But the Red River trains are almost as much of a curi-osity as the valley itself. They come from Manitobathe Winnipeg country-and are made up of carts, each drawn by a horse or a pony, or an ox or a cow. would laugh to see one of the carts, with its broad wheels, seven or eight feet high; its wooden axle, so loose in the hub that the wheel wobbles in all directions, and squeaks, squeaks, squeaks at every turn. There are two great bungling, heavy shafts, and a little rack upon them. The concern is made wholly of wood and rawhide. There is not an ounce of iron about them. The bands to the hubs are of rawhide; the tires of the wheels are of hide; the rack is tied together with hide. Shake the concern, and it almost rattles itself to pieces, and with your jackknife you could cut the thougs and let it fall apart in a minute or two. It is the craziest cart you ever saw. The people who drive these carts are half Indian and half French. They like to hunt buffalo, and race over the prairies on their ponies, and they had much rather smoke their pipes and tell stories than to hold the plow or hoe corn, and so they lead a shiftless life.

Every summer a long train of these carts—nearly three thousand of them in all—come from Winnipeg to Minnesota, bringing buffalo robes and fox and wolf skins, and carrying back goods.

You would like, I am sure, to see one of these trains the men and boys on Indian ponies, and the women and black-haired girls riding in the carts, whipping up the oxen; or, when they stop at night, cooking supper in a stew-pan; milking the cows; then all gathering round the camp-fire in the evening, smoking their pipes, telling stories, and huddling together under the cart, or in it, wrapped in their blankets, and sleeping just as soundly and as sweetly as you in your hedrooms.

and as sweetly as you in your bedrooms.

They always have a great number of spare horses and ponies that keep along with the train, nibbling the grass and kicking up their heels.

It is great fun to see them cross a river. They do not care to swim across, although they have no objection to wading in a little ways. At first they attempt to get away, run up the bank, and dart through the bushes, but the men and boys, moure don't he fastest ponies of the herd, head them off and lathem back into the current. The little colts, fearing noting, give a leap and are head and ears under water, but tacy quickly come to the surface, and snort, and put, and blow like a donkey-engine. Fast one, then another, and then the whole herd plunge

in. It is very funny to see a hundred noses and cars, nothing else, pushing across the stream.

But what a shaking of manes when they are all across, and then they caper off and have a jolly run, as if they felt refreshed after their swim, as I have no doubt they do.

If you would see a Red River train you will have to be quick about it, for the iron horse that cats wood and spits fire, that is to run from Lake Superior to Puget Sound, will be thundering through the valley in a few days, and then the Red River trains will be seen no more.

#### Tobacco-A Speech for Boys.

BY "BLUE-MOUNTAIN" (13 years old).

I go against tobacco, because it goes against me. I eschew it. I will not chew it. I will tell you why. st. I do not like the taste of it; it tastes worse than any medicine you can put to my lips, it is such sickening stuff. 2d. I don't like the looks of it; when I see the tobacco I pity the mouth that chews it; and when I see the mouth which chews it I pity the tobacco; it is of a dirty dirt-color. 3d. I don't like the effects of its use; it makes the teeth yellow and brown when they should be white; it makes the breath offensive when it should be sweet; it injures the voice so that those who chew can not sing and speak to advantage. The voice breaks, and the chorister croaks like a raven when he should sing like a boholink; the orator merely barks, and a tobacco bark is very disagreeable. 4th. I fear tobacco creates an appetite for liquor; it lights a fire in the throat which water may not put out.—M. K. B., Jr., Reading, Pa.

#### Aunt Sue's Puzzlc-Box.

We were rather hurried last month, and our announcement concerning the prizes for the solutions of the anagrams, and our notices to correspondents, were "too late." I was delighted to think they would "keep," notwithstanding the warm weather, and you shall have them now.

#### THE ANAGRAM PRIZES

were drawn by O. A. Gage, Pelham, N. H., Blue Bird, Bridgewater, Mass., H. E. P., Stratford, Conn., and Josiah, Box 767, P. O. New York City.

Now I am going to give you a fish story prepared by our friend Tempy. You are to fill all the blanks with the name of some fish that shall make sense of the story. In sending the solution, don't trouble yourselves to write out the whole peem; I should prefer to have you send your answers in this style: 1. Whale. 2. White. 3. Smelt. 4. Shiner. 5. Shark. 6. Bass, and so on (of course I have not given the right answers): and all those who give a correct version of the whole, shall have honorable mention.

Don't forget to direct your answers to Aunt Sue, Box 111, P. O. Brooklyn, N. Y., and not to the office of the Angenitarist

415. Illustrated Rebus.—Well, Annt Sue is a queer woman. Here she has left some rebuses, and has gone off into the country, without saying what shall be put un-

der them. We can't stop to guess them out, but we have not the slightest doubt that they are very good, and we are sure that they look sufficiently puzzling.—ED.

#### A FISH STORY.

BY SALMON C. PIKE, JR.

Once on a time, down East, in days of yore,
An old 1— dwelt (the 2— was cape 3— shore),
An 4— she, who erst sold heer for bread,

416. Illustrated Rebus.—See remarks under the rebus above, and guess away at it. When you have found the answer, don't send it to this office, but to Aunt Sue. Her Post-office direction is given in another column.

And happy lived till 5- enough to wed, She might have had a good old 6-Alas! alas! she chose that scamp — 7.

Ah! me, they lived a 8— and 9— lil

Till death in pity freed the poor 10—. - like life. \_\_\_\_\_ wooed her next, oft hight \_\_\_\_\_12\_\_ A 13 \_\_\_ man he, and sailor off and on, Who, though a reg'lar 14 --- reared and bred, Who, though a reg'lar '1— reared and bred, Rudder and '5— scorned, as soon as wed.
"I'm waxing old," he said, "infirm an '1—,
I find the seas too '17—, the wind the seas too '17— himself on '2—.

In sooth, he'd rather '12— himself on '2—.

Or '21— with '22— from off some '23— hook,
Or '24— along the '26— or tuven stay,
And '26— his '27— and '28— the livelong day,
Till '22—light '30— 'ring, or the '31— 's pale '22—
Then '33— at last from oft replenished '24—,
The '35— feels his hopeward way at day, The 35 - feels his homeward way at dawn, The <sup>35</sup>— tees his noneward way at dawn, To <sup>36</sup>— there like <sup>37</sup>— in his stye, Or like an o'erfed <sup>38</sup>— till noou to lie. No wonder <sup>39</sup> "—" dubbed by viliage boys, Who said old ——<sup>40</sup>— hailed from Illinois. And here like 49— snorting lies this sot.

Sdeath 1 — 50— — and bark ye — 51— Her voice was 52 \_\_\_\_, and when she chose to 53\_\_\_\_ Each word a 54-, tongue as 55- sharp; No 56 from 57 drawn inspired such dread
As this she 58 (To himself he said)

"By 59 1 she makes each tortured car 60 feel As if 'twere stung by au -Sweet wife," he plead (for brewing storm be 62-And the vexed 63— vainly haped to melt)
"My 64—1 dearest woman on the 65—" (Here from his bed he leaped into his robe), 'I'm off, for lo l last night I had a dream. Methought I canght, ah I such a 66— of 67—, Bought by the 68— Sam apon the hill, Did your lean purse with solid 69 -- fill, Bought Bob some 70 --- and you a 71 --- shawl. Me a ——<sup>72</sup>—, and Pet a doll."

Jack went and with him his fish <sup>73</sup>—— took, With clams for 74—, boh, sinker, line, and hook;

#### [COPYRIGHT SECUREO.]

#### MAKING MUD PIES .- Drawn and Engraved for the American Agriculturist.

Went, but he ne'er returned. Alas! sad fate,
It grieves my very 75— to have to state
Next moraing 76— and 77— both were found,
But not — 78—, although they dragged the 79—
To fish-her-man in vain the neighbors tried.
So Moll a relict lived, a widow died.
In truth, 'tis said, her grief was so profound
That she herself and grief in — 80— drowned.

TEMPY.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

E. L. CLARK. I "would rather have" short, pithy puzzles; charades, double acrostics, almost any thing but numerical enigmas and cross-words.

STAR AND CRESCENT. You have asked a good many questions, but I will try to answer them concisely. 1. For convenience of Publishers. 2. Yes. 3. About a thousand. JERE PLUMEN answers No. 12 of the Jane puzzles with "S-hot (shot), or S-warm (swarm)," which is not had.

"S-hot (shot), or S-warm (swarm)," which is not had.

MARY SOULE. The "diamond cross-puzzle" speaks
for itself in the "answers," this mooth.

L. S. C. Many thanks for your puzzles. Your "Proverb Pi" is particularly good. I know how much patience its construction costs.

BLUE BIRD. Of course I missed you. "Childish"?-not at all-very wise.

 $\ensuremath{\mathrm{J}},\ensuremath{\mathrm{B}},\ensuremath{\mathrm{E}},\ensuremath{\mathrm{I}}$  was only waiting to hear from you once more.

Will those sending enigmatical contributions please specify whether they are for the Agriculturist or for Hearth and Home?

Thanks for puzzles, etc., to Elcanor, Suicker, Ben, J. B. H., and W. H. K.

Healthy boys love the dirt. That fine fellow whose hat-brim is a little torn, perhaps from climbing trees, sits dawn on the lap of "mother earth" as though he were not a bit afraid. He is stirring that dough with a hearty good will. We like a boy that can play with girls. Both of these boys are gentlemen. One of them mixes dough while the other one is patting up the stove-pipe. The girl with the cup is making herself generally useful. She does not insist on mixing or baking, but she is a good-natured soul, ready to wait on the rest. The one with the pie already made on that bit of china is the "chief cook." But do you know which one we love best? The one we have not mentioned yet. That little young-old girl-woman in the sam-bonnet. How gingerly she holds that pan, making believe it is hot! Take care! Don't burn your fingers, my dear! We are really afraid that pan is so hot that yon will hurn your dress! And how about your pies? Nearly done, ch? Give them one more turn in the oven. They want a little more browning at the bottom! Ah! little woman, how red the little checks must be under that great big sun-bonnet. How we should like to kiss them! If we dared! For with so much dignity and care, perhaps she would be offended. She is playing old lady so carnestly that she may have forgetten that she is only a sweet little girl lost in mamms? (sun-bonnet, and that her pies are only mud!)

Ressed days of bare feet and broken china 1. We who are big and busy, envy you who mix your mud pies under the hollyhocks. Soon you will quit playing and go to work in earnest. God bless you, and may your pies never burn. Play on, and when play-time is over and working-time comes, try to keep your hearts as cheerful as they are now, making und pies under the hollyhocks.

HARVEY FISK

A. S. HATCH.

OFFICE OF FISK & HATCH,

#### Bankers and Dealers in Government Securities.

NO. 5 NASSAU STREET,

New York, August 15th, 1871.

The successful negotiation of the new Government five per cent loan, and the calling in of \$50,000,000 of Five-Twenties, to be paid in gold, show that hereafter from 5 to 4 per cent will be the highest rate of interest paid on the bonds of the United States. • Hence, investors who desire a larger income with equal security, are withdrawing a part of their funds from Government bonds, and are seeking to place their money where it will be equally safe and more remunerative. Railroad bonds of the highest class are believed to offer the greatest advantages; and among the best of these are the First Montgage Goln BONDS OF THE CHESAPEAKE AND OHIO RAILROAD, which promises to be one of the most remunerative, popular, and useful of the great through routes connecting the Mississippi Valley with the sea-board. The Company has no floating debt, and is under the management of men of well-known experience, character, ability, and wealth. It has already in operation 227 miles of road, well constructed and doing a good business. In forty days, 95 miles more will be opened, making 322 miles completed; and as about 5,000 men are constantly at work upon it, the remaining 105 miles, which will complete the whole, are expected to be opened next summer. The road has low grades and light curves, which seems an economy of transportation expenses. It is considerably shorter than the great competing lines, passes through a rich agri-cultural and mineral district, the deposits of iron and coal being inexhaustible. The bonds are an absolute thirty years' security, and if obtained in exchange for Five-twenties, the investor adds nearly 20 per cent to his capital, besides retaining 6 per cent gold interest.

Price, 92 and accrued interest from May 1st. The Bonds are in denominations of \$1,000, \$500, and \$100.

#### FISK & HATCH.

Avoid Lead Water Poison by Using the Tin-Lined Lead Pipe. It is the best and cheapest water-pipe, where strength and durability are considered. Price, 15 cents a pound for all sizes. Address U. S. PIANO CO., 645 Broadway, N. Y.

### 10 Reasons Why

### THE IMPROVED UNIVERSAL Is the BEST WRINGER.

- Ist REASON.—It has Rowell's Patent Double Coos on one end only of the shut. These cors have longer teeth, can play apart farther without disconnecting, can never crowd together so as to blad, never work sidewise out of place; wear more evenly and turn easier than any cog-wheel ever invented
- 2d REASON.—It has the Patent Stop, which keeps the Cogs from disconnecting and losing their power, yet allows the rolls to play apart far enough to wring the largest article easily.
- 3d REASON,—It has the Malicable Iron Folding Clamp, which can not be broken, and fastens securely aid easily to tube of any curve, and fits washing machines or stationary tube of fully two inches in thickness, which no curved or ordinary clamp can do, and it folds under out of the way when not in use and for convenience in packing.
- 4th REASON.—It has the Folding Apron or Guide, to conduct the clothes safely over the side of the tub, free from contact with the clamp or screws.
- 5th REASON.—It has the peculiar advantage of Two Pressure Screws, so arranged with patent wooden springs, that each screw presses on both ends of the roll alike, the same as if it was in the center, while the two together give double the capacity for pressure.
- 6th REASON.—The Elastic Rubber between the strong wooden springs relieves their rigidity, makes the machiae turn easier, saves the rolls from strain, and causes the pressure to bear on both ends of the roll alike.
- 7th REASON.—All its Iron parts are wrought or MALLEARLE, not liable to break, and carefully galvanized, to prevent rust.
- 8th REASON.—The Handle or Crank is not screwed on like other wringers, but BOLTED or RIVETED, and will turn clothes backward or forward, or from one tub to another, without coming loose.
- 9th REASON.—Its folding lower slat fits down to any stationary tub or washing machine, and prevents water slopping over, as it will with ordinary wriogers.
- 10th REASON.—It is very light and portable, yet built so substantially that the strongest person can not break it in wringing the largest garments.

With all these Advantages, its price is no greater than that of any inferior wringer with eogs Sold by the House Furnishing and Hardware Trade generally, and by

Metropolitan Washing Machine Company,

R. C. BROWNING, Pres't, 32 Cortlandt St., New York

Ives' Seedling and Concord, two and three-year-old selected vines, at \$35 per 1,000. Address H. B. BEAR, Harrison, O.

### RASPBERRIES.

The New Seedlings

"Herstine" and "Saunders."

Grown from the seed of the "ALLEN," planted in alternate rows with the Philadelphia, and doubtiess a cross between those two perfectly hardy mative varieties; having the color and flavor of the "Allen," the productiveness of the "Philadelphia," with much larger size and more firmness, and the hardiness of both—the Herstine having stood uniquired, without any protection, five winters, and the Saunders four—they are now confidently offered to the public as combining more desirable and valuable qualities than any other rarticles yet known. A limited number of plants will be for sale this fall at \$1 each, \$10 per doz., or \$75 per 100. Send stamp for circular giving cuts and a full description, also the ophilons of others with regard to them. Address.

## NISHWITZ Pulverizing HARROW,

With spring seat?

With spring seat?

It is indorsed by the American Institute Farmers' Club, Amherstson, and thousands of farmers who are using them. The best implement known for preparing land for wheat, and covering it. Often saves plowing. Circulars free, PEEKSKILL PLOW WORKS, 91 Beekman St., New York, or 61 Merwin St., Cleveland, Ohio.

### THE L. GREEN PLOW.

Superior to all others in these respects .

Superior to ail others in these respects.

It has a quick entry, adheres well to the ground, and rins perfectly flat and level, even in rough and stony land. It turns the furrow with unparalleled neatness, even up any ordinary sidehill. It pilverizes the soil in such a manner and to such an extent that it stands the drouth better. It works well in all kinds of soil. The share will wear longer and remain sharper than any other. It requires less power than any other. This saving of power is the most characteristic feature of these plows, and is due to the peculiar lines of the landside, moldboard, and share, by which the greatest possible avoidance of friction is effected. These, we are well aware, are large claims, but we believe them within the truth, and invite the most thorough examination. Send for a Circular. AGENTS WANTED.

Address POUGHKEEPSIE (N. Y.) PLOW COMPANY.

# Cane Machinery.

The best and cheapest First-Class Sugar machinery in market, for either Sugar Cane or Sorghum maunfacture. Evaporators perfected in 1871. A Valuable Home Library.

## **BACK VOLUMES**

# American Agriculturist,

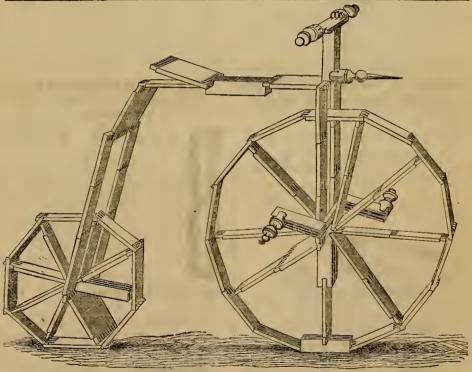

AND OF

## Hearth and Home.

The publishers of the American Agriculturist can supply any of the back volumes of that paper from the Sixteenth to the Twenty-ninth. These volumes contain more varied and interesting information on all matters pertaining to the Farm, Garden, and Household, than can be obtained in books costing three times as much money. Price of each bound volume, at the Office. \$2.00; sent post-paid, \$2.50.

The publishers can also supply the back volumes of their finely illustrated Weekly Journal, Hearth and Home, for the years 1869 and 1870. These volumes are Home, for the years 1869 and 1870. These volumes are neatly and uniformly bound in cloth, with title in gilt on back and side. With their beautiful engravings, and abundance of useful and entertaining reading, they will prove valuable additions to any library. Price of each bound volume, at the Office, \$1.00; if sent by express, the purchaser will pay express charges

Address N. H. BALDWIN, Laconia, N. H.

Best machine ever offered for paring, coring, quartering, or slicing apples. Does the eatire work expeditiously, promptly, and well—separating core and parings from the the fruit at once. Will prepare more fruit for drying, pies, or lamily use, than six of ordinary parers. For farmers it is indispensable. Fruit can be taken care of in season, instead of allowing it to rot in the orchard. Three times the price of Parer can be saved on every crop. A barrel of apples can be got ready for pies in one hour, saving in labor alone, in a study year, many times the cost of the Tarer. Territory for sale, Agents wanted. Seud for a circular.

TIPPECANOE APPLE-PARING MACHINE CO.,

49 Cortlandt St., N. Y.

THIS MACHINE is guaranteed (in its present completeness) to meet every want of the HOUSEHOLD, for either DOMESTIC or FANCY WORK-knitting every thing, and starting the work with selvedge edge.

## FIRST MORTGAGE SINKING FUND

### LAND GRANT BONDS

OF THE

# St. Joseph and Denver City Railroad Company, WESTERN DIVISION.

The St. Joseph and Denver Cliy Railroad Company, having successfully built and equipped the Eastern Division of its road, extending from the City of St. Joseph, Mo., to the City of Marysville, Kansas, a distance of 112 miles, is now actively engaged in the construction of the Western Division of this line of railway, extending from Marysville, Kansas, to a junction with the Union Pacific Railroad at Fort Kearney Station, a distance, including side tracks, of 170 miles.

For the purpose of building and equipping this road, the Company have executed and delivered to the Farmers' Loan and Trust Company, in trust, \$5,500,000 of First Mortgage Sinking Fund Land Grant Railroad Bonds, in denominations of \$1,000, \$500, and \$100, to be countersigned and issued only in conformity with the Mortgage Deed, which is:

First—For cash.

Second—A limited amount for iron and material. The cash is placed to the credit of the Company in trust, and can be drawn out only in payment for fully completed road, in sections of ten (10) miles each, at the rate of \$16,000 or \$22,000 per mile, respectively, until the entire completion of the road, when the balance of the loan will be paid over to the Treasurer of the Company for equipment purposes.

The iron, the equal of gold, and materials are brought under the subjection of the mortgage, made to secure the pay-

The iron, the equal of gold, and materials are brought under the subjection of the mortgage, made to seeme the payment of the bonds.

To secure the payment of the interest and principal of these bonds, the Company have made a first and only mortgage To secure the payment of the interest and principal of these bonds, the Company have made a first and only mortgage on their Western Division Road, completed and to be completed, from Marysville to Rearney Station, at a junction with the Union Pacific Road, a distance of 160 miles, with 10 miles side tracks, making a total distance of 170 miles, including rolling stock, motive power, depots, machine-shops, telegraphs, equipments of every description, rights of way, franchises, cash on deposit in any bank or trust company, and lands lying twenty miles on either side of the railroad, granted to the Company by the United States Government, amounting to 1,500,000 acres, and real and personal property of every description which the Company now own, or may hereafter possess, lying between Marysville and Kearney, and equipments appertaining to this Division of the Company's Road.

This entire property is mortgaged to the Farmers' Loan and Trust Company of the City of New York, as trustees. The mortgage is dated May 14, 1870, and under it, and as their security, these bonds are issued.

The bonds are now ready for sale and delivery through the undersigned. Holders and parties desiring to purchase will recognize that they can do so with perfect safety, as their value is always represented, either by lands equal in value, and a completed and equipped road—iron or cash in trust company. The mortgage expressly covers cash on deposit in bank or trust company.

st company.

The undersigned are authorized to announce the decision of the Company to sell their lands on the line of the road.

Under the mortgage deed given to secure these bonds, no land can be sold at a less price than \$4 per acre.

The lands being mortgaged to secure the payment of these bonds, this lien on any portion of the land can only be reved by paying to the trustees, as mortgagees, the full amount of the purchase money of any land sales.

The fund is applied as follows:

First-To the payment of the interest on the bonds during the construction of the road, and, if necessary, the space of

four (4) years

Second—To the payment of the principal of the bonds.

The payment of the principal before maturity is not compulsory to the holder of the bonds, but should holders desire to sell, the trustees are authorized to purchase, but not over a premium of fifteen per cent.

Every bond purchased under this authority is immediately canceled.

If the bonds can not be bought at one hundred and fifteen, the trustees are authorized to invest the proceeds of land sales in the bonds of the United States, States of New York, Massachusetts, and Illinois, and hold the same as a sinking fund for the redemption of these bonds at maturity.

The following beating convertions of the City of New York are designated deposituries of this lean.

The following banking corporations of the City of New York are designated deposituries of this loan: Farmers' Loan and Trust Company.
United States Trust Company.

Union Trust Company. Manhattan Company.

Manhattan Company.

The bonds have thirty years to run from May 11, 1870, payable in gold, in the City of New York.

They bear interest at the rate of eight (8) per cent per annum, payable in GOLD, free of tax, semi-annually, on the 15th days of February and August, in New York, London, or Frankfort O. M., at the option of the holder, without notice, and in the currency of the country in which the coupon is presented.

The equivalent of currency is at a uniform rate of exchange, and is expressed in the coupon.

They are coupon bonds, but may be registered in the owner's name with the coupons on, or they can be converted into a registered bond by the surrender of the coupons and the interest paid to the registered owner at any of the three points where the coupons are payable.

This consolidated mortgage is at the rate of \$15,000 per mile of road, and \$2 per acre of land.

The bonds are offered for the present at 97% and accrued interest, in currency, with the reserved right to advance the price without notice.

All kinds of marketable scentities will be received at the current market value, without commission, in payment of

All kinds of marketable scenrities will be received at the current market value, without commission, in payment of

this loan.

\*\*Molders of 5-20's, and especially those who do not desire to be paid off by the Treasury Department, can now exchange their Governments for these bonds at a good and substantial profit.

Expressage relating to the loan will be free.

Maps, pamphlets, and documents furnished on application.

It is believed no loan can be offered which rests on a more solid foundation than this loan of the St. Joseph and Denver City Railroad Company.

The most careful and critical examination of the Company's lands by experienced parties, and the estimates of prejudiced persons, have placed their value at not less than \$5 per acre, while others estimate them at a higher figure. The offers which the Company have received for them fully justify the assertion that the proceeds of their sale will pay off this loan, and leave the road free of bonded debt. These bonds are receivable at par and accrued interest, in payment of any lands solid under this mortrage.

loan, and leave the road free of bonded debt. These bonds are receivable at par and accrued Interest, in payment of any lands sold under this mortgage.

The Company, recognizing the principle that an element of strength in all loaus is the provision made for their redemption, in making their mortgage a consolidated one, covering both road and lands, have wisely made provision for the payment of this loan by the sale of their landed estate, which is not needed in operating the road, but which was granted to the Company by the United States Government for the express purpose of adding them to construct and operate this road.

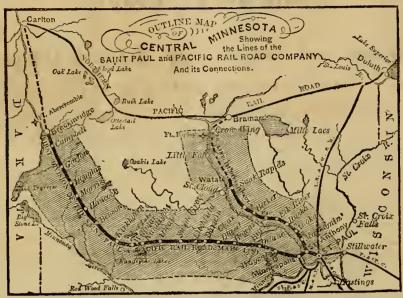

The St. Joseph and Denver City Railroad connects at St. Joseph with railways running direct to St. Louis, Hannibal, and Toledo on the east, and connecting as it will with the Union Pacific Road on the west, is a very important link in the continental chain of railways. It also has through railway connection with Chicago. A very large part of the line is graded, and track-laying being now far advanced, will continue rapidly until the junction with the Union Pacific Road is made.

We have been at great expense in the examination of this property and the bonds and mortgage, and are satisfied the investments in this loan will not only be safe, but profitable. We base our calculations on the fact that the First Mortgage Bonds of this Company, on the Eastern Division, lately successfully placed by our firm at 97%, have advanced to 102 and accrued interest, making them rule at 196, or nearly ten per cent advance.

Under all circumstances, we unhesitatingly recommend them.

### PARSONS ON THE ROSE.

A Treatise on the Propagation, Culture, and History of the Rose, Revised and newly electrotyped, Illustrated.
By Samuel B. Parsons. Price \$1.50. By Samuel B. Parsons.

The Rose is the only flower that can be said to have a history. It is popular now and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curions legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has been adopted, and the leading varieties under each class enumerated and briefly described. The chapters on moltiplication, cultivation, and training, are very Inil, and the work is altogether the most complete of any before the public.

### HOW CROPS FEED.

A Treatise on the Atmosphere, and the Soil as related to the Natrition of Agricultural Plants. Illustrated. By Prof. Samuel W. Johnson, of Yale College. Price, \$2.00.

The work entitled "How Crops Grow" has been received with very great favor, not only in America, but in Europe, It has been republished in England under the joint Editorship of Professors Church and Dyer, of the Boyal Agricultural College, at Circnecster, and a translation into German is soon to appear, at the instigation of Professor von Liebig, The author, therefore, puts forth this volume—the companion and complement to the former—with the hope that it slow will be welcomed by those who appreciate the scientific also will be welcomed by those who appreciate the scientific aspects of Agriculture, and are persuaded that a true Theory is the surest guide to a successful Practice.

### HOW CROPS GROW.

A Treatise on the Chemical Composition, structure, and Life, of the Plant. With numerous illustrations and tables of analyses. By Prof. Samuel W. Johnson, of Yalc College, Price \$2.00

This book is a guide to the knowledge of agricultural plants, their composition, their structore, and modes of development and growth; of the complex organization of plants, and the uses of the parts; the germination of seeds, and the food of plants obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture.

Either of the above books sent post-paid on receipt of

ORANGE JUDD & CO., 245 Broadway, New York.

A GENTS WANTED for the

TRANSMISSION OF LIFE.

By Dr. NAPHEYS, anthor of "The Physical Life of Woman."

It relates to the male sex; is highly endorsed by Bishops Scott, Morris, Clark, eminent Physicians, etc. Sold by subscription only. Prire \$2.00. Address for Contents and Testimonials,

J. G. FERGUS & Co., Philadelphia, Pa.

### FARM IMPLEMENTS AND MACHINERY.

The principles of their construction and use; with simple and practical explanations of the laws of motion and force as applied on the farm. By John J. Thomas. With 287 illustrations. Price \$1.50.

The basis of this admirable work was an essay published in 1830, in the Trunsactions of the N. Y. State Agricultural Society, which was colarged, and in 1834 published by the Harpers. It has been, and remains, the only work in which Harpers. It has been, and remains, the only work in which the principles of Natural Philosophy, camely, the mechanical powers, and the powers of water, wind, and heat, are systematically discussed as applied to the operations of the farm. This work has now been most carefully revised by the author. It is much colarged, and a great part has been re-written, while the illustrations, before abundant, now approprint physical and significance. number two hundred and eighty-seven. There is not no agri-cultural writer that could be named more respected than John J. Thomas, or one whose judgment and freedom from personal hias in discussing new implements could be more implicitly relied upon.

### NEW AMERICAN FARM BOOK.

Originally by Richard L. Allen. Revised and greatly enlarged by Lewis F. Allen. Price \$2.50, Allen's American Farm Book has been one of the standard

And a And-books for twenty years; it is still a valuable book, but not up to the times; and as its author, Mr.R.L.Allen, could not give time to its revision, this was no dertaken by his brother, Hon. Lewis F. Allen, the distinguished farmer of Eric county, editor of the American Shorthorn Herd-Book. The work is greatly enlarged, and full of suggestions from the rich experience of its editor and reviser, and is called the New American Farm Book.

### PRACTICAL FLORICULTURE.

PRACTICAL FLORICULTURE.

A guide to the successful propagation and enlivation of Florists' Plants. By Peter Henderson, anthor of "Gardening for Profit." Beautifully illustrated. Price \$1.50. Certainly the most practical and desirable work that has ever been published on this subject. We are selling them rapidly. Some no doubt will say that it exposes the "secrets" of the Trade too freely, and that it will make Gardeners and Propagators so plenty that our occupation, like Othello's, will be gone.—H. A. Deeer, Seedsman, Phila., Pa. Full-to overflowing with valuable information.

Francis Pichardsoon, Toronto, Canada.
Thoroughly practical, yet readable as a novel.—N. Y. Snn. Just the work for the young Florist or Amateur, as it tells him clearly there is no such thing as failure, if its simple teachings are followed.

teachings are followed.

# HARRIS ON THE PIG.

Breeding, Rearing, Management,

Improvement.

With Numerous Illustrations.

By JOSEPH HARRIS.

OF MORETON FARM, ROCHESTER, N. Y.

NOTICES BY THE PRESS.

To say that this work on the pig la by Jeseph Harris, to say that this work on the pig 1s by Joseph Harris, that genial philosopher-farmer of Rochester, N. Y., who writes the "Walks and Talks upon the Farm" in the Agriculturist, is to insure for his book at once a large circle of delighted readers. He is just the man to lay down the gospel for the raising of piga or any other domestic animal. If all breeders and farmers would follow the large the provided when the provided we have a provided to the pigalogy of the provided when the provided we have the provided the provided when the provided we have the provided when the pigalogy and the provided we have the pigalogy and the pigalogy are pigalogy and the pigalogy Mr. Harris's directions, pork would be a very different article of food from what it is now, and could be eaten without any fears of the trichina.

[Springfield Republican,

The author discusses the pig-for he takes exception to the word hog as applied to the domesticated animalwith a view of showing how the most pork and lard can be produced from the smallest amount of feed. He gives elaborate descriptions of the different breeds of swine, showing the peculiarities of each, and the relative advantages to the producer.—[Prairie Farmer (Chicago).

The pig is doubtless one of the most valuable animals that a farmer can raise, and it is the landable purpose of Mr. Harris to tell farmers how to treat their pigs so as to get the most profit from them, and what kind of piga are best.—[Daily Evening Traveller (Boston).

It treats of breeding, rearing, managing, and improving swine; and what Mr. Harris don't know on these topics, is hardly worth knowing at all. The book is fully illustrated, and is very valuable to all who are interested in this branch of stock-raising.

[Lowell (Mass.) Daily Courier.

The author is a practical farmer, and has gathered the results of many experiments besides his own. The book is amply illustrated.

[Republican Statesman (Concord, N. II.).

Almost everything a farmer wants to know about the breeding, keeping, and fattening of pigs, is here put down in plain, common sense, and is mainly the result of the writer's own management .- [Maine Farmer.

This is an interesting, valuable, and a much-needed Treatise on an important department of rural economy. It contains about 56 illustrations of pigs, piggeries, troughs, etc. We are hearthly glad our old friend Harris was persuaded to prepare this useful Manual on the Pig breeds, breeding, feeding, etc., comprising what farmers need know respecting this department of husbandry. [Boston Cultivator.

This little book is profusely illustrated, and contains information in abundance, which every farmer ought to possess.—[Weekly Mail (St. Lonis).

Here is a book written by a practical farmer, who has brought to the aid of his own large experience and observation the most extensive acquaintance with the science of breeding, and, as might reasonably be expected, we have from his pen the best book on the Pig ever written .- [Western Stock Journal.

> Price, Post-paid, \$1.50. ORANGE JUDD & CO., 245 Broadway, New York.

## AMERICAN CATTLE:

THETE

HISTORY, BREEDING,

AND

### MANAGEMENT.

By Lewis F. Allen,

Late President New York State Agricultural Society, editor "American Shorthorn Herd Book," author "Rural Architecture," etc., etc.

NOTICES BY THE PRESS.

We consider this the most valuable work that has recently been issued from the American press. It embraces all branches of the important subject, and fills a vacancy in our agricultural literature for which work the author by his many years' experience and observation was eminently fitted ..... It ought to be in the hands of every owner of cattle; and the country, as well as individuals, would soou be much richer for its teachings.

Journal of Agriculture (St. Louis).

The large experience of the author io improving the character of American herds adds to the weight of his observations, and has enabled him to produce a work which will at once make good its claims, as a standard authority on the subject. An excellent feature of this volume is its orderly, methodical arrangement; condensing a great variety of information into a comparatively small compass, and enabling the reader to find the point on which he is seeking light, without wasting his time in turning over the leaves.

This will rank among the standard works of the coun-

We think it is the most complete work upon neatstock that we have seen; embodying as it does a vast amount of research and careful study and observation.

Wisconsin Furmer.

His history of cattle in general and of the individual breeds in particular, which occupies the first 180 pages of the volume, is written with much of the grace and charm of an Allison or a Macauley. His description of the leading breeds is illustrated by ents of a bull, a cow, and a fat ox, of each race. The next one hundred pages are devoted to the subject of Breeding. This is followed by chapters on Beef Cattle, Working Oxeo, Milch Cows, Cattle Food, Diseases, etc. The arrangement, illustrations, analytical index, etc., of the work are in the best style of modern book-making.

New England Farmer.

The work is one that has long been needed, as it takes the place of the foreign books of like nature to which our farmers have been obliged to refer, and furnishes in compact and well-arranged volume all they desire upon this important subject. Maine Farmer.

Whatever works the stock farmer may already have, he cannot afford to do without this.

It is one of the best treatises within our knowledge, and contains information sound and sensible, on every page.

The People, (Concord, N. H.)

The object of the work, as stated by the author in his preface, "is not only to give a historical account of the Bovine race, to suggest to our farmers and cattle breeders the best methods of their production and management, but to exalt and ennoble its pursuit to the dignity to which it is entitled, in the various departments of American agriculture." From the little examination we have been able to give it, we can not recommend it too highly.

Canada Farmer.

Considering that there are some ten millions milch cows in the United States, and nearly a thousand millions of dollars invested in enttle, the magnitude of this interest demands that the best skilled talent be devoted to the improvement of the various breeds, and the investigation of the best method of so caring for the animals, as to gain the greatest profit from them. This volume will give the farmer just the instruction which he wants.

## GARDENING FOR THE SOUTH:

OR, HOW TO GROW

### VEGETABLES AND FRUITS.

BY THE LATE

WILLIAM N. WHITE,

OF ATHENS, GA.

WITH ADDITIONS BY MR. J. VAN BUREN, AND DR. JAS. CAMAK.

REVISED AND NEWLY STEREOTYPED.

ILLUSTRATED.

Though entitled "Gardening for the South," the work is one the utility of which is not restricted to the South. It is an admirable treatise on gardening in general, and will rank among the most useful horticultural works of the present day. Horticultural operations are clearly explained, and more in detail than is usual in works of this kind. To those living in the warmer portions of the Union, the work will be especially valuable, as it gives the varieties of vegetables and fruits adapted to the climate and the modes of culture which it is necessary to

# Saponaceous Compounds

Carbolic and Cresylic Acids. Disinfectant, Insect Destroyer, Preventive of Fungus, etc.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable benefit to the community. By tests made under our own supervision, and the reports of careful observers, we believe it to be established that these Cresylic Compounds are

Complete Disinfectants .- They not only renove all noxious odors from sinks, privies, stables, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Fever, Cholera, and other discases, may be effectually prevented. They are used in the New York and other Hospitals for these purposes.

2d. Insect Destroyers.—An animal washed with Carbolic Soap will be entirely freed from all vermin. It will destroy ticks on sheep, fleas on dogs, lice on eattle or poultry, roaches, ants, bed-bugs, etc., in rooms. It repels flies from animals, and thus is especially useful in case of wounds or sores from any cause.

3d. Preventive of Fungus Growth.—On this point we ask for further experiment. We feel confident this soap, properly applied, will prevent smnt in wheat, mildew on vines, and similar parasitic growth, and trust that experimenters will furnish the result of their trials,

11h. Cleaning Sores, etc.—For washing pleers and other foul sores, and preventing gangrene in wounds, etc., Carboile Soap is, we believe, unequaled. We know also that it has been successful wherever used, for footrot in sheep, and mange, itch, ring-worm, and other skin diseases

Desiring that our readers should be benefited by the extended introduction of what we believe to be so valuable, we have established a general agency for the sale of these compounds, keeping them constantly on hand, and are prepared to fill orders at wholesale or retail, at the following

Sheep Dip, for Curing Scab and Destroying Insects

| eep. |     |            |      |      |        |
|------|-----|------------|------|------|--------|
| .2   | Th  | Canisters. | <br> | <br> | \$1.25 |
| 10   | 42  | 64         |      | <br> | 9.95   |
| 50   | 9.6 | Kegs       |      | <br> | 10.00  |
| 200  | 44  | 226.50     |      | <br> |        |

Proportions are 1 to Dip to 5 gallons water for 5 to 10 Sheep, If they are very large and heavily fleeced. For ordinary sized unimals, or those recently shorn, 1 to Dip will take 8 to 10 gallous water. The solution must be graded according to the age and condition of the unimal.

Cresylic Olutment, for Cure of Footrot, etc. In solution for killing Insects, etc., on stock. In 1 to Canisters, at 50 cts.; in 3 to Canisters, \$1; in 5 to Canisters, \$1.25.

Carbolte Disinfecting Soap.—In tablets for convenient use in washing Horses, Dogs, Pigs, etc., destroying Insects of all kinds, protecting from Flies, curative of Sores, Scratches, and Chafes of all kinds. In lowes, 3 doz. tablets, \$3.60; in boxes of 1 to bars, 10 cach, \$4.00.

. Carbolic Plant Protector.—To be used as a wash for Plants, Trees, etc.; to destroy and prevent the harboring of Insects. In 1 b. Canisters, at 50 cts.; in 5 b. Canisters, at \$1.25; in 10 lb. Canisters, at \$2.25.

Granulated Carbolic Disinfecting Powder.—
It removes aoxious odors from Stables, Poultry-houses, Cellars, Sewers, Water-closets, etc., and prevents, in a great degree, infection from contagious diseases. It is specially well adapted for household use, to purify the air and preserve health. In 1 D. boxes, 25 cts.; In 5 D. boxes, \$1; in 10 D. boxes, \$1,50.

Carbolic Laundry Soap, for the Laundry, etc.; 60 m boxes, 14 cts. per m. 24 m boxes, and in 10 paper boxes con-taining 6 ms. each, packed in a case, 15 cts. per m.

Carbolic Tollet Soap, perfumed, two sizes, 82 and \$t per dozen, in boxes of 3 dozen each.

Carbolic Bath Soap, \$1.50 per dozen. In boxes of 3

## Take Notice.

## 2 Months' Subscription for \$0.00.

Every New Subscriber to the American Agriculturist for 1872, whose subscription comes to hand during October, will be presented with the paper the rest of this year without charge, if the name be marked new when sent in.... Take Notice, that this offer extends to All New Subscribers, whether coming singly, or in Premium Clubs, or otherwise. (This will help those who now begin to make up lists for Premiums, for they can offer to each new subscriber a bonus of two months, free, and still count these names in Premium Lists.)

N.B.—The German Edition is issued on the same terms as the English one, with the same privileges, and may form the whole or any part of any Club or Premium List.

### Calendar for October.

| Day of Month.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Boston, NEngland, N. ### AMERICAN AGRICULTURIST.

NEW YORK, OCTOBER, 1871.

On our own farm, we have always found October and November the two busiest months of the year. We have often had cause to regret doing work the early part of October that might have been postponed. We have dng out stones during fine weather in October, and been compelled afterwards to dig potatoes amid snow, sleet, rain, and frost the latter part of November. Let our readers be wiser. Push the work now. Hire extra help, if need be, to secure all the crops as soon as they are ready. The farmer that gets behind with his work now will certainly be a loser. Every thing will turn against him. The weather will grow colder, and the days shorter. Hired help will become scarcer, and will ask higher wages and do less work. We have paid men \$1.75 per day to dig potatoes the last of November, who were willing to work for \$1.25 in October. And they would have done one third more work.

A farmer should sit down and make out a list of the work he has to do before winter sets in. He should place the items under two heads, thus (we give a few items as an example):

Work that Must be done.

1st. To finish cutting up on.

1st. Ditches to be cleaned out and deepened.

2d. To dig potatoes, commencing on the ripest.

3d. Stones to be got out

commencing on the ripest.

3d. Apples to pick and and put in heaps, so that barrel

4th. Pumpkins to draw in. winter.

5th. Roots to harvest.
6th. Corn to lmsk, and husked in the barn.

stalks to draw in

7th. Stock to attend to, daily—almost honrly.

5th. Gate to hang, posts to straighten up, fences to fix, hoards to nail, etc., etc.

Under the head of work that ought to be done, a farmer, if he will jot them down as they occur to him, can readily find a score or two of items. The work that must be done should of course have the precedence, but if the weather is unsuitable, or the crops are not quite ready, select some job from the other column. Such a list will be found a great help, and we would urge every reader of the American Agriculturist to make one out at once.

### Hints about Work.

Rye will do well sown the first or second week of this month, and on rich, warm land a good crop may be obtained when sown as late as the first of

November. The earlier it is sown, the more the plants tiller, and the less seed is required, say 1½ bushels the first of October, and 3 bushels per aere towards the last of the month. Rye does not germinate as soon as wheat, and on wet, heavy, cold land is liable to rot in the ground. Where there is a good demand for the straw, rye is a profitable crop, and deserves more manure and better treatment than it usually receives. It delights in a warm, sandyloam, and frequently does well on low, mucky land where wheat would lodge. But it must be drained. It is throwing time, and labor, and seed away to sow any grain erop on wet land.

Winter Wheat sometimes does well sown as late as the beginning of October; and we once saw a good crop in Western New York that was sown in November. But, as a rule, north of 41°, wheat should be in by the last of September. When this cau not be done, better sow rye, or if the land is too heavy for this crop, better plow it this fall and sow it to oats or barley in the spring. A good crop of oats or barley is far more profitable than a poor crop of wheat.

After Wheat is sown, if there is reason to suppose some portions of the field, such as sandy knolls, too poor to produce a good crop, it is a good plan to spread some well-rotted manure on the surface. It often has a wonderful effect, not only on the wheat, but also ou the clover and grass afterwards. If manure can not be had, 200 lbs. of Peruvian guano per acre will be good, or 150 lbs. nitrate of soda sown this fall, and 150 lbs. in the spring.

Furrows to let off water, if not already done, should be made at once. Many an acre of wheat is lost from neglecting this simple operation.

Cutting up Corn should not be delayed an instant longer than necessary. A frost, while the corn is standing, injures the fodder, though it does not hurt it after it is eut up. And not only this: over-ripe or frosted corn is more difficult to bind properly. The contrivance for binding figured in the last Agriculturist will be useful in such a case.

Husking Corn will in time be done by machinery. We have already several machines that "promise well." But this year a hundred million bushels or more will have to be husked by hand. We have from time to time figured several little contrivances for facilitating the labor and relieving the fingers. Where a farmer and his boys do the husking, it is a good plan, at any rate for the first day or two, to husk for only a few hours at a time, and then go to some other job. In our own case, we find it cheaper to let out the work by the bushel—taking care to see that the corn is busked clean, that the stalks are properly tied, and the bundles made into compact, good-sized stooks, with two bands on top.

Corn-Stalks .- Hay will be searce and high the coming winter, and we ought to take extra care in curing and preserving eorn-stalks. Half the eornstalks, even in scetions where farmers pretend to think a great deal of them, are rendered comparatively worthless for want of a little attention in euring and stacking. Farmers know how this work should be done, but do not sufficiently realize its importance. In this case, as in so many others, they need exhortation rather than precept. The point is to enre the stalks as rapidly as possible, and to draw them in as soon as the sap is so much reduced that they will not ferment injuriously in the stack or barn. In this case, as with hay, the water or sap that is in the stalks is not half so likely to eause mold as a little water on the outside of the stalks from dew or rain.

Potatoes.—Commence to dig as soon as the tops are dead or dying. Better be a little too carly than too late. Give yourself plenty of time, and dig during fine days and when the ground is dry. If we might hazard an opinion, we should say that, taking everything into consideration, it will be full as profitable to sell the crop this fall, as soon as dug, as to be at the labor and expense of storing. The crop of 1868 brought double the price in the spring as in the fall; the crop of 1869 brought more in the fall than in the spring; the crop of 1870 again brought a very high price in the spring;

and the erop of 1871 will probably not pay so well for keeping until spring as that of a year ago. If you have not good conveniences for storing them, better sell them directly from the field. If kept in pits over winter, select a dry spot, cover with dry straw, and then throw over it three or four inches of soil. Let them remain so until winter is about to set in. Then put on another layer of straw, six or eight inches thick, and cover with soil as before. This middle layer of straw, acting as dead air, will do more to keep out frost than a foot of soild earth, and saves a great deal of hard work.

Live-Stock.—In the hurry of full work, we must not neglect our stock. Because beef, butter, cheese, and pork are low, many farmers are cruel and foolieh enough to neglect and half-starve their ealves, steers, cows, and pigs. We hazard nothing in saying that those who give their young stock good feed and the necessary care are sure of their reward. The present low prices are only temporary, and now is the time to prepare for the reaction which is sure to follow. Select the best cows and sows for breeding; use only thorough-hred males; feed liberally and take good care of the young stock; when the market changes for the better, you will have something that will bring a good price.

Sheep are again in the ascendant. At present prices, woot is more profitable than any other animal product. And there is little prospect of a decline, at any rate, for two or three years. In sections where there is no demand for mutton, there can be little doubt that Merino sheep are the most profitable to keep. They require less care than the mutton sheep. But where mutton and lambs are in demand, it is equally certain that as long as combing and delaine wool brings as bigh a price as fine wool, Cotswolds or Leicesters, and their grades, may be made to pay far more than Merinoes. It is simply ridiculous, however, to suppose that these sheep, which grow with great rapidity, require no more food than a Merino, which does not grow half as fast. A good-sized common Merino ewe, if well fed, and put to a thorough-bred Cotswold or Leicester ram, will produce a lamb weighing 12 lbs. at birth, and which the spring following, if well fed, will weigh 100 lbs., and shear 7 lbs. of washed wool, that will bring more per lb. than the best Merino wool. But this can not be done without good food and fair treatment.

Fattening Sheep in Winter.—The indications are favorable for this business. Select the best three or four-year-old Merino wethers that can be found, give them good grass and, if need be, a little grain this month, preparatory to shutting them up to fatten. They should gain more this month than during the two next. The profit comes, not from the increase in weight, but from the extra quality and the increased price of the mutton next spring. Much money has been made in this business, but a person who has had no experience should not rush into it on a large scale.

Do not Overstock .- This is a common error. Make an estimate of how much grain, hay, straw, and corn-stalks you have to feed out. Taking wheat, oats, peas, beaus, barley, and corn together, you will not probably be far wrong in estimating that for every 100 lbs. of thrashed grain you have left 150 lbs. of fodder. Cattle, horses, and sheep will eat per day, per 100 lbs. of live weight, 3 lbs. of hay or its equivalent-say 1/2 lb. hay, 2 lbs. of good straw, and 1/2 lb. of grain. Such a ration will keep animals in good growing condition, and 1/4 lb. more grain per day will make a full-grown sheep quite fat. It will be well to estimate that half of the straw and fodder will be wasted in the form of butts, tops of stacks, litter, etc. Do not overstock. If you have any hay or straw to spare it will bring a good price, and if you are short you will be very apt to put the animals on a short allowance-than which nothing is more unprofitable.

### Work in the Horticultural Departments.

In most localities the harvesting of the crops will be completed in October; but after this is finished there is still an abundance of work to do

in preparing for the next year's crop. The abundant harvest this year of nearly all kinds of fruits and vegetables, will give the gardener fresh encouragement to persevere. If some mistakes have been made or some experiment has failed, he should profit by them. The aim of the gardener or orchardist should be perfection, and he should never rest satisfied until he has the best varieties of vegetables and fruits that can be procured.

### Orchard and Nursery.

Planting of all kinds of fruit trees can be made now, as well as in the spring, and it will save much time when the early spring work is pressing. When trees are set in the fall they should have a good mulch. It is a common impression that stone-fruits should not be set in the fall. However this may be in colder localities, we find that in the great peach districts of Delaware and Maryland they set in the fall or spring, as most convenient.

Labels.—In planting see that the labels attached to the trees are not so tightly twisted as to cut the bark. Make a plan of the orchard and mark the position of each variety; do not rely upon labels.

Shade Trees.—Plant shade trees, except evergreens, as soon as the leaves fall; if done carefully they will hardly feel the effects of their removal.

Manure.—If the orchardist wishes for a good crop of fruit, he will find it necessary to give his trees a liberal supply of manure. Mannring not only pays in the larger quantity of fruit, but also in the finer quality.

Nursery Stock.—Keep the nursery rows clear of weeds. A dressing of well-decomposed manure, placed in furrows between the rows, will be of great benefit to growing trees and shrubs.

Seeds.—Save a supply of tree seeds, and keep in sand during winter.

Drying Fruits.—Where there is a full supply, a quantity may be dried for use next summer.

### Fruit Garden.

Plant all small fruits as soon as possible, in order that they may get established before winter.

Blackberries.—Set in rows eight feet apart and four feet in the rows, so as to give plenty of room to work between them. Before planting cut the canes off about six inches above the ground. Some hoed crops may be raised between the rows during the first year, for economy. The ground ought to be well manured before the plants are set.

Currants and Gooseberries.—Set out in rows five feet apart each way. Make cuttings as soon as the leaves fall off, and plant in good soil. Prune old bushes into shape.

Grapes.—Allow those that are intended for wine to remain upon the vines until thoroughly ripe. Pick those for market and keep in a dry, cool place, where there is no danger from frost. Prune as soon as the leaves have fallen. The vineyard ought to be shallow plowed, and if any fertilizer is used, apply ashes or ground bone. Remove tender varieties from the trellises, and cover with earth before the ground freezes.

Strawberries.—Where plants have been struck in pots, set out as soon as possible, otherwise it is best to defer the planting until next spring. Materials should be collected for covering the strawberry-beds during the winter, but the covering should not be put on until the ground begins to freeze. Leaves or straw make the best covering, though hay, corn-stalks, and branches of evergreens are often used.

Pears.—Pick as soon as matured, and before they begin to soften, and allow them to ripen upon shelves in the fruit-room.

## Kitchen Garden.

After the crops are harvested, preparing the soil for the next season's planting will occupy the gardener as long as the ground is capable of being worked. In most places it is not too late to lay drain-tile, and thus prepare the land for earlier working. Where the soil is stiff and difficult to

work, it might be greatly benefited by throwing into ridges, and allowing the frost to ameliorate it; in fact, all land ought to be plowed in the fall, as this often makes a difference of a week or more in the time of working it in the spring. Apply the manure in the fall when the plowing is done.

Asparagus.—As soon as all growth has ceased, cut off the tops and burn them, to prevent their seeds from being seattered. Cover beds with coarse stable manner.

Artichokes.—Draw the earth around the stems, and throw over the tops a little litter.

Beans.—If there is a crop of late string beans, pick and salt them as before recommended. Pick the late Linus, and if more ripen than are wanted for seed, try them baked in "pork and beaus;" they are much superior to the common field beans.

Beets.—Pull before the frost has injured them, as this impairs their sweetness. They are much better packed in sand, as this prevents wilting.

Cabbages.—Allow the winter sorts to remain in the ground until hard frosts, when they may be taken up and stored in trenches in the open ground, or remove them to a cool cellar. A good way to store them is to dig a treuch wide enough for three rows, and, after removing the outside leaves, pack the cabbages closely together and cover with six or eight inches of earth. Dig a drain to carry off the water, and when the earth over the cabbages is frozen, cover with 5 or 6 inches of litter.

Canliftowers.—These will usually head if set out in a cellar or cold-pit.

Carrots.—Preserve in sand or soil as recommended for beets. The tops are good for eattle.

Celery.—Continue to earth up, using care that no earth gets into the center of the plant.

Cold-Frames.—Prepare these for the reception of cabbages, canliflowers, etc.

Cucumbers.—Gather for pickles as long as the vines continue to bear, and salt down, as previously recommended.

Endive.—Take up the plants, with a quantity of earth attached, and set close in the cellar for a winter supply. The bitter taste of the endive will prevent its very general use as a salad plant, and no amount of blanching will entirely remove this.

Hot-Beds.—A good quantity of earth must be provided in the fall, as in the spring it can not be obtained without a good deal of difficulty. Store it in a cellar or shed.

Lettuce.—Plants can be set in a cold-frame, or in mild situations they will stand the winter well if only covered with a light layer of straw.

Manure.—No adequate returns can be expected from a garden unless plenty of manure is applied, and to do this the gardener ought to save everything that is capable of making manure, with the utmost care. All houseslops, small weeds, sods, and in fact all rubbish may be mixed with the compost heap. Store a supply of dry earth under cover for use in the privy, and to mix with fresh manure.

Onions.—Cover the late-sown beds with an inch or two of straw.

Parsnips.—Dig a supply for winter use before the ground freezes hard, and allow the rest to remain in the ground until spring.

Rhubarb.—Old plants may be divided in the fall. Set out the plants in well-manured soil four feet apart each way, before the ground freezes. Cover old beds with a thick layer of stable manure.

Salsify.—Treat as recommended for parsnips.

Spinach.—Keep the weeds down by the constant use of the hoe and rake, and cover lightly with litter before very cold weather.

Squashes.—Store before the frost has a chance to injure them, where they will not be subjected to great changes of temperature. Use the greenest specimens first.

Sweet Potatoes.—Harvest as soon as the tops are touched by frost. They must be dug on a warm day, and allowed to dry in the sun before storing them. Pack in barrels with cut straw. Use care

in handling, and store in a room with a warm, even temperature.

Tomatoes.—Cover up a few of the later plants during frosty nights. To protong their season pull up the vines and hang in a sunny room, and they will continue to ripen for a month or more.

Spading .- During warm spells spade such parts of the garden as ean not be plowed, and work in a good dressing of manure.

Turnips will do better in the ground until hard frosts come, then store in the root cellar.

### Flower-Garden and Lawn.

The present month is more favorable for laying out plans for improvements than during the pressure of spring work. New walks and drives can be laid out, and old ones repaired.

Bedding Plants .- Make cuttings of all seedling plants, if not already done, and take up such old plants as are to be kept during the winter.

Bulbs.—Plant early this month, if possible. Take up all tender hulbs like Tuberoses, Gladioluses, etc., before hard frosts, and store in a dry room where they will not be injured by mice.

Chrysanthemums. - These are very fine and showy for late bloomers, as they are not injured by the early frosts. Keep tied up to stakes; pot a few of the best for blooming in-doors.

Dahlias.-Keep tied up to sticks, and if they are prolected by a covering of paper they will continue in flower a long time. After the tops are killed by the frost, allow the tubers to remain in the ground for a week, in order to ripen.

Frames and Pits .- Have these ready to receive the plants as they are taken up from the border.

Cannas.-Take up before the foliage is killed by frost, and lay in a shed for a fortnight, and then store the same as Dahlias.

Peonies. - The hest time to set Peonies is in the fall, as they start too early in the spring to be moved with safety.

Perennials.-Transplant those sown in the spring to the place where they are to flower.

### Greenhouse and Window Plants.

The greenhouse ought to be ready for receiving all plants which are ontside, as soon as there are any signs of frosts. The tender ones must be taken in early, in order to have them grow well during the winter.

Annuals. -- Sow seeds of annuals, for winter flowering, in pans of rich soil, and prick out as soon as large enough to handle.

Bidbs.-Pot all bulbs for winter flowering, and allow them to remain in a dark place for a few weeks, to promote the formation of roots.

Insects.-Every plant ought to be thoroughly cleansed before being taken into the greenhouse, so as to remove all insects, and in order to keep the house clear of those pests of plant growth.

Materials. - See that all pots, soil, moss, etc., are in readiness for winter, so that nothing may occur to hinder work.

Forcing Plants .- Take up all shrubs which are to be foreed for winter flowering, pot them, and store in a cold frame, giving water occasionally until February, when they may be brought into heat and forced.

House Plants.—Re-pot plants which have become "pot-bound" in good, rich soil, and keep in the shade for a few days until established.

Cattle Eating Dry Earth.-C. Newton, Fayville, Mass., wants to know why his cattle eat dry earth in winter, when they have a liberal supply of meal and roots, and plenty of the best hay. This is becanse earth is a part of their natural food. In pasturing, rumioant animals partly cut off the grass and partly tear it up by the roots, taking more or less earth with it. The food is stored in large quantities in the first stomach, where it is more or less formented under the influence of the warmth and moisture to which it is subjected. The carth neutralizes the acids, and perhaps condenses the gases thus formed, and prevents the distension and discomfort that would ensue. When cattle are fed on clean forage, they merely gratify a healthful appetite in eating earth. This indicates the advisability of feeding roots without washing them.

Fowls for Town-Dwellers.-W. F. W., Selin's Grove, Pa., asks us to name a breed of fowls proper for a family living in town, who would keep a few only, and desire good layers, and also large-sized hirds for the table. These conditions are fulfilled by the Brahmas, either Light or Dark. They are fair layers of rich eggs, and produce well in fall and winter, there being no breed that distributes its laying favors so evenly through the year, a trait very desirable where the eggs are for family use. The great size of the Brahmas is too well known to need mention.

### Commercial Matters-Market Prices

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Sept. 15, 1871, and for the corresponding month last year,

TEANSACTIONS AT THE NEW YORK MARKETS.

Under more favorable foreign advices, there has been a decided improvement in values of Breadstoffe, with an active home and export demand for the leading articles, also some speculative foquiry, closing strong in most iostances. The scarcity of ocean freight-room and the high rates claimed by ship-owners have been against the outward movement ..... Provisiona have been more freely dealt in; Hog products have been quoted firmer; Butter, heavy; Cheese, steady.....Wool has ottracted attention and has shown less buoyancy as to price, but holders have not been eager to place stocks at less than full asking figures......Cotton has been quite freely purchased at higher prices......Tobacco has been quoted dearer on a fair trade.....Hops have been in reduced stock and good request at better rates. Seeds have been quiet and depressed.

Beef Cattle .- The weekly average for the past four weeks exceeds the average of the previous five weeks by 1,243 head, and is 1,856 greater than the weekly average of last year. While there has been plenty of thin, immature native cattle and a large number of Texans, the quality has averaged better than usual for the season. The demand has improved with the cooler weather and the return of our summer wanderers, and trade has been generally good and fairly remnnerative to shippers. For the second week under review, prices declined 1/2c. @ 1/4c. per ib., but this decline was recovered in the third week, and the close was firm at the rates given at the close of last month.

Below we give the range of prices, average price, and figures at which large lots were sold:

Aug. 21st, ranged 7 & 12%c. Large sales 10%@11%c. Av. 17 Aug. 23th, do. 7 @12%c. do. do. 10%@11 c. do. 10% Sept. 4th, do. 6%@12%c. do. do. 10%@11%c. do. 11% Sept. 11th, do. 7 @12%c. do. do. 11 @11%c. do. 11%

Milch Cows .- An increased supply has met the improved demand incident to the season, and trade has been moderately active, more especially for the last two weeks, at sustained prices. Mixed with a considerable number of old, worn-out stock were some fair to good milkers and some promising young heifers, but nothing really fine, and all in thin flesh. Some of the poorest offered as milch cows were sold at \$30 @ \$35 each; and some of the best, with good calves by their sides, sold at \$50 @ \$5; but \$40 @ \$75 is the general range......Calves.—Fat veal calves have been comparatively scarce and have ruled firm, with an advancing tendency. Grass calves were plenty, but sold readily at nearly sustained prices up to last week, since which time the market has been overstocked, with a marked decline. A few lots of fine, thrifty, well-bred calves have arrived, but the bulk of the receipts were poor to common. Good to prime milk-fed are firm at 914c. @ 1014c. per lb.; common to fair sell at 7½c. @ 9c.; mixed lots, half grassers and half milk-fed to slaughterers at 5½c. @ 7c.; and common to best grassers to feeders at \$5 @ \$9 per head ..... Sheep and Lambs. - The average receipts show a slight increase over the average for last month, but the demand has kept even pace with the larger offering and the market has ruled unusually steady. Excepting a few car-loads, weekly, from Ghio and from Canada, the sheep have been of only common to fair quality, and the lambs, particularly the large number from Canada, have not been so good as in former years at this season. Poor to medium sheep have sold at 41/2c. @ 51/4c. per Ib.; fair to good at 51/2c. @ 6c.; and prime to best selections at 6½c. @ 6½c., with one lot of extra, last week, at 7c. Lambs range from 6½c. @ 7%c. per B. generally, with some of the worst at 51/2c. @ 6c., and prime to extra lots at 8c. @ 8½c..... Swine.— There has been a small increase in the receipts and more sales of live hogs. Quite a number of car-loads have come in from this State and from Michigan, consigned to commission salesmen. With unimportant fluctuations in prices, the market has been much the same as for the preceding month. Live hogs have sold at 4%c. @ 5%c. per Ib., with one car-load of choice State, this week, at \$5.30 per 100 lbs.; and dressed are quoted at 6c. @ 7c., with the bulk of the sales at 64c. @ 6%c., closing steady.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space dsewhere.

Postage 12 Cents a Year in Advance.—The postage on the American Agriculturist anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

How to Remit:—Cheeks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county-seat, in all the cities, and in namy of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect Oct. 1, 1868, are a very safe means of sending small sums of money where P. O. Money Orders can not be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead-Letter Office. Buy and affix the stamps both for postage and registry, put in the money, and seal the letter in the presence of the postmaster, and take his receipt for it. Letters thus sent to us are at our risk

Where our Thoughts come from.

-The human mind is like a ponderons engine upon a railway track. A small point of iron at a switch will turn it to the right or left-sending it on its proper course, or perchance causing it to go over an embank ment, or into another train, crushing both in shapeless destruction. The sight of some object, a word spoken or read, will give one's train of thoughts a new direction, or some direction quite different from what it would otherwise have taken. Upon very small things depends all one's future course in life. Parents, teachers, gnardians, in fact every one, may well ponder this. We are all influencing each other, giving direction to thought, every day, every hour, every moment.-One hint in this connection: A family read a journal (say like this) for a year, and, at the end of that time, do not recall any particular advantage therefrom. But how many new channels of thought have their minds been led into hy what they have read! How many plans have indirectly and insensibly come from what they could have read! How much of vacancy there would be if they blot entirely from their minds all the information they have gained, and all the new ideas and plans of their own, suggested only, and indirectly at that, by what they have read during a year! The truth is, one can not read and think too much about his daily labor. If he get not one new positive piece of useful information, the thinking developed by reading other men's views and ideas can but be useful in stimulating him to reasoning, to intelligent labor-that labor in which his head aids his hands. Labor without intelligence is merely brute muscle in exercise.

Bill Catalognes.—The dealers are all ready to receive orders for bulbs. First came Richardson & Gould's catalogue, then James Fleming's, both of New York, then James Vick, of Rochester, and F. K. Phenix, of Bloomington, Ill. B. K. Bliss & Son, and J. M. Thorburn & Co., and we know not how many others, have sent their bulb lists. Let our readers look in the advertising columns, and they will a number of dealers who are ready to serve them with good bulbs.

The New England Fair, which was held at Lowell last month, was in many respects a success. The weather, as usual the first week in September, was very fine, which of course brought out a very large attendance. Other managers may notice this fact with The grounds at Lowell are large, and well arranged for all kinds of live-stock, giving good protection and comfort for the animals. The show of mechanic arts was spoiled by being divided into two parts. The exhibition of horses and cattle, sheep, swine, and ponltry, was very large and good. The show of Ayrshire cattle was very fine indeed—in fact, we have rarely seen The herds of Wm. Birnie, of Springfield, a better one. Mass., Messrs. S. M. and D. Wells of Wethersfield, Ct., and others, are hard to beat. The show of Jerseys was not large, but very fair in quality, some of the animals being as fine as can be found in the country. There was a good display of Hereford cattle, which are not commonly seen at the fairs, and they attracted much attention. Dutch cattle were fairly represented, and of good quality; while Shorthorns were there in comparatively small numbers, some of very good style and blood. Long-wooled sheep are rising in importance in New England, as elsewhere all over the country. Messrs, Appleton, of Mass., Hartwell, of Ct., and Chase, of Mass., showed some very fine Cotswolds. The collection of swine was quite large, but mostly of one kind-Chester Whitesmany of which were of very good quality, but the judges wisely gave the first prize and sweepstakes to a splendid Berkshire sow, and first prize to her litter of pigs. The officers of the Fair were very courteons and attentive to all comers, but there was evidently a great lack of efficient management. Committees were not in attendance early, and there were no proper arrangements for them to work when finally together. Marshals were not appointed to attend them until they begged and waited for them, and no proper provision was made for their entertainment Those who work hard all day for nothing should at least he furnished with a good dinner, but such could not even be bought on the grounds, and some of the committees regaled themselves on cream-cakes and returned to their labors. Let this matter be reformed, and let the management stop the peddler nuisance.

June or Blue Grass.—Jas. McC., Newfane, N. Y.—The specimen is what is commonly called June grass. It is quite different from the grass known as "Quack" or Couch grass, and can be more easily got rid of. It is in some places valuable for pasture—in fact, it is the same grass known as Kentucky Blue-grass. Plowing under will rid the land of this grass without trouble; but the soil being full of seed from past sowings, it will appear again after a grain crop. A clover and timothy crop will keep it dowe. The description of the conch-grass rake is too late for this month.

Fodder Crops.—W. Howard, Ithaea, N. Y.—It is not too late to sow rye for soiling. We have sown it as late as 14th October, and it was ready to ent by the middle of May. It must be sown on rich ground if a heavy cutting is desired. It will be followed by oats, for which the ground should be prepared, and well prepared, both by plowing and manuring this fall, and the seed sown as early as possible in the spring, at the rate of four bushels per acre. Good ground will bear heavy seeding for a forage crop.

Seed Wheat—"Golden Chaff May" Variety.—"D. P. M.," Raleigh, N. C., wants to know where he can procure a good variety of seed wheat, such as is grown on the hills of Pennsylvania. We are not acquainted with the variety, at least not under this name. The White Mediterranean, Treadwell, Diehl, and Michigan Amber are all favorite wheats in the locality mentioned. With us the Treadwell has succeeded very well, and has given fair crops, though it requires care and good cultivation where the winters are changeable and inclined to be severe. All of these varieties could be procured at the principal seed stores. See advertiseorents.

To Preserve Hams from Flies.—
S. Green, Jackson, Ill., asks how he can keep his hams free from skippers. The skippers, as they are called, are the larvæ of the meat-fly. To prevent their attacks we have enveloped the hams and bacon in thick paper, wrapping carefully, so that the meat is completely covered. Then the meat is put into a cotton bag, which is sewn up closely. The fly can not penetrate both envelopes with its ovipositor, and if no holes or small openings are left, the meat may be preserved from it. We have also packed the meat in wheat bran and oats in boxes and barrels, and have been successful in saving it. But we favor the first-mentioned plan.

Wild Carrot.—"H. J. J.," Franklin Co., Pa., wants to get rid of wild carrot. No weed is easier killed than this. As soon as the seed is matured the root dies. It is therefore necessary only to gather the seed, or, hetter still, to gather the flowers, which will prevent seeding for a year or two, and they will disappear. These roots are of no value for any purpose.

Golden Rod.—A "Subscriber," Milford, Pike Co., Pa., sends us a specimen of a weed for name and means of destroying it. It is a Solidago, or Golden Rod (Solidago nemoralis), known also by several local names, one of which, common in Pennsylvania, is Wire-weed. It is a very common and thrifty weed, and in damp meadows forms patches of matted roots, stont enough to throw out the plow. It can only be destroyed by plowing up the roots, and gathering and hurning them; or throwing them into a heap and decomposing them with quicklime, when they will make manure. This plant is so tenacious of life that a root we placed on the top of a

fence at one time, grew and struck its fibers into the crevices to seek a living. It is therefore hopeless to try to k ll it otherwise than as above.

Packing and Preserving Butter. "R. R." wishes to pack butter for sale, and also to have a process for coloring it evenly. Packing butter that is gathered up at country stores, is a nice operation, and needs to be carefully performed. As it is of all shades of color, from white to pale yellow generally, a coloring may be prepared by melting some of the butter and dissolving in it the prepared annatto, which may be procured at any drug-store. This should be kept for use as it is wanted. To use it, take a quantity of the butter to be colored in the mixing bowl, cut it into gashes with the butter-ladle (don't touch it with the hands), place a small portion of the coloring preparation in each of these gashes, and mix until the color is evenly spread and no streaks are to be seen. Then gash it once more with the ladle, spriokle one onnce of saft to the pound of butter, and twenty-four hours. Then pour off any water collected on it, and pack it in a new oak tub that has been soaked with brine for a day and night. Water should never be used in working butter at any time.

Abutilon strintum.—R. L. Schrock, Laclede, Mo. We preserve this over winter in the cellar, as you suggest. It makes a very good house-plant if you have room ecough to keep it in that way,

North-eastern Bec-Reepers\* Association will hold a meeting during the session of the New York State Fair. The evening of October 3d is assigned for the discussion of Bee Culture.

Keeping Eggs .- Relt Rednevae, Richmond, Ind., wants to know the best way to keep eggs. Parties in the egg business in a large way build brick vats made water-tight, in which is lime-water, made by putting lime in water, and when it is slaked and settled to the bottom drawing off the clear liquor. Ioto this liquor the eggs are placed and kept beneath the surface. They are kept as cool as possible. These are the "limed ' with which the markets are supplied during winter. Another mode of keeping eggs, tested by the Agricultural Department, is as follows: Rub the eggs with flaxseed (linseed) oil, and place them, small end wards, in sand. Eggs so prepared were found at the end of six months to have the taste and smell of perfectly fresh eggs, and to have lost in weight only three per cent. Greasing eggs with lard or tallow has not been successful in preserving them, except for short periods,

SUNDRY HUMBUGS.—Elsewhere we have spoken of a certain class of "medical" advertisements. An Illinois subscriber sends us a prominent advertisement of a so-called "Medical Retreat," in Cincinnati, O., of the "Madame Restell" order, which he says has polluted the fair pages of an otherwise good Peoria journal for a whole year past!.....The "Ladies' Health Association," 49 and 51 Wall street, New York, is a sheer humbing. No such articles as are professedly offered, even if desirable, can possibly be made. No letters to that address can hereafter get through the New York P. O.
..... "Dr." Andrews; of Albany, N. Y., whom we recently showed up, has various "female" "precautions," and many other things, in his so-called "Good Samari-" which he continues to scatter, to the destruction of life, health, and morals, and now we hear he is sugarcoating agents with the offer of building lots to those who aid him (and the Devil) in scattering his worse than who add him (and the Bevin) in scattering his worse that vile trash.....We suppose few editors are so "green" as to publish the "direct" advertisements of the so-called "Metropolitan Cash Prize Co.," until they get the money, and we hope there are few who care so little for their readers as to publish the advertisement at any price, though eash be paid down.... 'Ink Recipes,' etc., are advertised in some respectable journals. We have often shown them up, and need only say that whoever sends 25c. or 50c. or more for any such recipe or powder will lose not only his money and stamps, but all the time he expends in bothering with them.... Miss O. H. Hoover, of Hazle Barrens, Mo., wants to let people into the lite (light) of making money easy. We hardly know, from her illiterately written circular, whether to call her (or him) a swindler, a crazy person, or a fool. The last appellation will certainly belong to any one patronizing her (or him) .... No matter what the tickets say, we say that neither L. P. Pardee & Co., Biughamton, N. Y., nor any other parties, will for \$2 send you gold watches, chains, etc., etc., worth \$25, or anything like it. The most you will get in these cases, where you get anything for your money, will be cheap stuff, usually worthless, and always affording a good round profit to the sellers at the price you pay. The ticket and the C. O. D. dodges are to eatch greenhorns....We should pity South Carolina if her population could be increased by no other ald than that of the Lottery yelept "the S. C. Land and Immigration Ass." There can not be 150,000 foolish people who will pay \$5 each to float that scheme, showy as it looks on the red-line circulars. Probably some will want one chance in 150,000 at a \$250,000 Academy of Music, and have faith enough in their "luck" to pay \$5 for even such a chance. We would not give 5 cents ..... All "Honey-making recipes" offered for sale are to be avoided, no matter how highly set off. No one has any right to territory to sell, though sundry persons profess to have. New subscribers continually come asking about "Sunlight oil," etc. We have repeated, until we are tired of it, that all manufactured oils, as the so-called Sunlight oil, etc., are dangerous humbugs. For this class of readers we again say, that the entire brood of recipe-sellers are to be let alone entirely. Never advance any money, or order anything of the kind C. O. D. (to be collected on delivery). If you must try the sale of some of these recipes and gimeracks, make the seller trust you until you have tried the articles, and he very careful not to promise pay ou any conditions. And then, if you are not satisfied to pay after full investigation and trial, don't be scared into paying by any amount of threats of law-suits, etc,.... The Queer" or counterfeit money pretenders have been so fully exposed as to need no further notice here. Among the swindlers' newly-assumed names before us are Zena Walsh, 688 Broadway, N. Y. (the million-dollar man under his fortieth name); Wm. & John Hood, 192 Broadway, who use a Masonic emblem; Young & Morse, street, N. Y.; "Yours, etc.," inclosing card of J. T. Palmer, 39 Park Row, N. Y.; E. Sampson, 688 Broadway, who uses both Masonic and I. O. O. F. symbols; Wm. Sage & Co., 37 Spruce street, N. Y.; Saml. Davis & Co., 31 Liberty street, who also steals I. O. O. F. symbols; S. K. Kraiz, Doylstown, Pa., etc., etc.... A vast deal of nonsense is printed, putting forth the most absurd claims for electricity and galvanism, in cures, hair curling, etc., etc., well calculated to deceive the ignorant by the parade of scientific terms, even the proper use of which is not understood by the pretenders, as they plainly show. We have several very neatly printed circulars, pamphlets, and newspapers devoted to advertising these humbugs, but have barely space to properly characterize the whole class as ingenious swindles.

Murder-Those Terrible Revelations .- The reading people of our city, and, indeed, of the whole country, have been greatly excited during a month past by the "Trank Mystery," the detection of "Dr." Rosenzweig, "Madam" Burns, and others. It is well that these revelations have thus come prominently before the public in such a way as to arouse attention. To us there is nothing new in all this. The long-time readers of the American Agriculturist know how frequently this journal has uttered words of warning; how often it has spoken in deprecatory and sorrowful tones of the course of certain journals-albeit admitted into and supported by Christian families-that have acted as the paid and efficient agents of the incarnate devils who for money, murder in cold blood their hecatombs of living mortals, born or nnborn. Not long since we showed that, to pay the expenses of advertising, etc., these murderers must receive from their victims at least \$150,000 a year, to say nothing of the hundreds of thousands, if not millions, expended in gilded mausions and luxurious "country-seats." and we inquired how great the number of victims necessary, at the ordinary and extraordinary charges, to roll up these great sums of money. Now we see whole columns of malediction in the press. New York Herald joins in this cry; yet, after all these terrible revelations, we find in to-day's issues of that paper now before us, a string of advertisements of these murdering abortionists, inserted and spread before the families of those who admit the sheet to their homes, as many do, and all for the sake of the fifteen to thirty dollars paid it daily for the space. If this thing were confined to that sheet, it would be less disastrous, but hundreds of other journals over the country are printing advertisements that covertly accomplish the same result. What country editor so unsophisticated as not to know the aim and intent of advertisements of "obstacles from whatever cause," and the like? We are right glad to note the conversion of the New York Times, which is now attacking the Herald and kindred sheets. How long since the Times dropped from its columns the "medical" advertisements of like import? But we hail its conversion as one good omen.—We have long been aware that the success of these dangerous practitioners has arisen partly from a deficient moral sense, a failure to perceive the enormity of the crime of extinguishing a living spark of life yet unborn, and from a fatal reliance upon the assurances of the safety of such infanticide, so far as the parent is concerned. Time and again we have tried, in as delicate language as the case would admit of, to speak of the peril to her life and health. We quote a few extracts from our own columns, as specially applica-

ble at the present time: "On no rational ground, except that of sheer ignorance, can we explain the fact that many professedly religious journals, and others that claim to be respectable, continue to admit a certain class of medical advertisements. Some of these, published in leading religious papers even, covertly advertise the worst possible 'private medicines.'....There is probably no one thing so readily seized upon as the prospect of, or an offered remedy for disease. The suffering invalid, with his judgment impaired perhaps by disease, becomes a ready dupe, and the more terrible or prohably incurable the disease, the more eagerly he swallows the bait .---But, passing by the general run of quack medicines, we refer now to a specific class. In a chance number of one of the most respectable N. Y. Dailies, or one so considered, and patronized by a large class of respectable people, we find under the head of 'Medical,' half a column, or thirteen advertisements, of which at least ten are really of the worst possible character. For example, the first one is addressed to 'Married or Single Ladies,' professing to 'remove all stoppages or irregularities, from whatever cause,' etc. (We only quote what is placed before your families every day in the year, in at least half the journals printed.) The 4th, 5th, 6th, 7th, 9th, 11th, and 12th adertisements are of very similar character, some more bidden in their expressions, but all indicating what they are aiming at. These cost for one insertion \$19, and there is an average of as many on each of 350 days in the year, or over \$6,500 a year paid to one paper, with much larger sums paid to others. We name far less than the actual sum, when we say that \$150,000 are paid yearly by this single class of advertisers for publicity alone. Of course they must have a large patronage, or they would one of two things. Many of them buy useless medicines at enormous prices. Of course none of the purchasers expose themselves by exposing the swindlers. But some of them at least do buy medicines that attempt to effect what they propose. The result is not only 'the murder of the innocents,' but, in almost all cases, of the mothers themselves; or if not producing direct death, they leave a shattered constitution to drag out a miserable existence worse than death. Stung by guilt, the poor patient seldom betrays to her companion if married, or to her most interested friend if not, the cause of her suffering. Let us say to all who put any faith in the statements of this class of murderers, for such they really are, that the pretenses put forth for these medicines and operations are False, as every good physician well knows."...We repeat: Let no one flatter herself that private "relief" can be given by any one of these doctors, male or female, with any safety whatever. Their patients are almost invariably mardered by the unnatural processes and medicines, or so wrecked in health and constitution, that the remainder of their existence on earth is worse than a hundred immediate deaths. Let those who think they can easily, privately, and safely throw off a mother's responsibility, plainly understand that it is not so. Let the unfortunate understand also that it is far better to endure the shame of their condition, than to peril their lives and souls by any league with these foul murderers.—-P. S.—Since writing the above, we find in the New York Herald of Sept. 17th, one of the strongest articles we have seen on the subject, headed "The Sin of the Age," which speaks of the terrible consequences of the evil to society at large, and attributes its prevalence to "a renat press, a demoralized elergy, and medical charlatanism." The Herald might have reserved its fling at the clergy, for in that very paper we find advertisements of "medical charlaalias murdering abortionists. Shame on such "renality." Can decent people earry such a paper to their families, however valuable it may be as a news sheet?

Iloyd's Maps.—In response to numerous inquiries, we answer that we have full confidence in Messrs. II.H.Lloyd & Co., 21 John st., New York City, and Louis Lloyd & Co., 126 Dearborn st., Chicago, Ill. (note particularly the names and numbers.) We don't want to be questioned about any other Lloyd map business—have been bothered by it too much already. We don't propose to settle difficulties for those who send money foolishly in answer to every promising advertisement.

Lice on Poultry.—O. Kellog, Bradford Co., Pa., has his poultry infested with lice, and wants to know how to get rid of them. Take out of the house every perch, nest, box, or movable thing; remove all battens, cleats, or any thing whereby a crevice is made, so that the inside is smooth. Then make a whitewash of fresh lime, into which put one ounce of carbolic acid to a pailful. Wash the house thoroughly with this. Then wash the outside. Then smear the perches with a mixture of lard and kerosene oil, putting it on thick, so that when the fowls roost they will get some of it on their feathers. Also, put some of it on each fowl, under the wings. This will clear the house, and the hens will clear themselves if no recenits are furnished from the

house. In a month, or less, if there is occasion, wash the house again and grease the roosts; take care to fill all holes and cracks in the poles. It would be well to pass the poles through a fire made of straw, exposing them to the flame, before greasing them.

Osage Orange.—"Subscriber," Columbia Co., N. Y. The Osage Orange is fairly hardy at Newburgh. We cannot say how it would be with you. Honey Locust makes a better hedge, and is hardy.

Curious Peahen's Egg.—R. M. Griffith, Wilmington, Del., has a peahen that produced three eggs joined end to end, the united length being 9 laches 1 Each egg contained a perfect yolk.

Fastening Shells upon Wood.—
"Seamoss." The best way to fasten shells npon wood is to cover the wood with a thin layer of putty, and place the shells in position.

Price of Stock.—"W. H." asks what a two-year-old Ayrshire heifer and a yearling Shorthorn ball may be bought for. The heifer may be had for \$150 to \$1,500, and the bull for \$150 to \$9,000. You might as well ask what a house in New York can be bought for, so much depends upon circomstances and "faney." See notes on buying stock in Walks and Talks and O. F. Papers.

Pronunciation of Eumelan.—Mrs. "R. H. K.," Page Co., Va. The first syllable of Eumelan is the one accented, and it is pronounced the same as if it were spelled You-me-lan.

A Great Mistake about a Grater.— On page 385 there is a mistake in the make-up. What is now marked "Fig. 4. Wooden Revolving Grater" should be "Iron Revolving Grater," and vice versa.

Green Sings.—F. F., Portland, Me.—You do not say what kind of trees are affected. If you mean the green, slimy, leech-like slug that is found mainly upon cherry and pear trees, dry lime sifted over them will kill them. We had but a very few this year and treated them to very dry earth, and they disappeared, but the number was so small that we did not watch the experiment closely.

Apple-Trees do not Bear.—C. Hammatt, Putnam, Ct. The fact that your trees blossom and set well while the fruit drops early, would point to insects as the cause of the trouble. The codling moth is one of the worst pests. It deposits its eggs upon the young apple, and the larva or maggot eats its way in and causes mischief. It is hard work to fight insects without the coperation of your neighbors. Hay-bands and old cloths put loosely around the trees, in June, will catch many of the insects as they go down to change into the pupa state. Picking up fallen fruit and feeding to the pigs will also help.....H. B. Rose, Galliopolis, O., seems to have trees in a similar condition.

Cutting Cions.—"C. G. A.," Augusta, Me., writes: "Is there any sufficient ground for believing, as I have read, that cions cut from the top of a tree will be more fruitful, or in any way better, than those from another part of the tree? I have sometimes chosen the strong uprights on the horizontal limbs of large trees. Is that wrong?"—In selecting cions he should chose short-jointed and well-ripened wood. The shoots in the top of a tree are more apt than others to be very vigorous, and have poorly developed buds, and we should not select such, no matter in what part of the tree they grew.

....The same correspondent asks: "If a cion cut in the spring has brown pith, ought it to be rejected?"—Yes. The cion should be a perfect representative of the tree from which it is taken, and brown pith is an indication that it has been poorly kept.

Value of Sea-weed for Manure. Wm. Collins, Rye, New Hampshire, wants to know the best way to use sea-weed as manure. There are only two ways in which sea-weed can be profitably used. One is, to spread it and plow it under when fresh; the other, to gather it into piles, and when sufficiently dry to burn, to reduce them to ashes. In composting the bulk is very much reduced, and they seem to disappear almost altogether. When burned they yield a very large bulk of ashes-about one seventh part of their dry weight. ash contains, of potash, 12 per cent.; soda, 12 per cent.; salt, 20 per cent.; lime, 10 per cent.; phosphates, 5 per cent.; and sulphuric acid, 24 per cent. Besides these there are some chlorine and iodine. It will thus he seen that this ash is very valuable as a manure, and would pay excellently for the labor of gathering and burning. Plowed in fresh, it rapidly improves the soil, and no benefit is gained by any other more laborious manner of treating. Walue of Sea-Weed as Manure.— Wm. Collins. Rye, N. II., wants to know the best way to use sea-weed as manure. On page 333 (September) he will find an article on sea-weed, in which the mode of using it on the farms of Long Island is described. The Canadian farmers on the shores of the Gulf of St. Lawrence use it in a similar manner, and also burn it and spread the ashes on the land, or apply it in the hills when planting potatoes.

Woolly Taste in Mutton.—"J. G. L." writes us that it is the outside skin on the carcass that gives the woolly taste to the mutton. Butchers, he says, often gash it in fanciful figures as an ornament to the quarters, instead of removing it.—There may be some truth in this idea; but the English sheep have the same enticle on the carcass, and yet no one complains of the woolly taste in the mutton. And a well-fattened three-year-old Merino wether affords a saddle of mutton fit for the table of an epicure.

Painted Pails.—E. Skinner, Orange Co., N. Y., writes: "The pail almost exclusively used by farmers is the common painted wooden one. This can be bought for one third the cost of a tin pail. These pails are used for milking and for water; they are absolutely unfit for either—no liquid can remain in them, even for a short time, without becoming poisoned and disagreeable to the taste. I suggest that one half the pails sent to dealers in the country remain unpainted on the inside, so that farmers can secure the article they need. If this can be accomplished, it will prove a mutual benefit."—It is years since we have seen a painted pail. We find the unpainted ones in the country stores near our place. Storekeepers will usually sell such articles as the enstomers require.

Weak Knees in a Colt.—C. Schneider, McKee's Port, Pa., has a celt whose knees are so weak that it could not stand up for four weeks. The fore legs appear crooked. This is doubtless due to constitutional weakness, which no outward application will remedy. Give him, in some nourishing feed, as ground oats with wheat bran, also a tonic of sulphate of iron 20z., pulverized gentian root 10z., pulverized ginger 10z., saltpeter 10z.; make this into twelve powders; give one powder with each feed. Foment the knees with warm water, and put on a bandage to support the joint.

Muck for Wheat.—"K. T.," Iona, Mich., has a field of wheat; land has been run down, and has had little manure in fifteen years. He asks: "Will it be any benefit to top-dress the wheat this fall with nunck fresh from the swamp? Also if muck could benefit corn or oats next spring."—The muck will do but little if any good to the wheat without lime and salt or ashes. But still, if the muck is there, we would hanl it out and spread it, if nothing better can be done. The future crops will get the benefit of it. If hauled out and spread during the winter, it would be in better condition for spring crops than for wheat now.

Sowing Clover.—C. R. Shiller, Peoria, Ill., has a piece of land now in corn and potatoes, which he wants for hay next year, and have the aftermath for hogs in the fall, and asks, "How soon must the clover be sown?"—Clover should not be sown so late as this. It would be injured by the frosts. Better prepare the ground thoroughly before winter, and sow the clover seed early in spring, when, if the ground is in good heart, a crop of hay might be taken off the same season. But we would not advise it to be both mown and pastured; it would hardly sprvive such severe treatment the first year.

Compost of Muck, Lime, etc.—
"L. E. S.," Newburg, asks what proportions of muck, lime, and manure will make the most beneficial compost. —We would not recommend such a mixture. A compost of muck and stable manure, in proportion of two loads of the former to one of the latter, would make valuable application to land. The process of composting has no other end than to seeme fermentation and decomposition, without the loss of any gases formed during the process. Lime added to such a compost would have exactly this injurious effect, and therefore should not be used in contact with barn-yard manure. A good compost may be made with one cord of muck and four bushels of lime with one peck of salt. Ten to fifty bushels of lime is a proper quantity to apply alone to an acre of ground.

Hard Times for Farmers.—"C. A. W.," of Alleghany Co., N. Y., wrote us August 21th: "Pastures are dried up, and corn is going into the sear and yellow leaf; while some farmers are cutting it up and feeding it to the cows. Nobody has enough fodder corn. Two-year-old heifers only bring the price of yearlings last fall. What shall the end be?"—Since then we

have had a great rain, and we presume C.A.W. feels better, as he has sent us \$5 for two bushels of pure Diehl wheat! Did any one ever know a period when times are not hard? At any rate, hard times are as common as drouths, and fluctuations in prices seem the normal condition of American agriculture. The remedy for drouths is better tillage and heavier manuring. The way to have more green eorn for fodder is to make a piece of good land as rich as possible, and drill in three bushels of corn per acre, and use the cultivator freely between the rows. There is no individual remedy for fluctuations in prices. All that a sensible man can do is to prepare for them, just as he does for chances in the weather. He must not have all his eggs in one basket. He must try to raise things that require more brains, skill, energy, patience, and perseverance, than the majority of people are willing to bestow.

Molding Back the Milk.—F. Gross, Gordonsville, Va., says in Switzerland a wet rag is laid on the back of a cow that holds back her milk, and is a very good remedy. Another correspondent says a weight laid on the back—as a bag of earth or sand, or a chain in the bag—will make her give her milk.—As all the remedies in vogue for this vice relate to an application to the back, there probably may be something in it. We never could succeed in it, and shall be glad to hear more about it from those who have.

Fine Corn.—G. W. Craig, Arbuekle, West Va., sends a boxful of ears of corn as a specimen of his crop. The ears are enormous and a capital illustration of what may be done by selection of seed. Mr. C. states that varieties brought from further North do not succeed well with him. The kind he sends has been cultivated by father and son upon the same farm for forty or fifty years. Notwithstanding the drouth, this variety is so fine in appearance at least, that we do not know where he could go to better it, did he wish to make a change. Good for West Virginia.

To Cure' Incern Hay.—Peter A. Droubay, Pine Canon, Utah.—Lucern hay needs to be cured without exposure to the smr's heat. It should be put in cocks as soon as wilted, and allowed to ferment and heat for two days, during which time the moisture will pass off, leaving the hay still somewhat damp, in which state it may be safely stacked or put into the barn. The cocks may be made high, but narrow, so that the moisture may readily escape. We shall be happy to receive the information referred to.

Hronweed.—D. S. Major, Lawrenceburg, asks how to kill Ironweed (Vernonia). This weed is a perennial, and depends for its existence on the continuace of the root, and will succumb only to such a course of cultivation as will destroy the root. Repeated plowings, with a succession of hoed crops, will effect this. All attempts to get rid of weeds by enlivation and plowing will be abortive, if they are permitted to seed in the fence corners, or other waste places on the farm. These are the places that should be attended to closely.

Relative Value of Manures.—J. K. Webster, Dayton, Ohio, asks which is the cheapest manure to buy to apply on a market garden, soil sandy clay loam—stable manure, at 50 cents a two-horse wagon load; night-soil (delivered), 75 cents a cart load; refuse from glue factory, \$10 per ton; bone dust, \$45 per ton; distance to haul, one mile. We should say that the night-soil and stable manure were the cheapest, and if the sawdust and shavings are tolerably well rotted they will be of considerable henefit in a mechanical way to the soil. We would compost these two manures so that they should be well rotted, and at the prices mentioned would prefer them. But gardens need a rotation of manures as well as of erops. See Peter Henderson's book on Gardening.

Draining a Basin.—Leander J. Post, Lowell, Mich., wants to drain a basin which is surrounded by rising ground. Has tried digging a hole and filling it with stones for a drain, but it became clogged. This is our own experience with such a place. We did not succeed until a drain was dug through the bank which surrounded it, and the water led away. If the value of the land, the appearance, or the convenience warrants the expense, make the drain; if not, leave it as it is.

Sewage,—"A Digest of Facts relating to the Treatment and Utilization of Sewage, by W. II. Corfield, M.A." London and New York, McMillan & Co. How to dispose of the waste matter of towns and cities is a problem the difficulty of which increases in proportion to the size of the community. How to make this waste matter available in agriculture and to return to the land the fertilizing material it so much needs, is a question that has occupied the minds of individuals and legislatures, especially in England. In the various investigations that have been made in England, the name of Mr. Cor-

field, the author of the above-named work, has long been prominent, and the book before us presents in a concise form the present state of knowledge upon that subject. It seems that on a large scale the earth system is too enumbersome, and that the effete matters must be carried off by water. It appears probable that irrigation with sewage will be found the only feasible plan. The work is worthy the attention not only of agriculturists, but of those interested in sanitary matters. It is a handsome 8vo. of 349 pages. Price \$3.50.

Flax .- We would recommend every farmer who can make it convenient, or who has a piece of ground suitable, to prepare a piece to be sown in flax in the spring. As it is necessary to be sown early, the ground should be plowed in the fall. A piece of fairly good sod ground would do, but if stubble is to be taken it should be manured. The seed will be found valuable for the young stock and the horses, or a new mileh-cow; the fiber can be made available in almost every locality, for fortunately the old folks who can use the spinningwheel have not all disappeared, and a loom can yet be heard to rattle in almost every township of the United States. Linen towels, or table linen, or even linen grainbags of homespun, are worth much more than anything of the kind that can be parchased; and it is refreshing for one who has a lingering reverence for old times to see now and then the old-fashioned homespun, which bears an honest look on its face, and will, on acquaintance, verify abundantly all the good opinions that one may form

To Prevent Interfering.—Levi P. Simms, So. Marshfield, Mass., asks how to shoe a horse that strikes. There are two ways of striking—one when the horse strikes the toe of his hind foot on the heel of his fore foot, and another when he strikes the side of the near or off shoe against the fetlock joint on the opposite side. This is what we understand our correspondent to refer to. To prevent, remove the edge of the crust that strikes the ankle, and have the shoe set well under the foot. The opposite shoe should be set lower on the outside and a little higher of the inside, so as to turn the ankle somewhat, that the shoe may clear it in passing. Let the hind calks point inwards, and be rounded off on the outside. If all fails, put a leather shield on the ankle.

"What is the Best Way to Extirpate Sorrel and Mustard ? "-Mr. Il. L. Johns, of California, asks us this question. We do not know. It depends a good deal on the character of the land, the kind of crops grown, etc. We have succeeded in banishing sorrel from a piece of light, saudy land that was formerly covered with it, by seeding it down to grass and top-dressing it with manure. The first two years after it was laid down to grass, the sorrel almost killed out the grass, but the manure so encouraged the growth of the grass, that in two years more it crowded out the sorrel. and it entirely disappeared. The same result sometimes follows a dressing of wood-ashes or lime, and it has been supposed that the ashes or lime neutralized the acid in the soil and prevented the growth of the sorrel. There is nothing in this idea. The ashes and lime, like manure, encourage the growth of other crops, and these starve out or crowd out the sorrel. In regard to mustard, we know of no better plan to get rid of it than to summer or fall fallow, and follow with two or three hoed crops. point is to cause the mustard seed now in the ground to germinate and then kill the plants before they go to seed. Any plan that will do this is good. Seeding the land with clover and mowing the clover before the mustard goes to seed, will be useful.

Leaves .- In a short time the frosts, aided by rains and winds, will have scattered a bountiful supply of leaves over the woodlands. These leaves can he made to do an excellent service on the farm, should be carefully raked together in heaps, and drawn to the homestead, where a shed or some place can be found in which they may be stored away. They may be hauled in a hay-rack by weaving in some corn-stalks between the stakes, close enough to prevent them falling through. A large barn-basket is a convenient thing to load them with, and it will be surprising how many loads may be gathered from an acre of woodland. They make a very excellent bed for hogs, being to some extent the bed provided for them by nature. For sows with young pigs, they are the best bed that can be procured, as there is no danger, when they are used, of the young pigs getting entangled in the bedding and crushed. As a source of manure they are valuable: they rot easily, and have good fertilizing qualities. Elm and oak leaves contain a large proportion of potash, and leaf mold, or the decomposed leaves, make a valuable addition to the soil of flowergardens, or for potting plants. Where mannre is scarce -and where is it not ?-leaves should be the first resource whereby an increase may be made.

We respectfully ask every Reader to carefully consider the following Eight Paragraphs—or the last Six of them at least,—and to show them to others.

SOME EXPLANATIONS.

FIRST .- The reader must judge whether or not it pays to take this journal. We simply suggest that, while its cost is materially reduced when from four to twenty or more persons club together, its bighest cost to single subscribers is less than three cents a week-not the price of one poor segar-not the price of two eggs-not the price of 1/4 lb. sugar-not the price of an ounce of tea-or of two ounces of butter-or of one glass of cheap beer-and for a whole year only half the cost of one pair of shoes. Yet this small outlay secures neatly-printed copies of about Five Hundred Engravings, which cost over \$12,000, and Over One Thousand Columns of carefully prepared Original Reading Matter, besides a considerable amount of advertising, which is specially valuable because thoroughly sifted from all humbugs, deception, and unreliable parties.

The **Engravings** are not coarse, poorly printed ink blotches, but are so finely cut and carefully printed, that they really refine and cultivate one's mind and taste.

The Reading Matter is the result of an immense amount of careful thought and investigation. Reliability, freedom from error, is the first aim of the editors; to print that which will be useful to the most people, is the second; and to get the most thoughts, the most information, into the fewest plain words is their next endeavor. At least half a dozen conscientious, earnest, intelligent, practical minds-the very best the Publishers can secure at any cost-are constantly engaged in collecting and condensing into these pages information derived from experience, from wide observation, from a large correspondence, from reading-in short, from all sources; and the result of all this pains-taking and expense is enjoyed by every reader of these pages at the small cost above indicated. To write finely in high-sounding phrases, spread out over much space, is NOT the aim in this journal. We have to do with every-day work; we would aid in every possible way the toiling millions who are struggling for subsistence, for comfort and competence.-To guard our readers, and through them the public, against the wiles and tricks of ingenious swindlers, is another aim, and it is satisfactory to know that, not only our own readers generally, but multitudes of others, have been saved the loss of millions in the aggregate. That the hints and suggestions from time to time thrown ont have directly or indirectly led to profitable results, has been testified to by tens of thousands. (An example of thousands of letters is given in the item "\$185 per Acre," on page 369. See also the item "Where our Thoughts Come from," page 365.)

SECOND.—Without reckoning for the printing of a single copy, this journal costs about \$60,000 a year, for editing and gathering information, for engravings, offices, type-setting, electrotyping plates, postage, incidentals, etc. This is to be divided among all the subscribers, whether there be two thousand, or two hundred thousand. Of course, the greater the number, the less the cost for each, or the more there can be expended for all, in engravings, preparing matter, etc. Forthis reason, a paper of large circulation can give much more for the same money than a smaller one—to say nothing of the larger receipts from advertising in such a journal. (The Publishers of the American Agriculturist expend upon the paper all the money received from subscribers, and

\$30,000 to \$40,000, a year more, of money derived from advertisements. Subscribers thus get the paper for a great deal less than it costs to make it. This explains how it is that so large and so costly a paper is supplied for so small a price. It is beyond competition, because no other similar journal has one quarter of its cir-from, the further cost for each subscriber, or additional subscriber is only for printing paper, press-work, and mailing-these items amounting to bardly a dollar each where the paper is sent to large clubs, but much more where there is but one person at a post-office to be looked after during a year. It will be readily seen, then, that while the actual total cost is much greater than the subscription money received, it is profitable to extend the circulation, and why premiums can be paid to secure this. The advertising space is never allowed to crowd upon the reading columns, but it is made more valuable by every hundred subscribers added, and this supplies more means for improving the paper, for paying premiums, and for profit ... ... Again, believing the paper useful, the Publishers as well as Editors are gratified at every extension of its influence. "Published to do good and make money" is their motto.

THIRD.-Most readers voluntarily send in their annual subscriptions promptly, at single or club rates. Others, intending to do so, put it off from day to day until too late for the year. Others grently dislike letterwriting, and do without a paper rather than write for it. Msny others are unacquainted with the value of this paper to themselves. It is therefore convenient and desirable to have some one at EVERY Post-Office who will gather up the irregular subscriptions, and show and explain the character [of the paper and describe its usefulness to nonsubscribers, and even urge them to give it a trial. So, while trusting much to the voluntary good-will of those who send on the names of their neighbors and friends, the Publishers many years ago adopted the further plan (now largely imitated by other journals) of offering Prizes or Premiums to those who, in their own localities, where they are known, act as canvassers, and take the trouble and time to gather and forward subscriptions. The plan has worked very well nll round, as explained below. The Premiums are open to any and every one, and more than 13,000 persons have obtained them with almost universal satisfaction and pleasure.

FOURTH .- The large value of these premiums surprises some persons; they even think there must be deception. It is easily explained, and will be interesting to many. The Publishers as well as Editors are ever on the lookout for good things that will please or be useful to their readers, and are "dead set" against commending by engraving, or description, either in reading or premium columns, any article that they do not believe to be of the best quality and every way reliable. This is so well understood by manufacturers and sellers that they consider the best recommendation they can possibly get is to have their articles placed in our premium list. They are therefore quite ready themselves to supply some of their good articles free for our premium list, or at least to offer very grent inducements in the way of prices, advertisements, etc., for the comparatively limited number required for premiums. (Owing to the much larger circulation of this journal, its character, and this carefulness in commendation, better terms can be offered to its publishers than to any other paper.) ..... In addition to the above arrangements, the Publishers, in order to supply a large assortment to select from, add some other useful premium articles, books, etc., upon which they expect to lose money even, if it be not made up by increased advertising..... The above explains why so large premiums can be given, and why cash commissions of any thing like the amount can not be paid. Yet the preminm articles are each just as good to the recipicut as so much Cash. The assortment is large and varied enough for every one to select a needed or desired thing. After reading this page, please turn to page 393 and examine the list, and the descriptions following. Let it be distinctly understood that not a single article of a poor kind, or poor make, or second-hand, or in any way unreliable, is offered. The BEST is guaranteed in all cases. The price set against each article is that at which it is regularly sold; and, we repeat, that every article is just as good as so much CASH to every one who may desire it.

FIFTH.—The premiums are open to all persons alike, everywhere. There is no blind competition against unknown parties, or favorites, or pretended recipients of premiums, never really paid. The simple offer to each and every person is: Send so many names at the prescribed price, and the Premium shall be yours—no matter how many others are after the same thing. Arrangements are made with reliable parties to supply enough for all premium demands. (For any articles beyond the premium requirements, we must pay the regular prices.)

SIXTH .- We have thus given the whole secret of the premium business. Is not this a plain, straightforward orrangement, all round? It gives a good remuneration to those who take a little time and trouble to collect and forward names of subscribers, few or many. Those supplying the articles are satisfied. The Publishers are able to make the liberal offers. Those who get the premiums are pleased and profited. Those who are induced to subscribe through the premiums given to canvassers, get a good and useful paper at its usual cheap rate, and we are sure that every reader for a year will get hints, snggestions, information, engravious, etc., of far more value in the end than the small outlay for subscription. There are five million persons who ought to take the paper on their own account. A small company of them, at least, live within your circle of acquaintance, and you can reach them.

SEVENTH .- And Now, Reader, we cordially invite you to take a personal interest In this enterprise. There is hardly a post-office among the 30,000 in this country, and those in British America and elsewhere, around which there are not persons enough to form at least one premium club, and generally there is room for several such clubs. New and old subscribers may be included if there are some new names. Others in your locality may or may not take hold of the matter also. There is usually room for several, and you need not wait for others. You can hardly fail to find some very desirable article in the large list of premiums, and determination will secure it without cost. Over 13,000 other persons have obtained one or more of these premiums with great satisfaction, and you can do the same. It is certainly quite as honorable as soliciting trade in the highest ranks of husiness. Merchants, elergymen, and other professional men, ladies and children, are recorded in our past premium books in large numbers. One does a good work who promotes the diffusion of intelligence among his fellow-men, and such an end is gained by securing a wider circle of readers for a journal of this kind. Let ten, twenty, or thirty families in a neighborhood read it, and the thinking and reasoning developed, and the improved culture and the improved homestends, will tell upon the increased value of all property there.

received during the remainder of this year get the American Agriculturist from the time their names come in to the end of next year, for a single year's subscription price. Those coming early get more papers. Those coming in October get the paper for fourteen months. A Premium List can therefore be made up now quite as well as later, for there is the extra inducement for new subscribers coming now. Old subscribers can renew in a club now as well as a month or two hence. The canvassers for premiums first in the field will have the best opportunity. As fast as new names are secured send them on, that they may begin to receive the papers of this year free....See page 393.

Sterile Fan-tail Pigeons.—H. B. R., Easton, Pa.—Sterility in birds of all kinds is sometimes a consequence of great age. If your birds are young, a probable reason why their eggs did not hatch is non-inpregnation. Pluck the feathers from the middle of the tails of the heas, removing two thirds or more of the whole, for the trouble in impregnation with this breed is in a sense mechanical rather than physiological.

Poultry Disease. - W. G. West, New Berne, N. C., states that there is a disease prevalent the poultry in his neighborhood which causes the fowls to mope about and shake as if they were chilled; the comb and wattles break out in sores, and swell so the eyes are closed. Nine out of ten cases are damp, or unclean lodging. The cure is to administer the following: Finely pulverized charcoal, fresh burned, and new yeast, of each three parts; pulverized sulphur, two parts; flour, one part; water sufficient to make a thick paste. Give a dose about the size of a white bean three times a day. Another remedy is: Powdered gentian and ginger, each one part; sulphur, one part; Epsom salts, one and a half parts; mix with butter, and give a dose similar to the one above every morning. The head should be hathed with a lotion of one onnee sulphate of zinc in a quart of water or warm milk and water. Dry quarters must be given, and cleanliness is requisite.

Hogs and Horn Dust .- I. W., Camden Co., N. J., is feeding a pen of shoats liberally with steamed ship stuff. He mixes with the manure daily a portion of swamp muck and leaves, and sows over the whole a small amount of prepared horn and hoof dust. The hogs root out, and consume the horn dust, and as it costs \$80 a toa, I. W. wants to know if he loses anything in the process. We should say there was some loss. The hogs need something of the kind, or they would not eat it; and needing it, must of necessity assimilate some of What amount of loss there would be, is a question we could not answer. We would not mix any more in the pen, but would burn some bones and feed them to the hogs. If they are young hogs, they will require more phosphate of lime than they will get in their feed, which probably has the coarse bran taken out of it, to supply the demand of the growing frame of bone which must be built up very rapidly in fast-growing bogs; the burnt bond will be readily consumed by them, and what is not used ap in bone will be added to the manure. Bone, in this shape, will be found cheaper than in the form of horn.

Steaming Food .- W. C. Blackfan, of writes: "I would like to know if it Bucks Co., Pa., would be profitable for me to steam the food for my stock. I fatten twenty head of cattle, and have twelve to fifteen head of milk cows, sheep and swine, horses, etc. Would it pay to ent up corn fodder and steam it with meal on it? and would I be the gainer after the extra labor was deducted? I am a young farmer, and desire to make farming pay by any new improvements." is the general opinion that steaming saves one third of the food, and that cattle thrive better on cooked than on nncooked food. Our experience seems to sustain this as-Your stock seems to be about equal to forty head of cattle. If we fix the saving at one quarter, instead of one third, you will save by steaming the cost of the food of ten head. You know better than we do how much this is worth. The extra cost of steaming will be, say, 121/2 per cent on the cost of apparatus (about \$800), \$100; fuel, \$25; extra labor, \$100; in all, \$225. To off-set a portion of this, you will have steam-power for thrashing, sawing wood, grinding grain, etc., etc., and the services of the extra help for a portion of the time. If your own time is not fully occupied in the winter, your extra labor will cost less than our estimate. foregoing facts before you, you can decide better than we can whether it will pay. It does pay us.

Sour-Keep for Beet-Iseaves, etc.—
I. B. Root, of Rockford, Ill., says: "We have a great many tons of leaves of beets, carrots, cabbages, caulishowers, etc., in fall. Now, how can we keep them for feed even a few weeks? An answer through the Ogden Farm papers in Agriculturist would doubtless interest many. Last season I tried the Dutchman's 'sour-keep'—burying as so many roots after tramping very tight; but all heated and rotted."—We know of no way to preserve these leaves except by the German system of "sour-keep," and that we have not tried. The reports of the operation as practiced in Germany are very favorable, and we fear that the cause of failure in this instance is due to the admission of air. The leaves should be very tightly tramped down in a pit in dry soil, and covered with a well-packed layer of earth—raised so as to shed the rain. As the leaves ferment and settle, cracking the earth covering, this should be smoothed over so as to ex-

clude the air. We do not advise that the keeping of leaves in this way on a large scale be attempted at first. It is safer to begin with a limited experiment. The plan works well in Germany, and there is no reason why it should not here. Whether it will pay with our more costly labor is another question. Try it.

Good Advice from a Doctor.—
"Medicus" writes: "Let me say a word to my brother practitioners in the country. Take the Agriculturist, and study it, and you will be able to pass many a pleasant hour discussing its contents among your patrons. A physician is a man of influence, and much information is expected from him, let the farmer but see that you have accurate ideas of farming, and he will have more confidence in your professional skill. Of medicine he is ignorant, but if you are au fait on agricultural matters, he will take it for granted that your medical knowledge is equally reliable. So take the Agriculturist."

Wagon with a Low Body.-The figure of a wagon with no reach, given by Mr. Stoddard in his article on an Egg Farm in July last, has caused numerous inquiries by our readers. It is a proof that agricultural papers have a mission to perform ia disseminating information respecting valuable inventions, when so convenient a wagon is used only in a few localities, for it should find a place in every town in the country. The wagon is used a great deal in Rhode Island, where it is called the "Providence low-gear." The advantages in loading low, in ease of brick, stone, iron, and other heavy articles, are not the only ones secured, for in loading dirt, mannre, and the like, each shovelful is thrown a less distance than is necessary in loading a common wagon. The saving of time, as well as of muscular exertion in this way, is worth the attention of farmerstwo short throws with the shovel or manure-fork taking no more time than one long one. We know of instances in our own vicinity where the wagons give great satisfaction in many kinds of work, the owners declaring they would part with them on no account, and we have never heard of a trial resulting otherwise. The vehicle is simple, and casily huilt by any wagon-maker, with the exception of the rear axie-tree, which can be made to hetter advantage at a power-shop, where heavy forging is done, than at an ordinary blacksmith's. Iron sockets should be attached to the sides of the body, in which stakes may be inserted to support side boards when needed.

### A Missouri Farm - How to Manage it.

Mr. Alexander Morrison, of Michigan, writes us that he has "bought a farm in Missouri, and would like an answer to the following questions in the American Agriculturist.

"The farm is high rolling prairie, with soil from two to six feet deep, underlaid with limestone, but it is probable that the lime does not help it, as the soil is composed of the grass rotting on the surface for generations. The soil is flat or instpid, and needs something to quicken it. The crops of corn have ranged from sixty to seventy bushels per acre, according to season and cultivation, and now what I want to know is how to make it produce one hundred bushels per acre. I have a good limestone quarry on the farm, and a good coal bed a few feet from the surface, and there is any quantity of manure to be had for the earting less than a mile."

Question 1st. "Will fresh-burat lime do such land much good? If so, how much and how applied?"—The first thing to be done is to see that the land does not suffer from stagnant water. If it does, no amount of lime or manure will enable it to produce maximum crops. There is no other remedy hut draining; but probably a few surface ditches will be all that is needed to make such loose, rich land dry. When this is done, lime will probably be of great benefit, especially for wheat, clover, and tame grasses. If it can be burnt on the farm for five or six cents per bushel, the chances are that its application will be highly profitable, as the effect will last for many years. We should put on 160 bushels per acre, or a bushel to the square rod. Spread it broadcast over the land, and barrow or plow it in.

2d. "Would stable manure do good? How much and how applied?"—Apply it in any way and at any time that is most convenient to you. Put on twenty loads per acre, and as much more as you can find time to draw. It is ridiculous to suppose it will not do any good.

3d. "Would it pay to use gnano or flour of bone?"— Certainly not—when you can get manure for the hauling. 4th. "Will it pay to use plaster?"—We can not tell. Better try a little.

5th. "Is there any other fertilizer that will help such soils?"—Nothing so good as well-rotted manure. All that such land needs to enable it to produce 100 bushels of corn per acre, in a favorable season, is draining, good tillage, beavy manuring, early planting, and thorough enlitivation.

### \$185 an Acre in Improvements, and How it Pays.

Many readers will get a useful hint from the following facts, given to the American Agriculturist by a reliable gentleman, well known to us, but who wishes not to have his name in print. Such hints and details give great value to the pages of this journal, for every cultivator baving even the smallest plot of ground. .... Eleven years ago I bought a field that was somewhat wet in spots, not a little rough with stumps and bushes, and quite stony. With hard plowing, much hoeing and cultivating, a part of it yielded 34 bushels of corn per acre, and a part of it 67 bushels of potatoes. Failing to bargain for an adjoining piece of ground as I expected, I thought to put the money out at interest, but, guided by a suggestive item in your paper, I hired a lot of men just disebarged from a railroad, and set them to work with The roots and brush we burned. The larger stones we sunk in holes dug under them. The smaller ones, all that could be handled, we suak in large drains, dug every 25 feet, 5 feet deep, and filled up 21/2 feet with Where stones were lacking we filled out the drains with drain tiles. We spaded the whole piece over two feet deep, keeping the best soil on top, digging in twenty-five two-horse wagon-loads of manure pretty deeply, and picking out every stone as large as a hen's This whole work cost \$185 per acre, and all the neighbors called me foolish—wasting money that would have brought me 7 per cent. Indeed, I borrowed some money at that rate to finish my job. The whole field was as fine and mellow as an ash-heap or onion bed, and you could thrust a cane down into it two feet deep anywhere.

"Now for the result: For ten years past a part of that lot has given me an average of 76 bushels of corn per acre sold at an average of 83 cents per bushel-or 42 bushels more per acre than I could possibly have obtained as it was originally. It is like cultivating any other garden plot. It costs no more for manure, for seed, for planting and working, and the extra stalks have doubly paid for the handling of the extra 42 bushels of corn. So I have had annually 42 hushels of corn extra, at 83c, per bushel, or \$34.86 annual interest on the outlay of \$185 at first-equal to over 1834 per cent, instead of 7 per cent for money horrowed! Part of the same ground, when in potatoes, has vielded as high as 50 per cent interest per annum, and more. Indeed, though I can not give all the figures, I am sure that on all the crops, taken together, I have got my original investment fully back once in three years! From this experience, and others like it for a shorter period, I can fully subscribe to the oft-repeated doctrine of the American Agriculturist, that most farmers would make a great deal of money by selling half their land and putting the avails into the other half, if indeed it would not pay to sell two thirds. Much less expense would put the majority of soils into the ash-heap or garden condition of my land. Keep on drumming these ideas into our American cultivators. You put money into every man's pocket whom you bring over to intelligent culture. Arithmetic and common sense, or sound reasoning, will yet do the business of making farming pay better, and your journal must perform a large share of the work. I was led to give you this experience by a remark in your business aanouncement for September, in which you say that no cultivator can afford to be without the paper, unless he would suffer great loss, and fall behind his neighbors who do. I am thousands of dollars richer to-day for its hints to me, and I know several others in the same condition ....

### Bee Notes for October.-By M. Quinby.

The careful beekeeper will now select his stocks for winter. There should be about twenty-five pounds of honey in each, where there is much bee-bread; that, together with the wax, will often weigh ten pounds, and bec-bread is never reliable as sustenance for old bees. There will be very much more of it in a hive that has worked from the swarming season natil this time without a queen. There is danger of a hive having too much honey, as well as too little. The progressive beckeeper, with the movable frames, will find it best to alternate combs that are filled with such as are not. Do not attempt to winter a light, weak stock; unite it with some other. Feed up to the required weight as soon as brood is all hatched. If strained honey is used, seald it thoroughly, to avoid danger of foul brood. If comb is used, cut the sealing of the cells, and if robbers are excluded, it may remain on top of hive through the day. All stocks a year old should be examined with reference to foul brood, and by no means allow such to be robbed, thus infecting others. Remove boxes. If any are partly full, let the honey from such be removed by the bees of some hive that needs it, after which the clean empty combs can be saved for another year. Examinations for foul brood are best made in the middle of the day, but the strength of a hive is best ascertained in the morning. A cluster of bees

that extends through seven or eight combs on a cool moroing this mouth, may be considered strong enough. The combs of a light stock from which bees have beat taken can be set away to freeze, and be used for swarms another year. Set right side up, and exclude mice.

In preparing honey for market, care should be taken to have it look neatly, as experience proves that consumers have an eye to appearances. Wipe with a damp cloth any honey that may have leaked on to the glass. paper or muslin on the bottom of the box, to exclude dust. Boxes to ride to market should be inverted, to prevent breaking, but they should not be inverted at any other time, as there are often some unsealed cells that will leak, and give the combs and glass an untidy appearance. The effect is worse if they are turned bottom side up while warm, when first taken from the hive. In takhoxes from the hive, they should be carefully lifted with a strong knife slipped under the bottom. Set them on one side or end, keeping the combs vertical, until the bees are out, then put them away, standing them in the same position as when on the hive. In regard to foul brood, we have succeeded in eradicating it from our apiaries, not having seen a case of it this summer. I mention this as another argument for movable combhives. With their aid we can discover it in its incipient stages. Hence our success.

# Salting the Sheep. See Engraving on first page.

While flock masters differ upon various points of management, they all agree that sheep need salt. Some consider salt so necessary to the well-being of the flock, that they provide covered troughs to contain it, so constructed that the sheep can have constant access to the salt, while that is protected from loss by rains. Others content themselves with salting regularly once or twice a week. With our own flock, it is made the shepherd's duty to salt them every Saturday. There are those who contend that animals do not need salt, but if they could see the eagerness with which the sheep come at the call, they would be convinced that the appetite, if an artificial one, as they claim, has every appearance of being a natural one. In England, Flanders, and other countries, salt has long been regarded as the chief preventive of the formidable disease in sheep known as rot.

## Riding on Horseback.-No. 6.

The horse having taught the man—in the earlier papers of this series—it is time now for the man to teach the horse. That is, the pupil should now have sufficient skill to be able to take in hand any horse that is fit to be used for pleasure-riding, and so to train him as to make him a really good saddle-horse.

As the best way to do this is, in our opinion, on the principle of Baucher's system, we give here a brief sketch of his method, not being able to devote anything like the space necessary for its full exposition. The peculiarities of the method are thus set forth by Mr. Phillipps, from whose book we have before made extracts: "It begins by enabling the horseman to take complete possession of the horse's faculties while at rest and in slow motion. This ascendency, once gained, need never be lost; because a good horseman is always able to reduce his horse to that state in which it can be successfully re-asserted. The horse is, in this manner, soon made to perceive that if he escapes from the equilibrium required by his rider, when at a pace which gives him the opportunity of doing so, he will immediately find himself brought back to a pace at which he may be forcibly prevented from doing so. When he once understands this truth, his self-will is subdued forever."

Baucher teaches that the horse does his work easily to himself and measantly to his rider only when he moves under the rider's weight and in

obedience to his directions, with the same ease and grace, the same perfect equilibrium, as when playing with other horses in an open pasture. A horse moving in a state of freedom carries his hind legs so far under him, that they carry the weight of the hinder part of his body in the easiest way, and so as to give the front legs only their proper share of work to do. The neck is left perfectly free to carry the head in whatever position will best assist in maintaining the balance of the body. If we take an unbroken horse, whose movements in the pasture are all perfect, and put a rider on his back and a bit in his mouth, he will either perform such antics as will make him anything but a pleasant saddle-horse, or, which is most likely, he will become perfectly rigid and awkward, poking out his nose, bearing on the bit with the full force of his neck, carrying too much of the weight on the fore quarters, and straddling along with his bind legs in a very ungainly and uncomfortable way. Especially in the canter will he seem to plunge with his whole weight on to his fore feet, making his gait both uncomfortable and unsafe. Baucher's method overcomes these difficulties, empowers the rider to carry the weight of both horse and rider on the fore feet, or on the hind feet, or on all, at pleasure, and to soften the rigidity of the neck, and cause the head to be carried in an easy position.

The first step, after having broken the horse to saddle and bridle, is with the neck and mouth. Stand at his left side, facing his neck, holding the left rein of the snaffle in your left hand. Take both curb-reins in your right hand, a few inches back of the bit, and draw them gently towards the horse's chest, holding him in place, and keeping his head quiet with the left hand. The horse will at first resist the pressure of the curb, and try to throw up his head, but if you are patient and firm, he will presently bend his neck, draw in his chin, and champ the bit: then drop the curb-reins, pat his neck, and make much of him. Repeat the lesson at short intervals, until at the slightest touch of the curb he will arch his neck. This lesson having been repeated until it is perfectly understood, renew it in the saddle, drawing on the curb with a steady pressure, until he drops his head and champs the bit as before. Reward the first sign of obedience by caresses and praise. Repeat the movement, until at the first touch of the rein he lets go of the bit, arches his neck, and stands quietly and at ease. Even if you have to call assistance to keep him in place, do not let him either back or turn around in order to get away from the pressure of the bit.

The next step is to obtain the same control over the hind quarters that you now have over the forehand, and you must first teach him to bear the spur without moving. Accustom him first to the pressure of the leg and of the unarmed boot-heels, and later of spurs with cloth or leather over the rowels; when he is perfectly indifferent to them, then uncover the rowels.

Mr. Phillipps says: "When he has learned not to resist the spurs (by kicking), he must next be taught to spring from them. Get him well in hand, and touch him lightly but firmly on both sides. If he kicks or winces, you are getting on too fast, and must return to the covered rowels, if not to the bare heels.... If he tries to move forward, carefully restrain him by the bridle, and then, dropping both your legs and hands, caress him, and let him stand at ease. Repeat the lesson until the slightest pressure of your legs is sufficient to make him promptly collect himself and bring his hind legs under his body." The great point

is now secured; the horse has been taught the position you desire him to maintain, to carry his weight well on his haunches, to arch his neck, and to relax his jaw. Future instructions consist mainly in teaching him to preserve this position, and to avoid all rigidity at any speed.

## Ogden Farm Papers. - No. 21.

[Note.—This paper should have appeared in September, but the editor, going off for a vacation, put it into his pocket instead of sending it to the printer.—Ed.]

Whether it is in consequence of the dry season, or because of the cold June, I will not pretend to say, but for some reason Ogden Farm is producing a very small yield of suggestions at about this time. I can grow corn fodder in a very satisfactory way, and can make a good product of butter and get a good price for it; but when it comes to sitting down for the monthly chat with my readers, the soil seems to be sterile, and the erop of "ideas" to have been nipped in the bud. What to write about, that is the question, and it is sometimes a very hard one to answer. Some one suggests, "Your own experience." Very well, but is my experience worth the telling? How long can a man farm sixty acres of land-even in the best way-and get from it an experience that will always be worth telling? And then, to tell the truth, the editor won't let me write just as I like; if my efforts don't strike him as worth printing, he has a way of not printing them. The consequence of all this is, that I am often overtaken by the feeling that I would rather hoe corn all day than try to squeeze any more "papers" out of Ogden Farm.

But, after all, is this not a bilious, hot-weather view of the case? What man with crdinary wits can devote himself to the wonderful processes of an improving farm, and not have 'experiences" every day-yes, every hourthat are richly worth imparting, if only he had the faculty of setting them forth in their proper clothing of words, and of making others realize them as he does? We have been now nearly four years at our work; four years of preparation. A poor, wet, naked, mossy old farm, without a decent fence or a passable building on it, with not crops enough to pay rent and taxes, with no inducements to buy that were not comprised in a low price and a good fall for drainage. This was our starting point, and when we recall it, in all its dismal proportions, and then see where we are to-day, we do seem to have made headway. We have cleared away nearly all interior fences; relaid those that were kept; built a first-rate barn, sheds, and other out-buildings; made the house habitable; drawn away through thirteen miles of tile drains the accursing ooze that had made the farm a slime; accumulated a stock of over seventy, horse kind and horned cattle; fed them bountifully, and so made abundant manure for the fields, and have really got to a point where we can see daylight. The old farm was an inert tool-worn out, stuck in the mud, and utterly useless. Left to itself, it would soon have become a swampy, bushy, wild common. It is a source of no little satisfaction to have taken this tool out of the mire, put in new springs and stays, polished it up, and oiled its joints, so that it begins to work again; and to feel that the more it is used, if it is only well used, the better it will become. Every spot of strong and luxuriant growth is an earnest of what is coming in due time; it shows what the

farm will do when it has a chance—which we know it soon will have.

To show that my emotions do not depend entirely on what the farm is to do, let me say what it has done. We are now (end of July,) feeding in the barn and yards the equivalent of 35 fullgrown cows, and we have had about this amount all the season. About 15 acres of the land are in fallow (being cleaned for late planting), or just set out to roots and cabbage; 4 acres are in the inclosures about the buildings. This leaves about 42 acres in crop. Since about the middle of May the stock spoken of above has been fed (soiled) entirely from the produce of the land; we have housed 10 tons of well-cured oats and some 2 tons of rye straw; as much as 5 tons of oats, grass, vetches, and other surplus soiling crops will be secured within a week; nine and a half acres of new meadow (that has cut two crops of soiling oats already) will give a good aftermath to cure in August; thirteen acres of sowed corn is growing most luxuriantly, and seven acres more are to be planted at once for a tender bite in the autumn; four

aeres of potatoes are growing, and most of them promise well. Just how much of the cornland we shall have to cut over to feed our stock until frost, I do not know; it will depend very much on the age of the corn when cut, But I am confident that the 35 head of stock can not between now and November 1st consume more than one third of the crop, leaving two thirds to be cured for winter use. To sum up: If my anticipations are fulfilled, the 42 acres will have produced, this year, enough long fodder of vari-

ous kinds to entirely supply the 35 head, the year through, with all the hay and fodder they will need

This is no wonderful showing. Of course, there are many farms that have done better, and I regard it as only a commencement of our own possibilities; but it is fully enough to confirm me in my belief that before the time the Ogden Farm operation is put to the test of an auction sale, to determine the actual money result (six years hence), the 601 acres will produce all the long fodder needed for 50 cows, and salable crop enough to pay for all the grain they will need, that is, to support them entirely. When we estimate the yards, roads, headlands, etc., etc., the available area for cropping will be reduced to about fifty acres. A cow to the acre-well kept-is not unknown, but, in my experience it is at least unusual; and it is a result that can only be achieved by soiling, high feeding, and heavy manuring. That we need stop at this point, I am not inclined to believe. That an acre of land-with sufficient manure and sufficient labor-might support two cows, or even more, is within the range of possibility. It is mainly a question of the just apportionment of the means to the end-of the point at which the cost of production will overbalance the value of the product. Where this point lies with any given soil, has not, so far as I know, been determined. Probably it lies farther on than most of us would suppose, for, up to a very high rate of production, the expenses bear a less and less ratio to the crop the larger the crop becomes.

Before an average farmer can decide whether soiling will pay him, or not, he must know how much it costs him to pasture his stock, and how much it would cost to soil them, For instance: In my neighborhood, land that will carry one cow to two acres is worth \$150 per acre. The pasture for 20 cows (40 acres) would cost \$6,000; at seven per cent, the ontlay for summer keep would be \$420. Five acres of the same land that had been thoroughly prepared for soiling-that is, that had received, for ten years, all the manure and all the labor the forty acres had demanded to be kept in good orderwould, if the crops were well arranged, support the same head from early in May until November. Thus \$315 in interest would be saved. The labor of growing the crops and attending to the

tive" cattle do well if they hold to one half their yield six months after calving. Jerseys, that will not do a great deal better than this, are not worth having. I have a thorough-bred heifer ("Thrift"), that had her first calf as a two-year-old in October last. She took the bull again in November, and is to calve in August. She is small, and not an especially fine specimen of the breed. I have several young ones whose flow is much larger, and I only bring her forward as "a case in point." The following is her monthly average of milk:

The daily average for the ten months (during which time she gave 3,150 pounds of milk, or 1,575 quarts) was 10½ pounds—being 72 per cent of her fullest flow, while the product of the last month (within one month of calving) was 57 per cent of the fullest flow. It does not now look as though we would be able to dry her off.

At the date of this writing, when she is within three weeks of calving, and is springing a fresh bag, she is giving a little more than 8 pounds per day, considerably more than one half as much as she gave at her flush. This is what I mean when I say, that a good Jersey is the hest family cow. She is small, and cheaply kept, and while she will never overflow the pantry with more milk than the pans will hold, she will keep the milkman from the door more weeks of the year than any other cow in the

Fig. 2.—"Dubbed" white legnorns.—(See next page.)

stock would not cost so much as this, and there would be, so far as the land is concerned, all the difference of high condition and constant improvement, or low condition and constant deterioration. The land is like the human mind: the more we put into it, the more it will receive and make good use of, and the more it is used, the more serviceable it becomes, if only used with judgment and discretion.

Then, again, the produce of the cows will be more in the ease of soiling than in the other. In June I was making a very satisfactory amount of butter; so were the pasture men all around me. Now that the drouth has (in spite of passing rains) begun to affect the pastures, their product is falling off, and by September it will be materially lessened. My product is increasing week by week, until, from the same number of cows, it is now over ten per cent more than it was in June, and, as the experience of previous years has shown, it will be fully ten per cent more in September than it is now. Probably by that time the pastured cows will have fallen, on an average, to one half their June supply.

Some of this difference, though less than would probably be supposed, taking whole herds together, is due to the character of the cows." Na-

world. Five quarts a day is not a large amount of milk for a growing family, but if it is good Jersey milk, it will go as far (except in the swill-pail) as eight quarts of "milkman's" milk, and—what is the best of all—the cream does not fall away as fast as the milk does. The last month's milk is much richer than the first.

To explain my illustration of the economy of soiling, it is proper to say that it would probably be practically impossible to arrange the cropping of five acres so as to keep up a full season's supply for 20 cows, but ten acres may be made to feed the whole from one half its produce, the other half being cured for winter use.

As a report of progress to those who are curious about my dairying, I would say that the deep cans are still in constant use, and that I am more and more pleased with the system. With all sorts of weather, when we would probably have made several semi-failures if using shallow pans, the butter has been perfectly uniform, and even my Philadelphia customers (who like, when away from home, to brag about Philadelphia butter) say they have never eaten butter so good as the O. F. they are now getting; and a little praise goes a great ways with a young farmer.

there is little liking

for the adult fowls

the markets ordinarily afford, for

### An Egg Farm. BY H. H. STODDARD .- Sixth Article.

The layers must be of a breed that affords chickens easily reared, for success in the nursery department is all-important; they must be at

the head of the list of prolific layers of fair - sized eggs. None but a non - sitting race will answer, for sitters make fully double the labor during half of the and the year; feathers must be Eght, because dark ones show hadly when chickens are dressed. There is at present no breed that fulfills all these conditions as well as the White Leghorn. It may degenerate in time, as other races of fowls have done, by being bred for fancy instead of utility, but it possesses now more vigor thau any other

non-sitting breed. Excessive wattles, comb, and tail, prized by the fanciers, are for our purpose avoided, and by selecting the most moderate combs and other appendages for a number of generations, our stock appears as in fig. 1, which, like all of our illustrations, was drawn from life. In breeding poultry, show and utility do not get on well together in the long run. To fanciers unquestionably belongs the credit of originating improved breeds, but afterwards, in fixing conventional points for the

show - room, the stock is often ruined in their hands. To prevent freezing of the combs and wattles during severe winters, they should be dubbed when the birds are two thirds grown (see fig. 2 on preceding page). The operation is not so painful as might appear, and if shears are used, the bloodvessels are pinched, and but little blood will flow.

The layers are relied upon to produce the principal part of the income, and as they are chief in point of numbers, the detached stations

where they are kept form the main part of the establishment, to which the breeding and sitting departments are merely tributary. Most of the layers must be kept only until the age of from fifteen to twenty months, and then killed for sale, and their places supplied with

young pullets. This course is necessary, because the yield of eggs is greatest during the first laying season if the hens are of an earlymaturing breed and are fed high, and stimulated to the utmost, as they must be, to secure the highest profit. For though hens are still

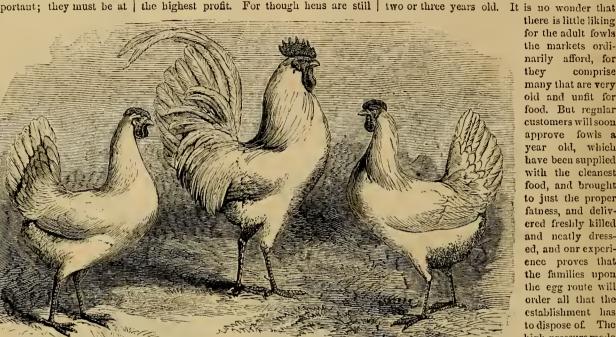

Fig. 1.-WHITE REGHORNS.

vigorous at two years, yet it will be found that after a course of forcing to their greatest capacity through the first season, they can not generally be made to lay profusely during the second. If we chose not to put on the full pressure of diet the first year, but to feed moderately high for two or three years, a fair yield of eggs would be afforded during each. But such a course would not pay as well as to keep pullets only, and maintain a forcing system constantly from the time they commence to lay until they stop,

food. But regular customers will soon approve fowls a vear old, which have been supplied with the cleanest food, and brought to just the proper fatness, and delivered freshly killed and neatly dressed, and onr experience proves that the families upon the egg route will order all that the establishment has to dispose of. The high-pressure mode

> turning off while yet young, is then the true policy. The point is, there is a certain consumption of food to enable any animal to keep alive. The ordinary vital operations, aside from laying or increase of size, demand force, obtained through foodwhich is money-and we should aim to support only such fowls as are all the while giving returns in either growth or eggs. The long period of moulting and recovering from its consequent exhaustion, costs, as does the maintenance of the vital fires during the cold of winter. It is a

matter of quick balancing of profits and expenses with animals, which, like fowls, consume the value of their bodies in about six months. If it is nrged that the stimulating diet and unnatural prolifieness will subject the stock to disease, the reply is that the regimen is not continued more than six or eight months, and in that time evil effects will not ordinarily follow, for the birds are allowed freedom, sun, and air, aud special provision is made for daily exercise. As none of the fowls to

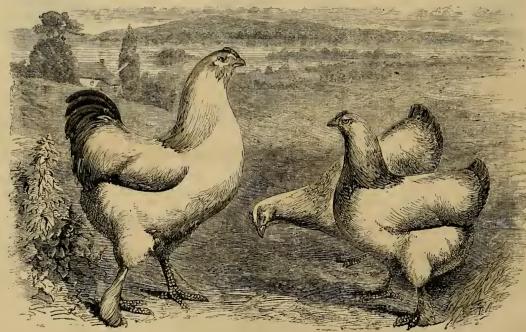

Fig. 3.-LIGHT BRAHMAS.

and then market them before they eat up the profits in the idleness of fall and winter. Pullets grow fast during the early part of their lives and give a return in flesh for what they eat then. After they commence laying, their eggs are prompt dividends, and, besides, their which this forcing system is applied, leave descendants, no evil effects are accumulated and entailed upon the stock. The layers are from the eggs of fowls that have not been subjected to any such pressure, and during the period of their principal growth they

have been given a nutritious but not especially stimulating food-like a colt at pasture. When they arrive at the laying age, they are kept like the horse-broken to work, and put to constant and severe labor, and fed as high as he will bear.

The sitters are of a breed chosen for persist-

ence and regularity in incubation, fidelity to their chickens, and gentleness of disposition. The Light Brahmas are our resource, and can not be excelled for hatching and rearing (see fig. 3). Pure bloods, however, are not used; but to give less awkwardness and greater spread of wings, they are crossed with snowwhite barn-yard fowls (see fig. 4). The half - bloods produced are represented very accurately by the artist (see fig. 5). They resemble the Brahmas the most in form and other

characteristics, and are almost uniformly docile. The half-blood Brahmas are extremely valuable for hatching and taking care of chickens. The results of the labors of poultry fanciers in producing two such breeds as the White Leghorns and Light Brahmas are enough to compensate for all the humbug practiced by many members of the guild. The sitters are not kept at detached stations like the layers, for several reasons. One is, they should be all near together,

necessary in con-nection with hatching. Then the buildings should be large enough for the keeper to enter, in order to take care of the nests and chickens, but the size of the structure and the risk of jarring eggs will prevent moving. Nor can the system of indirect feeding and no yards be pursued, for the sitters should be fed at the attendant's feet, and tamed so as to submit quietly to the handling they must receive while hatching and rear-Their yards ing. are sufficiently

large to admit of exercise, and for the same reason their dry grain is buried in the ground or under straw. In very cold weather they are confined to their houses for warmth, and are given a stimulating diet to promote winter laying, not so much for the value of the eggs as to render it certain that there shall be a considerable number of birds ready to sit in February, and many more in March. The fowls chiefly depended upon for this, consist of the earliest pullets of the previous year, and also the old hens that have been employed much of the time the preceding sum-

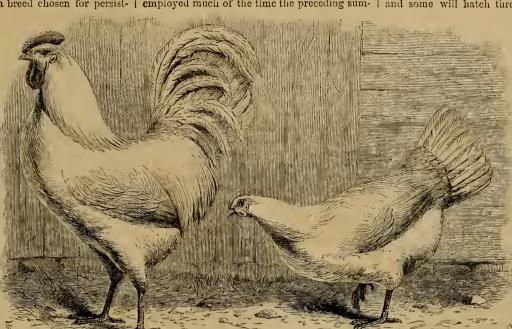

Fig. 4. -- snow-white barn-yard fowls.

mer in hatching two or three broods. The prevention of laying by hatching and rearing, causes birds thus occupied to lay earlier the next season. By a little management there is no difficulty in procuring plenty of offers to sit from February to June. One half the sitting stock are kept until two years old, and of the pullets of the sitting class raised yearly, some are hatched in February and March, and some in the first week in September, the better to se-

because of the great amount of attendance cure sitting at various parts of the year. Ex-

Fig. 5.—HALF-BREEDS FOR SITTERS.

cept in winter, the sitters should not be fed with a view to encourage laying, but the aim should be to keep them on as moderate an allowance as possible, and not have them become poor. Their specific purpose is incubation, and they should be made to do as much of this as possi-

ble. By uniting broods, when a hen has hatched one nestful of eggs she may be given another immediately, and if managed rightly she will not be injured by sitting a double term. Each hen must hatch two broods per year at least, and some will hatch three. In this way the

stock of 500 sitters will produce 10,000 chickens yearly, or an average of 20 apiece.

MANURING MEADOWS DURING THE AUTUMN. -The importance of properly caring for the preservation of mowing lands during winter can not be overestimated. In proportion to the yield of hay, is the feeding capacity of the farm; and in proportion to the amount of stock kept, is the size or richness of the manure pile or compost heap. Want of care may lead to serious damage if the

winter should happen to be unfavorable. To avert ill consequences, a coating of manure should be spread upon the meadows before winter sets in. No fear of waste need be entertained. The soil will absorb all soluble fertilizing matter that may be carried down by the rains into it, and the coarser matter left will remain as a protection for the roots from severe freezing. Rotting, as soon as exposed to the warm rains of spring, it will form a layer of fertile soil near the roots of the grass or clover

> plants, just where it is needed. If mowing lands have been closely pastured, a great risk is run of destructive freezing, unless a liberal amount of covering is supplied to them. A good stand of clover, unwisely pastured too close, has often been totally destroyed for want of protection during winter. The natural protection having been eaten off, a substitute must be furnished, failing which, total loss may result. But whether pastured or not, no harm can result from a liberal dressing of manure. On

the other hand, a good return may be confidently looked for next season. If sod ground intended for corn next spring is thus treated, it will not only gain the benefit of the protection afforded, but also of the manure added, and an important work will have been attended to

### Walks and Talks on the Farm-No. 94.

We are through thrashing, and can now take a breathing spell for a few days. It has been a trying season. Poor upland has suffered from drouth, and undrained lowland has suffered from water. Some of my corn was drowned out, and some of the late, planted on the sandy knolls, withered up just as it commenced to car. The truth is, no season suits a poor farmer. Some of my wheat this year could not have yielded over five bushels per aere, while other parts of the same field must have yielded thirty-five or forty bushels. About 200 acres of my farm is what is called "rolling land." The knolls are full of limestone rocks, and the soil is thin and of a light, sandy nature; while the level land is comparatively free from stones, and the soil is deeper and heavier, though not clayey. Before it is drained, it looks like clay, and bakes in spots as hard as a brick, but after it has been drained a year or two, and well worked. these "clay spots," as the men formerly called them, prove to be a rich, friable loam. It was here that I got my good wheat. The moment the reaper struck one of these underdrained valleys, the rake had all it could do to keep the platform clear, while on the sandy knolls the reel barely reached the grain, and the reaper had to run two or three rods to get a sheaf large enough to bind. This spring I saw something was the matter with the wheat on these knolls, and thought of winter-kill, Hessian fly, wireworms, etc.; but it is just poverty-this and nothing more.

I have thought that this poor yield of the sandy knolls was due to the fact that they had been plowed very deep. They were full of stones, and we made a business of getting them out by plowing round and round, and turning the furrows down hill. In this way, the land was plowed a foot or fifteen inches deep, bringing raw, poor sandy soil to the surface. Last year I had wheat on a knoll treated in this way, aud it was about as good wheat as any in the field, and the previous crop of barley was also just as good as the rest of the field. But the land had been well manured. This year my wheat was not manured, and the sandy knolls were exceedingly light, and the clover on them is by no means as good as I like to see.

One of my neighbors had a field of similar soil to these knolls of mine, which he summerfallowed, and sowed to Diehl wheat; and I understand that he only got fifteen bushels per acre, and the grain is so inferior that it will shrink away one third in cleaning Another neighbor, on adjoining land, near his barn-yard, and likely on this account to have received more or less manure in previous years, had over thirty bushels per acre of as handsome Diehl wheat as could be desired.

The Deacon thinks this does not say much for summer-fallowing. But I never supposed any one ever summer-fallowed such light, sandy soil with any expectation of enriching it. What I have advocated is summer-fallowing land of a clayey nature. Our clay loams usually abound in latent plant-food, and a summer fallow favors its decomposition, and renders it available. But light, sandy soils are porous enough already, and the organic matter they contain will decompose rapidly enough, without constant stirring and exposure to the atmosphere.

My wheat turned out better than I expected. Fourteen acres of it was after wheat, and eight after oats. Both these fields were seeded

down with clover the spring of 1870, but failed; and there was nothing to be done but risk them again with wheat. The remainder was after barley. In all, there was not quite forty acres, and we had 954 bushels of Diehl wheat. This is not so bad in the circumstances; but I shall not be content until I can average, taking one year with another, thirty-five to forty bushels per acre. If the land had been rich enough, there would unquestionably have been forty bushels per acre this year. That is to say, the season was quite capable of producing this amount; and I think the mechanical condition of the land was also equal to it; all that was needed was sufficient available plant-food in the soil.

Take the field of fourteen acres, where wheat followed wheat, as an illustration of a question which is now occupying the attention of many scientific farmers and investigators. The two crops together yielded forty-five bushels per acre, or twenty-three bushels in 1870, and twenty-two bushels in 1871. The field has had no manure of any amount for years. In fact, since the land was cleared, forty or fifty years ago, I presume all the manure that has ever been applied would not, in the aggregate, be equal to more than a good crop of clover hay. 'The available plant-food required to produce these two crops of wheat came from the soil itself, and from the rain, dews, and atmosphere. The land is now seeded down with clover, and with the aid of a bushel or two of plaster per acre next spring, it is not improbable that, if mown twice for hay next year, it will yield in the two crops three tons of hay per acre.

Now, three tons of clover hay contain about 33 pounds of phosphoric acid, 90 pounds of potash, and 150 pounds of nitrogen.

The last crop of Diehl wheat, of twenty-two bushels per acre, and say 1,500 pounds of straw, would contain:

It seems very unkind in this crop of wheat not to give me more than twenty-two bushels per acre, when the clover plants coming after will find phosphoric acid enough for forty bushels of wheat, and potash and nitrogen enough for nearly 100 bushels per acre. And, confessedly, these are the three most important constituents of plant-food. Why, then, did I get only twenty-two bushels of wheat per acre? I got twenty-three bushels on the same land the year previous, and it is not improbable that if I had sown the same land to wheat again this fall, I should get twelve or fifteen bushels per acre again next year. But the clover will find plant-food enough for forty bushels.

Why did I not get forty bushels per acre? A scientific answer to this question would be exceedingly interesting and useful, and recent investigations lead us to believe that it will not be long in forthcoming. In the mean time, we may safely conclude that the roots of wheat are so constituted that we can not get a maximum growth of wheat without having in the soil a far larger amount of available nitrogen than is required for the growth of a maximum crop of clover. And yet a maximum crop of clover contains twice as much nitrogen as a maximum crop of wheat.

What I want is, instead of getting forty-five bushels of wheat per acre in two crops, to get it in *one crop*. The three tons of clover hay that the field will yield per acre next year will contain much more than the necessary amount of plant-food required for such a crop. If this

clover was plowed under, or consumed on the land by sheep, and the land was then sown to wheat, why should it not yield forty bushels of wheat per acre? The land would certainly contain plant-food enough. But it would not all he in an available condition. The roots of the wheat would only be able to reach a portion of it. Mr. Lawes, in a recent address, referring to his long-continued and carefully conducted experiments, stated that "a mixture of 309 pounds of superphosphate and 200 pounds of ammonia salts, applied every year for nineteen years, has yielded almost exactly the same amount of barley as fourteen tons of dung applied annually for the same period." The average of these nineteen crops of barley grown every year on the same land, with the above two manures, was about fifty-three of our bushels per acre. To produce this result, one acre had received during the nineteen years 266 tons of manure, and the other acre only about 41 tons. Mr. Lawes remarks: "About 200 pounds of nitrogen was annually supplied in the dung, but with it there was no over-luxuriance, and no more crop than where 41 pounds of nitrogen was supplied in the form of ammonia or nitric acid. How is this to be accounted for?" He states that experiments are now being made at Rothamsted that may throw more light on this subject.

One thing is clear, that if 41 pounds of nitrogen, in the form of ammonia or nitric acid, will have as great an immediate effect as 200 pounds of nitrogen in barn-yard manure, it is very important for us to ferment and decompose our manure as much as possible before burying it in the soil. And it is very likely that applying it as a top-dressing to the land, where it would for several months be exposed to the atmosphere, and where the rains and dews would dissolve out the soluble matter and carry it into the soil, and distribute it more completely, would render it still more immediately effective. John Johnston and other good farmers have found from long experience that such is the case where the manure is applied as a top-dressing on grass land in the fall, and the field plowed up for corn the following spring.

A year ago, as I mentioned at the time, I had ten acres of wheat seeded down with clover, but on which the clover failed. I wished very much to get it into clover, and could hardly make up my mind to plow it up. I thought the clover might still come in. And so, immediately after harvest, I top-dressed it with barnyard manure, thinking that, if the clover came in, the manure would help it, and if it did not, that it would at any rate help any crop I might put on the land in the spring.

The clover did not come in. And so, with great reluctance, I this spring plowed it up, and drilled in three bushels of peas and one bushel of oats per acre. The manure put on the previous September was of good quality, pretty well rotted, and we put on a liberal dressing, say fifteen tons per acre. It was spread as fast as drawn. The weather was hot and dry, and some of my neighbors thought the manure would all be burnt up, or at any rate that nearly all the virtue in it would evaporate and be lost. I never had any fears on this score. We harrowed it once or twice last fall, and re-spread any portion that the harrows pulled together; and there the manure lay, exposed on this bare ground, through the fall and winter, until it was plowed under in the spring.

The result fully came up to my expectations..

We had on the ten acres eighty loads of produce. The loads were not large, but such as we usually put on when drawing in with three teams and three wagons. In such case, you know, it does not pay to put on extra large loads, as they are harder to pitch. But they were fair, medium-sized loads. The crop was pretty hard to thrash, as the straw and haulm was very long, and we raised the concave of the machine pretty high, and probably did not thrash very clean. Still we had 560 bushels from the ten acres, weighing 49 lbs. per bushel. Estimating the crop as oats, at 32 lbs. per bushel, the yield was equal to 881 bushels per acre. I was fortunate enough to get in the crop without a drop of rain falling on it, and the straw will be fully as good as over-ripe or badly cured hay.

Of course, I can not say that there would not have been just as good a crop if the manure had not been applied until spring, but I am inclined to doubt it. And, at any rate—and this was one of my objects—it gave an opportunity for the weed seeds in the manure to germinate last fall, and the spring plowing destroyed the plants. The field is the one I "fall-fallowed" three years ago, and, for a run-down, weedy farm, the land is now encouragingly clean, and I expect a good crop of wheat on it next year, and a big crop of clover hay, with the chance of a good crop of clover seed the year following.

After the clover seed is off, I propose to topdress the land with some good, well-rotted manure (and clover hay and peas will make good manure), and then, perhaps, pasture the field another year with sheep, until late in the fall, and then plow it up. The next spring I shall be ready to accept a challenge from the Deacon to see who can raise the biggest crop of corn.

"That is looking some distance ahead." Yes; and a farmer must look ahead if he intends to do any thing. He must "learn to labor and to wait." To a well-regulated mind, this is one of the charms and the advantages of agriculture. No great work was ever done in a hurry. The man who is not willing to lay plans five or ten years ahead, and set about accomplishing them now, and continue the work year after year, keeping his object steadily in view, had better quit farming. All good, successful farmers consciously or unconsciously possess this quality of planning, working, and waiting.

"What is the good of all this talk about improved farming?" remarks a grain speculator; "the trouble is that we raise too much produce already." Without admitting or disputing this assertion, it may be remarked that the province of an agricultural paper is not so much to induce farmers to raise a greater aggregate amount of produce, as to show them how it can be raised cheaper. What I advocate is trying to raise forty bushels of wheat per acre once in four years, instead of twenty bushels every other year, or ten bushels every year. I do not want farmers to raise more pigs than they do now, but I would like to see them raise better ones. I am sorry to see a farmer feed ten bushels of corn to produce a hundred pounds of pork, when a well-bred pig would produce the same amount of pork, and of far better quality, from six or seven bushels.

The present over-production in certain articles of farm produce is not the result of improved agriculture. It is the result of too many farmers turning their attention to the production of one thing to the neglect of others. A few years ago they sold their cattle for a song, to buy sheep

at high prices; subsequently, they sacrificed their sheep to go into the dairy business or hograising, or back again to cattle feeding. Now they will sell their cattle and hogs, and go into sheep again. There may have been agricultural writers who have advocated these various changes, but I am not one of them. What I preach and what I endeavor to practice is to be content with fair profits, to raise such crops and keep such animals as are best suited to the land and the location, and stick to it year after year, be prices what they may.

Our Orden Farm friend thinks my advice to the young Kansas farmer who wanted some thorough-bred stock is not sound-that it does not "do full justice to the breeders." I beg his and other breeders' pardon. No one appreciates their labors more highly than I do. But they are quite capable of taking care of themselves. My sympathies are with the young farmers who wish to buy thorough-bred animals to improve their common stock, and who have little money to spare. I have been in precisely that position myself. I can recollect, when I first commenced farming, writing to Mr. Thorn, asking him if he had a thorough-bred Shorthorn bull that was not of the stylish, fashionable kind that brings fancy prices, but which nevertheless had a good pedigree, and one which would, consequently, impress its characteristics on the calves from common cows, that he could sell me at a price a poor farmer could afford to pay. He offered me a calf for \$125. I thought this too much, and wrote to Mr. Sheldon, and he asked me \$300! The result was I did not buy one-and there I missed it. I think it would have been a thousand dollars in my pocket by this time if I had. But I needed every dollar I had to underdrain, kill weeds, and otherwise improve my farm. And while I know I have lost money by not using a thorough-bred bull, it is equally certain that I should have lost still more if I had taken \$125 out of my draining operations and invested in a calf. I ought to have done both. But I lacked pluck.

Now what our Ogden Farm friend says is all true. We have no right to find fault with the breeders for asking high prices. But, on the other hand, when a young farmer who is straining every nerve to improve his land asks my opinion as to how he can at the same time improve his stock, I have a right to advise him "not to be in a hurry," and not to pay "fancy prices"-to visit some of the breeders in his own State or county, and see if he could not find an animal with a good pedigree that could be got at a price he could afford to pay. Recollect I was writing to a young farmer who did not propose at present to raise pure-bred stock, but who merely wanted a thorough-bred bull for the purpose of raising animals for the butcher. It would be ridiculous for a man to pay "\$5,000" for a bull in such a case, no matter how rich the man might be, or how good the bull was; and it would be simple madness for a young farmer, who needed all his money to improve his farm, to buy such an animal.

"Ogden Farm" does not believe in the idea of "fancy prices." I agree with him perfectly in what he says on this point. Still I happen to know that a good many people pay fancy prices for fancy stock. Think of paying \$1,000 for a Berkshire pig! "But if he is worth it, why not?" Simply because a pig is merely a machine for converting corn into pork, and unless some new chemical or physiological discovery has been made, one good Berkshire pig

will, on the average, produce as much pork from a given quantity of food as another. If you have two Berkshire pigs, each a good specimen of the breed, and both equally well bred, I can not imagine any real reason why one should be worth \$1,000 and the other only \$50. I think it is mere "fancy." When, a few years ago, people paid \$500, \$1,000, and even \$10,000 for an American merino buck, I think they paid "fancy prices."

Mark you, I am not arguing against thoroughbred stock. No man believes in it more enthusiastically than I do. But even gold can be bought too dear. I think the young Kansas farmer, if he follows my advice, and buys a good, fair, thorough-bred Shorthorn bull, at a moderate figure, and avoids delusive hopes and fancy prices, will have no cause to regret it.

### The Benefits of Fall Plowing.

That the plowing of heavy soils in the fall is attended with excellent results is generally admitted. That any benefit accrues to soils of a lighter texture, is questioned by many agriculturists, with whom we do not altogether agree. All admit that the tenacious character of a clay soil is reduced, and its texture opened and rendered less compact, by the operation of frost. The lumps fall apart, and are disintegrated by the mechanical effect of the expansion in the act of freezing of the water held between the particles. The field, which at the commencement of winter exhibited only a surface of shapeless clods, in the spring is seen to have been brought into a condition of mellowness which no amount of plowing or harrowing could have effected. But is this the full effect of the forces of nature, which operate in small things as perfectly as in greater? The power which has forced asunder the clods, and reduced them to fragments, has also had an effect upon those fragments themselves, and has reduced them to particles so small, that the solubility of the soil has been increased. Thus another effect besides a mechanical one has been produced; or rather the operation of mechanical force has brought about conditions under which chemical action can more readily take place. Now, can we believe that this result only occurs in the case of clay soils? If this should be so, then, as there is a variety of such soils, the effect must be proportioned to the nature of the soil. If a clay soil is benefited, is not also a clay loam? And if a clay loam, why not a sandy loam? If the particles of a clay soil are rendered more soluble by this exposure to the frosts of winter, and those particles are mainly alumina and silica, how can another soil altogether escape similar effects, when only the proportions in which those constituents are combined are changed. But we are told that clay soils are absorbent, while more silicious soils are more or less leachy, and part with their fertile properties by the percolation of water through them. Then, if this were true, a light or sandy soil would in course of time be washed free from all fertilizing properties. But this is not the case with these soils. They can be improved by the addition of manure until their characters are changed; the added color and other qualities are not washed away. If this idea of leachiness, then, is unfounded, no harm, but only benefit, can result from plowing such soils in the fall. They will experience as much improvement in one sense as a heavier clay soil. The reduction of hard lumps is not necessary, for these soils are naturally mellow, but

an increased solubility will have been gained. But one other benefit must not be forgotten here, which is, that deeper plowing is permissiable in the fall, and six months' exposure to the sudden changes from frost to thaw will bring the hitherto unused soil into condition for assisting to bear crops. We do not advise the plowing of sod at this season, at least not for a corn erop. This should be postponed until the last possible day in the spring consistent with having the ground prepared in time. But for roots or oats, or other spring crops than corn, we would plow now and manure through the winter, when a mellow and rich soil some inches in depth will be ready to be stirred again early in the spring; and this we would do irrespective of the quality of the soil, whether it be clay or a light loam. Potatoes planted in a gravelly loam thus prepared, have with us given double the yield of those in ground not so treated. Oats, too, have been benefited greatly, but the result with corn was unfavorable, mainly, we believe, on account of the greater development of weeds, which prevented the crop from being kept clean.

We have not adverted to the economy of time resulting from having the ground plowed before winter, and ready for a second plowing early in spring; but this is a point worthy of attainment under any circumstances. Farm operations depend very much for their success on "taking time by the forelock," and keeping work well pushed forward; and to have all the stubbles plowed before frost sets in, must be a comfort to any farmer.

### An Easily-made Pile-Driver.

It has occurred in our experience that the use of a pile-driver, if one could have been had, would have resulted in great economy and advantage in such work as building bridges and dams, driving fence-posts, etc. Many a country bridge has been insecurely built, and has in consequence been washed away with the first freshet, because the piers were not made of piles. Had a simple pile-driver been built, at a cost of less

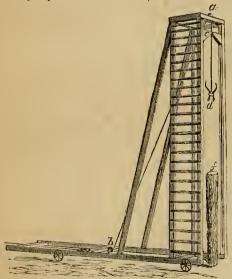

Fig. 1.—A SIMPLE PILE-DRIVER.

than forty dollars, and used on these constructions, much money might have been saved. In building dams, a few piles along the bank of the river, and a row to connect the cribs together, will make the work much more solid, and render it able to resist a freshet that otherwise would carry it away. Country roads and bridges might often be greatly improved by the use of a little engineering talent, but farmers generally, who are the men on whom the duties of making these roads mostly fall, although they may thoroughly understand their own business, have

Fig. 2.—MONKEY AND GRAPPLE.

seldom had opportunities of studying engineering. We illus-trate in figure 1 a simple pile-driver. It is intended to be worked by a pair of horses, and such a one as is here figured can be put together for less than fifty dollars, "monkey" included. The frame does not need to be very heavy -4×6 seantling is quite sufficient. The sills may be heavier, and six or eight feet long, and framed three feet apart, outside measure. This will leave two feet in the clear inside be-

tween the posts. The frame for hoisting need not be more than two feet clear inside, and should be sixteen feet high. A pair of braces should be framed in behind to stiffen it, and here and there side braces might be put in for the same purpose. Cleats are to be nailed up one side to make a ladder, which will be neces-

sary when the pulleys at the top require fixing. The pulley for hoisting is fixed at the top (a), the rope is brought down, and passes under another pulley at the bottom (b). Near the top of the frame, at the front, are two triangular catches (c), between which the hoisting rope passes, and which engage with the arms of the hoisting grapple (d), forcing them together, and releasing the monkey, which falls on the pile (f). The sides of the monkey are grooved; rails fixed on the sides of the

posts fit into these grooves, and guide the monkey in its fall. These should be greased when in use. Fig. 2 shows the monkey and the grapple on a larger scale. No detailed description of this is necessary, as the figure speaks for itself. Small wheels may be placed under the sills, which will assist in moving it

from place to place, but when in use it should be firmly fixed, and ballasted with a few large stones, to keep it steady. A light driver of wood might be made, bound at the bottom with a stout iron ring, to prevent splitting, which would be useful to drive fence-posts where the soil is not too rocky. On prairie farms, posts might thus be driven very rapidly. Care should be taken to point the posts cor-

rectly. The bevel from heel to point should be equal on all sides, or the post will not drive perpendicularly. The monkey ordinarily used is of cast iron, and weighs about 200 pounds.

If a pair of guides are fixed on the grapple in such a manner as to slide up and down on the rails on which the monkey slides, and retain the position necessary to enable the grapple to

connect with the catch, it may be made selfacting, and will not need any attention to fasten it on to the hook or catch of the monkey by which it is drawn up. For use on prairie farms. where posts will enter the soft, yielding soil very casily, a lighter machine may be built. If mounted on larger wheels, it could be readily moved from place to place by two men or a man and a boy. A driver weighing sixty pounds could be hoisted very easily by one man, and falling sixteen feet would drive a post with a few blows. Posts driven in such soil are much more solidly placed than if set by digging holes. It is necessary, in driving posts, to remove the bark from that portion which enters the ground; much less resistance is encountered, and the posts last longer.

## A Dumping Wagon.

Several have asked for plans for a dumping wagon. The simplest dumping wagon that we have met with is one that is in use in New York City, and shown in fig. 1. This works very well; in fact, the load is dumped from it just as easily as from a cart. The frame on which the box rests (fig. 2) is furnished with three rows of small wheels (a a a), about the size and shape of those used on a railway horse-power, say four inches in diameter. On the bottom of the box is an iron-flanged track of cast iron, which runs over the wheels. The frame is elevated sufficiently at the front to enable the box with the load to

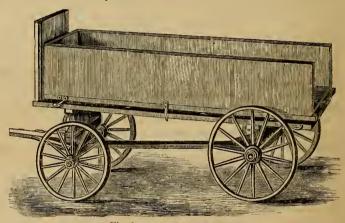

Fig. 1.—A DUMPING WAGON.

run back gently (as soon as started) on the wheels, until the box projects behind enough to make it tip and dump the load. At the proper point, the movement of the box (fig. 3) is stopped by a catch (b) on cach side of it, which engages with a hook on the frame (c), and prevents the box going further than is required to over-

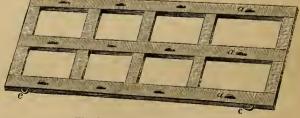

Fig. 2.—Frame to support box.

balance it and dump the contents. This catcialso prevents lateral movement of the box, and keeps it in its place. When the load is dumped, the driver lifts the box and pushes it back into its place, where it is held by a hook (d) on each side, fitting into eyes (e) fastened into the frame. The frame is fixed on the bolsters of the wagon, and no stakes are used to sustain the sides of

the box. We should not consider these wagons fitted for very rough roads, but on ordinarily smooth country roads they would doubtless

Fig. 3.-wagon-box.

stand very well. From the style in which these wagons are build, heavy lateral jars or jerks would be injurious to them.

# Reclaiming Swamps.

If any swamp lands require plowing, it must

be done during the months of August or September. These months include the season for preparing the ground and sowing wheat, and in case both can not be done, it is often a question which of them shall be put off. The alternative having been in many cases presented year after year, the swamp has generally had the go by, often unadvisably, as we think. A spring crop or a summer fallow would often pay better than a crop of fall grain; and when the question is presented, Shall that swamp remain forever unproductive? the resolution to undertake the task would be an eminently wise course, we think, even were the fall crop to be abandoned for one year. This experience has been passed through by the writer, and no regret ever occurred at the course taken, which was to bring the ground into profitable cultivation at all hazards. If such land can not be underdrained, it may be brought in by surface draining, as follows: We suppose the tussocks have been removed, and the coarse grass mowed off, as either of these would seriously impede the plowing. The first process is to lay out the ground to be plowed into lands of such a width as the underdrains would be apart when made. If the land is clay, 24 feet should be the distance for the drains, and this should be the width of the lands. This, for the reason that when the drains are dug the open furrows will be the places for them, and these will be already at least one foot below the average surface. To lay out the lands, plow a double furrow, throwing them together, to commence a ridge, at a distance of 12 feet from the edge of the field. Then measure 24 feet, and throw up another ridge, and so on through the piece to be plowed. An assistant, armed with a sharp bog-hoe, will be needed to cut off any roots that are not severed by the plowshare, and to help turn the sod into its place. It is often very refractory in this respect, and needs considerable humoring to get it to lie just right. Patience will be found a useful ally. When the lands are all carefully laid out, the plowing may be commenced. The assistant will no longer be needed. A deep slice should be taken, and the ridge well rounded up. The open furrows should be plowed out twice, until they are at least twelve inches deep, and the shovel should be used to complete them, throwing out the loose earth to the center of the ridge. When the lands are all finished, the headlands may be plowed, by going round the piece and throwing a flat furrow towards the center of the field. The open furrows must then be completed through the headlands, by means of spade and shovel, and the earth thrown up, to finish the ridge to the lowest boundary of the field. Here a substantial watercourse should be plowed out, to carry off the flow from the

furrows through the field, unless a natural one already exists, when a good connection should be formed therewith. This will complete the operation this fall. During winter, lime should be hauled for a dressing of 50 bushels per acre, to be applied early in spring, after which, as soon as sufficiently dry, the field should be harrowed lengthwise of the

ridges, and oats be sown. A bushel of redtop and a peck of timothy should be sown with the oats, of which grain two bushels per acre would be quite sufficient for seeding.

This arrangement of lands and furrows will permit the use of the reaper, and the land will be found sufficiently dry for its use if the furrows be kept open. But we would not advise that such a field should be considered finished, for, if not underdrained, coarse grass will work in. A part of the proceeds of it should be yearly invested in tiles, until the whole field is thoroughly drained. It will then doubtless be found the richest piece of the farm.

# An Arrangement for Spreading Liquid Manure.

The cost of a suitable vehicle for spreading liquid manure on grass lands is a great obstacle to its general use. A cart with tank especially prepared is an expensive article, and can be

Fig. 1.—APPARATUS FOR SPREADING LIQUID MANURE.

used for no other purpose; its cost is therefore greater than most farmers could afford. Without some such an arrangement, liquid manure can not be utilized, and it is therefore not collected. A few years ago we arranged a dozen large barrels (old kerosene-oil barrels, which held forty gallons each, and were all well hooped with iron hoops), so that they were suspended on the reach of a wagon, and by this means were enabled to spread liquid manure with case, and at a very small cost. In the first place, we procured short chains, with an iron plate attached to each end, and by riveting these iron plates to the barrels, fastened them together in pairs (fig. 2). The barrels of each row were then joined together by pieces of fouriuch rubber hose, which passed through holes bored in the barrels to receive them. The ends of the hose were slit for half an inch in length, and were turned down on the inside of the barrels and securely fastened there, and the joint covered on the inside of the barrel with a leaden plate nailed over it, and made water-tight (see a a a, fig. 1). Thus the dozen harrels were arranged in pairs, each pair connected with the adjoining pair, so that all communicated with each other. The last pair had a tin pipe fixed on (b), which was perforated with holes for the purpose of scattering the liquid. These barrels

were slung over a long reach on a wagon, and hung by means of the short chains, one of each pair on each side of the reach, at a sufficient hight to clear the ground easily. Fig. 1 shows the arrangement of the barrels, and the mode in which they were slung on the reach. When a load was wanted, the wagon was drawn to the barn-yard tank, the pump was set to work, and the barrels filled. They were drawn to the

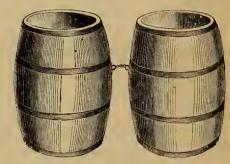

Fig. 2,-BARRELS CHAINED TOGETHER.

meadow, the valves were opened, and the load spread. The valves were fixed one on the iuside of each of the last pair of barrels; were made of a piece of wood covered with sole leather, and were held in their place by means of a piece of spring steel. A cord attached held them open when desired. If the supply was short, one valve only was opened; when the tank was full, and economy no object, the full supply was discharged.

One load of 480 gallons could be spread over an acre of ground by attending to the valves properly, and regulating the discharge. When it is necessary to attach the barrels to the wag-

on, the following arrangement is made: A frame of plank is constructed, consisting of two long pieces, each of which passes under one row of barrels, and three cross-pieces, one at each end and one in the middle, which hold the side planks together. This frame is made long

enough to permit the harrels to rest on it, and is supported by means of blocks about twelve inches from the ground. The barrels are put together on this frame, and when it is required to load them, the wagon is brought up, the reach taken out from the hind axle, and the front part of the wagon is backed up to the barrels, and the long reach placed between the two rows under the chains which hold them together; the bind axle is brought up and the reach inserted. Then, with a handspike or lever, the frame on which the barrels stand is raised (one end at a time), and the blocks removed. This lets the frame on to the ground, and the barrels

Fig. 3.—PLANK PLATFORM.

are suspended on the reach, and are ready for work. When they need to be unloaded, the frame is raised (the barrels are raised with it), and the reach drawn out. Figure 3 shows the frame for supporting the barrels; this should have a permanent place in a convenient situation, as it must of necessity be made the resting-place of the barrels when they are not in use.

## An Interesting Letter from Kansas.

Mr. R. A. Steele, of Douglas Co., Kansas, writes as follows: "I wish to tell you that I have been following your advice in regard to my farming operations. I have been in Kansas for fifteen years, and have been on the farm that I now occupy for five years. It consists of 500 acres, and over 200 acres of it is bottom land, and part of it wet. I wish you could see it now! I cut a main ditch, 200 rods long, running in the same direction as the River Wakarusa, and emptying into the river at a bend. This ditch prevents any water from running on my land, except what falls. The ditch is 6 feet deep at the outlet, and 2 feet at the starting point. I used a plow and scraper on the shallow part. I have on hand a large lot of tile which cost me three cents per foot, that I am going to put in soon. I have fifteen acres of corn on the wet part, where water stood the year round before ditching. I plowed it twice last summer, and during the winter I plowed it again full 8 inches deep, harrowed it this spring, and planted it on the 20th of April. I will send you a sample of the corn in the fall. It now beats any thing on the farm, and exceeds my most sanguine expectations. I spread over 200 loads of manure on my bottom land this spring. I think it pays. I feed every thing I raise. I fattened 75 head of cattle last winter, and about the same number of hogs.

"Last spring I started an orchard, or rather an addition to one. I broke the sod a year ago last June, and fenced off the land by itself. I penned 150 head of cattle on it for sixty nights; plowed it again in January, and also in April, and then planted 2-year-old apple-trees. Every one is now growing. I planted the orchard in beans, which is an experiment.

"Your plan with sheep is good for your country, but will not do here. I gave sheep a thorough trial, but they will not pay here. They improved my farm materially, and I lost no money, and made but little. I tried it for five years with from 100 to 1,000 head. The summer is what tries them. They may do when we get tame grasses.

"I have the Magie stock of hogs, which I think is superior to the Chesters or Suffolk. I intend to try the Essex breed."

Remarks.—We are glad to hear that our advice in regard to draining, and the thorough working of the soil, manuring, etc., has proved so satisfactory. The fact is, that the principles of good farming are true everywhere; it is their application that varies, according to the character of the soil, location, and circumstances. The wise farmer will learn all he can from others, and then think and act for himself.

Our correspondent is unquestionably right in feeding out his crops on the farm, rather than to pay the high charges for freight in shipping bulky produce to distant markets. We think, too, he is probably right in regard to cattle and hogs being more profitable on his land than sheep. Such is unquestionably the case on his low bottom land. We may add, too, that we have never recommended seeding a young orchard to grass. Our own practice, to which allusion is made, was on an orchard fifteen years from planting. We stated that it was our intention to keep it down in grass, to top-dress it every year or two with well-rotted manure, and keep it closely pastured with sheep. In this way, we thought the land would be kept rich enough for the trees without cultivating the land. But young orchards require cultivation,

either with a bare fallow or with some such erops as corn, beans, or potatoes, that admit the free use of the cultivator. And even in the case of old orchards, let no one suppose we recommend keeping them in grass, unless the grass is frequently manured and the whole of it is fed off on the land by sheep or swiue.—ED.

# What is Science in Farming?

It is not unusual—perhaps it is not unnatural—for one who has been only a "practical" farmer all his life to discourage the idea that science can be of assistance to him, and to doubt its value. Perhaps his objection would be less if he appreciated the exact meaning of the word. Webster gives it four definitions: "(1) Knowledge; penetrating and comprehensive information, skill, expertness, and the like. (2) The comprehension and understanding of truth or facts. (3) Truth ascertained; that which is known. (4) Knowledge duly arranged, and referred to general truths or principles on which it is founded and from which it is derived."

Now, surely no farmer will deny the value of knowledge-a knowledge of his own business. He must know how and when to perform the various operations of the farm, and if he knows also the reasons why they are necessary, he will be better able to exercise a sound judgment concerning them. The more penetrating and comprehensive his knowledge is, and the greater his skill and expertness, the more cheaply and the more effectively will his work be done. The more comprehension and understanding of the truths on which his success depends, and of the facts which daily arise in his management of his business, the better far-mer will he be. Truth ascertained, that which is known, is "Book Farming"—that is to say, the knowledge that we get from books and agricultural papers is nothing more nor less than the recorded knowledge (not the fancies) of other people. It is an important item of the science of farming, that seed, in order to germinate and produce a crop, must be so put in the soil as to satisfy the conditions of growth. This much every farmer knows, and to this extent has he acquired a scientific understanding of his business. The knowledge is of absolute value to him and to every other farmer, and its value would not be at all lessened if he were to write a communication to an editor informing him and his readers of it. If another person were to write that because the germinating plant comes up in a certain way, therefore all farmers ought to plant their grass seed with their fingers, always putting the right end uppermost, this would be neither book farming nor science, nor any thing else; but mere fancy, and a fancy of which every farmer would see the folly.

Now, generations of men have been busy in investigating, mainly in the field, every thing connected with the operations of practical agriculture. Little by little they have acquired knowledge, which knowledge has been duly arranged, and so much of it as is well understood has been referred to the general truths and principles on which it is founded, and from which it is derived. The knowledge itself is due mainly to the experience of working farmers; and chemists and others, who have made general truths and principles the subject of careful study, have classified and arranged it, and given it the form that is generally understood by the word "seience." No error, no unproved theory, none of the fancies of those who write from imagination rather than from experience,

is to be called either Science or Book-Farming, and it is unfortunate that so much of our agricultural writing has been done by men who lack experience on the farm. It has given rise to the doubt referred to in our first paragraph, and discouraged many of our best and most intelligent working men from seeking knowledge, where it is best to be found, in the recorded experience of those who have gone before them.

The real truth of the matter is that in decrying science farmers decry knowledge, and a natural deduction from their reasoning would lead them to withdraw from the management of their farms, because they have some knowledge, and give it over to men who have none whatever. If knowledge is essential, and if, as we are told and believe, "a little knowledge is a dangerous thing," then the more knowledge we get, the better our chances will be. Follow no false lights, but let the lamp of true knowledge lead wherever it will.

### How to Use Corn Fodder.

The usual method of feeding corn fodder has been hitherto a very wasteful one, though its now generally recognized value as an article of feed has to some extent brought about a change in this respect. Yet it is still true that the larger portion of the corn-stalks produced is wasted, so far as its feeding properties are concerned. It is the common practice to throw out into the barn-yard to the cattle a quantity of stalks, sometimes not even unbound, and allow them to eat what they can and destroy the rest. In the fighting and trampling done by cattle under such circumstances, the greater part of the fodder is unconsumed, and becomes trampled down in the mire or snow, a tangled mass of tough, unbroken stalks. There they remain, until it is necessary in the spring either to cart them out to the fields, or to turn them over in the endeavor to get them rotted. In the one case, they are useless as manure, and a very great impediment to the plow or harrow, and even to the mowing machine, for they often remain on the surface undecomposed until the hay crop comes round again. In the other case, much labor is necessary to get them rotted, and the tearing the mass of them apart and turning them, is certainly the most severe labor the farmer is called upon to perform.

Now, with a rational mode of using them, all this trouble and annoyance can be avoided, and their whole value as fodder be made available. If a farmer owns but one horse and cow, he can save money by procuring a fodder-cutter, and cutting up and feeding his corn-stalks. Where few stock are kept, the copper-strip fodder-cutter, of small size, and costing ten dollars or thereabouts, is sufficient. With a numerous stock, a larger machine, to run by horse-power, and costing \$30 to \$40, would be needed. Provided thus, the farmer should cut up the whole of his stalks. They contain, when properly harvested and housed, much nutritious matter, and in our experience we have found no difference in the appearance of our stock, or their productive qualities, whether fed on fodder or hay. Cut up, wetted, and sprinkled with meal of corn, oats, or buckwheat, either singly or ground together, with wheat or rye bran in equal proportions with the grain, at the rate of one quart to the bushel of fodder, with a handful of salt, they make a feed capable of keeping stock of all kinds in good, thriving condition throughout the winter. The quantity needed for one feed is one bushel of this mixture to

each full-grown animal (yearlings may be counted as two, and spring calves as three, for one full-grown). Hogs will eat the fodder readily, and poultry will pick out much of the finer shreds. On farms where heavy and fancy stock are kept, of course this feed would not be sufficiently rich; but we refer to the generality of farms, where stock receive ordinarily good fare. A cow or ox that has been used to winter in the shelter of a hay or straw stack, would improve wonderfully on the fare here recommended; and stock that have been used to receive hay ad libitum would present a better appearance, especially in smoothness and mellowness of skin, if fed on fodder thus prepared. In the present condition of our farms, when we need to increase as much as possible the amount of live-stock kept and fed though the winter, every means of economizing fodder is of value. Here is one most important item of economy, and we are able to assert from experience that if corn fodder is used in the manner here described, two head of stock may be fed where before only one could be.

### Bones, -A Great Waste.

Bones are a very important agricultural pro-

duct, for they remove from the soil a very large amount of its most valuable mineral constituent. Consisting largely of phosphate of lime, they abstract from the farm that which we find it most difficult and most expensive to replace. The extent of this abstraction, too, is something considerable. The number of animals brought into the city of New York during 1870 was as follows: 356,044 oxen, 889,616 swine, 1,463,852 sheep, and 116,480 calves. Estimating the average weights of these as 700 lbs. for beeves, 150 lbs, for swine, 75 lbs, for sheep, and 100 lbs, for calves, dressed weights, and the bones at 20 per cent of the weights of the carcass, there would be over 50,000 tons of bones. The consumption of New York is probably one twentieth of that of the whole United States. There would be therefore one million tons of bones produced on our farms and pastures in a year by means of animals raised for food alone. Fifty-five per cent of this consists of phosphate of lime, or 550,000 tons. Now it is a question worthy of consideration how much of this is returned to the soil in the shape of bone-dust or superphosphates, or whether it is possible ever to recover the greater portion of it. Vast quantities of bones are used in the arts, for the purpose of manufacturing handles of brushes and knives, rings, umbrella and parasol handles, buttons, and an infinite variety of other "notions," the material of which is lost to agriculture. Then there are exported to foreign countries over 72,000 tons per annum, in the shape of boneblack or raw-bone, which is also lost to us. Then the large quantity uncollected and left to waste all over the country would probably bring the total lost to agriculture to a half of the quantity produced. Therefore it is pretty certain that not more than one half of the amount of phosphates abstracted from the soil is returned thereto in the shape of bone-dust, superphosphates, and other artificial manures. We do not take into account the loss by means of the milk of ten million cows, which in 1869 were fed on our farms, which would equal 15 lbs. of phosphates per cow per annum; nor that contained in the vast quantity of grain raised and shipped away and sold. That the average yield of grain is each year diminishing, that pastures are no longer able to support the former stock, or that our agricultural population at the East are fast removing to "fresh fields and pastures new" in the far West, is no longer surprising, when we consider the steady drain to which our lands have been subjected for a period now measured by centuries in some districts, but by scores of years in almost all the eastern parts of the country.

But when we understand the cause of a thing, the remedy becomes apparent. And a remedy must be applied forthwith. We are abundantly warned in the lessening fertility of our fields that we must restore something of what we have for so many years been occupied in abstracting, and that, if possible, no particle of bone be suffered to escape the service for which it is so much required. That a large quantity is irrecoverably wasted each year is a fact beyond dispute, all of which would be gladly utilized if it could be secured. Hundreds of tons are annually wasted by farmers themselves, who, if they do not care to use them on their own farms, should feel it to be their duty to put others who would gladly use them in the way of procuring them. In most towns and villages of the United States, there are dealers who would gladly purchase them, at a price equal to or approximating a cent a pound; and if those who make a business of crushing bones, for the purpose of manufacturing them into manure, could procure them, there would be made a large addition to the available amount of fertilizers in the market, all of which would ultimately find its way back to the soil whence it was originally abstracted. Great Britain imports a large quantity of bones for agricultural use, and exports none, gathering from almost every country in the world; and the consequence is that crops there have reached and are maintained at an average quantity equal to the maximum ever reached in the most abundant periods of American agriculture. Here is a lesson for us that we should not hesitate to learn, and we shall guide ourselves accordingly.

### Raising Calves for Milkers.

It is not sufficient that we save all the good calves from the knife of the butcher, but we must give them wise and judicious treatment. Having chosen the animals to be raised, it is necessary to feed with generosity, and at the same time with caution, that a well-built frame may be established. A young animal intended for the dairy may be spoiled in the outset by improper feeding; or one that has been mistakenly selected, will take on fat in spite of all care, and may be discarded. It is not fat that we want. We want growth of bone and muscle, and all fattening food must be avoided. Good pasture through the summer, and feed of which wheat or rye bran and buckwheat meal are the principal constituents, are all that are needed, besides a regular supply of salt and free access to water. At the season when pasturing is over, the period has arrived which makes or mars the young beast. The cold rains and piercing winds of autumn have arrived, and one exposure to them will give the ealf a check which can be overcome only with much care. No young animal should be permitted to suffer from cold or wet to such an extent that its back is drawn upwards like a bow. When this occurs, dangerous effects will surely follow. Immediate steps should be taken to remedy these evil effects. Laxative food, with warm drinks and dry, warm quarters, will prevent hide-bound and loss of condition, which

would hinder growth throughout the whole or the ensning winter. Prevention would be the wiser course; therefore, let proper shelter be prepared in time. This should be closed against piercing winds, and have a roof that will shed rain, open to the sun on the southern side. and with good ventilation. No expensive shelter is required. When colder weather has arrived, and a new drain is made on the system to maintain the animal heat, more fattening food is required, and a half-pint of oilmeal or cotton. seed meal may be fed in addition to the other feed. We have always fed our calves, for convenience' sake, in the same manner as our cows; had them similarly tied in stalls, and the feed prepared for the whole stock was given to them in proportionate rations. We have found that three calves would consume an equal amount with one cow. In addition, each calf has been fed a daily ration of half a pint of wheat bran, with half a pint of oil or cottonseed meal, and a small quantity of salt. Feeding thus, we have had no difficulty in bringing our heifers into profit at two years old. Having passed through the winter thus cared for, the heifers will come out in the spring thrifty and in a growing condition, and when turned on to the grass in spring will push right along. During this time, and until they come in, no falling off in care should be permitted, and during the second winter it must be remembered that a new draft is made on the still growing animal that must be abundantly met. Feed rich in phosphates, such as coarse bran, should be well supplied, as well as such stimulating feed as corn-meal, and laxative feed like oilmeal. During the three months previous to calving, the future milking qualities of the cow are formed. and, as a matter of precaution, this period should be put off until grass has become the main feed. No inflammatory action is likely to take place while the animal is fed mainly on grass, and care and judgment must be exercised, as the important crisis approaches, that the system shall be in as natural a state as possible, all exciting feed being gradually withdrawn for a few weeks before the heifer produces her calf. When this event occurs, and all is well, the feed may be gradually restored and increased according to circumstances.

In raising milch cows, we aim to build up a healthy frame and sound constitution, with a facility for turning a large supply of food into a corresponding amount of milk or cream, and when we have raised an animal that is able to do this, and also able to transmit the same qualities to her offspring, we have a good cow; and her calves are worthy of good care.

FENCES.—As a general rule, it is too costly a practice for any farmer to permit his young grass or clover, or the aftermath of his meadows, to be pastured. Then the feuces dividing the fields thus occupied are really worse than useless, because they take up land that might be otherwise employed. As a specimen we would refer to one farm in particular that we know of. There are sixty acres of land, divided into six fields (one of which is an orchard), that are under the plow, and thirty acres in permanent pasture. Now, as cattle are in no case ever admitted into these fields, of what use are the inside fences, which take up three fourths as many rails as are required for the outside fence, and occupy an acre and a quarter of ground? ground would, if put in roots or corn fodder, furnish feed for all the stock kept on that farm for two months, or possibly double that time.

[COPYRIGHT SECURED.]

REPRISALS.—DRAWN BY J. C. BEARD.—Engraved for the American Agriculturist.

Most of the owls may be regarded as the farmer's enemies. The larger species, especially in new countries, prey upon the domestic fowls that roost out of doors, and they have been known to carry off even so large a bird as a half-grown turkey, while chickens fall ready victims to their powerful claws. Nor are the smaller species any less injurious, as they destroy large numbers of insect-eating birds, especially while young, and thus deprive the farmer of many a friend. Although some of the small owls prey upon mice and the larger insects, yet the good

they effect in this way is more than offset by the injury they do to birds. Owls of all kinds are regarded as marauders, and, like the hawks, are shot when opportunity offers. It is a satisfaction to know that the owls do not have it all their own way. Though they may make havoe at night, the small birds frequently have their revenge in the daytime, when the owl is scarcely able to see, and is almost powerless to act on the defensive. When the day birds discover the retreat of an owl, they make common cause against him. Almost all of the day birds, large

and small, seem animated by a decided antipathy to their nocturnal enemy, and gather around him, screeching and pecking at him, and making him the subject of their impotent rage. The small birds, not being birds of prey, have not the power to inflict much injury upon the owl, but they are able to greatly annoy him and interfere with his repose. Naturalists hunting for specimens are frequently able to find the whereabouts of an owl from the discordant screeching made by the usually mild-mannered birds that are thus attacking him.

## Hardy Bulbs, especially Tulips.

The bulb catalogues of the dealers have made their appearance, and we would remind the reader who intends to plant bulbs that the sooner he attends to the matter the better. There are no more desirable things for the garden in spring-be it of the largest or the smallest -than those flowers classed under the head of bulbs. The Hyacinths, Tulips, Narcissuses, Crocuses, and the like, give us earliness, beauty, brilliancy, and fragrance. Our people would plant more largely of bulbs were it not for two things. The work has to be done too far in advance of flowering time to suit our impatient amateurs, and, secondly, the directions for cultivation are unnecessarily ponderous and prolix. The bulb-faucier who wishes to obtain the best results and grow every flower to the regulation standard, must mix his soils, and go to a great deal of trouble. We like to see this painstaking upon the part of those who can afford it. But we would see a clump of hulbs in every back or front yard, or so near the farm-house that the good wife can look up from her work and catch a glimpse of brightness from the kitchen window. Bulbs of unnamed varieties, which will answer for common culture, may be had at very low rates, and the mail will bring them to every home. Unuamed Hyacinths may be had at \$1.25 to \$1.50 the dozen, early single and double Tulips at 50c., Crocuses and Snow-drops at 20c., Narcissuses and Jonquils at 50c. A few dollars rightly invested now in bulbs will bring abundant returns in pleasure next spring. Any good garden soil will answer, but it must not be wet. If heavy, add sand; if not rich enough, spade in well-rotted cow-manure. Plant any time in October or early in November. Set the bulbs to a depth equal to twice their thickness, and

three times this distance apart -i. e., if the bulbs are two inches through, set them four inches deep and six inches apart. When the ground is about to freeze, cover the bed with a few inches of leaves or littery manure, and leave until spring opens. The best results require the bulbs to be taken up when the leaves die down after flowering, but in ordinary culture they may be left in place for three or four years. This simplifies bulb culture very much. It is not the way to get exhibition flowers, but it is the way to make bulbs popular with the people at large, and this is what we are striving to do. The results reached in this way will be so pleasing as to inspire a desire for better things, and choicenamed varieties and more careful treatment will come afterwards. For a beginner, Hyacinths, Tulips, Crocuses, Narcissuses, Suow - drops, aud Bulbocodiums will be a good assortment. The last named is not very well known, but it is the earliest of all. It is the Bulbocodium vernum that we have in mind, and not the Nar-

cissus Bulbocodium, which is quite another thing. [ For a grand show, nothing is more effective

flowers are not as pleasing as the single ones, but a clump of the double ones is truly brilliant.

Fig. 1.—PARROT TULIP.—(Tulipa Turcica.)

The early tulips are from a different species from the late varieties. The early varieties are derived from the Tulipa suaveolens of Southern Europe, while the late tulips are derived from

Fig. 2.—HORNED TULIP.—(T. cornuta.)

Fig. 3.—ORIGINAL TULIP.—(T. Gesneriana.)

Tulipa Gesneriana of Asia Minor. This last is the Tulip of the florists, about which so much has than the early double tulips. Individually, the been written, and which some two centuries I must decline answering, and leave him in the

ago was the subject of extravagant speculations. The typical form of this tulip is shown in the engraving (figure 3). It has broken into a most wonderful number of varieties, which the florists have divided up into several classes. There are over fifteen hundred named varieties in some of the large European collections.

Some other species of tulip are interesting, though they are not very often seen in cultivation. The Parrot Tulip (fig. 1) is by some regarded as a distinct species, Tulipa Turcica, while others think it a garden variety produced by hybridization. It is a most striking variety, its petals being curiously cut or fringed upon the edges, and generally furnished with a spur. Sometimes it is self-colored; but the showiest forms are marked in the most brilliant manner with red and green on a clear yellow ground. Another species which we have satisfactorily cultivated is the Horned Tulip, Tulipa cornuta (fig. 2), whichis odd and unlike other tulips, but still not without a certain quaint beauty.

## The Egg-Plant.

BY PETER HENDERSON.

J. J., of Manorsville, Pa., writes that, for the first time, the egg-plant has been grown in his section this season, and that it has been a wonder to the good people of that place, and they wish for more light on its culture and uses. J. J. says that the earliest and best fruit is produced on the plants last set out (June 10th), and seems to wonder that such should be the case. His experience here teaches a forcible lesson on the subject that we so often dwell upon, cautioning against the sowing or planting of tender plants, such as tomato, egg-plant, euenmber, or melon, too early. In the latitude of New York, egg-plants should never be sown in hot-beds

soouer than April 20th, the temperature of the hot-bed to be not less than 70° at night. The plant at no season of its growth should be kept for any length of time at a lower average temperature than 70°, and for this reason: 'The experiment of J. J. demonstrated that his plants, planted in open air on May 19th, were inferior to those set out on June 10th. Egg-plants, when they first germinate, are very sensitive to damp and to being chilled, and the amateur often fails to raise them, even with his hotbed; but as they are now grown in all large towns, those wishing to try them, and not having the proper means of raising the plants, can procure them at trifling expense from the market-gardeners or florists of their nearest town. The soil they best fruit in is a light, sandy loam, well euriched by decayed stable manure.

J. J. further asks at what stage the egg fruit is fit for use. It may be used from the time it is the size of a turkey's egg until it is at its average size, say five inches in diameter; but it is not so good when

the seeds indicate an appearance of ripening. He wants to know how best to cook it; but here hands of some of your lady readers, who are au fait in the art, and who, when they know he is a bachelor, may commiscrate his case.

## Successful Hedging.

A few weeks ago we drove through portions

of the States of Delaware and Maryland, and were surprised to see how universally the hedge was used as a substitute for fences. One of our traveling companions was a gentleman who was quite familiar with England, and he would frequently exclaim, "This is like a road I remember in Kent," or some other part of England, so like was the scenery and the hedgerows. The Osage Orange may be said to be the universal hedge plant; here and there the Cockspur Thorn, or, as it is there called, the Black Thorn, and some other of our native thorns, are used. The Osage Orange, however, makes a superior hedge; not only is it more compact, but it presents a more pleasing green. its lively-looking foliage, even in a dusty time. making a much more cheerful appearance than that of the thorns. The thorns belong to the Rose family, and, like all their relatives, are subject to the attacks of numerous insects, a trouble from which the Osage Orange is particularly free. With hedges, as with all other crops, (?) the best results attend the best cultivation, and one can no more hope to grow a hedge under neglect than he can expect a crop of corn to successfully contend with the weeds, and then vield seventy-five bushels to the acre. The old method of hedge-making, that of cutting back each year, and raising the hedge by regular stages from a broad base, is well-nigh abandoned. In preparing the ground for a hedge, it is necessary to exercise great care in removing all roots of native shrubs or vines. If the hedge is to be set upon the site of an old fence, where vines and creepers have become established, this is especially necessary; otherwise the Cat-Brier, Virginia Creeper, and similar things will greatly interfere with the growth of the hedge. The plants are set about six inches apart, and kept carefully cultivated. Neither grass nor weeds are allowed to intrude upon the young growth, and a fence of some kind is put up to protect it from injury by animals. The plants are allowed to grow at will for three or four years, according to the growth they have made, after which time they are "laid down," as it is called in Delaware, or "slashed," as they say out West. This operation is performed in spring, and consists in bending the plants over and cutting each one half-way or more through, at a point three or four inches above the surface, and laying it down upon the preceding one. After this operation both the partially severed stump and the tops that have been laid down throw up innumerable shoots and form a broad and dense thicket, which is soon ready to be shaped into the proper form for a hedge. By this treatment a full, thick bottom is secured-so thick, that a rabbit can hardly get through it, and several prunings during the early growth are saved. The after treatment consists in giving two, and frequently three, prunings each year. The cutting, being done while the wood is still soft, is very rapidly performed. A simple knife, like a corn-eutter, is the implement generally preferred. The finest hedges we saw were those upon the estate of D. J. Blackiston, Esq., Kent Co., Md. This gentleman has five miles of hedging, and they are justly a matter of pride to him. He stated that last year he kept an account of what it cost him to keep his hedge in order. The work was done by one of his regular hands and the time that he devoted to the hedge came to \$26. Those who would see hedging successfully practiced, not as a matter of rural adornment, but as one of farm economy, should visit Kent Co., Maryland, and Kent Co., Delaware.

# The Fraxinella. BY CHARLES DOWNING.

[In a description of Fraxinella, given last August, we referred to a horticulturist with whom the plant is a great favorite. We had in mind Mr. Charles Downing, whose experience with herbaceous plants is more extensive than that of any one of our acquaintance. Mr. Downing kindly supplements our article with the following interesting notes.—ED.]

"In your notice of the Fraxinella, in the August number, you state that it does not produce seed very abundantly. I have always found it in quantity, but it should be gathered before fully ripe, because the seed-vessels, when quite ripe, burst, and the seed is lost. Sow it as soon as ripe, or soon after, in the open ground, and on the approach of winter cover it an inch or two deep with dry muck or some rubbish, to prevent the frost from throwing out the seed. This covering should be removed when the seed begins to vegetate in the spring. Plants grown from seed do not flower until three or four years old, but they are better than those grown from divisions of the root.

"The statement that the resinous secretion of the plant will burn is true, as I know from experience. When the plant is in flower apply of a damp evening a light to the lower part of the flower spike, and the resinous matter will burn with a flash. This will succeed with each cluster only once the same season, as the combustible matter is burned off."

## Notes from the Pines.

THE WEATHER.—It has rained every three days, or else there have been three rains in one day, and nothing flourishes but weeds. Light, sandy soil has been kept so wet, that moss and other low forms of vegetation form a green film upon it. Egg-plants grow as large as a bushel basket, and do not give a fruit; tomatoes decay before they are fully ripe; melons and squashes are all vines and no fruit, and sweet-potato plants find so much to do above ground, that they can not attend to their proper business. Things looked so badly, that I hardly cared to go about the garden. Just about at the worst of it I chanced to visit the garden of a millionaire, who was able, if he chose to do it, to put a man on every square rod of ground and tell him to keep it clean. This gentleman's garden was so much more weedy than mine, that I came home quite contented.

LIMA BEANS.—For two years my Limas have been well-nigh a failure. Last year I used somebody's superphosphate, and this year the Communipaw Plant-food. These are good fertilizers for most things, but they are very bad for Limas. Good stable-manure is the thing for them.

ASPARAGUS BEAN. — I never happened to grow this bean before the present year, and only regret that I put in so few. It is a pole-bean, and bears a very long pod. As a snap or string bean, it proves most delicious, cooking with a tender marrowness that is delightful.

THE TROPHY TOMATO.—Last year I was of insects; for weeks I have not seen a Vine obliged to report a perfect failure with the Fretter or "Thrips." The fall Web-worm

Trophy. I took unusual pains with it, and trained my plants to single stakes. The fruit clusters were so heavy, that they bent and constricted the stem which held them to that degree that circulation was stopped, or so far checked that as soon as the fruit attained its full size it decayed instead of ripening. This year I tried several methods of training. That which has given the best results, or at least as good as any, has been no training at all. After the brush for the early peas had served its purpose, it was gathered into fagots and laid alongside of the tomato vines, which were allowed to sprawl about at will, and only had their over-luxuriance held in check by an occasional pinching. Such abundance and such excellence of fruit compensated for last year's disappointment.

My Big Pear-Tree.-When I came upon the place I found a large pear-tree, some twentyfive or more feet high, and reputed worthless. For the last two years it fully sustained its reputation. Early in September it would shed its foliage, leaving a great quantity of the most miserable cracked and forlorn-looking fruit imaginable. No baking nor stewing would soften their obdurate hearts, and when asked what kind of a pear that was I always answered, "Cast-iron." In the press of other matters I failed to graft it. When I was able to go out this spring, I found that the housemaid, to save a few steps, had all through the winter thrown the chamber slops at the foot of this tree. So freely had they been used, that the grass all around was killed. I almost hoped that the tree had been killed also, but it took on an unusual appearance of health. The foliage and the fruit looked quite different from what they had ever done before, and upon examining the tree a few days ago I found that I had some bushels of Duchesse of a very fair size, and which had they been thinned would have been very fine. So much for this accidental manuring. Before that, Van Mons himself would not have recognized the tree as a Duchesse.

GRAPES.-What an amount of abuse has fallen to the share of those of us who have advocated the Concord! While we have freely admitted that the fruit is not by any means of the first class, we have claimed that fruit of a moderate quality was much better than none, and held that if a person wished grapes, he should plant the Concord to rely upon, and then experiment with as many others as he chose. There are my vines, some thirty or forty varieties; the Concords are loaded with fruit, the foliage perfect, and almost all the rest so much injured by mildew as to be unable to ripen their fruit. What seems the strangest, is that the Croton and Senasqua, which are more thoroughly foreign than any others in my collection, should be completely exempt from mildew, and that pure natives on either side of them are almost ruined. About the meanest grape in my soil is the Salem. I know it does splendidly elsewhere, but I have a four-year-old vine and some younger ones that are the poorest apologies for vines that one need wish to see. Much talk was made about the Black Hawk a few years ago. My vines have fruited this year, and a miserable foxy thing it is. It is worse than the Martha, which is high dispraise.

VINE INSECTS.—The heavy rains seem to have been unfavorable to the development of insects. The cabbage pest, which began the season in such a threatening manner, is scarcely to be found, and grape-vines have been nearly free of insects; for weeks I have not seen a Vine Fretter or "Thrips." The fall Web-worm

(Hyphantria textor), which spreads its tent as it moves along, does not seem to mind the rain, and is unusually abundant. What an omnivorous thing it is; there is scarcely an ornamental or fruit tree or vine upon which it will not make itself at home, and it has been more than usually troublesome upon the grape. Its web is almost invisible, and it is not usually discovered until considerable mischief is done.

BUGS AND BUGOLOGISTS.-The most destructive insect upon our encumbers, melons, and all plants of that family is the Northern Ladybird (Epilachne borealis). Here the Striped-bug and the Squash-bug are innoceut in comparison with this, which goes through the vines like a devouring flame. It is a yellow Lady-bird, with seven black spots upon each wing-case, and has a yellow larva bearing curiously branched black spines. Both perfect insect and larva eat the leaves at a fearful rate. It is the only known Lady-bird that is a vegetable-feeder, and it makes up for the abstemiousness of all the rest. C. V. Riley, the State Entomologist of Missouri, was here a short time ago. They do not have the *Epilachne* in Missouri—blessed people !- and it was gratifying to see him "go for" the specimens. He was heartily welcome. How refreshing it is to meet with au enthusiast in any department of science! Missouri presents an example that some of the older States might well follow. She keeps a throughly competent entomologist in the field, and publishes his reports in handsome style, with great promptness. In New York, the matter is left to that remarkably ponderous and slow-going body, the State Agricultural Society. They have an entomologist who sometimes reports and sometimes does not. Then, if he has any thing to communicate, in two or three years it may get before the people, or such of the people as happen to get the antiquated volume of reports.

### The Plum Curculio.

It would be interesting to have a list of the various methods proposed for the extermination of the curculio. Almost every year we have a secret preparation or other remedy proposed. It is never heard of afterwards, and we go on in the only known certain way, catching and killing. The latest new method comes from Col. Hardee, at Jacksonville, Florida. He proposes to frighten the "little Turk" out of his wits by means of concussion. He says: "I placed two pounds of powder in the hollow of a live-oak stump immediately in the vicinity where they (the curculios) promised the entire destruction of some plums, peaches, etc. The powder was fired off one calm night, and it not only destroyed every curculio, but every winged insect in my entire orchard." He claims that concussion is "the greatest fertilizer known."

Our Southern cotemporaries are giving considerable space to this matter. A correspondent of the Rural South-Land writes as follows: "Subsequent experiments have been made upon various crops by other persons carrying out Col. Hardee's idea, and especially in the destruction of the caterpillar in a cotton field, until Col. Hardee now claims that concussion may be economically used as a specific against the ravages of insects upon the vegetable kingdom. He further claims that it was by the frequent concussion of heavy artillery that the ravages of the yellow fever were prevented, and did not prevail in any of the Southern cities during the late war." This is, of course, one of those matters that can only be settled by experiment. Should the effects of concussion prove to be as destructive to insects as Col. Hardee claims, we can not only turn onr swords into plowshares and onr spears into pruning-hooks, but our artillery into curculio-catchers. Dr. Hull's curculio-catcher will please stand aside and let Hardee's battery come np. A gentleman of our acquaintance has a fine lot of plum-trees, which has in previous years given him good crops-jarring and killing the curculio having been faithfully followed. He saw it somewhere stated that the fames of carbolic acid would keep away the insects. So corn-cobs, saturated with the acid, were hung all over the trees, and the jarring abandoned. The result is, not a single plum, but the trees have a very unique appearance, on account of the numerous corn-cobs that are suspended all through them. We shall be very glad to record some well tested and successful method of warding off the attacks of the curculio, but at present we are unable to recommend any thing, except jarring the trees, catching, and killing.

# Be Just to the Gardeners. BY PETER HENDERSON.

A friend called at my office last week and asked me if I could recommend him a gardener who could manage his place. Knowing that already he had one of the best men in the vicinity of New York, I asked him what was the matter. He replied, that Mr. --- was perfectly incompetent, that his grounds were overgrown with weeds, and every thing in disorder. Further inquiries elicited the fact that he had reduced his assistants, to curtail expenses, which, coupled with the fact that this vicinity has been deluged with rain during the whole of August, readily accounted for the weeds and disorder. All who have had any experience in working the ground know that during periods of such incessant summer rains as we have had for the past six weeks, the labor of two men is hardly equal to that of one, and consequently, if additional assistance has not been given to meet such contingencies, nothing else can be expected but weeds and disorder. It is short-sighted economy to withhold labor in the garden or on the farm, whether it be worked for pleasure or for profit. Surely it is any thing but pleasing to see grounds overgrown with weeds, and as to profit, we all know that weeds in the ascendency are the bane of all profit to the worker of the soil.

Ten minutes of this kind of reasoning seemingly convinced my friend that he rather than his gardener was at fault.

### Large Collections of Fruit.

When we take the fruit lists of our nursery catalogues, and those given by our pomological writers, and compare the hundreds of varieties of apples and pears, for instance, with those that are actually to be found in the market, we see that the proportion of varieties really grown is very small in comparison with those that are known. In the absence of public collections we can not be too grateful to such men as Ellwanger & Barry, Col. Wilder, Charles Downing, and many others, who for many years have kept up, at great expense, large experi-mental orchards. The number of varieties of the pear that will bring a good price in the market, may be counted on the fingers, while those in the catalogue can be told by hundreds. Some Western fruit-grower has said that in the Chicago market they only know Bartletts and pears-all besides the popular Bartlett not being considered worthy of a name. Every novice in fruit-growing makes the mistake of planting too many varieties of any one fruit. When he comes to market his fruit, he finds that he has a miscellaneous lot of unpopular kinds, and not enough of any one sort to make a respectable consignment. In fruit-planting for market there should be varieties enough to extend over the season, and these of such kinds as are known in the market. We think that our Horticultural and other societies make a mistake in offering large premiums for the largest collections of apples, pears, etc.

### Pears in Orchard Culture

Pear culture may be regarded in two aspects. The amateur who has a few trees in his garden grows his trees as pets, cultivates them for the love of it, and it makes but little difference to him how much his pears have cost him a dozen, so that they are from his own trees and the results of his own labor. With one who sets out trees by the thousand with a view to profit from the sale of the fruit, the cost of his fruit is a matter of great consequence, and whatever affects the health of his trees or the quality of his fruit appeals at once to his pocket. Those who have not been over the ground can have but little idea of the extent to which pear culture has been undertaken in Delaware and the adjoining counties of Maryland. A recent trip through this section of country enabled us to see successes and failures, and a few notes on these may be of interest to those contemplating pear culture. In visiting a large number of orchards we found that success in raising pears, as with other crops, only attended good cultivation. While we saw partial failures in some cases where good culture had been given, we saw no instance in which good crops accompanied neglect. At Newark, Del., there are two very instructive orchards. One of these belonged to Randolph Peters, Esq., who has removed his nursery to Wilmington, but still retains at Newark a pear orchard of 10,000 trees. These trees have been set nine years and comprise standards and dwarfs in equal proportions. The rows are twenty feet apart, and the intervening spaces have been cropped with corn every year. An annual manuring is given to the corn crop and incidentally to the pear-trees. The leading varieties are Bartlett, Duchesse, Buffum, Seckel, and Laurence, though there are many other and mainly unprofitable varieties. The kinds mentioned were in full bearing, in many cases the trees being overloaded and breaking down with the weight of fruit. The show of Bartletts was worth going far to see. Charles Downing and P. T. Quinn, who were of the party, and who had visited the orchards of California, both declared that they saw nothing on the Pacific that equalled the display of Bartletts in Mr. Peters' orchard. Other varieties also made a fine show.

About a mile from Mr. Peters' orchard is that of Prof. E. D. Porter, Professor of Agriculture in the Delaware College. The soil of this orchard was well prepared, and the trees—1,000 of different varieties—were planted the same season as those of Mr. Peters. The trees, up to the time they were six years planted, had been kept thoroughly cultivated, and were considered models of shape, health, and productiveness. About this time the Gardeners' Mouthly was strongly advocating "Pear-Trees in Grass," and Prof. Porter was induced to try the plan. Cultivation was stopped, and the orchard seeded down to grass. The plan of the Gardeners' Monthly was thoroughly carried out and the

grass mowed several times a year and left upon the ground. We visited the orchard on the same day that we did that of Mr. Peters. Not a tree in it had a decent crop, is to cut, at the first appearance, down to sound wood, no matter if it takes the whole tree. Upon the supposition that the hlight may be caused by a fungus—though it is only a speculation—

We some months ago made a visit to the greenhouses of Mr. C. S. Sargent, at Brookline, Mass., —an enthusiastic farmer, and a most accomplished gardener. Mr. S. is a relative of Mr. Henry

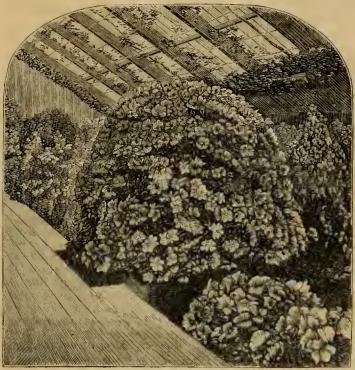

Fig. 2.—THE FERNERY.

Fig. 1.—THE AZALEA HOUSE.

many trees were quite dead, and others just lingering. The orchard, which was at one time the finest in all that region, is now such a melancholy wreck, that the Professor keeps the gate locked, and no one is allowed to enter, unless he desires to see an "example and a warning."

The next most injurious thing to grass in a pear orchard, according to the Penin-

sular growers, is strawberries. They interfere with the growth of the trees to such a degree, that many think they "poison the soil." Raspberries and currants between the rows, as they demand and allow of cultivation, are less objectionable, but the general impression is, that no crops save annual ones, requiring yearly manuring and abundant working, should be tolerated in the pear orehard. Many, if not most of the orehards, are planted with alternate dwarfs and standards. Where the pear stock takes root this plan will answer, but dwarfs, kept as such, are not profitable in orchard culture; their place is in the amateur's garden. The great drawhack to pear culture is blight, which, like the rain, comes upon the just and the unjust-those who cultivate their orchards, and those who neglect them. There is, we think, less blight in well-cultivated orehards than in others, but in the best kept it is sufficiently frequent as to cause great discouragement. A tree will one day be the picture of vigor, health, and fruitfulness, and the next a mass of blackened

limbs, only fit to be east into the fire. The ascribing this to fungus, electricity, etc., is only another way of acknowledging our ignorance. Some varieties seem to escape, and others to be particularly susceptible. The only thing to do

the dead limbs should be burned. The only hope of the pear growers is that the blight may prove here, as it has in other places, periodic.

## Fine Specimen Greenhouse Plants.

It is never amiss to have a high standard of excellence set before us, and those of our read-

Fig. 3.—PLANTS IN THE STOVE-HOUSE.

ers who have greenhouses, as well as those who have to content themselves with a few pots on a window-shelf, will be none the less eager in their endeavors, if they know what it is possible to attain under the best circumstances.

Winthrop Sargent, whose edition of *Downing's* Landscape Gardening is so well known.

The accompanying illustrations are from photographs taken in Mr. Sargent's houses. Fig. 1 is a view in the Azalea house, where we saw over a hundred very fine specimens in bloom. The central plant is the Azalea Indica "Decora," which has been brought to its pres-

ent perfection by about thirty years of careful training. An offer of \$1,000 was made for it (and refused, of course) some years ago. The circumference of the head of this plant is fifteen feet, and its hight above the tub four feet and one inch. At the time of our visit, it was one mass of rose-colored bloom, like an immense bouquet; and in its setting of other colors, it was more gorgeous than we had supposed it possible for any plant to be. Figure 2 is a view of the fernery; and figure 3 of some of the central plants in the "stove"-house. The great number of plants with fine foliage now in our collections allows the cultivator to keep up a brilliant appearance at all seasons, even when there are no flowers. Indeed, the leaves of the various Marantas, Caladiums, Allo-casias, Cyanophyllums, and plants of that character are so beautiful, that the absence of flowers is not noticed. These are only some of the items of an establishment where every thing is as nearly perfect as it is possible for skill and attention to make it. Upon a scale of equal completeness with his

greenhouses is Mr. Sargent's dairy, which, although luxurious beyond the needs of common farmers, combines several improvements well worthy of general adoption. The barn, and the Jersey cattle, too, are well worth a visit.

## THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

### Little Matters and Greater Ones.

In the primitive housekeeping of the wife of the Western pioneer, the skillet is the universal house-

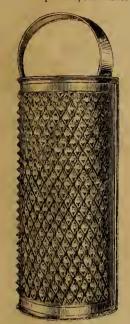

Fig. 1.—COMMON GRATER.

hold utensil. In this the bread is baked, the meat is cooked, and the dishes washed. Indeed, it serves so many domestic purposes, that those fastidious about their food should not investigate too closely. How bewildered one of these housekeepers would be could she visit a first-elass house-furnishing store, where human ingenuity would seem to bave been sorely taxed to invent a hundred utensils to do that which she had always found her simple skillet equal to! We like to visit a store of this kind, as it is wonderful to see the amount of thought and skill that have been expended for the benefit

of the housekeeper. It is not always the case that the new things are better in practice than old ones, but there is nevertheless the same display of ingenuity.

What a variety of devices have been presented for the simple purpose of beating an egg! We like now and then to drop in to the store of our neighbor Baldwin, in Murray street, to look at the strange "traps," and exercise our ingenuity in guessing their uses, for some of them are embodied conundrums, and it takes no little acuteness to make out what they are for. As an illustration of the inventive skill bestowed upon a simple thing, we will take the nutmeg-grater. The primitive grater (fig. 1) is well enough known: a rough piece of tin, upon which the nutmeg is to be rubbed-simple and effective. But careless people may grate their fingers as well as the nutmeg. may be prevented by providing a holder, in the shape of a wooden block with a hole in it (fig. 2). The nutmeg is placed in the hole in the block, which slides over

the grater. The same principle is expressed in a different way in figure 3, where the grater forms an are of a circle, and the nutmeg !holder, atfached to an axis, is pushed back and forth

nutmeg is held in place by means of a wooden spring, and the grater, in the form of a disk, is moved against it by turning a crank. The same idea is earried out in the iron implement, fig. 5, in which both nutmeg and grater are concealed from sight and also from dust. These are all single-barreled graters, but in figure 6 we have what might be called a revolver. The grater is a short eylinder, with the grating surface upon the inside.

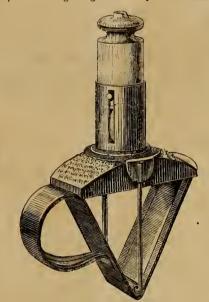

Fig. 3,-CURVED GRATER.

Within the grater is another short cylinder, which revolves; this has upon its eireumference four holes, at which four nutmegs are held by means of springs, and are brought in contact with the grating surface as the crank is turned. Any of these

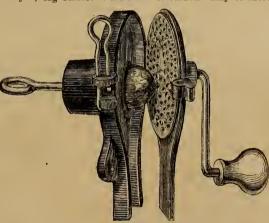

Fig. 4.—WOODEN REVOLVING GRATER.

graters do their work well. In purchasing household or any other implements, simplicity should be sought, as well as efficiency. That implement that will do its work with the fewest parts and joints is

to be preferred, as less liable to get out of order, to any complieated one, no matter how ingenious it may be in design.

### Letter from a Housekeeper.

DEAR AGRICULTURIST: There is nothing I enjoy reading better than a practical letter from some unknown sister housekeeper, and the farther off it comes, really, the more interesting it seems to be. Although nothing definite may be told about the circumstances surrounding her, yet

there is just enough mystery about it to make it pleasant to enlarge upon it in the imagination. It is astouishing how often I think of the mother, and her interesting family, who wrote the short but touching letter which appeared in one of the back numbers of the Agriculturist. You know the letter

refer to -"From Over worked Woman." When I am weary, and tired, and overdone, I just think of her, and somehow I feel better for the sympathy. I wonder if she won't write to us again, and let us Agriculturist sisters know how she is getting along? If she has dropped down in the harness, let us know it from her hushand or some neighbor, that her sisters may shed a tear to

I find this hot

her memory. Fig. 5 -- IRON REVOLVING GRATER.

weather that it is difficult to make bread without the Dough Turning Sour before I can get it baked; so lately I have taken the precaution to add a little earbonate of soda to the sponge. I use for my baking of twelve ordinary-sized loaves about two thirds of a teaspoonful, well dissolved in plenty of warm water. I have not had sour bread since I have done so, and I have followed this practice since early in the summer. As there is not the slightest discoloration in the bread, I know by this sign that it needed something of the kind. I have an idea that most of the flour we buy is slightly acid, but of course I don't know how far I am correct about this, but I do feel positive that the soda used as I use it, enables me to make whiter, sweeter, and more wholesome bread and biscuit than without. During the early spring, we had very poor old potatoes, and as the new oues were not large enough for the purpose, I omitted putting potatoes in my bread. Since the new ones have become large, mealy, and fully ripe, I have commenced using a generous quantity in the bread, and I am surprised to see what a great difference it makes. The bread is whiter, softer, firmer, and more glutinous-looking, and keeps moist much longer. ing a young housekeeper, I have often questioned with myself the utility of putting potatoes in bread. Since this experiment has been thrown in my way, my mind is fully made up, and I think I shall never again omit them. We are all fond of

Fig. 6. - Four-barreled revolving grater.

BISCUITS, and as I think raised biscuits the best, I always reserve a quantity of the raised dough for

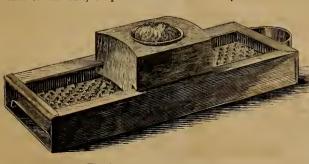

Fig. 2.—GRATER WITH GUARD.

over it. In these cases the nutmeg moves over the grater. There is another set of graters, in which the nutmeg is stationary and the grater moves. Figure 4 shows one of these, where the a good pan of biscuit for tea. I leave about as much dough as would make a good-sized loaf of bread, and I add to it, well working it in, a piece of shortening as large as a duck's egg. I let it rise again, and then mold and cut into biscuits. I let the biscuits touch in the pan, and I am very careful to set them perfectly even with one another, just so many and no more, both ways. Some housekeepers are not particular about this, and the biscuits look very ngly. One great secret in making good bisenits is to have them well risen. I have noticed that the same dough takes longer to rise in biscuit shape than if a loaf of bread had been designed. Have my of my sister housekeepers observed the same thing? Not leaving them to rise long enough is, I think, why some people fail to have light and white biscuit. Where bisenits are made by themselves, and for any especial occasion, new milk is much better with which to wet the sponge, as the biscuits will be much whiter, and the whole appearance will be better. Many persons, especially in the country, can use milk entirely for all the bread, but persons residing in the city are glad if they can afford milk to raise their biscuits.

Green-Grape Pie.—In the absence of other materials, and a friend having recommended me to do so, I have been making pies of green grapes. They take a good deal of sugar; that is the chief objection to them. I have at times added a few grains of soda in order to neutralize some of the acid, so as to use less sugar. The pie would then be very good; but for those who can afford it, no soda, and the full complement of sugar, will give better satisfaction to most tastes. The stones are now soft, and I do not remove them. I funcy that as the grapes get riper they will make a better pie than now—though we all agree that green-grape pie is excellent, and quite equal to a green gooseberry pie. My neighbor, Mrs. Sargent, makes a

GREEN-GRAPE STEW, which, she tells me, with plenty of sugar added, makes a good sauce for tea, in case nothing less expensive is convenient.

GEEEN-GRAPE JELLY.—There is hardly any finer jelly than that made from green grapes. Just before they turn color is the time to gather them.

Grape Jelly.—Ripe grapes make an excellent, fine-flavored, handsomely colored jelly. Strip from the stems any quantity of ripe and quite sound grapes. Extract the juice in the oven or over the fire, bruising them as slightly as possible, and using a wooden spoon to stir them up. After the grapes have burst, strain the juice through a flannel bag, twice. Then boil up the strained juice, and let it boil for twenty minutes. Now stir in the sugar, and boil for fifteen minutes, stirring constantly.

Grape Catsup.—Ripe grapes, with sugar, vinegar, cloves, and other spices, boiled until tender, make an excellent relish to eat with cold meat.

SQUASII PIE .- We have had so many squashes of all kinds this summer, that we were at a loss to know what to do with them. We gave a good many away. We had some white scallop summer squash, which we considered wonders in their way. One fellow struck us as so remarkable in shape and size, that husband took it to a butcher's shop and had it weighed. It turned the scale over four pounds and a half. Now, I suppose some farmer, with plenty of good land, and all the gnano and superphosphates and home-made what-do-you-call-'ems at his command, will laugh when he reads of our boasting over a four-and-a-half-pounder of a summer squash, but he must remember that we didn't have any Peruvian nor superphosphate stuffs to coax 'em with, but just planted the seed in the bare ground. But I was telling about squash pies. I think them most as good as pumpkin pies. As I had no recipe just at haud, I made them according to my judgment, and the result suited the children, at any rate. Boil until very tender any quantity of squash which has been previously peeled and freed from seeds. Mash until perfectly smooth. To about one pint of the pulp add two tablespoonfuls of sugar, a grated nutmeg, a half-pint of new milk, and two eggs well beaten. Bake in a tin plate, lined with a good paste, as a custard pie is made.

BY FAITH ROCHESTER.

A COVER FOR AN OPEN SEWING MACHINE.— This may be made very easily of an oblong piece of calico or linen, with rounded corners, hemmed around the edge. A strong string may be run in the hem, to tie under the edge of the iron machine upon the wooden stand. This protects the machinery from dust, and from meddlesome little fingers.

What object is served, I wonder, by rounding one end of the spools of cotton? Some of our best machine thread comes in that way; and in using it with machines where we sew directly from the spool (at least, in using it with Grover & Baker's machine), it is extremely annoying to have the thread run off faster than it is needed, and twist around the spindle, as it does from the rounded end when we put on a new spool.

NIGHT-GOWNS.—There are persons who do not seem to see the "sense" of night-gowns, especially of men's night-shirts. They may admit that it is quite reasonable for a man who wears fine starched linen about his daily business, to change to a plainer garment at night, especially if he cares for a small laundry bill. But why should a farmer take the trouble to put on a night-shirt?

Because the garment he has worn all day is so saturated with the perspiration of the wearer—the insensible if not the sensible perspiration—that it needs a good airing before further service. It is not tidy to sleep in it, especially if another person occupies the same bed. A due regard to the laws of health would lead us all—men, women, and children—to remove every article of clothing worn during the day on going to bed, changing to garments at night that have been well aired during the day. The habit of rolling up night-gowns in the morning, as soon as taken off, and placing them under the pillows, results from the same ignorance that leads housekeepers to make beds before they have been well aired in the morning.

Night-drawers, for young children of both sexes, have several advantages over the ordinary gowns. When properly made, they keep their place much better during the night, so that children who throw off the bed-spreads have at least one covering left. They are also a better protection to modesty, where several children are undressing and frolicking together. They should be made very long in the body, and very short in the legs, comparatively—though they should cover the little feet in winter. The opening reaches the whole length of the back to the legs, and should have a wide lap, and button securely together, to keep the back from exposure to cold. They look loose and bagging, but are very comfortable.

Men's night-shirts are made about the same as their day-shirts, only longer in the body, and without bosoms and wristbands for starching. A flannel night-gown, to be worn over an ordinary muslin one, is a great comfort in very cold weather.

Homes for the Homeless .- As eold weather approaches, and our thoughts run ahead to preparations for the comfort of our own beloved families during the coming winter, let us see if we cau not draw a little closer together in our homes, and so make room for some of the Lord's little ones who may be left to perish without our help. In all the great eities of our country they may be found. There are thousands who need comfortable Christian homes to save them from lives of vice and crime. And there are thousands of comfortable Christian bomes in our land where there is room for a poor, unfortunate child of poverty and ignorance, and where the hearty adoption of such a desecrated little image of the Lord, "in His name," would be a great benefit to the family adopting it. Careful training and kind treatment might make of the little waif a valuable member of the family and of general society. The moral culture of the selfdenial involved in such training, and the reflex influeoce of patience and kindness, are not among the least of the blessings sure to follow such adoption, if made from pure motives. The golden rule is grossly violated sometimes by those who adopt orphan children. Such little ones are treated like little slaves by some selfish people. If our children were left poor and orphaned among strangers, what treatment should we desire for them? Is the test absurd? Centuries ago, there lived on earth One who made the test of Christianity our love for our brethren-for the poorest, lowest, and vilesta love that would rush to their succor from degrading conditions of life. I often use the word "Christian," but hardly in the technical sensenever as necessarily synonymous with "churchmember" or "professor of religion." So when I bespeak "Christian homes" for homeless wanderers, I am thinking of the homes where Love and Duty preside.

The children of ignorance and vice increase so fast, we must work at both ends of reform movements if we really mean to do what we can toward true civilization; must stretch out helping hands toward the fallen in all possible places, and must work even more earnestly to keep the young from the same sad fatte.

THE AGRICULTURIST AND THE CHILDREN.—My small children welcome the coming of the Agriculturist with about the same eagerness with which they hail their own little green-covered "Nursery." Both are equally profitable to them, I think, though in different ways. Of course, they can not appreciate the reading of the Agriculturist (except the easiest part of that contained in the children's department), but they are full of questions about the pictures, and they learn something of natural history and botany from the pictures in the Agriculturist, with the explanations they coax from us.

I groan sometimes because I can not have the privilege of reading an illustrated paper or book in their presence without knowing that they are longing to have me show them the pictures, and "sing 'bout dat," as the youngest one pleads. But there is great delight in supplying their houses ueeds for knowledge with that which is wholesome and of lasting benefit. Many children are stuffed with any kind of intellectual busks that come handy, when they ask for stories or beg to see pictures.

Some of my friends seem to suppose that my little ones are peculiar in their aptitude for natural science, when they hear the five-year-old boy talk so familiarly about the physiology of plants and insects. Even the two-year-old toddler is fast learning the names of the weeds in the yard, as well as of the flowers in the garden, and begins to ask, with comical scriousness, "Is dat in 'e same family?" from hearing her brother inquires of often about the family relationships of plants and animals, and even of fabrics and kinds of cooked food.

But I can not believe that the natural inclination of these two children toward the observation of natural facts is above the average of children. I am thankful that we have been "led" in this way, and I believe that my children will be thankful some day that a taste for these pursuits was cultivated in them (or allowed a chance to grow) before the too, common pap of average Sunday-school books, and stories of fairy-land, and narrations of the everyday incidents of child-life, in repeated easy doses, had almost hopelessly demented them.

I used always to choose the easy reading for myself when I was a little girl—the little stories or baby novelettes. I had friends who regretted this, but the mischief had been done long before they thought of care in the matter. The little hands of my babies have led me nearer to nature, to learn something of her wonderful secrets, in order that I may teach and delight them with things more beautiful and wonderful than any fanciful traveler ever found in any imaginary fairy-land.

But I was going to tell how glad my boy and I were to find the "Arrowhead" pictured and described in the Agriculturist for July. It had proved too much for me with my old botany to decide upon. Other wild flowers are pictured every month that are the faces of friends familiar to us in the woods around, and whose names we have learned only within the last few years.

## BOYS & GURLS' COLUMNS.

## Churns and Bottles.

BY "CARLETON."

Churning! What would you say, my young friends, if you were riding over one of the great prairies of the North-west, away out on the frontier, fifty miles from any house, and were to find an old woman churning butter? Do you say that it is not a likely story? Well, but you can see such sights on the frontier. I have been traveling day after day over these green fields of the North-west, and have driven my horse almost a hundred miles without seeing a house, but I saw hundreds of wagons moving in long procession over the prairies, their white canvas tops fluttering in the wind, and droves of cattle and sheep following behind. Boys and girls, with bare feet and frowzy heads, were driving them. There was a chicken-coop on every wagon, and a pig-pen, and the roosters were crowing, and the pigs grunting, and the sheep and lambs were bleating, and there was music from one end of the train to the other. These were settlers who had sold out their farms in Wisconsin and Iowa, and were moving on to Dakota, to find new homea in one of the richest valleys in the world, on the

banka of the Red River of the North.

But about the churning. The teams had gone into camp for the night; the oxen were unyoked, and were feeding on the tall grass; the cows bad been browsing by the roadside all day long, and were glad to stand still and chew their cuds while the big girls milked them. The boys picked up some brush and sticks of wood, and kindled a fire, and went down to the brook and brought up pails of water. The women got their frying-pans down from the wagons, and hunted up pieces of pork from a barrel, and in a very short time there was a delightful smell of fried pork floating out on the evening air. And there a clattering of tin plates and cups, and knives and forks, which the little barefooted girls took out from a box beneath the wagon-seat. While all this was going on, the gray-headed grandmother sat in ber chair on the green grass, churning the milk in an old-fashioned dash-churn, and they all seemed to be just as happy and as contented as if they were at home. I think that the old grandmother had the hardest work

to do. When I was a little boy, I used to hate churning. I never could see any fun in lifting the dasher, and sending it down with a jab, hour after hour. It made my arma and back ache, and once I declared I would go without butter rather than chara. This gray-haired woman seemed to like it, and as I saw her lifting the dasher so ateadily, it set my thoughts running over what I had seen in the way of butter-making in years gone by, and I remembered how vexed I used to get when the butter wouldn't come; how once I began to churc in the morning, and kept at it all the forenoon and all the afternoon, and lost my temper, and wished the old churn was in Halifax, and, finally, got so mad that I jabbed the dasher down so hard that I split it, and came near staving a hole through the bottom; and how I churned, and churned, and churned, and still it wouldn't come, and went to bed with the back-ache, and got up in the morning and found the butter had come of its own accord in the night, and came to the conclusion that I had made a fool of myself by getting angry.

The witches used to get into the cream. People be-lieved in witches when I was a little boy, and I can just remember that one of the hired girls burnt out the old witch by dropping a red-hot iron wedge into the cream, and then the butter came at once. I never could find out, however, what became of the old witch.

I have seen a great many kinds of churns, with cogwheels, floats, rollers, paddles, dashers, rockers, and patent contrivances to make the butter come, but the funniest and queerest churn I ever saw was in the Eastern country; and it andoubtedly was just such a churn as Abraham, and Jacob, and all the old farmers that we read about in the Bible had in their households. It was a funny affair, and if you were to guess a dozen times I do not believe you could tell how it was made. It had no dasher; there was not a cog-wheel about it. It was made of raw hide—the skin of a goat, taken off from the animal with great care, and the hairy side turned in, and sewed neatly and tightly together with the sinews of the creature. It was sewed so well and so closely, that it was water-tight. That is the way they make bottles in the old countries. I think it likely that Hagar had just such a water-bottle when Abraham sent her, with the little acapegrace Ishmael, out into the descrt. I never thought it was very geutlemanly in Abraham to turn them out, but he wanted peace at home, and that was the way they did things in those olden times. That is the way they make wine-bottles in the East. Glass factories are not often found in Asia, but there are goats enough on the hills, and it is an easy matter to skin one, turn the skin inside out, and sew it np again—all but the neck.

Every family has such a chura. The housewife puts the cream into the churn. Do you ask if she turns it in upon the hair? Certainly, for the skin will not soak through near so quickly with the hair on the inside as it otherwise would. When the cream is all in a cord is tied around the neck, and then the hoys and girls have a game of football. They kick the churn round the room, they toss it into the air, give it a lusty shaking, and keep it going until the butter comes. Such butter! It holds together well. It is about as well haired as any you can find in your own market. Please do not turn up your noses at it, for it is the best you will get. Do we eat it? Certaioly; and when you read about butter and honey in the Bible, when you think of Samuel, David, and Daniel, of Paul, Peter, and the Saviour, as sitting down to dinner and cating bread and butter, you may be sure the butter was churned in such a churn.
Upon the whole, I think I had rather have an old-fash-

ioned dash-churn than a goat-skin, even if it does make my back ache.

MINNESOTA, August, 1871.

## Aunt Sue's Puzzle-Box.

[An apology is due to Aunt Sue and the boys and girls who cojoy her Pazzle-Box. Aunt Sue wrote, asking the editors what day they would need her "notices to correspondents," and the editor whose business it was to write and tell her, neglected, forgot, omitted, or something, and did not reply. She called in at the office the other day, on her way to the sea-shore, and was so goodnatured about it, that the delinquent editor felt very much ashamed of himself. So if correspondents have to wait another month for replies, it is not Aunt Sue's fault, for she is altogether too food of corresponding with children to intentionally neglect them .- EDITOR.]

## NUMERICAL ENIOMA.

I am composed of 11 lettera:

My 11, 10, 6, 3, is the name applied to the principal branch of a river.

My 5, 2, 3, 4, is a propeller. My 1, 9, 8, 3, is a sort of oven. My 4, 6, 8, 7, is a measure.

My whole is one of the kings of Europe. FRANK

SQUARE WORD.

Square the word "Write." STAR AND CRESCENT.

BLANKS.

(Fill the following blanks with words pronounced alike

but spelled differently.)

3. Will you — me a — ?

4. The — sang a plaintive —

- the men saw the -

- will read a ----.

They gave \_\_\_\_ a \_\_\_ to \_\_\_ will \_\_\_ the tree. - to read.

- was that of a man.

THE ITALIAN BOY.

## CROSS-WORD ENIGMA.

My first is in shadow but not in storm. My next is in substance by not in form. My third is in rain but not in snow. My fourth is in reap but not in mow. My fifth is in pipe but not in bowl. My sixth is in mouse but not in mole. My seventh is in bird but not in cage. My eighth is in sulky but not in stage.

My ninth is in bran but not in meal. My tenth is in grouse but not in teal.

And now, if you're patient, and clever, and witty, My whole you'll discover, the name of a city.

UNCLE ED.

PUZZLE. (Make sense of the following letters.)

YADOTO 11. RRELD RPVLN OUEIA WOFFU HATYO E. L. CLAUK. PROVERD PI.

(Make five proverbs out of the following 43 words.)

A good man goes to pay a debt. The only child goes sorrowing.

It is easier to revenge at sixteen.

He is to blame: health will prove it.

Do that which is above a wrong.

Do that which is above a wrong.

Wealth at sixty is better than a borrowing.

L. S. C.

## Summer and Winter.

How sweetly and peacefully grandma sits under the trees! She has been reading. But now the spectacles are laid upon the book, and the eyes are looking far away. Perhaps she hears the birds

sing. Perhaps she sees something. But we think not. What she hears, are the sweet voices of the girls who are swinging under the trees. She hears their happy voices, and her heart is made happy. She is thinking of the time when she, too, was a child. She seems to hear the voices of the little girls she used to play with so long, long ago. She can almost see them again. These little girls will have a long road to travel before they get to be as old as grandma. How many stories the old lady ean tell these two children in the evenings! But the stories they like best, begin: "When I was a girl." And these two happy girls are all the happier for having grandma by them. They brought her chair out here, and then they went and invited her to come out and sit with them under the trees. It makes grandma happy to know that she is loved and that the girls enjoy her company. A young person can do much to make the last days of an old person happy. The birds sing sweeter to these girls be-eause they are kind and loving, and the heart of the old lady is so happy that the happiness shines ont of her face. Dear old grandma! May you live many days yet, to make the children happy.

## Funding Five-Twenty Bonds.

OFFICE OF FISK & HATCH,

No. 5 NASSAU ST. New York, Sept. 5th, 1871.

We are strongly recommending in exchange for Five-TWENTY BONDS, soon to be called in, the SIX PER CENT GOLD BONDS of the CHESAPEAKE and OHIO RAILROAD COMPANY, now selling at 93 and interest, of which we have only some ,\$5000,000 still unsold. The total amount of the loan is \$15,000,000. They are issued in denominations of \$1,000, \$500, and \$100, coupon and registered, interest payable May and November, in New York City, in United States gold coin.

The CENTRAL PACIFIC SIXES, amounting to \$25,885,000, are in sharp demand for the German markets, and any amount can be sold as readily as so many Five-Twenty Bonds; they are freely dealt in at all the prominent Stock Exchanges in the world, and will soon advance to a large premium. That the same result will follow with the Chesapeake and Ohio Bonds, on the completion of the road, we have no doubt.

Holders of five-twenties, by conversion into Cen-That Pacifics, retain the same rate of interest, and increase their capital about 12 per cent. By converting into the Chesapeake and Ohio bonds the increase will be about 20 per cent.

Holders of Centrals can exchange for Chesapeake and Ohios, and increase their capital from 7 to 8 per cent, and in either case have a bond just as sure to be paid, prineipal and interest, as a Five-Twenty Bond.

As the amount of Chesapeake and Ohio bonds remaining unsold is so small, and the demand very great, they must soon be absorbed. There are very few Centrals on the market, and they will soon largely advance in price.

FISK & HATCH.

HARVEY FISK. A. S. HATCH.

# WATCHES!

The Famous Railroad Time-Keepers.

New York Centeal Raileoad, General Superintendent's Office, Albany, March 26, 1870.

T. M. Avery, Esq.,

Pres't National Watch Co., Chicago:

Dear Sir:—In answer to your inquiries as to the Watch I have of your manufacture, I would say that I have carried it some four months, and find it a good, reliable time-keeper. The movements seem perfect; it runs regular, and I see no difference in its register of time whether I carry it about with me in the office or when traveling by trains. I do not hesitate to recommend them as reliable Watches, with pernesitate to recommend them as reliable Watches, with perfect works running with great accuracy, and well adapted for use of railroad men or others that wish good Watches. Besides, they are the production of our own country's mechanics, and that, together with their merit as time-registers, should certainly give them preference over imported Watches, however good the reputation of foreign makers may be.

Yours truly

J. TILLINGHAST. J. TILLINGHAST.

Similar testimonials to the above have been received from the General San'ts of the Union Pacific, the Chicago, Alton, and St. L., the C. and R. L. the C. and N. W., the Eric. the Hudson River, the Peun, Central, the Mich. Central, and the Mich. Southern Railroads. The Penn. Central R.R. are furnishing the Elgin Watches to their engineers. Nearly 200 are now in use upon that line owned by the Company. Not the least among the causes why this leading and splendidly managed road has never met with a serious accident in the running of its trains, is the reliability of these time-keepers.

From the above testimony, it is claimed for them that they are the standard Bailroad Watches of the Country.

FOR SALE BY ALL JEWELERS.

The Elgin Illustrated Almanae, or the Illustrated Article on "Ancient and Modern Time-Keepers," by A. D. Richardson, sent free upon application to National (Elgin) Watch Company, 127 and 129 Lake Street, Chicago, or No. 1 Maidea Lane, New York.

## ARE YOU GOING TO PAINT? THE

## AVERILL CHEMICAL PAINT IS THE BEST

In the world for exterior work upon Cottages, Villas, or Buildings of any kind, whether built of brick, wood, or iron. It is a liquid, ready for use, and requires no oil-thinning or drier. Purest white, and any desired shade, can be had in packages from one gallon upwards.

Tests of six years warrant us in pronouncing it the most durable and beautiful paint made.

What People Say:
PETER HENDERSON, SEEDSMAN AND FLORIST, NEW
YORK, WRITES, Feb. 17, 1871:
"It is now a year and a half ago since I painted my residence with the Averill Chemical Paint, and, compared with painting that I had done with the best White Lead and Oil at the same time, I find that the CHEMICAL PAINT retains the color and gloss far superior to the lead oil. In the future I will use no other,"

I will use no other."

J. V. NICHOLS, Architect and Civil Engineer, Orange, N. J., writes, March:

"Over two years ago I had my house painted with the Avefill Paint, and from close observation think it superior to the hest English White Lead—covers better, retains its gloss, and does not crack or chalk off—in fact, hecomes firmer with age. I think it cheaper because of these qualities, allowing hirst cost the same. From my experience, the colors stand much better than any other Paint in use."

olors stand much better than any other Frant huse."

Mr. J. S. VALENTINE, of YONKERS, New YORK, says,
July 28, 1871:
"He painted his house two years ago, one coat only, with
the AVERILL CHEMICAL PAINT, and that it is as good to-day
as when first applied. It beats English and all other Leads
tor beauty, and its durability is beyond question. Would
have required two coats had he used Lead," etc.

Sample card of beantiful colors, and recommendations from owners of the finest residences in the country, furnished free by the

Gives every instruction, How to Grow Trees from Seed, How to Plant, and What to Plant for Sereens, for Ornamental Purposes, and for Groves. Its descriptive list of Trees and Evergreens is the most full and accarate yet written. Just the work needed to meet the Forest Tree necessities of the country. The hook is written in a simple, practical manner, and is suited to the tastes of all. Price \$1.50 by mail, post paid. For sale by Book Dealers everywhere.

Ladie Cabinet Initial Note-Paper.—A superb novelty in Stationery, with thated paper. Splendid initial

in a simple, practical manner, and is suited to the tastes of all. Price \$1.50 by mail, post paid. For sale by Book Dealers everywhere.

Ladles' Cabinet Initial Note-Paper.—A superb novelty in Stationery, with tinted paper. Splendid initial. Perfumed. Illuminated cover. Price 50e, perbox. Each box also contains a 25c, package of Flower Seeds.

Each year I test in my garden some of the most desirable Floral Novelties of the season, and if found really worthy, present them as Premiums to my subscribers, or distribute them freely among the public. The following varieties I have found so easy of culture, and so exquisite in coloring and gorgeous beauty, that they deserve a place in every flower garden:

The Amaranthus Bi-color Ruber.—Beautiful blood-red foliage. Grows three feet high. A most striking object for bed or border planting. Packet of Seeds, value 25 cents.

Diadem Pink.—The finest Flower Novelty introduced to years. Flower very double. Latensely brilliant color. Crimson and purple on white edge. Flant of luxuriant growth. Seed unusually choice and pure. Packets, value 25 cets. A choice of either of the above given to every subscriber to the Cabinet or Horricalturist, or to any one order to any action of the country on the process.—The finest of all the Gladioluses yet introduced. Most perfect shape. Flower large. Brilliant crimsen. Flowt vigorous and splendid. Price \$1 per bulb. Given free to any one who gets up a club of twenty for The Ladies' Floral Cabinet, or ten for the Horticulturist, or sent to any part of the country on receipt of price.

Brilliant crimsen. Finit vigorous and specular, the transfer of the Horticulturist, or sent to any part of the country of tor The Ladies' Floral Cabinet, or ten for the Horticulturist, or sent to any part of the country of free; the Ladies' Floral Cabinet, or ten for the Lilies. Immense clusters of flowers, red or rose-spotted; sometimes 50 to 100 on a single stem. Should be in every flower garden. Price 75c. Given to every one forming a club for either of the above journals, or each to any part of the country on receipt of rice. For a full illustrated description of all these, as well as other choice and beautiful novelties, see my Illustrated Prospectus and Premium List.

Williams' Illustrated Catalogue of all Books on Flowers, Gardening, Rural Architecture, and Rural Life. The handsomest and most complete ever published. Send 5 cents for it.

List of 100 Papers at Club Rates, comprising the most valuable and prominent Papers and Magazines in the conotry. Clubbed with either of my Journals, or with each other, at from 25c, to 50c, less than Publishers' full prices of each. Sent free on receipt of three-cent stamp.

Copies of all the above Books and Journals are for Sale, or supplied from every News Stand and Book Store in the Country. Early orders requested from the Trade.

## CASTERS FOR SEWING MACHINES.

## Combination of Patents.

All ladies using Sewing Machines, have experienced great annoyance and much hard work in moving their machines from one part of the room to another for the purpose of getting better light, sweeping, etc., etc., and have wondered why somehody would not get up a Sewing Machine Caster. Every one has wanted them and waited for them, and now here they are.

With a set of these Casters the machine is allowed to stand firmly on its feet (not on the Casters) while sewing; but by an ingenious, simple, and self-operating device, it is allowed to rest upon the Casters for moving about.

Manufactured by SARCENT & CO., 70 Beekman St., New York.

## Sold by Sewing Machine Agents Generally.

Dr cocipt of \$2, we will forward a set of these easters, express paid, to the nearest express station, to any address in the United States north of North Carolina and Tennessee and east of the Missouri River.

Beyond this boundary, a special arrangement as to expressage will be necessary.

When ordering, be sure to mention the name and particular style of machine for which Casters are wanted.

JOSEPH KIFT, West Chester, Pa.

THE

# NOVELTY CLOTHES-WRINGER.

Nothing, except the Sewing Machine, has ever been invented which so much relieves the labor of the household as the Wringer. But its usefulness does not end here. The saving of clothing is of much greater importance. It is often remarked that articles of fine texture last twice as long when versung in a Wringer as when wring by hand. The Novelley has Cog-wheels on both ends. \*\* The rolls are allowed to separate freely at cither end. These, besides other advantages which it contains, seem to be indispensable to a practical wringer.—New York Independent.

tical wringer.—New York Independent.

The Novelty Wringer has become an indispensable institution in thousands of families. And we believe its great and increasing popularity is fully merited—for the Novelty evidently possesses all the requisites of a first-class, practical machine. Indeed, after using one for many months in our own family, we are prepared to indorse the Novelty as ansurprassed (the laundress says unequaled) by any of the several wringers previously tried.—Moore's Rural New Yorker.

Sold everywhere. N. B. PHELPS & CO., Gen. Ag'ts, 102 Chambers St., N. Y.

## RASPBERRIES.

The New Seedlings "Herstine" and "Saunders."

Grown from the seed of the "ALLEN." planted in alternate rows with the Philadelphia, and doubtless a cross between those two perfectly hardy native varieties; having the color and flavor of the "Allen," the productiveness of the "Philadelphia," with much larger size and more himness, and the hardness of both—the Herstine having stood uniquired, without any protection, five winters, and the Saunders four—they are now confidently offered to the public as combining more desirable and valuable qualities than any other ravieties yet known. A limited number of phants will be for sale this fall at \$1 each, \$10 per doz., or \$55 per 100. Send stamp for circular giving onts and a full description, also the opinions of others with regard to them. Address.

D. W. HERSTINE,

No. 5 South Tenth St., Phila., Pa.

# PHOSPHATIC BLOOD GUANO

## An Improved Soluble Plant Food.

(its NITROGEN derived from Blood, and its Phosphates from Bonss.)

For seeding to Winter Grain and Grass it will more than repay its cost in one eron.

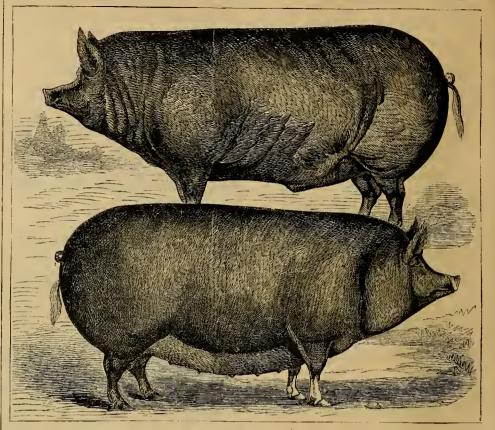

The greatest possible benefit to Lawns and Meadows is to be derived from manures applied during September and early part of October, ronducing a growth which protects the roots during winter, and imparting such life and vigor to them, that the crop will make an early start in spring and outstrip the weeds.

PRICE, \$50 PER TON.

Circulars on application.

P. O. Box 802.

THOS. J. HAND, Secretary, 31 & 33 Broadway, New York.

## Sixty Berkshire Pigs,

From imported Sows and Boars. This is said by good jadges to be the finest herd of Berkshires in the country. They are of large size, fine in hair and bone, and perfect in form and markings. A sow from this herd took the first prize and sweepstakes, and her litter of pigs the first prize, at the New England Fair at Lowell last month.

Sixty tries of AYLESBURY and ROUEN DUCKS, bred from IMPORTED FOWLS, and winners of first prize at the New York Poultry Show.

## Ten Shearling Cotswold Rams,

And six RAM LAMES, from IMPORTED EWES, and got by the Ram Lord Napier, which took severa: first prizes in England, and first prize at the Provincial Show, Canada, and first prize at the New York State Show, and first prize, for two years, at the Queens County Show.

## Ayrsnire and Alderney Calves.

The AYRSHIRES are the get of the bull Jock, winner of several prizes in Scotland, and he took second prize at the Stirling Show, 1869.

The ALDERNEYS are the get of Beacon Comet, who has no competitor; his stock prove to be unsurpassed by any for producing milk and batter, and wherever shown always carry off the gold and silver prizes.

## Horse Stock.

A number of YEARLING COLTS, got by the horse General Grant, winner of first prize, for two years in succession, on Long Island, open to competition. His sire, Black Hawk; grandsire, Sherman Morgan; g. g. sire, Justin Mogan, he by General De Lancy, thorough-bred.

A few CLYDESDALE FILLIES, got by Lord Clyde and Imported Bruns. Lord Clyde was awarded Diploma, 1869, and first prize 1870, at the Queens County Fair, L. I. His sire, Lord Clyde, bred by Mr. S. C. Crawford, Lanarkshire, Scotland; he by Crawford's celebrated Clyde, winner of first prize of the Highland Society, and was sold to the Douglass Society.

# For Everybody!

# LARGE PAY For Spare Hours, For Evening Work For Rainy Days, and

for those Seeking Employment.

GOOD FOR

Farmers. Postmasters. Gardeners, Merchants, Nurscrymen, Mechanics, Physicians, Lawyers, Students. Ministers, Teachers, Clerks, Conductors, Ladies, For ALL. Children,

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in announcing a new general Premium List for 1872 superior to anything before offered. The best premiums of hist year-those that gave the greatest satisfaction-are retained, and many new and valuable articles are introduced.

The design of this Premium List is fully explained on page 368 of Amer. Agriculturist, Oct., 1871, which please see.

These premiums have engaged the attention of all classes in past years, and over 13,000 persons have found pleasure and profit in them.

They are all new, first-class, valuable, reliable articles, just as good as money. The assortment is so large that every one will find something needed. See table and descriptions (p. 394).

Any person who chooses may collect a small or large list of subscribers and receive the preminm. It is only necessary to show a copy of the paper, explain its value, and collect and forward names.

It has been done largely at stores, shops, post-offices, etc., and by private individuals. By Co-operation, Ministers, Teachers, Churches, Sunday and week-day Scholars, have obtained Melodeons, Libraries, Cyclopedias, Dictionaries, etc., also Sewing Machines, and the like, for poor widows and others. Many professional men have opened and made up good premium lists at their offices. Clerks in stores and post-offices have

for themselves or for presents to others, all without the use of working hours, and at no money cost.

As a constant Business Employment, some persons canvass all the time, receive the premium articles, and sell them for eash, and thus seeure large salaries. One lady has averaged over \$3,000 a year for years past, and others are getting large pay for their time, often \$5 to \$20 a day. Some who did poorly at first have, by perseverance, acquired the art of canvassing, and become very successful. The work is honorable. The Journals are useful in every family in City, Village, and Country.

The American Agriculturist is everywhere known and approved. HEARTH AND HOME is now without a superior in the world as a splendidly illustrated Weekly Newspaper, for real value, cheapness, and adaptability to every home in America. The papers are entirely different. Taken together, they supply over \$30,000 worth of fine engravings, and more good reading than can be found in fifty books costing one Dollar each.

Premium Clubs ean be made up of subscribers to either paper, or partly of one and partly of the other, as noted over the Table. We call especial attention to the last column of figures, showing the small number of names required where both papers are taken, at the reduced price of \$4 a year.

You, Reader, can get a Premium. TRY IT.

## Explanatory Notes,

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices, But ... (b) Tell us with each name or list of names sent, that it is for a preminm .... (c) Send the names as fast as obtained. that the subscribers may begin to receive the paper at once. You can have any time, from one to six months, to fill up your list....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Specimen Numbers, Cards, and Show-hills will be supplied free as needed by canvassers, but they should be used carefully and economically, as they are very costly...(g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd & Co., or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. [In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 and \$3.00 a year, for the two papers; also at the club rates of \$1 and \$3.50; also at the rates of \$4 a year for both papers together.]

both papers together.]

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2nd and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

| l | or from the ste and set, or wholly from                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | (11)                                                                                                        |                      | (3)                                     |                    | r (5)           | 0r (6                                  |    |

Every Premium article is new and of to charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 8 to 12, 23 to 28, 31, 35, 36, 68 to 91, and 94 to 10G inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest recipient), to any place in the United materially increased their salaries thus, while individuals in all classes have secured good things is at our risk; otherwise it is not.

Management of the above ways is at our risk; otherwise it is not.

## Descriptions of Premiums.

(For number of Subscribers required, see Table, page 393.)

Nos. 1, 2, 3, 4, 5, 6.—American Table Cullery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign goods. Messrs. Patterson Bros., 27 Park Row, who supply us with these articles, are also importers of English goods. They recommend these Knives, nanufactured by the Meriden Cullery Co., as equal to any Cutlery in the market, and their recommendation is a guarantee, wherever they are known. We offer four kinds of Knives, and three sizes of each kind. No. 1 have Rubber Handles, which are netually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$14... For 23 subscribers at \$1.50, or 78 at \$1, we will give either the medium size or the table size, sold at \$15.50. No. 2 have Hvory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$15.50. For 31 subscribers, at \$1.50, or 100 at \$1, we will send the medium size, sold at \$20.50... For 34 at \$1.50, or 112 at \$1, we will send the Table size, sold at \$22.50. No. 3 are made of Solid Steel and are triple-plated all over with pure silver, which will wear for a long time, while the Kniffe is actually indestructible by ordinary use. Dessert size with Forks, sold at \$22.50... For 33 at \$1.50, or 120 at \$1, we will send the Table size, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger Hvory Handles, and are really splendid goods. Dessert size with Forks, sold at \$25. No. 4 have Steel Blades, triple-plated with silver, and larger livery Handles, and warranted double-plated with coin-silver. The Forks with No. 4 are warranted Triple-plated with coin-silver. These Forks are also furnished to us by Messus. Patterson Bros... The Carving-Knife and Crutlery Co., with the best Ivory, balanced Handles.

No. 7.—French Cook's Exnife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Pat. Rubber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by the Meriden Cutlery Co.

Nos. S. 9, 10, 11—Pocket Knives.—Here's for the Boys and Girls!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are made by Messes. Smith & Clark, BronxvIIIe, N. Y., whose work is equal to any done in this country or Europe. No. 8 is a neat, substantial Knife, with three blades and buck-horn handle. No. 9 is a still finer article, with four blades and buck-horn handle. No. 10 is an elegant Knife, with four blades and shell handle. No. 11 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 12.—Multum in Parvo Pocket Knife.—This is a most attractive as well as useful Premium. It comprises, in one knife-handle, a large and a small blade, a screw-driver, a saw, a strong hook, a untcracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim punch, and, in addition to this, it can be used for various other purposes which will at once suggest themselves to any smart boy or man. The knives will be sent anywhere in our country, post-paid.

No. 13.— Cake Basket.—A new pattern, oval-shaped, nicely chased—a very taking, nseful, and beautiful table ornament. This, with other articles that follow, is made by the Lucius Hart Manufacturing Co., of Nos. 4 and 6 Burling Slip, New York City, and is warranted by them to be of the best triple plate. Mr. Hart, "the veteran Sunday-school man," was engaged in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and have taken pleasure in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good-looking plated ware for less than half the money.

No. 14.—Casters and Fruit or Cake Basket Combined.—This is a new pattern, both novel and beantiful. It can be used as large, showy Casters, with six cut-glass bottles, or be instantly changed

into complete Casters, with Call-Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers and of equally good quality as the preceding.

No. 15.—Revolving Butter Cooler.—This is a really good and useful article. It is so arranged that a very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same house as No. 13.

No. 16.—Card Receiver. — This is a beautiful arnament, as well as a neeful article. It is finely chased and gitt-lined, and, like the three preceding, is from the Lucius Hart Manufacturing Co.

No. 17.—Nut Picks and Crackers.

—Here are twelve nut-picks, elegantly chased, of medallion pattern, with two handsome nut-crackers, in a morocco-covered case. From the same house as No. 13.

No. 18. — Half-Dozen Napkin Rings.—These rings are beautifully chased, and in a morocco-covered case. From the same house as No. 13.

No. 10.—One Bozen Teaspoons.— No. 20.—One Bozen Table-Spoons.— These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 13. They are far *cheaper* than anything we have found at half the price, and well worth working for.

No. 21.—One Dozen Table-Forks.

—The same description and remarks apply to these as to No. 20. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 22.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the ontside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life keepsake.

Nos. 23, 24, 25.—Gold Pens: with enerpointed Pencils, in extension, coin-sitter cases.—Premium No. 23 contains the best No. 4 Gold Pen; and No. 24 the best No. 6 Gold Pen, which is the same style, but larger. No. 25 contains No. 7 Gold Pen, in Gold-tipped Ehony Holder. Each pen will be sent in a neat leather case by mail, post-paid. These pens are made by Geo. F. Hawkes, No. 64 Nassau St., and bave obtained an excellent reputation. We have known the maker and his goods for many years, and can recommend them.

No. 26.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same makers as above.

Nos. 27, 28.—Ludden's Patent Magic Revolving Penell.—This is a beautiful Pocket Peneil, which is extended or closed by pulling or pressing the head. They are made with great care, and every Peneil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 cach, and one of heavier and firmer plate, at \$3.50. They are made by Ludden's Gold P. and P. C. Co., Will. A. Ludden, Agent, 195 Broadway, who has been in the business thirty years.

No. 29.—Annsette.—We believe in home entertainment for both young and old people. Our observation is, that the increase of entertaining home games is already doing much to keep not only the boys but their fathers away from drinking and gambling rooms, and other places of evening resort not conducive to good morals. This premium, the "Amusette," as it is called, will afford interest to the older as well as the younger members of the family, male and female. It only needs a smooth table of any kind covered with a cloth. The play with the balls will develop much of ingenuity and skill, and give a capital study of the laws of motion, force, etc. The price has been reduced from \$10 to \$6, and our premium will place it in the power of very many to secure this additional source of home amusements. The Amusette is supplied by E. F. Horsman, 100 William Street, N. Y., who will send any desired circulars giving information. It packs in small space and can be safely sent anywhere by express at small cost.

No. 30.—Buby's Chair.—This beautiful Premium will delight mothers and babies everywhere. It is a chair, in combination with a limited spring, suspined from a hook in the ceiling of a room. It gives a young child such a variety of amusement, such varied and healthful exercise, allowing free motion and action

for limb and muscle, that it becomes almost an indispensable article to the nursery. It is made of black walnut, nicely finished, upholstered in green, blue, or red, with cords to match, and sold, with the book, for §4. L. O. Colvin, 94 Waverley Place, Newark, N. J.

No. 31.— Partor Kalcidoscope.—
A most pleasing article—one which can not fail to delight all who receive it. The Kalcidoscope is handsomely finished, with brass object-box, mounted on a neat black-walnut stand. The changes and combinations of colors which may be seen are exquisitely beautiful, and almost numberless. The younger members of the family, especially, will find great entertainment in this elegant premium, which a little effort will secure for them.

No. 32.—Moore's Floral Set.—This is a beautiful Premium—a complete set of Ladies? or Children's Garden Tools for the cultivation of flowers, consisting of a Floral Hoc, Spade, Fork, and Rake. They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden and greenhause, and are pleasing toys for the little folks. Made by the Moore Manufacturing Company, Kensington, Ct.

No. 33.—Steam-Engine. — This is a veritable steam-engine; one that will GO; and a capital, intensely interesting, and instructive article for boys, and grown-up people too. Our cleven-year-old hoy ran his engine an average of an hour or more a day for six mouths; he has exhibited it in motion to many of his playmates; has hitched on various toy machinery, and it appears to go just as well as when first started.

No. 34.— Garden Seeds.—A valuable selection of 49 varieties of the best seeds for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next two are put up for us by Messrs. B. K. Bliss & Sons, Seed & Horticultural Warehouse, 23 Park Place and 20 Murray St. whose seed establishment is well known as one of the best in the country. This premium will be of great value and convenience to many, as we send the seeds post-paid.

No. 35.—Flower Seeds.—Like No. 34 this is a valuable premium. It consists of 100 different kinds of beautiful flower seeds, all in separate papers, and includes the finer common varieties, and many of the newer and rarer kinds that are costly. Delivered free.

No. 36.—Very Choice Garden Seeds and Flower Bulbs.—We have taken special pains to have prepared by Messrs. B. K. Bilss & Sons a list of seeds and bulbs of the very choicest kinds, and the most useful varieties. Though some are rare (and costly), all have been tested and found excellent. Here is an opportunity to obtain a valuable ussortment of seeds, as this preminm allows you to select from the list below any that may be desired, to the amount of two dollars. If more is wanted, it of course is only needful to secure two or more of the premiums, and select seeds accordingly. All delivered free; 1 Pkt. Early Wyman Cabbage, 25c.; Dioscorea Batatas, or Chinese Potato, per doz. bulblets, 25c.; Moore's Early Concord Cora, pkt., 25c.; Laxton's Alpha Peas, pkt., 25c.; Trophy Tomato, ½ oz. pkt., 50c.; ½ oz. Marblehead Mammoth Cabbage, 50c.; ½ oz. Improved American Savoy, do., 25c.; ½ oz. Iopproved Brunswick, do., 25c.; ½ oz. Premium Flat Dutch, do., 25c.; ½ oz. Improved Long Orange Carrot, 50c.; 1 pkt. Perpetual Spinach Beet, 25c.; 1 pkt. Boston Market Celery, 25c.; 2 oz. Dewing's Improved Early Turnip Beet, 25c.; 1 pint McLean's Little Gem Peas, 30c.; 1 pkt. Wew Black Pekin Egg-Plant, 25c.; 1 pint Carter's First Crop Peas, 30c.; 1 pint Crosby's Extra Early Sugar Corn, 25c.; 1 pkt. (ten Seed's) General Grant Cucumber, 25c.; 1 pkt. (ten Seed's) General Grant Cucumber, 25c.; 1 pkt. New Back Pekin Egg-Plant, 25c.; 1 pkt. Early White Erfurt Cauliflower, 25c.; 1 pkt. Early Simpson Lettnee, 25c.; 1 pkt. New Garnishing Kale, 25c.; 1 pkt. Latakia Tobacco, 25c.; 2 oz. Conn. Seed Leaf Tobacco, 50c.; 1 pkt. Early Paris Cauliflower, 25c.; 1 pkt. Early Rose Potato Seed (from balls), 25c.; 2 oz. Conn. Seed Leaf Tobacco, 50c.; 1 pkt. Early Paris Cauliflower, 25c.; 1 pkt. Early Rose Potato Seed (from balls), 25c.; 2 oz. Conn. Seed Leaf Tobacco, 50c.; 1 pkt. Early Paris Cauliflower, 25c.; 1 pkt. Early Rose Potato Seed (from balls), 25c.; 2 oz. Conn. Seed Leaf Tobacco, 50c.; 1 pkt. Early Paris Cauliflower, 25c.; 1 pkt. Early Rose Potato

No. 37.—Set of Field Croquet.—The game of Croquet is so pleasing, and has become so pop-

ular, that we believe many will be glad to avail themselves of the opportunity of obtaining this new and beautiful Premium upon terms as easy as we propose.

Nos. 38, 39, 40.—Sewing Machines.

"A good Sewing Machine lightens the labor and promotes the health and happiness of those at home." We offer a choice of three of the best of the leading machines, all of which have been thoroughly tested in our own families, and give entire satisfaction. While all are valuable. as some excellence peculiar to itself. The Grover & Baker Machine is remarkable for the elasticity of its stitch, which is at the same time very firm and durable. The structure of the seam is such that, though it be cut or broken at intervals of only a few stitches, it will neither open, run, nor ravel. Itsews directly from two spools, without rewinding.... The **Florence** Machine makes different stitches, each being alike on both sides of the fabric. One of its special advantages is that it has the fabric. One of its special advantages is that it has the reversible feed motion, which enables the operator, by simply turning a thumb-screw, to have the work run either to the right or left, to stay any part of the seam, or fasten the ends of scams without turning the fabric. The Willeox & Gibbs Machine excels in the exceeding Willox & Gibbs Machine excels in the exceeding simplicity of its construction. Very little instruction and ingenuity are required to understand the few parts of which it is composed, and their use; and there is no excess for getting it out of order, until the parts are fairly worn ont. One of its strongest recommendations is the case with which it is vertead, taxing the strength of the operator less than other machines. All these machines have constantly increasing sales, showing the public estimate of their value. Either of them will prove a great treasure in any household—worth more than \$500. The 7 per cent interest, would yield, less taxes, about \$30. Most families require at least four months of steady hand-sewing a year, costing, if all hired, not less than \$24 a month, board included, or \$36 a year. With a Sewing Machine, a woman can sew more in one month than in four months by hand. Here is a clear saving of \$72. But far above this—the everlasting "Stitch, stitch, stitch," the bending over the work, and the loss of sleep stitch," the bending over the work, who have brought tens of thousands to early graves. We say wife a Sewing Machine, even have brought tens of thousands to early graves. We say to every man, get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre nr two of laad—get the Sewing Machine any way. If you can get one through our premium-list—well; but get the machine.

—No charge for boxing the machines. They go safely as freight. Send for circulars, giving full instructions, to Grover & Baker Mftg Co., 405 Broadway, N. Y. Florence Sewing Mine Co., 505 Broadway, N. Y. Willcox & Glbbs Mftg Co., 508 Broadway, N. Y.

No. 41.—Bickford Family Krittlng Machine.—This is a practical and efficient
machine, simple in constructioo, works very easily,
makes scarcely any noise, occupies hat little space, can
be attached to any common table, and be removed instantly by simply turning a thamb-screw. It can be
worked by any person of ordinary intelligence, after a
careful perusal of the accompanying book of instructions
and a little patient practice. A great variety of articles
have been made with this machine, and it is capable of
prodacing many more and different kinds. A complete
stocking, heel, toe, and all, can be knit in ten minutes by
a skillful operator, and socks, sacks, hoods, skirts, mittens, undergarments, etc., in remarkably quick time.
Send for circular to Dann Bickford, General
Agent, 689 Broadway, New York. For 52
subscribers at \$1.50, or 169 at \$1.00, we will send the machine with black walnut table, price \$33.

No. 42.—Doty's Improved Clothes Washer, with the Metropolitan Balance Weight. Over sixty thousand families in the United States are now using the Doty Washing Machine, and we believe the improved machine has no superior. The "help" use it and like it. Send for descriptive circulars to R. C. Browning, 32 Cortlandt St., New York, or to Metropolitan Washing Machine Co., Middlefield, Ct. It goes cheaply by freight or Ex.

No. 43.—Universal Clothes Wringer.—A very useful, time-saving, strength-saving, clothessaving implement, that should be in every family. The wringing of clothes by band is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibers with lever power. With the Wringing Machine, the garments are passed rapidly between clastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the articles. We have given thousands of these premiums, with almost noiversal satisfaction. They are made by the Metropolitan Washing Machine Co., Middlefield, Ct.

No. 44.—Blanchard Churn.— The mannfacturers of this churn have been engaged (father and sons) in the making of churns for over fifty years! They have devoted much time to the scientific investigation of the chemical process of butter-making, and developing the best means for aiding it. They believe they have succeeded, and now offer "The Blanchard Churn" as in every

respect the best one ever made. It is not a new thing, as over thirty thousand are now in actual and successful operation. It has no cog-wheels or gearing of any kind. It brings the butter as quickly as it ought to come. It works the botter free from butter-milk in the churn, without any change of dasher, quicker and better than it can be done by hand. It works in the salt in the same way. These churns are manufactured by Porter Blanchard's Sons, and are supplied to us by R. II. Allen & Co., 189 Water st., New York. The churn in the list is No. 5, for about 8 galls, of cream, For 15 subs: at \$1.50, or 45 at \$1, we will give No. 3, for 2 galls, cream, price \$6; and for 18 subs. at \$1.50, or 58 at \$1, we will give No. 7, for 18 galls, cream, price \$10.

Nos. 45, 46.— Melodeous.— These are excellent and desirable instruments, for the Home Circle, for small Churches, for Sunday-schools, for Day Schools, Academies, etc. Instrumental and Vocal Music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer the Melodeons made by Messes. Geo. A. Prince & Co., Buffalo, N. Y., for we know them to be good. A large one in our own Sunday-school room has heen in use for twelve years, and is to-day just as good as when first purchased, though used from time to time by a large number of persons.—Several clergymen have obtained this premium for themselves, their Churches, or Sunday-school rooms. The clubs of subscribers were quickly raised among the members of their parishes.—Many others can get a Melodeon for their home use. Send a postage-stamp to the makers and get their illustrated descriptive circular. These Melodeons will be shipped direct from the mannfactory at Buffalo. They can go safely as freight or by express. If an Organ should be wanted instead of a Melodeon, we can supply it for an increased number of subscribers in proportion to the value.

No. 47.-Steinway Piano.-Seven Oc-TAVE ROSEWOOD CASE, SOLID ROSEWOOD DESK, LARGE FRONT, ROUND CORNERS; OVERSTRUNG BASE, FULL IRON FRAME, PATENT AGRAFFE TREBLE, CARVED LEGS, AND CARVED LYRE.—This is one of the most elegant Preminus ever offered; regular and only price \$625. That this magnificent instrument comes from the celebrated establishment of Messrs. Steinway & Sons, Nos. 109 & 114 East 14th St., is enough to say; but it is due to these enterprising manufacturers to state that, while their pianos have repeatedly received the First PREMIUMS, by the award of the most competent judges the world can produce, at the Universal Exposition, in Paris, they received the First Grand Gold Medal for American Planos in all three styles exhibited, viz.: Grand, Square, and Upright. The following official certificate was signed by the President and the five members of the International Jury: "Paris, July 20th, 1867. I certify that the First Gold Medal for American Pianos has been manimously awarded to Mesers. Steinway by the Jury of the International Exhibition. First on the List in Class X." The Society of Fine Arts in Paris unanimously awarded Steinway & Sons their only annual Testimonial Medal for 1867. The President of the Musical Department of that Society reports: "The pianos of Messrs. Steinway appear to me, as well as to all the of alesses, stellway appear to the, as wen as to all the artists who have tried them, superior to all that have been made to this day in the entire world." The best judges in America say the same. We also speak from personal knowledge, as each of our partners has one at home and desires no better. This splendid premium may be secured by many persons. Only 520 subscribers are required to do it. Several have obtained this preare required to do it. Several nave outlined this pre-mium during the last year. It will pay for even a year's labor. Classes of young ladies at school might unite in canvassing, and obtain a present for a Teacher, or a Piano for their school-room. We shall be glad to give this premium to a large number. Send to Messrs. Steinway & Sons for a free circular describing it.

No. 18.—A Good Watch.—The Watches made by the American Watch Co., Waltham, Mass., have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor, with machinery perfect and ample, enable them to offer watches at lower rates than any other manufacturers. Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of Englaud. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of over 400,000 Waltham Watches in the pockets of the people, is the best proof of the public approval. We offer a Silver watch.

jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, and in pure coin-silver "hunting" case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "AMERICAN AGRICULTURIST." MADE BY THE AMERICAN WATCH CO., WALTHAM, MASS."

No. 49.—Ladies' Fine Gold Watch.

This elegant Premium will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 40 above) includes these beautiful gold watches. They are full-jeweled, in 13-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time-Keeper. Upon the movement of each Premium Watch will be engraved "AM. Admiculturist. Made by the AM. Watch Co., Waltham, Mass."

No. 50.—Breech-loading Pocket Bile.—This remarkable little fire-arm weighs only eleven ounces, yet shoots with great accuracy and power from 30 to 100 yards, or more, and can be loaded and fired five times a minute. It can be carried in a side pocket, and is accompanied by an extension breech, so that it may be used either as a pistol or rifle. It is put up in a neat mahogany case, with 250 rounds of ammunition. The manufacturers are Messrs. J. Stevens & Co., Chicopee Falls, Mass., and the rifles are sold at retail by Messrs. Cooper, Harris & Hodgkins, No. 177 Broadway. This without the mahogany case, we will give the weapon, all complete, with 100 cartridges, packed in a pasteboard box, on receipt of 18 subscribers, at \$1.50 cach. For a full description see American Agriculturist for Jan. 1869, page 32.

No. 51.—Bomble-Barrel Gun; on Fowling Piece.—These guns are the gennine London "Twist" barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their caliber and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this Premium by Messrs. Cooper, Harris & Hodgkins, 177 Broadway, well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This Premium includes Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 52.—Chest of Good Tools.—We continue through the special favor of Messrs. Patterson Brothers, of 27 Park Row, the offer of chests of the very first quality of tools, of kinds and prices named below. Similar tools could be purchased for half the money, but these are all A No. 1, for practical use, and worth a dozen common articles. For this we have the guarantee of Messrs. Patterson, which is amply sufficient, for us, and for all who know them. Any of these tools may be ordered of them. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and hut few additions would be required for a Joarneyman Carpenter. The assortment we offer is as follows: 1 Tool Chest, \$S; 1 Jack Plane, \$1.75; 1 Smooth Plane, \$1.50; 1 Fore Plane, \$2.25; 1 Handsaw, 22 in., \$1.75; 1 Compass Saw, 10 in., 50c.; Compass, 6 in., 37c.; 1 Adz-eye Hammer, No. 4, \$1.25; 1 Intachet, No. 2, 90c.; 1 Draw Knife, 7 in., \$1.12; 1 Try Square, 6 in., 70c.; 1 Bevel, Sin., 75c.; 1 Chalk Line and Spool, 30c.; 1 Mallet, 30c.; 1 Pair of Pliers (steel), 5 in., 60c.; 1 Pair of Calipers, 4 in., 36c.; 1 Enace, No. 2, \$2.25; 1 Auger bit, ea. ½ in., 30c., ½ in., 32c.; ½ in., 45c.; 1 in., 50c.; 12 in., 40c.; 6 Gimlet bits, assorted, 90c.; 3 Gimlet bits, assorted, 33c.; 1 Screw-driver bit, 25c.; 1 Octagon Reamer, 30c.; 1 Taper bit, 30c.; 1 Gouge in Handle, ea. ½ in., 50c.; 1 Gouge in Handle, ea. ½ in., 50c.; 1 in., 70c.; 1 Chisel in Handle, ea. ½ in., 50c.; 1½ in., 50c.; 1½ in., 60c.; 1 Framing Chisel, ea. ½ in., 70c.; 1 in., 50c.; 1½ in., 60c.; 1 Screw-driver bit, 25c.; 1 SteBrad-awls in Handles, \$1 35; 1 in., 50c.; 14½ in., 60c.; 1 Faming Chisel, ea. ½ in., 70c.; 1 in., 50c.; 14; in., 60c.; 1 Faming Chisel, ea. ½ in., 70c.; 1 in., 50c.; 14; in., 60c.; 1 Faming Chisel, ea. ½ in., 70c.; 1 in., 50c.; 14; in., 60c.; 1 Faming Chisel, ea. ½ in., 70c.; 1 in., 50c.; 14; in., 60c.; 1 Faming Chisel, ea. ½ in., 70c.; 1 in., 50c.; 14; in., 60c.; 1 Sau File, ea. 4 in., 14c.; 5 in., 17c.; 1 in., 50c.; 18 in.,

No. 53.—Charles Pratt's Astral oil supplies a great Public Want for a Safe, Reliable, Illuminating Oil. It is manufactured by him and packed only in the Guarantee Patent Cans, expressly for FAMILY USE. It has more body, and an equal quantity will burn longer and give more light than other oils. The constant reentrence of explosions, fires, devastation, and death resulting from the use of what is called Kerosene Oil—but really a mixture of Benzine, Naphtha, and other highly inflammable substances, the use or sale of which is an infringement of United States Law—has induced us to place this article on our premium—list as a lumanitarian as well as a useful act. The Board of Health of the city of New

York have examined scores of samples of Oil obtained from as many different deaders in this city, and nearly all have been found far below the Government standard and entirely unfit for use. This "Astral Oil" is from the House of Chas. Pratt, 103 Fulton St. Mr. P., a merchant of high reputation, will keep up the article to its present standard. It has been tested, and fully indorsed by the highest scientific authorities in the land. The Gonranty Caos are made of tin, and sealed so that none of the oil can be removed without breaking the seal, thus securing safety in transportation. The can is inclosed in a strong wooden case, and may be returned for refilling. For 19 subscribers at \$1.50, or 65 at \$1.00, we will send a case containing 12 one-gallon Guaranty Cans of Oil, which may be distributed among a club.

Nos. 54, 55.—Mereurial Barometers,—Wooduff's Patent, made by Chas, Wilder, Peterboro, N. H. These are the most convenient and portable Mercurial Barometers made. (Send to Mr. Wilder fora circular.) The peculiar form of Mercury cup invented by Mr. Woodurff renders these Barometers so portable that Mr. Wilder guarantees their safe delivery, if not to be sent beyond the Rocky Mountains. The instruments are about 3 feet long, differing mainly in the style of case, both being supplied with Thermometer and Vernier. A Barometer is to farmers, or others on land, what it is to sailors at sea—an indicator of the weather to be looked for—and of special value and interest now with the Government Weather Reports.

No. 56.—Buckeye Harvester Mower.—The Buckeye Mower is so widely and favorably known that we need not describe it particularly. In 1870 this machine received the premium at twenty-eight field trials, and several gold medals. Messrs. Adriance, Platt& Co., 165 Greenwich St., N. Y. City, will send any one a circular, giving full description, engravings, etc. Many a farmer can secure this premium by a very few days' or odd hours' and evenings' canvassing for subscribers. A few can unite their efforts, each getting a part of the subscribers, and own the machine in common.—Ten subscribers a day for 15 days would secure it (§125).—Many can easily raise the necessary club at Town Meetings. Fairs, Elections, and other gatherings, or during evenings. The Buckeye Self-Rake Reaper has been proved to be a very valuable machine and is at least equal to any Reaper and Raker in the market. Those who secure this Mower, can afterward secure the Reaper, which can be attached. We can give, as Fremiums, any of the Buckeye machines.

No. 57.—Patent Cylinder Plow.—We hear very good reports from those who have heretofore received this premium. It is an Ohio invention, but is manufactured by the well-known firm of R. II. Allen & Co., 189 & 191 Water St., New York, to whom application may be made for descriptive circulars, etc. The kind we offer for premiums is the "Two-horse size, cutting a furrow 12 to 11 in, wide, and 5 to 8 in. deep." It is provided with a wheel and with a "skim plow," like the double "Michigan plow.".... For 29 subscribers at \$1.50, or 97 at \$1.00, we will give the Heavy Two-horse, 14 to 16 in, wide, and 6 to 9 in, deep, \$19.00.. For 32 at \$1.50 or 100 at \$1.00, the Two to Three horse, 16 to 18 in, wide, 8 to 11 in, deep, \$21.00.... For 22 subscribers at \$1.50 or 75 at \$1.00, the One-horse, 10 to 12 in, wide and 4 to 7 inches deep, \$15.00.

No. 58.—Collins & Co.'s Cast-Steel Plows.—These excellent plows are made by a patented process, of cast-steel recast (not rolled), tempered and polished like a good ax. They will scour in the softest soils, and are great favorites on the prairies. The canousser has his choice of eight plows named in the mannfacturers' circular at the same price (\$25), of which we particularly recommend "C, No. 3" for general use; "B, No. 12" for stubble only; and "E, No. 12" for strubble only; and "E, No. 12" for stubble only; and "Collins & Co., 212 Water St., New York.

No. 59.—Comstock's New Horticultural Implements Combined.—The Hand Cultivator and Onion Weeder will do the work of six men with boes. It pulls the weeds and thoroughly pulverizes the soil. It is as much superior to the hoe for all small drill culture, as the mowers and reapers are to the seythe and cradle. The Seed Sower is the most perfect small-seed drill we have seen. It sows Beet, Parsnip, and other difficult seeds, with the greatect regularity, and it is specially adapted to sowing Onion seed at the rate of 4, 5, or 6 pounds to the acre. It is readily attached to the Cultivator. The Strawberry Cutter takes off the runners and at the same time cultivates between the rows. After another year's trial of these implements on our own grounds, and the entire satisfaction they have given to all who ordered them of us as premiums, we offer them again and recommend them as being all the inventor claims—"the best in the world." For 19 subscribers at \$1.50, or 65 at \$1.00, we will give the Cultivator and Weeder and Strawberry Cutter, price \$12.00....For 22 at \$1.50, or 75

at \$1.00, we will send the Cultivator and Weeder and Seed Sower, price \$15.00.... For 27 at \$1.50, cr 90 at \$1.00, we will send all these implements complete, price \$18.00. Manufactured by Comstock Brothers, East Hartford, Ct., who furnish descriptive circulars to all applicants. See cuts in American Agriculturist, page 127, 1869, and page 118, 1870.

No. 60.—Cahoon's Broadcast Seed-Sower.—This is an article that the majority of farmers would be glad to own. The Premium offered is the Hand Seed-Sower. It sows from four to eight acres per hour, at a common walking gait, throwing wheat and rye about 33 feet wide; barley, 33 feet; hemp, 28 feet; oats, 23 feet; clover, millet, and Hungarian seed, 22 feet; and timothy 18 feet. The bag and hopper will hold about 22 quarts—as much as a man can well carry at once. The manufacturers warrant this machine to sow 50 acres of wheat, or 35 acres of outs, or 30 acres of grass seed in ten hours. Made by D. H. Goodell & Co., and sold by R. H. Allen & Co., 159 and 191 Water St., New York, who are the General Agents, and will send circulars if desired.

No. 61.—The American Submerged Pump.—Every family needs a reliable pump, capable of raising water easily and rapidly from the bottom of the well, be it deep or shallow—one that is durable, that will not get out of order, or be liable to injury from frost or gravel. When we add to these the qualities of a powerful force-pump, ability to throw water 60 or 70 feet from a hose-pipe, and a construction which renders freezing an impossibility, though it stand out of doors, we think we have a family and farm pump which we can conscientiously recommend. No. 1 will raise 20 gallons of water a minute, This is the pamp offered in the list. No. 3 will raise two bbls, per minute from an ordinary well; and there are larger sizes. Either of these pumps will be furnished for the same number of subscribers required for other premiams of the same price. The pump is set in the well, and nothing but the perpendicular brake and spout appear above the platform. Send for Circulars, to the Bridgeport Manufacturing Co., Bridgeport, Ct., or 55 Chambers St., New York.

No. 62.—Page's Patent Pump and Sprinkler.—A Hand Watering-Pot, a Greenhouse Syringe, a light Force-Pump and Garden-Engine. It is very simple in construction, light to carry, easy to operate, and adapted to many uses—convenient for washing windows or blinds, carriages, horses; watering plants, etc. Throws a small stream about 40 feet. It is so arranged that the stream can be instantly changed to drops, spray, or mist. For circulars, etc., address the patentee and manufacturer, N. Page, Jr., Dauvers, Mass.

No. 63.—Family Scales.—These scales, combining the advantages of counter and platform scales, are peculiarly adapted to household purposes. They weigh from ½ onnce to 240 lbs. They have a scoop, or pan, for weighing flonr, sagar, or other house stores, and a platform for heavier articles, and are just such an apparatus as is needed for in-door or out-door use, occapying less than 2 feet square. These scales are manufactured by the well-known Fairbanks & Co., No. 252 Broadway, New York, whose weighing apparatus has long ranked as the standard in all parts of the country. Send to them for circulars, if desired.

No. 64. — Crandall's Improved Building Blocks furnish a most attractive amasement for children. Churches, Dwellings, Baras, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingennity and taste of children they are nuequaled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc. This is one of the most successful toys ever invented.

No. 65.—Pocket Lanterns.—A very ingenious and valuable Yankee invention—a complete Lantern, yet it can be folded into a parcel 3 by 4 inches long, and 3 of an inch in thickness; it contains 3 little sperm candles, matches etc., always ready for use. Made by the Merriam Mant's Company (Julius Ives & Co., Agents, No. 37 Barclay St., New York).

No. 66. — New American Cyclopædla.—We can not commend this great work too highly. We wish it could be placed in every family in the country. Scholars at our Academies and Seminaries, and members of Library Associations, can easily unite their efforts and secure it. Young men should devote evenings and spare hours to canvassing for this magnificent and useful premium for their own use. Published by D. Appleton & Co., 90 Grand St., New York. The Cyclopædia is a whole library of itself, consisting

of sixteen very large octavo volumes, well bound, averaging 800 large, two-column pages in each hook. They treat upon over 25,000 different subjects. It is hardly possible to name any subject, any conotry, any person of note in past or recent time, concerning which pretty full information may not be found in the Cyclopædia, alphabetically. It is worth a year's effort in raising subscribers.

No. 67.—The Great Dictionary.—Workester's Large Pictorial Unabadoen Edition, containing 1854 three-column pages, with a multimate of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It gives the spelling and producciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopædia. The Dictionary can be called for at our office, or be sent by express or otherwise to any part of the country. It should be in every family. It is published by Brewer and Tileston, Boston.

Nos. 68 to 76.—Volumes of the American Agriculturist (Uabound). — These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. — They are profusely Illustrated, the energyings used in them having alone cost at least \$100,000. Those obtaining premiums for less than fourteen volumes can select any volumes desired, from XVI. to XXX. inclusive. For ordinary use, the sets of numbers unbound will answer.

Nos. 77 to S6.—Bound Volumes of the Agriculturist.—These are the same as Nos. 68 to 77 above, but are neatly bound in uniform style, and cost us more for binding and postage. Sent post-paid.

No. S7.—Farmer's Boy's Library.—
A few dollars' worth of books pertaining to the farm will give the boys new ideas, set then to thinking and observing, and thus enable them to make their heads help their hands. One such book will, in the end, be of far more value to a youth than to have an extra acre of land on coming to manhood. Any smart boy can easily secure this Premium, and he will have two sterling works by a well-known, practical farmer. They are Allen's New American Farm Book, and Allen's American Cattle.

No. 38.—Farmer's Boy's Library.— Both the books in No. 87, and also Herbert's Hints to Horsekeepers, and Henderson's Gardening for Profit.

No. 89.—Farmer's Boy's Library.— The four books in No. 88, with the addition of American Agricaltural Annual for 1871, American Horticultural Annual for 1871, and Harris on the Pig.

No. 90.—Farmer's Boy's Library.— The seven books in No. 89, with the addition of Thomas's Farm Implements, Tim Bunker Papers, and Waring's Draining for Profit.

No. 91.—Farmer's Boy's Library.— The ten books in No. 90, with the addition of Fuller's Grape Culturist, Breck's New Book of Flowers, and Hunter and Trapper—in all 13 fine volumes.

Nos. 92, 93.—Bound Volumes of Hearth and Home.—These volumes are neatly and uniformly bound in cloth, with title in gilt on back and side. With their beautiful engravings, and abundance of useful and entertaining reading for all the members of a family, they will prove valuable additions to any library.

Nos. 94 to 105.—Good Libraries.—
In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 94 to 105 may select any hooks desired from the list of our books published monthly in the American Agriculturist, to the amount of the premiums, and the books will be forwarded, Post or Express paid. The the farmers of a neighborhood unite their efforts, and through these premiums get an agricultural library for general use.

No. 106.—General Book Premium.

—Any one sending 25 or more names, may select books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1.20; or clubs of c each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through, by us,

This is becoming a very popular article in which to grow Ferns, and Plants adapted to the treatment. It is made of Black Walnut, and coutains a movable

## HALL'S PATENT HUSKING CLOVES!

FULL GLOVES.

The very best thing ever invented for husking corn. They give universal satisfaction in use. A man can husk from ½ to ½ faster with them. They absolutely prevent sore hands and cold ingers. The half gloves cover the parts of the hands which become sore. Frice \$1.50. The full gloves are considered by the heat was attached, and made of three sizes—large, medium as mall, for both right and left-handed persons. Set prepaid on receipt of price. A liberal discount to dealers. Address HALL HUSKING GLOVE.

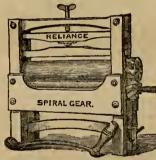

Best machine ever offered for paring, coring, quartering, or slicing apples. Does the cutire work expeditionsly, promptly, and well—separating core and parings from the the fruit at once. Will prepare more fruit for drying, pies, or family use, than six of ordinary parers. For farmers it is indispensable. Fruit can be taken care of in season, instead of allowing it to rot in in the orchard. Three times the price of Parer can be saved on every crop. A barrel of apples can be got ready for pies in one hour, saving in labor alone, in a single year, many times the cost of the Parer. Territory for sale. Agents wanted. Send for a circular.

NEW YORK, NOVEMBER, 1871.

NEW SERIES-No. 298.

HOLSTEIN COW AND BULL .- PRIZE ANIMALS AT THE NEW ENGLAND FAIR .- Drawn and Engraved for the American Agriculturist.

The Holstein cattle seem to have been strangely overlooked by our breeders, and it is only within a few years that they have made an appearance at our fairs. The Holsteins, also known as the Dutch cattle, are pre-eminently dairy animals. They come from a country where the production of butter and cheese is a leading feature of the agricultural industry, and the animals have been bred with a view to the

largest production of milk, though they are by no means inferior as beef animals. The cow represented in our engraving is the "Maid of Opperdoes," the property of Thos. G. Wales, Esq., Framingham, Mass., and took the sweep-stakes prize at the New England Fair. The bull, "Amsterdam," belongs to Chas. Houghton, Esq., Putney, Vt., and took the first premium for bulls. Mr. Allen gives an account of the

performance of an imported Holstein cow, which in ten days gave an average of nearly 74½ pounds of milk. The milk produced over 22 per cent of eream. Six days' milk of this cow yielded 17 lbs. 4 oz. of butter, or nearly three pounds per day. The grade animals are said to inherit the remarkable milking qualities of the breed. The colors of the Holsteins are pure jet black and clear white, variously pied and mottled.

# A "Baker's Dozen."

## Thirteen for Twelve.

Every New Subscriber to the American Agriculturist for 1872, whose subscription comes to hand during November, will be presented with the paper the rest of this year without charge, if the name be marked new when sent in.... Take Notice, that this offer extends to All New Subscribers, whether coming singly, or in Premium Clubs, or otherwise. (This will help those who now begin to make up lists for Premiums, for they can offer to each new subscriber a bonus of an extra month, and still count these names in Premium Lists.)

## Calendar for November.

## AMERICAN AGRICULTURIST.

NEW YORK, NOVEMBER, 1871.

November! One more month, and the year 1871 will be numbered with the past. How rapidly the months and years come and go! We can not stand still. The farmer has to deal with matter that is ever changing. And an accurate knowledge of these changes is essential to the highest success. This is agricultural science, pure and simple. There is nothing in it to frighten a farmer-nothing in it, certainly, that should excite his contempt. He must study these changes, and then apply his knowledge to the daily duties of the farm. set forth, unfold, illustrate, and apply this knowledge that is the great aim and work of the American Agriculturist. We know its importance. We glory in the work. We fully and freely admit the importance of good government, of cheap and rapid transportation, of mechanical inventions, and of manufactures, trade, and commerce; but, at the same time, we know and feel that farming is the basis of our material prosperity. Our aim is to lessen the cost and increase the profits of raising our agricultural products.

Those who live in large cities, with their thousands and tens of thousands of poor meu, women, and children struggling to obtain the bare necessaries of life, fully realize the importance of cheap bread. Cheap, wholesome, highly nutritious animal food, also, becomes daily of more and more importance as the masses of the people become more active, energetic, and intelligent. The thousands of young men (and young women, too) who use their brains, as well as their muscles, require a more nutritions kind of food than the mere plodder. The necessities of our agriculture on the one hand, and the requirements of the ever-increasing number of active, hard-working, intelligent consumers on the other hand, demand more and better animal food.

When in the city, we realize the importance of cheap bread, and a more abundant supply of nutritious meat. On the other hand, when at home on the farm, we have a farmer's desire to get good prices for our products. We know that farmer work hard, and seldom receive adequate compensation for their care, labor, and anxiety. Our profits are too small. As patriots, we want to see cheap bread and cheap meat; as farmers, we want

higher profits. We believe both these ends can be attained. How, it is the aim of the Agriculturist to explain. And, in preparing our monthly hints about work, as well as of other articles in the paper, this object is steadily kept in view.

## Hiuts about Work.

Live-Stock .- We would urge our readers to keep ever before their minds the idea that an animal is, so to speak, a machine that, from the day of its birth to the hour of, its death, is constantly in motion. It never stops; whether asleep or awake, in summer or winter, night and day, it is ever running. And the power required to keep it in motion is derived from the food, or from flesh and fat previously stored up in the animal. In the aggregate, farmers lose millions of dollars every year from not understanding and acting upon this simple truth. There are thousands of calves, cows, and steers that on the first of next April will weigh no more than they do now on the first of November. All the food they consume during the winter is used merely to keep up the animal heat and sustain life. Aside from the total loss of food, an animal so kept, especially a young animal, is not in a healthy condition, and it will take several months of good feed in the spring to give it a good start. An animal that will not pay for liberal feeding had better be sold for whatever it will bring.

The low price of Stock affords a favorable opportunity for purchasing good animals. Weed out the herds. The present depression will only be temporary, and you can now pick up good, thrifty animals at cheap rates. It certainly will not pay this year to winter a poor pig, cow, sheep, or steer.

Sheep.—The same remarks are generally true in regard to sheep, but, at the present time, not with equal force. There is an increased and increasing demand for sheep and wool, and it may pay better to winter a poor flock of sheep than to dispose of them. Better, however, sell the poor ones, and buy younger, healthier, and more thrifty sheep.

Look out for Storms.—Have the barns and sheds in readiness, and be careful not to let the sheep be exposed to severe rain. Nothing is more injurious.

Do not Confine Sheep in Close Quarters.—An open shed is better than a close, ill-ventilated harn. The moment the rain is over, if the sheep are still wet, they will do better and dry quicker out of doors in the wind than in a close barn, the atmosphere of which is saturated by the moisture evaporating from the damp wool. Dry cold seldom or never harts sheep. Damp quarters and wet land are exceedingly injurious.

Give the Sheep some Dry Food.—Grass at this season is comparatively inputritions. Let the sheep have all they will eat of it, but at the same time let them have access to racks filled with hay or straw. If they are not thriving, give a little grain—two bushels of oats per day to one hundred sheep.

Breeding Ewes should be served this month or the beginning of next. A little extra food at this season is particularly desirable. It will tend to secure more, better, and healthier lambs. Do not overtax the ram. If allowed to rnn with the flock, do not place more than sixty ewes with one ram, and if he has not attained his full growth, not over forty. In either case, give him from a pint to a quart of oats per day. Give a little salt every day.

Sheep like Exercise and Fresh Air, and it is desirable to let them run out on the pastures every day as long as they can get a bite of grass. It is a great mistake to suppose that they will not eat dry fodder as long as they can get at the grass. Give them all the hay and straw they will eat, and let them run ont every fine day, and they will thrive and stand the winter better than if shut up too early.

Fallening Sheep should gain rapidly this month. Let them run out on the pastures, and give hay and straw, and half a pound of oats or corn per day.

Swine.—Select out the best sows for breeding; and if you have no good ones of your own, buy the best you can find. Unless you propose raising breeding stock, you do not need to buy thorough-

bred sows. Get a good-sized, healthy, vigorous common sow, that is well formed, and likely to be a quiet mether and a good milker, and put her to a thorough-bred bear. Keep her in a thriving, half-fat condition, and you are pretty sure of a litter of healthy, handsome, fat pigs, that will give a good account of their feed next spring and snummer.

Futtening Hogs should be pushed forward rapidly, and sold early. We shall probably be obliged to accept low prices this season. In our section we are feeding at a decided loss. With good pigs, it requires from seven to eight bushels of corn, judiciously fed, to make 100 lbs. of pork. If a fat hog is worth one cent per lb. more than a lean or halffat one, it will pay us better to make him fat than to sell him lean. We shall probably lose money in either case, but less by making the hogs fat than by selling them lean. This is emphatically true in the cheap coru sections of the West. Besides, meat is very high in Europe, and wages are advancing, and there may yet be sufficient foreign demand to give us fair prices for our pork.

Milch Cows should on no account be suffered to decline in flesh at this season. A little bran and corn-meal will keep them wonderfully, both in flesh and milk. Guard against cold storms on the one hand, and hot, close stables on the other. We hardly know which is more injurious. If confined at night, let the stable be thoroughly ventilated and kept cool and clean. Give the cows all the corn-stalks or hay they will eat at night, and let them run on the pastures as long as they can get a good bite and do not peach the soft ground.

Potatoes should now be dug as rapidly as possible. If the ground is hard and weedy, plow a light furrow away from each side the row, as close as you can run without disturbing the potatoes; then run the plow under the row of potatoes, and follow with hooks. In our experience, by actual test, this saves one third the labor. Where potatoes are worth 50 cents a hushel, we think it better to go over the ground with hooks, as above recommended, than to try to get out the potatoes by harrowing. The potatoes left in the ground will more than pay the difference in the expense. See hints last month in regard to selling, storing, etc.

Small potatoes, cabbage leaves, etc., are usually fed out at this season. It is a great mistake. They are of far more value as a tonic than as food; and by and by, when the animals can not get a bite of grass, they will be worth double what they are now. The small potatoes will pay well to pit and keep untit spring.

Mangel-wurzel and other Beets should be secured at once. Be eareful not to bleed them. They keep better in pits than in a close cellar. But they keep well in the latter if properly corded, with spaces left for the air to circulate through, and the eellar is kept well ventilated, and seldom allowed to get warmer than 50°. The mangels should be kept until all other roots are gone. They improve by keeping. Fed at this season, they are apt to cause securs. This effect is usually attributed to their containing salts, but is probably due to the fact that the roots are not ripe. Their proper season is from February to May.

Ruta-bagas are not so liable to be injured by frost as mangels and beets, and if other work is pressing may he left out until December.

Beet and Turnip Leaves, if put into pits when the temperature is near the freezing point, and beat down very firm, and then lightly covered with earth, will keep through the winter, and be more valuable next March (because more needed) than if fed out now. Select a dry, sandy knoll, and be careful to pack them solid, and not until steady cold weather is about to set in.

Carrots wither up if kept in a loose heap in the cellar. A good plan is to put them in barrels or in a box or bin in the cellar, and put a layer of sand between each layer of carrots, and an inch or so of sand between the carrots and the sides of the bin. Put two or three inches of sand on top to prevent evaporation. Let the cellar be kept cool and well ventilated, and the carrots, if earth enough has

becu mixed with them, will neither mold nor shrivel up. Carrots can also be kept in pits, cording them up, and placing a vertical layer of soil between each pile of carrots.

Pursnips keep best in the ground, and only those needed during the winter should now be dug.

Cabbages are easily kept by placing them tight together in a furrow, with the roots sticking up, and then covering them with four or five inches of earth. Select a dry, light soil. This operation is best performed immediately before winter sets in. If done too early, and during warm weather, they may commence to decay, and when decomposition has once commenced, in this as in all other vegetable matter it is very difficult to stop it.

Common White or Soft Turnips are not worth much labor in housing. Better sell them or feed them out before Christmas.

Corn-Stalks should be secured without delay. If possible, let them be free from snow, rain, and all external moisture. If this can not be done, better let them stay out until they freeze dry. See hints for last month.

Full Howing should be pushed forward rapidly every day that the teams can be spared from the labor of gathering in the crops.

Surface Drainage is a very important matter, not only on winter wheat, but on all the land intended for spring crops. Those who have paid little attention to this matter will be surprised how much water can be let off their land by means of furrows made with a plowand the occasional use of a spade and hoe. We would urge attention to this matter at once, or at least after the first heavy rain.

Manure may be drawn out and spread on grass or other land whenever convenient. Except on steep hill-sides and on very sandy land, there is little danger of the manure leaching away. The ground will absorb it.

## Work in the Horticultural Departments.

A favorable November will give the gardener an opportunity to prepare himself properly for the winter, by clearing up his grounds, plowing, carting mannre, and doing many little jobs for which he can not spare the time in early spring. Many hints for October are applicable whenever the ground does not freeze so hard that it can not be worked.

## Orchard and Nursery.

Hanting.—Continue the operations of planting as long as the ground remains unfrozen, and prepare for spring planting by plowing and manuring.

Heeling in.—When nursery stock is received too late for planting this fall, heel in, taking care to select a light soil where water will not stand during the winter. Care must be used in filling the soil around the roots so as to leave no space for air. Trees thus treated will pass the winter in perfect safety, and be handy for early planting in the spring.

Apples.—These will all be harvested by this time, and if stored in hins just as they were picked, they ought to be sorted, put in barrels, and stored in a cool place where there is no danger from frost. Cider is best when made after cold weather has commenced, as fermentation is not so active then as during the warm weather of last month.

Cellars.—See that there are conveniences for ventilating cellars where fruit and vegetables are stored. The best way is to open a ventilator into the chimney flue. Do not close the cellar entirely until there is danger of freezing.

Grafting. — Seedling stocks for root grafting should be lifted and heeled-in in the cellar, where they can be easily reached during the winter. Cut cions after the trees have stopped growing, and bury in sandy soil in the cellar, or pack in sawdust.

Insects.—If not too cold, give the trees a thorough washing with strong soapsnds or lye, applied with a stiff brush; this will destroy many eggs, which would produce insects. Examine the trunks of the trees near the ground, and if there are any signs of berers at work, probe out with a stiff wire.

Labels.—Before freezing weather has set in, see that all labels are properly renewed, and set so firmly that the frost will not displace them. Labels for nursery rows, made of clear pine or cedar, 18 inches long, 3 inches wide, and ¾ of an inch thick, are very convenient. Paint with white-lead, and write the names with a soft, black lead-pencil. The part which is placed in the ground will last much longer if thoroughly saturated with petroleum.

Manuring.—Give orchards a good dressing of mannre, applied and plowed in this fall. No profitable returns can be expected from an orchard where the ground is exhausted by grass or grain erops, and where nothing is returned in the way of fertilizers to compensate for the crops of fruit which are annually taken from the trees.

Nursery Rows.—Give the rows of young trees in the nursery a final plowing before winter sets in, turning the furrows toward the rows.

Seedlings.—Seedling forest trees are covered with evergreen boughs, and see that there is sufficient drainage to prevent the water from standing and freezing about the roots.

## Fruit Garden.

Planting.—Make preparations for planting hardy shrubs and trees, and see that the tender ones are properly protected from the frosts.

Blackberries.—Plant as directed last month as long as the weather is suitable. In most localities, it will not pay to lay down and cover with earth.

Grape-Vines.—Set out good one or two year old plants with well-ripened wood, and cut back to within a foot of the ground. The best manure for grape-vines is ashes or bones which are not ground very fine, so that their action will continue for several years. If stimulating manure is applied, the wood fails to ripen properly. Any system of training can be adopted which seems best adapted to the wants of the cultivator.

Strawberries.—Cover the beds with a layer of leaves or straw as freezing weather approaches.

Manure.—In the fruit garden, as well as in the other divisions of the garden, manure is essential to the proper growth and ripening of the wood, and now is the best time to apply it.

Ruspherries.—Plant out new rows of these, and lay down the tender sorts. Set in rows four feet apart, with plants in the rows three feet apart.

## Kitchen Garden.

As long as the ground remains open, there is always plenty to do in preparing for the coming spring. If there are any crops left in the ground over winter, make suitable preparations to carry off all water. Plow or trench the soil as long as it remains open. Clear off all weeds which have been allowed to grow during the husy time of harvesting. If there are any which have been allowed to go to seed they must be collected and burned, together with any other rubbish which has been accumulating during the summer.

Asparagus.—Make new beds as before directed, and apply a coat of littery manure to insure an early and rapid growth next spring. Never allow a bed to be left full of weeds in the fall, but dig out all weeds, and in the spring apply a dressing of salt, which is a valuable fertilizer for asparagus.

Beets and Carrots.—Severe frosts injure these, and they must be harvested and stored in a dry cellar in sand if possible. The tops make valuable food for mileh cows. If one has a considerable quantity of tops to feed out, it would be well to try to preserve them by the "sour-keep," mentioned on page 369 in October. See notes on farm work.

Cabbages.—If any of the crup is still in the ground, remove and store as recommended last month. Savoys are not injured by moderate freezing.

Colory.—Store in trenches, or in earth in the cellar.

Cold-Frames.—Allow these to remain open as long as the weather is mild, taking eare, however, to close before nightfall. Provide shutters and mats for increased protection during very cold weather.

Mice.—See that no mice are allowed to infest the cold-frames. Seeds must also be constantly looked after. Destroy by using poison or traps.

Rhubarb.-Make new beds if not already done, and apply a heavy dressing of good stable manure.

Turnips.-Allow them to remain in the ground as long as possible, and when pulled and topped, store in the root-cellar, or in trenches ontside.

Tools and Wooden Appliances .- See that everything is in perfect order for cold weather. Never allow any implement which can be used another year to remain out of doors. Bean poles, if properly eared for, will last for several seasons, and save considerable time and expense every season. It is the little items which are to be carefully looked after, and it is only by prompt attention to these that success is attained. Don't think that because a roller is wholly of iron that it will not do any harm to leave it out all winter, or because a marker is easily made, that it can be easily replaced, and that the weather will not affect it.

Water .- If any part of the garden is so low that water stands upon the surface during the winter, open a surface drain to carry it off. Underdrains are better; still, surface drains are useful.

## Flower-Garden and Lawn.

Although the early September frosts destroyed the tender plants in Northern localities, still many of the hardier oues remain to beautify the flowergarden. The season has been favorable for the construction of walks and roadways, and for preparing beds for early planting in the spring.

Bulbs can be planted this month, if not already doue, provided the ground remains open enough. Dig up all tender bulbs which are still in the ground, and after drying in the sun a few hours remove to a dry place where they will not freeze.

Dahlias. -Before the weather becomes very cold, take up the tubers and store in a dry cellar, carcfully labeled with the name or color of each clump. They will keep well in any place where potatoes are stored, if packed in dry sand.

Frames and Pits.-Open these whenever the weather is mild, but take care to close them before they have time to become too cool. Water only when the earth looks dry. Use mats for protection during cold nights.

Lawns.-It is now too late to sow seed with any prospect of success, but preparations can be made for sowing early in the spring, by leveling the ground, manuring, etc.

Perennials .- The young seedlings will winter better if covered with a thin layer of litter or leaves.

Roses. - Remove the tender varieties to the cellar, or bend them down and cover with sod.

Cannas.-Take up the clumps before the foliage is killed by the frost, and store in a dry cellar. Save a supply of seeds for raising young plants.

## Greenhouse and Window Plants.

The chauge in temperature should be gradual, so that plants taken from the outside will not feel the effects of removal. Give plenty of air during the middle of the day. No fires will be needed unless the temperature of the house is below 45°. Use care in watering, as more plants are killed by too much water than from the want of it.

Annuals.—Seeds of annuals sown in pots or pans must be pricked out into boxes for winter flowering before they become drawn. If no seeds have been sown, prepare a few pans of Mignonette, Sweet Alyssum, etc., immediately.

Bulbs .- Remove a few pots from the cellar every week for winter flowering. It takes about six weeks for Hyacinths and Tulips to flower after they are brought into the greenhouse.

Camellias. -If early flowers are wanted, remove a few pots into a gentle heat, and give plenty of water, and once a week a watering of liquid man-The larger number of the plants should be kept back as long as possible.

Greens. - Store a quantity of Lycopodiums in the

cellar for use in making bouquets during the winter. Also secure a quantity of greeu moss for making up hanging-baskets, in-door rock-work, etc.

Insects.-Keep all plants free from insects by fumigating, or washing with whale-oil soap.

## Commercial Matters-Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, show at a glance the transactions for the month ending Oct. 17, 1871, and for the corresponding month last year.
