermentation. It is now worth about ten dollars a ton at the gin. A ton of seed yields about 1,000 pounds of seed after the

fiber and hull are stripped off, and this will give about 40 gallons of oil and 750 pounds of cake, The oil is used for various purposes in the arts. and the cake is ground up for cattle food, and sold at about forty dollars a ton. Large quantities of the cake are exported to England, where it is coming into competition with linseed cake. It only needs to be better known at the North as an article of provender to rival our grains and roots. There need be no apprehension about a market. We can take all the South can afford to sell. We have no doubt it is very bad policy for the planters to sell the seed so extensively as they do. The manure made from the meal is exceedingly valuable as a fertilizer, worth nearly as much, ton for ton, as the raw meal. Planters are now learning the economy of using manure, and are buying largely of guano, fish manure, phosphates, and other manufactured manures. They are also buying grain of the North-west with which to feed their nules and to make their bacon. If their own plantations can furnish in the cottonseed the provender and the mannre they are buying, it would seem to be very poor policy to be sending abroad for these articles. Some are prejudiced against the cotton-seed meal from the use of the article as it was first prepared. The seed was pressed without removing the lint and shell, and these sometimes injured eattle. But now nearly all the seed is decorticated, and the meal is used with as much safety as linseed oil-meal or corn. The only trial of it we ever made was in feeding milch cows, and this was in connexion with cut hay, corn fodder, sugar-beets and mangel wurzels. The cotton-seed meal was sprinkled upon the cut hay, and used once each day, in about the same quantity as we had been using corn-meal. The flow of milk was increased, and we should have continued the use of it, if it had been in the market. Some animals manifest a decided aversion to it at first. This can be overcome by mixing it in small quantities with cornmeal or with roots at first, until they acquire a taste for it. The estimated value, in gold, put upon cotton-seed cake as a fertilizer by Professor Johnson, is \$21.60. It loses very little of this value by feeding, and the best way of applying it is to pass it through the manger first. It is quite as valuable as linseed oil-cake for feeding, and worth a third more as a fertilizer.

Pigs Losing their Tails .- A correspondent, "A. B. H.," writes: "Grease the tails when the pigs are born, and I will guarantee that they will not come off."—This may be true, and at any rate so simple a preventive is worth trying, but we much doubt its efficacy in all cases. The trouble is caused by a ring, supposed to be of a fungoid character, growing round the base of the tail. If taken in time, before it has completely girdled the tail, its growth may be checked and the tail saved. But when the ring is once around the tail, it is almost impossible to save it. Carbolic soap and glycerine, with a little carbolic acid mixed with it-say one part of carbolic acid to ten parts of glycerine-is likely to prove as efficacious as any other remedy. We have generally depended on petroleum, and we have saved some tails, and some we have not. We have never lost a tail from a thorough-bred pig, but have lost a good many from cross-bred pigs and grades. The so-called Cheshires, or Jefferson County breed, seem to be particularly liable to lose their tails, and such is the case to some extent with the Yorksbires. The black pigs, when thorough-bred, are not, in our experience, affected with the disease.

### Soiling Cattle.

Captain Hawley, of New Haven, V., asks:

" t. How many acres of land should be planted with green crops for each cow during the season of green fodder?

- 2. Do you recommend keeping cows confined to a small yard and stable, or is it better to let them have the run of a small pasture a portion of the time, during the day?
- 3. What crops do you recommend to be sown for green feeding?"

To which we reply:

1. This depends entirely on the fertility of the land. Ordinarily good land, such as would produce 35 bushels of corn to the acre, ought, with moderately fair manuring, to produce the food required by an average cow throughout the season, and something over, to be cured and stowed away for winter. It would not pay to undertake soiling on any land less productive than this. A field of double the fertility of this -one that would produce 70 bushels of cornreceiving double the quantity of manure per acre, and skilfully managed, so as to produce two or three crops during the season, would amply feed four cows for the whole season. With any really good land, it should be easy to keep two cows to the acre, and to store surplus fodder for winter. On any land that we considered good enough to devote to soiling, we would consider 1 2 acre per head sufficient.

It will generally be found in the raising of all crops, but especially with green fodder, that if the manure and labor ordinarily applied to an acre are concentrated on a half-acre, more than double the amount of forage will be produced, and the land improved by the treatment.

- 2. If the pasture is small and is close to the barn, it will be, so far as the cows are concerned, as good as a yard-possibly better-but the animals should be fed five times a day, getting at each feeding as much as they will eat up clean, and no more; and after each feeding, they should lie quietly until they have finished chewing the cud. This will not give them much time, nor leave them much inclination for pasturing. Under a system of partial soiling, when the cows are fed in their stalls only twice a day (morning and night), they will of course need a good pasture. The full benefit of the system, however, cannot be obtained unless they are kept at all times either in the stable or in a small yard, where the manure can all be collected at short intervals, and applied in a systematic way to the land for which it is destined. As milch cows require very little exercise, and as much of the profit of soiling comes in the form of manure, the less they are allowed to roam the better. A couple of hours' daily exposure to the sun, with the least possible inducement to roam, will give the best results.
- 3. For the first feeding, before even grass is long enough for a good bite, rye, sown early in September, on heavily manured land. As the object is to get stalk and leaf rather than grain, the richer the land is made the better. If the cutting is commenced when the rye is a foot high, much of the field can be gone over a second time, and some of it even a third time. By the time this crop is finished, grass will be in good condition for the scythe. This will be followed by oats, of which a good area should be sown (on land plowed in the fall, and only harrowed in the spring—to save time), at intervals of about ten days, from the first moment when proper sowing is possible

until about May 1st. The first crop of oats will follow the grass, and the later ones will come ou in succession until the corn is three feet high. Early in May, the great soiling crop (Southern or Western corn) should be sown. The first sowing should be made as early in May as the season will permit, and successive plantings should follow, at intervals of about two weeks, until August 1st. After this date there is not much use in planting it.

For 10 cows we would devote, if we were about commencing the practice of soiling, 10 acres of good land, and an abundant supply of manure; 5 acres might answer, but it is always well to have too much of all kinds of green fodder. Two acres should be devoted to rye; two to grass; two to oats, and four to corn. If the land were capable of producing 70 bushels of corn, we would expect, with ample manuring, to get enough more than the cattle would consume to furnish one-half (if not all) of their winter supply of long forage.

The corn should not be allowed to fruit. As fast as it blooms it should be cut up and cured, and the soiling forage should be taken from the next planting. Grass can be cut at intervals during the summer for a change, but should never pass the stage of early blossoming.

#### How to Subdue Brush in Pastures.

In all the dairy region grass grows well, but brush grows better, extending the roots every year, and gaining in power to grow, the longer they are neglected. In three or four years it roots out the grass, and in twenty years makes a forest. We all know that brush can be subdued and kept under by plowing or by habitual entting; but in many cases the plowing is impracticable, and the annual cutting costs more than the grass is worth. We cannot afford to pay five dollars for four dollars' worth of pasture. Some fields are so rocky and wet that it would cost a hundred dollars an acre to clear and drain them, while adjacent land all cleared is not worth forty dollars an acre. That will not pay yet. We have thought of a mowing machine for cutting brush, and if we had one about three times as strong as a Buckeye, that would take off a half-inch stub, it would be just the thing for cutting sweet ferns, whortleberries, and briers that infest smooth pastures. But the machine to do this work is not yet in the market. Annual burning with seed sowing is probably the cheapest and best method on most pastures. Of course where the brush already has possession, it must be cut to begin with. On the burned spots grass seed should be sown in the spring. Young shoots will spring up the first season, and make a growth of two or three feet. The leaves will fall and cover the earth. This covering will become very dry by spring, and if a dry spell is chosen to fire them, the burning leaves and grass will make a fire hot enough to consume most of the new growth, and deaden the whole of it down to the ground. The roots will start again the second season, but with diminished vigor. The ashes from the annual burning will stimulate the growth of the grass. The clumps of brush will grow "small by degrees and beautifully less" until grass has full possession. The occasion of failure by burning is owing to the want of perseverance. It will not do to intermit for a single season. Close pasturing, especially with sheep, is a great help in the process. If the land has an annual burning, many of the tender leaves and twigs that start will be cropped by the animals, and the growth will be diminished. The burning is inexpensive. In favorable weather one man would burn over fifty acres in a day, and keep the fire from damaging trees or fences. We were recently in a pasture that had been under this treatment for several years. The bushes were nearly extinct, and the grass was green and vigorous, even in December. The torch had proved a worthy rival of the plow, as an implement of cultivation. The true policy in managing these rough pastures is a little labor applied persistently every year, leaving the bushes no chance to get a strong hold.

### Burying vs. Transporting Rocks.

There are two sides to most questions, and the question whether we shall bury or lift out the stones from our pastures is no exception to the general rule. Under certain circumstances it is admitted that the rock-lifters are the most economical. With Packer's Machine, or a Rocklifter, three men and a team will take out in a day-say one hundred rocks, weighing from two to six tons. It will take the same force, another day, to pack them away in a wall if it is handy. If you have to carry them a long distance and dump them into a swamp or pondhole, it will take still longer. If a man has the fence fever strong upon him, and cannot see that twenty-aere fields are better than four, then let him lift stones and build the heavy walls. But some of us covet large fields; and we prize the bogs too highly for eranberries, to fill them up and make upland of them. We want the stones out of sight, and out of the way of the plow. We cannot sell the rocks, and we have too many fences already. To us burying is the cheaper method. A good workman will put one of these large stones out of sight in about an hour, and in the fall and winter, when labor is cheapest and the weather is fittest, the cost will be fifteen cents. He simply digs a hole with pick and spade or shovel, beside the stone, partially undermines it, and, with crow-bar, tips the rock in, calculating in his digging to leave the top of the rock two feet below the surface of the ground. One advantage of this method is that it raises the surface of the ground. In removing the rocks, as we have to with the rock-lifters, the grade is so much lowered that sometimes new rocks unseen before are brought to the surface, and a second crop has to be pulled before we can give a clean sweep to the plow. In burying, we raise the grade so as to avoid this necessity. Much less of the subsoil is brought to the surface by this process than by the other. The stones and gravel are put in a pile on one side of the rock, and the surface soil in another pile. When the rock is dumped into the hole, the small stones are packed around the edges, and the subsoil and gravel filled in next, and the surface soil last. This treatment operates a good deal like subsoiling and underdraining combined. There is drainage all around the sides of the buried rock; the subsoil and surface soil are thoroughly loosened and sufficiently mingled, and the soil is put in the best mechanical condition for crops. The good effects upon the soil are visible for many years after the operation. Manure tells best over these sunken rocks, and the grass and other crops are largest. We do not mean to depreciate the value of the rocklifters. We need all of them, and more. But there are circumstances where burying is the cheaper way of clearing rocky pastures and meadows. CONNECTICUT.

### Making Butter in Winter.

"Anybody can make good butter in the summer." So they say; but we don't find it a true saying. The other part is true, though: "It is the winter that tells the tale." Not one dairy woman in five hundred can make really good butter in cold weather; that is, butter that will remain good a week after it is made. The difficulties are numerous, thus: The cows have not the best butter-making feed; they have little, if any, coloring matter in their feed; the temperature at which the milk is kept is very unequal; the danger of mixing in the flavors of the kitchen with the milk, the cream or the butter, is very great; and the butter is too apt to be allowed to become too warm or too cold before it is finally worked into shape.

Over the matter of feeding we can have only a limited control. Nothing that we can devise is so good as the natural green forage of summer. Our chief attention should be given, then, to temperature, pure air, and artificial coloring, without relaxing, of course, the always indispensable care with regard to perfect cleanliness and perfect working.

The milkroom had better be entirely by itself-where it cannot be pervaded by the odor of hoiled cabbage and fried onion-and it must be kept warm. A kitchen closet is the worst place to set milk in; a sitting-room closet is better, but not so safe as an isolated room, with a stove in it that can be made to keep its fire all night. After frost sets in regularly in November, the milk should be scalded as soon as it is brought from the stable. This is done by standing the vessel containing it (after straining) in a larger one on the fire, in which water is boiling, stirring the milk occasionally, and removing it when its surface begins to "crinkle" and to throw off a little cloud of vapor, or when it "begins to smoke." To allow it to become warmer than this will do harm. In this condition it may be poured into the pans-to a much greater depth than is usual in summer-in a closet or room in which the thermometer never goes below 55°, rarely below 60°, and never remains long above 65°. This milk can safely stand twenty-four hours, and by that time all the cream should have risen. The cream should be kept in a jar, in the same room, not too far from the stove, nor yet too near it, and it should be thoroughly stirred to the very bottom, every time a fresh skimming is added; that is, twice a day. The churning, which should be as often as once (and better twice) a week, should be done either in the milkroom or in some place not much colder. The butter should be worked in the warm milkroom, and it should be kept there while "soaking up the salt" between the two workings. After it is moulded or packed away, it may be kept in a cooler place, but it would be better never to let it become so cold as to get very hard-not colder than it would become in a snug cellar.

About coloring, we have given frequent directions. Carrot juice or a decoction of annotto may be put in the churn with the cream, or an extract of annotto in melted butter may be worked through the lump after it is taken out of the churn. Unless the cows are fed very largely on rowan hay or on carrots, some artificial coloring is important.

It should be borne in mind that these directions are only supplementary to those so often given on the general management of the dairy. They by no means supersede them; they only refer to conditions which are necessary, to make

winter butter from hay-fed cows as nearly like that of the summer as winter butter can be.

### Keeping Accounts.

The great mass of the farmers of this country keep no accounts at all—not even a memorandum book in which they note down current expenses, etc. The idea of "keeping books" has a terror about it, which deters most people whose success in life does not absolutely hang upon their keeping accurate accounts to have much to do with them. The amount of money which passes through the bands of a small farmer in any part of the country is so small, that his recollections about money transactions is usually pretty accurate, and the real necessity of spending the few minutes a day necessary to keep tolerably accurate accounts is not apparent to them, and will not be until proved.

It is not our object now to enter into an argument to convince any one of the desirableness of keeping accounts, but to show how it may be done conveniently and easily. The writer has for some time used the following system for keeping his family and farm accounts, which are kept together, and it certainly is simple, convenient, and appears to be all that is required.

The book is ruled with double dollar-andcent columns. In one of these columns the expenses are set down; in the other, the receipts. The book need not be larger than a common school copybook, and three minutes a day will serve to make all the entries. If the farmer is cold, and his fingers are stiff, his wife or one of his daughters will gladly take the pen. Oftener than otherwise, we think the wife, if not overburdened with the cares of household and children, would be the best one to keep the accounts. In a great many cases, dimes and halfdimes slip away for personal indulgences (glasses of something warm, or tobacco), which, were it the good wife's daily duty to make the record, would not be spent.

These accounts ought to be balanced as often as once a month. It will be observed that this book, if accurately kept, will only show the transactions in ready money, and hence should be called cash accounts. We almost all have, of necessity, another class of accounts to keep. It is not always possible or best to pay eash, and we make little debts and give credits all the time. The settlements are often made in produce, labor, or something besides money, but there should be just as accurate a record of the transactions for all that. With those persons with whom a running account is kept, there should be an account opened in another book, and some pages devoted to it. In other cases, a simple memorandum of the transaction may be sufficient. It requires no knowledge of bookkeeping, or skill as a mathematician. Any child of 16 can do all the work, and the advantages are, it is safe to say, beyond computation.

# How much Corn can a Man Husk in a Day?

W. B. Banfield, Charles City, Iowa, writes: "In your November 'Walks and Talks,' the writer says that some of the operators of cornhusking machines at the N. Y. State Trial of Implements cavilled at his assertion, that with good corn an active man could husk 40 bushels of corn in the ear per day, and that out West he supposes they could do more than this. In 1868, the corn crop of Iowa was 76,507,575

bushels of cars; the highest average yield per county was 46.26 in Henry County-a fair average of the State being not to exceed 35 bushels to the acre. I have, since last August, given the question of corn-husking a good deal of attention, and I feel positive that we do not in the West husk a good deal more than 40 bushels per hand per day. To husk and throw down an acre of corn without cribbing it, a man must walk over 5,953 feet per day, without allowing for the distance traveled in crossing from row to row when husking two rows at a time. We have in this county an active, powerful Scotchman, who is considered a sort of champion husker, who thinks it a good day's work to husk and throw on to the ground, without cribbing, 40 bushels per day. Messrs. Day Brothers, of Decorah, Iowa, have a farm of over 3,000 acres. They raised this year 700 acres of corn, which they have just finished husking. One of the firm told me that the average per haud was 25 bushels per day. Hon. E. H. Williams, of Clayton County, who farms about the same amount, and who, like the parties first named, has grown rich by farming, says that in more than 20 years' experience he has found the average per hand at corn-husking to be between 20 and 25 bushels to each hand.

This is husking from the stalk standing in the field. The man who can husk and crib his 40 bushels per day, and keep it up, is often heard of here, but is as difficult to find as the man who could formerly cradle 10 acres of wheat per day during harvest. I could enumerate many more leading farmers whose experience tallies with those I have mentioned, but content myself with saying that much of this large amount of field work to the hand is estimated by guess work, and that when actual account is kept the average falls far below the estimate."

REMARKS BY THE EDITORS.—Is it even so, that in Iowa 20 to 25 bushels of ears is an average day's work in "husking from the stalk standing in the field?" What, then, becomes of the numerous published statements in years past in regard to the cost of raising corn at the West? Here is one from Daniel M'Cready, near Fort Madison, Iowa: "Average produce of corn per acre, 40 bushels; cost of production per bushel, 14 cents." This, we presume, means shelled corn, or its equivalent. J. E. Johnson, Council Bluffs, Iowa, says: "60 bushels of corn is considered an average yield; and 10 cents per bushel is near the cost of raising." Edward Johnstone, Lee Co., Iowa, writes: "Yellow corn most esteemed, ripens soonest. White eorn yields more, but ripens later. Yield of yellow, about 45 bushels; yield of white, 55 bushels per acre. Cost of corn, from the seeding to the crib, is about 7 cents per bushel."-True this was before the war, when wages were from 25 to 50 per cent less than they are now; but still if corn cost only 7 cents from seeding to the crib, and the yield was 50 bushels, or \$3.50 per acre, how much must it have cost for husking after deducting the cost of plowing, harrowing, planting, cultivating, and cribbing? Probably it was not then considered such a laborious task to "walk over 5,953 feet per day," or about 11/8 mile, as our correspondent now thinks it. Cannot some inventive genius get up a kind of velocipede on which the poor man might ride up and down the rows? It is a fact that on our own farm, "with good corn, an active man can husk 40 bushels of ears per day," and tie up the stalks and put them in stooks; and it certainly has always been claimed that a man can husk more corn at the

[COPYRIGHT SECURED.]

### HUNTING THE ANTELOPE ON THE PLAINS.—Drawn and Engraved for the American Agriculturist.

West than with us. Again, we ask, what are the facts? We are well aware that a gang of ordinary men working by the day will not average 40 bushels of ears. Last fall we paid men from \$1.50 to \$1.75 per day, without board. At the same time, we got our corn husked "by the job" for 5 cents per bushel, (equal to at least 10 cents per bushel of shelled corn,) and the huskers made good wages. Some corn husked "by the day" in the same field, while we were absent at the State Fair, cost us over 9 cents per bushel of ears; but all that this proves is that the fellows were lazy. And we give it as our opinion, founded on most costly experience, that if these same men had been husking it with a machine, with no one to look after them, it would have cost even still more. The way to introduce corn-husking machines is for two or three good men to buy a machine and go round and husk corn by the bushel, just as is now done in thrashing grain. Mr. Banfield states that with an Aspinwall machine he has husked 8 hushels in 15 minutes, and at no time has he used more than four men about the machine. This is at the rate of 32 bushels per hour. At the N. Y. State Trial this machine busked the first bushel of ears in 3 minutes and 101, seconds, or at the rate of  $13^3|_4$  bushels per hour; and it husked another bushel in 2 minutes and 57 seconds, or at the rate of 20 bushels an hour. We have no doubt that our corn will be husked by machinery—whether it will be done any cheaper than we can now, sometimes, get it done by hand, is with us an open question.

### Hunting the Antelope on the Plains.

The wild life of the plains, the wild Indian in his buckskin and nakedness, the realities of the war-path and the scalping knife, are brought vividly under the scrutiny of the civilized world by the facilities of travel, the love of adventure, and the desire of pleasure-seekers to go amid new experiences. We all have the feeling that this interest and excitement of the wilderness and the frontier are passing away, and so whatever relates to them has an attraction for every one. Mr. Wm. M. Cary, who not long since returned from the Rocky Mountains, and whose pencil has repeatedly adorned our pages, furnishes to the Agriculturist the accompanying striking picture, with the following statement, drawn from his own observation and practice:

"In hunting the American Antelope, the hunter relies almost altogether upon the curiosity of the animal, and it is almost sure to fall a prey to its investigating spirit. The hunter approaches by stealth near enough to a herd to attract them by waiving his red blanket in the air, taking good care not to show himself; then setting up this blanket or a piece of scarlet cloth upon an arrow or wiping stick thrust into the ground, he goes back a few yards and throws himself down to await the approach of the herd. The decoy fluttering in the air attracts the animals, who come on, headed by an old, cautious buck, who stops every few steps to sniff the air for lurking danger. So they come on, stringing along one after the other, until they are within reach of arrows or bullets. Good care must be taken to kill at the first shot, for if one is allowed to run wounded among the herd, it is almost impossible to get within shot of them again. The flesh is very delicate, except in the spring, when it is rank. In the fall it is delicious, and is flavored with the wild sage which they feed upon. The fur is extremely coarse, and more resembles a rope-mat than hair. The hides, dressed like buckskin, are used as summer clothing for the Indian."

### How Plants and Flowers are Grown. BY PETER HENDERSON.

Thousands of the readers of the Agriculturist live so remote from our great cities and towns,

Fig. 1.—FIRST STAGE.—CUTTINGS OF VERBENAS.

that "Flower manufacturing," as it may be termed, is something by them unseen and even unheard of. To such the accompanying sketches, taken on the fifteenth of December

clean sand. The engraving shows the cuttings as they are inserted in rows in the sand. The space shown is about 9 square feet, in which are set about 1,000 Verbena cuttings. These are taken in the green state from the old plants, cut

into lengths of about 2 inches, and inserted about half their length in the sand. They are shaded when the sun is hot, and freely watered every day until they take root, which will be in about 12 days from the time they are planted in the sand. The proper temperature for the sand is 60 degrees, and that of the atmosphere of greenhouse should be 10 de-

grees lower. The sand on the bench in which the cuttings are placed is raised to a higher temperature than the air of the greenhouse, either by a smoke-flue passing under the bench,

or by pipes containing hot water. As soon as the cuttings are rooted they are planted in pots 2 inches in diameter by 2 in depth, and again freely watered by a fine rose watering-pot.

Figure 2 shows an inside section of a greenhouse, with the plants in this the second stage of growth. These operations are continued during the season, from November to May.

In May the plants are ready to be set out in the open ground. Some conception of the vast numbers grown of this plant—the Verbena—

may he formed when we say that 300,000 were sent from this Out establishment dnring the months of March, April, and May of last year; and when it is known that there are many hundreds, great and small, of Florists' Establishments in suburbs of New York, all growing more or less of this popular summer flowering plant, it may be estimated easily

that many millions are planted annually. We can well note the increase of taste in the culture of flowers from this single plant alone. Twenty years ago, when we grew 5,000 Verbenas one year, we thought we would overstock the market; but we did not, and the vast increase that has been steadily made tends to no such result. And it must not be forgotten that this is only one species

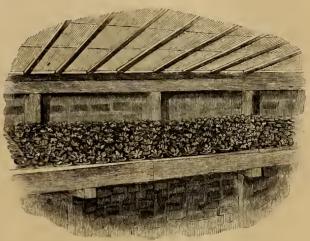

Fig. 2,—second stage,—verbenas in pots.

of flower, among many hundreds grown. Next in numbers to the Verbena comes the Rose; of these perhaps half the number is sold, but as the plant is more valuable, a far larger amount

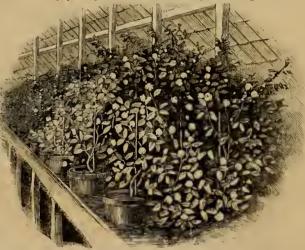

Fig. 4.—Roses in Pots.

in money is realized. Twenty years ago, 50,000 would have supplied all the demand for New York market; it must now require millions.

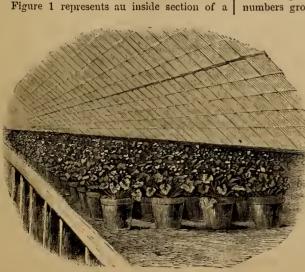

Fig. 3.—POINSETTIA PULCHERRIMA.

last, from our establishment in Jersey City,

N. J., may be interesting as well as instructive.

Fig. 5.—DOUBLE PRIMROSES.

propagating house. This has a propagating hench or table on each side, having a ledge to it, and is covered with about three inches of

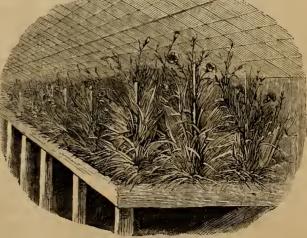

Fig. 6.—CARNATIONS.

Figure 3 shows another phase of Greenhouse culture—the growing of plants to produce cut flowers in winter. This section shows a mass

Poinsettia pulcherrima, as planted in one of the greenhouses. Each of these tropical-looking growths is about one foot in diameter, and of the brightest searlet that it is possible to conceive; these are not, however, exactly flowers, but are bracts or outer leaves of the flower. They are in perfection just at the holidays, and conduce more than any other flower to give the tables of our hospitable New Yorkers on New Year's Day a look of gorgeous elegance. A space of 3,000 square feet is devoted to this plant, and in bright sunshine such a blaze of scarlet is perfectly dazzling.

Figure 4 is a section of a Rose House, where the Tea Roses are being forced for their buds in winter. A space of 6,000 square feet of glass is devoted to this department, producing about a thousand buds daily. The varieties grown are very few, as we find only six or eight sorts are suitable for forcing. We name the kinds in order of excellence as we find them-Saffrano, Isabella Sprunt, La Pactole, Bon Silene, La Phenix, Agrippina, and Hermosa. Tuese embrace saffron, yellow, straw, pink, earmine, crimson, and rose colors. To force Roses in winter, the plants must be grown in pots during the previous summer and fall. It is useless to lift a Rose plant from the ground in the fall and expect it to flower well during winter.

Figure 5 represents a section of the house in which is grown the *Double White Chinese Prim-*rose. This is the most prolific of all winter flowering plants. The greenhouse in which we grow these has about 1,000 square feet of surface. Each plant occapies about a square foot of space, and produces not less than 500 flowers on each plant. In fact the whole greenhouse is one continued sheet of snowy whiteness from November to May. It is perhaps the most profitable of all winter flowering plants grown by the Florist.

Figure 6 is a section of Carnations or Pinks, as they are sometimes called, growing, planted out on one of the greenhouse benches. Of late years this has become one of our most popular winter flowers, and perhaps more space is devoted to it than to any other flower. Its cultivation is easy and simple, and for that reason it is less profitable here perhaps than any thing else grown. The cuttings are treated exactly as the Verbenas, described under (figure 1). As the plant is quite hardy, it is planted out from the greenhouses early in spring, (at the season we plant cabbages), in the open ground, at about one foot each way. The flowers are not allowed to develop during the summer, but are cut off as they appear-the flowering resources being husbanded for winter. In October they are lifted and planted, as shown in (figure 6). Many of these plants produce over a hundred flowers. The sorts grown are very few, mainly carmine and pure white. The family of Carnation, however, contains many hundred varieties; but we find comparatively few flower sufficiently freely in winter to warrant their growth; but for private collections a score of sorts might be grown to represent the different colors and

### "Hickory Farm" Adornments.

Dear Agriculturist,—"Hickory Farm" is not altogether terra ineognita to your readers, for not unfrequently hints upon properly farm topics, drawn from experience upon it, have found their way to your columns, but never before has any story of its horticulture been told. The reader ought to know that the farm is in

that region of New Jersey where "Holland Dutch" is the native tongue; where, though within an easy drive of your great city, the habits of the people are as simple and quaint, as little affected by city airs, and almost as characteristic of another race from that busy, restless population within a few miles of them, and now overrunning their pleasant hill-sides, as if it were on Haarlem Lake itself. The owner goes to New York every day to his business and returns about dusk. This is a hard sort of life, but, on the whole, decidedly preferable to life in town, for a man of rural tastes, whose wife also enjoys the country, loves her pony, her Jersey cows, her calves, and her poultry, and is never weary of planning adornments for both the outside and inside of her old stone house and its surroundings.

The house is of unhewn stone, roughly faced, but tolerably well laid, up to the caves, which project several feet, nearly horizontally, running into the gambrel roof upon a gradual curve. The gables are of wood. This is the prevailing style of architecture in which the old houses are built, and certainly it has many elements of beauty. I know of no more beautiful roof-lines than these old houses present, and no houses which, externally, convey more the idea of rural comfort.

Vines cling well to the rough stones; and ivy, trumpet vine, and Virginia creeper, hold on bravely, the rudest winds seldom tearing them from their hold. We have found two varieties of Virginia creeper (Ampelopsis quinquefolia), one which was taken from cultivated ground, and has clasping tendrils, wherewith to cling to the trellises or whatever it runs over, like those of the grape-vine, to which it is near akin. The other, taken from the rocky ledges and stone walls, instead of clasping tendrils, has tendrils, the ends of which are furnished with little flattened dises, like a fly's foot, growing upon them, and adhering fast to the stones. This looks very much as if natural requirements could develop certain characteristics in plants.

When we came, the house was hemmed in on every side with rubbish of old sheds and fences, smoke-house, hen-house, and corn-house, all "handy by." which was indeed their only recommendation. When this rubbish was moved, torn away, and cleared up, the ground, dug over and seeded down, had a very different look.

A fine young mulberry was crushed and smothered in the coils of a hundred-headed hydra of a wild grape-vine, of which one day it was barely relieved after two hours of hard labor. That was three years ago, and the vigor and beauty of that tree now is a joy to us every day. An old chestnut had been cut down before we came, and around the old stump perhaps twenty young trees were struggling for dear life, and throttling one another in self-There was little choice-the best would have made a light bean-pole, but it was picked out, and a shingling batchet made quick work with the rest. We have had nuts from this tree now for two years; the first year a handful, and last fall, enough to make quite a satisfactory "mess." The ground near by has been manured, and the roots reaching an ever flowing rill, the growth it makes is remarkable; -only because we have not been in the habit of watching similar things all our lives.

There was an old bridge over the aforesaid rill, which is indeed a perfect torrent after heavy showers. This was made by placing timber across between two piers, of the width of the road, and four feet apart, and covering

them with planks. It had yielded to the seductive influences of the stream, and was all but ready to fall into its embrace. We endured it as long as we could, but one day had John haul some good stones to the spot, and a sable wall-layer was hired for a day's work. Two new walls were laid, and enough long, flat stones were found to bridge over the space between them. The same evening the bridge was covered with small stones and fine gravel, making a good road and an excellent bridge, that will last a lifetime, at an actual out-go of only \$3. I came home one day, some time after, and found that as I had not provided quite work enough to last a carpenter we were employing all day, my wife had with his aid carried out a plan, which we had previously talked over, for finishing the bridge. Four strong, rough, cedar posts had been set, two on each side of the bridge, and on a line with it. Upon these, rather heavy cedar poles had been placed for handrails, and lower down other rails had been inserted between the posts; then, both by way of bracing and ornament, though no bracing was needed, cross-pieces of the same material (red cedar with the bark on, and only roughly trimmed) were set in the form of a very low broad X. The whole affair is now decidedly in keeping with the house and surroundings, rough and rustic, but having at least the beauty of strength and fitness, and the grace of appropriateness. Here, too, the never-failing vines begin already to clamber over the rails, and the wild clematis with the moonseed, will soon hang in festoons, or trail in the water.

Some time ago we had a visit from our good friend Mr. Weidenmann, whose elegant work on "Beautifying Country Homes" your house has just brought out. He was so kind as to give us upon paper his idea of how our grounds should be planted, so as to make the most of natural advantages, and so as to save expense both in laying out and keeping up a lawn. He agreed with us in the desire to keep up the old, comfortable look of the place, and to make everything tell for convenience as well as for beauty. It has been surprising to us to see how far a little work spent upon exactly the right place and according to a good plan goes.

We have made several successful attempts to move trees from the swamps and the woods; not, however, attempting any thing very large. Red cedars may be moved with ease if dug about in the fall and transplanted with a good large ball of frozen earth. There is some swampy ground upon the place and in the neighborhood, where there is only a surface stratum of black soil about 12 inches deep, and immediately beneath this a layer of impervious clayey sand, commonly called "hard pan;" a root penetrates it, and all the trees that grow upon this soil have of course no tap roots. If the roots are cut off in a circle around the stem, a tree may be pulled over far enough for a stone boat to be shoved under, and then when the tree is drawn back it may be drawn off without disturbing it very much. Last spring several considerable trees and shrubs were moved in this way, among them a big clump of black alders, several white birches and some cedars, which hardly seemed to know they had been disturbed, although put upon dry ground. The tough sward of swamp grasses is easily disposed of after the trees get to growing well; and, previous to that time, it serves an important purpose in holding the soil about the roots. I have a great admiration for the swamp pin oak. It grows well upon upland, and abounds

in these swamps. The tree is a mature looking one from its very youth. I see everywhere little ones, not more than ten feet high, which have all the style of a mountain monarch of a hundred years old and eighty feet in hight. We think they will make beautiful lawn trees: and but for the assurance of everybody we have spoken to, that we cannot transplant an oak, we would have tried it. Year before last a large one, say 30 feet high, and having a diameter of 14 inches at the stem, blew over. Its roots had been cut off upon one side by a ditch, made within a few feet of it. The prostrate tree did not wither; and although the mass of roots and earth adhering to them was exposed to sun and wind all summer and winter, it leaved out in the spring, and remained green the second season, notwithstanding the drouth. This fact encourages me to try to transplant some next spring, and I suggest the experiment to your readers.

## Hints on Grape Culture. BY KEYSTONE, ERIE CO., PA.

As to soil and site I shall say but little, only to have them high and dry; both, if possiblethe latter, at all events. I have found that grapes will bear any thing but too much water; in fact, I never yet saw them suffer for want of it, when intelligently cared for or wholly neglected, but have, in one or two instances, known of vines being injured by extreme summer pruning, and the damages charged to the drouth. At this age of grape culture I do not think it necessary to waste words on this part of the subject. A comparison of the extreme wet season of 1869 with the extreme dry one of 1870 leaves no chance for argument. Such extremes are seldom experienced, but, as teachers, are worthy of our closest scrutiny.

As to varieties I would be more explicit. Having had above thirty varieties under cultivation for several years, I can speak positively and favorably of only three in addition to the old standards-Isabella, Catawba, and Clinton. These are Concord, Hartford, and Ives. Some others have done well in favorable seasons, but these have invariably done well. Have stood the test of 20° below zero in winter, and 94° above in summer; the deluging rains of 1869, and the drouth of 1870; and have paid their way handsomely every season since the first bearing year. It is true the quality is not best, but so long as nine out of ten consumers judge by sight rather than taste, these varieties will sell at paying prices. They can be grown at half the cost of Delawares and Ionas, while they now command nearly as much per pound in market as the latter. We are told that this state of things will not always exist; but my convictions are that no planter will live long enough to regret his choice if he plant acres of these varieties. I know the market is sometimes overstocked with grapes of these varieties in bad condition, but it is because of their bad condition and not from a lack of excellence in the fruit. I have tested this many times by putting such fruit on the market in good condition, and realizing more than market quotations, with a ready sale.

I would not discourage the planting of new varieties. In fact, "test vines" of all of them are desirable; but the certain, regular income from reliable varieties is what growers want, and must have. When these test vines prove themselves worthy, adopt them if a grain ahead of the old ones, but not until then.

What few hints I have given, if well heeded, would have saved me some money, besides a good deal of vexation, and I give them to save others the same ordeal.

#### Depth of Covering for Cranberry Bogs.

The planting of cranberry bogs is greatly on the increase, and in some communities amounts to a fever. Cape Cod and Ocean County will no longer have a monopoly of the business. The industry no longer needs inspiration, but guidance only. Some ten years since, a patch of six or eight acres was planted in Essex, Ct. It has produced excellent crops so uniformly, that it has made a great many converts in all that region; and now capitalists are buying up suitable land, and laying out large sums in preparing it for planting. Much has been learned during the past twenty years, and the experience of intelligent cultivators has settled so many points in the management of the crop, that it is no longer regarded as a hazardous experiment. Capital is put into it with just as much assurance of ample and safe returns, as from ordinary market garden or farm crops. It has been settled that the three grand requisites for the successful cultivation of the cranberry are peat, sand or gravel, and capacity for flowage at will. Cranberries can be grown with some variation of these requisites, but not with uniform success. They will grow in almost any swamp that produces moss, maples, and swamp whortleberries, but the crop will be small and often fail. They can be planted on the bare peat, but there will be more vines than The vines will grow without flowage, herries but the fruit will often be destroyed by the frost and by the worms. But where the three requisites are all present, there is still occasion for inquiry and deliberation. What depth of sand or gravel is now a question of great importance, for it involves the outlay of many thousand dollars the coming season. Some say three inches, and some say six. Capt. Z. Small, of Harwich, Mass., the best authority we have on Cape-Cod cranberry culture, says three or six inches, according to the character of the bog. At the Grass Pond bog, in Coventry, R I., it is three inches, and that without skinning; and the cost is only about fifty dollars per acre for the preparation. The cost of six inches, with skinning, is from three to five hundred dollars per acre, according to the facility of getting sand, price of labor, etc. We shall get a clear view of the merits of this question if we consider the office which sand performs in the growth of the crop. The first object is to keep down the growth of all other vegetation until the cranberry vines are thoroughly established, and completely cover the ground. This takes three years where the vines are put out in hills, eighteen inches apart each way. If clean, silver sand or dead gravel is put on, few weeds or none will start, and the labor of hoeing is but a triffe. No cultivation is needed if there are no weeds. Now, if the sand has been spread upon a bare peat, that is, a peat bog skinned six or eight inches deep, three inches are just as good as six, so far as cheeking weeds is concerned. But the sand or gravel is also needed to check the growth of the vines after they are established. If the soil is too rich beneath the sand, the plants will run too much to vine and too little to fruit. If the bog is made up of decayed moss principally, three inches are enough. If it has grown maples and other bard-wood plants,

it will be too rich, and more depth of sand is needed to keep down the luxuriance of the vines. At Coventry, the bog is mainly the bed of an old pond that never grew any thing but moss and coarse, thin grass. The vines are not too luxuriant to yield, in favorable years, a barrel to the square rod. Another office of the sand is to retain heat, and thus guard against frost in June and August. It is well known that in the low places, where this plant flourishes, there are often light frosts, when there is none upon upland. Of course more heat will be retained in a covering of six inches of sand than in a covering of three, and a plantation might be saved from frost with the deeper covering, where otherwise it would be ruined; but if we have the control of water, we can keep off frost much cheaper with water than with sand. We notice that capitalists who are making plantations this season have generally covered with six inches of sand, without regard to the quality of their swamp land. This, to be sure, is the safer course, but we think from one to two hundred dollars an acre might often be saved in the covering, by a little discrimination in the character of the soil.

#### The Florists and Nurserymen's Black List.

(BY A NEW-YORK FLORIST.)

The magnitude of the business of horticulture is now such that it embraces many thousands of individuals, and, like all other trades, many unprincipled men are engaged in it. From its nature it has penetrated to every section of the country. Seeds, plants, and trees are sent to every town worthy of a name. In these towns dealers soon spring up that buy from the wholesale dealers; the great majority of these are upright and honorable men; but as in all other occupations, there is the usual proportion of black sheep. It is to these gentlemen I wish to refer.

For the purpose of preventing the operations of these gentry, a meeting was held in New York on the 3d of December last, which was largely attended by the principal seedsmen and florists of the vicinity. After an interchange of views, it was resolved to request all respectable men engaged in any department of the wholesale business, to hand into the secretary the name and address of any man known to be unworthy of credit; in short, to form a "black list" for mutual protection. This list is to be sent to all men of known good standing in the trade. This mode of protection is not new among wholesale dealers in the various trades, and the necessity for it in ours was well shown by one of the members present. He related the case of receiving a letter from Galveston, Texas, in August, 1869, ordering goods to the value of \$50. The character of the order led the nurseryman to believe that the party sending it was an amateur who did not know the rules of business, as no remittance was made, nor any thing said about payment; making allowance for this, he deviated from the usual rule, and sent the goods before receiving the money. In three weeks a draft was received for the full amount, accompanied by a complimentary letter thanking the nurseryman for the fine quality of the goods sent, and promising further orders. The next October this same gentleman wrote to a leading seedsman in Philadelphia, and referred him to the New-York nurseryman for his standing. Of course the New Yorker had no reason to think him dishonest, and reported accordingly. The

same season the Galveston man writes to the New York scedsman ordering goods to the value of \$300. These were sent, but the money this time was not, and inquiry developed the fact that the Galveston man was a well-known | year, referring to me. The fact is, I not on-

JAPAN GLOBE FLOWER-SINGLE FORM.

swindler who paid no one if he could help it, and that this mode of operating was an old practice of his.

Another shrewd mode of swindling came under my own observation. In the fall 1867, a private gardener whom I had known for several years started business in the town of Plainfield, N. J. He came to me and asked credit until spring for some stock, amounting to about \$100; in the following February he came and said his circumstances were such that it would be impossible, he thought, to pay in spring. I told him it made no difference, and offered him more stock if he needed it, which he gratefully declined, leaving me with the impression that he was a well-meaning man. In a week or two I began to get several inquiries whether I considered ---, of Plainfield, N. J., worthy of credit. My reply to the first few letters were favorable, but they began to increase rapidly, so that by May 1st, I sometimes received four letters by one mail asking the same question. The rascal must have written probably to a hundred men, shrewdly judging that there always would be a number that would be careless enough not to inquire; and so it proved in this case, for he succeeded, it is said, in getting nearly \$5,000 worth of trees without its costing him a cent, except for freight. Most of the victims were from Pennsylvania, where the swindler had formerly lived-two of them well known from advertising in the Agriculturist.

If these gentlemen had known this man's name as a swindler, of course they would not have been duped. Another person hailing from Fort Lee, N. J., has "tried the same game" this

ly never knew the man, but never heard of him until he was inquired about by those he attempted to dupe. Still another method is practised by these rogues. A great deal of nursery stock is sent by express, the bill to be collected on delivery; after this stock is removed from its regular place in the nursery or greenhouse and packed, it is of no value whatever to the shipper; moreover, the goods are perishable, and, if refused by the party ordering, the whole thing is a total loss to the nurseryman. Taking advantage of this fact, every now and then we find a scamp who refuses to pay the C.O.D., offering perhaps 25 per cent of the value of the bill, or as little as he thinks the shipper will accept rather than lose the whole and have to pay expressage besides. We are well aware that there are serious objections to the formation of such a list, that it might be made the means of injuring the credit of some honest man. This point was discussed fully at our meeting, and it was determined that only transactions that had an aspect of

trickery about them, should entitle the rogue to be put upon the list, and that a simple failure to pay debts was not enough; that no man should be thus tabooed, unless at least two men of known respectability should vouch for the fact that his transactions with them were of such a character as to show a design to defraud.

#### The Japan Globe-Flower. (Kerria Japonica.)

The Japan Globe-flower was introduced from Japan as early as 1700, and at first was described as a Corchorus, but it is now known to belong to the Rose family. It was first cultivated as a stove plant, then as a greenhouse plant, and finally it was found to be hardy enough to stand our winters. This plant is one of our most showy flowering shrubs for the open air, if it is properly pruned and cared for every year. It has green stems, with thin leaves, like those shown in the engraving, and is of very rapid growth; it produces globular heads of double yellow flowers in great abundance during the summer months; and if it is trained upon a fence or wall it makes a better appearance, as its branches are slender and liable to droop if they have no support. The ends of the branches are often winter-killed in the vicinity of New York, but not enough to prevent its flowering well. It throws up a great many suckers, forming a dense mass of wood; enough of this must be cut out to admit the sunlight and air. Any good, rich garden soil is suited to its growth, but it grows better in a somewhat shady position. The double variety was first introduced, and it is only some thirty-five years ago that the true species, the single form, has

been known to cultivators—only since 1835. We give an engraving of the double form, now common, and of the single, which is still rare.

Though so long in cultivation, it is much less frequently met with than many things of recent introduction. While poorly treated, it is but a shabby plant; yet, under good management, it is valuable in making a brilliant show. It multiplies itself with the greatest ease, by suckers from its underground runners.

PROTECTION TO HALF HARDY SHRUBS, ETC. -The high winds of winter are likely to tear off the straw or other protection placed about shrubs; and calves or other cattle allowed to run on the highways will often do injury. We have found red cedar boughs better than straw, because they are not eaten by animals. Sheep are very fond of hemlock, and young cattle will occasionally eat it, though it is much better than straw. Whatever has been used it should be looked to, patched up, or renewed, if necessary. It is much more important that the protection should be good at this season than earlier. The changes of weather are likely to be more severe and frequent. We may have days when it is so warm that the buds will swell, and the frost almost all come out of the borders, followed by a temperature of zero, or below. This is what kills fruit-buds, destroys the promise for blossoming of flowering shrubs, and brings for ward tender plants, only to suffer by the frost.

### THE HOUSEHOLD.

\$ F (For other Household Items, see "Basket" pages.)

#### The German Student Lamp.

Our ways and means for providing light are increasing gradually—not, indeed, with the rapidity one would suppose who reads the long lists of

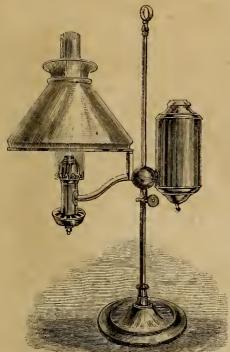

Fig. 1.—GERMAN STUDENT'S LAMP.

patents, entitled, "Improvements in Kerosene Lamps," for nine-tenths of the so-called improvements are so only in name. That horribly explosive "Fluid," a mixture of turpentine and alcohol, which was introduced in this country when sperm and whale cil went out of fashion from the searcity of whales and the demand for the oil for lubricating machinery, gave way to a no less dangerous article, a kind of coal-oil. This, however, was soon superceded by a safer and bet-

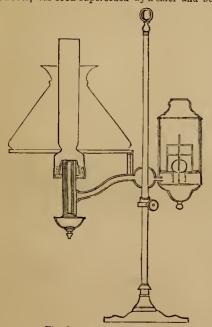

Fig. 2.—SECTION OF LAMP.

ter oil, and now the article which stands the firetest, or is up to the legal standard of density, is almost as free from danger, if properly used, as winter-strained sperm-oil. The amount of light which it gives, however, varies greatly with the lamp, and the comfort of its use depends greatly upon the construction of the same. Our people are ready and willing to pay for chimneys that will not break, for lamps that will not leak and defile both the hands and the air, for oil that will not explode, nor gum the wick, nor spatter and fizzle in the flame. There are those, of course, ready to go one step further, and make use of lamps which give the very best light and the most of it.

While we were using whale-oil and all manner of substitutes for it, the German people employed vegetable oils of various kinds, chief among which were those from rape and colza seeds, though olive-oil was also used, as well as other kinds. The favorite lamp with all classes has been the one recently introduced into this country, and known as the German Student Lamp, though called in trade the "St. German Lamp," for what reason does not appear. It is in form and structure precisely the same lamp as used by the writer when a student in Germany, seventeen years ago, except that a probable improvement has been made in the manner of raising and lowering the wick. Fig. 1 represents a view of this lamp, and fig. 2 a section of the same. There is a circular wick-tube and burner, surmounted by a tall, glass chimney, giving a powerful draft. This chimney is contracted about an inch above the top of the tube, so as to cause at this point a perfect combustion in the flame, which may be raised even so that it will flare a foot above the top of the chimney without smoking it. The wick-tube has, moreover, a draft up through the center, and a drip-cup at the bottom, all evaporation from which,

while the lamp is burning, is drawn up through the flame and consumed. Second, there is a porcelain glass shade, suspended by a ring on a level with the flame, which, while it cuts off very little light, diffuses a beautiful, soft illumination throughout the room, throws a powerful light upon the table where it is used, and entirely protects the eyes from the intense glare of the flame. Third, there is a eisteru and a reservoir for the oil at a distance of six inches from

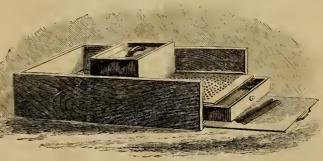

the flame, and connected with the wick-tube by a tube, which, as it always contains oil so long as a particle remains in the lamp, is a perfect safeguard against explosion from the flame passing back through it, even though the wick-tube should overflow and burn all over the outside. The structure of the eistern and reservoir is peculiar. It is shown in the section, so that it may be easily understood. The external cylinder, out of which the oil-tube goes, has a flat bottom above the ornamental one. Within this cylinder is another, open at the bottom only, with a narrow mouth, closed by a valve, as shown. This is drawn up, taken out, and inverted, to be filled; when full, a little wire, which is attached to the valve, is taken in the thumb and finger, and, by lifting it up, the valve is closed, and the reservoir may be turned up and placed in the cistern without spilling its contents. When settled to its place, the wire spoken of touches the bottom and the valve is lifted, and the fluid allowed to escape. It flows out until its level in the wicktube reaches the level of the mouth of the reservoir, when, by the well-known laws of hydrostatics, and the pressure of the air, it ceases to flow; but flows again, little by little, as the fluid is consumed, thus keeping it always at nearly the same level in the wick-tube. Fourth, there is the standard, which is an upright rod, with a heavy foot at the bottom and a ring at the top. The lamp is held upon this standard by a serew with a milled head, at any desired hight, thus placing the light close down near the book or paper, as one may be reading or writing alone, or higher up upon the standard, to light up the room.

To Cook Tripe.—The butcher should understand the business of cleaning, sconring, and soaking the tripe which is prepared from the stom-

ach of killed beeves, and is an epicure's dish. Boil the tripe in water, gently, until tender enough to almost fall apart (but not quite, you know; it must be tender). Remove from the water for which there is no further use. Serve with onion sauce, made of thickened milk and chopped boiled onions, and English mustard mixed with water.

#### Vegetable Slicer and Grater.

The simple contrivance, herewith presented, may be made by any neat carpenter, and by almost any one apt in the use of tools. It is a box, or trough, about 10 inches by 20 inches, open at one and and on the top, strongly made of inch stuff, furnished with strong cleats on the sides, upon which is a smaller box, without top or bottom, which may be moved back and forth through the box. Slides, very strongly made, to bear pressure, are fitted to rest upon the same cleats, but lower down, so as not to interfere with the free motion of the box over them. These slides are either graters for horse-radish, earrots, etc., or furnished with knives for slicing cabbage, or any other vegetables so used in the honsehold economy. In use, the article to be sliced or grated—say a cabbage head—is placed in the little box, shown in the engraving, and, the knife slide being inserted, it is shoved back and forth, bearing with the hand upon it nutil enough is cut off to enable the little follower to be put in, and after this the slicing is continued until it is all cut

GRATER AND SLICER.

up. A drawer beneath catches the shavings, or the gratings, and, if desirable, a place may be made to keep the slide which may not be in use, but this should not add much to the bulk of the machine.

#### The Wife for a Young Farmer.

All seem to agree that farming cannot be carried on very profitably by a man who has to depend upon hired labor and hired supervision inside the house. Why not? "Because no ordinarily paid housekeeper will look after the odds and ends with sufficient economy." Then an extraordinary housekeeper, who does attend to all the little details that save expenses, and add to the profits of farming, should receive more than ordinary compensation, should she not? even though she goes by the name of "wife." "But a wife," you say, "will do all that for love, not for money." "Yes, she will, indeed, for love." There is no telling how much a woman will do if she is sure of her husband's love, and if she loves in return.

But, my dear young farmer on the lookout for a suitable helpmeet, I want to whisper a few sisterly words in your car. Don't marry just for the sake of getting a housekeeper. Do you not see that it is the worst kind of cheating to tell a young woman that you love her when you are really intending to make of her an unpaid upper servant? Not that I want you to pay your wife a servant's wages. It would be better to give her the rank of a partner in the concern. But a true marriage is not a mere business transaction. It is a love affair. True love is amenable to reason. When any person of the opposite sex attracts you, ask yourself what part of your nature is moved, and whether the influence you feel is clevating or lowering. Love is something more than mere sexual passion.

It is more than mere fancy. It is a choice in which the heart and intellect are agreed.

With this definition of love in mind, I should say, instead of giving a catalogue of the peculiar virtues a farmer's wife should possess, marry the woman you love, it, after an intimate acquaintance, you both believe, on reasonable grounds, that you can be happy together. Learn each other's tastes, habits, plans and hopes, and seriously consider how you are going to "keep the pot boiling." All the better for you both if the one you marry has a practical knowledge of household affairs before her marriage; but if she is a good and sensible woman, and if you are a good and sensible man, you may be able to get along very happily, though she has all her experience of housekeeping to get after marriage. I would not advise any young couple to try this, but far worse mistakes are possible.

It is a hazardous thing to rest your hopes of a happy married life upon the quality of butter and bread a woman can make. Some perfect housekeeper may make you the most wretched of men. And it is a silly thing to be seared out of malrimony by any young woman's wardrobe. Let her know-the good and sensible girl whom you love -just what your circumstances are, and she will conform to them without a murmur;-that is, if she loves you as I suppose. You will be astonished to see how long she can make her nice dresses last without looking old-fashioned or shabby. If you love and marry a woman who is essentially silly and selfish, you will have to take the evil fruits of such a character, and this is why I say make character the test-not accomplishments of any kind, nor external circumstances-though all these things should be duly considered.

It is possible that your manhood-which is of rather more importance than your farm-may find its best complement in the womanhood of one who has a decided talent, that calls her away from the business of a housekeeper. Shall she bury her talent for your sake? Have you such a genins for the business you have chosen as she has for her art, whatever it may be? Perhaps you can arrange matters so that each may follow a chosen vocation without interfering with the other. Most people, in giving advice to a young farmer, would say-seek a wife who is healthy, energetic, thorough, practical, and amiable. Ou the whole, after all these remarks, I dare not give advice-not even the advice of Punch to those about to marry; "Don't!" For how do I know what experience is best for any soul? FAITH ROCHESTER.

## Home Doctoring. BY FAITH BOCHESTER.

GIVING MEDICINES.—Nobody need expect a list of prescriptions for various diseases under this head. It is distressing to read most of the reeipes for medicines which circulate in the newspapers. Here, for instance, is one which some lady says she has found "invaluable in children's bowel diseases," and she publishes it in the Tribune. Have children only one kind of bowel disease? Does she pursue the same course to check diarrhea as to overcome constipation? The medicine is compounded of three ingredients, noue of them harmless to a person in health, though none of them are classed among actual poisons. Is it not a dreadful thing for mothers to give their children drugs without having some idea of their nature and effects upon the system? I asked a woman, the other day, what she was doing for her sick child, "Oh. I give him some kind of doctor-stuff." said

che, complacently.

Of course we cannot reasonably expect to learn all about the properties of the various medicines used by physicians; but I surely would give none that I did not understand, except under the direction of a good physician, in whom I had great confidence; and I would never use medicines at all except as a last resort. Many persons say at once, when a person is ailing—"You had better take something?" that is their only idea of cure. When these drugs do not go to the right spot and effect a cure, who

knows what mischief they may do? Many of them are active poisons, and very few prove harmless if taken by persons in health. The disease you treat may seem to be arrested, only to give place to something quite as bad, or worse. There is about equal danger from

IMPROPER WATER TREATMENT.—A mode of treatment for diarrhea in children, which I just

read in a Western paper, is about as horrible as any kind of drugging; and I can hardly credit the assertion of the paper, that sixteen children out of twenty, as treated by a certain doctor, recovered! The method is this: "The child is enveloped in a common bed-sheet, which is first dipped in common well water, and then wrung thoroughly; the patient is next covered with a woollen blanket, and allowed to remain thus for one hour; after this,

cold compresses are applied to the abdomen. This is repeated every three or four hours—in severe cases, every hour." And the patient is a little child—so easily shocked or terrified by any harsh treatment!

I presume this performance is intended for a "pack," a mode of treatment, when properly carried out, that often proves very efficacious in different diseases. But a pack may be made one of the most barbarous operations in the world, if improperly administered. "Common well water!" Hard or soft? Icy cold or tepid? Soft water is best in all applications to the body, and should be preferred when it can be obtained. It is absolutely necessary that a patient in a pack should have the feet warm—by artificial means, if necessary; and he should always get thoroughly warm while in the pack. A single blanket would never be sufficient covering over the wet sheet; and a pack of an hour's duration would be too long in all but ex-

Some people seem to imagine that water is such a simple thing, it can neither cure nor kill; but it is quite capable of doing either, as it is wisely or unwisely administered. It is a blessed, cleansing, healing agency. We have little, downright sickness to deal with in our family, though none of us inherit very good constitutions. When sickness seems to threaten, we pay stricter attention to the rules which, moderately observed, keep us in moderate health, and this greater carefulness usually "cures" us. Perbaps some parent would like to know these

RULES OF GOOD SENSE.-Keep the feet warm and the head cool. Breathe pure air. Keep the skin clean. Take rest and exercise in such proportion as the body seems to require. Go to bed early, and ventilate your sleeping-room. Keep the bowels open by means of suitable diet and exercise, if possible: if not, by injections of pure water. plain, nutritious food at regular hours, nuder cheerful circumstances, and without haste. A little fasting is often the best remedy for a slight cold, a slight fever, neuralgia of the face, and all those diseases that arise from a disordered stomach. Some persons follow a fast with such a gorging as to destroy all its good effects. Cool compresses, made of a folded towel, wet in cool water, and covered by another doubled towel, applied to the head, throat, ehest, bowels, spine, or whatever part suffers pain, often afford speedy and permanent relief, and may be used without danger, provided the system is not shocked by too cold water. Ignorant people speak of the "cold water enre;" but the best practitioners seldom use absolutely cold water. For severe, sharp pains, cloths kept wet in as hot water as the patient can bear give most speedy relief. In almost any ease of acute disease I should, if possible, summon a

Good Doctor.—I should not care so much at what school he graduated as that he be a conscientions man, of good sense, and have a good knowledge of his profession. The more experience he had had the better; and the less he might seem to rely upon medicine, and the more he would trust to good nursing, the more confidence I should have in him. I should be very auxious to have him tell me just what was the matter if I did not already know; not simply the name of the disease, but what part of the system he supposed to be out

of order; and then I could never be satisfied until I found out the probable cause. I do not see how we can get along without educated physicians, so long as human nature is so untrue to the laws of its well-being, and so brings upon itself such numerous and complicated diseases.

### BOYS & GURLS' COLUMNS.

#### A Visit to Mount Vesuvius.

BY "CARLETON,"

A volcano! Is there a boy or girl who would not like to see a volcano? Who is there that would not go a long journey to see Vesuvius-that wonderful vent-hote in the crust of the earth? When I was younger than i am now I read about Mount Vesuvius-how the monutain was on fire, and was always smoking like a coal pit. or boiling over like a dinner-pot-how at times rivers of fire rolled down its sides, destroying fields and woods, houses and vineyards, cities and towns, and carrying desolation from the crater to the sea. The geography that I studied at school had a picture of the great traveler, explorer, and man of science-Alexander Humbolt-sitting on a shelving rock, and looking down into a lake of fire and brimstone that rolled and surged, and bubbled hundreds of feet below him. I often wished that I could see a volcano, and the time came at length when the desire of my boyhood was gratified.

It was a bright winter morning in Fehruary when we started out from a hotel in the city of Naples to ascend We could see the mountain a dozen miles away to the east, with a thin gray column of smoke rising from its summit. The street along which we rode runs by the shore of the sea, whose waves were rippling on the beach and gently rocking hundreds of that come up from Sorrento and Amalfi and other towns along the coast, loaded to the water's edge with oranges. I think that I never had seen so many oranges before in all my life. There were thousands of bushels. lay in great piles on the shore; there were baskets, boats, carts, and wagons heaped with them. And so cheap! I bought ten for a cent! How delicious they We obtain no good oranges in this country, for to get them to our market they must be picked before they are ripe. The people of Naples and Messina would think that the oranges in our market were only fit for pigs There were hundreds of carts in the streets, and thousands of donkeys carrying panniers filled with the fruit. I think that I never before or since saw so many donkeys together as there were along the quay. country people were in with vegetables for the market, consisting mainly of garlies, onions, cabbages, carrots and cauliflowers. Not unfrequently the donkeys would be so covered up with cabbages and carrots, that I could only see their noses and the flapping of their cars.

The Italians are very ernel toward the brute creation. They overload their horses and doukeys, and whip them immercifully. I have seen chicken pedlers break the wings and legs of the fowls they were taking to market, so that the poor things could not fly nor run away. I wanted to give the brutal fellows a crack over the head. The Society for the Prevention of Crucity to Animals will find Naples, missionary ground. I did not see a well-fed work-horse in the city. The people keep their horses and donkeys at the point of starvation. They do not give them much hay, and little, if any, grain; but feed them almost wholly on carrots.

As we ride along the street, our hack-driver stops a huckster and buys four cents' worth of carrots for his horse's dinner. Think of baiting a span of horses at that rate! The carrots were about six inches long, and there were about two dozen in the bundle—just a nibble for each horse. The horses were to go nearly thirty miles out and back—to be gone all day, and this was their feed. There is not a farmer's boy in America that would have taken less than a peck of oats for each horse. A merciful man is not only merciful to his beast, but gives good feed.

The street is crowded with people and carriages, and especially with onnibuses;—not such gaily painted vehicles as we see in our own cities—but a two-wheeled affair, somewhat like a sulky, but more like a dray. It is drawn by one horse, and there is only one seat; but it will carry from sixteen to twenty passengers! Four persons sit on the seat, while the others stand up or sit on the shafts with the driver; and there are usually four or five children that have a jolly time in a bag beneath the axle! We meet many of these carriages coming into the city from the suburbs. We pass a public washing-place where there is a great crowd of women and gitts round a stone trough, dipping clothes in the water and slapping them on the stones, and pounding them with a paddle to get the dirt out. There is not a Yankee wash

ing machine in all Naples. They do their washing without soap; and it is pretty much the way of the world every where, except in the United States, England, and Northern Europe II you ever travel in Europe, carry your own soap. You will not find the article at the hotels, not even in France, unless you call for it, and then you will find it charged to you in the bill at a high price. From what I have seen of the world, and the way people live in different countries, I have come to the conclusion that soap is a great promoter of civilization. I have found that where people use soap most freely there is the most cleanliness, intelligence, wealth and virtue, and happiness and comfort in life.

I dare say that most of you have seen pictures of Mount Vesuvius, a tall conical mountain, shaped like a stack of hay, and rising high above the Bay of Naples. At the base of the mountain we left our carriage and the main road, mounted our horses, and turned into a green lane and began the ascent.

There was a crowd of beggars around me-holding out their hands and their dirty caps begging for money. Four of them seized my horse by the bridle, and had a fight among themselves to see which should lead it; three or four more wanted to hold me on, and tried to make me understand that I should fall off; others caught hold of the horse's tail, determined to have the animal pull them up the mountain. They were villainous-looking wretches, with black beards, dirty faces, slouched

hats, and in rags and tags.
"Go back," I said. They bawled the louder. "Clear out!" They begged the harder. "Be off! Mind your business!" They didn't start. "I wont have you," I said, but it was clear they were determined to have me. I doubled up my fist, but they didn't mind it. I jumped from my horse, seized a endgel, and was on again in a twinkling. They understood that, and scampered like a flock of sheep; and we went on our way peacefully up the mountain, enjoying one of the loveliest views in all the world. It is about four thousand feet to the top. The entire mountain is of lava that has been thrown up from time to time from the interior of the earth.

Ages ago the volcano was in action: then the lava ceased to boil, and the whole mountain was covered with vines and trees. Seventy-two years before Christ was born, that brave warrior Spartacus-whom you, I dare say, have read about in Roman history-made the crater of Vesuvius his hiding-place.

Plutarch, the old Roman historian, tells us that there was only one way to get up to the crater over the rocks, and that Claudius posted his guards at the bottom of the precipice to starve out Spartacus; but the brave spirited fellow and his followers were not to be caught in that way, for one night they made the grape-vines into ropes, let themselves down the other side of the mountain, and were far away before Claudius knew that they had escaped.

It was in the year 79, about 1,800 years ago, that one day, about noon, the top of the mountain suddenly blew off-or out, or up, just like the explosion of a steam-boiler -with a terrible noise, and the air was filled with red-hot stones, einders, smoke, and steam, that darkened the sun and spread over all the surrounding country. There were terrific earthquakes—the whole mountain rocked and trembled, and there were vivid lightnings and fearful thunderings. The cinders fell on Pompeii, a city on the south side of the mountain, and buried it. A molten, red-hot lava rolled down the western side, over the town of Herculaneum, burying and destroying every thing in its path. Vineyards, houses, barns, wheatfields. and garden—every thing that could burn was enveloped in flames. The whole side of the mountain was on fire. The lava rolled into the sea, and heated the water boiling hot, and cooked all the fishes in the harbor, so that the next day and for weeks afterward the sea-shore was strewn with dead fishes already cooked for dinner! From that time to the present the fires have been constantly burning, and the hole in the top of the mountain has either been sending up columns of steam and smoke, or throwing up red-het stones, or boiling over like a kettle. There have been nearly sixty great eruptions, besides

numerous smaller ones. In 1822, the top of the mountain suddenly fell in with a loud crash, and then there was a furious boiling of the cauldron. For four days there was a continuous shower of red-hot stones rained upon the surrounding country. One red-hot rock, weighing four or five tons, was thrown three miles! The pillar of smoke that went up from the summit was two miles high, and spread out over the sea like a huge umbrella, hiding the sun and making it dark as midnight at noonday in Naples. When the cruption was over it was found that the whole top of the mountain had been blown away, and that a crater three miles in circumference and two thousand feet deep had been formed by the action of the internal fires !

Half way up the mountain we came to the river of There had been an eruption a few months before, and this was one branch of the great stream that had boiled over the rim of the crater. It had cooled so that

we could walk upon it, but it was still smoking and too hot to hold our hands in the crevices. We felt it warming up our feet and crisping the soles of our boots. It was a stream wider and deeper than the Mississippi! Think of it-a red-hot river of molten rock flowing down the mountain, sweeping every thing before it-widening and spreading till the whole mountain side-the vineyards, the trees, the towering pines, the earth itself-is ablaze! Think how it must look at night, glowing as brightly as the hottest furnace in a great iron-foundry! It had changed in color from the red-hot glow to a darkish brown. This was the lava; but as we approached the top we came to the cinders—dry, light pieces of lava as large as peas or coarse gravel, that were blown out hy the steam into the air and had fallen around the cone. It is hard work to climb to the top over the cinders; but we leave our horses at the hottom, and after much puffing and sweating reach the summit. A few months before we should have found it a lake of fire a third of a mile across, with steep banks forty feet high: but it had cooled so that we walked down into it, and went upon the stony waves. We passed through thick clouds of smoke and over beds of sulphur, where we were obliged to hold our breath. We could look down into the cracks and see the liquid fire beneath. There was a hissing and roaring as the mass seethed to and fro, and a cracking now and then of the rocks under our feet. stopped long enough to roast some eggs for our dinner. It did not take long, for when we thrust a cane into a crevice it took fire as quickly as if we had put it into a fire blazing on the hearth.

It was interesting to stand there-to watch the glowing heat, the curling smoke—to hear the low runthing and thundering far beneath us; but we felt a good deal safer when we were over the rim of the crater once more, and making our way down the side of the mountain.

#### Aunt Sue's Puzzle Box.

Now, children, I want you all to send answers to the puzzles, and I propose to give a prize every month to the one who sends the longest list of correct answers.

To give every one of you, far and near, an equal chance, I will give you two months to work in; i. e., the answers

to January No. will be published in March; those to February puzzles in April, and so on.

QUESTIONS, ENIGMAS, CHARADES, ETC.

RIDDLE.

One day my master shut me up, And stamped me on the back, Then sent me from before his face, On a returnless track.

I might have thought him crnel, But he was, in fact, a friend, And his own right hand safe guided me, Unto my journey's end.

ANAGRAMS.

(To properly enjoy these very amusing puzzles, it is necessary to have a box of letters; and I shall give as a prize, every month, one set of anagram letters to the one whose name is drawn by lot from those sending correct solutions to all the anagrams.)

1. Minced meat. 6. Stood in lace. 2. Toes dance. 7. Bride's hand. 3. Samuel Tot. 8. Heart Bolt.

Been wet. 9. Gripe none

5. I a girl? No! 10. I'm Tom Pane.

#### TRANSFORMATIONS.

Entire, I am actively disagreeable; behead me, and I am passively disagreeable; now, change my head several times, and make (1) a pen; (2) a metal; (3) informed; (4) disposed of; (5) andacious; and (6) part of a ship; now hehead me, and leave a state of being that few would fall short of.

DOUBLE ACROSTIC.

Scenes of carnage and war's dreadful din, The fruits of our moral corruption and sin; Never to cease until the world's at an end, And man never more can his brother offend.

- This, the papers in which most lawyers delight,
   With which they will this try to prove if they can;
   A small thing which Shakspeare esteems rather
- 4. Six feet, more or less, this may be for a man.
- 5. A protection and guard, of fine metal cast, To shield from the danger of some subtle fluids, 6. A kind of conveyance which travels quite fast,
- And is used for the transport of various goods. HAUTBOY.

#### CHARADE AND DECAPITATION.

My first does to my second what my whole was intended for; behead my first and use the remainder if you would do my second beheaded; behead my first again and transpose it, and you will find something that belongs to my second entire.

DIVISIONS.

- 1. Divide a piece of furniture and leave a district and a garment.
- 2. Divide a weapon and leave a boy's nickname and a
- 3. Divide something discordant so as to leave a vessel and an ornament.
- 4. Divide an old woman and leave illustrious and a

What part of the body could we easily dispense with?

NUMERICAL ENIGMA .- No. 1. I am composed of 7 letters:

My 2, 5, 6, 4, is the main point. My 6, 3, 7, 1, is an adverb.

My whole we should all avoid. H. G NUMERICAL ENIGMA.-No. 2.

I am composed of 22 letters:

My 4, 14, 6, is what many long to hear, when 10, 19, 3, 14, makes them ask a question.

My 22, 7, 5, 8, 18, 2, is something nice to cat, either raw or cooked.

My 11, 1, 20, is a marsh.

My 9, 13, 21, 15, 16, 17, 12, is to fluish; and my whole is an adage.

Answers to Puzzles in the December Number. REDUS No. 297 .- A clean glove often hides a dirty hand, CHARADE.-Monkey.

Correct answers received from Franklin W. Hall and H. C. Loomis.

AUNT SUE'S NOTICES TO CORRESPONDENTS. - W. II. Morrow. Your "first attempt is excellent" though simple, and shall be dressed up for the engraver. Let us have some more.

Downsey, "Good!" Back again.

Address all communications intended for the Puzzle Box, to Aunt Sue, Box 111, Brooklyn, N. Y.

Mustrated Rebus .- Good sentiment.

Illustrated Rebus .- An old motto.

403. Wustrated Rebus.-Geographical puzzle.

[COPYRIGHT SECURED.]

#### FEEDING THE SPARROWS.—Drawn and Engraved for the American Agriculturist.

What a pleasant dinner party we have here! Five little guests in their glessy brown coats, all with the choicest manners, never eating with their knives, never sticking out their elbews, never speaking with their mouths full, and never forgetting to hob their heads politely every time they are asked to take any thing. They very timid, peer little creatures, because, you see, they are foreigners, and not quite used to the ways of the country. Perhaps they have taken a bird's-eye view of Eoglish geographies, and learned that the natives of America are red-skinned savages. But if they only had courage enough to look at their hosts and hostesses, they soon would discover the mistake. Gentleness creates gentleness. The hirds make every heart here as tender as their own. How cautious and still the children are, lest they be disturbed! How the baby longs to poke them lovingly in their eyes, and how the little one near the window half hides and half comes out to look at the wonderful English sparrows, papa brought home only a week ago! He kept them in a big cage for a while, and then let them hop about on the piazza. This is the first time they have been asked in to dine, and see how wilmraly they come! To be sure there was a little shrinking at first, a little show of shyness, and a little too much ceremeny as to which one should enter first. But perhaps that was only a part of their good breeding. After this visit they will feel quite like members of the family. They will go in and out of their cage in the most light-hearted and familiar way possible, and consider the raising of a window as the most pressing of invitations. Passy, so far, has shown no desire to harm them; hut when they are so very close, Eddy thinks it rather more prudent to hold her in his arms-not tightly

enough to hurt her, but just so as to prevent her from slipping through. He has heard of the Happy Family in the menagerie, and confidently looks forward to the duy when Pussy shall walk about the lawn with a sparrow perched on each ear, and perhaps another swinging blithely on her tail. Why not? A great many English sparrows have of late years been brought to this country. They evidently like the climate. They build their nests, raise their families, and, full of life, full of husicess, twitter merrily together just as if in the writing on the blue sky overhead they read their naturalization papers. Naturalization may be a big word to some of our young folks, but it is in the dictionary as well as in the air we breath. At first, only a few of these sparrows were to be seen-a dozen in this park, a dozen in that, and sometimes a few on sale at five dollars a pair. "They would destroy the worms now infesting our cities," said the knewing ones, "but it would be quite impossible to raise them here on account of the boys." Did the hoys hear the slander and resolve never to deserve it, or did the gentle, stranger sparrows plead their own cause? Certain it is that the little creatures multiplied and prospered. Unharmed, they flew in and out among the roughest children of the street, hopping almost upon their feet, hurrying past their heads, and twittering by dozens within many an easy stone's throw. Summer and winter they stay and chirp their happy notes. "The children are our friends," they say; "even the law is good to us. It fines every man heavily who shoots or ensnares us. It lends its aid to give us all this world of sanshine to live in—twitter, twitter—we'll do all we can for them—we will, we will." And so they do. They destroy worms; they brighten our parks and cities; they make busy people, hurrying along the pavements, stop to admire their beauty and study their interesting ways; they cheer up dasty old ivy vines and sickly city Better than all, they awaken in the hearts of young and old gentle, kindly thoughts wherever they go.

#### A Cheap Elephant.

At the public sale of a menageric, lately held at Trenton, New Jersey, an elephant was put up to the highest bidder, and, as no one needed him, was just about being "knncked down" by the anctioneer for a very small snm, when a bystander resolved to purchase the monster himself rather than lose such a bargain. "Why, it's the chenpest thing I ever heard of!" he exclaimed, gleefully, when, after his adding "an 'af" to the few dollars already offered, he was declared to be the purchaser. "I'll put the creature in my barn for a day or so, and make a good thing of it." So that night Master Elephant was tied in the barn—a pretty strong barn it was, too—and toward daylight he amused himself by trying to break it to pieces. He succeeded so well in this little piece of playfulness that it was found necessary to remove him to stronger hailding. That night he again became restless, broke his fastenings, and dashed around at such a rate that the barn was soon one of the most thoroughly ventilated buildings in America. The total extent of damage done in the two nights was over five hundred dollars; and it is currently reported that somehody is extremely tired of his bargain, and advises all his friends never, on any account, to be tempted to buy a cheap elephant. The rule is a very safe one to follow, never to buy anything simply because it is cheap.

#### Sate Home Investment.

#### The Connecticut Air-Line, First Mortgage, Seven per cent Bonds,

are made unusually safe, by having Two Dollars of valuable productive property pledged to seenre each and every Dollar of Bonds issued, as under the Charter of the Company, the bonds can be issued for only one-half of the actual cost of the Road.

A rich and coterprising section of Connecticut is furnished for the first time, with ample railroad fueliities, by this Road, one-half of the line having been in successful operation since August, while the nufnished portion is rapidly approaching completion. This Road also forms, with its connections, the shortest route between Boston and New York, saving 27 miles in the distance, equal to Twenty per cent.

The Bonds are free from U. S. Tax, and from all State and Local Taxes in Connecticut, which makes a saving of some two per cent to investors. They bear 7 per cent inter-est are in denominations of \$500 and \$1,000, and can at the option of the holder, be registered.

We recommend these Bonds, issued by the

### The Premium Sanford Corn.

Farmers, procure your seed from "Headquarters." Get the genuine. Large quantities are being offered which are impure Beware of the spurions. The Sanford Corn has been tested the past season in nearly every State and Territory, and the claims made in favor of it are sustained by the most convincing and disinterested testimony (neither "Bogus" nor "Bougut,") establishing the fact that it is not a "Humbug," and confirming all previous evidences of its superiority. It has the reputation in this (Suffolk Country) of being the best field corn, and as such has taken the highest premium for five successive years. In many States it has ripened from two to four weeks carlier, and produced from one-third to double the quantity of other corn. These facts will warrant every Farmer in giving it a trial.

#### READ THE TESTIMONY.

PLEASANT RIDGE STOCK FARM,

PLEASANT RIDGE STOCK FAIM, Pittsfield, Mass., Dec. 28, 1830.

S. B. FANNING—Dear SI:—The Sanford Corn grew rapidly with immense foliage, the leaves being very long and wide. Many of the stalks produced four large ears, two-thirds had three ears on them. There was but little unsound corn, and most of the ears were filled ont to the top. It has been seen by many who have been here from the West, and all have said that it was the finest corn they ever saw. The small cob and large proportion of grain attracted their attention. We have not shelled all of it, but it is safe in saying that there are 110 bushels (shelled corn) per acre; and we have made up our minds that it is easier and cheaper to have made up our minds that it is easier and cheaper to raise 100 bushels of "Sanford Corn," than 40 of the "Tillot-

raise 100 bushess of "Sunport Sounders of any other variety grown here.

It has been the admiration of all, and we have often been leadered 50 ets. an ear for seed.

J. H. Crook & Son. offered 50 cts. an ear for seed.

RICHVIEW, ILL., Aug. 28, 1970 The Sanford Corn is early, having become scared; while my Dent Corn planted the same day is scarcely silked out. WM. E. THOMAS.

Office of T. A. Thompson, Co. School Sup't,

Office of T. A. Thompson, Co. School Sup't,
PLAINVIEW, WARBSHAW Co., MINN.
8. B. FANNINO.—I am sure that all that has been claimed
for the Sanford Corn is true concerning it. I believe, all who
engage in its culture will fully realize their expectations. I
have tried feeding it in connection with the Yellow Dent,
and my hogs would select and eat it all and leave the Dent.
I can recommend it to all.

T. A. Thompson.

TPSILATTI, MICH., Jan. 7, 1871, S. B. FANNING.—Thinking you might be interested, I give you the result with the Sauford Corn I planted the 26th of May, while my neighbors were cultivating theirs. Planted on clover sod—no mannre and only ordinary cultivation—I on clover sod—no manure and only ordinary cultivation—i have harvested from the first acre measured, 155 bushels; the second, 141 bushels. I cut the stalks the 10th of Sept, fully ripe. The best acre of my common cora planted in the same field with same culture, yielded but 110 bushels. I have 75 bushels more shelled corn than if I had planted the White Dent, Eight-rowed Yellow, or Red Blaze, From three bushels of ears I get two bushels of shelled corn. Have done bushels of ears I get two bushels of shelled corn. Have done this three or four times in shelling that amount. When weighed at the mill, I had 130 lbs, of nice corn from three bushels of ears. If any one can beat this I will make another trial next year, if I live. It is universally liked in this vicinity. The seed delivered cost me \$8.70. If I had paid \$25 for it, it would be the cheapest seed I ever planted. Some of my neighbors think I have "Corn on the Brain," and it is partly true, and I have it in the crib. John Howland.

S. B. FANNING-Sir-The Corn 1 purchased from you was planted on the 23d of May, two grains in a hill. Plowed it twice before and once after harvest. Did not see it after-wards until it had cared, and was surprised to find from three to eight stalks in a hill, and most of them with two and some with three ears on a stalk. It yielded at the rate of 120 bushels per acre, which was just twice the yield of our common cora. I intend to plant largely of it the next season, and think all farmers will find it to their advantage to give it a trial.

FRANK K. BOOLE.

MINNEQUA, PA.

Mr. Fannino.-The Corn you sent me last spring surpass-

ed any thing I ever saw in the corn line. I planted on the 22d of May one-eighth of an acre—gave it the same cultivation as my other corn. It grew more rapidly, came up more evenly, produced as much again and better fodder, proved earlier, and yielded twenty-five bushels of corn in the ear from the one-eighth of an acre. I shelled three bushels of ears and got two of shelled corn, which I sold readily at the rate of \$16 per bushel. All who saw the the corn while growing, and after harvested or cut up, (which was in August 25th), spoke for seed. Several stalks had on four good cars. I can highly recommend it to all corn-growers.

Thos. E. De Russe.

THOS. E. DE RIESE.

S. B. FANNING—Dear Sir:—I planted the Sanford Corn you sent me on light, sandy soil. It grows the fastest of any corn I ever saw. Each stalk produced from three to four ears. I believe it will make three or four times as much as any other corn I ever saw. It is from three to four weeks earlier than any corn I ever saw.

WM. S. BAMBERG.

JANESVILLE, Wis, S. F. FANNINO.—The Quart of Sanford Corn was planted on the 14th of May. It was over a week in coming up on account of the drouth. Many of the stalks producing two and three large

DR. S. N. SMITH.

BLOOMSBURG, N. Y.

S. B. FANNINO,—Dear Sir:—I planted the Sanford Corn on the 5th of June. The dry weather kept it back, and it was more than a week before it sprouted. It commenced to set cars about the 19th of July, and it beat all corn I ever saw for sets. Some stalks had five, some four, and none less than three. About this time the drouth commenced and dried up many of them, but it yielded 75 bushels per acre, and nothing but the dry weather kept it from yielding double that amount. I consider the stalks very valuable for fodder.! for fodder.!

AUBURN, Chio, Nov. 14, 1870.

AUBURN, Ohlo, Nov. 14, 1870.

S. B. FANNING.—I take pleasure in reporting result of my experiments with the Sanford Corn. Late in May I planted two Quarts on old ground, ordinarily manured. There was a fine growth of stalks and a large yield of splendid looking corn. From the two quarts planted on a quarter of an acre of ground, I obtained 35 hushels—at the rate of one hundred and forty bushels per acre. The large, well filled ears are admired by all who see them. A gentleman of this place raised 38 bushels from two quarts seed. I am satisfied that the Sanford Corn is not excelled by any variety. satisfied that the Sanford Corn is not excelled by any variety, but believe it superior to all,

GEO, WM. WILSON.

Mt. Eaton, Ohio, Dear Sir:—I planted the Sanford Corn on the 18th of May, it was ripe two weeks earlier than my other corn. I planted my common corn in the same field. It took 12 rows to make 45 bushels of ears. Of the Sanford Corn It took only eight rows to make the same number of bushels. It will yield with me one-third more than the common corn.

E. D. PINKERTON

Prices: One Quart, post-paid, 75 cts.: Two Quarts, \$1.25; One Peck, by Express, \$2; Half Bushel, \$3; One Bushel, \$5, Send stamp for Circular, giving full description, History and Testimony. Also, price-list of new varieties of Corn, Potatoes, Oats and other choice Farm Seeds. Money may be sent in Registered Letter, or Post-office Money Order (drawn on Riverhead P. O., N. Y.). Any amount less than \$2, may be sent by mail at my risk.

Box 191, Brooklyn, N. Y., or Flatbush, L. I.

A MERICAN IMPROVED IMPERIAL SUGAR BEET, Seed \$1.25 ner pound. Sent by mail, postage paid. Address HENRY LANE, Cornwall, Vermont.

#### WASHBURN'S

### AMATEUR CULTIVATOR'S GUIDE

#### FLOWER AND KITCHEN GARDEN.

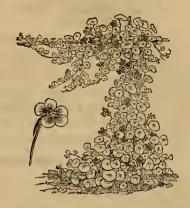

25th Editlon.

This work has 150 pages of closely printed matter, on fine paper, and is intended as a complete Guide to the Amateur Cultivator, for both Flower and Kitchen Garden. It is illustrated with over 130 beautiful Engrarings, two spiendally colored Lithographs, one of Moore's Early Concord Sweet Corn (described on page 30 of the Jan. No. of Am. Agriculturist), and a fine plate of Double Foruttaces. Also a list of 400 choice varieties of Annuals, 330 varieties of choice blennials, and perennials, over 200 varieties of finest Greenhouse Seeds, 100 choicest varieties of Climbers, 100 varieties of rare and desirable Everlastings, 100 choicest French and German Flower Seeds, 400 of Newest and most desirable kinds of Vegetables, to which is added a Descriptive List of Herbs, Tobacce, Ornamental Tree

Seeds, seeds for Hedges, Lawn Grass, Clover, choice new varieties of Potatoes, also a list of 130 varieties of Gladiolus, including all the new foreign sorts, Tuberoses, Tigridias, Vallottas, Amarylis, Lilies, Smilax, &c., which are all described, with full directions for their cultivation.

We feel assured, upon examination, this will be found to far surpass any existing work of similar description; we have spared neither time, trouble, nor expense in its compilation. It has been our endeavor to make it reliable, not only in the description of the great number of flowers and vegetables which are cammerated on its pages, but equally so in the full and complete practical directions for the successful growth of every variety. In addition to this information, our remarks on laying out flower gardens will, we hope, not only prove a valuable aid to amateurs, but assist in disseminating a true taste for gardening net.

As specialities, we refer particularly to the very extensive list of NOVELITIES, many of them of rare merit, and difficult to obtain. Other specialities are our choice selection of French and German flowered Balsams, Carnation and Picotee Pinks, Double Zinniss, Double Portulacas, &c.; and of green-house plants, Cinerar

pressly for us. In our collection of German, French, and English flower-seeds we feel especial pride; for they contain all the truly beautiful varieties obtained in Europe during the last ten years, all selected especially for us, and never surpassed,

are such vs we can recommend with the greatest confidence; and, though we have not had the opportunity to test the latest additions, the dealers from whom they have been obtained leave little doubt of their real value.

This work has been published regardless of expense, and as Mr. Bartlett, the wellknown Agriculturist of New Hampshire, expresses, "Is far ahead of any thing of the kind ever before issued from the American press." Our custom has been to charge for this work to all but our customers, but we find that nearly all receiving it become so, and we have concluded to SEND IT FREE to applicants upon receipt of two stamps."

### WASHBURN & CO.,

#### BRIGGS & BRO'S

Illustrated and Descriptive Catalogue Of Flower and Vegetable Seeds

AND SUMMER FLOWERING BULBS,

FOR 1871,

is now ready for mailing. It is printed on a most elegant neverthized paper, and ILLUSTRATED with nearly Five Headers Original Exgravinos and Two finely executed COLORED PLATES—Specimens for all of which were grown by ourselves the past season and from our own Stock of Seeds. All the Drawings and Engravings were executed by Artists of acknowledged taste and ability, who have made the subject of Floral and Vecetable representations a special branch of their business for the last eighteen years. The columns of the "Ruyal New-Yorker," "Horticulturist," and other popular publications, some of which from their beginning to the present moment, contain evidences of their skill. In the originality, execution and extent of the Engravings its unlike and eminently superior to any other Catalogue or "Floral Guide" extant.

The Catalogue consists of more than One Hundred and Twelve Pages, and as soon as published will be sent Free to all who ordered Seeds from us by mail the last season. To others a charge of 15 Cents per copy will be made, which is really not the pathe of the Cotorned PLATES. We assure our friends that the inducements we offer to purchasers of Seeds, as to quality and extent of Stock discounts and premiums, are unsurpassed. Please send orders for Catalogues without delay. We have now the best Artists of the country at work upon

#### A Colored Chromo for 1871.

It will be ready to send out about the middle of January. The Chromo represents Forty-two Varieties of the most showy and popular Flowers, of natural size and color. We design to make it the Best Plant of Flowers ever issued, size, 19x24 inches. The retail value would be at least Two Dollars; we shall, however, furnish it to customers at 75 Cents per copy, and shall offer thesa Premium upon orders for Seeds. See Catalogue when out.

We are now manufacturing more than one mile per day of our Improved Roofing for which we were awarded the first premium by the American Institute, Nov. 5th, 1870.

Extract from report of Committee appointed by Am. Inst. Farmers' Club to examine the improved Asbestos Roof-

Ing.

"The material constitutes, for a *cheap roofing*, one of unsual merit, much superior to any of the class previously brought to their notice, and worthy of trial by those who desire a durable, easily applied, comparatively inexpensive and safe roofing, the material having in addition to the other merits claimed for it, that of being practically fire proof."

Full descriptive Pamphiets, Price-List, and samples sent

#### H. W. JOHNS, 78 William Street, NEW YORK.

Also, manufacturer of Asbestos Roof Coating and Cement, Sheathing Felt, Boiler Felting, Preservative Paint—acid, water, and vermin proof paper, and dealer in Asphaltum and Asbestos.

FLORAL GUIDE & CATALOGUE
of Flower Seeds, now ready, and sent free to all who
apply.
J. H. PUNCHARD,
Salem, Mass,
Plesse state that you saw this in Am. Agriculturist.

#### CUCUMBER, GEN. GRANT.

A superior variety, either for foreing or for culture in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Many specimens were grown the past season averaging thirty inches in length. After a five years' trial, we unhesitatingly pronounce it better than any other variety for

Packets, containing 10 seeds. 25 cents. Five packets for \$1.00. B. K. BLISS & SONS,

P. O. Box 5,712, New York.

#### Conover's COLOSSAL ASPARAGUS Seed and Roots.

The experience of the past two seasons fully confirms all that was claimed for this variety when first offered, and it now stands unrivalled in size, productiveness, and quality.

Specimens were exhibited specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained for times the circ of the people a register.

which attained four times too size of that popular variety.
Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four luches in circumference. and were circumference, and were ready for entting one year in advance of the ordinary vari-

etics.
Seeds in half-ounce packets,
50 cents per packet, \$10.00 per

Hoots one year old, \$2.00 for fifty, \$3.00 per hundred; by mail, post-paid, \$25.00 per thousand, by express, freight paid by purchaser. Address

B. K. BLISS & SONS, Nos. 23 Park Place & 20 Murray St., New York.

CHARLES A. DANA, Editor.

### The Dollar Weekly Sun.

A Newspaper of the Present Times.

Intended for People Nowon Earth. Including Farmers, Mechanics, Merchants, Professional Men, Workers, Thinkers, and all Manner of Honest Folks, and the Wives, Sons, and Daughters of all such.

ONLY ONE DOLLAR A YEAR!

ONE HUNDRED COPIES FOR 850,

Or less than One Centa Copy. Let there be a \$50 Cinb at every Post Office.

THE SEMI-WEEKLY SUN, SO A YEAR,

of the same size and general character as the THE WEEKLY, but with a greater variety of miscellaneous reading, and furnishing the news to its subscribers with greater iresiness, because it comes twice a week instead of once only.

#### THE DAILY SUN, SO A YEAR.

A preëminently readable newspaper, with the largest circulation in the world. Free, independent, and fear-less in politics. All the news from everywhere. Two cents a copy; by mail, 50 cents a month, or \$6 a year. For Terms to Clubs, and Specimens, address

I. W. ENGLAND, Publisher, Sun office, New York.

#### AMERICAN AGRICULTURIST.

Annual Subscription Terms (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Twenty copies and nywards, \$1 each: Papers are addressed to each name.

HEARTH AND HOME: \$3 a year for less than four copies: Four to nine copies, \$2.75 each; Ten to nineteen copies, \$2.50 each: and twenty or more copies, \$2.25 each. Both Papers to one address, \$4.00 a year.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

### Worth Looking Into.

Nearly 12,000 Persons, at about 10,000 Post-offices, have each obtained, free of cost, one or more of the very valuable and useful articles catalogued in the table on this page, and described, in part, on the next two pages.

There are **18,000** other Post-offices in the United States, and some **1,500** more in British America, at each one of which any enterprising Man, Woman or Child can easily collect subscribers enough to secure one or two or more, of these good premiums, with no outlay.

Both the American Agriculturist (monthly) and Hearth and Home (weekly) are universally acknowledged to be excellent, practical, instructive, useful, reliable, and very cheap journals. No one can read either of them a year without getting hints and information that will be worth, and will pay back, many times their cost. (They are independent papers, and do not contain the same engravings or reading matter.)

The cost of both (at \$1.50 and \$3.00 a year) is less than 9 cents a week. The two journals together supply \$35,000 worth of pleasing and instructive engravings, and contain as much reading matter, as one will get in 122 Good Books sold at \$1 each. (See page 44.)

Let any one take copies of these journals, show their character and value, and explain the above facts, and it will be easy to collect names enough to secure some one or more of the excellent premium articles. TRY IT.

Note.—Many persons canvass all the time as a business, sell the premiums received, and thus clearing large wages.

One Lady actually thus earns over \$3,000 a year, and multitudes in this way secure salaries of \$300 to \$1,500 a year.

Special Notice To All Our Readers: We Have a Fine Lot Of Valuable Things That are First-rate: You Want Them. Should Have Them. And Can Have Them This Month February At no Money Outlay. Thousands of Others Are Getting Them, And You may do so, Just as well as They.

(See First Column.)

## Explanatory Notes, Read and carefully Note

the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But ... (b) Tell ns with each name or list of names sent, that it is for a premium ... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from one to five months, to fill up your list....(d) Send the exact money with each list of names, so that there may be no coufusion of money accounts ... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be need carefully and economically, as they are very costly....(g) Remit money in Checks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

[In the following table is given the price of each article, and the number of subscribers required to get it *free*, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50.]

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39,

\*\*Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums. Nos. 8 to 11, 21 to 24, 27, 28, 29, 47, 48, 63, 64, and 66 to 100 inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express affice nearest recipient), to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified. (Steam-Engine mailted for 35 cents extra.)

[See Next Page.]

#### Full Descriptions

of all the Premiums, are given in our October anmber, which will be mailed free to all applicants. Read over the descriptions, and you will find many desirable articles—indeed all are desirable. We have room in this paper only for the following DESCRIPTIVE NOTES:

Nos. 1, 2, 3, 4, 5, 6.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the heet foreign goods. Messrs. Patterson Bros., 27 Park Row, who supply us with these articles, are also importers of English goods. They recommend these Knives, manufactured by the Meriden Cutlery Co., as equal to any Cutlery in the market, and their recommendation is a gnaranty, wherever they are known. We offer four kinds of Knives, and three sizes of each kind. No. 1 have Rubber Handles, which are actually boiling water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$4.... For 23 subscribers at \$1.50, or 78 at \$1, we will give either the medium size or the table size, sold at \$15.50. No. 2 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$1.50, or 102 at \$1, we will send the Table size, sold at \$2.50. For 31 subscribers, at \$1.50, or 100 at \$1, we will send the medium size, sold at \$25.50. No. 3 are made of Solid Steel and are triple-plated all over with pure silver, which will wear for a long time, while the Knife is actually indestructible by ordinary use. Dessert size with Forks, sold at \$22... For 37 subscribers at \$1.50, or 118 at \$1, we will give the medium size, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Ivory Handles, and are really splendi

No. 7.-French Cook's Krife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Pat. Rabber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of heef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by The Meriden Cutlery Co.

Nos. 8, 9, 10, 11—Pocket Mnives.—Hene's for the Boys and Girls!—These Premiums are among the mostpleasing and useful that we have ever oflered. Every boy, and girl, too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are made by Messra. Smith & Clark, Bronxville, N. Y., whose work is equal to any done in this country or Europe. No. 8 is a neat, substantial Knife, with three blades and buck-horn handle. No. 9 is a still finer article, with four blades and buck-horn handle. No. 10 is an elegant Knife, with four blades and shell handle. No. 11 is a Lady's Pocket Knife, a 'beautiful article, with four blades and shell handle.

No. 12.—A Ten Set.—This premium has given the greatest satisfaction, for the last four years. There are six pieces; viz. A Coffee-Pot, two Teopols, a Creamer, Sugar and Slop Bowl—all of beautiful, uniform pattern, new style, with raised and embossed figure work. They are not the common silver-washed articles, but the best triple plate, the foundation being white metal, so as not to show, even when the heavy silver coating may chance to be worn off in any spot by long, hard usage—These sets are made by the Lucius Hart Manufacturiug Co., of Nos. 4 and 6 Burling Slip, New York City, and are warranted by them to be of the best triple plate; and each piece burs their stamp. Mr. Hart, "the veteran Sunday-school man," has been in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and take pleasure in commending and guaranteeing its value to be as represented. The amount of silver upon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly a good-lookeng plated ware for less than half the money.

No. 13.—Casters and Fruitor Cake Basket Combined.—This is a new pattern, both novel and beantiful. It can be used as large, showy Casters, with six ent-glass bottles, or he instantly changed into complete Casters, with Call-Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers as No. 12, of same metal, plating, etc.

No. 14. — Cake Basket.—A new pattern, cance shaped, nicely chased and very taking. It is from the same makers and of equally good quality as the two preceding premiums; is a beautiful table ornament.

No. 15.—Revolving Bratter Cooler.—This is a really good and useful article. It is so arranged that a very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same honse as No. 12.

No. 16.—Ice or Water Pitcher.—A large and ornamental article. It is of the same metal, plating, etc., and by the same makers as No. 12. For 35 subscribers at \$1.50 cach, we will include a round Saiver of pattern to correspond (value \$6); or, for 47 subscribers, a large 16-inch oval Salver (value \$14), large enough for two goblets with the Pitcher; and for 53 subscribers, the Pitcher, large Salver, and a pair of beautiful Goblets, silver-plated without, and gilded within (value \$3\$). This complete set is exceedingly desirable, though the Pitcher alone, or that and the smaller Tray, or Salver, will answer a good purpose, both for use and ornament.

No. 17.—One Bozen Teaspoons.—No. 18.—One Bozen Table-Spoons.—These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 12. They are far cheaper than any thing we have found at half the price, and well worth working for.

No. 19.—One Bozen Table-Forks.

The same description and remarks apply to these as to No. 18. We select as premiuns only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 20.—Child's Cnp.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the outside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life keep-sake.

Nos. 21, 22, 23.—Gold Pens: with everpointed Pencils, in extension, coin-silver cases.—Premium
No. 21 contains the best No. 4 Gold Pen; and No. 22 the
best No. 6 Gold Pen, which is the same style, but larger.
No. 23 contains No. 7 Gold Pen, in Gold-tipped Ebony
Holder. Each pen will be sent in a neat leather case by
mail, post-paid. These pens are made by Geo. Fo.
Hawkes, No. 61 Nassau St., and have obtained
a wide and good reputation. We have known the maker
and his goods for many years, and can recommend them.

No. 24.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same makers as above.

No. 25.—Lozo Pendulum Board.—
A very pleasing article for Boys and Girls (and we have seen not a few "grown up" folks playing with it). It is a neat Walnut Table Case, with rings, balls, looks, etc., etc. Seven different games can be played on this board. It is easily adjusted upon a table, chairs, piazza, etc., and readily closed and set away when not in use. Pictures and descriptions of it can be obtained by addressing "Novelty Game Company, Providence, R. H." As it requires only 18 subscribers at \$1.50 each, or 58 at \$1 each, to get this \$10 Prize, a great many of our young readers can quickly get up a club, and secure a Holiday present for themselves.

No. 26.—Annesette.—We believe in home entertainment for both young and old people. Our observation is, that the increase of entertaining home games is already doing much to keep not only the boys but their fathers away from drinking and gambling rooms, and other places of evening resort not conducive to good morals. Premium No. 25 is specially adapted to children. This one, the "Amusette," as it is called, will afford interest to the older as well as the younger members of the family, male and female. It only needs a smooth table of any kind covered with a cloth. The play with the balls will develop much of ingenuity and skill, and give a capital study of the laws of motion, force, ctc. The price has been reduced from \$10 to \$6, and our premium will place it in the power of very many to secure this additional source of home amusements. The

Amusette is supplied by E. I. Horsman, 100 William Street, N. V., who will send any desired circulars giving information. It packs in small space and can be safely sent anywhere by express at small cost.

No. 27.— Garden Seeds.—A valuable selection of 40 varieties of the best seeds for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next are put up for us by Messrs. B. K. Bliss & Sons, Seed & Horticultural Warchouse, 22 Park Place and 20 Murray St., whose seed establishment is well known as one of the best in the country. This premium will be of great value and convenience to many, as we send the seeds post-paid.

No. 28.—Flower Seeds.—Like No. 27 this is a valuable premium. It consists of 100 different kinds of beautiful flower seeds, all in separate papers, and includes the finer common varieties, and many of the newer and rarer kinds that are costly. Sent post-paid.

Nos. 32, 33, 34.—Sewing Machines. "A good Sewing Machine lightens the labor and promptes the health and bappiness of those at home." We offer a the health and bappiness of those at home." We offer a choice of three of the best of the leading machines, all of which have been thoroughly tested in our own families, and give entire satisfaction. While all are valuable, each has some excellence peculiar to itself. The Grover & Baker Machine is remarkable for the dealicity of its stilled, which is at the same time very firm and durable. The structure of the seam is such that, though it be cut or broken at intervals of only a few stitches, it will neither open, run, nor ravel. It sews directly from two spools, without rewinding....The Plorence Machine makes different stitches, each being alike on both sides of the fabric. One of its special advantages is that it has the reversible feed motion, which enables the operator, by simply turning a thumh-screw, to have the work run either to the right or left, to stay any part of the seam, or fasten the ends of seams without turning the fabric. The Willcox & Gibbs Machine excels in the exceeding simplicity of its construction. Very little instruction and ingenuity are required to understand the few parts of which it is composed, and their use; and there is no excuse for getting it out of order, until the parts are fairly worn out. One of its strongest recommendations is the ease with which it is worked, taxing the strength of the operator less than other machines. All these machines have constantly increasing sales, showing the public estimate of their value. Either of them will prove a great treasure in any household; worth more than \$500. \$500, at 7 per cent interest, would yield, less taxes, about Most families require at least four months of steady \$32. Most lamines require at teast four months of steady hand-sewing a year, costing, if all hired, not less than \$24 a month, board included, or \$36 a year. With a Sewing Machine, a woman can sew more in one month than in four months by hand. Here is a clear saving of \$72. But far above this—the everlasting "Stitch, stitch, stitch," the bending over the work, and the loss of sleep, stitch," the bending over the work, and the loss of sleep, have brought tens of thousands to early graves. We say to every man, get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre or two of land—get the Sewing Machine any way. If you can get one through our premium list—well; but get the machine.—No charge for boxing the machines. They go safely as freight. Send for circulurs, giving full instructions, to Grover & Baker Mff's Co., 495 Broadway, N. Y. Willeox & Gibbs Mf'g Co., 658 Broadway, N. Y.

No. 35.—Washing Machines.—For a long time we have annually tried many new Washing Machines, and "Doty's Paragon," which we have now used nearly five years, is the only one the "help" will nse voluntarily. Send for full Descriptive Circulars to R. C. Browning, 32 Cortlandt St., N. V., orto Metropolitan Washing Machine Co., Middlefield, Com. It goes cheaply by freight or express.

No.36—Clothes Wringing Machine.

—A very nseful, time-saving, strength-saving, clothes-eaving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the articles, We have given thousands of these premiums, with almost universal satisfaction. They are made by the Metropolitan Washing Machine Co., Middlefield, Ct.

Nos. 37, 38.— Melodeons.— These are excellent and desirable instruments, for the *Home Circle*, for small Churches, for Sunday-schools, for Day Schools, Academies, etc. Instrumental and Vocal Music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer the Melodeons made by Messrs. Geo. A. Prince

& Co., Buffalo, N. Y., for we know them to be good. A large ooe in our own Sunday-school room has been in use for eleven years, and is to-day just as good as when first purchased, though used from time to time by a large number of persons.—Several elergymen have obtaiced this premium for themselves, their Churches, or Sunday-school rooms. The clubs of subscribers were quickly raised among the members of their parishes.—Maoy others can get a Melodeon for their home use. Send a postage stamp to the makers and get their illustrated descriptive circular. These Melodeons will be shipped direct from the manufactory at Buffalo. They can go safely by freight or by express. If an Organ should be wanted instead of a Melodeon, we can supply it for an increased number of subscribers in proportion to the value. We have given these instruments for several years, and we believe they have invariably been greatly esteemed.

No. 40 .- A Good Watch .- The Watches made by the American Watch Co., Waltham, Mass., have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for haod labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of mannfacture are unattainable. A smoothness and certainty of movement are seenred which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor, with maohinery perfect and ample, enables them to offer watches at lower rates than any other manufacturers. Their annual maonfacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of over 400,000 Waitham Watches in the pockets of the people is the best proof of the public approval. We offer a Silver watch, jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, in pure coin-silver "hunting" case; weight 3 oz This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "American Agriculturist. Made by the American Watch Co., Waltham, Mass."

No. 41.—Ladies' Fine Gold Watch.

This elegant Premium will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 40 above) includes these beautiful gold watches. They are full jewelled, in 13-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time Keeper. Upon the movement of each Premium Watch will be engraved "AM. AGRICULTURIST. MADE BY THE AM. WATCH CO., WALTHAM, MASS."

No. 42.—Frank Wesson's Breechloading Rifle.—This is a capital little rifle, weighing 6½ lbs., 40 inches long including the breech, and an accurate and powerful shooter, to which our attention was recently called by our "great gun" friends, Messrs. Cooper, Harris & Hodgkins, of 177 Broadway. At our first trial, of ten shots, eight were put within an inch of the center of a target 60 yards off, and the other two were within 1½ inches. We stopped then because the bull'seye was destroyed, and tried twelve shots at 100 yards. Seven of these were within 1 inch of center, and the other five within 2½ inches. The above 22 shots were fired as fast as the marker could plug the holes and get out of the way. (Plain open sights were need. For very accurate shooting with any gun, the globe sight is necessary.) A few trials proved the gun to have great penetration and accuracy at the distance of 400 to 800 yards. With the ready fixed ammunitioo, (copper cartridges, containing powder, hall, and percussion), the loading is exceedingly simple and rapid. Pulling one trigger throws up the barrel, and ejects the used copper shell, a new one is inserted in an instant, the barrel is pushed down, the cock set—all done in a few seconds—and you are ready to fire again. One has only to carry the cartridges in his pocket, the hight rifle, and his game bag.—The usual length of barrel is 24 inches. Louger barrels can be had at an expense of 50c, an inch if wanted by any one,—Send for descriptive Circulars, etc., to the Agent, M. W. Robinson, 79 Chambers St., New York. Our premium will be the 24-inch steel-barrel rifle, including 100 eartridges. The recipient will please choose whether the caliber be 32-100, or 38-100, or 44-100. The last named is suitable for leavy game, the first for smaller, and the 38-100 for a medium. The first is hardly large enough for bears, buffalo, or deer, but is ample for any thing smaller.

No. 45.—Brecch-loading Pocket Rife.—This remarkable little fire-arm weighs only cleven ounces, yet shnots with great accuracy and power from 30 to 100 yards or more, and can be loaded and fired five times a minute. It can be carried in a side pocket, and is accompanied by an extension breech, so that It may be used either as a pisol or rifle. It is put up in a neat mahogacy case, with 250 rounds of am-

munition. The maonfacturers are Messes. J. Stevens & Co., Chicopee Falls, Mass., and the rifies are sold at retail by Messes. Cooper. Harris & Hodgkins, No. 177 Broadway. This Premium gave great eatisfaction last senson. Without the mahogany case, we will give the weapon, all complete, with 100 cartidges, packed in a pasteooard box, on receipt of 18 subscribers, at \$1.50 each. For a full description see American Agriculturist for Jan. 1869, page 32.

No. 41.-Maynard's Combination Gun-A Breech-loading Rifle and Shot-Gun, or Two Guns in One!—This is a capital gun for those who want a weapon to use either as a rifle or shot-gun. Either barrel can be slipped into the same stock moment. The ammunition is peculiar. The st brass cartridges are loaded at leisure, costing nothing but for the powder and lead, and may be used over and over again for any number of times. One can carry cartridges in his pocket, loaded with different sizes of shot, and slip in and fire any size wanted for large or small game. At our first trial with the rifle barrel, we twice over put 12 successive balls within an inch of the center of mark, at the distance of 60 yards, and within 114 inches of the center at the distance of 100 yards, and did nearly as well at still greater distances. We want nothing better for accuracy and penetration. The shot barrel carried admirably. Our Premium consists of a complete outfit, including an extra fine Stock, a 26-inch rifle-harrel, 35-100 hore, with elevating Peep Sight, Cartridge Retractor, Double Bullet Mould and Neck Cutter. Loader, Rod, Brush, Cone Wrench. Extra Cone, Rag-holder, and 50 Cart ridge-cases, Platina Bushing, Front-shaded Bead Sight; Shot Barrel, with 50 Shot Cartridge-cases, Rod and Brush, Wad-cutter, and Shot-loader, Powder-Flask, and extra Charger. For further particulars send for a Circular to the Massachusetts Arms Company, Chlcopee Falls, Mass.

No. 45. — Double Barrel Gim; on Fowling Piecs.—These guos are the genuine London "Twist" barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their calibre and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this premium by Messrs. Cooper, Harris & Modgkins, 177 Broadway, well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gan, and guarantee it in every respect. It is from one of the oldest and most favorably known Earlish manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This premium includes Gan, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 46.—Chest of Good Tools.—We continue through the special favor of Messrs. Patterson Brothers, of 27 Park Row, the offer of chests of the rery first quality of tools, of kinds and prices named below. Similar tools could be purchased for half the money, but these are all A. No. 1, for practical use, and worth a dozen common articles. For this we have the guarantee of Messrs. Patterson, which is amply sufficient for us, and for all who know them. Any of these tools may be ordered of them. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and but few additions would be required for a Journeyman Carpenter. The assortment we offer is as follows: 1 Tool Chest, \$8; 1 Jack Plane, \$1.75; 1 Smooth Plane, \$1.50; 1 Fore Plane, \$2.25; 1 Handsaw, 22 in., \$1.75; 1 Compass Saw, 10 in., 50c.; Compass, 6 in., 37c.; 1 Adze-eye Hammer, No. 4, \$1.25; 1 Hatchet, No. 2, 90c.; 1 Draw Knife, 7 in., \$1.12; 1 Try Square. 6 in., 70c.; 1 Bevel, 8 in., 75c.; 1 Chalk Line and Spool, 30c.; 1 Mallet, 30c.; 1 Pair of Pliers (steel), 5 in., 60c.; 1 Pair of Calipers, 4 in., 36c.; 1 Brace, No. 2, \$2.25; 1 Auger bit, ca. ½ in. 30c.; ½ in. 32c.; ½ in. 40c.; 1 in. 60c.; 1 Center bit, ca. ½ in. 32c.; ½ in. 32c.; 3 in. 40c.; 1 in., 60c.; 1 In., 70c.; 1 Taper bit, 30c.; 1 Since-driver bit, 25c.; 1 I flat Countersink, 25c.; Rose, 60., 25c.; Snail, 60., 25c.; 10 Catgon Reamer, 30c.; 1 Taper bit, 30c.; 1 Since-driver bit, 85c.; 1 I flat Countersink, 25c.; Rose, 60., 25c.; Snail, 60., 25c.; 10 Catgon Reamer, 30c.; 1 Taper bit, 30c.; 1 in., 60c.; 1 Framing Chisel, ca., ½ in., 40c.; 1 in., 50c.; 1 in., 60c.; 1 Framing Chisel, ca., ½ in., 40c.; 1 in., 50c.; 1 in., 60c.; 1 Framing Chisel, ca., ½ in., 50c.; 1 in., 70c.; 1 in., 50c.; 1 in., 60c.; 1 Framing Chisel, ca., ½ in., 50c.; 1 in., 70c.; 1 in., 50c.; 1 in., 50c.; 1 in., 60c.; 1 Soldering Copper, 60c.; Solder, Nails, etc., \$1.25; \$45.60c.

Nos. 50, 51.—Precurial Barometers.—Woodbuff's Patent, made by Chas. Wilder, Peterboro. N. H. These are the most convenient and portable Mercharial Barometers made. (Send to Mr. Wilder for a circular.) The peculiar form of Mercury cap invented by Mr. Woodbuff renders these Darometers so portable that Mr. Wilder quarantees their safe delivery, if not to be sent beyond the Rocky Mountains. The instrumeots are about 3 feet long, differing mainly in the style of case, both being supplied with Thermometer and Fernier. A Barometer is to farmers, or others on land, what it is to sailors at sea | an indicator of the weather

to be looked for. To us this instrument is of more real value, in a business way, than the interest on several hundred dollars. It more than pays its cost EVERY YEAR!

No. 59. — Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc., etc. This is one of the most successful toys ever invented. Twenty-five thousand dollars' worth were sold last year by Orange Judd & Co., Sole Agents.

No. 62.—The Great Dictionary.—Worcester's Large, Pictorial, Unabridged Edition, containing 1,854 three-column pages, with a multinde of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this by far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopædia. The Dictionary can be called for at our Office, or he sent by express or otherwise, to any part of the country. It should be in every family. It is published by Brewer & Tileston, Roston.

Nos. 66 to 76.—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Honsehold, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid.—They are profusely Illustrated, the engravings used in them having alone cost at least \$60.000. Those obtaining premiums for less than thirteen volumes can select any volumes desired, from XVI. to XXIX, inclusive. For ordinary use, the sets of numbers inbound will answer quite well.

Nos. 77 to \$7.—Esound Volumes of the Agriculturist.—These are the same as Nos. 66 to 76 above, but are neatly bound in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. SS to 99.—Good Libraries.—
In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 88 to 99 may select any books desired from the list of our books published monthly in the American Agriculturist, to the amount of the premiums, and the books will be forwarded, Post or Express paid. \$25 or \$50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acro of land on coming to manhood. End Let the Farmers of a neighborhood unite their efforts and through these premiums get an agricoltural Library for general use.

No. 100.—General Book Premium.

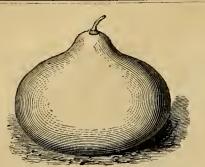

Any one sending 25 or more names may select Books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1,20; or 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

No. 101—Steam-Engine.—This is a veritable steam-engine; one that will GO; and a capital, intensely interesting, and instructive article for boys, and grown-up people too. [See description and Illustration in oar December Number, and in Hearth and Home for November 26.] Our eleven-year old boy has run his engine an average of an hour or more a day for five weeks past; has exhibited it in motion to many of his playmates; has hitched on the toy machinery, and it appears to go just as well as when first started. It is given to any one sending two subscribers to Hearth and Home, at \$3 a year; or three subscribers to American Agriculturist, at \$1.50 a year. It will be sent anywhere in the United States or Territories free, if 36 cents are sopplied to prepay postage.

#### Small Truck Farm, near New York City.

For Sale, a valuable Farm of 31 Acres of the best quality of land for raising Garden Truck for the N. Y. City markets, for which it has been in part devoted. It is on Long Island, less than 9 miles by the best of roads from the N. Y. City Ferrles, and in the midst of the celebrated Long Island Truck farms, many of which are valued at \$8.00 to \$1.40 per acre. It has near, comfortable. Now Buildings, and will be sold on easy terms of payment, sav one-third to one-half eash, and the balance on Bond and Mortgage. Price \$10,000. Address S. F. GOODING.

#### SUGAR TROUGH GOURD.

I have raised this year on ½ of an acre 750 of these gourds, that will average 5 gallons each, and 100 of the largest will bold from 7 to 11 gallons each. I believe one may be grown to hold 15 gallons; and in my Catalogue have offered a premium of \$10 for the largest, and \$5 for the second, grown in 71. I have need them in the Sugar Camp and for Lard Cans for several years, and they are not only the cheapest, but best vessels for these purposes; are valuable for a variety of household purposes.

riety of household purposes.

My stock of seed was exhansted last year, and I returned the money to nearly one thomand of my customers, but I can supply all demands this year. My Catslogue for 'Il given full directions for their growth and management, and the prices and description of 200 varieties of Field, Garden, and Flower Seeds, including 9 varieties of Beans, 9 of Beets, 10 of Cabbage; Cucumber, 7, Corn, 9, Gonrd, 5, Melon, 9, Peas, 8, and early every thing any family wants to plant; also 100 choice varieties of Flowers. Send for the Catalogue.

### SANFORD CORN, Hugh's Corn, Norway Oats.

I have a fine stock of the above, and wishing to get reports from my patrona, I have offered premiums for the largest yield from 4 lbs, of seed, in 'il. I believe the Hugh's Corn will yield more sound corn to the acre than any varlety I have ever seen. My Catalogue describes them, and gives conditions to those competing for premiums; also prices by the peck and bushel.

4 lbs. of any one of the above, by mall, \$1, or the three to one address, \$2.50.

Address

WALDO F. BROWN,

Box 75, Oxford, Butler Co., Ohio.

### DAIRYMEN

### Iron-Clad Milk Can.

The above cut represents the Side Handle of this Can, which is the best in use. It is made of the very best arought and malleable iron, timed, which makes it proof against breaking under any circumsdiances. It sets closer to the Cao than any other handle. The centre being raised above the handle part, it furnishes the hoisting and dumping socket, and presents a perfectly smooth surface, which precents brutising other 'Cans, settling near, in transportation; and the handle is arranged so as to drop against a piece of rubber, which does away with all noise in transporting or handling the Can.

Being made of Wrought Iron, they can be shaped to any sized Can without springing the tin.

P. S.—The Milk Pail will be shown in our next issue.

See Bottom and Cover in Dec. and Jan. Nos.

### Self-Acting Gates.

NISHWITZ

PULVERIZING HARROW?

The best in the world. See what responsible parties, who have used them, say:

From Cornell University. — "We would advise every farmer to procure one without delay. It will amply repay any one for the outlay in the first season of its use."

From Anherst College.— The Harrow has been thoroughly tried. We are more than satisfied with it."

Levi Stockbeidge, Prof. of Agriculture.

From report of the great National Trial at Ulica, N. Y., accompanied by a Special Gold Medal.— The effect of this Machine was most astonishing. We cannot speak too highly of it."

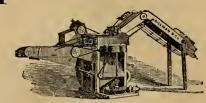

From report of American Institute Farmers' Club.—"It is as far ahead of the common Harrow as a Colt's revolver or Sharp's rifle is ahead of the old fint-lock fire arm."

SOLON ROBINSON.
From HON. JOHN STANTON GOULD.—"It is the very best Harrow I have ever seen. Its effect as compared with other harrows is as different as relvet and tow cloth,"

Send for Circular to

NEW-YORK PLOW CO., 91 Beekman Street, New York.

sessoo.

sessoo.

E. W. Christie, of Haverstraw, N. Y. under date of Oct. 20th, 1870, says: "I used the Double Refined Poudrette on Corn, Potatoes, and Cabbuge. I never saw better corn or more on the acte than I raised this year. I am satisfied the use of the Poudrette increased the yield fully one-third. It gives the plant an early start, makes it grow rapidly, giving less work to cultiviste It; I also find it a sure preventive of the Cut, or Wire-worm, which often destroys the young corn or cuts the roots. It more than doubled my yield of potatoes and cabbages."

toes and cabbages."

R. D. Pearce, of Squam Village, N. J., says in a letter dated Sept. 20th, 1870: "I used the Double Refined Pondrette mostly on corn. The corn came up in a superior, hestlity condition, and continued to grow fister and more stalky than that planted in the same field with best barnyard compost. I am well satisfied my corn is twice better than the cost of the Pondrette. I also applied it to pumpkins and other vines with much better results than with compost."

Price of Double Refined Pondrette, \$25 per Ton. Common Pondrette, \$2 per Barrel.

GRIFFING & CO.,
58 & 60 Cortlandt Street, New York.

Won highest prize at N. Y. State Trial, 1870. Sows Beet, Carrot, Onion, Parsnip, Turnip, etc. Seed Conductor being ENAMELLED WHITE Inside shores the seed as it drops. Packed one or six in a box. BALLARD'S

### Champion Shoe.

(Patented May 29th, 1866.) The "Champions" are made in the most Durable Man-NEE and of the very Best Material, and every pair

#### WARRANTED. Their Advantages.

The seams are at such points as can never hurt the feet and the shoe needs only to be closed at the top by a simple Buckle and strap; saving Time, treotele, and vexation. The forepart overapping the quarter renders it impossible for nint, stubble or rubbish to enter the shoe, which, to armers and laborers, proves a hiessing indeed.

Farmers, if you wish to procure for yourselves and boys a Good, Honker, sperviceable shoe, one that will give you entire satisfaction, save you time, trouble, and annorshare, you can remit us by mail the prices given below; stating your size or number, whether botble Sole or Single Sole of the Sole of Single Sole, by what Expless to ship, and they will be sent you by return Express.

New York, May 10, 1870.

We have examined carefully "HALLARD'S CHAMPION SHOE," and, without practical use, should indge it to be a capital article. The peculiar rut gives it the set and bearings of a boot, with the ease and lightness of a shoe; and the strap brings it as closely as desired around the aukle without the trouble of strings. Those which we have seen are of good stock and well made.

out the trouble of strings. Those winch we have seen are or good stock and well made.

ORANGE JUDD & CO.

Men's Pegged, Double or Single Sole, full Oak Kip...., \$2.75 1807's

Men's " " " N. K. Calif " 2.50 1807's

It would be better for 10 or 12 to club together and send as Monry Onnen or Registrated Letter. It is easler for us to send 12 Fairs to one address than in single Fairs.

The Champions are manufactured solely by the well-known House: BAY STATE SHOE & LEATHER CO., \$2 and \$1 Vesey St., New York.

Offer about 2,000,000 Acres

#### Iowa & Nebraska Lands for Sale

On 10 Years' Credit, at 6 per cent Interest,

No part of Principal due for two years from purchase and afterwards only one-uinth yearly.

Products will Pay for Land and Improvements.

The Liberal Credits given; Free Passes allowed; small annual payments required; the current market value of money, and profits on Stock raising, prove these terms cheaper, esser, and better than to buy U.S. land within railroad-land limits at \$2.0 per acre, while our prices range generally from 4 to 5, 6, 8, and 10 bollars per acre. Quality and local advantages rule the price.

On these generous Terms the industrious and competent can buy and pay for a good Farm and Home. In beginning, it is necessary to have money enough to pay sky pay cent interest on the land, obtain provisions, build a cabin, huy a team and agricultural implements till crops are raised, which can be done the first season, by commencing in early Spring.

CIRCULARS giving full particulars are supplied gratis, and any wishing to induce others to lumnigrate with them, or to form a Coiony, are invited to ask for all they want to distribute.

A SECTIONAL MAP, showing exact location of Lands for sale in lows, is sold for 30 cents, and a similar Map of Nebraska Lands is sold for 20 cents.

Apply to GEO. S. HARRIS,

Land Commissioner Burlington & Mo. River R. R. Co.

For lows Lands, at BURLINGTON, IOWA.

For Nebraska Lands, at LINCOLN, NEBRASKA.

UNION PACIFIC RAILROAD COMPANY, Have a Land Grant direct from the Government of 12,000,000 Acres of the Best Farming and Mineral Lands in America. \$,000,000 acres choice farming lands on the line of the road, in the STATE OF NEBRASEA, in the Great Platte of the road, in the State of Nebrasea, in the Great Platte Valley, now for sale, for cash or credit at low rates of interest. These lands are near the 41st parallel of North Latitude, in a mild and healthy climate, and for grain growing and stock raising are unequalled. Prices range from \$2.50 to \$10.00 per acre. Great Inducements to Settlers with limited means. 2.500,000 Acres tich Government lands along the road between OMAHA AND NORTH PLATTE, surveyed and open for entry under the Homestead and Pre-emption laws and can be taken by Actual Settlers Only. An opportunity never before presented for securing homes near a great Railroad with all the conveniences of an old settled country. GREEN, (Unrossted), 20, 25, 30, best 35c, per lb.

#### GETTING UP CLUBS.

Let each person wishing to join in a club, say how much Tea or Coffee he wants, and select the kind and price from our Price-List, as published. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need he no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Consumers can save 5 to 8 profits by purchasing of

#### Food for Cows and Heifers before Calving.—If the cows are in very high condition, it is

Calving .- If the cows are in very high condition, it is well, for a week or ten days before calving, to give them light food, such as bran-slops, with a moderate allowance of hay. The great point is to keep their bowels in a loose coudition. If the brau does not accomplish the object, a drench of 4 oz. of Epsem salts should be given, every second or third day for a week or ten days before With cows in ordinary condition, however, it would be much better to give a quart of flax-seed per day, instead of the salts. It should be boiled in three or four quarts of water for an hoar or more. This flaxaced-ten is very nutritious, easily digested, and acts as a mild cathartic. Linsecd oil-cake may be used for the same purpose, giving two quarts of meal per day, and boiling it in five quarts of water for two or three hours, until it is thoroughly cooked. It is said that if heifers are liberally fed, for two or three months before calving, they are much more likely to prove good milkers. There is nothing better for this purpose than bran and oil-cake, say six quarts of brau and two quarts of oil-meal per day. Until within a week or ten days before calving, the oilalso and hran may be fed dry.

Lime in a Compost-Heap.—J. H. M., sheiby Co., Tenu., writes: "I have a small thirty-acre farm of stiff clay, and am trying to make all the manure f can. I keep six cows, closely penned, and feed them on cotton-seed, corn and fodder. The manure is gathered and made into a compost-heap, using alternately a layer of air-slaked lime and a layer of manure and such other materials as can be gathered. I turn the heap and sprinkle it thoroughly with water. Do I make the heap right?" No. You should leave out the lime. Better use the lime in a separate compost of old sods, muck, etc.

#### AMERICAN AGRICULTURIST.

NEW YORK, MARCH, 1871.

In this month we finish up winter work, lay out for spring operations, and plan for the summer.

The memorandum-book is one of the farmer's best friends, if he will only make it so. It is nearly half any job to undertake it just at the right time, and a farmer whose work waits for him to see what his neighbors are going to do, may as well "lay down the shovel and the hoe." It requires but a modicum of experience, if a little thought be given to work, to be able to judge thus of the best time to do every common kind of farm-work. The hints which we give cannot, of course, have other than a general application, and are to be followed with common sense. It is well to remember that the simplest forethought has a greater practical value than the profoundest afterthought. Our best plans often escape our memories in the hurry of pressing farm-work, or are thought of when too late to carry them out, unless put upon paper and systematically referred to. If the memorandumbook shows just what work to do, it will matter little if the farmer is drawn on a jury, or otherwise necessarily absent; the oldest boy or the good wife will be able to see that the work goes on.

#### Hints about Work.

The Work-Bench.—A farm is as incomplete without a good work-bench as without a corn-house or granary. It should be a carpenter's bench, with a good wooden vise at the left-hand side, and machinist's or blacksmith's vise, which may be removed and attached at pleasure. There should be carpenter's tools, cold chisels, and punches, an assortment of files, awls, thread and wax for sewing leather, copper rivets, and a rivet-set for leatherwork, a soldering-iron, and shears for cutting tiu, besides paint-pots and brushes.

Rainy-Day Work.—There are the potatoes to be looked over, those fit for seed selected, the decayed ones thrown out, and all "sprouted"—that is, have the sprouts removed. It may be well, also, to cut or rub the tops off from ruta-bagas and other roots. (These young turnip sprouts, by the way, make delicious greens.) Ceilars may be cleaned out and whitewashed. Mith-cellars made ready for

use as soon as the weather is mild enough, and the milk is at hand. Tools repaired and sharpened; bechives made and put in order for summer, and a big heap of fodder cut, to save time.

Manure that is intended for use in the field may be hauled out while the suow lasts, or ever the hard frozen ground of the early mernings; if the distance is not great, half-a-dozen loads may be got out every morning, and the teams set at other work during the rest of the day. That which cannot be plowed in at once should be made into compost for corn, or for grass, and got out at once for this purpose. All manure and compost-heaps that have lain for awhile should be worked over.

Irrigation.—The melting of the snow will carry away much that is valuable, unless the streams of water flowing from it be conducted over the land. Grass-land is most benefited. Snow-water is always rich in nitrogen, and often contains other fertilizing material. The wash from roads and highways ought always to be turned upon the land, and conducted in rills over the grass.

Fences.—When the frost has come out of the ground, and before it is dry, fence-posts may be set with great ease. All the fences of the farm should be examined and the posts straightened; if need be, weak rails removed, and new ones put in.

Plowing must be delayed until the ground is erumbly. It would be hard to estimate the damage done to much land by plowing too early.

Grass-Land.—All kinds of "hand manures" may be applied with profit in the spring. A mixture of plaster and ashes is excellent. Guano and plaster, guano and superphosphate, hone-dust and fine earth, half and half, after lying and heating, are all good combinations, and better than either alone. It is much more profitable to save stable manure intended for top-dressing grass autil after mowing, and meanwhile compost it with muck or soil, so that it shall be fine and even at that time.

Potatoes.—It is rarely worth while to plant potatoes in March north of Washington. If we attempt to do so, we do not get the ground well enough prepared. In the garden it may do. At the South the earlier the ground can be prepared and potatoes planted, the better, as the chances then favor higher prices and a better crop.

Mares with foal should have roomy box-stalls; they should be worked moderately only, fed good hay, with a few carrots, or other roots, and enough meal-bran er oil-meal; or better, the three mingled on cut hay, to keep them in good order.

Cows approaching calving should be placed in box-stalls, well littered, and not interfered with. They should have all the good hay they want, with a quart of oil-meal, or four quarts of bran daily, and a peck of roots at least. Cows at calving should be fat. Let them have all the water they will drink, and it is best, when the weather favors, that they should be allowed the range of a sunny yard. If the new milk springs, and the udder becomes hard and feverish, draw the milk occasionally, and knead the bag a little. This never occurs until just before calving. When cows come in at this time of the year, it is very important that they have plenty of roots to take the place of the succulent grass of Juue.

Calves .- As a rule, we think it best never to let a calf suck. Let the cow lick it dry, and then remove it to an adjacent stall or box. She will see that it gets no harm, and will make no fuss about it, unless it is moved or roughly handled. The calf will soon learn to drink from a pail, and when the cows are turned to grass, such calves may be safely trusted with them-though it is well to put on a muzzle, with nails in it, for a few days, lest the cow may coax her calf to suck. The calf should have the warm malk of its dam pure, for a week, then halfskimmed milk for a week or less, always warmed; after this, skimmed milk, thickened with fine Indian meal or wheat middlings. We add oil-meal, and think it safer than Indian meal alone. Boiled milk, with fine flour, will cheek scours, and a little castor-oil will cure constipation.

Swine.-The sow approaching farrowing must

have a snug, warm, dry nest, where she can be easily watched. It must not be too abundantly littered, and the straw should be placed in it several days beforehand. She should be fed bran and roots with her other food, in order to get her bowels in good order. It is well to always watch a farrowing sow, so as to remove any still-born pig at once, and to prevent a clumsy-sow lying upon her pigs. If a pig is killed, the sow is very apt to cat it, and this may give her a relish for the entire litter.

Sheep. Treat for scab, ticks, and lice. If cwes yean early, take care that the lambs are not chilled. The careful shepherd has hot water, and stones or bricks, ready to warm the little creatures. Often a mild milk-punch is excellent for them. A warm bath, followed by friction with dry cloths, will often revive lambs nearly dead.

Working-Animals should be gradually used to hard labor, and if exhausted by hard work, horses especially, should have a good rubbing with straw and the brush over the bodies, and their legs should be hand-rubbed for an hour. This treatment is especially applicable to bigh-bred horses; but all are benefited by it.

Poultry of all kinds will be commencing to may this month. Geese may be allowed to sit as soon as they wish. Ducks' eggs should be set under hens if early broods are wanted, at least until the first of May. The middle of April is early enough for the earliest broods of chickens or ducks, unless especially good houses and yards are prepared.

Vermin must be looked to upon all domestic animals at this season. Sulphur given in small doses to pigs and poultry is a useful preventive. Flowers-of-sulphur in heus' nests, and kerosene upon their roosts, drives them away effectually. Carbolic soap, in strong solution, may safely be used to wash eattle and sheep with,

#### Work in the Horticultural Departments.

It is difficult to give hints for March work, as the month may bring us mid-winter or sunny working days. We write in the middle of February, while the heaviest snow of the year lies upon the ground. Many things set down for last month probably remain to be done. Every day of unfavorable weather this month will render work so much the more pressing, and every thing that can facilitate operations should be done during the stormy days.

#### Orchard and Nursery.

Planting should be done as soon as the ground will admit of being worked. The ground ought to have been plowed in the fall, and then thoroughly harrowed in spring before the trees are set. In setting out young trees, choose those of good, thrifty growth, and straight, smooth trunks.

Pruning and Scraping may be done when the weather is mild. Old trees, which would be nearly worthless without this renovation, may, with a little digging and manuring around, produce a considerable quantity of fruit.

Tent-Caterpillars' Eggs may be easily seen now, and removed, thus saving a great deal of trouble.

Canker-Worms will ascend during the warm days, and means should be taken to stop them. Strips of tarred paper around the trunks are good, if the coat of tar is frequently renewed. A more expensive way is to encircle the trees with a trough of glass or tin\_and keep it filled with petroleum. Clear the troughs of the dead insects, for, if left to accumulate, they only serve as a bridge for others.

Labels and Tying Materials should be prepared.

Manure can be carted out and spread upon the land, in order to save time during the busy season.

#### Fruit-Garden.

Strawberries set out in early spring, will bear a small crop of fruit the same season, but it is better for the vines to remove it. The strawberry is now so generally distributed throughout this country, and the plants are so easily obtained by mail, that no one need be without it.

Raspherries and Blackberries.—Plant as soon as the frost is out of the ground. The last year's canes should be cut back to four or five feet.

Cuttings of gooseberries and currants ought to be made and planted as soon as possible. The old bushes, when thoroughly thinned out, produce much nicer fruit than when left to themselves.

Grape-Vines do as well pruned early in March as at any other time, provided they are not frozen.

Spade or Plow in a liberal dressing of manure between the rows of small fruits; it will pay in the increased quality and quantity of the next crop.

#### Kitchen-Garden.

Our friend "Walks and Talks," has an article on gardening on page 102, which, as it is written by a farmer, should be read by every farmer. He gives the whole secretof success in gardening—abundance of good manure, and a persistent keeping down of weeds. We have a few general hints to add to his: Never sow a seed of doubtful identity or quality. Purchase seeds early, and order them of persons of good reputation. The seeds sold at country stores may or may not be good. On page 91, we notice the leading novelties of the season, and we enumerate here some of the good, old, standard sorts, which will give satisfaction, though there are others quite as good as those we mention. This is a busy month in this department, and arrangements for procuring seeds and plants ought to be finished, and everything in readiness for early planting.

Hot-Beds.—These should be made in some sheltered spot, where cold winds will not have access to the young plants. See article on page 103.

Window-Boxes.—A few early plants may be raised in shallow boxes, filled with earth, and set in the kitchen-window where there is plenty of sunlight. Lettuce, cabbage, and tomato plants, enough for the family-garden, may be easily raised in this way.

Asparagus must have a liberal dressing of manure, and also one of salt. If new beds are to be made, set out one-year-old plants, two feet by three, after the land has been properly spaded or plowed.

Beans.—Plant in drills two feet apart. Valentine is one of the earliest, and Dwarf Wax the best bush for snaps. Giant Wax and Large Lima, best pole.

Beets will hear considerable cold weather, and a few rows should be sown for early use. Plant in drills a foot apart. Bassano and Early Blood Turuips are good early. Dewing's, Hatch's, and Egyptian, are new, and highly recommended.

Broccoli.—Treat the same as cabhages. White and Purple Cape are good varieties.

Cabbage Plants, from a hot-hed or cold-frame, may be set out in many localities. The Jersey Wakefield and Winnigstadt are excellent for early. Marblehead, Drumhead, and Flat Dutch for winter use.

Carrots.—Sow the Early Horn in 12-inch drills, Cauliflower.—Half Early Paris and Boston Market are fine. Treat same as cabbage.

Celery.—Sow for early crops in hot-bed. Dwarf White Solid, and Boston Market.

Corn.—Crosby's Early, Mammoth Sweet, Stowell, and Mexican, are all good, reliable varieties.

Cress.—Sow the Curled at intervals of a week.

Cucumber.—Start on small pieces of sod under glass. Early Russian for early, White Spine for general erop; Green Prickly, for pickles, is sown later, in the open ground.

Egg-Plant.—Sow in hot-bed. Long Purple for early, and later, Purple, or Black Pekin.

Horse-Radish.—Plant sets in well-manured trenches, and earth up as it grows.

Kohl-rabi.—Sow Early White in two-foot rows.

Leck.—Sow Flag or Musselburgh same as onions.

Lettuce does well when sowed in the fall, and covered slightly with leaves or brusb. If this has not been done, sow in hot-bed or cold-frame, or open ground. Curled Silesia and Tennis Ball are good sorts.

Melons.—Sow the same as encumbers. Ward's Nectar, Skillman's Netted, are among the best.

Onions.-Sow in drills 15 inches apart, in rich

soil. Early Red and Yellow Danvers are good. Put out sets for early crops, and potato and top-onions.

Parsley. -Curled is best. Soak the seeds.

Pursnip. — Plant early, in drills fifteen inches apart. Hollow-Crowned is best.

Peas.—See "How to have a Garden," on page 102.

Peppers. — Start under glass, the Squash for pickles, and Sweet Mountain for stuffing.

Potatoes.—Start a few early potatoes in the hotbed. Cut in halves, expose a few days to a warm atmosphere, and then place in the hot-bed.

Radishes should be sown quite thickly, at intervals of a week or ten days for a succession. Early Scarlet Turnip, Olive Shaped, and French Breakfast.

Rhubarb should have plenty of manure dug in between the rows, to induce an early growth.

Salsify.—Sow fresh seed, the same as parsnips. Some prefer the Scorzonera, or Black Salsify.

Spinach.—That which was planted and covered over in fall will be ready to cut now. This excellent vegetable is not cultivated very extensively, except near cities and towns. It is excellent for early greens. Sow in 18-inch drills.

Sweet-Potatoes.—Start the same as recommended for potatoes, except that sweet-potatoes should have a layer of two or three inches of compost over them. Nansemond is usually grown.

Squash,—Summer Crookneck is best for early, and Boston Marrow and Hubbard for general use.

Tomato.—Sow in hot-hed. Early Smooth Red is the best of the older varieties. The Trophy Tomato is a new sort, very highly recommended.

Turnip.—Flat Dutch for early use, rcd and white strap-leaf for late. Sweet German and white French are the best ruta-baga sorts for family use.

Seeds.—Roots, etc., which are to be planted for seed, should go out this month. Earth up around the crowns, to keep the roots from freezing, and remove it when all danger of frost is over.

#### Flower-Garden and Lawn.

Annuals.—The hardier annuals may be sown in a warm, sheltered spot. When it is desired to have them flower early, a few may be sown in a hot-bed. Asters, Balsams, etc., may be started in this way.

Lawns should be raked, to gather up all litter, and then rolled to settle the soil. A top-dressing of fine compost spread upon it will induce a healthy and thrilty growth. Seed thin spots.

Gravel-Walks must be raked and rolled. Where new ones are to be made, remove the earth to the depth of 18 inches, or 2 feet, and the treuch nearly full of small stones: finish off with fine gravel.

#### Greenhouse and Window Plants.

Cuttings of bedding-plants should be started now, ready for planting out during the summer. Those enttings already rooted must be potted off into small pots. Cuttings of most bedding-plants are easily rooted in shallow saucers of wet sand. The sand should not be allowed to become dry.

Camellias and Azaleas are now in bloom, and care must be taken in watering not to wet or touch the flowers, as it renders them spotted and unsightly.

Climbing Plants should be trained to trellises, or to the greenhouse rafters.

Temperature.—The ventilators should be opened more now, being careful not to allow the wind to blow directly upon the plants. Close the ventilators by three o'clock, to prevent the heat from escaping.

Insects.-Fumigate, once or twice a week.

Roses should be brought forward as fast as possible now. Give plenty of manure-water. If mildew makes its appearance, use sulphur, mixed with water, and applied with a syringe.

Bulbs which have flowered should be gradually dried off, and then laid away in a dry place.

Water should be applied more liberally, both to greenhouse and window-plants, as they become dry very soon in the bright sun.

Seedlings.—Plant seeds of tender annuals, and when an inch high, prick out into shallow boxes of earth.

The Opportunity

#### AMERICAN AGRICULTURIST.

Annual Sunscription Terms (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upward, \$1 each. Papers are addressed to each name.

HEARTH AND HOME: \$3 a year for less than four copies: Four to nine copies, \$2.75 each; Ten to nineteen copies, \$2.50 each; and twenty or more copies, \$2.25 each. Both Papers sent to one address for \$4.00 a year.

#### Worth Looking Into.

Nearly 12,000 Persons, at about 10,000 Post-offices, have each obtained, free of cost, one or more of the very valuable and useful articles catalogued in the table on this page.

There are 18,000 other Post-offices in the United States, and some 1,500 more in British America, at each one of which any enterprising Man, Woman or Child can easily collect subscribers enough to secure one or two or more, of these good premiums, with no outlay.

Both the American Agriculturist (monthly), and Hearth and Home (weekly), are universally acknowledged to be excellent, practical, instructive, useful, reliable, and very cheap journals. No one can read either of them a year without getting hints and information that will be worth, and will pay back, many times their cost (They are independent papers, and do not contain either the same engravings or reading-matter.)

The cost of both (at \$1.50 and \$3.00 a year) is less than 9 cents a week. The two journals together supply \$35,000 worth of pleasing and instructive engravings, and contain as much reading-matter, as one will get in 122 Good Books sold at \$1 cach.

Let any one take copies of these journals, show their character and value, and explain the above facts, and it will be easy to collect names enough to secure some one or more of the excellent premium articles. TRY IT.

Note .- Many persons canvass all the time as a business, sell the premiums received, and thus clear large wages. One Lady actually thus earns over \$3,000 a year, and multitudes in this way secure salaries of \$300 to \$1,500 a year. Is Good Yet. But is Rapidly Passing Away. All the Premiums Offered in the next Column Can Still be Obtained by any one, Without Money. MARCH is a first-rate Month for Making up Premium Clubs. It Can be Done by Any one, Anywhere,

(See First Column.)

#### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But....(b) Tell us with each name or list of names sent, that it is for a premium....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from one to four months, to fill up your list ... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts .... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-hills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit moncy in Checks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50.1

N. B .- In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 cach, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39.

Hearth Table of Premiums and Terms. American|| For American Agriculturist, Home. turist. and for Hearth and Home, Number of Sub-scribers required for the Year 1871. Open to all-No Competition. \$1.50 \$1. : : 110 24 36 48 60 71 82 92 102 110 ii 47 18 24 31 38 44 50 56 62 68 50 100 125 148 24 207 287 282 360

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 8 to 11, 21 to 24, 27, 28, 29, 47, 48, 63, 64, and 66 to 100 inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express affice nearest recipient), to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified. (Steam-Engine mailed for 36 cents extra.)

Full Descriptions of the Premiums sent free to ALL Applicants.

#### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Feb. 15, 1871, and for the corresponding month last year.

Gold market has been stronger since our last, the price advancing to 112½, on a more active speculative demand. The inquiry now from all sources is less argent, and the final quotations are 111@111½....Breadstuffs bave been offered less freely, as a rule, and prices of the leading articles have been quoted higher, on a fairly active business for the season, mostly for home use and shipment, though considerable speculative purchases have been reported of shipping gražes of Flour, new crops Spring Wheat, and toward the close, of the better grades of Oats, Flour, Wheat, and Corn, closing in favor of huyers;—the foreign advices not having been equal to the anticipations of holders, and the reaction in gold, and firmness in ocean freights, tending to weaken confidence in values. The bulk of the stock of strictly prime new crop Spring Wheat now here, is under speculative control—held, in part, on Western account.... Provisions have been in

more general request. Hog products have been held with more firmness. There has been an unusually free export movement in prime mess Pork, prime steam Lard, Bacon, and Beef, partly for English and French Government use...... Cotton has been plenty and weak in price, on a moderately brisk trade. The receipts at the shipping ports have been very liberal, and have exercised a depressing influence on values..... Wool has been more sought after, and has been quoted dearer. The offerings of prime stock have been on a reduced scale..... There has been a fair inquiry noted for grass seeds, particularly for Clover, for export.... Tobacco has been quiet at about former rates...... Hay in demand, and firmer...... Hops in moderate demand at easier and irregular prices.

Beef Cattle .- Some interruptions to the trade bave been caused by disasters on the railroads and heavy snows, keeping trains back, but, as a general thing, a good supply has been kept up. Prices have been rather uniform, and not favorable to the seller. Some of the extensive shippers have sustained heavy losses, and are reefing sails, but new and venturesome craft put in in their places, under a full swell of canyas. During the past week a single Chicago shipper sent in 1,794 live cattle, besides numerous lots ready dressed. of Western-dressed beef average from 300 to 500 head per weck. It is now selling at 81/2c.@101/2c. per ib. Never before have we had anything like this amount of dressed heef, some of it from beyond the Mississippi. There is great complaint of bruised cattle among those brought in alive, and a call is made for those "palace stock-cars, or something else, which shall remedy the evil. Buffalo meat continues to come forward quite freely, and really has an effect upon the beef-market, as it can be sold at a profit, and yet below the price of good beef. The cattlemarket closes dull. Less beef will be used in Lent.

Below we give the range of prices, average price, and figures at which large lots were sold;

Jan. 23d,ranged 8 @15½c. Av. 18½c. Large sales 12 @14½ do. 30th, do. 8 @16 c. do. 13½c. do. do. 12½@14½ feb. 6th, do. 9 @16½c. do. 18½c. do. do. 13 @14½ do. 13th, do. 9 @16¼c. do. 13½c. do. do. 13 @14½ do. 13th, do. 9 @16¼c. do. 13½c. do. do. 13 @14½

Milch Cows .- The "Foot and Mouth Disease," more prevalent in cows than in other stock, has had a damaging effect upon the trade. There has been much more fright than the occasion warrants, but it was just as effectual in checking transactions. The report that extensive milk-producers in Westchester and Dutchess Counties had been prohibited from sending milk to market—true in itself—caused a great falling off in the de-mand for milk, and, as a result, milkmen sought to diminish rather than increuse their stock of cows. Just now the excitement is subsiding, and there is every prospect of an improved fresh cow trade. Common cows are quoted at \$50@\$60 cach; medium to good, \$65@\$80, with a few prime at \$90-rarely \$100..... Calves. There is a steady winter demand for calves, but as most of the stock is sent in dressed, the demand centers upon that. Fat hog-dressed milk-calves sell at 11c.@12c. per b.; common-fed calves, 8c.@10c. Live vary from 6c.@ 8c. for those reared without "mother's milk," to 10c.@ 12c, per B. for fair to prime milk-yeals....Sheep.—With only a slight decrease in numbers, prices have worked up slowly. The average quality is better, which partly accounts for the higher average. Many of the Canadian sheep average 115@130 lbs. by the car-load, and sell at 7c.@7½c. per D., live weight. The general prices are 5c.@514c. for thin; 6c.@7c. for fair to prime; and 714c. @714c. for extras. A few of 150 Bs, reached &c. Swine .- Here we have a great falling off in live, but dressed hogs have been coming in somewhat freely-7,664 average per week for a month past. All kinds have advanced more than 1c. per lb., ruling steady for the past fortnight; but as the packing season is nearly over, and Western-dressed pouring in rapidly, there is a weakness as we go to press, with every prospect of an early decline. We quote live at 81/2c.@82/2c., with city-dressed at 104c.@11c.,and Western-dressed at 94c.@95c.,light pigs reaching 10c. The heavy drain npon our provision market, to help revictual Paris, has helped the advance in hogs.

#### Let Us Help France to Seed-Grain.

Famine has conquered Paris. But when peace comes, as it must soon, famine will stare the peasantry of France in the face, for wherever the armies have marched and fought over the ground, and from whatever districts the forces of either army could derive grain and food, the wheat, rye, barley, oats, peas, and beans of the country have all been devoured. Throughout some fifteen of the grain-producing departments, embracing a territory as large as the arable lands of the great State of New York, with seven millions of people, there is no seed left for the farmers. This fact appeals to the generous sympathies of our American farmers and grain-holders, and the moment peace is declared a circular will be issued from responsible source, in New York, announcing what kinds and quantities of seed-grain are needed from the United States to meet the more pressing wants of the peasant-farmers in the wasted provinces of France. Even before the armistice, the Royal Agricultural Society of England resolved to take action to anticipate this want of seed. They have pledged a fund of several thou-sand pounds sterling, and many of the English country auxiliaries have begun to contribute small quantities of the much-needed seeds. But America should send as much as England and Belgium together. Let us be ready to give quickly and abundantly when the call comes in a way to be met .- P.S. Feb. 18.-The N. Y. Chamber of Commerce Committee just announce that they will forward to France, free of all cost for freight, etc., all seed-wheat given by Americans. The Treasurer of the Committee also offers to pay the freight to New York on any quantity exceeding 100 bushels. (Cannot a great number of villages and country neighborhoods club together and each collect a hundred bushels or more?) On smaller quantities the freight to New York should be Some of the railroads will carry such parcels prepaid. free-we hope all will. Note that spring wheat only is wanted for seed. Mark the name and variety on each sack. Send to "Storchouse of French Relief Committee, No. 64 Pearl street, New York City."

Messrs, Orange Judd & Co., Publishers of American Agriculturist and Hearth and Home, start the list with the gift of 100 Bushels of Spring Wheat. Who speaks next?

### Annual Meeting of the N. Y. State Agricultural Society.

The New York State Agricultural Society has a noble record. It has done, is doing, and will continue to do great good. There is no agricultural society in the country—probably none in the world—which has more devoted, self-denying, disinterested, and intelligent friends. It is always a pleasure to meet at the Annual Meeting with these noble old friends of the Society. But where are the plain, practical, common-sense farmers and fruit-growers of the State? We had the gentlemanly breeders of improved stock, inventors, implement-makers, nurserymen, and editors, but where are the farmers of the State? They are at home, grumbling about "the Albany Agricultural Ring," and they will continue, year after year, to grumble and stay at home, leaving the management of the Society in the hands of a dezen or so of wealthy, "gentlemen farmers." Now, we have no disposition to find fault with "the ring." There are no nobler men, We cannot spare one of them. What we want is to see this ring enlarged. It should contain half-a-dozen of the best farmers in every county in the State. We believe no one wishes this more than the "ring" gentlemen themselves. What they are afraid of is the politicians, the fast-horse men, and the uneasy radicals, who want to pull down without building up. But if the "ring" could know more of the true farmers of the State, and the farmers knew more of the "ring," mutual confidence and esteem would spring up, and great good to the agricultural interests of the State would be the result.

The late Annual Meeting, held at Albany February S-9,

The late Annual Meeting, held at Albany February 8-9, was unusually well attended. The meeting convened in the House of Representatives at 12 o'clock. The Secretary and Treasurer's reports were read, and the meeting then proceeded to elect officers for the ensuing year. Do our readers know how this is done? The State is divided into eight districts, and all the members of the Society from the district, who happen to be present, are invited to meet in this or that corner of the room for the purpose of selecting three delegates to form a committee of twenty-four, who shall nominate officers for the coming year. If in the 1st district there happen to be four members present, one of them nominates the other three; in the 2nd district perhaps there are five members. This is much pleasanter. One of them is elected chairman and another names the three remaining gentlemen for delegates. And so the committee of twenty-four is formed. These twenty-four gentlemen retire and talk over who shall he elected. They call it "nominated;" but it means

elected. Having written the names of the to-be officers on a ticket, the committee of twenty-four, headed by their chairman, return to the meeting. The constitution says the officers aball be elected by ballot. This is accomplished as follows: All the names are written on one single ballot, and some gentleman is appointed, "provided there be no objection," to cast the ballot for the meet-There never is any objection, and so the ballot is cast into a hat—and the officers are pronounced duly elected "by ballot." Some dignified gentleman then (at 2:30 P. M.) rises and says, "Mr. President, I propose that this meeting now adjourn, to meet here at 7:30 P. M." This is carried, and the members have thus five hours for a good dinner and mutual congratulations.

In the evening Mr. J. R. Dodge, of the Department of Agriculture, read an interesting paper on the "Prospects and Present Condition of Sheep Husbandry," followed, not by any discussion of the subject-there is no time for that-hut by a lecture on the Principles of Breeding, by Professor Law, of Cornell University, which showed a commendable acquaintance with the facts collected by Darwin in Animals and Plants under Domestication, and also that the learned Professor kept shead of the vanced thinkers" in regard to "protoplasm," &c.

#### Special Premiums,

FOR A RENEWAL AND ONE NEW SUBSCRIBER TO AMERICAN AORIOULTURIST, OR ONE SUBSCRIBER TO HEARTH AND HOME.

Trophy Tomato has proved so far superior to others that we desire to bave it widely distributed, and we have made soch arrangements with Col. Waring as to enable us to offer pure seed from headquarters, with his trade mark guarantee of genuineness.

Japan Lilies .- We offer from the gardens of A. S. Fuller, Esq., several of the beautiful Japan Lilies, some of which have been sold by seedsmen within the last two years as high as \$5 each. Any one of these is an ornament to any garden, and they can be had free as premiums.

Eumelan Grape-Vines .- Hasbrouck & Bushnell, proprietors of the original stock, will supply us with vines of this most excellent variety, and we wish all of our subscribers would try at least one.

I .- To every subscriber who, after this date, sends \$1.50 for American Agriculturist for 1871, and 5 cents for postage, we will send 1 Package (100 Sceds) of Trophy

II.-To every old subscriber to American Agriculturist who after this date renews, and sends one new subscriber, with \$1.50 for each, and 5 cents for postage on the premium, we will send any one of the following eight articles that may be chosen:

1 Package (200 Seeds) of Trophy Tomato Seeds.

Or :- 1 Bulb Red Japan Lily, Lilium speciosum rubrum.

Or:-1 Bulb White Japan Lily, Lilium speciosum album.

Or :- I Bulb Golden-banded Lily, Lilium auratum. Or:-1 Bulb Loog-flowered Lily, Lilium longiflorum.

Or:-1 Bulh Gladiolus, or Sword Lily, named varieties

Or :- 2 Bulbs Tigridia, or Mexican Tiger Lily, differ't kinds.

Or:-1 Enmelan Grape-Vine No. 1.

III.—For one subscriber, received after this date to HEARTH AND HOME, for one year, at \$3, with 5 cents for postage on the article, we will send any desired one of the above premiums. Subscriptions taking these special premiuma will not be counted in other premium lists.

containing a great variety of Hems, including many good Hints and Suggestions which see throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance. - The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid lu advance, twice these rates may be charged.

How to Remit :- Checks on New-York Banks or Bankers are best for large snms; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very

safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Bound Copies of Volume 29 are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the previous thirteen volumes (16 to 28) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus: a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$8; making a club at \$20; and so of the other club rates.

The Best Aid for the approaching spring and summer work on the farm, in the garden, etc., will be a careful reading of this journal and Hearth and Home. We hope our readers will remind their friends and neighbors of this, and induce them to supply themselves with one or both journals. The premiums are still open to those who make up clubs, as noted on page 84.

Don't! write to ask if this or that "Doctor." who advertises to cure this or that disease, is "trustworthy," or our opinion if such or such an advertised medicine is likely to help a particular case. We have so frequently written down all such "doctors," and all such medicines as humbugs, that our opinion ought to be pretty well known by this time. We shall, in future, answer no letters making private inquiry on the above millers, as we have a much better use for our time.

American Pomological Society. The President, Hon. Marshall P. Wilder, informs us that he has designated Sept. 6th as the time of the next biennial meeting, which will be held at Richmond, Va., and cootinue for three days. It is expected that the meeting will be a large one, and that many Southern pomologists, who have not of late attended these gatherings, will be present. The sum of \$2, remitted to Thomas P. James, Treasurer, Philadelphia, will make one a member, and entitle him to a copy of the Transactions.

Larch from Seed .- "H. P.," Solomon, Kan., asks where the European larch-seed can be obtained, price, and how to sow it. -- The seed is sold by all our principal seedsmen. The first catalogue we turn to has the price at \$2.50 per lb. It is of no nse to try to raise seedling-larches, or other conifers, unless means are provided for shading the young plants the first year. This is usually done by a lattice-work of laths, raised a foot above the seed-bed. Brush may be used for the same purpose. The soil must be light, and rich, free from weed-seeds. The larch-seed is sown in drills 6 inches apart, and the young plants kept carefully weeded.

Help Wanted-Employment Wanted .- At this season, especially, many persons write or call at our office in pursuit of workmen, and of employment.-It is impossible for no to attend, personally, to the multitude of inquirers. Any persons of either class may write out, on a foolscap sheet, and send us a state-ment of just what is desired, and we will put all euch etatements in a book, or portfolio, where they can be mutually examined by employers and employees. Those wanting places should state clearly their desires, and ex-perience, and references. When any want is supplied, the application should be immediately cauceled in the portfolio.-It will be kept in our front office, and should be always referred to, instead of making personal inquiries of persona in the office. This request is important, as the time of the publishers, editors, and several clerks, is frequently absorbed by the multitude of inquirers.

Buffalo and Buffalo Beef.-We have had large quantities of buffalo beef sent to our Eastern markets during this winter. Not a little of it bas been of the poorest and toughest quality imaginable, being the hams only of those patriarchs of the plains who, having been worsted in their battle with the younger and more vigorous bulls, are to be found more or less solitarily wandering or hanging about on the outskirts of the great herds, and easy victims of any one who can creep up and blaze away with an old army musket. The only portions taken is their hams, and these are used as dried or jerked meat on the plains, or shipped East. Mr. Rankin, of Kansas, brought on a car-load of very different meat in January last. The entire shipment consisted of

the hind-quarters of young cows, and heifers with several fine cslves. The meat was most delicious; it woke New-York people up to the realization of what buffalo beef The meat was consigned to Mr. Thursreally is. ton, of West Washington Market. It seems that a new profitable trade may be thus established, and this suggests to us an idea which we hope some one, or many persons, may follow up. It is well known, that after buffalo calves are two or three weeks old, when the herd is "stampeded," the calves will be left behind. They will follow any man or horseman who comes near them, or who spproaches and pets them a little. Would it not be easy to secure thus a herd of bull calves, turning the heifers back to find their dams again-as they would. These might be raised by hand, and as steers, thus gaining at two or three years' old much larger size than the heifers, and making better beef than the cows, while the existence of those splendid herds would not be imperiled. On the first page our artist has pictured the head of one of the patriarchs, which was brought on with the beef mentioned above.

SUNDRY HUMBUGS. - That the swindling fraternity are busy with new schemes is evident from the efforts now in progress to get revised lists of the names and post-office address of people generally throughout the country. It may as well be understood all over the country, by every man having a name and local habitation, that not only his own name, but frequently the name of his wife, if he have one, and of all his children old enough to read, are recorded on a list kept by some swindler in one or more of the larger cities-New York, Philadelphia, Boston, Cincinnati, Chicago, St. Lonis, etc. Some swindlers get one list, others get another, and these lists of names are sold or exchanged, so that every person is exposed to the fire of from one to a dozen different Certain of these swindlers direct their efforts toward the young especially, sending to them the circulars about counterfeit money, time-pieces, love-pow-ders, "French" appliances tending to the worst immorality, obscene books and pictures, etc. It is important for parents, guardiaus, and teachers of seminaries and boardlng-schools, to keep careful watch over what is received through the mails by the youth under their care. We frequently receive very painful accounts from parents of young men, and even small lads, led away by these villainous circulars. One of these name-collectors, at 85 Nassau-street, preteuds to be preparing a new edition of the United States Directory, and offers ten cents a name for lists of farmers, etc., etc. We hear from many who have furnished large lists, but can get no answer to inquiries after the promised pay. One of these establishments was broken up by the police, but the names obtained are doubtless in the hands of various swindlers who are sending out circulars, and the name-gatherer is probably operating elsewhere. Another operator pretends to hail from a farmer's paper in New York (which cannot be found here), asking, in a well-executed lithegraph letter sent to editors and others, for information about any published "Directories" of farmers, and offers to pay for manuscript lists-apparently a dodge to swell the list of victims to Circular Swindles ... . An ingenious 'Sovereign " swindle has been worked by one who calls himself Daniel D. Titus, 688 Broadway. He gets up a showy and very complete price-list of various kinds of tobacco, anuff, etc., and sends it out to various parties in the Canadas and along the border where people are acquainted with English money. With this he sends another, nusigned, offering Aluminum Counterfeit "sovereigns so perfect as I defy detection," and offering to send them packed in tohacco, duty paid, and makes many plausible statements to disarm the recipient of any suspicion or fear of being caught. These "perfect counterfeits" he offers at cost, or less, one-half cash and the rest in thirty days, etc. Of course those sending money to him never hear of it again-and never ought tothough he has doubtless received thousands of dollars. His letters are stopped, but probably ere this he has adopted a new name and location, and will continue to change as often as the character of his letters is discovered at the P.O. The transparency of this humbug will be seen at once by those who know that the specific gravity (or weight) of Aluminum is only about 21/2, while that of gold is over 19, or about eight times greater.....And here we will advise that no one heresfter send a dollar or dime for any thing in the shape of "Aluminum" or oroide watches or jewelry. There are so many swindlers in this line that it is entirely unsafe to do so, no matter how enticing the descriptive circulars or promises. Those who have sent to Williams for the \$2, and \$3, and \$4, and \$5 Aluminum watches, have lost their money. He is not to (This note must answer for a letter to many parties who have asked us to help them get back their money. The fellow never intended to send any thing or answer any letters after he go his victim's money)..... R. H. Foster, "Fourth-street, Williamsburg, N. Y." (there are three Fourth streets in Williamsburg, but this

fellow don't say which, or give his number) is one of the benevolent swindlers who wants to get your \$2.75 for a ticket promise to send "a \$50 patent gold double-cased American Watch," with ever so many fixings. Are there still people so foolish as to believe this? were not many such persons he would not keep scattering his circulars and tickets at large expense. Howard, hailing from the same place, is trying to cheat other rogues by getting their money on the promise of sending them good counterfeit money..... Thomas G. Allison, 30 Anu-street, New York (only to be reached by express, not by post-office), in addition to offering the "Queer," offers "Tobacco Stamps" on "reasonable terms"—genuine, of coarse t...... "The New York Cash Prize Company," advertised in some, otherwise respectable, newspapers, and largely by circulars, with several places of business on Broadway, is only known to people at a distance who have money to fool away in hopes of getting many dollars for one. Such people, of course, psy for the extensive advertising of these imaginary concerns.....A. R. W. Taylor & Co., gift-enterprise men, receiving money at Cincinnati, hut claiming to "draw" In St. Lonis, are still flooding the coantry with circulars, flaming bills, and private circulars, and, of course, all finding patrons among foolish people-not among any others. We notify them that we have lots of their tickets on hand, not "psid for," and that will not be. What will they do about it? Charge 'em We shall sell them for old paper at 4 cents a to us? pound, and—keep the money..... There are four or five "Doctors" at Albany, N. Y., or that number of assumed names, who flood the country with circulars, quasi medical journals, etc., which are very ingeniously worded to work upon the fears and hopes of sick and nervous people, as if it were not enough to be sick and uervous with out being bumbugged out of their hard-carned money into the bargain. We would whisper in the ear of such persons, " harn everything of the kind before reading beyond the title-page, if you value your money, your life, your comfort, or your peace of mind." It should be there oughly understood that NO reliable physician now advertises sure cures for anything. This is only done by quacks or villains. We cannot too strongly warn our readers against ALL these doctors advertising themselves, by circulars, etc., to cure eyes, ears, private diseases, female complaints, consumption, nervousness, neuralgia, asthma, dyspepsia, salt-rheum, scrofula, cancens, lung complaints under various names, catarrh, urinary troubles, etc., etc., etc. We heartily wish the whole tribe had but one neck, and we had a rope around it. We have studied medical science and practice enough to speak advisedly. The amount of money filched from those who can ill afford it, by these pretenders, counts by many millions of dollars anmally. The harm done by them is almost inconceivable.

Their ingeniously set-forth "symptoms" frighten millions of people into supposed sickness who would otherwise be well and bappy. Their professed cures are as false as their father, the — ..... Persons requested to act as agents for some old grancy's wonderful medicines sent to them without any money in advance, will do well to be careful about ordering packages of the stuffs, if they do n't want an elephant on their hands which they will have to pay for before they get through with their 'agency." A word to the wise, etc .... Numerous inquiries come to as asking about certain periodicals issued in Maine, in New Hampshire, in Massachusetts, in New Jersey, in Ohio, and in Illinois. They range in price from 25 cents to \$1.25 a year, and large cash commissions ara offered to those who will act as "agents." The inquirers must be their own judges. We should need some evideace beyond the promises of a private circular through There are sheets for which the issuers can give their "agents" all the subscription-money received; because these papers are used to promote the sale of nostrums, recipes, humbuga, etc. In other cases, one or two splendid specimen numbers are prepared and offered cheaply, and after pocketing all the yearly aubscriptions received, the papers are stopped, and the publishers are hereafter "non-come-at-ibus." This last-named swindle has been extensively practised.....We advise no one of the "50,000 young men going to premature graves" to sead their mouey to the very benevo-Nassau street man, who wants to send them, for \$5, "a sure-cure," medicines that cost \$5, precisely, or for \$2, if they can't afford \$5. He is too good by half or three-fifths-cat-meal-tnb ..... To one and all we say, give a wide berth to all advertisers by circular of books on delicate subjects, marriage-books, and the like. As a rule, no due return will ever come back for your money .....The counterfeit money operators are numberless in name, and we have hundreds of their circulars, which bave been already sufficiently explained and shown up. They cannot get letters through the P.O.: the Amer. Merchants' Union Express has long refused their business, and now the other companies are objecting to their business, so that this dodge is nearly np. They will doubt-less take some new tack. H. Colter is already in mourning, per envelope; Thos. Morgan, alias Wm. Hardy & Co., alias

Bates & Co., of 599 Broadway, professes to have been a U. S. engraver, and tells a plausible story in a very well executed lithograph letter. He wants you to come to his den, give the pass-word "ink," etc., and-get robbed of all the money you bring. Here are new names adopted by the "queer" swindlers; Wm. Sage & Co., 37 Nassau street; Robert S. Ward, 78 Broadway and 49 Pine street; Thos. A. Walker, 22 Park Row; A. D. Bates & Co., 599 Broadway; John Swallow, 59 Cedar street (well named); E. Connors & Co., N. Y.; Wm. Sage & Co.; Dr. Howard, Williamsburg, L. I.: Jos. A. Holt, 52 John street, N. Y.: James A. Holt, 52 John street; Thos. B. Gray, No. 6 or No. 1 Chambers street; Thos. F. Williamson, 52 John street; E. Monro Clay, 197 Broadway, etc., etc...... Wood, of Vernon, N. J., is a very vile villain, as what his circulars offer plainly indicate; no money sent to him could be safe.....It is unsafe to send money for cheap sewing machines to new or previously unknown parties, no matter how great may be the promises made, or how great the premiums or reductions offered. Pittsburgh is vicing with New York in this kind of swindling....
We know of no "Union Hospital" in this city having ageuts in Onio or West Virginia. All such pretenders should be hooted out of town wherever they make their appearance with their big advertisements ..... Our Western and Southern friends should not be taken in by any dingy-connected advertising sheet, dubbed a newspaper, which offers to supply ours or any other New York journal more cheaply than it is offered by the publishers themselves. If they send money to such concerns, it is the last they will see or hear of it. State Center P. O., and other localities in lowa, are flooded with this humbag.

A Small Truck Farm, such as has been frequently inquired after, is advertised on page 119.

Newspaper Club Agencies exist in various parts of the country. The self-appointed agent contracts with publishers for a large number of subscriptions at the lowest club rates, and supplies them to individual subscribers at a very small advance npon what he pays—thus securing a little profit and the facility of advertising other business in his business circulars. Some of these agencies have been long established, and so far as we know have treated their patrons honestly. A few others have been temporarily started in a small out-of-the-way fown, run a few weeks, and then absconded with all the mooey received. Persons who choose to subscribe through such agencies for any real or supposed incidental advantages, will of course look to their chosen agents for any deficiency. The publisher's responsibility to the subscriber only begins when his use and money is actually received, whether direct or from others.

Another Good Result of the Patching and Darning-Exhibition .- We suppose it is generally known that the irrepressible Phineas T. Barnum is collecting an immense traveling exhibition, or museum ou wheels, which will abound in all sorts of curious things. Seeing the great crowds that were so inteusely interested in the patched and darned clothing at our office, during four days, he sped away to the Five Points Mission, and planked down a round \$100 for a dozen or so of the garments, which was of course many times more valuable to the Mission in securing sapplies for the poor than the dozen garments could be. Furthermore, as the garments will be exhibited by him all through the country, multitades who could not come to New York will have a chance to see specimens of the 1,300 "darned things" as they were, not profanely, termed .- Note. Oue of the prize-takers writes as that it is causing ber much trouble. Her reputation as a prize-patcher is bringing in applications from all the neighborhood for the practical exhibition of her skill.

Plowing in Oats for Manure.—J. B. D., of Ohio, aska if oats "would be a good green crop to plow under for manure, the land to be followed with wheat?" No; peas would be much better. If the loud to standy, better summer-fallow than to sow oats for a green crop to be turned under as manure. Such, at least, is our opinion.

Early Lambs for the Butcher.—The essential points in the management of early lambs intended for the butcher are: (1) to feed the ewes well before calving; (2) to continue to feed them liberally after lambing, giving plenty of bran and all the roots that can be spared, with half a lb. of oil-cake or grain per day, and what clover hay they will eat, with constant access to fresh water. The shed or barn should be dry, warm, roomy, and well ventilated. Sawdust makes excellent litter for the floor, and the next best thing is chopped straw. Littering is an important point, and demands good judgment. Little and often is the rule. The ewes and lambs must have a dry, clean bed on the one hand, and the greatest care must be taken to prevent the ma-

nure from accumulating underneath to such an extent that it will ferment. The constant trampling of the sheep will prevent this, if too much litter is not used at a time (2) the lambs must be induced to cat as soon as possible. And it is necessary to partition off a space of say four feet wide on one side of the barn or shed where the ewes and lambs are, and nail up slats wide enough apart for the lambs to go through, but not wide enough for the laside this partition place a little rack for bay, and also a shaped trough, made of boards feur inches wide. In this trough place a little bran, or meal, or oilcake, or oats, or any thing that the lambs will eat. In our experience, we have found that they will eat bran as soon or sooner than any thing else. We have had them commence to cat a little at a week old. In two or three weeks they will cat a few sliced roots. And nothing is then better for them than roots, bran, and oil-cake, all they will eat. And at the same time every thing must be done to induce the ewes to give a good supply of milk. In sunny days the ewes and lambs may be allowed to go into a warm yard or grass-field, and their pens he well ventilated while they are out. But great care should be taken to prevent all risk of the lambs getting chilled. The more san that can be got into their apartment the better, provided the lambs can get into the shade, if desired. A bright sun is very invigorating to a strong lamb, but is sometimes very debilitating to a weak one exposed to it for any length of time. What we want is to keep the lambs in good health, so that they may eat well, sleep well, and get fat. They must be pushed all they will bear, and the advantage of having Leicester, Cotswold, or South-Down lambs is, not merely because they are larger, but because they will bear pashing better than the Meriages. They can be made ready for the butcher two months earlier than Merino lambs. And we need not say that a fat lamb in May is frequently worth 30 cents a 1h., while a similar lamb in July might not be worth 10 cents a lb. The great point, therefore, is to get them fat at the earliest moment, and sell the moment they are ready. The man who is afraid to feed liberally should not attempt to raise early lambs for the butcher.

Spring Seeds, Trees, etc., in great variety, are announced in our advertising columns by reliable parties. The present cheap mail facilities, enable any one living anywhere near a post-office, even in the remotest Territory, to order seeds from the best dealers, however distant. As the planting season will soon be along, it is time to provide a supply of seeds. Our advertising columns afford a wide choice, and it will pay to look them carefully through, as they constitute an important department of information at this period. Many advertisers desire us to request those ordering of them, or sending for circolars, catalogues, etc., to note in what journal their advertisements were seen.

New Seed-Store.—Messrs. Richardson & Gonld have taken rooms in the Agriculturist Building, 245 Broadway, for the transaction of a general seed-business in all its branches. Mr. Richardson has had several years' experience with those well-known and reliable seed-houses, J. M. Thorburn & Co., and B. K. Bliss & Sons, and is thoroughly posted in all the details of the seed-business. We bespeak for the new firm a share of the public patronage. They are prepared now to fill ordera for seeds in any quantity. Send for their catalogue.

Maple-Sngar Item .- Mr. W. J. Chamberlain writes as follows: Any one will confer a favor on many maple-sugar makers, by telling two things: 1st, how to keep the syrnp from crystalizing; and 2nd, how to separate the lime commonly found in syrup. When syrup is kept some time, it often tarms partly into grained sugar, and often crystalizes in part. A can scaled hot last spring, like canned fruit, lately opened in my family, contained about half a pound of crystals, almost as clear and hard as glass. These take much from the thickness, sweetness, and quantity of the eyrup, and it la difficult to dissolve them, or remove them from the can. Another can, opened about the same time, contained thicker syrup, and no crystals or sugar. Usually, however, the thickest syrup forms the most crystals and sugar. Now, why do the crystals form, and how can their formation be prevented? 2nd. When the soil of a manle-grove contains lime-and most maple soils do-the sap contains it also, and it forms a gritty sediment in the syrnp, no matter how well clarified, hard to separate from it by mechanical means, without waste, Is there any chemical process for its removal? The lime also coats the boilers, as toften coats tea-kettles. How can this be prevented? In my February article I gave, from inscenracy of memory, \$4 per 100 as the price of Post's Eureka Sap-spout; it seems \$4.50 has always been the price

Midder.-" W. D.," Dayton, O. Seed can be obtained of all principal seedsmen for about 75c. per 1

Fig. 1-FRONT ELEVATION-SEEN FROM THE NORTH-WEST.

#### Plan No. 28.-A \$2,000 to \$3,000 House.

As stated a year ago, Mr. Judd has from time to time erected one or more dwelling-houses, with the purpose of practically testing various plans and designs which seem to promise useful hints to the million readers of the American Agriculturist. The elevations given herewith are engraved from photographs of his twenty-eighth house, just completed. It is believed that this house will give more convenient rooms for the cost than any of the previous plans....Fig. 1 gives a Front View, or Northwest corner, and Fig. 2, a Rear View, or Southeast corner. The basement story or cellar, 7½ feet high in the clear, is set fully two-thirds above the surface, as should usually be the case. It is always more healthful to live and sleep well up from the ground. The high, well lighted basement can then at any time he fitted up. as

to live and sleep well up from the ground. The high, well lighted basement can then at any time he fitted up, as into the "Living into the "Living limits the "Living

Fig. 2.—REAR ELEVATION, AS SEEN FROM THE SOUTH-EAST.

a lanndry or wash-room, or kitchen and dining-room. The brick walls, being hollow, are security against frost, except in very cold localities..... The "Novelty" sideng is of inch-thick boards, 10 inches wide, with a center groove in each, which gives the appearance of narrow boards. (See fig. 6, on page 89, of our March No., 1870.) Such siding secures greater warmth, and makes a strong, substantial structure, even with very light timber. The roof projects over the sides 22 inches, somewhat in the Italian villa style..... A cheap and effective wall lining, devised by the owner, is introduced into these latest contracted houses. In the middle of the 4-inch space, between the siding and lath, strong roofing-felt is introduced, so so to leave an air-chamber of 2 inches on each side

of it. As confined air is one of the best nonconductors of heat, this plan is superior in some respects to the ordinary brick filling-in, while costing hardly an eighth as much as brick. The felt is shown in fig. 5. The studs, 3x4, are set 14 inches apart in the clear. A piece of felt, 16 inches wide, and 2 inches longer than the length of the studs, is turned over one inch on each side, and placed half-way back on the studs, and lath, clasping the turned edges, are nailed against the studding, so as to stretch the felt between the studs. This felt, thus firmly held, is impervions to wind or moisture. When brick are laid in, the mortar usually cracks more or less, admitting air-currents. The roofing-felt comes in rolls of any desired width. Mr. J. buys it 32 inches wide, and saws through the roll, which gives strips 16 inches wide. The strips should he hent and fastened with pieces of lath at

the top and bottom also, so as to be nearly air-tight, or at least wind-proof. Very good felt can be purchased in quantity for 3½ to 4 cents a pound—6 or 7 square feet to the pound. Two men, working together, will apply it to a house of the size here given, in 1 to 1½ days. Mice do not like it; we doubt if they would ever gnaw through it, not even to save themselves from actual starvation.

Fig. 3—First Story—Hight in clear, 9½ feet. Ground size, 22x29 ft., besides the rear addition, 12½x5 ft., and piazza, 21x7 ft. A single chimney furnishes flues for the three rooms in this story, and two rooms above. It is carried up through the hasement, with freplace below for either stove or range. The marble mantle in the parlor, P, is placed in the middle of that side of the room, and one flue of the chimney stands nearly against its center. The right-hand flue also extends far enough into the "Living" or "Dining"-Room, L D, for the

reception of a stove-pipe. At r a tin warm-air pipe, surrounded with iron lath, and plaster, is carried up from the basement to the second story, with registers in P and L D. and in E and F(fig. 4). A small portable or brick furnace can therefore be readily placed in the basement, and thus be made to heat nearly all the house. These pipes and registers are thus put in while building to save any after-cuiting of walls or disfiguring of rooms, and the house is thus ready for heating either with stoves or farnace, as may be desired by any occupant. The bay-window, b, adds materially to the roominess and apparent size of the family-room, L, D, and also gives a good architectural effect to the outside. It also enables one to look out upon the street and upon the rear garden without opening a window.....A peculiarity of this house is the arrangement of the rear entrance, and closets or pantries. Passing out of the kitchen, K, to the hall e, and then to d, six

steps takes one down to the ground level, whence he may pass out through the rear door, d (see also fig. 2), or turn to the right, where four steps takes him to the cellar, or basement. The closet, c, from L D, is placed high enough, with a slope at the back under the first shelf, to admit of easy passage to the cellar..... At p is a kitchen pantry, and at s a sink, with pump from cistern. The engraving hardly exhibits clearly the economy of space, halls, doors, covered cellar-entrance, etc., that are really secured in the arrangement of the "Addition," containing p,  $\epsilon$ , and d, carried up from the ground in the rear of the main building. From L D a door opens into a closet, c, nuder the stairs into the main hall, H..... From the parlor, P, a double or "twin" window, w, extends down

to the floor, and opens on to the front plazea, pp. It will be noted that room is economized in the Second Story by giving a half turn to the head of the main stairs, This

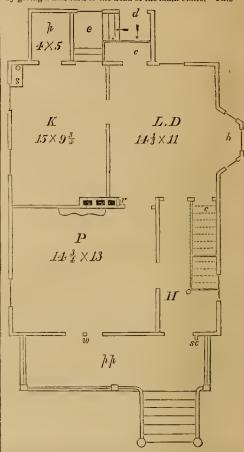

Fig. 3.—FIRST STORY.

turn projects with a curve in the upper corner of L, D, without lessening the size or convenience of that room. The turning of this curve, in L, D, gives opportunity to the carpenter and mason to display their ingenuity and taste, or lack of it.

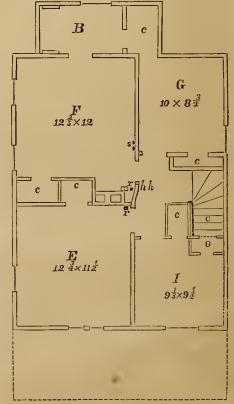

Fig. 4.—SECOND STORY.

Fig. 4., Second Floor.—Hight in clear 8% feet. It will be seen that the division here secures four good

Fig. 5.—SECTION OF OUTSIDE WALL.

rooms, with one or more closets in each. The hall, hh, at the head of the stairs (lighted by head-lights over the doors, which also furnish ventilation to the rooms), occupies hut little space, yet gives convenient access to all the rooms. The family chamber, F, is placed in the southeast corner of the house, to receive the warmth of the sun in the morning, and to be coul at night. Material changes in the planning of the whole house were made to secure this very desirable location. If possible, we would have all constantly-occupied sleeping-rooms on the east side of every house. B, the floor of which is two steps down from F, is for a large pantry, or store-room, or dressing-room, or for a bath-room. (The most approved bath-tubs are now made only 4 to 4½ feet long). Supports are placed upon the walls ready for a tank, which may receive water from the main roof, and also through a pipe earried up from a force-pump in the sink. The closet, c, adjacent, may be used from B, or from G, with which it is connected by a narrow door. A speaking-tube, s, in F, extends to the front-door bell (s, c, fig. 4), to communicate with any one calling at night, without baving to first dress and go down. F and E can be warmed by stoves, or by the warm-air registers, r, r. smaller front chamber, I, has one closet, e, another, c, over the stairs, and a platform or wash-stand, o, is cased in over the stairs coming up from below, with a cupboard or closet underneath. A scuttle-door, over hh, reached by movable steps, opens into the attic, where there is some store-room—the amount depending upon the hight of the attic. . . . . It will be seen that there are a dozen pantries or closets in the house, and that there is hardly an inch of waste room anywhere.....The same plan and internal arrangement are admirably adapted for smaller and larger houses, say from 20x27 to 25x33.

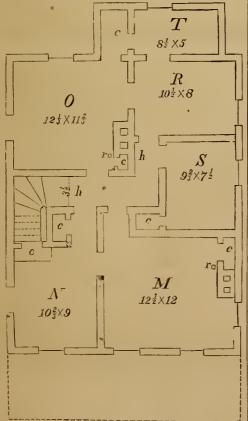

Fig. 6.—second story of a similar house,  $24 \times 31$ .

A Larger House on the same plan in the first story, 24x31, besides the addition and piazza, is differently arranged in the Second Story, as shown in Fig. 6. There are here five convenient bed-rooms, M, N, O, R, S, bath-room, T, etc. There are two chimneys, one from the parlor up through M, and one between the dining-room and kitchen. The closets, c, c, c, c, and the size of the rooms, and the hall, h, h, are shown in fig. 6. The rooms in the first story are of course larger than those shown in fig. 3, but they are arranged the same.

Another House, built for a small farm dwelling, is constructed on a similar plan in the first story, but is carried 3 feet higher, with steep shingle roof, which

furnishes a good deal of room in the attic. The **Second** Story (Fig. 7) is similar to fig. 4, except in the room I, where there is an attic stairway, a, s, Instead of the closets shown in fig. 4. To make a good head room for this attic stairs, a dormer window is placed in the roof, which gives a pretty effect to the outside of the house. The attic is large enough for two sleeping rooms, with windows in the gable ends, and for the atorage of fruit, furniture,

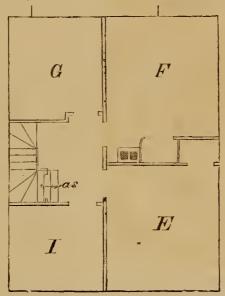

Fig. 7.—part of the second story of a smaller house,  $(21 \times 28_1)$  with attic stairs.

etc. Thia house is 21x23 on the ground, besides the rear additions and front piazza. As there were stones and sand for cellar walls at hand, and no front steps or piazza railing required, the cellar being mainly below the surface, (the house stands on a sandy knoll.) this house cost only \$2,100 to \$2,200. It appears to be a tasteful and convenient farm dwelling. It can be seen on the eastern road from Flushing to Jamaica, 2 miles from Flushing village, near the "Black Sump School House."——The two other smaller bouses are on Barclay-street, and those pictured above are on Franklin Place, in Flushing. Until sold and delivered, as they probably soon will be, any one can examine them by applying to Stephen F. Gooding, Esq., Superintendent, usually to be found at Mr. Judd's residence, in Flushing—if previous appointment be made.

Cost .- This depends very much upon the style of finish, outside and in, as well as upon the price of lumber, brick, lime, labor, etc. The houses above described were built under favorable circumstances. Eight were carried on together, securing the advantage of economy in the division of labor and use of machinery, in the wholesale purchase of materials, etc., and every thing was eash down," which always reduces the cost. following is a copy from the account-book for one house first described above: Digging cellar and grading, \$42\*; cistern, \$37; stone sills for door and windows, \$9; mason's brick-work for cellars and chimneys, including materials, \$244 (brick \$9 per 1,000); lath and plastering (hard white finish throughout), cornices, center-pieces etc., \$364\*; timber, lumber, including moldings, etc., and dclivery, \$560\*; carpenter's work, \$417; stairs, newels, piazza steps and railing, \$116\*; vault and privy, lattice around it, and grape-arbor, \$76\*; painting, \$203; felt for around it, and grape-arbor, \$76\*; painting, \$203; telt for lining siding, \$12; windows, sash, glazing, frames, and blinds (unpainted), \$163; doors, \$67; tinning roof, piazza, window-caps, and leader pipes, \$105\*; gas-pipes throughout house, and to street curb, \$36\*\*; marble mantle, \$25\*; summer piece, \$7\*; heater-pipes, iron lath and registers, \$30\*\*; hardware, as nails, hinges, locks, bolts, etc., \$106; sidewalks, \$24\*\*; picket-fence and painting, and board fence in rear, \$110\*\*; cartage and freight, \$37; iron sink and cistern-pump and pipe, \$16; drains. \$37; iron sink and cistern-pump and pipe, \$16; drains, etc., to street sewers, \$60\*\*; cleaning, and coal for drying, \$16\*\*; interest and insurance while building, \$89; sundry small items not included above, \$14. Total, \$2,993, exclusive of land. The items marked\* would be materially modified by locality, and by style of house and finishing; while the items marked \*\* could be thrown out entirely in ordinary country houses. In many localities, a plain dwelling, having all the room of this one, could be put up for considerably less than \$2,500. With stone and sand at hand, and with shingle roof, \$150, or so, would be saved in these two items alone.

A smaller house, 21x28 feet, with the rooms a little smaller, but otherwise entirely like the above, will cost \$2,500 to \$2,600. The figures are not all in yet. The cost of these could be considerably reduced, as noted in the starred \* and \*\* items above. The Farm-House,

21x28 feet, with attic, but omitting the double-starred \*\* items and some others, and having some of the materials on hand, cost \$2,100 to \$2,200 Another \$100 to \$200 could be saved in marble mantle, summer-piece, interest, cartage, etc. A very commodious dwelling can be put up of this size for just about \$2,000 for the house alone.

Bailding and Thatching Stacks.—A correspondent at White Plains wonders why we do not build good, large stacks of hay and thatch them. We have often asked ourselves the same question, but without getting any satisfactory answer. There are probably several reasons. Labor is scarce and high; and hay, when the country was new, brought a low price, as compared with labor, hence it did not pay to take that care of it which is practised in Europe. Then, boards were comparatively cheap, and enterprising farmers found it more economical to build barns for storing hay than to take the trouble of making good stacks and thatching them. The poor, enterprising farmers were the only ones that built stacks, and they had not the skill or the energy to build good ones and thatch them. Now, boards are costly and hay commands a good price, and it would pay well to take pains to build good stacks and thatch them. For our own part, we prefer barns; but not having sufficient barn room the past season, we have thatched all our hay-stacks, and can confidently recommend the practice. We hope never again to let a stack of bay go without thatching. A stack, if of good size, can be thatched for less than 25 cents per ton, and the hay keeps quite as well as in a barn.

Crops that will Stand Brouth.—

J. B. Wright, of Idaho, writes: "I have a nice tract of land, deep soil, which through April, May and June is in good condition; after that, there being no rain in this country, if dries out to the depth of eight or ten inches, and only a little moist below that. I would like to know what would be best to sow on it for either hay or pasture. Would clover roots die under such circumstances?"—We think not. If the land was mulched, it would do much towards checking evaporation and retaining moisture. If the land was subsoiled, the clover roots would go deep into the ground, and stand considerable drouth. But of all forage crops, lucerne is probably the best to withstand drouth. The tap-roots frequently go down several feet into the earth, and if the land is rich enough, and the surface is kept free from weeds, an enormous growth of green food or fodder can be obtained.

Preservation of Timber, Water, and Game.—An admirable suggestion comes from the Syracuse Standard, which every agriculturist, merchant, and political economist in the State of New York ought to second, and push to consummation. It involves, as we understand it, the proper supervision, care, judicious cutting and marketing of the timber on these immense tracts of swamp and timber land in the Counties of Essex, Lewis, Herkimer, St. Lawrence, Franklin, and Hamilton; the prime object being to preserve the water for the canals of the State, the timber would be of the first importance in less than 25 years—that the game, elk, deer fur-bearing animals, birds, and fish would be second in importance and profit to the State—and that valuable as is the water for canal and river navigation, it would occupy the third place as regards the State finances.

Three Horses Abreast on a Mowing-Machine.—H. E. H. We know of no way of doing it without having two poles. It must be very heavy grass, or a poor machine, that needs three horses. Better let one of the horses rest while the other two are on the machine, and change at dinner-time and lunch.

Preparing Land for a Garden.—
"Z. F. H.," of Illinois, writes: "I want to prepare ground for a garden, and have but little barn-yard manure, but a goed many ashes, and can get lime at \$1.25 per barrel. My land is clay. Would subsoiling be permanently beneficial? Have any quantity of forest leaves handy. Now, what course should I pursue to bring my ground into proper condition?"—First, dig some holes, three feet deep, in different parts of the land, and if water comes in and remains, the land needs underdraining, and you cannot have a good garden until it is thoroughly drained. Make a compost of the leaves and mannre, turning it over from time to time, to favor fermentation. Better buy manure than lime at the price named. Use the ashes freely,—say one bushel on a square rod, and work them thoroughly into the soil. Plow, cultivate, harrow and plow again, and then cultivate and harrow and work the land until it is reduced to as fine tilth as possible, and then plow in the composted manure. Keep the crops clean, and as soon as yon have an opportunity, plow, and keep plowing as often as possible. With clay land, this is the great secret of having a good garden.

How Much Plaster Per Acre?-We have given from one to two bushels per acre as the usual quantity. When plaster is cheap, and when the sowing costs more than the plaster, we would sow not less than two bushels, and when plaster is expensive, not more than one bushel. L. J. P. says the farmers in Sammit Co., Ohio, sow only one bushel on three acres. It is their opinion, that while a larger quantity will produce a greater growth of clover for a few years, yet if continued the land gets poorer, and in process of time the plaster fails to have any beneficial effect. "One of the best farmers in the county says be would not sow any plaster at all. He puts manure on a clover sod and plows it un-der, and thinks this better than all the plaster be could buy-and it is a fact that he raises the best crops of wheat, corn, oats and barley of any farmer in the township." He would probably raise still better if he sowed a little plaster on his clover. He gets good crops because he is a good farmer, and works his land well, and makes and applies good manure, and not because he does not use plaster. The others fail, probably, to get the full benefit of the plaster, because they depend on it alone. They should use the plaster simply to get more clover, and then use this clover to make more manure. If the increased crops produced by the plaster are fed out on the farm, its employment will enrich rather than impoverish the land. It is the abuse and not the use of plaster that is injurious.

### "The Practical Poultry Keeper."

"The Practical Poultry Keeper," by L. Wright, Orange Judd & Co, New York, as its title imports, is truly a practical work. Compact, concise, yet sufficiently explanatory, it treats upon the most important items connected with poultry in general, from the egg through all the stages of progress in the bird, until its final destination to either the table or whatever other purpose it may be assigned.

Whenever original composition is adopted, it is nicely written, or compilations are made from other authors, the matter is well selected. It is modern, too, in its arrangement; the current classification of breeds, with their individual characteristics, being well and accurately defined, so that the amateur, the fancier, and those who keep poultry simply as an item of domestic economy, need make no mistake in their selection, or be at a loss to know what they may obtain or breed. There have been many poultry books written, both in Europe and America. One pouderous in size, and exhaustive in subject, like Tegetmeier's, showy in binding, and too costly in price for the common reader; others of less assuming pretensions, but good in their way, like Bemeut's; still others, compilations chiefly, by those knowing little of the subjects of which they treated, and not leaving the reader much wiser, in a practical way, than when he started. Yet, some of the latter have proved useful in imparting primary instruction, and cultivating a taste for breeding and improving the various kinds of domestic fowls. The work under notice is a late English production, made up by the hand of a master; one well knowing what he was about, and valuable throughout in its instructions.

We have looked over the book; read it, indeed, with considerable care, and, comparing it with a fifty years' experience of our own in the poultry line, it merits our decided approbation. We cheerfully recommend it as good authority for all those who think a book of this character worth consulting at all.

When a boy of seven or eight years, or thereabouts, we brought home our first pair or so of chickens, for which we had "dickered" with a neighboring school-fellow, whose parents had a yard full of them at home, and essayed our first venture in the poultry line. Succeeding during the first season in rearing a thrifty prog-

eny from them, we added thereto in the duck and guinea-hen line; and as our boyhood grew, we found ourselves the proud owner of a populous poultry-yard with many varieties. We lived in the country, of course, city boys seldom having the opportunity of keeping fowls. The ignorant louts of the neighborhood, who had nothing but scraggy dung-hills at home, used to jeer us for our pains, but we happily survived it. Our father going on business to New York, we besought him to buy a book which treated of poultry, that we might be instructed in the science and skill of breeding and caring for them. We felt wofully disappointed on his return, as we remember, to find that no such book could be obtained. And such was the fact. He had searched high and low through all the book-stores, and could get nothing of the kind. Indeed, we had grown into stout, mature manhood, before the first poultrybook greeted our eyes; and what a feast we had for a long time over it! We are especially thankful to the many kind authors who, in this line, have become benefactors by improving their knowledge and tastes in these matters.

And with this modern poultry literature the taste for poultry cultivation has improved until it has become in fact one of the fine arts. Both men and women of mark and position have imbibed a taste for our finer breeds of poultry that will never be eradicated, while each younger generation will follow in a recreation, if not a pursuit, fraught with so much interest and pleasure, as well as adding largely to the luxuries of the table and household economy with all good livers. But we have written enough, and more than was intended when we sat down to notice the little work in hand. We heartily recommend it to the public as one of the best works on the subject we have seen.

#### Shallow Drains are better than None.

While we are firm believers in the economy and the effectiveness of deep drains, even in heavy clay soils, we have seen enough to convince us that those who, from lack of means or time, or on account of an insufficient outlet, find deep draining impracticable, will still find it to their material advantage to make shallow drains wherever the necessity for drainage is apparent. The first requirement of all is to get rid of the water that stands on the surface of the soil, for this brings absolute death to all vegetation. A simple plow furrow, to remove the water that accumulates in a depression of the surface, will often produce more beneficial effect than the same amount of labor applied in any other way. Next to surface water comes a sort of surface springiness, a superficial ooze, or water retained near the surface by a dense hardpan subsoil. Frequently this water collects in basins of the subsoil, and a shallow underdrain will effect its removal.

If a farmer does not feel justified in thoroughly underdraining any field that is too wet, he may at least be able to lay a few lines, two or three feet deep, running through the worst spots of the field, without much reference to its general conformation, and thus at least remove the most evident source of his inconvenience and loss.

Let it be distinctly understood that we do not recommend this practice for adoption in any case where it is practicable to do any thing more; but there is no reason why a farmer should suffer year after year from an annoyauce that it is in his power to lessen, because

his circumstances will not allow him to entirely remove it; occasionally a large tract of land lying on the slope of a hill, or at its foot, is made too wet for profitable cultivation by an underground spring, through which a water stratum in the higher land finds vent. In such cases, by digging straight into the hill—cutting some distance into the water seam—the flow may be induced to seek the artificial outlet; and in such a case even a shallow surface drain may carry the water away without allowing it an opportunity to do harm.

#### Water for Cattle in Winter.

This question affects the farmer's purse much more seriously than is commonly supposed. The common resort, even for those who shelter their animals, is the neighboring brook or pond, where a hole is cut through the ice every morning. There is often a long drive to this spot, and the cattle waiting for one another shiver in the keen winds for an hour or more, to get a chance to drink water at a temperature of 32°. This ice-water has to be warmed in the animal's stomach by the combustion of hay and grain. Of course all the food consumed in restoring this heat, lost by exposure and by the ice-water, is so much wasted. If an ox drinks three gallons of ice-water, when he might have spring-water at 50°, he wastes all the carbon it would take to raise three gallons of water from 32° to 50°. And this carbon is not in the shape of coals or wood, but in the much more costly form of food. We might estimate very accurately just how much is lost every day. But it matters very little for the argument, for it is clear that it costs no less than if the fodder were burned under a boiler and so made to produce the same effect. Every one can see that this small daily loss amounts to a considerable sum in the course of a foddering season of six months, and if this sum is multiplied by the number of stock kept, it amounts to an appreciable share of the farmer's fodder, and may make all the difference between loss and profit in the year's operations. We want, if possible, to have water for our cattle to drink at the temperature of well-water, or as near to 50° as may be, and to have it brought into the yard, or into their mangers. This may be done in several ways, and the method to be adopted is generally best determined by its cost. The cheapest method is usually to introduce spring-water where a sufficient fall can be had within a reasonable distance. Even though its first cost for pipe be a good deal, it is the cheapest in the end. When once well laid, it is a job done for a lifetime. The water is brought just where it is wanted, and there is no more labor nor expense about it. The next best thing is to bring water from a spring below the grade of the barn-either by a water-ram or by a windmill. Neither of these is very expensive, and the result is just as good, minus the cost of the ram or the windmill, and of keeping the apparatus in repair, and some loss of heat in the water. Another device is to build a large cistern to catch the rain-water from the roof of the barn. This can be done profitably wherever the cistern can be covered to such a depth in the bank as to keep the water at the temperature of spring-water. If the bottom of the cistern be so high that the water can be drawn as wanted through a stopcock into the trough or mangers of the cattle, all the better. If a pump has to be used, there is no advantage in a cistern over a well, where water is within twenty feet of the surface. If

there is porous, gravely subsoil, the drivenwell offers an effectual method. An iron pipe, suitably pointed, is driven down below the waterline, and will give just as good a supply of water as a well curbed with stone or brick to the same depth. The first cost of the driven-well is much less than any one of the other methods. The great objection to it is the cost of pumping the water, which, for a large stock of cattle, would be two or three hours' work every day. But even this expense would be better than drinking ice-water three months in the year. It Is manifest from this brief consideration of the different methods of supplying water for stock, that the elevated spring is altogether the best, and in most cases a man can better afford to lay a pipe a half-mile in length than to get his water by pump or windmill. If the whole cost were \$500, the interest of that is but \$35 annually, and this would not go a great way in supplying labor at the pump-handle, or in keeping machinery in repair. At any reasonable price we want spring-water brought into the barn or the yard, where cattle can help themselves. It will pay a large interest on the investment.

#### The Alkaline Soils of Colorado.

A correspondent of the American Agriculturist in Bent Co., Colorado, writes as follows: "We have some peculiarities of soil in Colorado which I do not understand. In some places on this Afkansas River the alkali is so thick on the ground it looks like a light snow, and can be scraped up, and sometimes there is no grass at all; and when very dry, as it often becomes here, large cracks come in it. In other places the grass is short or fine, but stock do n't seem to like it.

"In the East we would call it a stiff clay; here it is called adobe. We depend entirely upon irrigating our crops, and this soil needs watering oftener than any other. That which is brought into subjection, which is not the worst, is better adapted to wheat than almost any other crop. I should like to know the best way to treat it, to overcome the excess of alkali. On some farms it is predominant, but there is a great deal of rich, sandy soil, which grows the largest root crops I ever saw, and vines seem to grow almost spontaneously, and no bugs trouble them.

"It is difficult to raise potatoes here in Southern Colorado. Some years they do well, and others, as last year and this, the tops are thrifty and look well, but there are no bottoms; two years ago they were a success. Can you give us any hint through the Agriculturist that will be of practical benefit to us?"

We can give no advice on this subject. If we might hazard an opinion on theoretical considerations, we should think, if not altogether too costly, underdraining would be the best remedy; then, after draining, thorough cultivation, and then irrigation. Unless the land is naturally or artificially drained, we lose threefourths of the benefit to be derived from irrigation. This, so far as we know, is universal experience. We suppose the alkali is carried up out of the soil by water, which, on evaporating, leaves the alkali on the surface. Underdraining, by carrying off the water below, would do much toward preventing this deposit of alkali. Mulching would also do the same. The thorough cultivation of two or three inches of the surface soil would check evaporation. This loose soil, in fact, acts as a mulch, and is probably the cheapest mulch that can be used |

in this case. The fact that the clay soils need more irrigating than the sandy soils, indicates that they need draining and more thorough cultivation. If well drained and cultivated they would need less irrigating, and would probably prove exceedingly and lastingly productive.

We should like to know more about the trouble with the potatoes.—EDs.

#### Vegetables, New and Old.

We believe that the settlement of the muchdiscussed question of "How to make Boys stay on the Farm," will, in part at least, he found in the garden-patch. No sensible boy will be contented with poor fare; good fare can only be had with a plenty, and a good variety of vegetables; therefore we advocate, as one means of making home attractive, greater, far greater attention to the garden than most farmers give. We know that we cannot convince some that there is more profit in a half-acre of kitchengarden than there is in several of corn or wheat, but it is not the less so if health and comfort are regarded as of any account.

The new catalogues have come, and we have looked them over. We welcome with pleasure any new shrub or flower that will make our borders brighter, but it is with far greater pleasure that we notice a new vegetable that promises to excel in excellence any that we now have. The catalogues have to us all the charm of a new novel. They are of three sorts. First, we have catalogues of vegetable seeds only; a plan to be highly commended. Then, we have those in which vegetables are put first and the flowers come afterward; we make our best bow to these. Lastly, we have catalogues in which the vegetables ignobly come last; but as in these the list of seeds is usually a very good one, we forgive the authors, and wish they may do better another year. There are many old varieties of vegetables that have stood their ground for years, and it appears very unlikely that they will be superseded, while with others there is frequently great improvement in either size, earliness, or other important quality. While we advise those who grow for home use only to place their main reliance on well-tested kinds, we would encourage a trial of such new things as come well recommended, provided one feels able to risk the chances of the failures. which, of course, must sometimes occur. In our "Calendar," or Notes about Work, we usually mention the standard sorts of each vegetable, and we wish here only to enumerate those which are now offered as novelties.

BEANS.—Dwarf Wax.—We tried this variety last year and can highly commend it. It is for snaps only. French Asparagus, Pole, are highly spoken of.

BEET.—The Egyptian, sparingly tried last year, has proved itself of great value. Bastian's Extra Early Red Turnip (there's a name!) is introduced this year by Dreer, of Philadelphia, as superior to other early kinds.

CABBAGE.—Early Wyman was tried and approved last year. Vick offers Fearnought, which he says the English claim to be the earliest of all cabbages, but he does not indorse the statement for this country.

CAULIFLOWER.—llenderson & Fleming offer the Autumn Giant as a valuable late sort.

CORN.—Moore's Early Concord is put out by Gregory as a superior variety; and Vick has Early Minnesota and Russel's Prolific—varieties claimed to be very early.

CUCUMBER—Sooly-qua.—Here ought to be a novelty, as Thorburn asks \$1.50 a seed. It is from China, and is eaten cooked.

LETTUCE.—All the Year Round is offered by Bliss & Sons as a variety not liable to run early to seed, and Dreer has much to say in praise of the Hanson.

Melon.—The Valparaiso and New Mexican are upon Thorburn's list of novelties, and said to be of good quality.

PEAS.—Every year many new peas are offered. We always put in a plenty of Carter's First Crop, Little Gem, and Champion of England, and try the new ones which have not as yet induced us to give up the old sorts. The leading novelties this year are Alpha, Laxton's Quality, Laxton's Quantity, Kentish Invicta, Hundredfold, etc.

Sprouts.—Dalmeny. Said to be a cross between Brussells Sprouts and Savoy Cabbage, and valuable for hardiness.

Tomato.—The Trophy, of which we have already spoken in high praise, is now to be had at a low price, as will be seen by advertisements and our special premium list. The Currant Tomato is pretty, and will serve for pickles.

#### Ogden Farm Papers.-No. 15.

Either the types or my pen made a mistake in the January number. What I should have said was that the manure resulting from the consumption of a ton of hay is worth \$6.43 (gold)—not that it is worth this much per ton.

The correspondent who calls my attention to this error, urges me never to stop preaching "soiling;" and he says he has "fed nine head of full-grown stock for eight weeks off less than two-thirds of an acre of corn drilled for soiling." This is equal to feeding five cows one day from a square rod. If the corn were drilled at 3 feet intervals, it would allow about one lineal rod or row, daily, for each cow. This is a large story, but I fully believe it—and the fact that it is possible is worth all that could be written in a year to prove the economy of soiling.

In the November number of these papers I spoke of a neighbor who gets a very large produce from very little land. I stated the facts as I understood them, and as nearly accurate as I could make them without prying too closely into other people's business. If anybody thinks it nice work to write for an agricultural paper, I would be glad if he had written this statement. It would have cured him. I have had letters about it from all parts of the country. No one has told me I lied, but some have evidently suspected it; many have considered me deceived, and many more have asked for the minute details of my neighbor's management. At last, in pure self-defense, I called on him and told him my troubles. He frankly said that he had no objection to my knowing and printing the whole story. He naturally objects to having his name published, but it will be given to any one who desires it from other motives than curiosity.

To begin with, then, his farm contains—not 28 acres—only a little more than 26. It is a part of his business to buy and sell cows, so that his stock is constantly varying. It has run, during the past year, from eighteen to thirty head, averaging, probably, twenty-five or twenty-six. Money made or lost on the cows is not included in the farm accounts. He makes

it a practice to take all the calves his neighbors would otherwise "deacon," put them on to nurse cows, and grow them to good yeal condition. He also keeps a few sheep. I was not quite correct in my account of the pasture; it contains 12 acres instead of 14. I judged of the stock it carried from what I had often counted in passing it. I asked him the other day what was a safe estimate of the average number pastured in this field throughout the whole season. He answered, "twenty head." I replied that this was equal to soiling. He evidently thought that it was better, but he has never tried soiling. After going over the whole ground in detail, he gave me the following statement of his actual cash sales for the year 1870. He bought some grain and hired some pasture-enough, on a fair calculation, to balance the cost of keeping his teams at home, so that these sales are to be taken as covering the whole product of a little more than 26 acres of

CASH SALES FOR 1870.

	Amount Brought. \$2.318.85			
Eggs\$144.20	Carrots			
Turkeys 96.00	Beets (Mangel) 150.00			
Chickens 66.25	Turnips 100.00			
Butter 166.00	Round Turnips 43.00			
Cream 235.20	Calves 665.00			
Milk	Pork			
Potatoes 687.25	Lambs 144.00			
Tomatoes 50.00	Wool			
Onions	Squashes 12.00			
Amit Danmandad 69 210 65	Total 20 Fro 4r			

A few of these items are estimated in round numbers, but the estimate is under, rather than over, the truth.

The only remarkable thing about this showing is the number of eows kept on the place; but any farmer of strong land knows that with high manuring this is possible.

The total produce of the cows in butter, cream, milk, and calves, amounted to \$1,862.15, which, divided among twenty-five head, gives for each less than \$75, and the skimmed milk that was turned into pork.

The expense of carrying on the place I did not ask, nor is it especially important to my argument; for the schedule itself shows that the system of farming is such as to furnish steady work for the force employed, and to admit of economical management. The argument itself is, that it pays to make laud so rich as to produce the utmost that it is capable of, for it certainly is much easier to manage 26 acres, producing \$3,750, than to get the same income with the same investment for labor and manure from 260 acres; that is, to get a certain produce from one acre instead of from 10 acres; and it is my opinion that there are very few farms of 260 acres in America that produce a cash return of \$3,750. Every rod of the small farm is worked at a profit; on the larger one there would be many a poor aere that would lose money the better acres would have to make up, besides some land that would not return the amount of its interest and taxes.

This illustration has an especial value, as showing the value of high farming; the more so because it is high farming in the "good old way." What are known as "modern improvements" find no favor on the place. There is nothing done here that is not done on any good farm in New England; but every thing is done with a will; and industry, perseverance, and thoroughness, characterize every part of the work. The cultivation is thorough and cleanly; the use of manure excessive; the feeding high; the marketing skillful, and the economy in every department complete.

A correspondent asks for more details as to the size of my steamer, and its distance from the feed-ehest. He says: "I have a No. 1 (smallest size) Prindle steamer, situated about 50 feet from the feed-chest. It does not give satisfaction." My steamer is an upright tubular boiler, 7 feet high, 31/2 feet in diameter, with a very strong draught. It stands about 15 feet from the feed-chest, which holds over 400 cubic feet. The boiler is gauged to a pressure of 100 lbs. to a square inch. By vigorous firing, we are able to keep the pressure at 70 lbs. while steaming, to the full capacity of a 1-inch pipe. But the evaporation is so rapid, that the full force of the feed-pump is required to keep up the water in the boiler. The steam consumed would be ample to supply a ten-horse engine. I find it, in all respects, perfectly satisfactory, being able to raise the temperature of my chest full of fodder to 300 degrees Fahrenheit in less than an hour, securing its perfect cooking in every part before the box is opened the next morning. From my experience with the Prindle steamer, I should say that a No. 1 machine, standing close to a feed-chest of 40 cubic feet capacity, would raise its temperature to about 230 degrees in the same time, and that it would require, proportionately, a much larger amount of fuel. Fifty feet distant, the result would be even less satisfactory. I doubt if there can be any economical steaming of hay at a low pressure, for the reason that we must, in any ease, depend upon the mass cooking itself after the steam is turned off, which makes it important to have the temperature as high as possibleand a high temperature can be obtained only with a higher pressure than the Prindle steamer can bear. Of conrse I use the word economieal in a relative sense. Hay can be efficiently steamed by packing it in a covered flour barrel, and inserting the nozzle of a tea-kettle into a hole at the bottom, but the process would be by no means an economical one. It necessarily costs a good deal of money to arrange for steaming, and the process requires care, labor, and intelligent supervision; so that, although a certain percentage of forage will be saved, unless the arrangements are tolerably complete, the saying will cost more than it comes to. On the other hand, with a good boiler and a good engive or horse-power for cutting, the economy is decided and undoubted, and the results are in every way all that could be desired.

What is the best way to store ice? is a question yet to be decided. It is by no means certain that the elaborate plans frequently set forth in agricultural papers are not the worst that could be devised. At all events, experience has shown that the most costly ice-houses are by no means the best. We have just filled a house, holding about forty tons of ice, that was built on a plan described in a paragraph that floated through the country papers last summer. Its theory is perfect drainage, perfect ventilation, and the free evaporation of all moisture that gets into the packing, whether from rain or from the melting of the ice-evaporation being a cooling process. The house is 13 feet square and 13 feet high, with upright joists, all around between the sill and the plate. Rough hemlock boards, with open joints, are nailed on the inside of the joists. The doorway on the north side is 3 feet wide, reaching from sill to plate, and closed by pieces of board slipping in between cleats. There is no floor, and the roof, which is made of rough pine hoards, battened at the joints, is entirely open at both gables, so

that the wind can blow freely through. In filling, about 2 feet of marsh hay was put upon the bottom of the house. On this a layer of ice was closely packed, reaching within 8 inches of the outer boarding, all around. This 8-inch space was filled with hay and trampled down. Then another layer of ice was closely fitted to the first, and hay was packed around this, and so on, layer after layer, until the house was filled to within 3 feet of the plate. All the chinks between the cakes were filled with pounded ice as each layer was put in. The last 3 feet of filling was with salt hay, well trampled down. So we have a cube of ice about 11 feet square on the bottom and 9 feet high, surrounded on all six sides by a compact mass of salt hay, and inclosed in a wooden shell, from which the evaporation of moisture will be as complete as possible. We believe that this ice will keep well. Whether it does or not we will report next fall. If it does, there can be a good deal of money saved in the building of ice-

Farming, especially such farming as we carry on, is not a business in which it is possible to take an exact account of stock at the end of the year and determine the actual profits, particularly as the elements of appreciation and deterioration of both stock and soil can only be guessed at, but there are some items in which an approximate estimate can fairly be made. I can make such an estimate with reference tomy Jersey cows. The cost of keeping has been, as nearly as I can estimate, something less than \$50 for each full-grown cow. As I have both bought and sold cows during the year, I cannot determine the exact average yield of butter, but it has been not less than 200 lbs. for each cow of full age. This has been sold for an average price of 70 cents per pound. This brings the produce of each cow to \$140-ninety dollars a year more than the cost of feeding. After making a due allowance for the cost of milking, churning, marketing, etc.-not far from \$15 per cow-there is left a profit that I am willing to compare with those of any herd of native cattle with which I am acquainted.

The high value of my animals (from \$300 to \$800 each) cannot be used as an argument against me, because it is more than compensated for by the value of their progeny. I could well afford to pay \$1,000 for a really first-class Herdbook Jersey, four years old. With good luck I would sell from her, by the time she was fourteen years old (supposing half of her calves to be heifers), \$2,000 worth of stock in the first generation. But this is not farming, and is not to be used as a very important argument for convincing ordinary farmers, who are not so situated that they can make the sale of thoroughbred stock an important item. I think I may say, however, that any butter-making farmer can afford to pay fancy prices for his original stock-at least for a good cow and bull from which to stock a herd for his own use. By changing bulls when necessary, he can, from one cow, build up in a few years a fine herd of cattle; for animals that breed when two years old, multiply with astonishing rapidity.

I believe I have before mentioned in these papers a cow that I bought in February '68 (Fancy); she, and two of her daughters, born on the place, are to calve this spring; and I have one calf from her nearly a year old, and one from her oldest daughter, so that I shall have, with good luck, eight of the family by the 1st of May, all within a little more than three years from the time of receiving her.

#### Trapping the Muskrat.

The way to catch an animal is to study its habits; and if we could impress our young readers with this idea, the numerous insects which do such an immense damage to the farmer and horticulturist would soon be de-

stroyed. The muskrat, however, is comparatively harmless. He is not properly a rat. He has more of the habits and characteristics of the beaver, but without its marvellous intelligence. muskrat prefe**r**s a sluggish stream or pond, bordered with coarse grass, rushes, or flags; but the sides of the stream should not, in all parts, be low and saturated with water. There should be some spots where the banks are comparatively high and During the dry. summer, the muskrats live mostly in these banks, on the

borders of a swamp or stream, or in hollow | sharp at both ends, which he propels, where the trees. It is here that they breed. They are very prolific, having three litters a year, and from six to nine in a litter. And the females of the first spring litter also themselves have young early the same autumn. In October, or as soon as frosty nights occur, the muskrats begin to build their houses for the winter. Much ingenuity and intelligence are displayed in the location and construction of these winter residences. They are made of flags, poud-lily

tops, grass, roots, sticks, etc., cemented together with mud, carried in the mouth. Their houses are made in the shape of a dome, and are sometimes five or six feet high. Like the houses of the beaver, the entrance is under water, the muskrats diving under the water to get into them. Here they live during the winter, the family consisting of from six to ten members. If one of these houses is destroyed, the members are received in the other dwellings, and the hunters sometimes take advantage of

this hospitable disposition to get several families in one hut, and so secure a large number at once. The skins of the muskrat are most valuable early in the spring, and as soon as the ice begins to disappear, the hunter commences operations. The rats are speared or shot, but the best plan

is to catch them with steel traps. The muskrat is nocturnal in its habits, and while sometimes found feeding in the daytime, is usually caught at night. The hunter ascertains the feeding grounds of the muskrats from the tracks and droppings, and sets his traps in the paths. He usually takes a small, light, flat-bottomed boat,

TRAPPING THE MUSKRAT.

water is shallow, with a pole, and with a paddle where it is deeper. He carries with him an axe, a trap-hook, some bait, traps, and gun. About sundown, on bright, warm days, the muskrats are seen swimming, and he gets a shot at them. By imitating their peculiar cry, which is like the whining of a puppy, they can be induced to come within gun-shot, and a little exciting sport can be obtained. But the main dependence is on the traps. When a log is found

TRAPPING THE BLACK BEAR - (See next page.)

with some recent droppings of the muskrat on it, a notch is cut in the log for the trap, an inch or two under the water. The trap is fastened to a tally-stick, as shown in the illustration. These tally-sticks are green saplings, with a fork at the upper end, and a hook near the bottom to hold it in the loose ground. The chainring is slipped on to this tally-stick, and care is taken to so place the tally-stick and trap that when caught, the muskrat shall take to the water and be drowned. If on the land, among weeds and bushes, he will not unfrequently twist off his leg and escape. The traps

are also placed in the runs, on bogs and old muskrat houses, and wherever there are recent indications that the muskrats come to feed. Where the game is scarce, the traps are sometimes baited, but otherwise this is not necessary. Carrots, parsnips, apples, potatoes, or a piece of the flesh of a muskrat can be used for bait. A stick is stuck in the ground, slanting in such a manner that the end shall be six or eight inches above the treddle of the trap. The bait is stuck on the end of the stick, and in this

way, if there are any rats in the vicinity, you are pretty sure to catch them. Sometimes the traps are covered with an inch or two of weeds; and some trappers put a drop or two of the oil. found in the glands of the muskrat, on or near the traps. The next morning the hunter takes his boat and visits his traps. Mr. R. E. Robinson, of Vt., who made the sketch for the accompanying illustration, says: "A good trapper will tend from 50 to 100 or 125 traps, visiting them all every day. I have known a man at the begin-

> ning of the season to take upward of 40 rats out of 50 traps for two or three nights in succession. After that the catch begins to fall off. The season lasts from the 1st of March to the 1st of May. Twenty years ago it was not un usual for one trapper with 50 traps to catch 300 muskrats in the marshes of Lake Champlain and its tributaries in a fortnight or three weeks; but their number has been so diminished by trapping in the fall and winter, that the trapper is fortunate who now gets 150 in the whole season.

The muskrat is usually skinned by beginning at the head, ripping from the chin to between the fore legs, and then stripping the skin off over the body. When taken off in this manner the skin is stretched on a bent rod of tough, pliable wood. When skinned, from the tail it is stretched on a

board. Many years ago, when beaver skins were so valuable, muskrat skins were worth as high as 50 cents each. Then for years they were very low—from 5 to 10 and 15 cents. Within ten years, they have brought as high as 35 cents, but are now down again to 10 or 12 cents. These prices relate to skins taken in the spring, when they are in their best condition."

#### Trapping the Black Bear.

There are numerous species of bears, some not larger than a Merino sheep, and others weighing as much as the largest ox. American black bear is found in all the large forests of the Northern and Western States, and Canada. They bring forth their young in caves or hollow trees, in May or June, generally two at a birth, and during this period it is dangerous to approach the dam. At other times, they will not attack a man, unless in self-defence. They are great eaters, devouring corn, oats, grass, acorns, roots, fish, flesh, fowl, and honey. They seem particularly partial to the latter, and after dining on a fat pig, nothing affords them more satisfaction than to rob a bees' nest. This rich, carbonaccous food, enables them to store up large quantities of fat during the summer and autumn. On the approach of winter they retire to a cave and take a long sleep until the advent of warm weather in the spring. Like other hybernating animals, they live during this period on the fat stored up during the previous summer and winter. It fares ill with a wellbred pig that happens to be neighbor to a bear, hungry for a breakfast, after his long sleep.

Mr. Thrasher, author of the Hunter and Trapper, says: "Their mode of eating the hog is to take him up in their arms and squeeze him some, commencing at the same time to take their dinner out of the shoulder and neck at the back of the hog, which is alive, and squealing as only a hog can squeal. bear will carry a hog as heavy as himself. \* \* He is a great natural boxer, and it is not easy to hit him with a club, for he defends himself like a well-trained pugilist. He is a great hand to fight dogs, sets himself up on end and cuffs them right and left, one clip being enough to make a cripple. The bear is very fond of sweets. It is one of their curious tricks to climb a tree where bees have stored their honey, and gnaw them out; their constant growling about the bees' stings, often showing their whereabouts to the hunter. And they are often betrayed at the hog-pen by the squealing of the hogs. Nothing suits them better than to find a hog in a pen, and no one to oppose them. They will climb in and out again, hog and There are several ways of trapping the bear, but the one now generally adopted is to set a steel-trap near some place where the bear has been committing depredations, such as robbing a hog-pen. The trap is set, if convenient, under water, or in a swampy place, covering the trap in either case with moss, so as to look as natural as possible, and hanging a piece of fresh pig or sheep over the trap in such a way that the bear must step on the treddle in order to reach it. A short chain and clog, with three hooks, is attached firmly to the trap, which impedes the progress of the bear after he is caught. The accompanying sketch, drawn by Mr. R. E. Robinson, of Vermont, gives a lively idea of the scene, which will soon be ended on the arrival of the parties on whom the bear has being committing depredations.

Walks and Talks on the Farm-No. 87.

The Hon. T. C. Jones, one of the most distinguished agriculturists and breeders of Ohio, writes me as follows:

"Knowing you to be an accomplished chemist, and especially well instructed in all branches of that science relating to agriculture, many persons are surprised that so little of it is 'applied' in your practical management of the farm, as related in Walks and Talks."

I do not know what I have said that should lead to such a remark. I try to apply all the knowledge I have in the management of my farm, and feel the necessity of much more than I possess. I know nothing of chemistry compared to what I desire to know; but it is quite possible if I knew less, I might apply more. I have long abandoned all expectation that chemistry will revolutionize at once the practice of agriculture. I have no expectation of making a fortune by some chemical discovery in farming. I have never analyzed the soil on my farm to see if it did not lack some simple element of plant-food, the application of a few dollars' worth of which would double its productiveness and make a rich man of me. I know with a good degree of certainty, exactly what is wanted to make my farm rich. It needs, or did need, (1st,) underdraining; (2d,) the soil needed to be thoroughly broken up and pulverized; (3d,) the land was full of weeds and weed-seeds, and I knew I must kill the former, and cause the latter to germinate, and then kill the young plants. I have not tried any chemical mixtures to kill the weeds. I have cut down thousands of thistles in my pastures, and stubbles with a mowing-machine, and have seen it stated that if you would put a drop of sulphuric acid, or a few grains of salt, on each thistle after it was cut, the thistle would die. I have not "applied" this kind of chemistry to my farming operations. The salt and acid are not expensive, but I made a little calculation, somewhat as follows: There are 43,560 square fect in an acre, and, say six thistles on a square foot, and it would probably take about a minute to drop the acid on each thistle; if I worked ten hours a day, it would take sixteen months to go over an acre. I did not think it would pay!

I should have been a much more popular agricultural editor if I had not spent some years with Lawes & Gilbert. My experience on this great experimental farm taught me that ninetenths of the chemical nostrums of the day had no foundation in fact or science. It was a real misfortune! A quack doctor is always more popular than a thoroughly educated physician.

Nevertheless, I am sorry to hear that "many persons are surprised that so little chemistry is applied in the management of my farm." It is not true. I apply all the chemical knowledge I have. I do not think a single day passes in which I do not find use for chemical knowledge. For instance, this morning the thermometer was 10 degrees below zero. I am feeding about fifty pigs. I steam the food for them. By putting the steamed food in a vat, and covering it up tight, it will keep warmer than if kept in small quantities in different vessels. This is a chemical fact. And when I got a large vat, and had all the steamed food put into it, and shut up close for the night, it became "applied" chemistry." The food keeps warm in the coldest weather. Only a few minutes ago, the mau who has charge of the pigs told me the food froze in the troughs. "Then you must give them but a little at a time, and when they have eaten that, give more. Let them have all they will cat, but no more." You say this is not chemistry; but, in point of fact, there are several very important chemical laws involved in these simple operations; and if you will look into the matter, you will find that chemistry enters into nearly every thing that you do on the farm; and, other things being equal, the more thoroughly a farmer understands chemistry, the more he can economize his time and labor. He should apply it to little things as well as great things.

The trouble with most of our chemico-agricultural writers is, that they discuss questions very imperfectly understood, and say little of those simple, well-established principles which are applicable to the common, ordinary duties of every-day farm life. They prefer to talk about the amount of nutriment there is in cheese rather than to dwell on the importance of using boiling hot water to clean the milk pails and cheese vats.

Mr. Jones writes: "I have a question in regard to the nutritive qualities of common feed for stock, concerning which there is no settled opinion, and which your attainments ought to qualify you to decide. What is the difference in the nutritive value of Indian corn of the hard, white variety, as compared with a decidedly yellow variety? The latter is generally preferred for feeding and for fattening hogs. I suppose it the more valuable; but I have an idea that the white is richer in flesh-forming substances-better, therefore, for bread, and better for horses. I have tried to have this matter tested by analysis, but have not yet succeeded. My own opinion is founded chiefly on experiments and observation in feeding these grains." That is to say, the yellow is richer in oil and starch than the white. I do not know whether this is so in fact or not; a good analysis would determine this point. For my part, I should buy the corn that contained the most starch and oil, without any reference, so far as nutriment (not manure) was concerned, to the percentage of the ficsh-forming substances. A very poor, immature sample of corn might contain, and probably would contain, a higher percentage of nitrogen, or ficsh-forming matter, than a well-grown, fully-matured sample of corn. Just as a half-starved, lean ox would show a higher percentage of nitrogen than a well-fed, ripe one. There would not be as much nitrogen in the poor ox as in the well-fed one of the same age; but there would be more in a pound of the beef. And so in a shriveled, immature grain of corn, there would not be as much nitrogen as in a large grain, fully matured, but there would be a higher percentage. In other words, this poor, shriveled, immature corn would contain a higher percentage of "flesh-forming substances" than the richest, fattest, best developed corn grown in the Sciota Valley. And the beef from an old Texan ox would contain a higher percentage of "fleshforming substances" than the best and ripest Shorthorn in Mr. Jones' magnificent herd.

A skim-milk cheese contains a higher percentage of flesh-forming matter than one which contains all the cream. And I could almost wish that those who write so much about the "flesh-formers," or, as one popular author calls them, the "nitrates," were compelled to live on lean Texan beef, or mutton from half-starved Merino sheep, or on skimmed cheese, until they either studied the matter more thoroughly, or ceased writing about it.

Mr. Jones further asks—"What is the value of wheat bran as food, say for cattle? The

'authorities' generally place it low, but many breeders of large experience use it extensively. What is the value of shorts and of middlings?" I cannot answer these questions, for the simple reason that we do not know how much of the cellulose, or woody fibre in bran, hay or straw, is ordinarily digested by cattle and sheep. Lawes & Gilbert's experiments on pigs show that bran is a very indifferent fattening food for these animals. Their stomachs are not large enough to digest it. The following table shows the composition of wheat bran as compared with other standard articles of food:

	Water.	Crude Fibre.	Asb.	Total non-nutri- tious matter.	Albuminoids.	Carbo-hydrates.	Fat.	Total carboos- ceous matter= earbo-hydrates.	Total Nutri- tious matter.
Timothy Hay.	14.3	99 17	4.5	41.5	9.7	45.8	2.0	53.3	63.0
				41.0	9.4				
Clover Hay	16.7	35.S	6.2	58.7	13.4	26.7	3.2	34.7	48.1
	14.3				2.0				34.9
Wheat Bran	13.1	17.8	5.1	36.0	14.0	46,2	3.8	55.7	69.7
	14.4			22.0	10.0				88.5
Audition Collin.	173.3	. 0.0	**1	122.01	1 20.0	01.0	11.0	10.0	100.0

The carbo-hydrates include digestible cellulose, or woody fibre, starch, gum, sugar, etc. One pound of fat is equal to 21/2 lbs. of starch; and so, in the last column but one, I have given the total amount of digestible carbonaceous matter, calculated as starch; that is to say, I have multiplied the fat by 21/2. Thus 100 lbs. of timothy hay contain 45.8 lbs. of digestible carbonaccous matter and 3 lbs. of fat. These 3 lbs. of fat are equal to 71 2 lbs. of starch, which, added to the other digestible carbonaceous matter, make the total amount equal to 53.3 lbs. The last column is obtained by adding the albuminoids, or nitrogenous matter, to the total amount of digested carbonaceous matter, and consequently this column represents the total amount of nutriment in the different foods. According to these figures, we have the following results, estimating clover hay worth \$15 per ton:

		Value of the manure oh- tained from	ton after de-
Clover Hay Timothy Hay Wheat Straw Wheat Bran Indian Corn	\$15.00	\$9.64	\$5.36
	19.63	6.43	13.20
	10.87	2.68	8.19
	21.70	14.59	7.11
	27.58	6.65	20.93

According to analysis, therefore, if the nutriment in a ton of clover hay is worth \$15, that in timothy hay is worth \$19.53, that in bran, \$21.70, and that in corn, \$27.58.

In the second column is given the value of the manure from a tou of the food consumed. After deducting this from the actual nutritive value of the food, it will be seen that while the food in a ton of clover hay is worth \$15, it costs us only \$5.36; and while the food in a ton of timothy is worth \$19.63, it costs us \$13.20; wheat bran is worth \$21.70, and costs us \$7.11. A little calculation will show which of these articles is the cheapest food, after deducting the value of the manure.

It will be seen that Judge Jones is right in his estimate of bran as food for cattle and sheep. It is unquestionably a valuable food, and in those sections where manure is needed (and where is it not?) it can usually be bought to advantage. If timothy hay is worth \$20.06 per ton, bran is worth \$36.29; and I believe these figures represent the relative value of timothy hay and bran with a good degree of accuracy. But when you compare bran with corn, there is another question to be taken into consideration by the grain-growing farmer, who

has plenty of straw, corn-stalks, and other bulky fodder. It is certain that such a farmer cannot afford to pay \$36.29 per ton for bran while he can get corn for \$34.23 per ton. The corn is more easily digested than the bran; and furthermore, the nutriment in corn is more concentrated, and can be fed out to much greater advantage in connection with straw and stalks than bran can. The table shows that straw has a far greater nutritive value than it is usually found to be worth when fed out alone on the farm. Its actual value as food is \$10.87 per ton, as compared with clover hay at \$15 per ton. But it is certainly not worth half this sum to feed out alone. It is too bulky. The animals cannot eat and digest enough of it to enable them to take on flesh and fat rapidly. We need to feed out corn or other concentrated food with it; and in such a case as this, the figures in the table place the value of bran too high, and that of corn too low.

On my farm, I am always tempted to buy bran, when I can get it \$10 per ton less than corn-meal, simply because it makes such rich manure. But this winter, so far, I have not fed out a single ton. I buy corn and corn-meal instead. And I do it for the reason above given. With well-bred stock that is growing rapidly, bran is a substitute for hay and roots, not for grain. If I was short of hay and coarse fodder, I should buy bran; but with plenty of clover hay there is little necessity for buying bran. Better buy corn. Clover hay and corn are better for fattening stock than clover hay and bran.

I say well-bred stock, and by this I mean animals that have been bred to grow rapidly. Such animals require more nutriment in a given time than animals that have been bred to grow slowly. The latter can get all the food they need from ordinary hay; but the former must have hay of extra quality, or, in the absence of this, they must be fed enough grain to bring the hay or straw or roots up to the desired standard; and this standard will be determined by the growing qualities of the animals and the size of the stomach. The animal can eat only as much as the stomach will hold; and if this is sufficient to enable it to grow and fatten as rapidly as it is capable of growing, it would be a waste of food to give grain in addition, and would be deleterious to health. But if the animal is capable of digesting more food than the stomach will hold, it is a great loss not to furnish it. And we do this either by providing richer hay, or by substituting more or less grain in place of a portion of the fodder. In such a case it would be cheaper to feed corn than bran, even if the nutritive matter in the corn cost considerably more than that in bran. Nevertheless, I think very highly of bran, especially for milch cows, and for breeding ewes. It is the best substitute for roots that we have. But if the animals can stand it, I would give more or less grain in addition.

The Kausas Furmer says: ""Walks and Talks," in the September Agriculturist, advises sowing two bushels to the acre of wheat. We would call this pretty heavy seeding, out West here, and we believe our soil will stand a heavier seeding than the soil of New York will. We have advocated a heavier seeding of oats than our farmers generally give, and have thought that the seeding for wheat could be slightly increased with profit, but we believe that "Walks and Talks' has rather over-reached the mark. We are free to confess, however, that we have never tried two bushels per acre, nor have we ever seen it tried. \* \* \* Five pecks have been the

rule among the wheat growers of Indiana, Ohio, and Michigan, and that rule has rarely been infringed upon. In Kansas and Missouri some of our best wheat growers have used as much as six pecks of seed. We would like to hear from 'Walks and Talks,' if he has ever used two bushels of seed, and, if so, was it thinned by winter-killing or any other cause? And what was the yield of the crop?"

I have now between forty and fifty acres of winter wheat drilled in at the rate of two bushels per acre; and I have sown at this rate for several years, sometimes getting on a little more and sometimes a little less. I do not think my wheat has ever been injured by being too thick. The Deacon sows only a bushel and a half, and some others only five pecks. I sow later, and put on a little more seed. Some of them sow as early as the last week in August. I do not care to sow earlier than the 10th of September, and from that to the 25th. The Hessian-fly, which has not troubled us for many years, seems to have returned, and of course early sown wheat will be the most likely to suffer from its attack. On the other hand, to avoid the midge we want our wheat to ripen early, or perhaps more correctly speaking, to come carlier into flower. I have an idea that moderately thick seeding favors early ripening.

But after all that has been written on this subject of thick and thin seeding, and the numcrous experiments that have been made, there is a great diversity of opinion on the point. And the old question, as to whether rich land or poor land needs the most seed, is still in dispute. I suppose from the remark that "our soil will stand a heavier seeding than the soil of New York," the editor of the Kansas Farmer thinks that rich land requires heavier seeding than poor land. I have always taken the other view, so far as wheat, barley, and oats are concerned, but not in regard to Indian corn. Within certain limits, the richer the land the more plants of Indian corn can be left on an acre. But with wheat, the richer the land the more the plants will stool out and the less seed will be required.

But I suppose a good deal depends on what we understand by rich and poor land. What I mean by rich land is a soil that contains sufficient plant-food, in an immediately available condition, to produce as heavy a crop as the season is capable of bringing to perfection. In other words, on rich soil it is the character of the season that determines the yield per acre. And any land that, from lack of available plantfood, can not produce as large a crop\as the season is capable of maturing, is poor land. If the season is capable of maturing 40 bushels of wheat per acre, and the land is capable of producing only 30 bushels, that land is poor. If the season is capable of maturing only 30 bushels per acre, then this same land would be rich. Now, when we say "the richer the land the less seed we require," we refer to land capable of producing more wheat than the season is capable of maturing. On such land, containing an excess of available plant-food, the greater this excess the less seed, within certain limits, should we sow. One bushel per acre would be better than two bushels. And though it seems paradoxical, I think it may be true that the poorer the land the less seed is required. Land that is capable of producing only 5 bushels of wheat per acre would require less seed than land capable of producing 10 bushels, and this less than land capable of producing 20 bushels. Very rich and very poor land should be thinly seeded; but on medium land, such, say, as is capable of

producing from between 25 to 30 bushels of wheat per acre, I should sow two bushels of seed—a little less perhaps if sown early, and the soil was moist, warm, and in fine tilth.

John Johnston advocates thin seeding, but his land is thoroughly underdrained, in fine mech anical condition, free from weeds and rich in available plant-food. When, by growing clover and feeding it to sheep, I get my land as rich as his I shall probably sow less seed, but not till then.

Two years ago I sowed a ten-acre field of barley, that had been "fall-fallowed," at the rate of 11, bushels per acre, and another field of 14 acres, at the rate of 21/2 bushels per acre, and I had more barley from the 10 acres than from the 14 acres. If I recollect right, the thinseeded field yielded nearly 50 bushels per acre, and the other about 33 bushels per acre. Now, this proves nothing in regard to the advantages or disadvantages of thick or thin seeding. I expected no more than I got from either field. It was the condition of the land and not the amount of seed that determined the yield. If I had sowed 21/2 bushels per acre on the rich land, the season proving to be a very wet one, the crop would have fallen down and I should have got little or nothing but straw. Had I sown 11 4 bushels per acre on the poorer field, I have no doubt (though I have no proof) that I should have got a less yield than I got with  $2^{1}|_{2}$  bushels. I do not know how it is "out West," but here, in the Middle States, I think the error is in sowing too little rather than too much seed.

But a still greater and more prevalent error is in not getting the land rich enough. In this section, the farmers, as a rule (though there are far too many exceptions) put the land in good

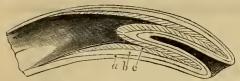

Fig. 1.—section of horse's tootu.

mechanical condition for the seed. They make it very smooth and mellow on the surface. But they do the work in too short a time, and get comparatively little benefit from the decomposing and fertilizing influence of the atmosphere. The fields look very smooth and nice. wheat is sown early, and presents a handsome appearance in the autumn, but does not come up to expectations the next spring and summer. It is not rich enough. On heavy clay land we must summer-fallow more, breaking up earlier in the spring, or the fall previous, and doing the work more thoroughly. On lighter land, that does not need summer-fallowing, we must grow more clover, manure higher, and grow grain crops less frequently until we get the land rich. Then, if you are afraid the land is so rich that the crop will fall down, sow less seed, and do not sow too early. If I had land that I thought was not rich enough to produce 15 bushels per acre, I would not sow over 11, bushels of seed (and if I acted wisely I should not sow at all). If I had reason to suppose the land rich enough to produce 30 bushels per acre, I would sow 2 bushels per acre. If I thought it rich enough to produce 50 bushels, I would not sow over 11 bushels per acre—perhaps only one bushel.

And I am not sure that the same principles will not apply to corn. On very poor land plant thin, on rich land plant thicker; and if there ever is a case where the land is too rich for corn, plant thinner again. But I have never known an instance of this kind. Practically, we should plant thicker as the land is

richer. I think you will find that all the great corn crops that have been reported have been planted thicker in the rows, one way, than usual. And hence I advocate drilling in corn on very rich land. But on poor land that will not yield over 70 bushels of ears per acre, I would plant in hills, three and a half feet apart each way, and three or four plants in a hill.

#### Horses' Teeth.

There is no disputing the convenience of horses' teeth as a means for ascertaining the age of the animals; but they perform a much more important office. No contrivance of art is so perfectly fitted for its destined use as these are adapted to theirs. It is worth one's while occasionally to study the admirable mechanical contrivances by which animals per-

form their various functions with ease and rapidity. The ruminants, cows, deer, sheep, etc., bite off the herbage by pressing their incisor or cutting teeth, which are in the lower jaw, against an elastic, firm, gristly cushion, which is in place of teeth upon the upper jaw in front. Of course the bite is decisive, the grass yields, and not a spear or leaf can pull through. When two sets of teeth opposed to each other, however, if like those of a man or a dog, grass would be likely to draw through and little really bitten off. In the structure of horses' teeth this is overcome by giving the teeth rough faces like those of the jaws of a pair of pincers. Such a distribution and alternation of enamel and bone is made that a most admirable surface for taking a tight nip is produced. Such a tooth must necessarily wear faster than one the surface of which is a thick, solid plate of enamel. And consequently there is provision for its renewal in the growth of the tooth, which continues throughout the life of the horse.

An idea of the structure of a horse's front teeth may be had if we suppose each tooth to have been once plastic and conical, hollow within, and composed of but three layers, which subsequently form the tough crust of the outside, the hard enamel next it, and the dentine or bony mass within surrounding the cavity. Now let us suppose the point of this conical, plastic body to be pushed inward into the cavity within the tooth, just as we can draw the toe of a stocking into the same. Figure 1 shows how this is. Here one of the incisors or nippers

is represented split lengthways. The tough *cement* or crust, a, is seen upon the outside passing over the edge, entering and lining the cavity. The *cnamel*, b, follows the cement, and the ivory or *dentine*, c, is reflexed upon itself. The grinding of the teeth upon each other, and upon grit contained in their food, soon wears them to a nearly flat "table," which will of course remain irregular on its surface so long as it is composed of substances

varying so much in hardness—the dentine of course wearing down and leaving the enamel and cement exposed to greater wear. The horse sheds his first pair of milk-teeth when coming three years old, and they are replaced by the two central incisors or nippers; the other two pairs of nippers follow, and by the time the animal is  $4^1|_2$  years old, all the permanent nippers are in sight, and the middle ones of both jaws show some wear. Fig.3 represents the lower nippers of a  $4^1|_2$ -year-old

horse, and fig. 2 the upper jaw of the same, which always show least abrasion. The sharp edges of the outside pair may be distinctly seen, and the dark cavity in the centre with its irregular edge. This cavity is called by horse-men the mark, as it forms a black mark, edged with white, in the center of each of the nippers, until a horse is about 7 years old, then it nearly or quite disappears from the two middle nippers of the lower jaw, and subsequently from the others. In a

Fig. 4.—UPPER NIPPERS OF A 6-YEAR-OLD.

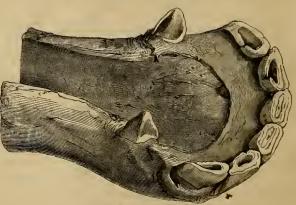

Fig. 5.—LOWER NIPPERS OF A 6-YEAR-OLD.

four-year-old the mark will take the fine point of a knife to the depth of about half an inch, and this much of the tooth must, of course, all be worn away before the tooth presents the appearance shown in fig. 6. The engravings, figs.

Fig. 6.—UPPER NIPPERS OF AN S-YEAR-OLD.

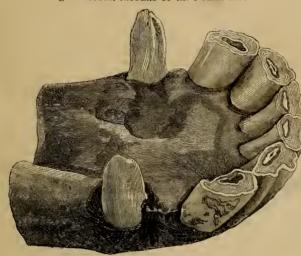

Fig. 7.—LOWER NIPPERS OF AN S-YEAR-OLD.

respectively of a horse between 6 and 7 years old; and figs. 6 and 7 of a horse about 8 years of age.

#### A Question for Pig-Feeders.

Z. F. Hopkins, Ill., writes: "We wish to submit to you for settlement the following question: Can shoats be fed with as much profit to the feeder as grown hogs? To be more explicit, A takes B's pigs-say seven to eight months old-to fat on halves. Now, the question is, can A feed them with as much profit as though they were full-grown pigs?"

REMARKS.—We would submit the question to our readers, remarking, at the same time, that if we understand the question aright, there can be no doubt that the full grown pigs may be fattened "on halves" with the most profit. If A should give to B a 300-lb. pig, worth, say \$15, to be fattened on halves, and to C a 200-lb. pig, worth \$10, and they should be sold the next day, it is evident that B would get more for his food than C. B would get \$7.50 for one day's food, and C only \$5.

But if the pigs weighed alike, it is not such an easy matter to answer the question. One thing, however, is clear: the shorter time the feeder kept there, the more he would make. If he sold them the day he got them, he would get half the value of the pigs for nothing. presume there is, in practice, some restrictions in regard to this point. Let us assume that A has two litters of pigs, of ten each. Lot 1 are well-bred pigs, that have had good care, and at

7 months old weigh 200 lbs. each. Lot 2 are 14 4 and 5, represent the upper and lower nippers | months old, and also weigh 200 lbs. each. B

takes them to fatten, and agrees to give them good care and all the food they will eat for ten weeks, and receive half the proceeds of the pigs for his trouble and food. Which lot would afford B the most profit?

We do not know of any experiments that enable us to answer this question; and if any of our readers have made such, we shall be glad to hear from them. Professor Miles, of the Michigan Agricultural College, put an Essex harrow pig, 11 weeks and 6 days old, in a pen June 30, and fed it all the cornmeal it would eat for nineteen weeks, or until Nov. 10. At the commencement of the experiment the pig weighed 541 2 lbs. In the nineteen weeks it ate 4093 lbs. of meal, and then weighed 1451 2 lbs., or a gain of 91 lbs. In other words, 436 100 lbs. of meal gave 1 lb. of increased weight.

At the same time he put in an adjoining pen a Suffolk barrow, 11 months old, that weighed 204 lbs. In nineteen weeks he ate 7961 2 lbs. of meal, and then weighed 3693 4 lbs., or a gain of 165° | 4 lbs. In other words, 4° | 10 lbs. of corn-meal gave 1 lb. of increased growth.

With the young pig, it required a ton of meal to produce 4583 4 lbs. of increase; and with the older pig, a ton to produce 4173 4 lbs. of increase. So far as this experiment throws any light

on the matter, therefore, a young pig will grow faster for the food consumed than an older one. And this result accords with the previous experiments made by Professor Miles,

as given in "Harris on the There can be little doubt that, as a rule, young animals eat more food, in proportion to live weight, and increase faster, in proportion to the food consumed, than older animals. This system of fattening pigs "on halves," though formerly not uncommon with distillery men, is now seldom, if ever, practised in this State, and we should be glad to hear more in regard to it. In the ease we have assumed, A furnishes a pig weighing 200 lbs., at 5 cents per lb., worth \$10. B gives the pig ten bushels of corn, and makes him weigh 300 lbs., worth, at 7 cents per lb., \$21

A makes half a dollar a pig by the transaction, and B gets one dollar a bushel for the corn and half a dollar a pig for his trouble.—EDS.

#### A Cheap Clod-Crusher.

A correspondent of the Agriculturist favored us with a sketch of a simple implement he had constructed for crushing clods and smoothing rough land. We have mislaid his description, but no one will have any difficulty in understanding how to make and use the implement. It is made of two-inch plank, bolted on to a frame in such a way that the lower front edge of each plank is raised a little higher than the rear edge of the plank which precedes it, and eight or nine inches from it. This is done in order to avoid clogging; and, for the same reason, one of the chains is made shorter than the other, so as to draw the implement in a slightly slanting di-

CLOD-CRUSHER.

rection. If not heavy enough it can be weighted with stones, or in unusually rough spots the driver can jump on and ride. -

#### Turning a Compost Heap.

The object of turning a compost heap is to break up the raw lumps, to reduce it to a fine, homogeneous mass, and to accelerate fermentation.. All admit the importance and advantage of the operation, but many are deterred from its performance by the labor and expense. Are there not many cases where these can be greatly reduced by the use of the plow, as shown in the annexed illustration? We have a large heap of peat and manure, but should not object if it was much larger. There is a layer of peat and then a layer of manure. Fermentation proceeds but slowly, and we wish to hasten it. To do this the heap must be turned, and we call in a yoke of eattle, a large, reversible plow, and a couple of men to aid us in the operation. We put in the plow and turn over a furrow. It is not model plowing. But do not be discouraged. It will save a good deal of hard work. The oxen will break down the side of the heap, and the trampling serves to mix the manure more intimately with the peat, while the plow, following, turns it over. If you have to go over it several times, it will do all the

TURNING A COMPOST HEAP.

more good. Three-fourths of the work can be done by the plow; but it is well to have a couple of men to throw up the loosened mass into a neat heap, taking pains to hreak up all the lumps and mix the manure with the peat. If the work is not as neatly performed as our artists have represented it, do not abandon the undertaking. You cannot stir the heap too much. You cannot trample it too much, provided the plow stirs it up again. Even in a large heap of manure, unmixed with peat or soil, we have used a plow with a sharp confter to help in turning over and mixing the manure.

#### When and Where to Irrigate.

In the almost rainless climates of some of our new Territories, of course, we must irrigate if we mean to have any crops. But is irrigation of any use in a climate giving forty-five or more inches of rain, as we have from Maine to Texas? Under certain circumstances we answer, very decidedly, yes. It will pay to irrigate any well drained land, and within certain appreciable limits, the more water you can get to pass through the soil the better for the growing crop. It might pay to raise water by wind or steampower under certain circumstances, but we do not think that time has come yet in ordinary farming. At least, if it has, it has yet to be proved, and some one has to pay a pretty heavy bill for the experiment. But there are many thousands of acres where the water for irrigation is already raised, and it only needs dams and ditches to turn it over these acres. There is no expensive machinery to be purchased, and after the dams and sluiceways are made, but little labor is required to turn the water on and off as it is needed. Two farmers in this State, A. B. Dickinson, of Steuben County, and the late L. D. Clift, of Putnam, have proved beyond all controversy that it pays largely to turn brooks that have sufficient fall out of their channels upon the adjoining upland. The impression that irrigation is only of service in the summer in time of drouth, is erroneous, and it is this error, doubtless, that has prevented many from investing in this cheapest form of manure. There are many brooks that run bank full in winter that are mere rills in summer. Mr. Clift for many years turned his stream over the adjoining meadows, and kept them running all winter. The crop of grass was more than doubled at once, and there was a steady increase of the crop from year to year without any other kind of manure. The impression, too, is quite common that this water-made grass is not as nutritious as that made from top-dressing with stable manure. This was also proved to be an error. The grass grows with great luxuriance, wherever the water runs, is as easily cured, and smells as sweet. If it is any less nutritious, the Shorthorn grades annually fattened upon this farm never found it out. The water furnishes the aliment the grass needs just as surely as stable mannre, and probably chemical analysis would not show much difference in composition. A good deal is brought down in the sediment which the clearest of brooks have in much larger quantity than any one suspects who has never studied the subject. Fish culturists tell us that even spring water has to be filtered through five or more flannel screens, before it is fit to hatch eggs. These filters are so covered with dirt, that they have to be changed daily. Brooks, although they seem to be transparent, are much more foul than spring-water, and after every rainfall, are usually discolored with matter held in suspension. Our heaviest rains occur in winter and spring, and the amount of sediment deposited by a stream kept flowing over a meadow for six months would be very large. But this is only one source of the supply of plant-food. Water is a powerful solvent, and is all the while acting upon the stones and minute particles of soil through which it flows. It is all the while making plant-food. Of course, much more aliment for plants must be prepared, where there is flowage for six months, than there could be by the usual rainfall. Whatever the philosophy of the fact may be, there can be no doubt of the fact itself. Irrigation alone will increase the productiveness of any

ordinary soil, and if persistently followed, will in time clothe it with a heavy sod. Near the Shore Line Railroad, in Groton, Conn., a deep cut was made into a bank to furnish earth for filling in a wharf, about a dozen years ago. For many square rods nothing but gravel was left overflowed by a spring. This once barren gravel is now covered every season with luxuriant grasses, and the only ameliorating agents have been the spring-water and the atmosphere. Those who have brooks running through their farms should put them at once to the work of irrigation.

#### How to Catch an Owl.

Owls are very destructive to poultry, especially in the breeding season, and are much more dangerous than hawks, inasmuch as they pay their visits to the roosts in the night. There is no effectual safeguard against their visits unless you have the hennery made owl-proof. Most farmers make their roosts under an open shed, or upon the trees, which are as free to birds of prey as to the hens. Chickens are very delicate food for young owls, and sometimes a dozen will be missing from the perch in a night, and their feathers and claws be found the next day in a neighboring owl's nest. Old hens will be taken and their heads be eaten off and the carcass be dropped under the tree, quite too heavy for the owl to carry off. Not a moment should be lost when these depredations occur. Tie the dead fowl upon the limb or the perch where it was accustomed to roost, and shut up the other fowls. The dead fowl should be tied in a roosting position, so as to seem alive to the owl. Place a small steel-trap on the back of the hen and fasten it to a neighboring limb. The owl will generally make his appearance the following night, and in swooping down upon the back of the hen will find his claws securely fastened in the trap. A small rat-trap without teeth is the best. The teeth would be apt to cut off the legs or claws and release the owl. The trap will often save many days of hunting a mean, skulking enemy, who only plunders in the night. CONNECTICUT.

## Like begets Like, or the Likeness of some Ancestor.

This last part of the sentence is a very important addition to the original formula, and but few farmers appreciate its force, or ever even think of it.

If some one raises a well-turned boar and keeps him for service, the neighbors will soon brand him as a "likely-lookin' pig," and in a year or two he will have scattered his progeny over the country for miles around-generally without having produced the least improvement on the native breed. The reason for this is that the boar himself is of the native breed, and the slight influence of his individual excellence, which is due more to his feeding than to his breeding, is overborne by that of his long line of low-bred progenitors, whose blood fills his veins and asserts itself in his progeny. If he is crossed with extra good sows, and the descendants are well nurtured, and are bred carefully for many generations, there will in time be produceda fixed type that will have impetus enough to carry its improvement to all its successors. Or if the boar be of one of the well-established breeds like the Essex, no matter what the sows may be, there will be a marked improvement in all their progeny. A half-bred, Jersey bull-calf

is sometimes raised for stock purposes, because he is individually a very promising animal, Now and then he may get a calf that will show the characteristics of the Jersey breed, but in nine cases out of ten his get will show more of the "native" than of the Jersey. Sometimes among dogs there will be one pup in a common litter that will look like a pure-bred "black-and-tan" terrier; but if this animal be used as a sire, his get may all be unmitigated "yaller dogs." A very handsome and very fast horse, used for service, may beget a county full of lunk-head colts; or a stallion that is perfectly sound may beget colts that will almost universally have a tendency to blindness, spavin, or some other glaring defect. In the human race, black-eyed parents (both father and mother) not infrequently have only light-eyed children.

The causes of all these variations are invariably to be sought in the ancestry. These blackeyed parents had blue-eyed sires or dames somewhere in their family history; the good-looking horse had, among his progenitors, some in whom the defects that he perpetuated were prominent; the black-and-tan dog had a flood of "yaller" blood in his veins; in the bull the Jersey influence was weakened by the mixture of common blood in his native dam; and so we may go on through the whole chapter of breeding from mixed races. It is only where certain qualities are concentrated by a long line of close breeding that we may depend with any certainty on their reproduction. Although it is very rare that any quality appears in the progeny that was not a characteristic of some ancestor, more or less remote, it is certain that these characteristics of ancestors, even though remote, show a strong tendency to reappear.

As an instance in point, we know a very good cow that is seven-eighths Jersey and one-eighth Ayrshire which might be sold to a good judge for a pure Ayrshire, having not the least appearance of Jersey about her; yet her dam (onequarter Ayrshire) looked like a pure Jersey, as do nearly all of her calves (one-sixteenth Ayrshire). Here, in a single instance, in the third generation, the characteristics of the Ayrshire dam have reappeared in full force after she was dead and gone. Thorough-bred horses (English race horses) always look like thorough-breds, never like Canucks or cart-horses. The fullblooded children of Jews-the only thoroughbred white race we usually see-always bear the Jewish face as unmistakably as the children of negroes carry their peculiarities. In these instances, both man and horse have bred so long in the pure line, that variations from the pure type are too remote to have influence.

The deduction from the foregoing statements is, that we should breed only from thoroughbred sires. Personal or constitutional defects being absent, the great thing to be regarded is pedigree. If you have your choice between two pedigreed animals, always take the handsomest and the best, but if you must choose between a somewhat inferior animal with a pedigree, and a perfect animal with an inferior pedigree, always regard the pedigrec as far outweighing individual excellence. Do not be misled by the superior beauty of the underbred beast. What you want of him is to transmit the qualities of his ancestors. His beauty, or want of beauty, he carries in his own person. The excellence or the defects that he will transmit to his descendants are an inheritance from his progenitors, and your business is much more with them than with himself. In our opinion no farmer can afford to breed from any but a thorough-bred sire, if a thorough-bred is within

his reach, for the reason that he cannot afford to take the risk of the reappearance of ancestral defects, which are always liable to crop out.

In some instances, as with swine, we believe that half-bred animals are often quite as profitable to the feeder as pure breeds; but it will not do to attempt to raise half-bred pigs from a half-bred boar and a half-bred sow. The result would be too uncertain. The boar should be a pedigreed animal; by which we mean that we should have satisfactory evidence that, for as many generations back as it is usual to trace thorough-breds of that race, there should be no admixture of other blood. In other words, in all breeding we should look back as far as possible to see what qualities we are likely to perpetuate in our breeding. There are certain indications by which we may judge (after a fashion) of the tendency of a bull to beget good milking cows. But if we can know that his dam and both his granddams, and all four of his great-granddams were first-class milking cows, we may safely disregard the utter absence of milking indications in the bull himself. He is only a channel through which milking qualities are to be transmitted-a channel that will convey nothing that has not been poured into it from above. The same is true with every kind of domestic animal, from chickens to horses. We must look for transmissible excellence, not in the animal himself but in his ancestry for several generations back; for although like often begets like, it always begets the likeness of some ancestor, one or more.

## The Specialties of Eastern Farming.

The practice of the farmers in New York and New England shows pretty clearly that it does not pay to raise grain to sell. They raise corn, rye, wheat, oats, barley, and buckwheat; but it is nearly all consumed upon the farm, and in many sections a great deal is purchased for feed-Corn grown upon the prairies in very large quantities is consumed in all our seaboard towns and far inland. We have not raised our own flour for a whole generation. It might pay possibly, but it does not. We cannot compete with the West in these things in our markets. We furnish but a small part of the beef and pork consumed in our large cities. Every year the city stretches out its iron arms to a greater distance, and brings cattle from regions where land is worth less than a dollar an acre, and where almost the only cost of raising cattle is the herding of them for branding the calves and for sale to the drover. It only pays us to make beef after we have raised and used the cattle for teams, or for milk and its products. We cannot compete with Texas and Kansas steers. We could not make pork at a profit if we did not need the manure. Fattening pigs in a cornfield will not pay in the East. Beyond the supply of the home market we shall have to give up these things, for the very satisfactory reason that other people can raise them cheaper and undersell us. But there are some farm products in which we can beat the West. The dairy interest can be indefinitely expanded with profit. Milk is wanted fresh every day in all our cities and large towns at paying prices. Condensed milk, brought from more remote regions, has not depressed the price very much, and probably cannot. Fresh milk, distributed from the milk-cart every morning, costs the consumer in country villages an average of 8 cents a quart the year round. This pays the producer. Butter has been about 40 cents a pound by the season, and in winter about 50 cents in the same regions. Cheese has

borne a corresponding price; and in many sections, where they have cheese factories, pays quite as well as butter. There is no danger of an overproduction, for there is a growing demand for our cheese in Europe. A good calf for the butcher will bring from twelve to eighteen dollars; and this is about what we can buy yearlings for, after they have been raised at the West, and sent to Albany or Brighton markets. It will not pay for us to raise calves, unless they are of extra quality or thorough-bred. We must keep up our stock of deep milkers, and for this end we want herd-book bulls, and calves from the best cows. A few of these grade heifers should be raised every year. Lambs, of all the muttou breeds of sheep, pay well. We know of a small farmer who averages a hundred dollars a year from eight South-Down grades. They are easily kept, and there is no trouble about marketing the lambs. Pigs, too, pay well in the neighborhood of all large towns. There is a very large class of villagers who keep one or two pigs and make their own pork; and the farmer's extra pigs are always in demand, and often at extravagant prices. Poultry receives great attention in all this region, and might receive much more, to the manifest advantage of producer and consumer. The watering-places are every where, and the demand for spring chickens, ducks, and goslings, from July to September, is very brisk at fancy prices. A small bird will often bring as much in July as a fullgrown one in November. But poultry allowed to grow up, and sold in the lump at Thanksgiving and Christmas, is one of the best crops raised on the Eastern farm. With a good range, turkeys cost very. little until October, when the regular feeding for the market begins. On many farms the whole care is bestowed by the housewife; and her annual sales of eggs and flesh frequently foot up three hundred dollars. If we cannot sell grain and other vegetable products from the farm at a profit, we certainly can certain kinds of animal products; and by carefully studying the compost heap, increase the value, profit and fruitfulness of our farms. Our chief drawback is comparatively poor land; our advantage is near access to market, and an increasing demand for all choice products, animal and vegetable.

## Fowls Winning the American Agriculturist Prize Cups.

The proprietors of the American Agriculturist, with a view to encourage the breeding of the most valuable kinds of fowls for general use, offered prizes to be awarded at the shows of the N. Y. State Poultry Society, in December, 1869, and 1870. This year the prizes consisted of four silver cups, valued at \$25 each, and were offered for Dark Brahmas, Buff Cochins, Gray Dorkings, and Houdans, which were to be exhibited as one trio of old fowls, and six of their progeny, shown in trios or pairs. Dark Brahmas and Buff Cochins were specified, not to indicate any preference for the Dark over Light Brahmas, or for Buff over Partridge or White Cochins, but because these are now favorite breeds, and attracting the attention of funciers quite as much as any of the Asiatic varieties.

We have repeatedly discussed the merits of these fowls in the Agriculturist, and will only briefly remind our readers of the peculiar merits of each. The Dorkings, seen in the lower left-hand corner, are an English breed, of great antiquity and excellence. They have been carefully bred for good size, good form, and

good quality of flesh; breeders carefully retaining a notable deformity, the fifth toe. Some strains produce excellent layers, and the best of sitters and mothers, while in other strains the hens are unreliable. These are, of course, among the high-bred, fancy birds. Common Dorkings are as reliable for their domestic relations as one can desire. The breed is known in two sub-breeds, namely, Colored and White. Of the Whites there are different strains, and single and rose-combed varieties. We think the preference is being given so strongly to the rose-comb, that the single ones will in time disappear. Among the colored or Gray Dorkings, a number of varieties are marked by slight differences of feather; and of these, numerous strains, originating in the yards of different breeders of note, are recognized by fanciers. The only variety which has commonly a separate class assigned to it at the shows is the Silver-Gray Dorking. The trio which won the prize, and are above represented, were exhibited by R. Gibson, of New York Mills, N. Y.

The Houdans are a French breed, and though a little less in size than the other famous French fowls, they are not less valuable, being decidedly the hardiest and most prolific. They combine two valuable qualities—the production of flesh and eggs-each in a high degree of excellence. From the fact that they exhibit the fifth toe of the Dorkings with something of the topknot and speckled plumage of the Silver Polands, which are famous, persistent layers, and sure sitters, it would seem almost as if these breeds had been united in their production. This was, however, probably not the case. The Houdans have been thoroughly tried in this country, and prove excellent in every respect. A good cock will weigh 7 lbs., and a good hen 51 2 lbs. The quality of the flesh is fully equal to that of the Dorking, and the eggs large and white. The engraving is from the winning groups which were exhibited by G. W. Bradley & Son, Hamden, Ct.

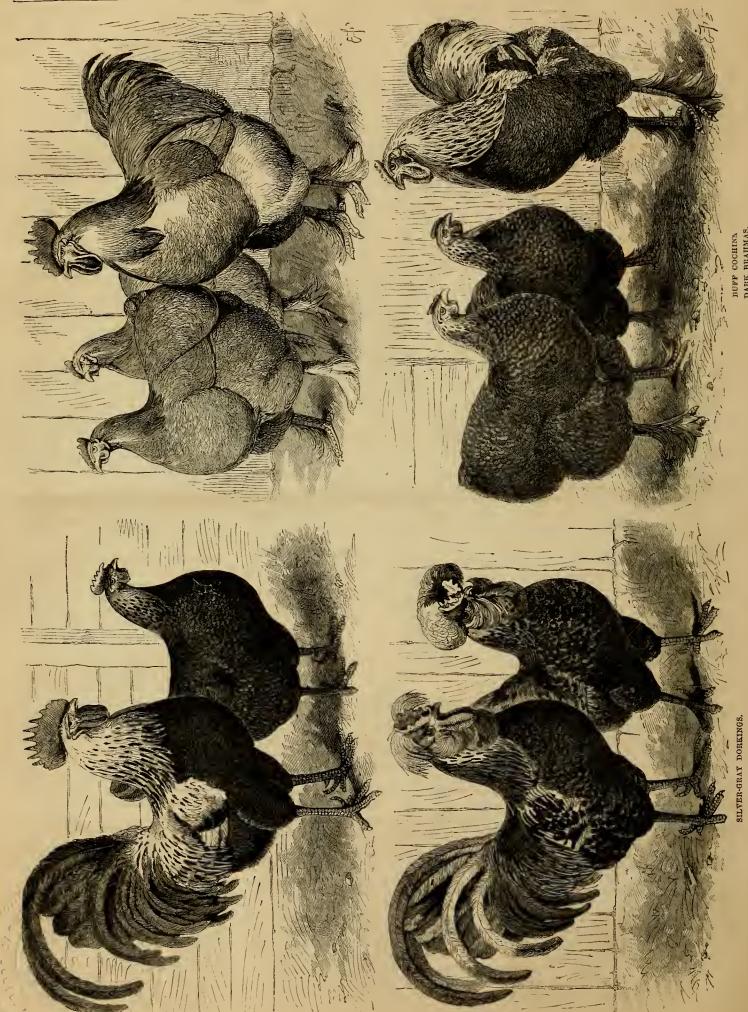

Altogether, the exhibition of fowls, brought out by the offer of these cnps, was a fine display of itself, there being close competition for each.

The Buff Cochins, on the left above, are a very attractive breed, from their immense size, their beautiful and very uniform buff plumage, their profusion of feathers and fluff; and they are useful as winter layers, as good mothers and nurses, and for their quick growth. The eggs are of fair medium size; the flesh not of the best quality when old, but very good when eaten as young chickens, and especially good as broilers of six or eight weeks old, if they have grown with sufficient rapidity. The winning group of nine, from which those engraved were selected, were exhibited by Isaac Van Winkle, Esq., of Greenville, N. J.

The Dark, or "Silver-Gray," Brahmas have useful characteristics, very closely resembling the Cochins. Their plumage bears a striking resemblance to that of the Gray Dorking, in color, but has, however, a very different texture, and is fluffy and downy. The Brahmas, like the Cochins, have very short tails, and short, round wings, making it difficult for them to fly over a fence three feet high, while one of four feet in hight effectually restraint them. The flesh of the Brahmas is usually esteemed as snperior to that of the Cocbins, while they are fully equal to them as, layers, and for early attaining sufficient size to render them fit for market as broilers. The fine collection which won the prize, a pair of the old fowls being engraved, was sent over expressly to compete for this prize by J. C. Cooper, of Ireland.

The Develop

BUFF COCHINA DARK BRAHMAS,

A New Japanese Euonymus.—(Euonymus Japonicus, var. sulphureo-marginatus.)

How often is the question asked: "What shall I do with my Hanging-Basket? 'Twas only two weeks ago I refilled it with the handsomest Ferns, Begonias, and Mosses I could find, and now there is scarcely a shadow of

EUONYMUS JAPONICUS, VAR. SULPHUREO-MARGINATUS.

them left. What plants will live and thrive in it?" There is a plant that suits the case exactly -the Sulphur-margined Japanese Euonymus. It makes a lovely contrast to Chinese Primroses, Cyclamens, and other flowering plants suitable for such baskets, and what is important to amateurs, is of as easy culture as a Rose Geranium.

This variety, which we found in the collection of Bennett & Davidson, Flatbush, L. I., is a late introduction from Japan; forms a compact, dwarf, conical plant, and will grow freely in common garden soil. The rounded-ovate, toothed leaves, are of a bright green color, broadly margined with a rich creamy yellow. When in a growing state, the marginal portion of the young leaves is considerably darker, thereby giving a striking and pretty appearance not possessed by any similar plant, and placing it in the first rank as a valuable addition to our half-hardy shrubs for lawn or parterre decoration during the summer and fall months.

The golden-edged variety, Euonymus Japonicus aureo-marginatus, and the older variety, with a large, golden-yellow blotch in the centre of each leaf, E. ovata aureo-pictus, are equally valuable for like purposes; while for a drooping plant for hanging-baskets, or a front ribbon row for garden decoration, nothing can surpass the lovely silver-edged E. radicans variegatus.

### The Perforate-leaved Scindapsus.

It is very difficult sometimes to find a popular name for an interesting plant. If we give the name by which it is known to florists and gardeners, it will look unattractive, and many will pass by the article who would have been interested in it had it a more attractive title. We are in a dilemma in the present case. The plant we wish to speak of is Scindapsus pertusus, and the best we can do with it is to call it the perforate-leaved Scindapsus, a name which is not translatable, as it is a Greek word for some climbing plant that has been applied to this. The plant is not rare in our larger col-

> lections of hot-house exotics, and is one which arrests attention both on account of its luxuriant growth, and the singular manner in which its broad leaves are perforated with large holes. These holes, which are sometimes so numerous as to completely riddle the leaf, are formed by the breaking away of the tissues when the leaf is very young, and as it grows, they increase in size. The plant is a native of the East Indies, where it is found climbing upon trees by means of its stout, flexible stem, and the numerous aërial roots which it emits from all parts of the stem. The engraving gives a good idea of the appearance of the plant, and shows the aërial roots as penetrating the soil. The Scindapsus belongs to the same family as the Calla, Indian Turnip, and Skunk Cabbage, and it resembles these in its manner of flowering. As in the plants we have mentioned, its inconspicuous flowers are crowded upon a fleshy stem, which is surrounded by a sheath or "spathe," as it is called,

which often being showy and completely concealing the flowers proper, usually, as in the Calla, passes for the flower. In the Scindapsus, this spathe is of a dark green. The flowers are very fragrant. Recent experiments have shown that this plant, like many others of the same family, emits an appreciable amount of heat at flowering time. The air within the spathe has been found to be as much as 15 degrees warmer than the outside temperature. This emission of heat is not constant, but varies considerably during the day. The fruit, shown in the engraving, has something the appearance of a long, green, pine-cone. It consists of numerous pulpy, one-seeded berries, which, when ripe, are edible, and have something of the flavor of the pineapple. The Seindapsus is usually found in collections and catalogues under the incorrect name of Philodendron, a nearly related genus, from which it is sufficiently distinct.

### Three Crops in One Season, with a Sketch of the Man who Does it.

BY PETER HENDERSON.

"A little farm, well tilled," has so often been our theme, that it would seem that we had exhausted the subject. Like many other axioms in horticulture and agriculture, it becomes necessary to preach from the same text again and again, to remind young and inexperienced readers that, particularly in the vicinity of large towns or cities, a farm of a few acres, "well tilled," will give each year such profits as farms counting their acres by the hundred do not often yield in a lifetime.

I had almost thought that I knew all about market gardening in this vicinity, that was worth knowing; but a successful experiment, made last fall by one of my neighbors, John Reilly, proved to my satisfaction that I was not yet too old to learn. The neighbor in question is an old foreman of mine, who cultivates about 8 acres, in the way usually practised here: first

planting the spring crops of early cabbages, beets, lettuce, onions, radishes, etc., which, being sold off by July, the land is again planted to the second crop, which is usually celery. This is all that we have been requiring of the soil, to give us two crops in one season. But this neighbor of mine is a man of more than ordinary shrewdness and a close observer; he saw that the long-continued drouth of last July and August was certain to seriously impair the fall cabbage crop, and that the consumer in consequence would pay high for a substitute. He knew that an excellent substitute was spinach, but his small farm of 8 acres was already planted with celery or other fall crops, and no other land rich enough to grow the spinach was accessible. He also saw that the drouth that was destroying the cabbage crop left the celery but little larger in September than when it was planted in July, and the three feet of space between the rows of celery were left uncropped; this suggested that a row of spinach might be sown between each two rows of celery; at any rate, it might be worth trying.

Twenty pounds of seed were procured, and about 6 acres of the ground planted with celery were sown with spinach. Mr. Reilly told me that the experiment netted him \$1,500, clear of all expenses, and that, too, without detriment

to the celery crop.

The spinach was sown September 1st, and was all cut off and marketed in six weeks from the time of sowing, which gave yet ample time to do the work on the celery crop. I have not the figures giving the profits of the three crops per acre, but judge it to be not less than \$1,000 in the hands of Mr. Reilly, who has been, perhaps, the most successful cultivator in the vicinity of New York. At least, I much doubt if more money has ever been made off the same number of acres in the same space of time than has been done by him. As some of the points in the history of such a man may be interesting to the thousands of your readers who cultivate the soil, I will briefly give them.

On a biting cold day in the mouth of January, some fifteen years ago, John Reilly, then about 19 years of age, clad in a rough grey frieze and corduroys, and just landed from an emigrant ship, asked me for a job. I was full to overflowing with help, as we usually are at such a season, but he was such a likely "boy," that I made room for him. His wages for the first year were only \$100, the next perhaps \$130. But up to this time I had seen but little of him, as he had been sent under a foreman to the place he now owns, which was some miles removed from my residence. Suddenly, one day, my old foreman died, and my garden, in full crop and working eight men, was without a leader. My practice had ever been, and still is, to select my overseer from the working hands, if possible; accordingly I passed these eight workmen through an examination, and without much hesitation decided that Reilly was the only one fitted to lead, though yet scarcely twenty-one. But I had hardly placed him in charge when trouble began; hands that had been with me for half-a-dozen years, and almost old enough to be his father, refused to obey his orders and resented his authority, and my hitherto peaceful garden bid fair to resemble Donnybrook on a small scale. I tried to conciliate, but to no purpose. John here developed his self-reliance, and showed his early genius as a commander. He insisted that all the old hands be discharged, and that their places be filled with men whom he could control. I hesitated, being loath to discharge trained men when I could only fill their places by green ones; but increasing difficulties made such a course a necessity; accordingly it was done, and from that time there was peace. John now had a chance to show his ability, and rapidly he did it. The garden, under his superintendence, soon became a model for the neighborhood; always clean, orderly, and having luxuriant crops, and worked at less expense than any of us had worked before. This was owing, in part, to the rigid discipline he enforced with his men, but more particularly to a manner of working them, peculiarly his own, and from which I believe he has not since deviated. He never allowed his men to separate, always working them in a body, himself leading; and no matter whether it was a job requiring an hour or a week to finish, he always moved them together, so that all were under his eye. Such manifest ability soon reaped its reward. In four years John had saved \$3,000 from the salary I paid him. He was then too rich to work for any one; and believing that the chances were a hundred to one that I could not replace such a man, I sold out the land and crop to him at a price that made his interest and taxes over \$2,000 a year. Such a load would have daunted most men, but not such as he. In four years he had paid every dollar of principal-over \$20,000-every cent of which he had made in that time from the product of these 8 acres of Jersey soil. He was now firmly on his feet. He bought another 8 acres, which he has long since paid for, so that now he is certainly worth \$60,000 in real estate alone, two-thirds of which have actually been paid for from the product of those 8 acres of land in eight or nine years. Proud may the man be of a fortune so honestly come by, dug by hard labor from old mother earth! We know that such amounts seem small to the mercautile community, and that our "self-made man" among these must have his millions before his history is thought worth recording; but the energy of mind and body necessary to accomplish so much in so short a time, in such a pursuit as gardening, may have been greater than that displayed by those who have attained greater fame.

### How to Have a Good Garden.

BY "WALKS AND TALKS."

A correspondent asks me how he shall go to work to have a good garden. If he had asked me last fall, I could have told him. To have a really good garden it is necessary to prepare the land the summer or autumn previous. But even without this preparation a good degree of success may be attained the first season.

The first thing to be done-and it should not be delayed a moment—is to prepare the manure. Select the richest manure you have, and that which is the shortest and most thoroughly rotted. Throw it up into a large, loose, conical heap, the wider and broader and deeper, the better. If it is too dry, throw on some liquid from the stables. In a few days, if it is horse or sheep manure, it will commence to heat, and in the course of a week or ten days, it may be turned over. In the meantime order half a ton or a ton of pure bone-dust. I would calculate to put on at the rate of twenty-five tons of manure and half a tou of bone-dust per acre. Turn the heap of manure, and while doing so, scatter a sprinkling of the bone-dust on each layer, say a bushel to the ton at first, and then, as the heap ascends, not quite so much, or it will not hold out. And if it does not, it will be none the worse, as the ammonia, generated from the lower layers, will be more likely to be retained by the upper portion. If it is not moist enough, water it with the drainage from the stables or yards, or if this cannot be had, with Or throw on soapsuds, and if they are warm, all the better. Hot water, or anything that will warm the heap, will accelerate fermentation and reduce the manure.

Ordinarily, it would be better to take a longer time and let the fermentation proceed more moderately. But now we cannot afford to wait. We shall soon need the manure. But no matter, a little skill and judgment will prevent waste. Water has a strong attraction for ammonia, and if the heap is kept almost to the saturating point, little or no ammonia will escape. But you must not put on too much, or it will cool the heap so much that fermentation will be arrested. It is here that judgment is required. If you have any genuine superphosphate on hand, you may have an opportunity of using it to good advantage. That is to say, the bone-dust and the manure, if both are good, will ferment very rapidly, and possibly ammonia may escape (though if due precautions are observed, it is not likely). In this case, put a pound or so of superphosphate in a pail of water, stir it up, and throw it all over the top of the heap, or where the steam is escaping the most rapidly. The acid phosphate will instautly arrest the ammonia. Plaster, in solution, will do the same thing-the only trouble being that only a very little of it can be dissolved. But it is worth while putting a little plaster in all the water that is thown on to the heapsay a tablespoonful in each pail of water.

More than this will not be dissolved, though if more is added, it will do no harm.

When fermentation begins to slacken, turn the heap again, and break up all the lumps. The finer you can make it the better. Be sure to keep it moist enough. If it ferments slowly, mix some sandy soil with it. Clay soil will arrest fermentation; sand will accelerate it. This treatment should give you as good and rich a heap of well-rotted, fine manure, as ever was put on a garden.

In applying manure, the great aim should be to incorporate it as completely as possible with the soil. It is not easy to do this unless the manure is thoroughly reduced before it is applied to the soil. If it is plowed in, be very careful in spreading it to break all the lumps. And it would be well, if it can be done, to harrow it after it is spread. If the harrow pulls it into little heaps, spread them out again and knock them to pieces before plowing them under.

The first thing I do in the garden is to sow peas. I want peas every day from the middle of June to the first of August-and I have them; and so may you and every other farmer. I think I have heard an occasional whisper in the kitchen to the effect that it is a good deal of work to pick the peas and shell them-but I am a little deaf at such seasons. And I believe if you will grow the peas, they will not be allowed to go to waste, or if they are not used, they will be good for seed. As soon as the frost is out of the surface-soil, three or four inches deep, I sow a quart of Carter's First Crop, a quart of Waite's Caractacus, and half a peck of Early Kent, or Daniel O'Rourke, I make the rows four feet apart, and set out some young cabbage plants, wintered over in a cold-frame, between the rows. I make the rows four inches deep, but do not cover the seed more than an inch deep with soil, but I put on three or four inches of horse manure on top. If the soil is not very rich, I would work in a good dressing of the well-rotted manure, prepared as above directed. Early peas want rich land, and they should also be sown very thick-say a quart to a row fifty or sixty feet long.

On warm, sunny days, rake off the manure and let the sun warm the light covering of soil on the peas, and warm the manure at the same time. Toward evening, rake back the manure on the rows to protect them in case of frost. When the peas begin to sprout, rake a little light, warm soil on top of them, mixed with a little manure, and keep doing this as the peas grow, until the soil and manure covers them an inch or so higher than the surface of the ground. Then hoe the soil up on each side the row, two or three inches higher than the peas. This will afford considerable protection from cold winds. When the peas get three or four inches high, draw up the soil on each side of the row in a broad ridge, leaving a wide space between, and then pole the peas. A farmer can get the nicest kind of pea-brush from the woods, which, if properly taken care of, will last two or three years. The more side branches on the poles, and the nearer the ground, the fewer poles will be required. Trim them up, fan-shaped, and sharpen the ends so that, they will go easily into the ground. Put them on each side of the row, and let them be narrower at the bottom than at the top. It is a very common mistake to have them closer at the top than at the bottom. They should be at least six inches apart at the top. The sun can then get among the vines, and they will pod better and ripen earlier.

For the main crop of peas, it is better to wait until the ground gets in good working order-

but no longer. They can hardly be put in too early, provided the soil is dry, but it is a great mistake to plant them when the ground is wet. This is especially true of Veitche's Perfection, and other large peas. They are almost certain to rot in the ground if it is cold and wet. I sow a quart of Bishop's Long Pod and a quart of Harrison's Perfection, and these will bridge over the time between the early peas and the main crop. I know of nothing better for the main crop than Champion of England. But they want deep, rich land, and land that was made rich a year or more ago. But in the absence of this, make the land rich by the liberal use of the well rotted manure we have described, and let it be thoroughly mixed with the soil under the peas and for at least a foot on each side the row, and nine or ten inches deep.

I have never had any satisfactory results from dwarf peas, but have not tried the Little Gem. With the editor of the Agriculturist at "The Pines," it proved excellent, and I mean to try it. With me, a short, half-dwarf pea is no object. If I have to pole the peas at all, it is about as easy to pole Champion of England as a variety that does not grow two feet high—and it is much easier work to pick from the tall rows than the low ones.

In the cities and villages, nearly every one who has any taste for gardening has a hot-bed. On the farm, we seldom see one; and yet the farmer has plenty of horse manure and can make a hot-bed with little trouble and expense; and most of the labor required is during a comparatively leisure season. It is high time that farmers, for their own sake, and the sake of their children, paid more attention to their gardens and less to fast horses. Don't tell me you cannot afford a hot-bed and a good flower and vegetable garden. It is not so. Draw out a dozen

HOME-MADE GARDEN MARKER.

loads of horse or sheep manure to some convenient sunny place in the garden, sheltered from the north and west winds. Throw the manure into a loose heap, and in a few days after the heat is well up, make it into a hot-bed, five feet high and a foot wider and longer than the sashes. If you have no mold already prepared, put on the top of the manure five or six inches of light, rich, sandy soil, free from lumps. The better way is to sift it. I should devote one sash to lettuce, sown in rows two inches apart. It is a great mistake to sow any thing broadcast, as it causes so much more work in weeding. And as soon as the plants are large enough to eat, you can pull out every alternate row, and leave the other rows to grow larger. If you have any superphosphate, two or three tablespoonfuls scattered over the soil in each sash will be a great help, especially to lettuce. Tomatoes should receive immediate attention. The market gardeners usually manage to have plants twice as large as I can raise, and three times as high; but they are not half as good as the nice, stocky plants we raise ourselves. I sow the seed thick in rows, and transplant into a cooler hot-bed or cold-frame when the plants begin to crowd each other. It is very desirable to put a dozen or two of plants, of some early variety, into two or three-inch pots and plunge them in the soil of the hot-bed. But I have not time to go into details. Full directions can be found in the Agriculturist and in the books for the management of hot-beds, etc. For my part, I attempt

to raise but few things in 'he hot-bed, such as lettuce, tomatoes, cucumbers, a paper or two of extra early cauliflowers and cabbage and flower seeds, and among the latter phlox drummondii is my great favorite. If I can get a hundred early, stocky phlox plants, I feel sure of having, for a farmer, quite an attractive flower-garden.

So far as cabbage and cauliflowers are concerned, I have usually far better success by sowing in some warm, sandy, sheltered spot in the open ground than in a hot-bed. I generally start a dozen or so early potatoes in the hot-bed, and when four or five inches high transplant them into the open ground, protecting them a few days with a wooden box with a pane of glass on top. They are checked but little by being transplanted. The main crop of early potatoes should be planted the moment the ground is in proper condition, and a little wellrotted manure in the trench is a great help, and so far as I have observed it does not increase the rot or injure the quality of the potatoes. Of course, a warm, dry, sandy soil is desirable.

Do not attempt to make a garden without a garden-line. Nothing looks worse than crooked rows. We should hardly know how to get along without a garden-marker. Quite a number of designs for making such a marker have been given in the Agriculturist. For ordinary garden purposes I find one made as follows to answer every purpose: Take a piece of two-bythree scantling, and bore holes in it with a threequarters or inch bit, 15 inches apart, and put in some pegs, 3 or 4 inches long. Bore a hole in the center and put in an old wooden rake handle. In a small garden, a marker with four teeth is large enough. And, while speaking of tools, let me say that you should have a light, bright, sharp spade, and a good steel rake. No man can do good work with a dull rusty spade. Use the grindstone freely and always have a sharp edge on the spades and hoes. For digging among the roots of trees and vines, of course you must have a garden fork, and the tines of this, also, should be kept bright and sharp at the points.

Comparatively few farmers have much success in growing black-seed onions. There are three principal reasons for this: poor seed, poor land, and late sowing. Onions should be sown at the earliest moment the ground can be got into good condition. And if they are sown by hand, I would soak the seed in warm water for 24 or 48 hours before sowing.

Parsnips should also be sown early; then carrots and early Bassano beets, and for my part I always like to put in a few hills of corn so early as to run considerable risk of having it rot in the ground or nipped by frost; putting in some more a week or so later. But I think I have said enough. In conclusion, to have a good garden you must kill the weeds. And it cannot be too often repeated that you must attack them early, the moment they are out of the ground, or before. Thousands of weeds, just as they are sprouting, can be killed with a steel-toothed rake. And as soon as the rows can be traced, use a hook or a hoe freely. You cannot stir the ground too frequently or too thoroughly. And another thing, do not leave the plants too thick. If there are three plants where there should be but one, two of them are weeds and should be treated accordingly.

Let me say a word about old currant-bushes. A little of the manure I have described, if forked into the soil around them, will act like magic. Keep the soil well stirred around them and free from weeds. Prune out all the dried and use-

less wood and shorten-in the shoots. As soon as the leaves appear, look out for the eggs of the current-worm on the under side of the leaves, and crush them. Dust the bushes with hellebore, keep down the suckers, and you will be rewarded with what few farmers in this section now have—a noble crop of currants.

Grassing a Terrace or Bank.—"To use the most improved method for covering a bank of earth with grass, there is just one satisfactory way," if time and uniformity of the surface are important. This is to cover it with sods, taken from a road side or from an old pasture-field. A heavy seeding of white clover and red-top will make a good finish where the soil does not wash and gully away; but alone they are hardly reliable for terrace work. Upon very steep surfaces the turf may be held in place by means of wooden pins driven through it into the bank. Pieces of lath, a foot long, answer the purpose very well.

### Rock-Work and Alpine Plants.

A mass of furnace clinkers, made glaring white with lime-wash, and built up into a grotesque form unlike any thing ever seen in nature, is often dignified by the name of rock-work. This mass is, in the building, provided with "pockets," to hold a quart or so of earth, and in these are planted Tropæolums, Scarlet Geraniums, and other bedding plants, which, in our

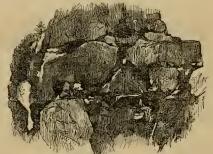

Fig. 1.-ROCK-WORK BADLY DONE.

hot summers, present a sorry spectacle, having no "deepness of earth." A structure of this kind obtruding itself in a conspicuous place in the lawn, is one of those horrors one is forced to witness in his travels. In spite of this sham work, rock-work can be constructed in a manner that will be in good taste and afford much pleasure. There are some places in which rock-work may be properly introduced as a fea-

Fig. 2.—ROCK-WORK PROPERLY DONE.

ture of the landscape; but our purpose is to speak of it as a place for growing such plants as will grow better upon rocks than elsewhere, as well as some that cannot be grown at all in the open border. No one but a real lover of plants will ever undertake a rock-work, as the plants which are most at home in such situations are usually delicate subjects that commend themselves to our attention by their

modest beauty rather than by their brilliancy. Certain plants are found growing naturally only upon rocks, where their foliage can spread | they have considerable inquiry for the seed. It |

itself to the sun, while their roots run down through the earth-filled crevices of the rocks into the deep, cool soil far below. This is particularly the case with plants growing in alpine regions, and such can only be cultivated with success where the natural conditions are observed. Other plants seem to flourish better among loose stones, which probably act as a mulch. What are called "Alpine Plants" are now becoming popular in England, though we must confess that the term "Alpine" is made to include a great number of things that have no mountain origin. We have already noticed Mr. Robinson's work, "Alpine Flowers for British Gardens;" a reference to its list of plants will show that the term "Alpine" is used in a very comprehensive sense. In the work referred to the author gives several illustrations of artificial rock-work, some of which we borrow. The artificial rock-work should not be built up like a stone-wall, as in figure 1; but the stones should be placed so as to appear as if they belonged there, as in figure 2. Whatever erevices are left for the accommodation of plantsand there should be a sufficiency of theseshould be continuous until they reach the earth. In cases where elevated masses of rock-work are built up, the same precaution of keeping open a communication with the earth below is to be observed. Figure 3 gives a work of this kind properly constructed, and figure 4 a bad example. In figure 3 the plants in each fissure have a chance to be benefited by the rains, while in figure 4 the upper rocks completely shelter the lower ones. Of course a rock-work can be made of any dimensions, according to the means and tastes of the builder; but fortunately it is not necessary to work on a large scale, as a small rocky bed may be made with little trouble and expense, which will grow alpine plants in a very satisfactory manner. A bed excavated to the depth of about 2 feet is to be filled in with peaty soil and leaf mold; stones of different sizes are placed around the

margin to raise the bed above the general level; more soil is to be added, and large and small stones are so placed as to crop out from the soil.

Fig. 3.-RIGHT.

A bed of this kind may be made in a retired part of the garden, and serve as the home of many choice alpines. Mr. Robinson gives an illustration, figure 5, of a bed of this kind made under his directions in the suburbs of London. We must defer a list of the readi-

ly obtainable plants snited for rock-work until another month.

## The Tall Meadow Oat-Grass.

BY T. B. BAKER, THORNDALE, CHESTER CO., PA.

[The Oat-Grass, or Tall Meadow Oat-Grass, as it is variously called, at one time received considerable attention from agriculturists, but it fell into a neglect from which it now appears to be reviving, as the dealers inform us that

THE TALL MEADOW OAT-GRASS .- (Arrhenatherum avenaceum.)

is usually in the catalogues under the incorrect name of Avena elatior. It is quite distinct in its structure from an Avena (oat). We give an en-

Fig. 4. - wrong.

graving, showing the general appearance of the foliage and flowering panicle. At one side is a magnified single spikelet. It is two - flowered; the lower flower is staminate and barren, and bears upon its back an awn, or bristle; the upper flower, only, is perfeet, or seed-bear-

ing. The following article, by Mr. Baker, was prepared at the request of Mr. Henry A. Dreer, of Philadelphia, through whose kindness we are able to present it to our readers.—ED.]

"In the winter of 1862, or spring of 1863, I purchased from Henry A. Dreer three or four bushels of Tall Meadow Oat-Grass seed; in the spring of 1863 I seeded it, with barley, on two

acres of good ground. The seed was mixed with the barley, and both drilled with the ordinary grain-drill. The greater portion of the grass

seed did not come up, owing, I think, to its being covered too deeply; the grass was consequently thinner than I desired, but still I have been well satisfied with the result. In the fall of the same year (1863) the grass, I think, obtained a growth of 18 inches, the blades very numerous and fine. In the spring of 1864, and every year since, I have cropped it for seed and mowed the stubble for hay. The stubble makes superior hay, because of the numerous green blades, about a foot long, growing from the roots of the grass while the seed is ripening. I have now about 100 acres of land seeded with this grass and orehard grass mixed, and next spring I hope to have 50 acres more. The grass matures for hay about the 5th of June, and for seed about the 10th to 15th of June. The seed is very difficult to save. The moment, almost, that it is ripe it falls off; the top seeds ripen a few days earlier than the lower seeds. For two seasons I lost all the seed by delaying cutting a few days.

"Last spring was the only time that the two acres were top-dressed with a light dressing of shovelings from a cow-yard. The land, as I have remarked, was in good condition when it was seeded, but I do not think it is hard on the ground; certainly it does not impoverish the ground equal to timothy. It would do a farmer good to see the stand of grass now on the two acres. There is no difficulty about getting three crops a year for soiling cows. By the middle of May the grass will be from ten to fifteen inches high. In the beginning of July it will be fit to cut again, and a third time in the latter part of August. For pasture, it excels all the grasses with which I am acquainted. Cattle, horses, and sheep prefer it to any other grass I have on the farm. I have heretofore seeded it with wheat, in the fall; the only objection to this is that the grass grows as fast as the wheat, and is quite as tall at harvest as the grain. The straw, however, is better than most of the hay that is made. In the winter of 1868 and 1869, I fed 70 acres of this kind of straw to my dairy cows;

they ate it better than they would timothy, and I am confident it was better for them than timothy hay. Next spring I purpose seeding 10 acres with 'Tall Meadow Oat-Grass' alone. I desire to have the ground prepared this fall, and sow the seed as early as possible in the spring. The quantity of seed to the acre should not be

Fig. 5.-A ROCKY BED FOR ALPINES.

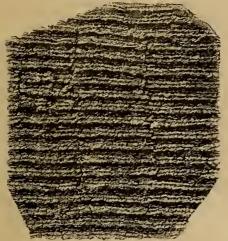

less than two bushels-I prefer three bushels. The grass ripens for hay rather earlier than clover, and is therefore better to sow with clover than timothy.

"I have given my driving horses, since the fall of 1863, no other kind of hay than 'Tall Meadow Oat-Grass.' These horses are valuable, and I feed them this because I think it the best hay I can grow for them. It is soft and pleasant to feel and look at, and not harsh and woody,"

## 'HIE HOUSEHOLD. (For other Household Items, see "Basket" pages.)

## The Patching and Darning Exhibition.

"What a pity," exclaimed many a visitor to the late Patching Exhibition at 245 Broadway, "that

CLASS n-PATCHING-SECOND PRIZE-COAT.

all the ladies who have contributed cannot be here to see this display!" It is a pity, for truly the sight was strangely interesting and suggestive. Aud, "what a pity," have we echced over and over again, "that they could not have seen the de-

CLASS E-DARNED STOCKING

fight of those who, after the show, opened the great bundles at the "Old Brewery" or Five Points Mission. That would have been reward enough for any one, even for the lady who sent the little

cloak made of sixty-eight pieces, and the darner of the stocking with one hundred holes. To be sure the February Agriculturist stood ready to tell all that was to be told, but it was in a burry to be off to the printers, and so could not take everything. There were photographs of garments, darns and patches to be shown, interesting letters, also, suggestions and hints to be communicated, and, beyond all, a document from the Committee of Award. "If we could but stretch the prize-lists," exclaimed oue of the judges, when, after examining the mended garments again and again, they laid this piece aside as BEST, then that piece, and another, and then, after anxiously comparing the three, settled the matter with a sigh. The presssure of about fifty "nearly bests" was torture. At every award the Committee could feel the reproachful eyes of wonderful patchers and darners turned in surprise toward them. One lady was almost sure she heard a plaintive "O don't!" from a marvel of a mended stocking, when, after much discussion,

it was placed on the no-prize pile. So it bappens, that while the February Agriculturist gave the prize-list entire, and, through the brilliant description of a lady visitor, took everybody to the show, this March number also has somewhat to do with the matter.

The following were awarded a copy of the American Agriculturist by the Publishers:

No. 83.-Mrs. Laura S. Bixby, Honesdale, Pa.; Class D, Men's Pantaloons. No. 195.—Master Newton G. Leslie, Comstock, Kalamazoo Co.; Mich.; Class A, Shirt; Class E, Socks. No. 92. Mrs. (Widow) F. G. Chamberlin, Locust Grove, Saratoga Springs, N. Y., eare of Luther W. Chamberlin, Saratoga Springs, N. Y.: Class F, Pair of Stockings. No. 482. - Miss Ellen A. Fisher, Georgetown, Ill.; Class B, Boy's Pantaloons (1 pair). No. 671.-Mrs. Betsey Baker, Genoa P. O., Pawnee Indian Agency, Platte Co., Neb.; Class D, Pantaloons; Class B, Coat.

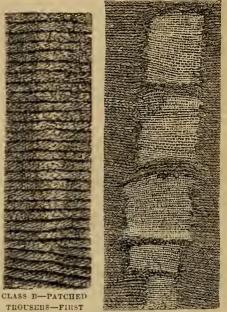

COMPETITORS DESERVING HONORABLE MENTION.

Ida Iugalsbee, N. Y.; Miss M. E. II. Hannetto, Conn. Mrs. E. S. Tank, N. J.; Miss J. Hague, N. J.; Mrs. S. S. Hooker, N.Y.; Mrs. B. K. Andrews, Mich.; A. B. Wilcox, Mass.; Mrs. S. D. Hopper, N. Y.; Eleanor Wood, N. Y.; Miss Jennie Megie, O.; Mrs. Jennie Minden, Ind.; Mrs. Cynthia Estler, N. J.; Mrs. Emily Clifton, Pa.; Mrs. J. B. Armstrong, Md.; Grace L. Sargent, Mass.; Mary A. Y.; Abbie A. Haviland, Md.; Mrs. Wm. H. Steere, R. I.; Mrs. J. H. Reed, N. Y.; M. P. Wyatt, N. Y.; Miss M. A. Chittenden, Mich.; Mrs. W. A. Bass,

Conu.; Emily Harrod, N. J.; Miss M. A. Fraliek, Mich.; Mary K. Lillie, N. J.

Our readers have already heard of the wondrous little cloak, pretty and demure - looking, that concealed in its fair expanse we cannot remember how many old pantaloons, vests and coat-linings. Its coat-linings. picture is given on this page, and here is the letter that came with it:

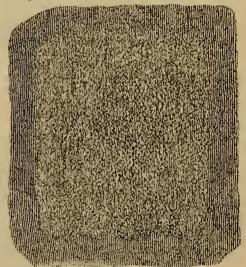

PRIZE.

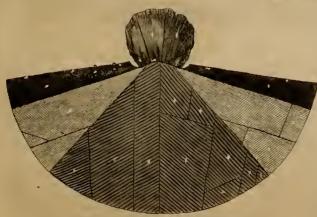

CLASS D-DARNING-1st PRIZE.

getting desperate in search of an economical wom-I presume, when you view this cloak, containing sixty-eight pieces, you will think you have found one. The garment you now see is made of four pairs of old pants, one old vest, and two old

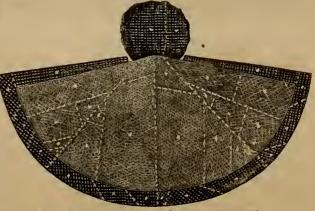

CLASS C-DARNING-SECOND PRIZE-GIRL'S SACK.

coat-linings. It has been worn by my little girl three years to public school just as it is now, with the exception of relining the hood and rebinding the cloak each season. Each garment from which this is made was worn over one year, and some of them were worn three and four years. I made this

CLASS B-FIRST PRIZE-GIRL'S CLOAK (INSIDE)

CLASS B-FIRST PRIZE-GIRL'S CLOAK (OUTSIDE).

in two days, and remarked when I was making it, "I deserved a pension," but I conclude now, if I can get \$15 af.er three years' wear, I will be satisfied. I am not a tailoress, but I am over sixteen years old. I am just a poor man's wife. May this cloak keep some other parents' little darling warm this winter. P. S.—I attach these little white pieces to assist you in counting.

MRS. M. C. PARKER.

The specimen of darning, on girl's sack, comes out distinctly under the searching eye of the camera, and is so shown in our engraving, but it is hard to find in the garment itself. This little note was pinned to the sack:

West Philadelphia, Dec. 31st, 1870. Dear Mr. Judd: I have seen your offer to little girls for them to send you samples of their skill in mending and darning clothes. I am now twelve years old and not a tailoress, and I thought I would send you this little sack, which I have been wearing for two years. I have darned it in several places entirely by myself. Hoping it may be of service to some poor little girl, Louise G. Dreer.

The other illustrations need no explanation. They are as accurate as photographer and engraver could make them, and, though homely in themselves, will certainly interest all who from a distance took an active part in the show.

Many of the letters accompanying articles for competition contained excellent suggestions, showing that the true housewifely spirit is by no means extinct in this age of revolutionary ideas. Now and then a husband has something to say, and always he says it with a will.

"I am delighted," writes W. P. S., "to see that such encouragement is given to this branch of economy. I am pastor of a United Presbyterian congregation in this place, and, like many of our country pastors, live on a small salary. We are poor, and try to economize. My wife, though not a tailoress, but formerly a school-teacher, makes and mends most of the clothes for the family."

Julia M. S., a Western woman who evidently has kept her heart young through the "three times sixteen" years of her life, lets fall a few suggestions, that are scattered here in the hope that they may take root and ripen in ready places:

"Of old coats and pantaloons, I have none to experiment on, as we have a worthy indigent friend who wears all of my husband's half-worn clothes, from his hat to his boots." Who has not a "worthy indigent friend" somewhere who could be thus delicately and generously aided without cost or labor? "As to woman's clothing," adds the lady, "my own experience is this, that it is better economy, both for myself and those to whom I give, for me to patch and darn for ourselves, especially if the garment is of fine material, and buy new, stout and substantial material for those who need; for that class of people have seldom the 'knowhow,'or the disposition, to make available anything that is half-worn and needs altering or mending."

Here comes a sweet, motherly bit of bragging: "I had one 'premium on patching' a short time ago; it was when I began to patch again after a long sickness, when other hands had done my sewing: I heard my two boys talking, as they looked at the knees of Wally's pants: 'There,' said one, 'that looks as though mother was better; just see those patches.' 'Yes,' said the other, 'mother's patches look nice enough to wear to meeting any time.' I think, after that compliment, I can do without a premium, don't you?" Yes, indeed we do,

A clergyman's widow incidentally brings forward a wrong that is often thoughtlessly done by even kind-bearted persons who feel that 'a small account is of no account,' and therefore neglect it day after day, forgetting that little wages often are the hardest to earn, and the most sorely-needed when they are earned:

"I have been instructing the children of quite a wealthy lady, who now owes me about ten dollars, which for weeks I have had the promise of receiving. But I understand she is gay and fashionable, and . . . When a person becomes a slave to fashion the heart seems to evaporate." Later in

the letter, however, comes these more cheerful words: "My son bids fair to make a good farmer, under his home instruction. As I have for some years past devoted myself to that branch of business, you can readily perceive that we need your papers." You shall have them, good mother.

Think of the patient industry of the home-life indicated in these simple sentences:

#### SECOND PRIZE-CLASS B.

O. JUDD & CO.—GENTLEMEN: This coat was two or three years ago so badly moth-eaten that it was considered beyond the possibility of repair. I have set in more than forty patches, and darned more than one hundred holes in it. A microscope would probably not reveal beauties in the work, but by it only can any considerable proportion of the number of the stitches taken in it be revealed. I have made all the repairs, am over sixteen, and am not a tailoress.

CLARA M. BLODGET.

"Years ago," writes Mrs. Laura A. B., "patching and darning constituted so large a share of the work of the wives and daughters of the well-to-do farmers and mechanics of the country, that it was no unusual thing for them to go into a store and inquire for darning-needles, and good stubbed patching-needles (bethinking themselves, no donbt, that as their husbands' garments were of such heavy material, no slender or delicate needle would do the work). But now-a-days, instead of darning and patching-needles, we find instead worsted and crotehet-needles

"let us add a new department to our public seminaries for girls—such a one as is suggested in an article on 'Helpless Girls,' in the Hearth and Home of Dec. 31st. If near enough resident, I would most cheerfully lend my hand to assist the lady in her charitable operation, and help her instruct her young ladies some hours each day to put on patches neatly, darn stockings handsomely, etc. I should be most happy to meet with the new department. It will be a very trying undertaking; it will be much like putting up a new building on no foundation, but foundations may be prepared for those to come. I should, sirs, he happy to receive the address through your paper."

With these brief extracts we conclude this little extra gossip about the Patching and Darning Show.

## Cows' Milk for Infants,

An English physician, Dr. Selby Norton, has recently been investigating the subject of rearing children by hand; his results are given in the London "Milk Journal," from which we condense the following notes: Dr. N. states that 90 per cent of the diseases of children fed by hand, are due to improper feeding. Mothers' milk is the very best food for the infant; next to this, stands cows' milk, properly diluted. So near a perfect substitute is the cow's milk for the mother's milk in chemical composition and adaptability to the infantile stomach, that he deems it a matter of indifference which is used. He utterly diseards all the starchy forms of food for infants, that have from time to time been proposed. The milk should be mixed with an equal bulk of water for the first three months of the child's life; after this the quantity of water may be gradually lessened, until at six months the proportions are one-third water and two-thirds milk. From this point to the end of the year, the richness of the mixture is gradually icereased to one-quarter water and three-quarters milk, but beyond this the quantity of water is never to be diminished. Among the common mistakes of those who feed cows' milk to infants, and which are to be avoided, Dr. Norton enumerates boiling the milk, which coagulates the albumen of the milk and renders it indigestible. The same result follows from adding the diluting water when too hot. Sugar should never be added to the milk. It is a very common custom to sweeten the child's food, but Dr. N. thinks that it interferes with its diges-Milk naturally contains a considerable proportion of sugar, but this is sugar of a peculiar kind, and cannot be replaced by ordinary caue sugar. Finally, the milk when fed, should be about as warm as new milk, and fresh and good, while the greatest care must be taken to keep the feeding-bottle clean and free from the slightest curd.

### A Towel for Each.

It is not uncommon, in country houses, for all the members of the family to use the same towel for wiping their hands and faces. I am often surprised to see how this practice prevails even among people of considerable cultivation. Frequently the towel is made of three yards of good erash, sewed together at the ends, and hung over a roller. This seems very generous and nice when it is clean, but not so after it has hung there two or three days, used at morning, noon and night by half a dozen persons. We may be able to endure a good deal of our own dirt, when we are obliged to, but it is not a morbid delicacy that shrinks from using a towel soiled by other persons.

Each human body gives forth its own peculiar personal exerctions from every pore of the skin—waste matter, more or less filthy. So it is not merely the impurity derived from external sources that we wash and wipe away when we perform our ablutions. It is also this one's dyspepsia, that one's biliousness, the other one's tobacco—ugh! Give me a clean towel, please!

And please give every child its own towel, and its own comb, as soon as it is old enough to use them. And now I want to add—please, O, fellow citizens! give every human being a chauce to bathe the whole body, privately, whenever one wishes to do so, in a comfortable bath-room, with pleuty of hot and cold water, and a good bath-tub, and all the clean towels desired!

R.

## Moreton Farm Cake. BY AUNT BATTIE.

Take two pounds of butter, set it in the cakebowl near the fire, until it is softened throughout, but not melted. Now add to the butter two pounds of nice, white, soft sugar, and mix them thoroughly together, or until creamed. Take out one half of this cream and reserve it in a separate bowl until wanted. To the cream in the bowl add one quart of pretty warm, sweet milk. Now stir in gradually four pounds of flour, and then mix in very thoroughly a teacupful of lively home-made yeast. Let it stand in a warm place until very light. In four hours it should be raised enough, when the remainder of the butter and sugar may be added, and a little more flour, if needed. pounds of raisins nicely stoned (seedless raisins are not so rich as the others), and add them to the cake, a little pulverized mace, and, if at hand, some candied lemon peel. Let it rise again. When well raised, mix it well, using the hands, and proportion it off into well-buttered pans. Allow the pans to stand in a moderately warm place until the cakes are beginning to rise, then put them to bake in a steady oven, and bake them fully an hour, or longer, if only one or two pans are used. It will be better to try the cake in the usual way before removing from the oven. Thrust a nice clean straw or fine skewer gently into the thickest part of the center of the loaf; if it is perfectly clear when drawn out, the cake is sufficiently baked. I generally leave it in a few minutes longer, to make sure. Fruit cakes require a much longer time to bake than delicate and spouge cakes. There are no eggs used in this cake; none are needed. It is an excellent cake for economical housekeepers to make in winter, when eggs are scarce. Some persons never cat cake because eggs disagree with them. They will find this cake wholesome and delicious. If the top and sides of the cakes are frosted, they will keep moist and sweet for a long time.

Brown paper is nice for keeping cake. Wrap the cake in the paper before putting it in the crock or tin cake-box. The paper helps to keep out the moisture of the changing atmosphere, and of course the cake will keep longer the more completely it is excluded from the air.

## BOYS & GURLS' COLUMNS.

### About Donkeys.

BY "CARLETON,"

During the years that I have been knocking about the world, I have traveled in a great variety of ways-in cars, on steamboats, on ocean steamers, in sailing vessels, in stages, in hacks, on rafts, on horseback, on donkeys, and on foot. I have seen many amusing scenes, especially with donkeys. I venture a guess that not more than half of the hoys and girls who read the Agriculturist ever saw one of the long-eared animals, for there are not many of them in the Eastern States. Their voice is not quite so tuneful as that of the nightingale, and when they attempt to bray they make such a hotch of it that you cannot help

My Uncle Ben bought one once when he was in Brighton market, and sent it up to his farm in the country; it was the first one ever seen in the neighborhood. Zeke Simple, not knowing what had happened, went into the atable, and the donkey, seeing the door open, pricked up his ears, opened his jaws, and gave a bray so loud and unearthly, so unlike any thing Zeke had ever heard, that his hair stood on end, his cheeks were white, and his eyes started from their sockets. He ran into the house and asked if it was not the devil!

Unless you have had some experience with donkeys you do not know their qualities; they are the most cheerful, patient, plodding, obstinate creatures in the world. They will work patiently all day, and live on little or nothing. They kick, and they stop when you want them to go, and go when you want them to stop. Their ears are so large that they take in a great deal of sound, which they let out through their mouths. They have big heads, and would have you believe that they are honest, but they are wily and cunning, and play a prank upon you when you least expect it.

I remember a very funny scene that I saw during the war. We were roughing it in Tennessee. It was a few weeks after the battle of Pittsburg Landing, and the army was in camp in the grand old woods, waiting for the mud to dry up. There was little to do except to eat our breakfast, dinner, and supper, of hard-tack and salt pork; but une day we had a hearty laugh over a donkeyrace, and this was the way it came about: Jim and Jake were negro teamsters, and each had a baggage wagon with six mules and donkeys to draw it. They had been slaves, but were in the Union army "A fitin' for de Union," as Jim said. They were proud of their positions and of their teams.

"My team is de best team dar is in the whole army,"

"No, it isn't, sah, my team is de bettermost. Dey is fat and slick, and can draw eber so much more dan ' Jim answered.

"O, no sah, dey can't; dey can't do it, no how, sah. I've got de hest donkey dar is in de whole army, dat grizzled one with a white nose. He can beat any one of your's, Jim, all boller, on a race," responded Jake.

"No, he can't, sah. You bet. Dat black one of mine, he'll beat yours all to nuffin' in no time," was Jim'a reply.

"I'll bet a dollar he can't. I'll bet two dollars he can run faster than yours."

"I'll bet one hundred dollars he can't."

"I'll bet five hundred dollars he can," said Jim, becoming quite excited. Jake, too, was getting warmed up, and the soldiers one by one came out from their tents to see what was going on. As they had n't five cents

in the world they had set the stakes quite high enough.
"Bring ont your donkeys," cried a wide-awake soldier, who wanted some fun; "here's a plng of tobacco for the one who wing."

Away went Jake, and away went Jim, and in a few minutes both were back again. Each mounted on his favorite donkey, without saddles, with rope halters round the necks of the animals, and each with a good switch.
"Go when I give the word," said the soldier, "and

the one who rides out round that oak tree in the old cotton field and gets back here first will get the tobacco.

The riders raised their switches, and sat ready to strike the donkeys.

"One-two-three-go!"

Each switch came down with a whack, and each donkey leaped ahead." "Go it Jim ("

"Put in Jake I"

Whack, whack, went the sticks. The donkeys ran and galloped. Now one was ahead, and now the other, and now they were neck and neck, and then Jake's donkey auddenly planted his fore feet into the ground, gave a kick with his hind ones, and the rider shot forward heels overhead, turned a summersault, and lay sprawling on the ground, while the donkey trotted off to a patch of green grass, and began to nibble it just as if he had played no prank; while Jim trotted back and took his

tobacco. It was so funny to see Jake flying through the air that the soldiers laughed until the tears ran down their cheeks. Jake was so mortified that he did not

show himself until the next day.

IIad I space I would like to tell you what I saw in Egypt, how I rode a donkey from Cairo to the great pyramids, with a little Arab boy trotting behind and crying "har! har!" and how the donkey pricked up his ears and went ahead upon the trot; how one donkey played a prank on a friend and pitched him into the mud; how I rode out to the spot where Joseph lived when he was brought into Egypt and sold as a slave; how I went to the donkey market and saw thousands of them for sale,and donkey colts, which I think are the funniest looking creatures in the world; how I saw a woman and a donkey yoked together and harnessed to a plow which was only a forked limb of a tree, and saw the husband of the woman holding the plow, and plying his whip to the team; how I saw a man traveling with his family-one donkey carrying two baskets full of children-one basket on each side of the animal; how the little black creatures, with laughing eyes peeped over the rims of the baskets and giggled at us. Probably they saw something funny in our stove-pine hats.

Donkeys are very common in the East, and in almost all the houses of the poor people in the country they munch their hay and grain beneath the same roof that shelters the master. Frequent mention is made in the Bible of asses. As you are attending school and learning to read correctly, let me tell you how a minister once read a passage about donkeys, and by placing the accent on the wrong word, not only made an ass of himself but set the congregation to tittering. Thus it was that he read: "And he said unto his sons, saddle me the ass. So they saddled him, the ass." You see where the laugh comes in, and you will also see that in order not to make ourselves ridiculous we must give the right accent when we are reading.

### Aunt Sue's Puzzle Box.

The answers are coming along merrily. In the April number you shall know who drew the prize for answering all the Anagrams in the Feb. No. The same reward is offered this month for the solution of the following

#### ANAGRAMS.

Viper event. Chop a real gig. 6. In same huts

Quit Somo.

7. Go sot, lose it. 8. Red as grain. Meet P. C. once.

Parcel trails. Cell soap.

10. O! Zehra But.

## ALPHABETICAL ARITHMETIC.

The following is a simple sum in division in which letters are substituted for figures.

NMO)INMELS(OODD NMO

GGE NMO OMAS OGED OEG

CONCEALED OREEK AND LATIN PROPER NAMES.

- This is the highest Pyramid, I ascend very slowly.
- I cannot run now, Sir, I used to.
- Since he has become a convert I cordially recommend him.
- Why! Mat, you amaze us, is it true?
- The pony is quiet, useful, and pretty
- 6. Jacob, Benjamin, and even Eli rode him.

### CHARADE.

### First.

See the poor little animal homeless and lone, How glad he would be if you gave him a hone.

Second.

You wont? Then my second, I freely confess Serves you right, if he did tear a hole in your dress. Whole

Come in with your boat, for the rapide are near, My whole is so strong, you have reason to fear.

NUMERICAL ENIOMA.

I am composed of 16 letters:

My 6, 2, 10, 3, 12, 14, is an article of dress. My 1, 7, 8, 15, 13, 5, is a contemptible trait of character.

My 16, 4, 1, 9, is a bird. My 11, 2, 16, is a fish.

My whole is good advice.

#### PUZZLE.

Take five hundred and fifty and one, And then add a thousand to that, If you place them in order required You'll see something good, kind, or "flat." SQUARE WORD.

2. A girl's name.

1. An animal. An exclamation. 4. A tool.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

FRANK. All communications for the Puzzle Box, must he sent to Aunt Sue, Box 111, P. O. Brooklyn, N. Y. Communications for the "Doctor," should be sent to 245 Broadway, New York. My respects to your father.

ARCHÆOLOGIST. Thanks for your history of relics, etc. Anna Davisson. Your affectionate welcome goes ANNA DAVISSON. Four anectionate welcome goes straight to my heart; many, many thanks. "Grandmather" is with us yet, and shall have your message.

EMMA BINGHAM, I love to be called "Dear Aunt Sue."

Do it again.

CLARA A. G. Did you get your big brother to write your letter for you?

The square word (" seven ") prize was won by Horace MILLER, Howard Springs, Tenn.

The prize for answering the greatest number of the January puzzles was won by LILLIE STREEPER, who answers correctly twenty-four.

Thanks for puzzles, etc., to Reen Ross, J. K. P., A. G. Pettinger, W., George E. Perry, W. H. Morrow, and Iowa.

ANSWERS TO PUZZLES IN THE JANUARY NUMBER.

RIDDLE. A book.

COUNTIES. 1. Rusk. 2. Jasper. 3. Victoria. 4. Polk. 5. Hant. 6. Moore.

NUMERICAL ENIGMA. Mahershalalhashbaz.

TRANSPOSITIONS. 1. Break, brake. 2. Leaf, flea. 3. Deer, reed. 4. Nile, line. 5. Sloe, sole. 6. Lead, dale. CAPES. 1. Henlopen. 2. Hatteras. 3. Lookout. 4.

PUZZLE. Cabbage.

SQUARE WORD. Seven, exile, vices, elect, rests. (This was correctly answered by Gussie Kilmer, C. E. Miller, S. L. C., Lillie Streeper, Henry Strohm, Olney K. Blanchard, Mary Leuisa Bell, L. R. C., Nellie Sanxay, Jennie B. Lyford, J. H. Bird, Mary Bidwell, Mary Gidley, J. H. Charles, Iowa, Horace Miller, H. L. Morse, Frank, George E. Perry, and Emma Bingham.)

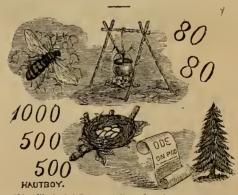

CHARADE. Mandate.

COMBINATIONS. 1. Arethusa. 2. Parasite. 3. Tem-

Renuses. 398. Chickasaw. 399. Be ye therefore wise as scrpents and harmless as doves. 400. (Which should have been credited to HAUTBOY.)—The most arch deed of pitiful massacre.

All communications intended for the Puzzle Box should be addressed to Aunt Sue, Box 111, P. O. Brooklyn, N. Y. (Not to 245.)

Answers to the puzzles in the March number must reach me by the first of April. Those received later will not be credited.

404. Illustrated Rebus .- A line of poetry.

405. Illustrated Rebus.-A proverh to be heeded.

[COPYRIGHT SECURED.]

#### CASTLES IN THE AIR .- Drawn and Engraved for the American Agriculturist,

"What a queer name for that picture!" many a little reader will say, and big one, too, as soon as they look at this page, "why, it's only a party of children sewing." True. But all the while their needles are flying, the

busy little folks are doing something very like building castles in the air. They are laying plans upon a great big "if"—and an "if" nearly always forms the cornerstone of an air-castle. The walls are made of hope.

It is a lively scene. All the children, Kitty, Fan, Mary, Ann, Bessie, and even Tom and little Toddlekins are stitching, basting, darning, and talking with wonderful eagerness. It is no common occasion. They are working for the great Patching Exhibition, and Tom is n't at all ashamed to be of the party. "A fellow ought to know how to mend his own clothes," he says, "and that 's all there is about it"—and he gives his thread an extra jerk, prond of the strength of his young fist that can put in a stroke in boxing as well as any other boy's in that part of the country. He is working upon an old jacket. Kitty is trying to thread her needle. She has taken an

extra large one for the occasion, but the result is not encouraging. She pokes the thread at it first in one direc-tion, and then in another, and finally declares that if it was a camel instead of a thread it could n't be harder to put it through. She wishes persons would make good

meedles, or that little girls' hands were more steady.

"Fair and easy wins," says Tom. "If at first you do n't succeed, try, try again. That's my motto."

"Oh, it's all very well to say, 'try, try again,'" said Mary, "but it is n't nice work a bit. It cramps one's financial is a dear the says of the says gers and do n't look like any thing when it 's done. I like to crochet and make lovely tatting and edging."

"Or any thing that is no manner of use," said Tom. "Just think how the poor folks will go for these duds."

"Oh, Tom, how slangy!" remonstrated Mary. "But, then, to be sure," she continued, "there's the money. Perhaps some of us will get the fifteen-dollar prize."

"Oh, that 's the thing," said Ann, who was busily examining her elder sister's work. "Think of the loads of patched-up clothes there "Il be to compete with."

"Oh, never say die," said Tom. "You 've just as good a chance as any body else; there 's a hundred and thirty

dollars, to say nothing of the papers, lying around loose.

Among us all, it'll be queer if we do n't get something."

"Toddy 'ep on," spoke up a sweet bahy voice from the other side of the table. Ann could just see the top of the speaker's head appearing above the cloth. The little fellow was doing his best at darning a great hole in a yarn stocking with a piece of twine, to which Tom had tied a big brass bodkin. "Toddle get a p'ize."

"If I get the fifteen dollars, I'll have a lovely gold chain

to my locket," said Mary, "they 're so fashionable."
"If I get the ten-dollar prize I 'll buy a full set of Dick-

ens," said Katie, who was very fond of reading.
"O, girls! I would n't," put in careful Fanny. "If I get the five dollars, I'll ask mother to lay it away with the rest of my savings. See if I don't."
"What will you do with your money, Tommy Tin-

ker?" asked the girls, looking enriously toward him.
"Well," said Tom, "I don't count my chickens before
they're hatched. I'm not working so much for the money as for fun, and to give the poor folks a lift. I want to do a good piece of work to astonish the natives. I hope these old pantaloons will keep some other fellow's legs as warm as they have mine. Still, you know, if a

prize falls to me I shan't cry. Upon the whole, I think I 'd like it; I 'd buy a great big wagon for Toddle."
"Toddle want the wagon now," put in a wee voice.
Then they all laughed, and sewed the harder, feeling that Toddle was quite a little goose to be so sure about it.

### The Icicle Prize.

What a number of expectant eyes will read this headwat a faminer of expectant eyes will read this head-ing, and what a number of disappointed youngsters there will be! Well, hoys, I can't help it. I might as well own up to having heen right down sick. "Pretty busi-ness for a 'Doctor,' "you will say; but doctors are not much better than common mortals, and are quite as helpless when they are sick as any of you youngsters. a pile of letters, long and short, large and small, as there is to look over, and only two prizes! Under the circumstances, the best I can do, is, to promise to try to announce the successful ones next month.

The Doctor. the successful ones next month.

### Mave a Solid Foundation.

Even Sir Walter Scott, able as he was, and celebrated as a writer, felt the ill effects of careless and undisciplined study in his youth. "It is with the deepest regret, sandy in its youth. Its with the deepest regret, sand he, when a middle-aged man, "that I recollect the opportunities of study which I neglected in my youth; through every part of my literary career I have felt hampered by my own ignorance; and I would at this moment give half the reputation I have had the good fortune to acquire if, by doing so, I could rest the remaining part upon a solld foundation of learning and science."

THE FIRST PREMIUM for the best TIN-LINED LEAD PIPE was awarded by the American Institute Fair to the Colwell's Shaw & Willard M. F. G. Co., No. 213 Centre St., New York, Manufacturers of Tin-Lined Lead Pipe, Block Tin Pipe, Lead Pipe, Sheet Lead, Solder, etc. Orders solicited. Tin-Lined Lead Pipe, 15 cents a pound, for all sizes. Warranted to he stronger than Lead Pipe of the same weight and size. Circular and sample of pipe sent by mail, free.

# TIME IS MONEY!

Will give you a great deal of time, for a very little money. We publish a very interesting pamphlet entitled a "HISTORY OF WATCHMAKING." It is beautifully illustrated TORY OF WATCHMAKING." It is beautifully illustrated with fine engravings, and is clearly printed on fine paper. We send this gratuitously to any one who will send us their address, and it will be found very interesting to both Watch Wearers and Watch Buyers With it we send our descriptive Catalogue and Price-list of Waltham Watches. It will afford us pleasure to send them to every reader of the Agricultured. riculturist.

Address (no stamps required for return postage),
HOWARD & CO., 865 Broadway, N. Y.
ALL PRICES REDUCED SINCE FEBRUARY 1st.

FARMS WITH NICE BUILDINGS.—See CHA-PIN'S FARM ADVERTISER for the spring of 1871. About 60 pages, with elegant map, Census of 1870, and de-acriptive articles by Rev Elias Nason, of the Mass. Horti-cultural Society. Mailed for 10 cents, which is but a fraction of its cost. Address GEO. H. CHAPIN, 24 Tremont Row, Boston, Mass.

## MAPLE SUGAR

Will be scarce this coming season, as there is no old sugar in the market, and will bring a high price if made in our IMPROVED EVAPORATOR. Send stamp for our Treatise on Sugar and Syrup-Making, to Hartford Sorghum Machine Co... Bellows Falls, Vt.

#### GOING TO PAINT? ARE YOU THEN USE THE

## CHEMICAL PAINT,

PUREST WHITE AND ALL THE FASHIONABLE SHADES.
Sold only by the Gallon. Will wear twice as long as best White Lead, and Costs less.

ANOTHER LIST OF RECOMMENDS.

ANOTHER LIST OF RECOMMENDS.

SAM'L L CONDE, Esq. Canastora, N. Y., writes: Lam much pleased with your Paint. Two houses to this place, painted with the best white lead the season after mine was painted with your paint, are already chalking and failing. The Chemical Paint is hard and fine. Such facts convinee me that you have the best paint made.

REV. S. C. ALEXANDER, Biddle Institute, Charlotte, N. C., writes:—"Please accept our testinionial of the great value of your paint. Of its superior beauty and brilliancy there is no question. We have saved \$150 more than we would have done had we used lead."

SCHENEYUS, N. Y.

done had we used lead."

SCHENEVUS, N. Y.
A. C. P. Co.—Gents: I have used your White Chemical
Paint on my old weather-worn house, and it has caused
quite a sensation in this village. It is truly handsome, and I
am more than satisfied.

Editor "Schenevus Monitor."

Rev. Albert Nash, Lee, Mass., writes:—"I have used
your paint on my house, and, for cheapness and beauty, it
surpasses any paint I have ever seen. It remains hard and
glossy, and, although it was painted immediately preceding
a heavy rain, it could not be seen to have washed a particle."

Gro. J. Colen Architect Waterhure. Yu. writes:—"I in-

GEO. J. COLBY, Architect, Waterbury, Vt., writes: "'I investigated the paint question thoroughly before deciding what to use on my 'model house,' and can say that the Averill Chemical Paint is all you claim for it."

Gents;—In reply to your favor, 31st, would say. In November last, I painted my house, 194 Waluut Ave, Boston Highlands, outside and inside, with Averill Chemical Paint, Thus far, it pleases me very nuch indeed, and compared with other houses painted at the same time with Lead, the very noticeable—its freshness and polish. I can only say that I should use it were I to build again, and have no hesitation in advising my friends to use it. Yours very truly, H. E. Simmonds, Treas. Au. Tract Society.

Before purchasing other Paint, obtain Sam-ple-Card and Price-List from any of the fol-lowing Depots:

## ROOFING.

THE PATENT

FIRST PREMIUM AWARDED BY THE AMERICAN INSTITUTE.

Nov. 5th, 1870.

This Improved Roofing Material is entirely different from any other, and is TEN TIMES STEONG-ER than any conjuscition Roofing in use. An examination of this material will satisfy competent judges that it is in every respect a substantial and durable fabric, made upon correct principles, perfectly adapted to the purpose, and totally unlike the numberless cheep and dinney articles heretofore sold for similar purposes. It is adapted for steep or flat roofs in any climate, and can be readily applied by any one.

or flat roofs in any climate, and can be readily applied by any one.

From Report of Judges Am. Institute Exhibition of 1870.

H. W. Johns' Improved Roofing. "It is strong and flexible; nnaffected by the sun's heat; practically fire-proof and water-proof, and is really an article of the first of merit."

(HORACE GREELEX, Frest, Signed, GEO, FEYTON, Rec'g See'y, Extract from Report of Committee appointed by Am. Institute Farmers' Clute to examine the ASBESTOS ROOFING.

"The material coostitutes, for a cheap roofing, one of unsual merit, much superior to any of the class previously brought to their notice, and worthy of trial by those who desire a durable, easily applied, and comparatively inexpensive and safe roofing, the material having, in addition to the other merits claimed for it, that of being practically fire-proof, and consequently much less liable than the shingles commonly used on barns and rural dwellings, to eatch fire from flying sparks, &c."

## 1870 SANFORD CORN acre shelled corn. TO ALL WHOM IT MAY CONCERN:

We, the understaned, residents and Farmers of Suffolk Co., N. Y., do testification, which we recognize the "Sanford Corn" to be a new and distinct variety, originating on the Farm of Ierael Fanning, Suffolk Co., N. Y., being known in this section as the Fanning Corn. That it has the reputation in this County as being superior to all other varieties, which is the result of "hybridization," and a cureful selection of seed for a number of years, and we attribute the success in improving and perfecting this valuable variety in a great degree to the manner of selecting the seed. We do with confidence recommend it to all corn-growers as being worthy of trial; Joseph Wells, Mattituck, N. Y., Goc. W. Hallook, Jamesport, N. Y.; Chas. Williamson, Jamesport, N. Y.; B., O. Plymouth, Mass.

## Mammoth Chili Squash.

This is probably the largest and most producilive of all the manmoth squashes. We have grown it as a field crop for two seasons, and the enormous size and number of squashes produced has exetted the wonder of all who have seen them. Many of them weigh from one to two hundred ibs., and some go still higher. At the Fairs where we have shown them they have attracted more attendent than any other one thing. By planting thinly, manufing highly, and allowing only one squash to grow on a vine, they grow to a monstrons size.

Price of seed, per oz., 25 ets.; ½ lb., \$1.75; per lb., \$8; 5 lbs., \$1.25.

Sent by mall, post-paid, on receipt of the price.

NATHAN PLATT & SONS, Milford, Conn.

FLOWER AND VEGETABLE SEEDS, with plain and thorough directions for their culture and treatment, sent to any address on receipt of Stamp.

Address J. T. SMITH & SONS, Brentwood, N. H.

## To Farmers & Gardeners.

If the Garden Seeds you use have proved fresh and true to name, stick to the man who sells them to you; he is worth enconruging. If you have not found them fresh and true, I shall be happy to add your name to those of the fifty thousand farmers and market-gardeners scattered through-out the Uulted States and Canadas, whom I annually supply with my warranted garden seeds. My large vegetable and flower seed Catalogue, abounding with elegant engravings, sent free to all. ent free to all.

## FARMERS SAVE FEET.

Ask your Merchants for

BALLARD'S Champion Shoe.

(Patented May 29th, 1866.)

(Patented May 29th, 1866.)

The "CHAMPIONS" are made in the most DURABLE MANNER and of the very BEST MATERIAL, and every pair

WARRANTED.

See what Mr. WHITE (Farmer) says:
SHEEDSIN, MASS., May 29, 1870.

The shoes came duly to hand; all iarmers know how disagreeable it is to wear boots in warm weather. I have tried for five years to find a shoe that would keep out the dirt when at work io plowed land, but had thrown away the last pair in disgnst. When I saw your advertisement in the American Agriculturist, I thought I would venture a pair of Champions. I have worn them in plowing and planting, and flud them just the thing. My feet will be as clean at night as if my boots were worn, and as free from dirt and grit. Sore feet, so common among farmers, is caused by wearing shoes in summer that will not keep out the dirt. The Champion obviates this fault and will prove a blessing to farmers and others who till the soil. As soon as your shoes become known to the farmers you will have large sales. I find the shoe just as you represented it.

T. B. White (Farmer).

For Prices, etc., see Page 78 February Number. BE SURE and ask your MERCHANTS for BALLARD'S CHAMPION SHOE "RIGHT AWAT" before they prochase their SPRING STOCK. A. BALLARD'S CHAMPION SHOE "RIGHT AWAT" before they prochase their SPRING STOCK. A. BALLARD'S CHAMPION SHOE."

## New and Choice Vegetables, Rare and Beautiful Flowers,

For Sale by B. K. BLISS & SONS, Nos. 23 Park Place and 20 Murray Street, (P. O. Box 5,712.) New York.

## CUCUMBER-GEN. GRANT.

A superior vsricty, either for forcing or for culture in the open ground. It is perfect in form, solid, and crisp, and of a most agreeable flavor. Many specimens were grown the past season, averaging thirty inches in length. After a five years' trial, we unhestatingly pronounce it better than any other variety for forcing.

Packets, containing 10 seeds, 25 cents. Five packets for \$1.00. B. K. BLISS & SONS, 23 Park Place, New York.

## The Earliest and Handsomest Beet.

Early Dark Red
Egyptian Turnip
Beet.—A trial of this variety for the past two years,
authorizes us in recommending it as a week or ten days
earlier than any other variety—which makes it invalinas well as to fail—the real
early Vegetables. 30 cts. per
early Vegetables. Sons,
Sons, 23 Park Place and 20
Murray St., New York.

## Bliss's Improved LONG ORANGE CARROT.

LONG ORANGE CARROT.

This superior variety is the result of a careful selection, for successive years, of the best-formed, largest, and deepest-colored roots of the Imported Long Orange Carrot, by which it has attained a perfection hitherto unknown in this useful vegetable, being larger, better flavored, and of a deeper orange color, and more sure to produce a crop. Butter-makers will find this variety very useful in giving to their butter a rich, deep yellow color. We unhesitatingly pronounce it the best variety in the market, and one which will not fall to give satisfaction to the purchaser. I oz., 15 cts. 10 cs., 50 cts. 10 cs. 
### Jerusalem Artichoke.

This well-known but much neglected vegetable just be-This well-known but much neglected vegetable just begins to be appreciated, and is much inquired for. I will grow anywhere—in fence corners, ditch sides, old pastures, or wherever a plece happens to fail. The tubers make exceilent pickles, and are very good boiled like potators. Sheep are found of the green leaves, and hogs will never cease rooting for it as long as one can be found, enter reservoir flesh. It also possesses anti-malarial properties, like the Sunflower, and should be grown where Fever and Ague prevails. 4 lbs. by mail, \$1.00; by express, \$1.50 per peck; \$5.00 per boshel; \$1.200 per bbl. Address

B. K. BLISS & SONS, P. O. Box 5,712, New York.

The hest in cultivation. Early, large, productive, and of the very best quality. 25 cts. per packet, 5 packets for \$1.00, \$5.00 per ounce.

B. K. BLISS & SONS,

Nos. 23 Park Place and 20 Murray St., New York. ASPARAGUS WORTH GROWING.

ONE-HALF THE AVERAGE SIZE.

SEED and ROOTS.—The experience of the past two seasons fully confirms all that was claimed for this variety when first offered, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two four inches in circumference, and were ready for enting one year in advance of the ordinary varieties. Our stock is all from the original Bed, and we guarantee its genuineness. Seeds in half-onnce packets, 50 cents per packet, 510 per pound. Roots one year old, \$2.00 for fifty, \$3.00 per hundred; by mall, post-paid, \$25.00 per thousand, by express, freight paid by purchaser.

B. K. BLISS & SONS, 23 Park Place, New York.

### THE EARLIEST AND BEST SWEET CORN.

ONE-HALF THE AVERAGE SIZE.

Originated by Capt. J. B. Moore, of Concord, Mass. The earliest, largest, aweetest, and best-flavored varlety in cultivation, apperior to any other for the market and family use. Ears average 12 to 16, and sometimes 20 rows. It was exhibited by the Mass, Hort'l Society every Saturday, from July 23d to Sept. 23d, in fine condition, and attracted the attention of all. A Silver Medal was awarded to this variety by the Vegetable Committee, Price, 50 cts, per packet. Selected ears, \$1 each. Address

B. K. BLISS & SONS, 23 Park Place, New York.

### The Best Potato.

ONE-HALF THE AVERAGE SIZE. Peerless in Beauty.

Peerless in Beauty.

Peerless in quality and Size.

Peerless in Productiveness.

A trial the past summer confirms all that was claimed for it when it was first offered by us in the spring of 1870, and it mow stands without a rival for a general crop. J. W. Beach, of South Orange, N. J., raised from a single potato, weighing 21 onnees, cnt into single eyes, 278 lbs. Several others report having grown from 600 to 800 bushels to the acre, with ordinary field enliture.

4 lbs. by mail, upon receipt of \$1.00. By express, \$1.50 per peek; \$5.00 per bushel; \$10.00 per bbl.

The Earliest Potato in Cultivation.—Received.

The Earliest Potato in Cultivation.—Bre-see's King of the Earlies (or No. 4). Known also as the Fifty-Dollar Potato. Ready for marketing from seven to ten days in advance of the Early Rose. By mail, 4 lbs., \$1; by Express, \$1.50 per peck; \$5 per bushel; \$10 per bbl. To avoid freezing, no potatoes will be sent out until the first of April, unless specially ordered.

B. K. BLISS & SONS, Nos. 23 Park Place and 20 Murray St., New York.

# Wethersfield Onion Seed (New Crop).

## LAWN GRASS SEED.

By the use of our improved mixture, a beautiful Lawn unly be made in a very short time. Full directions for preparing the Lawn and sowing the seed accompany each package. Packages of 1 quark 30 cents, mailed to any address, post-paid. By Express. Per peck, \$1.75; per bushel, \$6.0.

B. K. BLISS & SONS,
Nos. 23 Park Place and 20 Murray St., New York.

### Collections of Flower Seeds by Mail.

## HORSE HAY-FORK IMPROVED.

PATENTED Sept. 6, 1861; re-issued Dec. 18, 1866. Pat. Jan. 24, 1865; re-issued May 29, 1866, Pat. March 20, 1866; Dec. 18, '865; Ang. 18, '76; Nov. 19, '86; Jan. 11, '70; Jan. 18, '70. We have erected new works for the manufacture of these goods, and now hope to avoid the disappointments experienced by our customers, in not being able to supply the rapid increased demand. And as to their merits, we can produce evideoce that they are superior to any thiog in the inarket, which fact our Horse Hay-Fork and Fixtures have established at 22 State Fairs, where, in 15 months, they were awarded 37 First Premiums, and upward of 600 First Premiums at County Fairs. All the Premiums awarded at State Fairs were from actual test of goods. These facts are not equaled in the history of Agricultural Implements.

\*\*NELLIS'\* GRAPPLE\*\*, patented March 1st, 1870. Adopted by every farmer that has become familiar with its advantages. With it, Pulleys can be affixed to rafter or beam, or changed in one minnte without the use of a ladder. Its nominal cost is no consideration for its value and advantages. Also, manufacturers of Cultivator Teerii, Agriculturals.

\*\*Perlis and Index of all kinds and sizes.\*\*

Pampblets, giving full particulars, with illustrations, for depositing hay or straw in mow or on stack, are furaished free, by applying to A. J. NELLIS & CO. Manufacturers and Proprietors, Pittsburgli, Pa. ## DAIRYMEN

## Iron-Clad Milk Pail

This is the greatest improvement in the way of Pails that has ever been offered to the public, as it is well known that the sides of a pail will outwear two or three bottoms put on the old way. Therefore this bottom makes a pail worth three times as much as any other one ever made. The bottom, being couvex and set on small rests, is kept entirely out of the dirt, which does away with all trouble in cleaning. Be sure and see them before purchasing for the coming season. For sale by all Timers. At wholesale by the IROX-CLAD CAN CO., 42 and 41 Murray St., New York; 200 Randolph St., Chicago, Ill.

WHITMAN & BUENELL, Agents, Little Falls, N. Y.

Office & Warehouse, 58 & 60 Cortlandt St.,

We manufacture and sell to Dealers & Farmers Mohawk Valley Clipper Steel Plows; Eagle and Peekskill Plows; Southern Plows; Harrows and Clittvators of all kinds; Copper Strip and Telegraph Hay and Stalk Cutters; Harrington'a, Holdrook's, and Comstock's Seed Sowers and Cuttivators; and every other implement needed by the farmer. Also, FERTILIZERS of all kinds. Pure No. 1 Perming Gamo in lots of from 1 to 1,000 toos. Pure Ground Bone by the ton or cargo.

LODI MANUFACTURING COMPANY'S COMPANY SOMEON and DOUBLE REFINED POUDRETTE at retail and wholesale. This valuable fertilizer has been manufactured the past season with more than usual care, and having an abandance of pure night-soil, it has been used without stint in its manufacture. We give but few of the lundreds of testimonials received from those who have used it the past

Season.

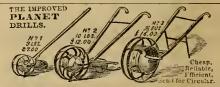

E. W. Christie, of Haverstraw, N. Y. under date of Oct. 20th, 1870, says: "I used the Double Refined Poudrette on Corn, Potatoes, and Cabbage. I never saw better corn or more on the acre than I raised this year. I am satisfied the use of the Poudrette increased the yield fully one-third. It gives the plant an early start, makes it grow rapidly, giving less work to cultivate it; I also find it a sure preventive of the Cut, cr Wire-worm, which often destroys the young corn or cuts the roots. It more than doubled my yield of potatoes and cabbages."

toes and cabbages."

R. D. Pearce, of Squam Village, N. J., says in a letter dated Sept. 20th, 1870: "I used the Double Refined Pondrette mostly on corn. The corn came up in a superior, healthy condition, and continued to grow faster and more stalky than that planted in the same field with best barn-yard compost. I am well satisfied my corn is twice better than the cost of the Pondrette. I also applied it to pumpkins and other vines with much better results than with compost."

Price of Double Refined Pondrette, \$25 per Ton. Common Poudrette, \$2 per Barrel.

GRIFFING & CO., 58 and 60 Cortlandt Street, New York.

Remodeled, improved, cheapened, under new patents of 1870. No yearing, no friction, no waste. No. 1, for Farm or Garden, No. 2, for Market-Gardeners, Seed-Growers, Nusery-men, thas convenient marker. GRAHAM, EMLEN & PASSMORE, Patentees and Manufacturers, 631 Market-st., Philadelphia, Penn.

GET THE BEST! ?? Especially when it costs no more than the poorest.

The "NOVELTY" is the only Clothes Wringer that has Cog-Wheels on both ends of the rolls, which allows the rolls to separate freely at either end; still the cog-wheels cannot be thrown out of gear on both ends of the wringer at the same time, unless the pressure is taken entrely off.

The Remember that wringers with cog-wheels on one end only, the rolls of which cannot separate at both ends, work very hard and wring very unevenly.

The NOVELTY Wringer has but one pressure screw. This always seemes an equal pressure the whole length of the rolls. It is instead to a tab or box by a Patent Curved Claum, which has an equal bearing on a tab the whole length of the varinger. Other wringers are merely fastened to a staye at each end, and are thus hable to wrench the stayes from their proper position and ruin the tub.

The Novelty Wringer is warranted perfectly satisfactory in every respect.

SOLD EVERY-WHERE.

WANTED FOR THE

COLBY'S

## Cheapest! Most Perfect, and Best Wringer in the World!

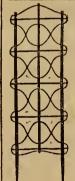

It has no iron holts or screws to rust, nor wood to mildew, rot, crack or swell; no cogsto slip, catch, bind, smash the children's fugers, and make WHEEL GREASE to soil the clothes. It has no ratchets to slip or get out of order—is the only Wringer which fastens itself to the tub, and is perfectly self-adjusting.

It is the only Wringer constructed upon pure scientific principles, combining just what is needed to perform the work perfectly, discarding all useless tumber and gearing. The Rolls are warranted of the hest quality white rubber, all through, and fastened to the shafts by Motitos's Pathent process, which renders it impossible for them to get loose. It is lighter and runs easier than any other—a little child can use it.

It is lighter and runs can use it.

Very liberal inducements offered to reliable, active, energetic, persevering men, and territory guaranteed. For descriptive circular and terms, address

COLBY BROS. & CO., 598 Broadway, New York.

THE DERROM BUILDING COMES.

## Marblehead Mammoth Cabbage!

This is the largest cabbage in the world, sometimes weighing over sixty pounds each, and averaging as high as thirty pounds by the acre! It is not only large, but cannot be surpassed for reliability for licading, tenderness, and sweetness. As some cultivators have an impression that this cabbage cannot be fully matured outside of Marblehead, I invite their attention to the following extracts from among the many commendatory letters which I have received:

"Your Marblehead Mammeth Cabbage cannot be excelled. There were heads weighing 50 ms., and heads of Fottler's Improved Brunswick (from your seed) weighing 40 ms.—
Join H. Howlett, Charlestown, Ill."

"I raised from your seed Marblehead Mammoth Cabbages that weighed 50 ms.—A. H. Mac, Clintonville, N. Y., Nov. 11th, 1869."

"Your Marblehead Mammoth Cabbages were very fine.

11th, 1953."
"Your Marblehead Mammoth Cabhagea were very fine, they all headed well, and weighed 27 to 46, and 47 ms.—W. Llewellya, Red Wing, Minn, March 12, 1863."
"Your Marblehead Mammoth Cabbages are wonderful; they grew to the size of an umbrella.—Thomas Flauigan, Palermo, Kansas."
"The Marblehead Mammoth Cabbages were a perfect success. They headed well, and were three times as large as any cabbage I ever raised before.—J. F. Butt, Kosciusco, Miss."

cess. They leaded well, and were three times as large as an embage I ever raised before.—J. F. Butt, Kosciusco, M. Carbolage I ever raised before.—J. F. Butt, Kosciusco, M. Carbolage I ever raised before.—J. F. Butt, Kosciusco, M. Carbolage I ever raised for the tenderest acd sweetest cabage I ever saw.—S. S. Groves, Stones Prairie, III."

John Van Wormer, Springs' Mills, Mich., raised some weighing 30 bs. John Humpinreys, Tinsville, N. Y., 334 bs. M. D. Clark, Elyria, Ohio, 37 bs. H. A. Terry, Crescent City, Iowa, 40 bs., measuring 56 inches around the solid head. Thos. A. Lambert, Becancour, C. W., exhibited three cabbages, weighing respectively 40, 424, and 44 bs. John W. Dean, St. Michael's, Md., has grown them weighing 33 bs. S. M. Shnek, Preston, Minn., 33 bs., when trimmed. E. H. Ellis, Etna Green, Ind., over 30 bs. A. E. Garrison, Des Moines, Iowa, 30 bs. James S. Allen, Union Springs, N. Y., 30 bs., when stripped of Ioose leaves. Win, Lee, Jr., Denver, Colorado, has grown heads weighing 45 to 50 lbs., as a penalty for which the miners of the mountains call him the "Big Cabbage Man." Leonard Choat, Denver, Colorado, raised one which weighed 46 lbs when trimmed of waste leaves. Collins Eaton, Ogdensburgh, N. Y., 50 bs. P. Sweeney, Loretto, Pa. 43bs. Sam'l B. Ornsbee, Rolling Frairie, Wis., 53 bs. Chas. W. Odensburgh, N. Y., 50 bs. P. Sweeney, Loretto, Pa. 43bs. Sam'l B. Ornsbee, Rolling Frairie, Wis., 53 bs. Chas. W. Oden, Little Sionx, Iowa, produced quite a lot weighing from 50 to 60 bs. A. C. Van Tassal, 30 bs. trimmed. A. C. Goodwin, Rennedy, N. Y., 45 to 50 lbs. W. H. Spera, Euphrata, Pa., raised the largest cabbage ever seen in the country." "Astonished all their neighbors." "That in sweetness, crispness, and tenderness they were unequaled." etc., etc. As the original introducer of the Manmoth Cabbage, I am prepared to supply seed grown from extra large Reads, at following prices, by mail, post-paid: Per package, 25 cts.; per oz., 75 Cts.; 4 ozs., \$3.50.; per lb., \$12.

Full instructions for cultiv

JAMES J. H. GREGORY Marblehead, Mass.

## Guano, Bone, Poudrette, Plaster.

TAKE NOTICE! The mixing of No. 1 Peruvian Guano with worthless Guano, or earth of the same appearance, and selling the same for pure is being done extensively by Unscrupulous Dealers. Those who manipulate are so expert in the business, that it is almost impossible to detect the fraud. Bags are properly branded and made to correspond with the original. Country merchants can make a Inrger profit by selling the mixed article. We guarantee that we sell to be Pure No. 1 Peruvian Guano. Farmers and dealers supplied at the lowest market price.

BONE! Every farmer, gardener and fruit-grower who has had experience, knows full well the value of Ground Bone as a manure; it is the cheapest and hest fertilizer for the farmer. All soil must have phosphate of time to make it fertile; vegetation feeds upon it, Pure Ground Bone will supply it. The Bone we sell is collected from our New York markets daily and ground, and is, we believe, the best in the market. Farmers and dealers supplied at lowest market

Price.
POUDRETTE! Common and Double Refined
Poudrette. The best in the market.
LAND PLASTER! This article, on some soils, acts like a

charm.

The above Fertilizers, together with a large assortment of Agricultural and Horticultural Implements furnished at Wholesale and Retnil.

BONE-MEAL prepared for borses, cows, swine, poultry,

etc. Send for Circular.

## What they say about the Blanchard Churn.

O. S. Bliss, Esq., Secretary of the Vermont Dstrymen's Association, in his valuable Essay on "The Management of a Good Butter Dairy," read before the late Annial Meeting of the American Dairymen's Association at Utes, says: "We use the Blanchard Churn, and recommend it so superior to any other for churning, gathering, working, and salting butter, not excepting the venerable and superanniated up-and-down dash."

M. C. Weld, Esq., late Associate Editor of the "American Agriculturist," says: "We have been using one of the Blanchard Churns a whole season. It does its regular duty, not only well, but to our suffermer satisfaction. Of late the whole work has been done by a girl of Jouvieen."

This Churn is for sale, wholesale and retail, by

## The Burlington & Mo. River R. R. Co.

Offer about 2,000,000 Acres

## Iowa & Nebraska Lands for Sale

On 10 Years' Credit, at 6 per cent Interest,

No part of Principal due for two years from purchase and afterwards only one-nigth yearly.

Products will Pay for Land and Improvements.

The Liberal Credits given; Free Passes allowed; small annual payments required; the current market value of money, and profits on Stock raising, prove these terms cheaper, easier, and better than to buy U.S. land within railroad-land limits at \$2.50 per acre, while our prices range generally from 4 to 5, 6, 8, and 10 Dollars per acre. Quality and local advantages rule the price.

On these generous Terms the industrious and competent can buy and pay for a good Farm and Home. In beginning, it is necessary to have money enough to pay six per cent interest on the land, obtain provisions, build a cabin, buy a team and agricultural implements till cropa are raised, which can be done the first season, by commencing in early Spring.

CIRCULARS giving full particulars are supplied gratis, and any wishing to induce others to immigrate with them, or to form a Colony, are invited to ask for all they want to distribute.

A SECTIONAL MAP, showing exact location of lands for sale in laws, is sold for 30 cents, and a similar Map of Nebrasks Lands is sold for 20 cents.

Apply to

GEO. S. HARRIS.

## The Eumelan Grape

Was awarded the following First Premiums for quality during the Fall of 1869:

Pennsylvania Horticultural Society (Philadel-Sept. 13, 16. 13, 16. 13, 16. Geneva Horticultural Society (Geneva, N. Y.)
Hammondsport Grape Exhibition
N. Y. State Grana Granage Theorem 29, 30, N. Y. State Grape-Growers' Exhibition (Can-

andaigua)...
Ohio Grape-Growers' Association (Gleveland).
Lake Shore Grape-Growers' Association 15, 16,

Also at many important Exhibitions in 1870. These are the strongest commendations of its quality, and the universal reputation this Grape has gained the past

three years, in addition to its previous history, will make for it a very general demand.

To Our stock of Plants is produced from the original Vines, which are growing in our own grounds, and every one is warranted true to name.

By reason of the great success of the Eumelan Grape wherever it has been planted, both North and South, as well as East and West, and its superior worth to all others, The FLORIDA IMPROVEMENT COMPANY of the City of New York have purchased of us for Spring planting Ten Thousand Dollars' worth of Eumelan Vines, of our best quality, with the view of propagating it extensively, and making the most extensive Vineyard in the State with the Enmelan Grape alone.

We have yet a sufficient stock of these Vines to snpply a very large demand, and offer them at as low rates as the same class of Vines can be obtained elsewhere.

Our terms to Agents and Canvassers are very liberal. Our terms to Agents and Canvassers are very liberal.

[COPYRIGHT SECURED.]

IMPORTED SOUTHDOWN SHEEP AT CENTRAL PARK, N. Y .- Drawn and Engraved for the American Agriculturist.

The fine expanse of lawn at Central Park have their beauty enhanced by the introduction of sheep, which give to the scene a pastoral air highly pleasing to those who otherwise might rarely enjoy the sight of a flock. The South-downs were first introduced, not for their beauty solely, as they are made useful in keeping the grass nibbled close, while at the same time they fertilize the turf. Animals of pure blood only being allowed in the flock, the sale of the increase has been a source of revenue, while the proceeds from sales of wool go toward paying attendance and winter keep. The pres-

ent Board of Public Parks, has recently made an important addition to the flock by the importation of five ewes. The animals are from Messrs. Bowen & Jones, Ensdon House, Shrewsbury, England, who furnish the following pedigree: "Sire, Lord Clifden, winner of Bath and West of England and Royal Agricultural Society of England prizes; bred by the late Bryce Wm. Bowen of Shranardine Castle. Sire of Lord Clifden, Patentee, the prize winner of Royal Agricultural Society of England, by old Patentee, the prime winner of Royal Agricultural Society of England, Dam of Lord Clifden by

Chester Billy, winner of two first prizes of Agricultural Society of England. Dam of Eucs. Ewes bred by Messrs. Bowen & Jones, Ensdon House, Shrewsbury, one of the original flock on which the Shropshire Sheep are founded." The public is to be congratulated upon the introduction of such fine animals, which are to be placed where they can be seen by all. It is gratifying that the Park authorities, while they offer instruction and amusement in a collection of wild animals, do not forget the domestic breeds, and we hope that in time the Park will be able to present the choicest specimens of them.

Pickerel Shooting

Black Walnuts.—G. M. Walrad, Wilkes Co., Ga.—We doubt if black walnuts which have dried for some months can be made to grow. The seed is very ofly and soon becomes rancid, nuless special pains be taken in the preservation.

Grapes in Va.—"Hollywood" writes that Grapes are successful in Fairfax Co. One of his neighbors sold fruit the first year of bearing, for enough to pay three-fourths of the expense of establishing his vineyard.

### AMERICAN AGRICULTURIST.

NEW YORK, APRIL, 1871.

To the good farmer, whose land is drained and clean and in good condition, who did more or less plowing last fall and top-dressed his grass land, who has his seed on hand and his implements and harness and teams in good condition, and who can avail himself of the first opportunity to put in his crops, April is usually a joyous mouth. But to the farmer whose land is undrained, who has not a field on the farm where there are not wet spots, who has part of his land dry enough to work, but where, iu the low spots, the water follows the plow in the furrows, April, to such a farmer, is the most trying and disheartening month in the year. And the more intelligent he is the more gloomy is the prospeet, for he knows that he is working to great disadvantage, and cannot in any event get remnnerative crops. His only consolation can be found in a firm resolution to drain his land before another rotation comes round. Such land should be kept in grass until it can be drained. In the meantime, if it must be eropped, make an earnest effort to let off all the water of surface drains. This is far better than nothing. A few furrows with a plow will frequently let off more water in an hour than the sun can evaporate in a week. Not an hour should be lost in doing this work.

Giving Directions to Help—Tell the men the night before what you want them to do the next day. And tell them, "if it is fine, do so and so; if it rains, do this or that;" and enter into details. A good man likes to know beforehand what he has to do, and he will think the matter over and decide how best to do it, and what tools he will want, and where they are; and in the morning he can get to work half an hour earlier than if he did not know what he was going to do.

Hiring Furm-men.—That farmer is fortunate who has two or three active and intelligent sons able and willing to take hold of farm work. Make much of them. Those who have to hire should be willing to pay good wages for good men. We do not sufficiently discriminate. Wages are too high, but good men are not likely to take much less than they got last year. Farmers are very remiss in one thing: they do not insist on having "a character" from the last employer. It should be a hard mat-

ter for a bad man, or one who left his employer during the busy season, to get another place. Farmers should combine to drive an unfaithful servant from the neighborhood. Pay good wages, and treat them with kindly consideration, but insist on having respectful behavior, and good work. Know what a good day's work is, and get it; but do not ask for more. An unreasonable employer makes discontented servants. If they do well, tell them so; if not, reprove mildly but firmly.

#### Hints about Work.

Rainy Days.—These will be frequent this month. There is nothing more important than to clean out the cellar. It is madness to suffer any decaying vegetables to remain. It is the cause of much sickness, especially among the children.

Whitewash the walls, ceilings, etc. See that the windows will open and shut easily, so that the cellar can be readily and frequently ventilated. Clean empty pork and eider barrels, inside and outside, and make the cellar neat and tidy. Water in the Cellar must be got rid of, no matter what the cost of draining may be. If it cannot be drained, better fill it up, and make an outside cellar. Inconvenience can be endured better than ill-health. At any rate, those who are afflicted with a wet cellar should not delay a moment after the water has subsided to clean out the sediment and cover the bottom with lime, which should he removed in a dny or two, and some chloride of lime be sprinkled about the cellar as a disinfectant. In the Barn, there is abundant of work for rainy days. Make every thing clean, and have a place for every thing, and see that every thing is in its proper place. Brush out the cobwebs. Clean the windows, and see that they will open and shut. Grind all the tools, rakes, hoes, and spades. Mark them, and rub the handles with petroleum or linseed oil. Scour off the rast, and rub on a little petroleum to keep them bright. Oil harness, and be sure to wash it clean with warm, soft water, soap and brush, before applying the oil. An extra evener for two, and especially for three, horses, will come handy on a stony farm before you are through plowing, and now is the time to make it. See that the Plows are in order; and if a new point or a new wheel is needed, get it now. Have the harrow teeth sharpened. Examine the drill, the roller, and the cultivators. If any of the wood-work is beginning to split, put in a carriage bolt. Puint every thing with petroleum, or with linseed oil paint. For old implements, machines, wagons, etc., the former is best, as it penetrates much deeper into the wood, and is far cheaper.

Sheep,-Tag any that need it. For mild cases of scours, nothing is better than milk-porridge, made with wheat-flour-say a pint of milk and a tablespoonful of flour for each sheep. For severer cases, give prepared chalk, or ten drops of landanum, repeating the dose every four or five hours till the discharges are arrested. Give gruel and tonics to keep up the strength of the animal. Salt regularly, and mix a little sulphur with the saltsny three pints of salt and half a pint of sulphur, twice a week, for a hundred sheep. Ewes expected to lamb should be watched night and day. But be careful not to render assistance when it is not needed. Rub the lambs dry, and see that they get milk immediately; and after that, with ordinary eare, there is little danger. A chilled lamb may be restored when apparently nearly dead, by putting it in a bath of warm water-say at blood-heat; or in the absence of this, place the lamb in a heap of hot fermenting manure. After the bath rub and dry, and be eareful that it does not take cold.

Milsh Cows that have but recently calved should have a liberal diet of good hay, with a pailful of warm bran-slops twice a-day; and in our opinion a quart of corn-meal, added to the bran, would be an improvement. Let the cows be kept in the stable nights and stormy days. See that their mangers are cleaned out every day. Whitewash the stable, and let it be well ventilated. Cows expected to calve should have exercise every fair day, and see that their bowols are not constipated. Bran

or oil-cake will regulate this matter. If the cow is very fat, it may be well to give a quarter of a pound of glauber salts ten days before calving, and repeat the dose every three or four days, if needed, to keep the bowels moderately loose.

Calves Fattening for the Butcher should suck the cow, and should be tied up in a warm, dry, well-ventilated apartment, that is not too light. Keep them as quiet as possible, and feed the cow liberally. After the third day there is little danger of milk-fever.

Calves to be Reared may be at once removed from the cow, and taught to drink milk from a pail, unless they are choice, thorough-bred animals, when it is better to let them suck the eow and have all the new milk they will take. Valuable shorthorn calves are sometimes allowed to take all the milk they want from two cows. Common calves that are not allowed to suck the cow, should have their own mother's milk for a week, and afterwards a little skimmed milk may be substituted for a part of the new milk; and in place of the cream removed from the milk, a little flax-seed tea should be substituted. It is a great loss to starve a ealf. When the calf gets to be a month or six weeks old. the cheapest and best food for it is oil-cake boiled in fresh skimmed milk; or if the milk is too sour to boil without curdling, boil the oil-cake in water tilt it will form a jelly on cooling, and then mix it

Pigs.-Last fall's pigs must be well fed, and got into a thriving condition before being turned ont to clover. Do not begrudge them all the corn-meal they will eat. It will pay better at this season than next fall. Breeding sows should be put into a pen by themselves a week or so before they come in. Have a rail round the pen to keep the sow from crushing the little ones. It should be from eight to twelve inches from the ground, according to the size of the sow, and six or eight inches from the sides of the pen. Give a liberal allowance of chaffed straw for bedding. Give the sow, for a week before and a week after pigging, warm branslops and milk; and later give richer food, such as cooked corn-meal with the bran. As soon as they will eat, let the little pigs have a few oats or soaked corn, or cooked corn-meal, in a separate pen from the sow. On warm days let the sow run out for an hour or two, and feed the little pigs just before she is let in again, and while they are hungry. Our readers will find some useful hints on this subject in "Harris on the Pig."

Hens, to lay well, must have plenty of exercise and liberal feeding. Let all their apartments be kept scrupulously clean. Where they have but a narrow range, they must have animal food, as a substitute for the worms and insects they find when running at large. Hens, with young chickens, should be confined in coops, and the chickens should be abundantly supplied with soft food and fresh water. Let the coops he moved on to fresh ground every few days. A common mistake is to have the coops too small. They should be at least three feet high and well ventilated. During a rain-storm, place the coops so that the back part, which is boarded up, will keep out the rain.

Barley is the first crop to be sown. Plow the land only when it is dry, and sow as fast as it is plowed. It should be harrowed and cultivated until the soil is mellow. Drill in 1½ to 2 bushels per acre. Roll the land soon after the barley comes up.

Clover-Seed should be sown on the winter wheat. If the land is dry and hard, harrow the wheat before sowing the clover-seed. It will kill weeds and help the wheat, and the clover-seed is more likely to germinate. A smoothing harrow may be passed over the land after the seed is sown. If the land is mellow and in good condition, 4 quarts of clover-seed and 4 quarts of timothy seed per acre is enough. For permanent pasture add a pint of white clover. When nothing but clover is sown, we generally put in from 6 to 8 quarts per acre. Last year we lost our whole seeding from not sowing early enough.

Oats will do better on sod land than barley, but neither of them do as well on a tough sod as after

corn or potatoes. Two bushels per acre is little enough seed. Land plowed last fall may be sown to oats without again plowing. Harrow them in thoroughly. If to be seeded down, make the land as smooth as possible after the oats are sown, and then sow the grass and clover-seed, and then roll.

Peas will do well on sod land, drilled in or covcred with a Shares harrow. Sow as early as the land can be got ready—two bushels per acre. One or two hushels of plaster per acre will be beneficial.

Potatoes.—Plant early on dry land. Deep planting and harrowing the land, just as the potatoes come up, saves much hoeing, but increases the labor of digging. Plaster sometimes has a marked effect on potatoes, and sometimes appears to do little good. See "Walks and Talks."

Land intended for Roots should be plowed and harrowed, cultivated, rolled, and plowed again, and worked until it is as mellow as a garden. Parsnips should be sown as soon as the land is in good order, and carrots a week or two later. Mangels and other beets need not be sown until May, and rutabagus two or three weeks later. Make the land rich with well-rotted manure, and ginano or superphosphate.

### Work in the Horticultural Departments.

At the time we write these notes, early in March, the weather is as warm and mild as it usually is in April, and every thing bids fair for an early return of spring. But it is not safe to depend too much upon the weather at this season, as it is always very variable at the North. If, however, this weather should continue, much of the work in the horticultural departments that is usually done in April will have already been disposed of.

### Orchard and Nursery.

The suggestions given last month will apply in many portions of the North for April. Trees for spring planting ought to be handled carefully and not allowed to become dry and shriveled; the nursery-man is often blamed for sending out poor trees, when the fault is with the planter who does not take eare to preserve them properly until ready for setting. Never set out trees until the land is dry enough to work without leaving it in a lumpy condition, as the lumps will never pack close, and the air has a chance to circulate around the roots, often causing the death of the newly planted tree.

Pruning ought to have been done last month. Do not prune after the sap has commenced to circulate.

Scraping, however, can be done at any time, and the trees will be benefited by a thorough washing with whale-oil soap, or very strong soapsuds; this destroys many eggs which are found upon the bark.

Canker-worms.—This month is particularly favorable to the ascent of these pests of fruit-growers. Follow the directions given last month.

Grafting should be done this month. Care must be taken not to graft too early, as this is often more injurious than late grafting. Cions may be cut if the buds have not started, and preserved in sand or earth until ready to set.

Seeds for stocks ought to be put in early. The pits of peaches and other stone fruits, which have been buried during the winter, start very early; they should be handled carefully, so as not to break off the spronts, if any have pushed. The seeds must have a good mellow soil to grow in, with a liberal dressing of well-rotted manure and ashes.

Manure may be hauled out and plowed in whenever the ground is dry enough.

Root-Grafts.—Set out in rows far enough apart to work with a cultivator.

#### Fruit Garden.

In many places the work suggested in the notes of last month has not been done yet; proceed as fast as possible with all planting, as the earlier plants are set, after the ground has become warm, the better growth will they make.

Strawberries.—Finish setting out new beds, and plow or spade up all old and unfruitful plants.

Gooseberries.—Set out the Houghton and American Seedling, and thin out the hranches of old and crowded plants to admit light and air.

Currants.—When the old plants have been allowed to take care of themselves, and the clumps are filled with grass and weeds, the best way is to grub them up and make new plantations; cuttings root very easily, and will bear a small crop the second year if properly cared for after planting.

Raspberries.—Uncover the tender varieties, and make new plantations early, before the buds have commenced to grow. Among the blackcaps, the Seneca and McCormick are good sorts.

Blackberries,—Plant early. The Kittatinny is one of the best varieties for general planting.

Dwarf Trees.—Where trees are needed, order early, and in setting use great care so as not to injure the roots or bark, as a slight injury often does a great deal of damage to the after-growth.

#### Kitchen Garden.

This month is one of activity in this department, as the ground is warm enough for planting many of the hardier vegetables. Last month we enumerated some of the standard varieties of vegetables; these sorts should be ordered of the seedsman, if not done already. The hot-beds and cold-framewill need particular care this month, as a neglect to give air during a bright warm day, may seorch the whole of the plants in a few hours, so that the labors of the past month will be entirely lost.

Window Boxes onglet to have an exposure to the air every mild day to harden the plants, so that they will not be put back when transplanted.

Asparagus.—Give a liberal coating of manure if not done last month. Go over the bed with a spading fork, and be eareful not to break nor injure the buds or roots. If plants are to be rulsed from seed, sow in carefully prepared soil, in drills a foot apart. An onnce of seed will produce about five hundred plants. When well up, thin to three inches.

Beans.—Do not plant in the open ground until all danger of frost is over. Limas may be planted in hot-beds any time this month.

Beets may be sown early this month in rich, fine soil. Their growth is facilitated by soaking in warmish water for 24 hours, and then pour off the water and put in a warm place until the sprouts start; roll in plaster to facilitate sowing. One ounce of seed is sufficient for 100 feet of drill.

Cabbages.—Set out plants from cold-frame as soon as the ground is dry. Sow seeds in open ground, and as soon as an inch or two high, sprinkle with ashes to keep off the cabbage-flea.

Cauliflower.—Treat the same as cabbages; they ought to be planted 2½ feet apart in the rows.

Celery. — Sow seed in the hot-bed this month, and when the plants are an inch or two high, transplant to a frame and set three inches apart.

Cress must be sown for a succession in drills ten inches apart, and at intervals of a week or ten days.

Egg-Plants ought to be several inches high by this time; transplant to another hot-bed with a gentle heat, and use great care to prevent their becoming chilled.

Horse-radish.—The earlier this is planted, the better growth will it make. Set out the small roots which have been preserved during the winter in sand. This crop needs a large application of manure to secure the best results. The roots should be about two inches long and set out in rows from eighteen inches to two feet apart.

Herbs can be sown in hot-beds now, or in open ground as soon as it is warm enough; those most commonly used are Sage, Thyme, Savory, Sweet Marjoram, and Basil.

Lettuce, sown in hot-beds, may be transplanted to the open ground; sow seeds in warm dry soil.

Melons.—A few may be planted on sods in hotbeds for early; they must not be planted in the open ground until it is well warmed.

Onions, in order to succeed well, need to be sown as early as the ground can be worked. Sow in fluorieh soil, in drills a foot apart. Put out Potato and Top Onions in rows fifteen inches apart, and the bulbs four inches apart in the rows.

Parsnips.—Sow last year's seed in drills 15 inches apart; one ounce of seed is enough for 200 feet.

Peas may be planted on high ground where the soil has become thoroughly dry, in double rows.

Peppers.-Sow in hot-bed the same as Egg-Plant. Potatoes, placed in a warm room to sprout last

mouth, can be planted out in well-manured soil. Radishes. - Sow in drills thickly once a week for succession.

Salsify should be sown this month and treated like parsnips.

Spinach for summer use may be sown now; that planted last fall will be ready to cut. The Perpetual Spinach Beet is valuable for early greens.

Tomatoes may still be sown under glass; those planted last month ought to be transplanted. Never set out in open ground until it is warm and dry.

Turnips for early crops should be sown in drills one foot apart; thin to 5 or 6 inches in the drills.

Manure. - See that the stable manure is not allowed to heat; turu it as often as it becomes hot, until ready to be plowed or spaded under.

#### Flower-Garden and Lawn.

Prepare the soil by plowing and spading. New beds can be cut, and walks made and repaired, as soon as the frost is out of the ground. If the soil in the flower-garden is of a strong loamy nathre, it would be greatly benefited by an application of sand well mixed with the soil. Only wellrotted manure should be used in the flower-garden.

Flowering Shrubs .- A few of these will probably come into flower the latter part of the month; give them a dressing of fine manure to encourage the growth of wood during the summer. If any are without a few of the more common flowering shrubs, they ought to procure plants and set them out this spring. Syringas, Lilaes, Weigelas, etc., are perfectly hardy, and with little care will give an abundance of flowers during the summer.

Climbers.-The hardy climbers are numerous and very pretty for covering arhors, or used as screens ; Wistarias, Honeysuekles, Virgins Bower, and last. but not least, the elegant Akohia quinata, are all perfectly hardy, and give an abundance of flowers.

Annuals started in hot-beds or window boxes last month, may be set out when the soil is dry. Bulbs of Gladioluses, Japan Lilies, etc., may be planted now for summer flowering.

Lawns .- Care must be taken that nothing is allowed to cut up the lawn, and no one should be allowed to walk upon it until the ground is entirely free from frost and well dried.

### Greenhouse and Window Plants.

Repotting-At this season most of the greenhouse plants used repotting, before they commence their growth. When very large plants are shifted, the best plan is to plant in a box of the required size; these always look neat, and if proper drainage has been provided, the plant will do as well as if planted in a pot; besides, all danger of breakage is avoided. The larger boxes ought to have books of iron attached to the sides, so that poles can be used in moving from one place to another.

Bedding Plants .- See that there is a good supply of bedding plants for out-door decoration as well as for growing in windows or hoxes, during summer.

Dahlias may now be brought out and laid in a warm place with a little sand to retain moisture. When the sprouts are a few inches high, remove to pots or set out in the open ground if suitable.

Plants in flower need to be kept near the light and free from all insects.

Seeds of the finer and delicate annuals, like the Lobelia, Salpiglossis, etc., ought to be sown in pots and theu transplanted to the open ground.

Tuberoses do best if started in pots and planted out when the soil is warm.

Roses and Carnations.—They are nearly hardy, and will do to go out any time after the frost is out.

### Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending March 16, 1871, and for the corresponding month last year.

Gold has been rather steadier in price, on a more active demand for Custom-house purposes, as well as for export and on speculative account. The supply, however, has been liberal, and has served to prevent any material rise. The closing quotation, March 15th, was 1111/2.... Breadstuffs have been in fair request, partly for export; and, while flour has not varied remarkably in value, wheat, corn, rye, and oats, have been quoted decidedly firmer in price, on very limited offerings of desirable samples. There has been an unusually free export movement in corn, chiefly for English ports. At the close, the market was steady, though not active, for all kinds of grain.... Provisions have shown a moderate degree of animation, the demand having been partly for home use and shipment, but largely on speculation, especially in mess pork and prime Western steam lard. Prices bave been irregular, closing with more firmness. Cotton has been offered freely at lower and unsettled prices, leading and extensive transactions for both prompt and forward delivery. The later dealings show a stendier market ... . Wool has been in reduced stock and moderate demand, at stronger prices ... . In the line of grass-seeds, clover has been the only active article, having been purchased freely, mainly for export, and it has been quoted decidedly higher.... Tobacco has been moderately dealt in at steady rates .... Hops have been more active, closing in favor of sellers.

Beef Cattle .- Receipts have averaged a little less than during the previous month, but the demand, as is usual in Lent, has fallen off so much that a decline of 1c. per lb. is noted. Trade has been very unsatisfactory for the Western shipper. Not unfrequently have droves been sold on this market at just about what they cost iu Chicago, thus losing the owners the freight, shrinkage, feed-bills, etc. Dealers have held on with the expectation of a turn in their favor, only to find the market here going from bad to worse. Their only salvation appears to be in getting the rates down at the other end, for it looks as though it will be hard to advance the prices Poultry has been very plenty and cheap, with eggs glutting the market. These largely take the place of beef. Below we give the range of prices, average price, and

figures at which large lots were sold: ngittes at with angle of the control 
Milch Cows .- When milk is scarce and high, fresh cows can be sold ludependent of the price of becf. Now there is a near affinity between the two, the very low rates of dry cows making a poor market for milkers. One other thing greatly injures the trade, and that is the poor quality of the cows sent here for sale. A good cow is worth keeping at home, but the worthless ones must be got rid of, and so are sent to this city. They have been sold as low as \$30 per head, the calf thrown in at that. Good milkers are in moderate request. Common cows are quoted at \$40@\$55 each; medium to good, \$65@\$80, with a few prime at \$90-occasionally \$100 ... Calves .-The market has ruled weak until within a few days past. Prime milk-fed calves run down to 11c., but will command 12c. per lb. live weight. A pen of 140 lb. State venls was just sold at 12c. There is a falling off in recelpts of dressed, the weather being unfavorable for selling them. We call thin live calves worth 7c.@9c., with fair to prime at 11c.@12c .... Sheep .- There has been quite a falling off in receipts of stock, farmers holding back for lambs and fleeces. Prices have advanced a full 1/2c. per lb. in consequence, and the market is active and strong. Thin lots sell at 5%c.@5%c.; medinm at 61/4c.@61/4c., with prime to extra 100@130 lb. sheep at 7c.@8c. A few weighing 150 lbs. were sold at 81/4c. Oue lot of sheared sheep came in from Ohio a few days since. They weighed 75 lbs., and sold at 5¼c. Spring lambs are expected next week....Swine.—These are also in lighter supply, while Western dressed have almost entirely ceased coming forward. They are no longer quotable. With this light run of live hogs, prices have declined 1c. per lh., selling at 7%c.@7%c., and city dressed at 91%c.@10c. The packing season is nearly over, which lessens the demand for hogs.

Pasturing Sheep on Wheat .- J. H. Sellman, of Anne Arundel Co., Maryland, asks: "Is pastaring sheep upon wheat daring the winter months considered injurious or beneficial to the crop? Does It have a tendency to make the wheat thinner or thicker ?-and adds: The practice prevails largely in this neighborhood. All acknowledge the benefit to the sheep, but I am sceptical about the advantage to the wheat."—Ans.: It is rarely of advantage to the wheat, except when there is a great growth of leaves, which smother the crowns and keep them too warm in case a good fall of snow comes. When fed off in the antama a desirable thickening up of the stand often takes place, but when fed close after growth stops, injury occurs. The point is to know when to feed and when to stop. We never feed off grain with sheep on good farms at the North. Calves are used; their feet are not so sharp, and they do not blte close.

### AMERICAN AGRICULTURIST.

Annual Sunscription Terms (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Twenty copies and pyward, \$1 each: Papers are addressed to each name.

ITEARTH AND HOME: \$3 a year for less than four copies: Four to nine copies, \$2.75 each; Ten to nineteen copies, \$2.50 each; and twenty or more copies, \$2.25 each. Both Papers sent to one address for \$4.00 a year.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

# \$10, \$15, \$20, \$25, \$50, \$75, \$100, \$125, \$625.

Any one of the above Sums can be Easily obtained—by Men, Women, and Children even, by the judicious use of Odd Spells, such as evenings, rainy days, etc., during APRIL, or during APRIL and MAY, or during APRIL, MAY, and JUNE.

The above may, at first sight, appear a little sensational, but it is only a statement of what has been done by many thousands of persons all over the country; and what has been done by these thousands, can be done by other thousands just as well. It only needs the desire to do it, and the WILL to do it, and it will be done.

1st—There are now about 40,000,000 people in this country, nearly all within reach of the 28,000 Post-offices. The most of these people are pushing along, seeking to better their condition. Their success depends upon two things, viz.: Steady, hard work, with body or mind, and knowledge enough to turn their work to the best account. One drudges along and fails of success, because he does not know how to work to the best advantage; another works less, and yet succeeds better, because his knowledge directs and aids his physical or mental labor.

2d—It is a benefit to the former class to add to his or her knowledge by every possible means.

3d—Two Journals, viz., the American Agriculturist (monthly) and Hearth and Home (weekly) are
prepared by those who make it their earnest business to gather all possible reliable information
about the best methods of doiny work, and of turning that work to the best possible advantage. These
persons talk and write from large experience
as workers, and from extensive observation, and
from an immense amount of correspondence from
practical men and women all over the country.

4th—It is impossible for any person, whatever his calling, to read the condensed information thus given in these journals without getting thoughts and hints that will directly or indirectly increase the value of his or her work many times more than the cost of the papers. The first one costs less than half a cent a day, and the second one less than one cent a day, and the two together less than 1½ cents a day—sums casily saved.

5th—It only needs some one to show the people these papers, point out their usefulness, and receive and forward their subscriptions.

6th—Ont of 40,000,000 people, there is at least one in every forty, or a million in all, who could take one or both of these journals with profit, whereas there are only about 200,000 that now take them, or one in every two hundred.

7th—We offer fine Premiums, as good as cash, (see next column,) to those persons who will take the trouble to show the papers and collect and forward the subscriptions. It can be done at odd spells, without interfering with other work, and premiums all the way from \$5 to \$625 can thus be secured without cost.

Sth—This has been done at 11,000 Postoffices by about 12,500 persons, with people enough left at these offices to make up twice as many premium clubs. There are 17,500 other Post-offices where no premium clubs have been raised, simply because no one has taken hold of the work.

9th and 10th — REEADER, you ean do it, this month of APRIL. It is a good time; spring work is opening and people are wanting help and information, and they can get it from these journals. You can secure one or more of the excellent premiums. You can do it this month, and, if you wish, have May and June to swell your club up to a larger premium. TRX IT.

### See Explanatory Notes.

Note.—Many persons canvass all the time as a business, sell the premiums received, and thus clear large wages. One Lady actually thus earns over \$3,000 a year, and multitudes in this way secure salaries of \$300 to \$1,500 a year.

### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But...(b) Tell us with each name or list of names sent, that it is for a premium .... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from one to three months, to fill up your list ... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts ... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit money in Cheeks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take bis receipt for it. Money sent in any of the above ways is at our risk.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.0.]

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39.

101-A Steam-Engine that will GO	0	. 49	. ~	. 0

We Every Premium article is **new** and of the very **best** manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 8 to 11, 21 to 24, 27, 28, 29, 47, 48, 63, 64, and 66 to 100 inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-affice or express affice nearest recipient), to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified. (Steam-Engine mailed for 30 cents extra.)

### Special Premiums.

FOR A RENEWAL AND ONE NEW SURSCRIBER TO AMERICAN AGRICULTURIST, OR ONE SURSCRIBER TO HEARTH AND HOME.

Trophy Tomato has proved so far superior to others that we desire to have it widely distributed, and we have made such arrangements with Col. Waring as to enable us to offer pure seed from headquarters, with his trade mark guarantee of gennineness.

Japan Lilies .- We offer from the gardens of A. S. Fuller, Esq., several of the beautiful Japan Lilies, some of which have been sold by seedsmen within the last two years as high as \$5 each. Any one of these is an ornament to any garden, and they can be had free as premiums.

Eumelan Grape-Vines.—Hasbrouck & Bushnell, proprietors of the original stock, will supply us with vices of this most excellent variety, and we wish all of onr subscribers would try at least one.

I.-To every subscriber who, after this date, sends \$1.50 for American Agriculturist for 1871, and 5 cents for postage, we will send 1 Package (100 Seeds) of Trophy Tomato Seeds.

H .- To every old subscriber to American Agriculturist who after this date renews, and sends one new subscriber, with \$1.50 for each, and 5 cents for postage on the premium, we will send any one of the following eight articles that may be chosen:

1 Package (200 Seeds) of Trophy Tomato Seeds.

Or:-1 Bulb Red Japan Lily, Lilium speciosum rubrum.

Or:-1 Bulb White Japan Lily, Lilium speciosum album.

Or :- 1 Bulb Gelden-handed Lily, Lilium auratum.

Or:-1 Balb Long-flowered Lily, Lilium longiflorum.

Or:-1 Bulb Gladiolus, or Sword Lily, named varieties.

Or :- 2 Bulbs Tigridia, or Mexican Tiger Lily, differ't kinds. Or:-1 Eumelan Grape-Vine No. 1.

III .- For one subscriber, received after this date to HEARTH AND HOME, for one year, at \$3, with 5 cents for postage on the article, we will send any desired one of the above premiums. Subscriptions taking these special premiums will not be counted in other premium lists.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Consulting Agriculturist.-In a large Agricultural Warehonse like that of R. H. Allen & Co., there are constant applications for advice about fertilizers, animals, implements, etc. To meet the wants of its patrons, the above-named firm has engaged the services Col. Mason C. Weld, as consulting agriculturist. Col. W. is eminently able to fill such a position, both on account of his thorough chemical education and practical knowledge of agriculture, while his editorial experience npon the Agriculturist has made him familiar with the wants of farmers in different portions of the country.

Money in the Garden. By P. T. Quino. This work, published by the Tribune Association, comes to hand just as we are going to press, and we cannot now give more than a more announcement of its publication. Mr. Quinn is widely known as a successful cultivator, and being over-run by inquiries-as every man will be who allows his name to get into print-he has in self-defence put his garden experience in a book form, and says: "Friends, you will find it all in this volume." Sent from this office, by mail, for \$1.50.

Smoked Meats .- "Subscriber," of Maryland, proposes the following questions: How long ought pork to be smoked, to keep-say one year from time of emoking? How long will smoked pork keep, properly cared for, without spoiling. And will it keep packed in barrels and stored in a cool place for sne year?—Ans.: Meat should be well salted or pickled before it is smoked. It is the pickling quite as much as the smoking that keeps the meat. The length of time it will keep depends hoth upon the strength of the pickle, the length of time it remains in it, and the thoroughness of the smoking. A pickle containing a small quantity of alkali (potash) is very penetrating, and causes the meat to take smoke well. To keep a yea, meat must be much salter than most people like, though sugar may be made to take the place of salt to a considerable extent. To keep hams and bacon, wrap in stout brown paper, and pack them in barrels in fresh wood-ashes. The potash of the ashes will do no harm even if it comes in contact with the meat.

Barley vs. Oats as Food.-(M. A. B., of Illinois.) When both are fed on the farm to horses, a crop of oats usually pays hetter than a crop of barley, and with you corn must be the more profitable crop for feeding hogs or cattle. Barley is a better crop to seed with than oats, and is excellent food for either pigs or horses. But you cannot get as large a crop per acre as from oats.

Death of Sanford Howard.—Just as we are making no the last pages of the paper, the intelligence comes of the death of Sanford Howard, Esq., at Lansing, Mich. For the present we must content ourselves with the statement that Mr. II, was widely known as an agricultural writer, and had been for several years Secretary of the Michigan State Board of Agriculture.

The Louisiana Fair, which had been announced for April 8th, has, on account of the burning of the fair buildings, heen postponed until Nov. 18th.

Asbestos Roofing .- The advertisement of Mr. Johns is worthy the attention of these who desire a cheap, good roofing. Mr. Johns has been engaged for many years in making improvements in roofing, and means to treat his patrons well, which is saying a good deal, though we nim to admit no one into our advertising columns who we do not think will do this. Some of our editorial corps have examined and tried his later improvements, and are well pleased with them,

The New U. S. Loan is a matter of great interest to the whole country. It appeals not only to patriutism, but it opens a very convenient means of depositing money safely where it will pay Gold interest regularly over a long series of years, with no change. The Bonds can not be called in under ten years, and they will have an advantage over other securities in that they will always be convertible at once into cash. The 5-20s at the present market price pay but a trifle more interest, and they are subject to be called in at par whenever the Government is in funds to bny them.

Horse and Horsemanship of the United States and British Provinces of North America. By Frank Forrester. This book was published fourteen years ago, and has had quite an extensive sale, as it was considered a necessity in the important public and private libraries of the country. It has now been theroughly revised by Messrs, S. D. and B. G. Bruce, of the Turf, Field and Farm, whose knowledge of our thorough-bred and trotting horses is nnexcelled. Pedigrees, performances, and importations of well-known horses have been revised and continued to date. In addition the histories and performances of the most celebrated herses of to-day are given with fourteen fine new steel portraits, which add much to its value to all lovers of fast horses. It is published in two large octavo volumes on fine paper, and contains in all thirty heautiful steel portraits. Price, post-paid, \$15.

A Cheap Leveling Instrument, very convenient for drainage and other purposes, is advertised by the Warwick Tool Company. Send for their circulars which give full particulars.

Plants Named .- "J. C. H.," of New York. Your "Hibiscus" is Malvaviscus arborens.... "Mrs. C. J. A.," Staffordville, Conn. No. 1. Abutilen Mesopotamicum. No. 2. Fringed Gentian, Gentiana crinita. No. 3. Achyranthes Verschaffeltii.

Samples of Seed .- We have just put into the chicken-feed a large number of samples of wheat, corn, oats, etc., which have been for some time accumu-These parcels were all sent by mail, and no letters have been received informing us concerning their contents and the object in sending them. Our correspondents should always send no explanatory note by the same mail that the seeds are forwarded. No writing whatever, beyond a label, should accompany the seeds, unless full letter-postage is paid upon the parcel.

Gapes in Chickens.-J. M. J. Manning, of Calloway Co., Ky., informs us that he has never failed to cure gapes in chickens, by the use of soft-soap, mixed with the dough, just enough to color it slightly. have heard this remedy spoken of highly by others who have tried it.

Raspberries .- D. B. Richards, Brewster's Station, N. Y. Plant from 4 to 6 feet apart each way, according to the variety. Set as early as possible. Cut off all of last year's stems. You might get a few straggling berries from them but no crop. The bearing will be next year from the stems which grow this year. The canes bear but once and are cut away when the fruit is off.

"Will posts put in the ground when green last as long as seasoned ones ?" -We think not.

"Answer through the Paper" is a request we are obliged to disregard, when the answer is of no interest to any one but the person asking the question. All questions of a purely personal nature should be accompanied by a stamp for a reply-not a cent more. Nothing is more unpleasant than to receive 25 or 50 cents to pay for "Information."-We maswer private letters of this kind if we can, and when we can, but it is a matter of courtesy only, not one of obligation.

The Iron-clad Can Co. have removed to spacions quarters in a five-story building No. 51 Deystreet, in order to meet the pressing demands for their goods. Since the introduction on the market of their Iron-clad Milk-Pail about 60 days ago, they have disposed of 17,000 of the "Patent Bottoms." This Company comof 17,000 of the "Patent Bottoms." This Company com-menced business in a small room a few months ago. See the results of advertising a good article in a good journal.

American Agriculturist or Hearth and Home ?-Many correspondents address inquiries to Orange Judd & Co. without specifying whether they wish the answer to appear in the Agriculturist or Hearth and Home. We hope that all our friends will take both papers, but those who content themselves with one should indicate which one, as they are entirely different.

Canker of the Month and Head in Fowls .. - Geo. Fanlkner, Fleming Co., Ky. The new disease which you have among your fowls, by which their mouths and throats become filled up with a cheesy substance of very offensive odor, which causes in some cases a stoppage of the windpipe and death by suffocation is called canker of the month. We have treated it successfully in this way. 1st-If the fowl is not worth a good deal cut its head off. 2d-If worth saving, with a small spoon and pincers take out all the cheesy matter and wipe out all the slimy mucus from month, nostrils, and eyes. 3d-Prepare a solution of chlorinated sada or chloride of lime. If chlorinated suda (Labaraque's solntion) is used, dilute it with one or two parts of water. Wash the head, eyes, nostrils, mouth, and throat, out thoroughly, using a soft swab with one of these solutions, and in 20 minutes give the fowl a good feed of chopped meat, mixed with bread soaked in ale or spirits and water, and well sprinkled with Cayenne pepper. Give some solution of iron in the water, and keep up the diet indicated antil well. Put the whole flock on a similar regime for a few days, especially those having colds.

Mangels.-"S. S. F.," Somerset Co., Pa. The quantity of seed usually planted is 4 to 6 lbs. per acre.

Rose-Slugs and Green-Fly .- "Mrs. E. L. Crumb," Danville, R. I. You mistake in supposing the worm and fly, which attack your rose-bushes, to be They are entirely different; the "worm" is known as the rose-sing, and the "insect" as the greeufly. If you have only a few rose-bushes, the best way to manage the sing is to lay a paper on the ground, under the plants, and shake them. If this be done early in the morning, the dormant slugs are easily captured. green fly is destroyed by syringing with tobacco-water.

New England Poultry Club's Exhibition, at Worcester, March 7th to 10th, 1871. A. M. II. writes: "The entries were fully up in numbers to last year and far superior in quality. Attendance good.

"The competition was very close in many of the classes. In light Brahmas, especially, the judges could not decide between the hest three coops, which should rank first, and two more persons were called in, and then they were anable to agree. Finally it was voted upon. This is unusual. The largest exhibitors were Messrs. Williams, Ball, Rice, Buzzell, Pogen, and Upham. A new feature, and a very pleasing one, was the 'Club Supper,' held on the evening of the 8th. This was a reunion of Poultry fanciers from this and other kindred societies. About 100 sat down to a well-filled table. An address was given by the President, Mr. O. B. Hadwin, and a poem by the Treasurer, Mr. II. Woodward.

"The gnests and members of other societies were then called upon for speeches. The addresses took a practical turn, and much interesting and valuable information was elicited. The resolution adopted by the Poultry Convention of Feb. 15, requesting Penltry societies to incorporate in their 'Rules for Exhibition,' the following, that exhibitors be required to name the breeder of the fowls exhibited, and that both the name of breeder and exhibitor shall be placed upon the coop doring the exhibition,' was discussed and cordially agreed to by all present. This is a much needed regulation, and it is to be hoped will be generally adopted."

Gray's Botanical Works. - "How shall I study hotany?" is probably asked a hundred times a year of the writer. The reply is essentially the same, but modified according to the age of the applicant. For a child, "How Plants Grow;" for an intelligent youth, the First Lessons, and for an advanced student, the Structural and Systematic Botany are recommended. These books are all by Prof. Asa Gray, and admirably adapted to the different classes of students. These works all teach the structure of plants. After this is understood, the examination and classification of plants may be undertaken; for this we have the Manual of Botany, which includes all the wild flowering plants of the Northern States, and the School and Field-book of Botany, comprising the most frequently occurring wild and cultivated plants Either of these may be had bound up with the lessons." These works form the most complete botanical series ever published in this, or indeed in any other country. It is very fortunate that one who stands among the first of living botanists has given time and thought to the preparation of elementary works—a task too often left to mere book-makers. Even those who do not wish to study botsny, will find the "Lessons" of great interest, as they give just that information about plants and vegetable growth, which every intelligent person should possesa, presented in a form at once attractive and simple.

Homes in Kansas.—All who contemplate going West, will be interested in the advertisement of the "Kansas Emigration Society." This Association is organized under State anthority, and is designed to furnish just the kind of information desired by emigrants. Every Western and Sonthern State and Territory should not only have such an organization, reliably officered, but also advertise the fact as widely as possible. A small increase of population will indirectly make up all the expense, and much more; and multiudes of emigrants will escape a vast amount of uncertainty and swindling.

Comstock's Hand Cultivator, Onion Weeder, and Seed-Sower combined, which we offer as premiums, will be found one of the most useful implements in the garden. It affords to amateurs the right kind of muscular exercise, enabling them to accomplish a great deal of garden work without fatigue. By practice the operator in weeding will soon learn to run it close to the rows without disturbing the young plants, and the implement works so easily and beautifully that it is a pleasure to use it. See our Premium List, No. 55. Descriptive circulars sent to applicants.

sundry humbugs.—The list of awindlers, of which accounts have been received within a month past, is appalling! Sorting, sifting, and catalogmeing the bushels of letters, circulars, investigations, etc., before as, and condensing and classifying them, we find we have no less than sixty-five (65) different swindlers, and respecting the operations of single individuals, we have as many as fifty different letters detailing the attempt to fleece their several victims. If these 65 operators have scattered on an average only 15,000 letters each (some of them each send out 100,000 to 200,000 or more), they have tried their schemes on at least a million persons—probably many more. We will refer to a few.

Medical .- J. H. Tuttle, who (or his namesake) has been in various enterprises, is now making the kindly effort to farnish "electric bandages" for those weakened by self-abuse, etc. He says: "it is a well-known fact among physicians, that no man sick or well should fail at times to wear a bandage," etc., which is sheer noneense, or worse. No man should wear anything of the kind except after the examination and prescription of a reliable physician. Never send your money for any thing of this kind except to a well known, reliable party, if you expect to get what you pay for . . . . It would be amusing, were it not sorrowful, to see the awarms of poor nervous mortals that flock in companies and regiments after every self-dubbed peripatetic "doctor" who wanders through the country, especially in the South and West, sticking up his shingle at a hotel temporarily, and acattering huge bills -proclaiming his superhuman skill, his great reputation la N. Y. and London, etc., and professing to have made wonderful discoveries by means of which he is able to infallibly cure about every disease that flesh is heir to. As a rule, this class feed up their patients on atimulants and keep up their hopes and faith, until their money is gone, and then the doctor moves on to "fresh fielda and pastures new." Every such traveling doctor is positively a quack and a swindler.....The so-called "Benefactor and Medical Friend," issued at Albany, is a villainons sheet, and they will do the wise thing who at once burn the copies poshed into their hands through the mail. It abounds in falsehood as well as vileness and mischief ...It is passing strange that there are enough people so ignorant as to afford patronage to the advertisers of medicines sent out from N. Y. City, and elsewhere, as the prescription of some old granny, or ye Indian savage, ..... D. J. Henry Hodge of Owensville, Robertson Co., Texas, alias some other place, offers "Magnetic balls" for certain purposes, which they will not effect even were the results desirable. Better put the \$5 in your pocket, and pick up the first round stone; it will be just as good, and a deal cheaper than this humbug's pretended nostrum.... T. L. H., of Penn., and other inquirers, are informed that we have no medicine or medical advice to sell or give away. No man can prescribe for disease except a thoroughly educated physician who can personally examine the patient

Gift Enterprises .- Aid for the suffering French should be sent direct to the Relief Committees, and not to any pretended Grand Diamond Gift Concerts, said to be open at Washington, D. C., but for which the money is to he sent to parties in Broadway, New York. You are more in danger of being struck by lightning, than of ever seeing one of those "\$9,650 sets and separate articles, all in diamonds," offered to ticket-buyers at \$6 esch...... Another of these "Grand Gift and Musical" schemes, alias grand humbugs, is announced as to come off at Keene, N. H. If any new hands want to try their luck in this, let them first ask the advice of those who have been through the mill in San Francisco, Hamilton, Ohio, etc., etc..... A Gift Enterprise, alias lottery, is advertised at Denton, Caroline Co., Md., also at Wilmington, Del., offering engravings, farms, watches, sewing machines, etc., etc., and a psper, called the Caroline Pearl, is issued to advertise it. It is of a piece with several gift enterprises, which have so disgusted the participators during a year past. None but foolish people invest. Most of the gift enterprises in the country resemble one started in this city some time ago. A man tried to sell to various publishers (to those of this journal among others) some plates and lithographic stones, for printing large pictures, which had not sold on their own merits. The printed sheets would have cost, perhaps, 25 or 50 cents each, but they were not sold. Shortly after, a grand gift enterprise was announced, in which these same pictures were puffed to the skies, and purchasers invited at \$5 each, with the bait thrown in, that each purchaser would receive a ticket, entitling him to a chance (one in 15,000 or 20,000), to draw a great farm, or something else, attractively described ... If one wants pictures, the cheapest way is to see the pictures, and bny on their real merits, and not trust to exaggerated printed descriptions.

The "Queer," or pretended "counterfeit money" operators still abound. William Lewis & Co., 59 Cedsrstreet, N. Y., is a new name for James Fisher & Co., before exposed.....B. F. Cramer, Brooklyn, N. Y., is of Fulton-street, like character.....Francis Ogden, 131 alias Horace L. Austin, 5 Park Place, ditto, ditto, with the offer of tobacco stamps. The following are also of the same class; they make great pretensions of "dealing on the square," etc., etc.: James A. Holt, 9 Beekmsn-street; James Reed & Co., 62 Broadway, alias James Goodwin & Co., 67 Exchange Place; William Wade & Co., 59 Cedar-street; Albert J. Hackett, 85 street, and 11 Ann-street; William Copper, 688 Broadway; R. H. Foster, alias B. W. Howard, Fourth-street, Williamsburgh. Smith & Co., 22 Ann-street advertise in the *Tribune* for "Agents," and to inquirers they send circulars with tempting offers (to the dishonest) to buy their pretended counterfeits. All these parties either make no return for money sent them, or send off a box of saw-dust and old paper, C. O. D.; or, if they get their victims into their dens, fleece them out of all the money they have, as previously described by us (see Oct. No., p. 365). No one corresponding with them, or calling upon them, dares to complain, or appear as a witness, lest he implicate himself as one trying to deal in counterfeit money. So the swindlers go on safely, cheating other would-be swindlers....W. F. Langdon, agent of the U. S. & Canada Express, at Plymouth, N. H., writes us describing the r ceipt of C. O. D. boxes for parties with \$50, etc., to be collected. The boxes, after being paid for, are opened, and found to contain old papers, chips, etc. This is a sample of multitudes of similar reports from all parts of the country. The victima are scarcely to be pitied, as they are trying to secretly get counterfeit money to circulate.-Many letters, to and about these chaps, we have no room for.

Warious other SwIndles.—A pretended "Watch Company," with a great show of names of officers, and a picture of a "manufactory," pretends to give for \$4, a watch guaranteed to keep correct time for two years, in cases undistinguishable from gold, and for all practical purposea just as good as gold; all of which is sheer bosh printed on paper. There is not a new watch sold any where for \$4 or \$5, that is worth a dollar to any body but the seller. No one can now safely buy a watch, except of a well-known, responsible dealer, to whom he can surely return it, if not good, and get it put right, or his money back.....Every vinegar recipe of-

fered for sale is to be avoided, no matter by whom recommended. One of these was unwittingly indorsed by two college professors; but we have their own letters, positively withdrawing their indorsement.....Don't send a dime to any recipe-seller, no matter how plausible he writes and prints. This applies to a score or more. There is no money to be made with any of these recipes, except as you temporarily humbug others into buying them of you.....Very many of the advertisements "Agents Wanted at \$50, \$75, \$100 a week," and upward, contain a cat in a meal-tub, that will scratch you hadly if you touch them-so heware. In no case advance any money for samples, or accept them C. O. D., or to be paid for afterward.... Frank Lewis, 103 Ludlow-street, N. Y., promises a valuable secret for 25 cepts, but "no attention is paid to you, unless 25 cents is first inclosed to This is cool. We suppose there are people green him." enough to send 25 cents on such unsupported claims and promises; but such people ought to be scarce for their own good, and the good of the world .... The "Sunlight Oil," of which circulars, come, was exposed by us as a humbug in May, 1870. The "Great American Oil" is of like character. The \$35 a week promised is "all in your eye.".....Advance no money for Ink recipes or Powders, Substitutes, Corn-Extractors, etc.; the money will never be seen again.....Isaac II. Hitchcock, of Philadelphia, is sending ont circulars, offering for \$15 to sell a secret of saving 80 per cent of seed potatoes. We make this offer to him: If he will send as the secret, we will examine it. and will keep it secret, and if it seems plausible, we will tell a good many hundred thousands of farmers so, and how the \$15 will flow in to him! Until he accepts our proposition, we advise all our readers to hold on to their \$15. We would willingly invest the \$15, and get the secret, but we have no security that it will come, if we send the money. So, though we spend any amount of money freely for information promising to be useful to our readers, we can't make np our minds to this trial-it do n't look right !..... We repeat for the twentieth time, give a wide berth to all Destroyers of Insects on Trees by any powder, etc., no matter how well fortified by bogus recommendations. The devil himself could get up a number of recommendations of character-fictitions and otherwise. We once heard a clergyman say, in the pulpit, that the devil was a gentleman, and understood good manners, because he was brought up in good society—that he would enter no man's house (or heart) where he was not invited!. ... The (rbnbarb) wineplant humbug is alive again—a swindle that has cost the farmers of our country hundreds of thousands of dollars, and not n few have lost their farms by it, too. As a hnmbng, it beats the morus multicaulus "all to pieces." so-called "Enterprise Publishing Company" of Broadway, N. Y., will be advoided by all decent people, and they will take care that their sons avoid it. Any sending his money there, ought to lose it.... Swindling soldiers, is about the meanest act we can think of. Parties here and there, especially at the West, advertise to collect their bounties, and ask soldiers to send them a dollar or two for this purpose. Of course they pocket the money, and answer no further inquiries. Soldiers should con-sult with no one but a well-known lawyer of first-class character. Such men will give advice freely, and if they undertake the collection of hounties, will at most charge only a very small sum for necessary expenses..... Some RAILROADS allow peddlers to go through the cars and sell prize packages for 50c, gnaranted to contain silver or gold coin of 5c, or 10c, to \$10. These parcels contain 4c, or 5c. worth of candy, and very seldom over 5c. or 10c. It is a small lottery swindle, that ought not to be allowed. have recently seen these operators on the Erie, and the N.Y. & New Haven railroads. The news agents on some roads constantly thrust into the faces of respectable ladies the basest sort of semi-obscene illustrated journals. The nuisance ought to be obviated by the railroad officers, The missance ought to be obviated by the railroad officers, without requiring the public to come to the rescue...... A so-called "Spanish Policy," is advertised (by mailed documents) by G. B. Chappell & Co., 680 Broadway—a swindle..... A book, called "Silent Friend" extensively advertised, is to be let alone severely except by those who are anxiona to bny the sheer nonsense..... For the "Royal Havana Lotteries," many persons advertise themselves, as "Agents." Nine-tenths of these are swindlers who pocket your morey and give you require the "Royal Havana Lotteries," many persons advertuse themselves, as "Agents." Nine-tenths of these are swindlers who pocket your money, and give no answer, and your chance, through any real agent is not worth a sixpence a ticket. None but the lunatic or insane will in-a reasonable price, is useful. Some who have acted as agents complain of receiving it of poor quality from those issning good certificates. We have hardly time to investigate all these cases, and only insert this paragraph to put boyers on their guard....."Co-operative" Ins Companies are, in our opinion, not worthy of patronized, whether advertised by reliable parties or not. We have seen some bogus advertisers of them who of course pocketed all the funds received.... But our space is exhausted and we must wait until next paper before finishing the pile of ewindling schemes before us.

What to mix with Hen-Manure. "J. H. F.," Lima, Pa., asks what is the hest thing to mix with hen-manure to make a compost to put in the hills of corn. A mixture of hen-dung, unleached wood-ashes and plaster, frequently has a wonderful effect on corn. Whether they would not have just as good an effect if applied without previous mixing, has not been determined. If the ashes and hen-manure are perfectly dry, no decomposition or chemical change will take place when they are mixed together. But if moist, more or less ammonia will escape, and the plaster will not hold it. The only advantage of mixing these articles together, aside from the case of applying them, is probably this: When the dry hen-manure is thoroughly broken up fine, and mixed with the ashes and plaster, and applied in the hill, the moist soil soon induces chemical action. This produces more or less heat immediately noder the seed and favors germination; carbonate of ammonia would also be given off and would be absorbed by the soil immediately in contact with the roots of the vonug corn plants, and would, if everything is favorable, cause them to grow rapidly and assume a dark-green color. And we all know that nothing is more important in the management of a corn crop than to give the plants a good start. But care must be used in applying the mixture or it may do more harm than good by burning the roots. It should be well mixed with the soil and not come in direct contact with the seed. Some farmers apply it on the hill after the plants are up, just as they frequently apply plaster or ashes alone.

### A Run-down Rhode Island Farm.

-A lady-farmer in Rhode Island says: "I want to ask a few questions about bringing a run-down farm into bear-What is the best fertilizer, when stable-manure is out of the question, for meadows without plowing? What would be the hest to spread on a cornfield, with stable-mannre, or on a soil that is not very light?"-One of the best means of renovation for worn-out grass lands is a subsoil plow, run eight or ten inches deep at intervals of two feet, first lengthwise and then across. This should be done early in the spring, and followed with a dressing of two or three hundred pounds to the acre of finely-ground bone-dast, Peruvian guano, or a reliable superphosphate of lime. After several rains have fallen, and before the grass has become too high, it will be well to pass a roller over it, to smooth down the elevated tracks of the subsoiler. Any of the special fertilizers mentioned above would be well to use in connection with stable-manure for corn; one-half the amount being applied in the hill before the first hoeing, and the other half is to be sown broadcast before the second hoeing.

### The Cottage without a Cess-pool.

-A correspondent in Westboro', Mass., asks, with reference to the plan described on page 53 of the present volume, what effect frost has on the drainage, thinking that the drains must be closed in winter when the ground is frozen.-The author of the article referred to informs as that, with more severe frost this winter than he has ever before known in Newport, there has been no trouble; the drains having worked uninterruptedly. In a colder climate, like that of Massachusetts, the ground immediately over the drains, and for a foot or two on each side, should be covered with a coating of coarse manure, or some other protection, naless there is a sufficient growth of grass to keep the frost from penetrating to the pipes. The covering should, of course, be removed early in the spring, as no manuring of the land will be necessary beyond what the honse-drainage itself would supply.

### Multum in Parvo Pocket-knife.

The various combination pocket-knives, are almost always too heavy and clumsy to be constantly carried in the pocket. When in London, four years since, we chanced to find the one here illustrated that contained many useful articles in a length of 3 inches, and only weighing about 2 ounces. We have carried it ever since, and twenty dollars would not buy it if we could not get another. Its weight is not inconvenient in the pocket. The handle is of ivory .- Description: Fig. 1 shows it closed. a, fig. 2, is an excellent saw with double teeth; so that it cuts smooth on both sides. We have often ent off an inch board 3 or 4 inches and more wide. It is very handy to cut a notch in a stick instead of straining the hands in using a blade. We have found hundreds of occasions for using it. b, is a good pen, or nailblade; c, is a strong screw-driver, seen on one end of the closed knife (fig. 1). This we have also used hundreds of times on all sizes of screws up to an inch or more; d, is the large blade; e, is a very handy hook, useful for lifting stove covers, prying open small boxes, doors, etc., pulling on shoes, cleaning horses' hoofs, and in many other ways. It is rasped at f, and, when shut down npon the hollow, g, is a convenient small nut-crack. The flat back of e, when closed, is much used as a small hammer for driving

tacks, pins, etc.; h, is a brad-awl for punching or enlarging holes in wood, leather, harness, etc; i, is a good gimlet; j, is an effective cork-screw; k, when drawn out, is a good pair of twezers for extracting slivers, etc. and l, when drawn out, is a long, slim, pointed brad-awl, or punch, for many purposes. There is no end to the uses for the various parts of such a kuife. It has saved us a great deal of time that would have been consumed in looking after other tools. We have no doubt that it saves us as much, or more, than the annual in-terest on a cost of \$50 (one cent a day). After four years of constant use, every part is as good as new. We name it the "Multum in Parvo Knife"—" much in little." We have sent to London and Sheffield several times to

get two or three dozen for friends and for holiday

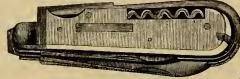

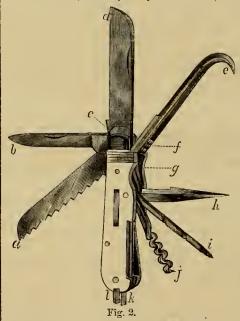

Fig. 1.

presents, but never succeeded in securing one with all the parts in so convenient a size and weight. The original maker is reported deceased. At last we called upon our Bronxville friends, Messrs. Smith and Clark, and we are happy to announce that they have reproduced for us a lot every way like the original-a little better, if possible. They can be sold at \$3.50 each, (sent by mail at same price). We intend them, however, chiefly as Premiums, and

make the following offers: One of ,nese Multam in Parvo Knives will be presented to any Boy (or man) who will now send us eight subscribers for the American Agriculturist for 1871, at \$1.50 each; or four subscribers for Hearth and Home, at \$3 a-year, to begin at any time. Or a club may be partly for both papers, counting one subscriber to Hearth and Home the same as two subscribers to American Agriculturist, or vice versa. It will also be sent for eight combined subscriptions—that is, eight subscriptions at \$4 each for the two journals. knives will be sent any where in our country, post-paid.

How much Food does au Animal require to Sustain the Vital Functions?— Mr. R. S. Hinman, of Conn., writes: "Walks and Talks,' in the February No. of the Agriculturist, says he 'cannot find any experiments that show the exact maintenance ration of well-bred cattle, etc.' In the same number he says: 'An animal will eat 3 lbs. of hay per day for each 100 lbs. of live weight.' I have a breeding mare, weighing 1,150 lbs, and a cow weighing, I judge, about the same that I have kept so far through the winter on 16 lbs, of hay per day, and I think they are in as good order as they were last fall. I fed the same to a couple of heifers coming two years old, with ealf, I suppose, but I find that growing animals need much more in proportion to their weight; and I find that full-grown animals make more manure from the same amount of hay than growing ones." These are precisely the kind of facts we want to get at—provided they are facts. All the evidence we have tends to show that, on the average, an animal that is growing, fattening, giving milk, or working, requires about 3 lbs. of hay or its equivalent per day for each 100 lbs. of live weight. And what we want to ascertain is,

how much of this food is used to keep up the animal heat sustain the vital functions and how much of it is left Mr. for the production of growth, or milk, or force? Mr. Hinman thinks about half the food is required for this purpose. If the animal is of a quiet disposition and is kept warm and comfortable, he is probably not far from right. But we believe that two-thirds would be much nearer the average. That is to say, that a cow weighing 1,000 lbs. and cating 30 lbs. of hay per day, would use 20 lbs. of it to "run the machine," and only 10 lbs. of it to produce growth or milk. But this is precisely the point we want to get at. And we hope others will make similar observations to those of Mr. Ilinman, and especially ascertain the exact weight of the animal before and after the experiment. In regard to old animals making more manure from the food consumed than growing animals, such is, of course, the case, provided the old animals do not use up as much of the food in fattening or in nourishing their young or in producing milk as the young animals do in producing growth. The difference, however, is farless than is usually supposed. The heifers referred to must have grown better than we should suppose they could on the amount of food mentioned if they took out, for growth, 5 per cent of the food consumed. It requires ral feeding and a well-bred animal to get 10 per cent of the food retained in the growth.

### About Railroads and Farmers.

During a business trip out on the Erie Railroad the other day, we were particularly impressed by the frequent announcement "Passengers change cars for the Railroad;" that is to say, every few miles there was some branch railway extending off from ten to a hnndred miles or more into a rich valley, so that the whole southern part of the State, but recently almost an inaccessible wilderness, is now supplied with a net-work of railroads that branch off from the great trunk line like the limbs or roots of a tree. And this is the case with the various truck roads leading from the Atlantic sea-board westward. Each one of these roads, by bringing the regions through which it passes nearer to a market, greatly increases the value of every acre of land, and every house, for a wide distance on each side. We doubt not that it could be demonstrated that there is hardly a region penctrated by a railroad where the real estate has not advanced enough to pay the entire expenses of the road. For illustration, suppose we estimate the cost of the railroads to average \$31,680 per mile, or \$6 per foot. If we confide the benefits to a strip 614 miles wide on each side, each foot of railway would then benefit 11/2 acres, and if taxed upon the land would amount to \$4 per acre. Is there a region penetrated by a railroad where the advance in real value has not been more than twice \$4 per nere on the average?......The annual interest on \$4 we will call 30 cents. That is equal to 2 cents per bushel on 15 bushels of wheat, or 1 cent per bushel on 30 bushels of corn; or 30 cents on a ton of hay, and so of other prod-Is there a point reached by a railroad where the advance in the value of produce has not been many times greater than this? It would be nearer the mark to say that the advance in price is enough to pay for a new railroad every year. The inevitable conclusion is that railroads are of an inestimable value to the agricultural regions of our country, and we bail with pleasure every new railway enterprise, no matter where it is located.

As above stated, every great trunk railroad is the center or main artery of a wide system of branches. This is true of the N. Y. Central R. R., the Midland R. R., approaching completion, the N. J. Central and Pennsylvania Central, and the Baltimore and Ohio R. R. And now we are soon to have still another further sonthward, the Chesapeake and Ohio R. R.—which will have advantages of grade, climate, etc., even more favorable than any of The construction is in rapid progress, and the others. will be finished by the middle of next year. All of these trunk lines, aided by their many branches and their through business from the great West, have proved profitable—at least their first mortgage bonds are, we believe, at par or above, and there is no doubt whatever that they will continue so. They furnish a safe, good interest-pay ing investment for any surplus funds. The Chesapeake and Ohio R. R. offers a comparatively moderate amount of bonds per mile, as stated in the advertisement of Messrs, Fisk & Hatch in another column, and these bonds are especially inviting to all who have money to invest.

Corn-husking Machine in Kansas.—A couple of young men at Mission Creek, Kansas, who "have each a homestead, and intend to make farming their business," wish to know if it would pay them to bny a husking machine. "There is but one thrashing machine in this section, and it pays well." No doubt; and so will the hasking machine when it is brought to the same degree of perfection as the thrashing machine. Until this is done, we would advise our young friends to stick to the farm and not invest their capital in new machines. They can use their money to better advantage in improving the land and introducing good stock.

American Agricultural Annual for 1871 .- Though tardy in making its appearance, this Annual has lost nothing by the delay. variety and value of the articles has been more than maintained, and the Farmers' Directory, which has been for two or three years a prominent feature, has been much extended and better classified, giving the addresses of reliable manufacturers and dealers in seeds, fertilizers, implements, and live-stock over the whole Union. The Annual contains, hesides the usual review of the year, and the prospects of the year to come, with the notes upon Progress in Dairy matters, Veterinary Medicine, Fish Culture, and the record of valuable Agricultural Inventions, etc. Articles upon Peat for Fuel, Steaming Fodder, Gas-Tar Walks, New Harrows, Fish for Sport and the Table (Black Bass); on Leguminous Plants, by Joseph Harris; on the best Potatoes of 1870, by Dr. Hexamer, on Mutton Sheep and other articles of practical value. Many of the illustrations are of rare excellence. There is a complete list of the agricultural and kindred papers of North America, and of the books of the past year having even a remote reference to agriculture.

The five volumes now issued form a neat Farmer's Library of themselves, containing really a great fund of very valuable information upon many topics. They each contain 152 pages, are beautifully illustrated, and are bound either in enameled paper or cloth covers. The price per volume is 50c. in enamelled paper; 75c. in cloth. Sort post-paid on receipt of price by Orange Jndd & Co., 245 Broadway, New York.

Lands in Iowa.—J. H. W. We must decline publishing such letters as yours; if we allow one to present the claims of his locality we must allow all to do so, and we could easily fill the paper with nothing else.

Grabs in Cattle.—C., Oregon City. The grubs under the skin of cattle along the back, come from an egg deposited by a fly. The common name of the trouble is warbles. A full account, with illustrations, was given in August last. The grubs may be killed by pressure, or by pricking them with a hot sharp wire.

Hog Disease .- J. M. Mitchell, Knob Noster, Mo., Mar. 6, 1871, writes: "I wrote you a month since referring to a hog disease prevailing here. Since that time this neighborhood has lost probably 1,000 hogs. The disease or diseases seems to resemble Measles, Pneumonia, and Erysipelas as described by Youatt and Martin. One additional matter has been noted, viz., the existence of large balls of small worms in the windpipe of the Pneumonia cases—no pleurisy."—All the symptons and lesions you describe, are those of malignant or irregular Measles or Rubcola, which has broken out in the epidemic form in your neighborhood. The causes are little known—want of cleanliness, atmospheric changes, individual predisposition, and contagion, being the principal ones. It is a blood disease, usually associated with severe derangement of the bowels, also with pulmonary troubles; in the first case often called blue disease, or hog cholera. The treatment in mild cases is generally simple.—great attention to cleanliness, free ventilation, and little medicine. If the eruption is slow to appear as in severe cases, diffusible stimulants such as comphor and carbonate of ammonia may be used with good effect. Much benefit is also obtained from elder-flowers. and chamomile teas. Inoculation has not succeded yet in producing a milder form of the disease."-[The former letter of this correspondent was sent to the Veterinary Editor, but was accidentally mislaid and nnanswered.]

A Word to "The Farmer."-There comes to us by the foreign mail a paper called "The Farmer-The Farm-The Field-The Forest-The Garden -A Journal for the Country House." This journal is pubin London, Edinburgh, and Dublin. Having reached its 16th volume, one would think it ought to have arrived at years of discretion and a knowledge of the distinction between meum and tuum. A frequent inspection of this "Farmer "shows it to be a most unblushing literary thief. For months it has published the "Tim Bunker Papers" as if they were original contributions. There was no accidental omission to give credit, as it has adapted the articles to the English render by the use of £ s. d. instead of our currency, and various verbal changes have been made, to try to give the papers an English air. This is, of course, a lame attempt, as the papers are so thoroughly American in character, that no intelligent person can be deceived. Besides this, "The Farmer" has taken whole chapters from books published by ns, and used them in its pages as communications, signing the name or the initials of the author, to make it appear as if the matter were written expressly for its columns. We have allowed these things to pass unnoticed notil, emboldened by our silence, "The Farmer"

has committed an outrage upon propriety which calls for the punishment of exposure. Timothy Bunker, Esq., is the nom de plume which a well-known agriculturist and agricultural writer uses for a certain class of his articles, and is as much his own property as "Boz" was that of Dickens, or as "George Elliot" is now that of Mrs. Lewes. What would be thought of a writer who should sign an article George Elliot? He would be branded by the whole press as a literary forger. This is exactly what this "Farmer" has done. Not content with stealing Timothy Bunker's" articles, it now filches his good name. In "The Farmer" for Jan. 30th we find a note, in which the writer says that, not being in a writing humor, he has prevailed upon Mark Twain to send an account of his experience as an agricultural editor-and this note is signed "Timathy Bunker, Esq.," with a coolness that could only come of a long persistence in the habit of appropriating other people's property. We know that there is no written law to prevent these things, and our only redress is in exposing its thievery and forgery.

Great Mortality among Swinc.-We continue to receive a great many letters from different parts of the United States and Canada, in regard to the diseases of pigs. A farmer in Ohio writes that he has lost over 60 pigs. We cannot tell, from his description, what the disease is. He sends us some of their teeth, which are discolored at the top, and asks if the disease can be the "black tooth." We have seen many healthy pigs with teeth much blacker than those he sends us. Black teeth may be an effect, but cannot be a cause of the disease. His pigs are "fat," and have been fed on middlings, shorts, and corn-meal, cooked, with a little raw corn. We could not wish for better food, and we sre assured that they have had good care and treatment. And many others make similar statements. We cannot account for this great mortality, unless the ancestors of the pigs have been badly treated. The whole subject needs thorough investigation. We would advise not only good treatment of the pigs we have, but also the exercise of great care in selecting animals to breed from that have for several generations back also received good treatment, and which were selected to breed from because of their health, vigor, and general superiority. aware that it is a difficult matter to find such pigs, but this, at any rate, should be our aim. We can suggest no remedy for pigs actually diseased. As a rule, the best thing to do with a sick pig is to make soap-grease of Our whole attention must be turned to keeping the stock healthy.

Inflammation of the Lungs in Lambs. - The most fatal disease to which lambs, especially of the English breeds of sheep, are subject, is inflammation of the lungs. When once attacked, it is rare that a lamb recovers. When a farmer loses a lamb, he When once attacked, it is rare should examine the lungs, and if inflamed, or there are parts which look somewhat like liver, cut out a piece of this inflamed part and throw it into water, and if it sinks, we may conclude that the lamb had what physicians call infantile pnenmonia, or inflammation of the Inngs; and the next lamb that is taken sick, if the symptoms are similar to the one that died, may be treated for this disease. And, what is more important, we should take immediate measures to prevent the spread of the disease. Not that it is infections, but the same causes that produce it in one case will be likely to produce it in others. It is not believed to be hereditary, though we have known a lamb die of the disease in less than twenty-four hours after it was born. We shall, probably, be safe in concluding that there is something wrong in the management of ewes and lambs. Damp and poorly-ventilated sheds, barns, or cellars, wet or fermenting manure, that the poor sheep and lambs are compelled to lie on, or exposure to draughts of cold air, are among the most frequent causes of this fatal disease. The month of March and beginning of April is a particularly trying time for young lambs. Better have them come in February, or defer it until the latter end of April or May. In the steady cold weather of February lambs will do much better than in the damp, rainy, cold, and changeable weather we frequently have the latter part of March and beginning of April. The rain and melting snow make the previous damp, and we sometimes have a warm day, with the thermometer at 75°, followed by a night ten or fifteen degrees below the freezing-point, and the sheep-breeder who has not every thing properly arranged will be likely to suffer great loss. We know a farmer who, two years ago in March, lost fifty nice Merino lambs in two weeks, "and yet," said he, "I kept them very warm in a base-ment-cellar." They could not have been in a worse place. Had he put them on the barn-floor, or in the bays above the cellar, he might have saved every lamb. Dry cold is not half as had as warm dampuess. Comparatively little can be done for a lamb attacked with inflammation of the lungs. The first thing is to put it in a warm room, and wrap it in flannel; or, what is better, make a

flannel wrapper for it. Put some tineture of cantharides on the chest, or, in the absence of this, a mild mustard-blister; give half a teaspoonful of castor-oil and 3 drops of landanum, and repeat the latter every four hours; give a little warm new milk frequently, but not too much at a time. If taken in time, the lamb may be saved, but rarely otherwise. Should it get better, it would be well, when it is taken back to the ewe, to put them in a pen by themselves, and to leave the flannel wrapper round the lamb for a few days.

Price of Wheat in Councetient Eighty Years Ago .- Mr. L. M. Lane, in looking over some old papers, came across a table his grandfather had prepared, showing the price of wheat per bushel at different times, from 1790 to 1818, and he has forwarded it to the Agriculturist. From February 12, 1790, to April 12, 1791, the price was 5s. 3d. The next year it was 4s. 6d., and the next, 4s. From February 11, 1792, to January 12, 1795, it was 4s. 6d, and during the next two years it was 9s., showing that prices fluctuated then as much as they do now. In 1798, it was down to 6s., and in two years, up to 9s. again, and the next year, 10s. 2d. In 1803, it was down to 6s. 4d., and in 1805, 1is. 9d; in 1808, 7s. 6d., and in 1810, it reached 12s. In 1813, it reached 12s. 6d., which is the highest figure reached during the twenty-six years. In 1816, it was 10s. 6d., and in 1818, The prices are taken from Mr. Lane's own books, and the table is prepared with great neatness, and doubtless with much care.

MILE-ROOMS.-Mr. A. O. Bagley, of Derby, Vt., asks for a plan of a good milk-room. He describes a room built by his father many years ago, which for some unknown reason is useless. It is 15 x 20 feet, 3 feet below the ground, and 6 feet above it; the foundation-wall and floor being of stone. It is ventilated by a door at one end and a window at the other. The thermometer stands, during hot weather, at about 60° in the lowest part, and 65° in the highest. Still he does not get more than two-thirds of the cream that he does in another room where the thermometer stands at 80° at the same time, and the cream is of no better quality .- Unless his thermometer is incorrect, we are at a loss to account for the difficulty. Common thermometers are often faulty; and if his marks two or three degrees too high, then his cellar milkroom is too cool; for 60° is the lowest that should be allowed under any circumstances, and unless the ventilation is very free, 65° would be better. We would suggest the experiment of putting another window in the side of the room that is most exposed to prevailing summer winds, so as to secure as free an admission of warm air as may prove to be necessary to secure the best product of cream. We know several milk-rooms, built on the plan of this one, that are entirely satisfactory; and in all successful milk-rooms, arrangements are made to keep the temperature down to 65°, or lower. About Philadelphia, where the best butter is made, they sometimes use spring-houses, built of stone, in the side of a bank, setting the milkpans in water of even less than 60° temperature. Others have dry milk-cellars, the whole of which, except room for ventilation at the eaves, is below the surface of the ground. In these rooms cream rises much more slowly than in a warmer temperature; and it is possible that our Vermont friend would have more cream if he gave it a longer time to rise.

VALUE OF CLOVER. — Mr. Harris, in his January "Walks and Taiks," falls far short of my standard of faith in the manurial influence of clover. I believe, and I think I have had good reason for the belief, that "necessarily and immediately the actual field" on which an abundant crop of clover has been grown is much richer by it, though two cuttings a year for two years may have been removed entirely

from it. As Dr. Voelcker's experiments clearly prove, there remains in the soil, after the removal of the crop, an enormous weight of clover roots, which on their decomposition supply, in an available form, a large amount of plant food that this vigorous feeder has collected largely from sources that would have been inaccessible to the finer tendrils of wheat roots. Furthermore, clover roots penetrate deeply into the subsoil, and when they decay they leave open a well-furnished and inviting channel by which the roots of more delicate plants can descend beyond the influence of drouth. This is in addition to the accumulation of nitrogen in the substance of the roots, and in the fallen leaves of the crop. Whatever the reason may be, the fact is most obvious whenever I have been able to observe its effect, that the growth of clover has invariably added to the apparent fertility (the available fertility) of the soil. The good effect is much more obvious after two years' growth of the clover.

### Tim Bunker on Selling Land.

----

Mr. EDITOR,—"Ye do n't say ye're gwine to sell that Horse-Pond lot and the Mash, do ye?" inquired Seth Twiggs, with an astonished air, as he walked up to my shed where I was chopping and splitting wood. It was a bitter morning, and the frost hung upon Seth's long beard and whiskers like a mantle of snow, and the smoke curled up from his pipe as from the top of a chimney.

"Why not?" I asked. "The time to sell any thing is when you can get your price for it; and Deacon Smith has offered me more than I think the land is worth to me for farming purposes."

"I should as soon have thought of your sellin' your house, blam'd of I should n't, Squire," said Jake Frink. "I did n't s'pose you could buy that hoss-pond lot of you kivered it with greenbacks, it growed such smashin' big crops sence you got hold on 't."

"And did ye say the Deacon was gwine to buy the Mash, too?" inquired Uncle Jotham Sparrowgrass, as he knocked his cane against the hickory log on which I was chopping. "The Deacon is a master critter to get hold of land, He's allers wanting more."

"And what 's the price?" asked George Washington Tucker, who is a good deal worried about the price of land, as most landless people are apt to be.

"Four hundred dollars an acre," I answered, "cash down. The Deacon never runs in debt; has always paid as he goes; and if you had gone on that principle, you might have owned the best farm in Hookertown to-day, instead of living in a wood-colored house, with old hats in the windows. It was running up scores at the tavern, and at the grocer's, and at every place where they would trust you, that fixed you, and always kept you a poor man."

"Four hundred dollars an acre! What a price for land in Hookertown!" exclaimed Benjamin Franklin Jones. "It will sartinly be the death of us; and we might as well get into our graves at once, to find a spot where we can rest. I s'pose I shall have to move agin, Squire, this Spring."

"May-be not," said I. "The Deacon has got to let the house to somebody, and if you pay the rent promptly I suppose he will let you stay."

"That, you see, is just where the shu pinches. I have been bothered to death to pay the rent to you, and 400 dollars an acre means higher

rent next year. Land is gettin' skase, and I shall have to emigrate."

My neighbors are at a loss to know why I

will sell land that is producing such crops as

grow on the Horse-Pond lot and the Marsh-

two and three tons of hay to the acre, selling this year at 30 dollars a ton. It pays a big interest. I expect that was what Deacon Smith looked at, when he offered me four hundred dollars an acre for it. Then it was as productive grass land as lies in Hookertown, requiring very little care to keep it up, and never wanting the plow, save with top dressing, to produce paying crops as long as grass grows anywhere. Banks fail sometimes to make dividends, and sometimes fail entirely. Since I knocked the hottom out of that pond-hole, the Hookertown bank has gone up entirely, and the stockholders will not get the first red cent of their capital. It used to be thought as good as Government bonds. I was fool enough to buy bank stock once. That thousand dollars haunts me yet. Not a dollar ever came back again. But this land that I bought of Jake Frink, thirteen years ago, for forty dollars, has given me nothing but satisfaction. I got rid of a nuisance by draining it. That has been a comfort every time I have looked at it, and I have seen it about every day since. It produced big crops, where nothing but green grass and hard-hack grew before. That was a sight worth seeing. The cattle ate the hay well, and that was cheerful, and grew fat and sold for eash, which was not bad to take. The improvement of the land cost me nothing, for the first two crops paid for every ditch and tile put down, and left a surplus. I have now sold for 800 dollars what cost me but 40 dollars. The purchase is a good one for Deacon Smith, and the sale a good one for mei.e., I can afford it. The Deacon has not so much taste for poor land as I have; don't like novelties so well. He is contented with three tons of hay to the acre straight along. I get sick of one thing after a while, and after raising that crop for a dozen years, I had rather begin on a new piece of worn-out land or swamp, and astonish the harren acres with new crops. The Marsh has not increased so much in value, because it was not so well purchased. It cost a hundred dollars an acre, and sold for 400 dollars. There was a strip of upland with it that will answer for building-lots, so that the price of the Marsh reclaimed perhaps might not be stated at more than three hundred dollars per acre. An increase three-fold upon stock that has paid regular dividends of 10 per cent for thirteen years in succession, would be considered a fair business by bankers or railroad men. I find a good deal more satisfaction in buying poor land, and fixing it up, than in holding on to land that is producing about all it can. This sale of land to Deacon Smith will give me capital enough to buy another piece of marsh four or five times as large as the old, and to reclaim it. That improvement led to a good many others in the neighborhood; and as the story was told in the Agriculturist, it led to many more in other parts of the land. I have visited two in Massachusetts, upon a much larger scale, and I have heard of one, at least, in California. I calculate that the country is richer by a good many hundred thousand dollars for this Hookertown experiment. You see the light that is put in your candlestick shines a great way, and helps a great many people. Mrs. Bunker sends her respects, and says she hopes you will keep shining.

Hookertown, Conn., Yours to command, Feb. 7, 1871. TIMOTHY BUNKER, Esq.

Ogden Farm Papers.-No. 16.

I have, in my time, lost two good "native" cows by milk-fever, and I have seen enough fatality from this dreadful disease among my neighbors' cattle to have made me fear it more than any non-contagious ailment that ever appeared in a herd, and to give some attention to studying its character and treatment. The first result of my examination was a conviction that the worst thing to be done in the premises, is to call in the assistance of a country cow-doctor, with his drugs and lancet—and the best, to leave nature the fullest control of the case; adopting always such aids as warmth, quiet, and cleanliness, and, above all, the utmost care of the diet as a preventive measure.

It is reported that cures have been effected when the disease has progressed so far that the animal can no longer rise, but I have never seen such a case, nor would I have much faith in recovery at this stage under any form of treatment-least of all under the violent handling of common farriers, who know nothing beyond the recipes of a school, whose science is sealed to them, and who lack the judgment of its trained practitioners. I would always appeal to a sensible physician rather than to a cow-doctor; but the latter is often an excellent nurse, and will be a valuable aid to the physician, if he can only be made to leave his lancet and his bottles at home. The worst thing about the country farrier - after his remedies - is his "gab." He always "knows all about it;" and he has a power to bully a farmer (who knows nothing himself, and who is helpless to prevent the death of his beast) that is difficult to resist. But it must be resisted or all is lost.

As most farmers are so situated that they cannot procure proper aid for the treatment of such sudden and severe illness, it will be well for them to know what to do to avoid it, and, so far as it is in their power, to help nature to cure the disease when it does arise. The great safety lies in prevention.

From three days to a month before the calving time-longer with a large milker or a fleshy animal than with a small milker or a lean oncstop all feed except dry hay; if there is much milk in the bag, milk it half out three times a day, even two or three days before calving; if the bag is hot and hard, rub it every hour with the hand wet with cool water. After the calf is born, give the cow half a pailful of warm water with a little bran or flour in it, not hot and not too much. Give absolutely nothing beyond this one drink, and now and then a little warm, pure water, for twenty-four hours. The great source of danger is in food given before or soon after calving. There is no safeguard like starvation -and nothing will so surely prevent fever. On the second day give a warm mash-a pailful this time-and about a quarter ration of hay. The next day give a half ration. Until after the fourth day do not give even cool water to drink, nor so much hay as the cow would like, nor any other food whatever. The danger will now be passed, if the food is gradually increased in quantity and in richness. Another week of good feeding will bring the milk to its full flow. If the calf is removed at once, the cow should be milked from three to six times a day, according to the quantity of milk in her bag, until after the fourth day, and then gradually reduced to the regular milkings. I think ten drops of tincture of aconite on a bit of bread given once a day until the milk flows regularly would add very much to the security of the treatment. But the great cause of the fever is kindness. Wo

all have an insane idea that food is the great cureall, and your country cow-doctor will pour gruel through a horn into the stomach of a cow that is down with milk-fever, when she is already bloated with the gases of her undigested food, and burning up with a fire to which his food is only additional fuel. What we want to do is to get the food out of the cownot to pour more in. Our fault has been in giving too much. Until health is fully restored, and the cow raises a natural cud, the less she gets to eat the better-she ought to have absolutely nothing. Have no fear of starvation. No cow falls with milk-fever without food enough in her stomach and fat enough on her bones to carry ber safely through any duration of the disease, and the great fear is that she has too much of both. I believe in high-feeding in health and high-starving in all febrile disease.

There is little or no danger with heifers calving for the first time, and the disease is less frequent in winter than in summer.

I wish we were a more thorough people and did not do things on so cheap a basis. Especially would it be well if we used a little more wrought-iron instead of east-iron. During the frosty weather, an important casting of my wind-mill was broken. I soon had a new one with which to replace it, but the weather was, incessantly, too cold or too windy for the renewal to be made. During all this time, we were suffering immensely for want of water, The two wells near the barn were nearly dry, the pond frozen nearly to the bottom, and it was with difficulty, and at great outlay for labor, that we could scrape together barely enough to water the stock and to make steam for driving the cutting machine and grist-mill. We could not get enough clean water for wetting the cut feed, and so we could not steam it; thus an important advantage of the machinery was lost. Had the piece in question been made of wrought-iron, all this bother would have been saved, and we would not have lost more than its cost in labor and in inability to cook our fodder. The milk and butter, too, fell off seriously in the absence of the steamed forage to which the cows are accustomed-possibly, too, from their not always having water at hand.

There is a great advantage in having a tight, warm, well-ventilated barn, and as I went about among the cattle in the bitter, winter weather, I could not help thinking, that, however poor I might be, if I were going to start afresh in farming, I would make a snug, comfortable, airy stable the first object of my efforts; for, in cold weather, while badly sheltered animals were piling in all the hay they could get to keep up the animal heat which was being constantly robbed from their coats by the cold air moving about them, mine seemed not to be eating more than in mild, winter weather. They never looked better and never seemed more flourishing.

I commenced last fall a new extravagance, and I am satisfied that it pays well. I had hitherto wintered my young calves on the same food with the yearlings, and always succeeded in bringing them through the winter in tolerable condition—quite as good as the average. This winter I have given to each from half a pint to a pint a day of whole oats, and I am satisfied that they have grown as fast as they would have done on summer pasture. The growth, too, is of the right character—in the bones; they are thrifty and lusty without being at all fat,

and I think have a better chance of becoming copious, bony cows and good milkers than if they had received only the usual rations. Some of my neighbors feed corn-meal to their calves, and I observe that the effect is very different from that of oats, producing less development of bone and more of fat—the opposite of what we want in milking stock.

We have had some reason to apprehend trouble from the cattle disease (Epizoötic Aphtha), as there have been several cases on the Island and much of it in different parts of the State. We hope to escape it by applying, in addition to the strict measures adopted by the State authorities, a rigid system of quarantine for our own farm. No horned eattle, sheep or swine are allowed to come upon the place under any pretext, nor are our own animals allowed to go upon the highways—the oxen being used for home work only. If this system were adopted by all farmers in whose vicinity the disease breaks out, its spread would be prevented and it would die out in a few weeks.

After weighing the question of corn-growing in all its bearings, I have concluded to make the experiment of giving it up. This year I shall grow none for grain. Instead of it I shall put in double the quantity (nearly twenty acres) of fodder corn, perhaps even more. In this I am "experimenting," for I have never known fodder corn to be largely grown as a substitute for hay. It may be a failure, but I think the chances are good enough to justify the trial. My reasoning is this: If corn-stalks that have produced and ripened their ears, and are only cut when fully mature, and containing their full measure of woody fibre, are a good forage for milch cows-and they are-younger stalks, which contain in their sap much of the material from which grain is formed, have very little woody fibre, and are sugary and tender, ought to be much better. The rock on which there is the most danger of splitting is the difficulty of getting the fodder sufficiently cured to store without molding. I think this may be done if we treat it as we do ripe corn fodder, save that it should be well dried, lying on the ground until thoroughly wilted, before being shooked up. Then the stacks must be small and they must stand for some weeks. When they are well dried I think the bundles may be put up in small stacks with safety. By the middle of November the stalks may be moved away with hay, unthrashed oats, or other well-dried forage intermixed in layers. It will be none the worse for feeding for the admixture.

After all, corn is one of the grasses, and I am inclined to think that if we can overcome the difficulty of euring, it will be the best of all from which to make hay for milch cows. As to the quantity that may be produced from an acre, I can form no just estimate, but I believe it will be less than those who have only used the crop for soiling would suppose. If the amount could be brought up to five tons per acre even under the best circumstances, I think we may be satisfied. From the trial I have had of its quality I believe that it will make as much milk or butter, ton for ton, as the best quality meadow or clover hay. However, this is only an opinion, and I hope to know more about it next winter and to report satisfactory results.

It is pleasant to see that the teachings of brother Harris, as they have been set forth in his invigorating Walks and entertaining Talks on the Farm, are taking root and producing so

good an effect. This is observable in many ways, but especially with reference to Essex Two years ago I was offered animals of this stock at quite moderate prices from all sources. A short time since, my own litters having been sold down to low-water mark, and applications constantly coming for more, I applied to all the breeders within my knowledge for young animals to supply the demand. Only one among them all could offer sow pigs even at \$30 cach, and when I wrote a few days after to say that I would take them, they had all been sold to go South. I think that the simple fact of his influence in extending a knowledge of this breed, is an ample "reason to be," as the French say, for all his writings, for there is no direction in which so widely valuable an improvement is likely to be effected as in the general introduction of these swine. The "improved" Berkshires may be as good-I have never seen them; it is hardly possible they should be better.

Speaking of pigs, I hardly know which makes me the more glad, the rise of the Essex or the fall of the Chester, for a considerable experience and much more extensive observation have convinced me, that of all mongrel-bred, mix-blooded brutes that ever had a name given them, the Chesters are entitled to the palm. I have three or four of them now, bred from parents (not akin), purchased from the best breeders in Chester Co. and warranted pure Chester, among which a skillful zoölogist might find clear traces of at least a half-dozen distinct porcine races. The only quality in which they are all alike is the size of the ears. If there is any difference in them in this regard, it is that one has larger ears than the other. There seems to have been an effort of nature to prove how much ear a given amount of pig can earry, and any one of them would supply material enough to furnish the ears of my whole family of Essexes-father and mother and six children.

In my reports made last summer of experience with Thomas' Smoothing Harrow, I expressed the opinion that it was not so good as the inventor believed for the cultivation of corn. I think that this was the opinion of many others who gave it a fair trial. Mr. Thomas has, since that time, made several important modifications of the implement with a view to overcoming the difficulties suggested. So far as I can judge without a trial, he has probably succeeded, and it is especially noteworthy that he offers to supply the new implement to those who were dissatisfied with the old one on very fair terms. Whether the new tool will be a complete success, of course only a season's trial will show, but what it proposes to accomplish—the entire work of cultivating field-corn without hand hoeing-is so important as to justify a thorough trial, and the fullest publicity of the result.

### Riding on Horseback.—No. 2.

The practice prescribed in our last having been persevered in until the pupil has made himself perfectly at home in the saddle, and so suppled his loins that the motion given to the upper part of the body has no effect on the seat, he may now resume the stirrups and learn their use. They are very important as a matter of convenience and comfort, but they should aid a rider to easily regain his seat when he has lost it, rather than to keep it. It is very fatiguing to ride, even at a walk, with the legs dangling at the horse's sides, and especially so when they are kept in the position indicated in the previous

article—the only position that can give a secure seat. In walking, a gentle support of the stirrups will help keep the body from swaying from side to side as the horse moves. In trotting, where stirrups are almost indispensable, they enable the horseman to either "rise to the trot," or to so distribute the shock in "riding hard," that it shall be no shock at all, but an easy, quick movement, distributed between the feet, the seat, and the thighs.

The length of the stirrups should be carefully attended to. Take the proper position in the saddle, with the whole inner part of the thighs, as far down as the knees, pressing firmly and immovably against the saddle, and the legs below the knees hanging vertically-the toes pointing a little downward. Then have the stirrup-leathers so adjusted that the irons will just touch the hollows of the feet, giving them support without raising their position. There will then be no danger that the stirrups will disturb the seat, either by raising the knees or by the effort of the rider to reach down to them when the straps are too long, while by drawing back the feet, so that their balls rest on the irons, a leverage will be given-from the balls of the feet to the ankle-joints-that will be sufficient to maintain an even pressure, even if the person is thrown a little from the saddle by the movement of the horse. As men's legs and their arms are generally of proportionate length, and as the stirrups are usually fastened a certain distance down on the sides of the saddle, the stirrups are of the proper length when the whole length of leathers and irons is a trifle less than that of the arm and hand; that is, lay the tips of the fingers on the band of the leathers where they pass around the bolt on the saddle-tree, and draw the irons toward the arm-pit. If they just touch the muscle under the shoulder-blade (not reaching away into the ribs), the straps are usually of the right length.

In ordinary riding, it is best to have the ball of the foot touch the stirrups, as the play of the ankle-joint gives more elasticity to the support; but in rough galloping or leaping, it is best to "drive the feet home," and carry the stirrup in the hollows. Especially must small stirrups be avoided. The irons should not, of course, be so large that the boot-heels can, by any accident, get through them, but there should be ample room for the foot to be thrust in and out with

Fig. 4.—MCCLELLAN SADDLE.

perfect freedom. This will be one of the best safeguards against the worst mishap that can befall an unhorsed rider—that of being dragged

by the heels by a runaway horse, owing to the binding of the foot in the stirrup. There have been numerous devices made to prevent this calamity. The only one of them that is even

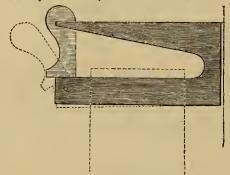

Fig. 3.—SAFETY STIRRUP.

tolerably sure (and that one is nearly perfect), is shown in fig. 3. This is simply an arrangement for closing the back part of the iron by which the stirrup-leather is fastened to the saddle,

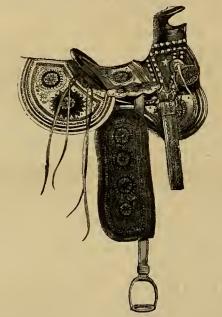

Fig. 5.—MEXICAN SADDLE.

with a movable piece held in place by a spring, exactly as the blade of a pocket-knife is held. It takes a sharp jerk to open this catch, but (unless it is allowed to become fastened with rust) it will yield to much less strain than that of a falling rider. These safety irons are attached, as a matter of course, to all English saddle-trees. At some future time, we shall enter at length into the question of the construction of saddles, but the beginner is most likely to use the saddle that he can get most conveniently. Whether this is a "McClellan" (fig. 4), saddle, a Mexican (fig. 5), or the better English (fig. 6) saddle, is not very important at the commencement.

Precisely as he has schooled his muscles to the requirements of his new position without the aid of stirrups, so must the learner now learn to make proper use of them, and he should attempt nothing further until he has learned how to use these accessories—that is, how to use them as accessories only, not as an essential dependence. Their most important office is to rest the legs, and to relieve the muscles of the fatiguing work of keeping the seat firm at all times. So long as there is no unusual disturbance of the position, it is well to depend mainly on the stirrups to preserve it; but any sudden start, in whatever direction, should find the knees and thighs at once ready to perform

theif duty of grasping the saddle. This cannot be the case if the weight is thrown too much on the feet; but it is also important to learn to stand in the stirrups (while the horse is in motion), turning so as to look to the rear, and to throw the weight first on one foot and then on the other; in short, to assume every possible position rapidly and easily, for all this adds immensely to the security, freedom, and grace of the seat. It is only in this way that one can hope to become so perfect a horseman as to justify the old description as being "a part of the horse," of "seeming to grow out of the horse's back."

This branch of the subject-acquiring a good seat with and without the aid of stirrups—may be appropriately closed by a quotation from "Man and Horse": "When you can sit your horse perfectly in his trot and canter, you possess a seat such as not one rider in half-a-dozen ever acquires. You are still far from being a good horseman. You cannot, indeed, properly speaking, be termed a horseman at all. But you may look forward with confidence to becoming what most men would consider an excellent horseman; because you have had the patience and perseverance to drudge on until you have been bumped and jolted into a smooth and solid union with your saddle. It is by the absence of this union, and by the abrupt shocks and displacements to which they are consequently exposed, that so many riders are disabled from acquiring the proper use of their hands and legs; consequently from ever becoming masters of their horses."

The next step should be to free yourself from your bondage to the person who has up to this time managed your horse for you; and a real bondage it is, as you will find when you first attempt to take him in hand yourself. You may even have been somewhat accustomed to riding before your present exercises commenced, yet you will feel very awkward when you first attempt to repeat your lessons while managing the animal yourself; for the mere fact of having to do something with your hands will have a tendency to constrain your position. It gives the body another employment, and the combination of demands upon it, and upon the attention, must be made familiar before it can become easy. There is no other rule than to learn one thing at a time, and then to learn the combination of each with all that has preceded it, before taking the next step;

Fig. 6.-ENGLISH SADDLE.

and this rule is equally applicable to the mau and to the horse. Both are "getting the knack" of an artificial habit, and they must learn it gradually, or they will never learn it at all.

## Hybrids among Domestic Poultry.

At the recent Poultry Fairs at Philadelphia, New York, and elsewhere, several interesting hybrids have been exhibited. Two of these we have had drawn and engraved. They are shown in the accompanying picture, and, with quite a

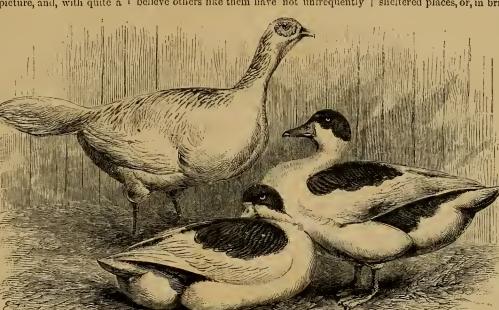

large class of similar origin, form a subject which will repay the close study of naturalists. The curious fowl in the background is a cross between the Turkey - hen and Gninea - cock. Its appearance is so totally dissimilar to that of either parent, that strong efforts were made to throw a doubt upon this statement of its origin; but after a close canvassing of the testimony, we see no reason to doubt the truth of the breeder's assertion, especially as it was confirmed in a singular and conclusive manner by a

gentleman from Kansas, who recognized the fowl at once as the product of this cross, from having seen similar ones at the Far West. In this bird we have a style of plumage much like that of the barn-door fowl. The body somewhat like the Turkey, but more like the former. The shape of the head is also more like the barn-door fowl than the Turkey, and totally dissimilar to the Guinea-hen. There is, however, a carunculated ring about the eyes, and a pendant curtain-like appendage which hangs below the bill, not

unlike that of the Turkey, but covered with feather, as is the whole head. The tail is much like that of the hen, but set drooping; and we regard the fact, that the legs considerably are feathered, to be, on the whole, the most remarkable feature of this strange animal; neither of the parents have feathered legs, nor, so far as we know, have ever shown any tendency to feathering upon the legs. With the exception of its curious form and dissimilarities to its parents, this bird is totally uninterest-

ing, being shy and wild, and apparently foolish, and uttering a peculiar sharp, startled cry, not like that of any of our domestic poultry. In sexual character it is a true mule. A Turkey-hen was left solitary upon the farm where this bird was bred, and accepted a Guinea-cock for her mate. She laid several eggs, which hatched; but this, we

believe, was the only bird which was raised. The pair of beautiful ducks shown in the engraving, are as comely as their companion is the reverse. They were bred by crossing the Musk-drake upon common ducks. These are mules also, but of symmetrical form; and we believe others like them have not unfrequently

MONGREL DUCKS-GUINEA-FOWL AND TURKEY HYBRID.

bred with one or the other of the parent breeds, as do also the mongrel geese, which are bred between the China or African and the common geese. The valuable characteristic of these "mongrel" ducks, as well as geese, is their excellence for the table. They grow rapidly to a large size, fatten very easily, and are of excellent flavor, without the musky odor of one of the parent species. These birds always bring a good price in market, and it is rather remarkable that more of them are not raised.

mout, sends us a sketch of the manner of hunting for pickerel, and the following account:

"When the ice thaws out in the marshes of Lake Champlain and the more sluggish of its tributaries, the pickerel come in great numbers into the shallow water, lying basking in warm, sheltered places, or, in bright still days, playing,

> with their back fins just breaking the surface of the water. I do not know whether they come to spawn, but conclude so from the fact that there are almost always two or more together, a female and male, or a female and several males. With many, shooting them at this season is a favorite sport. The fowling - piece is most used, though some prefer the rifle. The sportsman, if so he may be called, walks slowly along the shore, or wades cautiously in the shallow water; or, what is better, is paddled in a light

boat by the skillful hand of a companion, and examines closely every place in which fish are likely to lie in, and watches for the ripple of a fin on the glassy surface. When a fish is discovered, he approaches it with the utmost caution as closely as he can without disturbing it, for it is useless to fire at a fish at a greater distance than ten or twelve yards; nor even at that, unless it is very near the surface. Having come as close as may be, the hunter aims low, to allow for refraction, and fires. If he is near enough, and has aimed

correctly, he is re-warded by seeing the gleaming belly, or bellies, of one, two, three, sometimes as many as eight or nine pickerel, turned up, stunned and motionless. Now he must bestir himself with all speed to secure them, or such fish as are not killed outright-and they seldom are - will come to their senses and be off like lightning. If the sportsman shoots from a boat, he should have a spear, gaff, or landing net for this purpose; but if on foot, he must trust to his hands alone, Sometimes, all the condi-

hands alone, Sometimes, all the conditions being favorable, great numbers of fish are taken in the manner we have described, and the sport is very exciting. Now and then a monster pickerel, of fifteen or twenty pounds' weight is killed, but the average weight is from two to six pounds. Very large fish are seldom taken, as they are scarce, and very wild."

PICKEREL SHOOTING.

### Pickerel Shooting.

Those who fish for "pot" resort to means of capture that the regular sportsman looks upon with contempt. One of the ways of taking fish in an unsportsmanlike manner is by shooting them. Mr. R. E. Robinson, of Ver-

### Walks and Talks on the Farm-No. 88.

The Deacon has been visiting a farmer in an adjoining town, and brought me a sample of his clover hay. It is as bright, sweet, and almost as green as when cut. "I thought I would let you see," said the Deacon, "what kind of hay a good old-fashioned farmer makes. He says he would not have one of those spreading machines if you would give him one. The less you stir clover hay the better."-" It is splendid hay," I said; "but I am not sure that I have not got some that is just as good, though not quite so bright."-" All his hay is just like this," said the Deacon; "I picked this out of the barn just as it came. It is a good sample of the whole."-Now, it so happened that the Deacon had not his spectacles with him, and there was a good-sized thistle in the sample of hay: "Well, Deacon," said I, "if this is a fair sample of the whole, your friend has as many thistles on his farm as I have, though I presume I can beat him in docks."-By thorough cultivation, I have made encouraging progress in reducing the number of all weeds on my farm except docks. It would seem that the more we work the land the more the docks grow. It causes the seeds to germinate. There ought to be some way of killing the young dock plants in a wholesale way, but I have not yet discovered it. The Deacon says he will cure his clover hay in future as his friend does, and thought I would do the readers of the Agriculturist a good turn by publishing the method. It is simply this: Cut the clover with a machine in the morning. Let it lie until toward evening, without stirring it, and then put it in moderate-sized cocks, and let it remain in these cocks until it is well cured and fit to draw into the barn. Last year he let the cocks remain out five or six days. Now this is a capital way of curing clover hay, provided you could be sure of the weather. I was with Lawes and Gilbert when they made their well-known experiments with different manures on red clover, and I took duplicate samples of 25 lbs. of the clover, as soon as it was cut from each plot, for analysis. Of course we had to save every partiele of it, and we wrapped each sample in large sheets of brown paper, and conveyed it to a well-ventilated room warmed by a stove. Better hay was never made, and nothing would please me better than to have a hundred tons of such hay to feed out every winter. And if the Deacon will cure it for me in this way, I will let him have the job: Cut the clover when the dew is off, and draw it in immediately without bruising it, and then cure in thin layers in a warm ventilated room in the shade; this is the perfection of hay-making. But this cannot be done in practice. Now, what is the next best method? To bruise the clover as little as possible, and dry it by means of the wind rather than by the sun; and never let it be exposed to dew or rain, especially after it is partly cured. But, this is comparatively a slow method; and every day's delay, and in fact every hour's delay, increases the risk of having the hay damaged by ram. Taking this into consideration, and after giving considerable thought and study to the subject, I have concluded that, all things considered, the best plan is to cure the hay as rapidly as possible. If you chew a blossom of clover, you will find it quite sweet. It contains considerable sugar. And this sugar is soluble in water. And yet the heaviest rain falling continuously on a field of growing clover in full biossom will not wash out a particle of the sugar. The sngar is soluble, but the water cannot get at it. But cut down the clover and let it wilt and become partly dry, and the water will then wash out the sugar.

Experienced hay-makers know very well that a heavy rain or dew, falling on clover only just cut down, will not injure it. But rain or dew, falling on a field of partially-cured clover, does considerable damage. And the more the clover has been bruised in shaking it about, the greater will be the damage done by the rain. Bearing these facts in mind, when there is considerable clover to cut, I would start the machine about five o'clock in the afternoon, and cut as long as I could see; and unless there was a very heavy dew, I would start the machine soon after daylight in the morning, and keep on cutting until nine or ten o'clock. By this time the hay cut the night before will need moving. How best to do this is, with me, an open question. Some good farmers do it with a tedding machine. My own plan has been to take a self-acting steel-rake, that can be easily raised and lowered rapidly, and pull the clover into small windrows, five or six feet apart. In an hour or so afterward, turn these windrows by hand, and if any of the clover is green and matted together, shake it out. Treat the morning-cut clover in the same way. And if you have time, turn the night-cut clover again before dinner; but if not, turn it immediately after dinner. If it has been spread out much in turning, the horse steel-rake can be used again to considerable advantage. I have a twelve-year-old boy that does this work with the rake to perfection. The rake is lifted by the wheel, and it is thrown in and out of gear by a lever. He moves this lever back and forth, and keeps the rake going up and down about every second. The object is not to rake the grass together, but to turn it. The oftener the green hay can be stirred the more rapidly it cures, and this is the main object of the first day's operations. About three o'clock, pull the hay together into windrows with a wooden revolving-rake, and put it into moderate-sized cocks. At the same time, let the boy with the steel-rake run it between the rows of cocks, and make every thing clean and snug. The next morning, if necessary, turn over the cocks, and spread out any part of the hay that is still green. And it may be necessary to turn the hay again in an hour or so. By one o'clock the hay should be fit to draw in. The objections to this method are (1), that it takes more labor, and (2) that opening the cocks, if done carelessly, may shake off the leaves of the clover, which, except the blossoms, are the best part of the hay. The advantage is simply a gain of time, and less risk from bad weather.

A heavy growth of clover, badly knocked down, and twisted together by rain and wind, is a bad crop to handle. Better cut a heavy erop early, rather than run the risk of having it fall down. What you lose in the first crop by early cutting, you will gain in the second, or in the seed. Or, if you are short of pasture, an early-cut field of clover soon gives a capital bite for recently-weaned lambs. But early-cut clover shrinks a good deal, and it requires extra care in curing. The hay is very deceptive. It appears cured when it is not. The sap is quite weak, and the ingredients of the clover are only partially organized, and consequently more inclined to run into injurious fermentation. Eurly-cut clover, therefore, must be thoroughly cured. It then makes capital hay for milch cows.

day; "Early Rose will be cheap next fall, and Peachblows scarce and high. Everybody is going to plant Early Rose." I wish I could be sure that Peachblows would bring a good price. There is no crop that pays better, in this section, than Peachblow potatoes, provided you have a good yield, and get a fair price. I sold mine this year, in February, for \$1 per bushel of 60 lbs. If I could be sure of 50 cents a bushel at digging-time, potatoes would pay much better than any other farm-crop. But we should make our land rich enough to average 200 bushels per acre. The labor of digging is the main objection to the crop, and the only practicable way of lessening this labor is by getting a large yield per acre. It costs very little more to dig an acre that will yield 200 bushels, than one that only yields 100 bushels; and if the poor crop is weedy, as it is likely to be, it will cost more to dig the hundred bushels than the two hundred. I think you can raise more potatoes per acre, provided the land is rich enough, by planting in rows than by planting in hills, but it costs more to hoe them, and a good dealmore to dig them. And so, except on highpriced land, it is, perhaps, better to plant in hills, say three feet apart each way. Last year I planted my Peachblows 81 fect apart each way, and two sets in each hill, and the tops completely covered the ground. I am convinced that we talk too much about "large vs. small potatoes for seed," "planting in hills or drills," and depth of covering, and far too little about enriching and preparing the ground, and keeping the crop free from weeds. If the land is dry, rich, and clean, and the potatoes are planted in good season, and the soil kept well stirred by the use of the cultivator until there is actual danger of cutting off the roots and tubers, and any weeds that have escaped the hoe are afterward pulled out by hand, the chances are favorable for a good crop, no matter what system of planting is adopted. And, on the other hand, if the land is wet and poor, and the weeds are suffered to choke the crop, it is no use sending to Dr. Hexamer for seed, or of asking him what is the best method of cultivation. With all his skill, he cannot tell you how to raise a good crop in such circumstances. Get the land right, and if you have theu time to talk about new varieties, and the best method of planting, well and good; but do not try to get a good crop by any species of agricultural legerdemain. You cannot cheat nature; and all who attempt to do so are ultimately found out and punished. It is the greatest evil connected with our farming.

Mr. Cook, of Perry Co., Pa., says he has two hundred acres of land that has been dressed with lime at the rate of 100 to 150 bushels per acre. This puts it into paying condition, but not much more. And he wants to bring it into a high state of cultivation, and he cannot possibly make barn-yard manure enough for this purpose, and he asks if it will pay to use pure bone-dust at \$50 per ton. With ordinary farmcrops I do not think it will. It would pay better on turnips and mangel wurzel than on any other crop, and if we could get it for about \$25 per ton, it would be a profitable manure for turnips, and, probably, for old grass-land in the dairy districts. I think Mr. Cook can make manure much cheaper than he can buy it. Land that has received such a liberal dressing of lime ought to produce capital crops of clover. And the clover may be fed out on the farm in con-One of our large potato-dealers remarked to- I junction with bran and oil-cake, and thus the

richest of manure would be obtained. It is much more economica! to buy bran and oil-cake than to buy bone-dust at \$50 per ton.

The present condition of the artificial manuremarket in this country is eminently unsatisfactory to the farmer. The manures are mostly poor in quality and very high in price. If we could get Peruvian guano, containing 15 per cent of ammonia and 25 per cent of phosphates, for \$60 per ton in gold, we could afford to use it. Formerly it was not difficult to obtain guano that would come up to this standard. But, as I understand the matter, the deposits of guano on the Chincha Islands are exhausted, and the guano now sold by the Peruvian Government is very variable in composition, and of inferior average quality. Some cargoes are worth as much again per ton as others equally "genuine as imported." It is not the fault of the dealers. It is owing to the variable quality of the guano on the islands. There is but one remedy for this evil. The Peruvian Government should instruct its agents to sell the guano in accordance with its intrinsic value, or in other words, according to its composition. Take, for instance, a guano containing 14 per cent of ammonia and 25 per cent of phosphates as a standard, and worth say \$60 per long ton in gold. The ammonia would then cost us 14 cents per lb., and the phosphates 3 cents per lb. The Peruvian Government is selling some guano in our markets at these figures, and all we ask is that it shall sell all its guano at the same rates. If the rates are not high enough, put them higher; say 16 cents per lb. for the ammonia, and 3 cents for the phosphates. But whatever price is determined on, let all the guano sent here by the Peruvian Government be sold at one uniform price, according to its composition. We have a right to ask this; and until some such an arrangement is made, there can be no satisfactory trade in guano. I have no doubt that the United States would take 200,000 tons of Peruvian guano a year, if the trade could be placed on a satisfactory basis. Until then, our dealers should turn their attention to nitrate of soda. Cannot it be imported for \$70 or \$75 per long ton, in gold? Ordinary commercial nitrate of soda contains nitrogen equal to 19 per cent of ammonia. It acts quicker than guano, and I would be willing to pay 20 cents a lb. for the equivalent of ammonia. This would be \$85.12 per ton for the nitrate. Cannot it be sold at this price?

I have an orchard of over two hundred Northern Spy apple-trees, set out about a dozen years ago. I want to keep it in grass, as it is very conveniently situated for pasturing my Cotswold sheep, and in hot weather the shade of the trees is grateful to the sheep. I have given it a liberal top-dressing of manure, but if I could get nitrate of soda at a reasonable price, I would sow 50 lbs. per acre, two or three times a year, during showery weather. I should expect to see the grass immediately assume a dark green color, and, when closely cropped by the sheep, the field would look as handsome as a well-kept lawn. And furthermore, if the grass could not take up all the nitrates, they would sink down into the soil and be taken up by the roots of the trees. I believe nitrate of soda will prove to be our cheapest source of nitrogen for some years to come. Let our manure-dealers turn their attention to the matter.

M. S. Clark, of Vermont, has a piece of land that was in corn last year that he wishes to sow next fall with winter rye and seed down with

grass. His object is to get a good permanent meadow or pasture. He has no manure, and proposes to sow the field this summer with buckwheat and turn it under, and asks my opinion of the plan. If the soil is clayey, I should prefer a good summer fallow. Make the land as smooth and mellow as a garden, and sow on the grass-seeds the last of August without any other crop. Mr. C. asks me "how many crops of buckwheat would be equal to a dressing of 25 tons of baru-yard manure." We have not the necessary data to answer this question, but judging from what facts we have, I think it would take eight or nine average crops of buckwheat to furnish as much nitrogen as is contained in 25 tons of good manure.

The New York State Agricultural Society offers a prize for the best pen of five spring pigs, without regard to breed. In the "small breed" class the prize was awarded to me, for a pen of cross-bred Essex and Berkshires. We killed them yesterday, when they were just one year old. The following is their live and dressed weight, with the percentage of dressed weight to live weight:

	Live Weight.	Dressed Weight.	Percentage of Dressed to Live Weight.
No. 1 Barrow	ibs. 430 438 461 371 380	70 s. 382 ½ 384 ½ 404 321 ½ 328	88.95 87.78 87.63 86.65 86.31
Average of the five Pigs.	416	364	\$7.48

There is nothing remarkable about these weights. In fact, they are insignificant in comparison with the big hogs we often read about. All that can be claimed for them is, that they are quiet and docile, are good graziers, fatten at an early age, and make the choicest of pork and hams with a minimum of offal. As things now are, they are better for the consumers than for the producers. I question if the butchers will give me more than half a cent per lb. above the market price for them, and yet they are well worth three cents per pound more than ordinary hogs. The lard is well grained and remarkable for its whiteness and solidity, and the choice parts of the carcass are fully developed, while there is comparatively little bone, ears, snout, and legs. The whole hog is practically solid meat. A good many Western subscribers of the Agriculturist have written to me in regard to Berkshire and Essex pigs. The above facts will answer their inquiries. They seem to think that they are too small. They can judge for themselves. For my part, I think pigs that will average 364 lbs., dressed the day they are a year old, are large enough. The only objection I can see to these fine-boned pigs is, that they are worth more than we can get for them. But I live in hopes of seeing the day when the pork-packers will discriminate between good and poor hogs. And in fact they are now making more difference than formerly. As a rule, what is good for consumers will in the end be good for producers. And I believe that Berkshire pigs are as well suited to the circumstances of Western farmers as any other breed. But they must judge for themselves. A Western breeder of Chester Whites accuses mc of "puffing" the Berkshires from interested motives. He does not know that I do not breed any Berkshires for sale. If his hogs at a year old will dress over 87 per cent, I should be glad to know the fact.

A subscriber of the American Agriculturist, in one of the Western States, says he has a neighbor who makes a good deal of money by raising mustard-seed, but he will give no information in regard to the business, and he writes to know if we can tell him how to raise and harvest the crop. I do not exactly see how a farmer can keep the management of a crop a secret. In this section my neighbors know a good deal more about what I am doing on my farm than I do. I supposed there were no secrets in farming, any more than there are in medicine-the secrets belong to the quacks. There is certainly no secret about mustardgrowing. The chief difficulty is in harvesting it. It requires considerable skill, energy, promptness, ingenuity, and judgment, to cut at the right time, cure properly, and gather and thrash the crop. I know an English farmer who has had considerable experience in raising mustard, and I will get him to write an article on the subject for the Agriculturist; and as he is personally acquainted with our soils and climate, he will be able to give just such directions as we need. The profits of the crop are sometimes very large. A story is told of an English farmer who took a load of mustard-seed to market and got \$2,500 for it. Mustard for seed requires rich land, and it should be got ready the year previous. If I was going to raise a crop, I should summer-fallow the best field I had, and manure it with well-rotted manure next fall, and drill in the seed in good season the next spring. The great point is to make the land rich and clean. The seed is drilled in rows one foot apart, and the plants are singled out with a hoe about ten inches apart. The young plants grow slowly at first, and, unless hoed in good season, the weeds will smother them. Hence, the importance of rich, clean land. When the plants are hoed and get fairly started, they need no farther hoeing. The mustard grows so rapidly as to smother every thing. Nothing more is required until the crop is ready to harvest. There are two varieties of mustard, the white and black mustard. The black is the most pungent, and makes the hest table mustard, but both kinds are used by the manufacturers. The white is extensively grown as a green food for sheep. It is often sown after harvest on wheat stubbles, and is eaten off by sheep in September and October.

#### A Reclaimed Salt Marsh.

In the summer of 1869, E. Cheschoro reclaimed about ten acres of salt marsh at Stonington, Ct. The principal part of the work was a dyke, eight or ten rods long, thrown across the narrow neck of land that connects the marsh with tide-water. This and the tide-gate cost about three hundred dollars. Previous to the improvement, the marsh was overflowed in the high tides, and produced but two or three loads of black marsh grass, very good for bedding and manure, but of little value for fodder. The past season it has yielded three or four times as much hay as before, and of much better quality. The blue grass is every where making its appearance. Formerly, cows did not care to go upon the marsh to graze at all. Now they crop the aftermath with great relish. It only remains to top-dress with a light coat of soil and to sow grass-seed, to transform the whole into a productive meadow. Mr. Cheschoro considers the question of reclaiming as fully solved. The following figures will very nearly represent the expenses and profit of the enterprise: To 10 acres of marsh, \$20 per acre, Dr.. To cost of reclaiming..... By 10 acres of reclaimed meadow, at \$200 per acre.....

Profit..... \$1,500

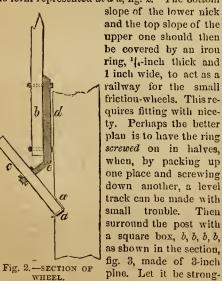

We have no doubt the land will pay the interest on this sum, if nothing further be done for it. By sowing grass seed, top-dressing, and further draining, it can be easily made to pay the interest on three hundred dollars an acre. One of the largest crops of hay we ever cut upon this kind of meadow was from a topdressing of mud, taken from a salt-water ditch. This mud lies in inexhaustible quantities within a stone's - throw of this reclaimed meadow. Three tons to the acre are not a large yield of hay for such top-dressed land. Hay is now selling in this locality for thirty dollars a ton. But at twenty dollars the crop would be worth sixty dollars an acre, and the cost of haymaking in good weather, with our improved implements, is not over three dollars a ton. We are glad to notice the progress that is making in this class of improvements.

#### Home-made Horse-powers Again.

Mr. J. K. Leonard writes: "I was much interested in the article ou 'Home-made Horsepowers' in the December Number of the

American Agriculturist. I wish to have one under my barn, and as there would not be room between the posts that support the barn, I want to know if it would be practicable to run a hollow shaft around one of these, posts, and what kind of bearing would be the best for the lower end of the shaft to run upon."-We think there would be no difficulty about constructing such a power. First, mark a circle, a a, fig. 1, not more than 12 inches from the bottom of the post, and another as near the top as will leave room to oil the wheels. Then with a chisel cut a nick all round the post

where you have marked, an inch deep, and in the form represented at a a, fig. 2. The bottom

ly spiked together, and banded with iron in three or four places. Get from a foundry eight small wheels, c, about 6 or 8 inches in diameter and 34-inch wide, with a bore of 1 inch. Each wheel must be fitted with an axle, d, fig. 2, 18 inches long, cramped at e to an angle of 45°, and with bolt-holes to bolt it securely to the box, b, as shown in fig. 2. Adjust them so that each wheel stands at the same angle, and presses equally upon the tramway. The engraving is shown with beveled

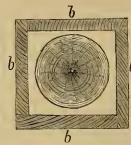

Fig. 3.-section.

wheel-gearing; but the same principle is applicable to any other method of transmitting power. b Make your sweep out of white ash or hickory, as long as your room will allow. A great defect in many horsepowers is making the sweeps too

short. A horse cannot exert his strength to so much advantage when walking in a circle 15 feet in diameter as he can iu one 25 feet in diameter; and it is preferable to get the speed by increasing the size of the driving-wheel, rather than by decreasing that of the horsewalk. If possible, therefore, make your sweep 13 feet long, and 5 inches square at one end, decreasing to 3 inches at the other. Select a straight grain, which may save you the trouble of replacing it at some future day, when you

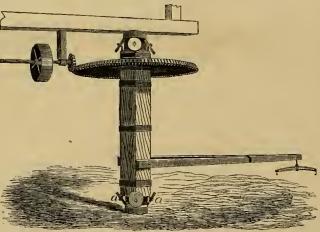

Fig. 1.—HOME-MADE HORSE-POWER.

can ill afford to lose time. Saw it down the middle, as far as f, and secure it from splitting by a substantial iron hoop driven on over the end. Force the cleft open, wide enough to admit the square shaft, b, about 2 feet to 2 feet 6 inches from the ground. Let the cleft ends into the upright shaft, just enough to make them fit down close, and secure by two good bolts through the sides of the hollow shaft. Such a pole or sweep will be difficult to break, and has so much spring as to prevent jerking and irregularity in the motion.

#### Abortion in Cows.

Mr. Charles L. Sharpless, well known as a breeder of Jersey cattle, has written an article for the Practical Farmer, in which he advances the idea that the tendency to abortion may be overcome by giving a rest to the generative organs. He says: "A neighbor, in the early spring of 1869, had thirteen cows which aborted. It happened when they were on winter keep, in January, February, and March. Instead of putting them to the bull in the summer, he adopted the suggestion of keeping them over until November, December, and January, which

brought them to calve from August to October. 1870. They all carried to maturity. This success, if understood, was reached from the fact that they had time to heal before being again stinted; and that after a good wintering, they came out on the grass of 1870 with the calves very young in them, before the aborting time, which is from five to eight months from conception."

How far this explanation may be scientific, we are not prepared to say; but whether scientific or not, the fact of such decided success in practice must have great influence in determining the owners of aborting cows to try the experiment. The experiment will be attended with no risk, save loss of time; and it certainly seems natural, that after such a shock to her system as the loss of a calf must occasion, the animal must be decidedly benefited by the functional rest of the injured parts. If Mr. Sharpless means by the use of the word "heal," the cicatrizing of any open wound, we think that his reasoning needs the support of experimental proof; but if he means a general restoration to health, he is probably quite right.

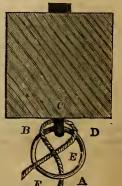

MILK-FEVER.-In the same article, Mr. Sharpless makes some very sensible remarks on the subject of milk-fever, saying that there is danger of its occurrence in winter as well as in summer, in the case of very large milkers, or of animals in high condition. He recommends that such animals he restricted to an exclusive hay diet from the time they first begin to spring bag; advising the same treatment even in summer-time, unless the animal is kept in very close pasture, and shows no tendency to fatteu. He advises, also, that a moderate feeding of hay, only, be continued until the fourth or fifth day after calving, at which time the full flow of milk is established, and the danger of puerperal fever has become slight.

Mr. Sharpless suggests the propriety of giving all cows a daily dose of aconite for two or three days after calving, increasing the frequency of the doses ou the least indication of fever (hot horns, dry muscle, or glassy eyes). Mr. Sharpless, no doubt, wrote after much consideration of the subject, for it is less than half a year since he lost his best imported Jersey cow by milk-fever. In like manner, the writer of this article has had his attention drawn to the subject by the recent loss of a very fine native cow from the same disease, evidently brought on by the mistaken kindness of her attendant, who kept her too fat before calving, and fed her too much immediately after.

#### Hitching a Horse.

When a horse is hitched by a rope halter,

tied in the common way, it often happens that by backing, the knot is drawn so tight that it is difficult to untie it. H. H. H., Riverside, Maine, sends us his manner of overcoming the difficulty, illustrated by a diagram. Instead of tying the rope in the ring in the usual manner, with aslip-knot around the "standing" part, he puts the end of the rope up through the ring,

HITCHING-RING.

as at A, in the engraving; it then passes over the ring at B, under the staple at C; over the ring again at D, under the rope at E; and over the ring at F. This, he claims, will not get drawn tight, and will not untie itself.

#### Curing small Skins.

The market value of a skin is greatly affected by the care taken in removing it from the ani-

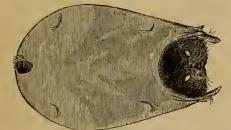

Fig. 1.—Bow STRETCHER.

mal, and in drying it. The common way for boys in the country is to tack the skin to the barn-door and let it remain stretched until quite dry. The trapper in the woods, having no such convenience as the barn-door at hand, is obliged to resort to other methods. One plan is to dry the skin on a hoop. A skin to be dried in this manner must not be ripped down the bolly, but it is cut from the lower jaw of the animal to just below its fore-legs; the lips, eyes, and ears being cut around, the skin is stripped off, leaving the fur side inward. The hoop consists of a branch of hickory or other elastic wood, an inch through at the butt. This is bent and pushed into the skin, which is drawn tight, and fastened in place by notches in the bow, drawing the skin of the lip into these notches, as in figure 1. A much neater way, and one generally preferred, is to use stretchers of thin wood. As these have to be carried by the trapper, they are made of light wood and very thin. They are 3/16 of an inch thick, 20 inches long, 6 inches wide at the larger end, and slightly tapering. They are rounded to a blunt point at the lower end, and the edges chamfered. Theskin is drawn over the board, as in figure 2, and secured with tacks. Skins stretched by either of these methods should not be dried in the sun nor by a fire, but in a cool place where they will be sheltered

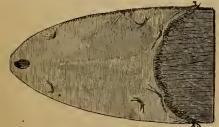

Fig. 2.-DOARD STRETCHER.

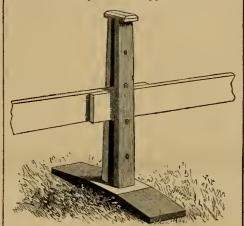

from the rain. No salt or other preservative is used upon skins intended for the market.

SAVING TIMBER.—It may be we are all right on fuel, and that the coal hasins and peat swamps are inexhaustible. Should these fail, it may be that we have oxygen and hydrogen enough in the water to give us lights and fuel for all coming time. But these substances can never supply the innumerable other uses to which we apply wood. Ten millions of acres of woodland are said to be swept off every year by our present population, and the destruction is constantly increasing. This must eventually make some impression even upon a continent. Alaska and St. Domingo wilt not supply us with timber. For the good of the whole country, for

its highest productiveness, we want at least onefifth of its whole surface covered with forest. A wise regard to his own pecuniary interests should lead every farmer to retain at least a fifth part of his land in wood. Timber is constantly appreciating in value. He can not better provide for his old age, or leave a safer inheritance for his children.

#### Another Portable Fence.

The Rev. W. B. Wells, Butler Co., O., sends a model of a post for a movable fence, which he has tried with much satisfaction. The engraving will show the construction. The upright portion of the post consists of two boards, fixed wide enough apart to allow two boards of the fence to enter the space between them, and rest upon pins placed for the purpose. A post like this is used for the reception of the ends of the fence-boards, and an intermediate one is used for each pannel to support them in the

POST FOR PORTABLE FENCE.

center. This middle post has the space only wide enough to admit one board.

#### Bringing in Clover.

White clover will not come into any soil by any process whatever where the seed is not already sown. On most old meadows and pastures, the seeding has been going on for many generations; and it is so abundant, that when the land is laid down to grass, no white clover seed is sown with the timothy and red-top. It takes care of itself, and is seen in the hay and aftermath for several seasons, and then disappears. It is highly esteemed for hay, and makes the best of dairy feed. This very desirable feed may be secured in many old pastures by sowing plaster at the rate of a bushel or two to the acre. The action perhaps has never been satisfactorily explained, but it does act, and the dormant seeds sprout, and the field is thickly strewn with clover blossoms the next season. In many districts, the pastures have been completely renovated, and are kept in high condition by this cheap fertilizer. Feeding with sheep on some farms greatly increases the growth of white clover. Spreading stable manure, compost, or ashes, secures the same result. Burning over old pastures, especially if infested with briers and brush-heaps, helps the growth of clover and the grasses. Sometimes scarifying an old moss-bound sod with a harrow has an excellent effect, and gives a new start to the grass. Almost any pasture will improve by close feeding, if the animals are suffered to remain upon it at night.

#### Traps for the Muskrat and Bear.

In the article upon "Trapping the Bear and Mnskrat," given last month on page 94, we had not space to give engravings of the traps in use.

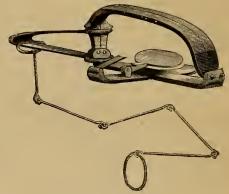

Fig. 1.-MUSKRAT TRAP.

Good trappers, after trying various devices, have fallen back upon some modification of the old steel-trap. Many of the traps found upon sale are nearly worthless. They either lack power to hold the animal; the jaws are so thin as to cut off the animal's leg by the spring of the trap; or there is some defect in the moving parts that prevents the trap from springing with the requisite quickness. An old trapper is as particular about his traps, and is as well acquainted with their peculiar merits and demerits, as is a huntsman with his rifle or shotgun. For the muskrat, mink, etc., the trapper chooses as light a trap as possible, as large numbers have to be carried on an expedition. Those in use are but little larger than the common rat-trap, but are made with a spring strong enough to hold a larger animal than the muskrat, if necessary. Figure 1 shows one of the approved forms. For the bear, a very powerful trap is required, like that in figure 2. It differs from the traps for smaller animals in having two powerful springs. The jaws have a spread of some 16 inches. In the one figured the jaws are furnished with strong teeth; but the utility of these is a point upon which experienced woodsmen are not agreed. The pan is small in proportion to the size of the jaws, in order to bring the animal's leg as near as possible to the center. To retard the movements of the

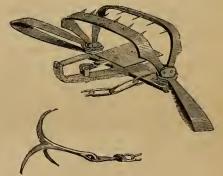

Fig. 2.—DEAR TRAP.

animal a strong chain is attached to the trap, and is terminated by a three-pronged grapnel, or attached to a heavy clog.

#### Coal-Ashes for Earth-Closets.

If there is any truth in the idea that reforms are to be spread by dint of giving "line upon line and precept upon precept," we shall be justified in recurring again and again to the simple means by which all persons in town and

country may effect the perfect deodorization and disinfection of haman fæces, and convert what is usually a great source of annoyance and waste into a valuable manure and source of profit. One great obstacle to the rapid introduction of the earth-closet is to be sought in the idea that people dread the difficulty of obtaining suitable earth in the proper state of preparation. Wherever coal is used for fuel, this obstacle is entirely removed, for the coal required to heat an ordinary house will yield ashes enough to supply the closets of its inmates. In our own experience, with a family of six persons, the fire of a small furnace which only partly heats the house, supplies the three earthclosets, which are the only conveniences of the family, and a sufficient surplus will be accumulated from that and the kitchen range during the winter to carry them through the summer. Aside from the ease with which this provides the necessary material, there is a further advantage in the regular sifting of the cinders that the system requires. A great deal of halfburned coal, that would otherwise be thrown away, is thus economized for a second burning, and the ashes themselves, instead of accumulating until the public dustman can be induced to take them away, are made very valuable for use in the garden. It scoms to make no difference whether the ashes are made from anthracite or from bituminous coal. We are using authracite ashes, and find them as good as the best earth, while in New Orleans, the ashes from bituminous coal from Pittsburgh have been used five times over, and seem to be perfectly inoffensive at the end.

#### How to have Good Mutton.

The sheep is a delicate feeder, and makes one of the most delicious and digestible of all the butcher's meats. Like most animals, it improves in flavor by age, and attains its perfection, in most breeds, at the age of three years, when it makes, in Daniel Webster's language, red-mutton-so-called because the gravy, though well done, is red and of high flavor. In feeding sheep for the luxurious table, there should be but few together, which allows them greater variety of food and more repose. In large flocks the strong sheep monopolize the best herbs and grasses, and the weaker ones are poor and mean meat; besides, there are always restless sheep where many feed together, and the others of the flock are ill at ease whilst any are on foot. Sheep well-grazed are better than the stall-fed, and have that "gamey" and juicy flesh so liked by epicures. The best table-sheep in the British isles are the small Welsh breed, which have the wide range of those mountains,

But the hest sheep in the world are often spoiled by bad butchering, and I propose to show how this should be done. Many persons become disgusted with, and never eat, mutton, because of what they term the "wool-taste." Now, a sheep well-dressed, may be wrapped in the skin and wool, as well as in the purest linen, and never have a "wool" flavor. The intestines of the sheep are, like those of all the ruminating animals, very long and powerful in capillary absorption; and, if allowed to remain in the body after death, infuse the odor and flavor of their contents into the meat, and thus give that ill taste. Everything, then, depends upon rapid dressing. While yet alive, the sheep should be suspended by the hind legs, well apart, to two pegs, or hooks, to a cross-timber, so that the body may be easily reached on all

sides without turning it. The butcher should be prepared, with a sharp knife, ax, meat-saw, thread, and water; also, with a block, or low stool, to stand upon, if need be; for the sheep, when suspended, is too long generally to be easily reached in all parts. The throat should then be cut, severing both arteries, and the blood entirely let out; if Professor Bergh is about, the animal may be knocked on the back of the head with the pole of the ax, before using the knife. The skin should then be rapidly taken off, at least from the parts to be cut in taking out the intestines, and pinned back, so as freely to allow that operation. This finished, the blood should be well washed out by casting on the body clean water freely. Should the intestines at any time be broken, let them be tied up at once, and the soiled parts well cleansed. The body should then hang until it is well dry, when it is ready for use. Mutton (and all meats) never ought to be salted, if possible, until it is ready for the cook. Salt absorbs the juices, dries and preserves the meat, but spoils the flavor. Meat should be hung in a cool, dry place, so that all parts may be aired. Do not allow it to become frozen, but if frozen, it should be used, at once, if possible. In some parts of Mexico, beef will hang in the air for weeks in the warmest weather, because of the dryness of the climate. The Iudians and hunters dry their meats with slow fires.

After large experience in many parts of the world, I should say that "flesh, fish, and fowl" should be eaten as soon as possible after the animal heat is out. Persons in cities learn to like "high" and stale meats, because they get no other; but it is a deprayed taste, as men may learn to use tobacco, which will kill most animals and make a dog sick!

C.

[REMARKS.—We commend the above suggestions to the readers of the Agriculturist. They are from a gentleman of great experience and observation. We think he should have added that cooking is also an essential point. The allusion to "red-mutton" is very suggestive. It is dependent, to some extent, on the age, breed, and food of the sheep, and also on so cooking the mutton that the juices will be all retained in the meat. The flavor of mutton is undoubtedly influenced by the food; but we can hardly expect farmers to do more than to rid their land of all noxious weeds, and encourage the growth of nutritious grasses. If they provide their sheep with good pasture, on dry upland, in summer, and plenty of clover hay, or bright straw and grain in winter, with abundance of fresh water, the mutton even from Merino sheep will not be bad flavored. A well-fatted Merino sheep has little of that "woolly taste" so much complained of. The trouble is, that not one Merino sheep in a thousand is fatted at all before being sent to market. It has been proved, by the experiments of Lawes and Gilbert, that the juiciness of meat is due, in a good degree, to the fact that it contains a less proportion of water. In a well-fed sheep the water in the lean meat is replaced to some extent by invisible fat. This fat does not evaporate in cooking, as water does, and consequently the meat is juley. Flavor, perhaps, requires age, but juiciness and nutriment can be obtained without keeping sheep until they are four years old. And it is certain that, in the older-settled parts of the country, we cannot afford to keep animals designed for meat, month after month, and year after year, merely to give the meat a little higher flavor. We must have early maturity, or we cannot afford to keep animals at all. Ou

all farms worth \$100 per acre, there is no profit in raising sheep for mutton, unless they can mature before they are two years old.—ED.]

#### The Fresh-Water Bass.

In the newly awakened interest in fish-culture, and the rage for stocking ponds, there is great danger that our waters may be permanently injured by transplanting inferior kinds of fish. Immense damage has already been done by transplanting pickerel to waters admirably fitted for trout. The rule should be to stock with the best varieties of fish that the water will sustain. Deep, cold ponds, and brooks that are congenial to the Salmonidæ, should be devoted exclusively to these fish. Ponds that are too warm in summer for trout should be given up to Black-bass (Grystes nigricans, of Agassiz), the best of all the freshwater fishes that go by the name of bass. It costs no more to get the best variety, they are as easily raised, are better game, and will give much better satisfaction in every respect. It is a serious matter to introduce a hardy fish into new waters. They often take complete possession, and they can only be got rid of by iutroducing a fiercer and stronger fish.

We place the Black-bass (Grystes nigricans) at the head of the list of fresh-water bass. It was found originally in the St. Lawrence basin, and from thence probably made its way through the Champlain canal into the upper waters of the Hudson. It is caught in great abundance in the St. Lawrence, and in most of the lakes and pouds of Central and Northern New York. It has all the good qualities of the other species, in addition to the excellence of its flesh, which is by many persons considered equal to salmon. It runs from three to nine pounds in weight, as taken in its native waters, and in ponds that have been long stocked with them. Few, however, are taken that weigh over five lbs., and six lbs. is considered a very large fish of this variety. It is readily distinguished by a carmine dot in the eye, and by a strong musky odor. This fish early attracted the attention of the late Samuel T. Tisdale, and was regarded as the only worthy substitute for trout in the ponds of eastern Massachusetts. They were transplanted thither from Saratoga Lake in 1850, and from thence have been widely distributed. Nearly all the ponds in New England that contain this fish-and there are over a hundred of them-have received their stock directly or indirectly from Saratoga Lake.

The Black-bass of the South (Grystes salmoides) looks much like the northern Blackbass to the casual observer. Its habits are similar, as are its fins and color, but it has a larger head, and grows to a larger size. Its flaky meat is soft and watery, and in this respect it is quite inferior to the St. Lawrence fish. It abounds in the rivers of Florida, and is found in many of the rivers of the Western States, as far north as Minnesota. It was first introduced to our Eastern waters by Mr. Stabler, a conductor on the Baltimore and Ohio Railroad, who brought them from Wheeling Creek, in his locomotive tank, and put them into the Potomac at Cumberland. All the tributaries of this river, down to Great Falls, are now abundantly stocked with them. Last fall they were planted in the Delaware, at Easton, which we consider a very serious error, as it must damage the prospect of restoring shad and planting salmon in the up. per waters of that river. It is well known to sportsmen that there are no finer trout-streams than the tributaries of the Delaware in Penn.

sylvania and New York, and that salmon will flourish in any water congenial to trout. It would seem to have been a much wiser policy to have reserved this stream for the king of the river fishes. The Black-bass of the South cannot fail to prove very destructive to salmon spawn and fry, should it ever be attempted to stock the river with salmon.

The Oswego bass is named from Oswego Lake, in which it is found, but it is by no means confined to those waters. It is found in most of the lakes in the interior of this State, and in the waters of Ohio and Kentucky, and in the west part of Canada. It is similar to the Grystes nigricans in all outward marks, except that it has a larger head, lacks the double curve at the end of the lateral line at the joining of the tail, and has no red in the eye. Its flesh is softer and more watery. We are not aware that any efforts have been made to transplant this fish.

The Spotted-bass and the Rock-bass of the lakes, are both smaller varieties, rarely reaching two pounds in weight, and though considered very good pan-fish, are not worth propagating where the larger and better varieties will flourish. These different species of bass have led to a good deal of confusion in the minds of fishculturists. Some persons have exported fish called Black-bass both to England and France, but whether they were the Grystes nigricans is quite questionable. Many are now inquiring for the best fish to stock ponds that will not support trout, and are liable to be misled for want of the information we have here endeavored to lay before our readers. The Grystes nigricans does well wherever it is introduced. It has gone into Pennsylvania; and for all places north of the southern line of that State, we have no doubt it is the best lake fish we have.

#### The Steaming and Cutting of Fodder.

Wm. Q. Elliott, of Centreville, Ind., asks: (1.) Are there steam-powers in use which both furnish the power to cut the feed and steam to cook it with? (2.) If so, where are they to be got, and what is the cost of one of sufficient capacity to cut and steam for 100 head of cattle? (3.) We have manufactured, in Indiana, a feedcooker designed to boil eorn in a large hopper, and it does it effectually. From your experience in cooking and steaming, would you think that a tight cover, placed over this large vat, and fastened down to save the steam, would make this answer to steam fodder in a large box, or chest, at a short distance? (4.) What do you use to cut with-what to steam with? (5.) What precautions have you against fire? (6.) The size of your car from which you feed?

(1.) The only steam-power we know any thing about is the steam-engine. This, with its boiler, does all you ask about. (2.) They are to be had from many machine-works in all parts of the country. The cost of a boiler and engine, to cut and cook for 100 head of cattle, would be from \$500 to \$900, according to circumstances. (3.) The principal objections to this apparatus would be that it would not make steam fast enough, and would not bear pressure enough to allow the steam to be raised to the most economical degree of heat .- For further particulars on this point, see Ogden Farm Papers in our March number. Whether this apparatus, or a better one, is used, the distance to the steamingbox should be as short as possible. If you have this apparatus, and cannot conveniently incur the expense of getting the better one, it will, of course, be possible to cook with this, but it will take longer and cost more. You will need to have some mechanical power to ent your fodder, and an engine is the best; consequently, if you have 100 head to feed—or even 50 head—it will pay you to start right. (4.) We use Cummings' Cutter (Rochester, N. Y.), driven by the steamengine, and steam from the same boiler that drives the engine. (5.) The engine-room is built outside of the stone wall that forms the north side of the first story of the barn; the north side of the first story of the barn; the so that all the firing is done in a safe place, and the smoke-stack is carried high above the eaves of the barn. (6.) The floor of the car is about 4x6 feet, and its sides are two feet high.

#### The Progress of the Earth System.

It has been a source of surprise to ourselves and to all who were enthusiastic in the belief that the earth-closet would effect a rapid reform in the habits and economies of our people, that its progress has thus far been, comparatively, slow; but on reflection it seems not unnatural that this should have been 'the case. Until now, the system has been adopted mainly by the better educated and more intelligent classes. The masses-those for whom it really promises the greatest benefits-are slow to change their habits in any respect. The inconvenience, the wastefulness, the danger to health, and the annoying exposure of the system that prevails, especially in villages and in the country, and above all in the Southern States, are deplorable in the extreme; but they have so long been accepted as a necessary evil, that those who endure them have come, by long habit, to disregard them, and to look with indifference upon any plan proposed for their avoidance. The means for the application of the reform are so perfectly within the reach of even the poorest people, that the bringing of the closet within the house itself, cannot fail sooner or later to approve itself to the minds of all.

If it were necessary to the establishment of a satisfactory earth-closet, that the patented apparatus should be adopted, even the moderate cost that this would entail would be a sufficient reason to deter many persons. But as the full essential benefit of the system lies within the easy reach of all who can provide themselves with earth of almost any description, or with coal-ashes, without the least necessity for the outlay of money, it is certainly reasonable to suppose that the amendment of our customs, which has taken so strong a hold among those who are in more comfortable circumstances, will in due time secure universal adoption. And when we reflect that the benefits of the use of earth in stables are hardly less marked than those of its use in closets, we are impatient to see its influence brought to bear, to check the appalling waste of every kind of animal manure that is now threatening the entire agricultural prosperity of the country.

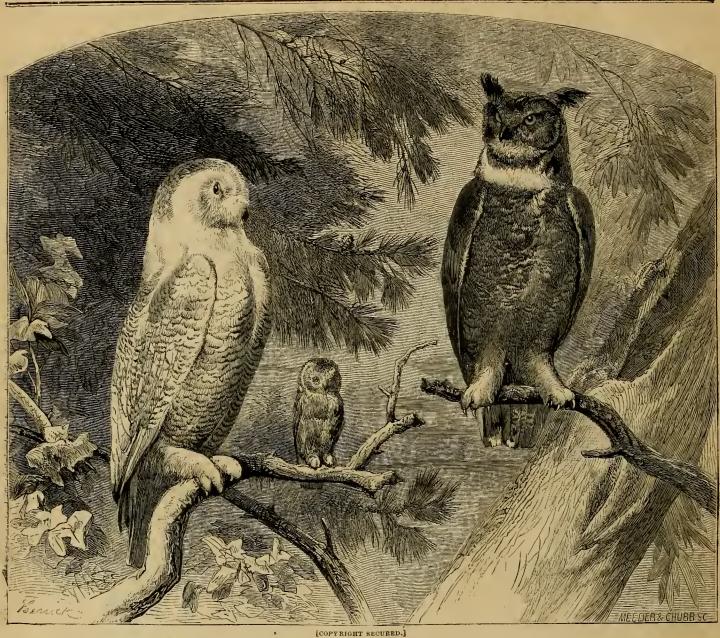

## How to make a Simple Hive. BY M. QUIMBY.

A subscriber to the Agriculturist in Florida wishes a full description of the frame hive so often referred to, and directions for use. He says: "The woods are full of bees, but they do not seem to work well in the old hive, many swarms leaving the day after hiving from the tree. If I knew how to make them stay, I

could get as many swarms as I could tend in a month. Information on these points will be gladly received."

The "information" may possibly benefit Northern bee-keepers also. A full description, and directions for making and using the simple, movable comb-hive will be found in "Bee Keeping Explained." There is another hive, still more simple, particularly adapted to the honey emptying machine, which, from present indications, is just what is wanted in Florida. The frames are about 11 x 18 inches square: strips for top and ends 11|2-inch by 1|2-inch; the bottom may be square or triangular. These frames are held upright by a short piece of hoop-iron, bent in this shape, [, and nailed on the bottom of the frame thus, \_, and hooked on the edge of another piece of hoop-iron, nailed to the bottom board; one edge, raised slightly, is sufficient to hook the bent piece under; the hottom board may be any size. Cut out a space for ventilation, a few inches square. in the center, and cover with wire cloth. Set up a half dozen frames close together, and put boards on each side just the size of frames, and you have a hive very near perfection for the warm climate of Florida. Farther North, an outside box, simply set over the frames, will be an additional protection from the weather. The boards forming the box may be held at the corners by hooks instead of nails. If surplus boxes are used, holes can be made through the top, and hoxes set directly on the frames. I think Mr. Warner would find it to his interest to make his bottom board large, and putting some twenty-five such frames together, making an enormous hive, and then use the honey emptying machine for his surplus. If the honey thus obtained is as much superior to the ordinary Southern honey, as our machineextracted is superior to ordinary strained honey, the difference in value would be inestimable.

From the south somewhere, honey now comes to our market by barrels, tierces and hogsheads. The flavor is very unpleasant, which, if not natural to it, may, and probably is, caused by carelessness in mashing up dead bees, larva and bee-bread, etc., in straining. It only finds a ready market here when Northern honey is scarce. But let pains be taken in preparing it for market, and sending a pure article-no taste of bee-bread or other adulteration-and our Mohawk Valley honey, that is now unsurpassed for fine flavor, would find a serious competition in quantity as well as quality. But the reflection that ten times the amount will be used that is now, when we have a better article, thereby increasing the demand, ought to satisfy our Northern producers that I have not wholly ruined their business by my instructions. Where bees are so plenty in the woods that they may be had for the taking, swarms can be no object, and swarming should be controlled. The large hive alluded to above would have a tendency to discourage preparations, but would not always do so. Find and clip one wing of the old queen, and when the swarm issues, the queen, unable to fly, will be found near the hive; or if there is not time to watch for their issuing, the hive may be opened once a week, and whenever any queen cells are found sealed up, destroy all but ouc. The old queen, also, not being of much account, should be destroyed, otherwise more cells will continue to be started. Another examination should be had in four or five days, to destroy other cells which might be started from the brood. In this way the whole force that accumulates may be employed in one hive. By

SNOWY OWL.

emptying the combs every few days, and returning ready for refilling, the bees lose no time in making comb, and collect several times the quantity they would if compelled to do so. To get combs in these frames, procure the contents of several of the trees from the woods, bees, combs, brood, etc., transfer to the frames-rejecting most of the drone comb, according to directions in "Bee Keeping Explained "-being sure to retain but one queen, with wing clipped. You would then have a mammoth swarm to begin with. It can be kept so by frequently emptying the combs, and keeping a supply of empty cells ready for the queen to deposit eggs in during the whole honey season, whatever may be its length.

If combs have to be built for a full supply, the frames should have a piece of guide-comb stuck in the top, and then put in between others near the middle of the hive. When these are filled, others may be added until the hive is as large as wished. We hope to furnish artificial comb soon, that will save time to the bee as well as honey. This style of hive involves the use of a honey-emptying machine—melextractor. This machine, introduced only a few years ago, is rapidly growing in favor in the North.

LITTLE ACADIAN OWL.

#### The Snowy, and other Owls.

The Snowy Owl, Nyctea nivea, though not rare in the Northern States during the winter months, is regarded as only a transient visitor, as it does not breed within our limits. . Indeed, its resting-place is not known with certainty, but it is supposed to be very far to the northward. Its large size and white plumage make it a very noticeable bird. Though designated as the White, or Snowy Owl, its plumage is not entirely white, it having spots and bars of brown. These markings vary greatly in different individuals. Nearly all owls are nocturnal in their habits; but this species hunts in the daytime, and proves a serious enemy to grouse, ducks, and pigeons, which it pounces upon when they are upon the ground, or upon the wing. It is said to be very annoying to trappers, as it robs their traps of muskrats. Not only does this bird prey upon quadrupeds and birds, but it is expert at fishing. The Snowy Owl is sometimes found as far south as Georgia, but it is more frequently met with in the New England States than in any other part of the country, and even there it is of very rare occurrence after the early part of February.

#### GREAT VIRGINIAN HORNED OWL.

The Great Horned Owl, Bubo Virginianus, is readily recognized by its large cartufts. This is also a large owl, being about twenty inches in length. It is found all over the United States, and is one of the most rapacious of the owls. It is variously mottled with brownish black, light brown, and gray; there is a conspicuous white spot upon the chin.

This species inhabits so wide a range—extending into South America-and presents such a variety in its color and markings, that several of its forms have been described as distinct species. It is a bird to be classed with "the pests of the farm," as its nocturnal forays are not confined to a search for wild food. The turkey-breeder has cause to regard him as an enemy; and those who do not give their fowls secure roostingplaces, are losers by this owl. In full sunshine the bird may be approached and captured, but in diffused sunlight it is able to see sufficiently well to escape. The smallest of the trio in the engraving is the Acadian, or Saw-whet Owl, and it is the smallest owl of the Northern States. It is only seven to eight inches in length, and its general color is reddish brown. It is called the Saw-whet Owl, because its note resembles the sound produced in filing a saw,

#### The Swiss Stone, or Cembrian Pine. (Pinus Cembra.)

A few weeks ago we received from M. F. R. Elliott, of Cleveland, Ohio, some notes upon

gretted that a tree of so many merits should be so little planted, and suggested that it ought to be brought more prominently to the notice of the public. We regret having mislaid Mr. Elliott's note, as we would be glad to present the evidence of so experienced a planter in favor of this tree. Coming from the highest limit of tree-growth upon the Alps, it possesses the important requisite in an evergreen-hardiness. No matter what grace of form or beauty of foliage an evergreen may present, if it be not hardy, it must be discarded from our lists. It possesses another quality which adapts it to general cultivation: it is not at all particular about soils, but will grow in the poorest, and in the most exposed and unpromising situations. It is true it will grow more rapidly in a fine deep soil, but it is a satisfaction to know of one evergreen that does not need to be coaxed and petted, and that will grow and flourish in soils and situations in which no other will maintain itself.

The young tree is of slow growth, and presents great regularity of form. We give an engraving of a specimen in the grounds of Parsons & Co., Flushing, L. I., which shows the

appearance of the tree before it becomes old and broken in outline. The dark foliage makes it valuable in grouping with other evergreens. To the great majority of those who plant trees, one evergreen is as good as another, and we find place after place presenting nothing but Norway Spruce and Arbor Vitæs. These are two most useful trees, but their constant repeti-

MYRSIPHYLLUM IN FLOWER.—(See new page.,

tion produces the effect of sameness. There is quite a long list of evergreens that may be obtained, that will give a pleasing variety in color and habit. The flowers and young cones of the Cembrian Pine are bright purple, and very ornamental. This tree, in its

native localities, attains the hight of fifty feet or more. The wood is very soft, fine-grained, and exhales a pleasing fragrance; it is much used in Europe for the interior finishing of houses, and is the wood from which the Cembrian, or Swiss Stone Pine. Mr. E. re- | the beautifully carved Swiss toys are made.

SWISS STONE, OR CEMBRIAN PINE.

#### Cheap Remedy for the Peach-Borer. BY M. B. BATEHAM, ESQ., PAINESVILLE, O.

I have been more or less engaged in the business of " peach-culture for profit" for the past twenty years, and have flattered myself that I thoroughly understood this branch of fruitgrowing; but on reading Mr. Fulton's little book on Peach-Culture, published by Orange Judd & Co., I have gained some hints which would have been some hundreds of dollars advantage to me if I had read them before planting my present orchard of 3,000 trees, six years ago. But my object in writing, at this time, is not so much to commend this book, as to make known what I believe to be a simpler, more effective, and cheaper method of preventing injury by the peach-borer, than any contained in that or any other book within my knowledge.

In the chapter on Insects, Mr. Fulton very justly says: "The Borer (Ægeria exitiosa) is the most common, as it is the most troublesome enemy of the peach." \* \* \* "But it must be destroyed at all events. There must be no truce, no mercy, if you wish to save your trees. If you leave even one, it will probably be the death of your tree, for it will eat, and eat away,

until it will destroy it. The greatest care should be taken to remove all. Sometimes quite a number will be found in one tree. Five and six are not at all unfrequent; and even more will sometimes be found." Then follows a description of the methods of destroying the borer.

The first and second years after planting my orchard, the borers were quite troublesome, and I fought them with the knife and wire, but still lost about one-tenth of my trees, and more were badly damaged. I then tried coal-tar, thickened with wood-ashes, to the consistence of paint or cream, and applied with a paintbrush around the base of each tree to the hight of 6 or 8 inches. This did not kill the worms that were already in the trees, but was quite useful in preventing the moths from depositing their eggs, if the application was made early in June, or just before they commenced their mischief; but the remedy was not completely effective, because the growth of the trees being quite rapid in summer, the outer bark would expand and form little fissures, in which the insect could deposit its eggs, during July and August, safe from the effects of the coal-tar; and even a second application would not reach them all. This remedy is also objectionable as being sometimes injurious to the bark of young trees at least, in hot weather. I next tried the application of tarred roofingpaper, in the form of collars fastened around the

base of the trees, and I found these quite effective and cheap, but requiring a good deal of care in their application. I therefore abandoned this method for the much better one which I am about to describe.

Having read the circular of Messrs, Buchan & Co., of New York, describing the effects of their Carbolic Soap as an insect-destroyer, I sent and procured a lot of that article for experi-

MYRSIPHYLLUM IN FRUIT.

ment, and after two years of trial, I feel quite safe in recommending its use as the cheapest and best method yet found for the prevention of injury by the peach-borer. (I presume it will prove equally effective for the apple-borer,

but I have not as yet tried it for that purpose.) My method of using this remedy is as follows: Take a five-pound can of the soap (costing only \$2), and turn it into a barrel one-third full of hot water; stir it occasionally, and let stand a few hours, or over night, for the soap to dissolve; then fill up the barrel with cold wateror I sometimes use soapsuds from the kitchen for this purpose. The liquid is now fit for use. It is of a milky appearance, and pungent but not offensive odor. It is too strong for using on plants, but will not hurt the bark or wood of trees. Applied with a paint-brush around the base of the trees, taking care to have the liquid enter all crevices, it immediately destroys all the insect-eggs that have been deposited, and any young worms which have not penetrated farther than the bark; and I believe that for some weeks, at least, unless heavy rains occur, the odor prevents the moths from depositing eggs. I at first thought that, for this purpose, a second application of the liquid might be necessary; but my experience the past scason has convinced me that one application in July, or early in August, is sufficient.

The barrel of liquid described is enough for a thousand trees of bearing size, and an active lad can do the work, in two days, if the orchard is in fair condition. But if many weeds are in the way, it will be necessary to first clear the surface around the stems of the trees with a hoe. The average expense of this remedy is not over five dollars per year for a thousand trees, or less than one-fourth that of the old method of killing the worms by hand (after they had done much mischief); and then, too, the new method is vastly more effective.

## The Myrsiphyllum, or Myrtle-leaf, as a House Plant.

Iu December, 1869, we figured the Myrsiphyllum asparagoides, a beautiful climber, which is often incorrectly called Smilax. The engraving referred to had leaves only; we now give fragments showing the flower, which is very small and white, and the small and asparaguslike berries. Our especial object in referring to the plant at this time is to call attention to its great value for window cultivation. The portions here figured are from a fine wreath sent by a lady to show how successful she had been with the plant in her window garden. The lady lives in the country, where gas and furnaces are not, and grows house plants in great perfection. The Myrsiphyllum, which in a city window will hardly keep alive, with her runs all over the window-casing, and flowers and fruits most freely. It needs a good rich soil and a sunny window, and the poison of gas and the drying heat of a furnace being absent, it will grow most luxuriantly. The plant bears cutting well, which is fortunate, as the graceful branches are in great demand for floral decorations, especially for the bair. Indeed, in the winter, the florists in New York charge a dollar a yard for the stems, and find it difficult to meet the demand.

MARKET-GARDENING IN THE RURAL DISTRICTS.—The census often shows the drift of farm-life more accurately than any partial observation, however minute. It is quite clear, from the returns already examined, that there is a decrease in the amount of live-stock in the New England and Middle States during the past decade, and likewise a decrease in the yield of staple grains, while there will be shown

a large increase in the crops of vegetables and in garden products. This shows pretty conclusively that grain-farming and live-stock raising, does not pay so well as some other branches of farming. The city and village population has increased, and the farmers in the immediate vicinity of these large towns are turning their attention more and more to supplying their daily wants. They can sell potatoes and turnips every day in the year if they have them, and garden products all through the summer and fall. There is, however, a brisk demand for poultry, eggs, milk, calves, lambs, and swine, and they very properly raise what the market demands.

## Horticultural Memoranda from Tennessee.

BY ANOERON PAGE.

MAONOLIA GRANDIFLORA SEED.—I obtained a few seeds, gathered in Memphis, Tenn., on Christmas, 1869. These I planted on a rich, sandy loam, cast up to a ridge. I covered the ridge lightly with oak leaves, and stuck down a row of cedar switches on the south side to break off the sun. Late in the spring they began to come up, and now I have eightly beautiful plants in my seed-bed. Other seed that were kept in sand until spring, and then planted out, did not germinate at all. These other seeds were, however, gathered at a different time and place. [The seeds of our hardy magnolias may be preserved until spring if removed from the cones as soon as they open, and then mixed with an abundance of sand and kept cool.—Ed.]

SEED OF OTHER EVERGREENS.—At the same time, I planted fresh seed (so said the seedsman), bought in New York—viz., one pound each of Hemlock Spruce and of Norway Spruce, the soil and all being the same as for the Magnolia. The Hemlock came up beautifully, the Norway Spruce not at all. The summer heat killed out a great many of my little Hemlocks. The rest made a poor growth, and look feeble now. [It is impossible to raise seedling confers unless the young plants are shaded. The Hemlock is particularly sensitive to exposure to the sun until it is well established.—Ed.]

AZALEA INDICA —I planted out-doors and indoors, on hot-beds and on horders, seeds of this shrub without securing a single plant. I have equally failed in trying to germinate our native Holly, and, on hot-bed planting, failed to germinate a single seed of the Chinese Tea Plant. [The Azalea requires nice management to raise it from seed. The Holly seed does not come up until the second year after sowing.—Ed.]

TEA PLANTS.—Grow well here out of doors. They are hardy in this State, and I think will stand a degree or two north of us. But my experience is that tea made from the leaves without rolling or baking, bears no comparison to tea prepared by the Celestials. I know no reason, however, why that preparation might not be init; ed.

Let your readers, however, bear in mind that the writer has no seed, and no plants of this or any thing else to sell. Tea plants can be had of P. J. Berkmans, Augusta, Georgia, at moderate prices. They are a beautiful evergreen.

Growing Grape Cuttings in Clay Soil.—We have to haul our sand here, and pay for it, too. Our stiff clay soil is the worst in the world for all sorts of cuttings. I secured a few hundred cuttings of Clinton, Concord, and Hartford grapes, from S. E. Dake, Rochester, N. Y. These I buried, top downward, in a ditch, be-

low frost. I trenched my ground and underdrained each row; then I hauled dirt from the creek and filled with it a furrow run through each row. In this I planted my cuttings in February, and secured almost as uniform a stand and growth as I did from rooted plants.

MISCELLANEOUS ITEMS.—Our fall and early winter have been so warm that our strawberries all bloomed out in November, and continne yet to bloom (middle of December); a few ripe berries have been gathered, but the whole prospect for a spring crop is, I fear, utterly blighted. I have pinks in bloom in the open ground at this time. A light covering of cedar brush protects them. A large jar containing a Camellia Japonica was left out until a few days ago (January). When I moved it into the pit, it was as fresh as if it were midsummer.

## Greenhouse and Hot-house Plants from Seed.

BY PETER HENDERSON.

Very few not engaged in the cultivation of flowers as a business, know that many of the most beautiful ones used to decorate flowerbeds in summer, and the hot-house, or parlor, in winter, can be raised from seed. The price of seeds, as compared with plants, is very low; a package of seed costing twenty-five cents will usually raise as many plants as could be bought from the florists for \$25. It is true that care and labor are necessary in starting them, but the pleasure derived from the operation alone, well repays that, independently of economic considerations. April is the best month for sowing most of the seeds of tropical plants, and it is best done, where there is the convenience, by hot-bed. The hot-bed is made in the usual manner. The soil used should be, if possible, of a light, sandy nature, mixed with at least one-third of leaf-mold from the woods; if the leaf-mold is not procurable, pulverized muck, or stable manure rotted to the condition of mold, will do nearly as well. This is spread over the manure of the depth of about six inches. The sashes of the hot-bed should fit close, and there should be some material ready for covering the sash at night; either straw, mats, or shutters. We, ourselves, use shutters made out of 1 |2-inch stuff, and exactly the size of the sash. All these preparations being made, insert a thermometer in the soil covering the hot-bed, and when it indicates a declining temperature of 75 degrees, the seeds may be sown. Most of the flower-seeds may be sown in a hot-bed just as we sow egg-plants or tomatoes, which is best done for private use by sowing in rows from a quarter of an inch to an inch in depth, according to the size of the seed, the distance between the rows being two or three inches. Let me here repeat a cautiou that I have often given in connection with seed-sowing: Be sure that the soil used for covering the seed is light; nothing is better than leaf-mold, but if it cannot be got, use the other substitutes before named. Onehalf of the loss in seeds is in consequence of their being covered with a heavy, clayey soil. The vital force of different plants in this respect is widely different. Thus, while the seeds of tomato will germinate in almost any soil, the egg-plant—a vegetable of the same class—requires the utmost care. As soon as the seeds have grown so as to attain the first true leaves -that is, the first leaves that show after the seed-leaves-they must be replanted carefully in soft, light soil, at from one to three inches apart, according to the kind. This will not only prevent

them from damping off, as many of them are very apt to do, but they will be much stronger and suffer less when replanted to the open ground. We prefer to replant the seedlings in shallow boxes—a soap-box cut in three, making a depth of two inches; they are more portable thus than if planted again in the soil of the hotbed; though, of course, after planting in the boxes these are put again in the hotbed. I may here mention that after the seedlings have been planted in these boxes they should be lightly watered and shaded for two or three days. As the season advances, ventilation, watering, and covering up at night, should be attended to.

To such as have not the convenience of a hotbed, the flower-seeds may be sown in the shallow boxes above mentioned, and placed in the window of a south or east room, where the thermometer does not average less than 70 degrees. Success would be more complete, however, if panes of glass were placed over the seeds, resting on the edge of the box an inch or so from the soil. This would prevent evaporation, and render watering, which has the effect of eaking the surface of the soil, and preventing germination, less necessary.

We will name the varieties of flowers most suitable for sowing at this season.

CANNA INDICA, or Indian Shot, grown mainly for the beauty of its foliage. Sown in hotbed in April, and planted out in the open ground in June, will, by August, attain a hight of six or eight feet. In addition to the rich, tropicallooking foliage, the flowers of some sorts are handsome—colors yellow, scarlet, orange, etc.

Antirrhinum, or Snap-Dragon.—A beautiful summer-flowering plant, presenting a great diversity of coloring, is easily raised from seed in the hot-bed. The Antirrhinums may be planted out in this latitude in May, and flower from middle of June throughout the summer.

COBEA SCANDENS.—A climbing plant, which will attain, from seed, a growth of twenty or thirty feet in one season. The flowers are bell-shaped; purple; 3 inches in length by 1<sup>1</sup>|2 inch in breadth. The seeds of this plant are thin and flat, and will germinate more safely if placed on edge when sown.

Coleus.—This famous ornamental-leaved plant is easily raised from seed, and breaks into endless varieties. It is exceedingly tender, however, and had better not be sown before May, nor planted out before June.

ZONAL GERANIUMS are, perhaps, the most valuable of all plants for summer-blooming in our climate. They are easily raised from seed, and will well reward the amateur by the endless variety produced. A few years ago the only colors of these were scarlet and pink. Now we have them of every shade, from white to crimson, with endless tints of scarlet and rose. The Zonal Geraniums may be lifted and potted in the full, and if well pruned in when lifted, will bloom finely in winter.

LANTANA is another summer-flowering plant, easily raised from seed, the flower resembles somewhat the Verbena, but has, besides many of the colors found in the Verbena, orange, and yellow, which are not found in that flower.

LOBELLAS.—Dwarf plants, well suited for hanging-baskets, or for ribbon-lining. The flowers range from pure white to blue. The blue of the Lobelia is often of the richest azure, unsurpassed by that of any other plant.

Pansy, or Heart's-Ease.—The usual mode with the florists is to sow the seeds of Pansy in the fall, so that the plants may be large enough to be in bloom when he sells in May. In this condition it will flower, perhaps, only to the

middle of June, for by thus being prematurely forced into flower it becomes exhausted and stops blooming, and often dies outright; but when sown in spring the growth is natural and unchecked, and it will grow and flower without cessation, from June to November.

PETUNIAS, being of rapid growth, will flower the first season, even if sown in the open ground, but usually not before July or Angust. If sown in the hot-bed in April, they will bloom in June, and make much larger and finer plants.

DIANTHUS.—The Pinks are numerous and varied, many of them having a rich, close fragrance. They present an endless variety in color and style of flower.

Salvia Splendens, or Scarlet Sage.—Seeds of this sown in April will flower by July or August, and continue throughout the season; this, perhaps, is the most gorgeous plant of our gardens; single plants often attain a hight of 6 feet, and nearly as much in diameter, having a hundred scarlet, plume-like flower-spikes; the color is so intense when seen against a green background, that it is often visible at the distance of half a mile.

VERBENAS .- The most popular plant of the day, is easily raised from seed, and no other plant that we know of will so well reward the trouble. The number of varieties now attained is something wonderful, even to us in the trade. Every year develops some new strain. Every color seemingly is obtained, but yellow or orange; these we never expect to have, as there seems to be a natural law of the floral kingdom that blue, yellow, and scarlet, are never found in varieties of the same species. Thus we have in Dahlias and Roses, yellow and scarlet colors, but no blue, just as we have in Verbenas blue and scarlet, but no yellow. Your readers will do well to remember this, and be saved, as they occasionally are, from investing in "blue" Roses or Dahlias, and "yellow" Verbenas, and know that the seller must either be ignorant of his trade or dishonest.

Double Zinnias.—These, like Petunias or Balsams, can be raised to flower by August, if sown in the open ground, but if sown under glass in April, will flower in June, and throughout the entire season, making larger and finer plants. There are few plants that have improved so much as the Zinnia, it being only ten or twelve years since the first double ones were introduced, and few of us then imagined that the present perfection of form and great variety would be obtained. We have now dazzling scarlets, yellow, orange, lilac, rose, white, and crimson, rivaling the Dablia in symmetry of form.

#### An Orchard Record.

Every orchard, at least those in which there are several varieties of trees, should be recorded. The planter may perhaps be able to remember the names of the trees he sets out; but orchards do not always remain in the possession of those who plant them, and a record is of the greatest importance to the one who succeeds to the property. Aside from the convenience to himself, it is a duty to those who come after him for each one who plants an orchard to make such a record as will be readily understood by others. Many plans have been proposed; the simplest is the best. We are reminded of the matter at this time by a letter from M. S., Hawleytown, N. Y., in which he gives his method. He numbers his rows from south to north, beginning at the southeast corner of the orehard, and the trees east and west. This being stated at the head of the record, the name of each

tree may be easily found by its position:

Tree.	Row No. 1.	Tree.	Row No. 2 (next north).
1	Baldwin	1	Newtown Pippin.
2	Lady	2	Bough.
3	Peck's Pleasant	3	Porter, etc., etc.

#### Osage Orange Seed,

We have quite frequently stated the manner of treating the seed of the Osage Orange, yet as several new subscribers send us inquiries about it, we reply briefly. The seed is to be soaked in blood-warm water for a week, changing the water every day. At the end of a weck turn off the water, and cover the seed with thick woolen cloths in order to keep them moist, and set them near the stove until they spront. Examine the seed daily, and stir them with the hand. When minute sprouts appear just breaking through, the seed should be sown. The seed-bed should be good, light, rich land, and the seeds be sown as early as possible. Sow in drills, two inches deep and a foot apart, putting about twenty-five seeds to the foot, and covering before the seed is dry. The young plants are to be earefully weeded and cultivated during the summer, and thinned wherever they are crowded. In the fall the plants are taken up, assorted into sizes, and heeled-in.

#### That Grape-vine.

" We say that grape-vine, because it is likely that the majority of our readers who live in towns and villages are obliged to content themselves with only one vine. What will apply to one vine, will serve for a dozen, or a whole vineyard; but this is written for those-and unfortunately it is a large class-who have no vine at all, never grew a vine, and are more likely to go wrong than to go right. In the first place, you cannot have fruit within a few days after the vine is planted. Some jobbing gardener may come along with a clump of a vine two inches through, and promise it to bear the same season. It may bear a few poor bunches, but the vine will never be a satisfactory one. Get a young vine, at most two years old, with good roots. If the vine comes with two or three feet of stem to it, cut it nearly all off, leaving only a short portion with three buds upon it. Set it in a sunny place if at command; but if it must be put in some particular place in order to cover a trellis, give it the best possible chance. A vine will stand almost any kind of abuse, except giving it a wet spot to grow in. If the ground is wet, make a large and deep excavation, and throw in stones, bricks, or other rubbish for drainage. See that the roots are placed in good soil; it need not be over rich, but it should not be worn out and impoverished. When the buds push, and the shoots have grown a few inches, rub off the two weaker ones and leave but one shoot. It will be hard for most persons to do this, the young shoots all look so promising; but the future success of the vine depends upon its being done. The first season after planting, the whole business of the vine should be to grow one strong and vigorous shoot. We shall be expected to name some varieties, and for every body every where we think that the Concord is best adapted. There are vastly better grapes, but it is so hardy and so reliable, that the novice had better make his first essay with the Coneard. Among the newer varieties there is none of greater promise than the Eumelan, which is a new, black grape, of most excellent quality. It is offered in the publisher's premium-list.

#### The Dwarf June-berry.

One of the most widely-distributed of our native shrubs is that popularly known in various parts of the country as June-berry, Shad-

DWARF JUNE-BERRY. bush or Shad-flower, Service-berry, Swamppear. It is found in all parts of the United States, and as far north as the arctic zone, and from Hudson's Bay to the Pacific. Having this wide range, it presents a great diversity of appearance, and the earlier botanists described as distinct species the different forms, which are now considered as varieties of one widely-distributed plant. The varieties differ in the length of the petals, the shape and downiness of the leaves, size of the flower, cluster, etc. While some may be considered as full-grown when only four or six feet high, others attain a hight of thirty or forty feet. Notwithstanding these differences, the forms seem to run into one another, and they are all put under one species, Amelanchic Canadensis. The shrub, or tree, is very common in swampy places, and along streams, and opens its clusters of white flowers in April. It is a very graceful shrub, and flowers so profusely as to be conspicuous in the landscape. We have often wondered that such an early-flowering shrub was not cultivated in ornamental grounds. The popular New England name, Shad-flower, has reference to a belief that the flowers open at the time shad ascend the streams. The flowers are in long drooping clusters; they have the same general structure as the apple and pear, to which the plant is elosely related, but they are much smaller, and the petals are long and narrow. The fruit is a more or less pear-shaped berry, containing sev-

eral seeds. The pulp is sweet and pleasant, though the fruit of our common varieties is seldom seen, as it is a great favorite with the birds.

Many years ago, Nuttall discovered, in the Rocky Mountains, a dwarf variety of the June-

berry, which has, within a few years, been sparingly cultivated for the sake of its fruit. It blooms and bears profusely when only a foot high, and old bushes only attain the hight of four or six feet. We have had for some time a bush of this variety among our ornamental sbrubbery, where its neat habit, and early and profuse flowering, makes it an interesting object. Last spring we procured a number of plants of Mr. H. A. Terry, Crescent City, Iowa, and placed them in the fruitgarden. Mr. T., who has been foremost in introducing this plant into cultivation, states that it has become quite popular in his vicinity, where, besides the name of June-berry, it also bears that of Mountain or Highland Huckleberry. The fruit has al-

ready appeared in their market, where it meets with a ready sale at good prices. We are always pleased to see any addition to our list of small fruits, and consider the Dwarf June-berry worthy of a trial by those curious in such matters. The great fondness of the birds for the berries is likely to prove an obstacle to its cultivation, our only bearing-bush being stripped before the fruit reached maturity. The fruit is red, turning to a blackish-purple when it is fully ripe.

#### Lady Banks' Rose.

The Banksian rose was so named in honor of the wife of Sir Joseph Banks, upon its introduction from China into England iu 1807. The plant is a vigorous climber, attaining the hight of 30 to 50 feet. Unfortunately it is not bardy in the Northern States, but our friends at the South can avail themselves of it as a most charming plant with which to ornament the pillars to their verandas. The flowers are only about half an inch across, and grow in clusters, which are produced most profusely. The engraving gives the flowers of the real size; there are white, yellow, and salmon-colored varieties. This species is sometimes used to train over the rafters of a greenhouse, and when its numerous flowers are seen among its glossy foliage, the effect is most pleasing; but as it blooms only once in the year, florists generally prefer to give the space to some more frequent flow-

ering variety. It is to be regretted that this highly ornamental species of rose is not generally hardy; and we hope that our readers who live in the milder parts of the country, will see that it is more generally grown than it is at present.

#### Starting Sweet-Potato Plants.

It is not necessary to start sweet-potatoes under glass, although when but few are wanted it is often convenient to use a part of a hot-bed for the purpose. Florists sometimes turn the unoccupied benches of their greenhouses to good account in raising sweet-potato plauts. In the Gulf States it is not necessary to use any heating material at all. Beds about four feet wide are made in a sheltered, sunny place; they are well enriched, and made to slope a little toward the sun. The potatoes are laid upon the beds, an inch or two apart, and covered to the depth of three or four inches with rich, light soil. Ten bushels of potatoes are allowed for each acre to be planted. Farther north, heating material is required, and a rude hot-bed is made by excavating a pit three or four feet deep. which is to be nearly filled with coarse fermenting horse-manure. Six inches of sandy soil is put upon the manure, and the potatoes are placed upon this, and covered as above stated. The bed is covered with planks at night and during chilly days. Water is given as needed; this should not be cold, as it would check the, growth of the plants. Add hot water to bring it to the temperature of the bed; and if the bed becomes too hot, it is cooled by making holes down through the manure by means of a stick. This is a cheap but efficient substitute for a hot-bed, but not so convenient to manage.

#### THIE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### Fashions in Boot-jacks.

One would suppose that a boot-jack was not susceptible of much improvement, and that a simple notched board, with a cleat to give it the proper elevation, would be all that was required. boot-jacks have been improved, and have even been the subject of numerons patents. If one has to use an implement daily, he desires it to be made in as comely a form as possible; hence it is pleasant to have the crude appearance of figure 1, with its sharp angles, modified into the neatly-rounded implement of figure 2. Those who travel much prefer earrying their own boot-jack to trusting to the uncertain resources of ordinary hotels. For the convenience of packing in the trunk, the folded

Fig. 1.—COMMON BOOT-JACK.

implement, shown in figure 3, has been contrived. Another folding style is shown in figure 4; the shorter portion has two stout pins, which, when in use, sufficiently elevates the end from the floor. When the parts are folded together, the pins fit into boles in the longer portion. All of the forms are easily made of wood, and numerons fancy patterns in iron may be had at the furnishing-stores. A bench for resting the foot while blacking, and which also serves as a box to hold the brushes, etc.,

Fig. 2.-IMPROVED BOOT-JACK.

is given in fig. 5. It is made in such a manner as to shut up and occupy but a small space. The box, D, forms the top of the bench, and holds the blacking and brushes. The lid, A, serves, when open, to hold the two folding legs, C, in place. When packed away, the lid, A, shuts down upon B, and the legs are then folded together, and secured by a hook.

#### A few Hints to Carvers and others,

BY MRS. J. W. T.

When carving a joint of meat, always keep the guard, or prong, open on the back of the carvingfork. Although you may have no fears for yourself, some of your guests may suffer execedingly from fear that the knife will slip and injure you or the person sitting at your left. Aside from this consideration, it appears very awkward when the

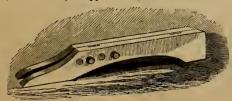

Fig. 3.—TRAVELERS' BOOT-JACK

guard is shut during the process of carving a joint. In cutting up a beefsteak, or in helping to ham, mutton-chops, etc., the gnard should be shut, as then it seems just as awkward to have it open.

Never place a guest at the left hand of the carver if the carver is right-handed, nor to the right if the

carver is left-handed. Some nervous persons, if seated in the line of a large, sharp-pointed, highly polished, carving-knife blade, would imagine all kinds of possible casualties to themselves, and would be exceedingly uncomfortable during the whole process of earving. When the meat is a joint, do not help a guest to slices from the dish, but cut them fresh from the joint as required.

Fig. 4.—FOLDING BOOT-JACK.

When earving from a joint of cold meat that was partly used the day before, do not help a guest to the outside slice. The reason for this is obvious: the juice has drained out, making it dry; it has also been exposed to the atmosphere, and is altogether a very undesirable piece of meat. It is, however, the piece which an unthinking earver generally gives to the most honored guest, because he helps her first. In helping persons the second time from the same joint, do not give them so much as at the first time. Where the first person helped prefers the meat rare or underdone, the carver will be under the necessity of cutting off several slices from the outside; these pieces may be placed neatly on the joint until wanted. It is usual to cut up the whole of a chicken or duck without removing the fork, afterward helping to any portion preferred. A guest should never hesitate when asked by the carver which part of the chicken, turkey or duck he will take. He should

anticipate the question, and be ready to say which part he would like. If the guest is embarrassed, and says, "I have no choice," the carver must not press the question, but help to any part. It is well to give some of both the white and dark meat. It is quite enough for the carver to help to the meat. He should have nothing to do with the vegetables or accompaniments. The waiter should attend to this, always going to the left of the guest, in order to allow of

the right hand of the guest being used. Where there is no waiter, the persons sitting opposite each vegetable will kindly help to it. The most convenient place for a carver to sit is facing the doors where the servants pass in and ont. In this position he commands the whole situation of affairs. Many earvers are put in the center of the table, which is very inconvenient. The carver sits at the end of the table; he has much more room than if in the center.

#### The use of Soda and Saleratus.

BY A. H.

I have seen housekeepers who seem to be ignorant of the effect of soda upon the materials used in cooking. They seem to have an idea that soda alone has a tendency to make any thing rise. Hence they use it indiscriminately in bread, biscuit, or eake. Years ago I knew an old lady who had this idea, and it was impossible to convince her to the contrary. Whenever she was afraid that the bread would not be light enough, she would add a quantity of saleratus. Her bread was often as yellow as saffron and not fit to eat. I often see yellow pie-ernst, especially upon chicken and meat-pies, plainly showing that soda has been used. Soda or saleratus should never be used unless the bread or pastry is sour, or unless you add to the flour, or to the dry soda, before mixing, a proportionate quantity of acid-such as cream of tariar. If you add soda alone to a perfectly sweet material, it has no more effect in making it rise than would so

much salt. It will, however, affect the flavor and color of the material. When using soda, be careful to use only enough to neutralize the acid. Some persons consider the use of soda at all in cooking, as positively injurious. They labor under a mistake, I think. Where the alkali and acid are properly proportioned and come together in the moist material, they completely neutralize each other and form a compound-Rochelle salt-the presence of which in small quantities is not perceptible, nor is it considered unwholesome. When too much soda has been used in 1 lead or biscuit, it is readily manifested by the cook. In cookies or sponge-cake, it is not so easily detected, as the yellow tinge may be supposed to be due to the egg used. I am not thus deceived. The col r given to cake and cookies by eggs is a bright, rich, golden yellow, while that from the use of too much soda is a dull, smutty, heavy-looking yellow. There are those who consider the free use of soda as very beneficial to health. They make a serious mistake. Soda is sometimes used as a medicine, to correct acidity in the stomach. It is better at such times to take the quantity prescribed mixed in a little water, and not in the food. The free use, for a length of time, of cookies, cake, etc., in which there is a superabundance of alkali, will result in an impaired digestion.

#### How to choose Meat.

BY ESTELLE EDGERTON

I have often been surprised at the large number of persons who seem to have no idea of the great difference there is between good and inferior meat, and who also seem to have implicit faith that the butcher will give them the best and primest parts

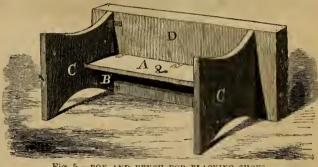

Fig. 5.-BOX AND BENCH FOR BLACKING SHOES.

of the animal. Now, it is not probable that he will give his best meat to persons whom he has found by experience will be satisfied with that of ordinary quality. There is always a demand for prime cuts, and as much the smaller portion (especially in beef) is prime, the butchers are very glad to dispose of those cuts that are not so desirable, and the more so when they get the "prime beef" price for it. Depend upon it, the only way to get the best meat the butcher has, is to be able to judge of the quality vourself. In this case it would not always be necessary for the purchaser to look at the meat before ordering it, for the butcher will very soon find out that you know good meat when you see it.

It is very poor economy to buy inferior beef for a roast, even if you get it at a lesser price, because a considerable portion of such meat is wasted. Poor beef, if you buy it at all, should be boiled or stewed, or made into soup.

A good housekeeper should know exactly what to do with a piece of meat that has been scut in. If her husband has ordered a roasting-piece of beef, and the butcher has sent up a piece only fit for boiling, she should either send it back, or have it boiled or stewed. It would be folly to roast it, as all the gristle and tough muscle which would soften, if gently stewed, would barden in the oven; and if it were stewed in water for a week afterward, it could not be softened.

Good beef will be very fat, and the grain smooth and fine. The fat should be more inclined to be white than yellow; the lean a bright healthy red. Beef should be mature. I do not like it when it is

neither veal nor beef. Heifer or very young beef may be easily told by the color. It is far less bright than matured beef, being of a dull, bloodless-looking color, something between that of veal and beef. The bones are small, and the fat white. Bull beef is known by its high color, its coarse grain, and unpleasant-looking fat. It is of very strong flavor, and undesirable, especially when old.

In good beef the fat is thoroughly mingled with the lean; but those cuts where there is the largest amount of th's intermingling of fat with the lean, are not always the best to buy. The ribs and the rump, in my opinion, are the best for roasting. I am quite well aware that the latter is usually salted and boiled, but it makes an excellent roasting-piece nevertheless; tender, juley, and of fine flavor. The sirloin is the tenderest part of beef, but when roasted, has not so fine a flavor as the ribs. Many prefer it, however. It is generally cut up into steaks for broiling, for which purpose it is the best adapted. Steaks are often cut from the middle of the rump, and also from the shoulder. These are very good, but not being prime parts, a much less price should be paid for them. A round steak from good, tender, fat beef is good and of excellent flavor; but eare must be taken not to purchase when the leg, from which the round is taken, has been cut down too far. The muscular leg should not be cut into steaks, but the butchers will do it so long as they can sell it. The thick ribs next to the shoulder are often sold by butchers to their best enstomers, as the primest part, and at a prime price. It makes a thick, firm, compact-looking roast, the lean very handsomely intermingled with fat. The shoulderblade runs three inches or more deep into the meat. This is removed, and a piece of solid suct neatly inserted in its place, thereby deceiving the unwary. It makes a very inferior roast.

To choose Mutton.-It should be fat, and the fat clear and white. Have nothing at all to do with mutton where the fat is yellow. Good mutton is of an entirely different color from good beef. The latter is a bright earnation, whereas mutton is of a darker and deeper hue. Mutton should be made from fully-matured sheep. If only a year old, it would be lamb. It should be three years old to be good, and five years old to be prime. The hindquarter is best for roasting. The fore-quarter of lamb is excellent roasted, but the fore-quarter of fully-matured mutton should be boiled. The ribs may be used for chops, however. Chops are cut from the ribs, the loin, and the middle of the leg. I think the rib chops the best, though where the butcher charges the same price for both, the legcutlets are the more economical, as there is much less bone, and no hard meat, as on the ribs.

The butcher will sell to the inexperienced buyer chops ent from the neek; also chops where the neek and shoulder join, and more than half houe.

Many persons, because they do not like fat, buy lean meat. This is poor economy. It is better to buy the fat meat. The butcher is generally willing to cut off considerable of the fat.

Veal should be clear, white, firm, and not too large. It is not fit to cat when neither real or becf. Do not bny real when it is dark and thin, and where the meat shows through the surface-skin.

#### Hints on Butter-making.

A lady who thinks that much that is written about butter-making is by "men," and not by experienced butter-makers, gives a few hints. the improvement of winter butter, she very sensibly begins with the cow, and advises feeding Indian meal. She says: "My rule in winter is to let the milk stand on a table in the cellar for 24 hours; set it on the stove until the cream wrinkles (do not let it get too bot), then let it stand another 24 hours, and skim. Use a skimming-ladle with holes, in order to have as little milk as possible with the cream. Stir the cream every day; and the day before churning put the pot near the stove to allow the cream to warm and get sour. Some have the mistaken idea that cream should not get sour; but it makes better butter, and more of it. Stir the cream well, as much depends upon that. If a clear, yellow skin forms on the cream, it will make the butter strong; it is as bad as mold, or worse. In summer throw a handful of salt into your creampot when you first set it; it will keep the cream sweet longer. Be sure to ventilate the cellar or milk-room. It is a mistake to churn sweet and sour cream together, as it makes the butter streaked. Do not work the butter too long; it will become oily; but have a fine cloth, squeezed ont of cold water, to take up the buttermilk with."

#### How I Wash my Dishes.

Of course, I make sure before breakfast or dinner that there is plenty of water in the boiler, and also in the tea-kettle. After the table is cleared, the table-cloth brushed off and neatly folded away, and the dining-room disposed of, I proceed with my dishes. First, I take my large dish-pan, put into it a piece of soap, and pour over the soap three or four dipperfuls of hot water from the boiler. Then I add two or three dipperfuls of cold rainwater. Then my dish-cloth. The water should now be so cool as not to turn the hands red when put into it. Take the dish-cloth and rub from the soap the melted surface, and put the remainder away. Wash a dish at a time and pass it to another pan; a milk-pan is generally used. When all are done, or the pan is full, take the tea-kettle and pour over enough hot water to thoroughly rinse and heat them. Now take them from the water, one at a time, and place them bottom-side up upon a tray or pan to drain. If they have been properly washed, this hot rinsing water will run off or evaporate in a minute, leaving the dishes nearly dry. However, they should now be wiped with a clean, dry towel, and put away. Dishes must be washed in soft water. Especially is this necessary where soap is used. And soap is really indispensable in washing dishes properly. The dishes should be seraped free from grease, crumbs, bones, etc., before commencing to wash them. A neat housekeeper will have the same dish-cloth in use until it is worn out, when it should be put into the ragbag. Never allow the dish-cloth to be used for any thing else but washing dishes. MRS. W. T.

## How to make Head-Cheese.

Select the cleanest and fattest and most perfect

pig's head. The butcher splits the head only once

-through the center of the forehead and snout-

taking off the jowls. Direct him to give it a cross eut-by the eyes-separating the snout from the forehead. Now ask him to take out the eyes, which he can do very readily with his sharp knife; see that he takes out both eye-lids-upper and lower-with the sac, in which is the eye and the surrounding membranes. He must go close to the bone socket, io order not to break the eye. Now let him take off the ears, including the wrinkled portion of the skin surrounding them, and going deep enough to remove the whole canal of the car. Open the ear, and scoop out the horny portion, about as large as an egg, containing the wax, drum, and dirt. It is easily done. The bones of the snout may now be removed without loss of flesh. The pieces should then be put to soak in plenty of lukewarm water. The water should be

the snout may now be removed without loss of flesh. The pieces should then be put to soak in plenty of lukewarm water. The water should be drained off and reuewed until all the blood is removed. The flesh, especially the fat part, and also the skin, will be of a very white and delicate appearance. Hair will remain on some parts of the head and on the ears, which the knife will not remove. These must be singed off with a piece of lighted paper. It is well to examine the fleshy part of the snont and lower jaw, and with a knife scrape off the skin which the butcher cannot remove before the head is split. I always find scalded skin here, which comes away with a mere touch of the knife. After this is done, wash again and then salt. Take a quart of salt and a tublespoonful of finely pulverized saltpetre, mix them thoroughly together, and rub the pieces of pork with the mix-

ture, adding sugar or molasses if you wish. I add

neither; nor do I put any water to the salt, nor over the meat; but I am careful that some of the salt shall touch every part of the meat. I pack the pieces closely in a crock, and let them stand for ten days or two weeks. It is well to turn them occasionally, letting the top pieces go to the bottom into the brine that has been formed. In two weeks, or perhaps less time, I take the pieces for the cheese from the crock, wash the brine from them, and boil them geatly until very tender. If the hones do not slip from the meat without the aid of a knife or force, it is not tender enough. When boiled sufficiently remove from the kettle, and take out all the bone. Now ent it up fine with a knife and fork-some use a chopping-knife and bowl, but I do not like that way. Season with black pepper--the meat is probably quite salt enough. Many add pulverized sage. This is also objectionable to me and my family, so I do not put nuy ia. I use only pepper. A little mace might be good, as it improves almost every thing when sparingly used. When the meat is chopped or ent up fine, it must be put into bowls to be pressed into shape. I think the practice of putting headcheese into milk-pans is wrong. It is a very inconvenient shape from which to cut the slices properly. A two-quart bowl is the shape I use for my family. Where two or more bowlfuls are made, only one is removed from the bowl as wanted, as the cheese keeps better. It will keep for some time if not loosened from the sides of the bowl, while a head-cheese exposed to the air soon deteriorates inflavor. A weight is necessary to press the meat in the bowl. An inverted plate and a flat-iron will do. The jowls or cheeks are seldom used in the cheese, as they are too fat. I salt mine with the rest of the head; and at the time of making the cheese remove them from the brine, wipe them dry, wrap them in a paper, and hang them up to dry and cure. They will be nice with roast or boiled chicken, or veal, next Summer. Cut head-cheese in very thin slices—the thinner the better—and eat with mustard and vinegar.

We useful than.—The ham should be nicely washed in warm water and put into cold water. Allow a quarter of an hour to each pound of ham. When sufficiently boiled, remove it from the water and place it in a baking-pan; remove the rind, and roast or bake one hour in a quick oven, dredging it frequently with a mixture of finely-powdered and sifted bread-crumbs and flour, in the proportion of one part of flour to three of bread-crumbs. If not scorehed, it will look finely upon the table. The flour prevents the crust of crumbs from scattering over the ham when cut.

Buckwheat Cakes.—Nanna W. thinks that her buckwheat cakes are so good that others ought to know how they are made. One cupful of corn-meal, two cupfuls of wheat flour, four cupfuls buckwheat flour, two teaspoonfuls of salt, one teacupful of yeast, and sufficient warm water to make a pouring batter; mix, and let rise overnight, and bake in the moroing. Leave a pint of the batter to set the next lot, and you need not use any more yeast the whole season. Keep the "stock" cool when not wanted. If the batter turns sour, stir in, just before using, a teaspoonful of baking soda dissolved in cold water.

Green Spinach .- At the head of that class of pot-herbs commonly called "greens," stands spinach, admitted to be the most delicate in texture and acceptable in flavor. Many like their greens boiled with meat-a treatment that may be well enough for turnip-tops, cabbage-sprouts, and the like coarse herbs, but to dreuch the refined and delicate spinach in greasy pot-liquor, is to my notion ont-and-out sacrilege. Often, with the best of intentions, the cook will send spinach to the table of an olive or nearly brown color, instead of the dark, pleasing green, which makes it as welcome to the eye as it is to the palate. This want of proper color is because the cook does not know one simple dodge. Always boil spinach in an uncovered pot. When the spinach is done, drain it on a colander, chop it fine, warm it up with a good lump of butter, and, when well heated through, serve.

#### BDYS & GURLS' COLUMNS.

#### The Icicle Prizes.

When I offered prizes for the best essays on the icicle, I little thought that it would be notil the mild days of April before I should announce who were the successful competitors. I told you last month the cause of the de-There is another thing I did not foresee-that I should have over a hundred and twenty essays to read! This was a little laborious, but it was very interesting to see the different ways boys would express themselves upon the same subject. One boy wrote six pages, and only two of them were about the icicle. The briefest article was from a boy in Dutchess Co. He condensed the whole matter as follows: "An icicle grows downward from its base. It is formed by drops of water freezing one upon another." Some used many more words without telling any more than that. It was very difficult to choose between the half-dozen best essays, as some touched points not noticed by others; but upon the whole I think the first prize must go to Rileigh T. Scott, ellow Stone, Wis., and the second to John Senger, St. Vincent's, Pa. Master Scott's account is printed in another column. Those whose articles were so good as to puzzle me in the decision, should be named. Here they are: Wm. T. Cooke, Scitnate, R. I.; Albert W. Bee, Dorchester, Mass.; Jerry W. Jenks, St. Clair, Mich.; Edward Jackson, Westchester, Pa.; H. M. Seymour, Hawley, Mass.; Olin Landreth, Rushville, N. Y.; Felix G. Owen, Springfield, Mo. I hipe that we shall have other and more promptly decided contests another winter, and that the girls as well as the boys will be able to take a part. THE DOCTOR.

#### Note from "Carleton."

Ms. Editon:-I am noder great obligations to my young friend, for such I take him to be, who lives away out in Kansas, for calling my attention to the mistake in my talk with the young folks about Vesuvins, in the Feb. Agriculturist. I said that Plutarch was a Roman. I had no right to say so, for he was n't. I was writing about the old Romans, and it was the most natural thing in the world for me to speak of him as a Roman historian, whereas he was a native of Greece.

Now let me say to the boys and girls that it was Master Still, of Leavenworth, Kansas, who had eyes sharp enough to see the mistake, and I am much obliged to him for calling my attention to what may seem to be a very small affair; but it is hest to be always right.

#### Aunt Sue's Puzzle-Box.

Lagain offer a prize for the longest list of correct answers to all the puzzles. Also, a set of anagram-letters, to be drawn by lot, for a correct solution of all the anagrams.

That those sending answers may be saved the trouble of writing the titles, I shall number the puzzles consecu-

Answers to these must reach me before the first of May, Those received later will not be credited.

Address Aunt Sue, Box 111, P. O. Brooklyn, N. Y.

#### ANAGRAMS. 1. I run lame, Ben.

- 6. Bridle us.
- 2. Lol ram it. 3. Aiding me.
- 7. Card spake. 8. Crop Street.
- 4. Runs alive.
- 5. Eric Daw.
- 9. Be less him.
- 10. Angle-oet.

#### DOUBLE ACROSTIC.

- 11. The initials and finals will name two different col-
- 1. To plot. 2. A leather thong. 3. Legally clsewhere. 4. A fruit. 5. A game.

#### WORDS ENIGMATICALLY EXPRESSED.

- Cut our hair.
- It is not smaller.
- KEYSTONE.
- 14. My crows contend.
- The string of the hotel. 15.
- An article at a distance.
- 17. Fruit pitcher.

Find the word out of which the following sentence was made (repeating the letters, of course).

A modern Matron had on a Roman garment and tore it on a thorn.

#### DECAPITATIONS.

- Behead a portion and leave an animal.
- Behead an animal and leave part of the human frame.
- Behead part of the human frame and leave a fish.
- Behead a fish and leave an animal.
- Behead an animal and leave a grain,
- Behead a grain and leave a luxury.

25. Complete I go through many a board; Behead,-a weapon unlike a sword; Behead once more you'll plainly view Nickname applied to many a Jew.

ADOLPH M. NAOEL.

#### ZOOLOGICAL ENIGMA. 26. I am compose? of seven letters

My 1, 2, 3, 4, is an animal found in cold climates. My 4, 5, 6, 7, is an animal found in warm climates. My whole is an animal found in cold climate

#### NUMERICAL ENIGNA.

- 27. I am composed of 22 letters:
  - My 17, 7, 14, 15, is an officer.

  - My 19, 5, 4, 12, is an actor. My 16, 20, 21, 11, is a tube. My 6, 8, 18, 11, 22, an edentate animal.
  - My 10, 2, 9, 1, 3, 12, 5, is a country in Africa.
  - My whole is good advice. J. I. M.

AUNT SUE'S NOTICES TO CORRESPONDENTS. HABRY H. I do "love children." Is it not against the rule to "write in school hours"? If not, thanks for

HARRY (No. 2). It would make the anagrams too easy of solution to define them as you suggest.

Harms. Thanks: they will "do" very nicely.

Uncle Eo. Only the little ones make cross-word enigmas; can't you soar higher?

A. H. H. You can study those things in school.

BK. I hope you will find occasion to write every month. Gnant. It is a pleasure to furnish entertainment to one so courteous as yourself.

JOHN A. BOSTON. The same remark applies to you.

JOHN A. BOSTON. The same remark applies to you D. E. STEVENS. Suppose I give you the words ' You print the letters "SLY WARE" on a card, then cut them separate, and transpose them until you make the original word with them; which is "Lawyers." To understand the acrostics, - study the original, with its answer.

JOHN AND GRIZ. I was rather sorry for the poor dog on the gridiron; but never mind, it will do very nicely, thank you; our artist will straighten him ont.

NELLIE B. CHAPMAN. Thank you for telling me just how you went to work. Did you suppose I should offer a prize for anything that was "as easy as rolling off a log"?

Auntie. I am very glad to hear from you and
Ronnie again. Your case must be discussed.

CONA E. SHULTZ. Did you write that letter your own alf? I never saw such pretty writing for "twelve years old,"

BLUE BIRD. I give a prize every week in HEARTH AND Home, for the solution of anagrams.

Jos. H. Bird. Your answers were so clearly and bean-

tifully arranged that I was in hopes you would win the prize: but alas! your solutions of Anagram No. 8, and Numerical Enigma No. 2, were incorrect, and two others you did not attempt to answer.

IDA B., AND O. B. McC., will please read the paragraph in the Special Notice to Puzzlers, which alludes to original

SABAH G. BATES. If you "really cannot wait for the chances," you can have a set, by inclosing twenty-five cents to Box 111; but you must promise not to give np trying to find out the Anagrams.

#### PRIZES.

The Anagram prize was drawn by David Baird, N. E. cor. 109th-street and Second Avenue, New York

I had to exclude several names from competition hecause one word in each of their lists was wrong; but io the prize for the greatest number of correct answers I counted all the Anagrams which were right.

JOHN A. BOSTON, P. O. Box 246, Newburyport, Mass., answers 22 of the puzzles correctly, and wins the prize. He failed to answer the eighth Anagram, and answers the CHARADE with "Steam Boats"; which, though very ingeoious, will not quite do.

WM. TAYLOR, and Lillie Streeper, each answer 20. Correct answers, more or less, have been sent by S. L. D., Harry, E. S. K., Lillie G., Mary Bridge, H. S. H., Harris, A. W. K., Adolph M. N., Julie A. T., Bk., H. W. O., Grant, J. H. S., Mary H. Cole, W. T. C., Bertha S., Benjamin J., Clarence Clifford, Lizzie L. A., Clinton F., D. E. S., T. H. H., Willie, C. S. M., F. W. H., and H.W. L., G. H. F., O. B. McC., M. Byrto, Nellie Bache, Hattie E. P., Harry Anderson, H. M. C., E. Carr, S. E. Ober, M. Richardson, B. W. P., C. W. Drury, Jere Plnmer, N. Walker, Jessie F. G., C. B. Jr., B. Rockwell, Robbie Eddowes, Annie Batchelder, Cora E. S., Claison S. W., Sarah G. B., and Blue Bird.

ANSWERS TO PUZZLES IN THE FEBRUARY NUMBER. RIDDLE. A letter.

Anagrams. 1. Medicament. 2. Anecdotes. 3. Mettocs. 4. Between. 5. Original. 6. Consolidate. Brandished, 8. Betrothal, 9. Reopening, 10. Pantomime,

TRANSFORMATIONS. Scold, cold, fold, gold, told, sold, bold, hold, old.

Double Acrostic. Battle-fields: brief, alibi, trifle, tall, lightning-rod, express.

CHARADE AND DECAPITATION. Scare-crow: care, row,

DIVISIONS, 1. Wardrohe, 2. Tomahawk, 3. Jarring. 4. Grandam.

CONUNDRUM. The waist (waste).
NUMERICAL ENIOMA, No. 1. Egotiam. 2. Envy is a self-executioner.

Rebuses .- 401. Labor, either brain or manual work, will be sure to pay: perseverance and patience pay doubly for efforts bestowed. 402. United we stand, but divided we fall. 403. Isle of Man.

Thanks for puzzles, etc., to A. R., I. H. Plummer, Harry, Uncle Ed., Bertha Stout, Clarence Clifford, H. W. L., Jesse Plummer, Maria L. B., Geo, E. Perry, W. H. M., Louise E. Turner, E. B. Jr., M. Richardson, Clinton F., Iows, S. L. D., and Bayard W. Purcell.

#### SPECIAL NOTICE TO PUZZLERS.

We do not want any Anagrams, so do n't waste your time over them on our account. As we give prizes for their solution we prefer to make them ourselves.

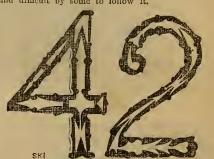

Be kind enough to send none but original riddles. It would be a poor compliment to our clever puzzlers to serve them up ancient and second-hand affairs.

If you will write your answers in the same order that you see them printed, it will save me much trouble.

Several answers to the "Seven" pazzle were received after the March No. had gone to press.

Illustrated Rebus.-Good advice, but it will be found difficult by some to follow it.

407. Mustrated Rebus.-The name of a Western locality.

#### Let us have a Garden.

We do not know how hoys and girls can get more instruction and amusement than in cultivating a little gardeo. Almost every one of them who lives in the country can easily have a small piece of land. Dwellers in cities must have their garden in the back-yard, or even be obliged to content themselves with a hox of earth. Whether it he large or small, the things that grow in it will be more valued in the eyes of the owner than acres belonging to others. What shall you grow in it? That will depend apon what seeds you can get. have no money to spend for seeds, you must depend upon the kindness of others for a supply. If you know of a man or woman who really loves flowers, you need not be afraid to ask for seeds. The culture of flowers opens the heart and lets in kindness. That is one reason why we wish you to have a garden. You will have heautiful flowers, and you will enjoy them so much, that you will wish others to have them too. Sow the little seeds in the earth, after the cold rains are over, covering them very slightly, and mark the place where they are. The next day you will probably go to see if the seeds are up, and as they are not, you will think something wrong, and perhaps be tempted to dig where they were sown to find out what the matter is. Do not do any such thing. Another reason for having a gardeo is, that it teaches

THE APRIL SHOWER .- Drawn and Engraved for the American Agriculturist.

patience; some seeds will break the ground in four days, and others in a fortnight after they are sown. Wait; for you have committed the seeds to the care of mother Earth, and she will not be hurried. By and by the flowers come, and then the seeds-seeds, little dark or black things, dry, seemingly dead, and so unlike the flowers from which they came! Yet you feel sure that next year these dry grains will give beautiful flowers, and you have been taught a lesson of faith. So let us have the little gardens; the flowers will please the senses of all, and to the more thoughtful they will bring lessons of kindness, patience, faith, and love.

#### An Icicle Prize Article.

BY RILEIGH T. SCOTT, YELLOW STONE, WIS.

The air must be at a certain temperature to form icicles well. If too warm, the water runs away without any forming; if too cold, there is no water to run. From have noticed, icicles form mostly on the north side of a building, and while the weather is steadily mild, for winter. If you will notice the caves of a house, or any other place that water drips from, you will see that it drips off in pretty regular places. These places are where icicles are formed. At times the rain or snowwater begins to drop slowly, but steadily, from the roof; nod as the air gets colder, a small drop of water that has collected on the esves becomes chilled, and, before another comes, is frozen into ice. This is the foundation of an icicle. The particles of water are gathering and moving down all the while; soon they are gathered in the form of another drop and hang from the first, are chilled

by the cold winds, and frozen. A dozen drops or more msy go through the same change, making the icicle half an inch or more long. The water, when it comes to the ice of which the little icicle is composed, wets it all around in its descent to the lower end, and this thin film or wetting is frozen to it, thereby increasing its diameter. So the process goes on, adding drops to the lower end, and thin sheets of ice to the sides of the icicle, until the flow of water is stopped by Jack Frost. I have seen forked icicles. They are caused by a drop of water starting down the main feicle, and, being chilled by the ice and wind before it gets many inches, is frozen to the side; the particles of water gather another drop to this frozen one, which is frozen likewise. In this way a fork is formed, perhaps half, or maybe equal in length to the icicle. Icicles are sometimes caused to slant at many degrees from a perpendicular, by the stendy blowing of wind. It seems to me that icicles are more frequent on kitchen roofs than any other, because kitchens are generally built only one story high, which brings the roof closer to the stove, causing the snow to melt very slowly, thereby making icicles; while on a two-story building the snow lays until a fine day, when the sun takes it off as "slick as a whistle."

#### The April Shower.

The pets of the poultry-yard were ont for a promenade. The bright sun of the fine April day made the plumage beautifully-marked Bautams more brilliant than ever. How they enjoyed the walk-especially the newly arrived Japanese Bantam rooster, who appeared to feel

as if he was the Tycoon himself ! He strutted to such an extent that his tail-feathers nearly touched his comb. Some ducks had joined themselves to the party, and were not altogether in favor with the Bantams. They did not strut at all, but only waddled-and such feet! The aristoeratic Bantams felt scandalized at being seen in such company, and tried to get rid of them. "My dear," said Mrs. Seebright Bantam to the mother duck, "you had better not go with us; the grass is likely to he damp, and your little ducklings will get their feet wet." "Just see that Ronen drake," said the Japanese dandy; "he puts on airs because he has some bright feathers; his voice shows him to be a coward, who would run at the first sign of danger." Just then, with but slight warning of gathering clouds, down came one of those showers such as only come in April. Such a dashing of large drops! At the first sprinkle away went the Bantams in search of shelter, their proud bearing and airs of superiority quite forsaking them, their only thought being to save their well-dressed plumage from a wetting. At last they succeeded in finding a friendly vine, which served as shelter, and, when fairly assured of their own safety, they looked out to see what a ludicrous sight the ducks must make in hurrying to get under cover. Much to their surprise the ducks made no effort to get out of the rain; and the little ducklings, about which Mrs. Bantam was so much concerned, were actually swimming in one of the little pools formed by the rain. The artist has made a beautiful picture, which shows the state of affairs just at this point; and we might add that the little story teaches a bit of a moral, only we prefer to let our young friends find out the iesson by themselves.

#### A. S. HATCH. HARVEY PISK.

Office of Fisk & Hatch, Bankers, No. 5 Nassau Street, New York.

FEBRUARY 27, 1871

THE

FIRST MORTGAGE BONDS

OF THE

#### Chesapeake and Ohio Railroad Co.,

originally offered by us last Winter, were so rapidly taken that, prior to the 1st of June last, a sufficient amount had been sold (upward of \$5,000,000) to supply the Company with all the money that would be required notil March

or April of the present year.

The Chesapeare and Ohio Railboad, A New Trunk Line from the Sca-Board to the West, is already completed and in operation from Richmond to the celebrated White Sulphur Springs, 227 miles,

During the past year, the work on the extension to the Ohio River has been prosecuted with great vigor; over 4,000 men having been employed during a great portion of the time.

The completed portion of the Road is doing a good tocal business, and its advantages as a great East and West through line for the transportation of the heavy freights (which constitute the principal part of the East and West

through traffic) are numerous and important.

1. A short route. 2. Low grades. 3. Light curves. 4. Genial climate. 5. East and West termini at favorable points on tide-water and the Ohio River. 6. A very large through and locat traffic awaiting its progress.

All these conditions favor a cheap and economical working of the line, and will enable the Chesapeake and Ohio route to do a profitable East and West through husiness at rates which would not pay by the more difficult and costly lines, and to control an enormous Southwestern

The most apparent and pressing want of the grain, pork, and wool-producing regions of the West, at the present time, is more conomical transportation to the sea-board.

The waters of the Ohio River, which flow by the western terminus of the CHESAPEAKE AND OHIO RAILROAD, connect with more than 12,000 Miles of Retiable River Navigation, and 8,000 miles additional which are available for portions of the year, and with over 20,000 miles of Railroad.

These rivers and railroads wash the shores and traverse the territory of sixteen magnificent, populous, and growing States, containing 1,000,000 square miles; unite more than 200 towns and cities, of which at least twenty-five contain each a population of 20,000 and upward, and minister to the wants of 10,000,000 of people.

To all this vast area, with its magnificent internal systems of water and railroad transportation, its teeming population, its wealth of production, and its enormous commerce, the CHESAPEAKE AND OHIO RAILROAD opens an accessible, short, easy, and economical outlet to the Atlantic coast, upon whose shores the great West and Southwest must find the chief market for their products, and whence they must mainly draw their supplies of manufactured and foreign goods,

Among the Officers and Directors are some of our best known and prominent business men—Mr. C. P. Huntington, whose financial management of the great Central Pacific Railroad has been so successful, is President of the Company, with Messrs. W. H. Aspinwall, A. A. Low, Jonas G. Clark, Richard Irvio, and others, well-known merchants of New York, as Directors. We are now authorized to sell an additional amount of

FIRST MORTGAGE 6 PER CENT GOLD BONDS of the Company, at the original price of 90 and accrued interest.

The bonds are secured by a mortgage upon the entire road, franchises, and property of the Company, which NOW, IN COMPLETED ROAD AND WORK DONE, EXCEEDS THE ENTIRE AMOUNT OF THE MORTGAGE, and which, when completed, will be worth at least \$30,000,000.

A SINKING FUND of \$100,000 per annum is provided for their redemption. They are issued as Coupon or Registered Bonds, and in denominations of \$100, \$500, and \$1,000. Interest payable May and November, in the City of New York.

The superior advantages, valuable property and franchises, and able and honorable management of the CHESAPEAKE AND OHIO RAILROAD COMPANY, render it one of the most substantial, reliable and trust-worthy Corporations in the country, and commend its Securities to the unhesitating confidence of capitalists and investors.

Pamphlets, maps, and full particulars furnished upon application.

FISK & HATCH, Bankers.

SAFETY LAMPS .- The alarming frequency of disastrous fires and shocking deaths from the breaking and explosion of glass kerosene lamps, renders a really safe metal lamp very desirable. "Perkins & Houses Patent Safety Metallie Kerosenc Lamp" claims to be perfectly safe from explosion or breaking. Light equal to gas, and no odor. Eminent scientific men, and thousands of families, including many of our readers, are delighted with it. For particulars, and terms to canvassing agents, address Montgomery & Co., 42 Barelay-street, New York, or Clevelaud, Ohio.

DOTY'S WASHER AND THE UNIVERSAL WRINGER.-You cannot do a better thing for your wife ou a washing-day than provide her a Doty Washer and a Universal Wringer It will keep aches from her back and arms, wrinkles from her forehead, and roughness from her hands. It will do the work of a hired woman and save your linea from being scrubbed out and her temper from being chafed out.—New York Weekly Tribune, March 22d, 1870.

## GREGORY'S Illustrated Catalogue

### Garden and Flower Seeds.

Having in former years introduced to the public the Hubbard Squash, American Turban, Squash, Marbiehead Mambut Cabbage, Mexican Sweet Corn, Phinney's Water-melon, Brown's New Dwart Marrowfut Pea, Boston Curled Lettuce, and other

#### NEW AND VALUABLE VEGETABLES,

with the return of another season I am again prepared to supply the public with Vegetable and Flower Seeds of the purest quality. My Anonal Catalogue is now ready, and will be sent free to all. My customers of last year will receive it without writing for it. It shounds in fine engravings, many of which were taken from photographs of the vegetables themselves. It has not only all novelties, but all the standard vegetables of the farm and garden (over one hundred of which are of my own growing), and a carefully selected list of Flower Seeds.

All my seed is sold under three warrants.—ist: That all my seed is sold under three warrants.—ist: That all my seed shall reach the purchaser. 3d: That my seed shall be fresh and true to name. I invite all to send for Catalogues, both for themselves and their friends.

JAMES J. H. GREGORY, Marblehead, Mass.

#### SEED CATALOGUES.

Our Annual priced-list of

#### Vegetable and Agricultural Seeds,

Embracing sil the standard kinds, at popular prices, is now ready, and mailed free to any address. Also ready, our Annual Descriptive List of Flower Seeds, including novelties for 1871. ALFRED BRIDGEMAN & SON, \$76 Broadway, New York,

#### The Mammoth Dent Corn.

In corn that yields largely, there are three points to be observed, viz.; large ears; depth of grain; and well filled at both ends. The Mammoth Dent is far superior to all other corn in these respects. It has from twenty to forty rows to each ear, and will weigh sixty nounds to the hashel. It is the largest esrly field-corn produced in America, and will ripen in from ninety to one hundred days.

In circumference of eur and depth of grain, it far surpasses any corn we ever suc.—N. Y. IBE JOURNAL.

Price, by mail: two pounds for one dollar, or six packages, two pounds each, five dollars. By express, one peck for \$2.00; half bushel, \$3.00; one bushel, \$5.00.

No order filled for less than one dollar.

Send stamp for Circular, giving full description of the corn and other choice seeds; also, fance poultry, etc.

Address

BAAC N. BALTHIS,

Box 59, Corydou, Indians.

#### Mexican Sweet Corn.

I rank this, after a rigid comparison of several years, will every other sort, as both the sweetest and tenderest of a varieties of Sweet or Sugar-Corn. Per package, 15 cts. M Seed Catalogue free to all. JAMES J. H. GREGORY, Marbichead, Mass.

SANFORD CORN FOR SALE.—Seed purchased last year from S. B. Fanning, Jamesport, New York. Warranted genuine. One bushel, \$2.50; two bushels and bag, \$4.50. RICHARD YOUNG, Morton's P.O., Springfield, Del Co., Pa.

#### Mammoth Sweet Corn.

This is as much larger than every other kind of corn as my Mammoth Cabbage is larger than every other cabbage. I have had over a thousand kernels on a single car, and ears as gathered from the stalk weighing between two and three pounds. Quality excellent. Per package, 25 ets. Seed Catalogue free to all.

# MOORE'S PREMIUM MAMMOTH

This superior variety, highly prized in the Boston Markets, has uniformly taken the first premium at the Exhibitions of the Massachusetts Horticultural Society at Boston. On the second day of June, last year, Mr. Moore exhibited a bunch of twelve stalks, which weighed 3 lbs. 5 oz. At the same time there was on exhibition, from New York, a bunch of Conover's Colossal, containing eighteen stalks, weighing 3 lbs. 8 oz., only three ounces more than the twelve stalks of Moore's Premium, to which the first prize was unanimously awarded.

Hatfounce packets of the Seeds, 50 cents, sent by mail on receipt of price.

Our Hustrated Catalogue sent gravis for the second.

Our Illustrated Catalogue sent gratis for two stamps. HOVEY & CO., 53 North Market-st., Boston, Mass.

## Conover's Colossal Asparagus.

Send for Circular of Directions for growing Asparagus,

Seed, \$1 per oz.; \$12 per lb., by mail.
Roots, \$3 Hundred; \$25 per M.
Early Mohawk and Early Rose Potatoes,
\$7 per Bbl.
S. B. CONOVER,
260 West Washington Market, foot of Fultonst., New York.

#### Mammoth Russian Sunflower.

The heads of this enormous variety grow to the size of 20 inches in diameter under ordinary cultivation; produces an immense amount of valuable green fodder, and about 50 bushels seed per acre. Seed white, the size of Deut corn grains—valuable or feeding poultry and horses, or for oil. A seed-head of mine, shown at the Mass. Hort. Society, attracted great attention, on account of its large size. A field of this variety makes the hest bee pasture known. A few stalks planted in door-yards will prevent fever, by absorbing malaria. Extensively cultivated in Russia. Have selected a quantity of the largest heads for seed. Plant in May; a large package of extra seed, sufficient to plant 15 square rods, sent post-paid, with directions, for 35 cents; small package, 15 cents.

E. BATCHELLEH, Box 909.

#### Michigan Mammoth Pumpkin.

Grows to weigh from thirty to forty-five pounds—will average as large round as a barrel, and yield on rich land from twelve to twenty tons to the acre, top-shelled. Per package, 15 cts. My Seed Cataloruc free to all.

JAMES J. H. GREGORY, Murblehead, Mass.

#### CHOICE MELONS.

Editors of "Hearth and Home" say: "Both this year and last Ward's Nectar was in point of sweetness and flavor, the best of several varieties tested." Cassaba grows to weigh 12 or 15 lbs, is very thick-fleshed, sweet, and delleions. Arlington grows to a still larger size, and is of superior quality. Each of these are green-fleshed. Sill's Hybrid has Sulmon-cotored flesh, and is characterized by a delicions, spicy sweetness. Each variety, per package, 15 cts; Ward's Nectar, 50 cts, per cz. Seed Cathlogues sent free to all.

JAMES J. II. GREGORY, Mathiehead, Mass.

## VEGETABLE PLANTS.

Cold-Frame, Early Wakefield Cabbage Plants (now ready). \$10,00 per 1,000 Mot-hed, Early Wakefield Cabbage Plants (ready in May). \$5.00 per 1,000 Cold-Frame, Erfurt Cauliflower Plants (now ready)... \$29.00 per 1,000 Hot-bed, Erfurt Cauliflower Plants (ready in May). \$0.00 per 1,000 Per 1,000 Fer 1,000 Per

## New and Choice Vegetables, Rare and Beautiful Flowers,

For Sale by B. K. BLISS & SONS, Nos. 23 Park Place and 20 Murray Street, (P. O. Box 5,712,) New York.

ONE-HALF THE AVERAGE SIZE.

GENUINE SEED.—The experience of the past two seasons fully confirms all that was caimed for this variety when first offered, and it now stands norivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty sprouts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Our stock is all from the original Bed, and we guarantee its genuincness. Seeds in half-ounce packets, 50 cents per packet, 50 per pound.

Per bush. of 22 lbs., \$1.25; 10 bush., or over, at \$1.00 (very leavy).

65 Main St., Terre Hante, Ind.

Comstock's Weeding Hook, 50 cents.

#### Jerusalem Artichoke.

This well-known but much neglected vegetable just begins to be appreciated, and is much inquired for. It will grow anywhere—in fence corners, ditch sides, old pastures, or wherever a piece happens to fall. The tubers make excellent pickles, and are very good boiled like potatoes. Sheep are fond of the green leaves, and hogs will never cease rootare fond of the green leaves, and hogs with never cease rooting for it as long as one can be found, and rapidly gain flesh. It also possesses anti-malarial properties, like the Sunflower, and should be grown where Fever and Ague prevails. 4 lbs. by mail, \$1.00; by express, \$1.50 per peck; \$5.00 per bushel; \$12.00 per bhl. andaigna)	Oct.	5, 6,
Ohio Grape-Growers' Association (Cleveland).	44	13, 14,
Lake Shore Grape-Growers' Association		
(Erie, Pa.)	4.4	15, 16,
Also at many important Exhibitions in	1870.	

These are the strongest commendations of its quality, and the universal reputation this Grape has gained the past three years, in addition to its previous history, will make

three years, in additionable one previous mistory, with make for it a very general demand.

\*\*Cor our stock of Plants is produced from the original Vines, which are growing in our own grounds, and every one is warranted true to name.

By reason of the great success of the Eumelan Grape between it has been planted both North and South as well.

By reason of the great success of the Emmelan Grape wherever it has been planted, both North and South, as well as East and West, and its superior worth to all others, The FLORIDA LUPROYEMENT COMPANY of the City of New York have purchased of us for Spring planting Tea Thousand Dollars' worth of Emmelan Vines, of our best quality, with the view of propagating it extensively, and making the most extensive Vineyard in the State with the Eumelan Canan along.

We have yet a sufficient stock of these Viñes to supply a very large demand, and ofter them at as low rates as the same class of Vines can be obtained clsewhere.

Our terms to Agents and Canvassers are very liberal. Posters and descriptive Pamphlet, with Price-list and Canvasser's terms, will be sent upon application.

First Premium Awarded by American Institute, 1870. The Great Improvement in 1858.

H. W. JOHNS' IMPROVED ASBESTOS ROOFING.

This Improved Roofing Material is entirely different from any other, and is TEN TIMES STRONGER than any other Portable or Composition Roofing in use. It is adapted for steep or flat roots in all climates, and can be readily applied by any one.

From Certified Report of Judges American Institute, Exhibition of 1870.

"This Improved Roofing is strong and flexible; unaffected by the sun's beat; practically fire-proof and water-proof, and is really an article of the first order of merit."

Signed, Signed, Signed, Signed, Signed, Signed, Signed, Signed, Section Report of Committee appointed by Am. Institute Farmers' Club to examine the ASBESTOS ROOFING. "The material constitutes, for a cleap roofing, one of unusual merit, much superior to any of the class previously brought to their notice, and worthy of trial by those who desire a durable, easily applied, and comparatively inexpensive and safe roofing, the material having, in addition to the other merits claimed for it, that of being practically fire-proof, and consequently much less liable than the shingles commonly used on barns and rural dwellings, to eatch fire from flying sparks," &c. Jos, B. Lyman, Ag'l Ed. N. Y. Tribune.
James A. Whitney, Ed. American Artisao,
We also manufacture from the indestructible fibrous mineral Ashestos, the patient

A FIBROUS COVERING, prepared ready for use, which can be applied with a brush, and forms an ELASTIC WATER-PROOF FELTING of any desired thickness. It is invaluable for restoring and preserving old shingle and other roofs. Also, Manufacturer of

#### FARMERS FEET!

#### The Advantages of the Champion Shoe!!

(Patented May 29th, 1866.)

The shoes came safe to hand, and I am well pleased with them; they are champions indeed. I am now in my 48th year, and I never had any thing on my teet that can compete with them for ease in walking. Yours truly, M. D. Seculien (Farmer).

I am in receipt of my shoes; they came up to your representation in every particular, in quality, ease, fit, etc., and if you will continue to use nothing but the hest material and not permit the quality of the shoes to decline, it is bound to be the universal shoe among farmers.

The Champions came safe to hand. Being so much pleased with them, I shall of course show them to my friends, and induce them to order. Please send me three more pairs at once, as I will wear no other; they more than come up to my expectations. W. S. Dudley.

Tours truly,

W. S. Dedley.

Weldon, N. C., June 27, 1870.

The two pairs of Champions came safe to hand, and I like them very mnch indeed, just as you represented. Inclosed find money for three more pairs. I am confident large quantities are bound to be sold.

Cold Water Depot, Miss., June 21, 1870.

I received my shoes, which I am well pleased with. I now want you to send two more pairs. I think they are a great invention, saving much trouble in tying. I think they are the best shoc I ever saw. I think I can induce all my neighbors to send for them.

G. H. Reiger.

#### THE SECRET OF THEIR SUCCESS.

Every pair contains a beavy sole-leather counter. For a Plow Shoe they are EXCELLENT. For the hanvest field they are invaluable. For boys' wear they are superior. They save time, trouble, and vexation by the entire absence of strings, and can be put on in the DARK as readily as the Boot. The seams are in such parts as can never hute the feet, and need only to be closed at the top by a simple "buckle and strap." The forepart overlapping the back, act like a PLOW; any thing coming in contact with the foot must FALL away, and renders it UTTERLY IMPOSSIBLE for diet or rubbish to cater the Shoe, which to FARMETS proves a blessing indeed.

made. ORANGE JUDD & CO.

MARBLE HILL, Mo., June 4, 1870.

The three pairs of Champions came safe to hand.
They are an excellent fit and give perfect satisfaction.

REV, JOHN BRANCH.

#### Sec what the Farmers Say.

See what the Farmers Say.

Shefforn, Mass., May 29, 1870.

The shoes came duly to hand; all farmers know how disagreeable it Is to wear boots in warm weather. I have tried for five years to find a shoe that wonld keep ont the dirt when at work in plowed land, but had thrown away the last pair in disgust. When I saw your advertisement in the American Agriculturist I thought I would venture a pair of Champinns. I have worn them in plowing and planting, and find them just the thing. My feet will be as clean at night as if my boots were worn, and as free from dirt and grit. Sore feet, so common among farmers, is caused by wearing shoes in summer that will not keep out the dirt. The Champion obviates this fault and will prove a blessing to farmers and others who till the soit. As soon as your shoes become known to the farmers you will have large sales. I find the shoe just as you represented it.

The Whitze (Farmer), are not by any MEANS in the RETAIL TRADE;

DON'T FORGET THIS.—We are not by any MEANS in the RETAIL TRADE; and onr only object in seuding out these single pairs is to get our Champions thoroughly introduced among the Farmers; as we have a GOOD THING, we want it on every FARMER'S FOOT. ASK YOUR MERCHANTS FOR THEM EVERYWHERE.

#### CLUBS AND PREMIUMS.

We have received so many communications from Farmers asking what inducements or considerations we would give to get up Clubs among their neighbors, that we have made the necessary arrangements for extending this GREAT OFFER

FOR A CLUB OF TWENTY-FOUR PAIRS of "Champlons," we will send one pair of our Sewed, fair stutch, lined, high cut, fine French Calf (a splendid Dress Shee).
FOR A CLUB OF TWENTY-FAIRS, one pair of Pgd., high cut, fine French Calf.
FOR A CLUB OF TWENTY PAIRS, one pair of Pgd., best Oak Kip.
FOR A CLUB OF SIX PAIRS, one pair of Pgd., best Oak Kip.
MEN'S SIZES RUN 6'S to Il's; BOY'S SIZES, I'S TO 5'S.

DON'T HESITATE because you don't happen to need a pair of Shoes RIGHT AWAY. YOU WILL WANT THEM. GO RIGHT AHEAD, and get a pair of "Champlons" FREE for yourself, and a GOOD THING for your neighbor.

#### GETTING UP CLUBS.

Let each person, wishing to join in a Clnb, say what kind of a Shoe he wants; select the kind and price from our Price-list, as published. Write the party's NAME, KIND of SHOE, and SIZE, and whether double sole or single sole, plainly in a list; and when the Clnb is complete, send it to us by mail, and we will put np each party's Sloes in a package, and mark the name plainly npou them, so there need be no confusion in their distrintion. The cost of transportation, the members of the Clnb can divide equitably among themselves, which will be from 5c. to 20c. per pair, according to distance sent. The funds to pay for Shoes ordered, can be sent by "Draits on New York," "Post-office Orders," "Registered Letters," or by "Express," at the option of the Clnb; or if the amount exceeds "Fifty Dollars," we will, if desired, send goods by Express to "Collect on Dellypert,"

We want at least ONE Club from every Post-office the Agriculturist reaches, so as to get on "Champions" thoroughly distributed over the country. Now, Farmers, if yon wish to procure for yourselves and boys a GOOD, HONEST, AND SERVICEABLE SHOE, one that will give you entire satisfaction, save yon TIME, TROUBLE, and ANNOYANCE, yon can remit ns prices as per List, and they will be sent to yon by return Express, EVERY PAIR WARRANTED. FORM YOUR CLUBS RIGHT AWAY.

## SIBLEY'S IMPROVED Leveling Instrument.

A want has long been felt by Carpenters, Masons, and all persons baving occasion to use the ordnary Spirit Level for the purpose of what is termed "running" level lines on a horizontal plane, of something more accurate than any thing now in use, less expensive than a Surveyor's Instrument. In placing this Instrument, represented above, before the public, we are anre that, for all distances within the scope of the eye, and for the practical purposes of the Mechanic and Farmer, it is equal to more expensive instruments. To the Carpenter and Mason for the purpose of Leveling for Foundations, etc., etc.; to the Farmer for Leveling for Foundations, etc., etc.; to the Farmer for Leveling for Itching, and other purposes about the farm, Price of Instrument, moneted on this care.

And many other like encomiums have been enthusiastically awarded this Reaper, the past few years, for meritorious

work.

It is the only reaper that will save the entire crop when badly tangled and lodged; and it has the only Original Device that is of practical worth for Reeling and Raking grain. We make them to cut a 5 or 6 feets wath, the draft of which is about the amme as that of a 4-feet cut light mower. Is acres is an ordinary day's work. 21 acres were cut with an ordinary pair of horses between annise and annest with a 6-feet cut; it is so simple in its construction, that any boy or ordinary field-hand can work it to its full capacity; or it may be worked automatically, as preferred.

For particulars send for Famphlets, and address

Also, FERTILIZERS of all kinds. Pure No. 1 Perusian Guano in lots of from 1 to 1,000 tons. Pure Ground Bone by the ton or cargo.

LODI MANUFACTURING COMPANY'S COMMON and DOUBLE REFINED POUDRETTE at retail and wholesale. This valuable fertilizer has been manufactured the past season with more than usual care, and having an abundance of pure night-soil, it has been need without slint in its manufacture. We give but few of the hundreds of testinonials received from those who bave used it the past season.

season.

E. W. Christie, of Haverstraw, N. Y. under date of Oct. 20th, 1870, says: "I used the Double Reflued Poudrette on Cova, Potatoes, and Cabbage. I never saw better corn or more on the acre than I rulsed this year. I am satisfied the use of the Poudrette increased the yield fully one-third. It gives the plant an early start, makes it grow rapidly, giving less work to entityiste it; I also find it, a nere preventive of the Cut, or Wire-worm, which often destroys the young corn or cuts the roots. It more than doubled my yield of potates and cabbages."

tees and cabhages."

R. D. Pearce, of Squam Village, N. J., says in a letter dated Sept. 20th, 1870: "I used the Double Refined Pondrette mostly on corn. The corn came up in a superior, healthy condition, and continued to grow faster and more stalky than that planted in the same field with best barn-yard compost. I am well satisfied my corn is twice better than the cost of the Pondrette. I also applied it to pumpkins and other vines with much better results than with compost."

Price of Double Refined Poudrette, \$25 per Ton. Common Poudrette, \$2 per Barrel.

### GRIFFING & CO., 58 and 60 Cortlandt Street, New York. Cahoon's Broadcast Sower,

## For Sowing all Kinds of Grain and Grass Seed.

The naprecedented success of this Seeder the past year is without a parallel in the history of Agricultural Implements. Joseph Harris, author of "Walks and Talks" in American Agriculturist, says: "I like the Caloon Seeder very much indeed," Wm. Crozier, Beacon Stock Farm, Northport, L. I., says: "It is the best Seed Sower I ever saw." Highly recommended by the American Agriculturist, Country, Country, See November 2018. try Gentleman, Rural New-Yorker, and the Agricultural Press generally.

The Iland-Machine will sow 5 acres; and the Horse-Power muchine 12 acres an hour.

Botanical Text-Books.

By Professor ASA GRAY. Of Harvard University.

"How Plants Grow," "School and Field-Book of Botany," "Manual of Botany," "Structural and Systematic Botany," &c., &c.

The publishers beg to call the attention of those about forming classes in Botany to the well-known works by Professor Gray. Having been carefully revised, they present the latest and most accurate principles of and developments of the science, and it is sufficient indorsement of them to state that they are used in almost every noted College, High School, and Seminary in the sonntry, and are recommended over other series by nine-tenths of the leading Professors and Botanical Teachers in the United States.

No author has yet approached Professor Gray in the rare art of making purely scientific theories and dry details pormilar and interesting. From his charming elementary work "How Plants Grow" to his more claborate "Manual," there is one simple, concise, and yet exhaustive method of teaching the various grades of the study.

Descriptive Circulars, giving full titles and prices, will be forwarded by mail, to any address, on application.

### The Burlington & Mo. River R. R. Co.

Offer about 2,000,000 Acres

## Iowa & Nebraska Lands for Sale

On 10 Years' Credit, at 6 per cent Interest,

No part of Principal due for two years from purchase and afterwards only one-ninth yearly,

Products will Pay for Land and Improvements.

The Liberal Credits given; Free Passes allowed; small anunal payments required; the current market value of money, and profits on Stock raising, prove these terms cheaper, easier, and better than to buy U.S. land within railroad-land limits at \$2.50 per acre, while our prices range generally from 4 to 5, 6, 8, and 10 Dollars per acre. Quality and local advantages rule the price.

On these generous Terms the industrious and competent can buy and pay for a good Farm and Home. In beginning, it is necessary to have money coough to pay six per cent interest on the land, obtain provisions, build a cabin, buy a tesm and agricultural implements till crops are raised, which can be done the first season, by commencing is early Spring.

CIRCUI.ARS giving full particulars are supplied gratis, and any wishing to induce others to immigrate with them, or to form a Colony, are invited to ask for all they want to distribute.

A SECTIONAL MAP, showing exact location of Landa for sale in lows, is sold for 30 ceets, and a similar Map of Nehraska Lands is sold for 20 cents.

## NEW LOAN

OF THE

# UNITED STATES

#### IMPORTANT CIRCULAR.

Treasury Department, Washington, February 28, 1871.

Public notice is hereby given, that books will be opened on the sixth day of March next, in this country and in Europe, for subscriptions to the National Loan, under the Act approved July 14, 1870, entitled "An Act to authorize the Refunding of the National Debt," and the Act in amendment thereof, approved January 20, 187t.

The proposed loan comprises three classes of Bonds,

First. Bonds to the amount of five hundred millions of dollars, payable in coin, at the pleasure of the United States, after ten years from the date of their issue, and bearing interest, payable quarterly in coin, at the rate of five per ceut per annum.

Second. Bonds to the amount of three hundred milliona of dollars, payable in coin, at the pleasure of the United States, after fifteen years from the date of their issue, and bearing interest, payable quarterly in coin, at the rate of four and a half per cent per annum

Third. Bonds to the amount of seven hundred millions of dollars, payable in coin, at the pleasure of the United States, after thirty years from the date of their issue, and bearing interest, payable quarterly in coin, at the rate of four per cent per snuum.

Subscriptions to the loan will have preference in the following order, namely:

First. Subscriptions that may be first made for five per cent bonds to the amount of two hundred millions of dollars; of which there will be reserved for twenty days, one-half for subscribers in this country and one-half for subscribers in foreign countries.

Second. Subscriptions for equal amounts of each class of bonds.

Third. Subscriptions for equal amounts of bonds bearing interest at the rate of four and a half per cent, and of bonds bearing interest at the rate of five per cent.

Subscriptions for any five per cent bonds that may not be subscribed for in the preceding classes.

When a subscription is made, the subscriber will be required to deposit two per cent of the amount thereof in coin or currency of the United States, or in bonds of the. class to be exchanged, to be accounted for by the Government when the new bonds are delivered; and payment may be made either in coin or in bonds of the United States known as fire-twenty bonds, at their par value.

The coin received in payment will be applied to the redemption of five-twenty bonds, and the debt of the United States will not be increased by this loan.

The bouds will be registered or issued with conpons, as may be desired by subscribers. Registered bonds will be issued of the denominations of \$50, \$100, \$500, \$1,000, \$5.000, and \$10,000; and conpon bonds of each denomination except the last two. The interest will be pnyable in the United States, at the office of the Treasurer, any Assistant Treasurer, or Designated Depositary of the Government, quarterly, on the first days of February, May, August, and November, in each year.

The bonds of the several classes aforesaid, and the interest thereon, are exempt from the payment of all taxes or dues of the United States, as well as from taxation in any form by or under State, municipal, or local authority.

After maturity, the bonds last issued will be first re-deemed, by classes and numbers, as may be designated by

the Secretary of the Treasury.

The bonds will be issued at the United States Treasury, but the sgents for the negotiation of the loan in Europe are authorized to make arrangements with subscribers for the transmission of the bonds to the agents through whom subscriptions may be received.

Subscribers in the United States will receive the new bonds of the agents with whom the subscriptions are

made.

In the United States, the National Banks are authorized to receive subscriptions, and subscriptions may also be made at the office of the Treasurer of the United States, or of any Assistant Treasurer, or the Designated Depositaries at Buffalo, N. Y.: Chicago, Ill.; Cincinnati, Ohio.; Louisville, Ky.; Mobile, Ala.; and Pittsburgh, Pa.

The following banking houses are also nuthorized to act as ngents in receiving subscriptions in the United States, viz:

New York City.

Austin Baldwin & Co. Baker & Klichen. A. Belmont & Co. Blake Brothers & Co. Brown Brothers & Co. Budge, Schiff & Co. Cecil, Stout & Thaver. John J. Cisco & Son. Clark, Dodge & Co. Henry Clews & Co. CLYDESDALE STALLION "LORD CLYDE."-Drawn and Engraved for the American Agriculturist.

The race of Clydesdale, so called because they are principally produced in the Valley of the Clyde, in Scotland, is supposed to have originated from a cross between the Flemish stallion and the native mares of the country. The animals of this race, while very large, have remarkable activity, and move with great promptness under very heavy loads. The characteristic length of body and hight of shoulder are well shown in the animal above figured. Unlike some other large races, the Clydesdales have well-developed feet with remarkably strong hoofs, which are important points in a heavy draught-horse. The colors are usually bay, or

brown, but gray and black sometimes occur. The Clydesdales are especially docile and intelligent, and these qualities, combined with their great strength and activity, make them prized for farm work. Experiments were made at the School of Agriculture, at Versailles, in 1850, in which two Clydesdale mares were put at the same work with two cach of Suffolk, Percheron, and Boulogne mares, and it was found that the two Clydesdales would do the same work as three animals of the other races. On the other hand the two consumed as much food as three others. Lord Clyde, of which we present an engraving, is a fine specimen of his race. He

is now owned by Wm. Crozier, Esq., Beacon Stock Farm, Northport, L. I. His color is a dapple bay, with a heavy black mane and tail; bis legs are all black, and he has a small star in the forehead. He stands 16 hands high, and weighs over 1,700 pounds. His sire was "Lord Clyde," bred by Mr. S. C. Crawford, Lanarkshire, Scotland, and he was by Crawford's celebrated Clyde, winner of the first prize of the Highland Agricultural Society, and sold to the Donglass Society for £460 sterling. The present "Lord Clyde" took the first prize, with diploma, at Hamilton, Canada, and has hesides taken several prizes at local fairs.

Old Staked Lime.—"B. F. S." can get some lime that has been exposed to the weather for six months, and asks if it is worth the drawing to spread on the land for manure?—Certainly it is. Probably not more than half the lime has been converted back into carbonate of lime; the remaining half is just as good as freeli-slaked lime, and even the carbonate is valuable for manure. Put it on at the rate of 2 bushels of the slaked lime to a square rod, and work it into the soil.

Cure for Hog Cholera.—"J. B. C.," of Kentucky, gives the Agriculturist "an almost infallible enze for Hog Cholera," viz.: One part slaked lime to three parts soft-soap. "My hogs," he says, "were affected with cholera, and I used it by smearing it on the corn or mixing in their feed, and it cured in every instance, almost. My neighbor refused for a long time to use it, on account of its simplicity, and lost seven hogs to my one. It is not a new remedy, however, by any means."

#### AMERICAN AGRICULTURIST.

NEW YORK, MAY, 1871.

May is always a capricious month; fine weather alternates with drenching rains, and not unfrequently the snow-flake flies, and "Winter lingers in the lap of May;" but the diligent farmer is not thereby discouraged, but patiently toils on, improving every moment, until all the appointments of his farm are in perfect order, and the labor of planting and sowing is at last done, and well done. Always do what is most urgent and most important. Early rising, and punctuality in every thing, is now most necessary to success.

#### Hints about Work.

Beef Cattle.—Roots may be employed as a relish, with the usual dry feed. Curry and brush off every day; give an honr or two of exercise in some dry, pleasant yard. Bring them to green feed by degrees, increasing the rations of mean daily as the warm weather advances.

Beets.—Those who raise stock, should now put in their field-crop of beets. Select a piece of ground where the soil is deep and rich—not less than one-fourth of an acre—an acre would be better. For good land, from fifteen to twenty two-horse wagon-loads of barn-yard manure to the acre will do. Break np and harrow the land well. Throw the surface into narrow ridges by back-furrowing—from two to two and one-half feet apart. Rake off the tops of the ridges, and sow on them with the seed-drill, from the 1st to the 15th of May, from five to six pounds of good seed to the acre. Expect from 20 to 25 tons of roots in a good season, when the crop is well taken care of.

Buildings.—Take away the earth or other banking from the lower beams and wood-work of farobuildings. Wherever foundations have settled, level them up. Examine barn and stable floors, and where there is a defective plank, replace it. General repairing and refitting continued this month.

Birds.—In many of the States, laws are in force for the protection of birds. Where such is not the case, each farmer should take upon himself the office of their defense. Most birds are his friends.

Bones.—It is not practicable for farmers to grind bones themselves. Where a bone-mill is accessible, sell the bones and buy the ground material. The

hest way to treat bones on the farm is to break them as fine as practicable, and mix them with good ashes. The whole being kept moist, not so wet as to leach, the bones will after some time crumble.

Calves.—The remarks of last month upon calves, both for rearing and fattening, are applicable to this.

Carrots.—Sow a broad space to the Long Orange, or White Belgian carrot, as soon as the ground becomes warm and dry. Distance between the rows, from sixteen to twenty inches. Test your seeds. Sow two pounds good seed to the acre. Yield, with good attention and a good season, three hundred bushels of the smaller kinds, and four hundred and fifty of the White Belgian per acre. Extra cultivation has produced one thousand hushels of the latter per acre.

Corn.—Devote to this, the greatest of our farm crops, all the ground that can be spared—old mossy pasture-land—meadows choked up with daisy or wild grass, or where the grass-seed has not taken well. Manure heavily; plow deep. After the ground is prepared, mark out green sward with a light plow or marker; plow land with a subsoil plow. Plant same day. Choose a variety of seed sure to ripen. Soak in warm water; stir in a little pine or coal-tar when swelled, and roll in plaster before planting.

Cows.—The remarks in regard to the feeding of beeves, will apply equally to cows, except that the quantity of meal per head need not be increased as the warm weather advances. Accustom them to green feed, by degrees. Look closely after those that are calving, and guard against constipated bowels and swelled udders by remedies heretofore recommended. If the calf sucks, strip out the milk left, Milk clean, and as fast as possible.

Drains.—Inspect underdrains all over the farm when it is rainy weather, and see that the water from above does not throw out the tiles, and fill the inside with obstructions. Clear away the outlets, so that the water can have a free passage. Open all the ditches in your grain fields, so that the springing crop may not be water-killed.

Grain Fields.—Early this month scatter over the fields put down to grain, such fertilizers as plaster, ashes, guano, etc. Common house-ashes are more easily obtained by farmers at a distance from large cities. Leached ashes may be obtained if there be an ashery in the immediate neighborhood.

Horses,—See that harnesses fit well; sronge and rub off the shoulders, feet, and legs of laboring horses, and blanket them only after severe exercise.

Machines and Tools.—Find out what you need for the coming season; order them promptly, so that there need be no delay when they are required. Mowers, particularly, should be ordered at once, us early grass will be ready to cut next month.

Manure.—Neither sell nor waste any manure, and take every opportunity of increasing the stock on hand. It is like money in bank. Make a tank for liquid manure, and start a compost-heap wherever convenient to do so.

Meadows.—Never pasture your mowing ground at this season. Buy hay in preference. The same fertilizers may be applied to meadows as are recommended above for grain fields. Liquid manure is the best application for irrigated meadows, and is equally good for any other kind of hay land.

Peas and Oats.—This, as a forage or soiling crop, will be ready before corn. Plow in the peas, and give the oats a light harrowing. Sow the first part of the month.

Polatoes.—Plant early, and let what manner you use he spread equally over the surface. Plant good full-grown seed.

Poultry.—As soon as the gardens are planted, place the poultry where they will not tromble them, and where they can have plenty of air, water, and exercise. Young chickens may be allowed to run in the garden, if the hens are cooped near by. Geese, ducks, and hens should be set early; turkeys not so soon, by two or three weeks.

Punpkins.—Where corn is not planted too thickly, and the land is underdrained and well manured, pumpkins will do no damage to the crop, and will be so much clear gain to the farmer.

Roads.—This is the month to work roads, rather than September. The track becomes hard and beaten before the fall rains. Level off the slopes and sides, and sow red-top or Kentucky bluegrass. The sod thus formed will rarely gally, even during freshets.

Sheep.—Let your sheep run under some kind of a shelter during the cold storms, which often occur this month. Introduce them gradually to the grass at the close of the foddering season. This is the period when grain and roots are required to keep up the heart of the animal, and to provide against the seours. Shear early; it is now common to omit the washing.

Sorghum.—Plow the ground deep, and till thoroughly. Plant very early, and on ridges, instead of in a farrow or drill. Good eorn ground will produce good sorghum. From two to three quarts will plant an acre.

#### Work in the Horticultural Departments.

The time for reading will necessarily be short this month, on account of the great pressure of spring work, and these notes must be brief and to the point. The gardener, to succeed, must toil early and late, and if he has laid his plaos well during the preceding months, there will be little need of much reading now.

#### Orchard and Nursery.

Planting must be forwarded as fast as possible, and if the trees have been properly heeled in, they can be set out several weeks after those in the nursery have started. If any crop is planted between the rows of young trees, be sure to supply plenty of manure, so that the trees will not be robbed.

Trees received from the nursery now are often shriveled and apparently worthless; to restore them, bury root and branch in the ground for a week. When packed close, the buds sometimes start; cut back to a dormant bud before planting.

Grafting, except with stone-fruits, may be done early this month; but use great care where vegetation is active.

Root-grafts, if not already set out, must not be delayed; plant in rows four feet apart and twelve inches in the row; press earth firmly around them.

Mulch newly-set trees with coarse hay or straw; it enables them to bear the drouth, and also prevents weeds.

Insects.—Destroy all tent-eaterpillar's nests as soon as they appear; the best time to do this is either at night or in the morning. Wild cherry-trees should be cut down, as they only serve as a harbor for these pests.

Scedlings of all kinds of trees must be kept free from weeds by constant stirring of the soil. If any seeds remain to be planted, do it early this month; they need to be shaded and have a free circulation of air around them; a shelter of laths is the best and cheapest in use.

#### Fruit Garden.

Planting may be done at any time when the stock has been heeled in to prevent growth, as recommended under the orehard notes.

Cuttings of currants, gooseberries, etc., which were put in sand last fall, may now be set out in rows three feet apart and six inches in the row, and after one seasou's growth taken up and planted.

Grape-vines.—In working among the vines, be careful not to break the buds. With newly-planted vines only one cane should be allowed to grow the first year; select the strongest, and cut off the rest that start.

Layers.—Put down layers of last year's wood in trenches, and leave uncovered until the bnds are well started, then gradually cover with soil.

Currants.—If the plants look weak and sickly, it is a pretty sure sign that borers are at work; ent

out all the injured portion, if it takes the whole bush. When currant-worms make their appearance npon the leaves, dust with powdered white hellebore. Mulch all newly-set plants early.

Stravberries must be set as soon as possible, before they have started into growth. Keep the beds clean, and if a mulch is given, it will save a great deal of trouble in hocing the weeds. A mulch should always be put on before the berries begin to ripen, as it keeps them free from dirt.

Puckages.—Where fruit is sent to market, a supply of baskets and crates should be provided for sending off the crop. There are many styles offered.

Raspberries and Blackberries.—Tie up the last year's growth to stakes or trellises, as preferred, and keep the ground clear of weeds.

#### Kitchen Garden.

Many of the hardier vegetables were sown last month, and in southern localities the early erop of peas, beets, radishes, etc., are being harvested. Where the ground has been wet and cold, there is little use of sowing seeds until it is warm and dry. In most localities all kinds of seeds may be sown this month.

Asparagus may be ent on beds which are two years or more old. New beds may be set.

Beans.—When all danger of frost is over, plant in rows three feet apart. Limas started under glass may be set out after the ground is dry and warm; they may be planted to poles four feet apart.

Beets.—The early plantings must be thinged out and kept earefully hoed; the plants which are pulled up make excellent greens.

Cabbage, and its varieties, Broceoli, Canliflower, etc., all need the same general treatment when young. Set out the early plants from the hot-beds and cold-frames, and keep well hoed. Seeds for later crops may be sown in the open ground.

Carrots must be kept free from weeds, especially when they are small, for if allowed to grow they soon exceed the carrots in size.

Celery.—Sow as directed last month; stir the soil between the rows as soon as up, and weed.

Cress, or Repper-grass.—Sow every week where one has a good locality to grow it well.

Corn may be planted this month, in rows four feet apart, which, in a garden, is preferable to hills. Plant once in two weeks for a succession.

Cucumbers.—Where there are cold-frames or hotbeds from which the plants have been removed, they can be profitably devoted to cucumbers. Plants started in pots or beds early, may be set out when the weather becomes warm. Sow plenty of seed, to allow for losses by the "bugs."

Egg-plants.—Set out as soon as all danger of frost is over, in a warm, rich spot.

Lettuce. — Set out the early-sown sorts; give plenty of manure. Sow seed for a succession.

Melons need the same treatment as encumbers. Give liquid manure when convenient; it aids the growth of the plants very much.

Onions.—Weed as soon as up, and keep the ground constantly stirred. A dressing of ashes, worked into the soil between the rows with a hoe, is very beneficial.

Parsley.—Sow in open ground this month after soaking the seed in warm water.

Peas should be bushed before they fall over. Earth up in hocing. Late sorts may be sown.

Potatoes.—Hoe as soon as up; fluish planting.
Radishes.—If a constant supply is wanted, sow
every week, and keep clear of weeds; when insects
appear, dust with air-slaked lime.

Parsnips ought to be sown early this month; they require the same treatment as carrots.

Rhuborb.—Do not remove the stalks from plants set last fall. Never cut the leaves, but pull with a slight sidewise twist; remove flower-stalks.

Squashes for late use may be planted the latter part of this mouth in well enriched soil. The early sorts are managed the same as encumbers.

Tomatoes,—Transplant from hot hed as soon as danger of frost is over; set four feet apart.

Turnips.—If the black fly attacks the young plants, give a sifting of fine air-slaked lime.

#### Flower-Garden and Lawn.

Evergreens, if set during this month, usually do the best; the great secret is to transplant them just as they begin their annual growth. As soon as they are taken from the nursery, see that the roots are protected from the air, as a tree of this kind, the roots of which have become dry, seldom recovers and does well. Among the best for specimen trees, or sereens, are the Hemlock, Norway Spruce, Arbor Vite, etc. In planting select, if possible, a moist, cloudy day; the soil around the roots should be fine and rich; fresh manure ought never to be used, but, when well established, give an annual dressing of good compost, with plenty of vegetable matter in it.

Deciduous Trees may still be set in good localities, where the yearly growth has not commenced.

Flowering Shrubs, if not set last month, may still be put out; for varieties, see last month's notes.

Margins around beds, or along walks, must be kept cut smooth by the use of the edging-knife. The outlines of the beds may be preserved by driving down stakes even with the surface.

Annuals.—The hardy ones must be sown immediately, while the tenderer sorts should be left until the ground becomes warm and dry, or they may be sown in boxes in the house now.

Perennials may be sown in beds apart from the annuals; keep free from all weeds. Sow seed of those coming into flower as soon as ripe.

Bulbs.—Plant out Gladioluses, Lilies, etc., as soon as the ground is dry. Tuberoses ought to be started in pots in the house or greenhouse.

Climbers.—Sow seeds of the Sweet-pea, Cyprusvine, Morning Glory, etc., to hide old fences and other unsightly objects, or to cover trellises, etc.

Dahlias, which have been started, may be planted out the latter part of this month.

Lawns.—In order to have a fine close turf, it is necessary that the ground should be rich, the seed sown thickly, and the grass mowed often. Weeds generally flourish best in a poor soil, where the grass does not make a growth strong enough to erowd them out. Lawns must be mowed often to keep the turf thick, and to destroy all annual weeds; the grass ought to be allowed to remain in the ground, where it acts as a mulch and fertilizer.

#### Greenhouse and Window Plants.

It has usually been the custom to put all houseplants, and most of those in the greenhouse, out of doors during the summer; many plants are injured in this way, and when in the fall it is found necessary to return them to the greenhouse, they often present a very unsightly appearance. By ventilation, and shading of the glass, plants may be kept in excellent condition during the summer.

Shelter.—Plants out of doors need shelter from the sun and winds, especially Camellias; the pots ought to be placed upon a layer of coal-ashes, to prevent the worms from getting into them.

Plunging, or setting the pot in soil up to its rim, is often advisable, to avoid the necessity of frequent watering during very warm weather.

Bedding Rants may be set out in the open border as soon as the ground is warm and dry.

Wants to be a Florist.—Amateur Florist, 29 years old, states that he is a genuine lover of plants and flowers, and wishes to be a florist. He asks our advice in regard to the matter.—His love for flowers would not specially help him in following the occupation of Florist as a business; in fact, it is rather considered a hinderance to success, as sometimes the tendency is to grow and admire particular sorts to gratify one's individual tastes instead of discriminating for the taste of the public. In learning the business with any of the large Florists, he would be considered as an apprentice, and would only receive \$4 or \$5 a week for two years or 80. The age (29) would be no hinderance; some successfal ones in the trade having begun later than that.

#### AMERICAN AGRICULTURIST.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upward, \$1 each. Papers are addressed to each name.

HEARTH AND HOME: \$3 a year for less than four copies: Four to nine copies, \$2.75 each; Tea to nineteen copies, \$2.50 each; and twenty or more copies, \$2.25 each.

Both Papers sent to one address for \$4.00 a year.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

# For Two Months Only. \$10, \$15, \$20, \$25, \$50, \$75, \$100, \$125, \$625.

Any one of the above Sums can be Easily obtained—by Men, Women, and Children even, by the judicious use of Odd Spells, such as evenings, rainy days, etc., during MAY, or during MAY and JUNE.

The above may, at first sight, appear a little sensational, but it is only a statement of what has been done by many thousands of persons all over the country; and what has been done by these thousands, can be done by other thousands just as well. It only needs the desire to do it, and the WILL to do it, and it will be done.

1st—There are now about 40,000,000 people in this country, nearly all within reach of the 28,000 Post-offices. The most of these people are pushing along, seeking to better their condition. Their success depends upon two things, viz.: Steady, hard work, with body or mind, and knowledge enough to turn their work to the best account. One drudges along and fails of success, because he does not know how to work to the best advantage; another works less, and yet succeeds better, because his knowledge directs and aids his physical or mental labor.

2d—It is a benefit to the former class to add to his or her knowledge by every possible means.

3d—Two Jonrnals, viz., the American Agriculturist (monthly) and Hearth and Home (weekly) are prepared by those who make it their carnest business to gather all possible reliable information about the best methods of doing work, and of turning that work to the best possible advantage. These persons talk and write from large experience as workers, and from extensive observation, and from an immense amount of correspondence with practical men and women all over the country.

4th—It is impossible for any person, whatever his calling, to read the condensed information thus given in these journals without getting thoughts and hints that will directly or indirectly increase the value of his or her work MANY times the cost of the papers. The Agriculturist costs less than half a cent a day, and Hearth and Home less than one cent a day, and the tro together less than 1¼ cents a day—sums casily saved.

5th—It only needs some one to show the people these papers, point out their usefulness, and receive and forward their subscriptions.

6th—Out of 40,000,000 people, there is at least one in every forty, or 1,000,000 in all, who could take one or both of these journals with profit, whereas there are only about 200,000 that now take them, or only one in every two hundred.

7th—We offer fine Premiums, as good as cash, (see next column,) to those persons who will take the trouble to show the papers and collect and forward the subscriptions. It can be done at odd spells, without interfering with other work, and premiums all the way from \$5 to \$625 can thus be secured without cost.

Sth—This has been done at 11,000 Post-offices by about 12,500 persons, with people enough left at these offices to make up twice as many premium clubs. There are 17,500 other Post-offices where no premium clubs have been raised, simply because no one has taken hold of the work.

Oth and IOth—INDER, you can do it, this mouth of MAY. It is a good time; spring work is progressing and people are wauting help and information, and they can get it from these journals. You can seeme one or more of the excellent premiums. You can do it this month, and, if you wish, have June to swell your club up to a larger premium. THEN HT.

#### See Explanatory Notes.

Note.—Many persons canvass all the time as a business, sell the premiums received, and thus clear large wages. One Lady actually thus earns over \$3,000 a year, and multitudes in this way seeme salaries of \$300 to \$1,500 a year.

#### Explanatory Notes.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But...(b) Tell us with each name or list of names sent, that it is for a premium....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have this and the next month, to fill up your list...,(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, Cards, and Show-bills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly....(g) Remit money in Checks on New-York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

[In the following table is given the price of each article, and the number of subscribers required to get it *free*, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$2.50.]

N. II.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the right-hand, or from the left-hand columns below, or partly of both, only excepting Premium No. 39.

Table of Premiums and Terms, For American Agriculturist, and for Hearth and Home, for the Year 1871.

Open to all-No Competition.

We Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 8 to 11, 21 to 24, 27, 28, 29, 47, 48, 63, 64, and 66 to 100 inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United States or Verritories.—The other articles cost the recipient only the freight after learing the manufactory of each, by any conveyance that may be specified. (Steam-Engine mailed for 36 cents extra.)

Full Descriptions of the Premiums sent free to ALL Applicants.

#### Commercial Matters-Market Prices.

Gold has been depressed in price, having receded to 1101%. The closing quotation, April 14th, was 1101%....
There has been a fairly active business in Breadstuffs since our last, but at variable prices. The export demand has been good for Wheat and Corn. The home trade inquiry has been moderate. Prices of Flour and Wheat have been comparatively well supported, on restricted offerings of desirable grades. Corn has been in liberal supply and much cheaper. Rye, Oats, and Barley, closed heavily....Provisions bave been generally quoted lower, with freer sellers, and a less confident demand from all sources....Cotton has been less sought after, and prices have been irregular....Wool has been held with a fair degree of firmness, on a limited supply of choice qualities, but the demand has been less animated... Hay and Hops have been in request at comparatively steady figures...Seeds have been dull and lower....Tobacco has been quiet, and tending downward.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending April 15, 1871, and for the corresponding month last year.

Beef Cattle.-Beginning with the close last month, and the first general market, with a light supply of cattle, ruled strong at nearly 1c. per b. advance, every thing selling off early, and drovers making money. The reccipts were much larger the following week, and the market showed less firmness. In fact, it nearly amounted to a decline. For the next market we find a still larger number, and the rates could no longer be sustained, holders yielding to a decline of 1/2c.@1/4c., else they had to keep their cattle, but the succeeding was the hardest market of all, coming when butchers and nearly every body else were participating in, or enjoying, the grand German Peace Demonstration, leaving the yards deserted. Besides, butchers were feeling sore under heavy losses caused by the unseasonable hot weather, which spoiled abandance of beef and other meat before it could he sold. Since then, the few scattering lots are selling very slowly, and at even lower rates, fair 7 cwt. steers going at 121/2c.@13c. per tb., net weight.

Below we give the range of prices, average price, and figures at which large lots were sold:

Mar. 20th, ranged 11 @16 c. Av. 13%c. Large sales 13 @15 do. 27th, do. 11 @16 c. do. 14 c. do. do. 13 @15 April 8d, do. 10½@15½c. do. 13%c. do. do. 13 @14 do. 10th, do. 10 @15 c. do. 13%c. do. do. 12½@14

Milch Cows.—As is usually the case at this season of the year, more fresh cows have been sent in for sale, partly because it is the natural period for cows to come in, and partly because there is more demand for them. The crade is unusually dull this spring, and long rows of milkers stand in the sale stables day after day awaiting purchasers. This city is each year becoming less and less a market for cows. Just at present the depressed state of the beef trade operates against selling fresh milkers. Common cows are quoted at \$45@\$55 each; medium to good, \$55@\$75, with a few prime at \$83@\$95, .... Calves.—These have been pouring in rapidly, both

dead and alive. The former run down very low during the heated spell, very many of them selling at 2c.@3c. each, while hundreds were taken by the sanitary police, entirely spoiled. Nor is there much improvement now, live calves selling in large quantities at 6c. 28e., while the best hog-dressed rarely go above 13c. Load after load of small calves has been sold at 4c. @6c. per D. A pen of 120 fb. State calves was just weighed off at 7c. We call thin live calves worth 4c.@6c., with fair to prime at 7c.@ 91/2c... Sheep .- About one-half of the stock arriving at present has been sheared. If very thin, the fleeces are left to hide their leanness, keep them from freezing, and help sell them, the pelts being the most valuable part. Prime sheep, except from the North, where the weather is too cold, are generally sheared, as more can be got in a car, and they show their good points to advantage. Trade is dull, and prices unsatisfactory for owners. few spriog lambs are arriving, but in such small quanti-ties, that they sell at 18c.@20c. per lb., some of the finest reaching 22c., but they will rapidly decline. Thin lots of wool sheep sell at 51/2c.@6c.; medium at 61/2c.@63/4c., with prime to extra 100@130 fb. sheep at 71/2c.@8c. Clipped sheep range from 5c.@7c., the latter price for extra fat lots....Swine.—With only a slight increase over the receipts of the previous week, prices have steadily declined, and the markets have shown an unusual dullness. The decline in all hog products, both at home and abroad, is the cause of the lower ruling of live and dressed hogs. The former are quoted at 65%c.@ 6%c., and the latter at 8%c.@8%c.

Itow to Fatten Blogs.—N. P. Pieree, of Iowa, wants to know "the best way to prepare food for hogs, which with us in Iowa is principally corn." "I think," he adds, "there must be some better way to raise pork than that practiced about here, which is, to feed hogs on dry corn some 18 months to get them up to 250 lbs."—One trouble is, that they do not feed enough corn. It seems bardly possible that any breed of pigs that any man of ordinary common sense would tolerate on his farm, could have all the corn they would eat for 18 months, and then only weigh 250 lbs. We presume

the breed is partly to blame, but the feeder still more. It is not the best method of preparing the corn that is so much wanted, but a disposition to feed liberally every day during the pig's life.

containing a great variety of Hems, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk.

Bound Copies of Volume 29 are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the previous thirteen volumes (16 to 28) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members, or a small club may be increased to a larger one; thus: a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$8; making a club at \$20; and so of the other club rates.

Conaut's Binder.—A very good article for preserving papers may be had at our store, or they will be sent, post-paid, on receipt of the price. Size for American Agriculturist, 75 cts.; Hearth and Home, \$1.25.

ago Mr. Judd, the senior publisher of this journal, settled in Flushing, L. I., seven miles cust of this city, and purchased a quantity of land which was then in the outskirts of the village and adapted to cultivation. But the rapid growth of the village, from 3,000 or 4,000, to 12,000 or 15,000, has surrounded him with a large number of residences, including about 30 of his own construction, and the land has become too valuable for mere enlitivation. He has therefore sold out most of his real estate, and "pulled up stakes," surrendering his residence for a Female Seminary, to which it seemed specially adapted. He has located temporarily in this city while prospecting for a future permanent residence at some desirable point within convenient reach of the business office. The present railroad facilities in every direction make it quite easy for one to live twenty to forty or more miles away, and yet come to the city at any and all business hours. With such smooth iron ways, and easy cars, as we now have on the principal railroads, one can read almost as well riding as if sitting still, so that little time is lost in traveling to and fro.

MILLOROGHES. — "W.," Germantown, Pa., writes: "Say to A. O. Bagley, in addition to the good advice already suggested, try ventilation from the floor of his milk-room before he abandous it as useless. In Eastern Pennsylvania we often have our milk-rooms or vanits in the cellars of our houses, instead of springhouses, and ventilation seemes good results with us. I built one in my cellar, which was every way satisfactory. It had two windows in it, but depended, as I believed, for its success, on having a flue brought down from the kitchen chimney to the floor of the room. The flue gives a current from the lower part of the room, and keeps the air always sweet."

Onion Sets.—"A Frieud." Light, fine, and not very rich, soil is required. The seed is sown thickly in rows 9 inches apart. To facilitate working, every eighth row is omitted in planting, so as to leave a walk. The plants are kept free from weeds during the season. The sowing is done in April, and the sets are ripe in Angust. It is estimated that about 40 lbs. of seed are required for an acre, and that a pound of seed will, under favorable circumstances, give three or four bushels of sets.

Many Questions.—A letter containing from ten to twenty questions on widely differing subjects is very likely not to be noticed, as long as there are letters with only one or two queries awaiting a reply.

Peas.—"E. W. J." asks how to tell when peas are large enough to pick "without pinching them."
—One familiar with peas can tell by the looks of a pod whether it is "filled" or not.

Excellent Schools Ladies .- The opening of a portion of the N. Y. and Midland R. R. has brought into direct connection with N. Y. City and the rest of the country, the beautiful and healthful village of Ellenville, Ulster County, N. Y., where is located the Ulster Female Seminary, under the care of S. A. L. Post, A. M., Principal, with an excellent corps of teachers. Mr. Post, a graduate of Yale, in 1853, has had long experience as principal and teacher, and this, with the choice character of the School, the desirable location, the family and parental care given to the pupils, and the low rates for board and tuition, renders the Ulster Seminary a desirable institution to parents having daughters to be educated. For particulars, address the Principal as above ..... Miss M. Macgregor has for several years past maintained a most excellent Boarding and Day School for girls and young ladies, at Flushing, Long Island, and has given great satisfaction to parents desiring their daughters to secure a thorough education under a conscientions, faithful, and competent teacher. At the desire of many of her patrons, she has pur-chased the commodious residence and beautiful grounds of Orange Judd, Esq., to which she will remove May 1st, and be prepared to receive, under her direct family care, a limited number of young ladies. From our personal knowledge of her competence, we unhesitatingly commend Miss Macgregor's school to the attention of those who are fortunate enough to secure a vacancy for their Flushing has loog possessed one daughters in her family. of the best boys' schools in the country, the "Fairchild Institute," and the opening now of Miss Macgregor's School in the new location, will enable parents to place their children of both sexes in institutions located in the Flushing is a most beautiful place, seven same town. miles east of N. Y. City, and connected with it by railroads furnishing communications at all hours of the day.

**Hoop-poles.**—"E. H." wants information about preparing and selling hoop-poles. Will some of our readers furnish it?

SUNDRY HUMBUGS.—We note with pleasure that the N. Y. Tribune, Sun, and a few other journals, have recently been using the endgel upon some of the swindlers. Now, let these journals exclude all hambugs from their advertising columns, and then constantly keep up a fire upon the swindling establishments, and they may help save to the people a vast amount of money. Right glad would we be to enjoy a rest and let our cotemporaries take the field.

An Oato correspondent asks us to ventilate the case of a man hairing from Clevelaod, who is traveling as agent for certain N. Y. papers, but apparently pockets the money. The particulars and proofs given are too indefinite for us to make out positive charges in this case; but we may say in general that care and discrimination should be used in paying over money to agents far from home, without positive evidence of their reliability. .. A Providence, R. I., chap, is writing letters to distant people, pretending that some aged relative of theirs has recently died, and that he, as attorney, has documents for securing them \$800 each as heirs; and here comes in the milk of that cocoa-nut—he wants \$20.50 cash, for preliminary expenses. This is an old dodge, often revived, with variations ..... Advertisements for a proposed new journal on gardening, to be issned in this city, are being solicited, and we are asked about it. We suspect it to be a covert scheme, especially as no location is given, except a P.O. Box number.....
"B. Fox & Co.," a suspicious name, ought to have a a suspicious name, ought to have a total habitation and number, to keep all the immense assortment of things he advertises by printed circular to supply; but he is only to be reached by mail at "Station A." Any man who will offer to vonth as he has done, or to old people either, such villainous thiogs as are found in his catalogue and description, would not be a very safe person to send money to, even for the good things he offers.

Cheap Sewing Machines have often been referred to, and we will here only add: First: Buy no machine to be turned by hand-that is, no one without table and footpedal. Second: Send no money for any new, cheap machipes, until you have seen one of them well tested and approved. Third: Accept no "agency" from any one asking a portion of the money in advance with the balance C.O.D. Fourth: Accept no agency for sewing or knitting machines from parties resident in large cities who omit to tell you on what street and at what number they may be found. Fifth: As a rale, the \$5, \$10, and machines are not worth a sixpence, except as old metal, no matter how strongly commended by certificates on paper. These certificates are readily manufactured by the thousand. The pretended signers are seldom to be found when you go to their reported residences......
"Family Rights" to make Baking Powders, Soaps, etc., etc., are extensively offered to "agents" dous discount. We are safe in asserting, from no little investigation, that most, if not all these are humbugs. A lot of printed recipes, costing less than a halfpenny each, and of no value, are sold at \$15 to \$50 per 100 to agents who are ndvised to sell them at \$1 or more apiece; sometimes nothing is returned for money forwarded.

Among the new names of those pretending to supply counterfeit money, we have: J. B. Page & Bro., 200 Broadway, who have the impndence to promise "fair dealing," etc.; Day & Wallace, 143 Fulton-st., N. Y., who advise you to "invest with them all the money you can spare;" Daniel H. Kappock, 35 Libertyst., or No. 11 Ann-st., Room 8, who pretends to have got your name from a neighbor of yours; Albert II. Smith, 22 Ann-st., Room 6; Wm. Wade & Co., 59 Cedar-st. Albert J. Hackett, 85 William-st., who sends out genuine \$1 and \$2 bills to promising customers, as samples of his immense stock, expecting these will bait on his victims to large investments in sawdust boxes; Samnel Davis & Co., 34 Liberty-st., who can't get any thing through the Amer. Merchants' Union Express; E. D. Milton. alias Thos. Morgan, 599 Broadway. Several of these offer tobacco stamps, and nearly all urge you to call at their dens, of course to get robbed of all you carry with you, as we have previously explained. That these parties find enough other would-be swindlers green enough to bite at the bait, is evident. We have hundreds of their circulars coming in from all directions, and especially from the South and West..... "Spanish Policy" is a humbug. Neither Ed. A. Blanchard & Company, nor Oliver Elmore & Co., 102 Nassau-st., nor any other socalled agents, will keep any promise to send a \$200 watch on receipt of \$10.50.....We make no exceptions, in warning our readers against all gift enterprises, whether ostensibly gotten up for foreign sufferers, or professed good home objects. Even when gennine, if there be such, a large percentage of the money goes into their pockets, and a very small one reaches the objects of sympathy. On the average, \$1 sent as a direct contribution to responsible parties, is of far more value to the sufferers than \$10 sent through any gift enterprise. It is not worth while to lose the other \$9 for the very remote chance of yourself getting some enormously over-valued · prize." This is a plain, common-sense view of all these benevolent gift enterprises . . . . Circulars of Wood, Mt. Vernon, N. J., continue to come. He has been too frequently exposed to need further caution to our readers.

If there were no fools, or very ignorant people left, such operators as "Dr. F. E. Andrews, of Albany." (and 404 East 58th-street, New York,) would shut up shop and seek a respectable employment..... Detroit, Mich., man, offers \$76,995 in including a \$42,000 Steamboat, a \$9.000 House, and \$25,000 in Cash, as premiums for 40,000 Subscribers, at \$5.00 each. Whew! Will any body get any prize if only 39,999 subscribers can be secured? As only 1,393 subscribers get prizes, how about the other 38,607 subscribers who pay \$5.00 apiece! Suppose a back-woodsman should draw the steamboat, what would he do with it? Will the publishers take it off his hands? and, if so, how much will they pay for it in available cash? Ditto of the "House and lot.".....Remember that all offers of gratuitons cures for consumption, private diseases, etc., etc., whether by Rev. Wilson, Inman, Reeves. or a hundred others, contain a very large "cat in a mealtub," and that the free offers will amount to nothing until they get some money out of their victims, and not any thing then either.

Young men and others should know that every single one of the Doctors, Howard Associations, Medical Universities, etc., that advertise to care or remedy 'private diseases," "errors of youth," and preventive powders, pills, etc., is a downright humbing. We know there are no exceptions to this sweeping statement. We have received accounts of multitudes of cases where these operators have squeezed the last dollar out of their victims,

and without any benefit in return. The details are not proper for publication. Albany, N. Y., has several of these swindling, self-styled Doctors. Philadelphia is also a sort of headquarters, and N. Y., Boston, Cincinuati, Chicago, etc., are not without a few of them ... Every advertising "Indian Doctor," and "Cancer Doctor," is a humbug. We know there are no exceptions.

Thornless Honey Locust.—"L. P.," Alsbach, Mo. This is no novelty. It was figured and described 75 years ago. The variety has been for a long time in cultivation, as there is a tree of it in England over 60 feet high. As an ornamental tree, it is preferable to the ordinary form, which is often annoying by dropping its thorns.

Hedge under Trees.—"W. B. E.," Plymonth, Ill., has maple-trees 20 feet apart, and wishes to make a hedge between them. The roots of the maples completely occapy the ground, and it will be very difficult for a hedge-plant to live close to the trees.

Steam-engines for Farm Use.—
Messrs. Wood, Taber & Morse, Eaton, N. Y., send us an exceedingly neat pamphlet, which, though particularly intended to describe their own engines, contains items of interest to all who contemplate using steam as a motive power, or for cooking food. The engines made by W., T. & M. have a good reputation.

Birn Weevil.—G. W. Allwright, Isabella Co., Mich., writes that powdered lime, sprinkled over the grain and on the barn floor, will cause the weevils to "emigrate to a more congenial climate."

Bones for Hens.—"F. M. T.," Buffalo, N. Y., finds great benefit from feeding unburnt bones to hens. He breaks them up in an iron mortar with a cover to it.

Raising Turkeys.—"B.," Vt. As a rule, we think it best to confine the heu in a coop until the young turkeys are a month old; although in a very dry season we have sometimes had better success by letting them run at large. As to who has choice poultry to sell, we must refer you to the advertising columns of the Agriculturist. We hear a good many complaints of the firm you allude to, and do not allow them to use our advertising columns.

How to Introduce Agricultural Implements.—A subscriber of the Agriculturist in Ohlo writes that he has a neighbor who has "invented a hay-fork that has taken the premium over all other forks at the County Fair, and wherever exhibited, and it is thought by those who have tested it to be the best that has ever been invented. I would be pleased to know the best method of introducing it to the public favor." The best, and cheapest, and speediest method of introducing all good things is to advertise them in the Agriculturist.

Farmer or Carpenter.—"E. L. E." is the only son of a Tennessee farmer of 160 acres, and writes us that he is "logeoious and apt, and has some notious of learning the carpenter's trade. Would you navise me to do so, or stay on the farm?" If your father wishes you to stay on the farm, do so; you will find ahundant exercise for all your ingennity; but if your father thinks you had better be a carpenter, follow his advice, and make up your mind to be a good one.

Pernyian Guano or Pondrette.— Mr. Edmnud Lee, of Florida, asks what he had better buy, pondrette or Peruvian guano—freight from New York being \$3 per bbl. We should prefer the guano.

Curry-combs and Brushes. — "G. P.," Eureka, Mo., writes: "Please tell us something about curry-combs and brushes. I cannot do without them; and still, after trying about half-a-dozen kinds, have not found anything to suit me." As a rule, the curry-comb is used too much, and the brush too little. When a horse is brought into the stable, covered with sweat and mud, he should be rubbed dry with straw Then, the next morning, with a curry-comb in one hand and a good brush in the other, he can be thoroughly cleaned—the enrry-comb only being used to straighten the hair ahead of the brush. The difficulty about getting a good enrry-comb arises from the neglect to rub the horse clean with straw before leaving him for the night. Much care should be used in cleaning a horse's legs with a curry-comb, so as not to injure the joints.

Charcoal for Earth - closets. — Inquirer.—We cannot state the value of charcoal as a

fertilizer, after having been used as a deodorizer in an earth-closet. In one of our southern cities (New Orleans) charcoal is used exclusively as a substitute for earth, and the deposits from the closets find ready sale through a Fertilizing Company of that city. Charcoal applied directly to the garden would be of little use, except mechanically, on a stiff soil. Its proper employment would be as an absorbent in the compost-heap.

The Tea as an Ornamental Shrub.

-Mrs. P. M. Edmondston kindly sends us from North Carolina some tea nuts, and states that she highly prizes the shrub as an ornament to her garden. It grows 10 feet high with her, and is an evergreen, which has endered the severe cold of the past winter without injury. With protection, it would be hardy further north. Mrs. E. prepares from the leaves tea of satisfactory quality.

Vegetables and Fruits.—"G. W. L.," Dacosta, N. J., offers the following as defining the difference between vegetables and fruits: "Fruits are the production of plants which live through the winter, vegetables are gruwn from seed planted annually."—Under this classification melons would be vegetables and asparagus a fruit!

Tarne Deer.—"H. G. P.," Weehawken, N. J. We cannot answer your question; but had you signed your name, as every man who writes a letter should, we should have taken pleasure in referring you to one who could give you the information you seek.

**Pomegranate.**—Mrs. J. C. Agard, Tolland Co., Conn., has a dwarf pomegracate, leaves of which ture yellow and drop off. If she will put her plant in the cellar during the winter, it will start into growth when brought out in the spriog.

Fattening Chickens.—"P. H.," Burlington Co., N. J., gives the following account of an experiment in fattening fowls: Weight of 25 chickens before fattening, 85½ lbs. After feeding 12 days, weight, 98 lbs.; weight when dressed, 92½ lbs. The food given was 4½ pecks of corn, 1½ pecks cracked corn, and nothing but pure water to drink.

Osiers.—M. Leroy, Hancock Co., Ill. The profitableness of the osier crop will depend upon facility for marketing. Good canes meet with a ready sale in New York. They are always sold with the bark removed. There are several willow-peeling machines, but we do not know the names of the makers. We have no statistics to show the profitableness of the crop.

Pear-Tree in a Garden.—"E. D. W.," Cheshire, Conn., says: "There is a large pear-tree in my flower-garden. In spading up the garden, five years ago, many of the tree-roots were broken off. These now sprout up, and with the flowers I have unmerous little trees. It becomes worse each year."—We are afraid that our correspondent must give up either his pear-tree or his flowers. If any one will suggest a remedy in his case, we shall be glad to publish it.

Brushing Peas.—C. W. Judd, Mass., proposes to suspend the brush from poles supported above rows upon crotched sticks. He thinks that this will present the spray of the brush to the young plant more perfectly than the usual manner of setting the brush. The objection to this plan is the difficulty of keeping the brush from being moved about by the winds. Where white birch is plenty, most excellent pea-brush can be obtained, and one can hardly invent any thing better.

Large Duck's Egg.—Mr. Wm. Crozier, Northport, L. I., sends in a Rouen duck's egg which measures 94 inches in its circumference, lengthwise, and 74 the other way, and weighs 6 oz. Who beats that?

Windmills -- A subscriber from Illinois writes: "I see that Col. Waring gets his corn ground at a windmill; now the thing I would like to know is, can a windmill be used to grind corn? Is it strong enough? And how many feet must it he in diameter to be three horse-power strong?"-This not only can be done, but has been done for centuries. In many parts of Europe, where there is no water power, previous to the introduction of the steam-engine, no other means of grinding were known, and windmills are still in use. The mills still standing on the Island of Rhode Island, have five arms. from 26 to 30 feet long, carrying a frame-work some 5 feet 9 inches to 6 feet wide, set angling to the wind. When it is desired to work, canvas sails are unfurled, and made to cover the frame-work. In light winds the whole sail is used, and in very high winds only a small part. The shaft to which the sail-arms are attached is fastened to the hood of the building, which, by a cog-wheel arrangement, can be turned, so as to make the sails face toward any point of the cumpass from which the wind may be blowing. The modern self-regulating mills have their sails arranged to occupy the entire area of the circle, and they are kept face to the wind by large vanes, working like a weather-cock. The sails are made of wood, arranged like window-blinds, so as not to offer too much resistance to a gale. These sails, farthermore, adjust themselves to the force of the wind, sometimes presenting more and sometimes less surface. Probably such a mill as this, to give three horse-power in an ordinary wind, should be about 20 or 25 feet in diameter.

Poultry Manure.—Mr. Geo. Hoover, of Stark Co., Ohio, has about fifteen bushels of poultry manner, and asks how he shall apply it to corn.—The best way will be to mix it with twice its bulk, or more, of dry earth, or dry coal-ashes, turning the heap several times to mix it thoroughly. Then give it a good wetting in every part, make it into a compact conical heap, and cover it with 2 or 3 inches of fresh earth. It will soou ferment, and the manure will disappear, diffusing itself throughout the mass. This compost may be used in the hill, but should not be allowed to tunch the seed, lest it cause it to rot.

Baying Manure. - A correspondent asks: "What can I afford to pay for manure; I live half-a-mile from town?"-The answer to this question depends entirely upon circumstances; on the amount of grain fed to the animals making the manure, on the work they are doing, on the amount of litter that has been used in making it, or its degree of fermentation, or the condition of the land to which it is applied, and on the value of the crops that are to be grown by it. It may be worth from \$1 to \$25 per cord, according to the circumstances named above. There is no safe rule, except the local custom. The price of manure is regulated by the farmers who buy it. As a general proposition it may be stated, that it is a good purchase at its market price, for farmers will not habitually pay more than they find profitable. The writer has purchased this spring forty cords of manure at \$8 per cord, delivered, made by artillery horses, receiving twelve quarts of grain and doing very little work. tobacco farmers on the Connecticut River pay \$15 per cord for manure of the same quality, and haul it five miles or more.

Jersey or Alderney.—"M. K. G." asks the difference between Jersey cattle and Alderney cattle. So far as the animals in this country are concerned, there is not necessarily any difference—that is, Jersey cattle are called Alderneys, but the same name also applies to cattle from the Island of Guerosey, which are very different from those from Jersey. We know of but one animal in the country from the Island of Alderney, and she looks like a Jersey.

Night-soil.—Henry Anderson, of Jamaica, L. I., has a nice light loam, about 4 feet deep, with a sandy subsoil under it. He can get plenty of night-soil, and aske advice as to the propriety of using it, and the best mode of application. The land is very poor. If there is either grass or grain on the land, the best plan will be to apply the manure broadcast, at the rate of from ten to twenty loads to the acre. If the manure is to be used for hoed crops, a night-soil bank should be made by throwing up a ridge of earth about two feet high, inclosing a space—say ten feet square. Fill this half-full of night-soil, and then throw in earth enough to absorb all the moisture. After standing a couple of weeks, the mixture will be entirely inoffensive, and may be used like any other manure, in a hill or otherwise. There is no better manure for any crop than human excrement.

Setting Milk in Summer.—A milkman in Paterson asks if there is any method of treating milk in summer to prevent its souring—say within 24 hours, and at the same time not to injure its quality. We know of no method except that of cooling the milk immediately after it is drawn, and setting it either in a very cool milk-room, or in vats of ice-water.

Cotton Seed vs. Plaster.—"J.H.M.," of Tennessee, says he can buy cotton-seed at \$9.00 per ton, and Virginia plaster costs \$9.00 per ton, and asks which is the cheaper manure? These articles are so unlike in their action, that we cannot compare the two. We should use both, especially if the cotton-seed can first be used for food and afterward for manure,

Fall-Fallowing. — A correspondent in Conn. writes: "I have been much interested in what 'Walks and Talks' says about fall-fallowing. I had supposed that fall-fallowing made the land poorer." Fall-

lowing not only destroys weeds, but develops the latent plant-food in the soil. If the crops are all removed from the land, and no manure is returned, fallowing is an impoverishing process. But if the crops are fed out on the farm, and the manure returned, fallowing will make the land permanently richer and more productive.

Are Chester White Hogs too Coarse? — Mr. R. S. Hinman, of Conn., writes: "Walks and Talks,' says that the Chester Whites he has seen, 'are altogether too coarse.' I have some Chester Whites that were obtained from Chester Co., Pa., which are believed to be pure bred, and some of my neighbors object to them because they are too fine. They are remarkably easy to fatten, and spring pigs weigh at nine months old about 250 to 275 lbs." Have they not got a dash of Suffolk blood in them?

Plants for Rock-work .- In an article on rock-work given last March, we promised to enumerate same of the plants suited to planting upon it. We name some of the most readily obtained. Plants of a trailing habit are particularly useful upon rock-work. Among them are the Ivies, several species of Clematis, Ampelopsis Veitchii, Money-wort, Vinca (Myrtle), especially the variegated. Among our native plants are Liverleaf (Hepatica), Wood and Rue Anemone, Columbine, Harebell (Campanula rotundifolia), Corydalis glauca, Dutchman's Breeches, or Squirrel Corn, Moss Pink, Bloodroot, Two-leaved Solomon's Seal, Bird's-foot Violet, Prickly Pear. If we were to turn to the nursery catalogues a very long list could be made out. Most of the Sedums and Houseleeks are excellent for rock-work. The beautiful Sedum Sieboldii, both plain and variegated, makes a fine show if placed so that its pendant branches can hang over the edge of a rock. Some things may he raised from seeds, such as Arabis alpina, Aubretia deltoidea, Alyssum saxatile, Iberis sempervirens, Tunica Saxifraga, Saponaria ocymoides. Cerastium tomentosum, Calandrinia umbellata, Campanula Carpatica, Myosotis, several species, Androsace, etc. If it be desirable to make a show with annuals, before the perennials become established, Portulacas, Dwarf Tropæolums, etc., may be used.

Sows Eating their Young .- A New-York subscriber of the American Agriculturist has a "very fine sow that had a litter of 14 pigs, which she ate all up a few hours after they were born;" and he asks us what he can do to prevent her cating up her next litter? We answer, make her fat, and then kill the brute. are you sure she did eat the pigs alive? We have seen sows cat up their own dead pigs, and have had sows eat up other sows' little pigs, but never happened to have a sow that ate her own live pigs. A number of remedies are suggested for this evil, such as making the sow drunk, or giving her succulent food, or bran, or oil-cake, to prevent costiveness, for a week or ten days before she is expected to come in. The latter is certainly good practice, whether it will or will not prevent the evil. Perhaps, giving her plenty to cat, would also modify her unnatural craving for animal food. A sow that could eat up 14 little pigs in an hour, weighing a lb. each, could not have had her stomach greatly distended with food before she commenced her meal. The best remedy, however, is the butcher's knife. A breed that produces such sows ought not to be propagated.

Plan of a Hog-pen wanted.—N. R. Pierce, of lowa, writes: "I want Mr. Joseph Harris to inform me through the Agriculturist the best style of hog-pen for a farmer keeping some 75 hogs."—In his book on the Pig, Mr. H. has given several plans of pigpens, and among them a plan of his own piggeries, which are cheap and simple, and well ndapted to his wants; but probably some of our Western breeders can furnish a plan better suited to the requirements of a Western pigbreeder, and we should be glad to hear from them.

Plowing under Clover vs. Feeding it off.—An Indiana farmer thinks there must be some mistake about our assertion that animals do not remove more than 5 per cent of the ingredients of food most valuable for manure. We cannot give our data for the assertion, because it is based on Lawes & Gilbert's experiments, the results of which, on this point, are not yet published. And we presume the investigation, though commenced over twenty years ago, is not fully completed. From private information kindly furnished us by Mr. Lawes, however, we think it will be found that these figures will not vary far from the truth. Even if as much as 10 per cent of nitrogen is removed from the food, it seems a great waste to plow under a good crop of clover hay. But our correspondent must determine the agestion for himself.

How Thuch Corn ean a man Thisk in a Day?—In a late number of the Agriculturist, "Walks and Talks" desires information concerning the amount of corn that can be basked by one man in a day. Two of my neighbors, B. Funk, and L. Funk, tried their skill for half a day. Each husked seventy (70) bushels ears of corn. Another person busked eighty-three (83) bushels in five hours and twenty minutes, and eighteen years ago the same person, in the working hours of one day, husked one hundred and forty-five (145) bushels cars of corn. In each case the corn stood in the hill and was untopped. Four rows being thrown in one row of piles. The above can be proved correct. C. C. F., Rowsburgh, O.

Selection of Dairy Cows.-D. C. Scofield, of Ill., writes: "Cows of extraordinary milking qualities are found as often among native as among grade and thorough-bred animals. The greatest milker that has come under my observation was a native. She would fill two pails of two-and-a-half gallons each, or five gallons at each milking, during four or five months of the year. The best milkers in my dairies have been, with few exceptions, natives. The grades of Durham and other stock, never excelling. As a rule, the progeny of these extra milkers become the best cows; and heifer calf from such should be raised, except it fail to carry the prevailing mark indicating a good milker. This mark is the upward growth of the hair on the inside of the thighs of the calf from immediately behind the udder, as high as the hair goes. If it be found running up in a smooth, unbroken column, all other things being equal, with good care and continued thrifty growth, there will scarcely be a failure. But whatever extraordinary qualities the cow may possess, unless this mark is found on the calf, it is not worth raising for a dairy cow. There are several other signs, or conditions, indicative of valuable milking qualities, some of which attend the first described. Smooth and fair-sized tests; a large and long milk vein; slim neck; and sometimes six teats; a yellow skio apparent about the eyes and nose, and other bare spots, are indications of rich milk, and one of the characteristics of a good cow."

Colic in Figs.—"A. J. M.," of Rhode Island, writes: "I have a pig three months old, which eats and grows well, but has spells of falling down, trembling all over, breathing fast, and squealing frantically."—He probably has the colic. For immediste relief, give two table-spannfuls of castor-oil and fifteen or twenty drops of landamm. But try to discover and remove the cause. It is probably indigestion. Do not make his food too sloppy, but see that he has a daily supply of fresh water in a separate trough from the food. Give him a little glauber salts—say not more than the size of a wheat kernel, given with his food three times a day; given in these small doses, they seem to have a wonderfully beneficial effect in correcting the disorders of the stomach and bowels.

Boughton Wheat.—"T. P. C.," Perry Co., Pa. The Boughton is not a new variety. We have known it in Western New York for a dozen or fifteen years. It was introduced there from Maryland. It ripened early, and could be grown in sections, where the Sonles was seriously injured by the midge. It never became, however, a favorite variety. On good, rich land it produced a fair crop of handsome wheat, but in unfavorable seasons, or on poor, undrained land, it was apt to winter-kill. The Diehl has all the good qualities of the Boughton, and is early enough to escape the midge, and is not so liable to winter-kill, or be amothered by heavy snows. We believe the Tappahannock, Boughton, and Early May are one and the same variety.

Norway Oats.—Thomas P. Cochran, of Penn., writes: "Last spring I got of Ramsdell & Co. one bushel of Norway oats, for which I paid \$7.00. Sowed them on 34 of an acre of good black, flint loam, early in April. Yield, 12 bushels of poor oats. As nice a awindle as ever was got up."—We ["Walks and Talks"] never had any faith in Norway osts. But it is evident, in this case, that there was something wrong either in the soil or season. People "awindle" themselves, when they imagine that there is any breed of animals or variety of plants that will give great returns without food and care. All that can be claimed for the Norway oats is, that in favorable conditions of soil and season, they give a large return of a somewhat inferior product.

Cranberry Lands.—"New Subscriber."
New Jersey is the great cranberry region. We gave the whole story of Cranberries upon Uplands in November last.

Chinese Yam. - C. W. Mills, Rome, Ga. The tubers are usually sold by seedsmen, but are rather

scarce this year. Ordinary price is \$2 per dozen. The small bulblets may be had. The great depth to which the tubers descend, and the consequent labor of digging, is the reason the plant is not grown more. It is perfectly hardy at the North.

Earth from Under Old Monses.—
J. A. Forney, Mo., states that during the war he saw a great deal of saltpeter made, by leaching the earth taken from under old houses, evaporating the lye, and allowing it to crystalize. He asks if earth of this kind is not valuable as a fertilizer?—Certainly, any earth containing nitrate of potash or saltpeter is valuable as a fertilizer. For a similar reason the lime rubbish from old houses, which contains a considerable portion of nitrates, is much valued by gardeners.

Raisins.—"J. W.," Sbirley Village, Mass.— Raisins can not be made from any American grape. The grapes raised in Califoroia are European varieties, some of which make raisins.

Gang Plows and Percheron Horses.—A Constant Reader asks: "Do Gang Plows pay?"—Double ones do...."Do they work well on ordinary prairie land?"—Yes.... "Would not a pair of large Percheron horses handle a gang plow, carrying two shares, with sufficient ease?"—Yes.... "And, altogether, would it not be a good investment for a young man just 'entering the profession' of farming?"—The Percherons would be the greater investment, and a very desirable one they would make. Two or three young Percheron mares from which you could get two colts a year would do all your plowing, and bring a large increase besides. You would have to import them. The gang plow, or double plow rather, drawn by two or three heavy horses, is just what is wanted for the prairies.

Will Fish Breeding Pay ?—"Subscriber," of Lewisburg, Preble Co., O., describes his water privileges, and asks advice, which, as we are not practical pisciculturists, we shrink from giving; and were we to answer the questions simply, it would require pages. Write to Wm. Clift, Mystic Bridge, Ct.; Dr. Slack, Bloomsburg, N. J.; or S. Il. Ainsworth, West Bloomfield, N. Y., for advice. If good fish are so abundant in your vicinity as yon state, it would hardly pay; but in most parts of the country they are not, and it would pay to raise them.

Where to Locate.-A gentleman in St. Lonis, who "can't stand the summers there," and who is tired of commercial life, wants "a good country home, with enough land to furnish butter and milk, fruit, vegetables, etc., for the small family, and food for the animals on the place. Does not want to farm for profit, but for health for himself and his family."-He wants us to tell him where he had better locate. Of course, we do not propose to tell him. He must decide for himself. There are thousands of just such places as he wants. If he doubts it, let him advertise in the Agriculturist. And then let him visit all the places offered him. He will thus find abundant occupation for a year or two, and the travel and change of air will do him good. But seriously, and in point of fact, such a place as he wants is hard to find. A small farm in good condition, with a comfortable house and well-arranged barns, ice-house, garden, fruit and ornamental trees, with a well-made lawn and good roads and walks, is a rare thing to find, and, when found, the owner does not want to sell it. For a bracing atmosphere and charming sceeery we should look among the hills and valleys of New England—say Berkshire County, Mass. With money enough, some charming places might be found on the Hudson. If good land is desired, in addition to charming scenery, it may be found among the Lakes in Western New York-say New Aurora, Geneva, or Canandaigua.

Boiled Corn for Hogs.—W. H. Barnes, Anderson Co., Kansas, asks: "Why is it that my pigs will not eat boiled or soaked corn?" He saya: "They will run about and squeal and fret with their trough full of boiled corn, and if boiled corn and raw corn are scattered together in the pen, they will sort ont the raw corn and leave the soft boiled corn. Nothing but hunger will drive them to boiled corn."—We presume they are it greedily at first, but they want variety. Potatoes would help the matter.

Locality for Market and Fruit Gardening.—Book-Farmer asks if a place on Long Island, 25 miles from New York City, would be a suitable locality for him to raise fruit and vegetables for the New York market, and what kinds he shall raise.—We think 25 miles rather too far out to profitably raise fruit or vegetables for New York; the distanc should not exceed 10 or 15 miles from Washington or. ulton mark-

ets, New York, for the reason that, for the business to be profitable, particularly for vegetables, the less handling the better; and if you are within the distance named, they can be carried in and sold out of the wagon without removal. For the kiods of vegetables best adapted for market, we refer you to Henderson's "Gardening for Profit;" of fruits, to Fuller's "Small Fruit Culturist," both of which are sold at this office.

Swamp-mid Ashes.—"A. J. M." If they can be readily gathered, they are well worth drawing and spreading on upland.

Interested Recommendations .- C. Thurston asks: "Is it not a fact that nearly every thing connected with farming is only or mostly recommended by those who have the articles for sale ?"-As far as the Agricultural Press is concerned, we can say decidedly no. There may be exceptions to this, but as far as our observation extends we think that the leading agricultural papers throughout the country praise or condemn implements, seeds, breeds of stock, and other matters, without the least interest whatever in the articles under considerntion. A few papers published in connection with stores and manufactories are of course mere advertising mediums, and it is well understood that they are such. often request a person to give us an account of an article that he is engaged in raising, when this is the only way in which we can get the information required.

Large Eggs.—A. Clark, Passaie, N. J., brings in four hen's eggs, which weigh 15½ oz. The largest one weighs 4 oz., and measures 8½ inches in its largest circumference. Who can beat it?

Smut in Wheat.—H. Boand, St. Paul, Minn. The "black" upon wheat is called smut, and the use of blue vitriol that you have seen in Switzerland is common here as a preventive.

Gas-lime.—"S. R. H.," Hadlyme, Conu. It has frequently been stated in these columns that gas-lime that has been exposed to the air for some time may be used wherever other lime would be beneficial.

Importation of Poultry.—Mr. G. H. Leavitt, who makes a specialty of Cochins, has recently imported four hens and a cock each, of White and Partidge Cochins; birds which have taken prizes at recent shows in England.

Timothy in Pa.—Warren Brink, Pike Co., Pa., thinks that his region is especially favorable to the growth of timothy. We are disposed to agree with him when he states that on new land the stalks are six feet high, with heads 10 to 12 inches long.

Rye, and Abortion in Cows.—"E. R. W." fed his cow with 8 or 10 quarts of unground rye a week, for two or three months previous to the time of calving. The cow dropped her calf prematurely, and asks if this was due to the rye.—Rye is often more or less ergotized, i.e., infested by a fungus. Ergot is one of the most powerful of knowo agents for producing abortion. It is very probable that some ergot was mixed with the rye, and that the effect is due to this rather than to the grain itself. What say others?

Exercy Cows.—Mr. Ezra Drew, of Orange Co., N. Y., wants to know where he can get Kerry cows, and whether they would be profitable on a monotain farm. The late Sanford Howard visited the native district of the Kerry cow, and spoke of them in the highest terms. Some of them have been imported, but we do not know whether they have proved any better than some of our small, hardy, native cows.

The Trophy Tomato Premium. A premium of \$100 is offered for the largest tomate that shall be grown during the coming season from Colonel Waring's Headquarters seed. Those to whom seed has been given as a premium for subscriptions to the Agriculturist, or Hearth and Home, can compete for the ize. The fruit is to be sent by express, prepaid, to the office of this paper. The award will be made by the Editors, and will be given to the largest (heaviest) fruit that is perfectly ripened, and free from irregularity of form. Hundreds of persons have announced their intention of competing for the premium; and it may not he amiss for us to give a word of advice to such of our readers as desire to enter the lists. The secret of raising large and smooth tomatoes (it being understood that the seed of the best-selected fruit is a sine qua non), lies in giving them an abundant supply of water; not so much during

the early growth of the plant, for at this time they usually get enough from rains, but especially during the ripening of the fruit, and in keeping the soil about them thoroughly stirred. We venture to predict that the prize will be awarded to the product of a plant about which the ground has been hoed every morning and watered every evening. A good amount of lenf should be left on the vine, but not in a position to shade or shelter the few specimens of fruit that are left after the severe thinning out that great size requires. While the fruit is green, its surfaces perform the office of a leaf, and it feeds itself directly from the atmosphere, and, therefore, there should be a free circulation of air about it. During its ripening it needs the fullest measure of direct sunlight. If the vine can be allowed to trail on the ground-the fruit being slightly elevated by little mats of straw-it is believed that the growth will be larger than when trained on a trellis, the whole weight of the fruit coming upon Mrs. Caroline Graves, of Dubuque, Iowa, says that she has raised the tomato from selected fruit, weighing from 14 lbs. to 24 lbs. She did not prune her vines at all. Her plants were raised in hot-beds, covered with muslin instead of glass.

Fodder Corn .- M. J. H. Foster, of Greeley, Colorado, in a letter to "Ogden Farm," says: "One season I grew in New Jersey as high as five acres of fodder corn for winter feed. I had no seales with which to ascertain the weight per acre produced; but I became convinced that it was fully three times what the same land would have produced in timothy hay, besides which it was much better for milch cows. The land was not rich, was strong and soddy, and the hired boys (as they will generally) sowed it too thickly. My rule was to grow ten stalks per foot of row. On this land I only wanted six per foot, but I got nearer fifteen; consequently, it did not grow over four feet high. It was supposed to have but few "nubbins" in; but when we came to feed in winter, the dung of the cows was freely interspersed with undigested grains of corn. There was evidently far more grain upon it than we thought there was. I never had cows do so well. I fed horses on it for two months or more without any grain, and they did well, and worked moderately, doing the usual winter hauling. I never had any trouble in curing. I used to cut it up, and place it in shocks of the same size as one hundred hills of corn would make. Delayed cutting until late—say ten days before we expected frost. Generally, though not always, I let it wilt for a few hours before shocking, entting from the time the dew was off until about 2 P. M., then shocked up. I do not know that wilting is necessary. In pleasant weather, in December, we divided the shocks in four, tted with rye-straw, and hauled to the barn; never stowed it more than six feet deep in the mow. If the shocks are well made, it will keep nearly all winter in the shock. The leaves get matted on the outside, and turn the water -(Note.) The foregoing indicates the value of corn fodder in an unmistakuble way; and we have no dcubt that, when grown to the degree of ripeness described, the question of curing for winter becomes very simple. It can hardly be doubtful, however, that the fodder would be more nutritions, if cut when in blossom, rather than after the grain is ripened. The question to be decided is, whether, while the stalks are full of sapa sap containing a good deal of sugar and other matters that ferment readily-it will be practicable, without the aid of artificial heat, to care them so thoroughly that they will not spoil. If this can be done at all, we believe that it will be by the aid of very thorough wilting before shocking, by putting the shocks into small stacks as soon as they are dry enough, and by postponing the hauling into baru until cold weather. It is very doubtinl whether fifteen plants to the foot, or even thirty, would be too many, if the land were in the condition best suited to the growth of fodder corn—that is, in good tilth and perfectly gorged with rich manure.

#### Bee Notes,—By M. Quinby.

When the weather is wet or cold for a few days, light colonies will need especial care to prevent starving. In favorable springs a small proportion of stocks will swarm during the blossoming of apple orchards. Many will swarm about the time these blossoms disappear, but not generally until clover comes. Bees that do not gain in honey during the season of apple-blossoms, will be quite sure to need feeding before that time. A knowledge of their natural history is quite as convenient this month as any other. The appearance of the queen-cells indicate when to expect swarms. With the movable comb-hive it is only necessary to quiet them with smoke or sugarwater, when the frames can be lifted out and seen. The box-hive must be inverted. The examination is more difficult, and the results more uncertain, but with smoke it can be done. The queen-cells are generally found on

the edge of combs, from three to twenty in number. The open end being downward, the contents are easily seen. They are scaled np when about an inch long, when, if the weather is fine, the old queen leaves with the first.swarm. The advantage of being tolerably sure when the swarm will appear is obvious. They will be a little in advance or behind this period, in proportion as honey is plenty or scarce. If through neglect it is uncertain whether a hive has swarmed, and none of these cells are found occupied, it is evidence that they have not. Second and third swarms, hived now, will be likely to get enough honey to winter them, unless the scason is very poor. This may be done when increase of stocks is more desirable than box honey. Have all hives clean and somewhat rough inside. Swarms should be hived immediately after clustering. Get all in, if possible. Stir them genethy, or sprinkle with water, if obstinate. Set them on the stand at once. Raise the front one-half inch and protect from the sun. 1 much prefer srtificial swarming, being careful to do it only when the bees are getting honey and seem prosperons. More of this in the season, but 'tis well to think of it now.

Those that have practiced transferring from the boxhive to the movable combs, and prevented swarming altogether, have obtained so much better results that I cannot avoid giving directions for doing it, and will follow next month with others, for the transferred swarmers. Any time before the 25th of May in this lati-tude, the box-hive may be treated as follows, and the best results realized. The hive, frames, and comb, being ready, proceed to raise the hive a little, and smoke just enough to keep the bees quiet. Bring into a warm room, the windows all darkened but one, so that the few bees that fly will gather to the light, ready to be brushed into the hive when that is arranged. Turn the hive bottom up on a table. With a long thin knife loosen the combs from the sides. Split each of the sides in several pieces with an ax, and remove three of them, leaving the combs standing upright. Very many of the bees, by this time, will creep to the top of the combs, and collect in little clusters, showing no disposition to sting. The outside comh is cut off at what is now the bottom, and lifted out and laid on a flat surface, and the bees brushed back; the edges trimmed until they just fit the frame. The combs are held in frames by splints, as described in "Bee-keeping Explained." When arranged, it is put in place in the new hive. The drone-comb should be nearly

The bees on the second comb, taken ont, may be brushed into the new hive, where they will gather on the first comb. All the combs containing brood must be placed in the same relative position that they occupied before, as the same number of bees can better protect them from the cold. When all is done, the scattered bees on the window are brushed down into the hive, which should be placed directly under it. All should be made to go among the combs. The hive is now to be closed and carried to the stand. The chances are that there will be room enough to hold all stores that are gathered until next month, yet if they seem crowded, give another comb or two.

#### An Egg Farm.

BY H. H. STODDARD .- First Article.

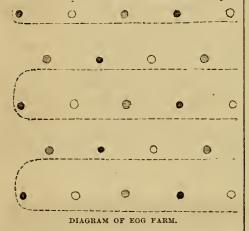

The tendency is for farming to become divided into specialties. It is only through division of labor that the precision and skill can be attained that becomes necessary as competitiou grows keener. Mixed farming begins already to stand at a disadvantage. Sheep farms, farms for milk, others for butter, small fruits, market vegetables, and so on, are accomplished facts. Eggs and fowls form such important articles of food, that they must in turn become a specialty, and be produced for the use of the great cities by extensive establishments conducted systematically, instead of in the old uncertain time-taking way of a few on each farm. The wholesale production of fowls for the table has already succeeded to some extent, but to raise eggs on a large seale is a much more difficult undertaking; and it is believed that the following is the first correct system ever published. Several joint-stock companies in England have attempted certain plans, possessing in some respects much merit, particularly Mr. Geyelin's, but some defect has prevented success; and the same may be said of numerous individual undertakings in this and other countries. The production of eggs must always be the key to the poultry interest, because raising pullets for layers brings so many supernumerary cocks, that these, with the fowls past their prime, always keep that side of the market better supplied than the egg department, and therefore special establishments for raising table poultry will not in the long ruu be demanded.

In managing animals of any kind we must follow Nature, for she will neither follow us nor be driven. The domestication of animals was only possible at the outset by proceeding on a natural ground-work. To illustrate: man domesticated dogs that, when wild, followed one of their own number for leader, by installing himself as leader instead-so naturalists state-and the cat will never be domesticated in such a way as to follow her master when he changes his abode, because originally a solitary animal. Just so the domestication of hens was effected by building upon an original foundation. In understanding the nature and needs of fowls, it will assist if we investigate the condition and habits of the wild parent stock in India, for the nature of any species remains essentially the same for long periods. The transfer from forest to farm has affected the life and most important habits surprisingly little. The tame fowls have the same cries of warning to each other, and other language, that observers have found in their native jungles; they still hide their nests in some corner, just as if they were selecting a nook in a thicket; and they are attached to the premises where they live, as they and all other gallinaceous birds are to some small district, when wild. The wild jungle fowl is by no means foreign to our subject; and in attempting to manage poultry by thousands, only a proper regard for original nature will prevent failure. According to this nature they live during the breeding season in distinct families under polygamy. Each family group has by tacit agreement a part of the forest for its beat, and the exclusion of strangers of the same species secures privacy and tranquillity. They have their freedom, and in that word are comprehended the needful exercise, sun, pure air, shade, and varied diet.

Some plans upon a large scale have secured small separate flocks without freedom, and others have secured freedom without separatiou. Small flocks at liberty on distinct farms have been kept successfully during centuries, because the owners were unconsciously imitating the natural groups of wild jungle fowl. But when it has been found that a flock of twenty gave a handsome profit, and the number has been increased to hundreds to multiply the gains, an unnatural mob has been formed, the hereditary instincts violated, and laying checked. The confusion has not, however, lessened the amount of feed consumed, and pecuniary results have been the wrong way. When it is attempted to divide the number, and place in separate inclosures, the results are still far from satisfactory. Small flocks kept yarded, may be multiplied on the same farm to any desired extent; but their wants can be all supplied only through an amount of labor that eats up the profits. In this land of high wages the expense of attendance determines to a great extent the success of the whole project. All persons who have tried managing a number of yards, are agreed as to the great labor involved when thorough care is taken, while without such care thrift cannot be maintained under the inclosure system.

Upon our poultry farm, then, we dispense

with yards (excepting for some special purposes), and imitate a country town, where is stationed at every farm-yard a flock. This method we know has succeeded for hundreds of years, since men became partly civilized; so it is no new experiment, and it is based on a state of things still older, extending beyond the period of domestication. Across a tract of 621 |2 acres, 100 rods square, run parallel wagon roads, 10 rods apart, with fowl-houses located quincunx style, every 10 rods. In this way each house is surrounded with six others, and is 10 rods to 11 and a fraction, from each. Now, when a flock is attached to each farm-yard in a village, and runs at liberty, the premises may be as near each other as 8, or 6 rods even, without danger of the hirds straying, ordinarily, when once fairly domiciled. This is because the neighbors' premises have a different look, and the buildings, garden, orehard, shrubbery, and fences, serve as landmarks to enable them to find their way back. To make each flock upon

our tract know its home, we have three styles of buildings, so unlike in color and other respects, as to be distinguished by their occupants, and these alternate in such a way as to prevent mistakes. Here the ancient instincts of the birds are our reliance, their powers of discriminating locality being very strong. It must be kept in mind that any faculty which was of use when the race was wild may be definitely counted on, unless it has since been persistently bred out. The buildings are white, black, and uncolored, in succession, so that the six immediately adjoining any one, are none of them like itself. The white and black coloring are of the cheapest sort—lime-wash and coal-tar.

In the diagram, showing a portion of the farm, the quincunx order is shown, and the position of the wagon path is indicated by the dotted line. The alternation of the colors of buildings will be understood from the white, black and tinted dots.

While pursuing the experiments which led to this system, we early perceived that while a flock thus situated would stay near home so long as no person approached, when feeding them, we were followed by birds from neighboring flocks, and there was confusion. Then, so accustomed do fowls become to associating the sight of their keeper with a boon, that they will follow him from one station to another, when on his rounds collecting eggs, or attending to other matters. True, their ability to find their way back is wonderful, but fighting follows intrusions, and thus the quiet and order so essential to laying are impaired. Besides, frequent association of this kind will, after awhile, break down all distinction between neighboring flocks. Such a trouble would be fatal to the whole plan.

The solution of this difficulty is original with our system, and the key to its success. The feeding business is the cause of the trouble, and the only reason why fowls follow their keeper. The remedy is to bring about the feeding indirectly. From earliest chickenhood the hirds are brought up so as to never perceive that the keeper has any thing to do with their feed. The small coops for young chickens (on a separate part of the farm) have boxes where the feed is placed, and a simple contrivance attached, that does not admit the chickens until some time afterward. This device will be described in the article on buildings. Adult fowls are given soft feed early in the morning in a feed-box in their house, so constructed that the keeper is not seen by them at all. All the hard grain for the day's allowance is deposited in a pile of straw outside, before they are let out of the building, and it is a day's work for them to scratch for it. This employment is very salutary to their health and spirits, and assists in keeping the flock together. The bright eye and keen faculty for prying and searching are employed, instead of the birds moping or standing listless. They feel as if everything was right and natural, and this influences laying to a surprising degree. The sight of the keeper is associated with no gift or boon whatever, scrupulous care being taken during the 15 to 18 months that limit the lives of most of the main laying stock, never to throw to them, directly, a morsel of food or allow them to see the drinking-vessels filled. All motions near the fowls should be slow and gentle; they should never be frightened, and should regard their keeper with neither fear nor aversion, but with total indifference. The two points, of differently appearing premises at different stations, and indirect feeding, both being attended to, we are enabled to keep separate flocks in freedom upon one farm without yards. The method of overcoming, by use of a team, the loss of time in attendance caused by the scattering of the buildings, will be described in its proper place, as well as the ways of securing throughout the greatest economy in labor and lumber. The description of soil and location, buildings, breeds, and general management, will also appear in future articles.

#### Ogden Farm Papers.-No. 17.

A subscriber of the Agriculturist writes: "Will Mr. Waring please give a balance-sheet of his farming operations at Ogden Farm annually? If he will, it would be valuable information to many of us farmers. We are willing to try similar farming, believing it will pay in time; but would like to know how much we must sink before it will pay, that we may know whether we can stand it." This reminds me, "Whosoever shall compel thee to go a mile, go with him twain." The inexorable public, at whose behest I stand, draws from me month after month a good many details of my farming affairs, and I am, of course, glad that they are interesting to so many readers; but there is a point beyond which it hardly seems necessary to go. The line must be drawn somewhere. I draw it at a balance-sheet.

It would be impossible now to offer any fair statement of the true position of an operation like that at Ogden Farm. The investment of money has hardly been made in a single instance with a view to immediate results, and the exact effect it has on the final condition of the farm and its finances cannot be justly estimated in advance. I can only say that what-

ever has been done has been with a view to profitable improvement, and while the mistakes that are inseparable from new undertakings have not been entirely escaped, I hope that the issne will show that my outlays, viewed as a whole, have not been injudicious.

Some years hence, when I can show a profit, I shall have no hesitation in making a public exhibition of my accounts, for it would do good as an encouragement to others; but until I can show a profit in money, there would be no good end subserved by parading my balance-sheet. No such statement can be of much value as a guide to other farmers, except in a very general way; for circumstances alter cases, and farming is a business of circumstances which are never the same in any two instances. From the farmer himself to the land he works, there is to be found in every thing some reason for doing or not doing what, under other conditions, would be most proper or most improper; and whatever be the facilities at the farmer's hands, and however much or little capital he may invest, the measure of his success is usually to be found in his ability to make the most of his opportunities, to decide on the wisest course to pursue, and, having decided on it, to stick to it through thick and thin, no matter how discouraging it may sometimes seem. When I can show a profit, my showing will induce some people to undertake to follow in my tracks, and many of them will fail, because they should have laid out new courses for themselves; others, who are wiser, will see in the example only the fact that good farming, well followed, is a good business, and they will feel secure in adopting such improvements, not as have been found best under my circumstances, but as are best suited to their own.

Were I obliged, now, to make a balancesheet that expressed my own estimate of the state of affairs at Ogden Farm, I should make it include a long look ahead, comprising not only the value of the manure I have already accumulated, but the effect on a naturally good, but long abused soil, of the application and reapplication of this manure-of the chemical action of the air, and the rain-fall, that thorough draining and thorough cultivation will allow to have its effect in developing the native fertility of the land-and of that greatest of all ameliorating influences, the decay in the soil of the roots of good crops. And the whole of this part of the estimate would have to be sustained only by faith: the faith, namely, that good farming is sure to prosper in the end. In this faith I work and write; and I do not shrink from the responsibility of urging all who care for improvement to accept it entirely, and to guide their actions by it.

Whatever may be said on the question of profit, we are now drawing rousing dividends; drawing them with double teams, out of the barn-cellar. I have seen a great deal of manure in my time, but I think I have never seen such "richness" as this. We use no litter, bedding our animals with beach sand. The consequence is that our manure is worth, load for load, fully three times as much as that made with profuse littering, to say nothing of some 25 or 30 tons of wheat-bran, and 800 bushels of corn, and considerable other grain that will have been consumed by the stock by the time the feeding season has ended.

Another correspondent asks: "What can a man do on 50 acres of fair land at green-soiling cows for buttermilk, and will it pay where there

is no home demand for milk (350 miles from New York). Would you recommend fixed stanchions where the cows are to be kept up most of the time, or would you have them tied? Is it best to feed the cattle in the stable or in a small lot? Perhaps you will tell us how to manage this thing most economically for a poor man, commencing at the stables; soiling crops; how cut; how fed; and how much exercise cows require to keep them healthy. We are near a creamery, and want to keep all the cows we can, and do them well." The subjects covered by this letter are of sufficiently general interest to justify the devotion of a little space to their discussion. It being assumed that although too far away to send milk to the city, there is a sufficient local demand for cream (or for milk) to make it desirable to keep as many cows as possible; that the land (50 acres) is of fair quality; and that the farmer has no means for rapid improvement; the question is: How shall he proceed to make the most of his chances?

Let us suppose that he has now 12 native cows of fair average quality. As it is too late to sow oats for soiling, and as rye should have been sowed last fall to be of any use this season. the best plan will be to sow 5 or 6 acres of the best of the land to some gourd seed-corn for green fodder (put in in drills and heavily manured, even if it is necessary to borrow money to buy bone-dust or Peruvian guano), and to continue in the old way until this begins to show signs of tasseling out. At this time add to the herd 6 of the best cows to be found, and if cream is the object, buy a yearling Jersey bull. The corn fodder, if manure has been abundantly applied to it, will support the herd until frost, allowing a good second cutting to be taken from the meadows early enough for a good fall growth to protect them through the winter, and saving them from the great injury that pasturing always causes them. Some of the pastures, too, may be made to yield a little hay at a late mowing. The extra hav made in this way would often be enough to feed the extra stock through the winter, but it will be the safest plan to raise a few hundred bushels of roots to make sure of having enough, and to convince the farmer that he can never afford to do without them. With their aid, the 18 cows should come out the next spring in better condition than the 12 did this spring. This is not, it is true, a very brilliant showing, but it is best to "make haste slowly," and (as we are short of capital) to avoid the necessity for buying fodder. We have devoted one year to getting ready, and the preparation has included the sowing of 4 or 5 acres of good land to rye-in September-for our first soiling crop, and of a like quantity of oats to follow it (the gap, if there is one, being filled by grass cut from the meadows). During the year we will have studied "Quincy on Soiling Cattle," and the articles on the subject in the Agriculturist, and shall have made out a system for soiling better suited to our purposes than any man writing without a knowledge of our circumstances could make for us; that is to say, I cannot tell any man whose farm I do not know, when, what, and how much to plant, one-half so well as he can find it out for himself if he will make a serious study of it. I can tell him one thing, however, that he may not already know, that is, that much of his success will depend on the improvement of his herd.

As an illustration of the extent to which the product of a herd can be increased by careful selection and suitable feeding, I quote from a

letter recently received from Mr. C. D. Avery, of Syracuse, N. Y.: "Having just completed my Milk Report for 1870, perhaps a few items from it may be of interest to you, especially as farm statistics are not often obtainable unless guessed at. I will state that my farm of 80 aeres, one mile out of town, is kept for the production of milk sold in the city, and grain and fodder, particularly for the cows. I cannot afford to raise such stock as I would prefer; hence I have only a good selection of such cows as I can find about here.

Average number of cows kept... 18

'product of milk per cow. 5,359 lbs.

price per quart...... 499/100 cents.

time of cows in milk... 9 mos. 3 wks. 1 dy.

number of cows in milk
for the senson..... 142/3

number of cows dry for

We estimate a quart of milk to weigh 2 lbs. My gain in milk for 1870 over 1869, was 164 lbs. per cow; and in 1869, over 1868, the gain was 486 lbs. I am satisfied a better class of cows, and a better mode of feeding, will improve these results."

the season .....

This is not only an example of rare precision in the keeping of farm records, but it shows a remarkable gain in money returns, still more in profit, for it is very doubtful whether it costs more for food for the better cows than for the poorer ones, while the cost of attendance was precisely the same. Taking the price of milk at 5 cents, the gain in 1870 over 1868 was \$16.25 per cow, being \$292.50 for the herd. This, if I understand it, is what is meant by an improvement in our agriculture—an addition to the money profit of farming, without a corresponding increase of capital invested.

Feed as we may, we cannot make good and cheap butter from a poor cow. The more we improve our stock, the more money we shall make; and improvement (for a butter dairy) must lie in the direction of a more complete extraction of the nutriment of the food and its more complete conversion into cream. We want the highest type of the Jersey-a butter breed almost exclusively-or as near an approach to it as our means will allow. A "poor man" cannot at once set up a herd of Jerseys, but no tarmer who owns 50 acres of fair land is so poor that he cannot afford to buy a thorough-bred Jersey bull from which to raise grade heifers to take the place of his present stock. The first cross will be much improved, and the heifers may be allowed to breed at 2 years, so that in 4 years there will be a good sprinkling of 3 |4breds. This generation may be sired by the same bull that sired their dams, thus much of in-breeding doing no harm when the sire is a thorough-bred; but after this it will be necessary to change the bull. Of course good "native" cows should be selected at the outset. All poor milkers should be sold off and their places supplied with the very best that can be found. Such a plan, coupled with soiling, will enable any farmer to double his net income within five years if he is farming only so much land as he can properly take care of.

As to stanchions, "I go agin 'em, that's flat." I think them an invention of the enemy—of comfort and thrift. It is true, they are convenient and effectual. A cow once locked in between stout stanchions is as fixed as a man with his head in a pillory, and I think about as comfortable. My eows are tied with 3-foot chains and broad collars around their necks, and it is evident that they are much more comfortable than

they would be in stanchions. When they finish their meals they lie down and stay down, which stanchioned cows do not, for when a single position becomes tiresome they must get up to change it, while my animals can loll about, lick their sides, and stretch themselves out at full length without rising. I sometimes find a cow lying flat on her side, with her head on the floor and all four legs stretched out, like a dead cow, but for the flirting of her tail; and if she don't enjoy it, there is no enjoyment to be had in a cow-stall. I would like to see a cow attempt this sort of luxnry in stanchions.

There is no other place where a cow can be fed so regularly, nor so economically, as from her own manger, and no place where she will eat so quietly, for she knows that the "master" cow is snugly tied in her own place, and cannot come to drive her away from her feed. If peace of mind is important to a cow, we can but pity the poor brute who is the butt of the yard, and is only able to snatch a mouthful here and one there, as she is driven from one pile of fodder to another, chewing her plunder as she runs.

#### Riding on Horseback.-No. 3.

Major Francis Dwyer, an English officer in the Austrian cavalry service, recently published a work on "Seats and Saddles, Bits and Bitting," which has the great advantage of being, in some respects, quite different from other books about horsemanship.

The theory advanced with regard to seats is, that at a point of the horse's back, directly over the fourteenth vertebra-that is, about half way between the withers and the coupling (or top of the hips)-there is located what he calls the center of motion and the center of strength; the central point from which the forces of the horse, when carrying weight, may be figuratively said to radiate. In other words, this is the point-the middle of the back-where weight can be most easily carried, where the least motion will be imparted to it, and where its distribution will be most equal over all four of the horse's feet; consequently, it is over this point that the rider's center of gravity should fall. As the rider should sit in the middle of his saddle in order that it may transmit his weight equally over so much of the horse's back as it touches, the middle of the saddle should be over this center of motion. As the fastening of the saddle by the girths should be directly under the rider's center of gravity, it follows that they should be under this center of motion. And, again, as it is important that when the rider's weight is transferred to the stirrups, it should not thereby be transferred to another point on the saddle, the attachment of the stirrups should also be in the center of the saddle. The reasoning on which these directions are based seem sound; but they are so different from the practice in which the writer has been trained, that he cannot fully indorse the recommendation without trial, though he is quite ready to advise that they be borne in mind, and that they be conformed to as nearly as the construction of our present saddles will admit. His own inclination would be to set the saddle a little farther forward, and to place the stirrups a little in advance of its center, adhering of course to the injunction that the rider's weight should be placed in the middle of the saddle and the girths attached directly in its middle. Major Dwyer is undoubtedly correct in objecting to what is called the chair-seat, where the rider sits far back on the saddle and sup-

ports his legs by stirrups attached near its front; and his illustration of the sort of seat that is

Fig. 1.—The modern military seat.

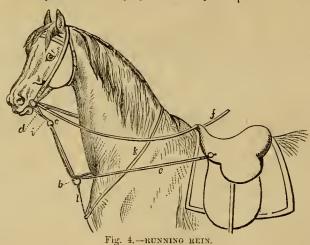

best (see fig. 1), is certainly very good indeed, and may well be taken as a model of elegance, ease, and safety for the imitation of the learner.

Mr. Apperley, a celebrated English authority on fox-hunting, says: "When hounds find and go away, place yourself well down in your saddle, on your fork or twist; and do not be standing up in your stirrups (as was formerly the fashion, and the cause of many a dislocated neck), sticking out your rump as if it did not belong to you;" and he accompanies his direction with a very instructive illustration of a bad and a good seat (fig. 2). As riding is an imitative art, there is really much more to be learned from these illustrations than from any description that it is in our power to give; but the rider should always bear in mind that a wellbalanced horse, in turning to the right or the left, turns on his center of gravity, or "center of motion;" and that if the rider's weight is placed to the front or rear of this position, it will not only impede the horse's free movement, but will feel much more disturbance than if in its proper position. The learner, if he really desires to become a first-rate horseman-and it is only when stimulated by this desire that one can really enjoy learning to ride-should consider well what experience has shown to be the best position (as indicated in our ents), and continue his practice until this position becomes the most easy and natural; it surely will become so by sufficient practice, and, when a good seat is once obtained, it can no more be forgotten than the art of swimming.

The second part of Major Dwyer's book,

has preceded him, the importance of great care in the adjustment and management of the bit and bridle, giving some opinious which are quite new to the writer, and which are obviously important.

His device for the head-gear of a young horse that is to be broken for any purpose, or of any horse that is to be trained to the saddle, we show in fig. 3. This is an ordinary snaffle bridle, with a single pair of reins, with the check-pieces drawn short enough to cause the bit to touch lightly in the corners of the mouth. There is attached to it, by two straps buckled one into each cheek-piece, a nose-hand, or strap, which passes around the nose quite below the bit, but high enough to take its bearing on the bone rather than on the cartilage of the nose. This strap is drawn tight enough to prevent the horse from opening his mouth to any eonsiderable width. There is no way in which a colt does more to make himself insensible to the action of the bridle than by stretching open his jaw and bearing against the bit. From the position of this nose-band, it is entirely out of the way of both bridle and bit; and as the mouth is not tightly bound together by it, it can iu no way interfere with proper control by the

rider. It simply prevents the horse from resorting to a very common means of defense.

Another apparatus described must be very useful, not only in training, but in the management of all horses who have the trick of carrying their heads so high as to cause the bit, when pulled upon, to ride up into the corners of their mouths instead of bearing, as it should do, against the lower jaw. It should be equally

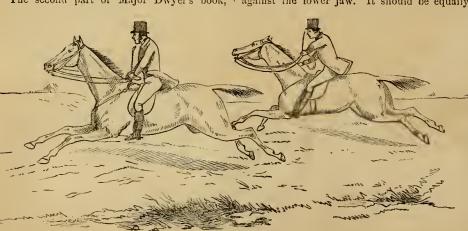

Fig. 2.—GOOD AND BAD SEAT.

which is perhaps even more valuable than the first, relates to "Bits and Bitting;" and he

valuable in preventing an animal from tossing his head in a fitful way, as many horses do. It shows more conclusively than any writer who is at the same time entirely free from the grave objections that hold against all forms of martingales, having nothing whatever to do

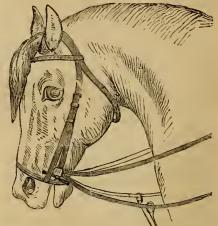

Fig. 3.—HEAD-GEAR FOR YOUNG HORSES.

with the reins, and subjecting the horse to no constraint so long as he carries his head in the proper position. It is called a "running rein," and is shown in fig. 4. A short strap, d, about six inches long, with a buckle at each end, is fastened to two rings

of the snaffle, and passes under the horse's chin. At the middle of this strap there is attached another, i, three or four inches long, at the end of which there is a stout, smooth ring, c, an inch or more in diameter. There is a strap, k, around the neck which supports an other, l, that passes back to the girth of the saddle, as with the ordinary martingale; but this latter strap, instead of being split into two parts, as in the martingale, extends six or eight inches beyond the neck strap, where it carries another smooth ring, b, somewhat larger than the one under the chin. These rings are better made of ivory; but iron, if smooth,

would answer tolerably well. The "running rein" e to f, is of the width of an ordinary bridle-strap, 81/2 feet long. If not made of one piece of leather, its joints should not be within 2 feet of the center. One of its ends is furnished with a buckle, and a tongue-strap 18 inches long, which is to be buckled through a staple or D ring on the left side of the saddle near the pommel. The other end of the strap is then passed through the ring, b, in front of the horse's breast, then through the ring, c, under his chiu, then again through the breast-ring, b, and brought up to the rider's right hand, f. This arrangement gives him more power to draw the horse's head down to its proper position than any other device in use. So long as the animal behaves himself, the slackening of the "running rein" leaves him perfect freedom, but, when necessary, the least pull acts with double force on his head and draws it in a downward direction.

Whether a horse is to be used for riding or for driving, there is no doubt that the use of the "running rein" and the nose-band bridle would offer the best means for his proper training, and would do very much to prevent the restiveness that is so common a result of the ordinary methods, and would often prevent the trainer's loss of temper, which has more effect in spoiling the disposition of the animal than have his own inherited qualities.

### Sturgeons and their Products.

The sturgeons present some striking peculiarities. The skeleton never becomes bony, but remains throughout the life of the fish in the condition of cartilage. The surface of the body is furnished with large bony plates, which are

placed in five longitudinal rows. There is but one back-fin. which is situated well toward the tail. The mouth is placed under the elongated, and often pointed snout, is toothless, and in front of it hang four barbels, or thread-like appendages. The gills are concealed by gill - covers, each having an opening, which is protected by an operculum. Most of the species inhabit the sea, and ascend the rivers to spawn; but there are some peculiar to fresh - water lakes. The sturgeons belong to the genus Acipenser, which is

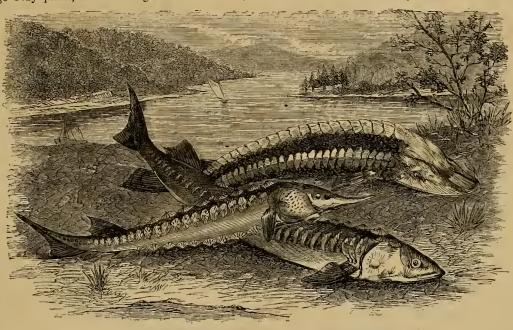

the Greek name for a fish much prized by the ancients, and believed to be the sturgeon. The most important species is the sturgeon of the Black and Caspian Seas, Acipenser Huso. This species, which grows to the length of twenty or twenty-five feet, furnishes the most valued isinglass and caviare. The best Russian isinglass is the swimming-bladder of this species, merely washed and dried. It is nearly pure gelatine, and is almost entirely soluble in hot water. Less valued kinds of isinglass are pro-

cured from other sturgeons, and some from other kinds of fish. Caviare is the roe of the female sturgeon, prepared by salting and drying. This is highly esteemed as an article of food in Russia, Germany, and other parts of Europe, and is kept at the German restaurants in this country. About 9,000 persons are said to be engaged the Caspian sturgeon fisheries.

The sturgeon business at various points upon the Hudson River is of considerable importance, some of the fisheries giving

employment to fifty men. The sturgeon, though so large a fish, is easily caught in nets. The species canght in the Hudson is principally the sharpnosed sturgeon, Acipenser oxyrhyncus. It is captured mainly for its fiesh, though we believe that caviare is made at some of the establishments. Considerable quantities of the fish are

pickled, and smoked. Sturgeon is frequently offered in the New York markets, but by far the greatest share caught in the Hudson finds its way to Albany, and all along the river the fish is known as "Albany beef." As many as seventy-five sturgeons, weighing in the aggregate about nine tons, have been taken to Al-

SHARP-NOSED, BLUNT-NOSED, AND SHOVEL-NOSED STURGEONS.

bany by one of the steamers at one trip. The flesh of the sturgeon has a light red color, and the fat is pale yellow. It is eaten fried and roasted, but seldom boiled. It is by some highly prized as an article of food. Several years ago the writer tried it, and has since had no desire to repeat the experiment. The spoonbilled sturgeon of our western rivers belongs to another genus. It has no bony plates upon its body, and its snout is expanded into a broad thin plate, sometimes nearly as long as the body.

ward and downward, and by its muffle, which is hairy, except a small place between the nostrils. As its name *Ovibos* implies, it partakes of the characters of both the sheep and the ox, and some naturalists classify it with the sheep and goat. The male Musk-Ox is about the size of a two-year-old cow. The horns meet on the

summit of the head; they are broad and flat, and curve downward between the eyes and the ears until opposite the mouth, when the points are turned upward. The hair, which is brownishblack, is very long and thick, and hangs down below the middle of the leg. Beneath the hair is a soft ashcolored wool of an exceedingly fine quality, which affords the animal ample protection against the rigors of an arctic winter. The animal's tail is so short that it was at first described as tailless, The Musk-

Ox is found from latitude 60° to as far north as land extends. It is found in small herds of twenty or thirty; when attacked, the cows run, but the bulls show fight, and prove dangerous antagonists. It is very nimble in its movements, and climbs hills and rocks with great ease. Its food is lichens and grasses. The flesh, when the animal is fat, is said to be of agreeable flavor, but when poor and lean it smells strongly of musk. The fossil remains of this ox are said to be found upon the northwest coast, and

those of the same, or a closely allied species, in Siberia. Although this animal is found living only upon this continent, it has been exceedingly difficult for our naturalists to obtain specimens from which to describe it. For a long time the only specimen known was one sent to England by Hearne, a celebrated traveler. Some years ago a stuffed specimen was presented by Doctor Kane, to the collection of Academy Natural Sciences at Philadelphia, where it remains, so far as we are aware, the

MUSK-OX.

### The Musk-Ox.—(Ovibos moschatus).

Of the Bovinæ, or Oxen, we have in this country but two native species: the well known Buffalo, Bos Americanus, and the very rare Musk-Ox, Ovibos moschatus. The genus Ovibos is distinguished by its horns, which curve out-

only representative of the species in the country. We do not know that any attempts have been made to domesticate the musk-ox, and it is doubtful if it would endure the climate of even the northernmost of our States. Still the exquisite fineness of its wool, said to excel that of any other animal, makes it desirable that the

experiment should be tried. If, as some naturalists claim, the animal is more of a sheep than an ox, interesting, and it may be useful, hybrids might result from crossing it with the sheep.

### Walks and Talks on the Farm-No. 89.

The Managing Editor of the Agriculturist writes: "Your 'Walks and Talks' would be more interesting if you would tell us more about your own agricultural operations. People want to know what you are doing on your farm." A detailed account of all we are doing would make him growl when he reads the proof. But he will have no one to blame but himself—and that very fact will only make him growl the louder. So here goes:

To-day, March 21, a neighbor called early in the morning to say that the dam on the creek which floods our land and prevents us from draining, had been washed away; and I went to a lawyer to see if we could not get an injunction restraining the mill-owner from putting it up again. He told us if those interested would stand by each other (which means foot the bill), it could be done-and we are going to do it. Another thing I did was to go to our railroad station. Last night the sheds, containing several hundred cords of wood, caught fire, and this morning there was a noble pile of ashes that I wanted to get for manure. I should like to put them on my Northern Spy Orchard. This orchard has been set out about fifteen years, and last season was the first year it has borne fruit. The soil is sandy, and I think ashes would help the trees. Many farmers have urged me to graft the trees with Baldwins, but I am persuaded that, with liberal manuring and thorough pruning, the Northern Spy will prove almost equally productive and more profitable. We have just finished pruning the trees, and have drawn off the brush into a large heap to be burned. It seems a shame to burn up so much wood; and I once bought a German hook for the purpose of chopping it into lengths to burn in the steamer. It makes capital wood when dry, but ought to be chopped while green; and the trouble is to store it away. In the old country, even in sections where coal is half the price it is here, every stick would be used for fuel; but, then, labor costs less than one-third what we have to pay. I am now paying \$1.25 a-day; and to one extra good man I pay \$1.50. He is better worth \$2.00 than some men are worth \$1.00. I have said all along that there would be no marked decline in wages, and in this section such proves to be the case. We are paying full as much as we did during the war, when gold was worth more than double what it is now. The railroad is paying \$1.50 per day, and farmers, whether they can afford it or not, must pay the current rates. They do not control the labor-market.

We are making some lye from wood-ashes, intending to use it for washing the truoks and limbs of the apple-trees to clean them of moss and fungus. We scraped off all we could, first, with a piece of hoop-iron. I think crude carbolic acid, which is quite cheap, would be better than the lye; but I am afraid to use it on a large scale lest it should injure the trees. I used a weak solution of it last year to kill currant-worms, but it did far less damage to the caterpillars than to the bushes.

One man is plowing in the garden, right in front of where I am now writing, and some fifty hens, more or less, are running along the fur-

rows picking up worms. We get about 40 eggs a-day; and the ducks have commenced to lay. Last year we had capital luck with the turkeys, owing, I suppose, to the dry weather. On the whole, poultry is the most profitable live-stock on the farm, except the pigs. But the money does not come into my pocket; and if things go on as they are, we shall soon have as many hens as Warren Leland.

The soil is dry, and turns up beautifully this spring. Last fall I manured the garden and plowed it under. That which was applied early has nearly all disappeared, while that turned under, just before winter set in, is comparatively unaltered. The former soil is in capital condition for onions, parsnips, and other small seeds, while the latter should be reserved for corn, cabbage, beets, and other coarser vegetables. We sowed peas ten days ago, and planted potatoes yesterday, and purpose sowing onions to-morrow. It is the earliest spring I can recollect; but I can hardly believe that spring has really come, and expect to wake up one of these mornings and find two feet of snow on the ground.

We are still cooking food for pigs. It is a good deal of work, and it is doubtful whether the saving of food would pay for the expense. But I cook to save digestion rather than to save food. I want to enable the pigs to cat and digest more food. And if cooking will do this, it will pay. Cooking does not increase the amount of nutriment in the food. It may make it more palatable and more easily digested—that is all. I am inclined to think that the assimilating powers of a well-bred pig are greater than his digestive capacity. If they are not, there is little to be gained by cooking the food.

We are still feeding our cows cooked cornmeal—say three quarts of meal per day to each cow. I am satisfied that it pays. We have made just as nice yellow butter all winter as I wish to eat—better butter than we make during the hot summer weather. I am inclined to think that the best time to have cows come in, where nothing but butter is made, would be in September, and let them go dry during the hot weather of July and August. We should then have plenty of skim-milk, just when we most want it, for young pigs. And the cows would run in the pasture, and require no milking during the busy season of harvest.

An English farmer who is staying with me, and who formerly kept some 300 breeding longwooled ewes, was at first quite disposed to laugh at my Merinoes. But he is now quite converted, It is really amusing to hear him talk so enthusiastically about the motherly qualities and milkproducing capacity of these little Merino ewes. So far, we have had 34 lambs from 26 ewes, and have saved every lamb, except one whose mother had no milk. The lambs are from a thorough-bred Cotswold buck. The ewes are common Michigan Merinoes, that cost about \$2.50 each. They have been well wintered, and the lambs come strong and healthy, and the ewes give very rich milk. But both ewes and lambs should be well fed. Butchers ought to pay a good price for such lambs in May, Some farmers have thought that the cross between a Leicester or Cotswold ram and a Merino ewe was too violent, but such is evidently not the case. I do not desire better luck than we have had with these ewes and lambs; and the ewes have had no roots.

We are plowing up our oat-stubble, where the clover and grass-seed failed last year, and, on the recommendation of my English friend, design sowing it with cole-seed and white mustard, to be fed off by sheep next fall. He wants me to plow it three times, while I argue that twice plowing and twice cultivating and harrowing would be cheaper, and do the land more good. There are 12 acres in the piece, and we have figured out the expense of the two methods as follows, reckoning a horse at \$1.00 per day, and a man \$1.50, and that a two-horse team will plow one and a half acres per day:

March 20.—Plowing 12 acres	\$28.08
May 1 Do. do	28.08
June 18.— Do. do	28.08
" Harrowing 12 acres	5.50
	—
Total	\$89.74
The method I propose would cost-	
March 20.—Plowing 12 acres	\$28.08
April 14.—Harrowing do	5.50
May 1.—Cultivating do	5.50
May 14.—Harrowing do	5.50
June 1Cultivating do	5.50
June 18.—Plowing do	28.08
" Harrowing do	5.50
Total	\$83.66

I contend that this would do the most good, as the land is stirred seven times instead of four. A greater number of weed-seeds would be likely to germinate and be destroyed, and more fresh soil would be exposed to the decomposing influence of the atmosphere.

If we had a double plow, the second and third plowings might be done with three horses, getting over two and a half to three acres a day, and this would be cheaper and better than cultivating. Now that our fields are getting free from stones and stumps, there is no reason why we cannot use these double plows; and it is surprising to me that our manufacturers do not turn their attention to the subject.

The cultivating I purpose to do with a four-horse cultivator, which would go nearly as deep as the land was plowed, and get over the twelve acres in a day. I have a cultivator made on purpose for this work. The horses are attached four abreast, the pole going between the two teams. The harrowing should be also done with four horses, using two sets of harrows, and going round the field, so as to avoid sharp turnings.

Whichever plan is adopted, the whole success will depend on getting the land clean and mellow. It is necessary to plow up fresh moist soil immediately before sowing the mustard or cole-seed; and the land is to be seeded down with clover and grass-seed at the time of sowing the mustard and cole-seed. This is the plan; and though I have some doubt in regard to its success, I propose to try it. My Euglish friend assures me that he has done it frequently, and that it is the best of all methods of seeding down land to grass.

Another thing we are doing is turning over the manure in the barn-yard. In the center of the yard we scooped out a basin about five feet deep, and, say, fifteen feet wide and thirty feet long. The long way, the sides slope so gradually that there is no difficulty in drawing out the manure. Into this basin all the manure is thrown, or wheeled, or carted, as fast as it is made.

We are now turning over the manure in this basin, to the infinite disgust of my English friend. He thinks "all the ammonia will escape;" and he is going to the city to-morrow to get some litmus paper to prove it. We are cleaning out the sheep-yards and carting the manure to the heap, mixing it as we draw it with that in the heap. We ought to have at

least 200 tons of manure, containing 15 lbs. of nitrogen to the ton. The heap, therefore, should contain 3,643 lbs. of "potential" ammonia; and if treated as I propose to treat it, I do not believe a single pound will escape. You must recollect that a pound of ammonia would make a powerful smell. Litmus paper will detect ammonia in an atmosphere containing only one seventy-five-thousandth part of it; and Prof. Johnson, in an article written for Hearth and Home, on "Mixing Lime with Manure," says:

"It is certain that a healthy nose is not far inferior in delicacy" to litmus paper. And so, even if the litmus paper should show - what I do not believe-that ammonia is escaping, the loss can only be so small that it is not worth while troubling about it. "But what do you gain by turning the heap?" asks my English friend. In the first place, we can reduce the bulk of the manure more than one-half, and thus save much labor in carting and spreading it; and then, manure thoroughly decomposed, will act much quicker on the plants; and this, for corn or roots, is a very important gain. We have a tin boat-pump for pumping up the liquid that drains from the heap back again on to the manure after it is turned over. Without this, the manure at the bottom of the basin is so wet that it will not ferment, and that at the top so dry that it might firefang. But pump up the water and keep the whole moderately moist, and fermentation will proceed rapidly without loss of ammonia.

These are some of the things we are doing just now on the farm. But perhaps my friend the Editor meant to ask what I, myself, personally, was doing on my farm. To-day I got out some stones where the men are plowing. I have a little steel bar for my own use, which I have an idea the men derisively speak of as my walking-stick. Still it has got out many a stone. But my favorite tool is a heavy spade, with straps the whole length of the handle. It is almost as strong as a crow-bar, and it has the advantage of furnishing its own "bate" or fulcrum. When a plow strikes a stone, get this heavy spade on the side or under the bottom of it, and let the horses pull steadily, prying on the spade at the same time, and in three cases out of four out comes the stone. To-day I worked a couple of hours cleaning out a ditch.

One of my underdrains discharges into a ditch on the Deacon's farm. At the outlet, the underdrain is not more than fifteen or eighteen inches sleep; but as the land rises the drain is deeper, and some of the branch drains are three and a half feet deep. The Deacon's notions of draining are somewhat antiquated; and the open ditch through his land is about a foot wide and fifteen inches deep, running along the fence by the side of his garden. The cattle tread in this ditch every summer, and the Deacon is kind enough to allow me to clean it out. I do the work myself, so as not to injure the Deacon by cutting the ditch any deeper or wider than just enough to allow the water from my underdrain to pass off. If I should set one of my men, who is used to ditching, to clean out this ditch, he would probably cut it two or three feet deep, and make the land dry and double the crops, and the Deacon would thus be put to additional expense in harvesting them. And so for the sake of good neighborhood I do the work myself; and I do not think I have injured the Deacon to any greater extent than removing the surface water, and rendering two or three acres of his land dry enough to plow a week or two earlier than would otherwise be the case. Another thing I do occasionally—and, in fact, I have done it to-day—is to take a flexible gutta percha curry-comb and card the cows and pigs. I think this pays as well as any work I do on the farm, and I enjoy it full as much as I do digging a ditch on the Deacon's land, but not as much as getting out stones. But, at any rate, the cows and pigs enjoy it. My English friend says he never knew a farmer that was so fond of animals as I am, or who gave them so much personal attention.

To be frank, I do not "work" a great deal on my farm. I do not think it would pay me to go into the woods and chop all day, or go to plowing. I think I have men who could beat me at a steady day's work; and John Johnston once told me that as soon as he got so old that he could not do more work than any man on his farm, he worked no more with his men. He planned the work and saw that it was done properly, but he did not take hold himself.

Thus I spend my days, except that I have to write some hours for the Agriculturist. I get no credit for this from my neighbors. "That is not work," they say. And yet I would at any time rather dig a rod of ditch than write for ten minutes.

The evenings are, with me, the pleasantest part of the day. The Deacon drops in, and we talk farming. Or we read the agricultural papers, and comment on the articles. Last night I read the remarks of a speaker at a Farmer's Club, as follows: "Buying cattle to feed is not legitimate farming; it may be in England, where it is better adapted to the circumstances of farmers, but it cannot be done to advantage here. It is uncertain business; it is doubtful whether stock can be bought, fed and sold, so as to make the operation pay. It takes capital; farmers do not always have it to use; they must practice economy. If all adopt this system, where will they get stock to feed? Some must raise the stock to sell. Buying to feed and sell makes a farmer a commercial man, and is a perfectly hap-hazard husiness. Legitimate farming is raising stock and crops on the farm." My English friend thought I was reading an article of Mark Twain's, and laughed heartily; but I assured him the man was in earnest. "Why," he said, "you have a much better chance to make money by fattening stock than we have, because you can buy lean stock in the fall for much less per lb. than it is worth per lb. when fat. In England we cannot do this." The Deacon said nothing, but I know he thinks it rather a speculating kind of business, that farmers had better let alone. In England, farming is much more of a commercial business than it is here. The farmers have frequently no more capital than we have, but ours is locked up in the farm, while there they lease the farm and use their capital to carry on their operations. They buy and sell more than we do-buy manure, buy stock, and buy oil-cake and grain to fatten it with. They risk more than we do, and generally make larger profits. But, of course, they sometimes lose heavily. My English friend says he once lost \$3,000 on his sheep in a season. "I tried to keep too many," he said, "and after a while I saw they were not doing well, and I commenced feeding oil-cake and grain rather freely, and got the fever into them. I lost 150 hoggets in a month or six weeks, and those that survived had to be sold at

It is certain that a farmer who has not had much experience should not go largely into

buying stock to fatten. And in fact, a farmer without experience should not go largely into any thing. But why a farmer who has acquired experience should not use it, I cannot understand. Such men as John Johnston and Jurian Winne, who have made themselves and their farms rich by buying sheep in the fall and fattening them, are in no sense speculators. They run no more risk in paying four dollars a head for a lot of sheep to fatten than the farmer who raised them would, if he, instead of selling them in the fall at this price, concluded to fatten them himself. The truth is, it would be much better for us all if there was more of a commercial element in American farming.

"I do not see how you get along without Fairs or Market-Days," remarked our English visitor. "With us they are absolutely essential to our system of farming. We always know where to buy such stock as we want, and cau depend on selling it for what it is worth at any market-day." He is right. As things now are. the farmer who fats fifty or seventy-five sheep is at the mercy of some local butcher. He cannot send them to New York with advantage, because he has not a car-load of them. But if we had a Fair once a month, we could sell small lots to dealers who were buying to ship, and there would be competition enough to secure us fair prices. Now, if a farmer has more feed than he wants, he does not know where to look for stock to eat it. He must spend days traveling about the country, picking up a few head here and there; and it is just as bad if he finds himself overstocked. He must sell to some one who knows how he is situated, and who will try to get them at a bargain.

The Deacon is still inclined to show fight on the corn-planting question. He thinks hills preferable to drills, both for corn and potatoes. They certainly give one a better chance to cultivate the land, and save much labor in hoeing, and also in cutting up or digging. We agree on one point, that corn is seldom cultivated half as thoroughly as it should be. Working the soil to kill weeds has been the only means I have had to depend on for enriching my land. And I am greatly encouraged, especially when we come to plow up a clover sod that four years ago was in corn, and received such an extra amount of cultivating. The texture and color of the soil has completely changed-and vastly for the better. In fact, it does not look like the same land. The men get quite enthusiastic over it, and can hardly believe that such a simple thing as cultivating a corn crop, nine or ten times in a season, can be the cause of the improvement. But this is all there is to it.

### A Poultry-house and Grapery Combined.

In the fall of 1869, Mr. John Warren, of Flushing, L. I., put up a structure which was intended to serve both as a poultry-house and a grapery. It has thus far proved a success, as far as the fowls are concerned, and as the vines will come in bearing this year, for the first time, the profitableness of the entire establishment will be decided this autumn.

Figure 1 gives a view of a portion of the main building, which fronts to the south; is 140 feet long, 18 feet wide, and is constructed like any ordinary grapery. The great surface of glass makes it a warm, dry and pleasant day run for the fowls. The interior of the grapery is divided into fourteen separate compartments,  $10 \times 18$ , which accommodate twenty fowls each.

YARD

hens are kept entirely separate from the cocks.

The setting-house occupies the cellar under the barn, and is capable of setting 150 hens; to the north of the barn, are large runs, well shaded with numerous storm-houses, where the pullets and cockerels are raised, the two sexes being

> separated as soon as they can be selected; they are allowed a large field range, and commodious roostingplaces. Last fall he had some 650 birds, and up to the last of September was still hatching. His birds were all free from disease, and fine, vigorous chickens.

> Mr. Warren is now experimenting with a new incubator, and has succeeded in hatching chickens, and before another season he

Fig. 2.—section of Portion of Fowl-House. will improve on his present plan. Experience has shown him that it is practicable to rear chickens artificially. Connected with this extensive establishment are two sheds, which open to the

breeding of choice animals to disturb the usual law of demand and supply. Like any other article in the market, they are worth just what they will bring. The scrub cow is good for beef

and milk, and it does not add a cent to her value that she can reproduce her kind, for thousands of her kind are every year deaconed, and the flesh is fed to swine or thrown away. If she is a good milker she is worth sixty dollars as a new mileh cow, if that is the market price of the article. If she will make five hundred pounds of beef, she is worth eight cents a pound live weight, if that is the market price. You can get as many as you like at

that price. But the thorough-bred is prized for different qualities altogether. If known to be a barren animal, she is worth no more than a scrub of the same weight. If she can reproduce her kind, every good quality in her is enhanced in value. We are ready to pay for her pedigree,

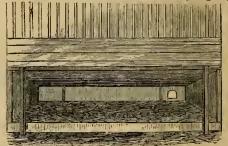

Fig. 6.-DUSTING-BIN.

her beauty of form, her capacity to make beef economically, to produce a large flow of milk, or to make rich butter and cheese. These extra qualities are the result of eare in breeding; they represent capital lavishly spent, and skill in the breeder, acquired by long years of experience.

He has in the careass of his thorough-bred animal a machine for the production of certain economical results. which has cost him large sums of money. If he can show that he can produce these results with a fair share of uniformity, he is entitled to an extra price for his thorough-bred animal. There is no doubt that the skillful breeder can do this. A shorthorn bull at his price is cheaper for a farmer who wants to raise beef in the blue-grass region, than a scrub bull at any price. It is

the confidence which farmers have that thorough-breds will transmit their good qualities that leads to the steady demand for them. A breeds them, it may be, to sell to Bat a fancy price. But B would not want them, unless he could sell to

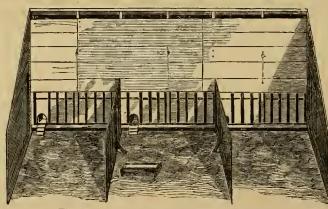

Fig. 4.—INTERIOR OF APARTMENTS IN GRAPERY.

ery are the self-feeding bins, filled with the different kinds of grain, and so arranged that each bird may have a bin to itself. When the fowls are let into the glass run in the morning, the bius are opened, and remain so until their appetites are satisfied; they are then closed until toward night, when food is again offered. Figure 3 shows a single feeding bin, and in figure 4, which represents the interior of the apartments in the grapery, the bins are seen in place. The roosting rooms have board floors; those in the grapery are earth. Figure 5 shows the interior of the roosting and laying apartments, ooking towards the grapery. The roosts are 18 inches from the floor, and are 4 inches wide. The nest-boxes are just over the feed-bins, three feet from the floor, and are reached by steps. The roosting apartments are ventilated by openings above the nests; these connect with the grapery, which has a row of ventilators extending its whole length. The building is so arranged that a wheel-barrow can be run its entire length for the purpose of cleaning. At the north of the building are yards, D, D, D, figure 2, where the birds run during summer. These yards are

10 x 26 feet, and each provided with a covered dustshed, figure 4. About the middle of March the fowls are shut out of the grapery, the partitions removed, and the vines made ready for the season. Beyond the small yards are large grass runs,

Fig. 3.—FEED-BIN. E, fig. 2, where the fowls are allowed to forage for a few hours each day. The stock consists wholly of Light and Dark Brahmas and Buff Cochins. Mr. Warren's experience is that these are the most profitable varieties, and has spared no expense in procuring the best blood to be found. In laying qualities, quiet disposition, and hardiness, they are unequaled. He had no success with the French breeds, and south,  $60 \times 13$  each, where hens and chickens are protected fromstorms, etc., and are kept until old enough to put with their several classes.

The whole management and arrangements of this establishment are most complete, and it is

probably the largest and best paying poultry-yard in this country. From the very start, the establishment has given a liberal return.

### High Prices for Thorough-bred Animals.

To a man, who deals in

serub cattle, worth fifty dollars a head, it seems an enormous price to pay two hundred dollars for a herd-

book animal, and six hundred is deemed a clear case of extortion. But there is nothing in the has found out that grade shorthorns will save a

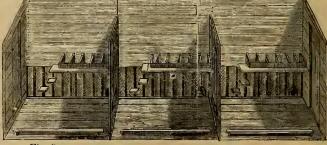

Fig. 5.—INTERIOR OF ROOSTING AND LAYING APARTMENTS

whole year of feeding, and one year's interest on the large capital he has invested in stock. He wants only a thorough-bred bull, and thinks he can afford to pay any price which is neces-

furrow-wheel (the foremost one), which is made to turn to the right or to the left by the movement of the long lever over the middle of the plow, so that the furrow may be made more or less

### Berkshire vs. Chester White Pigs.

A breeder of Chester White swine in Iowa takes exceptions to the remark of a "Western

Farmer," as given in "Walks and Talkson the Farm," in the Agriculturist for December. Speaking of the grand show of pigs at the Illinois State Fair, this prominent Western Farmer said: "The Berkshires were decidedly the best animals. The Magee and Chesters were out in large force, but they were too coarse, and, moreover, lacked uniformity," From this. and the remarks of "Walks and Talks," our correspondent

concludes that both these gentlemen are breeders of Berkshires. Such is not the case. Neither of these gentlemen breed Berkshires for sale, and could have no other than disinterested motives for speaking of them as they did.

The readers of the American Agriculturist

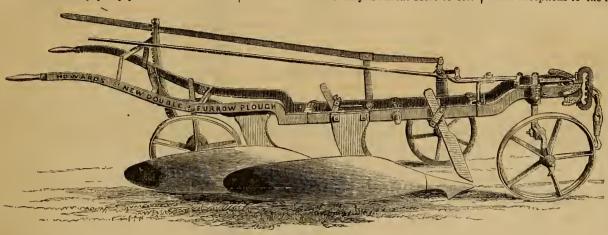

Fig. 1.—ENGLISH DOUBLE-FURROW PLOW.

sary to get him. The high prices for these animals will only continue as long as farmers find it for their interest to buy them. The several breeds of cattle meet real wants among farmers who desire them for ordinary purposes. The demand will probably continue as long as beef, milk, butter, and cheese are eaten; as long as oxen are used upon the farm. It is the most thrifty and skillful farmers that invest in thorough-bred animals. It is altogether probable that they understand their own interests.

### The English Double-furrow Plow.

Plows to cut two furrows at once-or two plows attached to one frame-are not a novelty; but their construction has recently been so much improved in England, as to create quite a general sensation among the farmers of that country, and to promise such advantages as to

make it well worth our while to investigate the matter in earnest. It is claimed-and the claim is based on practical use-that with one of these double-furrow plows, one man and three horses will do the work of two men and four horses under the single-furrow system-ef-

deep, or the direction changed by the plowman. By taking off the plow from the right-hand beam, and substituting a subsoil plow for it, we turn a single furrow, and subsoil the furrow of the last bout—with the great advantage that the subsoil track is never trodden by the team; it is

FURROW

immediately covered by the furrow from the lefthand plow. Fig. 2 shows such an arrangement.

### A Home-made Harrow.

M. W. L. Duraud, Derby, Conn., sends us a

model of a harrow which he has made for his own use, and which he thinks will be found convenient by those who still use the old-fashioned A harrow. The timber used by Mr. D. is 31/4 × 4-inch white oak, but the size of both timber and teeth can be varied according to the work to be done. The engraving will show the structure, the only peculiarity about which is, that it allows the

implement to be taken apart. Mr. D. finds this a convenience in loading the harrow into a eart, and it also allows it to be hung up out of the way when not in use. The cross-piece has a tenon at each end, which fits into a mortise upon the side-pieces. The sidepiece has an iron eye at one end, which catches upon a hook at the end of the centerpiece. A one-half-inch iron

bolt, attached to a chain, passed through the | Chester White sows, or large common sows, teuon, holds the parts together securely. with one of these highly-refined thorough-bred

need not be told that we have done no little toward introducing the Chester County pigs throughout the United States. We think very highly of them. They are a strong, healthy, vigorous race of hogs, growing rapidly, and attaining great size at maturity. They have done much toward improving our stock of common liogs. But it does not follow from this, that we have attained perfection in pig-breeding. It is an undoubted fact that, as compared with the Essex, the so-called Suffolk, the Berkshire, the Yorkshire, or the Jefferson County breed, the Chester White, as usually exhibited, even by the best breeders, lacks refinement. As compared with these breeds, and more especially with the Essex, the Chester White is a largeboned, heavy-eared, coarse, thick-skinned hog. No one who sees the two breeds together would dispute this for a moment. Now, what "Walks and Talks" advocated was crossing grade

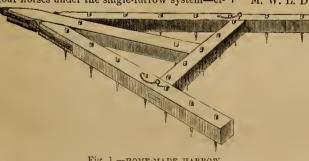

Fig. 1.-- HOME-MADE HARROW.

fecting a saving of one-half the wages and onefourth the horse keep-enough to turn the scale between profit and loss on many an acre.

The engraving, figure 1, shows the construction of the implement so clearly that explanation is hardly needed. The beams are "expanding," to regulate the width of the cut of the rear plow. The wheels stand obliquely (a novelty), so as to counteract the tendency of the plow to run to land-allowing the draft to be more direct than in the ordinary plow. The depth of the cut is regulated by the left-hand lever, which is held in place by a ratchet. The direction of the movement is regulated by the

boars. We believe this opinion is indorsed by all who have tried the cross. A letter just received from Mr. Richard Richards, of Wisconsin, an experienced breeder of Chester White and Berkshire pigs says: "I agree with you fully in regard to crossing a fine-bound boar on large sows. When I first got a Berkshire boar there was none of my neighbors that wanted to use him. They would bring as many as a hundred sows, some seasons, to my Chester White boar. My Berkshire boar, the first season, was small, and as many of them had small sows they were obliged, much against their will, to use the black pig. And the consequence was it opened their eyes, and now these farmers will use nothing else than the black breed. And I think they are right. A fine-boned boar on large sows gives the produce plenty of size and fine form, and such as will fat readily at almost any age. I agree with you, too, in thinking that the better bred the boar the better the cross will be."

Our Iowa correspondent says: "If your prominent 'Western Farmer' is a sporting man. I will wager forty pigs, that I can take my Chester Whites or Magees and beat his Berkshires, both in weight and form, at any time, and all the time, from two weeks to two years old." "Western Farmer" is not a sporting man-he is a gentleman-and this species of argument will have no more weight with him than it has with us. It is a poor cause that needs a wager to sustain it. "Western Farmer" is not a Berkshire breeder, but we hazard little in saying that he is as good a judge of the relative merits of the different breeds of pigs as any man in the country; and furthermore, he has made more accurate, more thorough, and more conclusive experiments in regard to the fattening of pigs of different breeds than any other man in the United States. His opinion on a question of this nature is entitled, at any rate, to respectful consideration. He thinks the Chester Whites and Magees too coarse, and it is no answer to say, "They will weigh more at two weeks or at two years" than the smaller breeds. This is not denied. But will they at six months or a year old give as much pork, and of as good quality, in proportion to the food consumed, as the more refined, small breeds? Will the grades, from common sows, be as good and as profitable in these respects? These are the questions at issue, and they should be met with candor and courtesy, with arguments and with facts, and not by assertions or wagers.

MESS PORK.-Several ask what part of the hog is manufactured into "mess pork," and how it is made. Cut off the head, the shoulders, and the hams; and the sides that remain make mess pork. Sometimes the shoulders and the cheeks are also included. The tenderloin and spareribs are usually taken out and eaten fresh, but the ribs are not unfrequently cured with the sides without being taken out. The method of curing is very simple. Cut the sides in the direction of the ribs into slices about six inches wide, and pack them round the barrel, commencing at the outside, and working towards the middle. Make the layer as close and tight as possible. Cover the layer with an inch of salt, put on another layer of pork, another layer of salt, and so on until the barrel is full. Then cover the top layer with salt-and always keep it covered. Make a brine with boiling water, (cold will answer if not convenient to boil it,) putting in as much salt as it will dissolve, and pour it into the barrel until all the pork is covered. The great point afterwards is to be sure and keep the brine at the top of the barrel saturated with salt. If the barrel is headed up, it is a good plan to turn it over, or upside down occasionally, as the salt is apt to settle at the bottom while the brine at the top may be too weak.

### A Cheap Two-rail Fence.

The fence question, though more easily solved where stone and timber are more plenty than upon the prairies, is still a troublesome matter. A six-rail fence will do where timber is very plenty, and you wish to get rid of it as a nuisance. But where railroad ties are worth 60 cents a piece, chestnut is too valuable to be put into rails. We have tried for two years a cheap two-rail fence, which turns cattle quite as well as the ordinary six-rail fence; and it has this advantage, that it can be made perfeetly straight, so as to make the full length of every rail available. It is made by driving stont crotches about three inches in diameter on the line of the fence, just far enough apart for the rails to span. The crotches should raise the bottom rail about two and a half feet from the ground. Stakes are driven at the crotches, crossing each other in the usual style of the Virginia worm-fence. A rider is then put upon the stakes, and we have a substantial fence, about four feet high, which answers a good purpose for orderly cattle. If for any reason a higher fence is desirable, the crotches must be made higher. This fence, of course, will not answer for sheep or swine, but for fencing out cattle from wood lots, or for dividing pastures, it serves a very good purpose. When the wood is at hand, and the cost of timber is not reckoned, this fence can be built for about 20 cents a rod, if the labor is not over \$1.50 a day.

Breachy Cattle. - "E. V." writes with reference to a cow that throws down rail fences: "I have seen cows with a board across their horns and another board extending to the end of the nose with nails in it (the nose did not have nails in it, but the board); I want to know how to fasten the board to her horns, or if there is any other way to keep her from letting down the fence?"-Bore a hole through each end of the board, where they will exactly fit the horns without stretching or pressing. Let the holes be small enough not to go too far down on the horns. Leave about an inch of the horn sticking through the board; drill a small hole through it, large enough to admit a horse-nail as a key. The board, reaching from this cross-piece to the nose, may be screwed fast to it (not to the nose, but the cross-piece); there will be play enough on the horns to give the necessary swing. If nails are used, they should be very smoothly blunted. We have never seen them used; the board itself over the nose having proved effective.-W. E. Harbaugh asks for a contrivance to keep a breachy hull from throwing down fences with his horns. A cross-piece may be fastened to the horns, as described above, or tied to the base of the horns, with a board or stake running down a few inches beyond the nose. From the lower end of this another stake, about a foot long, may be fastened at a right angle, so that when the animal stands in a natural position it will project toward the front. When he lowers his head to hook the fence, this projection will interfere with his design. A board in front of the eyes will sometimes effect the same purpose.

### Swedish Dairy Farming.

Near the University town of Lourd, in the county of Skane (Sweden), there is a farm, leased by the Baron Von Toll, which contains 1,500 Prussian acres under the plow, and 200 acres of grazing land. It is a fine example of rational farming in the fertile region of South Sweden, being worked under a 10-year rotation, comprising 3 years' pasture. The other crops are wheat, oats, and barley. The land is naturally fertile, and has a gentle slope toward the Baltic Sea. It is carefully cultivated, is thoroughly drained, and well manured.

The well-fed English Shorthorn cattle—125 cows and 50 oxen—are pastured during the summer. They are confined by long ropes, or "lariats," to stakes driven into the ground; and it is a strange sight to see the long, straight lines of cattle feeding. The clover pasture, being of excellent quality, is eaten off close; and each cow describes a perfect circle in eating, causing the field to look as if it had been mowed with a mammoth scythe.

Most of the milk is sold in the city. That which is retained for the butter and cheese is treated as follows: The churn is an upright one, with a vertical beater, which is worked by power. The butter is worked in an English machine, which consists of a heavy tin cylinder, 2 feet high and 6 to 7 inches in diameter. In the bottom are a number of small holes (about one-twelfth of an inch diameter), and after the butter has been well worked in the churn, it is forced through the small holes in the butterworker by means of a close-fitting piston, which is slowly moved down by a screw. The small size of the holes, and the severe pressure, cause the hnttermilk and other foreign matter to be entirely separated from the butter. This butterworker is made in England, and is in extensive

Another farm, of which we have an account, is "Hofgarden," on Lake Wetter, which is managed by Mr. G. Swartz. He is the great authority throughout Sweden and Denmark in all dairy matters, having made the manufacture of butter the study of a lifetime. An entirely new system of treating milk has been the result of his researches.

He has 1,800 Prussian acres under the plow, and 160 acres permanent meadow and pasture. The rotation of crops is nearly the same as that followed by Von Toll, and comprises 4 years' pasture on land laid down to timothy, yellow clover (hop-trefoil), and white clover. There are 160 to 170 cows, 20 oxen, and 32 working horses. During the summer the cows are pastured, but they are stabled at night.

Four Prussian acres are assigned daily to 132 head of cattle; the berdsmen marking with a scythe the bounds within which the animals may roam.

It is strange to see how they remain on the ground set apart for them; a few sometimes straying off to the section on which they had been the day before, they being allowed to do so. On coming to the stable at evening, they receive a very strange ration, consisting of horse-manure and crushed peas.

Mr. Swartz had once read of the good effects of this sort of feeding in an old Swedish book, but had paid no attention to it until he observed a shorthorn bull, who was roaming loose in his barn-yard, eating the manure from the horse stable, although he had just eaten all he wanted of his usual food in the stable.

The result of his experiments was, that he

feeds 8 lbs. horse-manure daily per head, and he finds that it acts favorably on the milk in increasing the butter therein. The peas increase the caseine in the milk.

The cows, though they have just come in from the pasture, enjoy their curious desert thoroughly. Though Mr. S. loses the horse-manure, he makes it up by being able to keep 20 to 30 cows more under this system. His rule is to give his cattle all they can eat, winter and summer.

The cows are milked by women in the stable, and the milk is at once poured into copper kettles (2 to 3 feet high, and equally wide), which stand in a trough filled with ice-water. Mr. S. acts on the principle to let the cream rise with the milk at the lowest possible temperature.

His dairy is a small building, in the center of which is a water-tank. The milk-cans, which are 20 inches high and 20 inches wide, are set into this tank, after the milk has been measured and poured into them. The cans have covers with an inch hole in them, and are not allowed to touch the bottom of the tank, but are hung up so that the cold water may circulate under them. During the summer, ice is used to keep the water in the tank at 39° to 41° Fahrenheit (45° at most), and in winter the water is naturally at about 33° Fahrenheit.

The ice-house at Hofgarden is curious and simple. It consists of a ditch over which a wooden grating is placed to allow the water to run off. In winter the cakes of ice are piled on this, all spaces between the cakes are filled in, and in cold weather water is thrown on the ice-heap, so that it freezes into a solid mass. It is then covered with a heavy layer of sawdust, and with a straw roof. To avoid uncovering the ice daily, several days' supply is taken out, placed near the dairy, and covered well with sawdust. Even when they have days with the temperature at 77° to 86°, which is not rare in Sweden, the loss of ice is very slight, provided plenty of sawdust be used.

The cream is churned at a temperature of 50°, and in summer it is cooled down to this point by ice. Owing to the hight of the milkpans, the cream attains a thickness of 1 to 2 inches, and can be skimmed without much of the milk being mixed with it. The cream is entirely sweet when it is churned.

Mr. S. has made many experiments in his system of allowing the cream to rise at a low temperature. He has discovered that 144 lbs. milk produce in the first 12 hours 5.30 lbs. cream; in the second 12 hours, 0.17 lbs. cream; In the third twelve hours, 0.06 lbs. cream. According to this, it is not worth the trouble to let the process last longer than 12 hours, particularly as the few remaining particles of butter in the skimmed milk add to the value of the "lean cheese" that is made of it.

The system that has made Mr. Swartz's name so well known in Sweden and Denmark is, therefore, founded on what almost all farmers oppose—namely, low temperature during the rising of the cream, and high milk-pans. Mr. S.'s aim is to cool the milk as soon as it is taken from the udder (the cooling apparatus being in the stable), and to expedite the rising of the cream by keeping the milk at a low temperature, 33° to 43°. The advantages claimed are:

1st. The cream is separated from the milk in 12 hours; and, 2d, The milk is sweet.

The 2-feet-high milk-pans, or cans, are contrary to tell the views on the subject, that the particles of butter rise quickest in flat milk-pans.

Mr. S. proves that, at a low temperature, the cream rises very rapidly. The surface of the

vessels being small, the cream lies thick on the top, and is easily skimmed off.

The foregoing is, to say the least of it, a very curious statement; and it may be worth while for American farmers to try the effect of the deep setting of the milk at low temperature.

The ration of horse-manure we do not care to recommend.

### Petroleum - The Early Days of the Business.

BY H. E. COLTON.

There is a principle of Nature's economy that when a demand is created, a supply is ready. For thousands of years a queer, pitchy, badsmelling oil had oozed from the earth in different parts of the world, and had in various ways served the use of man. With it the Egyptian embalmed his dead, and the leprous Assyrian bathed his sores. In our own land the virtues and value of Seneca oil had been transmitted down from the red man, and it was bottled and sent throughout our land to be used by the rheumatic, whose pains compelled an endurance of its smell, to give its healing virtue to the dumb beasts of our farms or stables.

But a change has come over the land of the Senecas; and the creek, on whose banks they once sat and dipped the queer oil with their horn cups, is now the center of a rushing, thriving industry. The wealth, which for so many years had lain dormant, was roused to life just at a time when the needs of this great country and the world demanded it.

Young, of Glasgow, had published to the world his wonderful discovery of extracting oil from coal, bringing to view the pent-up snnlight of ages; but this wonderful discovery only created an intense thirst for the product he could not supply in sufficient quantities. In the meantime, a corps of adventurous spirits were exploring and boring in the wild, bleak hills of Pennsylvania. To Messrs. Eveleth and Bissell is due the credit of having opened the Drake well. Drake was a conductor on the New Haven Railroad, and employed by them to open the well. Prof. Silliman, of Yale College, was the first President of an oil company. On the 28th day of August, 1859, the first vein of oil was struck. The well, at a depth of about 60 feet, yielded 400 gallons per day. From this beginning slowly came up the great business, until it reached the wild whirl of excitement and speculation in 1863-64. Fortunes were made and lost in a day; thousands of gallons of oil ran to waste, and hundreds of thousands were sold for less than the cost of production. The mystical Johnny Steele flourished around New York hotels and bar-rooms with his income of thousands per day; companies were gotten up with par shares from 50 cents to \$5: servant girls invested their all, hoping soon to be able to ride in their carriages and live in brown stone mansions. Never since the days of Law's great Mississippi bubble had the world seen anything equal to it. Unfortunately, this wild mania is too recently and painfully prominent with many of our readers. Many-hard-working men-invested their all in an engine and a lease, to work for days and weeks only to find nothing, and sit down penniless and despondent, fully and completely "busted."

The mode of getting petroleum is: A point selected, a derrick is erected, and augers gotten ready. The utensils consist of auger stem, reamer, bit, swivel, sinker-bar, sand-pump, etc. The auger stem is in sections, and as it goes down others are screwed on. Until the rock is

reached, the sand-pump has frequently to be used. When the hole is finally bored and oil reached, the tubing is put down to the hard rock and the seed-bag put in. This is a leather bag filled with flaxseed, which fits around the pipe. It is put in the hole just at the sand rock, and as the seed soon swells, effectually prevents the oil coming up outside the pipe or the surface-water getting down. It was certainly a valuable discovery in oil-pumping. In the early days of petroleum, in many of the wells when the oil was struck, it burst forth with great force, sending the pump-rods and derrick-frame high in the air, mingling oil, gas, and salt-water. One of the most noted instances of this was the Burning Well, on the Buchanan Farm, at which the gas took fire and 38 persons were burned, of whom 18 died; among them the owner of the farm. It is generally conceded that those wells are most permanent which have no gas; as people who make the most fuss in the world are not always those who accomplish the greatest good for themselves or others.

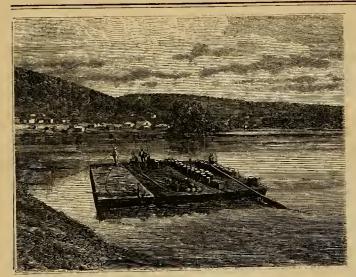

The number of the wells is legion, and the most condensed history of them would fill a large volume. On January 1st, 1869, there were 1,186 producing wells in Pennsylvania, and their average product was 1121, bbls. per day. Then there are many in Canada, Ohio, and West Va. There is some attention being turned to the deposits in South America. The whole daily product of crude petroleum cannot be far from 18,000 bbls., of 40 gallons each. Some of the wells have produced enormously, even over 4,000 bbls. per day. The oil has sold as low as 20 cents per barrel, and as high as \$10. It is said to pay handsomely at \$4. Millions of gallons are now sent to market without being barreled, except figuratively. It is transported to the railroad in pipes laid under ground, and put into gauged tanks: 40 gallons is a barrel.

In the early days it was floated down Oil Creek and its tributaries in flat-boats. The custom was to pond up the water, and, when all the boats were ready, cut away the dams, thus floating them on the freshet to the mouth of Oil Creek. As may be imagined, there was frequent accidents and the wildest excitement. As much as 50,000 bbls. of petroleum have been known to be thrown out on the waters of the creek and rivers from the bursting barrels, and crushed-up flats, in a "jam."

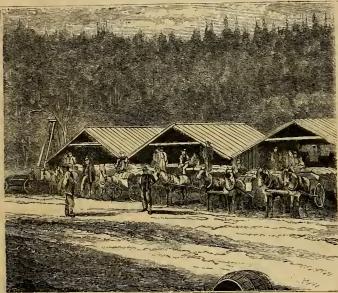

Fires of the most devastating character bave frequently occurred. The city of a day has been in a few hours a mass of ashes. Now, the old lumber huts have given place to substantial brick buildings. The same may be said of the whole petroleum business; its evanescent speculative character has passed away, and it is now one of the most substantial kinds of business in the land, the value of its export amounting to more than any other article except cotton.

The question whether these wells will continue to yield, or whence comes this oil, is one we shall not discuss. It would take more space than we have, and our readers would not then actually know more than they now do. Many wells that were flowing have become pumpingand these, too, have decreased in yield. Measures to resuscitate have been adopted, as exploding nitro-glycerine, etc., in them. This has temporarily restored them. One manager filled his well with henzine, let it stay two weeks, pumped it out, and his well continued to pump longer than from the nitro-glycerine explosion. His idea is, that the air which gets down into the wells causes the oil to gum and fill up the sand-rock through which it oozes.

The oil regions of Pennsylvania present a

RAFTING PETROLEUM DOWN OIL CREEK.

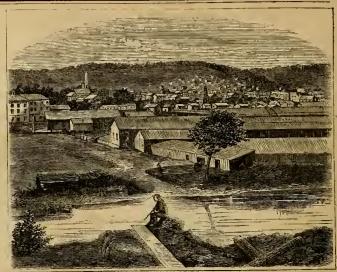

RAM-CAT WELL .- OLD MODE OF TRANSPORTATION.

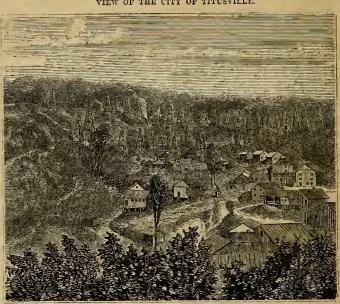

THE DRAKE WELL.—THE FIRST OIL WELL.

busy spectacle, as at Pleasantville, of which we present a picture, there being more than a hundred derricks in the space of a few acres. This oil-field is claimed to have been discovered by the agency of the spirits. Unfortunately, however, the good spirit which showed the way to

the first well did not lead his devotee to the best one by a great many barrels per day. Titnsville, of which we present a sketch, is the principal city of the oil region, and numbers about 12,000 inhabitants. In the old days of teamsters and the Ram-Cat Well, of which we

present an engraving, it was a mass of mud, slush, and oil, lumber shanties, and wild excitement. Now there are three railroads, well-paved streets, and good hotels. We are indebted to Messrs. Day & Co., New York, for facilities in obtaining the above illustrations.

### The Dwarf Cornel, or Bunch-berry.

Among the nine species of Cornel or Dogwood that are indigenous to the Northern States, there are two which have the flowers surrounded by a broad involuere, which, as it is

white aud petal-like, is taken by most persons for the flower itself. One of these species is the Flowering Dogwood -Cornus florida-which this month is so conspicuous in our woods, with its snow-white inflorescence; and the other is a very humble plant, which only reaches the hight of four or six inches, and would hardly be supposed to belong to the same genus with the treelike Dogwoods. This is the Cornus Canadensis, the Bunch-berry, or Dwarf Cornel. It is found in damp woods, and is quite common northward. The herbaceous stems, which are thrown up from a subterranean trunk, have scalelike leaves below, and larger ones above, which are crowded so as to appear like a whorl of four to six leaves. The small flowers are in a terminal head, and surrounded by a white four-leaved involucre. The plant is more conspicuous in autumn than in spring, as then the flowers are replaced by a close cluster of bright red globular berries. The berries, which have not much taste, are caten by children, and are sometimes made into puddings. Birds are very fond of them. The plant is successfully cultivated in English gardens.

### May-flower, or Trailing Arbutus.

There is, perhaps, no wild flower about which so much has been written in prose and poetry as the May-flower, or Trailing Arbutus. Its simple beauty, its very early flowering, and its rich fragrance-so rare among our wild flowers-all combine to make it a popular plant. It is found from the British

Possessions to Carolina and Georgia, though it cannot be called a very common plant. Its favorite place of growth is along the edges of woods, where it will be covered with leaves, and yet be open to the influence of the first warm

days of early spring. The illustration shows the prostrate habit of the plant, its traily stem running just at the surface of the ground, and throwing up from among the dead leaves leaf-bearing shoots, crowned by clusters of pearly white or rose - colored flow-The flowers ers. arise from scaly bracts, have a long tube, which is very hairy within, and which expands into five rounded lobes. The flower-buds are formed in August,

and are so well developed that it needs but a few days of mild weather to induce them to open. It is not rare to find them open in February, and it usually happens that the flowers are all gone

before May. The name May-flower, by which the plant is most commonly known in New England, is not in reference to its time of blooming, but because it is supposed to have announced to the crew of the May Flower that their first long dreary winter at Plymouth was

DWARF CORNEL, OR BUNCH-BERRY.

nearly over. The botanical name is Epigæa repens; the generic name is from the Greek, meaning upon the earth; the specific one, repens, means creeping. Like many of the Heath Family, to which the plant belongs, it has

MAY-FLOWER, OR TRAILING ARBUTUS.

fine fibrous roots, and is difficult to transplant. In England, where most plants of this kind do well, it is found to succeed only when grown in a frame. A lady has recently written us that | experience of ourselves and our neighbors,

she succeeds in growing it in a hanging basket, by keeping the stems close to the soil, and giving it frequent sprinklings. It is so charming a plant that its shyness is to be regretted. Those who have suitable situations by the edge of a wood can probably succeed by taking

large clumps with considerable earth. This can be best done just as the plant is about making its new growth.

### Roses for Winter Flowering. BY PETER HENDERSON.

Your correspondent, "N. G.," has asked questions upon the winter-flowering of roses, the reply to which would be too much for a private letter; and as the matter is of general interest in all large towns throughout the country, I have made it the subject of an article. Last season we built a greenhouse for these roses, 300 feet long, and 21 feet in width, of which the subjoined is an end section: It differs from that figured in "Practical Horticulture," in being one foot wider, and having the back and middle bench on the same level, which we find to be of convenience in working, besides giving the roses a better chance to grow higher. The question of the walls for such a structure as this is a very important one. We find that if brick is to be used for the north or back wall, it must be made hollow, as a solid wall of even one foot in thickness will not stand the extremes of temperature between the outside and inside; but as a hollow wall is an expensive matter, I would recommend to those with whom economy is an object to construct the walls thus: Get strong locust, chestnut, or cedar posts, of length sufficient to allow them to set 3 feet in the ground; place these 6 feet apart; outside of these nail hemlock or other rough boards; against this tack a layer of asphalt or tarred paper,

and then against the paper nail the weatherboarding, finishing at the top with a hollowedout timber, 6 or 8 inches wide, for a gutter. A greenhouse of this kind, heating apparatus, and all complete, will cost at present prices from

\$20 to \$25 per running foot; with hollow brick walls, it would cost about \$30 per running foot. The use of tarred paper for greenhouse walls is only a recent one; formerly we used to fill in with brick, or use double boarding, leaving a space of two or three inches, which was filled in with charcoal, sawdust, or some other non-conducting material; but the tarred paper is by far the cheaper, and better. Your correspondent also

asks the best method of growing roses for forcing-whether that of planting out or growing the plants in pots or tubs. By all the

we have come to the conclusion that growing them, in the portable condition, in pots or tubs, is the best, every thing considered. No doubt it is successfully done both ways; but one advantage of having them in pots is, that if any change is necessary in the greenhouse, the plants, if grown in pots, are available for sale, which they would not be if permanently planted out. The rose-house we erected last year contains about 5,000 plants, grown in 10 and 12inch pots, occupying about a square foot of space for each plant. No plants could possibly be in better health and vigor; and the amount of rose-buds, gathered from October to May, 30 weeks, averaged about 2,000 buds per week. At New York rates, which are very low-say \$6 per 100-this would give about \$3,600 for the crop. The varieties grown I will name in the order of their value here: Safrano (orange yellow), Isabella Sprunt (canary yellow), Bon Silene (carmine purple), and La Pactole (yellowish white). These are all tea-roses, and the varieties most valued for forcing; Bon Silene is the favorite, and is largely grown about Boston. One florist there sent last New Year's Day to the bouquet-makers of New York 1,200, for which he received \$300, or \$25 per 100. This variety, from its delicious odor and rare and bright shade of color, is generally of twice the value of any other; but against this advantage is the fact, that it is less prolific of bloom, scarcely giving half the number of flowers in a given space as any of the others named. "N. G." inquires also our method of summer preparation for forcing. We secure good healthy young plants that have been propagated in March or April; these, when first takeu from the cutting-bench, are placed in 2 or 3-inch pots; if rooted in March, they will have filled the small pots with roots by the middle of April; if in April, by middle of May. In either case they should be shifted into larger pots as soon as the ball of soil has been filled with white roots; if left too long unshifted, the roots become brown in color, and of a hard, woody nature; if in this condition they become checked in growth, they never afterward make so fine plants. Of course, until the middle of May, these shiftings of the young plants must be done under glass, but after that time they should be placed in beds of convenient width-say 4 or 5 feet, in some free and airy situation. When first shifted from a smaller to a larger pot, the plants should be placed close together, the rims of the pots touching; but as they begin to

PLAN OF ROSE-HOUSE.

grow freely, the pots should be drawn apart, so that the rims stand an inch or so clear of each other. This is very important, in order to admit free circulation of air around the sides of the pots, and develop strong and healthy roots. Until the middle of June we stand the pots on the surface of the ground; but about that time it is necessary to plunge the pots to the rim in sand, coal-ashes, waste tan-bark, or some such dry and light material. If this is not done, they can hardly be kept damp enough; and the intense heat of the sun beating down on the sides of the pots, dries up the young rootlets. It is necessary that the beds wherein the

roses are plunged should be so arranged that no water will lodge at the roots, as that would be quickly fatal. Last fall we found it necessary, after a heavy rain-storm, to lift the pots out of the sand in which they had been plunged, to allow them to dry. Forty-eight hours of heavy rain would have killed the young roots. It is also essential to watch that the roots do not get through the bottom of the pot; to prevent this, they should be turned around at least every ten days, to break off any roots that may have run through. It will be understood that continued shiftings into larger pots are necessary during intervals of four or five weeks during the

summer, until September, by which time, if well grown, they will be of sufficient size to require pots of 10 or 12 inches in diameter. We never shift them after middle of September, as the roots they have then made are sufficient to carry them through the winter and spring, stimulated, however, by water drained from the manure heap, which we use twice a week, from January on to May, diluted to the color of strong tea. The expenses attendant on the cultivation, and the interest on the investment of this rose-house the past season, were about as follows:

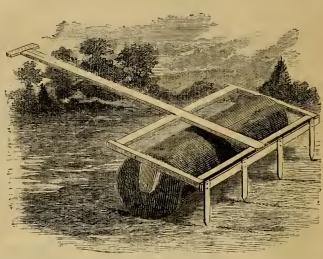

\$500
720
500
480
32,200
3,600
1,400

The second year, of course, the expense of buying stock would not come in, as the plants would be in better order the second and even the third year than the first; besides, if young plants are wanted for sale, they might be prop-

agated in any quantity from the flowering plants. Another question asked by "N. G." I had nearly forgotten: he wishes to know if one or more greenhouses of this construction may be joined together in front of each other. This is exactly what we did last year. We had previously built one house 300 feet in length by 20 feet in width, and conceived the idea of using the front wall of this for the back wall of the other, and so built with the best possible results. The house

placed in front must of necessity be from 1<sup>1</sup>|<sub>2</sub> to 2 feet lower than the one behind.

PEAS AND POTATOES.—Being short of ground for our gardening operations, we have this year adopted the plan of planting our peas and potatoes together in the same rows, planting the potatoes first, and then planting the peas as we would if they were to occupy the land alone, except that they are not planted quite so thick. This system is much in vogue among market-gardeners, and answers a very good purpose. The pea-vines are not brushed, but fall into the

ROLLER AND MARKER.

rows between the potatoes. It may be adopted with early or late potatoes equally well.

### Combined Roller and Marker.

Mr. Chas. T. Starr, Avondale, Pa., sends us a drawing of a combined roller and marker, which he has invented, and finds it in the truckgarden, and for root-crops, etc., superior to any thing he has tried. He thus describes it:

"It is in the shape of a wooden hand-roller, 12 inches in diameter, and 3 feet 6 inches in length; the frame is made of 2×2-inch white oak, with a tongue 6 feet in length. On the back part of the frame is hinged a piece of stuff  $1^{1}|_{2} \times 2^{1}|_{2}$  inches, to which markers, 2 inches wide, are attached, by two bolts in a slot, so they may be raised or lowered as required; this piece, with the markers attached, is fastened down by one hook, attached to the frame, which may be raised and hooked up, when the beds are planted and the whole is wished to be rolled to finish. The advantages, I think, are obvious: 1st, it crushes all small clods before marking, and levels the ground; 2d, the rows are all of a uniform width, and it will not vary from side to side in the least; 3d, the rows can be made straighter with this than any other marker; and 4th, it is two machines combined in one."

### Sweet Corn and Celery on the same Ground,

BY PETER HENDERSON.

About a dozen years ago I came into possession, about the 1st of May, of a four-acre plot that had lain for many years in sod. It was then too late to be able to break it up so as to plant with any of the finer kinds of vegetables; so I decided to plant it with sweet corn. Accordingly, I had the sod plowed over flat in such a manner as would best rot it. I was careful to have the furrows straight, and at every 5 feet, where they lapped together. I dropped sweet corn at 4 or 5 inches apart, so that when it started to grow it stood in regular lines 5 feet distant. The corn was planted about 20th of May, and hoed around the line as it grew, the

space between being run over by the harrow cultivator. By the middle of June, by the action of the cultivator, the space between the rows of corn was in fine friable condition, and celery was planted in double rows (10 inches apart). The shade given by the corn was of no injury to the celery at this early stage of growth, and as the corn crop was sold, so that the stalks were cleared off by the middle of August, the growth of the celery was not in the slightest impaired. The whole transaction was quite satisfactory; the corn crop sold (green) for about \$600, or \$150 per acre. The celery, at about \$400 per acre, which was exceedingly low, not much more than one cent per root for every root planted. Last year the price would have more than doubled that for the same quantity. I had forgotten this incident in our market-gardening experience, until in reply to one of your readers asking what he could best do with a piece of meadow so situated, I told him of this, and, thinking it might be of interest to many so situated, I briefly describe it here. The variety of sweet corn used was the "Early Darling;" celery, the "Incomparable Dwarf." No fertilizer was used, except a slight sprinkling of bonedust for the celery.

### Self-sown Verbenas,

L. B. Case, Richmond, Ind., writes: Every year, after our verbenas have done blooming, we cover the beds with straw or chip dirt; and in the early spring, after digging and working the beds, the self-sown verbenas come up in great quantities, and none from the greenhouse can excel them in size, beauty, or brilliancy of color. We have all the intermediate shades of color, from pure white to a very dark purple or plum color; indeed, almost black, and often some of the finest striped varieties. These selfsown seedlings of course are not as early as those raised otherwise, but they grow among other plants without much care; and if they prove worthless, or in the way, they can be easily pulled up, while, if fine, they well repay one for their waiting. We have several times had "sports" that were admired by many.

One of the self-sown seedlings last summer had a bunch of flowers on the central stalk, pure white, and all the branches starting from the base also had white flowers, except one branch, which had a red stripe in the center of each petal of all the flowers, and continued to bloom so all summer.

In the summer of 1869, one seedling had the flowers of the central stock half white and half of a dark, rich purple; the line of separation being so exact as to cut some of the petals of the single flower into halves across the center of the bunch, leaving one-half of the bunch pure white, and the other half a pure purple. The branches starting from the hase of the plant had either all white or all purple flowers.

#### Notes from the Pines.

It is not in the best taste to obtrude one's personal matters, but I would like to say to the many friends whose letters remain unanswered, and to those who have sent seeds and plants as yet unacknowledged, that I was "heeled in" about Thanksgiving, and remained there until the days of bluebirds and crocuses. For further particulars ask Doctor K.

BULBS.—The mention of crocuses reminds me to say a word about my bulb-bed. In the fall of 1869 I had a large variety of bulbs, and to try how much abuse they would stand, I put them out and let them remain all winter without any cover. Hyacinths, Tulips, Crocuses, Scillas, and a few others, made a good bloom the following spring; but all the more delicate, Narcissuses, Anemones, and the like, were never heard of. Last fall similar things were planted, and a light covering of salt hay thrown over, and the difference this spring is remarkable. My experiment the year before was made with the hope of being able to say to those people who wish to get along without trouble: "You need not cover your bulb-bed; the plants will do very well without it." But it wouldn't work.

BULBOCODIUM.—I have before said a good word for Bulbocodium vernum, and now wish to repeat that it is the best, earliest, and altogether the most satisfactory spring bulb. It is up and away before the slower Crocuses and Snowdrops have become conscious that winter is over.

Anemones and Ranunculuses.—A Ranunculus root looks like a many-pronged tooth, and that of the Anemone like something that had been trodden upon and flattened past recovery. It requires some faith to plant these with a view to returns. They both do very well with me on sandy soil, with a good covering through the winter. There are few things more brilliant than these flowers.

THE CABBAGE-WORM.—Last year the devastation caused by the caterpillar of the Pieris rapæ was disastrous; the insects did not injure the early crops much, but they came in legions for the late ones. This year the early crops will doubtless be attacked, as I saw butterflies the last week in March. Their chrysalides are found in all sorts of sheltered spots. I found some upon the under side of the branches of a peartree. The insect, in all its stages, was figured in November last. There are several broods in the course of the season, and every butterfly killed now is a great gain. While the weather is comparatively cool, the insects are less active than in the hot summer months, and may be more easily caught. Probably persistent hunting with sweep-nets is the most promising means of destroying the destroyer.

CORDON APPLES .- I have a row of appletrees in horizontal cordon along a garden road. The trees were allowed to grow upright last year, and are now to be brought down to a horizontal wire stretched a foot from the ground. One of the neighbors seeing me at work at these trees, had his curiosity so much excited that he had to come over for a nearer view. The matter was explained by a lecture on cordon trees in general, and the cordon horizontale in particular. The thing met with reluctant approval; but there was an objection-the fruit would be down too low, and it would be a trouble to stoop for it! It was an odd view to take of the matter, but it reminded me that I had not thought of fruit at all. I was just growing the trees for the fun of the thing, and was getting my full reward in making them take the shape I fancied. There is a sort of satisfaction in bullying a Baldwin or Northern Spy, and making it understand that a foot is the highest it shall ever get. I am glad to see that Mr. Waring, of Tyrone, Pa., is publishing articles on the cordon training of peach-trees, in Hearth and Home. One can get no end of pleasurable occupation out of a few peach-trees thus trained, besides a certainty of fruit not to be had in most localities, with trees grown in the ordinary manner.

Sowing Weeds.—In my collection of herbaceous perennials there are numerous Sedums, or Stone-crops. To my great regret I find this spring hundreds of self-sown Sedums, some of which are at a considerable distance from the mother-plants. These must be taken up and burned, or otherwise cared for, or they may become established weeds. The Live-forever is a Sedum (S. Telephium), and was first introduced as a garden plant. It is now an annoying weed in many localities. Indeed it has a foot-hold upon the adjoining place. I do not wish to have the credit of naturalizing any others of the genus.

Labels are a tribulation with me. The Northampton pencil makes a lasting mark, but the label must be smooth, and the rascally machine-made things are as apt to be rough as smooth. The solid ink pencil makes too little show. I have come back to white-lead and a common pencil. This will last much longer than will the miserable labels which the factories turn out. Who makes a decent label?

### Soaking Seeds.

There are some seeds, such as the Canna, which it is necessary not only to soak, but to almost cook before they will germinate; and those of the Cypress-vine and Globe Amaranth can only be successfully started by soaking in warm water. These seeds are sown where they can be attended to, if they are likely to suffer from dryness, and in these and other cases the soaking is necessary. We see it often recommended to soak the seeds of beets, carrots, and other garden seeds before sowing, and we bave practiced soaking such seeds with good results. Still we find that our marketgardeners, who yearly sow large quantities of seeds, seldom or never do it. If the ground into which soaked and often sprouted seeds are placed is in good condition, and should the weather remain favorable, all will go well, and some days be gained; but should a dry spell come on after the soaked seeds are sown, the germination which has started will be checked, and the whole sowing be lost. No subsequent moistening will resuscitate seeds that have had their germination arrested. This objection does not hold in small gardens where watering can be done without much trouble; and we would caution those who soak their seeds in order to hurry them up, to be careful to water them should the condition of the soil require it.

### Early Cucumbers.

Those who have cold-frames or hot-beds from which the plants have been removed, can make them still further useful in growing cucumbers. A hill can be planted under each sash, and being protected at night, they will come on rapidly. Cucumbers grown in this manner will need care in watering, airing, and covering at night; but they will be safe from the attacks of insects, and will be enough earlier than those grown outside, to pay for the trouble. The sashes may be kept off altogether after the middle of June. Those who have no glass, can forward the plants upon inverted sods. Good sod cut into squares of three inches are placed grass-side down in boxes, and several seeds sown in the earth of each piece. These must be cared for just as if they were house-plants, watered, aired by setting out of a warm day, and protected from cold at night and during stormy days. When the weather is settled, the squares of sod are to be set out in well-prepared hills.

### The Checkerberry, or Wintergreen.

Such a little plant as our Cheekerberry is well provided with names, as in various parts of the country it is known as Wintergreen, Boxberry, Teaberry, Ivory Plum, Mountain

Tea, and Partridge-berry. Most of these names are also applied to other plants, and it sometimes leads to confusion. The botanical name is Gaultheria procumbens, and when this is used there can be no doubt as to the plant intended. The name was given in honor of a Doctor Gaulthier, or Gaultier, of Quebec. The engraving, which is of the natural size of the plant, renders a description of its appearance unnecessary. It is frequently found in the cool shade of other evergreens, growing so abundantly as to form a carpet with its darkpolished leaves. It flowers in May and at the end of summer. The bright red berries are well known, and are much sought after by children. They are frequently found in our city markets, where their brilliant appearance causes them to meet a ready sale. They are, however, rather dry and insipid. The berry is an interesting one, from the fact that the eatable portion is not the fruit proper, or the ripened pistil, but it is the calyx which has, after flowering, grown so large as to quite hide the seed-vessel, and has become fleshy and eatable. This structure may be seen by splitting the fruit lengthwise. The leaves have a spicy flavor, due to a volatile oil.

This oil, when extracted, forms an article of commerce, and is used to flavor confectionary, etc. Like many other aromatics, the plant is considerably used in domestic medicine. The Gaultheria Shallon, the Sal-lal berry of the Northwest coast, is a much larger species than ours, growing to the hight of two or three feet. This is largely cultivated in England, but, like most other broad-leaved evergreens it

is difficult for it to stand our hot summers, and we very seldom see it in cultivation.

### Partridge - berry.

The little Partridge - berry (Mitchella repens) is very common in woods, creeping close to the ground, often forming a carpet close to the trees, and bearing considerable resemblance to the Money-wort. Though so delieate in appearance, it is an evergreen, and during winter its neat foliage and bright berries present a cheerful appearance. The

roundish leaves are dark green, and frequently variegated with a lighter spot. The flowers appear in pairs, their ovaries (the lower part of the pistils) being united; they are white, or tinged with purple, and very hairy within; they appear in June and July, and have a pleasing fragrance.

The fruit, which remains on all winter, is about the size of a huckleberry; it is made up of two fruits joined together, and bears at its top the remains of the calices of two flowers. From this peculiar character of the fruit it is frequently called Twin-berry. The berry is dry

CHECKERBERRY, OR WINTERGREEN.

and nearly tasteless, but is highly relished by partridges and other birds. The name *Mitchella* was given by Linnæus in honor of his correspondent, Dr. John Mitchell, of Virginia.

Transplanting Parsnips, Carrots, etc.—
"J. L. H." gives the following as his method of
transplanting parsnips and carrots: "Provide
a stick for a dibble about a foot long, as large

should be about the size of a small goose-quill. When a sufficient number of plants are ready, proceed with the transplanting. Make a hole with the dibble deep enough to allow the crown of the plant to be about half an inch below the surface. Insert the plant, and thrust the stick

down by the side of it, so as to press the earth toward the root. Fill this second hole with water. The ground, at the time the transplanting is done, should be so moist that the soil will not fall in and fill up the hole. It is best to do it after a rain or upon a rainy day. If dry weather comes on it will be necessary to keep the plants well watered for a few days; and with the earrot, which is more difficult to transplant than the parsnip, it is well to make a hole with the dibble by the side of the root, and fill it with water."

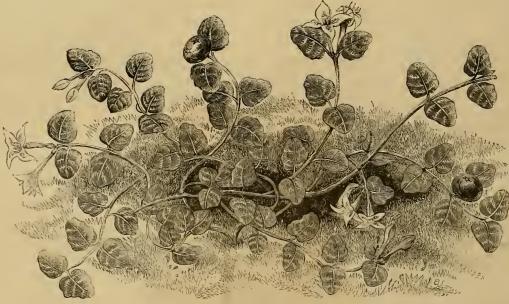

### Annual Climbers,

For ornamenting verandas, covering screens and other permanent work, the woody climbers are much to be preferred. Still, there are places where for immediate effect it is desirable to have annual vines, as a large space may be covered in a short time, while it usually takes a year for a woody climber to become established and ready to make a show. Some of the climbing annuals are in themselves so showy or interesting, that we grow them for their beauty alone, and provide supports for them. An enumeration of

some of the most useful annuals of this kind will aid in making a choice. In most places the seeds may be sown where the plants are to grow, but where cold nights yet prevail, it will be better to start the seeds in-doors, in pots or boxes. The Canary-Bird Flower is one of the prettiest climbers. It grows rapidly, a single plant soon covering a space several yards square, with its small and

pleasing The flowers are of a lively canary-color, and are so curiously formed as to appear somewhat like minute birds. As a vine to grow where spectators will not be tempted to handle it, the Brick-red Loasa will be found to spread very rapidly. It produces an abundance of foliage and brick-red or orangecolored flowers. Unfortunately, the leaves sting as badly as a nettle, and those who handle it without gloves will repent it. The wellknown Cypress-vine should not be forgotten. The seeds

need scalding or soaking some hours in warm weather. The showy Nasturtiums and the well-known Morning-glories are desirable for their rapid growth. The Maurandias, Cobæa Scandens, and Lophospermum may be raised from seed, but they will be rather late.

THE PARTRIDGE-BERRY .- (Mitchella repens.)

as one's finger and sharpened at one end, a pail of water, and a cup. Pull up the plants to be transplanted; pinch off the tops to within an inch or an inch and a half of the crown; shorten the points of the roots if they are too long, and drop them into the pail of water. The roots

### THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

#### About Baskets.

In one of the streets that take us to the ferry which enables us to reach our country home, is a basket-store. It tempts us sometimes to linger for a few minutes to notice the great variety of styles and their appropriateness to the uses for which they are intended. There are ladies' work-baskets of the finest material, and through every grade, to the coarse, heavy hamper on wheels used as a sort of go-cart in our city stores. We have of late no-

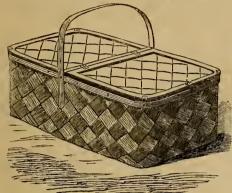

Fig. 1.—CHIP MARKET-BASKET.

ticed a new style of chip-basket, figure 1, which is very neat and serviceable. It is made of neatly interwoven wooden splits, with strongly-framed flat covers, which shut down closely, and are fastened by eatches. The corners are neatly rounded, as the corners of a basket to be used in crowded cities always should be. If one wishes to know how much one's comfort depends upon a trifling matter, let him go through the crowded passages of Washington market. His sides will be sufficiently bruised by sharp corners to make him ready to petition to Congress for an act to make all baskets with rounded ones. A basket for soiled clothes is a convenience that we do not often see outside of cities. These baskets are made tall, so as to occupy a corner without taking up much room. Soiled clothes, especially in summer, should never be put in a tight receptacle. A basket allows the needed ventilation. We figure on this page two forms of these clothes-baskets, a square and a round one.

### Home Topics.

BY FAITH ROCHESTER.

Graham Gems.—I am glad to see that Miss Catherine Beecher recommends Graham gems as among the most wholesome articles of diet. She says (and she has good authority for saying) that the wheat-keroel has all the elements contained in the human body. By the process of bolting, the flour is deprived of its woody fiber, which facilitates digestion; the lime needed for the bones; the silica for the hair, nails, and teeth; the iron for the blood; and most of the nitrogen and phosphorus needed for muscles, brain, and nerves.

And yet, as Graham flour is usually furnished at our call, the bran is coarse and offensive to many, especially to children. I confess I feel obliged to sift such Graham flour as I get before using it—through a coarse sieve, to be sure—but if the flour had been properly ground I should not remove any part of it. There are very few millers who grind "Graham" properly. The stones should be so sharp as to cut the grain evenly and finely, so that no coarse bran would appear. This is sometimes called "wheat-meal," and it is sweeter and more satisfactory in every way than the ordinary Graham flour which we buy—which is simply a mixture of fine flour, canaille, and bran, or those parts of the wheat left unseparated after grinding.

Miss Beecher, in her recipe for gems, directs the use of a "spoonful of molasses and a pinch of salt" to a quart of the flour. I cannot think that this

would be any real improvement upon the old rule that has found so many hearty friends—simply flour and water, well heaten together into a batter a little thicker than for griddle-cakes, dipped into gem-paus, and baked quickly in a hot oven.

These gems, made of good wheat properly ground, are fit to set before any king whatever—more than that, they are such nourishment as American citizens (far higher in true rank than kings) deserve and should have, to make them strong, and wise, and good; fit rulers of a self-ruling nation. Let patriotic women who would fain do the State some service take into consideration, among other things, the subject of healthful cookery. They are doing this, and will do so more and more.

A Baby's First Food.—There came to me, early last winter, via the office of the Agriculturist, a very pleasant letter from a lady in Virginia, asking for my opinion about the most suitable food for a baby during the first few days of its life. I supposed the inquirer expected her answer through the Agriculturist, but when I received her letter I had just sent off one month's talk; so I waited for the next month, and then did not write at all. When I decided to write directly to the lady inquiring, I was unable to find her letter; but I hope she still reads the Agriculturist, and will accept my apology for this seeming neglect.

In a former paper I said that the new-born infant needed no doses of a purgative nature, as old nurses used to suppose—that the maternal secretion (which at first is not milk, such as comes in two or three days after the birth) was exactly adapted to the emergency in all ordinary cases. This seems to have led my friend to suppose that other food must be provided for haby. I have not found it so in my own experience, and other mothers (of the intelligent kind—I have consulted no others) tell me that their little ones who have been put at once to the breast have prospered better than those that were fed at first. Such medical books as I have consulted advise the same course.

In cases where the mother is utterly unable to nurse her babe, it will be necessary to give the little thing some other nourishment, of course. The milk of a good new milch cow is best, diluted with one-half, or more than half (at first), its own bulk of warm water. We all know that the first milk drawn from a cow, after calving, is quite unlike her milk several days later; and at first it is entirely unfit for human food. Yet it is perfectly adapted to the little calf's needs, and continues to change as the calf grows older. The same change takes place with human milk.

My friend says that she has heard "sugar and lard in a rag" recommended for a babe's first food! I should say never give either to a baby, and the less of lard at any age, the better. Both are too concentrated in their form. To give such food to

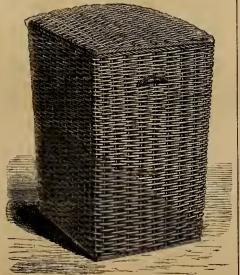

Fig. 2.—square clothes-basket.

a very young child when it needs nourishment in its most diluted form, is to my mind simply horrible! SUN-BONNETS.—It must be an unnatural child, I think, that can enjoy having a close, heavy sunbonnet tied on its head whenever it runs out to play. Children always prefer light straw-hats, and these are more sensible head-coverings for summer than close sun-bonnets. For very small children honnets are most convenient sometimes, but let them be light and comfortable in shape. The honnets stiffened by pasteboard slats or whale-bones

Fig. 3.-ROUND CLOTHES-BASKET.

running from back to front away out beyond the nose, so that one cannot see right nor left without turning the head, are heavy and worrisome to the children who wear them. There is the same objection to the stiff "shaker." A good sun-bonnet is deeper over the top than at the sides, serving as a shade, but not as "blinders." White sun-bonnets are trying to the eyes, and if used should have a piece of green silk basted in for lining. A corded gingham sun-bounet, stiffened with thin starch, or one made on a few ratans running over from side to side—deep over the top, but short around the cape; is easy to make and comfortable to, wear.

PROTECTION FOR WET WEATHER.—High rubber boots are very nice for children in weather that is bright over head but wet under foot. I find that one pair serves my little boy through three wet seasons—two springs and one fall—and it is a great pleasure and some profit to him to wade out iuto the vin-lakes, vin-occans, and vin-rivers made by rain or melted snow. "Vin" in his "Tench" language, means "dry-away-soon," I am informed.

Rubber boots are indispensable for women who are obliged to be out in all weathers and who wish to preserve good health. I often wonder why we who love the woods and fields do not provide ourselves with costumes suitable for rambling about comfortably. I remember that Mr. Beecher (in one of the first series of "Star Papers," I believe) recommended the bloomer for such occasions. So did Grace Greenwood in her early Greenwood Leaves. But that comfortable costume has fallen into such disrepute among persons who fancy that they already know and apply the laws of beauty in regard to woman's dress, that it requires great courage for a sensitive woman to "face a frowning world," even on a stormy day, in a dress that protects her person without wearying her in both body and mind by the constant care she is obliged to give it. I could n't advise her to try it, unless she has strength of nerve to spare.

THE KINDEUGARTEN. — I have been studying Froebel's Kindergarten system lately, and I believe it is all that has been claimed for it. I see now how we can get good workers in every department of life—in a few generations more, at least. Once get free Kindergartens established in this country, and the "good time coming" will come rushing right along! The Kiodergarten will be slow at first, be-

cause the need of it is now realized by only a very small portion of society. Most people suppose that our present modes of primary education are good enough. The Kindergarten (a German word that means child-garden) is for children between three and five years of age, and affords them employment in the form of plays, beautifully adapted to train the little fingers to careful work, and to oultivate the observing faculties, while affording at the same time the best kind of amusement.

Froebel devised a series of twenty "gifts" for infants under five or seven years of age. The exercises to be conducted with these gifts he called "plays"—so well did he realize that education may and should be a happy process.

I shall be glad to tell something more about the Kindergarten in future papers, for I do not see how Kindergartens can become common until there is a demand for them; nor how there is likely to be a demand until people are informed upon the subject.

### Teach Your Daughters.

BY MRS. I. W. T.

I have observed that the daughters of excellent housekeepers are often at a loss how to perform the most ordinary domestic operations. This ignorance on their part, is sometimes a cause of a great deal of trouble and vexation to them. A young lady told me of a mortifying occurrence which once happened to her. Soon after she was married, they went to live with her husband's mother. Desirous of making herself as useful as possible, she offered to help her mother-in-law get the dinner. "Well, my dear," said her new mother, "you may, if you please, stand by the stove and turn the fish while I set the table." "Would you believe it?" said my friend, "I turned that fish, and turned it, and turned it, until it was nothing but a mass of flesh and bones, and looked much more like a stir-pudding than the fine white fish it had been at first.

I know of another lady who actually stuffed a quantity of bull-heads, or eat-fish, with their skins on, using a forcemeat and cooking them according to the directions given in the cook-book for baked pickerel. Both ladies were good-naturedly laughed at, but they themselves were extremely mortified.

Many mothers say: "I dislike to have my daughters in the kitchen. They are no help—but a good deal of a hinderance. I would much rather have them stay in the parlor and play the piano." Such mothers make a great mistake. Duty and Love should lead them to inquire: "What is best for my daughter? How eam I best teach her to become a useful member of society? Will she not some time, in all probability, have a house of her own? If so, will it not be a great help to her to know how to manage it properly, and to be able to bake and roast meat, to get up a dinner, and to make wholesome and good bread? Who is better adapted than I, her own mother, to teach her these things?"

Such questions as these, faithfully answered, will be followed by an invitation to the daughter to assist in the duties of the kitchen until she has attained to a thorough knowledge of the way ordinary food, at least, is cooked.

### Ironing Made Easy,

BY MIRS. W.

Good ironing of clothes is a fine art, and is acquired by patient practice, and the habit of doing all work conscientiously. In families where there are young girls, there is often much nice ironing to do; and it should never fall to the mother's charge, but should be done by those who require it, except in cases where servants are kept for that purpose; and it is always well for young ladies to know how to iron in the best manner. Nothing so greatly facilitates the habit of ironing as to have each one who irons possess her own ironing tools, such as holders, etc. In otherwise orderly families I have seen young ladies catch up almost any thing that was conveniently near, to hold irons with; often scorehing valuable articles not suitable for the purpose. Each ironer should have a bag, fifteen or

eighteen inches square, to be suitably furnished, and used only by herself. It should contain an ironing-holder, of a size and thickness to snit herself; a few layers of newspaper in the middle make it lighter, and the hand will be less heated than if it is wholly made of cloth. Ironing-holders made of sawdust are the least heating to the hand. The sawdust should be nicely and thinly quilted into the holder; and to be just right, there should be two quite thin quilted holders tacked together, and then the cover put over both. Wood being a nonconductor in a great degree, the hand is not so injuriously affected by heat as from the old-fashioned metal-handle and a common holder. I wish some woman would invent a movable wooden handle for flat-irons, which would be easily adjusted on taking an iron from the fire. Some woman, whose husband is a blacksmith, and would make her models, perhaps might succeed. Each ironing-holder should have one or two covers of white cloth or light calico made to fit nicely, and should be fastened on with buttons or strings; then, when one cover becomes soiled it can be changed, and is far preferable to having several holders.

In the ironing-bags, there should always be kept a thin, soft-leaved pamphlet, for rubbing the irons upon, when first removed from the fire; do not use the covers. Keep in the bag also a nice soft cloth of a light color, to fluish off the iron with, also a light tin ring for resting irons upon. A muffin-ring is just the thing. Another smaller bag within the other should contain a small white cloth for rubbing speeks from starched clothes, and a soft, fine cloth for covering bosoms and collars if desired. It saves also much time and vexation to keep a wet towel near, to wipe the hands when starching, instead of rushing across a room to wash them while doing starched clothes.

One should have a small ironing-board for collars, cuffs, etc., a little larger than a handkerchief, and it should be covered with cloth and flannel.

To the upper corners of the board a strong string should be nailed to hang it up by, and a calico cloth should be attached to the top like the eover of a pamphlet, large enough to fall over both sides when hanging, to keep it from dust, and should be confined closely around the board by strings. With two such boards two can iron at the same table without interfering with each other, or could be carried to any part of the house, and saves all the time usually lost by folding and putting away ironing things of large size, as blankets and covers, which are often put away in a hurried and disorderly way, to the vexation of the next one who goes to the ironing-drawer or basket. These items seem small and insignificant, but attention to them would save much time and trouble, and render an otherwise tedious process pleasant and improving to the ironers of the family, by cultivating habits of order and regularity, and a just regard for the comfort of others.

### Unprincipled Neatness.

"Cleanliness is akin to godliness," a good mau says; but let us never forget that godliness is the first thing to be songht, and after that cleanliness to any extent. If any body supposes that I mean that you are to "get converted" in the ordinary sense of that phrase, and then go on scrubbing and scouring with all your might without any application of christianity to these wash-board and dish-pan affairs, that person has not made my acquaintance. The "fruit of the spirit is love, joy, peace, etc.," and beyond all price; neatness is only a secondary matter.

We are putting cleanliness above godliness if we brush and scour until our nerves are so wearied that good temper becomes almost a physical impossibility; or if we keep our friends in constant dread of making a speck of dirt upon our premises; or if we allow ourselves to be greatly put out by any disasters that happen to our carpets or tablecloths. It is hard to bear these things, if we have not abundant means and plenty of assistance; and I don't know of anything but a true philosophy, believed in by the heart as well as by the intellect,

that will help us through. Do we really desire to lead true lives, and to do our duty by our families? Then we must settle in our minds what are the essentials to this end, and resolutely make other matters subordinate.

It is neatness without principle that insists upon clean aprons and polished faces for the children more than upon gentle words and patient sympathy with their plans and pleasures, which concerns itself more about flies and dust than about the family health and happiness. Bright windows and spotless paint and well-seoured floors are excellent things in their way; but if you can only secure them by a loss of all time and relish for reading and out-of-door recreation, have the nobleness to bear with some dirt and rags, rather than sacrifice the life for meat or the body for raiment. For the sake of all about you, as well as for your own sake, save your nerves from over-strain and your intellectual life from starvation. But never sacrifice cleanliness to display. Those children are fortunate who are kept supplied with whole and clean clothing; but none of these things can begin to compare in value with a wise mother's love and care in respect to the formation of character and the development of a sound mind in a sound body. A husband has something to say "thank you" for, whose buttons are never missing and whose dinner is always in good time and good order; but he deserves to miss the best gifts of this life who values these things above a wife's companionship and inspiration in all things most lovely and of good report. F. E. R.

#### Lunches.

Many persons find that the lunches they catch at railroad stations, or which they carry with them in their bags or baskets, give them headaches and serve as very poor substitutes for warm dinners at home. It is probably because they are made up so largely of cake or pastry. The food is too concentrated, has not enough waste matter and finid about it, and so produces constipation, which is a sure cause of a dull head and general bodily discomfort. The vegetables and soups we cat with our dinners at home, are valuable for their waste matter as well as for their nutriment. With our lunches we miss these, but fruit is still better for those whose stomachs are healthy enough to eat it uncooked, and fruit we can almost always have with us.

For a substantial lunch to take from home, especially for one who is taking active exercise, cold chicken is good, or cold meat cut in slices. These, laid between buttered slices of bread, make very nice sandwiches. Thin biseuit is usually more acceptable than bread, and if cut open, spread with currant jelly, and put together again, is very nice. The less of cake, and the plainer that little, the better for the traveler's comfort. Fresh soda crackers and fresh apples make an excellent light lunch; but the fine flour crackers are so concentrated, that it is best for all who can do so to eat the accompanying apples without peeling them. A simple lunch of this kind, which you can buy as you hasten through the streets to the depot. is far better than the little sweet cakes and pastry abominations sold at stands near the depot. I doubt if women, who know how such things aremade, are often caught buying them. Figs or raisins go well with crackers or gems; but fresh, juicy fruit is preferable when you can get it.

sweet Pudding.—By T. S. Wright.—One cup of raisins chopped fine; one cup of suet, also chopped; one cup of sour milk, three eggs beaten, one teaspoonful of soda and a little salt, and flour enough for a stiff batter; steam two hours and serve with sance.

Rice Pudding.—By T. S. Wright.—Twothirds of a cup of rice, one cup of raisins, one quart of rich milk. Steam for two hours; then add one cup of sugar, two eggs, one quart of milk, a small piece of butter, and a little salt; mix with care so as not to break the rice, and bake until done. Serve warm or cold in slices, with sauce.

### BDYS & GIRLS' COLUMNS.

### Among the Bees.

BY "CARLETON."

Very amusing are some of the recollections of my early childhood and of later years, especially of my experiences among humble and honey-bees. I remember of climbing up into an old pear-tree, and running my arm into a hole to see if the bluebirds had built a nest there. I did not find any eggs, but there was a tremendous buzzing, and my arm came out a great deal quicker than it went in, and I slid down the trunk of the tree in a twinkling and took to my heels with two big bumble-bees after me, and a lot more swarming ont of the hole to see who it was that had knocked at their door so unceremoniously. I did not get stung that time, but the hired man who was at work in the garden laughed so lond to see me run that the people who lived on the other side of the meadow, a half mile away, heard his lond haw-haw-haw, and wondered what he was laughing at. What fun we boys used to have in taking bumble-bees' nests! Sometimes we found them in rock-heaps, sometimes under old stumps, and in old mouse-nests, where the mowers were cutting the hay. I remember how William and John, two of my mates, joined me once in a grand bumble-bee hunt. sallied out with shingles and bunches of oak-twigs for weapons. We took off the stones from a rock-heap, one by one, very gently, until we reached the nest, and then gave it a poke. There was a fine biz-biz-biz, and then, as we poked it again, a londer booz-booz-booz, and in a moment a bouncing fellow in buff and black made his appearance. We knocked him on the head, but there was another fellow creeping ont; a third-a fourth-a fifth -a dozen. Spat-spat spat went our shingles, but the bizzing and boozing became louder each moment, and before we were aware of it a dozen bees were about our ears. They had crept out at the backdoor of the nest, and had taken us in flank. While fighting those in the air, those in front of us rose from the nest and we had the entire swarm about us. The bumble-bee is no coward. O, No! He drives straight at the enemy, be it a man or an ox, and sticks his sharp dagger in wherever he can get a chance. One crept up William's trowsers, and we laughed to see him dance about, like a Dandy Jim, slapping his thighs. They buzzed around John's head, and he off with his cap and swept them away.

He put his cap upon his head again, but took it off a

good deal quicker than he put it on, for his hair was fall of bees. How he made the hay fly! for it was in a mowing-field, and the mowers langhed antil the tears ran down their cheeks to see us run, and cried. "Go it!"
"Scrutch gravel!" "Put in, or they will tack it into
you!" We dived under the hay cocks with the bees after ns, and did n't take the nest.

I remember of conceiving the idea of collecting all the humble-bees I could find, and putting them into a hive, and having a tame swarm. I went into the garden and and having a tame swarm. A court into a caught those in the hollyhock flowers, and those in the squash blossoms, and put them into an old hive; but when I let them out to gather honey, they never came back again—the ungrateful creatures! The attempt to celonize them was an ignominions failure.

It was pleasant to watch the honey-bees at work, coming and going all day long, making the air musical with their humming. It was delightful to creep up to the hives after sunset on a summer evening and hear the low murmaring of the bees inside. I remember wondering if they were singing a hymn, and saying their prayers before going to bed!

Honey-bees are teachable insects. If you treat them kindly, you can do almost any thing with them; but if you abuse them, they will take terrible revenge. I once knew a man who had a swarm of bees so educated that he could call them from the hive and they would alight upon his hands, or hang in a great bunch upon his heard and creep all over him; and then, when he gave a low hiss, they would rise in a cloud and go back into the hive. He traveled over the country exhibiting his educated bees.

But one of the most laughable scenes I ever saw was down in Virginia, during the war. It was early one morning in midsammer. The sun was just appearing. and the soldiers, who had had a hard march the day before, were rising from their bivonac in the fields near an old farm-house. The men were stretching out their arms and shaking their legs, and yawning and wishing that reveille had not come so early. Some were washing their faces in the little brook that trickled through the meadow. Camp-fires were lighted, coffee-pots steaming, and all hands were getting ready for breakfast.

The soldiers suddenly discovered a half dozen or more bee-hives in the garden. A squad rushed toward them, each soldier bent on having honey with his hard-tack for breakfast. One soldier seized a hive and gave it a shake. The hees fell upon the ground, but the hive was heavy

and dropped from his hands, falling upon some of the hees and crushing them into the earth. The air was filled in an instant with the remainder of the swarm. The other hives were seized by other soldiers, who suddenly found themselves enveloped in a cloud of bees. They swung their hats, struck wildly into the air with their hands, flapped their coats, and danced about like madmen. "He-he-he, ha-ha-ha, haw-haw-haw!" shonted the soldiers in camp. You could have heard it a mile. Londer grew the humming as the bees began to widen their circle. Now they swept over the fence and attacked the soldiers around the camp-fires, but the laughter took a sudden turn as the angry insects settled upon colonels, majors, captains, lientenants, and soldiers alike-pricking their checks, dabbing into their eyes, creeping up their nustrils, and buzzing in their hair, and working their way under their shirts and creeping up their trowsers. All over the field men were swinging their arms like wind-mills, rubbing their heads, slapping their thighs, throwing themselves upon the ground, and curling up in heaps and covering themselves with their blankets, or running as fast as they could to escape the fury of their tormentors. There was a sudden rearing and plunging among the mules and horses, a breaking of halters and pulling up of tether posts, and then a grand stampede of the entire camp. Away went donkeys and horses with their tails in the air, kicking, and rearing, and leaping over the fences. Suddenly there was a dab in my face, and a buzzing around my ears, as if the fellow was say-ing, "How do you like that?" I did not like it at all. And then another one came, another, and another, all asking the same question; and, without stopping to answer them. I took to my heels and ran with the soldiers, captains, and colonels, horses and donkeys, and left the bees masters of the field.

The hees resented such wholesale robbery and marder as the soldiers had engaged in, and I did n't blame them.

#### Aunt Sue's Puzzle-Box.

Well, the folks seem to have enjoyed themselves over the March puzzles, and I have enjoyed their kind letters on the subject. Many sent answers to the entire list, but were incorrect in their solutions of the sixth anagram, the first Latin name, and HAUTBOY'S Rebus.

W. H. Oris (Sherwood, Cayuga Co., N. Y.) has correctly answered all the March puzzles, and wins the prize offered.

#### THE ANAGRAM PRIZE

has been drawn by E. Goff, Sewickley, Alleghany Co.. Pa., Box 86.

I offer the same prizes again this month, and I want the little ones to distinctly understand that the one who sends the largest list of correct answers, gets the prize: should there be more than one answering the requirements, the prize will be decided by lot. Some of the children seem to think that they are entitled to a prize for answering one or two pazzles.

Answers to these must reach me by the first of June; those received later will not be credited.

Address Aunt Sue, Box 111, P. O., Brooklyn, N. Y.

Illustrated Rebus.-A common proverb, drawn 408. from honschold experience.

SUBSTITUTIONS .- (Change one letter.)

- 1. Change a mineral into herbage.
- 2. Change what young ladies like to do into the lad that likes to hear.
- 3. Change a young lady into what she often is.
- Change a country into a backbone.
- Change condemnation to recommendation.
- 6. Change glattony to truth.

#### CROSS-WORD ENIGMA.

My first is in pudding but 'tis not in pie, My next in horizon but not in the sky, My third is in actor but not in the play, My fourth is in hattle but not in the fray. My afth is in kitten but not in the cat,

My sixth is in bonnet but not in a hat, My seventh is in lion but not in fox, My eighth is in hamper but not in a box. My ninth is in platter but not in the dish, My tenth is in oyster but not in a fish: And now what I tell you may greatly astound, But my whole is a place where contentment is found.

Square the word "POWER."

DOUBLE ACROSTIC.

The initials and finals form two French cities.

- 1. A range of mountains in Europe.
- 2. A city of Australia.
- 3. A river in Texas.
- 4. A lake in Minnesota.
- 5. A country of Africa.

ADDITE M NACET

Illustrated Rebus.-A saying which has been at-409. tributed to Washington.

#### CROSS-PUZZLE.

1. Something heard in thunder. 2. In animal. 3. The capital of Henderson Co., Ill. 4. A river in North America. 5. A city in Michigan. 6. One of the patriarchs. 7. Something seen in chalk. The ontside letters (commencing with item No. 1, and reading downward on the right, then upward on the left, and adding the final letter of the second item,) will name something that should be in every BELLE.

11. Hereit dantss a seltac yb het ase, Hitw na canteni peke dan stnterr ether, Dan ni ti swelld a dyla rear, Chir dan volley thiw nogled riha, Yb het dwil vesaw shapglin raweily.

TRANSPOSITIONS NO. 2.

(Fill the following blanks with the same words transposed.)

- 12. They fired a --- into the -- village
- 13. The was closely followed by the —

  14. His told him to wash in the —

  15. The will an impression.

  16. The began to with the rain.
- 17. and are hoth cities.

SPECIAL NOTICE TO PUZZLERS.

I have been asked by several of my nieces and nephews to explain a "square word." I comply with pleasure.

Suppose I tell you to square the word "Clan;" get your slate or paper and write the letters across and downward, thus:

CLAN

Now you must find three words to fit the rest of the square. We want first a word of four letters beginning with L: shall we try "lean?" No, because that would bring two N's together and we could not find a word beginning with double N. Let us try "LORE."

CLAN LORE AR NE

Now you can finish the senare with "Arts" " Nest " or 'Area," and "Near," or "Neat."

Some of the little ones do not understand concealed names: let them look at the questions and the answers to them together, and if they don't understand then, it will be useless for me to attempt to explain.

I am much obliged for complimentary enigmas, but modesty forbids my using such, so please don't make any more on my name or on the title of the paper. Many thanks for kind interest and affectionate greetings, to E. A., Johnnie C. Watson, E. W. W., Ben, and D. F. T.

ANSWERS TO PUZZLES IN THE MARCE NUMBER.
ANAGRAMS.—1 Preventive. 2. Geographical. 3. Mosquito. 4. Caterpillars. 5. Collapse. 6. Enthusiasm. 7.

[COPYRIGHT SECURED.]

### THE WOODS IN MAY.—Drawn by Granville Perkins, and Engraved for the American Agriculturist.

Osteologist. 8. Disarrange, 9. Competence. 10. Outbrazen.

Alphabetical Arithmetic. 581)658420(1133. Key, "Old Enigmas."

Concealed Greek and Latin Proper Names.—1.
Midias. 2. Sirius. 3. Verticordia and Vertico. 4. Zens.
5. Quietus. 6. Veneli. (All these may be found at the end of Webster's unabridged.)

CHARADE. Current.

NUMERICAL ENIOMA. Do not be conceited.

PUZZLE. DLIM transposed to MILD.

SQUARE WORD. Bear, Ella, Alas, Rasp.

REBUSES. 404. Be wise to-day 'tis madness to defer, 405. The wise for cure on exercise depend.

J. H. Bird, Ainslee Brothers, Lillie Streeper, and Willis H. Ropes, each answered 21: Star and Crescent, and Blue Bird 20: Correct answers, more or less, have been received from Addie F. B., W. F. C., W. E., Chas. G. T., W. H. W., B. Foster, G. H. F., H. Elsworth,

Martha W. L., Harrie F. G., J. A. Smith, Nellie, H. M., J. C. W., L. F. Tapp, W. O. B., Mrs. C. D. F., Ruhy, W. T. Cooke, S. G. Kerr, E. A. Knapp, Mary M. L., Mt. Vernon, E. Goff, W. Thacher, Ettie Holder, Robbie Eddowes, and Tillie M.

Thanks for puzzles, etc., to A. Knowl, Reen Ross, J. H. Bird, F. Brooks, Mattie. Howard Moore, V. E. Souder, Nealie C., Star and Crescent, C. L. S., and F. G. T.

Several correct answers to the February puzzles were received too late for credit.

Will the recipients of prizes be kind enough to acknowledge the receipt?

### The Woods in May.

What a pity it is that May-day cannot be celebrated with any satisfaction by the majority of our boys and girls. Those who live in the milder Sonthern States can keep up the English enstom of "Going-a-Maying," but for the most of ns May-day is quite as apt to bring blue noses and cold fingers, as it is Violets and Wind-flowers.

The attempts we have seen at making the first of May a gala-day, have not been successful. The flowers are not abundant enough, the weather is apt to be unpropitions, and we think a floral festival can be much better enjoyed on the last day of May than on the first. Still, if May-day itself must be given up, the woods can be enjoyed during the month. The artist has given a picture which will recall to the young reader—and the old one too, perhaps—many a happy hour. How delightful it is to see every thing waking up from the long sleep. The new leaves, what a tender green they have! and the flowers, how much more delicate they are than those of a later season! You will find upon other pages of this paper engravings of some of the flowers which will be found in the woods this month. There will also be a plenty of Violets, Spring-beauties, Saxifrages, Monse-ears, Dog-tooth Violets, Wind-flowers, and many more, with which to make bouquets and garlands. Then, for all that we know, the Queen of May can be crowned just as well on one day as another; and after all, we can have a merry and happy May-day, even if it does not full on exactly the first of the month.

EAD and ZINC POISON, or IRON RUST, are all avoided by the use of the Tin-Lined Lead Pipe. It is the best Water-Pipe made, and is highly recommended. Price 15 cents a pound, for all sizes. Circulars and sample of Pipe sent by mail, free. Address the Colwells, Shaw & Willard Manufacturing Co., No. 213 Centre-st., New York.

The Universal Clothes Wringer.

The Universal Wringer has been in use in our family for years, giving entire satisfaction. We speak whercof we know when we say it is one of the best labor-saving machines ever invented, having several points of superiority over any Wringer we have examined. - New-York Liberal Christian, April 2d, 1870.

### MANIOCA! MANIOCA!

THE GREAT EAST INDIAN DELICACY .- Puddings, Blancmange, etc., are so delicious when made from Manioca, that it is welcomed at every table. It is a most nutritious vegetable production. One package makes six delicious puddings for twenty-five cents. It is Nature's blessing to invalids. If your grocer does not keep it, five packages will be sent free by express, on receipt of one dollar and twenty-five cents, by Manioca Company, 287 Washington-street, New York.

PRATT'S
Does not take fire or explade if the lamp is upset or broken. Over 100,000 families continue to use it, and no accidents of any description have occurred from it.

Oil House of Charles Pratt, Established 1770, New York.

The lates of the most delicious of all Tropical fruits, are now abundant and cheap in the markets of U.S. They make a most delicious preserve, marmalade, etc., when prepared as we direct with The American Preserving Powder, the best and latest improved method of preparing and preserving all kinds of fruits, etc. Circulars seut free, or a Minual of 56 pages, containing full directions and particulars, sent for 10 ets.

Address L.P., WOLFALL & CO., 153 Chambers-st., New York.

### New & Choice Vegetables, Rare & Beautiful Flowers,

For Sale by B. K. BLISS & SONS, Nos. 23 Park Place and 20 Murray Street, P. O. Box 5,712, New York.

GENUINE SEED.—The experience of the past two sensons fully confirms all that was claimed for this variety when first offered, and it now stands unrivaled in size, productiveness, and quality.

Specimens were exhibited the past season by Mr. Conover, which were grown alongside the best "Oyster Bay" varieties, and received the same care and treatment, which attained four times the size of that popular variety.

Though but two years from the seed, many of the plants produced from twenty to thirty spronts, averaging from two to four inches in circumference, and were ready for cutting one year in advance of the ordinary varieties. Our stock is all from the original Bcd, and we guarantee its gennineness. Seeds in half-ounce packets, 30 cents per packet, 30 per pound.

E. K. BLISS & SONS, 23 Park Place, New York.

Pecrless in Beauty.

Peerless in quality and Size.

Peerless in Productiveness.

A trial the past summer confirms all that was claimed for it when it was first offered by us in the spring of 1870, and it now stands without a rival for a general crop. J. W. Beach, of South Orange, N. J., raised from a single potato, weighing 21 onnees, cat into alagle eyes, 278 lbs. Several others report having grown from 600 to 800 bushels to the acre, with ordinary field culture.

4 lbs. by mail, upon receipt of \$1.00. By express, \$1.50 per peck; \$5.00 per bushel \$10.00 per bhl.

The Earliest Potato in Cultivation.—Bresee's King of the Earlies (or No. 4). Known also as the Figr-Dollar Potato. Ready for marketing from seven to ten days in advance of the Early Rose. By mail, 4 lbs., \$1; by Express, \$1.50 per peck; \$5 per bushel; \$10 per bbl.

B. K. BLISS & SONS,

Nos. 23 Park Place and 20 Murray St., New York.

JUDSON'S NEW BRANCHING FIELD CORN.

Early Golden Drop.—This valuable variety originated on the farm of E. O. Judson, and is the result of earchil selections for several years. It is now offered to the public as the most valuable variety for field enthure, especially in the Northern and Eastern States. Ears average ten inches in length, which are produced at the end of the shoots, branching from the axles of the leaves, each stalk averaging from three to five well-formed ears; some staks have been exhibited bearing eight full-grown ears. It is rendy for harvesting in ninety days after planting. Its rendy for harvesting in ninety days after planting. Its rendy for harvesting in minety days after planting. Its pearliness, extraordinary productiveness, and beautiful appearance, strongly recommend it for general cultivation.

B. K. BLISS & SONS.

B. K. BLISS & SONS, Nos. 23 Park Place and 20 Marray St., New York.

### NEW BRANCHING SWEET CORN.

Judson's Prolific.—A new and most desirable variety of Sweet or Sugar-cern, which has been improved from the Early Sweet corn in the same manner as the preceding variety. It is a second early variety, tender, sweet, and delicions. Its extraordinary productiveness and good quality recommend it to market-gardeners as well as for private gardens. 50 cents per packet; five packets for \$2.00.

B. K. BLISS & SONS,

Nos. 23 Park-place, and 20 Murray-street.

DIFFERENT VARIETIES OF FOWLS—
"G. H. WAENER's strain." Send for Price-List of D. D. F. COON, Marcellus, N. Y.

### New Early Sweet Potato-Southern Queen.

This variety, originally from South America, was introduced by us in this vicinity in the Spring of 1869, and has been extensively tested in various parts of the country for the past two years, with the most satisfactory results. It was grown the past summer by several cultivators of the "Nansemond," who pronounced it ten days earlier, more productive, a hetter keeper and of better quality than that tavorite variety, making it true Seeet Potato of the North, as well as a valuable addition to those cultivated at the South. Its keeping qualities are remarkable. If folly dried, and carefully handled to avoid bruising when harvesting, and placed in a warm, dry cellar, they need no more care than the common potato.

Price of the tubers, 4th. by mail, post-paid, \$1; by express, freight hald by purchaser, \$2 per peck; \$3 per half bushel; \$5 per bushel.

Slips of this variety will be for sale in May, by mail, prepaid, \$1 for fifty; \$1.50 per hundred; \$12 per thousand, by express.

R K BUSS & SONS No 28 Parkalages New York

paid, \$1 for fifty; \$1.50 per manage express. Address B. K. BLISS & SONS, No. 28 Park-place, New York.

### Bliss's Improved Long Orange Carrot.

This superlor variety is the result of a careful selection, for successive years, of the best-formed, largest, and deepest-colored roots of the Imported Long Grange Carrot, by which it has attained a perfection hitherto mage Carrot, by which it has attained a perfection hitherto mage color, and more sure to produce a crop. Butternakers will find this variety very useful in giving to their butter a rich, deep yellow color. We unhesitatingly pronounce it the best variety artery in a done which will not fall to give satisfaction to the purchaser. I oz., 15 cts.; 4 oz., 50 cts.; 4 ound. 81,50, by mail, nost-pair.

oz., 50 ets.; 1 pound, \$1.50, hy mail, post-paid.

### The Earliest and Best Sweet Corn.

Originated by Capt. J. B. Moork, of Concord, Mass. The earliest, largest, sweetest, and best-flavored variety in entitivation, superior to any other for the market and family use. Ears average 12 to 16, and sometimes 20 rows. It was exhibited by the Mass. Hort'l Society every Saturday, from July 23d to Sept. 23d, in fine condition, and attracted the attention of all. A Silver Medal was awarded to this variety by the Vegetable Committee. Price, 30 cts. per packet. Selected cars, \$1 each. Address B, K. BLISS & SONS, 23 Park-place, New York.

TO POULTRY FANCIERS AND AMATEURS.

—Having purchased from Mr. J. H. Fry (New Brighton, N. Y.) his entire importation of White Cochins (for which I received tak premium at N. Y. State Exhibition in New York in December, 1870), also his choice Birds of Buff and Partidge Cochins, with some extra Durk Brahmas, I am prepared to book orders for Eggs to be furnished during the coming season. Mr. Fry's Establishment having been visited by most of the Foultry Fanciers in the United States, the quality of the stock is too well known to require further comment. The Fowls can be seen in my yord at any time. For Price-List and information, address, with stamp inclosed,

JOHN J. BERRY, Hackensack, N. J.

TION:—THE AMERICAN STANDARD OF EXCEL-LENCE. Now ready. It contains a complete description of every known fowl, as revised by the Fanciers of America, at their conventioo, February, 1871. LA FLECHE, HOUDANS, LIGHT BRAHMAS, Silver-spangled Hamburgs, and Black African Bantams. Eggs for sale from splendlid birds of above breeds, Imported and prize stock. JOHN D. SHELTON, Jamaica, N. Y.

### THE IMPORTED THOROUGH-BRED HORSE WARMINSTER

WAKBILLA STER

Will stand for Mares during this season at the Farm of JOSIAH II. MACY, Town of Kyr, Westchester Co., N. Y. Warminster is a rich, dark brown; stands is 1-2 hands, with long, level, powerful quarters, and is perfectly sound. His pedigree is a peculiarly rich one in the favorite strains of Eclipse, Hered, and Matchem, of which he combines no less than thirty-five strains. He has remarkable trotting action for a thorough-bred horse, and his colts from trotting mares show indications of great speed. Re is a stout, game race-horse, having benten Loiterer, Prince Imperisl, and others, two miles upon the English Turf at Warwick, Eng., carrying 125 lbs, when three years old (see English Turf Register); he was fooled in 1859, and was bred by Mr. Capel, England. Was imported by ft. W. Cameron, Eeq., N. Y. City. Pedigree: Warminster was got by Newminster, dam Black Hess, by Ratcatcher; 2d dam Polydora, by Prince; 3d dam Mato, by Tiresias dam of Cassandra); 4th dam, by Walton; 5th dam, by Diomed; 6th dam, by Blank; 9th dam, Dizzy, by Driver; 10th dam, by Werlin; 13th dam, by Commoner; 14th dam, Duke of Somerset's Coppin Mare.—Terms: For thorough-bred mares, \$100; trotting mares, \$75; to be paid at time of service. If they do not prove with foal, may be returned next season.—Pusturage; For mares from a distance, \$15 per month, at owner's risk.

## The Flowing Spring POULTRY FOUNTAIN.

Patented Oct. 1st, 1867, and Dec. 27th, 1870.

Patented Oct. 1st, 1867, and Dec. 27th, 1870.

No further trouble in keeping a constant supply of PURE CLEAN WATER before your Fowls. A practical application of a scientific principle, saving nineteen-twentieths of the usual labor in watering lowls. Ornamental; very durable; cannot get out of order. Being made of iron, and well gaivanized dinside and out), it cannot rust nor break. Easily kept from freezing in the coldest weather.

The bulk of the water is always in an air-tight chamber, perfectly protected from all dust and dirt, from the action of the air, from all loss or waste, and from becoming impure from any cause whatever, and is automatically fed into the drinking-dish as required. The Poultry cannot soil the water in the dish, nor get their feet in it; and as the dish holds but a small quantity of water, it is renewed many times a day by fresh water from the reservoir.

We gnarantee good ware and perfect satisfaction.

B. VAN GAASBEEK, No. 12 First-st., New York.

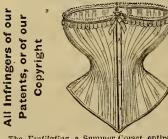

# PELON COLACO LANG.

### Floriculture; Practical

A GUIDE TO THE

Successful Propagation and Cultivation OF

FLORISTS' PLANTS.

PETER HENDERSON,

AUTHOR OF "GARDENING POR PROFIT."

BERGEN CITY, N. J.

Mr. Henderson is known as the largest Commercial Florist in the country. In the present work he gives a full account of his modes of propagation and cultivation. It is adapted to the wants of the amateur, as well as the professional grower.

#### NOTICES BY FLORISTS AND OTHERS.

Certainly the most practical and desirable work that Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone. H. A. Dreer, Seedsman and Florist, Philadelphia, Pa.

Truly "practical," and ongbt to be in the hands of every one engaged in the culture of Flowers.

T. C. MAXWELL & BROS., Geneva, N. Y.

It might be entitled "Floriculture Made Easy." I de not see why any one with ordinary common sense should not succeed, with this book in his hands.

L. C. LISHY, Florist, Nashville, Tenn.

No work ever before published in this country was practically valuable to those in want of direct information (upon this subject). WM. SAUNDERS,

Sup't Dep't of Agriculture, Washington, D. C.

Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.

GALVIN & GERAGHTY, Florists, Newport, R. I.

What is wonderful, the most of our Professional Florists here frankly admit their indebtedness to the work for information and suggestions. I am only an amateur in flowers, but feel gratefully indebted to its author for the pleasure its perusal has given.

George W. Sanders, Baltimore, Md.

Without exception the most practical work on Floriculture in the English language. All the prosy fossils of ——— &c., I consign to the lumber room. I shall order a dozen from the publishers to give to my friends.

JAMES FLEMING, Nurseryman and Florist, Toronto, Canada.

Complete in all its departments, a thoroughly commonsense book, valuable to all interested in Plants and Flowers. GEO. W. CAMPHELL, Nurseryman, Delaware, O.

We have been asked hundreds of times by our castom. ers for a work on flowers; now we get something creditable to recommend. ELLIOTT BROS. & BURGESS, Florists, Pittsburgh, Pa.

Apart from its great working value, the book is delightful reading. MISS ANNA WARNER, "The Island," West Point, N. Y.

Thoroughly practical, yet readable as a novel. New York Sun.

A worthy ontribution to every votary of Flora; style comprehensive, sharp and decisive, just what was to be expected from its well-known anthor.

F. K. PHENIX, Bloomington, Ill.

Full to overflowing with valuable information. FRANCIS RICHARDSON, Toronto, Canada.

### A BOOK FOR HUNTERS.

THE

## HUNTER AND TRAPPER.

### HALSEY THRASHER,

AN EXPERIENCED HUNTER.

#### ILLUSTRATED.

This little book will be read with interest by all who would find instruction and entertainment in the narrative of an old hunter's experience. The following, from the author's Preface, will give an idea of the character and design of the work:

"I am a blacksmith by trade, but when I was a boy I became fond of a gun and a trap, and my first success in my shop was to make a steel trap. It was my aim to become an expert trapper, and I tried my hand at catch-

"Many a dollar have I paid to cunning old men to learn the art, and I have succeeded pretty well, too; but why has not some man of experience written a book explaining the art of successfully trapping the different kinds of fur animals? I propose to tell the boys how to do it.

"I have studied the nntme and hnbits of animals of different species, and a plan that was good to capture the otter, the mink, and the benver, forty years ago, is just as good now as then. The nature of animals doesn't change like the nature of men; we have grown wiser, while they have remained the same. The mode of capturing them when I was a boy, and the way used now, may be put together, and succeed better than either one

"Men are traveling through the country selling recipes at a high price to teach how to dress skins. I propose in this work to teach all these things, so that n man may have them in a neat little volume for reference at any time. I shall also treat upon angling for the trout, the bass, and the pickerel, which I think I understand. I hope to make it all so plain that even the inexperienced will, in some measure, succeed."

### CONTENTS.

THE PRACTICAL

#### POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE

### MANAGEMENT OF POULTRY.

FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrated.

Br L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poulterer who must make the business pay, and the chicken fancier whose taste is for gay plumage, and strange, bright birds. The most valuable portloo is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed his aim. The middle parts of Mr. Wright's Manual are taken np with miunte directions for making show fowls for Fairs, a nice discussion of the good and bad points of the different breeds, and a brief sketch of such fancy stock as peafowl, pheasants, and water-fowl. Then follows a section on artificial hatching, and another, worth special attention, on large poultry yards....A study of Mr. Wright's hook will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutnegs merely, but the family supplies of sugar, shoes, and cloth.

New York Tribune.

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fowls. Farmers' Cabinet.

This is a reprint, with numerons wood engravings, of nn English book, the object of which is to convey in plain language a grent deal of practical information about the breeding and management of poultry, whether for domestic use, the markets, or exhibition...The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry.

Philadelphia Press.

It is a handsome volume, brought ont in the best style, and enriched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business. United Presbyterian.

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is embellished with numerous illustrative engravings.

New York Observer.

The author has called to his aid all who were experienced in the subject whereof he writes, and the consequeoce is a volume of more than ordinary thoroughness and exhaustiveness. Rochester Democrat.

The book is a complete and standard guide to the management of poulty for domestic use, the market, and for exhibition. Watchman and Reflector.

PRICE, POST-PAID, \$2.00.

ORANGE JUDD & CO., 245 Broadway, New York.

### ACENTS WANTED.

### THE BRINKERHOFF CORN-SHELLER. It Shells! It Separates! It Cleans!

It Shells! It Separates! It Cleans!

The U.S. Commissioner of Agriculture says, in his report to Congress: "It is the very best Hind-Sheller that is made in the United States." The American Institute Farmers' Club say: "It is the best Sheller ne have ever met with." The officers of the National Implement Trial say: "Uis the best Corn-Sheller we ever say: "The Itanal New-Yorker, The Western Rural, and all competent judges, concede that it is the very best Corn-Sheller in use.

We have greatly improved the working of the Sheller, by enlarging the gear and otherwise perfecting it so that it can be run with about one-half the power formerly required. Great care is also taken in make them strong and dirable, and it is now fully conceded by all competent judges that it is incomparably better than any other Corn-Sheller ever minde.

First Premlums awarded this Sheller at every State Fair at which it has been exhibited, including Ohio, Illinois, Michigan, Delaware, Louisiana, Georgia, and New York State Fairs', also at a large number of County Fairs in this and other States.

Price, No. 1, \$16; No. 2, heavier and stronger made, \$20.

White Spring Farm, Geneva,

FOR SALE.

This very desirable farm of 300 acres, located within one mile of the Village of Geneva, is offered for sale.

It is situated on a ridge overlooking Sencea Lake and

Geneva, and commands a most extensive view.

The Farm is in a very high state of cultivation, thoroughly underdrained, and the buildings mostly new and in excellent renair.

The Orchards are in full bearing; and the supply of

water is very abundant, and of excellent quality.

The Lawn surrounding the house contains some 40 acres, is in fine order, and ornamented with Natural

Forest-Trees.

As the farm is so well known, a further description is

deemed innecessary.

To any one desiring an elegant country residence, this offers a very favorable opportunity.

One-third of the labor required at the East in the culture farms will insure here double the amount of crops. PRICE OF LAND.—\$2 to \$8 per sere; credit of ten years' me.

#### AMERICAN CATTLE.

Their History, Breeding, and Management. Illustrated. By Lewis F. Allen. Price \$2.50.

This book will be considered indispensable by every breeder of live-stock. The large experience of the author in improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims as a standard authority on the subject. An excellent feature of the volume is its orderly, methodical arrangement, condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over

#### HOW CROPS GROW.

A Treatise on the Chemical Composition, structure, and Life of the Plant. With numerous illustrations and tables of analyses. By Prof. Samuel W. Johnson, of Price \$2.00,

This book is a guide to the knowledge of agricultural plants, their composition, their structure, and modes of development and growth; of the complex organization of plants, and the uses of the parts; the germination of seeds, and the food of plants obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture.

#### HOW CROPS FEED.

A Treatise on the Atmosphere, and the Soll as related to the Nutrition of Agricultural Plants. Illustrated. By Prof. Samuel W. Johnson, of Yale College. Price, \$2.00. The work entitled "How Crops Grow" has been received with very great favor, not only in America, but in Enrope.

It has been republished in England under the joint Editor-ship of Professors Church and Dyer, of the Royal Agricul-tural College, at Circucester, and a translation into German is soon to appear, at the instigation of Professor von Liebig. The author, therefore, puts forth this volume—the com-panion and complement to the former—with the bope that it also will be welcomed by those who appreciate the scientific aspects of Agriculture, and are persuaded that a true Theory is the surest guide to a successful Practice.

### AGRICULTURAL CHEMICAL ANALYSIS.

After E. Wolff, Fresenins, Krocker, and others. Edited by Prof. G. C. Caldwell, of Cornell University. Price \$2,00.

In this work Professor Caldwell has brought together the processes of analysis which apply especially to soils, fertilizers, animals and plants, and their products. He has tested the methods of the hest foreign anthorities, and presented them in a compact hand-book. Such a work has long been needed by all who teach agricultural chemistry, and by analytical chemists generally. Professor Caldwell modestly calls himself the editor, but his book shows that he has not contented himself with editing the works of others, but has contented himself with editing the works of others, but bas given much of his own experience.

### PARSONS ON THE ROSE,

A Treatise on the Propagation, Culture, and History of Rose, Revised and newly electrotyped. Illustrated. Samuel B. Parsons. Price \$1.50. By Samuel B. Parsons.

The Rose is the only flower that can be said to have a history. It is popular now and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curlous legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has been adopted, and the leading varieties under each class enumerated and briefly described. The chapters on multiplication, enlivation, and training, are very full, and the work is altogether the most complete of any before the public.

Either of the above books sent post-paid on receipt of price by

> ORANGE JUDD & CO., 245 Broadway, New York:

Mohr on the Grape Vine......\$1.00

This is a very plain discussion of the atructure of the Vine, and the principles involved in its pruning, training, and cultivation generally. As the propagation of American varieties is different from that pursued in Europe, the translator has given an account of our methods, and added brief notes on the American vario ties. By Prof. Frederick Mohr. Cloth, 12mo, 120 pp.

Sent post-paid on receipt of the price by

ORANGE JUDD & CO., 245 Broadway, New York.

### A BEAUTIFUL GIFT.

A Picture for the Home Circle.

## "DANDELION TIME."

By MRS. LILLY M. SPENCER.

The Publishers of the American Agriculturist have purchased of the artist this heautiful painting, and have issued it as a Chromo, designing thus to enable very many to seenre it as an ornament and source of pleasure in their homes. Mrs. Lilly M. Spencer has already won an honorable name in art. Though of a poetic imagination, and the author of many paintings which comprise classical and allegorical subjects, she is best known for her pictures of domestic life. Her works of this class have been reproduced in colored lithographa and other forms, and through these her name has become a familiar one throughout the country. Finding that pictures of a domestic character with something of the humorous in them were more popular than those to which her natural tastes inclined her, Mrs. S. for some years painted such subjects almost exclusively. Her "Shake Hands," "Jolly Washerwoman," "The Gossips," and others, are known to all lovers of pictures. They are full of life and meaning, and at the same time finished with un accuracy and detail that few artists attempt. Among her latest productions are "War Times at Home," "The Home of the Red, White, and Blne," "The Starry Flag," "Beauty to the Brave," etc. In the heautiful picture now offered, called

### "DANDELION TIME,"

three children, of whom the youngest is a plump, rosy babe, and a huge Newfoundland dog which they have decked with a dandelion wreath, are represented out at play upon the green grass. This Chromo is done in the best style, by Hermann Bencke, whose work equals any thing of the kind done in this country. The scene is full of happy life and cannot fail to delight both old and young.

The picture would prove an ornament in any home, and be a most beautiful and acceptable present to make to a friend. It is 13×18 inches in size, and monnted on linen, will be sent by mail, in a tube, with all materials and directions for stretching.

PRICE, POST-PAID, \$6.00.

If preferred, the picture will be sent by express, mounted on artists' board, all ready for framing, on receipt of the price, \$6.00, the purchaser to pay expresa charges. If ordered in a frame, it will be sent by express, carefully hoxed, on receipt of prices, as follows:

In a neat Black-Walnut Frame, gilt band.....\$ 9.00. 66 66 6.6 " wider gilt hand .. 10.00. " carved edged .. 11.00. " beautiful gilt " best quality..... 15.00.

If taken with a frame at the store, 245 Broadway, the charge for boxing, which is 75 cents, will be deducted from these prices. In all cases where sent by express, the purchaser will pay express charges.

A LIBERAL DISCOUNT MADE TO THE TRADE.

#### GETTING UP CLUBS.

Let each person wishing to join in a club, say bow much Tea or Coffee he wants, and select the kind and price from our Price-List, as published. Write the names, kinds, and amonuts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can di-

vide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Consumers can save 5 to 8 profits by purchasing of
